Enable AI Experiences

AI experiences on the ServiceNow AI Platform® extend your workflows with AI-driven automation. Use generative AI skills, AI agents, and agentic workflows to automate multi-step tasks, surface relevant answers, and support self-service across your organization.

Implementing AI on the ServiceNow AI Platform follows a natural sequence: assess your readiness and install Now Assist, establish governance policies, choose your language model strategy, prepare your data and search infrastructure, activate generative AI skills, deploy AI agents and agentic workflows, deliver AI capabilities to your users, measure effectiveness, and drive adoption across your organization.

Now Assist introduced AI on the platform. As that experience has evolved, there's a new name for the experience. ServiceNow Otto® is the conversational AI platform integrated into ServiceNow workflows. It provides agentic capabilities, supports multimodal interactions across web, mobile, and messaging channels, and enables autonomous orchestration for cross-system workflows.

AI journey

Get started

Assess your AI readiness, install Now Assist, and build the foundation for AI experiences across your workflows.

AI governance

Establish policies, roles, and guardrails for responsible AI deployment with AI Control Tower.

Large language models

Choose your language model strategy and configure the providers that power Now Assist generative AI.

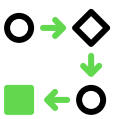
Manage data

Prepare your data foundation and configure AI Search and Knowledge Graph to power AI-driven results.

Generative AI

Activate and configure Now Assist generative AI skills to enhance productivity across your workflows.

AI agents and agentic workflows



Design, deploy, and evaluate AI agents and agentic workflows that autonomously complete multi-step tasks.

Getting started with AI on the ServiceNow AI Platform

Prepare your instance for AI by learning about the applications and roles involved, exploring the AI Admin Center, and evaluating your data and configuration readiness.

Implementing AI on the ServiceNow AI Platform begins with learning what is available, confirming that your environment is ready, and building the foundation that all AI capabilities depend on. A few key steps prepare your data, verify your applications, and align your organization's AI policies with your implementation.

Now Assist introduced AI on the platform. As that experience has evolved, there's a new name for the experience. ServiceNow Otto® is the conversational AI platform integrated into ServiceNow workflows. It provides agentic capabilities, supports multimodal interactions across web, mobile, and messaging channels, and enables autonomous orchestration for cross-system workflows.

ServiceNow® AI implementation

A successful AI implementation depends on three things:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Familiarity with the applications and features that make up the AI experience
- Clearly assigned roles for everyone involved in managing AI on the ServiceNow AI Platform
- A shared vocabulary for the concepts behind generative AI and agentic AI capabilities

Platform administrators, AI administrators, data stewards, knowledge managers, and business stakeholders each play a distinct part in an AI implementation. Existing platform engineers and domain experts can implement AI when they have clear role definitions and the right access.

To review the applications and features that make up the AI experience, the roles for everyone who manages AI on the platform, and a glossary of terms, see Implementing AI on the ServiceNow AI Platform.

AI Admin Center

AI Admin Center is a single workspace where you set up, manage, and optimize your generative AI solutions on the ServiceNow AI Platform. The home page is tailored to your environment, role, and business objectives, and surfaces AI-generated actionable use cases to help you implement AI adoption and best practices. AI Agent Advisor analyzes your instance data to identify leading automation opportunities and estimates the potential time savings for each one.

AI Admin Center also tracks performance of recently activated AI solutions with usage trend lines, provides direct access to AI readiness assessments, and links to other AI applications on the platform such as AI Agent Studio, AI Control Tower, and the AI Admin Hub.

To set up, manage, and optimize your generative AI solutions from one workspace and act on the automation opportunities AI Agent Advisor surfaces, see AI Admin Center (formerly Now Assist Center).

Assessing your AI readiness

AI Readiness Evaluation

The AI Readiness Evaluation app automates the assessment process by gathering, processing, and analyzing instance data, then delivering results within seconds with direct hyperlinks to improve any issues found. Each assessment provides an overall go or no-go status along with estimated remediation effort.

Data readiness

High-quality data that is complete, accurate, and contextually relevant is the foundation for delivering precise and trustworthy AI responses. Evaluate whether your records, knowledge articles, and catalog items are prepared for AI.

Application readiness

AI depends on several platform applications to deliver AI capabilities. Preparing these applications for AI spans the following areas:

- Knowledge base readiness: Verify that articles are current, well-structured with consistent templates, and populated with complete metadata so that ServiceNow Otto can deliver accurate responses across AI Search and Q&A Genius Results.
- Service Catalog readiness: Confirm that catalog items have clear names, user-friendly descriptions, and manageable variable counts, and identify which items can be made conversational for use with ServiceNow Otto for Virtual Agent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- AI Search readiness: Verify that AI Search is active, configure search sources and search profiles, and install ServiceNow Otto for AI Search to power Q&A Genius Results across your portals.
- ServiceNow Otto for Virtual Agent readiness: Install and configure an LLM assistant, review your Virtual Agent topic inventory, and migrate NLU topics to LLM to enable AI-driven conversational experiences.

To prepare your knowledge base, Service Catalog, AI Search, and Virtual Agent for AI, see Application readiness for AI on the ServiceNow AI Platform.

Implementing AI on the ServiceNow AI Platform

Preparing for an AI implementation involves more than installing plugins — your data, applications, and AI policy each shape the result. Working through these foundations before activation reduces rework whether you're enabling conversational catalogs, automating content generation, or enriching user interactions.

Get started

Organization and tools	Roles and responsibilities	Glossary
Learn about the applications and features that make up the ServiceNow AI experience.	Identify the administrative roles required to install, configure, and manage each ServiceNow AI capability.	Look up definitions for ServiceNow AI terminology.

Note: Depending on your license, you will have access to certain application features, generative AI skills, agentic workflows, and AI agents. For more information, see ServiceNow product tiers.

Additional implementation information is available on Now Create.

For additional Now Assist resources, see Additional resources for AI products and solutions.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:

- Not all model providers are available for customers with in-country SKUs, and some AI products/features are currently unavailable for in-country customers. For more information, see the KB1584492 article in the Now Support Knowledge Base. Be sure to check for model provider availability updates in future releases.
- Some AI products/features are currently unavailable for customers in the FedRAMP, NSC DOD IL5, or Australia IRAP-Protected data centers, self-hosted customers, or in other restricted environments. For more information, see the KB0743854 article in the Now Support Knowledge Base. Be sure to check for availability updates in future releases.
- Some AI products/features are currently available only for customers in some regions. Be sure to check for availability updates in future releases.
- Some AI products and skills are not available in Regulated Markets. For more information, see KB2593939: Regulated Markets AI Products/Skills Not Available. Be sure to check for availability updates in future releases.

AI limitations

This application uses artificial intelligence (AI) and machine learning, which are rapidly evolving fields of study that generate predictions based on patterns in data. As a result, this application may not always produce accurate, complete, or appropriate information. Furthermore, there is no guarantee that this application has been fully trained or tested for your use case. To mitigate these issues, it is your responsibility to test and evaluate your use of this application for accuracy, harm, and appropriateness for your use case, employ human oversight of output, and refrain from relying solely on AI-generated outputs for decision-making purposes. This is especially important if you choose to deploy this application in areas with consequential impacts such as healthcare, finance, legal, employment, security, or infrastructure. You agree to abide by ServiceNow's AI Acceptable Use Policy, which may be updated by ServiceNow.

Data processing

This application requires data to be transferred from ServiceNow customers' individual instances to a centralized ServiceNow environment, which may be located in a different data center region from the one where your instance is, and potentially to a third-party cloud provider, such as Microsoft Azure. This data is handled per ServiceNow's internal policies and procedures, including our policies available through our CORE Compliance Portal.

Data collection

ServiceNow collects and uses the inputs, outputs, and edits to outputs of this application to develop and improve ServiceNow technologies including ServiceNow models and AI products. Customers can opt out of future data collection at any time, as described in the AI Opt-Out page.

AI organization and tools on the ServiceNow AI Platform

The ServiceNow AI experience includes generative AI skills, agentic AI, and a conversational user engagement layer. An effective AI experience depends on quality data and a coherent AI policy that guides your implementation. AI Search capabilities and other tools help connect the pieces.

The following image illustrates the components of the ServiceNow AI experience. You can think of each area as a layer, with AI policy as the basis for your implementation. Data plays an important role, since poor data will lead to poor outcomes, and the search experience drives both generative and agentic AI capabilities. The conversational engagement layer allows your users to communicate with AI and perform tasks and self-serve more easily.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI policy

AI governance is defined by your organization and then implemented on the platform using AI Control Tower. AI Control Tower is designed to scale with your organization's AI maturity. It enables end-to-end life cycle management of AI agents and models, from intake and evaluation to deployment and optimization. It also connects governance committees and implementation teams, so that policy decisions are translated into technical configurations and operational controls. The platform includes the AI Risk and Compliance application, which comes with prebuilt content aligned to the EU AI Act and NIST AI Risk Management Framework (AI RMF), helping organizations address these requirements and implement responsible AI practices. For more information, see AI governance on the ServiceNow AI Platform.

For real-time guardrail enforcement for AI interactions, you can use AI Guardian to monitor and mitigate risks related to offensive content, sensitive topics, and security threats in generative AI outputs. Admins can configure these guardrails directly in the AI Admin Hub console, and logs are available to track detection events and guide decisions about blocking or escalation.

For more information about these tools, see:

- AI Control Tower
- AI Risk and Compliance
- AI Guardian

Data management

Poor, incomplete, or unstructured data leads to poor AI outcomes. To prepare your data for AI implementation, see Data readiness for implementing AI on the ServiceNow AI Platform.

ServiceNow provides several tools to help you manage data and provide user context on your instance. The AI Data Kit helps organizations manage AI training data on their ServiceNow instance. It provides a centralized workspace to curate, generate, cleanse, and evaluate datasets, including importing data from tables, adding ground truth, and creating derived datasets. It supports synthetic data generation—up to 1,000 records at a time—and includes tools to anonymize sensitive information for privacy compliance. Integrated with the AI Skill Kit, it enables teams to test custom AI skills and measure performance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Knowledge Graph makes AI more personal by using structured enterprise data to tailor responses to each user. It helps AI understand context, such as a user's role, location, or assigned assets, making answers more relevant and accurate. It also supports intelligent slot-filling, automatically pulling in known information to streamline conversations and reduce repetitive questions. This results in faster, more personalized, and trustworthy AI interactions.

For more information about these tools, see:

- AI Data Kit
- Knowledge Graph
- AI Readiness Evaluation

Internal and external content search

ServiceNow Otto for AI Search is the primary tool used to find content on your instance, whether it's in the form of knowledge articles, Service Catalog items, system users, Knowledge Graph schemas, or content in enhanced chats using ServiceNow Otto for Virtual Agent.

ServiceNow Otto for AI Search is a plugin that enhances your existing AI Search configuration, adding support for Genius Result answers.

You can expand the amount of content available to ServiceNow Otto for AI Search by using External Content Connectors. With this tool, AI Search applications can search content and metadata from external content repositories such as Atlassian Confluence Cloud and Microsoft SharePoint Online.

For more information about these tools, see:

- AI Search
- ServiceNow Otto for AI Search
- External Content Connectors

Generative AI skills

AI product plugins provide workflow-specific, generative AI skills that are tailored to specific use cases. For example, a skill might summarize a customer chat, suggest next steps in a workflow, or generate resolution notes for a task. For a list of available skills by product, see Generative AI skills.

Use the AI Admin Hub console to install and configure AI plugins, and perform the following tasks:

- Set up and configure skills to align with your business processes.
- Monitor and analyze usage, including adoption rates and performance metrics across the platform.
- Manage provider policies, data handling rules, and access controls.
- Turn on and configure the ServiceNow Otto panel.
- Manage large language models (LLMs).
- Configure translation for ServiceNow Otto.

If you need to customize or adapt existing skills, you can use the AI Skill Kit to build, customize, and test generative AI skills that are tailored to your organization's workflows. With features like a prompt editor, visual builder, and evaluation tools, it helps you fine-tune performance and ensure quality. It also integrates with the AI Data Kit and AI Guardian for testing and governance.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information about these tools and features, see:

- Overview tab in AI Admin Hub
  - ServiceNow Otto panel
  - Manage AI models
  - Analyzing AI performance
  - Multilingual service for Now Assist
  - ServiceNow Otto for Mobile
- AI Skill Kit

Agentic AI

In an agentic AI system, autonomous agents perform complex tasks by reasoning, planning, and executing actions across multiple steps. These agents break down goals, coordinate with other agents or systems, and complete workflows across multiple steps. In AI Agent Studio, AI agents and agentic workflows are built to handle tasks such as resolving incidents, managing requests, or navigating service catalogs using generative AI and orchestration logic. For a list of available agentic workflows by product, see Agentic workflows.

Use AI Agent Studio to perform the following tasks:

- Build or modify AI agents and agentic workflows using list views and guided setup tools.
- Simulate tasks and view execution logic to refine agent behavior.
- Access execution logs and version control to track performance and changes.
- Use the Settings page to enable AI Guardian for runtime safety, including detection of offensive content and prompt injection.
- Use the AI Agent Analytics dashboard to view usage stats, efficiency gains, and execution volume to help measure value.

The Model Context Protocol (MCP) client enables you to access the Model Context Protocol tools that are hosted externally and published using an MCP Server. MCP facilitates communication between an AI host application (like AI Agent Studio) and one or more MCP servers that expose specific capabilities such as tools.

The MCP Server Console is a tool for administrators to set up and manage Model Context Protocol (MCP) servers. These servers provide AI applications with access to ServiceNow features like incident lookups, case summaries, and workflow actions. The console lets you choose which capabilities to make available, so that everything stays secure and compliant. Then, from an MCP client, users can request information from the server and automate functionality using the available tools and data that the server returns.

For more information about these tools, see:

- AI Agent Studio (legacy)
  - AI Agent Studio overview
  - Implement access control in AI agents
  - AI Agent Analytics dashboard
  - Examples of using AI agents
- Model Context Protocol Client
- MCP Server Console

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Conversational AI engagement

ServiceNow Otto for Virtual Agent is the primary conversational interface for your organization's AI capabilities. It enables users to interact naturally with AI-powered assistants that understand intent, recommend actions, and deliver synthesized responses—all within familiar channels like the service portal, mobile app, and Microsoft Teams. This conversational layer enables your users to communicate with AI and perform tasks and self-serve more easily. It connects users to a wide range of AI-powered resources, including AI agents, generative AI skills, catalog items, Virtual Agent topics, Q&A Genius results from AI Search, and even custom subflows and actions.

By integrating with the AI agent framework, Virtual Agent can discover and trigger agentic workflows that dynamically solve problems based on context. For example, a user might ask about ordering a device, and the system can invoke a multi-turn catalog ordering skill, refine the request, and complete the task, within a single conversation. Similarly, Q&A Genius capabilities allow users to ask open-ended questions and receive actionable answers, links, or follow-up options, to help reduce the need for live agent intervention.

ServiceNow Otto for Virtual Agent also makes it easier to discover content without needing to know exact keywords. Users can search for and interact with catalog items, AI agents, and Virtual Agent topics using natural language. LLM topic discovery and Knowledge Graph slot-filling can return personalized responses and reduce repetitive questions.

To configure ServiceNow Otto for Virtual Agent, you set up an assistant. An assistant is a container for a specific conversational experience that can be delivered in portals on your instance, mobile apps, Microsoft Teams, and Slack. Use the Assistant Designer to create, configure, and manage these assistants, as well as link them to conversational assets in Virtual Agent.

To implement ServiceNow Otto for Virtual Agent, admins use the guided setup that requires no deep technical expertise. Assistant configuration includes the following options:

- AI agent enablement and orchestration
- Search sources
- Knowledge Graph schema usage
- Conversational assets, such as Virtual Agent topics, subflows, actions, generative AI skills, and AI agents
- The portals, channels, or apps the assistant will be used in
- Branding (the look and feel of the assistant)
- Chat experience, such as greeting, closing, and fallback messages

You can also customize an assistant for the ServiceNow Otto panel. The panel is available in workspace experiences and is typically used for contextual assistance within a specific workflow or record. ServiceNow Otto panel assistants have different configuration options and skill availability.

For more information about these tools, see:

- Virtual Agent
  - Assistants overview
  - Enhanced chat
  - Premium chat
  - Integrating ServiceNow® Otto for Virtual Agent with Microsoft Teams

Roles and responsibilities for AI administration

AI capabilities on the ServiceNow AI Platform require specific administrative roles. Identify these roles before implementation to plan access and assign accountability.

AI administration on the ServiceNow AI Platform is distributed across multiple specialized roles rather than a single platform-wide role. Each tool has its own dedicated administrative role. This separation supports least-privilege access and lets organizations assign responsibility to the people closest to each capability.

The sys_admin role does not automatically grant the following roles. Assign the AI administrative roles directly to the users who require them.

The following table identifies the role required to administer each area of AI implementation. Reviewing the table during planning helps you confirm assignments, request access ahead of activation, and align team members with their administrative responsibilities.

Note: Some roles, such as the Now Assist admin, apply to more than one implementation area. A single user can hold multiple administrative roles when their responsibilities span several areas.

Administrative roles by implementation area

Implementation area	Role	Responsibilities
AI policy	AI steward [sn_ai_governance_ai_steward]	Manages the platform's data assets and AI capabilities, ensuring data quality, integrity, and ethical use. Implements governance policies to maintain compliance, security, and responsible AI practices across ServiceNow applications and workflows.
	AI asset owner [sn_ai_asset_mgmt.ai_asset_owner]	Drives the development and delivery of AI-powered products, ensuring

Administrative roles by implementation area (continued)

Implementation area	Role	Responsibilities
		alignment with business goals and user needs. Defines product vision, manages feature prioritization, and translates business requirements into technical deliverables.
	AI Risk and Compliance Manager [sn_grc_ai_gov.ai_risk_and_compliance_manager]	Identifies, assesses, and mitigates risks related to AI use within the enterprise. Ensures AI compliance with laws, regulations, and internal standards while addressing issues such as bias, privacy, and transparency.
	AI Risk and Compliance admin [sn_grc_ai_gov.ai_risk_and_compliance_admin]	Configures risk assessment methodologies, risk contribution factors, and impact assessment templates. Defines automation rules for impact assessments, sets up and profiles AI case types, and deletes AI systems.
	Now Assist admin [sn_nowassist_admin.nsa_admin]	Enables and manages the AI Guardian guardrails within the AI Admin Hub console.

ServiceNow product tiers

ServiceNow structures its products and packages in three tiers — Foundation, Advanced, and Prime. Each tier incorporates AI and builds progressively on the previous one with additional AI capabilities, agents, and governance tools.

The Foundation tier delivers AI-assisted insights and routine automation. Advanced adds agentic workflows capable of synthesizing context across complex processes. Prime unlocks a fully autonomous workforce that executes multi-step tasks end to end.

This structure makes the path to greater automation simple, predictable, and scalable across your organization.

Note: Contact your ServiceNow account team for information about availability and entitlement details for your organization. The rollout of new product tiers is independent of your organization's upgrade cycle.

For the latest information about supported product lines, see ServiceNow Product tiers

Product tiers

Foundation	Advanced	Prime
AI skills, routine AI agents	Agentic workflows	Autonomous AI workforce
This solution provides task-based assistance using routine pattern recognition and categorization to accelerate understanding and help you work faster.	This solution automates entire steps in a workflow, working side-by-side with you while synthesizing new insights, understanding context, and applying deep domain knowledge.	This solution offers fully independent AI specialists to make and execute decisions autonomously. They apply deep, role-based expertise to master and run multiple agentic workflows.

AI platform enablers

Every offering has a set of platform-level AI capabilities powering the skills, agents, and governance experience across all product lines.

Now Assist

Now Assist is the generative AI experience embedded throughout the ServiceNow AI Platform, delivering skills such as incident summarization, sentiment analysis, reply generation, and case resolution assistance. AI skills are available at every tier, across ITSM, CSM, ServiceNow Otto for HRSD, and industry solutions. For a full overview of the ServiceNow Otto panel and administration tools, see Now Assist panel.

Now Assist AI agents

AI agents extend generative AI into autonomous agentic workflows. Using AI Agent Studio, administrators can configure out-of-the-box agents at Foundation and Advanced tiers, or build net-new agents from natural language instructions at the Prime tier.

AI Action Fabric

AI Action Fabric is the communication layer that enables ServiceNow AI agents to collaborate with each other and with third-party AI systems. It uses open protocols to facilitate this collaboration. These protocols include Agent-to-Agent (A2A) and Model Context Protocol (MCP). Foundation and Advanced tiers include A2A outbound connectivity; Prime adds inbound MCP Server Console

capability, enabling external platforms to invoke ServiceNow agents directly. For implementation details, see Enable MCP and A2A for your agentic workflows.

AI Control Tower

AI Control Tower is included in every tier (Foundation, Advanced, and Prime) with the same capabilities at each. It discovers and visualizes ServiceNow AI assets automatically, and external AI with setup. It also allows you to manage ServiceNow AI assets (governs, secures, observes, and measures). Full management of external AI assets (govern, secure, observe, measure) requires a separate AI Control Tower for Enterprise AI license. For configuration guidance, see Exploring AI Control Tower and Configuring AI Control Tower.

Workflow Data Fabric

Workflow Data Fabric grounds AI agents in real enterprise data by connecting any application, database, or system to the ServiceNow AI Platform — without requiring data to be moved or replicated. Workflow Data Fabric Foundation, including Integration Hub, Robotic Process Automation (RPA) Hub, Automation Center, and Data Catalog, is embedded in every tier edition. Workflow Data Fabric Advanced, adding Zero Copy Connectors and Stream Connect, is available as a paid upgrade.

RaptorDB

RaptorDB is the next-generation ServiceNow database, purpose-built to deliver the performance and scale that AI-native workloads demand. RaptorDB Standard underpins every tier edition with improved response times and optimized query performance. RaptorDB Professional unlocks ultra-scale analytics, enhanced column-store capabilities, and advanced instance topology support for organizations running the most demanding generative AI and machine-scale data use cases.

Moveworks for ServiceNow (EmployeeWorks)

ServiceNow EmployeeWorks brings together Moveworks' conversational AI and enterprise search with ServiceNow's unified portal and autonomous workflows. This combination gives employees a single, natural-language front door to enterprise services. The solution is available across Microsoft Teams, Slack, browser, and mobile. EmployeeWorks capability is bundled at a level aligned with each tier, ensuring that conversational access scales with your agentic AI investment. For more information, see the Autonomous Workforce and EmployeeWorks announcement.

Get started

To begin implementing the capabilities offered at each tier on your instance, see the following resources.

- Now Assist overview — Learn about the applications and features that make up the AI experience.
- AI Control Tower — Learn about the importance of AI governance to ensure responsible use, regulatory compliance, and alignment with enterprise goals.
- Data readiness — Learn how to prepare your instance data for AI.

AI glossary

Learn about the terms and concepts used on the ServiceNow AI Platform.

AI Admin Hub

A console for administrators to quickly set up, configure, and monitor generative AI features and capabilities offered on the ServiceNow AI Platform.

AI Analytics

A dashboard that provides insights into the usage, value, and performance of AI on a ServiceNow instance.

AI Guardian

A feature that monitors and evaluates content created with generative AI to protect users from harmful, offensive, or inappropriate content. It can log incidents and prevent such content from being displayed.

agents

An agent, in the context of AI, refers to a software entity that can perceive its environment, make decisions, and take actions to achieve specific goals. Agents can be simple or complex, ranging from basic reactive systems to sophisticated entities that learn and adapt over time. They are often used to automate tasks, interact with users, or manage complex processes.

agentic AI

Agentic AI refers to artificial intelligence systems that possess autonomy, enabling them to function independently and make decisions without continuous human oversight. These systems can perceive their environment, reason, learn from experience, and execute tasks to achieve specific goals. In ServiceNow AI Platform, agentic AI is powered by AI agents, agentic workflows, and Voice/Web agents.

agentic conversation

Agentic conversation refers to interactions between humans and AI systems where the AI exhibits autonomous behavior, making decisions and taking actions to achieve specific goals. In an agentic conversation, the AI agent can understand the context, reason, and respond accordingly, often without requiring explicit human direction. You can enable it in Virtual Agent, ServiceNow Otto panel, Voice/Web agents, and enhance it through Knowledge Graph, RAG, and Open Prompts.

agentic system

An agentic system is a type of software or AI that perceives its environment, makes decisions that are based on that perception, and takes actions to achieve specific goals, often with minimal human intervention. An agentic system can learn, adapt, and operate independently to solve problems or perform tasks.

agentic workflow

An agentic workflow is a structured sequence of tasks executed by one or more AI agents with minimal human intervention to fulfill a business objective. You can create and manage

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

these workflows in AI Agent Studio by using triggers, tools, and evaluation plans, and deploy across ITSM, HR, and CSM use cases.

AI agents

AI agents are autonomous digital workers that use LLMs, tools, and workflows to complete tasks across ITSM, HR, and CSM on behalf of users. They can reason, plan, and act independently or collaboratively. You can create and manage them using AI Agent Studio and orchestrate them in AI Agent Orchestrator. These agents are embedded in ServiceNow Otto panels, Virtual Agent, and custom workflows.

The AI agent is a virtual worker that performs specific tasks leveraging tools from the ServiceNow AI Platform such as workflow, skill, script, knowledge base, etc.

AI compliance

AI compliance refers to the adherence to regulatory requirements, standards, and guidelines governing the development, deployment, and use of artificial intelligence systems. It involves ensuring that AI systems are designed and implemented in a way that meets legal, ethical, and organizational standards. This includes addressing issues related to data privacy, bias, transparency, and accountability. You can manage it through audit trails, model life cycle management, and data masking by using AI Control Tower in ServiceNow AI Platform.

AI Control Tower

AI Control Tower is a centralized governance hub for managing AI models, agents, and compliance across the ServiceNow AI Platform. It provides visibility into model usage, performance, risk and compliance, and is integrated with AI Admin Hub.

AI governance

AI governance refers to the set of policies, procedures, and standards that guide the development, deployment, and use of AI systems within an organization. It ensures that AI systems are aligned with organizational values, comply with regulatory requirements, and are used in a responsible and transparent manner. In ServiceNow AI Platform, you can manage AI governance through AI Control Tower, AI Trust Guard, and role-based access in AI Admin Hub.

AI steward

An AI steward within ServiceNow AI Platform is a governance role responsible for overseeing the life cycle of AI assets, including models, data sets, and prompts. You can use AI stewards in AI Control Tower to coordinate governance activities between legal, security, compliance, and innovation teams for the responsible deployment of AI agents, skills, and models across the platform.

citation

Small, interactable number next to AI-generated content in the ServiceNow Otto panel that cites the source of the information.

custom skill

A user-defined AI capability tailored to meet specific business needs. It is created and trained using relevant data and prompts.

Dynamic Translation

A feature on the ServiceNow AI Platform that translates user input to English and then translates the AI-generated responses back to the user's preferred language.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

External Content Connectors

External

External Content Connectors is a ServiceNow® Store application that enables AI Search to index and search content from external repositories like Atlassian Confluence Cloud and Microsoft SharePoint Online. It expands search capabilities to include external content while maintaining original access permissions.

generative AI

A technology that uses large language model (LLM) to generate text, summaries, and other content.

generative AI skill

A predefined capability on the ServiceNow AI Platform that uses generative AI to perform tasks such as generating summaries, resolution notes, and so forth.

Generative AI Controller

A tool to customize the generative AI experience on the ServiceNow AI Platform, including integrating third-party large language model (LLM) licenses.

guardrail

A mechanism that monitors and evaluates user input and AI-generated response to ensure it is safe and appropriate.

Knowledge Graph

Knowledge Graph organizes structured and unstructured enterprise data into a semantic network that AI agents can query. The ServiceNowKnowledge Graph application enhances the performance of ServiceNow Otto for Virtual Agent, AI agents, and generative AI skills by leveraging structured and unstructured data from various sources. It provides a customized user experience by creating and managing Knowledge Graph schemas through a user-friendly interface. The application integrates with AI agents and Virtual Agent, offering prebuilt integrations for seamless functionality.

large language model (LLM)

A complex machine-learning model trained on large datasets to generate human-like responses to user input.

multi-turn catalog ordering

A feature in ServiceNow Otto for Virtual Agent that allows users to order catalog items from the service catalog through a conversational interface.

native translation

A feature in ServiceNow Otto that uses integrated large language models (LLMs) to generate responses in the user's preferred language. You can enable and configure it in the AI Admin Hub.

offensive content detection

A guardrail in AI Guardian that logs and blocks offensive, harmful, or inappropriate content.

orchestrator

The AI agent orchestrator is a specialized agent that plans, coordinates, and manages the execution of tasks across multiple AI agents. It holds short-term memory, tracks goals, and ensures agents collaborate effectively. This component is central to agentic AI architecture

and is configured in AI Agent Studio. The orchestrator conducts the planning and leads a team of AI agents to address a given agentic workflow.

prompt injection detection

A security feature in AI Guardian that identifies and prevents malicious inputs from being used to manipulate AI-generated responses.

Q&A genius result

Q&A Genius Results in ServiceNow Otto provide users with concise, actionable answers generated from relevant knowledge articles and other sources. These results are displayed as actionable cards, each including a link to the source knowledge article for further reference.

Retrieval Augmented Generation

Retrieval Augmented Generation is a generative AI technique that enhances large language model (LLM) outputs by retrieving relevant enterprise content, such as knowledge articles or records and using it as context to generate more accurate and actionable responses. Within ServiceNow, RAG is implemented in products like ServiceNow Otto for AI Search, where it powers Genius Results cards by combining AI Search with generative responses. It is also configurable in AI Agent Studio, allowing admins to define RAG based tools that retrieve external or internal data to support autonomous or supervised agentic workflows.

ServiceNow Otto context menu

A generative AI feature that assists agents in creating and editing emails and chat replies, available in the Next Experience for specific workflows.

ServiceNow Otto panel

A conversational interface to summarize chat, case, or incident or generate resolution notes so that you can get the context of the information more quickly.

AI Admin Center (formerly Now Assist Center)

Set up, manage, and optimize your AI solutions on the ServiceNow AI Platform from a single workspace.

Important: Lux is the new user experience for AI Admin Center. For more information on the Lux experience, see AI Admin Center user experience (Lux UI).

The Next Experience AI Admin Center workspace is being prepared for deprecation in the November store release and will no longer be supported. For more information on the Next Experience UI, see AI Admin Center workspace (Next Experience UI).

In AI Admin Center version 6.1, the Next Experience and Lux user interfaces are both available.

AI limitations

This application uses artificial intelligence (AI) and machine learning, which are rapidly evolving fields of study that generate predictions based on patterns in data. As a result, this application may not always produce accurate, complete, or appropriate information. Furthermore, there is no guarantee that this application has been fully trained or tested for your use case. To mitigate these issues, it is your responsibility to test and evaluate your use of this application for accuracy, harm, and appropriateness for your use case, employ human oversight of output, and refrain from relying solely on AI-generated outputs for decision-making purposes. This is especially important if you choose to deploy this application in areas with consequential impacts such as healthcare, finance, legal, employment, security, or infrastructure. You agree to abide by ServiceNow's AI Acceptable Use Policy, which may be updated by ServiceNow.

Data processing

This application requires data to be transferred from ServiceNow customers' individual instances to a centralized ServiceNow environment, which may be located in a different data center region from the one where your instance is, and potentially to a third-party cloud provider, such as Microsoft Azure. This data is handled per ServiceNow's internal policies and procedures, including our policies available through our CORE Compliance Portal.

Data collection

ServiceNow collects and uses the inputs, outputs, and edits to outputs of this application to develop and improve ServiceNow technologies including ServiceNow models and AI products. In addition, this application will collect information extracted from documents. Customers can opt out of future data collection at any time, as described in the Now Assist Opt-Out page.

For more information, see the Now Assist documentation.

Exploring AI Admin Center

The ServiceNow® AI Admin Center application is a single control hub that brings together other AI capabilities and configuration functions, making it fast and effortless for administrators to set up and manage AI solutions from a unified experience.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important: Lux is the new user experience for AI Admin Center. For more information on the Lux experience, see AI Admin Center user experience (Lux UI).

The Next Experience AI Admin Center workspace is being prepared for deprecation in the November store release and will no longer be supported. For more information on the Next Experience UI, see AI Admin Center workspace (Next Experience UI).

In AI Admin Center version 6.1, the Next Experience and Lux user interfaces are both available.

AI Admin Center overview

AI Admin Center is a unified administration workspace that consolidates the various AI applications into a single, guided, conversational environment.

It provides a centralized location for setup, configuration, navigation, recommendation, and solution-building capabilities so administrators can activate, manage, and scale AI solutions quickly and with far less complexity.

AI Admin Center users

The following table lists the primary users of AI Admin Center.

Users

User	Description
AI administrators	AI administrators responsible for organization-wide AI deployment and management
Platform administrators	Platform administrators overseeing enterprise AI governance
AI builders and practitioners	AI practitioners building and deploying custom AI solutions across ServiceNow workflows

AI Admin Center workflow

Overview of the AI Admin Center workspace

The AI Admin Center workspace provides features that enable you to set up of your AI solutions in a unified experience without switching between separate AI applications.

With the AI Admin Center workspace, you can:

- Access your integrated AI adoption capabilities using the side navigation bar.
- Use the home page features to assess your instance readiness, set up AI solutions, find and activate automation opportunities, and open related AI applications.
- Use the conversational interface in the ServiceNow Otto panel as your AI assistant to perform common setup, building, and question answering tasks.

Access the AI Admin Center workspace

To access the AI Admin Center workspace, navigate to **All** > **AI Admin Center** > **AI Admin Center (Legacy)**.

The first time you access AI Admin Center, a welcome message displays prompting you to get started by installing essential ServiceNow Otto plugins. If you already have these plugins installed, the message simply introduces the benefits of AI Admin Center. Select **Let's get started** to continue to the home page.

Welcome message

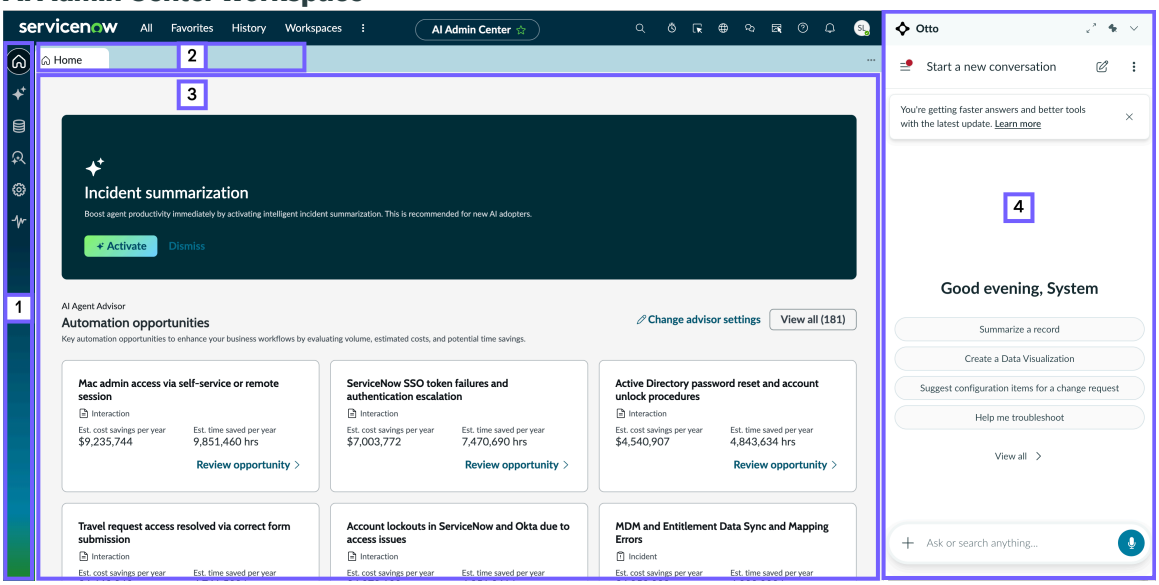
Layout of the AI Admin Center workspace

The following illustration shows the AI Admin Center workspace. The workspace includes:

- 1 - Side navigation bar
- 2 - Tabs
- 3 - Home page
- 4 - ServiceNow Otto panel

AI Admin Center workspace



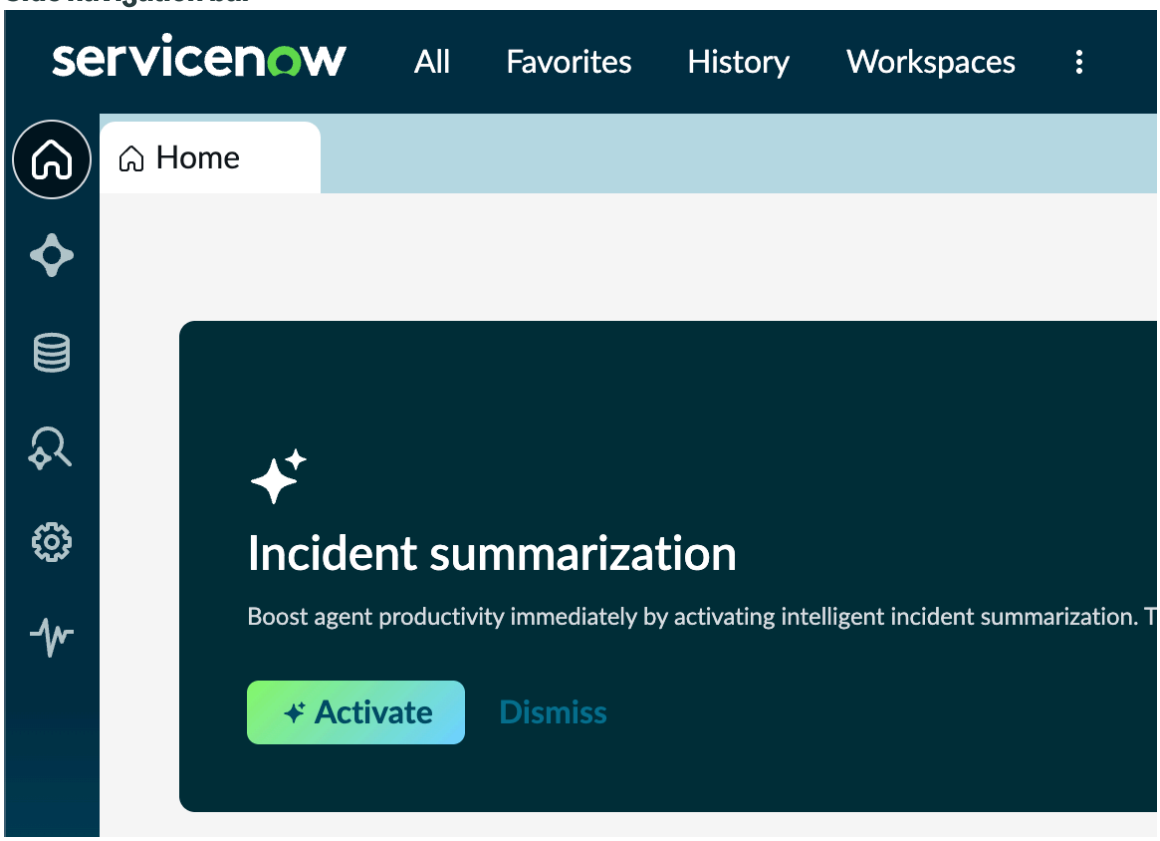
Side navigation bar

The side navigation bar provides access to the applications and features integrated with AI Admin Center.

Select an item in the navigation bar to open it in a workspace tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Side navigation bar



The side navigation bar includes the following options:

Navigation bar options

Option	Icon	Description
Home		The home page provides AI setup, administration, and monitoring features tailored to suit your instance.
Asset inventory		The asset inventory shows you all the ServiceNow AI assets in your instance. Each tab in the series provides a list for that asset type. You can view a list of all assets in the Overview tab.
Data		The data page allows you to use AI Data Kit in the AI Admin Center workspace.
AI readiness assessment		The AI readiness assessment page provides a general assessment summary and a list of AI readiness assessments based on your instance data.
Admin		The admin page allows you to use AI Admin Hub and AI Guardian in the AI Admin Center workspace.

© 2026 ServiceNow, Inc. All rights reserved.

Navigation bar options (continued)

Option	Icon	Description
		The admin page provides a series of links to admin pages. Select an item to open it in a separate workspace tab.
Monitor		The monitor page shows usage, performance, and adoption metrics for your AI solutions.

For more information, see Using other AI applications and features from AI Admin Center.

Home page

The AI Admin Center home page provides features to quickly set up your AI implementation, find automation opportunities, check the AI readiness status of your instance, track usage and performance of AI solutions, and access related AI applications.

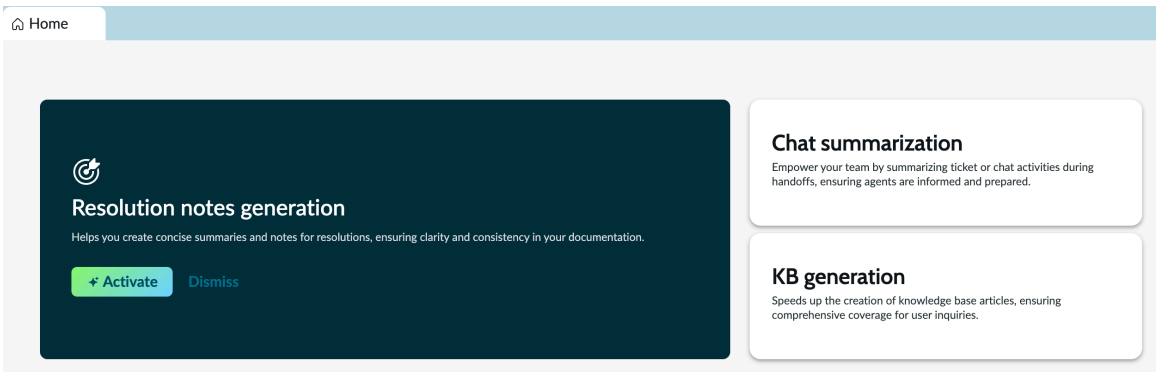
Your home page is tailored to suit your specific environment, role, and business objectives. The appearance your home page and its sections display accordingly. The entitlements, Impact subscription, plugin installations, and data associated with your instance may affect your experience on the home page.

The following sections may appear on your home page based on your instance.

Actionable use cases

The first section of the home page displays a series of AI-generated cards that represent quick-start use cases. Each use case is tailored to your environment and proposed to help you implement AI adoption, best practices, and administrative setup on the platform.

Actionable use cases section



Select **Activate** on the card to begin, and a conversation will open in the ServiceNow Otto panel. In the ServiceNow Otto panel, you can use natural language to have your AI companion implement the use case.

After it is implemented, the card disappears and the new solution appears under the **Recently activated AI** section of the home page.

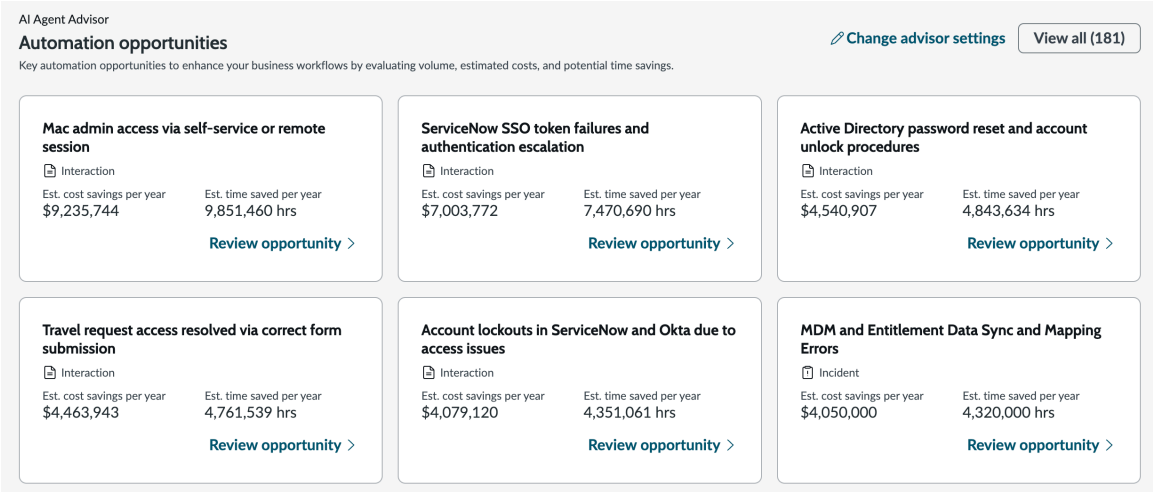
For more information, see Activating actionable use cases from AI Admin Center.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Automation opportunities

This section shows the most relevant opportunities to automate actions or workflows in your instance using AI. The opportunities appear as actionable cards, each showing the results of an assessment performed by AI Agent Advisor.

Automation opportunities section



AI Agent Advisor analyzes your instance data to identify the leading AI opportunities, estimates the potential time savings for each opportunity, and finds the AI agents needed to support the automation.

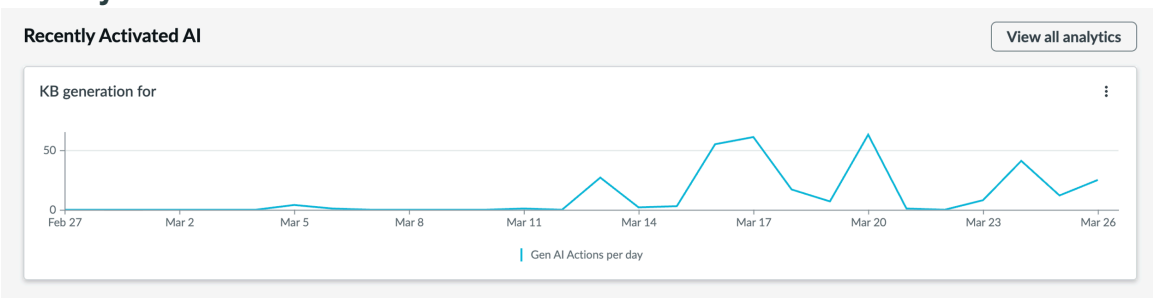
Select **View all** to see a list of all the opportunities identified by AI Agent Advisor.

For more information, see .

Recently activated AI

The Recently activated AI section provides performance statistics on your most recently activated AI solutions.

Recently activated AI section



Each card displays a usage trend line to show adoption over time beginning at the time of activation.

Select **View all analytics** to see a complete list of the AI performance metrics in the **Performance** section of the AI Admin Hub.

For more information, see Monitor your recently activated AI solution in AI Admin Center (Next Experience UI).

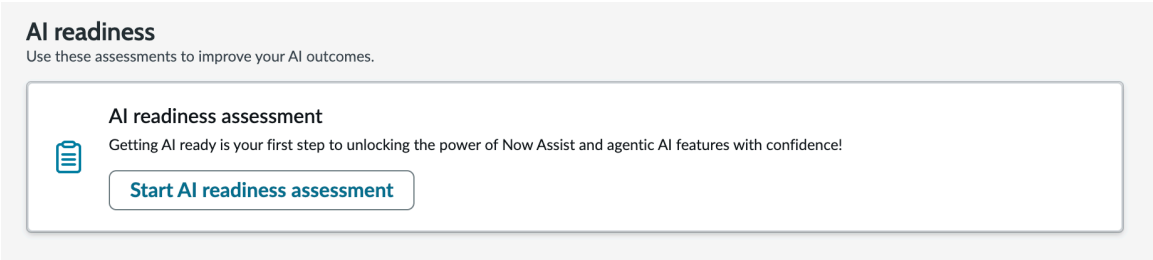
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI readiness

The AI readiness section shows the readiness assessments for your environment.

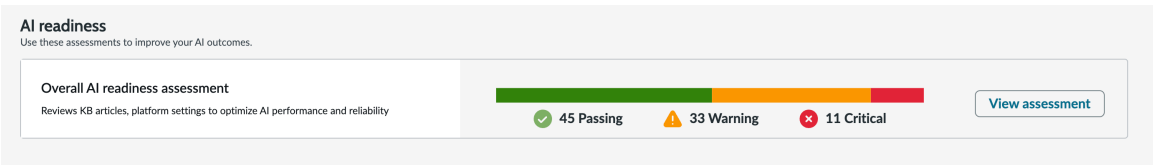
Each assessment helps to determine whether your organization's instance is ready to implement generative AI and agentic AI features. Explore actionable insights to enhance your data, applications, configurations, and workflows, improving the quality of your AI outcomes.

AI readiness section



Select **Start AI readiness assessment** to run the assessment of your instance. After the assessment is complete, the results display in a card showing your overall AI readiness status.

Overall AI readiness assessment



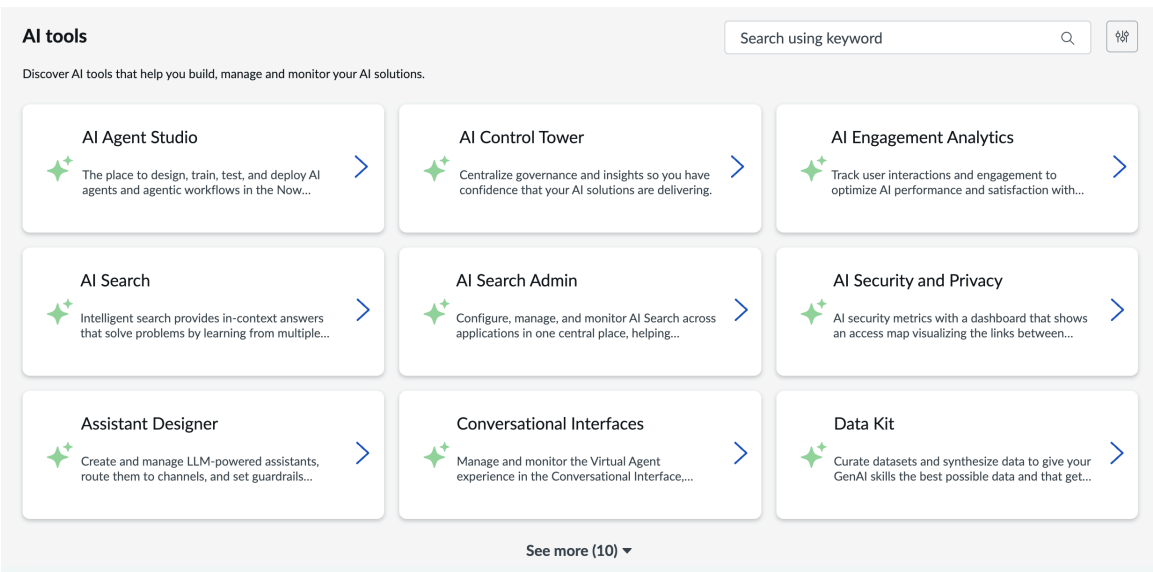
Select **View Assessment** to see the assessment on a separate workspace tab.

For more information, see Increasing AI readiness in AI Admin Center.

AI tools

The AI tools section shows other AI applications on the platform outside of AI Admin Center that can help you build, manage, and monitor your solutions.

AI tools section



Each application appears in a separate card or tile. Select the arrow in the card to open the application in a separate browser tab.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ServiceNow Otto panel

The ServiceNow Otto panel is the conversational interface where you can interact with the AI companion to perform setup, solution building, and question answering tasks.

The AI companion in the ServiceNow Otto panel uses AI to accomplish AI setup and configuration tasks on your instance based on your requests. Describe what you want to accomplish and the AI companion guides you through the process, executes actions with your confirmation, and answers questions about your instance and the AI products.

Use the ServiceNow Otto panel to perform the following types of actions:

- Perform common administrator functions
- Implement the setup and configuration of AI solutions
- Answer questions and find help documentation
- Activate and set up base system skills
- Enable or disable native and machine translation
- Configure language support for supported language models
- View privacy policy details and guidance
- View data sharing details and guidance
- View data overflow processing details and guidance
- View policy and model providers with management guidance
- View active and deprecated AI model versions
- Discover and assign AI agents and agentic workflows that implement use cases

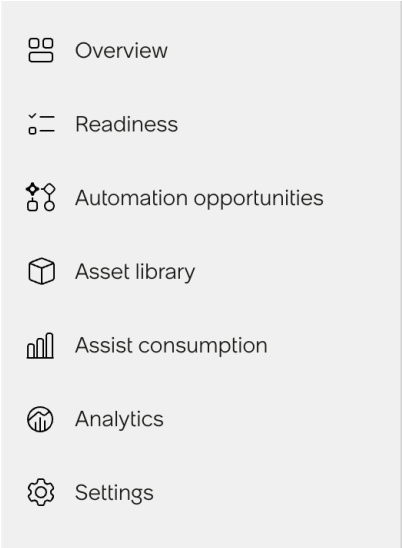
Side navigation panel



The side navigation panel includes the following options:

Navigation panel options

Option	Icon	Description
Overview		The Overview home page provides AI readiness, discovery, setup, and administration features tailored to your instance. The ServiceNow Otto box on the Overview page enables you to use a conversational experience to start activating AI solutions right away with the help of an AI companion.
Readiness		The AI readiness page provides readiness assessment results based on your instance data along with actionable findings to improve readiness to adopt AI.
Automation opportunitie		The Automation opportunities page shows a list of automation opportunities based on your instance data with features to deploy AI agents to implement the automations.
Asset library		The Asset library page shows you all the AI assets in your instance. Each tab in the series provides a list for that asset type. You can view a list of all assets in the **Overview** tab.
Assist consumptic		The Assist consumption page shows the amount of assists consumed by the AI skills and uses on your instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Navigation panel options (continued)

Option	Icon	Description
Analytics		The Analytics page provides dashboards showing usage, performance, and adoption metrics for your AI solutions. Select a tab on the Analytics page to view the Overview, Performance Explorer, Business Value, or Custom Metric dashboard.
Settings		The Settings page provides a list of settings from AI Admin Hub, AI Guardian, and other applications that enable you to set up your AI configuration.

Overview home page (Lux UI)

The AI Admin Center home page provides features to quickly set up your AI implementation, find automation opportunities, check the AI readiness status of your instance, and access related AI applications.

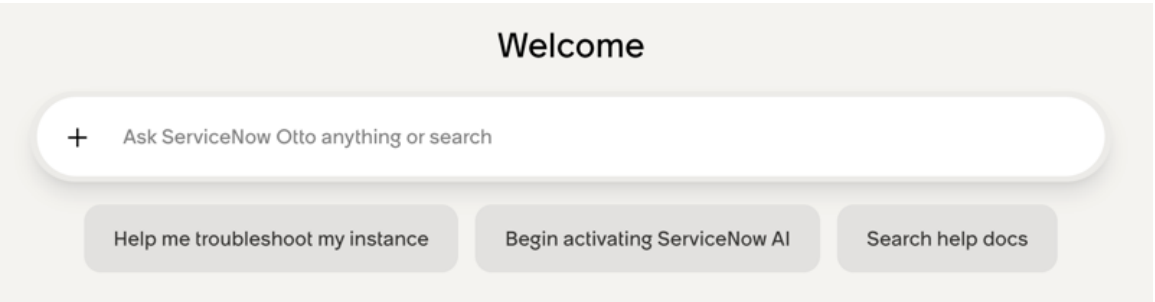
The **Overview** page is tailored to suit your specific environment, role, and business objectives. The sections on your home page display accordingly. The plugin installations and data associated with your instance may affect your experience on the page.

The following sections may appear on your home page based on your instance.

ServiceNow Otto search box

The ServiceNow Otto search box gives you a place on the home page to begin a conversation with your AI companion.

Use this conversational interface to begin a chat, where you can perform setup, solution building, and question answering tasks.



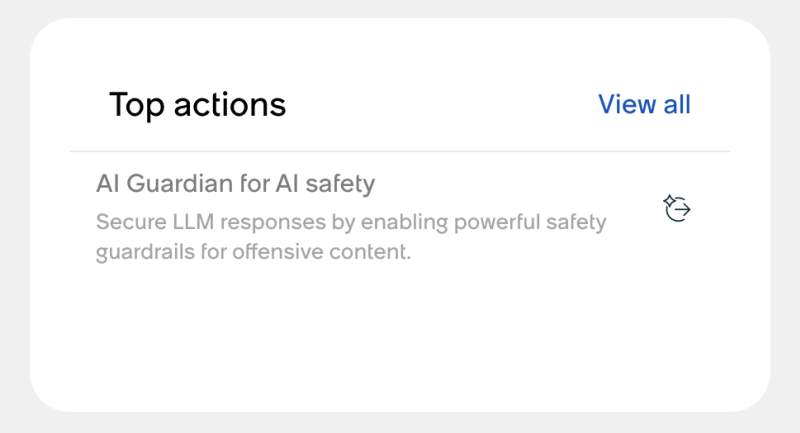
Type a request or select a quick action button to initiate a conversation. The ServiceNow Otto panel opens to continue your conversation.

For more information, see Using the conversational experience in AI Admin Center.

Top actions

The **Top actions** section of the home page displays a series of AI-generated items that represent quick-start use cases. Each use case is tailored to your environment and proposed to help you implement AI adoption, best practices, and administrative setup on the platform.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Select an action to begin, and a conversation opens in the ServiceNow Otto panel. In the ServiceNow Otto panel, you can use natural language to have your AI companion implement the use case.

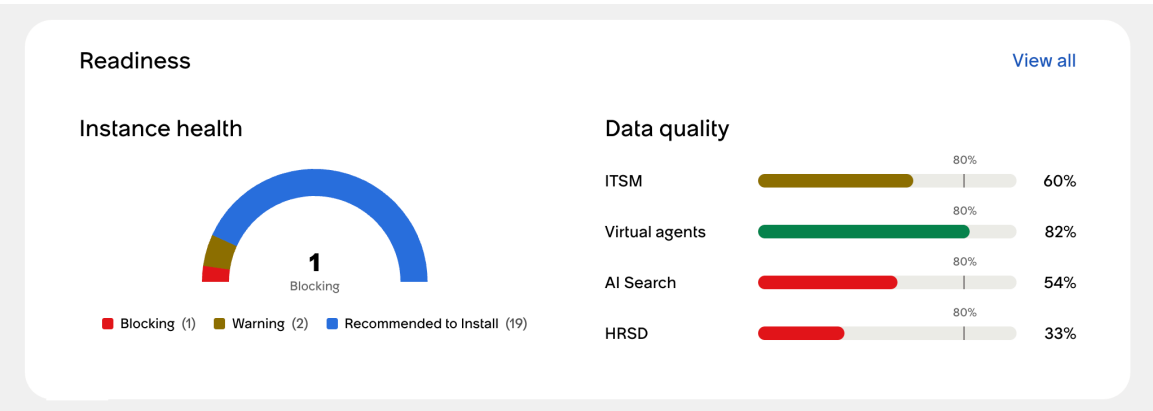
After it is implemented, the use case disappears from the **Top actions** list.

Select **View all** to see your top actions on the AI Solutions page.

For more information, see Activating actionable use cases from AI Admin Center.

Readiness

The **Readiness** section shows the readiness levels of the applications and data quality in your instance based on the readiness assessments performed. Readiness assessments help you to determine whether your organization's instance is ready to implement generative AI and agentic AI features.



The instance health visualization summarizes the outcome of health checks across your AI applications. The checks look for AI applications that are recommended for installation or might otherwise require a version upgrade, dependency installation, or licensing.

The data quality visualization shows the ratings of the data quality per domain based on a series of assessment checks. Each bar shows the percentage of checks that ranked with a passing score.

Select **View all** to see the AI readiness page with lists for instance health and data quality checks.

For more information, see Increasing AI readiness in AI Admin Center.

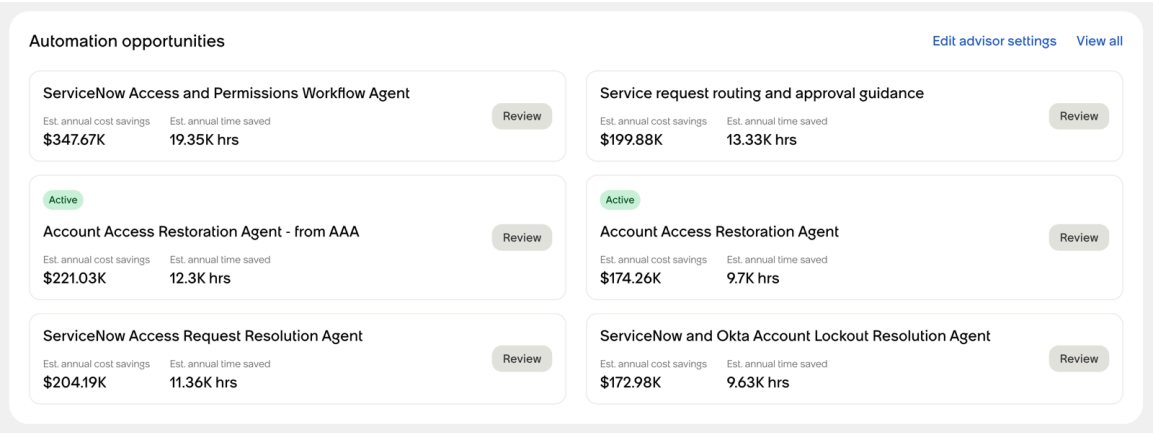
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Automation opportunities

The **Automation opportunities** section shows the most relevant opportunities to automate actions or workflows in your instance using AI. The opportunities appear as actionable cards, each showing the results of an assessment performed by AI Agent Advisor.



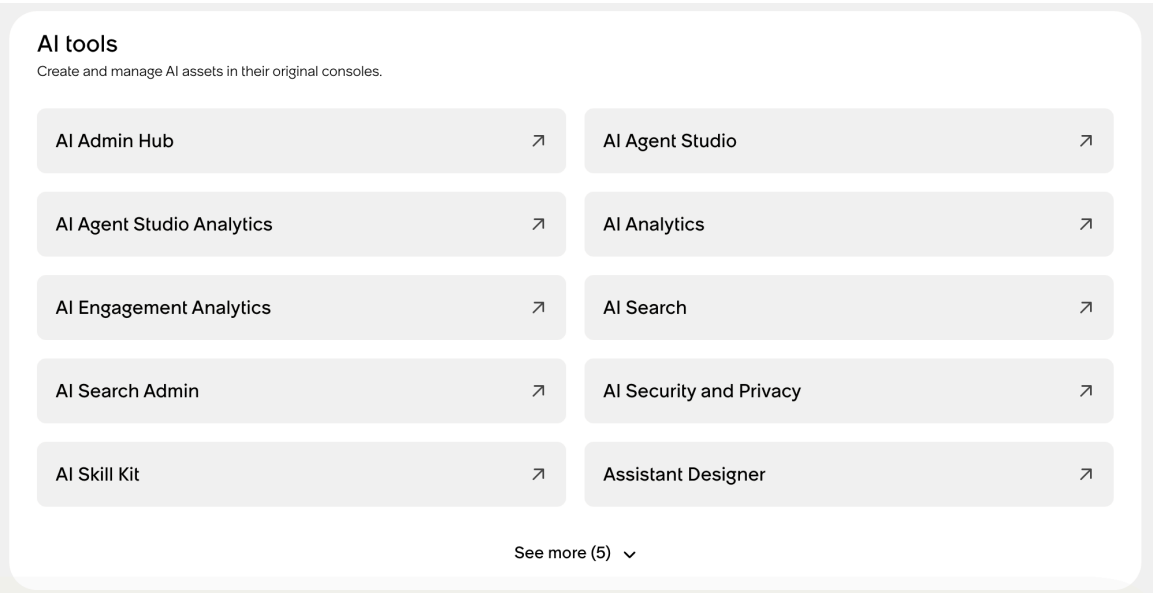
AI Agent Advisor analyzes your instance data to identify the leading AI opportunities, estimates the potential time and cost savings for each opportunity, and finds the AI agents needed to support the automation.

Select **View all** to see a list of all the opportunities identified by AI Agent Advisor. For more information, see Using AI Agent Advisor.

Select **Edit advisor settings** to configure the data source, filters, analysis schedule, and cost profile that AI Agent Advisor uses to identify the automation opportunities. For more information, see Set up a data source for analysis (Lux UI).

AI tools

The **AI tools** section shows other AI applications on the platform outside of AI Admin Center that can help you build, manage, and monitor your solutions.



Each application appears in a separate card. Select the card to open the application in a separate browser tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ServiceNow Otto panel (Lux UI)

The ServiceNow Otto panel is the conversational interface where you can interact with the AI companion to perform setup, solution building, and question answering tasks.

The AI companion in the ServiceNow Otto panel uses generative AI to accomplish AI setup and configuration tasks on your instance based on your requests. Describe what you want to accomplish, and the AI companion guides you through the process, executes actions with your confirmation, and answers questions about your instance and the AI products.

Use the ServiceNow Otto panel to perform the following types of actions:

- Perform common administrator functions
- Implement the setup and configuration of AI solutions
- Answer questions and find help documentation
- Activate and set up base system skills
- Enable or disable native and machine translation
- Configure language support for supported language models
- View privacy policy details and guidance
- View data sharing details and guidance
- View data overflow processing details and guidance
- View policy and model providers with management guidance
- View active and deprecated AI model versions
- Discover and assign AI agents and agentic workflows that implement use cases

For more information, see Using the conversational experience in AI Admin Center.

Supporting information for AI Admin Center

Get a quick overview of the important information that is related to the AI Admin Center application.

Supported versions

AI Admin Center is supported starting with Australia general availability (Patch 2).

AI Admin Center v3.0

Supported user interfaces

The AI Admin Center application supports the Next Experience workspace and the Lux experience user interfaces.

AI Admin Center provides features that enable you to set up of your AI solutions in a unified experience without switching between separate AI applications.

Important: Lux is the new user experience for AI Admin Center. For more information on the Lux experience, see AI Admin Center user experience (Lux UI).

The Next Experience AI Admin Center workspace is being prepared for deprecation in the November store release and will no longer be supported. For more information on the Next Experience UI, see AI Admin Center workspace (Next Experience UI).

In AI Admin Center version 6.1, the Next Experience and Lux user interfaces are both available.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Licensing requirements

Note: Depending on your license, you will have access to certain application features, generative AI skills, agentic workflows, and AI agents. For more information, see ServiceNow product tiers.

Application information

AI Admin Center (sn_na_center) is available as a plugin from the ServiceNow Store.

This store app has no dependencies.

For more information, see Configuring AI Admin Center.

Configuring AI Admin Center

Install and configure settings for AI Admin Center.

Confirm installation of AI Admin Center

Confirm the installation of the AI Admin Center application.

Important: Lux is the new user experience for AI Admin Center. For more information on the Lux experience, see AI Admin Center user experience (Lux UI).

The Next Experience AI Admin Center workspace is being prepared for deprecation in the November store release and will no longer be supported. For more information on the Next Experience UI, see AI Admin Center workspace (Next Experience UI).

In AI Admin Center version 6.1, the Next Experience and Lux user interfaces are both available.

Before you begin

Review the AI Admin Center application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.

Role required: admin

About this task

AI Admin Center installs and runs automatically as part of the standard ServiceNow Otto for Platform setup. No manual steps are required. After ServiceNow Otto panel for Platform is installed and configured, AI Admin Center will be present on your instance.

Follow these steps to confirm the installation of the AI Admin Center plugin.

Procedure

1. Confirm the AI Admin Center plugin is installed by navigating to **All** > **System Definition** > **Plugins** and selecting the **Installed** tab.
2. **Optional:** If the AI Admin Center plugin is not installed, perform the following steps to manually install it.
   a. Navigate to **All** > **System Definition** > **Plugins**.
   b. In the search box, type `AI Admin Center`.
   c. In the Store applications section under the Available for you tab, select the **AI Admin Center** card.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Select **Install**.

e. Select a version from the list.

f. Review the installation details and select **Continue**.

g. Select an installation schedule option.

h. Select **Install**.
The AI Admin Center application will install at the selected time.

3. Navigate to **All** > **AI Admin Center** > **Home** or **Admin** > **AI Admin Center** to confirm the successful installation.

Result
The application is installed and available to the appropriate user roles.

Enable the ServiceNow Otto panel (Next Experience UI)

Enable the ServiceNow Otto panel to have your AI companion perform setup, configuration, and administrative tasks more quickly using natural language prompts.

Important: Lux is the new user experience for AI Admin Center. For more information on the Lux experience, see AI Admin Center user experience (Lux UI).

The Next Experience AI Admin Center workspace is being prepared for deprecation in the November store release and will no longer be supported. For more information on the Next Experience UI, see AI Admin Center workspace (Next Experience UI).

In AI Admin Center version 6.1, the Next Experience and Lux user interfaces are both available.

Before you begin
Role required: sn_na_center.nac_admin

About this task
The ServiceNow Otto panel is turned on by default. If it is turned off, follow these steps to turn on the ServiceNow Otto panel.

The ServiceNow Otto panel must be enabled for administrators to use the conversational interface in AI Admin Center. When the panel is turned off, a banner appears on the home page notifying you that the conversational experience is unavailable, with a link to the settings page.

For more information on the capabilities of the ServiceNow Otto panel, see ServiceNow Otto panel.

Note: This topic describes the AI Admin Center feature based on the Next Experience UI. If you're using the Lux user experience for AI Admin Center, see the Lux UI version of this topic.

Procedure

1. Navigate to **All** > **AI Admin Center** > **AI Admin Center (Legacy)**.
2. Select **Admin** in the side navigation bar.
3. Under **AI Experiences** on the AI Admin Hub page, select **ServiceNow Otto Panel**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select **Turn on** to enable the ServiceNow Otto panel.
5. Select **Turn on** again to confirm.

Result

The ServiceNow Otto panel is enabled and available globally via the ServiceNow Otto icon ( ) in the Next Experience Unified Navigation. The panel understands where users are in the application and can personalize responses accordingly, streamlining the completion of tasks.

Enable the ServiceNow Otto panel (Lux UI)

Enable the ServiceNow Otto panel to have your AI assistant perform setup, configuration, and administrative tasks more quickly using natural language prompts.

Important: Lux is the new user experience for AI Admin Center. For more information on the Lux experience, see AI Admin Center user experience (Lux UI).

The Next Experience AI Admin Center workspace is being prepared for deprecation in the November store release and will no longer be supported. For more information on the Next Experience UI, see AI Admin Center workspace (Next Experience UI).

In AI Admin Center version 6.1, the Next Experience and Lux user interfaces are both available.

Before you begin

Role required: sn_na_center.nac_admin

About this task

The ServiceNow Otto panel must be enabled for administrators to use the conversational interface in AI Admin Center. When the panel is turned off, a banner appears on the home page notifying you that the conversational experience is unavailable, with a link to the settings page.

For more information on the general capabilities of the ServiceNow Otto panel, see ServiceNow Otto panel (Lux UI).

Note: This topic describes the AI Admin Center feature based on the Lux user interface (UI). If you're using the Next Experience UI for AI Admin Center, see the Next Experience UI version of this topic.

Procedure

1. Navigate to **All** > **AI Admin Center** > **Home** or **Admin** > **AI Admin Center**.
2. Select **Settings** ( ) in the side navigation panel.
   The Settings page opens.
3. Under **ServiceNow Otto Experience** on the Settings page, select **ServiceNow Otto panel**.
4. Select **Turn on** to enable the ServiceNow Otto panel.
5. Select **Turn on** again to confirm.

Result

The ServiceNow Otto panel is enabled and available globally using the ServiceNow Otto icon ( ). The panel understands where users are in the application and can personalize responses accordingly, streamlining the completion of tasks.

Using the conversational experience in AI Admin Center

Use the ServiceNow Otto panel to perform AI administration and setup tasks through a conversational interface directly in AI Admin Center.

Important: Lux is the new user experience for AI Admin Center. For more information on the Lux experience, see AI Admin Center user experience (Lux UI).

The Next Experience AI Admin Center workspace is being prepared for deprecation in the November store release and will no longer be supported. For more information on the Next Experience UI, see AI Admin Center workspace (Next Experience UI).

In AI Admin Center version 6.1, the Next Experience and Lux user interfaces are both available.

The ServiceNow Otto panel is enabled by default, and is accessible from every page in AI Admin Center. You can interact with your AI companion by typing questions and instructions in plain language.

For more information on the general capabilities of ServiceNow Otto panel, see ServiceNow Otto panel.

AI companion capabilities

Use the ServiceNow Otto panel to perform the following types of actions in AI Admin Center:

Setup and configuration

Start guided setup workflows for generative AI skills, AI Guardian settings, model configurations, multilingual service, data sharing and processing, integrations, and account details. The AI companion executes setup steps on your behalf and asks for your confirmation before any change takes effect.

Skill activation and deactivation

Activate or deactivate generative AI skills through conversation. The panel presents skill details and current state before requesting confirmation.

Instance and product details

Query configuration details about your instance including translation status, language configurations, data sharing settings, model providers, model versions, and integrations.

Create and manage intents

Create intent records and generate the name, description, example utterances, detection criteria, and resolution criteria for them. Use the conversation to find, update, activate, deactivate, or delete existing intents.

AI-assisted help

Ask questions about AI features, concepts, and admin tasks. The panel sources product documentation and training resources and returns answers with references and links to the source material.

After you enter your request in the chat, your AI companion generates a plan to implement your AI solution using the available AI assets. You can review the details of the solution, test it, and activate it, all in the conversation.

Self-service conversational troubleshooting

Depending on your chat request, the self-service conversational troubleshooting AI agents may be engaged to diagnose common AI administration issues.

Self-service conversational troubleshooting can help with issues such as:

- AI Admin Center configuration or setup problems
- Plugin installation or activation failures
- Missing or turned off AI application features
- Integration connectivity or credential problems
- Role or permission misconfigurations affecting access
- Feature flags or activation toggles in an unexpected state
- Compatibility conflicts between plugins or versions

For more information, see Self-service conversational troubleshooting.

AI Admin Center help

Based on your chat request, the help AI agent may be engaged to find answers to your AI admin questions based on ServiceNow documentation. The AI agent responses provide relevant descriptions, instructions, references, and links to source documents that support your product experience.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information, see AI Admin Center help.

AI analytics Q and A

Based on your chat request, the AI Analytics Q and A AI agent may be engaged to provide answers about AI analytics in AI Admin Center including metrics, dashboard widgets, and calculations.

The AI Analytics Q and A AI agent can address topics such as:

- KPI definitions in AI analytics dashboards, such as CSAT, deflection rate, and so on.
- How a dashboard widget or metric is calculated
- Data flows and processing context for AI analytics
- Deflection log states and common deflection scenarios
- Changes to AI analytics dashboards between releases, such as updated or removed indicators and new dashboards

For more information, see AI Analytics Q and A agent.

Intent management

Based on your request, an AI agent may be engaged to helps create and update Natural Language Understanding (NLU) intents. Intent management can help you to:

- Create an intent.
- Update an existing intent identified by a specific intent name or sys_id.
- Delete an existing intent.
- Activate or deactivate an existing intent.
- Look up intents by name or sys_id.

Self-service conversational troubleshooting

Use the AI Admin Center conversational experience to diagnose common AI administration issues.

Self-service conversational troubleshooting overview

Self-service conversational troubleshooting is a diagnostic assistant in the AI Admin Center conversational experience. It interprets your issue description and classifies it against a library of known AI admin failure patterns. The AI agent presents a root cause hypothesis with a confidence level, enabling you to make informed decisions about how to resolve the issue.

Self-service conversational troubleshooting may work with other AI agents to accomplish tasks. For more information on AI agents, see Explore AI agents.

AI agent access

The AI agent runs every action as you and never elevates your privileges. It can't make a change that your roles don't permit.

Role required: sn_na_center.nac_admin

AI agent uses

Use self-service conversational troubleshooting to help with issues such as:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- AI Admin Center configuration or setup problems
- Plugin installation or activation failures
- Missing or turned off Now Assist application features
- Integration connectivity or credential problems
- Role or permission misconfigurations affecting Now Assist access
- Feature flags or activation toggles in an unexpected state
- Compatibility conflicts between plugins or versions

For more information, see the troubleshooting issues described in KB article KB2330598 on Now Support.

AI agent actions

When used, the AI agent may attempt the following actions:

- Interpret the information provided by the user.
- Compare the information against documented issues.
- Present a root cause hypothesis with a confidence level.
- Recommend remediation actions after receiving user confirmation.
- Maintain issue context throughout the conversation.

How it works

1. Describe your issue in the conversational interface in AI Admin Center.
2. The AI agent interprets your description and matches it against known failure patterns.
3. The AI agent displays the possible root cause of the issue along with its degree of confidence that it is correct.
4. You review the hypothesis and confirm, adjust, or provide additional details about the issue.
5. After you confirm the diagnosis, the AI agent guides you toward a resolution.

   Depending on your issue, the agent may do one of the following:

   - Walk you through specific configuration steps.
   - Link you to relevant documentation or troubleshooting articles.
   - Suggest settings or statuses to verify.
   - Recommend escalation to support if the issue requires specialized help.
6. The AI agent retains your issue description, the diagnosis, and the confidence level throughout your session so you can ask follow-up questions without repeating context.

AI Admin Center help

Use AI Admin Center help in the conversational experience to find answers to your AI admin questions based on ServiceNow documentation.

AI Admin Center help overview

The AI Admin Center help AI agent is a product help assistant in the AI Admin Center conversational experience that uses all available ServiceNow documentation and training resources to answer your questions about the product. The AI agent responses provide relevant

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

descriptions, instructions, references, and links to source documents that support your product experience.

The AI Admin Center help AI agent may work with other AI agents to accomplish tasks. For more information on AI agents, see Explore AI agents.

AI agent access

Role required: sn_na_center.nac_user

AI agent actions

When used, the AI agent may attempt the following actions.

- Search and index all available ServiceNow documentation and training resources.
- Generate a descriptive response to the question.
- Provide references and links to the source documents that informed the response.

How it works

1. Ask a question in the conversational interface in AI Admin Center.
2. The AI agent interprets your question and searches the available ServiceNow documentation and training resources for the answer.
3. The AI agent displays the answer in the conversation including any links to related source documents.
4. You review the answer. If necessary, provide additional details about the question for a more relevant answer.
5. The AI agent retains the conversation throughout your session so you can ask follow-up questions without repeating context.

AI Analytics Q and A agent

Use the AI Analytics Q and A agent to get answers about AI analytics metrics, dashboard widgets, and calculations by asking questions in the ServiceNow Otto® panel.

AI Analytics Q and A agent overview

The AI Analytics Q and A agent answers natural-language questions about AI analytics in AI Admin Center. When you ask an analytics-related question in the ServiceNow Otto panel or in ServiceNow Otto for Virtual Agent, the AI Analytics Q and A Workflow is triggered first. This LLM-controlled agentic workflow has a single step that calls the AI Analytics Q and A agent to generate a response.

Note: The AI Analytics Q and A agent is not listed in AI Admin Hub under AI skills. It is built into the ServiceNow Otto conversational experience and is not available for separate configuration. The agent does not consume any assists from your entitlements.

The AI Analytics Q and A agent may work with other AI agents to accomplish tasks. For more information on AI agents, see AI Agent Studio (legacy).

Responses from the AI Analytics Q and A agent are generated using AI and may be inaccurate or incomplete. Review a response before you act on it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agent uses

Use the AI Analytics Q and A agent to ask about topics such as:

- KPI definitions in AI analytics dashboards, such as CSAT, deflection rate, and so on.
- How a dashboard widget or metric is calculated
- Data flows and processing context for AI analytics
- Deflection log states and common deflection scenarios
- Changes to AI analytics dashboards between releases, such as updated or removed indicators and new dashboards

Access requirements

Role required: sn_na_analytics.viewer

How it works

1. Ask a question about AI analytics dashboards using the panel or in ServiceNow Otto for Virtual Agent, for example, what a metric means or how a KPI is calculated.
2. The AI Analytics Q and A Workflow is triggered. This LLM-controlled agentic workflow evaluates your question and calls the AI Analytics Q and A agent.
3. The AI Analytics Q and A agent searches AI analytics content and displays a response.
4. Review the response. Ask follow-up questions to get more detail.

Increasing AI readiness in AI Admin Center

Use AI readiness assessments to help you find actionable items in your implementation preparation and direct links to improve those areas.

AI readiness overview

AI readiness assessments help you determine the readiness of your organization's instance to implement generative and agentic AI features. They enable you to assess whether updates, installations, or customizations of your instance could affect implementation.

The AI readiness assessments jobs automate assessment processes, evaluate data readiness, and provide actionable insights with links to help you more quickly prepare for AI adoption.

The AI readiness assessment evaluates and assesses the following areas of your instance for AI implementation readiness.

- AI agents and agentic workflows
  - Agentic AI for IT Service Management (ITSM)
  - Agentic AI for Customer Service Management (CSM)
  - Agentic AI for HR Service Delivery (HRSD)
- Generative AI capabilities
  - Generative AI for AI Search
  - Generative AI for Virtual Agent (VA)
  - Generative AI for IT Service Management (ITSM)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Generative AI for Customer Service Management (CSM)
- Generative AI for HR Service Delivery (HRSD)

Run the AI readiness assessment job in AI Admin Center (Next Experience UI)

Run the AI readiness assessment to analyze your instance and evaluate its readiness for AI adoption.

Important: Lux is the new user experience for AI Admin Center. For more information on the Lux experience, see AI Admin Center user experience (Lux UI).

The Next Experience AI Admin Center workspace is being prepared for deprecation in the November store release and will no longer be supported. For more information on the Next Experience UI, see AI Admin Center workspace (Next Experience UI).

In AI Admin Center version 6.1, the Next Experience and Lux user interfaces are both available.

Before you begin

Role required: sn_na_center.nac_admin

About this task

Follow these steps to run the AI readiness assessment job. The job performs an analysis of your instance data and produces readiness assessments. The assessments enable you to identify configuration gaps, measure readiness over time, and accelerate the path to AI implementation.

Note: This topic describes the AI Admin Center feature based on the Next Experience UI. If you're using the Lux user experience for AI Admin Center, see the Lux UI version of this topic.

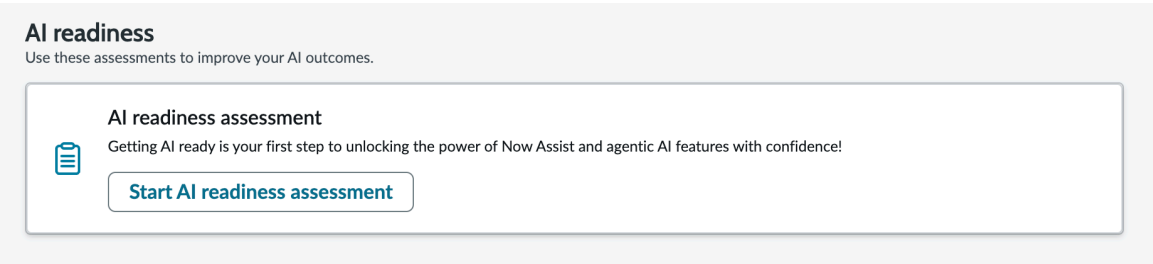
Procedure

1. Navigate to **All** > **AI Admin Center** > **AI Admin Center (Legacy)**.

   The AI Admin Center opens to the home page.

   The card in the AI readiness section displays a **Start AI readiness assessment** button if the assessment has not yet been run.

   AI readiness section

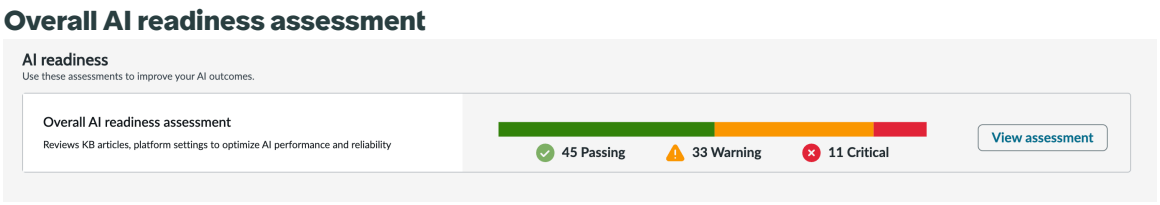
   


2. Select **Start AI readiness assessment** to run the assessment of your instance.

   The AI readiness assessment may take several minutes to run.

   After the assessment is complete, the results display in a card showing your overall AI readiness status.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. **Optional:** Re-run the overall AI readiness assessment at any time.

   a. Select AI readiness assessment ( ) in the side navigation bar.

   (Optional) The AI Readiness Assessment tab opens.

   b. Select **Re-run assessment**.

4. **Optional:** Re-run the individual AI readiness assessment for specified area of your instance at any time.

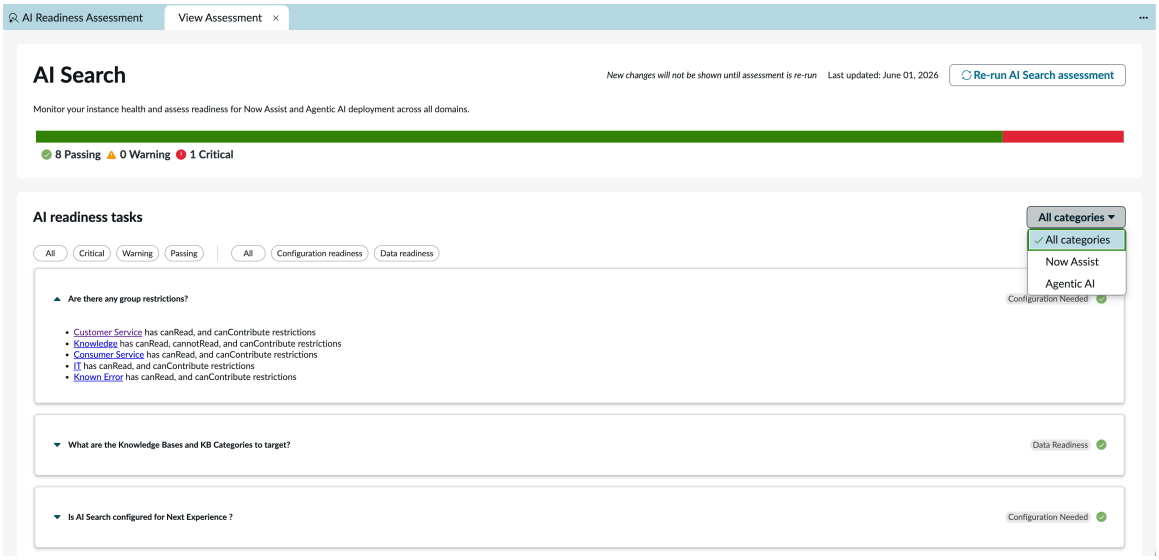
   a. Select AI readiness assessment ( ) in the side navigation bar.

   (Optional) The AI Readiness Assessment tab opens.

   b. Select **View assessment** in the card of an individual assessment.

   (Optional) The View Assessment tab opens showing the detailed results of a readiness assessment for the specified area of your instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



c. Select **Re-run assessment**.

Note: The label of the button includes the assessment name. In the example of running the assessment for AI Search, the button label is **Re-run AI Search assessment**.

What to do next

Review the readiness assessments results. For more information, see View an AI readiness assessment in AI Admin Center (Next Experience UI).

Run the AI readiness assessment job in AI Admin Center (Lux UI)

Run the AI readiness assessment to analyze your instance and evaluate its readiness for AI adoption.

Important: Lux is the new user experience for AI Admin Center. For more information on the Lux experience, see AI Admin Center user experience (Lux UI).

The Next Experience AI Admin Center workspace is being prepared for deprecation in the November store release and will no longer be supported. For more information on the Next Experience UI, see AI Admin Center workspace (Next Experience UI).

In AI Admin Center version 6.1, the Next Experience and Lux user interfaces are both available.

Before you begin

Role required: sn_na_center.nac_admin

About this task

Follow these steps to run the AI readiness assessment job. The job performs an analysis of your instance data and produces readiness assessments. The assessments enable you to identify configuration gaps, measure readiness over time, and accelerate the path to AI implementation.

Note: This topic describes the AI Admin Center feature based on the Lux user interface (UI). If you're using the Next Experience UI for AI Admin Center, see the Next Experience UI version of this topic.

Procedure

1. Navigate to **All** > **AI Admin Center** > **Home** or **Admin** > **AI Admin Center**.

   The AI Admin Center opens to the home page.

2. Select **Readiness** ( ) in the side navigation panel.
   The AI readiness page opens.
3. Select **Run assessment** or **Re-run assessment**.
4. **Optional:** Re-run the individual AI readiness assessment for a specified area of your instance at any time.

   a. Select the **Re-run assessment** drop-down button ( ).
   The re-run assessment list displays.

Run assessment on the AI readiness page

   b. Select an individual assessment.

What to do next

Review the readiness assessment results. For more information, see View your AI readiness in AI Admin Center (Lux UI).

View an AI readiness assessment in AI Admin Center (Next Experience UI)

Review the results of readiness assessments run for your instance.

Important: Lux is the new user experience for AI Admin Center. For more information on the Lux experience, see AI Admin Center user experience (Lux UI).

The Next Experience AI Admin Center workspace is being prepared for deprecation in the November store release and will no longer be supported. For more information on the Next Experience UI, see AI Admin Center workspace (Next Experience UI).

In AI Admin Center version 6.1, the Next Experience and Lux user interfaces are both available.

Before you begin

Before you can review your readiness assessments in AI Admin Center, you must first run the AI readiness assessment job. For more information, see Run the AI readiness assessment job in AI Admin Center (Next Experience UI).

Role required: sn_na_center.nac_admin

About this task

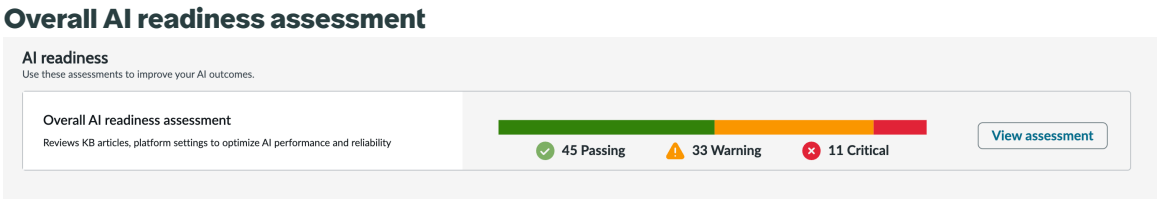
Follow these steps to review the AI readiness assessments based on your instance data.

Note: This topic describes the AI Admin Center feature based on the Next Experience UI. If you're using the Lux user experience for AI Admin Center, see the Lux UI version of this topic.

Procedure

1. Navigate to **All** > **AI Admin Center** > **AI Admin Center (Legacy)**.
2. Review the AI Readiness section of the home page to see the overall AI readiness assessment for the instance.

   The card displays a description of the assessment, the number of findings sorted by status, and a link to the AI Readiness Assessment page.



3. Select **View assessment** in the card or select AI readiness assessment ( ) in the side navigation bar to view the complete list of AI readiness assessments.

   The AI Readiness Assessment tab opens showing a general assessment summary and a list of assessments for individual product areas.

   Each card shows the number of assessment findings, the readiness status for each assessment category, and a link to view the assessment details.

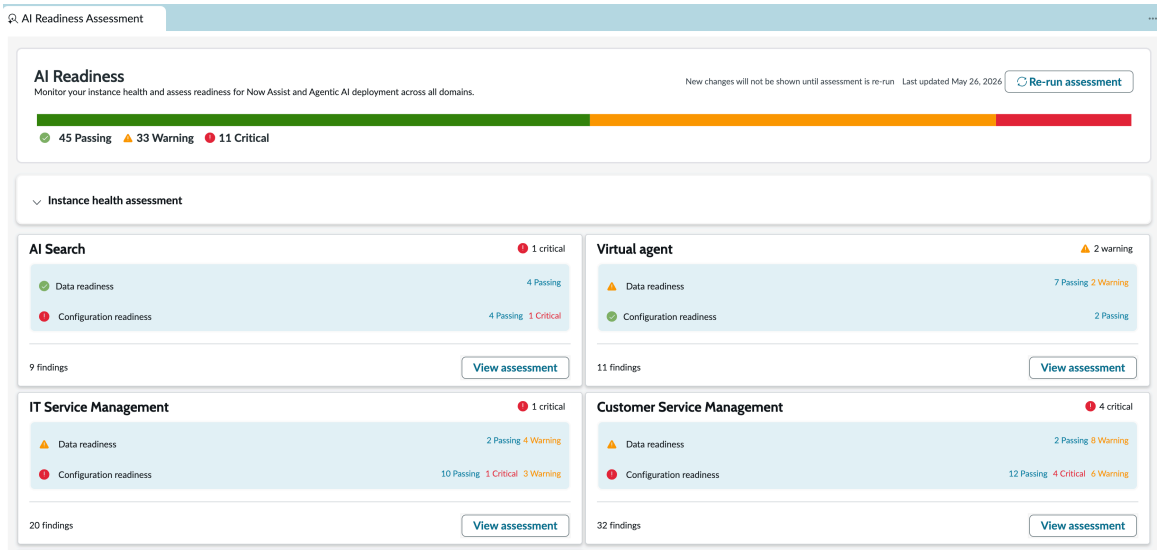
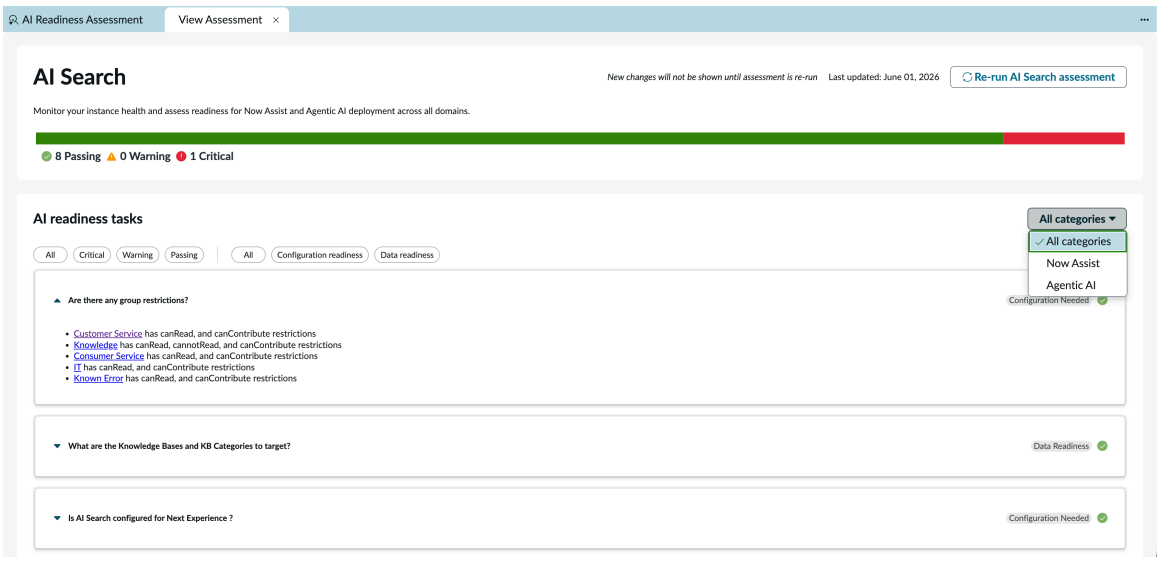
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Select the **Instance health assessment** card to view information about your instance status.
5. Select **View assessment** in the card of an individual assessment.

   The View Assessment tab opens showing the detailed results of a readiness assessment for the specified area of your instance. It shows the summary results of the checks performed and lists the important tasks to achieve AI implementation readiness.



6. **Optional:** Filter the list of tasks as needed.
   - Select the category box and choose a category to filter by category.
   - Select any combination of the filter option buttons to filter by readiness status and task type.
7. Select the caret-down-outline icon (▼) to view the task details.

What to do next

Resolve the reported issues to improve AI implementation readiness.

View your AI readiness in AI Admin Center (Lux UI)

Review the results of readiness assessments run for your instance.

The Next Experience AI Admin Center workspace is being prepared for deprecation in the November store release and will no longer be supported. For more information on the Next Experience UI, see AI Admin Center workspace (Next Experience UI).

In AI Admin Center version 6.1, the Next Experience and Lux user interfaces are both available.

Before you begin

AI readiness assessments are run on your instance to produce the results that you can view in these steps. You can re-run an AI readiness assessment at any time to update the results. For more information, see Run the AI readiness assessment job in AI Admin Center (Lux UI).

Role required: sn_na_center.nac_admin

About this task

Follow these steps to review and evaluate the readiness of your instance for AI adoption.

Note: This topic describes the AI Admin Center feature based on the Lux user interface (UI). If you're using the Next Experience UI for AI Admin Center, see the Next Experience UI version of this topic.

Procedure

1. Navigate to **All** > **AI Admin Center** > **Home** or **Admin** > **AI Admin Center**.

   The AI Admin Center opens to the home page.

2. Review the **Readiness** section of the home page to see the overall AI readiness for the instance.

   The section displays data visualizations for overall instance health and data quality.

3. Select **View all** in the **Readiness** section or select **Readiness** ( ) in the side navigation panel to view the complete list of AI readiness checks.

   The AI readiness page opens showing tabs for **Instance health** and **Data quality**.

   Each tab shows a general assessment summary and a list of checks performed for individual product areas.

What to do next
Resolve the reported issues to improve AI implementation readiness.

Plan an instance upgrade (Lux UI)

Run an upgrade readiness pre-check and evaluate the current version against the target version to determine if you're ready to upgrade your instance.

Important: Lux is the new user experience for AI Admin Center. For more information on the Lux experience, see AI Admin Center user experience (Lux UI).

The Next Experience AI Admin Center workspace is being prepared for deprecation in the November store release and will no longer be supported. For more information on the Next Experience UI, see AI Admin Center workspace (Next Experience UI).

In AI Admin Center version 6.1, the Next Experience and Lux user interfaces are both available.

Before you begin
You can select the LLM provider that generates the upgrade readiness pre-check results in the settings. For more information, see Manage model providers.

Role required: sn_na_center.nac_admin

About this task
Before upgrading your ServiceNow instance, run a pre-upgrade scan against a target release to identify how the upgrade will affect your AI plugin configurations and customizations.

The scan provides an impact report for your instance highlighting any potential risks from new features, deprecated features, customization issues, compatibility issues, and behavior changes. Use the impact report when planning remediation to help prevent the upgrade from breaking functionality.

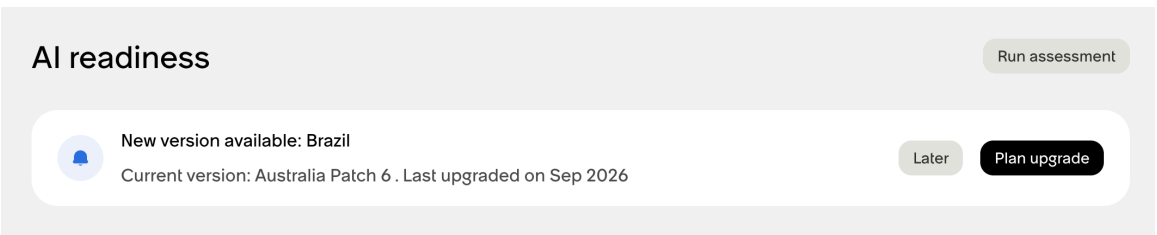
Each pre-upgrade scan and the resulting impact report reflects the configuration of the instance at that point in time. The system only retains the results of the current scan and the one immediately before it, so you can see what changed between them. Previous impact reports aren't permanently saved. You can download a copy of the impact report to save for reference.

Follow these steps to run the upgrade readiness pre-check and review the results.

Note: This topic describes the AI Admin Center feature based on the Lux user experience (UI). There is no Next Experience UI version of this topic.

Procedure
1. Navigate to **All** > **AI Admin Center** > **Home** or **Admin** > **AI Admin Center**.
2. Select **AI readiness** ( ) in the side navigation panel.
   The AI Readiness Assessment page opens.

   When a platform upgrade is available, a notification displays with a **Plan Upgrade** button.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

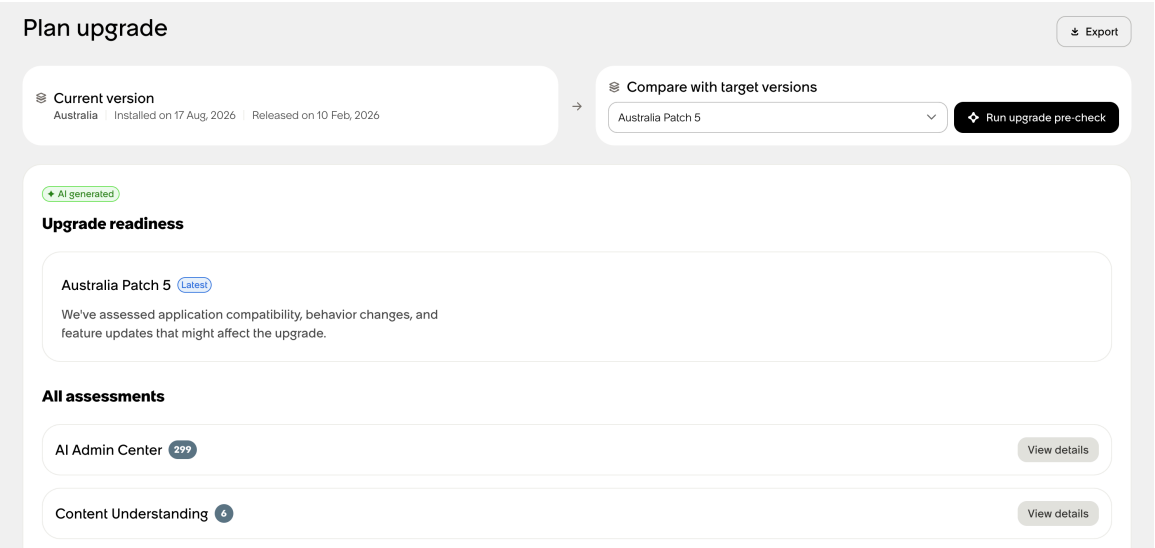
3. Select **Plan upgrade**.
   The Plan upgrade page opens showing the current version.

   The results of the last-run pre-check display, if applicable.

4. Select a target version for comparison.
   If your instance is on the latest version, there is no option to select.
5. Select **Run upgrade pre-check**.

   The results of the upgrade pre-check display in an **Upgrade readiness** list showing areas to address before upgrading.

Plan upgrade page with pre-check results



6. Select **View details** for each result in the list.

   The selected details open in a side panel, grouped by issue type.

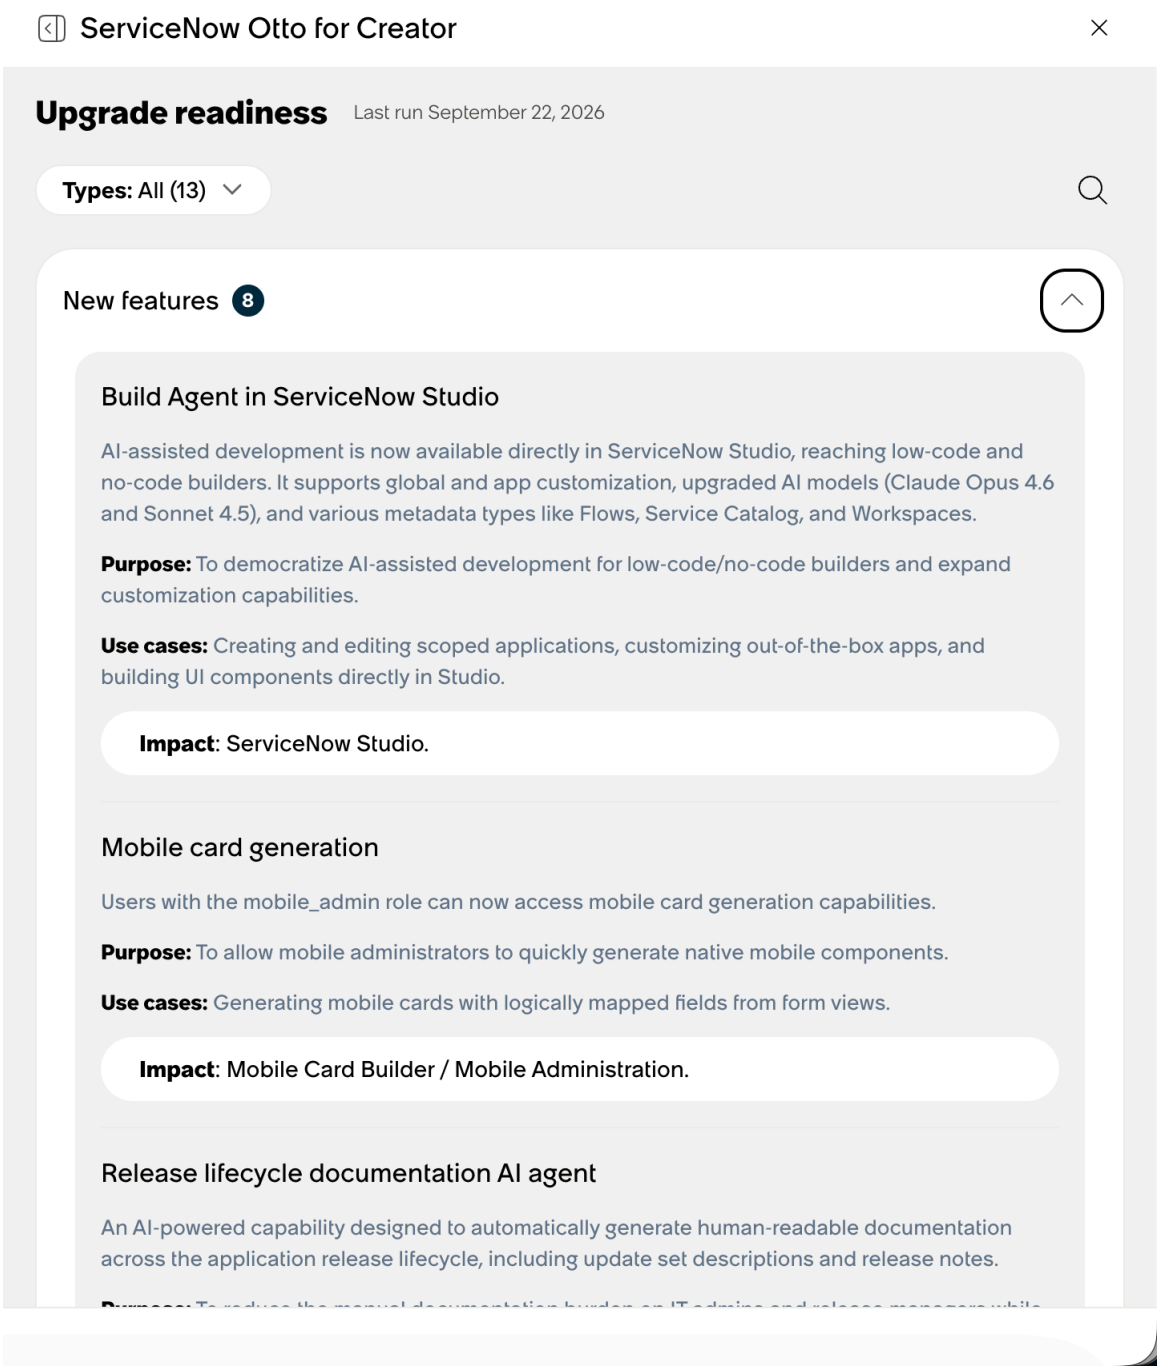
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Pre-check result side panel



a. Optional: Use the search and filter options to refine the list.

- Type in the search box and select the **Search** icon ( ) to filter by search criteria.
- Select one or more options from the **Types** filter menu.

b. Select the **Expand** icon ( ) for an issue type to view the issue details.

c. Select the **Close** icon ( ) to close the side panel.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. **Optional:** Select **Export** to download a copy of the upgrade readiness report.
   The upgrade readiness report downloads as a .csv file.
8. **Optional:** Select **Proceed to upgrade in upgrade manager** to go to the Upgrade Console to manage your upgrade.
   For more information, see Guided upgrade.

What to do next

Plan remediation steps based on the results of the impact report and prepare your instance for the upgrade to the target release.

Setting up AI capabilities and configurations in AI Admin Center

Use AI Admin Center to set up AI solutions on your instance.

Activate actionable use cases

Actionable use cases are quick-start scenarios that help you rapidly adopt AI capabilities on your instance.

Discover automation opportunities and implement AI agents

Use AI Agent Advisor to automatically discover automation opportunities in your instance and deploy AI agents to implement the automations.

Configure AI admin settings

Use AI Admin Hub configuration features to configure AI settings and experiences.

Manage AI assets

Use the asset library to manage the AI assets on your instance. AI assets include agents, agentic workflows, skills, subflows, intents, actions, virtual assistants, and topics. They also include datasets, knowledge graphs, and catalog items.

Manage custom datasets

Use AI Data Kit features to add custom datasets to a data catalog and create collections for use in AI Skill Kit.

Configure AI guardrails

Use AI Guardian capabilities to configure safety and governance controls for AI-generated content.

Activating actionable use cases from AI Admin Center

Actionable use cases are quick-start scenarios that help you rapidly adopt AI capabilities on your instance.

Important: Lux is the new user experience for AI Admin Center. For more information on the Lux experience, see AI Admin Center user experience (Lux UI).

The Next Experience AI Admin Center workspace is being prepared for deprecation in the November store release and will no longer be supported. For more information on the Next Experience UI, see AI Admin Center workspace (Next Experience UI).

In AI Admin Center version 6.1, the Next Experience and Lux user interfaces are both available.

Overview of actionable use cases

Actionable use cases are represented as top action items in the first section of the home page. Each item shows a supported and ready-to-activate AI solution for your instance, such as activating an AI skill for ITSM or configuring a safety setting through AI Guardian.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Actionable use cases use generative AI to tailor the solution and guide setup. The system analyzes your instance profile, organizational context, license entitlements, installed products, and current AI enablement state to determine which use cases to display and in which order. Only use cases for products that you're entitled to use appear on the home page.

Types of actionable use cases

The following are some examples of actionable use cases that may appear on your home page:

- Let's get you set up (install essential AI plugins)
- Case summarization for CSM
- Chat summarization for CSM
- KB generation for CSM
- Resolution notes generation for CSM
- Chat summarization for ITSM
- Incident summarization for ITSM
- KB generation for ITSM
- Resolution notes generation for ITSM

Install and configure essential AI plugins using AI Admin Center

Install the plugins required to enable AI solutions on your instance before activating use cases.

Important: Lux is the new user experience for AI Admin Center. For more information on the Lux experience, see AI Admin Center user experience (Lux UI).

The Next Experience AI Admin Center workspace is being prepared for deprecation in the November store release and will no longer be supported. For more information on the Next Experience UI, see AI Admin Center workspace (Next Experience UI).

In AI Admin Center version 6.1, the Next Experience and Lux user interfaces are both available.

Before you begin

Role required: sn_na_center.nac_admin

About this task

Follow these steps to install essential AI plugins.

Note: This topic describes the AI Admin Center feature based on the Next Experience user interface (UI). There is no Lux UI version of this topic.

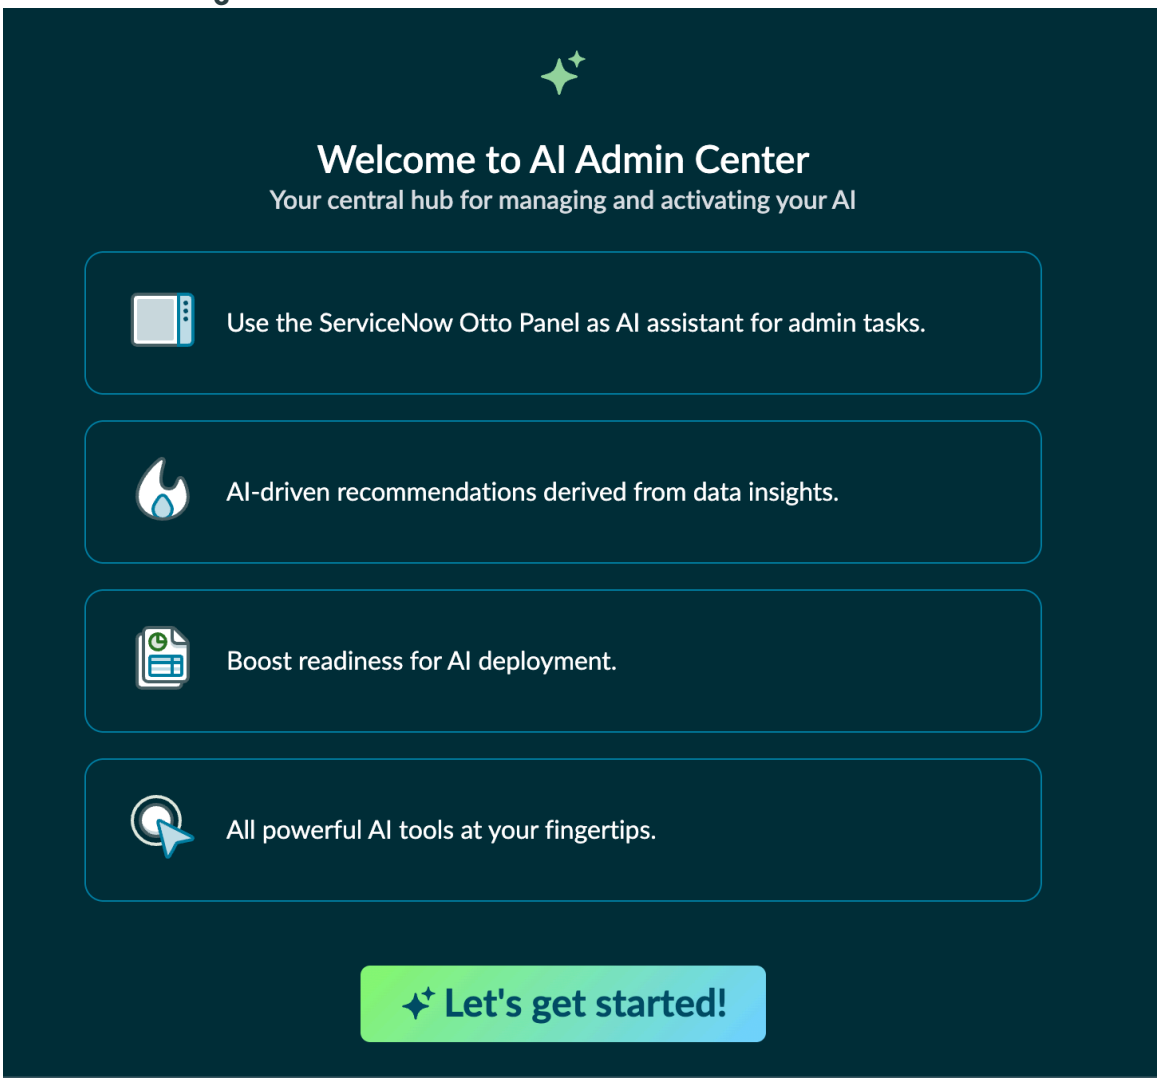
Procedure

1. Navigate to **All** > **AI Admin Center** > **AI Admin Center (Legacy)**.

   The first time you access AI Admin Center, a welcome message displays prompting you to get started by installing essential plugins. If you already have these plugins installed, the message simply introduces the benefits of AI Admin Center.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Welcome message

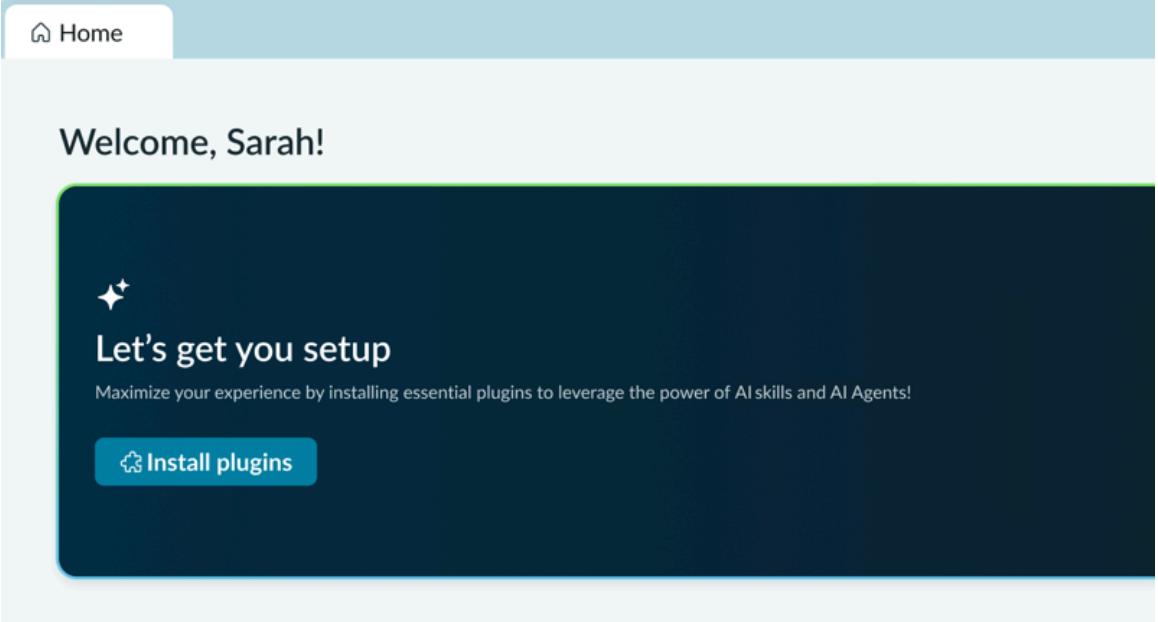


2. Select **Let's get started** to continue to the home page.

   The home page opens.

   If you don't have the essential plugins installed yet, the first section of the home page displays a **Let's get you set up** card.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. Select **Install plugins**.

   The Application Manager opens.

   AI Admin Center identifies which plugins are needed based on your license entitlements.

4. Follow the prompts to install the required plugins.
5. After installation completes, return to the AI Admin Center home page.

Result

The required plugins are installed on your instance.

Actionable use case cards tailored to your instance and entitlements now appear in the first section of the home page.

What to do next

To activate a use case, see View and activate actionable use cases in AI Admin Center (Next Experience UI).

View and activate actionable use cases in AI Admin Center (Next Experience UI)

View the top actions you can take right away to adopt AI capabilities on your instance.

Important: Lux is the new user experience for AI Admin Center. For more information on the Lux experience, see AI Admin Center user experience (Lux UI).

The Next Experience AI Admin Center workspace is being prepared for deprecation in the November store release and will no longer be supported. For more information on the Next Experience UI, see AI Admin Center workspace (Next Experience UI).

In AI Admin Center version 6.1, the Next Experience and Lux user interfaces are both available.

Before you begin

ServiceNow Otto panel must be enabled to activate the use cases. Actionable use cases work with the ServiceNow Otto panel to guide you through the setup in a chat conversation. For more information, see Enable the ServiceNow Otto panel (Next Experience UI).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Required plugins must be installed. For more information, see Install and configure essential AI plugins using AI Admin Center.

Note: If a card displays a Model provider not approved warning, the model provider for that skill has not been approved in AI Guardian. Resolve this issue before attempting setup for the use case.

Role required: sn_na_center.nac_admin

About this task

Follow these steps to activate an actionable use case.

The actionable use cases section on the home page displays solution cards tailored to your instance. Each card represents a base-system AI solution you can activate with guided assistance from the ServiceNow Otto panel. The system determines which cards to display based on your license entitlements, installed products, instance version compatibility, and current AI enablement state.

If there are no actionable use cases, the section doesn't appear.

Note: This topic describes the AI Admin Center feature based on the Next Experience UI. If you're using the Lux user experience for AI Admin Center, see the Lux UI version of this topic.

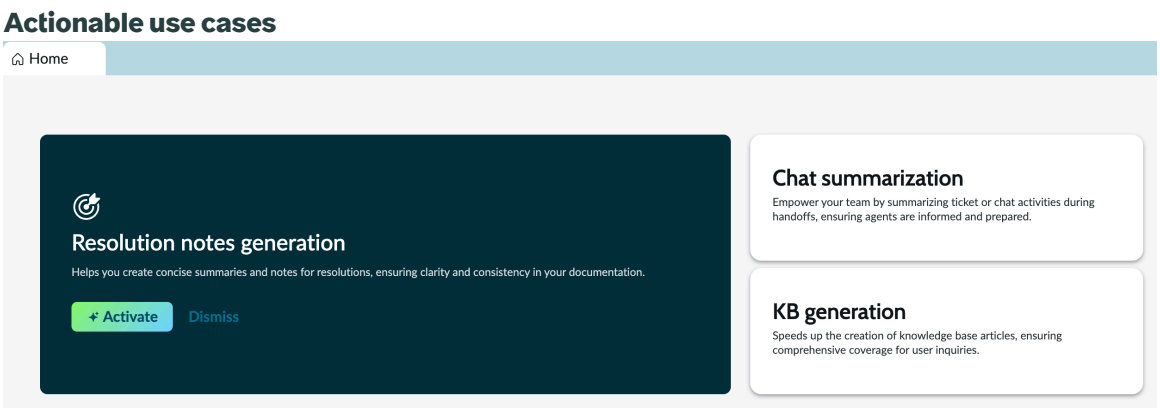
Procedure

1. Navigate to **All** > **AI Admin Center** > **AI Admin Center (Legacy)**.

   The AI Admin Center opens to the home page.

2. Review the actionable use case cards displayed in the first section of the home page.

   Each card shows the use case name and a brief description of the AI solution.



3. Select **Activate** on the card to begin.

   A conversation will open in the ServiceNow Otto panel.

   In the ServiceNow Otto panel, you can use natural language to have your AI companion implement the use case.

   Note: To remove a card permanently without activating it, select **Dismiss** on the card.

   Warning: Dismissed cards don't reappear in future sessions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. In the ServiceNow Otto panel, review the information provided about the solution.
5. When the panel asks you to confirm, respond to proceed with the activation.
6. Follow any additional prompts in the panel to complete the setup.

Result
The AI solution is activated. A confirmation message appears at the top of the workspace.

After it is activated, the card disappears and the new solution appears under the Recently activated AI section of the home page.

What to do next
To monitor the performance of the activated solution, review the Recently activated AI section on the home page. For more information, see Monitor your recently activated AI solution in AI Admin Center (Next Experience UI).

View and activate your top actions in AI Admin Center (Lux UI)

View the top actions you can take right away to adopt AI capabilities on your instance.

Important: Lux is the new user experience for AI Admin Center. For more information on the Lux experience, see AI Admin Center user experience (Lux UI).

The Next Experience AI Admin Center workspace is being prepared for deprecation in the November store release and will no longer be supported. For more information on the Next Experience UI, see AI Admin Center workspace (Next Experience UI).

In AI Admin Center version 6.1, the Next Experience and Lux user interfaces are both available.

Before you begin
The ServiceNow Otto panel must be enabled to activate a proposed solution. Action items work with the ServiceNow Otto panel to guide you through the setup in a chat conversation. For more information, see Enable the ServiceNow Otto panel (Lux UI).

Role required: sn_na_center.nac_admin

About this task
The **Top actions** section of the home page displays a series of AI-generated items that represent quick-start use cases. Each use case is tailored to your environment and proposed to help you implement AI adoption, best practices, and administrative setup on the platform.

Follow these steps to review and activate a proposed solution.

Note: This topic describes the AI Admin Center feature based on the Lux user interface (UI). If you're using the Next Experience UI for AI Admin Center, see the Next Experience UI version of this topic.

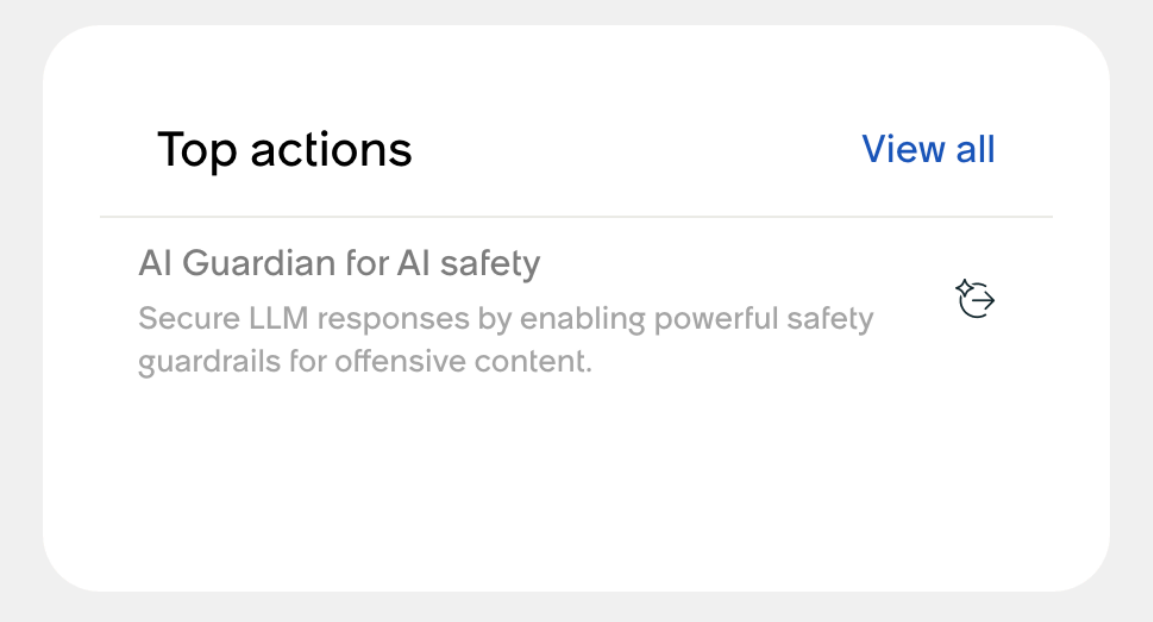
Procedure
1. Navigate to **All** > **AI Admin Center** > **Home** or **Admin** > **AI Admin Center**.

   The AI Admin Center opens to the home page.

   The **Top actions** section of the home page displays a list of any action items identified for your instance. If there are no action items, the section doesn't appear.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Top actions



2. **Optional:** Activate a proposed action item.

   a. Select the action item in the **Top actions** list.

      (Optional) The ServiceNow Otto panel starts a guided setup conversation. The panel describes the solution, confirms the current state, and asks you to confirm before making any change.

      Use natural language to have your AI companion implement the use case.

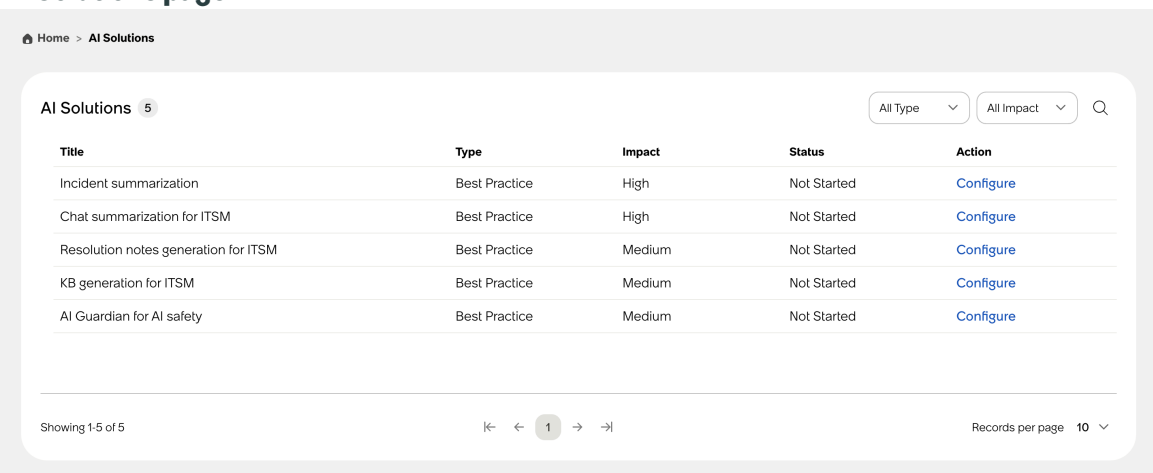
   b. Confirm the proposed action to implement it.

      (Optional) After you successfully activate a solution, the action disappears from the **Top actions** list and a confirmation message appears.

3. **Optional:** Select **View all** to see the list of proposed AI solutions.

   (Optional) The AI Solutions page opens.

AI Solutions page



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Use the search and filter options to refine the list.

- Type in the search box and select the **Search** icon ( ) to filter by search criteria.
- Select a combination of the filter options to filter by solution type and impact.

b. Select **Configure** to activate a proposed solution.
The related application opens depending on the solution type.

c. Activate the solution according to the application procedure.

(Optional) For example, follow the Activate an AI skill steps to use the AI Admin Hub.

Managing AI assets in AI Admin Center

The asset library lists the AI assets in your instance.

These assets include AI capabilities such as AI skills, AI agents, and AI agentic workflows. They also include conversational components that you can use to build an LLM conversation such as topics, subflows, actions, intents, and virtual assistants. You can also view your datasets, knowledge graphs, and catalog items.

View your AI assets in the asset inventory (Next Experience UI)

Use the asset library to view and manage the AI assets in your instance.

Important: Lux is the new user experience for AI Admin Center. For more information on the Lux experience, see AI Admin Center user experience (Lux UI).

The Next Experience AI Admin Center workspace is being prepared for deprecation in the November store release and will no longer be supported. For more information on the Next Experience UI, see AI Admin Center workspace (Next Experience UI).

In AI Admin Center version 6.1, the Next Experience and Lux user interfaces are both available.

Before you begin

Role required: sn_na_center.nac_admin

About this task

Follow these steps to view and manage the AI assets on your instance. AI assets include agents, agentic workflows, skills, subflows, actions, virtual assistants, and topics. They also include datasets, knowledge graphs, and catalog items.

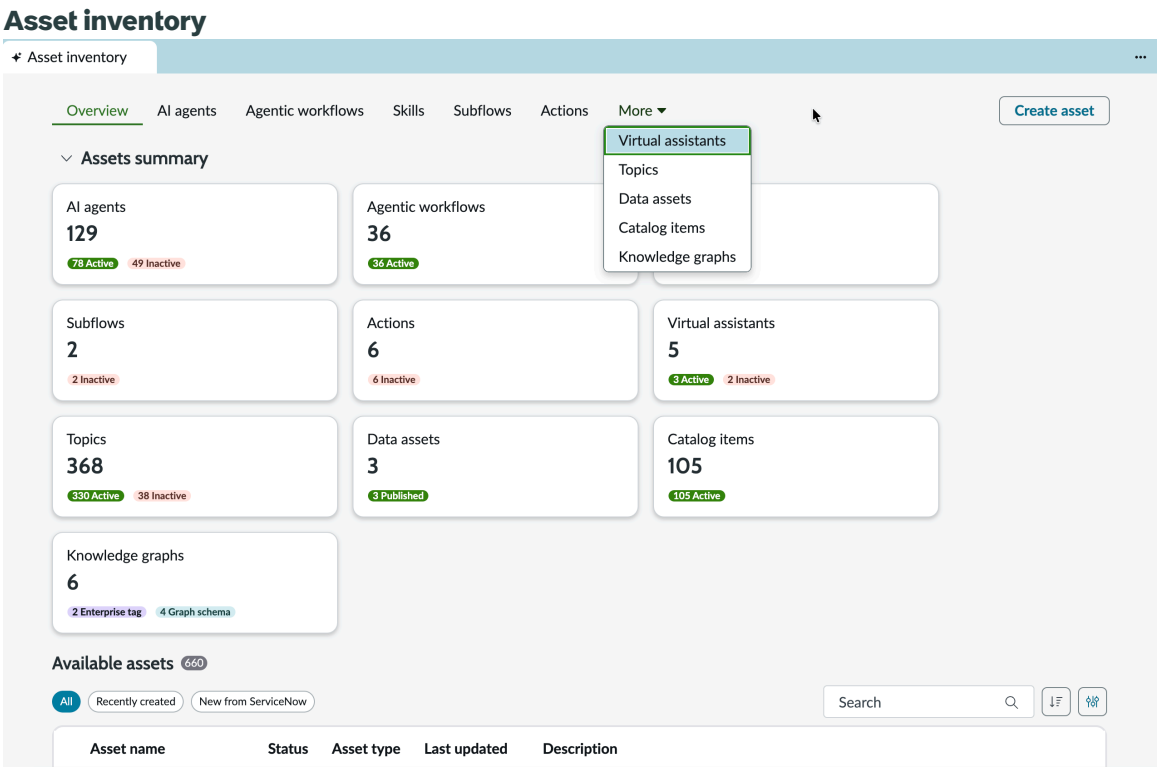
Note: This topic describes the AI Admin Center feature based on the Next Experience UI. If you're using the Lux user experience for AI Admin Center, see the Lux UI version of this topic.

Procedure

1. Navigate to **All** > **AI Admin Center** > **AI Admin Center (Legacy)**.
2. Select **Asset inventory** ( ) in the side navigation bar.

The Asset inventory tab opens showing tabs for the various asset types.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. Select the tab to view your AI assets for that type.

   Select **More** to view and select additional tabs.

   The asset inventory contains the following tabs.

Asset inventory tabs

Tab	Description
Overview	Displays the total number of each asset type and a full list of all assets in your instance. Select the **Recently created** or **New from ServiceNow** filters in the Discover assets section to see new AI assets.
Agents	Displays a list of all AI agents. An AI agent is an autonomous digital worker that uses LLMs, tools, and workflows to complete tasks on behalf of users. They can reason, plan, and act independently or collaboratively.
Agentic workflows	Displays a list of all agentic workflows. An agentic workflow is a structured sequence of tasks executed by one or more AI agents

Tab	Description
	intelligent search, insights, and AI-driven experiences.

4. **Optional:** Select a combination of sort and filter options to refine the list.

   (Optional) The filters vary depending on the asset tab selected.

   Filter and sorting controls

   
   - Select the **Sort by** button ( ) and select a sorting order.
   - Select a filter button.
   - Select an option from a filter menu.
   - Type in the search box and select the **Submit search** icon ( ) to filter by search criteria.

5. **Optional:** Change the columns that appear in the list table.

   a. Select the **Personalize columns** button ( ).

   (Optional) The **Select columns to display** box opens.

   Select columns to display

   
   b. Customize the columns as needed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Select an option in the **Available columns** panel to add the column to your list. Deselect an option to remove it.
- Select the **Remove items** icon (✕) on an item in the **Selected columns** panel to remove it from your list.
- Drag one or more columns to a different location in the **Selected columns** panel to change the order in which they appear in your list.

  Columns ordered from top to bottom in the panel appear from left to right in the list table.
- Select **Reset to defaults** to restore the column configuration before your changes.

c. Select **Apply**.

6. **Optional:** In the Overview tab, use the Available assets section to find the new AI assets on your instance.
   - Select the **Recently created** filter to see all AI assets you created in the last 30 days.
   - Select the **New from ServiceNow** filter to see all base system assets provided by ServiceNow within the last 90 days.
7. **Optional:** Select the asset name in the list to view the asset details.

   (Optional) The asset details page may open on a separate workspace tab if the selected asset is managed using an application that is fully integrated in AI Admin Center. If it is managed in another application, the application opens to the asset details page.

View your AI assets in the asset library (Lux UI)

Use the asset library to view and manage the AI assets in your instance.

Important: Lux is the new user experience for AI Admin Center. For more information on the Lux experience, see AI Admin Center user experience (Lux UI).

The Next Experience AI Admin Center workspace is being prepared for deprecation in the November store release and will no longer be supported. For more information on the Next Experience UI, see AI Admin Center workspace (Next Experience UI).

In AI Admin Center version 6.1, the Next Experience and Lux user interfaces are both available.

Before you begin

Role required: sn_na_center.nac_admin

About this task

Follow these steps to view and manage the AI assets on your instance. AI assets include agents, agentic workflows, skills, subflows, actions, intents, virtual assistants, and topics. They also include datasets, knowledge graphs, and catalog items.

Note: This topic describes the AI Admin Center feature based on the Lux user interface (UI). If you're using the Next Experience UI for AI Admin Center, see the Next Experience UI version of this topic.

   Select **More** to view and select additional tabs.

   The asset library contains the following tabs.

Asset library tabs

Tab	Description
Overview	Displays the total number of each asset type and a full list of all assets in your instance. Select the **Recently created** or **New from ServiceNow** filters in the **Available assets** section to see new AI assets.
Agents	Displays a list of all AI agents. An AI agent is an autonomous digital worker that uses LLMs, tools, and workflows to complete tasks on behalf of users. They can reason, plan, and act independently or collaboratively.
Agentic workflows	Displays a list of all agentic workflows. An agentic workflow is a structured sequence of tasks executed by one or more AI agents with minimal human intervention to fulfill a business objective.
Skills	Displays a list of all generative AI skills. A generative AI skill is a capability that uses generative AI to perform tasks such as generating summaries and resolution notes. You can have base system skills or custom skills created in AI Skill Kit.
Intents	Displays a list of all intents. An intent is a data record that captures and defines what a user is trying to accomplish in a chat request. Intent

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tab	Description
	records help the system classify, understand, and route user input appropriately.
Virtual assistants	Displays a list of all virtual assistants. A virtual assistant is the container for the end-to-end administrative configuration for a chat or voice conversation.
Subflows	Displays a list of all subflows. A subflow is an automated process that is part of a larger automated process. It consists of reusable actions and flow logic, data inputs, and outputs.
Data assets	Displays a list of all datasets. A custom dataset and data collection in AI Data Kit is used for evaluations in AI Skill Kit.
Actions	Displays a list of all actions. An action is a single step or task performed by an AI agent, a workflow, or a subflow.
Topics	Displays a list of all topics. A conversational topic is used to structure back-and-forth conversations between the virtual agent and the end user.
Catalog items	Displays a list of all catalog items. A catalog item is used to publish a service to users in the Service Catalog.
Knowledge graphs	Displays a list of all knowledge graphs. A knowledge graph is a graphical representation of real-world entities (tables) and their relationships. It's used to add context and meaning to information to enable intelligent search, insights, and AI-driven experiences.

4. **Optional:** Select a combination of sort and filter options to refine the list.

   (Optional) The filters vary depending on the asset tab selected.

   
   a. Select a filter button.

   b. Select an option from a filter menu.

   c. Type in the search box and select the **Submit search** icon ( ) to filter by search criteria.

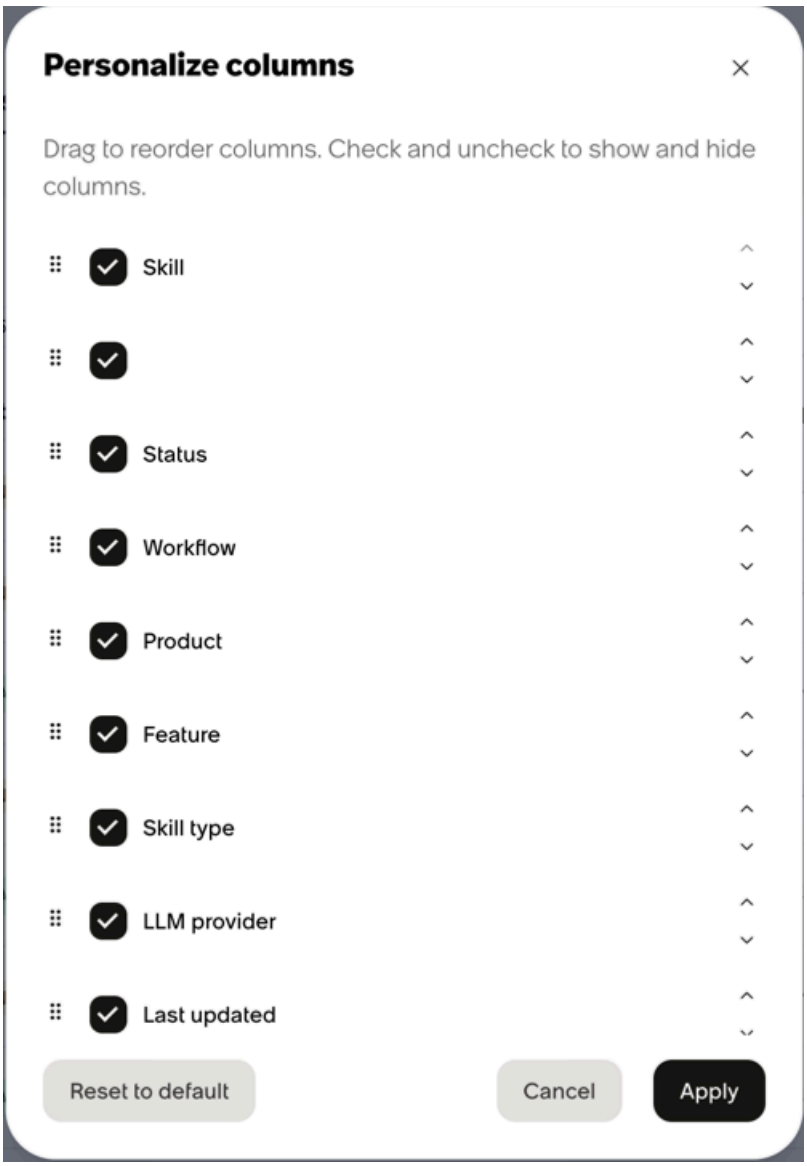
5. **Optional:** Change the columns that appear in the list table.

   a. Select the **Personalize columns** button ( ).

      (Optional) The **Personalize columns** box opens.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Personalize columns box



b. Customize the columns as needed.

- Select an option to add the column to your list. Clear an option to remove it.
- Drag one or more columns to a different location to change the order in which they appear in your list. Columns ordered from top to bottom in the panel appear from left to right in the list table.
- Select **Reset to default** to restore the column configuration before your changes.

c. Select **Apply**.

6. **Optional:** In the **Overview** tab, use the **Available assets** section to find the new AI assets on your instance.
   - Select the **Recently created** filter to see all AI assets you created in the last 30 days.
   - Select the **New from ServiceNow** filter to see all base system assets provided by ServiceNow within the last 90 days.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. **Optional:** Select the asset name in the list to view the asset details.

   (Optional) The asset details page opens in AI Admin Center if the selected asset is managed using an application that is fully integrated. If it is managed in another application, the application opens to the asset details page.

Create an asset in the AI asset inventory (Next Experience UI)

Use the asset inventory to create AI assets in your instance.

Important: Lux is the new user experience for AI Admin Center. For more information on the Lux experience, see AI Admin Center user experience (Lux UI).

The Next Experience AI Admin Center workspace is being prepared for deprecation in the November store release and will no longer be supported. For more information on the Next Experience UI, see AI Admin Center workspace (Next Experience UI).

In AI Admin Center version 6.1, the Next Experience and Lux user interfaces are both available.

Before you begin

Role required: sn_na_center.nac_admin

About this task

Follow these steps to create an AI asset.

From the asset inventory, asset types are created by opening their respective application.

- Create agents and agentic workflows with AI Agent Studio.

  For more information, see AI Agent Studio overview.

- Create assets with Assistant Designer, including topics, virtual assistants, subflows, and actions.

  For more information, see Assistant Designer.

- Create custom skills with AI Skill Kit.

  For more information, see AI Skill Kit.

- Create datasets with AI Data Kit.

  For more information, see AI Data Kit.

- Create catalog items with Catalog Builder.

  For more information, see Catalog Builder.

- Create knowledge graphs with Knowledge Graph Designer.

  For more information, see Knowledge Graph.

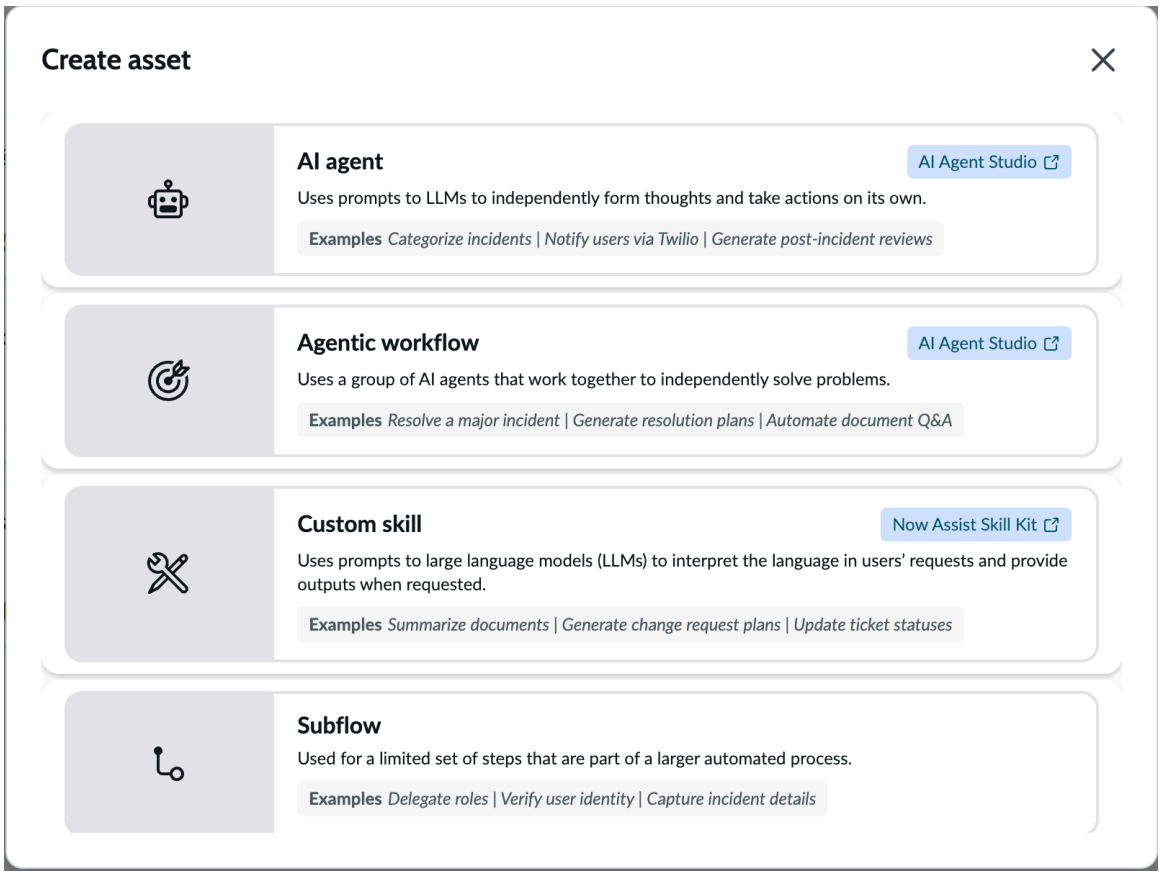
Note: This topic describes the AI Admin Center feature based on the Next Experience UI. If you're using the Lux user experience for AI Admin Center, see the Lux UI version of this topic.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **AI Admin Center** > **AI Admin Center (Legacy)**.
2. Select **Asset inventory** ( ) in the side navigation bar.
   The Asset inventory tab opens.
3. Select the **Create asset** button.

   The Create asset box opens showing the following options for the asset type.



Options in the Create asset box

Asset type	Description
AI agent	Opens the New AI Agent form in AI Agent Studio. An AI agent is an autonomous digital worker that uses LLMs, tools, and workflows to complete tasks on behalf of users. They can reason, plan, and act independently or collaboratively. For more information on creating an AI agent in AI Agent Studio, see Create an AI agent.
Agentic workflow	Opens the New agentic workflow form in AI Agent Studio.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Asset type	Description
	An agentic workflow is a structured sequence of tasks executed by one or more AI agents with minimal human intervention to fulfill a business objective. For more information on AI Agent Studio, see Create an agentic workflow.
Custom skill	Opens the AI Skill Kit home page. A skill is a self-contained unit of generative AI functionality that runs a prompt against a large language model (LLM) and returns a response. For more information, see Create a skill.
Subflow	Opens the New Subflow form in Assistant Designer. A subflow is an automated process that is part of a larger automated process. It consists of reusable actions and flow logic, data inputs, and outputs. For more information on creating an asset with the Assistant Designer asset library, see Build conversations in the Asset library in Assistant Designer.
Action	Opens the New Action form in Assistant Designer. An action is a single step or task performed by an AI agent, a workflow, or a subflow. For more information on creating an asset with the Assistant Designer asset library, see Build conversations in the Asset library in Assistant Designer.
Virtual assistant	Opens the Create an assistant page in Assistant Designer. A virtual assistant is the container for the end-to-end administrative configuration for a chat or voice conversation. For more information on creating a virtual assistant in Assistant Designer, see Assistants overview.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Asset type	Description
Topic	Opens the Create a topic form in Assistant Designer. A conversational topic is used to structure back-and-forth conversations between the virtual agent and the end user. For more information on creating an asset with the Assistant Designer asset library, see Build conversations in the Asset library in Assistant Designer.
Catalog item	Opens the Catalog Builder. A catalog item is used to publish a service to users in the Service Catalog. For more information on creating a catalog item in Catalog Builder, see Catalog Builder.
Data asset	Opens a **Create data asset** box. Choose one of the following options. ○ **Import and create data** Opens the Create dataset form in AI Data Kit. ○ **Generate synthetic data** Opens the AI Data Kit home page. A custom dataset and data collection in AI Data Kit is used for evaluations in AI Skill Kit. For more information on creating a dataset in AI Data Kit, see Using AI Data Kit.
Knowledge Graph	Opens Knowledge Graph Designer home page. A knowledge graph is a graphical representation of real-world entities (tables) and their relationships. It is used to add context and meaning to information to enable intelligent search, insights, and AI-driven experiences. For more information on creating a knowledge graph in Knowledge Graph Designer, see Using Knowledge Graph Designer.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select the type of asset you want to create.

   Depending on your selection, the application will open in a separate browser tab.

5. Complete the form for the new asset and submit it.

Result
An asset is created and can be seen in the related asset inventory list.

Create an asset in AI Admin Center (Lux UI)

Use the asset library to create AI assets in your instance.

> **Important:** Lux is the new user experience for AI Admin Center. For more information on the Lux experience, see AI Admin Center user experience (Lux UI).
>
> The Next Experience AI Admin Center workspace is being prepared for deprecation in the November store release and will no longer be supported. For more information on the Next Experience UI, see AI Admin Center workspace (Next Experience UI).
>

Catalog item	Opens the Catalog Builder. A catalog item is used to publish a service to users in the Service Catalog. For more information on creating a catalog item in Catalog Builder, see Catalog Builder.
Data asset	A custom dataset and data collection in AI Data Kit is used for evaluations in AI Skill Kit. Select **AI Data Kit** to go to the AI Data Kit home page. For more information on creating a dataset in AI Data Kit, see Using AI Data Kit. Select **Data asset** to create the asset in AI Admin Center. For more information on creating a dataset with AI Admin Center, see Create a data asset in AI Admin Center (Lux UI).
Knowledge graph	Opens Knowledge Graph Designer home page. A knowledge graph is a graphical representation of real-world entities (tables) and their relationships. It's used to add context and meaning to information to enable intelligent search, insights, and AI-driven experiences. For more information on creating a knowledge graph in Knowledge Graph Designer, see Using Knowledge Graph Designer.

4. Select the type of asset you want to create.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Depending on your selection, the application opens in a separate browser tab.

5. Complete the form for the new asset and submit it.

Result
An asset is created and can be seen in the related asset library list.

Create an intent in AI Admin Center (Lux UI)

Create an intent record to standardize a customer input goal and enable multichannel intent detection, AI agent routing, and contact center analytics.

Important: Lux is the new user experience for AI Admin Center. For more information on the Lux experience, see AI Admin Center user experience (Lux UI).

The Next Experience AI Admin Center workspace is being prepared for deprecation in the November store release and will no longer be supported. For more information on the Next Experience UI, see AI Admin Center workspace (Next Experience UI).

In AI Admin Center version 6.1, the Next Experience and Lux user interfaces are both available.

Before you begin
Role required: sn_na_center.nac_admin

About this task
An intent is a data record that captures and defines what a user is trying to accomplish in a chat request. Intent records help the system classify, understand, and route user input appropriately.

Intents are discovered and captured by AI Agent Advisor through scheduled analysis of multiple interaction channels. You can also create an intent using the conversational experience. Follow these steps to create an intent record manually.

Note: This topic describes the AI Admin Center feature based on the Lux user experience (UI). There is no Next Experience UI version of this topic.

Procedure

1. Navigate to **All** > **AI Admin Center** > **Home** or **Admin** > **AI Admin Center**.
2. Select **Asset library** ( ) in the side navigation panel.
   The Asset library page opens.
3. Select the **Create asset** button.
   The Create asset box opens showing options for the asset type.
4. Select **Intent**.
   The New intent form opens.
5. Complete the form.

   a. Enter a name for the intent in the **Intent name** field.

   b. Enter a description of the intent in the **Description** field.

   c. In the **Example utterance** field, enter training utterance examples that are relevant to the intent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Type the utterance and select the **Add** icon (⊕) to add the example.

d. In the **Detection criteria** tab, enter the conditions that determine when the intent applies to an utterance.

> **Tip:** Be specific about what the customer says or asks. Include two or three examples per bullet. Clarify what doesn't count as this intent to avoid confusion with similar intents.

e. In the **Resolution criteria** tab, enter the conditions that determine when the intent is considered resolved.

> **Tip:** Resolution requires concrete, observable outcomes, not effort. Number your conditions in logical order. Use "customer has," "confirmation was," or "system shows" to describe completed actions, not in-progress steps.

f. Turn the intent on or off by selecting the **Active** option.

6. Select **Save**.

Result
An intent is created and can be seen in the intents list on the Asset library page.

Edit an intent in AI Admin Center (Lux UI)

Edit the details and activation status of an intent record.

> **Important:** Lux is the new user experience for AI Admin Center. For more information on the Lux experience, see AI Admin Center user experience (Lux UI).
>
> The Next Experience AI Admin Center workspace is being prepared for deprecation in the November store release and will no longer be supported. For more information on the Next Experience UI, see AI Admin Center workspace (Next Experience UI).
>
> In AI Admin Center version 6.1, the Next Experience and Lux user interfaces are both available.

Before you begin
Role required: sn_na_center.nac_admin

About this task
Follow these steps to edit an intent record.

An intent is a data record that captures and defines what a user is trying to accomplish in a chat request. Intent records help the system classify, understand, and route user input appropriately.

Intents are discovered and captured by AI Agent Advisor through scheduled analysis of multiple interaction channels. You can create an intent manually in AI Admin Center. For more information, see Create an intent in AI Admin Center (Lux UI). You can also create, edit, or delete an intent using the conversational experience.

> **Note:** This topic describes the AI Admin Center feature based on the Lux user experience (UI). There is no Next Experience UI version of this topic.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **AI Admin Center** > **Home** or **Admin** > **AI Admin Center**.
2. Select **Asset library** ( ) in the side navigation panel.
   The Asset library page opens.
3. Select the **Intents** tab.
4. In the row of the intent you want to edit, select the intent name or select the **Actions** icon ( ) and choose **View details**.
   The intent details page opens.
5. Select **Edit**.
   The intent editing form opens.
6. Update the form as needed.

   a. Enter a name for the intent in the **Intent name** field.

   b. Enter a description of the intent in the **Description** field.

   c. In the **Example utterance** field, enter training utterance examples that are relevant to the intent.

   Type the utterance and select the **Add** icon ( ) to add the example.

   Select the **Remove** icon ( ) to remove the utterance.

   d. In the **Detection criteria** tab, enter the conditions that determine when the intent applies to an utterance.

   Tip: Be specific about what the customer says or asks. Include two or three examples per bullet. Clarify what doesn't count as this intent to avoid confusion with similar intents.

   e. In the **Resolution criteria** tab, enter the conditions that determine when the intent is considered resolved.

   Tip: Resolution requires concrete, observable outcomes, not effort. Number your conditions in logical order. Use "customer has," "confirmation was," or "system shows" to describe completed actions, not in-progress steps.

   f. Turn the intent on or off by selecting the **Active** option.

7. Select **Save**.

Create a data asset in AI Admin Center (Lux UI)

Create a dataset, generate synthetic data, and publish data collections to evaluate skills and agents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important: Lux is the new user experience for AI Admin Center. For more information on the Lux experience, see AI Admin Center user experience (Lux UI).

The Next Experience AI Admin Center workspace is being prepared for deprecation in the November store release and will no longer be supported. For more information on the Next Experience UI, see AI Admin Center workspace (Next Experience UI).

In AI Admin Center version 6.1, the Next Experience and Lux user interfaces are both available.

Before you begin
Role required: sn_na_center.nac_admin

About this task
Follow these steps to create a data asset.

A custom dataset and data collection in AI Data Kit is used for evaluations in AI Skill Kit.

Note: This topic describes the AI Admin Center feature based on the Lux user experience (UI). There is no Next Experience UI version of this topic.

Procedure
1. Navigate to **All** > **AI Admin Center** > **Home** or **Admin** > **AI Admin Center**.
2. Select **Asset library** ( ) in the side navigation panel.
   The Asset library page opens.
3. Select the **Create asset** button.
   The Create asset box opens showing options for the asset type.
4. Select **Data asset**.
5. Choose the type of asset you want to create.

   Select one of the following:

   - **Create dataset**. Import data from instance tables or local files to create a dataset.
   - **Standard synthetic dataset**. Generate synthetic data using standard templates and configurations.
   - **Multi-table synthetic dataset**. Generate synthetic data across multiple related tables simultaneously.

   The create dataset form opens.
6. Complete the setup based on the selection.
   - For more information on importing data from a table or a local file as a dataset, see Add a dataset.
   - For more information on generating synthetic datasets, see Generate synthetic data.

Result
A dataset is created and can be seen in the data assets list on the Asset library page.

Managing assist consumption (Lux UI)

The Assist consumption page provides features that enable you to view the assists consumed on your instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important: Lux is the new user experience for AI Admin Center. For more information on the Lux experience, see AI Admin Center user experience (Lux UI).

The Next Experience AI Admin Center workspace is being prepared for deprecation in the November store release and will no longer be supported. For more information on the Next Experience UI, see AI Admin Center workspace (Next Experience UI).

In AI Admin Center version 6.1, the Next Experience and Lux user interfaces are both available.

Note: This topic describes the AI Admin Center feature based on the Lux user experience (UI). There is no Next Experience UI version of this topic.

An assist is the unit of measurement for AI usage on the ServiceNow AI Platform. Assists are used to measure usage of generative AI skills through performed skill actions. Users consume assists when they execute skill actions.

Different skill actions consume different numbers of assists based on complexity. An assist is not a 1:1 ration with a user action. Each skill carries an assist ratio reflecting its relative cost, and total assists are calculated by multiplying the number of actions by the assist ratio. A simple summarization and a multi-step agentic execution consume very different amounts.

Three asset types consume assists: skills, conversational assistants, and AI agents and agentic workflows.

View your assist consumption in AI Admin Center (Lux UI)

View the AI assist consumption on your instance.

Important: Lux is the new user experience for AI Admin Center. For more information on the Lux experience, see AI Admin Center user experience (Lux UI).

The Next Experience AI Admin Center workspace is being prepared for deprecation in the November store release and will no longer be supported. For more information on the Next Experience UI, see AI Admin Center workspace (Next Experience UI).

In AI Admin Center version 6.1, the Next Experience and Lux user interfaces are both available.

Before you begin

Role required: sn_na_center.nac_admin

About this task

Follow these steps to view the AI assist consumption on your instance.

An assist is the unit of measurement for AI usage on the ServiceNow AI Platform. Assists are used to measure usage of generative AI skills through performed skill actions. Users consume assists when they execute skill actions.

Use the Assist consumption page to track total assist consumption and identify usage patterns across AI assets, departments, and users. For more information, see AI Admin Center Assist Consumption page.

Note: This topic describes the AI Admin Center feature based on the Lux user experience (UI). There is no Next Experience UI version of this topic.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **AI Admin Center** > **Home** or **Admin** > **AI Admin Center**.
2. Select **Assist consumption** ( ) in the side navigation panel.
   The Assist consumption page opens to the **Overview** dashboard.

   For more information, see AI Admin Center Assist Consumption page.

AI Admin Center Assist Consumption page

Use the Assist Consumption page in AI Admin Center to monitor assist consumption trends and identify which AI assets are consuming the most assists across your organization.

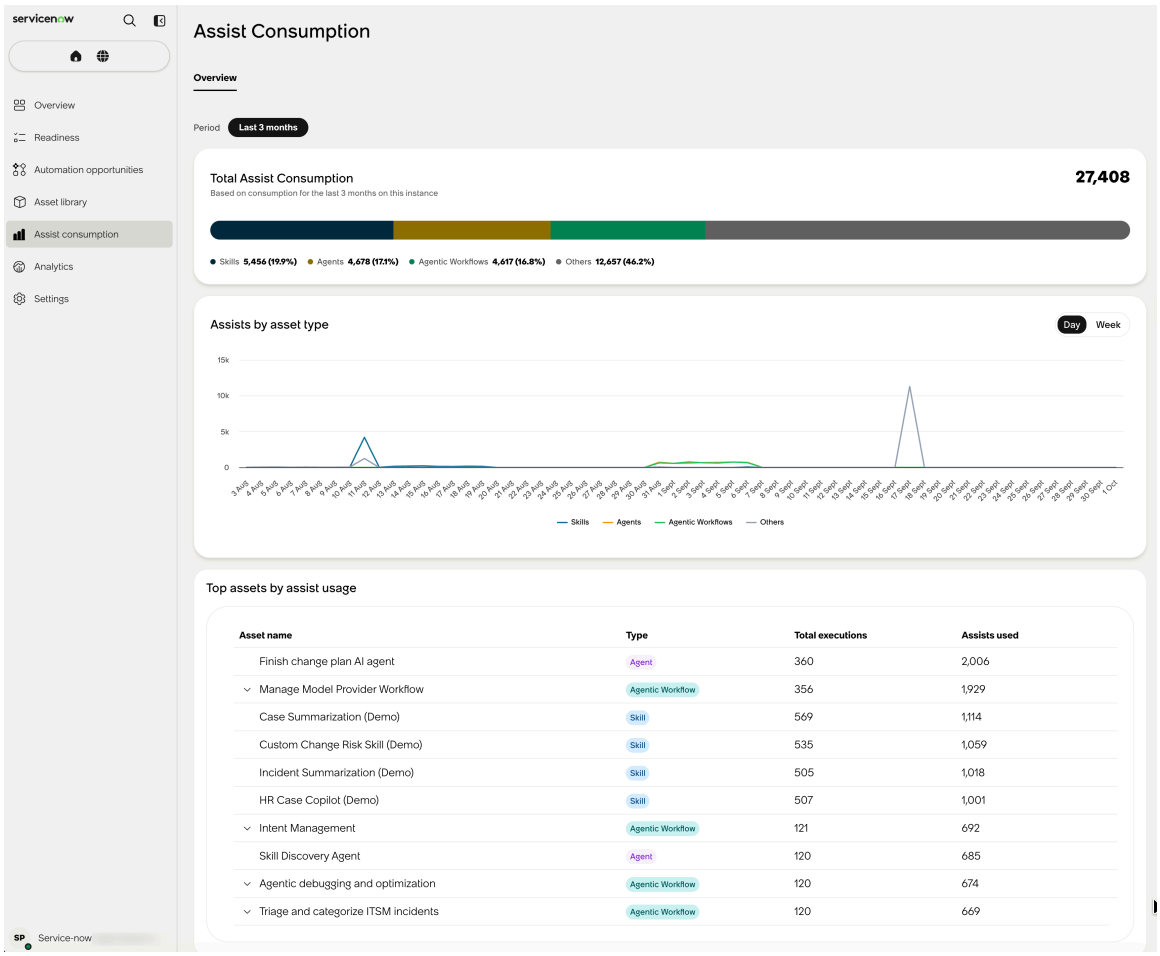
Assist Consumption page

The Assist Consumption page is accessible from the side navigation bar in AI Admin Center. Use the page to track total assist consumption and identify usage patterns across AI assets, departments, and users.

Use the date range filter at the top of the Overview tab to scope the data. The filter applies to the trend chart, the top assets table, and the top departments table. The default period is the previous three months.

The consumption band chart uses a fixed trailing 90-day window and does not respond to the date range filter.

Overview tab of the Assist Consumption page



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Overview tab of the Assist Consumption page contains the following components:

Total Assist Consumption

This area of the page displays a bar chart with a legend summarizing assist consumption for the selected period, broken down by asset type. Use this area to assess overall consumption and compare spend across asset types.

Assists by asset type

This area of the page displays a trend chart showing assist consumption over time for the selected period. Each filled area in the chart represents an asset type: Skills, Agents, Agentic Workflows, or Others. The Others series represents assists not attributed to the other asset types. Select Day or Week to set the granularity of the chart, and select a series in the legend to show or hide it.

Top assets by assist usage

This area of the page displays a table ranking AI assets by assist consumption in descending order for the selected period.

Asset name

The name of the skill, agent, or agentic workflow.

Type

The asset type, displayed as a color-coded badge.

Total executions

The total number of executions for the asset in the selected period.

Assists used

The total number of assists consumed by the asset in the selected period.

For agentic workflow rows, select the expand icon next to the asset name to view the individual tools within the workflow and their assist consumption.

Users by Assist Consumption Band

This area of the page displays a chart showing the distribution of users across consumption bands over the trailing 90 days. A consumption band represents a range of assists consumed by a user per month: fewer than 10, 10 to 100, 100 to 1,000, or more than 1,000. Use this chart to identify the concentration of high-consumption users and track how usage patterns shift over time.

Top 10 departments by assist consumption

This area of the page displays a table listing the departments with the highest assist consumption for the selected period, with assists consumed broken down by day.

Department

The name of the department.

Assists

The total number of assists consumed by the department for the selected period.

Avg / day

The average number of assists consumed per day by the department for the selected period.

A column for each day in the selected period shows the number of assists the department consumed on that day. A Total row summarizes the values for all listed departments.

Using other AI applications and features from AI Admin Center

Access other AI applications within AI Admin Center to configure and manage AI capabilities on your instance.

AI Admin Center is a unified administration experience that consolidates the capabilities in various AI applications into a single, guided, conversational environment.

Configure AI settings in AI Admin Center (Next Experience UI)

Use AI Admin Hub configuration features on the AI Admin Hub page in the AI Admin Center workspace.

Before you begin

Important: Lux is the new user experience for AI Admin Center. For more information on the Lux experience, see AI Admin Center user experience (Lux UI).

The Next Experience AI Admin Center workspace is being prepared for deprecation in the November store release and will no longer be supported. For more information on the Next Experience UI, see AI Admin Center workspace (Next Experience UI).

In AI Admin Center version 6.1, the Next Experience and Lux user interfaces are both available.

Role required: sn_na_center.nac_admin

About this task

Follow these steps to configure AI settings.

AI Admin Hub features from the Experiences and Settings sections are accessible on the AI Admin Hub page. The features are regrouped in AI Admin Center based on the type of action to perform.

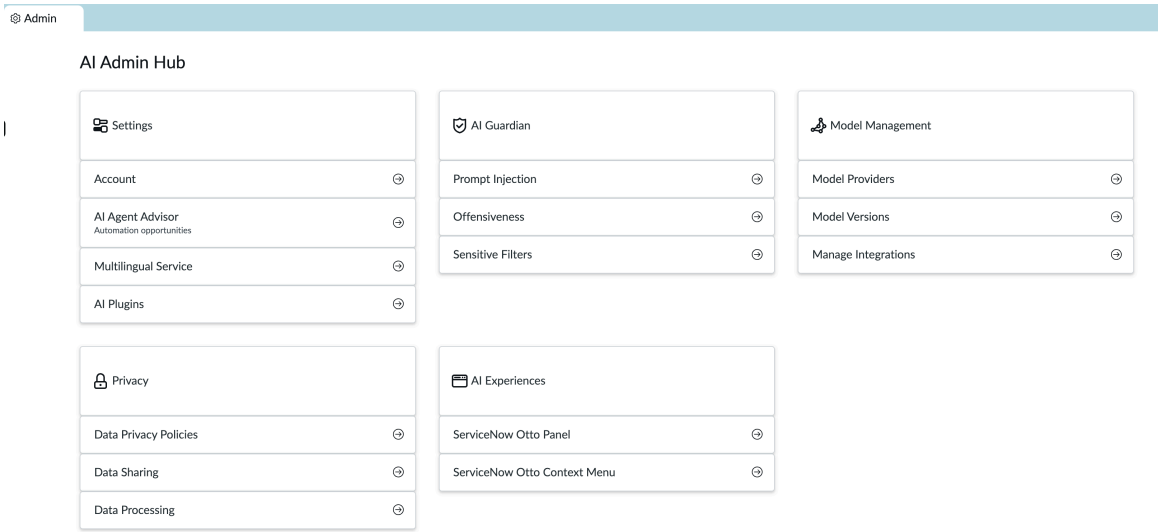
Note: This topic describes the AI Admin Center feature based on the Next Experience UI. If you're using the Lux user experience for AI Admin Center, see the Lux UI version of this topic.

Procedure

1. Navigate to **All** > **AI Admin Center** > **AI Admin Center (Legacy)**.
2. Select **Admin** ( ) in the side navigation bar.

   The AI Admin Hub page opens.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. Select one of the options to on the AI Admin Hub page.

   The selection opens in a new tab in the AI Admin Center workspace.

   The following table lists the options on the AI Admin Hub page.

AI Admin Hub options

Option	Description
Account	Opens the Account page from AI Admin Hub. Review your ServiceNow AI license details to make sure that you're up to date on what's available to you. For more information, see Review Now Assist account.
Automation opportunities	Opens the Automation opportunities settings page. Configure the data source, filters, schedule, and cost profile that AI Agent Advisor uses to identify automation opportunities and provide savings estimates for them. For more information, see Set up a data source for analysis (Next Experience UI).
Multilingual Service	Opens the Multilingual Service page from AI Admin Hub. Turn on multilingual service for user-entered text with native translation or Dynamic Translation in AI applications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	For more information, see Configure multilingual service for ServiceNow Otto applications.
AI Plugins	Opens the Plugins page from AI Admin Hub. Install AI plugins to enable generative AI on your instance. For more information, see Install plugins for ServiceNow Otto.
Prompt Injection	Opens the Prompt Injection page from AI Admin Hub. Activate or deactivate prompt injection attack detection to protect all generative AI applications and AI-generated text and conversations on your instance from malicious inputs and unintended model behaviors. For more information, see Configure prompt injection attack protection.
Offensiveness	Opens the Offensiveness page from AI Admin Hub. Activate offensiveness detection to log or block offensive content generated by AI skills and workflows. For more information, see Activate offensiveness protection for generative AI.
Sensitive Filters	Opens the Filters page from AI Admin Hub. Set up filters in AI Guardian to redirect Virtual Agent users to a live agent or HR case when a sensitive subject is detected in a conversation. For more information, see Configure sensitive topic filters.
Model Providers	Opens the Manage model providers page from AI Admin Hub. Edit or customize the model provider for a skill or skill group at the instance level from the list of supported third-party model providers. You can also review the model

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	policy set by your organization and view the change history. For more information, see Manage model providers.
Model Versions	Opens the Manage model versions page from AI Admin Hub. Manage the version of the model providers across skills and instance levels. You can change and update versions for the base system and custom skills. For more information, see Manage version.
Manage Integrations	Opens the Manage Integration tab on the Manage model providers page from AI Admin Hub. Choose the preferred integration type for configuring the available model providers. There are two ways to configure a model provider in AI Admin Hub. You can select Original Equipment Manufacturer (OEM) or Bring Your Own Key (BYOK). For more information, see Manage Integration.
Data Privacy Policies	Opens the Privacy policies page from AI Admin Hub. Configure privacy policies to anonymize data in AI applications. For more information, see Configure Now Assist privacy policies.
Data Sharing	Opens the Data sharing page from AI Admin Hub. Data sharing improves ServiceNow AI products. You can opt out of data sharing from this page. For more information, see Opt out of data sharing for Now Assist.
Data Processing	Opens the Data overflow processing page from AI Admin Hub.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	Configure where AI data is processed during periods of high traffic. For more information, see Configure Now Assist data overflow processing.
ServiceNow Otto Panel	Opens the ServiceNow Otto Panel page from AI Admin Hub. With the ServiceNow Otto panel, you can get assistance from generative AI experiences to solve customer issues faster. Use this conversational interface to summarize a chat, case, or incident, get help, or generate resolution notes so that you can get the context of this information more quickly. For more information, see ServiceNow Otto panel.
ServiceNow Otto Context Menu	Opens the ServiceNow Otto Context Menu page from AI Admin Hub. The ServiceNow Otto context menu uses generative AI to help agents summarize, create, and edit written content, thus streamlining their writing tasks. For more information, see ServiceNow Otto context menu.

Configure AI settings in AI Admin Center (Lux UI)

Use AI admin features on the Settings page in AI Admin Center to configure AI settings.

Important: Lux is the new user experience for AI Admin Center. For more information on the Lux experience, see AI Admin Center user experience (Lux UI).

The Next Experience AI Admin Center workspace is being prepared for deprecation in the November store release and will no longer be supported. For more information on the Next Experience UI, see AI Admin Center workspace (Next Experience UI).

In AI Admin Center version 6.1, the Next Experience and Lux user interfaces are both available.

Before you begin

Role required: sn_na_center.nac_admin

About this task

Follow these steps to configure AI settings.

AI Admin Hub experiences and settings features are accessible on the Settings page. The features are grouped in AI Admin Center based on the type of action to perform.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

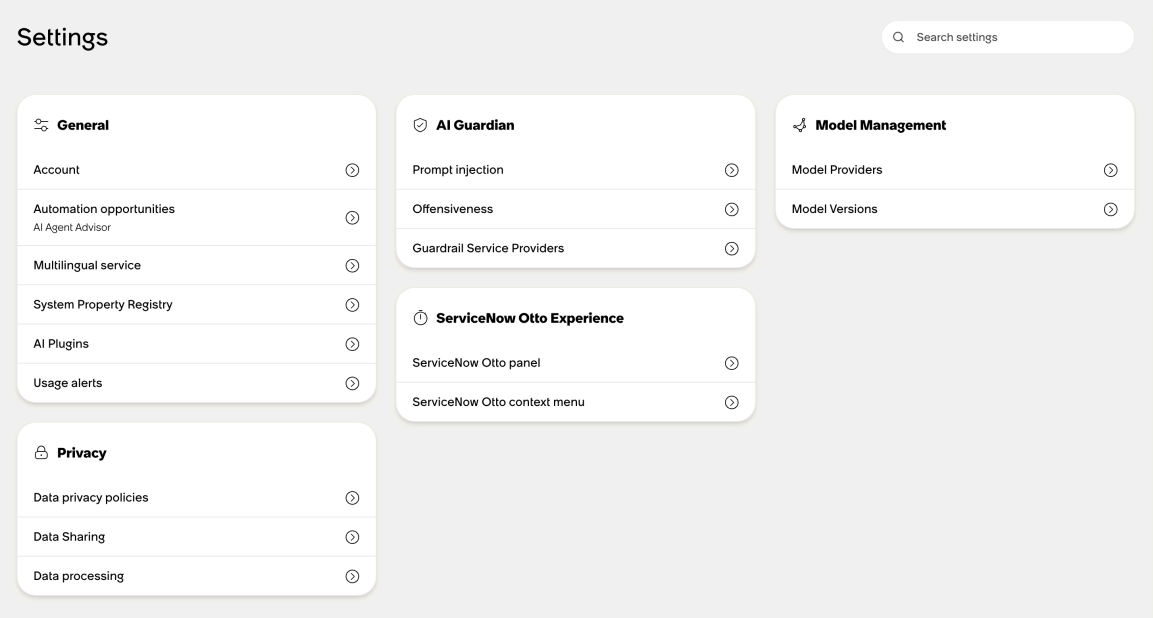
Note: This topic describes the AI Admin Center feature based on the Lux user interface (UI). If you're using the Next Experience UI for AI Admin Center, see the Next Experience UI version of this topic.

Procedure

1. Navigate to **All** > **AI Admin Center** > **Home** or **Admin** > **AI Admin Center**.
2. Select **Settings** ( ) in the side navigation panel.

   The Settings page opens.

Settings page



3. Select a settings option.

   The following table lists the options on the Settings page.

Settings

Option	Description
Account	Opens the Account page from AI Admin Hub. Review your ServiceNow AI license details to make sure that you're up to date on what's available to you. For more information, see Review Now Assist account.
Automation opportunities	Opens the Automation opportunities settings page. Configure the data source, filters, schedule, and cost profile that AI Agent Advisor uses to identify automation opportunities and provide savings estimates for them. For more information, see Set up a data source for analysis (Lux UI).

Option	Description
Multilingual service	Opens the Multilingual Service page from AI Admin Hub. Turn on multilingual service for user-entered text with native translation or Dynamic Translation in AI applications. For more information, see Configure multilingual service for ServiceNow Otto applications.
System Property Registry	Opens the System property registry page. View and edit the system properties for the AI applications in your instance. For more information, see Manage system properties for AI applications in AI Admin Center (Lux UI).
AI Plugins	Opens the Plugins page from AI Admin Hub. Install AI plugins to enable generative AI on your instance. For more information, see Install plugins for ServiceNow Otto.
Usage alerts	Opens the Usage alerts page from AI Admin Hub. Create alert rules to track the usage of generative AI skills and notify you in the instance and by email when the set thresholds are reached.
Prompt Injection	Opens the Prompt Injection page from AI Admin Hub. Activate or deactivate prompt injection attack detection to protect all generative AI applications and AI-generated text and conversations on your instance from malicious inputs and unintended model behaviors. For more information, see Configure prompt injection attack protection.
Offensiveness	Opens the Offensiveness page from AI Admin Hub. Activate offensiveness detection to log or block offensive content generated by AI skills and workflows. For more information, see Activate offensiveness protection for generative AI.
Guardrail Service Providers	Opens the Guardrail service providers page from AI Admin Hub. Choose the default service provider for AI Guardian. This provider is used by Offensiveness and Prompt Injection.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	For more information, see Configuring a Guardrail Service Provider.
Model Providers	Opens the Manage model providers page from AI Admin Hub. Edit or customize the model provider for a skill or skill group at the instance level from the list of supported third-party model providers. You can also review the model policy set by your organization and view the change history. For more information, see Manage model providers.
Model Versions	Opens the Manage model versions page from AI Admin Hub. Manage the version of the model providers across skills and instance levels. You can change and update versions for the base system and custom skills. For more information, see Manage version.
Data privacy policies	Opens the Privacy policies page from AI Admin Hub. Configure privacy policies to anonymize data in AI applications. For more information, see Configure Now Assist privacy policies.
Data Sharing	Opens the Data sharing page from AI Admin Hub. Data sharing improves ServiceNow AI products. You can opt out of data sharing from this page. For more information, see Opt out of data sharing for Now Assist.
Data processing	Opens the Data overflow processing page from AI Admin Hub. Configure where AI data is processed during periods of high traffic. For more information, see Configure Now Assist data overflow processing.
ServiceNow Otto panel	Opens the ServiceNow Otto Panel page from AI Admin Hub. With the ServiceNow Otto panel, you can get assistance from generative AI experiences to solve customer issues faster. Use this conversational interface to summarize a chat, case, or incident, get help, or generate resolution notes so that you can get the context of this information more quickly. For more information, see ServiceNow Otto panel.
ServiceNow Otto context menu	Opens the ServiceNow Otto Context Menu page from AI Admin Hub.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	The ServiceNow Otto context menu uses generative AI to help agents summarize, create, and edit written content, thus streamlining their writing tasks. For more information, see ServiceNow Otto context menu.

Use AI Data Kit features in AI Admin Center (Next Experience UI)

Use AI Data Kit on the data page in the AI Admin Center workspace.

Important: Lux is the new user experience for AI Admin Center. For more information on the Lux experience, see AI Admin Center user experience (Lux UI).

The Next Experience AI Admin Center workspace is being prepared for deprecation in the November store release and will no longer be supported. For more information on the Next Experience UI, see AI Admin Center workspace (Next Experience UI).

In AI Admin Center version 6.1, the Next Experience and Lux user interfaces are both available.

Before you begin

The following applications must be installed before performing this task:

- AI Admin Center.

  For more information, see Confirm installation of AI Admin Center.

- AI Data Kit.

  For more information, see Install and configure essential AI plugins using AI Admin Center.

Role required: sn_na_center.nac_admin

About this task

Follow these steps to use AI Data Kit capabilities from AI Admin Center.

AI Data Kit enables you to add custom datasets to a data catalog and create collections for use in ServiceNow SDK. The curated data works with ServiceNow SDK to enable the AI skill development and evaluation.

In AI Admin Center, the integration of AI Data Kit includes multi-tabbing support for working with datasets without leaving the application context.

Note: This topic describes the AI Admin Center feature based on the Next Experience user interface (UI). There is no Lux UI version of this topic.

Procedure

1. Navigate to **All** > **AI Admin Center** > **AI Admin Center (Legacy)**.
2. Select **Data** ( ) in the side navigation bar.

   The Data tab opens showing the AI Data Kit home page.
3. Perform any of the tasks you would perform in the AI Data Kit application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Each action you take will open in a new tab in the AI Admin Center workspace.

For more information on AI Data Kit, see AI Data Kit.

Use AI Guardian features in AI Admin Center (Next Experience UI)

Use AI Guardian features in the AI Admin Center workspace to detect offensive content, prompt injection attacks, and sensitive topics in generative AI interactions.

Important: Lux is the new user experience for AI Admin Center. For more information on the Lux experience, see AI Admin Center user experience (Lux UI).

The Next Experience AI Admin Center workspace is being prepared for deprecation in the November store release and will no longer be supported. For more information on the Next Experience UI, see AI Admin Center workspace (Next Experience UI).

In AI Admin Center version 6.1, the Next Experience and Lux user interfaces are both available.

Before you begin

The following applications must be installed before performing this task:

- AI Admin Center

  For more information, see Confirm installation of AI Admin Center.

- AI Admin Hub

  For more information, see Install and configure essential AI plugins using AI Admin Center.

Role required: sn_na_center.nac_admin

About this task

Follow these steps to use AI Guardian capabilities from AI Admin Center.

AI Guardian provides safety and governance controls for AI-generated content. It monitors AI interactions for potentially harmful, offensive, or policy-violating content.

In AI Admin Center, the integration of AI Guardian includes multi-tabbing support for working with safety and governance controls without leaving the application context.

For more information on AI Guardian, see AI Guardian.

Note: This topic describes the AI Admin Center feature based on the Next Experience UI. If you're using the Lux user experience for AI Admin Center, see the Lux UI version of this topic.

Procedure

1. Navigate to **All** > **AI Admin Center** > **AI Admin Center (Legacy)**.
2. Select **Admin** ( ) in the side navigation bar.

   The Admin tab opens showing AI Admin Hub options.
3. Select one of the options under **AI Guardian** to configure.

   AI Guardian provides three guardrails. Each guardrail has a different scope.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Guardrail	Description
Prompt injection detection	This guardrail attempts to override LLM in structions or expose restricted information. It applies to all generative AI applications and features. Select **Prompt injection** to open the Prompt injection tab. For more information on how to configure this guardrail, see Configure prompt injection at tack protection.
Offensiveness detection	This guardrail detects offensive or harmful content in AI inputs and outputs. It applies to specific generative AI skills and workflows. Select **Offensiveness** to open the Offensive ness tab. For more information on how to configure this guardrail, see Activate offensiveness protec tion for generative AI.
Sensitive topic filters	This guardrail filters subjects not suited for AI responses, such as workplace safety or employee compensation. It applies to Virtual Agent conversational skills only (available for HR Service Delivery and Customer Service Management). Select **Sensitive Filters** to open the Filters tab. For more information on how to configure this guardrail, see Configure sensitive topic filters.

Set up AI guardrails in AI Admin Center (Lux UI)

Use AI guardrails to detect offensive content, prompt injection attacks, and sensitive topics in generative AI interactions.

Important: Lux is the new user experience for AI Admin Center. For more information on the Lux experience, see AI Admin Center user experience (Lux UI).

The Next Experience AI Admin Center workspace is being prepared for deprecation in the November store release and will no longer be supported. For more information on the Next Experience UI, see AI Admin Center workspace (Next Experience UI).

In AI Admin Center version 6.1, the Next Experience and Lux user interfaces are both available.

Before you begin

Role required: sn_na_center.nac_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Follow these steps to set up AI guardrails in AI Admin Center.

AI guardrails provide safety and governance controls for AI-generated content. They monitor AI interactions for potentially harmful, offensive, or policy-violating content.

For more information on AI Guardian, see AI Guardian.

Note: This topic describes the AI Admin Center feature based on the Lux user interface (UI). If you're using the Next Experience UI for AI Admin Center, see the Next Experience UI version of this topic.

Procedure

1. Navigate to **All** > **AI Admin Center** > **Home** or **Admin** > **AI Admin Center**.
2. Select **Settings** ( ) in the side navigation panel.
   The Settings page opens.
3. Select one of the options under **AI Guardian** to configure.

   AI Guardian provides three guardrails. Each guardrail has a different scope.

Guardrail	Description
Prompt injection detection	This guardrail detects attempts to override LLM instructions or ex pose restricted information. It applies to all generative AI applications and features. Select **Prompt injection** to open the Prompt injection page. For more information on how to configure this guardrail, see Configure prompt injection attack protection.
Offensiveness detection	This guardrail detects offensive or harmful content in AI inputs and outputs. It applies to specific generative AI skills and workflows. Select **Offensiveness** to open the Offensiveness page. For more information on how to configure this guardrail, see Activate offensiveness protection for generative AI.
Sensitive topic filters	This guardrail filters subjects not suited for AI responses, such as workplace safety or employee compensation. It applies to Virtual Agent conversational skills only (available for HR Service Delivery and Customer Service Management). Select **Sensitive Filters** to open the Filters page. For more information on how to configure this guardrail, see Configure sensitive topic filters.

Manage system properties for AI applications in AI Admin Center (Lux UI)

Use the system property registry to view and edit the system properties for the AI applications in your instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important: Lux is the new user experience for AI Admin Center. For more information on the Lux experience, see AI Admin Center user experience (Lux UI).

The Next Experience AI Admin Center workspace is being prepared for deprecation in the November store release and will no longer be supported. For more information on the Next Experience UI, see AI Admin Center workspace (Next Experience UI).

In AI Admin Center version 6.1, the Next Experience and Lux user interfaces are both available.

Before you begin

Role required: sn_na_center.nac_admin

An elevated role may be required to perform some of the actions in this task. You must also have the role for the capability that the system property belongs to.

About this task

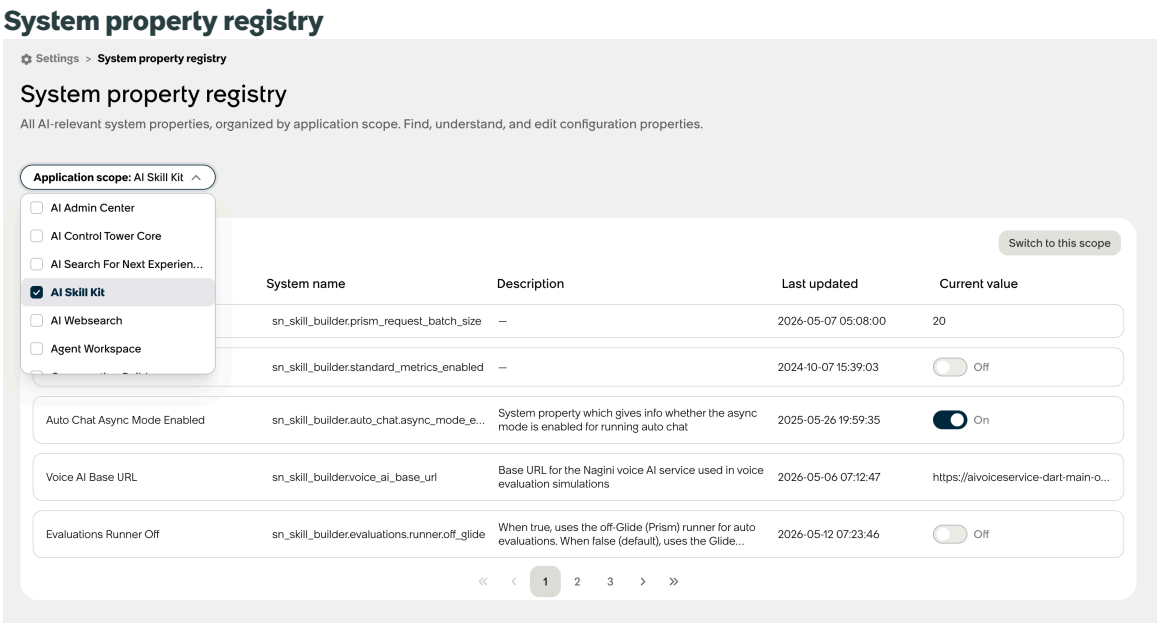
Follow these steps to view and edit the system properties for the AI applications in your instance.

For more information on system properties, see Available system properties.

Note: This topic describes the AI Admin Center feature based on the Lux user experience (UI). There is no Next Experience UI version of this topic.

Procedure

1. Navigate to **All** > **AI Admin Center** > **Home** or **Admin** > **AI Admin Center**.
2. Select **Settings** ( ) in the side navigation panel.
   The Settings page opens.
3. Select **System Property Registry** under the **General** heading.
   The System Property Registry page opens showing a list of all AI-related system properties grouped by application scope.



4. **Optional:** Select one or more options from the **Application scope** filter to refine the list.
5. **Optional:** Edit the system properties as needed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Go to the selected application scope.

(Optional) Editing is enabled only for the selected application scope. Select **Switch to this scope** to enable editing for properties in a different scope.

The scope panel displays **Editing enabled**.

b. Select the system property to edit.
The system property panel opens showing the property details.

c. Edit the value in the configuration box based on the value type.

- Type a new value within the stated restrictions.
- Toggle the **On-Off** option to a different value.

d. Select **Save changes**.

AI Agent Advisor

The AI Agent Advisor automatically discovers automation opportunities in your instance based on actual operational data and helps you to deploy AI agents to implement them.

Get started

Explore Learn about AI Agent Advisor concepts and features.	**Configure** Set up AI Agent Advisor to get started.
Use Use AI Agent Advisor to discover and implement AI automations.	**Reference** Get details about AI Agent Advisor properties and components.

Note: Depending on your license, you will have access to certain application features, generative AI skills, agentic workflows, and AI agents. For more information, see ServiceNow product tiers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:

- Not all model providers are available for customers with in-country SKUs, and some AI products/features are currently unavailable for in-country customers. For more information, see the KB1584492 article in the Now Support Knowledge Base. Be sure to check for model provider availability updates in future releases.
- Some AI products/features are currently unavailable for customers in the FedRAMP, NSC DOD IL5, or Australia IRAP-Protected data centers, self-hosted customers, or in other restricted environments. For more information, see the KB0743854 article in the Now Support Knowledge Base. Be sure to check for availability updates in future releases.
- Some AI products/features are currently available only for customers in some regions. Be sure to check for availability updates in future releases.
- Some AI products and skills are not available in Regulated Markets. For more information, see KB2593939: Regulated Markets AI Products/Skills Not Available. Be sure to check for availability updates in future releases.

Troubleshoot and get help

- Additional resources for AI products and solutions.
- ServiceNow Community on AI and Intelligence.
- Access real-time courses, self-paced training, and career resources at ServiceNow University.
- Search the Known Error Portal for known error articles.
- Contact Customer Service and Support.

AI limitations

This application uses artificial intelligence (AI) and machine learning, which are rapidly evolving fields of study that generate predictions based on patterns in data. As a result, this application may not always produce accurate, complete, or appropriate information. Furthermore, there is no guarantee that this application has been fully trained or tested for your use case. To mitigate these issues, it is your responsibility to test and evaluate your use of this application for accuracy, harm, and appropriateness for your use case, employ human oversight of output, and refrain from relying solely on AI-generated outputs for decision-making purposes. This is especially important if you choose to deploy this application in areas with consequential impacts such as healthcare, finance, legal, employment, security, or infrastructure. You agree to abide by ServiceNow's AI Acceptable Use Policy, which may be updated by ServiceNow.

Data processing

This application requires data to be transferred from ServiceNow customers' individual instances to a centralized ServiceNow environment, which may be located in a different data center region from the one where your instance is, and potentially to a third-party cloud provider, such as Microsoft Azure. This data is handled per ServiceNow's internal policies and procedures, including our policies available through our CORE Compliance Portal.

Data collection

ServiceNow collects and uses the inputs, outputs, and edits to outputs of this application to develop and improve ServiceNow technologies including ServiceNow models and AI products. In addition, this application will collect information extracted from documents. Customers can opt out of future data collection at any time, as described in the Now Assist Opt-Out page.

For more information, see the Now Assist documentation.

Exploring AI Agent Advisor

AI Agent Advisor automatically discovers automation opportunities in your instance and helps you to deploy AI agents to implement them.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Agent Advisor overview

AI Agent Advisor analyzes your instance data to identify the most frequent and impactful opportunities for efficiency gains in your workflows. For each identified opportunity, it proposes AI agents that can automate the solution, and generates new agents when no existing match is available.

This gives the AI administrator a data-driven starting point for AI adoption, eliminating the guesswork of deciding where to apply automation.

AI Agent Advisor users

The following table lists the primary users of AI Agent Advisor.

