Some actions may run in the background, particularly non-UI operations or processing tasks that don't require screen interaction. When you take control during background execution, AI Desktop Actions pauses all processing and waits for your input. After you provide handoff notes, the AI agent resumes with the updated context.

Procedure

1. Select **Take control** from the execution interface.
   The AI agent pauses immediately and the execution status changes to **You have control**.
2. Review the current state of your desktop and applications.
   The applications the AI agent was working will remain open and in their current state. The AI agent has paused executing any actions.
3. Make any manual changes or corrections you require to your desktop or applications.

   Example

   Examples of manual changes:

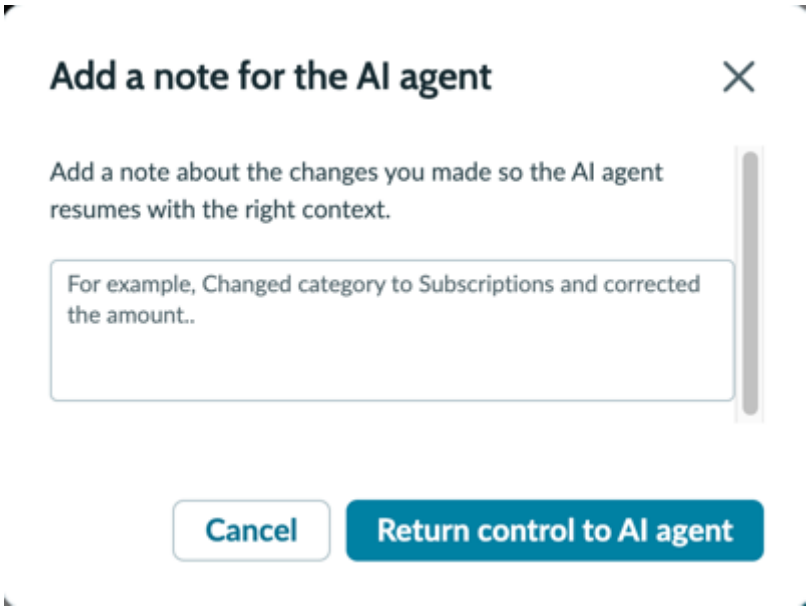
   - Dismiss a pop-up or browser security dialog
   - Complete a CAPTCHA or security challenge
   - Correct data that the agent entered incorrectly
   - Navigate to a different location or window
   - Make adjustments to form fields or settings

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Organize or reorganize files
- Cancel an action the agent started and redirect it

4. When you're ready to resume execution, select **Return control**.

   A text input area opens for you to leave notes for the AI agent.



5. In the Add a note for the AI agent dialog, describe the manual changes you made and any additional context the AI agent needs to resume correctly.

   Example

   Example handoff note: "Changed category to Subscriptions and corrected the amount to $250. The new total should be $2,100."

   Example handoff note: "Navigated to the Reports tab. Password field now contains the updated credentials."

   Be specific about what you changed and why, so the AI agent can continue with the correct context and avoid repeating unnecessary steps.

6. Select **Return control to AI agent** to resume execution.
   The AI agent reads your handoff notes, updates its context, and continues executing the remaining steps of your original request.
7. Monitor the execution status as the AI agent continues working.
   The execution status returns to Running. The AI Desktop Actions continues from where it paused, incorporating the changes you made and the context you provided in your handoff notes.

What to do next

After the AI agent resumes:

- Monitor the progress to verify the AI agent is executing correctly with your manual changes.
- If additional corrections are needed, you can pause execution again by selecting **Take control**.
- When execution completes, review the final results to verify that all steps were performed correctly.

Adaptive desktop actions for desktop and web-based tasks

Known issues and limitations of adaptive desktop actions

Known issues and limitations of adaptive desktop actions

Reference known issues, limitations, and resolution steps for AI Desktop Actions on macOS.

Known issues and resolution steps

Issue	Resolution steps
The app can't interact with lists, window overlays, popovers, pop-ups, or context menus in non-native applications, such as: • Microsoft Outlook for macOS (web-based) • Microsoft Teams (web-based) • Microsoft PowerPoint (web-based) • Other non-native macOS apps Reason: These applications are built as web-based interfaces inside native windows rather than traditional native apps. The interface elements don't respond to automation the same way native controls do.	The AI agent pauses when it encounters these interface elements and asks you to complete the step manually. You can: • Make the selection or interaction yourself. • Tell the AI agent that the action is complete to continue. The AI agent then resumes automating the remaining steps. **Tip:** When interacting with the app in the virtual desktop, select a text field or select from the list to change the green pointer into the macOS cursor. You can then interact normally and perform actions inside the virtual desktop.
After interacting with an application, the OS cursor may remain inside the virtual desktop instead of returning to your main session.	To bring the cursor back to the main desktop manually, move the cursor diagonally toward the top-left corner inside the virtual desktop. This moves the cursor out of the virtual desktop to your main session.
Unable to run automation tasks involving Microsoft Excel and Microsoft Word.	To use Microsoft Excel and Microsoft Word connectors, create resource access rules for these applications on your instance.
The AI agent is unable to select values in certain ServiceNow form field types, such as: • List field selections • Reference field value selections • Date and time picker controls • Overlay or pop-up selections	When the AI agent encounters these form field types, it pauses and asks you to take control. Do one of the following: • Select the required value in the list or reference field manually. • Pick the date or time from the date and time picker.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Known issues and resolution steps (continued)

Issue	Resolution steps
	• Confirm the selection is complete. • Return control to the AI agent to continue with the remaining steps. Alternatively, you can defer the action and provide the value in a subsequent task.
If the AI agent launches one instance of an application (for example, Outlook or Chrome), it continues performing actions on that instance even if you open other instances of the same application. The AI agent operates on the window it launched, not on windows you open separately. The AI agent detects and works with the specific application instance it created at the start of the task. It doesn't automatically switch between multiple instances. If you start a new task using the same application, the AI agent may open a new window or instance. You may see multiple icons of the same app in your dock.	• Before starting a task, close other instances of the same application to avoid confusion. • After completing a task, close unused instances of the application to keep your dock clean.
When the AI agent performs actions on non-UI tools like Microsoft Excel, Microsoft Word, and other document-based applications, you may not see any visual indicator of the actions being performed in the preview window. You can only see the **executing in background** tag in AI steps in the chat interface. Reason: The AI agent may interact with these applications through automation APIs rather than the graphical user interface. This is more efficient but means you won't see visual feedback of what's happening.	In some cases, the AI agent may open the target file on your main session before performing operations. When this happens, you can see the file open in your main desktop and observe the changes being made. Otherwise, monitor the AI agent's progress updates in the chat window, which reports the status of file operations.
Some applications are denied by default for security reasons, including: • Terminal • Run Shell Script • Automator • Script Editor The AI agent doesn't interact with these apps without explicit permission.	If you need the AI agent to use one of these apps for a specific task, update the resource access rules to allow these applications. ⚠ **Warning:** These apps have elevated system privileges. Update resource access rules only for trusted tasks.
Sometimes the AI steps shown in the chat window aren't in sync with the actions shown in the preview	Wait a moment for the chat and preview window to sync. The actions

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Known issues and resolution steps (continued)

Issue	Resolution steps
window. The chat may show one step while the AI agent is still working on a previous step in the preview window. The system is still evaluating the success or failure of its operations. Chat updates are provided as the AI agent progresses, but there can be a slight delay before the chat reflects the actual state in the preview window.	being performed in the preview window are the current state; the chat will update shortly.
The system may use alternate approaches to interact with specific files that differ from the default method. In the process, the alternate approach may generate additional OS dialogs (such as "Do you want to save?" prompts). Additionally, when the OS alerts you of pending operations, the OS animation may display in the currently active Dock. For example, the AI agent may use an alternate app to interact with a file. After some time, if you try to quit that app from your main session, you might see an OS save dialog. You then need to go back into the preview window and select **Don't Save** to complete the quit operation. The Dock icon may keep jumping up and down during this time.	• Let the AI agent complete its task before manually interacting with applications in your main session. • If an unexpected dialog appears, handle it in the preview window where the AI agent is working. • After the task is complete, close any alternate applications the AI agent may have opened.

AI Desktop Actions reference

Reference topics provide additional information about the roles and tables that are installed with the AI Desktop Actions application.

Components installed with AI Desktop Actions

Several types of components are installed with activation of the sn_desktop_agents plugin, including user roles and tables.

Roles used

Role title [name]	Description	Contains roles
AI Agent Admin [sn_aia.admin]	Enables you to create, manage, and test desktop actions in AI Desktop Actions and deploy them as tools in AI Agent Studio.	• agent_role_config_admin • sn_skill_builder.admin • connection_admin • flow_designer • sn_aia.viewer • sn_mcp_client.admin • sn_ace.ace_user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role title [name]	Description	Contains roles
ServiceNow Otto panel user [now_assist_panel_user]	Enables you to trigger desktop actions from ServiceNow Otto panel and execute desktop actions in the desktop environment using Execution workspace.	sn_nowassist_admin.user
Desktop action user [sn_desktop_core.desktop_action_user]	Enables you to create desktop actions using the **Record with AI** feature in AI Desktop Actions.	• sn_aia.admin • sn_nowassist_admin.user
Web Agent Runtime [sn_naa.web_agent_runtime]	Grants the Web Automation Agent's service account read and write access to data required during execution. Assign this role only to the service account the agent runs as (not to end users). Without this role, the agent can't read or write any data at runtime.	None

Tables installed

Table	Description
Desktop action [sn_desktop_core_action]	Stores details, such as input and output parameters and number of screens for on-screen desktop actions.
Desktop action application [sn_desktop_core_action_application]	Stores the desktop application associated with the desktop action.
Desktop action execution [sn_desktop_core_action_execution]	Stores the execution details of a desktop action, such as request, response, tool execution, and execution plan.
Desktop action parameter [sn_desktop_core_action_parameter]	Stores the desktop action parameter records as parent records.
Desktop action parameter value [sn_desktop_core_action_parameter_value]	Stores the desktop action parameter value records as child records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Plugins installed

Plugin	Description
AI Desktop Actions [com.sn_desktop_agents]	Contains configuration of desktop action tool used by AI Agent Studio to discover available desktop actions while creating AI agents and invoke desktop actions via AI agents during execution.
AI Desktop Actions Core [com.sn_desktop_core]	Packages tables, custom functionality specific to AI Desktop Actions application, and AI Desktop Actions download interface within a scoped application.
ServiceNow Otto AI web agents [sn_naa]	Contains system properties, default AI agent and agentic workflow named Web Automation Agent and Web Automation respectively, and functionality to perform adaptive automation on web.

System properties installed

Property	Description
sn_desktop_core.record_with_ai	Makes **Record with AI** the default recording option. Turn off this property to set the manual recorder as the default recording option. • Type: true | false • Default: true
sn_desktop_core.max_action_events	Modifies the limit of maximum number of events processed during a single Desktop action execution in AI Desktop Actions. • Type: Integer • Default: 200
sn_naa.ai_web_agent.enabled	Enables or disables the adaptive desktop actions on the instance. Set to 'true' to enable the web agent, or 'false' to disable it. • Type: true | false • Default: true Roles and permissions admin: Read
sn_naa.allowed_websites	Stores a list of websites that AI agents configured with adaptive desktop actions are permitted to open and perform tasks. Type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	Roles and permissions • admin: Read and Write • sn_naa_admin: Read and Write
sn_naa.context_closing_frequency	Specifies, in hours, how long to wait before closing orphaned, running `sn_naa_context` records in the database. • Type: integer • Default: 24 Roles and permissions • admin: Read and Write • sn_naa_admin: Read and Write
sn_naa.keep_tab_open	Keeps the browser tabs that open during goal execution open after the goal completes. Whenever you update the value, select the *ServiceNow* **Web Automation** extension icon, and save the instance provided in the extension. • Type: true | false • Default: true Roles and permissions • admin: Read and Write • sn_naa_admin: Read and Write
sn_naa.min_web_agent_version	Specifies the minimum adaptive desktop action (browser extension) version required for this instance to function correctly. If the installed version is lower than this value, the system will not run. Type: string Roles and permissions sys_admin: Read
sn_naa.NaaModeratorToolTimeLimit	Specifies the maximum duration, in milliseconds, that the web automation tool is allowed to run before it's considered a failure. • Type: integer • Default: 1800000 Roles and permissions • admin: Read and Write • sn_naa_admin: Read and Write

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
sn_naa.reasoning.manual_intervention_prompt	Instructs the system to pause and request explicit input, confirmation, or a decision from the user in scenarios that require manual intervention. Type: string Roles and permissions • admin: Read and Write • sn_naa_admin: Read and Write
sn_naa.step_record_cleanup_frequency	Specifies, in days, how long to wait before permanently deleting `sn_naa_step` records from the database. • Type: Integer • Default: 90 Roles and permissions • admin: Read and Write • sn_naa_admin: Read and Write
sn_naa.web_agent.compaction_enabled	Enables summarization of steps that exceed the history limit, rather than discarding them. When turned off, only the most recent configured number of steps are retained. • Type: true | false • Default: true Roles and permissions • admin: Read and Write • sn_naa_admin: Read and Write
sn_naa.web_agent.compaction_history_limit	Sets the maximum number of unsummarized steps allowed before the oldest batch is summarized. When unsummarized steps exceed this value, compaction is triggered. • Type: Integer • Default: 15 Roles and permissions • admin: Read and Write • sn_naa_admin: Read and Write
sn_naa.web_agent.summarization_batch_size	Sets the number of steps combined into a single summary. Larger batches reduce how often summarization runs, but produce less granular summaries. • Type: Integer • Default: 10

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	Roles and permissions • admin: Read and Write • sn_naa_admin: Read and Write
sn_naa.web_agent_environment_type	Specifies the adaptive desktop action execution type. Set to `cloud`, which runs execution in the cloud. Set it to `local` to run execution through the browser extension. • Type: choice list • Default: cloud Roles and permissions admin: Read
sn_desktop_core.enable_reusable_assets	Allows turning on or off the Reusable Skills feature enables reuse of recorded desktop actions as deterministic assets that execute from user prompts in the AI Desktop Actions application (macOS). • Type: true | false • Default: false Roles and permissions • admin: Read and Write • sn_aia.admin and now_assist_panel_user: Read

System requirements and limitations in AI Desktop Actions

Be aware of system requirements and a few limitations when you're using the AI Desktop Actions application for defined desktop actions.

Note: These system requirements and limitations apply to only defined desktop actions that are created in the AI Desktop Actions Windows application.

Hardware requirements

Hardware requirements for AI Desktop Actions

Resource	Minimum	Recommended
CPU	Intel Processor (Core i5)	Intel Processor (Core i7)
RAM	4-GB RAM	8-GB RAM

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Hardware requirements for AI Desktop Actions (continued)

Resource	Minimum	Recommended
Disk space	Minimum 20-GB free disk space after installing the OS, patches, and base software	Minimum 50-GB free disk space after installing the OS, patches, and base software

Software requirements

- Windows 11 operating system is used.
- A .NET 9.0 runtime v9.0.10 and .NET 9 Desktop Runtime v9.0.10 is installed.
- No extended monitors are connected.
- Add the end users who interact with the Execution workspace of AI Desktop Actions to the Remote Desktop Users group on the target machine and provide Remote Desktop access permissions for seamless automation execution.

  If your organization uses Group Policy, add the end users to a Microsoft Active Directory group that is permitted to use Remote Desktop through Group Policy on each target machine where desktop actions run.

  - Local changes to the Remote Desktop Users group are temporary unless they align with Microsoft Active Directory entitlements.
  - If the user is not entitled, Group Policy refresh automatically removes them from the group.
- Theme must match between the systems used for recording and execution.
- Confirm that your firewall allows bidirectional traffic between the AI Desktop Actions application and your ServiceNow instance on the port 80 for HTTP and port 443 for HTTPs.

  If your organization uses non-standard ports for HTTP or HTTPS, confirm the correct ports with your IT administrator before proceeding.

  You must have full permissions to create and use system I/O communication pipes.
- If applicable, confirm that the `snada://` custom URI protocol is registered to launch the AI Desktop Actions application in the browser.

Note: Screen resolution and scaling must be the same between the systems used for recording and execution of desktop actions that are created before AI Desktop Actions v1.0.1.

Limitations

Limitations with AI Desktop Actions

Limit	Description
RPA Attended robot and AI Desktop Actions parallel execution	To avoid conflicts, don't run the AI Desktop Actions Execution workspace and RPA Attended Desktop mode at the same time.
Pause for human input	If your automation requires manual inputs, such as entering an OTP or CAPTCHA, you must provide instructions to the AI Agent

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Limitations with AI Desktop Actions (continued)

Limit	Description
	to wait for user input during execution. Otherwise, the automation can't proceed.
Single execution	The system supports one automation execution at a time within the Execution workspace.
Screen elements	During recording, auto-assignment accuracy of screen elements depends heavily on the target application's technology and interface characteristics. Applications with strong accessibility support, such as well-defined UI elements and controls, stable rendering performance, and simple, consistent layouts enable anchors to be detected more reliably. In contrast, UI complexity, such as dynamic elements, frequent layout shifts, animations, or poor accessibility metadata can reduce accuracy and may require manual anchor configuration or additional tuning.
Getting table information	The **Get Table** step doesn't convert ordinary text to table data. For the step to capture table data successfully, the data must already be in the table form.
Browsers parallel execution	The Chrome or Edge browser must not be used in parallel in the main session and the desktop session on your system. You must close the session in the main session to execute automations that use the Chrome or Edge browser in the Execution workspace.
Sensitive information	The sensitive information isn't masked during recording. Confirm that you don't record any sensitive information.

Considerations for file upload and download

Lists the details of the supported file types and validation rules.

Upload validation rules

The agent checks the following conditions before and after providing a file for upload.

Upload validation rules

Condition	Result	Error message
The file path is empty, missing, or not text	A human-in-the-Loop step is triggered that prompts the user to provide the required file path to unblock the process.	"File path is empty or invalid"

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Upload validation rules (continued)

Condition	Result	Error message
The file path contains a parent-directory reference (`..`)	Blocked	"Path traversal (..) is not allowed"
The file extension matches a blocked type (see the following table)	Blocked	"Blocked file type: "
The file does not attach after being supplied — the path does not exist, is unreadable, or does not match the input's accepted file types	Blocked	"File was not attached. The path likely does not exist, is unreadable, or does not match the input's accepted file types."

Blocked file types

The agent does not upload files with the following extensions, regardless of the file input's accept attribute.

Blocked file extensions

Category	Blocked extensions
Executables	`.exe`, `.msi`, `.dll`, `.com`, `.scr`, `.pif`
Windows scripts	`.bat`, `.cmd`, `.ps1`, `.vbs`, `.vbe`, `.wsf`, `.wsh`
Unix scripts	`.sh`, `.csh`, `.ksh`, `.bash`
Other script or code files	`.js`, `.jsx`, `.ts`, `.tsx`, `.py`, `.pyc`, `.pyo`, `.rb`, `.pl`, `.php`, `.jar`, `.class`
Shortcut and link files	`.lnk`, `.url`, `.desktop`
Macro-enabled Office files	`.docm`, `.xlsm`, `.pptm`

Download status values

The agent reports every tracked download using one of the following statuses.

Download status values

Status	Meaning
`pending`	The download has started but has not yet finished.
`completed`	The download finished, and the browser reported a final saved-file path.
`interrupted`	The download stopped before finishing. The agent does not retry it automatically.

AI Desktop Actions glossary

Learn about the terms and concepts that are unique to AI Desktop Actions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A

Glossary terms are grouped alphabetically.

Action recorder

Recording feature in the Design workspace that auto-captures user interactions with desktop applications to create automated workflows. The recorder captures clicks, keystrokes, data entry, and visual and contextual information as screens and steps.

AI agent

Set of large language model (LLM) instructions and tools in AI Agent Studio that can process natural language inputs, generate execution plans, and run desktop actions autonomously or semi-autonomously.

AI Agent Studio

ServiceNow platform interface for creating, managing, testing, and activating AI agents. Desktop actions are published to AI Agent Studio as tools that AI agents can use during execution.

Anchor

Reference point on a captured screen that helps the automation identify and interact with nearby UI elements. During execution, the system uses computer vision to locate the anchor and then identifies UI elements at a relative distance from it. Anchors improve the stability and accuracy of steps when the target element location may shift or when the UI layout varies across sessions.

Auto-capture

Method of creating desktop actions by recording user interactions with desktop applications using the Action recorder. The recorder captures clicks, keystrokes, and data entry along with visual and contextual information.

C

Glossary terms are grouped alphabetically.

Confidence threshold

Accuracy level required for matching a captured image before the system performs a step. A value of 1 defines a 100% match while 0.5 defines a 50% match. The default value is 0.95 (95% match).

D

Glossary terms are grouped alphabetically.

Design workspace

Interactive no-code environment within Agentic Desktop for creating, configuring, managing, and testing desktop actions. The workspace provides a visual canvas where you can design multi-screen automation workflows that capture business processes across different applications. Accessible to users with the AI Agent Admin (sn_aia.admin) role.

Desktop action application

Record that stores the association between a desktop action and the desktop application it interacts with. Stored in the Desktop action application [sn_desktop_core_action_application] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Desktop action

Reusable automation that defines how AI agents interact with desktop applications. Desktop actions consist of screens, anchors, and steps. There are two types: UI block and non-UI block.

Desktop-in-Desktop (DiD) mode

Virtual environment within the Execution workspace where automations run in isolation from the main desktop session. You can monitor the execution of desktop actions and how they interact with desktop applications while continuing to work on other tasks.

Desktop session

Isolated Windows session within the Execution workspace where desktop actions run. The desktop session launches automatically when you test a desktop action or trigger an automation from the Now Assist panel.

E

Glossary terms are grouped alphabetically.

Execution status

Current state of an automation in the Execution workspace. Statuses include Ready, Initiated, Running, Success, Failed, and Canceled.

Execution workspace

Isolated desktop session where desktop actions run during testing or AI agent execution. This workspace launches automatically when you test a desktop action from the Design workspace or trigger an automation from the Now Assist panel. You do not open the Execution workspace directly.

M

Glossary terms are grouped alphabetically.

Manual capture

Method of creating desktop actions by taking screen captures, inserting anchors, and defining steps individually rather than recording interactions automatically.

N

Glossary terms are grouped alphabetically.

Non-UI block

Type of desktop action that uses pre-built connectors to interact with applications and system components in the background without UI interaction. Supported applications include Microsoft Excel, Microsoft Outlook, Microsoft Word, PDF, PowerShell, SQL, SSH, and System Actions. Non-UI block actions can't be created by users.

Now Assist panel

ServiceNow interface from which users trigger AI agent automations. When you provide instructions through the Now Assist panel, the AI agent selects and runs the appropriate desktop actions in the Execution workspace. Accessible to users with the Now Assist panel user (now_assist_panel_user) role.

P

Glossary terms are grouped alphabetically.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter record

Record created by an AI Agent Admin that stores a reference name for credentials such as usernames or passwords. AI agents access these records during desktop action execution to retrieve sensitive values securely. Currently supported only for SSH connector, non-UI block desktop actions.

Parameter Value record

Child record under a Parameter record that stores the actual credential value, such as a username or password, for a specific user. Only one Parameter Value record can be created per user for each Parameter record.

S

Glossary terms are grouped alphabetically.

Screen

Captured image of an application window within a desktop action. Screens represent the application states that the automation moves through during execution. Each screen contains one or more anchors and associated steps.

Smart sizing

Display feature in the Execution workspace that automatically adapts the desktop session to the display. Includes two options:

- **Fit to window**: Scales the session to fit within the Execution workspace.
- **Original resolution**: Displays the session at its native resolution with scroll bars if necessary.

Step

Individual interaction within a desktop action, such as clicking a button, entering text, or extracting data. Steps are positioned relative to an anchor.

- Input step types include Set Text, Click, Mouse Click, and Send Keys.
- Output step types include Get Text, Get Table, and OCR Read Text.

Step in / Step out

Manual control options in the Execution workspace. Step in transfers control to the user for manual input such as entering an OTP or CAPTCHA. Step out returns control to the AI agent to continue the automation.

T

Glossary terms are grouped alphabetically.

Tool

Desktop action that has been activated and added to an AI agent in AI Agent Studio. Tools provide AI agents with the capabilities to complete specific tasks during execution. An AI agent selects a tool based on its name and description.

U

Glossary terms are grouped alphabetically.

UI block

Type of desktop action that simulates human interactions with UI elements on thick client applications, legacy systems, or SaaS applications without APIs. Interactions include

clicking buttons, entering text, and selecting from menus. UI block actions are created and managed in the Design workspace.

Creating AI user experiences

Deliver AI capabilities to your users with the ServiceNow Otto panel, ServiceNow Otto for Virtual Agent, and on mobile.

The value of AI capabilities is realized when users can access them through the interfaces they use every day. Deliver AI experiences internally to both fulfillers working in workspaces and requesters using self-service portals. Use ServiceNow Otto for Virtual Agent to fulfill self-service needs anywhere your users are.

ServiceNow Otto context menu

The ServiceNow Otto context menu provides an additional interaction pattern for record views. Users can generate record summaries and answer queries on demand, without opening the ServiceNow Otto panel.

For more information, see ServiceNow Otto context menu.

ServiceNow Otto for Mobile

ServiceNow Otto for Mobile brings AI capabilities to users on mobile devices, making the same generative AI experiences available on desktop accessible wherever your users are working.

For more information, see ServiceNow Otto for Mobile.

Chatting with AI

ServiceNow Otto is the conversational AI experience across the ServiceNow AI Platform. ServiceNow Otto provides a natural language interface that makes it easier to look for information, complete a task, get help with work, or interact with AI-powered experiences.

ServiceNow Otto is the new name for experiences previously known as Now Assist, including ServiceNow Otto for Virtual Agent and the ServiceNow Otto panel. The underlying capabilities remain the same, with a unified brand and user experience across the platform.

ServiceNow Otto for Virtual Agent

ServiceNow Otto for Virtual Agent brings generative and agentic AI capabilities to self-service conversations. It helps employees and customers find information, complete requests, and resolve issues through natural language interactions. The experience combines traditional Virtual Agent conversations with large language models (LLMs), enabling more flexible, intelligent, and human-like interactions. Users can ask questions in their own words and receive answers grounded in enterprise knowledge, service catalog content, AI Search results, and configured conversational topics. New premium chat experiences provide a unified search and chat interface, allowing users to move seamlessly from asking questions to taking action.

Chat experiences in ServiceNow Otto for Virtual Agent are defined in assistants, which define the AI experience that users interact with. Depending on your needs, you can have different assistants for internal users, customers, and specific teams. The assistant can maintain context across multiple questions, provide personalized responses when configured, and guide users through tasks without requiring them to navigate multiple pages or applications. Admins can create assistants in Assistant Designer.

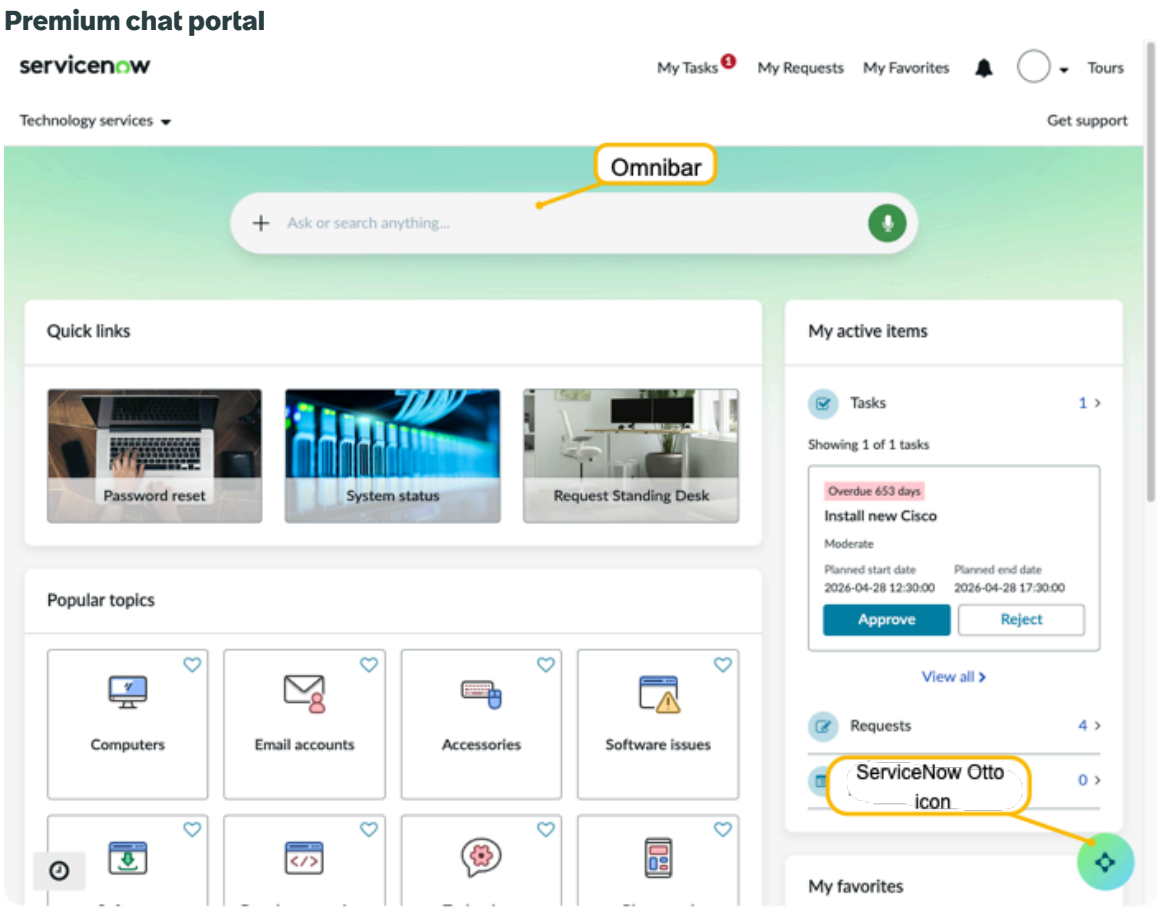
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



For more information, see Assistants and conversations in Assistant Designer and Premium chat.

ServiceNow Otto panel

The ServiceNow Otto panel is a conversational AI companion that is available across the ServiceNow AI Platform. The panel provides users with a centralized place to interact with AI while they work and is accessible from the ServiceNow Otto icon in the platform navigation.

Unlike ServiceNow Otto for Virtual Agent, which is focused on self-service conversations and customer or employee interactions, the ServiceNow Otto panel assists users directly within the context of their work. It detects where users are in the platform and can provide contextual assistance, helping them complete tasks more efficiently. Fulfillers can summarize a chat, case, or incident, get contextual help, or generate resolution notes directly within their workspace. Requesters interact with the panel through service portals where AI Search, Virtual Agent topics, and catalog recommendations come together. Learning the distinction between the fulfiller experience and the requestor experience is important for configuration. Each experience has different configuration options, available skills, and activation requirements.

The panel's premium chat experience brings together AI chat, search, file uploads, and multi-step AI-assisted tasks in a single interface. Users can search organizational knowledge, interact with records, and perform work without switching between multiple tools or applications.

The ServiceNow Otto panel experience has an assistant of its own where admins can configure it in Assistant Designer. For more information, see Assistants overview.

For more information about the panel, see ServiceNow Otto panel and Premium chat.

Assistants and conversations in Assistant Designer

Assistant Designer is the central workspace for creating, configuring, testing, and managing assistants and their conversational experiences. Administrators use it as a single place to define an assistant's knowledge sources, capabilities, behavior, and deployment channels.

Assistants

An assistant can answer questions, provide guidance, retrieve information, and help users complete tasks through natural language conversations. It brings together the capabilities needed for a conversational experience. These include knowledge sources, AI agents, topics, skills, actions, branding, and channel-specific settings.

Organizations can create multiple assistants for different audiences, use cases, or business functions. For example, a company might create separate assistants for employee support, customer self-service, IT help, or HR guidance. Each assistant can be deployed across channels such as portals, mobile apps, Microsoft Teams, and Slack while maintaining a consistent conversational experience. An assistant's effectiveness comes from the assets and information sources connected to it. These can include Virtual Agent topics, AI agents, skills, workflows, actions, search sources, and knowledge content. Together, these capabilities determine what the assistant can answer, what tasks it can perform, and how it engages with users.

Use Assistant Designer to create, configure, manage, and test LLM-based chat and voice assistants. How the assistant is configured impacts the quality of the experience that the user has when interacting with the assistant.

Assistant Designer has three primary tabs:

- **Assistants**
- **Asset library**
- **Analytics**

Assistants tab

The **Assistants** tab is where you create and configure individual assistants and define the overall experience. Administrators can create multiple assistants and tailor each one to a specific audience or purpose. Common configuration areas include the following:

- The channels where the assistant is available
- Branding and visual identity
- Greeting, closing, and fallback messages
- Search and knowledge configuration
- AI agent enablement and orchestration settings
- Overall conversational experience settings

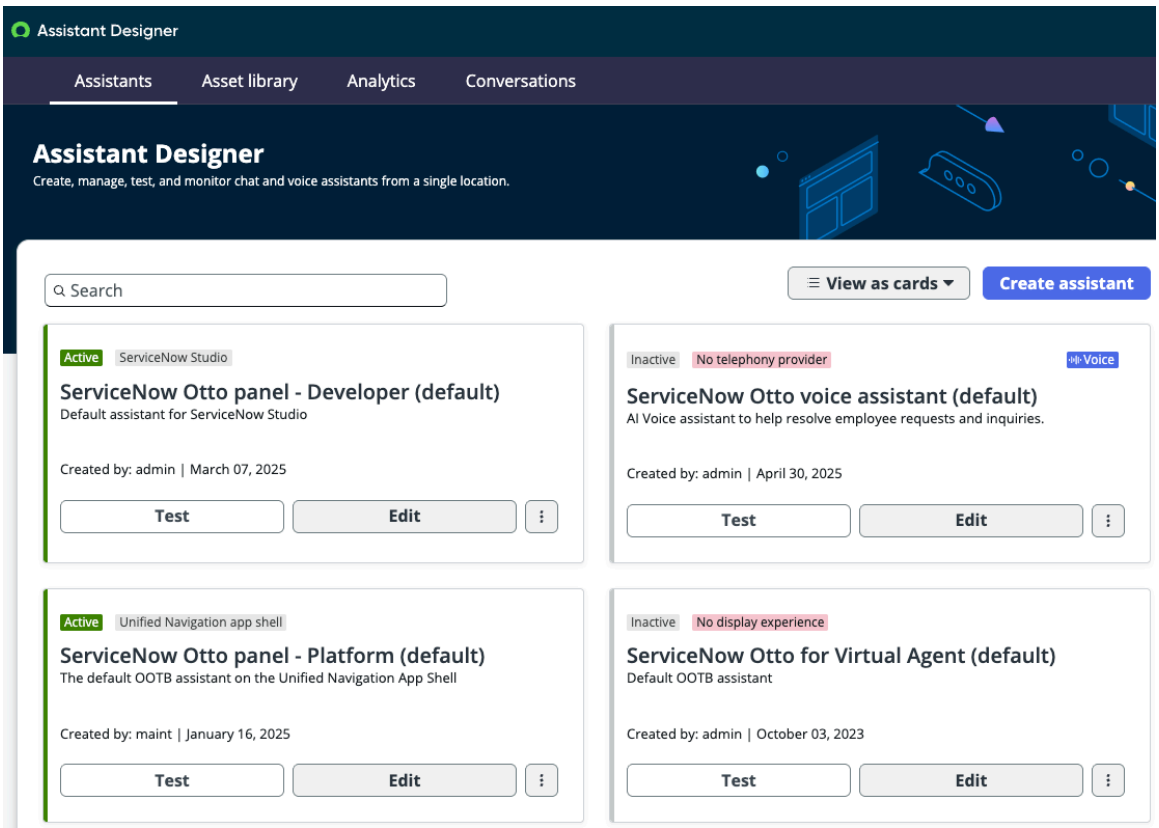
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Assistants tab



For more information, see Assistants overview.

Asset library tab

The **Asset library** tab is where you define the capabilities available to assistants. Assets represent the problems an assistant can help solve and the actions it can take during a conversation. Administrators create, organize, and manage these reusable conversational components, then make them available to one or more assistants.

Asset types include the following:

- Conversational topics (Virtual Agent topics)
- Subflows and actions
- AI agents
- Custom generative AI skills

By separating assets from assistants, organizations can reuse capabilities across multiple conversational experiences while maintaining centralized management.

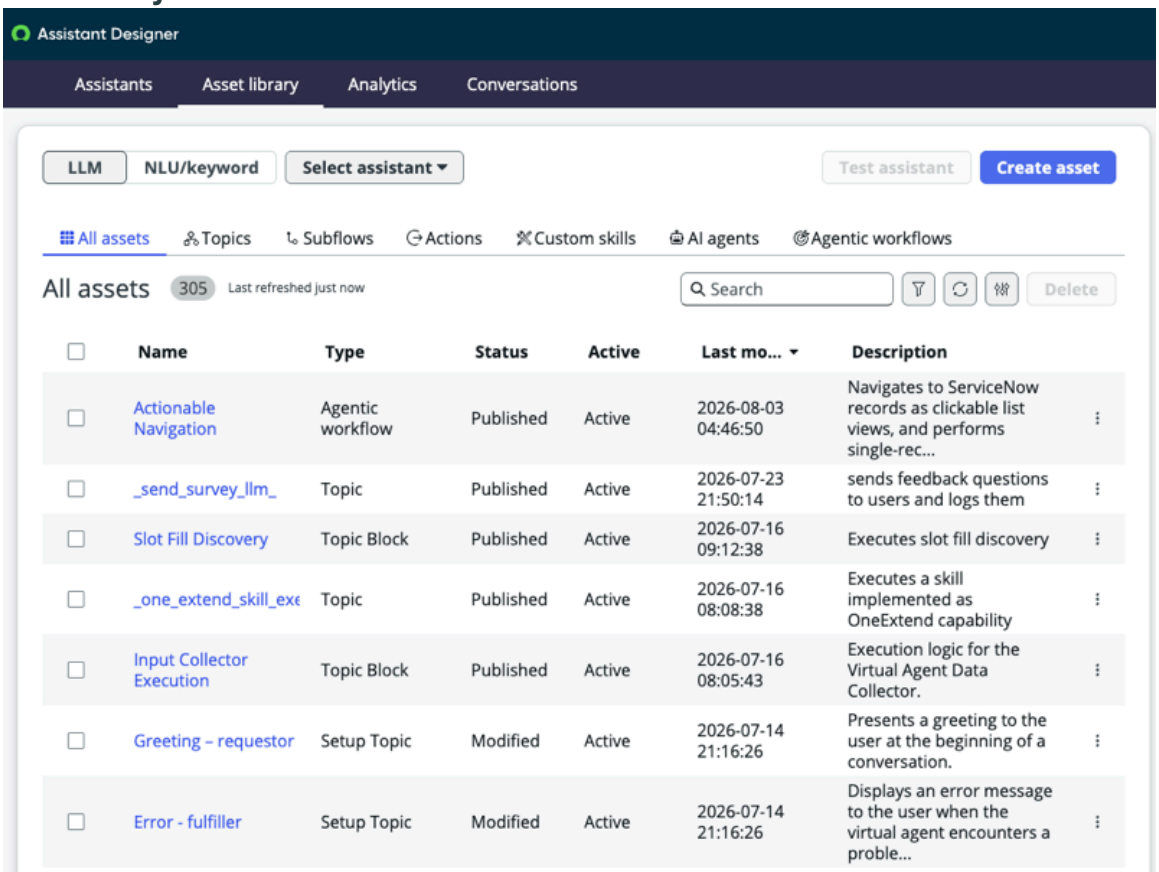
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Asset library tab



The Asset library includes the functionality of Virtual Agent Designer, a graphical design program that you can use to create Virtual Agent conversations. For more information, see Build conversations in the Asset library in Assistant Designer.

Analytics tab

The **Analytics** tab helps assistant administrators monitor the performance of their AI-powered assistants across channels and workflows. It provides actionable insights into how assistants are being used, how effectively they are resolving user issues, and where improvements can be made to enhance the self-service experience. Assistant analytics looks at usage trends, adoption and engagement, user sentiment, and assist consumption.

The **Analytics** tab has several page views, each answering a different question, including the following:

- Overview: overall assist usage and CSAT scores across everything
- Usage: conversation volumes, which channels users use, such as Microsoft Teams, Slack, web, and mobile, and resolution vs. escalation rates
- Adoption & Engagement: user growth over time, engagement patterns, and the assist-to-execution ratio, which measures how often a suggested assist becomes a completed action
- Sentiment: satisfaction scores, empathy indicators, and frustration signals, and indicators of the emotional quality of the conversation
- Self-solve performance: deflection rates (how many issues get solved without a human agent) and effort scores (how much work the user had to do)
- Assists: AI resource consumption, useful for understanding compute cost and which AI features are used
- Voice: AI resource consumption for telephony and voice channels

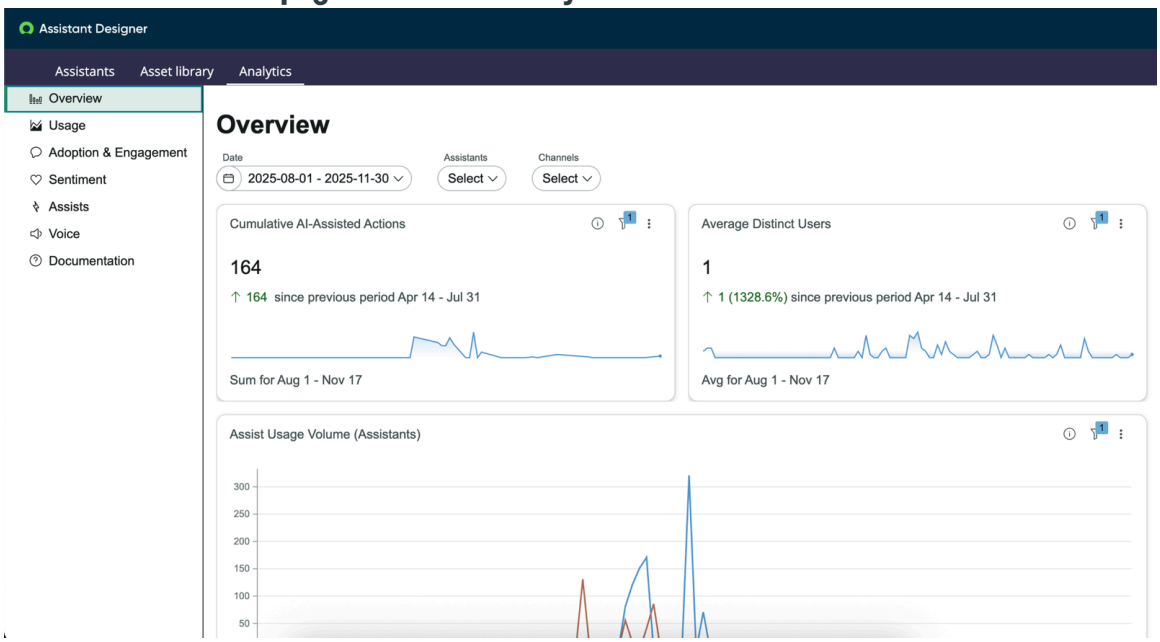
Overview dashboard page in Assistant analytics



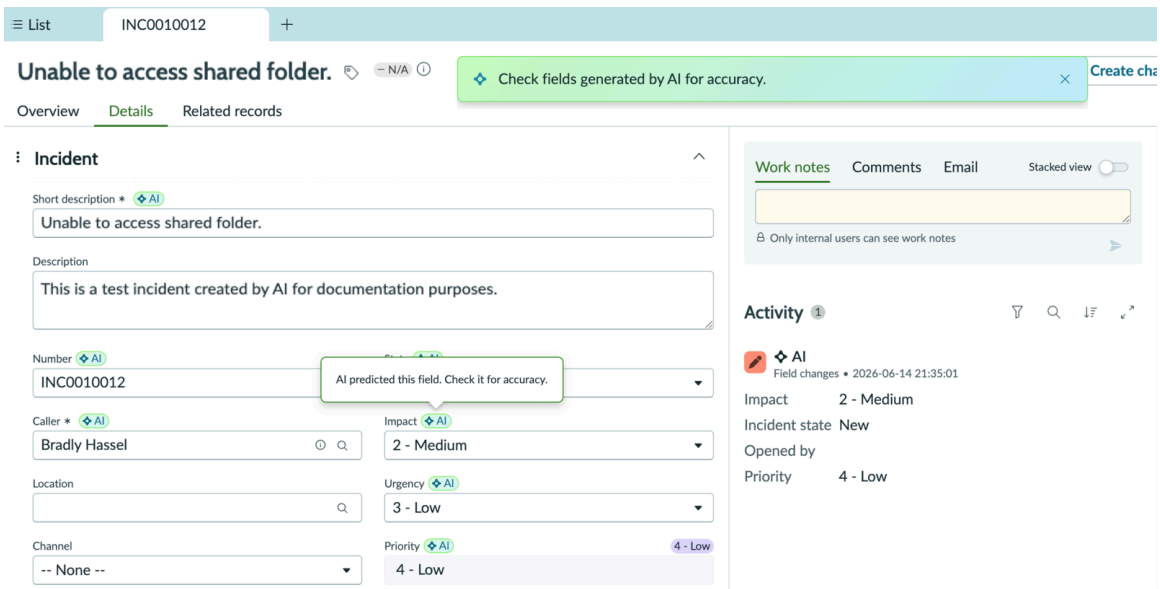
For more information, see Analyzing assistants.

AI indicators on form fields

The AI indicator is a badge that identifies form fields containing content generated or updated by an AI agent in Core UI and configurable workspaces.

AI indicators help distinguish AI-generated updates from human edits on a record. When an AI agent updates a field, an AI indicator appears next to the field label. Selecting the indicator opens a popover that displays a brief message. When a record contains one or more AI-updated fields, a record-level alert appears as a reminder to review AI-generated content before using or acting on it. AI-generated content may be inaccurate.

Note: The popover and alert messages aren't configurable.



AI indicators appear:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- When you open a record that contains one or more fields updated by an AI agent.
- When an AI workflow updates a field while the record is open.

AI indicators clear:

- When you manually modify the AI-generated value. Actions such as hovering over the indicator, selecting it, moving focus to the field, or saving the form do not clear the indicator.
- When a client script overwrites the AI-generated value.

AI indicators reappear when the field value is restored to the AI-generated value.

Configuration and AI activity tracking

AI indicators are included in the AI Field Activity (com.glide.ai_field_activity) plugin, which is activated with the Generative AI Controller (sn.generative.ai) plugin. No additional configuration is required.

- Information about AI-generated activity is stored in the sys_ai_record_activity table.
- This tracking data distinguishes AI-generated updates from manual edits, enables the display of AI indicators on form fields, and supports auditing, compliance, and AI governance.
- AI indicator activity records are retained for 365 days by default unless the associated AI indicator is cleared when the field value is manually modified.
- Admins can modify this retention period by configuring sys_auto_flush for the sys_ai_record_activity table.

AI tracking applies to all tables except the following:

- Tables with the prefixes:
  - sys_
  - v_
  - sysevent
  - syslog
  - sysrule
  - sysauto
  - sn_
  - one_
  - var_
- Infrastructure-related tables with the prefixes:
  - wf_
  - jrobin
  - ecc_
  - hermes
  - pa_
  - sa_
  - ua_
  - report_stats

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- High-volume telemetry, log, and queue tables, including:
  - report_executions
  - metric_instance
  - service_mapping_status
  - sp_log
  - sla_async_queue
  - attachment_scan_history
  - itam_asset_usage
  - itam_ci_usage
  - ts_query_kb
  - ts_search_summary
  - label_entry
  - label_history
  - qc_node_metric
  - qc_candidate_query
- To enable AI activity tracking for a specific table, add the dictionary attribute *no_ai_record_activity* and set it to **false**. To disable tracking, set the dictionary attribute to **true**.

Note: To disable AI indicators on form fields, create a system property named *glide.ai.field_indicators.enabled*, and set it to **false**. By default, this property is set to **true**.

Extending AI with external systems and providers

Connect to large language model (LLM) providers through the Generative AI Controller and integrate AI agents with external tools and services using the Model Context Protocol (MCP).

The ServiceNow AI Platform works with external systems and model providers, giving you flexibility to choose the LLM providers that meet your requirements and connect AI agents to tools and services beyond the platform.

Generative AI Controller

The Generative AI Controller integrates third-party generative AI into the platform. The controller supports external LLM providers, including OpenAI, Azure OpenAI, Google Cloud (AI Studio and Vertex), IBM watsonx, and Amazon Bedrock. These capabilities are available in Workflow Studio flows, Virtual Agent topics, and scripting such as background scripts and business rules. The Generative AI Controller is installed automatically with any AI application.

To bring third-party LLM providers such as OpenAI, Google, and Amazon Bedrock into flows, Virtual Agent, and scripts, see Generative AI Controller.

MCP Client

The Model Context Protocol (MCP) is a standardized client-server protocol that enables AI applications to discover and interact seamlessly with external tools, data sources, and services. MCP Client manages communication between a host application, such as AI Agent Studio, and one or more MCP servers that expose specific capabilities. MCP tools enable you to connect

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

your AI agent with a wide variety of external tools and add multiple MCP tools to an AI agent to perform a broader range of tasks.

To connect your AI agents to external tools, data sources, and services through the Model Context Protocol, see Model Context Protocol Client.

MCP Server Console

MCP Server Console console lets you create MCP servers on your instance and configure the tools they expose to external clients. Tools define which functionality and data a server makes available and the actions that can be performed on the instance. You can create tools based on existing capabilities such as generative AI skills, and you can create multiple servers that expose different tools for different use cases, such as HR or IT workflows, or for different clients.

Any AI application, such as Microsoft Copilot or AWS Claude, can call a server using OAuth 2.0 authentication and get a list of available tools. Employees using the MCP Client can then prompt the server for information from the instance or to perform an action, such as summarizing a list of recently closed incidents or cases.

Note: With AI Gateway in AI Control Tower, administrators can monitor MCP Server Console and access and view metrics for servers and their tools.

To create MCP servers that expose your instance's tools, including generative AI skills, to external clients such as Microsoft Copilot or AWS Claude, see MCP Server Console.

Generative AI Controller

Use Generative AI Controller to integrate your ServiceNow applications with third-party large language models (LLMs) and manage how generative AI requests are governed, protected, and logged.

Get started

Configure Generative AI Controller to set up your preferred external LLM provider, manage data privacy and AI Guardian controls, and monitor generative AI activity through logs. For more information about building custom generative AI skills and workflows, see Generative AI skills.

AI limitations

This application uses artificial intelligence (AI) and machine learning, which are rapidly evolving fields of study that generate predictions based on patterns in data. As a result, this application may not always produce accurate, complete, or appropriate information. Furthermore, there is no guarantee that this application has been fully trained or tested for your use case. To mitigate these issues, it is your responsibility to test and evaluate your use of this application for accuracy, harm, and appropriateness for your use case, employ human oversight of output, and refrain from relying solely on AI-generated outputs for decision-making purposes. This is especially important if you choose to deploy this application in areas with consequential impacts such as healthcare, finance, legal, employment, security, or infrastructure. You agree to abide by ServiceNow's AI Acceptable Use Policy, which may be updated by ServiceNow.

Data processing

This application requires data to be transferred from ServiceNow customers' individual instances to a centralized ServiceNow environment, which may be located in a different data center region from the one where your instance is, and potentially to a third-party cloud provider, such as Microsoft Azure. This data is handled per ServiceNow's internal policies and procedures, including our policies available through our CORE Compliance Portal.

Data collection

ServiceNow collects and uses the inputs, outputs, and edits to outputs of this application to develop and improve ServiceNow technologies including ServiceNow models and AI products. Customers can opt out of future data collection at any time, as described in the AI Opt-Out page.

Exploring Generative AI Controller

Learn how Generative AI Controller works as the control and visibility layer for all generative AI requests across your ServiceNow applications, what it controls, and how it integrates with third-party LLM providers.

Generative AI Controller overview

Every AI request from generative AI features, AI agents, and custom skills passes through Generative AI Controller before reaching your LLM provider. The controller enforces governance policies, applies privacy controls, and records activity for monitoring and troubleshooting.

Generative AI Controller integrates with external LLMs, including ones by OpenAI, Azure OpenAI, Google Cloud (AI Studio and Vertex), IBM watsonx, and Amazon Bedrock.

Note: Depending on your license, you will have access to certain application features, generative AI skills, agentic workflows, and AI agents. For more information, see ServiceNow product tiers.

Generative AI Controller governance and controls

Generative AI Controller manages the following controls for generative AI activity across your ServiceNow applications:

Logging

Records all generative AI requests and responses for debugging and auditing.

Rate limiting

Restricts the number of requests to an LLM provider within a given time frame.

Data privacy

Masks personally identifiable information in prompts before they are sent to an LLM.

External LLM connectivity

Connects your Now Assist applications to a third-party LLM provider.

Guardian guardrails

Applies content and safety policies to generative AI requests.

Generative AI Controller benefits

Benefit	Feature
Integrate with third-party AI service providers to customize your AI experience	OpenAI, Azure OpenAI, Google AI, IBM watsonx, Amazon Bedrock
Govern and monitor all generative AI activity in your ServiceNow applications	Data Privacy, Guardian guardrails, Rate limiting, and Activity logging
Use your own API keys for AI processing	Bring your own key for third-party AI provider integration

Get started with Generative AI Controller

- The Generative AI Controller application is installed automatically with any ServiceNow AI application.
- Sign up and create an account with a generative AI provider.
  - To sign up with OpenAI, go to their official platform website.
  - To get started with Azure OpenAI, go to their documentation.
  - To start using AI Studio with Gemini API, go to the AI Studio homepage.
  - To use Vertex AI on the Google Cloud, go to the Vertex AI homepage.
  - To get started with IBM watsonx, go to Getting started with IBM watsonx as a Service.
  - To get started with Amazon Bedrock, set up an IAM user with the correct permissions and then explore the Converse API.
- Configure credentials for your preferred AI service provider for the Generative AI Controller capabilities.
- Activate AI assets for your workflows and configure governance settings such as data privacy, guardrails, and rate limiting.
- Build custom skills for your organization's unique requirements using AI Skill Kit.
- Monitor generative AI activity through logs for troubleshooting and compliance.

Domain separation and Generative AI Controller

Domain separation is supported for Generative AI Controller. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Standard

- Includes all aspects of **Basic** level support.
- Application properties are domain-aware as needed.
- Business logic: The service provider (SP) creates or modifies processes per customer. The use cases reflect proper use of the application by multiple SP customers in a single instance.
- The instance owner must configure the minimum viable product (MVP) business logic and data parameters per tenant as expected for the specific application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sample use case: An admin must be able to make comments required when a record closes for one tenant, but not for another.

For more information on support levels, see Application support for domain separation.

Domain separation enables you to create partitions in the application data and administrative processes. Because the generative AI tables are domain separated, Generative AI Controller supports domain separation for OneExtend capabilities. The capabilities are the basic building blocks for generative AI features across the ServiceNow AI Platform. With domain separation, you can isolate the data and control access so that users in one domain don't have access to the capabilities of another domain.

How domain separation works in Generative AI Controller

Domain separation is possible at the generative AI OneExtend capability level. Records that are related to the execution and configuration of OneExtend capabilities, such as log tables that are accessible to ServiceNow personnel, are also separated according to the capability's domain.

If you want to create a copy of an existing generative AI capability in a different domain, you must create a record in the OneExtend Capabilities (sys_one_extend_capability) table. For more information about the OneExtend Capabilities table, see Reference for Generative AI Controller.

You set the domain when the record is created. The domain is based on the domain that you're in at the time that you create the record. When you're creating a capability record, you can use an existing OneExtend Capability record as a blueprint to help confirm that the capability works as intended.

After you create the OneExtend Capability record, you must create records for the following attribute and config records in the new domain:

- OneExtend Capability Attribute records with the same values as the capability in the global domain.
- A OneExtend Capability Definition that corresponds to the new capability.
- A OneExtend Definition Config definition record that includes the OneExtend Capability Definition for the new domain.

Note: The OneExtend Capability Definition record that you add must be the same as the capability that you want in the new domain. For example, if you're creating a capability in a new domain for an Amazon Bedrock integration, you could add the corresponding Amazon Bedrock Capability Definition record. Adding a different capability definition than the one you intend could result in unexpected behavior. The OneExtend Definition Config record that you select should include the OneExtend Capability Definition record that you added.

Use cases

With domain-separated capabilities, you can isolate generative AI configurations so that different domains use different LLM providers or settings.

Domain separation for service providers

Configuring Generative AI Controller

Configure Generative AI Controller providers and capabilities.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuration overview

Generative AI Controller enables you to choose between several AI providers or a generic connector.

- Microsoft Azure OpenAI
- OpenAI
- Google AI Studio
- Google Vertex AI
- IBM watsonx
- Amazon Bedrock

After you configure Generative AI Controller, activate and manage generative AI skills through the AI Admin Hub console to deliver generative AI capabilities to your users. For more information, see Generative AI skills.

Configure API credentials

Configure your large language model (LLM) credentials to use third-party integrations with OpenAI, Azure OpenAI, Google Cloud, IBM watsonx, Amazon Bedrock, and generic models to control the third-party integration.

Configure a generic LLM connector

Set up an external LLM to use generative AI capabilities to add finer control over prompts and transformer scripts.

Configure an AI service provider for a capability

Set your preferred AI service provider for each capability and tailor generative AI content to suit your business needs.

Enable recursive summarization for large inputs

Enable recursive summarization to retain context for large inputs in LLM calls.

Enable Dynamic Translation for generative AI capabilities

Use Dynamic Translation for in-product generative AI capabilities to support users who speak different languages.

Installing Generative AI Controller

The Generative AI Controller application (sn.generative.ai) is automatically installed with ServiceNow AI applications.

Installation requirements

You must be on Vancouver patch 2 or later.

Generative AI Controller is included as a dependency for all ServiceNow AI applications, such as ServiceNow Otto for IT Service Management (ITSM) or ITSM - Foundation, Advanced, or Prime. You can install ServiceNow AI applications from the AI Admin Hub console or directly from the ServiceNow Store. For details, see Install plugins for ServiceNow Otto.

Configuring API credentials for generative AI capabilities

Configure the credentials and connections for your preferred generative AI service provider to integrate third-party generative AI on the ServiceNow AI Platform.

You can use several different models and generative AI service providers to integrate into your custom flows, scripts, and topics.

- Amazon Bedrock
- Azure OpenAI
- Google - AI Studio
- Google - Vertex AI
- IBM watsonx
- OpenAI
- Generic third-party LLM

Configure API Credentials for Amazon Bedrock

Configure your API credentials to use AWS Bedrock as your LLM provider for Generative AI Controller capabilities.

Before you begin

You must have an AWS account and the IAM user needs permission to access the bedrock:InvokeModel action.

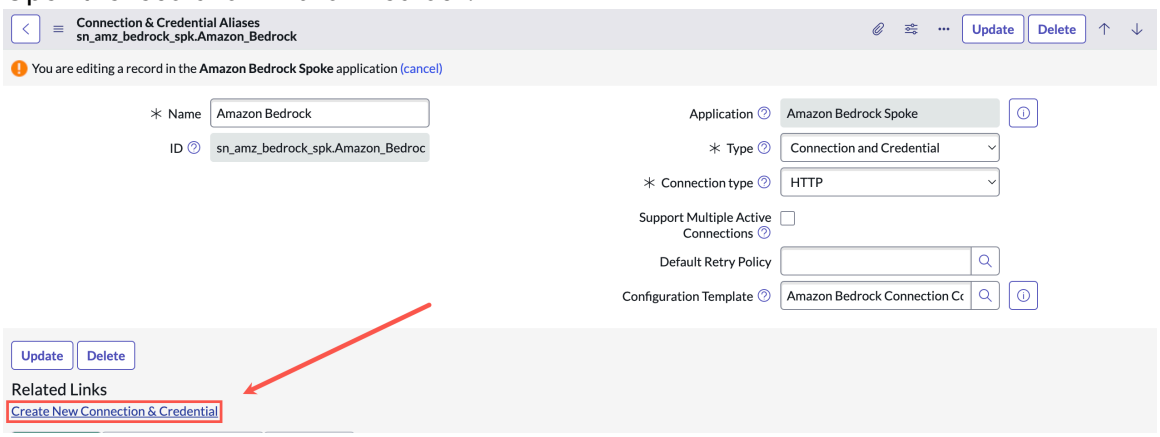
Role required: admin

About this task

To use Amazon Bedrock as your LLM provider for Generative AI Controller capabilities, you must have an active connection configured.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connections & Credential Aliases**.
2. Open the record for Amazon Bedrock.

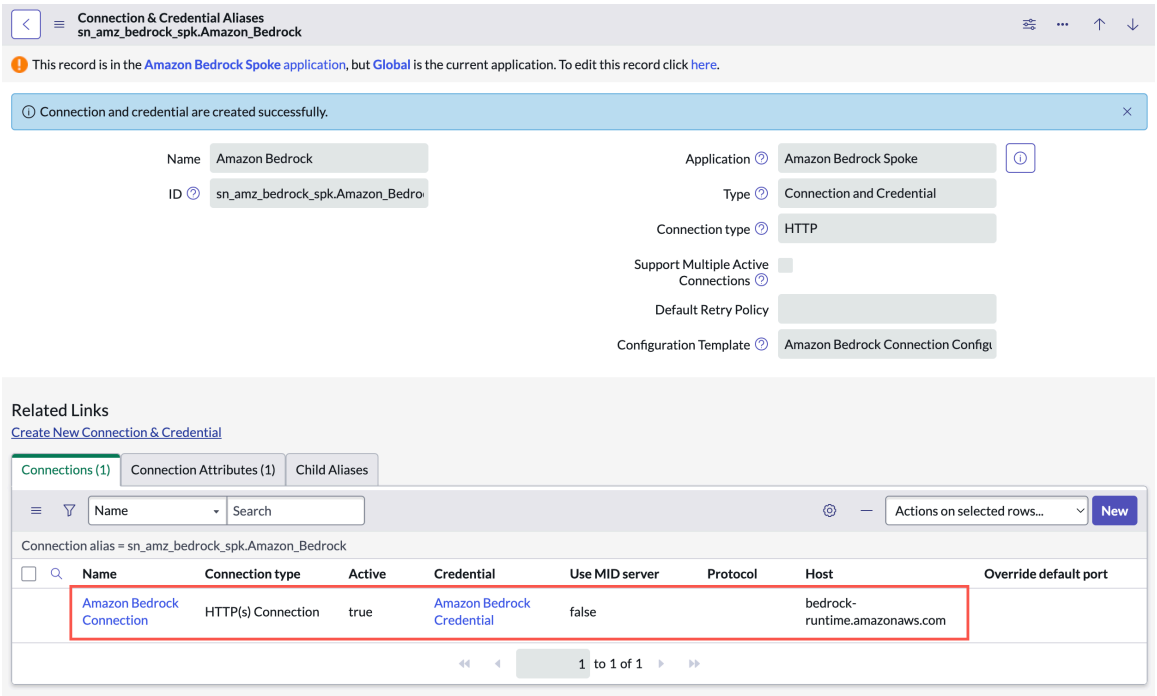


3. Select the **Create New Connection & Credential** related link.
4. Enter your **Region**, such as `us-east-1`.
5. Enter your API key.
   For more information, see AWS documentation on generating API keys.
6. Select **Create**.

Result

You can use Amazon Bedrock as your LLM provider for Generative AI Controller capabilities.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



What to do next

Activate generative AI skills in the AI Admin Hub console for your workflow. For more information, see Generative AI skills.

Configure API credentials for Azure OpenAI

Configure your API credentials to use Azure OpenAI as your LLM provider for Generative AI Controller capabilities.

Before you begin

To use generative AI capabilities with Azure OpenAI, you must have an Azure resource with an API key.

Role required: admin

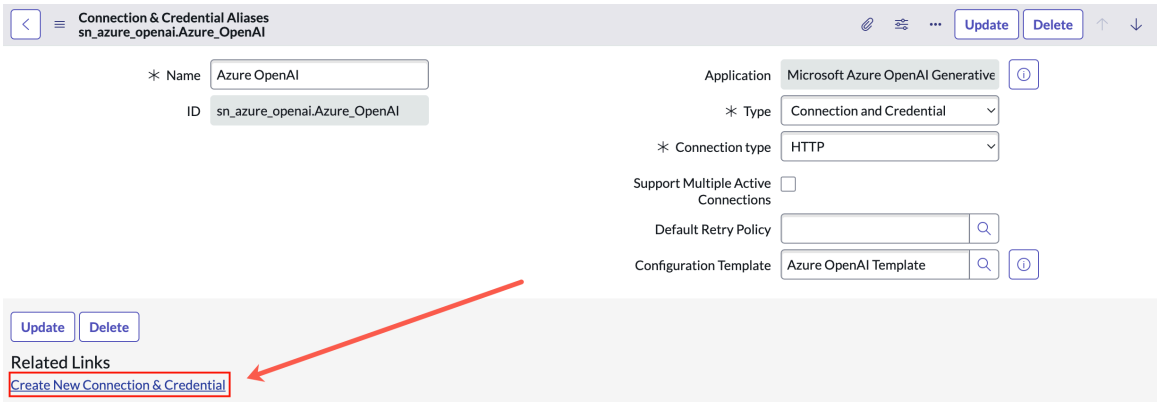
About this task

To use models with Azure OpenAI as your LLM provider for Generative AI Controller capabilities, you must have an active connection configured.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connections & Credential Aliases**.
2. Open the Generative AI provider record for Azure OpenAI.
3. Select the **Create New Connection & Credential** related link.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Edit the Connection URL to include your resource name.

   For Azure OpenAI, your Connection URL is in the form `https://{your-resource-name}.openai.azure.com`. See the Azure OpenAI documentation for more information.

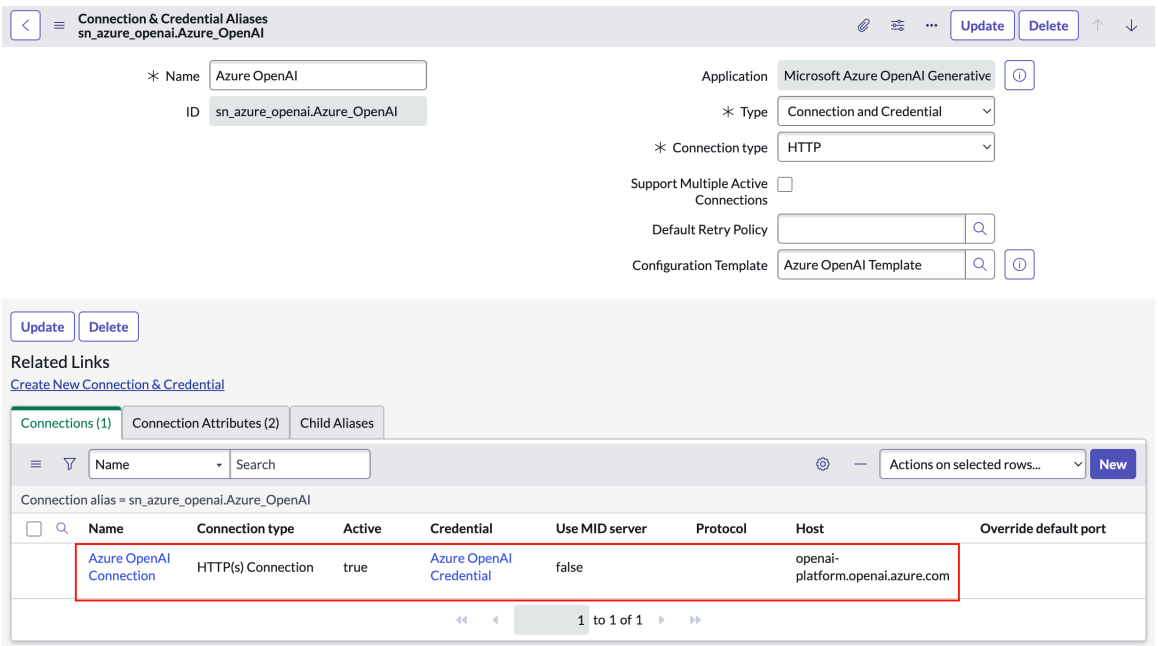
5. In the API key field, enter the API key for the provider.

   Note: The characters in the API key field are masked in the user interface.

6. Create a connection by selecting **Create**.

Result

You can now use capabilities labeled with Azure OpenAI as your LLM provider for Generative AI Controller capabilities.



What to do next

If you want to use generative AI capabilities through your MID Server, open the new Connection record, select the **Use MID server** check box, and save the record.

Activate generative AI skills in the AI Admin Hub console for your workflow. For more information, see AI Admin Hub.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure API credentials for Google AI Studio

Configure your API credentials to use Google AI Studio as your LLM provider for Generative AI Controller capabilities.

Before you begin

You must have a Google account to use AI Studio.

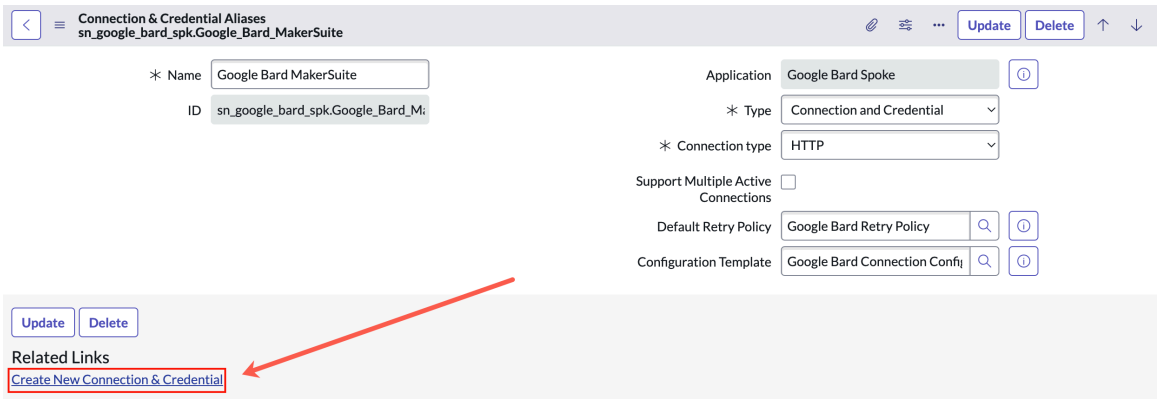
Role required: admin

About this task

To use Google AI Studio as your LLM provider for Generative AI Controller capabilities, you must have an active connection configured.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connections & Credentials Aliases**.
2. Open the record for Google Bard MakerSuite.
3. Select the **Create New Connection & Credential** related link.

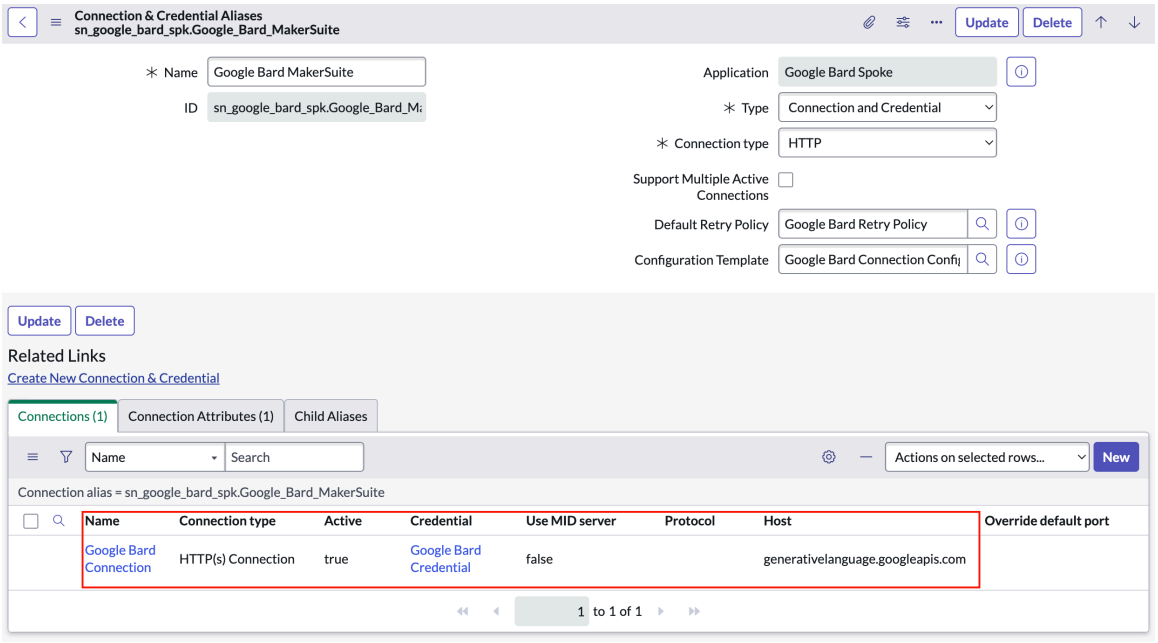


4. Enter your API key.
   You can find your API key in AI Studio by selecting **Get API Key** from the navigation menu.
5. Select **Create**.

Result

You can now use AI Studio (Google Cloud Chat Completion) as your LLM provider for Generative AI Controller capabilities.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



What to do next

Activate generative AI skills in the AI Admin Hub console for your workflow. For more information, see AI Admin Hub.

Configure API credentials for Google Vertex AI

Configure your API credentials to use Google Vertex AI as your LLM provider for Generative AI Controller capabilities.

Before you begin

You must have a Google Cloud project and the permissions to generate new OAuth credentials.

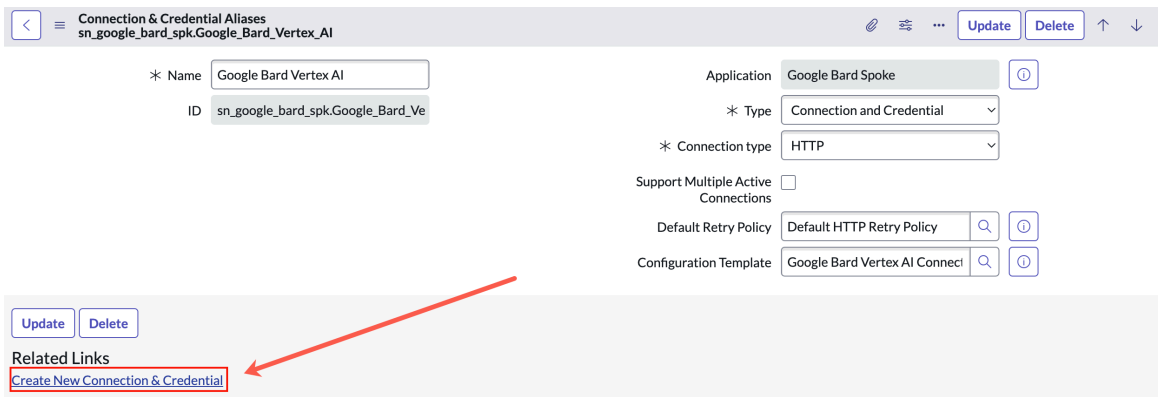
Role required: admin

About this task

To use Google Vertex AI as your LLM provider for Generative AI Controller capabilities, configure an active connection.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connections & Credentials Aliases**.
2. Open the record for Google Bard Vertex AI.
3. Select the **Create New Connection & Credential** related link.



4. Complete the required fields.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

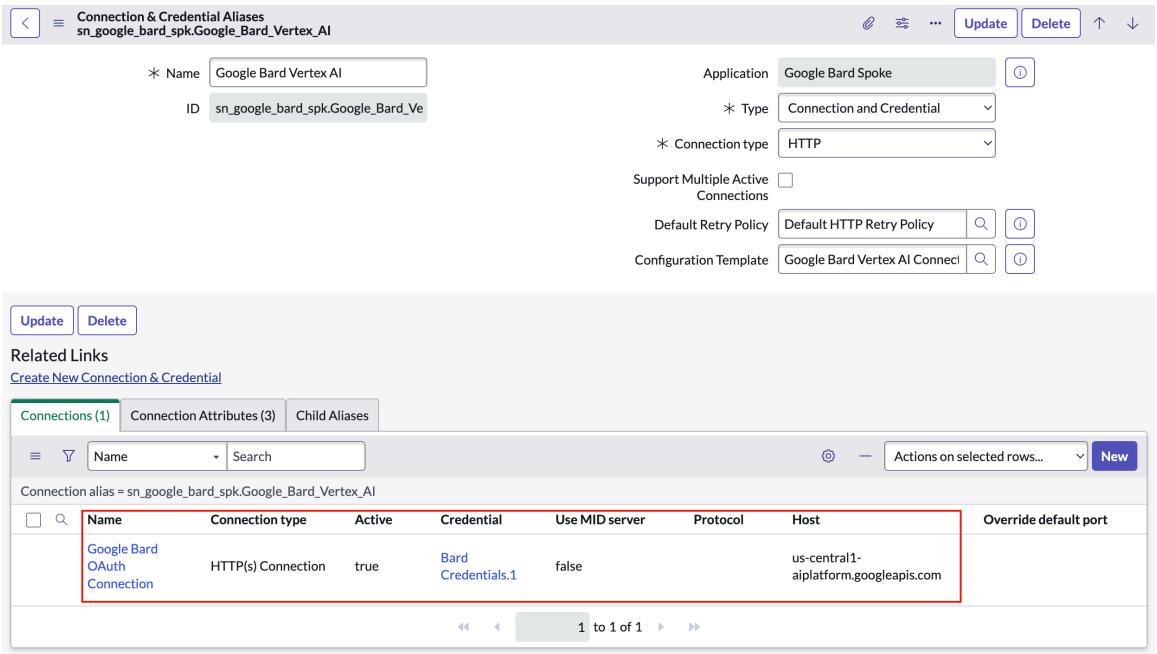
Google OAuth Connection

Field	Value
Project ID	The Project ID found in the Google Cloud console
Credential Name	The name of your credential, such as `Google OAuth Credential`
OAuth Name	The name of your OAuth authentication, such as `Google Registry`
OAuth Client ID	To get the OAuth Client ID, create a new OAuth Client ID with the Google Cloud console with the following attributes: **a.** Application type: `Web application` **b.** Authorized redirect URI: URL in the OAuth Redirect URL field, usually `<instance>.service-now.com/oauth_redirect.do` For more information, see the Google documentation for creating OAuth client IDs. After you create the OAuth client, a dialog box displays the Client ID and Client secret for you to copy.
OAuth Client Secret	Client secret from your OAuth Client ID found in the Google Cloud console

5. In the dialog box, log in to a Google Account with access to the project.
6. When prompted for Google Cloud access for gsuite spokes, select **Allow**.

Result

You can now use Completions – Vertex AI and Chat Completions – Vertex AI as your LLM provider for Generative AI Controller capabilities.



What to do next

Activate generative AI skills in the AI Admin Hub console for your workflow. For more information, see AI Admin Hub.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Configure API credentials for IBM watsonx

Configure your API credentials to use IBM watsonx Granite models as your LLM provider for Generative AI Controller capabilities.

Before you begin

To use IBM watsonx large language models (LLMs), you must configure your credentials to use the Generative AI Controller capabilities.

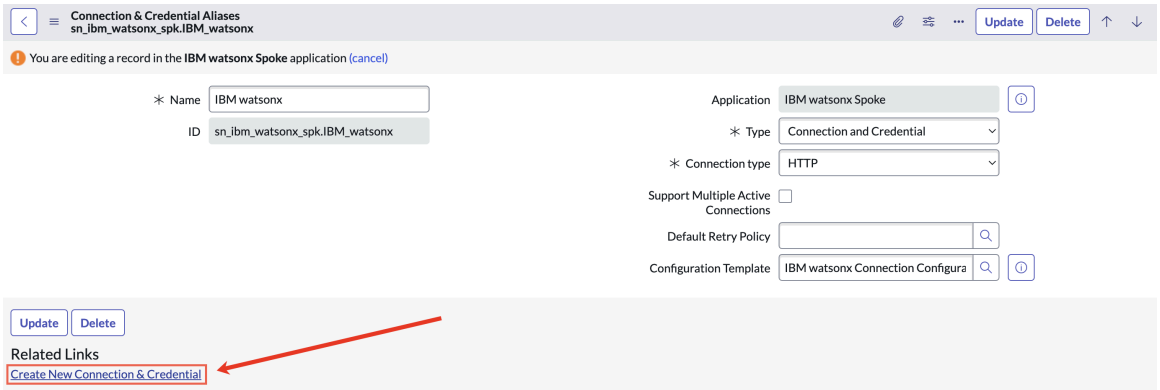
Role required: admin

About this task

To use models with IBM watsonx as your LLM provider for Generative AI Controller capabilities, you must have an active connection configured.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connections & Credential Aliases**.
2. Open the record named IBM watsonx.
3. Select the **Create New Connection & Credential** related link.



4. In the API key field, enter your API key.

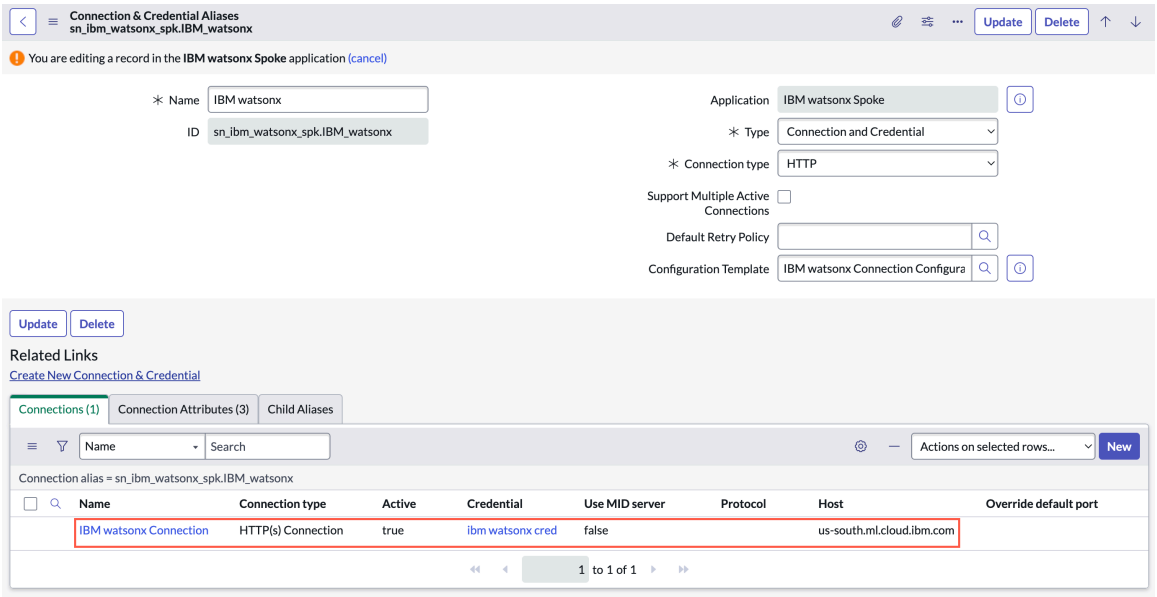
   For more information about generating an API key, see IBM's documentation for generating API keys for authentication.

5. Create a connection by selecting **Create**.

Result

You can now use capabilities labeled with IBM watson as your LLM provider for Generative AI Controller capabilities.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



What to do next

If you want to use generative AI capabilities through your MID Server, open the new Connection record, select the **Use MID server** check box, and save the record.

Activate generative AI skills in the AI Admin Hub console for your workflow. For more information, see AI Admin Hub.

Configure API credentials for OpenAI

Configure your API credentials to use OpenAI as your LLM provider for Generative AI Controller capabilities.

Before you begin

To use the OpenAI and Azure OpenAI large language models (LLMs), you must configure your credentials to use the Generative AI Controller capabilities.

Role required: admin

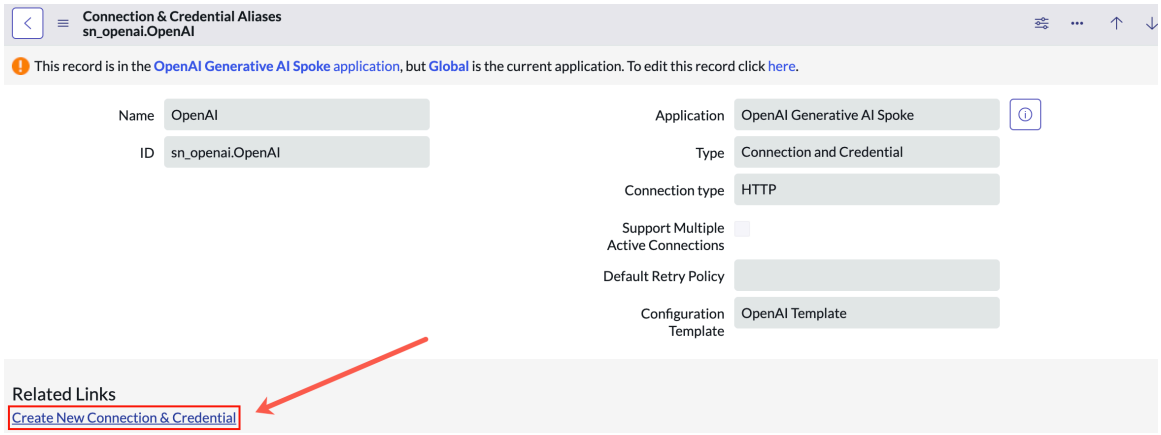
About this task

To use models with Azure OpenAI as your LLM provider for Generative AI Controller capabilities, you must have an active connection configured.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connections & Credential Aliases**.
2. Open the Generative AI provider record for OpenAI.
3. Select the **Create New Connection & Credential** related link.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



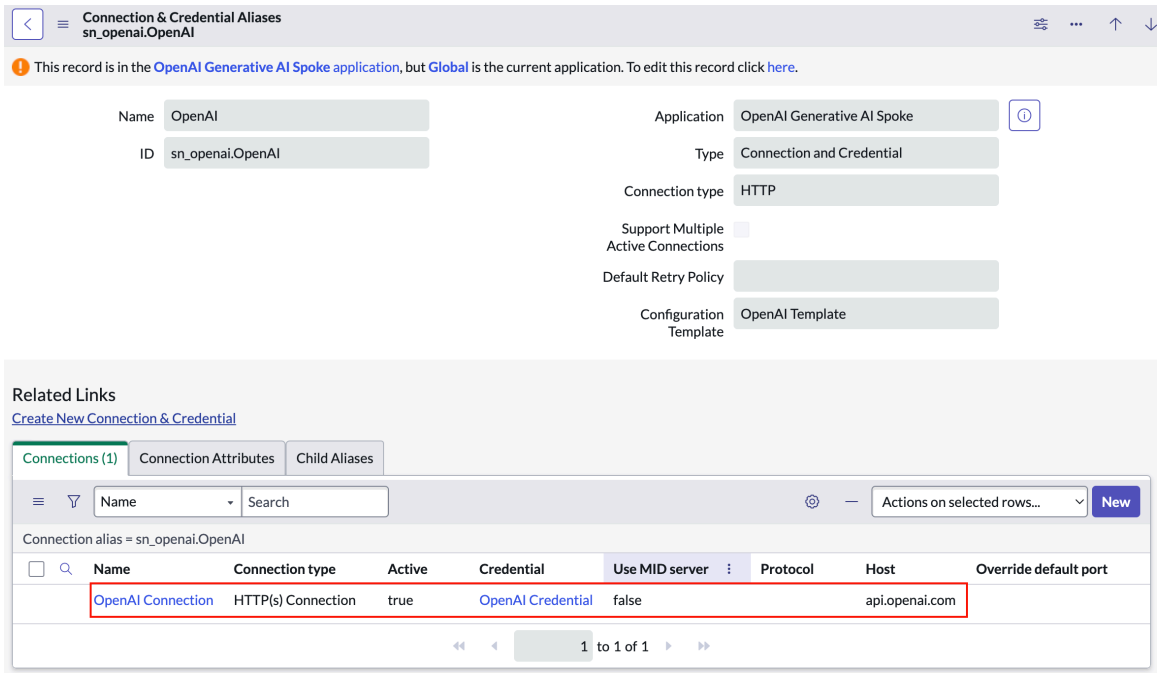
4. In the API key field, enter the API key.

   For OpenAI, see your OpenAI API keys for the credentials information.

5. Create a connection by selecting **Create**.

Result

You can now use capabilities labeled with OpenAI as your LLM provider for Generative AI Controller capabilities.



What to do next

If you want to use generative AI capabilities through your MID Server, open the new Connection record, select the **Use MID server** check box, and save the record.

Activate generative AI skills in the AI Admin Hub console for your workflow. For more information, see AI Admin Hub.

Configure API credentials for a generic large language model (LLM) connector

Use a generic LLM connector to connect an external AI provider to Generative AI Controller to use generative AI capabilities in your instance.

Before you begin

You must have access to the API of an external LLM to configure the credentials.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

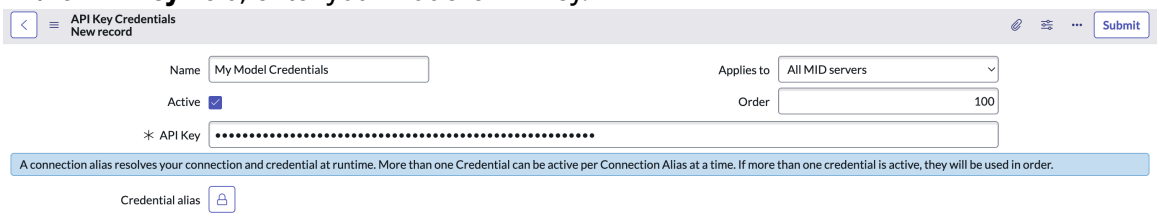
Role required: admin

About this task

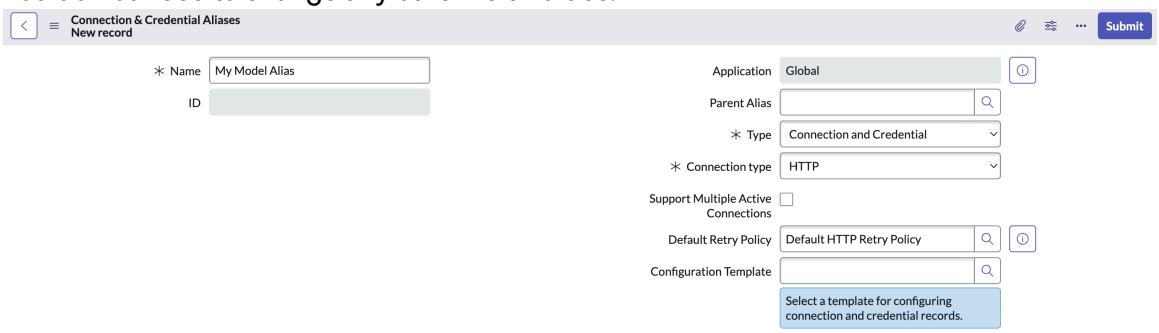
You can connect an external LLM to the ServiceNow AI Platform by creating a connection alias to the model, create a model record that points to the alias, create a prompt record for the model, and then create a transformer record to transform the request or response from the LLM.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Select **API Key Credentials**
3. In the **Name** field, give your API credential a name.
   Including the name of the model in the API Key Credential makes it easier to identify later.
4. In the **API Key** field, enter your model's API key.



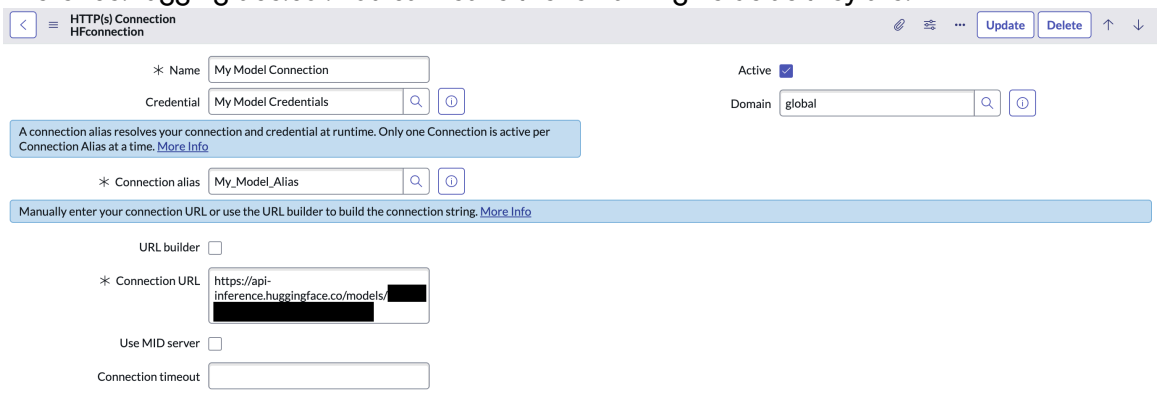
5. Select **Submit** to create the Credential.
   At this step, you have the API key information for the external LLM configured.
6. Navigate to **All** > **Connections & Credentials** > **Connections & Credential Aliases**.
7. Select **New**.
8. In the **Name** field, enter a name for the credential alias.
   You do not need to change any other field values.



9. Select **Submit.**
10. After you are redirected to the List view, find and open the record you just created.
11. Select **New** in the Connections related list to create a new Connection record.
12. Enter the name of the connection in the Name field.
13. In the **Credential** field, select the Credential record you created with the model's API key.
    You can search the list of Credentials by typing the name of the Credential in the field. You can also select the lookup icon ( ) to open a modal with the full list.
14. In the **Connection alias** field, select the alias record you created.
15. For the Connection URL, enter the endpoint URL for the model.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

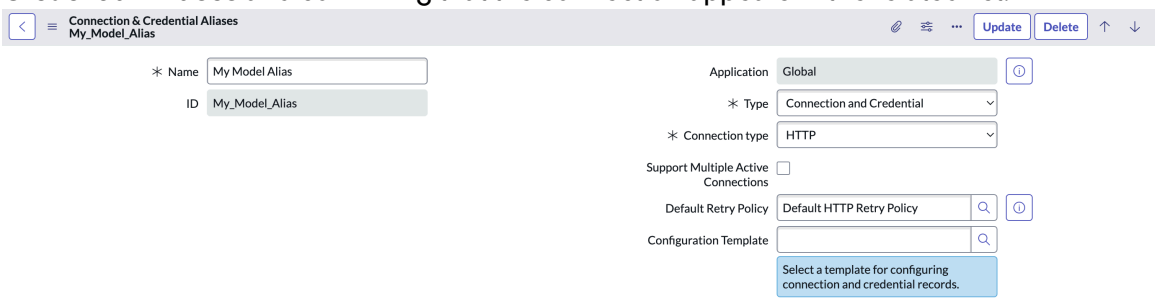
For example, a model from Hugging Face might start with "https://api-inference.huggingface.co". You can leave the remaining fields as they are.

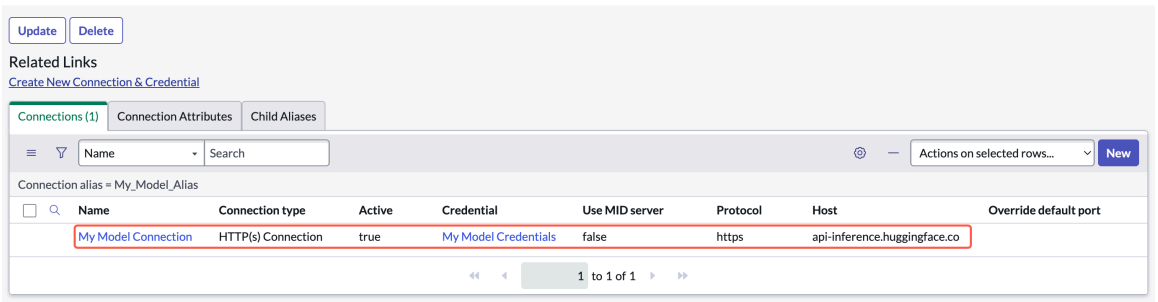


16. Select **Submit**.

Result

You have the connection and credential alias to use for connecting a generic LLM to use generative AI capabilities on the ServiceNow AI Platform. You can confirm this by navigating to **All** > **Connections & Credentials** > **Connections & Credential Aliases** and confirming that the connection appears in the related list.





What to do next

For more information on configuring a generic LLM, see configure a generic LLM connector

To build custom skills with this LLM, see AI Skill Kit.

Activate generative AI skills in the AI Admin Hub console for your workflow. For more information, see AI Admin Hub.

Configure a generic large language model (LLM) connector

Connect an external LLM to the ServiceNow AI Platform by using a generic LLM connector. With a connector, you can write your own prompts to send to the LLM and create your own generative AI capabilities.

Before you begin

You must configure API credentials for your LLM before setting up the connector. For more information, see configure API credentials for a generic LLM.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: admin

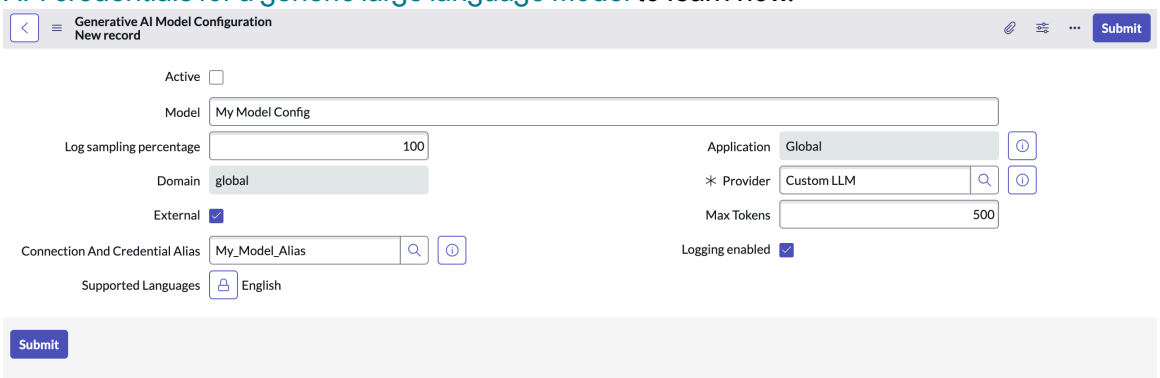
About this task

Generative AI Controller offers several base system connections to popular AI service providers such as Azure OpenAI and Google Vertex. However, you might want to incorporate an industry LLM, a case-specific LLM into your custom workflows, or an LLM that adheres to your organization's data handling policies.

Note: Generative AI Controller only supports text generation.

Procedure

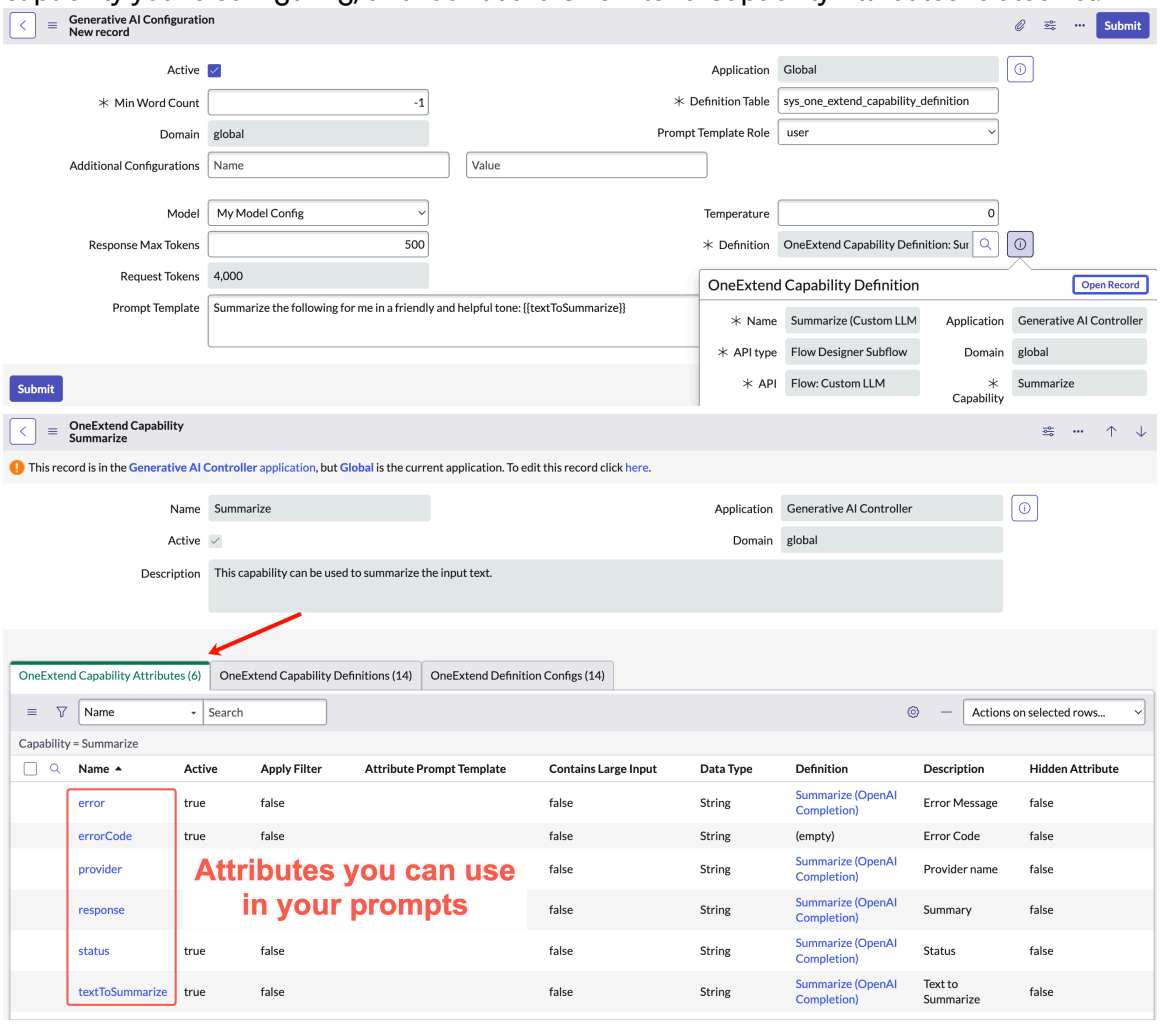
1. In the navigation filter, go to the Generative AI Model Configuration [sys_generative_ai_model_config] table by entering `sys_generative_ai_model_config.list`.
2. Select **New**.
3. In the **Model** field, enter the name of the model.
   If you're using Azure OpenAI, then the model name is the deployment name of your resource.
4. In the **Provider** field, select **Custom LLM**.
5. In the **Connection and Credential Alias** field, select the alias that you created when you set up your credentials.
   If you haven't already configured your API credentials, see configure API credentials for a generic large language model to learn how.



6. Create the model configuration by selecting **Submit**.
   The model configuration is associated with the API key of the external model.
7. In the navigation filter, go to the Generative AI Configuration [sys_generative_ai_config] table by entering `sys_generative_ai_config.list`.
8. Select **New**.
9. Select the list lookup icon ( ) next to the **Definition** field.
10. In the Select the document modal, select a capability that you want to configure with the Custom LLM provider.
    For example, if you're configuring a Summarize capability with a generic LLM provider, select **Summarize (Custom LLM)**.
11. Select **OK** to save your selection and close the modal.
12. In the **Model** field, choose the model configuration that you created in step 6.
    After you select a **Definition**, the **Model** field changes into a drop-down menu with options that use the Custom LLM provider. The model configuration that you made should appear in this list. If it doesn't, go back to step 1 and make sure that your model configuration has the **Provider** field set to **Custom LLM**.
13. In the **Prompt template** field, enter the prompt for the capability.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The prompt template is the instruction that is sent to the LLM to execute a capability. Use two braces around the capability attribute names to incorporate them into the prompt template. For example, if you're configuring a Summarize capability, your prompt template could be `Summarize the following for me in a friendly and helpful tone: {{textToSummarize}}`. To learn which attributes are available to include in the prompt, go to the OneExtend Capability [sys_one_extend_capability] table, find the record for the capability you're configuring, and look at the OneExtend Capability Attributes related list.



You might need to experiment with different prompts to determine what works best for your use cases.

14. Create the new Generative AI Configuration by selecting **Submit**.
15. In the navigation filter, go to the Generative AI Custom LLM Transformer [sys_generative_ai_custom_llm_transformer] table by entering `sys_generative_ai_custom_llm_transformer`.
16. Select **New**.
17. Write transformer scripts.
    To have Generative AI Controller understand the format of the inputs and outputs of your custom LLM, you must write transformer scripts. When you create a transformer record, code and comments are provided for you to use as a guide while you edit. These scripts depend on the expected request and response objects that are interpreted by your model.

    For example, the Azure OpenAI request structure looks like the following script:

```
{"messages": [{"role":"user", "content":"Summarize the
 following text: <<content>>"}], "max_tokens": 800,
 "temperature": 0.7}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The request transformer script for that request structure is the following script:

```
(function(inputs) {
    /* write code here to construct the request body and any
 custom headers needed using the inputs object.
    inputs structure: {
        prompt_data: object,
        request_data: object
    } */
    var requestData = inputs.request_data;
    var promptData = inputs.prompt_data;
    var prompt = promptData.prompt;
    var model = promptData.model;

    // construct body using the inputs
    var body = {
        messages: [{
        "role": "user",
        "content": prompt
        }],
        max_tokens: parseInt(promptData.max_tokens),
        temperature: parseInt(promptData.temperature)
    };

    //construct headers using the inputs
    var headers = {};
    return {
        body: body,
        headers: headers
    };
})(inputs);
```

The response structure from Azure OpenAI looks like this script:

```
{
    "choices": [{
    "finish_reason": "stop",
    "index": 0,
    "message": {
        "content": "<<response>>",
        "role": "assistant"
        }
    }],
    "created": 1714994995,
    "id": "chatcmpl-9LqpXeLVXDAi6kciPfLeIDjmALeea",
    "model": "gpt-35-turbo-16k",
    "object": "chat.completion",
    "usage": {
        "completion_tokens": 47,
        "prompt_tokens": 70,
        "total_tokens": 117
    }
}
```

Because of that response structure, the response transformer script looks like this script:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
(function(inputs) {
    /* write code here to transform the llm response into an
 array of text responses, using the inputs object
    inputs structure: {
        prompt_data: object,
        request_data: object,
        response_body: string,
        response_headers: string
    } */
    var requestData = inputs.request_data;
    var promptData = inputs.prompt_data;
    var responseBody = JSON.parse(inputs.response_body);
    gs.info("response : " + inputs.response_body);
    var responseTexts = [];

    // write code here to populate the responseTexts array.

 responseTexts.push(responseBody.choices[0].message.content);

    return responseTexts;

})(inputs);
```

18. Create the transformer scripts by selecting **Submit**.

Result
Your external LLM is connected to Generative AI Controller. You can use the AI service provider for generative AI capabilities on the ServiceNow AI Platform.

What to do next
After you connect the LLM, you can set a provider for the generative AI capabilities of Generative AI Controller. For more information, see Set a provider for a generative AI capability.

Build custom skills with this capability using AI Skill Kit. For more information, see AI Skill Kit.

Set a provider for a generative AI capability

Configure LLM providers for Generative AI Controller at the backend level. For most use cases, configure capabilities using AI Admin Hub.

Before you begin
Configure your credentials for your preferred provider. See Configuring API credentials for generative AI capabilities for more details.

Role required: admin

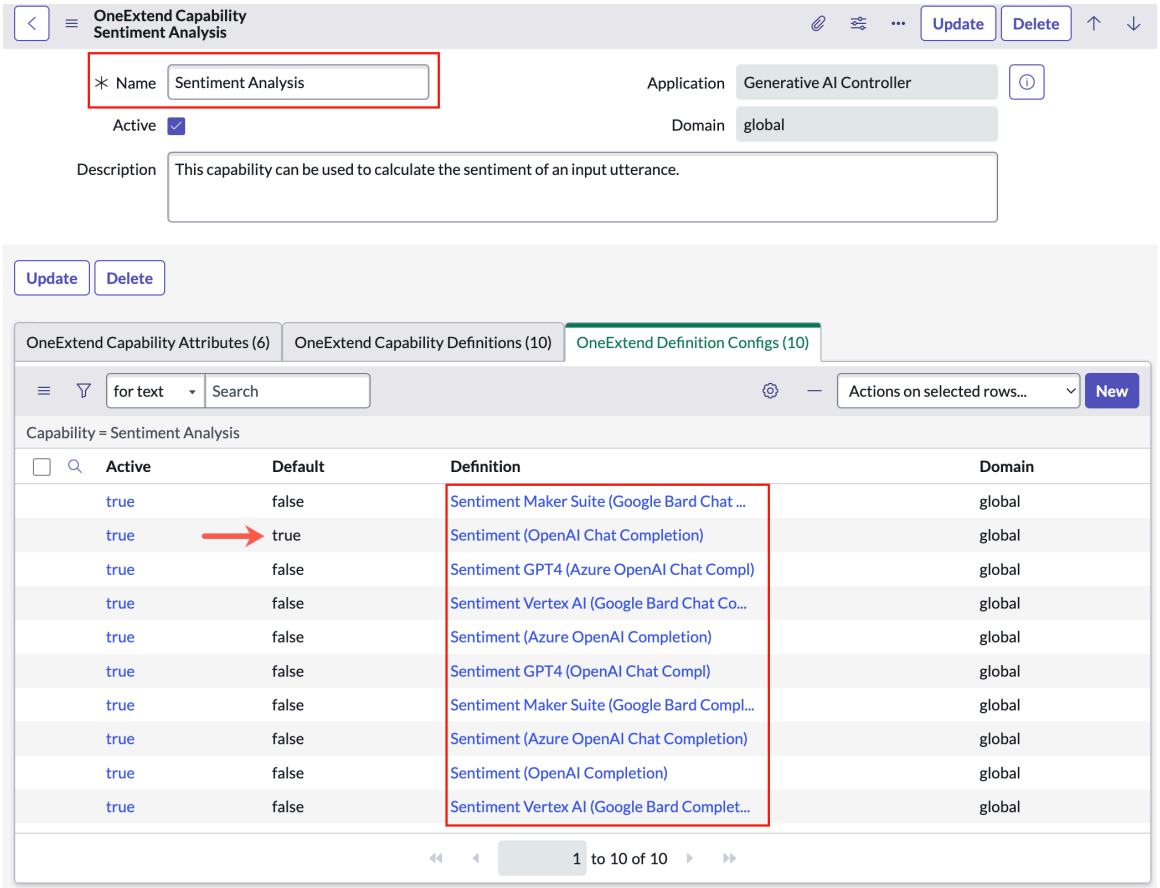
About this task
Use this procedure to configure LLM providers at the OneExtend Capability level. Generative AI capabilities are configured using the AI Admin Hub, which is the recommended approach. This procedure is for backend configuration when you need to manage custom OneExtend configurations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the navigation filter, search for the OneExtend Capability table by entering `sys_one_extend_capability.list`.
2. In the OneExtend Definition Configs related list, set **Default** to `true` for your preferred capability provider.

> **Note:** By default, you can choose only one provider for a capability. For example, if **Default** is `true` for Sentiment (OpenAI Completion), you must set **Default** to `false` before changing **Default** to `true` for Sentiment (Azure OpenAI).



Model Options

You have the option to choose between several different models for each capability.

Capability Definition	Model
○ OpenAI Completion ○ Azure OpenAI Completion	GPT-3
○ OpenAI Chat Completion ○ Azure OpenAI Chat Completion	GPT-3.5
○ GPT4 (OpenAI Chat Compl) ○ GPT4 (Azure OpenAI Chat Compl)	GPT-4

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Capability Definition	Model
○ AI Studio (Google Cloud Completion) ○ AI Studio (Google Cloud Chat Completion) ○ Vertex AI (Google Cloud Completion) ○ Vertex AI (Google Cloud Chat Completion)	Google Gemini
IBM watsonx	Granite

Result
The provider configuration is applied at the OneExtend Capability level and is available for use by generative AI capabilities in your instance.

What to do next
To configure generative AI capabilities through the standard approach, see Generative AI skills, AI Skill Kit, and AI Admin Hub.

Select a model for Amazon Bedrock

Choose which large language model (LLM) to use with Amazon Bedrock for custom skills.

Before you begin
You must have the latest version of Generative AI Controller and the Amazon Bedrock spoke installed on your instance. You must also set up your API credentials. For more information, see Configure API credentials for Amazon Bedrock.

Role required: admin

About this task
You may have multiple models configured to use with Amazon Bedrock. By default, the settings use Amazon's Titan model, but you can configure the spoke to use a different model by changing the Generative AI Model Config record.

Procedure
1. In the filter navigator, navigate to the Generative AI Model Config table by entering `sys_generative_ai_model_config.list`.
2. Search in the Provider field column for `Amazon Bedrock`, then open the resulting record.
3. In the Model field, enter the ID of the model that you want to use.
   You can find the model ID on the **Foundation models** > **Base models** page on Amazon Bedrock.
4. Select **Save** to update the record.
5. Map the chosen model to a custom skill.

   a. In the filter navigator, go to the Generative AI Config table by entering `sys_generative_ai_config.list`.

   b. Search for the custom skill you've created that uses Amazon Bedrock as the service provider, and open the record.
   The Definition should be OneExtend Capability Definition: <Name of Skill>.

   c. Set the Model field to the model ID you entered in step 3.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
Your chosen model with the Amazon Bedrock provider will be used for custom skills.

What to do next
You can create custom skills with the Amazon Bedrock provider in AI Skill Kit and perform step 6 to set the new model.

Configure generative AI skills in the AI Admin Hub console to use this capability. For more information, see AI Admin Hub.

Configure small talk filters

Redirect users to different Virtual Agent topics if small talk, such as greetings, expressions of gratitude, complaints, or requests to close, are detected in conversations.

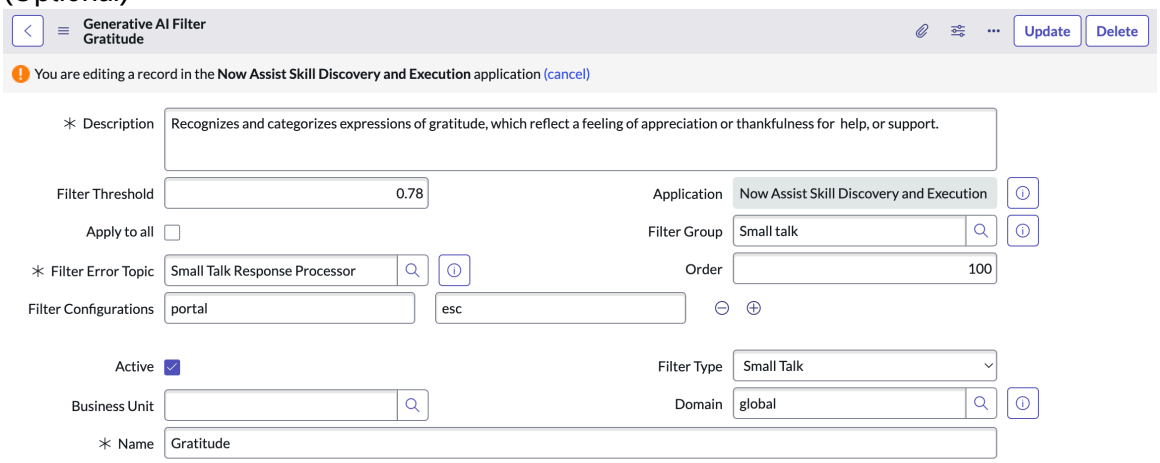
Before you begin
Role required: admin

About this task
When engaging with generative AI, many people send conversational messages that are ultimately unhelpful for the Virtual Agent when determining how to help the user achieve their goals. You can configure small talk filters that catch these conversational messages. When a user is sending a message such as a greeting or expressing complaints about the conversation, you can redirect them to serve their needs.

Procedure
1. In the navigator, go to the Generative AI Filter [sys_gen_ai_filter] table by entering `sys_gen_ai_filter.list`.
2. Open the record for the small talk filter that you want to configure or select **New** to create one.
   By default, the four available filters for small talk are Greetings, Gratitude, Complaint, and Closure. If you see other filters, those filters are sensitive topic filters that can be set up with the Now Assist Admin console. See Configure subject filters for generative AI for more information.
3. If creating a filter, add a **Name** and **Description** for the filter.
4. Choose the Filter Error Topic that you want to redirect users to when the small talk filter is detected.
   By default, the user is redirected to the Small Talk Response Processor topic.
5. For the **Order** field, choose the order to apply the filters.
   Filters are processed by lowest order to highest. A filter with order 100 is processed before a filter with order 200.
6. **Optional:** In the **Filter Configurations** field, use the name "portal" to determine where the filter should be run, such as setting "portal" to value "sp" to apply only the filter on the sp portal.
   Use a comma-separated list to select multiple values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

(Optional)



7. Select **Save** to save any changes.
8. In the navigator, go to the Generative AI Filter Sample [sys_gen_ai_filter_sample] table by entering `sys_gen_ai_filter_sample.list`.
9. **Optional:** Review the sample phrases for each filter.
   Statements that match these sample phrases activate the selected filter. You can create sample phrases manually by creating records on the table or by using generative AI to generate samples for you.

   a. To create a sample manually, select **New**.

   b. In the **Sample text** field, enter the sample text of what you want to be caught by the filter.

   c. In the **Filter** field, select the filter you want the sample to be applied to.

   d. If you want to generate more sample phrases with generative AI, open a record for a sample phrase for the desired filter.
   An example might be the "Thanks for your assistance with my task" sample filter for the Gratitude filter.

   (Optional)

   e. Select **Generate Samples** to create additional example statements to trigger the filter.
   The more sample statements that you provide, the more likely that the filter aligns with your expectations of its behavior.

Result

When engaging in conversations with generative AI, users are redirected to a new topic when filtered subjects or sentiments are detected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure AI search answers capability for web search

AI web search is a OneExtend capability that enables end users to perform web searches and receive AI-powered answers. The capability supports multiple AI providers and integrates with virtual assistants and workflows.

Before you begin

When web search is turned on, Google Gemini is the default AI provider. To switch AI providers, admins must configure the AI Search answers OneExtend capability. The instance or skills default AI provider that is set in AI Admin Hub can differ from the web search AI provider. For more information on the default instance or skills AI provider, see Manage model providers.

Some of the AI providers require API keys whereas others don't require API keys because they use OEM. The following table highlights the four AI providers and whether they use API keys or OEM.

AI providers that require API keys	AI providers that use OEM
OpenAI	Gemini **Note:** Google Gemini is the default web search AI provider in the AI Search answers OneExtend capability. If you selected Google Gemini as the LLM provider in AI Admin Hub and you want to use Google Gemini as your web search AI provider, you don't need to configure the AI Search answers OneExtend capability.
Perplexity	Azure **Note:** Azure doesn't currently support web search.

Role required: admin

Procedure

1. In the navigator filter, go to the OneExtend Capability list by entering `sys_one_extend_capability.list`.
2. Search for the `AI Search answers` OneExtend capability.
3. Select the AI Search answers record.
4. In the OneExtend Definition Configs related list, view the Default column.
   When the AI provider's Default column is set to `true`, that is the AI search provider used for the web search. Gemini defaults to `true`. To change the AI search provider to an AI provider that requires the use of API keys, such as Perplexity or OpenAI, continue with the following steps.

   Note: Although Azure OpenAI answer is an option for an AI search provider, Azure doesn't support web search and should remain set to `false`.

5. In the OneExtend Capability Definitions related list, select the value in the Connection And Credential Alias column for the AI search provider you want to use.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, if you want to switch the web search AI provider to OpenAI, select **sn_openai.OpenAI** from the Connection And Credential Alias column.
The Connection & Credential Alias form opens. If no connections are available within the Connections related list, you must create a connection.

6. Complete one of the following actions based on the following scenarios.

Scenario	Action required
Connection is available	If a connection is already available within the Connections related list, continue to the next step.
Connection isn't available and must be created	**a.** Select **New** within the Connections related list to create a connection. **b.** In the **Name** field, enter the connection name. For example, `Open AI connection`. **Note:** For more information about the fields on the HTTP(s) Connections New record form, see Create an **c.** Select the Lookup using list icon ( ) next to **Credential**. **d.** Select **New** to create a credential for your connection. **Note:** You may see an existing credential that you can select from the Credentials list, but some AI providers, like OpenAI, do not come with default credentials. **e.** Select **API Key Credentials**. **f.** Enter a name in the **Name** field. For example, `Open AI key`. **g.** Enter the API key in the **API key** field. **Note:** For more information about the fields on the API Key Credentials New record form, see API key creden **h.** Select **Submit**. You're redirected back to the HTTP(s) Connections new record form. **i.** Enter the connection URL in the **Connection URL** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scenario	Action required
	For example, enter `https://api.openai.com` for Open AI. **j.** Select **Submit**.

a. In the OneExtend Definition Configs related list, set the existing default AI provider from `true` to `false`.

b. In the OneExtend Definition Configs related list, set the AI provider that you want to use from `false` to `true`.

7. Select **Update**.
The AI provider for web search is now updated.

Result
End users can now perform an internet search to answer a query whenever in web search mode. For more information about web search mode for end users, see Web search.

What to do next
If you switched the AI provider to Perplexity, you must work with the *sn_ai_websearch.perplexity_model_name* system property. For more information on this system property, see ServiceNow® Otto for Virtual Agent system properties.

Enable recursive summarization for large inputs

Use recursive summarization to break down the requests to the large language models (LLMs) into smaller pieces so that you can maintain the context for generative AI capabilities.

Before you begin
Role required: admin

About this task
LLMs have a maximum number of tokens that can be processed in a single request. Certain fields, such as activity fields, can have more information than can fit in within those restrictions. Recursive summarization breaks the information given to an LLM into chunks, summarizes each chunk individually, and then processes the original request with the summarized chunks. The chunks are organized with overlaps between the pieces so that the context is retained across every piece. For more information about provider-specific token limits, see [KB2038552].

Note: Enabling recursive summarization may cause the capabilities to process large inputs more slowly because they must make multiple calls to the LLM instead of just one call.

Procedure
1. In the navigator filter, go to the OneExtend Capability list by entering `sys_one_extend_capability.list`.

2. Open the record for the OneExtend capability that you want to change.

3. In the OneExtend Definition Config related list, set **Enable Large Input Support** to true for the OneExtend Definition that you want to enable recursive summarization for.

4. In the OneExtend Capability Attributes related list, set **Contains Large Input** to true for the fields that you want to add recursive summarization in.
The fields that are most likely to contain a large amount of data, such as an activities field, should have their values set to true. You can also select the **Contains Large Input** check box on the OneExtend Capability Attribute record and save the record to set the value to true.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
Recursive summarization is enabled for the OneExtend Capability for the fields specified in this procedure.

What to do next
Configure generative AI skills in the AI Admin Hub console to use this capability. For more information, see AI Admin Hub.

Enable Dynamic Translation for capabilities in Generative AI Controller

Use Dynamic Translation to add multiple language support for generative AI capabilities to support users who speak languages other than English.

Before you begin
You must have the Dynamic Translation and Conversational Dynamic Translation plugins installed and enabled on your instance. For more information on setting up Dynamic Translation, see Configuring Dynamic Translation.

You must have a default Translation Configuration set in the Translation Configuration table (sn_dt_translator_configuration).

Role required: admin

About this task
By default, Dynamic Translation is inactive for capabilities with Generative AI Controller.

Dynamic Translation isn't available for capabilities in Virtual Agent or ServiceNow Otto panel.

Procedure
1. Navigate to the OneExtend Capability (sys_one_extend_capability) table by entering `sys_one_extend_capability.list` in the navigator.
2. Open the record for the capability that you want to enable Dynamic Translation for.
3. In the OneExtend Capability Attributes related list, open the record for the attribute you would like to be translated, such as response.
4. Select **Translate** to enable translation.
   If you don't see the field on the form, you must edit the form to display the **Translate**. One way of adding the field to the form is by selecting the menu icon by the table name of the form and choosing **Configure** > **Form Layout**. Add the **Translate** field to the Selected list. Then, select **Save** to save the form. You're then redirected back to the record with the field available to select.
5. Select **Submit** to save the record.

Result
Dynamic Translation is installed for your generative AI capability on the attribute that you selected.

What to do next
Configure generative AI skills in the AI Admin Hub console to use this capability. For more information, see AI Admin Hub.

Disable Dynamic Translation for LLM Virtual Agent conversations

Enable dynamic translation of chat messages into English before they are sent to the large language model in generative AI topics to support users who speak other languages.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
You must have Dynamic Translation for Virtual Agent installed and active for your Virtual Agent. For more information, check out .

Role required: admin

About this task
Dynamic Translation is enabled by default.

There are certain limitations of Dynamic Translation for Virtual Agent. Catalog item names aren't automatically translated, and only languages configured for language detection will be recognized.

Procedure
1. Navigate to **All**, and then enter `sys_properties.list` in the filter.
2. Select the magnifying glass icon ( ) to expand the column search row.
3. In the Name column, enter `sn_generative_ai.disable_dynamic_translation` and then press **Enter** to search.
4. Open the matching record.
5. Set the property value to `true`.
6. Select **Save** to save the record.

Result
Chat requester utterances are translated into English before being sent to the LLM, and output messages are translated back into the requester's preferred language.

Configure rate limiting for providers

Configure rate limiting to control the traffic flow to the one_extend request by restricting the number of requests that can be made within a certain time frame.

Before you begin
Role required: admin

About this task
To rate limit the one_extend request, you must define the rate limit rules for the incoming requests. You can create your own rule in the One Extend Rate Limit Rules table.

Procedure
1. On your ServiceNow instance, navigate to the One Extend Rate Limit Rules [sys_one_extend_rate_limit_rules] table and select **New**.
2. On the form, fill in the fields.

One Extend Rate Limit Rule form

Field	Description
Name	Name of the rate limit rule. Identify the rate limit rule with a name.
Application	Application scope that must be set to Global.
Resource	Resources to select for your rate limit rule.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Use one of the following resources for your rate limit rule: ○ **LLM Provider**: For the LLM Provider, select the generative AI provider mapping. ○ **Capability Definition**: For the Capability Definition, select the One Extend Capability Definition. ○ **All Capabilities**: Applies to all providers and all capability definitions.
Rule Type	Rule type for the rate limit rule. Define the rule type using the following options: ○ **Instance**: Accumulates data from all the users of that instance. ○ **User**: Keeps the count of the requests per user.
Request limit per hour	Maximum number of requests to be received per hour.
Active	Status of the rate limit rule.

3. Select **Submit**.

Bring your own key for third-party AI provider integration

The bring-your-own-key (BYOK) feature enables you to use your own API credentials from supported cloud AI providers, such as Azure OpenAI, Amazon Bedrock, and Google Gemini, to run generative AI skills and AI agents.

When BYOK is enabled, AI model requests are sent through your cloud AI provider account instead of ServiceNow AI Platform infrastructure. This approach lets you maintain ownership of your AI configuration, security controls, and data processing environment while continuing to use ServiceNow AI Platform capabilities.

BYOK supports the same AI models that the ServiceNow AI Platform supports. After you configure your API credentials, your provider resources are used to process requests instead of the default ServiceNow AI provider. BYOK keeps your keys under your control and AI workloads running within your cloud environment.

Note: Using your organization's cloud AI provider account might result in additional charges from that provider. Review the provider's pricing and terms of service before enabling BYOK.

ServiceNow integrated model providers

BYOK supports the following cloud AI providers:

- Azure OpenAI
- Anthropic Claude on AWS, which is accessible through Amazon Bedrock
- Google Gemini

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuring a BYOK connection with a cloud AI provider

To use your cloud AI provider resources within your ServiceNow instance, configure a connection between ServiceNow and your provider. Configuration steps vary by provider, but follow a similar high-level configuration workflow, such as the following:

1. Create connection and credentials for the provider, such as endpoint, API key, and region.
2. Enable BYOK for the provider in AI Admin Hub.
3. Map ServiceNow model aliases to provider model versions.

   For example, map `gemini_large` → 2.5 Pro.
4. Override variants in each skill in Version Management.
5. Validate that requests are using your AI provider account by reviewing outbound HTTPS logs.

For step-by-step instructions for each supported cloud AI provider, see Configure Bring Your Own Key (BYOK) for Now Assist and AI Agents [KB2666298] article in the Now Support Knowledge Base.

Example: High-level BYOK configuration for Azure OpenAI

1. Set up Azure OpenAI connection with your own key to use Azure OpenAI within your ServiceNow instance.

   For more information, see Configure API credentials for Azure OpenAI.
2. Configure your Azure OpenAI model and deployment name in Generative AI Controller so your ServiceNow instance can recognize and use it.

   For more information, see Create a custom embedding model.
3. Modify the prompt configuration to write your own prompts to send to the Azure OpenAI LLMs.

   For more information, see Configure a generic large language model (LLM) connector.
4. Switch providers to use BYOK for AI processing.

   For more information, see Manage Integration.

Related topics

Configure a custom resource path for BYOK models

Configure a custom resource path for BYOK models

Enter a custom resource path in your bring-your-own-key (BYOK) model configuration so that Generative AI Controller can connect to AI service providers that use a different web address than the default.

Before you begin

Role required: admin

About this task

When you configure a bring your own key (BYOK) model provider in Generative AI Controller, it uses the connection and credential alias to send requests to your AI provider. The alias contains the base URL and API key for your provider. Some AI providers, such as Azure OpenAI, include an extra path segment in their web address that Generative AI Controller does not add

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

by default. Without this segment, Generative AI Controller requests don't reach your provider correctly.

The Resource Path field in the model configuration record is where you provide that extra segment.

Note: The custom resource path configuration is currently supported for Azure OpenAI only.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connections & Credential Aliases**.
2. Open the Generative AI provider record for Azure OpenAI.
3. In the Connections Attributes related list, select the **Chat Completions Resource Path** attribute.
4. Enter the custom resource path for your provider's endpoint in the **Default value** field.
   For example, for Azure OpenAI, if your full endpoint URL is:

   ```
   https://<your-resource-name>.openai.azure.com/openai/deployments/<your-deployment-name>
   ```

   Enter the following resource path in the **Default value** field:

   ```
   /openai/deployments/<your-deployment-name>
   ```

   Note: You can find your resource name and deployment name in the Azure portal.

5. Select **Update**.

Result

Generative AI Controller now connects to your AI provider using the resource path you entered. Your agentic AI skills are ready to use this provider.

Reference for Generative AI Controller

Reference topics provide information about Generative AI Controller tables, and properties.

Tables installed

Name	Table	Description
OneExtend Capability	sys_one_extend_capability	Generative AI Controller capabilities for routing and governing generative AI requests for your ServiceNow AI applications.
OneExtend Capability Definition	sys_one_extend_capability_definition	Attribute configuration for input and output variables for for generative AI capability definitions.
OneExtend Capability Definition Attribute	sys_one_extend_definition_attribute	Input and output variables for for generative AI capability definitions. Variable names can't be changed if the capability is active and used on the instance. You can check whether

Name	Table	Description
		a capability is used by going to the OneExtend Usages table.
OneExtend Builder Config	sys_one_extend_builder_config	Determines which capability and provider is related to each generative AI builder component.
OneExtend Builder Capability	sys_one_extend_builder_capability	Definitions for a capacity and its provider for builder components.
OneExtend Usage	sys_one_extend_usage	Each usage of a generative AI capability across your Now Assist applications.
Gen AI Log Metadata	sys_gen_ai_log_metadata	Log data about requests to the LLMs, including information about definition, errors, user, and feedback provided. AI-generated content can be tracked for a duration beyond six months. You can export historical data by writing a script to copy it into a different table without deleting the information.
Generative AI Metric	sys_generative_ai_metric	Logs various metrics to help evaluate the performance and accuracy of LLM responses, such as edit score, edit distance, guardrail activity, and details about the LLM model used.
Gen AI Model Version Mapping	sys_gen_ai_model_version_mapping	Maintains mappings between AI model versions, their providers, and configuration details, providing a clear understanding of how source models map to target models. It also includes associated metadata, such as skill type, model type, resource associations, and provider information.
Generative AI Log	sys_generative_ai_log	Logs Generative AI prompts, responses, and edited responses to debug LLM calls. Log records are retained for 180 days. HR-related logs are restricted to HR Administrators, ensuring sensitive information remains protected. For more information, see Generative AI Controller tables.