Users

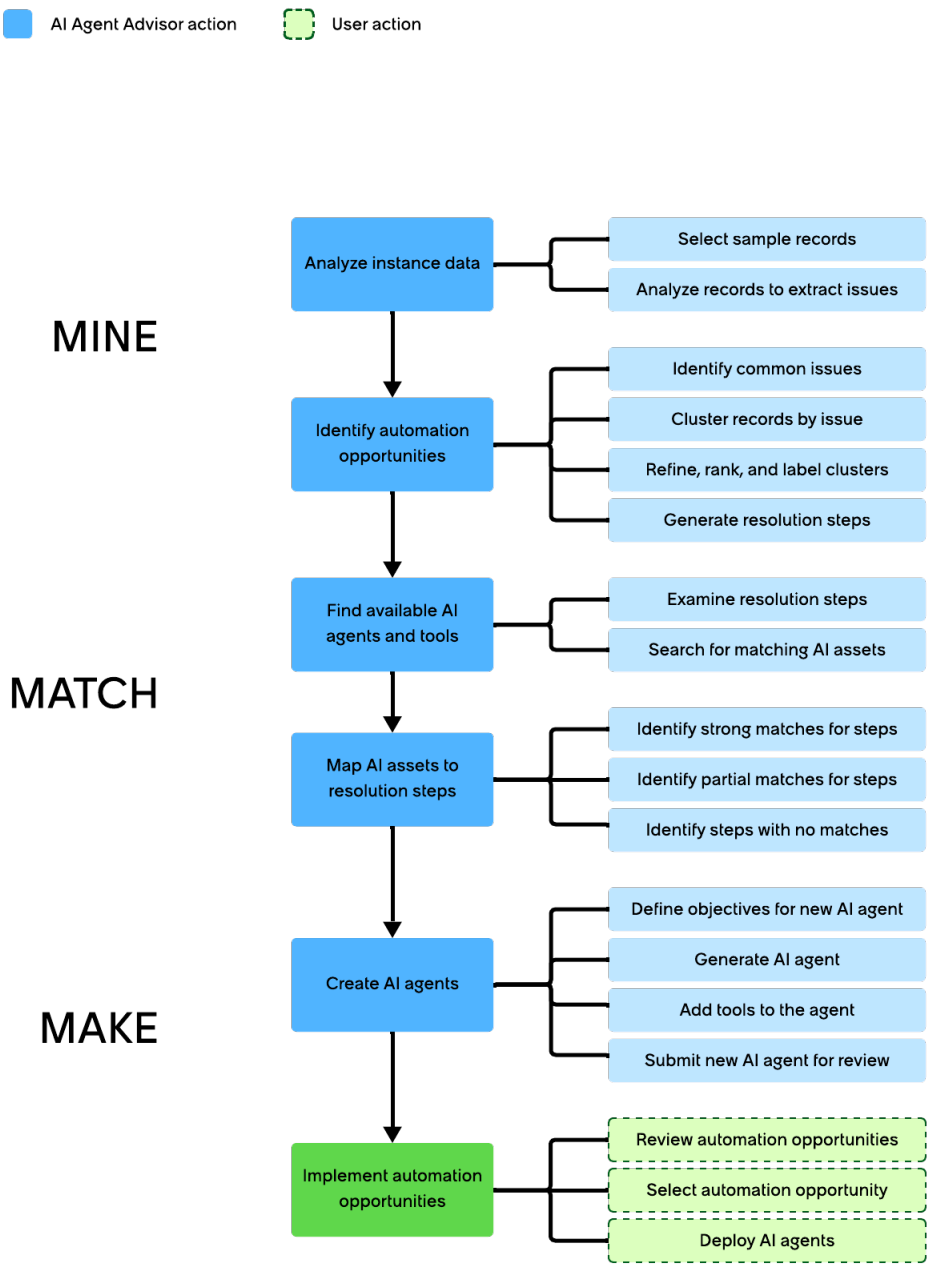
User	Description
AI Administrators	AI administrators responsible for organization-wide AI deployment and management
Platform administrators	Platform administrators overseeing enterprise AI governance
AI builders and practitioners	AI practitioners building and deploying custom AI solutions across ServiceNow workflows

AI Agent Advisor workflow

The following diagram shows the AI Agent Advisor workflow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Agent Advisor workflow



AI Agent Advisor operates through three sequential phases:

Mine

The system analyzes the records in your instance (for example, incident and case records) on a scheduled basis to identify recurring problems that are candidates for automation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can configure the data sources, filters, and schedule to target the most relevant records for your organization.

Match

For each identified opportunity, the system maps the resolution steps to existing AI agents, tools, and agentic workflows already available on your platform.

Make

When no existing agent is a strong match for a resolution step, the system generates a new AI agent tailored to that specific problem.

The result is a prioritized list of automation opportunities. Each opportunity displays the estimated time and cost savings, number of records analyzed, and available AI assets. AI Agent Advisor generates the resolution steps using the data from existing records on your instance. You can use this list to decide which opportunities to act on first.

AI Agent Advisor benefits

AI Agent Advisor provides the following benefits.

Benefits of AI Agent Advisor

Benefit	Feature	User
Quickly discover automation opportunities for your instance. AI Agent Advisor analyzes actual instance data to identify and propose AI automations that provide the greatest efficiency gains.	Automation discovery with AI Agent Advisor	AI administrator
Matches identified automation opportunities to existing AI agents on the platform and supports automated creation and deployment of new agents, shortening the path from insight to action.	AI agent matching and automated deployment	AI administrator AI developer

What to explore next

- AI Agent Advisor reference

Supporting information for AI Agent Advisor

Get a quick overview of the important information that is related to the AI Agent Advisor application.

Supported versions

AI Agent Advisor v1.0 is supported starting with Australia general availability (Patch 2) and Zurich (Patch 9).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported user interfaces

The AI Agent Advisor application is supported in the Next Experience workspace and the Lux experience user interfaces of AI Admin Center.

AI Admin Center provides features that enable you to set up of your AI solutions in a unified experience without switching between separate AI applications.

Important: Lux is the new user experience for AI Admin Center. For more information on the Lux experience, see AI Admin Center user experience (Lux UI).

The Next Experience AI Admin Center workspace is being prepared for deprecation in the November store release and will no longer be supported. For more information on the Next Experience UI, see AI Admin Center workspace (Next Experience UI).

In AI Admin Center version 6.1, the Next Experience and Lux user interfaces are both available.

Licensing requirements

Note: Depending on your license, you will have access to certain application features, generative AI skills, agentic workflows, and AI agents. For more information, see ServiceNow product tiers.

Application information

AI Agent Advisor (sn_agent_miner) is available as a plugin from the ServiceNow Store.

This store app has the following dependencies.

Required applications

Plugin name	Plugin ID	Version	Type
AI Agent Advisor	sn_agent_miner	0.2.1	App
Insights Clustering Utils	sn_icu	2.0.2	App
Group-Action Framework	sn_gaf	6.0.5	App
AI Search			
AI Admin Hub	sn_nowassist_admin	8.0.7	App
Now Assist Troubleshooting	sn_nowassist_diagn	4.0.2	App
Admin Experience Framework	sn_ace	5.2.0	App
Platform AI Agents and Skills	sn_uxc_gen_ai	12.0.12	App
Generative AI Controller	sn_generative_ai	13.0.3	App
Predictive Intelligence		Platform version	Plugin

>
> In AI Admin Center version 6.1, the Next Experience and Lux user interfaces are both available.

Before you begin

All required plugins must be installed before attempting to run AI Agent Advisor. For a list of dependencies, see Supporting information for AI Agent Advisor.

Role required: AI Agent Advisor admin [sn_agent_miner.app_admin]

About this task

AI Agent Advisor installs and runs automatically as part of the standard ServiceNow Otto setup. No manual steps are required. After ServiceNow Otto is installed and configured, AI Agent Advisor will be present on your instance and will begin analysis automatically.

Follow these steps to confirm the installation of the AI Agent Advisor plugin.

Procedure

1. Confirm the AI Agent Advisor plugin is installed by navigating to **System Definition** > **Plugins** and selecting the **Installed** tab.
2. **Optional:** If the AI Agent Advisor plugin is not installed, perform the following steps to manually install it.
   a. Navigate to **System Definition** > **Plugins**.
   b. In the search box, type `AI Agent Advisor`.
   c. In the Store applications section under the Available for you tab, select the **AI Agent Advisor** card.
   d. Select **Install**.
   e. Select a version from the list.
   f. Select an installation schedule option.
   g. Select **Install**.
   The AI Agent Advisor application will install at the selected time.
3. Navigate to **All** > **AI Admin Center** > **Home** or **Admin** > **AI Admin Center** to confirm the successful installation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The AI Admin Center home page opens.

Confirm the following:

- Automation opportunities appear on the AI Admin Center home page.
- All AI Agent Advisor dependencies are installed.

  Navigate to **System Definition** > **Plugins** and select the **Installed** tab to confirm all required plugins are installed.

- Scheduled jobs are installed.

  Navigate to **System Definition** > **Scheduled Jobs** to confirm that the Agent Miner jobs for incidents, cases, and cluster matching are included in the list.

Result
The AI Agent Advisor application is installed and available to the appropriate user roles.

Setting up automation opportunity discovery in AI Admin Center

Configure the data sources, filters, and schedule that AI Agent Advisor uses to analyze your instance and identify automation opportunities.

AI Agent Advisor runs a scheduled analysis of your instance records to discover automation opportunities. Follow these steps to specify which base system or custom data sources to include, apply filters to focus the analysis, and set the frequency and timing of the analysis.

Set up a data source for analysis (Next Experience UI)

Create and activate a scheduled analysis of your instance records to discover automation opportunities.

Important: Lux is the new user experience for AI Admin Center. For more information on the Lux experience, see AI Admin Center user experience (Lux UI).

The Next Experience AI Admin Center workspace is being prepared for deprecation in the November store release and will no longer be supported. For more information on the Next Experience UI, see AI Admin Center workspace (Next Experience UI).

In AI Admin Center version 6.1, the Next Experience and Lux user interfaces are both available.

Before you begin
You must have access to an ACL-protected table to run the analysis for it.

For AI Agent Advisor to configure a successful analysis, the data source must contain a minimum of 500 records.

Role required: sn_na_center.nac_admin

About this task
Follow these steps to configure the data source, filters, schedule, and cost profile that AI Agent Advisor uses to identify the automation opportunities and provide savings estimates for them.

In the event an error occurs when performing these steps, see the troubleshooting steps described in KB article KB2931703 on Now Support.

Note: This topic describes the AI Admin Center feature based on the Next Experience UI. If you're using the Lux user experience for AI Admin Center, see the Lux UI version of this topic.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **AI Admin Center** > **AI Admin Center (Legacy)**.

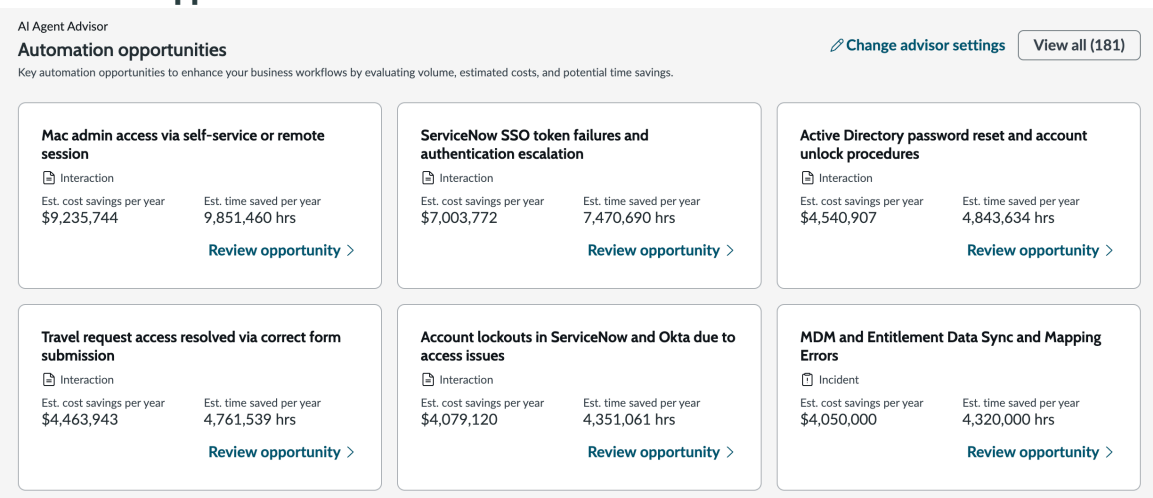
   The home page opens.

   The automation opportunities section displays only a **Review configurations** button If no opportunities are identified or if opportunity discovery is not yet set up.

   Empty automation opportunities section

   
   The automation opportunities section displays the top automation opportunities in separate cards if discovery is set up and opportunities are identified. The section also displays a **Change advisor settings** link to edit the discovery data sources.

   Automation opportunities section

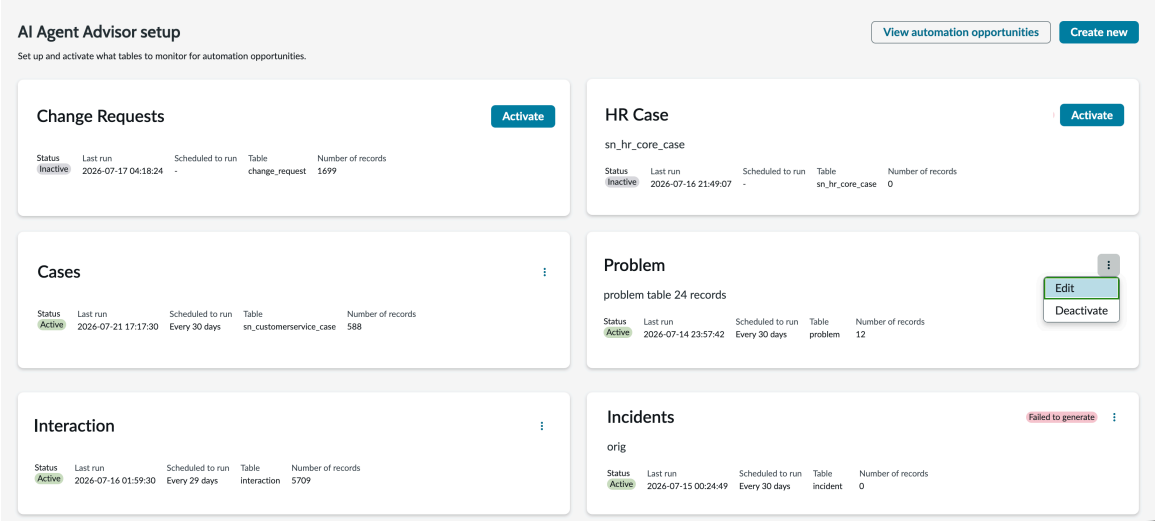
2. Select **Review configurations** or **Change advisor** settings to open the AI Agent Advisor setup page.

   You can also select **Admin** ( ) in the side navigation bar and select **AI Agent Advisor** under **Settings** on the AI Admin Hub page.

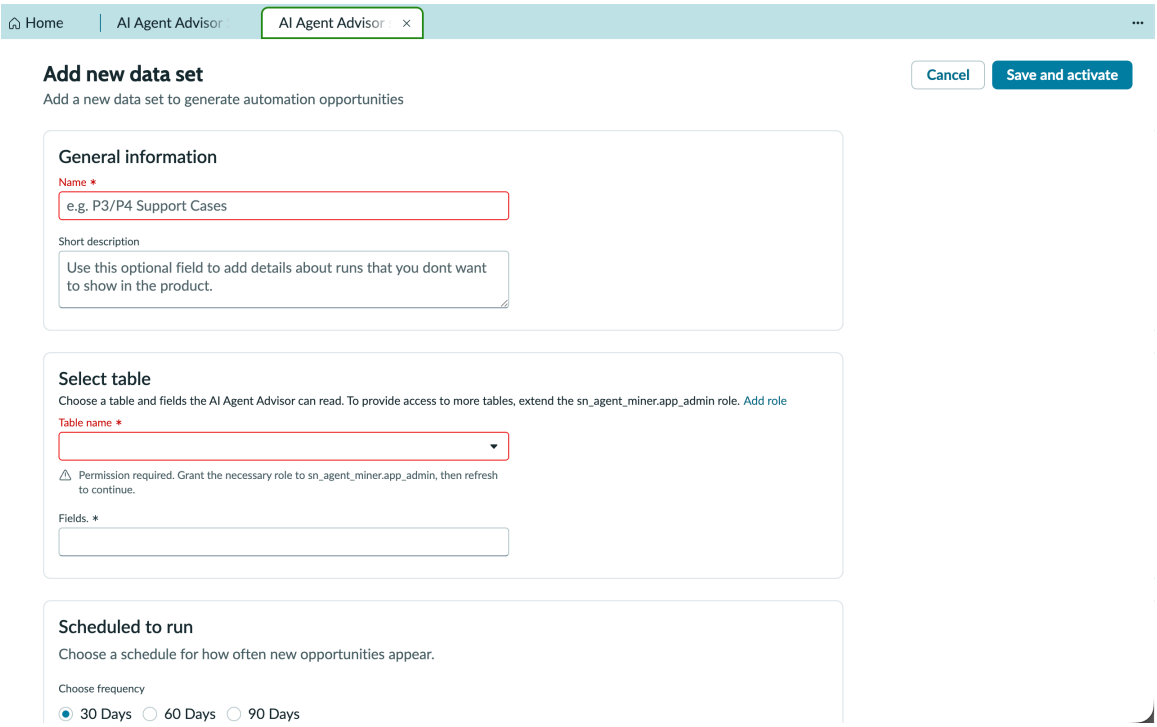
   The AI Agent Advisor setup page opens.

   If there are any data sources set up, a separate card displays for each data source.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. Select **Create new**.
   The Add new data set page opens.



4. Complete the **General information** section.
   a. Enter a name for the analysis configuration in the **Name** field.
   b. Enter a description in the **Short description** field.
5. Choose the data source in the **Select table** section.
   a. Select **Add role** if permission is required for AI Agent Advisor to access the table; then add the required role to the sn_agent_miner.app_admin role and return to the Add new data set page.

      For more information, see Add a role to an existing role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. Select a table from the **Table name** menu.

c. Select one or more fields from the **Fields** menu.

6. Select the frequency of the analysis schedule in the **Scheduled to run** section.
   - Select the 30, 60, or 90 day option.
   - Toggle the **On-Off** option to `Off` to stop AI Agent Advisor from running the recurring analysis and identifying opportunities.

     If the scheduled run is turned off, new opportunities for the data source won't appear until a new run is scheduled or triggered manually.

7. Apply filters to refine the scope of the analysis.

   a. Use conditions to select certain properties as a filter.

   For more information on how conditions work, see OR conditions.

   Note: A filter for the **Created** field is required.

   b. Select **Add condition set** to add conditions.

8. Create a cost profile to calculate the estimated time and cost savings from using the automation.

   a. Enter the hourly labor cost.

   b. Enter the active handling time rate.

   The percentage of a record's total open time that represents actual hands-on effort by a human agent.

9. Select **Save and activate**.

Result

AI Agent Advisor runs the analysis according to the configured filters and schedule. After the analysis completes, automation opportunities appear on the AI Admin Center home page and on the Automation opportunities page.

What to do next

View your automation opportunities on the home page. For more information, see View your automation opportunities (Next Experience UI).

Set up a data source for analysis (Lux UI)

Create and activate a scheduled analysis of your instance records to discover automation opportunities.

7. Apply filters to refine the scope of the analysis.

   a. Use conditions to select certain properties as a filter.

      For more information on how conditions work, see OR conditions.

      Note: A filter for the **Created** field is required.

   b. Select **Add group** to add more conditions.

8. Create a cost profile to calculate the estimated time and cost savings from using the automation.

   a. Enter the hourly labor cost.

   b. Enter the active handling time rate.

      The percentage of a record's total open time that represents actual hands-on effort by a human agent.

9. Select **Save and activate**.

Result
AI Agent Advisor runs the analysis according to the configured filters and schedule. After the analysis completes, automation opportunities appear on the AI Admin Center home page and on the Automation opportunities page.

What to do next
View your automation opportunities. For more information, see View your automation opportunities (Lux UI).

Edit an analysis data source

Edit a scheduled analysis of your instance records.

Important: Lux is the new user experience for AI Admin Center. For more information on the Lux experience, see AI Admin Center user experience (Lux UI).

The Next Experience AI Admin Center workspace is being prepared for deprecation in the November store release and will no longer be supported. For more information on the Next Experience UI, see AI Admin Center workspace (Next Experience UI).

In AI Admin Center version 6.1, the Next Experience and Lux user interfaces are both available.

Before you begin
You must have access to an ACL-protected table to configure the analysis for it.

For AI Agent Advisor to run a successful analysis, the data source must contain a minimum of 500 records.

Role required: sn_na_center.nac_admin

About this task
Follow these steps to change the configuration of the data source, filters, schedule, and cost profile that AI Agent Advisor uses to identify the automation opportunities.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can only edit an active analysis data source. To edit a deactivated analysis data source, you must first reactivate it. For more information, see Activate a deactivated analysis data source.

In the event an error occurs when performing these steps, see the troubleshooting steps described in KB article KB2931703 on Now Support.

Procedure

1. Navigate to **All** > **AI Admin Center** > **AI Admin Center (Legacy)** for the legacy AI Admin Center workspace.

   Navigate to **All** > **AI Admin Center** > **Home** or **Admin** > **AI Admin Center** for the Lux UI experience.

   The home page opens.

2. Select **Admin** ( ) in the side navigation bar in the legacy AI Admin Center workspace.

   Select **Settings** ( ) in the side navigation panel in the Lux UI experience.

3. Select **Automation opportunities** under **General** or **AI Agent Advisor** under **Settings**.

   The AI Agent Advisor setup page opens showing a separate card for each data source configuration.

4. Select **More options** ( ) on the data source analysis you want to edit.
5. Select **Edit**.
   The AI Agent Advisor setup page opens showing the configuration details.
6. Review the completed fields and edit as needed.
7. Select **Save**.
8. **Optional:** Select **Execute now** to run the analysis.

Result

AI Agent Advisor runs the analysis according to the configured filters and schedule. After the analysis completes, automation opportunities appear on the AI Admin Center home page and on the Automation opportunities page.

What to do next

View your automation opportunities on the home page. For more information, see View your automation opportunities (Next Experience UI).

Deactivate an analysis data source

Deactivate a data source analysis that you no longer want to run for automation opportunity discovery.

Important: Lux is the new user experience for AI Admin Center. For more information on the Lux experience, see AI Admin Center user experience (Lux UI).

The Next Experience AI Admin Center workspace is being prepared for deprecation in the November store release and will no longer be supported. For more information on the Next Experience UI, see AI Admin Center workspace (Next Experience UI).

In AI Admin Center version 6.1, the Next Experience and Lux user interfaces are both available.

Important: Lux is the new user experience for AI Admin Center. For more information on the Lux experience, see AI Admin Center user experience (Lux UI).

The Next Experience AI Admin Center workspace is being prepared for deprecation in the November store release and will no longer be supported. For more information on the Next Experience UI, see AI Admin Center workspace (Next Experience UI).

In AI Admin Center version 6.1, the Next Experience and Lux user interfaces are both available.

Before you begin

Role required: sn_na_center.nac_admin

About this task

Follow these steps to implement an automation opportunity with AI Agent Advisor.

Each automation opportunity includes a set of recommended resolution steps that describe how to automate the identified opportunity. AI Agent Advisor also maps each resolution step to an existing AI agent on your platform when a match is available. Review the details of an opportunity before deciding whether to deploy an agent for it.

Note: This topic describes the AI Admin Center feature based on the Next Experience UI. If you're using the Lux user experience for AI Admin Center, see the Lux UI version of this topic.

Procedure

1. Navigate to **All** > **AI Admin Center** > **AI Admin Center (Legacy)**.
2. In the Automation opportunities section of the home page or in the automation opportunities list tab, select an automation opportunity to view its details.

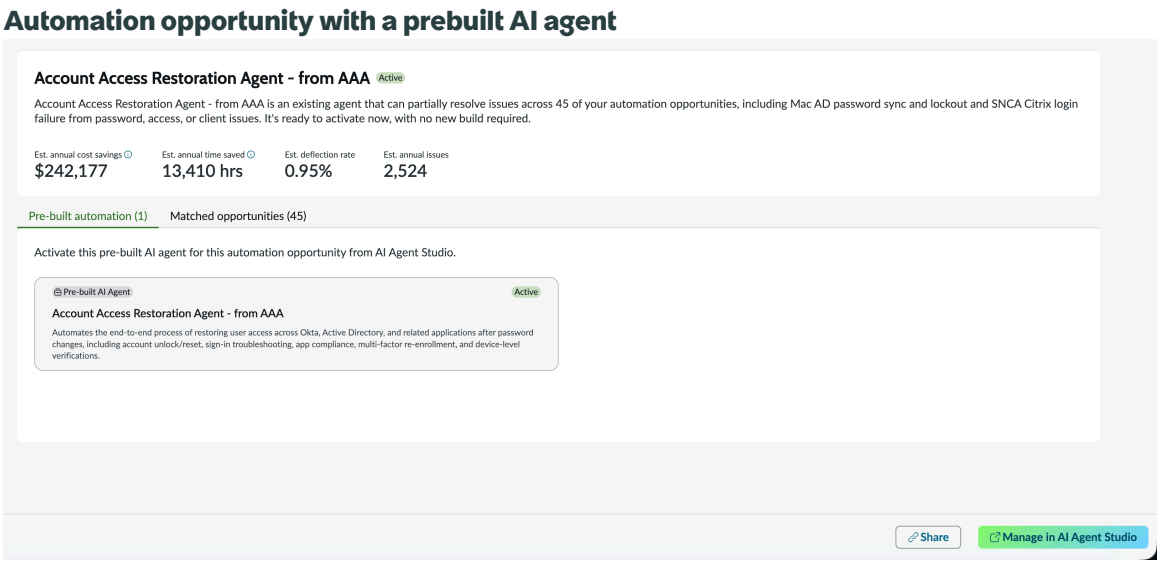
   The Resolution Steps tab opens showing the opportunity details.

   The page displays summary information for the opportunity, a **Resolution steps** tab with editable implementation steps, and an **Example records** tab with example records from the data source. It also displays an **AI Agents** tab showing the agents created from the automation opportunity.

Opportunity details page

   For an opportunity that has a matching prebuilt AI agent, the page displays the agent name and description.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



For more information on finding an automation opportunity, see View your automation opportunities (Next Experience UI).

3. **Optional:** Select the **Example Records** tab to review records from the source table.

   (Optional) Select a record number to open the record and view its details.

4. **Optional:** Select the **AI Agents** tab to view AI agents created from the automation opportunity.
5. Select the **Matched opportunities** tab for a prebuilt AI agent to view the automation opportunities that the AI agent can support.
   Select an opportunity to open it in a separate workspace tab.
6. In the **Resolution Steps** tab, review the steps for accuracy and completeness in planning your AI agent.

   The **Resolution Steps** tab shows the implementation steps and the matched AI agents for each step.

7. **Optional:** Adjust the steps as needed.

Option	Description
Add a step	**a.** Select **Add new step** under the steps. **b.** Enter the text and select **Save**.
Edit a step	**a.** Select the **Edit** icon ( ). **b.** Change the text as needed and select **Save**.
Delete a step	**a.** 1. Select the **Delete** icon ( ). **b.** 2. Select **Delete** to confirm.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
Reorder steps	(Optional) Select the **Up** icon (↑) or **Down** icon (↓) to move the step in the list.
Restore all	(Optional) Select **Revert all** to restore the original steps before changes.
Expand all	(Optional) Select **Expand all** to see the available assets for each step. In each applicable step, the description provides the tool name, context, confidence level, and rationale for matching the asset to the step. Select **Collapse all** to hide the details.

8. When the steps are ready to implement for a custom AI agent, select **Continue in AI Agent Studio**.

   For an opportunity that has a matching prebuilt AI agent, select **Manage in AI Agent Studio**. Skip ahead to step 11.

   The Continue building AI agent box opens.

For more information on finding an automation opportunity, see View your automation opportunities (Lux UI).

3. Select **Manage in AI Agent Studio**.
   The AI agent editing page opens in AI Agent Studio.
4. Edit the AI agent using AI Agent Studio capabilities.

   For more details on the guided setup forms, see Modify an AI agent.

AI Agent Advisor in AI Control Tower

View your top automation opportunities from AI Agent Advisor as actionable recommendations in AI Control Tower.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The integration with AI Control Tower activates automatically on installation of AI Agent Advisor and AI Admin Center. As AI Agent Advisor completes each recurring scheduled analysis of your instance records to discover automation opportunities, the highest-value recommendations display in AI Control Tower.

Select the recommendation to open the Automation details in AI Admin Center, where you can set up and deploy an AI agent to automate the solution.

For more information, see Recommendations and AI insights.

AI Agent Advisor in AI Agent Studio

Use AI Agent Studio to view and edit the prebuilt AI agents matched to each automation opportunity from AI Agent Advisor.

AI Agent Advisor pregenerates an AI agent for each automation opportunity it discovers. The AI agent has a **Pre-built AI Agent** solution type and includes a name, description, resolution steps, recommended tools, recommended skills, example records, and projected savings.

The AI Agent Advisor home page displays the AI agents pregenerated by AI Agent Advisor. As AI Agent Advisor completes each recurring scheduled analysis of your instance records to discover automation opportunities, pregenerated agents are updated to reflect the resolution plan and AI agent matches.

Select the AI agent to open it on the editing page in AI Agent Advisor, where you can refine AI agent as needed to automate the solution. The AI agent status then changes from **Recommended** to **Built** and resides in your agent inventory.

For more information, see AI Agent Studio overview.

AI Agent Advisor reference

The following topics provide additional information about the features and properties installed with AI Agent Advisor.

Components installed with AI Agent Advisor

Several components are installed with the AI Agent Advisor application.

Roles installed

The following roles are installed with AI Agent Advisor.

- AI Agent Advisor admin [sn_agent_miner.app_admin]
- AI Agent Advisor UI [sn_agent_miner.app_ui]
- AI Agent Advisor read only [sn_agent_miner.app_read_only]

For information on the roles installed with AI Agent Advisor, see AI Agent Advisor roles.

Tables installed

The following tables are installed with AI Agent Advisor.

- AI Agent Advisor Agent Match [sn_agent_miner_agent_match]
- AI Agent Advisor Agent Rank [sn_agent_miner_agent_rank]
- AI Agent Advisor Artifact Dataset [sn_agent_miner_artifact_dataset]
- AI Agent Advisor Clusters [sn_agent_miner_clusters]
- AI Agent Advisor Configs [sn_agent_miner_configs]

- AI Agent Advisor Created Automation [sn_agent_miner_created_automation]
- AI Agent Advisor Dataset [sn_agent_miner_dataset]
- AI Agent Advisor Executions [sn_agent_miner_executions]
- AI Agent Advisor Existing Automation [sn_agent_miner_existing_automation]
- AI Agent Advisor Resolution Steps [sn_agent_miner_resolution_steps]
- AI Agent Advisor Scheduled Jobs [sn_agent_miner_sysauto_script]
- AI Agent Advisor Tool Match [sn_agent_miner_tool_match]

Domain separation and AI Agent Advisor

Domain separation is not supported for AI Agent Advisor.

Domain separation allows you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

Support level: No Support

- The domain field may exist on data tables but there is no business logic to manage the data.
- This level is not considered domain-separated.

For more information on support levels, see Application support for domain separation.

AI Agent Advisor roles

AI Agent Advisor is installed with these roles.

AI Agent Advisor admin [sn_agent_miner.app_admin]

This role has full access to the AI Agent Advisor application and can access AI Agent Advisor tables.

Contains Roles

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

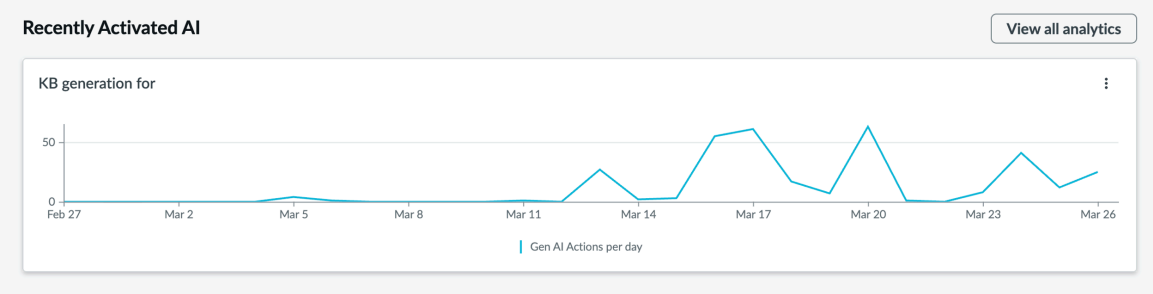
Note: This topic describes the AI Admin Center feature based on the Next Experience user interface (UI). There is no Lux UI version of this topic.

Procedure

1. Navigate to **All** > **AI Admin Center** > **AI Admin Center (Legacy)**.
2. Select **Home** ( ) in the side navigation bar.
3. Review the Recently activated AI section of the home page to see the performance metrics on your most recently activated AI solutions.

Recently activated AI section of the home page



4. Select **View all analytics** to see a complete list of performance metrics on the Analytics tab.

   The Analytics page opens.

   For more information, see View AI assets usage and performance in AI Admin Center (Next Experience UI).

View AI assets usage and performance in AI Admin Center (Next Experience UI)

Use AI Admin Center to view dashboards showing the usage and performance of your AI assets.

Important: Lux is the new user experience for AI Admin Center. For more information on the Lux experience, see AI Admin Center user experience (Lux UI).

The Next Experience AI Admin Center workspace is being prepared for deprecation in the November store release and will no longer be supported. For more information on the Next Experience UI, see AI Admin Center workspace (Next Experience UI).

In AI Admin Center version 6.1, the Next Experience and Lux user interfaces are both available.

Before you begin

Role required: sn_na_center.nac_admin

About this task

Follow these steps to view AI usage and performance dashboards.

Note: This topic describes the AI Admin Center feature based on the Next Experience UI. If you're using the Lux user experience for AI Admin Center, see the Lux UI version of this topic.

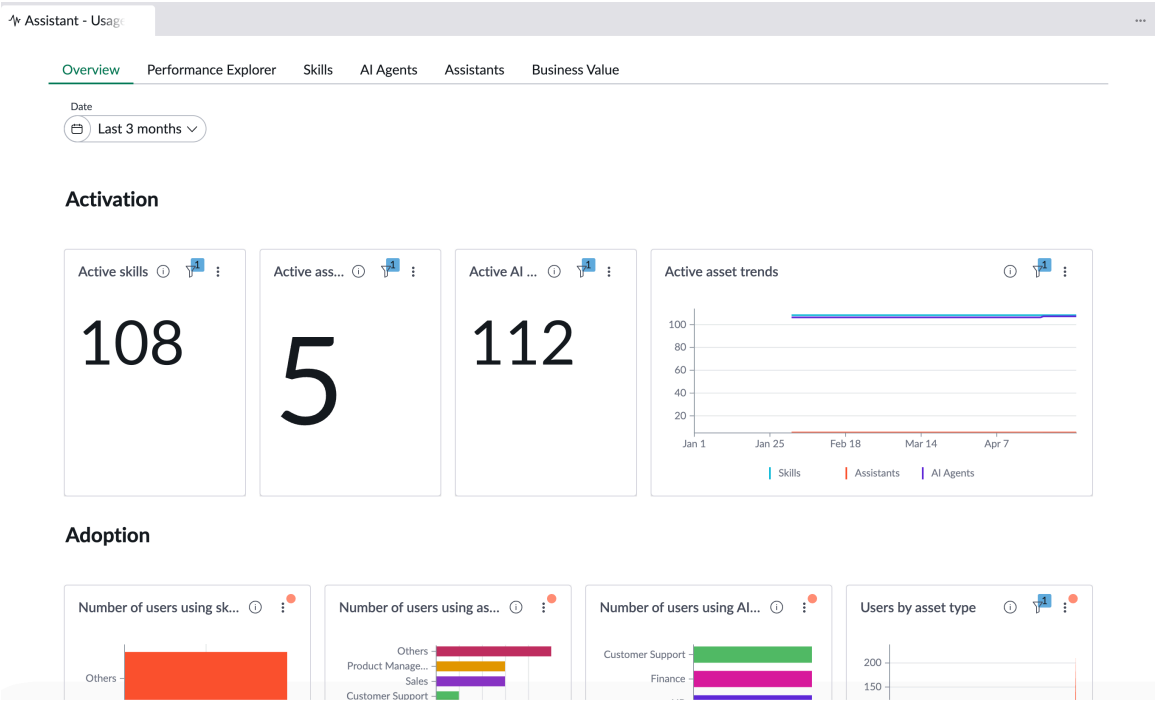
Procedure

1. Navigate to **All** > **AI Admin Center** > **AI Admin Center (Legacy)**.
2. Select **Monitor** ( ) in the side navigation bar.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Analytics page opens showing tabs for the different dashboards.

Dashboards and data visualizations are derived from various AI features and are grouped by asset type.



3. Select the tab for the dashboard you want to view.

   Some tabs contain another set of tabs for viewing the various usage, performance, and governance properties of the asset type.

4. Select the tab for the data visualizations you want to view.

   The Overview tab displays a summary of AI asset activation, adoption, and usage across your organization. Use the dashboard to monitor the state of your AI assets and track user engagement across departments. For more information, see AI Admin Center Overview dashboard (Next Experience UI).

   The Performance Explorer tab displays execution-level details for assistants and AI agents. Use the dashboard to investigate individual executions, analyze performance For more information, see AI Admin Center Performance Explorer dashboard (Next Experience UI).

   The Business Value dashboard displays a consolidated view of the business value generated by AI assets across your organization. Use the dashboard to monitor total executions, time saved, and cost saved across skills, AI agents, and agentic workflows. For more information, see AI Admin Center Business Value dashboard (Next Experience UI).

   The Skills tab provides dashboards showing usage and performance metrics for generative AI skills. The dashboards are featured in the Performance section of the AI Admin Hub. For more information, see Analyzing AI performance.

Dashboards under the Skills tab

Tab	Description
Usage Summary	The Usage summary dashboard page includes indicators on total and daily ServiceNow Otto actions, skill distribution and engagement trend, and daily unique users who have engaged with ServiceNow Otto. For more information, see Usage and adoption.
Offensiveness	The Offensive content dashboard page helps you monitor and evaluate the effectiveness of AI Guardian guardrails in tracking and analyzing requests sent to large language models (LLM) and their responses. For more information, see AI Guardian analytics.
Context Menu	The ServiceNow Otto context menu dashboard page helps you to evaluate the effectiveness of context menu actions in assisting agents with summarizing, creating, and editing emails and chat replies. For more information, see ServiceNow Otto context menu analytics.
Adoption	The Adoption dashboard page tracks the departments with the highest AI usage, comparison of actions by department, and feedback and error details. For more information, see Usage and adoption.
Skill Performance	The Skills performance dashboard page contains indicators that help you analyze the usage and performance of active skills. For more information, see Skills performance.
Prompt Injection	The Prompt Injection dashboard page helps you monitor and evaluate the effectiveness of AI Guardian guardrails in tracking and analyzing requests sent to large language models (LLM) and their responses.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tab	Description
	For more information, see AI Guardian analytics.
User Search Analyser	The User search analyzer dashboard page contains indicators that help you understand the effectiveness of search in enhancing the self-service experience. For more information, see User search analyzer.

The Auto Eval tab displays evaluation coverage, benchmark results, and assist consumption for AI assets on the instance. Use the dashboard to identify assets that are active but have not been evaluated, review benchmark results by asset, and track evaluation history over time. For more information, see .

The AI Agents tab provides dashboards showing usage and performance metrics for AI agents. The dashboards are featured on the AI Agent Analytics page of the AI Agent Studio. For more information, see AI Agent Analytics dashboard.

Dashboards under the AI Agents tab

Tab	Description
Overview	The Overview dashboard page provides summary indicators for the usage, performance, and efficiency of AI agents.
Status	The Status dashboard page provides an operational view of the AI agent deployment on the instance. It displays the current activation state of agentic workflows and AI agents and gives you a quick health check without having to navigate to individual asset records.
Insights	The Insights dashboard page shows deeper analytical findings about how AI agents are being used in practice. It helps you spot recurring problems by tracking errors over time and identify patterns in agent behavior.
Assist Consumption	The Assist Consumption dashboard page displays indicators for assist consumption and consumption trends on agentic executions so you can track spend against entitlements.
Performance	The Performance dashboard page helps you identify which agents, tools, or workflow

Tab	Description
	steps are introducing delays, and supports the optimization of multi-step agentic processes.
Troubleshooting	The Troubleshooting dashboard page provides diagnostics for failed or degraded AI agent executions. It shows error counts, failed tool calls, and failed agent calls across the instance, and helps you identify the scope and pattern of failures.
Security	The Security dashboard page displays metrics and status information related to security controls for AI agents and agentic workflows.

The Assists tab provides a dashboard for monitoring assist consumption trends and identifying the AI assets consuming the most assists across your organization. For more information, see AI Admin Center Assist Consumption page.

To ask natural-language questions about AI Analytics dashboards and metrics, use the AI Analytics Q and A agent from the ServiceNow Otto panel. For more information, see AI Analytics Q and A agent.

The Assistants tab provides dashboards showing usage and performance metrics for AI assistants. The dashboards are featured on the Analytics feature of the Assistant Designer. For more information, see Analyzing assistants.

Dashboards under the Assistants tab

Tab	Description
Overview	The Overview dashboard page provides high-level summary of assistant activity, assist usage, user engagement and overall customer satisfaction (CSAT) score. For more information, see Overview page in Assistant analytics.
Usage	The Usage dashboard page aggregates key metrics related to assistant usage, including the total number of conversations by assistant, conversations by channel, citations associated with the results, and the flow of conversation states. For more information, see Usage page in Assistant analytics.
Adoption & Engagement	The Adoption & Engagement dashboard page aggregates metrics related to user

Tab	Description
	adoption and engagement, including average active users, new user growth, conversation volume trends, assist-to-execution trend, and channel distribution. For more information, see Adoption and Engagement page in Assistant analytics.
Self Solved	The Self-Solve Performance dashboard page aggregates metrics related to self-solved events (instances where assistants resolved user queries), deflection rates, live agent transfers, and user effort. The deflection rate shown for each assistant is based on the custom metric active for that assistant. To customize how deflection is measured, create custom metrics. For more information, see Custom metrics in AI Admin Center. For more information, see Self-Solve Performance page in Assistant analytics.
Sentiment	The Sentiment dashboard page aggregates metrics related to user satisfaction, emotional feedback, empathy levels, and conversation outcomes. These metrics enable you to monitor inferred CSAT, track transfers and escalations, analyze empathy distribution, and review negative emotion trends. For more information, see Sentiment page in Assistant analytics.
Assists	The Assists dashboard page aggregates metrics related to conversational assists, including total assists consumed, usage breakdown by assistant, usage trends, and features which used the most number of assists. For more information, see Assists page in Assistant analytics.

AI Admin Center Overview dashboard (Next Experience UI)

Use the AI Admin Center Overview dashboard to monitor key metrics for AI asset activation, adoption, and usage across your organization.

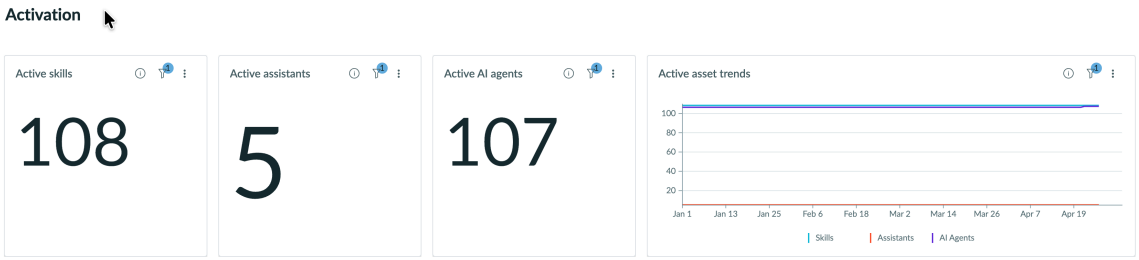
Activation section of the AI Admin Center Overview dashboard



Active skills

This area of the dashboard displays the total number of skills that are currently active in your instance. Use this count to understand the scale of your deployed skill library.

Active assistants

This area of the dashboard displays the total number of assistants that are currently active in your instance. Use this count to track the scale of your deployed assistant configurations.

Active AI agents

This area of the dashboard displays the total number of AI agents that are currently active in your instance. Use this count to understand the scope of your active AI agent deployments.

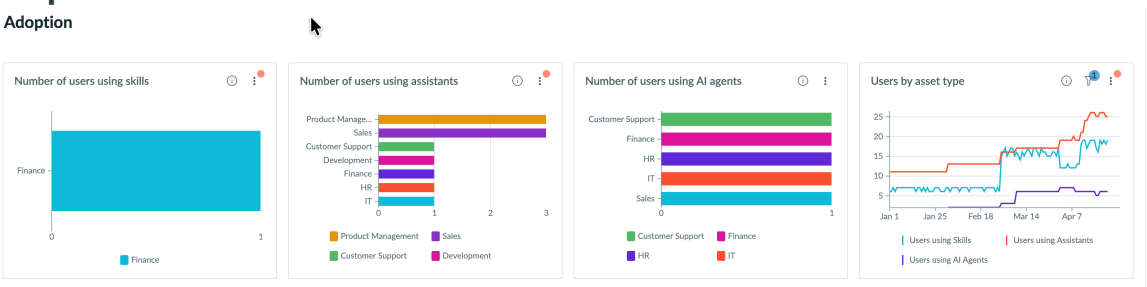
Active asset trends

This area of the dashboard displays a trend line chart showing the count of active skills, assistants, and AI agents over the selected time range. Use the trend lines to monitor how your active asset inventory has changed over time and identify periods of growth or reduction across asset types.

Adoption

The **Adoption** section shows how users across departments are engaging with AI assets over the selected time range.

Adoption section of the AI Admin Center Overview dashboard



Number of users using skills

This area of the dashboard displays the number of users who used skills in the selected time range, grouped by department. Use this visualization to identify which departments have the highest skill adoption and which may benefit from further enablement.

Number of users using assistants

This area of the dashboard displays the number of users who used assistants in the selected time range, grouped by department. Use this visualization to compare assistant adoption levels across departments and identify engagement patterns.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Number of users using AI agents

This area of the dashboard displays the number of users who used AI agents in the selected time range, grouped by department. Use this visualization to track AI agent adoption across your organization and identify departments with strong or limited engagement.

Users by asset type

This area of the dashboard displays a trend line chart showing the number of users per asset type (skills, assistants, and AI agents) over the selected time range. Use the trend lines to compare adoption levels across asset types and identify shifts in user preferences over time.

Usage

The **Usage** section displays the total number of executions for each AI asset type, grouped by department and asset type, over the selected time range.

Usage section of the AI Admin Center Overview dashboard

Total number of skill executions

This area of the dashboard displays the total number of times skills were executed in the selected time range, grouped by department. Use this visualization to understand which departments are driving the most skill usage and identify high-volume execution patterns.

Total assistant executions

This area of the dashboard displays the total number of assistant executions in the selected time range, grouped by department. Use this visualization to identify departments with the highest assistant usage and compare execution volumes across your organization.

Total AI agent executions

This area of the dashboard displays the total number of AI agent executions in the selected time range, grouped by department. Use this visualization to track AI agent usage patterns across departments and identify areas of high or low engagement.

Total executions by asset type

This area of the dashboard displays a trend line chart showing the total executions for skills, assistants, and AI agents over the selected time range. Use the trend lines to compare usage volumes across asset types and monitor changes in execution patterns over time.

AI Admin Center Performance Explorer dashboard (Next Experience UI)

Use the AI Admin Center Performance Explorer dashboard to review and analyze the execution details of assistants and AI agents across your organization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important: Lux is the new user experience for AI Admin Center. For more information on the Lux experience, see AI Admin Center user experience (Lux UI).

The Next Experience AI Admin Center workspace is being prepared for deprecation in the November store release and will no longer be supported. For more information on the Next Experience UI, see AI Admin Center workspace (Next Experience UI).

In AI Admin Center version 6.1, the Next Experience and Lux user interfaces are both available.

Note: This topic describes the AI Admin Center feature based on the Next Experience UI. If you're using the Lux user experience for AI Admin Center, see the Lux UI version of this topic.

AI Admin Center Performance Explorer dashboard

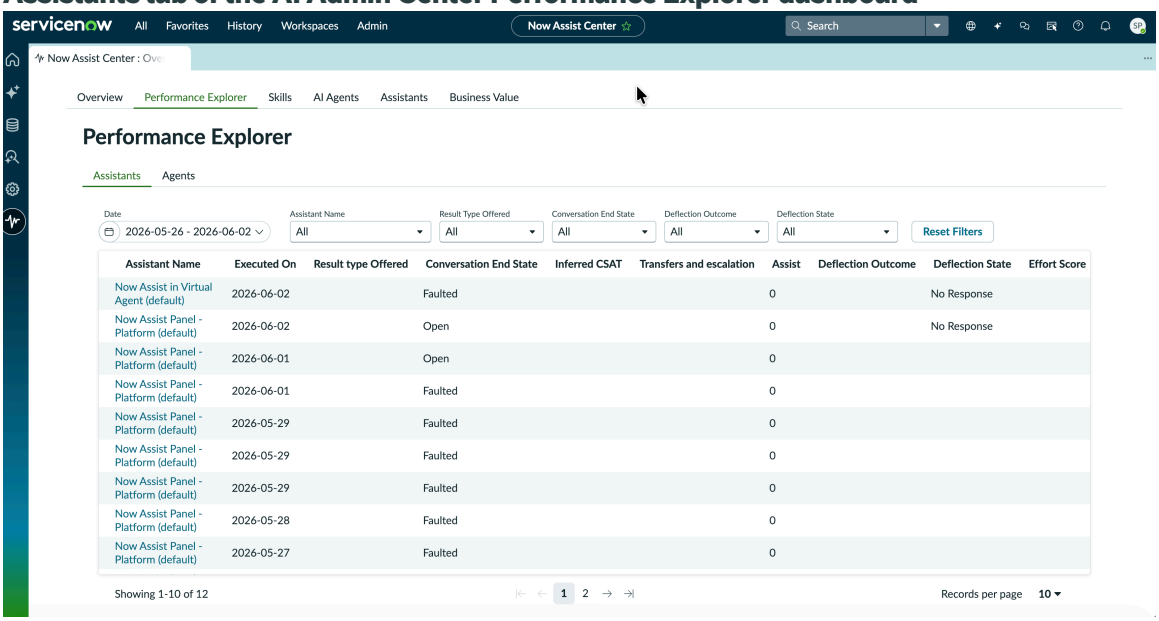
The AI Admin Center Performance Explorer dashboard displays execution-level details for assistants and AI agents. Use the dashboard to investigate individual executions, analyze performance metrics, and identify patterns across your AI asset deployments.

The Performance Explorer dashboard includes two sub-tabs: **Assistants** and **Agents**. Each sub-tab displays a table of individual executions for the selected asset type.

Assistants

The **Assistants** tab displays a list of individual assistant executions. Use the **Date**, **Assistant Name**, **Result Type Offered**, **Conversation End State**, **Deflection Outcome**, and **Deflection State** filters to narrow results. Select **Reset Filters** to clear all applied filters.

Assistants tab of the AI Admin Center Performance Explorer dashboard



Assistant Name

The name of the assistant that was executed. Select the assistant name to view the full execution record.

Executed On

The date on which the assistant execution occurred.

Result type Offered

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The type of result that the assistant offered during the execution, such as an answer, a deflection, or a transfer.

Conversation End State

The state of the conversation at the end of the execution, such as Open or Faulted.

Inferred CSAT

The inferred customer satisfaction score for the execution, calculated based on conversation signals.

Transfers and escalation

Indicates whether the conversation was transferred or escalated to a live agent during the execution.

Assist

The number of assist actions performed by the assistant during the execution.

Deflection Outcome

The outcome of the deflection attempt, indicating whether the conversation was successfully deflected.

Deflection State

The state of the deflection for the execution, such as deflected or not deflected.

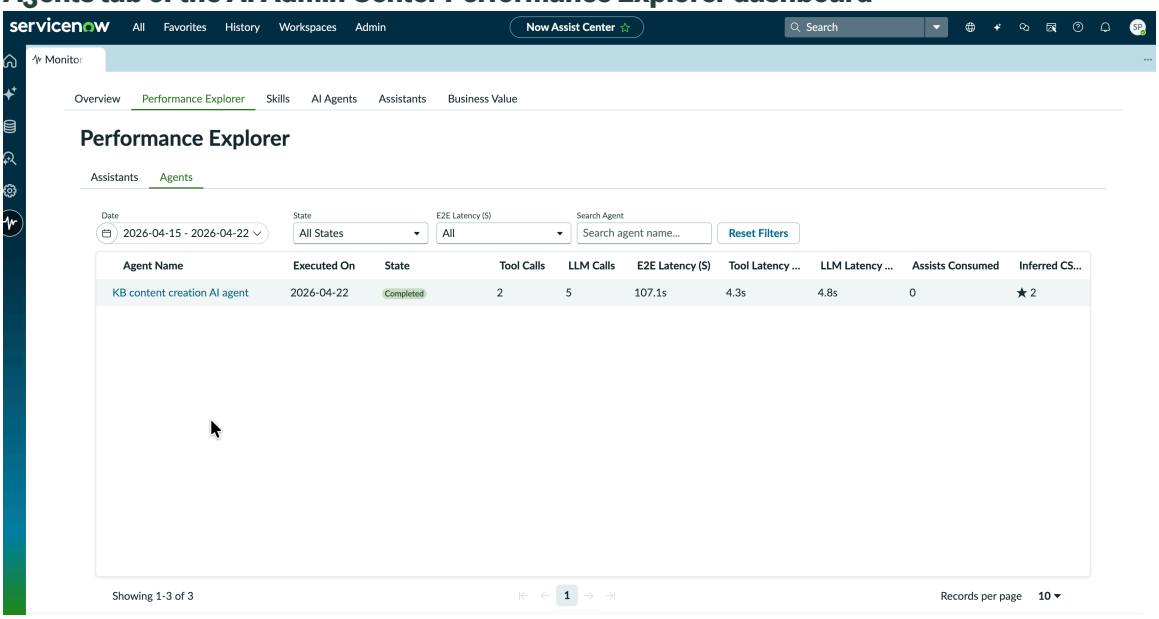
Effort Score

A score reflecting the level of effort required by the user to complete the interaction, based on conversation signals.

Agents

The **Agents** tab displays a list of individual AI agent executions. Use the **Date**, **State**, and **E2E Latency (S)** filters, or the **Search Agent** field, to narrow results. Select **Reset Filters** to clear all applied filters.

Agents tab of the AI Admin Center Performance Explorer dashboard



Agent Name

The name of the AI agent that was executed.

Executed On

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The date on which the AI agent execution occurred.

State

The state of the AI agent execution, such as Completed or Terminated.

Tool Calls

The total number of tool calls made by the AI agent during the execution.

LLM Calls

The total number of large language model (LLM) calls made by the AI agent during the execution.

E2E Latency (S)

The end-to-end latency of the execution, in seconds, measured from the start to the completion of the AI agent run.

Tool Latency

The cumulative latency contributed by tool calls during the execution.

LLM Latency

The cumulative latency contributed by LLM calls during the execution.

Assists Consumed

The number of assist credits consumed by the AI agent during the execution.

Inferred CSAT

The inferred customer satisfaction score for the execution, calculated based on interaction signals. See Exploring Conversation Insights for more information.

AI Admin Center Business Value dashboard (Next Experience UI)

Use the AI Admin Center Business Value dashboard to monitor the business value generated by AI assets across your organization, including total executions, time saved, and cost saved.

Important: Lux is the new user experience for AI Admin Center. For more information on the Lux experience, see AI Admin Center user experience (Lux UI).

The Next Experience AI Admin Center workspace is being prepared for deprecation in the November store release and will no longer be supported. For more information on the Next Experience UI, see AI Admin Center workspace (Next Experience UI).

In AI Admin Center version 6.1, the Next Experience and Lux user interfaces are both available.

Note: This topic describes the AI Admin Center feature based on the Next Experience UI. If you're using the Lux user experience for AI Admin Center, see the Lux UI version of this topic.

AI Admin Center Business Value dashboard

The AI Admin Center Business Value dashboard displays a consolidated view of the business value generated by AI assets across your organization. Use the dashboard to monitor total executions, time saved, and cost saved across skills, AI agents, and agentic workflows.

Use the **Date** filter at the top of the Business Value dashboard to set the time range for all metrics on the page.

Total executions

This area of the dashboard displays the total number of times AI assets were executed in the selected time range. Use this count to understand the overall scale of AI asset usage across your organization.

Total time saved

This area of the dashboard displays the total amount of time saved by AI asset executions in the selected time range. Use this metric to quantify the productivity impact of your AI asset deployments.

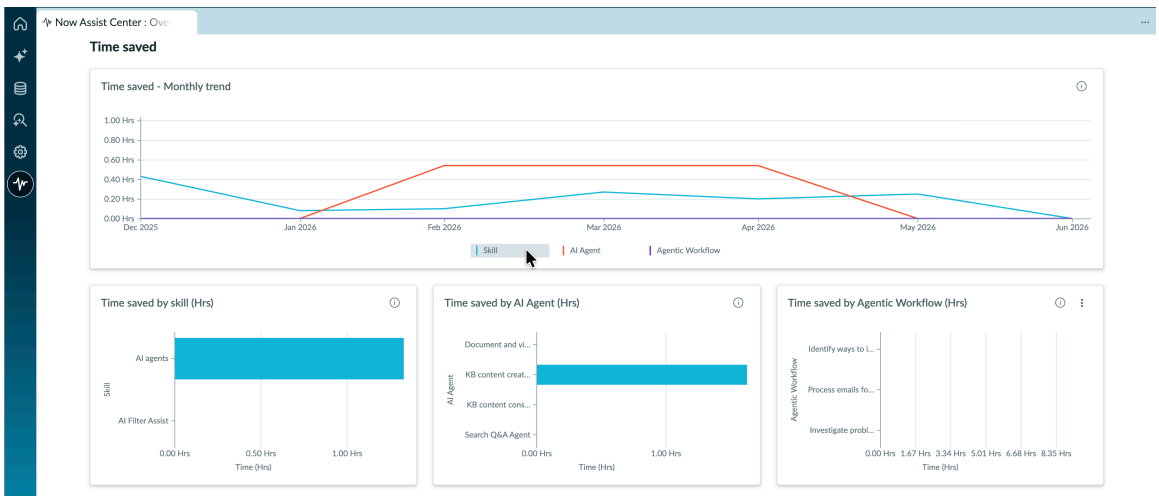
Total cost saved

This area of the dashboard displays the total cost savings generated by AI asset executions in the selected time range. Use this metric to assess the financial value delivered by your AI assets.

Time saved

The **Time saved** section displays the total time saved by AI asset executions, broken down by asset type and shown as a monthly trend over the selected time range.

Time saved section of the AI Admin Center Business Value dashboard



Time saved - Monthly trend

This area of the dashboard displays a trend line chart showing the total time saved by skills, AI agents, and agentic workflows each month over the selected time range. Use the trend lines to monitor changes in time saved across asset types and identify periods of higher or lower productivity impact.

Time saved by skill (Hrs)

This area of the dashboard displays a bar chart showing the total time saved by each skill in the selected time range. Use this visualization to identify which skills are delivering the greatest time savings in your organization.

Time saved by AI Agent (Hrs)

This area of the dashboard displays a bar chart showing the total time saved by each AI agent in the selected time range. Use this visualization to compare time savings across AI agents and identify your highest-impact deployments.

Time saved by Agentic Workflow (Hrs)

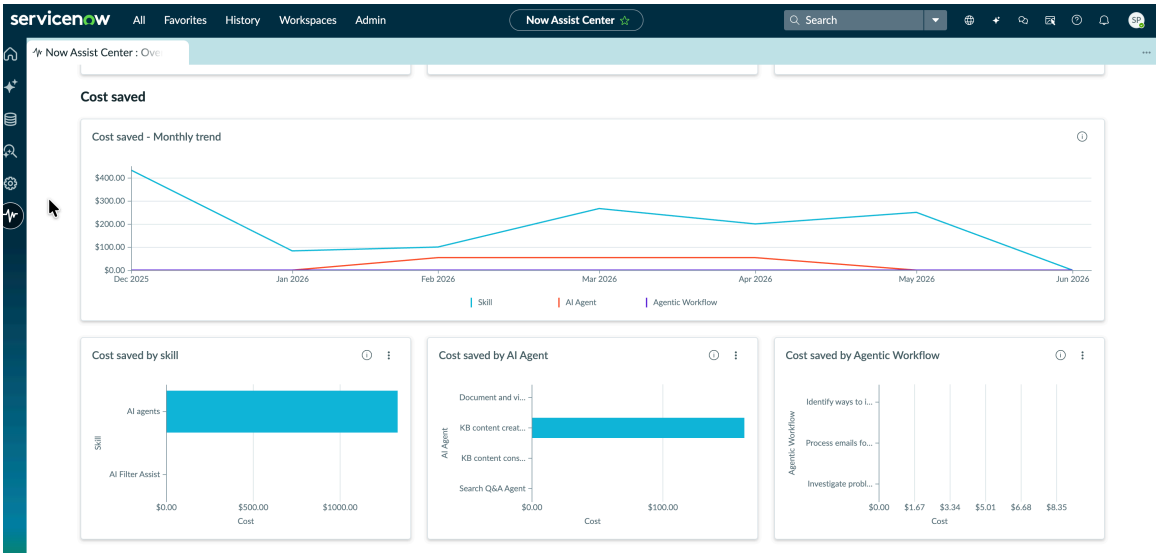
This area of the dashboard displays a bar chart showing the total time saved by each agentic workflow in the selected time range. Use this visualization to evaluate the time savings delivered by your agentic workflow configurations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cost saved

The **Cost saved** section displays the total cost savings generated by AI asset executions, broken down by asset type and shown as a monthly trend over the selected time range.

Cost saved section of the AI Admin Center Business Value dashboard



Cost saved - Monthly trend

This area of the dashboard displays a trend line chart showing the total cost saved by skills, AI agents, and agentic workflows each month over the selected time range. Use the trend lines to track changes in cost savings over time and identify periods of higher or lower financial impact.

Cost saved by skill

This area of the dashboard displays a bar chart showing the total cost saved by each skill in the selected time range. Use this visualization to identify which skills are generating the greatest cost savings across your organization.

Cost saved by AI Agent

This area of the dashboard displays a bar chart showing the total cost saved by each AI agent in the selected time range. Use this visualization to compare cost savings across AI agents and identify your highest-value deployments.

Cost saved by Agentic Workflow

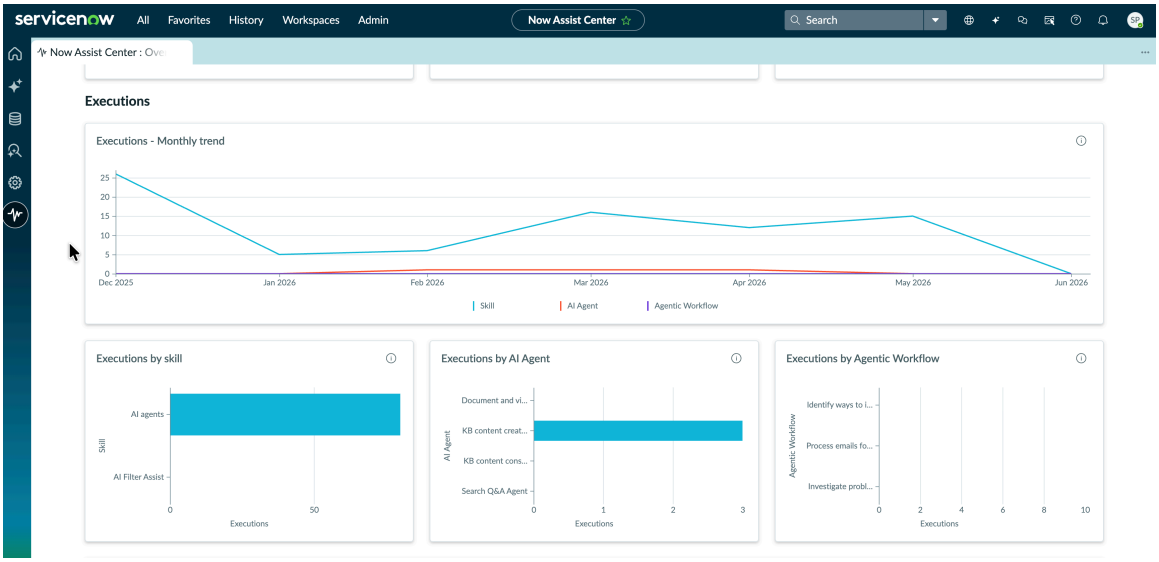
This area of the dashboard displays a bar chart showing the total cost saved by each agentic workflow in the selected time range. Use this visualization to evaluate the financial value delivered by your agentic workflow configurations.

Executions

The **Executions** section displays the total number of executions for each AI asset type, shown as a monthly trend and broken down by individual asset over the selected time range.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Executions section of the AI Admin Center Business Value dashboard



Executions - Monthly trend

This area of the dashboard displays a trend line chart showing the total number of executions for skills, AI agents, and agentic workflows each month over the selected time range. Use the trend lines to monitor changes in execution volume across asset types over time.

Executions by skill

This area of the dashboard displays a bar chart showing the total number of executions for each skill in the selected time range. Use this visualization to identify which skills are used most frequently and understand usage patterns across your skill library.

Executions by AI Agent

This area of the dashboard displays a bar chart showing the total number of executions for each AI agent in the selected time range. Use this visualization to compare execution volumes across AI agents and identify your most actively used deployments.

Executions by Agentic Workflow

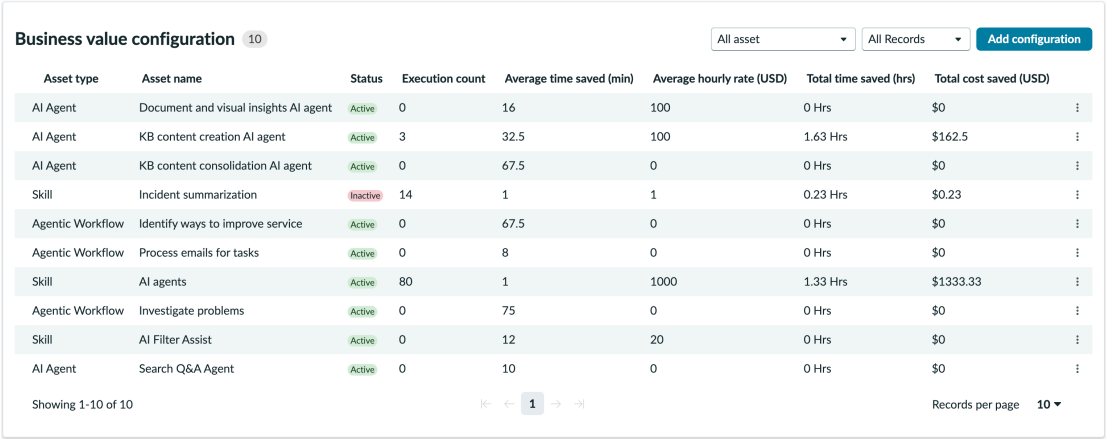
This area of the dashboard displays a bar chart showing the total number of executions for each agentic workflow in the selected time range. Use this visualization to track which agentic workflows are running most frequently and evaluate engagement patterns.

Business value configuration

The **Business value configuration** table lists all configured AI assets and the values used to calculate business value metrics. Use this table to review and manage the configuration for each asset.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Business value configuration table in the AI Admin Center Business Value dashboard



Asset type

The category of the AI asset, such as AI Agent, Skill, or Agentic Workflow.

Asset name

The name of the individual AI asset as configured in your instance.

Status

The current status of the AI asset, such as Active or Inactive.

Execution count

The total number of times the AI asset has been executed.

Average time saved (min)

The average amount of time, in minutes, saved per execution of the AI asset. This value is used to calculate the total time saved metric.

Average hourly rate

The average hourly rate used to calculate the cost saved by the AI asset. This value represents the estimated cost of the time saved per execution.

Total time saved (hrs)

The total amount of time saved by all executions of the AI asset, calculated from the execution count and average time saved values.

Total cost saved

The total cost saved by all executions of the AI asset, calculated from the total time saved and average hourly rate values.

Add a value configuration in the AI Admin Center Business Value dashboard (Next Experience UI)

Add a value configuration to define the business value metrics calculated for an AI asset, including average time saved per execution and average hourly rate.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important: Lux is the new user experience for AI Admin Center. For more information on the Lux experience, see AI Admin Center user experience (Lux UI).

The Next Experience AI Admin Center workspace is being prepared for deprecation in the November store release and will no longer be supported. For more information on the Next Experience UI, see AI Admin Center workspace (Next Experience UI).

In AI Admin Center version 6.1, the Next Experience and Lux user interfaces are both available.

Before you begin
Role required: sn_na_center.nac_admin

About this task
Value configurations define the data used to calculate business value metrics for each AI asset on the Business Value dashboard. Each configuration specifies the asset, average time saved per execution, and average hourly rate, which are used to calculate the total time saved and total cost saved displayed on the dashboard.

Note: This topic describes the AI Admin Center feature based on the Next Experience UI. If you're using the Lux user experience for AI Admin Center, see the Lux UI version of this topic.

Procedure
1. Navigate to **All** > **AI Admin Center** > **AI Admin Center (Legacy)**.

   The home page opens.

2. Select **Monitor** ( ) in the side navigation bar.
3. Select the **Business Value** tab.
4. Select **Add configuration**.
   The **Add value configuration** modal opens.
5. Select an **Asset type**.
6. Select an **Asset name**.

   The **Execution count (Last 7 days)** field is automatically populated based on the selected asset's execution history and is read-only.

   The **Currency** field displays the currency configured for your instance. To change the currency, update your instance configuration.

7. Enter a value in **Average time saved per execution (min)**.
8. Enter a value in **Average hourly rate**.

   The **Total time saved (hrs)** and **Total cost saved** fields are calculated automatically based on the execution count, average time saved per execution, and average hourly rate values.

9. Select **Add**.

Result
A **Benchmark created successfully** confirmation banner appears. The value configuration is added to the **Business value configuration** table and the Business Value dashboard metrics are updated to reflect the new configuration.

View AI assets usage and performance in AI Admin Center (Lux UI)

Use AI Admin Center to view dashboards showing the usage and performance of your AI assets.

Important: Lux is the new user experience for AI Admin Center. For more information on the Lux experience, see AI Admin Center user experience (Lux UI).

The Next Experience AI Admin Center workspace is being prepared for deprecation in the November store release and will no longer be supported. For more information on the Next Experience UI, see AI Admin Center workspace (Next Experience UI).

In AI Admin Center version 6.1, the Next Experience and Lux user interfaces are both available.

Before you begin

Role required: sn_na_center.nac_admin

About this task

Follow these steps to view AI usage and performance dashboards.

Note: This topic describes the AI Admin Center feature based on the Lux user interface (UI). If you're using the Next Experience UI for AI Admin Center, see the Next Experience UI version of this topic.

Procedure

1. Navigate to **All** > **AI Admin Center** > **Home** or **Admin** > **AI Admin Center**.

   The AI Admin Center opens to the home page.

2. Select **Analytics** ( ) in the side navigation panel.

   The Analytics page opens showing tabs for the different dashboards.

   Dashboards and data visualizations are derived from various AI features and are grouped by asset type.

3. Select the tab and any subtab for the dashboard you want to view.

   Some tabs contain another set of tabs for viewing the various usage, performance, and governance properties of the asset type.

   - The Overview dashboard displays a summary of AI asset activation, adoption, and usage across your organization. Use the dashboard to monitor the state of your AI assets and track user engagement across departments. For more information, see Overview dashboard in AI Admin Center (Lux UI).
   - The Performance Explorer tab displays the individual activity executions of your AI skills, agents, and assistants. Use this dashboard to analyze and optimize the performance of your AI assets. For more information, see Performance Explorer dashboard in AI Admin Center (Lux UI).
   - The Business Value tab displays the value generated by AI assets across your organization. Use the dashboard to justify continued investment, communicate ROI, or identify which AI integrations are delivering the most value. For more information, see Business Value dashboard in AI Admin Center (Lux UI).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Overview dashboard in AI Admin Center (Lux UI)

Use the Overview dashboard on the Analytics page to monitor key metrics for AI asset activation, adoption, and usage across your organization.

Important: Lux is the new user experience for AI Admin Center. For more information on the Lux experience, see AI Admin Center user experience (Lux UI).

The Next Experience AI Admin Center workspace is being prepared for deprecation in the November store release and will no longer be supported. For more information on the Next Experience UI, see AI Admin Center workspace (Next Experience UI).

In AI Admin Center version 6.1, the Next Experience and Lux user interfaces are both available.

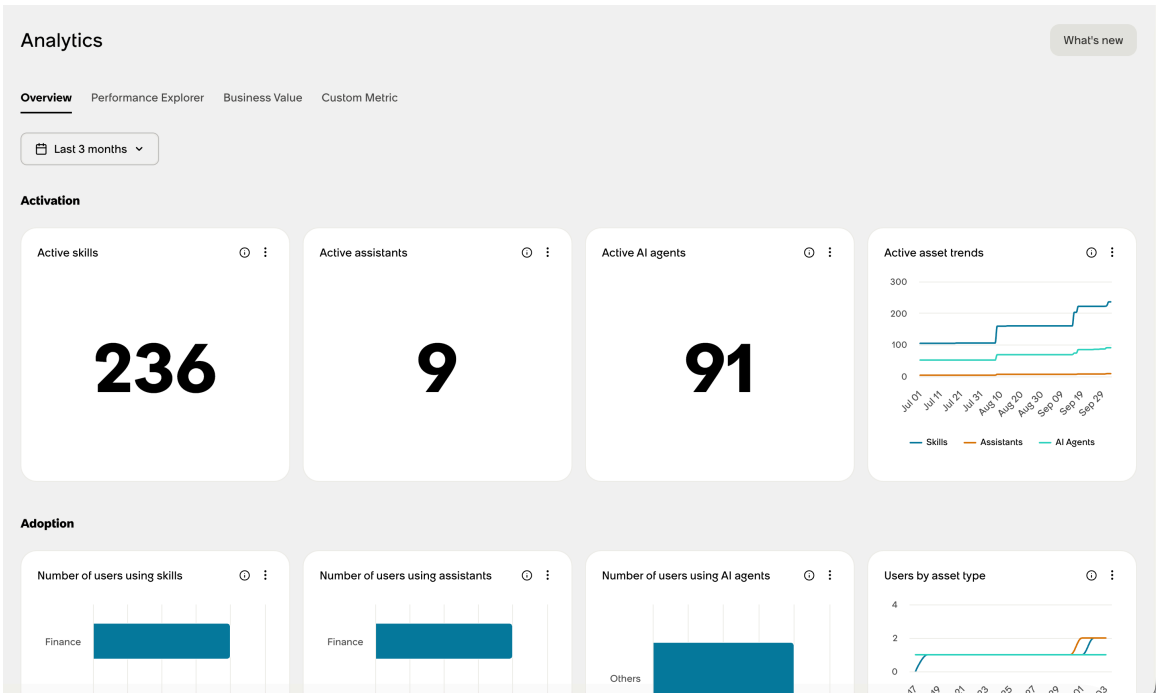
Note: This topic describes the AI Admin Center feature based on the Lux user interface (UI). If you're using the Next Experience UI for AI Admin Center, see the Next Experience UI version of this topic.

Overview dashboard

The Overview dashboard displays a summary of AI asset activation, adoption, and usage across your organization. Use the dashboard to monitor the state of your AI assets and track user engagement across departments.

Use the **Date** filter at the top of the Overview dashboard to set the time range for all metrics on the page. The default time range is **Last 3 months**.

Overview dashboard



Activation

The Activation section displays the current number of active AI assets and their trends over the selected time range.

Active skills

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This area of the dashboard displays the total number of skills that are currently active in your instance. Use this count to understand the scale of your deployed skill library.

Active assistants

This area of the dashboard displays the total number of assistants that are currently active in your instance. Use this count to track the scale of your deployed assistant configurations.

Active AI agents

This area of the dashboard displays the total number of AI agents that are currently active in your instance. Use this count to understand the scope of your active AI agent deployments.

Active asset trends

This area of the dashboard displays a trend line chart showing the count of active skills, assistants, and AI agents over the selected time range. Use the trend lines to monitor how your active asset inventory has changed over time and identify periods of growth or reduction across asset types.

Adoption

The **Adoption** section shows how users across departments are engaging with AI assets over the selected time range.

Number of users using skills

This area of the dashboard displays the number of users who used skills in the selected time range, grouped by department. Use this visualization to identify which departments have the highest skill adoption and which may benefit from further enablement.

Number of users using assistants

This area of the dashboard displays the number of users who used assistants in the selected time range, grouped by department. Use this visualization to compare assistant adoption levels across departments and identify engagement patterns.

Number of users using AI agents

This area of the dashboard displays the number of users who used AI agents in the selected time range, grouped by department. Use this visualization to track AI agent adoption across your organization and identify departments with strong or limited engagement.

Users by asset type

This area of the dashboard displays a trend line chart showing the number of users per asset type (skills, assistants, and AI agents) over the selected time range. Use the trend lines to compare adoption levels across asset types and identify shifts in user preferences over time.

Usage

The **Usage** section displays the total number of executions for each AI asset type, grouped by department and asset type, over the selected time range.

Total number of skill executions

This area of the dashboard displays the total number of times skills were executed in the selected time range, grouped by department. Use this visualization to understand which departments are driving the most skill usage and identify high-volume execution patterns.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Total assistant executions

This area of the dashboard displays the total number of assistant executions in the selected time range, grouped by department. Use this visualization to identify departments with the highest assistant usage and compare execution volumes across your organization.

Total AI agent executions

This area of the dashboard displays the total number of AI agent executions in the selected time range, grouped by department. Use this visualization to track AI agent usage patterns across departments and identify areas of high or low engagement.

Total executions by asset type

This area of the dashboard displays a trend line chart showing the total executions for skills, assistants, and AI agents over the selected time range. Use the trend lines to compare usage volumes across asset types and monitor changes in execution patterns over time.

Performance Explorer dashboard in AI Admin Center (Lux UI)

Use the Performance Explorer dashboard on the Analytics page to review and analyze the execution details of assistants and AI agents across your organization.

Important: Lux is the new user experience for AI Admin Center. For more information on the Lux experience, see AI Admin Center user experience (Lux UI).

The Next Experience AI Admin Center workspace is being prepared for deprecation in the November store release and will no longer be supported. For more information on the Next Experience UI, see AI Admin Center workspace (Next Experience UI).

In AI Admin Center version 6.1, the Next Experience and Lux user interfaces are both available.

Note: This topic describes the AI Admin Center feature based on the Lux user interface (UI). If you're using the Next Experience UI for AI Admin Center, see the Next Experience UI version of this topic.

AI Admin Center Performance Explorer dashboard

The Performance Explorer dashboard displays execution-level details for AI agents, skills, and assistants. Use the dashboard to investigate individual executions, analyze performance metrics, and identify patterns across your AI asset deployments.

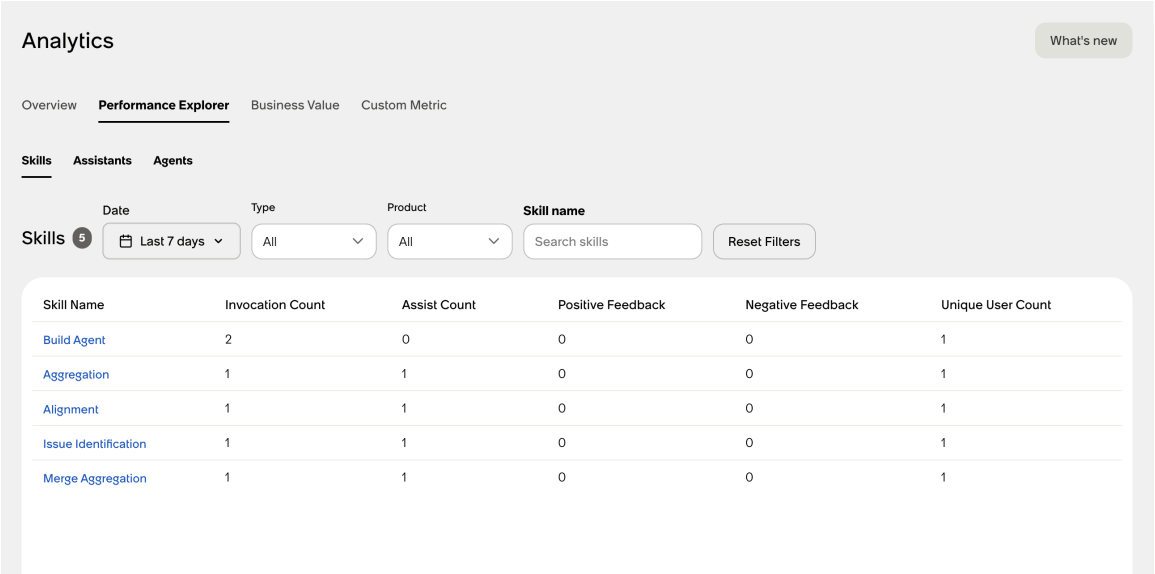
The Performance Explorer dashboard includes the following sub-tabs: **Skills**, **Assistants**, and **Agents**. Each sub-tab displays a table of individual executions for the selected asset type.

Skills

The **Skills** tab displays a list of individual generative AI skill executions. Use the **Date**, **Type**, and **Product** filters, or the **Search name** field, to narrow results. Select **Reset Filters** to clear all applied filters.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Skills tab of the Performance Explorer dashboard



Skill Name

The name of the AI skill that was executed.

Invocation Count

The number of invocations made to the skill.

Assist Count

The number of assist credits consumed by the skill during the execution.

Positive Feedback

The total number of positive feedback records received for the skill execution.

Negative Feedback

The total number of negative feedback records received for the skill execution.

Unique User Count

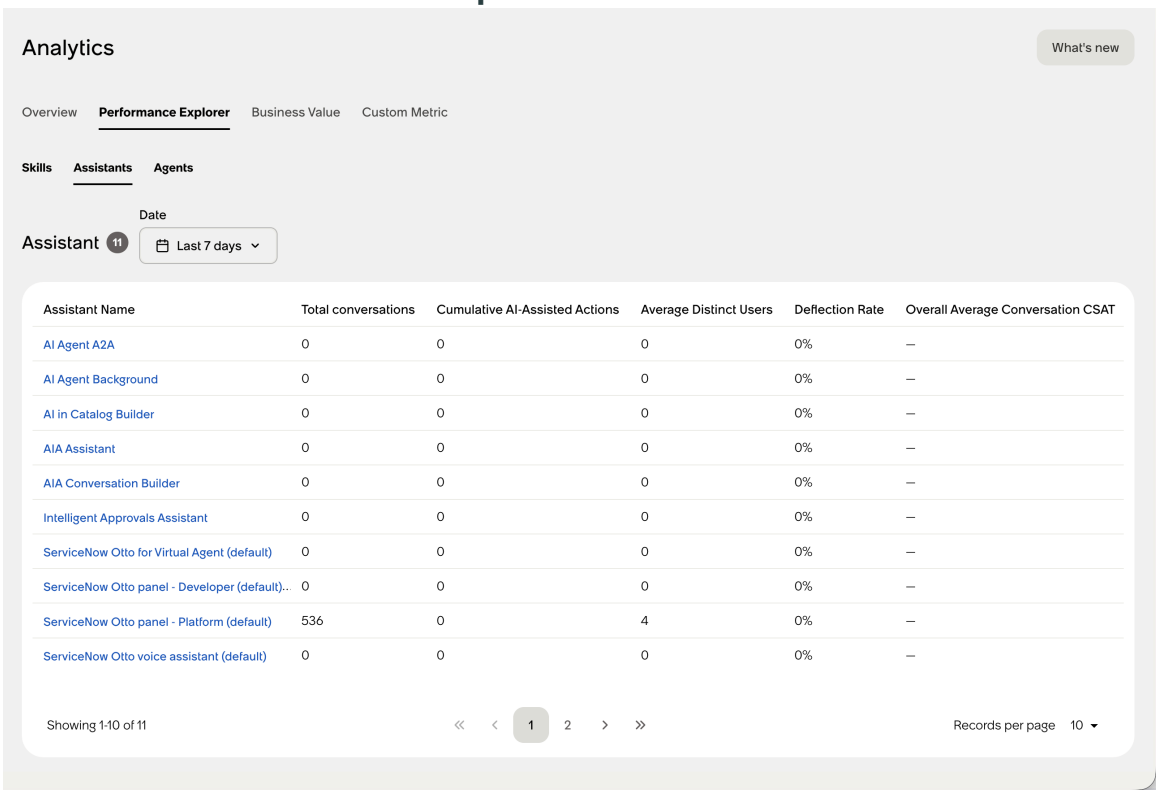
The number of unique users during the execution.

Assistants

The **Assistants** tab displays a list of individual assistant executions. Use the **Date** filter to narrow results.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Assistants tab of the Performance Explorer dashboard



Assistant Name

The name of the assistant that was executed. Select the assistant name to view the full execution record.

Total conversations

The total number of conversations where the assistant was executed.

Cumulative AI-Assisted Actions

The number of all AI-assisted actions performed by the assistant during the execution.

Average Distinct Users

The average number of distinct users during the execution.

Deflection Rate

The rate of deflection success for the execution.

Overall Average Conversation CSAT

The average customer satisfaction score for the conversation, calculated based on conversation signals.

Total Assist Usage

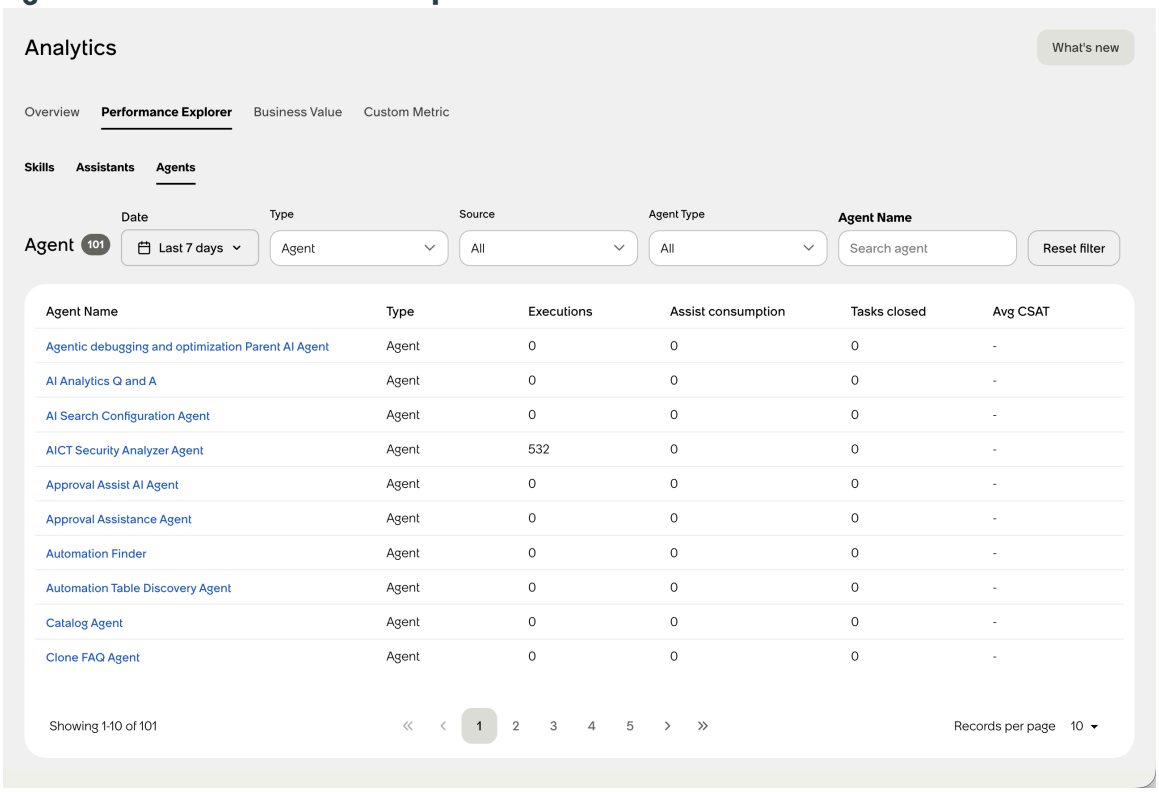
The number of assist credits consumed by the assistant during the execution.

Agents

The **Agents** tab displays a list of individual AI agent executions. Use the **Date**, **Type**, **Source**, and **Agent Type** filters, or the **Agent Name** field, to narrow results. Select **Reset filter** to clear all applied filters.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agents tab of the Performance Explorer dashboard



Agent Name

The name of the AI agent that was executed.

Type

The type of agentic AI asset, agent or agentic workflow.

Executions

The total number of executions made by the agentic AI asset.

Assist consumption

The number of assist credits consumed by the agentic AI asset during the execution.

Tasks closed

The number of tasks closed resulting from the execution.

Avg CSAT

The average customer satisfaction score for the execution, calculated based on interaction signals.

Business Value dashboard in AI Admin Center (Lux UI)

Use the Business Value dashboard on the Analytics page to monitor the business value generated by AI assets across your organization, including total executions, time saved, and cost saved.

Time saved by (Hrs) Agentic Workflow

This area of the dashboard displays a bar chart showing the total time saved by each agentic workflow in the selected time range. Use this visualization to evaluate the time savings delivered by your agentic workflow configurations.

Cost saved

The **Cost saved** section displays the total cost savings generated by AI asset executions, broken down by asset type and shown as a daily trend over the selected time range.

Cost saved - Daily trend

This area of the dashboard displays a trend line chart showing the total cost saved by skills, AI agents, and agentic workflows each day over the selected time range. Use the trend lines to track changes in cost savings over time and identify periods of higher or lower financial impact.

Cost saved by Skill

This area of the dashboard displays a bar chart showing the total cost saved by each skill in the selected time range. Use this visualization to identify which skills are generating the greatest cost savings across your organization.

Cost saved by AI Agent

This area of the dashboard displays a bar chart showing the total cost saved by each AI agent in the selected time range. Use this visualization to compare cost savings across AI agents and identify your highest-value deployments.

Cost saved by Agentic Workflow

This area of the dashboard displays a bar chart showing the total cost saved by each agentic workflow in the selected time range. Use this visualization to evaluate the financial value delivered by your agentic workflow configurations.

Executions

The **Executions** section displays the total number of executions for each AI asset type, shown as a daily trend and broken down by individual asset over the selected time range.

Executions - Daily trend

This area of the dashboard displays a trend line chart showing the total number of executions for skills, AI agents, and agentic workflows each day over the selected time range. Use the trend lines to monitor changes in execution volume across asset types over time.

Executions by Skill

This area of the dashboard displays a bar chart showing the total number of executions for each skill in the selected time range. Use this visualization to identify which skills are used most frequently and understand usage patterns across your skill library.

Executions by AI Agent

This area of the dashboard displays a bar chart showing the total number of executions for each AI agent in the selected time range. Use this visualization to compare execution volumes across AI agents and identify your most actively used deployments.

Executions by Agentic Workflow

This area of the dashboard displays a bar chart showing the total number of executions for each agentic workflow in the selected time range. Use this

visualization to track which agentic workflows are running most frequently and evaluate engagement patterns.

Business value configuration

The **Business value configuration** table lists all configured AI assets and the values used to calculate business value metrics. Use this table to review and manage the configuration for each asset.

Asset type

The category of the AI asset, such as AI Agent, Skill, or Agentic Workflow.

Asset name

The name of the individual AI asset as configured in your instance.

Status

The current status of the AI asset, such as Active or Inactive.

Execution count

The total number of times the AI asset has been executed.

Average time saved (min)

The average amount of time, in minutes, saved per execution of the AI asset. This value is used to calculate the total time saved metric.

Average hourly rate

The average hourly rate used to calculate the cost saved by the AI asset. This value represents the estimated cost of the time saved per execution.

Total time saved (hrs)

The total amount of time saved by all executions of the AI asset, calculated from the execution count and average time saved values.

Total cost saved

The total cost saved by all executions of the AI asset, calculated from the total time saved and average hourly rate values.

Add a value configuration in the Business Value dashboard (Lux UI)

Add a value configuration to define the business value metrics calculated for an AI asset, including average time saved per execution and average hourly rate.

Important: Lux is the new user experience for AI Admin Center. For more information on the Lux experience, see AI Admin Center user experience (Lux UI).

The Next Experience AI Admin Center workspace is being prepared for deprecation in the November store release and will no longer be supported. For more information on the Next Experience UI, see AI Admin Center workspace (Next Experience UI).

In AI Admin Center version 6.1, the Next Experience and Lux user interfaces are both available.

Before you begin

Role required: sn_na_center.nac_admin

About this task

Value configurations define the data used to calculate business value metrics for each AI asset on the Business Value dashboard. Each configuration specifies the asset, average time saved per execution, and average hourly rate, which are used to calculate the total time saved and total cost saved displayed on the dashboard.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: This topic describes the AI Admin Center feature based on the Lux user interface (UI). If you're using the Next Experience UI for AI Admin Center, see the Next Experience UI version of this topic.

Procedure

1. Navigate to **All** > **AI Admin Center** > **Home** or **Admin** > **AI Admin Center**.

   The home page opens.

2. Select **Analytics** ( ) in the side navigation panel.
3. Select the **Business Value** tab.
4. Select **Add configuration**.
   The **Add value configuration** modal opens.
5. Select an **Asset type**.
6. Select an **Asset name**.

   The **Execution count (Last 7 days)** field is automatically populated based on the selected asset's execution history and is read-only.

   The **Currency** field displays the currency configured for your instance. To change the currency, update your instance configuration.

7. Enter a value in **Average time saved per execution (min)**.
8. Enter a value in **Average hourly rate**.

   The **Total time saved (hrs)** and **Total cost saved** fields are calculated automatically based on the execution count, average time saved per execution, and average hourly rate values.

9. Select **Add**.

Result

A confirmation banner appears. The value configuration is added to the **Business value configuration** table and the Business Value dashboard metrics are updated to reflect the new configuration.

Custom metrics in AI Admin Center

Create custom metrics to define the criteria for measuring AI assistant performance, including custom deflection rates based on event-based condition logic.

Custom Metrics

The Custom Metrics section in AI Admin Center allows you to define custom metrics for measuring AI assistant performance. A custom deflection metric determines the criteria for counting an AI assistant interaction as deflected. A deflected interaction is one in which the assistant resolved the user's need without escalation to a human agent.

The platform includes a system-provided default metric. You can create custom metrics that reflect your organization's specific deflection criteria. Each AI assistant can be mapped to one active metric at a time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

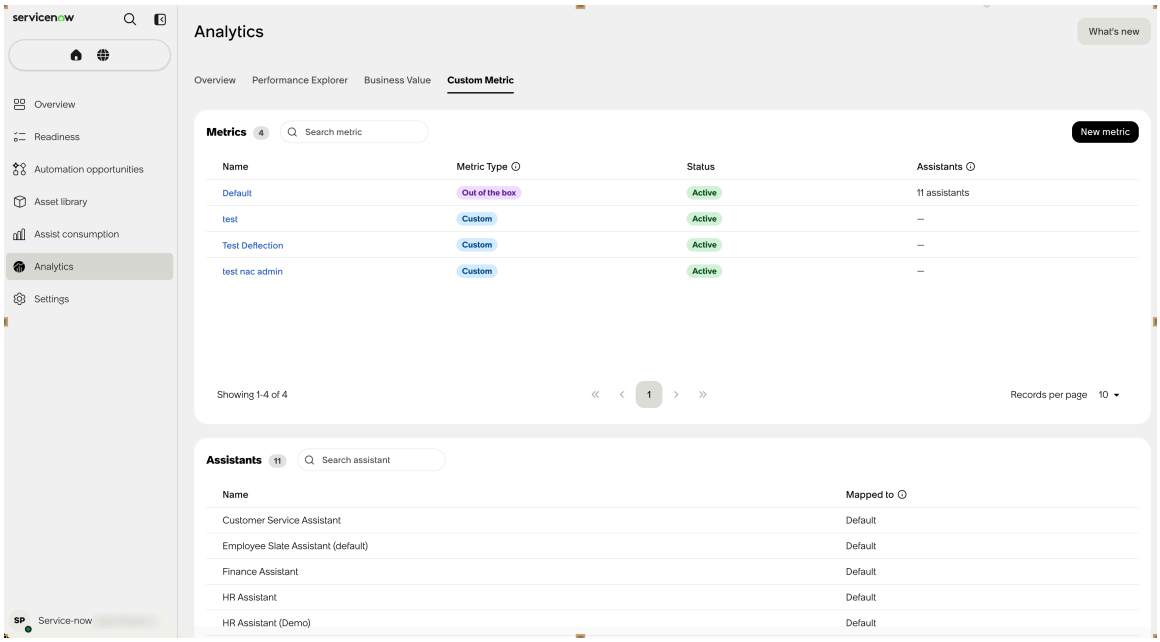
Important:

Set the `sn_nowassist_va.analytics.persistence_strategy` system property to `both` so that granular feedback and event data write to the ServiceNow Otto for Virtual Agent event tables that the condition builder evaluates. This data doesn't include events from other AI surfaces, such as AI Search or in-product skills. Custom metrics built on Feedback or Event type conditions require this data to return results.

Custom metrics list

The Custom Metrics page lists all metrics available in your organization. System-provided metrics and custom metrics are visually distinguished in the list. Select **New metric** to create a metric; for steps, see Create a custom metric in AI Admin Center. Use the search field above the list to filter metrics by name.

Custom Metric tab



Name

This area of the page displays the name of the custom metric.

Metric type

This area of the page displays the type of metric as a badge, either **Out of the box** for the system-provided default metric or **Custom** for a metric that you create.

Status

This area of the page displays whether the metric is active or inactive.

Assistants

This area of the page displays the number of AI assistants currently mapped to this metric.

Hover over the **Metric Type** and **Assistants** column headers for a description of each field.

Assistant mapping

Each AI assistant can be mapped to one custom metric at a time. When a custom metric is active for a mapped assistant, the deflection card on the assistant's Performance view shows the active

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

metric name. For steps to map an assistant to a metric, see Edit a custom metric in AI Admin Center.

The Custom Metrics page also lists all AI assistants in an Assistants table below the metrics list. This table shows each assistant's name and the metric it is currently mapped to, in the **Mapped to** column. Use the search field above the table to filter assistants by name.

Create a custom metric in AI Admin Center

Create a custom metric by specifying event-based condition logic and testing it against live data before saving.

Before you begin

Role required: `ai_engmt_admin`

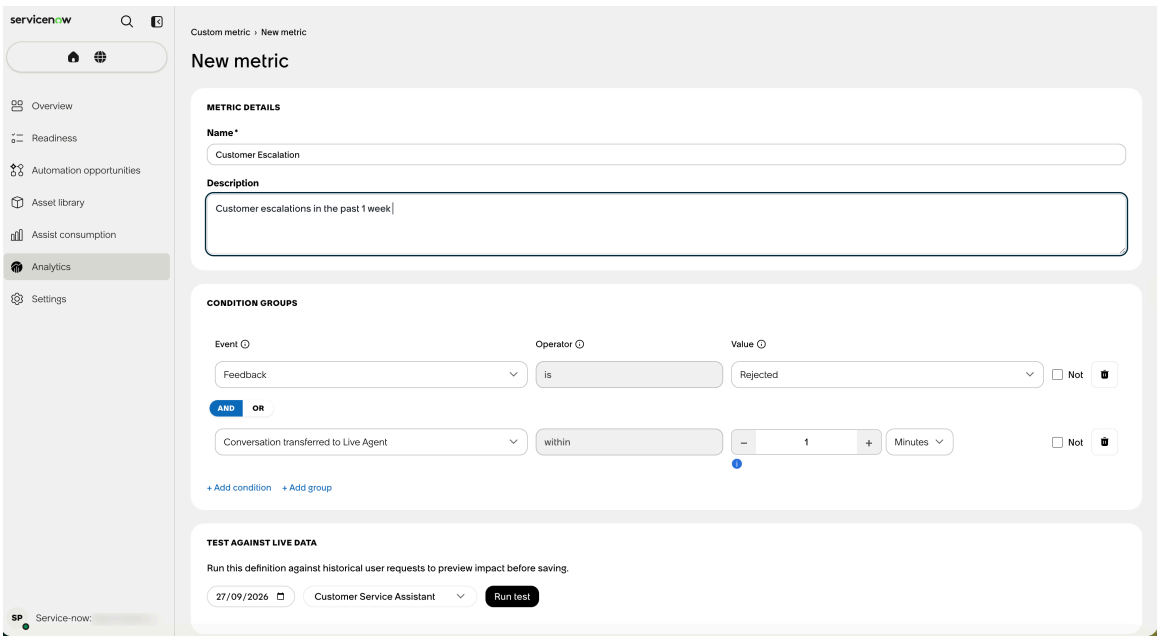
About this task

Custom metrics let you specify the event criteria that count as a deflected assistant interaction in your organization. After creating a metric, edit it to map it to one or more AI assistants and activate it.

Procedure

1. Navigate to **All** > **AI Admin Center** > **AI Admin Center (Legacy)**.
2. Select **Analytics** in the side navigation bar.
3. Select the **Custom Metric** tab.
4. Select **New metric**.
   The Custom Metric editor opens.

Custom Metric editor



5. Enter a **Name** for the metric.
6. **Optional:** Enter a **Description**.
7. Build the condition logic in the condition builder.

   Add events and connect them with AND, OR, or NOT operators. Groups can be nested to form recursive logic. Each condition specifies an event type, a reference point, and an optional time window.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Select from the following event types when building conditions: Response provided, Feedback, Event type, Conversation transferred to Live Agent, Request, and Response.

For time-based conditions, select the unit (Seconds, Minutes, or Hours) from the duration unit picker next to the duration field. The picker defaults to the largest unit that the stored duration value divides evenly into.

Hover over a column header in the condition builder for a description of that field.

8. **Optional:** Select **Test against live data** to validate the condition logic before saving.

   (Optional) Select a date and an assistant, then select **Run test**. The results show the number of requests that matched the metric's criteria for the selected day (matching count). The results also show the number of those requests counted as deflected under the metric (deflected count).

9. Select **Save**.

Result

The custom metric is added to the Custom Metrics list. To map the metric to AI assistants and activate it, see Edit a custom metric in AI Admin Center.

Edit a custom metric in AI Admin Center

Update a custom metric's condition logic, map AI assistants to it, and activate or deactivate it.

Before you begin

Role required: `ai_engmt_admin`

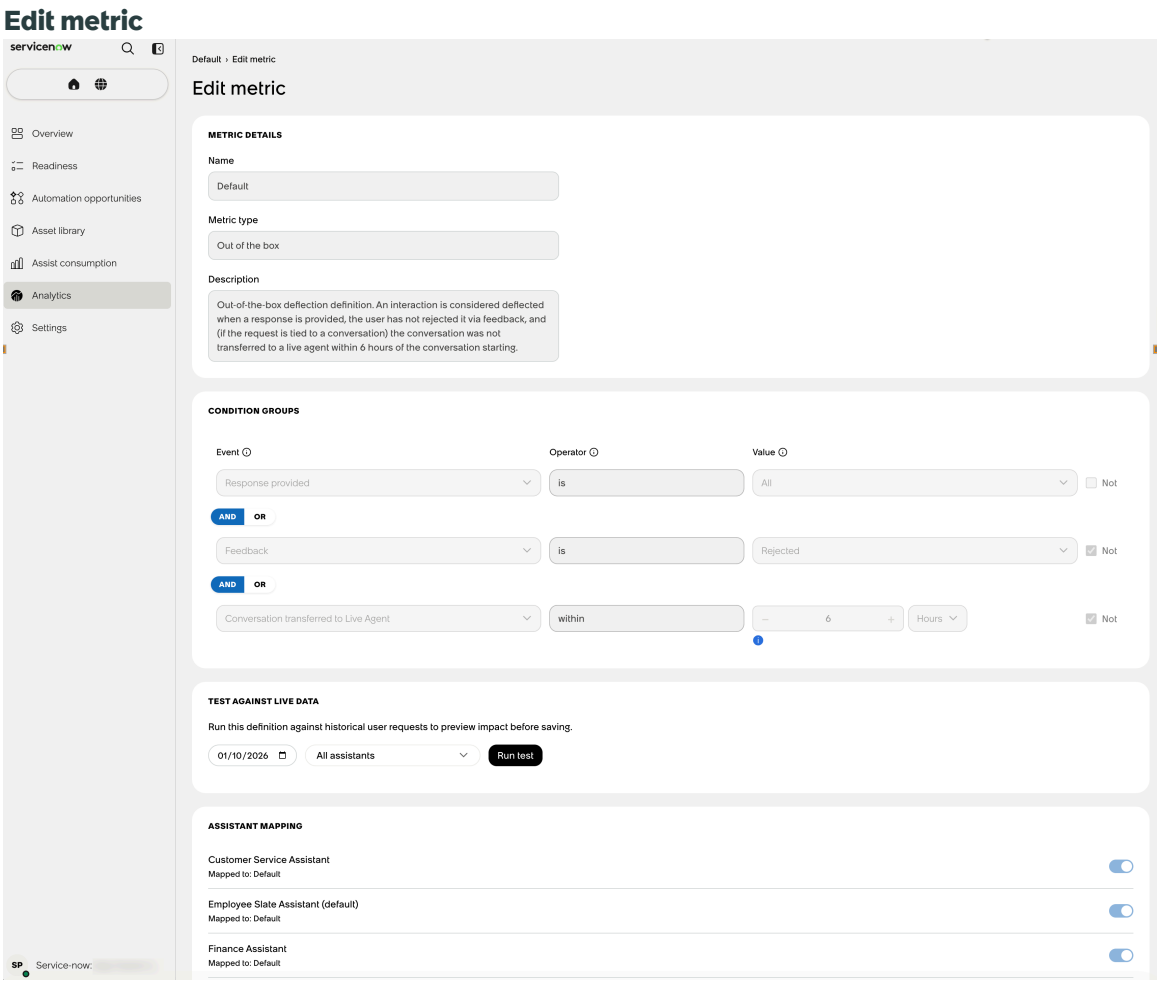
About this task

Edit a custom metric to change its condition logic, update which AI assistants are mapped to it, or activate or deactivate it.

Procedure

1. Navigate to **All** > **AI Admin Center** > **AI Admin Center (Legacy)**.
2. Select **Analytics** in the side navigation bar.
3. Select the **Custom Metric** tab.
4. Select the name of the metric that you want to edit.
   The Edit metric page opens.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. Update the **Name**, **Metric type**, or **Description** as needed.

   For a system-provided (**Out of the box**) metric, the metric details and condition logic are read-only. You can still update assistant mapping. System-provided metrics are active by default and can't be deactivated.

6. Update the condition logic in the condition builder as needed.

   Add, remove, or update condition groups, and connect them with AND, OR, or NOT operators. Groups can be nested to form recursive logic. Hover over a column header in the condition builder for a description of that field.

   If the metric is active and mapped to one or more AI assistants, your changes apply to deflection calculations going forward after you save. Deflection rates already calculated under the previous condition logic aren't recalculated.

7. **Optional:** Select **Test against live data** to validate your changes before saving.

   (Optional) Select a date and an assistant, then select **Run test**. The results show the number of requests that matched the updated criteria for the selected day (matching count), and how many of those requests count as deflected under the updated logic (deflected count).

   Testing is especially useful when the metric is already mapped to one or more assistants, so you can confirm your changes produce the expected results before they affect live deflection scoring.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. In the **Assistant mapping** section, enable or disable the toggle next to each AI assistant to map or unmap it from this metric.

   Each assistant can be mapped to one metric at a time. Enabling the toggle for an assistant here replaces any metric that assistant was previously mapped to. Disabling the toggle unmaps the assistant from this metric and reassigns it to the system-provided default metric.

9. Select **Save**.
10. To activate or deactivate the metric, select **Activate** or **Deactivate** and confirm.

    Activate a metric to make it eligible for deflection rate calculations. Deactivate a metric to remove it from scoring. When you deactivate a metric, all assistants mapped to it are remapped to the system-provided default metric. System-provided metrics cannot be deactivated.

Result
The custom metric reflects your updated condition logic and assistant mapping. If you activated the metric, the deflection rate shown on each mapped assistant's Performance view is calculated using this metric.

AI Admin Center reference

The following topics provide additional information about the features and properties installed with AI Admin Center.

Components installed with AI Admin Center

Several components are installed with the AI Admin Center application.

Roles installed

The following roles are installed with AI Admin Center.

- AI Admin Center admin [sn_na_center.nac_admin]
- AI Admin Center user [sn_na_center.nac_user]

For information on the roles installed with AI Admin Center, see AI Admin Center roles.

Domain separation and AI Admin Center

Domain separation is supported for AI Admin Center.

Domain separation allows you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

Support level: Standard

- Business logic: Ensure data goes into the proper domain for the application's service provider (SP) use cases.
- In the application, the user interface, cache keys, reporting, rollups, aggregations, and so on, all use domain at production run time.
- The owner of the instance must be able to set up the application to function across multiple tenants.

For more information on support levels, see Application support for domain separation.

Domain separation uses in AI Admin Center

- The system supports domain separation for skills and instructions.
- Ability to view domain-based skills in the actionable use cases on the home page.
- Ability to duplicate skills for different domains.
- AI Admin Center analytics data contains records from multiple domains.

Tables

The following AI Admin Center tables contain domain-separated fields:

- nac_promoted_skill
- nac_promoted_skill_state

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields

The following domain-separated fields are supported:

- sys_domain

  Associates the state record with a specific domain.

- sys_domain_path

  Manages domain hierarchy relationships.

- sys_overrides

  Enables child domain state records to override parent domain states.

AI Admin Center roles

AI Admin Center is installed with these roles.

AI Admin Center admin [sn_na_center.nac_admin]

Use the AI Admin Center workspace to access and set up Now Assist solutions, perform administrative tasks, and monitor performance. This role has full access to the AI Admin Center application, and can access AI Admin Center tables.

Assessing your AI readiness

Assessing readiness across your data, applications, and overall instance surfaces the gaps and dependencies that affect using AI on the ServiceNow AI Platform. Addressing these checks early helps your team avoid mid-implementation rework.

Get started

AI Readiness Evaluation	Data readiness	Application readiness
Evaluate your instance against built-in readiness checks for generative and agentic AI.	Learn how to prepare your instance data for AI.	Learn how to prepare your applications for AI.

Note: Depending on your license, you will have access to certain application features, generative AI skills, agentic workflows, and AI agents. For more information, see ServiceNow product tiers.

Important:

- Not all model providers are available for customers with in-country SKUs, and some AI products/features are currently unavailable for in-country customers. For more information, see the KB1584492 article in the Now Support Knowledge Base. Be sure to check for model provider availability updates in future releases.
- Some AI products/features are currently unavailable for customers in the FedRAMP, NSC DOD IL5, or Australia IRAP-Protected data centers, self-hosted customers, or in other restricted environments. For more information, see the KB0743854 article in the Now Support Knowledge Base. Be sure to check for availability updates in future releases.
- Some AI products/features are currently available only for customers in some regions. Be sure to check for availability updates in future releases.
- Some AI products and skills are not available in Regulated Markets. For more information, see KB2593939: Regulated Markets AI Products/Skills Not Available. Be sure to check for availability updates in future releases.

AI limitations

This application uses artificial intelligence (AI) and machine learning, which are rapidly evolving fields of study that generate predictions based on patterns in data. As a result, this application may not always produce accurate, complete, or appropriate information. Furthermore, there is no guarantee that this application has been fully trained or tested for your use case. To mitigate these issues, it is your responsibility to test and evaluate your use of this application for

Exploring AI Readiness Evaluation

The AI Readiness Evaluation app automates assessment processes, evaluates data readiness impacting implementation, and provides actionable insights to promote adopting AI quickly. The app enables you to assess whether updates, installations, or customizations of your instance could affect implementation. The assessments provide direct hyperlinks to improve any issues found.

Important: The AI Readiness Evaluation store application is being prepared for deprecation. The readiness assessment capability is now available as a native in-platform feature within the AI Admin Center application. For more information, see AI Admin Center (formerly Now Assist Center).

AI Readiness Evaluation overview

The AI Readiness Evaluation app is a solution designed to simplify and automate the agentic AI and Now Assist implementation assessment process. The app helps to determine whether your organization's instance is ready to implement generative and agentic AI features in Now Assist. Previously, manually assessing your organization's instance readiness was time consuming and took significant effort. Now, you can use the AI Readiness Evaluation app to automate gathering, processing, and analyzing instance data so that you can review your instance readiness more quickly. The app provides results within seconds, helping to reduce manual effort and promoting rapid and reliable assessments. The app includes assessment information for AI by separating agentic AI solutions and generative AI solutions by tabs. Agentic AI solution information appears in the agentic_AI tab and generative AI solution information appears in the tab.

The following list details what agentic solutions are evaluated and assessed after the necessary scheduled jobs have run.

Agentic AI for ServiceNow Otto for IT Service Management (ITSM)

Evaluates whether customizations on ITSM-related parent tables (such as Incident and Task) may interfere with AI agent behavior, task execution, or decision-making. Two use cases are available to select: **Categorize Incidents** and **Generate Change Request Plans**. The assessment identifies and flags high-risk customizations to help promote seamless agent operations and stable instance performance. Each

finding includes interactive hyperlinks to the impacted records, enabling you to review, validate, and address potential issues without navigating away from the dashboard.

Agentic AI for ServiceNow Otto for Customer Service Management (CSM)

Assesses whether customizations on CSM-specific tables (such as Case and Interaction) impact AI agent functionality. The assessment evaluates data completeness, field modifications, and scripting issues that may hinder agent-driven tasks and offers targeted estimated remediation to maintain agent efficacy. Each assessment finding includes interactive hyperlinks to the affected records, enabling you to navigate, validate, and resolve issues directly from the dashboard.

The following list details what generative AI Now Assist products are evaluated and assessed after the necessary scheduled jobs have run.

ServiceNow Otto for AI Search

This feature provides insights into the status and configuration of AI Search, such as active or inactive profiles, widget versions, and estimated remediation efforts. The assessment also evaluates Knowledge Management by assessing article counts, categories, group restrictions, and top searches or articles viewed. Additionally, the assessment highlights areas for improvement, offering actionable feedback to enhance knowledge quality and hygiene.

ServiceNow Otto for Virtual Agent

This feature checks if Virtual Agent is live, tracks active topics and catalog items, and identifies barriers to conversational functionality. The assessment highlights opportunities to convert non-conversational items to conversational ones and tracks automation in catalog items, along with estimated remediation efforts.

ServiceNow Otto for IT Service Management (ITSM)

This feature reviews customizations and configurations in the Incident and Task tables, such as fields, UI actions, and scripts. The assessment highlights changes made, tracks data completeness, and provides key metrics to improve accuracy and consistency in ITSM processes. The assessment also specifies the estimated remediation effort required and reports the language used in the instance.

ServiceNow Otto for Customer Service Management (CSM)

This feature reviews customizations in the Case and Task tables, tracks changes to fields, and monitors data completeness for key fields. The assessment provides insights into past cases and field-filling percentages, helping improve data accuracy in Customer Service Management. The assessment also reports the estimated remediation effort needed and the language used in the instance.

ServiceNow Otto for HR Service Delivery (HRSD)

This feature analyzes customizations in the HR Core Case and Task tables, tracking field-level changes and promoting data completeness for critical fields. The assessment provides insights into historical HR Core cases, including field population percentages, to enhance data accuracy in HRSD processes. Additionally, the feature identifies estimated remediation efforts required and reports the languages used within the instance.

Note: Additional configuration is needed to run the HRSD assessment successfully. For more information, see Configure the AI Readiness Evaluation guided setup.

Configuration overview

Before configuring the AI Readiness Evaluation app, confirm that it is installed. Navigate to **All** > **System Definition** > **Plugins**, and search for either the app name, `AI Readiness Evaluation`, or app ID, `sn_assess`, to confirm.

1. Run the GenAI/AgenticAI Assessment scheduled job

   Run the GenAI/AgenticAI Assessment scheduled job so that agentic and generative AI assessment results populate in **Workspaces** > **AI Readiness Evaluation**.

2. Configure the AI Readiness Evaluation guided setup

   Complete the configuration for the five AI jobs. Additional configuration is required to work with the ServiceNow Otto for HRSD assessment.

Run the GenAI/AgenticAI Assessment scheduled job

Before you can view the agentic AI or generative AI assessment results, you must first run the GenAI/AgenticAI Assessment scheduled job.

Important: The AI Readiness Evaluation store application is being prepared for deprecation. The readiness assessment capability is now available as a native in-platform feature within the AI Admin Center application. For more information, see AI Admin Center (formerly Now Assist Center).

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Scheduled Jobs**.
2. Set the Scheduled Jobs filter to `Application is AI Readiness Evaluation`, and then select **Run**.

   Tip: If the Application column isn't displayed in your ServiceNow instance, personalize the column settings using the Update Personalized List icon from the list header.

3. Select **GenAI/Agentic AI Assessment** from the Name column.
4. Select **Execute Now**.
   This action begins the scheduled job for the agentic and generative AI assessments found in **Workspaces** > **AI Readiness Evaluation**.

What to do next

If you must rerun all the scheduled jobs, or specifically, the agentic AI scheduled jobs for ITSM and CSM, repeat these steps.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: You must complete the additional steps in the AI Readiness Evaluation guided setup if you want to work with the ServiceNow Otto for HRSD product. If you don't complete the additional guided setup steps for the ServiceNow Otto for HRSD product, the assessment continuously fails. For more information about completing the AI Readiness Evaluation guided setup, see Configure the AI Readiness Evaluation guided setup.

Run individual assessment scheduled jobs

Use individual scheduled jobs to assess readiness for generative and agentic AI implementations across your instance.

Before you begin

Important: The AI Readiness Evaluation store application is being prepared for deprecation. The readiness assessment capability is now available as a native in-platform feature within the AI Admin Center application. For more information, see AI Admin Center (formerly Now Assist Center).

Role required: admin

About this task

The ServiceNow AI Platform provides scheduled jobs that assess your instance readiness for generative and agentic AI. The following individual scheduled jobs are available:

- AI Assessment - Virtual Agent
- AI Assessment - ITSM
- AI Assessment - HRSD
- AI Assessment - CSM
- AI Assessment - AI Search
- AgenticAIHRSDAssessment
- AgenticAICSMAssessment
- agentic AI Assessment - ITSM - Change Request

Procedure

1. Navigate to **All** > **System Definition** > **Scheduled Jobs**.
2. Filter the list by setting **Application** to `AI Readiness Evaluation`.
3. Select the job that you want to run.
4. Select **Execute Now**.

What to do next

Important:

For the Virtual Agent assessment to yield results, the following plugins must be active on your instance:

- Virtual Agent (com.glide.cs.chatbot)
- Catalog Conversational Coverage (sn_catalog_con_cov)

The Virtual Agent assessment requires the Catalog Conversational Coverage (sn_catalog_con_cov) plugin required for the assessment to run. For more information on Now Assist in Conversational Catalog Request, see AI in Conversational Catalog Request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure the AI Readiness Evaluation guided setup

Before you can review the Now Assist assessments in **Workspaces** > **AI Readiness Evaluation**, you must first complete the configuration for the five HRSD jobs.

Important: The AI Readiness Evaluation store application is being prepared for deprecation. The readiness assessment capability is now available as a native in-platform feature within the AI Admin Center application. For more information, see AI Admin Center (formerly Now Assist Center).

Before you begin

Before completing this guided setup, you must first run the generative AI and agentic AI scheduled jobs. For more information, see Run the GenAI/AgenticAI Assessment scheduled job.

Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Plugins**.
2. In the search bar, search for `AI Readiness Evaluation`.
3. Select the Installed tab to view the installed store application **AI Readiness Evaluation** App id: sn_assess.
4. Select **AI Readiness Evaluation**.
5. In the Get started area, select **Configure**.
6. Review the Want to know how it works? screen, and then select **Continue**.
   You're redirected to the Agentic AI Assessment Guided Setup.

   Tip: You can also access the Agentic AI Assessment Guided Setup screen by navigating directly to **All** > **AI Readiness Evaluation** > **Guided Setup**.

   Three sections appear: Scheduled Jobs, Restricted Caller Access Privileges, and System Properties. The Restricted Caller Access Privileges and System Properties sections are only applicable if you want to work with ServiceNow Otto for HR Service Delivery (HRSD).
7. Select **Start** in the Scheduled Jobs section.
   You're redirected to the five scheduled generative AI jobs.

   Note: You're unable to run agentic AI scheduled jobs from this guided setup. To run agentic AI scheduled jobs, you must do so through the GenAI/AgenticAI Assessment scheduled job. For more information on running the agentic AI scheduled job, see Run the GenAI/AgenticAI Assessment scheduled job.
8. Select the link to the specific scheduled job to have that job open in a new browser tab.
   For example, if you select the Now Assist Assessment - AI Search link, that scheduled job appears in a new browser tab.
9. Select **Execute Now** to begin that job.
   The job begins and you're redirected back to the guided setup.
10. Select **Next** in the guided setup.
11. Repeat steps 8-10 until you have run the scheduled jobs for the five assessments.
    You have completed the assessment jobs. If you ran the HRSD job, continue to the following optional steps.
12. **Optional:** If you have run the job for HRSD, select the **Change The State to Allowed for the following records** link on the Restricted Caller Access Privileges screen.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The following sub-steps can only be completed when in the Human Resources: Core application scope. For more information on changing application scopes, see Select an application from the application picker.

a. Change the Status column from `Requested` to `Allowed` on the Restricted Caller Access Privileges table, and then go back to the guided setup.

b. Select **Next** on the Restricted Caller Access Privileges screen.

c. Select the **Configure System Properties** link on the System Properties screen to review the system properties.

d. Select **Mark Complete**.

13. Select **Close**.

Result

You have completed configuration for the assessments.

What to do next

You can navigate to **Workspaces** > **AI Readiness Evaluation** to review your assessment results.

Using AI Readiness Evaluation

The AI Readiness Evaluation app helps you find actionable items in your implementation preparation and provides direct hyperlinks to improve upon those gaps.

Important: The AI Readiness Evaluation store application is being prepared for deprecation. The readiness assessment capability is now available as a native in-platform feature within the AI Admin Center application. For more information, see AI Admin Center (formerly Now Assist Center).

Overview of AI Readiness Evaluation

Use the AI Readiness Evaluation app to help you prepare to launch generative AI, agentic AI, or both for your organization. The following list is a high-level overview of the documentation topics in this section that you can refer to on how to use and interpret the AI Readiness Evaluation results.

- Using AI Readiness Evaluation dashboard

  View an overall dashboard of your assessments' findings divided up into percentages and bar chart visuals.

- Assessing readiness status

  View an overall dashboard of readiness and issue categorization before implementing AI.

- Reviewing your AI assessment

  View the AI assessment report results for the five available products.

- Reviewing your Agentic AI assessment

  View the agentic AI assessment report results for IT Service Management (ITSM) and Customer Service Management (CSM).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Using AI Readiness Evaluation dashboard

The AI Readiness Evaluation dashboard comes with two dashboard tabs: **Agentic AI - Assessment** and **AI Assessment**.

Important: The AI Readiness Evaluation store application is being prepared for deprecation. The readiness assessment capability is now available as a native in-platform feature within the AI Admin Center application. For more information, see AI Admin Center (formerly Now Assist Center).

Navigate to **Workspaces** > **AI Readiness Evaluation** to access the AI Readiness Evaluation dashboard. The AI Readiness Evaluation dashboard is the first tab you see.

The AI Readiness Evaluation dashboard is a powerful product feature that accelerates generative and agentic AI readiness by delivering automated, data-driven insights.

Note: The **Remediation properties** tab may also appear on the AI Readiness Evaluation dashboard. This tab only appears if the *sn_assess.effort_visibility* system property is set to true. For more information about this system property, see AI Readiness Evaluation system properties.

After reviewing the dashboard and making the suggested assessment changes, rerun your scheduled jobs to see how your results improve.

Agentic AI - Assessment dashboard tab

The AI Readiness Evaluation dashboard's **Agentic AO AI - Assessment** tab helps determine agentic AI readiness for IT Service Management (ITSM) and Customer Service Management (CSM) by delivering automated, data-driven insights.

Note: For results to appear in this dashboard, confirm that you have completed the configuration steps first. For more information on configuration, see Configuring AI Readiness Evaluation.

The following list describes details of the **agentic AI - Assessment** dashboard tab.

Total Estimated Effort (Days)

This area of the dashboard shows the total estimated work effort in development days.

Remediation Effort by Category

This area of the dashboard shows the estimated work effort needed to correct the findings for each product, depending on the findings category, in a bar chart.

Estimated Effort- Trends

This area of the dashboard shows the trends over time in a bar chart for each products' estimated work effort.

Assessment Findings

This area of the dashboard shows the number of assessment items that need attention.

Findings by Category

This area of the dashboard shows the percentage of each assessment finding category for each product in a bar chart.

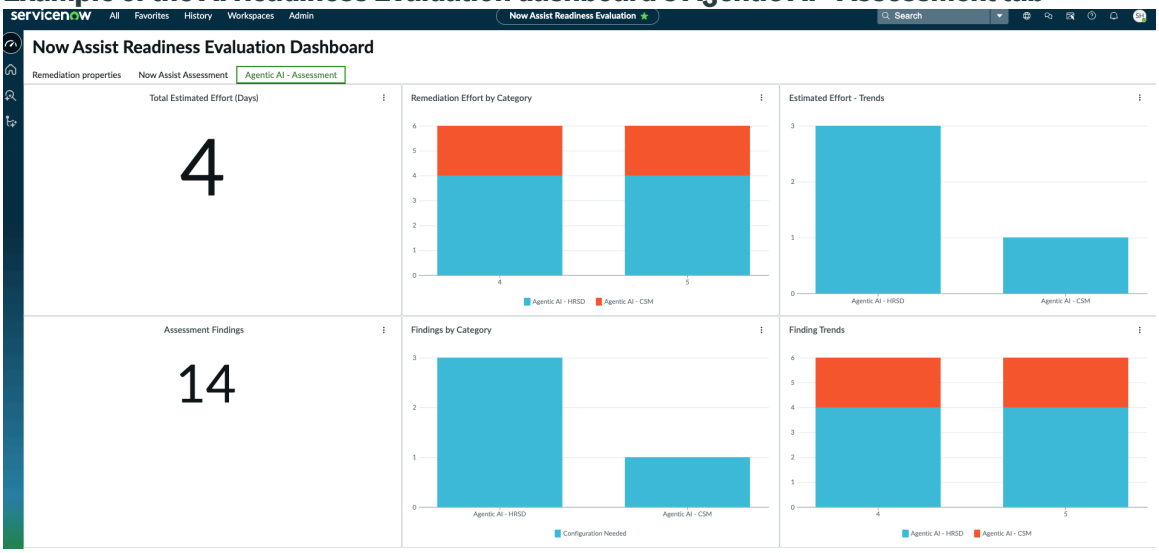
Finding Trends

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This area of the dashboard shows the trends over time in a bar chart for the products that need the most attention before implementation.

You can select each widget on the dashboard to have that table data open in a separate tab.

Example of the AI Readiness Evaluation dashboard's Agentic AI - Assessment tab



Note: This tab displays the Total Estimated Effort (Days), Remediation Effort by Category, and Estimated Effort – Trends cards when the *sn_assess.effort_visibility* system property is set to `true`. For more information, see AI Readiness Evaluation system properties.

AI Assessment dashboard tab

The AI Readiness Evaluation dashboard's AI Assessment dashboard tab helps determine generative AI readiness by delivering automated, data-driven insights.

Note: For results to appear in this dashboard, verify that you have completed the configuration steps first. For more information on configuration, see Configuring AI Readiness Evaluation.

The following list describes details of the AI Assessment dashboard tab.

Total Estimated Effort (Days)

This area of the dashboard shows the total estimated work effort in development days.

Remediation Effort by Category

This area of the dashboard shows the estimated work effort needed to correct the findings for each product, depending on the findings category, in a bar chart.

Estimated Effort- Trends

This area of the dashboard shows the trends over time in a bar chart for each products' estimated work effort.

Assessment Findings

This area of the dashboard shows the number of assessment items that need attention.

Findings by Category

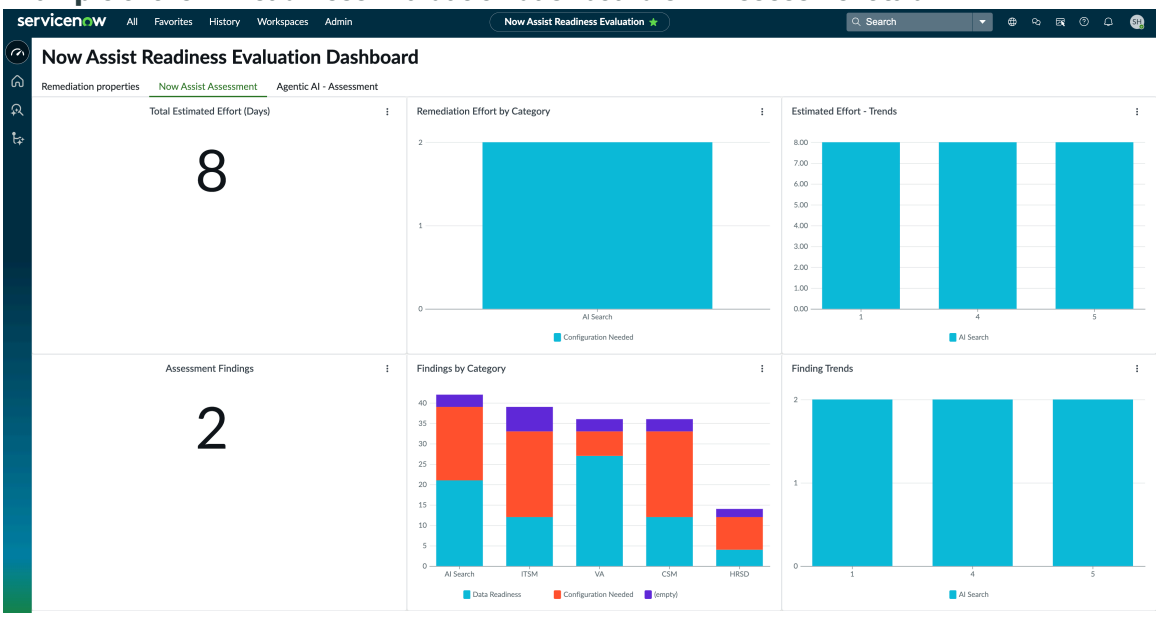
This area of the dashboard shows the percentage of each assessment finding category for each product in a bar chart.

Finding Trends

This area of the dashboard shows the trends over time in a bar chart for the products that need the most attention before implementation.

You can select each widget on the dashboard to have that table data open in a separate tab.

Example of the AI Readiness Evaluation dashboard's AI Assessment tab



Note: This tab displays the Total Estimated Effort (Days), Remediation Effort by Category, and Estimated Effort – Trends cards when the *sn_assess.effort_visibility* system property is set to **true**. For more information, see AI Readiness Evaluation system properties.

Assessing readiness status

The AI Readiness Evaluation app shows you a high-level overview of your go or no-go status for your organization's readiness to implement agentic AI, generative AI, or both.

Important: The AI Readiness Evaluation store application is being prepared for deprecation. The readiness assessment capability is now available as a native in-platform feature within the AI Admin Center application. For more information, see AI Admin Center (formerly Now Assist Center).

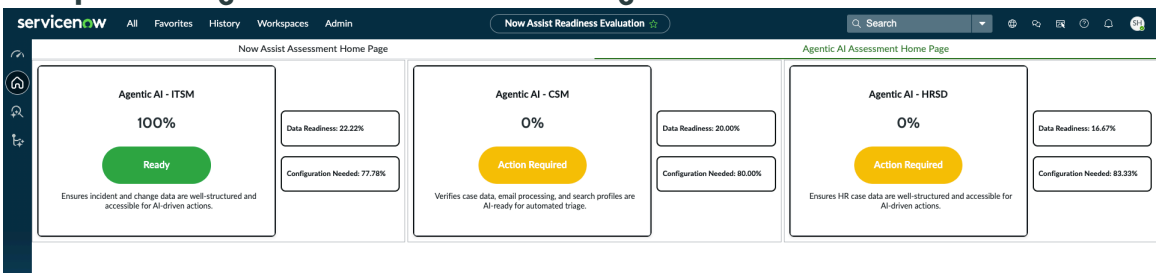
Navigate to **Workspaces** > **AI Readiness Evaluation** and select the Home icon to review your assessments' home page.

An overall ready or action-required status is determined by percentage rules. A green **Ready** button appears if over 75% of your instance is ready to implement agentic AI, generative AI, or both.A yellow **Action Required** button appears if 75% or less of your instance is determined to be ready to implement agentic AI, generative AI, or both. Each finding is broken down and automatically tagged as a product, data, or configuration issue. Having issues categorized lets you know whether you should open a Now Support case, cleanse data, or adjust platform settings.

The AI Assessment Home Page tab details the Ready or Action Required for agentic AI in ITSM and CSM.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

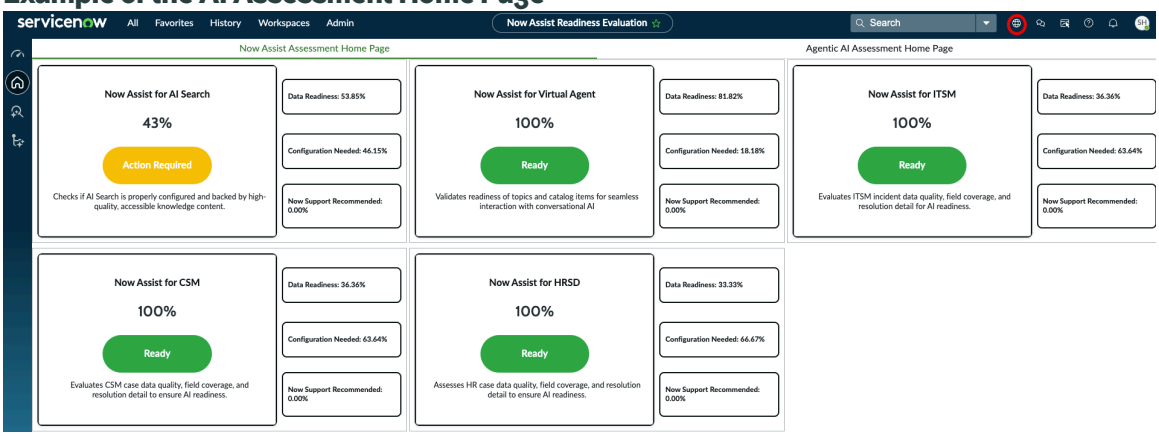
Example of the Agentic AI Assessment Home Page



The AI Assessment Home Page tab details the go or no-go status for AI products and features, including:

- ServiceNow Otto for AI Search
- ServiceNow Otto for Virtual Agent
- ServiceNow Otto for IT Service Management (ITSM)
- ServiceNow Otto for Customer Service Management (CSM)
- ServiceNow Otto for HR Service Delivery (HRSD)

Example of the AI Assessment Home Page



Select the assessment feature's tile on the home page to be redirected to that assessment tab's report results.

To impact these percentages, rerun your scheduled jobs after making your suggested assessment fixes.

Reviewing your AI assessment

This automated assessment process evaluates potential implementation impacts and provides actionable insights for your AI products.

Important: The AI Readiness Evaluation store application is being prepared for deprecation. The readiness assessment capability is now available as a native in-platform feature within the AI Admin Center application. For more information, see AI Admin Center (formerly Now Assist Center).

Navigate to **Workspaces** > **AI Readiness Evaluation** and select the assessment icon to review your AI assessment.

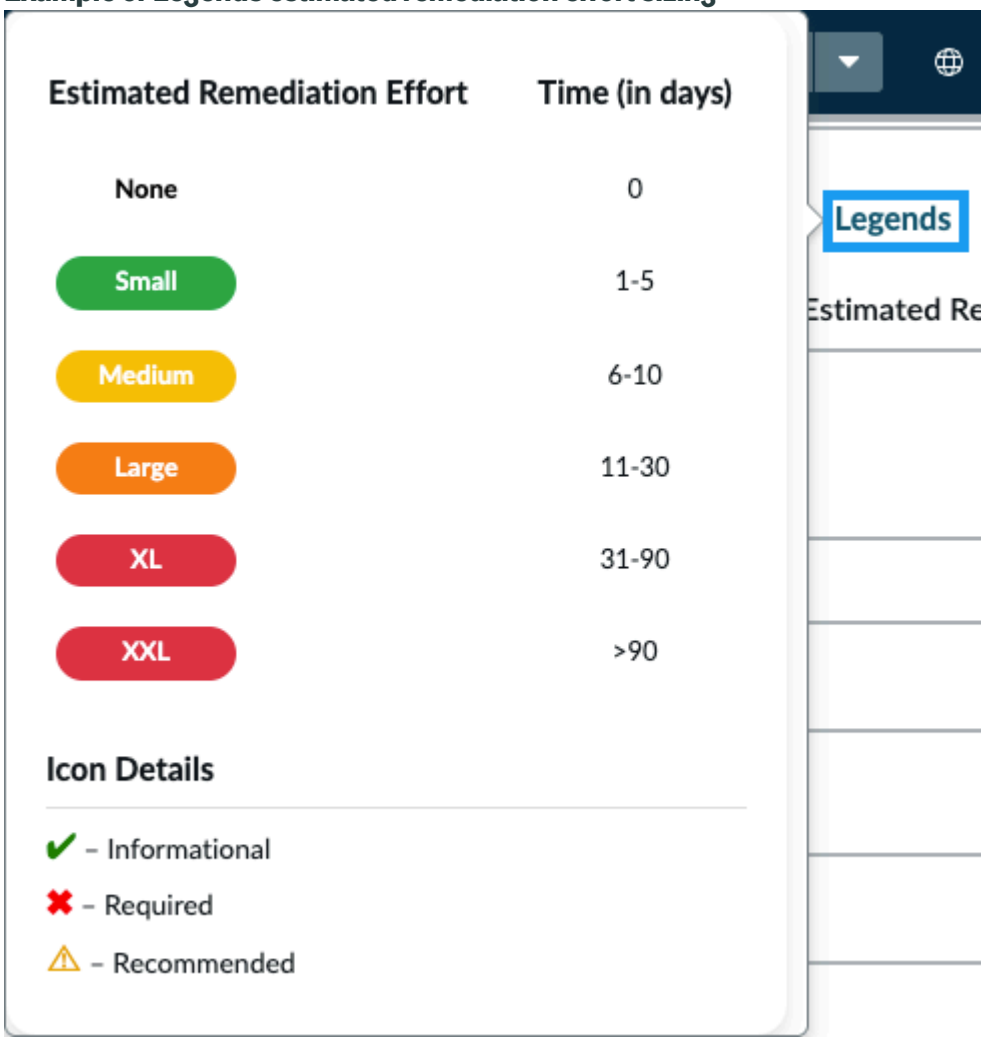
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Before viewing your AI assessments, you must first have run the scheduled jobs to get the assessment results. If you haven't run your scheduled jobs, you are prompted to do so on an individual job level. For more information on running scheduled jobs, see Run the GenAI/AgenticAI Assessment scheduled job and Configure the AI Readiness Evaluation guided setup.

The summary tab provides a consolidated summary of features, including AI capabilities across AI Search, Virtual Agent (VA), IT Service Management (ITSM), Customer Service Management (CSM), and HR Service Delivery (HRSD), as well as their corresponding estimated remediation efforts. The results shown are estimates. You should evaluate results provided by AI Readiness Evaluation for accuracy and appropriateness for your use case.

To understand the estimated remediation effort, select the **Legends** button. The legend shows the estimated remediation effort using sizing verbiage and colors, along with an estimated timeline of remediation in development days. The legend also includes descriptions of the icons found next to the assessment questions.

Example of Legends estimated remediation effort sizing



After reviewing the summary, select the individual assessment links to be redirected to that specific assessment in a new browser tab. The questions for each AI assessment differs. For example, the questions and answers on the ServiceNow Otto for AI Search assessment are different than the questions and answers on the ServiceNow Otto for Virtual Agent assessment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The assessments gather information from tables. To view any of the tables' available questions, answers, assessments, or assessment run successes or failures, search for the applicable table in the navigation filter:

- Questions [sn_assess_question] table
- Answers [sn_assess_answer] table
- Assessment [sn_assess_assessment] table
- Assessment Run [sn_assess_assessment_run] table

For more information about how to search for tables in the navigation filter, see Navigate directly to a table.

The assessments include visual indicators to guide you on non-blocker and blocker results. The following list details the descriptions of the assessment's visual indicators:

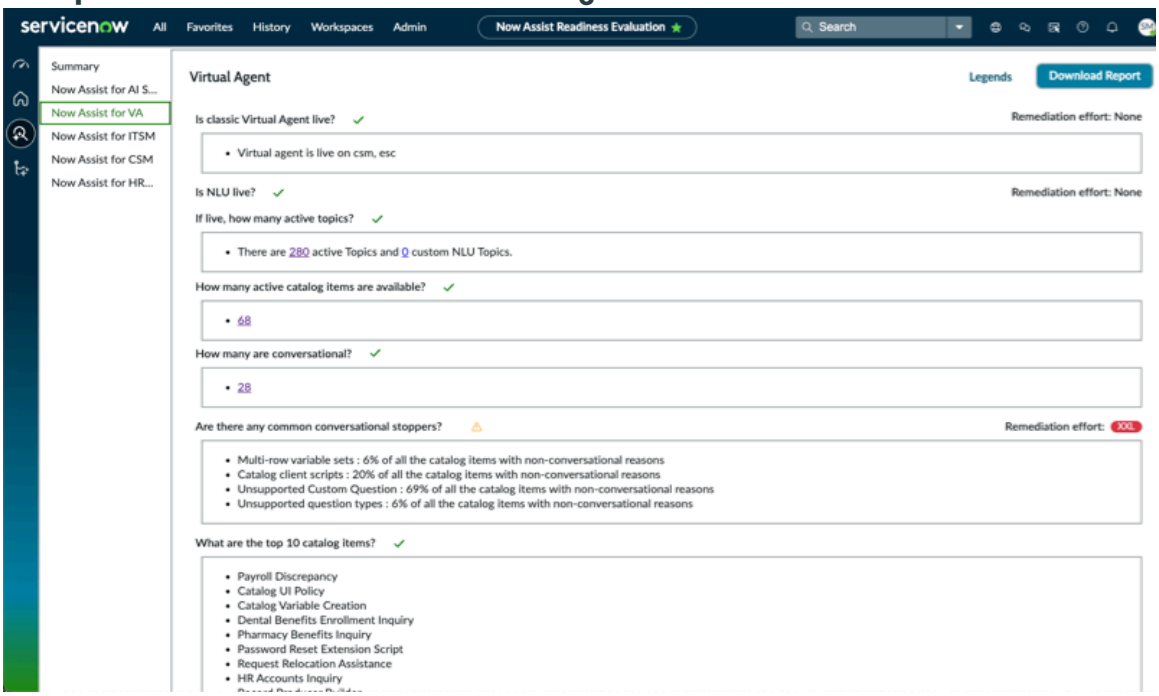
- ✓: Informational area and no further action needed.
- ✗: Further action is needed to resolve findings before implementation. These required areas include estimated remediation efforts.
- ⚠: Recommended area warning, but the finding should be evaluated before implementation. These recommendations are observations that should be reviewed prior to implementation but no estimated remediation effort is provided.

You can select **Download Report** to export the entire assessment report in PDF format from the Summary tab. The exported report still includes hyperlinks to the specific individual assessments. Selecting **Download Report** on an individual assessment downloads only that report in PDF format. After selecting a hyperlink in the PDF, that record or table opens in a separate browser tab.

Note: You don't have to select **Download Report** to work directly with the problematic records or tables found in the assessment. Each assessment includes hyperlinks to the records or tables that need attention. Selecting a hyperlink opens the record or table in a separate browser tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example of the ServiceNow Otto for Virtual Agent assessment



After reviewing the assessment and making the suggested assessment changes, rerun your scheduled jobs to see how your results improve. For more information on rerunning a specific job or all jobs, see Run the GenAI/AgenticAI Assessment scheduled job.

Reviewing your Agentic AI assessment

This automated assessment process evaluates potential implementation impacts and provides actionable insights for agentic AI in ServiceNow Otto for IT Service Management (ITSM) and ServiceNow Otto for Customer Service Management (CSM).

Important: The AI Readiness Evaluation store application is being prepared for deprecation. The readiness assessment capability is now available as a native in-platform feature within the AI Admin Center application. For more information, see AI Admin Center (formerly Now Assist Center).

Navigate to **Workspaces** > **AI Readiness Evaluation** and select the agentic AI assessment icon to review your agentic AI assessment.

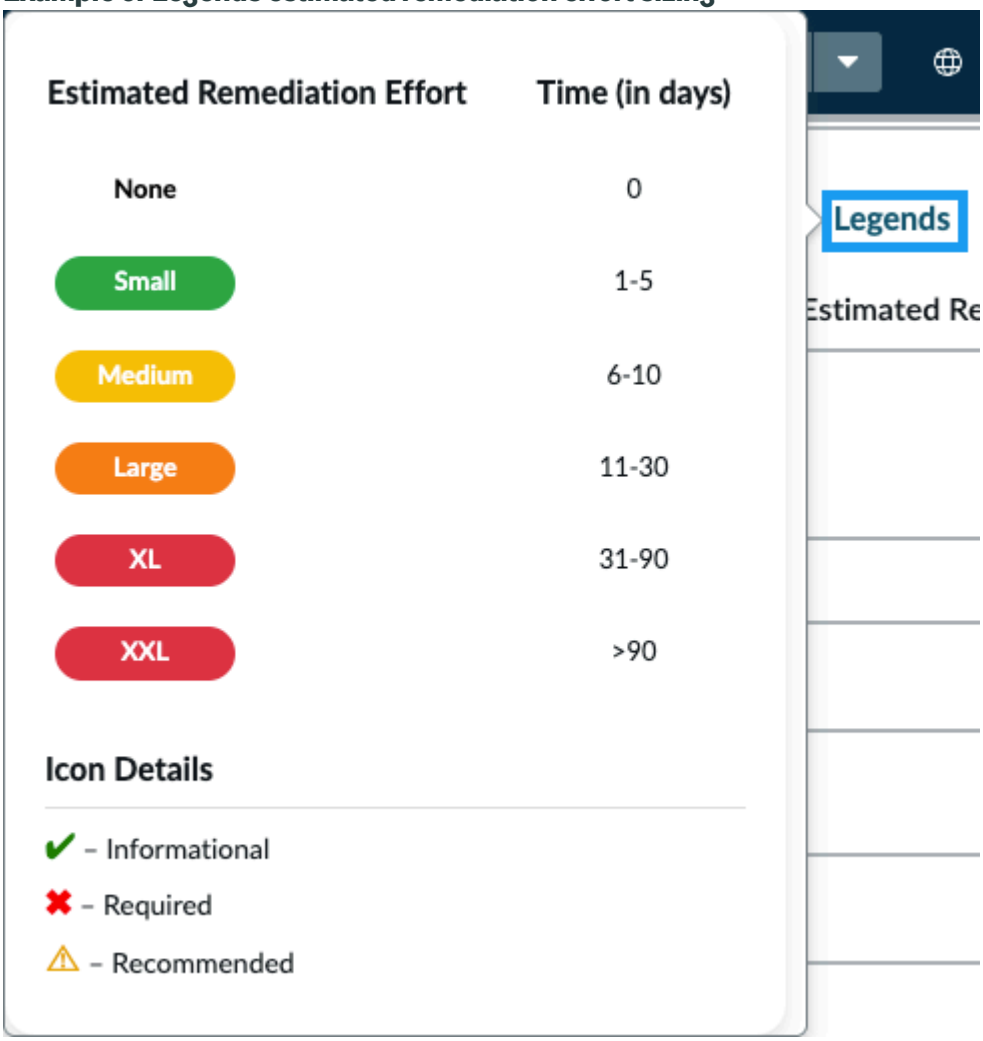
Note: Before viewing your agentic AI assessments, you must first have run the scheduled job to get the assessment results. If you haven't run your scheduled jobs, you are prompted to do so on an individual job level. For more information on running scheduled jobs, see Run the GenAI/AgenticAI Assessment scheduled job.

The summary tab provides a consolidated summary of overall findings along with summarization and resolution notes for ITSM and CSM. The results shown are estimates. You should evaluate results provided by AI Readiness Evaluation for accuracy and appropriateness for your use case.

To better understand the estimated remediation effort, select the **Legends** button. The legend shows the estimated remediation effort using sizing verbiage and colors, along with an estimated timeline of remediation in development days. The legend also includes descriptions of the icons found next to the assessment questions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example of Legends estimated remediation effort sizing



After reviewing the summary, select the individual assessment tabs to review those specific assessments. The questions for each assessment differ. For example, the questions and answers on the **Agentic AI - ITSM** assessment are different than the questions and answers on the **Agentic AI - CSM** assessment.

Note: The assessments gather information from tables. To view any of the tables' available questions, answers, assessments, or assessment run successes or failures, search for the applicable table in the navigation filter:

- Questions [sn_assess_question] table
- Answers [sn_assess_answer] table
- Assessment [sn_assess_assessment] table
- Assessment Run [sn_assess_assessment_run] table

For more information about how to search for tables in the navigation filter, see Navigate directly to a table.

The assessments include visual indicators to guide you on non-blocker and blocker results. The following list details the descriptions of the assessment's visual indicators:

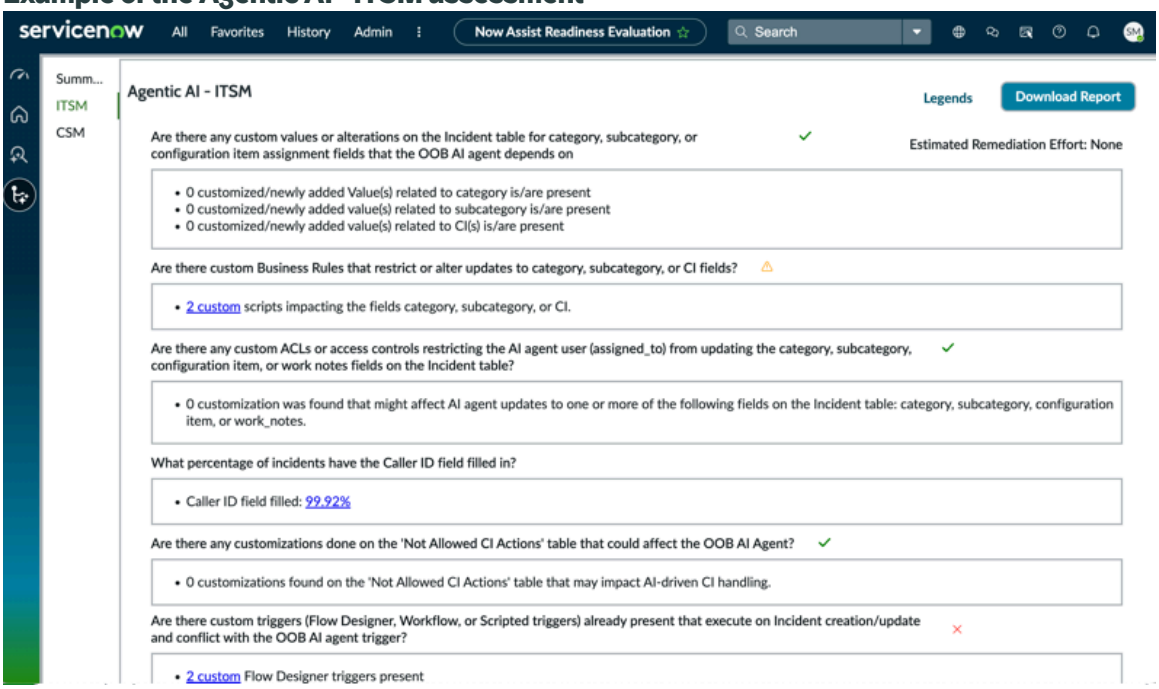
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- ✓: Informational area and no further action needed.
- ✗: Further action is needed to resolve findings before implementation. These required areas include estimated remediation efforts.
- ⚠: Recommended area warning, but the finding should be evaluated before implementation. These recommendations are observations that should be reviewed prior to implementation but no estimated remediation effort is provided.

You can select **Download Report** to export the entire agentic assessment report in PDF format from the Summary tab. The exported report still includes hyperlinks to the specific individual assessments. Selecting **Download Report** on an individual assessment downloads only that report in PDF format. After selecting a hyperlink in the PDF, that record or table opens in a separate browser tab.

Note: You don't have to select **Download Report** to work directly with the problematic records or tables found in the assessment. Each assessment includes hyperlinks to the records or tables that need attention. Selecting a hyperlink opens the record or table in a separate browser tab.

Example of the Agentic AI - ITSM assessment



After reviewing the assessment and making the suggested assessment changes, rerun your scheduled jobs to see how your results improve. For more information on rerunning a specific job or all jobs, see Run the GenAI/AgenticAI Assessment scheduled job.

AI Readiness Evaluation reference

AI Readiness Evaluation admins and implementers can work with select system properties for additional customization.

Important: The AI Readiness Evaluation store application is being prepared for deprecation. The readiness assessment capability is now available as a native in-platform feature within the AI Admin Center application. For more information, see AI Admin Center (formerly Now Assist Center).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Readiness Evaluation system properties

Use system properties to customize your readiness assessment results. Access these properties from the System Property [sys_properties] table.

Important: The AI Readiness Evaluation store application is being prepared for deprecation. The readiness assessment capability is now available as a native in-platform feature within the AI Admin Center application. For more information, see AI Admin Center (formerly Now Assist Center).

AI Readiness Evaluation system properties

Property	Description
sn_assess.assessment_limit	Reduce performance issues when a large volume of data is assessed. Adjust this system property, if needed, so that the job can run successfully. The default value is 10000.
sn_assess.effort_visibility	Control whether remediation effort estimates appear on the AI Readiness Evaluation.The default value is false. When this system property is set to **true**, both assessment tabs display effort cards and finding cards. The **Remediation properties** tab appears on the dashboard where you can customize estimated remediation efforts. All input values represent estimated remediation efforts in days. After making changes to the estimated remediation efforts, select **Save**, and then re-run the assessments to see the updated remediation efforts reflected.
sn_assess.va	Enables or disables the scheduled job for the AI Assessment - Virtual Agent. Set to **true** to enable, or **false** to disable. The default value is true. If set to **false**, the scheduled job will not run and no Virtual Agent assessment data will be generated. For the Virtual Agent assessment to run, the following prerequisites must all be met: • Virtual Agent (com.glide.cs.chatbot) must be enabled on the instance. • Catalog Conversational Coverage (sn_catalog_con_cov) must be active. This plugin is installed with ServiceNow Otto for Conversational Catalog Request (sn_now_assist_cr), which is included with ServiceNow Otto for Platform (sn_genai_platform).
sn_assess.itsm	Enables or disables the scheduled job for the AI Assessment - ITSM. The default value is true. If set to **false**, the scheduled job will

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Readiness Evaluation system properties (continued)

Property	Description
	not run and no ITSM assessment data will be generated.
sn_assess.csm	Enables or disables the scheduled job for the AI Assessment - CSM. The default value is true. If set to **false**, the scheduled job will not run and no CSM assessment data will be generated.
sn_assess.hrsd	Enables or disables the scheduled job for the AI Assessment - HRSD. The default value is true. If set to **false** the scheduled job will not run and no HRSD assessment data will be generated.
sn_assess.ai_search	Enables or disables the scheduled job for the AI Assessment - AI Search. The default value is true. If set to **false**, the scheduled job will not run and no AI Search assessment data will be generated.
sn_assess.Threshold	Defines the percentage threshold used to evaluate assessment results on the AI Readiness Evaluation home page, determining whether the status is displayed as *Good* or *Action Required*. The default value is 75% for all modules (ITSM, AI Search, CSM, Virtual Agent, and HRSD). If not set correctly, status indicators may be inaccurate.
sn_assess.TShirtMetric	Assigns numeric effort values to specific issue types and customizations, which power the remediation effort calculations displayed throughout the application. The default value is a JSON configuration. If modified, effort calculations will reflect updated values after the next assessment run. Review sn_assess.TShirtSize at the same time — if the two are out of sync, displayed effort estimates can may be inconsistent. If this property is not set, the system can't calculate remediation effort.
sn_assess.TShirtSize	Maps T-shirt size labels to effort in days. The default values are: *Small = 5 days*, *Medium = 10 days*, *Large = 30 days*, *XL = 90 days*, and *XXL = 180 days*. These mappings appear in effort pills and the Legends in the AI

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Readiness Evaluation system properties (continued)

Property	Description
	Readiness Evaluation dashboard. Review sn_assess.TShirtMetric at the same time when customizing. If not set correctly, effort pills will not display accurate effort in days and the Legends may show incorrect or missing information.
sn_assess.task_limit	Decides the maximum number of records to process for the ITSM assessment. The default value is 50. Be cautious about setting a higher limit or leaving the value empty because that would fetch all active records which could impact performance.

Data readiness for implementing AI on the ServiceNow AI Platform

High-quality data that is complete, accurate, and contextually relevant is the foundation for delivering precise, meaningful, and trustworthy AI responses.

AI requires high-quality data

To unlock the full potential of AI on your instance, the quality of your data is paramount. For AI to deliver accurate, context-aware, and actionable outputs, it must be trained and operate on high-quality data that is complete, consistent, and structured. When your data is well-prepared, AI can process user queries with greater accuracy, enabling faster resolutions and more effective self-service experiences.

Whether it's summarizing complex incidents, generating resolution notes, or creating knowledge articles, AI requires detailed records that reflect the full lifecycle of a task. Short or incomplete cases often lack the depth needed for meaningful AI processing, which can result in vague or unhelpful responses. The importance of data readiness extends beyond technical accuracy—it directly impacts user trust and adoption.

Clean, ready data also accelerates implementation. It minimizes the need for rework, reduces deployment friction, and helps AI features like summarization, recommendations, and workflow guidance operate reliably from the start. This leads to more consistent outcomes, helping teams focus on strategic tasks.

Moreover, high-quality data fosters trust in AI outputs. When users consistently receive reliable and context-aware responses, their confidence in the system grows—driving adoption. Ultimately, data quality supports user satisfaction and AI performance.

Follow these tips to assess your organization's data readiness:

- Audit task records for completeness and clarity, and ensure resolution fields are consistently filled out with clear summaries.
- Avoid using vague or generic language in task descriptions and updates.
- Maintain a clean and structured knowledge base and ensure that knowledge articles are linked to resolved cases.

  For details, see Knowledge Base readiness for AI on the ServiceNow AI Platform.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Audit Service Catalog items.

  For details, see Service Catalog readiness for AI on the ServiceNow AI Platform.

- Use the AI Readiness Evaluation app to assess catalog, case, and knowledge data.
- Use the AI Data Kit to curate and cleanse data sources.
- Align stakeholders (data owners, product managers, and engineers) around shared standards for AI-ready data.

  For details, see AI governance on the ServiceNow AI Platform.

For more information, see Data Readiness Checklist.

AI Readiness Evaluation app

Data readiness assessments can be time-consuming and manual, especially when evaluating whether catalog items are conversational or if knowledge articles are embedded in inaccessible formats like PDFs. The AI Readiness Evaluation app helps automate this process by analyzing service catalog entries, cases, and incidents, and then providing actionable recommendations to prepare data for AI use. It also enables you to assess whether updates, installations, or customizations of your instance could affect implementation. The assessments provide direct hyperlinks to improve any issues found.

For more information, see AI Readiness Evaluation.

Install AI Readiness Evaluation by requesting it from the ServiceNow Store. Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

AI Data Kit

If the base system generative AI skills don't fit your needs, use the AI Data Kit to curate, cleanse, and manage data for AI evaluations. You can create custom datasets and data collections that can be used in AI Skill Kit for evaluation. For more information, see AI Data Kit.

Application readiness for AI on the ServiceNow AI Platform

ServiceNow Otto uses the ServiceNow AI Platform to deliver AI solutions. Ensure that your instance is ready to use AI capabilities by preparing Platform applications, such as Service Catalog and AI Search.

Installing a product such as ServiceNow Otto for IT Service Management (ITSM) gives you access to AI capabilities in Platform applications and capabilities specific to your product workflow. Ensure that the appropriate Platform applications are ready for AI. To prepare your instance, review the following topics:

- Knowledge Base readiness for AI on the ServiceNow AI Platform
- Service Catalog readiness for AI on the ServiceNow AI Platform
- AI Search readiness for AI on the ServiceNow AI Platform
- ServiceNow Otto for Virtual Agent readiness on the ServiceNow AI Platform

After ensuring that your AI policy, your data, and your applications are ready, you can implement AI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Ensure entitlement for at least one ServiceNow Otto application. For a list of available applications, see Exploring AI Admin Hub.

   Note: Some ServiceNow Otto products may require other entitlements.

2. In the ServiceNow Store, check version compatibilities and dependencies for ServiceNow Otto apps.

   For more information, see Evaluating version requirements and dependencies.

3. Install ServiceNow Otto products from the AI Admin Hub console.

   For more information, see Install plugins for ServiceNow Otto.

Customization and AI

Customizing your ServiceNow instance is often necessary to meet unique business needs, but it can introduce unintended consequences for AI features. Changes to field names, UI actions, workflows, or table structures may disrupt how generative AI skills and agents operate. For example, modifying field states or labels can interfere with skill conditions and input mapping, while altering default UI actions may prevent agents from triggering correctly. Custom resolution workflows might conflict with the logic embedded in native skills, and table-level variations can affect where and how ServiceNow Otto functions across workflows. These customizations can also create upgrade friction, requiring additional testing, rework, or reconfiguration to confirm compatibility with new platform releases.

To mitigate these risks, you can use tools like the AI Readiness Evaluation app to identify high-impact customizations and plan for remediation before deploying or upgrading AI features. For more information, see AI Readiness Evaluation.

To maintain compatibility with ServiceNow Otto while accommodating custom configurations, several mitigation strategies are available:

- Duplicate skills before adapting them.
- Adjust skill inputs and role conditions to reflect organizational processes.
- Add input sources, such as related tables or emails.

For more advanced needs, build custom generative AI skills tailored to your unique business requirements, enabling deeper integration without compromising core functionality.

For more information about customizing AI solutions, see How to approach building custom generative AI solutions using Now Assist in the ServiceNow Community.

Knowledge Base readiness for AI on the ServiceNow AI Platform

The knowledge base enables ServiceNow Otto to deliver intelligent, accurate, and context-aware responses across AI Search, Q&A Genius Results, and other AI-powered experiences.

When users ask questions, ServiceNow Otto searches your knowledge articles to generate answers that reflect your organization's expertise and policies. This means the quality, clarity, and structure of your knowledge content directly influence the effectiveness of AI responses. Outdated, inconsistent, or poorly written articles can lead to incorrect outputs and user frustration. That's why maintaining a clean, well-organized knowledge base is critical—not just for documentation, but for enabling reliable AI performance.

The Knowledge Management Overview dashboard helps assess AI readiness. It provides key usage metrics such as article views, helpfulness ratings, and feedback trends, helping content

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

owners identify high-performing articles and prioritize updates to low-usage or outdated content. For more information, see Knowledge Management Overview dashboard.

High-level checklist

1. Review existing KB articles and knowledge bases

Get the total count of published KB articles and the number of active knowledge bases.

Why? To scope clean-up and identify high-priority content.

See: Knowledge Management Overview dashboard

2. Review the structural formatting of KB articles

Check for consistent template use (KCS-based, Q&A, Issue-Cause-Resolution, etc.). Verify that the Knowledge Management Advanced plugin is active.

If you're using custom templates, determine whether they follow a consistent format. Also ensure that key steps are clearly defined and consistently populated.

Why? Using templates consistently improves LLM understanding and summarization.

See:

- Knowledge article templates
- Activate the Knowledge Management Advanced plugin

3. Ensure metadata completeness in KB articles

Make sure that fields such as **Meta**, **Meta Description**, **Category**, **Author**, and **Validity** are populated.

Why? This practice enables precise AI filtering and targeting.

See:

- Create a knowledge article
- Knowledge article guidelines for generative AI (ServiceNow Community)

4. Perform maintenance audits

Flag KB articles that have not been updated in a year or more, that have no metadata, are duplicates, or are about to expire.

Why? Outdated content degrades user trust and AI performance.

See:

- Knowledge Management Overview dashboard
- Retire a knowledge article
- Identify and review duplicate Knowledge articles (requires ServiceNow Otto for Knowledge Management)

5. Review top searched queries

Identify search queries and articles for optimization, and limit Now Assist Q&A functionality to high-quality, optimized KB articles.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Why? This prevents low-value content from surfacing in answers.

See: Knowledge Management dashboard

Service Catalog readiness for AI on the ServiceNow AI Platform

A well-structured Service Catalog is essential to supporting AI capabilities. As the backbone of many self-service workflows, the catalog enables ServiceNow Otto to interpret user requests accurately, present the right options, and reduce complexity for users.

When catalog items are clearly defined and conversationally enabled, ServiceNow Otto for Virtual Agent can surface them more effectively, which can increase self-service rates and reduce escalations.

However, catalogs that are cluttered, inconsistent, or overly complex make it difficult for AI to parse and respond appropriately. That's why auditing your existing catalog is a critical first step. By identifying which items are AI-ready and optimizing those that aren't, you confirm that ServiceNow Otto can deliver intelligent, context-aware responses.

High-level checklist

1. Activate the Catalog Conversational Coverage (sn_catalog_con_cov) plugin

This plugin gives you access to the conversational catalog overview dashboard.

See: Install an application or plugin

2. Review your catalog inventory

Use the conversational catalog overview dashboard to review all active catalog items. From this list, determine which are most requested and the percentage that are conversational.

Why? To focus improvement efforts on the catalog items with the highest impact.

See:

- Catalog Conversational Coverage
- Conversational catalog overview dashboard

3. Determine which catalogs can be made conversational

Identify catalog items with fewer than 15 variables. (Items with more than 15 variables are better suited to be submitted as pop-up links to forms.)

> **Note:** Conversational catalog items require ServiceNow Otto for Virtual Agent. For details, see ServiceNow Otto for Virtual Agent readiness on the ServiceNow AI Platform.

Why? These are easier to convert and provide early AI improvements.

See: Service catalog variables

4. Analyze catalog item metadata

Ensure catalog items have clear, user-friendly names, tooltips, metadata, and categories. Using templates can help with this as well.

Why? This prevents large language model (LLM) misinterpretation and improves conversational flow.

See:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Service Catalog properties
- Edit a catalog item in Catalog Builder
- Create a catalog item using a template

5. Review advanced configurations

Review UI policies, client scripts, and user criteria.

Why? User criteria determines who can request an item, but policies and scripts are not processed by Virtual Agent.

See:

- Service catalog UI policy
- Set security for items and categories
- Create a user criteria record in Service Catalog
- Create a Service Catalog client script

Tips

- Use ServiceNow Otto for Catalog Builder to generate catalog items.
- Limit the number of variables. Fewer variables improve conversational accuracy.
- For form-based requests, select the Make item non-conversational in VA check box.
- Provide clear context for the LLM with distinct names, labels, and tooltips.
- Minimize the use of custom variable types. Use the service catalog variables included on the platform instead.
- Limit client-side scripting and use regular expressions for validation.
- Avoid complex dependencies. Simplify variable relationships to ensure a smooth conversation flow.
- Test and iterate: make changes based on feedback.

For more information about conversational catalogs in AI, see the following ServiceNow Community articles:

- Guidance for making catalog items conversational
- How to request catalog items in ServiceNow Otto for Virtual Agent

AI Search readiness for AI on the ServiceNow AI Platform

ServiceNow Otto for AI Search is built directly on the foundation of ServiceNow® AI Search. AI Search provides the underlying infrastructure that enables ServiceNow Otto to retrieve and rank enterprise content—such as knowledge articles, records, and documentation—based on relevance and access permissions.

Because AI Search adheres to ServiceNow security models, responses are grounded in content the user is authorized to access. Additionally, AI Search admin tools give you control over relevancy tuning, allowing you to refine how content is surfaced and verify that ServiceNow Otto delivers relevant results.

Every AI-generated answer includes citations and references, allowing users to see exactly where the information came from. Citations and references let users verify the source of information, helping to ground outputs in your organization's actual content.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Activate AI Search before implementing AI more broadly. After activation, it powers actionable Q&A through Genius Results cards in global search, Service Portal, Employee Center, and Virtual Agent.

High-level checklist

1. Verify AI Search status

Verify that AI Search is active on your instance. To check status, navigate to **All** > **AI Search** > **AI Search Status**. If AI Search is not active, select the **Request AI Search** button to initiate activation.

See:

- Configuring AI Search
- Enable AI Search in supported ServiceNow AI Platform® applications

2. Review search sources

Configure search sources to determine what data will be searched by user queries.

See:

- Control access to searchable content using search sources
- Create a search source for AI Search

3. Configure search sources for external content

Enables Q&A search to include external content.

See:

- Indexing and searching external content in AI Search
- Create an indexed source
- Configuring External Content Connectors

4. Enable AI Search on one or more portals

Display AI Search results in the portals on your instance.

See:

- Search application configurations
- Enabling and configuring AI Search in ServiceNow AI Platform® applications

5. Install ServiceNow Otto for AI Search

Install a ServiceNow Otto product in the AI Admin Hub console.

See: Install ServiceNow Otto for AI Search

6. Enable Q&A Genius Results in AI Search portals

Specify the Genius Result types you want to make available in each of your AI Search portals. Multi-Content Response Genius Results use an LLM to generate search and chat responses that synthesize information from knowledge articles, Service Catalog items, and other available content types. Answers are presented in Q&A format.

See:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Enable ServiceNow Otto for AI Search Genius Results in AI Search portals and mobile applications
- Knowledge base articles Genius Results

7. Verify AI Search widget customizations

Customized AI Search widgets may not correctly show Q&A search results even when configured for ServiceNow Otto, since customizations get skipped during upgrades.

See:

The ServiceNow AI Platform® offers a variety of search tools, which may return different answers for the same or similar searches. This disparity in results is expected. For more information, see Search result disparities between AI Search and ServiceNow Otto® search features.

For more information, see ServiceNow Otto for AI Search FAQ in ServiceNow Community.

ServiceNow Otto for Virtual Agent readiness on the ServiceNow AI Platform

ServiceNow Otto for Virtual Agent has AI-driven capabilities that interpret natural language, guide users through complex tasks, and deliver high-confidence answers without relying on rigid keyword matching or manual configurations.

ServiceNow Otto for Virtual Agent provides the following features:

- AI asset discovery

  ServiceNow Otto for Virtual Agent uses LLMs to automatically discover and match user intents to Virtual Agent topics and other AI assets, including generative AI skills, AI agents and agentic workflows, and subflows and actions.

- Simplified deployment

  Using LLM-powered Virtual Agent topics, teams can accelerate rollout and improve conversation quality.

- AI Search Genius Results

  Users receive curated, actionable responses via Genius cards, which contain summarized knowledge with direct actions such as **Request this item**.

- Conversational catalog ordering

  Users can request Service Catalog items using natural conversation. Virtual Agent asks clarifying questions and confirms the user's intent before completing the request.

  Note: Service Catalog items must be marked as conversational to work with Virtual Agent. For details, see Catalog item conversational details page overview.

- Multi-turn Q&A

  Follow-up questions are handled automatically, allowing users to refine their queries and get better answers.

Setting up Now Assist in Virtual Agent requires customizing or creating a new LLM assistant. You can assign an assistant to one or more portals. If LLM Virtual Agent topics aren't associated with an LLM assistant, they aren't discoverable.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

High-level checklist

1. Install ServiceNow Otto for Virtual Agent

You can install it from the Conversational Interfaces admin console after you install an AI product such as ServiceNow Otto for IT Service Management (ITSM).

To set up ServiceNow Otto for Virtual Agent, you configure an assistant.

See: Assistants overview

2. Review your Virtual Agent topic inventory

Review your topics and identify high-volume user queries. You can use Assistant Analytics to monitor, evaluate, and optimize the performance of your AI-powered assistants.

Why? This helps you identify the top self-solve opportunities in Virtual Agent.

See:

- (Legacy) Conversational Analytics dashboard in Platform Analytics experience
- Create an Automation Discovery report

3. Review your knowledge base

Identify KB articles that can self-serve any of the top intents you identified.

Why? This simplifies topic management and enables self-service.

See: Knowledge Base readiness for AI on the ServiceNow AI Platform

4. Migrate NLU topics to LLM

Use the topic migration tool in Virtual Agent to convert NLU topics to LLM.

Why? Use existing Virtual Agent topics with minimal effort.

See: Migrating NLU/keyword Virtual Agent topics to LLM topics

5. Review Service Catalog items

Identify self-serve catalog items that can be replaced with existing LLM topics.

Why? To avoid redundancy and eliminate the need to create new Virtual Agent topics.

See: Service Catalog readiness for AI on the ServiceNow AI Platform

6. Review LLM Virtual Agent topics

Use these LLM topics as a starting point for Virtual Agent topic creation.

Why? New LLM versions of older NLU Virtual Agent topics reduce rework.

See: ITSM Virtual Agent pre-built LLM topics

Tips

- When migrating legacy NLU topics, optimize topic descriptions so that the topic is clearly described and aligned with the intent and expected results.

  For details, see LLM description and instruction guidelines for Virtual Agent topics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- You can customize the look of your assistant and the chat experience during guided setup.

  For details, see Brand and personalize an assistant.

- You can choose the chat experience you want for each assistant:
  - Standard chat
  - Enhanced chat
  - Premium chat
- You can integrate ServiceNow Otto for Virtual Agent with Microsoft Teams.

  For details, see Integrating ServiceNow® Otto for Virtual Agent with Microsoft Teams.

For more information about conversational catalogs in AI, see the following information from ServiceNow Community and YouTube:

- How to request catalog items in ServiceNow Otto for Virtual Agent
- AI Academy: Enhanced chat experience with ServiceNow Otto for Virtual Agent

Establishing AI governance

Define policies, assign roles, and configure guardrails for responsible AI deployment across your organization.

Establish the governance framework that keeps AI deployments responsible, secure, and aligned with your organizational policies before activating AI capabilities across your organization. Governance is not a one-time setup; it is an ongoing discipline that grows alongside your AI adoption.

AI governance

AI governance on the ServiceNow AI Platform encompasses the policies, roles, and technical guardrails that control how AI solutions behave, who oversees them, and how you maintain accountability. Define your organization's AI usage policies: which use cases are approved, what data AI can access, and how outputs should be reviewed before action is taken.

To learn more about AI policy considerations and AI policy stakeholders see AI governance on the ServiceNow AI Platform.

AI Control Tower

AI Control Tower brings the teams responsible for AI across your organization into a single workspace, so they can expand AI adoption while maintaining oversight. The Home page gives governance leaders a portfolio-level view at a glance — the highest-priority work to act on, the makeup of the AI inventory, governance posture across quality, safety, security, compliance, and risk, regulatory risk classification, and the value AI assets deliver. From the same workspace, teams plan AI strategy, discover and inventory AI assets, govern risk and compliance, monitor AI in production, and measure value.

As AI activity grows, AI Control Tower surfaces the work that matters instead of leaving teams to search for it. Recommendations and AI insights flag the highest-priority governance issues and opportunities, ordered by role, severity, and confidence. Monitoring scores your AI systems for quality and safety, adds AI-generated insights, and tracks trends so regressions surface before they reach users. When an issue calls for judgment, a conversational assistant works through it

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

with you in the workspace, proposing actions you can accept, refine, or reject, while routine fixes can run hands-off through an automated agent.

To inventory your AI, monitor its quality and safety, track risk and compliance, and measure the value it delivers from one workspace, see AI Control Tower.

AI Risk and Compliance

For organizations in regulated industries or subject to frameworks such as the EU AI Act, the AI Risk and Compliance application helps you manage AI capabilities ethically, mitigate AI risks, and maintain compliance. Map AI solutions to regulatory requirements and maintain audit-ready documentation.

To map AI solutions to regulatory requirements such as the EU AI Act and keep audit-ready documentation, see AI Risk and Compliance.

AI Guardian

AI Guardian is built on the ServiceNow Small Language Model (SLM) and monitors generative AI interactions to detect offensive content, prompt injection attacks, and sensitive topics. Because LLM outputs are probabilistic and human interactions are unpredictable, Guardian provides a real-time safety layer that operates independently of the underlying language models.

To add a real-time safety layer that detects offensive content, prompt injection attacks, and sensitive topics in your generative AI interactions, see AI Guardian.

AI security

Strengthening your overall security posture, including access controls, data handling policies, and solution-level permissions, is critical for responsible AI deployment. Review and configure the platform security settings that apply to AI capabilities on your instance.

Note: Governance policies should be established before activating generative AI skills or deploying AI agents. This approach subjects every AI interaction on your instance to your organizational controls from day one.

To review and configure the access controls, data handling policies, and solution-level permissions that apply to AI on your instance, see .

AI governance on the ServiceNow AI Platform

As organizations increasingly adopt AI to drive efficiency, innovation, and customer experience, AI governance becomes essential to ensure responsible use, regulatory compliance, and alignment with enterprise goals. The ServiceNow AI Platform provides a comprehensive governance framework through key roles and applications that work together to manage AI across its life cycle.

AI policy considerations

The following policy considerations shape how AI is deployed, monitored, and maintained across the enterprise.

Data security and privacy

AI systems must comply with strict data handling protocols to protect sensitive information. This includes the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Data classification rules for personally identifiable information, protected health information, and financial data.
- Encryption standards for data in transit and at rest.
- Data residency and sovereignty restrictions, which determine where data can be stored and processed.
- Retention and deletion policies that govern how long data is kept and when it must be purged.

Admins can configure ServiceNow Otto for Data Privacy to mask sensitive fields and control what is shared with third-party models. For details, see Data Privacy for ServiceNow Otto.

Compliance and regulations

AI deployments must adhere to a range of regulatory frameworks, including:

- HIPAA, PCI DSS, GDPR, CCPA, and FedRAMP, depending on the industry and geography.
- Third-party/vendor risk management, especially when external models or services are used.
- Logging and traceability requirements help ensure accountability in AI decisions.

Legal reviews are often required before publishing documentation or releasing features, particularly when consolidating overlapping control objectives or addressing model transparency.

Responsible AI use

To ensure ethical and effective AI, organizations should enforce the following:

- Model approval and usage guidelines, including naming conventions and branding policies for AI agents.
- Bias and fairness safeguards, with AI Stewards evaluating risks like hallucination or exposure of sensitive data.
- Human oversight requirements, ensuring AI augments rather than replaces human judgment.
- Transparency obligations, such as disclosing the use of third-party models like Azure OpenAI in product documentation.

Governance and change management

AI governance is supported by structured oversight and change control processes:

- Definition, review, and approval of enterprise-wide guardrails and new use cases.
- Change control and rollout processes ensure that AI features are deployed safely and predictably.
- Incident response and escalation plans are in place to address issues such as data breaches or model failures.

AI policy stakeholders

The following groups set and execute AI policy in an organization:

Policy setters

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Chief Information Officer (CIO) or Chief Technology Officer (CTO) sets the overall technology strategy, ensuring AI initiatives align with enterprise architecture and innovation goals. The Chief Information Security Officer (CISO) establishes data security and encryption standards to safeguard sensitive information across AI workflows. The Chief Data Officer (CDO) oversees data usage and governance, ensuring that AI systems handle data ethically and in accordance with organizational policies. Meanwhile, the Chief Privacy Officer and legal teams are responsible for regulatory compliance, ensuring that AI deployments meet requirements such as GDPR, HIPAA, and other jurisdictional or industry-specific standards. Together, these leaders form the foundation of AI governance, guiding implementation teams and administrators in deploying AI responsibly and securely.

Internal governance and oversight

Governance and oversight of AI is led by structured groups that define and enforce responsible use. An AI Governance Committee and Data Governance Council set enterprise-wide guardrails for AI, including standards for privacy, fairness, and compliance, and are responsible for reviewing and approving new AI use cases. Supporting these bodies, the AI Steward ensures that AI is used responsibly across workflows, overseeing data quality, managing risks such as bias or data exposure, and monitoring adherence to regulatory requirements. Additionally, AI Stewards monitor regulatory compliance, assess performance and user feedback, and work with admins and developers to optimize AI automation while minimizing risk.

Implementation and operations

Implementation and operations teams are responsible for securely deploying and managing AI features in alignment with governance policies. The Now Assist admin configures and manages AI capabilities, ensuring that AI features are properly mapped to workflows and governed according to enterprise standards. Platform owners and ServiceNow admins oversee the deployment process, making sure that all configurations comply with established policies and technical requirements. Meanwhile, AI developers build, extend, and integrate AI features into business workflows, working closely with admins and platform teams to deliver scalable, compliant, and effective AI solutions. Together, these roles translate governance policies into secure, functional AI implementations.

For more information about AI governance user roles, see AI Risk and Compliance roles and Assign the data steward role.

For more resources about AI governance, see the following best practices topics:

- AI Governance White Paper
- Technical Governance Foundation Template
- Governance in operational phase: Roles and responsibilities

AI governance tools

AI governance is specified in the following tools:

AI Control Tower

The AI Control Tower functions as the central hub for AI strategy, governance, and analytics. It offers enterprise-wide visibility into AI assets, usage patterns, and compliance status, enabling organizations to maintain oversight and accountability. Through automated discovery and inventory of approved AI assets, it streamlines asset management while embedding governance checks and compliance alerts to ensure that all AI deployments remain secure and aligned with organizational policies.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information, see AI Control Tower.

AI Admin Hub

The AI Admin Hub is key to managing AI governance by configuring policies, enforcing data handling rules, and ensuring compliance with security and privacy standards. Admins oversee provider policies at the skill level, track usage analytics like success rates and adoption, and collaborate with AI stewards and business SMEs to align AI with organizational goals. They also connect governance committees with technical teams to support smooth policy execution.

For more information, see Overview tab in AI Admin Hub.

AI Control Tower

Gain visibility into your organization's AI footprint, manage the lifecycle of AI investments, govern risk and compliance, and measure the business impact of AI with AI Control Tower.

Track the value, adoption, and engagement of AI across your organization.	Track and resolve the governance work and AI-generated recommendations waiting for you in Activity Center.	Look up roles, tables, data model attributes, and form field details.

Important:

- Not all model providers are available for customers with in-country SKUs, and some AI products/features are currently unavailable for in-country customers. For more information, see the KB1584492 article in the Now Support Knowledge Base. Be sure to check for model provider availability updates in future releases.
- Some AI products/features are currently unavailable for customers in the FedRAMP, NSC DOD IL5, or Australia IRAP-Protected data centers, self-hosted customers, or in other restricted environments. For more information, see the KB0743854 article in the Now Support Knowledge Base. Be sure to check for availability updates in future releases.
- Some AI products/features are currently available only for customers in some regions. Be sure to check for availability updates in future releases.
- Some AI products and skills are not available in Regulated Markets. For more information, see KB2593939: Regulated Markets AI Products/Skills Not Available. Be sure to check for availability updates in future releases.

AI limitations

This application uses artificial intelligence (AI) and machine learning, which are rapidly evolving fields of study that generate predictions based on patterns in data. As a result, this application may not always produce accurate, complete, or appropriate information. Furthermore, there is no guarantee that this application has been fully trained or tested for your use case. To mitigate these issues, it is your responsibility to test and evaluate your use of this application for accuracy, harm, and appropriateness for your use case, employ human oversight of output, and refrain from relying solely on AI-generated outputs for decision-making purposes. This is especially important if you choose to deploy this application in areas with consequential impacts such as healthcare, finance, legal, employment, security, or infrastructure. You agree to abide by ServiceNow's AI Acceptable Use Policy, which may be updated by ServiceNow.

Data processing

This application requires data to be transferred from ServiceNow customers' individual instances to a centralized ServiceNow environment, which may be located in a different data center region from the one where your instance is, and potentially to a third-party cloud provider, such as Microsoft Azure. This data is handled per ServiceNow's internal policies and procedures, including our policies available through our CORE Compliance Portal.

Note: We have controls in place to enable/disable the data collection and data processing.

Data collection

ServiceNow collects and uses the inputs, outputs, and edits to outputs of this application to develop and improve ServiceNow technologies including ServiceNow models and AI products. Customers can opt out of future data collection at any time, as described in the AI Opt-Out page.

© 2026 ServiceNow, Inc. All rights reserved.

Exploring AI Control Tower

Learn how AI Control Tower provides centralized visibility and governance across your organization's AI portfolio, connecting strategic planning, asset discovery, monitoring, compliance, and value measurement in a single workspace.

AI Control Tower overview

As your organization deploys AI systems across business units, from generative AI assistants and agentic workflows to classical machine learning models, the challenge shifts from building AI to governing it. AI Control Tower addresses this by providing a centralized workspace where cross-functional teams can manage the full AI lifecycle.

- Maintain a complete, current inventory of AI systems, models, prompts, and tools across ServiceNow and external platforms including AWS, Azure, and Google Cloud.
- Detect quality and safety regressions before they escalate, using automated scoring and trend analysis for AI interactions in production.
- Track compliance posture against frameworks like NIST AI RMF and EU AI Act across your AI assets.
- Quantify the business value of AI investments with productivity, cost savings, and adoption metrics tied to individual AI systems.
- Coordinate governance work across cross-functional teams with lifecycle playbooks, approval routing, and AI-generated recommendations.

AI Control Tower users

Users

User	Description
AI steward	Oversees the state of AI across all inventory, including value and adoption insights. Reviews quality and safety scores, monitors risk and compliance posture, investigates cases and inquiries, and coordinates with AI system owners to maintain governance standards.
Administrator	Activates and configures AI Control Tower plugins, manages data sharing and multi-instance settings, configures AI model providers and data routing, sets up playbook templates, and maintains users and roles.
Workspace administrator	Tailors AI Control Tower pages for the organization by configuring the widgets on them, so that each page presents the terminology, level of detail, and records that teams work with. Widget configurations apply to all users on the instance.
AI asset owner / Product owner	Manages the AI assets they own, views value and adoption metrics for their systems, tracks lifecycle status, and creates or responds to AI cases and approval requests.
Risk and compliance user	Monitors risk classifications, reviews compliance posture against authority documents and policies, manages risk assessments, and helps track regulatory changes affecting AI assets.

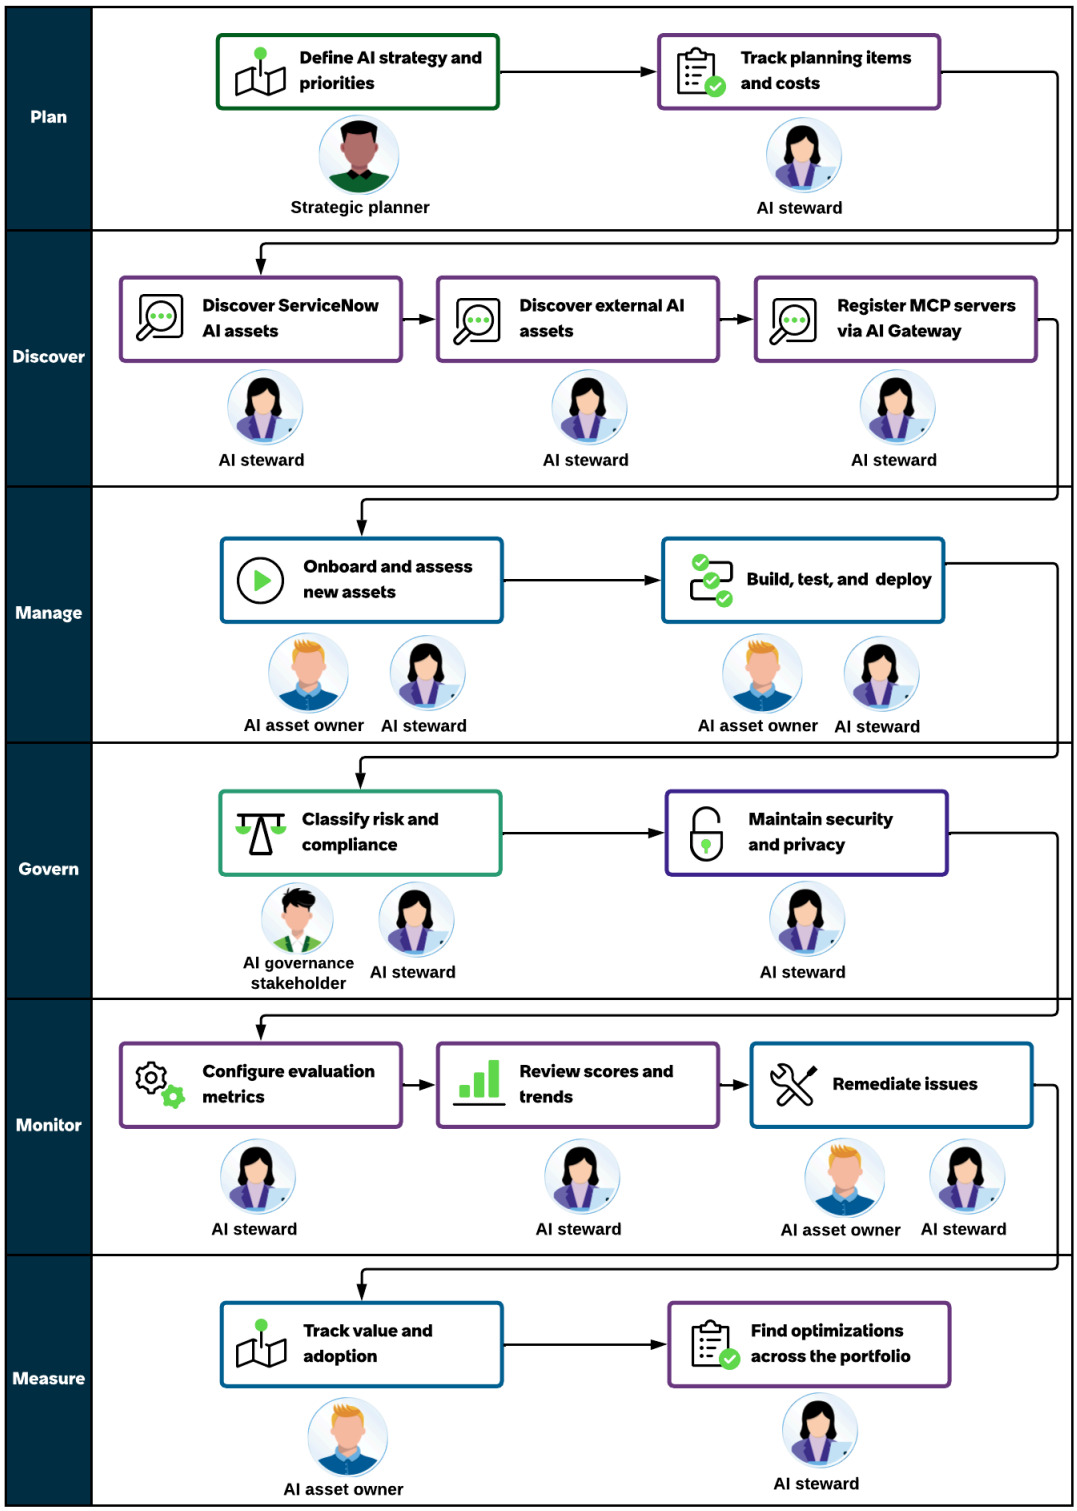
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Control Tower workflow

The following workflow shows how different users work together in AI Control Tower to take an AI asset from strategic planning through ongoing value measurement.

Managing AI assets with AI Control Tower



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. **Plan AI strategy.** Strategic planners and AI stewards define AI priorities, set measurable goals, and track planning items and costs through integrations with Goal Framework, Strategic Planning, and PPM Standard.
2. **Build the AI asset inventory.** AI stewards bring AI assets into the inventory through three discovery and registration mechanisms. Discovery automatically syncs ServiceNow AI assets — including skills, models, prompts, datasets, agents, and tools — into AI Control Tower. Hyperscaler connections find AI assets across external platforms like AWS Bedrock, Azure AI Foundry, Copilot Studio, and Google Cloud Platform Vertex AI. AI stewards register Model Context Protocol (MCP) servers through AI Gateway, where each registration is routed through an approval playbook before the server joins the inventory and benefits from AI Gateway's governance, observability, and security controls.
3. **Manage assets through the lifecycle.** AI stewards and asset owners take each asset through lifecycle playbooks — onboard, assess, build and test, and deploy — with the right approvals routed to the right reviewers at each phase. Lifecycle playbooks are how governance, risk, and compliance checks get applied operationally as an asset progresses toward deployment.
4. **Govern AI assets.** Risk and compliance users classify assets against frameworks like NIST AI RMF and EU AI Act and track regulatory posture across the inventory. AI stewards maintain AI security and privacy controls, including agent identities, access controls, privileged agent reviews, and dormant system reviews. Governance activities continue throughout an asset's lifecycle, not just at onboarding.
5. **Monitor AI in production.** The evaluation engine scores AI interactions automatically against quality and safety metrics. AI stewards review scores and trends, investigate regressions in low-scoring sessions, and coordinate with AI system owners to remediate issues by adjusting agent configuration, prompts, or tools.
6. **Measure value and adoption.** AI asset owners and AI stewards track value realization — productivity gains, cost savings, and user adoption — across the AI portfolio, then identify optimization opportunities to improve return on AI investments.

AI Control Tower benefits

AI Control Tower benefits

Benefit	Feature	Users
Review your AI portfolio at a glance — top priority actions, inventory composition, governance posture, regulatory risk, realized value, and outstanding tasks — from a single landing page.	Home	AI steward, AI asset owner
Track governance work across your team — your assigned items, team workload, unassigned queue, and AI-generated recommendations — in one workspace.	Activity Center	AI steward, AI asset owner
Focus on the highest-priority governance work automatically surfaced across the product, and resolve routine issues with supervised or unsupervised AI agents.	Recommendations and AI insights	AI steward, AI asset owner
View and update every aspect of an AI asset — details, lifecycle phase, risk and compliance posture, security findings, monitoring scores, and realized value — from a single record page.	Working with AI asset records	AI steward, AI asset owner

What to explore next

To learn more about each area of AI Control Tower, see the following topics:

- Configuring AI Control Tower
- Planning your AI strategy
- Discovering and managing AI assets
- Governing AI assets
- Monitoring AI systems
- Measuring AI impact
- Addressing your AI action items

AI portfolio overview

Act on the AI governance work that matters most, review the state of your AI portfolio, and track the value your AI assets deliver on the **Home** page in AI Control Tower.

Key benefits

- Identify the highest-priority recommendations and lifecycle tasks that need your attention today.
- Review the size and composition of your AI asset inventory and the split between managed and unmanaged assets.
- Check the governance posture of your managed AI assets across quality, safety, security, compliance, and residual risk avoidance.
- Track the total value your managed AI assets deliver and the trend over time.