Properties

Generative AI Controller properties

Property	Description
com.sn.generative.ai.provider	Default provider when capability definition has no default.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Generative AI Controller properties (continued)

Property	Description
	Type: choice list No default value
com.sn.generative.ai.ais.message	Message that is displayed when AI Search fails to find an answer to a query. Type: string Default value: No answer found.
com.sn.generative.ai.log_prompt	Prompt that determines whether generative AI API calls are logged. Type: true | false Default value: true
com.sn.generative.ai.moderation.message	Message that is displayed if the OpenAI or Azure OpenAI moderation tools identify the content that goes against their terms of service. Type: string Default value: The response cannot be displayed as it's deemed inappropriate by OpenAI.
com.glide.one.extend.token.buffer	Buffer that checks the request for the number of tokens before a OneExtend capability is executed. The maximum allowed request tokens are calculated based on the maximum tokens that are permitted by the AI provider's API minus the response token and buffer value that is specified in this system property. Type: integer Default value: 250
domain.llm.usage.entitled	Determines whether to use the LLM for a specific domain to process data or restrict its use. Type: true | false Default value: true

Generative AI Controller tables

Generative AI Controller use dedicated tables to log AI activities and track AI usage across the platform.

Generative AI Log [sys_generative_ai_log] table

Logs generative AI prompts, responses, and edited responses for debugging LLM calls. Log records are retained for 180 days.

HR-related log entries are restricted to HR administrator to protect sensitive information.

Generative AI Log [sys_generative_ai_log]

Column	Data type	Description
Additional Data	String	Contains concatenated values for actions performed on the generated LLM response, such as copied or edited. This field is populated through the feedback API.
Caller	String	Contains information about the calling application that generated the log entry.
Completed At	Date/Time	Timestamp when the generative AI execution completed.
Conversation	Reference	Reference to the conversation this log is part of.
Created	Date/Time	Date and time when the log entry was created.
Created By	String	Contains user information that initiated the execution or flow.
Definition	Reference	Reference to the capability definition responsible for generating the log entry.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Generative AI Log [sys_generative_ai_log] (continued)

Column	Data type	Description
Derived Scope	Reference	Associated scope of the application that generated the log entry.
Domain	Domain ID	Domain associated with the execution that generated the log entry.
Domain Path	Domain Path	Path associated with the domain from where the capability is executed. When domain separation is enabled, this column is automatically populated by the platform.
Edited Response	String	Captures the edited version of the response when a user modifies it.
Error	String	Error message, if the request encountered an error.
Error Code	String	Error code associated with the error message.
External	True/False	Indicates whether the log entry is for a request sent to an external third-party LLM provider. The default value is False.
Feedback	Choice	Feedback on the LLM response. Possible values: Accepted, Rejected, Ignored, SlightlyPositive, SlightlyNegative, LikelyPositive.
Feedback Timestamp	Date/Time	Timestamp when the feedback was submitted.
Gen AI Usage Log	Reference	Reference to the Gen AI Usage Log.
Metadata Document	Document ID	Document ID for metadata used for the requested execution, if only a single document is used.
Metadata Documents	Glide List	Document IDs for metadata used for the requested execution, if multiple documents are used.
Metadata Table	Table Name	Table name for the metadata.
Model Name	String	Name of the model used for processing the generative AI

Generative AI Log [sys_generative_ai_log] (continued)

Column	Data type	Description
		request, such as gpt_large, claude_small, or gemini_small.
Model Version	String	Version of the LLM model used.
Output Metadata	String	Metadata received from the model or LLM, including tokens, processing time, and response time.
Prompt	String	Final prompt passed to the model.
Prompt Config	Reference	Reference to the prompt configuration, which contains settings such as model and temperature used in the request to the LLM.
Prompt Token Count	Integer	Number of tokens used in the prompt.
Response	String	The response generated by the LLM.
Response Token Count	Integer	Number of tokens in the response.
Skill Config Id	Reference	Reference to the skill configuration.
Source	String	Source feature responsible for the execution, such as ChatSummary, Now Assist in AI Search, or WWNA: Refine.
Started At	Date/Time	Timestamp when the generative AI execution started.
Status	String	Status of the AI log. Possible values: Success, Error.
Target Language	String	Target language for the AI log.
Time Taken	Integer	Time taken for the AI log process.
Untranslated Prompt	String	The untranslated version of the prompt.
Updated	Date/Time	Date and time when the log entry was last updated.
Updated By	String	User who made updates to the log.
Updates	Integer	Number of updates made to the log record.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Gen AI Usage Log [sys_gen_ai_usage_log] table

Tracks each use of an AI capability on the platform. Use this log to monitor how your organization consumes assists, review trial assist usage, and understand generative AI activity at the user or team level.

To access the log, enter `sys_gen_ai_usage_log.list` in the navigation filter.

Gen AI Usage Log [sys_gen_ai_usage_log]

Column	Data Type	Description
Assists	Integer	Number of assists used or consumed.
Created	Date/Time	Date and time when the log entry was created.
Created By	String	Contains user information that initiated the execution or flow.
Document	Document ID	Document ID for metadata used for the requested execution.
Document Table	String	Table name for the document table.
Domain	Domain ID	Domain associated with the execution that generated the log entry.
Domain Path	Domain Path	Path associated with the domain from where the capability is executed.
Execution Type	Choice	Type of execution. Possible values: Test, Evaluation, Auto Prompt Tuning.
Feature	Reference	Source feature for the assist usage.
Line Item Name	String	License line item name associated with the assist usage.
License Name	String	License name associated with the assist usage.
Plugin Name	String	Plugin name that the feature responsible for the assist usage is part of.
Skill Config Id	Reference	ID of the skill responsible for the assist usage.
Status	Choice	Status of the usage log. Possible values: Completed, Pending.
Strategy	Choice	Strategy used for pricing the assist usage.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:

- Not all model providers are available for customers with in-country SKUs, and some AI products/features are currently unavailable for in-country customers. For more information, see the KB1584492 article in the Now Support Knowledge Base. Be sure to check for model provider availability updates in future releases.
- Some AI products/features are currently unavailable for customers in the FedRAMP, NSC DOD IL5, or Australia IRAP-Protected data centers, self-hosted customers, or in other restricted environments. For more information, see the KB0743854 article in the Now Support Knowledge Base. Be sure to check for availability updates in future releases.
- Some AI products/features are currently available only for customers in some regions. Be sure to check for availability updates in future releases.
- Some AI products and skills are not available in Regulated Markets. For more information, see KB2593939: Regulated Markets AI Products/Skills Not Available. Be sure to check for availability updates in future releases.

AI limitations

This application uses artificial intelligence (AI) and machine learning, which are rapidly evolving fields of study that generate predictions based on patterns in data. As a result, this application may not always produce accurate, complete, or appropriate information. Furthermore, there is no guarantee that this application has been fully trained or tested for your use case. To mitigate these issues, it is your responsibility to test and evaluate your use of this application for accuracy, harm, and appropriateness for your use case, employ human oversight of output, and refrain from relying solely on AI-generated outputs for decision-making purposes. This is especially important if you choose to deploy this application in areas with consequential impacts such as healthcare, finance, legal, employment, security, or infrastructure. You agree to abide by ServiceNow's AI Acceptable Use Policy, which may be updated by ServiceNow.

Data processing

This application requires data to be transferred from ServiceNow customers' individual instances to a centralized ServiceNow environment, which may be located in a different data center region from the one where your instance is, and potentially to a third-party cloud provider, such as Microsoft Azure. This data is handled per ServiceNow's internal policies and procedures, including our policies available through our CORE Compliance Portal.

Data collection

ServiceNow collects and uses the inputs, outputs, and edits to outputs of this application to develop and improve ServiceNow technologies including ServiceNow models and AI products. Customers can opt out of future data collection at any time, as described in the AI Opt-Out page.

For more information, see the Now Assist documentation.

Exploring Model Context Protocol Client

The Model Context Protocol (MCP) is a standardized client-server protocol that enables AI applications to discover and interact seamlessly with external tools, data sources, and services. MCP facilitates communication between an AI host application (like AI Agent Studio), an MCP Client embedded in the host, and one or more MCP Servers that expose specific capabilities such as tools.

Model Context Protocol Client terminology

- **MCP Host**: The AI application environment where the tasks are initiated.
- **MCP Client**: Manages communication between the host and the MCP Servers, handling the requests and responses.

  The MCP Client architecture enables AI agents to extend their capabilities by invoking external systems dynamically, enabling tasks like accessing APIs, databases, or file systems in a standardized way.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **MCP Server**: Provides external functionalities by exposing tools for AI agents to use.
- **MCP Tools**: The external tools exposed by the MCP Servers to be used by AI agents.

Why use MCP Tools

MCP tools enable seamless integration to:

- Connect your AI agent with a wide variety of external tools with minimal setup.
- Add multiple MCP tools to an AI agent to perform a broader range of tasks.
- Review and edit tool input parameters as needed before saving.

Configuring Model Context Protocol Client

Configure the MCP Client to execute agentic workflows with AI agents and mapped tools.

Configuring MCP Client enables you to:

- Incorporate external tools in AI agents built on ServiceNow.
- Access tools offered on external MCP Servers.
- Integrate MCP Client with the AI Agent Studio.

By setting up MCP Servers, AI agents in your environment can leverage external tools efficiently, enhancing their ability to perform complex tasks with up-to-date information.

Install Model Context Protocol Client

Install the MCP Client application on your ServiceNow instance to enable using the tools from the MCP Server in AI agents.

Before you begin

Role required: sn_mcp_client.admin

Verify that you:

- Install the AI Agent Studio plugin [com.snc.sn_aia] and the Generative AI Controller plugin [com.sn.generative.ai] to use the MCP Client.
- Enable the MCP Tool experience in your instance by setting the *sn_aia.enable_mcp_tool* system property to **true**.

Note: ServiceNow supports Protocol version 2025-03-26 of the MCP Servers for MCP Client.

Procedure

1. Navigate to **All** > **System Definition** > **Plugins**.
2. Search for Model Context Protocol Client plugin [sn_mcp_client].
3. Select **Install**.

Adding an MCP Server in AI Agent Studio

An MCP Server hosts the APIs and tools required by an AI application, enabling it to receive and process calls from MCP Clients to govern ingress traffic and to promote secure and efficient access to tools. Adding an MCP Server in the AI Agent Studio helps you to leverage the Model Context Protocol as a tool in an AI agent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connecting an MCP Server with the AI Agent Studio simplifies the integration process, making it easier to discover and invoke services. This connection enhances security and governance, providing a streamlined setup experience for administrators.

Adding an MCP Server requires you to add an MCP Server in the AI Agent Studio. You can add an MCP Server with one of the following authentication options:

1. **OAuth 2.1**: Helps add an MCP Server with an authentication code. For more information, see Add an MCP Server with OAuth 2.1.
2. **API Key**: Helps add an MCP Server with an API Key. For more information, see Add an MCP Server with API Key.
3. **Others**: Helps add an MCP Server in a manual way by selecting a Connection and Credential Alias record. For more information, see Add an MCP Server with Connection and Credential Alias.

Note: You must authenticate the users with the MCP Server to add the MCP tool to an AI agent and without prior authentication, you can't add the MCP Servers.

Add an MCP Server with OAuth 2.1

Add an MCP Server with OAuth 2.1 in the AI Agent Studio.

Before you begin

Role required: sn_mcp_client.admin

About this task

OAuth is the usual method to authenticate the MCP servers. If your MCP server supports it, choose OAuth 2.1 in the Authentication method.

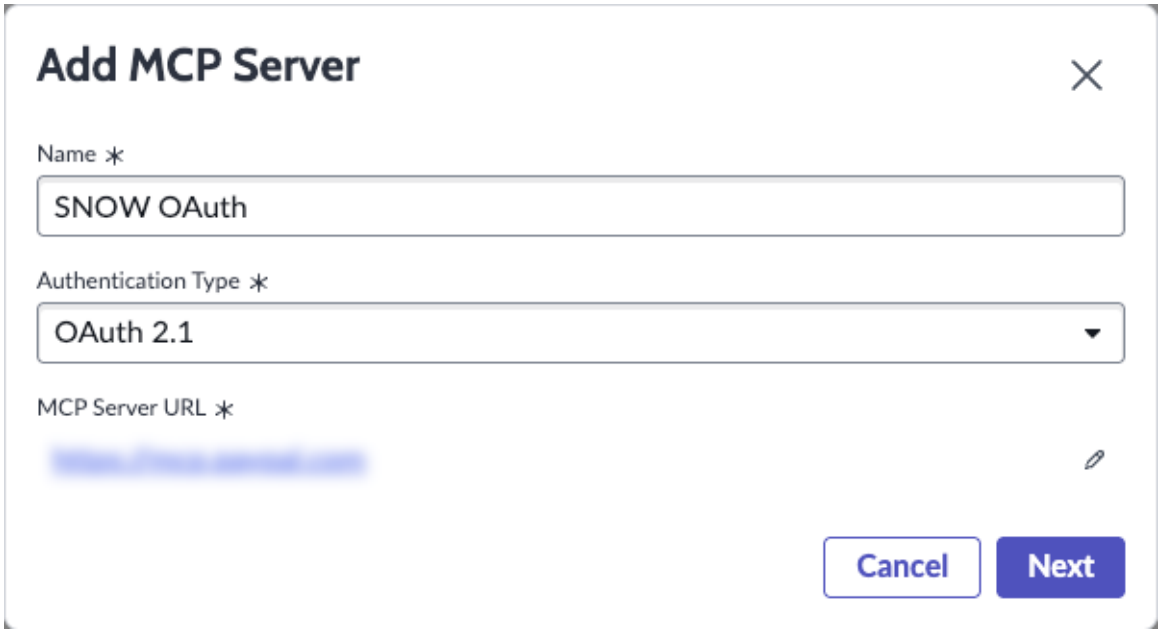
Procedure

1. Navigate to **All** > **AI Agent Studio** > **Settings**.
2. Navigate to **Manage MCP Servers** and select **New**.
3. On the form, fill in the fields.

Add MCP Server

Field	Description
Name	Name for your MCP Server.
Authentication Type	The authentication type with which you want to add your MCP Server. Select **OAuth 2.1**.
MCP Server URL	The web address of your MCP Server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Select **Next**.
   The form extends with the registration details.
5. On the form, fill in the fields:

   The dynamic client registration auto-populates the data in the form fields.

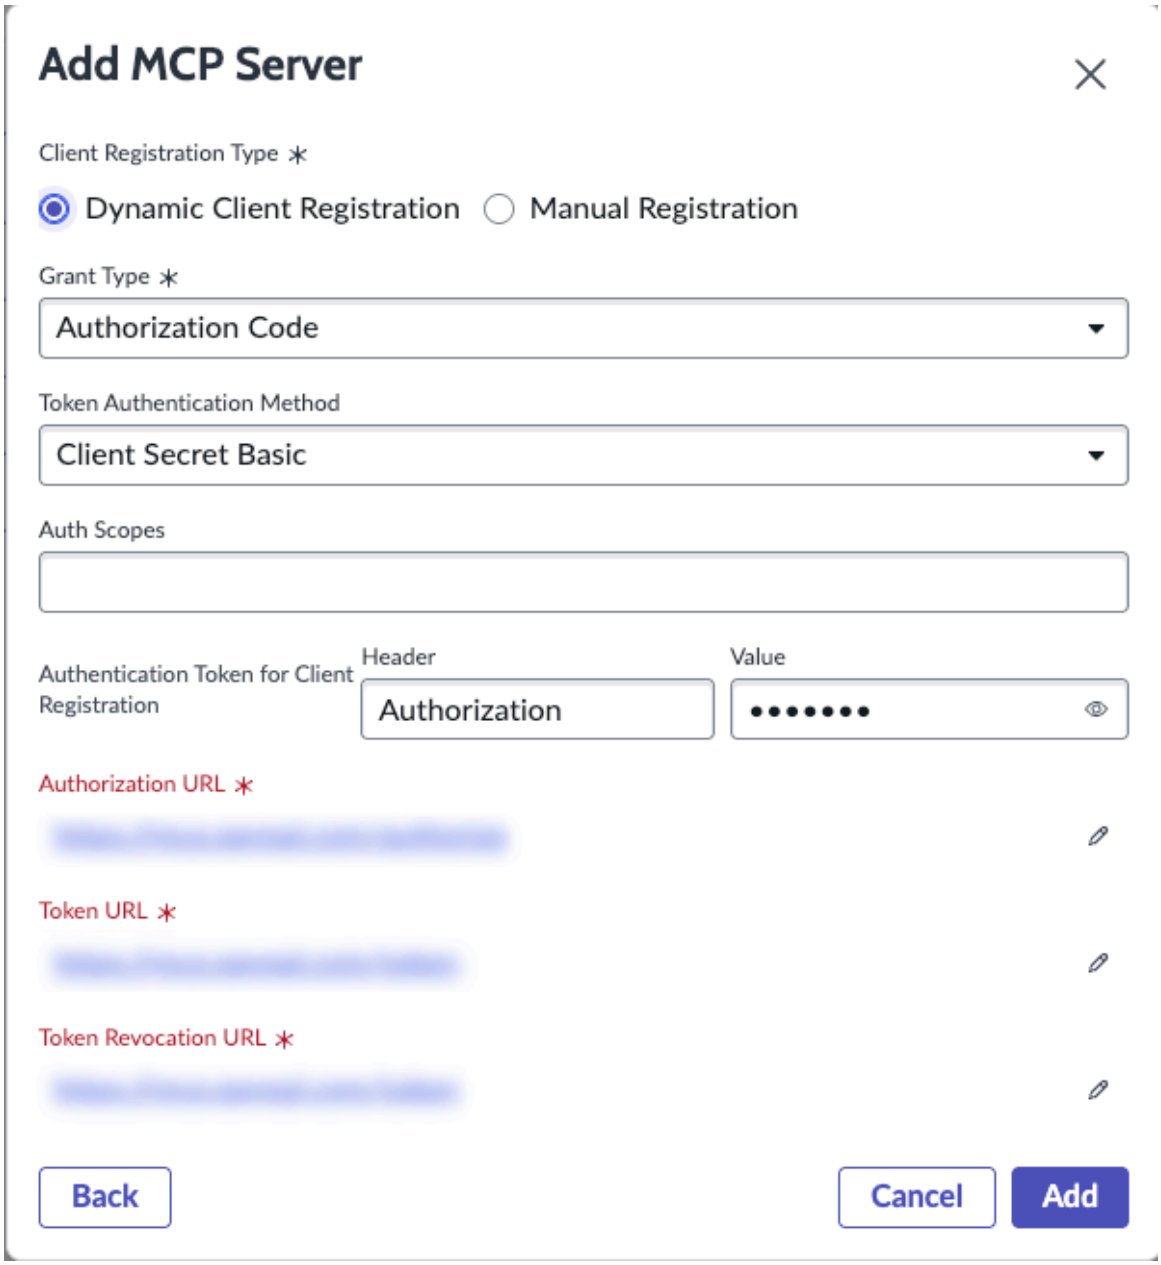
   Note: If dynamic registration is supported by the MCP Server, you'll be prompted to confirm the grant type and other inputs. If dynamic registration isn't supported, you can continue with the Manual Registration method in Step 6.

Dynamic Client Registration

Field	Description
Grant Type	The way you want to obtain an access token for accessing protected resources. One of the following two options is used here with auto-populated data. ○ **Authorization Code**: A system-generated code that is used for granting access to an application or resource. ○ **Client Credentials**: Access token provided by the administrator to access the application directly.
Token Authentication Method	Unique token granted to access resources. Select the value from the drop-down list.
Auth Scopes	Define the specific permissions for an application. **Note:** The Auth scopes must be comma-separated values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Authentication Token for Client Registration	Authentication token used to verify client's identity and grant it permission to register with an authorization token. Provide the following values: ○ **Header**: Authorization header. ○ **Value**: Authentication password.
Authorization URL	Web address of your server to direct authorization.
Token URL	Web address containing the token.
Token Revocation URL	Web address to revoke the previously provided token.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The MCP Server with dynamic client registration is added as a simple connection and credential alias.

6. On the form, fill in the fields:

Note:

- If your MCP Server doesn't support Dynamic Client Registration, then you can register the OAuth client for AI agents in your MCP Server manually and update those client details in AI Agent Studio.
- The manual client registration doesn't auto-populate the data in the form fields and must be manually provided.

Manual Registration

Field	Description
Grant Type	The way you want to obtain an access token for accessing protected resources. You can select one of the two options: ○ **Authorization Code**: A system-generated code that is used for grating access to an application or resource. ○ **Client Credentials**: Access token provided by the administrator to access the application directly.
Token Authentication Method	Unique token granted to access resources. Select the value from the drop-down list.
Client ID	Unique ID for authentication and authorization purposes.
Client Secret	Unique credentials used for authentication.
Auth Scopes	Define the specific permissions for an application. **Note:** The Auth scopes must be comma-separated values.
Authentication Token for Client Registration	Authentication token used to verify client's identity and grant it permission to register with an authorization token. Provide the following values: ○ **Header**: Authorization header. ○ **Value**: Authentication password.
Authorization URL	Web address of your server to direct authorization.
Token URL	Web address containing the token.
Token Revocation URL	Web address to revoke the previously provided token.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Select **Add**.
   Selecting Add takes you to the MCP Server record where you must authenticate it for adding an MCP tool to an AI agent.
8. Select **Authenticate**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Selecting **Authenticate** takes you to the third-party authorization page where you must select a workspace and select **Authorize**.

Note: When the OAuth access or refresh tokens aren't available, you must authenticate the OAuth configuration on the MCP Server record to add it as a tool to an AI agent.

Add an MCP Server with API Key

Add an MCP Server with an API Key in the AI Agent Studio.

Before you begin

Role required: sn_mcp_client.admin

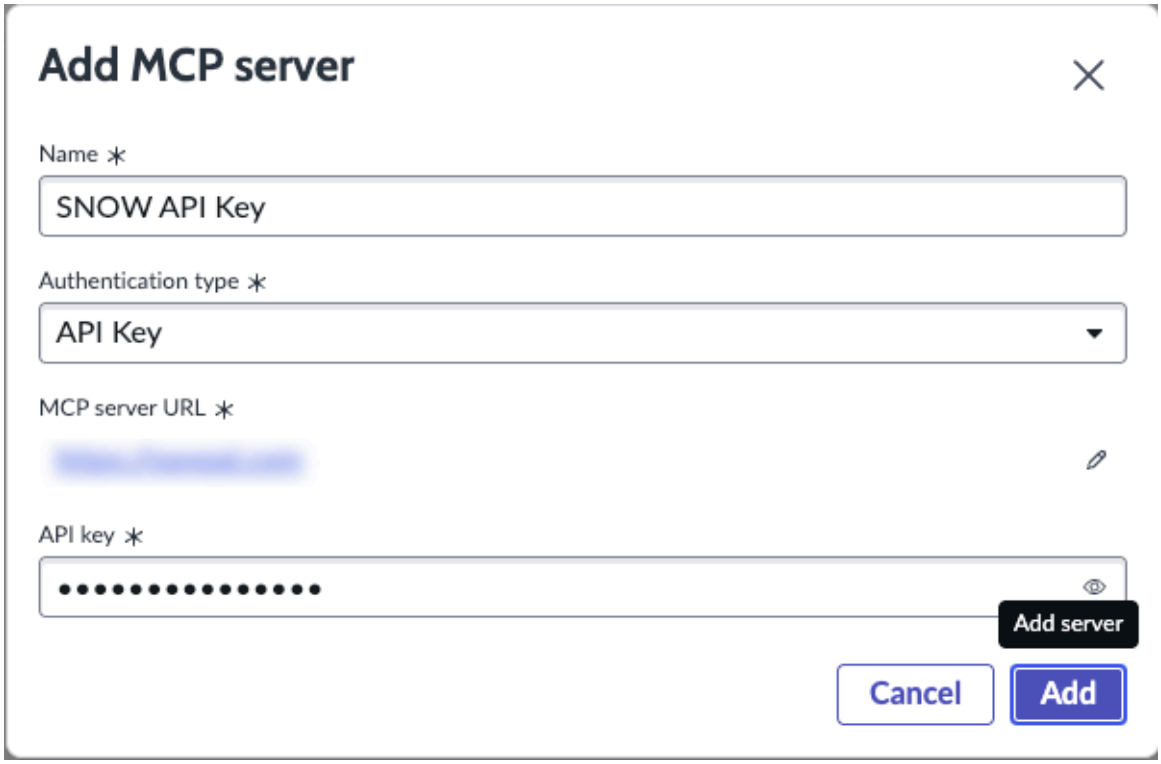
Procedure

1. Navigate to **All** > **AI Agent Studio** > **Settings**.
2. Navigate to **Manage MCP Servers** and select **New**.
3. On the form, fill in the fields.

Add MCP Server

Field	Description
Name	Name for your MCP Server.
Authentication Type	The authentication type with which you want to add your MCP Server. Select **API Key**.
MCP Server URL	The web address of your MCP Server.
API Key	A unique code or password to identify and authenticate the user or application when accessing the API. **Note:** The API Key adds a Connection alias dynamically at runtime and maps with the MCP Server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Select **Add**.

Result
An MCP Server with the name you provided appears in the list of MCP Servers.

Add an MCP Server with Connection and Credential Alias

Add an MCP Server by selecting a Connection and Credential Alias record.

Before you begin

- Role required: sn_mcp_client.admin
- Verify that you have a Connection and Credential alias record created before adding an MCP Server with Others as the option.

  For more information, see Create a Connection & Credential alias.

About this task
For using the Authentication methods not supported in MCP Server, you can use the Connection and Credential Alias method to create the Alias manually and then update it in the MCP Server. For using OAuth based authentication method, first create the OAuth entity profile and then create the Connection and Credential Alias. For other authentication methods like API Key, Basic Auth, AWS Credentials, SSH Credentials, create the connection and credential Alias directly.

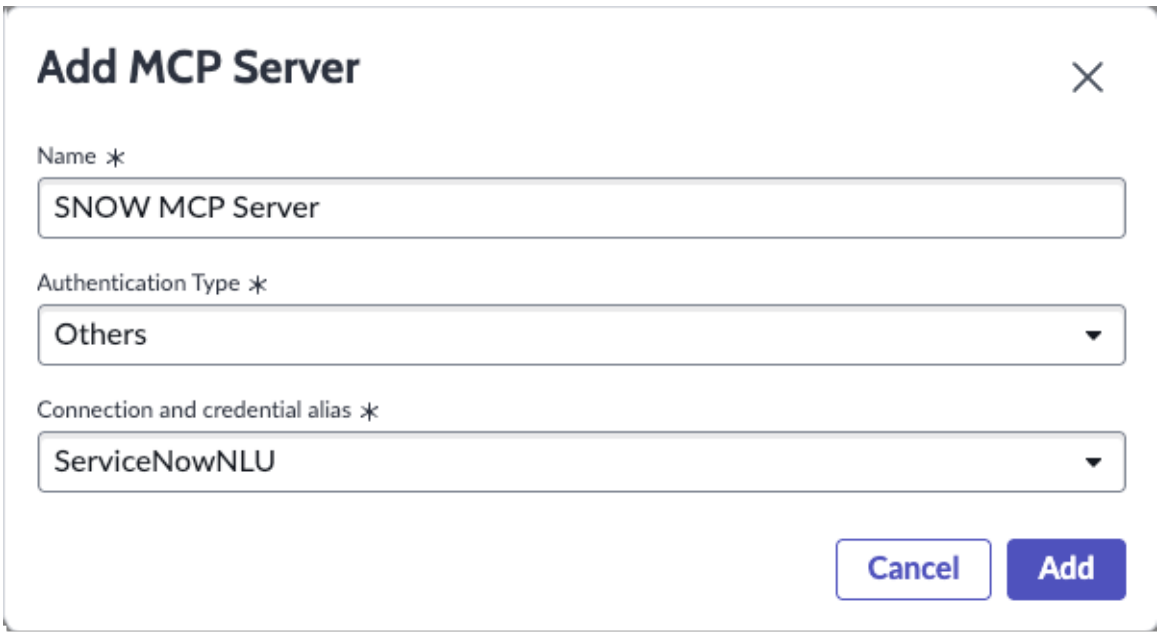
Procedure

1. Navigate to **All** > **AI Agent Studio** > **Settings**.
2. Navigate to **Manage MCP Servers** and select **New**.
3. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add MCP Server

Field	Description
Name	Name for your MCP Server.
Authentication Type	The authentication type with which you want to add your MCP Server. Select **Others**.
Connection and credential alias	Select a Connection and credential alias record to map with your MCP Server.



4. Select **Add**.

Note: Authenticate the MCP Server if you see the message requiring it.

Result
An MCP Server with the name you provided appears in the list of MCP Servers.

Add a Model Context Protocol to an AI agent

Add a Model Context Protocol tool to an AI agent in the AI Agent Studio so that your users can access the MCP Server.

Before you begin
Role required: sn_aia.admin

Procedure

1. Navigate to **All** > **AI Agent Studio** > **Create and manage** > **AI agents**.
2. Open the AI agent that you want to add a Model Context Protocol tool to and navigate to the Add tools and information section.
3. In the Add tool drop-down list, select **MCP server tool**.
4. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add a Model Context Protocol Tool

Field	Description
Select Model Context Protocol Server	The Model Context Protocol Server that you want to add to the tool. **Note:** Verify that the MCP Server is authenticated before adding the MCP tool to an AI agent. If the MCP Server isn't authenticated, then you receive an error message - "Authentication is needed to display tools. Open the MCP server record to authenticate."
Select Tool	The tool that you want to add from the Model Context Protocol Server.
Name	Name of the Model Context Protocol tool.
Tool and Description	Description of the Model Context Protocol and what it's going to do to assist your AI agent. **Note:** This description is sent to the LLM (LLM).
Execution Mode	Mode of execution for your selected Model Context Protocol tool: ○ **Supervised**: Inputs from your live agent are required during the execution of this Model Context Protocol tool while the AI agent runs. ○ **Autonomous**: Doesn't require any input from your live agent during the execution of this Model Context Protocol tool while the AI agent runs.
Display output	Permission to display the output of the execution in the Now Assist panel or in Virtual Agent: ○ **Yes** ○ **No**
Processing message	Message to display to users when the tool is running.
Output transformation strategy	Style for the LLM to present the results. ○ None ○ Concise ○ Paragraph ○ Verbose ○ Custom

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select **Add**.
   A Model Context Protocol tool is added in the Model Context Protocol Tools list on the Add tools and information page.

Test an AI agent

Analyze the performance of an AI agent with a Model Context Protocol tool added to it to verify that it functions the way that you defined it.

Before you begin

Role required: sn_aia.admin

About this task

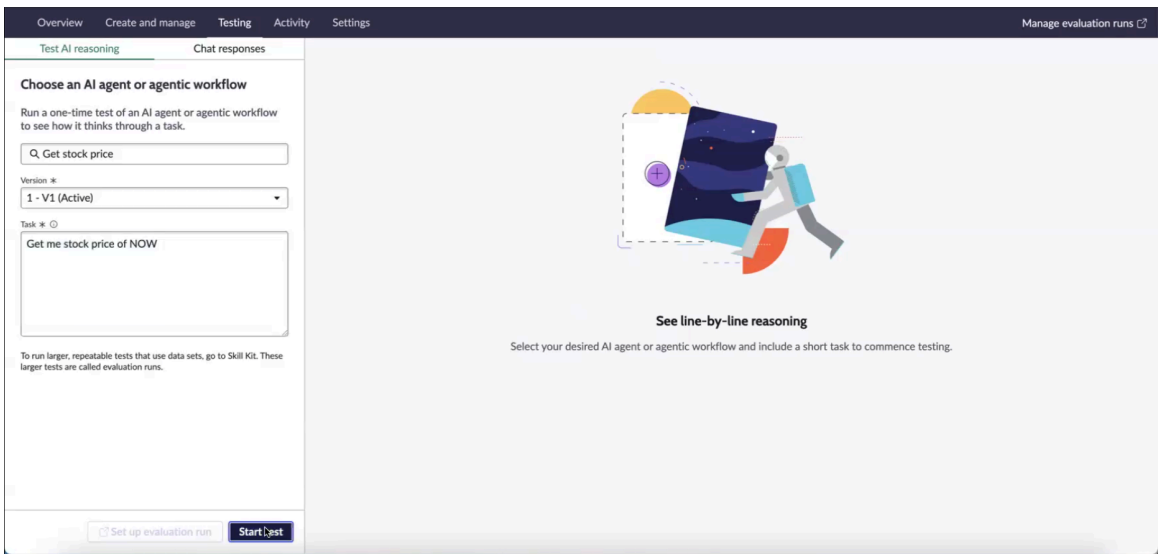
After you create an AI agent and a Model Context Protocol to it as a tool, test it to see that it functions the way that you defined it. Search for the AI agent that you want to test and select the version from the Version drop-down and provide a task with a concise summary and a reference number in the **Task** field to begin testing the AI agent.

Procedure

1. Navigate to **All** > **AI Agent Studio** > **Testing**.
2. In the **Test AI reasoning** tab, use the Search bar to search and select the AI agent that you want to test.
3. In the Version drop-down list, select the version of the AI agent.
4. In the **Task** field, provide a concise summary of the task to be achieved.

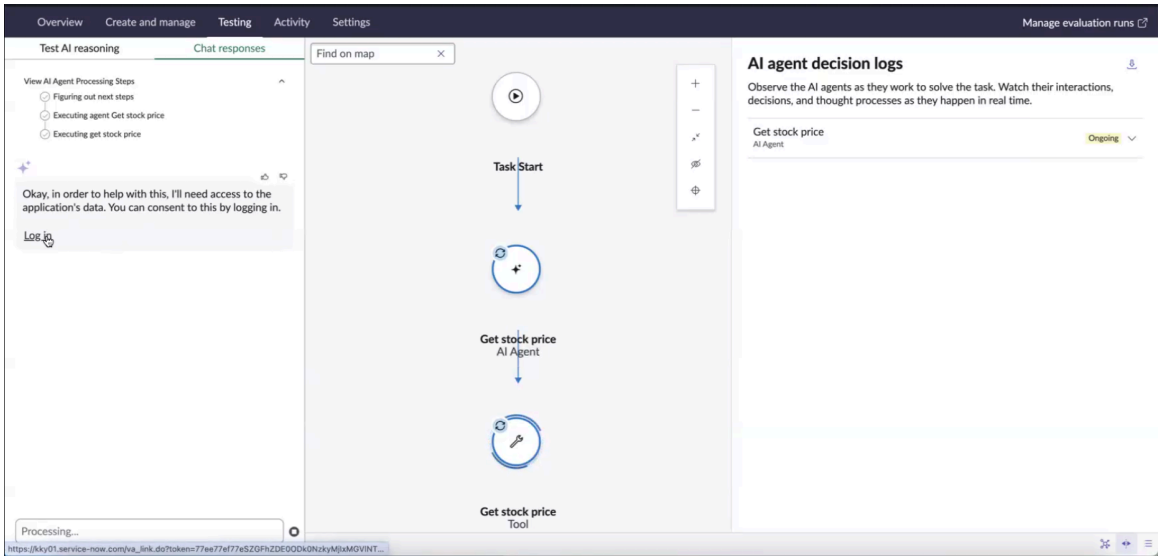
   Note: In the task summary, include a reference number or specific record for better results during your testing.

5. Select **Start test**.



You're directed to the **Chat responses** tab, where you can see Now Assist executing operations to test the AI agent.

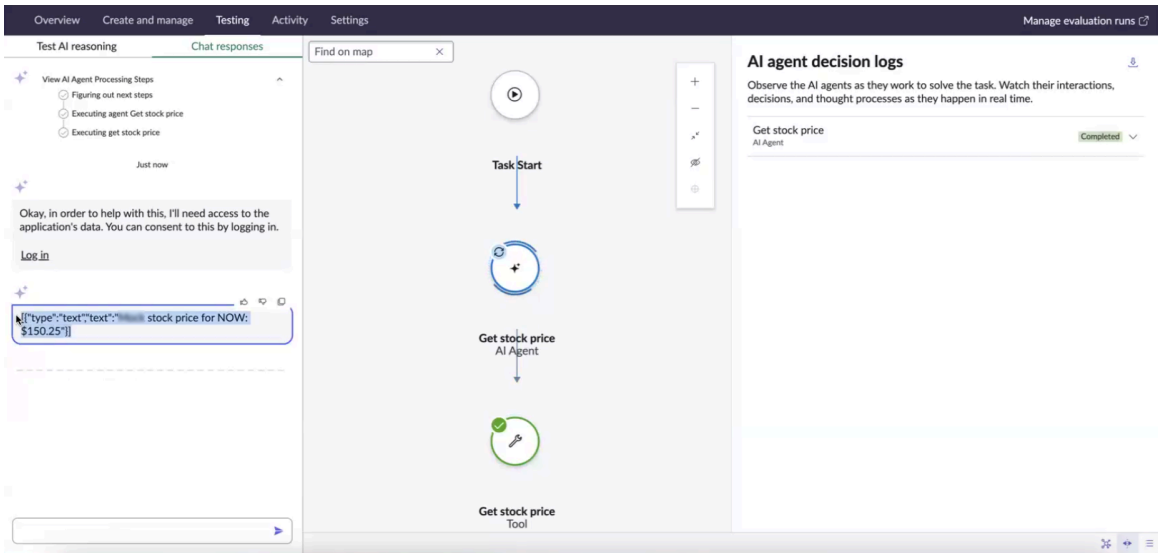
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. Select **Log in** and authenticate the MCP server to complete the testing.

Note:

- Log in will be visible only if the server isn't authenticated.
- Enabling access to the MCP Server refreshes the whole Testing page and resumes testing in the Chat responses tab. The OAuth token used for the authentication is saved in the OAuth Credentials table [oauth_credential].



Model Context Protocol Client reference

Find more information about user roles, tables, and the different properties that are installed with the Model Context Protocol Client application.

MCP Client Roles

The following roles are installed with the Model Context Protocol Client plugin [sn_mcp_client].

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles used in MCP Client

Role	Description
MCP Client Admin [sn_mcp_client.admin]	Administrator of the application. A user with the sn_mcp-client.admin role can create, read, update, and delete records. **Note:** The sn_aia.admin role contains the sn_mcp_client.admin role, a role inheritance on plugin activation.
MCP Client Viewer [sn_mcp_client.viewer]	Read-only access to the application. A user with the sn_mcp_client.viewer role has read and report access on all tables. **Note:** The sn_aia.viewer role contains the sn_mcp_client.viewer role, a role inheritance on plugin activation.

MCP Client system properties

The following system properties are installed with the Model Context Protocol Client plugin [sn_mcp_client].

System properties used for configuring MCP Client

System property	Description
sn_aia.enable_mcp_tool	Enables access to the MCP Client tool on your ServiceNow instance. Default value: **false**

MCP Client tables

The following tables are installed by default with the installation of the Model Context Protocol Client plugin [sn_mcp_client].

Tables used for configuring MCP Client

Table	Description
MCP Execution Logs [sn_mcp_execution_logs]	Lists the request and response, the method (tool call or tool list) that was carried out along with the mapped session. The execution logs table also helps to debug and shows if there are any errors.
MCP Client Server Session Mappings[sn_mcp_client_server_session_mapping]	Lists the sessions mapped to the server based on the capabilities support.
Model Context Protocol Severs [sn_mcp_server]	Lists the MCP Servers.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MCP Server Console

MCP Server Console enables secure and governed access to functionality on a ServiceNow instance for AI applications with Model Context Protocol (MCP) servers. MCP servers extend ServiceNow AI Platform® functionality into any external MCP client and employee experience over the Model Context Protocol.

Note: Depending on your license, you will have access to certain application features, generative AI skills, agentic workflows, and AI agents. For more information, see ServiceNow product tiers.

https://player.vimeo.com/video/1154347099?h=fd6c7893de&badge=0&autopause=0&player_id=0&app_id=58479

In this video, learn about the Model Context Protocol and how to create and use MCP servers with MCP Server Console.

AI limitations

This application uses artificial intelligence (AI) and machine learning, which are rapidly evolving fields of study that generate predictions based on patterns in data. As a result, this application may not always produce accurate, complete, or appropriate information. Furthermore, there is no guarantee that this application has been fully trained or tested for your use case. To mitigate these issues, it is your responsibility to test and evaluate your use of this application for accuracy, harm, and appropriateness for your use case, employ human oversight of output, and refrain from relying solely on AI-generated outputs for decision-making purposes. This is especially important if you choose to deploy this application in areas with consequential impacts such as healthcare, finance, legal, employment, security, or infrastructure. You agree to abide by ServiceNow's AI Acceptable Use Policy, which may be updated by ServiceNow.

Data processing

This application requires data to be transferred from ServiceNow customers' individual instances to a centralized ServiceNow environment, which may be located in a different data center region from the one where your instance is, and potentially to a third-party cloud provider, such as Microsoft Azure. This data is handled per ServiceNow's internal policies and procedures, including our policies available through our CORE Compliance Portal.

Data collection

ServiceNow collects and uses the inputs, outputs, and edits to outputs of this application to develop and improve ServiceNow technologies including ServiceNow models and AI products. Customers can opt out of future data collection at any time, as described in the Now Assist Opt-Out page.

For more information, see the Now Assist documentation.

Exploring MCP Server Console

Learn about how you can use Model Context Protocol (MCP) servers to allow AI applications to access data and perform actions on a ServiceNow instance.

MCP Server Console overview

The Model Context Protocol defines a standard method of communication between large language models (LLMs) and external systems, such as a ServiceNow instance. AI applications connect to an external system from an MCP client, such as an AI agent, using an MCP server. The server tells the client which external resources it can access and how to access them. Then, from an MCP client, users can request information from the server and automate functionality using the available tools and data that the server returns. For general information about the Model Context Protocol and MCP terminology, see the Model Context Protocol documentation on the modelcontextprotocol.io website.

With MCP Server Console, you can create MCP servers on an instance and configure the tools that they expose or use a preconfigured Quickstart Server. Tools define which functionality and data a server exposes to clients and the actions that can be performed on an instance by clients. You can create tools based on existing capabilities, such as AI skills.

Then any AI application, such as Microsoft Copilot or Claude, can call a server from a client using OAuth 2.0 authentication and get a list of available tools. With these tools, employees using MCP clients can prompt the server for information from the instance or to perform an action on the instance, such as to summarize a list of recently closed incidents or cases. You can also use the ServiceNow Model Context Protocol Client to let an AI application on one instance access tools from an MCP server on another instance.

Note: MCP Server Console currently has the following limitations:

- Only stateless and remote servers are supported.
- MCP resources and prompts aren't supported.
- MCP Server Console supports the Streamable HTTP transport. By default, tool calls return a single JSON response. Server-Sent Events (SSE) are optionally available for streaming response types. Stdio is not supported.
- The MCP rate limit is not configurable currently, and adjusting the rate limit requires a service restart. Contact your ServiceNow representative to learn more.

MCP Server Console users

User	Description
AI administrator	AI administrators can create MCP servers and configure which tools they expose to MCP clients. They also create OAuth inbound integrations on the instance for each client and configure clients with the server and authentication details.

MCP Server Console workflow

The following infographic shows the workflow for AI administrators to get started managing MCP servers with MCP Server Console.

Managing MCP servers with MCP Server Console

1. As an AI administrator, you identify which functionality on an instance to access from an external MCP client and employee experience.
2. You can use the preconfigured Quickstart Server or create an MCP server with the appropriate tools to use the desired functionality.

   You can create one or more servers that expose different tools for different use cases, such as for HR or IT workflows, or for different clients.
3. If needed, you can create additional tools from AI skills and configure which fields are exposed to clients and then add the tools to servers.
4. You create OAuth inbound integrations for each client to secure access to servers on an instance.
5. You configure clients to connect to a server using the server and OAuth inbound integration details.

   Then the client calls the server, which validates the OAuth token and responds with the list of tools available for use with the server.
6. Employees use clients, such as AI agents, to prompt the server for data from the instance or to perform an action on the instance.

Note: With AI Gateway in AI Control Tower, AI administrators can monitor MCP server access and view metrics for servers and their tools. For more information, see AI Gateway.

MCP Server Console benefits

Benefit	Feature	Users
Integrate with any AI application and MCP client using a standard protocol.	Create a Model Context Protocol server	AI administrator
Control which tools and fields are exposed to MCP clients.	Creating tools for a Model Context Protocol server	AI administrator
Securely access functionality from a ServiceNow instance in any external employee experience.	Configure an MCP client to connect to an MCP server	AI administrator

Quickstart Server in MCP Server Console

MCP Server Console includes a preconfigured Quickstart Server to help you get started learning about MCP servers and connecting MCP clients to a ServiceNow instance. The Quickstart Server includes tools for looking up and summarizing incident and case records, depending on the applications installed on your instance, such as ServiceNow Otto for CSM or ServiceNow Otto for ITSM.

Quickstart Server tools

Name	Description
Case summarization	Get a summary of details in a case record generated by ServiceNow Otto.
Incident summarization	Get a summary of details in an incident record generated by ServiceNow Otto.
Look up Case Records	Look up case records to enable summarizing them with the Case Summarization tool.
Look up Incident Records	Look up incident records to enable summarizing them with Incident summarization tool.

What to explore next

Model Context Protocol Client

Configuring MCP Server Console

Create a Model Context Protocol (MCP) server and configure the tools and inputs it exposes to MCP clients.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuration overview

1. Create a Model Context Protocol server

   An AI administrator creates a server and adds tools to the server.

2.
   - Out-of-box tools
     - Access the out-of-box tools of platform and business specific types to manage capabilities that AI agents and other clients can use through your MCP servers.
     - You can also clone these default tools into fully editable copies by selecting **Create like** option.

       Important: The minimum version required to access this feature is Australia patch 6 and Brazil patch 0.

       
       When the OOB source tool is updated, the clone owner gets a notification and can easily pull the update into their copy.
   - If additional tools are needed, the AI administrator identifies which functionality to expose and creates tools based on AI skills. From the tools, they configure which fields are exposed to clients as tool inputs.

     Tip: Creation of custom tools requires configuring the tool's from the scratch. However, cloning a default tool presents pre-filled fields on the tools creation form.

3. Create an MCP app

   Optionally, the AI administrator can also create an MCP app to deliver an interactive interface for tools that can be displayed by clients.

After configuring a server, the AI administrator configures OAuth inbound integrations for each client or configures an integration with a third-party identity provider (IDP) for authentication. Then they can configure clients to connect to the server using the server and authentication details. For more information, see Connecting to an MCP server from an MCP client.

Create a Model Context Protocol server

Create a Model Context Protocol (MCP) server and configure which tools it exposes to MCP clients.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_mcp_server.admin or admin

About this task
Depending on your requirements, you can create servers that expose different tools for different use cases, such as for HR or IT workflows, or for different clients. You can also use the preconfigured Quickstart Server. For general guidelines on designing a server based on the job to be done, see the Designing your first custom ServiceNow MCP server with MCP Server Console article in the ServiceNow Community.

Only stateless and remote servers are supported. Servers must be in the same application scope as any tools that they use.

Procedure
1. Navigate to **All** > **MCP Server Console** or **Admin** > **MCP Server Console**.
2. From the Configuration tab, select **Servers**.
3. Select **Create server**.
4. On the form, fill in the fields.

Server form

Field	Description
Label	An internal name of your choice, for the server.
Name	An auto-created server name derived from the label you chose. This will be used in the URL endpoint. The server URL is created accordingly.
Application	The current application scope. **Note:** Servers must be in the same application scope as any tools that they use.
Short description	A description of the capabilities and purpose of the server.
Tools	The tools that the server exposes.

5. From the Tools section, add the tools that the server exposes.
   a. Select **Add tools**.
   b. Search for tools from the list and select the tools to expose.
   The tool must be in the same application scope as the server. If you need to create a tool, select **Create tool**. For more information, see Creating tools for a Model Context Protocol server.
   c. Select **Add**.
6. Select **Create** to make the server active.

Note: To save your changes but not make the server active yet, select **Save as draft** instead. To activate it later, you can select **Activate** from the server record or the Servers page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

After creating the server, the Server URL field is populated with the endpoint that you use to integrate with clients: `https://<instance>.service-now.com/sncapps/mcp-server/mcp/<server-name>`.

Trouble?
If you need to turn off access to an existing server, select **Deactivate** from the server record or the Servers page.

What to do next

Configure clients to connect to the server. For more information, see Connecting to an MCP server from an MCP client.

Creating tools for a Model Context Protocol server

You can create tools from various tool categories to expose ServiceNow capabilities to Model Context Protocol (MCP) clients from MCP servers.

MCP tools overview

Tools define which functionality and data an MCP server exposes to clients and the actions that can be performed on an instance by MCP clients. You can create tools based on the following capabilities:

- Subflows
- Actions
- Knowledge Graph schemas
- REST APIs
- AI skills, including custom skills created with AI Skill Kit

Tools include inputs that correspond to the fields of the existing capability. Any inputs that are enabled for a tool are exposed to clients. Each server must include at least one tool, and tools must be in the same application scope as any servers that contain them.

When clients receive a list of available tools from a server, they rely on tool descriptions to decide whether to call a tool and how to call it. Every tool description should answer two questions: what does this tool do and when should it be called. When creating tools, particularly REST API tools, make sure the description is clear and complete, otherwise clients may select the wrong tool for the job.

Note: A tool can be used by multiple servers. Changes that you make to a tool's name, description, or enabled inputs apply to any servers that use the tool. Before editing a tool, review which servers it's associated with to determine the impact for every server.

MCP tools access

Existing access control lists (ACLs), role-based permissions, and field-level security all apply to tool calls made through an MCP server. MCP servers and tools don't bypass any ServiceNow access controls applied to the capabilities that tools are based on.

Evaluating ACL enforcement depends on who is calling a tool and which capability the tool is based on. If a caller lacks permission, tools can return an empty or incomplete result rather than an explicit authorization error so it's important to understand which type of enforcement applies to a given caller and tool type when troubleshooting unexpected results. MCP tool calls execute under one of two identities, which are evaluated differently:

Human users

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tool calls execute under the authenticated user's own ServiceNow user identity. A user who can't read incident records in the platform can't retrieve them through an MCP tool either. All four layers of the standard access model apply: role-based access, contextual script-based ACLs, row- and field-level security, and deny-unless-permitted defaults.

Autonomous agents

Tool calls execute under the identity of the integration user account rather than any individual end user's identity. What an agent can access is controlled by the integration user's roles and by the tool-level ACLs two layers, which are evaluated independently and both must permit the call for a tool to return data:

- The integration user must hold the roles required for every tool the agent will call. Under-provisioning this account causes tool calls to fail while over-provisioning creates unnecessary risk. For more information about configuring this account, see Create an OAuth inbound integration for an MCP client.
- Tool-level ACLs control whether execution is permitted at the level of the tool itself, independent of the integration user's roles. Configuration requirements differ by tool type.

ACL requirements for MCP tools

The configuration required for tool-level enforcement depends on which capability the tool is built from.

Tool-level ACL configuration by tool type

Tool type	ACL configuration
AI skill tools	An execute ACL and role masking is required for any custom AI skill to be used as a tool. Otherwise a tool can return empty results instead of an authorization error, which can be difficult to diagnose as a permissions issue rather than a data issue. For more information, see Create a skill and Create a tool from an AI skill.
Subflow and Action tools	An AI ACL is required for any Subflow or Action to be used as an MCP tool. For more information, see Create an AI ACL for a Subflow or Action and Check the compatibility of a Subflow or Action.
Knowledge Graph tools	ACL enforcement happens at the node level during every graph traversal. Two users or agents with different permissions issuing the identical query can receive different results, based on what each caller is permitted to see. For more information, see Knowledge Graph and Create a tool from a Knowledge Graph.

Create a tool from a Subflow

Create a tool from a Subflow to expose it to Model Context Protocol (MCP) clients from an MCP Server Console.

Before you begin

Perform these steps before creating a tool from a Subflow:

- Create a Subflow in Workflow Studio using supported input and output data types. See Create a subflow in Workflow Studio to learn more.

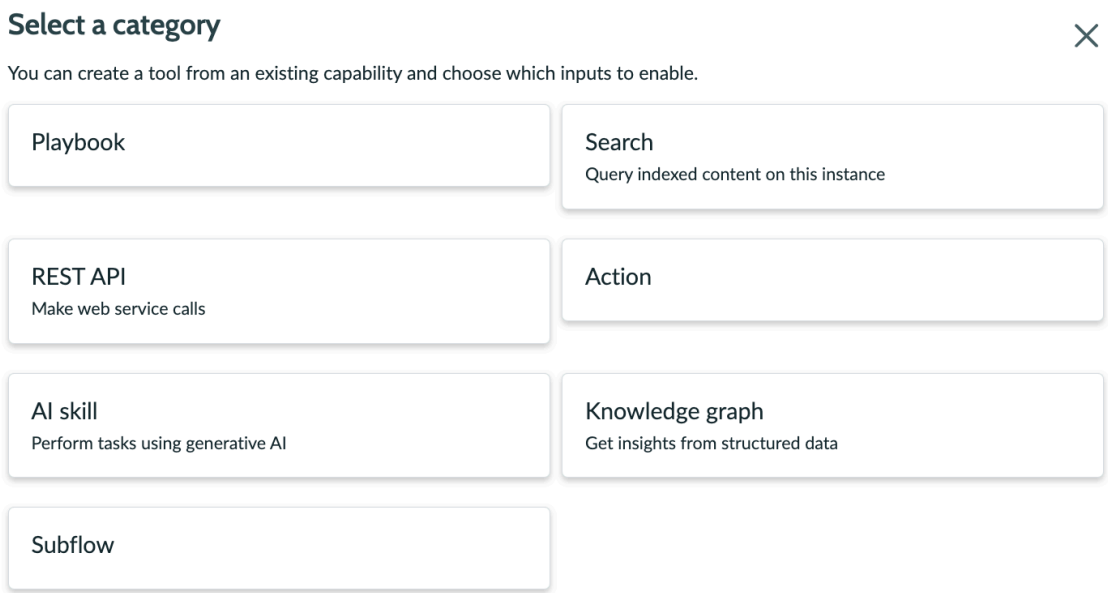
  Note: Only synchronous Subflows are supported. Subflows with wait steps, asynchronous execution, or human intervention steps can't be used as tools.

- Establish the required AI ACL (access control list) to enable external calls to the subflow. See Create an AI ACL for a Subflow or Action to learn more.
- Confirm the compatibility status in the staging table. See Check the compatibility of a Subflow or Action to learn more.

Role required: sn_mcp_server.tools_admin, sn_mcp_server.admin, or admin

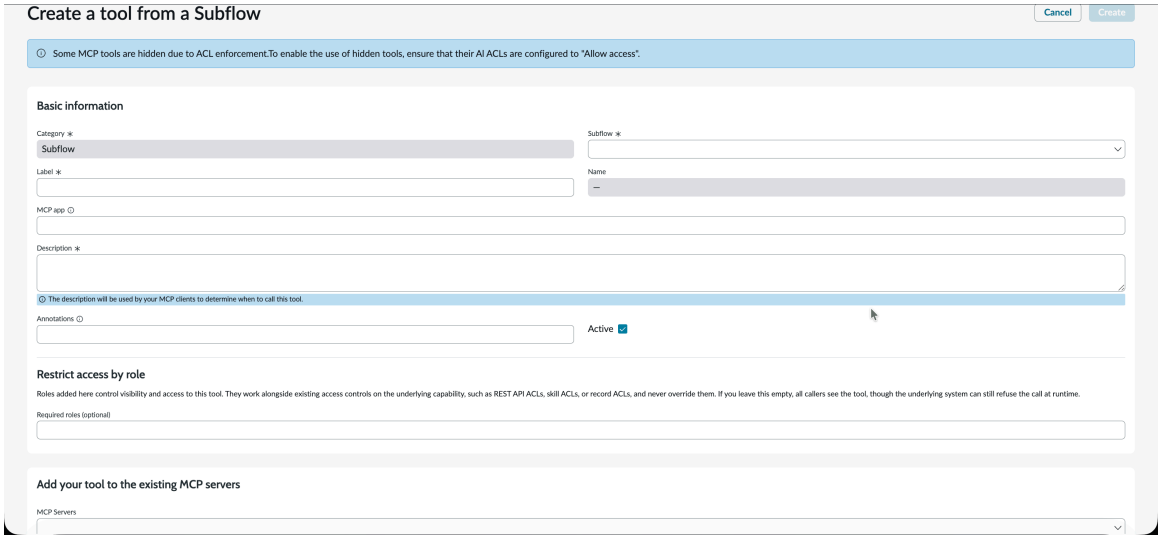
Procedure

1. Select Subflow from these categories.



2. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note: The **category** is automatically populated if selected in the last modal.

Tool form

Field	Description
Subflow	Select a Subflow type from the list.
Label	An internal name for the tool.
MCP app	An active MCP app linked to this subflow.
Description	The description of what the tool intends to do. This input is exposed to AI clients and used to determine when to call this tool. **Note:** Add a specific, action-oriented description so AI clients can determine when to invoke the tool.
Annotations	Indication of the tool's behavior with MCP clients, including whether it only reads data, is idempotent, makes destructive changes or updates, or can call external links. You can also specifically combine these annotations as needed. The MCP client uses the selected annotations to categorize tools according to their behavior.
Required roles	The MCP Tools admin selects one or more roles from the User Role [sys_user_role] table to specify which roles can access and use the tool.
MCP Servers	One or more servers to add the tool to.

Note: A tool can be used by multiple servers so any changes that you make to a tool apply to all servers that use the tool. Before editing a tool, review which servers it's associated with to determine the impact for every server.

In the Tool inputs section, the fields associated with the capability are added.

3. **Optional:** Turn off inputs from the tool that you don't want to expose.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the Tool inputs section, locate the tool input.

b. From the Enabled column, select the toggle to turn off the input.

Note: Some tool inputs are required and can't be turned off.

4. Select **Create**.

What to do next

Invoke the tool using an MCP client and verify that it works as expected. Launch MCP client to test end-to-end execution. For more information, see Connecting to an MCP server from an MCP client.

Create a tool from an Action

Create a tool from an Action to expose it to Model Context Protocol (MCP) clients from an MCP Server.

Before you begin

Perform these steps before creating a tool from an Action:

1. Create an Action in Workflow Studio using supported input and output data types. See Create an action in Workflow Studio to learn more.

   Note: Only synchronous actions are supported. Actions with wait steps, asynchronous execution, or human intervention steps can't be used as tools.

2. Establish the requisite AI Access Control List (ACL) to facilitate external invocation of the component. See Create an AI ACL for a Subflow or Action to learn more.
3. Confirm the compatibility status in the staging table. See Check the compatibility of a Subflow or Action to learn more.

Role required: sn_mcp_server.tools_admin, sn_mcp_server.admin, or admin

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Description	The description of what the tool intends to do. This input is exposed to AI clients and used to determine when to call this tool. **Note:** Admins must add specific and action-oriented description as the AI clients access it to decide when to invoke the tool.
Annotations	Indication of the tool's behavior with MCP clients, including whether it only reads data, is idempotent, makes destructive changes or updates, or can call external links. You can also specifically combine these annotations as needed. The MCP client will use the selected annotations to categorise tools according to their behavior.
Required roles	The MCP Tools admin selects one or more roles from the User Role [sys_user_role] table to specify which roles can access and use the tool.
MCP Servers	One or more servers you want to add your tool to.

Note: A tool can be used by multiple servers so any changes that you make to a tool apply to all servers that use the tool. Before editing a tool, review which servers it's associated with to determine the impact for every server.

In the Tool inputs section, the fields associated with the capability are added.

3. **Optional:** Turn off inputs from the tool that you don't want to expose.
   a. In the Tool inputs section, locate the tool input.
   b. From the Enabled column, select the toggle to turn off the input.

      Note: Some tool inputs are required and can't be turned off.

4. Select **Create**.

What to do next

Invoke the tool via Claude or an alternative MCP client and verify that it functions as intended with the tool you registered. Launch MCP client to test end-to-end execution. For more information, see Connecting to an MCP server from an MCP client.

Create a tool from a Knowledge Graph

Create a tool from a Knowledge Graph to expose it to Model Context Protocol (MCP) clients from an MCP Server.

Before you begin

Role required: sn_mcp_server.tools_admin, sn_mcp_server.admin, or admin

About this task

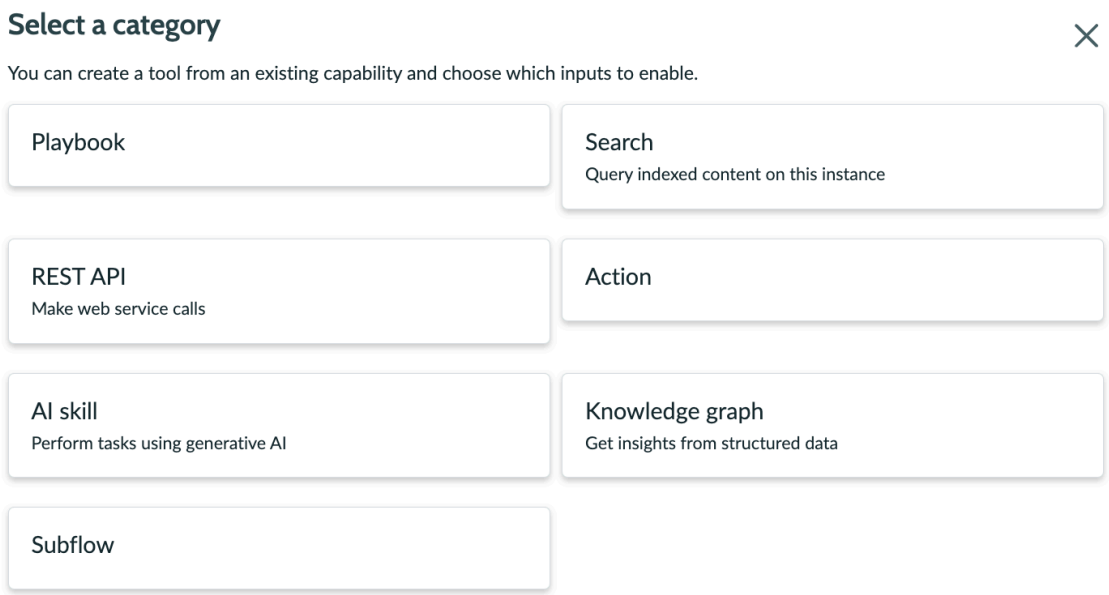
Knowledge Graph provides agents with accurate, relationship-aware access to live instance data. This enables more precise, context-aware responses in every workflow by directly querying

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

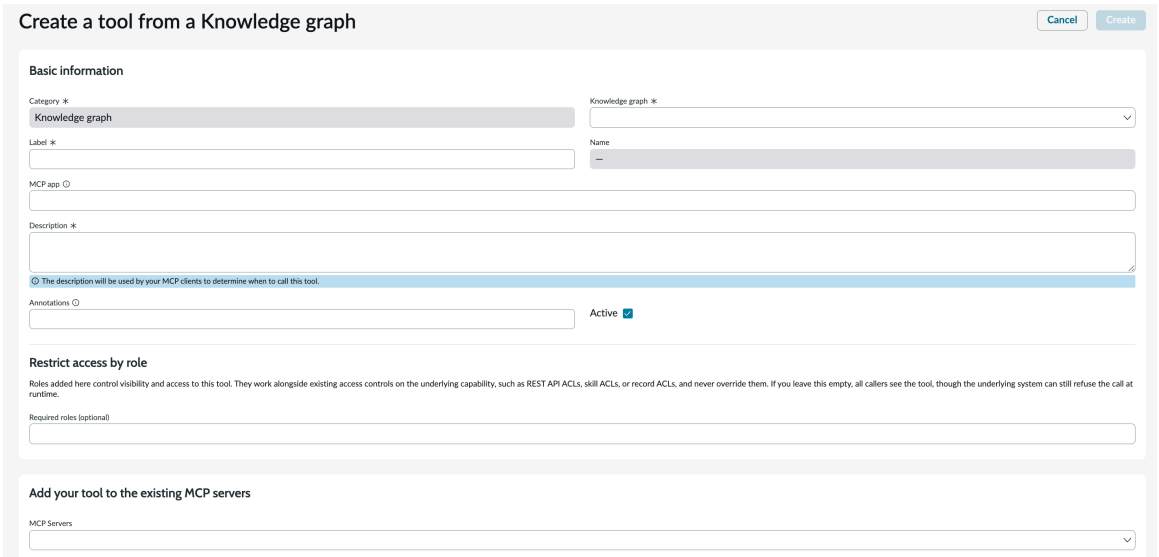
relationships. Some Knowledge Graph schemas are available by default when creating a tool. For more information, see Knowledge Graph schema support in MCP Server Console. To learn about creating Knowledge Graph schemas, see Exploring Knowledge Graph.

Procedure

1. Select Knowledge Graph from these categories.



2. On the form, fill in the fields.



Note: The **category** is auto-populated if selected in the last modal.

Tool form

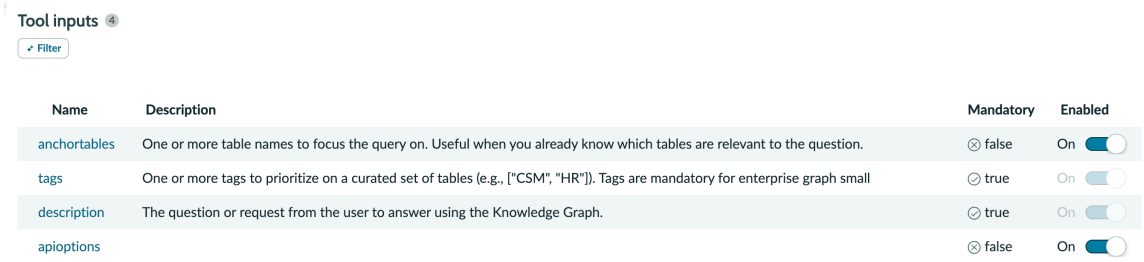
Field	Description
Knowledge Graph	Select a Knowledge Graph type from the list. You can either choose Enterprise Graph or one of the custom graphs.
Label	An internal name for the tool.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
MCP app	An active MCP app linked to this knowledge graph tool.
Description	The description of what the tool intends to do. This input is exposed to AI clients and used to determine when to call this tool. **Note:** Admins must add specific and action-oriented description as the AI clients access it to decide when to invoke the tool.
Annotations	Indication of the tool's behavior with MCP clients. 'Read Only' is the default annotation or tool behavior Knowledge Graph. The MCP client will use the selected annotations to categorise tools according to their behavior.
Required roles	The MCP Tools admin selects one or more roles from the User Role [sys_user_role] table to specify which roles can access and use the tool.
MCP Servers	One or more servers you want to add your tool to.

Note: A tool can be used by multiple servers so any changes that you make to a tool apply to all servers that use the tool. Before editing a tool, review which servers it's associated with to determine the impact for every server.

In the Tool inputs section, the fields associated with the capability are added.



- anchortables: Use one or more table names to make your query more specific when you select Enterprise Graph or Enterprise Graph (small). This is helpful when you know which tables are relevant to your question. This is an optional field.
- tags: Include one or more tags to prioritize a specific group of tables. For example, you can use tags like 'CSM', 'HR'. These tags are required for the Enterprise Graph and Enterprise Graph (small) though they are only mandatory for the latter. See Create Knowledge Graph tag for details on creating Knowledge Graph tags.
- description: Your query or request that will use Knowledge Graph.
- apioptions: Manually enter the JSON object as a collection of key-value pairs. It configures how to run queries and organizes the response:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

API option type and purpose

Option	Type	Default	Purpose
`resultLimit`	Number	10	Control how many records are returned in the response
`getEncodedQuery`	Boolean	false	Include a ServiceNow encoded query per table — useful for navigating to matching records in the UI
`getStatusMessages`	Boolean	false	Include a `meta` field with messages about result truncation and execution errors
`showColumnProperties`	Boolean	false	Include metadata for each column (table name, display value, sys_id) alongside the raw value
`groupByTable`	Boolean	false	Group result columns by their source table name — results structured as `{ tableName: { columnName: value } }`
`getExplanation`	Boolean	false	Include an explanation of the query — the tables, relationships, etc. to get the results

3. **Optional:** Turn off inputs from the tool that you don't want to expose.

   a. In the Tool inputs section, locate the tool input.

   b. From the Enabled column, select the toggle to turn off the input.

   Note: Some tool inputs are required and can't be turned off.

4. Select **Create**.

What to do next

Configure clients to connect to the server and use the tool. For more information, see Connecting to an MCP server from an MCP client.

Create a tool from a REST API

Use a REST API to create a tool and expose it to Model Context Protocol (MCP Server Console) clients from an MCP Server Console.

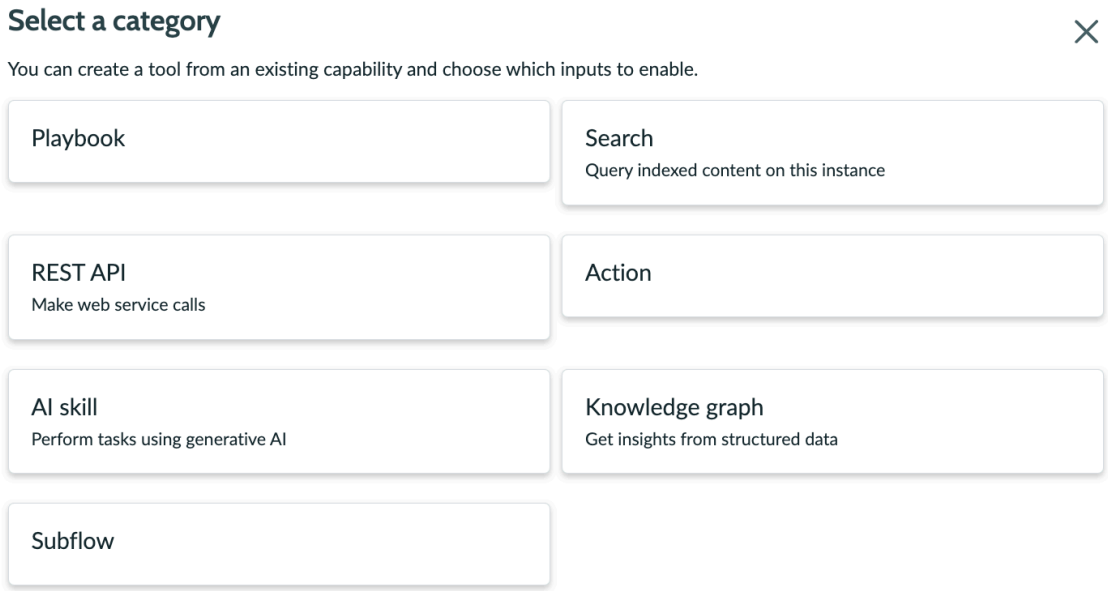
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

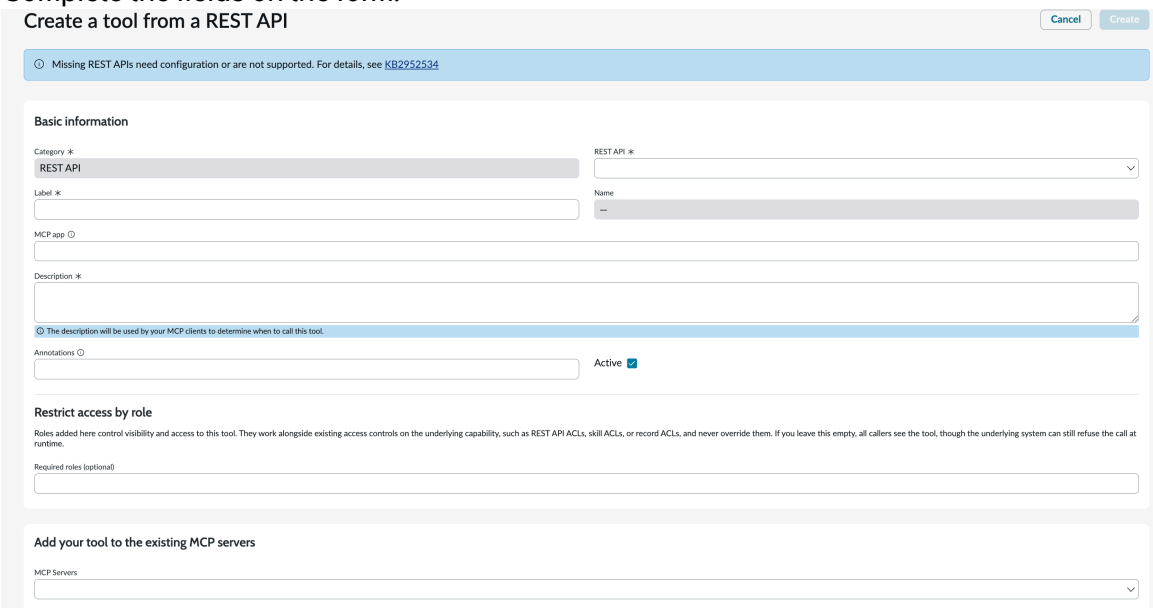
Role required: sn_mcp_server.tools_admin, sn_mcp_server.admin, or admin

Procedure

1. Select REST API from these categories.



2. Complete the fields on the form.



Note: The **Category** is auto-populated if selected in the previous dialog.

Tool form

Field	Description
REST API	REST API type for the tool.
Label	An internal name for the tool.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
MCP app	An active MCP app linked to this REST API.
Description	The description of what the tool does. This input is exposed to AI clients and used to determine when to call this tool. **Note:** Add a specific, action-oriented description. AI clients use it to decide when to invoke the tool. Client requests to Scripted REST API tools must include the inputs required by the API. The tool description must clearly state which inputs are required and what format they should be in so clients know exactly what to include in their request. For example, a well-written tool description could say: "Returns all open incidents assigned to a specified assignment group within a given date range. Requires: assignment_group (string, the exact group name), start_date (string, format YYYY-MM-DD), end_date (string, format YYYY-MM-DD)." The calling agent uses this description to determine what to collect from the user before invoking the tool.
Annotations	Indication of the tool's behavior with MCP clients, including whether it only reads data, is idempotent, makes destructive changes or updates, or can call external links. You can also specifically combine these annotations as needed. The MCP client will use the selected annotations to categorize tools according to their behavior.
Required roles	One or more roles from the sys_user_role [sys_user_role] table that control access to the tool.
MCP Servers	One or more servers to add the tool to.

Note: A tool can be used by multiple servers so any changes that you make to a tool apply to all servers that use the tool. Before editing a tool, review which servers it's associated with to determine the impact for every server.

In the Tool inputs section, the fields associated with the capability are added.

3. **Optional:** Turn off inputs from the tool that you don't want to expose.

   a. In the Tool inputs section, locate the tool input.

   b. From the Enabled column, select the toggle to turn off the input.

      Note: Some tool inputs are required and can't be turned off.

4. Select **Create**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

Configure clients to connect to the server and use the tool. For more information, see Connecting to an MCP server from an MCP client.

Note: When calling a Scripted REST API tool from a client, you must provide inputs in your request. If a required parameter, such as a record number, a date range, or a filter value, is not present in the request, the tool cannot complete the task.

Related topics

Create a scripted REST API resource

Create a tool from an AI skill

Create a tool from a generative AI skill to expose it to Model Context Protocol (MCP) clients from an MCP Server.

Before you begin

Role required: sn_mcp_server.tools_admin, sn_mcp_server.admin, or admin

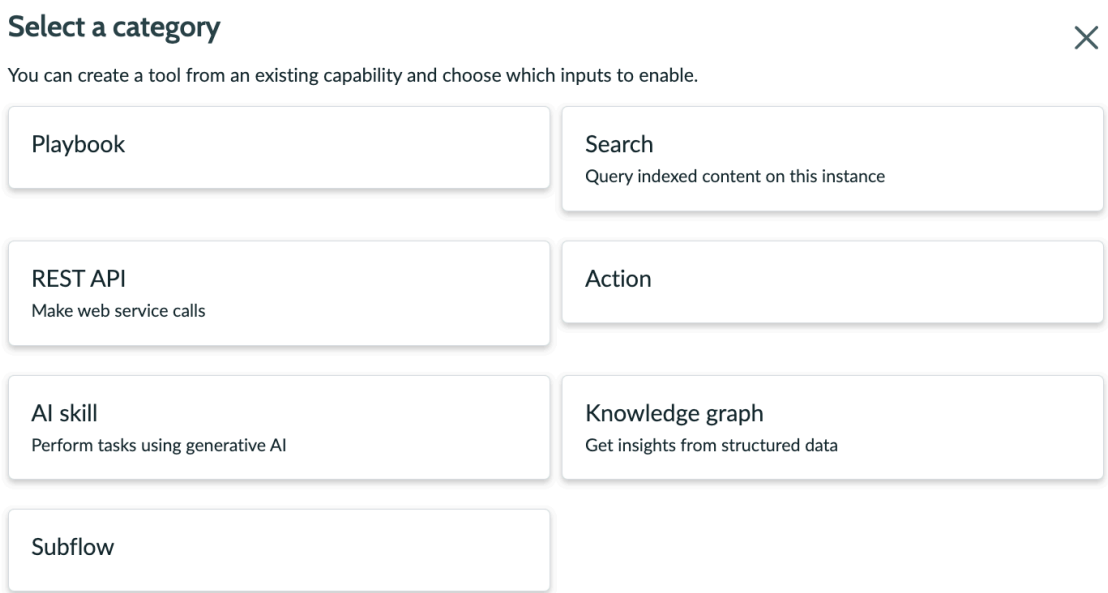
About this task

Prebuilt and custom AI skills are organized as governed MCP tools, enabling seamless discovery and accessibility for any standards-conforming MCP client. This structure enhances usability and encourages effective integration of these skills across various platforms. See AI skill support in MCP Server Console to learn about the pre-configured AI skills.

Note: Only AI skills that don't rely on internal information as inputs, such as sys_ids, are available to be created as tools. For more information about why a skill might not be available for creation as a tool, see the AI Skill Eligibility Criteria for MCP Tool Integration [KB2952564] article in the Now Support Knowledge Base.

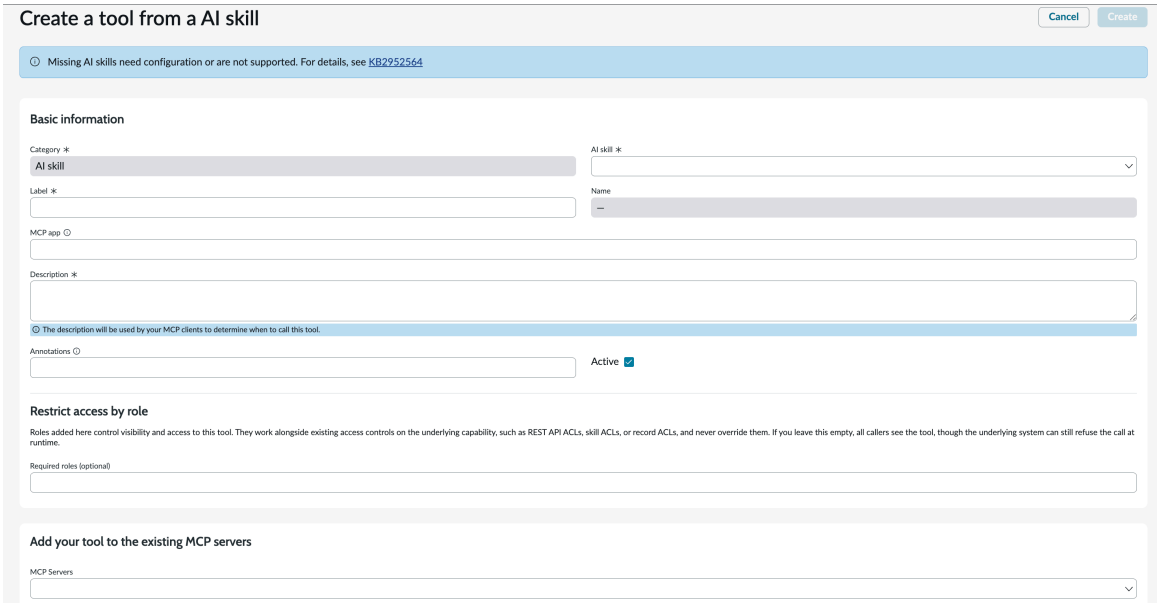
Procedure

1. Select AI skill from these categories.



2. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note: The **category** is auto-populated if selected in the last modal.

Tool form

Field	Description
AI skill	Select an AI skill type from the list.
Label	An internal name for the tool.
MCP app	An active MCP app linked to this tool.
Description	The description of what the tool intends to do. This input is exposed to AI clients and used to determine when to call this tool. **Note:** Admins must add specific and action-oriented description as the AI clients access it to decide when to invoke the tool.
Annotations	Indication of the tool's behavior with MCP clients, including whether it only reads data, is idempotent, makes destructive changes or updates, or can call external links. You can also specifically combine these annotations as needed. The MCP client will use the selected annotations to categorize tools according to their behavior.
Required roles	The MCP Tools admin selects one or more roles from the User Role [sys_user_role] table to specify which roles can access and use the tool.
MCP Servers	One or more servers you want to add your tool to.

Note: A tool can be used by multiple servers so any changes that you make to a tool apply to all servers that use the tool. Before editing a tool, review which servers it's associated with to determine the impact for every server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In the Tool inputs section, the fields associated with the capability are added.

3. **Optional:** Turn off inputs from the tool that you don't want to expose.

   a. In the Tool inputs section, locate the tool input.

   b. From the Enabled column, select the toggle to turn off the input.

      Note: Some tool inputs are required and can't be turned off.

4. Select **Create**.

Trouble?

Note: If you add inputs to a Now Assist skill definition after a tool has been created for the skill, you must create another tool to include the additional inputs and replace the existing tool.

What to do next

Configure clients to connect to the server and use the tool. For more information, see Connecting to an MCP server from an MCP client.

Create an MCP app

Build, register, and display user interfaces along with your tool's logic with MCP apps. This allows you to implement and manage interactive interfaces for your tools that can be displayed by MCP clients.

Before you begin

Role required: sn_mcp_server.tools_admin (for configuration)

About this task

Create an MCP app and enable MCP tools to deliver interactive user interfaces to hosts. It defines how tools declare UI resources, that hosts render securely in iframes, and how the two communicate.

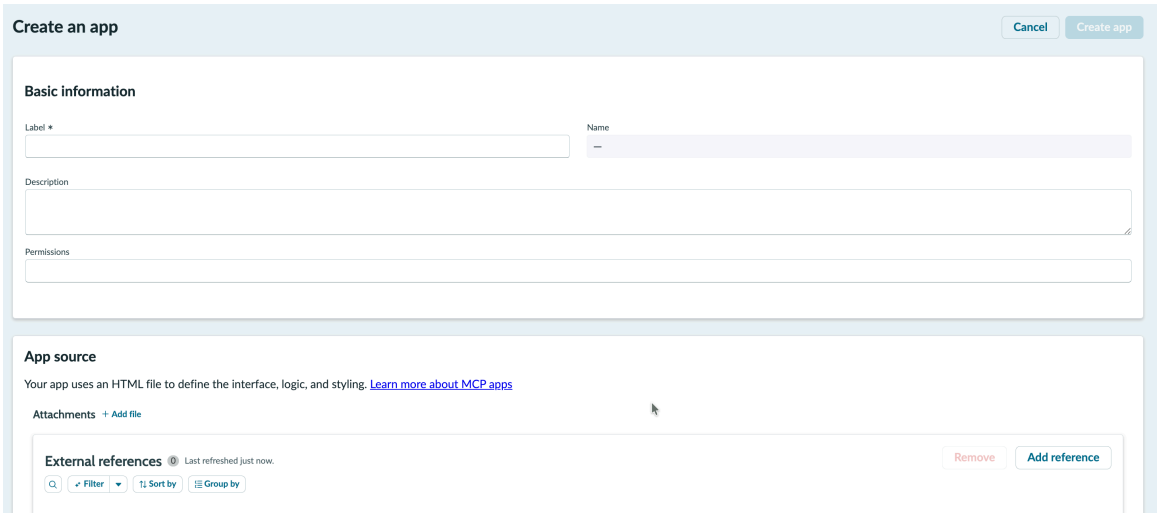
Create apps as a pre-step before MCP tools creations, so that you can choose one of the created apps while configuring the tool.

Note: The minimum version required is: Zurich patch 11 and Australia patch 4.

Procedure

1. Navigate to **All** > **MCP Server Console**.
2. From the Configuration tab, select **Apps**.
3. View the tools created from various categories, and their associated attributes.
4. Select **Create app**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

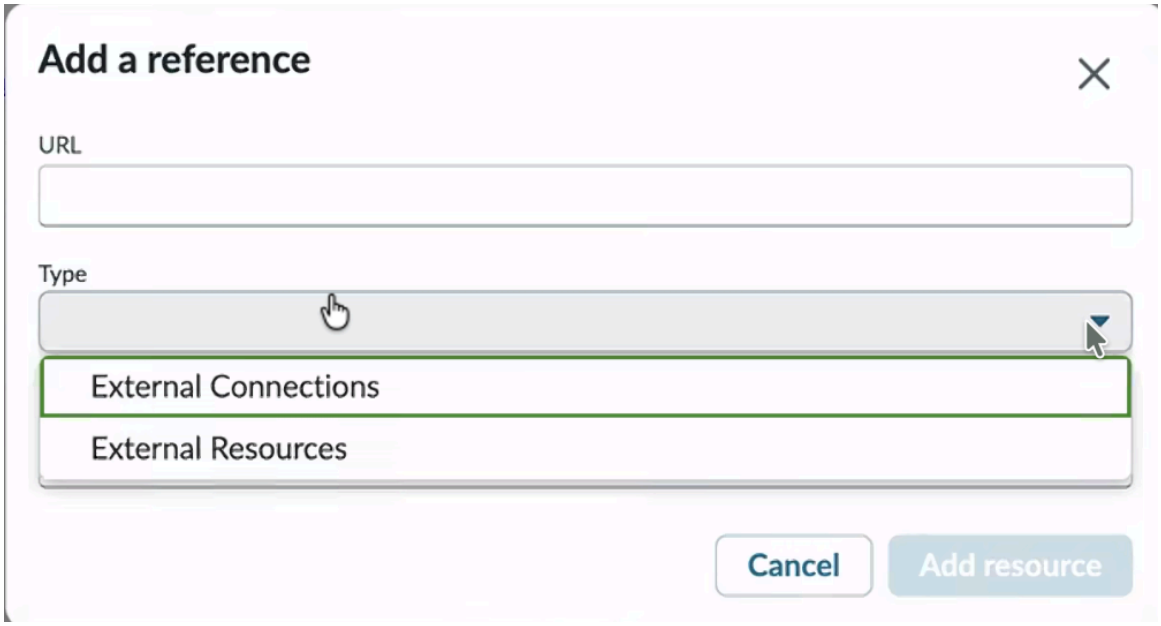


Apps form

Field	Description
Label	An internal name for the app.
Name	The name of the app generated automatically based on the label you enter.
Description	The description of what the app intends to do. This input is exposed to AI clients and used to determine when to use this app. **Note:** Admins must add specific and action-oriented description as the AI clients access it to decide when to call the app.
Permissions	Access granted to different browsers and devices needed to create the app. The options are microphone, camera, geolocation and clipboard.

5. Select **Add reference** to add references to the HTML files that will be used to style, script or define the logic your app.
6. Add details in the form:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



a. Declare the link to the external connection or resources to be referred.

b. Select **Type** of the reference.

c. Add link to the **Library**.

7. Add link to the HTML file containing the interactive interface in 'Attachments'.
   See https://apps.extensions.modelcontextprotocol.io/api/documents/csp-and-cors.html to learn more.

What to do next

Create an MCP tool and add one of these apps, created to render an interactive user experience displayed by the MCP client.

Monitoring dashboard

Explore MCP Server monitoring dashboard to review the performance and usage of the MCP servers and tools in a specific time frame.

Before you begin

Role required: sn_mcp_server.viewer

About this task

Review the successes, failures, throttling incidents, and denial events associated with servers and tools for the specified time period. This enables a detailed understanding of performance metrics and issues encountered.

Procedure

1. Navigate to **Admin** > **MCP Server Console** > **Configuration** > **Monitoring**.
2. Track the tools call volume and outcomes across your MCP servers.
3. Choose to view the tools or server data.
4. View the findings sorted by each tool used or by each server involved.
   - Calls: Number of times the tool/server call was attempted
   - Success: Number of times the tool/server was successively called

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Failed: Number of times the tool/server call failed. This count includes throttled, denied, and other failed calls
- Success rate: Percentage of successful tool/server calls
- Throttled: Number of calls that failed as they were over the call limit set by the platform or the server
- Denied: Calls denied due to authorization or policy

5. You can also turn on the **Show per-server details** to sort and view server-wise tools data.

Create an AI ACL for a Subflow or Action

Create the necessary AI Access Control List (ACL) for the component to be called externally.

Before you begin
Role required: admin

About this task
AI ACLs are required for any Subflow or Action to be used as an MCP tool. An AI ACL is essential for ensuring security compatibility of the component, regardless of data types or execution logic. This approach embraces a proactive deny-by-default model. For more information, see the Understanding invoke_from_ai ACL in ServiceNow article in the ServiceNow Community.

Procedure

1. Navigate to navigation filter and enter **Access Control List**.
2. Select **New**.
3. Set the **type** to flow_action.
4. Set the **Operation** to 'Invoked from AI'.
   This is the critical distinction. A standard record ACL will not work.
5. In the **Name**, paste the component's internal name (scope-qualified, e.g., global.get_flow_description).

   You can find this by publishing the component first, then, checking the three-dot menu or the staging table.
6. Under **Requires Role**, add sn_mcp_server.admin (or the appropriate role for the MCP server user).
7. Submit the ACL.
   Confirm that a record-type ACL isn't created in error, instead of an AI ACL (invoked from AI operation). If the staging table still shows security_compatible = false after publishing, verify the ACL type.

Check the compatibility of a Subflow or Action

After establishing the ACL, publish the component and check the compatibility staging table.

Before you begin
Role required: admin

Procedure

1. Go to Workflow Studio and publish the Subflow.
   You can also run a full compatibility scan via the scheduled job.
2. Open the compatibility staging table for the relevant Subflow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Locate your component by name or sort by updated date.
4. Verify all the three compatibility columns: security_compatible = true, data_compatible = true, execution_compatible = true.
   The overall status should read as compatible. If security_compatible is false, the other columns will show N/A (not applicable). The system uses a fail-fast approach, fix security first, then re-check.
5. Republish the component after making ACL changes for re-evaluation.
   Once marked as compatible, the component can be added to an MCP server as a tool.

What to do next

Subflows must be activated for AI use in Flow Designer to be available as MCP tools. Open the subflow, go to Manage Security, enable Callable by Client API, and add a Client Callable Flow Object ACL with execute permission. Skipping this step will prevent the subflow from appearing in the tool creation list.

Connecting to an MCP server from an MCP client

Connect to a Model Context Protocol (MCP) server from an MCP client by creating an OAuth inbound integration and configuring the client with the server details.

With the Quickstart Server or after creating a server, you can complete the following steps to connect to a server from a client:

1. Create an OAuth inbound integration for an MCP client or Integrate with a third-party identity provider
2. Configure an MCP client to connect to an MCP server

The process to configure a client to connect to a server is dependent on the client used. For more information, refer to the documentation for your AI application and client.

Create an OAuth inbound integration for an MCP client

Secure access to Model Context Protocol (MCP) servers on an instance by creating an OAuth inbound integration for each MCP client.

Before you begin

Role required: oauth_admin, mi_admin, admin

About this task

For each client that you want to access servers on an instance, create an OAuth inbound integration in Machine Identity Console. To create the OAuth integration, you need a redirect URL from the client. For more information, refer to the documentation for your AI application and client.

Procedure

1. Navigate to **All** > **MCP Server Console**.
2. From the Configuration tab, select **Servers**.
3. From the OAuth setup required banner, select **Set up OAuth**.
   Alternatively, you can navigate to **All** > **Machine Identity Console** and select the **Inbound integrations** tab.

> **Note:** In the list of existing inbound integrations, you might see integrations created with the same names as servers (including underscores). These are integrations for monitoring servers from AI Control Tower and shouldn't be used to integrate with clients.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select **New integration**.
5. Select **OAuth - Authorization code grant**.
6. On the form, fill in the required fields.
   For more information about this form, see Configure an OAuth authorization code grant.

Inbound integration form

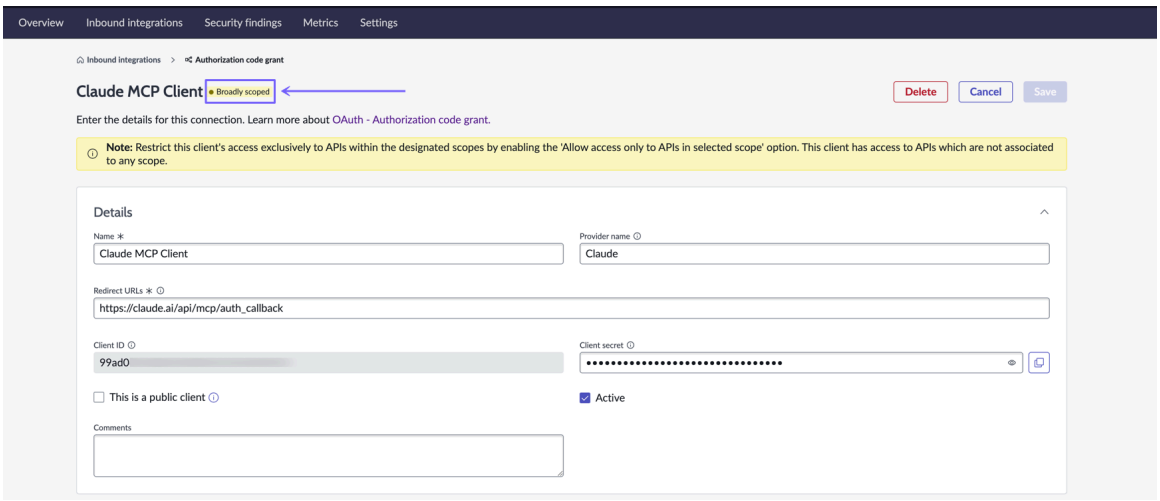
Field	Value
Details section	
Name	Enter a name for the OAuth integration.
Redirect URLs	Enter the redirect URL for a client. The authorization code is sent to this URL after authentication. To get the redirect URL, refer to the documentation for your AI application and client. To connect to the ServiceNow MCP client on another instance, use the following redirect URL: `https://<client-instance>.service-now.com/oauth_redirect.do`. For more information, see the Model Context Protocol Client documentation.
Auth scope section	
Allow access only to APIs in selected scope	Clear the check box to make the OAuth integration broadly scoped. **Important:** You must leave this option cleared. If you select this option, clients are unable to fetch tools from the server.
Advanced options section	
Token Format	Select **JWT**.

7. Select **Save**.

Note: If you're prompted to assign an auth scope, select **Skip for now**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The OAuth inbound integration is created as broadly scoped with a client ID and client secret that you use when configuring the client to connect to servers on the instance.



What to do next

Configure the client to use the client ID and client secret to authenticate with servers on the instance. For more information, see Configure an MCP client to connect to an MCP server.

Create client authorizations

Establish connections between your MCP clients and servers with client authorizations.

Before you begin

Role required: sn_mcp_server.admin (create); sn_mcp_server.viewer (to view)

About this task

Explore an alternate way of OAth creation with Client Authorization option within the left navigation of MCP Server Console. The process of creating an MCP Server by integrating OAuth Client registration directly within the MCP Server Console is streamlined. This feature eliminates the need to switch between different consoles. You don't have to leave the Machine Identity Console to register an OAuth Client, manually copy secrets and return to complete the MCP Client setup.

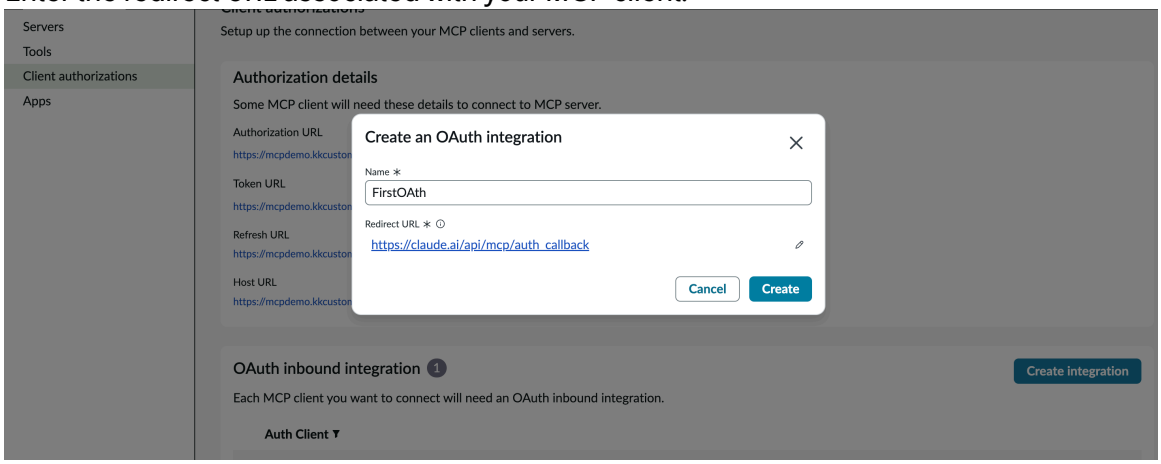
The the OAuth fields are auto-populated, generating the Client ID and Secret without the need for navigation, and providing a one-time Connection Summary that displays the necessary credentials.

Procedure

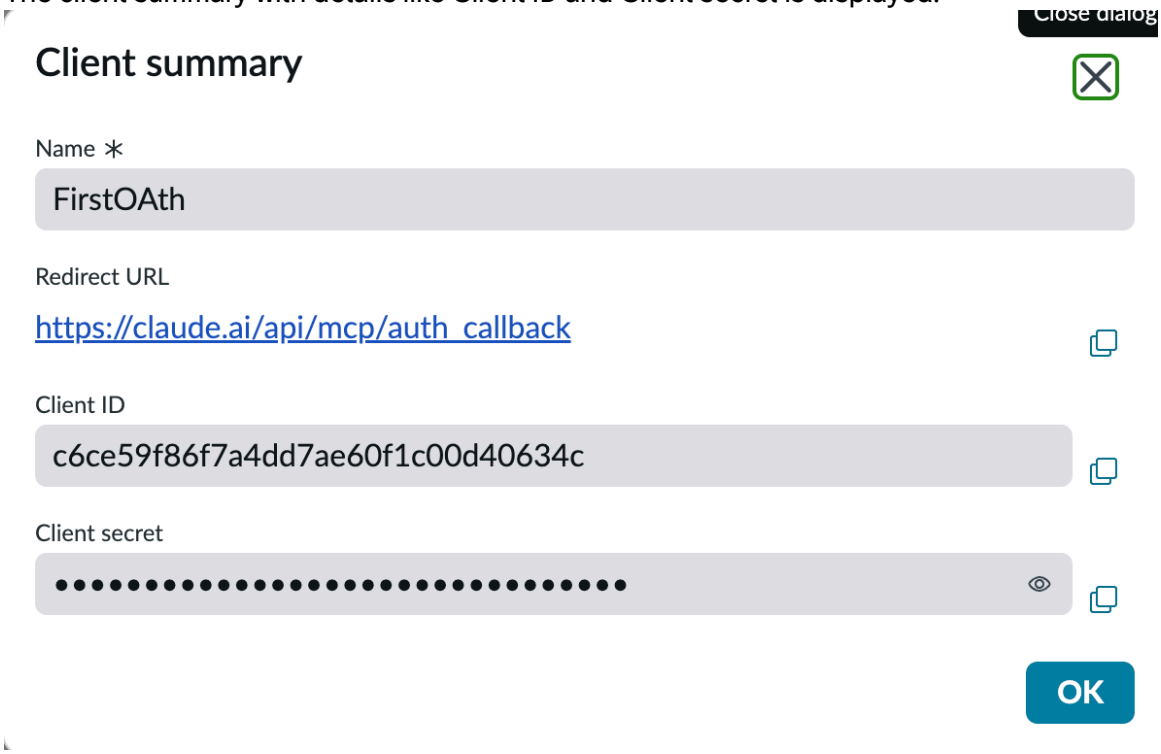
1. Navigate to **All** > **MCP Server Console** > **Servers**.
2. You can also navigate to **Admin** > **MCP Server Console** > **Servers**.
3. Select **Client authorization** on the left navigation.
4. Review all the authorization details that you will need, to integrate the MCP client. See Configure an MCP client to connect to an MCP server to details on these URLs.
   - Authorization URL
   - Token URL
   - Refresh URL
   - Host URL
5. Select **Create integration**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Enter a name for the OAuth integration you create.
7. Enter the redirect URL associated with your MCP client.



8. Select **Create**.
9. Select the authorization client you created.
   The client summary with details like Client ID and Client secret is displayed.



10. Copy the Client ID, Client Secret, Redirect URL, and connection URLs using the copy options.
11. Enter these details on the MCP client's OAuth configuration.
    MCP Server and Client connection is established with client authorization.

What to do next

Configure the MCP Client to connect to MCP Server. See Configure an MCP client to connect to an MCP server.

Integrating MCP server with third-party identity providers

Configure the ServiceNow® Model Context Protocol (MCP) server to authenticate users through a third-party identity provider (IDP).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When you integrate a third-party IDP with an MCP server, users authenticate through the external IDP instead of ServiceNow's native authentication. This process involves three phases:

1. ServiceNow (Glide) configuration
2. Third-part IDP setup
3. Integration and testing

The first phase is ServiceNow (Glide) configuration that involves setting up the necessary tables and mappings within your ServiceNow instance. This has three steps:

1. Configure the OIDC provider
2. Create the MCP server
3. Map the resource to the IDP

The second phase is Third-party IDP setup that involves setting up the application and authorization server within the IDP. This has three steps:

1. Account setup
2. Create an app integration
3. Configure the authorization server

The final phase is Integration and testing that involves connecting the MCP client (such as Claude Desktop) to the configured systems. This involves three steps:

1. Connect to the MCP client
2. Authenticate
3. Verify tool calls

Related topics

Integrate and test IDP with MCP server

ServiceNow(Glide) configuration for IDP

ServiceNow(Glide) configuration for IDP

This process involves setting up the necessary tables and mappings within your ServiceNow instance. This includes configuring ServiceNow, creating the MCP server, and connecting the MCP client.

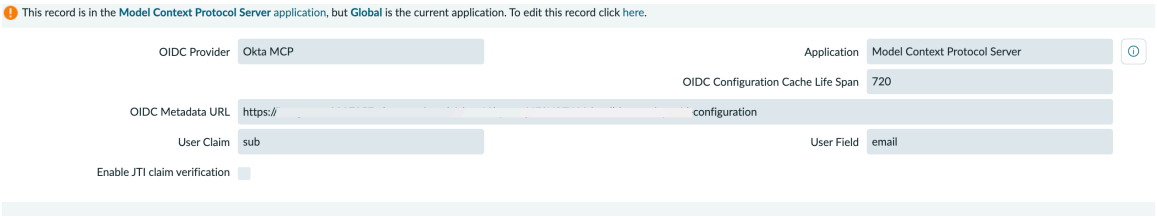
Before you begin
Role required: admin

Important: The minimum version required is Australia patch 3 or Zurich patch 10. Microsoft Entra is supported in Australia patch 4 or Zurich patch 11 onwards.

Procedure
Configure the OIDC provider

Note: Okta is used as the use case to guide you through the steps.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



1. Navigate to the **oidc_provider_configuration** table and select **New**.
2. Enter a **Name** for the OIDC provider.

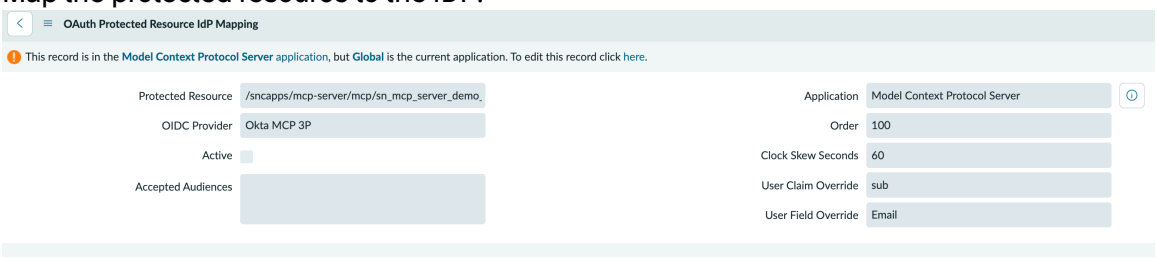
   Example
   For example, `Okta MCP Third Party`.
3. Set the **Cache Configuration Lifespan**.
   The maximum value is 720 hours.
4. Enter the IDP metadata URL into the **Metadata URL** field.
5. In the **User Field**, select **email**.
   This maps the user claim from the IDP token to the `email` field in the `sys_user` table.
6. Let **Enable JT1 claim verification** option remain unchecked.
   Enabling the JSON Web Token Identifier (JTI) would require the MCP client to reauthenticate with every request. Therefore, disabling the JTI check in the OIDC provider configuration is recommended for MCP third-party integrations. This is because the client reuses the same token for tool calls until it expires.
7. Select **Submit**.

Create the MCP server

8. Navigate to the MCP server console and select **Create Server**.
9. Enter a name for the server and add the required tools.

   Example
   For example, `MCP with Third Party IDP`.
   After you create the server, automatically generates an entry in the **oauth_protected_resource** table and populates it with the list of APIs allowed for that server.

Map the protected resource to the IDP:



10. Navigate to the **oauth_protected_resource_idp_mapping** table and select **New**.
11. In the **Protected Resource** field, select the resource that was created for your MCP server.

    Example
    If your MCP server name is `sn_mcp_server_default`, the protected resource path is `/sncapps/mcp-server/mcp/sn_mcp_server_default`.
12. In the **OIDC Provider** field, select the OIDC provider configuration you created earlier.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. For Microsoft Entra integrations only, configure the **Accepted Audiences** field in the `oauth_protected_resource_idp_mapping` table with the Entra Application ID URI (for example, api://<Application-ID>.
This allows ServiceNow to accept Entra-issued access tokens whose audience claim matches the configured Application ID URI.

13. Select **Submit**.

Result
Your MCP server is now configured to authenticate users through the third-party IDP. Users who connect an MCP client to this server are redirected to the related IDP to authenticate.

What to do next

1. Configure and set up the third-party IDP. This process involves setting up the application and authorization server within the third-party IDP setup. This document uses Okta as the use case, however, Microsoft Entra is also recommended.
2. Integrate and test from your MCP Client.

Integrate and test IDP with MCP server

This phase within integration of MCP server with IDP involves connecting the MCP client (such as Claude Desktop) to the configured systems.

Before you begin
Role required: admin

Procedure
Connect the MCP client

1. Navigate to your MCP client and go to **Manage Connectors** > **Add a custom connector**.

   Example
   For example, open Claude Desktop.
2. Enter the **Remote MCP Server URL** from your ServiceNow MCP server console.
3. Enter the **Client ID** and **Client Secret** from your third-party IDP application configuration.

Authenticate

4. Select **Connect** and authenticate with your third-party IDP credentials.
   You're redirected to the IDP login page. Enter your credentials and verify.

Verify tool calls

5. Test your tool calls to verify the connection is working correctly.

Result
Your MCP server is now configured to authenticate users through the third-party IDP. Users who connect an MCP client to this server are redirected to the IDP to authenticate.

Configure an MCP client to connect to an MCP server

Configure a Model Context Protocol (MCP) client to connect to an MCP server and prompt the server to perform a task.

Before you begin
Role required: sn_mcp_server.viewer

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The process to configure a client to connect to a server is dependent on the client used. The following procedure is a high-level overview of the workflow to configure a client to call a server. For more information, refer to the documentation for your AI application and client. For an example that demonstrates how to connect from a server on one instance to the ServiceNow Model Context Protocol Client on another instance, see the example following this procedure.

Note:

- MCP Server Console supports the Streamable HTTP transport. By default, tool calls return a single JSON response. Server-Sent Events (SSE) are optionally available for streaming response types. Stdio is not supported.
- The MCP rate limit is not configurable currently, and adjusting the rate limit requires a service restart. Contact your ServiceNow representative to learn more.

Procedure

1. Configure a client with the required server details as determined by the client.

Server details for MCP client configuration

Server details	Value
Server URL	`https://<server-instance>.service-now.com/sncapps/mcp-server/mcp/<server-name>` To connect to the preconfigured Quickstart Server, use `https://<server-instance>.service-now.com/sncapps/mcp-server/mcp/sn_mcp_server_default`.
Host	`<server-instance>.service-now.com`
Base URL	`/sncapps/mcp-server`
Scope	mcp_server
Authentication type	OAuth 2.0
Identity Provider	Generic OAuth 2
Authorization URL	`https://<server-instance>.service-now.com/oauth_auth.do`
Access Token URL	`https://<server-instance>.service-now.com/oauth_token.do`
Token Revocation URL	`https://<server-instance>.service-now.com/oauth_revoke.do`
Refresh Token URL	`https://<server-instance>.service-now.com/oauth_auth.do`
Redirect or Callback URL	`https://<server-instance>.service-now.com/oauth/callback`
Client ID	The client ID from the OAuth inbound integration on the server instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Server details	Value
	Note: For clients that support Client ID Metadata Document (CIMD) authentication, you can register a CIMD client and provide a CIMD URL instead of a client ID. For more information, see Configure a CIMD client
Client secret	The client secret from the OAuth inbound integration on the server instance. If you use CIMD authentication, you don't need to provide a client secret.

After configuring these details, the client calls the server with the `Authorization: Bearer <token>` header. If the token is validated by the server, the client receives the list of tools available for use.

2. From the client, you can view the list of tools available to determine how to prompt the server.
3. Enter a prompt for the information you need or for the tool to perform an action on the instance.

   For example, if the Look up Incident Records tool is available, you could enter "Get all open incidents". With the Case summarization tool, you could enter "Summarize all cases closed this week".

   Note: When calling a Scripted REST API tool from a client, you must provide inputs in your request. If a required parameter, such as a record number, a date range, or a filter value, is not present in the request, the tool will not be able to complete the task.

   The server runs the relevant tools and returns the result to the client as JSON data. The client presents the response as formatted text.

Important: The MCP service limits the size of tool call payloads. If a request payload from the MCP client exceeds 26 KB, the MCP service returns an error stating that the request payload is too big. If a response payload exceeds 64 KB, the MCP service returns an error stating that the response payload is too big. The minimum version for this restriction is Brail patch 1, Australia patch 7 and Zurich patch 13.

Trouble?

Note: If you don't receive the expected data in the response, review the following troubleshooting tips:

- If you receive an empty or incomplete response rather than an error, first check the ACL configuration for the invoked tool. For more information, see Creating tools for a Model Context Protocol server.
- If you receive a 401 error, generate a new authentication token from the client.
- If you receive a 403 error, confirm that the calling user or client has the required role and ACL access for the invoked tool.

Trouble?

If you run into other issues connecting to a server, see the following additional resources to help you troubleshoot:

- Creating tools for a Model Context Protocol server
- MCP Server Console FAQ in the ServiceNow Community
- OAuth Inbound Authentication with ServiceNow: Authorization Code Grant Flow Using Postman article in the Now Support Knowledge Base

Example: Connecting to an MCP server from ServiceNow Model Context Protocol Client

This example demonstrates how to connect to a server from an AI agent on another instance using the ServiceNow Model Context Protocol Client. First, you configure the client to call the preconfigured Quickstart Server. From an AI agent, you access the Quickstart Server's list of tools and add individual tools to the agent. Lastly, you test the agent in AI Agent Studio by providing a prompt and seeing the agent's response. For more information, see the Model Context Protocol Client documentation.

Role required: sn_mcp_server.viewer and sn_mcp_client.admin

1. On the server instance, create an OAuth inbound integration for the ServiceNow Model Context Protocol Client.

   For more information, see Create an OAuth inbound integration for an MCP client.

2. On the client instance, navigate to **All** > **AI Agent Studio** > **Settings**.
3. Select **Manage MCP Servers**.
4. Select **New**.
5. Add the Quickstart Server.

   For more information about this step, see Add an MCP Server with OAuth 2.1.

   a. On the Add MCP server form, fill in the fields.

Add MCP server form

Field	Value
Name	Quickstart Server
Authentication Type	OAuth 2.1
MCP server URL	`https://<server-instance>.service-now.com/sncapps/mcp-server/mcp/sn_mcp_server_default`

   b. Select **Next**.

   c. On the form, fill in the fields.

Add MCP server form

Field	Value
Client registration type	Manual Registration
Grant type	Authorization Code
Token authentication method	Client Secret Post

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
Client ID	The client ID from the OAuth inbound integration for the Model Context Protocol Client on the server instance.
Client secret	The client secret from the OAuth inbound integration for the Model Context Protocol Client on the server instance.
Authorization URL	`https://<server-instance>.service-now.com/oauth_auth.do`
Token URL	`https://<server-instance>.service-now.com/oauth_token.do`
Token Revocation URL	`https://<server-instance>.service-now.com/oauth_revoke.do`

d. Select **Save**.

6. Verify the OAuth configuration.

a. Select **Authenticate**.

b. Select **Allow** to allow the client to connect to the server.

7. Add tools from the Quickstart Server to an AI agent.

For more information about this step, see Add a Model Context Protocol to an AI agent.

a. In AI Agent Studio, select the **Create and manage** tab.

b. From the AI agents tab, select an existing agent or create one.

For information about creating an agent, see Create an AI agent.

c. Select **Add tools and information**.

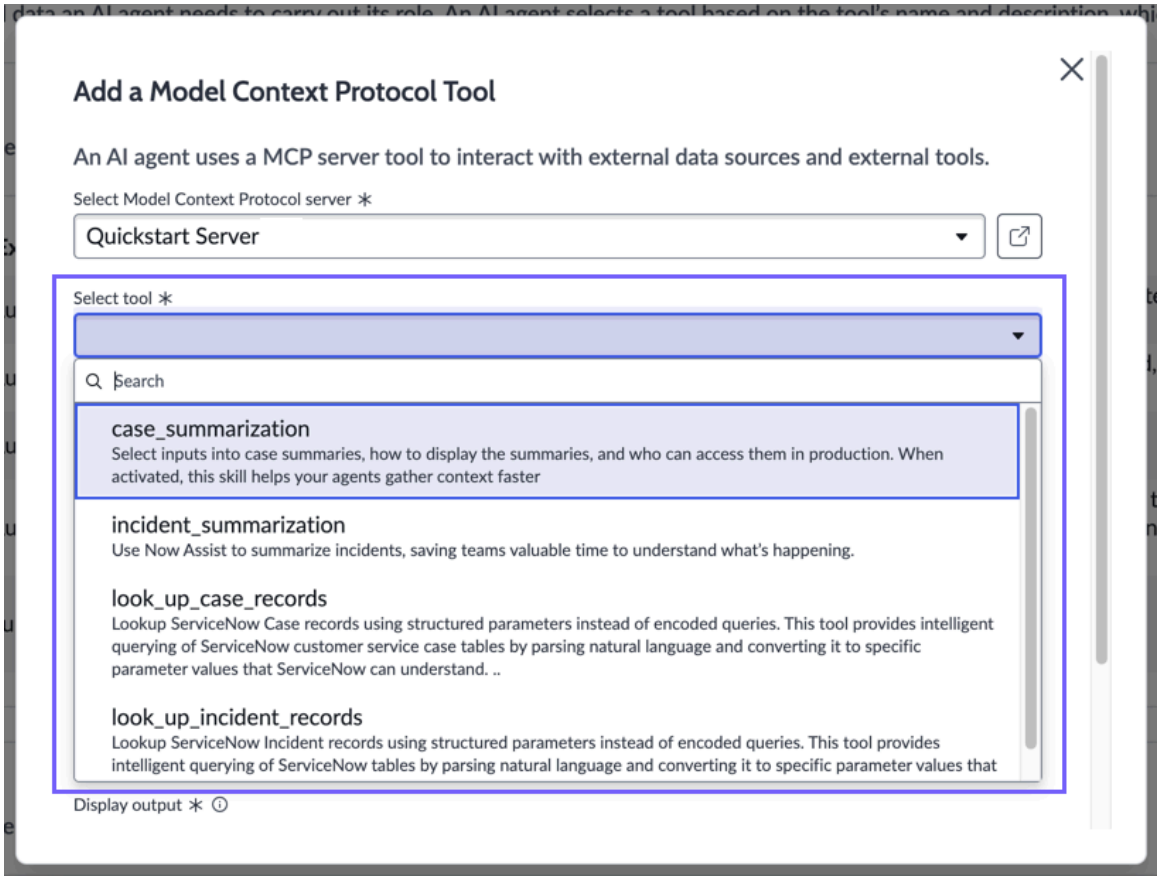
d. Select **Add tool** > **MCP server tool**.

e. On the form, fill in the fields.

Add a Model Context Protocol Tool form

Field	Value
Select Model Context Protocol server	Quickstart Server
Select tool	Select the tools from the Quickstart Server that you want to use with this AI agent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



f. Select **Add**.

g. Select **Save and continue**.

8. Test the AI agent.

   For more information about this step, see Test an AI agent.

   a. In AI Agent Studio, select the **Testing** tab.

   b. Select **Start manual test**.

   c. In the Choose a test type field, select **AI agent or workflow**.

   d. Select the AI agent you configured and its version.

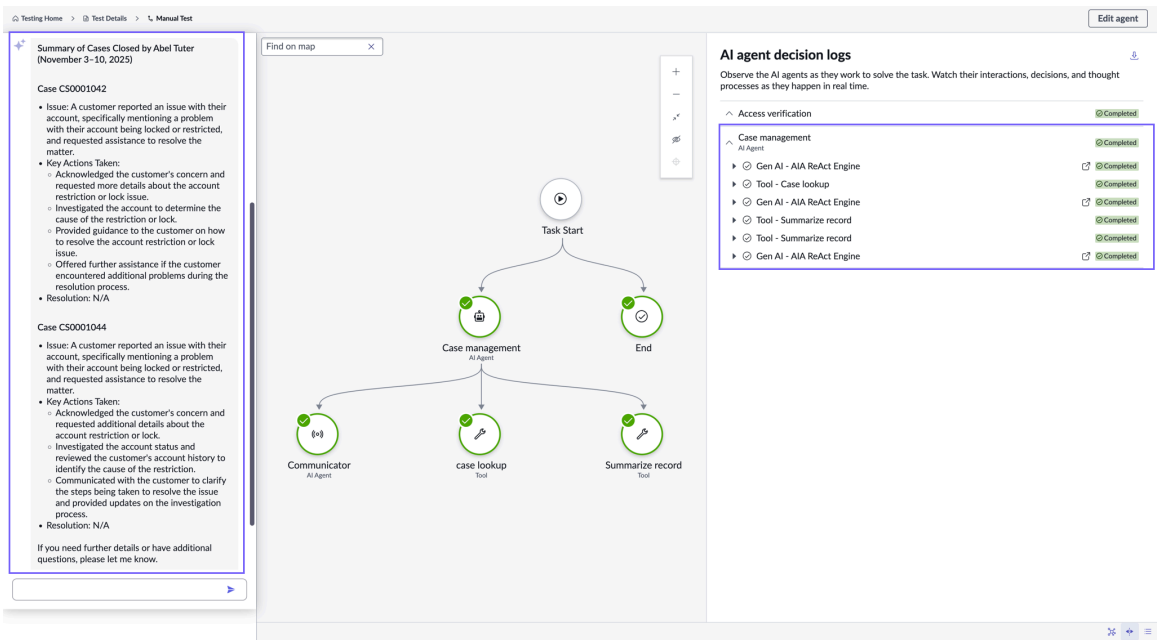
   e. In the Task field, enter a prompt to get information or to perform an action on the instance.

      The prompt should be based on which tools are available. For example, if you added the Look up Case Records and Case summarization tools, you can enter "Summarize all cases closed this week."

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

f. Select **Continue to Test Chat Response**.

The AI agent calls the server, and the server runs the tools requested based on the prompt. The server returns the information to the agent as JSON data, and the agent presents it as formatted text. In this example, the agent returns summaries of the cases closed by Abel Tuter in the past week.



MCP Server Console reference

Reference topics include information about MCP Server Console roles, tables, and more.

Components installed with MCP Server Console

Several types of components are installed with activation of the MCP Server Console application, including tables and user roles.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles installed

Role	Description	Contains roles
MCP Server administrator [sn_mcp_server.admin]	Performs create, read, update, and delete (CRUD) operations on all MCP Server Console tables.	sn_mcp_server.tools_admin
MCP Server tools administrator [sn_mcp_server.tools_admin]	Performs create, read, update, and delete (CRUD) operations for tools.	• canvas_user • sn_nowassist_admin.user • web_service_admin
MCP Server viewer [sn_mcp_server.viewer]	Invokes tools and views all MCP Server Console tables (read-only access).	• one_extend_viewer • canvas_user • sn_nowassist_admin.user • web_service_admin

Tables installed

Table	Description
AI Skill Tool Definition [sn_mcp_ai_skill_tool_definition]	Tools based on Now Assist skills. Extends the Tool Definition table.
AI Skill Tool Input [sn_mcp_ai_skill_tool_input]	Inputs for tools based on Now Assist skills. Extends the Tool Input table.
Provisioned MCP Server [sn_mcp_server_registry]	MCP servers deployed on the instance.
Scripted REST Tool Definition [sn_mcp_scripted_rest_tool_definition]	Tools based on Scripted REST APIs that enable other tools. Extends the Tool Definition table.
Scripted REST Tool Input [sn_mcp_scripted_rest_input]	Inputs for tools based on Scripted REST APIs. Extends the Tool Input table.
Tool Definition [sn_mcp_tool_definition]	Tools defined for use by MCP servers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
Tool Input [sn_mcp_tool_input]	Inputs defined for use by MCP server tools.

Model Context Protocol Server Console tools

Use the following tools that are available by default with Model Context Protocol Server Console depending on the applications installed on your instance, such as ServiceNow Otto for CSM or ServiceNow Otto for ITSM.

Tool definitions installed with Model Context Protocol Server Console

Name	Category	Description
case_summarization	AI Skill	Get a summary of details in a case record.
email_recommendation	AI Skill	Get a recommended response to an email.
incident_summarization	AI Skill	Get a summary of details in an incident record.
lookup_case_records	Scripted REST API	This API enables looks up case records for the case_summarization tool.
lookup_incident_records	Scripted REST API	This API looks up incident records for the incident_summarization tool.
lookup_kb_records	Scripted REST API	

AI skill support in MCP Server Console

MCP Server Console supports creating tools for Model Context Protocol (MCP) servers from a subset of AI skills.

The following AI skills are preconfigured as tools MCP Server Console:

- Case summarization
- Incident summarization

In addition, you can create tools from the following AI skills or from custom skills created with AI Skill Kit. Only AI skills that don't rely on internal information as inputs, such as sys_ids, are available to be created as tools. Some AI skills don't currently meet the criteria required to be used as tools. For more information, contact your ServiceNow representative.

- Analyze the CMDB Search request
- Change request risk explanation
- Code Assist AutoComplete
- Code Assist Edit
- Code Assist Generation
- Code Assist Summarization

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Common control objective creation
- Correlation insights generation
- Customer Service Summary
- Docs summarization in Collaborative Work Management
- Duration to Days convertor
- EAP doc summarization
- Error resolution recommendation
- Feedback summarization
- Flow generation
- Invoice Inquiry solution generator skill
- Multi feedback summarization
- Playbook Generation
- Playbook generation with images
- Policy Based HR Case Evaluator
- Problem investigator skill
- Project doc summarization
- Recommend preferred solution for VIT
- Refine content
- Regulatory alert impacted citations
- Regulatory alert impacted control objectives
- Regulatory alert impacted controls
- Relevant invoice finder
- Resume Skill Extraction
- Skill keyword extractor
- Spoke Generation
- Subflows and actions
- Supplier recommendation
- Survey Filler Answer Suggestion skill
- Text2Test Sentinel
- Text2Test Skill
- Vulnerable item deduplication

Knowledge Graph schema support in MCP Server Console

MCP Server Console supports creating tools from several preconfigured Knowledge Graph schemas, each suited to different types of queries.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following Knowledge Graph schemas are available by default when creating a tool from a Knowledge Graph. Select a schema based on the type of query your tool needs to run and how the underlying tables are used across your instance.

Tip: Start with Enterprise Graph (Small). Move to the full Enterprise Graph only if your workflows require cross-domain traversal that the smaller schema doesn't cover. For people and organizational structure queries, User Graph or NLQ User Graph is the more targeted choice.

Available Knowledge Graph schemas for MCP tools

Schema	Description
Enterprise Graph	Covers all tables on your instance. Best for complex queries that span multiple domains.
Enterprise Graph (Small)	A curated subset of the most commonly queried tables. Faster and more token-efficient than the full Enterprise Graph. Best starting point for most IT and HR workflows.
User Graph	Focused on people, organizational structure, roles, and relationships. Best for organization hierarchy look ups or manager relationships.
NLQ User Graph	A variant of the User Graph schema optimized for natural language queries. Consult your implementation guide for specific use cases.
Table Look up Graph	Designed for structured table and record look ups. Consult your implementation guide for specific use cases.
Identify Survey Instance	A specialized schema for survey-related workflows. Consult your implementation guide for specific use cases.

Knowledge Graph

Domain separation and MCP Server Console

Domain separation is supported for MCP Server Console. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Standard

- Includes all aspects of **Basic** level support.
- Application properties are domain-aware as needed.
- Business logic: The service provider (SP) creates or modifies processes per customer. The use cases reflect proper use of the application by multiple SP customers in a single instance.
- The instance owner must configure the minimum viable product (MVP) business logic and data parameters per tenant as expected for the specific application.

Sample use case: An admin must be able to make comments required when a record closes for one tenant, but not for another.

For more information on support levels, see Application support for domain separation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

How domain separation works in MCP Server Console

Domain separation limits the MCP tools and servers that a user can access based on their current domain. The rules follow a top-down hierarchy: a domain can view its own records, all records from descendant domains, and global records. The domain can't access records from ancestor or sibling domains.

- To enable domain separation in your MCP instance, install the domain separation plugin.
- The parent domain can view the servers, tools, and apps created within its child domains, and those created within its own domain.

> **Note:** A domain can view it's own records, descendent domain's and global records. But it can't view ancestor's and sibling domain records.

- An MCP tool can be attached to a server within the same domain.
- When a tool or server is created via the UI, it is stamped with the creating user's current `sys_domain`. This stamp is the source of truth for all visibility and scoping decisions.
-

Domain separation for service providers

ServiceNow Cowork

ServiceNow Cowork is an enterprise autonomous AI agent that connects to your enterprise applications and systems and executes complex and multi-step tasks autonomously, and operates within defined security, access, and governance policies.

Get started

Explore Learn what Cowork can do, who uses it, and how it fits into your organization's workflows.	Configure Install Cowork, connect your integrations, and set up your agent for the first time.
User Use ServiceNow Cowork start tasks and work with skills, workflows, and sub agents.	Reference Additional information about ServiceNow Cowork

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:

- Not all model providers are available for customers with in-country SKUs, and some AI products/features are currently unavailable for in-country customers. For more information, see the KB1584492 article in the Now Support Knowledge Base. Be sure to check for model provider availability updates in future releases.
- Some AI products/features are currently unavailable for customers in the FedRAMP, NSC DOD IL5, or Australia IRAP-Protected data centers, self-hosted customers, or in other restricted environments. For more information, see the KB0743854 article in the Now Support Knowledge Base. Be sure to check for availability updates in future releases.
- Some AI products/features are currently available only for customers in some regions. Be sure to check for availability updates in future releases.
- Some AI products and skills are not available in Regulated Markets. For more information, see KB2593939: Regulated Markets AI Products/Skills Not Available. Be sure to check for availability updates in future releases.

AI limitations

This application uses artificial intelligence (AI) and machine learning, which are rapidly evolving fields of study that generate predictions based on patterns in data. As a result, this application may not always produce accurate, complete, or appropriate information. Furthermore, there is no guarantee that this application has been fully trained or tested for your use case. To mitigate these issues, it is your responsibility to test and evaluate your use of this application for accuracy, harm, and appropriateness for your use case, employ human oversight of output, and refrain from relying solely on AI-generated outputs for decision-making purposes. This is especially important if you choose to deploy this application in areas with consequential impacts such as healthcare, finance, legal, employment, security, or infrastructure. You agree to abide by ServiceNow's AI Acceptable Use Policy, which may be updated by ServiceNow.

Data processing

This application requires data to be transferred from ServiceNow customers' individual instances to a centralized ServiceNow environment, which may be located in a different data center region from the one where your instance is, and potentially to a third-party cloud provider, such as Microsoft Azure. This data is handled per ServiceNow's internal policies and procedures, including our policies available through our CORE Compliance Portal.

Note: We have controls in place to enable/disable the data collection and data processing.

Data collection

ServiceNow collects and uses the inputs, outputs, and edits to outputs of this application to develop and improve ServiceNow technologies including ServiceNow models and AI products. Customers can opt out of future data collection at any time, as described in the AI Opt-Out page.

Exploring ServiceNow Cowork

ServiceNow Cowork is an autonomous AI agent that performs complex tasks, executes multi-step workflows, interacts with enterprise applications, and takes actions based on defined policies.

ServiceNow Cowork overview

ServiceNow Cowork completes tasks by identifying the required actions, running those actions, and adjusting its approach when conditions change or an action fails. Cowork executes within the security, access, and governance policies of your enterprise environment. Administrators define policies that control which actions Cowork can take autonomously. Users can delegate complex tasks that require several steps.

Cowork combines natural language interaction with direct access to ServiceNow APIs, Microsoft 365, file systems, GitHub and a sandboxed execution environment. With these capabilities together, it completes workflows end to end without needing constant human direction. Rather than running through a fixed sequence of predefined steps, Cowork analyzes each task, selects an approach, and executes the actions needed to complete it. Cowork works across your connected systems and delivers a completed result rather than a progress update.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

With Cowork, enterprise professionals can delegate work across their systems, and administrators can deploy and govern it.

Note: Cowork operates as a native desktop application on macOS. The agent runs locally and stores all data on your device. No data leaves the device unless you explicitly connect an integration that sends it externally.

ServiceNow Cowork users

Users

User	Role	Description
ServiceNow Cowork admin	sn_app_cowork.admin	Sets policies and approval gates, governs connectors and MCP servers, and controls which models are available.
ServiceNow Cowork user	sn_app_cowork.user	Uses the Cowork to perform tasks, interact with AI agents, use connectors, answers approval prompts, runs skills, workflows, and subagents.