The **Home** page provides a portfolio-level view of all AI assets across your organization. For a detailed view scoped to a single AI asset, see Working with AI asset records.

Note: If you have the AI Asset Owner [sn_ai_asset_mgmt.ai_asset_owner] role, the **Home** page displays details only for the AI assets that you're assigned to manage.

© 2026 ServiceNow, Inc. All rights reserved.

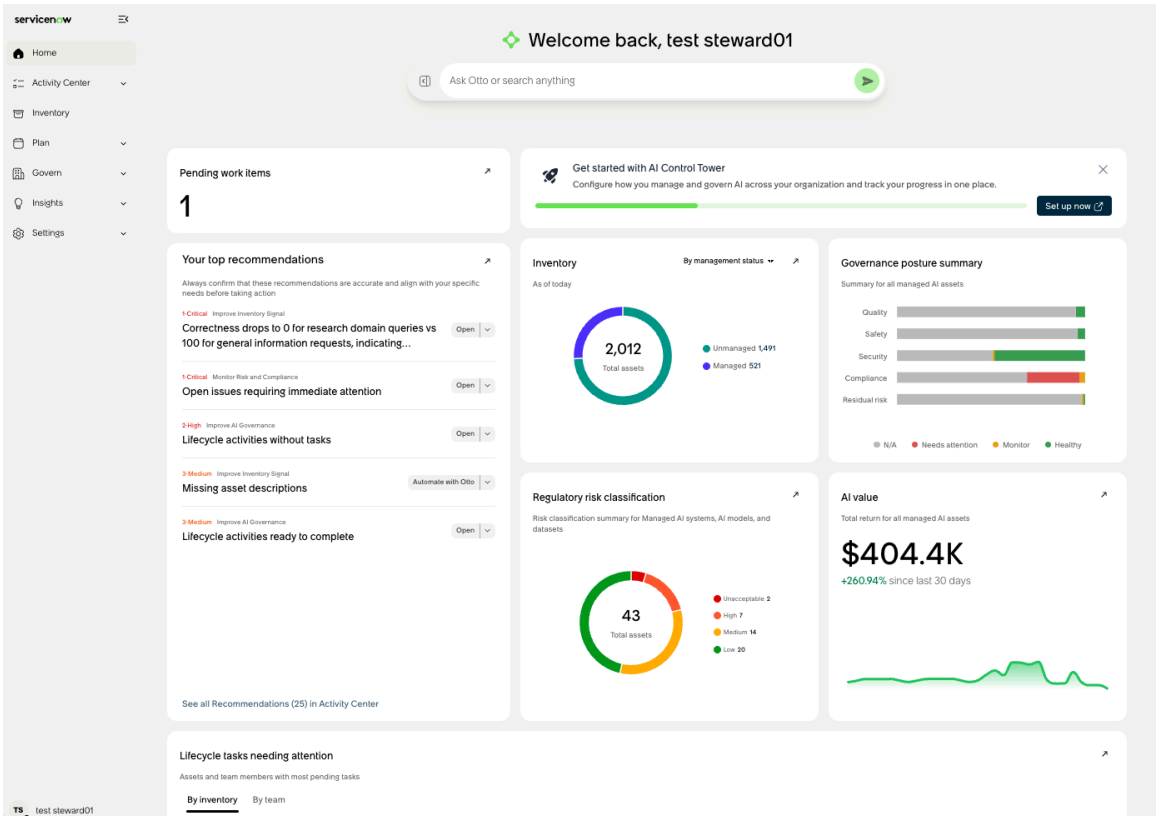
AI Control Tower Home



Required roles

The AI steward [sn_ai_governance.ai_steward] or AI asset owner [sn_ai_asset_mgmt.ai_asset_owner] role is required to access the **Home** page in AI Control Tower.

Accessing the overview

Access an overview of your AI portfolio on the **Home** page in AI Control Tower by navigating to **All** > **AI Control Tower** > **Home**.

Use cases

- Act on the recommendations AI Control Tower has surfaced for you from the **Your top recommendations** widget.
  - Review each recommendation and resolve it using the primary action on the card.
  - Select **See all Recommendations in Activity Center** to open the full list of recommendations for your portfolio. For more information, see Recommendations and AI insights.
- Check how much work is waiting for you across AI Control Tower from the **Pending work items** widget.
  - Review the total count of work items assigned to you or created by you, spanning recommendations, lifecycle tasks, and the other work types tracked in Activity Center.
  - Select the widget to open **Activity Center** and work through the underlying items. For more information, see Addressing your AI action items.
- Review the size and composition of your AI inventory.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If you have the AI steward [sn_ai_governance.ai_steward] role, you can view the total number of AI assets in the **Inventory** widget. If you have the AI asset owner [sn_ai_asset_mgmt.ai_asset_owner] role, you can view the total number of assets you own in the **Your inventory** widget.
- Break down your inventory by **By type**, **By status**, **By department**, or **By management status**, and identify where your assets are concentrated.
- Select the widget to open the **Inventory** page, where you can search, filter, and take action on individual assets.

- Assess the governance health of your managed AI assets from the **Governance posture summary** widget.
  - Review the distribution of managed AI assets across five dimensions: **Quality**, **Safety**, **Security**, **Compliance**, and **Residual risk**.
  - Identify the dimensions where your portfolio has the most assets in the **Low** or **NA** category, and use those findings to prioritize governance work.
  - If you have the AI asset owner [sn_ai_asset_mgmt.ai_asset_owner] role, this widget reflects only the assets you own. The **Quality** and **Safety** dimensions remain interactive, but **Security**, **Compliance**, and **Residual risk** are summary-only.
- Monitor the regulatory risk of your AI assets from the **Regulatory risk classification** widget.
  - Review the number of AI assets classified as **Unacceptable**, **High**, **Medium**, or **Low** risk.
  - Focus remediation efforts on assets in the higher-risk tiers, where misclassification or inadequate controls can have the most significant consequences.
  - If you have the AI asset owner [sn_ai_asset_mgmt.ai_asset_owner] role, this widget reflects only the assets you own, and does not link out to the full **Regulatory risk classification** page.
- Track the value your AI assets deliver from the **AI Value** widget.
  - Check the total return for all managed AI assets and the percentage change over the previous period. If you have the AI asset owner [sn_ai_asset_mgmt.ai_asset_owner] role, this reflects only the assets you own.
  - If you have the AI steward [sn_ai_governance.ai_steward] role, select the widget to open the full Value page, where you can see per-asset contribution and filter the view by time period, team, or AI system.
- Review your governance workload in the **Lifecycle tasks needing attention** table.
  - Select **By inventory** to view a list of AI assets with the most pending tasks. Use this view to identify the assets that are consuming the most governance capacity. If you have the AI asset owner [sn_ai_asset_mgmt.ai_asset_owner] role, this view is scoped to the assets you own.
  - If you have the AI steward [sn_ai_governance.ai_steward] role, select **By team** to view a list of tasks for team members. Use this view to identify team members who may be overloaded or falling behind.
- If you have the AI steward [sn_ai_governance.ai_steward] role, use the **Get started with AI Control Tower** widget to launch a guided setup experience that helps you configure AI Control Tower.
  - Track your overall setup progress and see the milestone you're currently working on.
  - Select **Set up now** to open guided setup, or select **Continue** to pick up where you left off.

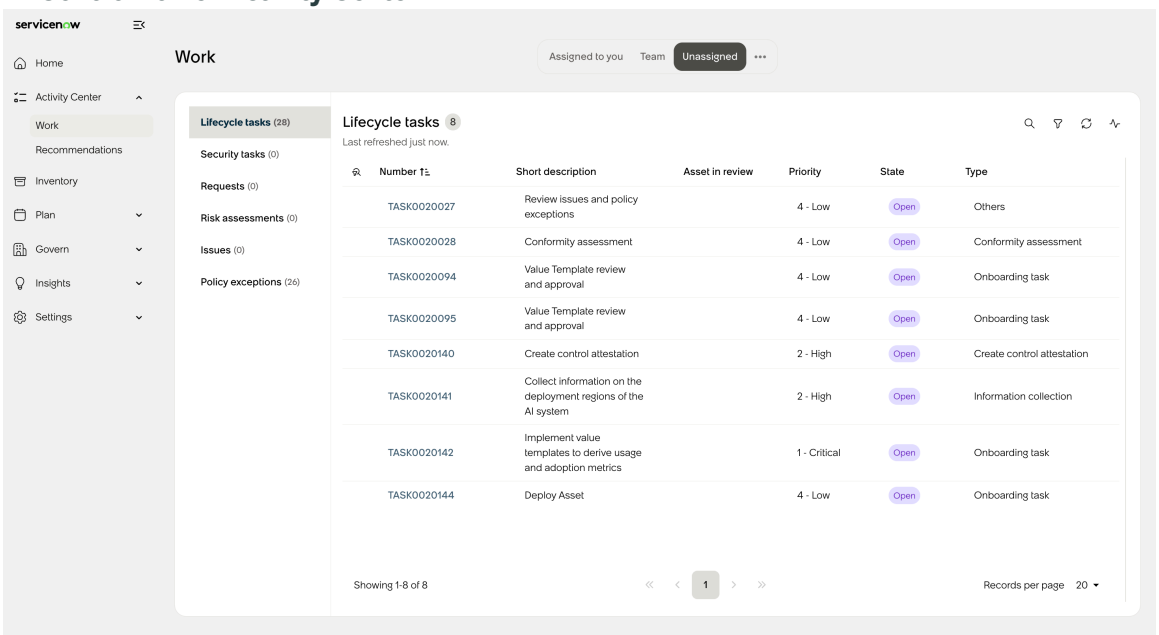
Activity Center

Track and act on the governance work generated across AI Control Tower from a single workspace, including lifecycle tasks, security tasks, change and offboarding requests, and AI recommendations.

Key benefits

- Find every piece of governance work that needs your attention across AI Control Tower in one place, instead of switching between asset records, dashboards, and email.
- Distinguish work assigned to you, work your team owns, work with no owner, and work you've submitted, so you can focus on what's yours and route what isn't. Team-level visibility is available to the AI steward.
- Resolve AI-generated recommendations directly or hand them off to the part of AI Control Tower where the resolution happens.

AI Control Tower Activity Center



Required roles

The AI steward [sn_ai_governance.ai_steward] or AI asset owner [sn_ai_asset_mgmt.ai_asset_owner] role is required to access the **Activity Center** in AI Control Tower.

Accessing Activity Center

Access the **Activity Center** in AI Control Tower by navigating to **All** > **AI Control Tower** > **Home** > **Activity Center**. Select **Work** to track governance work items or **Recommendations** to review AI-generated recommendations.

Use cases

Activity Center organizes governance work into two views: **Work** and **Recommendations**.

On the Work page, items are organized by ownership across four tabs: **Assigned to you**, **Team**, **Unassigned**, and **Submitted by you**. The **Team** tab is available only to the AI steward role. Within each tab, items are grouped into sub-tabs by type, such as lifecycle tasks, security tasks,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

requests, cases, risk assessments, issues, attestations, policy exceptions, and inquiries, each showing a count of open items.

- Focus on the work that's yours to complete on the **Assigned to you** tab, including your active lifecycle tasks, security tasks, requests, and other governance items sorted by due date. For example, complete an impact assessment that's due today before turning to lower-priority items waiting later in the week.
- Stay ahead of governance work piling up across your team by viewing the **Team** tab, which shows lifecycle tasks, security tasks, requests, and other governance items assigned across team members. For example, identify which team members are behind on critical onboarding tasks before a managed AI asset stalls because nobody noticed a review was past due.
- Claim or route work that has no owner on the **Unassigned** tab. For example, take ownership of an unrouted security task before a threat detected against a managed AI asset sits waiting for someone to claim it.
- Track the items you've submitted for review on the **Submitted by you** tab. View the cases, issues, policy exceptions, and inquiries that you've created, along with their current status.
- As an AI steward, review and approve a change request before it disrupts production. From the **Requests** sub-tab on the **Team** or **Assigned to you** tab, see the change requests and offboarding requests waiting for AI steward approval. For example, review the impact on related sub-systems before approving an asset owner's request to swap out the AI model backing an agent.
- As an AI Asset Owner, access and act on risk and compliance lifecycle tasks. Tasks include impact assessments and control attestations. The Activity Center surfaces AI asset tasks, issues, policy exceptions, and AI cases for the asset owner.
- Create a case, issue, policy exception, or inquiry without leaving Activity Center. For more information, see Managing AI tasks and approvals in Activity Center.

On the **Recommendations** page, you can resolve a backlog of similar AI recommendations by filtering the full list of AI-generated recommendations by category, priority, confidence, or outcome. For example, filter by the **Improve inventory signal** outcome to work through several assets that are missing descriptions in one pass. For more information about how recommendations are generated, prioritized, and resolved, see Recommendations and AI insights.

Recommendations and AI insights

Recommendations and AI insights direct your attention to the AI governance work that matters most, so you can resolve high-impact issues without searching for them.

AI Control Tower continuously evaluates your managed AI assets against governance, security, value, risk, and compliance criteria. When AI Control Tower detects an issue or an opportunity, it surfaces that finding as either a recommendation or an AI insight, depending on whether the user is expected to take action or to read contextual information.

Key benefits

- Focus on the highest-priority governance work without searching the product for issues that need your attention.
- Resolve routine issues hands-off by letting an unsupervised agent run the remediation workflow for you.
- Work through complex issues in a guided conversation with a supervised agent that proposes actions you can accept, refine, or reject.
- See the recommendations and insights most relevant to your role, with the severity, confidence, and age of each finding factored into the order.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Recommendations

A recommendation is an action item that AI Control Tower has identified as worth your attention. Each recommendation names the condition that was detected, the outcome it supports, and how you can resolve it.

Recommendations appear throughout AI Control Tower.

Your top recommendations in Home

Your top recommendations on the Home page provides recommendations across your portfolio. Select **See all Recommendations in Activity Center** to open the full list.

Recommendations view in Activity Center

The full list of recommendations across your portfolio, with filters for category, priority, confidence, and outcome. Use this view when you want to work through recommendations at scale or focus on a specific category such as Security or Risk and compliance.

Needs attention section on an asset record

Recommendations scoped to a single asset, visible on the **Overview** tab of the asset record. The recommendations shown here are the subset that apply to that asset. For more information about the **Overview** tab, see Reviewing AI asset status.

Note: The **Assigned to you** and **Unassigned** tabs of the Needs attention widget show lifecycle tasks rather than recommendations. Lifecycle tasks are governance and review work generated by AI asset lifecycle playbooks, not by AI detection.

AI Agent Advisor recommendations

When you install AI Agent Advisor, its highest-value automation opportunities also surface as recommendations in AI Control Tower, so you can discover agent-building opportunities without checking AI Admin Center separately. AI Control Tower shows your top automation opportunities, ranked by projected return on investment, up to a limit you can configure with the `sn_aict_genai.aaa_automation_opportunities_limit` property (10 by default).

Each recommendation card shows the opportunity's name and a short description. Selecting the recommendation's action opens the Automation details page for that specific opportunity in AI Admin Center, where you can act on it, such as by building an agent.

This integration requires no setup. The connection activates automatically when both AI Agent Advisor and AI Admin Center are installed on your instance. AI Agent Advisor must also complete at least one mining run before its opportunities appear. If AI Admin Center isn't installed, AI Agent Advisor doesn't send any recommendations to AI Control Tower.

Recommendations stay current on their own, refreshing daily. If an opportunity is still among the top group the next day, AI Control Tower updates the existing recommendation instead of adding a duplicate. If an opportunity drops out of the top group, or no longer exists in AI Admin Center by the time you select it, AI Control Tower removes the recommendation.

For details on AI Agent Advisor, see AI Agent Advisor.

AI insights

An AI insight is a contextual fact that AI Control Tower adds to a dashboard to give you a richer reading of the data. Unlike a recommendation, an AI insight does not ask you to take action. It appears as a short line of text near the data it explains, such as "Total productivity gains in last 30 days" or "Three AI systems delivered 82% of total value." AI insights appear inside widgets on the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Home page, the Value page, the Risk and Compliance page, Security page, and other AI Control Tower dashboards.

When an AI insight is associated with a supervised agent, you can select **Manage with AI** to start a conversation that expands on the insight with deeper analysis.

Resolving recommendations

Each recommendation includes a primary resolution that AI Control Tower has selected as the most efficient path to address the underlying issue. Alternatively, you can mark the recommendation as complete if you address the issue another way. For the full procedure, see Resolving AI recommendations in Activity Center.

The following options are available in the **Actions** menu:

Action	Description
View details	Provides the reasoning behind the recommendation, the asset or scope it applies to, and the history of earlier runs.
Complete	Marks the recommendation as resolved without running the primary resolution action. Use this option when you have addressed the underlying issue in another way.
Delete	Removes the recommendation. A deleted recommendation might reappear if AI Control Tower detects the same condition again.

Depending on how the recommendation was produced, you can use one of the following resolution options:

Primary resolution	Description
Automate with *Otto*	An unsupervised agent runs the resolution workflow on your behalf. When you confirm, the agent executes the steps and updates the recommendation status to **In progress**, then to **Complete** once the work is done. This resolution pattern is used for recommendations where the steps are routine and don't require your input, such as populating missing asset descriptions.
Manage with *Otto*	A supervised agent opens a conversation in the AI Control Tower chat interface. The agent proposes actions, and you accept, refine, or reject each one. This resolution pattern is used for recommendations that benefit from your judgment, such as reviewing the evidence behind a security threat before resolving it.
Open	AI Control Tower redirects you to the record, page, or workflow where you can resolve the issue directly. This resolution pattern is used for recommendations that require changes in another part of the product, such as creating tasks in an onboarding playbook.

When you select **View details** from the action menu, the side panel offers two views:

Focused

Shows the current status, the steps the agent will take or has taken, and an estimated time to complete. Use this view while an agent is running so you can monitor progress without leaving the page.

Details

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Shows the full reasoning behind the recommendation, including the data sources that contributed to it and the history of earlier runs.

Prioritizing recommendations

AI Control Tower does not show every recommendation it detects. Recommendations are prioritized according to the following factors:

Your role

An AI steward and a product owner see different recommendations in different order. Each role is responsible for different outcomes. For example, a product owner sees recommendations that help drive productivity for their own AI assets first, while an AI steward sees recommendations that improve inventory signal and AI governance across the portfolio first.

Severity

Each recommendation carries a priority level of **1-Critical**, **2-High**, **3-Medium**, or **4-Low**. Higher severity items rank above lower severity items when other factors are equal.

Confidence

Each recommendation carries a confidence level of **Low**, **Medium**, or **High**. Confidence reflects how certain AI Control Tower is that the detected condition is accurate. A high-confidence recommendation ranks above a low-confidence recommendation at the same severity.

Age

Recommendations become less prominent over time if no one acts on them. This prevents a long-standing issue from permanently occupying the top of the list and gives newer recommendations a chance to surface.

In Activity Center, use the **Refine list** panel to filter recommendations by priority, confidence, category, or outcome, and override the default ranking to focus on a specific area.

Recommendation outcomes

Every recommendation is tagged with an outcome that identifies the business goal the recommendation supports. The outcome appears on the recommendation card.

Outcome	Description
Drive AI productivity	Helps you increase the value that your AI assets deliver, such as identifying high-performing assets to scale or underused assets to retire.
Improve AI governance	Helps you strengthen oversight of your AI portfolio, such as completing lifecycle tasks or enforcing policy across managed assets.
Improve inventory signal	Helps you make your inventory more complete and accurate, such as populating missing asset descriptions or reviewing newly discovered assets.
Monitor security	Helps you respond to AI security threats and access issues, such as reviewing high-severity security events or addressing agent output deviation.
Monitor risk and compliance	Helps you maintain regulatory and policy compliance, such as reviewing overdue risk assessments or addressing non-compliant controls.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Recommendation status

Each recommendation moves through a lifecycle as you or an agent works on it. The status appears in the side panel that appears when you select **View details**.

Status	Description
Not started	The recommendation has been generated but no one has acted on it.
In progress	An agent is running or the assignee is working on the recommendation.
Complete	The recommendation has been resolved. Completed recommendations are removed from the list.
Failed	An agent could not complete the recommendation, or could only complete it for some of the assets it targeted. You can retry the action or resolve the recommendation manually.
Cancelled	The recommendation was stopped before it completed, either by the user or by the system.

You can manually mark a recommendation as **Complete** or delete it from the action menu on the recommendation card, regardless of its current status.

ServiceNow Otto in AI Control Tower

Ask questions about your AI portfolio in plain language and get answers drawn from your own AI Control Tower records.

How the conversational interface works

ServiceNow Otto is the conversational experience in AI Control Tower. It provides agentic orchestration on top of the premium chat in the ServiceNow AI Platform.

In AI Control Tower, the chat is delivered by an assistant named AICT Assistant, which is installed with the ServiceNow Otto for AI Control Tower application (`com.sn_aict_genai`). The chat window itself displays ServiceNow Otto, so the AICT Assistant name appears only where the underlying record is shown, such as in your AI asset inventory.

A dedicated assistant keeps the conversation scoped to AI Control Tower. Answers about your AI portfolio stay consistent because the other assistants configured on your instance don't take part in the conversation.

Answers are drawn from data retrieved from your instance at the time you ask. The assistant is configured to answer only from that retrieved data rather than from the general knowledge of the underlying model, so responses reflect the records in your own inventory and governance tables. When the assistant can't find an answer in your data, it tells you so rather than filling the gap.

Use cases

The assistant answers questions that span your inventory, risk, compliance, security, and usage records. For example:

- Find the AI systems that a particular business unit or business application owns, without constructing a query.
- See how your AI models break down by provider, so you know where your model dependencies concentrate.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Identify AI systems with no recent usage, which are candidates for review or decommissioning.
- Check inherent risk ratings across your portfolio to find assets that need attention first.
- Review security findings such as threat results and privileged activity for a given asset.

Responses can include an inline widget alongside the text answer, so results that are clearer visually are presented that way.

AICT Assistant in your AI asset inventory

AICT Assistant is the AI asset that represents the ServiceNow Otto conversational experience in AI Control Tower. Automatic discovery of ServiceNow AI assets registers the assistants on your instance, so your conversational experience is inventoried alongside the rest of your AI portfolio. See Discovering ServiceNow AI assets automatically.

To locate the asset, search your inventory for AICT Assistant.

Bringing AICT Assistant under management applies the same governance to your conversational experience that you apply to the rest of your AI portfolio, including evaluation scoring, lifecycle stages, risk classification, and value tracking. Like other discovered ServiceNow AI assets, AICT Assistant arrives unmanaged. See Managed and unmanaged AI assets and Working with AI asset records.

You can edit or customize the AICT Assistant in Assistant Designer. See Assistant Designer.

Configuring AI Control Tower

Set up AI Control Tower so your organization can begin managing AI assets, enforcing governance policies, and tracking AI value.

Once you activate AI Control Tower and assign roles, you can begin managing your AI inventory and configuring governance behavior in the **Settings** tab. The core settings cover integrations, automation rules, value and evaluation templates, playbooks, and platform-level AI controls.

You can unlock additional capabilities in AI Control Tower by activating add-on plugins. Each plugin extends a specific area of the workspace.

Activating AI Control Tower

Govern, secure, and measure the value of your AI assets across the enterprise by activating AI Control Tower.

For details on upgrading AI Control Tower, see the AI Control Tower Migration [KB3144679] article in Now Support.

Note: Depending on your license, you will have access to certain application features, generative AI skills, agentic workflows, and AI agents. For more information, see ServiceNow product tiers.

Guided setup

Configure AI Control Tower in a logical sequence and track your progress from a single summary page, instead of navigating separate Settings pages.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Key benefits

- Track setup progress across all four configuration areas from a single summary page, so you know what's done and what's left.
- Move between setup items in any order and complete them as your organization is ready, since each item's status is tracked independently rather than in a fixed sequence.
- Start from default configuration where it's provided, and confirm or adjust it to fit your organization instead of configuring every item from scratch.
- Review every configuration change made during setup, including the update set that captured it and who made it, from the Configuration activity list on the summary page.

Setup areas

Guided setup organizes configuration into four areas. Guided setup areas lists every setup item within each area and the topic to reference for more detail.

- **Users and roles.** Assign users to the AI Stewards, AI Product Owners, and AI Risk and Compliance Managers groups.
- **AI asset inventory.** Bring ServiceNow and external AI assets into your inventory, and decide which assets to manage.
- **Value and cost configuration.** Configure the templates and cost inputs used to calculate the value your AI assets deliver.
- **ServiceNow AI settings.** Configure data sharing, deployment approval, and AI model provider settings that apply across your instance.
- **Connectors.** Connectors integrate with AI Control Tower to create AI connections with to discover AI agents from external AI platforms such as AWS, Azure, Copilot, Snowflake, Google Cloud Platform (GCP) Vertex AI and so on for centralized governance.

  Note: The Connectors page is available only when the com.sn_ai_disc and sn_sgc_central plugins are installed.

- AI Enterprise Foundation installs all the plugins so this guided page will also be visible.

Required roles

The AI Steward [sn_ai_governance.ai_steward] and sn_ia_config.ia_user roles are required to access guided setup. For information about opening guided setup, see Access guided setup.

Access guided setup

Configure AI Control Tower in a logical sequence and track your progress toward a complete setup.

Before you begin

Role required: sn_ai_governance.ai_steward

About this task

The **Get started with AI Control Tower** widget on the **Home** page is visible only to users with the AI steward role. It tracks your overall setup progress and shows the setup area you're currently working on.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Launch the guided setup experience from the **Home** page in AI Control Tower or the **Admin Home** page.

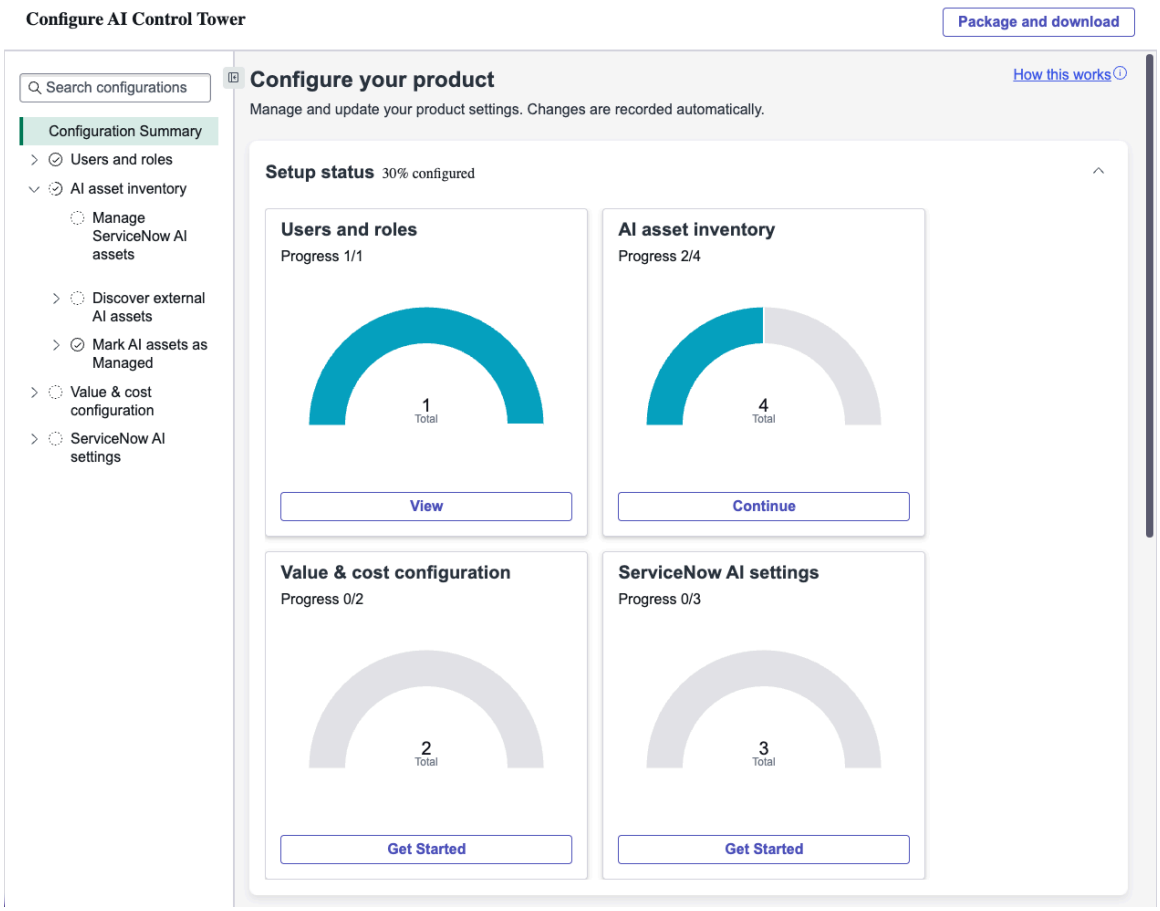
Option	Steps
Home page in AI Control Tower	**a.** Navigate to **All** > **AI Control Tower** > **Home**. **b.** In the **Get started with AI Control Tower** widget, select **Set up now** to open guided setup, or select **Continue** to pick up where you left off.
Admin Home	**a.** Navigate to **Admin** > **Home**. **b.** In the Manage your products section, se lect **AI Control Tower**. **c.** On the AI Control Tower page, select **Con figure**.

   Guided setup opens to a summary page showing your progress across all four setup areas.

2. Complete the setup items for each area.

   For a complete listing of setup items and the topic to reference for each one, see Guided setup areas.

Example: AI Control Tower guided setup



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Guided setup areas

Area-by-area listing of the setup items in guided setup, with cross-references to the topic each item relates to.

Guided setup groups setup items into the areas listed in this topic. The order of areas and items shown here matches the order in which guided setup displays them.

Users and roles

Assign users to the groups that grant access to AI Control Tower.

Users and roles setup items

Setup area	Setup item	Description
Users and roles	Assign users to roles	Assign users to the AI Stewards, AI Product Owners, and AI Risk and Compliance Managers groups to grant them the corresponding permissions. For more information, see Configure users and roles.

AI asset inventory

Bring ServiceNow and external AI assets into your inventory, and decide which assets participate in governance, monitoring, and value workflows.

AI asset inventory setup items

Setup area	Setup item	Description
AI asset inventory	Manage ServiceNow AI assets	Review AI systems, models, prompts, and datasets that AI Control Tower discovers automatically, and mark them as managed to bring them into governance, monitoring, and value workflows. For more information, see Managing your AI asset inventory.
Discover external AI assets	Configure external connectors	Connect to cloud hyperscalers or SaaS applications to discover AI assets automatically and bring them into your inventory. For more information, see Configuring connectors.
Discover external AI assets	Set up traces	Connect to AWS, Microsoft Azure, or Google Cloud to collect trace data, discover AI agents running on those platforms, and generate evaluation and security metrics. For more information, see Configuring trace connections.
Discover external AI assets	Add assets manually	Register an AI system, AI model, prompt, dataset, or MCP server that isn't reachable through a connector or trace. For more information, see Creating AI assets manually.
Mark AI assets as Managed	Mark assets as Managed manually	Select assets from your inventory and mark them as managed to give them access to governance, value assessment, risk

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI asset inventory setup items (continued)

Setup area	Setup item	Description
		classification, monitoring, and security capabilities. For more information, see Managed and unmanaged AI assets.
Mark AI assets as Managed	Set rules to mark assets as Managed	Create or activate automation rules that mark discovered AI assets as managed automatically, based on conditions you define. For more information, see Edit an automation rule.

Value and cost configuration

Configure the templates and cost inputs used to calculate the value your AI assets deliver.

Value and cost configuration setup items

Setup area	Setup item	Description
Value and cost configuration	Value templates	Select from existing value templates or create custom templates to define, calculate, and track the value your AI assets deliver. For more information, see Value.
Value and cost configuration	Cost framework	Configure cost and productivity inputs, such as hourly rates and AI costs by vendor, to calculate the net return on your AI investment. For more information, see Cost.

ServiceNow AI settings

Configure data sharing, deployment approval, and AI model provider settings that apply across your instance, not just AI Control Tower.

ServiceNow AI settings setup items

Setup area	Setup item	Description
ServiceNow AI settings	Configure data control preferences	Set how your organization shares data with ServiceNow and manages data traffic during peak usage. For more information, see Configure ServiceNow AI settings.
ServiceNow AI settings	Set builder controls	Require AI steward approval before AI assets deploy, and automate approval requests when new AI assets are added. For more information, see Configure ServiceNow AI settings.
ServiceNow AI settings	Configure AI model providers	Choose which AI model providers are allowed on your instance and set fallback behavior for AI systems whose providers aren't on the allowed list. For more information, see Configure ServiceNow AI settings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure users and roles

Add and manage role to a user group to grant its members the corresponding permissions in AI Control Tower.

Before you begin

Role required: admin

Confirm the following:

- The role you want to assign must already exist in the system.
- Identify which user group requires the role — AI Stewards, AI Product Owners, or AI Risk and Compliance Managers.

Procedure

1. Navigate to **Settings** > **Users and roles**.
   The Users and roles page displays AI Stewards, AI Product Owners, or AI Risk and Compliance Managers user groups with their current user and role counts.
2. To add a user, select **Add users**.
   a. Select the user from the list to add.
   b. Select **Add** to add the user.
3. To manage the users in the group, select **View group details**.
   a. Select the user from the list to add or remove.
   b. Select **Add** user to add or **Remove from group** to remove.

   Note: You can't remove yourself from the group.

Configuring integrations

Connect AI Control Tower to external AI platforms so you can discover AI assets, collect trace data for monitoring, and synchronize governance across multiple ServiceNow instances.

Connectors

Connectors let you discover AI assets from external cloud hyperscalers and SaaS applications and bring them into your AI asset inventory. When you establish a connector, AI Control Tower periodically scans the connected platform, discovers AI assets, and adds them to your inventory as unmanaged assets. You can then review the discovered assets and move them to a managed state. For more information, see Configuring connectors.

Traces

Trace connections collect observability data from external AI systems and route it into AI Control Tower for quality and safety monitoring. When you establish a trace connection to a supported platform, AI Control Tower collects trace data at a configurable frequency and makes it available on the **Monitor** tab of AI asset records and in the Monitoring overview.

The information collected from traces is entered into the inventory for discovery. It is also sent to the observability service within ServiceNow, which generates evaluation metrics and security metrics.

Trace connections are the recommended route for collecting observability data from supported platforms. For external AI systems hosted on unsupported platforms or third-party agents, you

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

can send trace data to AI Control Tower using the API instead. For a comparison of both methods and the list of supported platforms, see Configuring trace connections.

Multi-instance

Multi-instance setup lets a production (manager) instance control, manage, and communicate with multiple sub-prod (managed) instances for AI Control Tower. When multi-instance management is configured, the production instance synchronizes AI asset data, governance rules, and configuration preferences across connected sub-prod instances so that governance stays consistent across your ServiceNow environment.

Note: Verify that both the prod and sub-prod instances are running the same AI Control Tower core version (6.2.4), which is the minimum supported version.

If there's any upgrade to version 6.2.4 in a sub-prod, then it's advisable to upgrade the prod instance to 6.2.4 to confirm Multi-instance functions correctly.

Multi-instance setup synchronizes the following:

- AI inventory information, including AI systems, AI models, prompts, data sets, and AI agents across connected instances

  Note: State of the assets while configuring Multi-instance management.

  The AI inventory in production reflects the true state of your assets like models, datasets, or skills from a production standpoint. Even if a model or dataset is active in a sub prod (lower) environment, it's still considered as under development from a prod perspective, since it's being tested and not yet live.

  For this reason, you don't synchronize asset states across environments. An asset's state changes to deployed only when the asset and its related records are activated in the production system.

  In summary, the state represents the overall lifecycle of the asset, not its local status in a specific environment.

- Data sharing preferences from the production instance to all sub-prod instances, when enabled
- Data overflow processing and bursting preferences from the production instance to all sub-prod instances, when enabled

Asset states aren't synchronized across environments. An asset that is active in a sub-prod environment is still considered under development from the production perspective. An asset's state changes to deployed only when the asset and its related records are activated in the production system.

When multi-instance management is configured, all synchronizable preferences on sub-prod instances is set to read-only.

Note: Multi-instance management is not supported on Government Community Cloud (GCC) or on-premises instances. The `com.glide.mif.mtls` plugin must be active before you configure multi-instance management. If the plugin is not active, submit a support request with Customer Service and Support for MIF features.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Control enforcement points

Connectors in the **Control enforcement points** tab let you monitor and enforce guardrails for AI assets from external identity providers, cloud hyperscalers, and SaaS applications. When you establish a connector, you can then contain AI agents with kill switch protocol.

Supported connectors include:

- AWS Bedrock
- AWS Bedrock Agent Core
- Azure AI Foundry
- GCP Vertex AI
- ServiceNow Agents

The supported identity provider is Okta.

To set up a new connector, select an identity provider or platform from the Available connectors view and follow the guided setup wizard. Each connector has provider-specific prerequisites, which are linked from the first step of the wizard. For more information, see Configure AI agent containment using kill switch protocol manually.

Configuring connectors

Discover AI assets running on external platforms and hyperscaler environments to populate your AI asset inventory, apply consistent governance, and report on usage in AI Control Tower.

Key benefits

- Keep asset records current automatically through scheduled import jobs, without manually re-entering details each time an asset changes on the external platform.
- Track usage volume for imported assets alongside natively created ones, so governance teams can spot high-usage, dormant, or high-risk assets and prioritize oversight.
- Discover assets across multiple accounts or environments with a single AI connection, so oversight scales with adoption without adding to your team's workload.

Available connectors

For the complete list of supported service graph connectors, their prerequisites, and connector-specific configuration fields, see the AI Control Tower- AI Discovery Connectors [KB2986990] article in the Now Support Knowledge Base.

AI Control Tower also provides the Veza access intelligence connector, which enriches AI agents already in your inventory with access risk scores and severity levels. For more information, see Create an AI connection for Veza access intelligence.

How connectors discover AI assets

When you create an AI connection using a connector, AI Control Tower performs the following:

- Authenticates with the external platform using the credentials you provide, typically an access key, service account, or OAuth token depending on the platform.
- Discovers AI assets on the external platform, such as deployed models, agents, knowledge bases, and pipelines.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Imports the discovered assets into the AI asset inventory and the Configuration Management Database (CMDB), where they can be governed, evaluated, and managed alongside natively created assets.
- Keeps the inventory updated by re-running discovery on a scheduled import job, so new or changed assets on the external platform are reflected in AI Control Tower.

How connectors keep data current

Each connector runs two scheduled jobs:

- Discovery: Finds new or changed AI assets on the external platform and imports them into the AI asset inventory.
- Execution: Collects usage data, such as run counts by agent, date, and session, for assets the connector has already discovered.

Note: Verify that the AI discovery daily data collection job is active. This job is required for connectors to continue collecting new data.

Discovery connectors and trace connectors

Discovery connectors and trace connectors both discover AI assets and feed the same AI asset inventory, but they serve different primary purposes.

- A discovery connector authenticates directly to the external platform and queries it for AI assets. It's the more direct path for platforms it supports, and it also collects usage volume, such as run counts by agent, date, and session, which appears in the asset's **Value & engagement** tab and in the portfolio-wide value dashboard under Insights.
- A trace connector observes agent executions at runtime, primarily to generate evaluation and security metrics. Discovering the AI systems behind those executions is a secondary result, useful for catching assets a discovery connector can't reach. See Discovering AI assets through trace connectors.

Create an AI connection for discovery

Bring AI assets from an external platform into your AI asset inventory by creating an AI connection. AI Control Tower authenticates to the platform using your credentials and imports assets on a schedule, so they're governed and monitored alongside AI systems built natively on ServiceNow.

Before you begin

Confirm the following are in place:

- The com.sn_ai_disc and sn_sgc_central plugins installed on your instance. Without both plugins, the **Connectors** tab doesn't appear.
- The credentials required to authenticate AI Control Tower to the external platform. Credential requirements vary by connector.

Role required: sn_ai_disc.discovery_admin and sn_cmdb_int_util.sgc_admin

About this task

A connector is the mechanism; an AI connection is the configured instance of a connector on your instance. Create a separate AI connection for each account or environment you want AI Control Tower to discover assets from. A single connector type can support multiple AI connections.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home** > **Settings** > **Integrations** > **Connectors**.
2. On the **Available Connectors** tab, select the connector that you want to use.
3. On the form, fill in the fields.

   Fields and credential requirements vary by connector. For the complete list of connectors and the fields each one requires, see AI Control Tower- AI Discovery Connectors [KB2986990].
4. Select **Save**.

Result

The connection appears on the **Established connections** tab. After the discovery job runs, discovered AI assets appear in your AI asset inventory.

Create an AI connection for Veza access intelligence

Connect AI Control Tower to Veza using OAuth 2.0 so that agent risk scores and severity levels from Veza access intelligence appear in the agent map. Since Veza is an enrichment connector, it doesn't import new assets.

Before you begin

Confirm the following are in place:

- An OAuth 2.0 app or client configured in your Veza tenant. For more information, see OAuth2 apps and OAuth2 clients in Veza documentation.
- An OAuth profile configured on the ServiceNow platform and linked to the pre-provided `SN AI Security Veza Connector` connection alias. For more information, see Set up OAuth.

Role required: sn_ai_governance.ai_steward

About this task

The Veza connector authenticates using OAuth 2.0 only. Create the AI connection after you complete OAuth setup on both the Veza tenant and the ServiceNow platform.

Procedure

1. Navigate to **Settings** > **Integrations** > **Connectors**.
2. On the **Available connectors** tab, select the **Veza** tile from security connectors.
3. On the **Configure connector** page, confirm that **Provider type** is set to **Security**.
   The **Connection alias** field is pre-populated with `SN AI Security Veza Connector` and can't be edited.
4. Select the **I have configured the Veza user integration** check box.
   This confirms you completed the Veza-side OAuth setup. See Configure OAuth in Veza.
5. Select the **I have configured ServiceNow connectors/alias settings** check box.
   This confirms you completed the ServiceNow-side OAuth setup. See Configure OAuth for Veza in ServiceNow.
   The **Validate Connection** button is disabled until both check boxes are selected.
6. Select **Validate Connection**.
   If the connection already has a valid OAuth token, a `Connection Valid` message appears.
   If it doesn't, the button instead shows **Authenticate Connection**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If the button shows **Validate Connection**, continue to the next step.
- If the button shows **Authenticate Connection**, select it to log in to Veza. After you log in and allow access, the connection revalidates.

7. Select **Save**.

Result

The connection appears on the **Established connections** tab. Selecting **Re-Validate** from that tab updates the connection status.

Configuring trace connections

Collect trace data from AI agents running on supported cloud platforms and monitoring services to generate evaluation metrics, populate AI inventory, and support security monitoring in AI Control Tower.

Key benefits

- Collect trace data from AWS, Google Cloud, and Microsoft Azure platforms through a single interface, without SDK instrumentation in your agent code.
- Access cloud platforms securely through a MID Server, which authenticates to your cloud provider and keeps credentials protected within your ServiceNow instance.
- Generate evaluation and security metrics from collected traces when evaluations and security monitoring capabilities are enabled.
- Discover AI agents running on third-party platforms and add them to your AI asset inventory automatically.

Trace connections and SDK instrumentation

AI Control Tower supports two ways to collect trace data from AI systems: a trace connection, which polls a supported cloud platform at a configured interval, or SDK instrumentation, which sends trace data using an API key. Use a trace connection when your AI systems run on a supported platform.

For AI systems hosted on other platforms or third-party agents, send trace data using the API instead. See Activate evaluation scoring for external AI systems.

Trace connection limitations

- Up to 5 trace connections for each connector run in parallel. You can create more than 5, but only 5 run at a time.
- Manually running a trace connection, instead of waiting for its scheduled interval, counts against a separate limit: up to 2 manual runs at a time.

Add an AWS CloudWatch trace connection

Monitor AI agents built with AWS Bedrock AgentCore by adding an AWS CloudWatch trace connection. AI Control Tower collects trace data through your AWS credentials and a MID Server, without requiring SDK instrumentation.

Before you begin

Confirm the following:

- Your AI agents are built using AWS Bedrock AgentCore.
- Tracing is enabled for each AWS Bedrock AgentCore agent you want to monitor.
- You know the AWS region where your AI agents are deployed, such as `us-east-2`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- An active MID Server is installed and configured in your ServiceNow instance. See MID Server installation.
- An AWS access key ID and secret access key with permission to read trace data from CloudWatch is available.
  - The AWS CloudWatch connection supports access key authentication only. Connections using an assumed role or external ID aren't currently supported.
  - You must set up the access key and its IAM policy in AWS. After the access key ID and secret access key are created, work with your instance administrator to store them as a new AWS credential record in your instance. For details, see the Work Instruction | How to Create AWS Credentials on a Glide Instance [KB3143433] article in Now Support.

Role required: sn_ai_governance.ai_steward

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home** > **Settings** > **Integrations** > **Traces**.
2. On the **Available** sub-tab, select **AWS CloudWatch**.
3. On the form, fill in the fields.

Add AWS CloudWatch trace connection form

Field	Description
Name	Descriptive name for this trace connection. Use a name that distinguishes this connection from others you create, such as one that identifies the account, project, or environment.
Collection frequency (minutes)	Interval, in minutes, at which the MID Server polls for new trace data. The default is 30. Set a lower value to return results sooner or set a higher value to reduce overhead for lower-volume systems.
Region	AWS region where your AI agents are deployed, such as `us-east-2`.
Credential alias	AWS credential that authenticates AI Control Tower to CloudWatch. The credential must have permission to read trace data.
MID server	MID Server that runs trace collection. The MID Server must be active and validated. Select **Go to Mid server installation** to install or configure one.
Log group source	AWS CloudWatch log group that this connection collects trace data from. Select **Agent Core Log Group** to collect from the log group used by agents built with AWS Bedrock AgentCore. Select **Other Log Groups** to collect from a different log group. Select both to create a separate connection for each.
Active	Option to begin collecting traces when you save the connection. Clear it to save the connection without starting collection. You can activate the connection later from its record.

4. Select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result

One or more trace connections appear on the **Established** sub-tab. If you selected both log group options, two connections appear, distinguished by a log group suffix on the connection name. If a connection is active, AI Control Tower begins collecting trace data after the first polling interval.

What to do next

Choose which metrics to include in evaluation scoring. See Activate evaluation scoring for external AI systems.

Add an Azure trace connection

Monitor AI agents running on Microsoft Azure by adding an Azure trace connection. AI Control Tower collects trace data through your Azure credentials and a MID Server, without requiring SDK instrumentation.

Before you begin

Confirm the following:

- An active MID Server is installed and configured in your ServiceNow instance. See MID Server installation.
- Credentials for the Azure source system you plan to configure are available.
  - Each credential must be created in Azure for the source system it applies to.
  - The Azure service principal or managed identity behind each OAuth-based credential has the Reader role on the resource or resource group it collects traces from.
  - The Azure Application Insights API key credential, used for the **New Foundry** source system, has the "Read telemetry" permission.
  - After each credential is created in Azure, work with your instance administrator to store it as a record in your instance. For details, see the Azure Trace Collector Credentials Configuration [KB3144350] article in Now Support.

Role required: sn_ai_governance.ai_steward

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home** > **Settings** > **Integrations** > **Traces**.
2. On the **Available** sub-tab, select **Azure**.
3. Select the Azure source systems to integrate with.
   - **Classic Foundry** — collects traces from Azure AI Foundry (classic).
   - **New Foundry** — collects traces from the updated Azure AI Foundry experience.
   - **Application Insights** — collects traces from Azure Monitor Application Insights.
4. Fill in the credentials for the source system you selected.

Source system	Steps
Classic Foundry	**a.** Enter a descriptive name for the connection. The name distinguishes this connection from others you create. For instance, you may choose a name that identifies the account, project, or environment. **b.** Select the Azure AI Services OAuth 2.0 credential alias in the **Azure AI Services Credential Alias** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Source system	Steps
	c. Select the Azure Machine Learning Services OAuth 2.0 credential alias in the **Azure Machine Learning Credential Alias** field. **d.** Enter the interval, in minutes, at which the MID Server polls for new trace data in the **Collection frequency (minutes)** field. The default is 30. Set a lower value to return results sooner or set a higher value to reduce overhead for lower-volume systems. **e.** Select the MID Server that runs trace collection. The MID Server must be active and validated. Select **Go to Mid server installation** to install or configure one. **f.** Select **Active** to begin collecting traces when you save. Clear this option to save the connection without starting collection. You can activate the connection later from its record.
New Foundry	**a.** Enter a descriptive name for the connection. The name distinguishes this connection from others you create. For instance, you may choose a name that identifies the account, project, or environment. **b.** Select the Application Insights API key credential in the **Application Insights Credential** field. **c.** Select the Azure Machine Learning Services OAuth 2.0 credential in the **Azure Machine Learning Credential** field. **d.** Enter the **Application Insights Application ID**. Find this value in the Azure portal, under your Application Insights resource settings. **e.** Select the MID Server that runs trace collection. The MID Server must be active and validated. Select **Go to Mid server installation** to install or configure one. **f.** Enter the interval, in minutes, at which the MID Server polls for new trace data in the **Collection frequency (minutes)** field. The default is 30. Set a lower value to return results sooner or set a higher value to reduce overhead for lower-volume systems. **g.** Select **Active** to begin collecting traces when you save. Clear it to save the connection without starting collection. You can activate the connection later from its record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Source system	Steps
Application Insights	**a.** Enter a descriptive name for the connection. The name distinguishes this connection from others you create. For instance, you may choose a name that identifies the account, project, or environment. **b.** Select the Azure App Insights OAuth 2.0 credential alias in the **Azure App Insights Credential** field. **c.** Select the Azure Machine Learning Services OAuth 2.0 credential alias in the **Azure Machine learning credential** field. **d.** Enter the **Application Insights Resource ID**. Find this value in the Azure portal, under your Application Insights resource settings. **e.** Select the MID Server that runs trace collection. The MID Server must be active and validated. Select **Go to Mid server installation** to install or configure one. **f.** Enter the interval, in minutes, at which the MID Server polls for new trace data in the **Collection frequency (minutes)** field. The default is 30. Set a lower value to return results sooner or set a higher value to reduce overhead for lower-volume systems. **g.** Select **Active** to begin collecting traces when you save. Clear it to save the connection without starting collection. You can activate the connection later from its record.

5. Select **Save**.

Result

The trace connection appears on the **Established** sub-tab. If the connection is active, AI Control Tower begins collecting trace data after the first polling interval.

What to do next

Choose which metrics to include in evaluation scoring. See Activate evaluation scoring for external AI systems.

Add a GCP Cloud Trace connection

Monitor AI agents running on Google Cloud by adding a GCP Cloud Trace connection. AI Control Tower collects trace data through your Google Cloud credentials and a MID Server, without requiring SDK instrumentation.

Before you begin

Confirm the following:

- An active MID Server is installed and configured in your ServiceNow instance. See MID Server installation.
- A Google Cloud OAuth 2.0 credential with permission to read trace data is available.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- You must set up the GCP service account and grant the required IAM permissions in Google Cloud. After configuring the service account, work with your instance administrator to generate a certificate and create the OAuth 2.0 credentials and alias in your instance. For details, see the Configuring GCP Permissions and Credentials for ServiceNow AI Control Tower Trace Ingestion [KB3144347] article in Now Support.

Role required: sn_ai_governance.ai_steward

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home** > **Settings** > **Integrations** > **Traces**.
2. On the **Available** sub-tab, select **GCP Cloud Trace**.
3. On the form, fill in the fields.

Add GCP Cloud Trace form

Field	Description
Name	Descriptive name for this trace connection. Use a name that distinguishes this connection from others you create, such as one that identifies the account, project, or environment.
Collection frequency (minutes)	Interval, in minutes, at which the MID Server polls for new trace data. The default is 30. Set a lower value to return results sooner or set a higher value to reduce overhead for lower-volume systems.
Credential	Google Cloud OAuth 2.0 credential that authenticates AI Control Tower to GCP Cloud Trace. The credential must have permission to read trace data.
MID server	MID Server that runs trace collection. The MID Server must be active and validated. Select **Go to Mid server installation** to install or configure one.
Active	Option to begin collecting traces when you save the connection. Clear it to save the connection without starting collection. You can activate the connection later from its record.

4. Select **Save**.

Result

The trace connection appears on the **Established** sub-tab. If the connection is active, AI Control Tower begins collecting trace data after the first polling interval.

What to do next

Choose which metrics to include in evaluation scoring. See Activate evaluation scoring for external AI systems.

Troubleshoot a trace connection

Identify why a trace connection is not collecting data by reviewing its execution log and error messages.

Before you begin

Role required: sn_ai_governance.ai_steward

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Each trace connection record shows an execution log with the result of every collection attempt. When a connection shows an **Error** execution status, you can select the connection to view the log and read the error message.

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home** > **Settings** > **Integrations** > **Traces**.
2. Select the **Established** sub-tab.

   Each connection card shows its **State** and **Processing state**. A **Processing state** of **Error** indicates that the last collection attempt did not complete successfully.
3. Select the connection you want to investigate.
4. In the **Execution logs** section, review the log entries.

   Each log entry shows the following information.

Execution log fields

Field	Description
Start time	Date and time the collection attempt began.
End time	Date and time the collection attempt ended.
Traces collected	Number of traces collected during the attempt.
Execution status	Result of the collection attempt. A status of **Success** means traces were collected. A status of **Error** means the attempt failed.
Error message	Details about a failed collection attempt. Review this message to identify the cause of the error.

Result

You have reviewed the execution log and identified the cause of the collection error. Common causes include invalid or expired credentials, an inactive or unvalidated MID Server, and incorrect region or resource ID values.

What to do next

To update the connection configuration, see Edit a trace connection.

Edit a trace connection

Update the configuration of an established trace connection to change its credentials, collection frequency, MID Server, or other settings.

Before you begin

Role required: sn_ai_governance.ai_steward

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home** > **Settings** > **Integrations** > **Traces**.
2. On the **Established** sub-tab, select the connection you want to update.
3. Select **Actions** > **Edit**.
4. On the form, update the fields as needed and select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The connection is updated. If the connection is active, AI Control Tower uses the new configuration at the next collection interval.

Deactivate a trace connection

Stop trace collection for an established connection without deleting it, so you can reactivate it later.

Before you begin
Role required: sn_ai_governance.ai_steward

Procedure
1. Navigate to **All** > **AI Control Tower** > **Home** > **Settings** > **Integrations** > **Traces**.
2. On the **Established** sub-tab, select the connection you want to deactivate.
3. Deactivate the connection using one of the following methods.

Method	Steps
Actions menu	**a.** Select **Actions** > **Deactivate**. **b.** In the confirmation dialog, select **Deactivate**.
Edit form	**a.** Select **Actions** > **Edit**. **b.** Clear the **Active** option. **c.** Select **Save**.

Result
The connection remains on the **Established** sub-tab with a **State** of **Inactive**. Trace collection stops and no further observability metrics are generated from this connection until it is reactivated.

What to do next
Reactivate the connection by editing the connection and select the **Active** option.

Multi-instance

The Multi-instance Framework enables a prod (manager) instance to manage multiple sub-prod (managed) instances and facilitate communication for AI Control Tower.

Instance Management Hierarchy Overview

The Multi-instance Framework uses a hierarchical structure to organize how instances manage and communicate with each other. This hierarchy helps you configure the appropriate manager instance for your environment.

Instance Roles and Capabilities

Prod Instance

A prod instance can manage both other prod instances and sub-prod instances. This makes it suitable for centralized governance across your organization.

Sub-Prod Instance

A sub-prod instance can manage other sub-prod instances but can't manage prod instances. Sub-prod instances are typically used for specific teams, environments, or business units.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure Multi-instance Framework with Multiple Prod and Sub-Prod Instances

Scenario: You have two prod instances and 6–8 sub-prod instances, and you want to configure the Multi-instance Framework to manage and synchronize assets across all instances.

The Multi-instance Framework enables a prod instance to manage multiple sub-prod instances and facilitate communication for centralized asset governance. Depending on your organizational needs, you can configure the Multi-instance Framework in two ways:

- Centralized Configuration- Use when your organization prefers centralized governance and a streamlined review process.
- Distributed Configuration- Use when your organization has distinct business units or teams that require independent asset governance within a shared environment.

Centralized Configuration

Use this configuration if you want a single access move to review and manage data from all instances.

1. Select one prod instance as the manager instance from the list of instances.
2. Configure all other instances (the second prod instance and all sub-prod instances) to send synchronization requests to the manager instance.

The prod instance controls asset states, rules, and policies for all connected instances.

Distributed Configuration

Use this configuration if you want to organize instances into separate management groups.

1. Select the first prod instance to manage a group of sub-prod instances (for example, 2–3 sub-prod instances).
2. Select the second prod instance to manage another group of sub-prod instances (for example, 4–5 sub-prod instances).
3. Configure each sub-prod instance to send synchronization requests to its assigned prod instance.

After Configuration

After configuring the Multi-instance Framework, enable AI Asset data transfer on the prod instance from the AI Control Tower user interface.

When you configure AI Asset data transfer, the remaining values are automatically configured. No additional setup is required.

Note: To configure Multi-instance, you must request a Manager instance. For more information on requesting a manager instance, see Request a Manager instance.

AI Asset Synchronization

The Multi-instance Framework synchronizes assets from sub-prod instances to the manager instance, enabling faster review processes.

The framework also synchronizes rules from the prod instance to all sub-prod instances.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Starting with the May 2026 release, confirm that both the prod and sub-prod instances are running the same AI Control Tower core version (6.2.4), which is the minimum supported version.

Upgrade the prod instance to version 6.2.4 when you upgrade a sub-prod instance to confirm the Multi-instance Framework functions correctly.

AI inventory information

You can include the sub-prod instances to synchronize with the prod instance. This synchronization enables AI inventory information to flow between the instances.

When configured, the scheduled job synchronizes AI systems, AI models, prompts, and datasets across instances. Starting with the September 2025 release, the job also synchronizes AI agents.

Note: State of the assets while configuring Multi-instance.

The production AI inventory displays the actual state of your assets like models, datasets, and skills from a production perspective. Assets that are active in a sub-prod instance environment remain classified as under development from the sub-prod instance perspective. This classification occurs because they are still in testing and not yet live.

Due to this distinction, asset states remain separate across environments and don't synchronize. An asset's state transitions to deployed only when the asset and its related records are activated in the production system.

In summary, the state indicates the asset's complete lifecycle progression, not its status within any single environment.

Data sharing preference

Enable the data sharing preference to apply the production settings to all sub-prod instances. By default, this preference is turned off.

Data overflow processing

Enable data overflow processing to apply the production settings to all sub-prod instances. By default, this preference is turned off.

Note: All the preferences mentioned earlier for a sub-prod instance are available in read-only mode, when the Multi-instance Framework is configured and enabled.

For more information on trust concepts and trust configuration management, see Cross-instance application trust configuration.

Request a Manager instance

Request a Manager instance from the Multi-instance page to configure multi-instance management.

Before you begin

Note: This feature isn't supported on Government Community Cloud (GCC), on-premises, and Domain Separated instances.

Role required: sn_ai_governance.ai_steward

About this task

This task can be performed if you're logged in from a sub-prod (managed) instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Confirm that the plugin com.glide.mif.mtls is active. If it isn't active, install the plugin com.glide.mif.mtls by submitting a support request with Now Support for Multi-instance Framework (MIF) features.

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home** > **Settings** > **Integrations** > **Multi-instance**.
2. Under Request a Manager instance, select **Select a Manager instance** drop-down and select the manager instance.
3. Select **Send request**.

Result

The request is sent to your Manager instance for approval.

Configuring security connections

Connect AI Control Tower to the platforms where your AI agents run and to your identity provider so that policies and AI agent containment using kill switch protocol can act on agents wherever they're hosted.

Key benefits

- Connect AI Control Tower to these platforms that host your AI agents: Agent Client Collector (ACC), AWS Bedrock, AWS Bedrock Agent Core, Gemini Enterprise Agent Platform, Azure AI Foundry, and ServiceNow Agents. Also, you can use Okta as an identity provider, so policy and containment actions can reach agents no matter where they run.
- Deactivate an AI agent through Deny Resource policies applied directly on the AI agent runtime platform, without requiring a separate identity provider connection.
- Add an Okta connection to strengthen containment: when an agent's identity is federated through Okta, deactivating the agent also prevents future tokens from being issued to it.

Security connections and AI agent containment

A security connection authenticates AI Control Tower to the platform or identity provider where an AI agent runs, so that policies and AI agent containment using kill switch protocol can act on that agent. Each connector uses a different authentication model — access key credentials for AWS Bedrock and AWS Bedrock Agent Core, OAuth 2.0 with a JWT Bearer grant for Gemini Enterprise Agent Platform, an Azure AD app registration for Azure AI Foundry, and an API key for Okta — but every connector ultimately creates a security connector record that appears under the **Established connections** tab.

Behind the scenes, AI agent containment is enforced differently depending on which connections you have in place:

- On a supported AI agent runtime platform (AWS, Gemini Enterprise Agent Platform, and ServiceNow), deactivating an AI agent using kill switch protocol applies a Deny Resource policy directly on that platform. This prevents the agent from acting on that platform.
- On Azure AI Foundry, deactivating an AI agent using kill switch protocol disables the agent application directly through the Azure Resource Manager API, rather than applying a Deny Resource policy.
- If you also add an Okta connection, and the AI agent's identity is federated through Okta (AWS Bedrock, AWS Bedrock Agent Core, Gemini Enterprise Agent Platform, and ServiceNow Agents), deactivating the agent additionally prevents future tokens from being assigned to it.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important: AI agent containment for Gemini Enterprise Agent Platform agents is supported only for agents that have a unique agent identity configured. See Add a Gemini Enterprise Agent Platform connection.

Add an AWS Bedrock or AWS Bedrock Agent Core connection

Connect AWS Bedrock or AWS Bedrock Agent Core to AI Control Tower so policies and AI agent containment using kill switch protocol can reach and act on agents running on AWS.

Before you begin

Confirm the following:

- You have an AWS Identity and Access Management (IAM) service account with the permissions required for the connector you're configuring:
  - For **AWS Bedrock Agent Core**, in the `bedrock-agentcore:` namespace on `runtime/*` resources: `GetResourcePolicy`, `PutResourcePolicy`, `DeleteResourcePolicy`.
  - For **AWS Bedrock Agent** (classic), in the `bedrock:` namespace on `agent/*` and `agent-alias/*` resources: `ListAgentAliases`, `UpdateAgentAlias`, `TagResource`, `UntagResource`, `ListTagsForResource`.
- The AWS access key ID and secret access key for that service account are available.

Role required: sn_ai_governance.ai_steward

About this task

Adding this connection has two parts: first you create a Connection & Credential Alias that stores your AWS credentials, then you attach that alias to the security connector in AI Control Tower.

Procedure

1. Navigate to **Connection & Credential Aliases** (`sys_alias.list`).
2. Select **New**, set **Type** to **Credential**, and select **Submit**.
3. In the resulting alias record, create a credential and fill in the fields.

AWS Bedrock credential fields

Field	Description
Credential type	Select **AWS Credentials**.
AWS Access Key	Access key ID for the AWS service account.
Secret Key	Secret access key for the AWS service account.
Auth algorithm	Select **Amazon Bedrock AgentCore AICT-AiSP** if you're configuring AWS Bedrock Agent Core, or **Amazon Bedrock Agent AICT-AiSP** if you're configuring AWS Bedrock Agent (classic).

4. Select **Submit**.

   The Connection & Credential Alias record now has this credential attached.

5. Navigate to **AI Control Tower** > **Settings** > **Integrations** > **Control Enforcement Points**.
6. On the **Available connectors** sub-tab, select **AWS Bedrock Agent Core** or **AWS Bedrock**, matching the auth algorithm you selected earlier.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Fill in the fields.

AWS Bedrock security connector fields

Field	Description
Name	Unique, descriptive name for this connection.
Connection Alias	The Connection & Credential Alias record you created in the previous steps.
Active	Select this option.

8. Select **Submit**.

Result
The connector appears on the **Established connections** sub-tab. AI Control Tower can now use this connection to enforce policies and apply AI agent containment using kill switch protocol to agents running on the connected AWS Bedrock or AWS Bedrock Agent Core service.

Add an Azure AI Foundry connection

Connect Azure AI Foundry to AI Control Tower so that policies and AI agent containment using kill switch protocol can reach and act on agents running on Azure AI Foundry.

Before you begin
Confirm the following:

- You have an Azure AI Foundry agent already discovered in AI Control Tower inventory.
- You have an Azure AD app registration (service principal) with a role assignment that permits disabling and enabling agent applications on the target resource group.

Role required: sn_ai_governance.ai_steward

About this task
Adding this connection has two parts: first you create a connection and credential alias that stores your Azure credentials, then you attach that alias to the security connector in AI Control Tower.

Procedure
1. Navigate to **Connection & Credential Aliases** (`sys_alias.list`).
2. Select **New**, set **Type** to **Credential**, and select **Submit**.
3. In the resulting alias record, create a credential and fill in the fields.
4. Select **Submit**.

   The Connection & Credential Alias record now has this credential attached.
5. Navigate to **AI Control Tower** > **Settings** > **Integrations** > **Control Enforcement Points**.
6. On the **Available connectors** sub-tab, select **Azure AI Foundry**.
7. Fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure AI Foundry security connector fields

Field	Description
Name	Unique, descriptive name for this connection.
Connection Alias	The Connection & Credential Alias record you created in the previous steps.
Active	Select this option.

8. Select **Submit**.

Result
The connector appears on the **Established connections** sub-tab. AI Control Tower can now use this connection to enforce policies and apply AI agent containment using kill switch protocol to agents running on the connected Azure AI Foundry service.

Add a Gemini Enterprise Agent Platform connection

Connect Gemini Enterprise Agent Platform to AI Control Tower using a service account and OAuth 2.0 JWT Bearer authentication, so policies and AI agent containment using kill switch protocol can reach and act on agents running on Gemini Enterprise Agent Platform.

Before you begin
Confirm the following:

- A Google Cloud project with the Vertex AI API in Google Cloud enabled and IAM permissions to create a service account.
- A Google Cloud service account granted three IAM roles.

Required IAM roles

Role	Scope	Purpose
`roles/iam.denyAdmin`	Organization	Create and delete the Deny policy used to contain an agent.
`roles/aiplatform.viewer`	Project level	Read the agent's identity from Gemini Enterprise Agent Platform.
`roles/resourcemanager.projectViewer`	Project level	Resolve the Google Cloud project ID.

Deny policies are the only mechanism that overrides IAM allow policies, which makes them the reliable choice for containing an AI agent with the `roles/iam.denyAdmin` role. Removing an agent's role bindings isn't sufficient, because access granted elsewhere in the project still applies.

Gemini Enterprise Agent Platform doesn't provide an API to disable an agent without deleting it. Creating a deny policy requires the `iam.denypolicies.create`, `update`, and `delete` permissions. Google Cloud doesn't provide a way to obtain these permissions below the organization level. The `roles/iam.denyAdmin` role can't be granted on a folder or project, and the permissions can't be placed in a custom role at any scope. Grant the role at the narrowest scope the platform supports. For more information, see the Google Cloud IAM documentation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The `roles/iam.denyAdmin` role carries residual risk. This role permits creating deny policies against any resource in the organization, which is broader than the scope required for AI agent containment. Google Cloud doesn't provide a way to narrow the grant by scope, so manage this risk through monitoring rather than IAM. Monitor Cloud audit logs for changes to who holds the role, and monitor all deny policy create and delete actions. Alert on any policy that isn't a project-scoped policy targeting a single agent identity.

Complete these additional prerequisites before continuing:

- Download a JSON key for the service account. In the Google Cloud console, go to **IAM & Admin** > **Service accounts**, select the service account, then select **Add key** > **Create new key** and choose **JSON** as the key type. You'll need the `private_key`, `private_key_id`, `client_email`, and `token_uri` values from this file in the steps below.
- For each ADK-based AI agent you want containment to cover, enable Agent Identity. Create an `.agent_engine_config.json` file with `{ "identity_type": "AGENT_IDENTITY" }` and follow Create and deploy an agent with Agent CLI and Agent Identity to deploy the agent with a unique identity.

> **Important:** AI agent containment is supported only for Gemini Enterprise Agent Platform agents that have a unique agent identity configured this way.

Role required: creating the OAuth, JWT, and certificate records in steps 1–8 below typically requires an instance admin or integration admin role. Creating the security connector in steps 9–11 requires sn_ai_governance.ai_steward.

About this task

Gemini Enterprise Agent Platform authenticates using OAuth 2.0 with a JWT Bearer grant, which requires more setup than an access-key based connection: you convert the service account key into a Java Key Store, build a chain of OAuth and JWT records from it, and then attach the resulting Connection & Credential Alias to the security connector.

Procedure

1. Create the X.509 certificate.

   Convert the service account's private key into a Java Key Store (`.jks`) file and import it as an X.509 Certificate. See the ServiceNow documentation on converting a private key to a Java Key Store. If your team already has a pre-generated `.jks` bundle, you can upload it directly instead.

   Certificate (sys_certificate) fields

Field	Description
Name	Descriptive name, such as the service account's email address.
Type	Select **Java Key Store**.
Key store password	Password used when the `.jks` file was created.
Active	Select this option.

2. Create the JWT Keys record.

   Navigate to **JWT Keys** and create a new record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

JWT Keys fields

Field	Description
Name	Descriptive name.
Signing Keystore	The certificate record from the previous step.
Key Id	The `private_key_id` value from the service account JSON key. Copy it directly.
Signing Algorithm	Select **RSA 256**.
Signing Key	The password used to create the certificate in the previous step.
Active	Select this option.

3. Create the JWT Provider record.

   Navigate to **JWT Provider** and create a new record with the following:

   - **Name**: descriptive name.
   - **Signing Configuration**: the JWT Keys record from the previous step.
   - **Expiry Interval (sec)**: `3600`.

   Add these Standard Claims:

   - `aud`: The `token_uri` value from the service account key (typically `https://oauth2.googleapis.com/token`).
   - `iss`: The `client_email` value from the service account token.
   - `sub`: The `client_email` value from the service account token.

   Add this Custom Claim:

   `scope : https://www.googleapis.com/auth/cloud-platform`

4. Create the Application Registry record.

   Navigate to **Application Registries** and create a new **OAuth Provider** record.

Application Registry (OAuth Provider) fields

Field	Description
Name	Descriptive name.
Provider Type	Select **Connect to a third-party OAuth Provider – Outbound** (or the equivalent option on your instance).
Default Grant Type	Select **JWT Bearer**.
Client ID	The `client_id` value from the service account JSON key you generated earlier.
Client Secret	The `private_key` value from the service account JSON key, with `\n` sequences converted to actual newlines.
Authorization URL	`https://accounts.google.com/o/oauth2/auth`
Token URL	`https://oauth2.googleapis.com/token`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Refresh Token Lifespan	`8640000`
Active	Select this option.

Under **OAuth Entity Scopes**, add a scope named **Vertex AI Scope** with the value `https://www.googleapis.com/auth/cloud-platform`.

5. Update the default OAuth Entity Profile.

   Open the default profile that was automatically created for the OAuth Provider in the previous step, and set:

   - **Grant type**: **JWT Bearer**.
   - **JWT Provider**: the JWT Provider record from the earlier step.
   - **Is default**: select this option.

   Add **Vertex AI Scope** under **OAuth Entity Profile Scopes**.

6. Create the OAuth 2.0 Credentials record.

   Navigate to **OAuth 2.0 Credentials** and create a new record with the following:

   - **Name**: descriptive name.
   - **OAuth Entity Profile**: the profile from the previous step.
   - **Applies to**: **All MID servers** (or as appropriate for your instance).
   - **Active**: select this option.

   Use the **Get OAuth Token** related link to confirm the credential retrieves a token successfully.

7. Create the Connection & Credential Alias.

   Navigate to **Connection & Credential Aliases** and create a new record with the following:

   - **Name**: descriptive name.
   - **ID**: a unique identifier for the alias.
   - **Type**: **Connection and Credential**.
   - **Connection type**: **HTTP**.
   - **Default Retry Policy**: **Default HTTP Retry Policy**.

8. Create the HTTP(S) connection.

   From the **Connections** related list on the alias you just created, select **New** and fill in:

   - **Name**: descriptive name.
   - **Credential**: the OAuth 2.0 Credentials record from the earlier step.
   - **Connection alias**: the alias from the previous step.
   - **Protocol**: **https**.
   - **Host**: `iam.googleapis.com`.
   - **Connection URL**: `https://iam.googleapis.com`
   - **Active**: select this option.

9. Navigate to **AI Control Tower** > **Settings** > **Integrations** > **Control Enforcement Points**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

10. On the **Available connectors** sub-tab, select **Gemini Enterprise Agent Platform**.
11. Fill in the fields and select **Submit**.

Gemini Enterprise Agent Platform security connector fields

Field	Description
Name	Unique, descriptive name for this connection.
Connection Alias	The Connection & Credential Alias you created in the previous steps.
Active	Select this option.

Result

The connector appears on the **Established connections** sub-tab. AI Control Tower can now use this connection to enforce policies and apply AI agent containment using kill switch protocol to Gemini Enterprise Agent Platform agents that have a unique agent identity configured.

To verify the setup:

- Confirm the HTTP connection appears in the **Connections** related list on the Connection & Credential Alias.
- Confirm the OAuth 2.0 Credentials record can retrieve a token using **Get OAuth Token**.
- Confirm the connector appears under **Established connections** on the Control Enforcement Points tab.

To deploy the AI agent, see Create and deploy an agent with Agent CLI and Agent Identity in Google documentation.

Add an Okta connection

Connect Okta to AI Control Tower so that policies and AI agent containment with kill switch protocol prevent future tokens from being issued to a deactivated AI agent.

Before you begin

Confirm the following:

- You have an Okta tenant with admin access to generate an API token scoped to `okta.aiAgents.manage`. This scope is dedicated to AI agent lifecycle operations and meets least-privilege requirements; it isn't the broader `okta.users.manage` scope. Requires the Okta `SUPER_ADMIN` role.
- A security connection is already established for the platform hosting the AI agent — AWS Bedrock, AWS Bedrock Agent Core, Azure AI Foundry, Gemini Enterprise Agent Platform, or ServiceNow Agents. An Okta connection extends containment for agents whose identity is federated through one of those platforms; it doesn't replace the platform connection. See Add an AWS Bedrock or AWS Bedrock Agent Core connection or Add a Gemini Enterprise Agent Platform connection.
- The AI agents you want covered are actively configured on the Okta tenant — in other words, their identity is federated through Okta.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

APIs covered by the okta.aiAgents.manage scope

Operation	Kill switch use case	Okta endpoint
Activate AI agent	Reinstate after investigation clearance.	`POST /api/v1/agentregistration/{id}/activate`
Deactivate AI agent	Deactivate the agent as a containment action.	`POST /api/v1/agentregistration/{id}/deactivate`
Get all agents	Discover agent inventory for targeting.	`GET /api/v1/agentregistration`

Role required: Creating the Connection Alias, credential, and HTTP connection in steps 1–3 below typically requires an instance admin or integration admin role. Creating the security connector in steps 4–6 requires sn_ai_governance.ai_steward.

About this task

An Okta connection is optional but strengthens how AI agent containment using kill switch protocol works. If an identity provider isn't connected, AI agent containment acts at the runtime platform only; existing identity provider-issued session tokens aren't revoked and new tokens aren't blocked.

When Okta is configured and the agent's identity is federated through Okta, deactivating the agent additionally prevents future tokens from being assigned to it.

Procedure

1. Create the Connection Alias.

   Navigate to **Connection & Credential Aliases** (`sys_alias.list`) and select **New**.

   Okta Connection Alias fields

Field	Description
Name	Descriptive name, such as `Okta Identity Sync Alias`.
Type	Select **Connection**.
Connection Type	Select **HTTP Connection**.
Is Internal	Clear this option.
Multiple Connections	Clear this option.
Retry Policy	Select **Default HTTP Retry Policy**.
Application / Scope	Select **AI Security and Privacy**.

   Select **Submit**.

2. Create the API key credential.

   Navigate to **Credentials** (`discovery_credentials.list`), select **New**, and choose credential type **API Key Credentials**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Okta API key credential fields

Field	Description
Name	Descriptive name, such as `Okta SSWS Token - <your_okta_tenant_name>`.
Active	Select this option.
Type	Select **API Key**.
API Key	Your Okta API token.
API Key Prefix	`SSWS`.
Application	Select **AI Security and Privacy**.

Note: The `SSWS` prefix is automatically prepended to the token in the Authorization header. Don't include `SSWS` in the API Key field itself.

Select **Submit**.

3. Create the HTTP connection.

   Navigate to **HTTP Connections** (`http_connection.list`), or select **New** from the **Connections** related list on the Connection Alias record you created earlier.

Okta HTTP connection fields

Field	Description
Name	Descriptive name, such as `Okta Dev Tenant - <your_okta_tenant_name>`.
Active	Select this option.
Connection URL	`https://<your_okta_tenant>.oktapreview.com`
Connection Alias	The Connection Alias record from the first step.
Credential	The API key credential from the previous step.
Protocol	**https**
Host	`<your_okta_tenant>.oktapreview.com`
Application Scope	Select **AI Security and Privacy**.
Use MID	Clear this option.
MID Selection	Select **Auto select**.
Mutual Auth	Clear this option.

Select **Submit**.

4. Navigate to **AI Control Tower** > **Settings** > **Integrations** > **Control Enforcement Points**.
5. On the **Available security connectors** sub-tab, select **Okta**.
6. In the **Configure connector** panel, fill in the fields and select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Okta security connector fields

Field	Description
Name	Unique, descriptive name for this connection, such as `Okta - Dev Tenant`.
Provider Type	Select **Okta**.
Connection Alias	The Connection Alias you created in the first step.
Active	Select this option.

Result

The connector appears on the **Established connections** sub-tab. If Okta deactivation is skipped and only hyperscaler deactivation is performed, the AI agent is still effectively disabled; the Okta connection adds token-level containment on top of that.

To verify the setup:

- Open the Connection Alias record and confirm the HTTP connection appears in its **Connections** related list.
- Optionally, test the connection with a GET request to `https://<tenant>.oktapreview.com/api/v1/ai-agents?limit=200https://<tenant>.oktapreview.com/api/v1/agentregistration` using the alias, and confirm a `200 OK` response.

Add an Agent Client Collector (ACC) connection

Block and unblock AI usage on managed devices by configuring Agent Client Collector (ACC) as a control enforcement point.

Before you begin

Confirm the following:

- The Agent Client Collector (ACC) agent is deployed to the devices you want covered. For details, see Agent Client Collector.
- Devices with the deployed ACC agent can connect to your ServiceNow instance through a MID server or a proxy.
- If ACC is already installed and in use, confirm agents are reporting data on the **ACC Agent health dashboard**.

Role required: sn_ai_governance.ai_steward

About this task

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home** > **Settings** > **Integrations** > **Control enforcement points**.
2. On the **Available connectors** tab, select **ACC**.
3. Enter a name for this connection.
4. Confirm the **Domain** field.
5. **Optional:** Select a **Connection Alias**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Activate the connector by selecting **Active**.
7. Select **Submit**.

Result
The connection is created and appears on the **Established connections** tab.

What to do next
ACC is configured as a control enforcement point for explicit block policies. For details, see Create an Explicit Block policy.

Configuring rules and templates in AI Control Tower

Configure how AI assets are classified, evaluated, valued, and secured across your organization through rules and templates.

Rules and templates settings bring together the configuration that drives automated AI governance behavior on your instance.

Rules and templates

Automation rules

Define the conditions under which discovered AI assets are automatically marked as managed. Use built-in rules or create your own to reduce manual classification work and keep your inventory current. For more information, see Managing AI assets in bulk.

Evaluation

Configure evaluation scoring for ServiceNow and external AI systems. Select which metrics are scored on each evaluated session, and use metric templates to define how individual metric scores aggregate into quality and safety scores. For more information, see Configuring monitoring and evaluations in AI Control Tower.

Templates

Manage the value templates that define the productivity gain formula for AI assets. Configure default template rules that determine which template is applied to a new AI asset, and review the AI system mappings that show which template each asset is currently using. For more information, see Value.

AI skills

Enable the **AI-generated enrichment** toggle to run LLM-based enrichments with the AI Inventory Intelligence Agent. For more information, see AI Inventory Intelligence Agent

Cost

Configure the AI cost settings used to calculate net AI returns and the cost dimension of value templates. For more information, see Cost.

Security

Configure security rules and templates that control how AI Control Tower detects and responds to security threats across your AI assets. For more information, see Configure post-runtime security metrics.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Gateway

Use the AI Gateway settings page to control global transaction processing for all connected MCP servers and manage individual MCP server connections independently of the global gateway state.

Role required: sn_ai_governance.ai_steward

The AI Gateway settings page is the administrative control center for the AI Gateway in AI Control Tower. From this page, you can:

- Pause or resume global transaction processing across all MCP servers simultaneously.
- Monitor the connection status of individual MCP servers in real time.
- Pause or resume traffic to specific MCP servers independently from the global setting.
- Configure tools and policies for the AI Gateway using the Tools and Policies tabs.

The page is organized into three tabs: Overview, Tools, and Policies.

Overview tab

The Overview tab displays the global transaction control banner and the MCP servers list with server name, connection status, and server-level pause controls.

The transaction status banner appears at the top of the Overview tab. It shows the current global state of AI Gateway transaction processing and provides a control to change that state.

MCP servers table

The MCP servers section lists all MCP servers registered with the AI Gateway. The section header displays the total count of registered servers. The table provides the following columns for each server.

Column	Description
Server name	The display name of the MCP server as registered in the AI Gateway. The name links to the server's inventory record in AI Control Tower.
Connection status	Connection state, shown as a color-coded dot and label: • Green: Server is actively connected and processing requests. • Red: Server is not reachable or has been paused.
Last updated	The date and time when the connection status was last refreshed for this server
Pause / Resume button	Controls traffic to this MCP server. Select Pause to stop the AI Gateway from rou requests to this server only. Other servers continue to operate normally. Select Resume to restore routing.

Tools tab

The Tools tab governs the lifecycle of individual tools exposed by MCP servers. It provides two global toggle settings that automate tool management decisions based on security scanning results and MCP server approval workflows.

Tools tab settings

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Tools tab displays two configurable toggle settings: Auto-deactivate vulnerable tools and Auto-activate new tools. Both toggle settings are enabled by default.

Toggle settings	Description
Auto-deactivate vulnerable tools	New tools are automatically activated when an MCP server is approved. Tools identified as vulnerable are automatically deactivated.
Auto-activate new tools	New tools are automatically activated. Vulnerable tools are flagged but remain active until manually deactivated.

Policies tab

The Policies tab lets you manage how built-in AI Gateway policies are enforced across registered MCP servers. Each policy in AI Gateway targets a specific type of governance — such as data sensitivity checking — and can be applied selectively to individual servers.

From the Policies tab, you can view which MCP servers are running under a given policy and monitor their enforcement status. You can also activate or deactivate policy enforcement per server without affecting the global policy state.

AI Gateway policy

AI Gateway policy defines a set of rules that AI Control Tower can enforce when AI agents interact with MCP servers through the gateway. Policies operate at the server level: you can enable a policy for one server while leaving it inactive for another. AI Control Tower includes the following built-in policy:

Data Sensitivity Check: Scans tool inputs and outputs for sensitive data types. When active, the policy can intercept agent interactions and block or flag content that matches the configured sensitivity rules.

The Policies tab is organized into two areas: a policy activation banner and a server list.

The banner at the top of the page shows whether the policy is currently activated at the global level. It provides the following controls:

- Activate / Deactivate — Turns the policy on or off globally. When deactivated, the policy is not enforced for any server regardless of individual server policy status.
- Configure sensitive data types — A link that opens the sensitive data type configuration page, where you define the data categories the policy detects.

The server list displays all MCP servers that are associated with the active policy. The list includes the following columns:

Column	Description
Server name	The name of the MCP server running under the policy. Select the server nam
Policy status	Indicates whether the Data Sensitivity Check policy is enforced for this serv server enforces the policy. When inactive, the server does not.
Action	Select Activate or Deactivate to change the policy enforcement status for th

AI Control Tower playbooks

Drive the lifecycle and approval workflows for AI assets using playbooks in AI Control Tower.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Playbooks define the structured workflows that guide AI stewards and asset owners through asset onboarding, offboarding, and approval. The playbooks are active by default and can't be edited from within AI Control Tower. To modify a playbook's logic or steps, open it in Workflow Studio by selecting the playbook.

Playbooks

Playbook	Description
AI Asset Onboarding	Guides an AI asset through the onboarding lifecycle stages: Onboard, Assess, Build and test, and Deploy. Triggered when an asset is moved to managed and a lifecycle review is started. The playbook assigns tasks to AI stewards and asset owners for each phase and tracks completion before the asset moves to the Maintain phase.
AI Asset Offboarding	Guides an AI asset through the offboarding lifecycle stages: Assess, Pre-offboarding tasks, and Offboard. Triggered when an AI asset change request of type Offboarding reaches the In progress state. The playbook assigns tasks to the AI Stewards group and requires an approved assessment before the asset's inventory state and status update to Retired on completion.
Now Assist approval	Coordinates AI steward approval before a Now Assist AI asset is deployed. The playbook runs in three steps: Review asset, Evaluate asset, and Approve or reject. During the Evaluate asset step, AI stewards can create sub-approval tasks to gather input from other teams, such as Legal, Security, Data, or Privacy review. When approving or rejecting, the AI steward selects a Risk score and enters Close notes; these values become read-only after the step is marked complete. The playbook runs automatically when a new AI asset is added if AI steward approval is activated in Builder controls. See Configure ServiceNow AI settings.

Updated playbooks for governing managed assets

Manage AI assets through structured lifecycle workflows using the updated playbooks that automate governance tasks, route approvals, and track compliance requirements across onboarding, maintenance, and retirement phases.

Overview of the updated playbooks

The legacy playbooks experience inhibits flexible, risk-aware governance at scale. Tasks originate from disparate integrations rather than the playbook itself, removing context between stages and task origins. When tasks fail or don't appear, users don't have an easy way of determining whether the tasks skipped or encountered errors. Governance tasks apply uniformly across assets regardless of risk classification.

The updated playbooks improve on existing playbooks by introducing centralized task creation. This enables visibility into task lifecycle, providing a single source of truth for changes, allowing risk-based task differentiation, and improving discoverability through clearer navigation paths. The new playbooks provide structured workflows that guide AI stewards and asset owners through the complete lifecycle of AI assets. Playbooks automate governance tasks, assign responsibilities, and enforce compliance checkpoints as assets progress from initial onboarding through deployment, maintenance, and eventual retirement.

How playbooks work

Playbooks operate as workflow templates that activate when specific lifecycle events occur. Each playbook defines a sequence of activities and tasks that must be completed before an asset can advance to the next lifecycle phase. When an AI asset enters a new lifecycle stage, the corresponding playbook generates a set of activities and tasks tailored to that stage. Each activity represents a logical grouping of related governance work, such as risk assessment, security review, or deployment approval. This approach ensures that governance, risk, and compliance requirements are addressed operationally as part of the asset lifecycle rather than as separate processes.

Tasks within each activity are assigned to appropriate roles based on the type of review required. For example, impact assessments might be assigned to AI stewards, while security clearances are routed to security teams. The asset cannot progress to the next activity until all required tasks for the current activity are completed or approved. To learn more about the playbooks offered, see AI Control Tower playbooks.

Key benefits of the updated playbook

The updated playbook provides the following benefits:

- Task creation is handled by the playbook and is not dependent on separate workstream integrations.
- A consolidated overview of all tasks and their statuses are maintained in a single place. Tasks appear created, errored with a message, or skipped—all recorded in one place.
- Each workstream reads its own decision table. Task types are added or changed by configuration, not code.
- Asset attributes such as risk tier, phase, and use and purpose are considered before the tasks are assigned.
- Playbooks are shipped as protected. However, they can be cloned with the workflow and then customized to suit business requirements.

Lifecycle tasks

Lifecycle tasks are units of governance work that playbooks generate as assets progress through their lifecycle. Each task corresponds to a step in a playbook activity that requires human review, approval, or completion. Tasks include impact assessments, architecture reviews, security clearances, value template approvals, and other reviews that must be completed before an asset can advance.

Playbooks generate tasks based on the asset type, risk classification, and lifecycle phase. Tasks are assigned to specific roles or individuals based on the type of review required. For example, a high-risk AI system might trigger additional security review tasks that are not required for lower-risk assets.

Tasks appear in multiple locations for visibility and action. Asset owners see tasks on the asset record within the playbook visualization. AI stewards and reviewers see assigned tasks in the Activity Center and can filter by task type, priority, or due date. Tasks can also generate recommendations when they become overdue or when activities have no associated tasks.

Automated triggering of playbooks

Playbooks can be configured to trigger automatically when specific conditions are met. When the Automatically trigger playbooks setting is active in Builder controls, approval playbooks run

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

automatically when a new AI asset is added. This ensures that governance workflows begin immediately when assets enter the system.

When automatic triggering is inactive, asset managers can still initiate approval playbooks manually from the asset record. This provides flexibility for organizations that want to control when governance workflows begin or that have different approval requirements for different asset types.

Automatic triggering reduces manual overhead and helps prevent ungoverned assets from progressing through the lifecycle without required reviews. It also ensures consistent application of governance policies across all AI assets.

Related topics

Migrate to updated AI asset onboarding playbook

Migrate to updated AI asset onboarding playbook

Configure the new AI asset onboarding playbook to simplify AI asset management through structured lifecycle workflows. The migration also includes an opt-in to decide between moving to the new playbook or continuing in the existing playbook.

Before you begin

Role required: admin

Procedure

1. Navigate to **Settings** > **Playbooks**.

   The **Playbooks** settings page shows all published playbooks and their current status.

2. Locate the **Switch to AI Asset Onboarding playbook V2** option.

   This card displays the scope of the migration. It includes a description of what will change and a **Review and switch** button.

   Note: Switching to the new playbook will not migrate customization that has been implemented in the existing playbook and flows. However, it will flag the customized playbooks and flows. This enables you to make fixes to prevent disruptions.

3. Select **Review and switch**.
4. On the **What's changing** tab, review the three sections: **What's changing**, **What it affects**, and **Confirm**.

   The dialog lists artifacts that will be deactivated, remain active without changes, and activate as part of the migration.

What's changing

What's changing	Review details of the new playbook structure that is being introduced. The system retires artifacts specific to the old playbook during migration. After the switch, the new AI Asset Onboarding playbook introduces updates six areas: playbook structure, task assignment per asset, task rule configuration, lifecycle progression triggers, stage-specific user views, and new task type addition. The new

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

	approach replaces fixed paths with flexible, configurable options.
What it affects	Existing playbooks and flows remain active without changes. Review these items to verify they do not create duplicate approval tasks. The system activates one new customized AI asset onboarding playbook with all required components
Confirm	The system deactivates the old playbook automatically. Your customized flows and playbooks remain active and require your review. The new playbook activates with all required components. Confirm that you understand the old setup deactivates while your customizations remain active.

Note:

Switching to the new playbook impacts only new AI Assets. Existing AI Assets which are already part of a playbook will not be impacted.

5. Expand each section to confirm the specific playbooks, flows, and configurations affected by the switch.

   Based on your app version, complete the appropriate steps:

AI Asset Onboarding migration scenarios

Scenario and impact	Steps
App versions from `AICT UI Application v7.1.1`	
There are no impacts. AI Asset Onboarding V2 is enabled by default and requires no migration.	Not applicable.
App versions before `AICT UI Application v7.1.1`.	
If no customizations were made to the default playbook, the switch to the new playbook is executed with no impacts. Impact: No impact Remedial measures: No remedial measures are required.	**a.** In **Settings** > **Playbooks**, select **Review impacts** on the **Switch to AI Asset Onboarding V2** banner. **b.** Select **Review and switch** to complete the migration.
○ If the default playbook has been customized ○ If a custom playbook has been created to replace the default playbook and the default playbook has been deactivated. Impact: No impact	**a.** Deactivate the customized playbook. **b.** In **Settings** > **Playbooks**, select **Review and switch** to switch to AI Asset Onboarding V2.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scenario and impact	Steps
Remedial measures: The existing playbook needs to be deactivated.	
If the default flows are customized. Impact: Customized flows associated with the old playbook may create duplicate tasks when they continue to run alongside the new playbook. Remedial measures: Configure flow to check if AI Asset Governance Details record is linked to the old playbook and end the flow to prevent the flow from executing further. Add this check to all customized flows that generate tasks.	Modify the flow to introduce a check. For more information, see Edit a flow **a.** Add an action **Check if AI Asset Governance Details record is linked to the old playbook** to the customized flow. **b.** Add an **If** condition immediately after the check. **c.** Configure the condition: if the AI Asset Governance Details record is not linked to the old playbook, add an **End Flow** step. This configuration allows the flow to exit early for new assets tied to the V2 playbook and continue running only for existing assets on the old playbook. **Note:** The action **Check if AI Asset Governance Details record is linked to the old playbook** is available only after upgrading to version `6.1.2`
If the V2 playbook is to be cloned and customized.	**a.** Create a copy of the V2 playbook and modify it as needed. **b.** Set the *sn_ai_asset_mgmt.new_playbook_opt_in* system property to `true`. **c.** Deactivate the old playbook. **d.** Activate the newly cloned playbook. **e.** In the Playbook Configuration record, set the **Playbook record** field to `AI Asset Onboarding V2`. **f.** In the `AIAssetLifecycleAPI` script include, update the *NEW_PLAYBOOK_SYS_ID* variable to reference the copied playbook's sys_id.

6. Select **Continue**.
7. **Optional:** Review any additional confirmation prompts and select **Confirm** to complete the switch.

Configure ServiceNow AI settings

Control how AI features operate on your instance by configuring data sharing preferences, asset approval requirements, and allowed AI model providers.

Before you begin

Role required: sn_ai_governance.ai_steward

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

ServiceNow AI settings apply across your instance and affect all Now Assist features, not just AI Control Tower. Review each setting with your organization's data governance and AI governance policies before making changes.

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home** > **Settings** > **ServiceNow AI**.
2. On the **Data controls** tab, review and adjust your data sharing and overflow processing preferences.

   a. To stop sharing instance data with ServiceNow for AI model improvement, select **Opt out** on the **Data Sharing** card.

   Data sharing is active by default. When active, ServiceNow may use instance data that has been filtered for the purpose of removing personal data to improve AI model accuracy. Opting out does not affect your instance's access to AI features. For more information, see the FAQs and opt-out documentation linked on the card.

   b. To prevent Now Assist traffic from bursting to Microsoft Azure datacenters during high-traffic periods, select **Opt in** on the **Data overflow processing** card to keep all traffic within ServiceNow datacenters.

   Data overflow processing is inactive by default, meaning bursting to Azure is allowed. Opting in keeps all Now Assist traffic within ServiceNow datacenters but may result in processing delays or capacity errors during high-traffic periods.

3. On the **Builder controls** tab, configure approval requirements and automated playbook behavior for AI assets.

   a. In the **AI steward approval for AI assets** section, activate approval requirements for each asset type that should require AI steward sign-off before deployment.

   You can activate approval independently for AI systems, MCP servers, and AI models. When active for an asset type, an AI steward must approve the asset before it can be deployed. Select **Actions** on the asset type row to activate or deactivate the requirement.

   b. In the **Automated requests** section, verify that **Automatically trigger playbooks** is set to **Active** if you want approval playbooks to run automatically when a new AI asset is added.

   When inactive, asset managers can still initiate approval playbooks manually from the asset record. Activate or deactivate using **Actions** on the row.

4. On the **AI model providers** tab, configure which AI model providers are allowed on your instance and set fallback behavior.

   a. Review the **Impact summary** panel to see how your current provider selection affects the AI systems on your instance.

   The Impact summary panel shows the total number of AI systems on your instance, how many are supported by your allowed providers, and how many are running on fallback providers instead. Select an area in the chart or a count to open the full Impact summary page, where you can review the list of affected AI systems for that category, including each system's type, activation status, default provider, and per-provider support status.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. Select **Edit** to open the provider configuration.

c. In the **AI model providers supported by ServiceNow** section, select the providers you want to allow.

Supported providers include Now LLM Service, AWS Claude, Azure OpenAI, and Google Gemini. These providers are supported by ServiceNow or ServiceNow OEM partners. The data routing setting (Regional or Global) applies to this provider group.

Note: Some ServiceNow skills and agents use third-party provider APIs that may route data to datacenters outside your region. For a list of affected APIs and skills, see the Third-party APIs used in Advanced AI & Data Products [KB2596322] article.

d. In the **AI model providers configured by your organization** section, select any third-party providers your organization has configured with its own API keys.

Third-party providers include Custom LLM Provider, OpenAI, Perplexity, IBM Watson, and others. If your organization uses a provider that is not listed, an admin can add it using provider keys from AI Skill Kit.

e. In the **Is fallback activated?** section, decide whether AI systems whose providers aren't in the allowed list should remain active using their previously configured provider.

f. Select **Save**.

Data controls

Data controls in AI Control Tower enable you to manage how ServiceNow Otto traffic and data are handled across ServiceNow and external datacenters.

You can access Data controls from the **Settings** page in AI Control Tower by selecting the **Data controls** tab. Data controls contain two settings: Data sharing and Data overflow processing. Each setting has its own default state and can be opted out of independently.

Data sharing

Data sharing enables ServiceNow to use anonymized instance data to improve AI model accuracy, enhance user experiences, and better understand business needs.

Data sharing setting

Setting	Default	Effect
Data sharing	Active (on)	ServiceNow uses anonymized instance data to improve AI model accuracy and products. Opting out does not affect your instance's access to AI features, but your instance no longer contributes data to improve ServiceNow AI products.

To stop sharing instance data with ServiceNow for AI model improvement, select Opt out on the Data sharing card.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data overflow processing

During high-traffic periods, ServiceNow Otto traffic can burst to Microsoft Azure datacenters to maintain performance. Data overflow processing gives you control over this behavior.

If you opt out of data overflow processing, all ServiceNow Otto traffic remains within ServiceNow datacenters. However, opting out can result in processing delays or capacity overflow errors during high traffic periods.

Data overflow processing

Setting	Default	Effect
Data overflow processing	Inactive (off)	By default, bursting to Azure datacenters is allowed when ServiceNow datacenters experience traffic spikes. Opting in keeps all ServiceNow Otto traffic exclusively within ServiceNow datacenters, but may result in processing delays or capacity errors during high-traffic periods.

To prevent ServiceNow Otto from bursting to Microsoft Azure datacenters, select Opt out on the Data overflow processing card.

Note: The Data sharing and Data overflow processing cards are available for a sub-prod (managed) instance in read-only mode, when Multi-instance setup is configured and active.

Builder controls

Builder controls in AI Control Tower enable you to govern AI assets and workflows by requiring human approval before an asset is deployed or a playbook is triggered.

You can access Builder controls from the **Settings** page in AI Control Tower by selecting the **Builder controls** tab. Builder controls contain two governance settings:

- AI Steward approval for AI assets
- Automatically trigger playbooks

AI Steward approval for AI assets

When you activate AI Steward approval, an AI Steward must approve an AI asset before it can be deployed. You can activate approval independently for each asset type.

The following asset types support AI Steward approval:

Asset type and status

Asset type	Status	Description
AI systems	Inactive	Requires AI Steward approval before an AI system can be deployed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Asset type and status (continued)

Asset type	Status	Description
Model Context Protocol (MCP) servers	Inactive	Requires AI Steward approval before an MCP server is made available.
AI models	Inactive	Requires AI Steward approval before an AI model can be used by AI systems.

Each asset type has an independent status of Active or Inactive. When the status is Inactive, AI Steward approval is not enforced for that asset type.

Note: Activating AI Steward approval for one asset type does not affect the approval requirement for other asset types.

Automatically trigger playbooks

The **Automatically trigger playbooks** setting controls whether an approval request is triggered automatically when an AI asset is added. When active, an approval request is sent automatically whenever an AI asset is added. When inactive, the asset manager initiates the request manually.

Note: If you don't activate **Automatically trigger playbooks**, asset managers must initiate approval requests manually from the asset record.

AI model providers

AI model providers enable you to select data routing and manage third-party LLMs (Large language models) and SLMs (Small language models).

Overview of AI model providers

The AI Control Tower provides an AI model providers section where administrators can configure how AI requests are routed and which model providers are permitted on the instance. There are two categories of AI model providers:

- AI model providers supported by ServiceNow. For example, Now LLM Service, AWS Claude, Now LLM-LTS (Long Term Stable) model.
- AI model providers configured by your organization. For example, Perplexity, IBM Watson.

Note: You can select the Now LLM-LTS (Long Term Stable) model, which supports regulated industries such as financial institutions with stronger AI lifecycle management, governance, transparency, and conformance tools.

For more information on the Now LLM-LTS (Long Term Stable) model, see Long term stable models

Data routing and model providers

Data routing is a technology by which LLM and SLM requests are routed to the most suitable datacenter. This technology helps to optimize data traffic, which reduces latency and speeds up response time.

The Data routing and model providers section enables you to route AI model requests and select the allowed model providers. There are two types of data routing:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data routing type

Data routing type	Description
Regional data routing	Routes LLM and SLM requests to datacenters within your region. For example, if you're in the APJC (Asia Pacific, Japan, and China) region, requests are routed to the most suitable datacenter in the APJC region. Regional data routing can be mandated by governments of specific regions.
Global data routing	Routes LLM and SLM requests to the most suitable datacenter globally, regardless of the region where the request originates.

You can configure third-party LLM providers using the edit option by choosing either Regional or Global data routing and selecting all the Allowed model providers.

Model Preview Program

Model Preview Program (MPP) is an opt-in program that gives eligible users early access to AI models that aren't yet generally available. These models may be labeled as preview, beta, pre-release, or experimental.

With the MPP, you can:

- Experiment with upcoming AI models before general availability.
- Test new AI capabilities in their environment.
- Build and validate custom skills and agents using the latest models on the platform.
- Provide early feedback on new model offerings.

How MPP works in AI Control Tower:

- An MPP toggle appears in AI Model Providers settings.
- The toggle is off by default.
- An administrator must accept the terms and conditions before enabling the toggle.
- When enabled, eligible preview models are set to available for use.
- Acceptance is audited and recorded.

Fallback and spillover

Fallback and spillover

Feature	Description
Fallback	If you have active AI systems that aren't supported by your enabled model providers, the fallback mechanism enables these systems to continue operating with their default providers. If you choose not to enable fallback, these AI systems must be deactivated. AI systems deployed on fallback providers conform with the list of approved

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fallback and spillover (continued)

Feature	Description
	providers. The Fallback is activated by default and can be modified.
Spillover	Regional deployments of AI models can experience limited capacity, which could lead to request rate limiting and impact performance. Enabling spillover can help prevent these performance issues. In ServiceNow, only Azure OpenAI currently makes this switch. The Spillover feature is set to active when Azure OpenAI is selected.

Impact summary

The Impact Summary is determined by the chosen allowed model providers and the status of the fallback (active or inactive). The Fallback significantly affects how the Impact summary data appears in the Impact summary table.

You can use the edit option to select **Yes** or **No** for activating the Fallback. Before saving, you can select Preview impact to review and confirm all your selections.

Activate fallback: No

When Fallback is set to No, the Impact summary table shows:

- Total AI systems — all AI systems supported by the allowed model providers.
- AI systems supported by allowed providers — AI systems with skill sets supported by the providers.
- AI systems require deactivation — all active AI systems that lack provider support and must be deactivated because the fallback option is not enabled.
- AI systems can't be activated — all systems currently inactive and not supported by any provider.

Activate fallback: Yes

When Fallback is set to Yes, the Impact Summary table shows:

- Total AI systems — all AI systems supported by the allowed model providers.
- AI systems supported by allowed providers — all AI systems with skill sets supported by the providers.
- AI systems supported by fallback providers — AI systems that are non-conforming because fallback providers aren't permitted providers.

Note: The entries in the Impact summary table change based on the fallback status. When you select an entry from the table, the support matrix page appears with those selected entries, allowing you to update your personalized list.

Support matrix

The support matrix presents all AI systems in a table format, along with their respective AI model providers. The support matrix table includes categories such as AI system, type, activation status, and the selected AI model provider.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When you select an AI provider, it appears in the AI systems and model provider support table.

Audit logs

Audit logs show configuration changes made on Data, Approvals, and AI model providers categories in the AI Control Tower Workspace. Select the View audit logs option to view the Audit logs page.

The Audit logs page displays all configuration change details organized in the following categories:

- Timestamp
- User
- Changed category
- Changed setting
- After change
- Before change

You can also filter the changes by selecting a date range, starting with the last 90 days.

Note: In a Multi-instance setup, when a managed (sub-prod) instance is added to or removed from the synchronizing instances, the audit log displays two records. The first record shows all instances being removed and the second record shows the instance being added or removed.

Configuring pages in AI Control Tower

View and govern your AI portfolio using terms and visualizations tailored to your organization.

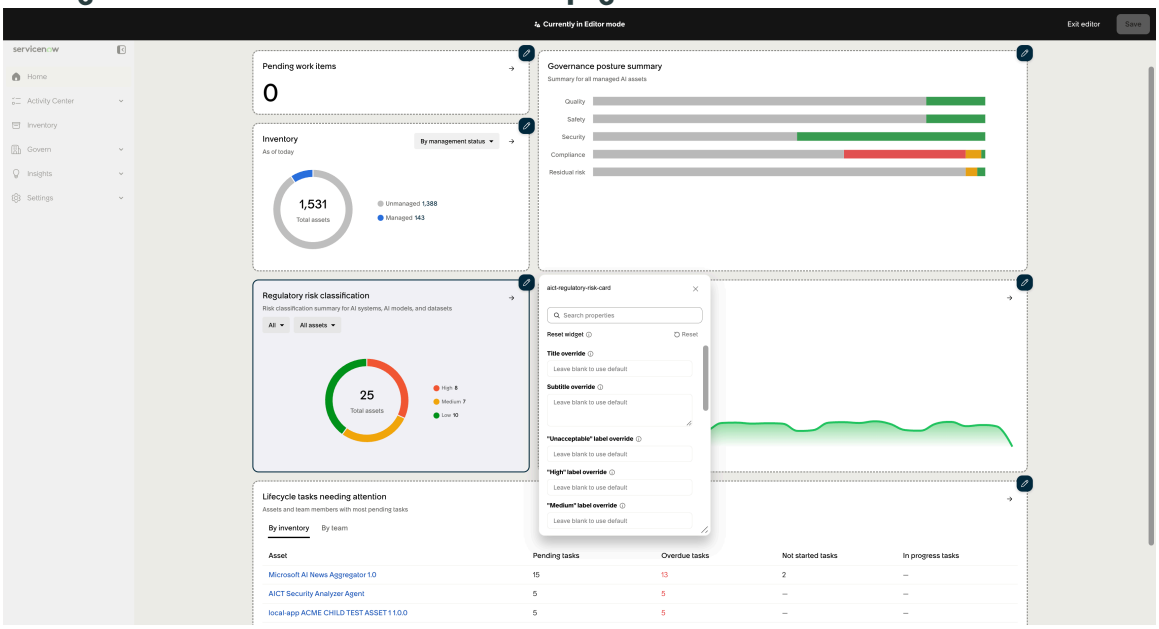
Key benefits

- Present AI Control Tower charts and details in your organization's own terms instead of the default labels.
- Provide data for a specific business unit or reporting period by building a condition into a card.
- Direct users from a card to a different list, report, or page instead of the default destination.

AI Control Tower pages ship with a default set of cards, titles, and visualizations that you can configure as needed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Editing cards on the AI Control Tower Home page



Every configurable card exposes a set of presentation settings, which let you match a page to the vocabulary and reporting style your organization already uses. For example, you can update a card title and subtitle, the chart type, its data labels and legends, and the number of rows and sort direction in a ranked list. The exact settings available depend on the card.

Cards that read directly from tables on your instance also provide a condition builder, so you can narrow a card to the subset of records a page is meant to report on. Cards that retrieve their data from an API provide presentation settings only.

Required roles

The workspace administrator [sn_ai_governance.workspace_admin] role is required to edit cards on AI Control Tower pages.

How configurations are saved and applied

Card configurations apply to all AI Control Tower users. Every user sees a saved configuration the next time the page loads.

Configurations are stored as metadata that layers over the default card, rather than as a copy of the card. When editing a card, an unset or cleared value uses the original behavior.

Note: Hiding information in a card changes only what the page presents. It doesn't restrict access to the underlying records, which remain governed by the access controls on your instance.

Configurations and application upgrades

Configurations remain in place through an application upgrade. When AI Control Tower is upgraded, saved configurations for cards that still exist are reapplied automatically, and the pages continue to show the configured titles, conditions, and display options.

Cards introduced by a new version appear with their shipped settings, which an administrator can then configure.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important considerations

- Configurations aren't scoped to a domain. Separate domains on a domain-separated instance can't have different versions of the same page.
- Card titles and labels that an administrator enters are stored as typed and aren't translated.
- Configuration is available on all pages and tabs except Activity Center, the Inventory list views, the Policies tab, and Settings.
- If the available settings don't cover a change your organization needs, you can extend pages with pro-code tools. For more information, see Creating or extending pages with pro-code tools.

Use cases

Matching card titles to internal terminology

An organization refers to its onboarded AI systems as registered assets rather than inventory. A workspace administrator changes the title of the inventory card on the Home page to Registered AI assets, so the page uses the same term that appears in the organization's internal governance process. Every user who opens the Home page sees the new title.

Preparing a page for a leadership review

A governance team presents AI system scores in a monthly leadership review, where a list of five systems is more detail than the meeting needs. A workspace administrator reduces the ranked list on the Monitor page to the two lowest-scoring systems and sets the sort direction to show the largest score declines first, so the page opens on the systems that need attention.

Narrowing a card to a reporting period

An organization reports on the AI systems it onboarded during the current fiscal year, but the inventory card counts every system on the instance. Because the card reads directly from a table, a workspace administrator adds a condition that limits it to systems created in the last year. The card count and the page it navigates to both reflect the condition.

Related topics

Configure a page card in AI Control Tower

Configure a page card in AI Control Tower

Change how a card presents its data so that a page matches the terminology, level of detail, and reporting focus your organization works with.

Before you begin

Role required: workspace administrator [sn_ai_governance.workspace_admin]

About this task

The settings available for a card depend on how that card gets its data. Cards that read directly from tables on your instance provide a condition builder in addition to their presentation settings. Cards that retrieve their data from an API provide presentation settings only. Saved changes apply to every user on the instance.

You can configure cards on all pages and tabs except Activity Center, the Inventory list views, the Policies tab, and Settings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home**.
2. Navigate to the page that you want to configure.
3. Select the edit icon ( ) to enter editor mode.
   A configuration control appears on each card that you can change.
4. Select the configuration control on the card that you want to change.
5. Change the settings for one or more cards.
   Leave a text field empty to keep the value that the card ships with.

Common configuration options	Description
Title override	Enter the text that you want to display in the title of the card.
Subtitle override	Enter the text that you want to display in the subtitle of the card.
Empty-state message	Enter the message that you want users to read when the card has no data to display.
Chart type	Select the chart type that presents the data most clearly for your organization. For example, change a donut chart to a pie chart or a semi-donut chart or show a trend chart as an area chart.
Labels	Adjust the label text to match the terms your organization us es.
Show category legend	Show or hide the legend, depending on whether the labels re peat information that the chart already conveys.
Number of rows and sort or der	**a.** Set the number of rows that you want a ranked list to dis play. **b.** Select the sort order so that the list opens on the records you want to review first, such as the lowest scores rather than the highest.
Additional filter	**a.** In the condition builder, select the field, operator, and value that limit the card to the records you want it to report on. **b.** Add more conditions as needed. The condition builder is available only for cards that read di rectly from tables on your instance. The condition also ap plies to the page that the card navigates to.
Show view-all arrow	Show or hide the arrow icon to view all items.
View-all URL	Enter the URL that you want the arrow icon to open, so that users move to the list or page your organization works from. This setting is available only for cards that already include an icon for navigating to another page.

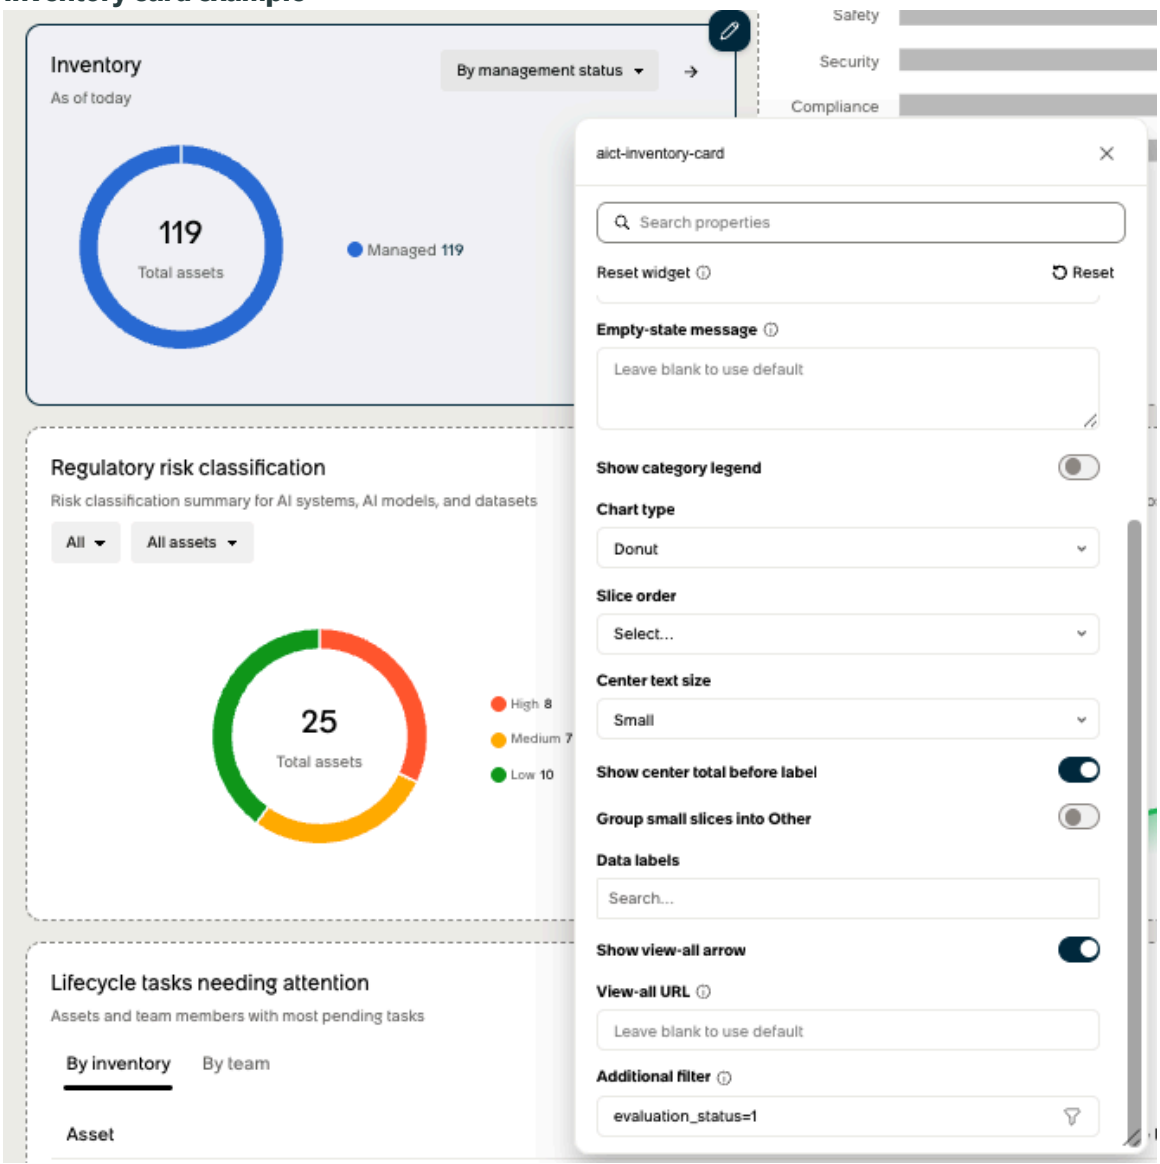
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Common configuration options	Description
Optional card elements	Turn off the elements that your organization doesn't track, to reduce the amount of information on a page. For example, you might hide token statistics, trend lines, a filter dropdown, or the chart in a card that also displays a total.

Example

Inventory card example



6. **Optional:** Return a card to the settings it ships with by selecting **Reset**.
   You can reset a card whether or not you have already saved your changes to it. Resetting a saved configuration removes it for every user.
7. Close the edit card panel.
8. Save the configuration changes that you made for all cards in the current session by selecting **Save**.

Creating or extending pages with pro-code tools

Extend your AI Control Tower pages beyond the built-in configuration options with the ServiceNow Lux Lab for VS Code extension.

If the built-in configuration options don't meet your organization's needs, you can customize AI Control Tower pages using the ServiceNow Lux Lab for VS Code extension. Delivered through the AI Experience Framework, the extension enables pro-code developers to create net new or extend existing pages, experiences, and widgets.

For information about installing and using the extension, see ServiceNow Lux Lab for VS Code extension.

For information about the configuration options that a workspace administrator can change without pro-code tools, see Configuring pages in AI Control Tower.

Planning your AI strategy

Define AI strategic priorities, set measurable goals, and track planning items and costs to align your AI investments with organizational objectives.

Why strategic planning matters for AI

AI investments succeed when they are tied to measurable organizational objectives — not deployed in isolation. Without a strategic framework, AI initiatives risk becoming fragmented experiments that are difficult to prioritize, fund, and sustain. AI Control Tower connects your AI governance capabilities to the broader strategic planning tools on the ServiceNow platform. Every AI investment traces back to a priority your organization has committed to.

The Plan area of AI Control Tower integrates with ServiceNow Goal Framework, Strategic Planning, and PPM Standard. Items categorized as Artificial Intelligence in those applications appear automatically in the AI Control Tower workspace. AI stewards and leadership get a single view of how AI work aligns with organizational strategy.

Defining strategic priorities and goals

In Strategic Planning, strategic priorities with the **Type** field set to **Artificial Intelligence** appear in the Strategy section of AI Control Tower. In Goal Framework, goals with the **Category** field set to **Artificial Intelligence** appear there as well. AI stewards and strategic planners can monitor progress against targets without switching between applications.

This integration makes AI governance tangible at the executive level. Leadership can see whether the organization's AI goals are on track, which priorities are stalled, and where resources may need to be redirected. All of this is visible within the same workspace where operational governance happens.

Tracking costs and prioritizing AI work

Planning items with the **Investment type** field set to **Artificial Intelligence** appear in the Costs section. There, you can compare planned, budgeted, and actual costs for AI projects, epics, and

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

demands. This visibility helps finance and governance teams ensure that AI spending aligns with approved budgets and delivers expected returns.

Prioritized planning items surface in the Prioritized AI work section, where you can track the status of projects, epics, and demands that have been selected for execution. For organizations managing multiple AI initiatives simultaneously, this view clarifies what is active, what is queued, and what has been deprioritized.

Monitoring risks, issues, and decisions

Projects classified as Artificial Intelligence appear in the AI RIDAC section. Projects linked to AI-classified goals and strategic priorities also appear there, surfacing their risks, issues, decisions, actions, and changes (RIDAC). This view consolidates project-level governance information from PPM Standard and Project Workspace. AI stewards can monitor execution risks and outstanding decisions across the AI portfolio in a single place.

Prerequisites

Important: The AI strategy area is available only with a Strategic Portfolio Management (SPM) Professional license.

AI strategy planning in AI Control Tower relies on data from the following ServiceNow applications. For details on configuring and using these applications, see their respective documentation:

- Goal Framework — for creating goals and strategic priorities
- Strategic Planning — for managing planning items and prioritization
- PPM Standard — for project management and RIDAC tracking

Planning your AI strategy, prioritize, and execute

Track your AI portfolio from strategy to delivery. Plan connects goal alignment, intake management, and execution tracking in one place within AI Control Tower. Portfolio managers and AI COE leads get a current view of AI investments without leaving the application.

Exploring AI Control Tower Plan

AI Plan in AI Control Tower gives portfolio managers and AI COE leads a single place within AI Control Tower to view goals, intake, and delivery work scoped to AI investments.

AI Plan overview

AI Plan integrates strategic planning, intake management, and execution tracking directly into AI Control Tower. Without this integration, teams managing AI work must switch between AI Control Tower and separate applications to get a complete picture of goals, intake, and in-flight projects.

The Plan menu in AI Control Tower contains three pages: Strategize, Prioritize, and Execute. Each page displays data that is automatically filtered to AI-related work. Filters for Strategic Priority, AI System, and Department are available across all three pages and update widgets and lists dynamically. All data shown in AI Plan is from records of the underlying SPM tables, so information stays consistent with what teams manage in their SPM applications.

AI Plan users

The following roles use the Plan menu in AI Control Tower:

- AI COE lead: Reviews AI system alignment to organizational goals and strategic priorities across the organization. Uses the Strategize page to identify goals and targets that are off track and to assess how well AI systems are aligned to business objectives.
- Portfolio manager: Manages AI-related demand intake on the Prioritize page, identifies records that don't have an owner at risk of stalling, and tracks active AI projects and epics on the Execute page.
- Department head: Applies the Department filter to view goals, intake, and delivery work for their team only.

AI Plan workflow

AI Plan organizes AI portfolio work across three stages.

Strategize

The Strategize page shows how AI systems align to organizational goals and strategic priorities. Widgets display goal, target, and strategic priority counts broken down by status (green, yellow, or red). The Goals and Targets list groups targets under their parent goals and shows each target's state, owner, and dates. Select a segment in a widget to filter the list to matching records. The AI System alignment widget shows what percentage of AI systems are aligned to at least one strategic goal.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Prioritize

The Prioritize page consolidates all AI-related intake in one view. Summary cards at the top show the total number of intake items across demands, product ideas, and feedback. Separate cards flag demands, ideas, and feedback that are not assigned to anyone and at risk of stalling because no one is reviewing or routing them. Following the widgets, separate lists show demands, product ideas, and feedback records individually. New intake records can be created directly from this page using the New button on each list.

Execute

The Execute page tracks active AI projects and epics. Widgets show project and epic counts grouped by state. The Project list and Epic list following the widgets display individual records with details such as project manager, portfolio, approved dates, state, and percent complete. Records can be opened directly from the list to view or update details.

AI Plan benefits

- AI-scoped data: All data on the Strategize, Prioritize, and Execute pages is filtered to AI-related work, so users see only what is relevant to the AI portfolio.
- No application switching: Users access goals, intake, and execution data without leaving AI Control Tower or opening separate SPM applications.
- Attention flags on intake: The Prioritize page surfaces demands, product ideas, and feedback that don't have any owners so that portfolio managers can identify and assign work before it is missed.
- Consistent data: AI Plan reads from the same underlying SPM tables that teams use in their SPM applications, so data is the same regardless of where it is accessed.
- Flexible filtering: Strategic Priority, AI System, and Department filters apply across all widgets and lists on each page, so users can quickly narrow the view to what is relevant to them.

Planning and tracking AI work in AI Control Tower

Use the Strategize, Prioritize, and Execute pages in the Plan menu of AI Control Tower to manage AI work from goal alignment through delivery tracking.

AI Plan organizes portfolio work across three pages that reflect the natural progression of AI delivery. On the Strategize page, define goals and assess alignment. On the Prioritize page, review and route incoming AI demand. On the Execute page, track active projects and epics. Work on any page independently depending on your role and current focus.

AI Plan pages and when to use them

Page	Use when	Learn more
Strategize	You want to assess how AI systems align to organizational goals, review goal and target status, or identify strategic priorities that are off track.	Strategizing the AI plan
Prioritize	You want to review incoming AI demand, product ideas, or feedback, identify intake with no owner, or create intake records.	Prioritizing AI plan in AI Control Tower
Execute	You want to track active AI projects and epics, view delivery status, or create projects and epics.	Monitoring AI plan execution in AI Control Tower

Strategizing the AI plan

The Strategize tab gives AI stewards a view of the AI strategic direction for their organization. Goals, targets, and strategic priorities that guide AI investment and governance decisions are tracked in one place.

Strategize tab overview

The Strategize tab provides a centralized workspace where AI stewards define the strategic intent behind AI investments. It connects organizational goals to AI systems, ensuring that AI activity across the enterprise is aligned to business priorities.

AI stewards use the Strategize tab to:

- Monitor AI goals that reflect the organization's intended outcomes from AI adoption.
- Track targets that measure progress against each goal.
- Establish strategic priorities that link AI systems and intake records to business objectives.

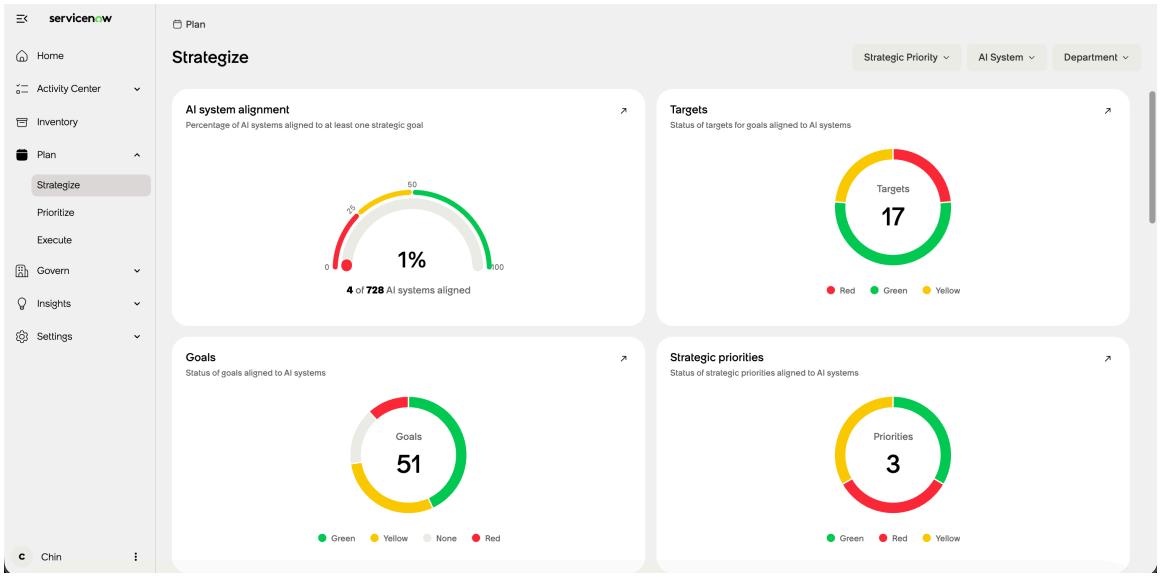
The page is divided into the following components:

- Four analytics widgets — display alignment and status across AI systems, targets, goals, and strategic priorities.
- Goals and targets list — displays targets grouped by goal for all goals aligned to AI systems.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Analytics widgets

The four analytics widgets display the current alignment and health status of AI systems, targets, goals, and strategic priorities. Each widget reflects the active filter state and can be expanded to a full-page view using the expand icon.



Analytics widgets

Widget	What it displays	Status breakdown
AI system alignment	The percentage of AI systems aligned to at least one strategic goal, shown as a gauge, with the count of aligned systems out of the total displayed below.	Not applicable. The gauge reflects alignment percentage only.
Targets	The total count of targets for goals aligned to AI systems, shown as a donut chart.	Red, Green, and Yellow segments indicate target health status.
Goals	The total count of goals aligned to AI systems, shown as a donut chart.	Green, Yellow, None, and Red segments indicate goal status.
Strategic priorities	The total count of strategic priorities aligned to AI systems, shown as a donut chart.	Green, Red, and Yellow segments indicate strategic priority status.

Goals and targets list

The Goals & targets list displays targets of goals that are aligned to AI systems, grouped by goal. Each goal row is collapsible and shows the targets associated with that goal. The list supports search, filter, refresh, and column personalization.

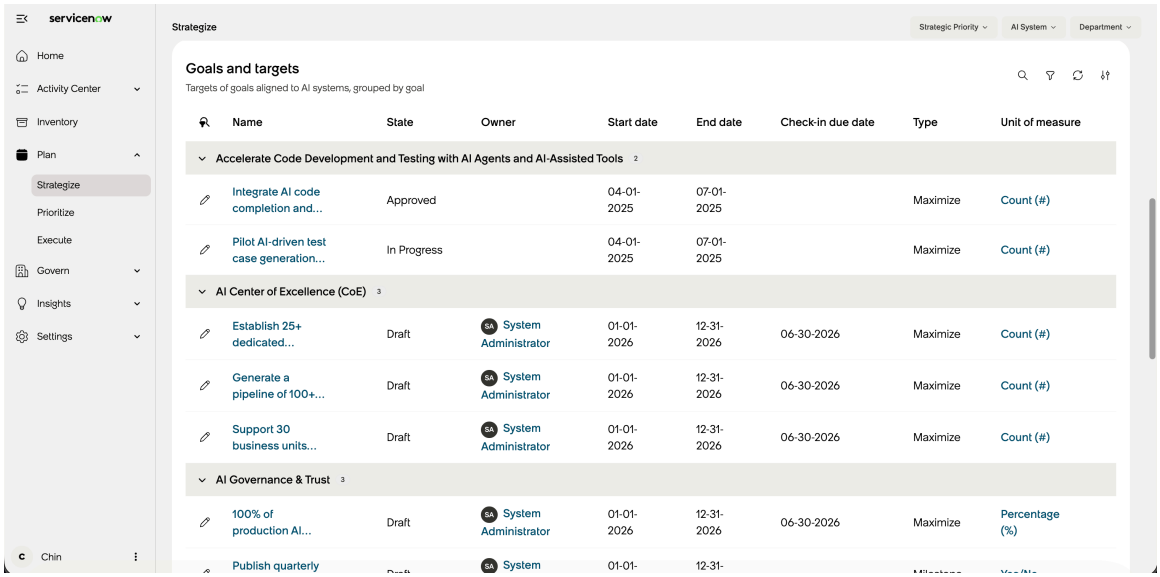
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



AI-related strategize list

List name	Source tables	Records displayed
Goals and targets	• sn_gf_goal • sn_gf_goal_target	Goals and their targets appear in the list when any of the following conditions is met: • Goal's Category is Artificial Intelligence. • Type of the goal's strategic priority is Artificial Intelligence. • Linked product belongs to the cmdb_ai_system_component_product_mode table, which includes generative AI, agentic AI, and other subclasses.

Goals

Goals represent the high-level outcomes the organization wants to achieve through AI investment. Each goal provides the strategic context that downstream prioritization and execution decisions reference. AI stewards create goals from the Strategize tab and associate them with one or more targets to make progress measurable.

Targets

Targets define the specific, measurable criteria that indicate whether a goal is being achieved. Each target is linked to a parent goal and provides the quantitative or qualitative benchmark that AI stewards and stakeholders use to evaluate AI strategy performance.

Strategic priorities

Strategic priorities rank and categorize AI activity so that intake records, demands, and execution efforts can be evaluated against organizational intent. A strategic priority connects an AI system

or initiative to a goal, providing the link that the Prioritize and Execute tabs use to surface the most business-relevant work.

Edit a strategize record

Update the details of an existing goal, target, or strategic priority record to reflect changes in organizational direction, scope, or measurement criteria.

Before you begin

Role required: sn_ai_governance.ai_steward

Procedure

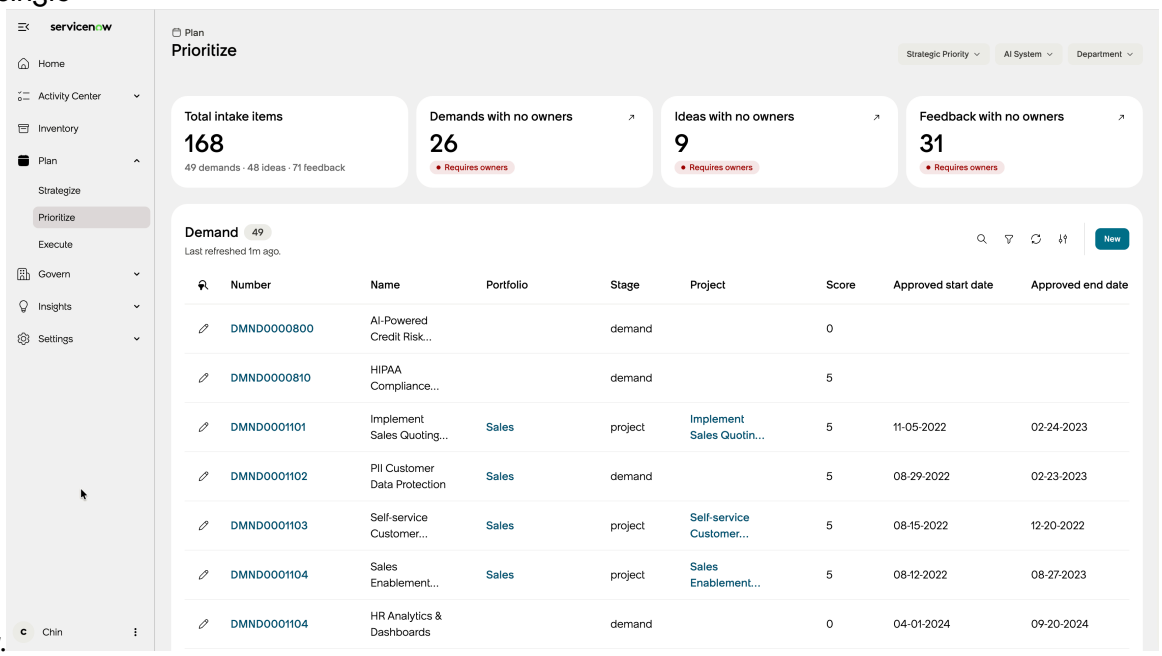
1. Navigate to **All** > **AI Control Tower** > **Home 2.0**.
2. Expand the **Plan** menu and **Strategize**.
3. Scroll to the Goals and targets list.
4. Next to the record that you want to edit, select the edit icon ( ).
   The record is displayed in the **Edit record** side panel.
5. Edit the fields as needed.
   For field information, see:
   - Goal form for goals
   - Target form for targets
6. Select **Update**.
   The updated record is displayed in the Goals and target list.

Prioritizing AI plan in AI Control Tower

View and manage AI-related intake items, demands, product ideas, and product feedback, through analytics tiles, contextual filters, and filterable lists in Prioritize tab. All three lists support creation of new records from this tab.

Prioritize tab overview

The Prioritize tab displays all AI-related intake records, demands, product ideas, and feedback, in a single view.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI stewards use the Prioritize tab to:

- Monitor incoming AI-related intake across all three record types.
- Identify unowned items that are at risk of stalling.
- Create records without leaving the planning context.

The page is divided into the following components:

- Analytics summary cards - displays real-time counts of intake and ownership status.
- Filters - helps narrow all tiles and lists by strategic priority, AI system, or department.
- Intake lists - displays the full set of demand, product idea, and feedback records.

Analytics summary cards

The four analytics tiles at the top of the page display counts based on the active filter state. All counts are updated when a filter is applied.

Summary cards

Summary card	Functionality	Drill-down
Total Intake Items	Displays the combined count of all demands, product ideas, and feedback	Not applicable as all records are visible in the lists.
Ownerless Demands	Displays the count of demands where the owner field is empty.	Drills down to the list of ownerless demands.
Ownerless Ideas	Displays the count of product ideas where the owner field is empty.	Drills down to the list of ownerless product ideas.
Ownerless Feedback	Displays the count of feedback records where the owner field is empty.	Drills down to the list of ownerless feedback records.

Filters

Three filters are available in the page header. All filters apply simultaneously across all tiles and all three lists.

Available filters

Filter	Description
Strategic Priority	Filters by the strategic priority associated with the records.
AI System	Filters by the AI system linked to the records.
Department	Filters by the department associated with the records.

Intake lists

The Demand, Product idea, and Feedback lists display the AI-related intake records from their respective tables. All three lists share the same behaviour and functionalities. You can search,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

filter, refresh, and personalize the columns in these lists. Additionally, you can create records or edit existing records directly from the lists. The lists and forms displayed for the records in the Prioritize pages are in the default view.

AI-related intake lists

List name	Source table	Records displayed
Demand	dmn_demand	The following records are displayed: • Investment type is Artificial Intelligence. **Note:** This is applicable only for demands and ideas. • Linked product belongs to the cmdb_ai_system_component_product_mode table, which includes generative AI, agentic AI, and other subclasses.
Product idea	sn_align_core_product_idea	
Feedback	sn_align_core_feedback	

The following list actions are available on all three intake lists:

List actions

Action	Description
Search	Search within the intake list.
Filter	Apply additional filter conditions to the list.
Refresh	Reload the list with the latest data.
Personalize columns	Add, remove, or reorder list columns.

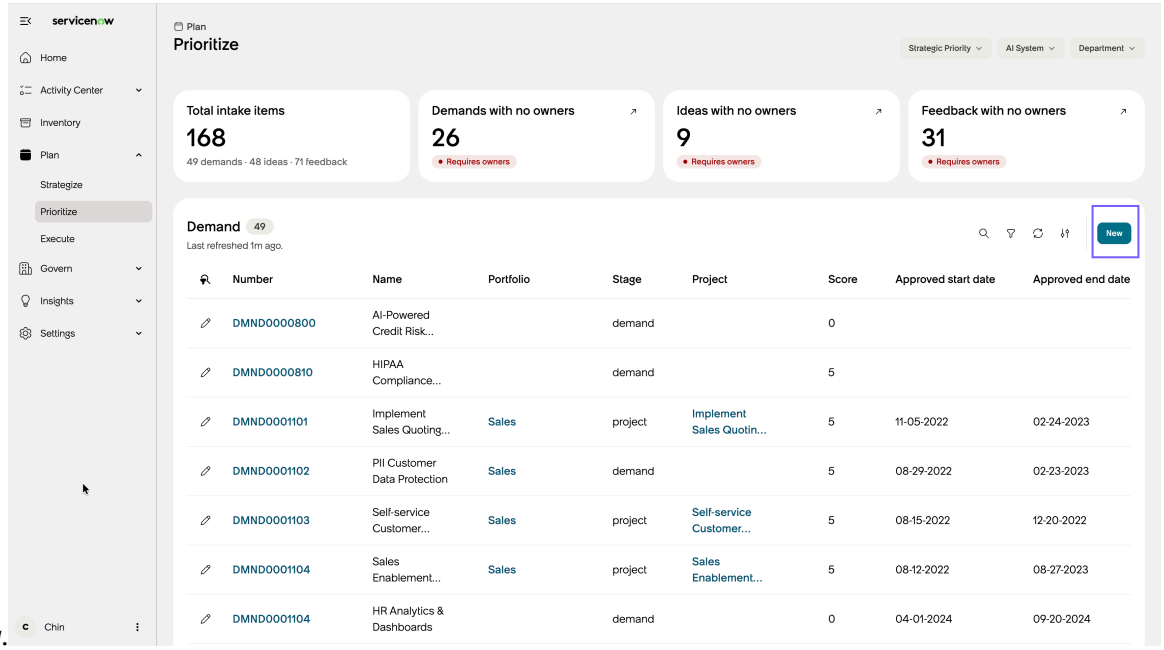
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select **New**.



5. On the form, fill in the fields.
   For field information, see:
   - Demand form
   - Feedback form
   - Product idea form

   Note:
   - For demand and product idea: The **Investment Type** field must be set to **Artificial Intelligence** or the **Product** field must be set to **AI System**.
   - For feedback: The **Product** field must be set to **AI System**.

6. Select the **Actions** drop-down list and select **Save**.
   The new record is displayed in the respective list if it meets the list's display criteria.

Manage intake records

Update the details of an existing intake record to reflect changes in scope, priority, or other relevant information.

Before you begin

Role required: sn_ai_governance.ai_steward

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home 2.0**.
2. Expand the **Plan** menu and select **Prioritize**.
3. Scroll to the list for the record type you must edit, Demand, Product idea, or Feedback.
4. Select the edit icon for the record that you want to edit.

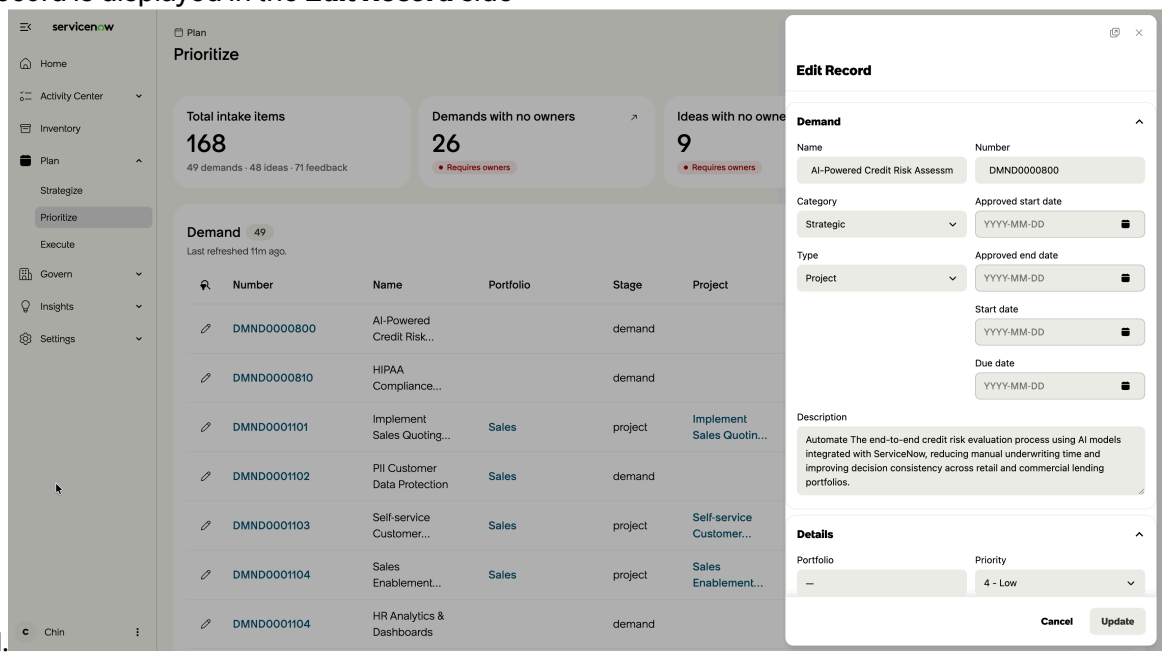
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The record is displayed in the **Edit Record** side panel.



5. On the form, edit the fields.
   For field information, see:
   - Demand form
   - Feedback form
   - Product idea form
6. Select **Update**.
   The edited record is displayed in the respective list if it meets the list's display criteria.

Monitoring AI plan execution in AI Control Tower

Monitor the delivery status of AI-related projects and epics from a single page in AI Control Tower, with widgets and lists that update dynamically when you apply filters.

Execute page overview

The Execute page shows AI-related projects and epics in one view. Portfolio managers and AI COE leads use this page to track delivery status across the AI portfolio without switching to separate project management applications.

The page has three components that work together:

- Two donut widgets summarizing project and epic counts by a grouping parameter such as state or priority.
- Header filters that narrow all widgets and lists simultaneously.
- Project and Epic lists showing individual records with key details.

Widgets

The Execute page has two donut widgets: one for Projects and one for Epics. Each widget shows the total count of AI-related records broken down by the selected grouping parameter. The default grouping is by state.

Use the **Group by** control on each widget to change the grouping parameter. Each widget's grouping can be changed independently. Available grouping options include the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Project: State, Status, Priority, Project Manager, Department, Product
- Epic: State, Status, Owner, Department, Product

Clicking a segment in a widget show the list of corresponding records.

Filters

Three filters are available in the page header. Selecting a filter value updates the widgets and lists simultaneously.

Available filters

Filter	Description
Strategic Priority	Filters by the strategic priority associated with the records.
AI System	Filters by the AI system linked to the records.
Department	Filters by the department associated with the records.

Project and Epic lists

The Project and Epic lists show individual AI-related records from their source tables. These lists are displayed based on the Default view of the project and epic. Each list has a toolbar with the following actions:

- Search: Find records by keyword.
- Filter: Open the filter panel to build conditions using field and operator combinations, sort records, or group them within the list. These are separate from the page-level header filters.
- Refresh: Reload the list to show the latest data.
- Personalize columns: Choose which columns are displayed and in what order. Search from available columns, add or remove them, and drag to reorder. Select **Reset to Default** to restore the original column set.
- New: Create a record directly from the Execute page.

Project and Epic lists

List name	Source table	Records displayed
Project	pm_project	Records where the investment type is Artificial Intelligence, or where the linked product belongs to the cmdb_ai_system_component_product_model table (includes generative AI, agentic AI, and other subclasses).
Epic	sn_align_core_scrum_epic	Records where the investment type is Artificial Intelligence, or where the linked product belongs to the cmdb_ai_system_component_product_model

Create a project or epic in AI Control Tower

Create a project or epic from the Execute page to track AI-related delivery work in AI Control Tower.

Before you begin

Role required: sn_ai_governance.ai_steward

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home 2.0**.
2. Navigate to **Plan** > **Execute**.
3. In the **Project** or **Epic** list, select **New**.
4. On the form, fill in the fields.

   For field descriptions, see:

   - Epic form for epics.
   - Project form for projects.

   These forms are displayed based on the Default view of the project and epic.

   Note: The **Investment Type** field must be set to **Artificial Intelligence** or the **Product** field must be set to **AI System**.

5. Select **Save**.
   The new record is displayed in the respective list if it meets the list's display criteria.

Edit a project or epic in AI Control Tower

Update the details of a project or epic from the Execute page in AI Control Tower to reflect changes in scope, state, priority, or other information.

Before you begin

Role required: sn_ai_governance.ai_steward

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home 2.0**.
2. Navigate to **Plan** > **Execute**.
3. In the **Project** or **Epic** list, select the edit icon ( ) next to the record you want to update.
4. Update the fields as needed.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For field descriptions, see:

- Epic form for epics.
- Project form for projects.

The forms display the Default view of the project and epic.

5. Select **Save**.
   The updated record is displayed in the respective list.

User roles are added with the installation of AI Control Tower and Strategic Planning application.

Roles installed

The following roles are added to the AI steward [sn_ai_governance.ai_steward] role when Strategic Planning is installed so that users can access features in the Plan menu.

Strategic planning workspace roles

Role title [name]	Description	Contains roles
AI steward [sn_ai_governance.ai_steward role]	Can access features in the Plan menu in AI Control Tower.	• sn_align_core.apw_user • it_demand_manager • it_project_manager

Demand form

Learn about the fields on the Demand form. Use this form to create or edit a demand from the Prioritize page in AI Control Tower.

Demand form fields

Field	Description
Name	Name of the demand.
Category	Category of the demand: • Strategic: For demands for plans, such as projects or stories. • Operational: For demands for operational work, such as changes or defects.
Type	The **Category** field selection determines the selections available in the **Type** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Demand form fields (continued)

Field	Description

	• The following demand types are available if the demand category is Strategic:
	  ○ Enhancement
	  ○ Project
	  ○ Epic
	  ○ Story
	  ○ EAP Epic
	  ○ EAP Feature
	  ○ EAP Capability
	  ○ No Conversion
	• The following demand types are available if the category is Operational:
	  ○ Change
	  ○ Defect
	  ○ No Conversion
	
	If the Agile Development 2.0 application is active, the Story, Epic, Enhancement, and Defect options are available.
	
	If the Strategic Planning application is active, the EAP Epic, EAP Feature, and EAP Capability options are available.
	
	The No Conversion option lets you fund a large project that includes one or more projects, epics, or programs.
	
	The selections in the **Category** and **Type** field also determine the fields that are displayed in the Assessment Data section.

Project	Name of the project created from this demand. This read-only field is visible only when you convert the demand into a project.
Enhancement	Number of the enhancement created from this demand. This read-only field is visible only when you convert the demand into an enhancement.
Epic	Name of the epic created from this demand. This read-only field is visible only when you convert the demand into an epic.
Story	Name of the story created from this demand. This read-only field is visible only when you convert the demand into a story.
Number	Unique, auto-generated identification number for the demand.
Approved start date	The formal date approved by stakeholders for starting the demand. This date is set after prioritization and stakeholder approval and represents the committed and authorized timeline for execution. It's used for governance and traceability.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Demand form fields (continued)

Field	Description
	For example, the approved date to start the database upgrade is 2026-01-10. This field is carried forward to the **Approved start date** field of the Project form when the demand is converted to a project. The value remains unchanged even if the project starts later. This field is highlighted in red if the date is different than the value in the **Start date** field. **Note:** If this field is empty while creating a demand, the date from the **Start date** field is inserted.
Approved end date	The formal date approved by stakeholders for completing the demand. This date is set after prioritization and stakeholder approval and defines the approved execution window and supports historical tracking. For example, the approved end date to complete the demand is 2026-02-15. This field is carried forward to the **Approved end date** field of the Project form when the demand is converted to a project. The value remains unchanged even if the project ends later. This field is highlighted in red if the date in this field is different than the value in the **Due date** field. **Note:** If this field is empty while creating a demand, the date from the **Due date** field is inserted.
Start date	The preliminary or estimated date when the work is initially planned to begin. This date helps outline the intended timing for early demand planning and prioritization. You can set this date during initial demand creation or anytime in the planning phase when a rough idea forms. This date can be updated until the demand is officially approved. For example, you're planning for a database upgrade to start on 2025-11-01. This date is changed to **Planned start date** when the demand is converted to a project. **Note:** • When you change the planned start date of a demand or project, the associated cost plans and resource assignments also change. The **Change Resource Plan and Cost Plan Start Date with Demand or Project Start Date Change** property controls the behavior for a demand date change. This property isn't enabled by default. • The **Start date** column label is changed to **Planned start date**. This change is applicable only for new customers who begin using the Brazil version. If you're upgrading to the Brazil release from an earlier release, you will continue to see the prior labels.
Due date	The preliminary or estimated date when the planned work is expected to be completed. This date provides an expected completion window for planning

Demand form fields (continued)

Field	Description
	and stakeholder communication. You can set this date anytime in the planning phase when a rough idea forms and can be updated until the demand is officially approved. For example, you're planning to complete the database upgrade by 2025-12-31. **Note:** • The **Due date** column label is changed to **Planned end date**. This change is applicable only for new customers who begin using the Brazil version. If you're upgrading to the Brazil release from an earlier release, you will continue to see the prior labels. • This date is changed to **Planned end date** when the demand is converted to a project.
Description	Description of the demand.

Details section of the Demand form

Field	Description
Portfolio	Portfolio indicating the business focus of the demand.
Program	Name of the program to which the demand belongs.
Investment Class	Type of investment class category assigned to the demand: • Run: Investment made to sustain the existing business. • Change: Investment made to implement a change in the business.
Investment Type	Investment type of the demand: • Cost Reduction • End User Experience • Legal and Regulatory • Revenue Generating • Service Sustaining • Strategic Enabler • Artificial Intelligence
Demand manager	Name of the demand manager.
Collaborators	Users who can edit or contribute to the demand. A demand requester can select any user as a collaborator.

Details section of the Demand form (continued)

Field	Description
Expense type	The type of the expense, either capital expense (capex) or operational expense (opex).
Priority	The priority of the demand.
Department	Department in a business unit to which the demand submitter belongs. **Note:** If you don't select a department, the default value is the name of the department to which the submitter belongs.
Project Manager	Project manager assigned to the project created from this demand. When a project is created, this field is set to read only. This field appears if the **Category** field is set to Strategic and the **Type** field is set to Project. If you delete the project created from this demand, this field is set to editable.
Business Unit	Business unit to which the demand submitter belongs.
Impacted Business Units	Business units affected by the submitted demand. The selected units could experience operational impact, process changes, technology adoption, and similar changes. For example, if a demand is submitted by the procurement business unit, it can impact the finance, legal, and IT business units.
Idea	Unique identification number of the idea from which the demand was created.
Business Capabilities	Business capabilities associated with the demand that links the demand to organizational goals and value. Business capabilities are defined in the Enterprise Architecture (formerly Application Portfolio Management) module.
Impacted Business Applications	If the demand is to change, enhance, or add one or more business applications, the applications associated with the demand. Business applications are defined in the Enterprise Architecture (formerly Application Portfolio Management) module. For more information, see Exploring business applications. You can select any business application in your enterprise regardless of whether

Details section of the Demand form (continued)

Field	Description
	it's related to a capability selected in the **Business Capabilities** field.

Business Case section of the Demand form

Field	Description
Strategic priority	Strategic objectives of the organization that the demand fulfills. A demand can fulfill multiple strategic objectives. If a business unit has been selected in the **Details** tab, the business strategies for the selected business unit along with other enterprise strategies are available for selection.
Primary goal	The primary goal associated with the strategy selected in the **Strategic priority** field. If a strategy hasn't been selected, all goals are available for selection.
Business case	Business arguments that support the demand.
Risk of performing	Risks if the demand is approved and implemented.
Risk of not performing	Risks if the demand isn't approved, for example, risk of loss of opportunity.
Enablers	Key enablers for the demand that help the demand be completed. For example, clearly defined resource and cost plans.
Barriers	Major barriers to the demand that obstruct the demand's completion. For example, incomplete or unclear demand details.
In scope	Scope of the demand, which is the set of boundaries that define the extent of a demand.
Out of scope	Activities or deliverables not in the scope of the demand. Anything not defined in the scope is out of scope.
Assumptions	Assumptions made for the demand. Assumptions help to define the scope and risks, and fine-tune the estimates for time and cost.

Financials section of the Demand form

Field	Description
Capital expense	Capital expenditure (capex) for the demand.
Operating expense	Operational expenditure (opex) for the demand.
Total planned cost	Result calculated based on the values in the **Capital expense** and **Operating expense** fields.
Financial return	Result calculated based on the values in the **Total costs** and **Financial benefit** fields.
Financial benefit	Estimate of revenue if the demand is approved. This value is rolled up from the benefit breakdown of the demand. You can also enter the value manually by selecting a currency icon and entering a value.
ROI %	ROI calculated based on the values in the **Total costs** and **Financial return** fields. This field is updated when a cost plan, benefit plan, or resource assignment is created or updated. The demand must be in the Qualified or Approved state.
Capital budget	Total capital budget allocated to the demand across all fiscal years. The value is rolled up from the capex budget of the demand.
Operating budget	Total operational budget allocated to the demand across all fiscal years. The value is rolled up from the opex budget of the demand.
Discount Rate %	Demand discount rate, which is the interest rate to determine the present value of future cash flows.
Net present value	Present value of future cash based on the given annual interest rate, a measure for comparing money spent today against future expected financial benefits. This value is useful when evaluating the overall investment performance. For example, at a 12% discount rate, $1.00 today is worth $0.80 in two years. Therefore, receiving $1.00 in two years is the same as receiving $0.80 today.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Financials section of the Demand form (continued)

Field	Description
	Net present value (NPV) is calculated from total costs according to year, financial benefit per year, and the discount rate for the demand.
Internal rate of return %	Annual interest rate required to achieve an NPV of zero. Internal rate of return (IRR) helps to determine which demands can deliver a higher rate of return in terms of revenue.
Demand Actual Cost	Total cost incurred while working on a demand and demand tasks. Demand actual cost is calculated after the assignee of the demand task creates and submits a time card. When the time card is approved, the resource rate, which is derived from the rate card, labor rate, or system properties, is used to populate this field.

Note: If you're creating a demand with the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin activated and the **Demand Currency** view enabled, the fields in the **Financials** tab differ from the **Default** view. For more information about the fields that are available only in the Demand Currency view, see .

Assessment Data section of the Demand form

Field	Description
Impact	Level of business impact created by the demand.
Risk	Risk value calculated from the demand assessment.
Value	Business value of the demand calculated from the **Impact** and **Financial return** fields.
T-Shirt size	Size of the demand. Before using this value as an indicator of demand size, consider creating and publishing definitions for each option outside the application. That process helps confirm that the values are interpreted correctly and consistently across the organization or department.
Score	The demand score is calculated based on the *risk*, *value*, and *size* attributes in the base system. The value of the *risk*, *value*, and *size* attributes are derived from the assessment

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Assessment Data section of the Demand form (continued)

Field	Description
	metric category results. For more information, see assessment categories and assessment category results. • When the *risk* and *size* values are high, the score of the demand is low. • When the *value* setting is high, the score of the demand is high.
Assessment Required	Option for enabling the assessments for the demand. This option is active by default. Only a demand manager can update this value when the demand is in the Draft or Submitted state. **Note:** If this option isn't selected and you reset the demand to the Draft state, the option remains unselected.

Note: The values in the **Value** and **Score** fields are updated when a cost plan, benefit plan, or resource assignment is created or updated. The demand must be in the Qualified or Approved state. The values in the fields are updated only until an artifact such as project, enhancement, defect, or change is created from the demand.

Notes section of the Demand form

Field	Description
Watch list	The groups and users subscribed to the demand who can view the information in the **Additional comments** field.
Work notes list	The groups and users subscribed to the demand who can view the information in the **Work notes** field.
Work notes	Information about the demand. Work notes are added throughout the demand management life cycle to communicate with other users associated with the demand.

Preferences section of the Demand form

Field	Description
Close Demand	Determines when to close the demand automatically if it's converted to a project.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Preferences section of the Demand form (continued)

Field	Description
	• **None**: Keeps the demand in the Open state after it's converted to a project. • **On creation of project**: Closes the demand when the demand is converted to a project. • **On closure of project**: Closes the demand when the project created from the demand is closed. **Note:** The **On creation of project** and **On closure of project** options appear when the value for the **Type** field is set to **Project**. If the **Type** field is set to **Enhancement**, the default setting is **None**.
Project calculation	Determines the calculation to use for task dependencies for the project when the demand is converted to a project. The default value is Automatic. • Manual: Task dates don't reflect any changes made to dependencies. • Automatic: Task dates are automatically updated to reflect any changes made to dependent or child tasks.

EAP Details section of the demand form

This section appears only if the selected type is an EAP entity.

Field	Description
Team	The planning team to which the created EAP entity is assigned. This field is set to read only after the EAP entity is created. This value is an optional value.
Converted to	The name of the created EAP entity. This field is read-only.

AI Associations section of the demand form

This section appears only if the AI Control Tower plugin is installed and the investment type of the demand is set to artificial intelligence.

Field	Description
Product	Product or system that the demand relates to.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Associations section of the demand form

This section appears only if the AI Control Tower plugin is installed and the investment type of the demand is set to artificial intelligence.

(continued)

Field	Description
Impacted AI systems	Impacted AI systems associated with the demand. You can select existing AI systems from the list or remove systems that are no longer relevant.

Epic form

Learn about the fields on the Epic form. Use this form to create or edit an epic from the Execute page in AI Control Tower.

These fields are displayed on the Epic form.

Epic form fields

Field	Description
Name	Brief description of the epic. This field is required.
Description	Detailed information about the epic.
State	Current working state of the epic. The default value is Draft.
Owner	User assigned to this epic.
Planning state	State of the epic in the planning backlog. The default value is New.
Percent complete	Percentage of work completed for this epic. This value is calculated automatically.
Primary goal	Goal associated with this epic as the primary goal.
Strategic priority	Strategic priority associated with this epic. This value is populated automatically based on the primary goal.
Enabler	Indicates whether this epic is an enabler.
Methodology	Agile methodology used for this epic. The default value is Scrum.
Department	Department associated with this epic.
Work notes	Notes to capture updates and discussions on this epic as work progresses.

Dates section of the Epic form

Field	Description
Planned start date	Planned start date for this epic.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dates section of the Epic form (continued)

Field	Description
Planned end date	Planned end date for this epic.
Approved start date	Approved start date for this epic.
Approved end date	Approved end date for this epic.
Actual start date	Actual date on which work for this epic started.
Actual end date	Actual date on which work for this epic was completed.

Details section of the Epic form

Capture additional details for this epic such as priority, business application, and story counts.

Field	Description
Priority	Priority of this epic. The default value is 4 - Low.
Business capabilities	Business capabilities associated with this epic.
Business application	Business application that this epic is related to.
Other impacted business applications	Business applications that this epic has an impact on.
Missing estimate	Number of stories in the epic that are missing estimates. This value is calculated automatically.
Percent complete by count	Percentage of completed work in the epic, calculated using story count. This value is calculated automatically.
T-Shirt size	Relative size estimate for this epic.
Completed count	Number of completed stories in the epic. This value is calculated automatically.
Completed estimate	Sum of the estimates of all completed stories in the epic. This value is calculated automatically.
Total count	Total number of stories in the epic. This value is calculated automatically.
Total estimate	Sum of the estimates of all stories in the epic. This value is calculated automatically.
Percent complete by estimate	Percentage of completed work in the epic, calculated using story estimates. This value is calculated automatically.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

WSJF section of the Epic form

Use this section if this epic is a SAFe epic. The WSJF score is calculated automatically from the values in this section.

Field	Description
WSJF score	Weighted Shortest Job First (WSJF) score used to prioritize and sequence epics to produce the most business value. An epic with the highest WSJF score gets the highest priority for implementation. This value is calculated automatically from the other fields in this section.
Time criticality	Impact on the business when deadlines are missed, for example how projected revenue gains are reduced over time when deadlines are shifted.
User business value	Business value of the job based on parameters such as impact on revenue or comparable capabilities available in the market.
Risk reduction	Measure of how much risk this epic helps avoid. Consider whether the job adds business value in other ways, creates new business opportunities, or reduces risk for a future delivery.
Job size	Estimated duration for completion of this epic.

Feedback form

Learn about the fields of the feedback form. Use this form to create or edit the details of a feedback record in AI Control Tower.

Note: Operational Sustainability Workspace and Strategic Planning users can't view the fields that aren't added to the default/custom form layout in the workspace. Configure the default/custom form layout to view those fields.

Details tab of the Feedback form

Field	Description
Name	A brief description of the feedback.
Description	Detailed description of the feedback.
Product idea count	Number of product ideas associated with the feedback.
State	Current state of the feedback. The available options are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Details tab of the Feedback form (continued)

Field	Description
	• Submitted • Need more information • Under review • In backlog • Planned • In development • Completed • Unlikely to implement • Duplicate • Already exists
Assigned to	User who is assigned to the feedback.
Source	Source of the feedback. The available options are: • Chat • Customer meeting • Email • Social media • Idea portal
Type	Type of the feedback. The available options are: • Issue • Enhancement request • Insight
Product	Product associated with the feedback.
Customer	The customer who submitted the feedback.
Sentiment	Sentiment of the feedback record. The available options are: Positive, Negative, or Neutral.
Created by	User who created the feedback record.
Business application	Business application that this feedback is related to.

Goal form

Use the Goal form to create goals for your organizational strategic priorities.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: For Operational Sustainability Workspace and Strategic Planning users, to view the other fields (that are not added to the default or your custom form view) on the form in the workspace, configure the default/custom form layout. For information on how to configure the form layout, see Configuring the form layout.

Goal form

Field	Description
Name	Name of the goal.
State	State of the goal. The state can be **Draft**, **In progress**, **Approved**, **Complete**, **Pending**, **Achieved**, **Not Achieved**, or **Cancelled**.
Category	Category of the goal. The available options are: • **Total Applications** • **Total Cost** • **Opex** • **Capex** • **Cloud Applications** • **Homegrown Applications** • **Support Cost** • **Labor Cost** • **Standards Compliance** • **Strategic** • **Operational** • **Tactical** • **Artificial Intelligence**
Status	Status of the goal. Status can be **Red**, **Yellow**, **Green**, or **None**.
Progress	Percentage complete for the goal. The progress value is calculated automatically if the goal has sub-goals or/and targets. For more information on how the progress value is calculated, see Progress value calculation.
Description	Brief description of the goal. You can refine goal description using the Refine records skill, if the ServiceNow Otto for SPM application is installed.

Parent information section of the Goal form

Field	Description
Strategic priority	Name of the strategic priority that this goal is created for.
Parent goal	Name of the parent goal that this goal contributes to.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parent information section of the Goal form (continued)

Field	Description
Impact on parent goal	A numerical value that represents the importance of this goal relative to sibling goals or other goals under its parent goal. By default, the value is (1) Neutral. The available options are: • **(0) No impact** • **(1) Neutral** • **(2) Moderate** • **(3) High** • **(4) Very high** • **(5) Maximum** **Note:** This field is available only when the **sn_gf.weighted_average_enabled** system property is set to **Yes**.

Owners & Contributors section of the Goal form

Field	Description
Assigned entity type	Entity type to which the goal is assigned. For example, Business Unit, Department, Company, or Portfolio.
Assigned entity	Entity to which the goal is assigned. For example,if the portfolio plan is created with Business Units, HR and IT, populate the Assigned entity type as Business Unit and Assigned entity type as HR or IT. **Note:** Populating the Assigned entity type and Assigned entity fields are required to display the goals in the portfolio plan.
Owner	Owner of the goal. By default, the name of the user creating the goal is populated.
Contributors	Users who contribute to the achievement of the goal.

Duration section of the Goal form

Field	Description
Start date	Start date for the goal. By default, the start date of the current quarter is populated. For

Details section of the Project form

Capture additional details for this project such as investment type, execution type, and impacted business units.

(continued)

Field	Description
Execution type	Delivery methodology for this project. Select from **Waterfall**, **Agile**, or **Hybrid**. The default value is Waterfall.
Impacted business units	Business units that this project has an impact on.
Expense type	Expense type for this project. The default value is Opex.
Business capabilities	Business capabilities associated with this project.
Impacted business applications	Business applications that this project has an impact on.

Business case section of the Project form

Capture business details for this project such as strategic alignment, risks, scope, and blockers.

Field	Description
Strategic priority	Strategic priority associated with this project. This value is populated automatically based on the primary goal.
Primary goal	Goal associated with this project as the primary goal.
Business case	Business case to invest in this project.
Risk of performing	Risks to the business if work on this project is completed.
Risk of not performing	Risks to the business if work on this project isn't completed.
Enablers	Enablers for this project.
Barriers	Blockers, if any, for this project.
In scope	Defined criteria that are included in this project.
Out of scope	Criteria that are explicitly excluded from this project.
Assumptions	Assumptions, if any, for this project.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Financials section of the Project form

Capture financial details for this project such as planned costs, actual costs, return on investment, and other estimates.

Field	Description
Total planned cost	Total planned cost for this project.
Planned benefit	Planned benefit from this project.
Planned capital	Planned capital expenditure for this project.
Planned return	Planned financial return on this project.
Planned operating	Planned operating expenditure for this project.
Planned ROI %	Planned return on investment percentage for this project.
Budget cost	Approved budget for this project.
Discount rate %	Discount rate used to calculate the net present value of this project.
Actual cost	Actual cost incurred on this project.
Net present value	Net present value of this project, calculated using the discount rate. This value is calculated automatically.
Estimate at completion	Estimated total cost at the time work on this project is completed.
Internal rate of return %	Internal rate of return for this project. This value is calculated automatically.
Estimate to completion	Estimated remaining cost to complete this project.

Score section of the Project form

Capture scoring details for this project such as risk, value, and size scores.

Field	Description
Risk score	Score for the risk associated with this project.
Size score	Score for the effort required to complete this project.
Value score	Score for the value delivered by this project.
Score	Overall score for this project, calculated from the risk, value, and size scores.

Notes section of the Project form

Field	Description
Watch list	Users who receive notifications about activity on this project.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Notes section of the Project form (continued)

Field	Description
Work notes list	Users who receive notifications when work notes are added.
Work notes	Notes to capture updates and discussions on this project as work progresses.

Preferences section of the Project form

Field	Description
Allow time card reporting on	Level at which time cards can be reported for this project. Select from project only or project and project tasks.
Derive assignee list from resource plan	Option to automatically populate the assignee list from the resource plan associated with this project.
Update actual effort from time card	Option to update the actual effort on this project automatically from submitted time cards.
Recalculate score on project change	Option to recalculate the project score automatically when project details change.
Calculation	Method used to calculate project progress. The default value is Automatic.
Project schedule date format	Format used to display dates in the project schedule.
Show on Program Status Report	Option to include this project in the Program Status Report.
Derive time component from planned dates	Option to derive the time component of duration fields from the planned dates.
Constraint date	Date constraint applied to the project schedule.

Risk overview section of the Project form

Field	Description
Inherent risk	Risk level of this project before any controls or mitigations are applied. Select **Inherent Heatmap** to view the risk distribution.
Residual risk	Risk level of this project after controls and mitigations are applied. Select **Residual Heatmap** to view the risk distribution.

Product idea form

Learn about the fields of the Product idea form. Use this form to create or edit the details of a product idea in AI Control Tower.

Details tab of the Product idea form

Field	Description
Name	Brief description of the product idea.
Description	Detailed description of the product idea.
Planning state	State of the product idea. The available options are: • New • In Review • Prioritized • Done • Cancelled
Owner	User assigned to this product idea.
MoSCoW	Priority of the product idea is based on its importance. The available options are: • Must have • Should have • Could have • Won't have
Created by	User who created this product idea.
Product	Product associated with the product idea.
Customers	Customers who have shown interest in the product idea. This field is automatically set based on the linked feedback.
Locations	Location impacted by the product idea.
Department	Department associated with the product idea.
Strategic program	Strategic program associated with the product idea.
Work notes	Notes for adding and tracking the activity of the product idea.

Dates section of the Product idea form

Field	Description
Approved start date	Approved start date for this product idea.
Approved end date	Approved end date for this product idea.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Details section of the Product idea form

Field	Description
Priority	Priority of this product idea.

Strategic Priority form

Use the Strategic Priority form to orient your organization strategic plan toward your goal.

Strategic Priority form

Field	Description
Name	Name of the strategic priority.
Parent	Name of the parent strategic priority that this strategic priority contributes to.
Owner	Owner of the strategic priority. By default, the name of the user creating the strategy is populated.
Start date	Start date for the strategic priority.
End date	End date for the strategic priority.
Type	Strategic priority type categorizes the strategic priority by its nature and organizational intent. Classifying priorities by type helps your organization distinguish different focus areas within a strategic plan and align goals across different dimensions of your strategy. The available options are: • **Key Initiative** • **Shared Vision** • **Strategic Target** • **Operating Principle** • **Relationship Strategy** • **Environmental** • **Social** • **Governance** • **Artificial Intelligence**
Status	Status of the strategic priority. Status can be **Red**, **Yellow**, **Green**, or **None**.
Strategic Plan	Name of the strategic plan for which this strategic priority is created.
Description	A detailed description of the strategic priority. You can refine strategic priority description using the Refine records skill, if the ServiceNow Otto for SPM application is installed.

Target form

Use the Target form to track and measure the progress of the goals.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: For Operational Sustainability Workspace and Strategic Planning users, to view the other fields that aren't added to the default view or your custom form view on the form in the workspace, configure the default or custom form layout. For information on how to configure the form layout, see Configuring the form layout.

Target form

Field	Description
Name	Name of the target.
Goal	Name of the associated goal. This field is auto-populated when creating a target from the Targets related list on the Goal form.
Description	Brief description of the target. You can refine target description using the Refine records skill, if the ServiceNow Otto for SPM application is installed.
State	State of the target. The state can be **Draft**, **In progress**, **Approved**, **Complete**, **Pending**, **Achieved**, **Not Achieved**, or **Cancelled**.
Status	Status of the target. The status indicates whether the target breakdown is likely to be completed by the planned end date.

Progress	Percentage of the target execution that is complete. The value is calculated automatically.
	
	If the **Type** field is set to **Maximize**, the progress value is calculated using the following formula:
	`Progress = (Actual value - Base value) / (Target value - Base value) x 100`
	
	If the **Type** field is set to **Minimize**, the progress value is calculated using the following formula.
	`Progress = (Base value - Actual value) / (Base value - Target value) x 100`
	
	For more information on how the progress value is calculated when the weight scale is defined, see Progress value calculation.

Impact on goal	A numerical value that represents the importance of the target relative to the other targets of the goal. If there are any subgoals present, they are also considered for relative weights and consequent progress calculation. By default, the value is **(1) Neutral**. The available options are: • **(0) No impact** • **(1) Neutral** • **(2) Moderate** • **(3) High** • **(4) Very high** • **(5) Maximum**

Target form (continued)

Field	Description
	Note: This field is available only when the **sn_gf.weighted_average_enabled** system property is set to **Yes**.
Assigned entity type	Entity type to which the target is assigned. For example, Business Unit, Department, Company, or Portfolio.
Assigned entity	Entity to which the target is assigned.
Owner	Owner of the target. By default, the name of the user creating the target is populated.
Contributors	Users who contributes to the achievement of the target. By default, the contributors of the associated goal are populated.

Duration section of the Target form

Field	Description
Start date	Start date for the target. By default, the start date of the associated goal is populated.
End date	End date for the target. By default, the end date of the associated goal is populated.

Metrics section of the Target form

Field	Description
Unit of measure	Measure type for the specified value. Usage of the measure such as cost, time, and rate. The available measure types are stored in the Units [sn_gf_units] table. Unit of measure defines the type of the target as qualitative or quantitative. The available unit of measures for the quantitative target are **#**, **$**, **%**, and **Days**. The available unit of measure for the qualitative target is **Yes/No**.
Type	Target type that signifies the direction of achievement. • **Maximize**: The direction of the progress is toward the target value from the base value where the base value must be less than the target value. • **Minimize**: The direction of the progress is toward the target value from the base value where the target value must be less than the base value. • **Milestone**: Fixed type. Only the qualitative target values are allowed (that are set in the **Unit of measure** field for the target)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Metrics section of the Target form (continued)

Field	Description
	to capture the achievement of the target. The **Milestone** option is applicable only for qualitative targets. The **Type** field becomes read-only with the value populated as **Milestone** for qualitative targets (when the **Unit of measure** field is set to a qualitative target value).
Start value	Start value of the target. The start value can also be considered as the present or current value. This field becomes read-only when a value is entered in the **Actual value** field. Clear the **Actual value** field to update a value in the **Base value** field. This field is available when the **Type** field is set to **Maximize** or **Minimize**.
Final target value	Final target value of the target. The target value should be aspirational and should challenge the teams. This field is available when the **Type** field is set to **Maximize** or **Minimize**.
Baseline reference	Past achievement of the target to provide reference for future performance. This value is only for reference purpose and not considered for target progress calculation.
Actuals to date	Actual value of the target at a given time. This field is available when the **Type** field is set to **Maximize** or **Minimize**.
Check-in frequency	Option to specify breakdown intervals for the target and how frequently the owner or contributor should update the actual value of the target. Breaking down the target into smaller periods helps you set a target for smaller periods and focus on the specific breakdown targets. The available options are **Daily**, **Weekly**, **Monthly**, **Quarterly**, and **Yearly**. Target breakdowns are automatically created when you set this field to any of the available options other than **None**. For more details on target breakdowns, see Target breakdowns in Strategic Planning.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Metrics section of the Target form (continued)

Field	Description
	Note: The target breakdowns feature isn't supported for qualitative targets.
Target value distribution	Option to specify the target to be calculated cumulatively or non-cumulatively. The available options are **Split equally across the time period (non-cumulative)** and **Spread linearly across the time period (cumulative)**. This field is available only when the **Check-in frequency** field is set to any of the available options other than **None**.
Remark	Remark entered by the user for business justification when updating the actuals.
Check-in due date	Due date that the owner or contributor of the target must update the actual value of the target to.
Confidential	Option to restrict the access for this target record to the specific users populated in the **Allowed groups** and **Allowed users** fields. This field is available when the Operational Sustainability Management application is installed and the *sn_grc.enable_record_confidentiality* property is enabled. This field is applicable only when the **Classification** field in the goal form of the target is populated as Environmental, Social, or Governance. The required role to configure this field is sn_esg.reader. **Note:** Irrespective of the target record set to confidential or not, the target progress value rolls up to its goal for calculating the progress value of the goal.
Allowed groups	User groups who can access the target record. This field is applicable only for the Operational Sustainability Workspace users. Even though a user group is populated in this field, the users can access the confidential record only if the user group has the sn_esg.reader role. This field is available when the **Confidential** field is set to **true**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Metrics section of the Target form (continued)

Field	Description
Allowed users	Users who can access the target record. This field is applicable only for the Operational Sustainability Workspace users. Even though a user name is populated in this field, the user can access the confidential record only if the user has the sn_esg.reader role. This field is available when the **Confidential** field is set to **true**.

Target Automation section of the Target form

Field	Description
Comments	Detailed comments for the target to facilitate collaboration.

Activity section of the Target form

Field	Description
Automate actual value	Option to enable the target automation feature for the target.
Actual value source	Target source table that the data is fetched from to auto-update the actual value of the target on the target's review due date. This field is available when the **Automate actual value** field is set to **true**.

Variables section of the Target form

This section appears based on the context variables available in the target source that is selected in the **Actual value source** field.

When you select Actual value source as Benefit Plans (Target automation script for benefit plans), the **Benefit Plan** field appears in this section, from which you can select the required benefit plans for automating the actual value of the target.

Note: You can use the Benefit Plans custom script only when PPM Standard (Project Portfolio Management) is installed. If you can't find the benefit plan that you want to select, you can find and select the same from Heisenberg UI by navigate to **Enterprise Goal Management** > **Targets** and opening the Target form.

Discovering and managing AI assets

Get a complete picture of every AI system in your organization by building and maintaining a comprehensive AI asset inventory.

Why discovery matters

Before you can govern, monitor, or measure the impact of AI, you need to know what AI assets exist in your organization. Many enterprises operate dozens or hundreds of AI systems across business units, with no single team holding a complete picture. Shadow AI, untracked models, and undocumented integrations create blind spots in governance and risk management. AI Control Tower addresses this by providing multiple discovery pathways that feed into a single AI asset inventory — a centralized record of every AI system, model, prompt, dataset, and MCP server across your enterprise. See Discovering AI assets.

AI asset inventory

View and manage AI assets across your entire portfolio or focus on a single asset in the AI Control Tower inventory.

The **Inventory** page is designed to give you a complete picture of every AI asset in your organization. From the inventory, you can make assets managed or unmanaged, filter by asset type or lifecycle stage, manually add assets that aren't reachable by automated methods, and respond to recommendations for assets that need attention. See Managing your AI asset inventory.

AI asset records

The asset record is where you investigate and act on a single asset. In the asset record, you can review the asset's governance posture, evaluation scores, lifecycle progress, and value contribution. You can initiate asset-level actions such as starting a lifecycle review, submitting a change request, or turning on evaluation. See Working with AI asset records.

Connecting external AI through AI Gateway

AI Gateway manages MCP (Model Context Protocol) server connections, providing a governed pathway for external AI tools to interact with your ServiceNow environment. Where Service Graph Connectors focus on discovering what AI exists externally, AI Gateway focuses on governing how external AI tools connect to and operate within your platform.

When an MCP server is added through AI Agent Studio, AI Gateway tracks the connection, monitors transaction volumes and success rates, and enforces approval workflows if MCP server approval controls are active. AI stewards can review MCP server records, pause and resume transactions, and manage global MCP clients from the AI Gateway settings page.

AI Gateway provides a comprehensive view of all connected MCP servers, showing name, total transactions, and success rate. Total transactions represent all tool calls (MCP method equal to "tools/call"), and the success rate reflects the proportion of those calls returning a successful HTTP status.

Discovering AI assets

Populate your AI asset inventory automatically as AI Control Tower discovers AI assets across external platforms, hyperscaler traces, and your ServiceNow instance.

AI Control Tower can discovery AI assets and add them to your inventory automatically. For example, AI Control Tower discovers assets running on external platforms through connectors or traces, and detects ServiceNow AI assets natively as they're activated on your instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When assets aren't discoverable through automated methods, you can add them manually. See Creating AI assets manually.

Discovering AI assets through connectors

Extend your AI asset inventory to platforms outside ServiceNow by discovering AI assets through Service Graph Connectors.

Enterprises run AI on more than one platform. Service Graph Connectors extend AI Control Tower's visibility beyond ServiceNow by discovering AI assets running on external platforms and synchronizing them into the inventory.

Each connector requires an AI connection, a configured credential and endpoint that allows AI Control Tower to communicate with the external platform. Once configured, the connector runs on a schedule to discover new assets, update existing records, and synchronize metadata. Some connectors also collect usage and execution data, enabling monitoring and value measurement for external AI alongside ServiceNow AI.

For details on discovery through Service Graph Connectors, see Configuring connectors.

Discovering AI assets through trace connectors

Extend your AI asset inventory to AI agents running on hyperscaler cloud platforms by discovering them through trace connectors.

Trace connectors are primarily an observability capability. A trace connector polls a supported cloud platform, such as AWS, Azure, or Google Cloud, and collects execution-level trace data through a MID Server. AI Control Tower analyzes that data to produce the evaluation scores that appear on the **Monitor** tab of the AI system's asset record, and the security metrics that appear on its **Security** tab.

An established trace connection that gathers trace data for monitoring quality and safety, or security, is discovering AI systems at the same time, filling in assets that connectors and native detection can't reach. Assets detected this way register automatically in your AI asset inventory.

For more information, see Configuring trace connections.

Discovering ServiceNow AI assets automatically

Populate your AI asset inventory automatically with every skill, agent, and model running natively on your ServiceNow instance.

ServiceNow AI assets including skills, agents, and models running natively on your instance are discovered automatically. No manual configuration is required. As AI capabilities are activated on your instance, the discovery process detects and registers them in the AI asset inventory, giving your governance team visibility into your ServiceNow AI systems from the moment they're deployed.

Automatic discovery helps you reduce the risk of ServiceNow AI systems operating outside the governance framework. Skills, AI agents built in AI Agent Studio, and model connections are tracked and available for lifecycle management, risk assessment, and performance monitoring.

Managing your AI asset inventory

Track every AI system, model, prompt, and dataset across your enterprise and control which assets participate in governance, monitoring, and risk workflows.

Key benefits

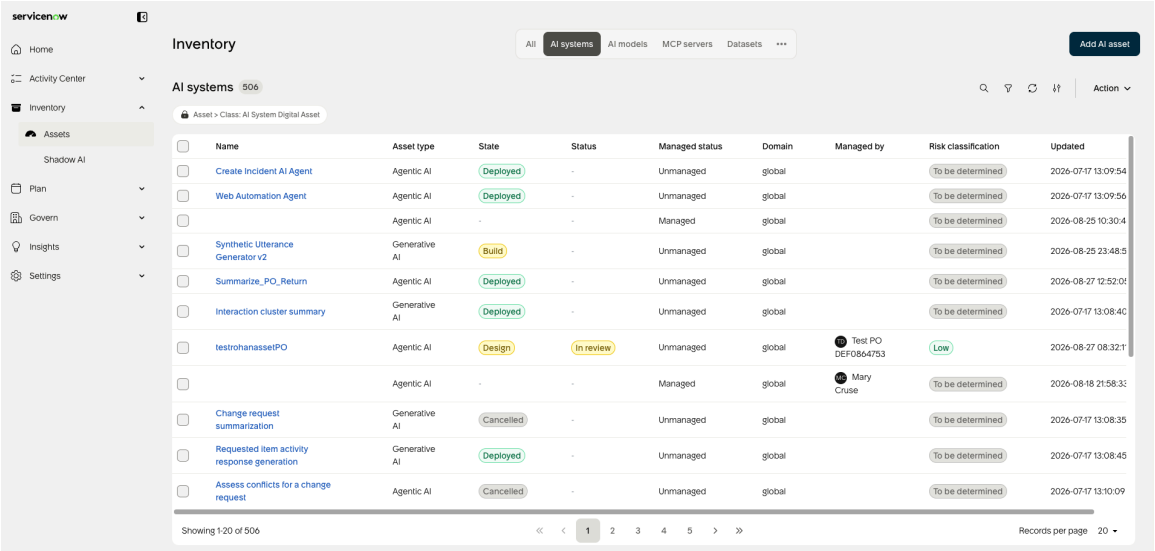
The AI asset inventory is the central record of AI assets in your organization. Assets that AI Control Tower discovers or identifies through traces appears here, organized by asset type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Get a complete picture of every AI asset across your organization, including assets discovered automatically and those added manually or through connectors.
- Control which assets participate in governance, monitoring, and risk workflows by setting management status directly from the inventory list.
- Filter and refine the asset list by type, risk classification, lifecycle state, asset status, and management status to focus on what needs attention.
- Add assets manually when a connector or trace can't reach them. See Creating AI assets manually.

For the ways AI Control Tower adds assets to your inventory automatically, see Discovering AI assets.

AI asset inventory



AI assets list columns

Column	Description
Name	The name of the AI asset as registered in AI Control Tower.
Asset type	The category of the AI asset, such as AI dataset, AI prompt, AI model, MCP server, or AI system.
State	The operational state of an AI asset.
Status	The governance status of the asset within its current phase.
Managed status	Indicates whether the asset is actively governed. Displays as true or false.
Domain	Domain the asset belongs to.
Managed by	The team or individual responsible for governing the asset.
Risk classification	The assessed risk level of an AI asset.
Updated	The date and time the asset record was last modified.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Required roles

The AI steward [sn_ai_governance.ai_steward] or AI system owner [sn_ai_asset_mgmt.ai_asset_owner] role is required to access the AI asset inventory.

Accessing the AI asset inventory

Navigate to **All** > **AI Control Tower** > **Home** > **Inventory** > **Assets**.

AI systems

An AI system is a deployed AI application or capability that your organization uses to perform work. Examples include Now Assist skills, AI agents built in AI Agent Studio, and AI-powered applications running on external platforms. AI systems are the primary unit of governance in AI Control Tower, and the assets you classify for risk, assign stewards to, monitor for performance, and measure for value.

In the Inventory, AI systems are identified by asset type: Agentic AI, Generative AI, or Classic AI. Select the **AI systems** tab to filter to these three types together.

- Filter to AI systems only to focus on the assets central to your governance program, regardless of provider.
- Select an AI system record to review lifecycle details, risk classification, monitoring data, and value metrics in one place.
- Designate AI systems as managed to bring them into governance workflows, or initiate a steward review to transition an unmanaged system automatically.

AI models

An AI model is a machine learning model or large language model (LLM) that powers one or more AI systems. Tracking models in the inventory gives you visibility into which models are in use across your organization, which vendors supply them, and whether they are approved for their current deployment context.

- Identify which models are active across your organization, including models imported from external providers such as OpenAI, Mistral AI, and Google.
- Review provider, vendor, and lifecycle state for each model to confirm models are from approved sources and are current.
- Spot models that may need review as vendors release new versions or as vendor relationships change.

AI datasets

A dataset is a collection of data used for training, fine-tuning, or evaluating an AI model. Tracking datasets in the inventory supports data lineage, compliance documentation, and risk assessment for AI systems that depend on specific training data.

- Track training, fine-tuning, and evaluation datasets alongside the models they support to maintain data lineage across your AI portfolio.
- Review provider, asset state, and management status for each dataset to identify datasets that may affect risk classification for dependent AI systems.
- Support compliance documentation by keeping a complete record of the data your AI models were built on.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI prompts

A prompt is a system prompt or prompt template that shapes the behavior of an AI system. Prompts define the instructions, context, and constraints an AI model operates under, making them a key governance asset for organizations that require AI behavior aligns with policy and acceptable use standards.

- See all system prompts and templates in use across your organization's AI systems in one place.
- Identify prompts that may need policy review or update as acceptable use standards evolve.
- Understand the reach of any prompt change before making it by tracking which AI systems and models each prompt supports.

Reviewing duplicate AI assets

AI asset deduplication can detect assets in your inventory that perform the same function, such as when two teams independently build similar AI agents to solve the same problem. AI Control Tower surfaces these likely duplicates as a group for an AI steward to review. The AI steward can then confirm the group as true duplicates or dismiss it, before changes are made to relevant asset records. For more information, see Duplicate AI assets.

Managing the status of AI assets

Control whether an AI asset participates in governance workflows by setting its management status. Managed assets are included in lifecycle management, governance, risk classification, value assessment, security, and privacy capabilities. Unmanaged assets are tracked in the inventory but excluded from those workflows. For more information, see Managed and unmanaged AI assets.

Managing AI assets in bulk

Classify large numbers of AI assets automatically instead of moving them to managed one at a time by creating automation rules. A rule matches assets against conditions you define, such as asset type or usage patterns, and marks every matching asset as managed at each scheduled run. For more information, see Managing AI assets in bulk.

Managing evaluations

Detect quality and safety regressions in your managed AI assets by enabling evaluation. Evaluation scoring assesses AI interactions against configurable quality and safety metrics and surfaces trends so you can investigate regressions before they affect users. Disable evaluation when an asset no longer needs active scoring; historical scores are retained either way. For more information, see Evaluating AI systems.

Deactivating managed AI agents

Deactivate a managed AI agent directly from its asset record using AI agent containment with kill switch protocol. For more information, see Deactivate a managed AI agent.

Creating AI assets manually

You can create AI assets manually to track and manage the life cycles of your AI systems, AI models, prompts, and datasets.

Most AI assets enter your inventory through automated discovery, Service Graph Connectors, or observability traces. Manual creation is the option to use when an asset isn't reachable by those

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

methods, or when you need to record an asset that isn't yet operational so governance work can begin before deployment.

Manually created assets enter the inventory in the unmanaged state. To bring an asset into governance workflows, set its management status to managed from the inventory list or initiate a steward review. For details on moving assets to managed status, see Managed and unmanaged AI assets and Managing AI assets in bulk.

Create AI system assets

Create AI assets to track and manage the life cycles of your AI systems

Before you begin

Role required: sn_ai_governance.ai_steward or sn_ai_asset_mgmt.ai_asset_owner

Note: Users with the AI asset owner [sn_ai_asset_mgmt.ai_asset_owner] role can only create AI assets and submit them for life-cycle review. They can't start or complete any life-cycle reviews.

About this task

An AI system is a software artifact that provides AI and machine learning (ML) capabilities to generate outputs, such as predictions, content, recommendations, and decisions, with varying levels of autonomy. Each AI system can be associated with one or more AI models, which may also be associated with one or more prompts and datasets. These AI models, prompts, and datasets enable the AI system to process data and solve complex problems with little to no human intervention.

When you manually create an asset, the asset defaults to a **Design** state.

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home** > **Inventory** > **Assets**.
2. On the Inventory page, select **Add AI asset**.
   The Add AI asset dialog box opens.
3. In the dialog box, select **Enter asset details**.
4. From the list of available asset types, select **AI system**.
   The dialog box closes and you're automatically redirected to the Add AI system asset form.
5. In the Details section of the form, fill in the fields.

Details fields in the Add AI system asset form

Field	Description
Name	Name of the AI system.
Provider	People or organization that developed the AI system.
Version	Version of the AI system.
Description	Brief description of the AI system.
Documentation	Additional information about the AI system, such as the method used to evaluate the efficacy of the AI system.
Asset state	Current state of the AI system. Select one of the following options: ○ **Design** ○ **Build**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **Available** ○ **Deployed**
Managed by	User who is assigned to manage the AI system. This field is automatically set to the user who creates the AI system asset. **Note:** This field is editable only if you have the AI steward [sn_ai_governance.ai_steward] role. If you have the AI asset owner [sn_ai_asset_mgmt.ai_asset_owner] role, this field is read-only.
License details	License that you are using for the AI system.
Asset type	Type of AI that your AI system is. Select one of the following options: ○ **Agentic AI** ○ **Classic AI** ○ **Generative AI**
Department	Department that the AI system belongs to.
Supported locations	Locations in which the AI system is supported.

6. Select **Next** to move to the next section of the form.

   You can also select **Save draft** to save the details in the form or select **Cancel** that provides you with the following options:

   - **Keep editing**: to continue editing the form.
   - **Save draft and exit**: saves the form and you exit the form.
   - **Discard and exit**: your unsaved changes are discarded and you exit the form.

7. In the Relationships section of the Add AI system asset form, associate the AI system with other AI assets that are related to it.

   a. Depending on the type of related AI asset that you want associate the AI system with, select one of the following options from the asset type menu:

      - To associate the AI system with any of its supported components or subsystems, select **Sub AI systems**.

        Note: This option is available only if you set the **Asset type** field to either **Agentic AI** or **Generative AI** in the Details section of the Add AI system form.

      - To associate the AI system with any of its integrated AI models, select **AI models**.
      - To associate the AI system with a dataset that is used to test an integrated AI model, select **Evaluation datasets**.
      - To associate the AI system with a prompt that you are providing to an integrated AI model, select **Prompts**.
      - To associate the AI system with any of its integrated AI tools, select **Tools**.

        Note: This option is available only if you set the **Asset type** field to **Agentic AI** in the Details section of the Add AI system form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To associate the AI system with a business application, select **Business applications**.
- To associate the AI system with a configuration item (CI), select **Configuration items**

The corresponding asset list opens.

b. Associate the AI system with a related AI asset.

i. Select **Add from inventory**.

ii. In the dialog box, select the check box for the related AI asset that you want to associate the AI system with.

> **Note:** If you want to associate the AI system with multiple related AI assets, select the check box for each asset.

iii. Select **Add**.

8. Select **Next**.

9. In the Use & purpose section of the form, fill in the fields.
This section enables you to specify the intended use and purpose of the AI system.