ServiceNow Cowork key features and benefits

- **Autonomous task execution**

  Cowork takes an objective and determines the steps needed to complete it. It plans, executes actions, checks results, retries and adjusts the approach when something fails. Policies determine where approvals are required.

- **Enterprise governance and controls**

  Organizations can monitor what agents accessed and what actions were performed. Administrators control agent permissions and activity through policies and AI Control Tower.

- **Skills and workflows**

  Skill packs extend what the agent can do and repair their own scripts when they fail. Workflows are reusable step sequences.

- **Works across applications**

  Cowork is not limited to the ServiceNow applications. It can interact with files, terminals, APIs, and enterprise systems to complete a task or a set of tasks.

- **Governed connections**

  Administrators control which external services Cowork can connect to through Model Context Protocol (MCP) servers. Connections can be disabled or isolated as needed.

- **Extensibility**

  Cowork connects to skills, sub-agents, MCP servers, and external services through a built-in settings library.

- **Tiered approvals**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Approval rules are configured as hard gates or soft gates. Hard gates block actions until approval is granted. Soft gates allow actions to execute without requiring approval first, but approval remains available if needed. An auto mode capability automatically routes lower-risk calls past the approval prompt.

- **Usage insights and skill telemetry**

  Usage insights report adoption rates, intervention frequency, policy events, and cost signals. Skill telemetry tracks performance metrics and compliance across deployed skills.

- **Semantic memory and knowledge graph**

  Cowork keeps two memory layers. Long-term memory stores preferences, decisions, and facts that persist across sessions. The knowledge graph, which automatically builds a structured map of people, projects, decisions, and action items from conversations and activity, is also maintained.

- **Automatic insight capture**

  Cowork captures activity and meetings, extracts decisions and action items, and delivers a structured summary with follow-up tasks.

- **Usage insights and skill observability**

  Administrators can view Cowork usage telemetry through usage insights for sessions, conversation counts, connector activity, and policy events. Skill observability tracks invocation counts, success rates, latency, and token consumption per skill, with detailed traces available in AI Control Tower.

What to explore next

To learn more about configuring and using ServiceNow Cowork, see:

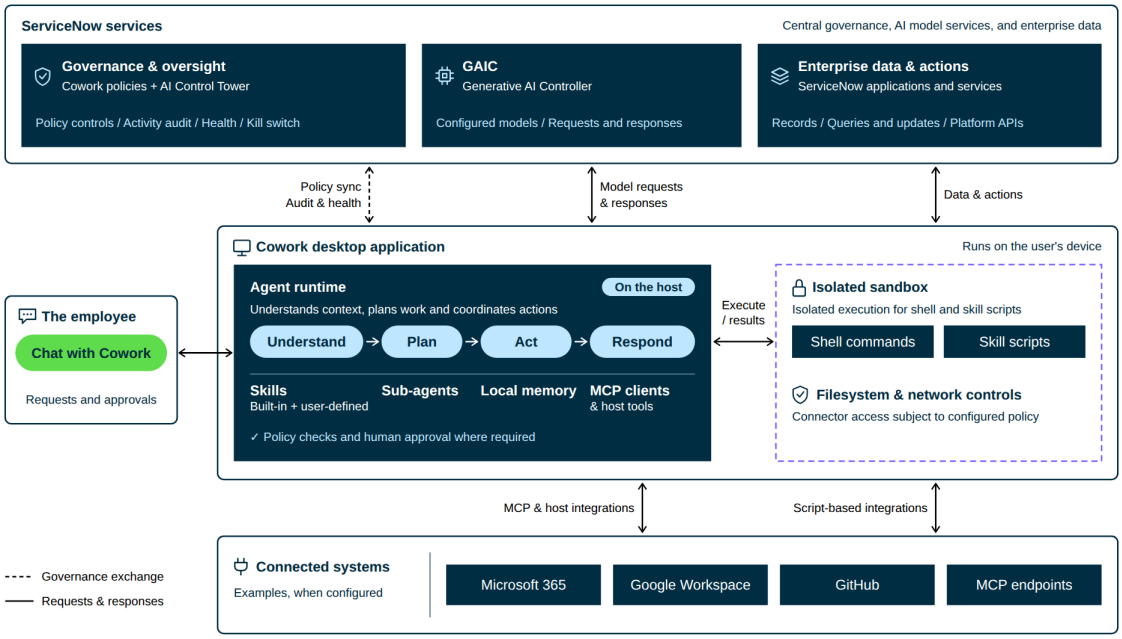
- Configuring ServiceNow Cowork
- Using ServiceNow Cowork
- ServiceNow Cowork reference

ServiceNow Cowork architecture

ServiceNow Cowork separates the client, the agent host, and an isolated sandbox so that planning happens on the host and agent commands run inside a container with its own network policy. Cowork runs on the desktop and connects to your ServiceNow instance, which governs what Cowork can do.

The high level architecture has three layers: the ServiceNow instance, Cowork, which governs Cowork based on the policy defined, the Cowork desktop application, which runs tasks; and the connected systems that Cowork works with.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



ServiceNow instance

The ServiceNow instance governs Cowork, logs its activity, and provides access to your data.

AI Control Tower manages policy and auditing, for Cowork when needed. It syncs policies to Cowork and registers each Cowork installation. Each installation sends AI Control Tower a periodic heartbeat, so AI Control Tower can show which installations are active and healthy. Administrators can use the kill switch in AI Control Tower to stop Cowork from taking further actions. For more information, see AI Control Tower.

Generative AI Controller (GAIC) logs every LLM (large language model) call that Cowork makes. User initiated requests consume assists and are recorded in the Generative AI Log under the feature name ServiceNow Cowork Execution. Requests that Cowork makes on its own, such as evaluating actions in Auto mode, don't consume assists. For more information, see Exploring Generative AI Controller.

Data and System of Action provides access to records, automation, and agents. Cowork reaches these resources through Action Fabric, the interface that connects Cowork to ServiceNow data and actions. For more information, see .

ServiceNow Cowork desktop application

ServiceNow Cowork runs on the user's desktop and has two main parts: the Cowork runtime and the secure sandbox.

The Cowork runtime includes the agent loop, sub-agents, skills, and memory. The agent loop plans a task, runs each step, checks the result, and adjusts when a step fails. Skills and connectors extend what Cowork can do, and memory stores preferences, decisions, and context across sessions.

The secure sandbox is an isolated environment on the device where tool execution, connectors, and the LLM client run under policy control. The LLM client sends requests to the large language model. Connectors run only when AI Control Tower policy allows them, so every action stays within the limits your administrator sets.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connected systems

Users provide a task to Cowork through chat. Cowork uses its connectors to gather context and take action in connected systems, including Slack, Microsoft 365, GitHub, Model Context Protocol (MCP) endpoints, and the ServiceNow instance. The same policy managed connectors handle both incoming work and outgoing actions.

Cowork runs tasks on the user's desktop. The Cowork runtime, memory, and tool execution stay on the device. Some data leaves the device:

- Requests from the LLM client to the large language model, which GAIC logs
- Policy sync and registration with AI Control Tower
- Data that connectors send to connected systems

Policy management and governance in ServiceNow Cowork

Policies are governance rules on your ServiceNow instance that control what ServiceNow Cowork can do, which actions need approval, and which actions are blocked.

ServiceNow Cowork is an autonomous AI agent that runs commands, reads and writes files, and reaches external systems on behalf of users. Because the agent acts for users, your organization needs control over what the agent can do.

Policies give you that control. You author policies on the ServiceNow instance, and every ServiceNow Cowork client enforces them on every action before the action runs. Users work within the boundaries set and approve actions when a policy requires it. Policies are the centrally managed rules and governance components that control what the agent can and can't do, preventing it from taking actions outside the boundaries you define. Every action the agent attempts is evaluated against the active policy before it runs.

The following properties make policy a governance mechanism rather than guidance:

Central authoring

Policies live in ServiceNow tables on your instance, not in local configuration that a user can edit.

Enforcement in code

ServiceNow Cowork enforces policy on every action, and neither the agent nor end users can bypass policy rules. Enforcement happens in code, not through the agent's instructions, so it doesn't depend on the agent choosing to conform.

Mandatory policy

ServiceNow Cowork runs nothing without a policy. Until the client retrieves an active policy from your instance, Cowork doesn't perform any action.

How policy reaches the client

The instance merges every policy that applies to a user and sends the client one effective policy bundle. Clients never see the individual policy records.

When you change a policy, the instance pushes the change to clients in near real time. Clients also check for changes in case they miss a push. Users can see the last policy sync time in their ServiceNow Cowork application under **Settings** > **Agent Sandbox**.

A policy bundle doesn't expire. If the instance becomes unreachable, the client keeps enforcing the last policy it retrieved.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Default Policy

Every instance includes the **Default Policy**. It's active, applies to all users, and includes values for all seven policy components. You can't edit the **Default Policy**. To change its behavior, create a policy with a lower priority number. For more information, see Policy stacking and precedence in ServiceNow Cowork.

For what each component controls, see Policy components in ServiceNow Cowork.

Policy components in ServiceNow Cowork

A ServiceNow Cowork policy has seven components, each controlling a different part of what the agent can do.

Each component is a separate record that you link to a policy from its tab on the policy record.

Default policy components

Every instance includes the **Default Policy**. It's active, applies to all users, and has values for all seven components.

Policy components

Component	Tab	Table	What it controls
Tool gates	**Policy Tool Gates**	sn_app_cowork_tool_gate	Sets each tool to **Allow**, **Deny**, **HITL**, or **Auto**.
Approval patterns	**Policy Patterns**	sn_app_cowork_approval_pattern	Defines which commands need a human decision, and whether the decision can be remembered (soft gate) or must be made every time (hard gate).
Network rules	**Policy Network Rules**	sn_app_cowork_network_rule	Lists the hosts and ports the sandbox can reach. Anything not on the allowlist is unreachable.
Sandbox rules	**Policy Sandbox Rules**	sn_app_cowork_sandbox_rule	Sets the sandbox filesystem boundary and network permissions for individual binaries. Rules can restrict access further but can't loosen the built in protection of credential paths and system directories.
File type rules	**Policy File Type Rules**	sn_app_cowork_file_type_rule	Sets read, write, or deny access for each file extension.
Connector scopes	**Policy Connector Scopes**	sn_app_cowork_connector_scope	Turns OAuth scopes on or off for each connector. Microsoft 365 is supported. By default, read scopes are on and send and write scopes are off.
Capabilities	**Capability Overrides**	sn_app_cowork_capability, sn_app_cowork_capability_override	Feature switches and numeric limits, such as subagents, auto approval, the feedback URL,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Policy components (continued)

Component	Tab	Table	What it controls
			and MCP override. Overrides change a capability's value for the users a policy covers.

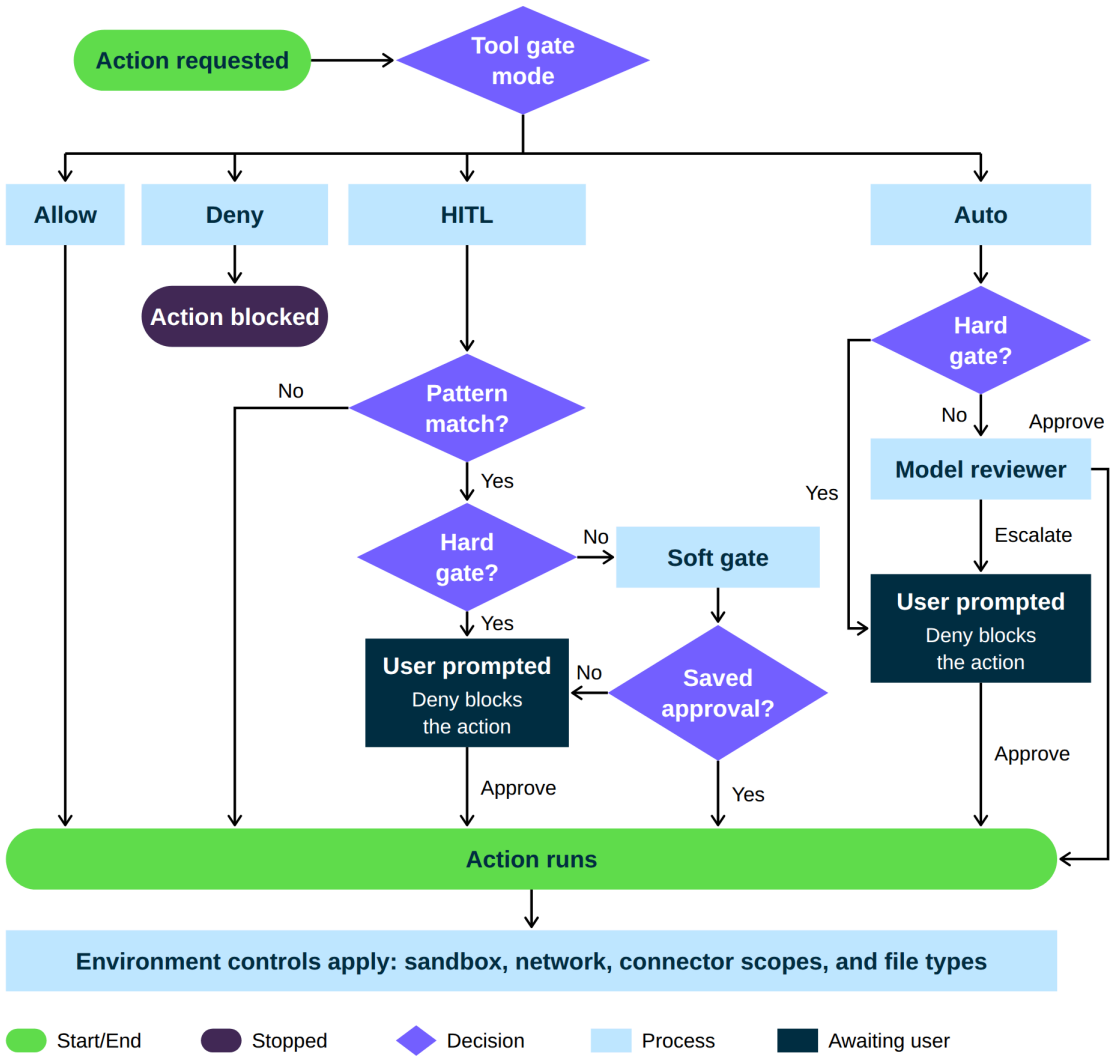
For how each tool gate setting handles an action, see Action approval flow in ServiceNow Cowork.

Action approval flow in ServiceNow Cowork

Tool gates, approval patterns, and auto approval determine whether each action in Cowork runs, requires approval, or is blocked.

Three controls determine whether an action runs. Tool gates set how Cowork handles each tool. Approval patterns identify commands that need approval. Auto approval lets an AI model reviewer approve some actions without prompting the user.

Action evaluation flow in Cowork



Every action passes through these controls in the following order:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Cowork checks for an active policy. If no active policy is available, Cowork refuses the action.
2. Cowork applies the tool gate for the tool. **Allow** runs the action, **Deny** blocks it, the (Human in the loop) HITL sends it to approval patterns, and **Auto** sends it to auto approval.
3. For HITL, Cowork compares the command against approval patterns. If no pattern matches, the action runs. If a hard gate pattern matches, Cowork prompts the user. If a soft gate pattern matches, the action runs when a saved approval exists. Otherwise, Cowork prompts the user.
4. For **Auto**, Cowork prompts the user if the action is under a hard gate. Otherwise, the model reviewer approves the action or escalates it to the user.
5. When prompted, the user approves the action to run it or denies the action to block it.
6. When the action runs, sandbox, network, connector scope, and file type rules limit what the action can access.

Gate strengths

Some actions require a human decision before they run. Approval patterns, described later in this topic, identify these actions and assign each one a gate strength:

Gate strengths

Gate	Behavior	Use
Hard gate	Requires a human decision each time the action runs.	Destructive actions, such as actions that delete data or make changes to external systems
Soft gate	Requires a human decision, which the user can save for later occurrences of the action.	Routine actions with low impact that users repeat

Tool gates

You set a mode on each tool. The modes and the tools each mode suits are described in the following table.

Tool gate modes

Mode	Behavior	Use
Allow	Runs the action with no pattern matching and no prompt.	Tools with low impact, such as tools that only read data
Deny	Blocks the action with no option to approve it.	Tools that your organization doesn't permit
Human in the loop (HITL)	Checks the action against approval patterns.	Tools where specific commands require human review

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tool gate modes (continued)

Mode	Behavior	Use
Auto	Sends the action to auto approval.	Frequently used tools where repeated prompts slow users down

Because **Auto** is a gate mode, you control it per tool. You can reduce prompts on one frequently used tool while keeping stricter handling on others.

Approval patterns

Approval patterns identify the commands that need approval when a tool gate is set to **HITL**. The Default Policy includes predefined approval patterns organized by action category. Each pattern uses one of the match tiers in the following table.

Approval pattern match tiers

Tier	You configure	Matches when
Pattern matching, exact	A literal string or regular expression	The command matches the pattern as written.
Pattern matching, relaxed fallback	A pattern of several words	The words appear in the command in order, even with flags and values between them.
Keyword matching	A list of write verbs	The command contains one of the listed verbs.

Note: Under **HITL**, a command that matches no approval pattern runs without a prompt. If you rely on keyword matching, a command that writes data with a verb that isn't in your list runs without approval.

Use exact matching when you know the precise command to control. Exact matching can miss variations of that command. Use relaxed matching to catch variations, but relaxed matching can match a word that appears where you didn't intend. Use keyword matching to require approval for any command that writes data.

Cowork applies a fixed guard on credential paths that you can't turn off.

Each pattern has one of the following gate strengths:

Hard gate

Requires a human decision each time the action runs.

Soft gate

Requires a human decision, which the user can save for later occurrences of the action.

The Default Policy applies hard gates to destructive operations and actions that delete data or make changes to external systems, and soft gates to selected routine patterns with low impact.

Use a soft gate for routine actions that users repeat.

When a pattern requires approval, Cowork holds the action and displays an approval card to the user. The approval card offers **Allow** for every matched action and **Allow always** only for soft gate patterns.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When a user selects **Allow always**, Cowork saves the decision and runs later actions of the same type without a prompt, such as the same command run on different files. An action of a different type prompts the user again. Users can view and revoke saved approvals in **Settings** > **Approvals**.

Auto approval

When you set a tool gate to **Auto**, Cowork prompts the user for any action under a hard gate. An AI model reviewer evaluates every other action, including actions that match no pattern, against the user's request.

The model reviewer escalates actions that are destructive, irreversible, or visible outside Cowork. Some of these actions escalate every time. Others escalate unless the user's request clearly identifies what to act on. For example, "close INCXXXXXXX" identifies a specific record, but "clean up the incidents" doesn't. An approved action proceeds. An escalated action appears to the user as a standard approval card.

The model reviewer is an AI model, and its decisions may be inaccurate or inappropriate. Because the reviewer evaluates context, its decisions can vary. Hard gate actions go to the user for approval, not to the model reviewer. To keep a human review step for sensitive actions, place those actions under hard gates.

Ways an action runs without a prompt

Under **HITL** or **Auto**, an action can run without a prompt in the ways described in the following table.

Ways an action runs without a prompt

Attribute	Saved approvals	Model review
Tool gate mode	HITL	Auto
Decision basis	A saved user decision for that type of action	An AI model's evaluation of the action in context
Set by	End user, one approval at a time	Administrator, by setting a tool gate to Auto
Scope	Soft gate patterns only	Actions not under a hard gate, including actions that match no pattern
Suited for	Repeated actions of a known, stable type	Actions that a static pattern can't classify in advance

Neither method approves a hard gate action or runs an action on a tool set to **Deny**. Hard gate actions go to a human for approval.

Cowork also exempts read only commands from prompts, so routine work isn't interrupted.

Policy stacking and precedence in ServiceNow Cowork

When more than one policy applies to a user, ServiceNow Cowork merges them and resolves conflicts by priority in a fixed order, specificity, and restrictiveness.

More than one policy can apply to the same user, for example the **Default Policy** and a policy for a support team. The **User Criteria** field on each policy record decides which users the policy applies to. The instance merges every policy whose user criteria match the user, then resolves conflicts in the following order:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Priority: Each policy has a priority number, and a lower number means a higher priority. The rule from the policy with the lowest priority number wins. For example, if the Default Policy has priority 999 and a support team policy has priority 100, the support team policy's rules override the Default Policy for users in that team.
2. Specificity: If two conflicting approval patterns come from policies with the same priority, the pattern that matches more of the command wins. For example, when a user runs git push --force, a pattern for git push --force takes precedence over a pattern for git push.
3. Restrictiveness: If rules still tie, the more restrictive rule applies, so an ambiguous configuration always resolves toward the safer outcome.

Restrictiveness by component

Restrictiveness by component

Component	Most restrictive to least restrictive
Tool gate	**Deny**, then **HITL** or **Auto**, then **Allow**
Approval pattern	Hard gate, then soft gate
File type rule	Deny, then allow write, then allow read
Network rule	Not allowlisted, then allowlisted
Sandbox filesystem	Deny, then read and write, then read
Connector scope	Scope off, then scope on

Change default behavior

To change a default, create a policy instead of editing the **Default Policy**:

1. Create a policy and set its user criteria to the users or groups it applies to.
2. Set a priority number lower than the policy you want to override. The **Default Policy** has priority 999. New policies have priority 1,000 by default, so change the priority, or the new policy doesn't override the **Default Policy**.
3. Add only the rules you want to change. Anything you don't add keeps coming from the **Default Policy**.

To undo the change, delete your policy. The previous behavior returns.

This approach has the following advantages:

Intact defaults

The **Default Policy** stays unchanged and keeps receiving product updates.

Explainable policy

The override and the rule it overrides both exist as records, so you can explain the effective policy.

Reversible changes

Reverting means deleting one record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example: Example: Allow a site that the Default Policy blocks

Your developers need Cowork to reach your internal package registry at registry.example.com, which isn't on the Default Policy network allowlist. To allow it, create a policy for the developer group, add a network rule for registry.example.com, and make sure the rule is active. At the next sync, the client receives the Default Policy allowlist and your rule merged together, so the registry is reachable for developers only.

How policy affects ServiceNow Cowork users

Your administrator's policies decide what ServiceNow Cowork can do for you. You see the result as approval prompts and blocked actions, and you can narrow some permissions yourself.

You can't see or change policy records. What you experience is the result:

Approval prompts

A card describes an action before it runs and asks you to approve or deny it. For some actions, the card also offers **Allow always**, which remembers your decision. Other actions ask every time.

Blocked actions

When a policy blocks an action or an external network call, Cowork tells you why.

Read only work

Commands that only read are exempt from prompts, so routine work isn't interrupted.

Controls you can set

These controls can only narrow what your administrator allows.

User controls

Control	Where	What it does
Microsoft 365 connector scopes	**Settings** > **Microsoft 365**	Turn off individual scopes your administrator enabled, for example letting Cowork read mail but not send it. You can't turn on a scope your administrator hasn't enabled.
Remembered approvals	**Settings** > **Approvals**	See every **Allow always** decision you've made, and revoke any of them.
Soft deletes	**Settings** > **General**	Keep deleted files recoverable in a dump folder instead of removing them right away.

Configuring ServiceNow Cowork

Activate ServiceNow Cowork plugin to download, install and setup Cowork.

Activate the ServiceNow Cowork plugin

You can activate the ServiceNow Cowork plugin (sn_app_cowork) for ServiceNow Cowork if you have the admin role. The application includes demo data and installs related ServiceNow® Store applications and plugins if they aren't already installed.

Before you begin

ServiceNow Cowork requires a separate subscription from the rest of the ServiceNow AI Platform.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To purchase a subscription, contact your ServiceNow account manager. When you purchase a subscription, certain plugins are activated automatically. If a paid plugin isn't activated automatically, you can manually activate it from the All Applications list in your instance.

Note:

Before purchasing a subscription, you can evaluate the feature on a non-production instance without charge by requesting it from the Now Support Service Catalog.

Role required: admin

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the ServiceNow Cowork plugin (sn_app_cowork) using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

   Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Download and install ServiceNow Cowork

Install ServiceNow Cowork on a Mac with an M-series processor to use the AI desktop agent on your computer.

Before you begin

Role required: sn_app_cowork.admin or sn_app_cowork.user

Procedure

1. Navigate to **All** > **ServiceNow Cowork** > **Downloads**.
2. Download the Mac installer.

   Note: ServiceNow Cowork is only available for macOS that uses M-series processors, such as M1, M2, M3, and M4.
3. Go to your **Downloads** folder and select ServiceNow Cowork installer package.
4. Open the ServiceNow Cowork installer package.
5. On the Introduction screen, select **Continue**.
6. On the Installation Type screen, select **Install** to perform a standard installation in your home folder.
7. **Optional:** Select **Change Install Location** to select a destination.
8. On the Destination Select screen, select how you want to install the software.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Install for all users of this computer: Installs Cowork for every user account on the computer.
- Install for me only: Installs Cowork in your home folder. Only you can use the software.
- Install on a specific disk: Installs Cowork on a disk that you choose.

9. Select **Continue**.
10. After the installation completes, select **Close**.

What to do next

After you install Cowork, it keeps itself up to date. It checks for updates at startup, during onboarding, every 30 minutes, and when you check for updates from **Settings**.

A required update shows the **Update and Restart** screen, and you install the update before you continue. An update found in the background appears as a notification that you can dismiss. Cowork verifies the signature of each update before it installs.

Set up ServiceNow Cowork

Connect Cowork to your ServiceNow instance and prepare your workspace and secure sandbox.

Before you begin

Role required: sn_app_cowork.admin or sn_app_cowork.user

Procedure

1. Select and open the ServiceNow Cowork application.
2. When macOS asks for access to your keychain, enter your login keychain password, and then select **Always Allow** or **Allow** to grant access for this session only.

   Your login keychain is your macOS password.

3. On the Meet ServiceNow Cowork screen, select **Get Started**.
4. On the Connect ServiceNow screen, enter your instance name in the **Instance URL** field.
5. Select a sign in method.
   - **Sign in within ServiceNow Cowork**: Use your password or PIN.
   - **Sign in via browser**: Use any sign in option your instance supports, such as SSO.
6. Select **Sign in with ServiceNow**.
7. Enter your user name and password, and then select **Log in**.
8. If the Update Required dialog appears, select **Update & Restart**.

   After Cowork restarts, sign in again.

9. On the Workspace & Security screen, confirm the default workspace folder or select **Choose** to pick a different folder.
10. Monitor the secure sandbox setup progress.

    Setup completes when **Secure Sandbox** shows **Ready** and these checks finish:

    - Rootfs image ready
    - OpenShell gateway started
    - MicroVM sandbox ready

    If setup stalls or fails, select **Retry**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

11. Select **Continue**.
12. On the You're All Set screen, confirm the model that Cowork uses, and then select **Start Using ServiceNow Cowork**.

Result
Cowork opens and is ready to use. You can change your workspace and other options anytime in **Settings**.

Create a ServiceNow Cowork agent policy

Create a policy to define what ServiceNow Cowork can do, which actions need human approval, and which actions are blocked.

Before you begin
Role required: sn_app_cowork.admin

About this task
A policy record sets which users the policy applies to and its priority. After you create the policy, you add components to it, such as tool gates, network rules, and sandbox rules.

Procedure
1. Navigate to **All** > **ServiceNow Cowork** > **Policies** > **Cowork Agent Policy**.
2. Select **New**.
3. **Optional:** In the **Domain** field, select the domain.
4. In the **User Criteria** field, select the user criteria record.

   The user criteria decide which users the policy applies to.
5. **Optional:** In the **Description** field, enter a description of the policy.
6. Confirm that **Active** is selected.

   An inactive policy doesn't apply to any users.
7. In the **Priority** field, enter a value.

   When more than one policy applies to a user, the policy with the lowest priority number takes precedence. The **Default Policy** has priority 999, and new policies default to 1,000. To override the **Default Policy**, enter a number lower than 999.
8. In the **Policy Name** field, enter the policy name.
9. Select **Submit**.

Result
The policy is created and applies to the users that its user criteria cover.

What to do next
Add components to the policy. For more information, see Configure a ServiceNow Cowork agent policy.

Configure a ServiceNow Cowork agent policy

Add tool gates, approval patterns, network rules, sandbox rules, capability overrides, connector scopes, and file type rules to a policy to control what Cowork can do for the users the policy applies to.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Create the policy. For more information, see Create a ServiceNow Cowork agent policy.

Role required: sn_app_cowork.admin

About this task

Each tab on a policy record links existing rule records to the policy. Add only the components you need. The number on each tab shows how many records are linked to the policy.

You can't edit or remove the predefined rules in the **Default Policy**, but you can add new ones.

When you use a policy to override the **Default Policy**, add only the rules you want to change. Anything you don't add keeps coming from the **Default Policy**.

Procedure

1. Navigate to **All** > **ServiceNow Cowork** > **Policies** > **Cowork Agent Policy**.
2. Open the policy you want to configure.
3. Add a tool gate.
   a. Select the **Policy Tool Gates** tab, and then select **New**.
   b. In the **Tool Gate** field, select the tool gate.
   c. **Optional:** In the **Domain** field, select the domain.
   d. Select **Submit**.
4. Add an approval pattern.
   a. Select the **Policy Patterns** tab, and then select **New**.
   b. In the **Approval Pattern** field, select the approval pattern.
   c. **Optional:** In the **Domain** field, select the domain.
   d. Select **Submit**.
5. Add a network rule.
   a. Select the **Policy Network Rules** tab, and then select **New**.
   b. In the **Network Rule** field, select the network rule.
   c. **Optional:** In the **Domain** field, select the domain.
   d. Select **Submit**.
6. Add a sandbox rule.
   a. Select the **Policy Sandbox Rules** tab, and then select **New**.
   b. In the **Sandbox Rule** field, select the sandbox rule.
   c. **Optional:** In the **Domain** field, select the domain.
   d. Select **Submit**.
7. Add a capability override.
   a. Select the **Capability Overrides** tab, and then select **New**.
   b. In the **Capability** field, select the capability.
   c. In the **Override Value** field, enter the value for the capability.
   d. **Optional:** In the **Description** field, enter a description of the override.
   e. **Optional:** In the **Domain** field, select the domain.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

f. Confirm that **Active** is selected.

g. Select **Submit**.

8. Add a connector scope.

   a. Select the **Policy Connector Scopes** tab, and then select **New**.

   b. In the **Connector Scope** field, select the connector scope.

   c. Select **Active**.

      The **Active** check box is cleared by default. If you don't select it, the connector scope doesn't take effect.

   d. **Optional:** In the **Domain** field, select the domain.

   e. Select **Submit**.

9. Add a file type rule.

   a. Select the **Policy File Type Rules** tab, and then select **New**.

   b. In the **File Type Rule** field, select the file type rule.

   c. **Optional:** In the **Domain** field, select the domain.

   d. Select **Submit**.

10. Select **Update**.

Result

The policy includes the components you added, and Cowork enforces them for every user that the policy's user criteria covers.

Trace evaluation for Cowork in AI Control Tower

AI Control Tower scores the traces that Cowork sends for quality and safety. Review the scores to understand usage patterns and identify where responses fall short.

As users work in Cowork, it records how its agents and skills run and sends that record to your ServiceNow instance in OpenTelemetry (OTel) format. AI Control Tower evaluates the records against a set of metrics and shows the results on the Cowork asset.

How traces reach AI Control Tower

When a user logs in to Cowork with a ServiceNow instance, Cowork registers itself on that instance as an AI application. The registration appears in the AI Control Tower inventory as the ServiceNow Cowork Agent asset. See Managing your AI asset inventory.

No trace connection is required. Cowork sends traces to the instance the user is logged in to and authenticates with that user's login.

AI systems that don't send traces this way connect to AI Control Tower through SDK instrumentation or a trace connection. See Activate evaluation scoring for external AI systems and Configuring trace connections.

Cowork sends traces whether or not the asset is managed, but AI Control Tower shows them only after an administrator moves the asset to the **Managed** state.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more on asset states, see Managed and unmanaged AI assets. To move the asset and review its traces, see Review Cowork traces in AI Control Tower.

A managed asset becomes eligible for life cycle review. See Managing your AI asset lifecycle.

Cowork doesn't display the traces it sends. Review traces and change the asset state in AI Control Tower.

Blocking access to Cowork

An AI Control Tower administrator can block access to Cowork with an Explicit Block policy. A policy scoped to a specific user ends that user's active Cowork session and helps prevent that user from starting a new one. A policy that doesn't name a user blocks everyone who has used Cowork. The policy stays in effect until it's deleted.

For how these policies work, see Explicit Block policies. To block access, see Create an Explicit Block policy.

Sessions, traces, and spans

Session

One Cowork conversation. Every trace from the conversation belongs to the same session, including background work that runs after a response, such as updating memory.

Trace

One agent run, from the user's request to the response. For example, asking Cowork to retrieve all incidents produces one trace. The agent run is the parent of every other span in the trace.

Span

One operation inside a trace, such as the agent run, a tool call, or a model call. Cowork sends the agent run and tool spans. The ServiceNow generative AI controller adds a span for each model call and places it under the agent run.

For how AI Control Tower structures and scores each level, see Sessions, traces, and spans.

Review Cowork traces in AI Control Tower

Check the quality and safety scores of Cowork sessions in AI Control Tower, then open a session or trace to see which metric scores and details.

Before you begin

Role required: sn_app_cowork.admin and sn_ai_governance.ai_steward

About this task

In AI Control Tower, each AI system is tracked as an asset in the Inventory Cowork appears as the ServiceNow CoworkAgent asset, which AI Control Tower creates when a user connects Cowork to the instance. The asset starts in the Unmanaged state, with limited functionality, and shows traces only after you move it to the Managed state. Nothing else needs to be configured to receive traces. For more on asset states, see Managed and unmanaged AI assets.

Review traces to see how users work with Cowork and to catch a drop in quality or safety scores, or a security issue in a response.

For how AI Control Tower scores traces, see Trace evaluation for Cowork in AI Control Tower.

Procedure

1. Navigate to **All** > **AI Control Tower** > **Home**,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Select **Inventory**.
3. In the search field, enter `Cowork`.
4. Select **ServiceNow Cowork Agent**.
5. **Optional:** Select **Move to Managed** to move the asset to **Managed**.

   (Optional) The asset shows Managed, and the **Monitor** tab appears.

   To move several assets at once from the Inventory list, see Move AI assets to managed.
6. Select the **Monitor** tab.

   The tab shows the average overall quality and safety scores, the metrics evaluated and their sample rate, average latency and tokens per session, and agent activity over time.

   Note: Scores appear only after evaluation finishes, which takes some time after a trace arrives. Until then, the score cards show no data. Refresh the page to see new scores.
7. Scroll to **Recent evaluated sessions** and review the quality and safety score for each session.
8. Select a session.

   The session page lists the lowest scoring metrics, a score and reason for each metric, and the traces in the session.
9. Select a trace, then select a span.

   The span details show each metric score and the reason behind it.

   To trace a low score to its cause, see Investigate a low-scoring session.
10. **Optional:** To change which metrics run on this asset, select the gear icon on the **Metrics evaluated** card.

    (Optional) Select the metrics in **Edit metrics evaluated for this asset**, then select **Save metric**.

    For the available metrics, see Evaluation metrics.

    For more options, including sample rates for this asset, see Configure asset-specific metrics for external AI systems.
11. **Optional:** To score more traces, navigate to **All** > **AI Control Tower** > **Home** > **Settings** > **Rules and templates** > **Evaluation**, and raise the **Sample rate** on the **AI evaluations** sub tab.

    (Optional) Select **Update** to save the change.

    For more about evaluation settings, see Activate evaluation scoring for external AI systems.

    To set the sample rate for each metric, see Configure global metrics for external AI systems.

Using ServiceNow Cowork

Use ServiceNow Cowork to get started with tasks, connect systems and extend Cowork capabilities.

Start a ServiceNow Cowork chat session

Send your first request to ServiceNow Cowork, from a simple question to a complex multi-step task, and track its progress.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_app_cowork.user

Procedure

1. Open ServiceNow Cowork application.
   The home screen opens with the message box and suggestions.
2. **Optional:** Select a suggestion category below the message box, and then select a prompt.

Suggestion categories

Category	Use it to
Get Started	Connect Microsoft 365, try a skill such as `/plan-my-time`, or browse the available skills.
For you	Ask about your meetings, pending approvals, assigned incidents, and upcoming SLA breaches.
IT Helpdesk	Work with incidents, change requests, the knowledge base, and the service catalog.
Ask Anything	Get help with everyday work, such as writing an email, drafting an agenda, or setting a reminder.

3. In the message box, describe what you need done, or edit the selected prompt.

   You can ask for a single answer or a complete piece of work. Cowork identifies the steps and completes them for you.

   To speak your request instead, select the microphone icon.

4. **Optional:** Select the add icon in the message box, and then select an option to add context or change how Cowork handles the request.

Message options

Option	Description
Attach files or photos	Add a file or photo as context for your request. Attached items don't change your workspace.
Web search	Turn web search on or off. A check mark shows that web search is on.
Workspace	View your default workspace folder. To change it, select **Open in Settings**.
ServiceNow	View the ServiceNow instance Cowork connects to.
Diagnose issues	Run a health check on Cowork and get suggested fixes.

5. Select the send icon.
   The chat appears in the sidebar so you can return to it later.

Select AI model and workspace folders

Select the AI model the agent uses, confirm its connection, and set the folders it works in. These settings control the quality of the agent's responses and limits file access to the selected folders.

Before you begin
Role required: sn_app_cowork.user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Settings** > **General**.
2. Under Connection & Model, select a model from the **AI Model** list.

   To use a different model for a single chat, select a model from the model list in the conversation box.
3. Select **Test Connection**.
4. Under Workspace, set the folders the agent can read and write without prompting for approval.
   - To add a folder, select **Add folder** and **Mark as primary** to make it your primary folder.
   - To change a folder, select the edit icon next to it.
   - To remove a folder, select the remove icon next to it and select **Remove folder** in the dialog box.
   - To return to your home folder as the only workspace, select **Reset to Home**.
5. Under Local Models, confirm that each model shows **Installed**.

   These models run on your device, so dictation and semantic search are processed locally on your device.

Result

The agent uses the model you selected, and a prompt appears before the agent reads or writes anything outside your workspace folders.

Respond to approval requests in Cowork

Before Cowork takes a sensitive action, such as changing a record or deleting a file, it pauses and asks for your permission. Responding to these requests keeps you in control of what the agent does on your behalf.

Before you begin

Role required: sn_app_cowork.user

About this task

When Cowork needs permission, an approval card appears in the chat and processing pauses until you respond.

Procedure

1. Open the chat that shows the approval card.
2. Review the action on the card.
3. Select how Cowork should proceed.

Permission options

Permission options	Result
Allow	Coworktakes this action now and asks again next time.
Allow always	Cowork takes this action now and doesn't ask again. The action is added to your standing approvals. This action is saved

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Permission options	Result
	Note: Select **Allow always** only for actions you would approve every time. You can revoke a standing approval at any time in **Settings** > **Approvals**.
Deny	Cowork doesn't take the action. **Note:** If an action looks unexpected or outside what you asked for, deny it and stop the task.

4. **Optional:** If you have set up TOTP authorization, enter the six-digit code from your authenticator app.

Assign tasks to ServiceNow Cowork

Use ServiceNow Cowork to complete multi-step work, such as investigating incidents, creating reports, or coordinating updates across platforms. Combine skills, sub-agents, and connectors in a single request so Cowork can complete the whole piece of work from start to finish.

Before you begin

Role required: sn_app_cowork.user

The platforms the task uses, such as ServiceNow instance, Microsoft 365, or GitHub, must be connected. For more information, see Connectors in ServiceNow Cowork.

Procedure

1. In the message box, describe the outcome you want, including the goal, the sources to use, and the format of the result.

   For example: Find my open P1 incidents, check each one for related changes in the last week, summarize the likely cause, and draft an update email to each assignment group.

   Cowork determines the steps automatically, so describe the result, not the steps.

2. **Optional:** Enter a slash followed by the skill name, such as /plan-my-time, to run a skill as part of the task.

   (Optional) Cowork also uses skills automatically when your request matches a skill's description.

3. **Optional:** Name a sub-agent in your request to hand part of the work to a specialist.

   (Optional) For example: Use the researcher sub-agent to find the API documentation, and then use the build-fixer sub-agent to fix the failing test. Cowork automatically routes work to sub-agents when a task requires focused expertise.

4. **Optional:** Include when the task should run, such as every Monday at 9 a.m., to run it on a schedule.
5. **Optional:** Select a model from the model list in the message box to use a different model for this task.
6. Select the send icon.
7. **Optional:** Select **Kanban** in the sidebar to follow the task.
8. If Cowork asks for approval or input, respond in the chat so the task can continue.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example request: Every Monday, summarize last week's P1 incidents, create a PowerPoint presentation with a slide per incident, and post the summary to my team's Teams channel.

Cowork processes this request in stages:

a. Queries ServiceNow for P1 incidents through the ServiceNow connector.

b. Assigns the analysis to the sn-analyst sub-agent.

c. Uses the pptx skill to create the presentation.

d. Asks for your approval before it posts to Teams through the Microsoft 365 connector.

e. Saves the request as a scheduled task that runs every Monday.

Result

Cowork executes each step of the task, using the required skills, sub-agents, and connectors. When the task is done, it moves to **Completed** on the **Kanban** board, and the results appear in the chat.

What to do next

For better results with complex tasks:

- Name specific sources, such as a ServiceNow table, a Microsoft SharePoint folder, or a GitHub repository.
- State the output format, such as an email draft, a spreadsheet, or a slide per item.
- For work you repeat, turn it into a custom skill.

Track tasks in Cowork

Check and track the progress of the tasks you have delegated and respond when Cowork needs your input. Tracking tasks lets you keep working while Cowork completes them, and responding quickly keeps paused tasks from stalling.

Before you begin

Role required: sn_app_cowork.user

Procedure

1. Select **Kanban** in the ServiceNow Cowork application.
2. Review the status of each task.

Task status

Column	Description
Queued	The task is waiting to start.
Running	Cowork is working on the task.
Awaiting Input	The task needs a response from you before it continues.
Completed	The task is done.
Failed / Stopped	The task ended before it completed.

3. If a task is in **Awaiting Input**, select it.
4. Respond to the request in the chat.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
Cowork continues the task after you respond, and the task moves to **Completed** when it's done.

Connectors in ServiceNow Cowork

Connectors link ServiceNow Cowork to the platforms you work in, so Cowork can read and update your real data, not just answer questions.

With connector, Cowork works across your platforms as part of any task you assign. For example, it can update incidents, schedule meetings, send email, and review GitHub pull requests, and it can combine these actions to complete larger pieces of work from start to finish.

Cowork includes connectors for ServiceNow, Microsoft 365, and GitHub. Each connector uses the authentication method that its platform supports. For example, the Microsoft 365 connector uses your Microsoft account sign in and covers mail, calendar, OneDrive files, Teams chats and channels, and directory users and groups. Cowork stores the connector tokens locally and refreshes them automatically, about every 90 days.

Connectors and MCP servers

Connectors and Model Context Protocol (MCP) servers both extend what Cowork can do, but they serve different purposes. Connectors are integrations with deep capabilities for ServiceNow, Microsoft 365, and GitHub. MCP servers add tools from other services, such as Sentry, SerpApi, or Postman, and you can choose which MCP servers each subagent can use. Use a connector when one is available for your platform, and add an MCP server for services that connectors don't cover. A remote MCP server connects through a server URL, while a local MCP server runs on your device outside the agent sandbox.

You can view and add connectors from **Settings** > **Connectors**.

Connect ServiceNow Cowork to Microsoft 365

Connect your Microsoft account so ServiceNow Cowork can work with your mail, calendar, Microsoft OneDrive files, and Teams chats and channels. After you connect, you can ask Cowork to draft and send email, schedule meetings, find files, and post to Microsoft Teams.

Before you begin
Role required: sn_app_cowork.user

About this task
Your organization must configure the Microsoft 365 app.

Procedure

1. From your user name, navigate to **Settings** > **Connectors**.
2. Select **Add**.
3. From the Connector type list, select **Microsoft 365**.
   Signing in with your Microsoft account includes your Microsoft Outlook email, calendar, Microsoft OneDrive and Microsoft SharePoint files, and Microsoft Teams chats and channels.
4. Select **Connect Microsoft 365**.
5. Select your Microsoft account.
6. Complete your organization's identity verification.
7. When Authorization Successful appears, close the browser tab and return to ServiceNow Cowork.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result

Microsoft 365 appears in the Connectors list with a Connected status, which confirms that the connector is configured and active. Cowork can now read and send mail, read your calendar, Microsoft OneDrive files, Microsoft SharePoint content, Microsoft Teams messages, and user profiles.

Connect ServiceNow Cowork to GitHub

Connect ServiceNow Cowork to GitHub or GitHub Enterprise to enable pull request review, CI checks, read code, and manage issues.

Before you begin

Role required: sn_app_cowork.user

Procedure

1. From your user name, navigate to **Settings** > **Connectors**.
2. Select **Add**.
3. From the **Connector type** list, select **GitHub**.
4. In **Hostname**, enter your GitHub host, such as github.com or your GitHub Enterprise hostname.
5. In the **Token** field, paste your personal access token.
   To obtain a personal access token from GitHub:
   a. Go to https://code.devsnc.com/
   b. Select the user icon on the top right.
   c. Go to **Settings** > **Developer Settings** > **Personal access tokens**.
   d. Select scopes **repo** check box and under **admin.org** select **read.org** check box.
   e. Copy the token starting with `ghp_` or `gho_`.
6. **Optional:** Select **Show setup instructions** to see how to get a token through CLI.
7. **Optional:** In **Label (optional)**, enter a name for the connection.
8. Select **Add Host**.
   Host is added and the token is stored securely.

Extend ServiceNow Cowork

Extend Cowork with skills, scheduled task, Model Context Protocol (MCP) servers, and sub-agents so the agent can handle more of your work. Each option adds new instructions, tools, or specialized agents, and you control what the agent can access.

Skills and custom skills

Skills give Cowork instructions for specific kinds of work, such as creating documents, summarizing data, or planning your time. Each skill is a folder of instructions, so you can version it, review it, and share it with a teammate.

ServiceNow provides default skills, and you can add custom skills for workflows that the defaults don't cover. Some skills run automatically when a request matches their description, so the right skill loads when the work calls for it and you don't need to memorize commands. Others run as slash commands that you enter in a chat. Some skills require a connector, such as Microsoft 365 or ServiceNow. In Settings > Skills, you can filter skills by source, invocation type, and connector.

Go to **Settings** > **Skills** to filter skills by source, invocation type, and connector.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A custom skill captures how you do a task, including the steps, format, and sources, so the next run takes one prompt instead of detailed instructions. You can turn a task you already do well into a custom skill and share it with your team. Cowork includes a default skill that creates custom skills for you from a description of the task. When no skill fits a request, Cowork can build one and save it for next time. i

MCP servers

MCP servers add tools and data from other services, such as Sentry, SerpApi, and Postman. You can add servers from the available list or add your own. Each server uses the authentication method that its service requires, such as an API key or OAuth.

Sub-Agents

Sub-Agents are specialized agents that the main agent hands work to. Each sub-agent has its own instructions and uses only the skills and MCP servers that you grant it. ServiceNow provides built in sub-agents for tasks such as research, ServiceNow analysis, and code review, and you can create custom sub-agents for your own specialized tasks.Cowork provides built in sub-agents, including:

- default: Plans the work and keeps context across tools.
- sn-analyst: Analyzes incidents, changes, and operations with deep platform expertise.
- comms-scheduler: Drafts email and schedules meetings using context from memory.
- explorer: Gives fast, read only answers across files, ServiceNow data, and documentation.

Skills tell Cowork how to do the work, MCP servers and connectors give it access to the services it needs, and sub-agents divide larger work into focused tasks. For example, a custom sub-agent for weekly reporting can use a status summary skill and the tools from an MCP server, while the main agent coordinates the overall task.

Extending Cowork doesn't change your safeguards. Cowork still asks for approval before sensitive actions, and commands run in the agent sandbox. Local MCP servers are the exception. They run on the device outside the agent sandbox and can act without asking for approval, so administrators can turn them off. For more information, see Turn off local MCP servers. To limit access, grant each sub-agent only the skills and MCP servers it needs.

Create a custom skill in ServiceNow Cowork

Create a skill for Cowork to do a specific task, customizing it to fit your needs. After running the same type of task a few times, turn it into a skill so future runs require just one prompt instead of detailed instructions.

Before you begin

Role required: sn_app_cowork.user

About this task

Cowork includes a default skill, that builds new skills for you. You describe the task, and Cowork creates the skill with a name, a description that the agent uses to determine when to apply it, and instructions.

Procedure

1. In the message box, ask Cowork to create a skill and describe what it should do.

   For example: Create a skill that turns my weekly incident notes into a status summary for my manager, using the same headings every time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Select the send icon.
3. Answer any questions Cowork asks about the steps, format, or sources.
4. Review the skill in the chat, and ask for changes if needed.
5. Navigate to **Settings** > **Skills**.
6. Select the refresh icon to view the skill.

   The skill appears in the list.
7. **Optional:** Filter the list by selecting **Custom** under **Filters**.

Result
Cowork uses the skill automatically when a request matches its description. If the skill is user invoked, enter its name as a slash command (/) in the message box.

What to do next
Be specific about the output you need. A skill that names its format and sources gives more consistent results. To edit a skill's files, navigate to the Skills page.

Create a sub-agent

Create a custom sub-agent to hand off a specialized task, such as code review or security analysis, to a reusable agent with focused instructions and limited access. A narrow scope helps produce consistent results, limiting the sub-agent to only the skills and MCP servers it requires.

Before you begin
Role required: sn_app_cowork.user

Procedure
1. Navigate to **Settings** > **Sub-Agents**.
2. Select the add icon.
   The **New Sub-Agent** dialog opens.
3. Enter the sub-agent details.

Field	Description
Name (slug format)	Unique name in lowercase letters and hyphens only, used to reference the sub-agent in `spawn_subagent`.
Description	A short summary of what the sub-agent does.
Skills (optional)	The skills the sub-agent can use.
MCP Servers (optional)	The MCP servers the sub-agent can use.
System Prompt (Markdown)	Instructions that define the sub-agent's role and guidelines.

4. Select **Create**.
5. **Optional:** Select the refresh icon to reload the list after you add or change a sub-agent.
6. **Optional:** Select the folder icon to open the folder where sub-agents are stored.

Result
The new sub-agent appears in the **Sub-Agents** list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

View and edit a sub-agent

Review a sub-agent's system prompt to understand how it behaves, and edit it when its results don't match what you need or its scope needs to change.

Before you begin
Role required: sn_app_cowork.user

Procedure

1. Navigate to **Settings** > **Sub-Agents**.
2. **Optional:** Enter a term in the **Search sub-agents** field to find a sub-agent.
3. Select the sub-agent.

   A details panel opens with the sub-agent's name, description, system prompt, and the file that stores it.
4. **Optional:** Select **Preview** for formatted text or **Source** for Markdown to change how the system prompt displays.
5. Select **Edit Sub-Agent**.
6. Make the updates.
7. Select **Update**.

Result
The sub-agent uses your updated settings the next time it runs.

Connect ServiceNow Cowork to MCP servers

Connect MCP servers so Cowork can use tools and data from other services, such as GitHub, Sentry, SerpApi, and Postman. Each server you connect adds capabilities to the agent, and you control which servers each sub-agent can use.

Before you begin
Role required: sn_app_cowork.user

About this task

Important: Local MCP servers run on your device outside the Cowork sandbox. After you connect one, it can take actions on your device without asking you to approve each action, and it stays configured when Cowork restarts. Your administrator can turn off local MCP servers. For more information, see Turn off local MCP servers.

Procedure

1. Navigate to **Settings** > **MCP Servers**.
2. In the **Available** list, select the install icon for the server you want to add.
3. In the **Server name** field, enter a name for the server.
4. In the **Server URL** field, enter the server's URL.

   For servers from the Available list, the name and URL are filled in for you.
5. **Optional:** Expand **Authentication (optional)** and enter the credentials if the server requires them.
6. Select **Add & Connect**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The server appears under **Configured**. If the connection succeeds, the agent can use the server's tools, and you can grant access to it when you create a sub-agent.

What to do next
To reconnect, edit, or remove a server, select the connect, edit, or delete icon on its card under **Configured**.

If a server card shows **Error**, read the message on the card. For example, a message about a missing Authorization header means the server requires credentials. Select the edit icon, add the credentials under **Authentication (optional)**, and then select the connect icon.

Review and revoke standing approvals

Review the actions you have allowed Cowork to take without asking, and revoke any you no longer require.

Before you begin
Role required: sn_app_cowork.user

About this task
A standing approval exists only after you select **Allow always** on an approval card when Cowork asks permission for an action.

Procedure
1. Navigate to **Settings** > **Approvals**.
2. Review the list of standing approvals.
3. Select **Revoke** for each approval to remove the approval.

   If you revoke the permission, Cowork requests permission again before running the action.

Set up TOTP authorization for sensitive actions

Set up TOTP authorization to add another layer of security check before performing any sensitive action, such as changing records, deleting files, or sending messages on your behalf.

Before you begin
Install and set up an authenticator app on your mobile device.

Role required: sn_app_cowork.user

Procedure
1. Navigate to **Settings** > **Security**.
2. Under **TOTP Authorization**, select **Set Up TOTP**.

   A QR code and a secret code appear.
3. Add Cowork to your authenticator app.
   - To use the QR code, scan it with your authenticator app.
   - To enter the secret code manually, copy the value in the **Secret** field and enter it in your authenticator app.
4. In the **Verify** field, enter the six-digit code from your authenticator app.
5. Select **Verify**.
6. Select the **Require TOTP for action approvals** check box.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
Cowork prompts you for a code from your authenticator app before approving sensitive actions.

Set agent limits and safeguards

Set limits on how long the agent runs and when it checks in with you, so it doesn't use more time or resources than a task needs and you stay in control of long runs.

Before you begin
Role required: sn_app_cowork.user

About this task
These limits work alongside the agent's own retry limit. When the agent makes several attempts at the same task without success, it stops and reports the problem instead of retrying indefinitely.

When a policy blocks an action, the agent reports the block and the reason and makes no further attempts. It doesn't try to work around the block.

Procedure
1. Navigate to **Settings** > **General**.
2. Scroll down to **Agent controls**.
3. In **Max turns**, move the slider to the number of turns the agent can take before it stops with an error.
4. In **Check-in at turn**, move the slider to the turn where the agent pauses and prompts you to confirm whether to continue.

   To turn off the pause, move the slider to 0. Set this value lower than **Max turns** so that the pause occurs before the hard stop.
5. **Optional:** Select **Let the agent decide** to have the agent evaluate its own progress at the **Check-in at turn** instead of pausing.

   (Optional) The agent still pauses when it cannot determine how to proceed.
6. **Optional:** Select **Read Aloud** to listen to long responses through your browser's built-in text-to-speech feature.

   (Optional) A speaker button appears on agent responses.
7. **Optional:** Select **Soft Deletes** to keep deleted files and folders recoverable.

   (Optional) The agent moves deleted items to a `dump/` directory with restore instructions instead of removing them permanently.
8. **Optional:** In **Retention (days)**, specify how many days to keep deleted items.

   (Optional) On startup, items older than the retention period are permanently removed.
9. **Optional:** Select **Browse Deleted Files** to view or restore deleted items.
10. **Optional:** Select **Reset to defaults** to return all settings to their original values.

Result
The agent uses your settings on its next run.

Update ServiceNow Cowork

ServiceNow Cowork checks for updates automatically and verifies each update before it installs. You can also check for updates yourself at any time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_app_cowork.user

About this task
Cowork checks for updates at startup,When it finds a required update, it shows the **Update and Restart** screen. When it finds an update in the background, it shows a notification that you can dismiss.

Procedure
1. In ServiceNow Cowork application, open **Settings**.
2. Select **About**.
3. Select **Update**.

   The **Update** button appears only when an update is available. If Cowork is current, **About** shows **Up to date** with the version number, for example **Up to date (v1.0.0)**.

ServiceNow Cowork reference

PLACEHOLDER: Short description of the reference information provided for ServiceNow Cowork.

Turn off local MCP servers

Turn off local MCP servers for users or user groups so that Cowork can't run MCP server actions directly on user devices.

Before you begin
Role required: sn_app_cowork.admin

About this task
Users can connect local MCP servers that run on their own device rather than through a remote server URL. A local MCP server runs outside the Cowork sandbox. After a user connects one, performs actions on the device without requiring approval for each one, and its configuration persists when Cowork restarts.

Administrators control whether users can connect local MCP servers.

Procedure
1. Navigate to **All** > **ServiceNow Cowork** > **Policies** > **Cowork Agent Policy**.
2. Open the policy assigned to the users or user groups you want to restrict.
3. Select the **Capability Overrides** tab, and then select **New**.
4. In the **Policy** field, select the policy you opened.
5. In the **Capability** field, select the capability.
6. In the **Override Value** field, enter .
7. In the **Description** field, enter a description of the override.
8. In the **Domain** field, select the domain.
9. Confirm that **Active** is selected.
10. Select **Submit**.

Result
Users covered by the policy can't connect local MCP servers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Prevent changes to sandbox files

Add a filesystem deny rule to your sandbox policy so that agent actions can't modify files in the sandbox runtime directory on user devices.

Before you begin

Role required: sn_app_cowork.admin

About this task

Cowork runs agent commands in an isolated sandbox. The sandbox reaches permitted files on the device through an authenticated file bridge, which is how tasks such as reading and saving documents work.

In affected releases, the file bridge doesn't prevent writes to the sandbox runtime directory. Cowork launches sandbox components from this directory when it creates a sandbox, so a replaced file there can run on the device with the privileges of the user running Cowork, outside the sandbox restrictions. The deny rule blocks these writes until you deploy a release that contains the permanent fix.

Procedure

1. Navigate to **All** > **ServiceNow Cowork** > **Policies** > **Cowork Agent Policy**.
2. Open the policy assigned to your affected Cowork users.
3. Select the **Policy Sandbox Rules** tab, and then select **New**.
4. In the **Sandbox Rule** field, select a sandbox rule.
5. In the **Domain** field, select the domain.
6. Select **Submit**.
7. In the **Policy Sandbox Rules** tab, select the rule you created.
8. Configure the rule.
   a. From the **Rule type** list, select **filesystem**.
   b. From the **Access mode** list, select **deny**.
   c. In the **Path** field, enter `.local/share/openshell/vm-runtime`.

      Enter the path exactly as shown. The path is relative to the user's home directory. Don't add ~/, environment variables, or wildcard characters. Apply the rule to the directory itself, not to a version folder or a file, because each new version creates its own subfolder.
9. Select **Update**.
10. Sync the policy to your Cowork clients.
11. Verify the rule.
    a. Confirm the rule is active and linked to the correct policy.
    b. Confirm each affected client received the rule.
    c. In a test environment, confirm that writes to the protected directory are denied.
    d. Confirm that normal file tasks outside that directory still work.

    A device is protected only after it receives and applies the policy. If verification fails, resolve the policy or sync issue before you treat the device as protected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important: Don't test the rule by overwriting, renaming, deleting, or running a real sandbox runtime file, because this can break the sandbox on that device. Use a separate test file in a test environment.

If your deployment uses a custom sandbox runtime location, add a separate deny rule for that location. Contact ServiceNow Support to confirm the path.

Result

Agent actions can't write to the sandbox runtime directory. Typical tasks are unaffected: users can open permitted documents, process them in the sandbox, and save results to permitted locations. Before wide deployment, validate your business critical workflows and any custom skills in a test environment.

Note:

The rule protects the configured path for operations that the sandbox policy controls. It doesn't cover:

- Custom runtime locations, unless you add rules for them
- Other processes that run on the device under the same user account
- Runtime files that were modified before you applied the rule

Approval prompts add oversight but don't replace this rule.

What to do next

Keep the rule in place until a release that contains the permanent fix is deployed to all affected devices and you verify protection on them. Remove the rule only through your normal change approval process.

If you suspect a runtime file on a device was already modified, follow your organization's security incident process and reinstall Cowork from a trusted source on that device.

Environment and capability controls

Environment and capability controls limit what ServiceNow Cowork can access while an action runs, keeping the agent within the boundaries you set.

Environment and capability controls govern what an action can access when it begins executing. Tool gates and approval policies determine whether an action can run, while environment and capability controls determine what a running action can access and do.

Sandbox rules

Cowork runs actions inside an isolated virtual environment. Sandbox rules set the file system boundary and network access for the execution environment. You can add restrictions to the default protections for credential paths and system directories but can't remove them. You can also add filesystem deny rules that block the agent from writing to specific paths. For an example, see .

Network rules

By default, Cowork blocks all outbound traffic except to the hosts, domains, and ports in the network allow list. The Default Policy includes a predefined list of trusted domains.

Connector scopes

A connection credential for a service from a third-party may grant broad access. Connector scopes restrict what Cowork can do on that service, independent of

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

the credential. Scopes apply to capabilities on a resource. For example, you can restrict write access to mail without affecting calendar access. For the Microsoft 365 connector, the OAuth scopes that you turn on determine which operations are available. Users can narrow their own permissions but can't widen them beyond what you turn on.

Capabilities

Capabilities are feature switches and numeric limits. You can turn features and connectors on or off for specific users or user groups, including connectors that are turned off by default. Capability overrides change an effective value without altering the default.

File type rules

File type rules set read, write, or deny access for each file extension. Rules apply in priority order, and ties resolve toward the more restrictive rule.

Test a ServiceNow Cowork policy change

Verify that a policy change works as intended before you apply it to all users.

Before you begin

Create the policy with user criteria that cover only a test user.

Role required: sn_app_cowork.admin

About this task

The instance merges policies and sends only the result, so a mistake in a broadly scoped policy affects every user it covers at their next sync. Test with a scoped policy first.

Procedure

1. Save the policy on the instance.
2. Sync the policy to the client.

   Wait for the change to arrive, which happens in near real time, or ask Cowork application on the client to restart the sandbox.

3. On the client, confirm the last policy sync time in **Settings** > **Agent Sandbox**.
4. Run the action you intended to control, and confirm that the policy handles it as expected.
5. Run an action that the change shouldn't affect, and confirm that it still works.

   Testing both confirms that the rule is doing what you intend, not blocking actions for an unrelated reason.

6. Update the policy's user criteria to cover the users or groups it's meant for.

Result

The policy change applies to its intended users at their next sync.

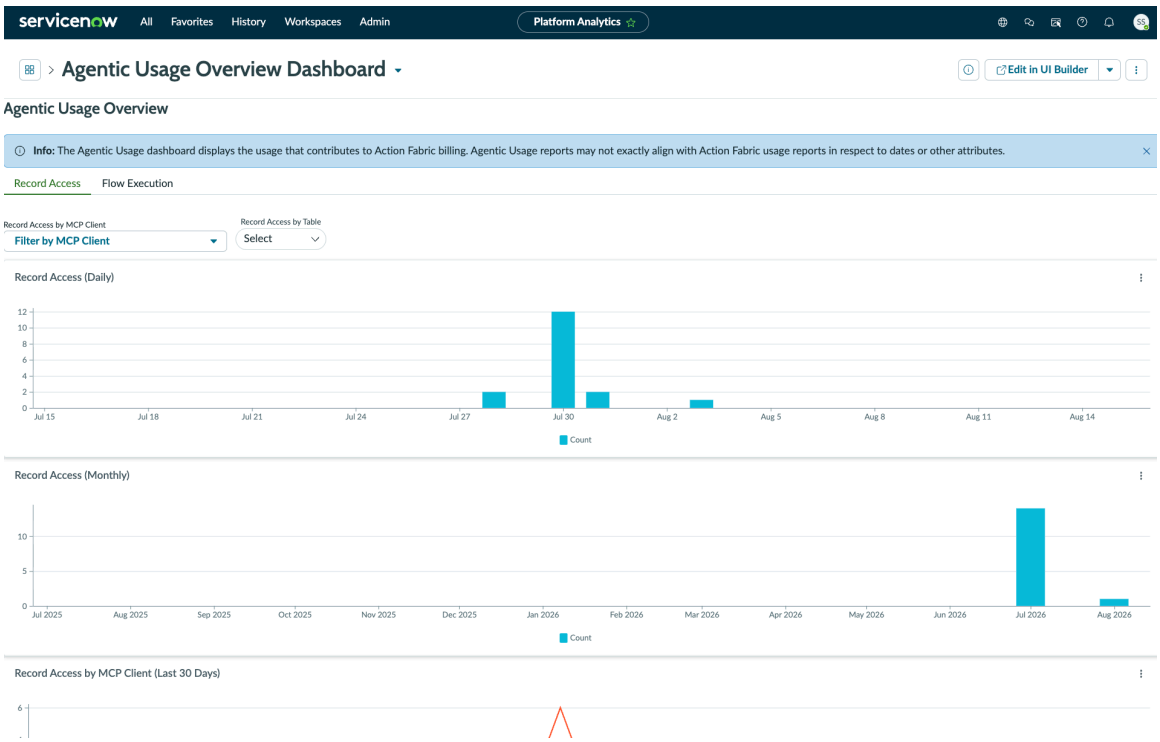
Agentic Usage Overview Dashboard

Monitor usage from inbound agentic connections to MCP servers from the Agentic Usage Overview Dashboard.

The Agentic Usage Overview Dashboard contains visualizations that help you assess the usage from Model Context Protocol (MCP) clients calling MCP servers in MCP Server Console.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Agentic Usage Overview Dashboard (sn_agentic_usage) is active by default. You can access the dashboard by navigating to **All** > **Agentic Usage** > **Agentic Usage Overview Dashboard**. With the sn_agentic_usage.user or sn_agentic_usage.admin role, you can view usage data across two tabs: Record Access and Flow Execution.



Record Access tab

The Record Access tab shows the number of records accessed through MCP servers. Use this tab to monitor record access volume over time and filter by MCP client or table. Select a bar or a point on a line chart to drill down to the records accessed with any currently applied filters retained.

Record Access tab visualizations

Visualization	Description
Record Access (Daily)	The number of records accessed for each day over the last 30 days.
Record Access (Monthly)	The number of records accessed for each month over the last 13 months.
Record Access by MCP Client (Last 30 days)	A trend line of records accessed by MCP client over the last 30 days.
Record Access by Table (Last 30 days)	A trend line of records accessed by table over the last 30 days.

Flow Execution tab

The Flow Execution tab shows the number of flows executed through MCP servers. Use this tab to monitor flow execution volume over time and filter by MCP client or flow name. Select a bar or a point on a line chart to drill down to the flows executed with any currently applied filters retained.

Analyzing AI effectiveness

Measure the performance and adoption of AI capabilities on your instance to identify what is working and where to improve.

Deploying AI capabilities is only the beginning. Measure performance and adoption continuously to confirm that your AI investments deliver value and to identify opportunities for improvement.

AI analytics

Effective AI measurement spans several dimensions: adoption (how many users engage with AI features), usage (which features are used and how often), sentiment (whether users find AI outputs helpful), accuracy (how well AI responses meet quality standards), and value (quantifiable outcomes such as time saved or cases deflected). Establishing baselines for these metrics before launching AI capabilities enables you to assess impact accurately.

AI Admin Center provides built-in analytics dashboards that track usage, adoption, skills performance, and user feedback across your instance.

For information about built-in analytics dashboards, see AI analytics.

Conversation Insights

Conversation Insights delivers Inferred CSAT scores and explanatory factors for conversations in Virtual Agent and agentic workflows. The application uses AI to analyze conversations in real time and provides insights that help improve Virtual Agent interactions, live agent interactions, and agentic workflows.

Inferred CSAT is a score from 1 (least satisfied) to 5 (most satisfied) predicted entirely from conversation transcripts without requiring input from the user. Along with the score, the model predicts contributing factors such as resolution, confusion, effort, empathy, next steps, frustration, and transfers and escalations. These factors explain user satisfaction or dissatisfaction, helping you target specific improvements.

To measure Inferred CSAT and the factors behind it across Virtual Agent and agentic workflow conversations, see Conversation Insights.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Conversation Improvement Themes

Conversation Improvement Themes automatically surfaces common topics and patterns across conversations, helping you prioritize which enhancements will have the greatest impact on the user experience. Use these themes to identify recurring issues, understand where conversations succeed or fail, and focus improvement efforts where they matter most.

Note: Analytics capabilities across the platform are consolidating. Monitor the AI Admin Hub console for the latest analytics features added in each release.

To surface recurring themes across conversations and prioritize the improvements with the greatest impact, see Conversation Improvement Themes.

AI analytics

AI Admin Center consolidates analytics for generative AI skills, AI agents, and assistants into a single monitoring experience.

The **Monitor** section in AI Admin Center groups dashboards by AI asset type into a single destination for reviewing performance across your AI deployment. For enterprise-level governance and value tracking, AI Control Tower provides additional capabilities outside of AI Admin Center.

AI Admin Center

The **Monitor** section in AI Admin Center organizes analytics dashboards into tabs based on asset type. Each tab surfaces the dashboards available in the corresponding standalone analytics application, so you can monitor all AI asset types without switching between applications.

The **Skills** tab provides dashboards for monitoring the usage and performance of generative AI skills, including usage summary, adoption, skill performance, offensiveness, and user search analysis. For more information, see Analyzing AI performance.

The **AI Agents** tab provides dashboards for monitoring the usage, performance, and operational health of AI agents and agentic workflows, including execution status, insights, assist consumption, and troubleshooting. For more information, see AI Agent Analytics dashboard.

The **Assistants** tab provides dashboards for monitoring AI-powered assistant performance, including usage, adoption and engagement, self-solve rates, sentiment, and assist consumption. For more information, see Analyzing assistants.

To open the **Monitor** section, see View AI assets usage and performance in AI Admin Center (Next Experience UI).

AI Control Tower

AI Control Tower provides governance, value tracking, and cost analysis for AI systems across your enterprise. Use it to track the value of your AI investments, monitor spending across AI vendors, and review your AI systems against governance policies.

For more information, see AI Control Tower.

Conversation Insights

The ServiceNow® Conversation Insights application is designed to deliver Inferred customer satisfaction (CSAT) scores, with underlying factors that can help improve CSAT actionability.

AI limitations

This application uses artificial intelligence (AI) and machine learning, which are rapidly evolving fields of study that generate predictions based on patterns in data. As a result, this application may not always produce accurate, complete, or appropriate information. Furthermore, there is no guarantee that this application has been fully trained or tested for your use case. To mitigate these issues, it is your responsibility to test and evaluate your use of this application for accuracy, harm, and appropriateness for your use case, employ human oversight of output, and refrain from relying solely on AI-generated outputs for decision-making purposes. This is especially important if you choose to deploy this application in areas with consequential impacts such as healthcare, finance, legal, employment, security, or infrastructure. You agree to abide by ServiceNow's AI Acceptable Use Policy, which may be updated by ServiceNow.

Data processing

This application requires data to be transferred from ServiceNow customers' individual instances to a centralized ServiceNow environment, which may be located in a different data center region from the one where your instance is, and potentially to a third-party cloud provider, such as Microsoft Azure. This data is handled per ServiceNow's internal policies and procedures, including our policies available through our CORE Compliance Portal.

Data collection

ServiceNow collects and uses the inputs, outputs, and edits to outputs of this application to develop and improve ServiceNow technologies including ServiceNow models and AI products. Customers can opt out of future data collection at any time, as described in the AI Opt-Out page.

Exploring Conversation Insights

Learn how Conversation Insights can help you to augment conversation insights with AI-based Inferred customer satisfaction (CSAT) scores and factors.

Conversation Insights overview

Conversation Insights is designed to deliver Inferred CSAT scores and explanatory factors for conversations in Virtual Agent and agentic workflows. It leverages AI to analyze conversations in real time, and provides actionable insights that help improve Virtual Agent and live agent interactions, and agentic workflows.

Inferred CSAT is a numerical score from 1 (least satisfied) to 5 (most satisfied). It's predicted entirely from conversation transcripts in real time without any input from the user. In addition to the CSAT score, the model also predicts CSAT factors that contributed to the CSAT score. The following CSAT factors are associated with the Inferred CSAT score.

- Resolution: Indicates whether the Virtual Agent or AI agent successfully resolved the user's issue without human intervention.
- Confusion: Indicates how often the Virtual Agent or AI agent misunderstood or failed to interpret the user's intent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Effort: Indicates the number of user turns or interactions required to reach a resolution.
- Empathy: Indicates how well the Virtual Agent or AI agent acknowledged and responded to the user's emotional tone.
- Next Steps: Captures whether the Virtual Agent or AI agent clearly communicated what the user should do next.
- Frustration: Flags signs of user dissatisfaction or repeated failed attempts during the interaction.
- Transfers and Escalations: Tracks how often the Virtual Agent or AI agent handed off the conversation to a human agent or another system.

Inferred CSAT scores and factors are calculated for each conversation. Conversational analytics applications can leverage the scores written to the Conversation Insights [sn_aci_insights] table to create custom dashboards and workflows. The AI Agent Analytics dashboard includes visualizations with Inferred CSAT scores and factors by default.

The data retention period for the Conversation Insights [sn_aci_insights] table is two years. For more information on creating custom dashboards, see Create a dashboard with the in-line editor and Select a table data source for a data visualization.

Conversation Insights are also supported by Voice Agents, ServiceNow Otto panel, and Virtual Agent.

To view the conversation insights for Voice Agents, go to **Assistant Designer** > **Analytics** > **Sentiment** dashboard.

To view the conversation insights for ServiceNow Otto panel or Virtual Agent, go to **Platform Analytics** > **Dashboards** > **AI Engagement Analytics**.

Inferred CSAT segmented by intent

Use the additional insights introduced to report on Inferred CSAT segmented by intent. It gives better insights into why customers contact the brand and how well their needs are met. This helps companies quickly spot and fix issues with their top customer intents.

The score for Inferred CSAT segmented by intent is automatically generated when customers upgrade the Conversation Insights app. It requires a minimum sample size of 500 conversations to start and samples up to 2000 records every 15 minutes.

These metrics are available in the AI Agent Analytics dashboard, under the Insights tab, where you can find two new charts.

You can also explore the conversational insights for ServiceNow Otto panel and Virtual Agent. To view the dashboard, go to **Dashboards** > **AI Engagement Analytics** > **Platform Analytics** section or **Dashboards** > **AI Engagement Analytics** > **Voice Agents** Agents section.

Additionally you can also go to **Assistant Designer** > **Analytics** > **Sentiment** dashboard to view these insights.

Conversation Insights workflow

The Conversation Insights workflow illustrates how each interaction, whether handled by Virtual Agent or an AI agent, is transformed into actionable insights. You can feed the insights directly into the dashboards for analysis and decision making. The Conversation Insights workflow shows the journey from conversations to insights on dashboards.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Conversation Insights workflow

1. Conversation sources
   - Agentic AI chats
   - Virtual Agent chats
2. Data aggregation
   - Agentic AI and Virtual Agent interactions are captured in the Conversation table [sys_cs_conversation].
   - The conversation transcript, including user query, agent response, timestamps, and metadata such as the session ID and channel type are also stored in the Conversation table for processing.
3. Insight generation
   - The model analyzes the conversation transcript.
   - Inferred CSAT scores are generated for CSAT factors such as Empathy, Resolution, Frustration, and so on.
4. Insights storage
   - Inferred CSAT scores and factors are stored in the Conversation Insights table [sn_aci_insights].
   - The Conversation Insights table acts as a structured repository for the extracted insights.
5. Dashboards
   - The insights are made available to create adhoc dashboards and workflows.
   - You can explore trends, performance metrics, and target improvements based on the Inferred CSAT scores.

Conversation Insights benefits

Problem	Solution
Traditional surveys often reflect extreme opinions and low response rates.	Inferred CSAT helps solve this problem by using AI to estimate CSAT score for conversations in real time, based on full conversation transcript. This CSAT score can help to eliminate bias and

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Problem	Solution
	reduce the need for reliance on explicit survey feedback.
Post-interaction feedback delays insights resulting in lagging indicators.	CSAT scores are generated immediately after the interaction, enabling faster detection of issues and trends.
Lack of actionable insight behind CSAT scores.	CSAT factors like Resolution, Empathy, Effort, and so on explain user satisfaction or dissatisfaction, helping you to target improvements.

What to explore next

To learn more about configuring and using Conversation Insights, see:

- Install Conversation Insights
- Conversation Insights reference

Install Conversation Insights

If you have the admin role, you can install the Conversation Insights application (sn_aci).The application includes demo data and installs related ServiceNow® Store applications and plugins, if they aren't already installed.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Review the application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.
- Inferred CSAT is calculated by an internal service that communicates with the instance using mutual Transport Layer Security (mTLS). To enable this, the instance must be configured to support Application Delivery Controller-to-Application (ADC-to-APP) mTLS. This setup ensures strong authentication and encrypted data exchange between internal services and the instance, requiring both client and server to present and validate certificates during the TLS handshake. For more information on mTLS configuration, refer to steps 1 and 2 in the Prerequisites section of KB0993615.

Role required: admin

About this task

The following items are installed with Conversation Insights:

- Plugins
- Store applications
- Roles
- Scheduled jobs
- Conversation Insights [sn_aci_insights] table

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Conversation Insights application (sn_aci) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you can't find the application, you might have to request it from the ServiceNow Store.

   A list of the versions available to you're displayed.
3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box, any dependencies installed with your application are listed.
4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
   Demo data are the sample records that describe application features for common use cases. Load the demo data when you first install the application on a development or test instance.
6. Select **Install**.

Conversation Insights reference

The following topics provide additional information about the features and properties installed with Conversation Insights.

Components installed with Conversation Insights

Installation of the Conversation Insights application also installs the Conversation Insights [sn_aci_insights] table.

Tables installed with Conversation Insights

The installation of Conversation Insights installs the Conversation Insights [sn_aci_insights] table. The data retention period for the Conversation Insights table is two years.

Conversation Insights table

Column	Description
Human Agent CSAT	Estimated Inferred customer satisfaction (CSAT) score based on the human agent's responses. The value range is 1–5 with 1 meaning that the user is extremely dissatisfied and 5 meaning that the user is extremely satisfied with the interaction.
Effort Score	A score of time and energy that the user had to put in during the interaction. The values are on a 3-point scale of low, medium, and high.
AI agent CSAT	Estimated CSAT score based on the AI agent's responses. The value range is 1–5 with 1 meaning that the user is extremely dissatisfied and 5 meaning that the user is extremely satisfied with the interaction.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Conversation Insights table (continued)

Column	Description
Frustration	Estimated CSAT score that indicates whether the user expressed frustration during the interaction. The values are Yes or No.
Empathy	Estimated CSAT score that indicates empathy shown toward the user during the interaction. The values are on a 3-point scale of low, medium, and high.
Session CSAT	Estimated CSAT score calculated based on the overall session interactions of a user. The value range is 1–5 with 1 meaning that the user is extremely dissatisfied and 5 meaning that the user is extremely satisfied with the interaction.
Next Steps	Estimated CSAT score that indicates whether the agent recapped the outcome and provided clear instructions on what the user should do next. The values are on a 3-point scale of low, medium, and high.
CSAT processed	Boolean flag indicating whether CSAT data has been processed for the interaction record.
Transfer and Escalation	Estimated CSAT score that indicates whether the conversation was transferred or escalated to a human agent. The values are Yes or No.
Closed At	Timestamp showing when the conversation was closed.
Conversation	Refers to the associated conversation record in the Conversation [sys_cs_conversation] table.
Resolved	Estimated CSAT score that indicates whether the issue was resolved. The values are Yes or No.
Confusion	Estimated CSAT score that indicates whether the user expressed confusion or the agent didn’t understand the user's intent. The values are Yes or No.

ServiceNow collects and uses the inputs, outputs, and edits to outputs of this application to develop and improve ServiceNow technologies including ServiceNow models and AI products. Customers can opt out of future data collection at any time, as described in the AI Opt-Out page.

Exploring Conversation Improvement Themes

The Conversation Improvement Themes application helps to transform conversation evaluations into long-term performance insights.

Conversation Improvement Themes overview

The Conversation Improvement Themes analyzes conversation quality data over time. The approach focuses on identifying recurring patterns linked to low conversation quality (and high) and categorizing user requests into actionable themes using metadata-driven classification powered by large language models (LLMs).

Note: Conversation Improvement Themes can use OpenAI, Gemini, or Claude. It's observed in certain instances that Gemini and Claude could consume a higher number of assists, compared to the OpenAI model, which is observed to have optimal use of assists.

How themes are created

To create themes, metadata like name, short description, and so on, from different content types like knowledge base articles, catalog items, virtual agent topics, and AI agents are analyzed. Theme generation is performed using an LLM-based categorization process that relies only on metadata rather than full article content, which helps limit token usage, reducing processing overhead. For each created theme, definitions are created using the tagged content from the LLM-based classification process, which helps in tagging primary requests from conversations.

Approach:

1. Filter by User Satisfaction Score. For example, select conversations where evaluator results are associated with low user satisfaction score (<=1.5) or High Score >= 4.5.
2. Extract and standardize Primary requests:
   a. Parse the user's Primary request, removing noise from different writing styles or phrasing.
   b. Apply standardization so similar intents, for example, reset my password versus can't log in are grouped consistently.
3. Frequency analysis:
   a. Link each standardized request to a theme.
   b. Count how often each theme appears when the virtual agent underperforms or performs well.
   c. Highlight themes where the virtual agent handles requests poorly or well on the screen.

Activating Conversation Improvement Themes

Activate the Conversation Improvement Themes application to analyze conversation quality.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Conversation evaluations have to be enabled in AI Control Tower. For more information, see Enabling evaluations.

Procedure

1. Navigate to **All** > **AI Admin Hub** > **Skills**.
2. Within the Platform category, select the feature **Conversation Evaluator** and verify that all the skills shipped with the Conversation Evaluator application are activated.
3. After that, activate the skills shipped with this application.
   - Theme Extraction
   - Themes Update Definition
   - Themes Primary Request Tagging
4. Navigate to **All** > **System Definition** > **Scheduled Jobs**.

   Apply the filter: `Application = Conversation Improvement themes`. Activate all scheduled jobs.

   - Create thematic executions
   - Evaluations for themes [Daily job]
   - Evaluations for themes [Historic job]
   - Themes - Create Daily Primary Request Executions
   - Update Theme Effective and Ineffective Scores
5. For access to the application, assign the following roles to the users:
   - sn_na_thematic.theme_admin
   - sn_na_conv_eval.eval_admin

   Note:

   Only users who have access to the roles mentioned previously can access the data on the Conversation Improvements dashboard and the tables. But they won't be able to see live agent invocations.

   User must have the following roles to access all the data on the themes dashboard:

   - sn_na_thematic.theme_admin
   - sn_na_conv_eval.eval_admin
   - Interaction_admin

Using Conversation Improvement Themes

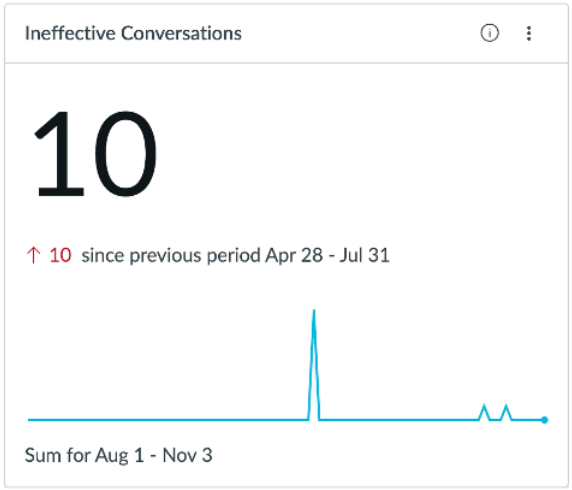
View performance insights using the widgets in Conversation Improvement Themes.

To access the application, navigate to **All** > **Conversation Improvement Themes** > **Overview**.

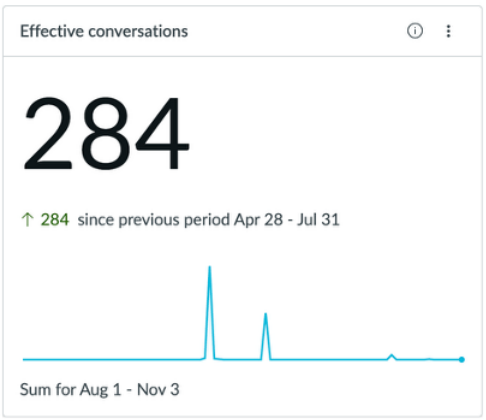
The Overview page has the following widgets:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

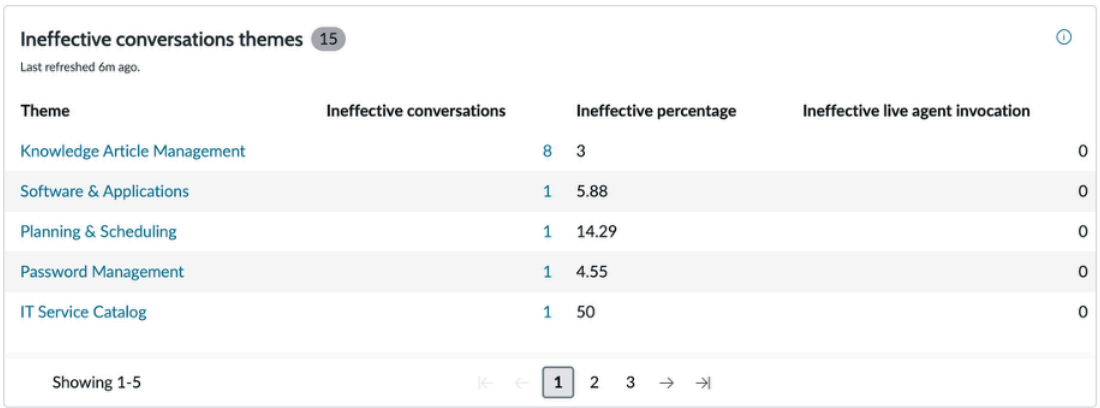
- Ineffective Conversations: The number of conversations with Auto evaluated user satisfaction scores of less than or equal to 1.5.



- Effective Conversations: The number of conversations with Auto evaluated user satisfaction scores of greater than or equal to 4.5.

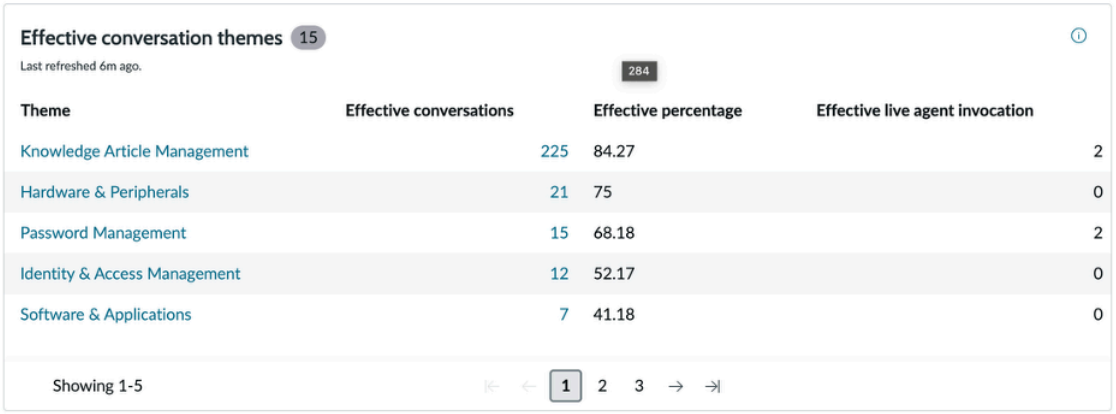


- Ineffective conversation themes: The themes that have ineffective conversations.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Effective conversation themes: The themes that have effective conversations.

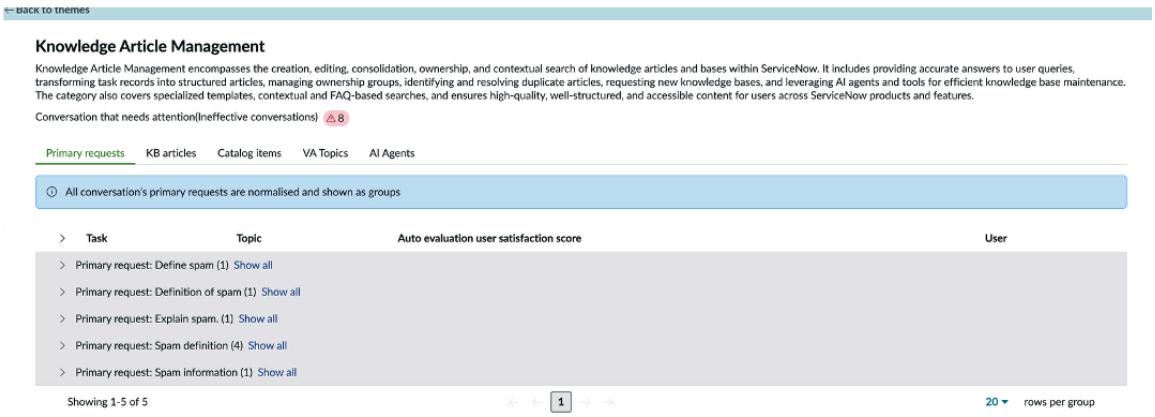


When you select any of themes under **Ineffective conversations themes** or **Effective conversations themes**, you're redirected to the theme.

For example, if you select Knowledge Article Management, it takes you to the page showing the theme name with its description and then shows the primary requests, knowledge articles, catalog items, VA topics, and AI Agents tagged to the theme. When you select on any of the tagged Primary requests, KB articles, Catalog Items, VA Topics, or AI Agents, you're redirected to these items.

Note: You can only see the sections to which you have access.

For example, you need access to AI Control Tower to access primary requests, Knowledge Base to access KB articles, Service Catalog to access catalog items, VA administrator to access VA topics, AI Agent Studio to access AI agents.



Reference for Conversation Improvement Themes

The following topics provide additional information about the features and properties installed with Conversation Improvement Themes.

Components installed with Conversation Improvement Themes

Several types of components are part of Conversation Improvement Themes, including scheduled jobs, tables, system properties, and flows.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles added

Role	Description
sn_na_thematic.theme_admin	Primary role to access dashboard and tables installed with the application.

Scheduled jobs installed

Scheduled job	Description
Create thematic executions	This scheduled job runs once a month and creates Themes Execution Staging Records that create themes and their description and tags knowledge articles, catalog items, VA topics, AI Agents, and conversations to these themes.
Themes - Create Daily Primary Request Executions	Runs daily and creates Themes Execution Staging Records that tags conversations to the existing themes, and if necessary, creates new themes
Update Theme Effective and Ineffective Scores	Runs daily and populates number of effective conversations and number of ineffective conversations for every theme.

Tables installed

Label	Name
Themes Configurations [sn_na_thematic_themes_configurations]	Contains various configurations for Conversation Improvement Themes. Configuration Name - Last scan date: Contains the last scanned date of the theme creation. After the first run, theme extraction and theme description update will only run on content updated or created after the last run date.
Themes [sn_na_thematic_themes]	Contains the themes created along with their descriptions.
Themes associations [sn_na_thematic_associates]	Contains the relationship between themes and different content types tagged to that theme.
Primary Requests [sn_na_thematic_primary_requests]	Contains all the primary requests extracted from evaluated chats.

System properties installed

Property	Description
sn_na_thematic.dataChunkSize	The default chunk size, used for Azure Open AI provider and as a backup. The default chunk size is 100. If you see Themes Execution staging record is either in a failed state or stuck on processing for a long time, reduce the chunk

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	size and change the state of the Execution staging record to draft and then again to processing.
sn_na_thematic.fallbackDataChunkSize	If any of the theme skills are not part of the Azure Open AI provider, the fallback size is used to create execution staging records. If you see Themes Execution staging record is either in a failed state or stuck on processing for a long time, reduce the chunk size and change the state of the Execution staging record to draft and then again to processing. The default chunk size is 25. But it should be set differently for different LLMS. • Gemini: 25 • Claude: 10 • Now LLM: 1

Business rules installed

Name	Description
Theme tagging	An asynchronous business rule that runs the state of the Themes Execution Staging record changes to processing. It invokes the Theme Tagging subflow.
Themes Update next record to processing	Runs state of the Themes Execution Staging record changes to Classification Complete, Complete or Failed.

Subflows installed

Flow	Description
Theme Tagging	Executes when the state of the Themes Execution Staging record changes to processing. The subflow creates themes, updates their description, and then tags knowledge articles, catalog items, VA Topics, AI agents, and conversations with the themes and moves the state of the Themes Execution staging record to complete.
Primary Theme Tagging	The subflow is called from Theme Tagging subflow. It tags conversations to the existing themes and if necessary, creates new themes.

Script includes installed

Script includes	Description
themesUtil	Primary utility function for Conversation Evaluator.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Troubleshooting for Conversation Improvement Themes

Troubleshooting steps for errors that might occur in Conversation Improvement Themes.

Scenario/Symptom: The dashboard is not showing any data, one week after the install.

Associated Error Codes/Warning: N/A.

Steps to Resolve:

Make sure all the skills and scheduled jobs are active by following the steps given in Activating Conversation Improvement Themes.

Scenario/Symptom: Execution staging records are stuck on Processing/Failed.

Associated Error Codes/Warning: Flow-related logs in syslog.

Steps to Resolve:

Increase flow logging (preferably in dev).

Environment guidance:

- Dev/Test: Set verbose logging to All configurations and runtime value.
- Prod: Use Runtime states and duration only. Don't enable All configurations and runtime value in production.

Steps:

1. Navigate to **Process Automation** > **Flow Administration** > **Properties**.
2. Set Level of reporting data generated by the flow engine to the appropriate level (see the guidance above).
3. Create a conversation through the Portal and end the conversation.
4. Navigate to **Process Automation** > **Flow Designer** > **Theme Tagging(subflow) or Primary Request Tagging(subflow)**.
5. Review flow executions. Identify any actions marked Failed or Error and address the cause.
6. If all actions are Complete and there is no other path indicating failure handling, open a Support ticket.

Scenario/Symptom: Execution staging records Failed when default model is Gemini/Claude/Now LLM.

Associated Error Codes/Warning: Skill Execution timed out.

Steps to Resolve:

This is a known issue with Gemini and Claude as they are slow thinking models, responses may be slow and sometimes can get timed out. To resolve this, reduce the chunk size in system properties by performing the following steps:

1. Navigate to **All** > **System Properties** (sys_properties.list) and search for **sn_na_thematic.dataChunkSize** and reduce it. The ideal chunk size for all the models is:
   - Azure Open AI: 100
   - Gemini: 25

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Claude: 5
- Now LLM: 1

2. Move the failed Execution staging record to processing.

Generative AI Logs: If an evaluation is not complete, navigate to sys_generative_ai_log and check for the following definitions to see if there are any errors:

- Theme Extraction
- Themes Update Definition
- Themes Primary Request Tagging

Outbound HTTP:

If no Gen AI logs are created, check the Outbound HTTP logs for any issues exist.

Sys Logs: Check sys logs for any errors related to passing with scope as sn_na_thematic.

AI adoption and change management

Apply proven change management strategies to help your workforce embrace AI capabilities and sustain adoption over time.

Activating an AI product is only the first step toward realizing its value. Because end users can choose whether to use AI-powered skills, AI requires more active change management than traditional products. A structured organizational change management approach helps users understand, embrace, and effectively use AI capabilities in their daily work.

An effective adoption program requires learning why change management is critical for AI, applying the four pillars of a structured program, choosing rollout strategies that build momentum, measuring success, and sustaining engagement after launch.

To apply the four pillars of a change management program, choose rollout strategies, measure success, and sustain engagement after launch, see Managing change for AI adoption.

Managing change for AI adoption

A structured organizational change management approach helps users understand, embrace, and effectively leverage AI capabilities in their daily work.

The difference between successful AI adoption and underutilized capabilities often comes down to how well you manage the human side of change. ServiceNow AI requires more active change management than traditional products because end users can choose whether to use AI-powered skills. A structured organizational change management (OCM) approach helps users understand, embrace, and effectively leverage AI capabilities in their daily work.

Why change management matters for AI adoption

Projects with strong change management are significantly more successful than those without structured adoption programs. With generative AI, the stakes are even higher:

- User choice drives adoption. Unlike mandatory system upgrades, AI features are optional tools that users must actively choose to incorporate into their workflows.
- AI changes how people work. Generative AI introduces new interaction patterns that may feel unfamiliar, requiring users to trust AI-generated outputs and adapt established habits.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Concerns must be addressed proactively. Users may have questions about trust, accuracy, job impact, and data security that require thoughtful communication.
- Value depends on usage. The return on investment of is directly tied to adoption rates. Features that go unused deliver no business value regardless of their technical capabilities.

Four pillars of effective change management

Successful AI adoption programs address four interconnected areas: stakeholders and champions, messaging and communication, training and enablement, and reinforcement and optimization.

Identify stakeholders and champions

Build a network of people who drive adoption across the organization:

- Executive sponsors provide visible leadership support and communicate strategic importance.
- Business partners take responsibility for messaging within their teams and hold accountability for adoption outcomes.
- Change champions are influential frontline employees or mid-level managers who advocate for AI adoption, help train colleagues, and provide valuable feedback.
- Subject matter experts confirm that AI capabilities align with actual workflow needs and validate that outputs meet quality standards.

Engage business partners early and assign clear ownership. Collaboration between IT and business teams is critical, with business partners taking responsibility for encouraging their teams to drive adoption. Communication is most effective when partners use language that emphasizes personal benefits to individual users.

Craft clear messaging

Develop communications that help users understand why AI matters and how it improves their work:

- Lead with benefits. Frame AI capabilities in terms of the problems they solve and the time they save, not just the features they provide.
- Address concerns directly. Proactively communicate about trust, accuracy, job impact, and data security through strategic messaging rather than waiting for questions to arise.
- Use multiple channels. Communicate through champions, focus groups, and interactive sessions rather than relying solely on email announcements.
- Share success stories. Highlight teams that have seen tangible improvements, such as reduced case review time or faster resolution rates, to build momentum and encourage broader adoption.

Meet users where they are by adapting communication approaches to your organization's preferences, whether virtual, in-office, or remote-first environments.

Provide effective training

Confirm that users are prepared to use AI successfully through structured enablement:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Develop role-based training. Different user personas interact with AI in different ways. Tailor training content to specific roles and use cases.
- Use hands-on approaches. Live demos, office hours, and interactive sessions outperform static documentation or slide presentations.
- Make training ongoing. Enablement is not a one-time event. Provide continuous learning opportunities as capabilities evolve and users gain experience.
- Provide digital enablement. Multimedia content, onboarding resources, and self-service learning materials extend the reach of your training program.

Reinforce and optimize

Track progress, gather feedback, and make continuous improvements:

- Measure adoption metrics. Track monthly active user percentages, feature usage rates, and user sentiment to understand adoption patterns.
- Collect and act on feedback. Establish channels for users to report issues, suggest improvements, and share experiences.
- Celebrate wins. Recognize teams and individuals who achieve measurable improvements through AI adoption.
- Iterate based on data. Use adoption analytics to identify areas for improvement and adjust your approach accordingly.

Recommended rollout strategies

How you introduce AI capabilities significantly impacts adoption success. Consider these proven approaches:

Start with pilots

Groups involved in pilots consistently show the highest adoption rates. Pilot programs allow you to gather feedback, refine training approaches, and demonstrate success before broader rollout. Study your users, understand their roles, and target the rollout with assigned access and permissions for active users. Without this focus, non-engaged users can skew adoption metrics.

Use phased rollouts

Implement iteratively with quick feedback loops rather than large, one-time rollouts. Phased approaches combined with persuasion-based communication help move users from curiosity to confident adoption. This approach also allows you to incorporate lessons learned from earlier phases into subsequent ones.

Start with quick wins

Begin with turnkey capabilities such as incident or case summarization that deliver immediate, visible value. Quick wins help you gain insights into user experience, value measurement, and change management while building foundational readiness for more advanced features.

Prioritize user experience

Features that require users to change their behavior need strong user experience design. Early UX research and limited rollouts help optimize the experience before broad deployment. Even small details matter: if a summarize button is positioned outside users' natural line of sight, adoption suffers regardless of how valuable the feature is.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Measuring adoption success

Before launching any use case, identify the metrics you will use to gauge adoption and usage. Track these key indicators:

- Adoption: the monthly active user percentage of AI users against total potential users.
- Usage: which features are used and how often, based on triggers such as summaries successfully generated.
- Sentiment: the proportion of positive feedback out of total feedback.
- Accuracy: how well AI outputs meet quality standards for the use case, such as search or conversation success rates and summary or code acceptance rates.
- Hours saved: the time savings that form the basis of value calculations for both fulfiller and requester use cases.

Track adoption metrics, analyze them for trends, and layer qualitative and quantitative data into the story to demonstrate impact and identify opportunities for improvement.

Driving ongoing engagement

Sustained adoption requires ongoing attention. Consider these approaches to maintain momentum:

- Promote a culture shift. Position generative AI as a trusted partner that enhances human capabilities rather than replacing them.
- Introduce gamification. Programs that reward high-quality usage, such as recognizing agents who generate the best knowledge base articles using AI, can increase engagement.
- Share success broadly. Feature success stories in newsletters, all-hands meetings, and internal communications to inspire others.
- Respond to feedback quickly. Demonstrate that user input drives improvements by acting on feedback and communicating changes.

Solving installation and configuration issues with ServiceNow AI features

Use this checklist to address issues or gaps in your AI configuration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Common issues by feature

Feature	Issue	Solution
AI and ServiceNow Otto applications	I want to view my subscriptions	See Product subscriptions overview.
AI agents	I can't find agent spokes	Install the ServiceNow Otto for Spokes application from the ServiceNow Store. For details, see Now Assist for Integration Hub.
AI Control Tower	No data on the Evaluations tab	Verify that the Conversation Evaluator [sn_na_conv_eval] plugin is active. Also verify that the Smooth Flowing Conversation Chat Eval skill is active in the AI Admin Hub console. (This skill may appear in the Platform workflow or in the Other workflow, depending on your instance.)
AI Search	External content isn't included in search results	You can use External Content Connectors to include other sources in your search results. For details, see External Content Connectors.
AI Search	ServiceNow Otto for AI Search Genius results don't appear	1. Verify that AI Search and ServiceNow Otto for AI Search are installed and configured. 2. To use Q&A Genius Results in AI Search applications, link the Q&A Genius Result configuration to your search profiles for those applications. For details, see Link a Genius Result configuration to a search profile. 3. Verify that all AI and ServiceNow Otto plugins are up to date. For details, see Update an application or plugin. 4. Try repairing the plugins.
AI setup	Errors after clone	Try repairing affected plugins. For details, see Repair an application or plugin.
AI setup	The Q&A results skill is not in the AI Admin Hub	Set up AI Search. For details, see Configuring AI Search.
AI setup	Features/ skills are missing or generally not working	• Verify that all AI and ServiceNow Otto plugins are up to date. For details, see Update an application or plugin. • Verify that version and dependency requirements are met. For details, see Evaluating version requirements and dependencies. • For skills, verify that they are active in the AI Admin Hub. For details, see Activate an AI skill. • Verify that the user has the correct role for the skill.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Common issues by feature (continued)

Feature	Issue	Solution
		• Try clearing the cookies and cache in the web browser. • Try repairing Generative AI Controller. For details, see Repair an application or plugin.
AI setup	Can't edit a skill	Verify that you have the AI Admin Hub role: sn_nowassist_admin.nsa_admin. You can edit a skill or make a copy of a skill to edit. For details, see Edit an AI skill and Make a copy of an AI skill.
AI setup	Missing entries, fields, and errors	• Verify that all AI and ServiceNow Otto plugins are up to date. For details, see Update an application or plugin. • Try repairing the application. For details, see Repair an application or plugin. • Try repairing Generative AI Controller. For details, see Repair an application or plugin.
AI setup	Problems upgrading AI and ServiceNow Otto applications	• Verify that you have a license for the application. • If the application was not previously installed, request it from the ServiceNow Store (Opt In). • If the application was previously installed, you may need to procure it from the ServiceNow Store again. For details, see Updating applications.
AI setup	Skills not working in Legacy Agent Workspace	Generative AI skills are not available in Legacy Workspace. Upgrade to Service Operations Workspace to use skills.
AI Skill Kit	AI Skill Kit is not visible on my instance	• Verify that you have at least one AI or ServiceNow Otto product installed. For details, see Install plugins for ServiceNow Otto. • Verify that the sn_skill_builder.admin role is assigned to the user.
AI Skill Kit	Skills are read-only	Verify that the sn_skill_builder.admin role is assigned to the user.
Knowledge generation	I can't generate a knowledge article	1. Verify that ServiceNow Otto for Knowledge Management is installed and configured. 2. Verify that all AI and ServiceNow Otto plugins are up to date. For details, see Update an application or plugin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Common issues by feature (continued)

Feature	Issue	Solution
		3. Verify that the knowledge generation skill is activated. For details, see Activate an AI skill. **4.** Try repairing the plugins.
Knowledge generation	The KB generation popup doesn't appear in Core UI	ServiceNow Otto for Knowledge Management formatters may be missing from the form layout, possibly due to form customizations. For details, see KB1710178.
ServiceNow Otto for Code	Don't see code suggestions	• Verify that the skill is active. For details, see Activate an AI skill. • Verify that the user has the appropriate role. Any authenticated builder can use the related active skill. • Verify that autocomplete is enabled. For details, see Generate code with autocomplete.
ServiceNow Otto for Creator	Skills not available or not working	• Verify that the skill is active in AI Admin Hub. • Verify that the user has the appropriate role. Any authenticated builder can use the related active skill.
ServiceNow Otto panel	Can't access skills in the ServiceNow Otto panel	• Verify that the skill is configured to display in the ServiceNow Otto panel. For details, see Edit an AI skill. • If you're using ServiceNow Otto for Virtual Agent, verify that search sources were configured for the ServiceNow Otto panel. You can specify search sources for a ServiceNow Otto panel assistant when you set it up. Search sources are essential for the panel and Virtual Agent. Without them, they cannot discover or rank skills and agentic workflows. For details, see Assistants overview and Assign search sources to a chat assistant. If ServiceNow Otto for Virtual Agent is not installed, the ServiceNow Otto panel uses default search sources.
ServiceNow Otto panel	Some users don't get a response to a question	Many generative AI skills require specific user roles. Verify that there are active skills with the user's role. For details, see Activate an AI skill.
ServiceNow Otto panel	I don't want skills to be available in ServiceNow Otto panel	Disable the ServiceNow Otto panel when you configure the skill. For details, see Edit an AI skill.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Common issues by feature (continued)

Feature	Issue	Solution
ServiceNow Otto panel	Options for ServiceNow Otto panel are grayed out in AI Admin Hub	The sn_nowassist_admin.user role provides read-only access only. To make configuration changes, the user must have the sn_nowassist_admin.nsa_admin role.
ServiceNow Otto for Virtual Agent	Topic not returning as expected	• Verify that the Virtual Agent topic is in the Active state and is published. For details, see Publish a Virtual Agent topic. • Verify that the topics are using LLM topic discovery. NLU/keyword topics cannot be used in a portal that is using ServiceNow Otto for Virtual Agent. You can migrate NLU/keyword topics to LLM, however. For details, see Migrating NLU/keyword Virtual Agent topics to LLM topics.
ServiceNow Otto for Virtual Agent	Can't add topics to the portal	Verify that the topics are using LLM topic discovery. NLU/keyword topics cannot be added to a portal that is using ServiceNow Otto for Virtual Agent. You can migrate these topics to LLM, however. For details, see Migrating NLU/keyword Virtual Agent topics to LLM topics.
ServiceNow Otto for Virtual Agent	Configuration issues	1. Verify that the plugin is up to date. For details, see Update an application or plugin. 2. Follow the guided setup to install and configure it. For details, see Assistants overview.
ServiceNow Otto for Virtual Agent	Unable to choose fallback options in setup	If you're using a custom fallback topic, this option may be unavailable in guided setup. For details, see KB1760362: Now Assist Chat Setup Not Allowing to Set Fallback Option. You may need to log in to view the article.
ServiceNow Otto for Virtual Agent	Chat is not showing search results	• Verify that all of your AI or ServiceNow Otto plugins are up to date. For details, see Update an application or plugin. • Verify that AI Search and ServiceNow Otto for AI Search are set up and configured. For details, see Configuring AI Search and Install ServiceNow Otto for AI Search. • Verify that search sources were configured for the Virtual Agent assistant. You can specify search sources for an assistant when you set it up. Search sources are essential for Virtual Agent and the ServiceNow Otto panel. Without them, they cannot discover or rank skills and agentic workflows. For details, see Assistants overview and Assign search sources to a chat assistant.
ServiceNow Otto for	Error when attempting to migrate	Verify that you have the correct role, either virtual_agent_admin or sn_vad_genai.topic_migration_admin. For more information, see Migrate NLU topics to LLM topics.

Common issues by feature (continued)

Feature	Issue	Solution
Virtual Agent	Virtual Agent NLU conversations to LLM	

Machine learning and natural language capabilities

The ServiceNow AI Platform includes non-generative AI capabilities that use machine learning and natural language processing to automate tasks, classify data, and enable natural interactions. These capabilities include Natural Language Understanding (NLU), Natural Language Query (NLQ), Predictive Intelligence, and Task Intelligence.

The ServiceNow AI Platform includes a set of non-generative AI capabilities that use machine learning and natural language processing to automate tasks, classify data, and enable natural interactions. These capabilities complement the generative AI experiences provided by ServiceNow Otto.

Natural Language Understanding (deprecated)

Natural Language Understanding (NLU) powers intent detection in Virtual Agent, enabling chatbots to understand what users are asking and route them to the right topic or response. NLU supports model management, multilingual models, and integration with Virtual Agent through the NLU Workbench. To build and manage the intent models that power Virtual Agent, including multilingual models in the NLU Workbench, see (Legacy) Natural Language Understanding.

Natural Language Query

Natural Language Query (NLQ) lets users query platform data in everyday language, so non-technical users can retrieve information without writing filters or building reports. To let users retrieve platform data in everyday language without building filters or reports, see Natural Language Query.

Predictive Intelligence

Predictive Intelligence applies machine learning across business units. Administrators can train machine learning models that automatically populate fields during record creation, categorize and route work based on how records have been handled in the past, recommend resolutions to cases that are similar to previous ones, and identify major outages based on incoming incidents. To train machine learning models that classify and route work, populate fields, and recommend resolutions from past records, see Predictive Intelligence.

Task Intelligence

Task Intelligence applies machine learning to task management, improving how work is routed and processed across the organization by learning from patterns in instance data.

Note: These machine learning capabilities operate independently of ServiceNow Otto and don't require an LLM. They are trained on instance data and can be deployed alongside generative AI capabilities.

To improve how work is routed and processed by applying machine learning to your task data, see Task Intelligence.

(Legacy) Natural Language Understanding

ServiceNow® Natural Language Understanding (NLU) provides an NLU Workbench and an NLU inference service that you can use to enable the system to learn and respond to human-expressed intent. By entering natural language examples into the system, you help it understand word meanings and contexts so it can infer user or system actions.

Overview of Natural Language Understanding

Starting with the Brazil release, Natural Language Understanding is being prepared for future deprecation. It will be hidden and no longer activated on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

For an overview of Natural Language Understanding, see (Legacy) Exploring Natural Language Understanding.

NLU terminology

In NLU parlance, these terms identify the key language components the system uses to classify, parse, and otherwise process natural language content.

Intent

Something a user wants to do or what you want your application to handle, such as granting access.

Utterance

A natural language example of a user intent. For example, a text string in an incident's short description, a chat entry, or an email subject line. Utterances are used to build and train intents and should therefore not include several or ambiguous meanings or intents.

Entity

The object of, or context for, an action. For example: a laptop, a user role, or a priority level.

System entity

These are predefined in an instance and have highly reusable meanings, such as date, time, and location.

User defined entity

These are created in the system by users and can be built from words in the utterances they create.

Common Entity

A context commonly used and extracted via a pre-defined entity model, such as currency, organization, people, or quantity.

Vocabulary

Vocabulary is used to define or overwrite word meanings. For example, you can assign the synonym “Microsoft” to the acronym “MS”.

NLU Model

A collection of utterance examples and their associated intents and entities that the system uses as a reference to infer intents and entities in a new utterance. The NLU Workbench comes with pre-built NLU models for specific business units, such as an ITSM model. You can also create custom models.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NLU Workbench

Use the NLU Workbench to create morphological representations of human language. These models enable you to create intents and entities expressed in natural language utterances. Any ServiceNow application can invoke an NLU model to get an inference of intents and entities in a given utterance.

Using the nlu_admin role, you build your models in the NLU Workbench, where you create, train, test, and publish them iteratively.

For information on how to build and use an NLU model, see: Create an NLU model.

NLU inference service

Natural Language Understanding provides an NLU inference service that helps the system to understand natural language and drive intelligent actions. This service trains and predicts intents and entities for a given user utterance in your model so that its text translates into machine-understandable formats, such as APIs and parameters.

The system uses an inference API to train NLU algorithms by using sample record data to identify intents and entities that are strong candidates for accurate prediction.

NLU model consumption

Other ServiceNow® applications consume NLU model output, such as Virtual Agent.

For example, Virtual Agent administrators can configure a Virtual Agent Designer conversation flow to consume NLU models so that agent chatbots can better understand user statements in the conversation. For more information on how Virtual Agent consumes NLU models, see: Natural Language Understanding (NLU) topic discovery in Virtual Agent.

Get started

Explore Learn about NLU concepts and features.	Use Create, test, translate, and publish your NLU models.

(Legacy) Exploring Natural Language Understanding

ServiceNow® Natural Language Understanding (NLU) provides an NLU Workbench and an NLU inference service that you can use to enable the system to learn and respond to human-expressed intent. By entering natural language examples into the system, you help it understand word meanings and contexts so it can infer user or system actions.

Natural Language Understanding overview

Starting with the Brazil release, Natural Language Understanding is being prepared for future deprecation. It will be hidden and no longer activated on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support knowledge base.

Natural Language Understanding (NLU) is a component of artificial intelligence natural-language processing that deals with machine-reading comprehension. Predictive Intelligence uses NLU so the system can understand word meanings and word contexts to infer user or system actions..

Natural Language Understanding benefits

Benefit	Feature	Users
Use the NLU Workbench to create models for Virtual Agent and AI Search.	NLU Workbench	NLU Administrator
Build the model's content by adding intents, entities, vocabulary, and test set utterances. Your NLU model content determines how the model responds to user inputs.	Model Management	NLU Administrator
Add a language to an existing NLU model by translating it. Use one of several translation options to add a secondary model in a supported language.	Model Management	NLU Administrator
Virtual Agent administrators can access and update their NLU models from within the Virtual Agent Designer user interface.	Virtual Agent Integration	Virtual Agent Administrator

(Legacy) Activate the NLU Workbench

Activate the following plugins to activate the NLU Workbench.

Before you begin

Role required: admin

About this task

Starting with the Brazil release, Natural Language Understanding is being prepared for future deprecation. It will be hidden and no longer activated on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Activate the following plugins if they aren't already active in your instance.

Plugin	Description
NLU Workbench - Core com.glide.nlu	Installs the required tables for persisting NLU models that are created using the NLU Workbench.
NLU Workbench com.snc.nlu_studio	Enables the creation of Natural Language Understanding (NLU) models. These models can understand the intent (action) and entities (details about the action) for a given user utterance. Any ServiceNow application can invoke an NLU model. Requires the NLU Workbench - Core plugin and the NLU Common Model plugin.
Predictive Intelligence com.glide.platform_ml	Enables the NLU Service APIs used for model creation and inference. Enables the creation of machine learning solutions that are trained on data in your instance. Provides frameworks for classification, similarity, and clustering. A trained solution can be invoked by any application by using a prediction API.
NLU Common Model com.glide.nlu.model	Packages all language NLU common models. Also includes commonly used pattern entities that can be imported and used in any NLU model in the NLU Workbench. Commonly used patterns like email, phone, and ServiceNow specific pattern entities such as INT, RITM are made available. Requires the NLU Workbench - Core plugin.
NLU Active Learning-Properties com.glide.nlu.active_learning_properties	Enables the nlu_admin to configure the system properties for the Expert Feedback Loop application. If you don't use the Expert Feedback Loop application, this plugin is not used and can safely be ignored. For more information about the system properties for the Expert Feedback Loop, see the NLU Expert Feedback Loop documentation.

The following two plugins are for apps associated with a for-fee subscription and are available on the ServiceNow Store. Installing these apps adds additional features to the NLU Workbench. Contact your account manager if you are interested in these apps.

Plugin	Description
(Legacy) Intent Discovery sn_nlu_discovery	Delivers the Intent Discovery feature, which identifies user intents by analyzing incident/case data. Use this application to help identify which intents to model and build for Virtual Agent conversations to attain maximum deflection. For more information, see (Legacy) Install Intent Discovery.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Plugin	Description
(Legacy) NLU Workbench - Advanced Features sn_nlu_workbench	Delivers the Model Performance, Multi-model Batch Testing, Cross-model Conflict Review, and Expert Feedback Loop features. For more information, see (Legacy) Install NLU Workbench - Advanced Features.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the following plugins using the filter criteria and search bar: NLU Workbench - Core (com.glide.nlu), NLU Workbench (com.snc.nlu_studio), Predictive Intelligence (com.glide.platform_ml), and NLU Common Model (com.glide.nlu.model).

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

   Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

(Legacy) NLU Workbench roles

NLU Workbench is installed with these roles.

To learn more about managing per-user subscriptions, see Managing per-user subscriptions in Subscription Management and contact your account representative.

NLU user [nlu_user]

Users who have read access to models in NLU Workbench.

Contains Roles

List of roles contained within the role.

None.

Groups

List of groups this role is assigned to by default.

None.

Special considerations

Important: Avoid granting an admin role when more specialized roles are available.

This role is installed with NLU Workbench - Core. This role does not have access to NLU Model Performance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NLU editor [nlu_editor]

Users who can edit NLU models assigned to them in NLU Workbench.

Contains Roles

List of roles contained within the role.

- import_admin
- sn_ace.ace_user
- nlu_user

Groups

List of groups this role is assigned to by default.

None.

Special considerations

Important: Avoid granting an admin role when more specialized roles are available.

This role is installed with NLU Workbench - Core.

NLU administrator [nlu_admin]

Users who can use NLU Workbench to manage NLU models.

Contains Roles

List of roles contained within the role.

- sn_ace.ace_user
- sn_nlu_workbench.nlu_feedback_admin
- nlu_editor
- nlu_user

Groups

List of groups this role is assigned to by default.

None.

Special considerations

Important: Avoid granting an admin role when more specialized roles are available.

This role is installed with NLU Workbench - Core.

NLU feedback admin [sn_nlu_workbench.nlu_feedback_admin]

Data labelling (NLU feedback) Admin role - to manage data labelling across models also ability to optimize models.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Contains Roles

List of roles contained within the role.

- sn_ace.ace_user
- platform_ml_write
- platform_ml_create
- ml_labeler

Groups

List of groups this role is assigned to by default.

None.

Special considerations

Important: Avoid granting an admin role when more specialized roles are available.

This role is installed with NLU Workbench - Advanced Features. For more information, see (Legacy) NLU Workbench - Advanced Features.

This role is used in Expert Feedback Loop modules. For more information, see (Legacy) NLU Expert Feedback Loop or (Legacy) Issue Auto Resolution Tuning in NLU.

(Legacy) NLU Workbench properties

Refer to these system properties for the Natural Language Understanding (NLU) application.

NLU Workbench properties and their usage

To access your system properties, use the admin or nlu_admin role and the following path in the application navigator: **All** > **NLU Workbench** > **Settings**.

Model Settings

Label and Name	Default value	Plugin	Recommen usage
Maximum number of utterances per intent *glide.nlu.utterances_per_intent.value_limit*	200	NLU Workbench	Use fewer than 200 utterances per intent t keep your model well balanced in terms of intent size.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Model Settings (continued)

Label and Name	Default value	Plugin	Recommen usage
			Note: Value must b greate than 5 and le than o equal 300.
Maximum number of records in a Table vocabulary source *glide.platform_ml.api.max_nlu_lookupsource_records*	100,000	NLU Workbench	Keep the value unde 100,000.
Maximum number of values in a List vocabulary source *glide.nlu.static_lookup.value_limit*	1,000	NLU Workbench	Keep the value unde 1,000.
Enable pre-built vocabulary for software names *glide.mlpredictor.option.nlu.@LookupSources:software*	enabled	NLU Workbench	Enable pre-built vocabulary so the system ca recognize software names.
Enable pre-built vocabulary for hardware names *glide.mlpredictor.option.nlu.@LookupSources:hardware*	enabled	NLU Workbench	Enable pre-built vocabulary so the system ca recognize hardware names.

Advanced Settings

Label and Name	Default value	Plugin	Recommended usage
Maximum number of records for Intent Discovery classification *sn_nlu_discovery.intent_discovery_max_classification_limit*	300,000	Intent Discovery	Keep the number of records less than 500,000.
Minimum number of records for Intent Discovery classification *sn_nlu_discovery.intent_discovery_min_classification_limit*	10,000	Intent Discovery	Use at least 10,000 records to get high quality results.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced Settings (continued)

Label and Name	Default value	Plugin	Recommended usage
Minimum number of records for NLU performance analysis *sn_nlu_workbench.glide.nlu.performance.min_clustering_records*	5,000	NLU Workbench - Advanced Features	Use at least 5,000 records to get high quality results.
NLU Conflict Detection - Moderate Threshold *sn_nlu_workbench.glide.nlu.conflict.moderate_threshold*	.85	NLU Workbench - Advanced Features	Must be a decimal between 0 and 1. Keep this threshold less than the Critical Threshold.
NLU Conflict Detection - Critical Threshold *sn_nlu_workbench.glide.nlu.conflict.critical_threshold*	.95	NLU Workbench - Advanced Features	Must be a decimal between 0 and 1. Keep this threshold greater than the Moderate Threshold.
The maximum number of rows in a batch test import file *sn_nlu_workbench.glide.nlu.batch_test.max_import_rows*	10,000	NLU Workbench - Advanced Features	Make sure your batch test import file has no more than 10,000 rows.
The maximum number of utterances to display for feedback in the expert feedback loop *glide.mlpredictor.option.nlu.activeLearning.label_candidate_table.max_respon*	300	NLU Workbench - Advanced Features	Pull no more than 300 utterances from your users' Virtual Agent chat logs to display for feedback in the Expert Feedback Loop application.The minimum umber of utterances a user should review before tuning the model
The minimum number of utterances a user should review before tuning the model *sn_nlu_workbench.glide.nlu.optimize.min_labeled_data*	100	NLU Workbench - Advanced Features	Provide and save feedback for at least 100 utterances from your users' Virtual Agent chat logs so you can execute the Tune Model feature in the Expert Feedback Loop application.
The maximum number of records to fetch from Virtual Agent chat logs *glide.mlpredictor.option.nlu.activeLearning.va_chat_logs.max_row_limit - 3000*	3,000	NLU Workbench - Advanced Features	If there is high NLU usage, increasing the default value to a maximum of 50,000 records will increase the data available for the active learning job to filter up on and display in the Expert Feedback Loop application to give feedback on.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced Settings (continued)

Label and Name	Default value	Plugin	Recommended usage
Size limit on Label Candidate Table (used for pruning the table) *glide.mlpredictor.option.nlu.activeLearning.label_candidate_table.max_data_s - 10000*	10,000	NLU Workbench - Advanced Features	The recommended usage for this property is the same as the property above.
Size limit on Labeled Data Table (used for pruning the table) *glide.mlpredictor.option.nlu.activeLearning.label_table.max_data_size - 10000*	10,000	NLU Workbench - Advanced Features	The recommended usage for this property is the same as the property above.
Enable this property to unblock your instance during NLU model training. The training will be scheduled for an off-peak time, and we will notify you when it's done. *glide.mlpredictor.scheduled.nlu.model.training*	False	NLU Workbench - Advanced Features	False

To get more feedback data from Virtual Agent (VA) chat logs, refer to the **Procuring additional VA feedback data on demand** section in the Expert Feedback Loop documentation.

(Legacy) NLU language support

The NLU Workbench application provides support for creating NLU models in different languages for use in other applications, such as Virtual Agent.

The platform supports NLU for 17 languages. Ten of these languages available to your models have both intent and entity support; the remaining 7 languages have intent-only support. (Japanese entity support includes character annotation.)

Note: Install the language plugins for languages you want to use in NLU. Installing and activating language plugins ensures that the languages are available in your instance. For more information see Activate a language.

With intent and entity support, NLU can understand sophisticated utterances such as intent-entity relationships, system entities, and user-defined entities. NLU relays this information to Virtual Agent, and the user is usually taken directly to the conversation topic that offers resolution.

With intent-only support, the focus is on intent recognition. With Virtual Agent using NLU, users are directed to the desired conversation topic, where qualifying follow-up questions may be asked before being taken to a topic that offers resolution.

Utterances for all languages are case insensitive during intent prediction.

The following table lists the currently available NLU languages and the features supported for each language.

All languages support intents, vocabulary, batch testing, NLU performance, fast training, and Virtual Agent model use.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NLU feature support by language

Language	NLU feature supported
English	System-defined entities, user-defined entities, vocabulary sources, pre-built vocabulary, intent discovery, conflict review, expert feedback loop, Search model use.
French	System-defined entities, user-defined entities, vocabulary sources, intent discovery, conflict review, Search model use.
Spanish	System-defined entities, user-defined entities, vocabulary sources, intent discovery, conflict review, Search model use.
German	System-defined entities, user-defined entities, vocabulary sources, intent discovery, conflict review, Search model use.
Japanese	System-defined entities, user-defined entities, vocabulary sources, intent discovery, conflict review, Search model use.
Portuguese	System-defined entities, user-defined entities, vocabulary sources.
Swedish	Virtual Agent model use.
Italian	User-defined entities, vocabulary sources.
Chinese (simplified)	Virtual Agent model use.
Brazilian Portuguese	System-defined entities, user-defined entities, vocabulary sources.
Dutch	User-defined entities, vocabulary sources.
French Canadian	User-defined entities, vocabulary sources.
Polish	Virtual Agent model use.
Korean	Virtual Agent model use.
Danish	Virtual Agent model use.
Finnish	Virtual Agent model use.
Norwegian	Virtual Agent model use.

(Legacy) NLU Service updates

Refer to this documentation so you are up to date with changes to the NLU Service.

Service update summary

Starting with the Brazil release, Natural Language Understanding is being prepared for future deprecation. It will be hidden and no longer activated on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

The NLU Service helps the system to understand natural language and drive intelligent actions. This service trains and predicts intents and entities for a given user utterance in your NLU model so it can understand human-expressed natural language, whether spoken or written. The source of this documentation is KB0953693.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This service is updated independently of your instance upgrade, and without any action required by you. These updates are done on a bi-monthly basis (once every two months) to improve the quality of NLU model training and predictions. Major updates are aligned with family releases such as Rome, San Diego, Tokyo, etc. Minor updates are automatically updated so you are using the latest version when you retrain an NLU model. While most of these updates don't impact your existing use of NLU, there may be some changes you need to be aware of.

May 2023 NLU Service update

- Introduced dialog acts to enable natural mid-conversation in Virtual Agent (VA) and improve conversation fluidity. Affirm, negate, and modify dialog acts are supported in English and enabled by default for all new VA topics.
- Migrated all languages to use new language models, boosting average intent prediction quality by 10% across all languages.
- Enabled customers to manage and edit irrelevant utterances for their models to improve irrelevance detection.
- Removed the requirement for a model to have 2 or more intents in the model, making it easier for end-to-end topic testing in VA.

March 2023 NLU Service update

- Improved intent/entity detection through better handling of common words in vocabulary sources.
- Improved latency and memory utilization for system entity (NER) detection.
- Updated version support so that customers will need to use newer versions of the NLU Service and cannot point to n-2 releases older than their current glide version.

January 2023 NLU Service update

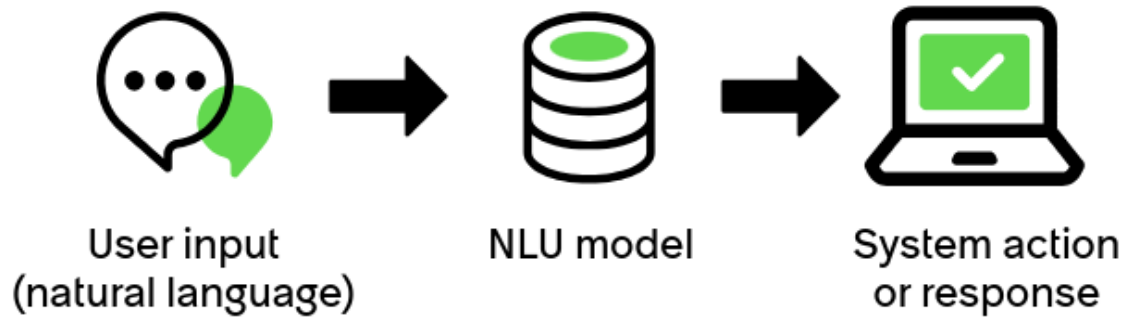
- Created the new DATE-TIME system entity (English only) for use in Virtual Agent.
- Added vocabulary source and entity support (simple, mapped, and open ended) for the Dutch and Italian languages, and system entity support for Portuguese and Brazilian Portuguese.
- Upgraded the ServiceNow Language Model for the Danish, Swedish, Finnish, and Norwegian languages, improving their average prediction quality by 17% from Tokyo.
- Improved the handling of punctuation in entities and special characters in vocabulary sources.
- Incorporated feedback provided on intent predictions by admin users in the NLU Workbench to improve model training data for Virtual Agent.

(Legacy) NLU models

Use NLU models to apply ServiceNow Natural Language Understanding on your instances. Create, manage, test, and publish NLU models with the NLU Workbench.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Overview of how user input is transformed to a system action



A model is a collection of utterances, intents, entities, and vocabulary that the system uses to respond to natural language inputs from your users. The model takes the natural language input from your users and matches it to actions to be performed by the system.

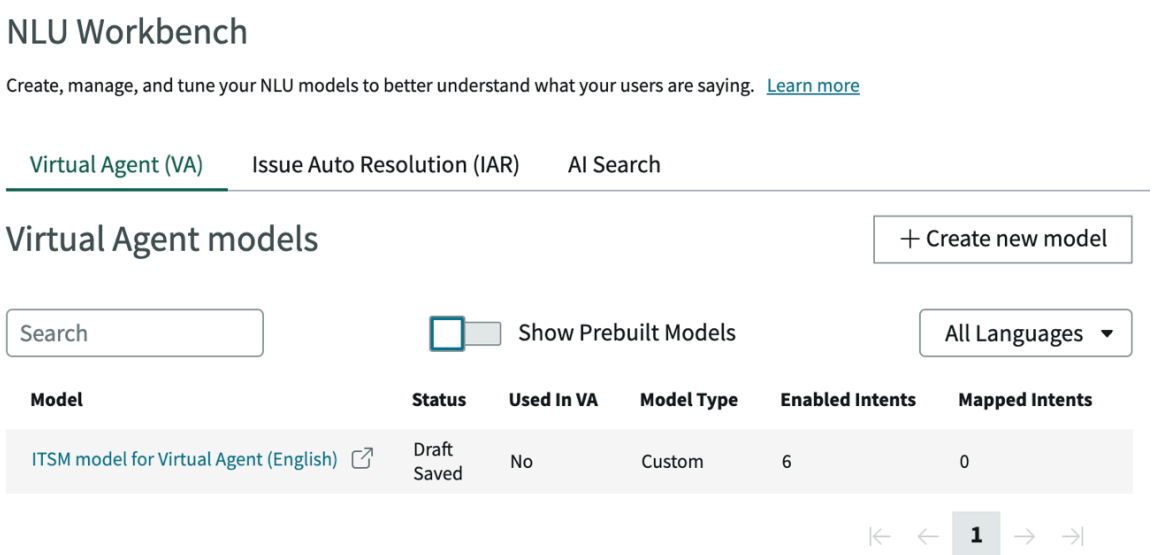
The utterances in your model data are examples of what your users might ask for. These examples are used to train your model to recognize which system actions to perform in response. These system actions are called intents.