Use & purpose fields in the Add AI system asset form

Field	Description
Intended outcome of the AI system	Primary business outcome that the AI system is expected to achieve. Select one of the following options: ○ **Not Applicable** ○ **Efficiency Boost** ○ **Quality Enhancement** ○ **Decision Guidance** ○ **Automation of Tasks** ○ **Customer Experience Upgrade** ○ **Insight Generation**
Interaction type with end users	Type of interaction between end users and the AI system, including whether outputs are visible, actionable, or interactive. Select one of the following options: ○ **Not Applicable** ○ **No Direct Interaction** ○ **Background Support** ○ **Notifications & Prompts** ○ **User-Facing Recommendations** ○ **Chat-Based Interaction** ○ **Interactive Experience**
Level of human involvement	Capacity at which users can guide, review, and accept AI system activities during operation. Select one of the following options: ○ **Not Applicable** ○ **Full User Control**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **User-Guided with AI Support** ○ **Shared Control** ○ **AI-Initiated with User Approval** ○ **Full Automated Workflow**
System autonomy level	Extent to which the AI system can initiate actions or decisions without human intervention. Select one of the following options: ○ **None** ○ **Assistive (AI suggests)** ○ **Semi-Automated (acts with confirmation)** ○ **Condition-Based Automation** ○ **Event-Triggered Automation** ○ **Fully Automated Execution**
Type of output produced	Type of output that the AI system produces for users, systems, or downstream processes. Select any of the following options: ○ **Automated Decisions** ○ **Generated Content** ○ **Insight & Summaries** ○ **Ranking & Scores** ○ **Recommendations** ○ **Simple Alerts** ○ **System Actions**
Area where the AI system is used	Business or operational areas where the AI system is used or provides value. Select any of the following options: ○ **Customer services** ○ **External Partner Ecosystem** ○ **Finance & Accounting** ○ **HR & Workforce** ○ **Internal Operations** ○ **IT & Security** ○ **Sales & Marketing** ○ **Supply Chain**
People affected by the AI system	Users who may be directly or indirectly affected by the AI system outputs or decisions. Select any of the following options: ○ **External Partners** ○ **General Customer Base** ○ **Internal Team** ○ **Public or Large Audiences** ○ **Specific Customer Groups**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Data used by the system	Types of data that the AI system uses to process inputs and generate outputs. Select any of the following options: ○ **Behavioral or Usage Data** ○ **Business Operational Data** ○ **Customer Interaction Data** ○ **Profile or Account Data** ○ **Public or General Info** ○ **Sensitive Business Data**
Additional use and purpose details	Additional information or context that helps clarify the specific use and purpose of the AI system.

For more information on classifying AI systems based on regulatory risk at intake by applying a configured Risk Assessment Methodology (RAM), see Request an AI use case.

10. Select **Submit for review**.
    The Asset record page opens and your asset is in an unmanaged state. You can edit details related to your asset on the **Details** tab by using the pencil icon in the sections titled **About this asset** and **Use and purpose**.
11. If you have the AI steward [sn_ai_governance.ai_steward] role, select the **Actions** menu and then select **Start lifecycle review**.

    Important: Only users with the AI steward [sn_ai_governance.ai_steward] role can start the life-cycle review.

    The Start AI steward review dialog box opens.
12. In the **Managed by** field of the dialog box, search for and select the user that you want to assign the life-cycle review to.

    Important: You must select a user with the AI steward [sn_ai_governance.ai_steward] role.

13. Select **Start review**.

    The asset automatically changes from an unmanaged asset to a managed asset and starts the onboarding workflow. The Lifecycle tab now contains three sub tabs: **Onboard**, **Maintain**, and **Retire**. The **Maintain**, and **Retire** are disabled and are enabled once onboarding is complete.

    The **Onboard** sub tab contains the Onboarding playbook with tasks displayed. If tasks are not already present in the Onboarding playbook, users with the AI steward [sn_ai_governance.ai_steward] role can create tasks by selecting **New** and assign them to other AI stewards.

14. If you're assigned to the life-cycle review, select **Mark complete** to complete each activity in the onboarding playbook.

    If your tasks are open and you select **Mark complete**, those tasks automatically get closed with the **Closed skipped** state and you move to the next stage of onboarding. Once you move forward, you can no longer create tasks in the previous stage.

    You can select the **Actions** menu and select **Reject request** to cancel the onboarding playbook and mark this asset as unmanaged.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When all stages in the onboarding playbook are marked as complete, the playbook status updates to **Complete**. The **Maintain** and **Retire** tabs show a status of **Not Started**.

Note: The end-to-end onboarding process from start to finish may take a few days.

Create AI model assets

Create AI assets to track and manage the life cycles of your AI models.

Before you begin

Role required: sn_ai_governance.ai_steward or sn_ai_asset_mgmt.ai_asset_owner

Note: Users with the AI asset owner [sn_ai_asset_mgmt.ai_asset_owner] role can only create AI assets and submit them for life-cycle review. They can't initiate or complete any life-cycle reviews.

About this task

An AI model is a program that is trained to process data and generate outputs, such as predictions, content, recommendations, and decisions, without human intervention. You can use an AI model to perform a specific task, such as image recognition, data classification, or price prediction.

When you manually create an asset, the asset defaults to a **Design** state.

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home** > **Inventory** > **Assets**.
2. On the Inventory page, select **Add AI asset**.
   The Add AI asset dialog box opens.
3. In the dialog box, select **Enter asset details**.
4. From the list of available asset types, select **AI model**.
   The dialog box closes and you are automatically redirected to the Add AI model asset form.
5. In the Details section of the form, fill in the fields.

Details fields in the Add AI model asset form

Field	Description
Name	Name of the AI model.
Provider	People or organization that developed the AI model.
Version	Version of the AI model.
Supported languages	Languages that are supported by the AI model.
Deployment guidelines	Guidelines or instructions on how to deploy the AI model.
Training procedure	Method that you're using to train the AI model.
Context window	Maximum number of tokens that the AI model can process and recall when generating outputs.
Model size in MB	Size of the AI model in megabytes (MB).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Model parameters info	Internal variables that the AI model learns during training to process data and generate outputs.
Description	Brief description of the AI model.
Asset state	Current state of the AI model. Select one of the following options: ○ **Design** ○ **Build** ○ **Available** ○ **Deployed**
Managed by	User who is assigned to manage the AI model. This field is automatically set to the user who creates the AI model asset. **Note:** This field is editable only if you have the AI steward [sn_ai_governance.ai_steward] role. If you have the AI asset owner [sn_ai_asset_mgmt.ai_asset_owner] role, this field is read-only.
License details	License that you are using for the AI model.
Base model	Base model, also known as a foundation model or pre-trained model, that the AI model was built from.
Department	Department that the AI model belongs to.
Supported locations	Locations in which the AI model is supported.
Model card	Brief document that describes important information about the AI model, including the context, intended use, training data, and limitations of the model.
Model weights info	Numerical parameters that define how the AI model learns during training so that it can generate more desired outputs.
Required infrastructure	Integrated software and hardware components that are required for developing, deploying, and managing the AI model.
Evaluation metrics report	Report that provides data for the metrics that you're using to evaluate the effectiveness of the AI model.

6. Select **Next** to move to the next section of the form.

   You can also select **Save draft** to save the details in the form or select **Cancel** that provides you with the following options:

   - **Keep editing**: to continue editing the form.
   - **Save draft and exit**: saves the form and you exit the form.
   - **Discard and exit**: your unsaved changes are discarded and you exit the form.

7. In the Relationships section of the form, associate the AI model with related datasets. Related datasets include any collections of data that can help test or train the AI model.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Depending on the type of related dataset that you want associate the AI model with, select one of the following options from the asset type menu:
   - To associate the AI model with a dataset that can help test it, select **Evaluation datasets**.
   - To associate the AI model with a dataset that can help train it, select **Training datasets**.
   - To associate the AI model with a configuration item (CI), select **Configuration items**

   The corresponding asset list opens.

b. Associate the AI model with a related dataset.
   i. Select **Add from inventory**.
   ii. In the dialog box, select the check box for the related dataset that you want to associate the AI model with.

   Note: If you want to associate the AI model with multiple related datasets, select the check box for each dataset.

   iii. Select **Add**.

8. Select **Submit for review**.
   The Asset record page opens and your asset is in an unmanaged state. You can edit details related to your asset on the **Details** tab by using the pencil icon in the sections titled **About this asset** and **Use and purpose**.
9. If you have the AI steward [sn_ai_governance.ai_steward] role, select the **Actions** menu and then select **Start lifecycle review**.

   Important: Only users with the AI steward [sn_ai_governance.ai_steward] role can start the life-cycle review.

   The Start AI steward review dialog box opens.
10. In the **Managed by** field of the dialog box, search for and select the user that you want to assign the life-cycle review to.

    Important: You must select a user with the AI steward [sn_ai_governance.ai_steward] role.

11. Select **Start review**.

    The asset automatically changes from an unmanaged asset to a managed asset and starts the onboarding workflow. The Lifecycle tab now contains three sub tabs: **Onboard**, **Maintain**, and **Retire**. The **Maintain**, and **Retire** sub tabs are disabled and are enabled once onboarding is complete.

    The **Onboard** sub tab contains the Onboarding playbook with tasks displayed. If tasks are not already present in the Onboarding playbook, users with the AI steward [sn_ai_governance.ai_steward] role can create tasks by selecting **New** and assign them to other AI stewards.

12. If you're assigned to the life-cycle review, select **Mark complete** to complete each activity in the onboarding playbook.

    If your tasks are open and you select **Mark complete**, those tasks automatically get closed with the **Closed skipped** state and you move to the next stage of onboarding. Once you move forward, you can no longer create tasks in the previous stage.

You can select the **Actions** menu and select **Reject request** to cancel the onboarding playbook and mark this asset as unmanaged.

When all stages in the onboarding playbook are marked as complete, the playbook status updates to **Completed**. The **Maintain** and **Retire** tabs show a status of **Not Started**.

Note: The end-to-end onboarding process from start to finish may take a few days.

Create prompt assets

Create AI assets to track and manage the life cycles of your prompts.

Before you begin

Role required: sn_ai_governance.ai_steward or sn_ai_asset_mgmt.ai_asset_owner

Note: Users with the AI asset owner [sn_ai_asset_mgmt.ai_asset_owner] role can only create AI assets and submit them for life-cycle review. They can't start or complete any life-cycle reviews.

About this task

A prompt is the instructive input that you provide to AI models to elicit specific responses or outputs. Examples of prompts include instructions, questions, and commands.

When you manually create an AI asset, it defaults to the Design state.

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home** > **Inventory** > **Assets**.
2. On the Inventory page, select **Add AI asset**.
   The Add AI asset dialog box opens.
3. In the dialog box, select **Enter asset details**.
4. From the list of available asset types, select **Prompt**.
   The dialog box closes and you're automatically redirected to the Add prompt asset form.
5. On the form, fill in the fields.

Add prompt asset form

Field	Description
Name	Name of the prompt.
Provider	People or organization that developed the prompt.
Version	Version of the prompt.
Description	Brief description of the prompt.
Documentation	Additional information about the prompt, such as the method used to evaluate the accuracy and quality of AI model responses based on the given input.
Asset state	Current state of the prompt. Select one of the following options: ○ **Design** ○ **Build** ○ **Available** ○ **Deployed**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Managed by	User who is assigned to manage the prompt. This field is automatically set to the user who creates the prompt asset. **Note:** This field is editable only if you have the AI steward [sn_ai_governance.ai_steward] role. If you have the AI asset owner [sn_ai_asset_mgmt.ai_asset_owner] role, this field is read-only.
AI model	AI model that the prompt is associated with.
Prompt information	Input that you want to provide to AI models.

6. Select **Save draft** to save the details in the form or select **Cancel** that provides you with the following options:
   - **Keep editing**: to continue editing the form.
   - **Save draft and exit**: saves the form and you exit the form.
   - **Discard and exit**: your unsaved changes are discarded and you exit the form.
7. Select **Submit for review**.
   The Asset record page opens and your asset is in an unmanaged state. You can edit details related to your asset on the **Details** tab by using the pencil icon in the sections titled **About this asset** and **Use and purpose**.
8. If you have the AI steward [sn_ai_governance.ai_steward] role, select the **Actions** menu and then select **Start lifecycle review**.

   Important: Only users with the AI steward [sn_ai_governance.ai_steward] role can start the life-cycle review.

   The Start AI steward review dialog box opens.
9. In the **Managed by** field of the dialog box, search for and select the user that you want to assign the life-cycle review to.

   Important: You must select a user with the AI steward [sn_ai_governance.ai_steward] role.

10. Select **Start review**.

    The asset automatically changes from an unmanaged asset to a managed asset and starts the onboarding workflow. The Lifecycle tab now contains three sub tabs: **Onboard**, **Maintain**, and **Retire**. The **Maintain**, and **Retire** are disabled and are enabled once onboarding is complete.

    The **Onboard** sub tab contains the Onboarding playbook with tasks displayed. If tasks are not already present in the Onboarding playbook, users with the AI steward [sn_ai_governance.ai_steward] role can create tasks by selecting **New** and assign them to other AI stewards.

11. If you're assigned to the life-cycle review, select **Mark complete** to complete each activity in the onboarding playbook.

    If your tasks are open and you select **Mark complete**, those tasks automatically get closed with the **Closed skipped** state and you move to the next stage of onboarding. Once you move forward, you can no longer create tasks in the previous stage.

You can select the **Actions** menu and select **Reject request** to cancel the onboarding playbook and mark this asset as unmanaged.

When all stages in the onboarding playbook are marked as complete, the playbook status updates to **Completed**. The **Maintain** and **Retire** tabs show a status of **Not Started**.

Note: The end-to-end onboarding process from start to finish may take a few days.

Create dataset assets

Create AI assets to track and manage the life cycles of your datasets.

Before you begin

Role required: sn_ai_governance.ai_steward or sn_ai_asset_mgmt.ai_asset_owner

Note: Users with the AI asset owner [sn_ai_asset_mgmt.ai_asset_owner] role can only create AI assets and submit them for life-cycle review. They can't start or complete any life-cycle reviews.

About this task

A dataset is a collection of data used for training, fine-tuning, or evaluating an AI model.

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home** > **InventoryAssets**.
2. On the Inventory page, select **Add AI asset**.
   The Add AI asset dialog box opens.
3. In the dialog box, select **Enter asset details**.
4. From the list of available asset types, select **Dataset**.
   The dialog box closes and you're automatically redirected to the Add dataset asset form.
5. On the form, fill in the fields.

Add dataset asset form

Field	Description
Name	Name of the dataset.
Provider	People or organization that developed the dataset.
Acceptable usage	Acceptable use for the dataset. You can specify more than one use.
Version	Version of the dataset.
Data type	Type of data that the dataset contains. You can specify more than one data type.
Source	Source of the dataset, such as internal customer data within an organization or publicly available data from a government agency.
Description	Brief description of the dataset.
Asset state	Current state of the dataset. Select one of the following options: ○ **Design** ○ **Build**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **Available** ○ **Deployed** **Note:** A concatenation of asset state and asset status appears on each asset record page The available UI actions on the asset record page vary based on the current state and status.
Asset status	Status of the dataset in a workflow. If this field is empty, that indicates the dataset is not going through any workflow. A value indicates if this dataset is going through a workflow, is approved or is rejected. **Note:** A concatenation of asset state and asset status appears on each asset record page The available UI actions on the asset record page vary based on the current state and status.
Managed by	User who is assigned to manage the dataset. This field is automatically set to the user who creates the dataset asset. **Note:** This field is editable only if you have the AI steward [sn_ai_governance.ai_steward] role. If you have the AI asset owner [sn_ai_asset_mgmt.ai_asset_owner] role, this field is read-only.
Creation type	Method by which the dataset was created. Select one of the following options: ○ **Curated**: The dataset was created through careful selection, organization, and refinement of data. ○ **Derived**: The dataset was created by processing, transforming, or combining data from existing datasets. ○ **Synthetic**: The dataset was created by using artificial data that mimics real-word data.
Base datasets	Base dataset that the dataset was built from.
Department	Department that the dataset belongs to.
Dataset creation date	Date and time that the dataset was created.
Dataset card	Brief document that describes important information about the dataset, including the context, intended use, limitations, and potential biases of the dataset.

6. Select **Save draft** to save the details in the form or select **Cancel** that provides you with the following options:
   - **Keep editing**: to continue editing the form.
   - **Save draft and exit**: saves the form and you exit the form.
   - **Discard and exit**: your unsaved changes are discarded and you exit the form.
7. Select **Submit for review**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Asset record page opens and your asset is in an unmanaged state. You can edit details related to your asset on the **Details** tab by using the pencil icon in the sections titled **About this asset** and **Use and purpose**.

8. If you have the AI steward [sn_ai_governance.ai_steward] role, select the **Actions** menu and then select **Start lifecycle review**.

   Important: Only users with the AI steward [sn_ai_governance.ai_steward] role can start the life-cycle review.

   The Start AI steward review dialog box opens.

9. In the **Managed by** field of the dialog box, search for and select the user that you want to assign the life-cycle review to.

   Important: You must select a user with the AI steward [sn_ai_governance.ai_steward] role.

10. Select **Start review**.

    The asset automatically changes from an unmanaged asset to a managed asset and starts the onboarding workflow. The Lifecycle tab now contains three sub tabs: **Onboard**, **Maintain**, and **Retire**. The **Maintain**, and **Retire** are disabled and are enabled once onboarding is complete.

    The **Onboard** sub tab contains the Onboarding playbook with tasks displayed. If tasks are not already present in the Onboarding playbook, users with the AI steward [sn_ai_governance.ai_steward] role can create tasks by selecting **New** and assign them to other AI stewards.

11. If you're assigned to the life-cycle review, select **Mark complete** to complete each activity in the onboarding playbook.

    If your tasks are open and you select **Mark complete**, those tasks automatically get closed with the **Closed skipped** state and you move to the next stage of onboarding. Once you move forward, you can no longer create tasks in the previous stage.

    You can select the **Actions** menu and **Reject request** to cancel the onboarding playbook and mark this asset as unmanaged.

    When all stages in the onboarding playbook are marked as complete, the playbook status updates to **Completed**. The **Maintain** and **Retire** tabs show a status of **Not Started**.

    Note: The end-to-end onboarding process from start to finish may take a few days.

Duplicate AI assets

AI asset deduplication in AI Control Tower identifies duplicate records in the AI asset inventory for AI Stewards to review and consolidate.

AI asset deduplication

AI asset deduplication detects AI assets in your inventory that perform the same function. AI Stewards can review and consolidate redundant entries instead of governing them independently.

Large organizations often have multiple teams building AI assets to solve the same problem independently and without visibility into each other's work. This results in duplicate entries in the AI asset inventory, where the same functionality appears more than once under different names.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI asset deduplication helps identify these redundant entries. The feature surfaces likely duplicates for review and routes the resolution decision to AI Stewards, who confirm or dismiss each group. No automatic changes are made to asset records. Detection and flagging are informational, with resolution actions taken by a human reviewer.

Key benefits

AI asset deduplication provides the following benefits:

- Reduces governance overhead by consolidating redundant assets under a single primary record.
- Prevents duplicate risk assessments and policy enforcement across functionally identical assets.
- Improves accuracy of AI asset inventory reporting and audit trails.
- Surfaces instances of uncoordinated AI development across teams and environments.

AI asset deduplication process

Deduplication works as follows:

- AI asset inventory scans registered assets and identifies groups of assets that appear to perform the same function. Each group is assigned a duplicate record with a unique ID in the format DUP followed by a number, for example, DUP0001028.
- Within each group, AI asset inventory selects a main asset, the asset recommended as the primary reference going forward.
- The duplicate group appears on the Review duplicates page in AI asset inventory, where AI Stewards can examine the group and take action.
- The AI Steward either confirms the duplicate grouping (**Mark assets as duplicates**) or dismisses it (**None of these are duplicates**).

How assets are detected as duplicates

Detection is informational only; no automatic changes are made to asset records until an AI Steward confirms or dismisses a group.

The two detection methods:

1. Predictive Intelligence (default): Uses machine learning clustering to identify similar assets based on shared attributes and behavior patterns. This is the original detection method and remains available.
2. LLM-powered detection: Uses a large language model to evaluate asset similarity, producing higher-accuracy duplicate identification than predictive intelligence clustering alone.

   Note: The LLM-powered detection capability will be available with selected ServiceNow product tiers. For more information, see ServiceNow product tiers.

Note: The system property: sn_ai_governance.asset_dedup.agent.enabled acts as the primary switch controlling which detection method is active:

- Off (false): The system uses Predictive Intelligence clustering only.
- On (true): The LLM-powered detection is enabled for Agentic AI assets.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Main asset selection

The system selects the main asset from the duplicate group based on the following criteria (in order of priority):

- Deployment state: A deployed asset takes precedence over an asset in the draft or retired state.
- Age: An older asset takes precedence over a newer asset with the same function.

Effect on managed status

When an AI Steward marks a duplicate group, the following managed status changes occur:

- Main asset: If the main asset is currently unmanaged, it is promoted to managed when the group is marked.
- Duplicate assets: No managed status change occurs on duplicate assets. Their status remains unchanged after marking.

Actions performed on duplicates

The following tables summarize Review duplicates page actions on the main asset and duplicates with each action's effect and resulting asset status.

Actions on the duplicate group

Action	Effect	Resulting asset status
Mark assets as duplicates	Confirms the AI-identified duplicates as true duplicates. The main asset is retained as the referenced record. All other assets in the group are marked as duplicates. These duplicate assets are no longer referenced by other records or workflows.	Main asset: promoted to managed if it was previously unmanaged (no change if already managed). Duplicate assets: no managed status change; they remain as they were.
None of these are duplicates/This is not a duplicate (for individual duplicate)	Dismisses the entire duplicate group. Removes the group from the Review duplicates page and restores all assets in the group to their normal, independently referenced state. No assets are deleted.	No managed status change on any asset in the group.
Convert to main asset	AI Steward overrides the system-recommended main asset by selecting a different asset from the duplicates list. The previously designated main asset moves to the duplicates list; the selected asset is designated as the new main asset.	A newly designated main asset is set to the primary reference for the group. The previously designated main asset moves to the duplicates list and is treated as a duplicate going forward.

Notes

If the main asset is already managed when the group is marked, no status change occurs; this is the default, no-op case rather than a distinct behavior.

Convert to main asset changes in which asset is designated as main but does not, by itself, resolve the group. Confirm whether the managed status promotion described under Mark assets

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

as duplicates applies immediately on conversion or only after a subsequent Mark assets as duplicates action.

Marking assets as duplicates can't be undone from the Review duplicates page.

Actions performed on duplicates

Review the actions and their immediate results when performed on duplicate AI assets in the Review duplicates page.

Before you begin

Role required: sn_ai_governance.ai_steward

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home** > **Inventory** > **Action** > **Review duplicates**.
2. Select **Mark assets as duplicates**.
   The main asset is promoted to managed if it was previously unmanaged; managed assets are unchanged. Duplicate assets retain their existing managed status.
3. Select **None of these are duplicates**.
   No managed status change on any asset in the group.
4. Select **Convert to main asset**.
   The newly designated main asset is set to the primary reference for the group, and the previous main asset moves to the duplicates list.
5. Select **This is not a duplicate**.
   No managed status change on any asset in the group.

AI Inventory Intelligence Agent

AI Inventory Intelligence Agent automatically analyzes the AI asset inventory, identifies assets with incomplete metadata, and generates enrichment recommendations to improve data quality and governance readiness.

When the AI Inventory Intelligence Agent is active, it scans the inventory on a scheduled basis and evaluates each asset's metadata completeness. It presents actionable recommendations directly on the asset record. AI Stewards can accept a recommendation to update the asset automatically or dismiss it if the suggestion isn't applicable.

Inventory data completeness score

The inventory data completeness score measures how completely each managed AI asset's critical metadata fields are populated. The score is calculated as the percentage of required fields that contain values.

A higher completeness score indicates that an asset has sufficient metadata to support governance, risk assessment, and lifecycle management workflows. Assets with low completeness scores are prioritized in enrichment recommendations.

The completeness score appears on the AI asset inventory list and on individual asset records, giving AI Stewards a quick view of which assets require attention.

Note: The completeness score formula definition is available as a tooltip on the score field. The formula counts the number of critical fields populated out of the total required fields for that asset type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Enrichment recommendations

Enrichment recommendations are field-level suggestions generated by the AI Inventory Intelligence Agent for assets with incomplete or missing metadata. Recommendations are sourced from two strategies:

- Deterministic enrichment: Rules-based suggestions derived from existing asset metadata such as vendor, model name, manufacturer, and category.
- AI-powered enrichment: LLM-generated suggestions for fields such as description, use cases, and documentation. AI-generated fields are marked with an AI indicator on the recommendation.

Each recommendation includes a confidence score and rationale, so AI Stewards can evaluate the suggestion before accepting it. Accepting a recommendation updates the asset field directly. Dismissing a recommendation leaves the field unchanged.

How the AI Inventory Intelligence Agent works

The agent operates as follows:

- The agent scans managed AI assets in the inventory on a scheduled basis.
- For each asset, it evaluates which critical metadata fields are missing or incomplete.
- It generates field-level enrichment recommendations using deterministic rules and LLM inference.
- Recommendations appear on the Enrichment Recommendations tab on the asset record.
- The inventory data completeness score is calculated and displayed for the asset.
- AI Stewards review recommendations and select accept (asset updated) or dismiss (no change made) for each suggestion.
- Accepted recommendations update the asset field; dismissed recommendations leave the field unchanged.
- The completeness score updates to reflect accepted changes.

Enabling the AI Inventory Intelligence Agent

The AI Inventory Intelligence Agent is configured from the Settings tab in the AI Control Tower. Use the activation toggle to enable or disable the agent. Agent configuration settings, including model provider and skill activation, are managed in ServiceNow Otto admin.

Note: To use the AI Inventory Intelligence Agent, install the ServiceNow Otto for AI Control Tower Workspace (com.sn_aict_genai) plugin.

The system property sn_ai_governance.enrichment.generative_enabled is set to false by default. When set to true, enrichment runs both deterministic and generative (LLM-based) strategies. When set to false, only deterministic strategies run.

The LLM-generated enrichments are available when you turn on the AI-generated enrichment toggle. These enrichments are available with selected ServiceNow product tiers. For more information, see ServiceNow product tiers.

Managed and unmanaged AI assets

Control whether an AI asset participates in governance workflows by changing the status in AI Control Tower.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can set or change the management status of any asset directly from the inventory list. Use these guidelines to decide when to move assets between states:

- Assets discovered automatically or imported through connectors enter the inventory as unmanaged by default. Move assets to managed when you're ready to bring them into your governance program. You can move one asset or multiple assets at the same time. When an asset's **Use and purpose** field is populated on creation, the system assigns it an initial risk rating automatically, whether the asset is managed or unmanaged. This lets you evaluate an asset's risk before deciding whether to bring it into your governance program.
- Move assets to unmanaged when they no longer need to participate in governance workflows. For example, you might move an asset to unmanaged when an asset has been superseded, is under evaluation for retirement, or was discovered but doesn't yet require governance oversight. Unmanaged assets remain in the inventory but are excluded from active workflows and lifecycle reviews.

Initiating a steward review for an unmanaged asset transitions it to managed status automatically. Automation rules can also set or change management status based on conditions you define. See Managing AI assets in bulk.

Note: The **Move to Managed** and **Move to Unmanaged** actions are now restricted to the AI Steward role. A Product Owner can't perform these actions on any asset, whether owned or not.

Move AI assets to managed

Bring discovered or imported AI assets into your governance program by moving them to managed status, making them eligible for lifecycle review, evaluation scoring, risk classification, and value measurement.

Before you begin

Role required: sn_ai_governance.ai_steward

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home** > **Inventory** > **Assets**.
2. Select the check box for each asset that you want to move to managed.
3. From the **Action** list, select **Move to Managed**.
4. In the confirmation dialog box that appears, review your current selections.
   a. Review each asset that you selected and its current state.
   b. **Optional:** Remove any asset that you don't want to update.
5. **Optional:** Select additional actions to perform while moving the asset to managed.

   Initiate lifecycle review

   Starts the onboarding workflow for the asset immediately after it moves to managed.

   Turn on evaluation

   Enables evaluation scoring for the asset so quality and safety scores begin generating.
6. Select **Move to Managed** to confirm.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The status changes to **New** for each asset that you selected. The asset now participates in governance workflows, including lifecycle management, risk classification, value assessment, security, and privacy.

Move AI assets to unmanaged

Remove AI assets from active governance workflows by moving them to unmanaged status, retaining them in the inventory for tracking without incurring subscription charges.

Before you begin
Role required: sn_ai_governance.ai_steward

Procedure
1. Navigate to **All** > **AI Control Tower** > **Home** > **Inventory** > **Assets**.
2. Select the check box for each asset that you want to move to unmanaged.
3. From the **Action** list, select **Move to Unmanaged**.
4. In the confirmation dialog box that appears, review your current selections.
   a. Review each asset that you selected and its current state.
   b. **Optional:** Remove any asset that you don't want to update.
5. Select **Move to Unmanaged** to confirm.

Result
The status for each asset that you selected changes to unmanaged.

- Each asset remains in the inventory but no longer participates in governance workflows, including lifecycle management, risk classification, value assessment, security, and privacy.
- Each asset is no longer charged as part of your subscription.

What to do next
To bring assets back into governance at any time, see Move AI assets to managed.

Managing AI assets in bulk

Classify large numbers of AI assets automatically instead of moving them to managed one at a time by creating automation rules.

As your organization discovers more AI assets, manually reviewing and moving each one to managed status doesn't scale. Automation rules let you define the conditions that qualify an asset for managed status once, then apply that classification automatically as new assets enter the inventory or existing assets change.

An automation rule queries AI asset or asset usage records for matches against conditions you define, such as asset type, asset state, or usage patterns, and marks every matching asset as managed. You can create up to 10 rules and activate up to 5 at a time, so you can maintain multiple classification strategies without constant manual upkeep.

To set up a new rule, see Create an automation rule. To change which assets an existing rule matches, see Edit an automation rule.

Create an automation rule

Set the conditions for automatically marking discovered AI assets as managed by creating a custom automation rule.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_ai_governance.ai_steward

About this task
An automation rule queries a table for AI assets that meet the conditions you define and marks the matching assets as managed. Once activated, the rule runs at the next scheduled execution. To run a rule immediately after creating it, use the **Run now** action from the rules list.

You can create up to 10 rules and have up to 5 active at a time. If you reach the active rule limit, deactivate an existing rule before activating a new one.

Procedure
1. Navigate to **All** > **AI Control Tower** > **Home** > **Settings** > **Rules and templates** > **Automation rules**.
2. Select **Create rule**.
3. Identify the rule by entering a **Rule name** and an optional **Description**.

   Use a name that reflects what the rule does, such as Mark all generative AI systems as Managed. The description appears in the rules list and helps other AI stewards understand the rule's purpose.
4. In the **Define condition** section, select the **Table** the rule queries against.

   Choose the table that holds the records you want to evaluate:

   - **Asset** — Use to write conditions against AI asset records, such as asset state, asset type, or creation date.
   - **Asset Usage** — Use to write conditions against asset usage records, such as how an asset has been used over time.

   The available fields are the same for both tables. The table selection determines the records the rule evaluates, not the conditions you can build.
5. On the **Conditions** tab, build the criteria that an asset must meet for the rule to mark it as managed.

   a. Select a **Field** from the table.

   b. Select an **Operator** and enter or select the value to compare against.

   c. To add another condition row, select **+ Add group**.

      New rows are joined to the previous row by an **and** connector by default, requiring an asset to meet all conditions to qualify. To branch the logic so an asset qualifies if it meets either condition, select **or** on the connector between the rows.
6. **Optional:** On the **Sort by** and **Group by** tabs, configure how the rule's results are ordered or grouped when the rule runs.
7. To run the rule at the next scheduled execution after saving, select **Activate this rule**.

   Leave this option clear if you want to review the rule in the rules list before activating it. You can activate the rule later by selecting **Activate** from the **Actions** menu on the rule's row.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Select **Save**.

   The rule appears in the **Automation rules for Managed assets** list. If you activated the rule, it runs at the next scheduled execution. To run it immediately, select **Run now** from the rule's **Actions** menu.

Edit an automation rule

Change which discovered AI assets a rule marks as managed, or update its name or description, by editing an existing automation rule.

Before you begin

Role required: sn_ai_governance.ai_steward

About this task

You can edit an automation rule when your classification needs updating, for example to broaden or narrow the set of assets the rule marks as managed, to point the rule at a different table, or to correct the rule's name or description. You change a rule's conditions the same way you build them when you create a rule. For details about the available tables, fields, and condition logic, see Create an automation rule.

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home** > **Settings** > **Rules and templates** > **Automation rules**.
2. On the rule you want to change, select the more actions icon and then select **Edit**.

   The **Edit automation rule** page opens with the rule's current settings.

3. **Optional:** Update the **Rule name** or **Description** to make the rule easier to identify in the rules list.
4. **Optional:** Change the records the rule evaluates by selecting a different **Table** in the **Define condition** section.

   (Optional) For the available tables and the fields you can build conditions against, see Create an automation rule.

5. **Optional:** Change which assets the rule marks as managed, add, modify, or remove conditions on the **Conditions** tab.

   (Optional) Each condition consists of a **Field**, an **Operator**, and a value. Rows are joined by **and** or **or** connectors, which determine whether an asset must meet all conditions or any one of them. To remove a condition, select the delete icon on its row.

6. **Optional:** Select **Activate this rule**.
7. Select **Save**.

   Your changes are saved to the rule. If the rule is active, it runs with the updated settings at the next scheduled execution. To apply the changes immediately, select **Run now** from the rule's more actions menu.

Evaluating AI systems

Monitor the quality and safety of select AI systems by enabling evaluations.

Evaluation must be enabled for an AI system before quality and safety scores are generated for it. You can enable evaluation for a single AI system or for multiple AI systems at the same

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

time. Evaluation can also be turned on as part of moving an asset to managed status. For more information, see Move AI assets to managed.

Disable evaluation when an AI system no longer needs active scoring. For example, you might disable evaluation when an AI system is no longer in used or when you want to reduce evaluation load for a period of time. Historical scores are retained and remain accessible on the asset record. Evaluation can be re-enabled at any time as long as the asset remains managed.

Enable evaluation for an AI system

Start generating quality and safety scores for one or more AI systems by enabling evaluation from the inventory.

Before you begin

Before enabling evaluation for an AI system at the asset level, activate evaluation scoring for AI systems.

- For ServiceNow AI systems, see Activate evaluation scoring for ServiceNow AI systems.
- For external AI systems, see Activate evaluation scoring for external AI systems.

Role required: sn_ai_asset_mgmt.ai_asset_owner or sn_ai_governance.ai_steward

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home** > **Inventory** > **Assets**.
2. On the Overview tab, enable evaluation for one or more AI systems.

Option	Steps
Enable evaluation for a single AI system	**a.** Select the AI system's display name to open its asset record. **b.** From the **Actions** list, select **Turn on evaluation**. **c.** In the confirmation dialog box, review the AI system that you selected. **d.** Select **Turn on evaluation** to confirm.
Enable evaluation for multiple AI systems	**a.** Select the check box for each AI system that you want to enable evaluation for. **b.** From the **Action** list, select **Turn on evaluation**. **c.** In the confirmation dialog box, review each AI system that you selected and its current state, and optionally remove any AI system that you don't want to update. **d.** Select **Turn on evaluation** to confirm.

Result

Evaluation is enabled for each AI system that you selected.

- New evaluation scores appear on the **Monitor** tab of each asset record within minutes.
- Historical scores for ServiceNow and external systems are saved.
- You can turn off evaluation for these assets at any time. See Disable evaluation for an AI system.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Disable evaluation for an AI system

Stop generating evaluation scores for one or more AI systems by disabling evaluation from the inventory, while preserving all historical score data.

Before you begin

Role required: sn_ai_asset_mgmt.ai_asset_owner or sn_ai_governance.ai_steward

Note: Users with the AI asset owner [sn_ai_asset_mgmt.ai_asset_owner] role can only disable evaluations for assets that they own.

About this task

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home** > **Inventory** > **Assets**.
2. On the Overview tab, disable evaluation for one or more AI systems.

Option	Steps
Disable evaluation for a single AI system	**a.** Select the AI system's display name to open its asset record. **b.** From the **Actions** list, select **Turn off evaluation**. **c.** In the confirmation dialog box, review the AI system that you selected. **d.** Select **Turn off evaluation** to confirm.
Disable evaluation for multiple AI systems	**a.** Select the check box for each AI system that you want to disable evaluation for. **b.** From the **Action** list, select **Disable evaluation**. **c.** In the confirmation dialog box, review each AI system that you selected and its current state, and optionally remove any AI system that you don't want to update. **d.** Select **Turn off evaluation** to confirm.

Result

Evaluation is turned off for each AI system that you updated.

- New evaluation scores stop appearing within a few hours.
- Historical scores are saved and remain visible on the **Monitor** tab of each asset record.
- You can re-enable evaluation for these AI systems at any time, as long as they are managed.

What to do next

To resume scoring, see Enable evaluation for an AI system.

External Registries

External Registries is the mechanism that lets an AI Steward make a managed AI agent discoverable to external systems.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When an AI agent is added to the inventory, AI Control Tower tracks whether it can be published to external registries. The publish-ability status appears in the External registries section of the AI asset detail record and can be changed at any time by an AI steward.

AI Control Tower no longer pushes agents to Microsoft. Instead, an AI steward marks an agent as publishable, which exposes it through a ServiceNow API. External systems such as Microsoft Agent 365 (A365) can then call this API at their own schedule (example: a periodic daily job) to discover and retrieve those agents.

Publishing an AI agent to an external registry makes it discoverable outside the AI Control Tower. Marking an agent as unpublishable removes it from consideration for external publication while keeping it active in the inventory. The agent is still managed by AI Control Tower regardless of its publish-ability status.

Note: Changing the publish-ability status of an AI agent does not affect its operational status or governance controls within AI Control Tower.

Eligibility Criteria for Publishing

An Agentic AI asset must meet all four of the following criteria before the External Registries tab appears and the publish action is set to available:

Publishable criteria

Criteria	Required value
Governed	True
Lifecycle state	Deployed
Asset status	Approved
Agent model category	Agentic AI
ServiceNow table	AI agent

Publish-ability states

An AI agent can have one of the following publish-ability states:

- Publishable- The AI agent is available for publication to external registries. AI Stewards can publish the agent and manage its external presence from AI Control Tower.
- Unpublishable- The AI agent is not available for publication to external registries. AI stewards can restore publish-ability at any time by selecting Mark as publishable from the actions menu on the asset detail record.

Note: The Microsoft integration provides the following methods to publish an AI agent so that Microsoft can discover it:

- An AI Steward can mark an AI agent as publishable or unpublishable directly from the AI asset record page.
- An AI Steward can mark an AI agent as publishable or unpublishable in the corresponding Onboarding playbook. This option is available through the Publish to External Registries task of the Deploy activity. For more information on the Onboarding playbook, see AI Control Tower playbooks.

If an AI agents meets all eligibility criteria, it is marked as publishable and returned by the discoverable APIs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

External Registry Support

Currently, Microsoft Agent 365 is the only supported external registry in the UI. However, the API is open by design and any third-party system can call the endpoint to retrieve publishable agents.

API Endpoints

Two API endpoints have been exposed for external systems:

- List endpoint- Returns a list of all agents marked as publishable.
- Detail endpoint- Returns detailed metadata for a specific agent, as required by Microsoft for display in Agent 365.

Publish AI agents

Marking AI agents as publishable from an AI asset record page.

Before you begin

Role required: sn_ai_governance.ai_steward

About this task

An AI agent needs to meet all the prerequisites criteria to be eligible to get publish-ability status.

Procedure

1. Navigate to **All** > **AI Control Tower** > **Inventory**.
2. Open an AI agent.
3. Select **Actions**.
4. Select **Mark as publishable**.

Result

The Agent is returned by discover-ability APIs; External registries section reflects updated status.

Deactivate a managed AI agent

Deactivate a managed AI agent directly from its asset record using kill switch protocol, even if the agent has no associated security event.

Before you begin

Role required: sn_ai_governance.ai_steward

This action is available only for managed AI agents in the Agentic AI category. It isn't available for unmanaged agents.

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home** > **Inventory** > **Assets**.
2. Open the AI asset record for the managed AI agent that you want to deactivate.
3. From the **Actions** menu, select **Deactivate Agent**.
4. In the confirmation dialog box that appears, provide the reason for deactivation and select **Deactivate**.
   For details on tracking deactivation progress, retrying a failed operation, and reinstating the agent afterward, see Contain AI agents manually using kill switch protocol.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The AI agent is deactivated using kill switch protocol.

Working with AI asset records

An asset record consolidates the state of a single AI asset and the actions you can take on it, so you can understand the asset's situation and respond from one page.

Overview of working with AI asset records

AI stewards typically open an asset record after a portfolio view, recommendation, or task points them to a specific AI asset. The record brings together information about that asset, including its scores, lifecycle position, connected assets, and pending work. It also provides the actions to respond to what needs attention, without piecing data together from monitoring dashboards, task queues, and inventory lists.

- Reviewing AI asset status

  Check the governance posture, pending work, key details, and value delivered by an asset at a glance from the **Overview** tab, and act on what needs attention without leaving the record.

- Managing AI asset details

  Keep an asset's metadata, use and purpose values, related assets, and supporting documents accurate over time so risk classifications, audit responses, and ownership stay current.

- Managing your AI asset lifecycle

  Advance an asset through its Onboard, Maintain, and Retire stages, work through the playbook tasks generated for each stage, and initiate change or offboarding requests from the Maintain stage.

- Planning AI work from Inventory in AI Control Tower

  Track the strategic priorities, goals, targets, demands, and projects tied to an asset across the Strategize, Prioritize, and Execute sub-tabs on the **Plan** tab.

- Governing AI assets

  Review an asset's regulatory risk classification, compliance score against controls for frameworks like the EU AI Act and NIST AI RMF, residual and inherent risk posture, and the AI cases, controls, and policy exceptions associated with it.

- Monitoring an AI system

  Investigate an asset's quality and safety performance in detail, including which metrics are pulling scores up or down, how performance is trending over time, and which sessions need attention.

- Viewing value metrics for an AI system

  Quantify the productivity gains, AI cost, net AI returns, and engagement metrics an asset has delivered over a date range you select.

- Viewing templates associated with an AI system

  View the value, quality, and safety templates mapped to an asset, and map a different template when the current one no longer reflects how productivity should be calculated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Governing AI asset security

  Review your asset's security score, access issues, and possible security events, and see how it relates to other AI agents in the AI agent map.

Reviewing AI asset status

Check the governance posture, pending work, key details, and value delivered by a specific AI asset, and act on what needs attention without leaving the record.

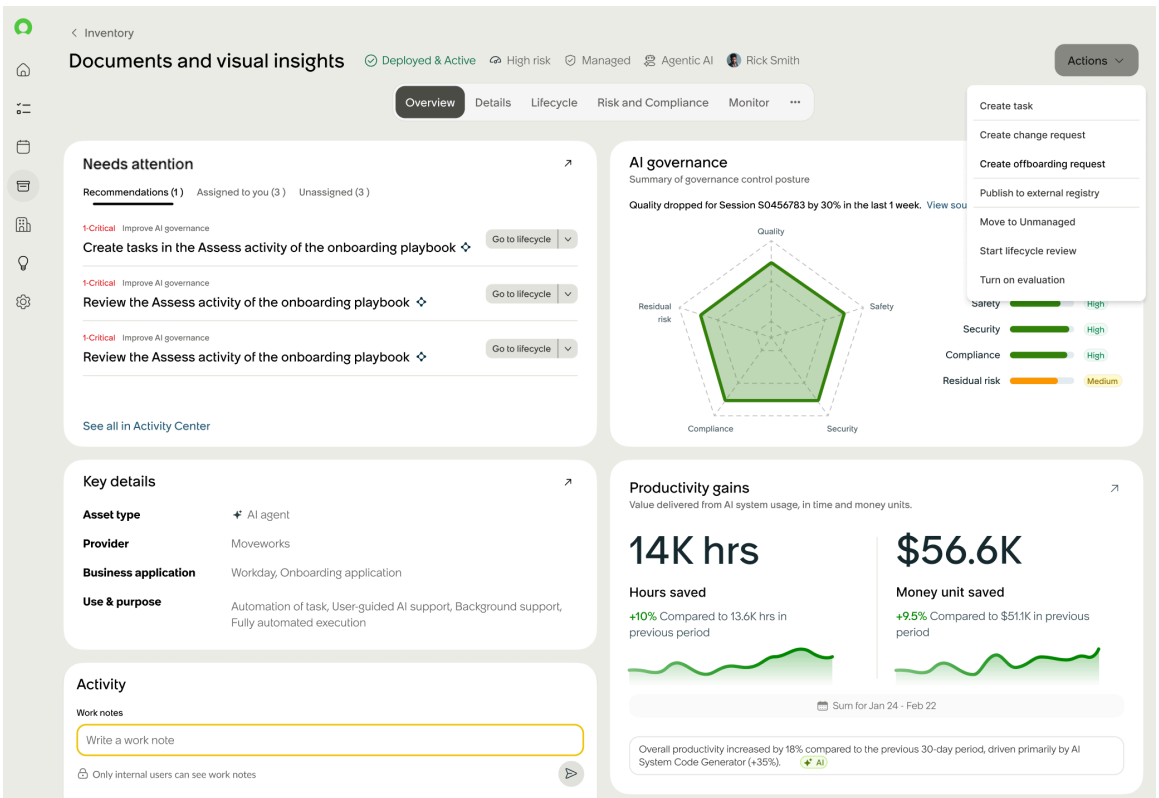
The **Overview** tab on an asset record brings together the governance posture, pending action items, key details, and value delivered by that asset on one page.

Key benefits

- See the recommendations, tasks, and unassigned work that apply to this asset, and act on them without leaving the record.
- Spot governance strengths and weaknesses across quality, safety, security, compliance, and risk on the AI governance radar chart.
- Confirm what the asset is and how it's used from its key details.
- Track the productivity, usage, and returns this asset has delivered over time.
- Review the asset's activity stream.

Depending on the asset's management status and lifecycle stage, you can take actions such as creating a change request, creating an offboarding request, moving the asset to unmanaged, or turning off evaluation.

Overview tab on an AI asset record



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Viewing items that need attention

See the recommendations, tasks assigned to you, and unassigned tasks that apply to this specific asset, and act on them without leaving the record, in the **Needs attention** list. Recommendations, tasks assigned to you, and unassigned tasks are organized into **Recommendations**, **Assigned to you**, and **Unassigned** sub-tabs. Confirm that a recommendation is accurate and aligns with your needs before acting on it. Select **See all Recommendations in Activity Center** to review work that applies to other assets. For more information about how recommendations differ from lifecycle tasks and how they're generated, see Recommendations and AI insights.

Reviewing AI governance

Spot at a glance which governance dimensions are strong and which need attention, in the **AI governance** radar chart. The chart summarizes this asset's governance control posture across five dimensions: **Quality**, **Safety**, **Security**, **Compliance**, and **Risk**. Review the callout for context on a recent change, such as a drop in a session's quality score.

Confirming key details

Confirm what this asset is and how it's used, without switching tabs, from the **Key details** list. The list shows the asset tag, asset type, provider, and use and purpose for this asset. To edit these values or review the asset's full metadata, see Managing AI asset details.

Tracking asset value

Track the productivity, usage, and returns this asset has delivered over a selected period, in the **Productivity gains**, **Total AI actions**, and **Net AI returns** widgets. Each widget shows a headline number, a trend line, a period-over-period comparison, and the exact date range the numbers are summed over.

Productivity gains

The hours and money saved from this asset's usage during the selected period.

Total AI actions

The total number of LLM-related actions this asset performed during the selected period.

Net AI returns

The net returns this asset delivered after deducting the cost of running it during the selected period.

Viewing activity

Review this asset's activity stream from the **Activity** list. Use the filter and settings controls to narrow the stream to the activity types you want to review.

Recommendations for your AI assets

Recommendations for AI assets are automatically generated for you to review and act on.

Overview of recommendations

Recommendations are automatically generated so that you can identify and address issues before they escalate, without the need for manual monitoring. You can view these recommendations only if you have the AI steward [sn_ai_governance.ai_steward] or AI asset owner [sn_ai_asset_mgmt.ai_asset_owner] role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Control Tower checks for a range of conditions on your assets on a schedule that varies by recommendation type, giving you a current view of which assets need attention and why.

Recommendations include, but aren't limited to, the following:

- Activities with no tasks: When an active life-cycle playbook activity is in an onboarding or offboarding phase but has no tasks linked to it, a recommendation is generated. This alerts you that work must be assigned before progress can continue.
- Activities ready to be marked as complete: When every child task under an activity is complete but the activity itself is still open, a recommendation is generated. This helps keep your life-cycle stages from stalling in an open state when the real work is already done.
- A missing or incomplete asset description.
- An asset that has been dormant long enough to be a candidate for retirement.

For the complete picture of how recommendations are generated, prioritized, and resolved across all categories, see Recommendations and AI insights.

Viewing recommendations

You can view recommendations in the following locations:

- AI Control Tower Home page: In the **Top action items** widget.
- Asset record page: In the **Needs attention** section on the **Overview** tab, under the **Recommendations** sub-tab. Select **See all Recommendations in Activity Center** to open the full list.
- Activity Center: On the **Recommendations** page.

Select a recommendation to review the reasoning behind it and the asset it applies to.

To resolve a recommendation, use the primary resolution action it offers; for the full procedure, see Resolve an AI recommendation.

Managing AI asset details

Confirm what an AI asset is, who owns it, how it operates, and what other assets depend on it before approving a change, investigating a score, or responding to an audit question.

An AI asset record stores the metadata, operating characteristics, related assets, and supporting documents that describe how the asset is built, owned, and used. The **Details** tab consolidates this information so that asset owners can keep the record current and AI stewards can reference it during reviews and audits.

The **Details** tab is available for both managed and unmanaged assets. For an unmanaged asset, it is the only tab on the record where this information appears, and is the starting point for review or onboarding.

AI asset details

Use the **Details** section to confirm and maintain the administrative metadata that identifies an AI asset and clarifies who is accountable for it. Asset owners reference these values to keep the record current. AI stewards reference them during reviews and audits. The asset tag contains the unique ID assigned to every asset. Each asset tag consists of a type prefix followed by a 20-digit number.

For example, the **Managed by** field identifies the asset owner who keeps the record accurate and receives lifecycle tasks. The **License details** field captures the license terms that apply to the asset and is referenced during procurement reviews. The **Locations** field records the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

geographic locations where the asset is supported and is used to confirm coverage during data residency reviews. To update any of these values, edit them on the asset record.

Use and purpose

Use the **Use and purpose** section to capture how an AI system operates and what outcome it produces. AI stewards reference these values to classify risk and set appropriate guardrails. Asset owners reference them when responding to audit or regulatory questions about how the asset behaves. When this section is populated when a record is first created, whether for a managed or unmanaged asset, the system uses it to assign the asset an initial risk rating automatically.

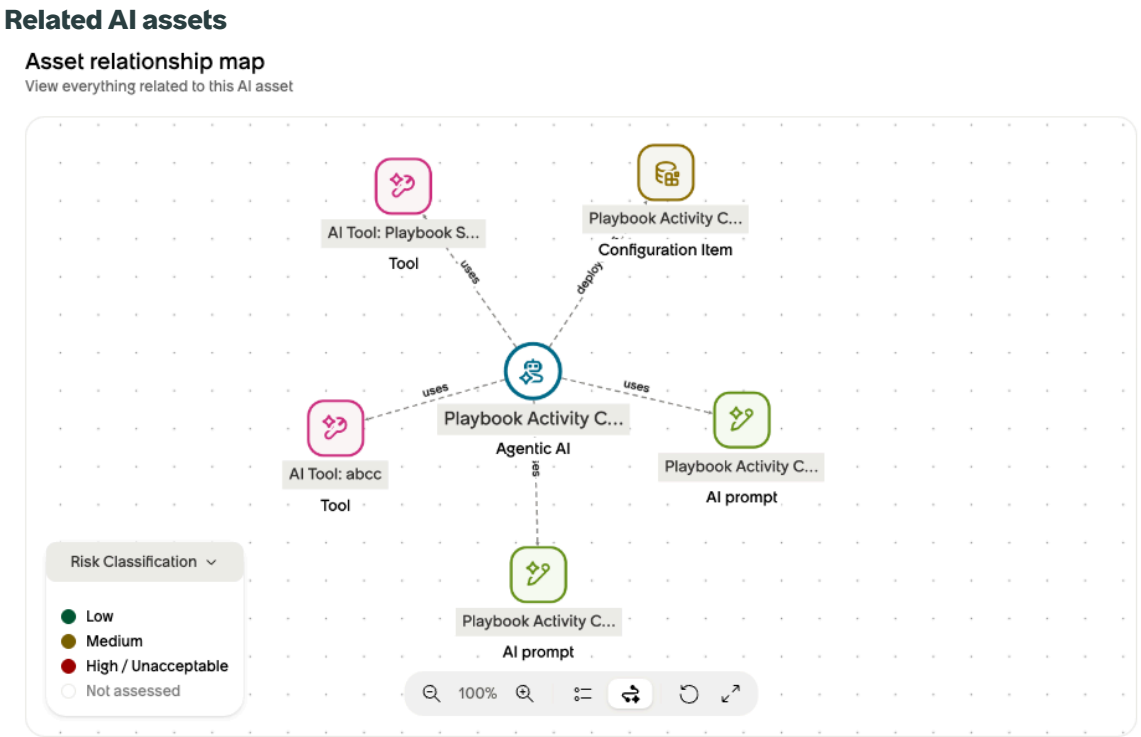
For example, the **System autonomy level** field records how independently the asset acts, with values that range from **Assistive (AI suggests)** at one end to **Fully Automated Execution** at the other. The **Intended outcome of the AI system** field records what business outcome the asset produces, with values such as **Efficiency Boost**, **Decision Guidance**, and **Automation of Tasks**. Together, these values give reviewers context to classify the asset and identify the controls that apply to it. Other fields in the section capture how end users interact with the asset, the level of human involvement in its workflow, and free-text descriptions of the data it uses and the people it affects.

To update **Use and purpose** values, see Update the use and purpose of an AI asset.

Asset relationship map

An AI asset can depend on other AI assets. For example, an AI system can use AI models, prompts, and datasets; can invoke other AI systems; and can be associated with one or more business applications. Use the asset relationship map to see these connections, assess the impact of a planned change, and navigate to a related asset's record.

Business application connections require the Enterprise Architecture for AICT plugin, which installs automatically with AI Control Tower Core at the required version. For upgrade-order considerations, see Enterprise Architecture for AICT plugin installation and upgrade considerations.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For step-by-step guidance, see Trace the relationships between AI assets.

Attachments

Use the **Attachments** section to keep supporting documents with the asset record, such as model cards, dataset cards, vendor contracts, and third-party documentation. Attached files open in the embedded document viewer, so reviewers can read them without downloading the file.

Update the use and purpose of an AI asset

Update the use and purpose values for an AI asset when its operating characteristics or business outcome change so that risk classifications and governance controls continue to reflect how the asset behaves.

Before you begin

Role required: sn_ai_governance.ai_steward or sn_ai_asset_mgmt.ai_asset_owner

Note: Users with the AI asset owner [sn_ai_asset_mgmt.ai_asset_owner] role can view details for any asset but can only update assets that they own.

About this task

Use and purpose values describe how an AI system operates and what outcome it produces. These values are first captured during asset onboarding, but they can change over time. For example, an AI system that originally proposed actions for a user to approve might later be reconfigured to act on its own. When that happens, the asset's **System autonomy level** and **Level of human involvement** values no longer reflect how the asset actually behaves, and any risk classification or control assignment based on those values is out of date.

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home** > **Inventory**.
2. Open the asset record for the AI asset that you want to update.
3. Select the **Details** tab and locate the **Use and purpose** section.
4. In the **Use and purpose** section, update the relevant fields.

   For example, an AI system that previously required user approval before acting has been reconfigured to act on its own. In this case, change **System autonomy level** from **Semi-Automated (acts with confirmation)** to **Fully Automated Execution**, and change **Level of human involvement** from **AI-Initiated with User Approval** to **Fully Automated Workflow**.

   For a description of the fields and their values, see Use and purpose fields.
5. Select the check icon to save your changes.

Result

The updated values appear in the **Use and purpose** section and are referenced in subsequent reviews, risk classifications, and audit responses.

What to do next

If the change affects how the asset operates, review the controls and governance assignments that depend on these values to confirm they still apply.

Use and purpose fields

Field and value reference for the **Use and purpose** section of an AI asset record. AI stewards and AI asset owners reference these values during onboarding, reviews, and audits.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

System autonomy level

System autonomy level values

Value	Description
Not Applicable	Indication that the autonomy dimension does not apply to the asset.
Assistive (AI suggests)	Mode in which the AI system suggests outputs and the user decides whether to act on them.
Semi-Automated (acts with confirmation)	Mode in which the AI system performs actions following user confirmation.
Condition-Based Automation	Mode in which the AI system acts automatically when defined conditions are met.
Event-Triggered Automation	Mode in which the AI system acts automatically in response to specific events.
Fully Automated Execution	Mode in which the AI system acts independently without human intervention.

Level of human involvement

Level of human involvement values

Value	Description
Not Applicable	Indication that human involvement does not apply to the asset.
Full User Control	Workflow in which the user is responsible for decision-making and the AI system isn't automated.
User-Guided with AI Support	Workflow in which the user directs the activity and the AI system contributes recommendations or analysis.
Shared Control	Workflow in which the user and the AI system share responsibility for decisions and actions.
AI-Initiated with User Approval	Workflow in which the AI system proposes actions and the user approves them before execution.
Fully Automated Workflow	Workflow in which the AI system completes the activity end to end without user involvement.

Interaction type with end users

Interaction type with end users values

Value	Description
Not Applicable	Indication that end-user interaction does not apply to the asset.
No Direct Interaction	Mode in which end users do not interact with the AI system.
Background Support	Mode in which the AI system operates behind the scenes to support a user-facing process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Interaction type with end users values (continued)

Value	Description
Notifications & Prompts	Mode in which the AI system communicates with end users through notifications or prompts.
User-Facing Recommendations	Mode in which the AI system surfaces recommendations directly to end users.
Chat-Based Interaction	Mode in which end users interact with the AI system through a conversational interface.
Interactive Experience	Mode in which end users interact directly with an AI-embedded interface or application.

Intended outcome of the AI system

Intended outcome of the AI system values

Value	Description
Not Applicable	Indication that the intended outcome does not apply to the asset.
Efficiency Boost	Outcome focused on reducing the time or effort required to complete a process.
Quality Enhancement	Outcome focused on improving the accuracy or consistency of a process.
Decision Guidance	Outcome focused on supporting human decision-making with analysis or recommendations.
Automation of Tasks	Outcome focused on completing tasks without human action.
Customer Experience Upgrade	Outcome focused on improving the experience of customers or end users.

Additional use and purpose fields

Additional fields

Field	Description
Type of output produced	Description of what the AI system generates, such as text responses, decisions, or recommendations.
Area where the AI system is used	Functional or organizational area in which the asset operates, such as customer service, IT support, or human resources.
People affected by the AI system	Groups whose work or experience is influenced by the asset, such as employees, customers, or partners.
Data used by the system	Categories of data the AI system reads, references, or processes, such as case records, knowledge articles, or customer profiles.
Additional use and purpose details	Free-text notes that capture context not covered by the other use and purpose fields.

© 2026 ServiceNow, Inc. All rights reserved.

Trace the relationships between AI assets

Identify the AI assets that depend on or feed into a specific AI asset to assess the impact of a planned change, investigate an unexpected evaluation score, or respond to an audit question about how data and models flow through your AI inventory.

Before you begin
Role required: sn_ai_governance.ai_steward or sn_ai_asset_mgmt.ai_asset_owner

Note: Users with the AI asset owner [sn_ai_asset_mgmt.ai_asset_owner] role can view relationships for any asset but can only update assets that they own.

About this task
The asset relationship map shows the current AI asset at the center, with connected AI assets arranged around it. Connected assets are grouped by node type, such as AI models, AI prompts, and AI datasets.

Procedure
1. Navigate to **All** > **AI Control Tower** > **Home** > **Inventory**.
2. Open the AI asset with connections that you want to trace.
3. Select the **Details** tab and locate the **Asset relationship map** section.
4. **Optional:** To narrow the map to a specific category of related asset, such as AI models or AI datasets, select a value from the **Node type** list.
   The map updates to show only nodes of the type you selected.
5. **Optional:** To find a specific related asset by name, enter the name in the search field.
6. To open a related asset's record, select its node on the map.
   The selected asset's record opens.

What to do next
Depending on the relationships identified, take one of the following actions:

- Add a relationship to another asset.
- If a related asset will be affected by an upcoming change, create a change request for that asset. See Create change requests for AI assets
- If you're investigating evaluation scores for an AI system, review the **Evaluation** tab on a connected AI model's record to see how that model performs in isolation. See Monitoring an AI system.

Associate a business application with an AI system

Associate an existing business application with an AI system asset, independently of whether the Enterprise Architecture Workspace plugin is installed.

Before you begin
Role required: AI Asset Owner [sn_ai_asset_mgmt.ai_asset_owner]

About this task
You can associate a business application with an AI system either while creating the AI system asset, or afterward by editing an existing AI system's relationships. This topic covers both.

This association requires the Enterprise Architecture for AICT plugin, which installs automatically with AI Control Tower Core at the required version. For upgrade-order considerations, see Enterprise Architecture for AICT plugin installation and upgrade considerations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **AI Control Tower** > **Inventory**.
2. On the Inventory page, select **Add AI asset**.
   The Add AI asset dialog box appears.
3. In the dialog box, select **Enter asset details**.
4. From the list of available asset types, select **AI system**.
   The dialog box closes and you are automatically redirected to the Add AI system asset form.
5. In the **Details** section of the form, fill in the fields and then select **Next**.
   For field information, see Create AI system assets.
6. On the Relationships page, from the **Related to** list, select **Business Applications**.
7. Select **Add from inventory**.
8. In the **Select Business Applications** dialog box, select the checkbox next to each business application that you want to associate, and then select **Add**.
9. Select **Next** to continue to **Use and Purpose**, or **Submit for review** if you're editing an existing asset.

Result

The selected business applications appear in the **Details** tab for that AI system.

Managing your AI asset lifecycle

Get a structured view of an AI asset's progression through its operational stages, from initial onboarding to retirement.

When you open an AI asset record, the **Lifecycle** tab shows the current lifecycle stage of that asset. The lifecycle provides governance visibility across the full lifespan of an AI asset.

Lifecycle stages

Lifecycle is divided into three stages, displayed as a horizontal progress indicator at the top of the tab:

Onboard

The initial stage for a newly added AI asset. The **Onboard** sub tab contains the Onboarding playbook with tasks displayed. If tasks aren't already present in the Onboarding playbook, the sn_ai_governance.ai_steward role can create tasks by selecting **New** and assigning them to an asset owner or other AI stewards.

Maintain

After onboarding is complete, the asset enters the Maintain stage. The **Maintain** sub tab is enabled only after onboarding is complete.

Retire

The final stage in the lifecycle. The **Retire** sub tab is enabled only after onboarding is complete. When an AI asset is no longer needed or has been superseded, it is moved to the Retire stage. Retirement ensures the asset is formally

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

decommissioned and removed from active use in a controlled and auditable manner.

Creating requests for AI assets

You can manage deployed AI assets effectively by creating change requests for updates to existing assets or by creating offboarding requests for retiring assets.

AI Control Tower supports two types of requests:

Change request

A request to modify a managed AI asset. A change request might propose switching the AI model that backs an agent, updating an asset's version, modifying the asset's use and purpose, or changing the sub-AI systems and AI models associated with the asset.

For details, see .

Offboarding request

A request to retire a managed AI asset. An offboarding request initiates the offboarding lifecycle stage for the asset, which removes the asset from active use and confirms that dependencies have been resolved and any data the asset produced is handled according to policy.

For details, see .

Create change requests for AI assets

Create a change request to modify the relationships between a deployed AI asset and its related assets.

Before you begin

Role required: AI steward [sn_ai_governance.ai_steward] or AI asset owner [sn_ai_asset_mgmt.ai_asset_owner]

Note: Users with the AI asset owner [sn_ai_asset_mgmt.ai_asset_owner] role can create change requests only for the AI assets that they are assigned to manage. In addition, they can only create change requests and submit them for review. They can't approve or reject requests or complete any corresponding change tasks.

About this task

To modify the relationships between related AI assets, you can initiate the change process by creating and submitting a change request.

You can create change requests for the following AI asset types:

- AI systems (classic, generative, and agentic)
- AI models
- Datasets

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home** > **Inventory**.
2. From the list of available assets, open an asset record with a state of **Deployed** and a status of **Approved**.
3. Initiate the change request by using one of the following navigation options.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Open the asset record and select the **Actions** menu and select **Create change request**.
- In the Lifecycle tab, go to the Maintain sub tab and select **Create change request.**

4. On the Change request form, fill in the fields.

New change request form

Field	Description
Change details	
Asset in review	The AI Asset that you want to modify related asset relationships for. **Note:** If you initiated the change request from an AI asset record, this field populates automatically.
Asset type	Type of asset.
Version	Updated version number of the AI asset.
Due date	Date and time at which the request must be completed.
Justification	Justification for creating the request.
Attachments	Accepts JPG, PDF, or XLSX files up to a maximum of 10 MB.
Sub AI systems **Note:** This form section appears only if you are creating a change request for an AI system with an Asset type of either Generative AI or Agentic AI.	
Updated Sub AI systems	Related AI components or subsystems that you want to associate the AI asset with.
AI models **Note:** This form section appears only if you are creating a change request for an AI system.	
Updated models	Related AI models that you want to associate the AI asset with.
AI prompts **Note:** This form section appears only if you are creating a change request for an AI system.	
Updated prompts	Related prompts that you want to associate the AI asset with.
Evaluation dataset **Note:** This form section appears only if you are creating a change request for an AI system or AI model.	
Updated evaluation datasets	Related evaluation datasets that you want to associate the AI asset with.
Tools	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Note: This form section appears only if you are creating a change request for an agentic AI system.	
Updated tools	Related tools that you want to associate the AI asset with.
Training datasets **Note:** This form section appears only if you are creating a change request for an AI model.	
Updated training datasets	Related training datasets that you want to associate the AI asset with.
Source **Note:** This form section appears only if you are creating a change request for a dataset.	
Updated source	Related data source that you want to associate the AI asset with.
Base datasets **Note:** This form section appears only if you are creating a change request for a dataset.	
Updated base datasets	Related base dataset that you want to associate the AI asset with.
Dataset card **Note:** This form section appears only if you are creating a change request for a dataset.	
Updated dataset card	Related dataset card that you want to associate the AI asset with.

5. Select **Save**, the **Actions** menu, and then select **Submit for review**.
6. In the Submit change request dialog box, select **Submit request**.
   The Impacted assets and Change tasks related list appear. You can approve or reject the request.
7. On the **Details** tab, set the **Assigned to** field to the user who you want to assign the change request to.
   You can assign the request to yourself or to any other user with the AI steward [sn_ai_governance.ai_steward] role.
8. Approve or reject the request.
   - To approve the request, select **Approve**.
   - To reject the request, select **Reject**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If you approved the request, the Status changes to **Approved** and the State changes to **In progress** (if there are impacted assets) or **Completed** (if there are no impacted assets). The new AI asset is created.

  The AI Control Tower application then generates a change task for each asset that is impacted by the request except for datasets. These change tasks appear on the **Change tasks** tab and specify the actions that must be taken on the impacted assets. Each change task is assigned to a user with the AI steward [sn_ai_governance.ai_steward] role. If you have any concerns or need further clarification on the request, you can create additional change tasks manually only if you have the AI steward [sn_ai_governance.ai_steward] role. After the assigned users complete all change tasks, the AI Control Tower application automatically creates a new AI asset record for the asset that the change request was created for. The State of the request then changes to Completed.

  Note: The **Impacted assets** tab is not available if the change request was created for a dataset.

- If you rejected the request, the Status changes to Rejected and the State changes to Completed.

Create offboarding requests for AI assets

Create an offboarding request to retire AI assets that are no longer needed.

Before you begin

Role required: AI steward [sn_ai_governance.ai_steward] or AI asset owner [sn_ai_asset_mgmt.ai_asset_owner]

Note: Users with the AI asset owner [sn_ai_asset_mgmt.ai_asset_owner] role can create offboarding requests only for the AI assets that they are assigned to manage. In addition, they can only create offboarding requests and submit them for review. They can't approve or reject requests or complete any corresponding offboarding tasks.

About this task

To retire a deployed AI asset, you can initiate the offboarding process by creating and submitting an offboarding request. This triggers the offboarding workflow that assigns tasks to impacted asset owners and updates the status of the AI asset record to **Retired** on completion.

You can create offboarding requests for the following AI asset types:

- AI systems (classic, generative, and agentic)
- AI models
- Datasets
- MCP servers

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home** > **Inventory**.
2. From the list of available assets, open an asset record with a state of **Deployed** and a status of **Approved**.
3. Initiate the offboarding request by using one of the following navigation options.
   - Open the asset record, select the **Actions** menu and select **Create offboarding request**.
   - In the Lifecycle tab, go to the Retire stage and select **Create offboarding request**
4. On the Offboarding form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

New offboarding request form

Field	Description
Asset in review	**Note:** If you initiated the offboarding request from an AI asset record, this field populates automatically.
Due date	Date and time at which the request must be completed.
Justification	Justification for creating the request.

5. Select **Save**, the **Actions** menu and, then select **Submit for review**.
6. In the Submit offboarding request dialog box, select **Submit request**.
   The offboarding workflow is initiated. The **Impacted assets** and the**Offboarding workflow** tabs also appear.

Planning AI work from Inventory in AI Control Tower

View all planning data for a specific AI system in one location. The Plan tab automatically filters goals, intake items, and delivery records to show only those linked to your selected AI system across Strategize, Prioritize, and Execute workflows.

Plan tab overview

The Plan tab appears on the record page of an AI system in AI Control Tower Inventory. It appears only for AI systems, not for other asset types such as AI prompts. The Plan tab provides a focused view of the goals, intake items, and delivery records associated specifically with the AI system you selected.

To navigate to the Plan tab of an AI system:

1. Navigate to **All** > **AI Control Tower** > **Inventory**.
2. Select **AI Systems** as the asset type.
3. Select an AI System record to open it.
4. Navigate to the Plan tab.

The Plan tab has three sub-tabs: Strategize, Prioritize, and Execute. The data on each sub-tab is filtered using the product model of the selected AI system. Records in tables such as goals, demands, and projects that carry a product model field are filtered to show only those linked to that product model. Because the data is already scoped to a single AI system, the Plan tab has no additional header-level filters.

Each list on the Plan tab has a toolbar with the following actions:

- Search: Find records by keyword.
- Filter: Open the filter panel to build conditions using field and operator combinations, sort records, or group them within the list.
- Refresh: Reload the list to show the latest data.
- Personalize columns: Choose which columns are displayed and in what order. Search from available columns, add or remove them, and drag to reorder.
- New: Create a record directly from the Plan tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can also edit a record inline by selecting the edit icon ( ) in the record row.

Note: When you create a record from the Plan tab, confirm that the product model field on the new record is set to the product model of the AI system that you're viewing. If the product model is not set correctly, the new record is excluded from the filtered list after saving.

Strategize

The Strategize sub-tab displays the Goal and Target lists, both filtered to show only records linked to the product model of the selected AI system. Unlike the Strategize page in the Plan menu, this view shows only the filtered lists without analytics widgets.

Strategize lists

List	Source table	Records displayed
Goal	sn_gf_goal	Goals where the product model matches the product model of the selected AI system.
Target	sn_gf_goal_target	Targets where the product model matches the product model of the selected AI system.

To edit a goal or target record, see Edit a strategize record.

Prioritize

The Prioritize sub-tab displays the Demand, Feedback, and Product idea lists, all filtered to show only records linked to the product model of the selected AI system. Unlike the Prioritize page in the Plan menu, this view shows only the filtered lists without analytics tiles.

Prioritize lists

List	Source table	Records displayed
Demand	dmn_demand	Demands where the product model matches the product model of the selected AI system.
Feedback	sn_align_core_feedback	Feedback records where the product model matches the product model of the selected AI system.
Product idea	sn_align_core_product_idea	Product ideas where the product model matches the product model of the selected AI system.

To create an intake record, see Create an intake record. To edit an existing intake record, see Manage intake records.

Execute

The Execute sub-tab displays the Project and Epic lists, both filtered to show only records linked to the product model of the selected AI system. Unlike the Execute page in the Plan menu, this view shows only the filtered lists without donut widgets or header filters.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Execute lists

List	Source table	Records displayed
Project	pm_project	Projects where the product model matches the product model of the selected AI system.
Epic	sn_align_core_scrum_epic	Epics where the product model matches the product model of the selected AI system.

To create a project or epic, see Create a project or epic in AI Control Tower. To edit an existing project or epic, see Edit a project or epic in AI Control Tower.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Risk & Compliance asset page sections (continued)

Section	What it displays	Status breakdown	Roles required
	control effectiveness metrics.		

Risk heat map	Identified risks associated with the AI asset. By default, the risk heat map applies the Residual risk filter, but you can filter the heat map by Inherent risk. Segmentation changes based on the selected filter. Risks appear under the respective combination of risk and control effectiveness, or impact and likelihood, depending on the selected risk classification filter.	The risk heat map consists of the following parameters along the X and Y axes:
		• Residual risk
		  ○ Inherent risk (X-axis)
		  ▪ Low
		  ▪ Medium
		  ▪ High
		  ○ Control effectiveness (Y-axis)
		  ▪ Effective
		  ▪ Needs improvement
		  ▪ Ineffective
		• Inherent risk
		  ○ Impact (X-axis)
		  ▪ Low
		  ▪ Medium
		  ▪ High
		  ▪ Critical
		  ○ Likelihood (Y-axis)
		  ▪ Unlikely
		  ▪ Likely
		  ▪ Highly likely
		  ▪ Almost certain

Monitoring an AI system

Assess the quality and safety performance of a specific AI system by reviewing its scores, metric breakdowns, trends, and evaluated sessions.

Key benefits

- See how a single AI system is performing without navigating between portfolio-level views and session lists.
- Identify which metrics are pulling a quality or safety score up or down by reviewing the data sources table directly on each score card.
- Detect regressions specific to an AI system by tracking metric trends over time.
- Review all evaluated sessions for an AI system in one place and open any session to investigate its traces and spans.

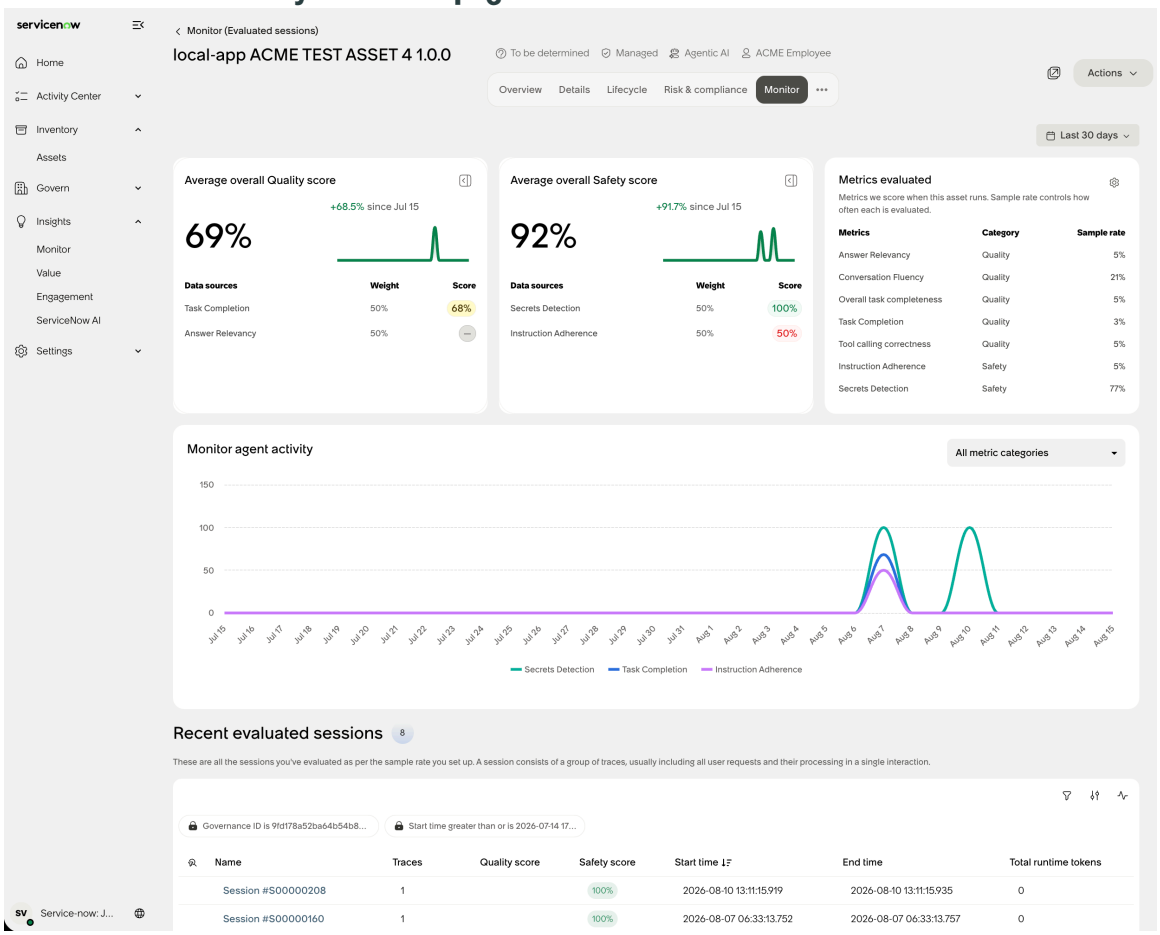
The **Monitor** tab on the AI system asset page focuses on a single AI system. While the monitoring overview shows portfolio-wide scores and rankings, the **Monitor** tab shows scores, trends, and sessions for the selected system only. Use the **Monitor** tab when you already know which system needs attention and want to understand its performance in detail.

To start monitoring scores for an AI system, you must activate evaluation scoring for the relevant system type (ServiceNow AI or external AI) and then enable evaluation for the AI system from the inventory.

- Activate evaluation scoring for ServiceNow AI systems
- Activate evaluation scoring for external AI systems
- Enable evaluation for an AI system

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Monitor tab on the AI system asset page



Required roles

The admin role is required to view the Monitor tab.

Accessing monitoring details for an AI system

Access monitoring details for an AI system in one of the following ways:

- Navigate to **All** > **AI Control Tower** > **Home** > **Inventory**. Select the AI system asset and then select the **Monitor** tab.
- Navigate to **All** > **AI Control Tower** > **Home** > **Insights** > **Monitor** and select a system name in the **AI systems ranked by score** widget.
- Navigate to **All** > **AI Control Tower** > **Home** > **Insights** > **Monitor** > **Evaluated sessions** and select the AI system name in the **AI system** column.

Quality and safety score cards

The **Average overall quality score** and **Average overall safety score** cards display composite scores for this AI system, averaged across all evaluated sessions within the selected date range. Each score card shows a percentage, the percentage change from the prior period, and a trend chart.

The data sources table lists every metric that contributes to the composite, along with its weight and current value.

Scores are color coded for quick interpretation:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Red (0 to 50%): Low. Investigate immediately.
- Orange (51 to 75%): Fair. Review recent sessions for trends.
- Green (76 to 100%): Good. Meeting quality or safety targets.

Score card side panel

Select the side panel icon on a score card to open a detailed breakdown of how the composite score is calculated.

- See how the score is calculated by expanding the **How is this score calculated?** section, which displays a stacked bar visualization of metric contributions. Each segment's width represents the metric's weight, and its shading represents the metric's score.
- Review the **Nuances to consider** section for notes about how the average score is derived and how different scoring formats (binary, percentage, tiered) affect the calculation.

For details on how scores are calculated, see How evaluation scoring works.

Metrics evaluated

View every metric currently scored for this AI system, whether the metric comes from your organization's global metric configuration or was added specifically for this system in the **Metrics evaluated** list. View the list to confirm exactly what's being evaluated for a single AI system without checking the global configuration separately.

Metrics

Name of the metric.

Category

Whether the metric is a Quality or Safety metric.

Sample rate

Percentage of eligible sessions that this metric evaluates. This value is set at the metric level and applies wherever the metric is used.

AI stewards can add or remove metrics for any AI system. Asset owners can do the same, but only for the AI systems they manage. For details on adding or removing metrics, see Configure metrics evaluated for an AI system.

Avg latency per session

Determine whether recent agent activity or another change is affecting this AI system's response times by reviewing the Avg latency per session card and its change from the prior period. This value reflects the AI system's language model response time, not the total time to complete a trace or session.

Select the expand icon on the card to open a chart of total latency by day, summed across all sessions evaluated that day.

Avg tokens per sessions

Estimate the cost of running this AI system by reviewing the Avg tokens per sessions card and its change from the prior period. This value averages the combined input and output tokens consumed per session over the last month.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Monitor agent activity

Track how quality and safety metrics for this AI system are trending over the selected date range. The chart plots every metric with data for this AI system so you can detect regressions specific to it, confirm that recent changes improved performance, and see which metrics are shaping its overall scores.

Two line styles distinguish how each metric contributes to scoring:

- Solid lines represent metrics that contribute to this AI system's overall quality or safety score. These metrics are configured in a metric template.
- Dotted lines represent metrics that are being collected for this AI system but don't contribute to its overall quality or safety score. These metrics aren't configured in any metric template.

To add a dotted-line metric to your scoring formula or to adjust how much existing metrics contribute to your overall scores, see Configure an evaluation metric template.

Choose which metrics to display by selecting an option from the list.

Lowest performing metrics

Show the top five metrics that had the biggest drop in performance over the selected time period. This is the default selection.

Top performing metrics

Show the top five metrics that had the biggest increase in performance over the selected time period.

Quality metrics

Show only metrics in the Quality category.

Safety metrics

Show only metrics in the Safety category.

All metrics

Show every quality and safety metric that has data for the selected date range.

Alternatively, select an individual metric from the list to view performance for that metric over time.

Point to a data point on the chart to see the exact score for that date.

Recent evaluated sessions

The evaluated sessions table lists all sessions for this AI system within the selected date range. Scores are color coded for quick scanning.

Select a session name to open the session detail page and begin investigating traces and spans. For details on investigating sessions, see Session details.

Name

Session identifier. Select the name to open the session detail page.

Trace

Number of traces in the session.

Spans

Number of spans across all traces in the session.

Quality score

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Composite quality score for the session, calculated from the weighted metrics in your quality template.

Safety score

Composite safety score for the session, calculated from the weighted metrics in your safety template.

Start time

When the session began.

End time

When the session ended or timed out.

Total runtime tokens

Combined input and output tokens consumed by the AI system during this session. This reflects the cost of running the interaction, not the cost of evaluating it.

Latency (ms)

Combined language model response time, in milliseconds, across all traces in the session. This measures time spent in language model calls, not the total time to complete the session.

Review scores for an AI system

Determine whether a specific AI system is meeting quality and safety targets by reviewing its scores, identifying which metrics are affecting performance, and checking for regressions over time.

Before you begin

Role required: sn_ai_asset_mgmt.ai_asset_owner or sn_ai_governance.ai_steward

About this task

When a specific AI system needs attention, determine which metrics are affecting its scores and whether performance is trending in the right direction. Review the **Monitor** tab on the AI system asset record after spotting a low-scoring system on the monitoring overview, receiving an AI-generated insight about a specific system, or being assigned a task related to an underperforming asset.

Procedure

1. Navigate to the **Monitor** tab for the AI system that you want to review in one of the following ways:
   - Navigate to **All** > **AI Control Tower** > **Home** > **Inventory**. Select the AI system asset and then select the **Monitor** tab.
   - Navigate to **All** > **AI Control Tower** > **Home** > **Insights** > **Monitor** and select a system name in the **AI systems ranked by score** widget.
   - Navigate to **All** > **AI Control Tower** > **Home** > **Insights** > **Monitor** > **Evaluated sessions** and select the AI system name in the **AI system** column.
2. Set the date range for the data you want to review.
   Select the date range picker and choose a time period. The default is **Last 30 days**. Select **Custom range** to specify an exact start and end date, up to 18 months apart.
   All score cards, trends, and session data on the page update to reflect the selected range.
3. Assess overall quality performance by reviewing the **Average overall Quality score** card.
   For example, if the quality score is 88%, the data sources table might show that Task completion (weight 40%) scored 88% while Answer completeness (weight 35%) scored 86%. A low score on a heavily weighted metric has a larger impact on the composite.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Assess overall safety performance by reviewing the **Average overall Safety score** card. For example, if the Instruction adherence score is lower than Secrets detection or Sexism detection, the agent may be handling sensitive data and language correctly but still straying from its approved response guidance. Reviewing the traces where Instruction adherence dipped lowest will show which specific exchanges the judge flagged and why.
5. Confirm which metrics are scoring this AI system by reviewing the **Metrics evaluated** card. This card lists every metric currently scoring this AI system, whether the metric comes from your organization's global metric configuration or was added specifically for this system. To change which metrics are evaluated, see Configure metrics evaluated for an AI system.
6. View the full scoring formula by selecting the side panel icon on a score card.
   a. View a stacked bar visualization of how each metric contributes to the composite score in the **How is this score calculated?** section.
   b. Learn how the average score is derived and how different scoring formats affect the calculation in the **Nuances to consider** section.
7. Assess the AI system's operational performance by reviewing its performance cards, such as latency and token usage.
   a. Determine whether recent agent activity or another change is affecting response times by reviewing the **Avg latency per session** card.
   b. Estimate the cost of running this AI system by reviewing the **Avg tokens per sessions** card.
   c. Understand how much the AI system relies on external tools by reviewing the **Avg tool call per trace** card.

   Each card shows its change from the prior period. For the **Avg latency per session** card, select the expand icon to open a chart of total latency by day, summed across all sessions evaluated that day.
8. Check performance over time by reviewing the **Monitor agent activity** trend chart.

Option	Description
Lowest performing metrics	View the top five metrics with the largest de cline in quality and safety over time.
Highest performing metrics	View the top five metrics with the largest in crease in quality and safety over time.
Quality metrics	View the performance of quality metrics over time.
Safety metrics	View the performance of safety metrics over time.
All metrics	View the performance of all metrics over time.
Select a specific metric	View the performance for a specific metric by selecting it from the list.

Solid lines represent metrics that contribute to this AI system's overall quality or safety score. Dotted lines represent metrics that are collected but don't contribute to those scores. You can point to a data point on the chart to see the exact score for that date.

For example, a gradual decline in Task completion from 90% to 72% over three weeks indicates a quality regression for this AI system that warrants session-level investigation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To add a dotted-line metric to your scoring formula, see Configure an evaluation metric template.

9. Identify sessions that need investigation by reviewing the **Recent evaluated sessions** table.
   a. Sort sessions by **Quality score** or **Safety score** to surface the lowest-scoring sessions.
   b. Select a session name to open the session detail page and begin investigating its traces and spans.

   For example, a session with a red safety score (below 50%) warrants immediate investigation. For details on investigating sessions, see Investigate a low-scoring session.

Configure metrics evaluated for an AI system

Add or remove metrics for a specific AI system to tailor evaluation coverage without changing your organization's global metric configuration.

Before you begin

Role required: sn_ai_asset_mgmt.ai_asset_owner or sn_ai_governance.ai_steward

Note: Users with the AI asset owner [sn_ai_asset_mgmt.ai_asset_owner] role can configure metrics only for AI systems they manage.

About this task

The metrics evaluated for an AI system come from your organization's global metric configuration by default. However, you might apply specific metrics for individual AI systems. For example, to check a customer-facing agent for profanity when profanity isn't part of your global safety configuration, you can add or remove the metric for that system specifically. Changes made here don't affect any other AI system or your global configuration.

Procedure

1. Navigate to the **Monitor** tab for the AI system that you want to configure in one of the following ways:
   - Navigate to **All** > **AI Control Tower** > **Home** > **Inventory**. Select the AI system asset and then select the **Monitor** tab.
   - Navigate to **All** > **AI Control Tower** > **Home** > **Insights** > **Monitor** and select a system name in the **AI systems ranked by score** widget.
   - Navigate to **All** > **AI Control Tower** > **Home** > **Insights** > **Monitor** > **Evaluated sessions** and select the AI system name in the **AI system** column.
2. Configure which metrics to score for this asset.

Important: Adding more metrics increases the visibility you gain into each session, but also increases assist usage to evaluate it. Select the metrics that give you the insight you need.

Scenario	Steps
Configuring for the first time	**a.** In the **Metrics evaluated** card, select **Setup asset specific metrics**. **b.** Find a specific metric using the search box or the **All**, **Quality**, and **Safety** tabs. **c.** Select the check box next to each metric that you want to evaluate for this AI system.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scenario	Steps
Modifying an existing configuration	**a.** In the **Metrics evaluated** card, select the settings icon. **b.** Find a specific metric using the search box or the **All**, **Quality**, and **Safety** tabs. **c.** Select or clear check boxes to add or remove metrics.

3. Select **Save metric**.
   A confirmation message appears summarizing the change, and the **Metrics evaluated** card updates to reflect it. If a metric you're removing is currently used in a published evaluation template or a compliance evaluation, the change isn't saved, and you're shown which templates or evaluations are using it so you can resolve that first.

What to do next

To change how often a metric is evaluated for this AI system, an AI steward can adjust the sample rate from the evaluation settings. For an external AI system, each metric has its own sample rate, which you can set for individual assets. See Configure asset-specific metrics for external AI systems. For a ServiceNow AI system, a single sample rate applies to all metrics for all assets. See Configure global metrics for ServiceNow AI systems.

Viewing value metrics for an AI system

View productivity gains, net returns, usage volume, and cost metrics so you can assess the business impact of a specific AI system over time.

You can determine whether an AI system is delivering value by viewing the **Value & engagement** tab an the asset record. The metrics on this tab are scoped to the individual AI system, unlike the aggregated data shown on the value dashboard under Insights. Use these metrics to report on AI system performance, assess business value delivery, identify usage trends, or validate the effectiveness of your AI investment.

Value and engagement metrics

The following metrics are displayed on the **Value & engagement** tab.

Value and engagement metrics

Metric	Description
Productivity gains	Value delivered from AI system usage, expressed in time and money units. Displays hours saved and money saved for the selected time period.
Net AI returns	Net value of AI consumption after deducting costs. Reflects whether the AI system is generating positive return on investment.
Total AI actions	Total number of LLM-related actions performed by the AI system during the selected period.
Total AI cost	Total cost of AI usage for this AI system. Displayed as a trend chart over the selected time period.
Total productivity gained	Productivity gains in hours across the selected time period, broken down by persona. Use the **Persona** filter to view gains for a specific user type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Time period

All metrics reflect data for the date range shown beneath each widget. You can adjust the time period to focus on a specific window of usage. By default, metrics display a rolling 30-day sum.

Viewing templates associated with an AI system

Learn how value is being measured for an AI system by viewing the value templates mapped to the asset and the productivity calculation each template uses.

Value templates define the formula used to calculate productivity gains for an AI system. The formula multiplies a usage metric by a time constant and a quality constant to produce a minutes-saved figure. Because each AI system can have templates mapped to different personas, the **Templates** tab gives you a per-asset view of exactly which templates are active and what each one calculates.

Value templates list

The **Templates** tab displays a **Value templates** section that lists all templates mapped to the AI system. Each template card shows the following attributes.

Template card attributes

Attribute	Description
Template name	Name of the value template mapped to this AI system.
Mapping status	Publication state of the template mapping. A **Published** mapping is active and contributes to value calculations. A **Retired** mapping is no longer used in calculations but remains visible for historical reference.
Persona	User role for whom the productivity value is calculated.
Department	Department associated with the template mapping, if specified.
Category	Value template category, such as Productivity.
Usage	Usage indicator that supplies the daily invocation count used in the productivity formula.
Time	Time constant (in minutes) applied per invocation in the productivity formula.
Quality	Quality constant (as a percentage) applied in the productivity formula. Represents the expected acceptance rate of AI outputs.

By default, only templates with an active mapping status are shown. To include retired templates in the list, enable the **Include retired templates** toggle.

Template details side panel

To review the full configuration of a template mapping, select **View details** on a template card. A side panel opens showing the following information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Template details side panel fields

Field	Description
Mapped template	Name of the value template mapped to this AI system.
Mapping status	Publication state of this template mapping.
Persona	User role for whom value is calculated using this template.
Productivity gained	Total minutes saved by this persona using this AI system over the selected time period, shown as a trend chart. Use the date range selector to adjust the reporting window.
Productivity calculation using this template	The formula applied to calculate productivity for this mapping, expressed as: Usage indicator × time constant (minutes) × quality constant (%). Select the usage indicator link to open its record.

To view the full template record and its configuration fields, select **Open template** in the **Template details** section of the side panel.

Governing AI asset security

Get a snapshot of your AI asset's security posture and visualize how your asset relates to other agentic assets in your enterprise in the AI agent map.

When you open an AI asset record, the **Security** tab shows the AI asset security score, access issues, security events, and its access posture, based on whether the asset was given elevated privileges or has been dormant (inactive) for over 90 days.

It also shows the AI agent map which illustrates how the AI asset relates to other managed AI agents, agentic workflows, providers, and tools across your enterprise. For AI models, the Security tab shows the AI asset security score, security events, and the AI agent map only.

Get details for each metric area by selecting the arrow in the upper-right corner of each metric. If there's no data available for the asset, metrics don't show on the page.

AI asset security score

The AI asset security score is a measure of the health of your AI asset in terms of access issues, privileged AI agents, dormant AI systems, output deviation, PII detection, and other criteria. Users should actively manage and review their agent assets and not rely solely on this AI asset security score.

For more information, see Configure the AI asset security score.

Access issues

The number of access issues encountered by this AI asset for the last 24 hours, by default. For example, the AI agent couldn't access a database field.

AI agents with access issues may be unable to complete their workflows due to the access issue.

Access issues can also be due to misconfiguration or potentially malicious acts by an agent.

Security events

The number of security events associated with the AI asset for the last 24 hours, by default.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

An AI asset security event is an occurrence that involves a potential threat to your environment's security. For example, if a credit card number is detected in LLM output (output PII violation), or if a user replaces an LLM prompt with a malicious prompt designed to obtain a user's password (prompt injection). Each AI asset security event has a threat type assigned. For more information, see Managing AI asset security reference.

Access posture

Whether the asset was given elevated privileges or has been dormant for the time period shown, expressed in Coordinated Universal Time (UTC).

Privileged

The AI agent has elevated permissions, such as an agent with admin or security admin permissions that can perform critical actions. Some workflows require that AI agents have elevated permissions to complete.

An external AI agent is privileged if it has write, modify, or delete access to systems or data. For example, access to cloud infrastructure, IAM configurations, secrets managers, key management services, production databases, or security configurations.

Dormant

The AI agent has been inactive for 90 days or longer. Review dormant AI agent permissions to reduce security risk.

AI agent containment

If a security event of any severity (Critical, High, Medium, or Low) is detected for an AI agent in the Agentic AI category, a banner appears on both the asset's **Overview** tab and its **Security** tab, letting you take action directly from the asset record.

Select **View containment options** on the banner to open a side panel showing recent critical events for the asset and a **Deactivate** action. Deactivating the asset triggers AI agent containment using kill switch protocol; you can track progress from the banner and retry the operation if it fails or partially completes. After the underlying issue is resolved, you can reinstate the asset. For details, see Contain AI agents manually using kill switch protocol.

An AI agent can also be contained automatically when a Threat Response policy detects a matching threat. For details, see Threat Response policies.

AI agent map

The agent map is an interactive node map showing the relationships of your AI agents, agentic workflows, and tools across your enterprise. You can use the map to review these relationships and AI asset details. When you expand the map, you can filter by agents and agentic workflows.

For more information, see Discover your agent network with the map.

Working with MCP server records

The MCP servers tab on the AI Control Tower Inventory page provides a centralized view of MCP servers registered in your ServiceNow instance.

MCP servers are AI assets that expose tools, resources, and capabilities to AI agents through a standardized protocol. Registering MCP servers in the inventory enables AI Control Tower to govern, classify, and monitor their usage alongside other AI assets. The **MCP servers** tab displays only assets of type MCP server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MCP servers inventory list

The MCP servers inventory list displays the following columns for each registered server:

Column	Description
Display name	The display name of the MCP server. Servers sourced from external registries may display their registry path as the display name, for example: io.github.pipeworx-io/dictionary.
Asset type	Always MCP server for entries on this tab.
State	The lifecycle stage of the MCP server. Common values include Deployed. Se MCP server States for the full list.
Status	The approval status of the MCP server. Possible values are Approved and empty (not yet reviewed). See MCP server Statuses for details.
Managed status	Indicates whether the MCP server is under active governance. Possible valu are Managed and Unmanaged.
Risk classification	The assessed risk level of the MCP server. The default value is To be determined until a risk assessment is completed.
Updated	The date and time the record was last modified.

Refine results panel

Use the Refine results panel to filter the MCP servers list by one or more criteria simultaneously.

The following filter groups are available in the Refine results panel:

Filter group	Available values
Managed status	Managed, Unmanaged
Risk classification	Critical, Unacceptable, High, Medium, Low (select Show all for additional values).
State	Ideation, Design, Build, Available, Deployed (select Show all for additional values).
Status	In review, Ready for deployment (scroll or select Show all for additional values).

Managing MCP server records

Learn about the MCP server record, including the MCP server overview and details available in AI Control Tower.

An MCP server record in AI Control Tower provides a detailed view of a registered MCP server. The record shows the server's identity, connectivity configuration, AI Gateway integration details, lifecycle stage, and risk and compliance posture. Use the record to monitor server health, manage authorization, and apply governance controls.

MCP server Overview

When you select an MCP server from the inventory list, the MCP server record opens.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Key details panel

The Key details panel on the Overview tab displays the primary identity and connectivity information for the MCP server. The following fields are available:

Field	Description
Asset tag	The unique ID assigned to this asset. Each asset tag consists of a type prefix followed by a 20-digit number.
Name	The display name of the MCP server as registered in AI Control Tower.
Description	A free-text description of the MCP server's purpose, capabilities, usage context.
Lifecycle phase	The current lifecycle stage of the MCP server. Reflects the phase selected during registration or updated through the Lifecycle tab.
Asset type	The classification of this record. Always MCP server for records of this type.
MCP server URL	The endpoint URL of the external MCP server. AI agents and the AI Gateway use this URL to connect to the server and call its tools. For example, https://mcp.linear.app/mcp.
External documentation URL	A link to the vendor-provided or internally authored documentation for this MCP server.
Provider	The organization or vendor that publishes or maintains this MCP server.
Business application	The ServiceNow business application that this MCP server is associated with. This field establishes ownership and CMDB relationships.

AI Gateway MCP server details panel

The AI Gateway MCP server details panel displays the ServiceNow-side connectivity configuration that the AI Gateway uses to proxy requests to and from the external MCP server.

Field	Description

AI Gateway MCP server URL	The internal ServiceNow URL through which the AI Gateway exposes this MCP server to the AI agents. AI agents send requests to this URL rather than directly to the external MCP Server URL.
	
	Note: The AI Gateway proxy URL format has changed. The new format is:
	
	`https://<instance-url>/sncapps/aigw/mcp/<mcp-server>`
	
	Previously, the URL format was:
	
	`https://<instance-url>/sncapps/awh/<mcp-server>/mcp`
	
	However, those who were using AI Gateway before the temporary unavailability in August will be redirected automatically to the latest URL

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Authorization endpoint URL	The OAuth 2.0 authorization endpoint used to initiate the authorization cod flow for this MCP server. For example, https://<instance>.service-now.com/ mcp_auth.do
Token endpoint URL	The OAuth 2.0 token endpoint used to exchange authorization codes for ac tokens. For example, https://<instance>.service-now.com/mcp_token.do

MCP server Details

The Details tab of an MCP server record displays the server's governance metadata, ownership information, and the complete list of tools that the server exposes. Use this tab to review and update server details, manage attachments, and audit the tools available to AI agents through this server.

The tab is divided into two main panels displayed side by side:

- Details panel
- Available MCP tools panel

Details panel

The Details panel displays the governance attributes and system-generated timestamps for the MCP server. These fields reflect the server's current state in the AI Control Tower governance framework.

Field	Description
Name	The display name of the MCP server as registered in AI Control Tower.
Managed status	Indicates whether the MCP server is under active AI governance. Possib Managed and Unmanaged. A managed server is subject to approval wor enforcement, and audit logging.
Asset type	The classification of this record. Always MCP server for records of this ty
Managed by	The ServiceNow user responsible for governing this MCP server. This is AI steward or asset owner.
State	The current lifecycle stage of the MCP server. For example: Deployed. Re phase set during registration or updated through the Lifecycle tab.
Status	The approval status of the MCP server in the governance workflow.
Risk classification	The assessed risk level of the MCP server. For example: To be determine remains as To be determined until a formal risk assessment is completed Risk & compliance tab.
Created	The date and time the MCP server record was created in AI Control Towe system-generated and read-only.
Updated	The date and time the MCP server record was last modified. This field is generated and read-only.

Available MCP tools panel

The Available MCP tools panel, displayed to the right of the Details panel, lists tools that the MCP server exposes to AI agents. Each tool represents a discrete capability that an AI agent can invoke through the AI Gateway.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The panel shows the following columns:

Column	Description
Name	The programmatic name of the tool as defined by the MCP server. Tool names use underscore-separated lowercase format, for example, get_diff, create_issue_label.
Description	A natural-language description of the tool's function and usage context. Descriptions are provided by the MCP server and reflect the vendor's documentation.
Status	Indicates whether the tool is currently active and available for AI agents to call. Values are Active (green) and Inactive (red).

Tool Status

Each tool in the Available MCP tools panel has a status that indicates its operational availability:

Status	Description
Active	The tool is operational and available for AI agents to invoke through the AI Gateway. Active tools appear with a green status badge.
Inactive	The tool is not available for use. AI agents can't invoke inactive tools. Inactive tools appear with a red badge. Contact your AI steward or MCP server administrator to investigate why the tool is inactive.

MCP server setup

Explore the complete MCP server setup process in configuring and introducing MCP servers via AI Gateway.

Role required: sn_ai_governance.ai_steward

The MCP server setup process consists of several key workflows:

1. MCP server intake: The MCP server can be added in three different ways:
   - Automatic discovery: Add an MCP server from AI Agent Studio.
   - MCP Catalog: Add an MCP server from MCP Catalog.
   - Manual registration: Add an MCP server manually from AI Control Tower.
2. AI Steward playbook approval: The AI Steward moves the MCP server through the onboarding lifecycle.
3. Client registration and AI Gateway setup: After the MCP server is approved, register the clients that connect to it through AI Gateway.

Add an MCP server from AI Agent Studio

When you add an MCP server in AI Agent Studio, it's automatically discovered and synced to AI Control Tower.

Before you begin

Role required: sn_aia.admin, sn_mcp_client.admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The AI Steward (sn_ai_governance.ai_steward) role gets inherited with the following roles:

- (AI admin) sn_aia.admin
- (AIG admin) aig_admin
- (MCP Client admin) sn_mcp_client.admin

Procedure

1. Navigate to **Workspaces** > **AI Agent Studio** > **Settings** > **Manage MCP servers**.
2. Select **New**.

   Note: In the Create and manage tab of the AI Agent studio, you can add only those MCP servers that have been approved in the AI Control Tower.

3. Enter the Name.
4. Select the Authentication type: OAuth 2.1.

   Note: AI Gateway supports OAuth 2.1.

5. Select **Next**.
6. Select the **Client registration type**: Dynamic client registration.

   AI Gateway registration in AI Agent Studio supports Dynamic Client Registration.

   When the server allows dynamic client registration, it will automatically retrieve the necessary details. Otherwise, you have to enter the details manually.

7. Select the **Grant type**.
8. Select **Add**.

   The server gets added and displays the details of the server.

9. Select **Authenticate** to authenticate the server with your credentials.
10. Select **Save**.

    Note: A scheduled job named **AI Agent Studio to AICT-MCP server sync** runs every 15 minutes to synchronize the MCP servers from AI Agent Studio to AI Control Tower.

Result

After synchronizing, the MCP server shows up in the AI asset inventory with its Status listed as In review, and the lifecycle phase listed as New.

Note: After the MCP server is added to the AI Control Tower, it can't be added again. Additionally, AI Agent Studio will not discover a server that has already been added.

What to do next

MCP server approval workflow.

Add an MCP server from MCP Catalog

Add an MCP server from the MCP Catalog via AI Gateway.

Before you begin

Role required: AI steward [sn_ai_governance.ai_steward]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The AI steward (sn_ai_governance.ai_steward) role gets inherited with the following roles:

- (AI admin) sn_aia.admin
- (AIG admin) aig_admin
- (MCP Client admin) sn_mcp_client.admin

Procedure

1. Navigate to **AI assets** > **AI asset inventory** > **MCP Servers**.
2. Select **Add**.
   Add MCP server page appears.
3. Under Details, select **Choose from MCP Catalog**.

   Note:

   If you're unable to see any servers in the MCP Catalog during manual intake of MCP servers, perform the following procedure:

   a. Navigate to **System Definition** > **Scheduled Jobs**.

   b. Open Sync MCP Server Registry.

   c. Select **Execute Now** to run the job manually.
   The MCP Catalog drop-down populates with the available MCP servers.

   Note:

   Run this job manually only if the MCP server catalog shows no records or fewer records than expected. By default, the job runs automatically on a schedule.

4. Search for a server using the search box, or browse available MCP servers displayed as cards with icons, descriptions, and versions.
5. Select a server to view details including:
   - MCP server URL
   - Transport type (HTTPS or SSE)
   - Available tools and capabilities

   Note: SSE servers are visible in the MCP catalog, but AI Gateway does not support the SSE transport type. If you manually enter an SSE server in the intake form, the following warning message appears: " SSE transport type was deprecated in the MCP specification in favor of Streamable HTTP and isn't supported by ServiceNow AI Gateway. Use the server's Streamable HTTP endpoint if available."

6. Click **Select** to import the server.

   Note: The system auto-fills Name, MCP server URL, Authentication type, and Transport type.

   If the selected server supports CIMD (Client Identity Metadata Document), client registration details are also pre-filled automatically.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Select **OK** to confirm your server and endpoint selections.
8. Select **Submit**.

   The MCP server is submitted for an AI Steward review.

   Note: You can only add one MCP server at a time. The MCP catalog only displays MCP servers that have not already been added to your instance.

Result
The MCP server is added to AI Control Tower as an unmanaged asset with a lifecycle status of **In review**.

What to do next
An AI Steward must review and approve the MCP server before it becomes available for use.

Add an MCP server from AI Control Tower

Add an MCP server manually from AI Control Tower.

Before you begin
Role required: sn_ai_governance.ai_steward

Note: The AI Steward (sn_ai_governance.ai_steward) role gets inherited with the following roles:

- (AI admin) sn_aia.admin
- (AIG admin) aig_admin
- (MCP Client admin) sn_mcp_client.admin

Procedure

1. Navigate to **AI assets** > **AI asset inventory** > **MCP servers**.
2. Select **Add**.
3. Enter the Name (Server name).
4. Enter the MCP server URL.
5. Enter the Description (Optional).
6. Enter the External MCP server documentation URL (Optional).
7. Select the Provider from the list.
8. Select the Vendor from the list.
9. Select **Next**.
10. Select the **Client registration type**.

    Note: If you select Dynamic client registration, AI Control Tower automatically receives the Client ID and Client secret. If you select Manual registration, you must create the client externally on the MCP provider side and enter the Client ID and Client secret manually.

11. If you select Manual registration, review and complete the following details:
    - Grant type
    - Token authentication method
    - Client ID

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Client secret
- Auth scopes
- Authorization URL
- Token URL
- Token revocation URL

12. Select **Submit**.

Result
The MCP server is registered in the AI asset inventory as an unmanaged asset with a status of In review.

What to do next
MCP server approval workflow.

MCP server approval playbook workflow

After you register and manage an MCP server, the AI steward moves it through the onboarding lifecycle before agents can use it.

Role required: sn_ai_governance.ai_steward

This process has two outcomes that unlock different capabilities:

- Managed: activates AI Gateway functionality.
- Approved: makes the MCP server available for use in AI Agent Studio. Achieved by completing all phases of the Onboard playbook.

Onboard MCP server approval playbook

The Onboard playbook tracks the MCP server through assessment, testing, and deployment.

Before you begin
Role required: sn_ai_governance.ai_steward

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home** > **Inventory** and select an MCP server.
2. Access phase:
   a. Navigate to the **Lifecycle** tab and select **Access**.
   b. Select **Create new task**.
   c. Complete all tasks for this phase.
   d. Select **Mark complete**.
3. Build and test phase:
   a. Select **Build and test**.
   b. Create and complete tasks for this phase.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Select **Mark complete**.

> **Note:** When the MCP server approval enforcement is active on your instance, agents will not be able to connect to the server until the Deploy phase is complete and the server reaches Approved status.

4. Deploy phase:
   a. Select **Deploy**.
   b. Create and complete the remaining tasks.
   c. Reload the page.

Result

The Onboard playbook status updates to Complete. The MCP server status updates to Deployed and Approved and managed status updates to Managed. The MCP server is now available for use in AI Agent Studio and fully configured for client registration.

Client registration and AI Gateway setup

Once an MCP server has been managed and approved, register the clients that will connect to it via AI Gateway.

Client registration establishes a secure OAuth 2.1 connection between your AI agent platform and the MCP server through AI Gateway. The registration process generates credentials client ID and client secret to authenticate your agents when they make requests to the MCP server.

Selecting a registration type

When you add a client to an MCP server, you can choose between two registration types:

- **CIMD client:** Automated registration with a Client Identity Meta-data Document. The client's metadata URL is checked, and OAuth credentials are created automatically. Currently supported for VS Code only.
- **MCP client:** Manual registration. You enter a client name and a redirect URL. Use this for AI Agent Studio, Postman, Claude Desktop, Copilot Studio, and all other platforms.

Add a CIMD client

Add a CIMD client that connects to MCP servers through AI Gateway.

Before you begin

Role required: sn_ai_governance.ai_steward

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home** > **Inventory** and select an MCP server.
2. Select the **AI Gateway** tab.
3. Select the **Setup** sub-tab.
4. In the MCP client integration section, select **Add client**.

> **Note:** The Add client form presents two registration types: CIMD client and MCP client. Select the appropriate client.

5. Select CIMD client.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Enter the **Client ID**.
7. Select **Validate**.
8. Select the **Metadata sync mode**.
9. Select **+Add URL** to add Redirect URL.
10. Enter the **Logo URL**.
11. Configure the Security controls (Optional).
12. Select **Save**.

Result
The CIMD client is added and registered.

Add an MCP client

Add an MCP client that connects to MCP servers through AI Gateway.

Before you begin
Role required: sn_ai_governance.ai_steward

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home** > **Inventory** and select an MCP server.
2. Select the **AI Gateway** tab.
3. Select the **Setup** sub-tab.
4. In the MCP client integration section, select **Add client**.

   Note: The Add client form presents two registration types: CIMD client and MCP client. Select the appropriate client.

5. Select MCP client.
6. Enter the **Client name**.
7. Enter the **Redirect URL**.
8. Select **Save**.

Result
The MCP client is added and registered.

Edit a registered client

Update the configuration of a registered client (MCP or CIMD) in an MCP server record.

Before you begin
Role required: sn_ai_governance.ai_steward

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home** > **Inventory** and select an MCP server.
2. Select the **AI Gateway** tab.
3. Select the **Setup** sub-tab.
4. In the MCP client integration section, select the registered client that you want to edit.
   The Edit client screen appears.
5. Update the client configuration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The fields available for editing depend on the client type.

For a CIMD client, you can update:

- Client ID
- Redirect URL
- Metadata sync mode
- Security controls

For an MCP client, you can update:

- Client name
- Redirect URL

6. Select **Save**.

Result
The client record displays the updated configuration.

Configure agents to use MCP servers

After client registration is complete, configure your AI agents to connect to MCP servers through AI Gateway.

This configuration confirms all agent traffic is governed, secured, and observable. The configuration approach depends on how the MCP server was registered:

- Register via AI Agent Studio: Update the existing agent to route through AI Gateway.
- Register via AI Control Tower: Register the server in AI Agent Studio and then add it as a tool.
- External agent platforms: For agents created on external platforms such as Microsoft Copilot Studio, Google Gemini, Amazon Bedrock, and others, set AI Gateway as the MCP Server endpoint.

Register via AI Agent Studio

Registering MCP servers via AI Agent Studio.

Before you begin
Role required: sn_aia.admin

Procedure

1. Navigate to **All** > **Workspace** > **AI Agent Studio**.
2. Open the agent that uses the MCP server.
3. Select **Edit**.
4. Select **Tools**.
5. Select the MCP server tool you want to update.
6. Update the connection configuration:
   a. Enter the Server URL.
   b. Enter the Client ID.
   c. Enter the Client secret.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Enter the Authentication endpoint URL

e. Enter the Token endpoint URL.

7. Select **Save**.

Result

The agent now connects to the MCP server through AI Gateway instead of directly. All requests are routed through AI Gateway, ensuring consistent policy enforcement across your AI ecosystem.

Register an MCP server via AI Control Tower

When MCP Servers are registered through AI Control Tower, connecting them to an agent happens in two steps: first register the server at the instance level in AI Agent Studio, then add it as a tool within the specific agent.

Before you begin

Role required: sn_aia.admin

Procedure

1. Navigate to **All** > **Workspaces** > **AI Agent Studio**.
2. Select **Settings**.
3. Select **Manage MCP servers**.
4. **New**.
5. Enter the details:
   - Name
   - MCP server URL
   - Authentication type
6. Select **Next**.
7. Create connection:

   a. Select **Manual registration**.

   b. Enter the following details:
      - Grant type
      - Token authentication method
      - Client ID (required)
      - Client secret
      - Auth scopes
      - Authorization URL (required)
      - Token URL (required)
      - Token Revocation URL

8. Select **Submit**.

> **Note:** AI Control Tower doesn't sync credentials with AI Agent Studio automatically. You must copy credentials manually.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The MCP Server is registered at the instance level in AI Agent Studio and is available for agents to use as a tool source.

9. Add MCP sever as a tool in your agent:

   Note: Once the MCP server is registered in AI Agent Studio (Phase 1), add it to a specific agent as a tool.

   a. Navigate to **AI Agent Studio**.

   b. Open an existing agent or create a new agent.

   c. Select **Edit**.

   d. Select **Tools**.

   e. Select **+ Add a tool**.

   f. Select **+ New tool**.

   g. Select **Model Context Protocol**.

   h. Select the MCP server from the list.

      Note: In AWH for AI Control Tower (2.0.0), unapproved MCP Servers appear in the list but tools can't be fetched until the server is approved in AI Control Tower.

10. Select the specific tools from the MCP server that the agent should use.
11. Select **Save**.

    Note: Only approved MCP Servers can be added as tools in AI Agent Studio. If a server is not yet approved, a warning displays: Approval is needed to display tools. Check the MCP server record and contact your AI Steward

Result
The MCP server is registered via AI Control Tower on a instance level and added it as a tool within the specific agent.

Managing your AI Gateway

Manage your AI Gateway tab on the MCP server record.

The AI Gateway tab displays the configuration for exposing the MCP server to AI agents. Use the tab to review connectivity endpoints, manage MCP client integrations, configure available tools, and apply gateway policies to the server.

AI Gateway in MCP server record

The AI Gateway acts as a managed proxy between AI agents and external MCP servers. When an AI agent needs to use tools from an MCP server, it connects through the AI Gateway rather than directly to the external server. This approach centralizes authentication, helps enforce policies, and provides observability for tool calls.

The AI Gateway tab provides a complete view of how a specific MCP server is integrated with the AI Gateway. It is divided into three sub-tabs:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sub-tab	Description
Setup	Displays the AI Gateway MCP server connection details and the MCP clients integrated with this server. This is the default sub-tab.
Tools	Lists the tools exposed by this MCP server through the AI Gateway and allows tool-level configuration.
Policies	Lists the gateway policies applied to this MCP server, such as rate limiting, access control, and usage policies.

Setup

The Setup sub-tab is the default view of the AI Gateway tab. It displays the endpoints that clients and agents use to connect to this MCP server through the AI Gateway. It also lists the MCP clients registered to use this server.

AI Gateway MCP server details panel

The AI Gateway MCP server details panel displays the ServiceNow-generated endpoints that clients and agents use to connect to this MCP server through the AI Gateway.

MCP client integration panel

The MCP client integration panel lists all MCP clients registered to use this MCP server through the AI Gateway. The count badge next to the panel heading shows the total number of registered clients.

An MCP client is a consumer of the MCP server's tools — typically an AI agent host application, a developer tool, or an integrated platform. MCP clients connect to the AI Gateway MCP server URL to invoke tools.

To register a client, select **Add client**. After registration, clients can be edited on the Edit Client page.

Tools

The Tools sub-tab lists the tools exposed by the MCP server through the AI Gateway and allows tool-level configuration.

Before MCP server tools are activated, the system scans them to determine whether they pose a potential security threat. Threat categories are based on the OWASP MCP Top 10, the ten most critical MCP-related security vulnerabilities as defined by OWASP. For more information, see OWASP MCP Top 10.

System properties control whether Now Assist Guardian tool scanning and more advanced scanning are enabled. For more information, see System properties for AI Control Tower.

Threat category	Description
credential_harvesting	Potential collection or exposure of sensitive credentials.
excessive_permissions	Optional parameters potentially granting dangerous capabilities beyond their stated purpose.
execution	Potential shell commands, code evaluation, or subprocess spawning.
exfiltration	Potential unauthorized data export to external destinations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Threat category	Description
hidden_instructions	Potentially concealed directives using steganography or authority-framing manipulation.
name_description_mismatch	Tool name potentially implies a different function than the description or schema reveals.
network	Potential unauthorized network access (SSRF, DNS rebinding, or arbitrary URLs).
none	No potential threats detected.
obfuscation	Encoded content (base64, hex, URL-encoded) potentially concealing true behavior.
prompt_injection_payload	Potential direct prompt injection. For example, a phrase such as "ignore all previous instructions".
tool_poisoning	Description contains instructions that could potentially manipulate agent behavior.
write	Potential unauthorized file system modifications.

Scan status indicates the current state of the MCP tool scan. Possible values are:

- Completed
- Failed
- Pending
- Timeout

Policies

The Policies sub-tab lists the data governance policies applied to the server. From the Policies sub-tab, you can manage policy enforcement at the server level and the individual tool level.

Data sensitivity check

The Data sensitivity check area controls whether the AI Gateway inspects tool inputs and outputs for sensitive data. When enabled, this setting prevents sensitive data from passing between AI agents and the MCP server.

Policy status table

The policy card displays the current server-level state of the Data sensitivity check policy and provides a control to change it.

Policy status	Description
Activated	The Data sensitivity check is enabled at the server level. The Deactivate button is available. Enforcement still depends on individual tool-level Policy status settings.
Deactivated	The Data sensitivity check is disabled at the server level. No sensitive data inspection occurs for any tool on this server, regardless of tool-level Policy status. Select Activate to turn it on.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Governing AI assets

Govern AI assets across the life cycle with integrated risk, compliance, security, and privacy oversight in AI Control Tower.

Governance overview

Deploying AI at enterprise scale introduces regulatory, operational, security, privacy, and reputational risks. Regulations and frameworks in this space require organizations to demonstrate that AI systems are assessed, monitored, and controlled. Governance also addresses operational and security risks such as biased outputs, unauthorized data access, privileged agents operating without oversight, and inactive systems that retain active permissions.

The Govern area in AI Control Tower brings together Risk and Compliance and Security and Privacy to support end-to-end AI governance. These areas work alongside life-cycle management and approval workflows to support end-to-end AI governance. Different teams manage each governance area by using their respective tools, while AI Control Tower provides a unified view of governance information for AI assets.

Risk and Compliance provides visibility into regulatory classification, compliance posture, risk, assessments, and related governance records. Security and Privacy provides visibility into access concerns, privileged and dormant AI agents, AI asset security posture, and sensitive data protection.

For more information about how AI Control Tower and AI Risk and Compliance work together across the AI life cycle, see AI governance life cycle.

Managing AI risk and compliance

Depending on your role, you can engage with AI Control Tower and AI Risk and Compliance in different ways. AI asset owners typically use individual AI asset records to review risk posture, compliance posture, and related governance records. AI stewards and risk and compliance teams use portfolio-level views, assessments, and cases to monitor governance posture, identify gaps, and initiate remediation.

The Risk and Compliance area in AI Control Tower provides visibility into how AI assets align with organizational policies and regulatory requirements. Summarized views of regulatory risk classification, compliance posture, compliance score, and aggregated risk score help governance teams evaluate AI risk without manually consolidating information from multiple systems.

Regulatory risk classification applies to AI systems, AI models, and datasets. Assessments determine whether an asset has a high, medium, low, or unacceptable regulatory risk classification by evaluating its potential impact across multiple dimensions. Compliance is tracked against authority documents and organizational policies. AI Risk and Compliance includes built-in support for priority regulatory frameworks and supports organization-specific requirements.

The Risk posture section in AI Control Tower groups AI assets by aggregated risk score and displays a risk heat map. The heat map plots AI assets by inherent or residual risk level against control effectiveness. You can switch between inherent and residual risk views.

The Risk and Compliance page in the Govern area provides the following information:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Compliance score: Percentage of controls in a compliant state across mapped frameworks.
- Regulatory risk classification: Distribution of AI assets by regulatory risk level.
- Compliance posture for priority frameworks: Compliant and noncompliant control counts for the two highest-priority frameworks.
- Top recommendations: High-priority governance work, such as overdue life-cycle tasks and AI asset issues that require review.

For supported AI assets in the AI asset inventory, the **Risk & Compliance** tab provides governance information scoped to the selected asset. This information includes regulatory risk classification, compliance score, aggregated risk score, compliance posture for priority frameworks, and a risk heat map. The Governance section on the same tab provides access to assessments, risks, controls, attestations, issues, and policy exceptions associated with the asset.

AI cases and inquiries provide structured workflows for investigating and resolving governance concerns. Teams can use cases to track violations, risks, or compliance gaps through investigation and remediation. Inquiries support compliance-related requests for clarification.

For more information about risk assessment workflows, compliance framework configuration, and governance case management, see AI Risk and Compliance.

Note: To use AI Risk and Compliance with AI Control Tower, install the required applications from the ServiceNow Store and activate the required plugins. AI Risk and Compliance can be installed as a standalone application from the ServiceNow Store, but life-cycle-driven governance requires integration with AI Control Tower. AI Control Tower is used to register AI systems, models, and datasets and to manage life-cycle progression that triggers risk and compliance assessments, governance tasks, and case workflows.

Some AI risk and governance capabilities depend on additional plugins. Governance of ServiceNow AI assets with Now Assist requires the AI Risk and Asset Management for Now Assist plugin, which depends on integration between AI Risk and Compliance and AI Control Tower, and AI Asset Management. In new IRM deployments, the IRM Standard plugin is required to make AI intake request forms available for submitting AI systems, models, and datasets for governance and risk evaluation.

Securing AI assets and managing privacy

The security area covers user access, data protection, and autonomous systems and agents that hold permissions, execute workflows, and interact with external tools without direct human involvement.

AI Control Tower provides visibility into the following dimensions of AI security:

- Access issues: Identifies AI agents that experience access-related errors that can prevent workflows from completing.
- Privileged AI agents: Identifies agents with elevated permissions, such as admin or security admin, to support least-privilege reviews.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Dormant AI systems: Identifies agents that have been inactive for more than 90 days and retain permissions, and generates review tasks for asset owners.

- Access map: Visualizes relationships between ServiceNow agents, agentic workflows, and the tools that they use to support access analysis and impact assessment.

- AI asset security score: Provides a composite view of AI asset security posture based on access issues, privileged agents, guardrails, and dormant systems, with details for individual assets.

For privacy oversight, AI Control Tower integrates with the Data Privacy plugin to display sensitive data detection and anonymization activity. The Security and Privacy area shows the enabled data patterns used to detect and anonymize sensitive information in AI prompts.

For organizations using Now Assist, ServiceNow AI Insights summarizes observations across the AI security posture, including areas that require attention and remediation actions. This capability requires the Now Assist AICT Security Posture Summarizer skill.

Managing risk and compliance in AI Control Tower

Gain visibility into AI-related risks, compliance posture, and governance outcomes for your AI portfolio in AI Control Tower.

Reference		
Look up Risk and Compliance terminology and the governance records that support your AI portfolio.		

Important:

- Not all model providers are available for customers with in-country SKUs, and some AI products/features are currently unavailable for in-country customers. For more information, see the KB1584492 article in the Now Support Knowledge Base. Be sure to check for model provider availability updates in future releases.
- Some AI products/features are currently unavailable for customers in the FedRAMP, NSC DOD IL5, or Australia IRAP-Protected data centers, self-hosted customers, or in other restricted environments. For more information, see the KB0743854 article in the Now Support Knowledge Base. Be sure to check for availability updates in future releases.
- Some AI products/features are currently available only for customers in some regions. Be sure to check for availability updates in future releases.
- Some AI products and skills are not available in Regulated Markets. For more information, see KB2593939: Regulated Markets AI Products/Skills Not Available. Be sure to check for availability updates in future releases.

Data processing

This application requires data to be transferred from ServiceNow customers' individual instances to a centralized ServiceNow environment, which may be located in a different data center region from the one where your instance is, and potentially to a third-party cloud provider, such as Microsoft Azure. This data is handled per ServiceNow's internal policies and procedures, including our policies available through our CORE Compliance Portal.

Data collection

ServiceNow collects and uses the inputs, outputs, and edits to outputs of this application to develop and improve ServiceNow technologies including ServiceNow models and AI products. Customers can opt out of future data collection at any time, as described in the AI Opt-Out page.

Exploring Risk and Compliance

Risk and Compliance in AI Control Tower provides a summary of regulatory classification, compliance, and risk across your AI portfolio and individual AI assets.

Risk and Compliance overview

Risk and Compliance in AI Control Tower provides governance visibility for AI systems at the portfolio level and the individual AI system level.

The Risk and Compliance page shows summarized signals across AI assets, including recommendations, regulatory risk classification, compliance posture, compliance score, aggregated risk scores, and risk heat maps. The summaries help stakeholders identify trends, prioritize attention, and focus on higher-risk areas of the AI portfolio.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When you access a record from your AI asset inventory, the **Risk & Compliance** tab provides detailed governance information for that AI asset. Details include its regulatory risk classification, compliance score, aggregated risk score, compliance posture for priority frameworks, risk heat map, and related governance records.

AI Control Tower displays these outcomes for oversight. Risk assessments, control execution, remediation, and other governance activities are managed through related governance solutions and supporting workflows.

Risk and Compliance users

Risk and Compliance user types

User	Description
AI governance stakeholder	Uses portfolio-level summaries to assess overall governance posture, identify priority recommendations, and monitor how AI assets are classified and governed across the organization.
AI steward or asset stakeholder	Uses the asset-level Risk and Compliance view to review the governance posture of an individual AI system, including its assessment status, compliance score, aggregated risk score, and related governance records.
Governance reviewer	Uses framework-specific and risk-specific views to identify which areas require follow-up, such as unresolved issues, incomplete assessments, ineffective controls, or missing governance data.

Risk and Compliance benefits

Benefits by feature

Feature	Benefit	Users
Top recommendations	Identify high-priority governance work that requires immediate attention.	AI governance stakeholder, governance reviewer
Regulatory risk classification	Review how AI assets are grouped by regulatory risk level and identify assets that require closer review.	AI governance stakeholder, governance reviewer
Compliance score and compliance posture for priority frameworks	Review compliance posture for the configured frameworks and see where issues affect governance coverage.	AI governance stakeholder, AI steward or asset stakeholder
Aggregated risk score and risk heat map	Learn how inherent risk and control effectiveness influence residual risk for an AI system.	AI steward or asset stakeholder, governance reviewer
Assessments, risks, controls, issues, and policy exceptions	Review governance records associated with a specific AI system without leaving the AI system context.	AI steward or asset stakeholder

Configuring Risk and Compliance in AI Control Tower

Risk and Compliance information appears in AI Control Tower only when the required governance applications, frameworks, and data are available in your environment.

Configuration overview

Risk and Compliance information in AI Control Tower reflects the current state of governance activity for your AI portfolio and for individual AI assets. The information shown is based on available governance data rather than on configuration performed directly in these views.

- The relevant governance applications, frameworks, and governance processes are available in your environment.
- AI systems have governance data that can be surfaced, such as assessment status, control-related outcomes, compliance posture, risks, issues, or policy exceptions.
- Portfolio-level views such as regulatory risk classification, compliance posture, and risk heat maps depend on governance results that have already been produced.
- Asset-level views may display states such as **To be determined**, **No data available**, or a zero compliance score when required governance activities haven't yet produced visible results.

How configuration affects what users see

The Risk and Compliance views in AI Control Tower don't define governance logic. Instead, they surface the outcomes of configured governance activities, such as regulatory classification,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

framework-specific compliance information, aggregated risk ratings, and related governance records.

For example, compliance posture for priority frameworks appears only when relevant framework and control information is available. Similarly, regulatory classification and risk heat maps depend on the presence of underlying governance results for the selected assets.

If the necessary governance information isn't yet available, incomplete states may indicate the AI system or portfolio requires additional governance activity before a full posture can be displayed.

Risk and Compliance information depends on AI Risk and Compliance being installed and, for life-cycle-driven governance, integrated with AI Control Tower. Some capabilities also depend on additional plugins, such as the AI Risk and Asset Management for Now Assist plugin and, in new IRM deployments, the IRM Standard plugin for AI intake request forms. For the full list of dependencies, see Governing AI assets.

For the specific properties, applications, and publishing steps required for regulatory risk classification, aggregated risk score, and compliance score, see Configure classification, risk score, and compliance score. For more information about configuring AI Risk and Compliance, see Configuring AI Risk and Compliance.

Configure classification, risk score, and compliance score

Configure the applications, properties, and data that the classification, risk score, and compliance score depend on for an AI asset.

Before you begin

Role required: sn_grc_ai_gov.ai_risk_and_compliance_admin, admin

About this task

You don't configure these three metrics in the Risk and Compliance views. The views only display the results of the configuration described in this topic.

Procedure

- To configure regulatory risk classification, do the following:

  1. Navigate to **All** > **AI Risk and Compliance** > **Risk Assessments** > **Risk assessment methodologies**, then publish the risk assessment methodology (RAM) that you need to use for automated classification, or publish a custom RAM.
     RAMs ship in the Draft state and can't classify assets until published.

  2. Navigate to **All** > **AI Risk and Compliance** > **General Administration** > **Properties**.

  3. Set the *sn_grc_ai_gov.ai_system_automated_risk_classification_asmt_ram* property to the published RAM.
     For more information, see Set up AI Risk and Compliance properties.

  4. Confirm the Use and purpose record is linked to the governance details record of each AI asset.
     This link is created automatically during intake. If a condition isn't met, the classification remains To be determined. For the full set of conditions, see Classifying AI assets by regulatory risk.

- To configure the aggregated risk score (inherent, control effectiveness), do the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Install the Advanced Risk application.
   Skip this step if you're using AI Control Tower — it includes this application.

2. Navigate to **All** > **Advanced Risk assessment** > **Administration** > **Properties**.

3. Set the **Migrate to Advanced Risk Assessments** property to **Yes**.
   This is a one-way configuration change. Until this property is set to **Yes**, risk score rollup isn't supported and no aggregated risk score appears. For what changes after you enable it, see Set up Advanced Risk assessments properties.

4. Navigate to **All** > **AI Risk and Compliance** > **Risk Assessments** > **Risk assessment methodologies**, then publish the **Risk assessment for AI inventory** RAM, or a custom risk-based RAM that assesses risks and belongs to the AI risk and compliance domain.

5. Set a primary RAM directly on each AI system record, or navigate to **All** > **AI Risk and Compliance** > **General Administration** > **Properties** and set a portfolio-wide default in the *sn_grc_ai_gov.aisystem_primary_ram* property.
   An AI system without a primary RAM doesn't show rollup scores. For the full requirements and default-selection order, see AI risk score calculation reference.

- To configure the compliance score, do the following:

1. Open the AI system record and map every relevant entity in the Related Entities related list.
   An entity that isn't mapped doesn't affect the score, so a missing entity can make the score look better or worse than the real compliance posture.

2. **Optional:** Navigate to **All** > **AI Risk and Compliance** > **General Administration** > **Properties**.

3. **Optional:** Set the *sn_grc_ai_gov.highlighted_authority_document* and *sn_grc_ai_gov.highlighted_policy* properties to choose up to two authority documents and two policies to show as priority frameworks on the Compliance score card.
   For more information, see Set up AI Risk and Compliance properties.

Result

Regulatory risk classification, aggregated risk score, and compliance score are available on the AI asset record and in the Risk and Compliance views in AI Control Tower and the AI Risk and Compliance Workspace. To view them, see View classification, risk, and compliance scores.

Trouble?

If the Risk and Compliance dashboards on the AI asset record page or the landing page show a `No data found` error, see Risk score and compliance score dashboard errors.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Customize classification and scoring formulas

Change the factors, weights, rating bands, and rollup formula that determine how classification, risk, and compliance scores are calculated.

Before you begin

The current factors, weights, and rating bands must be reviewed before a formula is changed. For the current values, see Regulatory risk classification reference and AI risk score calculation reference.

Role required: sn_grc_ai_gov.ai_risk_and_compliance_admin

About this task

Changing a scoring formula affects every AI asset that uses the risk assessment methodology (RAM) or governance pipeline you edit, both for new assessments and for existing scores after they next recalculate.

> **⚠ Warning:**
>
> Changing factor weights, point values, or rating bands on a predefined RAM changes how every AI asset using that RAM is scored. Consider creating and testing a custom RAM instead of editing a predefined one. Automated Scripted Factors contain script logic, not simple field values, so changing their point thresholds requires editing and testing a script, not just a form field.

Procedure

- To customize the regulatory classification or risk score formula, do the following:

1. Navigate to **All** > **AI Risk and Compliance** > **Risk Assessments** > **Risk assessment methodologies** and open the RAM that you need to change.
   Consider copying the RAM or creating a custom RAM rather than editing a predefined one, so that other AI assets aren't affected while you test your changes.

2. **Optional:** For a risk-based RAM, edit the Rollup configurations section on the RAM form to change the rollup formula for the qualitative and quantitative scores.
   Entity-hierarchy rollups can use Sum, Average, Maximum, or Minimum.

3. **Optional:** To change factor weights or point values, navigate to **All** > **AI Risk and Compliance** > **Risk Assessments**, then select **Group Factors**, **Manual Factors**, **Automated Factors**, or **Automated Scripted Factors**, depending on the factor type the RAM uses.
   For the current factor names, fields, and point values for the predefined RAMs, see Regulatory risk classification reference and AI risk score calculation reference.

4. **Optional:** To change rating band thresholds or labels, navigate to **All** > **AI Risk and Compliance** > **Risk Assessments** > **Risk Criteria**.

- To customize the compliance score formula, do the following:

1. Navigate to **All** > **AI Risk and Compliance** > **Policy & Compliance Administration** > **Properties**.

2. Set **Use weighted control average when calculating compliance scores** (*sn_compliance.cal_score_by_weighted_control*) to **Yes** to weight controls when averaging a citation's compliance score instead of using a flat average.
   For the weighted and flat average calculations, see Compliance score calculation for a citation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

This setting changes citation-level compliance scores only. These scores determine the compliance posture shown for authority documents and policies on the Compliance score card. It doesn't change the AI system's own compliance score, which is calculated separately from linked entities. For that formula, see AI system compliance score calculation reference.

3. Set **Enable association of citations to controls mapping** (*sn_compliance.enable_association_of_citations_to_controls*) to **Yes** to calculate a citation's compliance score from its directly linked controls instead of its associated control objectives.
   For the control-objective-based and directly-linked-controls formulas, see Compliance score calculation for a citation.

4. Set **Entity hierarchy based scoring** (*sn_compliance.entity_hierarchy_based_scoring*) to **Yes** to calculate the compliance score of an entity from its downstream entities and its direct controls.
   When the property is set to **No**, which is the default, the compliance score of an entity comes from its direct controls only. When the property is set to **Yes**, the score of an entity is based on the average compliance score of its downstream entities and the average compliance score of its direct controls.

5. If you changed the **Entity hierarchy based scoring** property, navigate to **All** > **System Definition** > **Scheduled Jobs** and deactivate the *Compliance Score V2* scheduled job.

6. Open the *Update compliance scores for hierarchy entities* scheduled job and select **Execute Now**.
   The job recalculates the compliance scores of all entities with the current value of the property. If the job isn't run after the property changes, the compliance scores of entities can be inconsistent.

7. After the job completes, activate the *Compliance Score V2* scheduled job again.

Result

New assessments use the updated formula. Existing scores update the next time the affected assessments or rollups recalculate.

Trouble?

If the compliance scores of entities are inconsistent after the **Entity hierarchy based scoring** property is changed, the *Update compliance scores for hierarchy entities* scheduled job might not have run. Run the job, and then activate the *Compliance Score V2* scheduled job again.

Reviewing AI governance posture and compliance status

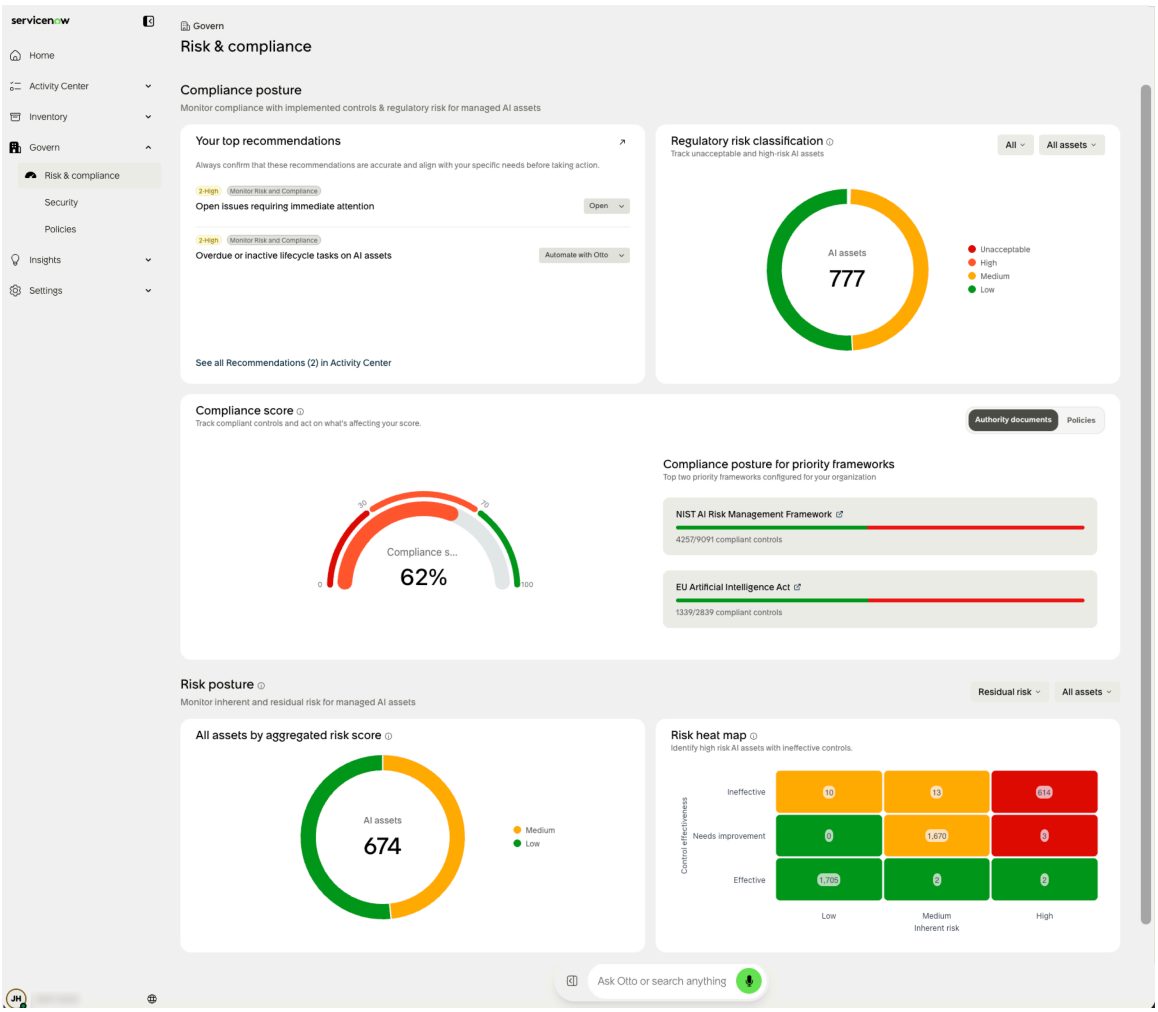
The Risk & Compliance tab under **Govern** displays regulatory classification, risk posture, and compliance information for AI assets.

Overview of Govern

Use the **Risk & Compliance** tab under **Govern** in AI Control Tower to monitor governance activities across your AI portfolio. Review AI asset classifications, identify risk and compliance concerns, track governance work, and investigate issues that require attention.

From here, you can:

- Review and act on top recommendations
- Review regulatory risk classification
- Track compliance score and compliance posture
- Review AI risk posture, including aggregated risk score and the risk heat map
- Monitor cases, issues, and governance actions
- View and manage business application associations with AI systems. For more information, see Associate a business application with an AI system



The page is divided into the following components:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Compliance posture: Monitor compliance of implemented controls and regulatory risk across the AI portfolio.
- Risk posture: Monitor inherent and residual risk across the AI portfolio.

Compliance posture

The widgets under compliance posture display the top action items to execute and track the risk classification and compliance score of AI systems and controls. Each widget reflects the active filter state. View details for each metric area by selecting the arrow for each metric. Select an individual component on the widget to view underlying assets.

Compliance posture widgets

Widget	What it displays	Status breakdown	Roles required
Your top recommendations	Recommended action items along with other assigned and unassigned action items. For more information, see Act on AI asset governance insight recommendations	• 1-Critical • 2-High • 3-Medium • 4-Low	sn_ai_governance.ai_steward
Regulatory risk classification	• Regulatory risk classification of assets in the portfolio. Use the drop-down to filter the assets into **AI System**, **AI Model**, and **Dataset**. • The assets are categorized based on their status. Select each status to drill down further. For more information, see Reviewing regulatory classification and compliance status	• Low • Medium • High • Unacceptable • Critical • To be determined	sn_ai_governance.ai_steward
Compliance score	• Compliance scores for AI assets compared to adopted frameworks and policies. • Compliance status for top regulatory frameworks. The progress indicator shows compliant and non-compliant controls and displays an alert badge for high-priority issues. Toggle between	• Compliant • Non-compliant • To be determined	sn_ai_governance.ai_steward

Compliance posture widgets (continued)

Widget	What it displays	Status breakdown	Roles required
	Authority documents and **Policies** to view detailed information. For more information, see Reviewing regulatory classification and compliance status		

Actionable intelligence insights

The **Your top recommendations** widget is powered by two AI-generated insights, Stalled Lifecycle Tasks and Significant Issues, that evaluate your AI portfolio and surface governance work that needs attention. AI-generated insights may not reflect all relevant context — review recommendations before acting on them. For what each insight identifies, how it's determined, and how to act on its recommendations, see Detecting governance insights.

Risk posture

The widgets under risk posture provide a summary view of the inherent and residual risk across the AI portfolio. Use the drop-down to filter the assets into **AI System**, **AI Model**, and **Dataset**. To view detailed information about the risk and compliance posture, select **Take me there**. This opens the AI Risk and Compliance Workspace.

Risk posture widgets

Widget	What it displays	Status breakdown	Roles required
Aggregated risk score	AI system risk landscape, categorized by aggregated risk score. Use the drop-down to filter between **Inherent** and **Residual** risk. For more information, see Reviewing AI risk posture	• High • Medium • Low	
Risk heat map	Assessed AI risks displayed in a color-coded matrix to help identify concentrations of higher-risk AI assets and compare current and intended risk posture. Use the drop-down to filter between **Inherent** and **Residual** risk. Select **Open heatmap workbench** to open the heat map in the AI Risk and Compliance Workspace. For more information, see Reviewing AI risk posture.	• High • Medium • Low	

View classification, risk, and compliance scores

View the regulatory risk classification, aggregated risk score, and compliance score of an AI asset on its record or in a workspace.

Before you begin
Role required: sn_ai_governance.ai_steward

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

You can view an AI asset's regulatory risk classification, aggregated risk score, and compliance score in three places: on the asset's own record, at the portfolio level in AI Control Tower, or at the portfolio level in the AI Risk and Compliance. The **Govern** area of AI Control Tower and the AI Risk and Compliance Workspace render the same underlying Risk and Compliance information.

Procedure

- View the scores for a single AI asset:

  1. Open the AI asset from the AI asset inventory.
  2. Select the **Risk & Compliance** tab on the asset record.
     The tab shows the asset's regulatory risk classification, aggregated risk score, compliance score, compliance posture for priority frameworks, and risk heat map together. For more information, see Governing AI assets.

- View portfolio-level scores in AI Control Tower:

  1. Navigate to **Workspaces** > **AI Control Tower** > **Govern** > **Risk & Compliance**.
  2. In the Compliance posture section, view the Regulatory risk classification and Compliance score widgets.
     For more information, see Reviewing regulatory classification and compliance status.
  3. In the Risk posture section, view the Aggregated risk score and Risk heat map widgets.
     For more information, see Reviewing AI risk posture.

- View portfolio-level scores in the AI Risk and Compliance Workspace:

  1. Open the AI Risk and Compliance Workspace and select the **Risk and compliance** tab.
  2. In the Compliance overview section, view the Regulatory risk classification donut chart and the compliance scores for authority documents and policies.
  3. In the Risk overview section, view the AI systems by aggregated risk score chart and the Risk heatmap.
     For more information, see Risk & compliance tab.

Result

You can see the AI asset's current regulatory risk classification, aggregated risk score, and compliance score, scoped to either a single asset or your full AI portfolio.

Trouble?

If the Risk and Compliance dashboards on the AI asset record page or the landing page show a `No data found` error, see Risk score and compliance score dashboard errors.

Related topics

- Classifying AI assets by regulatory risk

Reviewing regulatory classification and compliance status

Review regulatory risk classification and compliance posture to understand how AI assets align with configured governance expectations.

Overview of regulatory classification and compliance status

Regulatory risk classification and compliance score views help you understand how AI assets are categorized and how their control posture aligns with configured frameworks.

AI assets refer to the various components and resources that are essential for the development, deployment, and operation of artificial intelligence systems. These assets can include:

1. AI systems: The complete software or hardware infrastructure that runs AI algorithms and processes. This can include machine learning platforms, natural language processing systems, and other AI-driven applications.
2. AI models: The mathematical and computational models that are trained on data to perform specific tasks. These models can range from simple linear regression models to complex deep learning neural networks.
3. AI datasets: The collections of data used to train, validate, and test AI models.

For more information, see AI systems, AI models, and Datasets.

At the portfolio level, you can get a snapshot view of the regulatory risk classification for your AI portfolio. This classification groups AI assets into categories such as unacceptable, high, medium, and low. Compliance views show an overall compliance score and framework-related posture for authority documents or policies.

Regulatory risk classification

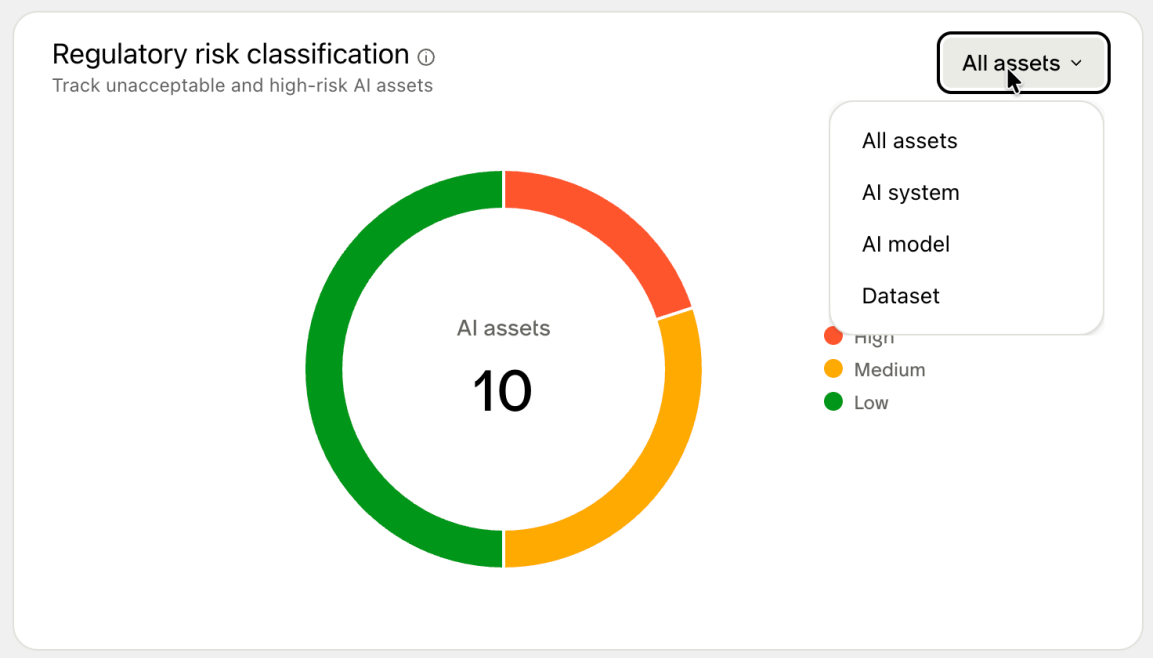
The Regulatory risk classification widget presents a donut chart that organizes AI assets into risk levels based on their regulatory risk assessment results. This section displays the risk classifications of AI systems, AI models, and datasets using donut charts. The risks are qualitatively classified as **Low**, **Medium**, **High**, **Unacceptable**, **Critical**, and **To be determined**. The risk level displayed for each asset is the regulatory risk classification assigned when the asset's regulatory risk classification assessment completes. This dashboard widget enables your governance teams, compliance officers, and AI administrators to assess risk exposure and identify assets requiring intervention.

How this is calculated:

For the full process, including the properties and records involved, see Classifying AI assets by regulatory risk.

- Managed assets: The risk level shown for an asset comes from the `risk_score` field on the asset's governance details record. This field is populated when the asset's regulatory risk classification assessment completes, and the widget reflects that value in real time on every page load.
- Unmanaged assets: The risk level shown for an unmanaged asset comes from the **Use & purpose** field on the asset's governance details record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Compliance score

Framework-specific compliance posture and issue indicators help you understand whether governance coverage is available for the selected frameworks and which areas may require additional attention.

Compliance scores measure how well AI systems conform to applicable regulations, policies, and controls. The section shows compliance based on controls implemented. By default, compliance scores are displayed for the priority frameworks configured in your environment. Each framework's citations, and any child citations, are mapped to control objectives, and each citation's compliance score is calculated based on its control attestations.

You can choose to view compliance data by selecting one of two options: **Authority documents** or **Policies**. Additionally, you can view the overall compliance score percentage, along with the number of compliant and non-compliant authority documents and policies, by using the drop-down filter to select specific authority documents or policies. You can also see all the issues that require immediate attention and AI cases related to each authority document or policy.

Compliance score calculation:

For the calculation rules, an example, and how scores are processed, see Compliance score calculation.

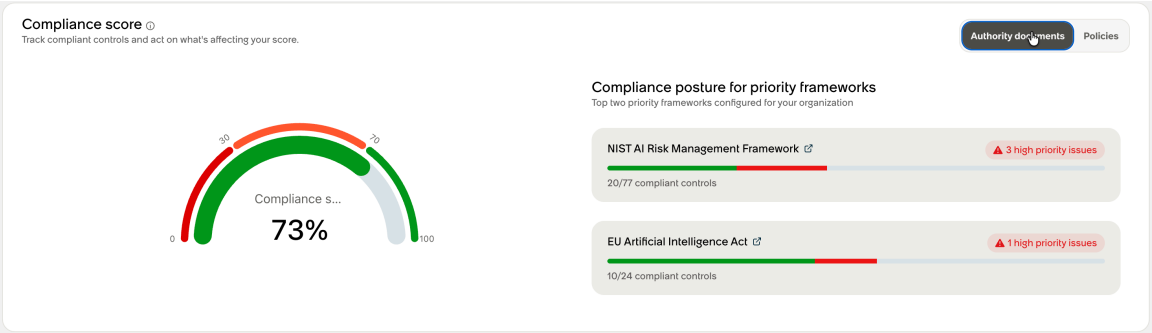
1. Each AI system is linked to one or more entities or profiles through the entity map record (sn_grc_ai_gov_ai_system_entity_map).
2. Each entity has its own compliance score calculated by the Policy & Compliance engine. The score is based on the state of its controls (whether controls pass or fail compliance tests and attestations).
3. The AI system's compliance score is calculated as the average of all active entities' compliance scores, truncated to a whole number.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- Compliance scores depend on linked entities; ensure all relevant entities are properly mapped to AI systems for accurate scoring.
- **Retired** and **Cancelled** AI systems are excluded from compliance score calculations to maintain focus on active systems.
- Compliance scores are averaged across all active linked entities; individual entity scores may vary.

The authority documents are provided solely for informational and guidance purposes to assist with the initial setup of AI Risk and Compliance frameworks. It doesn't constitute legal advice or assurance of regulatory compliance. You're solely responsible for ensuring that all use of the content complies with applicable laws, regulations, directives, and industry standards in their jurisdictions.



How data is determined

Regulatory status data is updated through scheduled and on-demand processes that evaluate your AI assets and calculate their risk and compliance metrics.

Regulatory risk classification data:

- The `risk_score` field on the governance details record is populated when the asset's regulatory risk classification assessment completes
- Status charts and reports are generated in real time based on live values; no scheduled refresh is required
- Widgets and visualizations reflect current data on every page load

Compliance score data:

- Individual AI system compliance scores are calculated by scheduled and on-demand jobs
- System scores are based on the compliance scores of linked entities, which are maintained by the Policy & Compliance engine

Scheduled and on-demand jobs

Regulatory status data is kept current through the following automated processes:

For regulatory risk classification:

- No scheduled or on-demand jobs directly update risk classifications
- The `risk_score` field is populated when a regulatory risk classification assessment completes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For compliance scores:

- *AI system Compliance score calculation*: Calculates individual AI system compliance scores based on linked entity scores
- *AIRC daily compliance score scheduled job*: Refreshes compliance score data for the home page compliance score widget on a daily schedule

Classifying AI assets by regulatory risk

Regulatory risk classification places an AI asset in a risk rating, such as Low or High, based on the score from a risk assessment.

A regulatory risk classification is the inherent rating that a risk assessment produces for an AI asset. The AI Risk and Compliance application uses the classification to group AI assets, such as AI systems, AI models, and datasets, into rating bands on the Regulatory risk classification donut chart. For more information about how to read the chart, see Reviewing regulatory classification and compliance status.

For the risk assessment methodologies (RAMs), formulas, risk ratings, and factors, see Regulatory risk classification reference.

How automated classification works

The Automated risk classification for AI system RAM produces the classification without an assessor. For the classification that an assessor produces, see Risk rating calculation.

The automated classification scores six factors from the Use and purpose responses. Each response option carries a point value, and each factor adds up the points of the fields that it uses. The inherent score is the highest of the six factor scores. The system converts the score to a rating.

A factor whose points total is 9000 or more scores 10. That score places the asset in the top rating band, Unacceptable.

If an asset has no Use and purpose record, every factor scores 0 and the classification is To be determined.

⚠ Warning:

The system generates the automated classification without an assessor. The classification can be inaccurate or incomplete, for example, when the Use and purpose responses are out of date. Review the classification and the responses that produced it before you rely on it.

Example: Example: Customer service chatbot

A support team registers a customer service chatbot as an AI system. The chatbot drafts replies to customer emails, and it uses past support tickets that contain customer names and account details. In the Use and purpose section, the team answers the questions about the chatbot:

- For **Type of output produced**, they select **Generated Content**, which carries 50 points.
- For **Data used by the system**, they select **Profile or Account Data**, which carries 9000 points.

The Data & Model Risks factor adds these points: `50 + 9000 = 9050`. Because the total is 9000 or more, the factor score is 10, regardless of the other five factors. The highest factor score becomes the inherent score, so the chatbot's inherent score is 10 and its classification is Unacceptable.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When and how the classification is applied

The system calculates the classification when the asset is created. After the asset moves to the Managed state, the system revises the classification when the Use and purpose fields or the regulatory risk classification are updated.

Automated classification runs only when all of the following are true:

- The *sn_grc_ai_gov.ai_system_automated_risk_classification_asmt_ram* property specifies a RAM.
- The specified RAM is published.
- The Use and purpose record is linked to the governance details record of an AI asset.

If a condition isn't met, the system doesn't create a classification assessment and the classification remains To be determined.

When the conditions are met, the system completes these actions:

1. Runs the automated risk assessment subflow in the background.
2. Stores the resulting inherent rating on the governance details record of the asset.
3. Copies the inherent rating to the **Risk Classification** field of the related entity of the AI system. The system updates the related entity only when the rating changes.

For unmanaged AI assets, the classification is based on the Use and purpose data on the governance details record of the asset.

The system can cancel a classification assessment that is still open for the related entities of an AI asset. An assessment is open when its status isn't Completed, Archived, or Cancelled. A canceled assessment doesn't produce a classification. The system doesn't change assessments that are completed, archived, or canceled. The system cancels open classification assessments when the AI asset's **Active** field changes to false, such as when you retire or cancel the asset.

Classification and aggregated inherent risk

The regulatory risk classification of an AI asset is separate from the aggregated inherent risk rating that the risk rollup calculates for an AI system. The classification comes from the classification RAM. The aggregated inherent rating comes from the risk assessments of the risks that belong to the AI system. For the aggregated rating, see Risk rating calculation.

Compliance score calculation

The compliance score of an AI system measures how well its controls are met, based on the scores of its active related entities.

How the score is calculated

AI Risk and Compliance doesn't score an AI system directly. It averages the compliance scores of the entities that are linked to the AI system. For the formula, calculation rules, scheduled jobs, and properties, see AI system compliance score calculation reference.

An AI system links to one or more entities in the AI system entity map. The system averages the compliance scores of the active linked entities and stores the result as the compliance score of the AI system. The system skips AI systems in the Retired or Canceled state and excludes entities that belong to third-line audit entries.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

Map every relevant entity to the AI system. An entity that isn't mapped doesn't affect the score, so a missing entity can make the score look better or worse than the real compliance posture.

Example: Example: Hiring assistant AI system

A hiring assistant AI system is linked to three active entities in its governance plan: Data privacy compliance (80), Model bias testing (60), and Vendor risk assessment (70). The compliance score of the AI system is `(80 + 60 + 70) ÷ 3 = 70`. After an AI steward also links a fourth entity, Incident response readiness, with a compliance score of 50, the score becomes `(80 + 60 + 70 + 50) ÷ 4 = 65` - mapping an additional entity can lower the overall score if that entity needs attention.

Where the entity scores come from

The Policy and Compliance engine calculates the compliance score of each entity, based on the state of its controls, such as whether the controls pass compliance tests and attestations. Depending on configuration, this calculation can also take the scores of related entities into account. For the formula, calculation rules, and configuration options, see Compliance score calculation of an entity.

The compliance score of an AI system changes when the score of any contributing entity changes.

An individual entity's compliance score is color-coded consistently with other Policy and Compliance records: green for 80-100, yellow for 50-79, and red for 0-49.

How and when scores are processed

The system queues an AI system for recalculation when its compliance score record is inserted. A scheduled process then completes these actions:

1. Picks up queued records that are in the Inserted or Error state and marks them as processing.
2. Calculates the average of the compliance scores of the related entities for each queued AI system.
3. Stores the new score on the AI system.
4. Removes the processed records from the queue.

If the calculation fails for an AI system, the system logs an error, but the queued record is still removed in the same run. The AI system isn't automatically retried unless a new compliance score record is queued for it again.

Scores by authority document or policy

A compliance score relates to an authority document through the citation that the authority document is associated with. The citation is also linked to the applicable control. Based on these relationships, the system calculates the compliance score for the corresponding authority document.

The Compliance score card shows the score as a percentage on a gauge. The card also shows compliance posture for the priority frameworks, with separate tabs for authority documents and policies. Those posture scores come from the compliance of citations and their controls, and they are separate from the compliance score of the AI system. For how citation scores are

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

calculated, see Compliance score calculation for a citation. For how to read the compliance views, see Reviewing regulatory classification and compliance status.

Review of calculated scores

The system calculates the compliance score automatically, without an assessor. The score can be inaccurate or incomplete, for example, when entities or controls are missing or out of date. Review the score and the entity scores that produced it before you rely on it.

Things to note for addressing errors

If the Risk and Compliance dashboards on the AI asset record page or the landing page show a `No data found` error for the compliance score, see Risk score and compliance score dashboard errors.

Reviewing AI risk posture

Aggregated risk posture displays inherent risk, residual risk, and control effectiveness for AI assets.

Overview of AI risk posture

Risk posture views in AI Control Tower help you understand the level of risk associated with AI assets and how that risk changes when control effectiveness is considered.

At the portfolio level, risk posture views summarize how AI assets are distributed by risk level and highlight concentrations of higher-risk assets. At the AI system level, aggregated risk rating views show the relationship between inherent risk, control effectiveness, and resulting residual risk for a specific AI system.

Risk heat maps add more context by showing how counts of risks are distributed across inherent risk levels and control effectiveness levels. These views help you identify where ineffective or partially effective controls are associated with higher-risk conditions.

Use the global filter on the Risk posture page to switch the widgets between **AI System**, **AI Model**, and **Dataset** asset types. Selecting an asset type updates the aggregated risk score chart and the risk heat map to show results for that asset type only, and relabels the chart to match (for example, **AI systems by aggregated risk score**). By default, the page displays results for **AI System**.

Aggregated risk score

AI assets are classified by aggregated risk score using a donut chart. The risk scores are qualitatively classified as Low, Medium, and High.

AI systems are distributed across risk rating levels through two primary visualizations: inherent risk and residual risk.

Inherent risk: Risk level of an AI system before controls, mitigations, or safeguards are applied. This baseline view identifies the potential risk exposure that exists in the AI environment without intervention. The chart categorizes systems into three risk levels: Low, Medium, and High.

Residual risk: Risk level after controls, mitigations, and safeguards are implemented. This view demonstrates the effectiveness of the risk management program by showing how control measures reduce overall exposure. By comparing inherent and residual risk charts, you can measure the impact of governance controls.

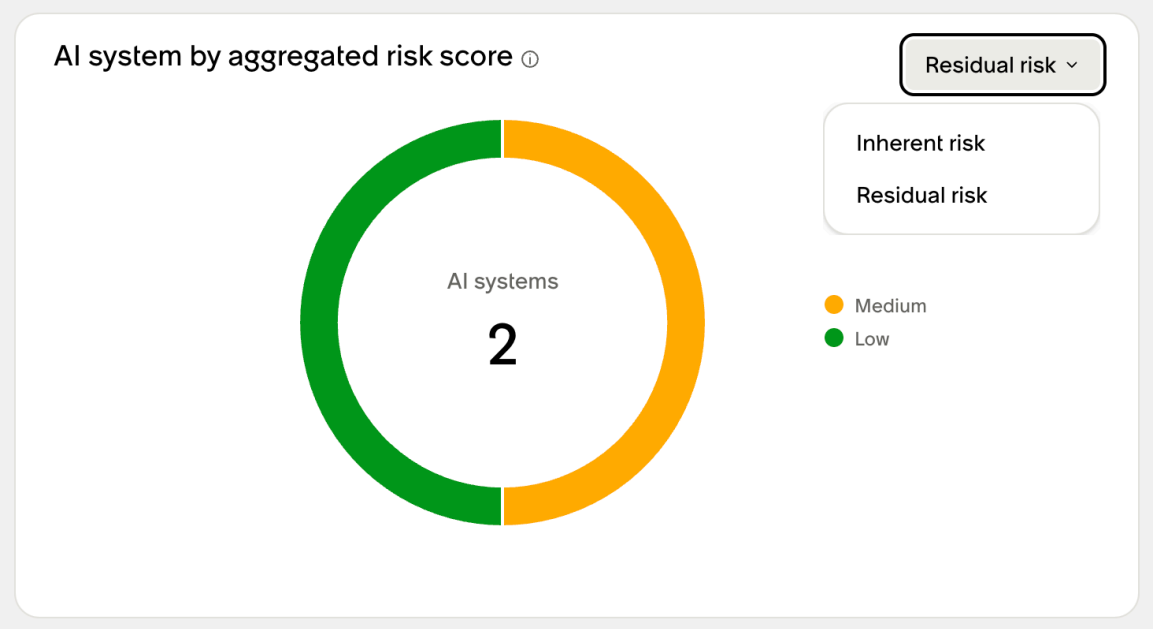
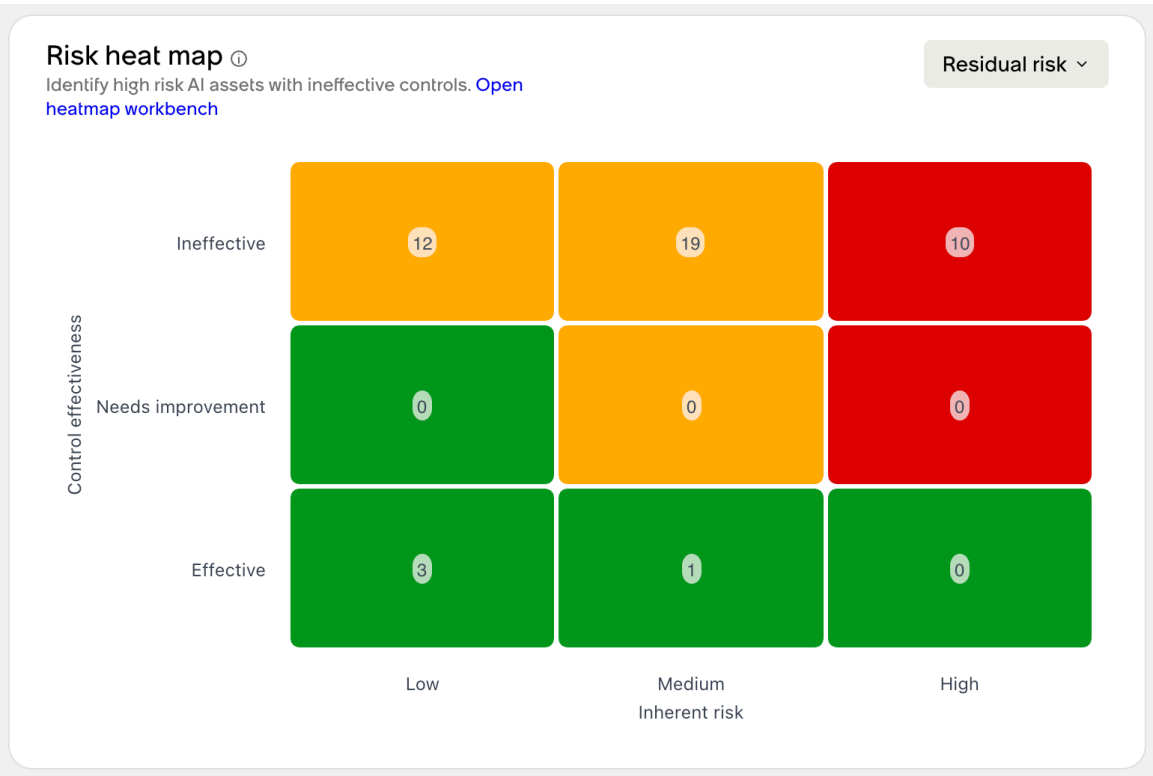
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Risk heat map

The Risk heat map widget displays identified risks for AI assets. By default, the widget applies the **Residual risk** filter, but you can filter the heat map by **Inherent risk**. Segmentation changes based on the selected filter. Risks appear under the respective combination of risk and control effectiveness, or impact and likelihood, depending on the selected risk classification filter. You can filter the risk heat map by Risk Assessment Methodology (RAM) when more than one methodology is available. For more information about RAMs, see Risk assessment methodologies reference.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

How data is determined

For the full calculation, including the primary RAM, contributing entities, and recalculation, see Risk rating calculation.

AI systems by aggregated risk score:

- Risk ratings come from risk assessments performed against the risks linked to each AI system.
- A background job rolls up the individual assessment results into a single risk rating per AI system.
- The chart then counts how many AI systems fall into each rating level (for example, Low, Medium, High).

Risk heat map: Each cell shows the count of risk assessment instances at that intersection. This is the standard Advanced Risk heat map, scoped to AI governance entities.

Risk rating calculation

The inherent, control effectiveness, and residual ratings of an AI system come from risk assessment scores that a risk rollup aggregates.

How the system calculates risk scores

AI Risk and Compliance calculates the risk scores of an AI system in two stages. First, a risk assessment scores each risk that belongs to the related entities of the AI system. Second, the Advanced Risk rollup engine aggregates the scores of those risks into one inherent rating, one control effectiveness rating for the AI system. For how the rollup works in general, see Risk score rollup in Advanced Risk Assessment.

For the formulas, rating bands, and rollup settings, see AI risk score calculation reference.

Important:

The rollup requires the Advanced Risk application. Install it and set the **Migrate to Advanced Risk Assessments** property to **Yes** before the inherent, control effectiveness ratings become available. This is a one-way configuration change.

The predefined risk assessment methodology (RAM) named Risk assessment for AI inventory defines the scoring logic. It's a risk-based RAM with inherent, control assessments, and it applies to AI systems, AI models, and datasets alike: every AI digital asset is represented by the same underlying AI system entity map record regardless of its asset type, so the same rollup and primary RAM apply no matter which asset type you're viewing. It ships in the Draft state, so publish it or a custom RAM before you use it.

Note:

The aggregated inherent rating of an AI system is separate from its regulatory risk classification. The aggregated rating comes from the risk rollup. The classification comes from the classification RAM. For the classification, see Classifying AI assets by regulatory risk.

Score types

Each risk is scored before the rollup.

Inherent risk

Risk level before controls are considered, based on the inherent assessments of the contributing risks. For each risk, an assessor answers two choice factors, Impact

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

and Likelihood. The score of each factor is the value of the option that the assessor selects, and the inherent score is the average of the two factor scores.

Control effectiveness

Measure of how well the controls address the risks, based on the control assessments of the contributing risks. For each risk, the system calculates the score from the status and weight of its controls. No assessor input is needed.

Example: Example: Fraud detection model

A fraud detection model has three active controls. The access control review is compliant and carries the most weight, 100, because restricting who can modify the model is the most important safeguard. The data retention policy and the bias testing control are both non-compliant, each weighted at 10. The control effectiveness is `(100 ÷ 120) × 100 = 83`, close to a perfect score, but because two controls are still non-compliant, it lands in the Needs improvement band (level 1) rather than Effective.

Primary RAM

The rollup runs against one RAM for each AI system, called the primary RAM. A RAM can be the primary RAM only when it is published, assesses risks, and belongs to the AI risk and compliance domain. Each AI system stores its own primary RAM. If you remove the primary RAM from an AI system, the AI system no longer shows rollup scores.

When you don't set a primary RAM, the system selects a default. You can set the default in the *`sn_grc_ai_gov.aisystem_primary_ram`* property.

Aggregation to the AI system

The rollup includes the active related entities of the AI system that use the same primary RAM, the risks of those entities, and their assessments in the Monitor state. The rollup excludes third-line audit entries, and it skips AI systems in the Retired or Canceled state.

The rollup averages the scores of the contributing risks and converts the average to a rating band. The rollup takes the maximum of the annual loss expectancy values.

Example: Example: Loan approval assistant

A loan approval assistant has three contributing risks: unauthorized access to applicant data (inherent rating High, 7), model drift from outdated training data (inherent rating Medium, 4), and dependency on a single data vendor (inherent rating Low, 1). The average is `(7 + 4 + 1) ÷ 3 = 4`, so the inherent rating of the AI system is Medium. The control effectiveness ratings of the AI system are aggregated the same way from the values of the same risks.

When scores are recalculated

Each AI system has one risk rollup result. The system flags the result for recalculation after the primary RAM of the AI system is set or changed, or after a score-affecting change on a related entity that uses the primary RAM. A scheduled job then recalculates the scores. Scores on the AI system don't change at the moment that an assessment changes. They update after the next scheduled recalculation.

Where the scores appear

The ratings appear on the AI system record and in the Risk posture charts and risk heat map. The Risk posture page shows the All assets by aggregated risk score chart and the Risk heat map, and you can switch the charts between inherent and residual risk. For how to read them, see

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Reviewing AI risk posture. To see which assessments contributed to the score of an AI system, use the contributing assessments of the risk rollup result.

Review of calculated ratings

The system calculates the control effectiveness, and aggregated ratings automatically, without an assessor. The ratings can be inaccurate or incomplete, for example, when controls or assessments are out of date. Review the ratings and the assessments that produced them before you rely on them.

Assessed classification

An assessed classification is the inherent rating that an assessor produces for an AI asset. The assessor answers Impact and Likelihood questions, and the classification is the average of the two scores. The assessed classification is separate from the automated classification, which the system calculates from the Use and purpose responses.

The system applies one of two RAMs, depending on the type of AI asset. Risk classification for AI system applies to AI systems. Risk classification for AI Model or Dataset applies to AI models and datasets. You select the RAM when the assessment starts. For the formulas, subfactor weights, and rating bands, see AI risk score calculation reference.

Things to note for addressing errors

If the Risk and Compliance dashboards on the AI asset record page or the landing page show a `No data found` error for the risk score, see Risk score and compliance score dashboard errors.

Detecting governance insights

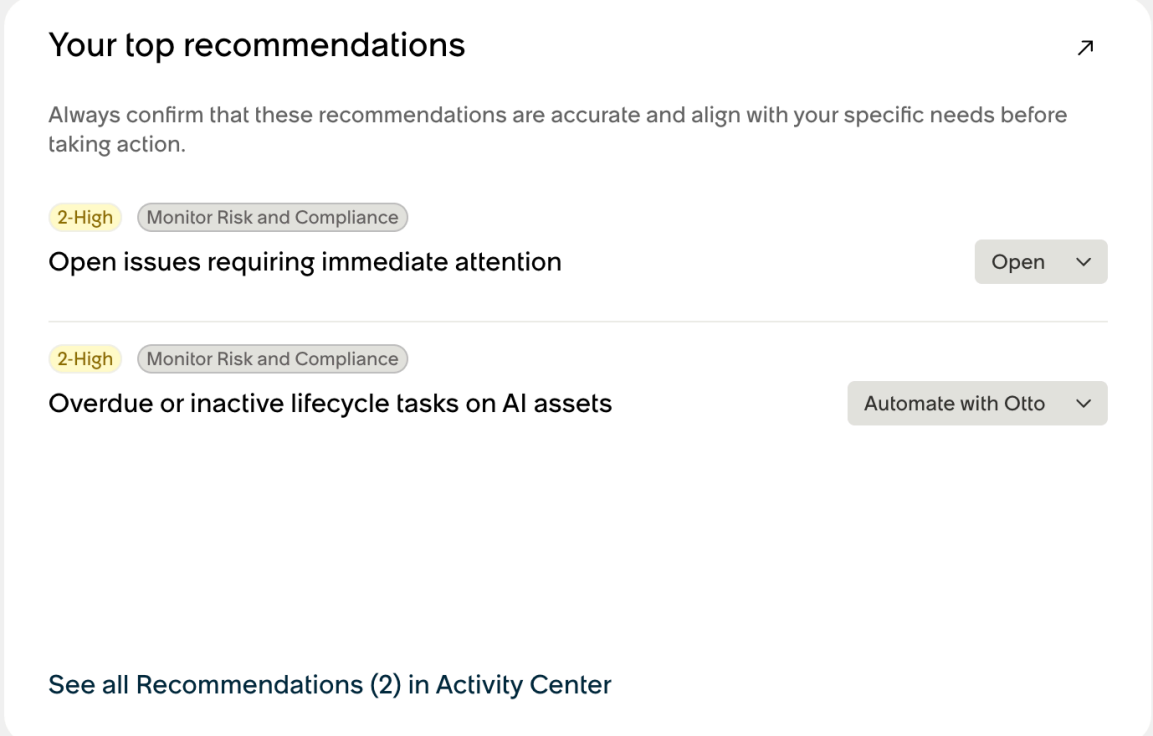
Scheduled detection jobs evaluate your AI portfolio and generate the Stalled Lifecycle Tasks and Significant Issues insights that appear as recommendations.

The Your top recommendations widget surfaces two insights that identify governance work needing attention across your AI portfolio: Stalled Lifecycle Tasks and Significant Issues. Both run as scheduled detection jobs rather than as on-demand reports, so the widget reflects the most recent scheduled run rather than real-time state.

Governance insights

Insight	Purpose
Stalled Lifecycle Tasks	Identifies lifecycle tasks on AI systems that have seen no progress or updates and require attention to resume completion.
Significant Issues	Identifies open issues on AI systems that have a meaningful impact on risk or compliance and warrant timely review.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



These insights provide the following benefits:

- Surface high-priority governance work without requiring you to search across individual AI systems.
- Detect stalled work and significant issues on a recurring schedule.
- Provide a portfolio-wide, severity-prioritized view of items that need attention.

How each insight is determined

Both insights follow the same two-stage pattern. First, a detection job identifies AI systems and records that match a set of criteria. Then a generative AI skill prioritizes which matches are most important to surface. If the AI skill call fails or returns no results, the detection job falls back to a deterministic, rule-only ranking so the insight still generates.

For the exact criteria, detection intervals, and fallback ranking for each insight, see Governance insight detection reference.

⚠ Warning:

AI-generated summaries and prioritization can be inaccurate or incomplete. Review each recommendation and the records behind it before you act on it.

Automating a response

Stalled Lifecycle Tasks recommendations include an **Automate with Otto** action. Selecting it opens a confirmation dialog box with the message `Automate this action item? This will initiate a workflow run by an unsupervised agent.` Review the recommendation before you proceed. Select **Automate** to proceed, or select **Cancel**. Significant Issues recommendations don't have this option. Resolve them directly from the issue list.

Viewing recommendation details

Selecting **View details** on a recommendation in the Your top recommendations panel opens a record with the fields in the following table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Recommendation record

Field	Description
Short description	Generated summary of the recommendation. The summary can also name specific AI systems and recommend actions, not just report totals. • For a Significant Issues recommendation, this includes the number of active issues found, managed AI assets affected, and top issues and assets shown. For example: `11674 active issues across 483 managed AI assets require review. Showing the top 50 issues on the 10 highest-priority assets.` • For a Stalled Lifecycle Tasks recommendation, this includes the total number of overdue tasks, dormant tasks, and governed AI assets affected. For example: `319 overdue and 473 dormant lifecycle tasks across 213 governed AI assets.`
Activity type	**AI recommendation** for these insights.
Type	Insight category: either **Stalled Lifecycle Tasks** or **Significant Issues**.
Initiated date	Date and time the detection job generated this recommendation.

The record also includes the same action and a **History** section. For a Significant Issues recommendation, the default action is **Open**, with **Complete** and **Delete** available from the drop-down list. For a Stalled Lifecycle Tasks recommendation, the default action is **Automate with Otto**, with **Complete** and **Delete** available from the drop-down list. There is no separate **Open** action for this insight.

For a Significant Issues recommendation, selecting **Open** navigates to a filtered Issue list scoped to that recommendation's issues. Results are sorted by priority, then by how long each issue has been open.

Viewing insights

Both insights appear in the Your top recommendations widget, which is shown both on the AI Control Tower home page and on the **Risk & Compliance** tab under **Govern**. Select **See all Recommendations in Activity Center** to see the full list of assigned and unassigned action items generated by both insights. For more information, see Act on AI asset governance insight recommendations.

Governance insight detection reference

Thresholds, criteria, and refresh schedule that determine when an AI system appears in the Stalled Lifecycle Tasks or Significant Issues insight.

Stalled Lifecycle Tasks criteria

A lifecycle task is flagged if either of the following is true:

- Overdue: The task has a due date that is more than 7 days in the past.
- Dormant: The task hasn't been updated in more than 7 days, regardless of its due date.

Tasks already in a terminal state (such as Closed complete, Closed incomplete, or Cancelled) are excluded. The AI system itself is also excluded if it's in the Retired or Cancelled state.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The detection job evaluates four task types: AI system lifecycle tasks, assessment tasks, risk assessment instances, and risk assessment projects.

Significant Issues criteria

An open issue on a managed AI system is included if any of the following is true:

- The issue is linked to a control whose control objective is classified Preventive.
- The issue is linked to a control with a Non-compliant status that has at least one failed indicator.
- The issue has no linked control at all.
- The issue's own priority is Critical or High, regardless of its linked control's status.

Only active issues on governed, active AI systems are evaluated.

Refresh schedule

The following table lists how often each detection job runs.

Detection intervals

Insight	Detection interval
Stalled Lifecycle Tasks	Every 5 days
Significant Issues	Every 1 day

Fallback ranking

The following table lists how each detection job ranks matches when the generative AI skill call fails or returns no results.

Fallback ranking by insight

Insight	Ranking
Stalled Lifecycle Tasks	AI systems ranked by combined overdue and dormant task counts
Significant Issues	AI systems ranked by critical issue count, then by risk rating, then by unassigned issue count

Act on AI asset governance insight recommendations

Resolve Stalled Lifecycle Tasks and Significant Issues recommendations to keep AI systems moving through their governance life cycle.

Before you begin

Role required: sn_ai_governance.ai_steward

About this task

The Your top recommendations widget on the **Risk & Compliance** tab under **Govern** surfaces recommendations from the Stalled Lifecycle Tasks and Significant Issues insights.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home** > **Govern** > **Risk & Compliance**.
2. Act on recommendations from Stalled Lifecycle Tasks:

   a. Select the arrow next to a stalled task item.
   The list of lifecycle tasks on that AI system that have seen no progress or updates opens.

   b. In the task list, select a task to open its details.

   c. Take action to resume the task, such as updating the task status, reassigning it, or adding a work note.
   You can also select **Automate with Otto** to have an AI agent act on the recommendation for you. For information about completing a lifecycle task, see Complete a lifecycle task.

   > **Important:**
   >
   > Automate with Otto uses an unsupervised AI agent to act on this recommendation. AI-generated actions can be inaccurate or incomplete. Review the recommendation and the task it applies to before you select **Automate with Otto**.

   When you address a stalled task (such as completing it, updating its status, or reassigning it), it is removed from the recommendation list. The AI system moves forward through its governance life cycle.
3. Act on recommendations from Significant Issues:

   a. Select the arrow next to a significant issue item.
   The list of open issues associated with that AI system opens.

   b. In the issue list, select an issue to open its details and review its impact on risk or compliance.

   c. Take action to mitigate or resolve the issue, such as updating the issue status, adding mitigation steps, or assigning a remediation owner.

   When you resolve a significant issue (such as closing it, implementing mitigations, or reducing its compliance impact), it is removed from the recommendation list. The risk and compliance posture of your AI system improves.
4. To view all recommendations, select **See all Recommendations in Activity Center**.
   For information about resolving a recommendation from the full list, see Resolve an AI recommendation.
   The full list of assigned and unassigned action items generated by both insights appears.

Detecting governance insights

Risk and Compliance reference

Review the scope of Risk and Compliance visibility in AI Control Tower, including key terminology used across these views.

Risk and Compliance in AI Control Tower provides governance visibility for AI assets. It summarizes and presents governance outcomes at both the portfolio level and the individual AI system level.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

These views support awareness, prioritization, and review. They do not replace the underlying governance processes that generate assessments, risks, controls, issues, policy exceptions, or related records.

Risk and Compliance terminology

Key terms used across Risk and Compliance views in AI Control Tower, including compliance score and regulatory risk classification.

Regulatory risk classification

Regulatory risk classification groups AI assets by acceptability or risk category, such as unacceptable, high, medium, and low. At the asset level, classification can remain undetermined until the relevant governance data is available. For more information, see Classifying AI assets by regulatory risk.

Compliance score and compliance posture

Compliance score represents visible compliance posture for the selected scope. Framework-specific posture views show how governance information is presented for priority authority documents or policies and can surface issue indicators relevant to those frameworks. For more information, see Compliance score calculation.

Inherent risk, residual risk, and control effectiveness

Inherent risk describes the level of risk before control effectiveness is considered. Control effectiveness describes how well controls address the identified risk. Residual risk represents the level of risk that remains after control effectiveness is considered. For how these scores are calculated, see Risk rating calculation.

Risk heat map

Risk heat maps show how risk information is distributed across combinations of risk level and control effectiveness. These views help you understand where higher-risk conditions are associated with less effective controls. For more information, see Reviewing AI risk posture.

Governance records

Asset-level Risk and Compliance views can surface related governance records for an AI system, including assessments, risks, controls, issues, policy exceptions, attestations, and similar governance artifacts that contribute to the system's current posture. For the full list of record types, see Governance record types.

Incomplete states

Some Risk and Compliance views can display incomplete states such as **To be determined**, **No data available**, or zero-valued indicators. These states indicate that the relevant governance information is not yet available for display in the selected context.

Governance record types

Record types under the Governance section of an AI asset's Risk & Compliance tab in AI Control Tower, used to support governance review.

The Governance section of an AI asset organizes related governance records into four categories: Assessments, Governance, Tasks, and Tracking.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Governance section record types

Category	Record type	Description
Assessments	AI assessments	General assessments that evaluate an AI asset against governance criteria, such as intended use, risk classification, and compliance requirements. Risk assessments and regulatory risk assessments (below) are the specific assessment types that feed the asset's regulatory risk classification and aggregated risk rating.
Assessments	Risk assessments	Assessments that identify and rate the risks associated with an AI asset, including inherent risk and the effectiveness of the controls applied to it. Results contribute to the asset's aggregated risk rating and risk heat map placement.
Assessments	Regulatory risk assessments	Assessments that determine how an AI asset is classified against regulatory frameworks and requirements, such as unacceptable, high, medium, or low risk. Results populate the asset's regulatory risk classification.
Assessments	Bulk risk assessments	A grouping of risk assessments run across multiple AI assets at once, used to assess several assets against the same criteria in a single pass instead of individually. For more information, see Risk assessment project in AI Risk and Compliance.
Governance	Risks	Individual risk records identified for the AI asset, each describing a potential issue along with its inherent risk level. Risks are the basis for the asset's risk heat map and aggregated risk rating.
Governance	Controls	Control records that describe the safeguards applied to mitigate the risks identified for the AI asset. The status and weight recorded on each control determine its control effectiveness score, which directly affects the asset's residual risk.
Tasks	Attestations	Records that capture confirmation that a control is in place and operating as expected, tied to a specific compliance framework or policy. Attestation state, such as Complete or Ready to take, feeds the asset's compliance score and compliance posture for priority frameworks.
Tracking	Issues	Records that track a compliance or control gap identified for the AI asset that requires remediation. Open issues surface as high-priority items in the asset's compliance posture and top action items.
Tracking	Policy exceptions	Records that document an approved deviation from a policy or control requirement for the AI asset, including justification and expiration. Policy exceptions provide an audit trail for accepted risk.

Regulatory risk classification reference

Risk assessment methodologies, formulas, risk ratings, and records that determine the regulatory risk classification of an AI asset.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Risk assessment methodologies

The following table lists the predefined risk assessment methodology (RAM) that produces an automated classification. The RAM ships in the Draft state. Publish the RAM before you use it. For the RAMs that produce an assessed classification, see AI risk score calculation reference.

RAM that produces an automated classification

RAM	Applies to	Score formula	RAM selection
Automated risk classification for AI system	AI systems	Highest of six factor scores	Specified by the *sn_grc_ai_gov.ai_system_automated_risk_classification* property

Risk ratings

The following table lists how the automated RAM converts a score on a scale of 0 to 10 to a rating.

Score-to-rating conversion

Score	Rating
0	To be determined
0.1 to 5.00	Low
5.01 to 7.00	Medium
7.01 to 9.00	High
9.01 to 10	Unacceptable

An asset without an inherent rating is treated as To be determined. In the automated RAM, a score above 0 but below 0.1 also falls in the To be determined risk rating.

Automated classification formulas

The automated RAM uses the following formulas.

```
Factor score = (points total ÷ maximum possible points) × 8
Inherent score = Maximum(factor 1, factor 2, factor 3, factor 4,
 factor 5, factor 6)
```

A factor whose points total is 9000 or more scores 10. For a field that accepts several selections, the points total uses the highest value among the selected options. The factor score has two decimal places.

Automated classification factors

The following table lists the six factors and the Use and purpose fields that each factor uses.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Automated classification factors

Factor	Fields and maximum points	Maximum total
Context of Use	Interaction type with end users (60), Area where the AI system is used (80), Intended outcome of the AI system (60)	200
Autonomy & Role of Human Oversight	System autonomy level (50), Type of output produced (50), Level of human involvement (50)	150
Data & Model Risks	Type of output produced (50), Data used by the system (40)	90
Impact on Individuals & Society	People affected by the AI system (50), Type of output produced (50), Intended outcome of the AI system (60)	160
Cybersecurity & Systemic Risks	Area where the AI system is used (80), Data used by the system (40), System autonomy level (50)	170
Governance & Compliance Maturity	Area where the AI system is used (80), People affected by the AI system (50), Level of human involvement (50)	180

Use and purpose answer point values

The following tables list the point value of each answer option for every Use and purpose field.

Answer point values for the Intended outcome of the AI system field

Answer option	Points
Not Applicable	0
Efficiency Boost	10
Quality Enhancement	20
Decision Guidance	30
Automation of Tasks	40
Customer Experience Upgrade	50
Insight Generation	60

Answer point values for the Area where the AI system is used field

Answer option	Points
Internal Operations	10
Customer Services	20
Sales & Marketing	30
Finance & Accounting	40
IT & Security	50
Supply Chain	60
HR & Workforce	70

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Answer point values for the Area where the AI system is used field (continued)

Answer option	Points
External Partner Ecosystem	80

Answer point values for the Type of output produced field

Answer option	Points
Simple Alerts	10
Insight & Summaries	20
Ranking & Scores	30
Recommendations	40
Generated Content	50
Automated Decisions	9000
System Actions	9010

Answer point values for the People affected by the AI system field

Answer option	Points
Internal Team	10
Specific Customer Groups	20
General Customer Base	30
External Partners	40
Public or Large Audiences	50

Answer point values for the Level of human involvement field

Answer option	Points
Not Applicable	0
Full User Control	10
User-Guided with AI Support	20
Shared Control	30
AI-Initiated with User Approval	40
Fully Automated Workflow	50

Answer point values for the Data used by the system field

Answer option	Points
Public or General Info	10
Business Operational Data	20
Customer Interaction Data	30

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Answer point values for the Data used by the system field (continued)

Answer option	Points
Behavioral or Usage Data	40
Profile or Account Data	9000
Sensitive Business Data	9010

Answer point values for the Interaction type with end users field

Answer option	Points
Not Applicable	0
No Direct Interaction	10
Background Support	20
Notifications & Prompts	30
User-Facing Recommendations	40
Chat-Based Interaction	50
Interactive Experience	60

Answer point values for the System autonomy level field

Answer option	Points
Not Applicable	0
Assistive (AI suggests)	10
Semi-Automated (acts with confirmation)	20
Condition-Based Automation	30
Event-Triggered Automation	40
Fully Automated Execution	50

Selecting **Profile or Account Data**, **Sensitive Business Data**, **Automated Decisions**, or **System Actions** triggers the 9000-point override described in the Automated classification formulas section, regardless of the other answers on the same asset: The factor score becomes 10 and the inherent score is Unacceptable.

Records and fields

The following table lists the records and fields that store the classification.

Records and fields that store the classification

Record	Field	Purpose
Asset governance details [sn_ai_governance_asset_governance_details]	Inherent risk rating	Inherent rating that the classification assessment produces

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Records and fields that store the classification (continued)

Record	Field	Purpose
AI system entity map [sn_grc_ai_gov_ai_system_entity_map]	Risk classification	Classification of the related entity, copied from the governance details record

Properties

The following table lists the property that controls automated classification.

Automated classification property

Property	Purpose
sn_grc_ai_gov.ai_system_automated_risk_classification_asmt_ram	Published RAM that classifies AI systems automatically

AI risk score calculation reference

Formulas, rating bands, lookup matrix, and rollup settings that determine the inherent, control effectiveness, and residual ratings of an AI system.

Formulas

The risk assessment methodology (RAM) named Risk assessment for AI inventory uses the following formulas for each risk.

```
Inherent score = Average(Impact, Likelihood)
Control effectiveness % = (sum of weights of compliant controls
 ÷ sum of weights of compliant and non-compliant controls) × 100
```

The Impact and Likelihood factors each use the following scale.

Impact and Likelihood scale

Rating	Score
Low	1
Medium	4
High	7
Critical	10

The control effectiveness calculation uses only active controls with a status of Compliant or Non-compliant, weighted by the control weighting value. The result is rounded to a whole number. If the risk has no such controls, the result is 0.

The rollup combines the scores of the contributing risks into one score for the AI system.

```
AI system score = Average(score of each contributing risk)
AI system rating = rating band of the AI system score
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

The tables and formulas use "AI system" terminology throughout, matching the underlying table and field names. The same rollup, primary RAM, and formulas apply to AI models and datasets, because every AI digital asset is represented by the same AI system entity map record regardless of asset type.

Inherent rating bands

Inherent rating bands

Rating	Lower limit of band	Rating value
Low	0	1
Medium	4	4
High	7	7

Control effectiveness rating bands

Control effectiveness percentage to rating

Control effectiveness %	Level	Rating	Rating value
Less than 60	0	Ineffective	1
60 to 99	1	Needs improvement	4
100	2	Effective	7

Primary RAM requirements

The following table lists the requirements for a risk-based RAM to be the primary RAM of an AI system.

Primary RAM requirements

Requirement	Value
State	Published
Assessed on	Risks
Domain	AI risk and compliance

The default primary RAM is selected in the following order.

1. The RAM in the *sn_grc_ai_gov.aisystem_primary_ram* property, when more than one eligible RAM exists and the RAM is eligible. If the property value isn't eligible, no default RAM is set.
2. The first eligible RAM in alphabetical order by name, when the property is empty or only one eligible RAM exists.

Rollup inputs

The following table lists what contributes to the AI system rollup.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Inputs to the AI system rollup

Input	Rule
Related entities	Active entities in the AI system entity map whose primary RAM matches the primary RAM of the AI system, excluding third-line audit entries
Risks	All risks of the contributing entities, excluding third-line audit entries
Risk assessments	Active assessments on the contributing entities that use the primary RAM and are in the Monitor state
AI systems	All AI systems except those in the Retired or Canceled state

Rollup settings

Rollup settings of the Risk assessment for AI inventory RAM

Setting	Value
Score rollup	Average
Annual loss expectancy rollup	Maximum

Rollup result stages

Rollup result stages

Stage	Description
Needs update	Result flagged for recalculation after the primary RAM of the AI system is set or changed, or after a score-affecting change on a related entity that uses the primary RAM
Processing	Result picked up by a scheduled job that recalculates the scores
Updated	Result stored with the new ratings. A result flagged again during processing returns to Needs update.

Properties

Risk score property

Property	Purpose
sn_grc_ai_gov.aisystem_primary_ram	Default primary RAM for AI systems when more than one eligible RAM exists

Assessed classification

The following table lists the predefined RAMs that produce an assessed classification. Each RAM ships in the Draft state. Publish a RAM before you use it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

RAMs that produce an assessed classification

RAM	Applies to	RAM selection
Risk classification for AI system	AI systems	Selected when the assessment starts
Risk classification for AI Model or Dataset	AI models and datasets	Selected when the assessment starts

Both RAMs use the following formula.