Usage, roles, and navigation

Use the nlu_admin role to access the NLU Workbench.

Navigate to **NLU Workbench** > **Models**.

There are three tabs on the NLU Workbench homepage: Virtual Agent, Issue Auto Resolution, and AI Search. The Virtual Agent tab opens by default. Select the correct tab for your application.



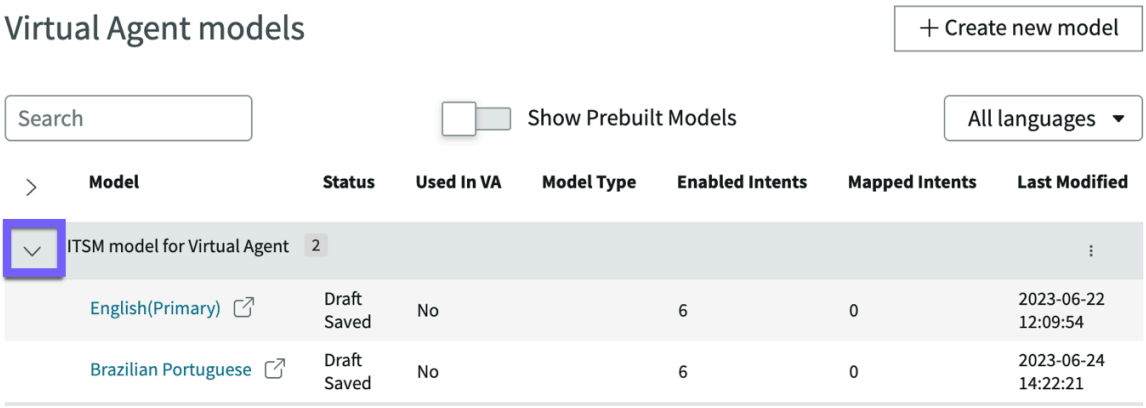
You can use the **Search** field to look for models by name.

The default setting of the **All Languages** filter displays all models regardless of their language. You can filter models by language using the list in **All Languages**. To learn more about the available languages, see (Legacy) NLU language support.

If you have a multilingual grouped model, its row in the list of models has an arrow on the left side. Select the arrow to expand the group so that all language versions of the model are displayed. For more information

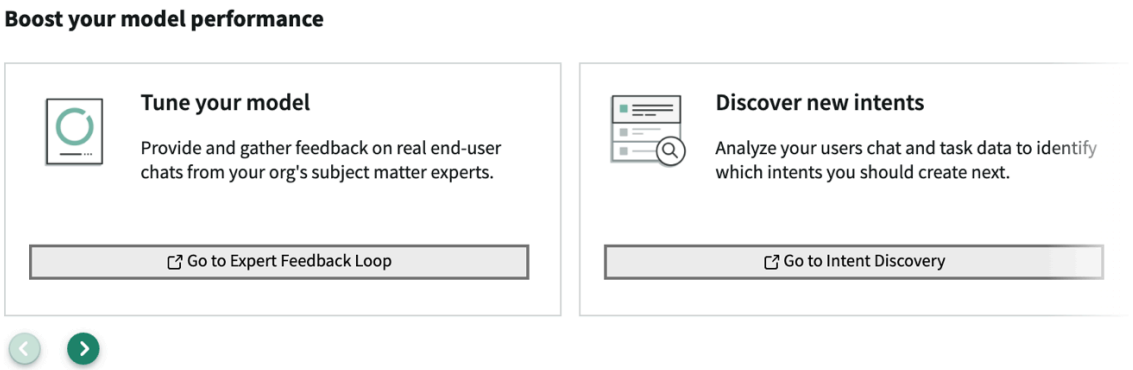
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

on model languages and grouping, see (Legacy) Multilingual model management.



The **Used In VA** column indicates whether a model has already been linked to another application such as Virtual Agent. For AI Search, this column indicates whether the model has already been linked to a Genius Result. Similarly, the **Mapped Intents** column displays a count of intents that have been mapped or linked to Virtual Agent topics.

Scroll down the NLU Workbench homepage to view the **Boost your model performance** section. This section displays cards you can use to access functions that are available to your model type.



Model applications

The output of your NLU models can be consumed by the ServiceNow applications Virtual Agent, Issue Auto Resolution, and AI Search. The NLU Workbench homepage organizes each application's models by tab. In the list of models, different columns are displayed depending on the application.

NLU Models for Virtual Agent

For more information on Virtual Agent, see Virtual Agent.

- The tab for Virtual Agent displays a list of models. Select a model name to open an overview page for that model.
- The **Show Prebuilt Models** toggle is off by default. Switch this toggle on to display read-only models that can be copied and used as the basis for your custom models.
- The **Boost your model performance** section displays a total of 5 cards for functions available to Virtual Agent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NLU Models for IAR

Fewer functions and columns are displayed for IAR than for the other applications in NLU Workbench. This is because the IAR model is prebuilt and is configured in the IAR Admin console.

- When you select the name of your IAR model in NLU Workbench, you are taken to IAR Tuning rather than to a model overview. For more information, see (Legacy) Issue Auto Resolution Tuning in NLU.
- The **Show Prebuilt Models** toggle is not displayed.
- The **Create new model** button is not displayed because the prebuilt model is used directly.
- The section **Boost your model performance** is not displayed.

For more information on setting up IAR, see (Legacy) Using Issue Auto Resolution.

NLU Models for AI Search

- There is one prebuilt model for AI Search. You can copy this model as the basis for a custom model.
- The **Show Prebuilt Models** toggle is on by default.
- The **Create new model** button is available.
- The **Boost your model performance** section displays two cards for functions available to AI Search.

For an introduction to managing AI Search in the NLU Workbench, watch the following video.

For more information, see the AI Search landing page.

What you can do next

To learn more about model content and the model life-cycle, see (Legacy) Model management.

(Legacy) Model management

Manage your NLU model's life cycle in the NLU Workbench. Model management phases guide you through the iterative process of building, testing, and publishing your model.

Bringing your NLU model from creation to deployment requires multiple steps, separated into phases. You can return to earlier phases when you want to adjust and maintain your model.

The phases available for your model depend on the model's application. The system will display a phase, button, or function only when it applies to your model's application.

To use the model management phases, ensure you have all the necessary NLU plugins. For more information, see the following resources:

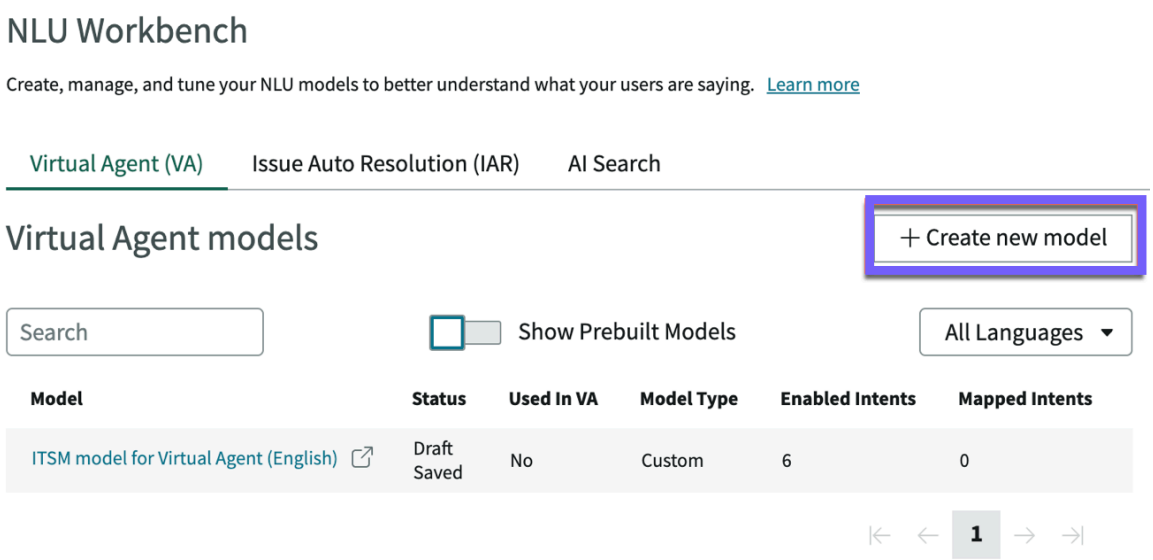
- (Legacy) Activate the NLU Workbench
- (Legacy) Install NLU Workbench - Advanced Features
- (Legacy) Install Intent Discovery

Note: NLU Workbench - Advanced Features and Intent Discovery are available from the ServiceNow Store. NLU model testing and performance monitoring require NLU Workbench - Advanced Features.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a model

To create a model for Virtual Agent or AI Search, navigate to **NLU Workbench** > **Models**. The Virtual Agent tab opens by default. Select the appropriate tab for the model you want to create.



You can choose different ways to create a model:

- **Use prebuilt model**: Copy one of the included read-only models, and add content specific to your business.
- **Import data from CSV**: Upload a CSV file that contains training utterances and matched intents.
- **Start from blank**: Go through the process of setting up a new model from scratch.

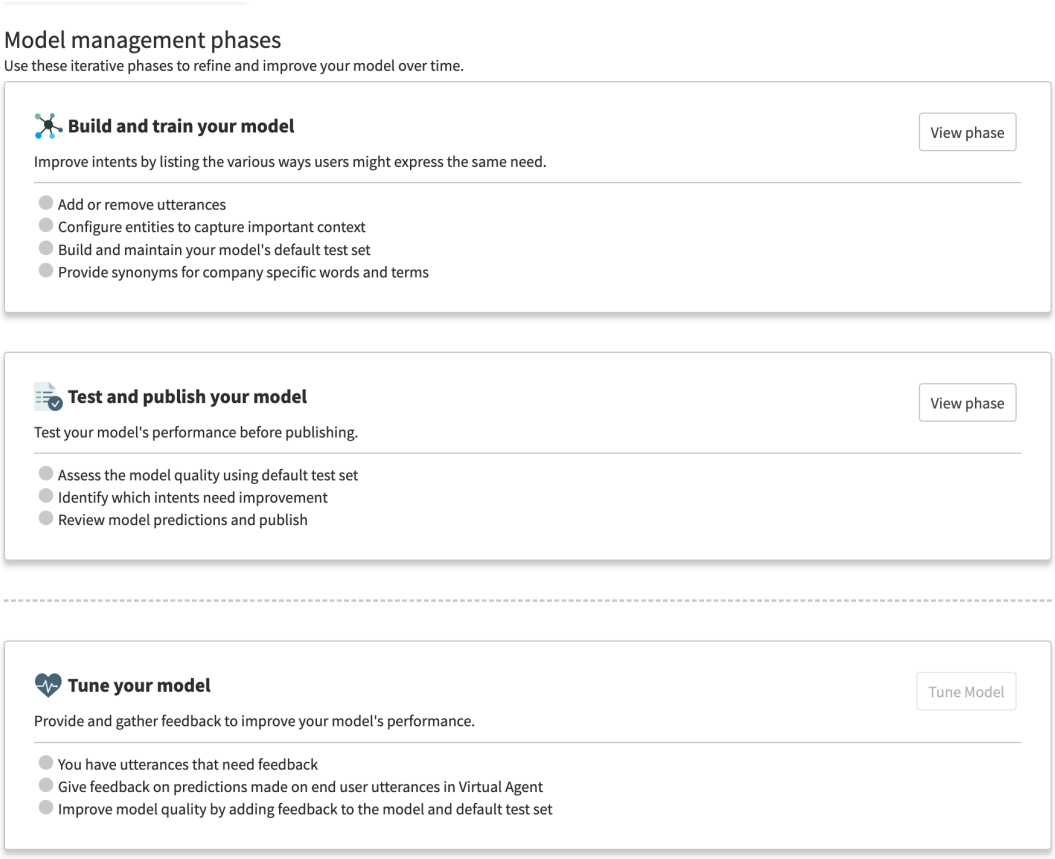
To get started, see (Legacy) Creating models.

Model management phases

After creating a model, access its management phases by navigating to **NLU Workbench** > **Models**. Select the tab for your model's application, then the name of the model to open the **Model details** page on the model overview.

There are three phases on a Virtual Agent model's overview page: Build and train your model, Test and publish your model, and Tune your model. These phases guide you as you build and improve your model.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Build and train your model

Build the model by adding and managing content:

- Intents: Add more intents to broaden the range of user requests that your model can understand.
- Entities: Add more entities so that your model can extract more contextual details from your users' requests.
- Vocabulary: Add vocabulary to enable the model to better understand words and phrases that are specific to your business, such as industry terms and acronyms.
- Test set: Add test utterances and their expected intents to your model's default test set.

To learn more, see (Legacy) Build and train your model.

Train your model using utterances that the model is likely to encounter from your users. To learn more, see (Legacy) Train and try your NLU model.

Test and publish your model

Test your model to gauge the performance and identify areas for improvement.

Note: Model testing requires the NLU Workbench - Advanced Features store application. For more information, see (Legacy) NLU Workbench - Advanced Features.

For more information on testing and thresholds, see (Legacy) Test and publish your model.

When you're satisfied with the results of testing, publish your model to make it available for use by other applications. For more information, see (Legacy) Publish your NLU model.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tune your model

If NLU Workbench - Advanced Features is installed, and your model is created for Virtual Agent, the **Tune your model** phase is enabled. With this phase, you can use **Expert Feedback Loop** to incorporate actual user utterances into your model.

For more information, see (Legacy) Tune your model.

If your model is created for Issue Auto Resolution, you will be taken to IAR Tuning by selecting the name of your model in the IAR tab of the NLU Workbench homepage. For more information, see (Legacy) Issue Auto Resolution Tuning in NLU.

Model settings

Use the **Settings** page of the model overview to change the name and description of the model. You can also modify the confidence threshold of the model. The confidence threshold determines how confident the model must be to predict an intent.

For more information, see (Legacy) NLU model settings.

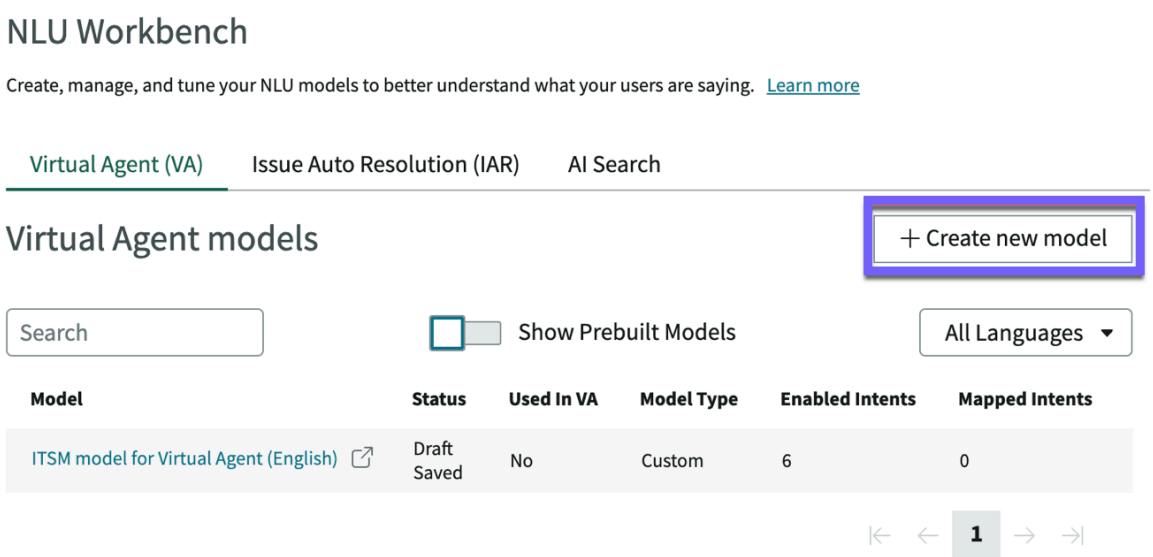
(Legacy) Creating models

Creating models is the first step to taking advantage of Natural Language Understanding (NLU) in your instances. Create models for Virtual Agent and AI Search in the NLU Workbench.

You create NLU models for consumption by the ServiceNow applications Virtual Agent or AI Search.

Note: For Issue Auto Resolution, a prebuilt model is provided for you to configure.

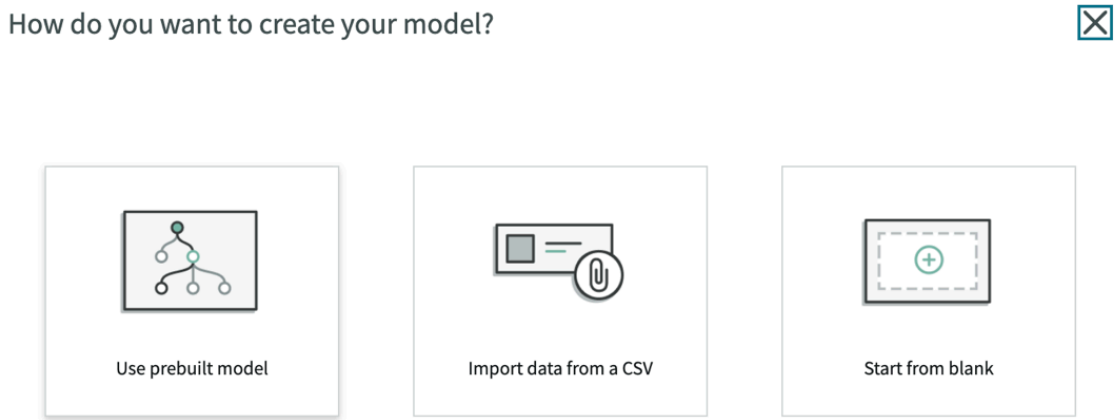
To start creating models, set your scope to the application scope you want for your new model. Then navigate to **NLU Workbench** > **Models**. The Virtual Agent tab opens by default. Select the appropriate tab for the model you want to create.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Model creation

When you select the **Create new model** button, a modal opens to display your model creation options. Start by selecting one of the



icons:

- (Legacy) Create an NLU model using a pre-built model: Copy a prebuilt model and its contents as a starting point for your new model.
- (Legacy) Create an NLU model from a CSV file: Upload a CSV file containing a list of intents and corresponding utterances.
- (Legacy) Create an NLU model from blank: Build a model from scratch and add intents and utterances as you go.

After creating, add content to your model. The intents, utterances, entities, and vocabulary you add helps improve the model's ability to interpret natural language. See (Legacy) Build and train your model.

Duplicating, exporting, and updating

After creating a model, you have options to use that model across other models and instances. With the NLU Workbench, you can perform the following actions with your models:

- (Legacy) Duplicate an NLU model: Copy a model to create a model with the same content.
- (Legacy) Export an NLU model: Export a model as a CSV file containing the associated utterances and intents. Share the model or use it to create one.
- (Legacy) Add an NLU model to an update set: Add a model and its artifacts to an update set to transfer the model across instances.

(Legacy) Create an NLU model from blank

Create a Natural Language Understanding (NLU) model from scratch. Start with an empty model to have full control over the model's content.

Before you begin

- Make sure that the NLU Workbench plugin, NLU Workbench - Core plugin, and Predictive Intelligence plugin are all installed and activated on your instance.
- You can create NLU models for Virtual Agent and AI Search.
- Role required: nlu_admin or admin

About this task

In this example procedure, you're building an NLU model to help Virtual Agent understand human-expressed intent regarding Human Resources.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

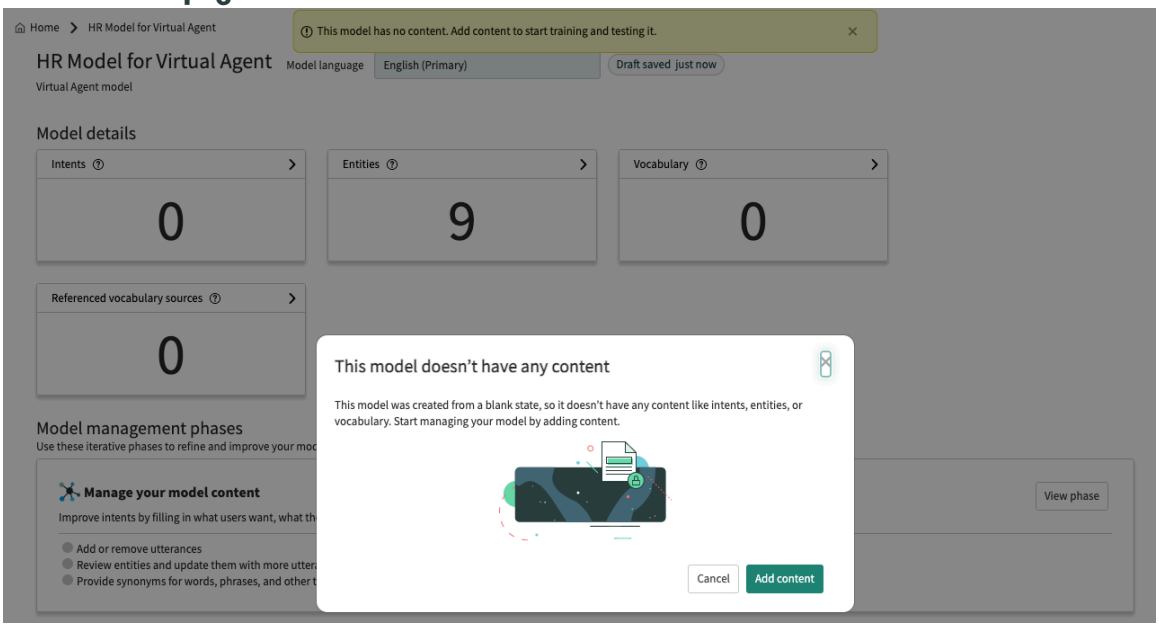
1. Set your scope to the application scope you want for your model.
2. Navigate to **All** > **NLU Workbench** > **Models**.
   The Virtual Agent tab opens by default.
3. Select the tab for the type of model you want to create, such as AI Search.
4. Select the **Create new model** button.
5. In the **Add some details** window, select the **Start from blank** button.
6. In the define details page, enter a unique **Name** and **Short description**.

   In this example scenario, you enter `HR Model for Virtual Agent` for the name and `Natural language for Human Resources user requests` for the description.
7. Select the language and purpose from the drop-down lists.
   In this example scenario, select `English` and `Virtual Agent`.
8. **Optional:** Select a business area for your model.
9. Select **Next**.
   Your model starts building. When complete, select **View model** to open the **Model details** page for your new model.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

Model details page



Your new model contains no content. Select **Add content** to begin adding intents, entities, and vocabulary. For more information, see (Legacy) Build and train your model.

Add test utterances and intents to build the model's default test set. For more information, see (Legacy) Test set creation and management.

(Legacy) Create an NLU model from a CSV file

Upload a CSV or XLSX (Excel Workbook) file containing utterances and their intents to create a Natural Language Understanding (NLU) model. Use this method to quickly create models from your data or other exported models.

Before you begin

- Make sure that the NLU Workbench plugin, NLU Workbench - Core plugin, and Predictive Intelligence plugin are all installed and activated on your instance.
- You can create NLU models for Virtual Agent and AI Search.
- Role required: admin or nlu_admin

About this task

In this example procedure, you're building an NLU model to help Virtual Agent understand user requests regarding calendars.

In a CSV file, you've listed the intents and utterances in two columns.

Sample CSV setup

Intent	Utterance
schedule	when is my next meeting
schedule	what time is my next meeting
schedule	schedule a meeting for 11am
schedule	cancel my 4:30 meeting

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sample CSV setup (continued)

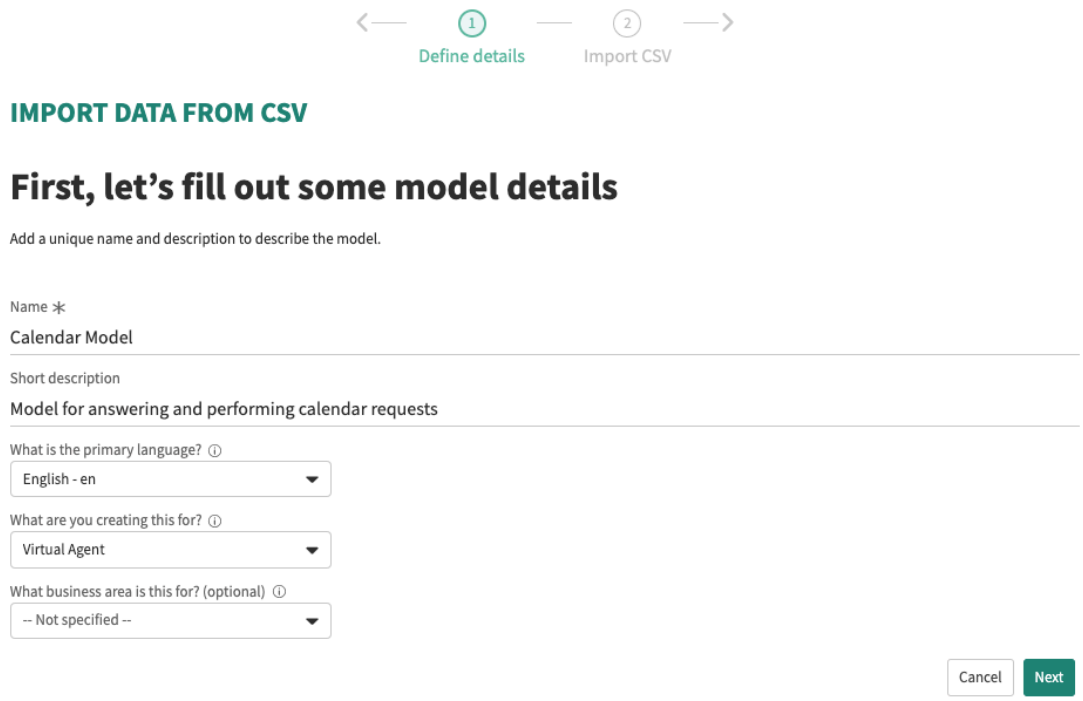
Intent	Utterance
holiday	when is the next holiday
holiday	do we get Black Friday off
timeoff	request friday off
timeoff	how many PTO days do i have

Note the following for creating NLU models by CSV import:

- A model needs at least 1 intent with a minimum of 5 training utterances in each intent. For optimum performance, aim to have 15 training utterances per intent.
- Utterances should not contain a comma.
- Importing with a CSV file does not preserve entities. Make sure to annotate utterances as needed after importing.

Procedure

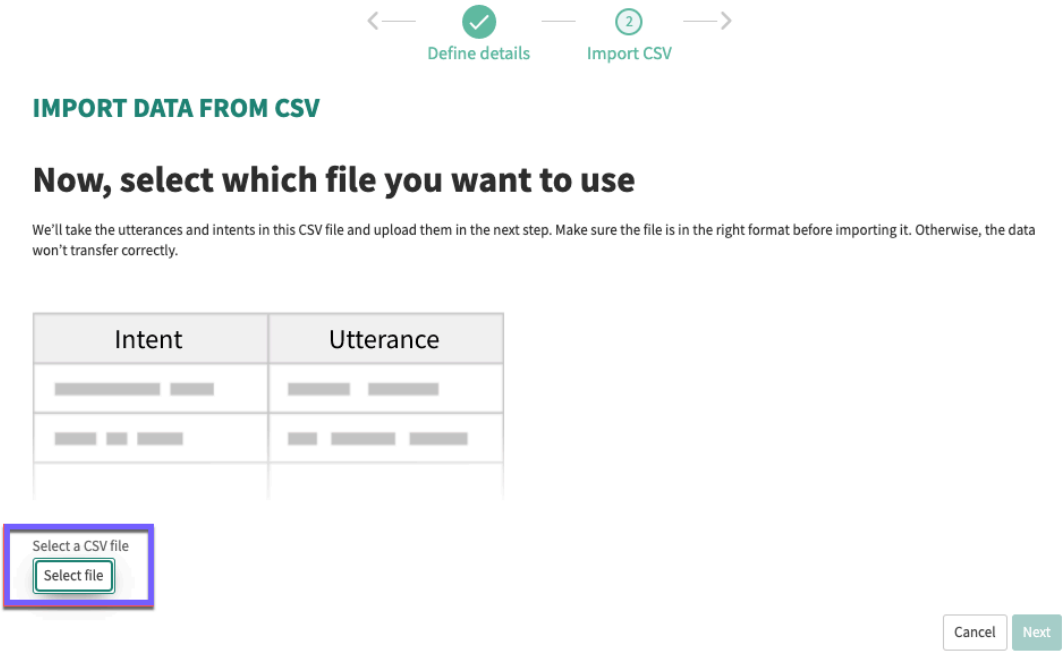
1. Set your scope to the application scope you want for your new model.
2. Navigate to **All** > **NLU Workbench** > **Models**.
   The Virtual Agent tab opens by default.
3. Select the tab for the type of model you want to create, such as AI Search.
4. Select the **Create new model** button.
5. In the **How do you want to create your model?** window, select **Import data from a CSV**.
6. In the **Add some details** window, add the **Name** and **Short description** for the model.



In this example scenario, you enter `Calendar Model` for the name and `Model for answering and performing calendar requests` for the short description.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Select the language and purpose from the drop-down lists.
   In this example scenario, you select `English` and `Virtual Agent`.
8. Select **Next**.
9. On the **Import CSV screen**, select **Select file**.



10. Choose the CSV or XLSX (Excel Workbook) file from the pop-up.
11. Select **Next**.
    Your model starts building. After completion, select **View model** to open the model details page.

What to do next

Add intents and training utterances to continue building the model. Add entities and vocabulary to help the model understand inputs from your users. For more information, see (Legacy) Build and train your model.

Add test utterances and intents to build the model's default test set. For more information, see (Legacy) Test set creation and management.

(Legacy) Create an NLU model using a pre-built model

Use the prebuilt Natural Language Understanding (NLU) models in the NLU Workbench to create a new one.

Before you begin

- Make sure that the NLU Workbench plugin, NLU Workbench - Core plugin, and Predictive Intelligence plugin are all installed and activated on your instance.
- You can create NLU models for Virtual Agent and AI Search.
- Role required: nlu_admin or admin.

About this task

In this example procedure, you're building an NLU model based on the prebuilt HR NLU for VA model. You base your model on the prebuilt model, then edit or add to the model content to meet your business requirements.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Your new model contains intents, entities, and vocabulary from the prebuilt model. The new model also contains an empty default test set, ready to be populated with test utterances.

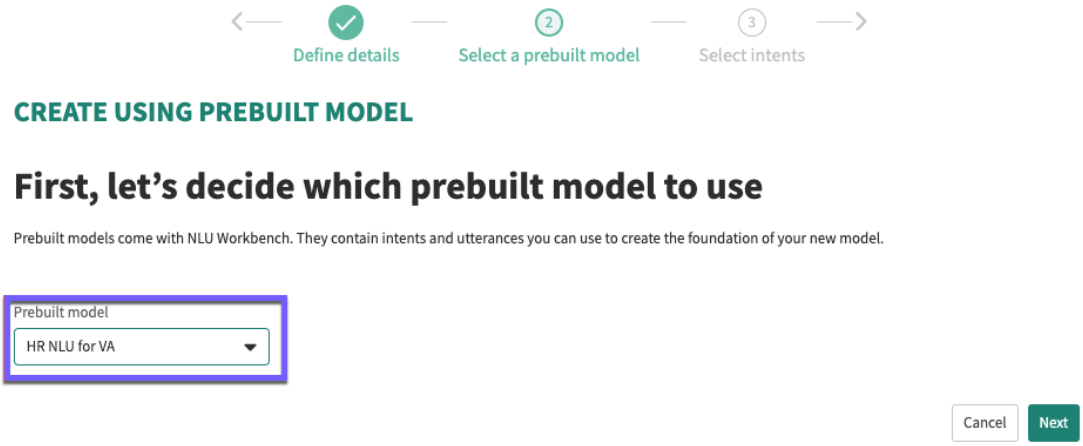
Procedure

1. Set your scope to the application scope you want for your new model.
2. Navigate to **All** > **NLU Workbench** > **Models**.
   The Virtual Agent tab opens by default.
3. Select the tab for the type of model you want to create, such as AI Search.
4. Select the **Create new model** button.
5. In the **How do you want to create your model?** window, select **Use prebuilt model**.
6. On the **Add some details** window, fill in the **Name** and **Short description** for the model.

   In this example scenario, you enter `Human Resources VA Model` for the name and `Virtual Agent Model for responding to HR Requests` for the short description.

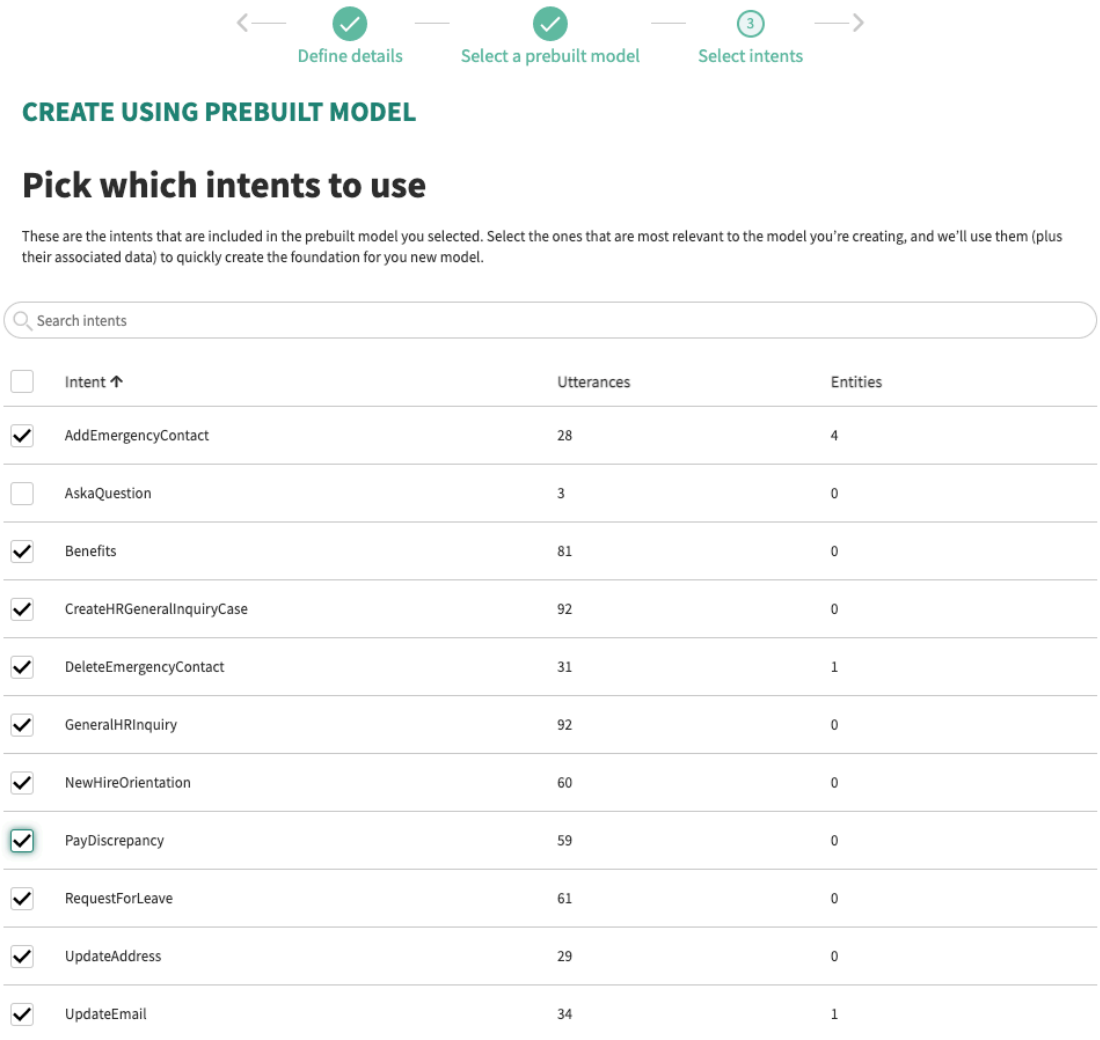
7. Select the language and purpose from the drop-down lists.
   In this example scenario, you select `English` and `Virtual Agent`.
8. **Optional:** Select the business area for the model.
   In this example scenario, you select HR.
9. Click **Next**.
10. Select the prebuilt model from the drop-down list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



In this example scenario, you select HR `NLU for` VA.

11. Select **Next**.
12. On the **Select intents** screen, select the prebuilt intents to add to your model.



Intent	Utterances	Entities
AddEmergencyContact	28	4
AskaQuestion	3	0
Benefits	81	0
CreateHRGeneralInquiryCase	92	0
DeleteEmergencyContact	31	1
GeneralHRInquiry	92	0
NewHireOrientation	60	0
PayDiscrepancy	59	0
RequestForLeave	61	0
UpdateAddress	29	0
UpdateEmail	34	1

In this example scenario, you select 10 intents from the list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: You can select all the prebuilt intents by checking the **Intent** box at the top of the list.

13. Select **Next**.
    Your model starts building. After completion, select **View model** to open the **Model details** page for your new model.

What to do next

Add more intents and training utterances to continue building the model. Update entities and vocabulary to help the model understand inputs from your users. For more information, see (Legacy) Build and train your model.

Add test utterances and intents to build the model's default test set. For more information, see (Legacy) Test set creation and management.

(Legacy) Duplicate an NLU model

Duplicate an existing Natural Language Understanding (NLU) model to create a new one. Duplicating a model copies the settings and contents of the original model, including its default test set.

Before you begin

- Make sure that the NLU Workbench plugin, NLU Workbench - Core plugin, and Predictive Intelligence plugin are all installed and activated on your instance.
- Identify an existing NLU model to copy from. The source model should have the language and purpose you want for the new model. If a suitable model does not exist, create and train one.
- Role required: nlu_admin or admin.

About this task

In this example procedure, you've already created a model that's titled NLU for Access Requests. You want to customize it for another department. You duplicate the model to create a new, separate model. To customize the new model, you then add content related to the other department.

Procedure

1. Set your scope to the scope of the model you want to create.
   After creation, these model settings cannot be changed: language, purpose, scope.
2. Navigate to **All** > **NLU Workbench** > **Models**.
3. On the far right column of the model list, select the **More options** menu for the model you want to duplicate.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select **Duplicate this model**.
5. In the **Duplicate this Model** window, enter a name and description for the new model.

In this example scenario, you enter `NLU for Access Requests Copy1` for the description.

6. Click **Duplicate**.
The system duplicates the model. The **Model details** page loads for your new model.

What to do next

You can customize the new model by adding new content to it. Train, test, and publish the new model. For more information, see (Legacy) Build and train your model.

To duplicate an entire model group, or one of the models in a group, see (Legacy) Multilingual model management.

To transfer a model to a different instance, see (Legacy) Add an NLU model to an update set.

(Legacy) Export an NLU model

Export a Natural Language Understanding (NLU) model to create a CSV file of the intents and utterances. You can then use the CSV file to edit, share, and import.

Before you begin

- Make sure that the NLU Workbench plugin, NLU Workbench - Core plugin, and Predictive Intelligence plugin are all installed and activated on your instance.
- Role required: nlu_editor, nlu_admin, or admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Exporting an NLU model creates a CSV file. The file contains a table of the utterances from the model and the matched intents. The data comes from the **Utterances** tab for each intent in the model.

Note: The file doesn't contain the sources of the utterances. Also the file doesn't transfer entities or vocabulary associated with the model. To export all model data, see (Legacy) Add an NLU model to an update set.

Procedure

1. Navigate to **All** > **NLU Workbench** > **Models**.
   The Virtual Agent tab opens by default.
2. Select the tab for your model's application, and find your model in the list.
3. Scroll to the far right column of your model's row, and select the more options menu of the model you want to export.

4. In the more options menu, click **Export model as CSV**.
   The model CSV file downloads to your browser.

What to do next

You can use the CSV file to share the model or edit the utterances. You can also create a model by importing the CSV file. For more information, see (Legacy) Create an NLU model from a CSV file.

(Legacy) Add an NLU model to an update set

Use update sets to move your Natural Language Understanding (NLU) models from one instance to another. Update sets include all records needed for your model to function on the target instance.

Before you begin

- Make sure that the NLU Workbench plugin, NLU Workbench - Core plugin, and Predictive Intelligence plugin are all installed and activated on your instance.
- The following instructions apply to NLU models for Virtual Agent and AI Search.
- Role required: admin

About this task

Use update sets to transfer a model from a source instance to a target instance. The target instance must already have the same scope as the model's scope in the source instance.

Adding a model to an update set includes the following resources:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Model content (intents, utterances, entities, annotations, vocabulary, and the default test set)
- Associated vocabulary sources
- Corresponding latest active ML solution
- ML model artifacts
- ML solution and definition (last three runs, provided one of them was successful)

For more information on update sets, see System update sets.

If you want to add the model to a different update set, you must make that update set the current one. See Create and select an update set as the current set.

For optimum portability, add your NLU model to a new, dedicated update set rather than to a system Default update set. To do this, a new update set must be manually created in the model's scope. An error is displayed if the current update set is the scope's Default. This error contains a link for manually creating a new update set.

If the model contains records from multiple scopes, such as vocabulary tables, its update set must have a parent-child (batch) structure. Follow the procedure from step 5 to create a parent-child update set.

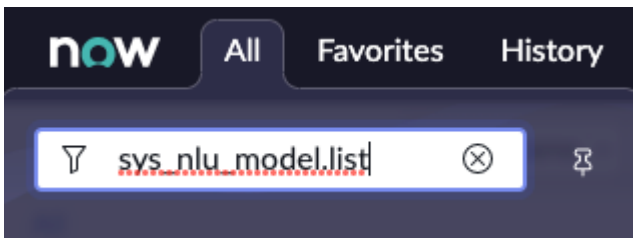
When models (either Global or scoped) are moved using update sets, their training and publishing state remains the same after transfer. So a model that is trained and published before it is added to an update set does not require retraining or republishing on the target instance.

For information about parent-child update sets, see Working with batched update sets. The following video provides a demonstration of this process.

A video walkthrough of migrating NLU models by update sets in the Vancouver release.

Procedure

1. Select **All** and enter `sys_nlu_model.list` into the navigator.



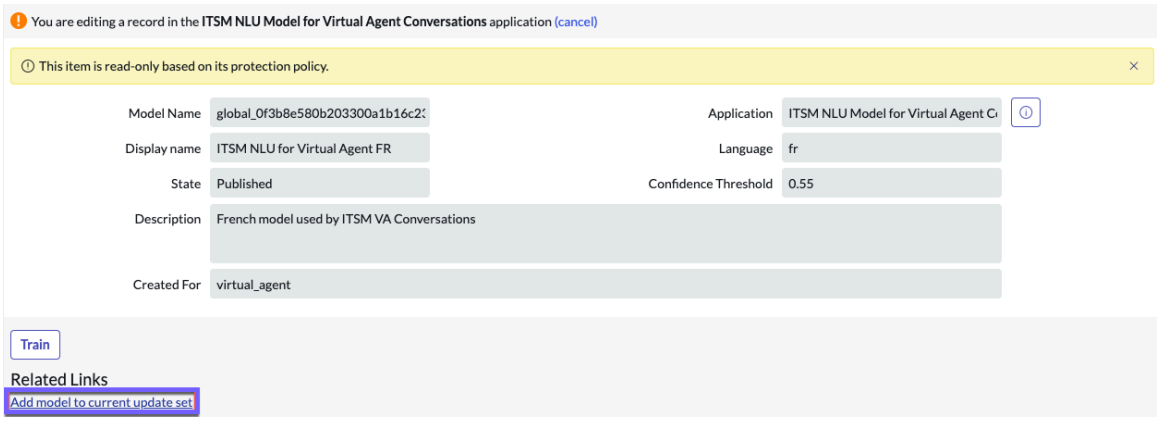
2. Select the **Model Name** of the model.

   The **Display name** is the name you gave the model when creating it. The **Model name** is given to the model by the system.

3. **Optional:** If Global is your current application, follow the prompt at the top to edit the record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

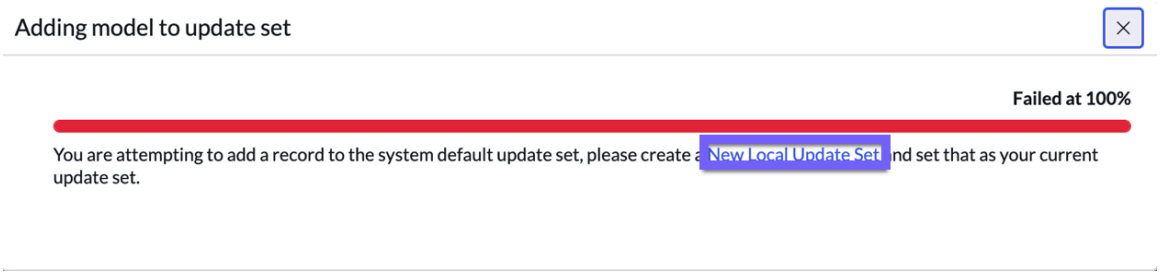
(Optional) 
4. In the **Related Links** section, click **Add model to current update set.**



If the model's records are all in one scope, the system adds the model to the current update set. Once completed, the record can be found in the sys_update_set table.

However, the system displays an error if the designated scope is the Default scope. Continue with the following steps.

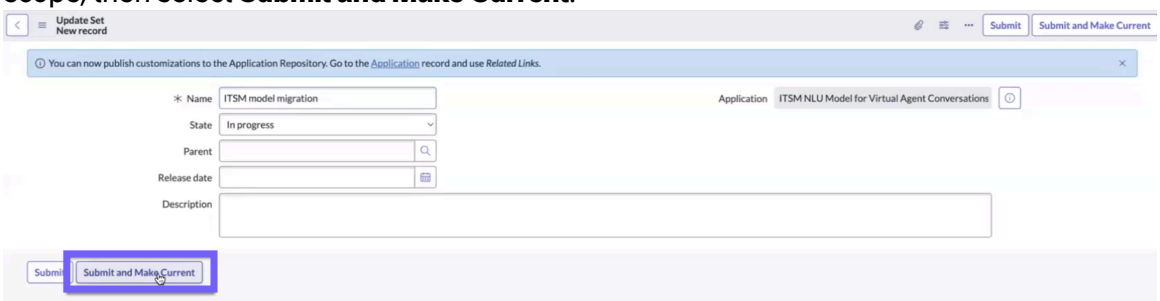
5. If the system displays the error **You are attempting to add a record to the system default update set**, continue with the remaining steps in this procedure.



In the error banner, select the **New Local Update Set** link to create a new update set which is not Default. In the case of a parent-child update set, the parent is first created in the model's scope. (Any child update sets are created in a later step).

New Local Update Set opens a new record in the sys_update_set table.

6. For the new update set record, provide a name, review other values including Application scope, then select **Submit and Make Current**.



A new update set is created, and the screen re-opens to the model's record in the sys_nlu_model table.

7. In the model's record in sys_nlu_model, select **Add model to current update set** under **Related Links**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When the model's records are in multiple scopes, this step creates child update sets that have Global scope.

> **Note:** If the model's records are all in one scope, the system adds the model to the current update set. Once completed, the record can be found in the sys_update_set table.

8. If the model is in a non-Global scope: In the Update Sets table sys_update_set, locate the parent update set and its child update sets (refresh the page if necessary).
   - The parent update set has the value **(empty)** in the Parent column.
   - Child update sets have the name of the parent in the Parent column, and **Global** in the Application column.
   - Both parent and child update sets contain the same value in the Batch Base column.
9. Open the parent's record in sys_update_set and set the **State** field to `Complete`.
   A Confirmation dialog box pops up. Select `Yes` to confirm. This sets the parent and all child update sets to Complete.
10. To migrate the update set file, select **Export Update Set Batch to XML** in the parent's record in sys_update_set.
    The parent and child update sets are packaged together and exported.

What to do next

In the target instance, navigate to **Retrieved Update Sets** and select **Import Update Sets from XML**. When unpackaged, the parent and all children will be listed in the Retrieved Update Sets table. Open the parent and select **Preview Update Set Batch**.

If a referenced record in the source instance is not present on the target instance, you may encounter errors while applying the update set. For example, the origin field on sys_nlu_intent could refer to an intent from a different model that doesn't exist on the target instance. You can select **Accept remote update** on the failed records to commit the update set anyway.

(Legacy) Delete an NLU model

Delete a Natural Language Understanding (NLU) model permanently.

Before you begin

Role required: admin or nlu_admin

About this task

Deleting an NLU model removes the model and its contents, including its default test set, from the system. You cannot delete a model if it meets any of the following criteria:

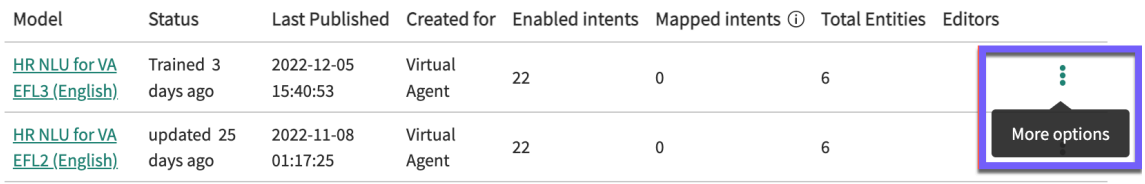
- The model is pre-built
- The model contains at least one intent that is mapped to a Virtual Agent topic

> **Warning:** Deleting a model cannot be undone.

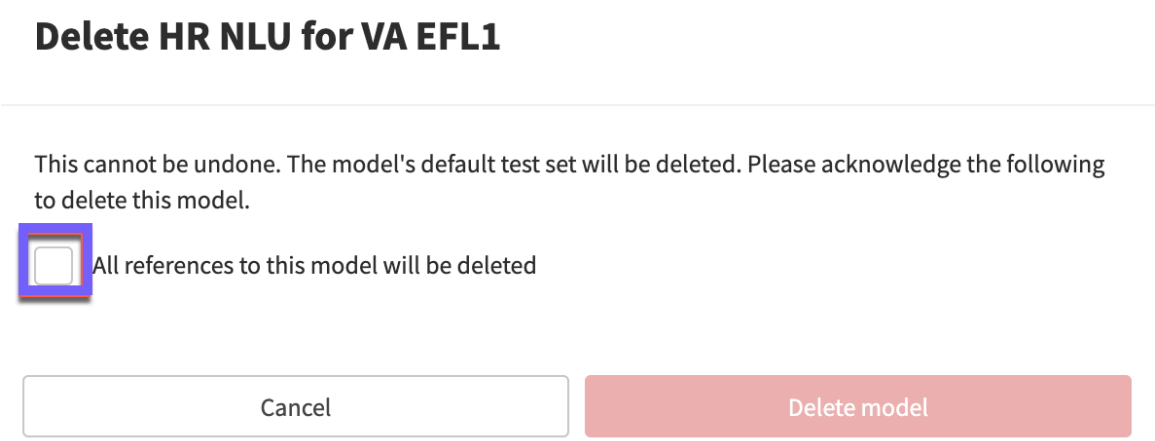
Procedure

1. Set your scope to the scope of the model you want to delete.
2. Navigate to **All** > **NLU Workbench** > **Models**.
3. On the far right column of the model list, select the more the **More options** menu for the model you want to delete.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Select the option to **Delete this model**.
5. Select the check box to acknowledge that all references to this model will be deleted.



6. Select **Delete model**.
   The system deletes your model and reloads the page.

(Legacy) Build and train your model

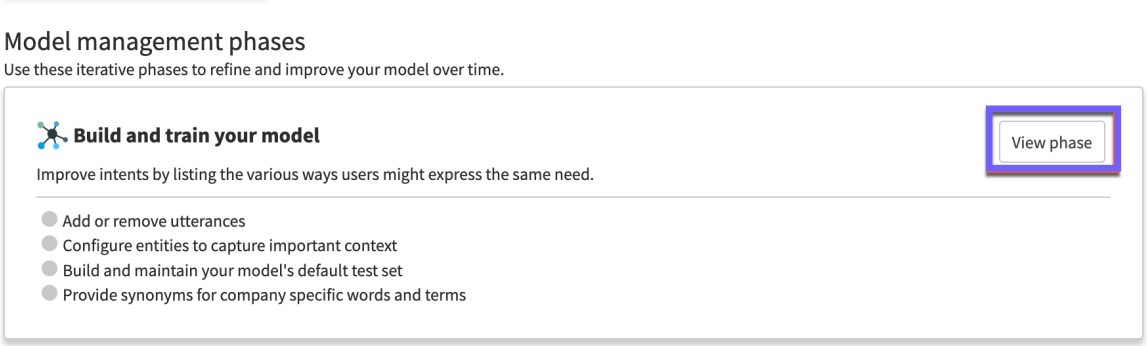
After creating a model, build the model's content by adding intents, entities, vocabulary, and test set utterances. Your NLU model content determines how the model responds to user inputs.

Models are made up of the following content:

- Intents: An action the user wants to do or wants the application to do.
- Entities: Object or context for an action.
- Vocabulary: Add vocabulary to help your model understand the range of words in your users' utterances.
- Test set: To assess model performance, add test utterances and the intents that you expect to be predicted for those utterances.

To access the model content, navigate to **NLU Workbench** > **Models**. The Virtual Agent tab opens by default. Select the tab for your model's application and then select the name of the model to open the **Model details** page. In the **Build and train your model** card, select **View phase**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Intents

When your model receives user input, it uses an intent to perform a system action. For example, a user types in `I have a critical issue with a slow laptop`. The model matches the utterance input to the intent #TroubleshootSlowComputer. If the intent is linked to a Virtual Agent topic, it triggers further action.

Intents contain training utterances, or examples of user inputs that would trigger the system action. Provide realistic utterances that the model might encounter from your users. The quality of training utterances affects the accuracy of your model.

For more information, see (Legacy) NLU intents.

Entities

Your intents use entities to provide additional context for the model when receiving inputs. In the computer example, the laptop is the entity, or object of, the action.

NLU entities fall into two categories: system-defined and user-defined. System entities such as DATE, TIME, and LOCATION are available by default in your instance. You can create your own user-defined entities to provide additional associations and meaning for your business requirements.

All entities are reusable across other NLU models. However, you must add them to a training utterance for each model to use them.

For more information, see (Legacy) NLU entities.

Vocabulary

Your users' input may contain a wide variety of words and phrases. Also, your model may not understand some terms used in specialized domains or business areas.

To improve your model's ability to understand a wide range of user input, you can define synonyms by creating vocabulary items.

For example, your model includes an entity for the term computer. When a user types in `I need a new computer`, the model knows how to respond. However, if a user enters `laptop` or `workstation`, the model might fail to predict the intent. You can add vocabulary to the model to train it to understand synonyms and variations.

You can also use tables and lists as vocabulary sources. Your models can look up the vocabulary sources when predicting intents.

For more information, see (Legacy) NLU vocabulary.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Test set

Your model contains a default test set that you can use to evaluate the model's performance. Initially the test set is empty, ready to be populated with your content. Add test utterances and their expected intents to build the test set.

For more information, see (Legacy) Test set creation and management.

Test panel

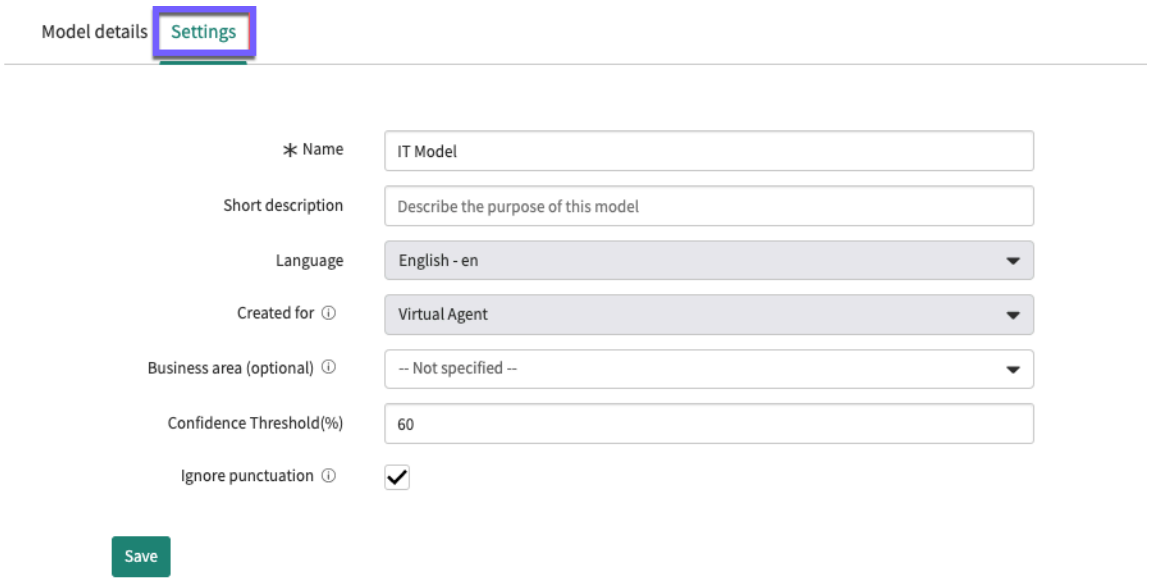
Access the test panel by clicking **Train model** or **Try model** in the **Build and train your model** phase. Training incorporates new content into your model. With **Try model**, you can manually enter individual utterances to test what intents the model predicts for them.

For more information, see (Legacy) Train and try your NLU model.

You can also use the test panel to provide feedback on your model's predictions. Your feedback helps improve intent prediction. See (Legacy) Test panel feedback.

Settings

Use the **Settings** tab to edit the name, short description, and confidence threshold of the model. You can't change the language or purpose of the model.



For more information on the confidence threshold, see (Legacy) Test and publish your model. For more information on Settings, see (Legacy) NLU model settings.

(Legacy) NLU intents

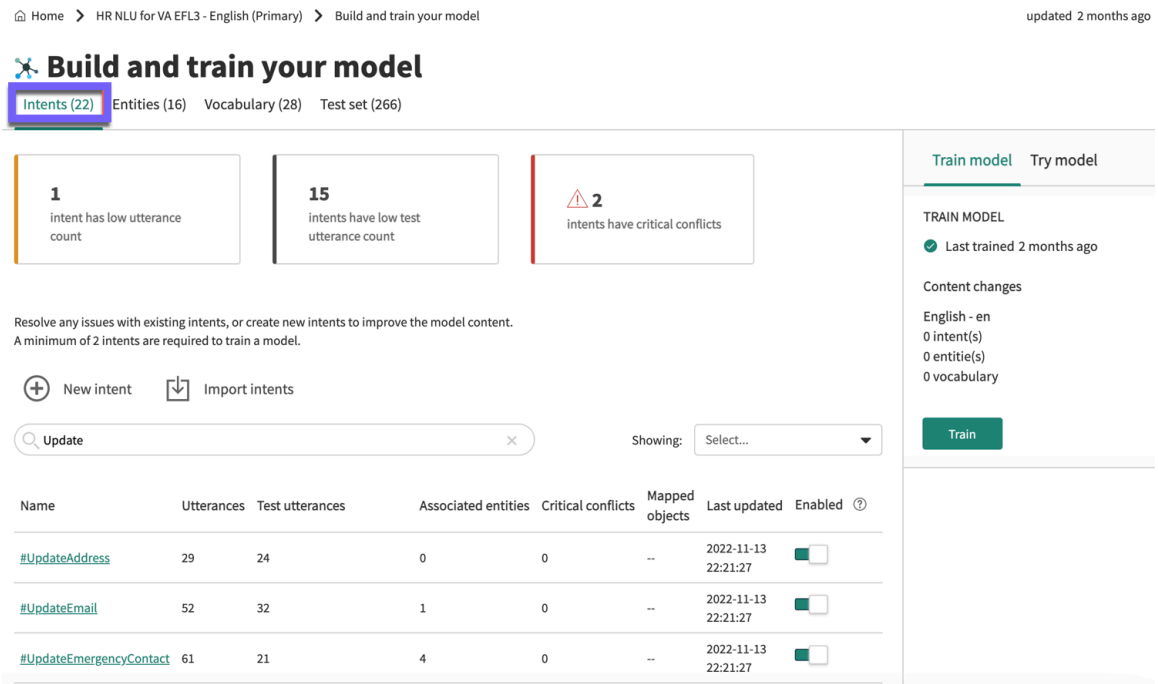
Intents drive your models' responses by matching a system action to user inputs. Models with good intents help Virtual Agent and Search respond to your users accurately.

Think of intents as the core that drives the comprehension of natural language. Intents help the models translate utterances from your users into actions that the system can perform. Intents perform best if your utterances, entities, and vocabulary work together to support your model. Using vocabulary and realistic utterance examples can help the system to be more accurate when predicting intents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When creating your Natural Language Understanding (NLU) model, you add intents to match user inputs with system actions. The more intents that a model has, the more actions it can take when it receives utterances from your users. Model intents can perform various actions, from creating hardware service requests to adding users to groups.

To access your model's intents, navigate to a model's overview page. In the **Build and train your model** phase, select **View phase**. The **Intents** tab shows by default.



A model can contain up to 750 intents. However, models with over 300 intents or 4500 utterances, whichever comes first, take longer to train, test, and publish.

Note: As you create intents, keep in mind that they can sometimes impact each other. For example, you build and test an intent that works on one or two utterances. But when you test it in a larger intent environment, it might behave differently. To reduce the likelihood of such an event, you may want to create at least five intents in a model before you start proper testing.

To start adding content to your model, see (Legacy) Create an NLU intent.

The **Enabled** column shows whether or not the intent is active in predictions. An NLU admin can deactivate an individual intent but keep it in the model.

However, if an intent is mapped to a published Virtual Agent topic:

- You cannot deactivate the intent.
- You cannot delete the intent.

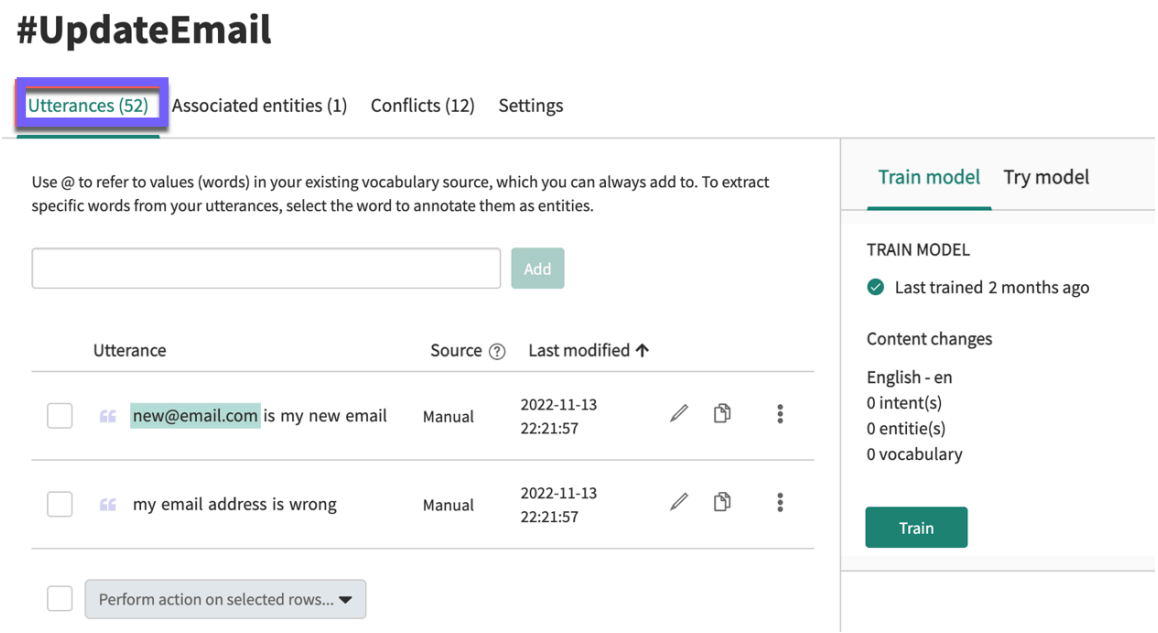
After changing the **Enabled** status of an intent, retrain the model.

Utterances

Intents contain training utterances, which are examples of inputs that the model may see from your users. Each intent in a model has its own utterances. When trained, the model learns to recognize similar utterances from your users and then respond with the matching intent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Select an intent to access the intent details page. The **Utterances** tab lists all the utterances currently in the intent.



After adding utterances, you can edit, copy, move, or delete the utterances using the icons in the right column. You can move or delete multiple utterances by selecting the box on the left first and using the **Perform action on selected rows** button.

Here are some things to consider when adding utterances to intents:

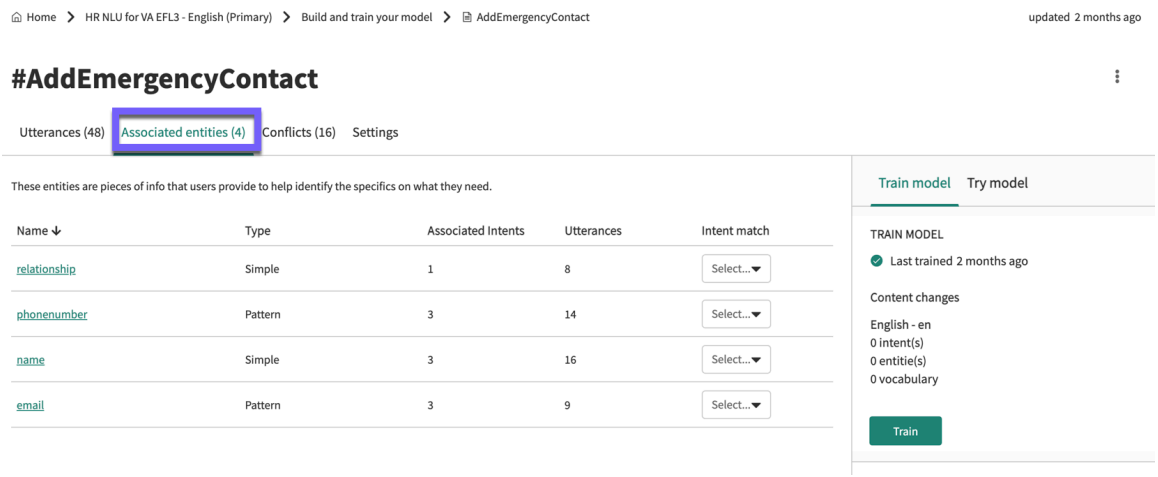
- A model must have at least 1 intent, with a minimum of 5 utterances in each intent.
- An intent needs at least 5 utterances to begin training.
- The system currently supports utterances up to 25 words or 200 characters. Utterances that exceed that limit fail to return an intent prediction.
- The system currently supports up to 20,000 utterances in a single model.
- Models with more than 4,500 utterances take longer to train, test, and publish.

Provide vocabulary for any words or phrases that are relevant to your organization or domain when adding utterances to your model. The vocabulary helps with intent prediction for words and phrases that your users are likely to use. You can use the @ symbol when adding an utterance to call on a vocabulary source. For more context and examples, see (Legacy) NLU vocabulary.

Associated entities

Your model uses entities to provide additional context and meaning when predicting user input. You add entities to the training utterances of your intent to provide the system with more information to perform the intended action.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

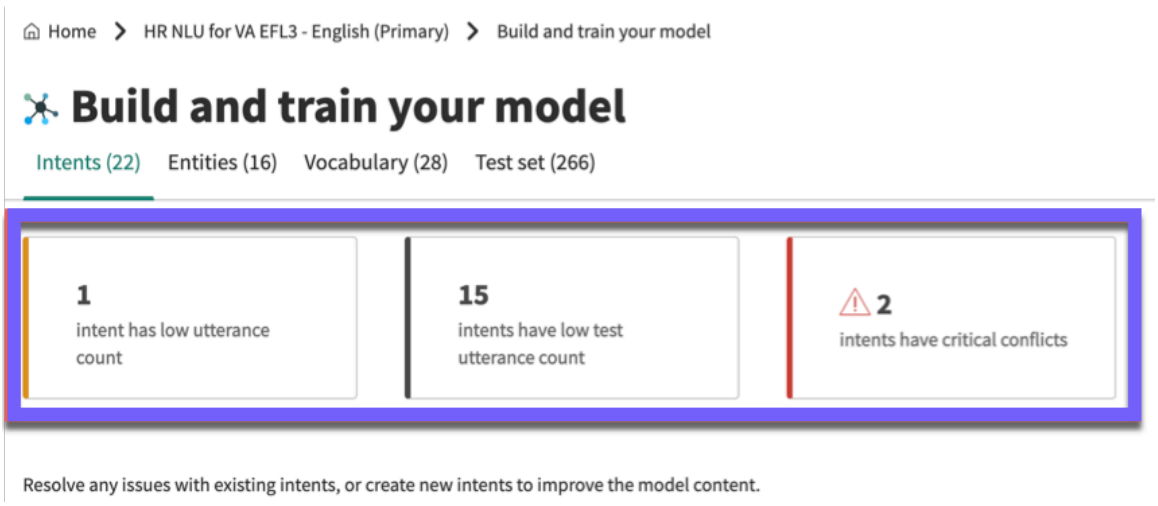


For more information, see (Legacy) NLU entities.

Intent issues

Building large models increases the chance that intents overlap, conflict, or fail to contain enough training utterances. For example, the utterance examples in one intent may end up identical to the examples in another intent. If your intents conflict, the model may not know which intent to predict when receiving user input.

If your model has issues or conflicts, the **Intents** page displays cards showing the number of intents affected.



Select a card to see a filtered list of intents with that issue. Resolving issues ensures that your intents meet the requirements and work as intended.

For more information, see (Legacy) Resolve intent issues.

(Legacy) Create an NLU intent

Create an intent for your Natural Language Understanding (NLU) model. Intents provide your model with a system action to perform when it receives user input.

Before you begin

- Make sure that the NLU Workbench plugin, NLU Workbench - Core plugin, NLU Workbench - Advanced Features plugin, NLU Common Model plugin, and Predictive Intelligence plugin are all installed and activated on your instance.
- Ensure that you are in the same application scope as your model.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- You can create intents for Virtual Agent and AI Search models in NLU Workbench.
- Role required: admin or nlu_admin

About this task

This procedure shows you how to create an intent. To reuse intents from other models, see (Legacy) Reusing intents from prebuilt NLU models.

Here's an example of how intents can interact with the vocabulary in their training utterances.

- Intent: #AddMembersToDistributionList
- Utterance A: "Please add Carlos Santana to the uxinfodev list"
- Utterance B: "I'm mistakenly removed from the arlo-drury-directreports group"
- Result: The system doesn't recognize uxinfodev or arlo-drury-directreports and can't use these words to predict the intent.
- Solution: Add uxinfodev and arlo-drury-directreports as vocabulary items and add synonyms to them. The synonyms you provide help add more context to the utterance and the intent in which they reside. Your intent prediction confidence can be even higher if you also mark them as entities.

Note: Training utterances and utterances from your users have a limit of 25 words or 200 characters. Utterances that exceed that limit fail to return an intent prediction.

Do not include unrealistic terms such as "OrderLaptop" or "sfsdfasdfas" in training utterances. Utterances should be correct and natural examples in the model's language.

In the following example procedure, you're creating an intent and adding utterances that users might say when requesting information on payment. You've already created an NLU model that you've titled HR Model for Virtual Agent and you're creating an intent in that model.

Procedure

1. Set your application scope to your model's scope.
2. Navigate to **All** > **NLU Workbench** > **Models**.
   The Virtual Agent tab opens by default.
3. Select the tab corresponding to your model's application, then select the name of the model you want to add an intent to.
   In this model example, you select your HR Model for Virtual Agent model.
4. In the **Build and train your model** card, select **View phase**.
5. Select **Intents**.
6. Select **New Intent**.
7. In the **Create an intent** window, add a name and description for the intent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

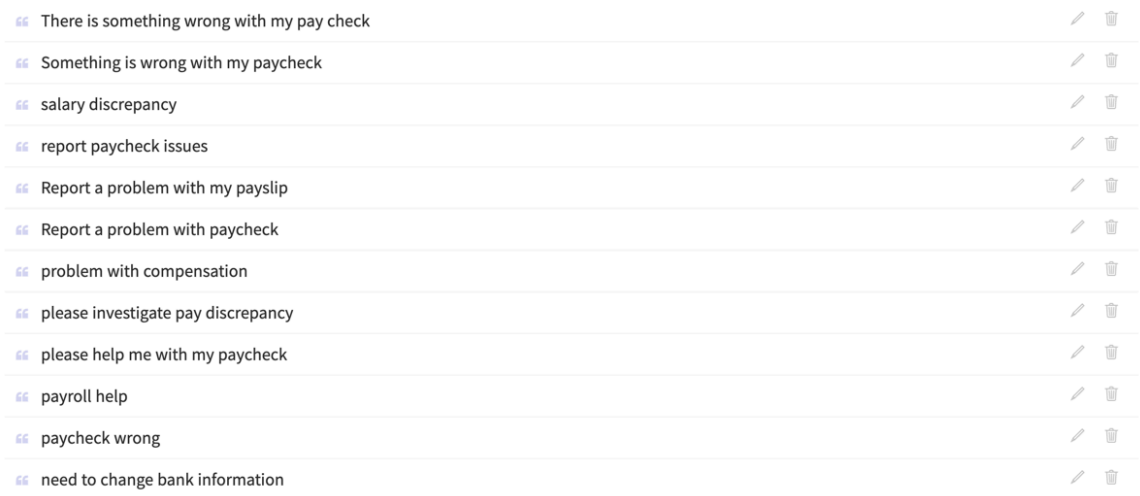
In this example scenario, you enter `PayDiscrepancy` for the name. You can also add a description.

Note: When you create an intent, the system adds a hashtag to the intent name.

8. Select **Add intent**.
   The #PayDiscrepancy intent screen appears, including sections for its utterances, associated entities, and settings. The intent draft status is also shown in the upper right corner of the Intent screen.
9. In the **Utterances** tab, enter training utterance examples that are relevant to the intent.

   Note: The utterance examples that you provide must be unique and contain fewer than 25 words or 200 characters. Aim to add at least 15 utterances with as much variety between them as possible. You must add at least 5 utterances to begin training the model.

   In this scenario, you add the following utterances into the field and select **Add**



As you build and retrain your model iteratively, you can check how your updated intent affects the model's predictions. See (Legacy) Train and try your NLU model.

What to do next

Train your model to save your updates. For issues with intents, see (Legacy) Resolve intent issues.

To improve your utterances, add entities to provide context. See (Legacy) NLU entities.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The available (Legacy) Intent Discovery feature can help identify intents that would be possible to add, based on your historical data.

(Legacy) Reusing intents from prebuilt NLU models

Reuse Natural Language Understanding (NLU) intents by importing them from a prebuilt NLU model to other models. Reusing intents saves time when building your models.

Prebuilt Virtual Agent NLU models provide language understanding needed for chatbot conversation flows in ITSM, CSM, and HR topics. Each NLU intent in these models maps to a single Virtual Agent conversation topic created in Virtual Agent Designer accordingly.

The prebuilt models are read-only, but contain validated intents that you can reuse in your NLU models. For example, the prebuilt HR model for Virtual Agent contains several intents regarding HR requests. Adding the intents to one of your models makes that model ready to respond to user inputs regarding HR.

Prebuilt Virtual Agent model content

Each of the prebuilt Virtual Agent models uses language that's pertinent to their respective business unit (BU). The NLU that processes this language, built from a word corpus of 3 million words, is context-aware of general linguistic patterns and both ServiceNow and user-defined vocabularies.

The prebuilt models map to common conversation topics used by Virtual Agent chatbots across each of the three BUs. Those topics correspond with intents that perform BU-specific actions.

For more NLU and Virtual Agent context, refer to the following product documentation:

- For ITSM context, see ITSM Virtual Agent.
- For HR context, see Virtual Agent for HR Service Delivery.
- For CSM context, see Customer Service Virtual Agent conversations.

Virtual Agent and NLU plugins and roles

To access the prebuilt Virtual Agent models in the NLU Workbench, you must install and activate these plugins using the admin role.

Plugins	Descriptions
• CSM Virtual Agent conversations [com.sn_csm.virtualagent] • Human Resources Scoped App: Virtual Agent Conversations [com.sn_hr_virtual_agent] • ITSM Virtual Agent conversations [com.snc.itsm.virtualagent]	Enables Pre-built Virtual Agent topics, topic blocks, and ServiceNow NLU models for the Customer Service Management, HR Service Delivery, and IT Service Management applications. • Requires the Glide Virtual Agent (com.glide.cs.chatbot) plugin to be activated. • Automatically activates the NLU Workbench (com.snc.nlu_studio) plugin.

Creating NLU models that reuse predefined Virtual Agent intents

The prebuilt Virtual Agent models are set to read-only and can't be edited. However, the intents in these models can be imported into your new model, alongside any new intents you've created in

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

your model. You can also copy the prebuilt model and use the intents as a foundation for a new model.

To reuse the intents from a prebuilt Virtual Agent model, choose the prebuilt model when importing intents. See (Legacy) Import an NLU intent.

NLU models and their intents and entities are associated to an application scope. The scope can't be changed later, so verify your target application scope before you begin.

(Legacy) Import an NLU intent

As you create intents for your Natural Language Understanding (NLU) model, you can also import and reuse intents from other models in the same application scope. Reusing intents saves time when building new models.

Before you begin

- Make sure that the NLU Workbench plugin, NLU Workbench - Core plugin, and Predictive Intelligence plugin are all installed and activated on your instance.
- You can import intents for Virtual Agent and AI Search models.
- Verify that the application scope of your source model and target model are the same.
- Role required: nlu_editor, nlu_admin, or admin

About this task

When you import an intent, the following associated items are also imported:

- training utterances, with their entity annotations
- entities

The following items are not included when importing an intent:

- test utterances in the default test set
- regular and pattern vocabulary

Note: You cannot import intents in the following situations:

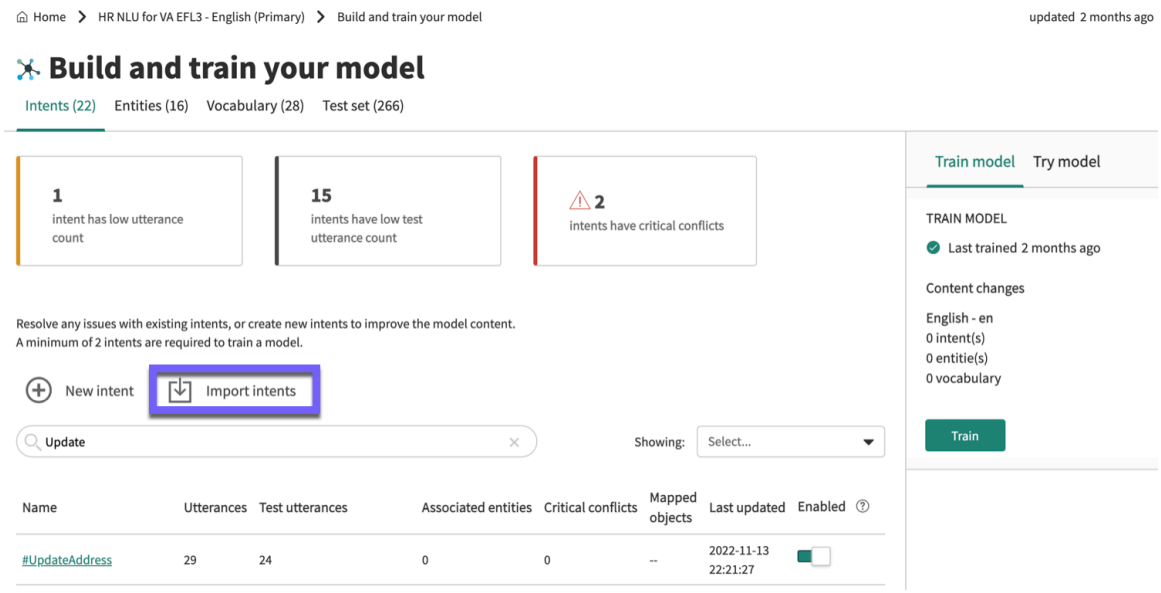
- When the model already has an intent with the same name as the intent you are trying to import.
- When the model already has an entity with the same name but different attributes as what you are trying to import.

In this example scenario, you are building the content of your NLU model and you want to enhance the model by reusing intents from another model.

Procedure

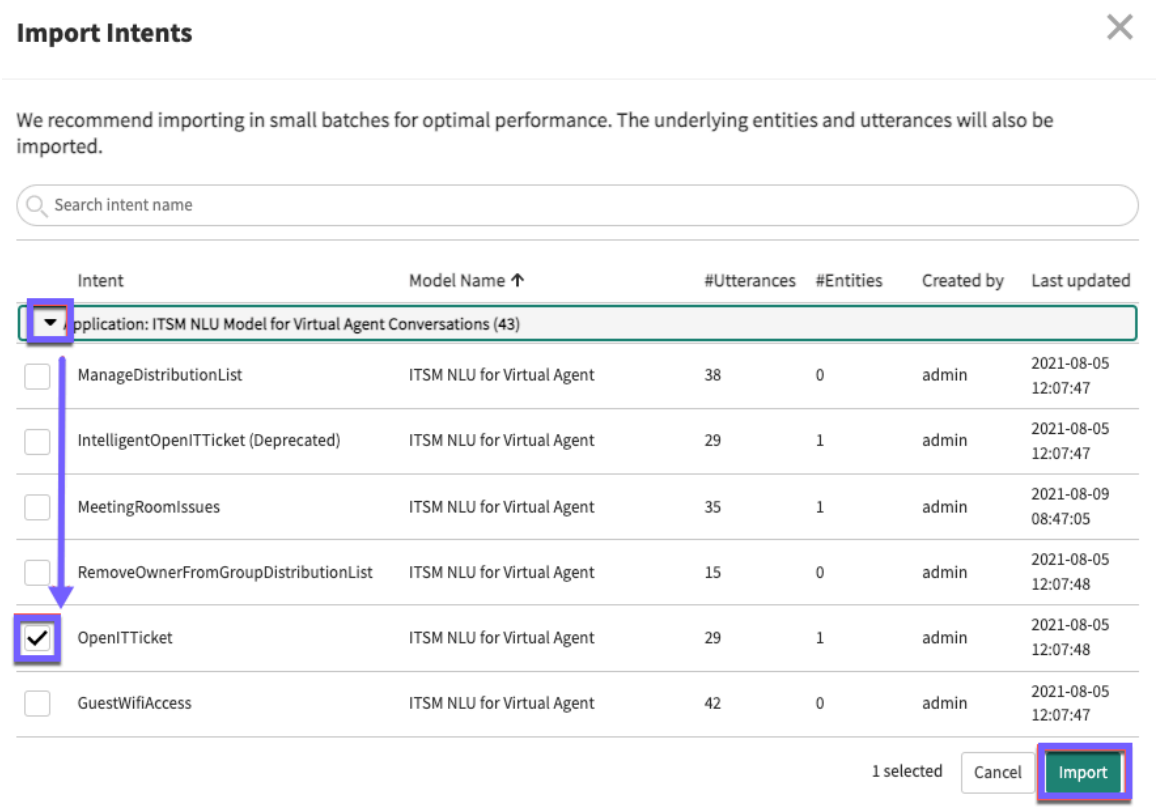
1. Ensure that you are in the target application scope, and navigate to **All** > **NLU Workbench** > **Models**.
   The Virtual Agent tab opens by default.
2. Select the tab for your model's application, then select the name of the model you want to add an intent to.
3. In the model overview page, find the **Build and train your model** phase and select **View phase**.
4. In the **Intents** tab, select **Import intents**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The **Import intents** screen appears, showing a list of NLU models from which you can select intents to import.

5. Locate the intents you want to import, and select their check boxes.



In this scenario, you select the **OpenITTicket** intent in the ITSM NLU Model for Virtual Agent Conversations model.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Select **Import**.

   Result: The **#OpenITTicket** intent appears in the intents list of your target model. By importing this particular intent, you have added 29 additional training utterances to your model.

What to do next

Review the annotations of the newly imported training utterances. Add vocabulary annotation if needed.

Train your model to save your updates. For issues with intents, see (Legacy) Resolve intent issues.

If there are any secondary language models associated to your target model, consider importing and translating the new content. See (Legacy) Import primary model content to a secondary model.

For information about prebuilt Virtual Agent models that you can import from, see (Legacy) Reusing intents from prebuilt NLU models.

(Legacy) Resolve intent issues

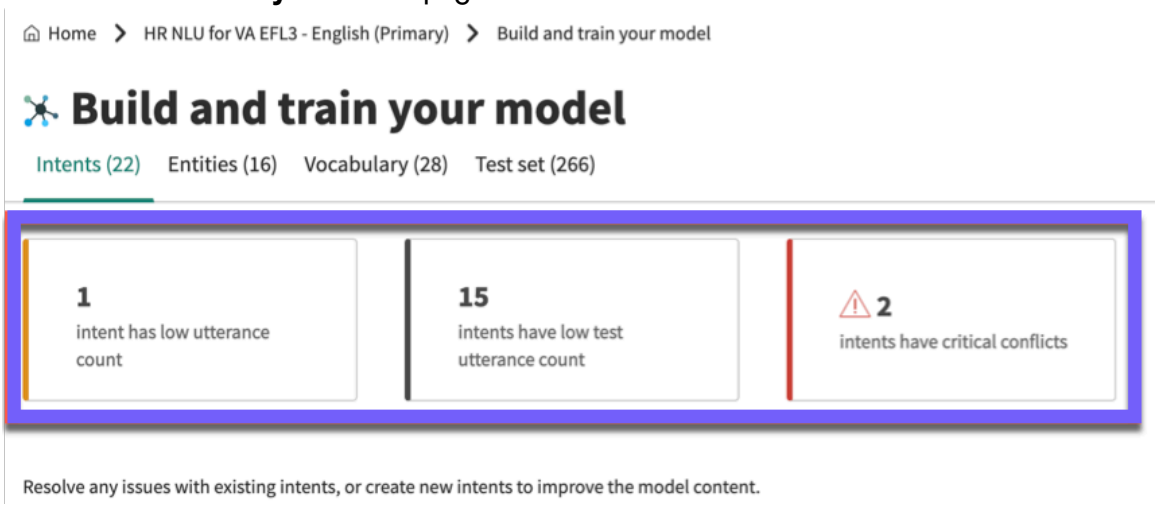
Use the issue cards to identify intents that have conflicts, need reviewing, or need more utterances. Resolving intent issues ensures the intents in your Natural Language Understanding (NLU) models work properly.

Before you begin

- Make sure that the NLU Workbench plugin, NLU Workbench - Core plugin, NLU Workbench - Advanced Features plugin, and Predictive Intelligence plugin are all installed and activated on your instance.
- You can resolve conflicts for Virtual Agent and AI Search models.
- Role required: nlu_admin or admin. When assigned to a model, the nlu_editor can resolve intent issues for that model.

About this task

When a trained model contains intents with issues, the issue cards are displayed on the intents tab of **Build and train your model** page. Select each card to filter the list of intents for that issue.



The cards display different issues:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **intents have low utterance count**: Intent doesn't contain the required minimum of 5 training utterances. This card also displays when the intent contains less than the recommended count of 15 utterances.
- **intents have low test utterance count**: The default test set does not have enough test utterances for the intent. This card displays when the count of test utterances for an intent is below the recommended 15.
- **intents have critical conflicts**: Intent contains training utterances that overlap with utterances in another intent.

  Note: Utterances which are marked as `Not relevant`may also conflict with utterances assigned to intents. For more information, see (Legacy) Irrelevance detection in NLU.

- **intents need review**: Intent was translated but must be reviewed by an nlu_admin or nlu_editor.

The issue cards are hidden under the following circumstances:

- The model is a pre-built model
- The model is in a draft state and not trained
- The model contains no conflicts
- A successful conflict report doesn't exist for the latest trained version
- The NLU Workbench - Advanced Features plugin isn't installed

Resolve issues in the following ways:

Issue	Resolution
intents have low utterance count	Add more training utterances to the intent. Intents need at least 5 utterances. The recommended count is at least 15 utterances.
intents have low test utterance count	Add more test utterances for the intent to the model's default test set. The recommended count is at least 15.
intents have critical conflicts	Remove or edit any utterances so that each utterance applies to only one intent.
intents need review	Have an nlu_admin or nlu_editor review the intent. For more information, see (Legacy) Enable or disable a secondary model intent.

In this example procedure, you are resolving critical conflicts in one of your intents. You built a Virtual Agent model for handling HR requests, but two of your intents, GeneralHRInquiry and CreateHRGeneralInquiryCase included similar utterances.

Procedure

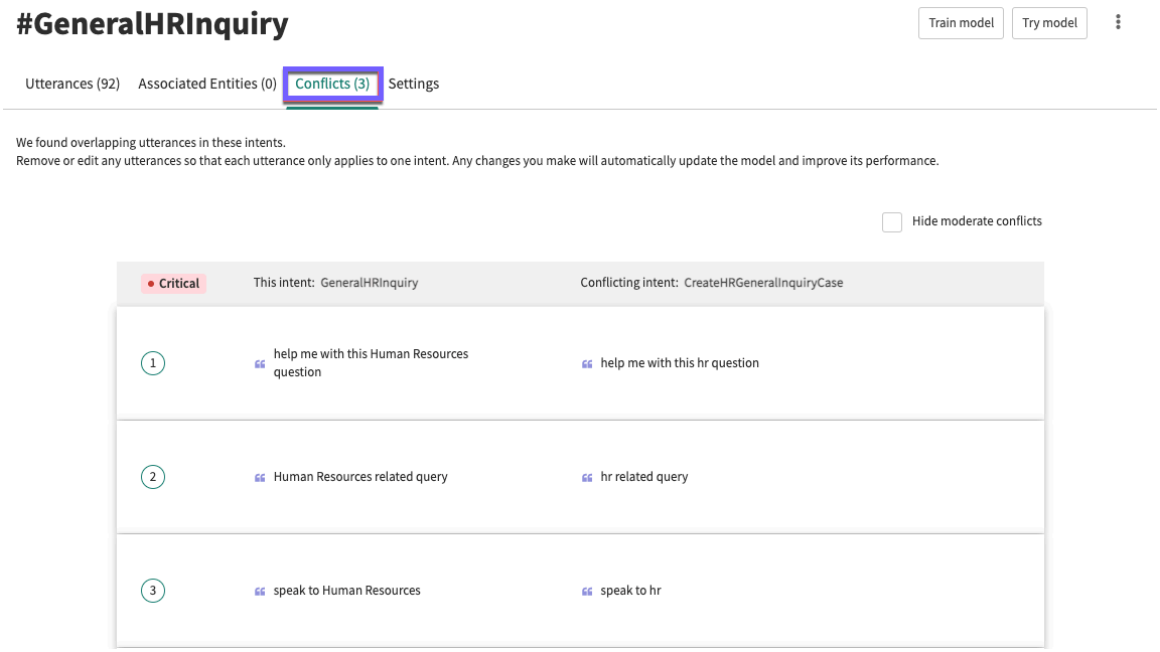
1. Ensure that you are in the same application scope as your model, and navigate to **All** > **NLU Workbench** > **Models**.
   The Virtual Agent tab opens by default.
2. Select the tab corresponding to your model's application, then select the name of your model.
3. In the **Build and train your model** card, click **View phase**.
4. On the intents tab, click the **intents have critical conflicts** card.
   The intents list filters and shows the intents with critical conflicts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Click the intent name you want to resolve.
   In this example, you click the GeneralHRInquiry intent.
6. Click the **Conflicts** tab.

   The conflicts tab appears and lists the conflicting utterances. The utterances for the current intent show on the left. The conflicting utterances for the other intent appear on the right.

   Note: You can hide moderate conflicts to focus on the critical conflicts. You can also ignore conflicts. However, be sure to fix all conflicts for best performance.



7. Point to the utterance that you want to edit or remove.

   In this example procedure, click the trash icon to remove the utterance from the CreateHRGeneralInquiryCase intent.

   The utterance is removed from the intent.

   Note: Any changes you make automatically save.

What to do next

Utterances designated as `Irrelevant` or `Not relevant`may also conflict with training utterances. Irrelevant utterances are displayed as though they are in their own intent named **NO_INTENT**. However, these utterances cannot be edited or deleted in Conflicts. Copy the utterance to the Irrelevance Detection module to edit or delete. For more information, see (Legacy) Irrelevance detection in NLU.

Continue to resolve all conflicts. When finished, train your model to see a list of updated conflicts, if any. Resolve all intent issues prior to testing and publishing your model.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

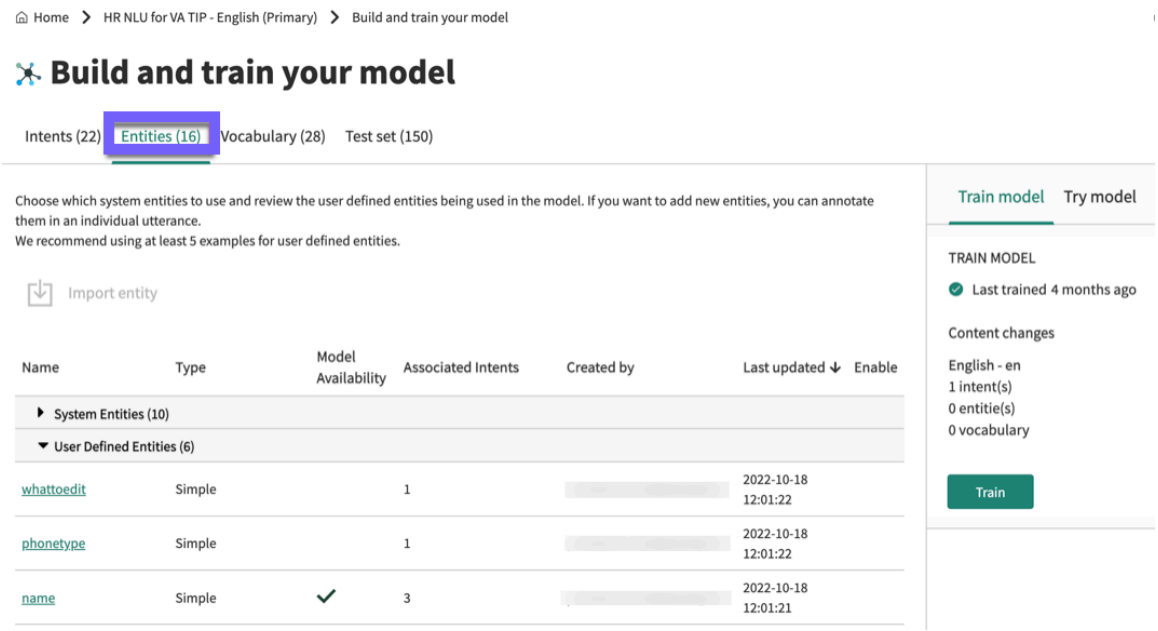
(Legacy) NLU entities

Entities provide your model with additional context when receiving user input. Add entities to your utterances and intents to improve the predictions of your Natural Language Understanding (NLU) model.

Think of entities as the object of the action that the user wants to perform. The model interprets the utterance by matching it with an intent, but also uses entities to gather more details on the request.

For example, if a user types in `I have a critical issue with a slow laptop`, the system predicts a match to the intent #TroubleshootSlowComputer. From this utterance, the model also identifies the following entities:

- HARDWARE (entity) - laptop (value)
- urgency (entity) - High (value)



NLU entities fall into two categories: system and user-defined. System entities such as DATE, TIME, and LOCATION are available by default in your instance. You can create your own user-defined entities to provide context relevant to your business.

There are five types of user-defined entities. Select one of the following links to learn more.

- (Legacy) Create a simple entity
- (Legacy) Create a mapped entity
- (Legacy) Create a pattern entity
- (Legacy) Create a system-derived entity
- (Legacy) Create an open-ended entity

When you create entities, annotate them on utterances to provide examples to help your model learn. By annotating entities, you provide your model with linguistic associations and meaningful context for the system vocabulary. Annotations strengthen the relevance of entities and help your model perform the correct action in response to your users' inputs.

You add entities to your utterances when you are creating the intents. The entities then become associated to that intent, giving you the **Associated Intents** number.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Regular expressions

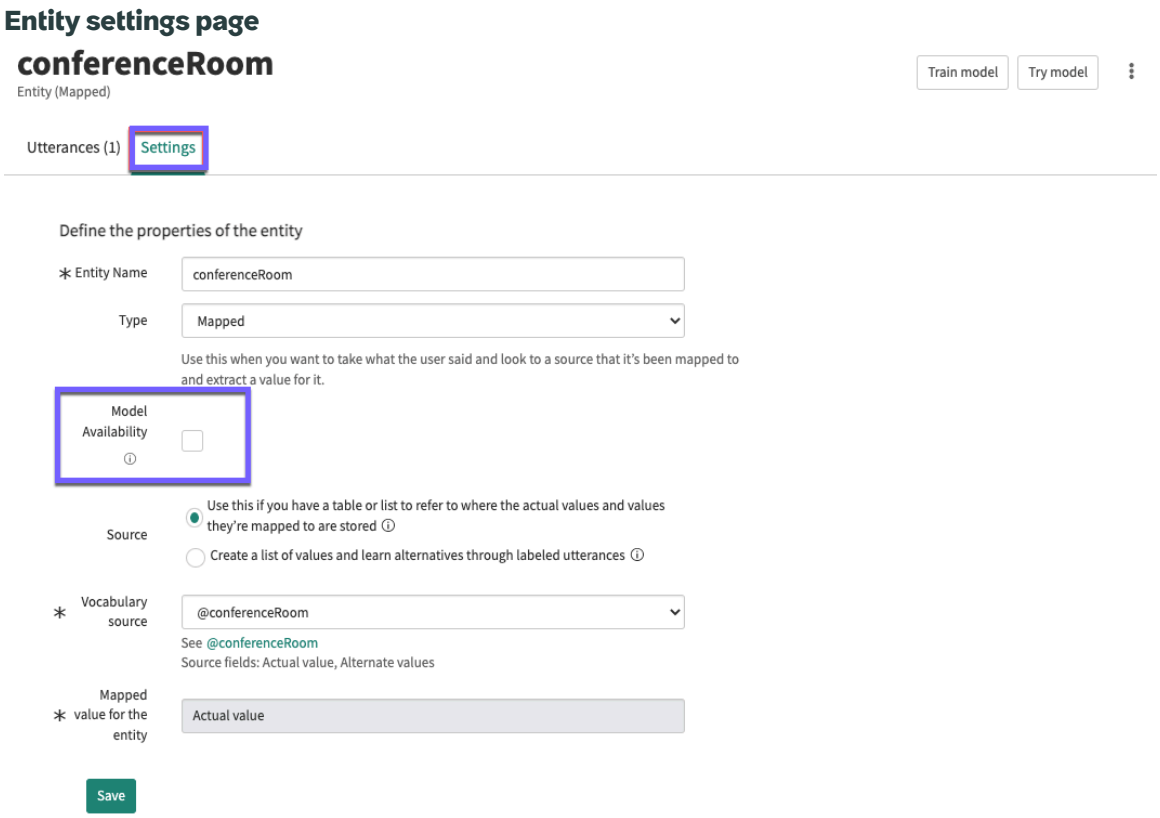
Regular expressions (regex) help your model establish patterns that improve that model's ability to locate, match, and manage text. Use regular expressions with pattern entities to help your model understand formats such as email addresses, phone numbers, and incident numbers.

To learn more, see (Legacy) Using regular expressions in entities.

Model availability

When you create an entity, you can choose to make the entity available for reuse by other intents in the model. If you didn't select the **Model availability** box when creating the entity, you can edit the entity afterwards.

On the Model details page, select **Entities**. Select the name of the entity to bring up the entity details page. Then, select the **Settings** tab.



(Legacy) Create a simple entity

Create one or more simple entities from words in your utterance examples. An entity is an object of, or context for, an action.

Before you begin

- Make sure that the NLU Workbench plugin, NLU Workbench - Core plugin, NLU Common Model plugin, and Predictive Intelligence plugin are all installed and activated on your instance.
- Create or use an existing NLU model for Virtual Agent or AI Search.
- Create or use an existing intent.
- Role required: nlu_editor, nlu_admin, or admin. The nlu_editor must be assigned to the model.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

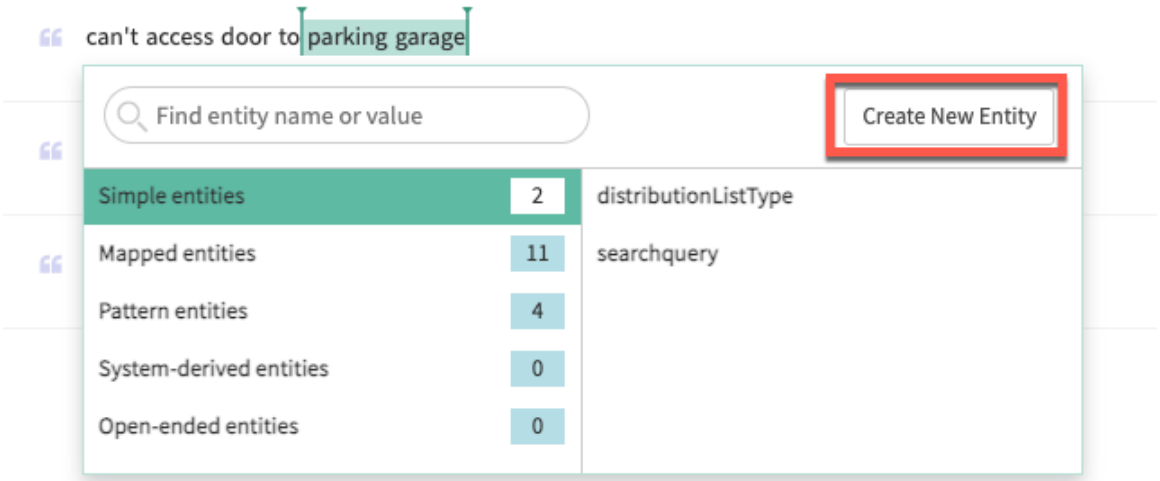
About this task

Simple entities are words or phrases whose value can be extracted by your model. Simple entities are identified based on the context in which the entity is used in an utterance.

For the following example procedure, you've already created an intent that's titled SubmitAccessRequest and you're creating a simple entity for the type of access the user is requesting.

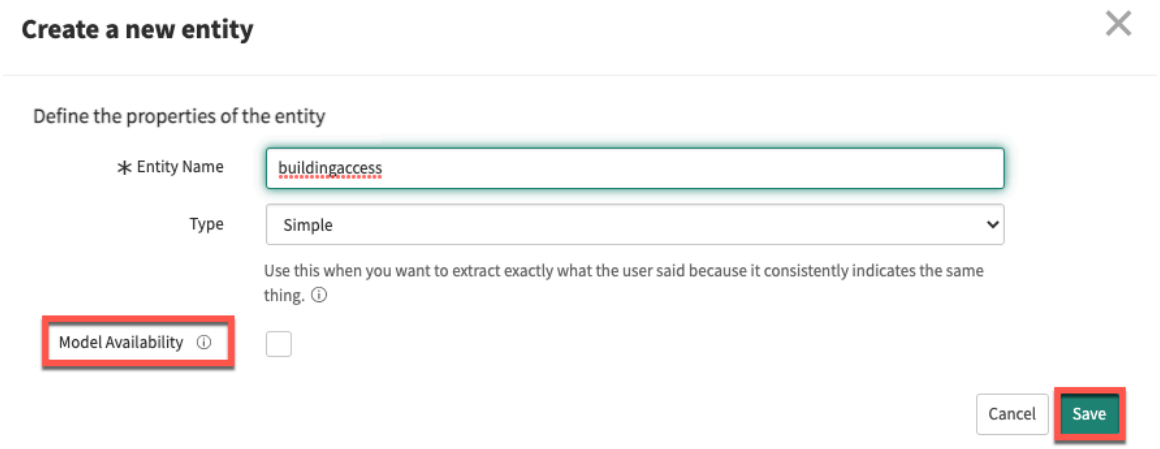
Procedure

1. Navigate to **All** > **NLU Workbench** > **Models**.
   The Virtual Agent tab opens by default.
2. Select the tab corresponding to your model's application, then the name of the model you want to add an entity to.
   For this example, you choose the NLU for Access Requests model.
3. In the **Build and train your model** card, click **View phase**.
4. In the intents tab, click the name of the intent.
   For this example, you click SubmitAccessRequest.
5. Click a word in one of the utterances to bring up the entity window.
   For this example, click the word parking garage.



6. Click **Create New Entity**.
7. In the Create a new entity screen, enter a name and select the **Simple** entity type.
   For this example, you enter `buildingaccess` for the **Entity Name**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

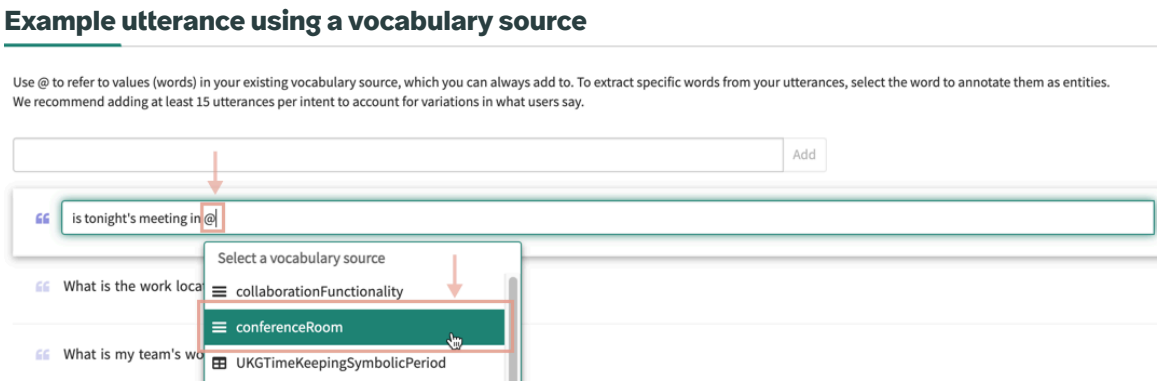


Note: Select **Model availability** to make the entity available to every intent in the model. If you check the box, the entity shows in the **Associated Entities** tab.

8. Click **Save**.
   The entity saves and the words in the utterance remain highlighted.

What to do next

Your utterances can reference a vocabulary source by using the @ handle. If you have a list of values that are defined in a vocabulary source, you can annotate the @ handle as a simple entity to extract it rather than repeating the utterance for all of the values. The referenced vocabulary source can be a table or a list. For example, the following image shows how you invoke a vocabulary source that lists various conference room names.



For more information, see (Legacy) NLU vocabulary.

(Legacy) Create a mapped entity

Create an entity mapped to a vocabulary source, or to a list of values you manually create for the entity. Mapped entities can help provide multiple values the model can use as context when interpreting utterances.

Before you begin

- Make sure that the NLU Workbench plugin, NLU Workbench - Core plugin, NLU Common Model plugin, and Predictive Intelligence plugin are all installed and activated on your instance.
- Create or use an existing NLU model for Virtual Agent or AI Search.
- Create or use an existing intent.
- Role required: nlu_editor, nlu_admin, or admin. The nlu_editor must be assigned to the model.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Mapped entities take the words of the utterance and extract value based on a designated source. The model uses the source when predicting the intent.

When you create a mapped entity, you have the following three options for the source.

- Manual list of values: Use this option to manually enter a list of values for the entity. For example, you could create a mapped entity named priority and map it to the word urgent in an utterance, then manually build a list for it with values of High, Medium, and Low.
- Table vocabulary source: Use this option if you have a ServiceNow table that has the values you're looking for. Mapping an entity to a table vocabulary source enables the entity to reference multiple values from the table. For example, use a @Location vocabulary source, where @Location has values for cities and countries.
- List vocabulary source: Use this option if you don't have a ServiceNow table that has the values you're looking for. For example, use a @mouse vocabulary source, where @mouse has values for various models of hand-held computer devices.

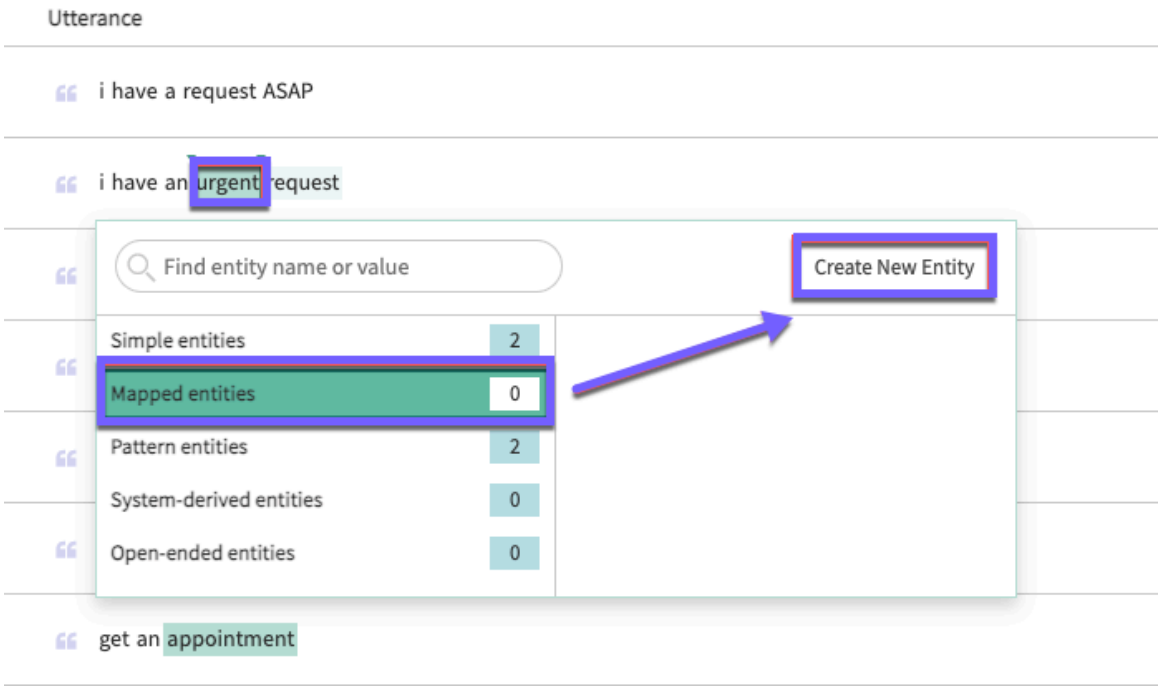
In this example procedure, you create a mapped entity for urgency.

Procedure

1. Navigate to **All** > **NLU Workbench** > **Models**.
   The Virtual Agent tab opens by default.
2. Select the tab for your model's application, then the name of your model.
3. On the model details page, select the **Intents** tab.
4. In the Intents section of the model, select the name of an intent.
   For this example procedure, you select **#SubmitRequest**.
5. In the Utterances tab, select a word in an utterance

   In this scenario, you select the word urgent in the utterance I have an urgent request.
6. Select **Mapped entities**.
7. Select **Create New Entity.**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



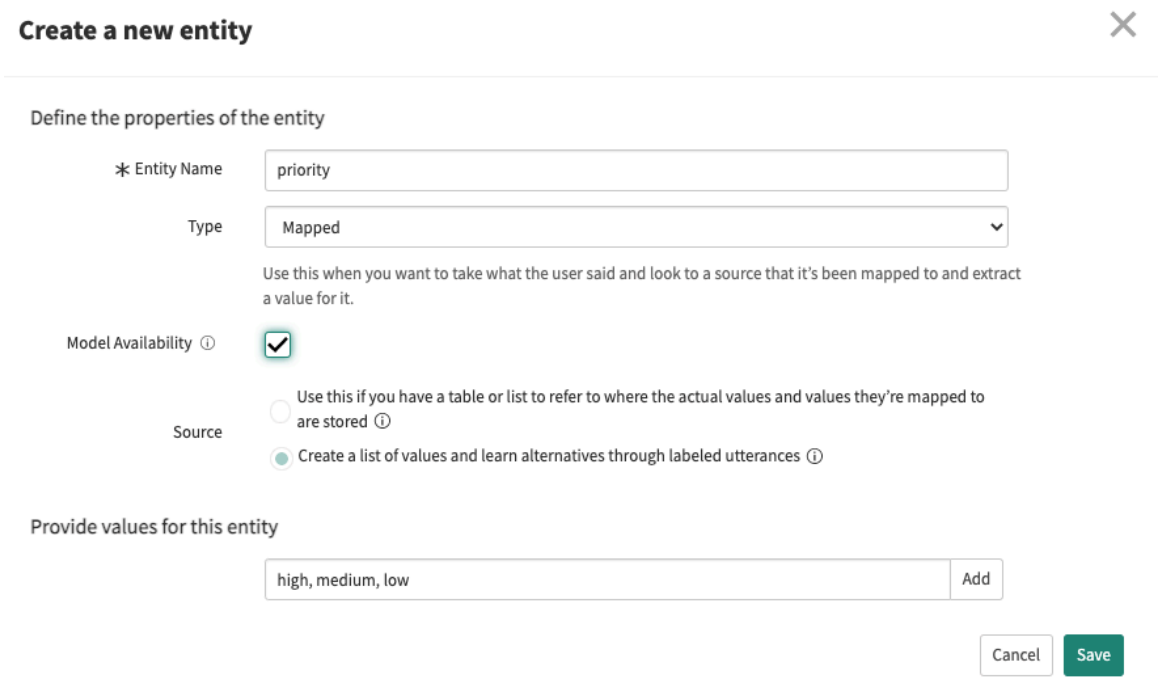
8. On the form, configure the fields.

Field	Description
Entity Name	Name for the entity.
Type	Type of entity.
Model availability	Select this option if you want this entity to be included in all intents in your model.
Source	Source of the entity values.
Provide values for this entity	Values used to provide context for the model.

For this example procedure, use the following configurations:

- **Entity Name**: `priority`
- **Type**: Mapped
- **Model availability**: Select the check box
- **Source: Use this if you have a table or list to refer to where the actual values and values they're mapped to are stored**
- **Mapped value for the entity**: `high, medium, low`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



9. Click **Save**.

   Result: Your mapped entity saves. The entity appears on the **Associated entities** tab. Now the model can leverage machine learning and use the values provided to identify possible values.

What to do next

You can create a mapped entity using a vocabulary source to use the values in the source as the mapped entity.

Related topics

(Legacy) Create a table vocabulary source

(Legacy) Create a list vocabulary source

(Legacy) Create a pattern entity

Create a pattern entity from a word or phrase with repeatable patterns, such as email addresses and phone numbers. These patterns help the system to recognize similar utterances based on the patterns.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Make sure that the NLU Workbench plugin, NLU Workbench - Core plugin, NLU Common Model plugin, and Predictive Intelligence plugin are all installed and activated on your instance.
- Create or use an existing NLU model for Virtual Agent or AI Search.
- Create or use an existing intent.
- Role required: nlu_editor, nlu_admin, or admin. The nlu_editor must be assigned to the model.

About this task

Pattern entities help your model identify, contextualize, and govern similar types of content. Inputs such as phone numbers and email address follow the same pattern. By creating a pattern entity, you can train the model to recognize all variations of those inputs.

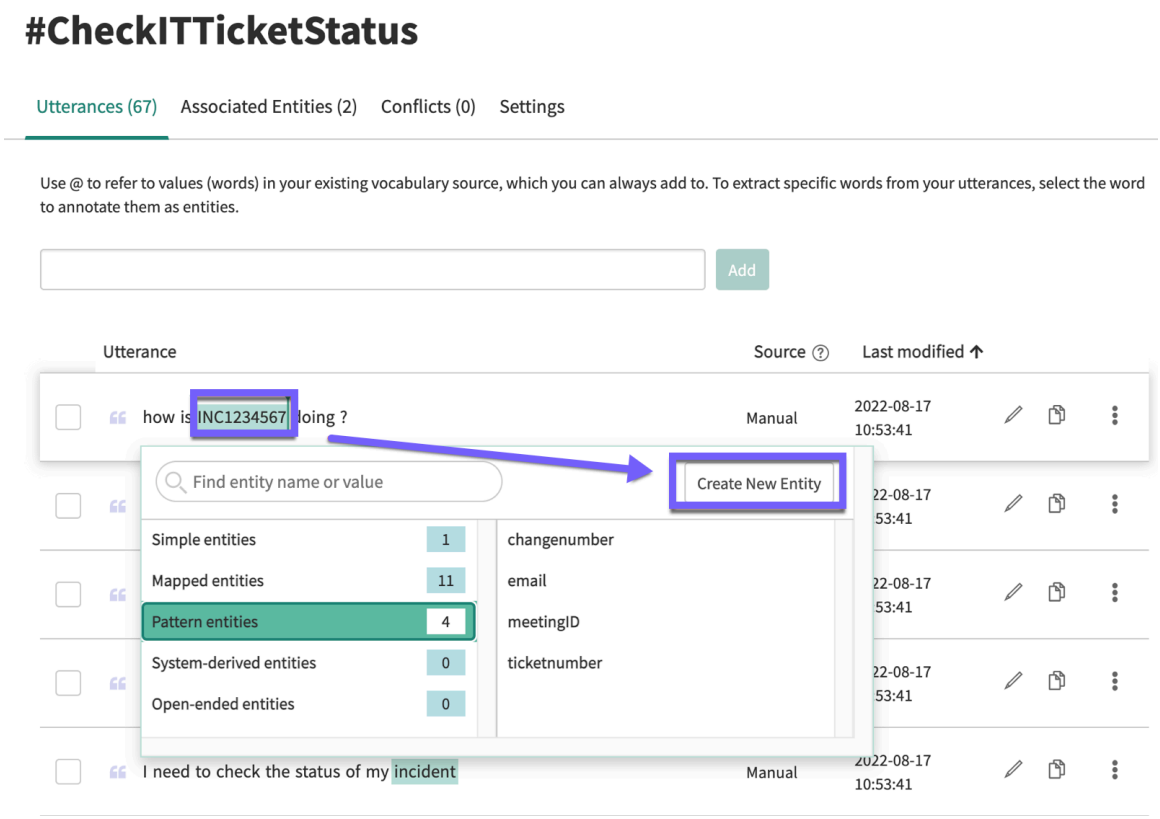
Note: Pattern entities use regular expressions (regex). The regex field value is a Java regular expression. For more information on how to use regex, see Using regular expressions in entities.

In this example scenario, you've created an intent that's titled #CheckITTicketStatus. In this example procedure, you're creating a pattern entity for incident record numbers.

Procedure

1. Navigate to **All** > **NLU Workbench** > **Models**.
   The Virtual Agent tab opens by default.
2. Select the tab for your model's application, then the name of the model.
3. On the model details page, select **Intents**.
4. Select the name of an intent.
   In this example scenario, you select **#CheckITTicketStatus**.
5. Select one of the words of an utterance.
   In this scenario, you click **INC1234567**.

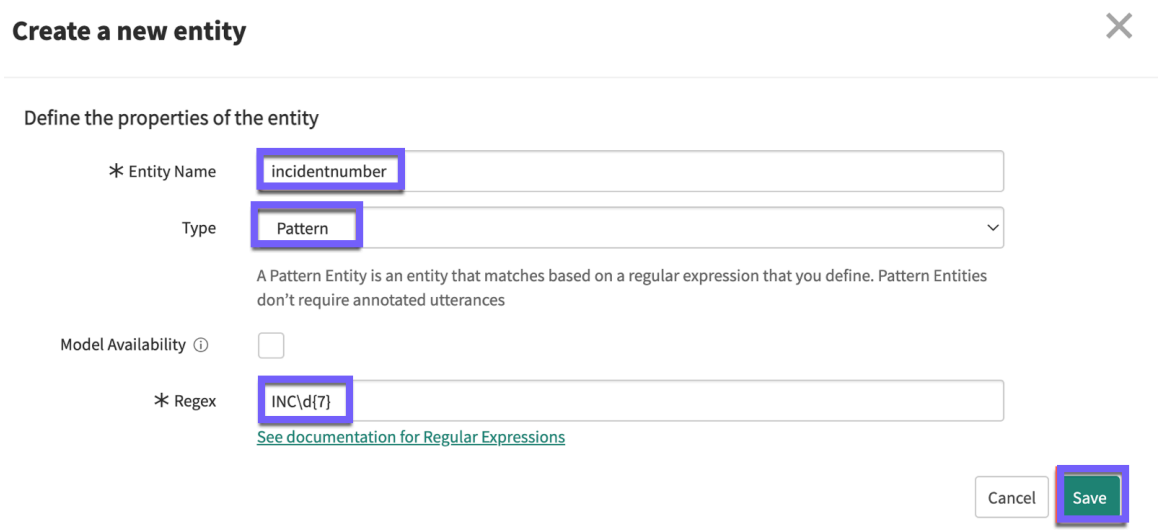
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. Select **Create New Entity**.
7. In the Create a new entity window, configure the fields.

   For this example procedure, use these configurations:

   - **Entity Name**: Enter `incidentnumber`
   - **Type**: Select **Pattern**
   - **Model Availability**: Select this box if you want this entity to be included in all intents in your model
   - **Regex**: Enter `INC\d{7}`



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Click **Save**.
   The pattern entity saves and appears in the **Associated Entities** tab. The model can use the pattern entity to interpret variations of the annotated utterance. For example, the model can match the #CheckITTicketStatus intent if a user enters any incident record number.

(Legacy) Create a system-derived entity

Create a custom entity that's derived from a default system entity such as date, time, duration, or location.

Before you begin

- Make sure that the NLU Workbench plugin, NLU Workbench - Core plugin, NLU Common Model plugin, and Predictive Intelligence plugin are all installed and activated on your instance.
- Create or use an existing NLU model for Virtual Agent or AI Search.
- Create or use an existing intent.
- Role required: nlu_editor, nlu_admin, or admin. The nlu_editor must be assigned to the model.

About this task

System entities are pre-built in your ServiceNow instance by default, and appear on the Entities section of the Model screen. These entities, such as DATE, TIME, and DATE_TIME, are enabled by default. You can disable and re-enable them if needed by clicking **Enable**.

System-derived entities extend your system entities, providing more context. For example, your model already understands date formats thanks to the system entity DATE. However, you can create system-derived entities, such as startdate and enddate, to extract more information from user utterances regarding dates.

For the following example scenario, you're creating a model for booking flights, cars, hotels, and events. You want your intent #FlightBooking to interpret utterances with your users flight requests. Your model contains the system entity LOCATION, but flight plans usually involve two locations.

In this example procedure, you create two system-derived entities to gather the departure and arrival locations of the flight.

Procedure

1. Navigate to **All** > **NLU Workbench** > **Models**.
   The Virtual Agent tab opens by default.
2. Select the tab for your model's application, then the name of your model.
3. In the model details page, select **Intents**.
4. Select the name of the intent.
   For this example, you select the **#FlightBooking** intent.
5. On the **Utterances** tab, select a word or phrase from one of the utterances.
   In this example scenario, you have an example utterances `book a flight from San Diego to San Francisco`. For this step, click **from San Diego**.

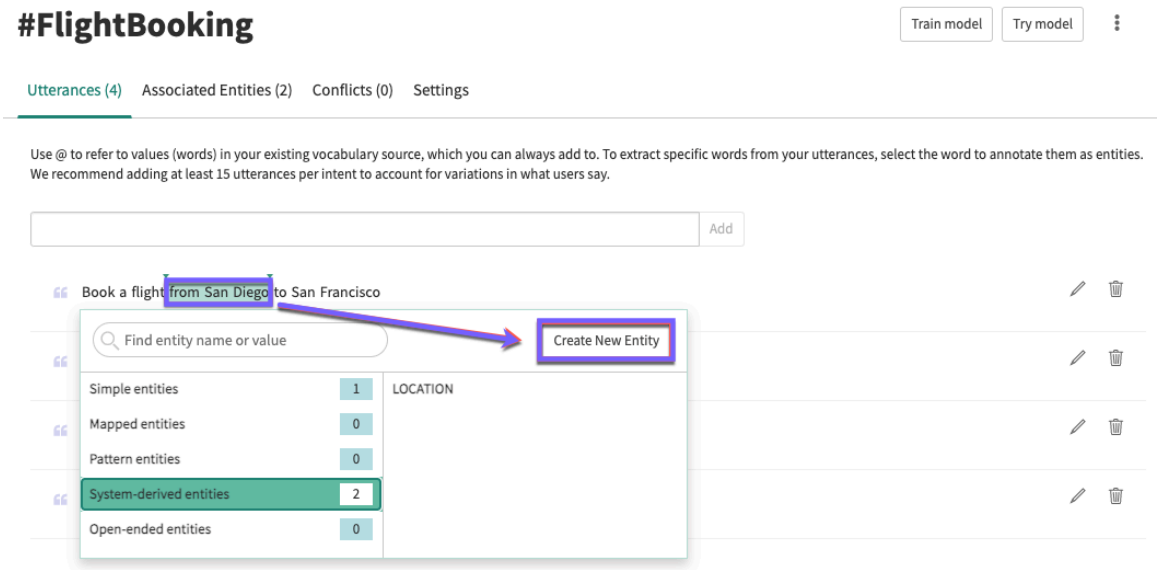
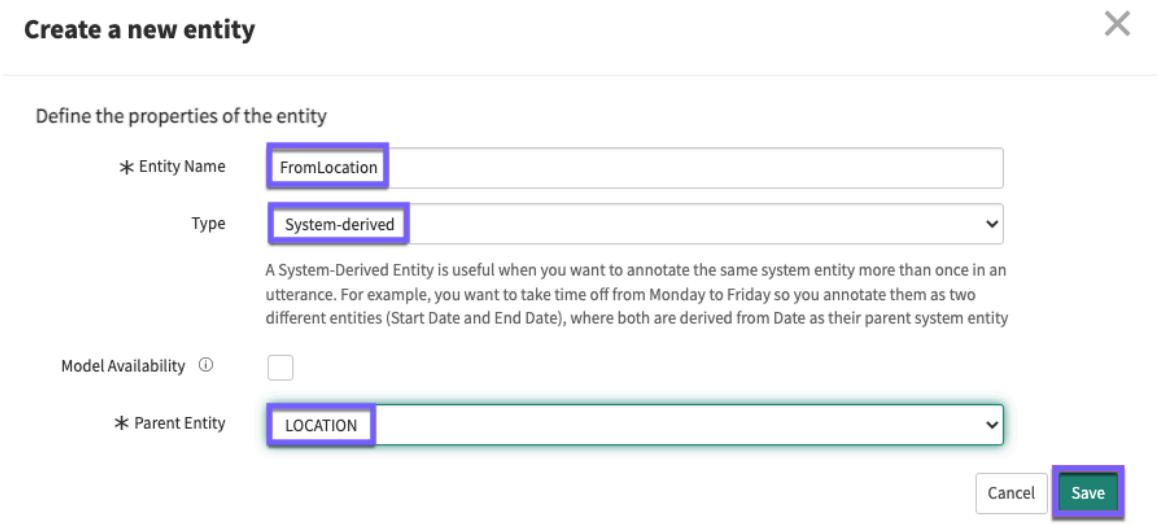
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. Select **Create New Entity**.
7. In the Create a new entity screen, configure the fields.

   For this example, use these configurations.

   - **Entity Name**: Enter `FromLocation`
   - **Type**: Select **System-derived**
   - **Model Availability**: Select this check box if you want this entity to be included in all intents in your model
   - Parent Entity: Select **LOCATION**



8. Select **Save**.
9. On the same utterance, select another word or phrase.
   In this example scenario, you click **to San Francisco**.

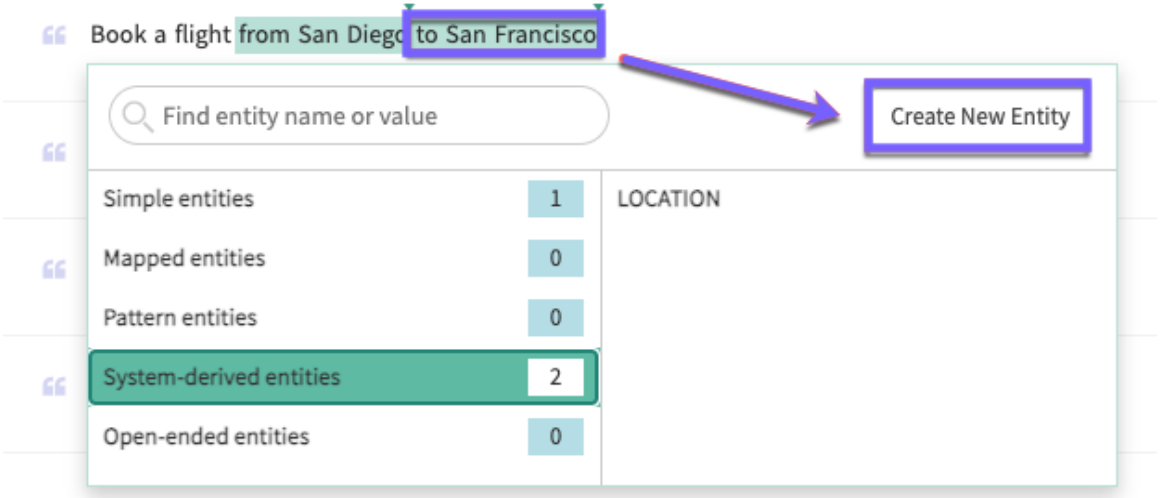
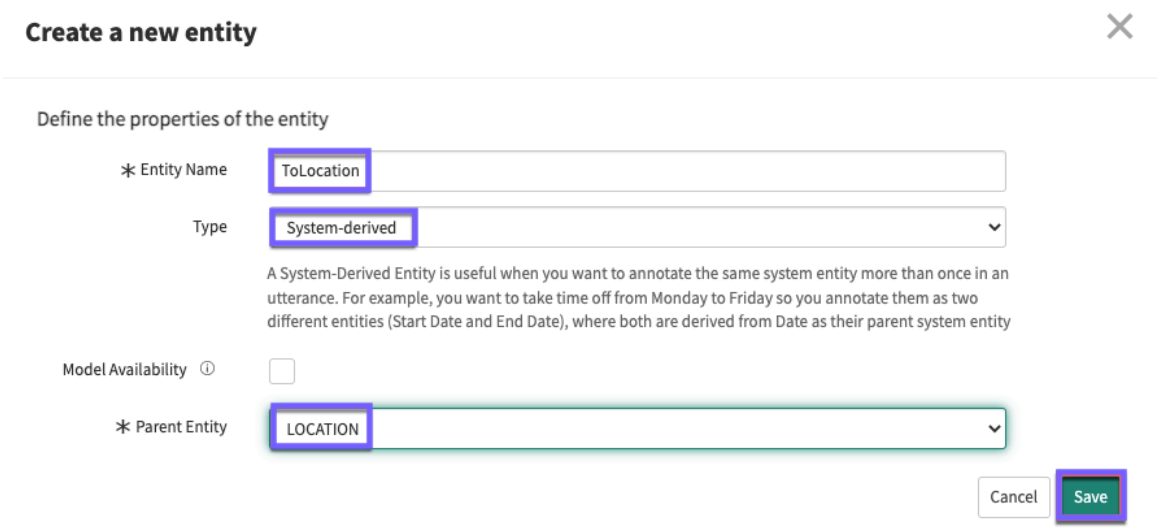
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



10. Select **Create New Entity**.

    For this example, use these configurations.