```
Inherent score = Average(Impact score, Likelihood score)
```

The following table lists how each RAM converts the inherent score to a rating.

Assessed classification score-to-rating conversion

Score	AI system	AI model or dataset
0 to 5.00	Low	Low
5.01 to 7.00	Medium	Medium
7.01 to 9.00	High	High
9.01 to 10	Unacceptable	Critical

The Impact factor is a weighted average of six subfactors. The following table lists each subfactor and its weight.

Impact subfactors and weights

Subfactor	Weight
Regulatory scrutiny	15%
Financial impact	20%
Operational impact to the business	20%
Regulation complexity	20%
Number of businesses impacted	10%
Reputational impact	15%

The following table lists how the weighted average converts to the Impact score.

Impact weighted average to Impact score

Weighted average	Impact score
0 to 5.00	5
5.01 to 7.00	7
7.01 to 9.00	9
9.01 to 10	10

The Likelihood factor uses a four-point scale. The following table lists each rating and its score.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Likelihood scale

Rating	Score
Rare	1
Possible	7
Likely	9
Immediate	10

AI system compliance score calculation reference

Formula, calculation rules, scheduled jobs, and properties that determine the compliance score of an AI system.

Formula

```
AI system compliance score = average of the compliance scores of
 its active related entities
```

The result is a whole number from 0 to 100. The decimal part of the average is truncated, not rounded (for example, an average of 66.7 produces a score of 66, not 67).

Calculation rules

The following table lists the rules that apply to the compliance score of an AI system.

Rules that apply to the AI system compliance score

Rule	Behavior
Entity link	Only entities linked to the AI system in the AI system entity map [sn_grc_ai_gov_ai_system_entity_map] table contribute
Active entities	Inactive entities don't contribute
Third-line audit entries	Entities that belong to third-line audit entries don't contribute
Excluded AI systems	AI systems in the Retired or Canceled state have no score calculated
No related entities	The score is 0
Whole number	The average is truncated to a whole number before it is stored; the decimal part is dropped, not rounded

Scheduled jobs

The following table lists the scheduled jobs that keep the compliance scores current.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Compliance score scheduled jobs

Scheduled job	Purpose
Compliance Score V2	Calculates the compliance score of each entity every two minutes from the entities queued in the compliance score table [sn_compliance_compliance_score].
AI system Compliance score calculation	Calculates the compliance score of each AI system from the scores of its linked entities
AIRC daily compliance score scheduled job	Refreshes the data for the compliance score widget on the home page each day

An entity is queued for the *`Compliance Score V2`* job when a control changes compliance status, a control is added to or removed from the entity, the entity is activated or inactivated, or its hierarchy changes. The **Entity hierarchy based scoring** property determines how the score is calculated.

Compliance score gauge

The Compliance score card shows the score on a colored gauge. The gauge's color bands are a fixed default of the visualization component and aren't an admin-configurable setting.

Properties

The following table lists the properties that select the two priority frameworks of each type that appear on the Compliance score card. For steps to configure these properties, see Set up AI Risk and Compliance properties.

Compliance posture properties

Property	Purpose
sn_grc_ai_gov.highlighted_authority_document	Up to two authority documents to show as priority frameworks
sn_grc_ai_gov.highlighted_policy	Up to two policies to show as priority frameworks

Risk score and compliance score dashboard errors

Properties and scheduled jobs that resolve `No data found` errors in the risk score and compliance score dashboards on the AI asset record and landing pages.

No data found errors

A `No data found` error can appear in the Risk and Compliance dashboards on the AI asset record page or the landing page. To resolve the error, an administrator must complete the following actions for the score that doesn't appear. If the error persists, create a case on the Now Support portal for further investigation.

The following table lists the actions to complete, in order, for each score.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Actions that resolve No data found errors

Score that doesn't appear	Order	Action	Location
Risk score	1	Set the **Migrate to Advanced Risk Assessments** property to **Yes**.	**All** > **Advanced Risk assessment** > **Administration** > **Properties**
Risk score	2	Run the *GRC rollup assessment scores* scheduled job.	**All** > **System Definition** > **Scheduled Jobs**
Risk score	3	Run the *AI inventory risk score rollup* scheduled job.	**All** > **System Definition** > **Scheduled Jobs**
Compliance score on the landing page	1	Run the *AIRC daily compliance score scheduled job*.	**All** > **System Definition** > **Scheduled Jobs**
Compliance score of an AI system	1	Run the *Compliance Score V2* scheduled job.	**All** > **System Definition** > **Scheduled Jobs**
Compliance score of an AI system	2	Run the *AI system Compliance score calculation* scheduled job.	**All** > **System Definition** > **Scheduled Jobs**

Note:

On the Advanced Risk Assessment Properties page, a banner can state that the record is in the GRC: Advanced Risk application while another application is current. To edit the property, select the link in the banner.

Managing AI asset security with AI Control Tower

Review AI asset security metrics such as access issues, dormant and privileged AI agents, and map the relationships of your ServiceNow agents, agentic workflows, and tools.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Get started

Explore Learn AI asset security basics to help you get the most out of security metrics.	Configure Activate and configure your implementation of security metrics.	Use the agent map Visualize your entire agentic ecosystem across your enterprise.
Monitor AI security tasks Triage and resolve security tasks to optimize AI asset security.	Manage AI agents with kill switch protocol Contain AI agents with suspicious activity to improve security posture.	Reference Learn details about every metric in the security area.

Important:

- Not all model providers are available for customers with in-country SKUs, and some AI products/features are currently unavailable for in-country customers. For more information, see the KB1584492 article in the Now Support Knowledge Base. Be sure to check for model provider availability updates in future releases.
- Some AI products/features are currently unavailable for customers in the FedRAMP, NSC DOD IL5, or Australia IRAP-Protected data centers, self-hosted customers, or in other restricted environments. For more information, see the KB0743854 article in the Now Support Knowledge Base. Be sure to check for availability updates in future releases.
- Some AI products/features are currently available only for customers in some regions. Be sure to check for availability updates in future releases.
- Some AI products and skills are not available in Regulated Markets. For more information, see KB2593939: Regulated Markets AI Products/Skills Not Available. Be sure to check for availability updates in future releases.

AI limitations

This application uses artificial intelligence (AI) and machine learning, which are rapidly evolving fields of study that generate predictions based on patterns in data. As a result, this application may not always produce accurate, complete, or appropriate information. Furthermore, there is no guarantee that this application has been fully trained or tested for your use case. To mitigate these issues, it is your responsibility to test and evaluate your use of this application for accuracy, harm, and appropriateness for your use case, employ human oversight of output, and refrain from relying solely on AI-generated outputs for decision-making purposes. This is especially important if you choose to deploy this application in areas with consequential impacts such as healthcare, finance, legal, employment, security, or infrastructure. You agree to abide by ServiceNow's AI Acceptable Use Policy, which may be updated by ServiceNow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data processing

This application requires data to be transferred from ServiceNow customers' individual instances to a centralized ServiceNow environment, which may be located in a different data center region from the one where your instance is, and potentially to a third-party cloud provider, such as Microsoft Azure. This data is handled per ServiceNow's internal policies and procedures, including our policies available through our CORE Compliance Portal .

Data collection

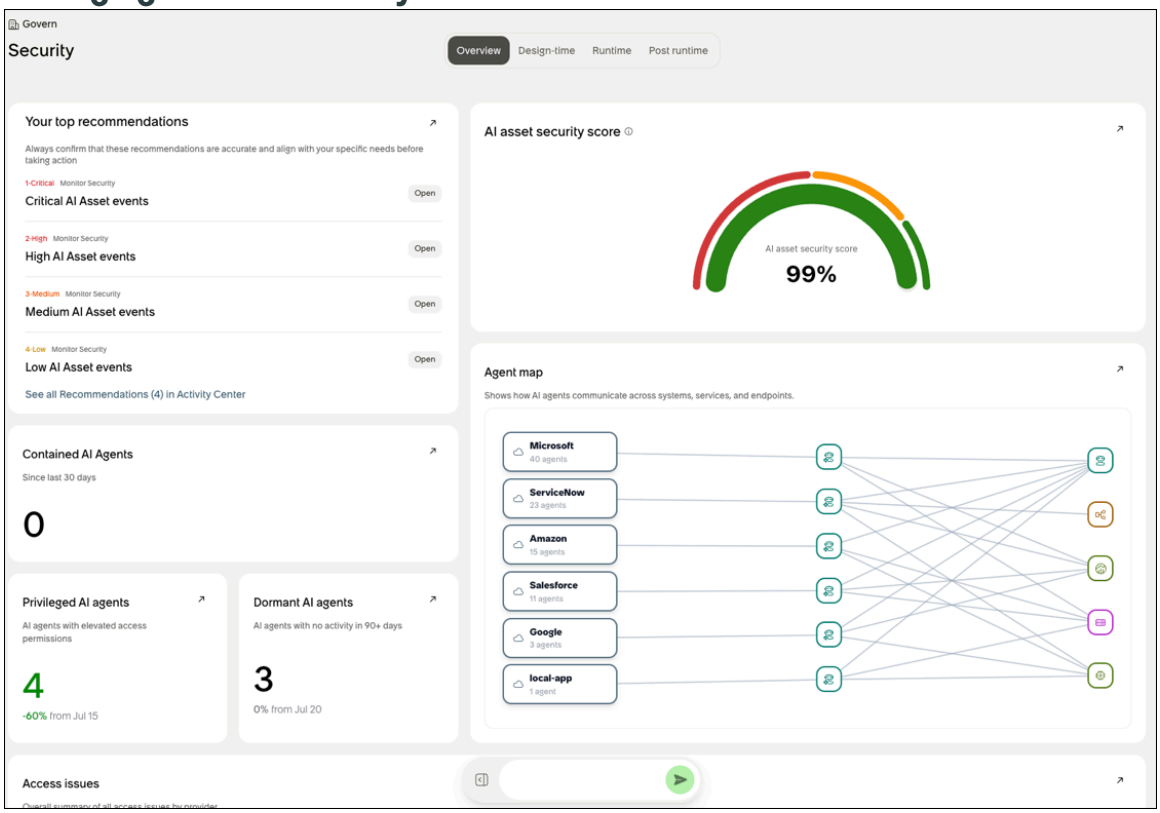
ServiceNow collects and uses the inputs, outputs, and edits to outputs of this application to develop and improve ServiceNow technologies including ServiceNow models and AI products. Customers can opt out of future data collection at any time, as described in the AI Opt-Out page.

Note: We have controls in place to enable/disable the data collection and data processing. For more information, see Data sharing and processes.

Exploring security in AI Control Tower

The security area of AI Control Tower offers a dashboard-based view of your AI asset security metrics. In addition to tracking metrics, the security area contains the agent map, a tool that gives a node-graph visualization of the relationships between your AI agents, agentic workflows, and tools.

Managing AI asset security



Use the security area of AI Control Tower to monitor and improve your security posture across your AI asset ecosystem. Monitor overview, design-time, runtime, and post-runtime metrics to identify problem areas and troubleshoot LLM guardrail policy violations. For details about every metric, see Managing AI asset security reference.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Security users

Users

User	Description
AI steward	Monitors overall security posture of the AI asset ecosystem. Uses the security dashboard to maintain accountability for AI-related security threats.

Security benefits

Security benefits

Benefit	Feature	Users
Review and troubleshoot access issues, critical AI asset security events, overall security posture, and other indicators.	Overview metrics	AI steward
Evaluate LLM model-level security exposure.	Design-time metrics	AI steward
Stop the execution of agents that potentially violate LLM guardrails in real time.	Runtime metrics	AI steward
Review AI asset security events to audit AI asset security threats and mitigate risk.	Post-runtime metrics and AI agent containment using kill switch protocol manually	AI steward

What to explore next

To learn more about configuring and using AI Control Tower, see:

- Configuring security metrics in AI Control Tower
- Discover your agent network with the map
- Monitor AI asset security events and recommendations
- Managing AI asset security reference

Basic concepts for AI asset security

Learn more about the AI asset security score, agent map, AI asset security events, and internal and external agents.

AI asset security events

An AI asset security event is an occurrence that involves a potential threat to your environment's security. For example, if a credit card number is detected in LLM output (output PII violation). Or, if a user replaces an LLM prompt with a malicious prompt designed to obtain a user's password (prompt injection). Each AI asset security event has a threat type assigned. For more information, see Managing AI asset security reference and Monitor AI asset security events and recommendations.

On the Post-runtime tab, the top AI asset security events are organized by threat category to help you prioritize areas to focus on and address. Selecting a cell in the heat map shows a corresponding list of AI asset security events below it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI asset security score

The AI asset security score reflects the health of your AI assets in terms of access issues, privileged AI agents, dormant AI systems, output deviation, PII detection, and other criteria. When you view score details, a list view shows the AI assets that are included in your AI asset security score calculation. Your score is the average of all managed AI assets listed. Users should actively manage and review their agent assets and not rely solely on this AI asset security score.

You can exclude an AI asset from your score by muting it. For example, you can mute an AI asset if you determine that remediating the asset's issue would be a risky change. For more information, see Managing AI asset security reference.

You can also configure the score to remove security categories from the score calculation or change the weights of categories. For more information, see Configure the AI asset security score.

Agent map

The agent map is an interactive map showing the relationships of your AI providers, AI models, MCP servers, AI agents, agentic workflows, and tools across your enterprise. You can use the map to review these relationships and AI asset details. The map includes filters for both agents and agentic workflows.

Internal and external agents

Internal agents are agents that are provided by ServiceNow. External agents are those provided by third parties, such as Google or Amazon Web Services. On the Runtime and Post-runtime tabs, filter on internal or external agents to compare the security postures of your ServiceNow and third-party agents.

AI agent containment using kill switch protocol manually

Explore how deactivating AI agents works to enforce guardrails and help improve your security posture.

AI agents operate as autonomous actors across the enterprise, frequently with elevated or administrative privileges. AI agent containment using kill switch protocol gives you the ability to immediately contain an AI agent and revoke all of its active credentials across the connected enforcement points that you configured.

Control enforcement points (PEPs) are part of AI agent containment. CEPs can be identity providers, AI agent runtimes, or infrastructure platforms. Supported AI agent platforms are AWS Bedrock, AWS Bedrock AgentCore, Azure AI Foundry, Gemini Enterprise Agent Platform (agents with a unique identity only), and ServiceNow AI agents. The supported identity provider is Okta.

When you contain an AI agent, AI Control Tower issues revocation requests and confirms enforcement completion from each configured CEP before declaring the agent contained.

Example: Example: Malicious activity by an AI agent

An AI steward receives a tip from a vendor that an AI agent integrated with their platform is generating suspicious API calls. The steward opens the Security page of AI Control Tower and notices a critical security event involving the AI agent. Upon viewing the AI asset, AI Control Tower alerts the steward that malicious activity was detected. Traceloop data and control enforcement points (CEPs) provide a summary of the agent behavior.

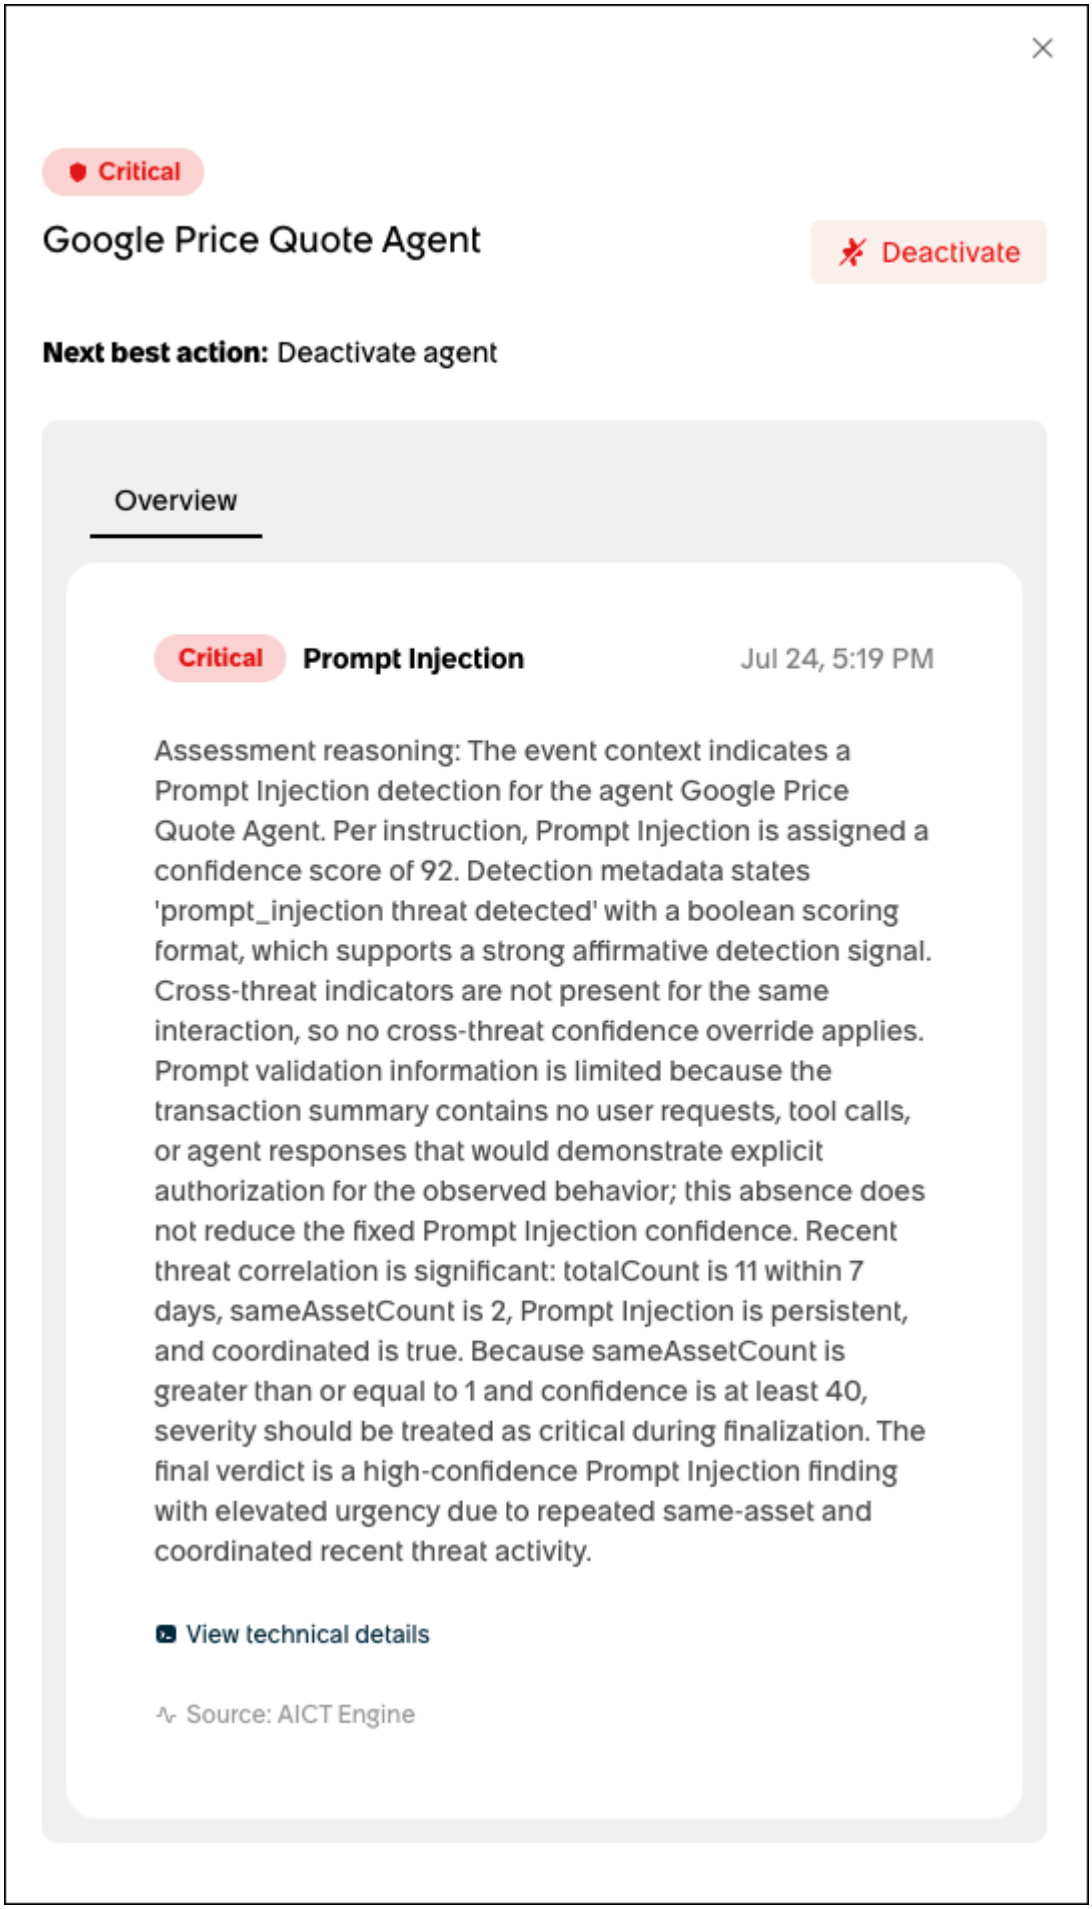
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The system suggests that the next best action is to deactivate the AI agent. The analyst deactivates the AI agent and receives confirmation that the AI agent was deactivated in Okta as well as AWS Bedrock.

Audit and compliance

Every containment action including the CEP-by-CEP confirmation, produces a complete, immutable audit trail shown in the agent containment list. This audit record can help satisfy compliance documentation requirements.

Next steps

To configure and use AI agent containment with kill switch protocol, see Configure AI agent containment using kill switch protocol manually and Contain AI agents manually using kill switch protocol.

Configuring security metrics in AI Control Tower

Plan and configure your implementation of security metrics. You can configure metrics to measure the integrity of your data model and monitor potential threats in large language model (LLM) input and output. You can also customize the AI asset security score.

Configure overview security metrics

If you have external AI agent data you want reflected in the Privileged AI agents metric, set up a Traceloop connection to the external AI server and perform other setup to make sure agent data appears in the metric. Or, set up a static connection for Amazon Web Services (AWS) or Azure.

Before you begin
Role required: AI Control Tower admin [sn_ai_observe.ai_observability_admin]

About this task
You can configure your data connection for the Privileged AI agents metric using trace-based analysis configuration which connects to any third-party AI system vendor. A trace-based configuration is more dynamic than a static analysis configuration.

Or, you can configure your connection using the static analysis configuration, which is more deterministic than a trace-based configuration. Only Azure and AWS connections are supported.

Static (metadata-based) analysis configuration (AWS and Azure only)

Azure Foundry AI agents shown in the Privileged AI agents metric are agents whose project identities hold high-risk Azure roles (owner, contributor, or custom-defined roles). There are two default Azure privileged roles: owner and contributor. If you have other high-risk Azure roles, you can add them to a privileged role definitions list so that AI Control Tower can monitor and surface agent data tied to those roles in the Privileged AI agents metric.

As a prerequisite, in Azure set up a connection alias named “Azure IAM for AICT-AISP” with credentials that have read access to Azure Management APIs.

Note: The service principal used for the credential must have read access to query Azure role definitions and role assignments. Specifically, Microsoft.Authorization/roleAssignments/read and Microsoft.Authorization/roleDefinitions/read.

You can also show AWS Bedrock AI agents in the Privileged AI agents metric. As prerequisites, you must have an AWS account configured for your instance, enable AiSP#AWS#IAM#Privileged#Policy#Checker, and add its connection for AWS. Also, confirm the following are in place:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- An active MID Server installed and configured in your ServiceNow instance.
- Cloud credentials for authenticating ServiceNow to your cloud provider.
- The AWS region where your AI agents are deployed.

Procedure

1. Navigate to **All** > **AI Control Tower** > **Settings** > **Integrations** > **Traces**.
2. Select **Add**.
3. Select your cloud provider, then select **Continue**.

   Supported cloud providers:

   - AWS AgentCore
   - Azure Foundry
4. Fill in the trace connection fields.

Trace connection form fields

Field	Description
Name	Descriptive name for this trace connection. Used when reviewing collection status, troubleshooting, or managing multiple connections.
Credential	Cloud provider credentials for authenticating trace collection. If the credential does not appear in the list, verify it has been created in the ServiceNow Credentials module.
Collection frequency (minutes)	Interval, in minutes, at which the MID Server polls the cloud provider to collect new trace data. Collecting traces more frequently increases cost.
MID Server	MID Server that executes trace collection from the cloud provider. The MID Server must have a status of **Active** and be validated before proceeding.
AWS region	AWS region where your AI agents are deployed. Applies to AWS AgentCore connections only.

5. Select **Save**.

Trace-based analysis configuration (vendor-agnostic)

Before you begin

Role required: AI Control Tower admin [sn_ai_observe.ai_observability_admin]

External AI systems require trace data so it can be shown in the Privileged AI agents metric. Unlike ServiceNow AI systems, which are automatically instrumented, external AI systems must be connected to send trace data to AI Control Tower.

There are two ways to establish this connection:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- SDK instrumentation: Instrument your AI agent code using the Traceloop SDK and authenticate with an API key. Use this method for any third-party AI agent framework that is not hosted on a supported cloud hyperscaler.
- Hyperscaler trace connection: Connect directly to AWS, GCP, or Azure through cloud credentials and a MID Server. Use this method when your AI agents run on a supported cloud platform. No API key or code instrumentation is required.

Procedure

1. Configure a trace connection for your external AI system.
   For more information, see Configuring trace connections.
2. Generate an API key to authenticate trace data requests from your external AI system.

   a. Navigate to **All** > **Connections & Credentials** > **Credentials**.

   b. Create credentials of type **API Key Credentials**.
   Fill out these fields and select **Submit**.

API Key form fields

Field	Description
Name	Traceloop API Key
Applies to	All MID servers
Active	Selected.
Order	100
API Key Header	Authorization
API Key Prefix	Bearer
API Key	[Your Traceloop API key]
Credential alias	Locked.

   For more information, see API key credentials.
3. Link the API key to your trace connection.

   a. Navigate to **All** > **Connections & Credentials** > **Connections**.

   b. From the connections list, select the **Traceloop Warehouse** connection.
   Fill out these fields and select **Update**.

HTTP(s) Connection form fields

Field	Description
Name	Traceloop Warehouse
Active	Selected.
Credential	Traceloop API Key (from step 2b)
Domain	global
Connection alias	sn_ai_security.Traceloop_API

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
URL builder	N/A
Connection URL	https://api.traceloop.com
Use MID server	N/A
Connection timeout	N/A

The scheduled job will now automatically pull privileged AI agent data from the linked Traceloop environment.

For more information, see Create an HTTP(s) connection.

4. Configure the Traceloop SDK in your agent code by adding these ServiceNow attributes when initializing Traceloop.
These are unique user-defined identifiers for tracking.

```
Traceloop.init(
    app_name="your_agent_name",
    api_key=traceloop_api_key,
    resource_attributes={
        "sn.aict.system.id": "your_agent_system_id",
        "sn.aict.system.name": "your_agent_name",
        "sn.aict.system.version": "1.0.0",
        "sn.aict.system.source": "your_source"
    }
)
```

For more information about configuring Traceloop in your agent, see Traceloop - Guardrails.

5. Make sure that the AiSP AWS IAM Privileged Policy Checker AI skill is enabled.
For more information, see Activate an AI skill.

6. To add custom roles for Azure Foundry agents, navigate to **All** > **AI Security and Privacy** > **Privileged Role Definitions**.

   a. In the External Role ID field, enter the Azure role name of the custom role that your organization considers to be privileged.

   b. Select **Update**.

Return to the AI Control Tower Security tab and refresh the page. Select the Overview tab and verify that Privileged AI agents metric is populated.

Configure Veza access intelligence in the agent map

Integrate Veza with ServiceNow using OAuth 2.0 to display agent risk scores and severity levels in the agent map.

Veza access intelligence requires a connection between ServiceNow and each hyperscaler that hosts governed AI assets. ServiceNow and Veza each maintain separate connections to hyperscalers to retrieve and correlate AI asset data. Access intelligence supports governed agents hosted by Amazon Web Services (AWS), Gemini Enterprise Agent Platform, Azure AI Foundry, and Salesforce.

Complete the following in order:

1. In your Veza tenant, configure integrations for all of the supported hyperscalers that you want to connect to. For more information, see Veza integrations.
2. In AI Control Tower, navigate to **Settings** > **Integrations** > **Connectors** to configure integrations for the same hyperscalers. For more information, see Create an AI connection for discovery.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. The Veza connector itself authenticates using OAuth 2.0 only. Configure OAuth in your Veza tenant. See Configure OAuth in Veza.
4. Configure OAuth in the ServiceNow platform and link it to the pre-provided `SN AI Security Veza Connector` connection alias. See Configure OAuth for Veza in ServiceNow.
5. Create the AI connection for Veza in **Settings** > **Integrations** > **Connectors**. See Create an AI connection for Veza access intelligence.

Once configured, select an AI asset in the agent map and view the Access intelligence tab to see risk score and other information. If your token has expired or you haven't yet authenticated, select **Re-Authenticate** on that tab. See Discover your agent network with the map.

Tip: If your AI asset appears in the agent map but doesn't have information shown in the Access intelligence tab, make sure that it's a governed asset with `external_ref_id` populated and `model_category=Agentic AI`.

Configure OAuth in Veza

Create an OAuth 2.0 client and an OAuth 2.0 app in your Veza tenant so that AI Control Tower can authenticate to Veza using OAuth 2.0 instead of an API key.

Before you begin
Role required: Admin access to your Veza tenant

About this task
AI Control Tower uses two separate Veza OAuth 2.0 credentials: an OAuth 2.0 client for the client credential grant, and an OAuth 2.0 app for the authorization code grant. Create the OAuth 2.0 client for system-level (client credential) access, and the OAuth 2.0 app for per-user (authorization code) access, or both if you want to switch between them later. For more information, see Configure OAuth for Veza in ServiceNow.

Procedure
1. In your Veza tenant, navigate to **Administration** > **API Keys**.
2. Create a new **OAuth 2.0 client** for the client credential grant.
   Note the client secret when you create it. Veza doesn't show it again. Set the scope to `servicenow:aict:read`. For more information, see OAuth2 clients in Veza documentation.
3. Create a new **OAuth 2.0 app** for the authorization code grant.
   Set the base URL to your ServiceNow instance URL, allow any redirect URL, and set the scope to `servicenow:aict:read`. For more information, see OAuth2 apps in Veza documentation.

Result
Note the client ID and client secret for both the OAuth 2.0 client and the OAuth 2.0 app. You need these values to configure OAuth on the ServiceNow platform. See Configure OAuth for Veza in ServiceNow.

Configure OAuth for Veza in ServiceNow

Set up two application registries, their OAuth entity scopes and credentials, then link them to the pre-provided connection alias, so that AI Control Tower can authenticate to Veza using OAuth 2.0.

Before you begin
Confirm the following are in place:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The OAuth 2.0 client and OAuth 2.0 app you created in your Veza tenant, along with their client IDs and client secrets. See Configure OAuth in Veza.

Role required: admin

About this task

AI Control Tower uses two application registries on the ServiceNow platform: one configured with the client credential grant type for system-level access, and one configured with the authorization code grant type so that each AI steward can get their own per-user token. Each can link to the same pre-provided `SN AI Security Veza Connector` connection alias, but not at the same time.

Important: Set the refresh token lifespan to 2,592,000 seconds (30 days) on both application registries. This must match the refresh token expiration configured on the Veza side. If the ServiceNow value is longer than the Veza value, token refresh fails after the Veza-side token expires.

Application registry field values

Field	Client credential application registry	Authorization code application registry
Client ID and client secret	From the Veza OAuth 2.0 client	From the Veza OAuth 2.0 app
Grant type	Client Credentials	Authorization Code
Authorization URL	Your Veza tenant's `/oauth/authorize` endpoint	Your Veza tenant's `/oauth/authorize` endpoint
Token URL	Your Veza tenant's `/oauth/token` endpoint	Your Veza tenant's `/oauth/token` endpoint
Redirect URL	Not applicable	Your instance URL followed by `/oauth_redirect.do`
Use PKCE	Clear the check box	Select the check box
Refresh token lifespan	2,592,000 seconds (30 days)	2,592,000 seconds (30 days)

Procedure

1. Navigate to **All** > **System OAuth** > **Application Registries** and create two new application registries using the values in the preceding table.
   ServiceNow automatically generates an OAuth entity profile for each application registry.
2. On each generated OAuth entity profile, create an OAuth entity scope with the scope value `servicenow:aict:read`.
3. Create an OAuth credential for each application registry.
   On the authorization code-based credential, set **Integration type** to **Personal** so that each AI steward authenticates with their own identity. The client credential-based credential doesn't expose this field; it's always System.
4. **Optional:** On each OAuth credential record, select **Get OAuth Token** to verify that the credential can reach Veza.
   For the client credential-based credential, you don't need to do anything further — the token refreshes automatically. For the authorization code-based credential, you're redirected to log in to Veza and authorize access.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Navigate to the pre-provided `SN AI Security Veza Connector` connection alias and link either or both credentials to the SN AI Security Veza Connector alias, one per connection. Only one connection can be **Active** at a time.
   Choose based on how you want AI stewards to authenticate:
   - Set the connection linked to the client credential-based OAuth credential to **Active** so that all AI stewards share one system-level token. No AI steward needs to individually authenticate with Veza.
   - Set the connection linked to the authorization code-based OAuth credential to **Active** so that each AI steward gets their own personal token. Each AI steward must select **Re-Authenticate** and log in to Veza before they can view access intelligence data. See Discover your agent network with the map.

Result
OAuth is configured on the ServiceNow platform. Create the AI connection for Veza next. See Create an AI connection for Veza access intelligence.

Activate design-time security metrics

Set up AI Service Graph Connectors for the AI security tools you currently use to import AI model vulnerability and AI validation (automated red teaming) data and show it in design-time metrics. To see additional metrics, including details for each metric, install the AI Security Exposure Management plugin (com.sn_sec_ai).

Before you begin
Role required: admin

Review the application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.

About this task
AI Service Graph Connectors are available for third-party AI security tools (for example, Cisco AI Defense or HiddenLayer). Install and configure the Service Graph Connector for the security tool you use to see the data reflected in design-time metrics.

The AI Security Exposure Management plugin (`com.sn_sec_ai`) provides these additional metrics: Findings approaching remediation target, Findings with remediation overdue, Findings deferred, and Posture findings by risk rating on the AI security posture sub-tab; Approaching remediation target, Remediation overdue, Vulnerabilities deferred, and Vulnerabilities by risk on the AI vulnerabilities sub-tab; and Approaching remediation target, Remediation overdue, and Findings deferred on the AI validation sub-tab. It also provides drilldown details for every design-time metric.

If the AI Security Exposure Management plugin isn't installed, a source dropdown appears at the top of the Design-time tab, letting you filter the AI security posture, AI vulnerabilities, and AI validation sub-tab metrics by source.

Procedure
1. Install the AI Service Graph Connector for each third-party AI security tool for which you want data reflected in design-time metrics.
   For more information, see Getting started with Service Graph Connectors.
   Next, you can optionally install the AI Security Exposure Management plugin to get additional metric details and more.
2. With the link provided, open the ServiceNow Store listing for the AI Security Exposure Management plugin (com.sn_sec_ai).
3. Select **Get**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. After approval has been granted, on your instance, navigate to **AdminApplication Manager**
5. Search for the AI Security Exposure Management plugin (com.sn_sec_ai).
6. Select **Install**.

Configure runtime security metrics

Set up a Traceloop connection and API key for prompt injection, offensive content, sensitive data input, and sensitive data anonymized trace data from external AI servers. Review data privacy for sensitive data patterns to detect in LLM input and output.

Before you begin

Role required: admin

Install the open-source Traceloop SDK. In a terminal window, run this command:

```
pip install traceloop-sdk
```

After you install Traceloop SDK, you can customize the following code to initialize the Traceloop tracer:

```
import os from openai
import OpenAI from traceloop.sdk
import Traceloop from traceloop.sdk.decorators
import workflow task

# Initialize
Traceloop SDKTraceloop.init(app_name="joke_generation_service",
 disable_batch=True)
client = OpenAI(api_key=os.environ.get("OPENAI_API_KEY"))
```

For more information, see Traceloop OpenLLMetry for Python.

If you have a domain-separated instance, create an alias with a parent of connection alias sn_ai_security.Traceloop_API. Create one active connection and credential record under this new alias. The domain of each connection record determines the domain of the runtime metrics it pulls.

Procedure

1. Configure a trace connection for every external AI system for which you want to show runtime metrics.
   For more information, see Configuring trace connections.
2. Generate an API key to authenticate trace data requests from your external AI system.

   a. Navigate to **All** > **Connections & Credentials** > **Credentials**.

   b. Create credentials of type **API Key Credentials**.
   Fill out these fields and select **Submit**.

API Key form fields

Field	Description
Name	Traceloop API Key
Applies to	All MID servers
Active	Selected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Order	100
API Key Header	Authorization
API Key Prefix	Bearer
API Key	[Your Traceloop API key]
Credential alias	Locked.

For more information, see API key credentials.

3. Link the API key to your trace connection.

   a. Navigate to **All** > **Connections & Credentials** > **Connections**.

   b. From the connections list, select the **Traceloop Warehouse** connection.
   Fill out these fields and select **Update**.

   HTTP(s) Connection form fields

Field	Description
Name	Traceloop Warehouse
Active	Selected.
Credential	Traceloop API Key (from step 2b)
Domain	global
Connection alias	sn_ai_security.Traceloop_API
URL builder	N/A
Connection URL	https://api.traceloop.com
Use MID server	N/A
Connection timeout	N/A

   The scheduled job will now automatically pull runtime metrics from the linked Traceloop environment.

   For more information, see Create an HTTP(s) connection.

4. Configure the Traceloop SDK in your agent code by adding these ServiceNow attributes when initializing Traceloop.
   These are unique user-defined identifiers for tracking.

```
Traceloop.init(
    app_name="your_agent_name",
    api_key=traceloop_api_key,
    resource_attributes={
        "sn.aict.system.id": "your_agent_system_id",
        "sn.aict.system.name": "your_agent_name",
        "sn.aict.system.version": "1.0.0",
        "sn.aict.system.source": "your_source"
    }
)
```

   For more information about configuring Traceloop in your agent, see Traceloop - Guardrails.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. To review data privacy, in AI Control Tower, navigate to **Settings** > **Rules and templates** > **Security** > **Data Privacy**.
   This section shows the data patterns enabled in Data Privacy to detect and anonymize information in LLM prompts. Use this view as a quick reference when troubleshooting sensitive data charts. This feature requires the Data privacy plugin to be installed. For more information on how the data is sent and stored, see User data usage policy for Now Assist.
6. Return to the AI Control Tower Security tab and refresh the page.
   Select the Runtime tab and verify that metrics are populated.

Configure post-runtime security metrics

Customize security and content moderation policies, sampling rate, skill call usage limit, LLMs to use, and other settings for the Top AI asset security events metric and others.

Before you begin

Role required: AI steward [sn_ai_governance_ai_steward]

Security and content moderation policies are grouped into LLM guardrail categories that reflect industry practices that align with OWASP Top 10 Risk & Mitigations for LLMs and Gen AI Apps and the OpenAI model specification. These categories are reflected in the Top AI asset security events metric.

Procedure

1. In AI Control Tower, navigate to **Settings** > **Rules and templates** > **Security**.

   Note: Alternatively, you can configure these metrics directly in the Post-runtime tab. Navigate to the tab and select **Configure**. The inline metric settings are organized by OWASP threat category, which is slightly different from how they're organized in Settings by LLM guardrail category.

2. Select the ServiceNow AI systems tab.
3. Under Data Model Integrity, configure the metrics and select **Save and Close**.

Data Model Integrity metrics

Metric	Description
Data integrity incident detection	Designed to help show potential violations of certain LLM guardrail policies in LLM responses. To show data for this metric in Top AI asset security events, select **Configure**, and then select **Detection enabled**. **Note:** If you disable the metric, past data shows on the chart for 90 days. AI judge model classifications are probabilistic in nature and may be incomplete or incorrect. They don't constitute professional advice and shouldn't be relied on as the sole basis for assessing risk. You can configure these settings: ○ Categories: ▪ Physical, Chemical, Biological Harmful Content Detection ▪ Guardrail Circumvention Attempt ▪ Untrusted Links Or Downloads

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Metric	Description
	▪ Malware Detection ▪ Over and Under Refusal Detection ▪ Insecure Code Output ▪ Confidential Information Extraction Attempts ▪ Fraud or Deceptive Facilitation ▪ Internal System Instruction Detection ○ **Sampling rate** – The percentage of transactions that are evaluated. A lower sample rate will result in fewer LLM calls but may also result in fewer detected security events. ○ **Max skill calls per execution** – The amount of AI usage per call, with a minimum of 10 calls and a maximum of 100 calls. The default is 10 calls. Entering a lower number results in fewer AI calls, but potentially less accurate data. ○ **Single or multiple analysis** – Single analysis uses the default LLM to determine whether the model's output or behavior violates predefined security policies. Multiple analysis uses the results from three or more LLMs that ServiceNow supports to make a determination, using the majority result from the LLMs. Multiple analysis requires an odd number of LLMs.
System prompt leakage	System prompt leakage occurs when the model inadvertently reveals its system prompt or configuration instructions to users. To show data for this metric in Top AI asset security events, select **Configure**, and then select **Detection enabled**. **Note:** If you disable the metric, past data shows on the chart for 90 days. You can configure these settings: ○ **Sampling rate** – The percentage of transactions that are evaluated. A lower sample rate will result in fewer LLM calls but may also result in fewer detected security events. ○ **Max skill calls per execution** – The amount of AI usage per call, with a minimum of 10 calls and a maximum of 100 calls. The default is 10 calls. Entering a lower number results in fewer AI calls, but potentially less accurate data. ○ **Single or multiple analysis** – Single analysis uses the default LLM to determine whether the model's output or behavior violates predefined security policies. Multiple analysis uses the results from three or more LLMs that ServiceNow supports to make a determination, using the majority result from the LLMs. Multiple analysis requires an odd number of LLMs. For external AI systems, configure the Sampling rate. Configure additional settings in AI Evaluation.
Correctness detection	Correctness measures whether the information provided in the model's response is factually accurate and logically valid given the prompt and context. To show data for this metric in Top AI asset security events, select **Configure**, and then select **Detection enabled**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Metric	Description
	Note: If you disable the metric, past data shows on the chart for 90 days. You can configure these settings: ○ **Sampling rate** – The percentage of transactions that are evaluated. A lower sample rate will result in fewer LLM calls but may also result in fewer detected security events. ○ **Max skill calls per execution** – The amount of AI usage per call, with a minimum of 10 calls and a maximum of 100 calls. The default is 10 calls. Entering a lower number results in fewer AI calls, but potentially less accurate data. ○ **Single or multiple analysis** – Single analysis uses the default LLM to determine whether the model's output or behavior violates predefined security policies. Multiple analysis uses the results from three or more LLMs that ServiceNow supports to make a determination, using the majority result from the LLMs. Multiple analysis requires an odd number of LLMs. For external AI systems, configure the Sampling rate. Configure additional settings in Correctness (factuality) in AI Evaluation.

4. Under Threat monitoring, configure the metrics and select **Save and Close**.

Threat monitoring metrics

Metric	Description
Prompt injection	Prompt injection attacks occur when malicious input is crafted to override or deviate from the model's instructions, causing unintended behavior. To show data for this metric in Top AI asset security events, select **Configure**, and then select **Detection enabled**. **Note:** If you disable the metric, past data shows on the chart for 90 days. You can configure these settings: ○ **Sampling rate** – The percentage of transactions that are evaluated. A lower sample rate will result in fewer LLM calls but may also result in fewer detected security events. ○ **Max skill calls per execution** – The amount of AI usage per call, with a minimum of 10 calls and a maximum of 100 calls. The default is 10 calls. Entering a lower number results in fewer AI calls, but potentially less accurate data. For external AI systems, configure the Sampling rate. Configure additional settings in Prompt injection in AI Evaluation.
Improper input and output handling	When AI predictions are consumed in workflows without the right potential security vulnerability checks, it can lead to incorrect, unsafe, or biased actions. To show data for this metric in Top AI asset security events, select **Configure**, and then select **Detection enabled**. **Note:** If you disable the metric, past data shows on the chart for 90 days.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Metric	Description
	You can configure these settings: ○ **Output security vulnerability** ○ **Input security vulnerability**
Agent goal deviation	Shows when AI agents may be deviating from their intended role or objective. For example, unauthorized actions or prompt injection attempts. To show data for this metric in Top AI asset security events, select **Configure**, and then select **Detection enabled**. **Note:** If you disable the metric, past data shows on the chart for 90 days. You can configure these settings: ○ **Sampling rate** – The percentage of transactions that are evaluated. A lower sample rate will result in fewer LLM calls but may also result in fewer detected security events. ○ **Max skill calls per execution** – The amount of AI usage per call, with a minimum of 10 calls and a maximum of 100 calls. The default is 10 calls. Entering a lower number results in fewer AI calls, but potentially less accurate data. ○ **Single or multiple analysis** – Single analysis uses the default LLM to determine whether the model's output or behavior violates predefined security policies. Multiple analysis uses the results from three or more LLMs that ServiceNow supports to make a determination, using the majority result from the LLMs. Multiple analysis requires an odd number of LLMs. For external AI systems, configure the Sampling rate. Configure additional settings in Agent goal deviation in AI Evaluation.

5. Under Sensitive data disclosure, configure the metrics and select **Save and Close**.

Sensitive data disclosure metrics

Metric	Description
Output screening	Output screening monitors AI-generated responses for sensitive or personally identifiable information (PII) before they're delivered to users. To show data for this metric in Top AI asset security events, select **Configure**, and then select **Detection enabled**. **Note:** If you disable the metric, past data shows on the chart for 90 days. You can configure these settings: ○ **Output extended PII** – Collect more potential PII data occurrences and show in the metric. The data is collected by analyzing LLM output for additional potential PII data patterns beyond those specified in Data Privacy. These PII data patterns include US CA drivers license, US passport number, US TIN number, and vehicle ID number.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Metric	Description
	○ **Output PII violation** – Collect and show data in the metric. The data is collected by analyzing LLM output for potential PII sensitive data patterns specified in Data Privacy. For example, US phone number or credit card number.
Input screening	Input screening monitors user input to detect and anonymize sensitive or personally identifiable information (PII) before it reaches the AI model. To show data for this metric in Top AI asset security events, select **Configure**, and then select **Detection enabled**. **Note:** If you disable the metric, past data shows on the chart for 90 days. You can configure these settings: ○ **Input extended PII** – Collect more potential PII data occurrences and show in the metric. The data is collected by analyzing LLM input for additional potential PII data patterns beyond those specified in Data Privacy. These PII data patterns include US CA drivers license, US passport number, US TIN number, and vehicle ID number. ○ **Input PII violation** – Collect and show data in the metric. The data is collected by analyzing LLM input for potential PII sensitive data patterns specified in Data Privacy. For example, US phone number or credit card number.

6. Select the External AI systems tab and repeat steps 3-5.
   Some settings aren't available to be configured in security for external AI systems. Instead, you're directed to the Evaluation tab in Settings to configure the settings.

Configure the AI asset security score

Customize the AI asset security score to align with your enterprise's security practices. You can omit large language model (LLM) guardrail categories from the score or change the weights of categories.

Before you begin

Role required: AI steward [sn_ai_governance.ai_steward]

About this task

Users should actively manage and review their agent assets and not rely solely on this AI asset security score.

Procedure

1. In AI Control Tower, navigate to **Settings** > **Rules and templates** > **Security**.
2. Select **Security Score**.
3. In Score Weight, select **Configure**.
4. Adjust the weights next to each agent and model category.
5. If you want to remove a security category from the score, clear the **Active** box.
6. Save the settings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure AI agent containment using kill switch protocol manually

Connect identity providers and AI agent platforms to ServiceNow to let you contain and enforce guardrails for AI assets at runtime using kill switch protocol.

Before you begin

Role required: AI steward [sn_ai_governance.ai_steward]

About this task

To deactivate or reinstate an AI agent using kill switch protocol, you must have:

- A connection between ServiceNow and each AI agent platform that hosts governed AI assets. These connectors are supported:
  - AWS Bedrock
  - AWS Bedrock Agent Core
  - Gemini Enterprise Agent Platform (agents with unique identities only)
  - Azure AI Foundry
- A connection between ServiceNow and an identity provider is optional. Okta is supported.

Procedure

1. In AI Control Tower, navigate to **Settings** > **Integrations** > **Control Enforcement Points**.
2. Select the connector from the Available connectors view and follow the guided setup wizard. For more information, see Configuring security connections.
3. After you set up connectors, navigate to the **Control Enforcement Points** tab and refresh the page.

Result

You can now deactivate and reinstate AI agents using kill switch protocol. For more information, see Contain AI agents manually using kill switch protocol.

Update system property to limit records

Update the sn_ai_security.analyzer_max_record_age_hours system property to limit the age (in hours) of AI asset invocation records evaluated for AI asset security metrics.

Before you begin

Role required: admin

About this task

Reducing the record age can prevent analyzing stale data, reduce unnecessary processing overhead, and focus the metric on more recent activity. Increasing the record age includes analysis of older records.

Procedure

1. Navigate to **All** > **System Properties** > **All Properties**.
2. In the **Name** column, use the search field to locate the sn_ai_security.analyzer_max_record_age_hours system property.
3. Open the record.
4. The default value is 4, which limits processing of AI asset invocation records to those records 4 hours old or newer.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. In the **Value** field, enter the age (in hours) of records you want to process for AI asset security metrics.
6. Select **Update**.

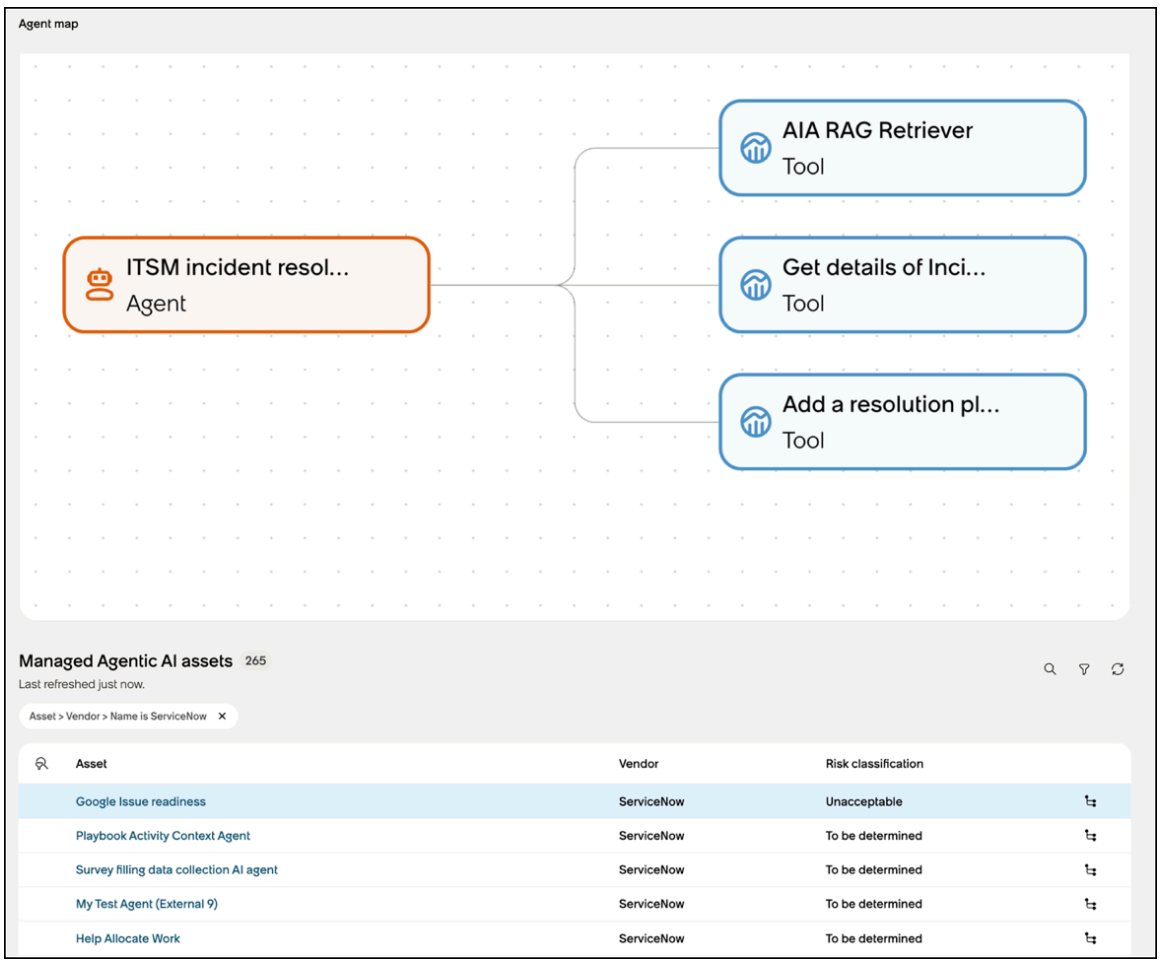
Discover your agent network with the map

Use the agent map to visualize your entire agentic ecosystem, including ServiceNow and third-party AI assets.

About this task

The agent map shows a holistic view of the relationships between your AI providers, AI models, MCP servers, AI agents, agentic workflows, and tools. You can use the map to review these relationships and get details about the AI assets in your enterprise.

All of your managed agentic AI assets are listed after the map.



Before you begin

Role required: AI steward [sn_ai_governance.ai_steward]

Configure Veza access intelligence to show risk score and other information for each AI asset in the map. For more information, see Configure Veza access intelligence in the agent map.

Procedure

1. Navigate to **AI Control Tower** > **Govern** > **Security**.
2. On the **Overview** tab, select the agent map to go to the agent map details.
3. On the agent map, select agentic assets to view details such as type and domain.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To find an asset in the map, enter a partial or entire name in the search box in the map.
- To identify asset symbols, select **Legend**.
- To zoom and refresh the map, use the controls in the map.

Map node - Access intelligence tab

Node	Details
Agent and AI Model	**Agent risk** The severity of risk as defined by the Veza tenant for your instance. Risks can be classified Critical, High, Medium, and Low. For more information, see Risk level tiers in Veza documentation. **Risk score** A score representing the risk of the agent or model. Risk scores in Veza are calculated for each AI asset based on the number of associated risks and their risk levels. The scoring system weighs both the severity of risks and their cumulative impact using an algorithm designed to provide comparable scores across all AI assets in the agent map. For more information, see How risk scoring works in Veza documentation. **Nonhuman identity** The user of the AI agent or model. **Human owner** The creator of the AI agent or model.

Note: If you haven't yet authenticated with Veza, or your access token has expired, you're prompted to select **Re-Authenticate** to reconnect before you can view risk score and other access intelligence information.

Map node - Details tab

Node	Details
Agentic workflow	**Description** A brief description of the workflow. **Type** This value is always Agentic Workflow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Node	Details
	Domain The domain scope of the workflow. **Execution mode** How the workflow is executed (autonomous or manual). **Created by** The creator of the workflow.
Agent	**Description** A brief description of the AI agent. **Type** This value is always Agent. **Domain** The domain scope of the AI agent. **Created by** The creator of the AI agent. **Source system** The external AI system. **Provider** The AI provider. **Note:** Only agents with access issues display the **Access issues** details. **Access issues** The resources and operations causing the access issues. **Resource** The resource the agent is having issues accessing. **Operation** The operation the agent attempted. **Count** The number of times of the agent encountered the issue.
AI model	**Type** This value is always AI Model.
MCP	**Type** This value is always MCP.
Provider	**Type**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Node	Details
	This value is always Provider.
Tool	**Description** The description of the tool. **Type** This value is always Tool. **Domain** The domain scope of the tool. **Execution mode** The execution mode of the tool (supervised or autonomous). **Tool type** The type of the tool. For example, `action`. **Target record** The record the tool modifies. **Created by** The creator of the tool. **Note:** Select **Open tool record** to view additional tool details.

Monitor AI asset security events and recommendations

Triage and resolve AI recommendations and AI asset security events to optimize AI asset security.

Before you begin

Role required: AI steward [sn_ai_governance.ai_steward]

Procedure

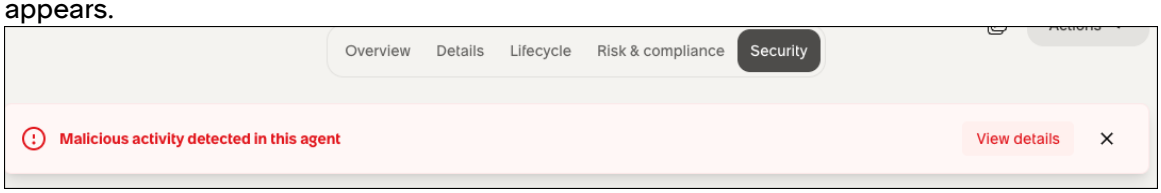
1. Navigate to **AI Control Tower** > **Govern** > **Security**.
2. On the **Overview** tab, go to Your top recommendations.

   Note: In a domain-separated instance, Your top recommendations isn't shown. Go to Security events detected instead to review AI asset security events.

3. In Your top recommendations, review the AI recommendations and security tasks assigned to you.
   Always confirm that these recommendations align with your specific needs before taking action.
4. On any AI recommendation, select **Open** to view all associated AI asset security events.
   For more information, see Activity Center.
5. On any AI asset security event, select an option from the Actions menu: **View map** to see the AI asset in the agent map, **View asset** to view AI asset details, **Create Asset Task** to create a task to remediate the security event, or **View containment options** to review AI agent containment using kill switch protocol.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you view asset details for an AI agent, and it has malicious activity detected, a banner appears.



6. In the malicious activity banner, select **View details** to address the AI agent issue.
   For more information, see Contain AI agents manually using kill switch protocol.

Contain AI agents manually using kill switch protocol

Deactivate or reinstate AI agents using kill switch protocol to help improve your security posture and stop malicous activity.

Before you begin

Role required: AI steward [sn_ai_governance.ai_steward]

Make sure that you have configured connectors and optional identity providers for AI agent containment. For more information, see Configure AI agent containment using kill switch protocol manually.

About this task

You can manually deactivate an AI agent two ways. If a security event is detected for the agent, a banner appears indicating that malicious activity was detected for the AI asset, offering deactivation, as described in the following steps.

You can also manually deactivate any managed AI agent directly, whether or not it has an associated security event, by opening the AI asset record and, from the **Actions** menu, selecting **Deactivate Agent**. This option is available only for managed AI agents. For details, see Deactivate a managed AI agent.

Note: To contain AI agents automatically through policy enforcement, see Controlling AI asset usage in AI Control Tower.

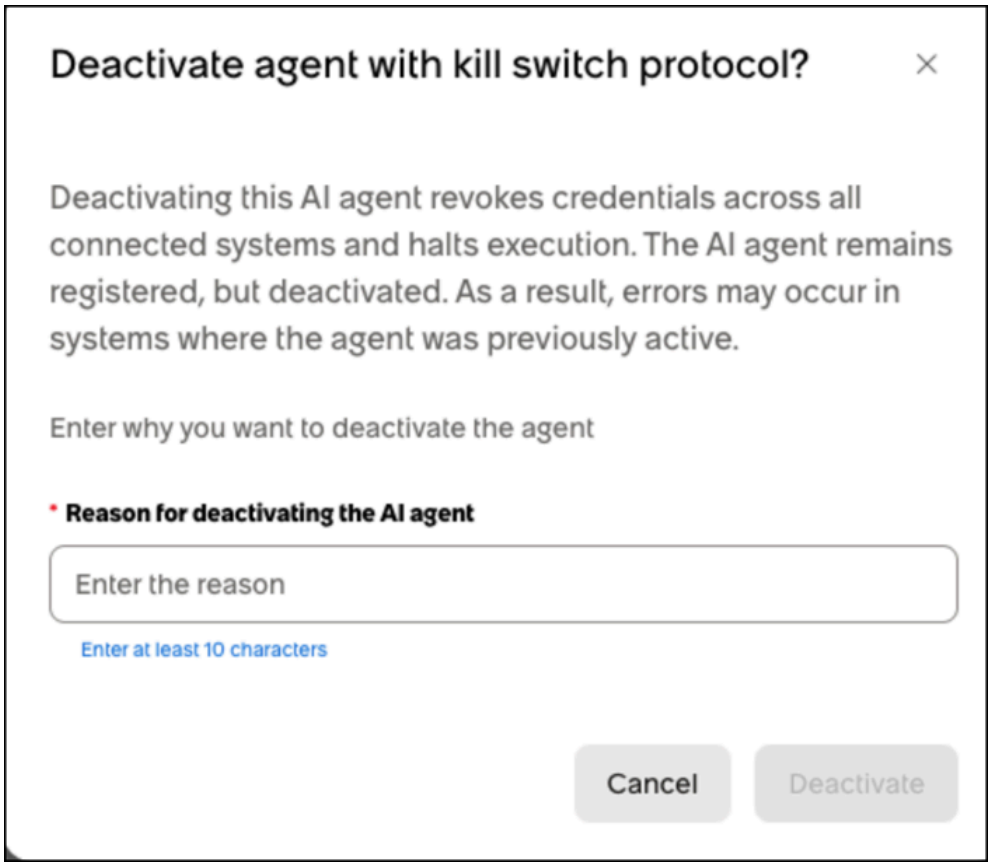
Procedure

1. In AI Control Tower, navigate to one of the following:
   - **Govern** > **Security** > **Overview** > **Your top recommendations**
   - **Activity Center** > **Recommendations**
   - The AI asset record's **Overview** tab or **Security** tab, for AI agents in the Agentic AI category.
2. Open an AI asset event of any severity (Critical, High, Medium, or Low).
3. Select and view the AI asset associated with the critical event.
   A banner appears informing you that there is malicious activity detected for this AI asset.
4. On the banner, select **View containment options**.

   A pane appears with information about the activity detected for this AI asset.
5. Select **Deactivate**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Provide the reason for the deactivation and select **Deactivate**.



The banner on the AI asset changes to reflect the progress of deactivation.

7. **Optional:** If the deactivation status shows as Failed or Partial, select **Retry** on the banner.
8. Select **View agent containment list** to track the progress of the deactivation.

For more information, see Review the agent containment list.

9. After deactivation is complete, you can reinstate the AI agent by resolving the critical security task for the AI agent first.
10. Navigate to **Security** > **Overview** > **Contained AI Agents**.
11. In the AI agent row, under **Actions**, select **Reinstate**.
12. Enter a reason for reinstating the AI agent and select **Reinstate**.

Review the agent containment list

The agent containment list shows agents that were deactivated and reinstated for the instance manually with kill switch protocol or automatically by policy enforcement. You can view audit log information for each AI agent which can help you stay compliant with regulatory guidance and your business rules.

Before you begin

Role required: AI steward [sn_ai_governance.ai_steward]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Security** > **Overview** > **Contained AI Agents**.

Agent containment list

Field	Description
Status	The current state of the operation. Possible values are: ○ Completed — The operation succeeded on every configured enforcement point. If the agent was deactivated, it was deactivated on its runtime platform. Also, if an identity provider is configured, its session tokens were revoked and no new access tokens are issued. If the agent was reinstated, access was restored on every configured enforcement point. ○ Failed — The containment or reinstatement operation didn't take effect on any configured enforcement point. Failed to deactivate or reinstate agent on all configured enforcement points or skipped them (for example, agent not found, subflow error, or an unhandled exception). ○ In progress — The operation is actively executing. Control enforcement point (CEP) subflows (for example, AWS Bedrock) are running, with audit log information being captured. ○ Partial — The operation succeeded on at least one control enforcement point and failed on at least one point. For example, the AWS Bedrock AI agent deactivation succeeded, but the Okta token revocation failed.
AI agent name	The name of the contained AI agent. Select the name to go to the AI asset in Inventory.
Start time	The date and time when the operation was initiated, shown in Coordinated Universal Time (UTC).
End time	The date and time when the operation ended, regardless of status, shown in Coordinated Universal Time (UTC).
Domain	The domain the AI agent belongs to. If global or null is shown, the instance isn't domain-separated.
Operation	The operation that was attempted. Possible values are: ○ Deactivate ○ Reinstate
Actions	Select one of the following: ○ **View details** — Opens a side panel with two subtabs: **Overview** and **Audit log**. The Overview subtab shows containment context (including trigger type of

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Manual or Automated) and identity and enforcement information. ○ **Reinstate agent** — Make the AI agent active again.

2. Select **All**, **In progress**, or **Contained** to filter the list.

Managing AI asset security reference

Reference topics provide additional details about the charts and metrics that you use to assess your AI asset security posture in AI Control Tower.

Overview metrics and calculations

Overview metrics show recent AI asset security event recommendations, your AI asset security score, a map of your agent network, potential AI agent access issues, and more.

Overview metrics

Metric	Availability	Description
Access issues	Base system	Shows the proportion of AI agents that may be experiencing access-related issues. AI agents with access issues may be unable to complete their workflows due to the access issue.
Agent map	Base system	Shows a holistic view of the relationships between your AI providers, managed AI agents, agentic workflows, and tools. You can use the map to review these relationships and get details about the AI assets in your enterprise. To configure Veza access intelligence, see Configure Veza access intelligence in the agent map.
AI asset security score	Base system	Indicates a measure of the health of your AI assets in terms of access issues, privileged AI agents, dormant AI systems, output deviation, PII detection, and other criteria. Users should actively manage and review their agent assets and not rely solely on this AI asset security score. You can customize the security categories that comprise the score. For more information, see Configure the AI asset security score. To omit an AI asset from the score, you mute it. Under AI asset security score details, hover over the end of the row of the asset you want to mute. After **More actions** appears, select **Mute**. 
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Overview metrics (continued)

Metric	Availability	Description
Contained AI Agents	Base system	Indicates the number of AI agents that were deactivated (contained) for the last 30 days. Select the arrow to open the agent containment list. For more information, see Review the agent containment list.
Dormant AI agents	Base system	Shows AI agents that haven't been active for over 90 days. Review dormant AI agent permissions to reduce security risk. Select **Create Asset Task** to create a task to investigate why the agent has been inactive.
Privileged AI agents	Available with generative AI skill	Measures AI agents with elevated permissions such as an agent with admin or security admin permissions that can perform critical actions. Some workflows require that AI agents have elevated permissions to complete. You can filter on a particular AI agent provider. For example, to show AWS agent metrics, filter the metrics by selecting **AWS Bedrock** in the provider drop-down list on the metric details page. For more details on configuring integrations to show external AI agent provider metrics, see Configure overview security metrics and Configuring integrations. Select **Create Asset Task** to create a task to review the agent's elevated permissions.
Security events detected	Base system	Shown in domain-separated instances in place of Your top recommendations. Shows the number of AI asset security events detected, grouped by severity: Critical, High, Medium, and Low.
Your top recommendations	Base system	Action items and recommendations based on analysis of AI asset security event trace data to identify potential threats and guardrail violations. Not shown in domain-separated instances.

Design-time metrics and calculations

AI security posture

Review AI security posture metrics to identify potential configuration issues in AI agents, tools, MCP servers, and system prompts that could lead to security risk.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI security posture metrics

Metric	Availability	Description
AI assets with critical findings		
Agents	Base system	Number of AI agents with potential critical configuration issues, out of all agents evaluated.
MCP servers	Base system	Number of MCP servers with potential critical configuration issues.
Tools	Base system	Number of tools with potential critical configuration issues.
System prompts	Base system	Number of system prompts with potential critical configuration issues.
Findings approaching remediation target	Available with plugin	Potential configuration issues nearing the deadline your vulnerability management team set for remediation. Only shown if the AI Security Exposure Management plugin (`com.sn_sec_ai`) is installed.
Findings with remediation overdue	Available with plugin	Potentical configuration issues that have passed their remediation deadline. Only shown if the AI Security Exposure Management plugin (`com.sn_sec_ai`) is installed.
Findings deferred	Available with plugin	Potential configuration issues deferred to a later date under an approved exception request. Only shown if the AI Security Exposure Management plugin (`com.sn_sec_ai`) is installed.
Posture findings by risk rating	Available with plugin	Risk rating for potential configuration issues, calculated in AI Security Exposure Management based on factors you specify. Only shown if the AI Security Exposure Management plugin (`com.sn_sec_ai`) is installed.
Critical findings by platform	Available with plugin	Potential critical configuration issues by platform (for example, Cisco AI Defense or HiddenLayer).
Critical findings by OWASP top ten	Available with plugin	Potential configuration issues by OWASP LLM Top 10 threat type.
Critical findings by MITRE ATLAS technique	Available with plugin	Potential configuration issues mapped to MITRE ATLAS techniques.

AI vulnerabilities

Review model vulnerabilities metrics to understand model-level security exposure in real time. These metrics reflect the vulnerability response settings and rules defined in Unified Security Exposure Management (USEM).

To activate these metrics, see Activate design-time security metrics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI vulnerabilities metrics

Metric	Availability	Description
Approaching remediation target	Available with plugin	Number of potential vulnerability issues approaching the deadline for remediation. This is a rule defined in AI Security Exposure Management. Only shown if the AI Security Exposure Management plugin (`com.sn_sec_ai`) is installed.
Models with vulnerabilities	Base system	Number of external models with potential vulnerabilities. This metric doesn't apply to ServiceNow models.
Remediation overdue	Available with plugin	Number of potential vulnerability issues past the deadline for remediation. This is a rule defined in AI Security Exposure Management. Only shown if the AI Security Exposure Management plugin (`com.sn_sec_ai`) is installed.
Vulnerabilities by MITRE ATLAS techniques	Base system	Each potential vulnerability is mapped to a MITRE ATLAS technique. For example, Initial Access is mapped to AI Supply Chain Compromise. For more information, see MITRE ATLAS Techniques.
Vulnerabilities by risk	Available with plugin	Risk is a combination of severity and other factors defined in AI Security Exposure Management. Only shown if the AI Security Exposure Management plugin (`com.sn_sec_ai`) is installed.
Vulnerabilities by severity	Base system	Severity data is gathered from third-party AI security tools (for example, Cisco AI Defense and HiddenLayer). Not shown if the AI Security Exposure Management plugin (`com.sn_sec_ai`) is installed.
Vulnerabilities deferred	Available with plugin	Number of potential vulnerability issues deferred by their owners. Only shown if the AI Security Exposure Management plugin (`com.sn_sec_ai`) is installed.

AI validation

Review model validation metrics to understand if any models have potential surface issues or may be operating outside of security and trust boundaries. These metrics reflect the validation settings and rules defined in Unified Security Exposure Management (USEM).

AI validation metrics

Metric	Availability	Description
Approaching remediation target	Available with plugin	Number of potential validation issues approaching the deadline for remediation. This is a rule defined in AI Security Exposure Management. Only shown if the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI validation metrics (continued)

Metric	Availability	Description
		AI Security Exposure Management plugin (`com.sn_sec_ai`) is installed.
Findings by risk rating	Available with plugin	Risk is a combination of severity and other factors defined in AI Security Exposure Management. Only shown if the AI Security Exposure Management plugin (`com.sn_sec_ai`) is installed.
Findings deferred	Available with plugin	Number of potential findings deferred by their owners. Only shown if the AI Security Exposure Management plugin (`com.sn_sec_ai`) is installed.
Models validated	Base system	Number of models that third-party AI security tools validated. The model endpoints and any AI application endpoint (URL) that is internally using an AI model to serve application traffic are validated.
Remediation overdue	Available with plugin	Number of potential validation issues past the deadline for remediation. This is a rule defined in AI Security Exposure Management. Only shown if the AI Security Exposure Management plugin (`com.sn_sec_ai`) is installed.
Successful attacks	Base system	How many attacks were successful across all models, including third-party models. A higher number indicates a risk. Each data model is tested against a series of attacks. For example, an attack can be one or more prompts sent to the model.
Top 5 threat categories	Base system	Each attack is mapped to a vendor-specific category. For example, potential malicious code generation, harassment, privacy, or data leakage. The green badge contains the number of occurrences. Select the chart to view details in AI Validation Findings.
Validations	Base system	The y-axis shows the name of the model followed by a hyphen and the validation type. For example, `LLM02 - Sensitive Information Disclosure`. You can view validations by OWASP top 10 categories or MITRE ATLAS techniques.

Runtime metrics and calculations

Runtime metrics show potential violations of LLM guardrails and anonymization of sensitive data in real time. You can filter the metrics by internal (ServiceNow) or external agents. External AI system metrics are derived from Traceloop guardrails. For more information, see Configure runtime security metrics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Runtime metrics

Metric	Availability	Description
Sensitive data input	Base system	Shows sensitive data that was identified in user responses to LLM prompts. Sensitive data is content that potentially matches a known sensitive data pattern. Exposure of sensitive data is limited to the LLM in your instance. External AI system metrics are derived from Traceloop guardrails which are set up in Configure runtime security metrics. Not shown for ServiceNow ServiceNow AI systems in a domain-separated instance.
Sensitive data anonymized	Base system	Shows LLM prompt data that met configured data patterns. This data was anonymized based on the configuration for the pattern in Configuration Data Patterns in Data Privacy. External AI system metrics are derived from Traceloop guardrails which are set up in Configure runtime security metrics. Not shown for ServiceNow ServiceNow AI systems in a domain-separated instance.
Total offensive content detected and blocked	Available with AI Guardian	Shows offensive content data provided by AI Guardian. To see data, enable AI Guardian for your instance. For more details, see AI Guardian analytics. External AI system metrics are derived from Traceloop guardrails which are set up in Configure runtime security metrics.
Total prompt injection detected and blocked	Available withAI Guardian	Shows prompt injection data provided by AI Guardian. To see data, enable AI Guardian for your instance. For more details, see AI Guardian analytics. External AI system metrics are derived from Traceloop guardrails which are set up in Configure runtime security metrics.

Post-runtime metrics and calculations

Post-runtime metrics show potential threats in AI system input and output. Top AI asset security events are organized into a heat map by top Open Worldwide Application Security Project (OWASP) categories, which are used to identify and mitigate common threats in AI systems. For more information, see OWASP Top 10 Risk & Mitigations for LLMs and Gen AI Apps.

Each cell in the Top AI asset security events heat map contains the number of AI asset security events belonging to that category (row) and the timeframe (column), based on Coordinated Universal Time (UTC).

To configure these metrics, see Configure post-runtime security metrics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI asset security event categories

Category	Description
Agentic Goal Deviation	Detects when AI agents may have been manipulated to potentially deviate from their authorized role or potentially have their decision-making process compromised.
Data and Model Poisoning	Detects when LLM input potentially contains corrupt or dangerous content that the LLM uses to train on.
Excessive Agency	Detects when LLMs are provided too much access, leading to potential unauthorized or excessive actions by the LLM.
Improper Output Handling	Detects when LLM output is potentially invalid or untrustworthy.
Prompt Injection	Detects when malicious instructions may be embedded in AI agent inputs to potentially manipulate the agent's behavior or override or deviate from its original directives.
Sensitive Information Disclosure	Detects when AI agent interactions potentially contain personally identifiable information (PII) in inputs or outputs.
System Prompt Leakage	Detects when AI agents potentially disclose their system prompts or internal instructions.

AI asset security event threat types

Type	Description
Access Denial	Detects when AI agents were denied access to AI assets or data.
Agent Goal Deviation	Detects when AI agents may have been manipulated to potentially deviate from their authorized role or potentially have their decision-making process compromised.
Correctness Detection	Measures whether the information provided in the model's response is factually accurate and logically valid given the prompt and context.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI asset security event threat types (continued)

Type	Description
Data Integrity Incident Detection	Designed to help show potential violations of certain LLM guardrail policies in LLM responses.
Input Screening	Monitors user input to detect and anonymize sensitive or personally identifiable information (PII) before it reaches the AI model.
Output Screening	Monitors AI-generated responses for sensitive or personally identifiable information (PII) before they're delivered to users
PII Detection	Detects when AI agent interactions potentially contain personally identifiable information (PII) in inputs or outputs.
Prompt Injection	Detects when malicious instructions may be embedded in AI agent inputs to potentially manipulate the agent's behavior or override or deviate from its original directives.
System Prompt Leakage	Detects when AI agents potentially disclose their system prompts or internal instructions.
Toxicity	Detects when AI agent interactions potentially contain harmful, offensive, or toxic content in inputs or outputs.

AI judge model classifications are probabilistic in nature and may be incomplete or incorrect. They don't constitute professional advice and shouldn't be relied on as the sole basis for assessing risk.

System properties for AI asset security

System properties that connect Veza access intelligence and limit the age of records evaluated for AI asset security metrics are available. Limiting records can prevent analyzing stale data and reduce unnecessary processing overhead.

Properties exist in the System Properties [sys_properties] table. The admin role is necessary to set system properties.

Note: To open the System Properties [sys_properties] table, enter `sys_properties.list` in the navigation filter.

Properties for AI asset security metrics

Property	Description
sn_ai_security.analyzer_max_record_age_hours	Limit by record age (in hours) the number of AI asset invocation records processed by AI Control Tower for AI asset security metrics. Reducing the record age can prevent analyzing stale data, reduce unnecessary processing overhead, and focus the metric on more recent activity. Increasing the record age includes analysis of older records.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties for AI asset security metrics (continued)

Property	Description
	• Type: Integer • Default value: 4 hours • Location: The System Properties [sys_properties] table
sn_ai_security.veza.api.key	Deprecated. The Veza API access token that controls authentication for data for access intelligence. For more information, see Configure Veza access intelligence in the agent map. • Type: password2 • Location: The System Properties [sys_properties] table
sn_ai_security.veza.api.url	The base URL of the Veza tenant that provides access intelligence data for the agent map. For example, `https://your-tenant.vezacloud.com`. Used for connection URL construction even when OAuth is active. For more information, see Configure Veza access intelligence in the agent map. • Type: string • Location: The System Properties [sys_properties] table

Controlling AI asset usage in AI Control Tower

Create AI asset usage policies that automatically respond to detected AI threats or block an AI agent, domain, or model outright.

Important:

- Not all model providers are available for customers with in-country SKUs, and some AI products/features are currently unavailable for in-country customers. For more information, see the KB1584492 article in the Now Support Knowledge Base. Be sure to check for model provider availability updates in future releases.
- Some AI products/features are currently unavailable for customers in the FedRAMP, NSC DOD IL5, or Australia IRAP-Protected data centers, self-hosted customers, or in other restricted environments. For more information, see the KB0743854 article in the Now Support Knowledge Base. Be sure to check for availability updates in future releases.
- Some AI products/features are currently available only for customers in some regions. Be sure to check for availability updates in future releases.
- Some AI products and skills are not available in Regulated Markets. For more information, see KB2593939: Regulated Markets AI Products/Skills Not Available. Be sure to check for availability updates in future releases.

AI limitations

This application uses artificial intelligence (AI) and machine learning, which are rapidly evolving fields of study that generate predictions based on patterns in data. As a result, this application may not always produce accurate, complete, or appropriate information. Furthermore, there is no guarantee that this application has been fully trained or tested for your use case. To mitigate these issues, it is your responsibility to test and evaluate your use of this application for accuracy, harm, and appropriateness for your use case, employ human oversight of output, and refrain from relying solely on AI-generated outputs for decision-making purposes. This is especially important if you choose to deploy this application in areas with consequential impacts such as healthcare, finance, legal, employment, security, or infrastructure. You agree to abide by ServiceNow's AI Acceptable Use Policy, which may be updated by ServiceNow.

Data processing

This application requires data to be transferred from ServiceNow customers' individual instances to a centralized ServiceNow environment, which may be located in a different data center region from the one where your instance is, and potentially to a third-party cloud provider, such as Microsoft Azure. This data is handled per ServiceNow's internal policies and procedures, including our policies available through our CORE Compliance Portal.

Data collection

ServiceNow collects and uses the inputs, outputs, and edits to outputs of this application to develop and improve ServiceNow technologies including ServiceNow models and AI products. Customers can opt out of future data collection at any time, as described in the AI Opt-Out page.

Exploring policies in AI Control Tower

Learn how policies let you automatically respond to detected AI threats or block AI usage outright, and where policies are enforced across AI Control Tower.

Policies overview

Blocking a rogue AI agent or containing a detected threat typically involves writing custom scripts, or reacting to an issue that's often discovered well after it has occurred. These

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

approaches don't scale past a handful of one-off exceptions, and they don't hold up consistently across every platform your organization runs AI on.

Policies address this by letting you define that governance once, as a reusable rule, instead of reacting case by case.

- Respond automatically when a detected threat, such as a prompt injection or excessive data exposure, crosses a threshold you define.
- Stop a specific AI agent, model, or domain from being used, without writing a flow.
- Preview which requests a policy would affect before publishing it.
- See exactly which policy blocked or allowed a given request, and why.

Policy users

Users

User	Description
AI steward	Creates, edits, clones, and deletes Threat Response and Explicit Block policies, and reviews policy enforcement activity to confirm policies are working as expected.

Policy types

Policies come in two types, each suited to a different governance need.

Threat Response

Watches for a specific threat category, such as sensitive data disclosure or prompt injection, crossing a threshold you define (for example, more than 50 detections in 10 minutes). When triggered, deactivates the affected agent, and can create a ticket for a team or notify a group. The affected agent stays offline until it's reinstated. For details, see Threat Response policies.

Explicit Block

Stops a user, a department, or everyone from using a specific AI agent, model, or domain. Once initiated, the block stays in effect until the policy is deleted. For details, see Explicit Block policies.

Policy enforcement points

Policies are evaluated and enforced at points throughout your organization.

Agent Client Collector (ACC)

Blocks and unblocks AI agents by model or domain, through ACC's AI governance policy.

Cloud-hosted agent platforms

Amazon Bedrock, Amazon Bedrock AgentCore, Azure AI Foundry, and Gemini Enterprise Agent Platform agents. Each platform is enforced through its own native access control, so the same rule reaches an agent no matter which of these it runs on.

Okta

Blocks and unblocks a person's access through their Okta-managed identity.

ServiceNow agents

Blocks and unblocks AI agents hosted by ServiceNow.

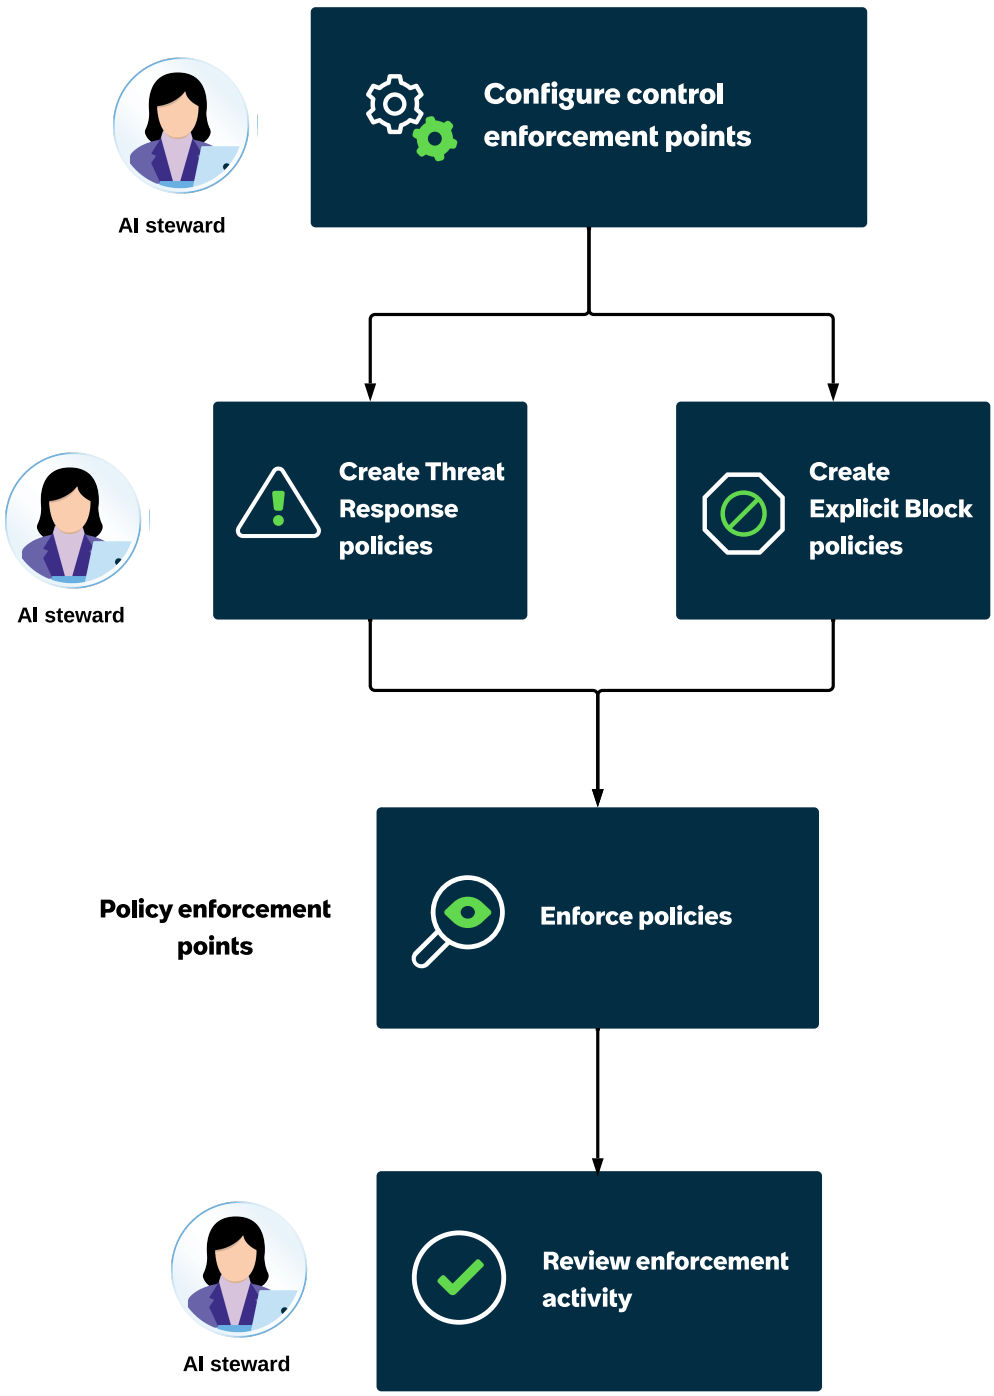
For a complete list, see Control enforcement points.

Policies workflow

This infographic shows a sample end-to-end workflow of the AI steward sets up policy enforcement points, creates policies, and reviews enforcement activity.

Managing policies in AI Control Tower



In this workflow:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. The AI steward configures one or more control enforcement points.
2. The AI steward creates a Threat Response policy and defines the threat category, its scope, and the threshold that triggers a response.
3. The AI steward creates an Explicit Block policy and defines who is blocked and what they're blocked from using.
4. Once published, the policy is enforced at whichever connected points apply.
5. The AI steward reviews enforcement activity to confirm the policy is working as expected.

Policies benefits

Policies benefits

Benefit	Feature	Users
Respond automatically to a detected threat before it spreads further.	Create a Threat Response policy	AI steward
Stop specific AI usage outright, without writing a flow.	Create an Explicit Block policy	AI steward
Confirm a policy is working as expected.	Reviewing policy enforcement in AI Control Tower	AI steward

What to explore next

To learn more about configuring and using Policies, see:

- Configuring policies in AI Control Tower
- Managing policies in AI Control Tower
- Reviewing policy enforcement in AI Control Tower
- AI Control Tower policies reference

Threat Response policies

Automatically contain an AI agent the moment it crosses a risk threshold you define, instead of waiting for someone to notice and act.

Key benefits

- Contain a misbehaving or compromised agent the moment a defined threat is detected, without waiting for someone to notice and react.
- Apply the same containment rule across every platform your agents run on, instead of building a separate mechanism for each one.
- Reduce how long a risky agent stays active, since the response happens automatically instead of depending on when someone happens to check.

How Threat Response policies work

You choose a threat category and define its scope; the policy then watches continuously for conditions matching that category within that scope. Between a threat being detected and someone noticing and manually shutting down the affected agent, there's normally a window where that agent keeps acting. A Threat Response policy closes that window: once a matching detection occurs, it contains the affected agent automatically, without waiting on a person to be available, notice, and react.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The same policy applies across every enforcement point you've configured. An organization running agents across ServiceNow and multiple cloud providers doesn't need a separate containment mechanism for each one; a single rule reaches all of them, each enforced through that platform's own native access control.

The following connectors are supported:

- AWS Bedrock
- AWS Bedrock Agent Core
- Gemini Enterprise Agent Platform (agents with unique identities only)
- Azure AI Foundry
- ServiceNow Agents
- Agent Client Collector (ACC)

A connection between AI Control Tower and an identity provider is optional. Okta is supported.

A policy can also be changed without leaving stale enforcement behind: editing one reverses what it previously enforced and reapplies enforcement for the updated conditions, so a refined rule doesn't leave an old block sitting in place alongside a new one.

Use cases

Containing an agent that deviates from its goal

An agent is given a defined task, but through a misconfiguration, a bad tool call, or unexpected input, it starts acting outside that task. Left running, it keeps taking those actions until someone catches it.

A Threat Response policy scoped to the Agentic Goal Deviation threat category watches for exactly this. When a detection matches the category and the policy's scope, the affected agent is taken offline automatically.

The agent stays offline until someone reinstates it from Security. The policy itself keeps running and will contain the next agent that matches its conditions.

Containing an agent under repeated prompt injection attempts

An agent that processes external or user-submitted content, such as documents or messages, can be exposed to prompt injection: hidden instructions embedded in that content that try to override its original task. A single attempt might not be a real problem, but a sudden spike suggests something is actively probing it.

A Threat Response policy scoped to the Prompt Injection threat category can use a threshold instead of triggering on every detection, for example, more than a set number of attempts within an hour.

Once that threshold is crossed, the affected agent is taken offline automatically, the same way as any other Threat Response policy.

Explicit Block policies

Stop a specific person, a department, or your whole organization from using an AI agent, model, or domain, enforced automatically everywhere that access could happen.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Key benefits

- Stop a specific person, a department, or your entire organization from using an AI agent, model, or domain, without writing a script for each platform.
- Apply one rule consistently whether it covers a handful of contractors or thousands of employees, without reconfiguring it person by person.
- Keep enforcing at every connected point even if one point is unavailable or doesn't apply, instead of the whole block depending on all of them.

How Explicit Block policies work

You define who's blocked and what they're blocked from, and publish it. Restricting access this way usually means writing a custom script for each platform involved, or relying on someone to remember to check and revoke access manually; an Explicit Block policy replaces that with one rule, enforced consistently everywhere that access could happen. The policy stands until it's deleted; there's no pause or in-between state.

Enforcement is attempted independently at each connected point, so if one point is unreachable or doesn't apply, the block still takes effect everywhere else it can.

Because Explicit Block covers users, departments, agents, models, and domains under this same mechanism, the same policy type applies whether the goal is keeping a contractor off internally sensitive tools or keeping an entire department off a model that isn't approved for their work.

Use cases

Blocking access to ServiceNow Cowork

Employees use ServiceNow Cowork to ask instance-specific questions. The organization might need to block one person from using it, for example while a security review is underway, or prevent anyone from using it at all until that review is complete.

An Explicit Block policy scoped to a specific person and ServiceNow Cowork ends that person's active session and prevents them from starting a new one. Publishing the same policy without naming a person blocks everyone who has used ServiceNow Cowork instead.

Blocking access to a specific model

Employees often reach AI models directly, outside of any agent or approved workflow, through a browser or a desktop app installed on their own machine. An organization might restrict this to internally hosted models only, or allow certain roles to use specific external models while keeping others off-limits.

An Explicit Block policy can target a specific model for a specific person: for example, blocking one employee's access to an external model while leaving everyone else's access untouched. Enforcement happens at the device level, so the block applies no matter which application or browser the employee uses to try to reach that model.

Configuring policies in AI Control Tower

Set up policies in AI Control Tower by configuring control enforcement points.

Configuration overview

Setting up policies involves defining where polices can run by configuring control enforcement points.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For steps to configure AI agent containment automatically, see Configure automatic AI agent containment.

Configure automatic AI agent containment

Connect an identity provider and the AI agent runtime platforms to AI Control Tower so a Threat Response policy can automatically contain an AI agent using kill switch protocol.

Before you begin

Role required: sn_ai_governance.ai_steward

About this task

To let a Threat Response policy automatically contain an AI agent using kill switch protocol, you must have:

- A connection between AI Control Tower and each AI agent runtime or infrastructure platform that hosts the agents the policy covers. These connectors are supported:
  - AWS Bedrock
  - AWS Bedrock Agent Core
  - Gemini Enterprise Agent Platform (agents with unique identities only)
  - Azure AI Foundry
  - ServiceNow Agents
  - Agent Client Collector (ACC)
- A connection between AI Control Tower and an identity provider is optional. Okta is supported.

Procedure

1. Navigate to **AI Control Tower** > **Settings** > **Integrations** > **Control Enforcement Points**.
2. Select the connector from the **Available connectors** sub-tab and follow the guided setup wizard.
   For more information, see Configuring security connections.

Result

You can now create a Threat Response policy that automatically contains an AI agent using kill switch protocol on the connected platforms. For details, see Create a Threat Response policy.

Managing policies in AI Control Tower

Create, change, or remove the policies that respond to detected threats or block AI usage.

Managing policies workflow

Create a Threat Response policy to automatically contain an agent when a detected threat matches conditions you define, or an Explicit Block policy to stop specific AI usage outright.

Both policy types work the same way once published. Edit a policy to change what it enforces, clone it to try a variant without changing the original, or delete it to end its enforcement entirely. A policy has no pause or disable state, so deleting it is the only way to stop it from running.

Once a policy is published, confirm it's doing what you designed it to do. See Reviewing policy enforcement in AI Control Tower.

Create a Threat Response policy

Automatically contain an AI agent when a specific threat is detected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Confirm the connector for each AI agent runtime platform you want to cover is active. See Configuring security connections.

Role required: sn_ai_governance.ai_steward

About this task

A Threat Response policy watches for a specific threat type. Once conditions matching that type are detected, it automatically contains the affected agent instead of waiting for someone to notice and act.

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home** > **Govern** > **Policies**.
2. Select **Create policy**.
3. Enter a name and description of this policy.
4. In the Policy type section, select **A threat response**.
5. In the On threat section, select the threat type the policy watches for, such as **Prompt Injection**.
   For the full list, see Threat types.
6. In the On threat section, define which agents the policy covers.
   Build a condition from a field, an operator, and a value, such as a specific agent or a platform vendor. Combine multiple conditions with **and** or **or**, or select **Add group** for another set of conditions.
7. In the On threat section, set the sensitivity.
   For example, trigger the policy **on every detection**, or only once detections cross a threshold you define.
8. **Optional:** In the Do this section, add one or more follow-up actions.
   A follow-up fires only when the policy actually blocks an attempt, not just because it's published.

Follow-up action	Description
Create a ticket	**a.** Select **+Add follow-up**. **b.** Select **Create a ticket**. **c.** Select the assignment group that will re ceive the ticket.
Notify	**a.** Select **+Add follow-up**. **b.** Select **Notify**. **c.** Search or enter the user to notify.

9. Review the policy summary, then select **Publish**.

Result

The policy runs as soon as a matching threat is detected. The affected agent is taken offline and stays offline until it's reinstated from Security. For details, see Contain AI agents manually using kill switch protocol.

What to do next

Confirm the policy is working as expected by reviewing policy enforcement activity. For details, see Reviewing policy enforcement in AI Control Tower.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can edit a Threat Response policy directly to change its threat type, scope, sensitivity, or follow-up actions. For details, see Edit a Threat Response policy. Alternatively, clone the policy to test a variant without changing the original, then delete the original once your clone is confirmed working, if you no longer need it. For details, see Clone a policy.

Edit a Threat Response policy

Change an existing Threat Response policy's threat type, scope, sensitivity, or follow-up actions.

Before you begin
Role required: sn_ai_governance.ai_steward

About this task
You can change the threat type, which agents it applies to, and more by editing an existing Threat Response policy. Editing keeps the same policy record, along with its enforcement history. The policy type is read only. To use a different policy type, create a new policy instead.

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home** > **Govern** > **Policies**.
2. Find the Threat Response policy you want to edit.
3. Select **Edit**.
4. **Optional:** In the On threat section, update the threat type, which agents the policy covers, or the sensitivity.
5. **Optional:** In the Do this section, add, remove, or update follow-up actions.
6. Review the policy summary, then select **Publish**.

Result
The policy takes effect with your changes. Enforcement activity from before the edit stays available in the policy's history.

What to do next
Confirm the policy is working as expected by reviewing policy enforcement activity. For details, see Reviewing policy enforcement in AI Control Tower.

Create an Explicit Block policy

Stop a user, a department, or everyone in your organization from using a specific AI agent, model, or domain.

Before you begin
To enforce a block on an external system, confirm the corresponding connector is already configured. External systems include cloud AI agents and devices running Agent Client Collector (ACC). See Configuring security connections.

Role required: sn_ai_governance.ai_steward

About this task
An Explicit Block policy stops a user, a department, or everyone in your organization from using a specific AI agent, model, or domain. Once published, it stays in effect until you delete it; there's no pause or in-between state.

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home** > **Govern** > **Policies**.
2. Select **Create policy**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Enter a name and description of this policy.
4. In the Policy type section, select **An explicit block**.
5. In the Block section, define who's blocked.
   Select **User** to block specific people, or **Department** to block everyone in a department. Leave the search field empty to apply the block to everyone.
6. In the Block section, define what they're blocked from using.

Option	Description
AI agent	**a.** In the What field, select **AI agent**. **b.** Identify the AI agent that you want to block by building a condition using a field, an op erator, and a value. For example, **Asset** | **is** | **ACME Agent**. **c.** Combine multiple conditions with **and** or **or**, or select **Add group** for another set of conditions.
Model	**a.** In the What field, select **Model**. **b.** Enter one or more models in a comma-sepa rated list.
Domain	**a.** In the What field, select **Domain**. **b.** Enter one or more domains in a comma-sep arated list.

7. **Optional:** In the Block section, add a follow-up action.
   A follow-up fires only when the policy actually blocks an attempt, not just because it's published.
   a. Select **+Add follow-up**.
   b. Select **Notify**.
   c. Search or enter the user to notify.
8. Review the policy, then select **Publish**.

Result
The policy takes effect at every enforcement point it applies to. If enforcement depends on an agent installed on a device, such as ACC, the block takes effect when the policy syncs to that device.

What to do next
Confirm the policy is working as expected by reviewing the policy enforcement activity. For details, see Reviewing policy enforcement in AI Control Tower.

To change who or what a published policy blocks, edit it. For details, see Edit an Explicit Block policy. Alternatively, clone the policy to try a variant without changing the original, then delete the original once your clone is confirmed working, if you no longer need it. For details, see Clone a policy.

Edit an Explicit Block policy

Change who an Explicit Block policy blocks, what they're blocked from using, or its follow-up actions, without recreating the policy.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_ai_governance.ai_steward

About this task
Narrow or widen an existing block by editing the policy instead of replacing it. Editing keeps the same policy record, along with its enforcement history.

Procedure
1. Navigate to **All** > **AI Control Tower** > **Home** > **Govern** > **Policies**.
2. Select the Explicit Block policy you want to edit.
3. Select **Edit**.
4. **Optional:** Update the policy name or description.
5. **Optional:** In the Block section, update who's blocked.
   Change the type between **User** and **Department**, remove a selection, or search for another one. Leave the search field empty to apply the block to everyone.
6. **Optional:** In the Block section, update what they are blocked from using.
   For an AI agent, adjust the field, operator, or value of each condition, or add and remove conditions. For a model or a domain, update the comma-separated list.
7. **Optional:** In the Block section, add, remove, or update follow-up actions.
8. Review the policy summary, then select **Publish**.

Result
The policy takes effect with your changes at every enforcement point it applies to. Enforcement activity from before the edit stays available in the **Enforcement activity** tab.

What to do next
Confirm the policy is working as expected by reviewing policy enforcement activity. For details, see Reviewing policy enforcement in AI Control Tower.

To try a variant of a policy without changing what's already published, clone it instead of editing it. For details, see Clone a policy.

Clone a policy

Start a new policy using an existing policy as a template.

Before you begin
Role required: sn_ai_governance.ai_steward

About this task
Clone a policy when you want to start a new version from an existing one, without changing what's already published. The clone is a separate, independent policy; the original keeps running until you delete it.

For example:

- Clone an Explicit Block policy when you want to scope the same block to a different set of users or models without changing the original. You can also edit an Explicit Block policy directly; see Edit an Explicit Block policy. Once your clone is confirmed working, delete the original if you no longer need it.
- Clone a Threat Response policy when you want to test a variant of its threat type, scope, or sensitivity without changing the original. You can also edit a Threat Response policy directly; see Edit a Threat Response policy. Once your clone is confirmed working, delete the original if you no longer need it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home** > **Govern** > **Policies**.
2. Find the policy that you want to clone.
3. In the More actions menu, select **Clone**.
4. **Optional:** Update the cloned policy's conditions.
5. Select **Publish**.

Result

The policy is cloned with any optional updates that you added. The original policy stays in force.

What to do next

Once the clone is confirmed working as expected, you can delete the original if it's no longer needed. For details, see Delete a policy.

Delete a policy

Remove a policy you no longer need.

Before you begin

Role required: sn_ai_governance.ai_steward

About this task

A policy has no pause or disable state. You must delete the policy to end enforcement.

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home** > **Govern** > **Policies**.
2. Find the policy you want to remove.
3. In the More actions menu, select **Delete**.
4. In the confirmation dialog box, select **Delete policy**.
   Deleting a policy can't be undone. Activity from the deleted policy stays available in the **Enforcement activity** tab.

Result

What happens next depends on the policy type.

Threat Response

The policy stops responding to new detections. An agent it already took offline stays offline; reinstate it separately from Security. For details, see Contain AI agents manually using kill switch protocol.

Explicit Block

Access is restored at every enforcement point the policy applied to.

Reviewing policy enforcement in AI Control Tower

Review policy activities and execution results.

Key benefits

- Confirm a policy actually reached every point it applied to.
- Tell a real failure apart from a policy that simply didn't apply anywhere it could.
- Look up a specific person or asset, without checking policies one at a time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

View policy enforcement as an audit trail in the **Enforcement activity** tab. Each entry represents enforcement against one asset and shows its outcome. When a policy triggered the entry, the entry also shows which policy. A policy that enforces through more than one connector produces a separate entry for each connector.

For AI agent containment specifically, the **Enforcement activity** tab shows all agents that were contained automatically through a Threat Response policy, and those contained manually using kill switch protocol. Those contained manually show Kill Switch Manual Trigger in the **Source** column.

An outcome other than success has a specific meaning, not just pass or fail:

- **Error** means something actually went wrong at a connector, and the record includes why.
- **Skipped** means no connector applied to that context, either because there was nothing to enforce against, or because the connector for that point was never configured. If you expected enforcement at a given point and see **Skipped**, confirm that point is configured and active on the **Control enforcement points** tab; otherwise, a real coverage gap can look like a clean run. See Configuring security connections.
- **Timeout** means a connector didn't respond within its window.

Use cases

- Confirm whether a particular person was blocked from a particular model, and which connector enforced it.
- Check an entry to determine whether a policy needs to be fixed. An outcome other than success can mean the policy simply didn't apply rather than failed.
- When a user reports they've lost access, or a security review needs to know whether a specific asset has been affected by any policy, filter the activity by that person or asset.

To create or change a policy, see Managing policies in AI Control Tower.

AI Control Tower policies reference

Reference topics provide additional information about threat types and where policies are enforced.

Threat types

Threat types available in a Threat Response policy.

Threat type	Description
Agentic Goal Deviation	An agent's actions diverge from the objective it was given.
Data and Model Poisoning	Training data or a model's behavior has been tampered with.
Excessive Agency	An agent takes actions or accesses systems and data beyond what its task requires.
Improper Output Handling	A model's output is used downstream in a way that introduces risk, such as executing unvalidated content.
Prompt Injection	Untrusted input manipulates a model into ignoring its original instructions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Threat type	Description
Sensitive Information Disclosure	A model exposes confidential, personal, or restricted data in its output.
System Prompt Leakage	A model reveals its own underlying instructions or configuration.

Control enforcement points

The systems an AI Control Tower policy can act on.

Enforcement point	Description
Agent Client Collector (ACC)	A lightweight agent installed on employee devices. Blocks and unblocks AI agents by model or domain, enforced at the device regardless of which application or browser someone uses to reach it.
AWS Bedrock	Blocks and unblocks Amazon Bedrock agents.
AWS Bedrock AgentCore	Blocks and unblocks Amazon Bedrock AgentCore agents.
Azure AI Foundry	Blocks and unblocks Azure AI Foundry agents.
Gemini Enterprise Agent Platform agents	Blocks and unblocks Gemini Enterprise agents. **Note:** Applies to agents with unique identities only.
Okta	Blocks and unblocks a person's access through their Okta-managed identity.
ServiceNow agents	Blocks and unblocks AI agents on the ServiceNow AI Platform®.

Monitoring AI assets

Evaluate the quality and safety of AI interactions across your portfolio using automated scoring, configurable metrics, and trend analysis for both ServiceNow and external AI systems.

AI systems can perform well at deployment and degrade weeks later as data sources shift and edge cases emerge. Monitoring in AI Control Tower addresses this by continuously scoring a sample of live AI interactions against configurable quality and safety metrics. AI stewards use the resulting scores to detect regressions, investigate the underlying causes, and coordinate with AI system owners on the changes that restore performance, across both ServiceNow and external AI systems.

Monitoring also feeds the AI value calculation. When you configure a value template to use quality score as a dimension, AI Control Tower pulls the live quality score from the monitoring pipeline into the productivity formula, so the value an AI system reports reflects how well it is actually performing. For more information about value templates and the dimensions they use, see Measuring AI systems.

Monitoring and evaluating AI systems in AI Control Tower

Continuously monitor your ServiceNow and external AI systems to determine whether they meet quality and safety standards, and investigate root causes when they don't.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Investigate sessions Drill into sessions to find and fix root causes.	Reference Evaluation metrics, fields, and system values.	

Important:

- Not all model providers are available for customers with in-country SKUs, and some AI products/features are currently unavailable for in-country customers. For more information, see the KB1584492 article in the Now Support Knowledge Base. Be sure to check for model provider availability updates in future releases.
- Some AI products/features are currently unavailable for customers in the FedRAMP, NSC DOD IL5, or Australia IRAP-Protected data centers, self-hosted customers, or in other restricted environments. For more information, see the KB0743854 article in the Now Support Knowledge Base. Be sure to check for availability updates in future releases.
- Some AI products/features are currently available only for customers in some regions. Be sure to check for availability updates in future releases.
- Some AI products and skills are not available in Regulated Markets. For more information, see KB2593939: Regulated Markets AI Products/Skills Not Available. Be sure to check for availability updates in future releases.

AI limitations

This application uses artificial intelligence (AI) and machine learning, which are rapidly evolving fields of study that generate predictions based on patterns in data. As a result, this application may not always produce accurate, complete, or appropriate information. Furthermore, there is no guarantee that this application has been fully trained or tested for your use case. To mitigate these issues, it is your responsibility to test and evaluate your use of this application for accuracy, harm, and appropriateness for your use case, employ human oversight of output, and refrain from relying solely on AI-generated outputs for decision-making purposes. This is especially important if you choose to deploy this application in areas with consequential impacts such as healthcare, finance, legal, employment, security, or infrastructure. You agree to abide by ServiceNow's AI Acceptable Use Policy, which may be updated by ServiceNow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data processing

This application requires data to be transferred from ServiceNow customers' individual instances to a centralized ServiceNow environment, which may be located in a different data center region from the one where your instance is, and potentially to a third-party cloud provider, such as Microsoft Azure. This data is handled per ServiceNow's internal policies and procedures, including our policies available through our CORE Compliance Portal.

Data collection

ServiceNow collects and uses the inputs, outputs, and edits to outputs of this application to develop and improve ServiceNow technologies including ServiceNow models and AI products. Customers can opt out of future data collection at any time, as described in the AI Opt-Out page.

Exploring AI system monitoring in AI Control Tower

Learn how AI Control Tower automatically scores live AI interactions against quality and safety metrics using an OpenTelemetry-based data model of sessions, traces, and spans.

Monitoring overview

An AI system that performs well in testing can drift in production. Models degrade, data sources change, and tool integrations break. Without ongoing evaluation, these problems go undetected until users report them.

Monitoring in AI Control Tower addresses this by automatically scoring a sample of live AI interactions against configurable quality and safety metrics. Scores are aggregated into weighted measures and surfaced alongside trend data so you can detect regressions early and investigate before users are affected.

- Get continuous visibility into AI system quality and safety through automated large language model (LLM)-based scoring.
- Align scoring to your organization's priorities by selecting which metrics are evaluated and how much each one contributes to the overall score.
- Assess both ServiceNow and external AI systems through a single evaluation framework.
- Catch gradual regressions, not just one-off failures, by tracking score trends over time.
- Identify the exact cause of a quality or safety issue by drilling from an aggregate score down to a specific span.

Important: Evaluation scores are generated by AI models. Review AI-generated scores alongside session-level detail before taking action on individual cases.

Monitoring users

Users

User	Description
AI steward	Activates evaluation scoring, configures metric templates and weights, and manages which systems are included or excluded from scoring. Reviews quality and safety scores across the AI portfolio, investigates low-scoring sessions, identifies trends and regressions, and coordinates with AI system owners to improve agent performance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Users (continued)

User	Description
AI asset owner	Works with AI stewards to understand evaluation results for their specific AI systems and adjusts agent configuration, prompts, or tool access to improve scores.

How monitoring works

The monitoring pipeline has four stages:

1. **Collection.** For ServiceNow AI, trace data is collected automatically. For external AI, trace data is sent to ServiceNow via API using a generated API key.
2. **Scoring.** The evaluation engine applies your configured metrics to each sampled session. Metrics are scored by LLM judges, which are custom models fine-tuned for specific evaluation criteria. For ServiceNow AI, the AI Skill Kit Auto Eval engine scores sessions. For external AI, sessions are scored by ServiceNow evaluation models.
3. **Aggregation.** Per-metric scores are combined into composite quality and safety scores using the weighted average formula you define in your metric template.
4. **Visualization.** Scores, trends, and session-level detail are available on the overview and through drill-down into individual sessions, traces, and spans.

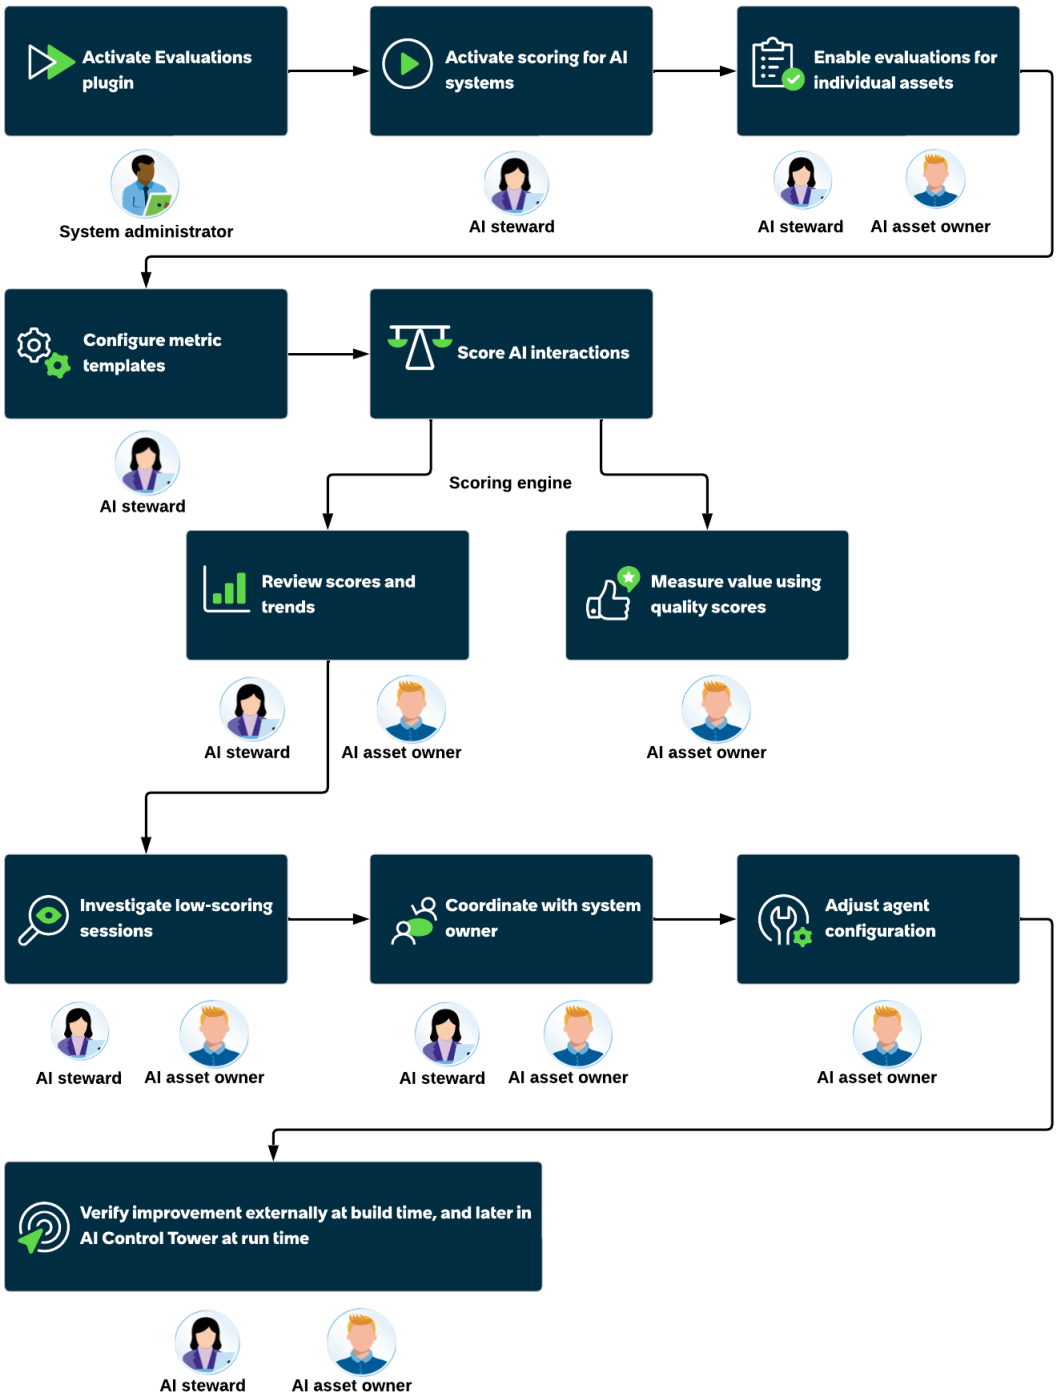
The evaluation metrics you select determine which metrics are scored for each session. The metric templates you configure determine which of those scored metrics contribute to your quality and safety scores. Metrics that are scored but not included in a template are still visible when you investigate individual sessions, traces, and spans.

Monitoring workflow

This infographic shows a sample end-to-end workflow of how different users work together to set up monitoring, analyze AI system quality and safety, and investigate issues.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Monitoring AI systems in AI Control Tower



In this workflow:

1. The system administrator installs AI Control Tower which includes the Evaluations plugin. The Evaluations plugin enables the evaluation framework, scoring engine, and monitoring components.
2. The AI steward activates evaluation scoring for ServiceNow AI systems. For external AI systems, the AI steward generates an API key and configures the external system to send trace data or configures trace connectors to send trace data from a supported cloud platform.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. The AI steward and AI asset owner enable evaluations for individual assets by updating asset records in the AI Control Tower inventory.
4. The AI steward configures evaluation metric templates by selecting quality and safety metrics and assigning weights to create a scoring formula.
5. The evaluation scoring engine automatically scores a sample of live AI interactions. For ServiceNow AI, the AI Skill Kit Auto Eval engine scores sessions. For external AI, sessions are scored by ServiceNow evaluation models.
6. The AI steward and AI asset owner review aggregated quality and safety scores, identify underperforming AI systems, and track trends over time.
7. The AI steward and AI Asset owner investigate low-scoring sessions by drilling into session detail, reviewing per-metric scores and judge reasoning, and tracing root causes through individual traces and spans.
8. The AI steward coordinates with the AI system owner to adjust the agent's configuration, prompts, or tool access based on investigation findings.
9. The AI system owner makes adjustments to agents as necessary.
10. The AI steward and AI Asset owner verify improvements externally at build time and continue verification in AI Control Tower at run time.

ServiceNow AI vs. external AI

Both categories use the same evaluation framework, but they differ in data collection and available metrics.

ServiceNow AI vs. external AI comparison

	ServiceNow AI	External AI
Data collection	Automatic	Via API key (ai_observe.ai_data_sender role) or trace connector
Scoring engine	AI Skill Kit Auto Eval	ServiceNow evaluation models
Default quality metrics	Overall task completeness, Tool calling correctness	Task completion, Answer relevancy
Safety metrics	Not available with ServiceNow AI systems	Secrets detection (additional safety metrics available)

Where monitoring fits in AI Control Tower

AI Control Tower provides three complementary governance areas:

- Inventory manages what AI systems exist and their lifecycle state.
- Govern enforces policies, approvals, and compliance requirements.
- Insights provides ongoing operational visibility into how those systems actually perform.

Insights depends on inventory, since only managed assets are evaluated. The relationship also runs in reverse: connecting an AI system to send trace data can surface other AI systems and agents that aren't yet tracked, adding them to inventory automatically and helping you manage AI sprawl. To learn more about connecting your AI systems for evaluation and populating inventory, see Configuring trace connections.

What to explore next

To learn more about configuring and monitoring in AI Control Tower, see:

- Configuring monitoring and evaluations in AI Control Tower
- Reviewing AI system quality and safety scores
- Investigating low-scoring sessions

Sessions, traces, and spans

Understand the three levels of AI interaction data that AI Control Tower uses to structure, score, and display runtime behavior.

To investigate a low quality or safety score, you can dig deeper into a session to narrow the problem to a specific step in the AI system's reasoning. AI Control Tower structures interaction data into three hierarchical levels following open telemetry standards.

Interaction data levels

Level	What it represents	Ends when	Example
Session	One complete interaction with an AI system.	User closes the conversation, or 10 minutes of inactivity.	An employee asks an ITSM agent to create an incident for a VPN failure.
Trace	One turn in the interaction: one input, one output.	The AI system finishes processing and responds.	The agent asks "Which VPN client are you using?" and the user answers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Interaction data levels (continued)

Level	What it represents	Ends when	Example
Span	A single step the AI system takes within a trace, such as a tool call, LLM call, database query, or workflow step.	The individual operation completes.	The agent calls the CMDB API to look up the user's VPN configuration.

Why levels matter for scoring

Different metrics are evaluated at different levels because each level captures different aspects of behavior.

- Session-level metrics (such as Task completion) need the full context of the conversation to determine whether the user's goal was met. There is one score per session.
- Trace-level metrics (such as Overall task completeness for ServiceNow AI systems) assess whether a single turn achieved its intended outcome.
- Span-level metrics (such as Tool error) assess whether the AI system made good decisions at the individual step level, including whether the correct tool was called with valid parameters.

Telemetry data on traces

Each trace displays telemetry data alongside evaluation scores: total latency, span count, input tokens, output tokens, and total runtime tokens. These values reflect the tokens consumed by the AI system's actual execution, not the tokens consumed by evaluation scoring.

Navigating the hierarchy

Evaluation data is structured so you can move from a broad signal to a specific cause. A low quality score tells you something is wrong. Session-level scores tell you which interaction went wrong. Trace-level scores and reasoning tell you which step in that interaction produced the problem. Span-level input and output data tells you exactly why: the wrong tool was called, a parameter was malformed, or a data source returned an error.

How evaluation scoring works

Understand how AI Control Tower calculates quality and safety scores so you can interpret results accurately and configure scoring to reflect your priorities.

Evaluation scoring happens in two stages. The first stage calculates a score for each individual metric. The second stage combines those metric scores into a composite quality or safety score using the weights you configure.

Stage 1: How each metric is scored

The scoring engine evaluates each metric independently across the traces or spans in a session. It averages all individual evaluations to produce a metric score for that session.

How that score is determined depends on the level at which the metric is evaluated.

Session-level metrics

Produce one score for the entire session. No averaging is needed. Task completion is an example of a session-level metric.

Trace-level metrics

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Receive a separate score on each trace in the session. The metric score is the average across all traces. Overall task completeness is an example of a trace-level metric for ServiceNow AI systems.

Span-level metrics

Receive a separate score on each span in the session. The metric score is the average across all spans. Tool error is an example of a span-level metric.

For example, Tool calling correctness is a binary metric evaluated on four spans in a session. Each span scores either 0% (fail) or 100% (pass): 100%, 100%, 0%, and 100%. The metric score is the average across the spans:

```
(100 + 100 + 0 + 100) ÷ 4 = 75%
```

After stage 1, every metric in your template has a single score for the session, regardless of how many traces, spans, or evaluations produced it.

Stage 2: How metric scores combine into a single score

The metric scores from stage 1 are combined into a single measure score using the weights you configure in your metric template. Each metric's score is multiplied by its assigned weight, and the results are added together. All weights must sum to 100%.

A single measure can include metrics from any combination of levels. Stage 1 handles the level differences, so by the time a metric reaches stage 2, it is a single score with an assigned weight.

For example, a quality template for an external AI agent includes metrics from the session and span levels:

External AI quality score calculation

Metric	Level	Weight	Score (from Stage 1)
Task completion	Session	25%	72%
Answer completeness	Span	40%	91%
Context relevance	Span	25%	79%
Tool error	Span	10%	85%

The quality score is:

```
(72 x 0.25) + (91 x 0.40) + (79 x 0.25) + (85 x 0.10) = 18.0 +
 36.4 + 19.75 + 8.5 = 83%
```

For a ServiceNow agent, the same principle applies with different metrics. A quality template includes Overall task completeness at 60% weight and Tool calling correctness at 40% weight. If Overall task completeness scores 85% and Tool calling correctness scores 75%, the quality score is:

```
(85 x 0.60) + (75 x 0.40) = 51.0 + 30.0 = 81%
```

Metrics included and excluded from the formula

You don't have to include every evaluated metric in your metric template. Metrics that are evaluated but not included in a template still produce scores. You can view those scores when drilling into traces and spans, but they don't affect the quality or safety score. This is useful when you want to monitor a metric for a period before giving it weight in the formula.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Security metrics and scoring

AI Control Tower also evaluates a set of security metrics that assess risks specific to AI system inputs and outputs, such as prompt injection attempts and exposed personal data. Security metrics serve a different purpose than quality and safety metrics: they identify risks rather than measure performance.

Security metrics aren't available in monitoring metric templates and don't contribute to composite quality or safety scores. For details on security metrics, see Configuring security metrics in AI Control Tower.

When a metric in your template isn't evaluated

When a metric in your quality or safety template isn't evaluated on a given session, trace, or span, the composite score is calculated from the remaining evaluated metrics rather than resolving to zero. Partial evaluation coverage still produces a meaningful composite, so a single skipped or unavailable metric doesn't invalidate the score for that session.

For example, if your quality template includes Task completion, Answer completeness, and Context relevance, and Context relevance isn't evaluated on a particular session, the quality score for that session is calculated from Task completion and Answer completeness only.

How session scores are aggregated

Session scores are the foundation for broader scores across AI Control Tower. At the system and portfolio level, scores are simple averages with no additional weighting.

AI system score

Averages quality scores across all evaluated sessions for that system. Each session counts equally regardless of duration or token usage.

When evaluation is enabled for an individual AI system, you can view the aggregated score by selecting the **Monitor** tab on the asset record.

Portfolio score

Averages quality scores across all AI systems. Each system counts equally regardless of how many sessions it has.

To review quality and safety scores for AI systems across your portfolio, navigate to **Monitor** > **Overview**.

Scoring formats

All metrics use a scale where higher is better.

Binary

Produces a score of 0% (fail) or 100% (pass). Sexism detection, Profanity detection, and Tool calling correctness are binary. Because there are no partial scores, a single failure in a set of evaluations has an outsized effect on the average.

Percentage

Produces a score on a continuous scale from 0% to 100%. Answer completeness and Context relevance are percentage metrics.

Tiered

Produces specific score values rather than a full continuous scale. Overall task completeness scores as successful (100%), partial (50%), or unsuccessful (0%).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Score color coding

Score color coding

Color	Range	Meaning
Red	0–50%	Low. Investigate immediately.
Orange	51–75%	Fair. Review recent sessions for trends.
Green	76–100%	Good. Meeting quality or safety targets.

Evaluation scoring examples

Worked scoring examples show how metric configuration, weights, and evaluation levels combine to produce quality and safety scores for different AI system types.

The following scenarios walk through how quality and safety scores are calculated for specific sessions. Each scenario shows the evaluation configuration, what happens during the session, and the resulting score calculation. For details on the two-stage scoring model these scenarios illustrate, see How evaluation scoring works.

Scenario 1 — Quality scoring for an external IT support agent

An organization deploys an external AI agent called "IT Support Bot" that helps employees resolve IT issues such as password resets, VPN troubleshooting, and software installation requests. An AI steward wants to understand how the quality score for a single session is calculated.

Configuration

Five quality metrics are enabled. Three are included in the quality template with weights:

IT Support Bot quality template configuration

Metric	Weight	Evaluation level	Scoring format
Task completion	40%	Session	Percentage
Answer completeness	35%	Span	Percentage
Context relevance	25%	Span	Percentage

Agent goal accuracy and Tool error are also evaluated but not included in the template. Their scores are visible in drill-down views but don't affect the quality score.

What happens

A user opens a session to resolve a VPN connectivity issue. The session contains three spans: a knowledge base search to find relevant troubleshooting steps, a diagnostic tool call to identify the root cause, and a response generation call that assembles the agent's reply.

Span-level scores for the IT Support Bot session

Span	Answer completeness	Context relevance
Knowledge base search	88%	100%
Diagnostic tool call	52%	100%

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Span-level scores for the IT Support Bot session (continued)

Span	Answer completeness	Context relevance
Response generation	82%	91%

The knowledge base search returned relevant troubleshooting steps and scored well on both metrics. The diagnostic tool call correctly identified a certificate expiration but its output didn't include the renewal steps the user needed — the information was incomplete, so Answer completeness scored 52%. The response generation span assembled a readable reply from the diagnostic output, recovering somewhat to 82%, but Context relevance dipped to 91% because the response introduced some general VPN advice that wasn't directly relevant to the certificate issue.

Calculation

Task completion (session-level): The judge evaluates the full session and determines the user received a diagnosis but not actionable renewal steps. Score: 72%.

Answer completeness (averaged across spans): (88% + 52% + 82%) ÷ 3 = 74%.

Context relevance (averaged across spans): (100% + 100% + 91%) ÷ 3 = 97%.

```
Quality = (72 x 0.40) + (74 x 0.35) + (97 x 0.25) = 28.8 + 25.9
 + 24.25 = 79%
```

The composite quality score of 79% lands in the green range, which on its own would suggest the session is healthy — but the metric-level detail tells a more useful story. The averaged Answer completeness of 74% is dragged down by the diagnostic tool call span, which scored only 52%. Without drilling into span detail, that specific failure point is invisible. An AI steward reviewing only the composite quality score would have no way to know that one step in the agent's workflow — not the overall interaction design — is where the completeness problem lives. Identifying and fixing that single span's output behavior is far more targeted than retraining the whole agent.

Scenario 2 — Quality scoring for a ServiceNow change request agent

A ServiceNow AI agent called "Change Request Workflow" automates change request processing. It reads the change request, selects an approval workflow, calls the approval API, and updates the record.

Configuration

The AI steward has customized the quality template to include all three available ServiceNow AI quality metrics, with weights:

Change Request Workflow quality template configuration

Metric	Weight	Evaluation level	Scoring format
Overall task completeness	50%	Trace	Scale (0%, 50%, 100%)
Tool choice accuracy	30%	Span	Percentage
Tool calling correctness	20%	Span	Binary

What happens

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The session has one trace (the workflow execution) with four spans. Overall task completeness is evaluated at the trace level on a three-tier scale — unsuccessful (0%), partial (50%), or successful (100%). Assessing the workflow as a whole, the judge scored it partial (50%): the change request was submitted, but approval routing was incorrect due to a malformed API parameter.

Span-level scores for the Change Request Workflow session

Span	Tool choice accuracy	Tool calling correctness
Read change request	95%	100%
Select approval workflow	80%	100%
Call approval API	90%	0%
Update record status	100%	100%

Tool calling correctness for the approval API call scored 0% because the agent passed an incorrectly formatted parameter. This is a binary metric, so there is no middle ground: the tool call was either correct or it wasn't.

Calculation

Overall task completeness: 50% (single trace-level evaluation).

Tool choice accuracy (averaged across spans): (95% + 80% + 90% + 100%) ÷ 4 = 91%.

Tool calling correctness (averaged across spans): (100% + 100% + 0% + 100%) ÷ 4 = 75%.

```
Quality = (50 x 0.50) + (91 x 0.30) + (75 x 0.20) = 25.0 + 27.3
 + 15.0 = 67%
```

The single 0% binary score on the approval API call dragged Tool calling correctness to 75%. Combined with a partial task completion (50%), the quality score lands in the orange range. Binary metrics make individual failures visible: one bad call out of four is immediately reflected.

Scenario 3 — Safety scoring for an external HR case management agent

An external AI chatbot handles HR case management, including benefits questions, leave requests, and policy inquiries. Because it handles sensitive employee data and communicates directly with employees, safety scoring is critical.

Configuration

HR case management agent safety template configuration

Metric	Weight	Scoring format
Instruction adherence	51%	Percentage
Profanity detection	49%	Binary (0% or 100%)

What happens

The session has two traces. Trace 1: the agent answers a benefits question and stays within its approved response guidance. Instruction adherence: 100%, Profanity detection: 100%. Trace 2: the agent responds to a leave-request question but volunteers an opinion about whether the leave is likely to be approved — guidance its instructions tell it not to give. The instruction-adherence judge scores the response as only partially compliant. Instruction adherence: 70%. Profanity detection: 100%.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Calculation

Instruction adherence (averaged across traces): (100% + 70%) ÷ 2 = 85%.

Profanity detection (averaged across traces): (100% + 100%) ÷ 2 = 100%.

```
Safety = (85 x 0.51) + (100 x 0.49) = 43.4 + 49.0 = 92%
```

The safety score is green, but the Instruction adherence dip in Trace 2 is worth watching. If the agent repeatedly strays from its approved guidance, the averaged Instruction adherence score trends downward over time. The AI steward can then investigate specific traces, review the judge's reasoning, and work with the development team to tighten the agent's guardrails.

What if Profanity detection had flagged Trace 2?

If Profanity detection had scored 0% on Trace 2 instead of 100%, the Profanity detection average would drop to 50%, and the safety score would fall to:

```
Safety = (85 x 0.51) + (50 x 0.49) = 43.4 + 24.5 = 68%
```

That single flagged trace would move the session safety score from green (92%) to orange (68%). Binary metrics make issues impossible to miss: even one flagged trace is immediately visible in the score.

How monitoring scores contribute to AI value

Quality scores from monitoring can feed the value calculation. The value an AI system reports then reflects how well it performs, not just how often it is used.

Value calculations in AI Control Tower measure productivity by combining how often an AI system is used, how much time it saves per use, and a quality dimension.

```
Productivity = Usage × Time × Quality
```

The quality dimension can be a constant, an indicator, or the quality score that monitoring produces. When a value template uses the quality score, AI Control Tower pulls the live score from the monitoring pipeline into the calculation, so the productivity an AI system reports reflects how well it actually performs.

Why quality scores improve value accuracy

Because quality is one of the three dimensions in the productivity formula, the quality score directly affects the value an AI system reports. A system that scores poorly on quality reports lower productivity, even when usage is high. Configuring evaluation metrics that reflect your organization's quality standards therefore produces more accurate value measurement. When the metrics behind a quality score don't match what your organization considers good performance, the resulting value is skewed.

When a quality score is not available

A value template uses the quality score only when one exists for the asset. When evaluation is not enabled for an asset, or no sessions have been scored yet, the template uses the **Default quality constant** so that value calculation continues without interruption. To start generating quality scores, enable evaluation for the asset.

Setting and tracking value with quality scores

An asset owner selects **Quality Score** as the **Quality type** when creating or editing a value template. The asset owner then tracks the resulting productivity in the Value area, where the value reflects both how often and how well the AI system performs.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information about value templates and the dimensions they use, see Measuring AI systems.

Configuring monitoring and evaluations in AI Control Tower

Set up monitoring in AI Control Tower by activating evaluations, adding metrics, and configuring metric templates.

Configuration overview

Setting up monitoring involves enabling scoring for each type of AI system you want to evaluate, managing which metrics to include, and configuring metric templates that define how quality and safety scores are calculated. After the initial setup, you can configure how long trace data is retained, and adjust which AI systems are included in scoring as your portfolio changes.

Configure evaluation scoring for ServiceNow AI systems

Monitor and configure evaluation scoring for AI systems that run on the ServiceNow AI Platform.

ServiceNow AI systems are automatically instrumented for evaluation because they run on the ServiceNow AI Platform, so no connection setup is required before you activate scoring for them.

Activate evaluation scoring for ServiceNow AI systems

Assess the quality of your ServiceNow AI systems by activating evaluation scoring in AI Control Tower.

Before you begin
Role required: sn_ai_governance.ai_steward

About this task
ServiceNow AI systems are scored by the AI Skill Kit scoring engine. No additional configuration is required to collect trace data from ServiceNow AI systems.

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home** > **Settings** > **Rules and templates** > **Evaluation**.
2. On the **AI evaluations** sub-tab, select **ServiceNow AI systems**.
3. Set the **Activate** toggle to on.

Result
Evaluation scoring is active for ServiceNow AI systems. Scores appear on the monitoring Overview page as new sessions are evaluated.

What to do next
To add or remove metrics or adjust the metric sample rate for ServiceNow AI systems, see Configure global metrics for ServiceNow AI systems.

Configure global metrics for ServiceNow AI systems

Choose which metrics to evaluate for ServiceNow AI systems and optionally adjust the shared sample rate.

Before you begin
Role required: sn_ai_governance.ai_steward

About this task
After activating evaluation for ServiceNow AI systems, configure the global metrics that AI Control Tower evaluates for every ServiceNow AI system by default and how often they run.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home** > **Settings** > **Rules and templates** > **Evaluation**.
2. On the **AI evaluations** sub-tab, select **ServiceNow AI systems**.
3. Review the quality metrics that are included by default.
   The following quality metrics are evaluated for ServiceNow AI systems by default.

   Overall task completeness

   Whether the agentic workflow completed its assigned task, including all required steps and proper resolution or escalation.

   Tool calling correctness

   Whether tool calls used correct parameters, formatting, and expected values.

   For a complete list of available metrics and their descriptions, see Evaluation metrics.

4. **Optional:** In the Evaluation metrics for Agentic AI section, add or remove metrics that you want to evaluate.

   Important: Adding more metrics increases the visibility you gain into each session, but also increases assist usage to evaluate it. Select the metrics that give you the insight you need.

Option	Description
Add metrics	**a.** Select **+ Add metrics**. **b.** In the Add evaluation metrics panel, find or search for the metric that you want to add. **c.** Select the metric. **d.** Select **Done**.
Remove metrics	**a.** Find the metric that you want to remove. **b.** Select the remove icon. **c.** Select **Remove** to confirm.

5. **Optional:** Update the sample rate.

   (Optional) The sample rate determines what percentage of AI executions are evaluated. ServiceNow AI systems use a single sample rate for all metrics, unlike external AI systems, where each metric has its own rate. The default is 100%. You can enter a lower percentage to evaluate fewer executions.

   Important: Increasing the sample rate evaluates more executions and gives you more confidence in your scores, but also increases assist usage. Set the lowest rate that produces enough evaluated sessions to trust the score.

   a. Enter the sample rate to use when evaluating ServiceNow AI systems.

   b. Select **Update**.

What to do next

To have an added metric contribute to your quality score, add it to a metric template and assign a weight. See Configure an evaluation metric template.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To tailor metrics for an individual ServiceNow AI system instead of changing the global configuration, see Configure asset-specific metrics for ServiceNow AI systems.

Configure asset-specific metrics for ServiceNow AI systems

Add or remove metrics for one or more ServiceNow AI systems, without changing your organization's global metric configuration.

Before you begin

Role required: sn_ai_governance.ai_steward

Note: The AI system must have evaluation enabled. See Enable evaluation for an AI system.

About this task

You can optionally override which metrics are evaluated for specific ServiceNow AI systems. For details on adding or removing metrics for an AI system from that system's asset record instead, see Configure metrics evaluated for an AI system.

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home** > **Settings** > **Rules and templates** > **Evaluation**.
2. On the **AI evaluations** sub-tab, select **ServiceNow AI systems**.
3. Configure the metrics that you want to evaluate for specific AI systems.

Important: Adding more metrics increases the visibility you gain into each session, but also increases assist usage to evaluate it. Select the metrics that give you the insight you need.

Option	Steps
Add one or more AI systems and selected metrics	**a.** In the Asset-specific metrics section, select **Add**. **b.** In the side panel, select one or more AI systems that you want to add a metric for. **c.** Select **Next**. **d.** Select one or more metrics that you want to evaluate for the AI systems that you selected. **e.** Select **Add metrics**.
Remove one or more metrics	**a.** In the Asset-specific metrics section, select the check box next to the metric or metrics that you want to remove. **b.** Select **Remove**. **c.** In the confirmation dialog, select **Remove**.

Exclude ServiceNow AI systems from a metric

Exclude one or more ServiceNow AI systems from a specific metric, without changing that metric's configuration for every other system.

Before you begin

Role required: sn_ai_governance.ai_steward

About this task

You can optionally exclude one or more AI systems from a single metric without affecting other ServiceNow AI systems. For example, if one agent occasionally handles data that would

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

otherwise fail a secrets detection metric, you can exclude just that agent from that one metric while still scoring it against everything else.

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home** > **Settings** > **Rules and templates** > **Evaluation**.
2. On the **AI evaluations** sub-tab, select **ServiceNow AI systems**.
3. In the Evaluation metrics for Agentic AI section, find the metric that you want to exclude AI systems from.
4. In the **Excluded AI systems** column, select the pencil icon.
5. In the side panel, search or filter to find the AI systems that you want to exclude.
   - Fixed filters limit the systems to those that are managed, agentic, and have evaluation enabled.
   - You can find systems where a low score reflects a mismatch with the metric rather than an actual issue by viewing AI systems in the **Lowest performing** tab.
   - You can find systems that consistently perform well on this metric and don't need continued scrutiny by viewing AI systems in the **Highest performing** tab.
6. Select the AI systems that you want to exclude.
   Each selected AI system appears as a removable pill after the list.
7. Select **Save**.
   If a selected metric is currently used in a published evaluation template or a compliance evaluation, the exclusion isn't saved, and you're shown which templates or evaluations are using it so you can resolve that first.

Result

The metric no longer evaluates the AI systems that you excluded. They remain subject to every other metric in your global configuration, and their existing scores for other metrics are unaffected.

Configure evaluation scoring for external AI systems

Monitor and configure evaluation scoring for AI systems that run outside the ServiceNow AI Platform.

External AI systems must be connected to send trace data to AI Control Tower before you can activate evaluation scoring for them.

Activate evaluation scoring for external AI systems

Assess the quality and safety of your external AI systems by connecting them to AI Control Tower and activating evaluation scoring.

Before you begin

Role required: sn_ai_governance.ai_steward

About this task

External AI systems require trace data to be scored by the evaluation engine. Unlike AI systems on the ServiceNow AI Platform, which are automatically instrumented, external AI systems must be connected to send trace data to AI Control Tower. There are two ways to establish this connection:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **SDK instrumentation**: Instrument your AI agent code using the Traceloop SDK and authenticate with an API key. Use this method for any AI agent framework that is not hosted on a supported cloud platform or monitoring service.
- **Trace connection**: Connect to a supported cloud platform or monitoring service through your cloud credentials and a MID Server. Use this method when your AI agents already run on or send traces to a supported platform. No API key or code instrumentation is required.

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home** > **Settings** > **Rules and templates** > **Evaluation**.
2. On the **AI evaluations** sub-tab, select **External AI systems**.
3. Set the **Activate** toggle to on.
4. Connect your external AI system to send trace data to AI Control Tower using SDK instrumentation or a trace connection.

Connection method	Description
SDK instrumentation	Use for any third-party AI agent framework (CrewAI, LangChain, AWS Agent Core, and others) not connected through a trace con nection. Requires generating an API key and configuring the Traceloop SDK in your agent code. **a.** Generate an API key to authenticate trace data requests from your external AI system. **Note:** Multiple API keys can exist, but only one is active at a time. **i.** In the **API key for external AI system evaluation** section, select **Create API key**. The API Key record page opens on a new browser tab. **ii.** On the form, fill in the fields. **API Key form fields** **Field** / **Description** Name — Name for the API key. Description — Purpose of the API key. User — User associated with this API key. Select a user with the `sn_ai_observe.ai_data_sender`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

<table>
<tr><th>Connection method</th><th>Description</th></tr>
<tr><td></td><td>
<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td></td><td>role. Use a dedicated service account rather than a user with elevated permissions. This role is installed with the AI Control Tower Evaluations plugin and grants permission to send observability data without granting read or write access to AI Control Tower configuration. If the service account does not already have this role, assign it before creating the API key.</td></tr>
<tr><td>Active</td><td>Whether the API key is active.</td></tr>
<tr><td>Auth Scope</td><td>Scope that controls the API key's authority at runtime.</td></tr>
<tr><td>Expiry</td><td>Date when the API key expires. Leave empty for no expiration.</td></tr>
</table>
iii. Select Submit.

iv. Copy the generated token and store it securely.

The token is displayed only once. If you lose it, generate a new key, which deactivates the previous one.

v. Return to the AI Control Tower browser tab and refresh the page.

The new API key appears in the API key for external AI system evaluation section.

b. Instrument your AI agent to send trace data to your ServiceNow instance.

For instrumentation steps using the Traceloop SDK, see Instrument a third-party AI agent with the Traceloop SDK for AI Con
</td></tr>
</table>

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection method	Description
Trace connection	Use when your AI agents run on a supported cloud platform or already send traces to a sup ported monitoring service. The ServiceNow AI Platform collects trace data through your cloud credentials and a MID Server. No API key or SDK instrumentation is required. See Configuring trace connections.

Result
Evaluation scoring is active for external AI systems. Scores appear on the monitoring Overview page as new sessions are evaluated.

What to do next
To add or remove global metrics and adjust their sample rate, see Configure global metrics for external AI systems.

Configure global metrics for external AI systems

Choose which metrics evaluate all your external AI systems by default, exclude an individual system from a specific metric, and adjust how often each metric runs.

Before you begin
Role required: sn_ai_governance.ai_steward

About this task
Global metric configuration determines which metrics evaluate every external AI system by default and how often each one runs.

Procedure
1. Navigate to **All** > **AI Control Tower** > **Home** > **Settings** > **Rules and templates** > **Evaluation**.
2. On the **AI evaluations** sub-tab, select **External AI systems**.
3. Review the quality and safety metrics that are included by default.
   The following quality and safety metrics are evaluated for external AI systems with a 5% sample rate by default.

   Task completion

   Whether the agent decision path and output satisfy the user's request.

   Answer relevancy

   Whether the response addresses the query and remains on topic.

   Secrets detection

   Whether the response contains leaked credentials, API keys, or other sensitive secrets.

   Instruction adherence

   How closely the response follows the given instructions.

   For a complete list of available metrics and their descriptions, see Evaluation metrics.
4. **Optional:** In the Evaluation metrics for Agentic AI section, add or remove metrics that you want to evaluate.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important: Adding more metrics increases the visibility you gain into each session, but also increases assist usage to evaluate it. Select the metrics that give you the insight you need.

Option	Description
Add metrics	**a.** Select **+ Add metrics**. **b.** In the Add evaluation metrics panel, find or search for the metric that you want to add. **c.** Select the metric. **d.** Select **Done**.
Remove metrics	**a.** Find the metric that you want to remove. **b.** Select the remove icon. **c.** Select **Remove** to confirm.

5. **Optional:** Adjust the sample rate for one or more included metrics.
   The sample rate determines what percentage of AI executions a metric evaluates. For external AI systems, each metric has its own sample rate, so you can evaluate the metrics that matter most on more executions and sample the rest.

   (Optional) When metrics that contribute to the same quality or safety score use different sample rates, the metric with the higher rate evaluates more executions and can skew that score toward its results.

   Important: Increasing a metric's sample rate evaluates more executions and gives you more confidence in its score, but also increases assist usage. Set the lowest rate that produces enough evaluated sessions to trust the score.

   a. In the Evaluation metrics for Agentic AI section, select the edit icon next to the sample rate that you want to update.

   b. Enter the new sample rate.

   c. Select **Apply**.

What to do next

To have a metric contribute to your quality or safety scores, add it to a metric template and assign a weight. See Configure an evaluation metric template.

To tailor metrics for an individual external AI system instead of changing the global configuration, see Configure asset-specific metrics for external AI systems.

Configure asset-specific metrics for external AI systems

Add or remove metrics for one or more external AI systems without changing the global metric configuration, and adjust metric sample rates.

Before you begin

Role required: sn_ai_governance.ai_steward

Note: The AI system must have evaluation enabled. See Enable evaluation for an AI system.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

You can optionally override which metrics are evaluated for specific external AI systems. For details on adding or removing metrics for an AI system from that system's asset record instead, see Configure metrics evaluated for an AI system.

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home** > **Settings** > **Rules and templates** > **Evaluation**.
2. On the **AI evaluations** sub-tab, select **External AI systems**.
3. Configure the metrics that you want to evaluate for specific AI systems.

> **Important:** Adding more metrics increases the visibility you gain into each session, but also increases assist usage to evaluate it. Select the metrics that give you the insight you need.

Option	Steps
Add one or more AI systems and selected metrics	**a.** In the Asset-specific metrics section, select **Add**. **b.** In the side panel, select one or more AI systems that you want to add a metric for. **c.** Select **Next**. **d.** Select one or more metrics that you want to evaluate for the AI systems that you selected. **e.** Select **Add metrics**.
Remove one or more metrics	**a.** In the Asset-specific metrics section, select the check box next to the metric or metrics that you want to remove. **b.** Select **Remove**. **c.** In the confirmation dialog, select **Remove**.

4. **Optional:** Adjust the sample rate for one or more metrics.
   The sample rate determines what percentage of AI executions a metric evaluates. For external AI systems, each metric has its own sample rate, so you can evaluate the metrics that matter most on more executions and sample the rest.

   (Optional) When metrics that contribute to the same quality or safety score use different sample rates, the metric with the higher rate evaluates more executions and can skew that score toward its results.

   > **Important:** Increasing a metric's sample rate evaluates more executions and gives you more confidence in its score, but also increases assist usage. Set the lowest rate that produces enough evaluated sessions to trust the score.

   a. In the Asset-specific metrics section, select one or more AI systems that you want to update.
   b. In the More actions menu, select **Edit sample rate**.
   c. In the side panel, select the pencil icon for the metric that you want to update.
   d. Enter the sample rate that you want to use.
   e. Select **Apply**.
   f. Update the sample rate for additional metrics in the side panel as needed.
   g. Select **Save**.

Exclude external AI systems from a metric

Exclude one or more external AI systems from a specific metric, without changing that metric's configuration for every other system.

Before you begin
Role required: sn_ai_governance.ai_steward

About this task
You can optionally exclude one or more AI systems from a single metric without affecting other external AI systems. For example, if one agent occasionally handles data that would otherwise fail a secrets detection metric, you can exclude just that agent from that one metric while still scoring it against everything else.

Procedure
1. Navigate to **All** > **AI Control Tower** > **Home** > **Settings** > **Rules and templates** > **Evaluation**.
2. On the **AI evaluations** sub-tab, select **External AI systems**.
3. In the Evaluation metrics for Agentic AI section, find the metric that you want to exclude AI systems from.
4. In the **Excluded AI systems** column, select the pencil icon.
5. In the side panel, search or filter to find the AI systems that you want to exclude.
   - Fixed filters limit the systems to those that are managed, agentic, and have evaluation enabled.
   - You can find systems where a low score reflects a mismatch with the metric rather than an actual issue by viewing AI systems in the **Lowest performing** tab.
   - You can find systems that consistently perform well on this metric and don't need continued scrutiny by viewing AI systems in the **Highest performing** tab.
6. Select the AI systems that you want to exclude.
   Each selected AI system appears as a removable pill after the list.
7. Select **Save**.
   If a selected metric is currently used in a published evaluation template or a compliance evaluation, the exclusion isn't saved, and you're shown which templates or evaluations are using it so you can resolve that first.

Result
The metric no longer evaluates the AI systems that you excluded. They remain subject to every other metric in your global configuration, and their existing scores for other metrics are unaffected.

Configure an evaluation metric template

Adjust the scoring formula for a metric template to change which metrics contribute to quality or safety scores, or to change how much weight each metric carries.

Before you begin
Role required: sn_ai_governance.ai_steward

About this task
You can adjust a metric's influence on the score, add metrics previously tracked for visibility only, or remove metrics that aren't required by editing a metric template. Changes apply to new evaluation sessions only. Existing sessions keep the scores they were originally calculated with.

For the full list of quality and safety metrics, see Evaluation metrics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home** > **Settings** > **Rules and templates** > **Evaluation**.
2. Select the **Metric templates** sub-tab.
3. Select the metric template that you want to edit.
4. Update the metric template as needed.

   For example:

   - Select the primary metric, which is required for every measure.
   - Adjust a metric's weight to increase or decrease its influence on the score.
   - Add a metric by selecting **+ Add metrics** and assigning a weight.
   - Remove a metric from the formula.

   After any change, verify that all weights still sum to 100%.

   Note: Only metrics that are enabled for scoring on the AI evaluations page are available to add. See Activate evaluation scoring for ServiceNow AI systems and Activate evaluation scoring for external AI systems.

5. Verify the updated formula by expanding the **How is this score calculated?** section.

Result

The updated formula is applied to new evaluation sessions. Scores on the monitoring overview reflect the updated formula as new data is collected.

Configure trace data retention and access

Control how long session, trace, and span data is stored to reduce storage usage, and choose whether that data stays available for analysis.

Before you begin

Role required: admin

About this task

By default, session, trace, and span data is retained for 30 days. If your organization has strict data-minimization requirements, a system administrator can shorten that window or stop retaining trace data altogether. Aggregate quality and safety scores remain available either way; only the underlying trace-level detail is affected.

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home** > **Settings** > **Rules and templates** > **Evaluation**.
2. Select the **Trace data retention and access** sub-tab.
3. Choose a trace retention option.

Option	Description
Don't keep traces	Permanently delete session, trace, and span data after approximately 1 day, once scoring is complete, by selecting **Don't keep traces**. After selecting this option, no session data is displayed in AI Control Tower.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	○ Evaluated sessions views on the monitoring overview and on each AI system's **Monitor** tab are hidden. ○ Actionable insights from AI Skill Kit are turned off.
Keep traces for scoring	**a.** Retain data for analysis and re-scoring by selecting **Keep traces for scoring**. **b.** Specify the number of days to keep the data from 1 to 30.

4. Select **Save**.

> ⚠ **Warning:** If the new setting would delete data you're currently storing, a confirmation dialog shows how many traces would be deleted and how many AI systems are affected. Type the exact trace count shown, then select **Deletion** to confirm. This action can't be undone.

Result

A confirmation message shows the retention period now in effect. The setting applies instance-wide, across all AI evaluation pipelines.

Managing evaluation cost

Reduce the assists that evaluation consumes by adjusting what you evaluate, how often you evaluate it, and which AI systems you evaluate.

Evaluating both ServiceNow and external AI systems consumes assists. Three settings determine how many assists your evaluations consume.

- Consider which metrics require evaluation. Each metric increases the visibility you gain into a session but also increases assist usage to evaluate it. Evaluate only the metrics that give you the insight you need.
- Adjust the sample rate as needed. A higher sample rate evaluates more executions and gives you more confidence in your scores but also increases assist usage. Set the lowest rate that produces enough evaluated sessions to trust the score. ServiceNow AI systems use a single sample rate for all metrics. External AI systems have a sample rate per metric, so you can keep higher rates for the metrics that matter most and sample the rest.
- Evaluate AI systems that require oversight. Evaluation runs for every AI system that has it turned on, so turn it off for the systems that you don't need to monitor, such as test or retired systems.

Reviewing quality and safety scores

Determine whether your AI systems are meeting quality and safety targets by reviewing scores and evaluation trends.

Reviewing scores workflow

When evaluations are active and sessions have been scored, start with the monitoring overview to assess performance across your AI portfolio. The overview provides score cards, AI-generated insights, trend data, and ranked lists of AI systems so you can identify which systems need attention.

When you identify a system that needs closer review, select the **Monitor** tab on the AI system's asset page to see scores, metric breakdowns, trends, and evaluated sessions scoped to that system alone. See Monitoring an AI system.

Monitoring overview

Identify low-scoring AI systems quickly by reviewing quality and safety scores, AI-generated insights, and performance trends across your AI portfolio.

Key benefits

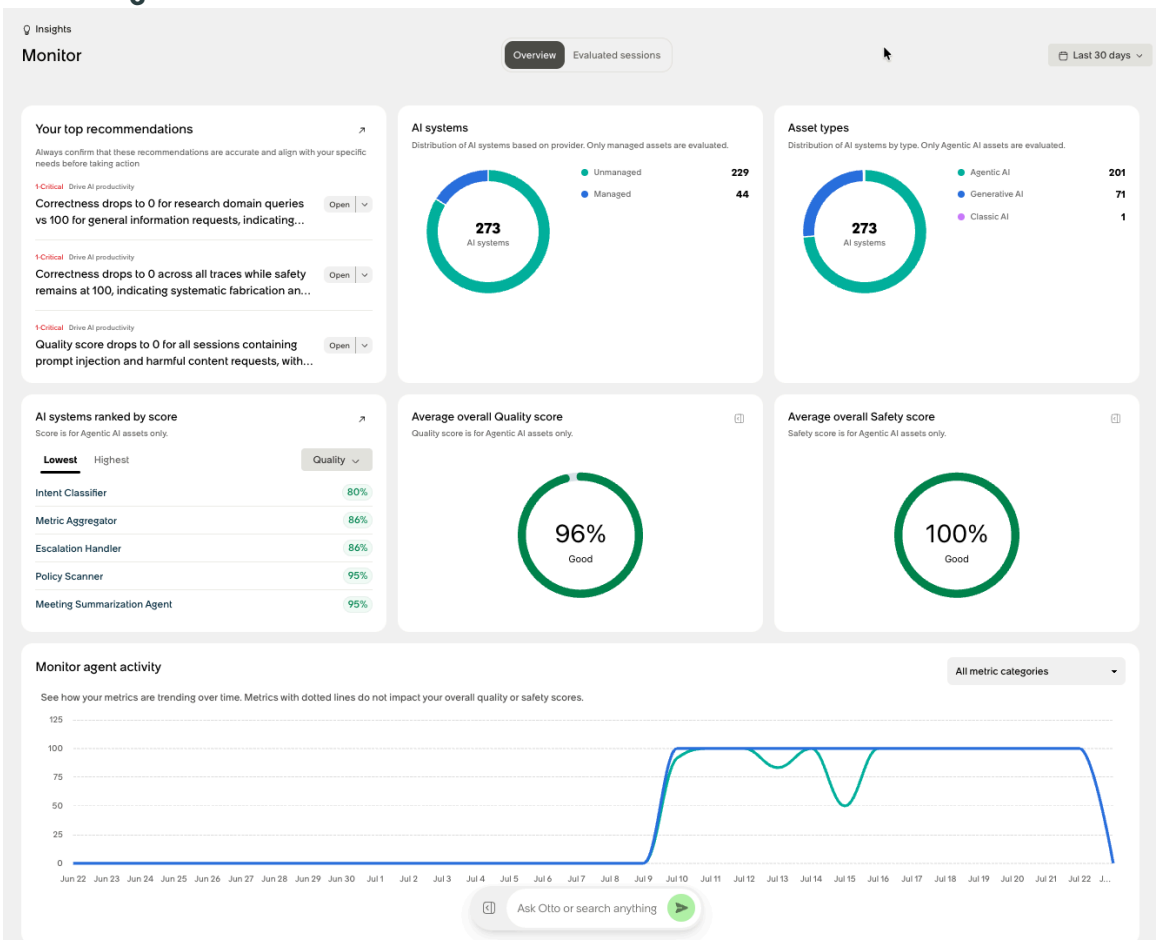
- See the quality and safety health of your entire AI portfolio at a glance without opening individual system records.
- Focus your attention on the AI systems and metrics that need it most using ranked lists and AI-generated insights.
- Detect gradual regressions before they affect users by tracking metric trends over time.
- Understand exactly how a composite score is calculated by expanding the scoring breakdown for any score card.

The monitoring overview is the starting point for assessing how your AI systems are performing in production. It brings together score cards, inventory data, AI-generated insights, and trend analysis so you can identify issues and take action from a single page.

Note: If you have the AI Asset Owner [sn_ai_asset_mgmt.ai_asset_owner] role, the **Overview** page provides a summary for only the AI systems that you own.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Monitoring overview



Required roles

The AI steward [sn_ai_governance.ai_steward] or AI asset owner [sn_ai_asset_mgmt.ai_asset_owner] role is required to view the monitoring Overview tab.

Accessing the monitoring overview

View the monitoring overview by navigating to **All** > **AI Control Tower** > **Home** > **Insights** > **Monitor** > **Overview**.

Your top recommendations

AI-generated insights surface the highest-priority issues affecting your AI systems. Each recommendation includes a severity level, an outcome category (for example, Drive AI Productivity), and a brief description of the issue.

Note: Insights are generated daily based on sessions from the previous 24 hours. This delay allows the evaluation engine to collect enough sessions to produce meaningful analysis.

Each insight card provides the following actions:

View details

Opens a side panel with the full analysis, including affected metrics, impact, description, and root cause.

Open

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Navigates to the location where you can act on the insight. For ServiceNow AI agents, this option takes you to actionable recommendations in the AI Skill Kit. For external AI systems, this option takes you to the related AI asset page in AI Control Tower.

Complete

Marks the insight as resolved and removes it from the list. Use this options after you have addressed the underlying issue.

Delete

Removes the insight from the list without marking it resolved. Use this option for insights that don't require action, such as duplicates or expected behavior.

Use the recommendations to prioritize which issues to investigate first. For example, an insight might report that a safety score dropped significantly during the past week and identify the specific session and metric driving the decline.

Important: AI-generated insights are based on automated analysis and may not reflect all contributing factors. Verify findings by reviewing session detail before taking action.

AI systems and asset types

Two inventory widgets show the distribution of AI systems on your instance.

AI systems

Shows the total count of AI systems by management status (Managed and Unmanaged). Only managed assets are evaluated.

Asset types

Shows the distribution of AI systems by type (for example, Agentic AI, Generative AI, and Classic AI). Select a type to open the inventory filtered by that type. Only Agentic AI assets are evaluated.

Average overall Quality and Safety scores

The quality and safety score cards display average overall scores for your Agentic AI systems. Each score card shows a percentage and a performance label.

Scores are color coded for quick interpretation:

- Red (0 to 50%): Low. Investigate immediately.
- Orange (51 to 75%): Fair. Review recent sessions for trends.
- Green (76 to 100%): Good. Meeting quality or safety targets.

The safety score card populates only when external AI systems are being evaluated and have returned scored sessions. Because ServiceNow AI systems don't have safety metrics available, the safety score card remains empty until at least one external AI system has produced evaluated sessions. If the card appears empty, verify that evaluation scoring is active for your external AI systems and that trace data is being received.

View a scoring breakdown by selecting the side panel icon.

Score card side panel

Selecting a quality or safety score card opens a side panel with a detailed breakdown of how the composite score is calculated. The panel includes tabs for **ServiceNow AI systems** and **External AI systems** so you can view the scoring breakdown for each type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- See how the score has changed over time by reviewing the average score and the percentage change from the prior period with a trend chart.
- Identify which metrics are contributing to the score by reviewing the data sources table, which shows each metric's name, weight, and current score, and evaluation count.
- Expand the scoring formula section to see a visualization of how each metric contributes to the composite, along with explanatory notes about how the score is calculated.

Note: If one or more metrics have a noticeably lower evaluation count than the others, a bias indicator appears next to the scoring formula section. A metric with fewer evaluations still counts at its full configured weight, so metrics that evaluate more consistently can carry more real influence on the score than their configured weight alone suggests.

Analyze which metrics are pulling a composite score up or down, and by how much. For details on how scores are calculated, see How evaluation scoring works.

AI systems ranked by score

View which AI systems are scoring lowest or highest. Select **Quality** or **Safety** from the list, and select **Lowest** or **Highest** to change the sort order. Select a system name to open its evaluation details.

Monitor agent activity

Track how quality and safety metrics for your Agentic AI systems are trending over time in the Monitor agent activity chart. The chart plots every metric with data for the selected range so you can detect gradual regressions, confirm that recent changes improved performance, and see which metrics are shaping your overall scores.

Two line styles distinguish how each metric contributes to scoring:

- Solid lines represent metrics that contribute to your overall quality or safety score. These metrics are configured in a metric template.
- Dotted lines represent metrics that are being collected but don't contribute to your overall quality or safety score. These metrics aren't configured in any metric template.

To add a dotted-line metric to your scoring formula or to adjust how much existing metrics contribute to your overall scores, see Configure an evaluation metric template.

Choose which metrics to display by selecting an option from the list.

Lowest performing metrics

Show the top five metrics that had the biggest drop in performance over the selected time period. This is the default selection.

Top performing metrics

Show the top five metrics that had the biggest increase in performance over the selected time period.

Quality metrics

Show only metrics in the Quality category.

Safety metrics

Show only metrics in the Safety category.

All metrics

Show every quality and safety metric that has data for the selected date range.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alternatively, select an individual metric from the list to view performance for that metric over time.

Point to a data point on the chart to see the exact score for that date.

Use cases

Identifying a quality regression during a weekly review

An AI steward opens the monitoring overview on Monday morning. The quality score card shows 68% (orange), down from 82% the previous week. The administrator selects the score card and sees that Task completion dropped from 88% to 54%. The AI systems ranked by score widget shows a specific incident resolution agent at the bottom of the list. The administrator selects that system, opens the lowest-scoring session, and discovers that a downstream API integration started returning timeout errors over the weekend. The administrator files an incident and monitors subsequent sessions to verify the fix.

Responding to an AI-generated insight

The top recommendations list surfaces a critical insight: "Safety score dropped the most this week." The administrator selects **View details** and reads that the Instruction adherence metric dropped 18% for an external HR case management agent. The root cause analysis indicates the agent began straying from its approved response guidance in leave-request responses. The AI steward shares the insight with the product owner, who adjusts the agent's response guidelines.

Monitoring a newly deployed agent

After deploying a new ServiceNow ITSM agent, the product owner opens the monitoring overview and filters to the new system using the AI systems ranked by score widget. Over the first week, the trend chart shows Tool choice accuracy starting at 62% and improving to 78% as the team adjusts the agent's tool configuration. The owner uses the scoring breakdown side panel to confirm which metrics are improving and which still need attention.

Review scores across your AI portfolio

Assess the quality and safety of your AI systems by reviewing scores, identifying low-scoring systems, and learning which metrics are affecting each score.

Before you begin

Role required: sn_ai_asset_mgmt.ai_asset_owner or sn_ai_governance.ai_steward

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home** > **Insights** > **Monitor**.
2. Set the date range for the data you want to review.
   Select the date range picker and choose a time period. The default is **Last 30 days**. Select **Custom range** to specify an exact start and end date, up to 18 months apart.
   All score cards, trends, and session data on the page update to reflect the selected range.
3. Check for critical issues that need immediate attention by reviewing **Your top recommendations**.
   a. Review each insight card for its severity level and outcome category.
   b. Select **View details** to open the full analysis in a side panel, including affected metrics, impact, description, and root cause.
4. Understand which metrics are affecting a score by selecting the score card to open the scoring breakdown.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select the **ServiceNow AI systems** or **External AI systems** tab to view the breakdown for a specific AI system type.

b. Review each metric's name, weight, current score, and change over time.

c. Expand the scoring formula section to see a stacked bar visualization of how each metric contributes to the composite score.

For example, if the Quality score is 68%, the side panel might show that Task completion (weight 25%) scored 54% while Answer completeness (weight 40%) scored 91%. The low Task completion score is pulling down the composite.

5. Identify which AI systems need attention by reviewing the **AI systems ranked by score** widget.

a. Select **Quality** or **Safety** from the list to choose which score to rank by.

b. Select **Lowest** or **Highest** to change the sort order.

c. Select a system name to view its evaluation details.

For example, sorting by Lowest quality might reveal that an incident resolution agent is scoring 52% while all other systems are over 80%. This tells you where to focus your investigation.

6. Assess overall quality performance by reviewing the **Average overall Quality score** card.

The score card displays a composite weighted average as a percentage. For example, a Quality score of 88% labeled Good (green) indicates that your AI systems are meeting quality targets overall.

7. Assess overall safety performance by reviewing the **Average overall Safety score** card.

The Safety score card displays a composite weighted average as a percentage. For example, a Safety score of 70% labeled Fair (orange) indicates that one or more safety metrics need attention.

8. Check performance over time by reviewing the **Monitor agent activity** trend chart.

Option	Description
Lowest performing metrics	View the top five metrics with the largest de cline in quality and safety over time.
Highest performing metrics	View the top five metrics with the largest in crease in quality and safety over time.
Quality metrics	View the performance of quality metrics over time.
Safety metrics	View the performance of safety metrics over time.
All metrics	View the performance of all metrics over time.
Select a specific metric	View the performance for a specific metric by selecting it from the list.

Solid lines represent metrics that contribute to this AI system's overall quality or safety score. Dotted lines represent metrics that are collected but don't contribute to those scores. You can point to a data point on the chart to see the exact score for that date.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, a gradual decline in Task completion from 90% to 72% over three weeks indicates a quality regression for this AI system that warrants session-level investigation.

To add a dotted-line metric to your scoring formula, see Configure an evaluation metric template.

Investigating low-scoring sessions

Narrow a quality or safety issue from a broad score to a specific cause by reviewing evaluated sessions and session details.

Investigation workflow

When a quality or safety score drops, investigate a session to narrow the problem from a broad score to a specific cause. Session-level scores tell you which interaction went wrong. Trace-level scores and the judge's reasoning tell you which exchange produced the problem. Span-level input and output data tells you exactly why: the wrong tool was called, a parameter was malformed, or a data source returned an error.

Important: Trace and span detail for a session is available only for a limited time. To review the judge's reasoning and the input and output for a specific trace or span, investigate within 7 days for ServiceNow AI systems, or within 30 days for external AI systems. After that window, the session's quality and safety scores remain available, but the trace and span detail behind them is removed.

Evaluated sessions

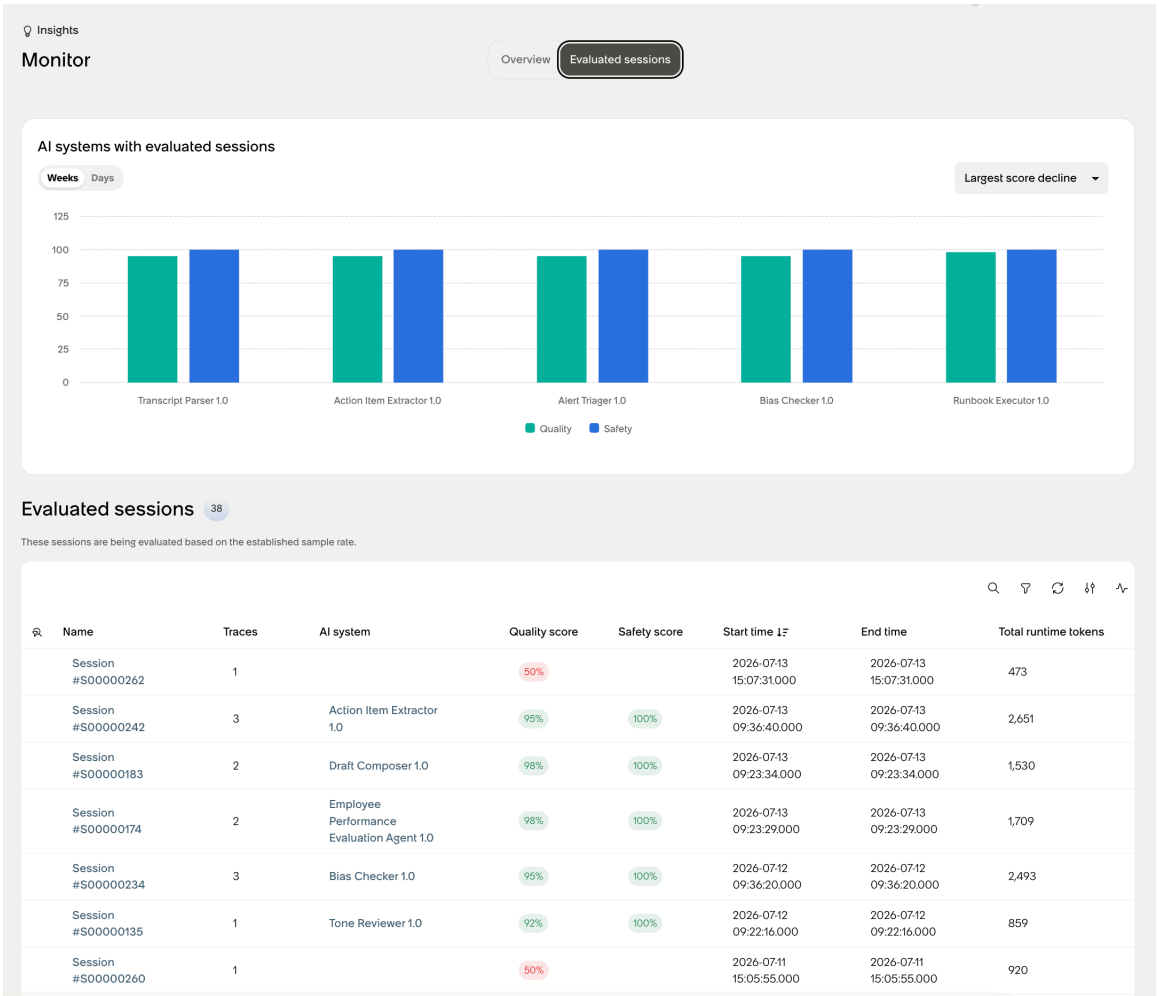
View all evaluated AI sessions across your portfolio, compare quality and safety scores by AI system, and identify the sessions that need investigation.

Key benefits

- Compare quality and safety scores across AI systems to identify which systems are declining or performing well.
- Find low-scoring sessions quickly by sorting and filtering the session list.
- View score trends by AI system over weeks or months to detect patterns.
- Open any session directly to investigate its traces and spans.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Evaluated sessions



Required roles

The AI steward [sn_ai_governance.ai_steward] or AI asset owner [sn_ai_asset_mgmt.ai_asset_owner] role is required to view evaluated sessions.

Accessing evaluated sessions

View evaluated sessions by navigating to **All** > **AI Control Tower** > **Home** > **Insights** > **Monitor** and selecting the **Evaluated sessions** tab.

AI systems with evaluated sessions

Compare quality and safety scores across your AI systems using the bar chart. Each AI system displays a pair of bars representing its quality and safety scores.

- Group scores by **Months**, **Weeks**, or **Days** to adjust the time granularity.

  For example, after deploying an update to an AI system, group the chart by **Days** to see whether the update improved scores without affecting other systems.

- Select **Largest score decline** or **Top performers** from the list to change how AI systems are sorted in the chart.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Evaluated sessions list

Find the sessions that need attention by reviewing the evaluated sessions table. Scores are color coded for quick scanning: red (0 to 50%), orange (51 to 75%), green (76 to 100%).

Name

Session identifier. Select the name to open the session detail page and begin investigating traces and spans. See Investigate a low-scoring session.

Traces

Number of traces in the session. A session with many traces represents a longer, multi-turn interaction. Low scores on sessions with few traces can indicate a fundamental issue, while low scores on sessions with many traces may point to degradation over the course of the conversation.

Spans

Number of spans across all traces in the session. A high span count relative to the number of traces can indicate the AI system is taking many steps, such as tool calls, to complete its task, which can also help explain elevated latency or token usage.

AI system

The AI system associated with the session. Select the name to view aggregated quality and safety scores across all evaluated sessions for that system.

Quality score

Composite quality score for the session, calculated from the weighted metrics in your quality template. Sort by this column to surface the lowest-scoring sessions first.

Safety score

Composite safety score for the session, calculated from the weighted metrics in your safety template. A red safety score warrants immediate investigation.

Start time

When the session began. Use this to correlate low scores with known events such as deployments, configuration changes, or outages.

End time

When the session ended or timed out.

Total runtime tokens

Combined input and output tokens consumed by the AI system during this session. This reflects the cost of running the interaction, not the cost of evaluating it. Unusually high token counts can indicate inefficient agent behavior such as excessive retries or overly verbose responses.

Latency (ms)

Combined language model response time, in milliseconds, across all traces in the session. This measures time spent in language model calls, not total session duration. Unusually high latency can point to a slow-responding model or a high number of tool-calling steps within the session.

Session details

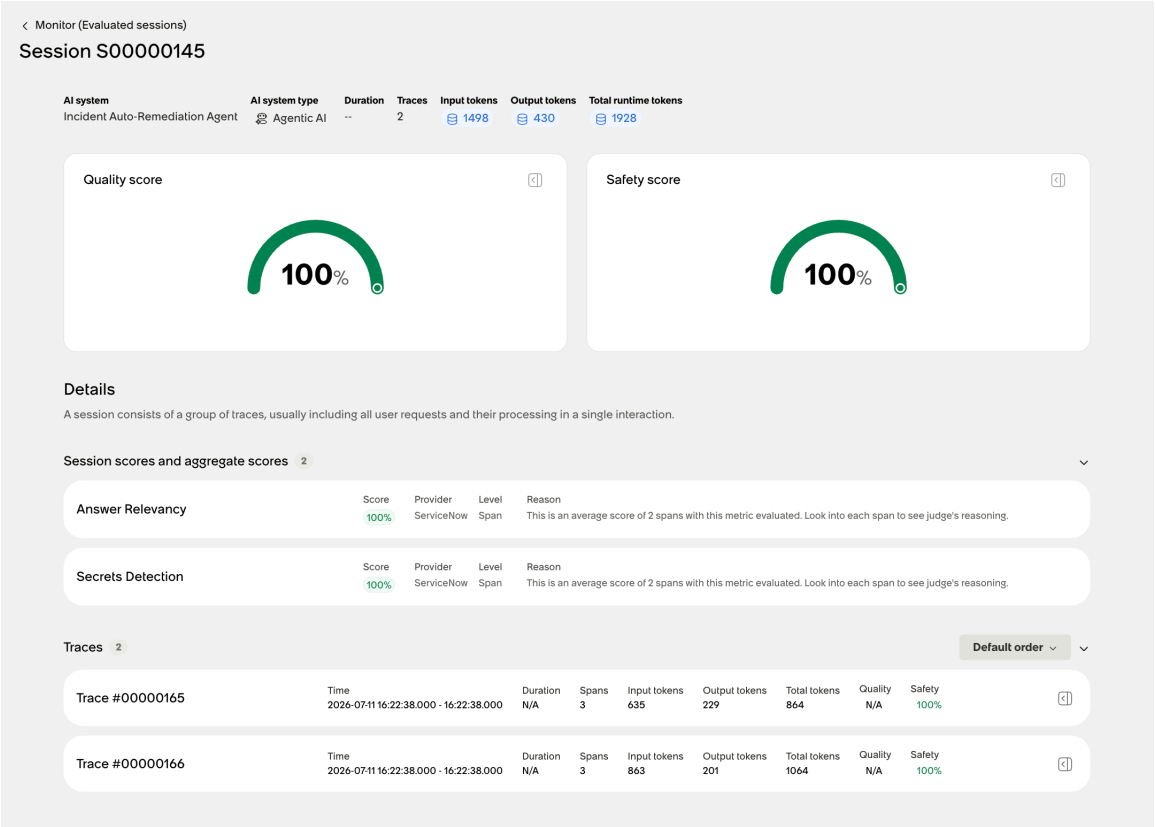
View metric breakdowns, the judge's reasoning, and trace and span data for a specific evaluated session.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Key benefits

- Understand which metrics are pulling a session's quality or safety score up or down by reviewing the scoring breakdown.
- Read the judge's reasoning for each metric to understand why a score was assigned.
- Identify the exact trace and span where an issue occurred by following the score indicators in the span timeline.
- Compare the AI system's input and output at each step to determine whether the issue originated in the data the system received or the response it produced.

Session details



Viewing session information

The session details page shows the AI system, its type, session duration, and token usage. Duration is measured from the first interaction to session close or timeout (10 minutes of inactivity). Total runtime tokens reflect the cost of running the interaction, not the cost of evaluating it.

The header also shows latency and span count for the session. Latency reflects the AI system's language model response time across the session's traces, which is typically much shorter than the session duration since duration also includes think time and tool-call execution. Span count is the number of spans across all traces in the session.

Quality and Safety score cards

Review the overall quality and safety of the session by reviewing the score cards. View a breakdown of the score by selecting the side panel icon. The side panel is filtered to show only the metrics that apply to this session, along with each metric's weight, score, and explanatory notes about how the score is calculated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Learn which metrics are impacting the overall score by viewing the lowest scoring metrics list.

To learn more about any single score, point to the information icon. The reason notes that the score is an average and points you to open an individual span or trace to read the judge's reasoning for each one.

Details

Identify which trace in the session is responsible for the low score by reviewing the traces list. Sort the Traces list to focus your investigation by selecting Lowest quality score, Lowest safety score, Highest latency, or other criteria from the list.

A trace shows N/A for its Quality or Safety score when no metrics in your corresponding metric template apply to that trace. This happens when all metrics in the template are evaluated at the session or span level only, or when the metrics that do apply to the trace level weren't evaluated for that particular trace. An N/A score doesn't indicate a problem with the trace. Rather, it indicates that your template's formula has nothing to calculate at the trace level. To see scores for that trace, either:

- Add a trace-level metric to your template. See Configure an evaluation metric template.
- Review span-level scores by expanding the trace and selecting individual spans in the timeline.

Trace detail

View the span timeline and evaluation data by selecting a trace.

Span timeline

Visualizes the trace as a waterfall where each span appears as a horizontal bar showing its duration. Nested spans are indented under their parent. Quality and safety indicators on individual spans highlight which spans scored highest or lowest, so you can focus your investigation on the right span without reviewing each one individually.

Evaluation scores

Lists each evaluation metric scored for this trace, along with the score and the judge's reasoning. Select a reason to open the full reasoning in a modal. Use this table to understand which metrics drove the trace's score before selecting individual spans.

Details

Shows what the AI system received and what it produced for this trace. Select **Open details** to view the full content in a modal. Select the **Input** tab to view the user's request or the data passed to the agent. Select the **Output** tab to view the agent's response.

Navigate between traces without returning to the session detail page by selecting **Previous trace** or **Next trace**.

Span detail

Identify the root cause of an issue at the most granular level by selecting a span in the timeline and viewing the details.

Duration

Time the span took to execute. Unusually high duration can indicate a slow external service call or a timeout that affected the agent's response.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tokens (input, output, total)

Number of tokens consumed by the span. Compare input and output token counts to assess whether the response is proportional to the prompt. A high input token count relative to other spans may indicate the agent is sending excessive context to an LLM call.

Quality

Quality score for this span. A low quality score on a specific span helps you pinpoint which step in the agent's reasoning or tool usage produced an incorrect or incomplete result.

Safety

Safety score for this span. A low safety score on a specific span helps you isolate which step in the agent's execution produced inappropriate content.

Note: The token counts reflect the cost of running the AI system's actual interaction, not the cost of evaluating it. Evaluation scoring consumes separate tokens that aren't displayed here.

Learn why a span scored the way it did by reviewing the evaluation metric scores and the judge's reasoning. For example, a Tool choice accuracy score of 54% with reasoning that says "the agent selected a knowledge base search when a CMDB lookup was more appropriate" tells you exactly what decision the agent made incorrectly.

Determine whether the issue originated in the input or the output by viewing the Details section. The **Input** tab shows the data or prompt passed to the span. The **Output** tab shows what the span returned. For example, a correctly formatted request paired with an incorrect tool call tells you the issue is in the agent's logic, not the incoming data. Select **Open details** to view the full content when the preview is truncated.

Investigate a low-scoring session

Determine the root cause of a low quality or safety score by working through the session detail, trace timeline, and span-level input and output data.

Before you begin

Role required: sn_ai_asset_mgmt.ai_asset_owner or sn_ai_governance.ai_steward

About this task

Trace and span detail for a session is available only for a limited time. To review the judge's reasoning and the input and output for each trace and span, complete your investigation within 7 days for ServiceNow AI systems, or within 30 days for external AI systems. After that window, the session's quality and safety scores remain available, but the trace and span detail is removed.

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home** > **Insights** > **Monitor** and select the **Evaluated sessions** tab.
2. In the Evaluated sessions list, find the session that you want to investigate.
   For example, sort by score to identify the lowest-scoring sessions, search for a specific session by name, or filter the list to find the session.
3. Select the session that you want to investigate.
4. On the session detail page, determine which quality metrics are contributing to the low score by reviewing the Quality score card.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Open the quality scoring breakdown by selecting the side panel icon.

b. Review each metric's weight and score to determine which metric is affecting the score.

c. Close the side panel.

For example, if the session quality score is 67%, the side panel might show that Task completion scored 50% at 40% weight, while Answer completeness scored 91% at 35% weight. The low Task completion score is the primary contributor to the low quality composite.

5. On the session detail page, determine which safety metrics are contributing to the low score by reviewing the Safety score card.

a. Open the safety scoring breakdown by selecting the side panel icon.

b. Review each metric's weight and score to determine which metric is affecting the score.

c. Close the side panel.

For example, a Profanity detection score of 0% at 49% weight would immediately explain a low safety composite.

6. Review the score and the judge's reasoning for every evaluated metric in the Session scores and aggregate scores section.

Metrics scored at the session, trace, or span level all roll up here, so you can identify what's driving the quality and safety scores without opening each trace or span. The reasoning explains why the judge assigned each score. For example, a Task completion score of 50% might include reasoning such as "The user's goal was partially accomplished but the agent did not confirm the resolution."

When a metric's score is an average aggregated from the trace or span level, open an individual span or trace to read the judge's reasoning for each one.

7. Identify which trace is responsible for the low score by sorting the traces list.
   - Find the trace with the lowest quality score by selecting **Lowest quality score**.
   - Find the trace with the lowest safety score by selecting **Lowest safety score**.
8. Select the trace that you want to investigate.
9. In the trace side panel, determine which metrics failed on that trace by reviewing the trace-level evaluation scores and the judge's reasoning.

The evaluation scores table shows only the metrics applicable to this trace. Different metrics are available at the trace level than at the session level.

The judge's reasoning tells you what specifically went wrong. For example, an Answer completeness score of 60% with reasoning "The response did not address all aspects of the user's query" tells you the agent's response was incomplete.

10. Determine whether the agent's response addressed the user's request by reviewing the trace-level input and output.
The input and output show you the actual conversation between the user and the AI system.

a. Select the **Input** tab to see what the user asked or what data was passed to the agent.

b. Select the **Output** tab to see how the agent responded.

c. Select **Open details** to view the full content when the preview is truncated.

11. Identify and select the span that caused the issue using the quality and safety indicators in the span timeline.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

12. Confirm the root cause by reviewing the span's evaluation scores and comparing its input and output data.
    a. Review the evaluation metric scores and the judge's reasoning for this specific step.
    b. Select the **Input** tab to see what data was passed to this span.
    c. Select the **Output** tab to see what the span produced.
    d. Select **Open details** to view the full content when the preview is truncated.

    At the span level, the input and output show the agent's internal execution, not the user-facing conversation. For example, the input might be a correctly formatted API request, while the output shows the agent called the wrong endpoint or passed a malformed parameter.

13. **Optional:** Review additional traces to determine whether the issue is isolated or recurring by selecting **Next trace** or **Previous trace** to navigate between traces.

What to do next

After identifying the root cause, coordinate with the product owner to adjust the agent's configuration, prompts, or tool access. Monitor subsequent sessions to verify that the issue is resolved.

AI Control Tower evaluations reference

Reference topics provide additional information about the evaluation metrics in AI Control Tower.

Evaluation metrics

All evaluation metrics available in AI Control Tower, with their categories, evaluation levels, scoring formats, and descriptions.

AI Control Tower provides evaluation metrics that are enabled by default or enabled via opt-in. The metrics available for a given AI system depend on whether it is a ServiceNow AI or external AI system.

ServiceNow AI metrics

Metric	Category	Default or Opt-in	Level	Prompt owner	Scoring format	Description
Overall task completeness	Quality	Default	Trace	AI Skill Kit	Scale (0/50/100%)	Whether the agentic workflow completed its assigned task, including all required steps and proper resolution or escalation.
Tool calling correctness	Quality	Default	Span	AI Skill Kit	Binary	Whether tool calls used correct parameters, formatting, and expected values.
Tool choice accuracy	Quality	Opt-in	Span	AI Skill Kit	Percentage	Whether the agent selected the most appropriate tool for each step while completing a task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

External AI metrics

Metric	Category	Default or opt-in	Level	Scoring format	Description
Task completion	Quality	Default	Session	Percentage	Whether the agent decision path and output satisfy the user's request.
Answer relevancy	Quality	Default	Span	Binary	Whether the response addresses the query and remains on topic.
Secrets detection	Safety	Default	Span	Binary	Whether the response contains leaked credentials, API keys, or other sensitive secrets.
Instruction adherence	Safety	Default	Span	Percentage	How closely the response follows the given instructions.
Agent goal accuracy	Quality	Opt-in	Span	Percentage	Whether the AI agent achieved its intended objectives.
Agent goal completeness	Quality	Opt-in	Span	Percentage	Whether the agent successfully accomplished all user goals.
Agent tool trajectory	Quality	Opt-in	Span	Percentage	Whether actual tool calls match the expected reference tool calls.
Context relevance	Quality	Opt-in	Span	Percentage	Whether retrieved context is pertinent to the user query.
Profanity detection	Safety	Opt-in	Span	Binary	Whether the response contains inappropriate language.
Sexism detection	Safety	Opt-in	Span	Binary	Whether the response contains sexist or discriminatory content.
Tool error	Quality	Opt-in	Span	Binary	Whether errors or failures occurred during agent tool execution.
Faithfulness	Quality	Opt-in	Span	Binary	Whether the response is free of hallucinations and grounded in verifiable facts.
Answer correctness	Quality	Opt-in	Span	Percentage	Whether the response is factually accurate when compared against ground truth.
Answer completeness	Quality	Opt-in	Span	Percentage	How completely responses use relevant context

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Metric	Category	Default or opt-in	Level	Scoring format	Description
					to address all relevant information.
Conversation quality	Quality	Opt-in	Span	Percentage	Whether the conversation demonstrates appropriate tone, clarity, flow, responsiveness, and transparency.

Measuring AI systems

Measure quantifies the productivity value delivered by your AI systems and tracks their costs. It also reports the net return on AI, enabling you to determine where to scale, fund, or retire AI.

Measure overview

Measure is one of the AI Control Tower (AICT) pillars (Discover, Observe, Govern, Secure, Measure). While the other pillars focus on finding, monitoring, governing, and protecting your AI systems, Measure is responsible for reporting the results produced by those systems. It answers three questions:

- What is AI actually delivering?
- What is it costing you?
- What's the net return?

Components

Measure has three components:

Value

Value converts AI usage into a productivity figure.

Cost

Cost records the actual expenses of your AI, enabling AI Control Tower to compare this against productivity gains and calculate the net AI return. You set it up by inputting your organization's average hourly rate and specifying prices for both integrated and non-integrated vendors.

Dashboard

Dashboards are where value and cost converge. The dashboard presents productivity gains, AI costs, and net AI return together. It breaks usage and costs down by user and department. It shows adoption patterns and flags AI systems that record no usage.

How Measure helps

As organizations scale AI across teams and providers, it becomes harder to understand whether AI investments are delivering measurable business value. Costs can accumulate across multiple model providers, while productivity gains often remain anecdotal or inconsistent across teams.

As AI adoption grows, Measure helps organizations:

Prove business value

Calculate productivity value and net AI return for specific AI systems, instead of relying on estimates or anecdotal feedback.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Control AI spend

Monitor AI system costs, including token-level costs across model providers, so spend is visible and predictable.

Make informed investment decisions

Identify where AI is creating value, where spend is increasing, and which AI systems to scale, optimize, fund, or retire.

Standardize value measurement

Use templates so teams can calculate value consistently, and results can be compared or rolled up across the organization.

Reduce manual reporting

Run scheduled value jobs so dashboards stay up to date without teams assembling spreadsheet-based reports.

Attribute accountability

Assign value and cost to the departments and users that generate them.

Measure AI systems

Measure is the AI Control Tower capability for measuring the productivity gains, cost, and net AI return of your AI systems. It brings together value measurement, cost tracking, and dashboards.

Get started

Explore

Learn how value templates, cost frameworks, and productivity calculations work.

Configure

Set up AI costs, create value templates, and map them to AI systems.

Use

Use Dashboards to review and analyze the productivity gains, AI costs, and the net return on AI investment.

Reference

Learn about the roles, Performance Analytics indicators, and the tables used in value calculation.

Exploring Measure

Measure helps you determine whether your AI systems deliver more value than they cost. It brings value and cost data together in dashboards so that you can compare productivity gains with AI spend.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Measure is one of the AI Control Tower pillars. It helps you quantify the value your AI systems deliver, track what they cost, and monitor the results over time. Measure includes the following components.

Value

Value translates AI usage into measurable productivity metrics. It uses value templates and value jobs to assess the impact of AI usage on productivity and to calculate the productivity gains from your AI systems.

A value template is the metric that converts AI usage into productivity gains. Each template includes a usage indicator, the minutes saved per occurrence, and a quality score. Templates are reusable by design, so a single template can be applied to multiple AI systems.

Value jobs are scheduled tasks that run at set intervals—daily (default), monthly, or quarterly—to capture usage and user metrics and to power dashboards.

Cost

Cost records the actual expenses associated with your AI systems, enabling AI Control Tower to compare these costs against productivity gains and calculate the net return on investment. You configure costs by entering your organization's average hourly rate and defining prices for integrated and non-integrated vendors. The cost configuration converts token usage and ServiceNow Assist consumption into monetary costs.

Dashboards

Dashboards are where value and cost come together. Dashboards display productivity gains, AI costs, and the net return on AI investment. They break down usage and costs by user and department, highlight adoption trends, and identify AI systems that show no usage.

How Measure turns AI usage into business value

Measure uses value templates, hourly rates, and vendor costs to calculate the value and cost of AI systems. The value measurement follows this sequence.

1. Define how value is calculated.

   A value template defines the calculation. The template captures a persona, a usage metric, a time value, and a quality (acceptance) value.

2. Convert time saved into financial value.

   Configure hourly rates globally or by persona to convert productivity gains, measured in hours, into monetary value.

3. Add costs for integrated vendors.

   Add cost details for ServiceNow and integrated vendors so that Measure can calculate costs from monitored usage and observability data.

4. Add costs for non-integrated vendors.

   Add cost details for vendors that aren't integrated with ServiceNow by using a token-based calculation or by entering the total cost directly.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Calculate savings, cost, and return.

   Total savings and total cost are calculated for the selected time period. Total savings represent the productivity gains, calculated as the total dollar amount saved by using AI systems. Total cost includes the overall token and Assist costs associated with using these AI systems.

6. Review results on dashboards.

   Dashboards display savings, cost, and net AI return, with breakdowns by AI system, department, and user.

Value

Value translates AI usage into measurable productivity metrics.

Value uses templates and value jobs to assess the impact of AI usage on productivity and calculate the productivity gains from your AI systems.

Value templates define how Measure converts AI usage into productivity gains. Each template includes the usage indicator, time saved per occurrence, and quality score used in the calculation. You can reuse a value template across multiple AI systems.

Value jobs are scheduled tasks that collect usage and user metrics. By default, value jobs run daily. You can also schedule value jobs to run monthly or quarterly based on your reporting requirements.

Value templates

Value templates define how the AI Control Tower calculates the productivity value of an AI system. Each template captures a persona, usage indicators, a time value type, and a quality score.

Value template overview

A value template, also called a productivity template, is the record that the AI Control Tower (AICT) uses to measure the productivity value of an AI system. Each template defines a name, a department, a description, and a persona, and then sets the indicators that determine how usage and time saved are calculated.

Every AI system supports a persona, such as agent, fulfiller, requester, developer, or others. You select the persona that the AI system supports so that value is attributed to the correct group of users.

A value template is reusable. You define it once and map it across as many AI systems as you want, so you don't repeat the same calculation for every skill or agent. The AI Control Tower ships out-of-the-box templates, and you can also create your own.

The AI Control Tower ships the following out-of-the-box value templates:

- Third-party Assets
- ServiceNow Skills
- ServiceNow Agents
- ServiceNow Agentic Workflows

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Key benefits

Value templates provide the following benefits:

- Calculate productivity value consistently across ServiceNow and third-party AI systems.
- Measure the time saved by each AI system by using out-of-the-box indicators or a fixed baseline.
- Factor the quality of AI output into the value calculation through a quality score.
- Attribute value to a specific persona so that results reflect the users who benefit.
- Reuse a single value definition across multiple AI systems.
- Capture value automatically each day after you publish a template.
- Measure value by persona and by department.
- Map default templates automatically to newly discovered AI systems.

How value templates are composed

A value template combines the following elements to produce a value calculation:

- **Usage indicators:** A set of out-of-the-box indicators measures execution counts, including agent execution, use case execution, skill execution, worker execution, and execution from third-party systems. Each indicator reads the table where those executions are stored.
- **Time value type:** Sets how time saved is calculated. Select an indicator to derive time saved from usage, or select a constant to apply a fixed baseline that you define.
- **Quality score:** Represents the quality of each execution. You can apply a constant value, such as 50 percent or 70 percent, or derive the score from observability performance evaluation. When an AI system has no quality score, the value defaults to 50 percent, which you can overwrite.

Two out-of-the-box indicators calculate time saved: one captures the read and write token counts and computes the total time saved, and one counts each consumed assist as one minute saved. When neither indicator fits, you can define a constant baseline, such as five minutes saved per incident summarization, based on your own assessment.

When the time value type uses the quality score, the AI Control Tower reads the score from observability. Observability runs a performance evaluation for each AI agent and AI system against production data.

The template elements combine into the productivity value using the following formula: **Productivity = Usage × Time Saved per invocation × Acceptance Rate**. The acceptance rate is the percentage of AI-generated outputs that end users accept, and it corresponds to the quality-score factor. It can be a constant, such as 50 percent, or a Performance Analytics (PA) indicator. For the full formula, the metric definitions, and a worked example, see Value calculation formula and metrics.

The three metrics at a glance

However the fields are labeled in the interface, every value template comes down to the same three numbers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The three value metrics

Metric	What it answers	How you provide it
Usage	How often is this AI system used?	A daily Performance Analytics (PA) indicator that counts executions.
Time saved	How much manual effort does one use avoid?	A constant, such as 15 minutes, or a PA indicator. The constant is the manual execution time minus the AI execution time.
Acceptance rate (quality)	How much of the AI output do people actually accept?	A constant, such as 50 percent, or a PA indicator. Defaults to 50 percent when no score is available.

Note:

The third metric appears as **Quality type** and **Quality constant (in %)** in the calculation builder, and as the acceptance rate in the productivity formula. They refer to the same factor: the share of AI outputs that are accepted.

After you publish a template, the default AI value engine job runs each day, captures value for the mapped AI systems, and populates the Value dashboard.

Considerations

Consider the following when you work with value templates:

- Each deployed AI system must have one published value template so that value calculation continues without interruption.
- You can create a published template for each persona, such as agent or requester. At least one published template must remain mapped to the AI system.
- A value job runs each night and calculates usage for the previous day, so the Value dashboard shows the value from the previous day.

Value calculation and value jobs

Value jobs calculate the productivity value of your AI systems on a schedule. Automated jobs run each night, and manual jobs run monthly or quarterly for AI systems that you onboard manually.

Value jobs overview

A value job reads the usage recorded for your AI systems and calculates the productivity value from the mapped value template. The AI Control Tower (AICT) runs value jobs on a schedule and calculates value for the previous day. As a result, the Value dashboard shows the value from the previous day.

Value calculation uses Performance Analytics (PA) indicators. An out-of-the-box daily PA indicator job calculates the usage scores for the previous day. Any custom indicator you use for value calculation must also be daily. It must complete its run before 1:00 PM each day so the value job can use its scores.

Key benefits

Value jobs provide the following benefits:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Calculate value automatically each night for integrated AI systems.
- Run manual jobs on a monthly or quarterly cadence to match how you collect data.
- Show failed manual jobs with the reason for the failure so that you can rerun them.

Automated and manual value jobs

The AI Control Tower runs two kinds of value jobs:

- **Automated value job:** Runs each night for ServiceNow AI systems and for third-party AI systems that use a usage integration. The job fetches the usage for the previous day and calculates value.
- **Manual value job:** Runs for AI systems that you onboard manually through the inventory intake form and that do not have a usage integration. You create manual indicators, and the job runs on the cadence set by those indicators.

For manual value jobs, the AI Control Tower derives the cadence from the indicator type. A monthly indicator runs as a monthly job, and a quarterly indicator runs as a quarterly job.

Failed value jobs

Automated daily jobs run without manual intervention and retry automatically if a run does not complete. You can't rerun a daily job manually. You can rerun a monthly or quarterly job that fails, for example after a timeout or when a server is unavailable. The manual value jobs list filters to failed transactions by default and shows a comment that describes why each job failed.

Considerations

- A value job requires an active user. If that user is inactive, value calculation stops until you assign an active user.
- Both value and cost are calculated for the previous day, so configuration changes appear on the dashboard after the next scheduled run.

Value calculation formula and metrics

The AI Control Tower calculates the productivity value of an AI system by multiplying usage, time saved per invocation, and the acceptance rate.

Productivity formula

The AI Control Tower calculates the productivity value of an AI system with the following formula:

```
Productivity = Usage × Time Saved per invocation × Acceptance
 Rate
```

Metric definitions

Persona

The user role for whom the value is calculated, specific to the selected AI system, such as agent, requester, developer, and others.

Usage

The number of times a specific AI skill, agent, or feature is triggered within the platform. Usage is measured by counting events in logs, or by aggregating unique user interactions, over a defined period (currently daily). For example, if the Incident Summarization skill is triggered 94 times on August 18, its usage for that day is 94. Usage is calculated through a Performance Analytics (PA) indicator. Only daily

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

indicators are supported. An out-of-the-box daily PA indicator job calculates usage scores for the previous day. Custom indicators must be daily and must complete their run before 1:00 p.m. each day.

Time Saved

The reduction in manual effort per invocation. It is estimated as the difference between the time a user spends performing the task manually and the time spent with AI assistance. Time saved can be a constant, such as 15 minutes, or an indicator. If it is an indicator, it follows the same rules as the usage indicator. For example, if each Knowledge Base (KB) generation call uses 5 assists and each assist saves 1 minute, the calculation records 5 minutes saved.

Acceptance Rate

The percentage of AI-generated outputs that end users accept, which indicates the effectiveness of, and trust in, the AI solution. Acceptance Rate = (Accepted AI outputs ÷ Total AI outputs) × 100. The acceptance rate can be a constant value, such as 50 percent, or a PA indicator that follows the same rules as usage.

Sample calculation: HR case summarization

The following example shows how the productivity metrics are derived for the HR case summarization skill.

HR case summarization

Metric	Value
Count of HR cases created	5,000
HR cases not processed by agentic AI	2,750
Cases with summarization (45%) — Usage	2,250
Cases with accepted summarization (30%) — Acceptance rate	675
Time saved per execution	5 mins

Value tracking for managed and unmanaged AI systems

The AI Control Tower value dashboard shows value and usage only for AI systems that were managed during the reporting period. Value realized while an AI system was managed stays on the dashboard, even after the AI system becomes unmanaged.

Value data for unmanaged AI systems

An AI system that changes from managed to unmanaged continues to appear on the value dashboard. AI Control Tower counts its value and usage only for the dates when the AI system was managed. Data from after the AI system became unmanaged isn't included in the total value.

For the date range when the AI system was managed, the AI system name on the value dashboard is a link that opens the AI system record.

Unmanaged AI system example.

Incident Summarization is a managed AI system that an AI steward marks as unmanaged on January 15. When you view the value dashboard for the 30 days of January, the dashboard shows the following.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- All managed AI systems, including Incident Summarization.
- Value and usage data for Incident Summarization from January 1 through January 15 only.
- A link to Incident Summarization for its managed period.

Important:

If your organization uses a ServiceNow SKU and you upgrade AI Control Tower, review your AI systems and mark those you would like to track as managed. For more information, see Move an unmanaged AI system to managed.

Value template tab

When an AI system is unmanaged, the **Value template** tab shows its value templates as unmapped. Actions that change the AI system or its value templates aren't available.

Unmanaged AI system statuses

Field	Value for an unmanaged AI system
Lifecycle status	**Unmanaged**
Value template status	**Unmapped**. Applies to all templates that were previously mapped, including published and draft templates.

Value templates for unmanaged AI system

When an AI system is set to unmanaged, AI Control Tower automatically unmaps the AI system from all of its value templates. Templates that were previously mapped, whether published or draft, show the **Unmapped** status. The lifecycle status of the AI system changes to **Unmanaged**. Value and usage for the period when the AI system was unmanaged aren't calculated.

While the AI system is unmanaged, you can't add, edit, reject, or delete value templates or the AI system from the **Value template** tab.

Value data when an AI system is managed again

When an AI steward changes an unmanaged AI system back to managed, AI Control Tower does the following.

- Maps the AI system to the same value templates that it was mapped to before.
- Restores each template to its previous status.

Important: Mappings that were in draft status when the AI system was set to unmanaged aren't restored.

- Resumes value and usage calculations from the date the AI system is set to managed again.

For ServiceNow SKUs, when you mark an AI system as managed again, AI Control Tower resumes value and usage calculation. It fills in the value data for the time the AI system was unmanaged. By default, it fills in up to 30 days. To fill in a longer period, change the date range of the historical job. For more information, see Set look back date range for unmanaged AI systems.

Value data isn't filled in for enterprise AI systems. When an enterprise AI system is marked as unmanaged, its connectors are disabled and no usage data is collected for that period.

Multi-Instance Framework for AI value data

The Multi-Instance Framework (MIF) synchronizes AI value data from a sub-production instance to a production instance only for Creator skills. In this setup, the AI Control Tower calculates value for Creator skills using data from development and testing environments.

For creator skills deployed in a sub-production instance, you can evaluate how the value is determined for an AI system by running a metric within its value template. The results are synced to the production instance for the value calculation.

To facilitate this process, MIF connects the sub-production instance to the production instance, which functions as the manager instance. MIF then synchronizes value data for Creator skills to the production instance.

Note:

MIF supports value calculation on sub-production instances only for Creator skills. Value calculation on sub-production instances isn't available for any other skills.

Value data that MIF syncs

MIF syncs the following value data from the sub-production instance to the production instance:

- Creator metrics data for all creator skills
- Results from testing value templates for AI systems in the sub-production environment

Related topics

Set up Multi-Instance Framework for value calculations

Cost

Cost records the actual expenses associated with your AI systems, enabling AI Control Tower to compare these costs against productivity gains and calculate the net return on investment.

Cost provides the expense data that AI Control Tower uses to calculate net AI return. The Cost framework evaluates savings and costs (expenses) to calculate net returns by monitoring spending on LLM tokens, and ServiceNow Assist usage.

To configure cost, set your organization’s average hourly rate, add token pricing for integrated LLM vendors, and add pricing for non-integrated vendors. For integrated vendors, you can also configure input and output token prices separately. After you review and submit the configuration, AI Control Tower uses the cost data to compare AI spend with productivity gains and derives net returns.

Only users with the AI steward role can configure cost.

AI cost and net AI return

The AI Control Tower tracks the cost of your AI systems and subtracts it from the productivity value to show the net AI return. Cost is tracked by vendor from token consumption or a direct cost.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI cost and net AI return overview

The AI Control Tower (AICT) reports the productivity value of your AI systems as productivity gains, which it derives from your value templates and can express in currency. It also tracks the cost of running those AI systems. The net AI return is the money saved minus the cost.

Key benefits

AI cost tracking provides the following benefits:

- Show the return of your AI systems by comparing value against cost.
- Track cost automatically for integrated vendors through the trace integration.
- Record cost as token consumption or as a direct cost.
- Break down cost by vendor and by AI system.

How cost is calculated

The AI Control Tower calculates cost at the vendor level, because usage details for external vendors are available for the vendor rather than for each agent. For each vendor, the calculation uses the unit consumption, such as tokens, and the cost. A breakdown at the AI system level appears where that data is available.

Integrated vendors, such as ServiceNow, the Vertex AI service, the Amazon Bedrock service, and the Azure Foundry service, use the trace integration to capture token consumption. When the API endpoint and the validation key are configured, the AI Control Tower tracks cost for those vendors automatically.

You can define cost in two ways. Input and output token cost applies a separate rate to every million input tokens and output tokens. Direct cost applies a total cost that you enter, without a unit consumption.

To express value in currency, you configure an hourly rate, which is the total workforce cost divided by the total workforce hours. You can set a single hourly rate or set a rate for each persona.

Note:

- Cost configurations use effective dates. A configuration for a future date is a draft, the current configuration is active, and a past configuration is expired.
- Cost is calculated for the previous day, so a new cost configuration appears on the dashboard after the next scheduled run.

Why cost tracking matters

Cost tracking connects the productivity hours that AI systems save to their financial impact, so that you can answer key business questions:

- Are we getting value? How much money are we saving with AI?
- What are we paying? How much do the AI systems actually cost?
- Is it profitable? Are savings exceeding costs?
- How long to payback? When will AI investments pay for themselves?
- Where are the costs? Which vendors cost the most?

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Without cost tracking, you can see hours saved but can't connect them to financial impact. With it, you have complete visibility into AI net returns.

Three pillars of the Cost framework

The Cost framework rests on three interconnected pillars that together enable complete financial visibility and net return analysis:

Savings

Quantifies the value (benefits) delivered by AI systems.

The Savings pillar converts productivity into currency. AI systems are evaluated for the number of work hours they save. An average hourly rate defines the labor cost per hour. Money saved is calculated by multiplying the hours saved by the average hourly rate.

For example, 40 hours saved × $100/hour = $4,000 in weekly savings.

Cost

Tracks all expenses associated with running AI systems, across LLM token costs, Assist costs, integration costs, and infrastructure costs.

Net returns

Calculates the net financial benefit as savings minus cost. A positive result is profitable, zero is breakeven, and a negative result means the investment is not yet profitable.

For example: $4,000 savings – $500 cost = $3,500 net returns (profitable); $2,000 – $2,000 = $0 (breakeven); $1,000 – $2,000 = –$1,000 (not yet profitable).

Cost categories tracked

The Cost pillar tracks the following categories of expense:

LLM token costs

Charges from LLM providers based on token usage. Token costs vary by the model used (more advanced models cost more), the usage volume (more interactions mean higher cost), and vendor pricing (different providers have different rates).

Assist costs

ServiceNow AI Assist charges for running AI agents and assistants. These recurring costs are based on the number of active agents, the frequency of usage, and the complexity of tasks.

How costs are tracked

The system tracks costs automatically as follows:

1. Captures all LLM API calls and token usage from integrated systems.
2. Records token costs based on vendor pricing models.
3. Aggregates Assist costs from configuration and usage tracking.
4. Groups costs by system, vendor, department, and time period.
5. Calculates trends and period-over-period comparisons.

Costs are updated in real-time, although dashboards typically show consolidated daily or hourly summaries.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Complete calculation flow

The Cost framework calculates financial metrics in the following sequence:

1. The system collects productivity metrics (hours saved from AI automation).
2. The system looks up the average hourly rate configured for your organization.
3. The system calculates money saved as hours saved × hourly rate.
4. The system aggregates total cost as token costs + Assist costs.
5. The system calculates net returns as money saved – total cost.

All of these calculations feed the dashboards and reports used for stakeholder analysis.

Key assumptions and considerations

The Cost framework relies on several assumptions. Verify them regularly and adjust configurations as needed:

- Productivity measurement accuracy: Hours saved must be captured accurately from AI system activity logs.
- Hourly rate accuracy: The average hourly rate must reflect the true labor cost, or a documented business rationale must support different rates.
- Cost completeness: All relevant costs must be captured.
- Time period consistency: Savings and costs must cover the same time period for a valid comparison.

Cost types and sub-vendor rates

Record what your organization pays each AI vendor so that AI Control Tower can calculate total Enterprise AI cost and net returns. Choose the cost type that matches each contract, and set sub-vendor rates where a specific service is billed differently from its vendor.

AI Control Tower estimates the financial value of your AI assets by comparing total savings with total Enterprise AI cost. Total savings come from productivity gains and the hourly rates that you configure. Total Enterprise AI cost is the sum of integrated vendor costs and other vendor costs. Net returns are total savings minus total Enterprise AI cost.

Integrated vendors and other vendors

Integrated vendors are vendors that have a trace or SDK integration with AI Control Tower, such as Microsoft, Google Vertex AI, and Amazon Web Services (AWS). AI Control Tower gets token consumption metrics for these vendors from the traces.

Other vendors are vendors that don't have a trace or SDK integration with AI Control Tower. Entering costs for these vendors is optional.

Cost types

The cost type determines which values you enter and how AI Control Tower calculates the cost for a vendor.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cost types for integrated vendors

Cost type	Values you enter
Overall cost	A single cost per million tokens.
Input and output costs	Separate costs per million input tokens and per million output tokens.
Subscription	The number of licensed seats, the cost per seat per month, and the contract start and end dates. You can also add a one-time setup fee.

For other vendors, the Add Vendors menu offers three pricing options:

- **Token-based**: Costs are calculated based on the total number of tokens used and the cost per token.
- **Direct Cost**: The total cost is entered directly.
- **Subscription**: Pricing is determined by a per-seat subscription model.

These options provide flexibility in how costs are determined.

Sub-vendor rates

A sub-vendor is a specific service that a vendor offers. For example, Microsoft is a vendor, and Azure is one of its sub-vendors. In the cost list, it appears as the vendor name followed by the service name.

A sub-vendor rate takes precedence over its vendor's rate. When a vendor has at least one sub-vendor rate, its entry shows the message **Applies only where no sub-vendor rate is set**. The vendor rate continues to apply to usage that isn't covered by a sub-vendor rate.

Estimated monthly cost for subscriptions

For a subscription, the **Estimated monthly cost** value is the number of licensed seats multiplied by the cost per seat per month. The value updates as you enter the details.

If you add a one-time setup fee, AI Control Tower spreads the fee evenly over the number of months that you enter in **Amortise over (months)**. It adds the resulting monthly amount to the estimated monthly cost. The per-month amount of the fee appears after the field.

Cost entry status

A cost entry that you add or change has the status **Draft**, and the page shows the message **Changes will apply after you submit in Preview cost & savings**. Draft entries don't affect calculated values until you submit the configuration in the **Preview cost & savings** step. Submitted entries have the status **Active**.

An entry can also have the status **Expired**.

Related topics

Add costs for integrated vendors

Add costs for other vendors

Subscription-based costs for AI vendors

Use the **Subscription** cost type in AI Control Tower to track vendor costs billed per licensed seat under a fixed-term contract rather than by token or usage.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Subscription-based cost overview

Subscription-based cost, also called seat-based pricing, is a cost type for AI vendors that bill through a contract with a fixed monthly price per licensed seat. It's available alongside the existing overall cost and input and output cost options.

In a seat-based contract, you purchase a specified number of seats at a fixed price per seat for a defined contract period. Because the contract does not limit token consumption, the subscription cost calculated by AI Control Tower remains the same regardless of token usage.

Benefits

Token-based cost types don't reflect the actual spend for vendors that bill by seat. With the Subscription cost type, you enter the contract value once, and AI Control Tower applies the resulting monthly cost to each month of the contract period. The cost and value figures on your dashboards then match what your organization pays the vendor.

When to configure subscription costs

The **Subscription** cost type is available when you add vendor costs during the cost configuration steps of AI Control Tower onboarding, also called the day zero experience. Configure subscription costs during onboarding, when you set up the rest of your AI cost configuration.

You can update a subscription cost at any time after onboarding. Updates apply only from the next day onward. You can't change cost data for today or earlier dates. For details, see Cost updates and calculation schedule.

Subscription cost components

A subscription cost consists of the following parts:

Licensed seats and cost per seat

The number of seats in the contract and the price for each seat per month. Both values are required.

Contract period

The contract start and end dates. AI Control Tower applies the monthly cost to each month from the contract start date until the contract end date. Both dates are required.

One-time setup fee (optional)

A flat fee that some vendors charge for eligibility for seat-based pricing or discounted seat-based pricing. Organizations refer to this fee by different names, such as base license fee or one-time setup fee. For example, a vendor might require you to buy another subscription before it offers a discounted per-seat price.

Amortization period

The number of months over which AI Control Tower spreads the one-time setup fee. The amortization period is populated by default from the contract start and end dates. You can override the default value.

Monthly cost calculation

AI Control Tower calculates subscription costs monthly. The estimated monthly cost is the licensed seat cost plus the amortized setup fee, if configured:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
Estimated monthly cost = (licensed seats × monthly cost per
 seat) + (one-time setup fee ÷ amortization period)
```

Example calculation

A contract includes 1,000 licensed seats at $25 per seat each month and a $20,000 one-time setup fee amortized over 14 months:

- Monthly seat cost: 1,000 × $25 = $25,000
- Monthly amortized setup fee: $20,000 ÷ 14 = $1,428.57
- Estimated monthly cost: $25,000 + $1,428.57 = $26,428.57

Cost updates and calculation schedule

Cost configurations

Cost updates and calculation schedule

AI Control Tower preserves recorded cost data and calculates cost and value on a daily schedule. These rules determine when a cost change takes effect and when it appears in your dashboards.