    - **Entity Name**: Enter `ToLocation`
    - **Type**: Select **System-derived**
    - **Model Availability**: Select this check box if you want this entity to be included in all intents in your model
    - **Parent Entity**: Select **LOCATION**



11. Select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result: Your two system-derived entities appear in the entity window.

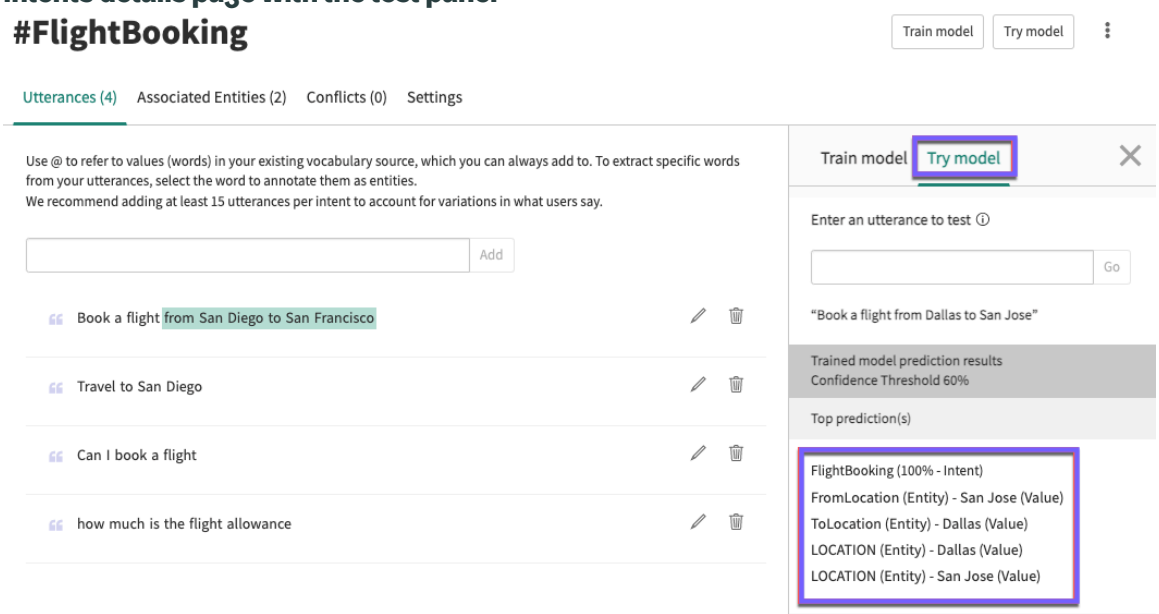
What to do next

Train your model to save the entities. You can try your model to see if it recognizes and interprets variations of the entities that you created.

For this example, you can test your model with a different departure and arrival location.

1. Select **Try model**.
2. Enter `book a flight from Dallas to San Jose`.
3. Select **Go**.

Intents details page with the test panel



The model predicts the intent, showing the entities it used to determine the values. Notice how it uses both the system entity and system-derived entity when predicting.

(Legacy) Create an open-ended entity

Use an open-ended entity when you want to improve intent prediction accuracy. Open-ended entities help your model focus on the context of the utterances.

Before you begin

- Make sure that the NLU Workbench plugin, NLU Workbench - Core plugin, NLU Common Model plugin, and Predictive Intelligence plugin are all installed and activated on your instance.
- Create or use an existing NLU model for Virtual Agent or AI Search.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Create or use an existing intent.
- Role required: nlu_editor, nlu_admin, or admin. The nlu_editor must be assigned to the model.

About this task

Open-ended entities tell the model to focus on the context of the entity rather than the entity itself. When you mark a word or phrase as open-ended, the system skips the entity and predicts the intent from the context that precedes or follows the entity in the utterance.

For example, in the utterance `I want to order an iPhone`, you annotate the words "an iPhone" as an open-ended entity. The model focuses on the context, predicting the user wants to order something. Since there are numerous things the user could want to order, naming all of them would be an unbearable task for the model author.

Using an open-ended entity instead of a simple entity helps the model focus on the rest of the utterance and not the entity. In the iPhone example, the entity itself is less relevant; so you want the system to ignore it.

In other scenarios you should use a simple entity, as there could be multiple intents where you shouldn't have the system ignore the entity.

Note: You can't annotate a vocabulary source (referenced by @vocab_source in an utterance) as an open ended entity. You can only annotate a vocabulary source as a simple entity or a mapped entity. For example, if the utterance is “I want to order a laptop”, then the word “laptop” can be annotated as an open ended entity. However, if the utterance is “I want to order @laptop” where @laptop refers to a table vocabulary source or a list vocabulary source, it can't be annotated as an open ended entity.

For this example scenario, you've created an NLU model with an intent for your users to order company merchandise.

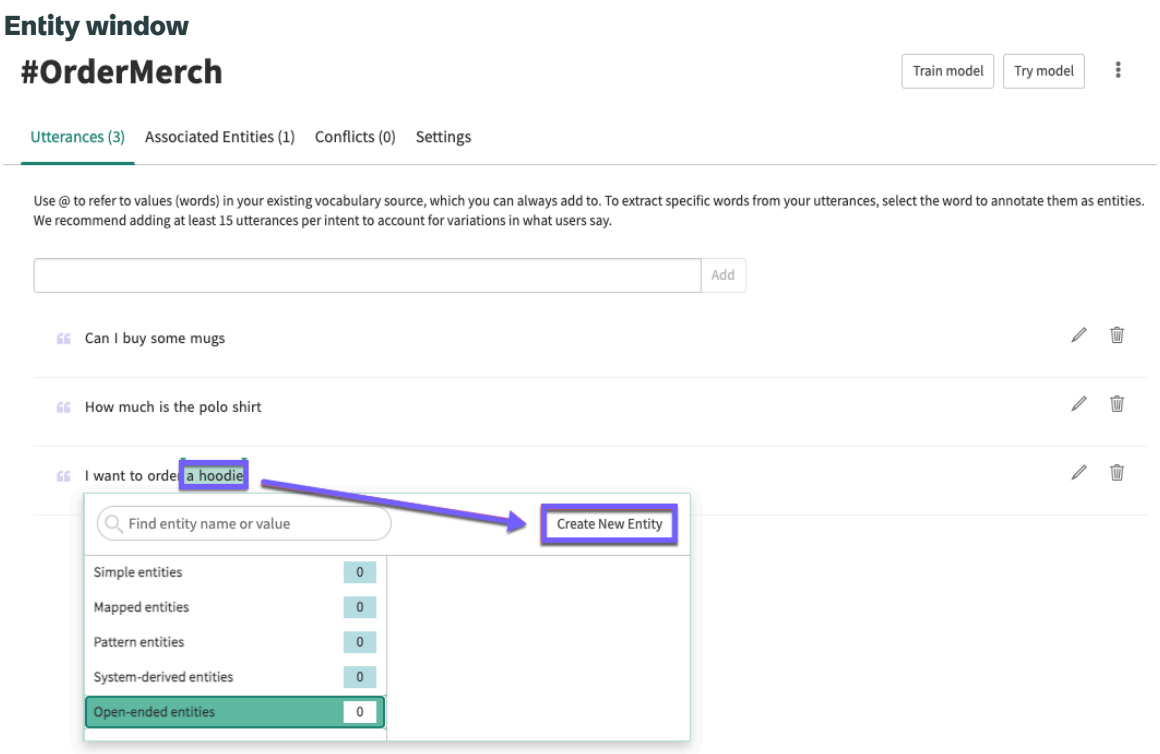
In the following example procedure, you create an entity from one of your utterances so the system can recognize it as open-ended and reusable in other NLU models in your instance.

Note: You can use only one open-ended entity per intent.

Procedure

1. Navigate to **All** > **NLU Workbench** > **Models**.
   The Virtual Agent tab opens by default.
2. Select the tab for your model's application, then select the name of your model.
3. On the Model details page, click **Intents**.
4. Select the name of the intent you want to add the entity to.
   For this example, you select the #OrderMerch intent.
5. In the Utterances tab, select a word or phrase of one of the utterances to bring up the entities window.
   For this example, you select a hoodie.

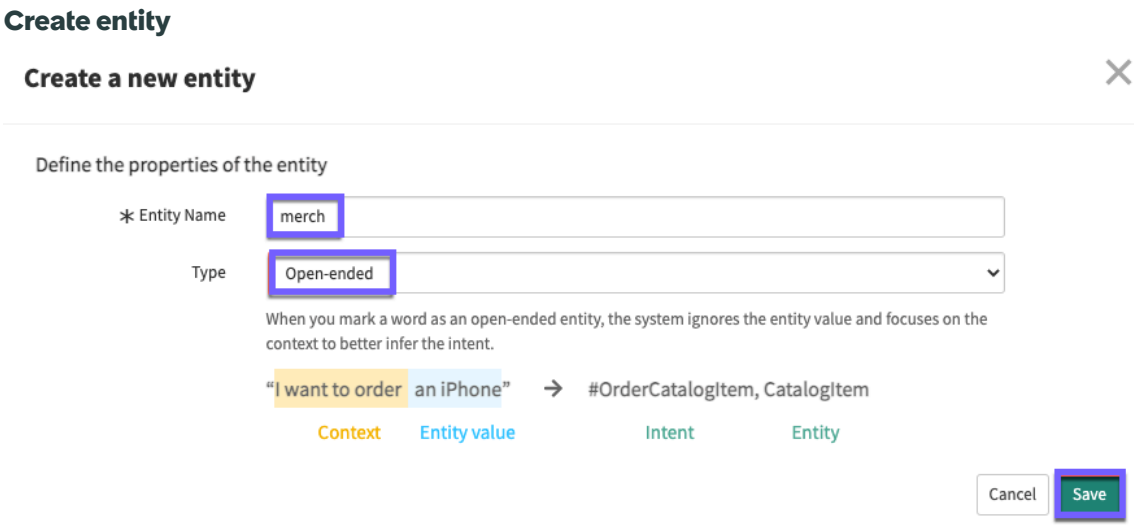
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. Select **Create New Entity**
7. On the Create a new entity screen, configure the fields.

   For this example, use the following configurations:

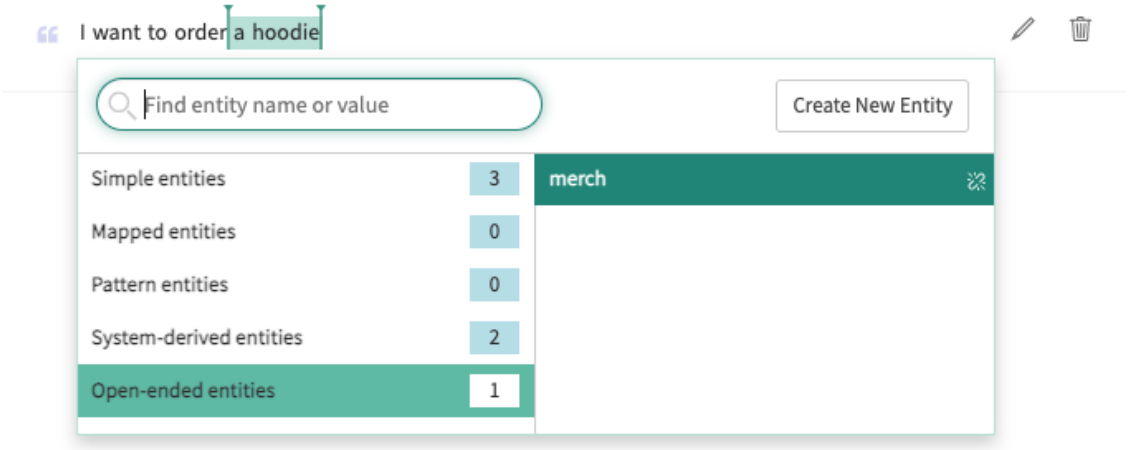
   - **Entity Name**: `merch`
   - **Type**: Select **Open-Ended**



8. Select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The merch open-ended entity is annotated in the Utterances section of your model's Intent screen. When you point to its name, you can see that it persists as a new entity in the annotation details. This entity is reusable in all other NLU models in your instance.

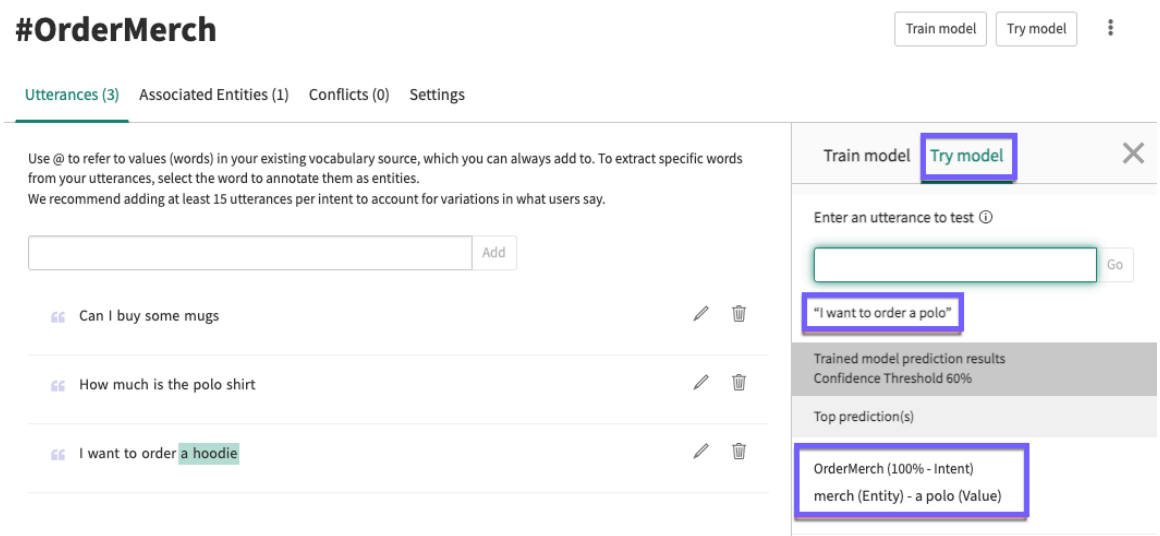


What to do next

Train your model to save the entities. You can try your model to see if it interprets the utterance based on the context of the entity, rather than the entity itself.

For this example, you can test your model with a different merchandise item.

1. Select **Try Model**.
2. Enter `I want to order a polo`.
3. Select **Go**.



The model predicts the intent and shows that it used the merch entity for the a polo value.

(Legacy) Import entities

Reuse entities that you have created across your other Natural Language Understanding (NLU) models. Importing entities saves time and helps improve the intents in your model.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Make sure that the NLU Workbench plugin, NLU Workbench - Core plugin, NLU Common Model plugin, and Predictive Intelligence plugin are all installed and activated on your instance.
- Create or use an existing NLU model.
- Create or use existing intents and entities.
- Role required: nlu_editor, nlu_admin, or admin. The nlu_editor must be assigned to the model.

About this task

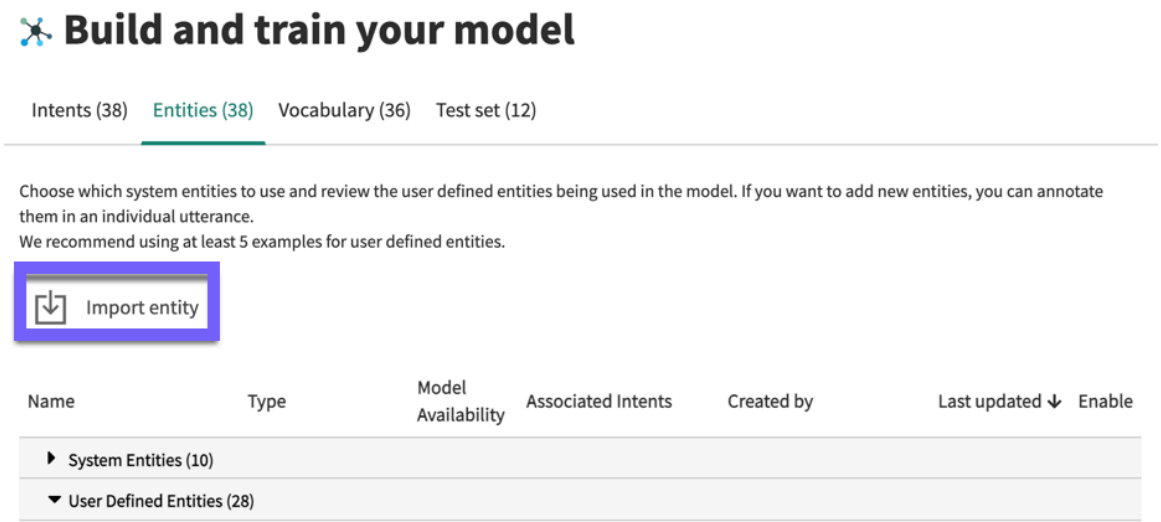
New entities are usually created inside an individual intent. To help save time and improve your intents, you can also reuse entities from your other models by importing them. After importing entities into a model, annotate the model's utterances using the new entities.

Note: All models include several system entities by default.

In this example procedure, you are importing several entities to a new model.

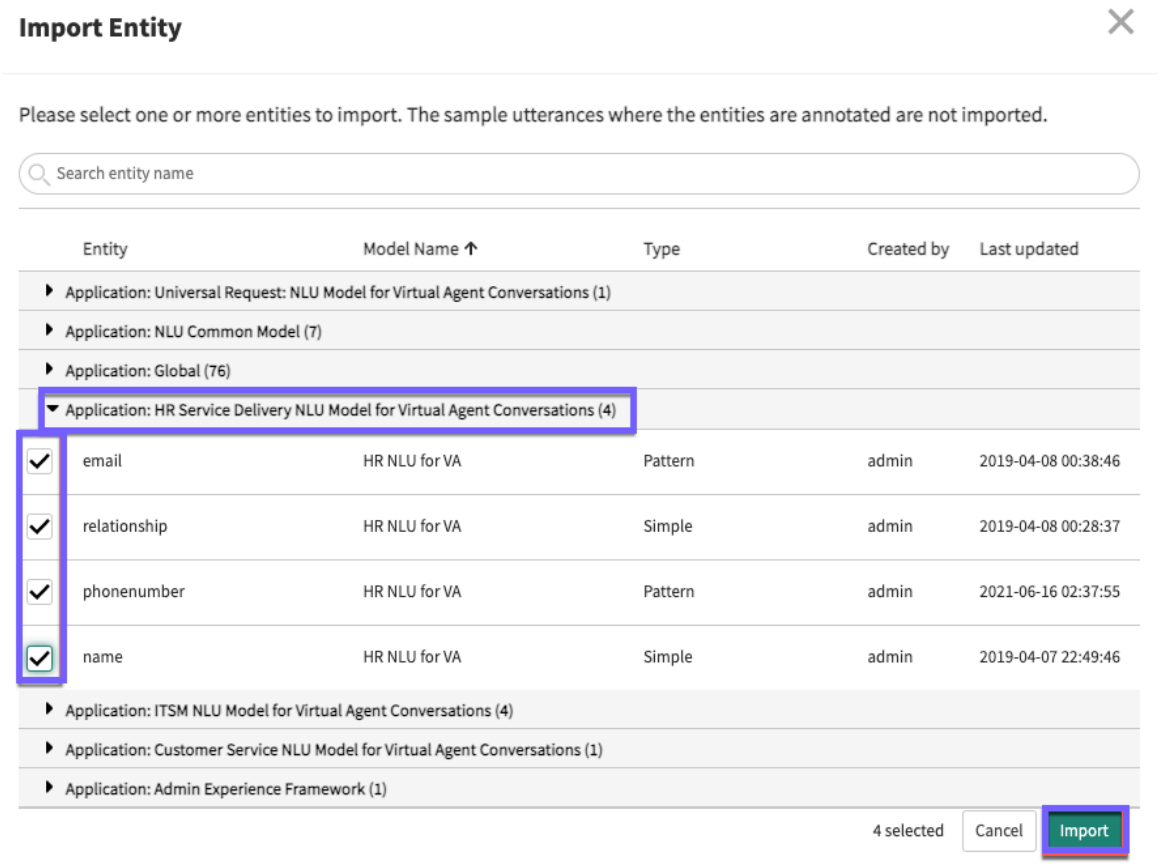
Procedure

1. Navigate to **All** > **NLU Workbench** > **Models**.
   The Virtual Agent tab opens by default.
2. Select the tab corresponding to your model's application, then select the name of the model you want to add entities to.
3. In the **Build and train your model** phase, select the **Entities** tab.
4. Select **Import entity**.



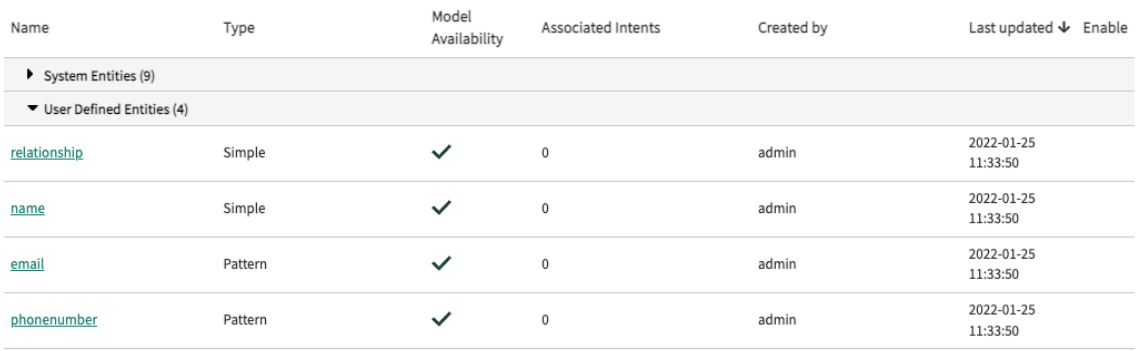
5. In the Import Entity window, select the entities you want to import.
   In this example, you click the drop-down arrow for Application: HR Service Delivery NLU Model for Virtual Agent Conversations. Select the four entities.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note: Importing entities does not import any utterances that are annotated with those entities. You must annotate your current model's utterances using the new imported entities, then retrain the model.

6. Click **Import**.
   The selected entities import to the model. The entities appear under **User Defined Entities** in the Entities tab. By default, **Model Availability** will be enabled so that all intents in the model can use the entity.



What to do next

Use the imported entities to annotate the utterances of the model. Train your model to save your changes.

Related topics

(Legacy) Import an NLU intent

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

(Legacy) Using regular expressions in entities

Learn how to use regular expressions in your NLU entities to establish patterns that help the system locate, match, and manage text.

Pattern entities use regular expressions (regex) to match any pattern of text, such as the format of an email address, a phone number, or an incident or case ID.

Note: ServiceNow uses and supports Java regex exclusively and not other vendor options, such as Perl regex.

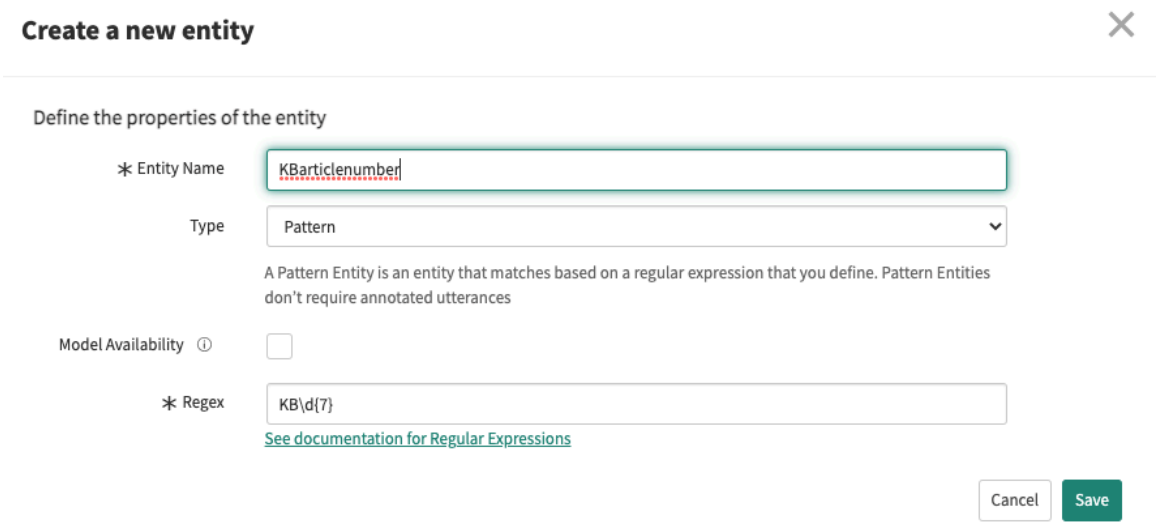
Regex examples

For a full example of regex code used in a pattern entity, see Create a pattern entity.

The following four examples provide the format and regex code for different pattern entities.

Knowledge base article

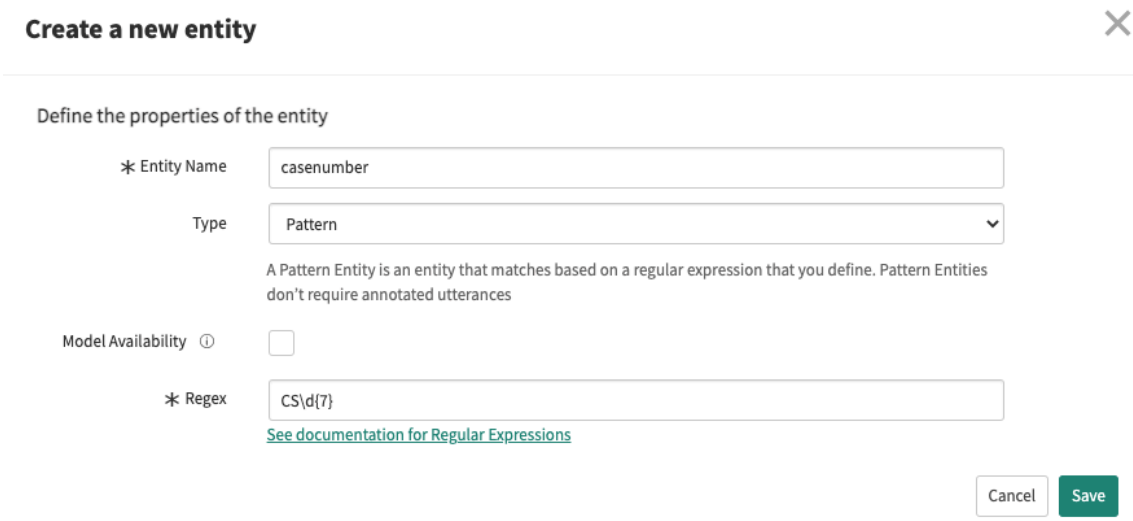
ServiceNow Knowledge Base (KB) articles use the format KB1234567. The regex code is KB\d{7}, where KB = knowledge base record and d{7} = 7 digits.



Case number

Case tasks use the format CS1234567. The regex code is CS\d{7} where CS = case record and d{7} = 7 digits.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



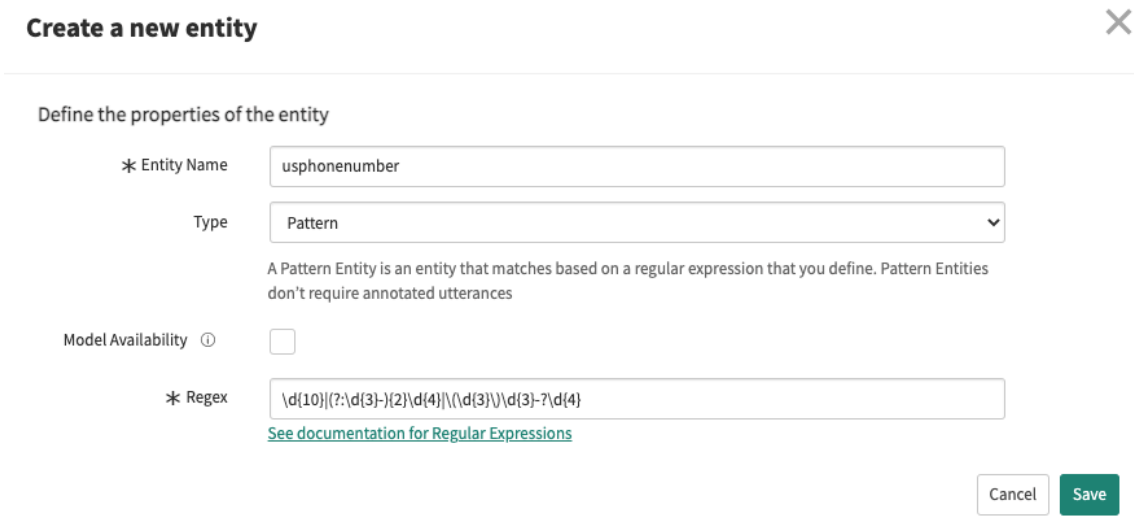
Email address

Email addresses use the format name@servicenow.com. The regex code is \b[a-zA-Z0-9&*/_.+-]+@[a-zA-Z0-9-]+\.[a-zA-Z0-9-.]+\b, which supports these formats: name@servicenow.com and name@servicenow.co.in.

Phone number

United States phone numbers use the format 555-123-4567. The regex code is \d{10}|(?:\d{3}-){2}\d{4}|\(\d{3}\)\d{3}-?\d{4}, which supports these formats: 5108882062,510-888-2062, and (510)888-2062.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Regex resources

For further information on regular expressions, see the following external links.

- Java Regular Expressions
- Java Regular Expression Tester
- Pattern (Java Platform SE7)
- Java regex match abbreviations

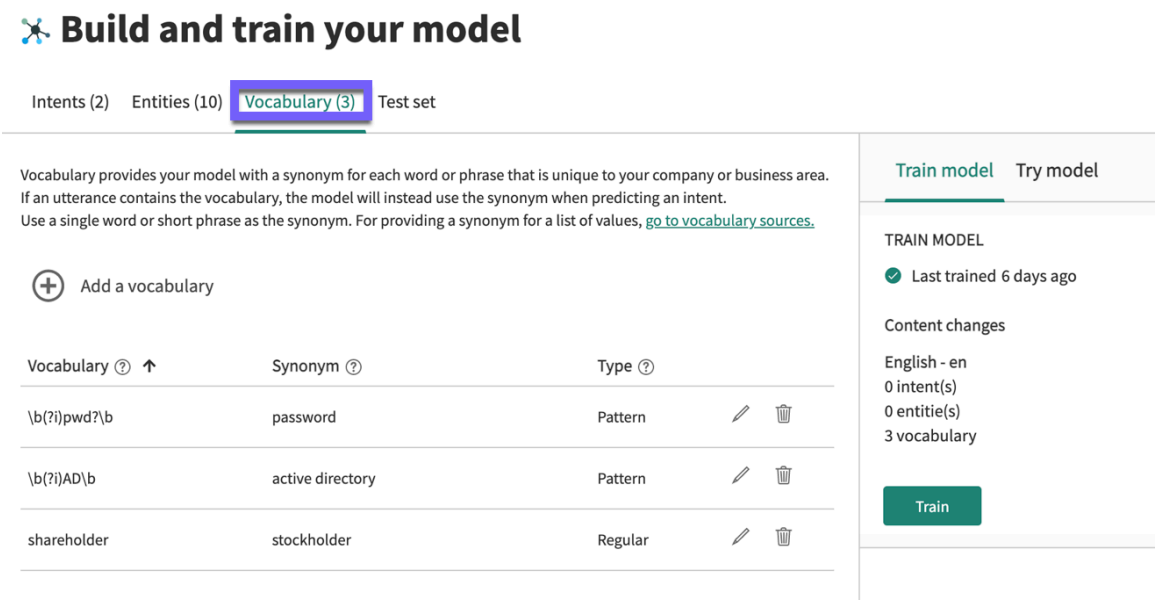
(Legacy) NLU vocabulary

Use NLU vocabulary items to help the system recognize the various ways your users express their requests. Use vocabulary sources to help the system recognize objects in tables or lists, such as names of conference rooms or catalog items.

Vocabulary usage and context

Vocabulary helps your model with the various words and phrases that it may encounter from your users. Since humans are not computers, they may come up with different ways to say the same thing. For example, if one user inputs an acronym rather than the full phrase, the system might be able to predict the correct intent by using the context in the utterance. However, by defining the acronym with a vocabulary item, you raise the model's confidence level and capability to predict intents correctly.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Vocabulary items cover the varying words or phrases that might appear in utterances. The vocabulary items are mapped to the synonyms that you provide, for intent prediction. This helps the system recognize the various ways your users express their requests, while at the same time ensuring the consistency, confidence, and accuracy of predictions.

Vocabulary item types

NLU provides the following vocabulary types that you can use to create and configure a vocabulary item.

Type	Definition
Regular	A word or phrase that is not commonly known, such as a business or industry specific term or acronym. Regular vocabulary is case insensitive, so all case variations will be captured by the vocabulary you create. See (Legacy) Create a regular vocabulary item.
Pattern	A regular expression (regex) that can capture specific formats such as email addresses and phone numbers. See (Legacy) Create a pattern vocabulary item.

Vocabulary sources

You can also use vocabulary sources to cover various objects that your users might request. Vocabulary items and vocabulary sources differ in their usage:

- Use a vocabulary item for an individual word, phrase, or pattern that can easily be mapped to a single synonym for the model to use.
- Use a vocabulary source to reference a ServiceNow table or list so that the values can all be replaced by the single synonym you define. Vocabulary sources can be reused across all your NLU models.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use vocabulary sources when your user utterances refer to objects in a set. The sources can be referenced from a list of values from a ServiceNow table or a static list that you define, such as a list of catalog items or conference rooms. Once you create and save these sources, you can use the @ symbol to specify them in training utterances. You can also use these sources as entity values.

For example, say you already have a list of all the conference rooms for your office. You can create a vocabulary source to reference that list rather than typing each conference room name into your intent's training utterances.

To create vocabulary sources, refer to (Legacy) Create a table vocabulary source and (Legacy) Create a list vocabulary source.

Vocabulary usage in relation to an intent

Here's an example of how an intent can interact with the vocabulary in its utterance examples.

Note: In NLU vocabulary, the synonym replaces the vocabulary that appears in the utterance.

Intent: OrderSoftware

Utterance	Issue and Solution
"I need to access sfcrm"	• Issue: the system doesn't recognize the acronym sfcrm, so can't accurately predict the intent. • Solution: Add sfcrm as a regular vocabulary item, and provide a synonym such as CRM software.
"I need to install Word"	• Issue: The term word is very common and does not necessarily indicate a software product. The term install may provide helpful context, but the confidence score may be too low to predict the OrderSoftware intent. • Solution: Create a pattern vocabulary item with a regex for capitalized Word, so that the system can recognize it as a software product. This added constraint makes it more likely that the OrderSoftware intent will be predicted. **Note:** To extract the specific software name to use in a Virtual Agent conversation topic, annotate it as an entity in the utterance.

Use a single word or short phrase as a synonym for best results. You can map multiple vocabulary items to one synonym. Do not map one vocabulary item to multiple synonyms.

For more context and examples, see (Legacy) Create an NLU intent.

A Regex example for a pattern vocabulary item

Let's say that you want to use a vocabulary item to identify the acronym IT, and map it to the synonym information technology.

Regular vocabulary items are case-insensitive by default. This means that a regular vocabulary item would match both the acronym IT and the common word it. So you decide to use a pattern vocabulary item.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The regex pattern that you can use is `\bIT\b`. The `\b` is a word boundary marker. This ensures that the pattern would not match ITSM or JIT, for example. The default case sensitivity of pattern vocabulary items means that `\bIT\b` would not match the common word it.

Regex details: You can turn off case sensitivity in a pattern by using `(?i)`. You can end that mode by using a minus sign as in `(?-i)`. For example, `(?i)te(?-i)st` should match both test and TEst, but not teST or TEST.

For more information, see (Legacy) Using regular expressions in entities.

Related topics

(Legacy) Create an NLU intent

(Legacy) Create a regular vocabulary item

Add a word or phrase that your users might use, and match that vocabulary item to a synonym. Your model uses the synonym during intent prediction.

Before you begin

- Make sure that the NLU Workbench plugin, NLU Workbench - Core plugin, NLU Common Model plugin, and Predictive Intelligence plugin are all installed and activated on your instance.
- Create or use an existing NLU model for Virtual Agent or AI Search.
- Role required: nlu_editor, nlu_admin, or admin. The editor must be assigned to the model.

About this task

Regular vocabulary items provide the model with a synonym for words or phrases your users might use in an utterance. The model uses the synonym to replace the vocabulary when predicting the intent. Use a single word for the synonym when possible.

Regular vocabulary items are case-insensitive by default. If you need to create a case-sensitive vocabulary item, use a pattern vocabulary item. For more information, see (Legacy) Create a pattern vocabulary item.

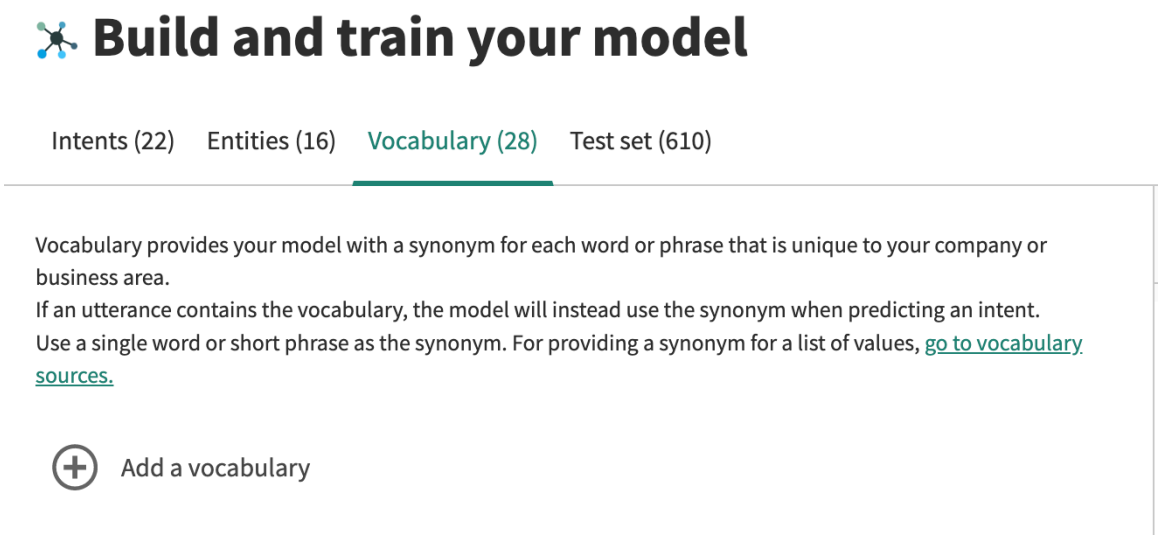
Note: Choose a synonym that is a commonly-occurring word in the same language as your model.

In this example scenario, you are adding a vocabulary item for the word credentials. Say that your users may use credentials to refer to their password. By creating a vocabulary item, you can make sure that the system correctly predicts the intent for an utterance such as reset my credentials.

Procedure

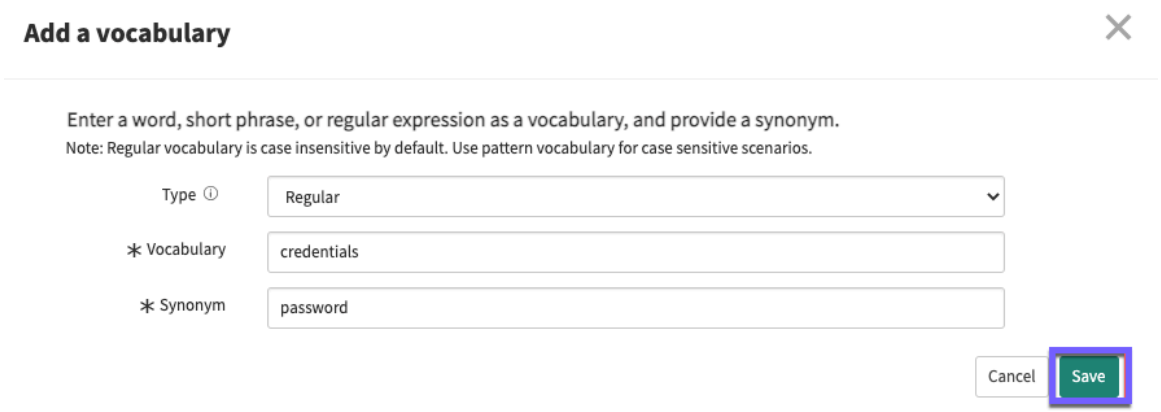
1. Navigate to **All** > **NLU Workbench** > **Models**.
   The Virtual Agent tab opens by default.
2. Select the tab corresponding to your model's application, then select the name of your model.
3. On the Model details tab of the model overview, select the **Vocabulary** card.
4. In the Vocabulary tab, select **Add a vocabulary**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. In the **Add a vocabulary** window, select **Regular** as the Type.
6. Add a vocabulary word or phrase that your users might use, and then add the synonym that the model should use for intent prediction.

   In this example procedure, add credentials as the vocabulary and password as the synonym.



7. Select **Save**.

What to do next

To deploy your new vocabulary item, train and publish your model again.

Add more vocabulary items to improve model coverage and accuracy.

(Legacy) Create a pattern vocabulary item

Use regular expression (regex) encoding to establish a pattern format for vocabulary items such as email addresses, phone numbers, and record naming conventions. You can create your own patterns for the vocabulary data in your instance.

Before you begin

- Make sure that the NLU Workbench plugin, NLU Workbench - Core plugin, NLU Common Model plugin, and Predictive Intelligence plugin are all installed and activated on your instance.
- Create or use an existing NLU model for Virtual Agent or AI Search.
- Role required: nlu_editor, nlu_admin, or admin. The editor must be assigned to the model.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

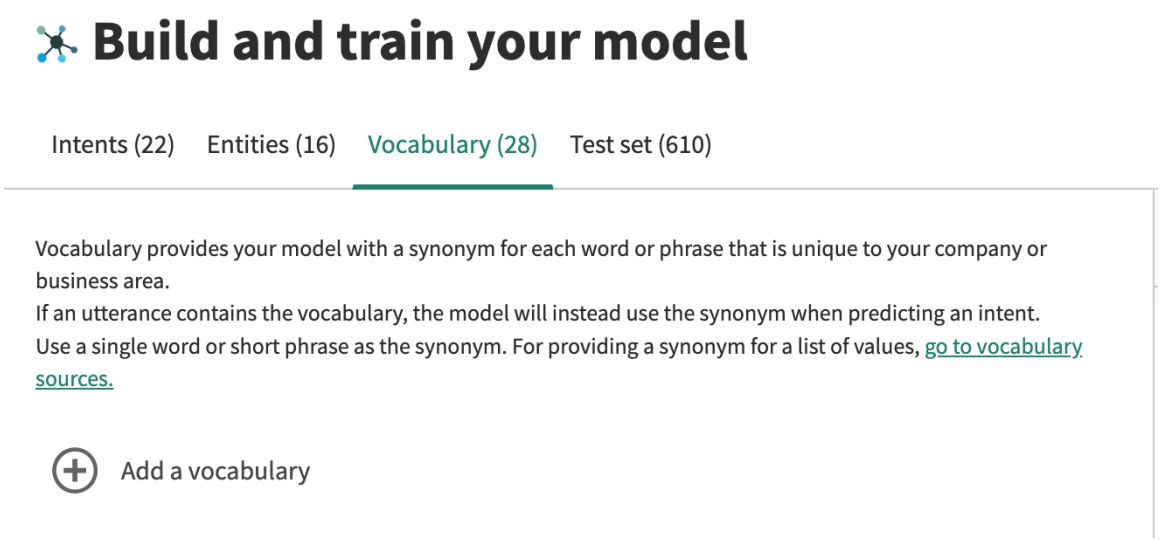
Pattern vocabulary items use regular expressions (regex) to find variations of words and phrases in your users' utterances. The pattern then maps these variations to the synonym you provide. The synonym is used during intent prediction.

In this example scenario, you've created an NLU Virtual Agent model for requests related to authentication. To refer to multi-factor authentication, your users often use "MFA", "mfa", or "mfa authentication". You can provide a pattern to cover these variations. They are replaced with the matching synonym multi-factor authentication when predicting an intent.

See (Legacy) Using regular expressions in entities for further details on regular expressions.

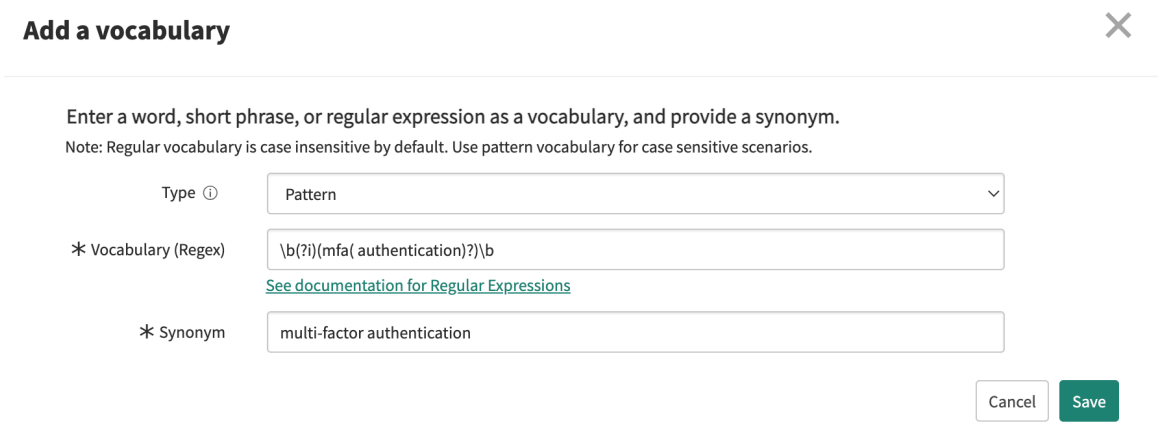
Procedure

1. Navigate to **All** > **NLU Workbench** > **Models**.
   The Virtual Agent tab opens by default.
2. Select the tab corresponding to your model's application, then select the name of your model.
3. On the Model details tab, select the **Vocabulary** card.
4. Click **Add a vocabulary**.



5. In the **Type** field of the **Add a vocabulary** window, select **Pattern**.
6. Add a regular expression that covers words or phrases in your users' utterances, and a synonym the model uses to predict the intent.
   In this example, the regular expression covers several variations of "mfa authentication".

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



7. Click **Save**.

   Result: Your pattern vocabulary item appears in the Vocabulary section of your Model screen. Each time a user's utterance contains one of the spelling variations, the system recognizes the meaning as multi-factor authentication, in this example.

Related topics

(Legacy) NLU vocabulary

(Legacy) Using regular expressions in entities

(Legacy) Create a list vocabulary source

Create a list of words or phrases to act as a vocabulary source. The values in the list source are replaced by the synonym if they are detected in a user utterance.

Before you begin

- Make sure that the NLU Workbench plugin, NLU Workbench - Core plugin, NLU Common Model plugin, and Predictive Intelligence plugin are all installed and activated on your instance.
- Role required: admin, nlu_admin, or nlu_editor

About this task

Creating a list vocabulary source enables your models to interpret all the alternate and actual values of the list if they appear in a user utterance. The model interprets those values as the synonym you provide when predicting an intent.

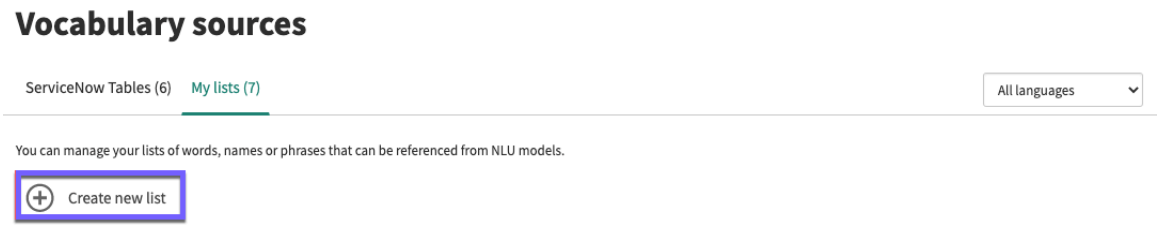
Note: During intent prediction, the synonym you provide replaces the value. During entity prediction, the actual value is used as the entity if the actual value or one of the alternate values are detected in the utterance.

In this example procedure, you're creating a list vocabulary source for your company's meeting rooms. You add the names of the rooms and alternatives your users might call them. Once you create the list, you add it to an utterance in an intent for the model. The model interprets the intent (for example, #BookMeetingRoom) and uses the name the user entered as an entity (for example, Everest).

Procedure

1. Navigate to **All** > **NLU Workbench** > **Vocabulary Sources**.
2. Click the **My lists** tab.
3. Click **Create new list**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

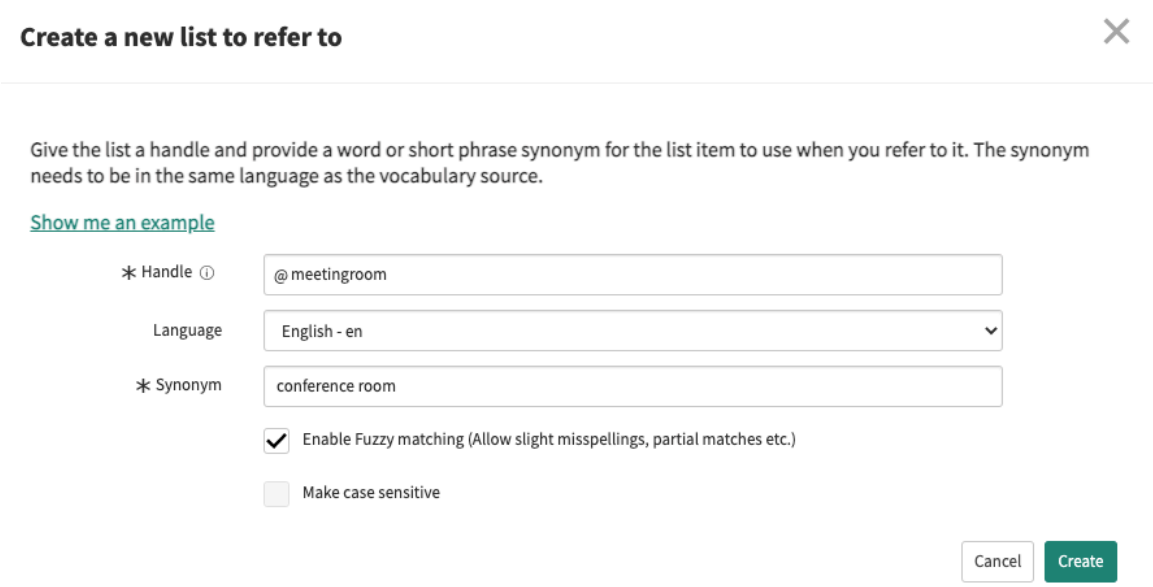


4. In the **Create a new list to refer to** window, configure the fields.

Field	Description
Handle	Name for the vocabulary source. Used to refer to in an utterance.
Language	Language of the vocabulary source. Synonym must be in the same language.
Synonym	Word or phrase the model uses during intent prediction. Choose a commonly-occurring word in the same language as your model.
Enable Fuzzy Matching	Check this box if you want the items on the list to match when a user utterance has slight misspellings.
Make case sensitive	Check this box to make the values in the list case sensitive. Utterances with wrong cases won't match.

For this example, use the following configurations:

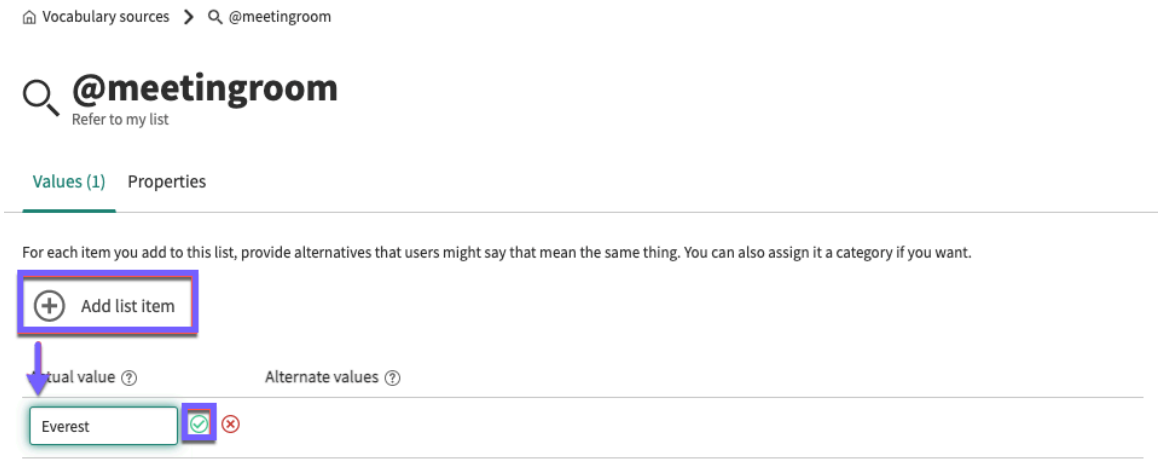
- **Handle**: `@meetingroom`
- **Language**: `English - en`
- **Synonym**: `meeting room`
- **Enable Fuzzy Matching**: Select the box.
- **Make case sensitive**: Leave the box clear.



5. Click **Create**.
   Your list vocabulary source draft appears in the My lists section of the Vocabulary sources screen.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Click the name of the list vocabulary source.
7. Click **Add list item**.
8. Enter a value for the list and click the green check mark.



In this example, you enter `Everest`.

9. Double-click the area under **Alternate values** to add alternatives separated by a comma.

10. Train the model to make the list vocabulary source available.

What to do next

Add the rest of the break room names and alternatives.

You must retrain the model after updating a list vocabulary source. For more information, see (Legacy) Train and try your NLU model.

Then you can use the list vocabulary source when annotating a training utterance. Use the @ symbol with the handle to refer to this vocabulary source.

(Legacy) Create a table vocabulary source

Use the values from a ServiceNow table as a vocabulary source. Your Natural Language Understanding (NLU) models use your provided synonym to interpret utterances that contain values from the chosen source fields of the table.

Before you begin

- Make sure that the NLU Workbench plugin, NLU Workbench - Core plugin, NLU Common Model plugin, and Predictive Intelligence plugin are all installed and activated on your instance.
- Role required: admin or nlu_admin

About this task

Add a ServiceNow table to be used as a vocabulary source. Select one or more source fields of the table. Then, provide a synonym to be used by the model when interpreting utterances that contain values from the table. Note that the **Reference** field is not supported as a source field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When you create and sync a table vocabulary source, the values from the table in your instance are extracted, and a vocabulary source is created in the NLU Service. For more information on the NLU Service, see NLU Service Updates.

Note: You should not create multiple vocabulary sources that reference the same table and fields. Create only one vocabulary source (and provide a synonym) for the particular table and fields you want to reference in the model. Otherwise, it would cause confusion in the model and interfere with prediction quality.

In this example procedure, you want your models to be able to interpret utterances with locations. The ServiceNow location (cmn_location) table already contains information regarding important locations. You set up the location table to be used as a vocabulary source.

Procedure

1. Navigate to **All** > **NLU Workbench** > **Vocabulary Sources**.
2. Click **ServiceNow Tables**.
3. Click **Add another table**.
4. On the Add another table to refer to page, configure the fields.

   a. Select the table, handle, and synonym for the table.

   In this example, use the following configurations:

   - **Table**: Select **Location (cmn_location)**.
   - **Handle**: Use the system-generated handle, @Location.
   - **Synonym**: Use the system-generated synonym, Location. You can update this value to ensure that it's a synonym for each individual item in the vocabulary source.

     Note: Choose a synonym that is a commonly-occurring word in the same language as your vocabulary source.

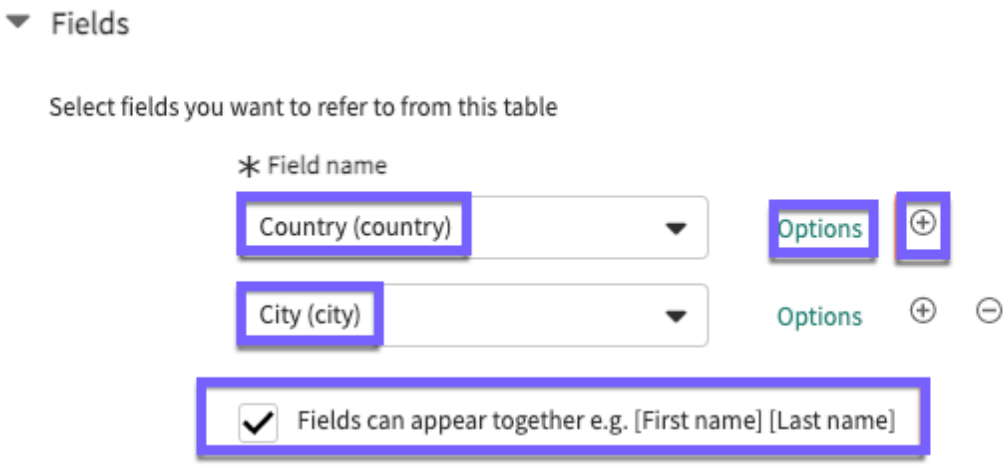
   b. Select the fields you want to refer to from the source table.

   Note: To add multiple fields, select the plus icon.

   In this example, use the following configurations:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Field name**: Select the **Country (country)** and **City (city)** fields.
- **Options**: Click **Options**, then select the **Use this field to look up values** check box for both of the **Field name** values. Checking the box makes it so either a country name or a city name can be used in an utterance for finding a record in the vocabulary source. You can also use multiple comma-separate values in this field, for example, if your city column has multiple names, such as NYC, New York, and New York City.
- **Fields can appear together**: Leave the check box empty. This field is typically used in an NLU Search model, where users can enter words next to each other in an utterance to find a record. For example, you can enter `Pierre Development` while searching for an employee named Pierre who works in the Development team, where **Name** and **Team** are two fields in the table.



c. Configure the advanced options.

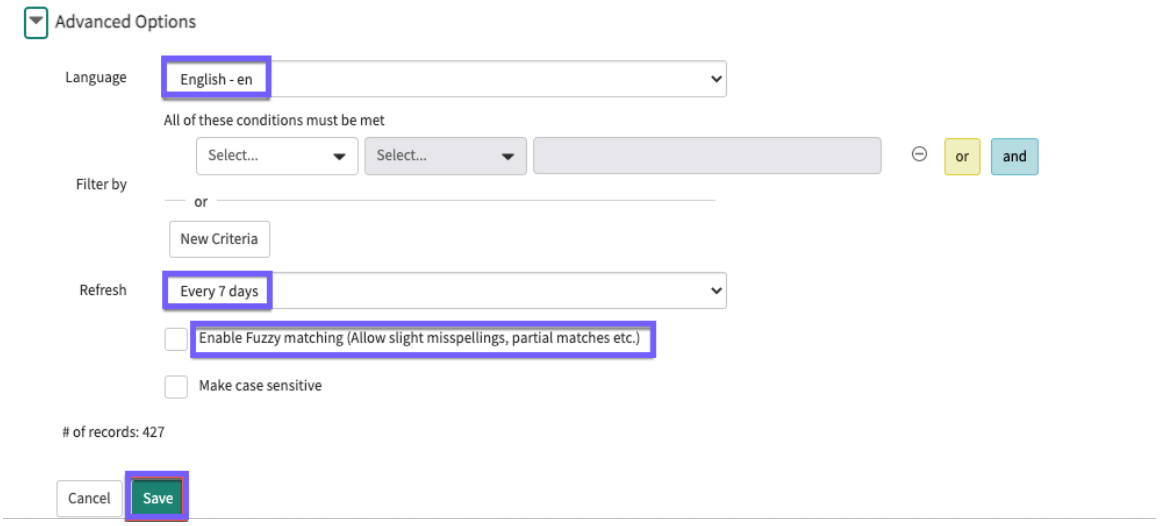
In this example, use the following configurations:

- **Language**: Select **English - en**.
- **Filter by**: You can use the condition builder to filter the values in the source table for the vocabulary source. Leave empty for this scenario.
- **Refresh**: Select **Every 7 days**. By selecting this, you set the system to get new values from the table every seven days. There are different refresh options you can choose based on how often the source table is updated.
- **Enable Fuzzy matching**: Checking this box make it so a record can be matched even if an utterance contains a slightly misspelled word or part of a word. For example, when searching for a city such as Kansas City, you might enter Kansas City or just Kansas, and the system will still be able to match with the correct location record. Fuzzy matching may

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

return false matches in some cases. Use fuzzy matching sparingly and test out your model before using it.

- **Make case sensitive**: If you don't enable fuzzy matching, you can check this box to make the values in the source table case sensitive. If an utterance doesn't use the correct cases, the model doesn't predict the intent.



5. Click **Save**.

   Result: Your **@Location** table vocabulary source appears on the Vocabulary sources screen, where it begins to sync with its source table.

6. If the sync doesn't start immediately, select the **Sync Lookup** icon on the far right to sync the source table data with the NLU Service.
   Result: When the sync completes, you can use the vocabulary source in your models. You don't need to retrain the model after updating a table vocabulary source.

What to do next

Add a vocabulary source to a model by annotating an utterance. Use the @ symbol when adding an example utterance to an intent.

(Legacy) Sync a table vocabulary source

Synchronize your table vocabulary sources to obtain the latest changes to the ServiceNow source table. Synchronizing your vocabulary sources ensures your NLU models have the latest values when predicting intents.

Before you begin

- Make sure that the NLU Workbench plugin, NLU Workbench - Core plugin, NLU Common Model plugin, and Predictive Intelligence plugin are all installed and activated on your instance.
- Role required: admin or nlu_admin

About this task

When you reference a vocabulary source in an utterance, it pulls the values at the time the model is trained. However, if the table values change over time, the model still references the values from the last training session.

You can select a schedule to automatically refresh the vocabulary values used by NLU. This schedule can be edited later. For more information, see (Legacy) Create a table vocabulary source.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

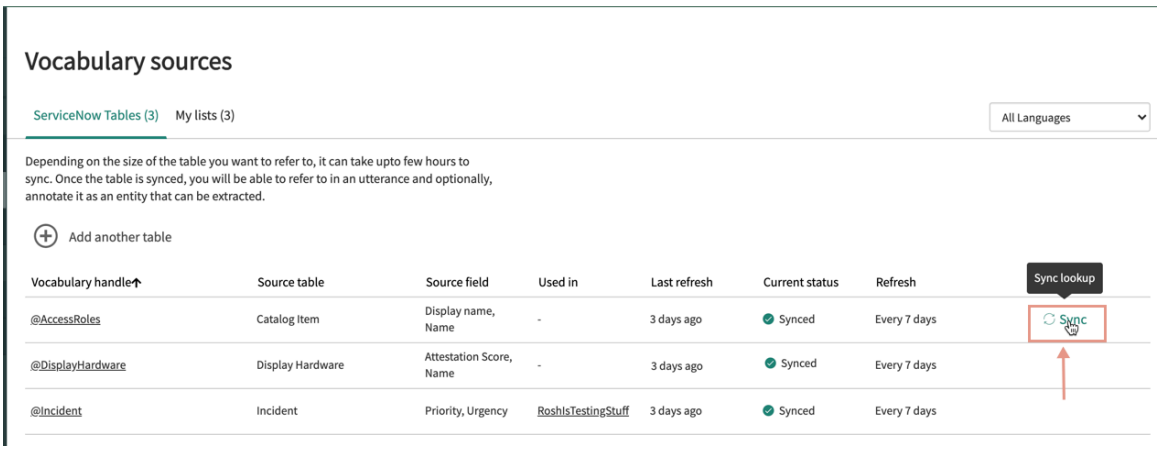
You can also manually sync a table vocabulary source, such as before model training.

Note: If an utterance references a table vocabulary source that has never been synchronized, the model fails to train. Check the vocabulary source's current status, and sync manually if **Never synced**.

In the following example scenario, you're manually syncing the @AccessRoles vocabulary source to the Catalog Item table.

Procedure

1. Navigate to **All** > **NLU Workbench** > **Vocabulary Sources**.
2. In the ServiceNow Tables tab, point just to the right of the **Refresh** column to invoke the **Sync lookup** icon.

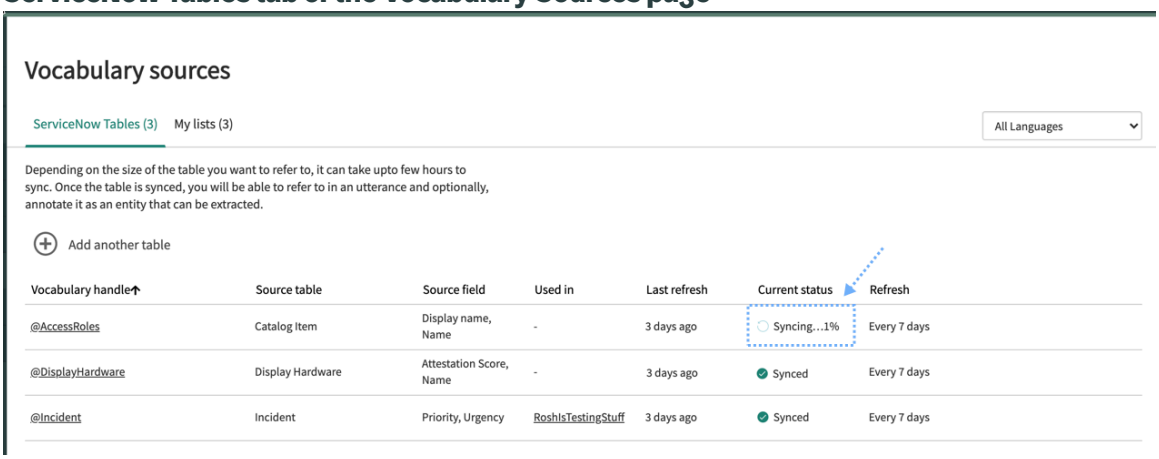


3. Select **Sync**.
   The vocabulary source starts synchronization.

What to do next

The syncing operation can take some time, depending on the source table size.

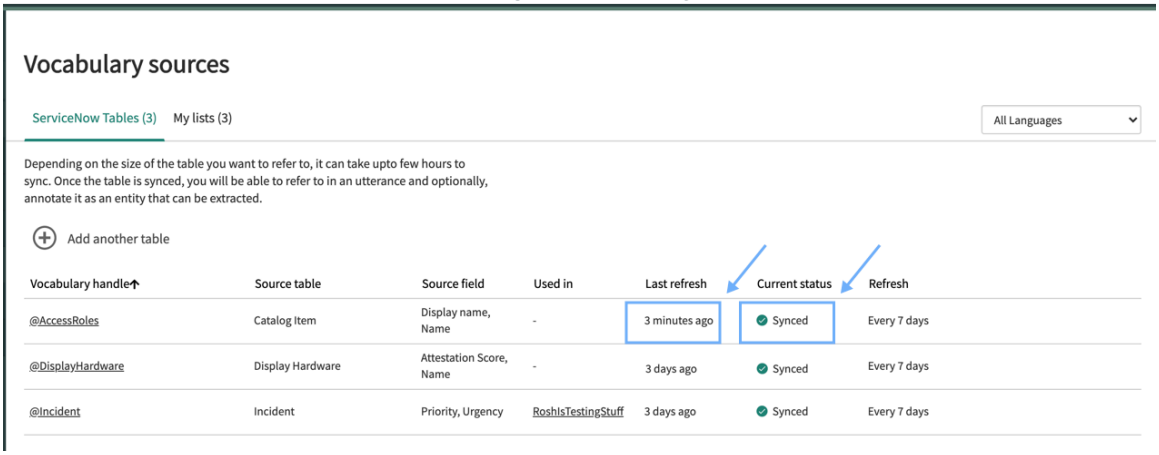
ServiceNow Tables tab of the Vocabulary Sources page



The values in the Last refresh and Current status columns reflect the current status of the vocabulary source.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ServiceNow Tables tab of the Vocabulary Sources page



Proceed to train your model. For more information on model training, see (Legacy) Train and try your NLU model.

For information about errors when syncing a table vocabulary source, see article KB1588239 in the Now Support Knowledge Base.

Related topics

(Legacy) Create a table vocabulary source

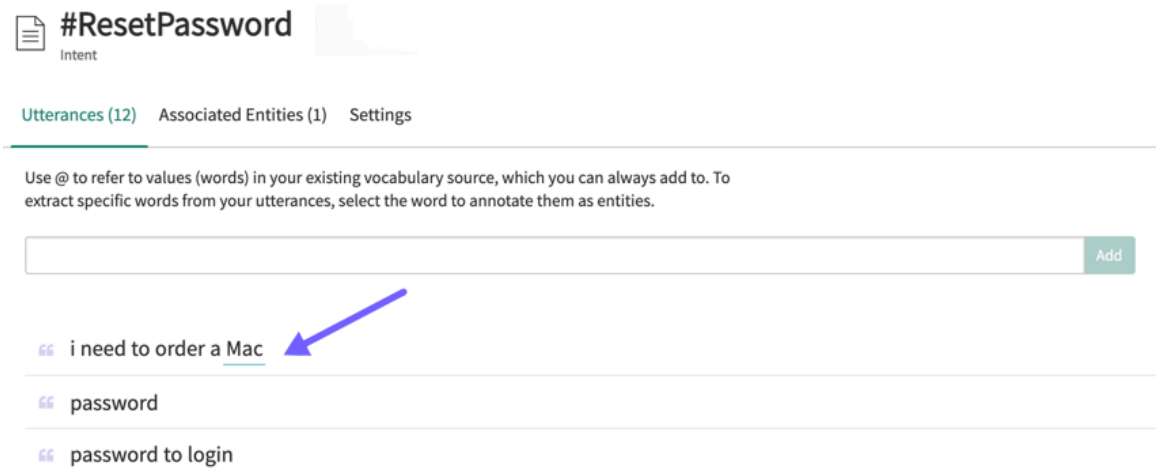
(Legacy) Pre-built vocabulary

Use ServiceNow® pre-built vocabulary for software and hardware terms so the system recognizes their multiple variations in utterances.

Your Natural Language Understanding models contain pre-built vocabulary settings you can use when adding an example utterance. The vocabulary provides definitions for software and hardware terms whether they're expressed in slang or professional usage. The vocabulary can also recognize product misspellings.

For example, for one of your example utterances, you enter `I need to order a Mac`. When the system recognizes a pre-built vocabulary item, the term has a blue line under it.

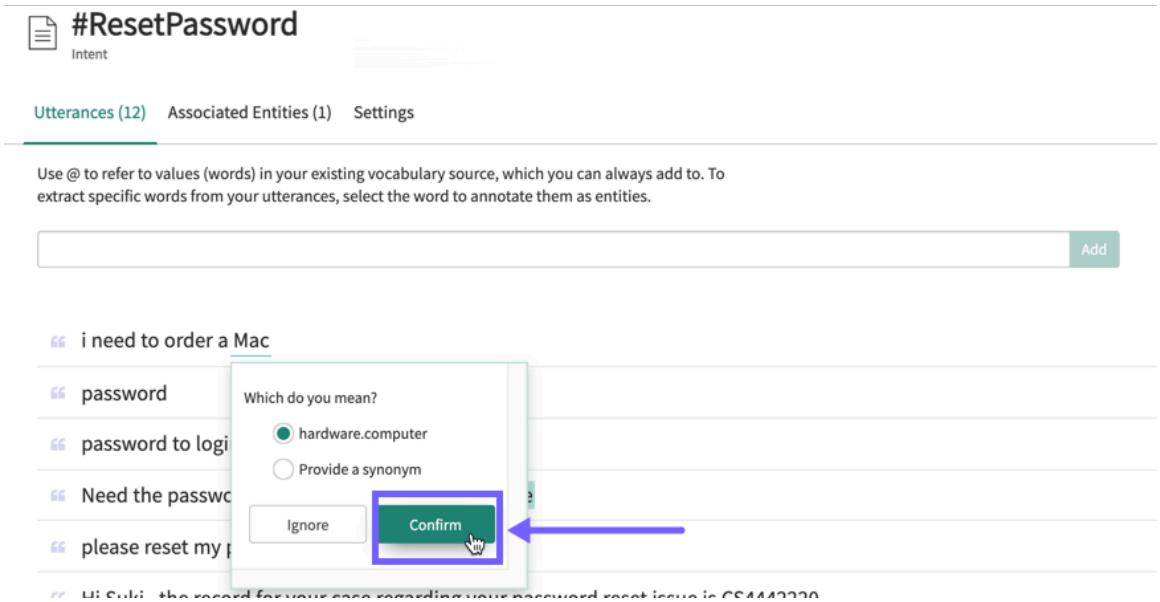
Utterance tab of the Intent details page



When you click the word, a window appears with two options to choose for the word:

- A pre-built suggested definition for the word
- An option to add a synonym

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



If you select the first option and click **Confirm**, the system uses the pre-built suggested definition and the blue line disappears.

If you select the second option, enter a synonym for the word, and click **Confirm**, the word and the synonym are added to the model vocabulary.

If you select either of the two options and click **Ignore**, the blue line disappears and the word remains as it was previously.

(Legacy) Test set creation and management

Use the default test set of your NLU model to test the model's performance and accuracy. Manage your test set over time by building or updating its content in the NLU Workbench.

Note: To test your model, install the ServiceNow® Store application NLU Workbench - Advanced Features. For more information, see (Legacy) Install NLU Workbench - Advanced Features.

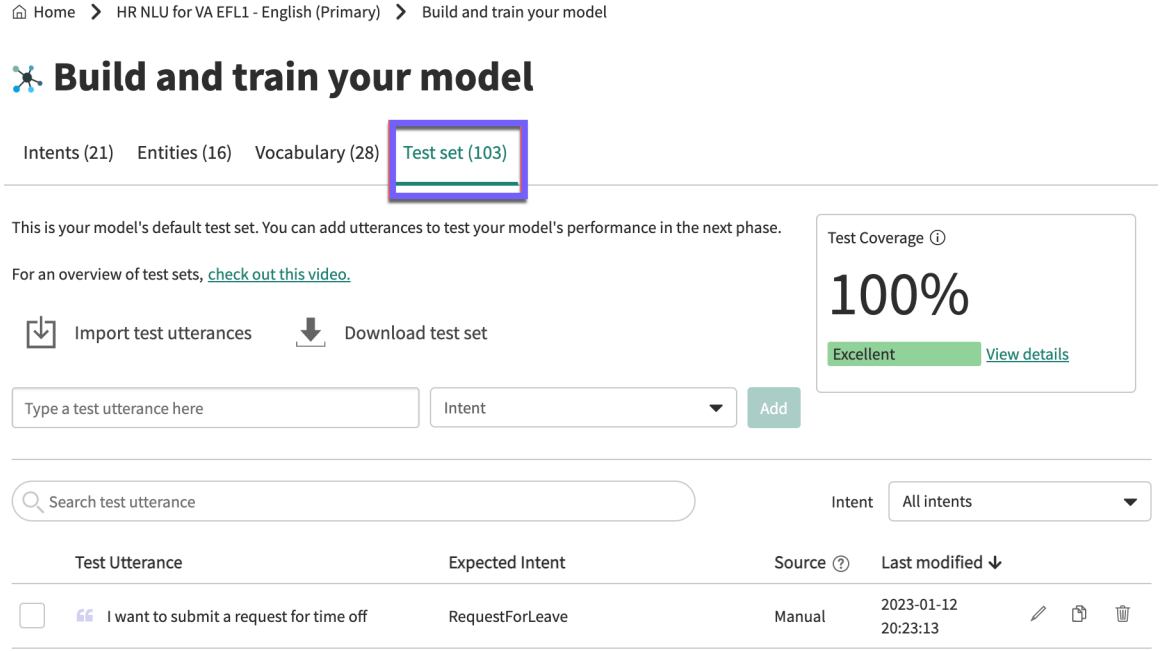
When you create an NLU model for Virtual Agent or AI Search, a default test set is created and associated to the model. You can use the default test set to evaluate the model's performance. Initially the test set is empty, ready to be populated with your content.

Access your default test set

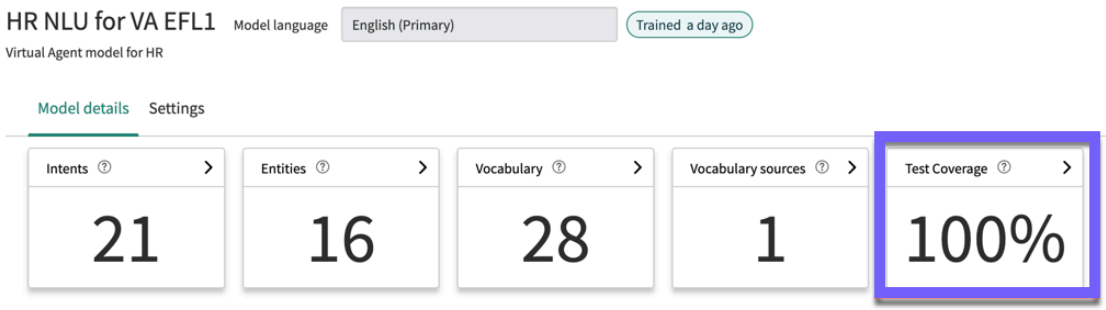
Access your default test set with one of the following methods.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Navigate to **All** > **NLU Workbench** > **Models**. Select the tab for your model's application, then the name of your model from the list. On the model's overview page, find the **Build and Train your model** card and select its **View phase** button. Then select the **Test set** tab.



- Navigate to **All** > **NLU Workbench** > **Models**. Select the tab for your model's application, then the name of your model from the list. On the model's overview page, select the **Test Coverage** tile.



- Navigate to **All** > **Multi-model Batch Testing** > **Test sets** tab. Find the name of your model. Default test sets are labeled as **Default**.

Add content to your default test set

Add utterances and their expected intents to build and manage your test set over time. You can add content to the default test set with the following methods:

- Add test utterances and their expected intents manually. From the model's overview page navigate to **Build and train your model** > **Test set** tab. Type your input into the Type a test utterance here field, select an appropriate intent, then select the **Add** button.

  These test utterances are assigned a source of Manual.

- Import test utterances and their expected intents from a CSV file or from other models. To import content to a default test set, from the model's overview page navigate to **Build and train your model** > **Test set** tab. Select **Import test utterances**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Imported test utterances are assigned a source of Manual.

- The Expert Feedback Loop feature lets you add actual user utterances from Virtual Agent chat logs to the test set.

  These test utterances are assigned a source of Expert Feedback. For more information, see (Legacy) NLU Expert Feedback Loop.

Test Coverage

The Test Coverage score is the percentage of a model's enabled intents that have test utterances in the default test set. Before testing your model, ensure that there is at least 60% coverage. The higher the Test Coverage score, the more accurate the performance testing results.

Your test coverage needs to be at least 60%, with at least 5 test utterances per intent, in order for the system to provide an optimal confidence threshold during batch testing. For more information about the confidence threshold, see (Legacy) NLU model settings.

Aim to have about 10 percent of a model's test utterances marked as "not relevant", meaning that there is no intent associated. This helps assess how the model handles irrelevant utterances which should not have any intent predicted. For more information about irrelevant utterances, see (Legacy) Irrelevance detection in NLU.

Use the test set

To use the default test set from the **Test and publish your model** phase, see (Legacy) Test and publish your model.

To use the test set in Multi-model Batch Testing, see (Legacy) Multi-model Batch Testing.

Characteristics of default test sets

When an instance is upgraded, default test sets are created for any existing models that don't already have them.

When you copy a model using **Duplicate this model**, the original's default test set is copied into the new model. For more information, see (Legacy) Duplicate an NLU model.

The utterances in the test set shouldn't be the same as the utterances in the training set.

Default test sets can't be deleted separately from their models.

Test set utterances should be in the same language as their model.

Test sets are available for Virtual Agent or AI Search models.

Downloading or moving default test sets

Default test sets can be downloaded or moved as follows.

- Default test sets can be separately downloaded in CSV format. To download the test set, from the model's overview page navigate to **Build and train your model** > **Test set** tab. Select **Download test set**.

  Note: Test sets that are downloaded from **Download test set** contain test utterances and their expected intents, but not the sources.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Default test sets can be moved with update sets. When you add an NLU model to an update set, its default test set is added, including test utterances, expected intents, and sources. For more information, see (Legacy) Add an NLU model to an update set.
- When using the **Export model as CSV** function in the **All existing models** table, the default test set is not included. For more information, see (Legacy) Export an NLU model.

(Legacy) Train and try your NLU model

Train and try your model iteratively so that its intents and entities are validated, compiled, and saved to your model.

Before you begin

- Make sure that the NLU Workbench - Core plugin, NLU Workbench plugin, and Predictive Intelligence plugin are all installed and activated.
- Create an NLU model. For more information, see (Legacy) Creating models.
- Create one or more NLU intents and their associated entities for your model. For more information, see (Legacy) NLU intents.
- If any utterance references a table vocabulary source, ensure that the source has been synchronized so that its values are available to your model. For more information see (Legacy) Sync a table vocabulary source.
- Role required: nlu_editor, nlu_admin, or admin. The NLU editor must be assigned to the model.

About this task

Training your model saves any changes you made to the content, and checks for conflicts or errors. Training also makes a model available for publishing.

After training, you can try your model by manually entering individual utterances to see what intents are predicted.

Note: To run a test of your model against a list of test utterances, see (Legacy) Test and publish your model.

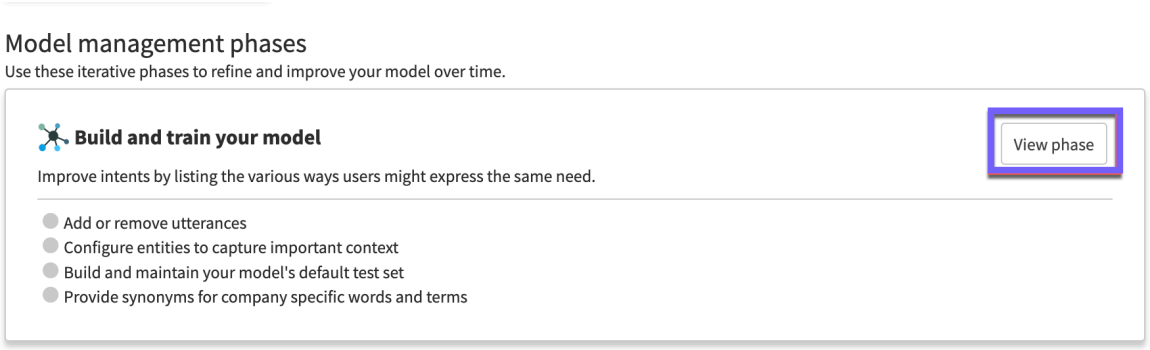
The mid-conversation responses of Dialog Acts can't be tried or tested in NLU Workbench.

In this example scenario, you've already built sufficient model content by adding intents, utterances, entities, and their associated annotations. Following the example procedure, you first train your NLU model. Then you try your model by manually entering utterances so you can check the prediction results and confidence scores.

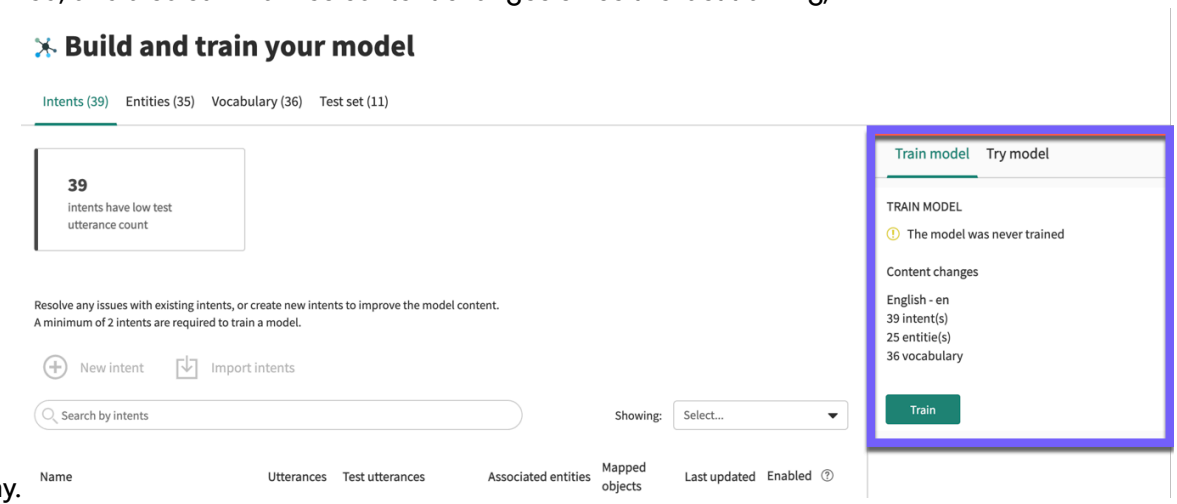
Procedure

1. Navigate to **All** > **NLU Workbench** > **Models**.
   The Virtual Agent tab opens by default.
2. Select the tab for your model's application, then select the name of your model.
3. In the **Model details** tab of the model overview, make sure there is enough content in Intents, Entities, and Vocabulary.
4. On the **Build and train your model** card on the model overview, select **View phase**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



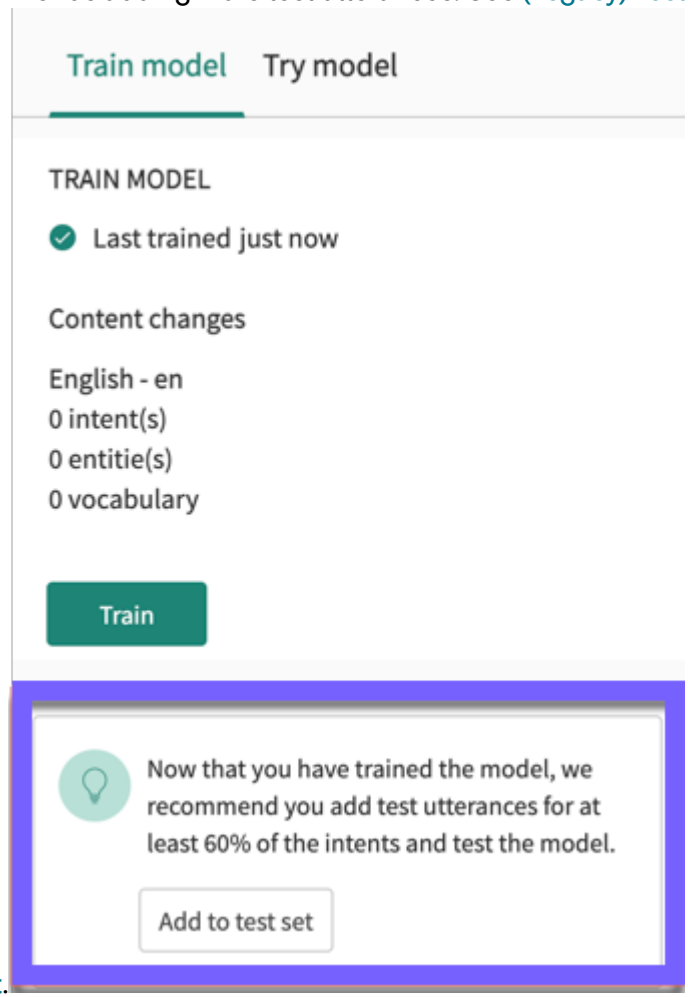
5. When the **Build and train your model** phase opens, ensure that the **Train model** tab is selected.
   Result: The **Train model** tab displays the last time the model was trained, and also summarizes content changes since the last training, if any.



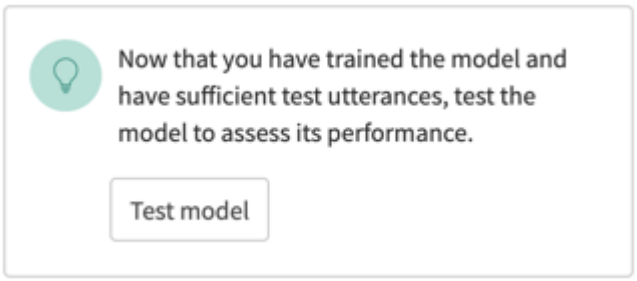
6. Select the **Train** button.
   Result: The system displays a progress bar during training. When finished, the system displays one of two recommendations:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- When less than 60% of the model's intents are covered in the default test set, the system recommends adding more test utterances. See (Legacy) Test set creation and management.



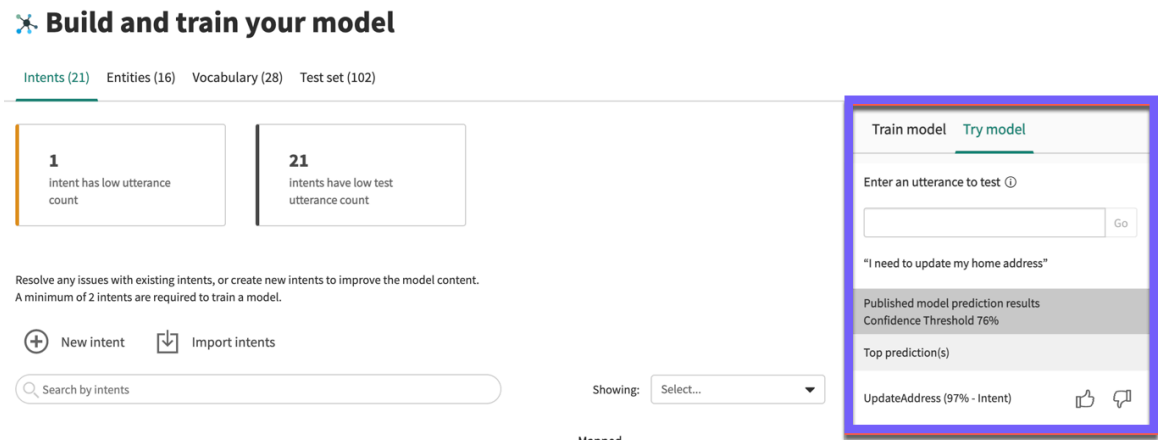
- When over 60% of the model's intents are covered in the default test set, the system recommends proceeding to testing. See (Legacy) Test and publish your model.



7. To manually try individual utterances, select the **Try model** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. In the text field under **Enter an utterance to test**, type an utterance and select **Go**.



Result

In this example, you entered `I need to update my home address` as the utterance to try.

1. The system displays the model's confidence threshold, which is 76% in this example.
2. Under **Top prediction(s)**, the system displays all intents that were predicted with a confidence score greater than the threshold.
3. In the example, the intent UpdateAddress is predicted with a confidence score of 97%, which is greater than the threshold of 76%.

The **Try model** results also display thumbs-up and thumbs-down icons for you to provide feedback. For more information, see (Legacy) Test panel feedback.

What to do next

- Continue trying various utterances to check that your updates to model content are effective. See (Legacy) Compare draft and published versions of your NLU model.
- To test your model against a list of test utterances, use its default test set in the (Legacy) Test and publish your model phase, or navigate to (Legacy) Multi-model Batch Testing.
- To adjust the model's confidence threshold, use the **Settings** tab on the model's overview page. For more information, see (Legacy) NLU model settings.
- If you're satisfied with the results of your testing, Publish your NLU model.

(Legacy) Test panel feedback

When testing your NLU model on the Try model section of the test panel, use this feature to provide feedback on the model's intent predictions.

Summary context

When a model is trained and tested for an utterance and the model returns an intent prediction, you can provide a thumbs up or thumbs down rating on the predicted intent it returns. Marking a different intent prediction as correct adds the utterance to the corrected intent. All other feedback is captured for continual learning. The system then incorporates your feedback to optimize the model predictions. This feature requires the nlu_admin role to access and test the model. NLU editors can also access the test panel if an NLU admin assigns them to it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Providing prediction feedback

The ratings you provide help the system to match an intent to an utterance. These ratings are essential for the system to continuously learn, evolve, and improve the accuracy of the intent predictions based on user input. They also enable you to notify the system if the intent prediction is correct or not.

The following scenarios below show examples of how to interact with your model test panel and provide prediction feedback to the system. In all scenarios, you use these four steps:

1. In the **Build and train your model** phase of your model, select **Try model** to open the test panel.
2. In the test panel's **Enter an utterance to test** field, enter a brief utterance that's similar to a training utterance in one of the intents.
3. Click **GO**.

   Result: The system returns its predictions for your test utterance in the **Top Predictions(s)** section of the test panel.

4. Click the **Thumbs Up** icon or the **Thumbs Down** icon.

   If you want the system to know it has predicted the correct intent for your utterance, select the **Thumbs Up** icon.

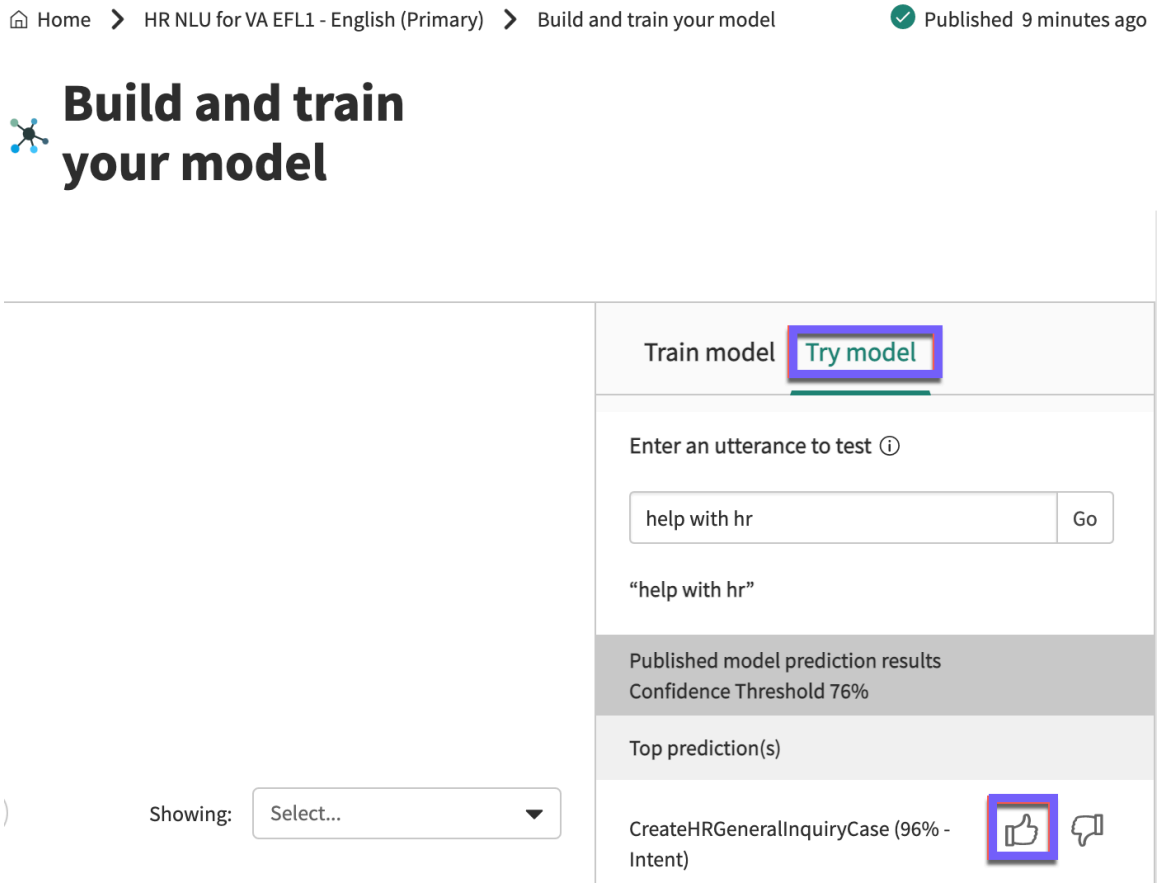
   In all other cases, select the **Thumbs Down** icon, which opens the **Provide feedback to improve this prediction** section. Here you can choose an intent other than the top predicted intent.

Scenario 1: On the Try model section of the test panel, you enter `help with hr` as the utterance. When the top prediction results appear, you're confident that the predicted intent is the correct match to your utterance. So in this case, you click the **Thumbs Up** icon.

Results:

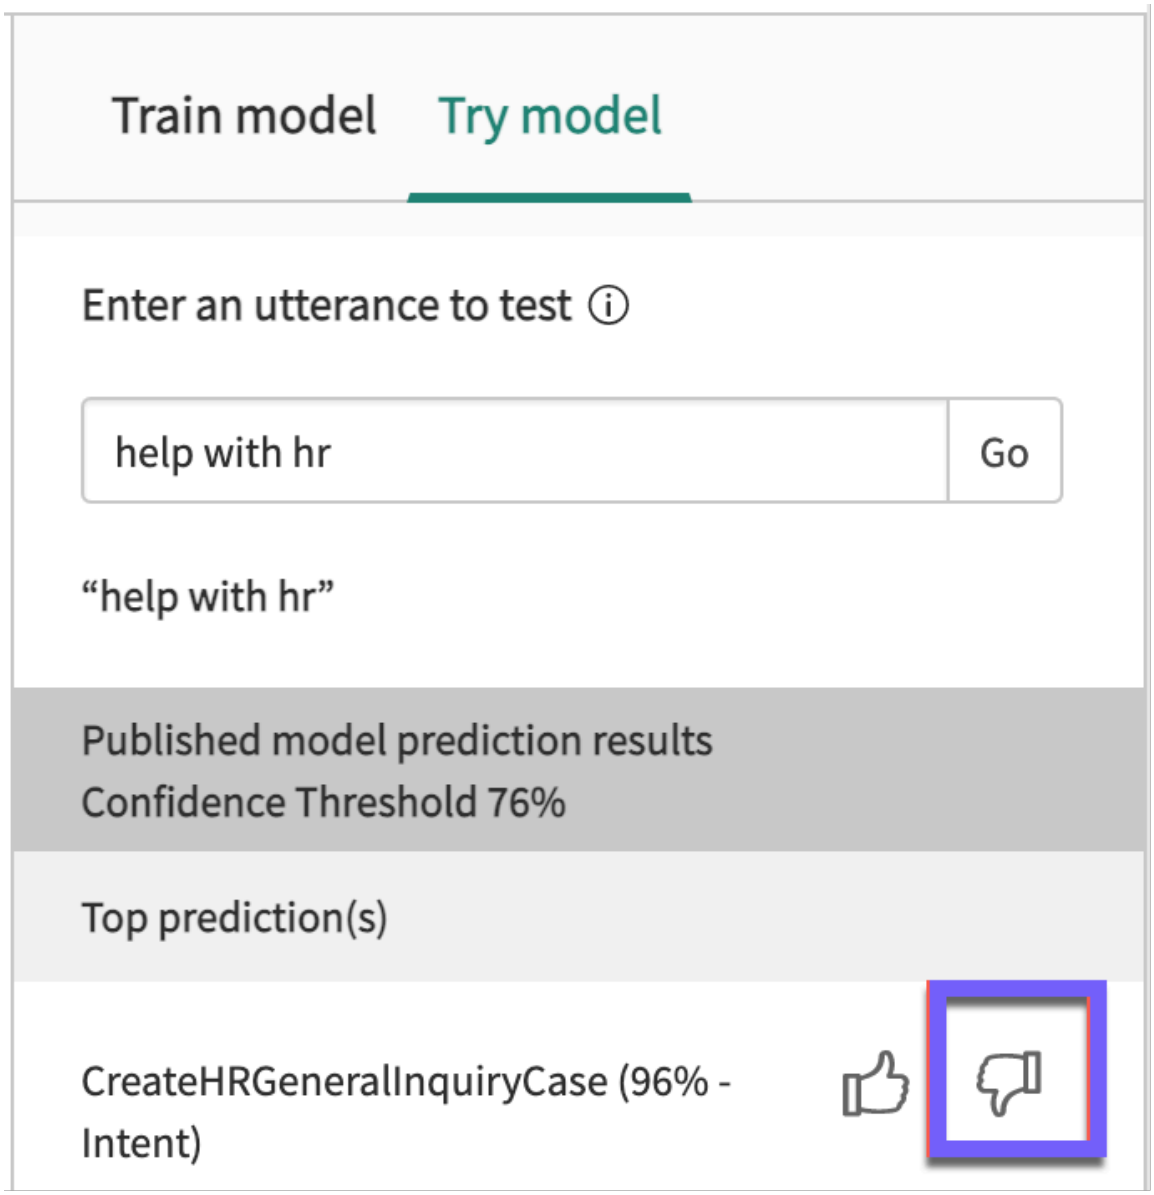
- The system predicted the correct intent, which in this case is **#CreateHRGeneralInquiryCase**.
- Your feedback notifies the system that it has matched the correct intent to your test utterance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Scenario 2: In a separate model on a separate instance, a different user enters the same `help with hr` utterance. The system responds with the top prediction results for the intent, but the user isn't sure if it's the correct intent or not. So this user clicks the **Thumbs Down** icon, as shown in the image below.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

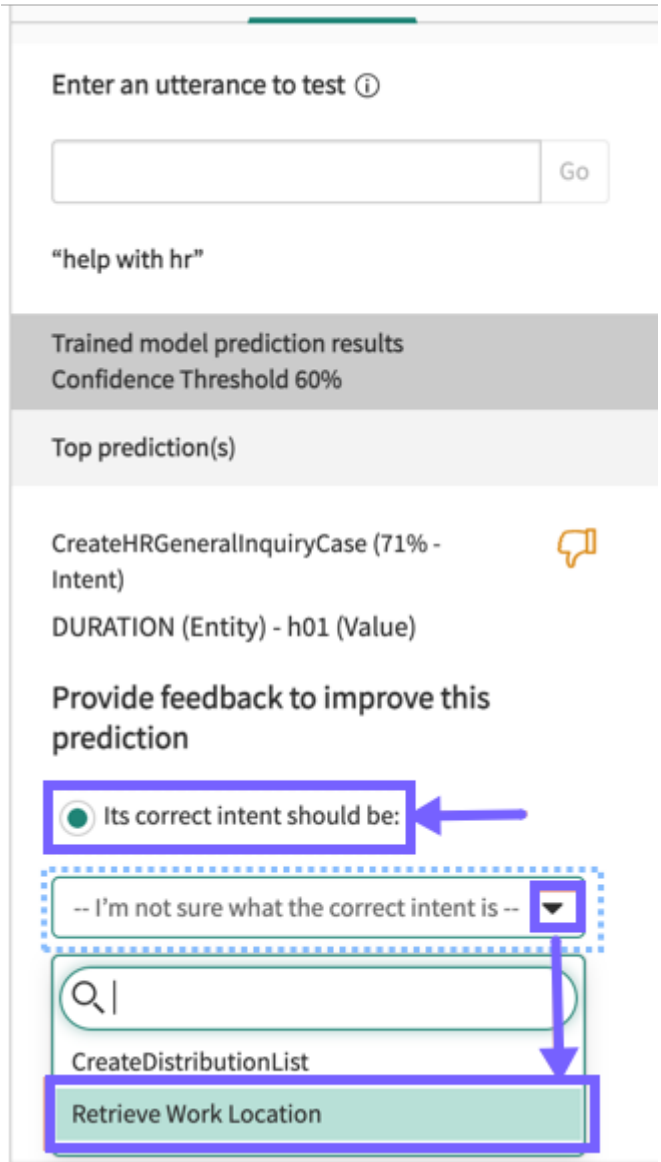


Result: The panel expands to show the **Provide feedback to improve this prediction** section where users can submit feedback that may help to improve the intent prediction.

There are two options here:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

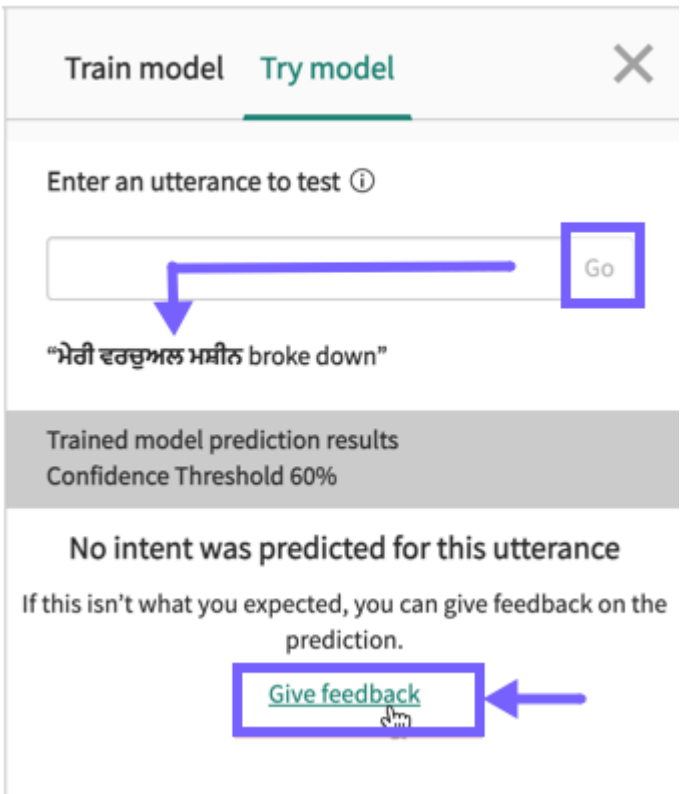
- If users click the **Its correct intent should be:** button, a list appears where they can choose a more appropriate intent for the test utterance. In this example scenario, a user selects the **Retrieve Work Location** intent, as shown in the image below.



- If you click the **I'm not sure what the correct intent is** prompt, instead of returning a top prediction, the system shows the next best intent predictions available.

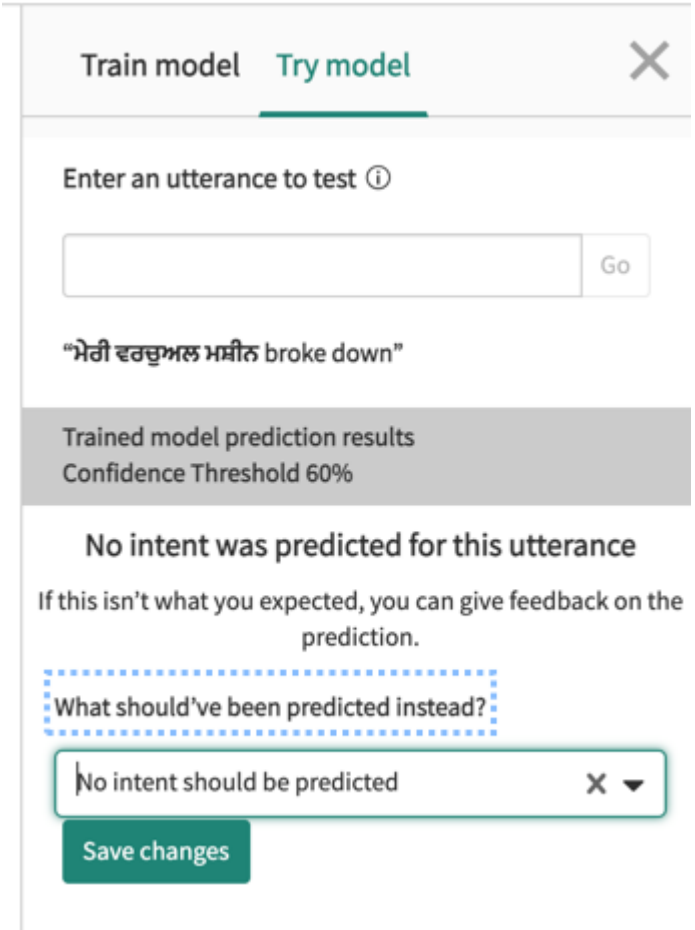
Scenario 3: In a separate model on a separate instance, another user submits an utterance that uses gibberish, or uses a language that's different from the language the model uses. For example, a user mistakenly submits an utterance comprised of both non-English and English languages, as shown in the image below.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



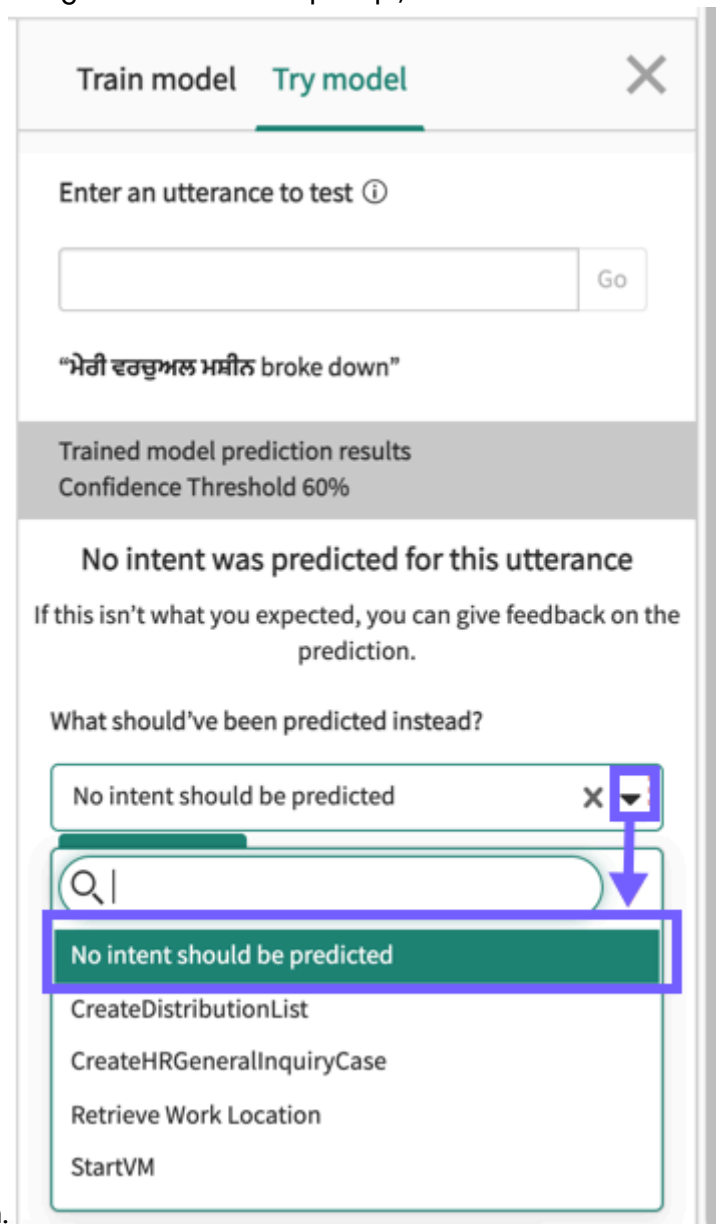
Result: The system doesn't return a prediction because the utterance uses two different languages together. Since no intent was predicted, the user clicks the **Give feedback** option which expands the Try model section to show other intent alternatives.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

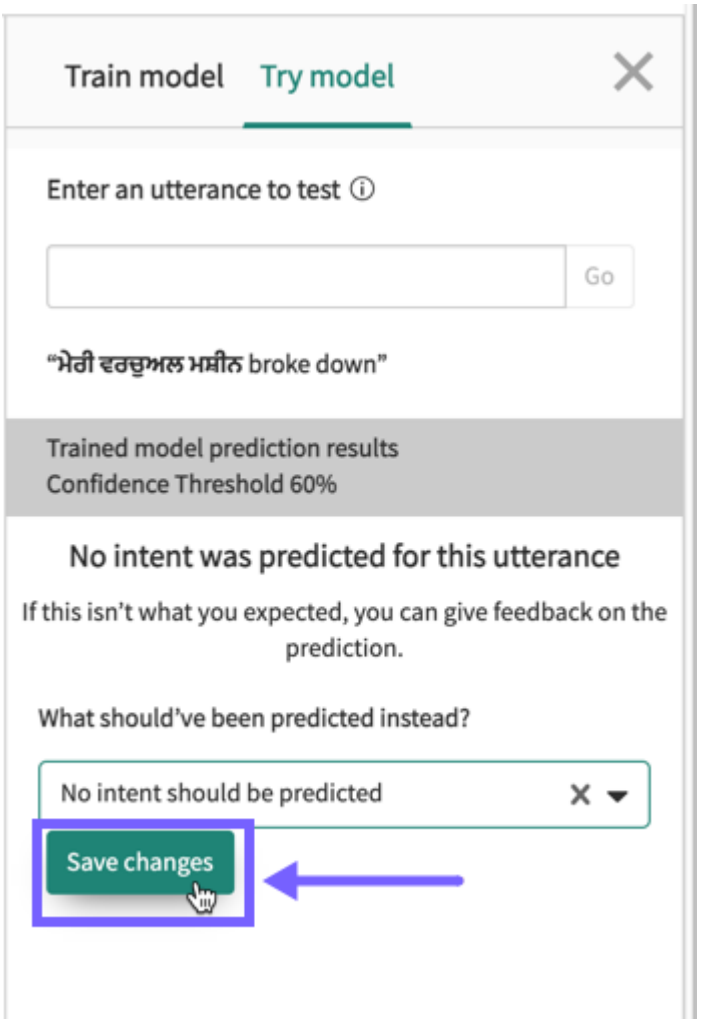
So instead of choosing an intent from the prompt, this user selects the **No intent should be predicted** option.



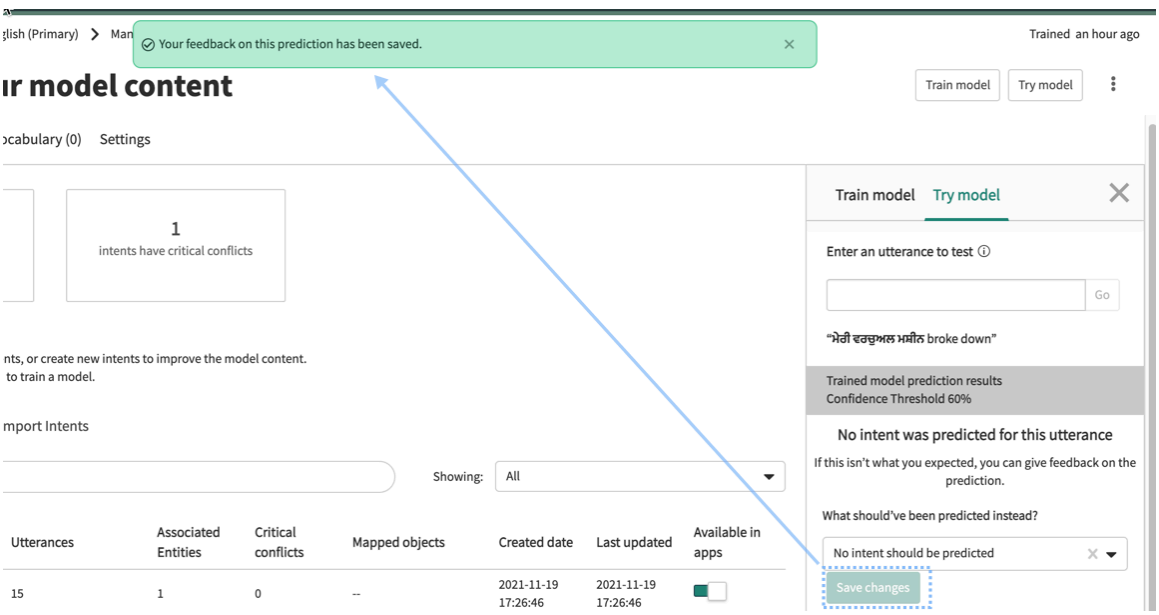
Note: When you choose and save **No intent should be predicted**, the utterance is removed from all intents which it is a part of.

Scenario 4: Along with choosing from a list of your model's intents for a prediction, you can also directly notify the system that the utterance is irrelevant to the model. To do this, you click the **Exclude this model's predictions for this utterance** button, then click **Save changes**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Result: A banner appears at the top of the screen confirming the user feedback for the prediction is saved, as shown in the image below.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Accessing your feedback records

Your feedback data is stored in the **ml_labeled_data** table, which is also used by other ServiceNow products. This table can also house multiple sources, such as Virtual Agent chat logs that can be used for future predictions.

(Legacy) Test and publish your model

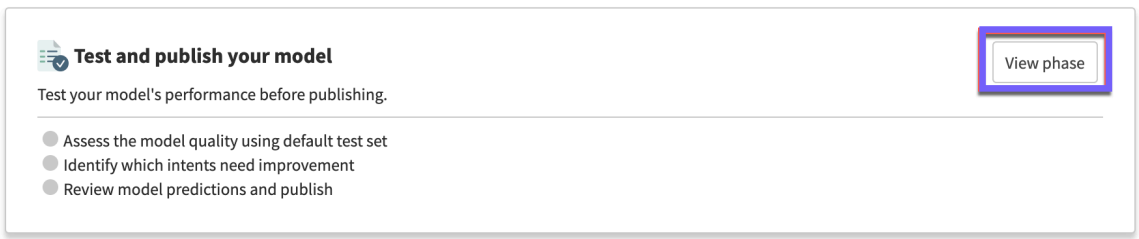
Assess the performance of your NLU model to identify areas for improvement. Then publish your model to make it available to other applications such as Virtual Agent.

Summary usage

Test your Virtual Agent or AI Search model against its default test set to see how the model responds. Test results provide information you can use to improve your model.

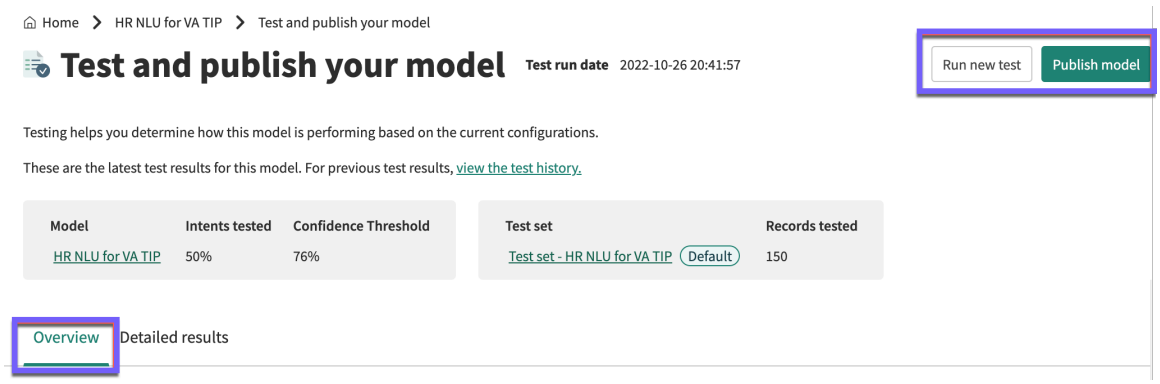
Note: Testing your model requires the Multi-model Batch Testing feature, available with the NLU Workbench - Advanced Features application from ServiceNow® Store. For more information, see (Legacy) Install NLU Workbench - Advanced Features.

To test your model, navigate to **NLU Workbench** > **Models**. Select the tab for your model's application, then select the name of the model. In the **Test and publish your model** card, select **View phase.**



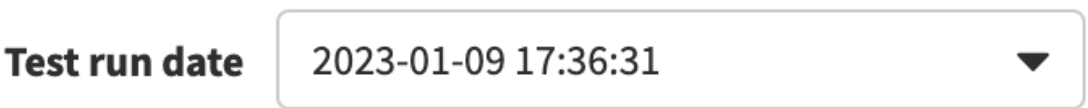
Overview of testing and publishing your model

The **Test and publish your model** phase opens in the **Overview** page by default. Buttons for **Run new test** and **Publish model** are located here.



Overview provides information about a previous test run, with bar charts summarizing the test results.

If you have earlier test runs, you can view those by selecting from the **Test run date** list.

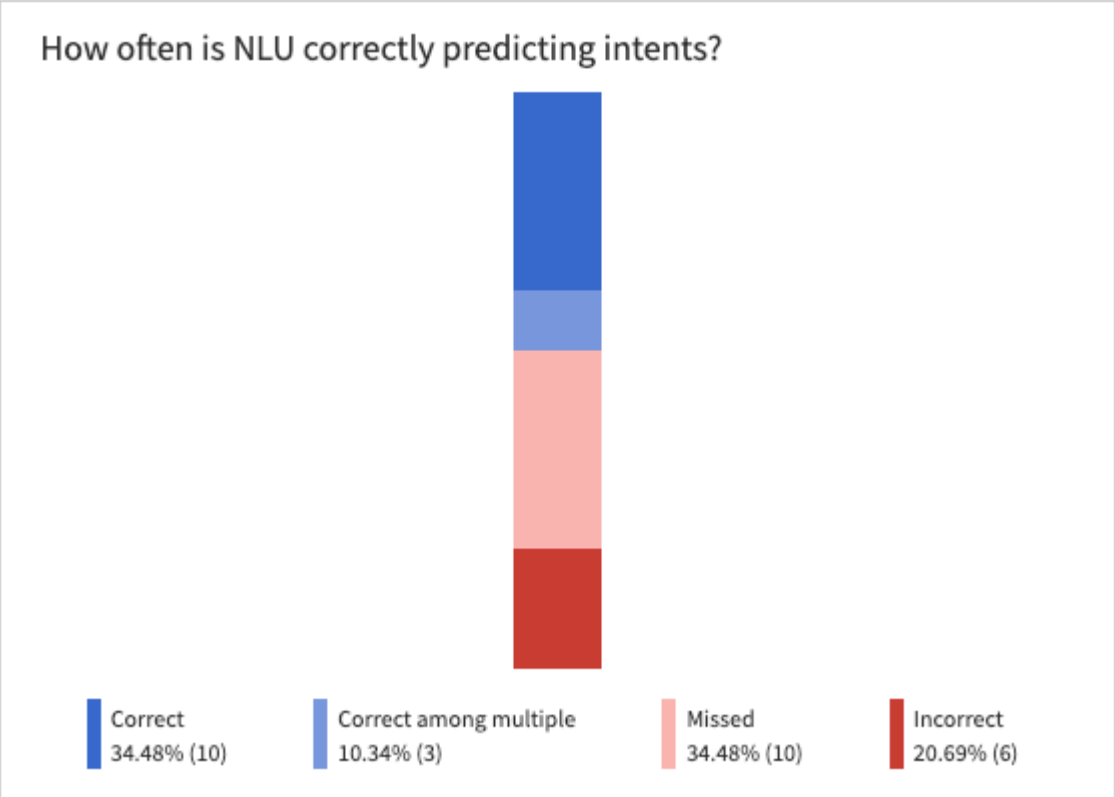


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To drill down into the test results table, select the **Detailed results** tab. Each test utterance is listed in **Detailed results**, with its prediction.

Understanding test results

The test results show how your model responded to the utterances in the test set.



The bar chart shows the prediction percentages for correct, correct among multiple, missed, and incorrect:

Percentage	Description
Correct	The percentage of utterances for which your model correctly predicted the intent. When the model predicts no intent for utterances marked as `Not relevant`, that result is counted as Correct.
Correct among multiple	For utterances that had more than one intent predicted. The percentage of utterances for which the model correctly predicted the intent or intents, but also predicted intents that did not belong to the utterance.
Missed	The percentage of utterances for which your model did not predict an intent, even though there was an expected intent.
Incorrect	The percentage of utterances for which your model predicted an intent that was not correct.

Testing can affect the model's confidence threshold. The confidence threshold determines how confident a model must be to predict an intent for an utterance. For more information on confidence thresholds, see (Legacy) NLU model settings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For information about utterances which should not have any intent predicted, see (Legacy) Irrelevance detection in NLU.

Publish model

The **Publish model** button makes the current version of the model available to other applications such as Virtual Agent.

> **Note:** If the model has not been trained, the **Publish model** button is unavailable. Return to the **Build and train your model** phase to train the model before publishing.

For more information on publishing your model, see (Legacy) Publish your NLU model.

Multi-model Batch Testing

In the **Test and publish your model** phase, you test your model against its default test set. With Multi-model Batch Testing, you can test against other test sets, test multiple models at once, and see your test results. To use Multi-model Batch Testing, navigate to **NLU Workbench** > **NLU Advanced Features** > **Multi-model Batch Testing**.

For more information, see (Legacy) Multi-model Batch Testing.

For more information about test sets, see:

- (Legacy) Create a test set
- (Legacy) Test set creation and management

For information about the process of testing, see (Legacy) Test your model.

(Legacy) Test your model

Test your Natural Language Understanding (NLU) model against its default test set. Testing helps determine how your model is performing with the current content.

Before you begin

- Make sure that the NLU Model Builder - Core plugin, NLU Model Builder plugin, NLU Workbench - Advanced Features plugin and Predictive Intelligence plugin are all installed and activated.
- Have a trained model for Virtual Agent or AI Search. For more information, see (Legacy) Build and train your model.
- Have a test set for testing models. For more information, see (Legacy) Test set creation and management.
- Role required: nlu_editor, nlu_admin, or admin. The editor must be assigned to the model.

About this task

Run a test of your model using its default test set, which contains test utterances and their expected intents.

- If an expected intent in your test set does not correspond to any intent in the model, the utterances with those intents are not used for testing. They are not included in the test results.
- The mid-conversation responses of Dialog Acts can't be tried or tested in NLU Workbench.
- When the model returns no prediction for utterances which are marked as `Not relevant`, that result will be counted as **Correct**.
- If your test set does not cover at least 60% of intents in the model, the system will not recommend a confidence threshold. However, you can still run the test.

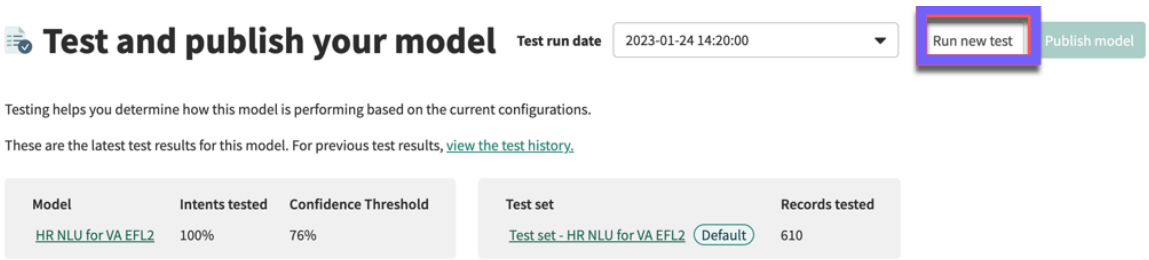
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In this example scenario, you've trained your model and want to assess the performance.

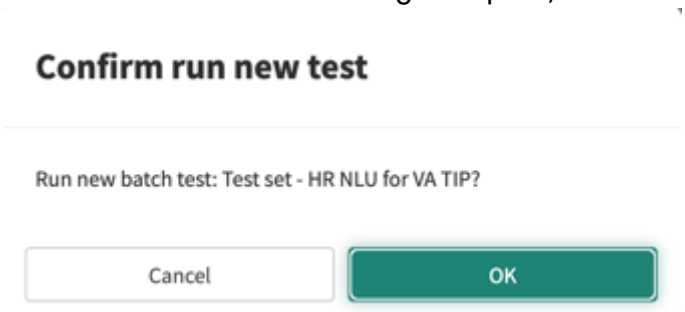
Procedure

1. Navigate to **All** > **NLU Workbench** > **Models**.
   The Virtual Agent tab opens by default.
2. Select the tab for your model's application, then the name of the model you want to test.
3. On the model overview's **Model details** tab, locate the card for the **Test and publish your model** phase, then click **View phase**.
4. Select **Run new test**.

   Note: Other phases are unavailable during a test.



5. The **Confirm run new test** dialog box opens, so select **OK**.



The test begins and the **Testing is in progress...** page loads.

Result

When the test is finished, the **Test and publish your model** page reloads. The **Test run date** field reflects the date and time of this test.

The **Overview** tab displays a chart of the test results. It also displays a list of the top 5 incorrect intents and the top 5 missed intents.

The **Detailed results** tab lists all of the test utterances and their prediction outcomes.

You can see previous test results by clicking **view the test history** on **Test and publish your model**, or by navigating to **Batch Testing** > **Test results**.

What to do next

Use the results to edit and improve your model's content. When you are satisfied with the results, publish your model to make it available to consuming applications such as Virtual Agent.

(Legacy) Publish your NLU model

Publish your Natural Language Understanding (NLU) model to activate it and make it available for use in other applications that consume NLU.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Make sure that the - NLU Workbench - Core plugin, NLU Workbench plugin, and Predictive Intelligence plugin are all installed and activated.
- Have a trained and tested NLU model.
- Role required: admin or nlu_admin

About this task

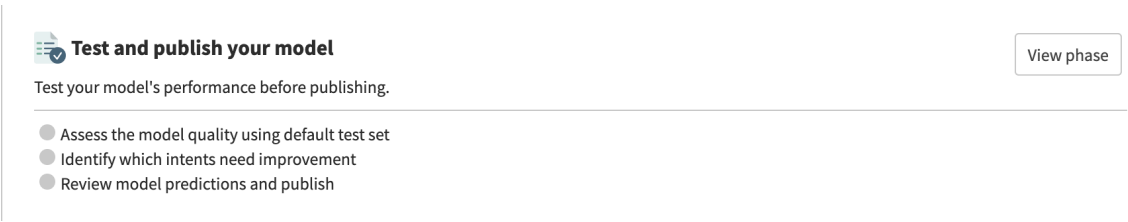
For this procedure, you've already trained, tested, and refined your NLU model and are satisfied with the results.

If your model is already published, you can publish it again. However, you must train the model again before republishing.

Procedure

1. Navigate to **All** > **NLU Workbench** > **Models**.
   The Virtual Agent tab opens by default.
2. Select the tab corresponding to your model's application, then select the name of your model.
3. On the Model overview page, locate **Test and publish your model**, then select **View phase**.

   Note: If the model hasn't been built or trained yet, the **Test and publish your model** phase is not available.



4. On the **Test and publish your model** screen, select **Run new test** to assess the model using its default test set.
   Testing can be skipped, but model performance may not be optimal. If testing is skipped, a confirmation message displays, asking if you want to continue without testing. For more information on testing, see (Legacy) Test and publish your model.
5. Click **Publish model**.

   Note: If the model hasn't been tested yet, the **Publish model** button is white. If the model has already been tested, the button is green. If the last trained model is already published, the **Publish model** button is unavailable. Return to **Build and train your model** to train again.

Result: The most recent version of your NLU model is published. The model is active and available for use in other ServiceNow applications, such as Virtual Agent. Publishing also replaces any older versions of the model that are currently in use by those applications.

(Legacy) Compare draft and published versions of your NLU model

Compare a draft trained Natural Language Understanding (NLU) model to its most recent published version. Test and review the changes to make sure that your draft model will have increased performance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Make sure that the NLU Workbench plugin, NLU Workbench - Core plugin, NLU Workbench - Advanced Features plugin and Predictive Intelligence plugin are installed and activated.
- Role required: nlu_editor, nlu_admin, or admin. The editor must be assigned to the model.

About this task

In this example scenario, you're training and trying a published NLU model in the NLU Workbench iteratively with the goal of improving its prediction confidence scores.

When you try an utterance against an NLU model:

- If the model is trained and never published, the Test Model panel shows only trained model results.
- If the model is trained and published, the Test Model panel shows only published model results.
- If you've made changes to a published model and trained it, the Test Model panel shows both the trained model results and the published model results for comparison.