You can update a vendor's cost configuration at any time, such as when your vendor contract is renewed at a new rate. AI Control Tower applies these changes based on two rules: historical cost data is preserved, and cost and value calculations are performed on a daily schedule.

Cost changes take effect the next day

You can't change cost data for the current date or a previous date. AI Control Tower retains recorded costs to maintain consistency in historical cost and value reports.

A cost change takes effect the day after you make it. Costs recorded through the current date continue to use the previous value.

For example, assume that the cost per seat is $25 starting in January. If you change the cost to $30 on September 22, AI Control Tower uses the $25 rate through September 22 and the $30 rate starting September 23. You can't apply the $30 rate to September 22 or an earlier date.

Because you can't backdate cost changes, update the cost configuration before the new contract rate takes effect.

Calculation schedule

AI Control Tower uses scheduled jobs to calculate cost and value:

- A nightly job processes data from the previous day.
- A value calculation job runs every 24 hours.

Cost and value figures on your dashboards reflect data up to the previous day. Any costs you add or change don't appear in the dashboards until the scheduled jobs process them.

Dashboards

Dashboards provide insights into the productivity gains, costs, and net returns of the AI systems within your enterprise. There are distinct dashboards for reporting on vendors and ServiceNow AI, ensuring that enterprise-wide metrics remain separate from those specific to ServiceNow AI systems.

Dashboards overview

Dashboards provide in-depth insights into various aspects of AI systems within your organization. These dashboards highlight key metrics for productivity gains, cost reductions, and net returns of the AI systems within your enterprise.

To cater to different reporting needs, there are separate dashboards designed to track performance metrics for external vendors and those specific to ServiceNow AI. This segregation is essential to ensure that the analysis of enterprise-wide metrics remains distinct and does not get conflated with the data pertaining solely to ServiceNow AI systems.

The following dashboards are included:

Value

This dashboard reports on productivity gains, costs, and returns across all vendors. The metrics included are limited to those that can be calculated for every vendor.

Engagement

Reports how often AI systems are used, and by which departments and countries, across all vendors.

ServiceNow AI

This dashboard combines both the value and engagement metrics specific to ServiceNow AI systems and includes additional metrics that are unique to these systems.

The ServiceNow AI dashboard features its own tabs, including tabs for creator skills and evaluation. Creator skill metrics apply exclusively to ServiceNow AI systems and don't appear in the broader enterprise-wide views.

Dashboard visibility

The dashboards that appear depend on your subscription. A subscription that covers only ServiceNow AI systems shows the ServiceNow AI dashboard. A broader subscription shows all three views.

How it works

Dashboards use multiple sources within the Measure pillar to provide insights.

Value templates

These templates provide productivity gain figures that support time savings and rank top AI systems.

Cost framework

This framework supplies the average hourly rate and total AI costs used to calculate money saved and net AI returns.

Discovery

This component identifies the AI systems and executions included in the engagement metrics, noting that manually created indicators aren't counted.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

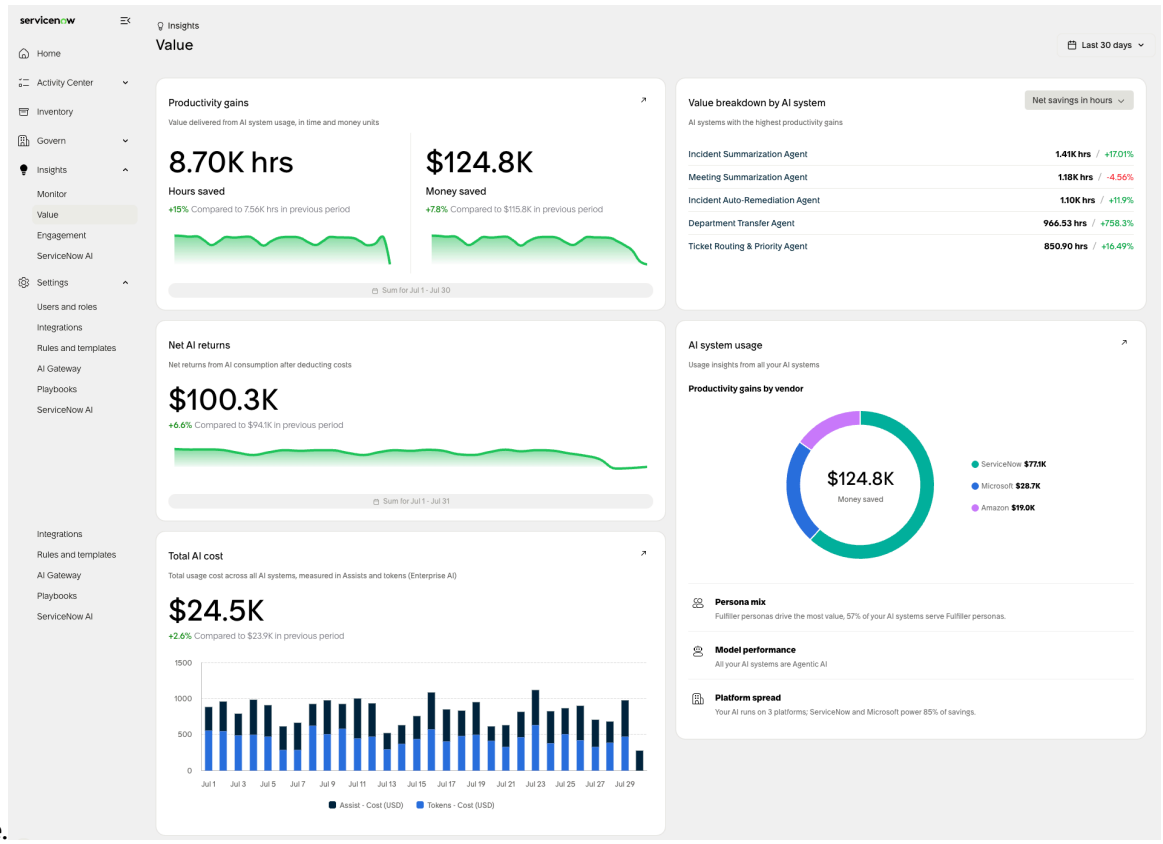
The AI system usage widget provides a summary of usage by vendor and reports the total value generated for each vendor. By selecting a vendor, you can access a detailed list view that reports on each individual AI system.

Value dashboards

The Value dashboard provides real-time visibility into the productivity gains and financial returns delivered by your AI Control Tower agents. Track hours saved, cost savings, net returns, and system performance to measure ROI and demonstrate AI investment impact.

The Value dashboard aggregates metrics across all deployed AI agents and systems, enabling you to understand the business impact of your AI Control Tower implementation. Use this dashboard to track productivity improvements, monitor financial returns, compare agent performance, and communicate value to stakeholders.

To view the Value dashboard on AI Control Tower, navigate to **All** > **AI Control Tower** > **Home** > **Insights** > **Value**.



> **Note:** All metrics on the Value dashboard default to the last 30 days. Use the time period selector in the top-right corner to adjust the date range and view metrics for different time periods (for example, last 7 days, last 90 days, or a custom range).

Productivity gains

The Productivity gains section displays the total hours and the money saved across all AI systems during the selected time period. This metric represents direct productivity improvements delivered by AI agents through:

Hours saved

Total agent-hours of work eliminated or accelerated through AI automation. The trend line shows how hours saved has changed over time, with percentage comparison to the previous period.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Money saved

Monetary value of the productivity gains, calculated in dollar terms. This metric helps translate productivity improvements into business-relevant financial impact.

Both these metrics include trend lines showing daily fluctuations and a percentage comparison badge indicating whether productivity is increasing or decreasing relative to the previous period.

You can view the AI systems and edit the set the time period for productivity gains. On the AI system productivity gains page, you will see the AI systems listed along with the Productivity gains in hours and Productivity gains in currency. To change the time period, select the calendar drop-down, choose the time period, and select **Apply**.

Value breakdown by AI system

The Value breakdown by AI system section lists the top-performing AI agents and their individual productivity contributions, ranked by hours saved.

For each agent, the dashboard displays:

- Agent name
- Hours saved by that agent or USD saved by the agent

  Note: You can view the value breakdown either by hours or USD using the drop-down.

- Percentage change compared to the previous period

This breakdown helps you identify which agents deliver the most value, prioritize optimization efforts, and allocate resources toward the highest-impact use cases.

Net AI returns

The Net AI returns section shows the net financial return from AI consumption after deducting costs. This metric represents the true ROI of your AI investment.

The Net AI return displays:

- Money saved minus Total AI cost
- Percentage change relative to the previous period
- A trend line about how the net returns have evolved over time

Use this metric to demonstrate business value and justify continued investment in AI Control Tower capabilities.

Total AI cost

The Total AI cost section displays the total usage cost across all AI systems, measured in assists and tokens (Enterprise AI). This metric reflects the investment required to generate the value shown on the dashboard.

- The aggregated cost across all deployed AI systems
- Percentage change relative to the previous period
- A bar chart showing daily cost distribution, broken down by Assist and Tokens displayed with legends.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Monitor this metric to optimize AI spending and understand the cost-to-value ratio of your deployment.

View the AI cost overview and the AI cost breakdown by selecting the external link icon on the Total AI cost section. On the Total AI cost value page, you will see:

- The AI cost overview trend with AI total cost in USD vs the selected time period (to change the time period, select the calendar drop-down, choose the time period, and select **Apply**).

  Note: You can view this data for all vendors or a selected vendor.

- The AI cost breakdown data for only those AI systems and vendors whose token consumption is captured via integrations or manual cost configuration.

AI system usage

The AI system usage section provides insights into how your AI systems are being consumed across the organization through:

Productivity gains by vendor

The Productivity gains by vendor visualization shows how the value is distributed across different AI vendors (for example, ServiceNow, Microsoft, Amazon). The donut chart helps you understand which vendor platforms contribute the most to your overall value delivery.

Persona mix

The Persona mix section indicates which user personas are driving the most value from your AI Control Tower. This metric shows what percentage of your AI systems serve fulfiller personas or other user types.

The persona mix helps target adoption efforts, identify the under-served user groups, and prioritize agent development for high-value personas.

Model performance

The Model performance section indicates the AI model types powering your AI Control Tower systems. For example, this metric flags whether all your AI systems are using agentic AI models or if you're using a mix of model types.

Use this insight to verify consistency in AI capabilities and plan upgrades to newer, higher-performing models.

Platform spread

The Platform spread section shows which platforms are running your AI systems. For example, this metric displays what percentage of your AI runs on ServiceNow, Microsoft, Amazon or other platforms.

Monitor platform spread to understand vendor dependencies, plan multi-vendor strategies, and optimize for platform consolidation if needed.

You can view the overall AI system usage displayed agent-wise. This includes details such as persona, deployed date, and actions. It also provides information on the average user using the agent and productivity gains. Furthermore, the report includes the AI system type, vendor, and total AI usage. You can use the time period selector in the top-right corner to adjust the date range and view metrics for different time periods.

To understand more about the value insights from the ServiceNow AI value dashboard, see ServiceNow AI Value dashboard.

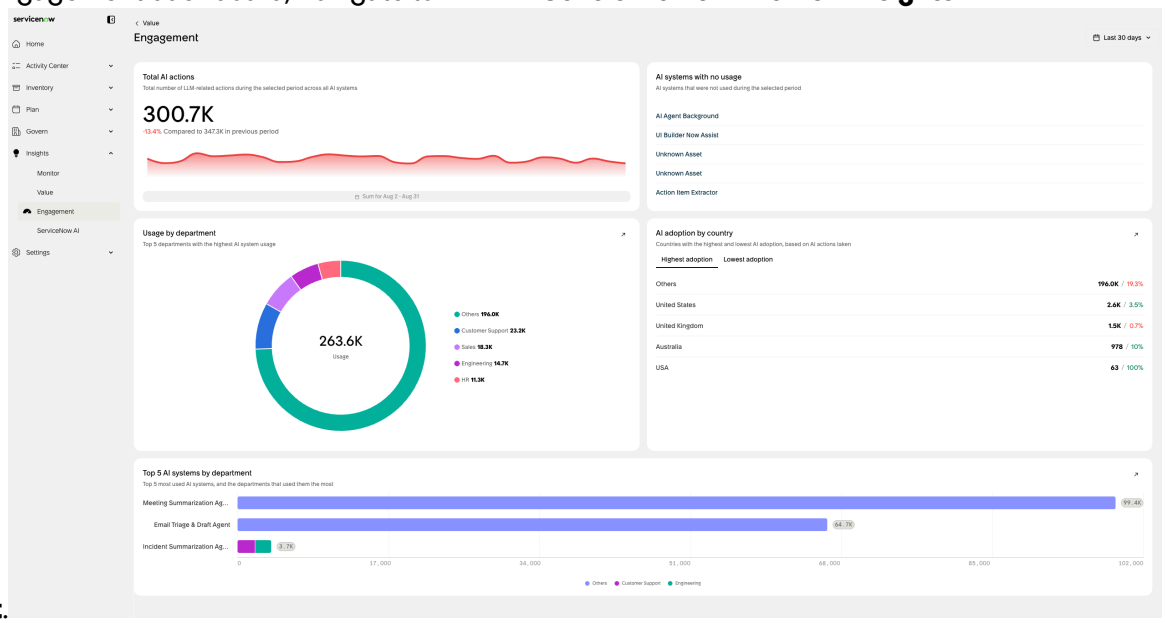
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Engagement dashboard

The Engagement dashboard provides visibility into AI system usage patterns across your organization, including adoption metrics, department usage, and system adoption by geographic region.

The Engagement dashboard displays aggregated data about LLM-related actions and AI system usage across your enterprise. Use this dashboard to monitor AI adoption trends, identify systems that require attention, and understand usage patterns by department and location.

To view the Engagement dashboard, navigate to **All** > **AI Control Tower** > **Home** > **Insights** > **Engagement**.



> **Note:** All metrics on the Engagement dashboard default to the last 30 days. Use the time period selector in the top-right corner to adjust the date range and view metrics for different time periods (for example, last 7 days, last 90 days, or a custom range).

Total AI actions

Displays the total number of LLM-related actions performed across all AI systems during the selected time period. This metric includes a comparison to the previous period, expressed as a percentage change.

The Total AI actions display:

- The aggregated cost across all deployed AI systems.
- Percentage change relative to the previous period.
- A trend line about the daily sum of actions over the selected date range, allowing you to identify patterns and spikes in the system usage over time.

AI systems with no usage

Lists AI systems that were not used during the selected time period. This section helps you identify systems that may require user outreach, enablement, or evaluation for continued relevance.

Systems are displayed by name; select a system name to drill into additional details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Usage by department

Shows the distribution of AI system usage across the top five departments in your organization. Data is displayed in a donut chart that shows total usage and breaks down usage by department.

Each department is color-coded and displayed with its usage count. The chart shows departments such as Customer Support, Sales, Engineering, HR, and others based on your organization's structure.

Note: View the AI systems usage by department that is measured by the number of times each system was used in an AI workflow.

AI adoption by country

Displays AI adoption rates by geographic location, comparing the highest and lowest adoption regions. Adoption is measured as a percentage based on the number of LLM-related actions taken.

Two tabs allow you to view data sorted by highest adoption or lowest adoption. Countries are listed with their adoption percentage, shown in color-coded format to indicate adoption levels (green for high adoption, red for low adoption).

Top 5 AI systems by department

Shows the five most frequently used AI systems across your organization, broken down by the departments that use them. Each system bar indicates the total usage count and shows department-level usage contribution through color coding.

Systems are listed in descending order by usage. Hover over a bar to see the department breakdown within that system's total usage.

To understand more about the Value insights from the ServiceNow AI Engagement dashboard, see ServiceNow AI Engagement dashboard.

ServiceNow AI dashboard

The ServiceNow AI dashboard is a central hub for monitoring and evaluating the performance, adoption, and financial impact of AI systems deployed across your ServiceNow environment.

ServiceNow AI overview

The ServiceNow AI dashboard consolidates operational and financial metrics from all AI agents, offering real-time insights into AI value delivery, cost management, and usage patterns. It helps organizations evaluate AI effectiveness, support investment decisions, and identify optimization opportunities.

By consolidating AI performance data into a single interface, the dashboard eliminates the need to gather metrics from individual system sources or manual reports. It presents productivity gains, financial returns, operational costs, and usage insights in an accessible visual format suitable for both technical practitioners and business leaders.

The dashboard serves multiple audiences and use cases. Operational teams use the dashboard to monitor whether deployed AI agents are performing as expected and delivering measurable value to end users. Finance and business leaders use the dashboard to assess return on AI investment and make informed decisions about resource allocation. Product and platform teams use the dashboard to understand adoption patterns and identify which AI capabilities drive the highest user engagement.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The dashboard displays metrics across configurable time ranges, enabling trend analysis and historical comparison. Period-over-period comparisons help identify whether AI value delivery, costs, and usage are improving, stagnating, or declining, supporting data-driven conversations about AI strategy and optimization priorities.

The ServiceNow AI dashboard in the Value module consists of three sub dashboards:

Value dashboard

The ServiceNow AI Value dashboard aggregates data from all AI systems in your organization monitoring AI value delivery, track usage trends, and assess return on investment.

For more information about what the ServiceNow AI Value dashboard contains, see ServiceNow AI Value dashboard.

Engagement

The ServiceNow AI Engagement dashboard provides visibility into user adoption, utilization patterns, and performance metrics across all AI systems in your ServiceNow instance. Monitor AI action volume, user engagement trends, departmental usage, and task efficiency gains to identify adoption opportunities and system effectiveness.

For more information about what the ServiceNow AI Engagement dashboard contains, see ServiceNow AI Engagement dashboard.

Creator skills

The ServiceNow AI Creator Skills dashboard provides insight into how your organization uses AI-powered creator skills—automated code generation, documentation, and testing capabilities—to boost developer productivity.

For more information about what the ServiceNow AI Creator skills dashboard contains, see ServiceNow AI Creator skills dashboard.

Evaluation

The ServiceNow AI Evaluation dashboard offers insights into the performance of AI-generated responses.

For more information about what the ServiceNow AI Evaluation dashboard contains, see ServiceNow AI Evaluation dashboard.

ServiceNow AI Value dashboard

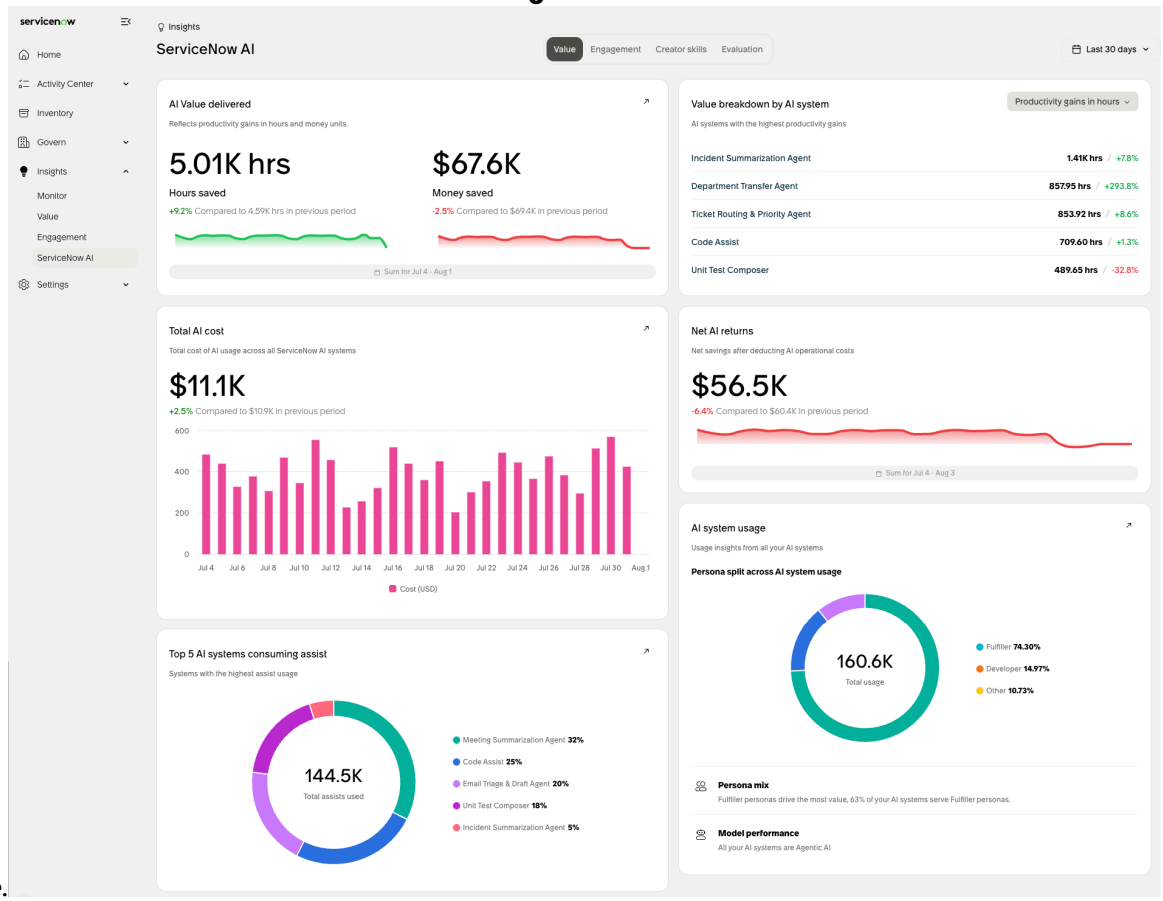
The ServiceNow AI Value dashboard provides a comprehensive view of AI system performance, value delivery, and operational metrics across your organization. The dashboard displays productivity gains, financial returns, system usage patterns, and agent performance data.

Value dashboard overview

The ServiceNow AI Value dashboard aggregates data from all AI systems in your organization. You can monitor AI value delivery, track usage trends, and assess return on investment. The dashboard updates continuously and provides configurable time-range filtering for trend analysis.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To view the ServiceNow AI Value dashboard on AI Control Tower, navigate to **All** > **AI Control Tower** > **Home** > **Insights** > **ServiceNow AI** > **Value**.



AI Value delivered

The AI Value delivered section displays the aggregate productivity gains and financial returns generated by AI systems across your organization. This section presents two key metrics:

Hours saved

Reflects productivity gains measured in hours, calculated based on time saved by AI-assisted processes and automations. The metric displays the total hours saved compared to the previous period as a percentage change.

Money saved

Shows the estimated financial return in monetary units, derived from productivity gains and operational cost reductions. This metric also includes a period-over-period comparison to track improvement or decline in financial returns.

Both metrics are visualized with trend lines showing performance across the selected time range, enabling you to identify patterns in value delivery.

You can view the AI systems and edit the set the time period for productivity gains. On the AI system productivity gains page, you will see the AI systems listed along with the Productivity gains in hours and Productivity gains in currency. To change the time period, select the calendar drop-down, choose the time period, and select **Apply**.

Value breakdown by AI system

This section details productivity gains attributed to individual AI agents within your environment. It ranks AI systems by their contribution to overall productivity, showing hours saved per agent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For each agent, the dashboard displays:

- Agent name
- Hours saved by that agent or USD saved by the agent

  Note: You can view the value breakdown either by hours or USD using the drop-down.

- Percentage change compared to the previous period.

Each agent displays its productivity contribution as hours saved, along with percentage change compared to the previous period. Use this breakdown to identify which agents deliver the highest value and to prioritize optimization efforts.

Total AI cost

The Total AI cost section aggregates the operational costs of running all AI systems in your organization. This section displays:

- Total cost: The sum of all AI usage costs across ServiceNow AI systems.
- Cost trend: A period-over-period comparison showing cost increase or decrease.
- Daily cost breakdown: A bar chart showing daily cost distribution across the selected time range, enabling you to identify cost spikes or trends.

Use this section to monitor AI operational expenses and assess cost efficiency relative to value delivered.

Net AI returns

The Net AI returns section calculates the financial impact of AI investments by deducting operational costs from value delivered. This metric represents the net savings after accounting for AI system operational expenses.

The section displays:

- Net returns: The gross savings (money saved) minus total AI costs, expressed in monetary units.
- Return trend: A period-over-period comparison indicating whether net returns are improving or declining.
- Return trend line: A line chart visualizing net returns across the selected time range.

This metric is essential for assessing whether your AI investment is delivering positive financial outcomes.

AI system usage

The AI system usage section provides visibility into how AI systems are consumed across your organization.

Personal split across AI system usage

The persona split shows the distribution of AI usage across user types:

- Fulfiller: Usage by service desk agents and operational fulfillment personnel.
- Developer: Usage by development and engineering teams.
- Other: Usage by all remaining user personas and roles.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The donut chart displays total usage across all AI systems and shows the percentage contribution of each persona type. This breakdown helps identify which user groups benefit most from AI and informs training and adoption strategies.

Persona mix

Indicates the percentage of usage driven by Fulfiller personas, highlighting which user type represents your primary AI consumption base.

Model performance

Identifies the AI model powering your systems. This section indicates all systems are running on agentic AI models.

Top 5 AI systems consuming assist

This section identifies the top five AI agents with the highest usage volume in your organization. The donut chart ranks systems by total assists used and displays each system's percentage contribution to total assist consumption.

Use this view to identify your most-utilized AI systems and to prioritize optimization, configuration, and user enablement efforts for systems with the highest adoption.

ServiceNow AI Engagement dashboard

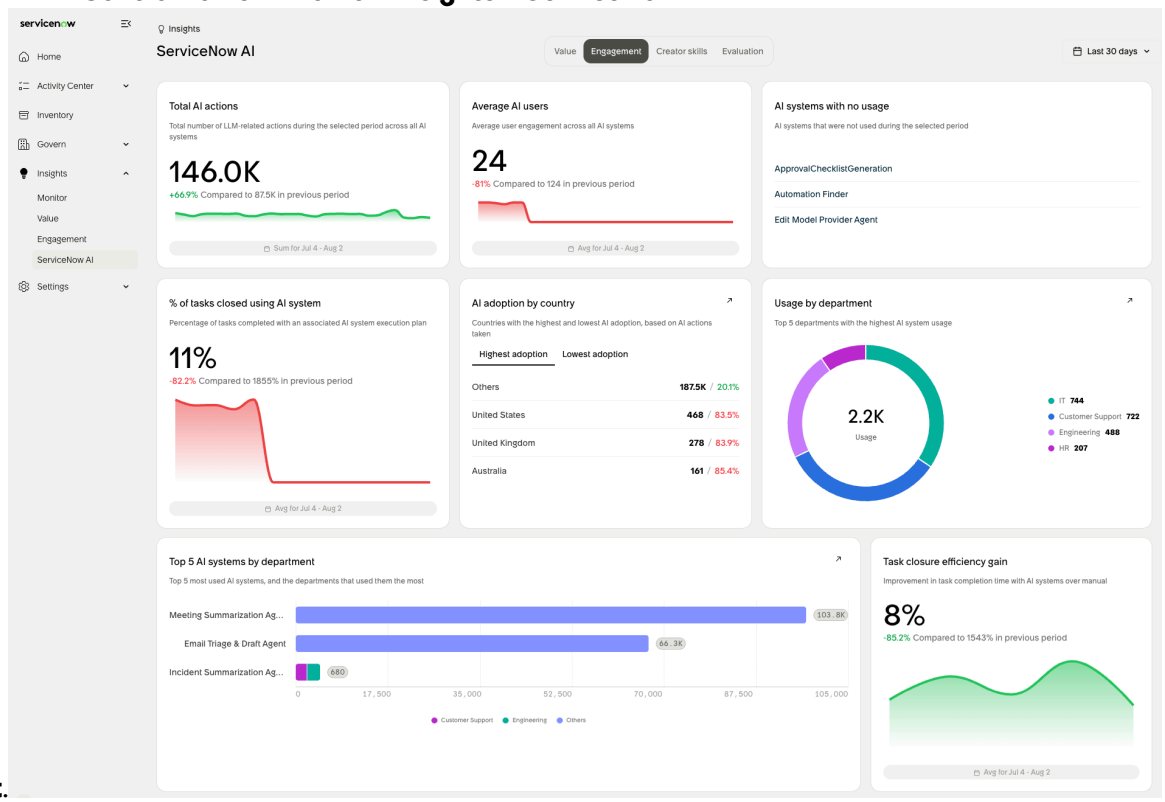
The ServiceNow AI Engagement dashboard provides visibility into user adoption, utilization patterns, and performance metrics across all AI systems in your ServiceNow instance. Monitor AI action volume, user engagement trends, departmental usage, and task efficiency gains to identify adoption opportunities and system effectiveness.

Engagement dashboard overview

The ServiceNow AI Engagement dashboard displays real-time and historical metrics that help administrators and stakeholders understand how AI systems are being adopted and used across the organization. Use this dashboard to track engagement trends, identify underutilized systems, and measure the productivity improvements delivered by AI automation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To view the ServiceNow AI Engagement dashboard on AI Control Tower, navigate to **All** > **AI Control Tower** > **Home** > **Insights** > **ServiceNow AI** > **Engagement**.



Total AI actions

This metric displays the total number of LLM-related actions initiated during the selected period across all AI systems in your instance. The trend line shows cumulative action volume over time, and the comparison indicator displays the percentage change from the previous period.

Use this metric to assess overall AI system adoption velocity and identify upward or downward trends in AI utilization across your organization.

Average AI users

This metric shows the average number of unique users engaging with AI systems across all platforms during the selected period. The trend visualization indicates how user engagement is changing week-over-week or month-over-month.

Track this metric to measure user adoption growth and to identify periods of increased or decreased engagement with AI capabilities.

AI systems with no usage

This section lists all AI systems that did not record any user interactions or actions during the selected period. Each system is displayed as a separate item in the list.

Use this section to identify underutilized or unused AI systems that may require additional enablement, user awareness, or configuration review. Common reasons for no usage include insufficient user adoption, lack of awareness, or systems awaiting initial roll out.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Percentage of tasks closed using AI system

This metric displays the percentage of tasks that were completed with the assistance of an associated AI system during the selected period. The trend line illustrates how task closure efficiency changes over time, showing whether organizations are increasingly leveraging AI for task automation.

Use this metric to evaluate the impact of AI systems on task completion workflows and to understand the correlation between AI adoption and operational efficiency.

AI adoption by country

This section breaks down AI system adoption by geographic region, displaying both the highest and lowest adoption countries. Each country is represented with its adoption rate and the percentage change from the previous period.

Use this geographic view to identify regional adoption gaps, prioritize enablement efforts in lower-adoption regions, and benchmark regional performance.

Usage by department

This visualization shows the distribution of AI system usage across the top departments in your organization. The donut chart displays the number of unique users from each department interacting with AI systems and their proportional contribution to total usage.

Use this section to identify which departments are leading AI adoption, to target enablement efforts toward lower-usage departments, and to recognize department-specific adoption champions.

Top 5 AI systems by department

This section displays the five most frequently used AI systems across the organization, broken down by the departments that use them. A horizontal bar chart shows usage volume for each system, with color coding to distinguish contributions by department (Customer Support, Engineering, and Others).

Use this section to understand which AI systems are delivering the most value, to identify system-to-department alignment, and to guide resource allocation and investment decisions.

Task closure efficiency gain

This metric measures the percentage of improvement in task completion time when AI systems are used. The trend line shows how efficiency gains are changing over the selected period, indicating whether AI system improvements or increased adoption are delivering measurable productivity benefits.

Use this metric to quantify the business value delivered by AI automation and to communicate ROI to stakeholders.

ServiceNow AI Creator skills dashboard

The ServiceNow AI Creator skills dashboard provides insight into how your organization uses AI-powered creator skills—automated code generation, documentation, and testing capabilities—to boost developer productivity. Monitor skill satisfaction, usage patterns, and outcomes to optimize adoption and identify high-performing skills across your instance.

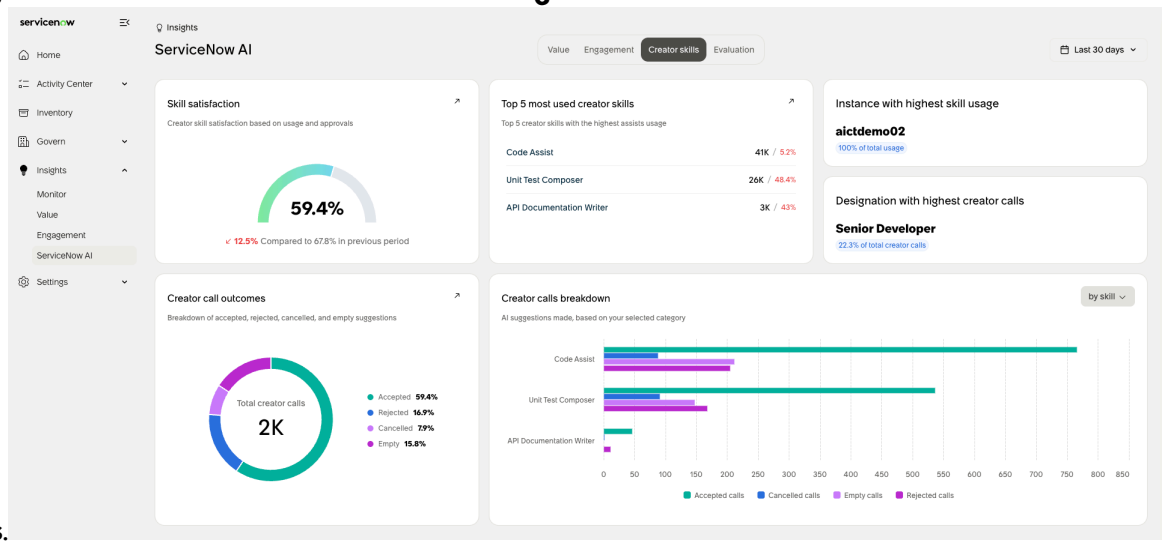
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Creator skills dashboard overview

Creator skills are AI-powered agents within ServiceNow that assist users by automating repetitive development tasks. These skills use large language models and ServiceNow specific training to generate code, compose unit tests, write API documentation, and perform other knowledge-intensive tasks. By integrating creator skills into your workflow, your team can accelerate development velocity, reduce manual effort, and maintain consistency across projects.

Creator skills operate within generative AI and are governed by ServiceNow's AI governance and control framework. Each suggestion is tracked, and users can accept, reject, cancel, or ignore recommendations. This feedback loop helps improve skill performance and informs adoption metrics.

To view the ServiceNow AI Creator skills dashboard on AI Control Tower, navigate to **All** > **AI Control Tower** > **Home** > **Insights** > **ServiceNow AI** > **Creator skills**.



Skill Satisfaction

Skill satisfaction measures the overall approval rate of creator skill suggestions based on user usage and approvals. This metric reflects the ratio of accepted suggestions to total suggestions across all creator skills in your instance.

A satisfaction score indicates that users accepted or approved all AI-generated suggestions. Compare this metric over time to track improvements in suggestion quality and relevance.

You can view the creator skills performance for the available skills and set the time period selecting the external link icon. On the Creator skills performance page, you can see the total number of calls, calls accepted, cancelled, rejected, calls that were empty, and the satisfaction score. To change the time period, select the calendar drop-down, choose the time period, and select **Apply**.

Top 5 most used creator Skills

This section ranks creator skills by total assists delivered over the selected time period. High usage indicates strong adoption and integration into developer workflows.

Each skill displays both absolute assist count and satisfaction percentage. Skills with high usage and high satisfaction are strong candidates for broader promotion and training programs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Instance with highest skill Usage

This metric identifies which instance in your ServiceNow environment has generated the most creator skill assists. High usage may indicate:

Use this insight to understand which instances are leading adoption and to share best practices from high-usage instances with others in your organization.

Designation with highest creator calls

This metric shows which user roles or designations use creator skills most frequently. Tracking creator skill usage by designation helps identify which personas and job roles benefit most from AI-powered assistance.

Use this information to tailor training and enablement programs to designations with lower adoption, and to understand where creator skills deliver most value.

Creator call outcomes

This section breaks down all creator skill suggestions into four outcome categories:

- Accepted: User accepted the suggestion and used it in their work.
- Rejected: User explicitly rejected the suggestion or indicated it was not useful.
- Cancelled: User cancelled or abandoned the creator skill session before completing the suggestion.
- Empty: No usable suggestion was generated (null or incomplete response).

The total count of creator calls represents the cumulative demand for AI assistance across your instance. Monitor outcome ratios to identify quality issues, user satisfaction trends, and skill performance over time.

Creator calls breakdown

This visualization shows the distribution of outcomes (accepted, rejected, cancelled, empty) for each creator skill. Use this breakdown to:

- Identify which skills have the highest acceptance rates
- Detect skills with high cancellation rates, which may indicate usability or performance issues
- Compare skill quality and reliability
- Prioritize skills for enhancement or training

Skills with consistently high acceptance and low rejection rates are performing well and are good candidates for expanded adoption. Skills with high rejection or empty response rates may require tuning, additional training data, or user education.

Note: You can view the creator calls breakdown by the following metrics:

- By skill
- By title/designation
- By code development
- By instance name

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ServiceNow AI Evaluation dashboard

Use the ServiceNow AI Evaluation dashboard to get a comprehensive visibility into AI agent performance.

The ServiceNow AI Evaluation dashboard has two complementary views.

Conversation evaluation

Measures response quality across dimensions such as accuracy, completeness, truthfulness, and context retention.

For more information about the ServiceNow AI Conversation evaluation dashboard, see ServiceNow AI Conversation evaluation.

Impact

View quantifies business outcomes including resolution rates, time savings, and operational value.

For more information about the ServiceNow AI Impact evaluation, see ServiceNow AI Impact.

Together, these views enable organizations to monitor AI quality, validate user satisfaction, and demonstrate ROI from AI investments.

ServiceNow AI Conversation evaluation

The ServiceNow AI Conversation evaluation dashboard displays AI response quality metrics and satisfaction scores for individual conversations. It includes detailed evaluation records with human feedback and automated scoring across quality dimensions such as intent accuracy, request completion, truthfulness, and context retention.

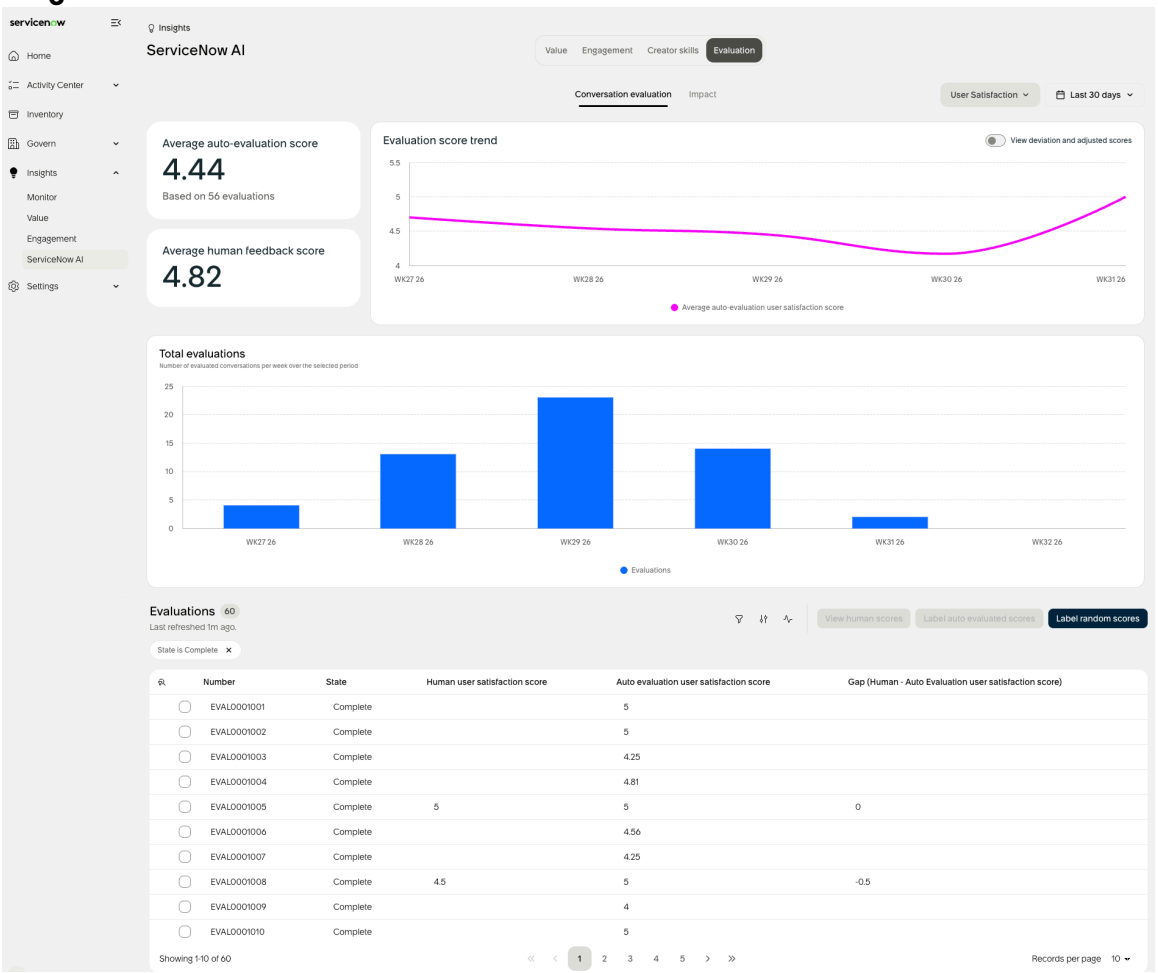
Conversation evaluation overview

The ServiceNow AI Conversation evaluation dashboard displays key performance indicators (KPIs), trend analysis, volume metrics, and detailed evaluation records. These metrics collectively provide visibility into AI response quality and user satisfaction levels.

To view the ServiceNow AI Conversation evaluation dashboard on AI Control Tower, navigate to **All** > **AI Control Tower** > **Home** >

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Insights > ServiceNow AI > Evaluation > Conversation evaluation.



Note: You can filter the Evaluation dashboard view by:

- **User Satisfaction**: Displays the overall satisfaction metric aggregated across all evaluation criteria.
- **Request Completion**: Measures whether the AI response fully addresses the user's request or question.
- **Intent Accuracy**: Assesses whether the AI correctly understood the user's underlying intent or purpose.
- **Slot Filling**: Evaluates the AI's ability to extract and identify key information entities from conversations.
- **Truthfulness (Hallucination Prevention)**: Evaluates the AI's ability to extract and identify key information entities from conversations.
- **Context Retention**: Assesses whether the AI maintains and references relevant context from prior conversation turns.
- **Conciseness**: Measures whether the AI response is appropriately brief and focused without unnecessary verbosity.
- **Smoothness (Deadlock avoidance)**: Assesses the AI's ability to navigate conversation flow without getting stuck or repeating itself.
- **Coherence**: Measures whether the AI response is logically consistent, well-organized, and easy to follow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

All metrics on the Value dashboard default to the last 30 days. Use the time period selector in the top-right corner to adjust the date range and view metrics for different time periods (for example, last 7 days, last 90 days, or a custom range).

Average autoeEvaluation score

The Average auto-evaluation score widget displays the mean satisfaction score calculated from automated evaluation algorithms applied to AI-generated responses. The auto-evaluation score uses predefined criteria to assess whether responses meet quality standards, including relevance, accuracy, completeness, and appropriate tone.

Average human feedback score

The Average human feedback score widget captures the mean satisfaction rating provided directly by users or evaluators who interact with AI responses. Human feedback scores are typically higher than auto-evaluation scores when the AI system is performing well. Users may appreciate factors that automated systems don't capture, such as tone, helpfulness, and contextual understanding. Significant gaps between these metrics may indicate areas where evaluation criteria need adjustment.

Evaluation score trend

The Evaluation Score Trend line chart visualizes the trajectory of average auto-evaluation user satisfaction scores over a selected time period.

You can view the average satisfaction score on the Y-axis and the weekly periods on X-axis along with the evaluation trend with fluctuation over time.

This metric helps you determine whether your AI system performance is improving, degrading, or remaining stable, enabling data-driven decisions about optimization efforts.

Total evaluations

The Total Evaluations bar chart shows the volume of AI response evaluations completed per week across your selected time period.

You can view the number of evaluations on the Y-axis and the weekly periods on the X-axis. A consistent evaluation volume strengthens the statistical reliability of your performance metrics. Sudden drops in evaluation volume may indicate reduced AI agent usage or fewer user interactions.

Evaluations

The Evaluations table provides a detailed record-by-record view of all AI response evaluations within your selected date range. You can see the evaluations listed by State, Human user satisfaction score, Auto evaluation user satisfaction score, and Gap (Human - Auto evaluation user satisfaction score).

Note: For a single evaluation record, you can select to view the evaluations by **View human scores** and **Label auto evaluated scores**, where as **Label random scores** is the default view.

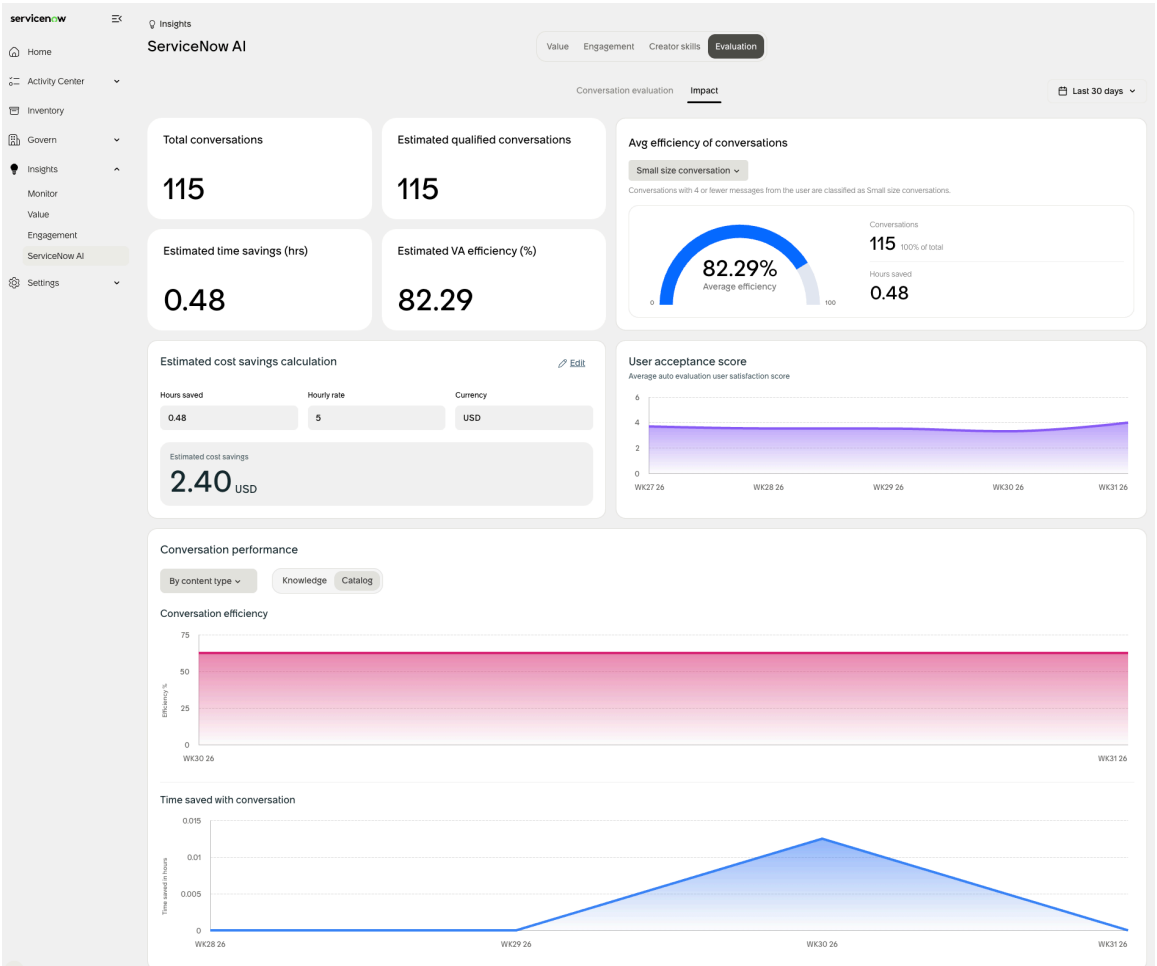
ServiceNow AI Impact

The ServiceNow AI Impact evaluation dashboard displays business outcomes and operational results from AI conversations. Metrics include issue resolution rate, time saved, cost reduction, and other KPIs demonstrating AI business value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Impact evaluation overview

The ServiceNow AI Impact evaluation dashboard displays impact evaluation metrics, accessible through the Insights interface in ServiceNow AI.



Total conversations

The Total conversations widget displays the cumulative count of all conversations initiated within the selected time range. This metric represents the overall volume of interactions with ServiceNow AI across your organization.

Estimated qualified conversations

The Estimated qualified conversations widget displays the count of conversations that meet qualification criteria for impact evaluation. This represents conversations eligible for efficiency, savings, and performance analysis.

Estimated time savings (hrs)

The Estimated time savings (hrs) widget displays the cumulative time saved (in hours) through ServiceNow AI conversations within the selected time range. This metric is calculated based on estimated efficiency gains compared to manual task completion.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Estimated VA efficiency (%)

The Estimated VA efficiency (%) widget displays the average efficiency percentage of virtual assistant conversations. This metric represents how effectively AI interactions resolved or assisted with user requests, expressed as a percentage.

Average efficiency of conversations

The Average efficiency of conversations widget displays the mean efficiency rating across all conversations in the selected period. A circular progress indicator shows the percentage, with supporting metrics including:

- Total conversation count
- Hours saved per conversation

You can filter this metric by the following conversation sizes to view efficiency for specific conversation types:

- Small size conversation
- Medium size conversation
- Large size conversation

Estimated cost savings calculation

The Estimated cost savings calculation widget displays cost savings derived from time savings, calculated using the following configurable parameters:

Hours saved

The total hours saved by AI conversations.

Hourly rate

The cost per hour applied to the calculation (default: USD currency).

Currency

The currency denomination for cost calculations.

The widget displays the calculated estimated cost savings figure in the specified currency. You can edit cost parameters by selecting **Edit** on the widget.

User acceptance score

The User acceptance score widget displays an average auto-evaluation user satisfaction score trend over the selected time range. The score is represented as a line chart showing satisfaction ratings across multiple weeks, indicating user acceptance trends for ServiceNow AI conversations.

Conversation performance

The Conversation performance section displays conversation efficiency metrics segmented by content type. The section includes the following elements:

Type

Allows filtering by the following categorizations:

- By conversation size
- By content type

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Knowledge

Display performance data for conversations using Knowledge.

Catalog

Display performance data for conversations using Catalog content sources.

Performance metrics are visualized as two area charts showing efficiency trends across the selected time period:

Conversation efficiency

The Conversation efficiency chart displays efficiency percentages over time, represented as a filled area chart. The chart shows efficiency performance from the earliest date in the selected range through the most recent date, visualizing efficiency trends across weeks

Time saved with conversation

The Time saved with conversation chart displays the trend of hours saved through AI conversations over the selected time range. The metric is visualized as a line chart showing cumulative time savings across weeks, with peaks indicating periods of higher time savings contribution.

Role based data visibility

The AI Control Tower shows value, engagement, and cost data for the AI systems in a user's scope. AI stewards can view data for all AI systems in an instance. Product owners can view data only for the AI systems that they manage.

AI Control Tower supports two responsibility levels. AI stewards oversee AI systems at the instance level. Product owners oversee individual AI systems.

To access AI Control Tower, users must have either the AI steward role (`sn_ai_governance.ai_steward`) or the product owner (`sn_ai_governance_ai_asset_owner`) role. Users without one of these roles can't access the application.

Data scope for each role

Data scope is based on the **Managed by** field on the AI system record. If the **Managed by** field lists a user, that AI system is in the user's scope. AI Control Tower filters value, engagement, and cost data to that scope.

A product owner's scope is always a subset of an AI steward's scope. For example, an AI steward might see all AI systems in the instance, while a product owner sees only the AI systems that they manage.

Only deployed AI systems are included in calculations. Retired AI systems and AI systems in other states are excluded. As a result, the number of AI systems shown in a chart can be lower than the number of AI systems in the user's scope.

If a product owner doesn't manage any AI systems, AI Control Tower shows zero values and empty widgets.

Why access differs

A product owner has detailed knowledge of the AI systems that they manage and can adjust how those AI systems are measured. Instance-level decisions stay with the AI steward, so a product owner can't change settings that affect AI systems outside their scope.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cost configuration is defined at the vendor level. Changes to vendor configuration affect every AI system mapped to that vendor, including AI systems outside a product owner's scope. For this reason, cost configuration is read-only for product owners.

When product owners use scoped data

Product owners use scoped data to review value and engagement results, map AI systems to value templates, and review cost output for the vendors behind their AI systems.

Conversational evaluator

Conversational evaluator measures the quality of Virtual Agent conversations in AI Control Tower.

Conversational evaluator overview

Conversational Evaluator gives you a measurable view of conversation quality so you can track Virtual Agent performance over time.

A conversation that saves time for a live agent is treated as a successful conversation. Conversational Evaluator combines quality scores with value metrics, such as estimated time savings, so you can connect conversation quality to business impact.

You access Conversational Evaluator from the **Evaluation** tab in AI Control Tower.

Note: Generative AI may produce inaccurate or incomplete information. Always validate AI-generated content.

Benefits

Conversational evaluator provides the following benefits:

- Track Virtual Agent performance across a defined set of quality metrics.
- Define your own quality benchmark by rating conversations.
- Estimate the hours and cost that Virtual Agent conversations save.

How it works

Conversational evaluator uses an auto-evaluation framework to score Virtual Agent conversations. It works as follows:

1. The system identifies qualified conversations by excluding conversation types that aren't suitable for evaluation.
2. The system selects a random sample of qualified conversations for auto-evaluation.
3. The auto-evaluation framework scores each sampled conversation against a set of quality metrics and rolls the metric scores up into a user satisfaction score.
4. The system calculates value metrics, such as estimated time savings and estimated Virtual Agent efficiency, based on the evaluated conversations.

Conversations excluded from evaluation

The following conversation types are excluded from auto-evaluation by default:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Conversations that use an inaccessible or empty knowledge base
- Conversations that transfer immediately to a live agent
- Short conversations
- Conversations started by custom triggers

A script include controls these exclusion rules. You can extend the script include to exclude other types of conversations, such as conversations from a specific geographic location.

Evaluation metrics

The auto-evaluation framework scores conversations on the following metrics, which roll up into the **User Satisfaction** score:

- Request completion
- Intent accuracy
- Slot filling
- Truthfulness
- Context retention
- Conciseness
- Smoothness — deadlock avoidance
- Coherence

Value metrics

The **Value** view shows metrics that estimate the business impact of Virtual Agent conversations, including **Total evaluations**, **Average auto-evaluation score**, and **Evaluation score trend**.

Conversations are grouped into small, medium, and large sizes based on the number of words in each conversation. For example, a conversation of about 200 words or fewer is a small conversation.

You can view conversation efficiency and time savings by conversation size or by content type, such as knowledge and catalog.

The value metrics also include a user acceptance score and an estimated cost saving calculation that converts hours saved into a currency value.

Calculate Virtual Agent cost savings

Configuring Measure

Set up default template rules, the value job user, AI cost, and usage tracking so that the AI Control Tower can calculate value and cost.

Recommended order

Configuration falls into two independent tracks that meet on the dashboard. Complete the Value track first, because cost figures are only meaningful once value is being calculated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Value: Configure default template rules, then assign the value job user. Publish at least one value template and map your AI systems to it.
2. Cost: Configure the average hourly rate, add integrated vendor costs, add other vendor costs if you use any, and then review and submit. These four tasks are steps in one flow, so complete them in order.
3. Dashboard: Set up usage tracking by user and department so that usage and cost can be attributed correctly.

Important:

Cost configuration can't be altered for past dates. Make sure you have the correct hourly and vendor rates before submitting, as any corrections will only apply to future dates.

Configure value management

The following topics describe how to configure value management:

1. Set up value template rules. Do one of the following:
   - To use the out-of-the-box templates, review default value template rules.

     For more information, see Review or create default template rules.
   - To build your own, create new value template rules.

     For more information, see Create and publish a value template.
   - To manage AI systems that don't have discovery integration, create and run manual value jobs.
     For more information, see Create and run manual value jobs.
2. Assign the value job user.

   For more information, see Assign the value job user.
3. Map an AI system to a value template.
4. (Conditional) Set up the Multi-Instance Framework for value calculations

   For more information, see Set up Multi-Instance Framework for value calculations.
5. Configure the average hourly rate for your organization.

   For more information, see Configure average hourly rate for your organization.
6. Add and configure costs for integrated vendors.

   For more information, see Add costs for integrated vendors.
7. Add and configure costs for non-integrated vendors.

   For more information, see Add costs for other vendors.
8. Review and submit the cost configuration.

   For more information, see Review and submit the cost configuration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. Set up usage tracking by user and department.

   For more information, see Set up usage tracking by user and department.

Value configurations

Configure the value templates, value jobs, and calculation settings that AI Control Tower (AICT) uses to measure the business value of your AI systems.

Value configurations control how AI Control Tower calculates value for the AI systems in your organization. Configure the templates that define which metrics are calculated, and the value jobs that run those calculations.

Review or create default template rules

Assign a default value template to each AI system category and vendor so that newly onboarded AI systems are mapped automatically.

Before you begin

Role required: sn_ai_governance.ai_steward

About this task

AI Control Tower includes out-of-the-box templates so that each AI system category has a default template. When a new AI system is onboarded, AI Control Tower maps a default template to it based on the vendor and, for ServiceNow, the AI system category.

After you set up default rules, value templates are automatically assigned to new AI systems. When AI Discovery registers a new AI system, and the system reaches the **Deployed** state, AI Control Tower applies the matching default rule. This automation reduces manual setup by eliminating the need to map each new AI system individually.

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home**.
2. Navigate to **Settings** > **Rules and Templates** > **Templates** > **Default template rules**.
3. Select an existing template from the list to review it.
4. **Optional:** If the existing templates don't meet your requirements, create a new default template rule.

   a. Select **Assign default templates**.
   The Assign default template dialog box appears.

   b. From the **Template** list, select a template.

   c. From the **Vendor** list, select a vendor.

   d. If you selected **ServiceNow** as the Vendor list, select an AI system category.

   e. Select **Assign as default**.

Result

When AI Discovery registers a new AI system, it checks if it matches the asset type and vendor. If it does and reaches the "Deployed" state, AI Control Tower maps the default templates to that system.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create and publish a value template

A value template defines the formula used to calculate productivity gains for mapped AI systems. After you publish a template, the value job runs automatically and populates the Value dashboard.

Before you begin

Role required: sn_ai_governance.ai_steward

About this task

Create a value template when you want to measure the productivity value of one or more AI systems. You define the metric once, map the AI systems that the metric applies to, test the calculation, and then publish the template.

The template flow includes three stages: Formula, Mapping, and Test (optional). All fields remain editable until you publish the template.

Productivity is calculated as: Usage × Time × Quality. Where Usage is how often an asset is used, Time is how much time it saves per use, and Quality is the share of outputs that are accepted.

A template saved as a draft is listed in the Draft state and does not calculate value until you publish it.

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home**.
2. Navigate to **Settings** > **Rules and Templates** > **Templates** > **All templates**.
3. Select **Create template**.
4. Enter a name, a department, and a description for the template.

   The template detail fields are described in the following table.

   #### Template detail fields

Field	Description
Template name	Enter a unique name for the template. This field is required.
Value template category	Select the category, such as **Productivity**. The Productivity category measures total productivity gain in terms of time saved.
Department	Select the department that the template applies to.
Description	Enter a description of the template.

5. In the **Persona** field, select the persona that the AI system supports, such as **Agent**.
6. In the **Usage** field, select the indicators that measure execution, such as agent execution, use case execution, skill execution, worker execution, or third-party system execution.
7. Set the time value type.

   Select an indicator to derive time saved from usage, or select a constant to apply a fixed baseline that you define.

8. From the **Quality type** list select an option.

   When you select the quality score, the value defaults to 50 percent. You can overwrite the default value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

Productivity = Usage × Time × Quality. Productivity is calculated by multiplying how often an asset is used, how much time it saves per use, and the share of outputs that are accepted.

The calculation builder fields are described in the following table.

Calculation builder fields

Field	Description
Persona	Select the persona that the metric applies to. This field is required.
Usage	Select the usage metric for the calculation. This field is required.
Time value type	Select how the time value is provided, such as constant or an indicator.
Time constant (in minutes)	Enter the time saved per use, in minutes. This field is required when the time value type is constant.
Quality type	Select how the quality (acceptance) value is provided, such as constant or an indicator.
Quality constant (in %)	Enter the share of outputs that are accepted, as a percentage. This field is required when the quality type is **Constant**.

To include additional metrics in the calculation, select **Add metrics**.

9. Select **Save as draft**.
10. Select **Next** to map the AI systems that the metric applies to.
11. Select an AI system type, such as **Generative AI** or **Agentic AI**, and then select the AI systems to map.
12. Select **Map AI systems**.

    You can select more than one AI system. Your selections are saved automatically.
13. Select **Next**.
14. Select the AI systems to test, and then select **Validate and calculate**.

    You can select up to 10 AI systems at a time. The value job runs and shows the numbers under current productivity or new productivity, depending on whether the AI system already has a template.
15. Select **Publish template**.

    If a selected AI system already has a published template, a message states that the existing mapping is retired when you publish. Confirm the override to continue.

Result

The template is published and mapped to the selected AI systems. The value job calculates the productivity gains for the previous day and shows them on the Value dashboard.

The template is listed on the **Templates** tab. A template saved with **Save as draft** is listed in the Draft state and does not calculate value until you publish it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Edit a published value template

Change the department, description, or AI system mappings of a published value template, and remove templates that you no longer need while keeping value calculation uninterrupted.

Before you begin

The value template must be published.

Role required: sn_ai_governance.ai_steward

About this task

After you publish a template, you can't change its metric. You can still change the department and the description, and you can add or remove the AI systems that the template is mapped to.

The actions that you can perform on a template depend on its current state:

Permitted actions by template state

Template state	Permitted actions
Published	• Metric fields can't be edited. • Template details (Department, Description) can be updated. • Mapping records can be added or removed. • Can use the **Duplicate** action to clone the template, with or without its mapping records. Cloned templates start in the draft state.
Draft	• All fields (metrics, template details, mapping records) are editable. • Draft templates can be deleted or published.

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home**.
2. Navigate to **Settings** > **Rules and templates** > **Templates** > **All templates**.
3. Select the template that you want to edit.
   To reuse a published template as a starting point, select **Duplicate template**.You can duplicate the template with or without its mapping records. The cloned template is created in the draft state, so you can edit all of its fields before you publish it.
4. Select **Edit template**.
5. Change the department and description, and then select **Next**.
6. In the mapping step, you can do the following:

   a. To add a mapping, select an option from the **AI system type** list, select an option from the **AI system** list, and then select **Map AI systems**.

      When you add an AI system, the AI Control Tower starts calculating value for it against this template.

   b. To remove the mapping, select 🗑 beside the AI system type that you want to delete.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Each deployed AI system must have a published template so that value calculation continues. When you map the AI system to another published template, the AI Control Tower retires the earlier mapping. A message explains this when you try to remove the only mapping.

7. Select **Save**.

Result
Changes to the template are saved.

Assign the value job user

Assign an active user to run value jobs so that the AI Control Tower can calculate value. When the assigned user is inactive, value calculation stops.

Before you begin
Role required: sn_ai_governance.ai_steward

About this task
A value job requires an active user to operate. Make sure to assign an active user to run value jobs.

If the user becomes inactive, the value job will not run, and the calculation of values will cease. You will see a message indicating that the value calculation has stopped because the user required to run the value job is inactive. The message will also prompt you to assign an active user to resume the value calculation.

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home**.
2. Navigate to **Settings** > **Rules and templates** > **Templates** > **Value controls**.
3. Select **value.job.user**.
4. From the **Value** list, select a user.

   You can select any active user, because the AI Control Tower uses the user to run the job rather than to check privileges.

5. Select **Update**.

> **Note:** If you see a message indicating that the value calculation has stopped because the user required to run the value job is inactive, select **Assign User** from the message. From the **Value** list, select a user, and then select **Update**.

Result
Value jobs run based on the schedule.

Create and run manual value jobs

Set up manual value jobs for AI systems that you onboard manually, so that the AI Control Tower calculates their value on a monthly or quarterly cadence.

Before you begin
Role required: sn_ai_governance.ai_steward.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Some AI systems don't have discovery integration but still need to be managed in the AI Control Tower. For these AI systems, you onboard them manually, create manual indicators, and the value job runs according to the cadence you set.

Procedure

1. Onboard the AI system manually through the inventory intake form.

   Complete the intake form details, follow the asset onboarding lifecycle, and map a value template. For more information, see Creating AI assets manually.

2. Create the manual indicators with a monthly or quarterly cadence.

   The AI Control Tower derives the run cadence from the indicator type. A monthly indicator runs as a monthly job, and a quarterly indicator runs as a quarterly job to capture productivity gains. For more information, see Manual indicators.

3. Rerun a scheduled value job.

   a. Navigate to **All** > **AI Control Tower** > **Home**.

   b. Navigate to **Settings** > **Rules and Templates** > **Templates** > **Scheduled value jobs**.

   c. Select the job that you want to rerun, and then select **Re-run**.
   The **Re-run** option is not available for jobs with a daily cadence.

Result

The AI Control Tower calculates value for the AI system on the monthly or quarterly cadence set by its indicators.

Set up Multi-Instance Framework for value calculations

Connect a sub-production instance to a production instance through the Multi-Instance Framework (MIF) so that the AI Control Tower can run value calculations across Creator skills.

Before you begin

You must have access to both the sub-production and the production instances.
Role required: sn_ai_governance.ai_steward

About this task

Use the Multi-Instance Framework to register a sub-production instance under a production instance so that value calculations run against the correct managed instances.

Procedure

1. In the sub-production instance, navigate to the Manager Instances [sn_mif_managed_by_instance] table and create a record.

   Manager Instances record values

Field	Value
Application	AI Control Tower Core
Manager Instance	Your production instance

2. Monitor the **Approval** field until it changes to **Auto-Approved**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the production instance, open the **AI Control Tower** workspace.
4. Go to **Configurations**.
5. On the **Multi-instance setup** tab, complete the following substeps to add your sub-production instance.
   a. Select **Add instances**.
   b. Select your sub-production instance.
   c. Select **Save**.

Result
The sub-production instance is registered with the production instance. The AI Control Tower can run value calculations across the following data:

- Creator metrics data for all creator skills
- Results obtained from testing Value Templates for AI systems in the sub-production environment.

Related topics

Multi-Instance Framework for AI value data

Move an unmanaged AI system to managed

When an AI system is unmanaged, its value data stops appearing on the value dashboard and its value templates are unpublished. Move it back to managed in AI Control Tower to restore value tracking.

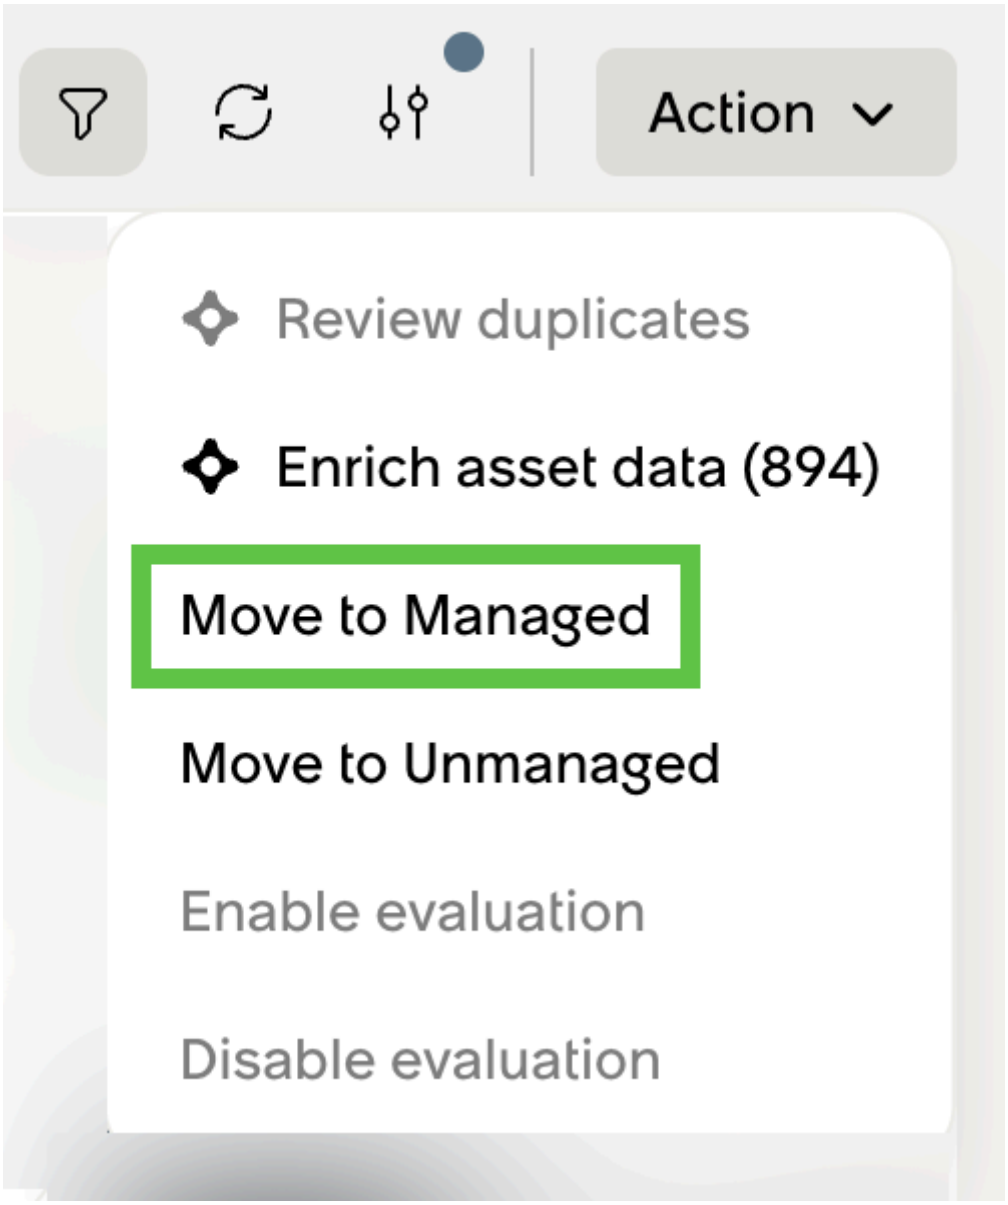
Before you begin
Role required: sn_ai_governance.ai_steward

About this task
The value dashboard shows insights only for managed AI systems. Move an unmanaged AI system to managed when you want to track its value again.

Procedure
1. Navigate to **All** > **AI Control Tower** > **Home**.
2. Navigate to **Inventory** > **Assets**.
   All AI assets are listed.
3. Select the check box for the AI system that you want to move to managed.

   To find an AI system, filter the list by **Display name**.
4. From the **Action** list, select **Move to Managed**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



A confirmation message appears, confirming the AI system is now managed.

Result
The AI system moves to the managed AI asset inventory. Its value templates return to the **Published** state, and its value data starts appearing on the value dashboard again.

The template mappings of the AI system appear in the **Templates mapping** list.

Related topics

Value tracking for managed and unmanaged AI systems

Set look back date range for unmanaged AI systems

Change how many days of missing value data AI Control Tower fills in when you mark an unmanaged AI system as managed again.

Before you begin
Role required: sn_ai_governance.ai_steward

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

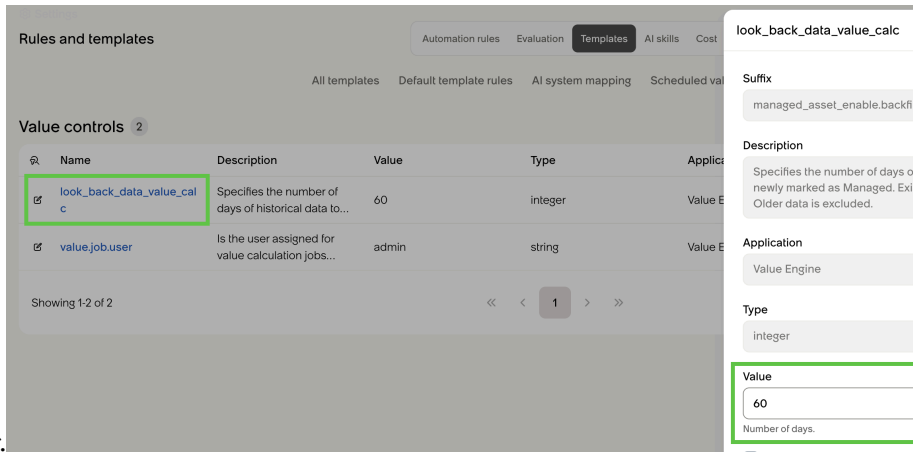
While an AI system is unmanaged, its value data doesn't appear on the value dashboard. When you mark the AI system as managed again, the AI Control Tower fills in the data for the period it was unmanaged. Thus ensuring there are no gaps in the dashboard numbers.

By default, AI Control Tower fills in up to 30 days of value data. If an AI system was unmanaged for longer than 30 days, increase the date range so the dashboard shows the full period. For example, if an AI system was unmanaged for 6 weeks, set the date range to 45 days.

This setting applies to all AI systems that you mark as managed again. It also covers AI systems that were set to unmanaged automatically when you upgraded with a ServiceNow SKU.

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home**.
2. Navigate to **Settings** > **Rules and Templates** > **Templates** > **Value controls**.
3. Select *look_back_data_value_calc*.



4. In the **Value** field, enter the number of days of value data to fill in.
   AI Control Tower supports 30, 45, and 60 days.
5. Select **Update**.

Result

The next time AI Control Tower fills in value data for an AI system you have marked as managed, it uses the date range you entered.

Related topics

Value tracking for managed and unmanaged AI systems

Cost configurations

Configure the hourly rates and vendor costs that AI Control Tower (AICT) uses to calculate what your AI systems cost to run.

Cost configurations establish the input for the Cost Framework in the AI Control Tower. Set up these inputs to make sure that cost data is accessible for the AI systems in your organization. After you configure, review the details and submit the configuration to activate it.

Configure average hourly rate for your organization

Set the average hourly rate that the Cost Framework uses to convert hours saved into financial savings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Determine your organization's total annual labor cost and its annual working hours, or a pre-calculated average hourly rate.

Role required: AI steward (`sn_ai_governance.ai_steward`).

About this task
The average hourly rate represents the cost of an average employee, including salary, benefits, and overhead, divided by annual working hours. This rate converts productivity hours into financial savings.

Cost setup is a four-step process: configure hourly rates, add integrated vendor costs, add other vendor costs, and preview cost and savings. You can select **Save and close** at any step and return to the configuration later.

Procedure
1. Navigate to **All** > **AI Control Tower** > **Settings** > **Rules and Templates** > **Cost**.
2. Select **Configure** or **Edit configuration**.

   Note:

   The currency shown is the currency configured for the instance. You can't change it here.

3. In the **Configure hourly rates** section, locate the **Avg hourly rate (in USD)** field and determine the correct rate for your organization.

   For example, if the total annual labor cost is $100,000 and the annual working hours are 2,000, the hourly rate is $100,000 ÷ 2,000 = $50/hour.

4. With **Set up a global rate** selected, enter the hourly rate in the **Avg hourly rate (in USD)** field.
5. **Optional:** Select **Set up rates per persona** and then enter the rate in the **Avg hourly rate (in USD)** field for each persona listed.

   (Optional) You must define a rate for each persona, such as agent, developer, fulfiller, or others.

   Important:

   The configuration shows only the personas that are mapped to the templates you created. If a persona is not mapped to your templates, it does not appear in the configuration.

6. Select **Next** to continue.

Result
Your organization's average hourly rate is configured. The Cost Framework uses this rate to calculate financial savings from productivity hours.

Add costs for integrated vendors

Add the cost of a vendor or sub-vendor integrated with ServiceNow so that AI Control Tower includes it in the total Enterprise AI cost. Set a sub-vendor rate when a specific service is billed differently from the vendor.

Before you begin
Role required: AI steward (sn_ai_governance.ai_steward).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The system automatically captures token usage from integrated LLM providers, such as Amazon Bedrock, Google Cloud AI, ServiceNow, and Microsoft. However, you must configure the cost rates for each vendor based on your specific commercial agreements.

Procedure

1. Navigate to **All** > **AI Control Tower** > **Settings** > **Rules and Templates** > **Cost**.
2. Select **Edit configuration**.
   The Edit value and cost configuration page opens at the **Configure hourly rates** step.
3. Verify that you have configured the average rate.
   For more information, see Configure average hourly rate for your organization.
4. Select **Next**.
   The **Add integrated vendor costs** step displays the vendors that already have costs.
5. Select **Add vendor**.
6. In the **Vendor** field, select a vendor or sub-vendor.

   Sub-vendors appear after their vendor name, for example, **Amazon - AWS AgentCore**. A sub-vendor rate takes precedence over its vendor's rate.

7. In the **Cost type** field, select a cost type and enter the related values.

Cost type	Values to enter
Overall cost	In **Cost per million tokens**, enter the cost for one million tokens.
Input and output costs	In **Input cost (per million tokens)** and **Output cost (per million tokens)**, enter the cost for one million input tokens and one million out put tokens.
Subscription	In **Licensed seats**, enter the number of seats. In **Cost per seat (per month)**, enter the month ly cost of one seat. In **Contract start** and **Con tract end**, select the contract dates.

   Contract start defaults to the current date.

   For a subscription, the **Estimated monthly cost** value updates as you enter details.

8. **Optional:** To include a one-time setup fee in a subscription, turn on **Add a one-time setup fee**, and then enter the fee in **One-time setup fee** and the number of months in **Amortise over (months)**.

   (Optional) The fee is spread evenly over the number of months that you enter. The monthly amount appears after the **Amortise over (months)** field and is added to the estimated monthly cost.

9. Select **Save**.
   The entry appears in the vendor list with the status **Draft**. If you added a sub-vendor, its vendor's entry shows the message **Applies only where no sub-vendor rate is set**.

Result

The cost is saved as a draft. It's applied after you submit the configuration in the **Preview cost & savings** step.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

Select **Next** to add costs for other vendors, or continue to the **Preview cost & savings** step to submit your changes.

Related topics

- Cost types and sub-vendor rates
- Add costs for other vendors
- Review and submit the cost configuration

Add costs for other vendors

Configuring costs for LLM vendors without direct integrations with the AI Control Tower requires manual input. You must manually enter token usage, direct costs, or a per-seat subscription. The AI Control Tower can then include these costs in total AI cost calculations.

Before you begin

Role required: AI steward (sn_ai_governance.ai_steward).

About this task

Not all LLM vendors have direct integrations with the AI Control Tower. For vendors without integrations, you manually capture and configure their costs so that they are included in your total AI cost calculations. The following approaches are available:

- Token-based: You enter the units consumed, and the system calculates cost based on the rate you provide.
- Direct cost: You enter the total cost directly.
- Subscription: Use a subscription when the vendor bills per seat.

The cost entry you add stays in draft until you submit the configuration in the **Preview cost & savings** step.

Cost setup is a single four-step flow: configure hourly rates, add integrated vendor costs, add other vendor costs, and preview cost and savings. You can select **Save and close** at any step and return to it later.

This step is optional. If every vendor you use is integrated, select **Next** and move on.

Procedure

1. Navigate to **All** > **AI Control Tower** > **Settings** > **Rules and Templates** > **Cost**.
2. Navigate to **Settings** > **Rules and Templates** > **Cost**.
3. Select **Edit configuration**.
   The Edit value and cost configuration page opens at the **Configure hourly rates** step.
4. Confirm that the average rate is configured.
   For more information, see Configure average hourly rate for your organization.
5. Select **Next** until the **Add other vendor costs** step opens.
6. In the **Add other vendor costs** section, select **Add vendors** and choose an approach.
   - Token-based — Track token usage for the vendor and let the system calculate cost from the rate.
   - Direct cost — Enter the total cost for the vendor for a time period.
   - Subscription — Use a subscription when the vendor bills per seat.
7. For a token-based vendor, enter the details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Token-based fields

Field	Description
Start date	Start date for calculating the vendor cost.
End date	End date for calculating the vendor cost.
Vendor	Name of the vendor.
Unit type	Choose Assist or Tokens according to the consumed category of cost.
Cost type	Choose Overall for a single cost per token, ServiceNow Assist, or Input and output cost to add a separate per-token cost for input and output tokens.
Units consumed	Total number of units consumed.
Avg cost per million units	Average cost per million units within the selected time period.

8. For a direct-cost vendor, enter the details.

Direct cost fields

Field	Description
Start date	Start date for calculating the vendor cost.
End date	End date for calculating the vendor cost.
Vendor	Name of the vendor.
Unit type	Choose Assist or Tokens according to the consumed category of cost.
Total cost	Total cost within the selected time period.

Add costs for all non-integrated vendors that your organization uses.

Select **Add vendor** to save each entry, and then continue.

9. For a subscription vendor, enter the details.

Subscription fields

Field	Description
Contract start	Select the contract start date. The contract start date defaults to the current date.
Contract end	Select the contract end date.
Vendor	Select a vendor or sub-vendor.
Licensed seats	Enter the number of seats.
Cost per seat (per month)	Enter the monthly cost of one seat. The **Estimated monthly cost** value updates to the number of seats multiplied by the cost per seat.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Add a one-time setup fee	Turn on **Add a one-time setup fee** toggle, and then enter the fee amount in **One-time setup fee** and specify the duration in **Amortise over (months)**.

Select **Add vendor** to save each entry, and then continue.

The subscription is saved as a draft. It's applied after you submit the configuration in the **Preview cost & savings** step.

10. Select **Next** to continue, or **Save and close** to complete the configuration later.

Result
All non-integrated vendors that your organization uses are configured in the Cost Framework. The AI Control Tower uses these rates for total AI cost calculations, even though the vendors don't have automatic data integrations.

Review and submit the cost configuration

Review all Cost Framework configurations, verify the calculations, and submit to activate the Cost Framework.

Before you begin
Role required: AI steward (`sn_ai_governance.ai_steward`).

About this task
Before activating the Cost Framework, review all configurations to verify accuracy. The review screen displays how money saved is calculated (based on the hourly rate), how total cost is calculated (all vendors combined), and a preview of the net returns calculation. After your verification is complete, the system uses these calculations in dashboards and reports.

Procedure
1. Navigate to **All** > **AI Control Tower** > **Settings** > **Rules and Templates** > **Cost**.
2. Select **Edit configuration**.
3. Make sure you have configured the average rate, added integrated vendor pricing, and added other vendor pricing (if applicable).
   For more information, see Configure average hourly rate for your organization, Add costs for integrated vendors, and Add costs for other vendors.
4. Go to **Preview cost & savings** section and review the details.
5. Select **Submit** to activate the Cost Framework.

   The system uses these configurations for cost calculations.

Result
Your Cost Framework configuration is complete and active. The system calculates money saved, total costs, and net returns based on your specifications, and dashboards and reports show the financial impact of your AI investments.

What to do next
Verify that the Cost Framework is active in the dashboards:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Navigate to **All** > **AI Control Tower** > **Insights** > **Value**.
2. Confirm that the Productivity gains widget shows total money saved (not just hours), the Net AI Returns widget shows total calculated returns, and the Total AI Cost widget shows aggregated vendor costs.
3. Verify that these values match the values on the Cost setup page.

After submission:

- Monitor regularly: Check the Cost Framework dashboards weekly to track costs and savings.
- Update as needed: If vendor pricing changes or you add new vendors, reconfigure them from **Settings** > **Rules & Templates** > **Cost**.
- Review quarterly: Reassess hourly rates and vendor pricing quarterly to verify accuracy.
- Investigate anomalies: Watch for unexpected cost spikes or changes in savings patterns.
- Use for decisions: Share Cost Framework insights with stakeholders for budget and investment decisions.

Dashboard configurations

Configure the tracking settings that determine which usage data appears on the dashboards in AI Control Tower (AICT).

Dashboard configurations determine the data that the AI Control Tower collects for its dashboards. It is important to set up usage tracking. This ensures that the dashboards provide adoption data at the level of detail required by your analysts. Analysts need this information to assess how AI systems are utilized across your organization.

Set up usage tracking by user and department

Add user email and department information to the User table so that the AI Control Tower can break down usage and cost by user and by department.

Before you begin

Role required: sn_ai_governance.ai_steward

About this task

Usage by user and department is available for ServiceNow and the Anthropic service. The usage by user and department widget shows the cost breakdown by user and by department. For ServiceNow, the AI Control Tower reads user consumption and maps each user to a department through the User table. For the Anthropic service, it maps the usage email address to a User record, and then reads the user name and department from that record.

Procedure

1. Navigate to **Insights** > **Value** and review the usage by user and department widget.
2. For a user who has no record in the User [sys_user] table, create the user record with the email address.
3. For a user with a missing department, add the department in the User [sys_user] table.

   When email or department information is missing, you will see a message. The message indicates that information may be unavailable for some users and prompts you to update the email and department details in the User table.

4. Run the sync to pick up the new records.

   The sync job runs every four hours and picks up newly created records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The usage by user and department widget shows usage and cost broken down by user and by department.

Use

Use Dashboards to review and analyze the productivity gains, AI costs, and the net return on AI investment.

Review value and engagement insights for AI systems

Use AI Control Tower to review productivity gains, cost savings, and engagement results for AI systems in your scope. AI stewards review data for all AI systems on the instance. Product owners review data for the AI systems that list them in the **Managed by** field.

Before you begin

- You must have the AI steward role or the product owner role. Users without one of these roles can't open AI Control Tower.
- If you have the product owner role, at least one AI system must list you in the **Managed by** field.

Role required: sn_ai_governance.ai_steward or sn_ai_governance_ai_asset_owner

About this task
Both roles use the same pages. The difference is the set of AI systems included in each chart.

AI systems included by role

Role	AI systems included
AI steward	All AI systems on the instance.
Product owner	AI systems that list the product owner in the **Managed by** field.

For both roles, only AI systems in the Deployed state contribute to calculations. Retired AI systems and AI systems in other states are excluded.

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home**.
2. Navigate to **Insights** > **Value**.
3. Select a date range to set the reporting period.

   The change values shown against each AI system compare the selected period with the preceding period of the same length.

4. Review the productivity gains and cost savings data in the charts.

   Each chart displays aggregated results for AI systems in the **Deployed** state within your scope.

5. To see the AI systems contributing to a chart, select the chart to open the detail view.

   Because only AI systems in the **Deployed** state contribute, the count in the detail view can be lower than the number of AI systems in your scope.

6. Select the **Engagement** tab to review engagement results.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. To review results limited to ServiceNow AI systems, open the **ServiceNow AI** tab.
8. In the **ServiceNow AI** tab, select **Value**, **Engagement**, or **Creator skills** to view detailed information.

Result
If you have the AI steward role, each chart shows results for every AI system on the instance.

If you have the product owner role, each chart shows results for the AI systems that you manage. If you don't manage any AI system in the Deployed state, the charts show zero values.

Evaluate conversations

Use Conversational Evaluator in AI Control Tower to review conversation quality scores, and estimate the cost savings from Virtual Agent conversations.

Conversational Evaluator provides auto-evaluation scores to track conversation quality over time. You can label individual conversations to set a quality benchmark and verify auto-evaluation accuracy. The tool also converts hours saved into a currency value to estimate the cost savings from Virtual Agent conversations.

Related topics

Conversational evaluator

Review conversation evaluation scores

Review auto-evaluation scores for Virtual Agent conversations in AI Control Tower to track conversation quality over time.

Before you begin
Role required: sn_ai_governance.ai_steward, interaction_admin

About this task
Compare the average auto-evaluation score with the average human feedback score to check how closely automated ratings match human judgment.

Procedure
1. Navigate to **All** > **AI Control Tower** > **Insights** > **ServiceNow AI** > > **Evaluation**.
2. Select the **Evaluation** tab.
3. In the **Select metric** list, select a metric and then select **Apply**.

   Select **User Satisfaction** to view the combined score, or select an individual metric, such as **Intent Accuracy** or **Slot Filling**.
4. In the **Select date range** list, select the time period to review.
5. Review the **Evaluation score trend** chart.

Related topics

Calculate Virtual Agent cost savings

Calculate Virtual Agent cost savings

Estimate cost savings from Virtual Agent conversations by entering an hourly rate in the Value view of Conversational Evaluator.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_ai_governance.ai_steward, interaction_admin

About this task
The **Impact** view shows the total hours saved by Virtual Agent conversations. Enter an hourly rate to see the estimated dollar value of those savings.

Procedure
1. Navigate to **All** > **AI Control Tower** > **Insights** > **ServiceNow AI** > > **Evaluation**.
2. Select the **Evaluation** tab.
3. Select **Impact**.
4. **Optional:** In the **Select date range** list, select the time period to calculate.
5. In the **Estimated cost saving calculation** section, enter a value in the **Hourly rate** field.
6. **Optional:** Select a currency from the **currency** list.
7. Select **Update**.

Result
You can see the estimated cost savings from Virtual Agent conversations.

Reference
Reference topics provide additional information about the required roles and Performance Analytics indicators, and the tables used in the value calculation.

Performance Analytics indicators and the database tables
Learn about the out-of-the-box Performance Analytics (PA) indicators and the database tables that the AI Control Tower uses to calculate value.

Predefined PA indicators for ServiceNow® AI systems

Predefined Performance Analytics (PA) indicators

Metric field	PA indicator name	Description
Usage – Agent	AIValue - Daily Agent Executions	AI agent actions
Usage – Skills	AIValue - Daily Skill Executions	AI skill executions
Usage – AI Workflow	AIValue - Daily Agent Workflow Executions	AI workflow executions
Time Saved	AIValue - Daily Average Skill Assist; AIValue - Daily Average Agent Workflow Assists; AIValue - Daily Average Agent Assist	1 assist = 1 minute saved
Time Saved (Token)	AIValue Average RWTS per Skill	Read/write token count; applicable for AI skills only
Acceptance Rate	AIValue.CreatorMetrics.AcceptedCalls	Total accepted creator calls

© 2026 ServiceNow, Inc. All rights reserved.

Predefined performance indicators for enterprise AI systems

The following out-of-the-box performance indicators are available for enterprise (third-party) AI systems:

- EnterpriseAgents.InvocationCount.Daily - Tracks the number of third-party agent invocations per day.
- AIValue - Daily Worker Executions - Tracks the number of AI worker executions per day.

Key database tables

Key database tables

Table	Purpose
`sys_gen_ai_usage_log`	Stores daily skill and agent execution counts and assist averages. Stores usage data for ServiceNow® AI systems.
`sn_ai_disc_ai_usage`	Stores usage data for third-party (external) agent invocations.

The AI Control Tower derives two common measures from the `sys_gen_ai_usage_log` table:

- **Daily Skill Executions**: the count of records in `sys_gen_ai_usage_log` for a specific asset on the previous day.
- **Daily Average Skill Assist**: the average of the assists column in `sys_gen_ai_usage_log` for a specific asset on the previous day.

Feature access by role

Access to features varies by role. The value, engagement, and cost features differ between AI stewards and product owners.

The differences between the two roles are provided in the following table. Where a product owner sees a subset of data, the subset is the AI systems that list them in the **Managed by** field.

Differences between AI steward and product owner access

Feature	AI steward	Product owner
Value data	Data for all AI systems on the instance.	Data for the AI systems they manage.
Engagement data	Data for all AI systems on the instance.	Data for the AI systems they manage.
Percentage of tasks closed using an AI system, and task closure efficiency	Available.	Not available.
ServiceNow AI value and engagement dashboards	Data for all ServiceNow AI systems.	Data for the ServiceNow AI systems they manage.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Differences between AI steward and product owner access (continued)

Feature	AI steward	Product owner
Creator skills data	Data for all AI systems on the instance.	Data for the AI systems they manage.
Value templates	All templates, regardless of mapping or state.	Templates mapped to AI systems they manage, plus templates they created, including drafts.
Default template rules	View rules and assign a default rule.	View rules only. The assign control isn't available.
Template mappings	All mappings for all AI systems.	Mappings for the AI systems they manage. Can create and change these mappings.
Scheduled jobs	All scheduled jobs.	Scheduled jobs for the AI systems they manage.
Value controls	Available.	Not available.
Cost calculation output	For all vendors on the instance.	Read only
Integrated vendors and other vendors	All vendor records.	Read only
Vendor configuration	Editable. Can submit changes.	Read-only. Can't submit changes.

Addressing your AI action items

Track and act on the governance work and AI-generated recommendations that AI Control Tower surfaces for you in Activity Center.

Activity Center is the single workspace where AI Control Tower brings together everything that needs your attention: governance work assigned to you or your team, and AI-generated recommendations worth reviewing. Both sections save you from switching between asset records, dashboards, and email to find out what needs to happen next.

Governance work

Lifecycle tasks, security tasks, requests, cases, risk assessments, issues, attestations, policy exceptions, and inquiries are routed to the people who own them, with a single view to track and resolve each one. For more information, see Managing AI tasks and approvals in Activity Center.

AI-generated recommendations

When AI Control Tower detects an issue or an opportunity in your AI portfolio, it surfaces a recommendation with a resolution action attached. For more information, see Resolving AI recommendations in Activity Center.

Managing AI tasks and approvals in Activity Center

Track and resolve the governance work that AI Control Tower generates as your AI portfolio grows, such as lifecycle tasks, security tasks, cases, and risk assessments.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

As AI Control Tower discovers new assets, evaluates their quality and safety, monitors them for risk and security concerns, and tracks their progress through the lifecycle, it produces a continuous stream of items that need human judgment. AI Control Tower can route these items to users who can track and resolve the items in Activity Center. For the AI-generated recommendations that Activity Center also surfaces, see Resolving AI recommendations in Activity Center.

Types of governance work

Activity Center surfaces the following governance work:

Lifecycle tasks

Tasks generated by AI asset lifecycle playbooks as managed assets move through the onboarding, assessment, build and test, deployment, and offboarding stages. Lifecycle tasks include impact assessments, architecture reviews, security clearances, and other reviews that must be completed before an asset can advance to the next stage. For more information, see AI asset lifecycle tasks.

Security tasks

Tasks generated when AI Control Tower detects a security threat, policy violation, or access concern on a managed AI asset. Security tasks route to the AI steward or security team responsible for the affected asset. For more information, see Security tasks.

Requests

Change requests and offboarding requests submitted by asset owners that require AI steward review and approval. A change request initiates a controlled update to a managed asset, such as switching the AI model backing an agent. An offboarding request initiates the retirement of an asset. For more information, see Change and offboarding requests.

Cases

A structured investigation into an incident affecting a managed AI asset, such as a suspected security breach, data exposure, or policy violation. For more information, see AI cases.

Risk assessments

An evaluation of a managed AI asset's inherent, control, and residual risk that AI Control Tower generates automatically when the asset is onboarded or its use and purpose changes. For more information, see Risk assessments.

Issues

A tracked problem identified with a managed AI asset that needs a resolution or an action plan, such as a gap surfaced during a governance review. For more information, see Issues.

Attestations

A request to acknowledge a compliance policy that applies to a managed AI asset, generated automatically when the policy requires acknowledgment from the asset's steward or owner. For more information, see Attestations.

Policy exceptions

An approved, time-bound deviation from a policy or control objective that applies to a managed AI asset. For more information, see Policy exceptions.

Inquiries

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A general request for information or clarification related to AI governance, such as a question about a policy, a process, or a specific AI asset. For more information, see AI inquiries.

Where governance work appears

Governance work surfaces in three places in AI Control Tower:

Home page

The Top action items widget on the Home page shows a prioritized snapshot of recommendations, tasks assigned to you, and unassigned tasks. Use this widget to start each session with the items that most need your attention. For more information, see AI portfolio overview.

Activity Center

Activity Center is the full workspace for governance work. On the **Work** page, it organizes work by ownership across the **Team**, **Assigned to you**, **Unassigned**, and **Submitted by you** tabs. Use Activity Center to filter, group, and work through items at scale. For more information, see Activity Center. AI-generated recommendations appear on a separate **Recommendations** page within Activity Center; see Resolving AI recommendations in Activity Center.

AI asset records

The **Needs attention** section on the **Overview** tab of an asset record shows the recommendations and tasks scoped to that single asset, under the same Recommendations, Assigned to you, and Unassigned sub-tabs as the Top action items widget on the Home page. Use this section when you're investigating an asset and want to see the open governance items that apply to it without leaving the record. For more information, see Working with AI asset records.

AI asset lifecycle tasks

Advance managed AI assets through controlled stages of governance by completing the reviews, assessments, and approvals that AI asset lifecycle playbooks require.

A lifecycle task is a unit of governance work that an AI asset lifecycle playbook generates and assigns to an AI steward, asset owner, or other reviewer. Each lifecycle task corresponds to a step in a playbook activity that requires human judgment, such as evaluating an asset's risk, confirming its regulatory conformity, or collecting the information a review requires. AI Control Tower uses lifecycle tasks to help enforce consistent governance as a managed AI asset moves from onboarding through active use to retirement.

How lifecycle tasks are generated

Lifecycle tasks are generated by the playbooks that run during the Onboard and Retire stages. Each playbook advances the asset through its own set of named activities and generates the tasks required to complete each one. For example, the Onboarding playbook's Assess activity might generate an impact assessment task, a legal collaboration task, a security clearance collaboration task, and an architecture review task.

AI Control Tower routes each task to the role responsible for completing it, based on the playbook's logic. The asset cannot advance to the next activity or lifecycle stage until all required tasks for the current activity are completed.

Lifecycle stages

Every managed AI asset progresses through three lifecycle stages, shown as a horizontal progress indicator on the asset's **Lifecycle** tab. AI Control Tower generates lifecycle tasks in the two stages that run a playbook:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Onboard

The asset is introduced into the organization. The Onboarding playbook advances the asset through its own activities, including Assess, Build and test, and Deploy, and generates a lifecycle task for each activity it requires.

Maintain

The asset is in active, ongoing use. This stage becomes available after onboarding is complete. It does not run a playbook, so it tracks change requests instead of lifecycle tasks.

Retire

The asset is decommissioned and removed from active use. This stage becomes available after onboarding is complete and runs its own playbook to generate the lifecycle tasks required to retire the asset.

Where lifecycle tasks appear

Lifecycle tasks appear in three places in AI Control Tower:

The Top action items widget on the Home page

Lifecycle tasks assigned to you appear on the **Assigned to you** tab. Lifecycle tasks with no assignee appear on the **Unassigned** tab.

Activity Center

Lifecycle tasks appear on the **Lifecycle tasks** sub-tab of the **Team**, **Assigned to you**, and **Unassigned** views, depending on assignment.

The Lifecycle tab on an asset record

Lifecycle tasks for a specific asset appear in the playbook visualization on the **Lifecycle** tab, where you can see how each task fits into the asset's overall lifecycle progression.

Complete a lifecycle task

Advance a managed AI asset through its lifecycle by completing the reviews, assessments, or approvals that an asset lifecycle playbook requires.

Before you begin

Role required: sn_ai_asset_mgmt.ai_asset_owner or sn_ai_governance.ai_steward

About this task

Lifecycle tasks are generated by an AI asset lifecycle playbook. Lifecycle tasks include impact assessments, architecture reviews, security clearances, value template approvals, and other reviews that must be completed before a managed AI asset can advance to its next lifecycle stage.

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home** > **Activity Center** > **Work** > **Assigned to you**.
2. On the **Lifecycle tasks** tab, select the lifecycle task that you want to complete.
3. In the Task side panel, review the task details and complete the work that the task requires. For example, an impact assessment task requires you to evaluate the asset against the assessment criteria and record your findings in the form. An architecture review task requires you to review the asset's architecture and confirm that it meets your organization's standards.
4. In the side panel, select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The task is updated with your status change. The asset's lifecycle progresses according to the playbook's logic. If your task was the last outstanding task for the current activity, the asset advances to the next activity in the lifecycle stage.

Security tasks

Address possible security threats, policy violations, and access issues on managed AI assets by acting on the security tasks the system generates for AI stewards and security reviewers.

A security task is a unit of work that AI Control Tower generates when it detects a security concern on a managed AI asset. Security tasks route to the AI steward or security reviewer responsible for the affected asset, where they can investigate the concern, take remediation action, and document the resolution. Security tasks give AI governance teams a consistent, traceable way to respond to AI-specific security threats.

How security tasks are generated

AI Control Tower generates security tasks from several sources:

- Threat detection on AI agents, including prompt injection, data exfiltration, and policy bypass attempts.
- Access and privilege monitoring on AI agents that have unusual or excessive permissions.
- Output deviation detection on AI agents whose responses depart from expected behavior.
- Dormant agent detection on AI agents that have not been used for an extended period and may pose a stale-credential risk.

Where security tasks appear

Security tasks appear in:

Activity Center

Security tasks appear on the **Security tasks** sub-tab of the **Team**, **Assigned to you**, and **Unassigned** views, depending on assignment.

Resolve a security task

Investigate a security concern that AI Control Tower has detected on a managed AI asset, take the appropriate remediation action, and document the resolution.

Before you begin
Role required: sn_ai_asset_mgmt.ai_asset_owner or sn_ai_governance.ai_steward

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home** > **Activity Center** > **Work** > **Assigned to you**.
2. Select the **Security tasks** sub-tab.
3. Select the security task that you want to resolve.
   The task opens in a side panel with the affected asset, the type of security concern that triggered the task, the supporting evidence, and any recommended remediation actions.
4. Investigate the security concern.
   Review the evidence in the task, examine the asset's security posture on the asset record's **Security** tab, and determine whether the concern is a true positive that needs remediation or a false positive that can be dismissed.
5. Take the remediation action that addresses the security concern.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Remediation actions vary by the type of concern. For example, a prompt injection task might require updating the agent's guardrails, while a dormant agent task might require retiring the agent or rotating its credentials.

6. Document the resolution and update the task status.
   Record the action you took and the outcome in the task's resolution notes so the security audit trail is complete. Set the task status to **Completed** when the work is done.

Result

The resolved security task no longer appears in the **Assigned to you** view. The asset record's **Security** tab reflects the updated security posture. If the underlying condition recurs, AI Control Tower generates a new security task.

Change and offboarding requests

Make controlled changes to a managed AI asset, or retire an asset that is no longer needed, by submitting a request for AI steward review and approval.

A request is a structured submission that an asset owner makes when they need to change or retire a managed AI asset. AI Control Tower routes each request to an AI steward for review, runs the request through the appropriate approval playbook, and either applies the requested change or moves the asset to retirement. Requests give asset owners a controlled way to evolve their AI assets, and they give AI stewards a consistent way to govern those changes.

Types of requests

AI Control Tower supports two types of requests:

Change request

A request to modify a managed AI asset. A change request might propose switching the AI model that backs an agent, updating an asset's version, modifying the asset's use and purpose, or changing the sub-AI systems and AI models associated with the asset. Change requests give asset owners a path to keep their assets current without bypassing governance.

Offboarding request

A request to retire a managed AI asset. An offboarding request initiates the offboarding lifecycle stage for the asset, which removes the asset from active use and confirms that dependencies have been resolved and any data the asset produced is handled according to policy.

Request lifecycle

Both request types follow a similar lifecycle:

1. An asset owner submits the request from the asset record.
2. AI Control Tower runs the request through an approval playbook. The playbook might require a review of the asset, an evaluation of the impact, and a remediation plan before the request can be approved.
3. An AI steward reviews the request, including the impact on related sub-AI systems and AI models. The steward approves or rejects the request.
4. If approved, AI Control Tower applies the change to the asset (for a change request) or moves the asset into the offboarding stage (for an offboarding request). If rejected, the asset is unchanged and the request is closed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Where requests appear

Requests appear on the **Requests** sub-tab of the **Team**, **Assigned to you**, and **Unassigned** views in Activity Center, depending on assignment. Asset owners can also see requests they have submitted from the affected asset's record.

Review and approve a change request

Evaluate a change request submitted by an asset owner and either approve the change so AI Control Tower can apply it, or reject the change so the asset remains unchanged.

Before you begin

Role required: sn_ai_governance.ai_steward

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home** > **Activity Center** > **Work** > **Assigned to you**.
2. Select the **Requests** sub-tab.
3. Select the change request that you want to review.
   The change request opens in a side panel with three tabs: **Details**, **Change tasks**, and **Impacted assets**.
4. Review the proposed changes on the **Details** tab.
   For example, compare the asset's current configuration with the values the requester has proposed for fields such as Asset type, Version, Updated AI Asset, Sub AI systems, and AI models. You can review the justification to understand the business context for the change.
5. Review the work that the request will generate on the **Change tasks** tab.
   For example, view the tasks that will be created if the request is approved, along with their assignees and current state. A change request that switches an AI model might generate a "Review change request" task for the AI steward and a "Validate model performance" task for the asset owner.
6. Assess the impact on related assets on the **Impacted assets** tab.
   For example, you might review impacted assets to determine whether the change might break a downstream dependency or require coordinated updates.
7. Approve or reject the change request.

Option	Description
Approve the request	**a.** Select **Approve**. **b.** If prompted, record the rationale for the ap proval. **c.** Confirm the approval. AI Control Tower ap plies the change to the asset and updates the asset record with the new values.
Reject the request	**a.** Select **Reject**. **b.** Record the rationale for the rejection so the requester understands why the change can not proceed. **c.** Confirm the rejection. AI Control Tower clos es the change request and the asset re mains unchanged.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
If you approved the request, AI Control Tower applies the change to the asset and the request is marked **Completed**. If you rejected the request, the asset is unchanged and the request is closed. The asset owner receives a notification with the outcome and your rationale.

Review and approve an offboarding request

Evaluate an offboarding request submitted by an asset owner and either approve the request to move the asset into the offboarding lifecycle, or reject the request so the asset remains active.

Before you begin
Role required: sn_ai_governance.ai_steward

Procedure
1. Navigate to **All** > **AI Control Tower** > **Home** > **Activity Center** > **Work** > **Assigned to you**.
2. Select the **Requests** sub-tab.
3. Select the offboarding request that you want to review.
   The offboarding request opens in a side panel with the asset details, the requester's justification, and the dependencies that the asset has.
4. Review the offboarding rationale and the asset's current state.
   For example, evaluate whether the asset has had recent activity, whether the requester has identified a replacement asset, and whether retiring the asset will affect users or downstream systems.
5. Assess the impact of retiring the asset by reviewing related sub-AI systems, AI models, and other dependencies in the request.
   For example, identify any downstream assets that depend on the one being retired so you can confirm whether they have been migrated to a replacement or whether additional planning is needed before approval.
6. Approve or reject the offboarding request.

Option	Description
Approve the request.	**a.** Select **Approve**. **b.** If prompted, record the rationale for the ap proval. **c.** Confirm the approval. AI Control Tower moves the asset into the offboarding lifecy cle stage and generates the offboarding tasks defined by the offboarding playbook.
Reject the request.	**a.** Select **Reject**. **b.** Record the rationale for the rejection so the requester understands why the asset can not be retired at this time. **c.** Confirm the rejection. AI Control Tower clos es the offboarding request and the asset re mains active.

Result
If you approved the request, the asset moves into offboarding and lifecycle tasks are generated to complete the retirement. If you rejected the request, the asset remains active. The asset owner receives a notification with the outcome and your rationale.

AI cases

Investigate and document an incident affecting an AI asset, such as a suspected security breach, data exposure, or policy violation, using a structured case record.

An AI case documents an incident that requires investigation, such as a suspected security breach, a data exposure, or a policy violation involving an AI asset. A case moves through breach analysis, root cause analysis, and remediation as the investigation progresses.

Case lifecycle

An AI steward or asset owner reports a case to document an incident, such as a suspected breach, data exposure, or policy violation. AI Control Tower assigns a case analyst, who triages and investigates the incident to determine whether a breach occurred. The **Reporting status** field is set automatically based on the regulations associated with the case.

Once the case analyst completes the root cause analysis, the **Primary cause** and **Primary consequence** fields populate from that analysis. The case analyst records whether remediation measures have been taken and documents any preventive measures. The case then moves through a post-case review before closing, or it can be canceled if no further action is needed.

Where AI cases appear

AI cases appear on the **Cases** sub-tab of the **Team**, **Assigned to you**, **Unassigned**, and **Submitted by you** tabs in Activity Center, depending on assignment.

Create an AI case

Open an AI case to investigate and document an incident affecting an AI asset, such as a suspected breach, data exposure, or policy violation.

Before you begin

Role required: sn_ai_governance.ai_steward or sn_ai_asset_mgmt.ai_asset_owner

About this task

An AI case documents an incident that needs investigation, such as a suspected security breach, a data exposure, or a policy violation involving an AI asset. Creating a case starts a structured investigation that can include a breach determination, a root cause analysis, and a remediation plan.

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home** > **Activity Center** > **Work** > **Assigned to you**.
2. Select the **Cases** sub-tab.
3. Select **New**.
4. Fill in the fields that describe the case.

AI Case fields

Field	Description
Name	Name of the case.
Description	Description of the case.
Type	Type of case. Defaults to **AI case**.
Sub-type	Subcategory of the case type, if applicable.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
State	Current state of the case. Defaults to **New**.
Priority	Priority of the case.
Requester	User requesting the case. Defaults to you.
Requested on behalf of	User the case is being requested for, if different from the requester.

Note: The **Primary entity** and **Entity owner** fields populate automatically and aren't set when you create the case.

5. In the Assignment section, specify who should work the case.

Assignment fields

Field	Description
Assignment group	Group responsible for working the case.
Watch list	Users who want to stay informed about the case.
Case analyst	User assigned to analyze the case.
Accountable executive	Executive or executives accountable for the case outcome.

6. In the Primary origin section, describe where the case originated.

Primary origin fields

Field	Description
Location	Location where the case originated.
Sub-location	More specific location within the primary location.
Impacted business unit	Business unit affected by the case.
Impacted department	Department affected by the case.
Additional source	Additional context about how the case was identified.

Note: The **Source** field is set automatically based on how the case originated (such as manually, or from an email or a security incident) and isn't set when you create the case.

7. In the Schedule section, record the dates relevant to the case.

Schedule fields

Field	Description
Date of occurrence	Date the underlying event occurred.
Date of discovery	Date the case was discovered. Defaults to the current date.
Case closure SLA	Target date and time for closing the case.
Investigation planned start	Planned start date for the investigation.
Investigation planned end	Planned end date for the investigation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Investigation actual start	Actual start date of the investigation.
Investigation actual end	Actual end date of the investigation.
Remediation planned start	Planned start date for remediation.
Remediation planned end	Planned end date for remediation.
Remediation actual start	Actual start date of remediation.
Remediation actual end	Actual end date of remediation.

Note: The **Reported date** field is set automatically to when you create the case.

8. In the Breach analysis section, record whether the case involves a breach.

Breach analysis fields

Field	Description
Breach status	Whether the case involves a data or security breach. Defaults to **To be determined**.
Reporting status	Whether the case has been reported to regulators. This field is set automatically based on the frameworks associated with the case. Defaults to **To be determined**.

9. In the Root cause analysis section, document your findings and any remediation.

Root cause analysis fields

Field	Description
Overall observations	Findings from your review of the case.
Remediation taken	Whether remediation measures have been taken to address the case. Options are **Yes** and **No**.
Overall preventive measures	Steps to prevent the issue from recurring.

Note: The **Primary cause** and **Primary consequence** fields populate based on further analysis and aren't set when you create the case.

10. In the Activity section, add any supporting notes or comments.

Activity fields

Field	Description
Work notes (Private)	Internal notes about the case that aren't visible to the customer.
Additional comments (Customer visible)	Comments about the case that are visible to the customer.

11. Save the case.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The case is created and appears in the **Cases** sub-tab, where you and the assigned case analyst can track the investigation through to closure.

Risk assessments

Complete a risk assessment that AI Control Tower generates automatically for a managed AI asset, evaluating its inherent, control, and residual risk.

Unlike a case, an issue, or a policy exception, you don't create a risk assessment. AI Control Tower generates a risk assessment automatically and assigns it to the asset's steward or owner to complete. For more information about how risk is assessed across your AI portfolio, see Reviewing AI risk posture.

How risk assessments are generated

AI Control Tower generates a risk assessment when a managed AI asset is onboarded, and again whenever someone edits the asset's use and purpose details, since a change in how an asset is used can change its risk profile. AI Control Tower doesn't surface the specific reason for a re-triggered assessment on the Risk assessments tab itself; that reason appears in the asset's work notes.

To respond, open the risk assessment from Activity Center, or select **New assessment** from the asset's own record. Both paths take you to an assessment response view, where you evaluate the asset's inherent risk, the effectiveness of its controls, and its resulting residual risk. Some assessments also require a target assessment, or a risk response describing whether you plan to accept, avoid, mitigate, or transfer the risk, before you submit the assessment for approval.

Risk assessment lifecycle

A risk assessment moves from new to in progress as you work through it, to awaiting approval once you submit it for review, and then to completed once an approver signs off. A completed assessment can later be archived, and an assessment can be canceled at any point if it's no longer needed.

Where risk assessments appear

Activity Center

Risk assessments appear on the **Risk assessments** sub-tab of the **Team** and **Assigned to you** tabs, depending on assignment.

The asset record

You can start or continue a risk assessment for a specific asset directly from that asset's own record, using the **New assessment** action.

Issues

Track a problem identified with an AI asset, such as a performance or compliance gap, through to resolution with a documented action plan.

An issue tracks a problem identified with an AI asset that needs a resolution or an action plan, such as a gap surfaced during a governance review. Related issues can be grouped under a parent issue so they can be tracked and managed together. For more information about governance records associated with AI systems, see Governing AI asset risk and compliance.

Issue lifecycle

An issue starts in a new state and moves through analysis and response before you close it as complete or incomplete. An AI steward or asset owner creates the issue and assigns it to a user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

or group to work. The assignee analyzes the issue, documents a recommendation and an action plan, and moves it toward resolution.

Where issues appear

Issues appear on the **Issues** sub-tab of the **Team**, **Assigned to you**, **Unassigned**, and **Submitted by you** tabs in Activity Center, depending on assignment.

Create an issue

Track a problem identified with an AI asset, such as a performance or compliance gap, and document the action plan for resolving it.

Before you begin

Role required: sn_ai_governance.ai_steward or sn_ai_asset_mgmt.ai_asset_owner

About this task

An issue tracks a problem identified with an AI asset that needs a resolution or an action plan, such as a gap surfaced during a governance review. For more information about governance records associated with AI systems, see Governance record types.

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home** > **Activity Center** > **Work** > **Assigned to you**.
2. Select the **Issues** sub-tab.
3. Select **New**.
4. Fill in the fields that describe the issue.

Issue fields

Field	Description
Name	Name of the issue.
Issue type	Type of issue.
Classification	Classification of the issue.
Location	Location associated with the issue.
State	Current state of the issue. Defaults to **New**.
Substate	More specific status within the current state.
Priority	Priority of the issue.
Issue rating	Severity rating assigned to the issue.
Description	Description of the issue.

5. In the Assignment section, specify who should work the issue.

Assignment fields

Field	Description
Assignment group	Group responsible for working the issue.
Assigned to	User assigned to work the issue.
Issue manager group	Group responsible for managing the issue.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Issue manager	User responsible for managing the issue.
Watch list	Users who want to stay informed about the issue.

6. In the Schedule section, set the dates and duration for resolving the issue.

Schedule fields

Field	Description
Due date	Date and time the issue must be resolved by.
Confirmed date	Confirmation date for the issue. This field is auto-filled.
Planned start date	Planned date and time to start work on the issue. Defaults to the current date and time.
Planned end date	Planned date and time to finish work on the issue. Defaults to the current date and time.
Duration (duration)	Planned length of time to resolve the issue, in days, hours, minutes, and seconds.
Created	Date on which the issue is created. This field is automatically set to the current date and time.
Closed	Date on which the issue is closed.
Actual start date	Actual date and time work on the issue started.
Actual end date	Actual date and time work on the issue ended.
Actual duration	Actual length of time spent resolving the issue, in days, hours, minutes, and seconds.

7. If the issue is part of a group of related issues, associate it with its parent in the Issue grouping section.

Issue grouping fields

Field	Description
Parent issue	Parent issue that this issue belongs to, if the issue is part of a group.

Note: When advanced issue grouping is enabled, the form also shows a **Group level** field that indicates whether the issue is a parent, child, or standalone issue, and a **Management method** field that indicates whether the issue is managed from the parent or from child issues individually.

8. In the Action plan section, describe how the issue will be resolved.

Action plan fields

Field	Description
Recommendation	Recommended action to resolve the issue.
Action plan	Plan for resolving the issue.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. In the Confidentiality section, restrict visibility of the issue if needed.

Confidentiality fields

Field	Description
Confidential	Options that restricts visibility of the issue to confidential users and members of confidential user groups.
Allowed users	Users who can access the issue if it's marked confidential.
Allowed groups	Groups who can access the issue if it's marked confidential.

10. In the Activity section, add any supporting notes or comments.

Activity fields

Field	Description
Work notes (Private)	Internal notes about the issue that aren't visible to the customer.
Additional comments (Customer visible)	Comments about the issue that are visible to the customer.

11. In the Settings section, specify the functional domain that the issue belongs to.

Settings fields

Field	Description
Functional domain	Functional domain that the issue belongs to, such as **AI Risk and Compliance** or **IT risk and compliance**.

12. Save the issue.

Result

The issue is created and appears in the **Issues** sub-tab, where the assigned user or group can work it through to resolution.

Attestations

Respond to a request to acknowledge a compliance policy that applies to a managed AI asset you own or steward.

Unlike a case, an issue, or a policy exception, you don't create an attestation. AI Control Tower generates an attestation when a compliance policy that applies to a managed AI asset requires acknowledgment from the asset's steward or owner. Activity Center surfaces the attestation, but selecting it takes you to the **AI Risk and Compliance Workspace**, where you review the policy and record your response.

Attestation lifecycle

An attestation starts with no response. You review the policy and choose how to respond: accept it to confirm the asset complies, or decline it if the asset doesn't. If the asset can't currently meet the policy, you can request an exception instead of attesting directly; see Policy exceptions for more information. AI Control Tower can also exempt an attestation if the policy no longer applies to the asset, or cancel it if it's no longer needed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Where attestations appear

Attestations appear on the **Attestations** sub-tab of the **Team** and **Assigned to you** tabs in Activity Center, depending on assignment.

Policy exceptions

Request an approved, time-bound deviation from a policy or control objective that applies to an AI asset.

A policy exception documents why an AI asset can't currently meet a control objective and requests approval to operate outside that control for a defined period. Each exception includes a justification and a risk assessment that an approver reviews before the exception takes effect.

Policy exception lifecycle

An AI steward or asset owner creates a policy exception, identifies the policy or control objective it applies to, and documents the justification and risk assessment. The exception is valid only for the period defined by its **Valid from** and **Valid to** dates; a valid-to date is required to raise an exception.

The exception moves into review, and the request routes to an approval group or approver. The approver approves or rejects the exception based on the documented justification and risk assessment, and an approved exception closes once its valid-to date passes.

Where policy exceptions appear

Policy exceptions appear on the **Policy exceptions** sub-tab of the **Team**, **Assigned to you**, **Unassigned**, and **Submitted by you** tabs in Activity Center, depending on assignment.

Create a policy exception

Request an approved, time-bound deviation from a policy or control objective that applies to an AI asset, supported by a justification and a risk assessment.

Before you begin

Role required: sn_ai_governance.ai_steward or sn_ai_asset_mgmt.ai_asset_owner

About this task

A policy exception documents why an AI asset can't currently meet a control objective and requests approval to operate outside that control for a defined period. The exception routes to an approver, who reviews your justification and risk assessment before approving or rejecting the request.

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home** > **Activity Center** > **Work** > **Assigned to you**.
2. Select the **Policy exceptions** sub-tab.
3. Select **New**.
4. Fill in the fields that describe the exception.

Policy exception fields

Field	Description
Name	Name of the policy exception.
Requester	User requesting the exception. Defaults to you.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
State	Current state of the exception. Defaults to **New**.
Reason	Reason for requesting the exception.
Priority	Priority of the exception request.
Justification	Justification for requesting the exception.

Note: The **Substate** field populates automatically as the exception moves through review, such as **Under review** or **Pending risk assessment**, and isn't set when you create the exception.

5. In the Source section, identify the policy or control the exception applies to.

Source fields

Field	Description
Source type	Type of source the exception applies to.
Policy	Policy that the exception applies to.
Control objective	Control objective that the exception applies to. When **Source type** is set to **Control objective**, select the control objective first, then select the specific controls from the impacted controls list.

6. In the Schedule section, set how long the exception is valid for.

Schedule fields

Field	Description
Valid from	Date and time the exception takes effect.
Valid to	Date and time the exception expires.

Note: The **Duration** field is calculated automatically from the **Valid from** and **Valid to** dates and isn't set directly.

7. In the Assignment section, specify who should review the exception.

Assignment fields

Field	Description
Watch list	Users who want to stay informed about the exception.
Approval group	Group responsible for approving the exception.
Approver	User responsible for approving the exception.

8. In the Risk assessment section, document the risk that the exception introduces.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Risk assessment fields

Field	Description
Method	Method used to determine the risk rating.
Risk rating	Risk rating assigned to the exception.
Risk description	Description of the risk associated with the exception.
Analysis of risk and impact	Analysis of the risk and its potential impact.
Risk mitigation plan	Plan for mitigating the risk while the exception is in effect.

9. In the Confidentiality section, restrict visibility of the exception if needed.

Confidentiality fields

Field	Description
Confidential	Restricts visibility of the exception to confidential users and members of confidential user groups.
Allowed users	Users who can access the exception if it's marked confidential.
Allowed groups	Groups who can access the exception if it's marked confidential.

10. In the Comments section, add any supporting notes.

Comments fields

Field	Description
Work notes (Private)	Internal notes about the exception that aren't visible to the customer.
Additional comments (Customer visible)	Comments about the exception that are visible to the customer.

11. In the Settings section, specify the functional domain that the exception belongs to.

Settings fields

Field	Description
Functional domain	Functional domain that the exception belongs to, such as **AI Risk and Compliance** or **IT risk and compliance**.

12. Save the policy exception.

Result
The policy exception is created and routes to the assigned approver for review. The exception appears in the **Policy exceptions** sub-tab, where you can track its status.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI inquiries

Ask a question or request information related to AI governance, such as a question about a policy, a process, or a specific AI asset.

An AI inquiry is a general request for information or clarification related to AI governance, such as a question about a policy, a process, or an AI asset. Unlike a case or an issue, an inquiry doesn't require an investigation or an action plan, only a documented response.

Inquiry lifecycle

An AI steward or asset owner submits an inquiry, and it's triaged and moved into progress by an assignment group or assigned user. If the inquiry requires a decision, it routes to an approver, who approves or rejects it. The inquiry is closed once the requester has the information they need, or it can be canceled if it's no longer needed.

Where AI inquiries appear

AI inquiries appear on the **Inquiries** sub-tab of the **Team**, **Assigned to you**, **Unassigned**, and **Submitted by you** tabs in Activity Center, depending on assignment.

Create an AI inquiry

Submit an AI inquiry to ask a question or request information related to AI governance, such as a question about a policy, a process, or a specific AI asset.

Before you begin

Role required: sn_ai_governance.ai_steward or sn_ai_asset_mgmt.ai_asset_owner

About this task

An AI inquiry routes a question or request for information to an assignment group or approver so you can get a documented response without opening a case or issue.

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home** > **Activity Center** > **Work** > **Assigned to you**.
2. Select the **Inquiries** sub-tab.
3. Select **New**.
4. Fill in the fields that describe the inquiry.

AI inquiry fields

Field	Description
Name	Name of the inquiry.
Description	Description of the inquiry.
State	Current state of the inquiry. Defaults to **New**.
Priority	Priority of the inquiry.
Requested by	User submitting the inquiry. Defaults to you.
Requested on behalf of	User the inquiry is being submitted for, if different from the requester.

5. In the Assignment section, specify who should handle the inquiry.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Assignment fields

Field	Description
Assignment group	Group responsible for working the inquiry.
Approvers	Users responsible for approving the inquiry.
Assigned to	User assigned to work the inquiry.
Watch list	Users who want to stay informed about the inquiry.

6. In the Primary origin section, identify where the inquiry originated.

Primary origin fields

Field	Description
Business unit	Business unit associated with the inquiry.
Location	Location associated with the inquiry.

7. In the Activity section, add any supporting notes or comments.

Activity fields

Field	Description
Work notes (Private)	Internal notes about the inquiry that aren't visible to the customer.
Additional comments (Customer visible)	Comments about the inquiry that are visible to the customer.

8. Save the inquiry.

Result

The inquiry is created and appears in the **Inquiries** sub-tab, where the assignment group or approver can respond to it.

Resolving AI recommendations in Activity Center

Resolve the AI recommendations that AI Control Tower generates when it detects an issue or an opportunity in your AI portfolio, using AI automation, a guided AI conversation, or your own review.

As AI Control Tower continuously evaluates your managed AI assets, it surfaces the issues and opportunities it detects as recommendations, each with a resolution action attached, so you don't have to search for the work that matters most. Unlike a lifecycle task, a case, or the other governance work types described in Managing AI tasks and approvals in Activity Center, a recommendation isn't assigned to you through ownership of an asset. Instead, a recommendation is created when AI Control Tower detects something worth your attention, which you can resolve yourself or with AI. For more information about what recommendations are, how they're prioritized, and the related concept of AI insights, see Recommendations and AI insights.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Where you resolve recommendations

Recommendations surface on the Home page and on individual asset records so you don't miss the highest-priority items, but you resolve them from the **Recommendations** page in Activity Center, alongside the **Work** page described in Managing AI tasks and approvals in Activity Center.

Resolving a recommendation

Every recommendation offers a primary resolution action: an unsupervised agent can run the fix for you, a supervised agent can walk you through it in a guided conversation, or AI Control Tower can redirect you to resolve the issue yourself in the part of the product where it lives. You can also mark a recommendation complete without running its primary action, if you've already addressed the issue another way. For the full procedure, see Resolve an AI recommendation.

Resolve an AI recommendation

Address an issue or opportunity by running an unsupervised agent, working through a guided conversation with a supervised agent, or resolving the issue yourself.

Before you begin

Role required: sn_ai_asset_mgmt.ai_asset_owner or sn_ai_governance.ai_steward

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home** > **Activity Center** > **Recommendations**.
2. Identify the recommendation that you want to resolve.
   In the **Refine list** panel, you can narrow the list by applying filters for category, priority, confidence, outcome, completion status, or asset.
3. Review the details of the recommendation by selecting **View details** from the action menu.
   The side panel shows the reasoning behind the recommendation, the asset or scope it applies to, and the history of any earlier runs.
4. Resolve the recommendation using AI automation, AI review, or resolve the issue yourself.

Option	Description
Automate using AI	**a.** Select **Automate using AI**. **b.** Confirm the action when prompted. AI Con trol Tower runs an unsupervised agent that executes the resolution workflow on your behalf. **c.** Monitor progress in the side panel. The **Fo cused** view shows the steps the agent is taking and the estimated time to complete. The recommendation status moves to **In progress** while the agent runs and to **Com plete** when the agent is finished.
Review with AI	**a.** In the chat interface, work through the su pervised agent's proposed actions one at a time. Accept, refine, or reject each action based on your judgment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	b. Close the conversation when the agent re ports that the recommendation is resolved. The recommendation status moves to **Com plete**.
Open	**a.** Select **Open**. AI Control Tower redirects you to the record, page, or workflow where you can resolve the issue directly. **b.** In the record, page or workflow, take the ac tion required to resolve the issue. **c.** Return to the Activity Center Recommenda tions view. After AI Control Tower detects that the underlying condition is resolved, the recommendation status moves to **Com plete**. To mark the recommendation as re solved manually, select **Complete** from the action menu on the card.

Result

The recommendation status moves to **Complete** and the recommendation is removed from the default Recommendations list. To see completed recommendations, open the **Refine list** panel and select **Completed** in the **Completion status** filter.

AI Control Tower reference

Reference topics provide additional information about the roles, tables, data model attributes, and form fields used to configure and administer AI Control Tower.

Components installed with AI Control Tower

Several types of components are installed with activation of AI Control Tower, including plugins, user roles, and tables.

Plugins installed

Activation of AI Control Tower installs the following plugins. Additional plugins listed in Additional plugins extend AI Control Tower with capabilities for discovery, security, dashboards, and reporting.

Plugin	Plugin ID	Description
AI Control Tower Core	`com.sn_ai_governance`	Centralizes AI governance across the enterprise by combining AI assets and controls in a single hub.
AI Asset Management	`com.sn_ai_asset_mgmt`	Tracks and manages the lifecycle of AI assets such as systems, models, datasets, and prompts.
AI Risk and Compliance Management	`com.sn_grc_ai_go`	Manages AI risks across their lifecycle, including risk classification, mapping to regulatory authority documents, and policy compliance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Plugin	Plugin ID	Description
AI Case Management	com.sn_ai_case_mgmt	Tracks, triages, and resolves inquiries and incidents related to AI assets.
AI Risk and Compliance Integration with Control Tower	com.sn_grc_ai_int_ctrl	Surfaces risk posture, compliance status, and case workflows directly in AI Control Tower so you can manage AI use cases against regulatory frameworks.
AI Control Tower Evaluations	com.sn_ai_evaluations	Enables the evaluation framework, scoring engine, and monitoring components for your AI systems.
AI Risk and Compliance Content (optional)	com.sn_grc_ai_gov_content	Loads frameworks, citations, control objectives, risk statements, and assessment templates for the EU AI Act and the NIST AI Risk Management Framework.

The following plugins extend AI Control Tower with capabilities for discovery, security and privacy monitoring, value and engagement dashboards, and reporting.

Additional plugins

Plugin	Plugin ID	Description
AI Security and Privacy	sn_ai_security	Provides security and privacy monitoring for AI assets.
AI Discovery	sn_ai_disc	Discovers AI assets, agents, and usage from hyperscaler and external AI platform connectors.
AI Control Tower for Now Assist	sn_aict_nowassist	Syncs Now Assist AI skills into the AI Control Tower inventory.
Value Dashboard for AI Control Tower	sn_ai_value	Provides the Value dashboard for measuring AI investment return and adoption.
Health Dashboard for AI Control Tower	sn_ai_health	Provides the Health dashboard for monitoring the operational health of AI systems.
Engagement Dashboard for AI Control Tower	sn_ai_engagement	Provides the Engagement dashboard for tracking user engagement with AI assets.
AWH for AI Control Tower	sn_awh_config	Configures the Agent Workspace Hub for AI Control Tower.
ServiceNow AI Lens	sn_ai_lens	Provides AI reporting and lens capabilities.
Asset Classes	sn_ent	Required for AI Assets API access. Activate this plugin before configuring API-based integrations to the AI Asset records.
Enterprise Architecture for AICT	com.sn_ea_aict	Provides the shared many-to-many data model connecting AI systems and business applications, independently of the plugin. For more information, see

AI Case Admin [sn_ai_case_mgmt.ai_case_admin]	Configures AI case types, state models, assignment rules, and assessment templates. Deletes AI cases.	• sn_grc_case_mgmt.grc_case_a • sn_ai_case_mgmt.ai_case_man

Tables installed

Table	Description
AI System Digital Asset [alm_ai_system_digital_asset]	Records for AI system assets. Captures class, state, ownership, model category, and the associated models and datasets.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
AI Model Digital Asset [alm_ai_model_digital_asset]	Records for AI model assets. Captures training and evaluation datasets and defaults the category to AI Model.
AI Dataset Digital Asset [alm_ai_dataset_digital_asset]	Records for AI dataset assets. Captures dataset relationships and defaults the category to AI Dataset.
AI Prompt Digital Asset [alm_ai_prompt_digital_asset]	Records for AI prompt assets. Prompt assets are created from the AI Control Tower workspace only, not through Service Catalog.
AI System Component Product Model [cmdb_ai_system_component_product_model]	Product model attributes for AI system assets. Linked 1:1 to the AI System Digital Asset record.
AI Model Product Model [cmdb_ai_model_product_model]	Product model attributes for AI model assets. Linked many-to-one to the AI Model Digital Asset record.
AI Dataset Product Model [cmdb_ai_dataset_product_model]	Product model attributes for AI dataset assets.
AI Prompt Product Model [cmdb_ai_prompt_product_model]	Product model attributes for AI prompt assets.
AI Asset Governance Details [sn_ai_governance_asset_governance_details]	Primary lifecycle governance record. Provides end-to-end lifecycle visibility, governance state tracking, and oversight across the Assess, Build & Test, and Deploy phases.
AI Asset Lifecycle [sn_ai_governance_lifecycle]	Lifecycle phase definitions. AI Stewards can extend the default Assess, Build & Test, and Deploy phases by adding records to this table and updating the corresponding playbook.
AI Asset Approval Request [sn_ai_governance_assessment_request]	Approval requests that operationalize the lifecycle defined in the AI Asset Governance Details record. Configured with Type = "AI Governance Lifecycle" and drives progression across the lifecycle phases.
AI Asset Approval Task [sn_ai_governance_assessment_task]	Discrete governance and compliance tasks created within an approval request. Each task represents an activity across the Assess, Build & Test, or Deploy phase.
AI Asset Use and Purpose [sn_ai_governance_asset_use_purpose]	Records the intended outcome, usage area, output type, impacted stakeholders, human involvement, interaction model, and autonomy level for each AI system. Used

Enterprise Architecture for AICT plugin installation and upgrade considerations

Upgrading AI Risk and Compliance, Enterprise Architecture Workspace, and AI Control Tower Core out of sync with each other temporarily affects the AI system-to-business application association.

About the Enterprise Architecture for AICT plugin

The Enterprise Architecture for AICT plugin (*com.sn_ea_aict*) provides the shared many-to-many data model connecting AI systems and business applications, independently of the Enterprise Architecture Workspace plugin. Because the association no longer depends on Enterprise Architecture Workspace licensing, you can associate AI systems with business applications, and see that context in AI Control Tower, whether or not you use Enterprise Architecture Workspace.

Why upgrade order matters

The Enterprise Architecture for AICT plugin (*com.sn_ea_aict*) installs automatically as a dependency of AI Control Tower Core. AI Risk and Compliance, Enterprise Architecture

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workspace, and AI Control Tower Core can be upgraded independently. Each handles the AI system-to-business application association differently before and after Enterprise Architecture Workspace version 10.1.3. Upgrading only one of the three can temporarily create inconsistent data between workspaces.

AI Control Tower Core is itself a required dependency for AI Risk and Compliance, and the Enterprise Architecture for AICT plugin is a required dependency for AI Control Tower Core. Upgrading AI Risk and Compliance without AI Control Tower Core is not possible; the scenarios below cover the combinations that are.

Recommended path

- Upgrade AI Control Tower Core, Enterprise Architecture Workspace, and AI Risk and Compliance together in the same maintenance window.
- If you can't upgrade all three together, upgrade AI Control Tower Core first. It brings in the Enterprise Architecture for AICT plugin automatically. Upgrade the other two as soon as possible afterward.

Consequences of a partial upgrade

If you upgrade	without also upgrading	You may see
All three plugins together	—	Best case: everything works on the new data model immediately. Run the migration job once to move existing associations.
Enterprise Architecture Workspace only	AI Control Tower Core, AI Risk and Compliance	The AI systems related list and Business portfolio widget disappear from the business application record in Enterprise Architecture Workspace. The intake form field and the BA related list in AI Control Tower keep working on the old data model. Upgrade AI Control Tower Core at the same time to avoid this gap.
AI Control Tower Core + AI Risk and Compliance	Enterprise Architecture Workspace	Everything keeps working — Enterprise Architecture Workspace stays on the old data model while AI Control Tower and the intake form use the new one. The AI Control Tower home page shows a single Business portfolio, from the Enterprise Architecture for AICT plugin.
AI Control Tower Core + AI Risk and Compliance (no Enterprise Architecture Workspace installed)	—	New capability: the intake form field, the BA related list, and the Business portfolio widgets all become available for the first time, with no dependency on Enterprise Architecture Workspace.
AI Control Tower Core only (no Enterprise Architecture Workspace installed)	AI Risk and Compliance	The BA related list and Business portfolio widgets in AI Control Tower become available, but the intake form field still won't appear until AI Risk and Compliance is upgraded too.

After upgrading

You must run the Migrate BA Product Model Map from EA Workspace job manually to move your existing associations into the new data model because the job does not run automatically.

Agents and skills inventory

The ServiceNow Otto for AI Control Tower plugin (com.sn_aict_genai) includes agents and skills that enhance the AI asset management and governance.

Agents and skills overview

The AI Control Tower agents and skills inventory details agent functions and skill descriptions within their respective interface plugins.

- Agents perform tasks such as dormant asset deactivation, auto-populating AI asset descriptions, lifecycle task reminders, and outcome ranking.
- Skills focus on tag generation, metadata enrichment recommendations, and AI governance insights including quality scoring and critical issue identification.
- All agents are active with configurations and all skills are shipped inactive. The ServiceNow Otto for AI Control Tower (`com.sn_aict_genai`) plugin contains no agentic workflows.

Note: To use the agents and skills in AI Control Tower, install the ServiceNow Otto for AI Control Tower (com.sn_aict_genai) plugin.

Agents

The agents are available on the AI Agent [sn_aia_agent] table and are active by default with their corresponding `sn_aia_agent_config` records. The agents are gated behind these interface plugins:

- `com.sn_value_engine`
- `com.sn_grc_ai_gov`
- `com.sn_ai_opty_engine`

Agent name	Interface plugin	Description
Deactivate Dormant Asset	`com.sn_value_engine`	Autonomously analyzes and retires a single dormant AI asset by running comprehensive analysis and creating an offboarding change request.
AI Asset Description Auto-Populator	`com.sn_value_engine`	Generates and directly applies descriptions for AI assets missing description information. Uses vendor, model name, manufacturer, and category metadata.
Lifecycle Task	`com.sn_grc_ai_gov`	Sends email reminders to assigned users for all overdue and dormant lifecycle tasks across high-priority AI assets.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agent name	Interface plugin	Description
Reminder Agent		
Outcome Ranker Agent	`com.sn_ai_opty_engine`	Ranks AI insight outcomes by relevance per persona. Writes ranks via the Populate Outcome Ranks tool, then triggers prioritization recompute.

Skills

The skills are available on the Now Assist Skill Config [sn_nowassist_skill_config] table. All six skills are shipped with inactive status and all the skills except for Tag Generator and Metadata Enrichment are gated behind these interface plugins:

- `com.sn_ai_evaluations`
- `com.sn_grc_ai_gov`

Skill name	Interface plugin	Description
AI Asset Tag Generator	Base plugin (no gate)	Derives tags for an AI asset based on its metadata, guided by existing tags present in the system.
AI Asset Metadata Enrichment Recommender	Base plugin (no gate)	Analyzes AI asset metadata and generates field-level enrichment recommendations using LLM inference and optional web search. Suggests values for description, use cases, and docs with confidence scoring.
Score and Categorization Insight	`com.sn_ai_evaluations`	Analyzes evaluated agent sessions to identify where quality and safety scores degrade across usage categories. Correlates session and trace-level metrics to pinpoint problem patterns.
Use and Purpose vs Intent Insight	`com.sn_ai_evaluations`	Compares an AI agent's registered use & purpose against actual user interactions from session trace data. Detects divergence patterns and escalates meaningful mismatches.
Lifecycle Task Health Prioritization	`com.sn_grc_ai_gov`	Prioritizes lifecycle task health across AI governance tasks.
Critical Issue Identifier	`com.sn_grc_ai_gov`	Identifies and prioritizes critical AI governance issues.

AI Control Tower email notifications

Identify the email notifications that AI Control Tower sends automatically, the events that trigger each notification, and the recipients. These notifications keep AI Stewards, asset owners, and assignees informed so that they can take action promptly on AI asset approvals and lifecycle events.

The notifications listed in this topic are part of the base system and are sent automatically when the trigger condition is met. To customize notification content or recipients, see Create an email notification.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI asset approval request notifications

The following notifications are sent for events related to AI asset approval requests and their associated approval tasks. AI asset approval requests are stored in the `sn_ai_governance_assessment_request` table; approval tasks are stored in the `sn_ai_governance_assessment_task` table.

Approval request notifications

Notification	Trigger condition	Recipients
Approval request — work note added	A work note is added to an AI Asset Approval Request record.	Assigned To
Approval request — approved or rejected	An AI Asset Approval Request is approved or rejected.	Asset Managed By
Approval request — comment added	A comment is posted on an AI Asset Approval Request record.	Asset Managed By
Approval request created — unassigned (Stewards)	An AI Asset Approval Request is created and remains unassigned.	AI Stewards group
Approval request created — unassigned (Asset Manager)	An AI Asset Approval Request is created and remains unassigned.	Asset Managed By
Approval task created	An AI Asset Approval Task record is created.	Assigned To

AI asset lifecycle notifications

The following notification is sent when an AI asset transitions to a terminal lifecycle state. The notification alerts downstream owners — including issue, policy exception, and case analyst owners — so that any open work tied to the asset can be resolved or reassigned.

AI asset lifecycle notifications

Notification	Trigger condition	Recipients
AI asset retirement or cancellation	An AI Asset record transitions to Retired or Cancelled state.	AI Analyst, Policy Exception Owners, Issue Owners, AI Case Analysts

Related information

For email notifications sent by AI Risk and Compliance workflows and inherited Risk Management processes, see Email notifications.

Domain separation and AI Control Tower

Domain separation is supported for AI Control Tower. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic*

The support level is Basic but has some exceptions or special conditions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Business logic: Ensure that data goes into the proper domain for the application's service provider (SP) use cases.
- The user interface, cache keys, reporting, rollups, and aggregations all use the domain at production run time.
- The owner of the instance must be able to set up the application to function across multiple tenants.

Sample use case: When an SP uses chat to respond to a tenant-customer's message, the client must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

Overview

AI Control Tower helps you discover, govern, monitor, and measure the value of AI systems across your enterprise. If you manage multiple business units or client tenants from a shared instance, such as a managed service provider, domain separation lets you keep each tenant's AI assets, risk posture, security data, and value calculations distinct while administering the deployment from a single instance.

Sample AI Control Tower use case: When a service provider (SP) configures a discovery connector for a client, the client is able to see all assets from their environment.

How domain separation works in AI Control Tower

AI Control Tower provides Basic support for domain separation beginning with the September release, across all pillars: inventory and discovery, monitoring, risk, security, and value.

Some elements remain common across domains regardless of this support level: playbook rule and template definitions, flows, and the AI Control Tower interface itself are shared. The data and behavior described in the pillar sections later in this topic are specific to each domain.

Within a domain hierarchy, a parent domain's view generally combines its own domain with all of its child domains, while a child domain's view shows only that domain's own data. Configuration settings, such as evaluation metric sample rates and cost framework rates, are inherited from a parent or global domain by default, and you can override a setting for a specific domain without affecting the global default or other domains.

How to set up domain separation for AI Control Tower

The base system provides built-in functionality to separate an instance by domain. After an instance is domain-separated, any application that supports domain separation can be installed on that instance.

The application inherits and operates within the domain-separated setup, provided that the application itself supports domain separation.

For example, an organization can host Customer A and Customer B on the same instance, while logically separating their data and access by domain. Customer A can see only its own data, and Customer B can see only its own data.

For more information, see Domain separation setup and administration.

Use cases

The following sections describe how domain separation applies within each pillar of AI Control Tower.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Inventory and discovery

For inventory and discovery, domain separation keeps each domain's AI assets distinct while giving administrators at a parent domain oversight across their child domains.

- AI asset visibility follows the domain hierarchy. A user at a parent domain can see AI assets across all of its child domains, while a user at a child domain sees only the assets in that domain.
- Automated discovery and connectors create records in the domain of the user who configures the connector, so discovered AI systems and connections from both ServiceNow and external platforms are associated with the correct domain.
- External AI systems registered with an API key are added to the domain of the user who created the key. A warning helps prevent registering an asset in the wrong domain with a key issued to another domain.
- Automation rules and their templates show both the current domain's own records and any records inherited from a parent domain that haven't been overridden, but only the rules created within the current domain actually run.
- Asset tags are scoped by domain, so a tag created for an asset in one domain doesn't appear in another domain's asset views.

Monitoring

For monitoring, domain separation ensures that evaluation data, trace history, and configuration changes for one domain never surface in another domain's view, even when the underlying AI agent is scoped globally.

- Aggregate evaluation metrics reflect only the domains a user can see: their own domain, any child domains, and the global domain. Metrics from sibling or parent domains are never included, even for a globally scoped AI agent.
- Traces and sessions are scoped to the domain of the user who generated them, not the domain of the AI agent. Running a globally scoped agent from within a specific domain still creates a trace that only that domain can see.
- Evaluation metric configuration, such as sample rates and trace API limits, is inherited from the global domain by default. Overriding a setting for a specific domain applies only to that domain and its children, without changing the global default or affecting other domains.

Risk and compliance

For risk, domain separation isolates each domain's risk posture while letting administrators at a parent domain see and manage risk across their child domains.

- Risk assessment tasks and controls, such as impact assessments, attestations, and policy exceptions, are scoped to the domain of the related AI asset. A user sees the tasks assigned within their own domain plus any tasks in the global domain, but not tasks in sibling domains.
- Aggregate risk rating and classification for an asset reflect only the data in the currently selected domain, so a rating calculated for one domain's assets never includes another domain's data.
- Risk dashboards, including the regulatory risk classification, governance posture summary, and risk heat map, filter by the selected domain and roll up through the domain hierarchy. A parent domain's view combines its own data with all of its child domains, while a child domain's view shows only its own data.
- Asset intake and onboarding workflows keep related records, such as configuration items, business applications, and datasets, in the domain of the new asset. Approval routing and

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

any tasks the onboarding playbook creates stay within that domain, so users in other domains don't receive related notifications.

- AI model provider and data privacy settings, such as which model providers are allowed and how data overflow is handled, are configured per domain. A change made in one domain's settings doesn't affect another domain's configuration, and using a model outside a domain's allowed list is blocked.

Security

Domain separation ensures that each domain's security posture reflects only its own AI assets and activity, while dashboards and metric detail pages still honor the domain hierarchy.

- The AI asset security score is calculated from the AI assets in the currently selected domain, so each domain's score reflects only its own assets.
- In the Activity Center, security tasks are scoped to the current domain, so a domain shows only the security tasks associated with assets in that domain.
- The agent map and access issue details inherit the domain of the underlying asset or agent. Viewing a parent domain includes the agents and access issues from its child domains.
- In Post-runtime metrics, threat detection data for both internal and external agents is scoped by domain, so the threat map and related guardrail data reflect only the current domain's activity.
- Your top recommendations don't appear on the security dashboard in domain-separated instances, because its underlying data isn't domain aware. Instead, a Security events detected section is shown.
- In Runtime metrics, Sensitive data input and Sensitive data anonymized metrics aren't shown for ServiceNow AI agents on domain-separated instances.
- Details for Privileged AI agents, Dormant AI agents, Access issues, Security events detected, Agent map, Post-runtime, and AI asset security score include a Domain column showing the domain the AI asset belongs to.

Value

For value, domain separation lets each domain calculate productivity gains and cost savings using its own assumptions, while still rolling results up for domains that oversee multiple child domains.

- Value templates, the formulas used to calculate productivity gains for a managed AI system, can be inherited from a parent domain or overridden for a specific domain. Overriding a template in a child domain doesn't change the calculation for the parent template or other domains.
- Productivity gains and savings data roll up through the domain hierarchy. A parent domain's dashboard combines its own data with all of its child domains, while a child domain's dashboard shows only its own data.
- Cost framework rates cascade from the global domain to child domains by default. Administrators can override rates for a specific domain without changing the global rate or other domains' rates.
- Rate changes apply prospectively only. Savings and cost data already calculated under a previous rate aren't recalculated when the rate changes.

Strategy and planning

For strategy and planning, domain separation keeps AI investment demands, epics, and goals within the domain where they originate.

- AI investment demands, and the epics, goals, and stories created from them, stay in the domain where they were created. Domains outside that hierarchy can't see these records.
- Product feedback submitted for an AI asset, and any demand created from that feedback, stay in the same domain as the asset. Domains outside that hierarchy can't access the related records.

Important:

- Not all model providers are available for customers with in-country SKUs, and some AI products/features are currently unavailable for in-country customers. For more information, see the KB1584492 article in the Now Support Knowledge Base. Be sure to check for model provider availability updates in future releases.
- Some AI products/features are currently unavailable for customers in the FedRAMP, NSC DOD IL5, or Australia IRAP-Protected data centers, self-hosted customers, or in other restricted environments. For more information, see the KB0743854 article in the Now Support Knowledge Base. Be sure to check for availability updates in future releases.
- Some AI products/features are currently available only for customers in some regions. Be sure to check for availability updates in future releases.
- Some AI products and skills are not available in Regulated Markets. For more information, see KB2593939: Regulated Markets AI Products/Skills Not Available. Be sure to check for availability updates in future releases.

AI limitations

This application uses artificial intelligence (AI) and machine learning, which are rapidly evolving fields of study that generate predictions based on patterns in data. As a result, this application may not always produce accurate, complete, or appropriate information. Furthermore, there is no guarantee that this application has been fully trained or tested for your use case. To mitigate these issues, it is your responsibility to test and evaluate your use of this application for accuracy, harm, and appropriateness for your use case, employ human oversight of output, and refrain from relying solely on AI-generated outputs for decision-making purposes. This is especially important if you choose to deploy this application in areas with consequential impacts such as healthcare, finance, legal, employment, security, or infrastructure. You agree to abide by ServiceNow's AI Acceptable Use Policy, which may be updated by ServiceNow.

Data processing

This application requires data to be transferred from ServiceNow customers' individual instances to a centralized ServiceNow environment, which may be located in a different data center region from the one where your instance is, and potentially to a third-party cloud provider, such as Microsoft Azure. This data is handled per ServiceNow's internal policies and procedures, including our policies available through our CORE Compliance Portal.

Data collection

ServiceNow collects and uses the inputs, outputs, and edits to outputs of this application to develop and improve ServiceNow technologies including ServiceNow models and AI products. Customers can opt out of future data collection at any time, as described in the AI Opt-Out page.

Note: We have controls in place to enable/disable the data collection and data processing.

Exploring AI Control Tower (legacy)

Explore and learn about the AI Control Tower and its role in managing the AI asset inventory, overseeing configurations, integrating with other applications, and handling the asset approval workflow.

AI Control Tower overview

AI Control Tower provides enterprises with visibility into their AI footprint, manages the lifecycle of their AI investments, and identifies risks. This AI Control Tower's functionality ensures that their AI models, workflows, and agents are governed, optimized, and aligned with business strategy. It focuses on:

- **AI Strategy & Value:** Tracks how AI improves efficiency, revenue, and cost savings.
- **AI Governance & Compliance:** Ensures that AI systems follow company policies and global regulations, focusing on privacy, data governance, and ethical AI.
- **Security, Access & Privacy:** Manages AI agent identities, access controls, and sensitive data to ensure security.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Lifecycle Management:** Handles the entire lifecycle of AI assets, including onboarding, offboarding, skill management, and performance monitoring.
- **Health & Performance:** Evaluates how reliably and efficiently AI systems operate.
- **Enterprise AI Integrations:** Provides a platform to discover and use AI projects, models, and data from within the company and external partners.

AI asset Data Model

The AI asset data model catalogs different AI assets such as AI systems, AI models, datasets, and prompts. It also manages the relationship between different assets that helps manage the AI inventory effectively.

AI Control Tower benefits

- Visibility and management of enterprise AI in the organization.
- Manage the lifecycle of AI assets such as AI systems, AI models, prompts, and datasets.
- Identify risks and set controls.
- Proactively manage AI risks and compliance while protecting your business and speeding up AI innovation.

What to explore next

AI Control Tower dashboard

The AI Control Tower dashboard displays a comprehensive overview of the AI status, AI inventory, and other AI related metrics.

The AI Control Tower dashboard's left navigation view has **Home**, **AI assets**, and **Configuration** icons.

The table below illustrates how the navigation view in AI Control Tower appears for different persona.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Navigation view for users

Persona	Navigation view
AI steward	• Home page • AI assets • Configurations
Product owner/ asset owner	• Home • AI assets
AI Control Tower workspace user	• Home page • AI assets
Risk and compliance user	• Home page • AI assets

Note: The information and actions available to a user will vary based on their role. For instance, AI stewards have access to the state of AI across all inventory, including value and adoption insights. Product owners, on the other hand, can view only the assets they manage, along with details on their value and adoption.

AI Control Tower Home

The AI Control Tower home view on the dashboard features recommendations for actions at the top displaying task statuses, pending asset reviews, and newly added AI systems. The home page displays the Overview tab in AI Control Tower, AI strategy tab in AI Control Tower, AI asset inventory tab in AI Control Tower, Value tab in AI Control Tower, Adoption tab in AI Control Tower, Risk and compliance tab in AI Control Tower, AI cases tab in AI Control Tower and Security & Privacy tab in AI Control Tower tabs.

Each of these tabs includes widgets, and you can explore the data within each widget in more detail. For instance, the AI system trend widget displays trends based on historical data about AI system deployments. Similarly, the AI risk classification widget shows data according to the default risk classification settings for your skills.

Each of these tabs includes widgets, and you can explore the data within each widget in more detail. For instance, the AI system trend widget displays trends based on historical data about AI system deployments. Similarly, the AI risk classification widget shows data according to the default risk classification settings for your skills.

The data appearing on these widgets consists entirely of transactional data. Data is populated once assessments are completed. When AI Control Tower is first installed, there's no data available.

Note: AI system trend's data is dependent on two types of scheduled job.

- AI Control Tower Core Monthly Data Collection
- AI Control Tower Core Historical Data Collection job

The AI Control Tower Core Monthly Data Collection is a job that runs each month to collect data. In AI Control Tower, this data is displayed on a quarterly basis through aggregation. So, if you configure AI Control Tower for the first time you don't see any data.

The AI Control Tower Core Historical Data Collection job, which is used to gather historical data. If there was any relevant data from previous months, it can be collected using this job. You can run this job manually, as the monthly job only collects data going forward, not from the past.

Overview tab in AI Control Tower

Explore the overview tab in AI Control Tower and the widgets available on the tab.

Overview dashboard

Prerequisites

Role required: AI steward [sn_ai_governance.ai_steward]

The **Overview** tab of the AI Control Tower dashboard provides a comprehensive view of all metrics of AI systems.

- Agentic AI
- Generative AI
- Classic AI

Risk classification

This section shows the risk score of AI systems. The risks are qualitatively classified as

- High
- Low
- Medium
- Unacceptable

AI systems by provider

This section shows the number of AI systems, categorized by the providers.

> **Note:** The AI system by provider donut chart doesn't display the **Other** category when there are more than five providers, which can cause a mismatch between the number of metric labels and the items shown in the list when selecting a metric label.

Compliance

This section shows the compliance effectiveness percentage of different statuses of active controls applied on **Authority documents** and **Policies**. You can drill down respective sectors of the bar graph to access and view the list of active controls.

AI cases by priority

This section shows the total number of AI cases with breakdown analysis by priority rating. You can drill down to respective sectors of the donut chart to access and view a list of recorded AI cases.

AI strategy tab in AI Control Tower

The **AI strategy** tab includes information about all the AI-related priorities, goals, planning items, and execution items—projects and demands in the AI Control Tower workspace.

This tab helps you track and monitor AI-related work across various sections—Strategy, Costs, Prioritized AI work, and AI Risks, Issues, Decisions, Actions, and Request Changes (RIDAC)—enabling you to make informed decisions. The tab displays the AI-related work defined in ServiceNow® Goal Framework, the ServiceNow® Strategic Planning, and ServiceNow® PPM Standard.

Strategy

The Strategy section helps you monitor and track your AI strategic priorities, goals, and targets associated with these goals.

Strategic priorities with the **Type** field set to **Artificial Intelligence** and goals with the **Category** field set to **Artificial Intelligence** in the Goal Framework application appear in the Strategy section in the AI Control Tower workspace, enabling you to monitor their progress effectively. For details, see Create a strategic priority for a strategic plan and Create a goal in Strategic Planning.

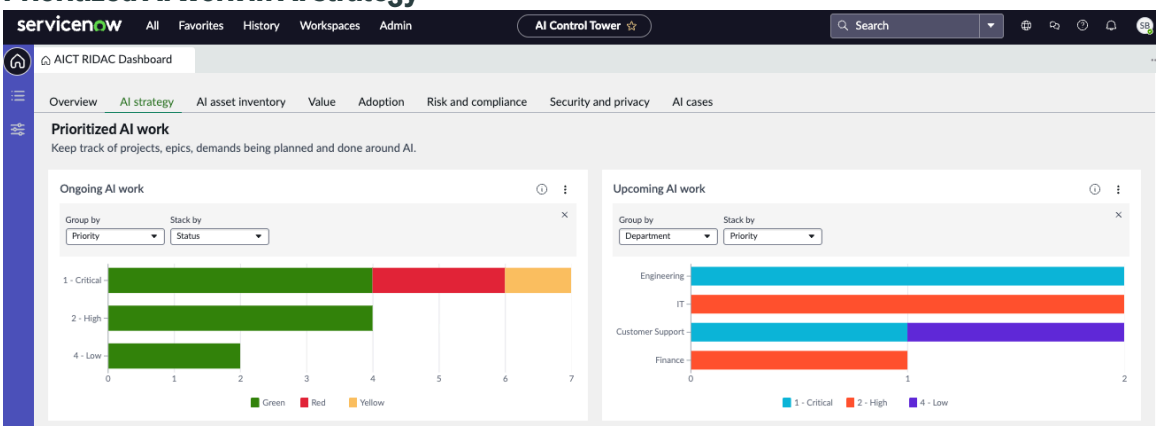
AI Control Tower workspace, enabling you to monitor their progress effectively. For details, see Add planning items to Prioritization and Prioritize work.

Prioritized AI work in AI strategy



AI RIDAC

The AI RIDAC section helps you monitor key project risks, issues, decisions, actions, and changes, enabling you to make informed decisions.

Projects that meet any of the following criteria appear in the AI RIDAC section in the AI Control Tower workspace, enabling you to monitor their progress effectively:

- Projects with the **Investment type** field set to **Artificial Intelligence** in PPM Standard (Project Management or Project Workspace). For details, see Create a project from Project Workspace and Add RIDAC records to projects from All RIDAC page.
- The **Category** field on the associated primary goal record is set to **Artificial Intelligence** in Goal Framework or Strategic Planning Workspace. For details, see Create a goal in Goal Framework and Create a goal in Strategic Planning.
- The **Type** field on the strategic priority of the associated primary goal is set to **Artificial Intelligence** in Goal Framework or Strategic Planning Workspace. For details, see Create a strategic priority for a strategic plan.

AI RIDAC in AI strategy

Adoption tab in AI Control Tower

Use the Adoption dashboard page to view data about user engagement and feedback, and adoption of every type of AI.

The Adoption dashboard page contains two tabs that provide insights on usage and adoption.

The **Usage** tab includes indicators on daily AI actions, daily unique users who have engaged with AI, AI system group distribution, and daily usage comparison by workflow. The **Adoption** tab tracks the departments with the highest AI usage, comparison of AI actions by user department, and feedback details. Use the date range filter to view usage and adoption indicators for the selected period. The default date range is 30 days.

The high-level indicators on the Adoption dashboard page provide an overview of user engagement.

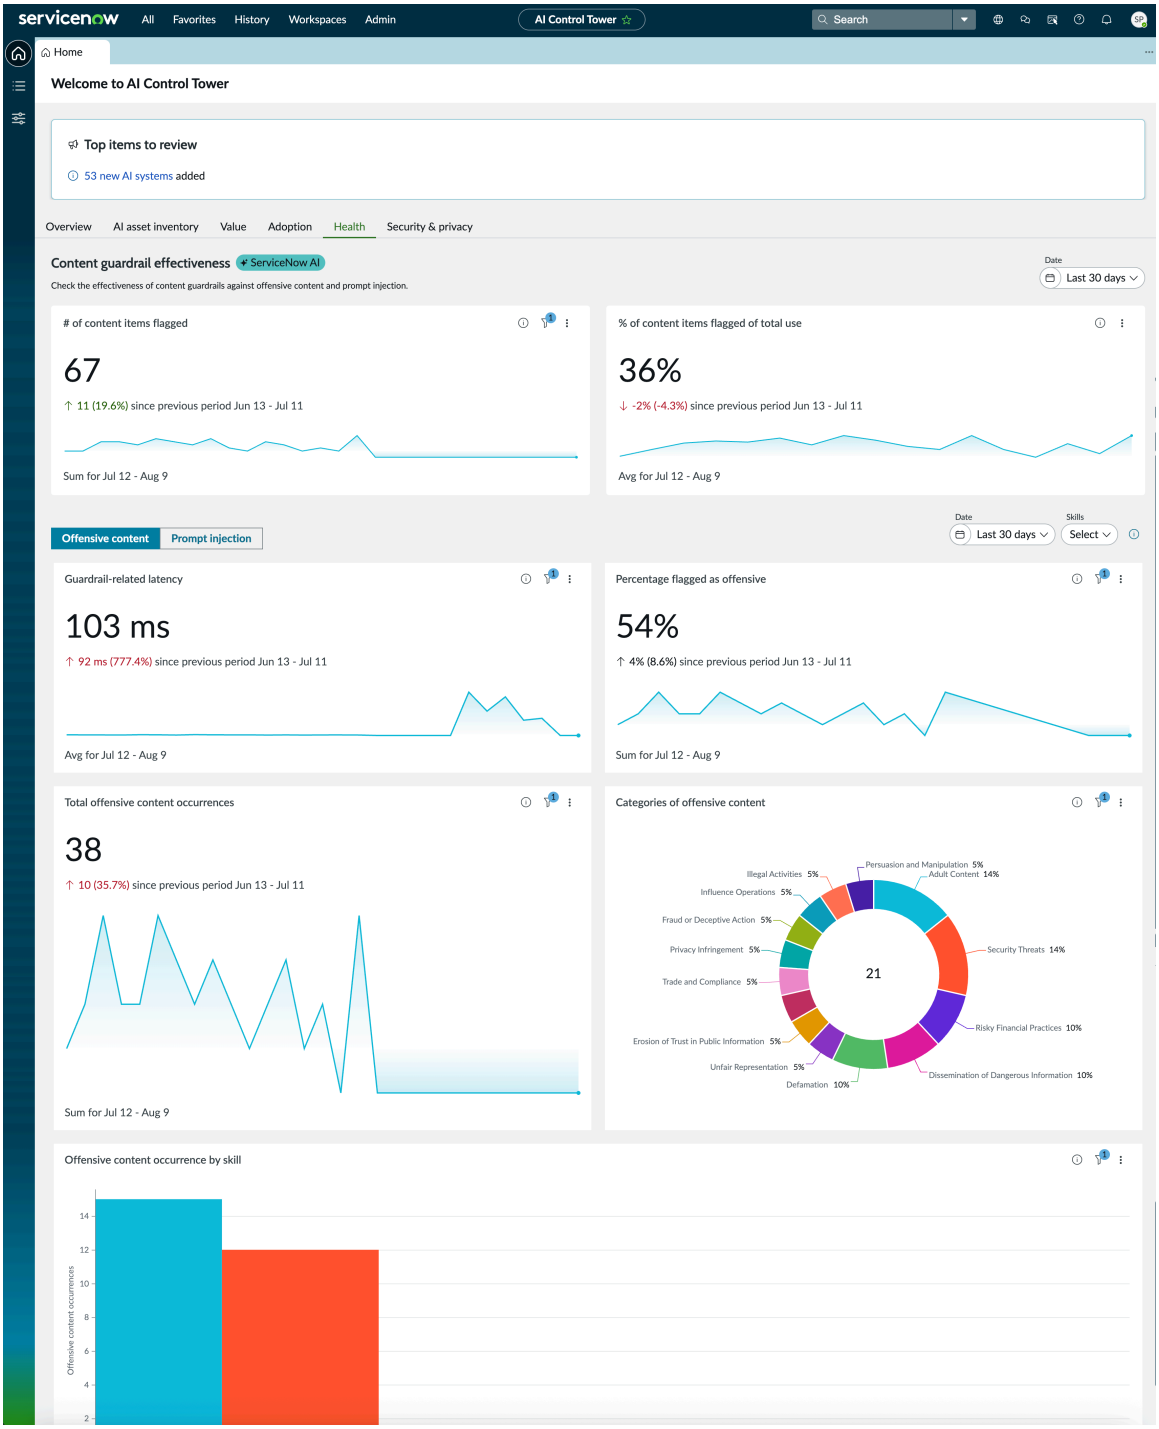
Health tab in AI Control Tower

Monitor the performance of guardrails enabled through AI Guardian.

The Health tab in the AI Control Tower dashboard helps you monitor and evaluate the effectiveness of offensive content and prompt injection guardrails active on your ServiceNow AI assets.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Health tab in AI Control Tower



The visualizations on the Health tab provide the following insights.

- Average latency as a result of active offensive content and prompt injection guardrails. High latency could mean increased guardrail activity in the period.
- Count and percentage of offensive content and prompt injection occurrences.
- Skills where offensive content and prompt injection occurrences were detected.

The dashboard does not consider historical data for Health metrics.

Apply the filters on the dashboard to view guardrail activity for skills in a date range.

Risk and compliance tab in AI Control Tower

The Risk and compliance tab on the AI Control Tower displays the risk classification of AI assets and the compliance posture for selected authority documents and policies.

AI assets refer to the various components and resources that are essential for the development, deployment, and operation of artificial intelligence systems. These assets can include:

1. AI systems: The complete software or hardware infrastructure that runs AI algorithms and processes. This can include machine learning platforms, natural language processing systems, and other AI-driven applications.
2. AI models: The mathematical and computational models that are trained on data to perform specific tasks. These models can range from simple linear regression models to complex deep learning neural networks.
3. AI datasets: The collections of data used to train, validate, and test AI models.

For more information, see AI systems, AI models, and Datasets.

Understanding and managing these AI assets is crucial for ensuring that AI systems are effective, reliable, and compliant with regulatory and ethical standards as defined by your organization.

The Risk and compliance dashboard has the following sections. You can drill down into the data on each widget in any section.

Compliance overview

Regulatory risk classification

This section displays the risk classifications of AI systems, AI models, and Datasets using donut charts. The risks are qualitatively classified as **High**, **Low**, **Medium**, and **Unacceptable**. These classifications are based on the risk assessments of the AI assets.

Compliance by authority documents and policies

The section shows compliance based on controls implemented. By default, the compliance scores are displayed for the following frameworks that are provided in the library:

- NIST AI Risk Management Framework: This framework displays the four key associated citations, namely map, measure, manage, and govern. Each citation's compliance score is displayed based on its control attestations.
- EU Artificial Intelligence Act: This framework has multiple chapters that are displayed as citations and child citations. Each citation is mapped to a control objective to provide you with a compliance percentage score.

Additional frameworks, including the Transparency in Frontier Artificial Intelligence Act (SB 53) and the Colorado Artificial Intelligence Act, are available in the AI

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Risk and Compliance content pack and can be activated to add their citations to the compliance posture view. For more information, see AI Risk and Compliance Content Pack.

You can choose to view compliance data by selecting one of two options: **Authority Documents** or **Policies**. Additionally, you can view the overall compliance score percentage, along with the number of compliant and non-compliant authority documents and policies, by using the drop-down filter to select specific authority documents or policies. You can also see all the issues that require immediate attention and AI cases related to each authority document or policy.

The authority documents are provided solely for informational and guidance purposes to assist with the initial setup of AI Risk and Compliance frameworks. It does not constitute legal advice or assurance of regulatory compliance. You are solely responsible for ensuring that all use of the content complies with applicable laws, regulations, directives, and industry standards in their jurisdictions.

Note: You can configure which authority documents and policies you want to display on the home page. For more information, see Set up properties for compliance posture.

Risk overview

This section monitors and tracks the risk posture of the AI assets in your organization. Using the **AI asset** filter, you can filter risk posture insights by the type of AI asset inventory.

AI systems by aggregated risk score

This section displays the classifications of AI systems by aggregated risk score using a donut chart. The risk scores are qualitatively classified as **High** and **Low**.

Risk heatmap

The Risk heatmap widget displays the visualization of all identified risks within the AI assets. By default, the Residual risk filter is applied, but you can filter the heatmap based on Inherent risk. The heatmap is segmented, and the segmentation changes based on the filter. The activities fall under the respective combination of risk and control effectiveness, or impact and likelihood. The combination is based on the selected risk classification filter. You can filter the risk heatmap by Risk Assessment Methodology (RAM)when more than one methodology is available.

Regulatory landscape overview

You need to install GRC: Regulatory Change Management application to see this section. For more information, see Installing Regulatory Change Management.

Overview

- Alerts

  This section displays the risk classifications of AI systems, AI models,and AI datasets using donut charts.

- Change tasks

  This section displays the distribution of regulatory change tasks by workflow state or lifecycle phase using a donut chart.

Assessments

AI cases tab in AI Control Tower

Track, monitor, and analyze your AI case workflows, identify your workflow bottlenecks, and check your accountability of your AI-related risks by using the AI risk and compliance dashboard. As an AI steward, you can also use the dashboard to track the status and trends of your AI-related inquiries.

AI cases

The **AI cases** tab on the AI risk and compliance dashboard provides the key metrics, trends, and actionable tasks that you can use to track your AI risks, case activities, compliance tracking, and governance enforcement. You can get case-level insights, task-level tracking, and accountability for your responsibilities and progress. As an AI steward, you can report a case when a violation is found. An AI analyst also follows the case and comes up with a resolution.

You can drill down into the data on each of the following widgets to learn more about an AI case.

AI cases status by state

Shows distribution of reported AI Cases by lifecycle state or workflow state.

AI cases status by priority

AI cases based on their priority: Critical, High, Moderate, Low, and Planning.

AI cases

Summarized list of AI cases reported:

- All: All the AI cases
- Overdue: AI cases that are past the due date.
- Due in 7 days: AI cases due in the next 7 days.
- Unassigned: AI cases that are not assigned to anyone.

Attributes of each case, such as Name, Sub-type, Case analyst, Priority, and State are available in a list view. Select each card to view that category of AI cases in a list view.

Trends

Visual patterns and historical data that are associated with the AI cases:

- AI cases by subtype widget: Trends by different categories of the AI case subtypes. You can group data by business unit, location, or primary cause to get contextual insight into the issues or AI cases patterns across the departments or systems. You can filter by AI assets.

- Open and closed cases widget: Historical trends of the case resolutions over a specified time frame. You can see the historical trends in the last 12 months. The historical trends help stakeholders to analyze the volume fluctuations and how efficiently the cases were closed.

  For example, in the last 12 months, consider that 4,200 cases were created and 3,960 cases were closed. The average time of case closure was 2.8 days, the peak case volume was in January 2025 (510 cases were created), and the fastest case resolution month was March 2025. You can see that over the past 12 months, the case closure efficiency has steadily improved, with a 12% decrease in the average resolution time compared to the previous year.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tracking

AI case progress at the task and issue level:

- Action tasks
  - Number of tasks in the Overdue, Due in 7 days, or Unassigned states.
  - Task distribution by the status, such as Draft or Work in Progress.
- Issues
  - Counts of issues that are linked to AI cases by their states like New, Review, or Responds.
  - Counts of issues that are linked to AI cases by additional details like Overdue, Due in 7 days, or Unassigned.

You can create AI cases and issues from the AI cases tab in both the AI Control Tower Workspace and the AI Risk and Compliance Workspace. The Create AI case button lets you initiate a new AI case record directly from the monitoring dashboard. Use this option to document, investigate, or track issues, risks, or compliance concerns related to AI models or datasets. Select the dropdown arrow next to Create AI case, and then select Create issue to create an issue related to an existing AI case.

For more information, see Create an AI case in the AI Risk and Compliance workspace and Create an AI issue in the AI Risk and Compliance workspace.

The following example shows the **AI cases** tab on the AI risk and compliance dashboard.

Inquiries

The **Inquiries** tab on the AI risk and compliance dashboard provides you with a structured view of the AI inquiry workflow. Use the following widgets on the dashboard to track the compliance and then to monitor the status and progress of an inquiry:

You can drill down into the data on each of the following widgets to learn more about an AI inquiry.

Inquiries status by state

Counts of inquiries by state. New, Triage, In progress, and Approved inquiries are represented in the donut chart.

Inquiries status by priority

Counts of inquiries by priority. An inquiry can have Critical, High, Moderate, Low, or Planning priorities.

Inquiries

Summarized list of all AI inquiries. It's filterable based on parameters such as status, priority, and assignment.

The essential attributes of inquiries are based on the operational relevance or urgency. Each inquiry entry includes metadata such as:

- Name
- Requested by
- Assigned to
- State
- Priority

Trends

Trend-based insights into your inquiry activity across the organization. These visualizations support longitudinal analysis to improve planning and compliance responsiveness.