In this example procedure, you've cloned the model from a pre-built read-only HR model. You've cloned the model to create your own business-specific version of it while leveraging the existing intents from the pre-built model.

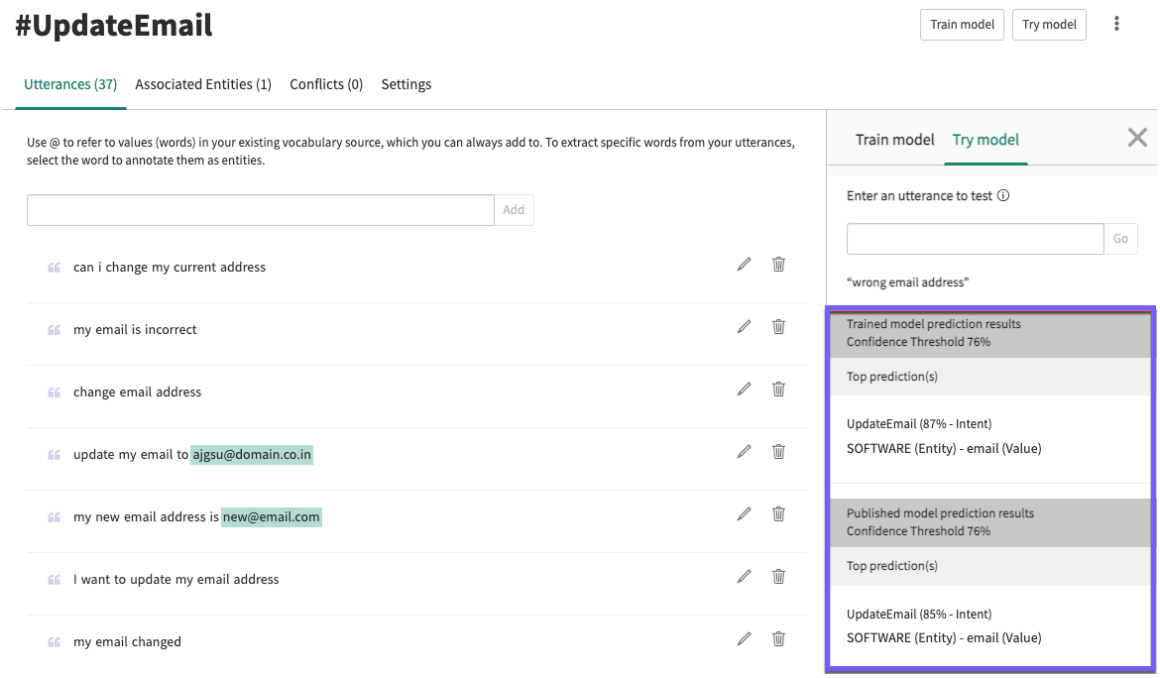
Procedure

1. Navigate to **All** > **NLU Workbench** > **Models**.
   The Virtual Agent tab opens by default.
2. Select the tab corresponding to your model's application, then select the name of your published model.
3. From the model's overview page, locate the **Build and train your model** card and click its **View phase**.
4. Make a change to the intents, utterances, entities, or vocabulary.
   In this example scenario, you add a few more training utterances to the #UpdateEmail intent.
5. Train and try the changed model so you can see its prediction scores compared to the published version's scores.
   a. On the **Train model** tab, click the **Train** button.
   b. When training is finished, the system displays The model has been successfully trained.
   c. In the **Try model** tab, enter this utterance: `wrong email address`.
   d. Click **Go**.

   The panel displays predictions results for both the published model and the trained model. Compare the results of the two versions of the model, before and after your changes. In this

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

example, the confidence score increased by a small margin. By making significant changes to the model content, the confidence score or even the intent predictions may change.



What to do next

Use the information in the test panel to see if the changes you make will improve the model's performance. Once you are satisfied with your changes, test your model before publishing. Then, publish your model to replace the current published version.

(Legacy) Irrelevance detection in NLU

Keep Virtual Agent chats focused with Irrelevance detection. Use the Irrelevance detection feature to train your NLU model to avoid making predictions for utterances that are not relevant.

Summary information

The Irrelevance detection feature improves the prediction accuracy of NLU models by training them to ignore certain utterances. These utterances from your users may not apply to any intent, so should not get any prediction.

To ensure that models do not predict an intent when they are not supposed to, you can mark utterances as `Not relevant`. These marked utterances are included as part of model training. When the published model encounters similar utterances from your users, no intent is matched or predicted.

The Irrelevance detection table is where you can manage utterances marked as `Not relevant`.

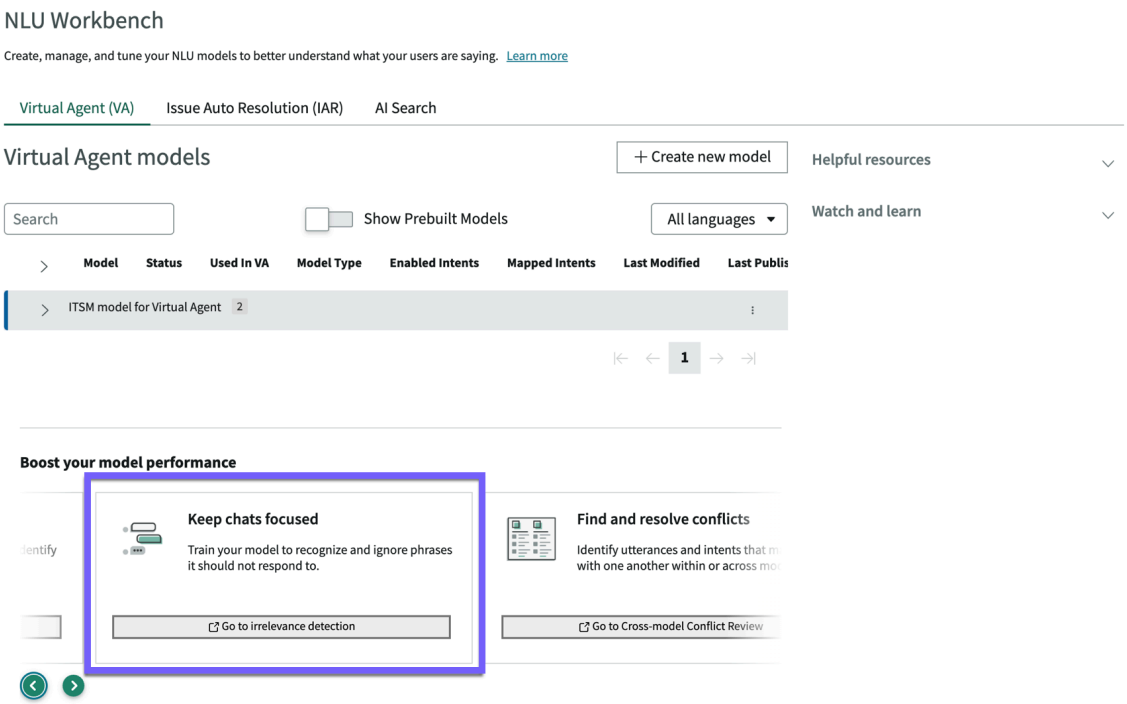
Roles, Usage, and Navigation

Use the nlu_admin or admin role to access Irrelevance Detection. The nlu_editor role is also able to access Irrelevance Detection, but must be assigned to a model to edit that model's contents.

Irrelevance Detection is available for Virtual Agent models only.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Navigate to **All** > **NLU Workbench** > **Models**. The Virtual Agent tab opens by default.
2. Scroll down the list of Virtual Agent models to the **Boost your model performance** section.
3. Scroll horizontally to locate the card **Keep chats focused**, and select its button **Go to irrelevance detection**.



Note: The instance URL for this feature is <instance-name>.servicenow.com/now/nlu-workbench/irrelevant-utterances.

Adding utterances to Irrelevance detection

There are several methods for adding utterances to **Irrelevance detection**:

- The Virtual Agent chat log: In the Expert Feedback Loop in NLU Workbench, when you review an utterance collected from the Virtual Agent chat log, you can mark it as `Not relevant`. The system will ask whether it should be irrelevant to a particular model, or to all models. After adding, these utterances may display as **NO_INTENT** in Expert Feedback Loop.

  For more information on Expert Feedback Loop in NLU, see (Legacy) NLU Expert Feedback Loop.

  These utterances have a Source of **VA Chat Logs** in the Irrelevance detection table.

- Manual input: In Irrelevance detection, type your utterance in the **Type utterances here** field, then select **Add**. The system will ask whether it should be irrelevant to a particular model, or to all models.

  These utterances have a Source of **Manual** in the Irrelevance detection table.

- Importing: When you use a CSV or XLSX (Excel Workbook) file to import training utterances and their intents, you can indicate irrelevant utterances by leaving the Intent column empty. These utterances may display as **NO_INTENT** in areas such as Expert Feedback Loop and Conflict Review.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information on importing utterances and intents, see (Legacy) Create an NLU model from a CSV file.

These utterances have a Source of **Manual** in the Irrelevance detection table.

Behavior of irrelevant utterances

There are two types of irrelevant utterances: those associated to one specific model, or those irrelevant to any model. A model can have a maximum of 200 irrelevant utterances associated to it.

Following are details of how these two types and the 200-count maximum interact.

When a model is submitted for training, at most 200 irrelevant utterances are submitted with it. First, irrelevant utterances directly associated to that model are submitted. Then, utterances which are designated as not relevant to any model are submitted. The total of these types does not exceed 200.

If a model has 200 irrelevant utterances associated to it, and a new irrelevant utterance is added, then the model's oldest utterance is dropped. The new irrelevant utterance could be of either type (not relevant to the specific model, or not relevant to any model).

A model cannot have more irrelevant utterances than normal training utterances.

Conflict review

If an utterance is marked as irrelevant, and there is a similar utterance in an intent, the model does not make a prediction for that utterance. In other words, irrelevant utterances take precedence over training utterances.

Because irrelevant utterances impact the model's predictions, they are displayed as conflicts when they overlap with training utterances.

There are two locations where conflicts with irrelevant utterances are highlighted:

- The Cross-model Conflict Review module. For more information about this module, see (Legacy) Cross-model Conflict Review.

  Note: The Cross-model Conflict Review module is available with the NLU Workbench - Advanced Features application from ServiceNow® Store. For more information, see (Legacy) NLU Workbench - Advanced Features.

- The Conflicts tab of an intent. For more information on conflicts in an intent, see (Legacy) Resolve intent issues.

For the purpose of reviewing conflicts, irrelevant utterances are displayed as though they are in their own intent, named **NO_INTENT**.

Note that irrelevant utterances cannot be edited or deleted on the conflict page. Copy the irrelevant utterance from the conflict page to the Irrelevance detection page to modify or delete the utterance.

More information

- In test sets, aim to include about 10% of test utterances as irrelevant. This helps to assess how your model handles utterances that should not have an intent predicted. When you import training or test utterances from a CSV or XLSX (Excel Workbook) file, you can indicate that an utterance is irrelevant by leaving the Intent column empty.

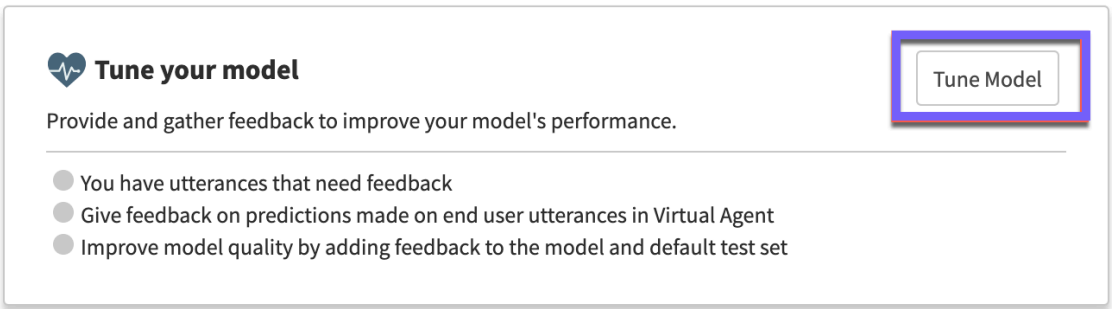
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- When testing models against test sets, results are considered Correct if no intent is predicted for an irrelevant utterance.
- Utterances that were marked as `Not relevant` can be re-assigned later. For example, if a new intent is created, existing irrelevant utterances can be manually assigned to the new intent. They then become part of the normal training utterances.

  To re-assign an utterance in Irrelevance detection, expand the list in the **Corrected intent** column and select the appropriate intent. Be sure to select the **Save feedback** button after re-assignment. Also be sure to retrain the model to incorporate these updates into the model.
- Irrelevant utterances are not associated to particular intents within a model. They are either associated to one model, or marked as not relevant to any model.
- The utterances which are marked as not relevant to any model are submitted as part of the training data for each model. In other words, these apply to all models.
- Model training is necessary to incorporate `Not relevant`utterances. Training any model adds newly marked utterances to all models.
- Utterances can be deleted or edited in the Irrelevance detection table.
- Irrelevant utterances should have content that is different from utterances associated to an intent.

(Legacy) Tune your model

On your model's overview in NLU Workbench, open the **Tune your model** phase to review and incorporate user utterances from the Expert Feedback Loop.



Summary usage

The **Tune your model** phase on your model's overview takes you to the NLU Expert Feedback Loop feature, which collects data from Virtual Agent chat logs and provides it to you for feedback.

Note: The ServiceNow® Store application NLU Workbench - Advanced Features must be installed to view **Tune your model**. The Virtual Agent plugin is also required.

When the Expert Feedback Loop has feedback waiting for your review, **You have utterances that need feedback** is highlighted on the card.

For more information, see (Legacy) NLU Expert Feedback Loop

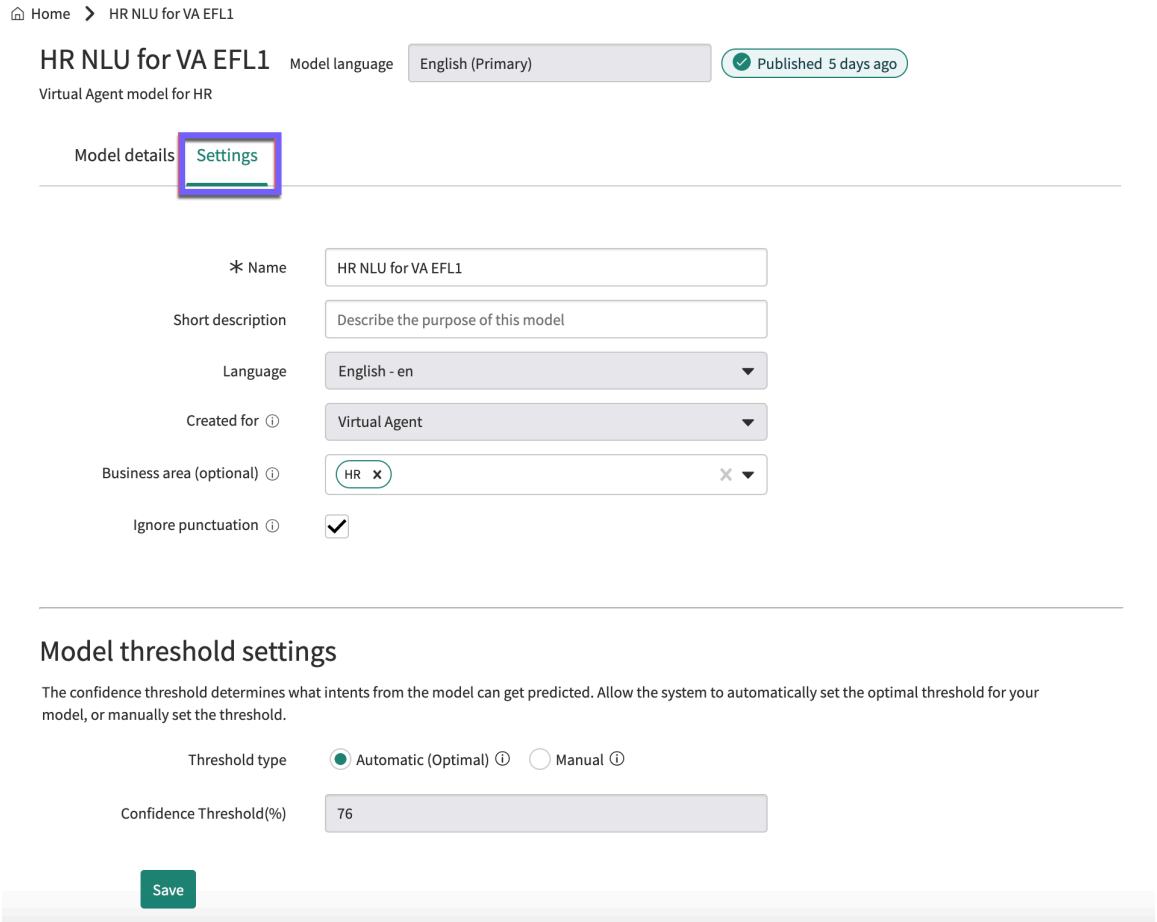
(Legacy) NLU model settings

Change your NLU model's name, description, or confidence threshold on the **Settings** page of the model overview.

Access the model's settings by navigating to **All** > **NLU Workbench** > **Models**. Select the tab for your model's application, then your

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

model's name. On the model's overview, select the **Model settings** tab.



Model settings

In the upper section of the model settings page, you can change the model's name, short description, and business area. You cannot change the model's language, purpose, or scope. To make a model with a different language, purpose, or scope, see (Legacy) Creating models.

By default, the **Ignore punctuation** check box is active. Ignoring punctuation makes it so that there is less variance between predicted intents and confidence scores for utterances with slightly different punctuation. For best results, keep the check box active.

Model threshold settings

Here you can adjust how the confidence threshold works in your model.

A threshold is a confidence score represented by a percentage. The confidence threshold of a model determines what intents from that model will be predicted for a given utterance. For example, if the model threshold is 65%, then an intent will be predicted for an utterance only when the intent has a confidence score that is at least 65%. Setting a threshold that is too low may increase the false positives by predicting intents that should not be a match for an utterance. On the other hand, a model threshold that is too high may filter out intents that you do want to get predicted. Finding the ideal threshold improves your model's ability to predict intents correctly.

There are two types of model threshold settings:

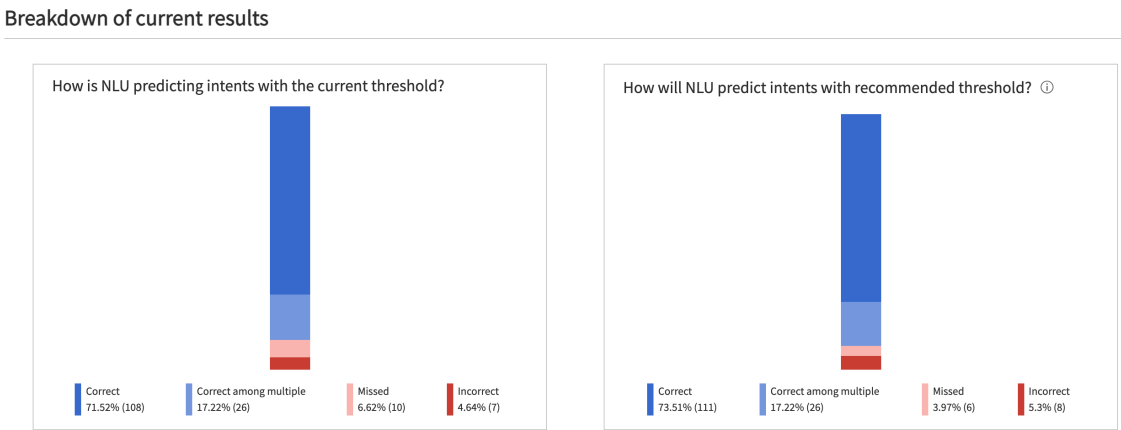
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Automatic** - Allow the system to choose the optimal confidence threshold for your model. The value is updated dynamically based on test results. This happens in the **Test and publish your model** phase, where your model's default test set is used.
- **Manual** - You can manually set the confidence threshold. The system may also recommend a better threshold for the model during testing. You can choose to accept recommendations.

Prebuilt models come with a tuned threshold. The confidence threshold on prebuilt models was chosen specifically for that model.

Test results include a model threshold recommendation only if they meet the following requirements:

- The test set has a Test Coverage score of at least 60%, with at least 5 test utterances per intent. For more information, see (Legacy) Test set creation and management.
- The test set has at least 100 utterances.
- The model is not a prebuilt model.
- The recommended threshold would have better results than the current threshold.



Test results with a recommended threshold contain a second graphic. The second graphic shows the prediction percentages with the recommended thresholds applied.

Applying the threshold recommendation may improve the prediction percentages of your model. Select **Apply recommendations** to change the threshold. The system automatically retrains the model, and the test results show the prediction percentages with the new threshold.

(Legacy) Multilingual model management

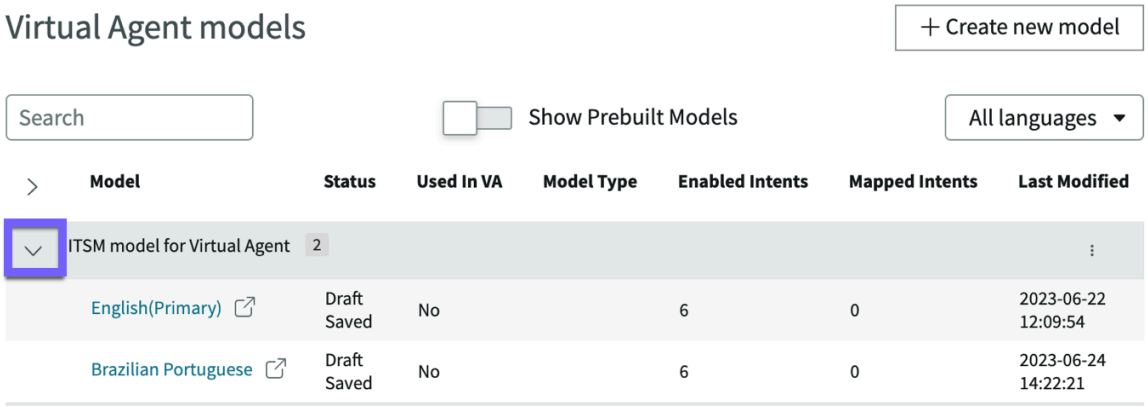
Use multilingual Natural Language Understanding (NLU) models for the system to understand user input in several languages. The NLU Workbench helps you manage and maintain a consistent structure for content across languages to provide a unified experience.

Primary and secondary languages

A primary language is the source language you choose when creating a model. These models are considered primary models. Primary models can then be translated into different languages. Those translated models are referred to as secondary models. The languages in which they are translated are referred to as secondary languages.

The NLU Workbench home displays primary and secondary language models nested under the model name. Select the arrow to the left of the model name to expand the language group.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Multilingual model management provides a way for you to group, oversee, and update your NLU models. The designation for the model language works as follows:

- Primary models have a language you assign to them during model creation and listed as English (Primary). The language of the primary model is the source language for the translations that follow later in the secondary models.
- Secondary models are translated copies of the primary model. Each secondary model uses a different language, such as Brazilian Portuguese, Polish, or Finnish.
- Any supported language can be the primary language for a primary model or the secondary language for a secondary model.
- Within a model group, you can't have two secondary models that use the same language.

For more information on the languages available in NLU, see (Legacy) NLU language support.

Implementing language grouping

Grouping languages is optional but helps with organizing various language versions of models. There are two methods for ensuring that model languages are grouped:

- You can add a language to a primary model in the model's More options menu, which automatically creates a secondary language model with translation options. For more information on adding and translating a language, see (Legacy) Translate a multilingual model.
- You can access the instance model migration page directly by visiting `<instance_name>.service-now.com/$nlu-studio.do#/model-migration`. For more information on language grouping using this method, see (Legacy) Model language grouping.

Primary and secondary model interactions

To ensure consistency within a model group, the names of intents and entities in all secondary models are the same as the content in the primary model. New intents can only be created in a primary model. Creating an intent in a primary model adds the intent to all the secondary models within the model group, but without any utterances in them. New intents are inactive by default. New entities can also be created in secondary models for languages that support entities. Adding an entity in a primary model creates it across all secondary models within the model group, if valid.

When you add an intent to a primary model, the intent is added to all of its secondary models. Every intent in a secondary model is mapped to its corresponding intent in the primary model. The mapping of intents ensures that any application that uses these intents can access all the secondary intents through their corresponding primary intents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When you delete an intent or entity in a primary model, its corresponding intents and entities are also deleted in its secondary models. Therefore, the secondary models follow the status of the primary model content. Although you can't delete intents in secondary models, you can deactivate them.

For more information on intent interactions, see (Legacy) Import primary model content to a secondary model.

You can't delete an entity created in a secondary model if it's a copy of a corresponding entity created in the primary model. However, you can add or delete an entity in a secondary model if it doesn't have a corresponding entity in the primary model.

Whenever you translate a model or add intents and entities to secondary models, the model must be reviewed. Secondary models marked with **Needs review** must be manually reviewed before publishing.

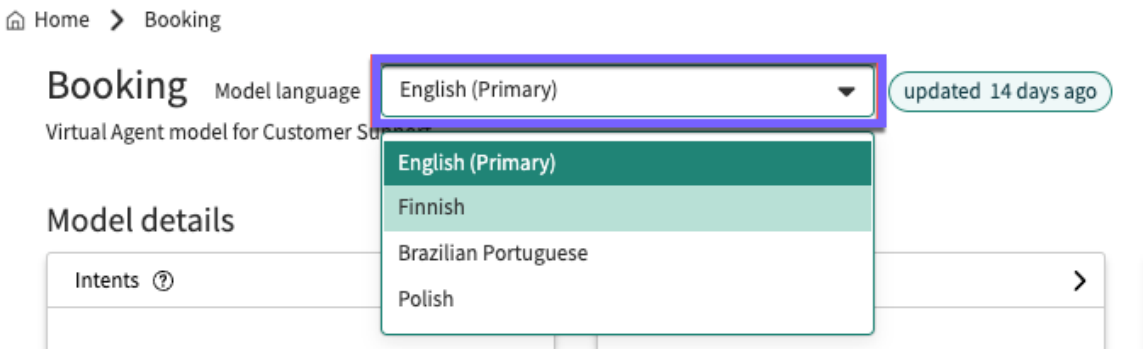
Viewing secondary models that need reviewing

If every intent in a secondary model is deactivated, then the **Train** and **Try** buttons are also deactivated in the model. However, even if only one intent is enabled in the model, then you can train and test the model. Ensure that some intents are enabled in your secondary models to translate them.

Note: When training and testing, prediction scores for similar utterances across primary and secondary models can be different. The context comes across differently among languages due to inherent structural variations.

When looking at a model, you can navigate between languages in the model group. On a Model details page, use the **Model language** drop-down list to navigate to other models.

Viewing model languages list



Duplicating grouped models and model groups

Using the nlu_admin role, you can duplicate primary models, secondary models, and entire model groups. You can duplicate just the primary model or a set of secondary models from among the model group.

Following is a list of system behaviors you may encounter when you duplicate these models.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If you duplicate a secondary model that's in a model group, the duplicated version becomes a separate primary model that is outside that model group.
- All intents are duplicated. The duplicated intent maintains the same **Enabled** status as the original intent.
- When duplicating a primary model, you can duplicate a set of secondary models, or all of the secondary models along with it. This action creates a model group comprised of duplicated versions with the respective original models marked as the source models.
- When duplicating a model group, you can choose an existing secondary model to be the primary model for the duplicated group.
- If you select a secondary model in an existing model group as a new primary model while duplicating the group, all the deactivated entities are enabled for the duplicated version of the secondary model. The secondary model becomes the primary model in the new duplicated model group.
- If you duplicate a primary model without any secondary model, the duplicated version becomes a separate primary model.

For more information, see (Legacy) Duplicate an NLU model.

(Legacy) Model language grouping

Language grouping makes it easier to manage your multilingual Natural Language Understanding (NLU) models. You can review existing language groups and designate new language groups.

Language grouping

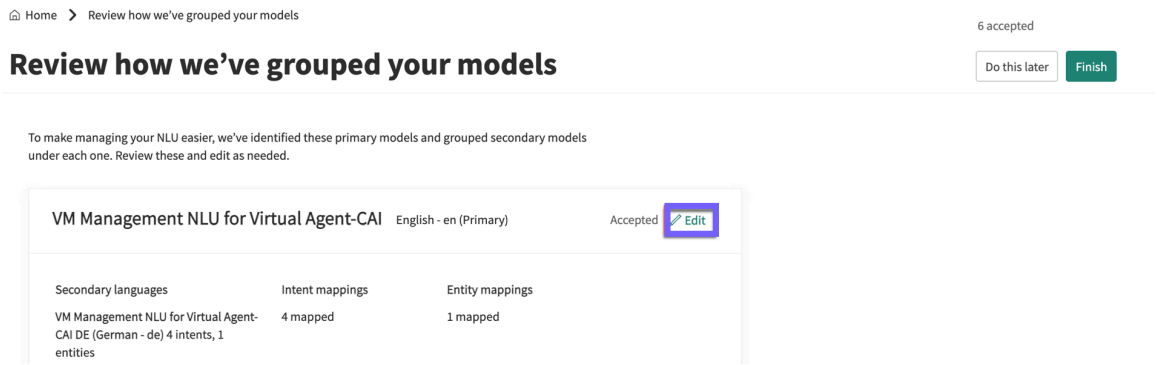
Language grouping organizes your NLU models into primary and secondary models, and indicates the primary language and primary model for the group.

If you have added a new language to a model, a language group is created automatically, so you may already have existing language groups. For more information on adding and translating a new language model, see (Legacy) Translate a multilingual model.

To view current language groups and inspect possible new language groups, navigate to:

`<instance_name>.service-now.com/$nlu-studio.do#/model-migration`.

The page titled **Review how we've grouped your models** opens.

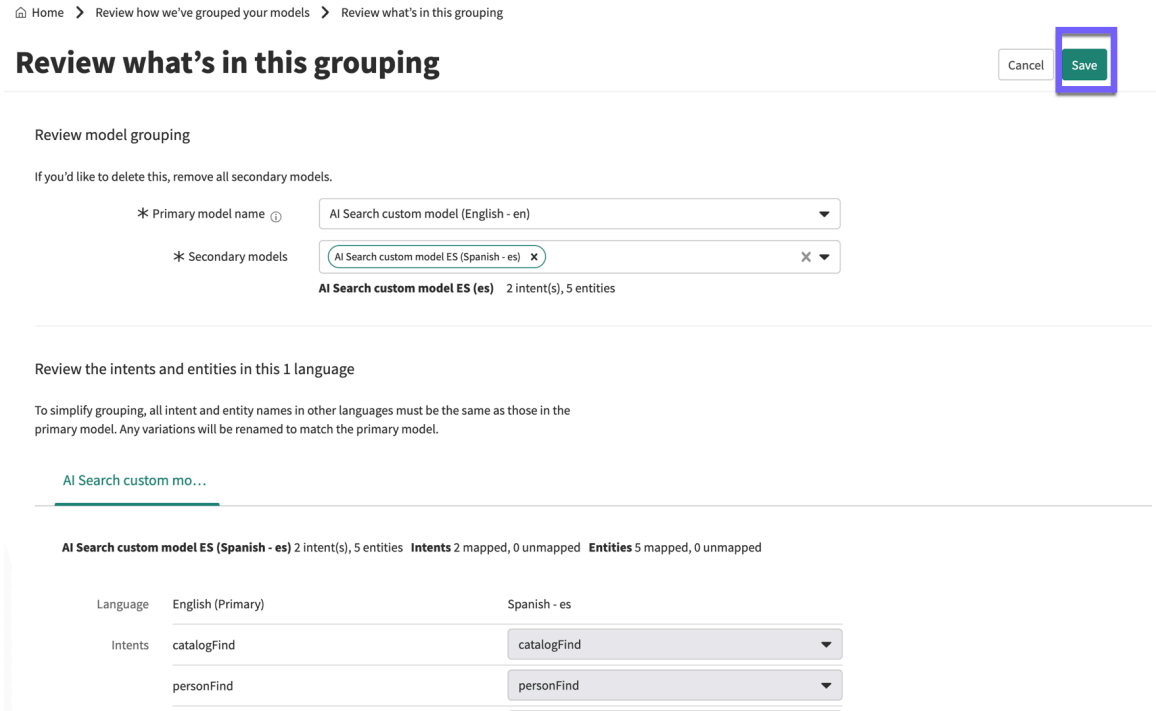


Reviewing your grouped models

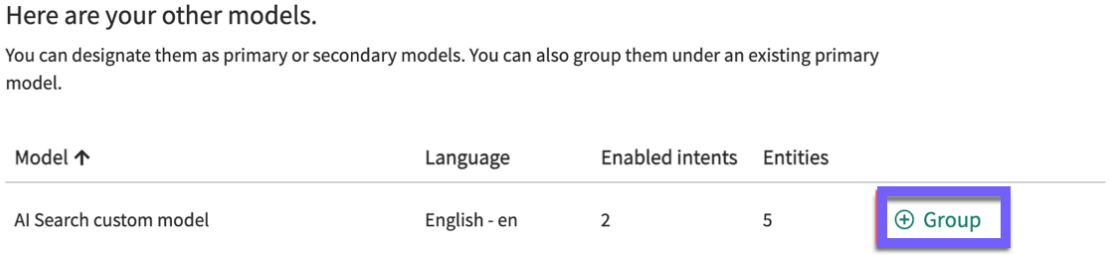
There are two things you can do on the **Review how we've grouped your model** screen when using the nlu_admin role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

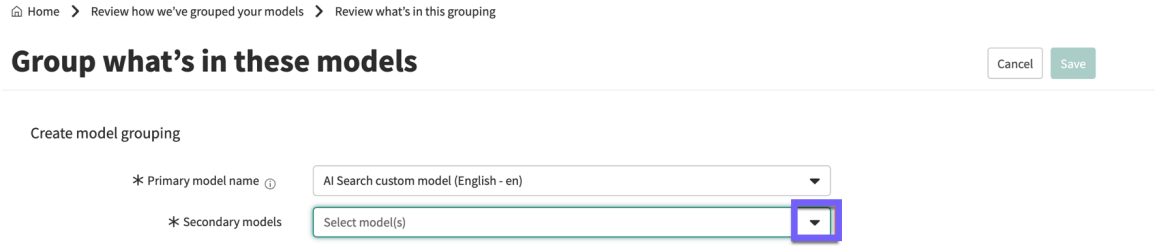
- You can review and edit current model language groups in the upper section. For existing language groups, any intent and entity mappings from Virtual Agent (VA) are displayed. To update VA mappings or to make one of the secondary languages the primary language in the group, select the **Edit** button. The page titled **Review what's in this grouping** opens. When you complete your edits, select the **Save** button.



- You can manually group models in the **Here are your other models** section of the screen. Scroll down the page to view this section, if necessary. To set up a language grouping for a model, expand its **Group** button.



The **Group** function opens the page titled **Group what's in these models**. You can expand the list of possible Secondary models, and then select the **Save** button. Any new groups are displayed in the upper section of **Review how we've grouped your models**, after refreshing the page.



Note: The time it takes the system to group your models depends on the number and size of your models.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

(Legacy) Translate a multilingual model

Add a language to an existing NLU model by translating it. Use one of several translation options to add a secondary model in a supported language.

Before you begin

- Activate the Localization Framework (com.glide.localization_framework.installer) plugin. See Localization Framework.
- In your target application scope, create a primary language model, or use an existing primary model.
- Multilingualism is available for Virtual Agent and AI Search models.
- Role required: nlu_admin or admin.

Note: The nlu_editor role cannot initiate a model translation, because the nlu_editor does not have permission to create a new model. See (Legacy) Assign an NLU editor to a model.

About this task

Translating a model creates a secondary model of the language you choose, in the same application scope as the primary model.

The secondary model contains the same content as the primary. However, the intents of the secondary model are disabled and must be reviewed prior to publishing the secondary model.

To translate a primary model and create a secondary model, you must choose a translation mode. The modes appear in the user interface as individual cards that you use in Step 4 of this procedure. Activated cards appear surrounded by a thin green border. Only activated cards can be selected as your translation mode. For the Use AI and Use a third party modes, selecting the **Add** button on an activated card starts the translation.

The No translation mode is active by default and available for all languages. However, the Use AI and Use a third party modes are activated only when the localization framework (LF) settings for the secondary language are in place.

Note: Before you add a new model in a secondary language, you must ensure that the Localization Framework (LF) settings for the secondary language are completed.

Translation mode	Description
Use AI	Translate using machine-intelligence providers such as Google. Selecting the card creates a translated secondary model. Machine translations may be incorrect or too literal, so review the translated content for accuracy. For more information, see Dynamic Translation. To activate the Use AI mode, Localization Framework must be configured and activated.
Use a third party	Request translation by a professional translation team. When you select this mode, an LF task is created per the LF language group settings for the secondary language. When the translations are completed, the translated model is created and ready for review. For more information, see Localization Framework and Translation modes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Translation mode	Description
No translation	Default. Manually translate your primary language into a secondary language. Selecting this mode creates a draft secondary model with the intent names the same as that of the primary model. These intents are disabled by default, and you must enter your utterances manually. Names of intents and names of entities imported from the primary model aren't editable. Names of entities that you create directly in the secondary model are editable. This mode is also helpful if you want to draft and save the primary model first, and then translate your utterances later.

Multilingual models are supported in 17 languages.

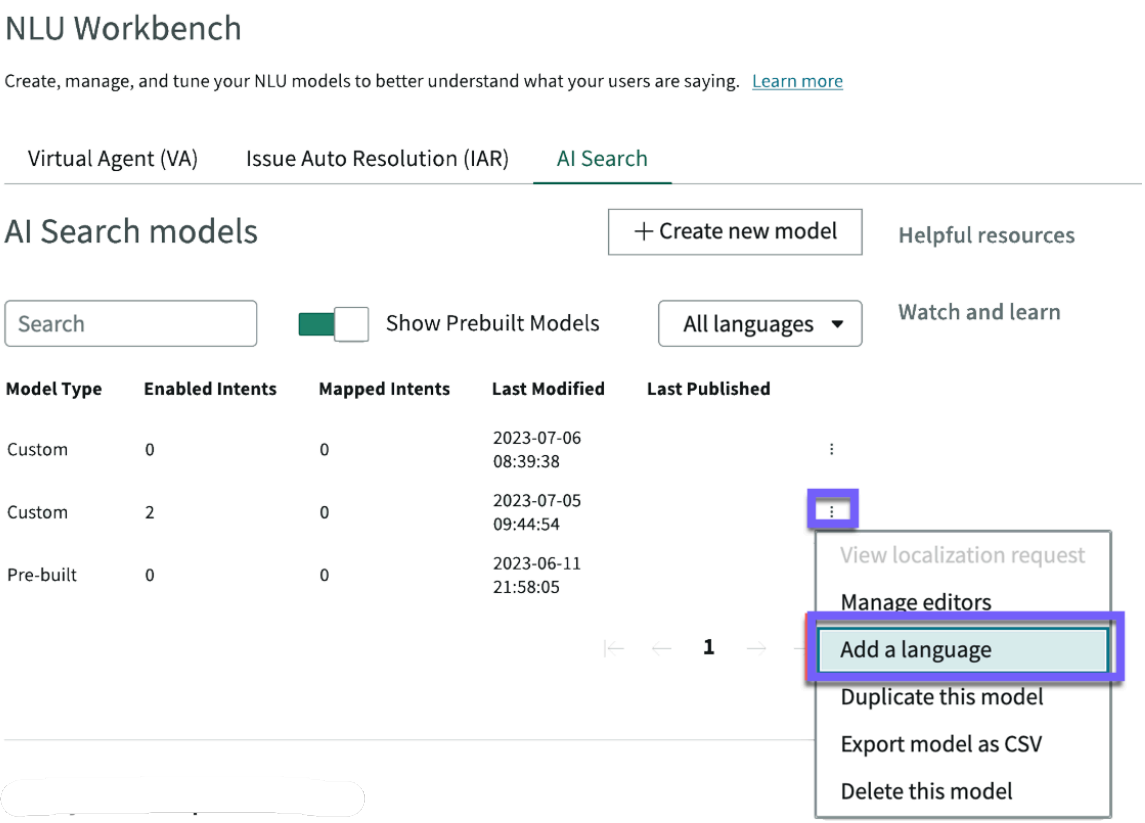
Note: Some of these languages support only intents, not entities. If the language is intent-only, your primary model entities will not be translated or copied. For more information, see (Legacy) NLU language support.

In this example scenario, your primary model uses the English language and you're adding a version in the French language, without translating utterances.

Procedure

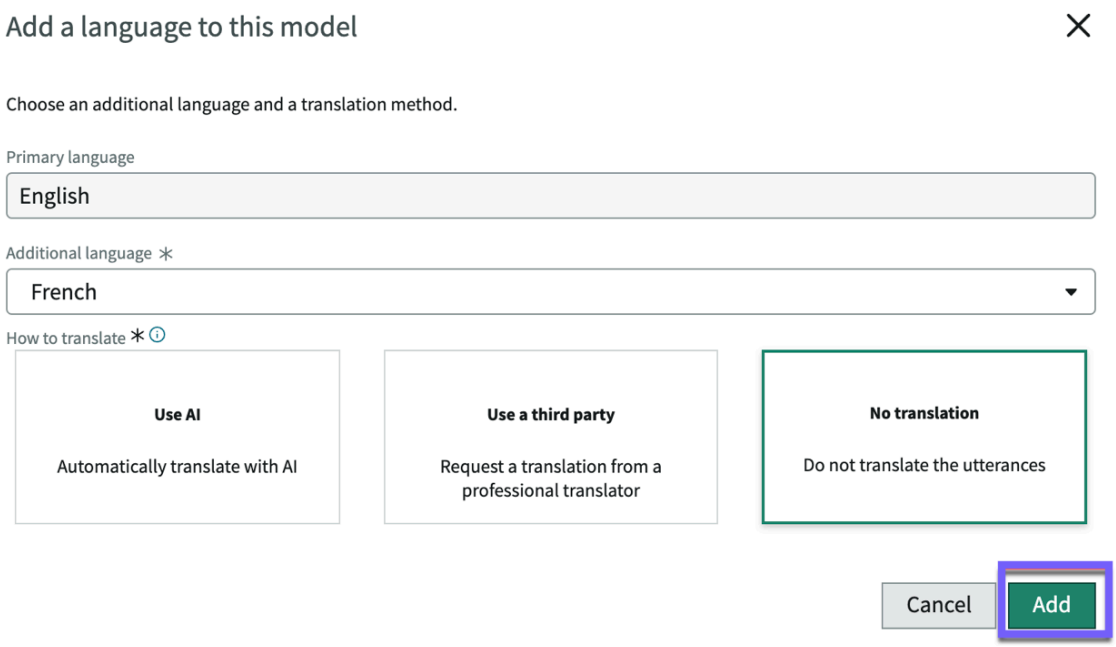
1. Navigate to **All** > **NLU Workbench** > **Models**.
   The Virtual Agent tab opens by default. If appropriate, select the AI Search tab.
2. Identify a primary model to which you want to assign a secondary language.
3. In the row of the primary model, select the more options menu, then select **Add a language**.

   Note: You may need to scroll to the right to find the more options menu.



4. In the **Add a language to this model** window, choose the desired language for the secondary model and the translation method.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. Select the **Add** button.
   The secondary model is created and the **Build and train your model** phase of the secondary model loads.

What to do next

If you chose to enable the model without translation, you must manually enter training utterances for each intent. If you choose to use software or a third-party translator, you must review the translations before you can continue working on the model.

Entering training utterances and reviewing secondary models can be delegated to users who have the nlu_editor role. For more information, see (Legacy) Assign an NLU editor to a model and (Legacy) Resolve intent issues.

(Legacy) Enable or disable a secondary model intent

Enable and disable intents in your Natural Language Understanding (NLU) models to make them active or inactive. Disable intents while editors or admins edit, review, or update its content and translations.

Before you begin

Role required: nlu_admin or nlu_editor

About this task

NLU admins and NLU editors can enable or disable intents in secondary models. If an intent is disabled, the model doesn't use it to make predictions. However, it also can't be accessed by any ServiceNow application using the model, such as Virtual Agent or Search.

An intent's state is represented in the **Enabled** column.

Enabling of intents works in the following ways:

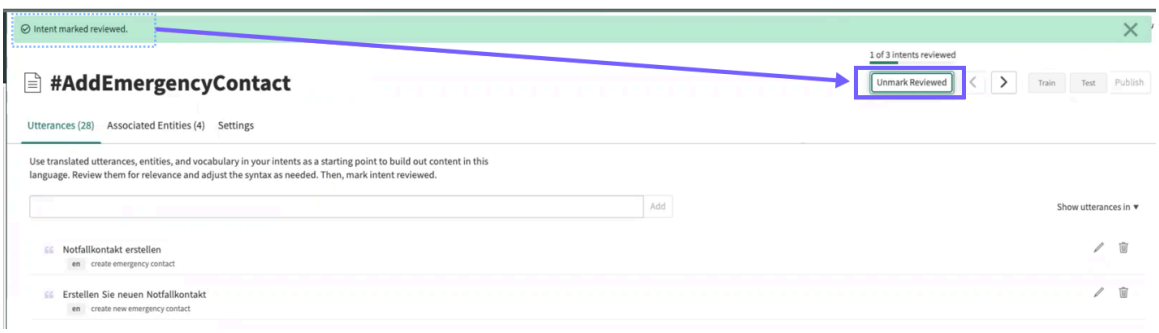
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Intents created in primary models are active by default.
- Intents from primary models are automatically created, but not enabled, in their secondary models (pending import).
- Disabling an intent in the primary model disables the corresponding intent in all secondary models.
- If an intent is disabled in the primary model, the intent can't be re-enabled in a secondary model.
- Enabling a disabled intent in the primary model does not enable the corresponding intents in the secondary models.
- Disabling intents in secondary models has no effect on the primary model or other secondary models.
- Secondary model intents that are marked with Needs review are disabled by default.
- If you disable a primary model intent that is mapped to a Virtual Agent (VA) topic, a confirmation message appears.
- If you disable a secondary model intent that is mapped to a VA topic, a confirmation message appears.
- NLU admins can enable and disable intents in any model.
- NLU editors can enable and disable intents only for models they are assigned to.

Disabling intents gives editors time to review the intent translations and update them if needed. When you're satisfied with the content, enable the intent to make it accessible to other NLU models and ServiceNow applications.

In this review example, you have a list of disabled intents in the Needs review state. The goal of this task is to review the translated content for a secondary model. When you complete your review, or if the content is fine as it is, you click Mark as reviewed. This moves the intent into the Reviewed state. You can also undo the Mark as reviewed state for an intent by clicking the **Unmark Reviewed** button, but only if you remain on the Intent screen. If you leave the screen prematurely, the **Unmark Reviewed** button disappears, and you won't be able to retrieve it.

Switch between the Reviewed and Unmark Reviewed states for an intent

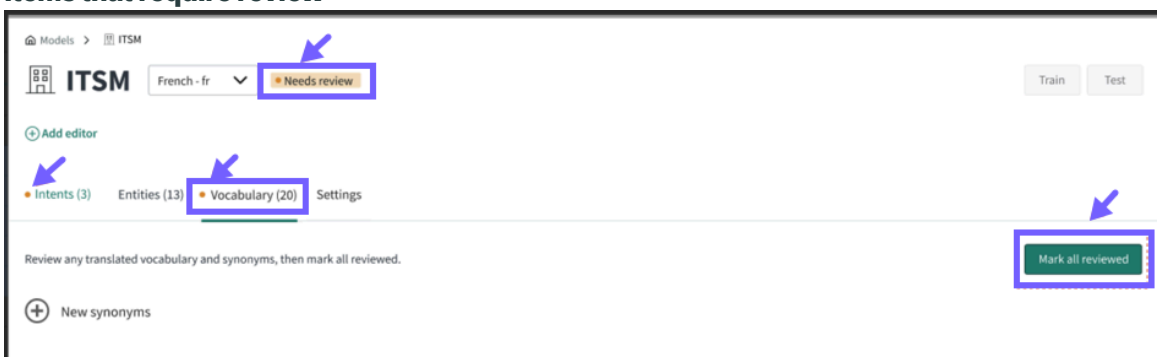


The editorial review also includes the Vocabulary section on the Model screen, where vocabulary that has been translated from the primary model to the secondary model is marked with an orange dot and the Needs review state. You can edit or delete the vocabulary items, even if they are in review. After you review the vocabulary and update the translations if needed, you can mark all of them at once by clicking the Mark all reviewed button. This action makes the orange dot disappear from the Vocabulary section of the Model screen.

Note: The **Train** and **Try** buttons on the Model screen are disabled until the vocabulary is reviewed, and the intents in the Needs review state are either reviewed or disabled.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Items that require review



In this example scenario, you have applied the Use Software translation mode to translate a secondary model into the Japanese language. Because the translation hasn't been reviewed yet, the system marks the intents and the model with the Needs review state. When a model is in the Needs review state, it can't be trained, tested, or published. When it moves out of the Needs review state, you can then train and test the model.

Note: An NLU editor can't create or publish a model. Only the NLU admin has permission to do this.

In this example procedure, you're reviewing the intents in a model one at a time.

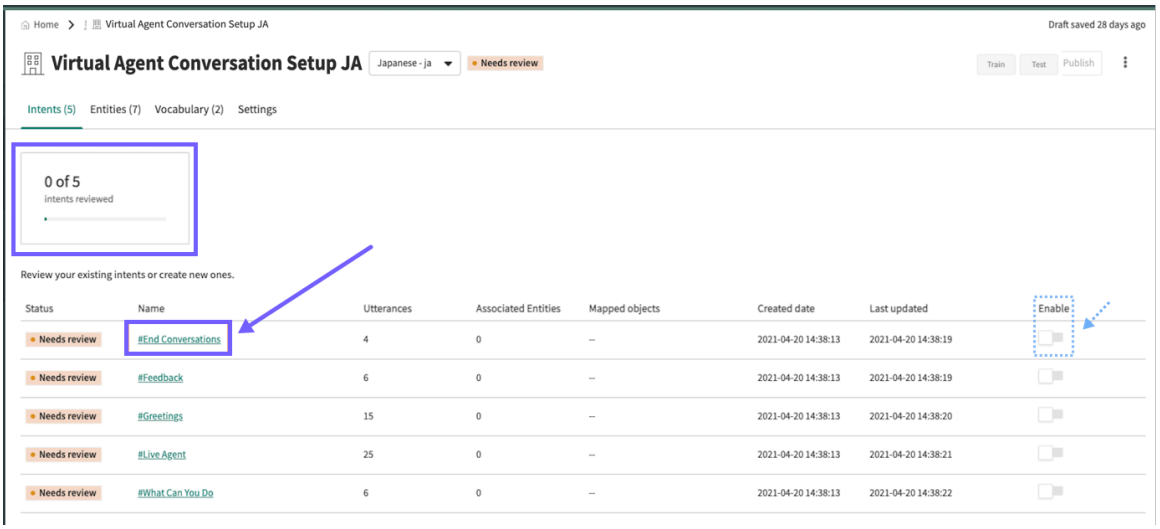
Procedure

1. Navigate to **All** > **NLU Workbench** > **Models**.
2. Locate one of your secondary models that has already been translated.

   In this example scenario, you locate the Virtual Agent Conversation Setup JA model, as shown in the image below.

   In the Intents section of the model, there's a list of five intents that are marked with the Needs review state. Above the list of intents, there's also a box that shows a running count of the intents that need review.

The needs review state



3. Click an intent Name so you can access the intent content.
   In this scenario, you click the **#End Conversations** intent name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Review the secondary language translations of the model utterances, entities, and vocabulary, then update the content as needed.
   When you finish your review of the intent, the Mark as reviewed button appears.
5. Click **Mark as reviewed**.
   Result: The system updates the **#End Conversations** intent from the Mark as reviewed state to the Reviewed state. In addition, the reviewed intents box changes its running count from 0 of 5 to 1 of 5.
6. If you're satisfied with your intent review, click the **Enable** button so the intent is available and can be accessed by any application, such as Virtual Agent (VA) or Search.

What to do next

Repeat Steps 1 through 6 for the four remaining intents in the list. As each intent review completes and is marked with the Reviewed state, the running count in the intents reviewed box increases toward 5 of 5.

(Legacy) Assign an NLU editor to a model

Assign an editor to review your Natural Language Understanding (NLU) model translations and edit model content. Delegate the maintenance, testing, and optimization of model content to an editor.

Before you begin

- Create a model, or use an existing one. For translation review, create both primary and secondary (translated) models. For more information on multilingual model groups, see (Legacy) Multilingual model management.
- Assign the nlu_editor role to users. See Assign a role to a user.
- Role required: nlu_admin. The nlu_editor can't assign another editor to models.

About this task

The nlu_admin can delegate model content work to an nlu_editor. Assign language specialists as editors to review the consistency between primary and secondary (translated) models, or further localize the translation by editing intents and utterances. Delegate the maintenance of an existing model's content, without affecting the model's published status.

The nlu_editor can do the following, when assigned to a model:

- Train and test the model.
- (Legacy) Export an NLU model as CSV.
- When a model or intent is in the **Needs review** state, the editor can mark it as **Reviewed**.
- Modify the model's confidence threshold.
- Edit the model name and description in **Settings**.
- Review, edit, and approve translated utterances.
- Add, edit, and delete training utterances.
- Annotate training utterances (add references to (Legacy) NLU vocabulary and (Legacy) NLU entities).
- Update entity properties (except the entity name in a secondary model).
- Add, edit, or delete the model's vocabulary.
- View the **Vocabulary sources** module (read only).
- Add, activate, and de-activate (Legacy) NLU intents in primary and secondary models.
- Resolve conflicting intents; also access the (Legacy) Cross-model Conflict Review module.

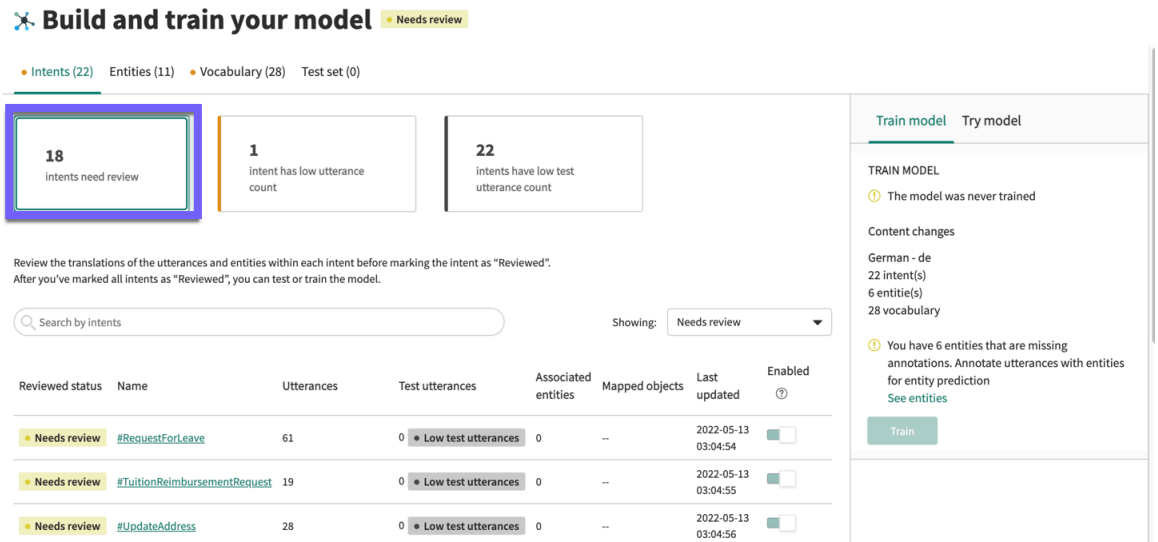
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- View the (Legacy) Irrelevance detection in NLU module.
- Add, edit, or delete a test utterance in a test set; also access the (Legacy) Multi-model Batch Testing module.

Note: The editor must be assigned to a model and in the model's application scope to take these actions, unless otherwise indicated.

The nlu_editor can't do the following:

- Create, add, publish, or delete a model.
- Duplicate a model.
- Translate a model (initiate a translated secondary model).
- Import primary model content to a secondary (translated) model.
- Sync or edit vocabulary sources.
- View model performance.
- Provide feedback in (Legacy) NLU Expert Feedback Loop.
- Manage other editors, such as assigning an editor to a model or removing an editor from a model.



First, an admin assigns the nlu_editor role to a user. Next, the NLU admin assigns the editor to a model.

When you assign an editor to a model, you must do so at the individual model level. You can't assign an editor at the model group level.

The following models can't be assigned to an editor:

- Prebuilt models
- Models that have a translation in progress

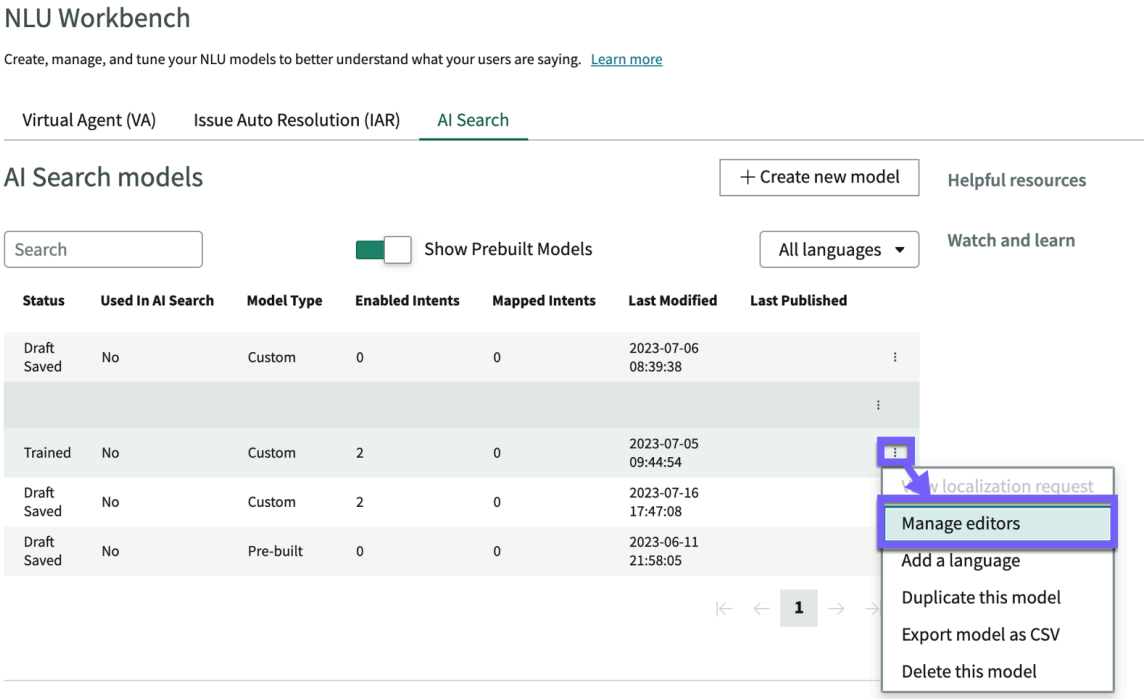
In this example procedure, you add an NLU editor to a secondary model that needs reviewing.

Procedure

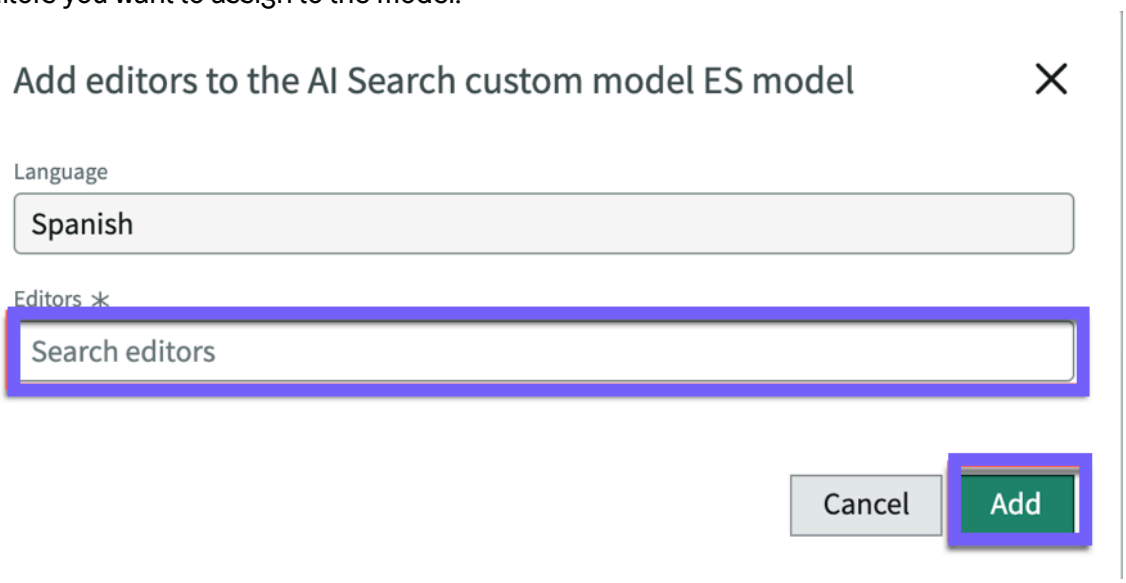
1. Navigate to **All** > **NLU Workbench** > **Models**.
   The Virtual Agent tab opens by default. Select the appropriate tab for your model.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

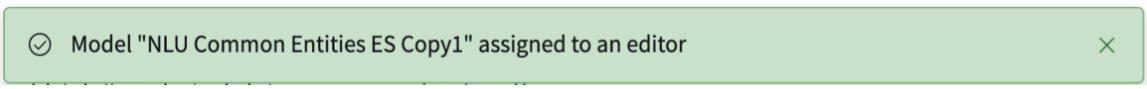
2. Locate the name of your NLU model and scroll to the right end of its row.
   If your model is in a multilingual group, expand the group to find the individual model. Editors cannot be assigned to groups.
3. Select the model's **More options** menu, then select **Manage editors** in the list.



4. In the **Add editors** window, use the drop-down list and search bar to add the names of the editors you want to assign to the model.



5. Select **Add**.
   The editor is assigned to the model. A banner acknowledgement displays at the top of the screen. To add more editors, or remove editors, repeat this procedure.



What to do next

Assign more editors to the model, if necessary. You can assign up to four editors to a model at one time. To add more editors, or remove editors, repeat the above procedure.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

As an NLU admin, ensure that your editors have what they need to properly review and edit models.

(Legacy) Import primary model content to a secondary model

When content in your primary NLU model is updated, you can import the updates directly to secondary models.

Before you begin

- Activate the Localization Framework (com.glide.localization_framework.installer) plugin. See Localization Framework.
- For Virtual Agent or AI Search models, create or use an existing primary model that has at least one secondary model.
- Role required: nlu_admin or admin.

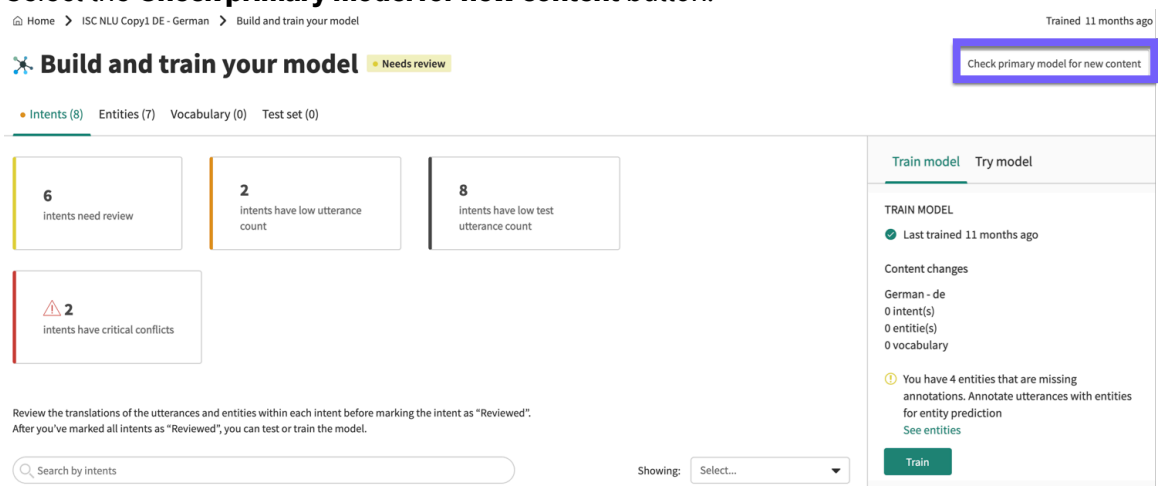
About this task

You can import content from a primary model to a secondary model after the initial translation. If you modify the primary model, those changes can be imported to your secondary models without the need to translate the entire primary model once again.

You can import primary model content to only one secondary model at a time.

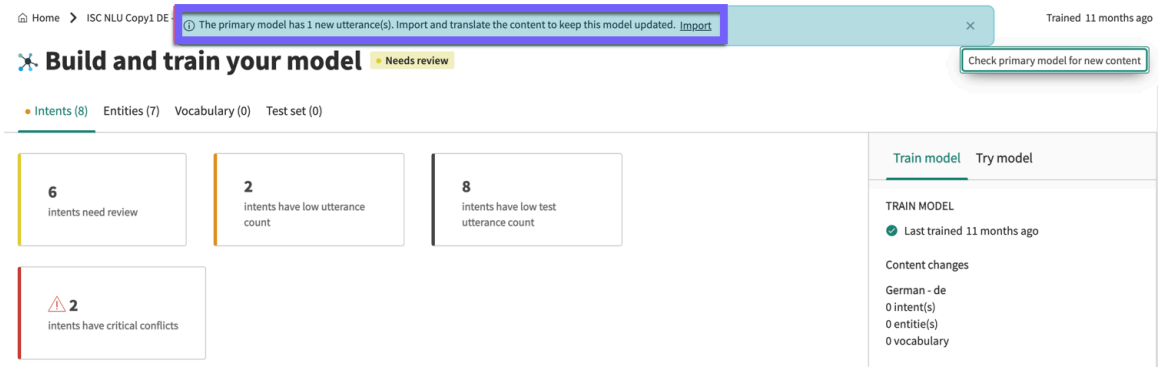
Procedure

1. Navigate to **All** > **NLU Workbench** > **Models**.
   The Virtual Agent tab opens by default. Select the appropriate tab for your model.
2. Access a secondary model that has been translated under the primary model, and on **Build and train your model**, select **View phase**.
   By default you are taken to the **Intents** tab.
3. Select the **Check primary model for new content** button.



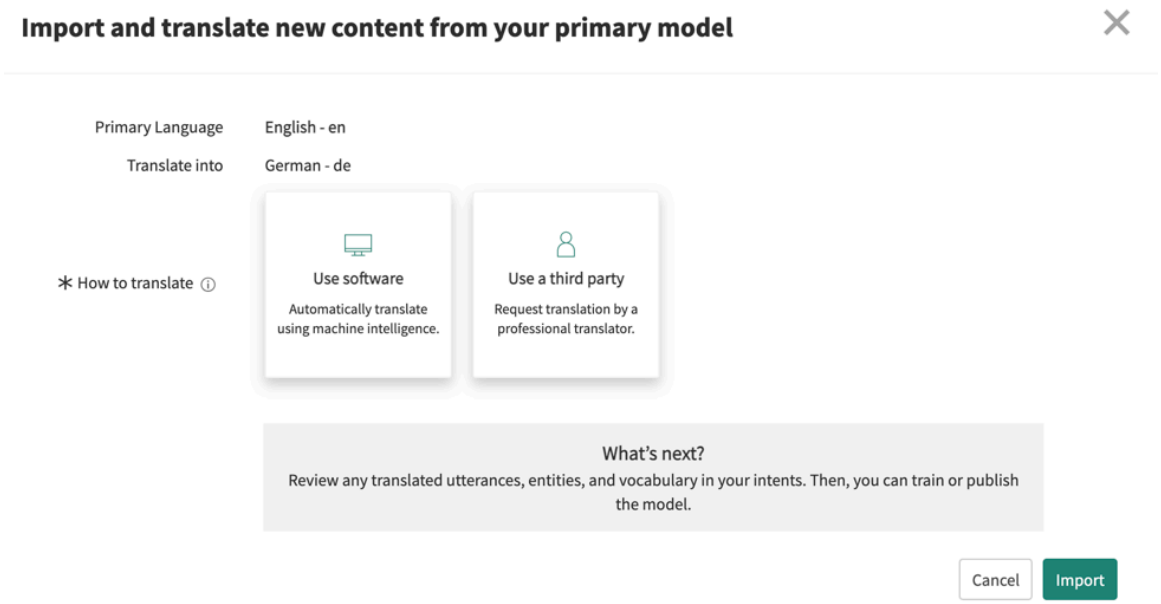
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The banner Import and translate the content to keep this model updated appears at the top of the screen, along with a summary of the updates in the primary model.



Note: By default, newly imported intents are disabled in secondary models. Activate any imported intents manually.

4. In the banner, select **Import**.
5. In the **Import and translate new content from your primary model** window, choose a translation method and select **Import**.



The new content begins translating. When finished, the translated content must be reviewed.

What to do next

Make sure that each of your secondary models receive the new content from the primary model. Review all the new, translated content before publishing the secondary models.

(Legacy) Virtual Agent and NLU Workbench integration

Virtual Agent administrators can access and update their NLU models from within the Virtual Agent Designer user interface.

Starting with the Brazil release, Natural Language Understanding is being prepared for future deprecation. It will be hidden and no longer activated on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support knowledge base.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If you have Now Assist in Virtual Agent, you can continue to use your existing NLU topics and migrate them into new LLM topics using the topic migration feature within Virtual Agent Designer. For more information on topic migration, see Migrate NLU topics to LLM topics.

Integration setup tasks, roles, and details

As Virtual Agent administrators create and configure their conversation topics, they must first create their NLU model and its associated intents in the NLU Workbench. This action requires they use the NLU Workbench and the admin or nlu_admin role.

In addition, they must also complete the following tasks in Virtual Agent **General Settings**.

- Enable NLU.
- Select the NLU service provider.
- If using language-specific NLU models, enable the languages for those models.

Virtual Agent administrators must also apply their NLU model to a conversation topic by completing the following tasks in Virtual Agent Designer:

- In **Topic Properties**, select the NLU model, the NLU intent, and the topic switching behavior.
- For input controls used in the topic flow, set the NLU properties for entity extraction.

Optionally, admins can activate Dialog Acts to enable Virtual Agent to respond flexibly when users make a modification in mid-conversation. Currently available response types are Modify, Affirm, and Negate, based on the last 5 exchanges in the conversation. Dialog Acts can be configured for English only, in Topic Properties. For more information see (Legacy) Dialog Acts for Virtual Agent.

After the NLU model is complete and associated with a Virtual Agent conversation topic, administrators with the virtual_agent_admin or admin role can do the following from within the Virtual Agent Designer user interface.

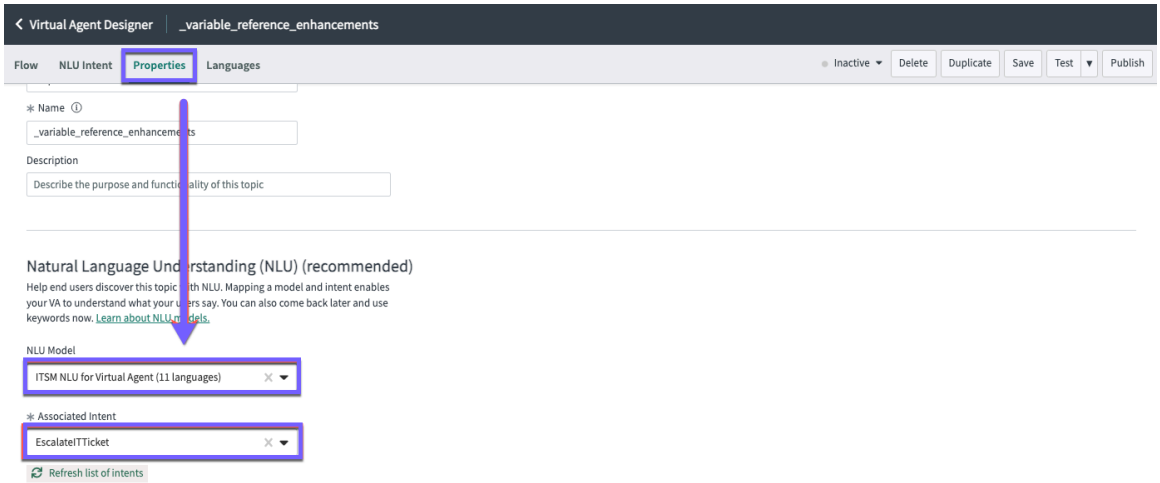
- Update NLU intent utterances.
- Train, test, and publish the NLU model.

For more information, see Natural Language Understanding (NLU) topic discovery in Virtual Agent.

Publishing topics from Virtual Agent

When your model is published in the NLU Workbench, it's ready to use in Virtual Agent Designer. When editing a topic, click the **Properties** tab to select a model and intent to map to that topic.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



When you click **Publish**, the model and intent are mapped to that topic and published seamlessly.

Publishing a topic with a mapped intent fails for the following reasons:

- Model isn't trained, or training is in progress.
- The last trained model is already published with a VA topic.
- The intent is not enabled in the model.

(Legacy) NLU Workbench - Advanced Features

NLU Workbench - Advanced Features expands the functionality of NLU Workbench to help you manage and improve your models.

Summary usage

Starting with the Brazil release, Natural Language Understanding is being prepared for future deprecation. It will be hidden and no longer activated on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

The NLU Workbench - Advanced Features application includes the following features:

- (Legacy) Multi-model Batch Testing: Test large groups of utterances against your NLU models to see how the model predicts intents.
- (Legacy) Cross-model Conflict Review: Identify conflicting intents within or across models to improve model performance.
- (Legacy) NLU Model Performance: Use NLU Model Performance to see how well your models predicted intents in Virtual Agent based on end-user confirmation.
- (Legacy) NLU Expert Feedback Loop for VA: Provide feedback on Virtual Agent chat log utterances to help the system continuously learn and to better predict user input.
- (Legacy) Irrelevance detection in NLU: train your Virtual Agent models to ignore utterances that are not relevant.
- (Legacy) Issue Auto Resolution Tuning in NLU (Expert Feedback Loop for IAR): provide feedback to your ITSM Issue Auto Resolution model to improve its predictions.

After the application is installed and activated, Model Performance, Expert Feedback Loop for VA, and Expert Feedback Loop for IAR appear under **All** > **NLU Workbench**. Multi-model Batch

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Testing and Cross-model Conflict Review appear under **All** > **NLU Workbench** > **NLU Advanced Features**.

Installation

NLU Workbench - Advanced Features is available from the ServiceNow Store. For instructions on how to purchase and download, see (Legacy) Install NLU Workbench - Advanced Features.

Note: The available (Legacy) Intent Discovery ServiceNow Store application is installed separately from NLU Workbench - Advanced Features.

Related features

(Legacy) Install NLU Workbench - Advanced Features

You can install the NLU Workbench - Advanced Features application (com.snc.nlu.workbench.advanced) if you have the admin role.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Review the NLU Workbench - Advanced Features application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.
- NLU Workbench - Advanced Features requires the following plugins. Ensure that these plugins are activated before you install NLU Workbench - Advanced Features.

  Required ServiceNow plugins

  Predictive Intelligence (com.glide.platform_ml)

  Enables various Predictive Intelligence and Machine Learning capabilities for training models. See Predictive Intelligence.

  NLU Workbench - Core (com.glide.nlu)

  Adds NLU Model capabilities. See (Legacy) Activate the NLU Workbench

  NLU Workbench (com.snc.nlu_studio)

  Create and train NLU models. See (Legacy) Activate the NLU Workbench.

Role required: admin

About this task

Starting with the Brazil release, Natural Language Understanding is being prepared for future deprecation. It will be hidden and no longer activated on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Tables are installed with NLU Workbench - Advanced Features.

For more information, see (Legacy) Components installed with NLU Workbench - Advanced Features.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the NLU Workbench - Advanced Features application (com.snc.nlu.workbench.advanced) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

   Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.
3. In the Application installation dialog box, review the application dependencies.

   Dependent plugins and applications are listed if they will be installed, are currently installed, or need to be installed. If any plugins or applications need to be installed, you must install them before you can install NLU Workbench - Advanced Features.
4. Select **Install**.

What to do next

The following available ServiceNow Store application is installed separately from NLU Workbench - Advanced Features:

Intent Discovery

Discover user intents from requests, incidents, or cases to help maximize deflection with Virtual Agent and NLU. For more information, see (Legacy) Install Intent Discovery.

(Legacy) Components installed with NLU Workbench - Advanced Features

Several types of components are installed with activation of the com.snc.nlu.workbench.advanced plugin, including tables.

Note: The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Tables installed

Table	Description
NLU Performance Ignored Clusters [nlu_performance_ignored_clusters]	Contains information on the ignored cluster. Filled when user clicks **Ignore**.
NLU Batch Test Result [nlu_batch_test_result]	Contains the parsed results of a batch test including each utterance and predicted intent.
NLU Conflict Execution [nlu_conflict_execution]	Stores the information related to each execution of a conflict analysis run for a given definition.
NLU Batch Test Run Definition	Contains base information related to the batch test execution.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
[nlu_batch_test_run_definition]	
NLU Batch Test Run Execution [nlu_batch_test_run_execution]	Contains information related to each execution of the batch test.
NLU Conflict Result [nlu_conflict_result]	Stores the complete results of a conflict analysis execution.
NLU Batch Test Utterance [nlu_batch_test_utterance]	Contains the utterances used for a test set. Populated by the import set.
NLU Batch Test Set [nlu_batch_test_set]	Includes the information for the batch test. Referenced by the utterance record and run definition.
NLU Performance Utterance Trace [nlu_performance_utterance_trace]	Contains the information on the utterances added to an intent.
NLU Conflict Definition [nlu_conflict_definition]	Contains the details of the NLU model or pair of models used for the conflict.
NLU Model Analysis Definition [nlu_analysis_definition]	Supports IAR model tuning in NLU Workbench.
NLU Model Analysis Execution [nlu_analysis_execution]	Stores records for each instance of IAR model tuning in NLU Workbench.
ML Label User Feedback [ml_label_user_feedback]	Stores utterances that are marked Needs review.

Role installed

NLU Workbench - Advanced Features

Role	Description
NLU Feedback Admin [nlu_feedback_admin]	Data labelling (NLU feedback) Admin role - to manage data labelling across models also ability to optimize models

(Legacy) Multi-model Batch Testing

Test multiple Natural Language Understanding (NLU) models against a large set of utterances to evaluate the performance of the models. Add test sets, test multiple models, and see test results.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Summary usage

Use Multi-model Batch Testing to create and upload test sets comprised of utterances and their expected intents. You can then run tests against your NLU models.

Multi-model Batch Testing works with models for all supported NLU languages. See (Legacy) NLU language support.

Installation

Multi-model Batch Testing is part of the NLU Workbench - Advanced Features app available on the ServiceNow® Store.

To use Multi-model Batch Testing, ensure that the NLU Workbench - Advanced Features (com.snc.nlu.workbench.advanced) plugin is active on your instance. For more information, see (Legacy) Install NLU Workbench - Advanced Features and Activate the NLU Workbench.

Test sets

Test sets are lists of utterances and matched intents. Create a test set by using a table in a CSV or XLSX (Excel workbook) file. The table should contain two columns: one for utterances, and one for the expected intent. Your test set can include up to 10,000 rows.

To get the most out of testing your NLU models, your test sets should include utterances that the model is likely to encounter from your users. Test utterances should be in the same language as the model to be tested. The test set should also include utterances with no expected intents. Including utterances with no expected intent helps assess your model's ability to detect utterances which are irrelevant and shouldn't have any intent predicted.

By including these types of utterances, the test better assesses the model's ability to perceive intents and respond to your users. If your test set does not cover at least 60% of the intents of the models, you can still run the test but the recommended threshold may not be optimal.

Note: Certain test utterances are skipped during the test if their expected intent does not match any intents in the models.

To create a test set, see (Legacy) Create a test set.

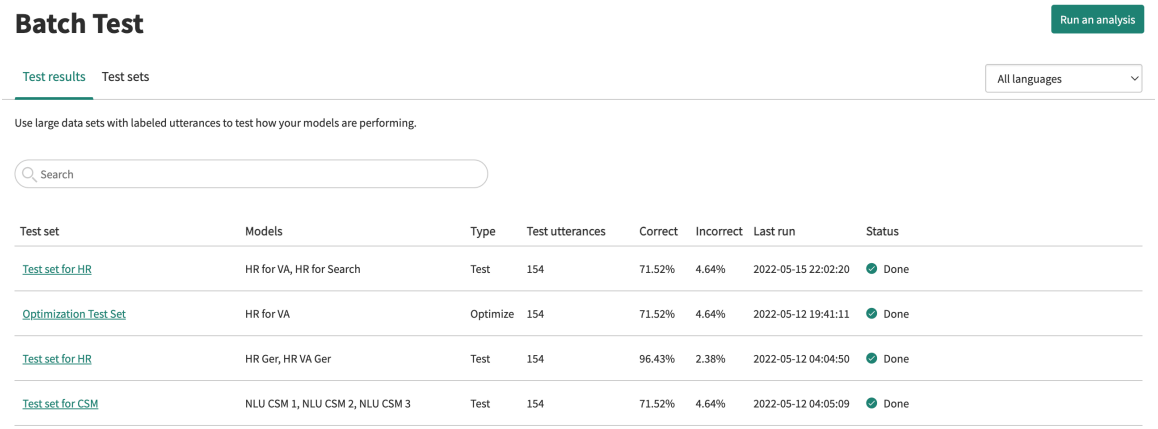
After you have a test set, you can test trained NLU models. To begin testing, see (Legacy) Run a multi-model batch test.

After running a test, your results appear on the **Test results** page.

Test results

The **Test results** page lists your completed and in-progress tests. At a glance, the results page shows the models tested against, the number of utterances, and prediction percentages.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



To see the details of a test result, click the name of the test set.

The **Overview** page shows summary information about the results and includes a graphic with a breakdown of predictions.

The **Intents that need attention (Current model)** shows the top 5 missed and incorrect intents. Click the intent name to drill down into the test utterances that were predicted incorrectly. Use this information to improve the model.

The **Detailed results** tab lists information about each utterance that was tested. From here, you can see the prediction outcome and confidence per model for each utterance. Filter the results by using the search bar or interacting with the filter tools and column headers.

You can also export the test results to a CSV file by clicking **Export**. The file includes the same columns as the detailed results page.

For more information on understanding your test results, see (Legacy) Test and publish your model.

(Legacy) Create a test set

To create or add to an NLU test set, you can upload a file of test utterances matched with correct intents. Use the test set to assess the performance of your model.

Before you begin

- Ensure that the NLU Workbench - Core plugin, NLU Workbench plugin, NLU Workbench - Advanced Features plugin and Predictive Intelligence plugin are all installed and activated
- You can use test sets with NLU models for Virtual Agent and AI Search.
- Role required: nlu_editor, nlu_admin, or admin. The editor must be assigned to the model.

About this task

Your CSV or XLSX (Excel Workbook) file should contain a table that pairs your test utterances with the intents that you expect for them. Your file can contain up to 10,000 utterances. Ensure that the file has columns titled "Utterance" and "Expected intent".

Note: For test sets in languages other than English, you must add the glide.import.csv.charset system property with the value UTF-8. See Import sets properties.

For the most accurate test results, include utterances that the model is likely to encounter from your users. Ensure that you have test utterances covering all the intents in your model.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Aim to include about 10% of test utterances with no expected intents. Including utterances with no expected intent helps assess your model's ability to detect irrelevant utterances that should not have any intent predicted.

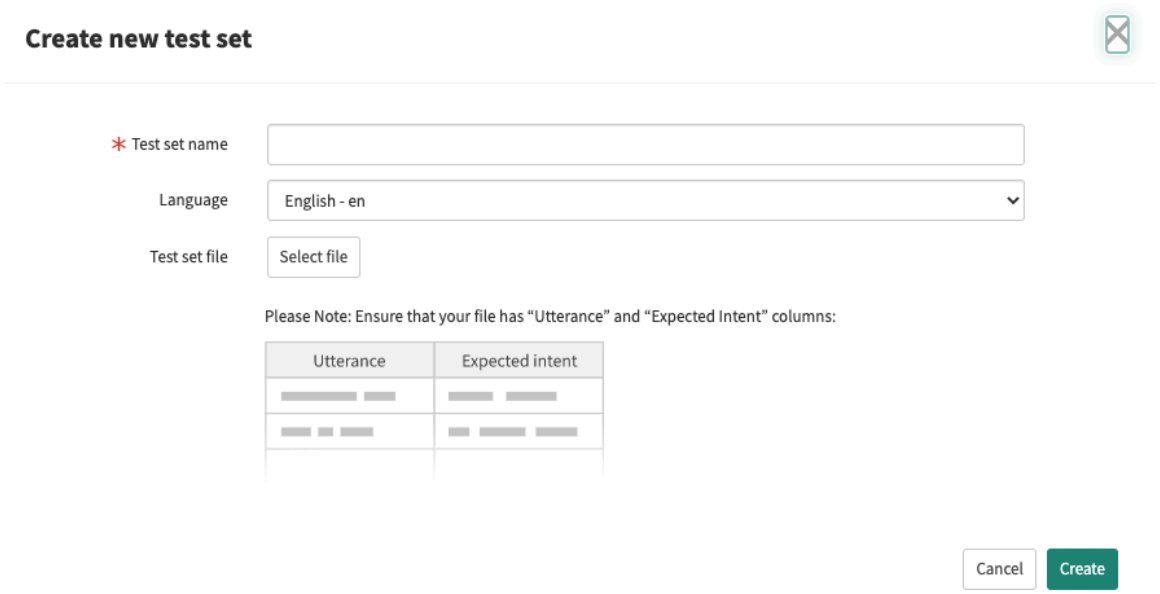
Note: To indicate that a test utterance in your file has no expected intent, the value for "Expected intent" should be empty.

Example test set table

Utterance	Expected intent
Let me have a burger	Order
I want to pay	Payment
Get me something sweet	Order
Is the restaurant open	
Something wrong with my payment	Order, Payment
Total cost	Payment

Procedure

1. Navigate to **All** > **NLU Workbench** > **NLU Advanced Features** > **Multi-model Batch Testing**.
2. Click **Test sets**
3. Click **Create test set**.



4. Choose a name for the test set.
5. Choose a language.
6. Click **Select file** and choose a CSV or XLSX (Excel Workbook) file.
7. Click **Create**.
   Your test set appears in the list.

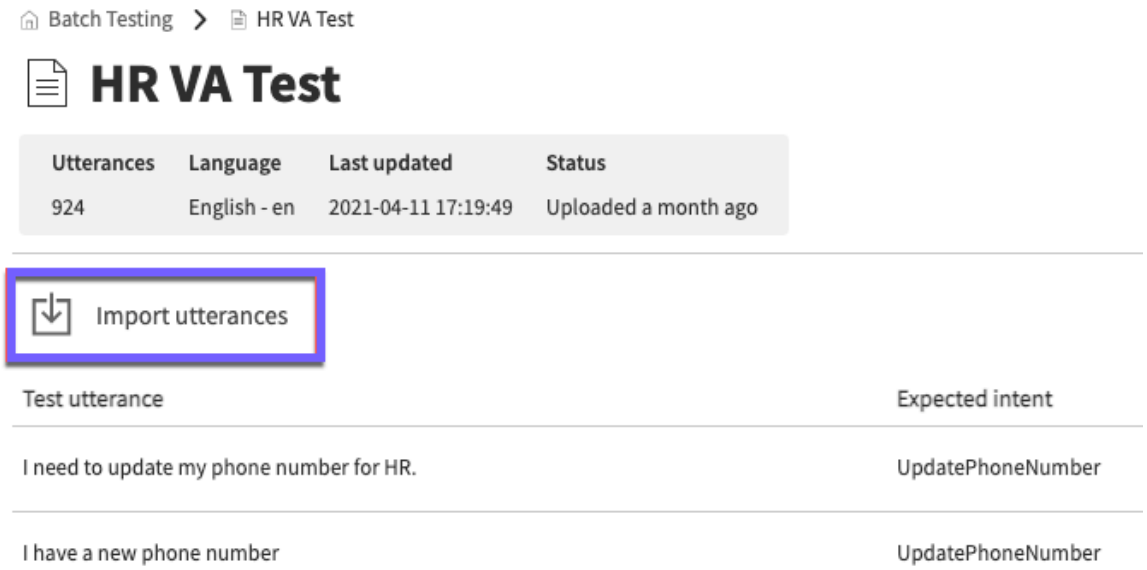
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

Use the test set to run a test on your models. To learn how, see (Legacy) Test your model or (Legacy) Run a multi-model batch test.

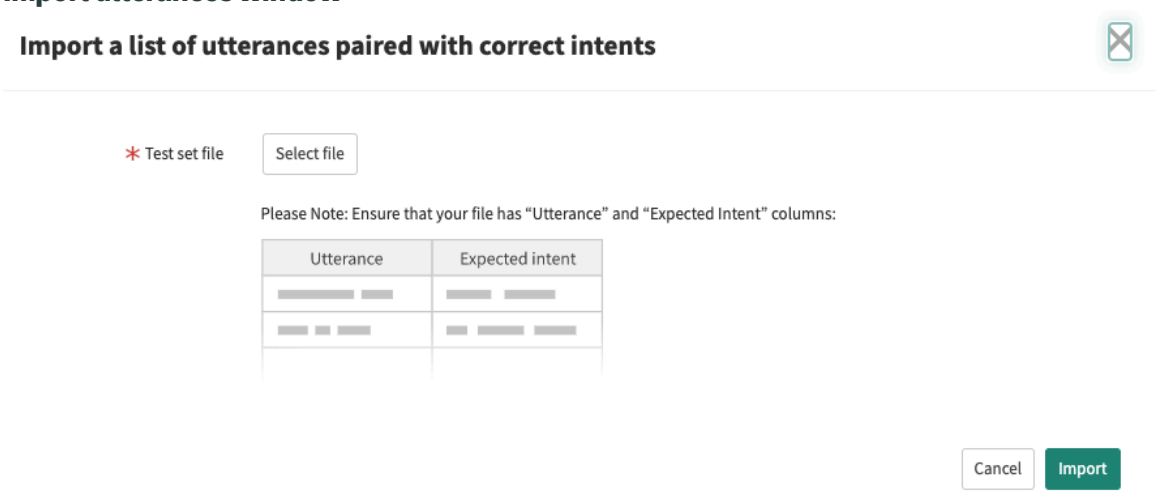
After you have created a test set, you can add more utterances to it. When viewing a test set, click **Import utterances**.

Test set page with import utterances button



Select a CSV or XLSX (Excel Workbook) file with your additional utterances to import.

Import utterances window



Click **Import**. The system adds your utterances to the test set. After importing, rerun any tests that use the test set.

(Legacy) Run a multi-model batch test

Test multiple Natural Language Understanding (NLU) models against a test set. Evaluate the quality of your models and refine them to improve intent prediction.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Make sure that the NLU Workbench - Core plugin, NLU Workbench plugin, NLU Workbench - Advanced Features plugin and Predictive Intelligence plugin are all installed and activated.
- Have one or more trained models for Virtual Agent or AI Search.
- Have a test set containing test utterances with expected intents. See (Legacy) Create a test set or (Legacy) Test set creation and management.
- Role required: nlu_admin or admin. When assigned to a model, the nlu_editor role can run tests and modify test utterances for that model.

About this task

In **Multi-model Batch Testing**, you can use a test set that is not the model's default test set.

Also, you can test up to ten models at one time using **Multi-model Batch Testing**. However, tests with fewer models run more quickly.

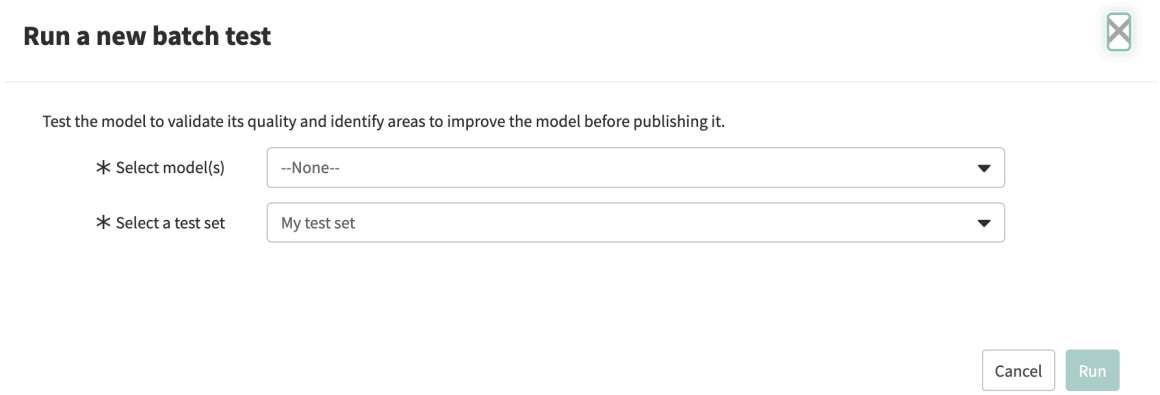
When testing multiple models, your test set must cover at least 25% of the total intents of all the models. Use test sets that contain utterances the models are likely to encounter in Virtual Agent or AI Search.

Note: If an expected intent in your test set doesn't match any intent in your models, that expected intent and its test utterances are skipped. They aren't counted or displayed in test results.

To test a single model against its default test set, use the **Test and publish your model** phase on the model's overview page. For more information, see (Legacy) Test and publish your model.

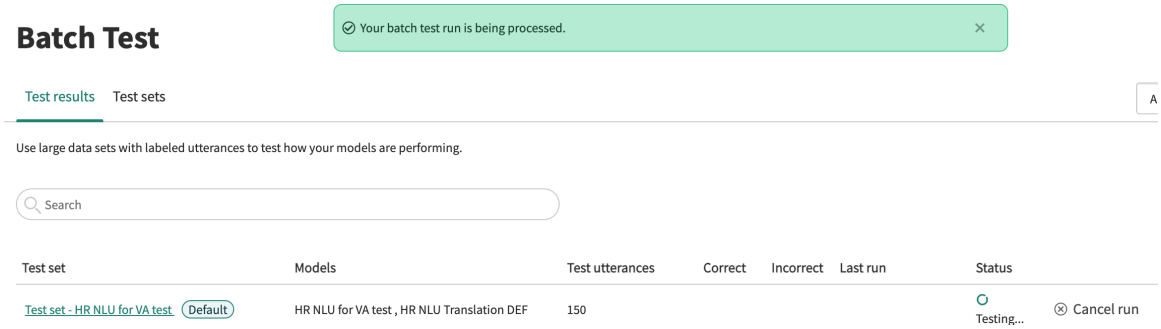
Procedure

1. Navigate to **All** > **NLU Workbench** > **NLU Advanced Features** > **Multi-model Batch Testing**.
2. Click **Run a test**.
3. In the **Run new batch test** window, select your models from the list.



4. Select a test set from the list.
5. Click **Run**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Your new test shows in the **Test results** list with a **Testing...** Status.

What to do next

When the batch test is finished, its Status changes to **Done**. You can click the name of the test set to view the test results.

Use the results to adjust and improve your models. Then, run the test again to assess the performance.

Batch testing may affect confidence threshold recommendations. For more information, see (Legacy) NLU model settings.

(Legacy) Cross-model Conflict Review

Identify conflicting intents within or across models so you can take corrective actions, resolve such conflicts, and improve your NLU model performance.

Summary usage

As the number of intents within a model increases, two intents may overlap in scope. This may occur when training utterances in one intent are almost identical to utterances in another intent. There may also be conflicting intents across models and even applications.

Utterances may also be marked as `Not relevant`, meaning that no intent should be predicted. When these irrelevant utterances are too similar to utterances assigned to an intent, they are displayed in Conflict Review. For more information, see (Legacy) Irrelevance detection in NLU.

To address and fix these issues, Cross-model Conflict Review runs an analysis on your models. Use the analysis to identify and resolve these issues prior to model publication and deployment.

Installation

Cross-model Conflict Review is part of the NLU Workbench - Advanced Features app available on the ServiceNow® Store.

To use Cross-model Conflict Review, ensure that the NLU Workbench - Advanced Features (com.snc.nlu.workbench.advanced) plugin is active on your instance. For more information, see (Legacy) Install NLU Workbench - Advanced Features and Activate the NLU Workbench.

Roles

To access Cross-model Conflict Review, use the nlu_admin or admin role. When assigned to a model, the nlu_editor can resolve conflicts in that model.

Running the analysis

The Conflict Review screen shows a list view of all conflict reviews created in your instance. When a review is completed, it's added to a running list of reviews. In this example scenario,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

you're creating the first review in your instance, so when it's completed, it's shown in the count as 1 of 1 reviews. As more conflicts arise over time, you will see multiple reviews in the list.

Conflict reviews are analyzed on either one or two NLU models. When you run an analysis on a single model, the system shows intents and utterances that are only in that model. When you run an analysis on 2 models, the system shows intents and utterances that are in both models.

Conflict reviews always run on the last trained version of the model(s) they analyze.

Conflict reviews have two types: Critical and Moderate. The standard approach is to begin with the critical ones.

When a conflict is detected, you can use one of following actions to resolve the conflict:

- Ignore the conflict
- Delete an identical or nearly identical utterance from one of the intents
- Edit the utterances to make them more distinct from each other

In this example scenario, you're resolving a conflict where two different intents contain the exact same utterance.

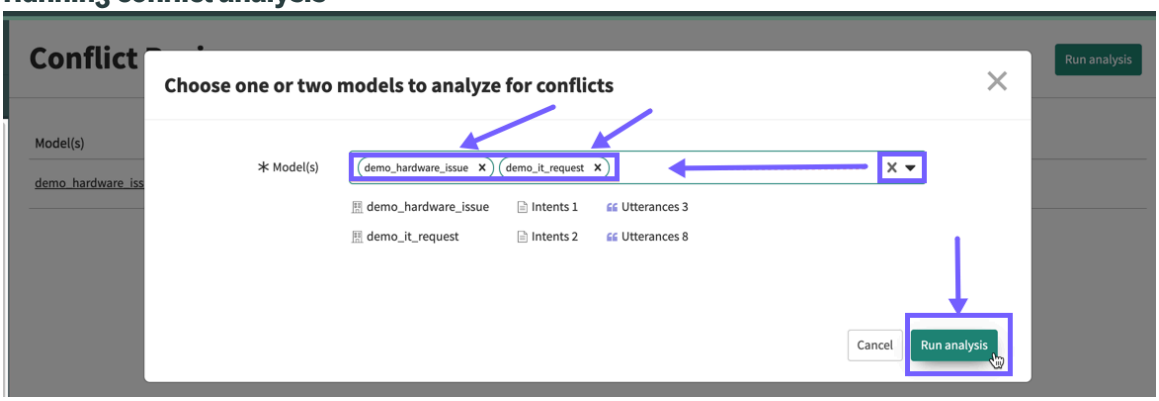
1. Navigate to **All** > **NLU Workbench** > **NLU Advanced Features** > **Cross-model Conflict Review**.

2. Select **Run analysis**.

3. In the **Model(s)** field on the Choose one or two models to analyze for conflicts screen, select two NLU models for the analysis. In this example scenario, you choose the demo_hardware_issue and demo_it_request models.

4. Select **Run Analysis**.

Running conflict analysis

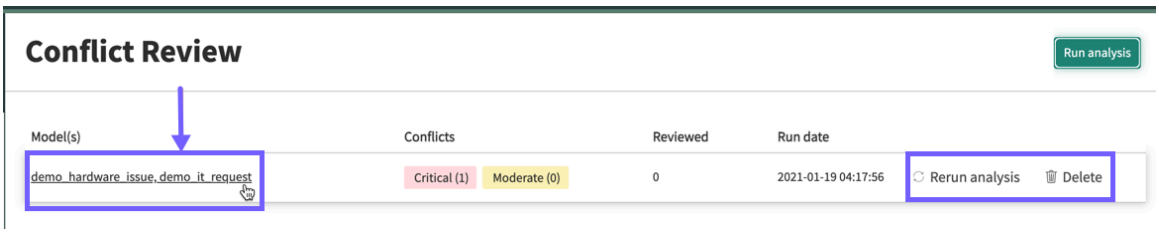


The Conflict Review screen refreshes to show the analysis, including the two models you selected for analysis, the counts of Critical and Moderate conflicts under review, the number of reviews that have been completed, and the run date for the analysis. If you point to the far right column on the screen you will see options to rerun the analysis, or delete it and start all over.

5. In the **Model(s)** column, select your two paired models so you can drill down into the review.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

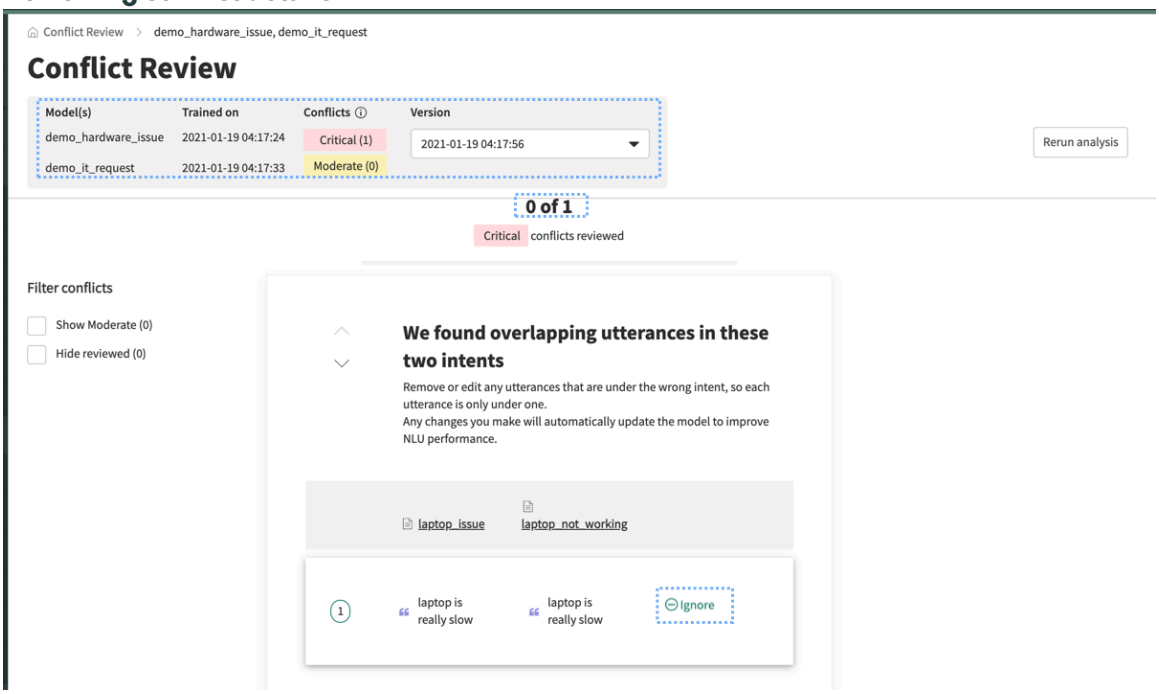
Conflict review



The screen refreshes to show the details of the conflict review. Note the summary of the two models you chose for the analysis, their latest training dates, the types of conflicts they hold, and the version time stamp of the analysis. Note also the 0 of 1 count, which indicates that this is the first conflict review created in this instance. As the system detects more conflicts over time, and those conflicts are reviewed, the count increases.

If you were to determine the utterances in the image below are fine as they are, then you should click **Ignore**. Clicking Ignore tells the system you've completed your review, so it marks it as reviewed and moves on to the next conflict review. However, in this scenario, you don't ignore the conflict, because intents that share the same utterance are a conflict worthy of review.

Reviewing conflict details



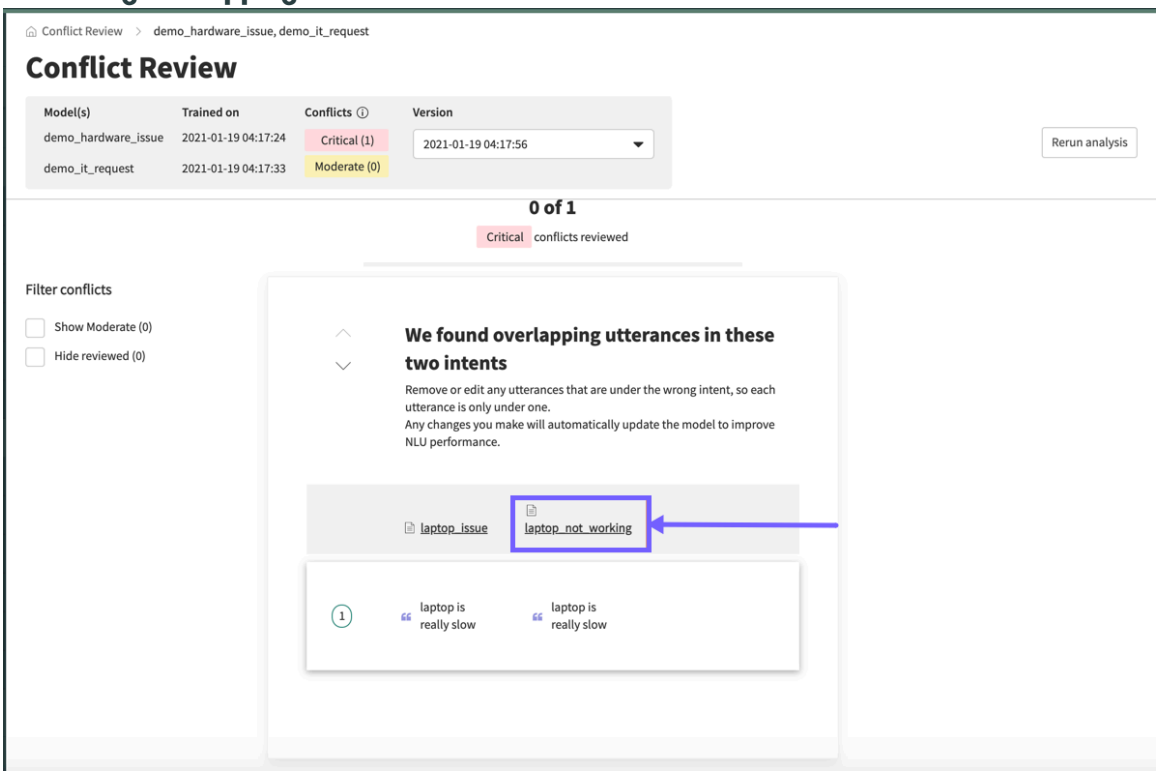
To determine how you will resolve this conflict, consider the 2 intent names and the identical utterances they share. Consider which intent is more likely to use the laptop is really slow utterance. If you compare the 2 intent names closely, you might realize that a laptop that's really slow isn't the same as a laptop that doesn't work. However, a laptop that's really slow is indeed a laptop issue. So in this example scenario, you decide to dig deeper into the intents to scan the context of their other utterances.

Note also that when an intent uses unique utterances, it helps the system to more accurately predict which utterances belong to it. Hence, you will need to edit or delete the utterance from 1 of the 2 intents. In this example scenario, you decide to dig into the #laptop_not_working intent.

6. Select **laptop_not_working**.

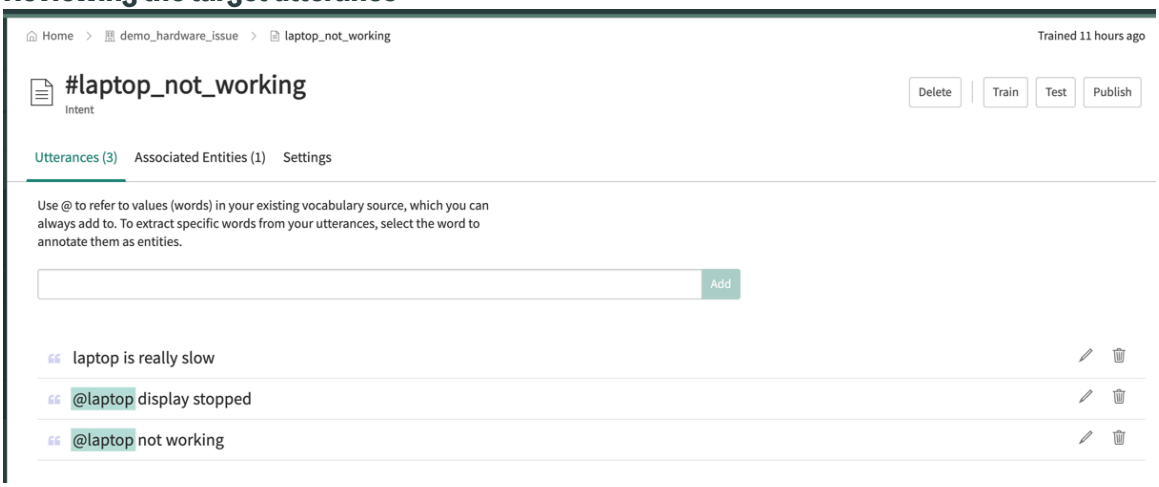
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Reviewing overlapping utterances



The #laptop_not_working Intent screen appears, showing its current 3 utterances. You make the decision to delete the laptop is really slow utterance from the #laptop_not_working intent.

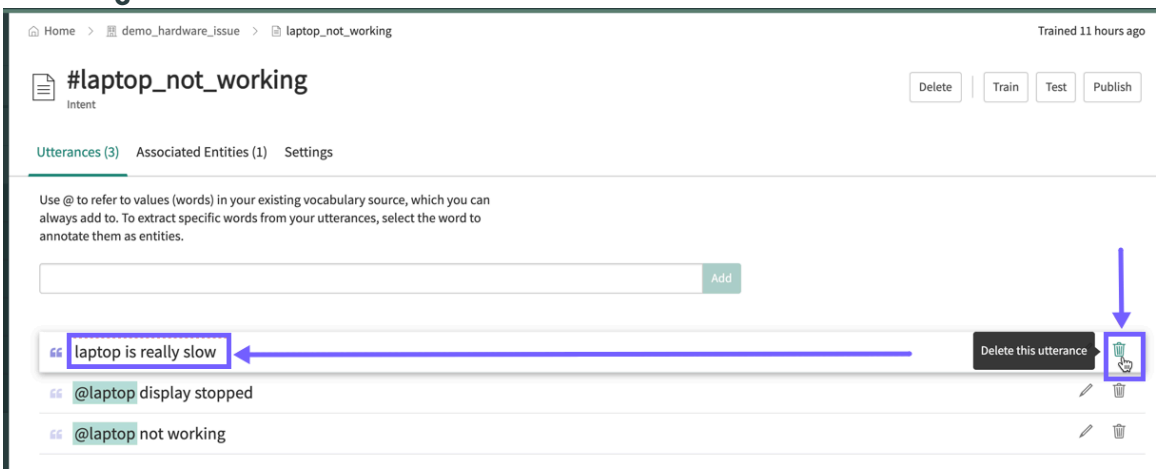
Reviewing the target utterance



7. Click the **Delete this utterance** trash can icon.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

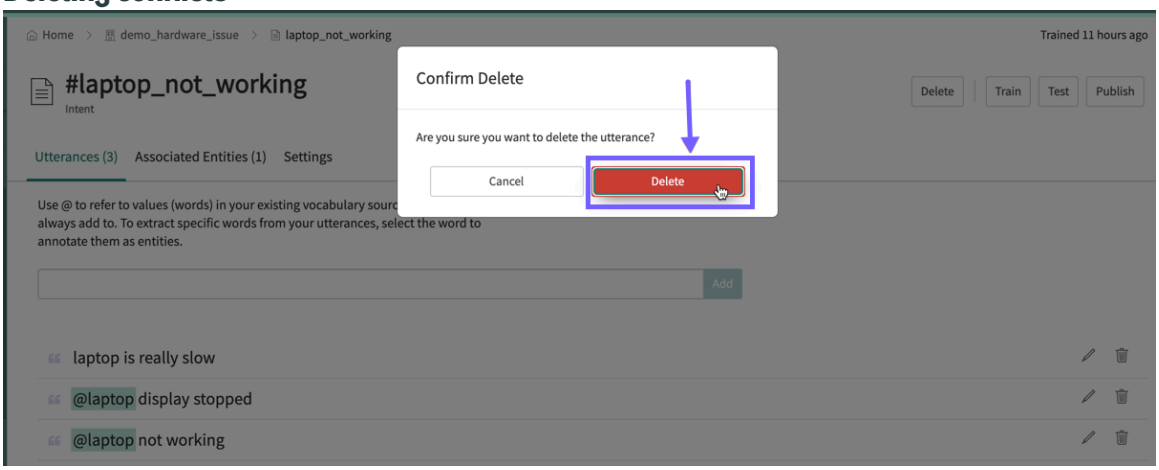
Resolving conflicts



The Confirm Delete screen appears.

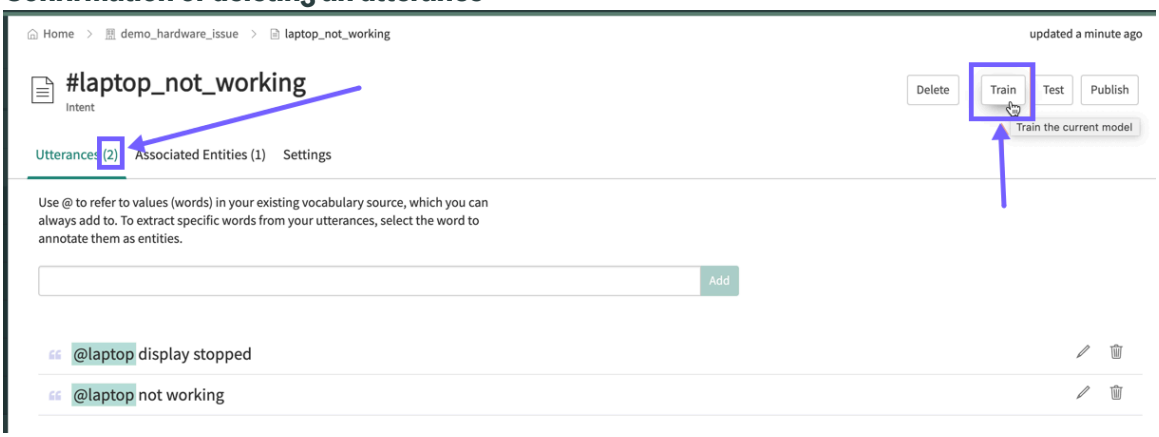
8. Select **Delete**.

Deleting conflicts



The Confirm Delete screen disappears, and the Utterances count drops from 3 to 2 because you've deleted the laptop is really slow utterance from the intent.

Confirmation of deleting an utterance



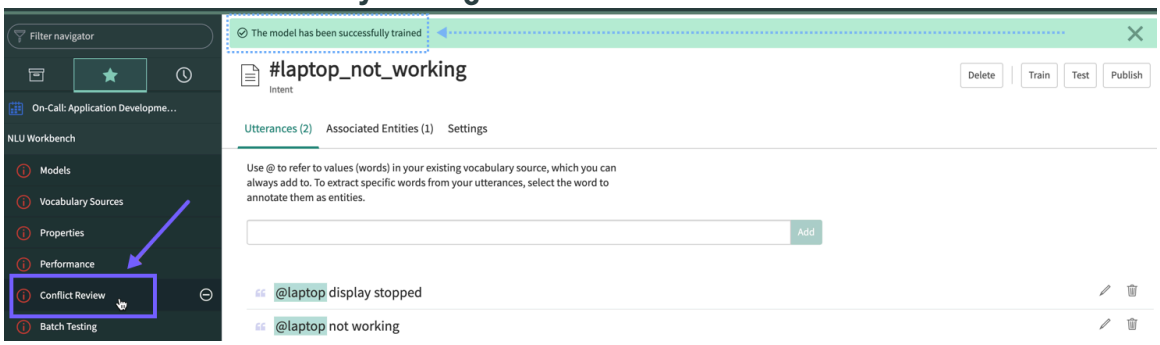
9. Select **Train**.

A banner appears on the Intent screen, confirming the model is successfully trained.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

10. Select **Conflict Review** in the navigator.

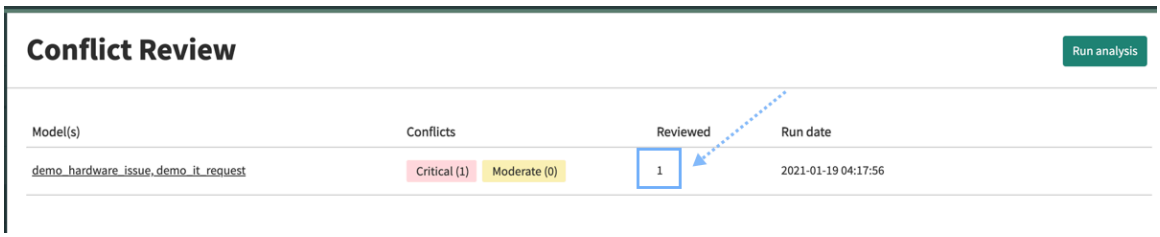
Confirmation of successfully training a model



Result:

The Conflict Review list screen appears, showing your conflict review analysis is complete, and that it's been reviewed.

Confirmation that a conflict has been reviewed



(Legacy) NLU Model Performance

Use NLU Model Performance to see how well your models predicted intents in Virtual Agent (VA) based on end-user confirmation.

Summary usage

The NLU Model Performance application provides an analysis and report of how well your NLU models predict VA users' intents from their utterances. As NLU models for VA are updated, published, and deployed, you can use NLU Model Performance to review the efficacy of the intent predictions they make. If these predictions are skipped, it's because they're unable to predict an intent with a high enough confidence score for the model. To improve VA topic prediction, the system groups unsupported VA utterances into clusters for an analysis and then generates a report that identifies the outcome of the analysis.

To access this application, use the nlu_admin or admin role and navigate to **All** > **NLU Workbench** > **Performance**.

Note: To use NLU Model Performance, you must first have at least 5,000 VA utterances in your instance. With the nlu_admin role, you can modify this limit by resetting the *sn_nlu_workbench.glide.nlu.performance.min_clustering_records* property.

Installation

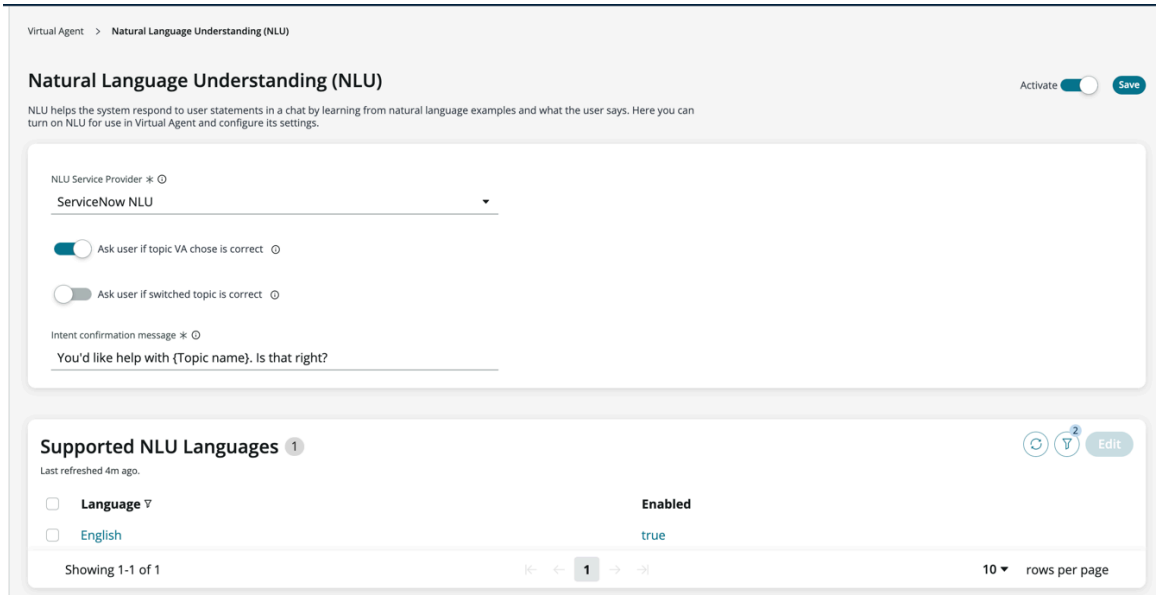
NLU Model Performance is an application available on the ServiceNow® Store. To use this application, ensure that the NLU Workbench - Advanced Features (sn_nlu_workbench) plugin is active on your instance. For more information, see (Legacy) Install NLU Workbench - Advanced Features and Activate the NLU Workbench. Because NLU Model Performance relies on data

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

coming in from VA, ensure that the Glide Virtual Agent (com.glide.cs.chatbot) plugin is also active. See Activate Virtual Agent.

Configuring Conversational Interfaces settings for ServiceNow NLU

To help with tracking NLU performance, you must first configure the Conversational Interfaces (CI) settings in Virtual Agent. To access these settings, navigate to the top of the **NLU Model Performance for Virtual Agent** landing page and click **Conversational Interfaces Settings**. This action takes you to the CI settings page in Virtual Agent, as shown in the image below.



To configure the settings, you need to use the virtual_agent_admin or admin role. For configuration guidance, see Implement NLU in Virtual Agent and Enable NLU languages in Virtual Agent settings.

Reviewing the user interface (UI)

The NLU Model Performance UI is comprised of the listed parts below, which are highlighted in the following image that shows the NLU Model Performance default landing page.

- The **Performance** tab and its colored chart which shows data describing scenarios that occur when users interact with VA. This chart is segmented in shades of three colors, each representing a user scenario. The rows in the chart that have text and percentages are referred to as the legend. The three scenarios in the first row of the legend have two outcome scenarios beneath them in the second row. The bars underneath the legend correspond to the colors of the scenarios above them. These bars range in size based on the percentage value for each scenario.
  - For example, the dark blue bar shows you that 10% of this batch of VA users confirmed that the system presented them the correct topic to use for their VA chatbot conversation, and that 58 % of the users (represented by the dark red bar) confirmed that the topic presented to them was incorrect. Residing between these two scenarios is a scenario showing that 32% of the users (represented by the dark brown bar) didn't make any confirmation at all.
  - It's a good idea to toggle the **Show all bars** filter back and forth at any time to see or hide the colored bars and their associated scenarios in the chart. Note also that when you first access NLU Model Performance, the default view of the chart shows only the first row of scenarios and the first row of bars.
  - There are also other views you can see depending on which scenario you're viewing. For example, when you first access NLU Model Performance and you click a scenario in the first

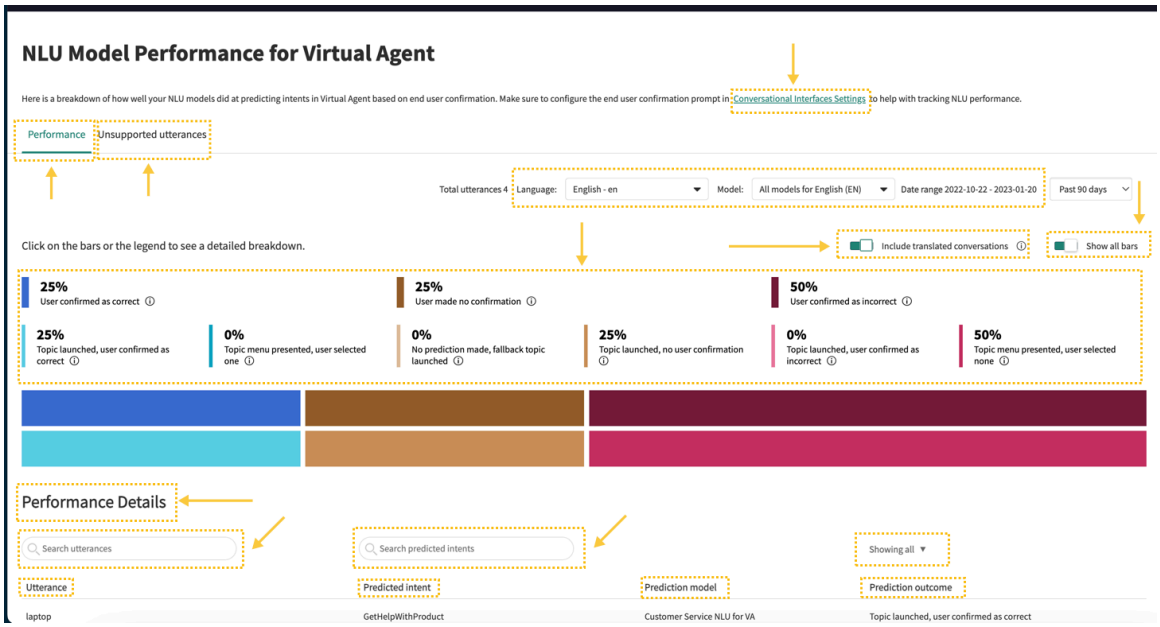
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

row of the legend, the system hides the bars of the other two scenarios. This helps to keep the UI less cluttered because it partially isolates the scenario you're focusing on from the rest of the scenarios. These actions don't change any data, they simply show you different views of the legend and bars within the chart.

- The **Unsupported utterances** tab, which shows utterances that are grouped into clusters for use in the performance analysis. This section of the UI is where you can navigate to and return from the Expert Feedback Loop application, and also where you can run the analysis.

  Unsupported utterances are different from irrelevant utterances. For more information, see (Legacy) Irrelevance detection in NLU.

- The **Performance Details** section located underneath the bar chart. This section has these four columns: **Utterance**, **Predicted intent**, **Prediction model**, and **Prediction outcome**. The details shown in this section interact with the legend data and bar data above them.



Reviewing the VA user scenarios

In the legend section of the UI, the text and percentages are accompanied by Information icons. Point to an icon to invoke the definition for its user scenario. Refer to the table below to see the definitions.

Scenario Definitions

Scenario	Definition
User confirmed as correct	The correct topic was presented to the end user and the end user has confirmed it is correct.
Topic launched, user confirmed as correct	The topic was launched and the user confirmed it is the topic they needed.
Topic menu presented, user selected one	Multiple topics were shown as a menu to the user and the user chose one of the topics to address their need.
User made no confirmation	The topic was launched but the user did not confirm whether or not it met their need.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

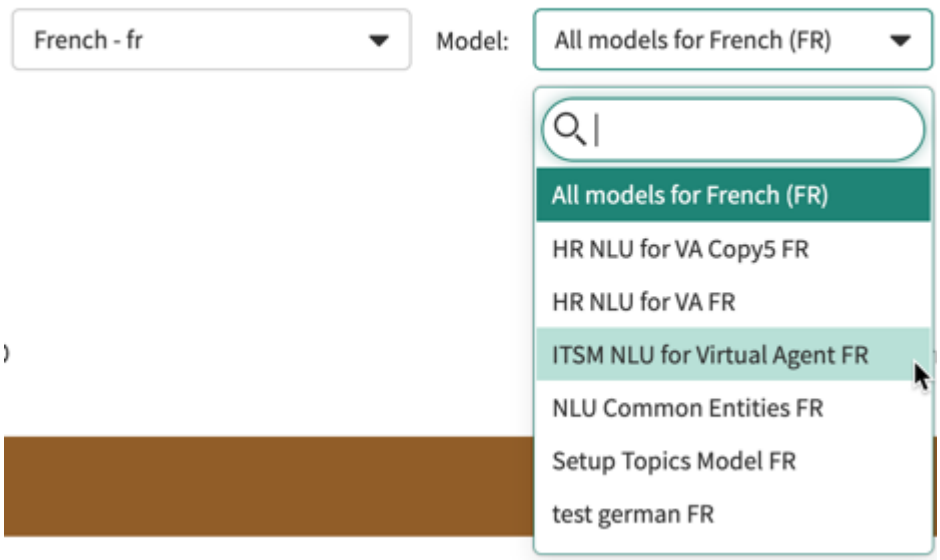
Scenario Definitions (continued)

Scenario	Definition
No prediction made, fallback topic launched	No predictions were made and the fallback topic was launched.
Topic launched, no user confirmation	The topic was launched but the user did not confirm whether it was correct.
User confirmed as incorrect	The topic(s) presented did not address the end user's needs, and the user has confirmed it is not correct.
Topic launched, user confirmed as incorrect	The topic was launched and the user confirmed it was not correct.
Topic menu presented, user selected none	Multiple topics were shown as a menu to the user and the user decided none of the topics were relevant and did not choose any topic.

Using the Language and Model filters

On the Performance tab, you can see the Language and Model filters. Next to them, you can also see the most recent Date range values you set above the legend and bars of the chart. Click the **Language** filter to see all languages that are available in NLU. Click the **Model** filter to see all prediction models that are available in your instance. The default setting for the **Language** filter is **All languages**, and the default setting for the **Model** filter is **All models**.

The Language and Model filters interact with each other. For example, if you choose `French - fr` in the **Language** filter, the **Model** filter automatically shows all prediction models in your instance that use the French language, as shown in the following image.



There are other interactions. For example, from the default view of the NLU Model Performance landing page:

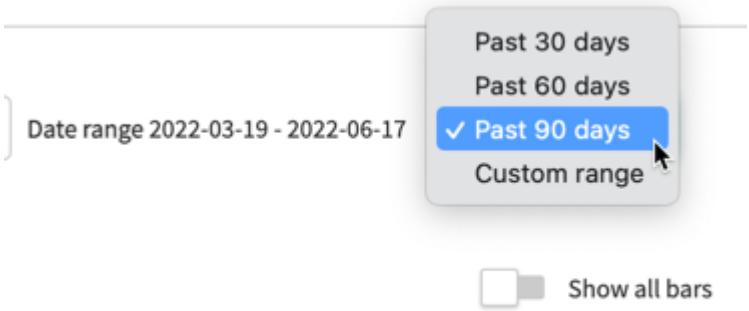
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If you select a specific model from the **Model** filter, the **Language** filter value is updated to display the language of the selected model.
- If you select a specific language from the **Language** filter, the **Model** filter only displays models of that selected language.

Underneath the Language and Model filters, you can see the **Include translated conversations** switch. To include the performance of VA conversations that were translated to your primary language using dynamic language translation, toggle the switch to the right so it changes color from grey to green. When you do this, the bars in the charts legend may also change position and colors. You can manage dynamic language translation in the **Conversational Interfaces Settings**.

Setting the Date range

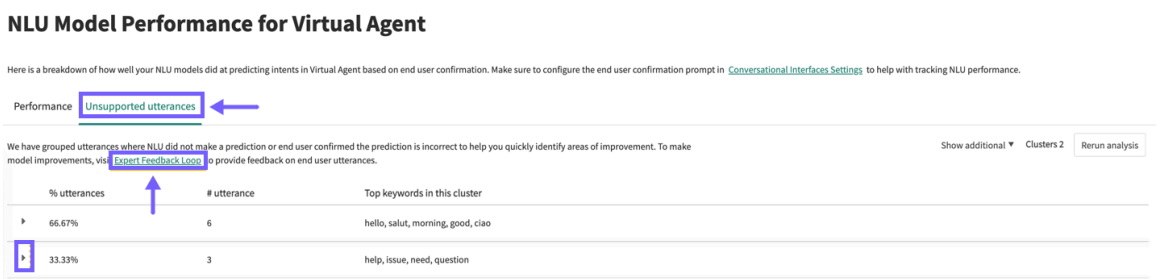
On the Performance tab, use the **Date range** to define how far back you want the system to pull VA data from. Choose **Past 30 days**, **Past 60 days**, **Past 90 days**, or **Custom range**. The further back you go in the date range, the more data you will have in your analysis.



Running an analysis

To run a performance analysis, click the **Unsupported utterances** tab. This section of the UI shows rows of expandable clusters containing VA utterances where NLU didn't make a topic prediction, or where the VA end-user confirmed that the predicted topic was incorrect. The next thing you want to do is to click **Expert Feedback Loop**. This action takes you to the NLU Expert Feedback Loop application where you review and provide feedback on the utterances that were pulled in from VA.

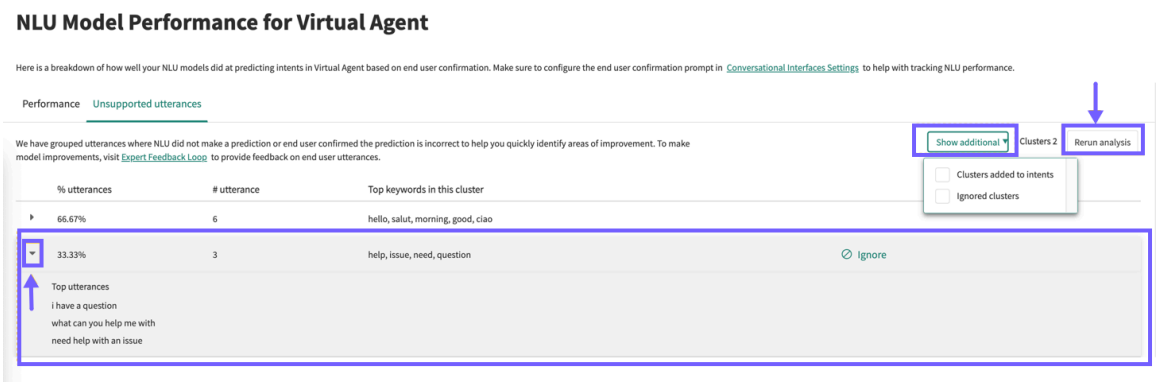
Reviewing unsupported utterances



When you leave the Expert Feedback Loop application and return to NLU Model Performance, click the **caret** icon in any cluster to open it. Within the cluster you can then see the top most representative VA utterances, as shown in the following image.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Reviewing the top representative utterances in a cluster



Click **Run analysis** or **Rerun analysis**, whichever is available. Each time you run an analysis, the system pulls the most recent VA utterances into the analysis.

Related topics

Virtual Agent

Natural Language Understanding in Virtual Agent

(Legacy) NLU Expert Feedback Loop

Provide feedback on Virtual Agent chat log utterances to help the system continuously learn and to better predict user input.

Summary usage

The Expert Feedback Loop takes data from your instance and provides it to you for feedback. This data comes from your users' Virtual Agent (VA) chat logs and includes utterances from those logs. Using the nlu_admin role, navigate to **All** > **NLU Workbench** > **Expert Feedback Loop** and mark each utterance in a model by confirming whether the utterance is correct (match) or incorrect (mismatch) to an intent. This feedback helps the model to continuously improve the model performance.

Installation

Expert Feedback Loop is part of the NLU Workbench - Advanced Features app available on the ServiceNow® Store.

To use Expert Feedback Loop, ensure that the NLU Workbench - Advanced Features (sn_nlu_workbench) plugin is active on your instance. For more information, see (Legacy) Install NLU Workbench - Advanced Features and Activate the NLU Workbench.

Because Expert Feedback Loop relies on the data from VA chat logs, make sure that the Glide Virtual Agent (com.glide.cs.chatbot) plugin is also active. See Activate Virtual Agent.

Importing expert feedback loop data between instances

Before you start an import, make sure you have access to the data in your instance and have enough data to proceed with your feedback.

If you're working in a non-production instance, you must import the feedback data from the **open_nlu_predict_intent_feedback** table in your production instance to your non-production instance. For guidance on how to import, see Importing from another ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Here are a few data scenarios regarding the system behavior for the NLU models that house the feedback loop utterances.

- If you move a model to a different instance, the feedback data persists.
- If you upgrade the instance, the feedback data persists.
- If you clone an instance, the data does not persist, so import the data onto the cloned instance.

Feedback context and access

The Expert Feedback Loop provides a mechanism for you to improve NLU models deployed to VA through feedback that you provide on a select subset of utterances. For each utterance, you are asked to confirm the predicted intent or to provide the correct intent that the utterance belongs to. After this feedback is complete, the data is used to tune the model performance, resulting in an improved model that can now be redeployed to gather more end user data. This is an iterative cycle that allows the system to continuously collect data, learn from the feedback you provide, and use that feedback to further improve your NLU models.

Once every 30 days, the system pulls up to 300 utterance samples from VA chat logs to the Expert Feedback Loop. The utterances are selected for feedback based on how well they represent all the utterances in the logs. Every utterance sampled from VA chat logs has a predicted intent picked by the system.

You can also set the number of utterances you want to be pulled from VA chat logs by adjusting the setting for the *glide.mlpredictor.option.nlu.activeLearning.label_candidate_table.max_respons* system property.

Further information on the process of pulling utterances from VA chat logs can be found in the sections Procuring additional VA feedback data on demand and Using the Active Learning job, below.

As you review the utterances, decide whether each utterance belongs to its predicted intent or should be moved to a different intent. If you aren't sure about the correct intent, the utterance can be marked to revisit for further review. After you have marked at least 100 utterances with your feedback, the system uses all the marked utterances to tune and improve the model.

Reviewing your VA chat log utterances

Now that you're in the loop, you can see in the following image a list of NLU utterances that support the intents in the VA models. Each page of the list shows approximately 20 utterances per page. Your goal is to review each utterance and mark its relationship status to a given VA intent. You mark each utterance with either the **NLU_Match**, **Mismatch**, or **Unsure** value.

Marking an utterance as **NLU_Match** means that you agree with the NLU prediction for that utterance. Marking an utterance as **Mismatch** means that the utterance belongs to a different intent, and if you select **Mismatch**, a dropdown of intents appears so you can select the correct intent. If you aren't sure which intent is correct, you can mark it as **Unsure**.

Utterances that are marked and saved with the **NLU_Match** value or the **Mismatch** value are moved to the **Completed reviews** section. Utterances that are marked and saved with the **Unsure** value are moved to the **Needs further review** section.

Here's a scenario for the basic steps you use to complete your utterance reviews:

1. At the top of the Export Feedback Loop screen, select a model you want to review in the **Expert Feedback Loop for** prompt. Within this feature, in some ways it doesn't matter which model you choose because these models serve mainly to house the utterances you are marking in

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

your reviews. So in this example scenario, you decide to select the **IT Model** model, which has five intents and many utterances within each of those intents. The number of utterances you need to review are shown next to the name of the predicted intent, as shown in the following image. The intents in these models are listed in the **Predicted intents** column on your screen. Although you can review and mark utterances in any of the predicted intents, it's a better idea to complete the reviews consecutively in the order the intents first appear. For example, begin with the **ad_password_change** intent and then onward to other predicted intents.

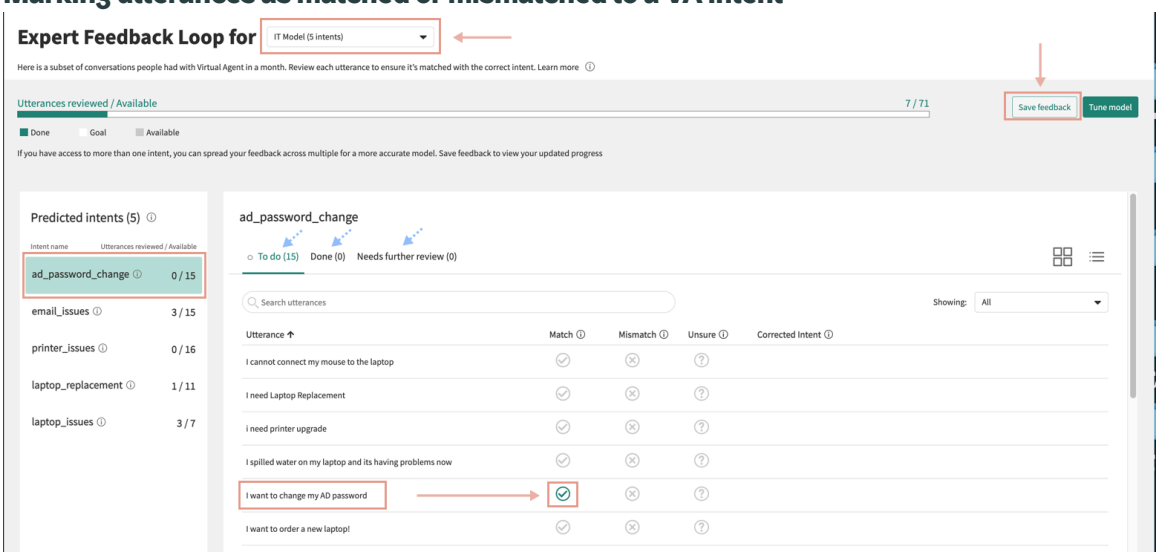
2. Click the **ad_password_change** intent so it loads its utterances into the **To do** section for your review.
3. Review the 15 utterances in the intent. In this scenario, you've started by correctly marking the I want to change my AD password utterance as a match to the **ad_password_change** intent.
4. Click **Save feedback**.

   Result: The system moves the utterance you marked over to the **Done** section of the screen. At the same time, the count of **To do** utterances drops from 15 to 14, while the count on the **Done** section rises from 0 to 1. If you had also marked another utterance with the **Unsure** value and saved that change, the count of utterances in the **Needs further review** section would also rise from 0 to 1.

   Note: If you don't know which intent best matches the utterance, mark it with the **Unsure** value. This action moves the utterance over to the **Needs further review** section, giving you time to mark other utterances in the **To do** section that may be easier to match or mismatch to an intent. You can return to the **Needs further review** section to mark utterances that are more difficult to pin down to a specific intent.

5. Repeat steps 1 through 4 as you move through the remaining intents in the **Predicted intents** column.

Marking utterances as matched or mismatched to a VA intent



The utterances in the **ad_password_change** intent are easy to mark as a match to its predicted intent because there's at least one utterance within the intent that has the word password in it.

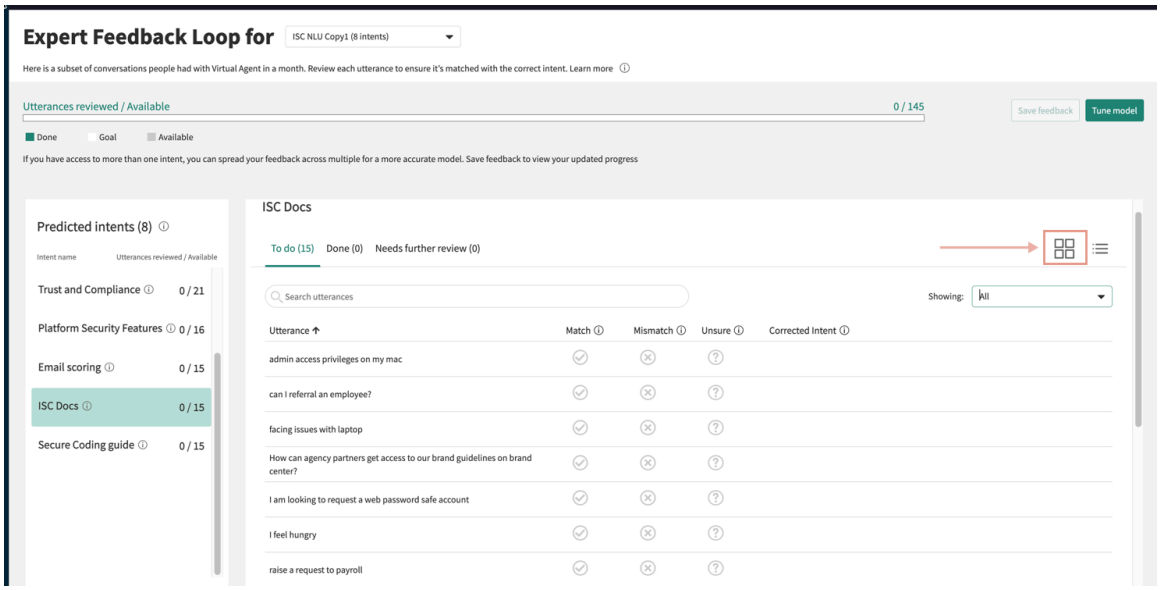
When you have finished reviewing the utterances in the predicted intent and you select **Save feedback**, the screen refreshes to highlight the next predicted intent in the model.

If you want to see your utterances grouped by their value, click the **Showing** filter and select one of the options in its prompt. The values are **All**, **NLU_Match**, and **Unsure**.

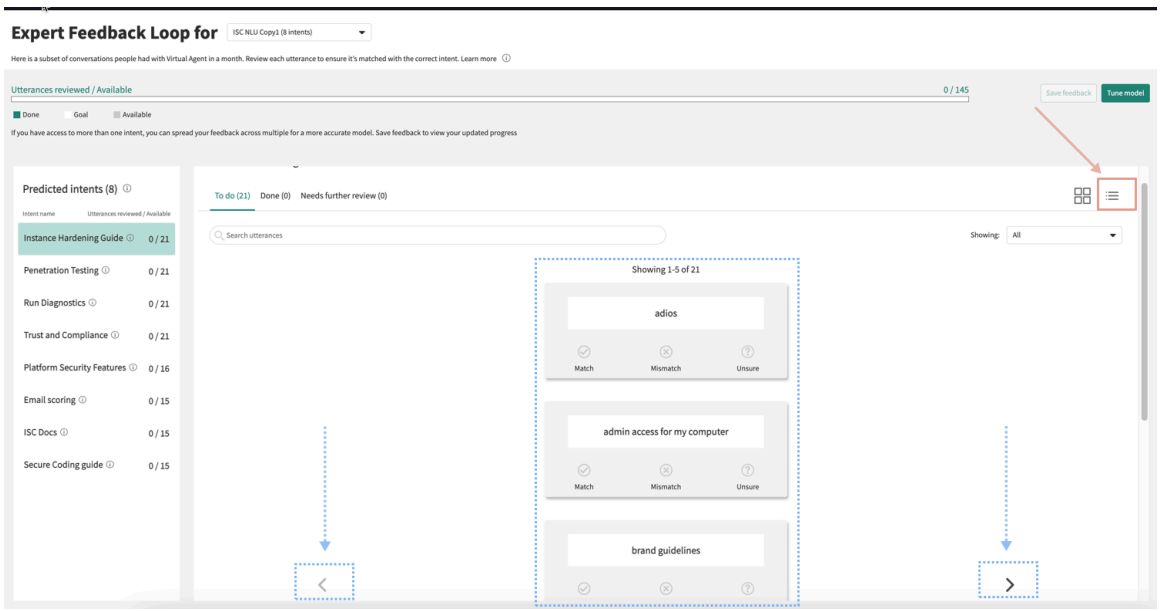
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Using the card view option to review your utterances

Your Expert Feedback Loop utterances appear on the **To do** section in a list view by default, as shown in many of the images you've seen so far above. However, you can also choose a different view that shows each utterance framed within a card. If you choose this option, each utterance appears on the page in groups of five. While still within the list view, select the **card** icon.



Result: The card view replaces the list view. Note the left and right arrows on either side of the page of utterance cards. When you click the right arrow, it turns the page to the next set of five cards. When you click the left arrow, it turns the page to the previous set of five cards. If you want to switch back to the list view instead of the card view, click the **list** icon as shown in the upper right hand corner of the image below.



Changing an utterance value

If you mark an utterance but then change your mind on the value you chose, you can resolve the issue by clicking on **MisMatch** and selecting another intent. Select **Save feedback** to save the change.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

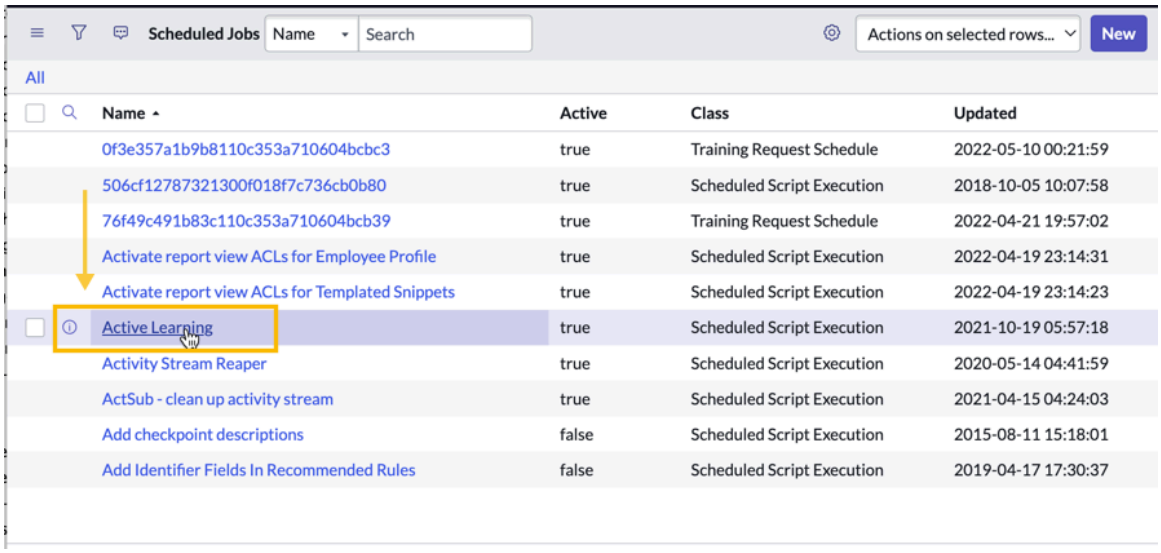
Unsaved feedback

If you finish and log out of a session of marking your utterances, but forget to save your changes, select **Unsaved changes** from the **Showing** prompt. This action displays all the utterances you have given feedback for but haven't saved yet.

Procuring additional VA feedback data on demand

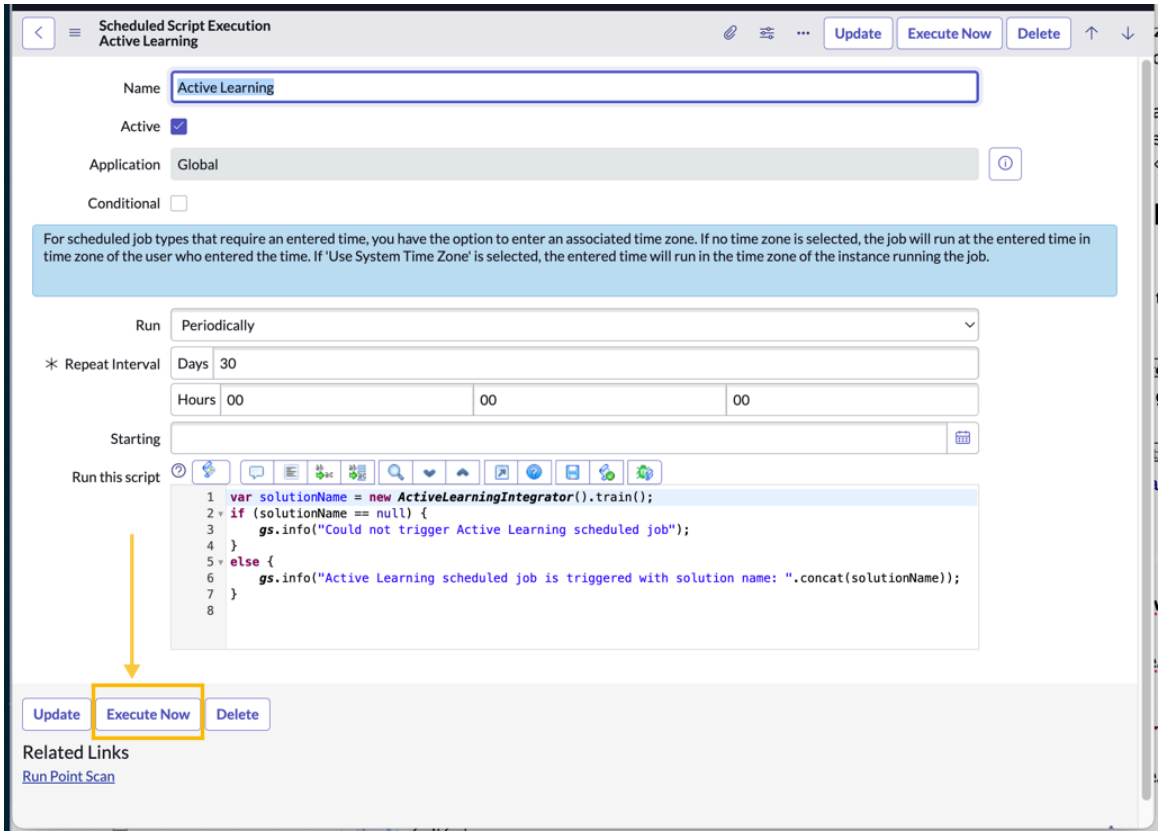
To get more data from the VA chat logs to use in the Expert Feedback Loop, take the following steps.

1. Use the nlu_admin role and navigate to **All** > **System Definition** > **Scheduled Jobs** > **Active Learning**.
2. Click **Active Learning**.



3. Select **Execute Now**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Increase or set the values in the following four NLU system properties.

- *glide.mlpredictor.option.nlu.activeLearning.va_chat_logs.max_row_limit - 3000*
- *glide.mlpredictor.option.nlu.activeLearning.label_candidate_table.max_data_ - 10000*
- *glide.mlpredictor.option.nlu.activeLearning.label_table.max_data_size - 10000*
- *glide.mlpredictor.option.nlu.activeLearning.label_candidate_table.max_respo*

To see how these properties work within the context of other NLU properties, see (Legacy) NLU Workbench properties.

Reviewing uncategorized utterances

As part of the feed from VA chat logs to the Expert Feedback Loop, the system collects and displays in a list any utterances in your instance that aren't part of a VA intent. You access these utterances by selecting **Uncategorized** in the **Expert Feedback Loop for** prompt at the top of your screen.

When the screen refreshes, these utterances are shown in the **Utterance** column of the **Uncategorized utterances** section of your screen.

Important: It is extremely important to provide feedback on this set of utterances because the system is suggesting there is no associated intent for these utterances. By confirming this lack of association or by associating these utterances with an existing intent, you are helping the model to learn correctly.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

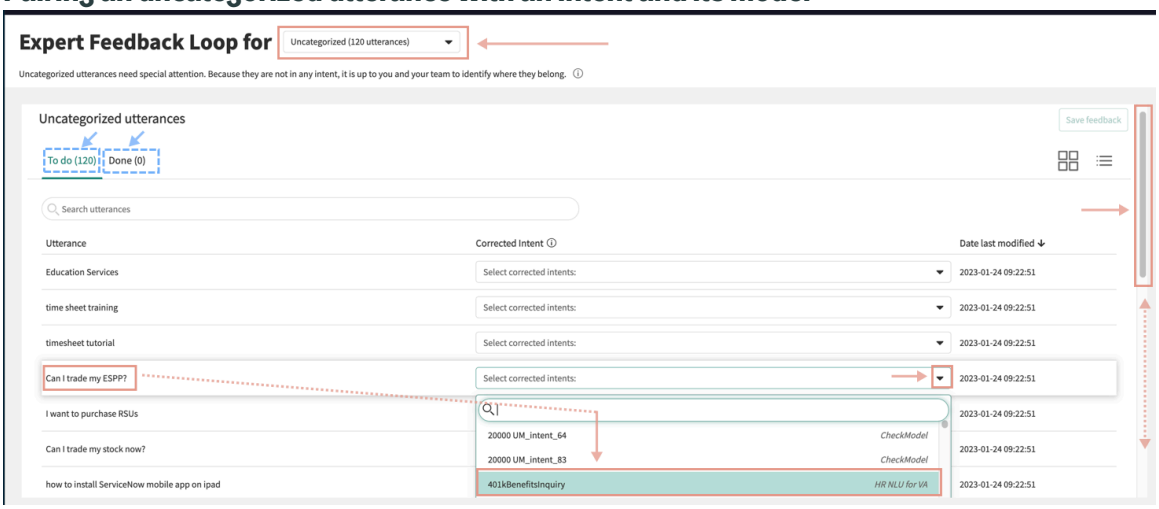
Here are the steps you use to connect an uncategorized utterance to an intent:

1. In the **Utterance** column, select an utterance from the list.
2. In the **Corrected Intent** column, search and select an intent and its model from the prompt that you think is the best match for the utterance.

For example, a good pairing for this connection is the Can I trade my ESPP? utterance from the **Utterance** column and the 401kBenefitsInquiry intent from the **Corrected Intent** column, as shown in the image below.

Note: The **Corrected Intent** column enables you to search for and use all intents across all models in your instance.

Pairing an uncategorized utterance with an intent and its model



Regarding the image above, let's cover a few items that help describe how the uncategorized utterances page works, as follows. The **To do** section collects utterances that must be connected to an intent. On this particular day we see there are 120 such utterances. Note that the **Done** section on the screen has no utterances because you've not taken any action yet.

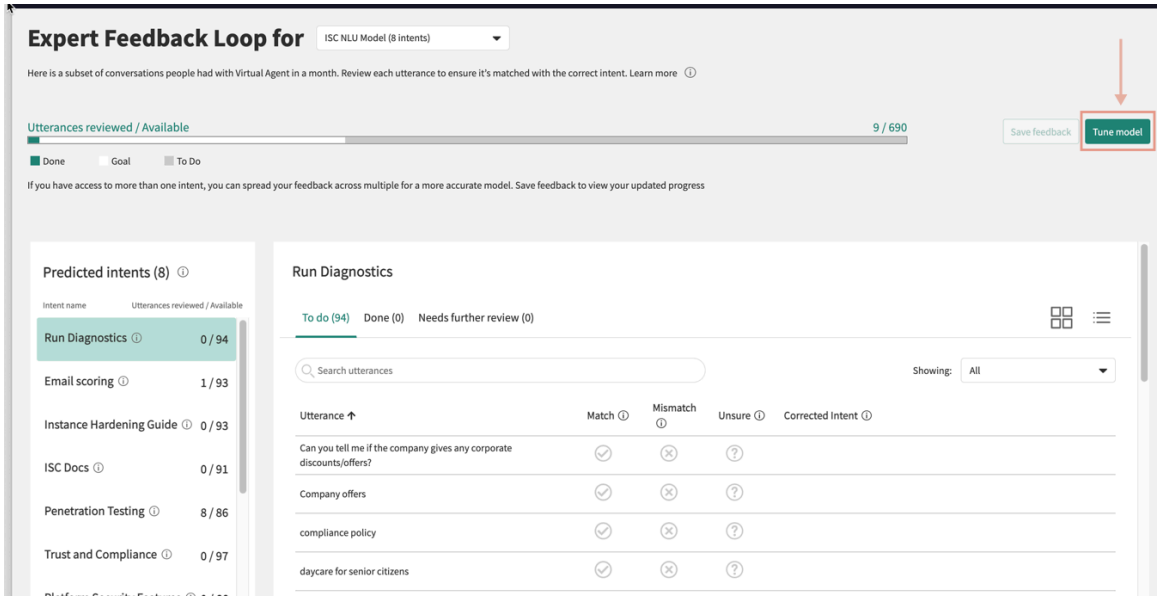
Note also that there's a vertical bar to the far right of the screen where you can scroll up and down to navigate the list of utterances. At the bottom of this scrolling screen, there are arrows that point left and right so you can to turn to the next or previous page of the full utterance list for the day.

Note also that when you do take action to make a connection, the **Save feedback** button, normally active by default, deactivates because the system recognizes your action and automatically saves your change.

Expert Feedback Loop data in the Tune Model phase

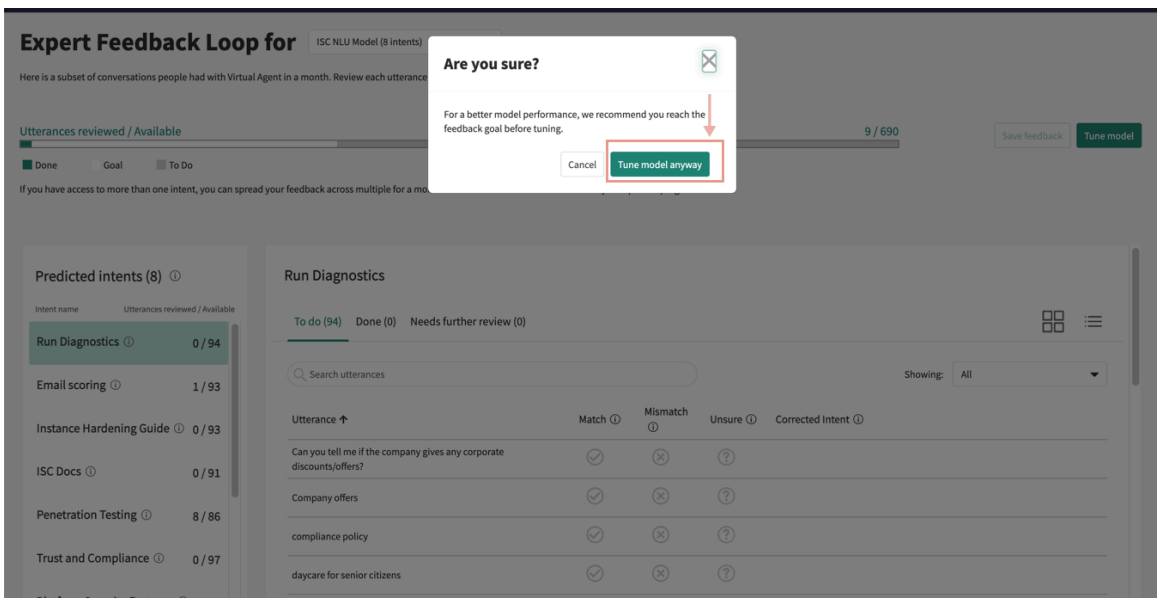
The **Tune model** button in the Expert Feedback Loop is always enabled and supports the experience of moving utterances from the Expert Feedback Loop **Done** tab to the model and its test set. Use the nlu_admin role to select this button any time you need to tune or retune your model.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



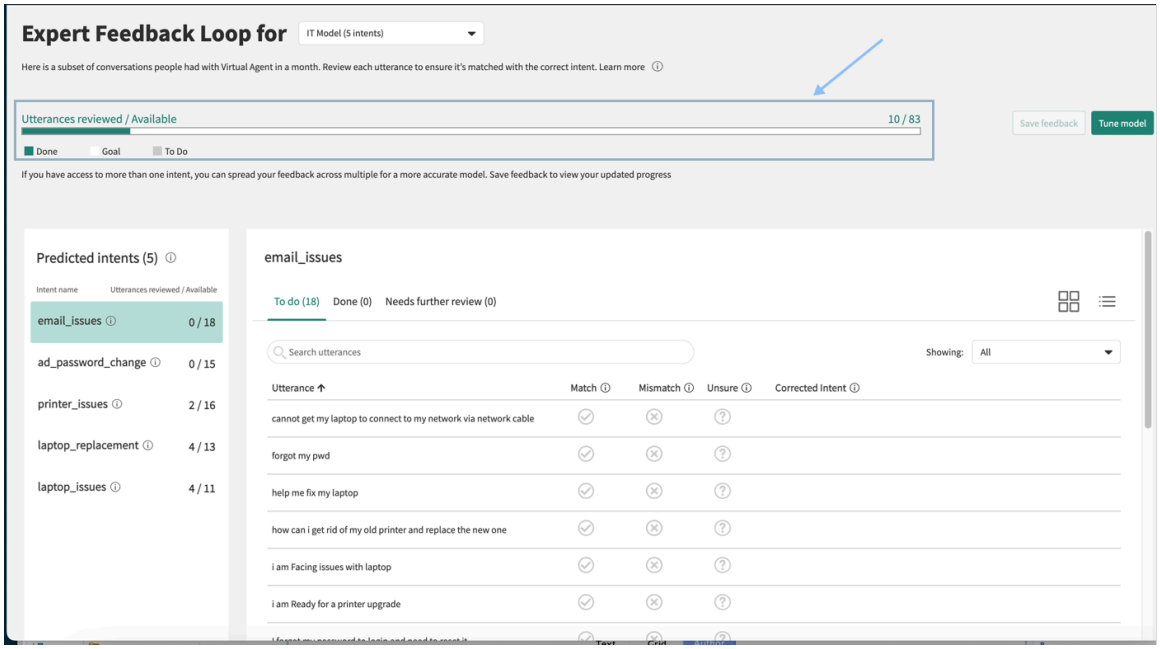
After reviewing utterances in the Expert Feedback Loop, you can push a portion of the feedback data to the default test set of your model. These utterances are then directly added to the **Test utterances** tab of your model. This helps you to continuously maintain and update your test set with real end user utterances. The system tracks the source of the test utterances for visibility into whether they came from the Expert Feedback Loop or from another source.

If you select the **Tune model** button before you have marked and saved at least 100 utterances, the screen refreshes to remind you that your model performance increases in quality when you have passed the 100 utterance feedback goal, as referenced in the text in the image below.



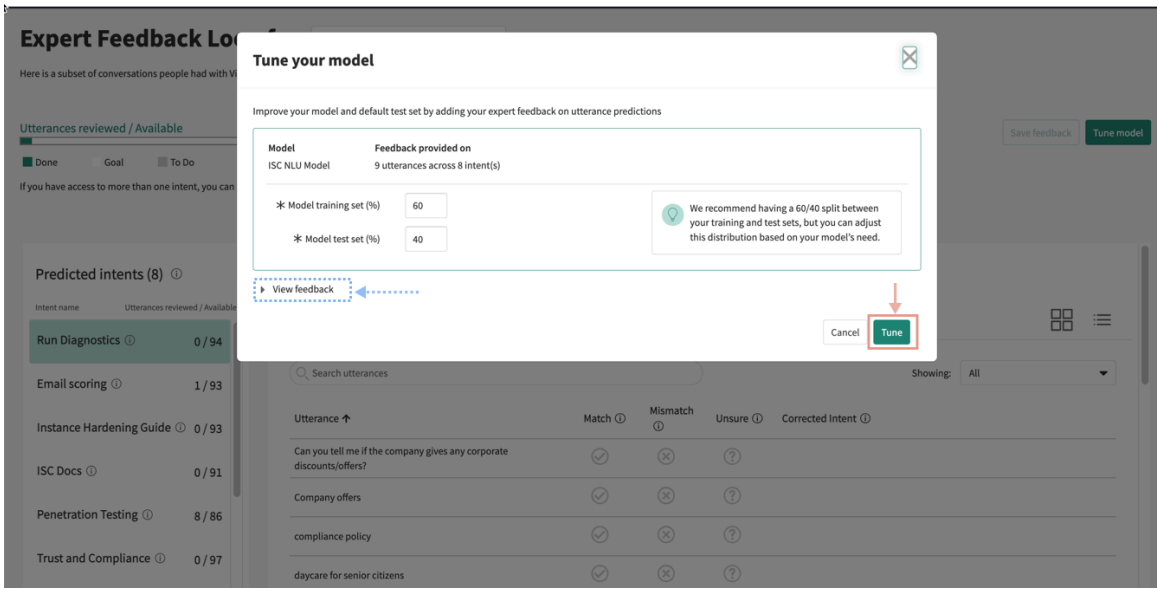
As you keep marking and saving your feedback data, you can see the ratio of reviewed utterances (in green), and those that are still available for review (in white) on the progress bar image below.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



On the **Tune your model** image below, you can see the default 60/40 percentage split for your model training set and your model test set. You can adjust these default values if needed by selecting your own chosen numbers in each of the two **(%)** boxes. Once you're satisfied with your percentage split, select the **Tune** button to tune your model based on the percentage values you chose.

Note: If you select the **View feedback** caret, it takes you to an Expert Feedback Loop screen where you can continue reviewing, marking, and saving your feedback utterances.



Using the Active Learning job

Scheduled jobs, also known as batch jobs or batch scheduling, are automated pieces of work that are performed at a specific time or on a recurring schedule. Many jobs run on schedules but we're focusing now on the Active Learning job as an example.

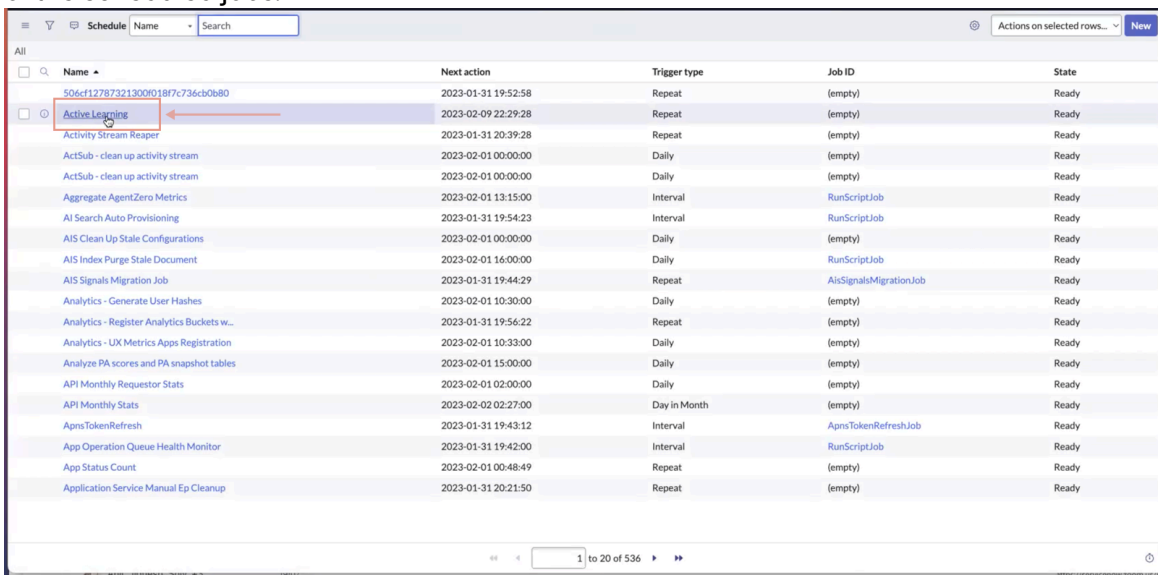
Here are three things you can do when using the Active Learning job.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

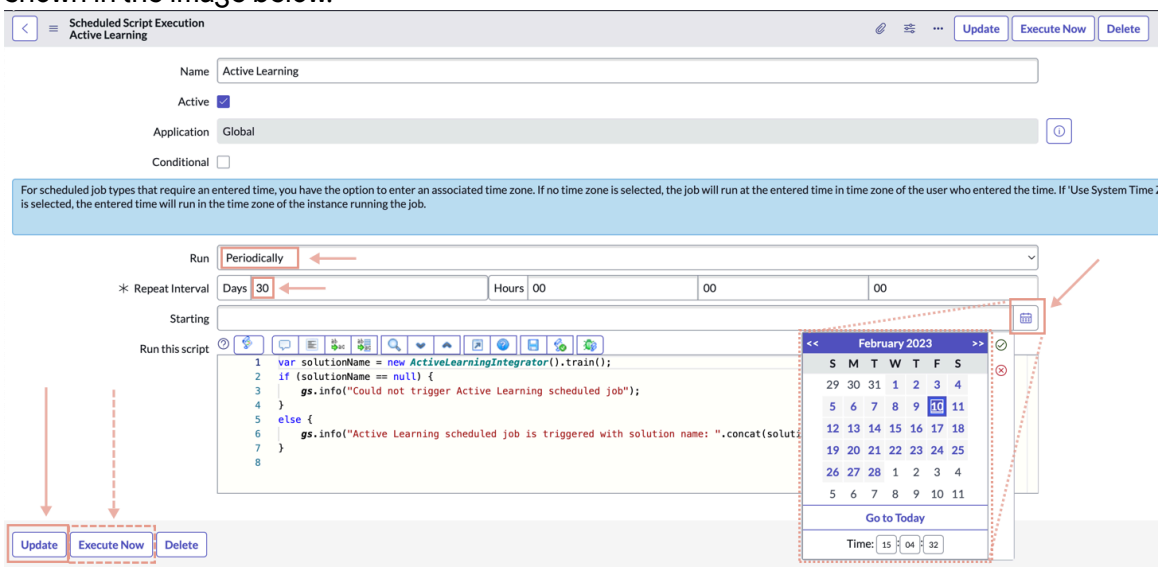
- Change the repeat frequency interval with which the Active Learning job will be set to run.
- Check when the next scheduled run is set for the Active Learning job.
- Execute the Active Learning job whenever you want (on demand).

Here are some steps to use to get started.

1. Using the nlu_admin role, navigate to the **All** field and type **sysauto_script.list**, then press the **return** key on your keyboard. The screen refreshes to show the Schedule page, which lists all of the scheduled jobs.



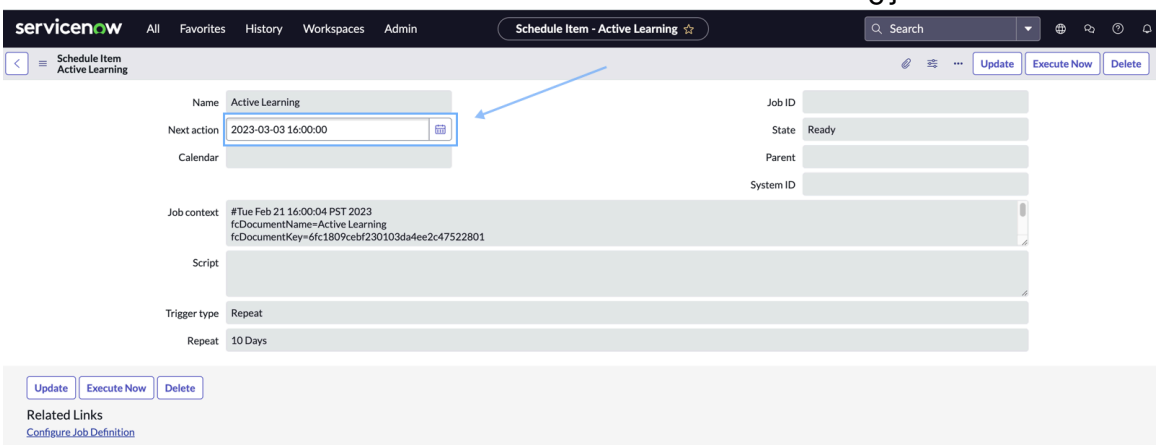
2. On the Schedule page, click **Active Learning**. A record for the Active Learning job appears, as shown in the image below.



3. On the Active Learning record, configure the following fields.
   - In the **Run** field, select one of the eight Repeat Interval options for the job. The options are: Daily, Weekly, Monthly, Periodically, One, On Demand, Business Calendar:Entry Start, and Business Calendar:Entry End.
   - In the **Repeat Interval** field, enter the number of days you want between now and the next repeat interval for the Active Learning job.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- In the **Starting** field, click the Calendar icon and choose the day and time for the next Active Learning job interval.
- Select the **Update** button to save your configurations or select the **Execute Now** button to start the Active Learning job run.
- To verify when the next Active Learning job runs, navigate to the **All** field and type **sys_trigger.list**, then press the **return** key on your keyboard. The Schedule page appears. Click **Active Learning**. The Schedule Item/Active Learning record appears and populates the **Next action** field with the date and time for the next Active Learning job run.



Detailed information about NLU's Active Learning job can be found in this KB article on the Support portal: KB1633901.

(Legacy) Issue Auto Resolution Tuning in NLU

Use the NLU Workbench homepage to support Issue Auto Resolution (IAR) tuning in NLU.

Summary usage and roles

Use the nlu_admin or admin role to access IAR Tuning in the NLU Workbench. Accessing IAR Tuning in the NLU Workbench requires at least the nlu_feedback_admin role (the nlu_admin role contains the nlu_feedback_admin role). Also, the virtual_agent_admin role contains the nlu_admin role.

Selecting a IAR model name in the list takes you to tuning. For Issue Auto Resolution, you are not taken to a model overview page, so this behavior differs from Virtual Agent or AI Search models in the NLU Workbench.

The IAR Tuning workflow

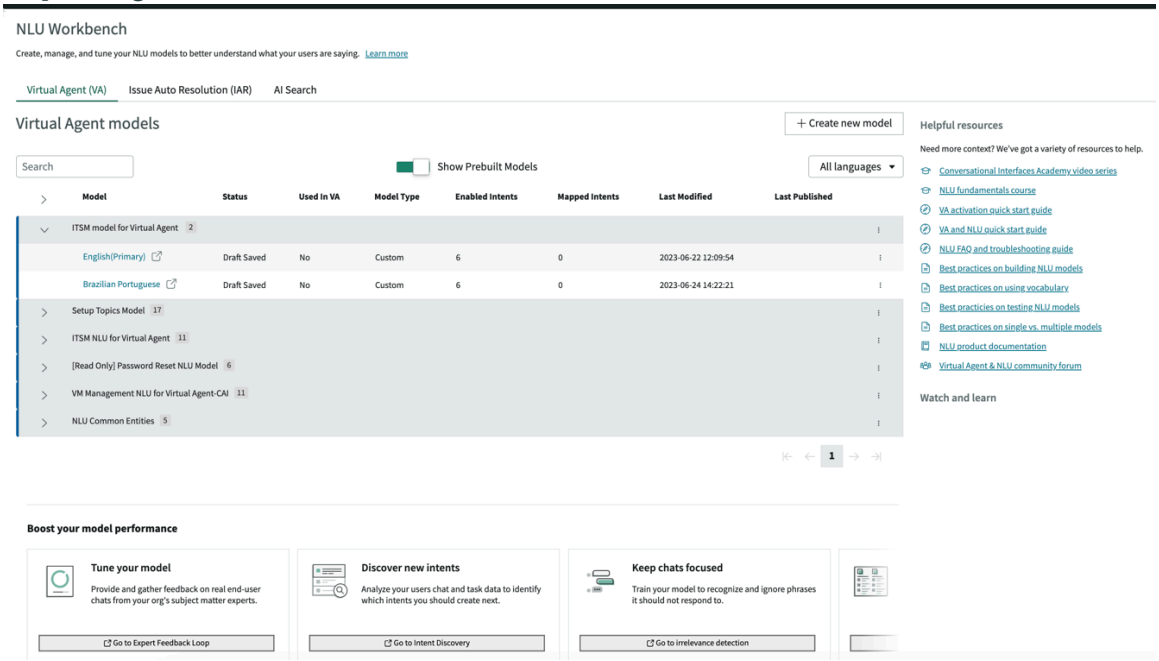
IAR admins begin their model tuning journey in the IAR Admin Console, and then land in the NLU Workbench to tune their ITSM model. If they haven't trained the ITSM model in the console yet, the workflow sends them to the Expert Feedback Loop documentation under the **Boost your model performance** section of the NLU Workbench.

How IAR models differ from NLU models

Unlike the Virtual Agent and AI Search tabs, the IAR tab doesn't use a **Create new** model button. The IAR-ITSM model that IAR admins use is a prebuilt model. IAR models can't be moved using update sets.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Exploring the NLU Workbench



At the top of the NLU Workbench page are three tabs that group Virtual Agent, Issue Auto Resolution, and AI Search models separately. Below those tabs are a list of models colored gray. In the Model column of the list, when you select the caret to the left of the model name, the model changes color from gray to white and opens to show the model's languages; status; usage; model type; number of enabled intents and mapped intents and the date when the model was last modified or last published.

(Legacy) Issue Auto Resolution tuning options

When you are tuning your Issue Auto Resolution model in NLU Workbench, you can adjust the output for several goals: precision, automation, or a balance of the two. Compare how your choice of tuning options affect match rate and coverage, before committing.

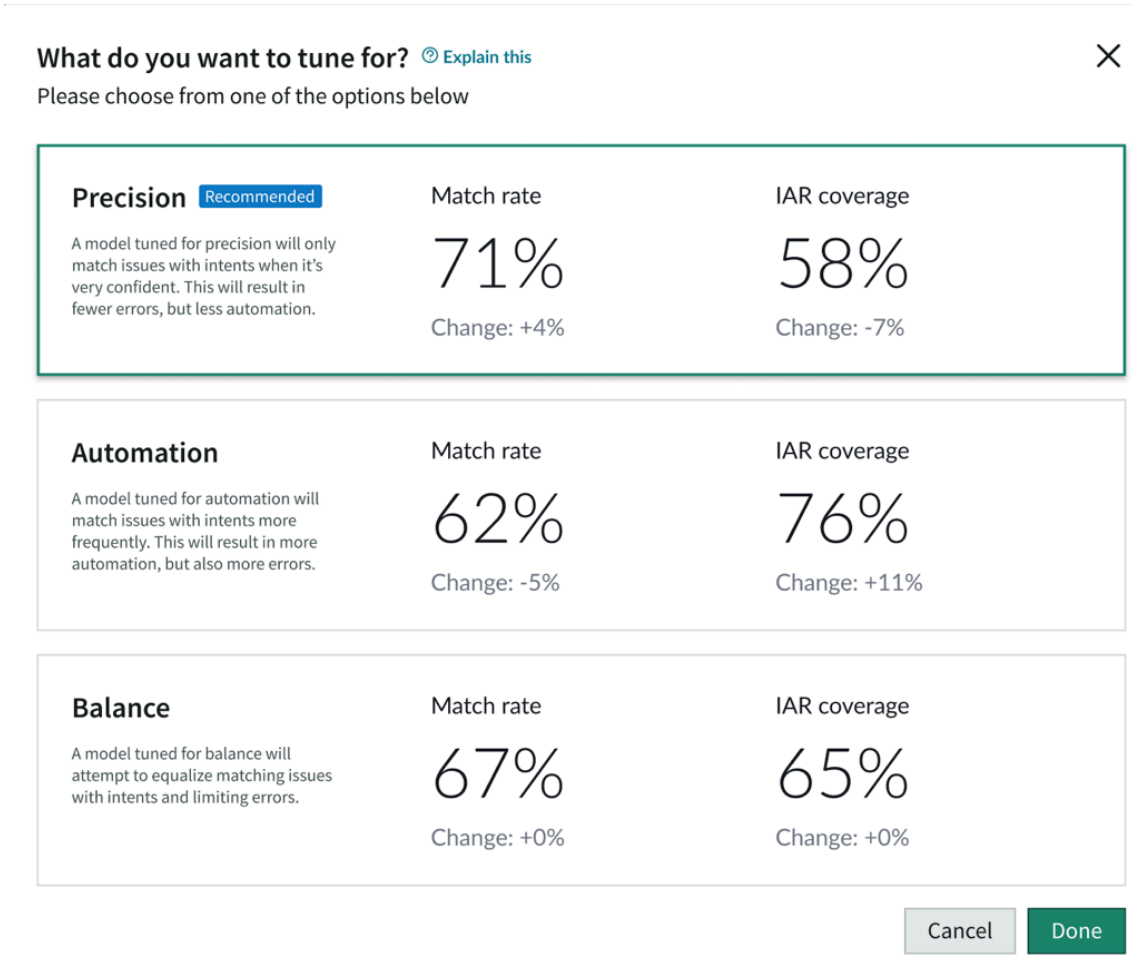
Summary usage

By default, Issue Auto Resolution tuning in NLU Workbench optimizes for precision. Depending on your business requirements, you can also tune the model for other objectives. In the **Analyze** step of Issue Auto Resolution tuning, the tuning goals list enables you to adjust for **Precision**, **Automation**, or **Balance**. As you select one of these options, the projected Match rate and IAR coverage percentages change accordingly, so you can compare possible outcomes.

To access the **Analyze** step of IAR tuning, use the nlu_admin role and navigate as follows.

1. Navigate to **All** > **NLU Workbench** > **Models**.
2. Select the Issue Auto Resolution tab, then select the model name. The tuning experience opens to step 1 (Feedback) initially.
3. Provide feedback, then select the **Analyze** button. Step 2 (Analyze) opens.
4. In the section **Here are your tuning options and projected results**, using the list **You can tune for precision, automation, or balance**, select options to see projected scenarios. You can also select the link **Learn about tuning goals** to open the following window.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Precision

When tuned for precision, the IAR model makes predictions only when its confidence is relatively high. This results in lower error rates, but also in fewer incidents resolved.

Precision is the recommended tuning option for the IAR ITSM model, so this option is selected by default.

Automation

When tuned for automation, the IAR model makes predictions at a lower confidence threshold. This results in more predictions, so more incidents are resolved. However, higher error rates are possible.

Balance

When tuned for balance, the IAR model attempts to strike a balance between precision and automation.

Match rate

The match rate is defined as the number of Incidents where the intent was predicted correctly, divided by the number of predictions for that intent. This ratio is averaged across all intents except for **NO_INTENT**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

IAR Coverage

Coverage is defined as the percentage of Incidents that would be resolved because the model was able to make predictions above its confidence threshold. The predictions may contain some errors.

Using tuning options

Select several different tuning options to compare projected results. Depending on the option you select, the system presents scenarios for projected Match rates and IAR coverage rates. Also the system displays how much these rates change according to your selection.

Review further information in the **Here's a detailed breakdown** section of Analyze. Here you can drill down into results that are specific for each intent in the model.

Note that the intents are grouped into mapped and unmapped intents, depending on whether they have been mapped to Virtual Agent topics. After providing feedback in IAR Tuning, you may wish to activate some intent-to-topic mappings. To do so, expand **See unmapped intents**, then select the **Map more intents** button. This opens the IAR Admin Console.

When you have decided the optimum tuning option for your requirements, select the **Save choice** button in the **Learn about tuning goals** window. Then, select the **Tune and publish model** button to advance to the next step.

(Legacy) Intent Discovery

Use the Intent Discovery application to help identify opportunities for incident deflection. For example, you can use it to identify which Virtual Agent conversations to activate next.

Summary usage

For applications that consume NLU, such as Virtual Agent and AI Search, Intent Discovery helps you to better understand which prebuilt intents you can benefit from, and which custom intents would be useful to create.

Intent Discovery provides an analysis that you run on historic incident data or other task data. You can also group the run's remaining records into different clusters so you can manually add utterances to NLU intents. In addition, you can use specific clusters to create new intents in a model.

In this example scenario, you're using Intent Discovery to identify the top intents in your instance, and how much coverage they can provide across your historic incident records.

Installation

Intent Discovery is available from the ServiceNow Store. For more information, see (Legacy) Install Intent Discovery.

After Intent Discovery is installed and activated, it appears under **All** > **NLU Workbench** > **NLU Advanced Features**.

Note: Although organized under NLU Advanced Features in the navigation pane, Intent Discovery is a separate application that is not included when installing NLU Workbench - Advanced Features.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Intent Discovery report details

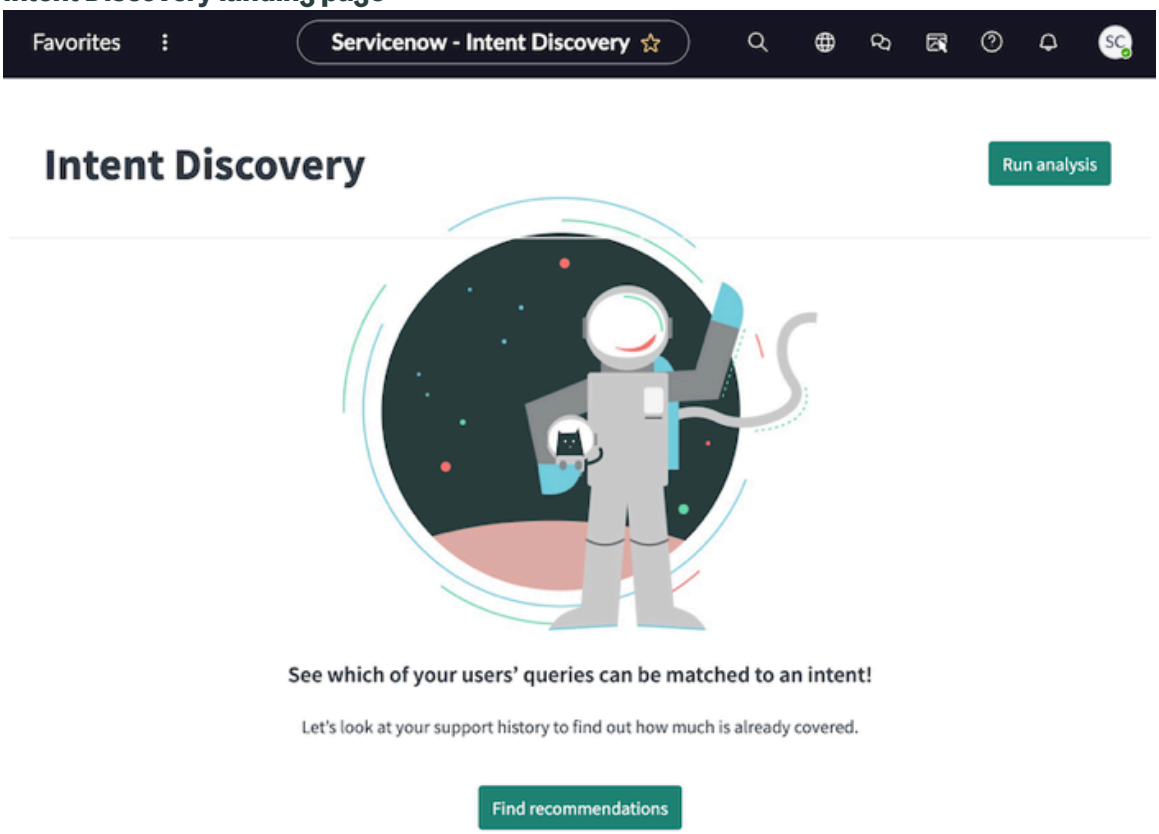
- When **Taxonomy** is selected, the generated report contains intent recommendations against the selected taxonomy. A taxonomy is a prebuilt library of intents in a specific domain. While you don't have access to the underlying intents, when you run Intent Discovery against a specific taxonomy, data that maps to any intent in the taxonomy will be identified.
- **Unmatched records** are the utterances which couldn't match to any intent in the taxonomy.
- **Recommended intents** are the intents which are found from utterances that data was run on.
- The percentage of **Unmatched records (clustered)** are the records that aren't classified (records that don't belong to any of the recommended intents).
- The percentage of unmatched records and the number of recommended intents don't need to match. It's a coincidence if they match.

Creating an Intent Discovery report

1. Using the admin or nlu_admin role, navigate to **All** > **NLU Workbench** > **NLU Advanced Features** > **Intent Discovery**.

2. Select either **Run analysis** or **Find recommendations**.

Intent Discovery landing page



Running an analysis on the report

1. For this example report, you configure the following fields on the Intent Discovery > Create new screen.

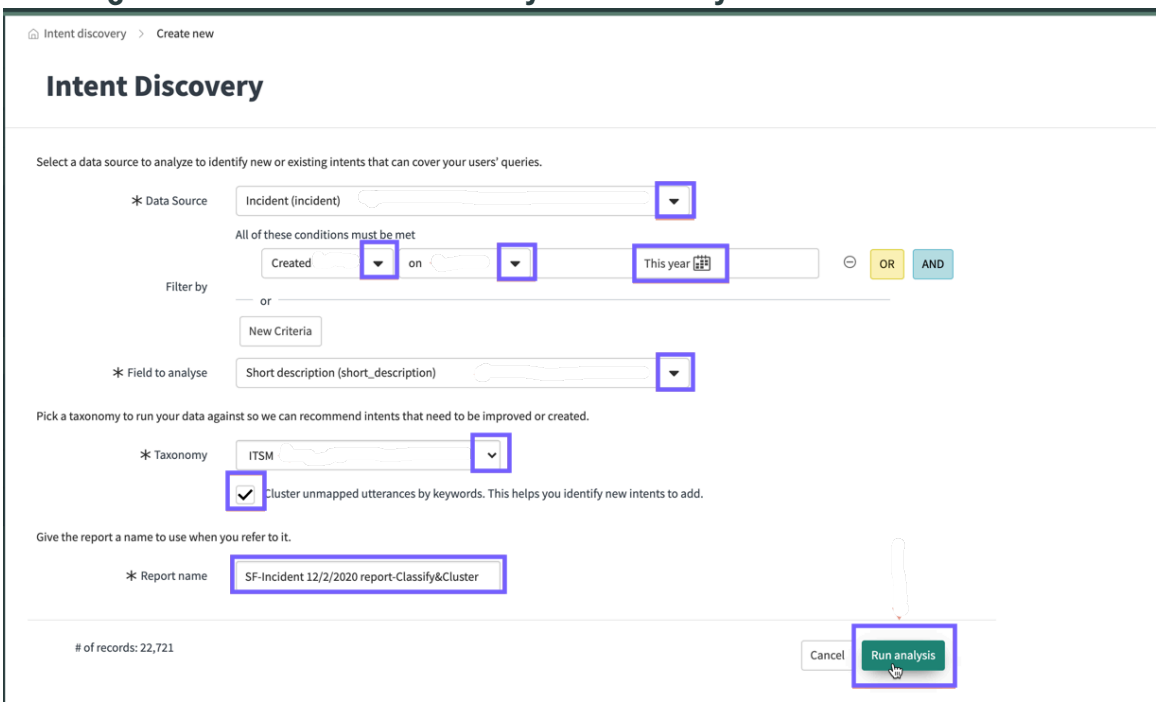
- Data Source: Select the **Incident (incident)** table.
- Filter by: **[Created] [on] [This quarter]**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Field to analyze: **Short description (short_description)**. You choose Short description because it's a highly used string field that references words that can help the system identify an intent.
- Taxonomy: Select **ITSM**. This field tells the system to run classification processing on your ITSM incident records. It has 3 options: Classification, ITSM, or blank, which defaults as Classification.
- Cluster unmapped utterances by keywords... : Select the **check box**. When you check this box, the system groups your incident records that weren't classified into clusters.
- Report name: The field automatically defaults to **Incident <month/day/year>**. You can edit the name if you prefer. In this example scenario, you enter `Incident 12/16/2020 - SF Test`.

2. Select **Run analysis**.

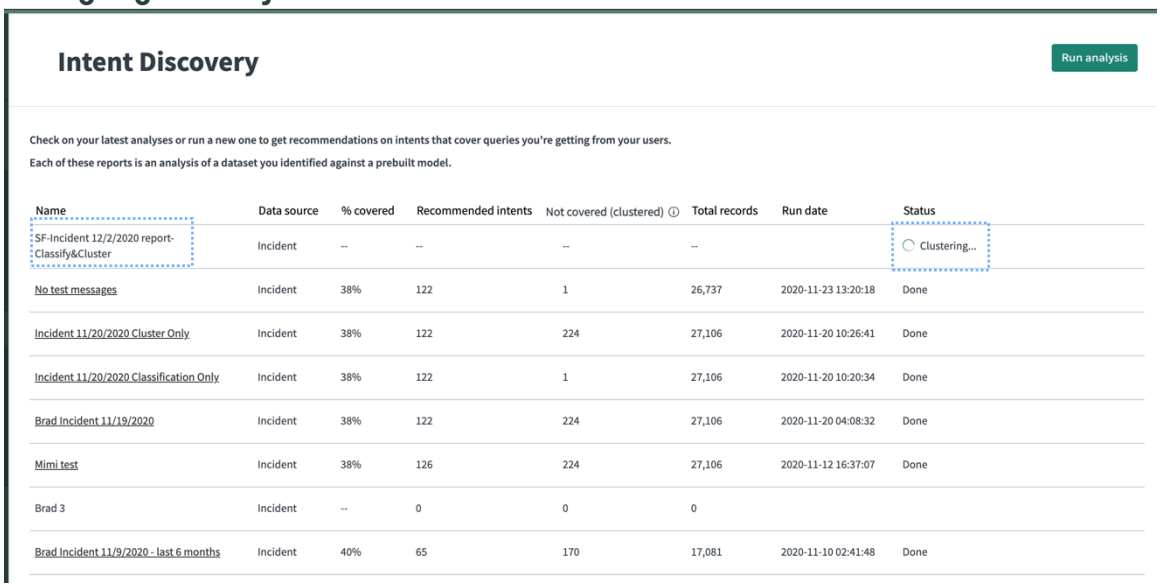
Selecting data sources in Intent Discovery for a run analysis



Result: Your report appears on the Intent Discovery screen, showing its status as the analysis begins. The subsequent status values appear in the following order during the analysis: Preparing to run, Work in progress, Clustering, and Done. This can take from 5 minutes to 30 minutes to complete. The fewer the records you have in a cluster, the less time it takes. Turning clustering off can also speed up the process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

An ongoing run analysis

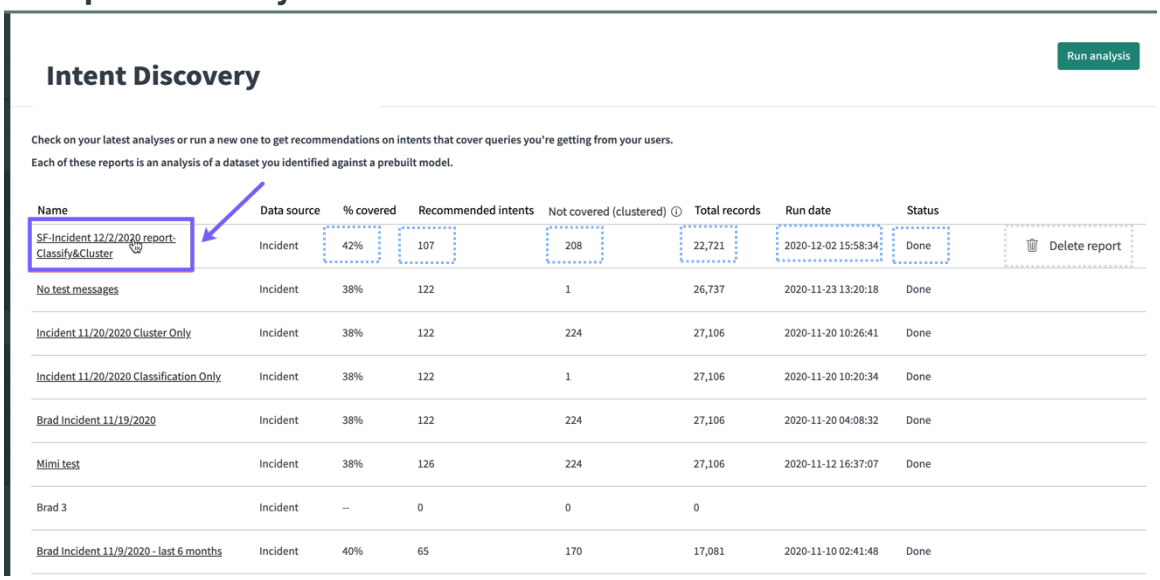


When the analysis is complete, the column values on the screen appear, with the **Status** column value set to **Done**, as shown in the image below.

Note: If you want to delete the report and start over, point to the right of the Status column to invoke the **Delete report** icon.

3. Select the **Name** of your report.

A completed run analysis



Result: The screen refreshes, showing the analyzed incident records and the remaining incident records that were not classified.

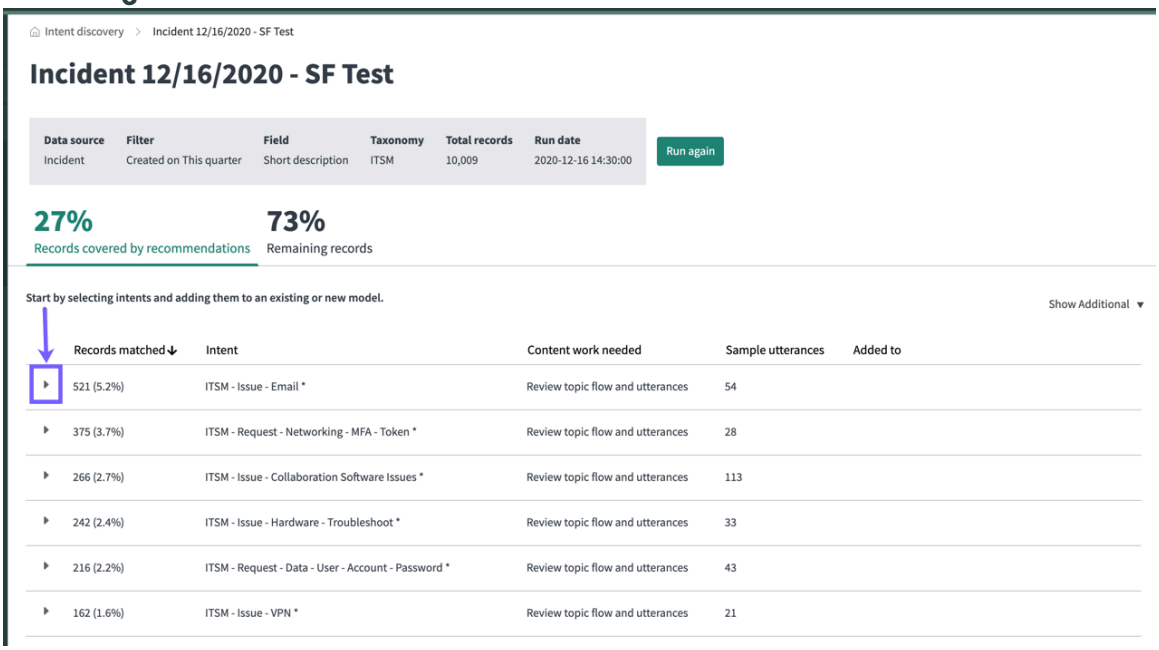
Importing recommended intents to new or existing custom models

Before importing intents to an NLU model, ensure that you are in the same application scope as the model. For more information, see Select an application from the application picker.

1. On the Records covered by recommendations section of the screen, select the caret icon on a recommended intent you want to add to a custom model.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

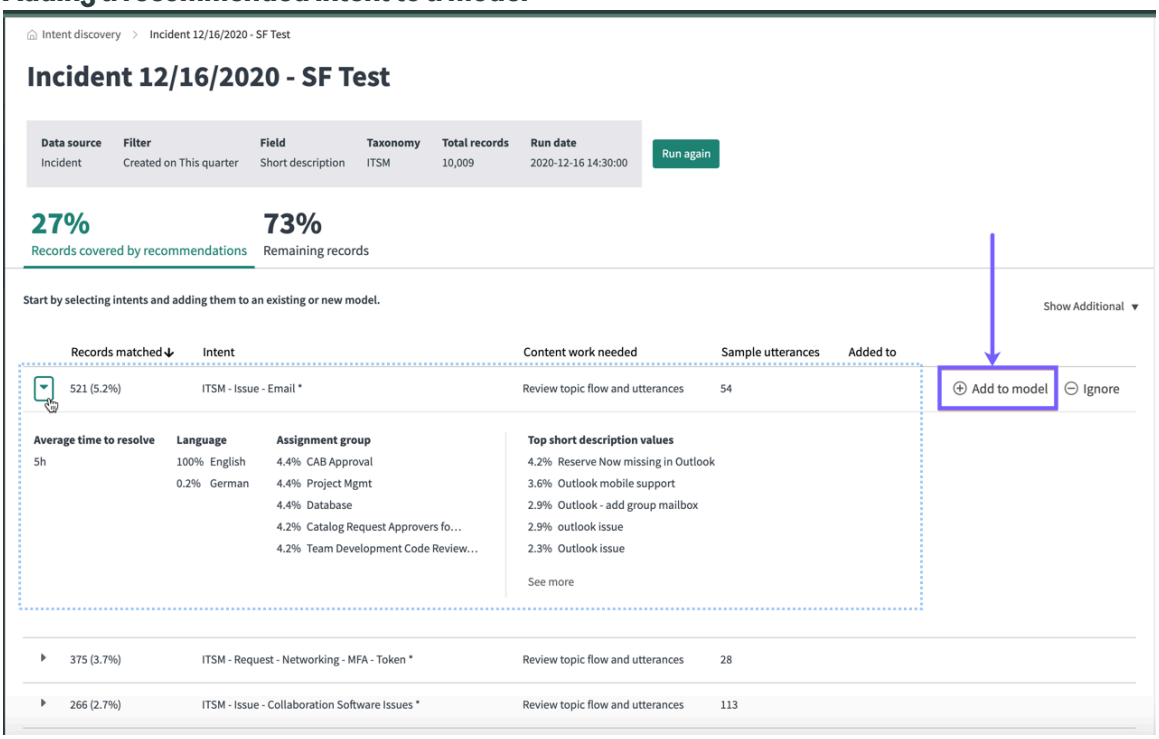
Reviewing a recommended intent



Result: The details of the recommended intent appear so you can review them, as shown in the image below.

2. Select **Add to Model**.

Adding a recommended intent to a model



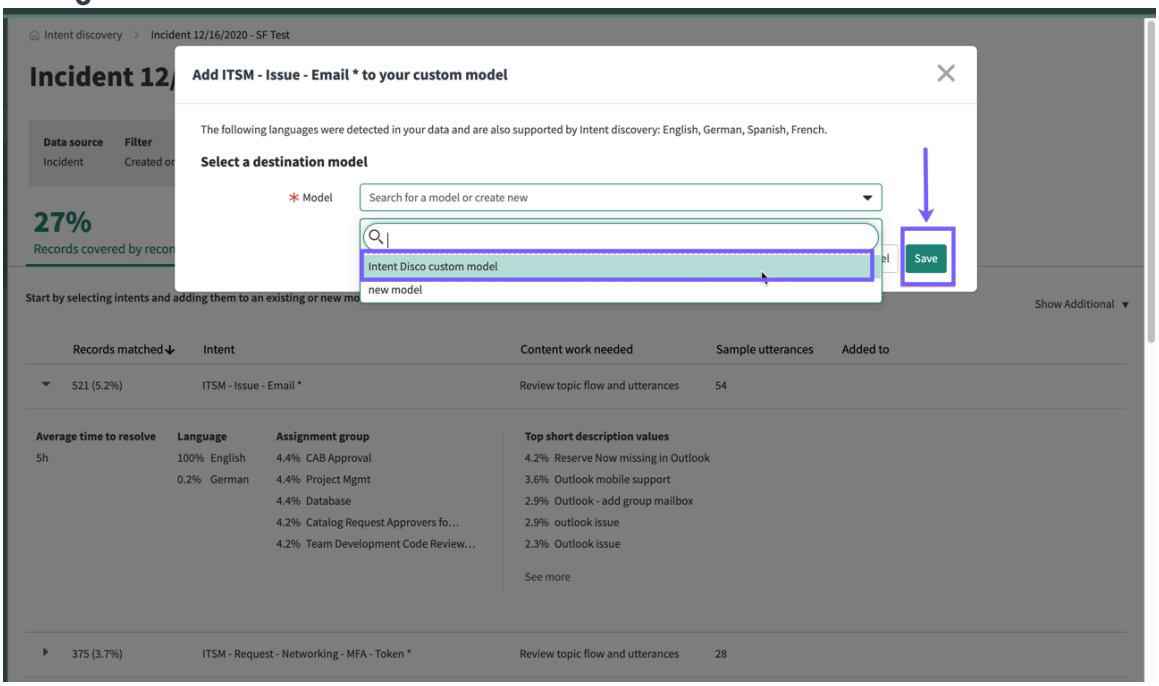
3. On the Select a destination model screen that appears, choose a model you want to add the recommended intent to. If you can't find an appropriate model, create a new one, return to the report, and add the new model.

Note: The model you choose must have the same application scope as your current scope.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

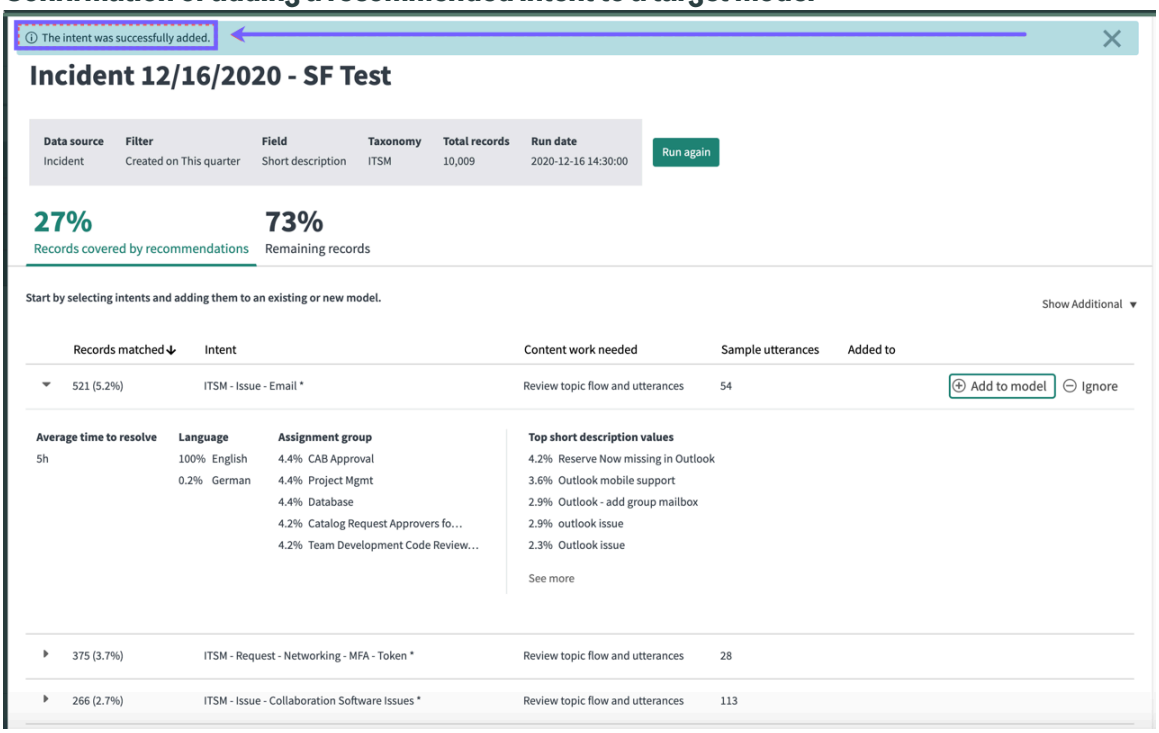
4. Select **Save**.

Saving a recommended intent to a model



Result: A banner appears on the screen, confirming the intent is added to the target model.

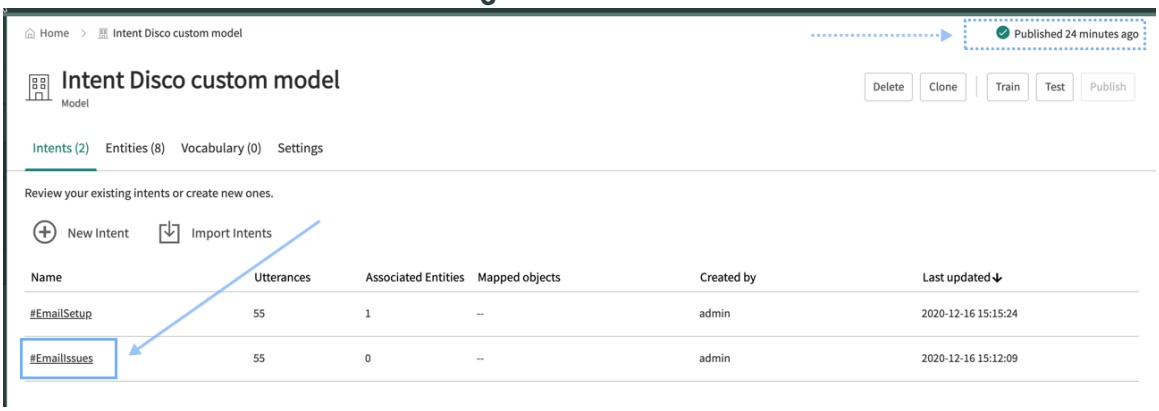
Confirmation of adding a recommended intent to a target model



The recommended intent also appears on the Model screen of the target model, as shown in the image below.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

View a recommended intent in the target model



Adding clustered utterances to an intent and its model

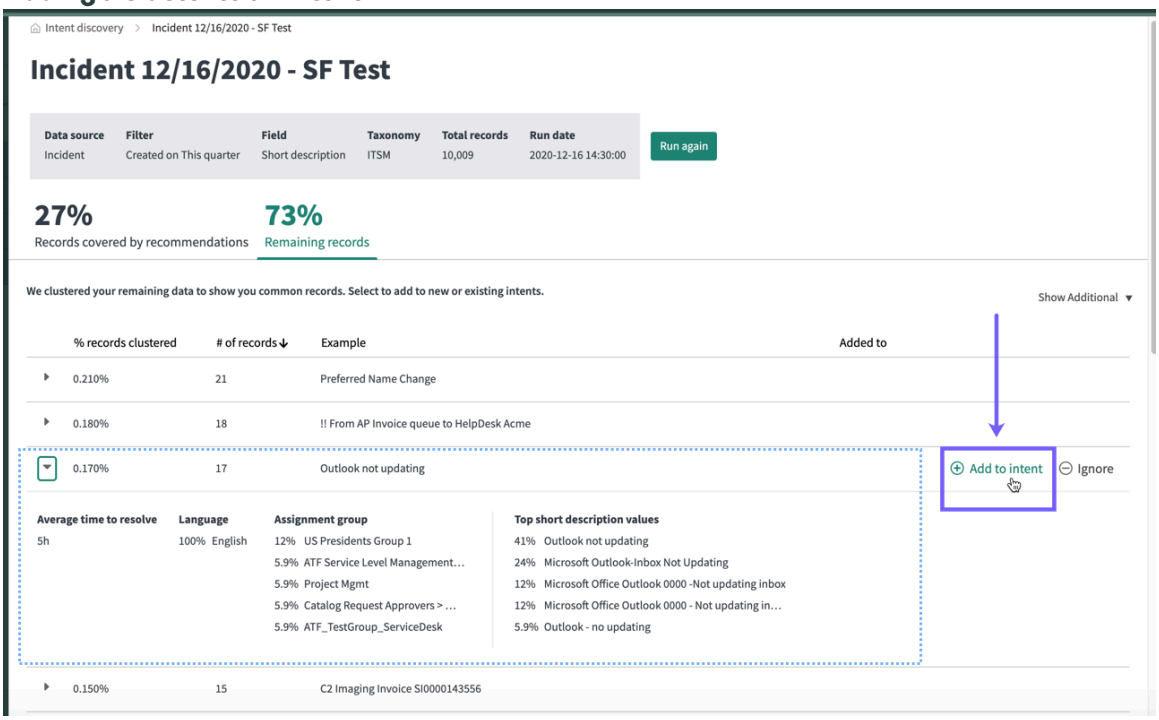
1. On the Remaining records section of the intent discovery records screen, select and open a cluster of utterance and short description data that you want to add to an intent and its associated model.

As you continue to build out new intents from these clusters, you can click the **Ignore** icon to remove any unwanted intents from the report.

There's also a **Show Additional** filter you can use to show or hide the added intents, and the ignored intents as well.

2. Select **Add to intent**.

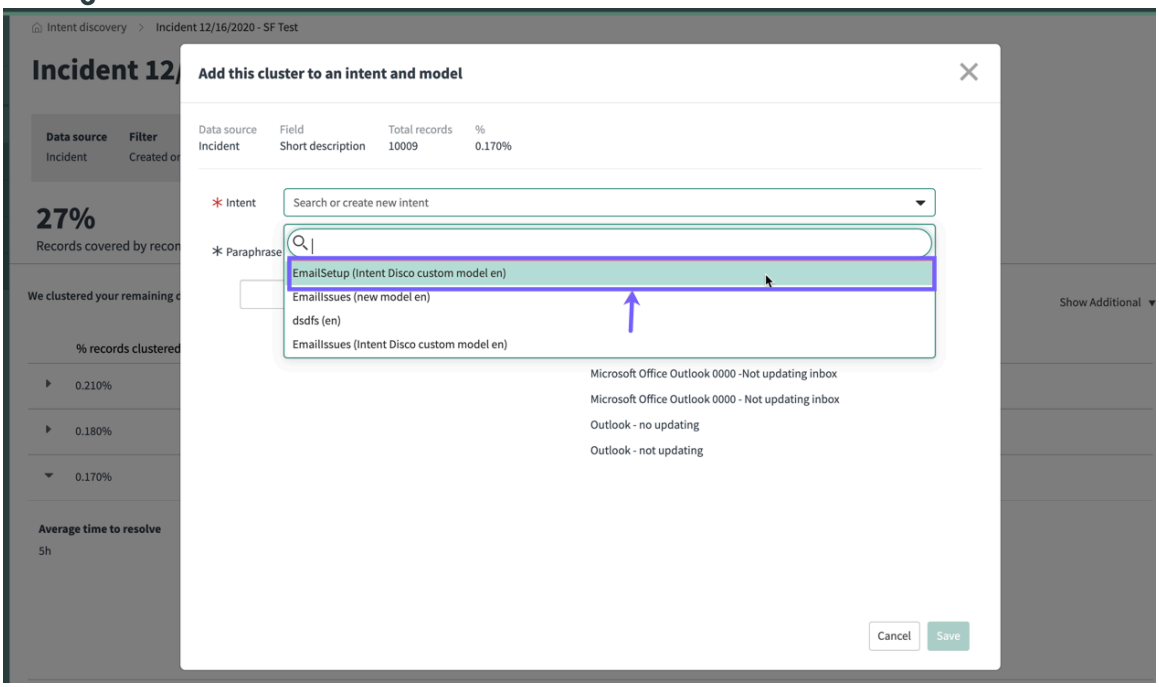
Adding a cluster to an intent



3. In the Add this cluster to an intent and model screen, select an intent and model pair you want to associate to this cluster.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

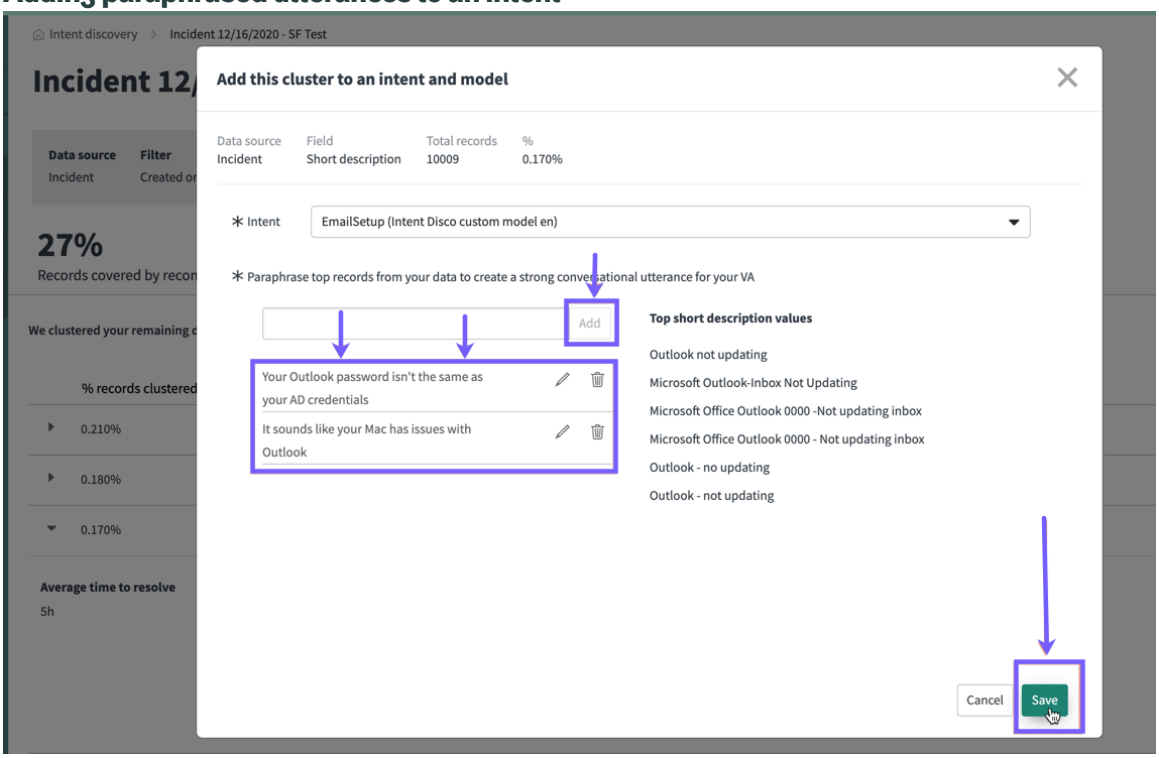
Adding a cluster to an intent and model



4. Enter a few utterance examples into the open text field. Select **Add** each time you complete your entry to save it in the system. Use the pencil icon or the trash can icon respectively to edit or delete your entry.

5. Select **Save**.

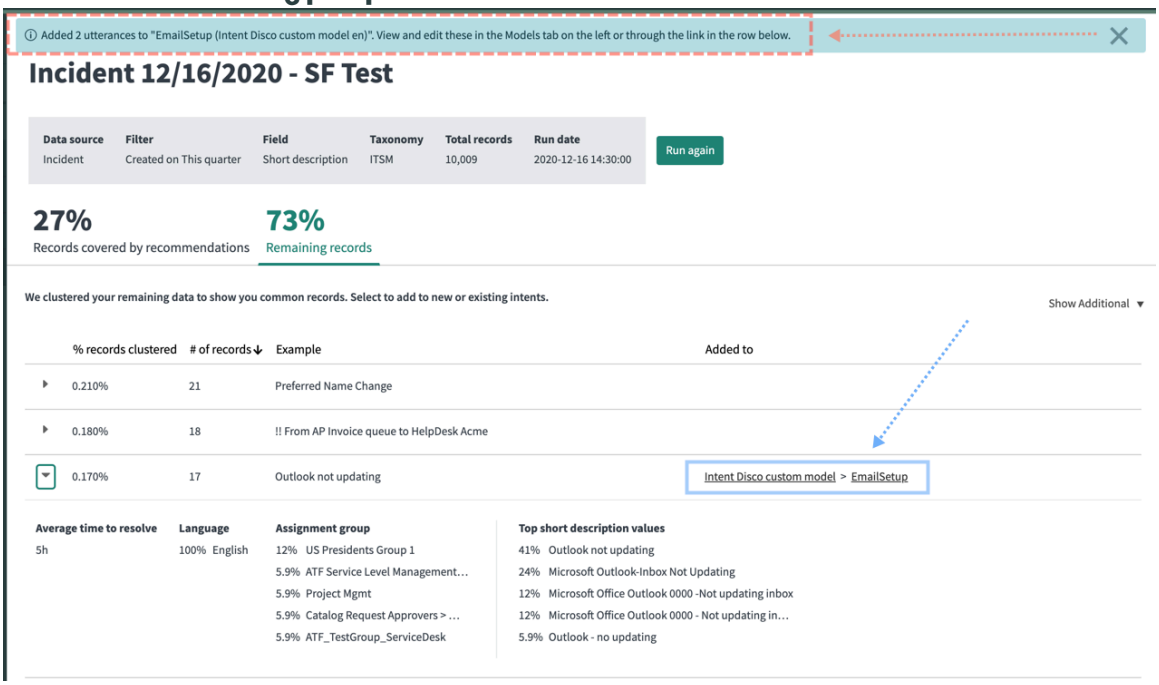
Adding paraphrased utterances to an intent



Result: The records screen appears, showing a banner confirming you added two new utterances to the target intent and its associated model. The model and intent pair appears in the **Added To** column, as shown in the image below.

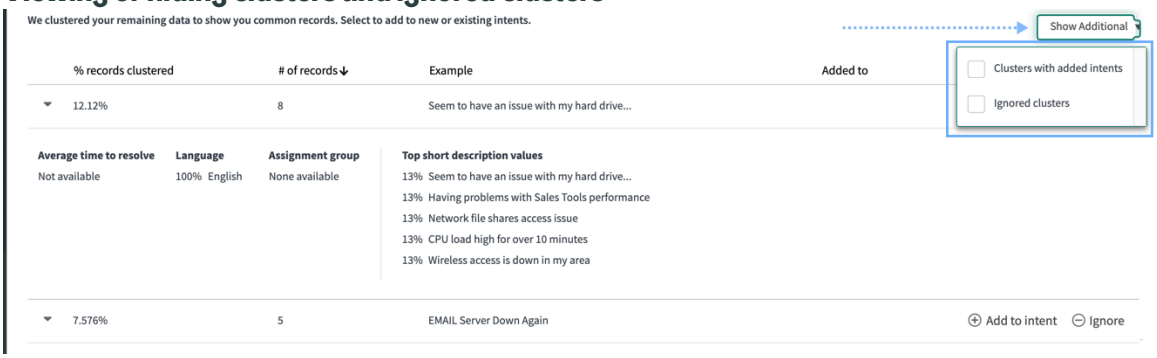
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Confirmation of adding paraphrased utterances to an intent



Use the **Show Additional** filter if you want to show or hide the clusters that have added intents, and the clusters that are ignored.

Viewing or hiding clusters and ignored clusters

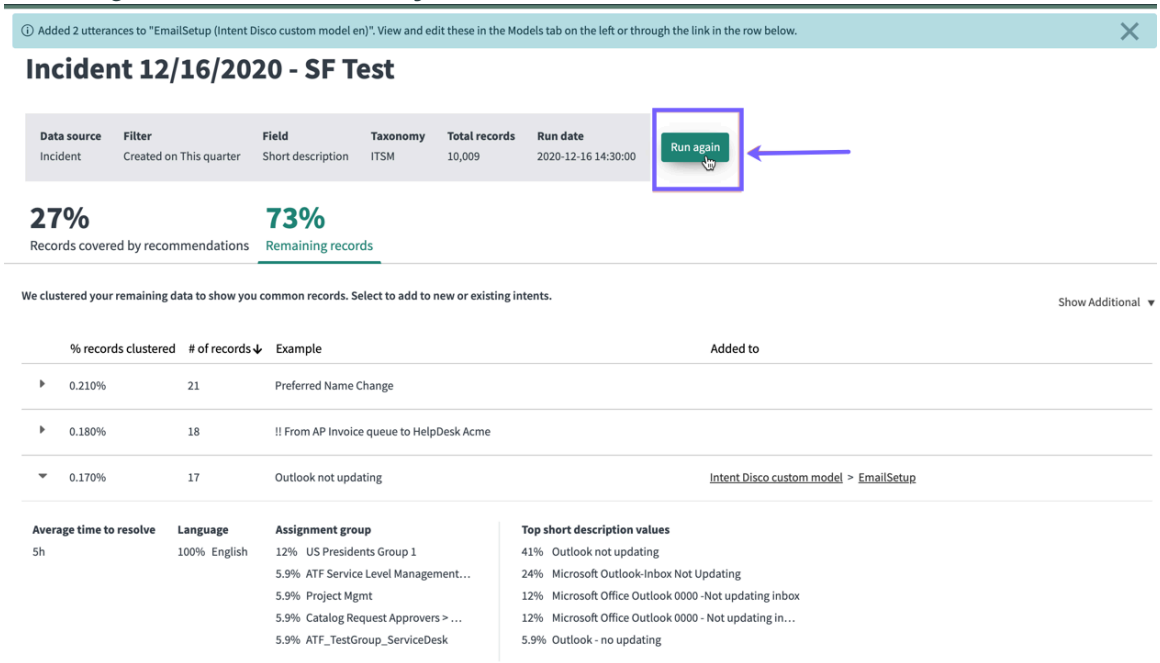


Running another analysis on your Intent Discovery report

1. Select **Run Again**.

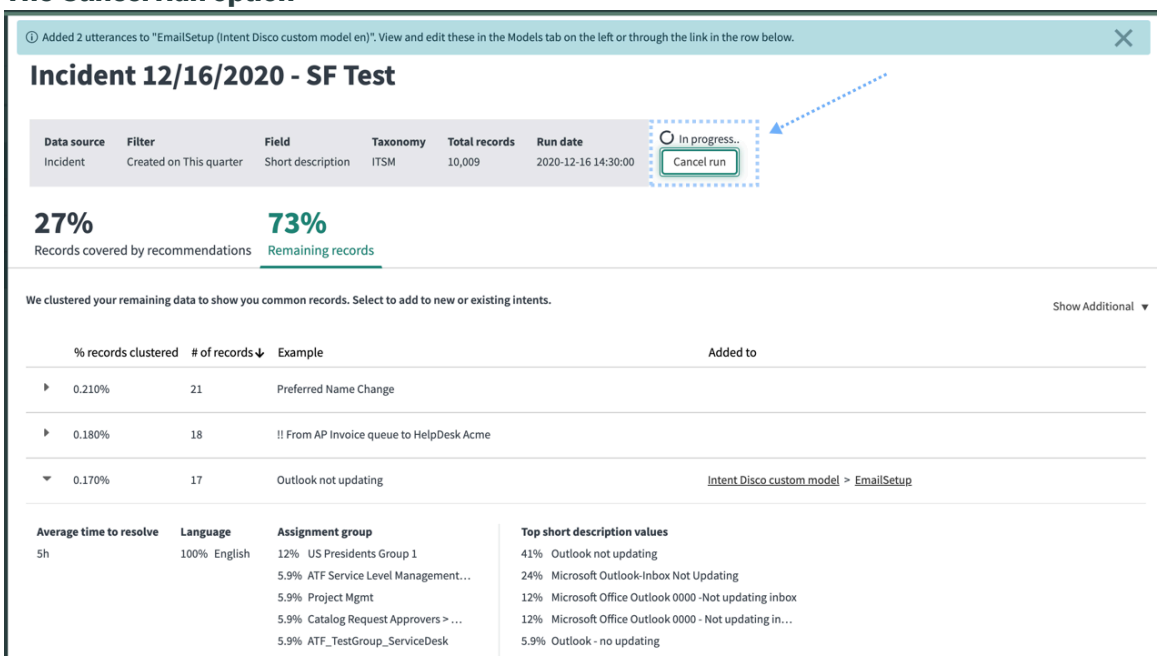
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Selecting the version of the analysis to run



Result: The new run begins. When it's in progress, the option to cancel the run appears, as shown in the image below.

The Cancel Run option

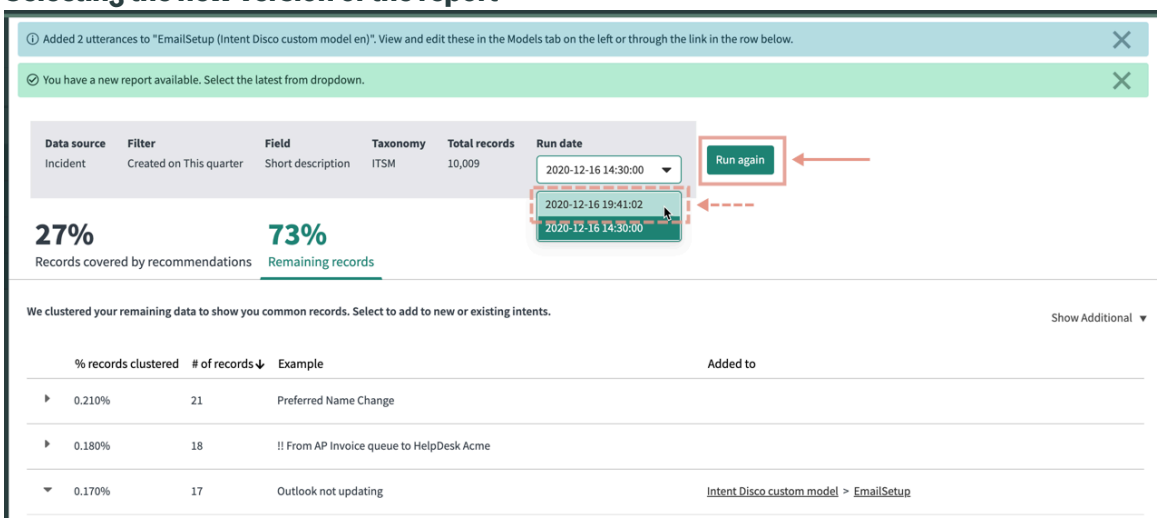


When the run is complete, a new banner appears that states you have a new version of the report.

2. Select the new version, then select **Run Again**.

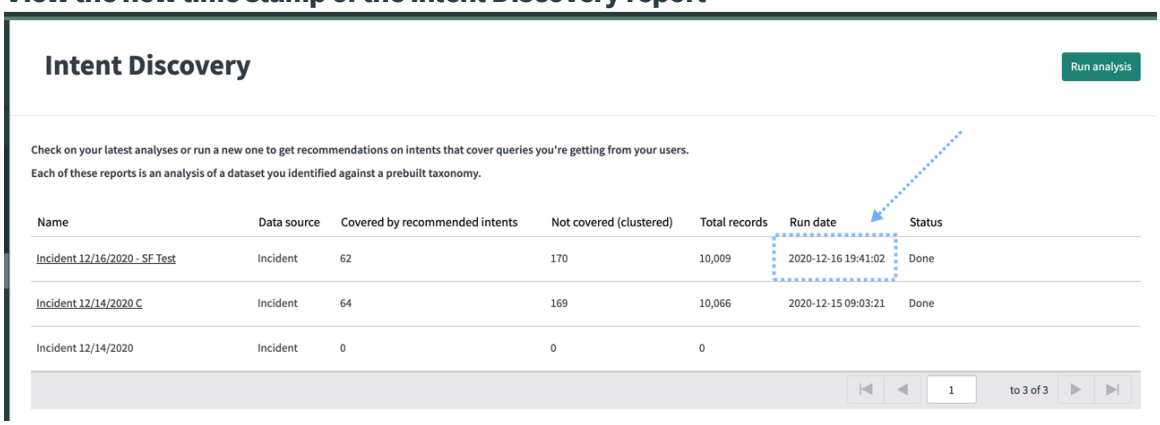
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Selecting the new version of the report



Result: The time stamp you selected for the most recent run appears in the **Run date** column of the Intent Discovery screen.

View the new time stamp of the Intent Discovery report



(Legacy) Install Intent Discovery

You can install the Intent Discovery application (sn_nlu_discovery) if you have the admin role.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Review the Intent Discovery application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.
- Intent Discovery requires the following plugins. Ensure that these plugins are activated before you install Intent Discovery.

Required ServiceNow plugins

Predictive Intelligence (com.glide.platform_ml)

Enables various Predictive Intelligence and Machine Learning capabilities for training models. See Install Predictive Intelligence.

NLU Workbench - Core (com.glide.nlu)

Adds NLU Model capabilities. See (Legacy) Activate the NLU Workbench.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: admin

About this task

Starting with the Brazil release, Natural Language Understanding is being prepared for future deprecation. It will be hidden and no longer activated on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Tables are installed with Intent Discovery:

For more information, see (Legacy) Components installed with Intent Discovery.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Intent Discovery application (sn_nlu_discovery) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

   Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.
3. In the Application installation dialog box, review the application dependencies.

   Dependent plugins and applications are listed if they will be installed, are currently installed, or need to be installed. If any plugins or applications need to be installed, you must install them before you can install Intent Discovery.
4. Select **Install**.

(Legacy) Components installed with Intent Discovery

Several types of components are installed with activation of the sn_nlu_discovery plugin, including tables.

Note: The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Tables installed

Table	Description
Discovery Report [sn_nlu_discovery_report]	Reference table for discovery clusters and intents.
Discovery Message [sn_nlu_discovery_processed_message]	Contains flexible references to the source record and field that was used for analysis.
Discovery Report Trace [sn_nlu_discovery_report_trace]	Contains the information on the utterances added to intents.
Discovery Intent	Contains the intents for a report.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
[sn_nlu_discovery_intent]	
Discovery Cluster [sn_nlu_discovery_cluster]	Contains the clusters for a report.
Discovery Report Definition [sn_nlu_discovery_report_definition]	Includes the necessary information for generating reports.

Natural Language Query

Natural Language Query (NLQ) enables you to query the data in your instance by entering plain language requests into the user interface.

Get started

Choose one of these tiles to get started.

Explore

Learn about NLQ concepts and features.

Use

Use NLQ to query your data with requests in natural language.

Configure

Set up NLQ for your environment.

References

Get details about properties and roles installed with NLQ.

Exploring Natural Language Query

NLQ is a ServiceNow AI Platform feature that is active by default. Use NLQ to query the data in your instance by entering plain language requests into the user interface.

ServiceNow® NLQ translates natural language user input into glide record queries. The queries are rendered into an executable structured format, such as a JavaScript Object Notation (JSON) file or a visual definition. The output, in whichever format, is the response to the user's request.

Note: When a user enters a request directly into the user interface (UI), the text of the request is called an utterance in tables such as NLQ logs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NLQ is a ServiceNow AI Platform feature that is active by default and supports the following data operations:

- Driving table suggestion
- Filtering
- Grouping and aggregations
- Sorting
- Data visualization (single score, list, bar chart, pie chart, time series)
- Business calendar
- Single number
- Multi-table

For more information, see Using Natural Language Query.

NLQ doesn't support domain separation. It also doesn't support on-premise instances.

Language support

NLQ supports American English by default. For all applications and features except CMDB, NLQ also supports queries in Spanish, French, French Canadian, German, and Japanese.

You must first activate the languages on your instance for NLQ to parse queries in those languages. For more information, see Activate a language.

Using NLQ in other applications and features

Other ServiceNow® applications and features can consume NLQ functionality. See the following resources for more information.

Features that can consume NLQ

Application or feature	Information
Analytics Q & A	Create a report with Analytics Q&A
Configuration Management Database (CMDB)	Query your CMDB data without needing to know table relationships or data structures. • Querying the CMDB • Intelligent Search for CMDB English is the only supported language for CMDB.
NLQ with AI Search in global search	NLQ Genius Results in AI Search (supports English only)
List V2	Filter through any platform list by entering in a plain-language request.

Using Natural Language Query

With Natural Language Query (NLQ), you can query data in your tables by entering requests in natural, everyday language.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NLQ overview

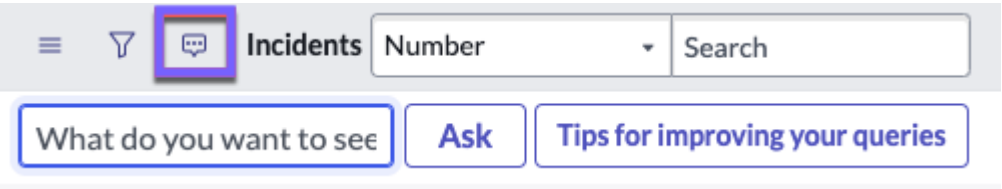
NLQ turns your plain-language requests into structured queries of your data. You don't need to know how to use the condition builder, because NLQ constructs and displays the conditions for you.

If you have a role such as itil that can view and interact with tables, you can use NLQ by selecting the natural language filter icon.

NLQ works on any list on the platform. It returns results only from the table or list you query on.

Find and use the natural language filter

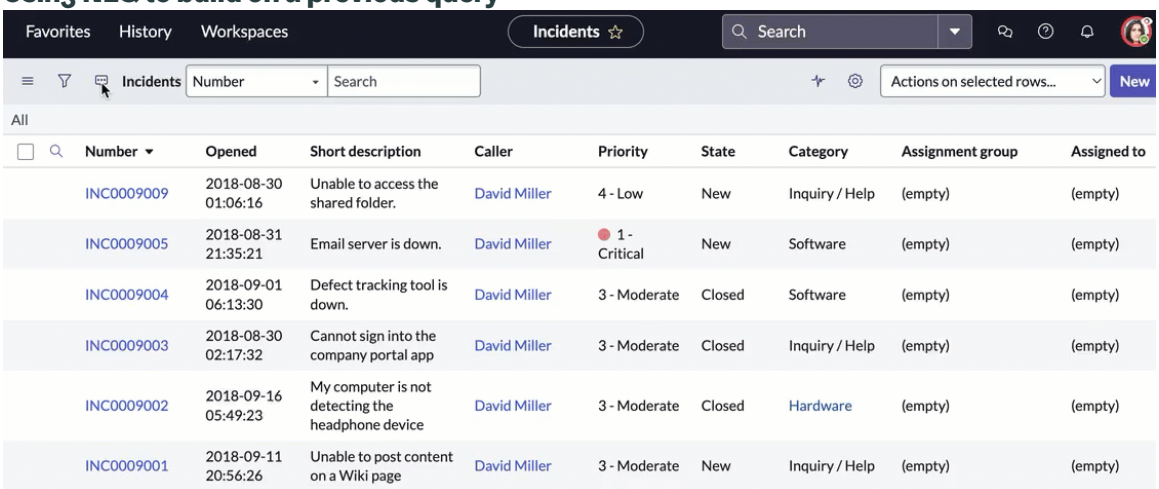
Selecting the natural language filter icon brings up the NLQ interface.



Enter your request in the What do you want to see field, then select **Ask**. NLQ parses your request, then displays the query in the condition builder. The results of the query are displayed in the list.

With the default configuration of NLQ, you can continue to refine your query by entering another request into the What do you want to see field.

Using NLQ to build on a previous query



Number	Opened	Short description	Caller	Priority	State	Category	Assignment group	Assigned to
INC0009009	2018-08-30 01:06:16	Unable to access the shared folder.	David Miller	4 - Low	New	Inquiry / Help	(empty)	(empty)
INC0009005	2018-08-31 21:35:21	Email server is down.	David Miller	1 - Critical	New	Software	(empty)	(empty)
INC0009004	2018-09-01 06:13:30	Defect tracking tool is down.	David Miller	3 - Moderate	Closed	Software	(empty)	(empty)
INC0009003	2018-08-30 02:17:32	Cannot sign into the company portal app	David Miller	3 - Moderate	Closed	Inquiry / Help	(empty)	(empty)
INC0009002	2018-09-16 05:49:23	My computer is not detecting the headphone device	David Miller	3 - Moderate	Closed	Hardware	(empty)	(empty)
INC0009001	2018-09-11 20:56:26	Unable to post content on a Wiki page	David Miller	3 - Moderate	New	Inquiry / Help	(empty)	(empty)

This example image and procedure illustrates how to build a query using NLQ:

1. On the Incident table in the natural language filter, enter `show me active hardware tickets` and select the **Ask** button.
2. The condition builder displays **All** > **Active = true** > **Category = Hardware** as the query. The filtered results are displayed in the list.
3. To narrow down the list of results further, enter `without assignment group`. Notice that as you type, NLQ displays possible matches for columns and fields. Select assignment group from the list of suggestions, and then **Ask**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. In the condition builder, NLQ adds **>Assignment group is empty** to the query. The list refreshes to display only the matching rows.
5. To reset and start a new query, delete everything in the condition builder so that only **All** remains.

Useful information

Keep the following information in mind when using NLQ.

- Your requests can contain periods and apostrophes, but not wildcard characters such as asterisks or regex.
- To group by a field or column, that column must be visible in the list view. Use the personalize list icon ( ) to hide or display columns.
- For information about querying CMDB tables, see Querying the CMDB .

Tips for improving your queries

When you select the **Tips for improving your queries** button, a modal window appears in the user interface. This window offers the following information about terms you can use in your NLQ questions and requests:

- Sorting or grouping: grouped by; sorted by; A-Z; z-a
- Dates: today; yesterday; last; this; next day(s); week(s); quarter(s); year(s)
- Filtering: starts with; ends with; more than; less than; empty; not empty; and; or
- Other information: my; my team; created by; unassigned

Query	Example
Sorting or grouping	incidents grouped by category
Dates	created last month
Filtering	short description starts with computer
Other information	unassigned tickets
Single number	INC0777

Configuring NLQ

Enhance your users' query experience by supplementing NLQ with words and terms used in your environment. Review your users' actual requests in the NLQ logs to find possible synonyms and shortcuts to add.

Natural Language Query functionality is included in the base system. Admins can optionally expand NLQ's range of understanding by adding terms that commonly occur in users' requests. Review the following topics to learn more.

For information about system properties related to NLQ, see Natural Language Query References.

Create an NLQ synonym

Add synonyms to improve the ability of NLQ to recognize the various ways your users request data. With synonyms, you can map commonly used words or terms to table columns.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin, nlq_admin, or pa_analyst

About this task
NLQ synonyms enable you to map common words in your users' requests to the columns in your instance tables. When these words are detected in natural-language queries, NLQ replaces them with actual column and table names, then submits the formal query.

Several synonyms are provided in the base system, and you can add more for your use cases and business requirements. Review NLQ logs of actual user utterances to find possible synonyms to add. For more information, see View NLQ logs.

You can create a new synonym, or modify an existing synonym, as follows.

- If any synonym already exists for your target table and column, you must add your new synonym to the current record. Separate multiple synonyms with a comma.
- Synonyms can point to reference fields, using dot-walking. For more information, see Dot-walking examples.
- Synonyms are case-insensitive in queries.
- Synonyms can contain apostrophes and periods, but not commas.
- Synonym records are associated to one table. You can use the same synonym term for more than one table, but you must create a record for each table.

Procedure
1. Ensure that you are in the application scope you want for your synonym, then navigate to **All** > **NLQ** > **Synonyms**.
2. Select **New**.
   If you are updating an existing record, select its **Column name** in the list.
3. On the form, fill in the fields.

Field	Description
Synonym Type	Type of synonym. ○ **Table or Column**: Synonym for a value on a table or a specific column in that table. ○ **Record**: Synonym for a value on the CMDB tables [cmdb_rel_type_table]. For more information, see Querying the CMDB. **Note:** Supports cmdb_rel_type,cmdb_group, cmdb_ci_service_technical, cmdb_ci_service_discovered, cmdb_ci_query_based_service tables.
Application	[Read only] Application scope that can use the synonym in a query. The default is **Global**. When creating a synonym, ensure that you are in the scope you want for the synonym.
Table	Source table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	You can use the same term for more than one table, but you must create a synonym record for each table. The synonym's mapping is unique to the table.
Column name	Specific column on the source table.
Language	Language of the synonym. Should match the language of the source value.
Synonyms	Words or short phrases that the system should map to column names or tables, when converting the utterance to a formal query. Separate multiple synonyms with a comma.
Extend to All Child Tables	**Table or Column** type only. Select this option to make any child tables of the source table inherit the synonyms.

4. Select **Submit** if new, or **Update** if you are modifying an existing record.

Result

The new synonym is available to your users as soon as they refresh the browser window of the list.

Example: NLQ Synonym for the Active field

The following image shows an example of an NLQ synonym record for the **Active** field on a change request. The synonyms open and in progress are replaced by the term active when the system submits a query.

With this synonym record, a user can type `show open change requests` or `change requests in progress` and the system displays active change requests.

Create an NLQ shortcut

Create a semantic shortcut to help improve the ability of NLQ to recognize the various ways your users request data. Semantic shortcuts operate similarly to NLQ synonyms by mapping common words to columns, but for a selected table when certain conditions are met.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin, nlq_admin, or pa_analyst

About this task
Like NLQ synonyms, semantic shortcuts enable you to map common words in your users' requests to the columns in your instance tables. When these words are detected in natural-language queries, NLQ replaces them with actual column and table names, then submits the formal query.

Semantic shortcuts provide a condition builder so that you can filter which records are covered by the terms you provide.

Some semantic shortcuts are provided in the base system, and you can add more for your use cases and business requirements. Review NLQ logs of actual user utterances to find possible terms to add. For more information, see View NLQ logs.

You can create a new shortcut, or modify an existing shortcut, as follows.

- If any shortcut already exists for your target table and filter conditions, you must add your new shortcut to the current record. Separate multiple shortcuts with a comma.
- Shortcuts can point to reference fields, using dot-walking. For more information, see Dot-walking examples.
- Synonyms are case-insensitive in queries.
- Synonyms can contain apostrophes and periods, but not commas.
- Synonym and shortcut records are associated to one table. You can associate the same synonym term to more than one table, but you must create a record for each table.

Procedure
1. Ensure that you are in the application scope that you want for your shortcut, then navigate to **All** > **NLQ** > **Semantic Shortcuts**.
2. Select **New**.
   If you are updating an existing record, select its row in the list.
3. On the form, fill in the fields.

Field	Description
Table	Source table. You can use the same term for more than one table, but you must create a record for each table. The synonym's mapping is unique to the table.
Conditions	Conditions on the source table that must be met for the synonym to work.
Synonyms	Words or phrases that the system should map to column names or tables, when converting the utterance to a formal query. Separate multiple synonyms with a comma.

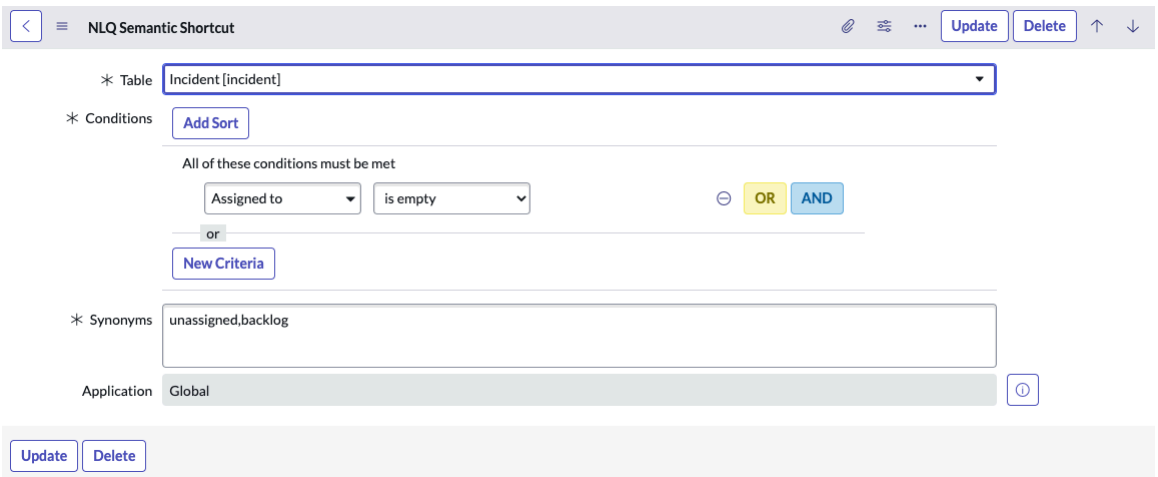
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Application	[Read only] Application scope that can use the synonym in a query. Default is **Global**. Ensure that you are in the target application scope for your shortcut before creating it.

4. Select **Submit** if new, or **Update** if you are modifying an existing record.

Result
The new shortcut is available to your users as soon as they refresh the browser window of the list.

Example: Semantic shortcut for Incident backlog
The following image shows an example of a semantic shortcut used on incident records. Incidents contain the Assigned to field. Using the condition builder, you can provide synonyms for when the field is empty. When NLQ detects unassigned and backlog in your users' input, it replaces them with the SQL clause `assigned_toISEMPTY`.



A user can enter `show me incident backlog` or `unassigned incidents` and the system displays incidents with an empty Assigned to field.

View NLQ logs

Review NLQ logs to see how the system has handled your users' plain-language requests. Use log records from attempted requests to expand NLQ synonyms or shortcuts.

Before you begin
Role required: nlq_admin, pa_analyst, or admin

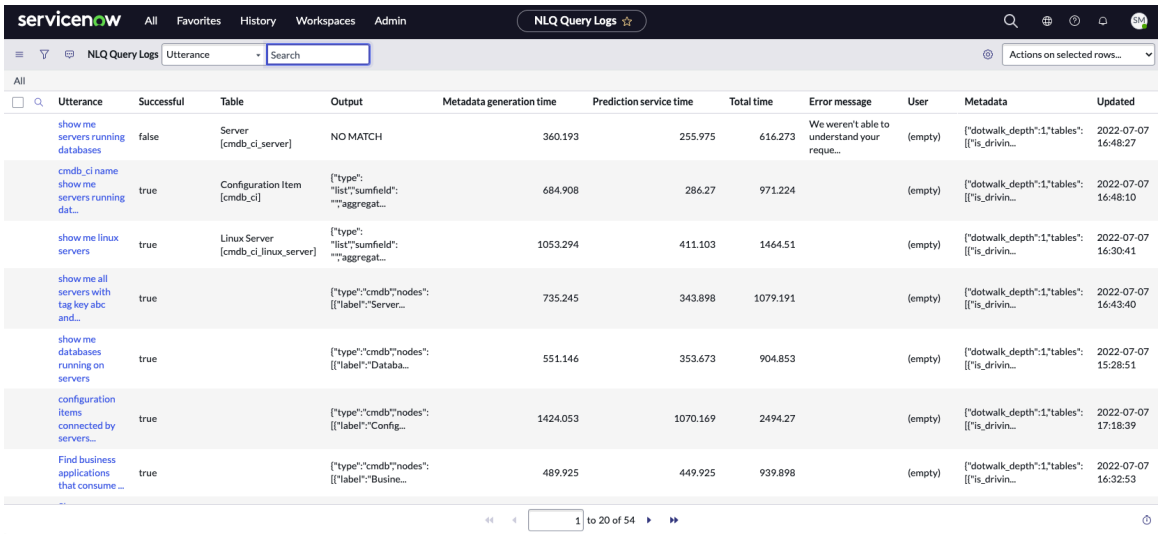
About this task
Every natural language query is logged in the *NLQ* **Query Logs** table [nlq_query_log]. Each log entry provides details such as the table that was queried, whether the query succeeded, and how the results were generated. Other available fields include the following.

- Output Source: how the results were generated. The value **BNF** indicates a rules-based method. The value **GAI** indicates the Now LLM Service (fallback) method.
- Source: the location from which the query was initiated. The value **AC** indicates Analytics Overview. The value **CMDB_WS** indicates CMDB Workspace.
- Utterance: the original natural-language request which triggered NLQ.

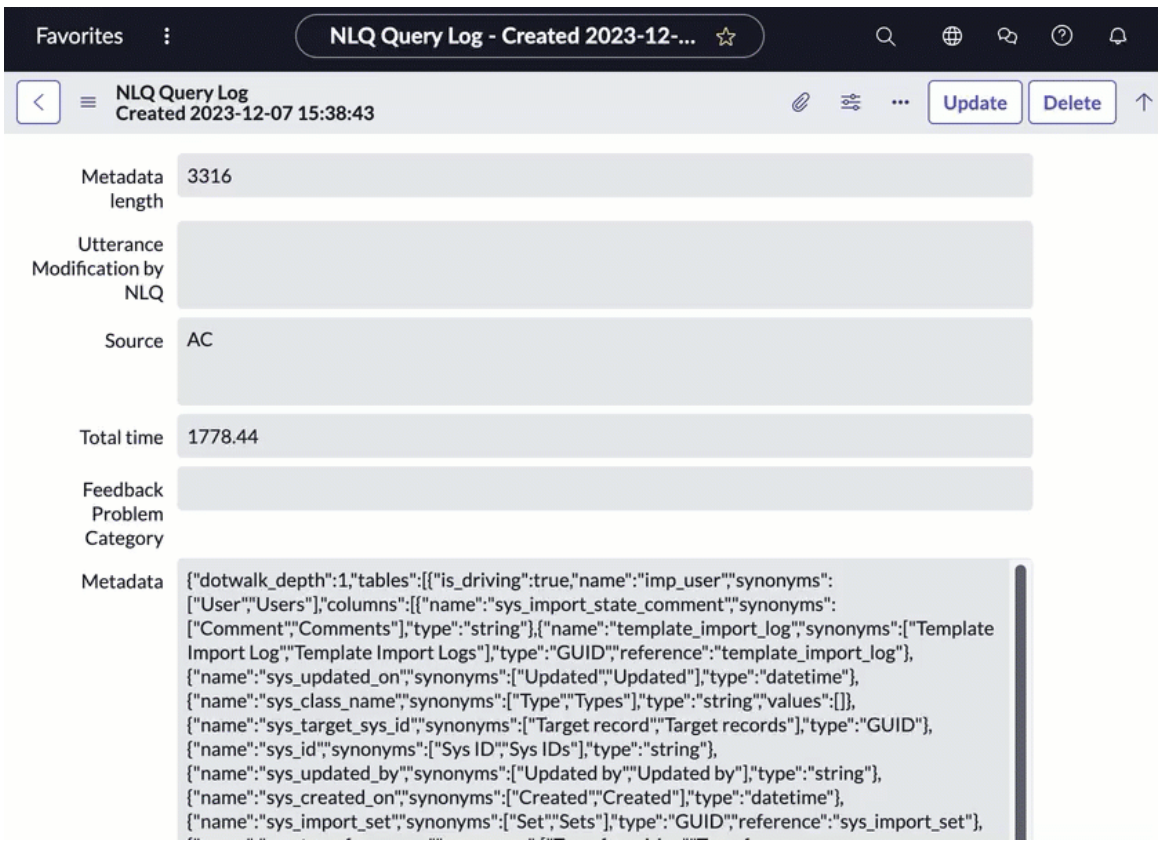
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **NLQ** > **Logs**.



2. Select the value in the **Utterance** column to open the full log entry.



What to do next

Based on your users' attempted queries, consider adding more synonyms or shortcuts.

View NLQ Table Guesser logs

Use the Table Guesser logs to review the CMDB tables that were picked by NLQ in response to plain-language queries.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
This module is read-only.

Role required: nlq_admin.

About this task
When a plain-language request for CMDB data is parsed by NLQ, the system tries to determine the specific tables the user intended. The system's guesses, including confidence levels, are recorded in the NLQ Table Guesser logs module [nlq_table_guesser_log].

Review these logs to troubleshoot which CMDB tables were inferred by NLQ.

Note: This list is read-only for NLQ admins. There are no buttons or actionable functions in the UI.

Procedure
1. Navigate to **All** > **NLQ** > **Table Guesser Logs**.
2. Select the personalize list icon ( ) to display the columns **Matched words to table names** and **Confidence scores**.

   The **Utterance** column shows the user's natural language query.
3. Use the information in the **Matched words to table names** column for troubleshooting if needed.
   In this column's value field, the first word was found in the utterance. Next is a list of the CMDB tables that were matched to that word.

What to do next
For more information on CMDB queries, see Exploring CMDB Query Builder.

Natural Language Query References

The following components are installed with Natural Language Query.

NLQ properties

The Natural Language Query (NLQ) properties control how and where NLQ operates.

Admins can edit properties of NLQ by navigating to **All** > **System Properties** > **All Properties**. Filter for the NLQ properties.

Note: Editing these system properties requires the admin role. The nlq_admin role does not have permission to edit records in this table.

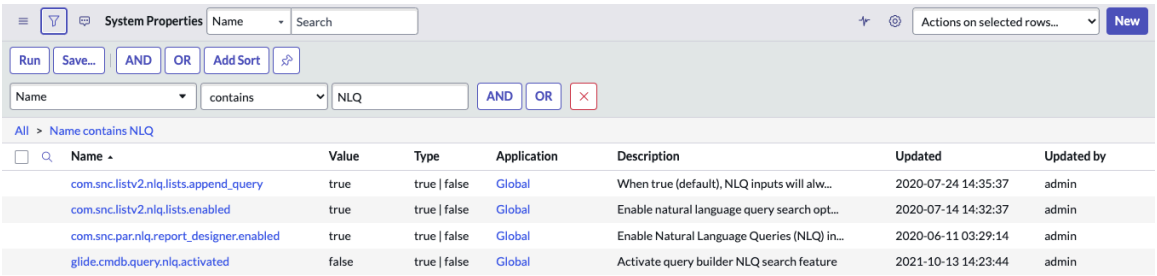
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Property	Description
com.snc.listv2.nlq.lists.append_query	• True: NLQ inputs add onto existing queries via an "and" operator • False: New NLQ input replaces any existing queries Example: You run two queries. • Query 1: Incidents with critical priority • Query 2: assigned to John Smith If the property is set to true, the results show incidents with critical priority that are assigned to John Smith. If the property is set to false, the results show only items assigned to John Smith.
com.snc.listv2.nlq.lists.enabled	• True: Enables NLQ search option for List v2 • False: Removes NLQ search option for List v2
com.snc.nlq.gai_enabled	• True: The Now LLM Service fallback is available • False: The Now LLM Service fallback is not available Initially, queries are interpreted using a rules-based method. If that method fails, queries are passed to the Now LLM Service as a fallback. Queries that fail both of these methods are marked as unsuccessful in the NLQ log.
com.snc.par.nlq.report_designer.enabled	• True: Enables NLQ in Report Designer • False: Removes NLQ in Report Designer
glide.cmdb.query.nlq.activated	• True: NLQ search feature is active in CMDB Query Builder • False: NLQ search feature is inactive in CMDB Query Builder

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

processes across the platform. Predictive Intelligence enables you to do things such as the following:

- Automatically populate fields during case creation.
- Categorize and route work based on how records have been handled in the past.
- Recommend resolutions to cases that are similar to previous ones.
- Identify major outages based on incoming incidents.

Explore Learn about Predictive Intelligence and machine learning	**Install** Install Predictive Intelligence and its associated apps	**Configure** Configure Predictive Intelligence on the platform
Train Create and train machine learning solutions.	**Use** Use Predictive Intelligence for machine learning.	**Reference** Get details about Predictive Intelligence components such as properties and language support.

Explore Predictive Intelligence

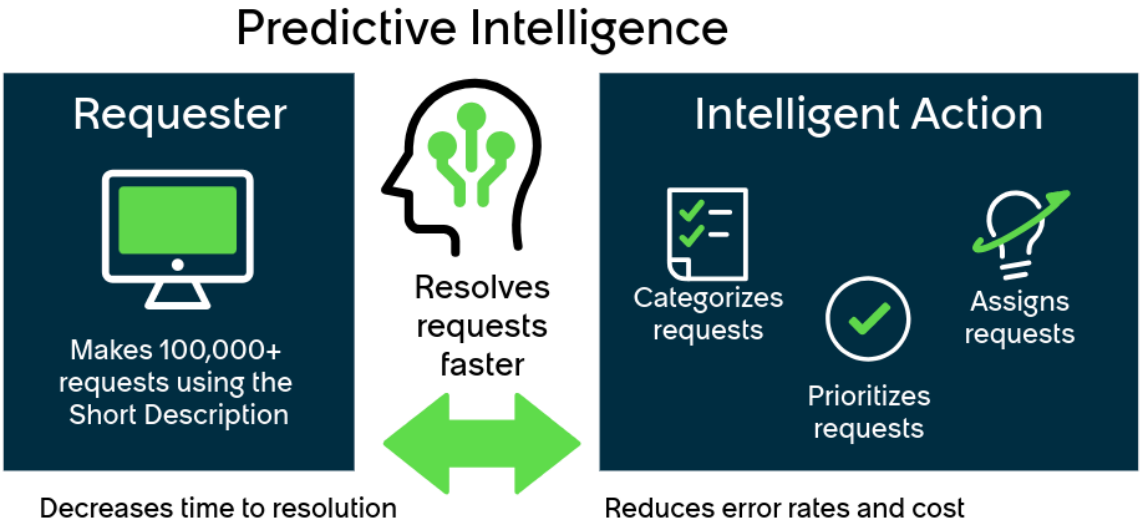
ServiceNow® Predictive Intelligence is a platform function that provides a layer of artificial intelligence that empowers features and capabilities across ServiceNow® applications to provide better work experiences.

Overview of Predictive Intelligence

Predictive Intelligence is a powerful set of tools applying artificial intelligence and machine learning to make predictions. You can create and train models in three different frameworks: classification, clustering, and similarity. A

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

trained solution can be invoked by any ServiceNow application through an API.



To learn more about ways to use existing models, see Using Predictive Intelligence.

Predictive Intelligence for on-premise customers

Predictive Intelligence is also available for on-premise customers. If you're interested in deploying this product on-premise, contact your account manager. For on-premise installation and configuration instructions, see the complete instructions for Machine Learning Engine installation and configuration for self-hosted customers [KB0782052] in the Now Support Self-Hosted Knowledge Base.