Note: Longitudinal analysis refers to the process of analyzing data points across departments, teams, or systems over a period of time.

Filters, such as the AI assets and the time range, help you to refine the analytics.

- Inquiries by business unit: You can see the distribution of inquiries across the various departments or functional areas of your organization. This distribution helps you to identify where most AI-related concerns originate so that you can plan on more targeted risk mitigation or awareness training.
- Open and closed inquiries: You can track the volume of inquiries that are initiated and resolved within a selected time range. This tracking enables you to track how your workflow is performing and to plan for future capacity.

Use the **Create inquiry** button to initiate a new inquiry. You can make timely reports of AI-related concerns or clarification requests.

The following example shows the **Inquiries** tab on the AI risk and compliance dashboard.

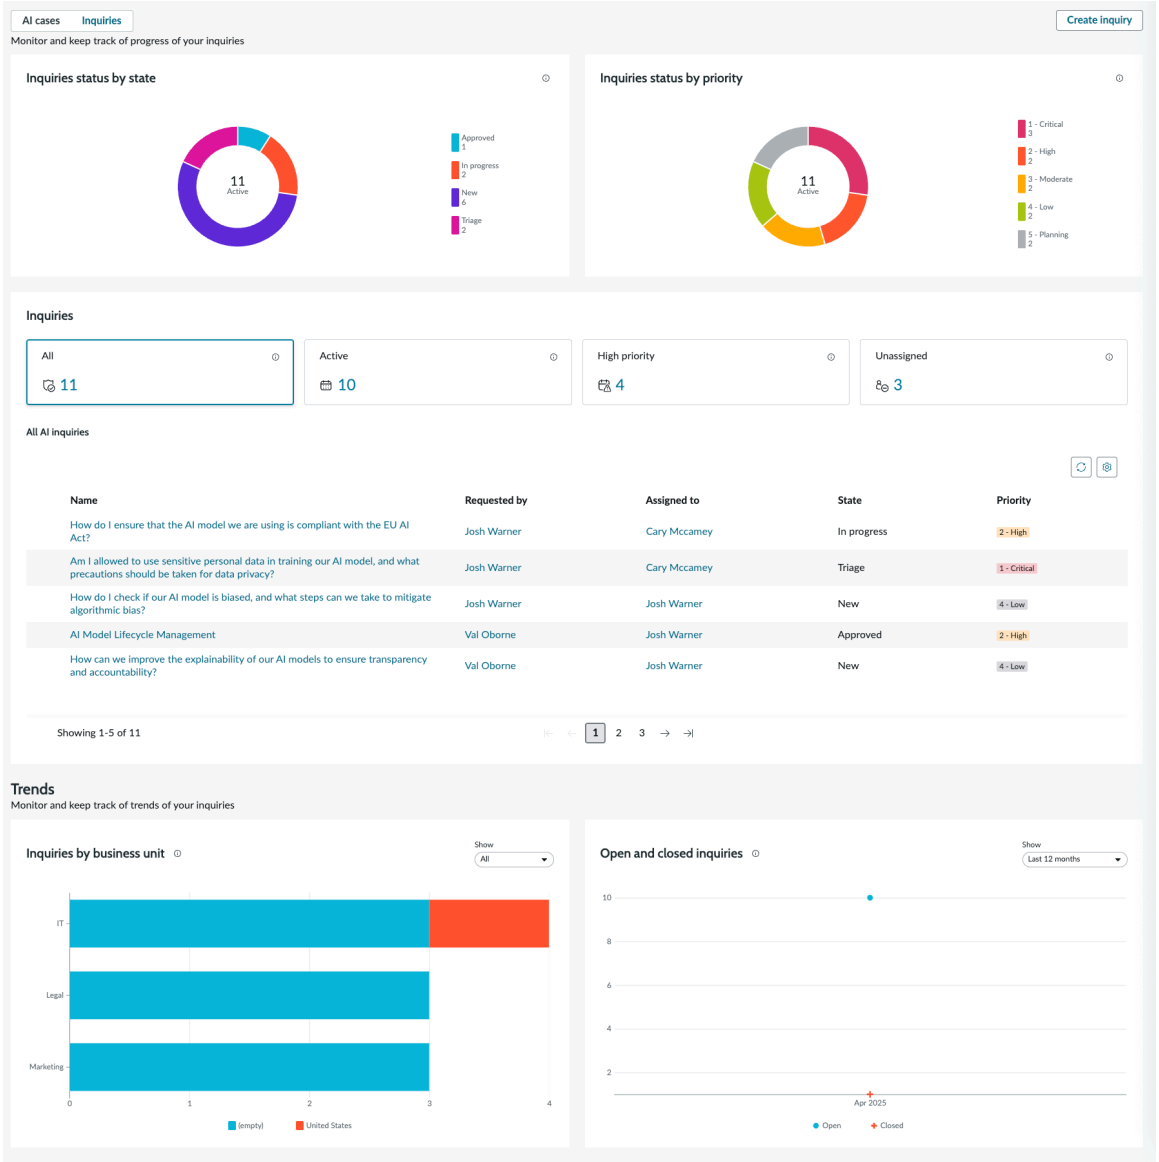
Inquiries tab on the AI risk and compliance dashboard



For more information, see AI Risk and Compliance documentation.

Evaluation tab in AI Control Tower

The **Evaluation** tab contains the Evaluation dashboard, which is designed to measure, automate, and improve the quality of interactions with Virtual Agent. This dashboard addresses several key challenges to enhance the end-user experience and overall virtual agent utility.

Evaluation dashboard

Prerequisites

Role required: sn_ai_governance.ai_steward

You must Enabling evaluations.

Conversations are excluded from auto-evaluation if any of the following conditions are met:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- HR conversations: Conversations related to Human Resources are filtered out, which means that they aren't evaluated.
- Inaccessible or empty Knowledge Base (KB) articles: Conversation involving a Genius Result that points to a KB article that is either not accessible via script or is empty. For example, certain restricted HR Knowledge articles.
- Immediate live agent transfer: A conversation that begins immediately with transfer to a live agent, with no prior interaction with the virtual agent.
- Short conversations: Conversations having fewer than 180 words before a live agent is invoked. The word count is configurable via the *autoEvalConstants* script Include. The assumption is that conversations below this threshold didn't contain a meaningful interaction with the Virtual Agent.
- Custom triggers: Any custom-defined exclusion triggers.

Evaluation dashboard overview

The Evaluation dashboard helps in:

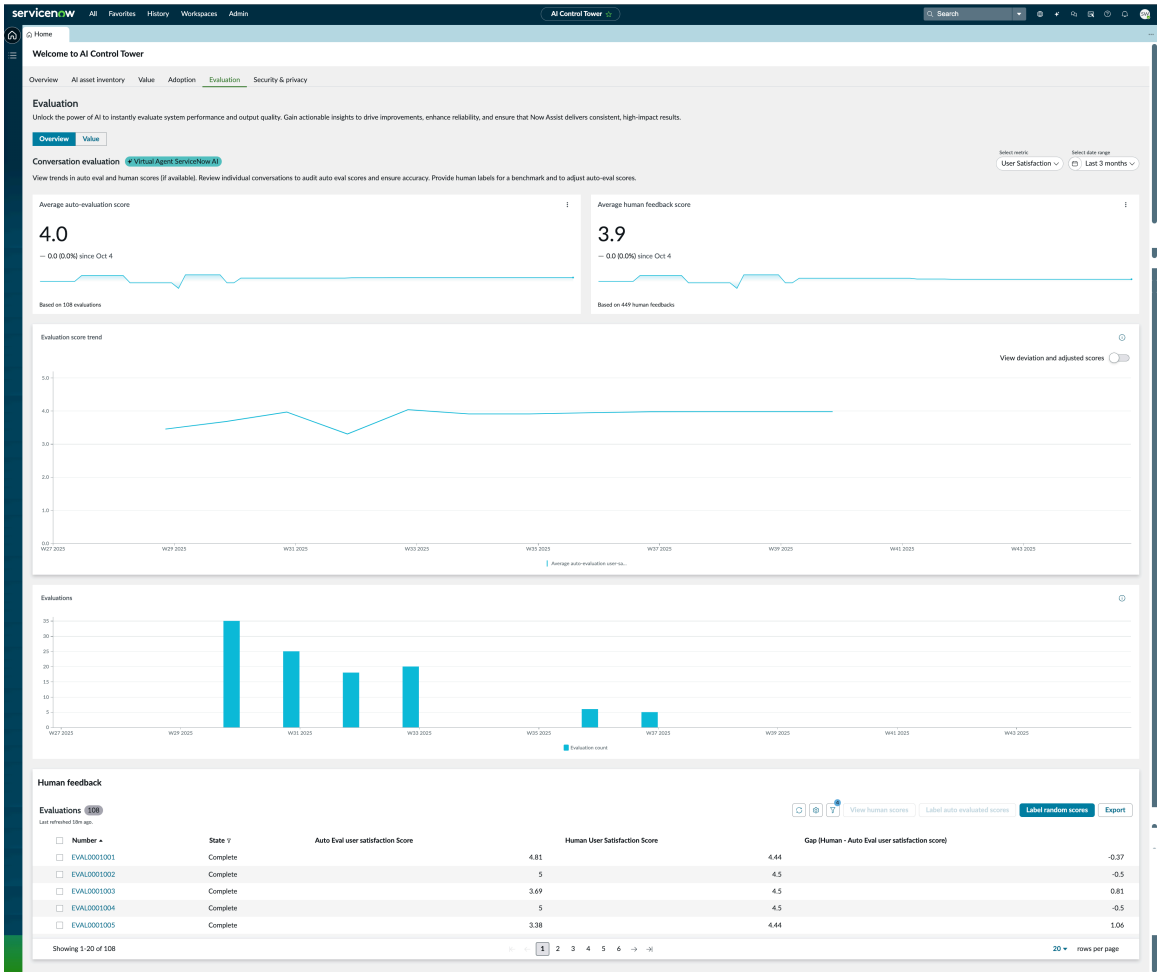
- Establishing a reliable measurement process by enabling the systematic tracking of the end-user experience with the Virtual Agent, providing deeper insights into interactions.
- Automation of conversation quality evaluation by automating the process of evaluating conversation quality across different user interactions. This automation helps lead to the creation of a trusted, scalable metric for performance tracking.
- Continuous improvement by supporting the iterative refinement of the virtual agent's performance, enhancing the overall user experience.
- Scalable monitoring by helping ensure that the process of evaluating and tracking virtual agent quality is both efficient and scalable, promoting quick identification of issues and improvements over time.
- User feedback integration through a set of optional questions enables you to provide direct feedback on their experience, which is used to improve the quality of future interactions.
- Service desk manager insights by enabling service desk managers to track and review auto-evaluation scores over time. Managers can also manually add feedback for benchmarking purposes, providing valuable insights into conversation quality and opportunities for improvement.
- Sustainable evaluation process by continuously improving virtual agent performance through a combined approach of automated evaluation and manual feedback enabling a scalable and sustainable system that evolves over time.

Important: Evaluation dashboard doesn't support domain separation.

Overview tab

The **Overview** tab of the Evaluation dashboard provides a comprehensive view of all metrics and evaluation data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The following widgets are available, showing various metrics:

- Average Auto Eval score for the selected metric: Shows the average auto-evaluation score for the metric selected and its trend over time.

  For more information about each metric, see Evaluation metrics and calculations.

- Average Human Feedback score for the selected metric: Shows the average human-labeled score for the selected metric.

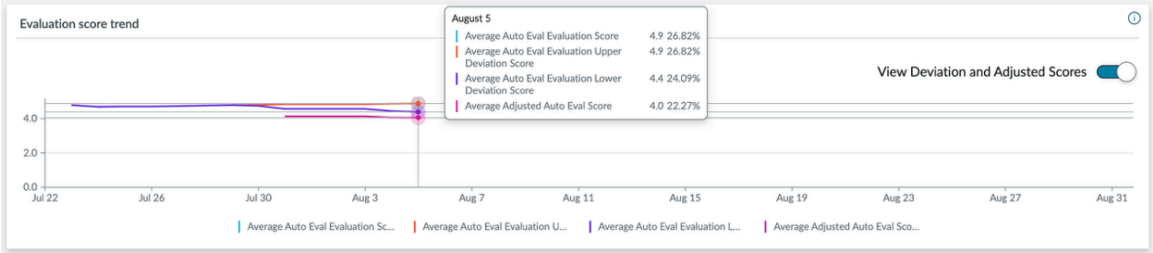
  Note: The score is available only if there are sufficient chat records that are manually evaluated. For more information about manually evaluating conversations, see Human feedback for evaluations.

- Evaluation score trend: Tracks the weekly score for the selected metric.

  If you turn on the **View Deviation and Adjusted Scores** toggle, it shows the comparison between the auto-evaluated and user-defined scores by overlaying the upper, lower deviations, and the final adjusted score on the trend chart.

  Note: The deviation and adjusted scores are calculated only if you have at least 50 human labels.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



For more information about how the calculations are made, see Evaluation metrics and calculations.

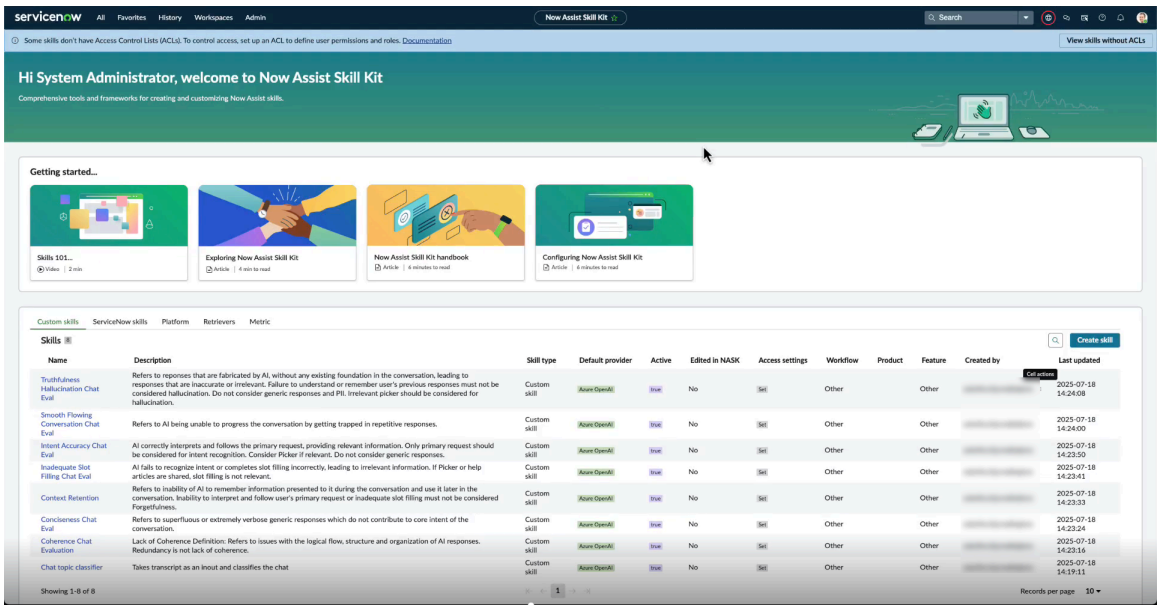
- Evaluations: Shows the total number of conversations that were evaluated each week.
- Human feedback section: Contains detailed information about each evaluation. From here, you can manually evaluate conversations. For more information, see Human feedback for evaluations.

Evaluations

Each conversation is evaluated on eight different metrics. For each of these metrics, there's a separate skill. You can view these skills in AI Skill Kit under **Custom skills**.

For more information about each metric, see Evaluation metrics and calculations.

Role required: sn_skill_builder.admin



The following Now Assist custom skills are used:

- Chat Topic Classifier
- Coherence Chat Evaluation
- Conciseness Chat Eval
- Context Retention
- Inadequate Slot Filling Chat Eval
- Intent Accuracy Chat Eval

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Smooth Flowing Conversation Chat Eval
- Truthfulness Hallucination Chat Eval

The default provider for these skills is Now LLM. You can change the provider to Azure OpenAI, Google Gemini or AWS Claude. Azure OpenAI has been observed to improve results in certain scenarios.

For more information about AI Skill Kit, see AI Skill Kit.

Process of evaluation

Flow: Execute Evaluation.

1. 10% of the daily conversations are sampled, checking if the conversation is good enough to be evaluated or not. The evaluation is done by building the transcripts for these conversations and then sending it to the set large language model (LLM).
2. For the conversations that are good enough to be evaluated, the transcripts along with the prompts for different scales are sent to the LLM and the LLM then evaluates the conversations.
3. After evaluation, the conversation goes through post processing, where the scores and the reason for scores that the LLM has provided are parsed and stored in the Evaluation and Evaluation Metrics tables.

Note: Conversation evaluation estimates are considered as of evaluation date and not the conversation created date. For example, if a chat that happened at time t is evaluated at time t+10, the scores from evaluator is aggregated for the week of t+10 and not for the week of t.

For detailed information about the evaluation flow, see Evaluation flow.

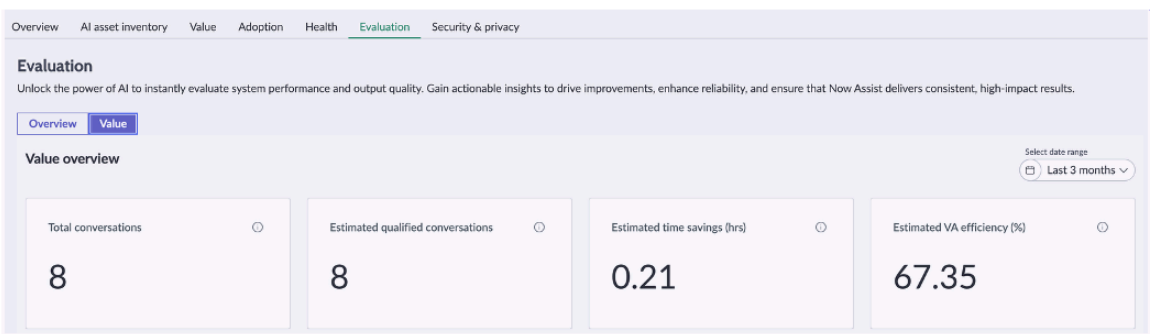
Value tab in the Evaluation dashboard

Evaluation dashboard reference

Value tab in the Evaluation dashboard

The **Value** tab in the Evaluation dashboard displays the value, efficiency, and time savings of the virtual agent. The information on this tab gives you a transparent and reliable estimation of the value delivered by the virtual agent, focusing on a quality-adjusted calculation of the time saved for users.

The **Value** tab shows a robust and realistic evaluation of the virtual agent's value. By incorporating sampling for scalability, rolling averages for stability, and a quality-weighting framework for business relevance, the resulting metrics gives the automation impact and time saved for the organization.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

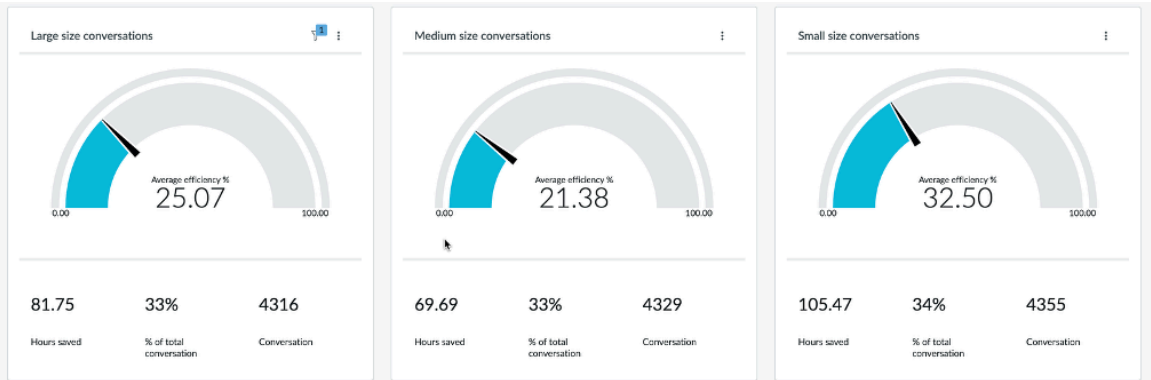
The following widgets are available:

- Total conversations: Shows the total volume of conversations initiated with the virtual agent for the selected date range. This metric is a direct indicator of user engagement and virtual agent usage.
- Estimated total hours: Shows the cumulative, quality-adjusted time saved by users interacting with the virtual agent.
- Estimated VA efficiency (%): Calculated as the ratio of the estimated total hours saved to the total duration of all conversations (Estimate Time Savings/Total Conversation Time). The estimate indicates how effectively conversation time is converted into value.
- Gauges by chat size: The gauges show a breakdown of the estimated total hours saved, segmented by the size of the conversation (long, medium, and short).

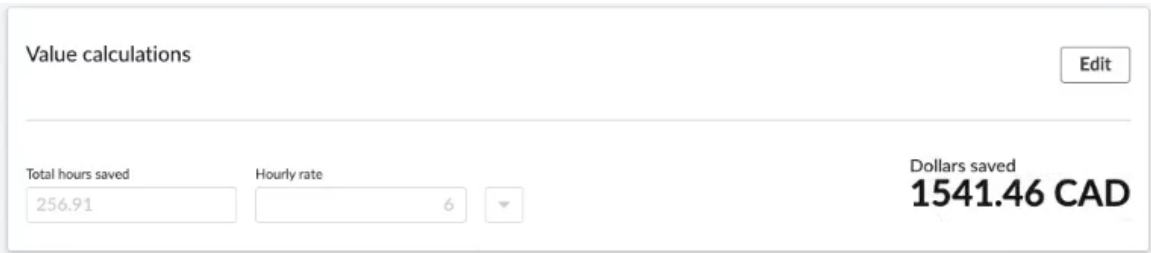
  Conversations are segmented based on their size to accurately correlate effort with value. The principle is that longer, more complex chats that successfully resolve issues save more time than shorter, simpler ones.

  - Large-size conversations: Conversations with more than 10 messages from the user.
  - Medium-size conversations: Conversations with more than 4 but fewer than 10 messages from the user.
  - Small-size conversations: Conversations with 4 or fewer messages from the user.

  Note: To change the definition of small, medium, and large conversations, update the property *sn_na_conv_eval.value_chat_classifier*. For more information, see Components installed with the Evaluation dashboard.



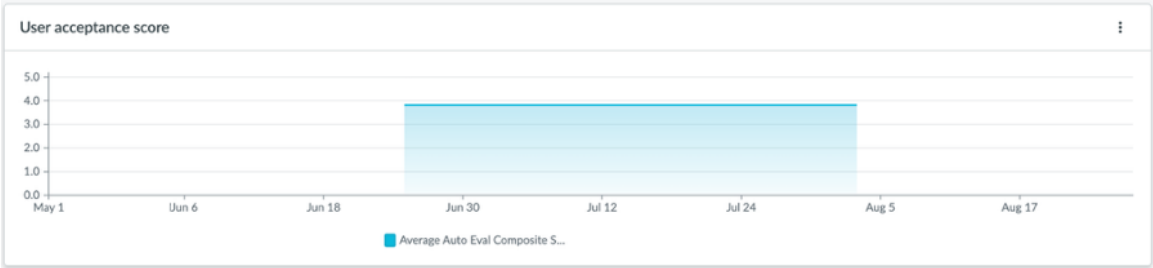
- Value calculations: Shows the amount saved based on the numbers of hours saved and the hourly rate.



- User acceptance score: The average satisfaction score derived from the conversation evaluator, scaled to 100 for easy interpretation. This score reflects the overall user perception of the virtual agent's quality of assistance.

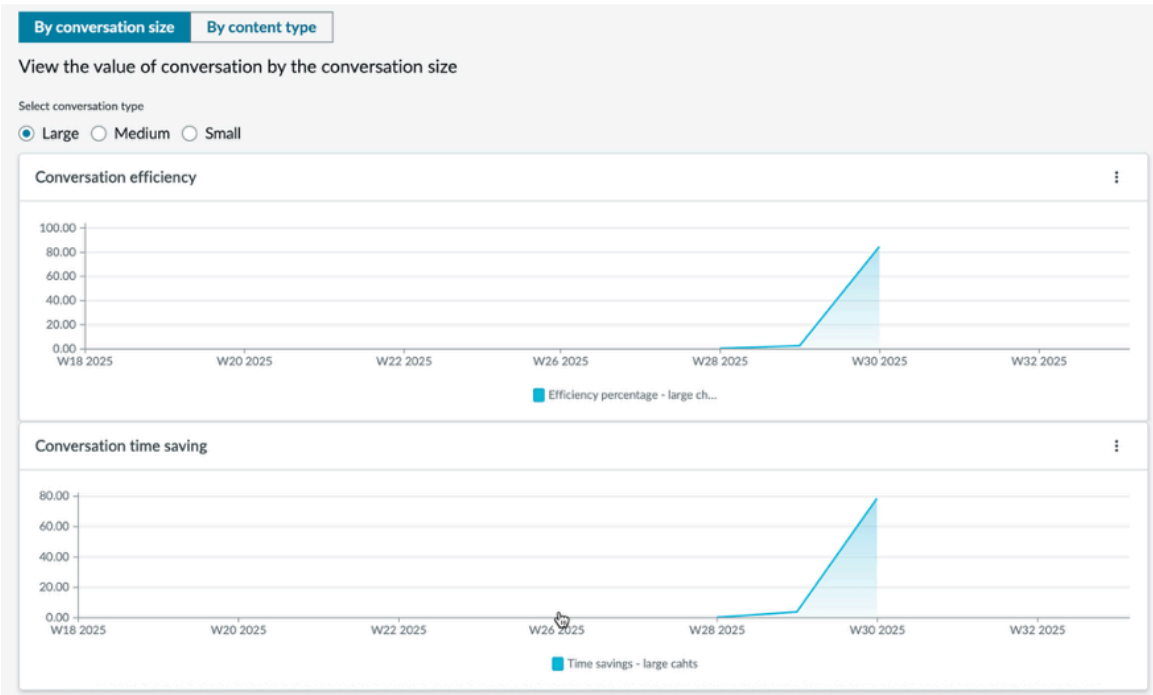
Weekly user acceptance trend

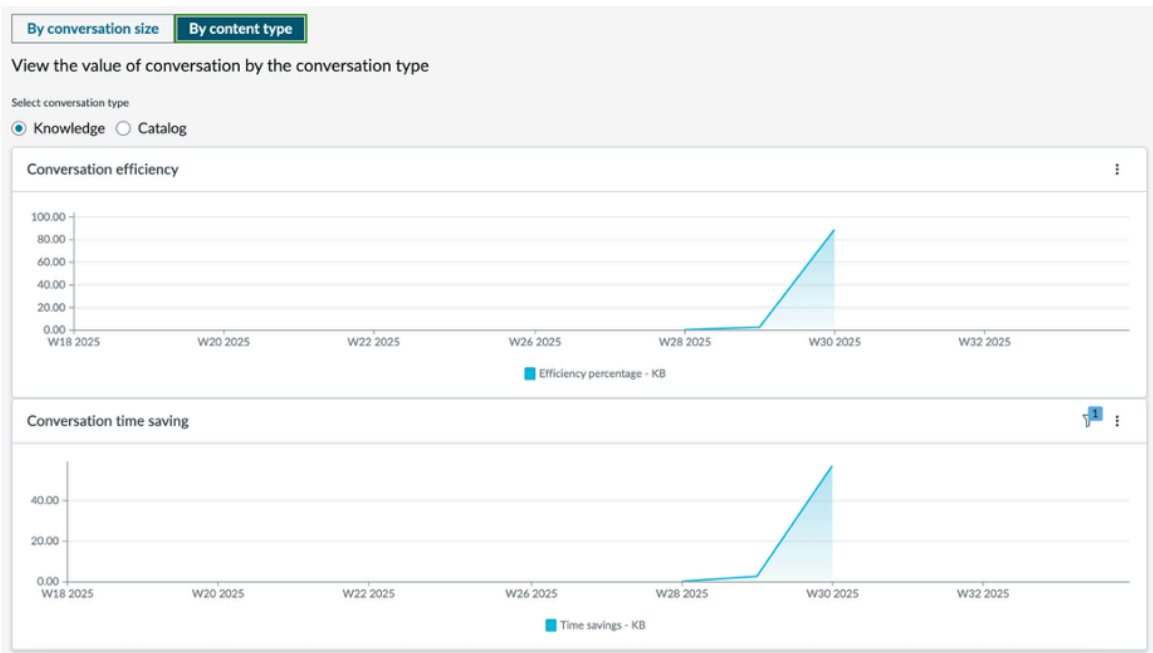
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The line chart tracks the User acceptance score over time, providing insight into how user satisfaction is evolving on a weekly basis.

- Weekly efficiency trends:





© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The weekly efficiency trend charts display the weekly trend of the Estimated Efficiency (%) metric, further broken down by both chat size and the type of content (Knowledge Base (KB) article or Service Catalog item) used during the conversation.

Note: Conversation evaluation scores are tagged as of evaluation date and not the actual conversation date. Hence older or historical chat scores are considered as of the day of evaluation for value calculation and not as of the conversation created date.

Calculating the estimated total hours

The estimated total hours calculated is the result of a multi-step, daily process designed to adjust raw time based on the quality of the interaction. It's calculated through the following steps:

1. Data sampling for quality evaluation.

   To limit number of assists, every conversation isn't evaluated. Instead, a daily sampling process is used.

   - Sample size: 10% of all conversations are selected for evaluation from the previous day.
   - Daily cap: The sample is capped at a maximum of 50 conversations daily.
   - Analytical dataset: To identify stable patterns in virtual agent quality, a rolling 30-day window is used for these evaluated chats, which creates a dataset of approximately 1,500 evaluated conversations (50 chats/day for 30 days) for analysis.

2. Categorizing conversation quality.

   Each of the ~1,500 conversations in the 30-day analytical dataset is assigned a quality score by the conversation evaluator. Based on the score, the conversation is categorized into one of five satisfaction levels:

Quality category	User satisfaction score range
Extremely satisfied	4.5–5.0
Satisfied	3.5–4.5
Average	2.5–3.5
Unsatisfied	1.5–2.5
Extremely unsatisfied	1.0–1.5

3. Projecting quality scores onto the daily conversations.

   There might not be a quality score for all virtual agent conversations, which limits the ability to accurately estimate the time saved by the virtual agent. To solve this issue, the quality distribution from the 30-day analytical dataset is projected onto the daily virtual agent conversations.

   a. Calculate rolling averages: From the ~1,500 evaluated chats, the percentage distribution of total chat time across the five quality categories for each segment is calculated.

      For example, for all short chats, or for all chats that invoked a KB article. Suppose that the 30-day analysis of short chats shows their total duration was 100 minutes. If 25 of those minutes came from chats rated as extremely satisfied, then the extremely satisfied category for short chats has a 25% time-based score.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. Apply averages to the daily conversations: The daily chats are grouped by their segment (for example, by chat size). The rolling average percentages are then applied to the total time of these groups.

For example, if the daily chats contain 400 short chats with a total duration of 4,000 minutes, the rolling average calculated is used to project that 25% of the time (1,000 minutes = 4000 minutes * 25%) was of extremely satisfied quality. The calculation is repeated for all quality levels and all segments.

4. Applying quality-adjustment weights.

To convert raw conversation time into a realistic measure of time saved, a weight is applied to the projected time in each quality category. Time from low-quality interactions contributes little to no savings, while time from high-quality interactions contributes 100% of its duration to savings.

Conversation quality category	Weight applied to time
Extremely satisfied	1.0 (100%)
Satisfied	0.5 (50%)
Average	0.25 (25%)
Unsatisfied	0.1 (1%)
Extremely unsatisfied	0.0 (0%)

Example continued, the 1,000 minutes of extremely satisfied time calculated in Step 4 is multiplied by a weight of 1.0, resulting in 1,000 minutes of estimated time saved. If another 500 minutes were projected to be satisfied, they would contribute 500 * 0.5 = 250 minutes of time saved.

5. Weekly aggregation:

The daily Final Daily Time Saved figures are aggregated at a weekly level for display on the dashboard's trend charts.

Important: Only the chat time before the first live agent invocation is considered for value calculation. That is, the time the user has spent interacting with the virtual agent. The chat time with the live agent isn't considered for value calculation.

Conversation evaluations scores are tagged as of evaluation date and not the actual conversation date. Hence older or historical chat scores are considered as of the day of evaluation for value calculation and not as of the conversation created date.

If data isn't updated on the dashboard, perform the following steps.

Role required: admin

1. Navigate to **All** > **System Definitions** > **Scheduled Jobs**.
2. Search for and select the *CE Populate Value Aggregates Chats - Daily* scheduled job.
3. Set it as **Active**.
4. Execute the scheduled job.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Navigate to **All** > **Platform Analytics** > **Platform Analytics Administration** > **Data Collector** > **Jobs**.
6. Search for and select the **"[Conversation Evaluator] Evaluation Score Daily Data Collection** scheduled job.
7. Execute the job.
8. In the Related Lists section, check the **Job Logs** tab to see if the data was collected successfully.

Related topics

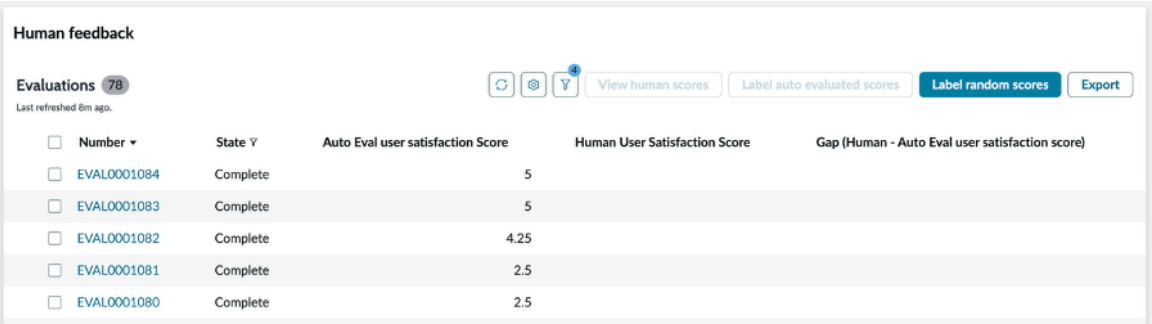
Evaluation dashboard reference

Human feedback for evaluations

Expand the Human feedback section to see details on evaluations and their satisfaction scores.

Role required: interaction_admin

Note: To label a record or label a conversation, you must have access to the transcript, and only users with the interaction_admin role have access to the transcript.



The Evaluations section shows all the chats that were auto-evaluated by the large language model (LLM). You have the option to manually evaluate conversations to compare the AI evaluations against your own interpretation of how the agent conversation was.

Field	Description
Number	Evaluation number assigned to each chat conversation. Select the evaluation number to see the respective chat and its evaluations.
State	State of the evaluation.
Auto Eval user satisfaction Score	Satisfaction score calculated automatically by the LLM.
Human User Satisfaction Score	Satisfaction score calculated based on the user evaluation of the chat.
Gap	Difference between the human and auto-evaluated satisfaction scores.

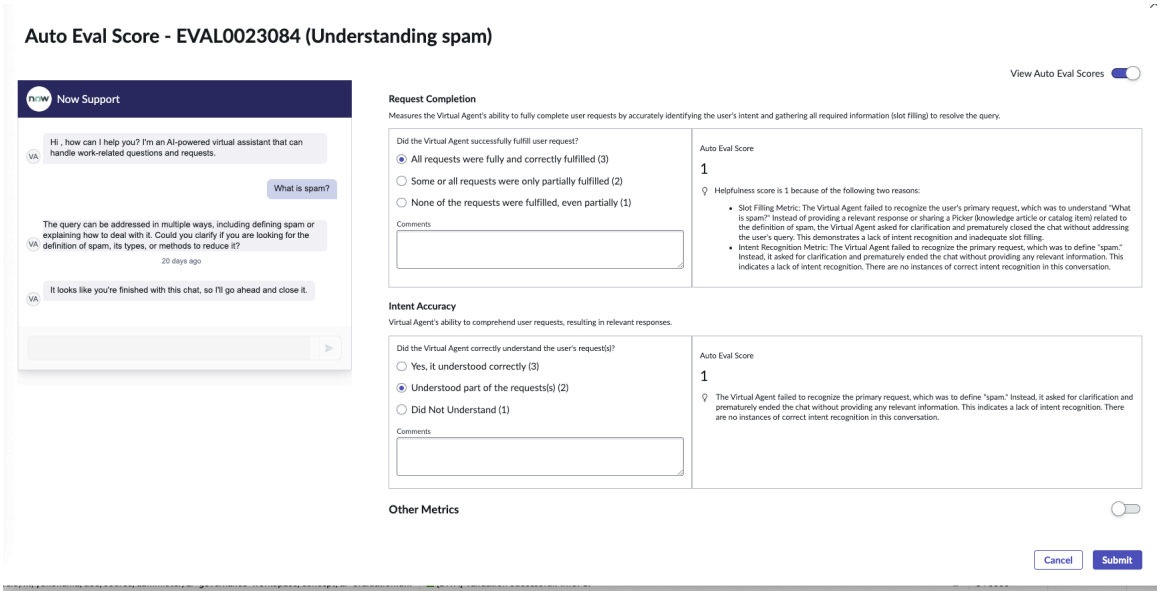
Manually evaluate a chat

You can manually evaluate each chat to compare it with the AI evaluation.

1. Select the evaluation that you want to score manually.
2. Toggle the **View Auto Eval Scores** switch on to see the AI evaluation for each category.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. For each category, select your answer for how accurately you feel that the agent responded.



4. Toggle the **Other Metrics** switch on for a more detailed evaluation.
5. After completing, select **Submit**.

The **Human user Satisfaction Score** value gets calculated based on your response to the questions. You can see your responses for each evaluation by selecting it and then selecting **View Human Scores**. The **Export** option enables you to export the data in your preferred format.

You can also randomly label evaluations by selecting **Label random scores**. When selected, a list of 10 random, unevaluated conversations from the past 10 days are loaded for manual labeling.

Enabling evaluations

Evaluate random conversations by enabling continuous monitoring.

Role required: admin

Enable evaluations and set the number of evaluations to be performed daily.

Enable evaluations

1. Activate Skills:
   a. Navigate to **Admin** > **Now Assist Admin** > **Now Assist Skills** > **Platform**.
   b. Turn on the following skills:
      - Intent Accuracy Chat Eval
      - Inadequate Slot Filling Chat Eval
      - Smoothness (Deadlock avoidance)
      - Context Retention
      - Coherence Chat Evaluation
      - Truthfulness Hallucination Chat Eval

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Conciseness Chat Eval
- Chat topic classifier

Note: You can get the filtered list using the filter condition **Conversation Evaluator** under **Features**.

2. Set the value for the system property **sn_na_conv_eval.maxEvaluateCount**.
   a. Navigate to **All** > **System Properties** > **All Properties**.
   b. Search for and select the property **sn_na_conv_eval.maxEvaluateCount**.
   c. Update the **Value** field to set the maximum number of conversations to be evaluated daily.

   d. Select **Save**.
3. Activate the following associated scheduled jobs:
   a. Navigate to **All** > **System Definition** > **Scheduled Jobs**.
   b. Apply the filter condition `Application is Conversation Evaluator` and filter out the job Evaluation Value Calcuation - Runs Only once after install.

   c. Activate all the scheduled jobs in the filtered list.
4. Activate the Execute Evaluation flow in Flow Designer.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

By default, the Execute Evaluation flow is deactivated. You can use the nightly scheduled job, Execute Evaluations, to evaluate the chats. The nightly job won't dominate over LLM calls from other services, whereas the real-time evaluation through the Execute Evaluation flow might conflict with LLM calls from other applications.

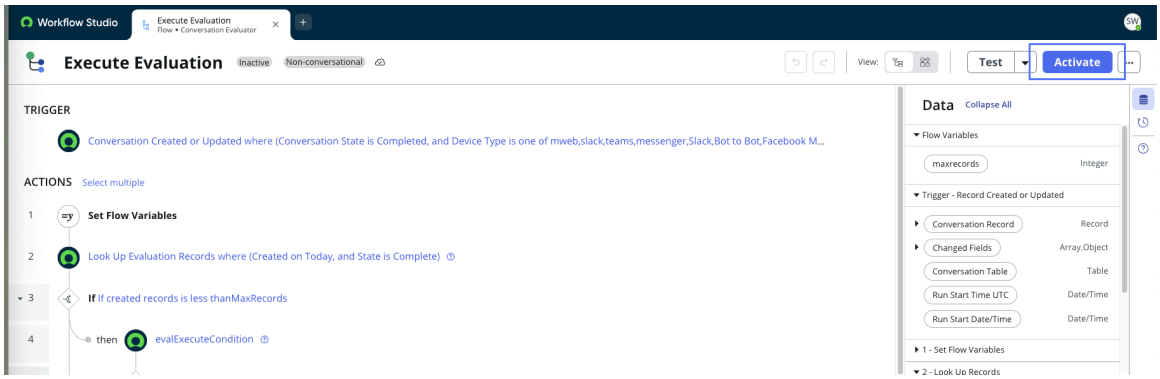
If you want to evaluate the chats real-time on chat completion, activate the Execute Evaluation flow. Domain separation is not supported.

a. Navigate to **All** > **Process Automation** > **Flow Designer** and select **Flows**.

b. Select the Execute Evaluation flow.

c. Select **Edit flow**.

d. Select **Activate**.



Note:

- If you want to configure some of the evaluation parameters based on your requirements, see Configuring evaluations.
- If you want to import historical data to be evaluated, you must run batch evaluations by activating the Execute Batch Evaluation flow. For more information on the batch evaluation workflow, see Evaluation flow for batch evaluations.

Evaluation dashboard vs. Conversation Insights

You can use the Evaluation dashboard and the Conversation Insights (CI) application together to gain a complete picture of virtual agent effectiveness, from system performance to end-user satisfaction.

For more information about Conversation Insights, see Conversation Insights.

Metrics captured by the Evaluation dashboard	Metrics captured by Conversation Insights
The Evaluation dashboard provides granular diagnostic explanations that help improve virtual agent design, dialog flows, and model accuracy. It evaluates performance along dimensions critical to task success and trustworthiness. For example, "Is the system working properly and performing the expected task?"	Conversation Insights focuses on measuring customer satisfaction and effort. It uses inferred customer satisfaction (CSAT) and supporting signals to show how end users perceive their interaction with the virtual agent. For example "Is the end user happy with the virtual agent's performance?"

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Metrics captured by the Evaluation dashboard	Metrics captured by Conversation Insights
• Intent Recognition: Whether the virtual agent correctly interprets the user's primary goal. • Slot Filling: Accuracy of extracting structured inputs required to complete tasks. • Conciseness: Avoidance of verbose or repetitive responses. • Coherence: Logical flow and organization of the virtual agent's responses. • Truthfulness: Ensures that responses are grounded in context or knowledge sources, not hallucinated. • Context Retention: Virtual agent's ability to remember earlier user inputs in the same session. • Deadlock Avoidance: Detects loops where the virtual agent gets stuck repeating questions or responses. • User Satisfaction (proxy): Correlates critical failures (like intent recognition or slot filling) with likely negative user perception.	• Inferred CSAT: Composite score (1–5) estimating overall satisfaction with the conversation. • Effort Score: Measures how much work the user had to do (low/medium/high), based on transfers, escalations, repeated data collection, or wait times. • Resolution: Tracks whether the user's issue was fully, partially, or not resolved. • Frustration: Detects explicit signs of user frustration such as rude language, sarcasm, or complaints about difficulty. • Confusion: Identifies misunderstandings between the user and virtual agent or the live agent. • Transfers and Escalations: Flags when a conversation is passed to another agent, team, or supervisor. • Empathy: Scores how polite, personable, and supportive the virtual agent or live agent was (low/medium/high). • Next Steps: Measures how clearly the virtual agent or live agent explained outcomes, instructions, or follow-up actions (low/medium/high).

Together, the Evaluation dashboard and Conversation Insights provide complementary value for virtual agent implementations.

- Conversation Insights offers a lightweight, cost-free view of the customer experience across all conversations.
- The Evaluation dashboard delivers granular, task-focused diagnostics that enable targeted improvements to virtual agent design and performance.
- Consolidated in AI Agent Analytics and AI Control Tower dashboards, these metrics give users complementary views into virtual agent system health and end-user satisfaction.

Configuring evaluations

Configure conversation evaluations by disabling evaluations, adjusting execution logic and thresholds, and tuning scoring weights.

Disable evaluations

Prerequisites

Update must be created.

Disable evaluations:

1. Navigate to **Process Automation** > **Flow Designer** and select **Flows**.
2. Select the Execute Evaluation flow.
3. Select **Deactivate**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Change the evaluation execution conditions

Change the evaluation execution conditions:

1. Navigate to **System Definition** > **Script Includes**.
2. Search for and select the script Include `evalExecuteCondition`.
3. In the **Script** field, modify the *`executeEvaluation`* method.
   - Input: The method receives the conversation reference record as a parameter.
   - To restrict by user profile, use the initiatedUser variable (contains the user's sys_id).
4. Use GlideRecord queries or other logic as needed to implement custom execution conditions.
5. Save and test in a non-production environment before promoting.

Set the daily limit on evaluations

Set a maximum daily limit on evaluations:

1. Navigate to **All** > **System Properties** > **All Properties** (sys_properties.list).
2. Search for and select the property **sn_na_conv_eval.maxEvaluateCount**.
3. Set the **Value** field to the desired integer value to limit the maximum number of evaluations created per day.

Configure the minimum records for error bands

Set the minimum number of records required to calculate the error band for upper and lower deviation:

1. Navigate to **All** > **System Properties** > **All Properties** (sys_properties.list).
2. Search for and select the property **sn_na_conv_eval.errorBandMinRecords**.
3. Set the **Value** field to the desired integer value to define the minimum number of records required before upper and lower error bands are calculated.

Adjust skill weights for the composite score

Set the weights for each evaluation metric for chat evaluation, which are used to compute total and composite scores on evaluation records:

1. Navigate to **All** > **System Properties** > **All Properties** (sys_properties.list).
2. Search for and select the property **sn_na_conv_eval.evalWeights**.
3. Update only the value components for each skill.

   The composite score is calculated as Sum(Skill Score × Skill Weight) / Sum(Skill Weights).

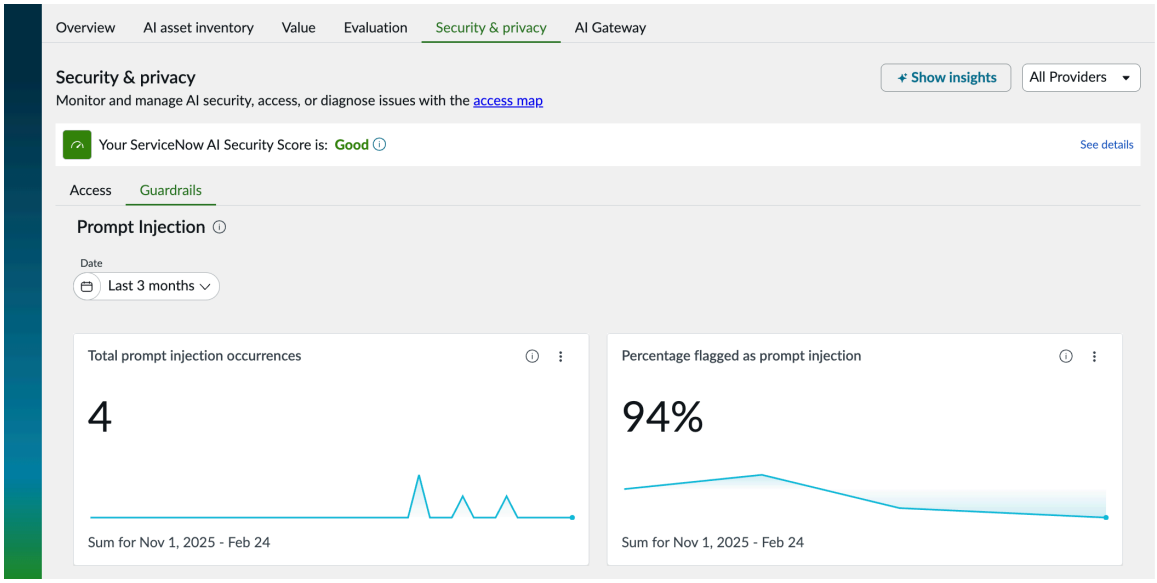
Security & Privacy tab in AI Control Tower

Review AI security metrics such as access issues, dormant and privileged AI agents, and map the relationships of your ServiceNow agents, agentic workflows, and tools.

The **Security & Privacy** tab of AI Control Tower offers a dashboard-based overview of your AI security metrics. The dashboard contains several visualizations detailing AI security metrics. In addition to tracking metrics the **Security & Privacy** tab contains the access map, a tool that gives an node-graph visualization of the relationships between your ServiceNow agents, agentic workflows, and tools. You can use the map to investigate the relationships between your AI agents and workflows further.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: You can drill down into the data on each widget by selecting the chart.



ServiceNow AI Insights

ServiceNow AI Insights require that the Now Assist AICT Security Posture Summarizer skill is enabled. For more details, see Activate a Now Assist skill.

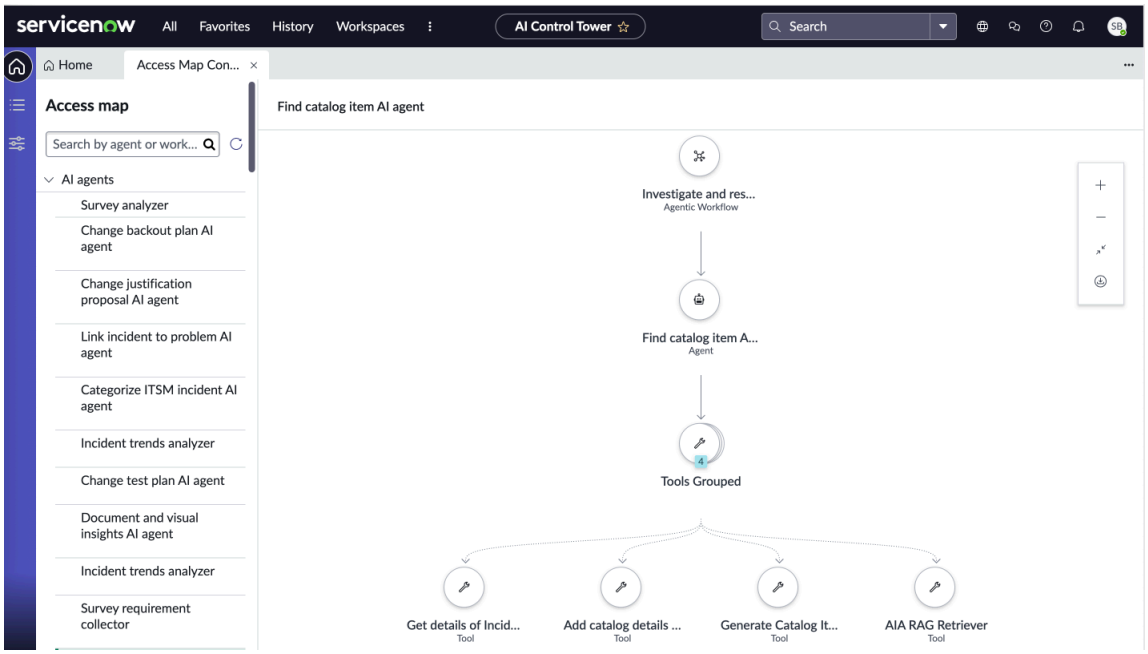
AI Control Tower AI insights summarize positives and potential issues to remediate to improve the overall security posture of your instance.

- Positives: Enabled settings and features that improve your security posture.
- Areas for Attention: Low- to medium-risk items to resolve.
- High Impact Observations: High-risk items to resolve.
- Actions: Suggested action items to address Areas for Attention and High-Impact Observations.

Access map

The **Access map** displays a node map detailing the relationships of your ServiceNow® agents, agentic workflows, and tools. You can use the map to review these relationships, configure agent details, and resolve access issues. The map includes filters for both agents and agentic workflows. You can open the access map by either navigating to **All** > **AI Security and Privacy** > **Access Map**, or selecting the link in the dashboard. See Using the access map to learn how to use access map.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



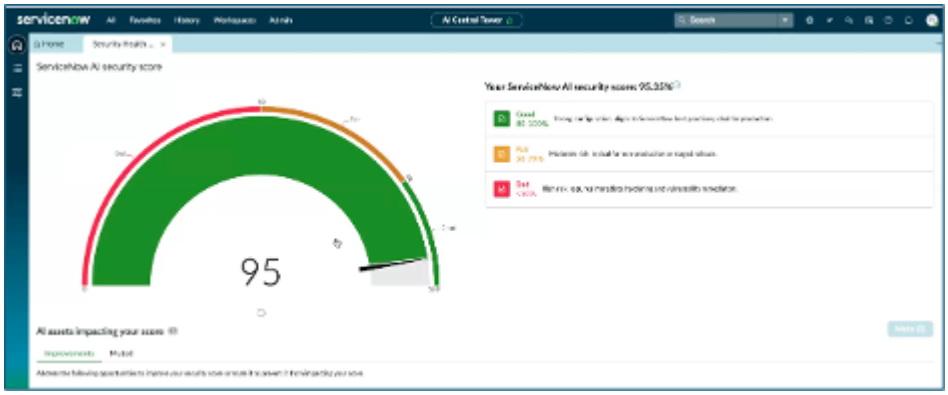
If a warning icon appears on any agent, that agent has access issues. Select the warning icon to see details such as the workflow, agent, and tool associated with the access issue.

In Access issues, the User ID is the ID of the user who ran the agent.

ServiceNow AI Asset Security Score

The ServiceNow AI asset security score is a measure of the health of your ServiceNow AI assets in terms of access issues, privileged AI agents, and dormant AI systems.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



AI assets impacting your score

To see more information about your score, select **See details** in the **Security & Privacy** tab. A list view shows the ServiceNow AI assets that are included in your AI asset security score calculation. Your score is the average of all managed ServiceNow AI assets listed.

You can exclude an asset from your score by selecting a row and selecting **Mute**. For example, you can mute an AI asset if you determine that remediating the asset's issue would be a risky change. You can also configure the score to remove security categories from the score or change the weights of security categories. For more information, see Data sharing, Data overflow processing, and Security & privacy in AI Control Tower.

AI asset details

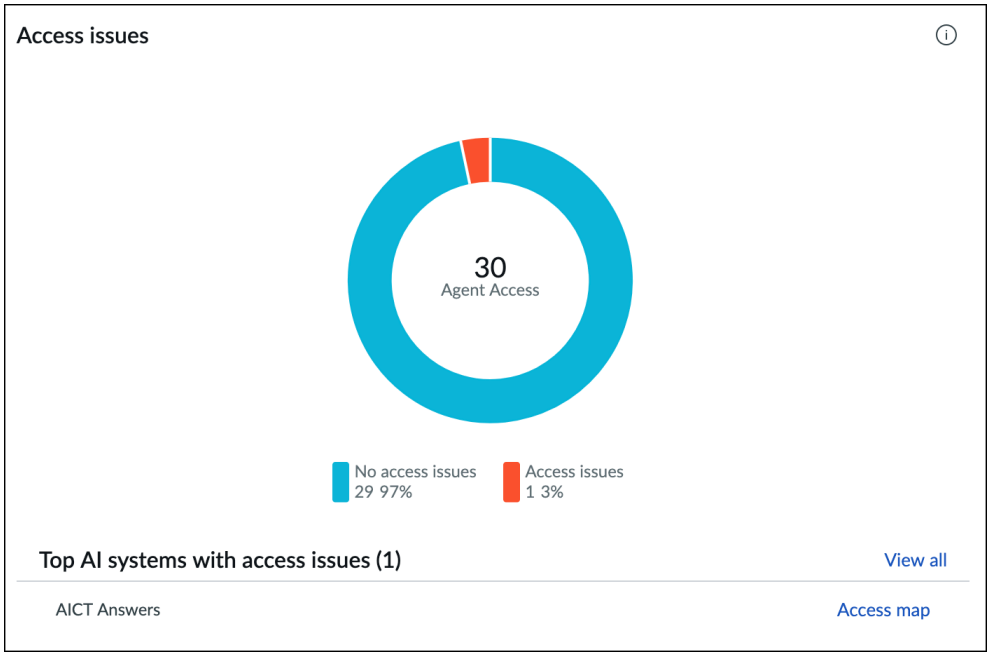
Column	Description
AI system	Name of the ServiceNow asset.
Category	Type of issue, such as dormant AI system, privileged AI agent, or access issue.
Provider	This value is always ServiceNow.
Score impact	The percentage impact to your AI asset security score.
Date	Date the issue occurred.
AI Task	The AI security task to remediate the issue, if applicable.

Access

Access issues

The Access issues chart displays the proportion of AI agents experiencing access-related issues and lists the top AI systems with access issues. AI agents with access issues may be unable to complete their workflows due to the access issue. Hover over a portion of the chart to see the exact proportion and count of agents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



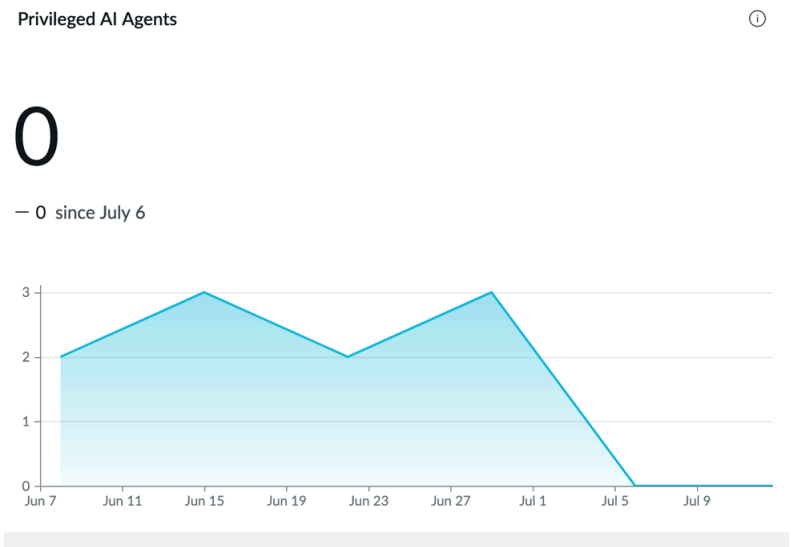
You can create AI security tasks directly from the list view by selecting **Create AI task**. See all active AI security tasks in **AI assets** in the AI Task section. Access to this section requires the sn_vsc.task_manager role.

Resolved AI security tasks that are over 180 days old are archived. Archival days can be configured in system properties.

Privileged AI Agents

The area chart shows AI agents with elevated permissions such as an agent with admin or security admin permissions that can perform critical actions. Some workflows require AI agents have elevated permissions to complete. Hover over a portion of the chart to see the exact number of privileged agents on that day.

To show AWS agent metrics, filter the metrics by selecting **AWS Bedrock** in the provider drop-down list. You must have an AWS account configured for your instance and the Now Assist AiSP AWS IAM Privileged Policy Checker skill enabled. For more details, see AI connections and Activate a Now Assist skill.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

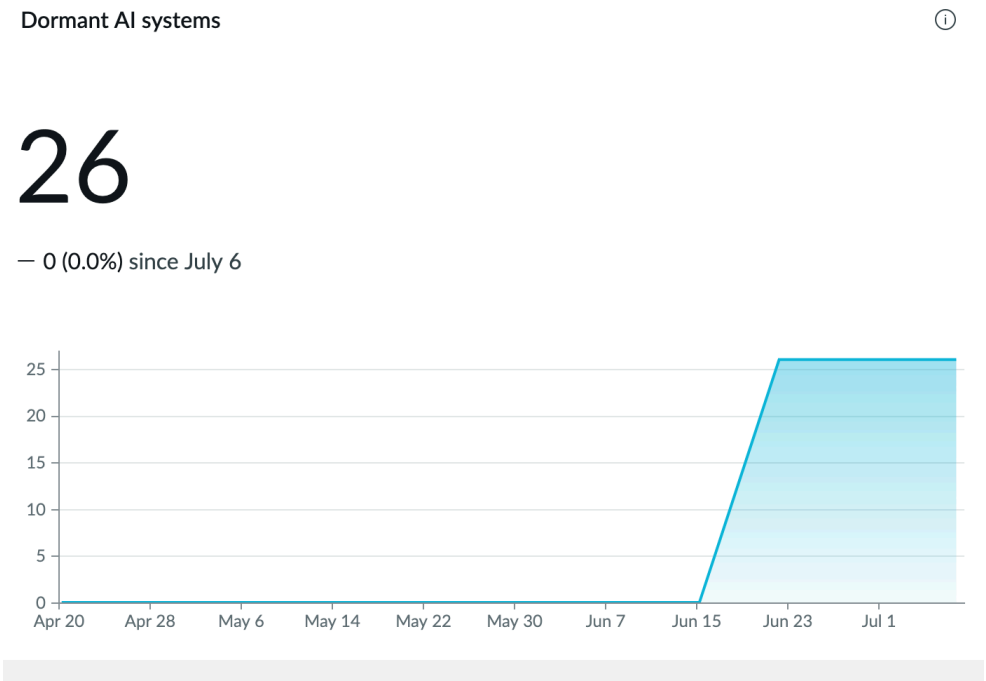
You can create AI security tasks directly from the list view by selecting **Create AI task**. See all active AI security tasks in **AI assets** in the AI Task section. (Role required: sn_vsc.task_manager.)

Resolved AI security tasks that are over 180 days old are archived. Archival days can be configured in system properties.

Dormant AI systems

The area chart shows AI agents that have not been active for over 90 days. Review dormant AI agent permissions to reduce security risk. Hover over a portion of the chart to see the exact number of dormant AI systems for that day.

To show AWS agent metrics, filter the metrics by selecting **AWS Bedrock** in the provider drop-down list. You must have an AWS account configured for your instance. For more details, see AI connections.



When an AI agent becomes dormant, an AI security task is created automatically to streamline your workflow, and quickly resolve issues. The AI security task is assigned to the agent's owner. See all active AI security tasks in **AI assets** in the AI Task section.

Resolved AI security tasks that are over 180 days old are archived. Archival days can be configured in system properties.

ServiceNow instance access to MCP servers

MCP server access metrics include all MCP client-server interactions routed through this instance's AI Gateway. Interactions that bypass the AI Gateway or are routed through another instance's AI Gateway aren't included.

Clients connecting to MCP servers

The Clients connecting to MCP servers chart shows the top 10 clients (ServiceNow AI agents or registered third-party MCP clients) connecting to MCP servers through this instance's AI Gateway. MCP server access metrics are captured for all client-server interactions routed through the AI Gateway. To see more clients, select the chart to drill down into the data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Authorized access attempts to MCP servers

The Authorized access attempts to MCP servers chart shows successful access attempts from MCP clients to MCP servers through this instance's AI Gateway. Clients include ServiceNow AI agents and registered third-party MCP clients. To see more attempts, select the chart to drill down into the data.

Failed access attempts to MCP servers

The Failed access attempts to MCP servers chart shows unsuccessful access attempts from MCP clients to MCP servers through this instance's AI Gateway. Clients include ServiceNow AI agents and registered third-party MCP clients. To see more data, select the chart to drill down into the data.

Guardrails

Prompt injection

These charts show prompt injection data provided by AI Guardian. To see data, enable AI Guardian for your instance. For more details, see AI Guardian analytics.

Offensive content

These charts show offensive content data provided by AI Guardian. To see data, enable AI Guardian for your instance. For more details, see AI Guardian analytics.

Sensitive data

The Sensitive data detected chart shows sensitive data that was identified in user responses to Now Assist prompts. Exposure of sensitive data is limited to the LLM in your instance.

The Sensitive data anonymized chart shows prompt data that met configured data patterns. This data was anonymized based on the configuration for the pattern in Configuration Data Patterns in Data Privacy.

Security policy violations

The Security policy violations chart shows violations of ServiceNow security policies detected in LLM output. The data is collected by scanning generative AI logs to detect policy violations in LLM responses. ServiceNow security policies are based on industry best practices and can't be modified. For example, one policy prohibits linking to executable files or malware, directing users to run unverified downloads or macros, or asking users to disable their antivirus protection. For more information about policies and how to configure data for this chart, see Data sharing, Data overflow processing, and Security & privacy in AI Control Tower.

Agent goal hijack

The Agent goal hijack chart shows when AI agents deviate from their intended role or objective. For example, unauthorized actions or prompt injection attempts. The data is collected by scanning and analyzing agent execution history. For information on how to configure data for this chart, see Data sharing, Data overflow processing, and Security & privacy in AI Control Tower.

AI agent output with PII detected

The AI agent output with PII detected chart shows when agents' LLM output contains personally identifiable information (PII). The data is collected by scanning LLM output for default PII sensitive data patterns specified in Data Privacy and additional PII patterns. For example, U.S. phone number, credit card number, or U.S. passport ID. For information on how to configure data for this chart, see Data sharing, Data overflow processing, and Security & privacy in AI Control Tower.

High-risk AI agent output

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The High-risk AI agent output chart shows when agents' LLM output contains security-vulnerable patterns. The data is collected by scanning LLM output for known vulnerable patterns and potential corresponding attack vectors. For example, HTML tags shouldn't have scripts associated with them for cross-site script attacks (XSS), or no stacked SQL queries that could result in SQL injection attacks. For information on how to configure data for this chart, see Data sharing, Data overflow processing, and Security & privacy in AI Control Tower.

AI Gateway tab in AI Control Tower

Explore the AI Gateway tab in the AI Control Tower.

AI Gateway overview

Prerequisites

Role required: AI steward [sn_ai_governance.ai_steward]

The AI Gateway tab shows the metrics at the MCP (Model Context Protocol) server level, listing all connected MCP servers along with the total number of transactions for each server and its success rate.

The AI Gateway displays a comprehensive view of all MCP servers categorized into:

- Name
- Total transactions
- Success rate

Total transactions are all tool calls, calculated by MCP method equal, which is ("tools/call").

The success rate is the number of such transactions that have an HTTP status from 200 through 299 divided by the total.

AI assets

An AI asset refers to a digital tool or resource that uses artificial intelligence to carry out particular tasks or address problems. Examples include machine learning models, chatbots, natural language processing systems, image recognition software, and similar technologies.

Details

For information on AI inventory, see AI asset inventory

For information on AI asset Lifecycle, see AI asset lifecycle

For information on approval playbook workflow, see Create an AI Control Tower Playbook workflow.

For information on creating Now Assist approvals task, see Create a Now Assist approval task.

For information on AI security tasks, see AI Task.

AI asset inventory

AI asset inventory includes all the AI assets such as AI models, AI systems, prompts, datasets, and MCP servers that an organization can use.

AI asset inventory view

AI systems

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

An AI system can make predictions, recommendations, or decisions that impact physical or virtual environments, with outputs or behaviors that aren't always predetermined by the developer or user. These systems are often trained using large amounts of structured or unstructured data and may function with different levels of autonomy, or none at all, to fulfill objectives set by humans.

AI models

AI models consist of functions and algorithms that are trained and evaluated on datasets to generate predictions or take decisions.

Prompts

Any data, including text or images, that is used to guide, instruct, or influence an AI model's output. Prompts can also refer to an element in a process that requires user input in a field before moving to the output screen.

Datasets

A dataset usually consists of records and fields organized into rows and columns. These datasets are stored within a database table.

MCP Server

Provides external functionality by exposing tools for AI agents to use.

AI assets are presented in a list format and organized by display name, provider, vendor, managed by, lifecycle phase, state, status, and risk classification.

For information on AI asset record details, see View AI asset details

For information on creating AI assets, see Creating AI assets

For information on process flow of the MCP servers, see Process flow of MCP servers via AI Gateway

Assets list- managed and unmanaged assets

Learn about the AI assets list, managed and unmanaged assets.

Assets list

AI assets are presented in a list format and organized by display name, provider, vendor, managed by, lifecycle phase, state, status, and risk classification.

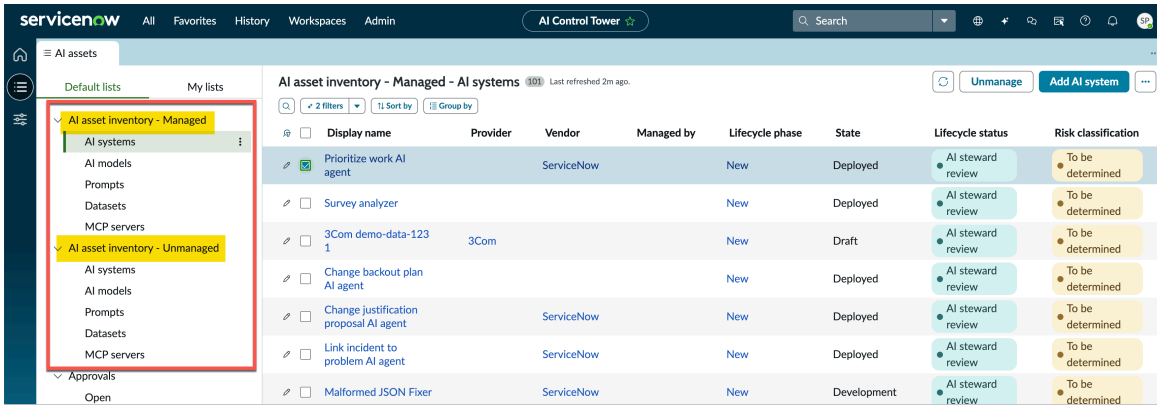
Managed & Unmanaged assets

Starting with the March (2026) release, you can designate assets as managed or unmanaged directly from the list. By default, all the assets in AI Control Tower are under unmanaged assets.

When an unmanaged asset is marked as managed, it gains access to AI Control Tower capabilities such as governance, lifecycle management, value assessment, risk classification, security, and privacy. If a managed asset is switched back to unmanaged, it loses all the before mentioned AI Control Tower capabilities.

The Automation rules define how AI assets are set to managed. For information on Automation rules page, see Automation rules

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note: Initiating a steward review for an unmanaged asset triggers the lifecycle process and automatically transitions the asset to a managed state.

View AI asset details

View the AI asset governance details to track the lifecycle's status, phase, and the install status.

Before you begin

Role required: AI steward

Procedure

1. Navigate to **Workspaces** > **AI Control Tower**.
2. From the AI Control Tower, open the AI assets view.
3. From the navigation menu of the AI assets view, under AI asset inventory, select an AI asset. AI asset details page is displayed.
4. On the page, review the AI asset details.

Field	Description
Version	Version number of the asset
Asset type	Type of assets: ○ Generative AI ○ Agentic AI ○ Classical AI ○ AI model ○ AI system ○ AI prompts ○ AI datasets
Provider	who has built the asset
Vendor	Who has sold the Asset
Department	Department where the asset is allocated
Managed by	Managed by the user who owns the asset
License details	License details of the asset

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Supported locations	Shows the locations supported for the AI as set.
Lifecycle phase	Shows the asset's lifecycle phase. ○ New ○ Assess ○ Build and test ○ Deploy ○ Offboarding
State	The state of the asset. ○ Deployed ○ Retired ○ Development ○ Unknown ○ N/A
Lifecycle status	The lifecycle status of the asset. ○ In review ○ Approved ○ Rejected ○ Deployed ○ AI steward review ○ Approved for development ○ Ready for deployment ○ Approved for deployment ○ Canceled
Risk classification	Risk classification of the asset
Created	Creation date
Updated	Updated date

AI asset lifecycle

The AI asset life cycle defines the series of stages that you must follow to manage an AI system, AI model, prompt, or dataset throughout its useful life.

AI asset lifecycle stages

The AI asset lifecycle consists of the following stages:

Onboard

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The onboard stage is the introduction of an AI asset into your organization. During this stage, you can define important details about the AI asset, including the asset version and documentation.

Assess

The Assess stage is the evaluation of an AI asset to determine its effectiveness, its efficiency, its reliability, and its alignment with your organizational goals. This evaluation includes assessments for the performance, business and risk impact, regulatory compliance, and overall value of each AI asset.

Build and test

The Build and test stage is the development and testing of an AI asset to prepare it for deployment. When you're developing an AI asset, you must create the asset, code any applicable algorithms, and integrate relevant data sources. After you develop the AI asset, you can run tests to verify that it functions correctly, meets your performance standards, and produces accurate results. You can also identify and resolve bugs.

Deploy

The Deploy stage is the integration of an AI asset into your existing workflows. During this stage, you can also set up monitoring to track the performance of the AI asset. You can choose to deploy each AI asset through either a gradual roll-out, in which the asset can be used only by a specific subset of users within your organization, or a full roll-out, in which the asset can be used by any user within your organization.

For more information on Completing AI lifecycle stages, see Complete AI asset lifecycle

For more information on view AI assets by lifecycle stage, see View AI assets by life-cycle stage

Approvals

The approvals are requests created to either approve or reject an asset. The Approvals menu displays a list of Now Assist approvals.

Approval record

The Now Assist approval record displays **Details** and **Playbook** tabs.

The **Details** section displays all the details of an approval and the asset in review. The Assigned to field is editable and the rest of the fields are auto-populated.

The Playbook section displays the workflow for the Now Assist approvals to approve or reject an asset.

The Playbook templates list has a record of playbooks to configure an approval record in three steps:

- Review asset
- Evaluate asset
- Approve or reject an asset

The AI steward can save an approval record by clicking **Save** option and select the more actions icon to **Cancel approval request** or **Delete approval request**.

You can post your work notes in the **Comment** section and track the approval task requests from the **Activity** section.

For enabling Now Assist governance, default Approval Playbook is available.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Approval Playbook feature is available for all Now Assist customers.

Note: If the onboarding playbook is present, then this feature isn't available.

For information about creating AI Control Tower Approval Playbook to enable Now Assist governance, see Create an AI Control Tower Playbook workflow.

For information about creating Now Assist approvals task, see .

Cases

You can view all the assigned and unassigned AI cases in a list view in the AI Control Tower.

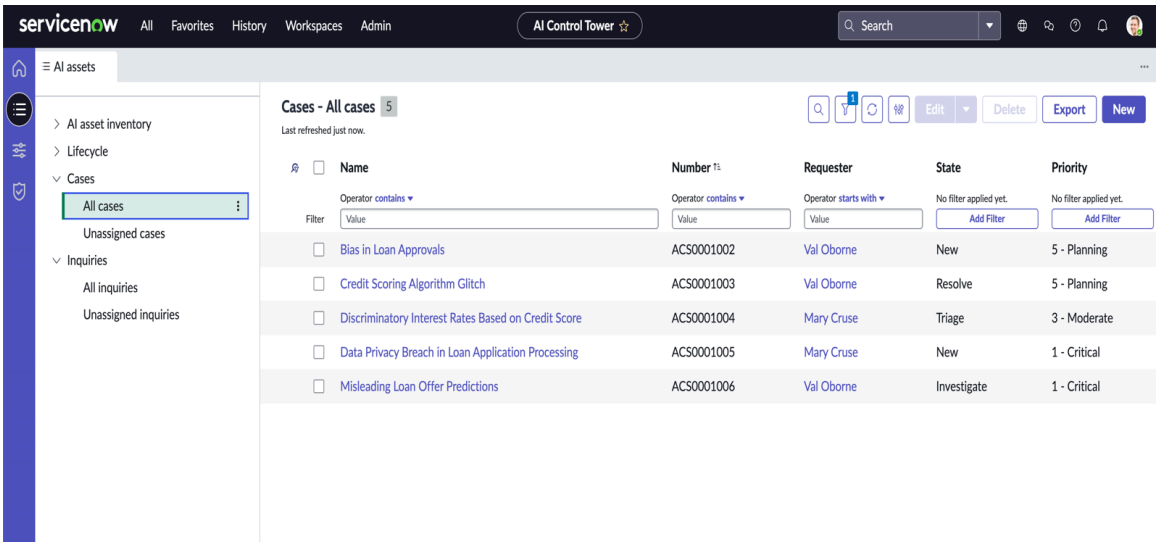
Cases list view

You can view all the cases in a list view. You can perform actions such as search, filter, refresh, and personalize list features on the list view.

Select any case from the list, select **Edit-More Actions** to assign the case to yourself, or **Delete** or **Export** the selected case. You can also select **New** to create a new AI case.

The following image displays all the AI cases in a list view.

Cases



For information about creating AI cases from the AI cases tab in the AI Control Tower workspace, see Create an AI case in the AI Control Tower

Inquiries

You can view all the assigned and unassigned inquiries in a list view in the AI Control Tower.

Inquiries list view

The inquiries section displays all the AI inquiries in a list view.

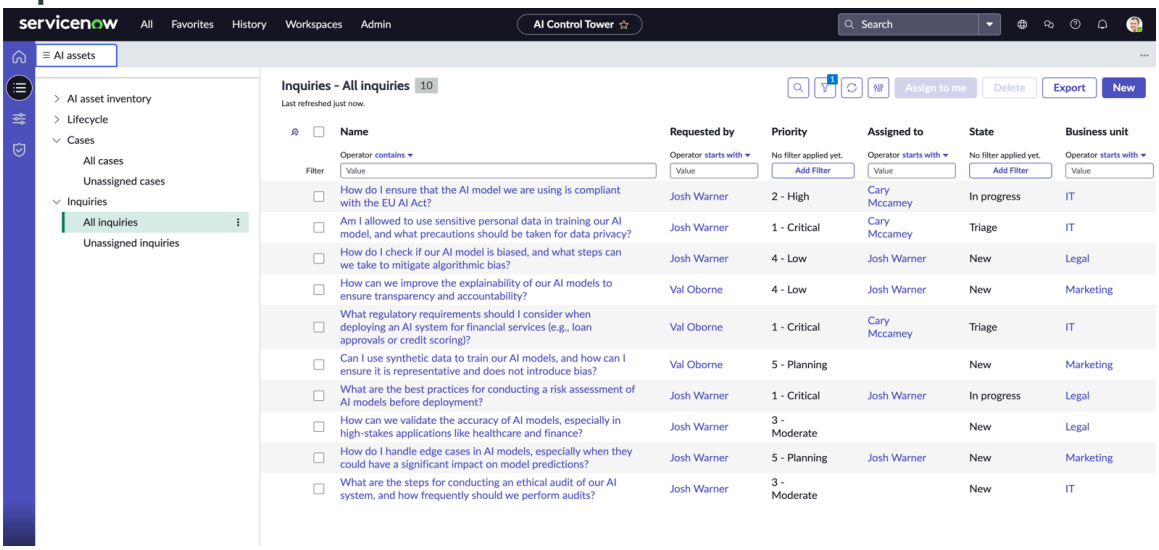
You can perform actions such as search, filter, refresh, and personalize list the inquiries on the list view.

Select any inquiry from the list, click **Assign to me** to assign the inquiry to yourself, or **Delete** or **Export** the selected inquiry. You can also click **New** to create a new AI inquiry.

The following image displays all the AI inquiries in a list view.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Inquiries



For information about creating AI inquiries from the AI cases tab in the AI Control Tower workspace, see Create an AI issue in the AI Control Tower

AI strategies and goals

You can track and monitor the progress of your strategic priorities, goals, planning items, and execution items—projects and demands classified as Artificial Intelligence in other ServiceNow applications.

Strategies

Actions of a strategic plan and its strategic priorities that help to orient your organizational strategic plan toward your goal. Strategic priorities are the objectives of your organizational plans. Strategic priorities help you to achieve your goals over a designated time period. The strategic priorities are also known as focus areas or long-term strategies.

Goals

Goals refer to objectives that an organization sets for itself to accomplish their organizational plans. Goals are typically qualitative in nature. Goals should be ambitious and are expected to motivate and challenge your teams.

Monitoring AI-related items

With Strategic Planning, you can track and monitor the progress of your strategic priorities, goals, planning items, and execution items—projects and demands classified as Artificial Intelligence in the Strategic Planning Workspace. For details, see Managing portfolio plan goals in Strategic Planning Workspace.

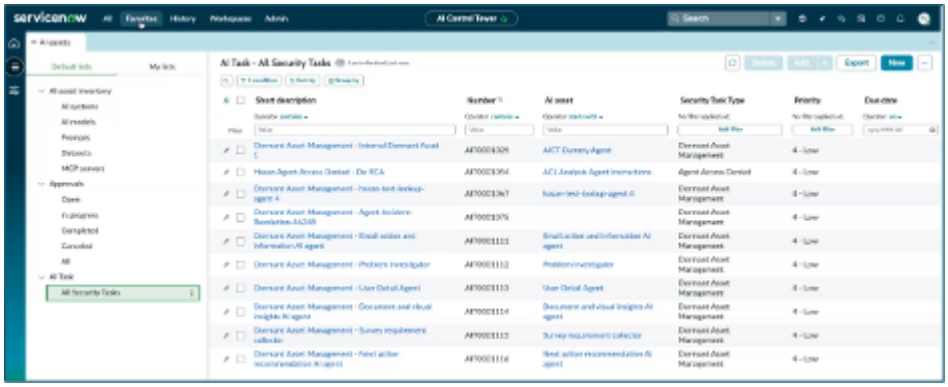
With Goal Framework, you can track and monitor the progress of your strategic priorities and goals classified as Artificial Intelligence in the Goal Framework application. For details, see Managing goals using Goal Framework or Goal Framework for SPM.

With PPM Standard, you can track and monitor the risks, issues, decisions, actions, and changes of your projects classified as Artificial Intelligence in Project Management or Project Workspace, or the primary goal or strategic priority associated with projects and categorized as Artificial Intelligence in Goal Framework or Strategic Planning Workspace. For details, see Create a project from Project Workspace and Add RIDAC records to projects from All RIDAC page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Task

Use the **All Security Tasks** tab to view all AI security tasks for your instance. You can also create an AI task on this page.



Configurations

Explore the AI Control Tower Configurations page to manage and govern ServiceNow® AI assets.

The **Configurations** page contains the following sections to manage the workflow of AI Control Tower

- Data sharing, Data overflow processing, and Security & privacy in AI Control Tower
- Controls
- Multi-instance Setup
- AI Gateway
- AI connections
- Playbooks

For information on configuring AI Control Tower, see Configure AI Control Tower.

For information on completing the AI asset lifecycle, see Complete AI asset lifecycle.

Data sharing, Data overflow processing, and Security & privacy in AI Control Tower

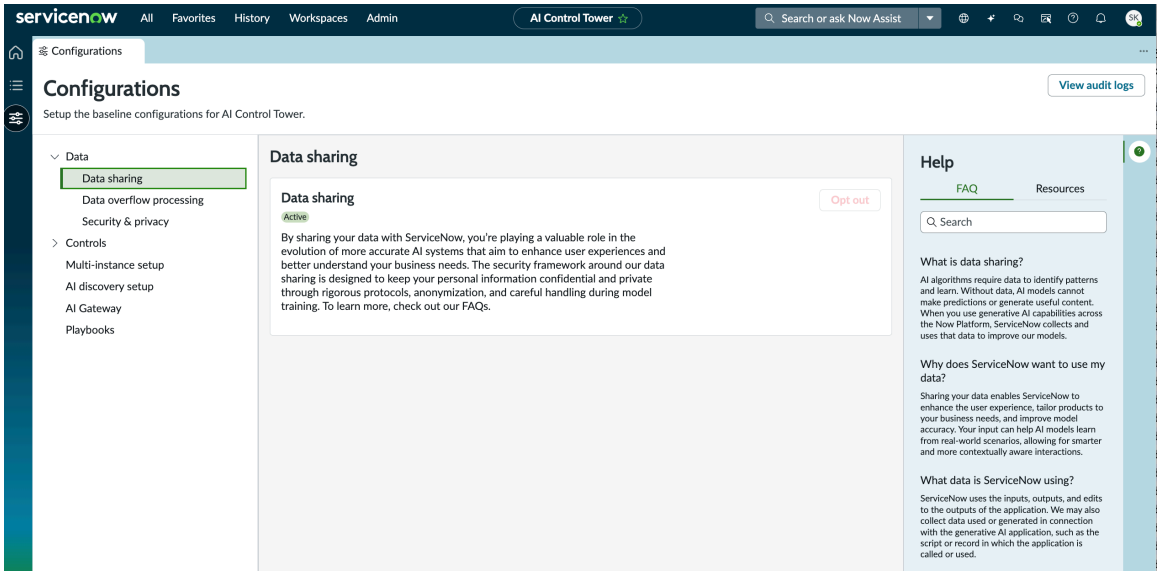
Explore the Data sharing, Data processing, and Security & privacy sections.

The section focuses on improving AI models, managing datacenter traffic, and enabling metrics to measure the integrity of your data model and monitor potential threats in large language model (LLM) input and output.

Data sharing

By default, Data sharing is active. You can opt out to deactivate AI Control Tower and share your data with ServiceNow to improve AI accuracy, enhance user experiences, and gain a better understanding of business needs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Data sharing helps enhance ServiceNow products, but if you choose to opt out of the ServiceNow data sharing program, you'll no longer be able to contribute data to improve ServiceNow AI products.

For information on data sharing opt-out, see Opt out of data sharing.

Data overflow processing

By default, all Now Assist traffic is managed within ServiceNow datacenters. If there are traffic spikes, the system automatically redirects to Microsoft Azure datacenters to maintain performance. You can opt out of this feature to keep all Now Assist traffic exclusively within ServiceNow datacenters. By default, data overflow processing is inactive.

Note: The Data sharing and Data overflow processing features are available for a sub-prod instance in read-only mode, when Multi-instance setup is configured and active.

Security & privacy

Secure policies violation

These configuration settings control the Security policy violations chart, which shows violations of policies detected in LLM responses. To show data for this chart on the dashboard, select **Configure**, and then select **Active**. If you want to discontinue collecting data for the chart, deselect **Active**.

Note: If you inactivate the chart, past data shows on the chart for 90 days.

You can configure these settings:

- **Security policies** – Predefined ServiceNow policies to track for violations. These policies are based on industry best practices and can't be modified.
  - **Physical Chemical Biological Harm** – Detect recipes, parts lists, or methods that could cause real-world harm. For example, explosives, toxins, or bio agents.
  - **Policy Circumvention** – Detect jailbreak techniques. For example, disabling safety instructions or acting as an unfiltered model.
  - **Untrusted Links Or Downloads** – Detect linking to executable files or malware, directing users to run unverified downloads or macros, or asking users to disable their antivirus protection. Heuristic red flags include EXE, BAT, PS1, and APK files, along with macro-enabled documents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Intellectual Property Proprietary** – Detect verbatim reproduction of paywalled or proprietary text or code beyond fair use.
- **Malware Exploits Hacking** – Detect exploited payloads, brute force attacks, evasion, persistence, keyloggers, or “ready-to-run” steps.
- **Refusal Appropriateness** – When a request conflicts with policy, refusal should be safe and brief. Detect under- and over-refusal. For example, refusing benign content.
- **Code And Command Safety** – Detect destructive and insecure commands. For example, don't allow “try this risky one-liner,” disabling security, or running unvetted code.
- **Social Engineering Deception** – Detect impersonation and phishing scripts, credential harvesting, and manipulative pretexts.
- **Fraud Misinformation Illegal Facilitation** – Detect how-to guides for illegal or deceptive practices. For example, for market manipulation, fraud templates, or evading audit. Benign corrections of misinformation are allowed, but not fabrication.
- **System Integrity Prompt Containment** – Detect output of system prompts, hidden policies, and internal configurations or tokens.
- **Legal Regulatory Compliance** – Detect guidance to evade regulations or practice without a license. For example, prescriptions, export control, or money laundering evasion.

- **Sampling rate** – The percentage of transactions that are evaluated. A lower sample rate will result in fewer LLM calls but may also result in fewer detected security events.
- **Max skill calls per execution** – The amount of AI usage per call, with a minimum of 10 calls and a maximum of 100 calls. The default is 10 calls. Entering a lower number results in fewer AI calls, but potentially less accurate data.
- **Single or multiple analysis** – Single analysis uses the default LLM to determine whether the model's output or behavior violates predefined security policies. Multiple analysis uses the results from three or more LLMs that ServiceNow supports to make a determination, using the majority result from the LLMs. Multiple analysis requires an odd number of LLMs.

Agent goal hijack

These configuration settings control the Agent output deviation chart, which shows when AI agents deviate from their intended role or objective. For example, unauthorized actions or prompt injection attempts. To show data for this chart on the dashboard, select **Configure**, and then select **Active**. If you want to discontinue collecting data for the chart, deselect **Active**.

Note: If you inactivate the chart, past data shows on the chart for 90 days.

You can configure these settings:

- **Sampling rate** – The percentage of transactions that are evaluated. A lower sample rate will result in fewer LLM calls but may also result in fewer detected security events.
- **Max skill calls per execution** – The amount of AI usage per call, with a minimum of 10 calls and a maximum of 100 calls. The default is 10 calls. Entering a lower number results in fewer AI calls, but potentially less accurate data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Single or multiple analysis** – Single analysis uses the default LLM to determine whether the AI agent's or skill's response diverges from the expected output. Multiple analysis uses the results from 3 or more LLMs to make a determination, using the majority result from the LLMs. Multiple analysis requires an odd number of LLMs.

Output screening

These configuration settings control the AI agent output with PII detected and High-risk AI agent output charts, which show when agents' LLM output contains PII or security-vulnerable patterns. To show data for these charts on the dashboard, select **Configure**, select **Active**, and then select a setting for the data to collect. If you want to discontinue collecting data for the charts, deselect **Active**.

Note: If you inactivate the charts, past data collected shows on the charts for 90 days.

You can configure these settings:

- **Output Security Vulnerability** – Collect and show data in the High-risk AI agent output chart. The data is collected by scanning LLM output for known vulnerable patterns and potential corresponding attack vectors. For example, HTML tags can have scripts associated with them to generate cross-site script attacks (XSS), or stacked SQL queries that can result in SQL injection attacks.
- **Output Extended PII** – Collect more PII data occurrences and show in the AI agent output with PII detected chart. The data is collected by scanning LLM output for additional PII data patterns beyond those specified in Data Privacy. These PII data patterns are U.S. CA drivers license, U.S. taxpayer ID, U.S. passport number, and vehicle ID number.
- **Output PII Violation** – Collect and show data in the AI agent output with PII detected chart. The data is collected by scanning LLM output for default PII sensitive data patterns specified in Data Privacy. For example, U.S. phone number or credit card number.

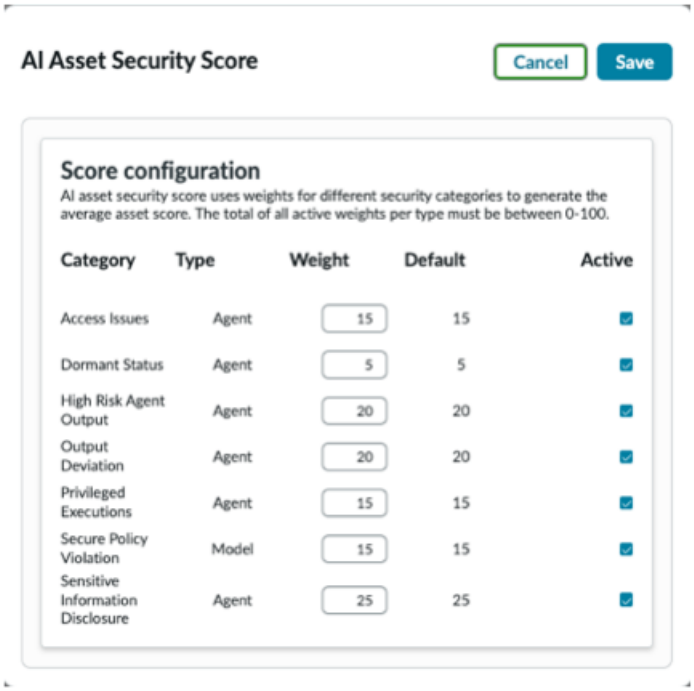
Sensitive data input and anonymization

This section shows the data patterns enabled in Data Privacy to detect and anonymize information in LLM prompts. Use this view as a quick reference when troubleshooting Sensitive data detected and Sensitive data anonymized charts. This feature requires the Data privacy plugin to be installed. For more information on how the data is sent and stored, see User data usage policy for Now Assist.

Score weight

This setting controls how the security categories that comprise the score are weighted. You can change the default weights or remove security categories from the score by deactivating them. The score formula is an average across all managed AI assets.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Controls

Explore the **Controls** section on the configurations page of the AI Control Tower.

Expand the **Controls** section to explore the sub sections:

- Explore Approvals
- AI model providers
- Automation rules

Explore Approvals

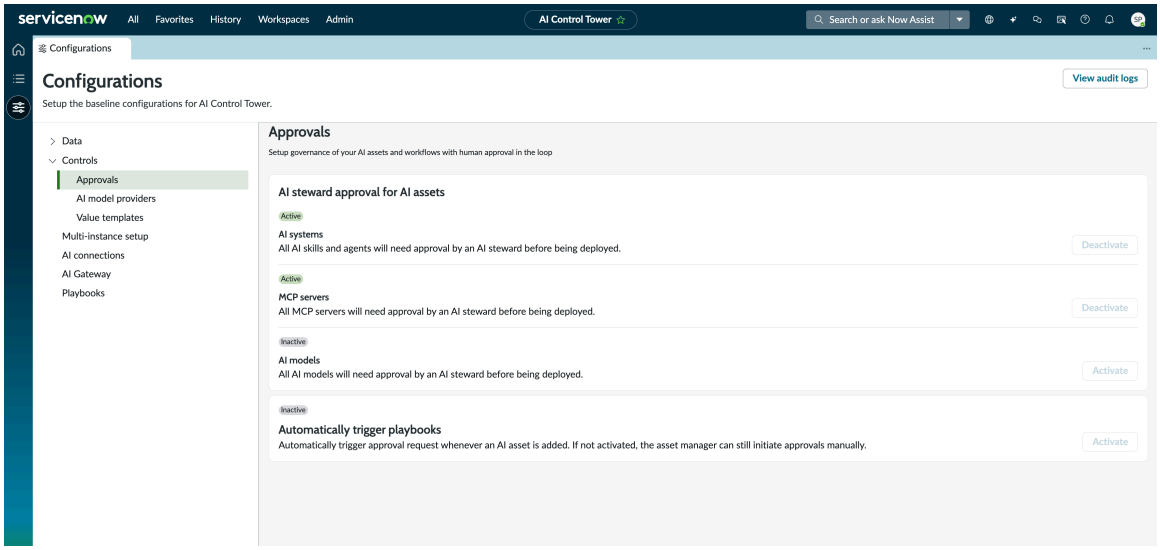
Explore the **Approvals** section on the Configurations page of AI Control Tower.

The approvals page has two features to set up governance of your approvals for AI assets and workflows.

- AI steward approval for AI assets- when the AI steward approval-required control is active, asset deployment is blocked until it receives an approval from the AI steward approves it. This control is inactive by default but can be activated for required approval before deploying an AI asset.
  1. AI systems- Activating AI systems, all the AI skills and agents need approval by an AI steward before being deployed.
  2. MCP servers- Activating MCP servers setting, AI Stewards can block unapproved MCP servers from being used in AI Agent Studio. The setting is deactivated by default and must be manually activated by the AI steward.

     When you attempt to add an unapproved server in Agent Studio, you'll see an error message: 'Approval is needed to display tools', helping prevent any interaction with that server.
  3. AI models- Activating this all AI models need approval by an AI steward before being deployed.
- Automatically trigger playbooks- enabling automatically trigger playbooks control triggers approval requests for AI assets. When inactive, only the AI steward can initiate requests manually. The recommendation is to have this control activated in the production environment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Explore AI model providers

Explore the AI model providers section in AI Control Tower.

AI model providers enable you to select data routing, manage third-party LLMs (Large Language Models) and SLMs (Small Language Models), and configure the third-party LLMs by selecting the allowed model providers.

Data routing and model providers

Data routing is a technology by which LLM and SLM requests are routed to the most suitable datacenter. This technology helps to optimize data traffic, which reduces latency and speeds up response time.

The Data routing and model providers section enables you to route AI model requests and select the Allowed model providers.

There are two types of data routing:

Regional data routing

Regional data routing routes LLM and SLM requests to datacenters within your region. For example, if you're in the APJC (Asia Pacific, Japan, and China) region, these requests could be routed to the most suitable datacenter in the APJC region. Regional data routing can sometimes be mandated by governments of specific regions.

Global data routing

When you opt for Global data routing, LLM and SLM requests are routed to the most suitable datacenter globally.

You can configure the third-party LLM providers using the edit option by choosing either Regional or Global data routing and select all the Allowed model providers.

There are two sections of AI model providers:

- AI model providers supported by ServiceNow
- AI model providers configured by your organization

The AI model providers supported by ServiceNow contain providers such as Now LLM Service, AWS Claude, Now LLM-LTS model and so on.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The AI model providers configured by your organization such as Perplexity, IBM Watson and so on.

AI asset lifecycle

Note: You can select Now LLM Service- LTS (Long term stable) Model, which supports regulated industries, such as financial institutions, with stronger AI lifecycle management, governance, transparency, and compliance tools.

For more information on Now LLM Service- LTS model, see Long term stable models

For information on exploring the scenarios configuring third-party LLMs for all the regions, see Explore Third-party LLMs and regions

For information about configuring third-party LLMs through Data routing configuration for APJC region, see Configure third-party LLMs using AI Control Tower

Fallback and Spillover

Fallback

If you have active AI systems in ServiceNow® that aren't supported by your enabled model providers, the 'fallback mechanism' enables these systems to continue operating with their default providers. However, if you choose not to enable fallback, these AI systems must be deactivated. AI systems deployed on fallback providers conform with the list of approved providers.

Note: The Fallback is activated by default and can be modified.

Spillover

Regional deployments of AI models can experience limited capacity, which could lead to request rate limiting and impact performance. Enabling spillover can help prevent these performance issues. In ServiceNow®, only Azure OpenAI currently makes this switch.

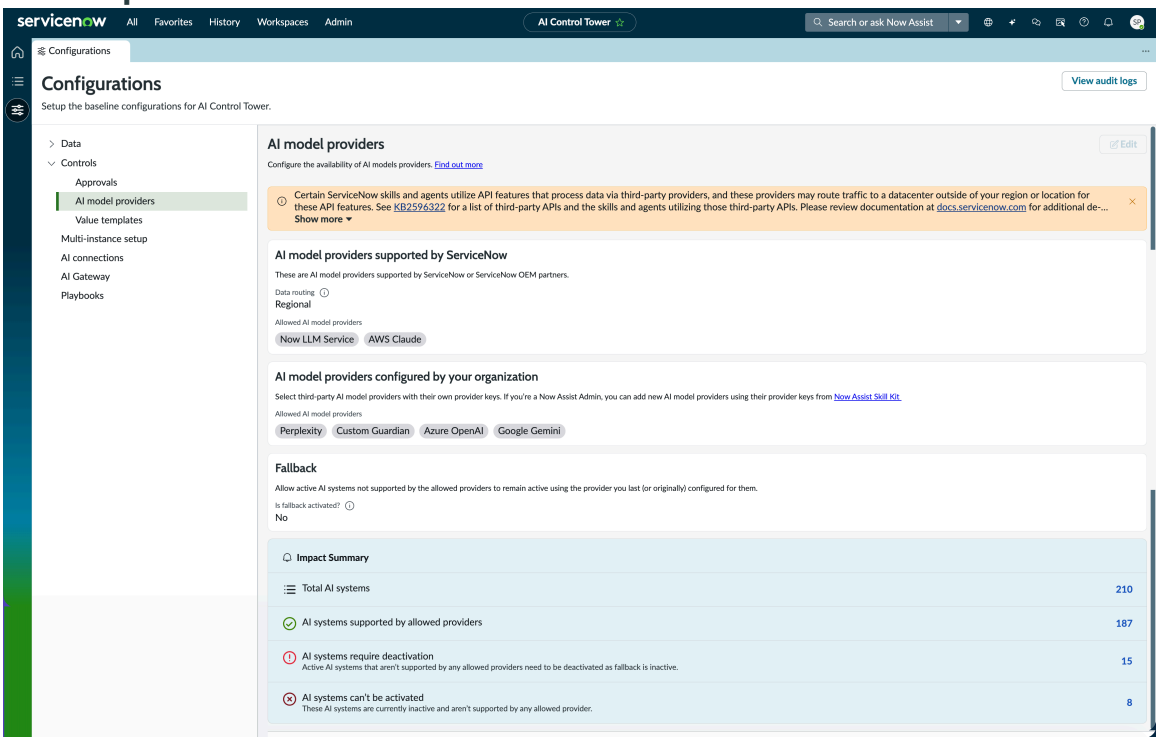
Note: The Spillover feature gets active or enabled when Azure OpenAI gets selected.

Impact Summary

The Impact Summary is determined by the chosen Allowed model providers and the status of the fallback, which is either active or inactive. The Fallback significantly affects how the Impact Summary data appears in the Impact Summary table.

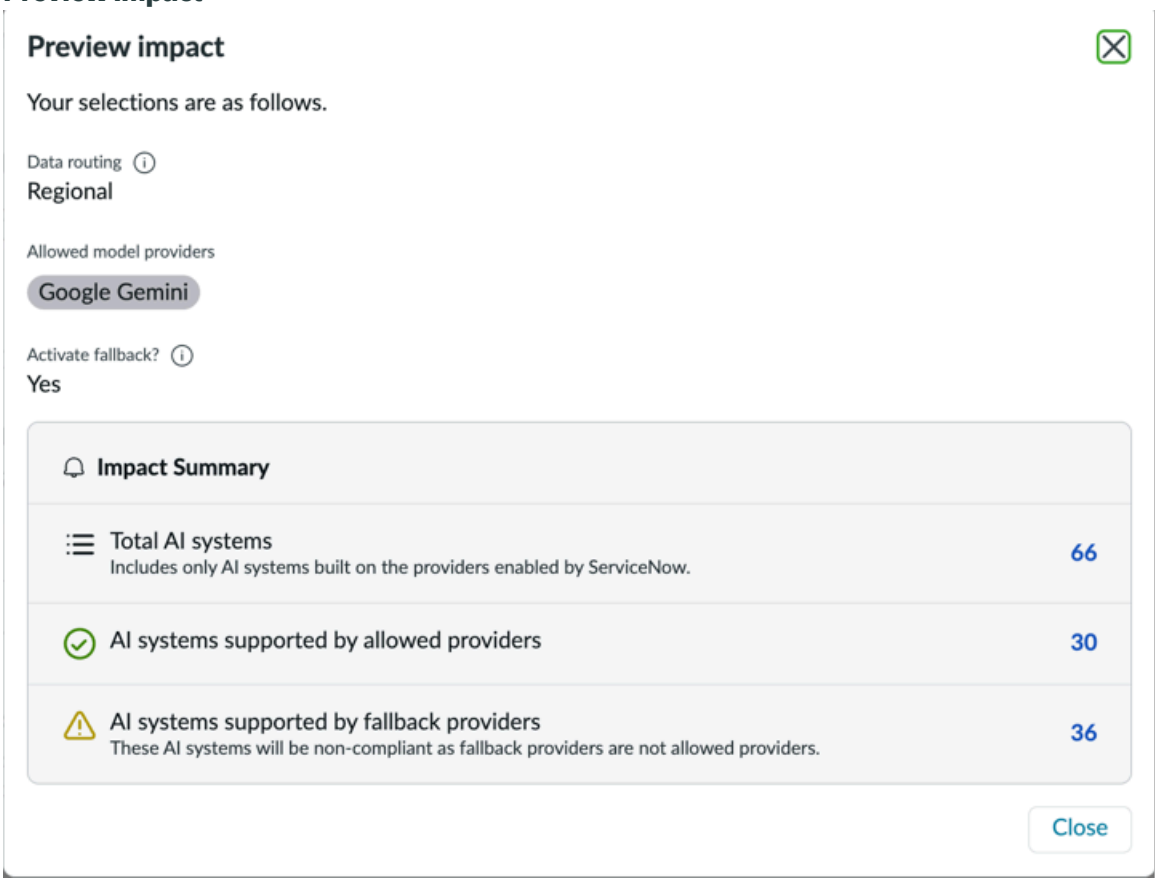
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI model providers



You can use the edit option to select Yes or No for activating the Fallback. Before saving, you can select Preview impact to review and confirm all your selections.

Preview impact



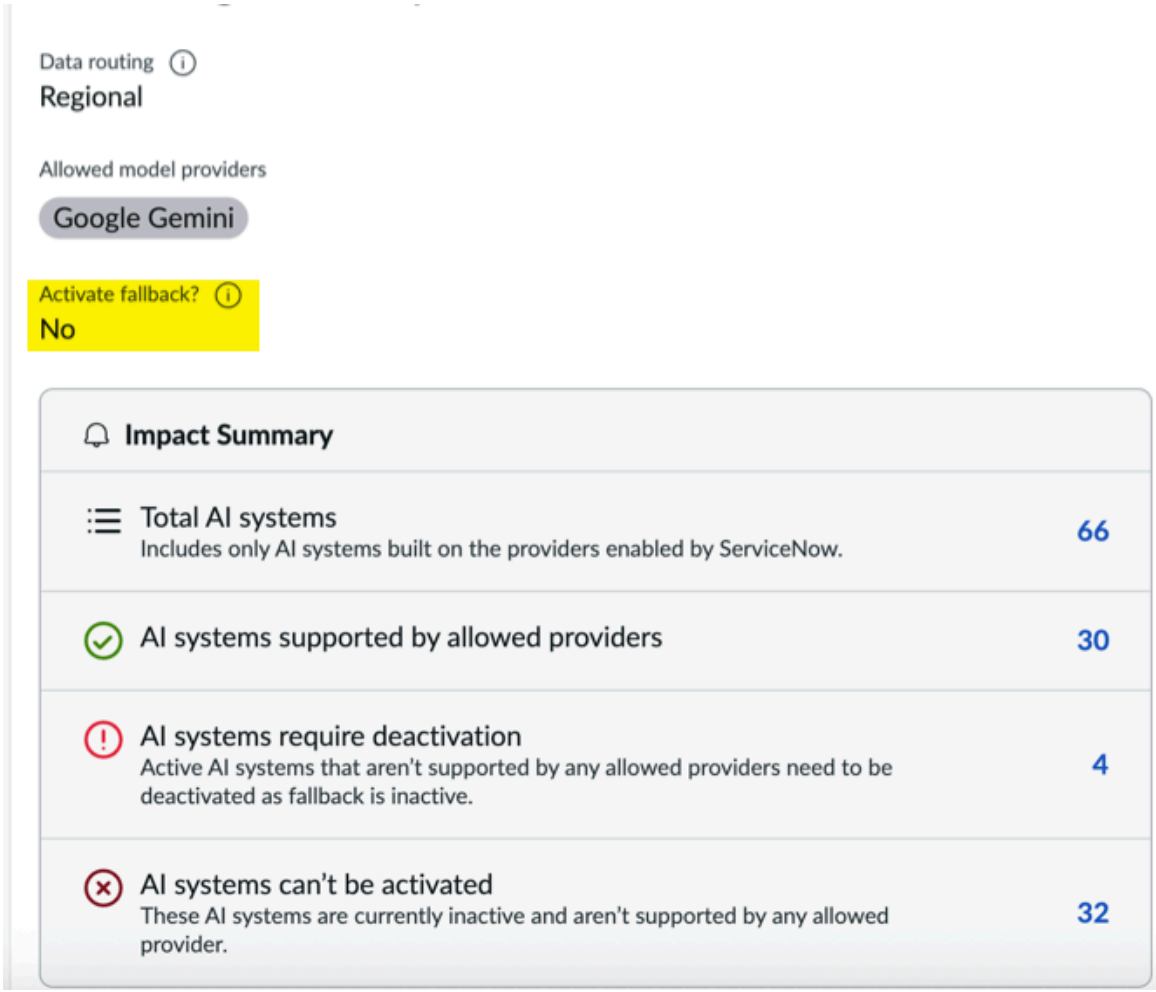
Let's review the Impact Summary table data for the following two scenarios.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Activate fallback- No

- Total AI systems- Shows all AI systems that are supported by the allowed model providers.
- AI systems supported by allowed providers- Shows AI systems with skill sets that are supported by the providers.
- AI systems require deactivation- Lists all active AI systems that lack provider support and must be deactivated because the fallback option isn't enabled.
- AI systems can't be activated- Shows all those systems, which are currently inactive and aren't supported by any provider.

Activate fallback- No

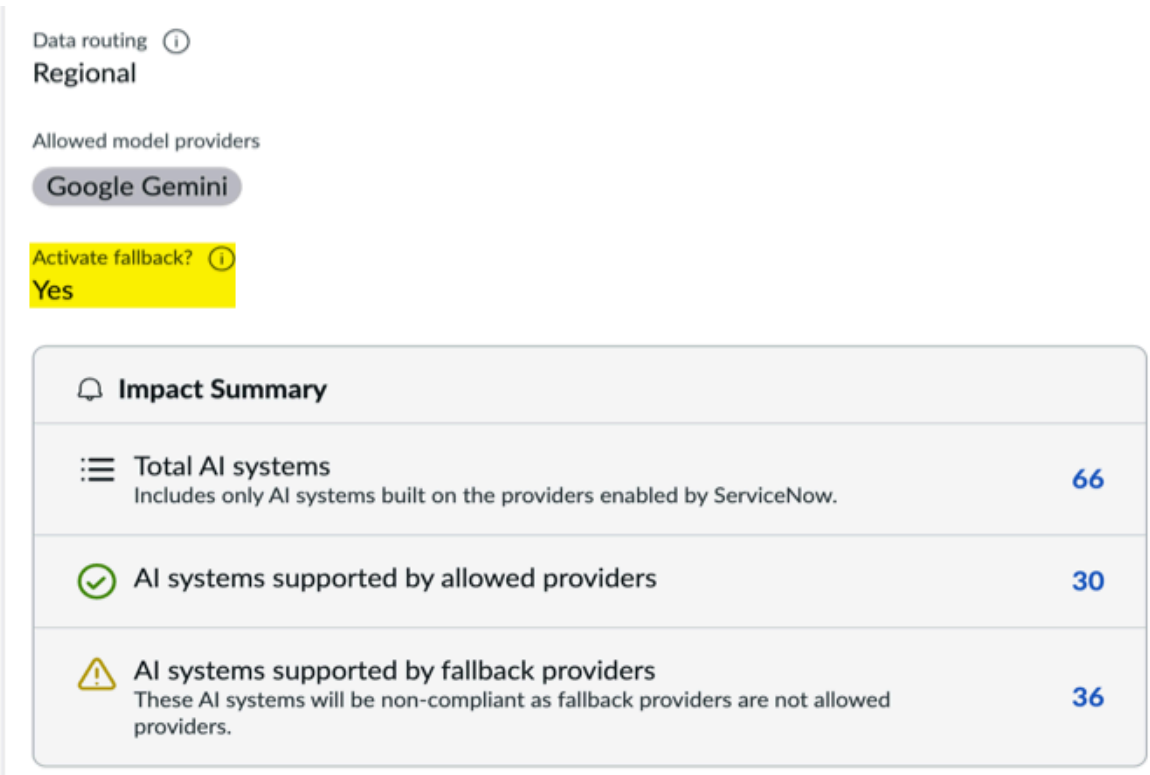


Activate fallback- Yes

- Total AI systems- Shows all AI systems that are supported by the allowed model providers.
- AI systems supported by allowed providers- Shows all AI systems with skill sets that are supported by the providers.
- AI systems supported by fallback providers- Shows AI systems that are non-compliant as fallback providers aren't permitted providers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Activate fallback- Yes



Note: The entries in the Impact summary table change based on the fallback status.

When you select an entry from the table, the support matrix page appears with those selected entries, allowing you to update your personalized list.

The support matrix presents all AI systems in a table format, along with their respective AI model providers. You are able to view the support matrix table and categories such as AI system, type, activation status and more, as well as the selected AI model provider.

If you have selected an AI provider, which is supported by your organization or a third party provider, the selected provider will show up in the AI systems and model provider support table.

Support Matrix

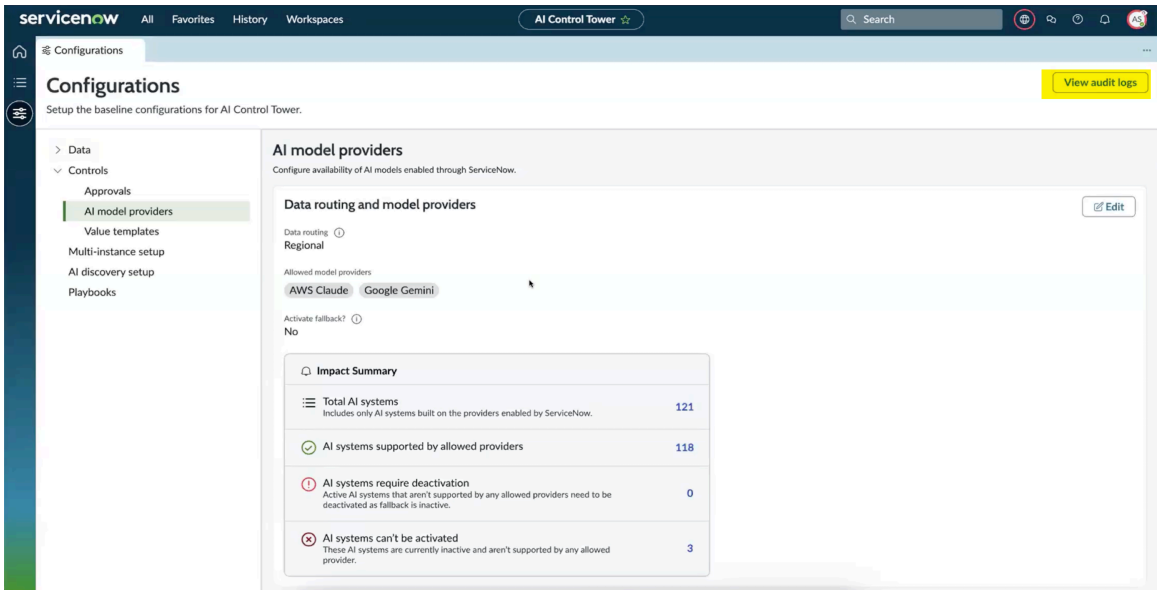
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Audit logs

Audit logs show configuration changes made on Data, Approvals, and AI model providers categories in AI Control Tower. You can select the **View audit logs** option to view the Audit logs.



The Audit logs page displays all the configuration changes details organized in the following categories:

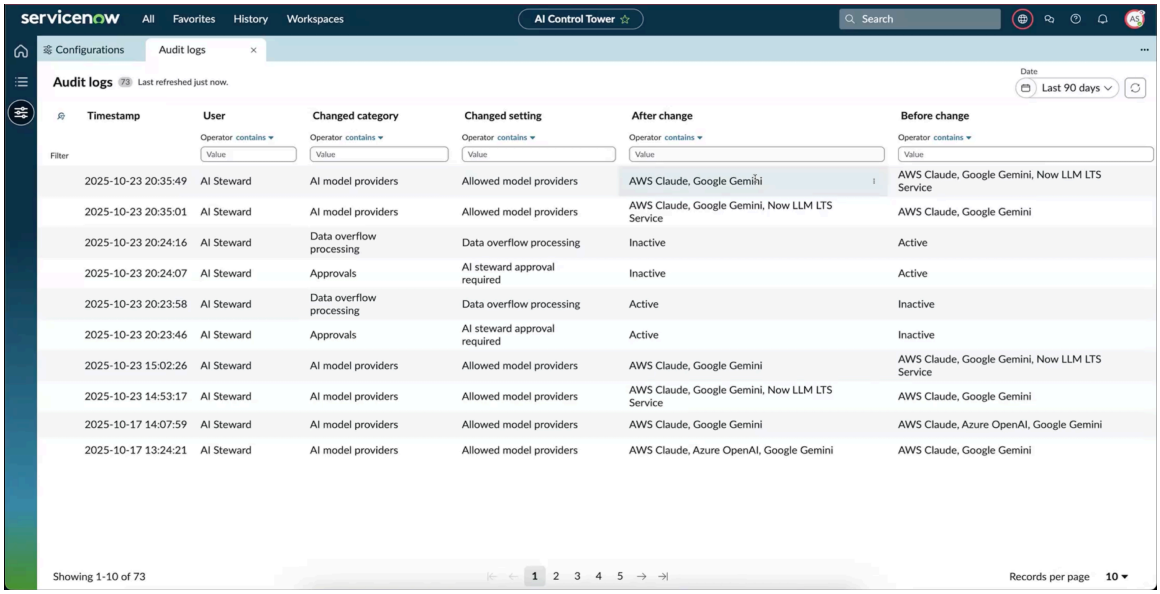
- Timestamp
- User
- Changed category
- Changed setting
- After change
- Before change

You can also filter the changes by selecting a date range, starting with the last 90 days.

Note:

In the Multi-instance setup, when a managed (sub-prod) instance is added or removed from the syncing instances in the AI inventory information to synchronize with a specific manager (prod) instance, the audit logs first display a record of all instances being removed, followed by a separate record indicating the instance being added or removed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Automation rules

The Automation rules define how AI assets are set to managed.

Automation rules Overview

The Automation rules page displays all default rules available in AI Control Tower. AI Stewards can modify existing rules or create based on their organizational requirements.

Rule limits

- Maximum rules allowed: 10
- Maximum rules that can be active simultaneously: 5

How rules are applied

Once activated, rules are enforced according to the schedule defined in the Run AI Asset Management Rules Scheduled job.

Reference

For information on managed and unmanaged assets, see Assets list- managed and unmanaged assets.

Multi-instance Setup

The multi-instance setup enables a prod (manager) instance to control, manage, and communicate with multiple sub-prod (managed) instances for AI Control Tower.

AI asset Synchronization

Multi-instance setup uses the multi-instance framework, which helps the user to synchronize assets from sub-prod instances to prod instances for a faster review process.

Multi-instance setup synchronizes rules for the sub-prod instances from the prod instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Starting with the February 2026 release, ensure that both the prod and sub-prod instances are running the same AI Control Tower core version (5.1.1), which is the minimum supported version.

If there's any upgrade to version 5.1.1 in a sub-prod, then it's advisable to upgrade the prod instance to 5.1.1 to ensure Multi-instance framework functions correctly.

AI inventory information

You can include the sub-prod instances that you want to synchronize with the prod instance. This synchronizes AI inventory information between the instances.

When configured, the scheduled job starts syncing AI systems, AI models, prompts, and datasets. From the September (2025) release, the job has been enhanced to include syncing AI agents as well.

Note: State of the assets while configuring Multi-instance management.

The AI inventory in production reflects the true state of your assets like models, datasets, or skills from a production standpoint. Even if a model or dataset is active in a sub prod (lower) environment, it's still considered as under development from a prod perspective, since it's being tested and not yet live.

For this reason, you don't synchronize asset states across environments. An asset's state changes to **deployed** only when the asset and its related records are activated in the production system.

In summary, the state represents the overall lifecycle of the asset, not its local status in a specific environment.

Data sharing preference

You have the option to enable the data sharing preference, when it is enabled the preferences of the data sharing from the production will be applied to all sub-prod instances. By default, the data sharing preference is turned off.

Data overflow processing and bursting preference

You have the option to enable the data overflow processing and bursting preferences, when it is enabled the preferences of the data overflow and bursting from the production will be applied to all sub-prod instances. By default, data overflow processing and bursting is turned off.

Note: All the preferences mentioned earlier for a sub-prod instance are available in read-only mode, when Multi-instance is configured and enabled.

For information about configuring Multi-instance management for AI Control Tower, see Configure multi-instance management for AI Control Tower

For information about Data section, see Data sharing, Data overflow processing, and Security & privacy in AI Control Tower

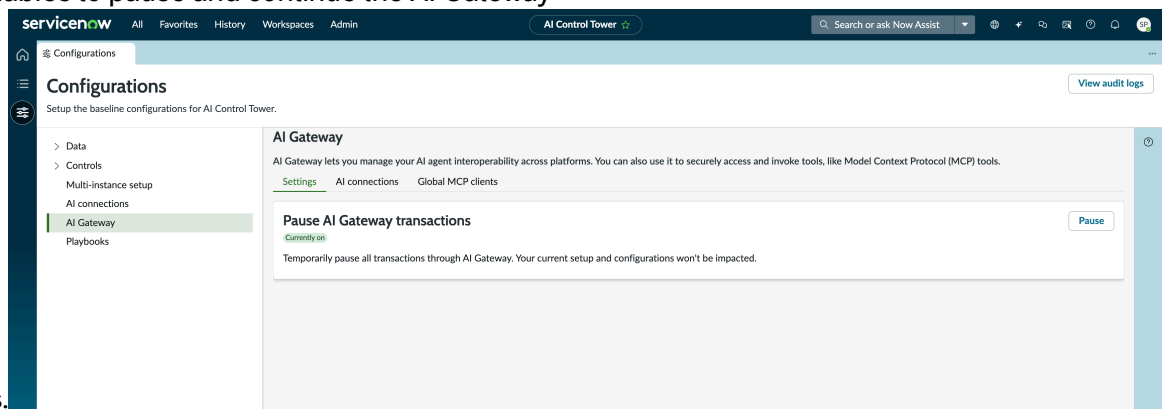
AI Gateway

Explore the AI Gateway page and its tab in the AI Control Tower Configurations.

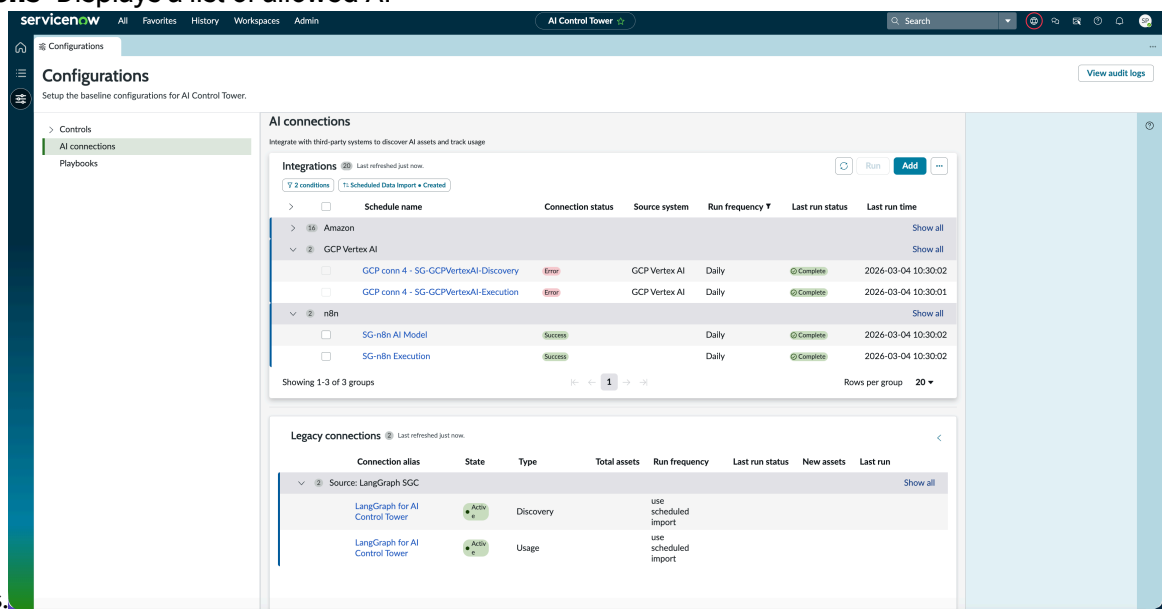
The AI Gateway page enables you to pause and resume AI Gateway transactions, as well as monitor AI connections. The AI Gateway page has the following tabs:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

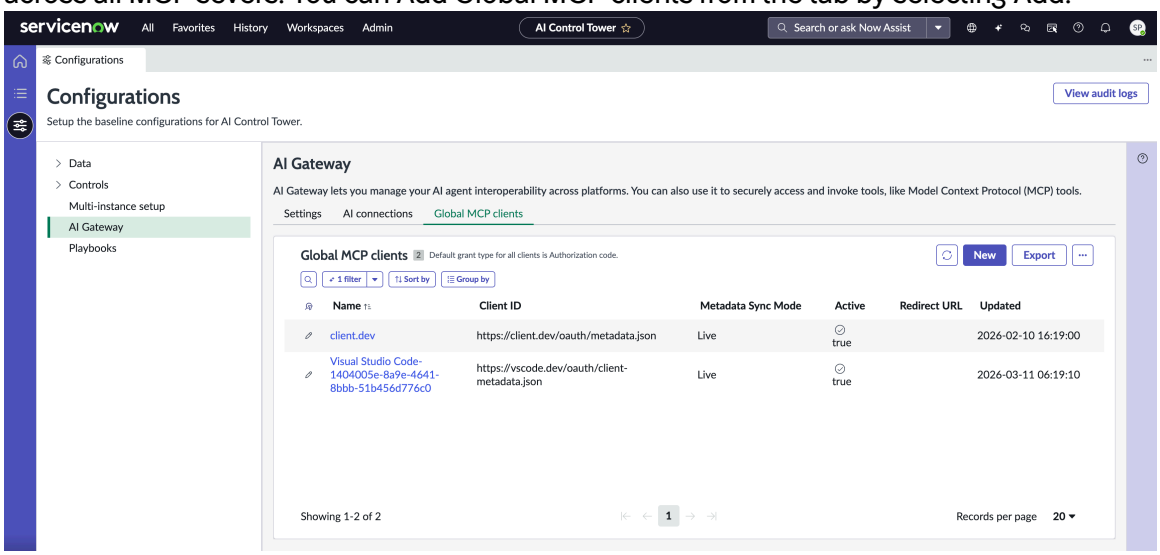
Settings- enables to pause and continue the AI Gateway transactions.



AI connections- Displays a list of allowed AI connections.



Global MCP clients- View the list of Global MCP clients (CIMD support), Where CIMD refers to Client ID Metadata document. These Global MCP clients once created can be used across all MCP severs. You can Add Global MCP clients from the tab by selecting Add.



For more information on adding a Global MCP client, see Add a Global MCP client.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can filter and export the list into PDF, JSON, Excel, and CSV format. The list of allowed AI connections is categorized into.

- Name
- Allowed on AI Gateway
- Last updated by
- Updated

For information on AI Gateway tab on the AI Control Tower Home, see AI Gateway tab in AI Control Tower

Playbooks

The Playbook templates list has a record of Approval Playbook for Now Assist approvals and Asset lifecycle playbook templates.

The Now Assist approval is a workflow that facilitates the AI asset approval process.

The AI asset lifecyle is completed by the following steps:

- Onboarding
- Assess
- Build and test
- Deploy

You can create your own playbook workflow by customizing the number of steps or rearranging them, as well as applying different security policies.

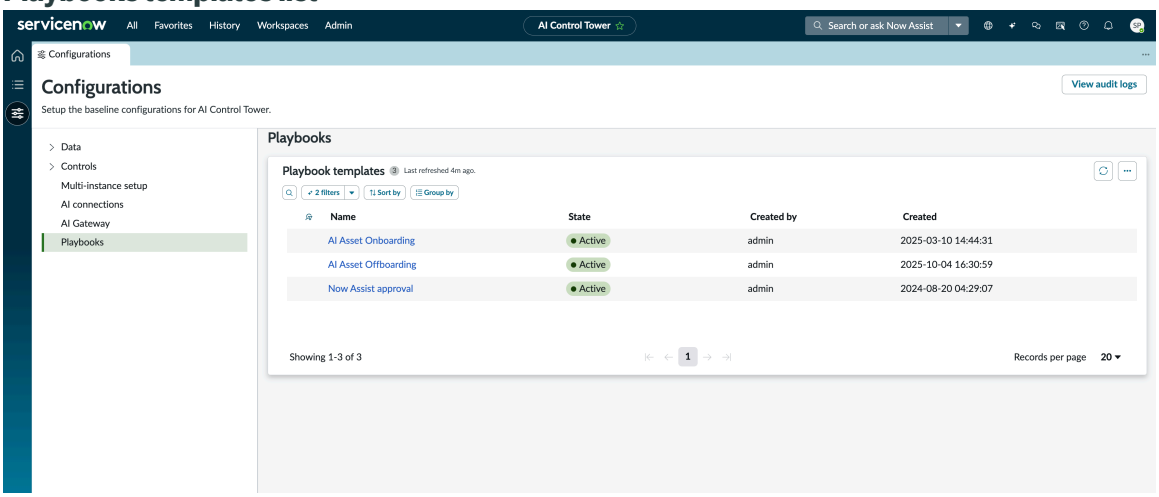
Note: To retire an asset, offboarding process is initiated.

For information about AI asset lifecycle process, see AI asset lifecycle

To view AI assets by lifecycle stages, see View AI assets by life-cycle stage

For information about Off-boarding and creating offboard requests for AI assets, see Create offboarding requests for AI assets

Playbooks templates list



For information on creating a AI Control Tower playbook workflow for Now Assist approvals, see Create an AI Control Tower Playbook workflow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To view the Asset lifecycle stage, see View AI assets by life-cycle stage and to view the completing of the Asset lifecycle stage, see Complete AI asset lifecycle

Product Owner portal

Explore the product owner view and navigate through the accessible tabs on AI Control Tower to ensure a comprehensive understanding of the features.

Product owner view

The AI Control Tower product owner view displays tabs for AI asset owner and workspace users. The AI asset owner can access **My overview**, **Value**, and **Adoption** tabs and the workspace user can access the **AI portfolio** tab.

For information about My overview tab, see My overview tab in AI Control Tower

For information about My portfolio tab, see AI portfolio tab in AI Control Tower

For information about Value tab, see Value tab in AI Control Tower

My overview tab in AI Control Tower

The **My overview** tab in the AI Control Tower home page displays all active assets to the asset owner and the AI stewards for assets that they manage or own.

Explore My overview tab

The **My overview** tab displays the following widgets. You can drill down into the data on each widget.

Assets

This area displays all the assets owned by the asset owner, organized into the following categories:

- Generative AI
- Agentic AI
- AI prompt
- AI dataset
- AI model

Assets by lifecycle status

This area displays the lifecycle status of the assets, organized into the following categories:

- Deployed
- In review
- AI steward review
- Ready for deployment
- Rejected
- Cancelled

AI cases by state

This area displays the active cases categorized into **New** and **Triage**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The **Create an AI asset** button is added to the home page to track and manage the life cycles of your AI systems, AI models, Prompts, and Datasets.

Tasks and cases list

The **My overview** tab displays a list of tasks and cases. You can view all the active tasks that are assigned by default under tasks.

The tasks list includes the following columns:

- Number
- Priority
- Short description
- Assigned to
- State
- Due date
- Asset in review

The cases list includes the following columns:

- Name
- Number
- Case analyst
- Assignment group
- State
- Priority

AI portfolio tab in AI Control Tower

The **AI portfolio** tab in the AI Control Tower home page displays all AI assets, which includes (active, inactive, and completed) to the workspace users.

Explore AI portfolio tab

The AI portfolio tab AI shows all the active AI assets organized into the following categories:

- AI systems
- AI model
- Datasets
- Prompts

The lifecycle status of AI assets is divided into the following categories:

- In review
- Approved
- Rejected
- Deployed
- Retired

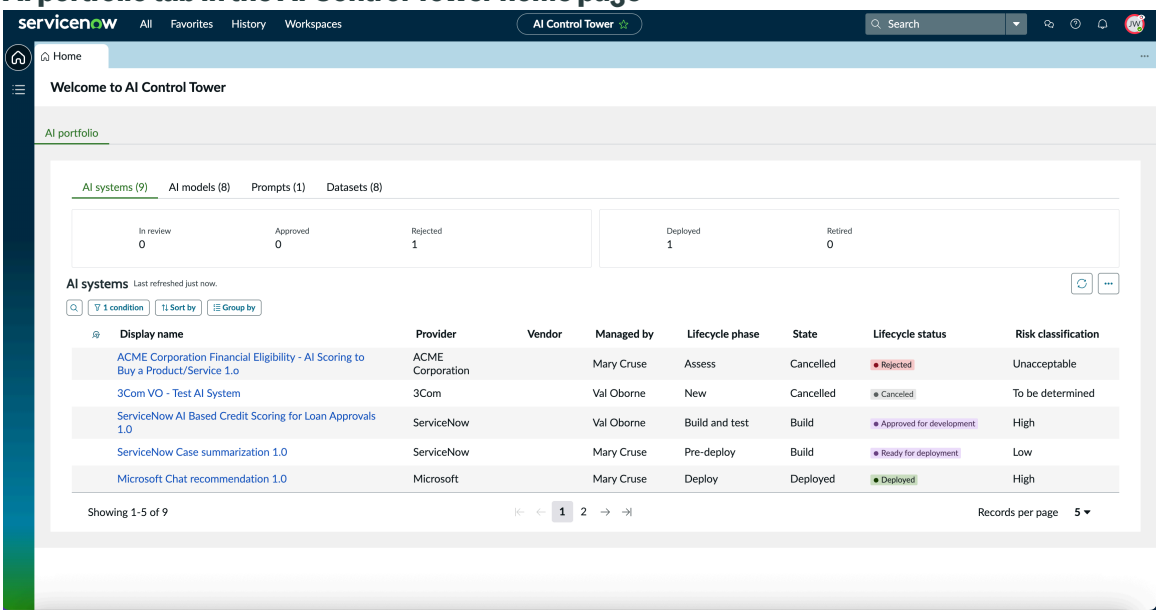
The AI assets list includes the following columns:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Display name
- Provider
- Vendor
- Managed by
- Lifecycle phase
- Install status
- Lifcycle status
- Risk classification

The following image displays the AI portfolio tab as it appears to a workspace user.

AI portfolio tab in the AI Control Tower home page



Business portfolio tab in AI Control Tower

The Business portfolio tab on the AI Control Tower home page displays AI adoption trends across your business application portfolio.

The Business portfolio tab is accessible from the AI Control Tower workspace home page.

Business portfolio widgets

The Business portfolio tab displays the following widgets. You can drill down into the data on each widget.

- Business applications by AI system association: The total number of business applications, broken down into **Linked to AI systems** and **Not linked to AI systems**.
- AI systems by business application association: The total number of AI systems, broken down into **Linked to business applications** and **Not linked to business applications**.

You can filter the widgets by business application attributes, such as department, business unit, or application family.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Viewing the underlying list

Select either segment of a donut chart to open the corresponding filtered list of business applications or AI systems.

Select a business application's **Number** in that list to open its record directly within the AI Control Tower, without navigating to the Enterprise Architecture Workspace.

AI Control Tower integration with Enterprise Architecture

Definitions of AI asset inventory

Explore AI asset inventory, and AI assets.

AI asset inventory overview

The AI asset Inventory provides a record of all components and their connections that contribute to an AI experience. In ServiceNow AI Control Tower, AI asset inventories can be organized in multiple ways. Organizations may opt to manage one or more of these AI assets as part of their overall AI governance strategy.

- AI systems
- AI models
- Datasets
- Prompts

For more information on, AI asset inventory tab, see AI asset inventory tab in AI Control Tower

For information on AI assets, see AI assets

AI systems

Explore AI systems in detail with examples.

AI system

An AI system is a type of computer program designed for performing tasks that typically require human intelligence, such as learning the language, deciding, or recognizing images. Unlike traditional software that operates based on set rules, AI systems learn from data, adapt their actions, and can decide on their own.

Hierarchical AI system

AI systems can be interconnected, with one system potentially depending on the outputs of another, referred to as a sub AI system." Recognizing these connections is important for monitoring AI usage and clarifying responsibilities.

Tools are considered attributes of an AI system or sub AI system. They aren't tracked as separate AI assets in the inventory and don't have a lifecycle managed by the AI Control Tower for governance or value assessment. The concept of Tools is relevant for agentic AI use cases, where they're linked to AI systems during discovery, often through cloud platforms like Azure Foundry, AWS, or internal discovery processes.

AI Control Tower helps identify and track all AI systems in an organization, including how they're connected. This supports AI risk assessments and audits.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Examples:

- Spam filter in Gmail- Determines whether emails are spam or not
- Netflix recommendation engine- Suggests shows that you might like
- Self-driving car software- Makes driving decisions
- Chatbot like ChatGPT-Responds to questions
- AI Issue Resolution Agent- uses other smaller AI systems like Issue Summarization and Owner Mapping

Example of an AI system

The AI Control Tower application and the AI Risk and Compliance application play a critical role in managing and governing the responsible use of AI systems, especially in high-stakes domains such as banking and finance.

While AI risks extend beyond banking and finance, consider an AI system for credit scoring in loan approval as an example. This system interacts with other models, interfaces, monitoring tools, and decision rules. The AI Control Tower solution along with the AI Risk and Compliance application can help to ensure compliance and responsible usage when the AI system is created, built, and deployed.

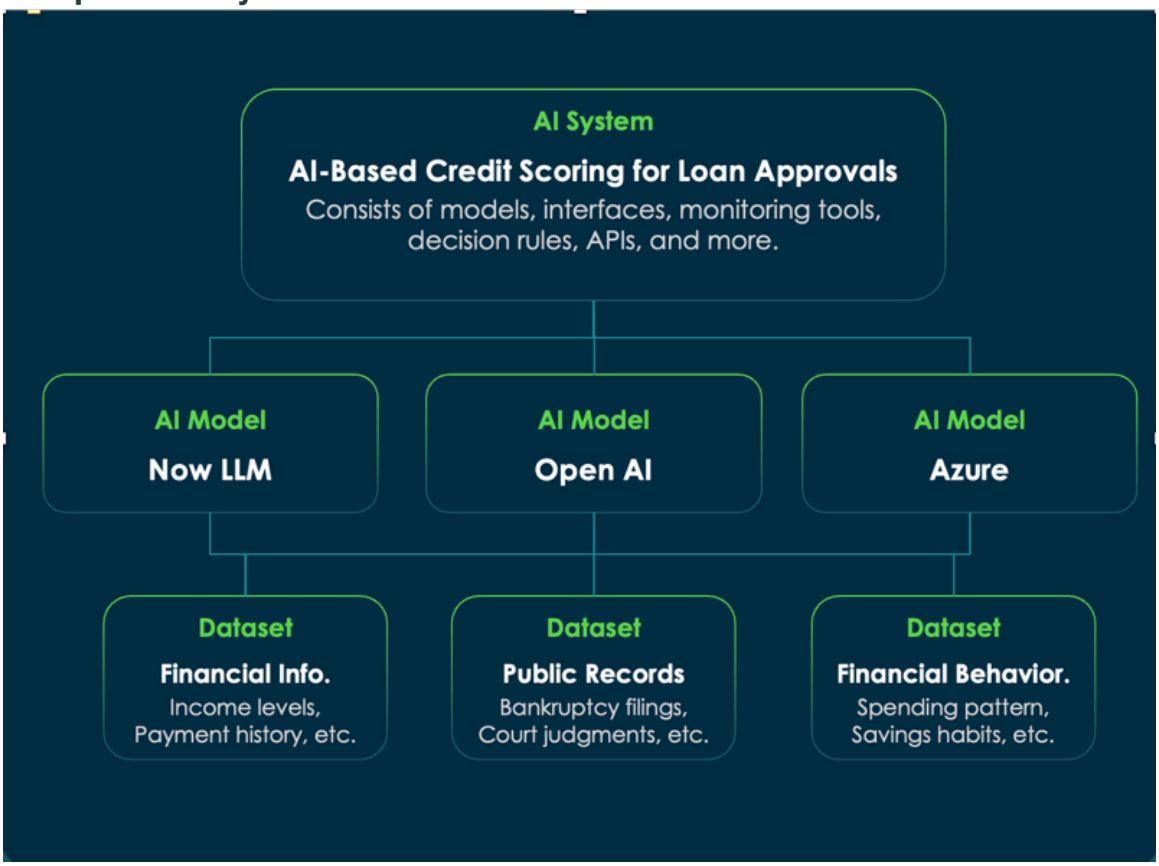
For instance, an organization might use AI to generate credit scores for loan approvals and using those scores to make approval decisions. The AI system can be fed a variety of data from the following large language models (LLMs):

- Now LLM: Provides financial information, payment history, and so on.
- Open AI: Provides details such as bankruptcy filings, court judgments, and so on.
- Azure OpenAI: Provides spending and saving patterns.

The figure in the following example illustrates how an AI system is interrelated with datasets, models, and the broader ecosystem.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example of an AI system



AI models

Explore AI models in detail with examples.

An AI model acts as the "brain" of an AI system. It learns from previous data and applies that knowledge to make predictions, respond to questions, or identify patterns. Models are developed using various training techniques, such as:

- Supervised learning
- Unsupervised learning
- Reinforcement learning

Learning which models power your AI systems is important for monitoring their accuracy, fairness, and potential risks.

Examples:

- Spam detection model- Flags emails as spam
- Language model (like ChatGPT)- Generates text
- Image model- Recognizes objects in photos
- Credit model- Predicts who might default on a loan

Prompts

Explore prompts in detail with examples.

A prompt is a question or instruction provided to an AI system, indicating what you want it to accomplish. Prompts are commonly used in tools like ChatGPT or image generators.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Certain AI systems, such as GenAI systems, require user prompts to function. Monitoring prompts can help analyze user interactions with the AI and the types of outputs produced.

Examples:

- Write a poem about the moon- AI writes a poem
- Translate hello into Spanish- Hola
- Show red dresses under $50- Filters e-commerce results
- Summarize this email- Creates a short summary

Datasets

Explore datasets in detail with examples.

A dataset is a collection of data used to train or evaluate an AI model. You can think of it as a large spreadsheet with rows representing examples and columns for features or labels. Datasets can also come in other formats, such as images, audio, or video. They help models learn patterns and decide.

Mapping datasets within the AI Control Tower is important for tracking data sources, ownership, and other key details, making it a vital part of the organization's AI governance program.

Examples:

- A set of labeled images (dogs, cats) for training a model
- Articles and books for training a language model
- Customer purchase history for recommendations
- Medical records for diagnosis tools

Inter-dependencies

Explore the inter-dependencies of AI systems, AI models, and datasets.

An AI system operates as part of a larger framework, closely connected to the AI model powering its capabilities and the datasets that shape its behavior. While these elements are interrelated, each plays a unique role and should be clearly identified to confirm effective governance.

Overlooking any aspect, such as the training dataset or the model supporting an AI feature can result in incomplete risk assessments, audit challenges, or compliance issues.

Comprehensive responsible AI governance requires attention to all these components:

- Inventory for each AI system
- Identify the associated AI model
- Document the dataset

For a visual example of how these elements interact, see Example of an AI system

For information on Model asset classes, see Model asset classes

For information on AI assets API, see AI Assets API

Explore Third-party LLMs and regions

Explore all the scenarios for configuring third party LLMs and SLMs based on the regions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuration overview

These are the few scenarios to consider when configuring LLMs:

APJC, AMS & EMEA regions

LLMs follow regional data routing configurations, as there's no global routing option and you can view all the allowed providers.

Regulated markets

The Data routing configuration isn't available, and the list of allowed providers is limited. You can view the allowed provider, but only in a read-only format.

Activating Fallback enables AI systems supported by your approved providers to stay active by using their default providers. Manually deactivating Fallback ensures that these AI systems remain inactive.

For information about Data routing, Fallback, Spillover and Impact summary, see AI model providers

For information on configuring of third party LLMs for APJC region, see Configure third-party LLMs using AI Control Tower

Explore Now Assist AI asset discovery

Explore the syncing process of AI assets including models, datasets, prompts, skills, and agentic AI components into the AI Asset Inventory of AI Control Tower.

The AI systems are synchronized from source Now Assist skill config record (sn_nowassist_skill_config).

1. The out of the box skill meets the following conditions for an AI system:
   a. If active, insert.
   b. If not active, insert only if it belongs to the custom skill category and is published.
2. If the skill exists in AI Control Tower and the source Now Assist skill config record is updated, those changes are applied to the AI system record in AI Control Tower. The state for the AI system is mapped as follows based on source Now Assist skill config record state:
   a. Active: Mark as Deployed
   b. Published or Draft: Mark as In Development
   c. Retired: Mark as Retired
   d. Deleted: No update is made

AI Asset Sync Mapping Overview

Type	Source Table	Target Tables	Field Tracked	Records included
Models	sys_generative_ai_model_config	cmdb_ai_model_digital_asset, cmdb_ai_model_product_model	active, max_tokens, model, supported_languages, domain_id	Active = true
Datasets	sys_one_extend_test_dataset	cmdb_ai_dataset_digital_asset, cmdb_ai_dataset_product_model	status, name, description	Published = true eval_run datasets

AI Asset Sync Mapping Overview (continued)

Type	Source Table	Target Tables	Field Tracked	Records included
Skills	sn_nowassist_skill_config	alm_ai_system_digital_asset, cmdb_ai_system_product_model	active, datasets, prompts, model, sys_created_by, domain_id, name, description	Active = true or state = published for custom skills; skill family not platform or any of its children(non platform skills)
Prompts	sys_generative_ai_config	alm_ai_prompt_digital_asset, cmdb_ai_prompt_product_model	active, prompt, model, name, version	Active prompts with active model and linked skill
Tools	sn_aia_tool	sn_ent_ai_tool	name, description, type, active, sys_created_by, domain_id	
AI Agents	sn_aia_agent	alm_ai_system_digital_asset, cmdb_ai_system_product_model	name, description, role, instructions, sys_created_by, domain_id	Active = true
Agent Tool Mapping	sn_aia_agent_tool_m2m	sn_ent_ai_system_agent_tool_component_m2m	agent, tool mapping	All agent-tool mappings
Agent Use cases	sn_aia_usecase	alm_ai_system_digital_asset, cmdb_ai_system_product_model	name, description, sys_created_by, domain_id	Active = true
Usecase to Agent mapping	sn_aia_team_member	sn_ent_ai_system_usecase_agent_m2m	usecase, agent mapping	All usecase-agent mappings

For more information on Model, dataset, prompt, and skill sync process, see KB2674041 article in the Now Support Knowledge Base.

Enterprise AI discovery: Unlock Visibility, Governance & Value

Explore Enterprise AI discovery, its key benefits, and capabilities.

AI discovery overview

Enterprise AI discovery is a fundamental feature of the AI Control Tower offering a unified and comprehensive view of all AI assets—including AI systems, agents, models, prompts, and tools—across various hyperscalars, AI apps, and Agentic AI frameworks via Service Graph Connectors (SGC).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Key Benefits

- **Eliminate Blind Spots:** Aggregate fragmented AI assets for holistic visibility and control.
- **Accelerate Governance:** Centralize compliance, security, and operational efficiency.
- **Drive Innovation:** Enable responsible, scalable, and auditable AI ecosystems where governance and innovation coexist.

Why AI discovery

- Fragmented AI ecosystems create governance and compliance risks.
- Enterprises need real-time visibility into AI usage including shadow AI to ensure security, compliance, and operational efficiency.
- AI discovery empowers organizations to accelerate innovation while reducing risk.

Key Capabilities

- **Unified Registry:** Aggregate AI assets from hyperscalars, AI apps, and Agentic AI frameworks such as AWS Bedrock, Azure AI Foundry, Copilot Studio, Google Cloud Platform (GCP) Vertex AI, ServiceNow agents, and more.

  Note: We identify Assets and CIs (Configuration Item) using their unique source IDs, such as ARN (Amazon Resource Names) for AWS and Product Models are identified by the associated asset.

- **Automatic Discovery:** Seamlessly discover and incorporate agents, models, prompts, and tools into the AI Control Tower's AI asset inventory.
- **Comprehensive Meta data:** Capture detailed information for each asset, including relationships, versions, and operational status.
- **Visibility & Control:** Eliminates silos by aggregating AI assets from all major platforms, enabling holistic management and oversight, across cloud, on-premises, and hybrid environments. The AI steward has visibility into all the connections and integrations that the admin has set to be able to maintain oversight and get access to active connections. Enabling AI stewards to selectively synchronize assets and environments.

AI discovery challenges & solution

Enterprise AI adoption is growing rapidly, yet many organizations face challenges with fragmented visibility across internal developments, vendor offerings, and cloud deployments. The AI discovery feature in AI Control Tower automatically detects AI assets on the Now Platform, AWS Bedrock, Azure Machine Learning Services, Azure Cognitive Services, Copilot Studio, and GCP Vertex AI, then adds them to the ServiceNow's Configuration Management Database for unified governance.

This capability helps organizations achieve comprehensive visibility of their AI assets while supporting the expansion of initiatives across hybrid cloud environments.

Business Impact

AI discovery helps organizations reduce AI deployment risks by automatically finding AI assets and simplifying compliance. This feature improves governance by showing AI deployments across different environments, helping executives make informed decisions with full transparency. It also tracks AI usage and adoption, allowing organizations to measure productivity gains.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For customers using both ServiceNow and cloud platforms, AI asset discovery is unified. This simplifies operations and ensures strong visibility.

AI discovery in the AI Control Tower enables enterprises to automatically find, catalog, and manage AI assets across cloud platforms through AI connections.

This setup can be accessed through the AI connections page in AI Control Tower using ServiceNow Graph Connectors to discover AI assets, and usage.

AI connections

Explore the AI connections page and its features.

AI connections overview

The AI connections page enables you to integrate the third-party systems to discover AI assets and track data usage from hyperscalars, AI apps, and agentic AI frameworks via Service Graph Connectors (SGC) to set AI connections. AI stewards can access the AI connections page and on this page, you can find a list of data sources displayed in columns.

Note: The AI connections page appears only when the plugins com.sn_ai_disc and sn_sgc_central are installed.

Agents are discovered according to the set run frequency, but you can also manually discover agents or collect usage data by selecting a connection and choosing the run option. AI stewards are able to perform this action, including activating or deactivating the AI connection by selecting the State column in the list. Admins are able to adjust the run frequency by accessing the connection alias.

Note: Uninstall the AWS AI Discovery plugin before installing the AI Discovery plugin (sn_ai_disc) to use the AI connections.

There are two types of scheduled jobs on AI connections.

Discovery

To discover AI assets from hyperscalars, AI apps, and agentic AI frameworks.

Execution

To process usage data and the data is visible on the Performance analytics page for every individual discovered agent.

Note: Confirm that the AI discovery daily data collection job is active, which is the key element in collecting the data.

AI connections are a combination of hyperscalars, AI apps, and agentic AI frameworks created using Service Graph Connectors. AI connections can discover AI agents and usage data from the hyperscalars, AI apps, and agentic AI frameworks.

Navigate to the AI connections page in the AI Control Tower, you're able to create AI connections as well as manage the existing ones. The existing connections appear under the section Legacy connections.

Starting March 2026, these AI Service Graph Connectors #are available.

- AWS
- GCP Vertex AI
- LangGraph
- Microsoft

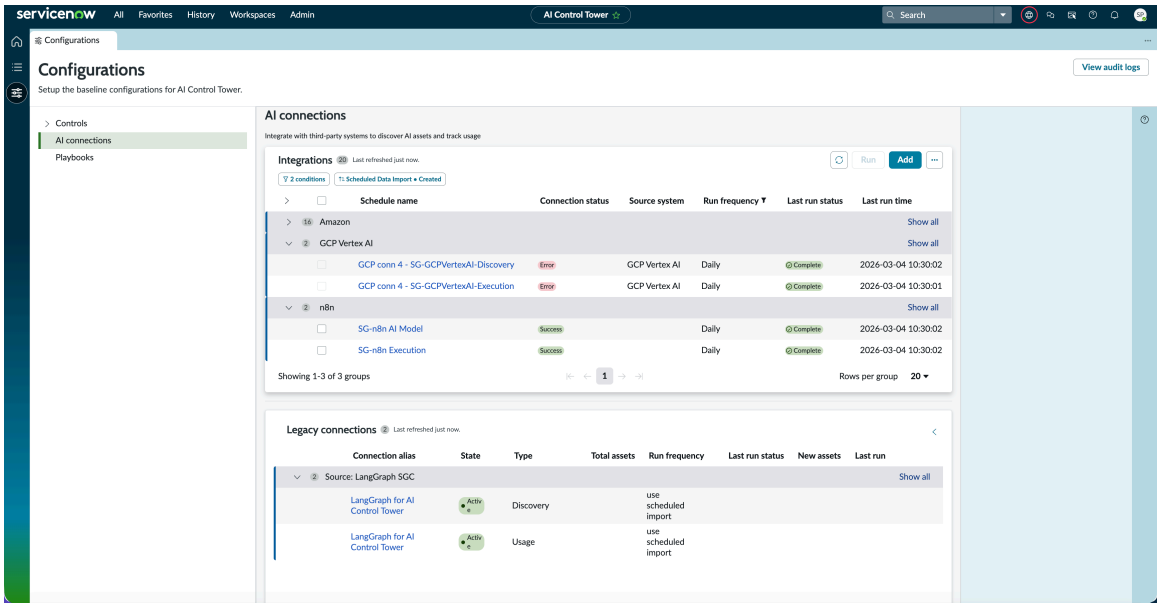
- Salesforce



AI connection record

The AI connection record has the following tabs:

Details- displays the connection details of the AI connection.

Data sources- represent a running unit, which defines what data is fetched from a third-party system.

Import schedules- Run the parent data import and execute the job to discover AI Agents and track usage data.

Service Graph Connectors for AI Control Tower

You can use Service Graph Connectors (SGC)#to import and integrate third-party data into #CMDB#and non-CMDB#tables to create AI connections.

How SGC works

When you access third-party APIs, they return data. This data must be stored in ServiceNow tables. Before saving it, we should transform the data from its JSON format into our preferred format and then store it in ServiceNow tables.

Benefits of SGC

Lets explore some of the major benefits:

- Gain trust in your CMDB data.
- Minimize operational risk.
- Minimize custom integrations.
- Accelerate time to value.

To understand benefits and features of SGC in detail, see Service Graph Connectors

AI Service Graph Connector for Amazon

Use the#AI Service Graph Connector for Amazon to discover AI assets such as AI systems, agents, models, tools, and prompts and well as usage data for these AI agents within your ServiceNow AI Control Tower. This usage information is consumed by the AI Control Tower value dashboard.

Download apps from the Store

Visit the#ServiceNow Store website to download the AI Service Graph Connector for Amazon app.

Supported ServiceNow versions

- Australia
- Zurich patch 7
- Yokohama patch 11

User roles

Roles required in the ServiceNow environment:

- sn_ai_disc.discovery_admin
- sn_cmdb_int_util.sgc_admin

Prerequisites from AWS

Role required: IAM user

AWS Prerequisites

Before proceeding, ensure you have:

- AWS Account- Active AWS account with access to the services you want to connect.
- IAM Credentials: AWS Access Key ID and Secret Access Key with read permissions for the services you plan to migrate.
- Service Access- API access enabled for Amazon Bedrock, Amazon SageMaker, Amazon CloudWatch, and/or Amazon Bedrock AgentCore.

Required IAM Permissions

Your IAM user role or role needs these permissions.

- Amazon Bedrock: bedrock:List*, bedrock:Get*
- Amazon SageMaker: sagemaker:List*, sagemaker:Describe*
- Amazon CloudWatch: logs:DescribeLogGroups, logs:DescribeLogStreams, cloudwatch:GetMetricData
- Amazon Bedrock AgentCore: bedrock:ListAgents, bedrock:GetAgent

AWS Setup documentation

Use these AWS resources to set up credentials and enable services:

- AWS IAM- Managing Access Keys
- Amazon Bedrock- Setting Up

Create AI connection for Amazon

Create an AI connection for Amazon in AI Control Tower using the AI Service Graph Connector for Amazon.

Before you begin

Role required: sn_ai_disc.discovery_admin and n_cmdb_int_util.sgc_admin

Procedure

1. Navigate to **AI Control Tower** > **Configurations** > **AI connections**.
2. Select **Add**.
3. Select **AWS** from all the available connectors.
4. Click **Create connection**.

   Note: The Review the setup instructions page appears and verifies to follow all the prerequisites.

5. Click **Continue**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Setup page appears.

6. Select Source systems.
7. Choose the AWS services that you want to integrate with ServiceNow.
   - Amazon Bedrock
   - Amazon Bedrock AgentCore
   - Amazon SageMaker
8. Click **Submit**.
9. **Configure Bedrock**

   a. Enter the **Connection Name**.

   b. Enter the **Access Key ID**.

   c. Enter the **Secret Access Key**.
   Access keys are long-term credentials for an IAM user or the AWS account root user. Access keys consist of two parts: an access key ID and a secret access key. For detailed information, see how to get access and secret key

   d. Enter the **AWS Region**.

   Note: The region information is available in the navigation bar of the AWS management console.

   e. Click **Update and test connection**.

   f. Click **Continue**.

10. **Configure Bedrock import schedule**

    a. Open a parent schedule import.

    b. Select the Active check box.

    c. Select Run according to your preference.

    Note: This is an optional step as the schedule imports run according to the schedule.

11. **Configure CloudWatch logs forBedrock**
    a. Enter the **Connection Name**.
    b. Enter the **Access Key**.
    c. Enter the **Secret Key**.
    d. Enter the **AWS Region**.
    e. Enter the **Log Group Names**.
    f. Click **Create and test connection**.
    g. Click **Continue**.
12. **Configure CloudWatch logs import schedule for Bedrock**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Open a parent schedule import.

b. Select the Active check box.

c. Select **Execute Now**.

> **Note:** This is an optional step as the schedule imports run according to the schedule.

d. Click **Continue**.

13. **Configure SageMaker**
    a. Enter the **Connection Name**.
    b. Enter the **Access Key ID**.
    c. Enter the **Secret Access Key**.
    d. Enter the **AWS Region**.
    e. Click **Create and test connection**.
    f. Click **Continue**.
14. **Configure SageMaker import schedule**

a. Open a parent schedule import.

b. Select the Active check box.

c. Select Run according to your preference.

d. Select Execute Now.

> **Note:** This is an optional step as the schedule imports run according to the schedule.

e. Click **Continue**.

15. **Configure CloudWatch monitoring for SageMaker**
    a. Enter the **Connection Name**.
    b. Enter the **Access Key**.
    c. Enter the **Secret Key**.
    d. Enter the **AWS Region**.
    e. Click **Create and test connection**.
    f. Click **Continue**.
16. **Configure CloudWatch monitoring import schedules for SageMake**

a. Open a parent schedule import.

b. Select Active check box.

c. Select Run according to your preference.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Select Execute Now.

Note: This is an optional step as the schedule imports run according to the schedule.

e. Click **Continue**.

Result
AI connection is created for AWS.

AI Service Graph Connector for Google Cloud Platform (GCP) Vertex AI

Use the AI Service Graph Connector for GCP Vertex AI plugin to create AI connections to discover AI assets such as AI systems, models, prompts, and tools as well as usage data for these AI agents within your ServiceNow AI Control Tower. This usage information is consumed by the AI Control Tower value dashboard.

Download apps from the Store

Visit the ServiceNow Store website to download the AI Service Graph Connector for GCP Vertex AI app.

Supported ServiceNow versions

- Australia
- Zurich patch 7
- Yokohama patch 11

User roles

Roles required in the ServiceNow environment:

- sn_ai_disc.discovery_admin
- sn_cmdb_int_util.sgc_admin

Prerequisites from GCP Vertex

Prerequisites:

Review the setup instructions to create a service account, assign roles, bind roles to the service account, enable APIs, create a JKS file, and register it in your ServiceNow instance. For setup instructions and used APIs, see the Service Graph connector for GCP Vertex AI- Setup Instructions [KB2731256]

Data Mapping

The following table lists the data sources, the staging tables, and the target tables CMDB CI classes and non-CMDB classes where data is stored for a GCP Vertex AI project.

Data source	Staging table	Target tables
SG-GCPVertexAI-Execution	sn_ai_disc_gcp_sgc_sg_gcp_execution	sn_ai_disc_ai_usage

Create AI connections for GCP Vertex AI

Create an AI connection for GCP Vertex AI in AI Control Tower using the#AI Service Graph Connector for GCP Vertex AI.

Before you begin

Role required: sn_ai_disc.discovery_admin and sn_cmdb_int_util.sgc_admin

Procedure

1. Navigate to **AI Control Tower workspace** > **Configuration** > **AI connections**.
2. Select **Add**.
3. Select **GCP Vertex AI** from all the available connectors.
4. Click **Create connection**.
   Review setup instructions page displays
5. Verify to follow all the prerequisite steps.
6. Check the option **I have read the setup instructions**.
7. Click **Continue**.
8. Create **X.509** certificate.
9. Select **New**.
10. Enter the **Name**.
11. Enter the **Key store password**.
12. Click **+Add file**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

13. Select the JKS file.
14. Select **Upload** to upload the JKS file.
15. Click **Save**.
    The JKS file is added.
16. Select **Continue**.
    Setup page appears
17. Create and test connections
    a. Enter the **Connection Name**.
    b. Enter the **Cloud region**.
    c. Enter the **Service Account Email**.
    d. Enter the **Keystore**.
    e. Enter the **Keystore Password**.
    f. Enter the **Organization Id**.

    Note: This field is needed only if you are looking to discover agents related to one organization. This is valid only if the service account email has organization level access.

    g. Click **Create and test connection**.
    h. Click **Continue**.
18. Configure import schedule
    a. Ensure that both the parent scheduled jobs, Discovery and Execution are active as they are shipped out of the box inactive.

    Note: Ensure to execute the Discovery scheduled job first.

    b. Set the run frequency.
    c. To run frequency by demand, select **Execute now**.

    Note: This is an optional step as the schedule imports run according to the schedule.

    d. Click **Continue**.
    e. Click **View all connections** to view the newly created connection.

Result
AI connection is created for GCP Vertex AI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Service Graph Connector for IBM

The AI Service Graph Connector for IBM enables you to discover and import AI assets from your IBM environment into ServiceNow AI Control Tower.

The AI Service Graph Connector for IBM integrates with your IBM account to catalog AI systems, agents, tools, models, and prompts. After discovery is run, usage data is automatically collected and populated into the AI Control Tower value dashboard, providing comprehensive visibility and governance of your AI operations.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Supported ServiceNow versions

- Zurich (Patch 8)
- Australia (Patch 1)

User roles

You must have one of the following roles:

- sn_ai_disc.discovery_admin
- sn_cmdb_int_util.sgc_admin

ServiceNow prerequisites

Complete the following setup steps when configuring the connector for the first time.

Note: Updating data source access and clearing cache are prerequisites that must be completed only once, when setting up a new instance for the first time.

Update data source access

The connector requires write permissions to the Data Source table to create data sources.

To enable data source creation:

1. Select **Global** from the application picker.
2. Navigate to **Application Access**.
3. Select the **Can create**, **Can update**, and **Can delete** check boxes.
4. Select **Update**.
5. Switch to the connector application scope.

Clear cache

Clear the cached data for the Data Source and Tables.

To clear the cache:

1. Navigate to **System Definition** > **Background Scripts**.
2. Enter the following script in the **Run Script** text box:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
GlideTableManager.invalidateTable('sys_data_source');
GlideCacheManager.flushTable('sys_data_source');
GlideTableManager.invalidateTable('sys_db_object');
GlideCacheManager.flushTable('sys_db_object');
```

3. Select **Run Script**.

> **Note:** The script might take several minutes to complete. After completion, switch to the connector application scope.

IBM prerequisites

Generate an IBM Cloud API Key and configure access for the connector before creating a connection. For setup instructions and API details, see the AI Service Graph Connector for IBM — Setup Instructions [KB2901071] article in the Now Support Knowledge Base.

After completing the IBM setup requirements, register the connector in your ServiceNow instance.

Create an AI connection for IBM

Create an AI connection for IBM in AI Control Tower using the#AI Service Graph Connector for IBM.

Before you begin

Role required: sn_ai_disc.discovery_admin and sn_cmdb_int_util.sgc_admin

Procedure

1. Navigate to **SGC Central** > **Create Connection**.
2. Select **IBM Watsonx AI** from the list of connectors, and then select **Create connection**.
3. On the#Review setup instructions#page, select **I have read the setup instructions**, and then select **Continue**.
4. Select the IBM watsonx AI services.

   a. Select the services that you want to discover.

   - **IBM WatsonX Runtime**: Discovers Runtime agents, prompts, and models.
   - **IBM WatsonX Orchestrate**: Discovers Orchestrate agents, tools, prompts, models, and usage traces.

   > **Note:** You can select both services, if required.

   b. Select **Submit**.

5. Configure the selected services.

   a. For Runtime: In the Regions and Deployment spaces activity, enter the region and deployment space ID, and then select **Submit**.

   Alternatively, select **Skip** to discover all accessible regions and spaces.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. For Orchestrate: In the Orchestrate Instances activity, enter a comma-separated list of instance GUIDs (tenant IDs) for which discovery should be run.

Alternatively, select **Skip** to discover all accessible Orchestrate instances.

6. Configure and test the connection.

a. Enter the **Connection name**.

b. Enter the **IBM Cloud API Key**.

c. Select **Create and test connection** to validate that the API key is working.

d. Select **Continue**.

7. Configure the import schedule.

a. Verify that the parent scheduled jobs are active.

These jobs are shipped as inactive and must be activated manually.

- *SG-IBMRuntime-Discovery* for Runtime#.
- *SG-IBMOrchestrate-Discovery* for Orchestrate#.

b. Set the run frequency for the scheduled import jobs.

Alternatively, select **Execute now** to execute the import schedule immediately.

c. Select **Continue**.

8. Select the **Confirm connection setup** activity to verify whether the connection was configured.

What to do next

Select **View all connections** to review the connection details. The created connection appears in the Installed connections list.

Note: The Discovery scheduled job must be executed before viewing discovered data in the CMDB.

APIs used by AI Service Graph Connector for IBM

Explore the IBM APIs used by the AI Service Graph Connector for IBM

The AI Service Graph Connector for IBM calls the following IBM APIs during discovery.

IBM API list and IAM permissions

Method	API	IAM permission	Purpose
IBM watsonx Orchestrate			
GET	https://resource-controller.cloud.ibm.com/v2/resource_instances	Resource Controller Viewer	Discover all watsonx Orchestrate instances in the account.
GET	https://api.region.watson-orchestrate.cloud.ibm.com/instances/instanceGuid/v1/orchestrate/agents	Orchestrate Reader	List all agents for an instance.

IBM API list and IAM permissions (continued)

Method	API	IAM permission	Purpose
GET	https://api.region.watson-orchestrate.cloud.ibm.com/instances/instanceGuid/v1/orchestrate/tools/toolId	Orchestrate Reader	Get details of each tool referenced by an agent.
POST	https://api.region.watson-orchestrate.cloud.ibm.com/instances/instanceGuid/v1/traces/search	Orchestrate Reader	Search usage trace records (cursor-paginated, separate scheduled import).
POST	https://iam.cloud.ibm.com/identity/token	None	Exchange API Key for IAM Bearer token.
IBM watsonx Runtime			
GET	https://api.region.dataplatform.cloud.ibm.com/v2/spaces	Watson Studio Viewer	List all watsonx spaces per region. **Note:** For the us-south region, the API is `api.dataplatform.cloud.ibm.com v2/spaces`.
GET	https://region.ml.cloud.ibm.com/ml/v4/deployments	WML Viewer	List all AI model deployments in a space (paginated).
GET	https://api.region.dataplatform.cloud.ibm.com/wx/v1/prompts/promptId	Watson Studio Reader	Get prompt template details, including model_id and system prompt. **Note:** For the us-south region, the API is `api.dataplatform.cloud.ibm.com wx/v1/prompts/promptId`.
POST	https://iam.cloud.ibm.com/identity/token	None	Exchange API Key for IAM Bearer token.

For the full API list and required IAM permissions, see the AI Service Graph Connector for IBM — Setup Instructions [KB2901071] article in the Now Support Knowledge Base.

Data mapping for AI Service Graph Connector for IBM

The AI Service Graph Connector for IBM uses separate data sources and staging tables for each asset type, per service. The staged data is transformed and loaded into target CMDB tables.

The following table lists the data sources, the staging tables, and the target tables as CMDB CI classes for IBM.

Data mapping for IBM

Data source	Staging table	Target tables
IBM Watsonx Runtime		
SG-IBMRuntime-Agent	SG-IBMRuntime-Agent [sn_ai_ibm_disc_runtime_ai_agent]	alm_ai_system_di cmdb_ci_function cmdb_rel_asset_c

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data mapping for IBM (continued)

Data source	Staging table	Target tables
		cmdb_ai_system_
SG-IBMRuntime-Prompt	SG-IBMRuntime-Prompt [sn_ai_ibm_disc_runtime_ai_prompt]	alm_ai_prompt_d cmdb_ai_prompt_
SG-IBMRuntime-Model	SG-IBMRuntime-Model [sn_ai_ibm_disc_runtime_ai_model]	alm_ai_model_dig cmdb_ai_model_ cmdb_ci_ai_mode cmdb_rel_asset_c
IBM Watson Orchestrate		
SG-IBMOrchestrate-System	SG-IBMOrchestrate-System [sn_ai_ibm_disc_orchestrate_ai_system]	alm_ai_system_di cmdb_ci_function cmdb_rel_asset_c cmdb_ai_system_
SG-IBMOrchestrate-Tool	SG-IBMOrchestrate-Tool [sn_ai_ibm_disc_orchestrate_ai_tool]	sn_ent_ai_tool
SG-IBMOrchestrate-Prompt	SG-IBMOrchestrate-Prompt [sn_ai_ibm_disc_orchestrate_ai_prompt]	alm_ai_prompt_d cmdb_ai_prompt_
SG-IBMOrchestrate-Model	SG-IBMOrchestrate-Model [sn_ai_ibm_disc_orchestrate_ai_model]	alm_ai_model_dig cmdb_ai_model_
SG-IBMOrchestrate-Usage	SG-IBMOrchestrate-Usage [sn_ai_ibm_disc_orchestrate_ai_usage]	sn_ai_disc_ai_usa
SG-IBMOrchestrate-SystemSubcomponentM2M	SG-IBMOrchestrate-SystemSubcomponentM2M [sn_ai_ibm_disc_orchestrate_ai_system_subcomponent_m2m]	sn_ent_ai_system

CMDB classes targeted in AI Service Graph Connector for IBM

When you complete setting up the connection, you can configure the integration to periodically pull data from IBM. The data is saved in tables that extend from the Configuration Item [cmdb_ci] table.

AI Function [cmdb_ci_function_ai]

The following attributes in the AI Function [cmdb_ci_function_ai] table are populated by collected data:

Attribute label	Attribute name
Name	name
Install Status	install_status

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Attribute label	Attribute name
Object ID	object_id
Model ID	model_id
Vendor	vendor
Discovery Source	discovery_source

AI Model Deployment [cmdb_ci_ai_model_deployment]

The following attributes in the AI Model Deployment [cmdb_ci_ai_model_deployment]#able are populated by collected data:

Attribute label	Attribute name
Name	name
Install Status	install_status
Object ID	object_id
Model ID	model_id
Vendor	vendor
Discovery Source	discovery_source

AI Service Graph Connector for IBM properties

AI Service Graph Connector for IBM properties control the behavior of the connector.

Connection properties

These connection properties are available for AI Service Graph Connector for IBM. These connection properties are automatically set when a new connection is configured and runtime or orchestrate services are selected.

Connection properties for AI Service Graph Connector for IBM

Property	Service	Description
IsRuntimeSelected	IBM watsonx Runtime	Enable IBM watsonx Runtime discovery for the connection.
Runtime_Spaces	IBM watsonx Runtime	Optional: Specify the JSON map of IBM Cloud regions to deployment space IDs. If no value is specified, all accessible spaces in all regions are discovered.
IsOrchestrateSelected	IBM watsonx Orchestrate	Enable IBM watsonx Orchestrate discovery for the connection.
Orchestrate_Instances	IBM watsonx Orchestrate	Optional: Specify the comma-separated list of IBM watsonx Orchestrate instance GUIDs (tenant IDs) to be discovered.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection properties for AI Service Graph Connector for IBM (continued)

Property	Service	Description
		If no value is specified, all accessible instances are discovered.
SourceSystem	IBM watsonx Runtime IBM watsonx Orchestrate	Identifies the source system for the connection. The value is set automatically by the connector to#`IBM WatsonX AI`. **Note:** This property is system-managed and can't be modified manually.

AI Service Graph connector for LangGraph

Use the#AI Service Graph Connector for LangGraph to discover AI assets such as AI systems, agents, models, tools, and prompts and well as usage data for these AI agents. This usage information is consumed by the AI Control Tower value dashboard.

Download apps from the Store

Visit the ServiceNow Store #website to download the AI Service Graph Connector for LangGraph app.

Supported ServiceNow versions

- Australia
- Zurich patch 7
- Yokohama patch 11

User roles

Roles required in the ServiceNow environment:

- sn_ai_disc.discovery_admin
- sn_cmdb_int_util.sgc_admin

Prerequisites from LangGraph

Enter the connection details, API Key credentials and update the credential record.

Create an API key for the AI Connector to authenticate with LangGraph. For more information on creating API Key in LangGraph, see Create an API Key

Note: To access the latest and most comprehensive guidelines for managing API keys, see About LangGraph

Data Mapping

The following table lists the data sources, the staging tables, and the target tables #CMDB#CI classes and non-CMDB#classes where data is stored for LangGraph project.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data Source	Import Set Table	Target Table(s)
SG-LangGraph Agents	sn_langgraph_integ_agents	alm_ai_system_digital_asset alm_ai_prompt_digital_asset cmdb_ci_function_ai
SG-LangGraph Usage	sn_langgraph_integ_usage	alm_ai_model_digital_asset sn_ai_disc_ai_usage

Create an API Key for LangGraph

Create an API Key for the AI Connector to authenticate with LangGraph.

Before you begin

Role required: Workspace user (Organization user or Organization editor).

Procedure

1. Navigate to **Settings** > **API Keys in LangSmith**.
2. Click **+API Key**.
   API Key is created.
3. Save the API Key.

> **Note:** Ensure that the API Key grants access to the workspace where you intend to explore AI assets and usage details. Store the API key in a secure and private location.

Result

The API Key is created.

Create AI connection for LangGraph

Use the AI Service Graph Connector for LangGraph plugin to create AI connections to discover AI assets such as AI systems, models, prompts, and tools as well as usage data for these agents. This usage information is consumed by the AI Control Tower value dashboard.

Before you begin

Role required: sn_ai_disc.discovery_admin and n_cmdb_int_util.sgc_admin

Procedure

1. Navigate to **Service Graph connectors** > **LangGraph** > **Setup**.
2. Select **Add**.
3. Select **LangGraph** from all the available connectors.
4. Click **Create connection**.
   Setup instructions page displays.
5. Verify to follow all the prerequisite steps.
   Setup page appears
6. Create and test connection

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Enter the **Connection Name**.

b. Enter the **Connection URL for LangSmith API**.

c. Enter the **Connection URL for LangSmith Rest API**.

d. Enter the **API Key**.

> **Note:** Log in to LangGrapH instance and navigate to settings and select API Keys and create an API Key.

e. To use a MID server, select the MID server check box.

f. Click **Create and test connection**.

g. Click **Continue**.

7. Configure import schedule

a. Ensure that both the parent-scheduled jobs, Discovery and Execution are active as they're shipped out of the box inactive.

> **Note:** Ensure to execute the Discovery-scheduled job first.

b. Set the run frequency.

c. To run frequency by demand, select **Execute now**.

> **Note:** This is an optional step as the schedule imports run according to the schedule.

d. Click **Continue**.

e. Click **View all connections** to view the newly created connection.

Result
AI connection is created for LangGraph.

APIs used for LangGraph connector

Explore the AWS APIs used in AI service Graph Connector for LangGraph.The table lists all the LangSmith API endpoints used by the connector.

The following table lists all the LangSmith API endpoints used by the connector.

API	Endpoint (example)	What it does
List Workspaces	https://api.smith.langchain.com / api/v1/workspaces/	Lists all workspaces at the given endpoint for the current API key or user
List Deployments	https://api.host.langchain.com/ v2/deployments	Lists all agent deployments for a particular workspace

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

List Tracer Sessions	https://api.smith.langchain.com/api/v1/sessions	Lists all tracer sessions for a given workspace
Get Run Stats	https://api.smith.langchain.com / api/v1/runs/stats	Gets stats on a particular run, including LLM invocations

This table lists all the LangGraph Agent Deployment APIs used by the connector. The “endpoint_url” below will be specific to each deployment and will be discovered at runtime by the app.

API	Endpoint (example)	What it does
Search Assistants	{{endpoint_url}}/assistants/search	Lists all assistants in each deployment
Search Threads	{{endpoint_url}}/threads/search	Lists all threads for each deployment

Target tables for LangGraph

Target tables for storing Service Graph Connector for LangGraph data.

The LangGraph connector uses following main target tables:

Digital asset tables

- alm_ai_system_digital_asset - AI System digital assets
- alm_ai_prompt_digital_asset - AI Prompt digital assets
- alm_ai_model_digital_asset - AI Model digital assets

Usage table

sn_ai_disc_ai_usage - AI Usage/Execution data.

CMDB table

cmdb_ci_function_ai – AI Function (Agent) CI table.

AI Service Graph Connector for Microsoft

Use the #AI Service Graph Connector for Microsoft#plugin to create AI connections for Azure Foundry and Copilot to discover AI assets such as AI systems, models, prompts, and tools as well as usage data for these AI agents within your ServiceNow AI Control Tower. This usage information is consumed by the AI Control Tower value dashboard.

Download apps from the store

Visit the#ServiceNow Store #website to download the AI Service Graph Connector for Microsoft app.

Supported ServiceNow versions

- Australia
- Zurich patch 7
- Yokohama patch 11

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

User roles

Roles required in the ServiceNow environment:

- sn_ai_disc.discovery_admin
- sn_cmdb_int_util.sgc_admin

Prerequisites from Azure Foundry environment

Setting up Azure Foundry:

- To get the OAuth credentials, refer to the Azure documentation.
- The Azure client application needs at least 'User. Contributor' role on AI Hub (ML services) API. Refer documentation for Azure Hub roles. It also requires a workspace to be created.
- The Azure client application needs at least an 'Azure AI User' role on the Azure Foundry (Cognitive Services) API. Refer documentation for Azure Foundry roles. It also requires an account (resource name) to be created.
- Enable both Discovery and Execution import schedules to discover agents and retrieve execution data.

Prerequisites from Copilot environment

Setting up Copilot

- Register an application in Microsoft Entra ID and Register to obtain the Client ID and Client secret.
- Open the Power Platform Admin Center, select your Copilot environment, then go to Settings > Users+permissions > Application users, add a new app user using the Client ID and assign Basic user and System administrator roles.
- Find the Organization ID, Tenant ID under Settings > Session details.
- Usage is tracked only in non-developer environments.
- Enable both Discovery and Executions to discover agents and retrieve execution data.

Note: For Microsoft, OAuth authentication is supported.

Create AI connection for Azure Foundry

Create an AI connection for Azure Foundry in AI Control Tower using the#AI Service Graph Connector for Microsoft.

Before you begin

Role required: sn_ai_disc.discovery_admin and n_cmdb_int_util.sgc_admin

Procedure

1. Navigate to **AI Control Tower workspace** > **Configurations** > **AI connections**.
2. Select **Add**.
3. Select **AI connector for Microsoft** from all the available connectors.
4. Click **Create connection**.
5. Select Azure Foundry check box.
6. Review setup instructions page displays.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Verify to follow all the prerequisite steps.

7. Click **Continue**.
8. Setup page appears
9. **Configure and test ML services connection**
   a. Enter the **Connection Name**.
   b. Enter the **Connection URL** (https://<region>api.azureml.ms).
      Note: The region is available under project details.
   c. Enter the **OAuth client ID**OAuth client ID.
   d. Enter the **OAuth client secret**.
   e. Enter the **OAuth token URL** (https://login.microsoftonline.com/<tenantid>/oauth2/v2.0/token).
      The tenant id can be found in the URL of every page. It's abbreviated as tid.
   f. Click **Update and test connection**
   g. Click **Continue**.
10. **Configure and test AI services connection**
    a. Enter the **Connection Name**.
    b. Enter the **Connection URL** (https://<resource-name>services.ai.azure.com)
       Note: To obtain the resource name, make sure that you are on New Foundry (Enable the New Foundry toggle) and select the project. Once you're on the home page, look for the Project endpoint to view the resource name.
       Starting from March 2026 onwards, ServiceNow provides support to the New Foundry along with the old Foundry.
    c. Enter the **OAuth client ID**.
    d. Enter the **OAuth client secret**.
    e. Enter the **OAuth token URL**.
11. **Configure import schedule**
    a. Ensure that both the parent-scheduled jobs, Discovery and Execution are active as they're shipped out of the box inactive.
       Ensure to execute the Discovery-scheduled job first.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. Select **Execute now** to run.

Note: This is an optional step as the schedule imports run according to the schedule.

c. Click **Continue**.

d. Click **View all connections** to view the newly created connection.

Result
AI connection is created for Azure Foundry.

Properties of Azure Foundry

System properties for AI Service Graph Connector for Microsoft (Azure Foundry specific).

System properties

Property	Description
sn_ai_msft_integ.usage_data_lookback	Number of days to look back for fetching threads before the run collection window start time. Type: Integer Default value: 3 Location: System Property [sys_properties] table
sn_ai_msft_integ.usage_first_run_lookback_days	Number of days to look back for usage data on first run (when no last_success_import_time exists). Type: integer Default value:30 Location: System Property [sys_properties] table

Create AI connection for Copilot

Create an AI connection for Copilot in AI Control Tower using the#AI Service Graph Connector for Microsoft.

Before you begin
Role required: sn_ai_disc.discovery_admin and n_cmdb_int_util.sgc_admin

Procedure

1. Navigate to **AI Control Tower workspace** > **Configurations** > **AI connections**.
2. Select **Add**.
3. Select **AI connector for Microsoft** from all the available connectors.
4. Click **Create connection**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select the Microsoft Copilot check box.
6. Review setup instructions page displays.

   Note: Verify to follow all the prerequisite steps.

7. Expand Create Copilot connection section.
8. Click **Continue**.
9. Setup page appears
10. **Configure and test Copilot connection**
    a. Enter the **Connection name**.
    b. Enter the **Connection URL** (https://<provider-domain-name>.com).
    c. Enter the **OAuth client ID**.
    d. Enter the OAuth client secret.
    e. Enter the OAuth token URL (Tenant id).
    f. Click **Create and test connection**
    g. Click **Continue**.
11. **Configure import schedule**

    a. Ensure that both the parent-scheduled jobs, Discovery and Execution are active as they're shipped out of the box inactive.

       Ensure to execute the Discovery-scheduled job first.

    b. Set the run frequency.

    c. To run frequency by demand, select Execute now to run.

       Note: This is an optional step as the schedule imports run according to the schedule.

    d. Click **Continue**.

    e. Click **View all connections** to view the newly created connection.

Result
AI connection is created for Copilot.

APIs used by Microsoft- Azure & Copilot

Explore the AWS APIs used in AI service Graph Connector for Amazon.

The table lists all the Amazon API endpoints used by the connector.

New Azure Foundry — Discovery & Usage

API	Endpoint	What it does
List Projects	https://management.azure.com/subscriptions/{subscription_id}/resourceGroups/{resource_group}/	Lists all Azure AI Foundry projects in a resource group

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

	providers/Microsoft.CognitiveServices/accounts?api-version=2025-06-01&kind=Project	
List Deployments	https://resource_name.services.ai.azure.com/api/projects/project_name/deployments?api-version=v1	Lists all model deployments within a Foundry project
List Agents	https://resource_name.services.ai.azure.com/api/projects/project_name/agents?api-version=2025-11-15-preview	Lists all agents in a Foundry project
List Agent Versions	https://resource_name.services.ai.azure.com/api/projects/project_name/agents/agent_name/versions?api-version=2025-11-15-preview	Lists all versions of a specific agent
List conversations	https://resource_name.services.ai.azure.com/api/projects/project_name/openai/conversations?api-version=2025-11-15-preview	Lists all conversation threads in a Foundry project
List Conv Items	https://resource_name.services.ai.azure.com/api/projects/project_name/openai/conversations/conv_id/items?api-version=2025-11-15-preview	Lists all messages/items within a specific conversation

AI Services (Classic)

API	Endpoint	What it does
List Projects	https://management.azure.com/subscriptions/{subscription_id}/resourceGroups/{resource_group}/providers/Microsoft.CognitiveServices/accounts?api-version=2025-06-01&kind=Project	Lists all AI Services projects in a resource group

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

List Subscriptions	https://management.azure.com/subscriptions?api-version=management_api_version	Lists all Azure subscriptions available to the authenticated principal
List Resource Group	https://management.azure.com/subscriptions/subscription_id/resourceGroups?api-version=management_api_version	Lists all resource groups within a subscription
List MLWorkspaces	https://management.azure.com/subscriptions/%7Bsubscription_id%7D/resourceGroups/%7Bresource_group%7D/providers/Microsoft.MachineLearningServices/workspaces?api-version=2023-04-01	Lists all Azure ML workspaces in a resource group
List Deployments	https://resource_name.services.ai.azure.com/api/projects/project_name/deployments?api-version=2025-11-15-preview	Lists all model deployments within an ML project
List Assistants from ML Services	https://region.api.azureml.ms/agents/v1.0/subscriptions/subscription_id/resourceGroups/resource_group/providers/Microsoft.MachineLearningServices/workspaces/workspace_name/assistants?api-version=v1	Lists all agents/assistants from an AzureML workspace
List Threads from ML Service	https://region.api.azureml.ms/agents/v1.0/subscriptions/subscription_id/resourceGroups/resource_group/providers/Microsoft.MachineLearningServices/workspaces/workspace_name/threads?api-version=v1	Lists all threads from an AzureML workspace
List Thread Runs from ML Service	https://region.api.azureml.ms/agents/v1.0/subscriptions/subscription_id/resourceGroups/resource_group/providers/Microsoft.MachineLearningServices/workspaces/workspace_name/threads/thread_id/runs?api-version=v1	Lists all thread runs within a specific thread in an AzureML workspace

AWS APIs used for Copilot

API	Endpoint	Description
List of all the agents in the Copilot environment	<org-url>/api/data/v9.2/bots	Returns metadata about all Copilot Studio bots (agents) registered in a Dataverse environment, including their name, status, authentication config, and ownership details. This is the primary endpoint to discover and inventory deployed copilots.
List of all the components per agent	<org-url>/api/data/v9.2/botcomponents	Exposes the internal authoring components of a Copilot, such as topics, entities, variables, and trigger phrases, stored in the botcomponent table. Essential for inspecting or programmatically analyzing a bot's conversational logic and structure.
List Conversations	<org url>/api/data/v9.2/conversationtranscripts	Retrieves the full chat/conversation transcripts between users and Copilot Studio bots, stored in the Dataverse conversationtranscript table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Target tables for Microsoft

Target tables for storing Service Graph Connector for Azure and copilot data.

Both Azure Foundry and Copilot data sources use the following main target tables:

Digital Asset Tables

- alm_ai_system_digital_asset- AI System digital assets
- alm_ai_prompt_digital_asset- AI Prompt digital assets

Entity Tables

- sn_ent_ai_tool- AI Tools
- sn_ent_ai_system_subcomponent_m2m- AI System Subcomponent many-to-many relationships

Usage Table

sn_ai_disc_ai_usage- AI Usage/Execution data.

Additional information

- Staging tables are import set tables where data is initially loaded from external sources.
- Target tables are the destination where transformed data is stored.
- Data flows from Data Source → Staging Table → Transform Map → Target Table
- For the tools attached to AI Agents which are discovered, the tool names are suffixed to ensure uniqueness. This is the format for tool name- tool-name:tenantid:resource-name:project-name.

AI Service Graph Connector for n8n

Use the#AI Service Graph Connector for n8n to create AI connections to discover AI assets such as AI systems, models, prompts, and tools as well as usage data for these AI agents.

Download apps from the Store

Visit the#ServiceNow Store website to download the AI Service Graph Connector for n8n app.

Supported ServiceNow versions

- Australia
- Zurich patch 7
- Yokohama patch 11

User roles

Roles required in the ServiceNow environment:

- sn_ai_disc.discovery_admin
- sn_cmdb_int_util.sgc_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Prerequisites from n8n

Create a n8n API key using your n8n instance.

For more information on creating a n8n API Key, see Create an API Key in n8n environment

Create an API Key in n8n environment

Creating a API key in n8n environment using your n8n instance.

Before you begin
Role required: admin (authenticated user with the appropriate administrative permissions#in the n8n instance)

Procedure

1. Log in to your n8n instance.
2. Navigate to **Settings** > **n8n API**.
3. Select **Create an API Key**.
4. Choose a label and set an Expiration time for the key.
5. Copy the API Key and use this key to authenticate your calls.

Result
The n8n API Key is created.

What to do next
Create an AI connection for n8n

Create an AI connection for n8n

Use the#AI Service Graph Connector for n8n#to discover AI assets such as AI systems, models, prompts, and tools well as usage data for these AI agents. This usage information is consumed by the AI Control Tower value dashboard.

Before you begin
Role required: sn_ai_disc.discovery_admin and sn_cmdb_int_util.sgc_admin

Procedure

1. Navigate to **Service Graph connectors** > **n8n** > **Setup**.
2. Select **SGC Central** tab.
3. Select **Add**.
4. Select **n8n** from all the available connectors.
5. Click **Create connection**.
   Setup page appears
6. Configure and test connection.

   a. Enter the **Connection Name**.

   b. Enter the **Connection URL**(https://<n8n-instance>)

   c. Enter the **API Key**.

   d. Click **Create and test connection**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

e. Click **Continue**.
Setup page appears

7. Configure import schedule

a. Select a parent import schedule job.

b. Select the Active check box.

c. Select run and time to schedule the job.

d. Select all the additional settings if necessary.

e. Ensure that both the parent-scheduled jobs, Discovery and Execution are active as they're shipped out of the box inactive.

Note: Ensure to execute the Discovery-scheduled job first.

f. To run frequency by demand, select **Execute now**

Note: This is an optional step as the schedule imports run according to the schedule.

g. Select **Save**.

h. Click **Continue**.

8. Select **View all connections** to view the newly created connection.

Result
AI connection is created for n8n.

Properties for n8n

Service Graph Connector for n8n#properties control the behavior of the connector.

System properties

Note: To open the System Properties [sys_properties] table, enter#sys_properties.list#n the navigation filter.

System properties

Property	Description
sn_n8n_integ.list_execution_page_size	The maximum number of items to return in each page of sn_n8n_integ.sgn8n_list_execution datastream. This is passed as a query parameter to n8n REST API via the datastream. **Note:** The maximum permitted size is 250 by n8n.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

System properties (continued)

Property	Description
sn_n8n_integ.list_workflow_page_size	The maximum number of items to return in each page of sn_n8n_integ.sgn8n_list_workflow datastream. This is passed as query parameter to n8n REST API via the datastream. **Note:** The maximum permitted size is 250 by n8n.

Target tables for n8n

When you complete setting up the connection, you can configure the integration to periodically pull data from a n8n project. The data is saved in tables that extend from the CMDB CI classes and other non-CMDB classes.

Target tables for AI systems

[cmdb_ai_system_component_product_model]

The following attributes in the n8n Datacenter [cmdb_ai_system_component_product_model] table are populated by collected data.

Attribute label	Attribute name	n8n attribute
Name	name	name
Version	version	Type version

[alm_ai_system_digital_asset]

The following attributes in the n8n Datacenter [alm_ai_system_digital_asset] table are populated by collected data.

Attribute label	Attribute name	n8n attribute
External Ref id	external_ref_id	Connection Url
Display Name	display_name	Name
Install Status	Install_status	Data is Archived
AI Models	ai_models	AI Language model

[cmdb_ci_function_ai]

The following attributes in the n8n Datacenter [cmdb_ci_function_ai] table are populated by collected data.

Attribute label	Attribute name	n8n attribute
Name	name	display name

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Object ID	object_id	external reference id
Install status	install_status	Install status
Model ID	model_id	model
Vendor	vendor	vendor

Target tables for AI model

cmdb_ai_model_product_model.

The following attributes in the n8n Datacenter [cmdb_ai_model_product_model] table are populated by collected data.

Attribute label	Attribute name	n8n attribute
Name	name	Model name
Version	version	Type version

alm_ai_model_digital_asset.

The following attributes in the n8n Datacenter [alm_ai_model_digital_asset] table are populated by collected data.

Attribute label	Attribute name	n8n attribute
External Ref ID	external_ref_id	Connection URL, model name, type version

Target tables for AI prompts

cdmb_ai_prompt_product_model.

The following attributes in the n8n Datacenter [cdmb_ai_prompt_product_model] table are populated by collected data.

Attribute label	Attribute name	n8n attribute
Name	name	Name
Prompt Info	prompt_info	Parameters system message

alm_ai_prompt_digital_asset.

The following attributes in the n8n Datacenter [alm_ai_prompt_digital_asset] table are populated by collected data.

Attribute label	Attribute name	n8n attribute
External Ref ID	external_ref_id	Asset type, asset id

Target tables for AI Subcomponents

sn_ent_ai_system_subcomponent_m2m.

The following attributes in the n8n Datacenter [sn_ent_ai_system_subcomponent_m2m] table are populated by collected data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Attribute label	Attribute name	n8n attribute
AI System	ai_system	connectionUrl + workflowId + +nodeId or n8n
AI Subcomponent	ai_subcomponent	connectionUrl + workflowId + nodeId or n8n
AI subcomponent reference table	ai_subcomponent_reference_table	agents or tools

Target tables for AI Usage

sn_ai_disc_ai_usage.

The following attributes in the n8n Datacenter [sn_ai_disc_ai_usage] table are populated by collected data.

Attribute label	Attribute name	n8n attribute
AI System	ai_system	connectionUrl+ workflowId + nodeId
Session ID	session_id	data.id
Time	time	runData.executions
Count	count	runData.executions.length

AI Service Graph Connector for OCI

The AI Service Graph Connector for OCI enables you to discover and import AI assets from your OCI environment into ServiceNow AI Control Tower.

The AI Service Graph Connector for OCI integrates with your OCI account to catalog AI systems, agents, models, and prompts. Usage data is automatically collected and populated into the AI Control Tower value dashboard, providing comprehensive visibility and governance of your AI operations.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Supported ServiceNow versions

- Zurich (Patch 8)
- Australia (Patch 1)

User roles

You must have one of the following roles:

- sn_ai_disc.discovery_admin
- sn_cmdb_int_util.sgc_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ServiceNow prerequisites

Complete the following setup steps when configuring the connector for the first time.

Note: Updating data source access and clearing cache are prerequisites that must be completed only once, when setting up a new instance for the first time.

Update data source access

The connector requires write permissions to the Data Source table to create data sources.

To enable data source creation:

1. Select **Global** from the application picker.
2. Navigate to **Application Access**.
3. Select the **Can create**, **Can update**, and **Can delete** check boxes.
4. Select **Update**.
5. Switch to the connector application scope.

Clear cache

Clear the cached data for the Data Source and Tables.

To clear the cache:

1. Navigate to **System Definition** > **Background Scripts**.
2. Enter the following script in the **Run Script** text box:

```
GlideTableManager.invalidateTable('sys_data_source');
GlideCacheManager.flushTable('sys_data_source');
GlideTableManager.invalidateTable('sys_db_object');
GlideCacheManager.flushTable('sys_db_object');
```

3. Select **Run Script**.

Note: The script might take several minutes to complete. After completion, switch to the connector application scope.

OCI prerequisites

Create a Java KeyStore (JKS) certificate, configure OCI IAM policies, bind the policies to the OCI user, and configure the connection in your ServiceNow instance. For setup instructions and API details, see the Service Graph Connector for OCI - Setup Instructions [KB2898105] article in the Now Support Knowledge Base.

After completing the OCI setup requirements, register the connector in your ServiceNow instance.

Create an AI connection for AI Service Graph Connector for OCI

Create an AI connection for OCI in AI Control Tower using the#AI Service Graph Connector for OCI.

Before you begin
Role required: sn_ai_disc.discovery_admin and sn_cmdb_int_util.sgc_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **SGC Central** > **Create Connection**.
2. Select **OCI GenAI** from the list of connectors, and then select **Create connection**.
3. On the Grant attachment update permissions page, enable edit permissions for the Attachment [sys_attachment] table, and then select **Continue**.
4. On the#Review setup instructions#page, select **I have read the setup instructions**, and then select **Continue**.
5. Create an X.509 certificate.
   a. Select **New**.
   b. Enter the **Name** for the certificate.
   c. Enter the **Key store password**.
   d. Select **Add file** to attach the Java KeyStore (JKS) file.
   e. Select **Upload** to upload the JKS file.
   f. Select **Save**, and then select **Continue**.
6. Select the source system.
   a. Select the services that you want to discover.
      - **#Generative AI**: Discovers base models, custom (fine-tuned) models, and imported models.
      - **Generative AI Agents**: Discovers AI agents, agent-referenced models, AI tools, AI prompts, and agent usage metrics.

      Note: You can select both services, if required.

   b. Select **Continue**.
7. Configure and test the connection.
   a. Enter the following details for the connection.

Field	Description
Connection name	Name to identify the OCI connection.
Tenancy ID	The OCID of your OCI tenancy. For example, `ocid1.tenancy.oc1..aaaaaa....`
User ID	The OCID of the OCI user whose API key is configured.
Key Fingerprint	The fingerprint generated when uploading the public key. See OCI prerequisites and the Service Graph Connector for OCI - Setup Instructions [KB2898105] article in the Now Support Knowledge Base.
Region	The OCI region identifier. For example, `us-chicago-1`.
Certificate	The JKS certificate. See OCI prerequisites and the Service Graph Connector for OCI - Setup Instructions [KB2898105] article in the Now Support Knowledge Base.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Certificate Alias	The alias used during JKS certificate creation. See OCI prerequisites and the Service Graph Connector for OCI - Setup Instructions [KB2898105] article in the Now Support Knowledge Base.
Certificate Alias Password	The alias password used during JKS certificate creation. See OCI prerequisites and the Service Graph Connector for OCI - Setup Instructions [KB2898105] article in the Now Support Knowledge Base.
Compartment ID (optional)	The OCID of a specific compartment to scope discovery to that compartment and its sub-tree. If no value is specified, the entire tenancy is discovered.

b. **Optional:** Select a MID Server.

c. Select **Create and test connection**, and then select **Continue**.

8. Configure the import schedule.

a. Verify that the parent scheduled jobs are active.

These jobs are shipped as inactive and must be activated manually.

- *SG-OCIGenAI-Discovery* for Model Track#.
- *SG-OCIGenAIAgents-Discovery* for Agent Track.
- *SG-OCIGenAIAgents-Usage* for Usage metrics.

b. Set the run frequency for the scheduled import jobs.

Alternatively, select **Execute now** to execute the import schedule immediately.

c. Select **Continue**.

9. Select the **Confirm connection setup** activity to verify whether the connection was configured.

What to do next

Select **View all connections** to review the connection details. The created connection appears in the Installed connections list.

Note: The Discovery scheduled job must be executed before viewing discovered data in the CMDB.

APIs used by AI Service Graph Connector for OCI

Explore the OCI APIs used by the AI Service Graph Connector for OCI

The AI Service Graph Connector for OCI calls the following OCI APIs during discovery.

For the full API list and required IAM permissions, see the Service Graph Connector for OCI - Setup Instructions [KB2898105] article in the Now Support Knowledge Base.

Data mapping for AI Service Graph Connector for OCI

The AI Service Graph Connector for OCI uses separate data sources and staging tables for each asset type, per service. The staged data is transformed and loaded into target CMDB tables.

The following table lists the data sources, the staging tables, and the target tables as CMDB CI classes for OCI.

Data mapping for OCI

Data source	Staging table	Target tables
Generative AI Service (Model Track)		
SG-OCIGenAI-Model	sn_ai_oci_disc_ai_model	cmdb_ai_model_product_mode alm_ai_model_digital_asset cmdb_ci_ai_model_deployment cmdb_rel_asset_ci
Generative AI Agents Service (Agent Track)		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data mapping for OCI (continued)

Data source	Staging table	Target tables
SG-OCIGenAIAgents-Model	sn_ai_oci_disc_ai_agent_model	cmdb_ai_model_product_mode alm_ai_model_digital_asset cmdb_ci_ai_model_deployment cmdb_rel_asset_ci
SG-OCIGenAIAgents-System	sn_ai_oci_disc_ai_system	cmdb_ai_system_component_p alm_ai_system_digital_asset cmdb_ci_function_ai cmdb_rel_asset_ci
SG-OCIGenAIAgents-Prompt	sn_ai_oci_disc_ai_prompt	cmdb_ai_prompt_product_mod alm_ai_prompt_digital_asset
SG-OCIGenAIAgents-Tool	sn_ai_oci_disc_ai_tool	sn_ent_ai_tool
SG-OCIGenAIAgents-SystemSubcomponentM2M	sn_ai_oci_disc_ai_system_subcomponent_m2m	sn_ent_ai_system_subcompone
SG-OCIGenAIAgents-Usage	sn_ai_oci_disc_ai_usage	sn_ai_disc_ai_usage

CMDB classes targeted in AI Service Graph Connector for OCI

When you complete setting up the connection, you can configure the integration to periodically pull data from OCI. The data is saved in tables that extend from the Configuration Item [cmdb_ci] table.

AI Function [cmdb_ci_function_ai]

The following attributes in the AI Function [cmdb_ci_function_ai] table are populated by collected data:

Attribute label	Attribute name
Name	name
Description	short_description
Object ID	object_id
Model ID	model_id
Vendor	vendor
Asset	asset
Discovery Source	discovery_source

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Relationship created for AI Function

Parent class	Relationship type	Child class
AI Function [cmdb_ci_function_ai]	Depends on::Used by	AI Model Deployment [cmdb_ci_ai_model_deployment]

AI Model Deployment [cmdb_ci_ai_model_deployment]

The following attributes in the AI Model Deployment [cmdb_ci_ai_model_deployment] table are populated by collected data:

Attribute label	Attribute name
Name	name
Description	short_description
Object ID	object_id
Install Status	install_status
Model ID	model_id
Vendor	vendor
Asset	asset
Discovery Source	discovery_source

AI Service Graph connector for Salesforce

Use the#AI Service Graph Connector for Salesforce to discover AI assets such as AI systems, agents, models, tools, and prompts and well as usage data for these AI agents. This usage information is consumed by the AI Control Tower value dashboard.

Download apps from the Store

Visit the ServiceNow Store website to download the AI Service Graph Connector for Salesforce app.

Supported ServiceNow versions

- Australia
- Zurich patch 7
- Yokohama patch 11

User role

- sn_ai_disc.discovery_admin
- sn_cmdb_int_util.sgc_admin

Salesforce AI Metadata mapping in ServiceNow tables

AI Agents

alm_ai_system_digital_asset -> Model table (cmdb_ai_system_component_product_model)

Time	Time	timestamp
Parent ID	Session ID	parentid
Total Invocations	Count	totalinvocations
Conversion Definition ID	AI system	conversationdefinitionid

Create AI connection for Salesforce

Use the AI Service Graph Connector for Salesforce plugin to create AI connections to discover AI assets such as AI systems, models, prompts, and tools as well as usage data for these AI agents within your ServiceNow AI Control Tower. This usage information is consumed by the AI Control Tower value dashboard.

Before you begin

Role required: sn_ai_disc.discovery_admin and n_cmdb_int_util.sgc_admin

Procedure

1. Navigate to **AI Control Tower** > **Configuration** > **AI connection**.
2. Select **Add**.
3. Select **Salesforce** from all the available connectors.
4. Click **Create connection**.
   Review setup instructions page displays
5. Verify to follow all the prerequisite steps.
   Setup page appears.
6. Create and test connection
   a. Enter the **Connection Name**.
   b. Enter the **Connection URL**.
   c. Enter the **OAuth Client ID**.
   d. Enter the **OAuth Token URL**.
   e. Click **Create and test connection**.
   f. Click **Continue**.
7. Configure import schedule

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Ensure that both the parent-scheduled jobs, Discovery and Execution are active as they're shipped out of the box inactive.

Note: Ensure to execute the Discovery-scheduled job first.

b. Select Run according to your preference.

c. To run frequency by demand, select **Execute now**.

Note: This is an optional step as the schedule imports run according to the schedule.

d. Click **Continue**.

e. Click **View all connections** to view the newly created connection.

Result
AI Connection is created for Salesforce.

APIs used by Salesforce

Explore the Salesforce APIs used in AI service Graph Connector for Salesforce. The table lists all the Salesforce API endpoints used by the connector.

The following table lists all the Salesforce API endpoints used by the connector.

API	Endpoint
Bot Definition, BotVersion	https://<domain_name>.salesforce.com/services/data/v65.0/query?q=SELEC BotVersions) FROM BotDefinition WHERE Type != 'Bot' LIMIT 100 OFFSET 100

AI Gateway

Explore the AI Gateway, its value and learn how to use and configure it for your MCP (Model context protocol) transactions.

Model Context Protocol

The Model Context Protocol (MCP) is a standardized client-server protocol that enables AI applications to discover and interact seamlessly with external tools, data sources, and systems. MCP facilitates communication between an AI host application (AI Agent Studio), an MCP Client embedded in the host, and one or more MCP servers that expose specific capabilities such as tools.

For more information on MCP, see Model Context Protocol Client

AI Gateway overview

AI Gateway enables governance, observability, and security for your MCP transactions. AI Gateway is designed to be platform agnostic, delivering the above-mentioned benefits both within ServiceNow (AI Agent studio) and in external agentic studios and hosts.

Why Gateway

Enterprises are building unified AI across vendor boundaries. Their agentic workflows operate across platforms requiring governance.

AI Gateway offers:

- Lifecycle management
- Asset registry
- Identity and access management
- Secure authentication method (OAuth 2.1)
- Observability

Value of AI Gateway

With the increasing need of interoperability across different AI solutions across enterprises. AI Gateway provides a way for interoperability governance, observability & security.

Features and benefits

- Enable tight governance and control of cross-platform resources such as MCP servers.
- Enable enterprises to securely connect their agents to remote MCP servers, which work for any agent and MCP server.
- Provide visibility into production metrics such as usage and latency.

Installation and prerequisites

Applications

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Now Assist subscription (required)
- AI Control Tower for Now Assist – Pro Plus license (auto-installs sn_awh_config)
- AI Agent Studio (required for MCP server intake in AI Gateway for AI Control Tower (1.0.5))

Plugins

- sn_ai_governance (version 5.0.6 or higher)
- sn_telemetry_data (version 1.1.10 or higher)

Roles

- AI steward [sn_ai_governance.ai_steward] - for approval workflows and policy management
- AI Agent admin [sn_aia.admin] – for configuring MCP servers as tools in AI Agent Studio

The AI Gateway application is automatically installed for customers who use AI Control Tower for Now Assist.

If you're using any generative AI features, you already have access to AI Gateway. The AI Gateway is included with all types of pro plus licenses. To use the features in AI Gateway, ensure that both AI Agent Studio and AI Control Tower are available in your instance.

What to explore next

- For information on the process flow of MCP servers, see Process flow of MCP servers via AI Gateway
- For information on AI Gateway setup tab, see MCP server record
- For information on AI Gateway in the configuration page, see AI Gateway
- For information on the roles in AI Control Tower and their role with AI Gateway, see AI Control Tower roles

Process flow of MCP servers via AI Gateway

Explore the process flow of configuring and introducing MCP servers via AI Gateway in AI Control Tower.

The following steps are performed in the following order to complete the process flow of MCP servers.

Role required: sn_ai_governance.ai_steward

1. Adding an MCP server (The MCP server can be added in three different ways)
   - ServiceNow AI Agent studio
   - AI Control Tower
   - MCP Catalog
2. MCP server approval workflow
3. AI Gateway setup and Client Registration

Add an MCP server from ServiceNow AI Agent studio

Add an external MCP server from ServiceNow AI Agent studio.

Before you begin

Role required: sn_ai_governance.ai_steward

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The AI Steward (sn_ai_governance.ai_steward) role gets inherited with the following roles:

- (AI admin) sn_aia.admin
- (AIG admin) aig_admin
- (MCP Client admin) sn_mcp_client.admin

For more information on the AI Steward role and its responsibilities, see AI Control Tower roles

Procedure

1. Navigate to **Workspaces** > **AI Agent Studio** > **Settings** > **Manage MCP servers**.
2. Select **New**.

   Note: In the Create and manage tab of the AI Agent studio, you can add only those MCP servers that have been approved in the AI Control Tower. To view these approvals, go to the Approvals tab on the MCP server record. For more information on Approvals tab and MCP server record, see MCP server record

3. Enter the Name.
4. Select the Authentication type: OAuth 2.1

   Note: AI Gateway supports OAuth 2.1.

5. Select **Next**.
6. Select the Client registration type: Dynamic Client Registration.

   AI Gateway registration in AI Agent Studio supports Dynamic Client Registration.

   If the server allows dynamic client registration, it will automatically retrieve the necessary details. Otherwise, you will need to enter the details manually.

7. Select the **Grant type**.
8. Select **Add**.

   The server gets added and displays the details of the server.

9. Select **Authenticate** to authenticate the server with your credentials.

   Note: To view the approval request record for every MCP server in the AI Agent studio, select **View Approval record**. This action will direct you to the Related Variants tab of the respective MCP server

   To know more about Related Variants tab in the MCP server record, see MCP server record

10. Select **Save** to create an MCP server record.

    Note: A scheduled job named **AI Agent Studio to AICT-MCP server sync** runs every 15 minutes to synchronize the MCP servers from AI Agent Studio to AI Control Tower.

Result

After synchronizing, the MCP server shows up in the AI asset inventory with its Status listed as In review, and the lifecycle phase listed as New.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: After the MCP server is added to the AI Control Tower, it can't be added again. Additionally, AI Agent Studio will not discover a server that has already been added.

What to do next

The MCP server approval request must be approved. See MCP server approval workflow

Add an MCP server from MCP Catalog

Add an MCP server from the MCP Catalog in the AI Control Tower

Before you begin

Role required: sn_ai_governance.ai_steward

Note: The AI Steward (sn_ai_governance.ai_steward) role gets inherited with the following roles:

- (AI admin) sn_aia.admin
- (AIG admin) aig_admin
- (MCP Client admin) sn_mcp_client.admin

Procedure

1. Navigate to **AI assets** > **AI asset inventory** > **MCP servers**.
2. Select **Add**.
3. Select **Choose from MCP Catalog**
4. Search for a server using the search box, or browse available MCP servers displayed as cards with icons, descriptions, and versions.
5. Select a server to view details including:
   - MCP server URL
   - Transport type
   - Available tools and capabilities
6. Click **Select** to import the server.

   Note: The system auto-fills Name, MCP server URL, Authentication type, and Transport type.

7. Select **OK** to confirm your server and endpoint selections.

   Note: Add any additional details.

8. Select **Submit**.

   The MCP server is submitted to AI Steward review.

   Note: You can only add one MCP server at a time.

Result

The MCP server is added to AI Control Tower with status In review and synced to AI Agent Studio within 15 minutes.

Add an MCP server from AI Control Tower

Add an MCP server from the AI Control Tower.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_ai_governance.ai_steward

Note: The AI Steward (sn_ai_governance.ai_steward) role gets inherited with the following roles:

- (AI admin) sn_aia.admin
- (AIG admin) aig_admin
- (MCP Client admin) sn_mcp_client.admin

For more information on the AI Steward role and its responsibilities, see AI Control Tower roles

Procedure

1. Navigate to **AI assets** > **AI asset inventory** > **MCP servers**.
2. Select **Add**.
3. Enter the Name (Server name).
4. Enter the MCP server URL.
5. Select **Next**.
6. Select the Client registration type.

   Note: Selecting Dynamic client Registration, AI Control Tower automatically receives the Client ID and Client Secret. Selecting Manual registration, the client must be created externally on the MCP provider side while the client ID and secret must be entered manually.

7. Review all the other details such as Grant type, and Token authentication method.

   Note: There are three sections for the URL:

   - Authorization URL: Where the user authenticates and grants access token\
   - Token URL: Where the system exchanges and authorization code for an access token
   - Token revocation URL: Used to invalidate issued tokens if supported.

8. Select **Submit**.

Result
The newly added MCP server is registered in the AI asset inventory MCP servers list and available for approval workflow.

MCP server approval workflow

Explore the MCP server approval workflow.

Before you begin
Role required: sn_ai_governance.ai_steward

Procedure

1. Navigate to **AI Control Tower** > **AI assets** > **Approvals**.
2. Select the MCP server from the asset type filter or navigate to Lifecycle and filter by the current state: **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select the MCP Server record with its Status: **New**.
4. Select **Start Review**.

   Note: Within AI Agent Studio, the MCP Server shows a status of AI Steward review during this phase. Product Owners can select View approval record in AI Agent Studio to go straight to the MCP Server record in AI Control Tower.

   A playbook is triggered to guide the approval process through three phases: Assess, Build and Test, and Deploy.
5. Select **Mark as Complete** for the Assess phase.

   Note: The Asses phase includes Architecture review, Risk Assessment, and Stakeholder review.

6. Complete the Build and Test phase activities.

   Note: The Build and Test phase involves out-of-application testing and validation activities such as running a test AI agent using the MCP Server as a tool and validating output received.

7. Select **Mark as Complete** for the Build and test phase.
8. Select **Mark as Complete** for the Deploy phase.

   Note: The Deploy phase is the final step to deploy and allow the MCP Server for usage.

9. Select **Save**.

   Note:

   The AI Gateway setup tab appears only after an MCP server request is approved. The AI steward can pause transactions whenever needed through this tab. For information on the tabs appearing in the MCP server record, see MCP server record

AI Gateway setup and Client Registration

Setting up AI Gateway tab and creating MCP Client Registration.

Before you begin

Role required: sn_ai_governance.ai_steward

Procedure

1. Navigate to **AI assets** > **AI asset inventory** > **MCP servers**.
2. Select and open an approved MCP server.
3. Navigate to the **AI Gateway setup** tab.

   If an AI steward wants to enable ServiceNow Agent Studio for the approved MCP server, they can create a new MCP Client integration.

4. Select **New** under **MCP Client integration**.
5. Enter the **Name**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: A redirect URL will be available after an agent is created and configured. The redirect URL is a callback point endpoint used during OAuth.

The redirect URL for the MCP clients is unique to each:

- AI Agent Studio: https://<instance_name>.service-now.com/oauth_redirect.do
- Copilot studio: Unique to the tool or connection that you can create inside their Copilot agent.
- Postman: https://oauth.pstmn.io/v1/browser-callback
- Other platforms: Consult the platform's OAuth documentation

6. Select **Save**.

Result
A connection to the MCP server is set up via AI Gateway.

Note: The Client ID and Client secret are automatically generated and available in the MCP server record. These credentials are used to authenticate the client when connecting to the Gateway.

To connect with Copilot Studio via AI Gateway, see Connecting with Microsoft Copilot Studio Via AI Gateway

MCP server record

Explore the MCP server record and its associated tabs.

The MCP server record has the following tabs:

1. **Details**: Displays all the asset details along with the MCP server URL at the bottom of the page.
2. **Approvals**: Displays all the approval requests for the MCP server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

When MCP servers are synced to the AI Gateway with the AI Control Tower Core (with Now Assist), an option appears in AI Control Tower to start the approval process. However, with AI Control Tower Pro license version, the button doesn't appear after the synchronization job runs, and the Lifecycle Status is shown as 'None'.

This is a known behavior. As a workaround, set the lifecycle phase to "New" and the lifecycle status to "AI Steward review" for the relevant sn_ai_governance_asset_governance_details record.

This can be achieved by running a script manually:

```
var assetGovernanceRecord = new
 GlideRecord('sn_ai_governance_asset_governance_details');

if (assetGovernanceRecord.get('<sys_id of asset governance
 record>')) {

    assetGovernanceRecord.setValue('status', 5);

 assetGovernanceRecord.setDisplayValue('lifecycle_phase','N
ew');

    assetGovernanceRecord.update();

}
```

For more information on workflow of MCP server approval request, see MCP server approval workflow

3. **KPIs & Metrics**: Displays the MCP tools observability metrics for each server, which is approved and running. In the KPIs & Metrics tab, the AI steward can view different tools, which have been invoked across gateway usage from different hosts. The tab shows the total number of requests sent, the success rate, and any latency observed.

   Note: Similarly, at the AI Gateway tab in AI Control Tower tab on the landing page of AI Control Tower, you can view the various servers that have been used, along with the total number of requests or transactions and the corresponding success rate.

4. **AI Gateway setup**: The AI Gateway setup tab appears only after an MCP server request is approved. From the AI Gateway setup tab, you can pause the AI Gateway transaction of the MCP server and add an MCP Client integration. The AI Gateway tab is accessible for all AI Control Tower workspace users.

   The AI Gateway setup tab has three sections:

   - **AI Gateway MCP server details** - Displays the following URLs:
     - **AI Gateway MCP server URL**- The Gateway endpoint that clients connect to
     - **Authorization endpoint URL**- OAuth authorization endpoint.
     - **Token endpoint URL**- OAuth token exchange endpoint.

     Note: All the three URLs are generated automatically and can't be modified.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If an MCP server is identified as malicious for a certain period, the AI stewards can pause all transactions directed to that server through the AI Gateway. Once the risk is resolved, transactions can be resumed. Similarly, at the AI Gateway level, it's possible to pause all transactions across all servers from the AI Gateway page on the Configurations section of AI Control Tower.

- **MCP Client Integration**- Displays Registered clients for the server. Each agent builder requires its own client registration and MCP client Integration generates a client ID and client secret. If you want to enable ServiceNow Agent Studio for a linear MCP server, then you can create an MCP client integration by selecting **Add**.

  Note: For more information Gateway setup and MCP Client Integration, see AI Gateway setup and Client Registration

- **Global MCP Clients**- Global MCP clients are set up separately from server records. You can configure them on the Configurations page of AI Control Tower in the AI Gateway section. Once they're created, they're automatically available across all MCP servers, so there's no need to set up individual client integrations for each server.

5. **Related Variants**: The Related Variants tab provides a one-to-one mapping of all the MCP server entries from AI Agent Studio, so each entry is visible and trackable in AI Control Tower. In the Related Variants tab, you can have multiple MCP servers of the same variant.

Note: The AI steward can activate sensitive data protection for any transaction across servers by selecting **Activate PII check**. By activating, the AI gateway blocks those transactions, which involve sharing sensitive information to the MCP server.

Add a Global MCP client

Adding a Global MCP client from the AI gateway configuration page.

Before you begin

Role required: AI steward

Procedure

1. Navigate to **AI Control Tower** > **Configurations** > **AI Gateway** > **Global MCP clients**.
2. Select **Add**.
3. Enter then Client ID.
4. Select **Next**.
5. Select Metadata sync mode.

   It is preferable to select Live.

6. Change the Security controls according to the requirements of the agent builder.
7. Click **Submit**.
   A Global MCP client is created.

Result

The MCP client is created and appears in the Global MCP client tab.

Configuring AI Control Tower (legacy)

Configure the AI Control Tower workflow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuration overview

1. Activation and installation of AI Control Tower
2. Configure AI Control Tower
3. Configure multi-instance management for AI Control Tower

Activation and installation of AI Control Tower

The following section provides an order of installing the applications and their dependent plug-ins.

Installation overview

Installing **AI Control Tower (sn_aict)**, the dependent plug-ins are installed in the following order:

1. AI Control Tower Core- This combines AI assets and controls in a central hub, ensuring comprehensive governance and management.
2. AI Asset management- The ability to collect information, track changes and manage lifecycle of AI artifacts like AI systems, models, datasets, prompts etc.
3. AI Risk and Compliance management- It is a comprehensive framework that facilitates end-to-end lifecycle management of AI risks. It supports activities such as risk classification of AI assets, mapping to regulatory authority documents, continuous monitoring, and policy compliance to ensure responsible and accountable AI usage.
4. AI Case management- This module enables tracking, triaging, and resolution of incidents or inquiries related to AI systems. It provides a structured case handling mechanism for AI stewards, compliance officers, and stakeholders to manage AI-related exceptions, investigations, and operational events efficiently.
5. AI Risk and Compliance integration with Control Tower- It establishes a seamless connection between AI Risk and Compliance and the AI Control Tower workspace. This integration ensures unified visibility into AI governance activities, allowing users to monitor risk postures, compliance statuses, and case workflows directly within the Control Tower interface for a centralized oversight experience.
6. AI Risk and Compliance content (optional)- Provides customers to ensure compliance with the applicable laws, regulations, directives and/ or standards and that any content provided in the product is accurate and up to date. Customer acknowledges that the content provided with the product is for ease of use and it is Customer's responsibility to replace the content with the applicable laws, regulations, directives and/ or standards at its own discretion.
7. AI Control Tower- Provides a single, consolidated view of all enterprise AI assets and their relationships, empowering organizations with enhanced integration, governance, and operational efficiency.

Application list

Application	Dependent plug-in
AI Control Tower Core	Data Foundation Model (sn_cmdb_foundation:1.1.0)
AI Risk and Compliance management	• AI Control Tower Core (sn_ai_governance:4.0.2) • GRC Feature roles (sn_grc_ftr_role:21.0.1) • GRC: Common workspace elements (sn_grc_workspace:21.0.4)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Application list (continued)

Application	Dependent plug-in
	• GRC: Policy and Compliance management (sn_compliance:21.0.2) • Post assessment actions for Smart assessments (sn_smart_imp_auto:20.1.0) • GRC: Risk management (sn_risk:21.0.2) • Regulatory agency library (sn_reg_body_mgmt:21.0.0) • Smart assessment core (sn_smart_asmt:21.0.1) • Smart assessment connected (sn_smart_asmt_conn:21.0.1) • Smart assessment designer (sn_smart_asmt_desg:21.0.3)
AI Risk and Compliance integration with Control Tower	• AI Case Management (sn_ai_case_mgmt:21.0.1) • AI Risk and Compliance management (sn_grc_ai_gov:21.0.1) • GRC: Advanced Risk (sn_risk_advanced:21.0.2)
AI Control Tower	• AI Asset Management (sn_ai_asset_mgmt: 2.0.0) • AI Control Tower Core (sn_ai_governance:4.0.2) • AI Risk and Compliance integration with Control Tower (sn_grc_ai_irm_intg:21.0.1) • Engagement dashboard for AI Control Tower (sn_ai_engagement:2.1.6) • Value dashboard for AI Control Tower (sn_ai_value:2.1.6) • AI Discovery (sn_ai_disc:1.0.4)
AI Control Tower for Now Assist 1.01	Gen AI Controller (sn_generative.ai 11.0.9)

When the dependent plug-ins are active, you can look for AI Control Tower application in the ServiceNow store, and download the application when available.

For more information about downloading any application from ServiceNow store, see Download any application from ServiceNow

Configure AI Control Tower

Configuring the AI Control Tower for Now Assist from the **Configurations** page.

Before you begin

Role required: AI steward [sn_ai_governance.ai_steward]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to the **Configurations** view in the AI Control Tower.
2. Expand **Data** and select **Opt in** under **Data sharing**.
   To view the **Data** section, confirm that the generative AI Controller plugin is installed.
   The **Opt in** option is enabled by default.

   Note: Opting out of data sharing can only be reversed by your Account Executive or the Now Support team.

   For more information about Data sharing, see the FAQs (common questions) section on the Data Sharing page.
3. Select **Controls** and activate the **Automatically trigger playbooks** option.
   The **Automatically trigger playbooks** option is inactive by default.
   Enabling the **Automatically trigger playbooks** and adding an AI asset to this environment automatically triggers approval requests.

   Note: When the Automatically trigger playbooks isn't enabled, the approval requests aren't generated automatically, however, the asset manager can initiate them manually.

   Verify to have the **Automatically trigger playbooks** option enabled in your production environment.

Result
The AI Control Tower is configured.

Configure multi-instance management for AI Control Tower

Configuring Multi-Instance management for AI Control Tower.

Before you begin
Note: The feature is available on Yokohama release onwards.

This feature isn’t supported on Government Community Cloud (GCC) and on-premises instances.

Role required: AI Steward [sn_ai_governance.ai_steward]

About this task
Note: Make sure the plugin com.glide.mif.mtls is active. If it is not installed, contact Now Support to activate the plugin com.glide.mif.mtls for MIF features.

Procedure
1. Log in to the managed instance and navigate to **All** > **Multi-Instance Management** > **Manager Instances**.
   The Manager Instances list view page appears.
2. Select **New**.
3. Select the **Application**: AI Control Tower Core.
4. Select the **Manager Instance**.

   Note: The **Approval** field will show Awaiting Manager Confirmation.
5. Select **Submit**.
6. Log in to the valid prod instance (selected in the step 4) and navigate to Managed Instances.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A record will appear with the request status in auto-approved state. It gets auto-approved in 5 to 10 minutes.

7. Navigate to the Managed Instances tab on the Multi-instance Setup page to view all registered managed instances.

Result

Multi-instance management is configured for the AI Control Tower.

For more information about Trust configuration and Trust configuration management, see Cross-instance application trust configuration.

For more information about AI asset synchronization process, see Multi-instance Setup section under Exploring the AI Control Tower configurations.

Configure third-party LLMs using AI Control Tower

Use the AI Control Tower to configure third-party LLMs based on the data routing configuration for the APJC region.

Before you begin

Role required: AI steward [sn_ai_governance_ai_steward]

Procedure

1. Navigate to **All** > **AI Control Tower** > **Configurations** > **Controls** > **AI model providers**.
2. Select **Edit**.

   You can configure AI model requests through these types of data routing configuration:

   a. Regional

   b. Global

3. Configure LLMs through Regional data routing.

   a. Select **Regional**.
   All allowed model providers are displayed:

   - Now LLM Service
   - AWS Claude
   - Azure OpenAI
   - Google Gemini

   b. Select the model providers according to your organizational policies.
   When Azure OpenAI is selected, you're asked to Allow Spillover, which redirects the traffic to Global data routing.

   c. Enable spillover by selecting **Yes**.

   d. Select **Save**.
   The Data routing confirmation consent request appears informing you to provide the consent.

   e. Select **Agree and proceed**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

f. Select **Save**.
The third-party LLMs are configured with Regional data routing configuration for the APJC region.

4. Configure LLMs through Global data routing.

a. Select **Global**.
All allowed model providers are displayed:

- AWS Claude
- Azure OpenAI
- Google Gemini
- Now LLM Service

Note: Selecting global data routing redirects your data processing location to a global datacenter.

b. Select all the model providers.

c. Select **Save**.

Result

The third-party LLMs are configured with the Global data routing configuration for the APJC region.

For information about Data routing, Fallback, and Spillover, see AI model providers

For information about scenarios for configuring third-party LLMs for regulated markets and AMS & EMEA regions, see Explore Third-party LLMs and regions

Using AI Control Tower (legacy)

Use AI Control Tower for creating governance workflows.

Create an AI Control Tower Playbook workflow

Create a AI Control Tower Playbook workflow for Now Assist approvals to approve or reject an asset.

Before you begin

Important: The AI Control Tower Approval Playbook for the Now Assist approval isn't created manually. They're automatically triggered when an approval request is created while the approval mandate is enabled. To automatically trigger, activate the Automatically trigger playbooks feature under configuration.

Role required: AI steward [sn_ai_governance_ai_steward]

Procedure

1. Navigate to **Workspaces** > **AI Control Tower**.
2. From the AI Control Tower, open the **AI assets** view.
3. From the navigation menu of the AI assets view, navigate to Now Assist **Approvals** and open an Approval record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Under the **Playbook** section of the approval record, you can see the Now Assist **Approvals** workflow.

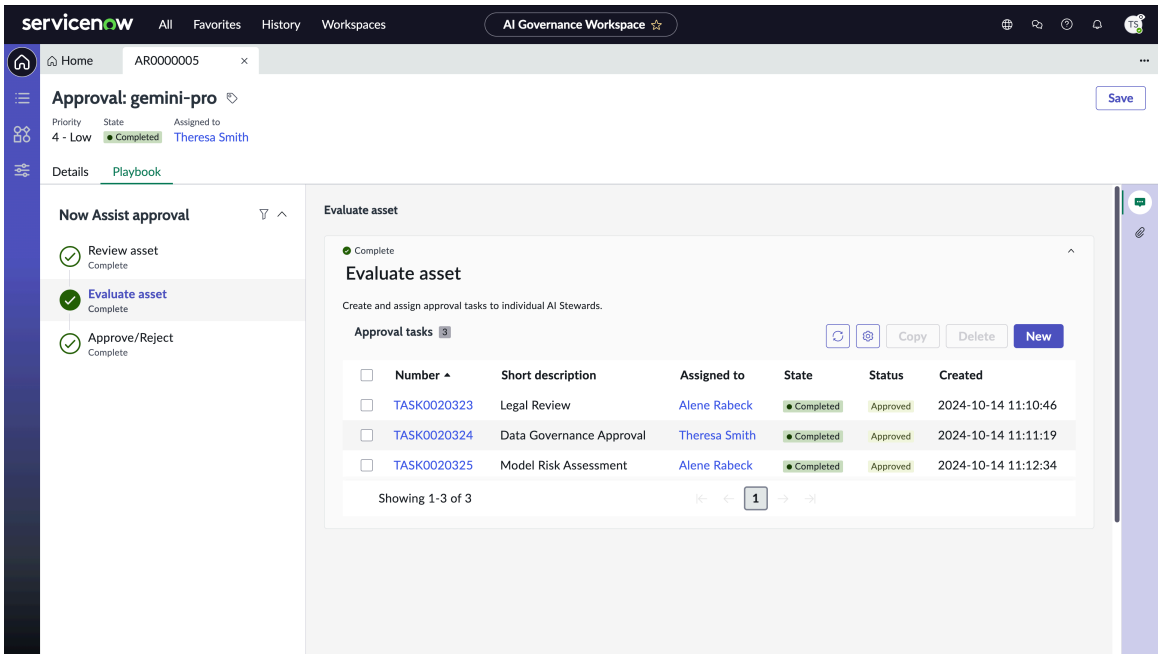
   You can save the **Playbook** record using the **Save** option or select **Cancel approval request** to cancel the workflow during any step.

5. **Review asset**- You can view all the details of an asset in review.
6. Select **Next**.
   The approval status changes when the Review asset step is marked as complete.
7. **Evaluate asset**- AI Stewards can create and assign the approval tasks to other individual AI Stewards to evaluate the assets.
   For information on creating a Now Assist approval task for evaluating assets, see Create a Now Assist approval task.

   Note: You can **Copy** or **Delete** the tasks and create a task using the **New** option in the Approval tasks list.

8. **Approval/Reject**- AI Stewards can select the Risk score from the drop-down menu and enter the Close notes, while approving or rejecting an asset based on the evaluation of the tasks.
9. Select **Reject** or **Approve asset** to complete the workflow.

   The **Risk score** and **Close notes** can't be modified after the **Approve/Reject** step is marked as complete.



What to do next

If you need to activate any skill from Now Assist Admin, an approval request is now required. The AI Control Tower approvals are integrated with both the builder team on the Skill Kit and Now Assist Admin. You may only use models, skills, or AI systems that have been approved. Approval is granted when the "AI steward approval required" option is enabled.

Create a Now Assist approval task

Create an Now Assist approval task to evaluate the assets. The Now Assist approval task is a sub task of an approval request where you will need approvals from other organizations or entities like Legal review, Security review, Data review, Piracy review etc.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

Procedure
1. Navigate to Now Assist **Approvals** and open an Approval record.
2. Under the **Playbook** section, confirm that the **Review asset** step is marked as complete.
3. Select **Create new task** under **Evaluate asset**.
   A new approval task is created. The task number and task type fields are auto-populated.
4. Enter the **Short description**, **Description**, **Due date**, and **Close notes**.
5. Select the **Priority**, **State**, and **Status** of the task from the drop-down menu.
6. Enter and search for **Assigned to** and **Parent approval record**.
   The **Parent approval record** gets auto-populated and appears in a read-only mode.
7. Select **Save**.
   A Now Assist Approval task of an approval request is created.

Creating AI assets

You can create AI assets to track and manage the life cycles of your AI systems, AI models, prompts, and datasets.

Create AI system assets

Create AI assets to track and manage the life cycles of your AI systems.

Before you begin
Role required: sn_ai_governance_ai_steward or sn_ai_asset_mgmt.ai_asset_owner

About this task
An AI system is a software artifact that provides AI and machine learning (ML) capabilities to generate outputs, such as predictions, content, recommendations, and decisions, with varying levels of autonomy. Each AI system can be associated with one or more AI models, which may also be associated with one or more prompts and datasets. These AI models, prompts, and datasets enable the AI system to process data and solve complex problems with little to no human intervention.

Procedure
1. Navigate to **Workspaces** > **AI Control Tower**.
2. From the AI Control Tower, open the AI assets view.
3. From the navigation menu of the AI assets view, navigate to either **AI asset inventory - Managed** > **AI Systems** or **AI asset inventory - Unmanaged** > **AI Systems**.
4. Select **Add AI system**.
5. In the Details section of the Add AI system form, fill in the fields.

Details fields in the Add AI system form

Field	Description
Name	Name of the AI system.
Provider	People or organization that developed the AI system.
Version	Version of the AI system.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Description	Brief description of the AI system.
Documentation	Additional information about the AI system, such as the method used to evaluate the efficacy of the AI system.
Managed by	User who is assigned to manage the AI system. This field is automatically set to the user who creates the AI system asset. **Note:** This field is editable only if you have the AI steward (sn_ai_governance_ai_steward) role. If you have the AI asset owner (sn_ai_asset_mgmt.ai_asset_owner) role, this field is read-only.
State	State of the AI system. The options are **Draft** and **Deployed**.
License details	License that you are using for the AI system.
Asset type	Type of AI that your AI system is. Select one of the following options: ○ **Agentic AI** ○ **Classic AI** ○ **Generative AI**
Department	Department that the AI system belongs to.
Supported locations	Locations in which the AI system is supported.

6. Select **Next**.
7. In the Related assets section of the Add AI system form, associate the AI system with other AI assets that are related to it.

   a. Depending on the type of related AI asset that you want associate the AI system with, select one of the following options from the asset type menu:

   - To associate the AI system with any of its supported components or subsystems, select **Sub AI systems**.

     Note: This option is available only if you set the **Asset type** field to either **Agentic AI** or **Generative AI** in the Details section of the Add AI system form.

   - To associate the AI system with any of its integrated AI models, select **AI models**.
   - To associate the AI system with a dataset that is used to test an integrated AI model, select **Evaluation datasets**.
   - To associate the AI system with a prompt that you are providing to an integrated AI model, select **Prompts**.
   - To associate the AI system with any of its integrated AI tools, select **Tools**.

     Note: This option is available only if you set the **Asset type** field to **Agentic AI** in the Details section of the Add AI system form.

   The corresponding asset list opens.

   b. Associate the AI system with the related AI asset.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Depending on if the related AI asset is currently available in your asset inventory, proceed with one of the following options:

- To associate the AI system with a related AI asset that is currently available, use the following steps:
  i. Select the Add from inventory drop-down menu on the header of the corresponding asset list.
  ii. Select **Add from inventory**.
  iii. In the Add from inventory dialog box, select the check box for the related AI asset that you want to associate the AI system with.

  > **Note:** If you want to associate the AI system with multiple related AI assets, select the check box for each asset.

  iv. Select **Add**.
  The dialog box closes and the selected AI asset appears in the corresponding asset list.
- To associate the AI system with a related AI asset that is not currently available, use the following steps:

  > **Note:** This option is not available for AI tools.

  i. Select the Add from inventory drop-down menu on the header of the corresponding asset list.
  ii. Select **Create**.
  iii. Create the AI asset.
    - If you are creating an AI system asset, return to step 5.
    - If you are creating an AI model asset, follow the proceeding steps in Create AI model assets.
    - If you are creating a prompt asset, follow the proceeding steps in Create prompt assets.
    - If you are creating a dataset asset, follow the proceeding steps in Create dataset assets.

  The new AI asset appears in the corresponding asset list.

8. Select **Next**.
9. In the Use & purpose section of the Add AI system form, fill in the fields.
   This section of the Add AI system form enables you to specify the intended use and purpose of the AI system.

Use & purpose fields in the Add AI system form

Field	Description
Intended outcome of the AI system	Primary business outcome that the AI system is expected to achieve. Select one of the following options: ○ **Not Applicable** ○ **Efficiency Boost** ○ **Quality Enhancement** ○ **Decision Guidance** ○ **Automation of Tasks**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **Customer Experience Upgrade** ○ **Insight Generation**
Interaction type with end users	Type of interaction between end users and the AI system, including whether outputs are visible, actionable, or interactive. Select one of the following options: ○ **Not Applicable** ○ **No Direct Interaction** ○ **Background Support** ○ **Notifications & Prompts** ○ **User-Facing Recommendations** ○ **Chat-Based Interaction** ○ **Interactive Experience**
Level of human involvement	Capacity at which users can guide, review, and accept AI system activities during operation. Select one of the following options: ○ **Not Applicable** ○ **Full User Control** ○ **User-Guided with AI Support** ○ **Shared Control** ○ **AI-Initiated with User Approval** ○ **Full Automated Workflow**
System autonomy level	Extent to which the AI system can initiate actions or decisions without human intervention. Select one of the following options: ○ **None** ○ **Assistive (AI suggests)** ○ **Semi-Automated (acts with confirmation)** ○ **Condition-Based Automation** ○ **Event-Triggered Automation** ○ **Fully Automated Execution**
Type of output produced	Type of output that the AI system produces for users, systems, or downstream processes. Select any of the following options: ○ **Automated Decisions** ○ **Generated Content** ○ **Insight & Summaries** ○ **Ranking & Scores** ○ **Recommendations** ○ **Simple Alerts** ○ **System Actions**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Area where the AI system is used	Business or operational areas where the AI system is used or provides value. Select any of the following options: ○ **Customer services** ○ **External Partner Ecosystem** ○ **Finance & Accounting** ○ **HR & Workforce** ○ **Internal Operations** ○ **IT & Security** ○ **Sales & Marketing** ○ **Supply Chain**
People affected by the AI system	Users who may be directly or indirectly affected by the AI system outputs or decisions. Select any of the following options: ○ **External Partners** ○ **General Customer Base** ○ **Internal Team** ○ **Public or Large Audiences** ○ **Specific Customer Groups**
Data used by the system	Types of data that the AI system uses to process inputs and generate outputs. Select any of the following options: ○ **Behavioral or Usage Data** ○ **Business Operational Data** ○ **Customer Interaction Data** ○ **Profile or Account Data** ○ **Public or General Info** ○ **Sensitive Business Data**
Additional use and purpose details	Additional information or context that helps clarify the specific use and purpose of the AI system.

10. Select **Submit for review**.

> **Note:** If you aren't ready to submit the AI system for review, select **Save** instead. You can then edit it and submit it for review later by navigating to **AI assets** > **Lifecycle** > **Onboard** and then selecting the AI system from the list. When the AI asset record opens, continue editing the AI system details.

Result

The AI system is added to your AI asset inventory. It automatically enters the onboard stage of the AI asset life cycle and is updated with a Lifecycle status of AI steward review.

What to do next

Users who are assigned the AI steward (sn_ai_governance.ai_steward) role can start the review process to begin tracking and managing the life cycle of the AI system. For detailed instructions, see Complete AI asset lifecycle.

Create AI model assets

Create AI assets to track and manage the life cycles of your AI models.

Before you begin

Role required: sn_ai_governance_ai_steward or sn_ai_asset_mgmt.ai_asset_owner

About this task

An AI model is a program that is trained to process data and generate outputs, such as predictions, content, recommendations, and decisions, without human intervention. You can use an AI model to perform a specific task, such as image recognition, data classification, or price prediction.

Procedure

1. Navigate to **Workspaces** > **AI Control Tower**.
2. From the AI Control Tower, open the AI assets view.
3. From the navigation menu of the AI assets view, navigate to either **AI asset inventory - Managed** > **AI Models** or **AI asset inventory - Unmanaged** > **AI Models**.
4. Select **Add AI model**.
5. In the Details section of the Add AI model form, fill in the fields.

Details fields in the Add AI model form

Field	Description
Name	Name of the AI model.
Provider	People or organization that developed the AI model.
Version	Version of the AI model.
Supported languages	Languages that are supported by the AI model.
Deployment guidelines	Guidelines or instructions on how to deploy the AI model.
Training procedure	Method that you're using to train the AI model.
Context window	Maximum number of tokens that the AI model can process and recall when generating outputs.
Model size in MB	Size of the AI model in megabytes (MB).
Model parameters info	Internal variables that the AI model learns during training to process data and generate outputs.
Description	Brief description of the AI model.
Managed by	User who is assigned to manage the AI model. This field is automatically set to the user who creates the AI model asset. **Note:** This field is editable only if you have the AI steward (sn_ai_governance_ai_steward) role. If you have the AI asset owner (sn_ai_asset_mgmt.ai_asset_owner) role, this field is read-only.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
State	State of the AI model. The options are **Draft** and **Deployed**.
License details	License that you are using for the AI model.
Base model	Base model, also known as a foundation model or pre-trained model, that the AI model was built from.
Department	Department that the AI model belongs to.
Supported locations	Locations in which the AI model is supported.
Model card	Brief document that describes important information about the AI model, including the context, intended use, training data, and limitations of the model.
Model weights info	Numerical parameters that define how the AI model learns during training so that it can generate more desired outputs.
Required infrastructure	Integrated software and hardware components that are required for developing, deploying, and managing the AI model.
Evaluation metrics report	Report that provides data for the metrics that you're using to evaluate the effectiveness of the AI model.

6. Select **Next**.
7. In the Related assets section of the Add AI model form, associate the AI model with related datasets.
   Related datasets include any collections of data that can help test or train the AI model.

   a. Depending on the type of related dataset that you want associate the AI model with, select one of the following options from the asset type menu:
      - To associate the AI model with a dataset that can help test it, select **Evaluation datasets**.
      - To associate the AI model with a dataset that can help train it, select **Training datasets**.

      The corresponding asset list opens.

   b. Associate the AI model with the related dataset.
      Depending on if the related dataset is currently available in your asset inventory, proceed with one of the following options:
      - To associate the AI model with a related dataset that is currently available, use the following steps:
        i. Select the Add from inventory drop-down menu on the header of the corresponding asset list.
        ii. Select **Add from inventory**.
        iii. In the Add from inventory dialog box, select the check box for the related dataset that you want to associate the AI model with.

        > **Note:** If you want to associate the AI model with multiple related datasets, select the check box for each dataset.

        iv. Select **Add**.
        The dialog box closes and the selected dataset appears in the corresponding asset list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To associate the AI model with a related dataset that is not currently available, use the following steps:
  i. Select the Add from inventory drop-down menu on the header of the corresponding asset list.
  ii. Select **Create**.
  iii. Create the dataset by following the proceeding steps in Create dataset assets. The new dataset appears in the corresponding asset list.

8. Select **Submit for review**.

> **Note:** If you aren't ready to submit the AI model for review, select **Save** instead. You can then edit it and submit it for review later by navigating to **AI assets** > **Lifecycle** > **Onboard** and then selecting the AI model from the list. When the AI asset record opens, continue editing the AI model details.

Result
The AI model is added to your AI asset inventory. It automatically enters the onboard stage of the AI asset life cycle and is updated with a Lifecycle status of AI steward review.

What to do next
Users who are assigned the AI steward (sn_ai_governance.ai_steward) role can start the review process to begin tracking and managing the life cycle of the AI model. For detailed instructions, see Complete AI asset lifecycle.

Create prompt assets

Create AI assets to track and manage the life cycles of your prompts.

Before you begin
Role required: sn_ai_governance_ai_steward or sn_ai_asset_mgmt.ai_asset_owner

About this task
A prompt is the instructive input that you provide to AI models to elicit specific responses or outputs. The more detailed and descriptive a prompt is, the higher the quality of the response or output. Examples of prompts include instructions, questions, and commands.

Procedure
1. Navigate to **Workspaces** > **AI Control Tower**.
2. From the AI Control Tower, open the AI assets view.
3. From the navigation menu of the AI assets view, navigate to either **AI asset inventory - Managed** > **Prompts** or **AI asset inventory - Unmanaged** > **Prompts**.
4. Select **Add prompt**.
5. In the Details section of the Add prompt form, fill in the fields.

Details fields in the Add prompt form

Field	Description
Name	Name of the prompt.
Provider	People or organization that developed the prompt.
Version	Version of the prompt.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Description	Brief description of the prompt.
Documentation	Additional information about the prompt, such as the method used to evaluate the accuracy and quality of AI model responses based on the given input.
Managed by	User who is assigned to manage the prompt. This field is automatically set to the user who creates the prompt asset. **Note:** This field is editable only if you have the AI steward (sn_ai_governance_ai_steward) role. If you have the AI asset owner (sn_ai_asset_mgmt.ai_asset_owner) role, this field is read-only.
State	State of the prompt. The options are **Draft** and **Deployed**.
Prompt information	Input that you want to provide to AI models.

6. Select **Next**.
7. In the Related assets section of the Add prompt form, associate the prompt with related AI models.

   Related AI models include any AI models that you can provide the prompt to. These AI models can process inputs from the prompt and help generate appropriate outputs.

   Depending on if the related AI model is currently available in your asset inventory, proceed with one of the following options:

   - To associate the prompt with a related AI model that is currently available, use the following steps:

     a. Select the Add from inventory drop-down menu on the header of the AI models list.

     b. Select **Add from inventory**.

     c. In the Add from inventory dialog box, select the check box for the related AI model that you want to associate the prompt with.

     Note: If you want to associate the prompt with multiple related AI models, select the check box for each model.

     d. Select **Add**.
     The dialog box closes and the selected AI model appears in the AI models list.

   - To associate the prompt with a related AI model that is not currently available, use the following steps:

     a. Select the Add from inventory drop-down menu on the header of the AI models list.

     b. Select **Create**.

     c. Create the AI model by following the proceeding steps in Create AI model assets.
     The new AI model appears in the AI models list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Select **Submit for review**.

> **Note:** If you aren't ready to submit the prompt for review, select **Save** instead. You can then edit it and submit it for review later by navigating to **AI assets** > **Lifecycle** > **Onboard** and then selecting the prompt from the list. When the AI asset record opens, continue editing the prompt details.

Result
The prompt is added to your AI asset inventory. It automatically enters the onboard stage of the AI asset life cycle and is updated with a Lifecycle status of AI steward review.

What to do next
Users who are assigned the AI steward (sn_ai_governance.ai_steward) role can start the review process to begin tracking and managing the life cycle of the prompt. For detailed instructions, see Complete AI asset lifecycle.

Create dataset assets

Create AI assets to track and manage the life cycles of your datasets.

Before you begin
Role required: sn_ai_governance_ai_steward or sn_ai_asset_mgmt.ai_asset_owner

About this task
A dataset is a collection of structured or unstructured data that you can use to train and test AI models. Datasets can help you improve the performance and efficacy of your AI models.

Procedure
1. Navigate to **Workspaces** > **AI Control Tower**.
2. From the AI Control Tower, open the AI assets view.
3. From the navigation menu of the AI assets view, navigate to either **AI asset inventory - Managed** > **Datasets** or **AI asset inventory - Unmanaged** > **Datasets**.
4. Select **Add dataset**.
5. On the form, fill in the fields.

Add dataset form

Field	Description
Name	Name of the dataset.
Provider	People or organization that developed the dataset.
Acceptable usage	Acceptable use for the dataset. You can specify more than one use.
Version	Version of the dataset.
Data type	Type of data that the dataset contains. You can specify more than one data type.
Source	Source of the dataset, such as internal customer data within an organization or publicly available data from a government agency.
Description	Brief description of the dataset.
Managed by	User who is assigned to manage the dataset. This field is automatically set to the user who creates the dataset asset.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: This field is editable only if you have the AI steward (sn_ai_governance_ai_steward) role. If you have the AI asset owner (sn_ai_asset_mgmt.ai_asset_owner) role, this field is read-only.
State	State of the dataset. The options are **Draft** and **Deployed**.
Creation type	Method by which the dataset was created. Select one of the following options: ○ **Curated**: The dataset was created through careful selection, organization, and refinement of data. ○ **Derived**: The dataset was created by processing, transforming, or combining data from existing datasets. ○ **Synthetic**: The dataset was created by using artificial data that mimics real-word data.
Base datasets	Base dataset that the dataset was built from.
Department	Department that the dataset belongs to.
Dataset creation date	Date and time that the dataset was created.
Dataset card	Brief document that describes important information about the dataset, including the context, intended use, limitations, and potential biases of the dataset.

6. Select **Submit for review**.

Note: If you aren't ready to submit the dataset for review, select **Save** instead. You can then edit it and submit it for review later by navigating to **AI assets** > **Lifecycle** > **Onboard** and then selecting the dataset from the list. When the AI asset record opens, continue editing the dataset details.

Result
The dataset is added to your AI asset inventory. It automatically enters the onboard stage of the AI asset life cycle and is updated with a Lifecycle status of AI steward review.

What to do next
Users who are assigned the AI steward (sn_ai_governance.ai_steward) role can start the review process to begin tracking and managing the life cycle of the dataset. For detailed instructions, see Complete AI asset lifecycle.

Creating requests for AI assets

You can manage deployed AI assets effectively by creating change requests for updates to existing assets or by creating offboarding requests for retiring assets.

Create change requests for AI assets

Create a change request to modify the relationships between a deployed AI asset and its related assets.

Before you begin
Role required:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- AI steward (sn_ai_governance_ai_steward)
- AI asset owner (sn_ai_asset_mgmt.ai_asset_owner)

About this task

To modify the relationships between related AI assets, a user with the AI asset owner (sn_ai_asset_mgmt.ai_asset_owner) role can initiate the change process by creating and submitting a change request. After the request is submitted, a user with the AI steward (sn_ai_governance_ai_steward) role can review and approve the request. This approval triggers the AI Control Tower application to create a new AI asset record for the asset that the change request was created for. The asset then automatically enters the onboarding stage of the asset life cycle.

You can create change requests for the following AI asset types:

- AI systems (classic, generative, and agentic)
- AI models
- Datasets

Procedure

1. Navigate to **Workspaces** > **AI Control Tower**.
2. If you have the AI asset owner (sn_ai_asset_mgmt.ai_asset_owner) role, create a change request.

   a. Initiate the request by using one of the following navigation options.

Navigation option	Procedure
AI Control Tower Home view	**i.** From the Home view of the AI Control Tower workspace, select the **Create request** drop-down menu. **ii.** Select **Create a change request**.
Change requests list	**i.** From the AI Control Tower workspace, open the AI assets view. **ii.** From the navigation menu of the AI assets view, navigate to **Requests** > **Change requests**. **iii.** Select **Create change request**.
AI asset record	**i.** From the AI Control Tower workspace, open the AI assets view. **ii.** From the navigation menu of the AI assets view, locate the **AI asset inventory - Managed** section and then select the subsection for the type of AI asset that you want to create a change request for. Alternatively, navigate to **Lifecycle** > **Deploy**. **iii.** Select an AI asset that meets the following criteria: ▪ The State is set to Deployed. ▪ The Lifecycle phase is set to Deploy. ▪ The Lifecycle status is set to Deployed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Navigation option	Procedure
	iv. Select the **Create a request** drop-down menu. **v.** Select **Create a change request**.

b. On the form, fill in the fields.

New change request form

Field	Description
Change details	
Asset in review	The AI Asset that you want to modify related asset relationships for. **Note:** If you initiated the change request from an AI asset record, this field populates automatically.
Version	Updated version number of the AI asset.
Due date	Date and time at which the request must be completed.
Justification	Justification for creating the request.
Sub AI systems **Note:** This form section appears only if you are creating a change request for an AI system with an Asset type of either Generative AI or Agentic AI.	
Updated Sub AI systems	Related AI components or subsystems that you want to associate the AI asset with.
AI models **Note:** This form section appears only if you are creating a change request for an AI system.	
Updated models	Related AI models that you want to associate the AI asset with.
AI prompts **Note:** This form section appears only if you are creating a change request for an AI system.	
Updated prompts	Related prompts that you want to associate the AI asset with.
Evaluation dataset **Note:** This form section appears only if you are creating a change request for an AI system or AI model.	
Updated evaluation datasets	Related evaluation datasets that you want to associate the AI asset with.
Tools	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Note: This form section appears only if you are creating a change request for an agentic AI system.	
Updated tools	Related tools that you want to associate the AI asset with.
Training datasets **Note:** This form section appears only if you are creating a change request for an AI model.	
Updated training datasets	Related training datasets that you want to associate the AI asset with.
Source **Note:** This form section appears only if you are creating a change request for a dataset.	
Updated source	Related data source that you want to associate the AI asset with.
Base datasets **Note:** This form section appears only if you are creating a change request for a dataset.	
Updated base datasets	Related base dataset that you want to associate the AI asset with.
Dataset card **Note:** This form section appears only if you are creating a change request for a dataset.	
Updated dataset card	Related dataset card that you want to associate the AI asset with.

c. Select **Submit for review**.

d. In the Submit change request dialog box, select **Submit request**.
After the dialog box closes, you are automatically redirected to the new change request record.

3. If you have the AI steward (sn_ai_governance_ai_steward) role, approve or reject the request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Open the change request record by using one of the following navigation options.

Navigation option	Procedure
Change requests list	**i.** From the AI Control Tower workspace, open the AI assets view. **ii.** From the navigation menu of the AI assets view, navigate to **Requests** > **Change requests**. **iii.** From the list of available change requests, select the record number for the request that you want to approve.
AI asset record	**i.** From the AI Control Tower workspace, open the AI assets view. **ii.** From the navigation menu of the AI assets view, locate the **AI asset inventory - Managed** section and then select the subsection for the type of AI asset that the change request was created for. Alternatively, navigate to **Lifecycle** > **Deploy**. **iii.** Select the AI asset that the change request was created for. **iv.** On the AI asset record, select the **Requests** tab. **v.** Select **Change requests** from the request types menu. **vi.** From the list of available change requests, select the record number for the request that you want to approve.

The change request record opens.

b. On the **Details** tab, set the **Assigned to** field to the user who you want to assign the change request to.
You can assign the request to yourself or to any other user with the AI steward (sn_ai_governance_ai_steward) role.

c. If you are the assigned user, approve or reject the request.

- To approve the request, select **Approve**.
- To reject the request, select **Reject**.

○ If you approved the request, the Status changes to Approved and the State changes to In progress.

The AI Control Tower application then generates a change task for each asset that is impacted by the request. These change tasks appear on the **Change tasks** tab and specify the actions that must be taken on the impacted assets. Each change task is assigned to a user with the AI asset owner (sn_ai_asset_mgmt.ai_asset_owner) role. If you have any concerns or need further clarification on the request, you can create additional change tasks manually. After the assigned users complete all change tasks, the AI Control Tower application automatically creates a new AI asset record for the asset that the change request was created for. The State of the request then changes to Completed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The **Change tasks** tab is not available if the change request was created for a dataset.

- If you rejected the request, the Status changes to Rejected and the State changes to Completed.

Create offboarding requests for AI assets

Create an offboarding request to retire AI assets that are no longer needed.

Before you begin

Role required:

- AI asset owner (sn_ai_asset_mgmt.ai_asset_owner)
- AI steward (sn_ai_governance_ai_steward)

About this task

To retire a deployed AI asset, a user with the AI asset owner (sn_ai_asset_mgmt.ai_asset_owner) role can initiate the offboarding process by creating and submitting an offboarding request. After the request is submitted, a user with the AI steward (sn_ai_governance_ai_steward) role can review and approves the request. This approval triggers the offboarding workflow that assigns tasks to impacted asset owners and updates the Status of the AI asset record to Retired upon completion.

Note: We have automated the ServiceNow AI model to initiate the offboarding workflows when a deprecation date is present.

You can create offboarding requests for the following AI asset types:

- AI systems (classic, generative, and agentic)
- AI models
- Datasets
- MCP servers

Procedure

1. Navigate to **Workspaces** > **AI Control Tower**.
2. If you have the AI asset owner (sn_ai_asset_mgmt.ai_asset_owner) role, create an offboarding request.

   a. Initiate the request by using one of the following navigation options.

Navigation option	Procedure
AI Control Tower Home view	**i.** From the Home view of the AI Control Tower workspace, select the **Create request** drop-down menu. **ii.** Select **Create an offboarding request**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Navigation option	Procedure
Offboarding requests list	i. From the AI Control Tower workspace, open the AI assets view. ii. From the navigation menu of the AI assets view, navigate to **Requests** > **Offboarding requests**. iii. Select **Create offboarding request**.
AI asset record	i. From the AI Control Tower workspace, open the AI assets view. ii. From the navigation menu of the AI assets view, locate the **AI asset inventory - Managed** section and then select the subsection for the type of AI asset that you want to retire. Alternatively, navigate to **Lifecycle** > **Deploy**. iii. Select an AI asset that meets the following criteria: ▪ The State is set to Deployed. ▪ The Lifecycle phase is set to Deploy. ▪ The Lifecycle status is set to Deployed. iv. Select the **Create a request** drop-down menu. v. Select **Create an offboarding request**.

b. On the form, fill in the fields.

New offboarding request form

Field	Description
Asset in review	**Note:** If you initiated the offboarding request from an AI asset record, this field populates automatically.
Due date	Date and time at which the request must be completed.
Justification	Justification for creating the request.

c. Select **Submit for review**.

d. In the Submit offboarding request dialog box, select **Submit request**.
After the dialog box closes, you are automatically redirected to the new offboarding request record.

3. If you have the AI steward (sn_ai_governance_ai_steward) role, review the request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Open the offboarding request record by using one of the following navigation options.

Navigation option	Procedure
Offboarding requests list	**i.** From the AI Control Tower workspace, open the AI assets view. **ii.** From the navigation menu of the AI assets view, navigate to **Requests** > **Offboarding requests**. **iii.** From the list of available offboarding requests, select the record number for the request that you want to review.
AI asset record	**i.** From the AI Control Tower workspace, open the AI assets view. **ii.** From the navigation menu of the AI assets view, locate the **AI asset inventory - Managed** section and then select the subsection for the type of AI asset that the offboarding request was created for. Alternatively, navigate to **Lifecycle** > **Deploy**. **iii.** Select the AI asset that the offboarding request was created for. **iv.** On the AI asset record, select the **Requests** tab. **v.** Select **Offboarding requests** from the request types menu. **vi.** From the list of available offboarding requests, select the record number for the request that you want to review.

The offboarding request record opens.

b. On the **Details** tab, set the **Assigned to** field to the user who you want to assign the offboarding request to.
You can assign the request to yourself or to any other user with the AI steward (sn_ai_governance_ai_steward) or AI asset owner (sn_ai_asset_mgmt.ai_asset_owner) role.

c. If you are the assigned user, select **Start review**.

The **Offboarding workflow** tab appears and then the offboarding workflow initiates. In addition, the **Impacted assets** tab automatically updates with the list of assets that are impacted by the request.

The offboarding workflow contains the Assess, Pre-offboarding tasks, and Offboard stages. You can create and delete relevant tasks in all three stages. Any tasks that are generated for impacted assets also appear in the corresponding workflow stages.

Note: Each user who is assigned to an impacted asset must complete the corresponding task by either accepting or rejecting it.

- If the user accepts the task, the Status task changes to Accepted and the State changes to Completed.
- If the user rejects the task, the Status of the task changes to Rejected and the State changes to Completed.

d. Complete all tasks in the Assess stage.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

e. Select **Mark as complete** to move to the Pre-offboarding tasks stage.

f. Complete all tasks in the Pre-offboarding tasks stage.

g. Select **Mark as complete** to move to the Offboard stage.

h. Complete all tasks in the Offboard stage.

i. Select **Mark as complete**.

After all three stages are marked as complete, the Status of the request changes to Approved and the State changes to Completed. The State of the asset then changes to Retired.

View AI assets by life-cycle stage

View AI assets based on the AI asset life-cycle stage that they are currently in. Use this information to determine which AI assets require your attention.

Before you begin

Role required: sn_ai_governance.ai_steward or sn_ai_asset_mgmt.ai_asset_owner

Procedure

1. Navigate to **Workspaces** > **AI Control Tower**.
2. From the AI Control Tower, open the AI assets view.
3. From the navigation menu of the AI assets view, locate the **Lifecycle** section.
   You can select **Cancel** to cancel AI asset.
4. Depending on the life-cycle stage that you want to view AI assets for, select one of the following Lifecycle subsections:
   - To view the list of AI assets that are currently in the New stage, select **New**.
   - To view the list of AI assets that are currently in the assess stage, select **Assess**.
   - To view the list of AI assets that are currently in the build and test stage, select **Build and test**.
   - To view the list of AI assets that are currently in the deploy stage, select **Deploy**.
5. Select an AI asset to launch the life-cycle review process or to view and modify additional details about the asset.
   - To initiate the life-cycle review process for the asset, select **Start review** and then follow the proceeding steps in Complete AI asset lifecycle.
   - To continue a life-cycle review that is already in progress, select the **Lifecycle** tab and then follow the proceeding steps in Complete AI asset lifecycle.
   - To view or modify general details about the asset, select the **Details** tab and then navigate to **Details** > **Details**.
   - To view or modify the use and purpose of the asset, select the **Details** tab and then navigate to **Details** > **Use & purpose**.

     Note: This option is available only for AI systems.

   - To view, modify, or add associations to other AI assets that are related to this asset, select the **Details** tab and then locate the **Related assets** section of the navigation menu.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Select the subsection for the type of related AI asset that you want to view, modify, or add associations for.

For example, if you want to view all datasets that can help train an AI model, select the **Training datasets** subsection.

Note:

If you want to associate the asset with additional related AI assets, select one of the following options from the Add from inventory drop-down menu:

- To associate the asset with a related AI asset that is already available in your asset inventory, select **Add from inventory**.
- To associate the asset with a related AI asset that is not already available in your asset inventory, select **Create**. This option is not available for related AI tools.

You can then follow the proceeding steps in the corresponding AI asset creation topic:

- Create AI system assets
- Create AI model assets
- Create prompt assets
- Create dataset assets

- To view evaluation metrics for the asset, select the **KPIs & metrics** tab.

  Note: This tab is available only for AI systems and AI models.

- To view, modify, or create value templates that are mapped to the asset, select the **Value template** tab.

  Note: This tab is available only for AI systems.

  For more information on value templates, see Using value templates.

- To view associated onboarding, change, and off-boarding requests for the asset, select the **Requests** tab.

  For more information on change and off-boarding requests, see Creating requests for AI assets.

- To view the evaluations that are enabled for the asset, select the **Evaluation template** tab.

  Note: This tab is available only for AI systems.

Enable or disable the management of an AI asset

Enable or disable the management of an AI asset by designating it as either managed or unmanaged.

Before you begin

Role required: sn_ai_governance.ai_steward

About this task

If you designate an AI asset as managed, you can perform all life-cycle management and request creation processes on that asset. In addition, you can determine the risk classification, value, quality, and safety of the asset. If you designate an AI asset as unmanaged, you cannot perform any processes on it. By using these designations, you can streamline the asset management

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

process and reduce operational risks. For more information on managed and unmanaged AI assets, see Assets list- managed and unmanaged assets.

Note: By default, all AI assets that you create through the AI Control Tower application are automatically designated as managed.

Procedure

1. Navigate to **Workspaces** > **AI Control Tower**.
2. From the AI Control Tower, open the AI assets view.
3. Depending on whether you want to enable or disable the management of an AI asset, proceed with one of the following options:
   - If you want to enable the management of an AI asset, use the following steps:
     a. From the navigation menu of the AI assets view, locate the **AI asset inventory - Unmanaged** section.
     b. Select the subsection for the type of AI asset that you want to enable the management of.

        For example, if you want to enable the management of an AI system, select the **AI systems** subsection.
     c. From the list of available AI assets, select the check box for the asset that you want to enable the management of.

        Note: If you want to enable the management of multiple assets, select the check box for each asset.
     d. Select **Move to Managed**.
     e. In the dialog box, select **Move to Managed**.

     The asset is designated as managed and automatically moves to the corresponding **AI asset inventory - Managed** subsection. The life-cycle review process, risk classification, value template calculations, and evaluations for the asset automatically initiate.
   - If you want to disable the management of an AI asset, use the following steps:
     a. From the navigation menu of the AI assets view, locate the **AI asset inventory - Managed** section.
     b. Select the subsection for the type of AI asset that you want to disable the management of.

        For example, if you want to disable the management of an AI model, select the **AI models** subsection.
     c. From the list of available AI assets, select the check box for the asset that you want to disable the management of.

        Note: If you want to disable the management of multiple assets, select the check box for each asset.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Select **Unmanage**.

e. In the dialog box, select **Unmanage**.

The asset is designated as unmanaged and automatically moves to the corresponding **AI asset inventory - Unmanaged** subsection. The life-cycle review process, risk classification, value template calculations, and evaluations for the asset are automatically canceled.

Complete AI asset lifecycle

Complete the AI asset lifecycle process starting from assessment through deployment.

Before you begin

Role required: AI steward [sn_ai_governance.ai_steward] or Asset owner [sn_ai_asset_mgtm.ai_asset_ownerAI]

Procedure

1. Navigate to **Workspaces** > **AI Control Tower**.
2. From the AI Control Tower, open the AI assets view.
3. From the AI assets view, locate and open an asset which has its **Lifecycle status** as steward review.
4. In the asset record view, initiate the lifecycle process by selecting **Start review**.
5. On the **Lifecycle** tab, select **Assess** to create tasks.

   Note: The AI steward can manually create tasks under **Lifecycle**>**Assess** and assign them to an asset owner. The asset owner or the AI steward can mark this task as complete and move on to the next stage.

6. Select **Build and test** and create tasks under the **Development plan** and **Pre-deployment assessments** phases.

   Note: An AI steward can create tasks in the **Development plan** and **Pre-deployment assessments** phases, marking the tasks as complete in both the phases using the **Complete** button.

7. To create tasks and complete the AI asset Lifecycle, select **Deploy**.
   The asset owner can mark the task as complete.

Result

The life cycle status of an AI asset is deployed and completed.

To manage the approval workflow for ServiceNow® AI, see Create an AI Control Tower Playbook workflow.

Using AI Control Tower to create hyperscaler connections

Use AI discovery setup on AI Control Tower to create hyperscaler connections.

AI discovery setup page allows to connect third-party applications for discovering assets and usage data.

- Hyperscaler connection with Azure
- Hyperscaler connection with AWS

Hyperscaler connection with Azure

Explore the hyperscaler connections with Azure.

To set up a Hyperscaler connections for asset discovery and usage from Azure, perform the following steps:

1. Configure Azure portal.
2. Connect to Azure from ServiceNow.

Configure Azure portal

Configuring the Azure portal.

Before you begin

Role required: Azure admin

Procedure

1. Log in to the Azure portal as Azure admin.
2. Navigate to **Azure AI Foundry**.
3. Open the **AI HUB resource** containing your agents.
4. Select **Access Control (IAM)**.
5. Select + Add icon to **Add role assignment**.
6. Add roles **Cognitive Services Open AI Contributor** and **Contributor** to Service principal (Integration user).

   The credentials used on ServiceNow to connect to Azure are the credentials of the Service principal (Integration user).

What to do next

Connect to Azure from ServiceNow

Connect to Azure from ServiceNow®

Connecting to Azure from ServiceNow for an hypserscaler connection.

Perform the following actions from ServiceNow for asset discovery and usage from Azure:

- Create a hyperscaler connection for asset discovery for Azure Foundry
- Create a hyperscaler connection for usage data for Azure Foundry
- Create a connection alias for Azure Foundry

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Create a HTTP(s) connection for Azure Foundry
- Create a Credential alias (user specific)

Create a hyperscaler connection for asset discovery for Azure Foundry

Use the AI Control Tower workspace to create a hyperscaler connection for asset discovery from Azure Foundry.

Before you begin

Role required: admin

Ensure the plugin AI discovery (sn_ai_disc) is installed.

- With Generative AI Controller application for Now Assist.
- With AI Control Tower application.

Procedure

1. Login to Azure portal and ensure to activate your roles.
2. Navigate to **All** > **AI Control Tower** > **Configuration** > **AI discovery setup**.
3. Select **Set up now** to create a new connection or if there are existing connection aliases, select **New**.
   AI data source new record page appears.
4. Enter the Connection alias.

   For more information on creating a connection alias for Azure, see Create a connection alias for Azure Foundry
5. Select the Source configuration: Azure
6. Select the type as **Discovery** to discover AI assets.
7. Select the Run frequency as **Daily**, **Weekly**, or**Monthly**.
8. Select the Run hour of day.
   The Run hour of day depends on the Run Frequency.
9. Save the record.

   To add the information about the AWS to the connection alias, you must create a HTTP(s) connection under the connection alias record. For more information about creating a new HTTP(s) connection for Azure see, Create a HTTP(s) connection for Azure Foundry

   The connection alias has been added to the AI discovery setup page.
10. Enter the HTTP(s) connection and ensure the newly created HTTP(s) connection appears active under Connections section on the connection and credential alias page.

    The hyperscaler connection is created, and you can view the connection on AI discovery setup. If a connection is active, it will run based on the given schedule. To manually run, select the connection alias and select **Run** to discover all the agents from Azure Foundry to AI Control Tower.

    To view all the assets discovered from Azure Foundry, see the AI asset inventory view on the AI assets page.

Create a hyperscaler connection for usage data for Azure Foundry

Use the AI Control Tower workspace to create a hyperscaler connection for usage data from Azure Foundry.

Before you begin
Role required: admin

Ensure the plugin AI discovery (sn_ai_disc) is installed.

- With Generative AI Controller application for Now Assist.
- With AI Control Tower application.

Procedure

1. Log in to Azure portal and ensure to activate your roles.
2. Navigate to **All** > **AI Control Tower** > **Configuration** > **AI discovery setup**.
3. Select **Set up now** to create a new connection or if there are existing connection aliases, select **New**.
   AI data source new record page appears.
4. Enter the Connection alias.

   For more information on creating a connection alias for Azure, see Create a connection alias for Azure Foundry
5. Select the Source configuration: Azure
6. Select the type as **usage** to load usage data of the assets.
7. Select the Run frequency as **Daily**, **Weekly**, or **Monthly**.
8. Select the Run hour of day.
   The Run hour of day depends on the Run Frequency.
9. Save the record.

   To add the information about the Azure to the connection alias, you must create a HTTP(s) connection under the connection alias record. For more information about creating a new HTTP(s) connection for Azure see, Create a HTTP(s) connection for Azure Foundry

   The connection alias has been added to the AI discovery setup page.
10. Enter the HTTP(s) connection and ensure the newly created HTTP(s) connection appears active under Connections on the connection and credential alias page.

    The hyperscaler connection is created, and you can view the connection on AI discovery setup. If a connection is active, it will run based on the given schedule. To manually run, select the connection alias and select run to load the usage data of the assets from Azure Foundry to AI Control Tower.

    To view the usage data of the assets, see the AI discovery setup page and the connection alias type and the number of assets.

Create a connection alias for Azure Foundry

Use the AI Control Tower workspace to create a connection alias for asset discovery for Azure Foundry.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Enter the look-up list of connection alias field.
   When opened, the look-up list shows a list of existing connection aliases; you can select an appropriate alias or select New to navigate to the new record page.

   A new connection & credential aliases record page appears.
2. Enter the Name.
3. Enter the Parent Alias: sn_ai_disc_Azure_Foundry_for_AICT
4. Click **Submit**.
   The connection alias is configured

What to do next

Return to step 4 Create a hyperscaler connection for asset discovery for Azure Foundry

Create a HTTP(s) connection for Azure Foundry

Use the AI Control Tower workspace to create a HTTP(s) connection for Azure Foundry.

Before you begin

Role required: admin

Procedure

1. Open the Connection and credential alias record page.
2. Under the **Connections** section, select **New** to create a HTTP(s) connection.
   A new HTTP(s) connection new record page is created.
3. Enter the Name.
4. Enter the Credential.

   This credential is user/customer specific. You can create **OAuth credential** or any other credential as per your specifications.
5. Enter the Connection url.
6. Enter the Connection Alias.
7. Enter the Attributes such as **Subscription ID**, **Project Name**, **Resource Name**, and **Resource Group Name**, and **Workspace Name**.
8. Click **Submit**.

Result

A new HTTP(s) connection has been created.

What to do next

Return to step 10 Create a hyperscaler connection for asset discovery from AWS

Hyperscaler connection with AWS

Explore the hyperscaler connection procedure with AWS.

To set up a Hyperscaler connections for asset discovery and usage from AWS, perform the following steps:

1. Configure AWS console.
2. Connect to AWS from ServiceNow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure AWS console

Configuring AWS for a hyperscaler connection.

Perform the following actions in an order in the AWS console:

1. Configure IAM user
2. Configure an IAM for Agent discovery
3. Configure an IAM policy for execution monitoring
4. Configure CloudTrail and CloudWatch in the AWS Console

Configure IAM user

Configuring the IAM user in the AWS console.

Before you begin

Role required: AWS Admin

Procedure

1. Log in to https://console.aws.amazon.com
2. Navigate to **IAM**>**Access management**>**Users**.
3. Select **Create user** and configure the user with the policies mentioned in the following section. The IAM user is created.
4. Open the user and create an access key for a third party service.
5. Copy the **Access key ID** (AWS Specific) and the **Secret access key** (AWS Specific) to a text file. You can only show the secret access key once, but you can delete and create keys when necessary.

What to do next

The IAM user must configure policies for Agent discovery and Execution monitoring.

1. Configure an IAM for Agent discovery
2. Configure an IAM policy for execution monitoring

Configure an IAM for Agent discovery

Configuring IAM policy action permissions necessary for Agent discovery and integration user access on AWS to read bedrock agentic data.

Before you begin

Role required: Admin

AWS provides the minimum given policies by default:

- AmazonBedrockReadOnly
- CloudWatchReadOnlyAccess

The minimum policy action permissions needed for the integration user on AWS to read bedrock agentic data:

- ListAgents
- GetAgent
- ListAgentActionsGroups
- ListAgentVersions

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- GetInferenceProfile
- GetFoundationModel
- ListAgentCollaborators
- GetAgentAlias

Note:

To exclude specific resources from AI Control Tower, you can restrict them from the resources region. Select 'all' to include all AWS bedrock agentic resources data into AI Control Tower.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "VisualEditor0",
            "Effect": "Allow",
            "Action": [
                "bedrock:ListAgents",
                "bedrock:ListAgentVersions",
                "bedrock:ListAgentCollaborators",
                "bedrock:ListAgentActionGroups",
                "bedrock:GetInferenceProfile",
                "bedrock:GetFoundationModel",
                "bedrock:GetAgent"
            ],
            "Resource": "*"
        }
    ]
}
```

What to do next

Configure an IAM policy for Execution monitoring.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure an IAM policy for execution monitoring

Configuring IAM policy action permissions necessary for execution monitoring and integration user access on AWS to read Cloudwatch logs usage data.

Before you begin

Role required: Admin

Cloud watch logs:

- StartQuery
- GetQueryResults

Note: To exclude specific resources from AI Control Tower, you can restrict them from the resources region. Select 'all' to include all CloudWatch logs data in AI Control Tower.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "VisualEditor0",
            "Effect": "Allow",
            "Action": [
                "logs:GetQueryResults",
                "logs:StartQuery"
            ],
            "Resource": "*"
        }
    ]
}
```

For more information about creating an user in IAM and providing the required access, see Understanding and Getting Your Security Credentials page on the AWS Documentation site.

What to do next

Configure CloudTrail and CloudWatch in the AWS Console.

Configure CloudTrail and CloudWatch in the AWS Console

Configure CloudTrail to store execution logs of your bedrock agents activities and configure CloudWatch to monitor your trail logs and notify you when specific activity occurs.

Before you begin

Role required: AWS Admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Log in to https://console.aws.amazon.com
2. Select **CloudTrail** from the AWS Console home.
3. Select **Trails** under section **Lake** on the left pane the AWS Console.
   The Choose trail attributes page is displayed to create a trail.
4. Enter a display name for your trail in the **Trail name** field.
5. To store the logs of the trail, you can select **Create new S3 bucket** or **Use existing S3 bucket**.
6. Select **New** check box under customer managed by AWS KMS (Key management system) key and enter the AWS KMS alias.

   Verify the KMS key and newly created S3 bucket must be in the same region.
7. To configure CloudWatch, ensure to select **Enabled** check box under the **CloudWatch Logs** section.
8. Select the **New** check box and enter the **Log group name**.
9. Select **Next**.
   The Choose log events page is displayed.
10. Select the **Data events** check box and clear the **Management events** check box under **Event type**.
11. Select **Add data event type**.
12. Select the **Resource type** and keep the **log selector template** as **log all events** for all the resource types.
    List of Resource types
    - Bedrock session
    - Bedrock async invoke
    - Bedrock Invoke Inline-Agent
    - Bedrock knowledge base
    - Bedrock model
    - Bedrock flow alias
    - Bedrock agent alias
13. Select **Next**.
    The Review and create page get displayed. You can verify all the data event types.
14. Select **Create trail**.

Result

The CloudTrail and CloudWatch are configured in the AWS Console. The CloudTrail is accessible from CloudWatch.

Connect to AWS from ServiceNow®

Connecting to AWS from ServiceNow for a hyperscaler connection.

There are two procedures for connecting AWS to ServiceNow, which include connecting for AI asset discovery and usage. To complete these procedures, you will must follow the necessary sub steps in the order for both AI asset discovery and usage.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Create a hyperscaler connection for asset discovery from AWS
  1. Create a connection alias for asset discovery for AWS
  2. Create a HTTP(s) connection for asset discovery for AWS
  3. Create an AWS credential for asset discovery
- Create a hyperscaler connection for usage from AWS
  1. Create a connection alias for usage for AWS
  2. Create a HTTP(s) connection for usage for AWS
  3. Create an AWS credential for usage

Create a hyperscaler connection for asset discovery from AWS

Use the AI Control Tower workspace to create a hyperscaler connection for asset discovery from AWS.

Before you begin

Role required: admin

Ensure the plugin AI discovery (sn_ai_disc) is installed.

- With Generative AI Controller application for Now Assist.
- With AI Control Tower application.

Procedure

1. Navigate to **All** > **AI Control Tower** > **Configurations** > **AI discovery setup**.
2. Select **Set up now** to create a new connection or if there are existing connection aliases, select **New**.
   AI data source record page is created.
3. Enter the Connection alias.
   For more information on creating and configuring connection alias, see Create a connection alias for asset discovery for AWS
4. Select the Source configuration: AWS
5. Select the type as **Discovery** to discover AI assets.
6. Select the Run frequency as **Daily**, **Weekly**, or **Monthly**.
7. Select the **Run hour of day**.

   The Run hour of day depends on the Run frequency.
8. Save the record.

   To add the information about the AWS to the connection alias, you must create a HTTP(s) connection under the connection alias record. For more information about creating a new HTTP(s) connection see, Create a HTTP(s) connection for asset discovery for AWS

   The connection alias has been added to the AI discovery setup page.
9. Enter the HTTP(s) connection and ensure the newly created HTTP(s) connection appears active under Connections on the connection and credential alias page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The hyperscaler connection is created, and you can view the connection on AI discovery setup.If a connection is active, it will run based on the given schedule. To manually run, select the connection alias and select run to discover all the agents from AWS to AI Control Tower.

To view all the assets discovered from AWS, see the AI asset inventory view on the AI assets page.

Create a connection alias for asset discovery for AWS

Use the AI Control Tower workspace to create a connection alias for asset discovery for AWS.

Before you begin
Role required: admin

Procedure

1. Enter the look-up list of Connection alias field.
   When opened, the look-up list shows a list of existing connection aliases; you can select an appropriate alias or select New to navigate to the new record page.

   A new connection & credential aliases record page appears.
2. Enter the Name.
3. Enter the Parent Alias: **sn_ai_disc_Amazon_Bedrock_for_AICT**
4. Click **Submit**.

Result
The connection alias is configured.

What to do next
Return to step 3 Create a hyperscaler connection for asset discovery from AWS

Create a HTTP(s) connection for asset discovery for AWS

Use AI Control Tower workspace to create a HTTP(s) connection for asset discovery for AWS.

Before you begin
Role required: admin

Procedure

1. Open the Connection and credential alias record page.
2. Under the Connections section, select **New** to create a HTTP(s) connection.
   A new HTTP(s) connection new record page is created.
3. Enter the Name.
4. Enter the Credential.

   For more information on creating AWS credential, see Create an AWS credential for asset discovery
5. Enter the Connection url.
6. Enter the Connection alias.
7. Enter the Attributes.
8. Select **Submit**.
   A new HTTP(s) connection has been created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next
Return to step 9 Create a hyperscaler connection for asset discovery from AWS

Create an AWS credential for asset discovery

Use the AI Control Tower workspace to create an AWS credential for asset discovery.

Before you begin
Role required: admin

Procedure

1. Select the look-up list of the **Credential** field.
   The AWS credentials new record page is displayed
2. Enter the Name.
3. Enter the Access Key ID.
4. Enter the Secret Access Key.
5. Enter the authentication algorithm: **Amazon Bedrock Algorithm for AICT**.
6. Select **Submit**.
   The AWS credential is created

What to do next
Return to step 3 Create a HTTP(s) connection for asset discovery for AWS

Create a hyperscaler connection for usage from AWS

Use the AI Control Tower workspace to create a hyperscaler connection for usage from AWS.

Before you begin
Role required: admin

Ensure the plugin AI discovery (sn_ai_disc) is installed.

- With Generative AI Controller application for Now Assist.
- With AI Control Tower application.

Procedure

1. Navigate to **All** > **AI Control Tower** > **Configurations** > **AI discovery setup**.
2. Select **Set up now** to create a new connection or if there are existing connection aliases, select **New**.
   AI data source record page is created.
3. Enter the Connection alias.
   For more information on creating and configuring connection alias, see Create a connection alias for asset discovery for AWS
4. Select the Source configuration: AWS
5. Select the type as **Usage** to load usage data of the AI assets.
6. Select the Run frequency as Daily, Weekly, or Monthly.
7. Select the **Run hour of day**.

   The Run hour of day depends on the Run frequency.

8. Save the record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To add the information about the AWS to the connection alias, you must create a HTTP(s) connection under the connection alias record. For more information about creating a new HTTP(s) connection see, Create a HTTP(s) connection for asset discovery for AWS

The connection alias has been added to the AI discovery setup page.

9. Enter the HTTP(s) connection and ensure the newly created HTTP(s) connection appears active under Connections on the connection and credential alias page.

   The hyperscaler connection is created, and you can view the connection on AI discovery setup.If a connection is active, it will run based on the given schedule. To manually run, select the connection alias and select run to load all the usage data of the assets from AWS to AI Control Tower.

   To view the usage data of the assets, see the AI discovery setup page and the connection alias type and the number of assets.

Create a connection alias for usage for AWS

Use the AI Control Tower workspace to create a connection alias for usage for AWS

Before you begin
Role required: admin

Procedure

1. Enter the look-up list of Connection alias field.
   When opened, the look-up list shows a list of existing connection aliases; you can select an appropriate alias or select New to navigate to the new record page.

   A new connection & credential aliases record page appears.

2. Enter the Name.
3. Enter the Parent alias: sn_ai_disc_Amazon_Cloudwatch_for_AICT
4. Click **Submit**.

Result
Connection alias is configured.

What to do next
Return to step 3 Create a hyperscaler connection for asset discovery from AWS

Create a HTTP(s) connection for usage for AWS

Use the AI Control Tower workspace to create a HTTP(s) connection for usage for AWS.

Before you begin
Role required: admin

Procedure

1. Open the Connection and credential alias record page.
2. Under the Connections section, select **New** to create a HTTP(s) connection.
   A new HTTP(s) connection new record page is created.
3. Enter the Name.
4. Enter the Credential.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information on creating AWS credential for usage, see Create an AWS credential for usage

5. Enter the Connection url.
6. Enter the Connection alias.
7. Enter the Attributes: CloudWatch log Group Names.
8. Select **Submit**.

Result
A new HTTP(s) connection has been created.

What to do next
Return to step 9 Create a hyperscaler connection for usage from AWS

Create an AWS credential for usage

Use the AI Control Tower workspace to create an AWS credential for usage.

Before you begin
Role required: admin

Procedure
1. Select the look-up list of the **Credential** field.
   The AWS credentials new record page is displayed
2. Enter the Name.
3. Enter the Access Key ID.
4. Enter the Secret Access Key.
5. Enter the authentication algorithm: **Amazon CloudWatch Algorithm for AICT**.
6. Select **Submit**.
   The AWS credential is created.

What to do next
Return to step 3 Create a HTTP(s) connection for usage for AWS

Using value templates

Use value templates to define, calculate, and track the value delivered by your AI systems and models.

Value templates introduces a unified and structured framework for defining, calculating, and tracking the value delivered by your AI assets. You can define value based on personas and formulas using customizable templates.

Value templates offer the following benefits.

- Transparency: Provides visibility into how value is determined for an AI asset.
- Customization: Supports various persona-driven and formula-based definitions.

Currently, value templates are supported for skills and agents. A value template is assigned to an asset when a skill or agent is activated and deployed as an asset in the system. The following table lists the default value templates.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Default value templates

AI asset	Default value template
ServiceNow skill	Daily skill executions (Usage) x average time per execution (Time) x 50% (Acceptance rate) For example, for Incident Summarization skill, if the daily executions are 1500, average time per execution is 0.2 minutes, acceptance rate is 90%, the value as per the default value template is 1500x0.2x90/100, which is 270 minutes.
ServiceNow AI agent	Daily AI agent executions (Usage) x average time per execution (Time) x 50% (Acceptance rate) For example, for Problem investigator agent, if the daily executions are 1000, average time per execution is 1.5 minutes, acceptance rate is 50%, the value as per the default value template is 1000x1.5x50/100, which is 750 minutes.
AWS and Microsoft AI agents	Daily AI agent invocations (Usage) x 15 mins (Time) x 50% (Acceptance rate)

Add a value template

Add a value template to define, calculate, and track the value delivered by an AI asset.

Before you begin

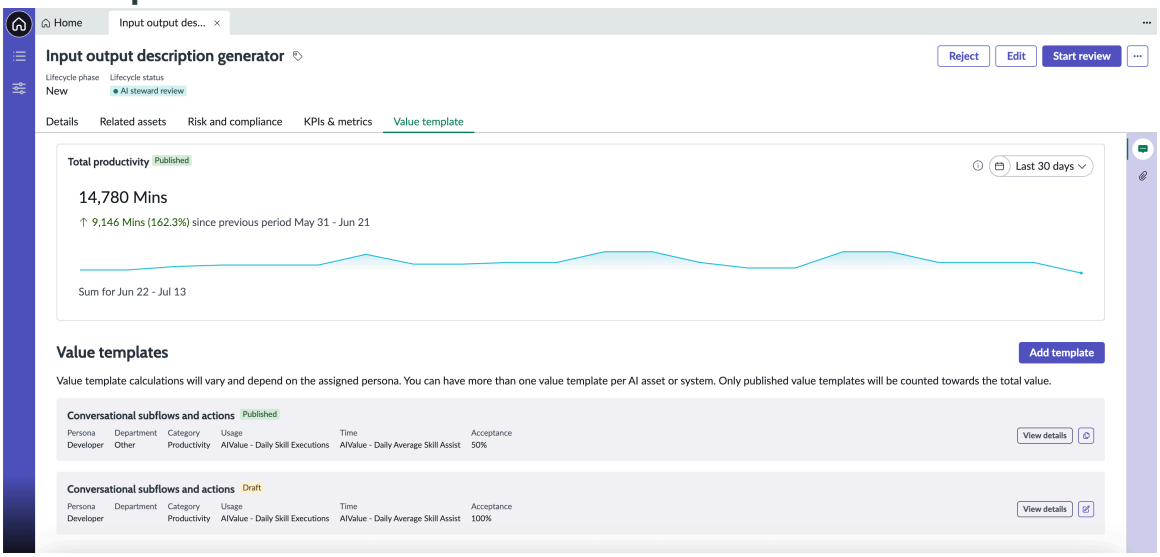
Role required: [sn_ai_governance_ai_steward]

Procedure

1. Navigate to **Workspaces** > **AI Control Tower**.
2. Select the **AI asset inventory** tab and navigate to the asset that you want to assign a value template to.
3. In the **Value template** tab, select **Add template**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Value template tab



4. On the Add value template form, fill in the fields.

   For a description of the field values, see Add value template form.

5. Select **Save as draft**.
6. Validate and test the formula against the available dataset by selecting **Validate and calculate output**.
   You can change the values and validate the formula until you're satisfied with the output.
7. If you're satisfied with the output, publish the template by selecting **Publish**.
   When a value template is published, it's modified across all instances and subsequent calculations are based on the new template.

Edit a value template

Edit a value template to update how value is calculated for AI assets.

Before you begin

Role required: [sn_ai_governance_ai_steward]

Procedure

1. Navigate to **Workspaces** > **AI Control Tower**.
2. Select the **AI asset inventory** tab and navigate to the asset that you want to edit the value template for.
3. In the **Value template** tab, select **Duplicate**.
   A new tab with the same details as the original template opens for you to edit.
4. Edit the value template according to your requirements.
5. Select **Save as draft**.
6. Validate and test the formula against the available dataset by selecting **Validate and calculate output**.
   You can preview calculations from the past 30 days using the new template before publishing. This functionality enables you to evaluate the impact of the new template while preserving the historical data associated with the previous version.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. If you're satisfied with the output, publish the template by selecting **Publish**.
   When a value template is published, it's modified across all instances and subsequent calculations are based on the new template.

Create an AI case in the AI Control Tower

Create an AI case in the AI Control Tower by providing a detailed description, such as system behavior, affected users, and any relevant data. Ensure all necessary information, such as supporting attachments, is included for prompt resolution.

Before you begin

Role required: sn_ai_case_mgmt.ai_case_analyst or sn_ai_case_mgmt.ai_case_manager

Procedure

1. Navigate to **All** > **AI Control Tower**.
2. Go to the **AI cases** dashboard.
3. On the AI cases dashboard, on the **AI cases** tab, select **Create AI case**.
4. On the form, fill in the fields.
   For a description of the field values on the Create New AI case form, see Create new AI case form.
5. Select **Save**.
   After you submit this form, the AI case team will provide the insights and support you need.

Create new AI case form

Use the Create New AI case form in the AI Control Tower to report an AI case with the necessary details.

See the following table for a description of the field values.

Create new AI case form

Field	Description
Number	Number of the request. This field is automatically set to a request number.
Name	Name of the AI case. For example, `Incorrect AI recommendation`.
Description	Description about the AI case in detail. For example, include information such as the expected recommendation, actual suggestion, context, impact, and steps to reproduce the issue, especially for cases such as Incorrect AI Recommendation.
Type	Type of the AI case. This field is automatically set to **AI case**.
Sub-type	Subtype of the case. For example, Adversarial attacks (Deliberate manipulation of AI models to produce incorrect results).
State	Workflow state of the request. This field is automatically set to **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create new AI case form (continued)

Field	Description
Priority	Urgency of the AI case. It enables the AI case team to triage requests effectively and responds based on how critical the request is. The options are as follows: • **Critical** • **High** • **Moderate** • **Low** • **Planning**
Requester	Name of the person who raised the request.
Requested on behalf of	Name of the person that you created the request for.
Primary entity	Entity impacted by the AI case. Only the entities identified in the impacted areas are available for selection as the primary entity.
Entity owner	User who is the owner of the entity. This field is automatically set based on the entity selected in the Impacted areas related list.
Assignment	
Assignment group	Group that is assigned to the request. **Note:** The assignment group is preconfigured to the request type during the configuration setup.
Case analyst	Analyst who will analyze and work on the AI case. The AI case analyst is a part of the Assignment group.
Watch list	Person who must be informed about the AI case.
Accountable executive	Person who is accountable for the AI case.
Primary origin	
Location	Location where the AI case occurred. For example, Japan.
Sub-location	Sub location of the AI case occurrence. For example, the sub location is Tokyo.
Impacted business unit	Business unit that is affected by the reported AI case. For example, Finance.
Impacted department	Department that is affected by the AI case. For example, Customer support.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create new AI case form (continued)

Field	Description
Source	Source of the AI case creation. This field is automatically set to Manual when the case is manually created. If the case is reported from the Employee Center, the field displays the source as Employee Center.
Additional source	Mode of how the AI case is reported when the case is created manually. This field is available only when **Manual** is selected from the **Source** field and the record is saved. The choices are as follows: • Email • Phone
Schedule	
Date of occurrence	Date when the AI case occurred. For example, the case may have occurred on 18-02-2025.
Date of discovery	Date when the case was discovered. For example, the case may have occurred on 18-02-2025, but was discovered on 12-03-2025.
Reported date	Date the case is reported.
Case closure SLA	Expected date of case closure.
Investigation planned start	Planned start date to investigate the case.
Investigation actual start	Actual start date of case investigation.
Remediation planned start	Planned start date to remediate the case.
Remediation actual start	Actual start date of case remediation.
Investigation planned end	Planned end date to investigate the case.
Investigation actual end	Actual end date of case investigation.
Remediation planned end	Planned end date of case remediation.
Remediation actual end	Actual end date of case remediation.
Breach analysis	
Breach status	Status to indicate if a breach has occurred or not. The choices are as follows: • **To be determined**: This value is the default value. • **Breach detected**: If the breach is confirmed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create new AI case form (continued)

Field	Description
	• **Future potential**: If the breach hasn't occurred but may occur in the future. • **Not a breach**: When there's no breach detected.
Breach start	Date the breach started. This field only appears when **Breach detected** or **Future potential** is selected from the **Breach status** field.
Reporting status	Status of the AI case being reported to the regulators. This field is automatically set based on the reporting status of the regulations associated with the case. If an AI case has many regulations and even if one regulation is identified as reportable, then the reporting status of the case is set to **Reportable**. The default value of this field is **To be determined**.
Breach end	Date the breach ended. This field only appears when **Breach detected** or **Future potential** is selected from the **Breach status** field.
Breach significance identified	Date when the user identifies that the breach is significant. This field only appears when **Breach detected** or **Future potential** is selected from the **Breach status** field.
Root cause analysis	
Primary cause	Primary cause of the AI case occurrence. This field is automatically set to the primary cause that is selected in the Cause and consequences related list.
Primary consequence	Consequences of the primary cause for the AI case.
Overall observations	Observations made regarding the AI case.
Remediation taken	Field to indicate if remediation measures have been taken to address the AI case. The choices are as follows: • **Yes** • **No**
Overall preventive measures	Preventive measures taken toward the case.
Activity	
Work notes (Private)	Notes or information about the request.
Additional comments (Customer visible)	Additional information about the request that you want to share with your customers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create an AI issue in the AI Control Tower

Identify and manage issues related to the impacted areas for the reported AI case in the AI Control Tower.

Before you begin

Role required: sn_grc_ai_gov.ai_risk_and_compliance_analyst or sn_grc_ai_gov.ai_risk_and_compliance_manager

Procedure

1. Navigate to **All** > **AI Control Tower**.
2. Go to the **AI cases** dashboard.
3. On the AI cases dashboard, on the **AI cases** tab, select **Create issue**.
4. On the form, fill in the fields.
   For a description of the field values on the Create New AI case, see Create new AI issue form.
5. Select **Save**.

Create new AI issue form

Use the Create New Issue form to identify and manage issues related to the impacted areas for the reported AI case.

See the following table for a description of the field values.

Create New Issue form

Field	Description
Number	Number of the issue. This field is automatically set to a request number.
Name	Name of the issue. For example, `Cyber Attack on Acme`.
Issue source	Source from where the issue was created. This field is automatically set to **AI case**.
Issue type	Type of the issue. The options are as follows: • **Control design effectiveness failure**: The control was poorly designed and cannot effectively prevent or detect the intended risk. • **Control operative effectiveness failure**: The control was well-designed but failed during execution or wasn't followed correctly. • **Control doesn’t meet requirement**: The control is in place but doesn't satisfy regulatory, policy, or business requirements. • **Control doesn’t exist**: There is no control present to address a known risk or requirement. • **Non-compliance to a regulation**: A law or regulation was not followed, potentially exposing the organization to penalties. • **Non-compliance to a policy**: An internal policy was not adhered to, which could lead to risks or inefficiencies. • **Improvement or suggestion to an existing policy**: A recommendation to enhance an existing policy for better clarity, coverage, or effectiveness. • **Recommendation for a new policy**: A proposal to create a new policy to address a gap or need that currently isn’t covered.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Issue form (continued)

Field	Description
	• **Process optimization or improvement**: Opportunities identified to improve efficiency, accuracy, or effectiveness of a business process. • **Observation**: A general note or finding that may not be an issue now but could warrant attention. • **Data breach**: Unauthorized access, disclosure, or loss of sensitive or personal data. • **Fraud**: Intentional deception for personal or organizational gain, such as misappropriation of assets. • **Misstatement**: Errors or omissions in financial or operational reporting that misrepresent facts. • **Training**: Gaps or needs identified in knowledge or skills that require attention. • **Documentation**: Issues related to missing, outdated, or inaccurate documentation. • **Risk issue**: A broad risk-related concern that may not fall under other specific categories. • **Other**: Any issue that doesn't fit into the above types but is still worth tracking and resolving.
Classification	Classification of the issue. The options are as follows: • **Compliance** • **Risk** • **Audit** • **Vendor Risk**
Location	Location where the issue occurred. For example, Japan.
State	Workflow state of the issue. This field is automatically set to **Review**. The options are as follows: • **New** • **Analyze** • **Respond** • **Review** • **Closed Complete** • **Closed Incomplete** For more information on Issue management workflow and life cycle, see View AI assets by life-cycle stage.
Substate	Substate of the issue. This field is auto-filled.
Priority	Urgency of the issue. It enables the team to triage requests effectively and respond based on how critical the request is. This field is automatically set to **Review**. The options are as follows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Issue form (continued)

Field	Description
	• **Critical** • **High** • **Moderate** • **Low** • **Planning**
Issue rating	Rating of the issue. The options are as follows: • **Very High** • **High** • **Moderate** • **Low** • **Very Low**
Description	Description about the issue in detail. For example, ACME experienced a cyber attack that resulted in unauthorized access to internal systems.
Assignment	
Assignment group	Group to whom the issue is assigned. For example, Risk Managers.
Assigned to	User to whom the issue is assigned.
Issue manager group	Manager group that the issue is assigned to. The options are as follows: • **Compliance Managers** • **IT Risk Managers** • **Risk Managers**
Issue manager	Manager to whom the issue is assigned.
Watch list	Person who must be informed about the issue.
Schedule	
Due date	Date when the issue is due.
Confirmed date	Confirmation date for the issue. This field is auto-filled.
Created	Date on which the issue is created. This field is automatically set to the current date and time.
Closed	Date on which the issue is closed.
Planned start date	Planned start date for the issue.
Planned end date	Planned end date for the issue.
Duration	Duration for the issue in days, hours, minutes, and seconds.
Actual start date	Actual start date for the issue.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Issue form (continued)

Field	Description
Actual end date	Actual end date for the issue.
Actual duration	Actual duration for the issue in days, hours, minutes, and seconds.
Issue grouping	
Issue group rule	Group rule for the issue. This field is auto-filled.
Parent issue	Parent issue that is associated with the issue.
Action plan	
Recommendation	Recommendation for the issue. For example, `Enhance cybersecurity measures and provide regular security training`.
Action plan	Action plan for the issue. For example, `Upgrade the firewall to the latest version and implement multi-factor authentication for all administrative accounts.`
Activity	
Work notes (Private)	Notes or information about the issue.
Additional comments (Customer visible)	Additional information about the issue that you want to share with your customers.
Settings	
Functional domain	Functional domain that the issue belongs to. For example, an issue may belong to the AI Risk and Compliance domain.

Using the access map

Learn how to use the **Access map** in AI Control Tower.

Before you begin

Role required: AI Steward

Procedure

1. Select **access map** in the header of the **Security and privacy** tab.
   You can also access the map by navigating to **All** > **AI Security and Privacy** > **Access Map**.
2. Select an AI agent/agentic workflow using the **Access map**.
   You can also use the **Search by agent or workflow** field, and the **AI agents** and **Agentic workflows** to refine your search. Additionally, agents with access issues will have a ⚠ icon.
3. In the node map, select a node to view the connections of your AI agent/agentic workflow.
   Agents with access issues with be highlighted with a ⚠ icon in the map.
4. Select a node to get further details and configure settings.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Access map node details

Icon	Label	Details
	Agentic workflow	**Description** A brief description of the workflow **Domain** The domain scope of the workflow **Execution mode** How the workflow is executed (Autonomous or manual) **Created by** The creator of the workflow
	Agent	**Description** A brief description of the agent **Domain** The domain scope of the agent **Created by** The creator of the workflow **Tables accessed** Review the table accesses of the agent over the last month. Select **Operation** to filter specific access operations. **Note:** Only agents with access issues will display the **Access issues** details. **Access issues**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Icon	Label	Details
		Details the resources and operations causing the access issues. **Resource** The resource the agent is having issues accessing **Operation** The operation the agent attempted **Count** The number of times of the agent encounter the issue
	Tool	**Description** The description of the tool. **Domain** The domain scope of the tool. **Execution mode** The execution mode of the tool (Supervised or Autonomous) **Type** The type of tool **Target record** The record the tool modifies. **Created by** The creator of the tool **Note:** Select **Open tool record** to view additional tool details.

AI Control Tower reference (legacy)

Reference topics for AI Control Tower.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add value template form

Add value template form fields and descriptions.

Add value template form

Field	Description
Calculation builder	
Persona	The user role for whom the value is being calculated, for example, Agent, Requester.
Usage	The usage indicator that you want to associate the value template with.
Time value type	The type of time-based metric used in the calculation, for example, Constant or Indicator. Choose a value that aligns with your performance goals.
Time constant	A fixed time value (in hours, minutes, or days) used as a baseline or threshold in the calculation. Useful for comparisons or normalization.
Time indicator	The time indicator that you want to associate the value template with.
Acceptance rate type	The type of acceptance metric to include, such as Indicator or Constant.
Acceptance rate constant	A fixed percentage or ratio used to represent an expected or target acceptance rate in the value calculation.
Attributes	
Template name	A unique and descriptive name for the value template. This name appears in the list of templates and should clearly indicate its purpose.
Value template category	The categorization of the template based on its use case, for example, Productivity, Efficiency, Accuracy. Helps in organizing and filtering templates.
Department	The business unit or department associated with the value template. This helps in aligning the template with organizational goals.
Description	A brief explanation of what the value template does, including its purpose and how it contributes to measuring value.
Calculation output	
Instance	The instance where the value template is applied. This field is useful for managing value templates across instances.

Add value template form (continued)

Field	Description
	Note: You can validate a formula in a non-production instance before publishing it to a production instance.

AI Control Tower roles

Certain roles are installed along with the installation of the AI Control Tower.

Roles and their descriptions

Role title [name]	Description	Contains roles
AI steward [sn_ai_governance_ai_	**Note:** The organization decides on assigning the AI steward role. By adding the users to the AI stewards group, allows user to have additional permissions related to playbook. The AI steward is responsible for: • Configuring AI Control Tower • Adoption of AI governance practices. • Adoption of managing AI Control Tower and linking the AI asset Inventory. • Execution of AI Control Tower initiatives. • Understand the AI assets and AI Control Tower policies. • Creating AI assets. • Completing the AI asset lifecycle. • Collaboration of cross-functional teams within the organization to confirm that the organization policies are adhered. • Creating AI Control Tower Approval Playbook for Now Assist approvals. • Configure third-party LLMs and SLMs. • Configure Multi-instance management. • Add and edit a value template. • Learning to use the access map • Approve or reject an approval request. For AI discovery:	• sn_nowassist_admin.user • sn_ai_governance.workspace_admin • sn_aia.admin • aig_admin • sn_mcp_client.admin

Roles and their descriptions (continued)

Role title [name]	Description	Contains roles
	• Activate or deactivate hyperscaler connections. • Select the hyperscaler connections to discover agents and usage on-demand. For AI Gateway: • Add an MCP server via AI Agent Studio. • Set up MCP client connections.	
AI Control Tower Workspace user [sn_ai_governance_workspace_user]	The AI Control Tower Workspace user is responsible for: • Own and manage the AI assets. • Access the AI Control Tower home page. • Exclusive access to the AI portfolio tab.	None
AI asset owner/ Product owner [sn_ai_asset_mgmt.ai_asset_owner]	The AI asset owner/Product owner is responsible for: • Ensure that AI assets are represented accurately and kept up to date. • Manage AI assets like AI systems, AI models, datasets, and prompts through their asset lifecycle from intake to retirement. • Access My overview, Value, and Adoption tabs. • Creating an AI asset from the AI Control Tower home page using **Create AI Asset icon**. • Marking the deploy phase of the AI asset lifecycle task complete. If the AI asset gets deployed, then the state of the task doesn't change anything automatically in the asset table or the asset governance details record.	None

AI Risk and Compliance roles

The AI Risk and Compliance application installs the essential role to perform respective day-to-day operational tasks for managing AI systems across the enterprise.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles and their descriptions

Role title [name]	Description	Contains roles
AI Risk and Compliance Admin [sn_grc_ai_gov.ai_risk_and_compliance_admin]	The AI Risk and Compliance Admin can perform the following tasks: • Set up risk and impact assessment frameworks. Configure risk assessment methodologies, risk contribution factors, and impact assessment templates. • Define automation rules for impact assessments to determine applicable risks and controls based on the assessment responses. • Set up and profile AI case types. • Delete AI systems.	• sn_risk.admin • sn_smart_asmt.template_manager • sn_grc_ai_gov.ai_risk_and_compliance_mana • sn_smart_asmt.assessment_admin • sn_grc_workspace.state_model_admin • sn_smart_asmt.template_contributor • sn_compliance.admin • sn_compliance.control_framework_admin* • sn_compliance.library_admin* • sn_compliance.policy_admin*
AI Risk and Compliance Manager [sn_grc_ai_gov.ai_risk_and_compliance_manager]	The AI Risk and Compliance Manager can access all AI systems on the system and perform the following tasks: • Initiate impact assessments. • Manage the lifecycle of an AI system. • Initiate risk assessments. • Initiate control attestations.	• sn_grc_ai_gov.ai_risk_and_compliance_analy • sn_smart_asmt.template_contributor • sn_smart_asmt.template_manager • sn_risk.manager • sn_compliance.control_framework_manager* • sn_compliance.library_manager* • sn_compliance.policy_manager*
AI Risk and Compliance Analyst [sn_grc_ai_gov.ai_risk_and_compliance_analyst]	The AI Risk and Compliance Analyst can access all AI systems assigned to them in the system and perform the following tasks only on the assigned records: • Initiate impact assessments. • Manage the lifecycle of an AI system. • Initiate risk assessments. • Initiate control attestations.	• sn_smart_asmt.assessment_reader • sn_grc_ai_gov.ai_risk_and_compliance_busi • sn_smart_asmt.template_reader • sn_risk_advanced.ara_approver • sn_grc_ai_gov.ai_risk_and_compliance_reader • sn_grc_workspace.user • sn_risk.user • sn_risk_advanced.ara_assessor • sn_compliance.library_user* • sn_compliance.control_framework_user* • sn_compliance.policy_user*

© 2026 ServiceNow, Inc. All rights reserved.

Roles and their descriptions (continued)

Role title [name]	Description	Contains roles
AI Risk and Compliance User [sn_grc_ai_gov.ai_risk_and_compliance_business_user]	The AI Risk and Compliance User can perform the following tasks: • Create AI case on the Employee Center. • Work on the assigned tasks. • Perform control attestations.	• sn_grc_workspace.assessment_template_co • sn_smart_asmt.actor • sn_grc.business_user • sn_grc_workspace.user • sn_smart_asmt.assessment_reader • sn_compliance.control_framework_business • sn_compliance.library_business_user* • sn_compliance.policy_business_user*
AI Risk and Compliance Reader [sn_grc_ai_gov.ai_risk_and_compliance_reader]	The AI Risk and Compliance Reader can have read access to the AI systems and AI impact assessments.	• sn_risk.reader • sn_grc_workspace.user • sn_compliance.library_reader* • sn_compliance.control_framework_reader* • sn_compliance.policy_reader*
AI System Reader [sn_grc_ai_gov.ai_risk_and_compliance_ai_system_reader]	The AI System Reader can have read access to the AI systems on AI Control Tower workspace and AI Risk and Compliance workspace.	NA
AI Case Business User [sn_ai_case_mgmt.ai_case_business_user]	The AI Case Business User can create AI case and AI inquiry on the Employee Center.	sn_grc_case_mgmt.grc_case_business_user
AI Case Analyst [sn_ai_case_mgmt.ai_case_analyst]	The AI Case Analyst can review the AI cases and AI inquiries assigned to them in the system and perform the following tasks only on the assigned records: • Identify and manage impacted and related areas such as policies, regulations, and enterprise wide compliance risks. • Identify and manage issues related to impacted areas to eliminate the root causes.	• sn_grc_case_mgmt.grc_case_analyst • sn_ai_case_mgmt.ai_case_business_user
AI Case Manager	The AI Case Manager can review all the AI cases, AI	• sn_ai_case_mgmt.ai_case_analyst • sn_grc_case_mgmt.grc_case_manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles and their descriptions (continued)

Role title [name]	Description	Contains roles
[sn_ai_case_mgmt.ai_case_manager]	inquiries, and its associated information.	
AI Case Admin [sn_ai_case_mgmt.ai_case_admin]	The AI Case Admin can manage type profiles to segregate AI cases. They can set up assignment rules and delete AI cases.	• sn_grc_case_mgmt.grc_case_admin • sn_ai_case_mgmt.ai_case_manager

Important: Roles indicated with an asterisk (*) indicate feature roles.

Note: Feature Roles provide granular access to individual risk and compliance capabilities, enabling teams to share only the functionality they need. This capability replaces broad Integrated Risk Management (IRM) roles with feature-specific roles for better control. Non-Integrated Risk Management families like Privacy Management, Operational Sustainability Management, and AI Risk and Compliance are restricted from accessing IRM-specific data or core plugin features. This model ensures secure, domain-specific access and simplifies governance across GRC applications.

For more information, see https://www.servicenow.com/products/employee-center.html.

Tables installed with AI Control Tower

Certain Tables or fields are installed along with the activation of the AI Control Tower core plugin.

The following table is provided to understand the AI assessment and AI task fields.

AI Control Tower details

Asset	ai_asset	Reference
Risk classification	risk_score	choice
Status	approval_status	choice

AI asset assessment request

Sys ID	sys_id	SYS_ID
AI asset	asset	Reference
Parent Task	parent_task	Reference (ai_gov_review_task)
State	state

AI asset data model attributes

Additional attributes for the AI asset data model.

Attributes

AI model product model: Product Information for the AI model that is used by the AI system to generate responses without human intervention (cmdb_ai_model_product_model).

AI model product model

Attribute	Description
Model parameters info	Number of parameters for the model.
Supported languages	Languages supported.
Model size	Size of the model in MB. Mostly applicable for models developed and deployed within the organization.
Deployment guidelines	Instructions applicable for models developed and deployed within the organization.
Source	Links or details of source of the model sources example: Hugging face, Microsoft, and so on.
Training procedure	Types of training • Decision Trees • Deep Neural Networks • Linear Regression • Logistic Regression • Random Forest • Supervised Learning • Unsupervised Learning • Reinforcement Learning • Transfer Learning • Semi-Supervised Learning • Instruction Finetuning • Supervised Finetuning

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI model product model (continued)

Attribute	Description
Context window	Size of input sequences that the model can handle (number of tokens).

AI dataset product model: Product Information for the collection of data that is used to train and test AI models (cmdb_ai_dataset_product_model).

AI dataset product model

Attribute	Description
Data type	Describes data, example: Text, Image, Video, and Table
Source	Links or details of source of the dataset sources, example: Customer, Wikipedia, Hugging face, Crowd sourced, and so on.
Acceptable usage	Acceptable usage of the data according to license / contract example: Training, and Evaluation.

AI prompt product model: Product Information for instructions given to AI models to get a response for AI system (cmdb_ai_dataset_product_model).

AI prompt product model

Attribute	Description
Documentation	Links and information about requirements, design, and related information.

AI system product model: Product Information for software that provides ML / AI capability to generate outputs, such as decisions, recommendations, content, or predictions (cmdb_ai_system_product_model).

AI system product model

Attribute	Description
Documentation	Links and information about requirements, design, and related information.

Information asset

Attribute	Description
Data classification	Classification according to organization's data classification model, example: Public, confidential, and customer confidential.

AI digital asset

Attribute	Description
ServiceNow® record reference	Reference to Now Assist record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI digital asset (continued)

Attribute	Description
ServiceNow® table	Now Assist table.

AI system digital asset

Attribute	Description
AI models	Reference to more than one associated models.
Evaluation Dataset	Reference to more than one associated datasets used for evaluation.
Evaluation Metrics Report	Details of evaluation results.

AI model digital asset

Attribute	Description
Base model	This AI model version was derived from an internal model developed within the organization.
Model weights info	Additional model information if available. Mostly applicable for models developed within the organization.
Required infrastructure	Documentation of infrastructure requirements for model deployment, primarily for models deployed within an organization. Example: Infrastructure stack and processing requirements.
Training dataset	Reference to one or more associated datasets used for training the model. These datasets are mostly applicable for models developed within the organization.
Evaluation dataset	Reference to one or more associated datasets used for evaluating the model. These datatsets are mostly applicable for models developed within the organization.
Evaluation metrics report	Links or details of evaluation results
License details	Link or detail to applicable licenses applied to the model.
Model card	Links to shareable model card (Internal and external model card).

AI dataset digital asset

Attribute	Description
Base datasets	This version of the AI dataset was derived from the previous version.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI dataset digital asset (continued)

Attribute	Description
Dataset card	Information on number of records, distribution, and so on. Documentation for data quality and known risks and limitations.
License details	Link or detail to applicable licenses applied to the dataset, example: CommonCore, Apache 2.0,etc.

AI prompt digital asset

Attribute	Description
Prompt information	Details of the prompt.
AI model	Reference to the AI model for which the prompt is created.

Evaluation dashboard reference

Reference topics for the Evaluation dashboard.

Components installed with the Evaluation dashboard

Several types of components are part of the Evaluation tab, including scheduled jobs, tables, system properties, and flows.

Scheduled jobs installed

Scheduled job	Description
CE Populate Value Aggregates Chats – Daily	This scheduled script runs daily and randomly selects 1000 conversations from yesterday's conversations. After that, for each conversation, this job extracts the chat duration and classifies them as small, medium, or large. It also classifies the chats in which a Knowledge article or catalog item was invoked. For the evaluated chat, it also classifies the conversations based on the chat performance and populates that data into the Evaluation Value Aggregates table.
Evaluation Value Calcuation - Runs Only once after install	Deletes all the records on the Evaluation Value Aggregates tables, runs the calculations again and stores the aggregated value in the Evaluation Value Aggregates table. The data is from the first evaluation date.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tables installed

Label	Name
Evaluation	[sn_na_conv_eval_evaluation]
Evaluation configurations	[sn_na_conv_eval_evaluation_configurations]
Evaluation Metrics	[sn_na_conv_eval_evaluation_metrics]
Evaluation Set	[sn_na_conv_eval_evaluation_set]
Evaluation Value Aggregates	[sn_na_conv_eval_evaluation_value_aggregates]

Remote tables installed

Table	Description
Conversation Evaluator Value Calculations [sn_na_conv_eval_st_value_calcs]	For the given query, the definition for this remote table calculates the time savings and efficiency percentage for small, medium, and large chats. Also, it returns the time savings and efficiency when a Knowledge article or catalog item was invoked.
Conversation weekly calculations [sn_na_conv_eval_weekly_cals]	For the given query, the definition for this remote table calculates the time savings and efficiency percentage for small, medium, and large chats for different weeks of the selected date range. Also, it returns the time savings and efficiency when aKnowledge article or catalog item was invoked for all the different weeks of the selected date range.

System properties installed

Property	Description
sn_na_conv_eval.errorBandMinRecords	Minimum number of records required to calculate the error band for upper and lower deviation. By default, the value is 30.
sn_na_conv_eval.evalWeights	Contains weights to each evaluation metric for chat evaluation. This property is used to compute total or composite scores for evaluation records.
sn_na_conv_eval.maxEvaluateCount	Maximum number of records to evaluate in a day. By default, the value is 200.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
sn_na_conv_eval.total_sampled_conversations	Edit this property to control the total number of conversations that can be sampled for value calculations. By default, the value is 1000.
sn_na_conv_eval.value_chat_classifier	Edit this property to change the definition of small, medium, and large conversations. By default, the value it stores is 4, 10. Here, 4 and 10 signify the total number of inbound messages. Fewer than or equal to 4 inbound messages in the sys_cs_message table for a conversation means that it's a small conversation. More than 4 inbound messages and fewer than or equal to 10 inbound messages means that it's a medium conversation, and more than 10 inbound messages means that it's a large conversation.
sn_na_conv_eval.ce_value_calculation_weights	Value calculation weight values for each type of evaluated chat.
sn_na_conv_eval.eval_value_rerun_status	Recalculate value calculations once after the installation. This property will check the status of the Conversation Evaluator Value Rerun status. If it has run, then the script will change the value of this system property to false.

Business rules installed

Name	When	Insert	Update	Filter Conditions
Add info message for Evaluation set	after	TRUE	TRUE	stateCHANGESTOIn Progress^evaluation_type=conversation^

Flows installed

Flow	Description
Execute Evaluation	Performs evaluations when conversations are completed. By default, the Execute Evaluation flow is deactivated. You can use the nightly scheduled job Execute Evaluations to evaluate the chats. If you want to evaluate the chats on chat completion, activate the Execute Evaluation flow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Flow	Description
Execute Batch Evaluation	Performs batch evaluations, evaluating up to 100 completed virtual agent conversations. Flow is triggered when the Evaluation set is created or updated and the Evaluation Type is Conversation.

Flow actions installed

Flow action	Description
Randomize conversations	Performs randomization of conversations and returns 100 conversations randomly from a given query.
invokeApiDefinition	Invokes OneExtend Capability in the large language model (LLM).
Chat Classifier Eval	Gives the title, category, and whether the evaluation should be executed.
buildTranscript	Builds the transcript from a conversation.
evalExecuteCondition	Checks if the transcript is good enough to be evaluated.

Script includes installed

Script includes	Description
evalExecuteCondition	Use this script include to update the evaluation condition.
evalUtils	Primary Utility function for the Evaluator.

Related topics

Remote tables

Evaluation metrics and calculations

Metrics against which conversations are evaluated and calculation of adjusted scores.

Metrics

The Select metric list shows all the metrics against which each conversation is evaluated for the selected date range. You can filter the evaluation trend based on each metric. The following metrics are available:

Metric	Description
Request Completion	Measures the virtual agent's ability to complete user requests by accurately identifying the user's intent and gathering all required information (slot filling).
Intent Accuracy	Shows the virtual agent's ability to comprehend user requests, resulting in relevant responses.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Metric	Description
Slot Filling	Shows the virtual agent's capability to interpret user responses and extract structured answers to the required questions.
Smooth Flowing Conversation (Deadlock avoidance)	Checks if the virtual agent responds dynamically, successfully moving the conversation forward without repetition.
Context Retention	Shows if the virtual agent succeeds in retaining and using information provided during the conversation, including request interpretation and slot filling.
Truthfulness (Hallucination Prevention)	Shows if the virtual agent generated genuine responses grounded in conversation, excluding fabrication or memory and comprehension failures.
Conciseness (Redundancy Avoidance)	Checks the virtual agent's ability to avoid superfluous or verbose and generic responses, which doesn't contribute to the core intent of the conversation.
Coherence	Checks for clear logical flow, structure, and organization of the virtual agent's responses.
User Satisfaction	Weighted average of all the other metrics on which the conversation was evaluated.

Note: All the metrics are rated on a scale of 3 or 5, and are finally scaled up to 5.

Calculations

Calculation of deviations and Adjusted Score:

To align the auto-evaluation scores with human judgment over time, a deviation is calculated and used to produce an adjusted score on metric level.

- Upper Deviation

  Condition: If the number of human-labeled scores that are higher than the auto-evaluated scores in the last 6 months is more than 30.

  Calculation: The top 90% of these cases are taken and the difference (delta) between the human score and the auto-evaluated score is averaged. This delta is the Upper Deviation.

- Lower Deviation

  Condition: If the number of human-labeled scores that are lower than the auto-evaluated scores in the last 6 months is more than 30.

  Calculation: The top 90% of these cases are taken and the difference (delta) between the human score and the auto-evaluated score is averaged. This delta is the Lower Deviation.

- Adjusted Score

  The final Adjusted Score is calculated based on the availability of the deviations.

  - If at least 30 distinct evaluations of both upper and lower deviations are labeled for a given metric, Error band is calculated as SUM(Avg labeling score – LLM score)/Distinct evaluations. This error band is added to Auto-Eval score to get Adjusted Score.
  - If neither deviation is available, then Adjusted Score = Auto-Eval Score

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Calculation of Auto eval user satisfaction score, Human user satisfaction score, and Upper and Lower deviation on Evaluation level:

- Auto eval user satisfaction score: For a given evaluation, get all the scores for each metric that are LLM generated and calculate SUM(metric score * metric weight)/SUM(metric weights).
- Human user satisfaction score: For a given evaluation, if at least one metric is labeled, it's considered to calculate the human user satisfaction score. If labeled, the labeling score is used, or else LLM score is used. Calculated as SUM(metric score * metric weight)/SUM(metric weights).
- Gap: Gap is calculated as (Human user satisfaction score – Auto eval satisfaction score).
- Upper Deviation: If the Gap is positive and there are more than 30 records, the error band is calculated at top 90% by SUM(Positive Gap) / Distinct evaluations. This error band is added to the Auto eval user satisfaction score.
- Lower Deviation: If the Gap is negative and there are more than 30 records, the error band is calculated at top 90% by SUM(Negative Gap) / Distinct evaluations. This error band is added to the Auto eval user satisfaction score.
- Adjusted user satisfaction score is calculated as SUM(Gap) / Distinct evaluations.

Note:

- The evaluator provides aggregated score per chat, even if there are multiple different requests made by user.
- Performance Analytics indicators are used to calculate the average score over time. If you run batch jobs on historical data, then by the definition of Performance Analytics indicators, these evaluations are counted on the evaluation date in aggregated scores and not counted for scores on the actual chat date.

Evaluation flow

The workflow for evaluation execution, which performs evaluations when conversations are completed.

Conversations are evaluated using the following logic:

1. Conversation capture:

   All end-user interactions with the virtual agent are logged in the Conversation table [sys_cs_conversation]. When a user ends the conversation, the record's state is updated to Complete.

2. Automated flow evaluation trigger:

   Flow name: Execute Evaluation.

   Trigger condition:

   - Table: Conversation table [sys_cs_conversation]
   - State: Complete
   - Device type: Web Client, Slack, Teams, Bot to Bot, Messenger

Sequence of execution:

Action 0: Check evaluations count for today

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Perform a query on evaluation table and to get record count.
- If record count is less than Max Number of evaluations per day, continue to Action 1, else end flow.

Action 1: evalExecuteCondition

- Invokes the `evalExecuteCondition.executeEvaluation` script Include with conversation reference.
- Generates a random number (1–100). Proceeds only if ≤10 (10% random sampling).
- Outcome: Returns true or false for further processing.

Action 2: Conditional Branch

- If true: Proceed to the next action.
- If false: Evaluation stops.

Action 3: Lookup Interaction Table:

Matches the conversation's channel metadata with the interaction table to fetch related records.

Action 4: Application Scope Filter:

If the interaction's application scope doesn't include `hr`, continue.

Action 5: buildTranscript:

Detailed Transcript Construction:

- Tags: [User]: For user messages, [Virtual Agent]: For virtual agent messages.
- For any referenced Knowledge article:
  - Pulls the complete article body to replace genius result, tagged with `[Virtual Agent]: Help articles for user query:` and delimited by Article_Start/Article_End.
  - If the Knowledge article is in HR scope/inaccessible, skip evaluation.
  - If the Knowledge article content is >10,000 words: Truncate at 10,000.
  - Attached files (PDF/Word/Txt): Use genius result instead.
- For referenced Catalog Items:

  Extracts name, short description, description, annotated as `[Virtual Agent]: Please choose one of the below options:` with citation number.

- If the first message is to the live agent, or the live agent is invoked within the first 120 words: skip evaluation.

Outputs:

- ExecuteEvaluation (true/false)
- Chat Transcript
- Knowledge articles or catalog items referred
- Sys_id of first live agent invocation (if any)
- List of skills to invoke (all evaluation skills for Evaluation dashboard)
- Additional evaluation logs

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Action 6: Conditional Branch:

If ExecuteEvaluation is true: Continue to Action 7.

Action 7: Chat Classifier Eval

- Builds the initial transcript from *sys_cs_message*.
- Uses Chat topic classifier to determine:
  - Should the conversation be evaluated? (ExecuteEvaluation: true/false)
  - Topic Name
  - Category (IT/HR)
- If ExecuteEvaluation is true: Proceed to Action 6.

Action 8: Create or Update Evaluation Record:

Create a record on Evaluation [sn_na_conv_eval_evaluation] table with:

- Document Conversation: Conversation reference
- State: Processing
- Topic, Category, Knowledge article or catalog references, first live agent sys_id, type, user who initiated, message log

Action 9: For each skill:

Repeats for each skill flagged in Action 6.

Action 10: invokeApiDefinition

- Inputs: Skill name, conversation, transcript, evaluation id
- Calls Now Assist Skill API asynchronously.
- Post processing available in sys_generative_ai_response_validator, performs the following parsing:
  - Score
  - Reason for Score
  - Examples for the reasoning
- Parsed data is created on the Evaluation Metrics [sn_na_conv_eval_evaluation_metrics] table (Score, Reasons, Examples, and the entire reasoning for scoring [Scratchpad]).

Action 11: Waits 7 seconds before continuing to the next skill.

Special behavior and edge case handling:

- Sampling: Only 10% of conversations (randomly chosen) are evaluated.
- Channel Filter: Only Web, Slack, Teams, Bot to Bot, Messenger.
- Application Scope: Excludes records with `_hr_` in the scope.
- Knowledge article controls: No evaluation for HR or inaccessible. Knowledge articles, limits on Knowledge article size, and file handling.
- First live agent invocation: Excludes conversations routed to the live agent at the start or within 120 words.
- The Request Completion skill is added as part of a business rule where the score is tagged as the lowest between Slot filling and Intent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The reason on the record is added as follows:

```
if (Slot filling score > Intent score) {
Intent reason is used
} else if (Slot filling score < Intent score) {
Slot filling reason is used
} else {
Both are used
}
```

Evaluation flow for batch evaluations

Batch evaluation enables Eval admins to evaluate up to 100 completed virtual agent conversations at once, based on a saved query.

Flow name: Execute Batch Evaluation.

The flow creates evaluation records and invokes Now Assist skills for each eligible conversation, mirroring the single-conversation evaluation logic, but at scale. It enforces HR scope exclusions, topic/category validation, transcript construction rules, early live-agent exclusions, and asynchronous scoring through skills.

Batch evaluations are performed using the following logic:

Trigger

- Table: Evaluation set [sn_na_conv_eval_evaluation_set]
- Condition: State changes to In Progress and Evaluation type = Conversation

Inputs

- Evaluation Set record with:
  - Query filter: A query that targets conversations to be evaluated (for example, sys_cs_conversation filters).
  - Evaluation type: Conversation
  - State: In Progress (to start)
- LLM/Skills: Chat Topic Classifier, plus the evaluation skills listed after this.

High-level behavior

- Reads the query filter and randomly samples up to 100 conversations.
- Skips already-evaluated conversations.
- Excludes HR-scoped interactions.
- Uses Chat Topic Classifier to validate evaluation eligibility and extracts Topic and Category.
- Builds a transcript with controlled inclusion of Knowledge articles and catalog sources, and applies early live agent exclusions.
- Creates an Evaluation record and asynchronously invokes all selected evaluation skills, writing scores and rationale to metrics.

Sequence of execution:

Action 1: If the query filter isn't empty

- Purpose: Guard clause.
- Logic: Look up the Evaluation Set record and check the query filter field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If the query filter is present: Proceed to Action 2.
- If empty: Stop and optionally log `No query provided`.

Action 2: Randomize conversations

- Purpose: Select a bounded, random sample of conversations from the provided query.
- Logic:
  - Execute the query to get matching conversation records.
  - Randomly select up to 100 conversations.
    - If >100 matches, cap at 100.
    - If <100, select all.
  - Validate the query; if invalid, return false and an empty or partial array.
- Outputs:
  - success: true/false
  - conversation_ids: array of sys_ids (max 100)
- If success = true: Proceed to Action 3; otherwise, stop and log the validation error.

Action 3: Look up the evaluation table to check prior evaluation

- Purpose: Avoid duplicate evaluations.
- Logic: For each conversation sys_id, check sn_na_conv_eval_evaluation for existing records indicating that it's already evaluated or is in progress (implementation choice: state not in canceled/failed).
- If not previously evaluated: Proceed to Action 4 for that conversation.
- If already evaluated: Skip this conversation, optionally log `Already evaluated`.

Action 4: Look up the interaction record

- Purpose: Enforce HR scope exclusion.
- Logic: Resolve the interaction related to the conversation. If its application scope contains `hr`, skip the conversation.
- If the scope doesn't contain `hr`: Proceed to Action 5.

Action 5: buildTranscript

- Purpose: Construct the final, minute-level transcript and determine downstream skill set and guardrails.
- Steps:
  - Aggregate all conversation messages.
  - Tag user messages as `[User]:` and virtual agent messages as `[Virtual Agent]:`.
  - Knowledge articles:
    - If genius results reference Knowledge articles, query the Knowledge article and replace the genius snippet with the entire article body.
    - Annotate with `[Virtual Agent]: Help articles for user query:` and wrap content within Article_Start and Article_End.
    - Constraints:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

        - If the KB is HR-scoped or inaccessible, don't evaluate (skip conversation).
        - Truncate the article body to a maximum of 10,000 words.
        - If the KB content source is attached files (PDF/Word/Txt), fall back to the genius result instead of full file content.
    - Catalog Items:
        - If genius results reference catalog items, query sc_cat_item and build a string: catalog name, short description, description.
        - Annotate with `[Virtual Agent]: Please choose one of the below options :` and include citation order.
    - Live Agent Exclusions:
        - If the first user message requests a live agent, skip evaluation.
        - If a live agent is invoked within the first 120 words, skip evaluation.
- Outputs:
    - ExecuteEvaluation: true/false (post-guardrail outcome)
    - Chat transcript
    - Knowledge articles referred
    - Catalog items referred
    - First live agent occurrence: Sys_id of the conversation message (if present)
    - Skills to invoke:
        - Coherence Chat Evaluation
        - Conciseness Chat Eval
        - Context Retention
        - Inadequate Slot Filling Chat Eval
        - Intent Accuracy Chat Eval
        - Smooth Flowing Conversation Chat Eval
        - Truthfulness Hallucination Chat Eval
    - Additional logs
- If ExecuteEvaluation = true: Proceed to Action 7; otherwise, skip the conversation.

Action 6: If Block

- Purpose: Branch to record creation.
- Logic: If ExecuteEvaluation from Action 6 is true, go to Action 8.

Action 7: Chat Classifier Eval

- Purpose: Validate whether the conversation should be evaluated and extract high-level labels.
- Logic:
    - Build a lightweight transcript from sys_cs_message for classification input.
    - Invoke Chat topic classifier skill with the transcript.
    - Receive:

© 2026 ServiceNow, Inc. All rights reserved.

        - Execute evaluation: true/false
        - Topic Name
        - Category: IT or HR
- If Execute evaluation = true: Proceed to Action 6.
- If false: Skip conversation and log the classifier decision.

Action 8: Create or Update evaluation record

- Purpose: Persist an evaluation entry for this conversation.
- Table: sn_na_conv_eval_evaluation
- Field population:
    - Document conversation: Conversation reference
    - State: processing
    - Topic: from Action 5
    - Category: from Action 5
    - KB Referred: from Action 6
    - Catalog Referred: from Action 6
    - First live agent occurrence: from Action 6
    - Type: chat summarization
    - User: initiating user for the conversation
    - Message log: Additional logs from Action 6
- On success: Proceed to Action 9.

Action 9: For Loop over skills

- Purpose: Execute each selected evaluation skill.
- For each skill in the list from Action 6:
    - Action 10: invokeApiDefinition
        - Inputs: Skill Name, Conversation, Transcript, Evaluation Id
        - Behavior:
            - Invoke the Now Assist skill asynchronously.
            - The post-processor writes results into sys_generative_ai_response_validator.
            - Extract JSON response fields:
                - Score
                - Reason for Score
                - Examples supporting the reasoning
            - Create child metric records in sn_na_conv_eval_evaluation_metrics linked to the parent evaluation.
    - Action 11: Wait

      Pause seven seconds before proceeding to the next skill to manage rate limits or throttling.

AI Risk and Compliance

The AI Risk and Compliance (AIRC) application gives your risk and compliance team a dedicated workspace to assess AI-specific risks, attest to controls, demonstrate regulatory compliance, and manage AI-related cases for the AI capabilities and other AI assets your organization deploys.

Why AI Risk and Compliance matters

Generative AI introduces a class of risks that traditional risk and control frameworks weren't built to address. AI systems can produce biased outputs, expose sensitive data, or fall under emerging regulations such as the EU AI Act, NIST AI RMF, Colorado's SB 205, or California's SB 53. Without a coordinated way to assess and document those risks, organizations either slow AI adoption or accept exposure they can't measure.

The AI Risk and Compliance application gives your risk and compliance team the structure needed to govern AI responsibly while keeping AI deployments moving. Impact and risk assessments quantify exposure for each AI system, model, and dataset. A regulatory content pack maps requirements from major AI frameworks to your internal controls. AI case management captures investigations, exceptions, and incidents without disrupting development.

How AI Risk and Compliance works with AI Control Tower

AI Risk and Compliance and AI Control Tower work as a coordinated governance framework. AI Control Tower serves as the system of record for AI assets, managing inventory, life cycle state, and progression across phases. AI Risk and Compliance performs the independent risk, regulatory, and control governance activities that determine whether an AI system can advance through those phases.

A typical interaction follows this pattern: an AI use case is submitted through the Employee Center. AI Control Tower creates the inventory record and manages the asset through its life cycle. AI Risk and Compliance evaluates impact and risk during assessment, validates that required controls are implemented during build, and approves or blocks deployment based on residual risk. After deployment, AIRC monitors for new risks and manages the cases and inquiries that arise.

Neither application replaces the other; together they provide consistent oversight from demand through life cycle closure.

Key capabilities

Intake and risk-based classification

Intake requests provide a structured entry point for new AI use cases, models, and datasets. Responses to screening questions in the Use and Purpose section drive an initial risk classification (High, Medium, Low, or Unacceptable), so the appropriate level of governance attention is applied from the start of the life cycle.

Impact and risk assessments

Risk Assessment Methodologies (RAMs) define the scoring frameworks used to classify AI systems and evaluate the individual risks tied to each asset. Default RAMs cover regulatory classification and quantitative risk scoring across AI systems, models, and datasets. Administrators can configure custom RAMs to match organizational requirements.

Regulatory content pack

The AI Risk and Compliance Content Pack ships with authority documents and citations for the EU AI Act, NIST AI RMF, California's SB 53, and Colorado's SB 205.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Citations are mapped to control objectives across frameworks, so a single attested control can satisfy requirements from multiple regulations.

Control attestation and issue management

Controls associated with AI assets can be attested as part of the build and validation phase. Issues that surface during attestation are tracked and remediated, and policy exceptions can be raised and documented when controls can't be implemented as designed.

AI case management

AI cases and inquiries support investigation, exception handling, and regulatory response after AI systems are deployed. Cases capture governance events, document decisions, and trigger reassessment when changes in risk warrant it, without breaking life cycle continuity.

AI Risk and Compliance workspace

The workspace is the central hub for AI risk and compliance managers. The Risk and Compliance dashboard shows risk posture and assessment status. The Operations dashboard tracks controls, issues, and exceptions. The AI Cases dashboard surfaces active investigations and inquiries.

Explore further

For details on configuring and using AI Risk and Compliance, see AI Risk and Compliance.

AI Guardian

AI Guardian provides the runtime protection layer for your generative AI deployments, evaluating requests and responses in real time to detect offensive content, prompt injection attacks, and sensitive topics that aren't suited for an AI response.

Why AI Guardian matters

Generative AI behavior is probabilistic. The same input sent to a large language model (LLM) can produce different outputs from one request to the next, and even well-tested skills can return content that's harmful, off-topic, or manipulated by a bad actor. Lifecycle governance can establish policies and controls before a generative AI skill goes live, but it can't catch what happens in the moment a user submits a prompt.

AI Guardian closes that gap by evaluating every request and response in real time. Offensive content is detected before it reaches a user. Prompt injection attempts that try to override LLM instructions are flagged or blocked. Conversations that drift into topics not suited for AI responses are redirected to a fallback flow. Together, these protections give your governance team the runtime evidence and enforcement they need to deploy AI with confidence.

How AI Guardian fits into AI governance

AI governance operates at two levels, and a complete program needs both. Lifecycle governance, supported by AI Control Tower and AI Risk and Compliance, evaluates AI assets before deployment and across their full life cycle: intake, impact assessment, risk classification, control attestation, and ongoing monitoring. Runtime governance, supported by AI Guardian, evaluates each individual AI interaction as it happens.

The two layers reinforce each other. Lifecycle reviews establish which AI systems are approved to operate and what controls must be in place. AI Guardian enforces parts of those controls at runtime and produces the logs that feed back into ongoing risk monitoring. When a guardrail

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

surfaces a pattern of incidents, that signal can drive reassessment in AI Risk and Compliance without disrupting service.

The three guardrails

AI Guardian provides three guardrails, each with a different scope of applicability.

Offensiveness detection

Identifies toxic, defamatory, fraudulent, or otherwise harmful content in both the input sent to an LLM and the output returned. By default, detections are logged. You can configure the guardrail to block detected content and return a standard error message instead of the generated response. Offensiveness detection applies to specific generative AI skills and agentic workflows.

Prompt injection detection

Identifies attempts to override LLM instructions or expose restricted information through techniques such as role playing, paraphrasing, repetition, or instructions to ignore previous prompts. Prompt injection protection applies across all generative AI applications and features on your instance, and you can configure it at the instance level or for individual skills. When both are set, the more protective setting applies.

Sensitive topic filters

Identifies subjects not suited for an AI response, such as workplace safety, employee compensation, or personal well-being. When a filter triggers, the user is redirected to a Sensitivity Detection: Fallback Virtual Agent topic that can route them to a live agent or help them open a case. Sensitive topic filters apply to Virtual Agent conversational skills and are available with HR Service Delivery and Customer Service Management.

Logging and blocking

Offensiveness and prompt injection detections are logged by default. Logs capture the request, the conversation context, and any user feedback, and are accessible from **AI Admin Hub** > **Settings** > **AI Guardian**. Reviewing logs over a representative period of time gives your team a baseline for how often issues occur in your environment before you enable blocking.

When blocking is enabled and a guardrail triggers, the user sees a standard error message and the generated content isn't returned. Personally identifiable information (PII) is anonymized from requests before they reach the LLM, and the type of data anonymized is configurable.

Explore further

For details about configuring guardrails, exporting logs, and setting up a Guardrail Service Provider, see AI Guardian.

Large language models and providers

Large language models (LLMs) power every Now Assist generative AI capability. Understand how LLMs work on the ServiceNow AI Platform, choose model providers, and write effective instructions.

Large language models (LLMs) are the engine behind generative AI capabilities. Every skill, AI agent, and agentic workflow on the ServiceNow AI Platform relies on an LLM to interpret context, reason through tasks, and generate responses from your enterprise data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Large language models on the ServiceNow AI Platform

An LLM is a machine learning model trained on large datasets to generate text-based responses. Because LLMs are probabilistic rather than deterministic, the same prompt may produce slightly different outputs each time. Learning this characteristic helps you set appropriate expectations and design effective interactions with AI capabilities. To understand how LLMs generate responses and why their probabilistic nature shapes the way you design AI interactions, see Large language models on the ServiceNow AI Platform.

Now LLM Service

The ServiceNow AI Platform manages LLM interactions through Now LLM Service, which provides access to optimized models hosted by ServiceNow. Now LLM Service handles model selection, routing, and updates so that AI capabilities on your instance stay current without manual model management. Long-term stable (LTS) model options are available for organizations that require predictable behavior over extended periods, such as those in regulated industries. To use hosted models that handle selection, routing, and updates for you, including long-term stable models for regulated environments, see Model provider updates.

Writing effective instructions

How you write instructions and prompts for an LLM directly affects the quality of its output. General guidelines for writing effective instructions help you craft clear, specific prompts that produce consistent, useful results. These guidelines apply whether you're configuring base system skills, building custom skills with AI Skill Kit, or defining instructions for AI agents. To write clear, specific instructions that produce consistent results across skills, AI Skill Kit, and AI agents, see General guidelines for writing instructions for generative AI large language models (LLMs).

Providers and models

The ServiceNow AI Platform supports third-party model providers and the Now LLM Service. Configure provider connections, create model records, and understand the capabilities and constraints, such as context windows and token limits, that affect how AI features perform on your instance.

Note: If you notice inconsistencies in AI-generated results when using different search tools on your instance, refer to the topic on discrepancies when using different AI search tools.

To connect third-party model providers, create model records, and work within context-window and token limits, see Providers and Models.

Large language models on the ServiceNow AI Platform

ServiceNow AI Platform® utilises large language models (LLM) for generative AI and agentic AI functionality. You can choose the ServiceNow® LLM or supported third-party models. LLMs bring about the Generative AI application capabilities by understanding and generating human language, and processing vast amount of data.

Third-party model strategy

ServiceNow® supports third-party AI model providers, which signifies that the admin persona can select a third-party large language or an AI model provider for Now Assist skills that are available out of box. Find the supported model providers, the LLM services and the version.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Third party AI model providers

Model provider	Large language model	Version	Deployment policy
ServiceNow®	Now LLM Service	Latest update for your instance	
Microsoft Azure	Azure OpenAI	OpenAI GPT-4.1 and GPT-4.1-mini	https://learn.microsoft.com/en-us/azure/ai-services/openai/how-to/deployment-types#global-standard
Google	Google Gemini	Gemini 2.5 Flash and 2.5 Pro	https://cloud.google.com/vertex-ai/generative-ai/docs/learn/locations
AWS	AWS Claude	Claude 3.7 Sonnet	https://docs.aws.amazon.com/bedrock/latest/userguide/models-regions.html **Note:** Some out of box skills, Agents, and Agentic Workflows do not support Now LLM Service or third party model providers. To learn more about the exceptions to LLM service and third party model providers support, see https://support.servicenow.com/kb?id=kb_article_view&sysparm_articl

Note: Some out of box skills, Agents, and Agentic Workflows do not support Now LLM Service or third party model providers. To learn more about the exceptions to LLM service and third party model providers support, see https://support.servicenow.com/kb?id=kb_article_view&sysparm_article=KB2222333

Large language model selection

This selection is supported at various levels such as, skill, skill group and instance levels. However, the controls that define LLMs mapping to different skills, allowed at various global locations, are configured and approved in AI Control Tower by the AI steward. The model

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

provider options for custom skills created in Now Assist skill kit and AI Agent Studio are also configured in AI Control Tower. See Configure third-party LLMs using AI Control Tower to learn more.

The **Manage large language models** feature enables the admin persona to perform additional actions like:

- Edit the model provider at the instance, skill group and skill levels
- Deactivate active skills which are non-compliant with fallback as **No**. See AI model providers to learn more.
- View audit history on policy updates by AI steward in AI Control Tower
- Select allowed model providers across domain separated instances.

See Manage AI models to learn about managing.

For more information on selecting and updating model providers, see Manage model providers.

Model provider updates

Review these updates to learn which model providers and models are available for your skills and agents. Review the model cards for information about how each model is intended to be used.

Model cards

Large language models (LLMs) are complex machine-learning models that are trained on large datasets like websites and documentation to perform language-related tasks. Examples include text generation for case summaries and resolution notes.

Model cards explain the specific model's context, intended use, training data, limitations, and other important information.

These model cards reflect the AI models that power various features within the ServiceNow platform. These include skills, agents, and agentic workflows within ServiceNow Otto as well as AI powered features outside of ServiceNow Otto. To see which model a ServiceNow Otto skill, agent, or agentic workflow is using, you can check the skill list in the AI Admin Hub console and review the LLM service column.

Model card for Gemma 4 26B A4B

Selectable ServiceNow Otto model for enterprise AI that enhances text-based automation and content generation in ServiceNow workflows, including requester OOTB skills, custom skills, and agentic use cases.

Model card for ServiceNow large language model (V2)

ServiceNow Otto model for enterprise AI that enhances text-based automation and content generation in ServiceNow workflows, including requester OOTB skills, custom skills, and agentic use cases.

This model is available for Generative AI Controller application 15.1.0 or higher.

Model card for ServiceNow small language model (V2)

ServiceNow Otto model for enterprise AI that enhances text-based automation and content generation in ServiceNow workflows, including creator and fulfiller OOTB skills as well as custom skills.

This model is available for Generative AI Controller application 11.2 or higher.

Model card for ServiceNow third party large language model

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ServiceNow Otto models used for AI-driven solutions for text generation, summarization, and conversational AI.

Model card for ServiceNow Voice AI Speech-to-Text and Text-to-Speech models

Models used within ServiceNow AI Voice Agents for converting spoken user input to text and generating natural-sounding speech from AI responses.

Model card for ServiceNow AI Guardian model

This model provides content moderation and helps identify different kinds of prompt injection attacks and offensive content.

Model card for ServiceNow Inferred CSAT and Factors large language model

This model is designed to ingest a conversation and predict a CSAT score as well as factors that explain the predicted score.

October 2026

The October release adds models to the Now LLM Service and to Google Gemini. It also retires the Gemini 2.5 models and Claude Sonnet 4.5, and begins the deprecation of the Now LLM Service V2 models.

- New model in the Now LLM Service: Gemma 4 26B-A4B is available for both large and small language model use cases. Third-party models remain the default. You can select the Now LLM Service for your skills and agents instead of the default.
- New restricted model: Gemini 3.7 Flash supports the Build Agent. You can't select it for your skills and agents.
- Gemini 2.5 models retired: Gemini 2.5 Pro, Gemini 2.5 Flash, and Gemini 2.5 Flash Lite are retired on October 8, 2026. These models are no longer available, and requests to them fail. Gemini 3.5 Flash replaces all three models. Review your skills, agents, and generative AI configurations for references to the retired models, and select Gemini 3.5 Flash instead.
- Claude Sonnet 4.5 retired: Claude Sonnet 4.5 is retired on October 8, 2026. Claude Sonnet 4.6 replaces it. Select Claude Sonnet 4.6 for your skills and agents.
- V2 models deprecated for new development: The ServiceNow large language model (V2) and small language model (V2) are deprecated for new development. Your existing skills and agents continue to work. Retirement is planned for the December release, when these models are replaced by Gemma.

September 2026

September release adds restricted models from AWS Anthropic. Restricted models support specific features only. You can't select them for your skills and agents.

This release doesn't add any general purpose models. The models that you can select in the AI Admin Hub console are unchanged.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Claude Sonnet 5 and Claude Fable 5 support the Build Agent.

- Restricted replaces limited: The card now uses **Restricted** instead of **Limited** to identify models that you can't configure. Claude Opus 4.6 and Gemini 2.5 Flash Lite use the new term. Their supported features haven't changed. Gemini 2.5 Flash Lite is retired on October 8, 2026, and is replaced by Gemini 3.5 Flash.

July 2026

The Now LLM Service model strategy has moved toward integrated model provider flexibility. Store application updates have started shipping, and the default model for base system skills and agents is changing from the Now LLM Service to an integrated third-party model provider. If you haven't changed the default model for a skill, that skill uptakes the new default.

- Integrated third-party model providers: The integrated third-party model providers are Google Gemini, AWS Claude, and Azure OpenAI.

- New general purpose models: You can select these models for your skills and agents in the AI Admin Hub console. Model availability varies by your instance, your configuration, and your geographic region.
  - Azure OpenAI: GPT-5.1, GPT-5.4 Mini, and GPT-5.1 Mini
  - Google Gemini: Gemini 3.5 Flash

- GPT-5.2 deprecated: GPT-5.2 is no longer available as a model option. GPT-5.4 replaces it. If you selected GPT-5.2, update your model configuration records to select GPT-5.4. References to GPT-5.2 aren't redirected automatically.

- The Now LLM Service is still supported: The change to the default model provider doesn't remove access to the Now LLM Service. You can still select it for your skills and agents if you require a ServiceNow hosted model.

- Existing selections preserved: If you have already selected a model provider, that configuration is preserved. The update doesn't overwrite an explicit selection.

- Changing your model provider: To select a model provider other than the default, review the providers that are allowed for your instance in AI Control Tower. Navigate to **Configurations** > **Controls** > **AI model providers**, and then make your changes in the AI Admin Hub Center by navigating to **Settings** > **Manage AI Models** > **Manage Model Providers**.

- Explicit model names required: Update prompt and generative AI configuration records that use generic large or small model references. Reference a specific supported model by name instead.

June 2026

June release includes updates to third-party model defaults. It also contains a change to the default reasoning effort setting for GPT-5 Mini, and the retirement of the Now LLM long-term support (LTS) SKU.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Third-party default model version update: Teams that did not update their third-party default model versions to the latest available versions in the May release must do so in the June release. GAIC 13.1.2 is the required version for this update.

- GPT-5 Mini: `reasoning_effort` default change: The default `reasoning_effort` setting for GPT-5 Mini has changed from `none` to `minimal`. This change is included in GAIC Snapshot 14.0.0, which is compatible with Now Assist for Platform 12.0.0.

  Teams using GPT-5 Mini should run regression and functional testing to confirm that the new default works as expected. If you explicitly set `reasoning_effort` in your generative AI config additional properties, smoke test to verify there are no unexpected effects. If you have `reasoning_effort: none` set in additional properties, update the value to `minimal` and run regression and functional testing.

- Claude Sonnet 4.0 retirement: Claude Sonnet 4.0 references are being redirected on the backend. No team action is required.
  - `claude_large` / Claude 4.0 Sonnet redirects to Claude 4.5 Sonnet
  - `claude_small` / Claude 4.0 Sonnet redirects to Claude 4.5 Sonnet

- Now LLM LTS SKU retired: ServiceNow no longer offers the LTS model SKU. There are no testing requirements or expectations for teams related to this retirement.

May 2025

An advanced 12B general-purpose small language model (SLM) with a singular, high-performance architecture that supports a wide range of tasks in ServiceNow's context was released. Fine-tuned on Mistral-Nemo-12B-Instruct, this model is designed and optimized for tasks like Agent Assist, Text-to-Flow, Text-to-Cypher, Safety & Content Moderation and Text-to-Code.

Key Enhancements:

- Enhanced instruction adherence: Improved the model's capability to accurately interpret and follow user instructions, ensuring that the model can better understand and execute complex commands. Leading to more precise and reliable outcomes than previous releases.
- Increased context window: Increased context window from 16K to 32K, enabling the model to better understand long-form inputs. This increase maintains coherence over extended interactions, and supports more complex tasks with richer contextual awareness.
- Improved multilingual proficiency: Boosted performance across languages compared to previous releases, with notable enhancements in Japanese processing.
- Optimized for ServiceNow workflow related capabilities: Extended support coverage for Text-to-Flow, and improved the performance of Text-to-Code, Text-to-Cypher etc.
- Continuously enhanced model deployment consolidation: Integrates ServiceNow-related tasks into a single model, reducing system complexity at the same time while elevating overall performance.

March 2025

A powerful 12B general-purpose small language model (SLM) designed to enhance a wide range of applications, including text-to-code and agent use cases was released. Fine-tuned on Mistral-

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Nemo-12B, it streamlines deployment and consolidates multiple functionalities into a singular, architecture.

Key Enhancements:

- Optimized to fulfill use cases: Enhances case summarization, chat summarization, resolution notes, and knowledge base generation across supported languages, including improvements in Japanese quality.
- Superior text-to-code and text-to-cypher performance: Delivers major advancements in Glide JavaScript and generic JavaScript editing and generation, along with improved accuracy in query generation and execution for structured databases.
- Robust content moderation and safety: Provides stronger protection against adversarial prompts, jail-breaking attempts, and harmful content generation, ensuring safer deployment with built-in content filtering.
- Unified model deployment:integrates ServiceNow-related tasks into a single model, thereby reducing system complexity while elevating overall performance.
- Improved instruction adherence: Delivers better instruction following and consistency across varying levels of prompt and instruction strictness than the current text-to-text NowLLM.

November 2024

Several key improvements were added to the Now LLM Service that are aimed at enhancing performance and quality.

- Multilingual support: Now LLM Service supports 8 additional languages, enabling global teams to use the model in their native languages.

  The supported languages are: English, German, French, Japanese, Dutch, French Canadian, Spanish, Brazilian Portuguese, and Italian.

- JSON format support: The model now provides output in JSON format, making it easier for developers to integrate with various applications and automate workflows seamlessly.
  - Deterministic responses: JSON mode ensures structured, consistent output, which improves predictability and reliability when integrating with applications.
  - Error reduction: Unlike free-form text mode, JSON responses are less prone to format errors or stray characters, minimizing integration issues.
  - Lower token consumption: The fixed structure of JSON can reduce token usage, making it more efficient and cost-effective for applications with high response frequency.
- Improvements in instruction following: The model has been fine-tuned to understand and follow instructions more precisely. This enables the model to deliver more to-the-point and actionable responses, helping users get the information they need faster and more efficiently.

General guidelines for writing instructions for generative AI large language models (LLMs)

When using Now Assist products and skills, you may have the option to give specific instructions or other guidance to the LLM. Writing generative AI instructions is different from conducting a keyword search. Use the following general guidelines when crafting your instructions.

Writing instructions for generative AI is very different from using search keywords. Keywords are the words that you might expect to appear in your results. For example, if you search for "gray bobtail cats," then you can reasonably expect your search results to return with topics or media that is about gray cats, bobtail cats, or even just cats in general. But with generative AI, you are

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

asking the LLM to perform a task for you. The phrase "gray bobtail cats" does not include a verb to tell the LLM what to do. What about these gray cats? Should it locate all there is to know about them? Should it find gray bobtail cats to adopt? Should it create a picture of a gray bobtail cat? Should it be a realistic picture, or more of a line drawing? Generative AI needs more than just keywords.

General LLM instructions

Use instructions or questions to tell the LLM what you want. They can include four parts:

Goal

What kind of result do you want from the LLM?

Example: `I want a list of 3-5 bullet points to prepare me...`

Context

Why do you need it, and who is involved?

Example: `...for an upcoming meeting with [client], focusing on their current state and what they're looking to achieve with their "Phase 3+" brand campaign.`

Expectations

How should the LLM best fulfill your request?

Example: `Please use simple language so I can get up to speed quickly.`

Source

What information or other resources would you like the LLM to use?

Example: `Focus on email and Teams chats with [people] since June.`

Sample LLM instructions

Continually test and refine your instructions. Creating good LLM instructions is an iterative process, and as the LLM model learns, you may want to modify your instructions over time.

Stating your goal

When constructing an LLM description or instruction, consider these basic guidelines.

- Lead with action verbs. Use the imperative form or direct commands.
- Be direct and use simple sentences rather than complex ones.
- Be specific.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

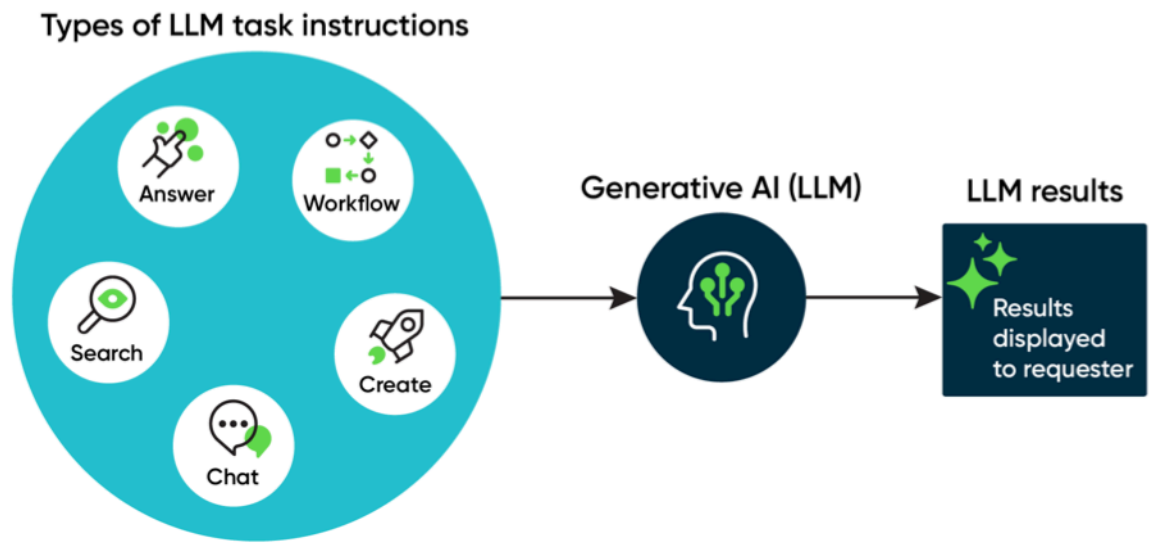
- Don't use jargon or slang terms.
- Avoid references to third parties or pronouns. Removing the subject or any identifiers generally prevents the LLM from personifying or otherwise misidentifying the end user.
- Your words instruct the logic that generative AI will use. Detailed, chain-of-thought instructions work well for this.

Instructions should also be tailored to the type of task. The following table describes the different kinds of tasks and the sort of instructions you might write for each circumstance.

Types of generative AI tasks and example instructions

Task type	Description	Example instruction
Simple search	Simple search for an answer.	When is the next company holiday?
Answer	Gather information from multiple sources and provide a summarized answer.	What were the major customer support issues in the past 30 days?
Chat	A back-and-forth conversation in which the LLM is getting additional information from the requester.	I have a new phone and now I can't access Okta.
Create	Create a new ServiceNow component.	Write a new KB on common reasons for slow query execution and how to fix it, based on problems created in the last 12 months.
Workflow	Leverage existing workflows and create conversations from them.	Reset my Okta password.

LLM instruction workflow



Providing context in your instructions

Providing context to the LLM may feel like you are stating the obvious. For example, you may need to explain why your user would want to perform the task, or explain more about what the task is about. If you're using language that could have alternative meanings, you may want to define your terms. For example, if your instructions are about Microsoft Teams, you may need

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

to say something like, "Teams refers to Microsoft Teams, an application that employees in a company can use to communicate with one another individually or in groups."

When providing context, think about the target audience for the task. This will help you to write better instructions. Mentioning whom the task is for also helps the LLM carry out the task.

Types of users to consider:

Admins

Admins configure skills in the AI Admin Hub console. They work with platform owners and product owners for tasks and requirements. Subject-matter experts check the accuracy of generative AI results. Governance boards or committees may oversee final sign-off on the skill.

Builders

Builders create assets such as applications and workflows. Their skill level may vary from no-code, low-code, mid-skill, or high-skill. They mostly interact with each other and admins.

Agents

Agents provide technical assistance, customer support, or other problem-solving help for users of a product, service, or organization. Agents work with their peers and support many kinds of requesters.

Requesters

Requesters may include your organization's employees, partners, or customers. Requesters encounter generative AI mostly in a self-service context. Generative AI provides the opportunity to requesters to solve the problem themselves before they resort to asking an agent for help.

In addition, you may need to "instruct" the LLM how to arrive at the kind of answer you want. Detailed chain-of-thought instructions are more likely to produce the results you're looking for. If you make assumptions in your instructions, your results may vary wildly.

Example of chain-of-thought instructions

Standard instructions	Chain-of-thought instructions
Q: Start with 5 tennis balls. Buy 2 more cans of tennis balls. Each can has 3 tennis balls. How many tennis balls are there now? A: The answer is 11. Q: The cafeteria had 23 apples. If the cafeteria used 20 to make lunch and bought 6 more, how many apples does the cafeteria have?	Q: Start with 5 tennis balls. Buy 2 more cans of tennis balls. Each can has 3 tennis balls. How many tennis balls are there now? A: There are 5 balls. 2 cans of 3 tennis balls each is 6 tennis balls. 5+6=11. The answer is 11. Q: The cafeteria had 23 apples. If the cafeteria used 20 to make lunch and bought 6 more, how many apples does the cafeteria have?
LLM results (incorrect!)	LLM results (correct!)
A: The answer is 27.	A: The cafeteria had 23 apples originally. They used 20 to make lunch. So they had 23-20=3. They bought 6 more apples, so they have 3+6=9. The answer is 9.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Expectations

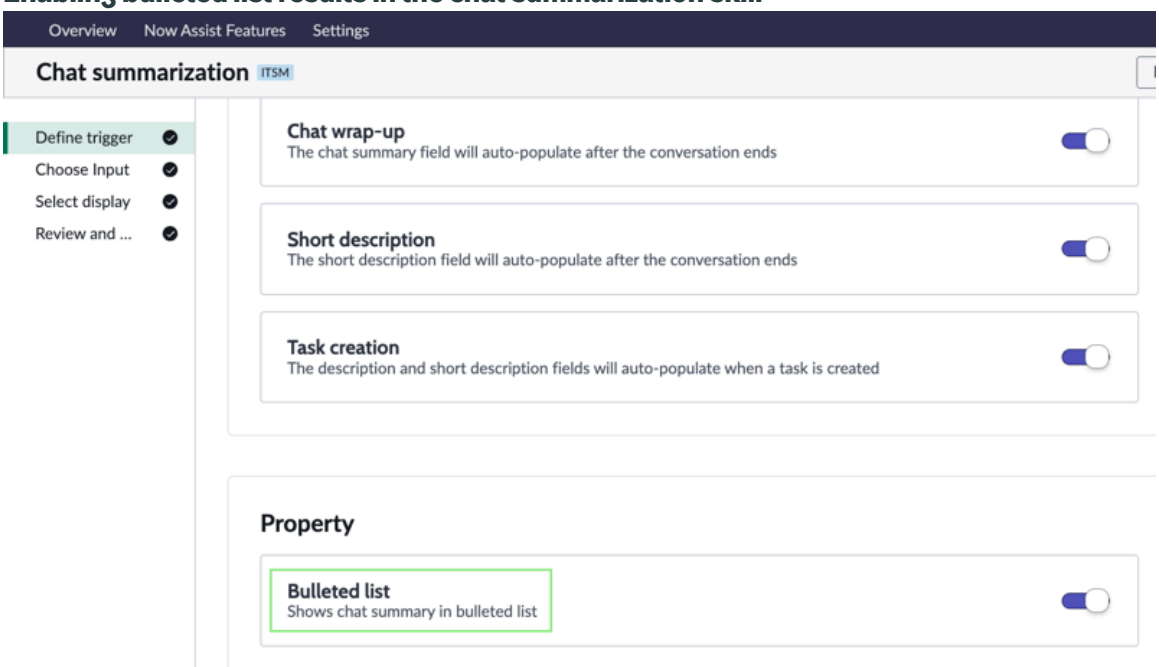
You can specify how you want your results to sound and look. For example, you can tell the LLM what kind of tone you want it to use.

Modifying the tone of LLM results

Instruction	LLM result	Evaluation of result
Greet the user with a casual, laid-back tone.	Hey there! (: Welcome to May 22, 2024, a Wednesday. Chill and have a great day!	Too casual!
Greet the user with a professional, business-like tone.	Good day, welcome to our business. How may I assist you today?	A little too formal.
Greet the user with a professional, but friendly tone.	Hello there! I'm glad to assist you today, May 22, 2024. How can I help you?	Great, but I don't want the date.
Greet the user with a professional, but friendly tone. Do not include the date.	Hello! I'm here to help. How can I assist you today?	Perfect.
Instruction	LLM result	Evaluation of result

In some Now Assist applications, you may have the option to specify formatting. In those cases, you can tell the LLM to provide answers in a bulleted list, for example. Bulleted lists are often easier to read.

Enabling bulleted list results in the chat summarization skill



Source

You can suggest a variety of sources that the LLM should use to find answers, including Microsoft Teams conversations, Microsoft SharePoint Online sites, incidents and cases, and

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

internal knowledge articles. In order for an agent or skill to access all of these sources, an admin must configure access on the instance.

For developers, the sources that a skill or AI agent can access may vary depending on the desired outcome. For example, the incident summarization skill uses the Incident table as its source. AI agents use different tools and knowledge sources, customized for the task they perform.

For more information about configuring sources for skill or AI agent use, see the following topic areas:

- AI Search
- ServiceNow Otto for AI Search
- External Content Connectors
- Overview tab in AI Admin Hub
- AI Agent Studio (legacy)

Long term stable models

Long term stable (LTS) models support regulated industries, such as financial institutions, with stronger AI lifecycle management, governance, transparency, and compliance tools.

Long term stable models enable you to adopt AI confidently while supporting customers in their operational and compliance needs. These models also integrate with tools like AI Control Tower to support customers with governance, monitoring, and compliance controls along with guidance for implementing AI responsibly.

LTS models provide predictable AI updates, longer model stability windows, and early access testing for smoother adoption.

You can configure long terms stable models in AI Control Tower. You can also navigate to **Manage model providers** section in the Now Assist settings and select Now LLM Service-LTS as a provider for specific Now Assist skills.

© 2026 ServiceNow, Inc. All rights reserved.

Discrepancies when using different AI search tools

Different AI search tools may return different answers for the same or similar searches. This difference in results is expected. It occurs because each large language model (LLM) uses a different approach to find results and generate answers that match your search.

Overview of how LLMs create responses

Large Language Models don't retrieve answers from a single source. Instead, they generate responses by predicting the next most likely word, one at a time, based on patterns they've learned from the data they were trained on.

Because of that, several factors can make the answers vary each time. The factors include:

- Probability
- Multiple good answers
- Context sensitivity
- LLM variation

Answer generation involves probability, context, and variation. Therefore, responses to the same question can differ slightly each time it is asked, and from provider to provider.

For more information on differences in ServiceNow AI results, see Search result disparities between AI Search and ServiceNow Otto® search features.

Example: Now LLM Service response vs. Azure response

The difference in responses by Now LLM Service and Azure for information about tuition reimbursement

Providers and Models

You can bring your own large language model (LLM) provider and API to use with Now Assist.

Bringing your own large language model enables:

- Data Privacy & Compliance: Keep sensitive data within your own environment and meet regulatory requirements.
- Customization: Fine-tune models for domain-specific needs and control behavior.
- Integration Flexibility: Connect easily with existing infrastructure and preferred cloud providers.
- Cost Control: Use existing contracts and optimize resource usage to avoid extra charges.
- Strategic Autonomy: Maintain vendor neutrality and avoid lock-in for future-proofing.

Managing data for AI

Build the data foundation and search infrastructure that AI capabilities depend on to deliver accurate, relevant results.

The quality and accessibility of your enterprise data directly affects how effective your AI capabilities are. Generative AI outputs are grounded in the content your instance provides. If that content is outdated, incomplete, or poorly structured, AI-generated summaries, answers, and recommendations reflect those gaps.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connecting enterprise data

Workflow Data Fabric is the unified data foundation that connects enterprise data where it lives, governs it through stable contracts, and makes it ready for workflows, analytics, and AI. Data is often scattered across dozens of systems, and integrations are rebuilt team by team. Workflow Data Fabric addresses this challenge so that after data is connected and governed, any team can discover and reuse it without rebuilding pipelines or compromising data integrity. To learn about connecting enterprise data where it lives, governing it through stable contracts, and making it ready for AI, see Connecting enterprise data for AI.

Knowledge Graph

Knowledge Graph creates a connected representation of data that maps entities and their relationships, adding context and meaning to information across your enterprise. This semantic layer enhances Virtual Agent, AI agents, and generative AI skills by enabling natural language queries against structured data, providing user context such as role, department, and location for personalized responses, and simplifying interactions through automatic slot-filling in forms and chat requests. To map the entities and relationships that give AI the context for natural language queries, personalized responses, and automatic slot-filling, see Knowledge Graph.

AI Data Kit

AI Data Kit enables you to add datasets to a data catalog and create data collections for evaluation in the ServiceNow SDK. When the base system generative AI skills don't fit your needs, AI Data Kit provides the tools for creating custom datasets that can be used to develop and evaluate custom AI capabilities on your instance. To build custom datasets and data collections for developing and evaluating AI capabilities in the ServiceNow SDK, see AI Data Kit.

AI Search

AI Search is the retrieval layer that powers search experiences across the ServiceNow AI Platform®. AI Search indexes content from your instance and from connected external sources, then delivers relevant results through platform applications such as Global Search, Service Portal, Employee Center, and workspaces. Configuring AI Search effectively, including defining search sources, search profiles, and relevancy settings, is a high-impact step in your AI implementation. To learn about configuring the search sources, profiles, and relevancy settings that power retrieval across Global Search, portals, and workspaces, see AI Search on the ServiceNow AI Platform.

External Content Connectors

External Content Connectors index content and metadata from external source systems such as Confluence, SharePoint Online, Google Drive, and other supported repositories, making those systems searchable through AI Search. Indexing preserves the original user access permissions from the source system, so users only see content they are authorized to access. Connector administrators schedule content crawls and permission crawls to keep indexed content current. To learn about making external systems searchable through AI Search while preserving source permissions, see External Content Connectors on the ServiceNow AI Platform.

Note: Data quality is an ongoing effort. Establish regular review cycles for your knowledge base, search sources, and AI training data to maintain the quality of AI outputs as your organization evolves.

Connecting enterprise data for AI

Workflow Data Fabric connects enterprise data across systems, governs it through stable contracts, and makes it available to AI agents, workflows, and analytics on the ServiceNow AI Platform.

AI capabilities on the ServiceNow AI Platform are only as effective as the data they can access. Workflow Data Fabric is the unified data foundation that addresses a common enterprise challenge: data scattered across dozens of systems, integrations rebuilt team by team, and AI agents lacking the governed context needed to act reliably. After data is connected and governed through Workflow Data Fabric, any team can discover and reuse it without rebuilding pipelines or compromising data integrity.

Workflow Data Fabric support for AI

AI agents, generative AI skills, and agentic workflows consume data through the governed contracts that Workflow Data Fabric provides. When an AI agent needs to retrieve information from an external system to complete a task, or when a workflow needs real-time data from a data warehouse to make a decision, Workflow Data Fabric supplies that data through stable, access-controlled interfaces. This means AI capabilities operate on trusted, contextualized data rather than on ad hoc integrations that may lack governance or break over time.

Workflow Data Fabric lifecycle

Workflow Data Fabric operates through four phases that separate planning, access, governance, and consumption:

Prepare

Explore the Data Catalog to find existing data products and data interfaces that may already meet your needs. ServiceNow Otto for Workflow Data Fabric (WDF) provides AI-guided recommendations that help you determine whether to reuse existing data or connect a new source.

Connect

Establish secure connections to external systems in Connect Hub. Connect Hub is a unified workspace for discovering, building, and managing integrations between the ServiceNow platform and external systems. Connection admins configure credentials, authentication, and metadata collectors for external data sources including databases, APIs, data lakes, and SaaS applications.

Understand

Convert raw connectivity into governed, reusable data. Metadata collectors automatically populate the Data Catalog with discovered schemas, lineage, and governance metadata. Data stewards author data interfaces in the Data Workbench — stable contracts that define how consumers access data. Data stewards then package these interfaces into data products with business context, documentation, and access controls.

Act

Discover published data products in the Data Catalog, request access through governance workflows, and consume data through Workflow Studio, dashboards, API queries, and AI agents. Data is consumed exclusively through data interface contracts, preserving governance boundaries and data quality.

Key components

Connect Hub

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A unified workspace for discovering, building, and managing integrations. Connect Hub supports prebuilt integration components including spokes and zero copy connectors, and provides access to Model Context Protocol clients for connecting AI agents to external tools.

Data Catalog

A self-service discovery layer where consumers browse and evaluate data products, data interfaces, and other cataloged assets. The Data Catalog displays trust scores, lineage, and governance metadata, enabling consumers to request access and confirm data usability before building on it.

Data Workbench

The interface where data stewards create data interfaces and data products. Data interfaces are stable, governed contracts that define the schema through which consumers access data. They support single table, JOIN, and UNION patterns, and enforce backward compatibility to protect consumers from breaking changes. Data products package one or more data interfaces with business meaning, documentation, and governance metadata.

Data fabric tables

A projection of an external data object that makes external data accessible as if it were a local ServiceNow table, without physically copying the data. Data fabric tables enable AI agents and workflows to query external data in real time using the same patterns they use for instance data.

ServiceNow Otto for Workflow Data Fabric (WDF)

An AI-guided entry point that helps you discover data fabric tables, connectors, and collectors, and request guidance on how to set up integrations. Describe what you need in natural language and Now Assist recommends whether to reuse existing data or connect a new source, then routes you to the right place.

Additional resources

To connect data sources, define the contracts that govern how that data is accessed, and make it available to AI agents, workflows, and analytics, see Workflow Data Fabric.

Knowledge Graph

The Knowledge Graph application, uses the structured and unstructured data from ServiceNow records, knowledge bases, and external sources to enhance the performance of *ServiceNow Otto for Virtual Agent*, AI agents, and generative AI skills.

Exploring Knowledge Graph

Knowledge Graph provides a connected representation of data that maps entities and their relationships, adding context and meaning to information to enable intelligent search, insights, and AI-driven experiences.

Knowledge Graph overview

ServiceNow Knowledge Graph application enhances the ServiceNow AI Platform® by creating a semantic layer that connects data, relationships, and context across the enterprise. It structures information as a graph of entities and connections, bringing context and meaning to the available raw data. By leveraging AI, it powers personalized and intelligent experiences across the ServiceNow® platform including ServiceNow Otto for Virtual Agent, AI Agents, and AI Search to deliver more relevant insights and automation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

By linking data and embedding semantic meaning, ServiceNow Knowledge Graph transforms raw data into actionable knowledge, fueling faster resolutions, richer insights, and more personalized AI-powered experiences.

ServiceNow Knowledge Graph application:

1. Natural language queries: Enables user to query structured ServiceNow data conversationally —for example, “Who is my manager?”, “What’s the status of my incident?”, or “What assets are assigned to me.” For more examples, see Natural language queries use cases and examples.
2. User context: Provide Now Assist in Virtual Agent and AI Agents with contextual information such as role, department, or location to deliver personalized and relevant responses.
3. Slot-filling: Simplify user interactions by automatically populating known information in forms or chat requests, reducing effort and friction.
4. Smarter AI Agents: Empower agents to retrieve insights, facts, and relationships directly from the knowledge graph to automate actions and improve accuracy.
5. Integration with Workflow Data Fabric: Use an integrated data layer that gives real-time, secure, and unified access to data from any source without duplicating it, enabling faster, data-rich workflows across the platform.

Knowledge Graph components

ServiceNow Knowledge Graph is a graphical representation of real-world entities (tables) and their relationships, stored in a database. Each graphical representation is called as a Knowledge Graph Schema that consist of relevant entities called nodes. The relationship between each entity is called an edge.

To create, edit and manage Knowledge Graph schema for your specific use cases, ServiceNow Knowledge Graph has introduced, Knowledge Graph designer.

Users can use these schema to customize and extend Knowledge Graph integrations with Now Assist Virtual Agent and AI agents, and Now Assist panel. ServiceNow also provides some Prebuilt integrations, that connects Knowledge Graph with Now Assist Virtual Agent and AI agents, and other ServiceNow applications, enabling seamless AI-powered workflows and personalized experiences.

Knowledge Graph Designer

Knowledge Graph Designer is a dedicated, no-code UI where Knowledge Graph administrators (kg_admins) can effortlessly:

- Design and manage Knowledge Graph schema, and configure the related nodes (tables), properties (columns), and their relationships.
- Analyze results of the Knowledge Graph APIs integrated in downstream products by auditing the schema using natural language queries and achieved responses.

The Knowledge Graph Designer streamlines the entire process, from schema creation and data ingestion to performance monitoring and results analysis. The new approach confirms a scalable, flexible, and intuitive way for Knowledge modeling.

Graph query Builder

Use the Graph query Builder to run queries visually by selecting an entity, adding relationships and filters,without any query syntax.

For more details, see Graph Query Builder

Prebuilt Integrations

By unifying Knowledge across platforms and integrating with ServiceNow Otto, AI Search, AI agents, and skill kit, the prebuilt integrations of Knowledge Graph helps the customer drive productivity, enhance decision-making, and unlock the full potential of enterprise data, while maintaining robust data governance and permission controls.

In this release, the available prebuilt integrations are:

1. Integration with ServiceNow® Otto for Virtual Agent, ServiceNow Otto panel and AI agents for User Context: Helps users with personalized responses.
2. Integration with ServiceNow® Otto for Virtual Agent and ServiceNow Otto panel for Slot filling: Helps pre-fill the slots for Virtual Agent topics using the Natural Language Querying feature of Knowledge Graph.
3. Integration with ServiceNow® Otto for Virtual Agent and ServiceNow Otto panel for Employee schema: Helps requesters and fulfillers with personalized responses on people queries and Natural Language queries. Also supports people citation card. By default the user NLQ graph is connected which is used for people queries but you also have sample graph schema for other employee queries. To see more sample graphs for employee queries refer, KB article .
4. Integration with AI agents as a tool: Used to retrieve results in Natural Language and perform follow up tasks that are assigned to the AI agents.

Knowledge Graph users

Knowledge Graph users

User role	KG Functionality	Description
Knowledge Graph Admin (kg_admin)	Knowledge Graph Designer	The Knowledge Graph Admin can create and manage Knowledge Graph schemas.
Requester	Prebuilt integration with Virtual Agent and Agentic AI	Helps requesters with personalized answers, natural language queries, and fewer conversation turns with pre-filled slots for LLM topics and skills.
Fulfiller	Prebuilt integration with ServiceNow Otto panel and Agentic AI	Helps fulfillers with personalized answers, natural language queries, and fewer conversation turns with pre-filled slots for LLM topics and skills.

What to explore next

To learn more about configuring and using Knowledge Graph, see:

- Configuring Knowledge Graph
- Using Knowledge Graph Designer
- Reference for Knowledge Graph

Access Knowledge Graph Schema

Use Knowledge Graph Designer to create, edit, and manage Knowledge Graph schema.

Before you begin
Role required: kg_admin

Procedure

Navigate to **All** > **Knowledge Graph** > **Knowledge Graph Designer**.
The Knowledge Graph Designer landing page displays a list of all the Knowledge Graph schemas available for users.

ServiceNow some provides prebuilt schema that are non-editable. Currently, the following prebuilt schemas are available:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

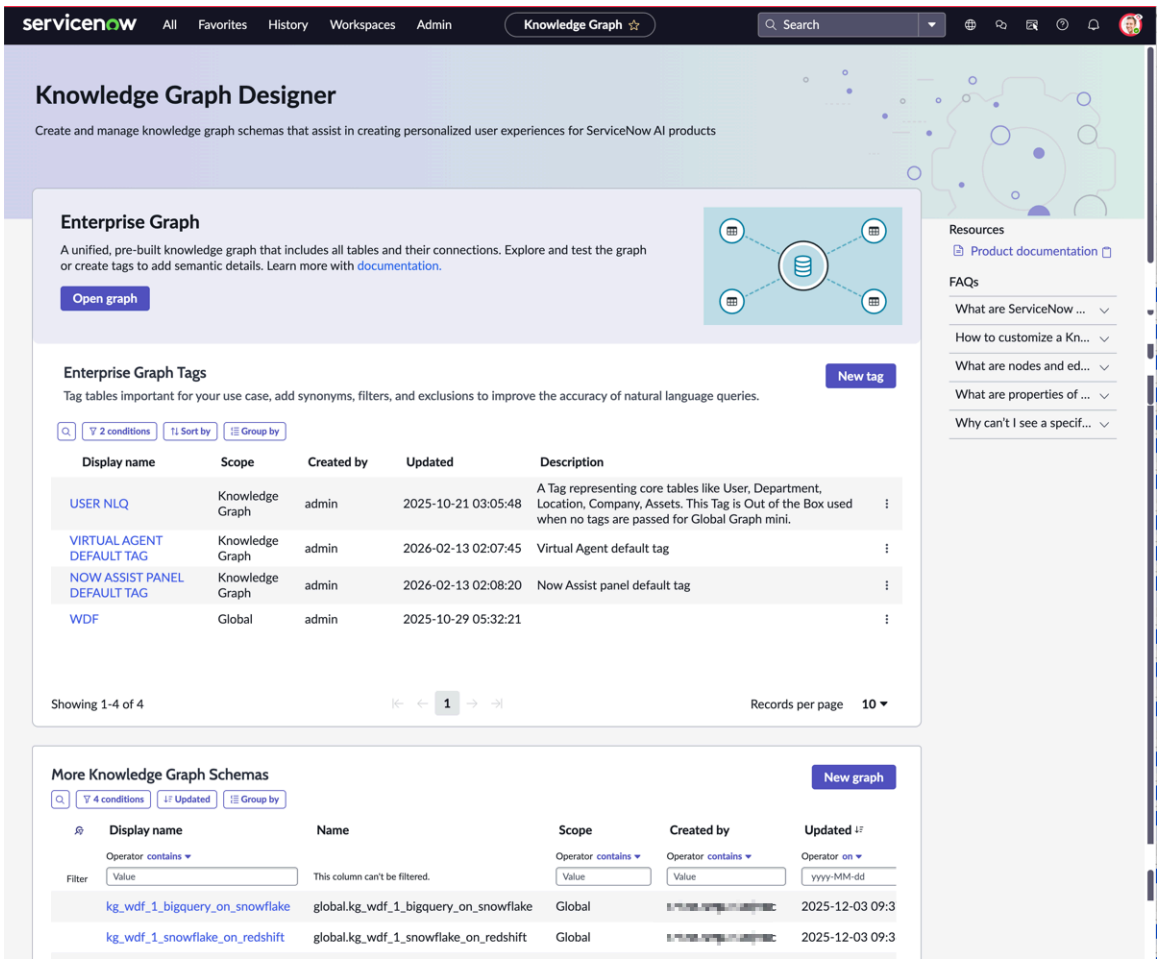
- User graph schema: Used to provide logged in user's details to Virtual Agent for personalized response. The profile section is used by AI agents for additional user context.
- Natural Language Query Scheme: Helps the requester with personalized responses on people queries and Natural Language queries. Also supports people citation card. By default the user NLQ graph is connected which is used for people queries but you also have sample graph schema for other employee queries. For more details on other prebuilt schema, see KB article.

ServiceNow® has also introduced Enterprise Graph, a pre-configured Knowledge Graph schema that maps all instance tables and their connections, enabling natural language queries from data across all tables. For more details, see Using Enterprise graph schema.

Along with Enterprise Graph, you can also create, edit and manage tags with Knowledge Graph Designer. You can use these tags to mark the key tables, that are important for answering natural language questions for specific use cases. For details, see Tagging in Knowledge Graph Designer

Knowledge Graph supports Admin to create Knowledge Graph schema with WorkFlow Data Fabric tables. This helps accessing data from different system in real time without moving it.

You can create a Knowledge Graph schema from the landing page.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Knowledge Graph integration with ServiceNow® Otto for Virtual Agent and ServiceNow Otto® panel

Knowledge Graph integrates with ServiceNow® Otto for Virtual Agent and ServiceNow Otto® panel to provide personalized, permission-aware responses based on user context, relationships, and enterprise data.

In this release, the available prebuilt integrations with ServiceNow® Otto for Virtual Agent and ServiceNow Otto® panel are:

- Integration with ServiceNow Otto® for Slot filling: Helps requester and fulfiller in pre-filling the slots for LLM topics and skills execution using Natural Language Querying of Knowledge Graph.
- Integration with ServiceNow Otto® for User Context: Helps requester and fulfiller with personalized responses.
- Integration with ServiceNow Otto® for Natural Language Query graph: Helps requester and fulfiller with personalized responses on people queries and Natural Language queries. Also supports people citation card.

Note:

- To enable Knowledge Graph for ServiceNow® Otto for Virtual Agent, ensure that *sn_vad_genai.knowledge_graph.enabled* and *sn_ais_assist.enable_knowledge_graph_nlq* system properties are set to true. See Add a Knowledge Graph schema to a chat assistant
- To enable Knowledge Graph for external users, with user role `snc_external`, verify if the *sn_kg.enable_external_user_check* property is set to true.

For more information see Add a Knowledge Graph schema to a chat assistant.

Note:

- To enable Knowledge Graph functionality in the ServiceNow® Otto for Virtual Agent and conversational catalog, make sure to fill the Slot Filling Schema.
- To use Knowledge Graph for Question Answering from VA, fill out the Natural Language Query Schema in the ServiceNow Otto® panel.
- You can only have one active Knowledge Graph schema at a time for either Slot Filling or Natural Language Query. Multiple active Knowledge Graph schemas aren't supported.

Integration with ServiceNow Otto® for User Context

For the users of ServiceNow Otto®, Knowledge Graph integrates the context from the prebuilt User profile schemas that provide personalized responses.

By leveraging relationships between users, teams, and content, products like AI Search and ServiceNow Otto® can provide relevant, permission-aware answers instead of generic results.

With Knowledge Graph, responses are dynamically tailored based on:

- Who the user is: Role, department, and location
- Who they collaborate with: Manager, reportee
- What assets do they have

Here’s an example use case:

- An employee uses ServiceNow® Otto for Virtual Agent for information on parental leave policy. They enter the query in the Virtual Agent window `What is my parental leave policy?`
- Virtual Agent receives the user information like. The employee is based in the country: USA, state: California, City: Santa Clara, from the Knowledge Graph User Profile Schema.
- This additional user profile context is used to personalize the synthesized response to the exact location of the employee
- Therefore, instead of getting a link to the parental leave policy document or a generic response, the employee gets a tailored contextualized answer:

```
Your company offers a generous parental leave policy to its
employees in California. As of January 2022, the company
increased paid time off for workers who give birth to a maximum
of 24 weeks from the previous 18. In addition to the company's
internal policies, California state law provides further
protections. The California Family Rights Act (CFRA) offers
eligible employees up to 12 weeks of unpaid, job-protected
leave to care for their own serious health condition or that
of a family member, or to bond with a new child. This is
complemented by the Pregnancy Disability Leave (PDL) law, which
provides up to four months of unpaid, job-protected leave for
employees disabled by pregnancy, childbirth, or related medical
conditions.
```

Integration with ServiceNow Otto® for Slot filling

Knowledge Graph enhances the ServiceNow Otto® user experience and makes the process seamless and efficient by reducing the slot-filling questions asked during conversations.

Here's an example use case:

An employee uses ServiceNow Otto® to request a laptop replacement. ServiceNow Otto® uses the assigned Knowledge Graph schema to find information and resolve the query with minimal user inputs.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. The user uses Virtual Agent to query `Need assistance in laptop replacement.`
2. Virtual Agent processes the query and generates the following prompts required for this request:
   - Topic: New laptop request
   - Name
   - Location
   - Department
   - Laptop model
   - Address
3. Virtual Agent first tries to gather this information using Knowledge Graph.
4. The Knowledge Graph schema leverages LLM to retrieve the data from all the relevant entities, called nodes using the relationship between these nodes, called edges, and provides the following output:
   - Topic: New laptop request
   - Name: John Doe
   - Location: Santa Clara
   - Department: Marketing
   - Badge Template: User input needed
   - Address: 123 Street, CA, USA
5. Virtual Agent requests verification of the output and add details for the missing fields.
6. The user can edit and verify the provided information before confirming. Once confirmed, the request is processed with minimal effort from the user.
7. Virtual Agent processes the user input and completes the user query.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Knowledge Graph leverages the existing information available in the internal databases and auto-populates it to reduce the efforts while making the entire experience seamless.

Integration with ServiceNow Otto® for natural language queries

Knowledge Graph assist in answering natural language queries accurately. For more examples, see Natural language queries use cases and examples

ServiceNow Otto® can now provide users with information about people in your organization.

If you ask Virtual Agent about a person,the Information about that person you're searching for appears in the synthesized response, along with an inline people citation.

Inline citations appear at the end of the relevant synthesized response sentence. Selecting an inline citation results in a popover containing either a link to an article or source, or a description and action to start the action.

Note: Shared files only appear if Knowledge Graph admin has activated the *sn_kg_conn_user_shared_files* record in Knowledge Graph related data map [sn_kg_related_data_map_list] table. To active it, set the **Active** field to **True**.

Here's an example:

Example of synthesized response for people on the portal's search results page