Note: Only on-premise accounts can access the Now Support Self-Hosted Knowledge Base.

Terminology

Artificial intelligence

Systems designed to do work that needs a level of human intelligence to accomplish.

Machine learning

Ability for models to improve over time with more experience.

Models

Collections of algorithms, math, and statistics that make predictions and decisions based on input-output data.

Training

Adding or changing data that the model is based on to affect future predictions.

Supervised Training

Providing input-out pairs so that the model can generate rules that connect the two.

Unsupervised Training

Providing raw data so that the model can identify structures in the data set.

Training frequency

How often models are retrained to incorporate new data into an existing model.

Word corpus

Vocabulary that a model can use to look for textual similarity.

© 2026 ServiceNow, Inc. All rights reserved.

Predictive model components

A predictive model includes these components, some of which you must provide.

Solution definition

A data record you create and configure that specifies these values for training a predictive model.

- The records used to train the model. For example, only train on incidents that are resolved or closed within the last six months.
- The input fields that the model uses to make predictions. For example, use the incident short description to make a prediction.
- The output field whose value the model predicts. For example, set the incident category based on the short description.
- The frequency to retrain the model. For example, retrain the model every 30 days.

Solution

The solution is the result of a solution definition that you've trained in a ServiceNow datacenter. Predictive Intelligence uses the solution to predict a target field value given one or more input field values. All solutions specify these values.

- The solution precision is the aggregate percentage of correct predictions. For example, a precision of 50 means that out of 100 predictions, half of them should have the correct value.
- The solution coverage is the aggregate percentage of records that receive a prediction. For example, a coverage of 50 means half of all eligible records actually receive a prediction.
- The solution classes are the output field values for which the model can make predictions. Each class is an output field value with a list of possible precision, coverage, and distribution metrics to choose from. For example, the Incident Categorization solution has a class for each category such as software, inquiry, and database.
- The class distribution is the percentage of records from the entire table that have this particular output field value. For example, a distribution of 50 for the inquiry class means that half of incidents have the inquiry category.

Predictive Intelligence frameworks

Predictive Intelligence provides three different model frameworks in the Brazil release: classification, similarity, and clustering. Each framework specializes in different types of predictions.

Predictive Intelligence classification framework

The Predictive Intelligence classification framework enables you to use machine-learning algorithms to set categorical field values during record creation. For example, you can use the model to set the incident category based on the short description. You can train predictive models so they act as an agent to categorize and route work automatically based on your past record-handling experience.

Enable Predictive Intelligence to handle volumes of incoming requests at lower costs. Automate the categorization and assignment of requests to reduce:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Task resolution times.
- The number of interactions required to resolve tasks.
- The error rates of categorizing and assigning work.

For more information, see Create and train a classification solution.

Predictive Intelligence similarity framework

The Predictive Intelligence similarity framework identifies existing records that have similar values to a new record. For example, you can train a subset of your incident records to recommend a resolution based on the information of a similar incident record. By borrowing from similar closed incidents that have a proven resolution, you can help agents and fulfillers quickly provide the best resolution for an incoming incident.

The similarity framework doesn't need an exact match of keywords for its text comparisons because its algorithms identify similar words and synonyms based on similar contexts. For example, the phrases printer not working and printer broken are both recognized as similar. The framework also collects, learns, and applies your industry-specific context. For example, the phrase unable to join network has a different context in a computer networking company than it does in a healthcare insurance company.

The similarity framework uses a workflow similarity solution. For more information, see Create and train a similarity solution.

Predictive Intelligence clustering framework

Clustering divides data into groups that can then be used to identify patterns. You can then address records collectively or find gaps in existing data. For example, you can group similar new incidents to identify a major outage.

The clustering framework uses a workflow clustering solution. For more information, see Create and train a clustering solution.

Deprecated in the Washington DC release: Predictive Intelligence regression framework

Note: Support for creating new regression solutions was removed in the Washington DC release. You can train and edit any existing solutions, but you can't initiate new ones. The following information is provided for legacy context.

Regression is a machine-learning framework that uses historic data to predict numeric outputs, such as a temperature or a stock price.

For more information, see Create and train a regression solution.

ServiceNow® apps and features that use Predictive Intelligence

Learn about ServiceNow applications and features that leverage Predictive Intelligence. Solutions that you can adapt are available for various business units and industries.

ServiceNow teams work together to offer models that apply the artificial intelligence and machine learning capabilities provided by Predictive Intelligence. For example, Customer Service Management (CSM) partners with Predictive Intelligence to deliver BU-specific solutions to ServiceNow CSM customers.

Following is a listing of some ServiceNow products that use Predictive Intelligence functionality.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Machine learning solutions for Customer Service Management
- Machine learning solutions for Event Management
- Issue assignment using the Governance, Risk, and Compliance Predictive Intelligence plugin
- Machine learning solutions for HR Service Delivery
- Predictive Intelligence for Innovation Management
- Machine learning solutions for IT Service Management
- Machine learning solutions for Knowledge Management
- Machine learning solutions for Search administration
- Machine Learning solutions for Vulnerability Response
- Work order insights powered by Predictive Intelligence
- Machine Learning solutions for Flow Designer

Install Predictive Intelligence

Activate Predictive Intelligence on your instance and get started with basic configuration.

Before you begin

Role required: admin

About this task

The Predictive Intelligence plugin (com.glide.platform_ml) is included in the base system, but if necessary you can use the following procedure to activate it.

Other related plugins and store applications are available. For example, Predictive Intelligence for Field Service Management (com.snc.fsm_ml) provides solutions relevant to FSM. Some of these plugins may require a separate license.

When you activate the Predictive Intelligence plugin for the first time on your instance, the system launches a Homepage. The Homepage provides an overview of your solution definitions in the classification, similarity, clustering, and regression frameworks. You can create, train, and test solutions directly on the Homepage. A summary of the latest trained solution is also available.

Procedure

1. Navigate to **System Definition** > **Plugins**.
2. Use the search bar to locate the Predictive Intelligence (com.glide.platform_ml) plugin.
3. Select **Install** and then in the Activate Plugin dialog box, select **Activate**.
   When you activate a plugin, any dependent plugins are activated automatically.
4. Confirm that the activation has successfully created a sharedservice.worker user.
   When training your solutions, Predictive Intelligence operates as this user.

   Note: The sharedservice.worker user includes the following roles:
   - platform_ml_read
   - platform_ml_write
   - platform_ml_create

   These roles are required to create, train, and view solutions. They are internal roles and not meant to be edited or assigned to other users.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Implement Predictive Intelligence

Implement initial setup and configuration steps for Predictive Intelligence to train a machine-learning (ML) algorithm to make predictions based on your past record data.

Before you begin

Role required: admin or ml_admin

About this task

The training process requires sending record data to a training service in the nearest datacenter. Since every datacenter has its own dedicated training server and the data doesn't leave the datacenter, this service is also available to customers who have data sovereignty requirements. For more information on this process, see Explore Predictive Intelligence.

For frequently asked questions regarding initial configuration and setup, see KB0781894.

Procedure

1. Activate Predictive Intelligence on a non-production instance.
2. From your production instance, export the records that you want your Predictive Intelligence solutions to process.
   For example, export 12 months of incident records to a non-production instance.
3. On the non-production instance, import the records you exported.
4. On the non-production instance, review the default solution definition records to determine if the filter, input fields, and output field are sufficient to predict your incident or task records.
   If necessary, create a solution definition for each record set you want to predict.
5. On the non-production instance, train the solution definition records.
6. Test the solution predictions on the non-production instance by either creating test records or importing more records from production.
7. For classification solutions, review the prediction reports to determine the accuracy and coverage of your solution and individual classes.
8. For similarity solutions, review the similarity examples to update the similarity score threshold if needed.
9. If necessary, update the solution definition filter to include more or different training records.
10. Retrain and retest any updated solution definition records.
11. When you are satisfied with your solutions, activate Predictive Intelligence on your production instance.
12. Recreate any custom solution definition records and train the solution, or import the solution from your non-production instance to your production instance.

Related topics

Create and train a classification solution

Create and train a similarity solution

Configure Predictive Intelligence

Configure solution definitions for Predictive Intelligence to train, test, and monitor solution definitions

Configuration

Use the following links to guide you as you set up your solution definition.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Database View support for Predictive Intelligence

Use database views to join two or more tables as input for your Machine Learning (ML) solution.

Using database views in an ML solution

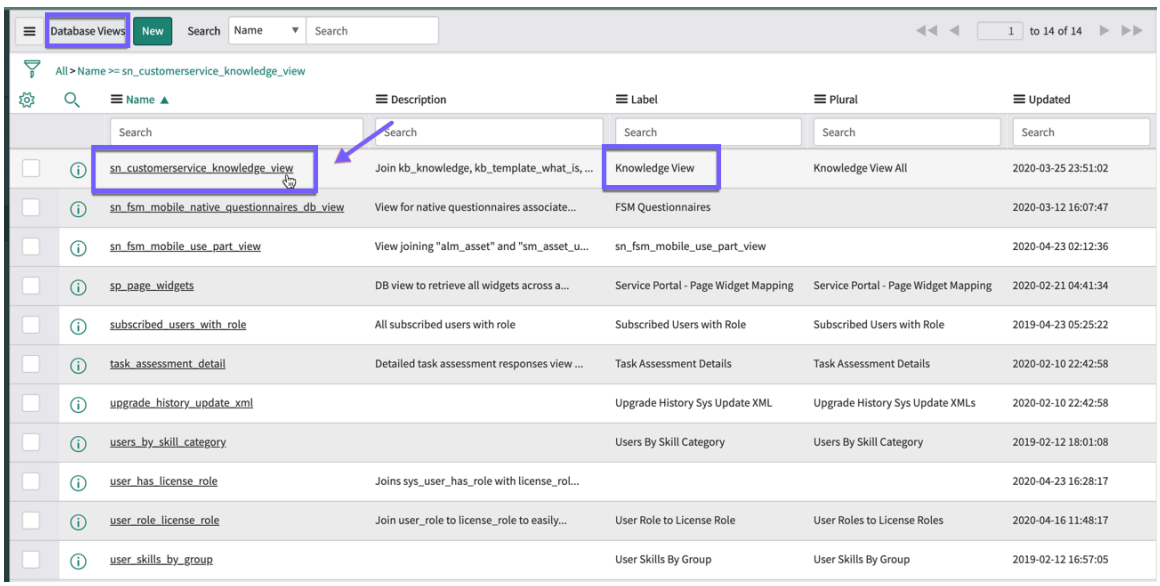
Database views help expand the amount of fields your solution can use for training. By using more than one table in your ML solution definition form, you can access more input data to help enrich the solution outcome.

Database views enable you to join two or more tables into one consolidated view. For this to work in an ML solution you must first create the database view. See Database views.

Database views are supported in all four of the Predictive Intelligence capability frameworks: classification, similarity, clustering, and regression.

A database view example for Predictive Intelligence

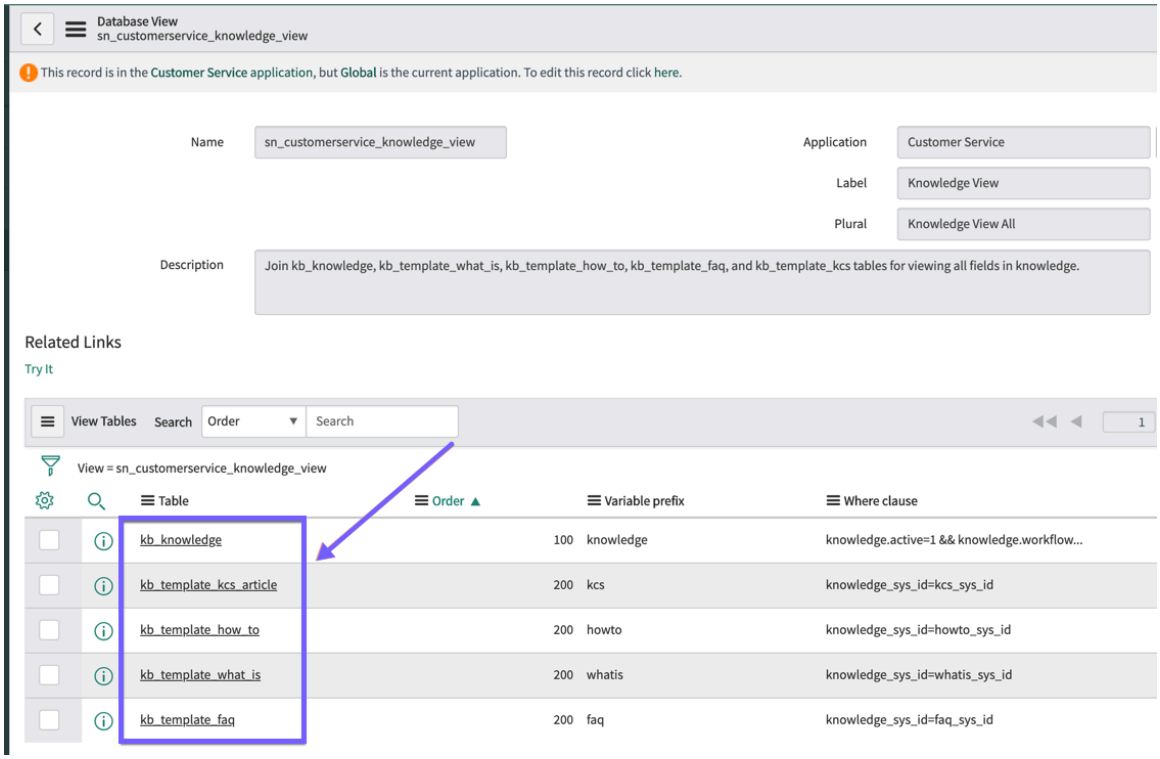
In the following example scenario, you've created a database view for use in an ML similarity solution. The image below shows the database view record you've created, including its **Name** and **Label**.



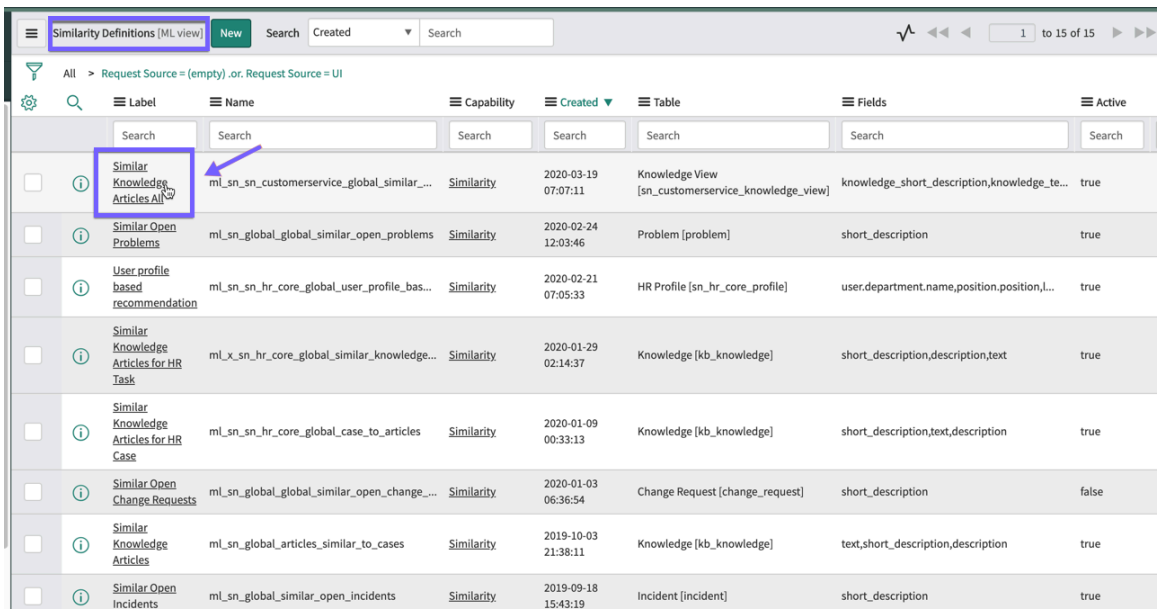
When you click the record **Name**, its content appears, as shown in the image below. Within the database view content, the five Knowledge Base tables you've joined to the view are listed. Most of these tables contain different Knowledge article template types, such as an FAQ or a How To article.

When a database view is used as input to a similarity solution, each of the tables that constitute the view must have at least the required number of records set in the configuration of your ServiceNow instance. The default minimum number required is 10,000. For example, the **Knowledge View** database view has five tables and each table must have 10,000 records. If a table doesn't have 10,000 records, you may not see the results from that table. If you must change that value, contact Customer Support.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



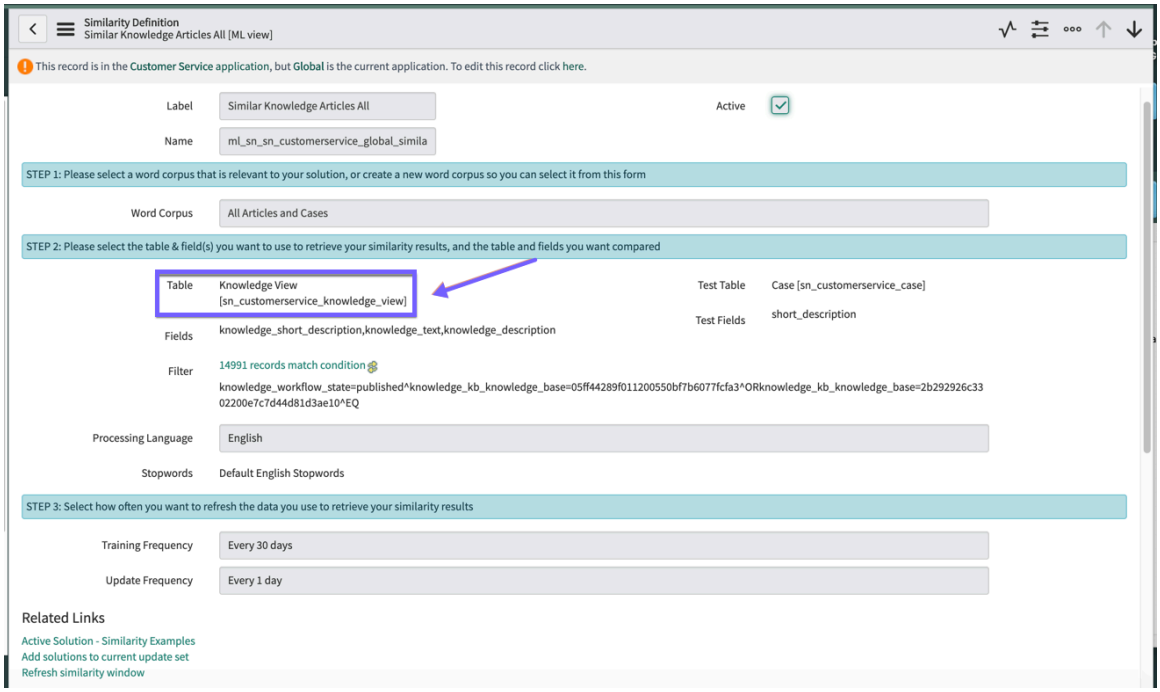
In the image below you can see the similarity solution definition record you've already created, which you plan to associate to your database view. When you click the **Label** for your similarity record, its Similarity Definition form appears.



Similarity Definition forms compare your existing table records based on their similarity by using a table in the **Table** field and another table in the **Test Table** field.

To use a database view in your similarity solution, instead of selecting a table in the **Table** field, you select the database view you created, which in this example scenario is the **Knowledge View** database view. This configuration increases the number of records your solution uses in training because the system compares and processes five tables of data instead of one.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Configuration tips for Predictive Intelligence

If you encounter issues during your solution training and solution prediction, follow these suggested resolutions.

Input Data

It is recommended to have at least 30,000 records to train your models with, but the accuracy of the model is determined by the input data.

There are three primary factors that determine the quality of the input data used to train solutions:

- Cleanliness: Sanitized data reduces noise, making the model more accurate.
- Quality: The input and output should be valid and correct to train the model to make accurate predictions.
- Distribution: Data that represents the entire dataset as a whole will result in a model that can make more generalized predictions.

Most raw data sets contain dirty and unusable data. Reviewing your input sets before training is essential to keeping accurate predictive models.

It is recommended to use approximately 80% of your input data to train your model and about 20% of the data to evaluate whether the model is accurate. You can compare the model's predicted results against the real values for the 20% of remaining data.

Solution training

Issue	Resolution or suggested action
The solution training remains in Waiting for Training status for too long, as the scheduler job is using an incorrect Glide callback instance URL.	Ensure the *glide.servlet.uri* property in the Glide instance is set to the correct instance URL. This issue can occur when:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Issue	Resolution or suggested action
	• An instance is cloned from production, yet it still refers to the production URL for the *glide.servlet.uri* property. • The Glide instance is provisioned and runs the training for the first time.
New categories have been added and aren't yet having an impact on training.	This is expected behavior, as the new categories may not yet have sufficient data until the solution is retrained.
The solution training fails.	When the training fails, click the **Show Training Progress** related link on the solution screen to determine where the potential problem resides.
The solution training fails due to user authentication.	Navigate to **System Security> Users** and ensure the sharedservice.worker user is set to Active.
The model training returns saying the model cannot be created. The training fails and shows the “Error while training solution” message. The training progress window shows this message: “Solution training failed as either the data used isn't sufficient or the input field isn't predictive of the output field."	This issue can occur when the data quantity or the distribution of field values isn't sufficient for a model to build successfully. Follow these steps to troubleshoot: **1.** Ensure the distribution of the output field isn't skewed. **2.** Retrain the model by changing the date filters to use a larger amount of data. **3.** If the input fields are not fully populated, add a filter to remove null records.
The solution has data in multiple languages but the coverage and precision results are poor.	Use the following options to help improve your metrics. Option 1: Update the processing language of the solution to the most prominent non-English language. **Note:** English is applied by default for all datasets. Option 2: If there's sufficient data for each language/region: **1.** Add a filter criteria for a specific language/region where the primary language can be identified (Dutch, English, French, German, Japanese, or Spanish). **2.** Generate a solution for each language/region and apply the proper processing language to each solution.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Solution prediction

Issue	Resolution or suggested action
The prediction fails and returns a Java exception where the cause is unknown.	1. Search for the exception in the Predictive Intelligence Glide logs. 2. Submit an Incident record for Predictive Intelligence including all relevant details, such as the exception, the impacted instance, the solution name, and the input string.
There is no prediction applied to the incident/case record but the prediction returns a value when tested in the Rest API Explorer.	This can occur when the confidence of the prediction is less than the threshold required to make a prediction. After your solution is trained, use the following steps to confirm if your solution settings need adjusting. 1. Navigate to **System Web Services > REST > REST API Explorer** to find the confidence level for the prediction. See Test a classification solution prediction. 2. On your ML Solution Definition record, check the threshold set for your outcome class that was returned in the prediction by clicking on the name of the class. The **Class** page appears. 3. Check the **Estimated Precision** and **Estimated Coverage** values. If the corresponding threshold is more than the prediction confidence of the outcome, this is the root cause for why you did not see any prediction. 4. Adjust the class precision and coverage values to increase coverage or precision. See Tune a trained classification solution.

Instance cloning

Issue	Resolution or suggested action
After an instance is cloned, predictions for your existing solutions fail.	The ML solution artifacts in the [ml_artifacts] table are stored in the [sys_attachment table]. If the [ml_artifacts] table isn't included in the clone when you run it, the predictions fail. Ensure your clone includes the machine-learning artifacts, as these are critical components of your Predictive Intelligence solution.
After an instance is cloned, the solution training fails.	As the cloning run proceeds, it is possible that the sharedservice.worker user has either been

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Issue	Resolution or suggested action
	inactivated, locked out, or the user ID isn't set. Resolve these problems so that the solution training succeeds.

Create a custom stopwords list

Exclude common words you want the system to ignore during training and prediction.

Before you begin

Role required: admin or ml_admin

About this task

Stopwords lists enable the system to exclude extraneous words that can impede search and the overall natural language processing of your data.

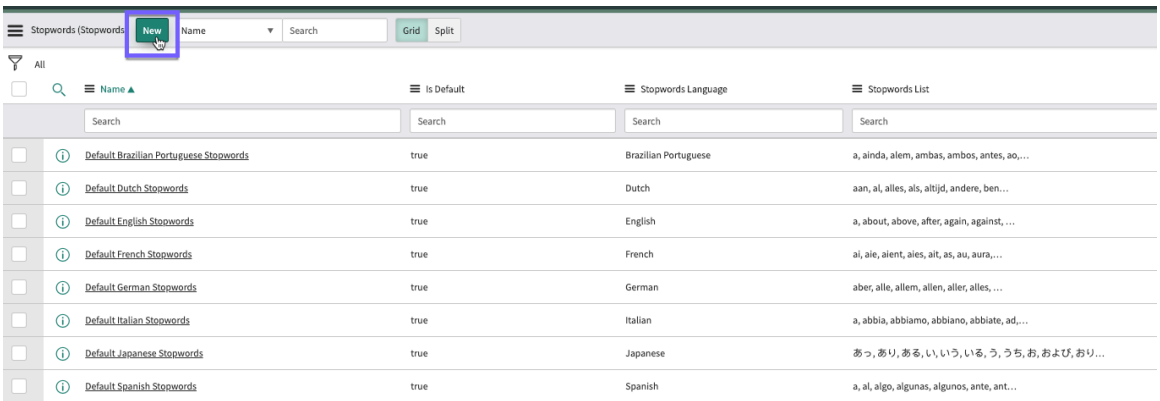
Predictive Intelligence provides you with default stopwords lists for each language the system supports. Examples of stopwords include words such as in, the, and the names of people and companies. You can also define your own stopwords list that's comprised of words specific to your organization and industry.

The custom list you provide works alongside those that the system already uses by default. For example, if incident records are used in a classification solution, and a company name is used in those records, consider adding that name to your list, as it's unlikely to provide any relevant information for the solution you're building.

In this example scenario, you create a custom stopwords list for the Brazilian Portugese language.

Procedure

1. Navigate to **All** > **Predictive Intelligence** > **Stopwords**.
2. On the Stopwords list, click **New**.

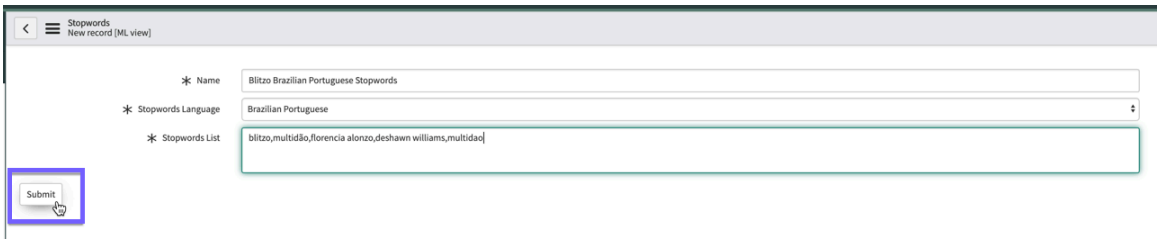


3. In the Stopwords form, configure these fields.

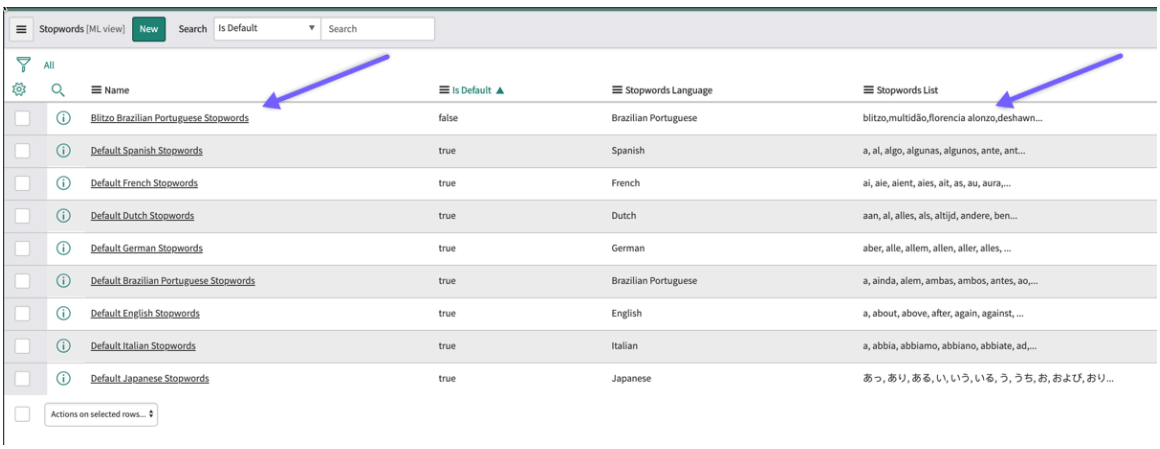
Field	Value
Name	Enter a unique name for the list, such as the name of your company and the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

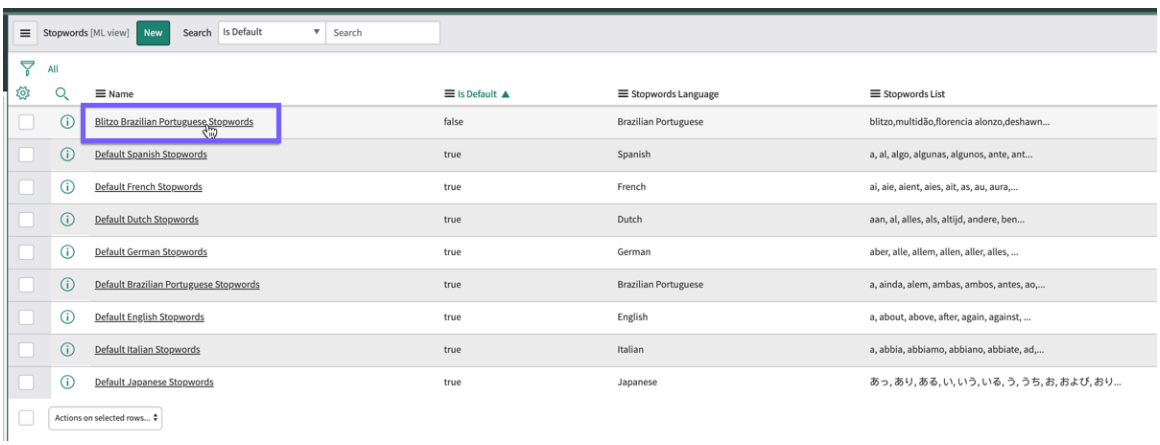
Field	Value
	processing language. For example, `Blitzo Brazilian Portuguese Stopwords`.
Stopwords Language	Select **Brazilian Portuguese**
Stopwords List	Manually enter the stopwords using a comma-separated format. For more examples of stopwords, see the image in Step 2 of this procedure.



4. Click **Submit**.
   Your custom stopwords list appears in the Stopwords list view.



5. **Optional:** If you need to update your stopwords list, just click its Name, add or remove words from the list, and click **Update**.



What to do next

Assign a custom or default stopwords list to a classification, similarity, clustering, or regression solution definition.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a word corpus

Build a collection of words and phrases that functions as the vocabulary the system uses to compare your instance records based on their textual similarity. You can think of the word corpus as a dictionary that you want your machine-learning system to understand.

Before you begin

Role required: admin or ml_admin

Important: In the Brazil release, models in the classification, clustering, and similarity frameworks use Workflow solutions. These are pre-trained, so a word corpus isn't needed for your new solutions.

After upgrading, your existing solutions with a word corpus become Workflow solutions the next time they are re-trained. Also the Word Corpus field is removed from the form.

The following information is provided for legacy context.

About this task

The primary purpose for a word corpus is to infer textual data for training your NLU model. If using a word corpus in a solution, you must specify it for training in the solution definition phase of a solution. A trained word corpus can be reused across solutions and capabilities.

You can use a word corpus to help compare similar record text in a table or across multiple tables. A word corpus can also be helpful in other scenarios, such as clustering, where you group similar records together for data analysis, reuse, or review. The items you add to your corpus should be specific to your company and your industry so you can reuse it in other similarity or clustering solutions and apply it to various use cases.

In this example procedure, you're working on incident records and you want to locate relevant knowledge base (KB) articles that could provide resolutions to those incident cases. Your goal here is to create a word corpus that you can apply to a new similarity solution that compares active incidents to published KB articles.

Procedure

1. Navigate to **All** > **Predictive Intelligence** > **Word Corpus**.
2. In the Word Corpus form, click **New**.
3. Configure these fields according to the following guidance.

Field	Description
Name	A unique title that references the contents of your corpus. For example, in this use case you could enter a name such as `Active Incidents and Published KBs`, as the name indicates the tables that your corpus will mine to help create your solution.
Active	Select this check box if you're creating more than one word corpus at a time and you plan to configure their detail components later. Otherwise, leave it blank because you can select it in a later step.

4. Select **Submit**.
5. In the Word Corpus list view, locate your new word corpus and click its **Name** value to open the record.
6. In the Word Corpus Contents section, Click **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. In the Word Corpus Content form, configure these fields per the following guidance to define a content component for your word corpus.

Field	Description
Name	Enter a title that references the data you want to add to your corpus, such as `Incidents closed in last 6 months`.
Table	Select the table that contains the data you want to include in your word corpus. For this use case, select **Incident [incident]**. **Note:** The number of records per table for Word Corpus creation used in Similarity and Clustering solutions is limited to 300,000.
Filter	Select the following filter condition values: **[Closed] [is not empty] and [Created in last 6 Months]**.
Field List	For this use case, select **Short description**, **Description**, and **Resolution notes**.
Domain	The system automatically displays the user group for your corpus. For example, in this use case it shows the global user group. You can select other user groups as well.

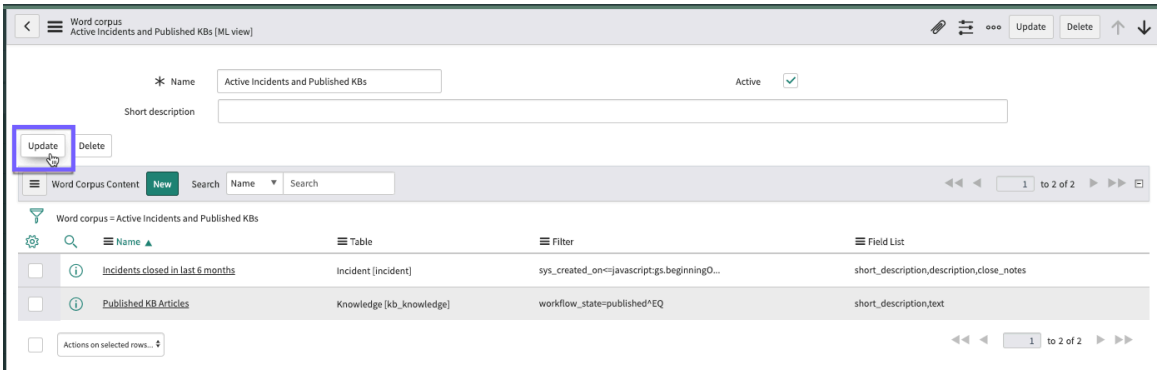
8. Select **Submit**.
9. In the Word Corpus Details section, select **New**.
10. Configure these fields according to the following guidance to define a second content component for your word corpus.

Field	Description
Name	Enter a title that references the data you want to compare to your first content component, such as `Published KB Articles`.
Table	Select the table that contains the data you want to compare to your first content component. For this use case, select **Knowledge [kb_knowledge]**. **Note:** The number of records per table for word corpus creation used in Similarity and Clustering solutions is limited to 300,000 records per table.
Filter	Select the following Filter Condition values: **[Workflow] [is] [Published]**.
Field List	Select **Short description** and **Article body**.

11. Select **Submit**.

    Your two word corpus content components appear on the word corpus form.

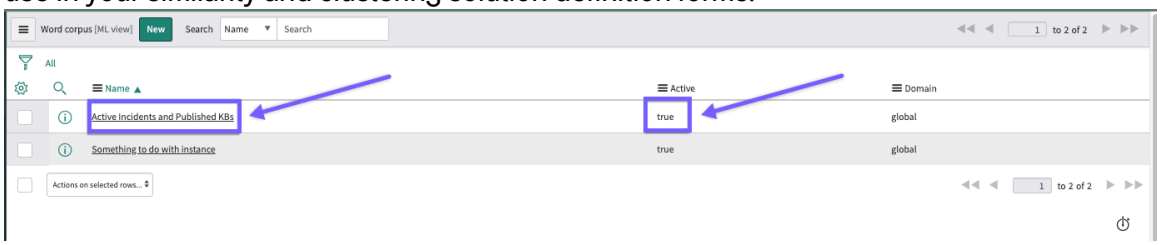
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



12. Select **Update**.

Result

The completed word corpus you created appears on the word corpus form and is available for use in your similarity and clustering solution definition forms.



What to do next

Create a solution in the appropriate framework. For more information, see the links in the Related Content panel on this page.

Quick start tests for Predictive Intelligence

Validate that Predictive Intelligence still works after you make any configuration change such as applying an upgrade or developing an application. Copy and customize these quick start tests to pass when using your instance-specific data.

Predictive Intelligence quick start tests require activating the Predictive Intelligence [com.glide.platform_ml] plugin. To execute critical upgrade tests on existing machine learning solutions, create a basic authorization profile named ml_atf in the Basic Auth Configurations table (sys_auth_profile_basic.list). To run the tests successfully, the user attached to the ml_atf authorization profile must have the ml_admin role.

Predictive Intelligence: ATF Test Suite

Test	Description
PI: Presence of ML model artifacts persisted in glide	Verify all the trained ML model artifacts are persisted in glide (sys_attachments table) after model training/instance cloning so that ML prediction calls are successful.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Predictive Intelligence: ATF Test Suite (continued)

Test	Description
PI: Valid setup of ML user (sharedservice.worker) in glide	Validate if the ML user in glide (sharedservice.worker) is active and not logged out so that model training is successful.
PI: Glide upgrade test for Classification solution	Validate that the classification model prediction on existing active models is producing the same class membership and confidence value results after a glide upgrade.
PI: Glide upgrade test for Similarity solution	Validate that the similarity model prediction API calls on active models are successful after a glide upgrade.

Quick start tests

Activate a solution version

Predictive Intelligence activates the most recent version of the solution when it completes training a solution. However, you can activate any previously trained solution version. Only one solution version can be active at a time, and only the active version is used when making predictions.

Before you begin

- Manually train a solution multiple times or set a training schedule.
- Role required: admin or ml_admin

About this task

The system creates a solution version each time you train a solution definition. Typically, you manually create a solution version only when you change the solution definition filter and want to test it. Otherwise, most solution versions are created during scheduled solution training.

Procedure

1. Navigate to **All** > **Predictive Intelligence** > **Classification** > **Solutions** or **Predictive Intelligence** > **Similarity** > **Solutions** or **Predictive Intelligence** > **Clustering** > **Solutions** or **Predictive Intelligence** > **Regression** > **Solutions** .
2. In the list view of the ML Solutions table, find the row that you want to activate, then select the value in the first column to open the individual record.

   You can also open the individual record by selecting the row's reference lookup icon , then selecting **Open Record**.
3. In the solution record, select **Activate**.
   The system activates this solution version and deactivates any other solution version.

What to do next

For classification solutions, review the trained solution precision and coverage statistics. For similarity solutions, review the similarity examples.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Export trained solutions to production

Refine and test your ML solutions iteratively on a non-production instance, and then use update sets to export the changes to your production instance. This practice mitigates the risk of retraining solutions on your live production instance.

Before you begin

Prior to testing on a test instance, ensure that the instance hosts recently-cloned data from your production instance so that the solutions you train on the test instance remain valid when you export them to production.

Role required: admin or ml_admin

About this task

Plan your changes carefully, and remember that update sets match records based on the system ID [sys-id] and not the version number. Note that moving solutions to instances can sometimes deliver unpredictable results. If you run into such an issue, retrain the solution again, which takes 5 minutes per solution. For more information on update sets, see System update sets .

Procedure

1. Navigate to **All** > **Predictive Intelligence** > **Classification** > **Solution Definitions** or **Predictive Intelligence** > **Similarity** > **Solution Definitions**.
2. Click the name of your trained ML Solution Definition record to open it.
3. In the Related Links section, click **Add solutions to the current update set**.
4. Click **Update**.

Result

Your trained ML solution artifacts, such as solution definitions, template records, and predictive model statistics, are added to the current update set.

What to do next

Depending on where you are in your solution testing, schedule your update set for export to another non-production instance for further testing, or on to production.

Note: After you export a similarity solution, click **Refresh similarity window (Required after Solution Import)** in the Related Links section of the corresponding ML Solution Definition form.

Configuring advanced settings for your ML solutions

Learn about advanced settings for your Predictive Intelligence machine learning (ML) solutions. Apply optional technology and algorithms for classification, clustering, similarity, and regression capabilities.

Using advanced settings in your ML solutions is optional. If you choose to implement any of these settings, make sure you're well informed regarding the technology you're enabling in the solution, and that your use case benefits from what the technology offers. For more information about several of these parameters, see the Dive deeper with Clustering Advanced Parameters article on ServiceNow Community.

Most of the advanced settings are limited to only one capability because their functionality is targeted to specific use cases.

Classification, clustering, similarity, and regression advanced settings

Using the admin or ml_admin role, you apply these technologies by configuring a parameter in the **Advanced Solution Settings** tab on your ML solution definition form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To update or remove an existing setting: on the solution definition form, select the **Advanced Solution Settings** tab, then select the name of the solution parameter. For details, see the following procedures.

- Configure class recall for a classification solution
- Configure TF-IDF for solutions
- Configure DBSCAN for a clustering solution
- Configure HDBSCAN for a clustering solution
- Configure XGBoost for classification or regression solutions
- Configure Connect Component algorithm and Levenshtein Distance method for a clustering solution
- Apply purity on a clustering solution
- Analyze a cluster with Cluster Insight

Advanced Solution Settings for Classification

From the Zurich release, classification solutions offer the following advanced solution settings.

- Config parameters for model config in classification
- Configure include only top N labels
- Minimum records needed for label to include it
- Remove others label
- Use LightGBM algo for classification model training

Configure class recall for a classification solution

Create and apply a class recall parameter to an ML solution prior to training its data. For example, you set and apply this solution parameter to 90% recall for all records in the Email class.

Before you begin

Note: Using advanced settings in your ML solutions is optional. If you choose to implement any of these settings, make sure you're well informed regarding the technology you're enabling in the solution, and that you have a use case that benefits from what the technology offers.

- Create and save a classification solution definition or use an existing one.
- Role required: admin or ml_admin

About this task

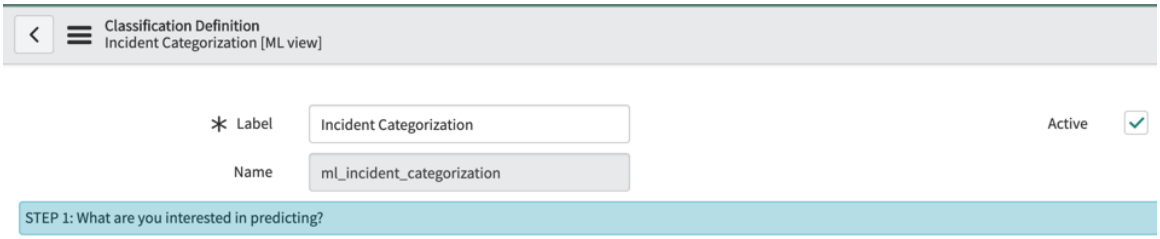
The class recall solution parameter enables you to steer a solution's training to bias a specific class. For example, classifying an incoming email as a Phish or not can be an important use case in a security-related machine learning solution. In this situation, it's very important to identify every Phish, and it may be acceptable to report a non-Phish as a Phish occasionally. However, no actual Phish should be classified as a non-Phish. In such situations, the recall metric must have a high value to minimize false negatives. High recall values might lead to lower percentages for precision and coverage.

You can apply a recall value to one class per solution definition.

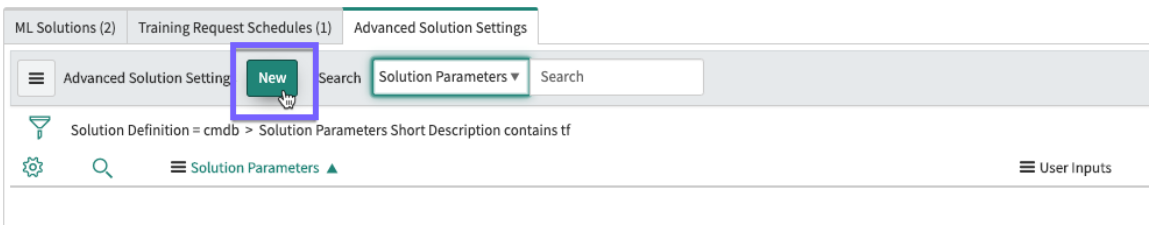
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Predictive Intelligence** > **Classification** > **Solution Definitions**.
2. Open a saved classification solution definition form.
   In this example scenario, you use an Incident Categorization solution definition form that you haven't trained yet.



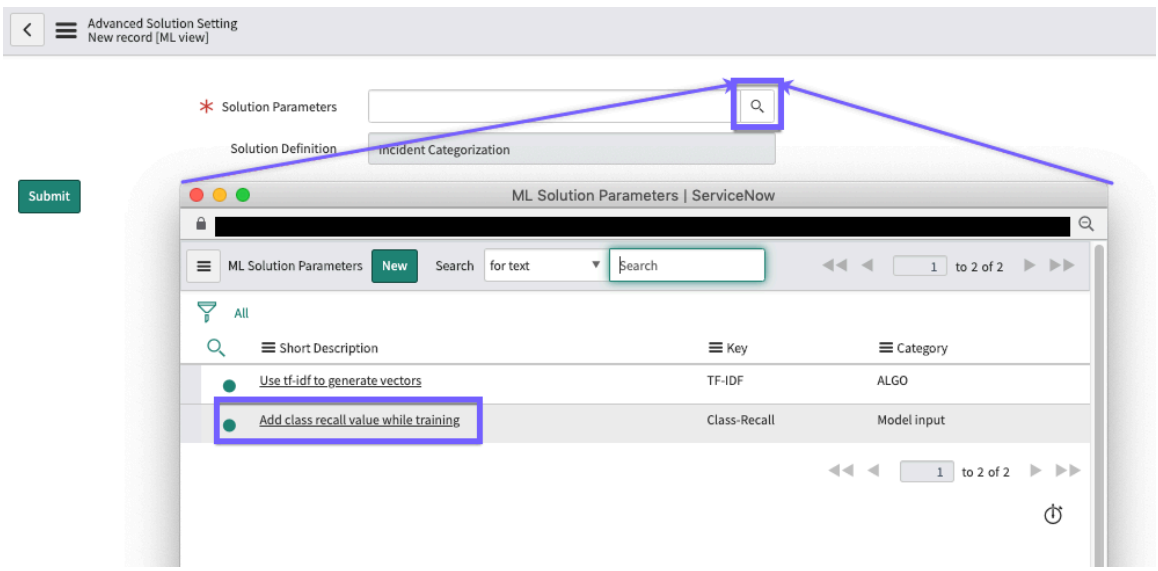
3. On the Advanced Solution Settings tab in the Related Links section of the form, select **New**.



4. Create a parameter record.

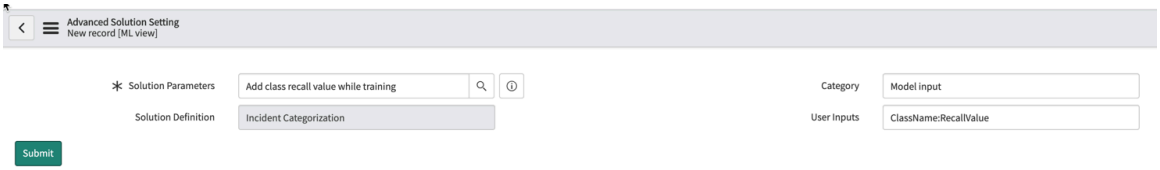
   a. In the **Solution Parameters** field, select the search icon.

   b. In the ML Solution Parameters screen, select **Add class recall value while training**.



The Advanced Solution Setting [ml_advanced_solution_settings] record appears.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

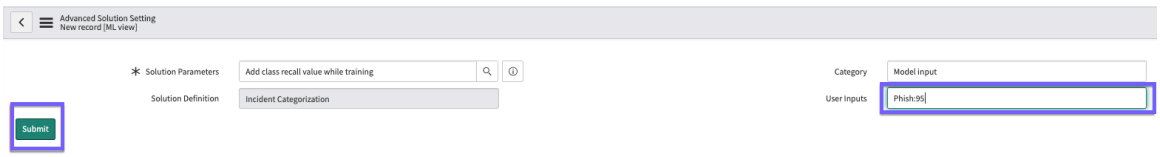


5. Add your values to the **User inputs** field, in the format `ClassName:RecallValue`.

   a. Enter the name of the class for which you want to specify a recall value.
   In this scenario, you enter `Phish` for the **ClassName**.

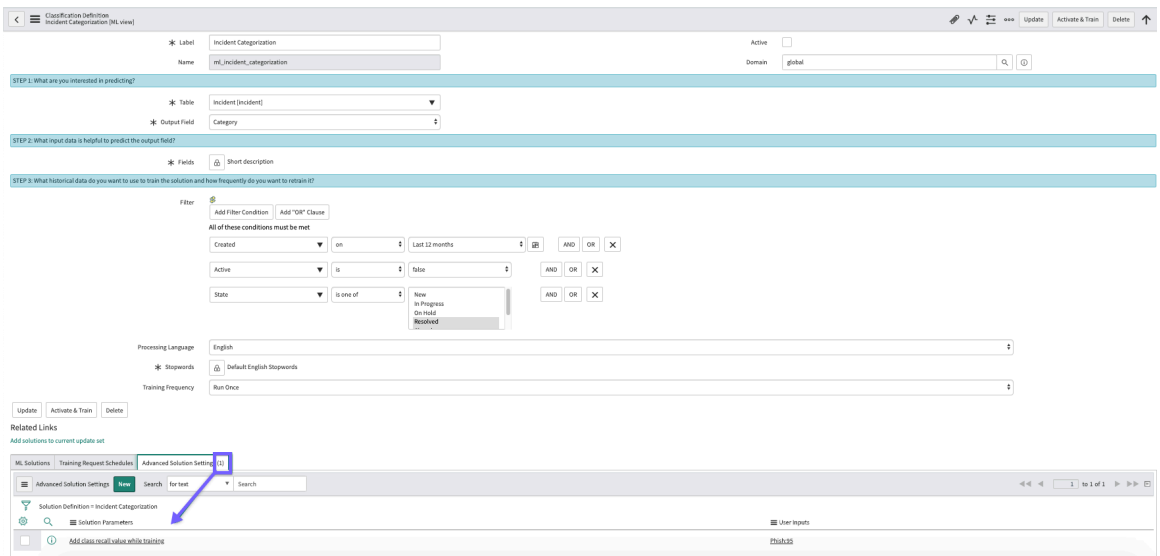
   b. Enter a colon character (:), then the Recall value.
   Enter `95` for the **RecallValue** in the example scenario.

   In other words you're specifying Phish as the target class, and 95 is the Recall percentage you're requesting the system to deliver during solution training (`Phish:95`).



6. Select **Submit**.

   Result: Class recall is configured for your classification solution. Its solution parameter appears on the Advanced Solution Settings tab of your classification solution definition form.



What to do next

Train your saved classification solution so that your updates are incorporated.

Related topics

- Create and train a classification solution
- Configuring target metrics for a trained classification solution
- Configure TF-IDF for solutions

Configure TF-IDF for solutions

Apply Term Frequency–Inverse Document Frequency (TF-IDF) encoding to classification, clustering, or similarity solutions for Predictive Intelligence.

Before you begin

Note: Configuring advanced settings on your ML solutions is optional. If you choose to configure any of these settings, make sure you're well informed regarding the technology you're enabling in the solution, and that you have a use case that benefits from what the technology offers. For more information, see https://www.servicenow.com/community/intelligence-ml-articles/dive-deeper-with-clustering-advanced-parameters/ta-p/2695847.

- Create a classification, clustering, or similarity solution definition or use an existing one.
- Role required: admin or ml_admin

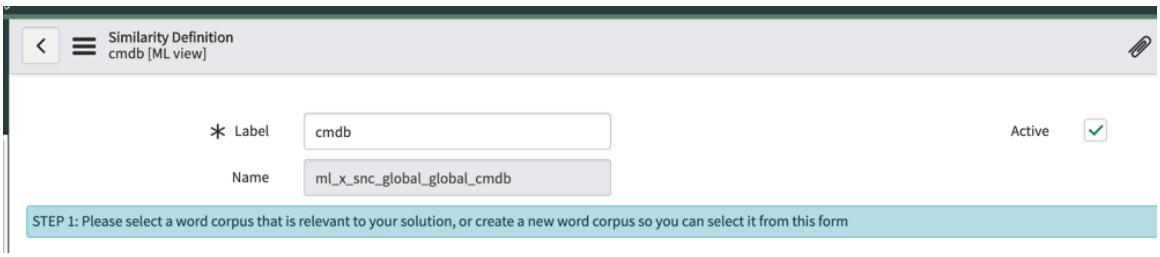
About this task

Predictive Intelligence uses paragraph vector word embedding by default in its classification and similarity frameworks, which is highly effective for processing data comprised of primarily human-readable content. However, TF-IDF might return better prediction results for records that have machine-generated content, such as alerts and error messages for log files. Choose advanced settings that are appropriate for the kind of data your solution is processing.

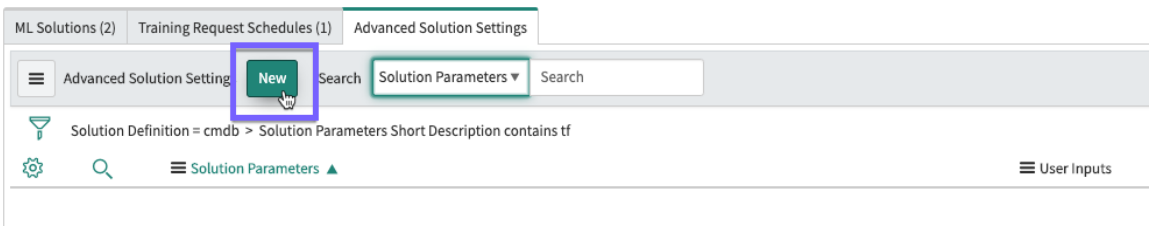
Note: The steps for configuring TF-IDF are the same for all model frameworks, but TF-IDF support for clustering solution definitions is applicable only if you have a Professional subscription.

Procedure

1. Navigate to a **Solution Definition**, such as **All** > **Predictive Intelligence** > **Similarity** > **Solution Definitions**.
2. Open a solution definition form.
   In this example scenario, you use a CMDB similarity definition form.



3. On the Advanced Solution Settings tab in the Related Links section of the form, click **New**.



4. Create a parameter record.
   a. In the **Solution Parameters** field, click the search icon.
   b. In the ML Solution Parameters screen, select **Use tf-idf to generate vectors**.

Configure XGBoost for classification or regression solutions

Apply XGBoost encoding to optimize the training for your classification or regression solutions.

Before you begin

- Create a classification solution definition or use an existing one.
- Create a regression solution definition or use an existing one.
- Role required: admin or ml_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

XGBoost is an optional gradient boosting framework that uses multiple decision trees and supports both Paragraph Vector-based text and TF-IDF distance-based text. LogR is the default distance-based model algorithm.

From the Brazil release, Test time explainability is available when using xgboost in Classification solutions.

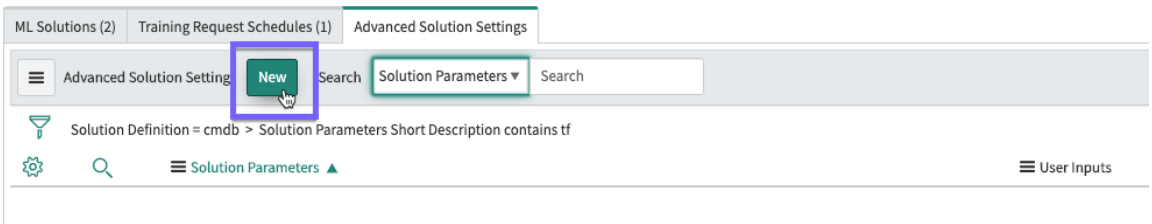
Configuring advanced settings on your ML solutions is optional. If you choose to configure any of these settings, make sure you're well informed regarding the technology you're enabling in the solution. Also make sure you have a use case that benefits from what the technology offers.

In this example scenario, you apply XGBoost to both a classification solution and a regression solution.

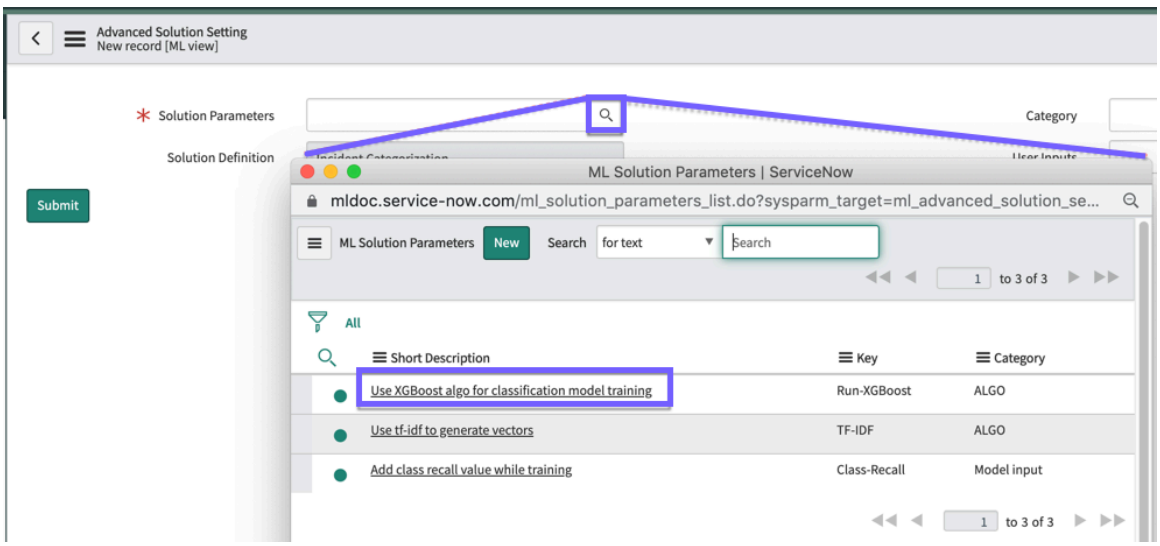
Note: The regression framework is deprecated in the Brazil release. You can continue to use existing regression solutions but you can't initiate new ones.

Procedure

1. Navigate to **All** > **Predictive Intelligence** > **Classification** > **Solution Definitions**.
2. Open a classification solution definition form.
3. On the Advanced Solution Settings tab in the Related Links section of the form, select **New**.



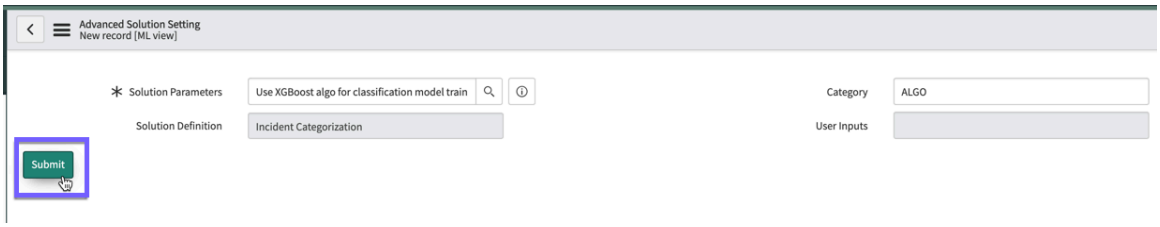
4. Create a parameter record.
   a. In the **Solution Parameters** field, select the search icon.
   b. In the ML Solution Parameters screen, select **Use XGBoost algo for classification model training**.



5. Select **Submit**.

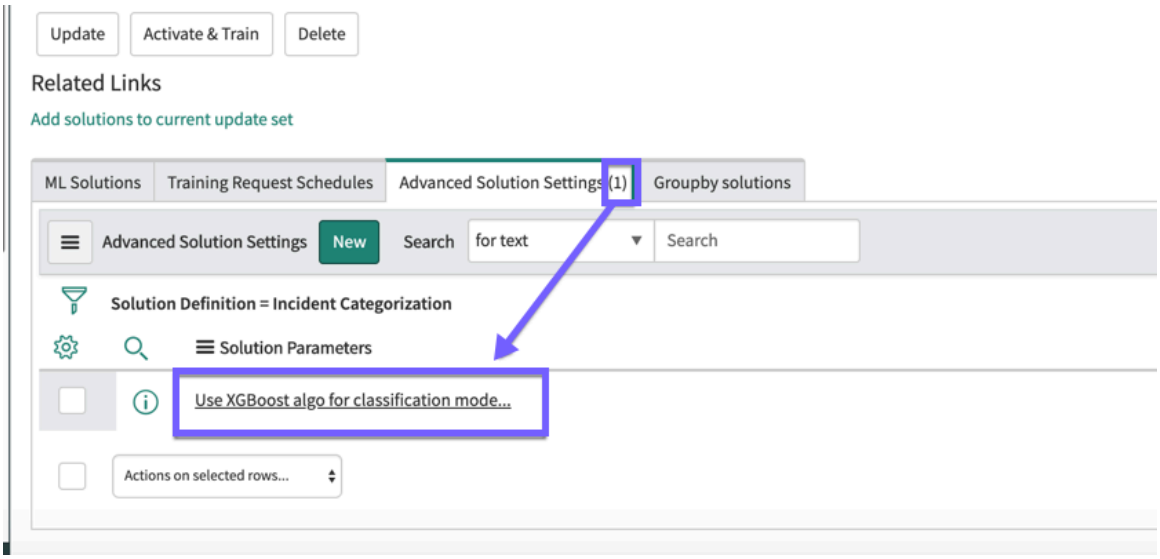
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Advanced Solution Setting record screen refreshes.



6. Select **Submit**.

Result: XGBoost is configured for your classification solution. Its solution parameter appears on the Advanced Solution Settings tab of your classification definition form.



Note: Follow the steps below if you want to configure XGBoost on a regression solution.

7. Navigate to **Predictive Intelligence** > **Regression** > **Solution Definitions** (available only if you had created a regression solution before the regression framework was deprecated).
8. In this second scenario, you open a regression solution definition form.
9. Repeat the steps from the previous classification solution example, except this time you're using a regression solution.
10. Select **Submit**.

Result:

XGBoost is configured for your regression solution. Its solution parameter appears on the Advanced Solution Settings tab of your regression solution definition form.

Configure DBSCAN for a clustering solution

Consider applying the Density Based Spatial Clustering of Applications with Noise (DBSCAN) algorithm to your clustering solution. DBSCAN is available as an alternative to the default clustering algorithm, k-means.

Before you begin

Note: Configuring advanced settings on your ML solutions is optional. If you choose to configure any of these settings, make sure you're well informed regarding the technology you're enabling in the solution, and that your use case benefits from what the technology offers. For more information, see the Dive deeper with Clustering Advanced Parameters article on ServiceNow Community.

- Create a clustering solution definition or use an existing one.
- Role required: admin or ml_admin

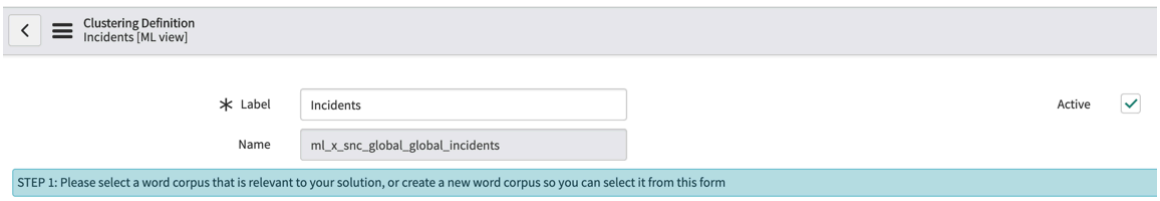
About this task

Predictive Intelligence uses the k-means algorithm by default in its clustering framework. DBSCAN is another clustering algorithm that's also used in data mining and machine learning. Some users prefer DBSCAN as it doesn't require you to specify the number of clusters in the data before clustering. For a summary of the pros and cons for each algorithm, see this conversation and this article.

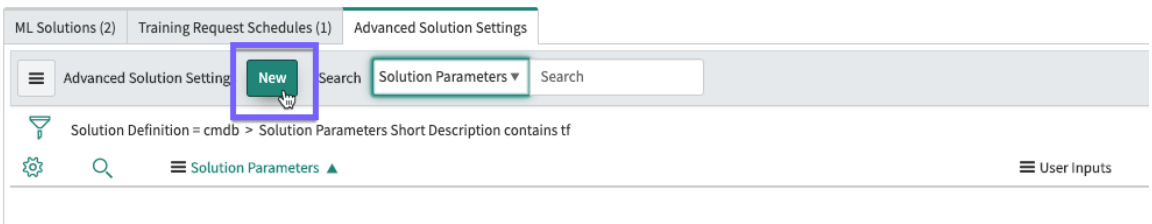
In this example scenario, you apply DBSCAN to a clustering solution.

Procedure

1. Navigate to **All** > **Predictive Intelligence** > **Clustering** > **Solution Definitions**.
2. Open a clustering solution definition form.
   In this example scenario, you use an Incidents clustering solution definition form.



3. On the Advanced Solution Settings tab in the Related Links section of the form, select **Solution Parameters** from the picker, then click **New**.

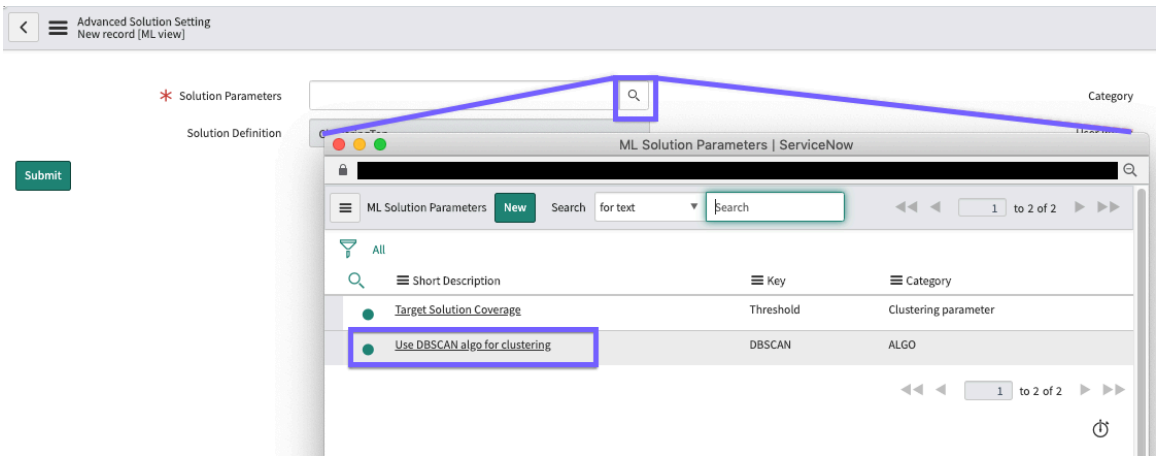


4. Create a parameter record.

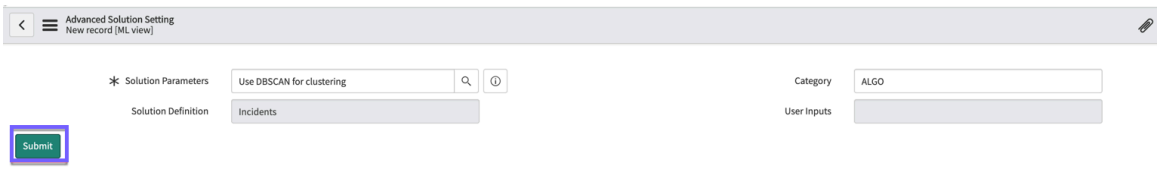
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the **Solution Parameters** field, select the search icon.

b. In the ML Solution Parameters screen, select **Use DBSCAN algo for clustering**.



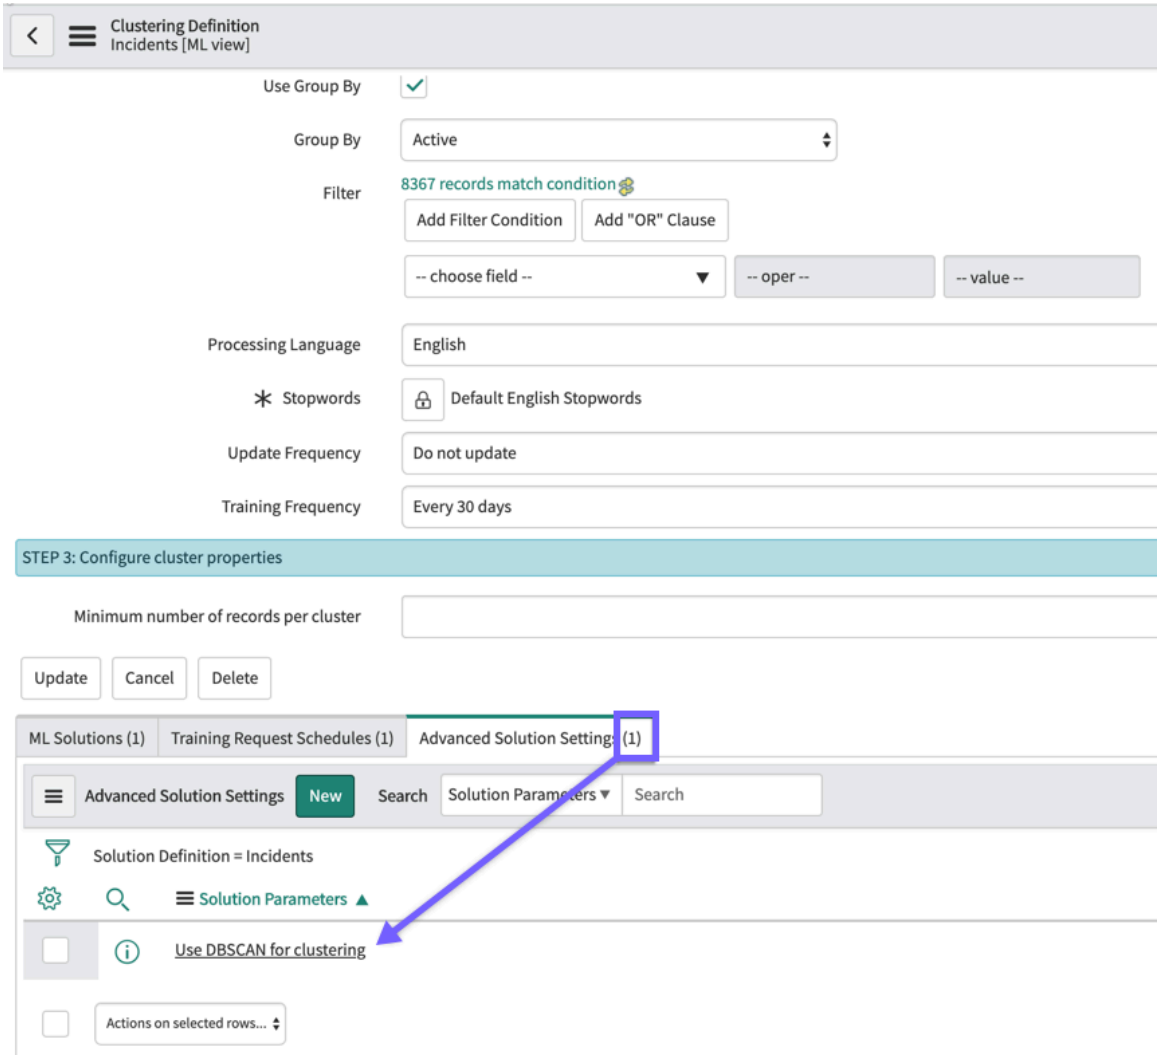
5. Select **Submit**.
The Advanced Solution Setting record appears. The field **User Inputs** is grayed out because it does not apply to this algorithm.



6. Select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result: DBSCAN is configured for your clustering solution. Its solution parameter appears on the Advanced Solution Settings tab of your clustering solution definition form.



Related topics

Create and train a clustering solution

Configure HDBSCAN for a clustering solution

Consider applying the Hierarchical Density Based Spatial Clustering of Applications with Noise (HDBSCAN) algorithm to your clustering solution. HDBSCAN is available as an alternative to the default clustering algorithm, k-means.

Before you begin

Note: Configuring advanced settings on your ML solutions is optional. If you choose to configure any of these settings, make sure you're well informed regarding the technology you're enabling in the solution, and that your use case benefits from what the technology offers. For more information, see the Dive deeper with Clustering Advanced Parameters article on ServiceNow Community.

- Create a clustering solution definition or use an existing one.
- Role required: admin or ml_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

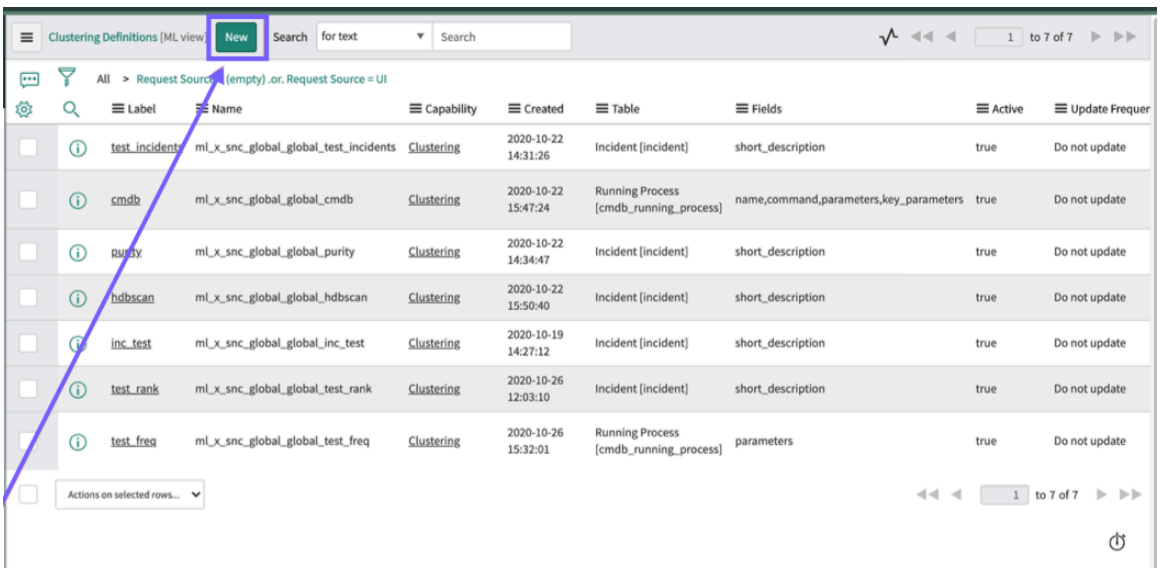
You can apply the HDBSCAN algorithm to help the system identify data samples that aren't assigned to any cluster. For example, you can apply HDBSCAN to support Topic Discovery.

Predictive Intelligence implements the k-means algorithm by default in its clustering framework. HDBSCAN is similar to the DBSCAN clustering algorithm except that it works with minimum-sized clusters and can help deliver more stable and persistent clusters. For a summary of how HDBSCAN works, see this article. For a comparison between DBSCAN and HDBSCAN, see this article and this article.

Note: Clustering solutions trained with HDBSCAN do not support cluster updates. Updates on these solutions fail and the solutions are not logged in the ml_cluster_detail_table. Use DBSCAN or k-means training methods if you want to enable cluster updates.

Procedure

1. Navigate to **All** > **Predictive Intelligence** > **Clustering** > **Solution Definitions**.



2. Select **New**.
3. Create a new clustering solution definition form or use an existing one.
   In this example scenario, you create the hdbscan-sf clustering definition form as in the image below. Configure the fields as follows:
   - **Label**: `hdbscan-sf`
   - **Word Corpus**: `incident_wc`, or any other word corpus that has incident record data (from the Washington DC release, a word corpus is not needed, so this field does not appear).
   - **Table**: Incident [incident]
   - **Fields**: Short description
   - **Update Frequency**: Do not update
   - **Stopwords**: Default English Stopwords
   - **Training Frequency**: Every 30 days
   - **Processing Language**: English

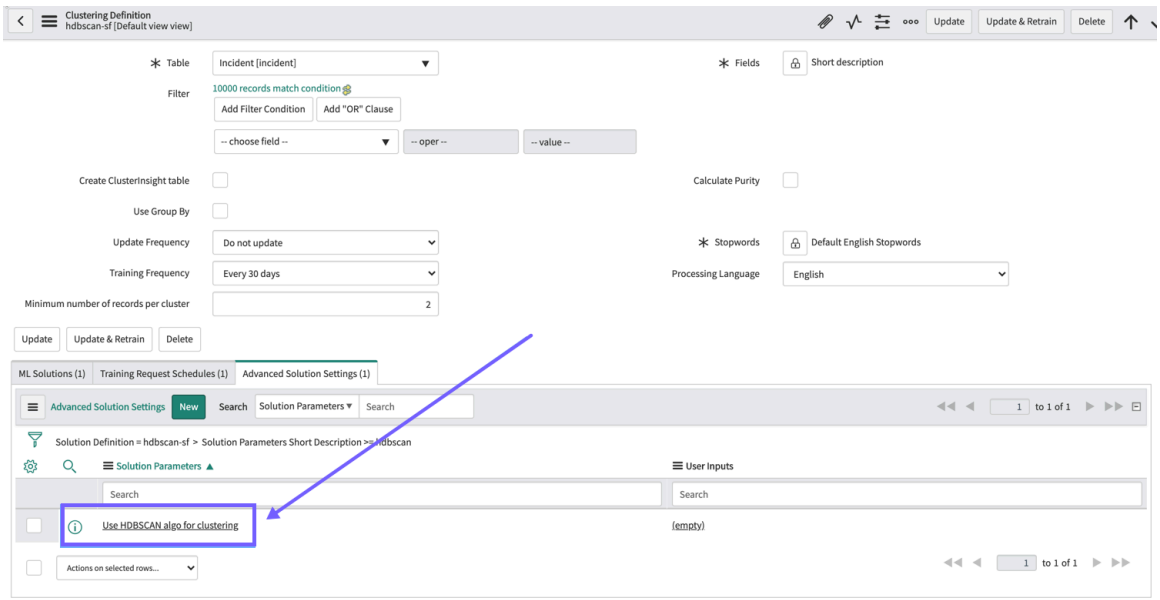
Result: HDBSCAN is configured for your clustering solution. Its solution parameter appears on the Advanced Solution Settings tab of your clustering solution definition form.



Related topics

Create and train a clustering solution

Configure Connect Component algorithm and Levenshtein Distance method for a clustering solution

Apply Configure Connect Component and Levenshtein Distance method encoding to optimize the training for your clustering solutions.

Before you begin

Role required: admin or ml_admin

Note: Configuring advanced settings on your ML solutions is optional. If you choose to configure any of these settings, make sure you're well informed regarding the technology you're enabling in the solution, and that your use case benefits from what the technology offers. For more information, see the Dive deeper with Clustering Advanced Parameters article on ServiceNow Community.

- Create and train a clustering solution definition or use an existing one.
- Role required: admin or ml_admin

About this task

When training clustering solutions, you have the following three options.

- Use the default k-means algorithm.
- Use the optional DBSCAN solution parameter with the Euclidean distance method as a metric.
- Use the optional DBSCAN, Minimum Neighbors, and Levenshtein Distance solution parameters. Connect Component is enabled by DBSCAN and Minimum Neighbors, and supports both Paragraph Vector-based text and Levenshtein Distance-based text. If you train your solution using the Levenshtein Distance method, you don't need to use a word corpus in your clustering solution.

Create and train a clustering solution

Config parameters for model config in classification

Customize the training behavior of your classification solution by passing in a dictionary of parameters in JSON format.

Before you begin

Role required: ml_admin or admin

About this task

You can fine-tune model performance by passing in a dictionary of parameters to adjust training behavior.

Understand the machine learning hyperparameters relevant to your model objective. This option is advanced and should be modified with care.

You can add these parameters in the solution definition form by using the following procedure.

Alternatively, you can use a script to add these parameters. For the format to use when scripting, see the **What to do next** section of this page.

Procedure

1. Navigate to **All** > *Predictive Intelligence* > **Classification** > **Solution Definitions**.
2. Open an existing classification solution or create a new one.
3. Select the **Advanced Solution Settings** tab in the **Related Links** section of the form.
4. Select **New** to open the **Advanced Solution Setting** (ml_advanced_solution_settings) form.
5. In the **Solution Parameters** field, search for `Config parameters for model config in classification`.
6. In the **User Inputs** field, enter the following key-value pairs, after editing the values per your requirements.

> **Note:** When pasting the parameters into the solution definition form, don't include JSON's enclosing label, braces, or parentheses. Enter the key-value pairs in the format shown here, after editing the values according to your requirements.

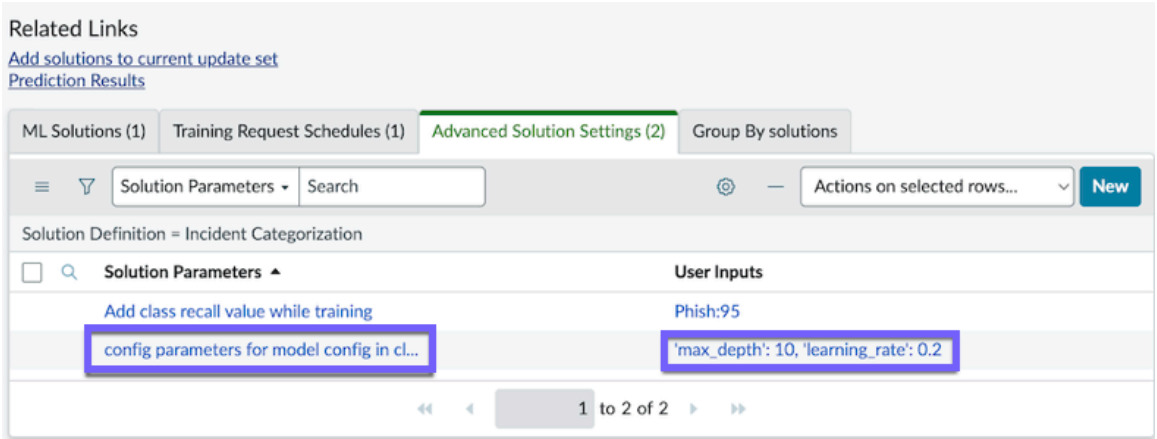
 1,'colsample_bynode': 1,'min_child_weight': 1.25,'n_jobs':
 11,'validate_parameters': true
```

7. Select **Submit** to update the solution definition.

Result

The setting appears as a row on the **Advanced Solution Setting** tab on your solution's form.



What to do next

Retrain your solution.

You can also pass in this dictionary with a script. Be sure to use the enclosing label, braces, and parentheses when scripting.

Script example:

```
config.setModelParams({
                    'max_depth': 10,
                    'learning_rate': 0.1,
                    'objective': 'multi:softprob',
                    'num_class': 11,
                    'random_state': 10,
                    'eval_metric': 'mlogloss',
                    'booster': 'gbtree',
                    'n_estimators': 150,
                    'verbosity': 1,
                    'use_label_encoder': false,
                    'tree_method': 'hist',
                    'num_parallel_tree': 1,
                    'gamma': 0.25,
                    'subsample': 0.8,
                    'max_delta_step': 5,
                    'reg_alpha': 0,
                    'reg_lambda': 1,
                    'colsample_bytree': 0.8,
```

Using Machine Learning APIs

Create and train a classification solution

Use LightGBM algo for classification model training

Enable the LightGBM (Light Gradient-Boosting Machine) algorithm as an advanced option for training classification models.

Before you begin

Role required: ml_admin or admin

About this task

The LightGBM algorithm offers performance and efficiency for large datasets. For detailed information about this algorithm see https://lightgbm.readthedocs.io.

Use the following procedure to add this option in the solution definition form. Alternatively, you can use a script to add this algorithm.

To add this option using a script:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

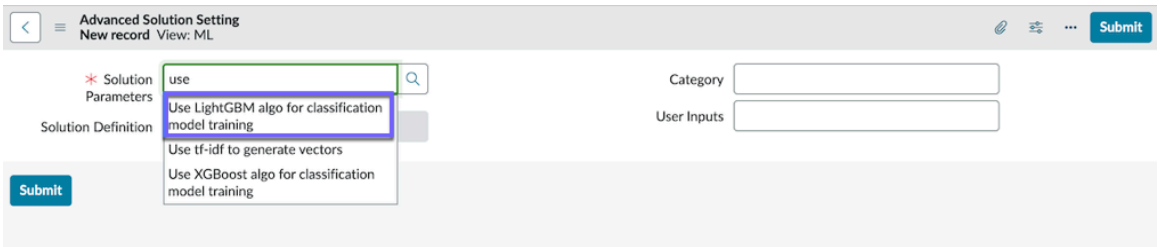
```
var config = new MLPredictorConfig('ml_solution_ID');
                    config.useLightGBM();
                    config.updateConfig();
```

In JSON format:

```
{
    "use_lightgbm": true
    }
```

Procedure

1. Navigate to **All** > *Predictive Intelligence* > **Classification** > **Solution Definitions**.
2. Open an existing classification solution or create a new one.
3. Select the **Advanced Solution Settings** tab in the **Related Links** section of the form.
4. Select **New** to open the **Advanced Solution Setting** (ml_advanced_solution_settings) form.
5. In the **Solution Parameters** field, search for `Use LightGBM algo for classification model training`.
6. Leave the **User Inputs** field blank, and select **Submit**.



Result
The setting appears as a row on the **Advanced Solution Setting** tab on your solution's form.

What to do next
Retrain your solution.

Create and train a classification solution

Minimum records needed for label to include it

Set a threshold for the minimum number of records a label must have in your dataset to be included in model training.

Before you begin
Verify that your dataset includes label values suitable for classification.

Role required: ml_admin or admin

About this task
This advanced option helps to eliminate labels that occur infrequently. Setting this minimum threshold can reduce overfitting and unreliable predictions.

To configure, you provide a number for a minimum count of records. Any class value with fewer records than the minimum is dropped from the training set. Class values that are dropped before training can't appear in predictions.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To add this option using a script:

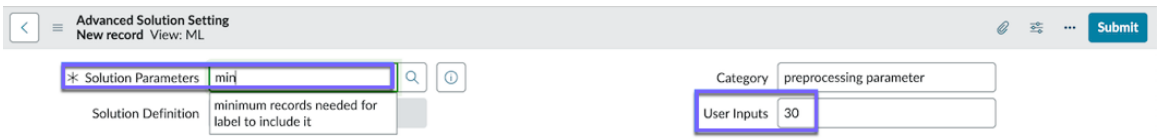
```
config.setMinLabelCount(50);
```

In JSON format:

```
{
    "min_label_count": 50
    }
```

Procedure

1. To add this option in the solution definition form, navigate to **All** > *Predictive Intelligence* > **Classification** > **Solution Definitions**.
2. Open an existing classification solution or create a new one.
3. Select the **Advanced Solution Settings** tab in the **Related Links** section of the form.
4. Select **New** to open the **Advanced Solution Setting** (ml_advanced_solution_settings) form.
5. In the **Solution Parameters** field, search for `minimum records needed for label to include it`.
6. In the **User Inputs** field, enter the number of records you want as the minimum, then select **Submit**.



Result
The setting appears as a row on the **Advanced Solution Setting** tab on your solution's form.

What to do next
Retrain your solution.

Configure include only top N labels

Limit your classification model to use only the most common classes when training. You can specify the number of classes to use.

Before you begin
Role required: ml_admin or admin

About this task
Restricting the model to a fixed number of the most frequent labels improves focus and performance, especially with large datasets.

You can add this option in the solution definition form by using the following procedure. Alternatively, you can use a script to add this option.

To add this option using a script:

```
config.setTopNLabels(100);
```

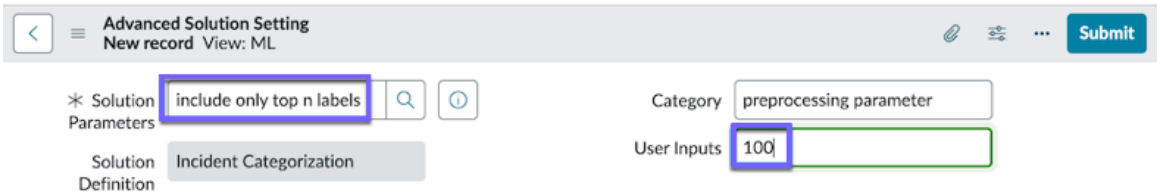
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In JSON format:

```
{
    "include_top_n_labels": 100
    }
```

Procedure

1. To add this option in the solution definition form, navigate to **All** > *Predictive Intelligence* > **Classification** > **Solution Definitions**.
2. Open an existing classification solution or create a new one.
3. Select the **Advanced Solution Settings** tab in the **Related Links** section of the form.
4. Select **New** to open the **Advanced Solution Setting** (ml_advanced_solution_settings) form.
5. In the **Solution Parameters** field, search for `include only top n labels`.
6. In the **User Inputs** field, enter the number of classes you want as the limit, then select **Submit**.



Result
The setting appears as a row on the **Advanced Solution Setting** tab on your solution's form.

What to do next
Retrain your solution.

Create and train a classification solution

Remove others label

Reduce noise in your classification model and enhance predictive accuracy by removing records with the label "others" from training data. These are records with a distribution frequency of under one percent.

Before you begin
Role required: ml_admin or admin

About this task
When this option is set to true, records under 1% of total data distribution are excluded from training. These records are labeled "others" in the interface. The 1% threshold can't be modified.

You can add this option in the solution definition form by using the following procedure. Alternatively, you can use a script to add this option.

To add this option using a script:

```
config.removeOthersLabel(true);
```

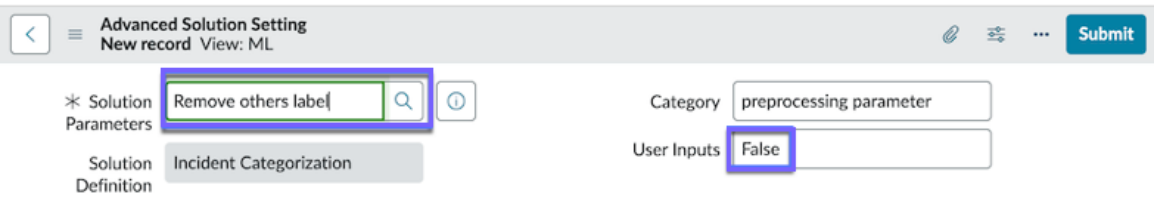
In JSON format:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
{
    "remove_others_label": true
    }
```

Procedure

1. To add this option in the solution definition form, navigate to **All** > *Predictive Intelligence* > **Classification** > **Solution Definitions**.
2. Open an existing classification solution or create a new one.
3. Select the **Advanced Solution Settings** tab in the **Related Links** section of the form.
4. Select **New** to open the **Advanced Solution Setting** (ml_advanced_solution_settings) form.
5. In the **Solution Parameters** field, search for `Remove others label`, then select **Submit** to save your update.



Result

The setting appears as a row on the **Advanced Solution Setting** tab on your solution's form.

What to do next

Retrain your solution.

Related topics

Using Machine Learning APIs

Create and train a classification solution

Creating and training solutions

Use one of the Predictive Intelligence (PI) frameworks to create and train machine-learning solutions. Each framework delivers a different solution type for training the system to predict, recommend, and organize data outcomes.

Types of solutions

The three PI frameworks provide different solutions that can be invoked by any application through a prediction API to make a prediction. Create and train your own solutions using your previous data. Navigate to **All** > **Predictive Intelligence** > **Homepage** to view and create solutions.

Select the best framework for your desired prediction:

- Classification solutions:

  Sets field values during record creation to automatically categorize and route work based on past records. See Create and train a classification solution.

- Similarity solutions:

  Identifies similarities between new and existing records to recommend resolutions. See Create and train a similarity solution.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Clustering solutions:

  Groups similar records into clusters to identify patterns and major incidents. See Create and train a clustering solution.

- Regression solutions:

  Note: From the Washington DC release, support for creating new regression solutions was removed. You can still edit and train existing regression solutions, but you won't be able to initiate new ones.

  Uses historic data to predict numeric outputs, such as estimating the time it takes to resolve an incident or case. See Create and train a regression solution.

Selecting data records for training your solution

A solution is only as good as the record data you use to train it. In general, a good training dataset has these characteristics.

- The solution definition input fields are available to users when creating records. To make predictions at record creation, the solution must have the input field values at record creation.
- The solution definition output field is a choice field. To make more accurate predictions, limit the output field to a finite set of possible values.
- The training records only contain correct values for the output field. To make more accurate predictions, filter out any records that have unreliable output field values. For example, if recently closed incidents are subject to review and change for a month, filter out any recently closed incidents.
- The training records contain multiple examples of each output field value that you want the solution to predict. To provide more record coverage, include multiple examples of each output field value.
- The training records include common variations of the input fields. To provide more record coverage, include multiple examples of input field values.

Exporting your solution for training

To train a solution, you export its solution definition and associated records to a centralized training server within the same datacenter. When the training completes, the training server exports the solution back to your instance and deletes all of your training data from the server. Each datacenter has its own dedicated training server and the data doesn't leave the datacenter. Confirm that your configuration aligns with your compliance requirements.

Predictions occur on a centralized prediction server within the same datacenter as the instance. The trained model artifacts are sent from the instance server to the prediction server when the prediction is invoked for the first time. After that, the trained model artifacts are cached on the prediction server for subsequent predictions.

Note: All communication between the instance and the training service occurs within the same datacenter firewall. Even so, all communications occur over HTTPS.

Solution training troubleshooting

For troubleshooting common training issues, see the Predictive Intelligence Common issues [KB781893] article in the Now Support Knowledge Base.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create and train a classification solution

Specify the records used to train a classification solution, what fields trigger a prediction, and how often you want to retrain your solution.

Before you begin

- Create a custom stopwords list if needed.
- Role required: admin or ml_admin

Important: In the Brazil release, models in the classification, clustering, and similarity frameworks use Workflow solutions. These are pre-trained, so a word corpus isn't needed for your new solutions. When your existing solutions with a word corpus are re-trained after upgrading, they become Workflow solutions, and the Word Corpus field is removed from the form.

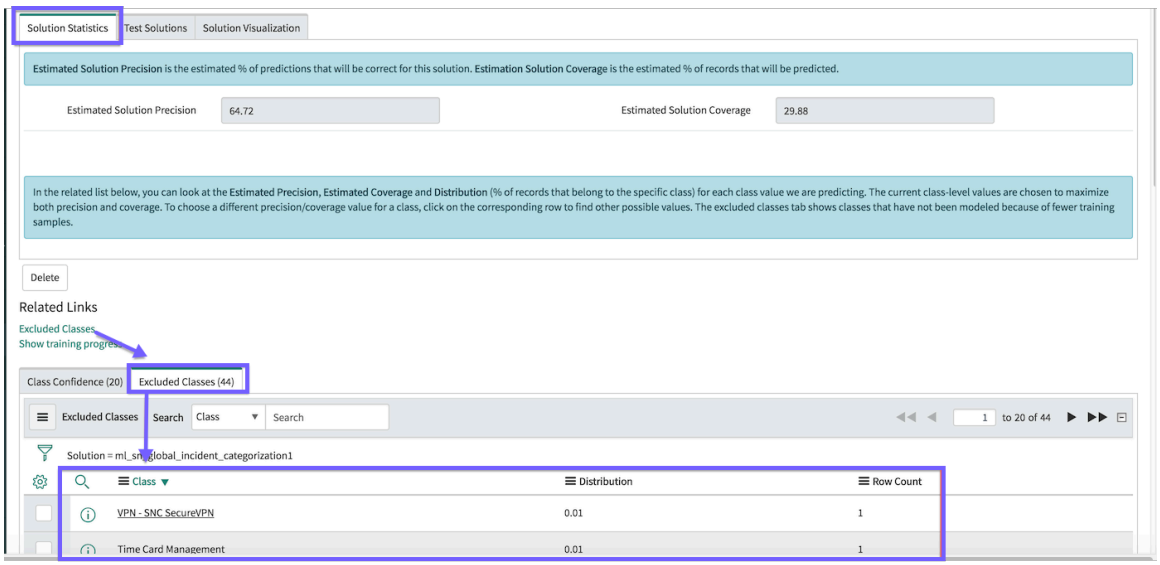
About this task

A predictive model is only as good as the data that you use to train it. To select appropriate records for training, examine the table's database dictionary as well as the current quality of the record values that you want to use.

For information on using encrypted training data, see Data Encryption in Predictive Intelligence.

For information about the minimum and maximum number of records you can use for training, see Predictive Intelligence properties.

Note: Classes that have fewer than 30 records in your training dataset are excluded from solution training. When your solution is trained and complete, any excluded classes are listed in the Solution Statistics section of your ML Solution form.



You must create a separate solution definition for each predictive model you want to support. The following procedure explains how to create a new classification solution, but you can also copy an existing solution definition and its configuration into a new record by selecting **Copy Solution Definition** from the context menu. Edit the field values on the new record as needed.

From the Yokohama release, you can also create a Workflow Classification solution using a script if you want to include an analysis of the key features influencing the model's predictions. For more information see Model Explainability.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Ensure that you are in the application scope you want for your solution definition, then navigate to **All** > **Predictive Intelligence** > **Classification** > **Solution Definitions**.
2. On the Classification Definitions list, select **New**.
3. On the empty Classification Definition form, configure the fields according to the following guidance.

Field	Value
Label	Enter a unique name for the solution record.
Name	The system generates the value of this read-only field based on the Label value that you entered.
Word Corpus	Select a word corpus that's relevant to your solution. For more information, see Create a word corpus. **Note:** Word Corpus is not a required field for customers implementing Predictive Intelligence for the first time starting in Utah. A pre-trained model is used instead. The Word Corpus field is removed for pre-trained models.
Table	Select the table containing the target records that you want the system to predict.
Output Field	Select the field whose value you want the predictive model to set. In general, a good output field has these characteristics. ○ It's a choice field or a string field with a finite set of possible values. ○ It has some causal connection to the input fields. For example, on the default **Incident Categorization** solution definition, the output field is set to **Category**.
Fields	Select the input fields that you want the solution to use to generate a prediction. Input fields are fields within a record that may contain the classification information your prediction solution needs to succeed. For example, if you're predicting the correct class for triaging an incident record, the prediction should gather records containing text that references the class. Most records have contextual text in their **Short description** field, so it's a great input field to use in general. You could also use **Resolution notes** as an input field, as it too might reference the incident class in the detailed notes for the incident. In general, good input fields have these characteristics. ○ The fields are available to users when creating records. ○ The field data type can be string, reference, choice, or HTML. The more information that a field provides, the more often a solution can make a prediction, and the more often predictions are accurate. ○ The field has a default value and should not be blank.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
	All default solution definitions use the **Short description** field.
Filter	Click **Add Filter Condition** to apply conditions to the records you're training. For example, the **Incident Categorization** solution definition uses a filter with these conditions: **[Created][on][Last 12 months] AND [Active][is][false] AND [State][is one of][Resolved | Closed]** To train a solution, the filter must return at least one record. If your filter returns no records, update it until it returns records for training. **Note:** The recommended number of records for training a good solution is from 30,000 through 300,000. If you submit more than 300,000 records, the most recent 300,000 records are used to train the solution. Use only authentic records from the database. In general, a good filter has these characteristics. ○ The training records are inactive and their states indicate work completed within your standard process, such as resolved or closed. ○ The target fields contain only correct values. Filter out records with unreliable target field values. For example, if you're predicting the assignment group/ category and your historic incident data contains assignment groups/ categories that are no longer used, add a filter to remove such records from the training. ○ The training records contain multiple examples of each target field value you want the solution to predict. ○ The training records include common variations of the input fields. Use relative date filters such as last 3 months or last 12 months. Don't use hard-coded dates because these filters aren't updated when the solutions are retrained, unless you update them manually.
Processing Language	Select the dominant language of the dataset that you're training on the solution definition. If the dataset language is Italian, choose `Italian`. Also, English processing is applied to all datasets by default. For example, if you select Italian, the system processes the data in both English and Italian. **Note:** The term processing indicates some of the language-specific steps used as part of training a solution. For example, tokenizing words, removing stop words, and stemming.
Stopwords	When you select your processing language, the system automatically adds a Stopwords list for that language. For example, if your processing language is Italian, the **Default Italian Stopwords** list appears. The **Default English Stopwords** list is also included. If you create a custom stopwords list, you can select it from the Stopwords field to add to your solution.
Training Frequency	Select how often the system regenerates the solution. The available options range from **Run once** up to **Every 180 days**. **Note:** The minimum number of records required for classification solution training is set at 10,000.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
	By default, the system runs training once. This provides you time to review and update the solution definition until it provides acceptable coverage and precision values. When your solution definition is fairly stable, consider scheduled trainings, as data can age over time, thus degrading the accuracy of your prediction model. **Note:** The ML scheduler limits the number of trainings an instance can commit to 50 new ML training requests per instance within a 24-hour window. This limit excludes scheduled retraining requests, clustering updates, and similarity updates, even if the new training requests exceed 50 within a 24-hour window.

4. Click the appropriate context menu option or button for your solution definition.

Option	Description
Save or Save & Train	Save your solution definition record so you can return to it later, or save and submit it for training.
Submit or Submit & Train	Create your solution definition record and submit it, or submit and train it.

5. If you submitted the solution for training, click **OK** on the **Training Activation** window to confirm.

   - The system schedules the solution for training with the nearest training service. The system sends you a notification when the training completes, including any errors that may have occurred in the training. Other users can subscribe to the Predictive Intelligence Notifications category. When training completes, the system uploads the solution as an Attachment record.
   - A bubble chart populates the Solution Visualization tab of your solution form, showing the estimated precision and coverage for each of the classes covered by the solution. The

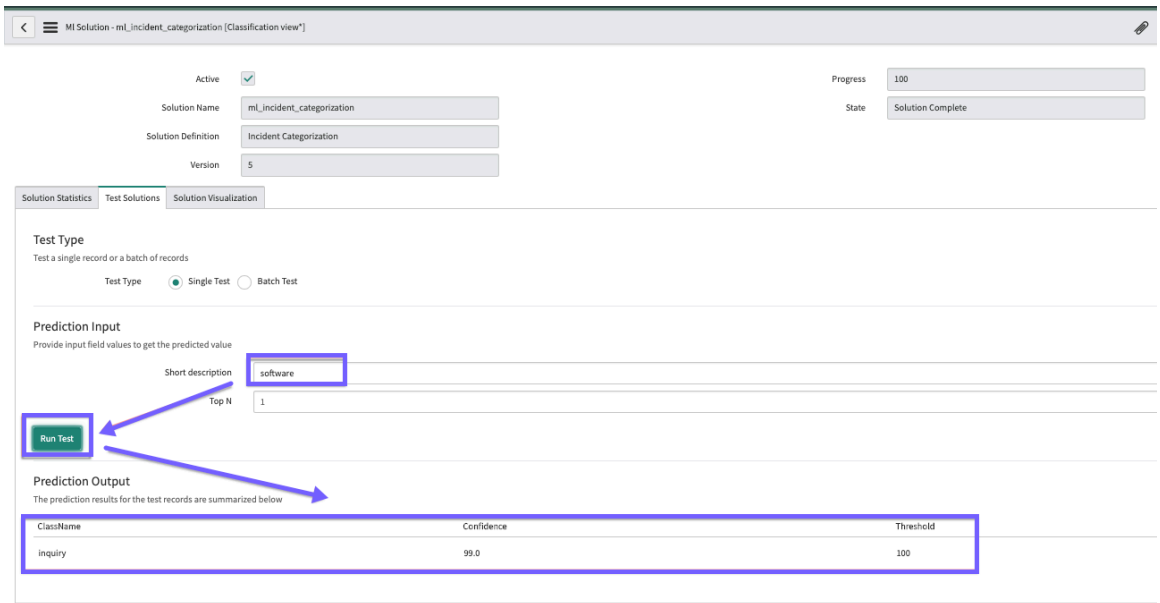
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

size of the bubble indicates the percent of records (distribution) that belong to the class. When you point to a bubble, you can see its estimated coverage, estimated precision, and distribution.

What to do next

In the Class Confidence section of the Solution Statistics tab in your solution, review the trained solution precision and coverage statistics.

In the Test Solutions tab in your solution, you can test the prediction output by entering values from the input fields, such as the Short Description.



Exclude a class from prediction

Exclude a class from prediction if its precision or coverage aren't satisfactory. Excluding a class prevents the classification model from predicting a particular output field value.

Before you begin

- Train the solution definition whose output field values you want to exclude.
- Role required: admin or ml_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
As part of the testing and refinement of your classification solution, you can try excluding an output class to check the effect on the model's results.

Excluding a class from prediction is temporary. The class is restored the next time you train your solution, as long as the solution definition remains the same. If your precision or coverage targets are still not met, consider deactivating the solution or changing the solution definition.

Typically, you exclude a class from prediction if you want a person to manually set the excluded class value. For example, exclude a particular incident category when the solution doesn't offer sufficient precision or coverage, or because the class triggers other business logic that requires review or approval.

Procedure
1. Navigate to **All** > **Predictive Intelligence** > **Classification** > **Solutions**.
2. In the ML Solutions list, select the solution whose classes you want to exclude.
   This solution must have a **State** of **Solution Complete**.
3. In the **Class Confidence** related list, select the class you want to exclude.
4. In the Class Confidence record, review the precision and coverage combinations available from the **Precision Coverage Lookups** embedded list.
5. Select the check box for the 100 precision and 0 coverage combination.

   You can select only one check box.

6. From the Actions on selected rows control, select **Apply Values**.
   The system shows a **Precision / Coverage Setting** confirmation window.
7. Click **OK** to confirm the change or **Cancel** to discard it.

Result
The solution excludes the class from all predictions until the next training cycle.

What to do next
If you conclude that this class does not contribute to meaningful predictions, consider deactivating the solution or changing the solution definition.

Exclude a class from solution training

Exclude a class from solution training to prevent the model from ever making predictions for a particular output field class. For example, you can exclude a particular incident category from training if you plan to retire or change the category.

Before you begin
Role required: admin or ml_admin

About this task
Excluding a class from training doesn't prevent the solution from making predictions for records that use the excluded class. Solution training still uses the input and output field values as data and attempts to match input field values to a new output field class. This attempt may cause undesirable prediction results unless you have another suitable class to replace the excluded class value.

Typically, you only exclude a class from training if you change the list of valid output field values. For example, if you replaced one incident category with another incident category, you may exclude the old category from training so that the solution only uses the new category for predictions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If you specify a target recall for a class, don't exclude the class from training even if the number of records are less than 30 for that class.

Procedure

1. Navigate to **All** > **Predictive Intelligence** > **Classification** > **Solution Definitions**.
   The system shows the current list of solution definitions.
2. Select the solution definition you want to edit.

   Example
   For example, select **Incident Categorization** to exclude an incident category from training.
3. Edit the filter to exclude the class.
   You can use the **[is one of]** or **[is not one of]** operators to exclude a particular class.

   Example

   For example, if you want to exclude the Hardware class, add this condition: **[Category] [is not one of] [Hardware]**.
4. Click **Update & Train**.
   The system schedules the solution for training with the nearest training service. When training is complete, the system uploads the solution as an Attachment record.

Result
The solution excludes the class from all predictions.

What to do next
Review the trained solution precision and coverage statistics.

Tune a trained classification solution

Tune the performance of a trained classification solution by configuring class level precision and coverage values.

Before you begin

- Train the solution definition whose output field values you want to configure.
- Role required: admin or ml_admin

About this task
The system creates a class record for each output field value that it can predict. Each class record includes a list of possible precision and coverage combinations to choose from. By default, solutions use the highest combination of precision and coverage available. You can select another combination to refine predictions based on acceptable precision and coverage values.

Procedure

1. Navigate to **All** > **Predictive Intelligence** > **Classification** > **Solutions**.
   The system shows the list of available solutions.
2. Select the solution whose classes you want to configure.
   This solution must have a **State** of **Solution Complete**.
   The system shows the Solution record.
3. From the **Class Confidence** related list, select the class you want to configure.
   The solution only lists output field values for which it can make predictions. If the output field value is missing from this list, update the solution definition filter to provide more data for this output field value, and retrain the solution.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The system shows the Class Confidence record.

4. Review the precision and coverage combinations available from the **Precision Coverage Lookups** embedded list.
5. Select the check box for the precision and coverage combination you want to use to make predictions for this class.

   You can only select one check box. Some combinations produce special prediction results.

Special prediction combinations

Prediction result	Precision	Coverage
Never include class in predictions	100	0
Always include class in predictions	0	100

6. From the Actions on selected rows control, select **Apply Values**.
   The system shows a **Precision / Coverage Setting** confirmation window.
7. Click **OK** to confirm the change or **Cancel** to discard it.

What to do next

Test predictions for this class to verify that the system produces acceptable results.

Configuring target metrics for a trained classification solution

Set values for precision, coverage, and recall statistics for a trained machine learning solution.

Setting classification metric values at the class or solution level

Predictive Intelligence provides three classification metric types: precision, coverage, and recall. You configure these metrics on the Solution Statistics tab of a trained classification solution form. While you can manually set values to these metrics at the class level, doing so can be challenging if you have a large number of classes to cover. In many cases, you may not know the best value to set until your solution is trained. This topic focuses on setting the metric values at just the solution level.

Configuring solution metrics

When you apply a value to one metric, it changes the values of the other two. This behavior enables you to modify your metrics iteratively in real time to see which value combinations render particular results. When you apply a new value to a metric, the system recomputes it by considering its new targets.

Applying a value to a metric asks the system to train its predictions to favor the metric you set based on the highest percentage value, and at a cost to the other metrics. The system tries to meet these values but may not set them exactly as you request due to how the data you're training is distributed.

When you apply metric values at the solution level, the system automatically sets the appropriate values at the class level.

Here are the basic steps for configuring a target metric for your solution.

1. Navigate to the Solution Statistics tab of a trained ML solution.
2. Review the messages on the green banners of the screen. These define each of the metrics so you can better understand the values you want to assign to the solution. The first two message

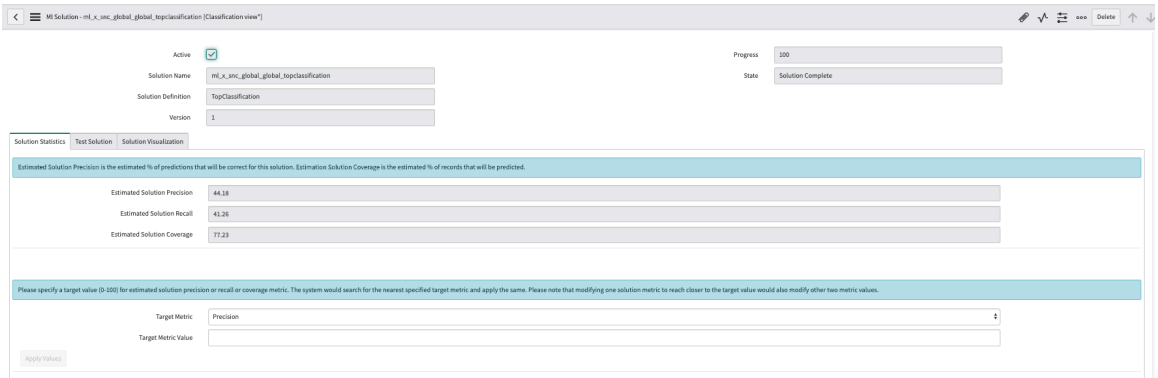
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

banners address estimated solution-level metrics. The third banner addresses class-level results based on the solution values you applied.

3. In the **Target Metric** choice list, select the metric you want to configure.
4. In the **Target Metric Value** field, enter a numeric percentile value between 0-100.
5. Click **Apply Values**.
6. Result: On the Solutions Statistics tab, you can review the change in values to the **Estimated Solution Precision**, **Estimated Solution Recall**, and **Estimated Solution Coverage**. The system calculates these values based on the **Target Metric** you select and the **Target Metric Value** you enter for the solution.

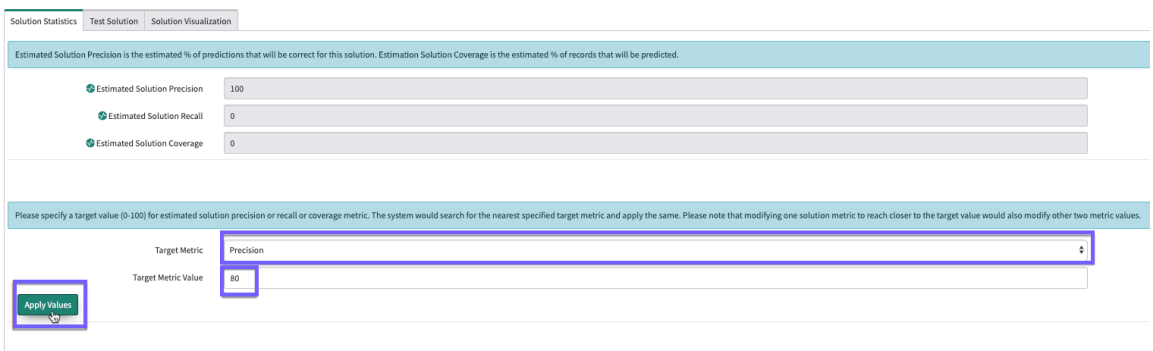
Here's a sample landing page for a recently trained classification solution. As you can see, the precision metric is 44.18, recall is 41.26, and coverage is 77.23.



To adjust these default values for a use case refer to the sample configurations as follows. For example, based on the classification solution you're implementing, you might want to change the target metric value for precision, recall, or coverage. Keep in mind that changing the target metric value for one metric (such as precision) impacts the values of the recall and coverage metrics as well.

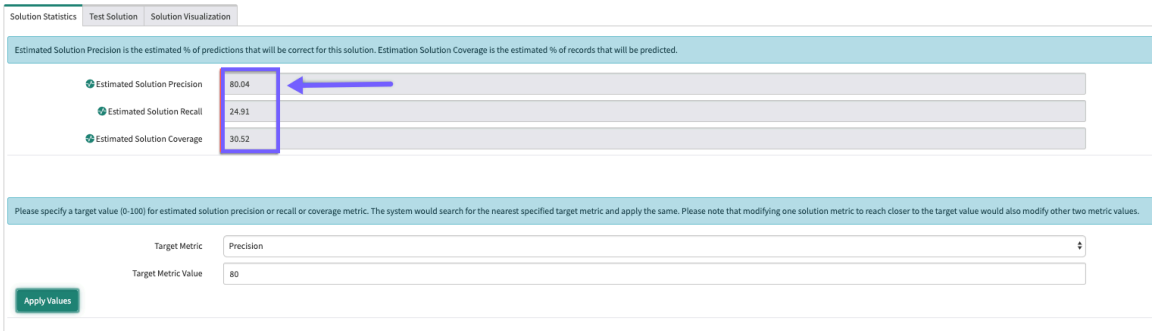
Precision configuration example

In this example scenario, you're replacing a manual triage process for routing incident records with an ML classification solution that automatically assigns the records to the correct assignment group. For this scenario, you have a target value in mind and the system must predict correctly at least 80% of the time. So you set the precision metric value to 80 and click **Apply Values**.



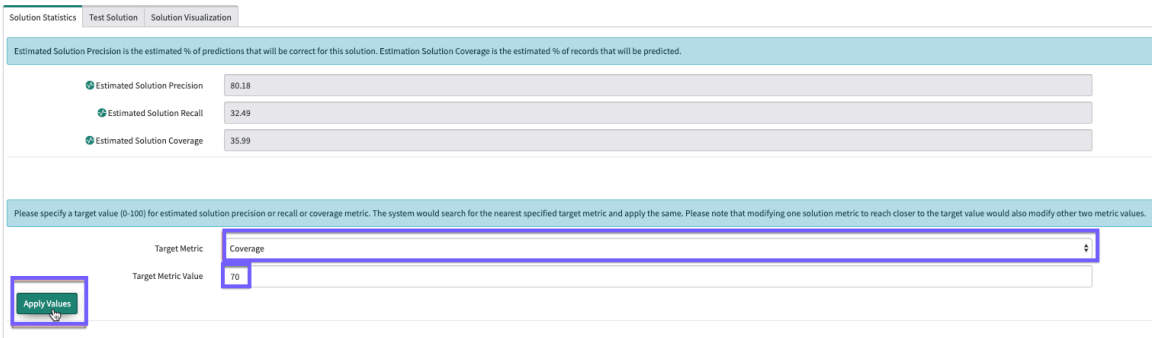
Here are the metric values the system applied to the solution. In this scenario, the precision value of 80.04 slightly exceeded your request for 80%, so you're likely satisfied with that value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

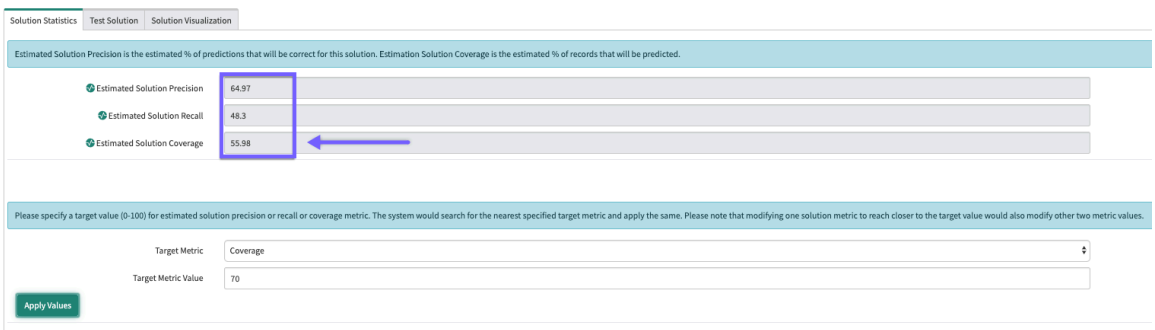


Coverage configuration example

In another example scenario where you're replacing a manual triage process for routing incident records, your minimum goal is to predict at least 70% of incoming incidents in the first quarter of the year. So you set the coverage metric value to `70` and click **Apply Values**.



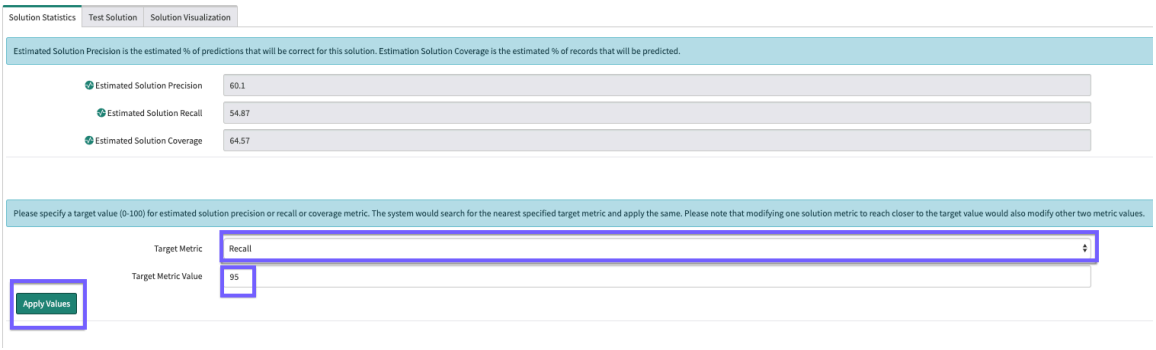
The metric values the system applied to the solution are shown in the following image. The coverage metric value increased from 35.99 to 55.98. However, the precision metric decreased from 80.18 to 64.97. This could be because you set the coverage metric to a relatively high value of 70, or perhaps because of how the data you're training is distributed.



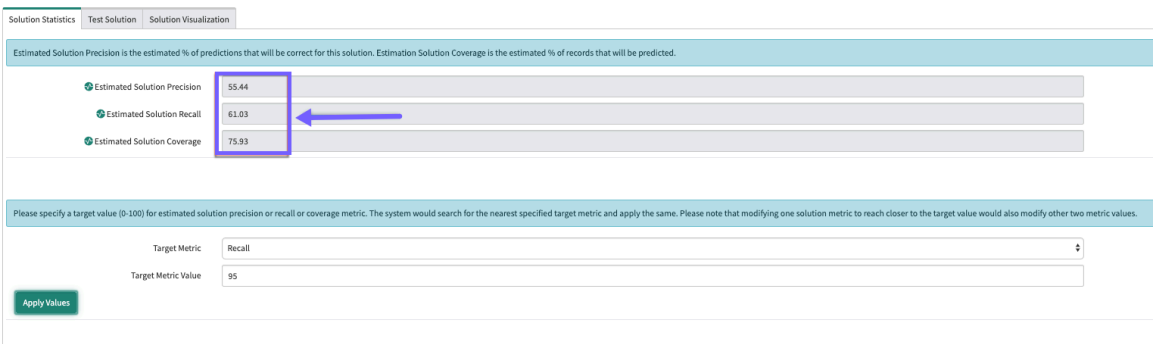
Recall configuration example

In another scenario, classifying if an incoming email is a Phish or not can be an important use case in a security-related machine learning solution. In this situation, it's very important to identify every Phish, and it may be okay to report a non-Phish as a Phish occasionally. However, no real Phish should be classified as a non-Phish. In such situations, the recall metric must have a high value, which might lead to lower percentages for precision and coverage. So here you can set the recall metric to `95` and click **Apply Values**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



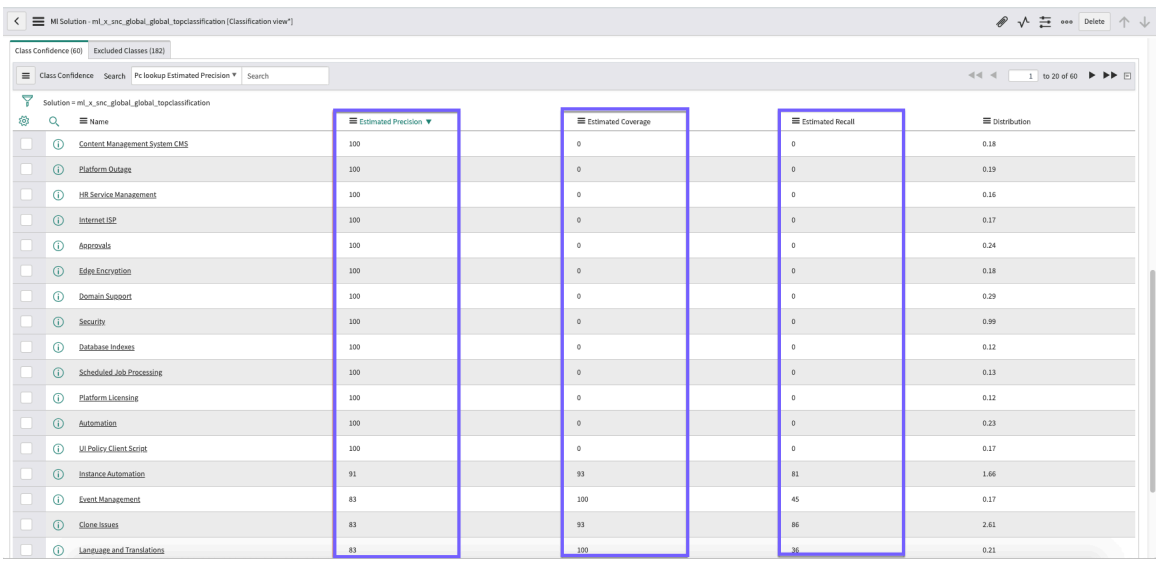
Here are the metric values the system applied to the solution. The recall metric value increased from 54.87 to 61.03. However, the precision metric decreased from 60.1 to 55.44. This is likely because you set the recall metric to the high value of 95.



Class-level results for the solution metric values you apply to your solution

The following image shows an example of the class-level results the system applied to a solution's precision, coverage, and recall statistics for 37 classes. You can keep modifying the metric values until you're fully satisfied with the results.

By Sorting (z to a) on the Estimated Precision column you can see which classes have the highest precision for the solution.



Using Group By for classification

Use APIs to simultaneously submit multiple classification solutions for training based on the Group By field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can use the optional Group By capability to train and maintain one classification solution that covers more than one data area, such as geographical location or domain.

To train a solution using Group By, you must add the groupby parameter while creating a classification solution definition using APIs. The groupby parameter accepts only categorical columns as inputs, where individual models are created on the subset of data belonging to each of the groupby values. Only those child solutions that pass the minimum records criteria set for the capability are created. Here, the prediction calls are routed to the corresponding Group By model based on the Group By value present in the prediction input. Batch predictions are not supported.

A Group By scenario for geographical locations

Let's say your global company uses classification routing for incoming records, with one support center in the US and one in Europe. Here, you want to create a single classification solution that has one model for your United States incidents and another model for your European incidents.

In this scenario, you could use one of these two approaches:

- Create and train two separate ML classification solution definitions, where one is filtered by US incidents only, and one by European incidents only.
- Use the groupby parameter to create Groupby for the country location so that all US definitions create a US model and all European definitions create a European model. Then, based on the incident, the system identifies which model it uses to predict the correct classification category.

The second approach has benefits in that the models you use can even be in different domains, such as healthcare or finance. This approach is especially beneficial if you have several country locations or domains to maintain.

Example usage for training and prediction using Group By via API

```
var myIncidentData = new sn_ml.DatasetDefinition({
    'tableName' : 'incident',
    'fieldNames' :
 ['category','short_description','assignment_group','description
','priority'],
    'encodedQuery' : 'activeANYTHING'
});

var mySolution = new sn_ml.ClassificationSolution({
    'label': 'solution label',
    'dataset' : myIncidentData,
    'groupByFieldName' : 'assignment_group',
    'predictedFieldName': 'category',
    'inputFieldNames':
 ['short_description','description','priority']
});
//Add solution definition
var solution_gr =
 sn_ml.ClassificationSolutionStore.add(mySolution)
//Get existing solution
var my_unique_name =
 sn_ml.ClassificationSolutionStore.get('solution name');
// submit training job
var solutionVersion = my_unique_name.submitTrainingJob();
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// Run prediction
var input = new GlideRecord("incident");
input.get("sys_id");
// configure optional parameters
var options = {};
options.apply_threshold = false;
var mlSolution = sn_ml.ClassificationSolutionStore.get('solution
 name');
//Prediction using glide record
var results = mlSolution.getActiveVersion().predict(input,
 options);
//Prediction using map
var results =
 mlSolution.getActiveVersion().predict([{ 'short_description':
 input.short_description,

 'assignment_group': input.assignment_group }], options);
```

Model Explainability

Analyze the importance of each input field to your model's predictions using model explainability. Create a Workflow Classification model that includes a graphical analysis of feature importance by executing the provided script.

Before you begin

- This method uses the Workflow Classification Solution API, instead of the Solution Definition form, to create and train a model with explainability added. For information about the components of Workflow Classification models, see Create and train a classification solution.
- Role required: ml_admin or admin

About this task

Model explainability helps identify the key features that influence the model's predictions during training.

Note: Explainability can't be added to an existing model. This method uses a script to create and train a new Workflow Classification model. For more information about scripting the creation of Classification solutions, see ClassificationSolution - Global.

The script provided in the procedure creates and trains a model with explainability set to true. On the new model's solution form, an additional tab labeled **Feature**

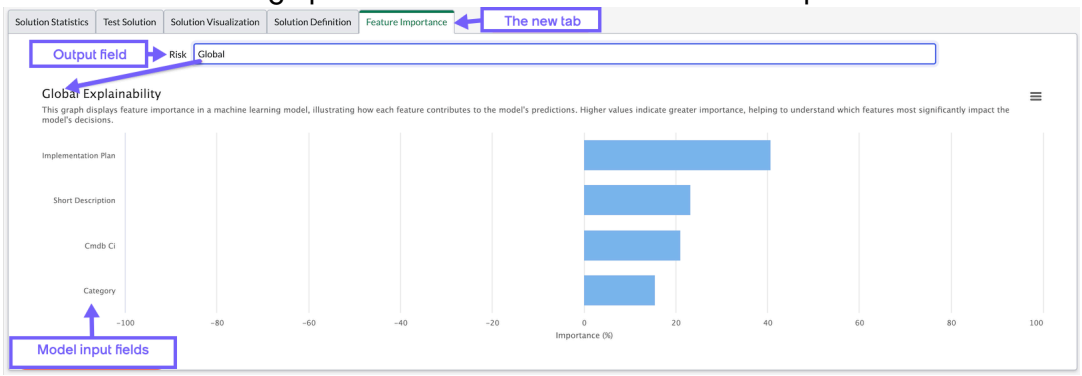
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Importance appears. This tab offers a graph of the relative contribution of each input to the prediction.



Procedure

1. Navigate to **All** > **System Definition** > **Scripts - Background**.
2. Edit the query filter and table, field, and variable values in the following script according to your planned model, then execute the script.

```
// Define a dataset
                    var myIncidentData = new
sn_ml.DatasetDefinition({
                    'tableName': 'incident',
                    'fieldNames': ['category',
'short_description', 'sys_updated_by', 'assignment_group',
'description', 'priority'],
                    'encodedQuery': 'activeANYTHING'
                    });

                    // Define a classification solution
definition with explainability field
                    var mySolution = new
sn_ml.ClassificationSolution({
                    'label': 'model explainability',
                    'dataset': myIncidentData,
                    'predictedFieldName': 'category',
                    'inputFieldNames': ['short_description',
'priority'],
                    //setting the explainability field to true.
                    'explainability': true,
                    });

                    // Add solution to
ClassificationSolutionStore
                    var my_unique_name =
sn_ml.ClassificationSolutionStore.add(mySolution)

                    // Submit training job
                    var solutionVersion =
mySolution.submitTrainingJob();
```

Note: Substitute the query filter and table, field, and variable names in this script with your own values.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Navigate to the ML Solutions [ml_solution] table and open your new solution by selecting the value of its **Active** field.
4. On the solution form, locate and open the **Feature Importance** tab.
   Feature Importance displays a drop-down list.

   - The label for this drop-down list is the name of your output (predicted) field, so the label is specific to each model.
   - The values in the drop-down list are the possible output classes for your output field, plus the **Global** option.

List option	Description
Global	Provides an overview of how the model be haves across all predictions, showing the overall impact of each input feature. Select **Global** to open a graph of the impor tance of your input fields to predictions for all output classes as a whole.
`Your output class value`	Focuses on the model's behavior for the cho sen class only, showing how input features contribute to predictions on a per-class basis. Select one of the possible output classes to open a graph of the importance of your input fields to predictions for that class.

5. Launch the graphical analysis by selecting a value from the drop-down list.
   The y axis shows your input fields and the x axis shows the numerical importance for each input. The label of the graph reflects the class that you chose in the drop-down list.

   You can hover over a bar to display the numerical percentage for each input's importance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
A positive importance value means that the input field increases the model's prediction score. A negative value means that the input field decreases the prediction score.

What to do next
Consider dropping input fields with low importance scores. Retrain your model after modification.

Test time explainability

Understand the reasons your machine learning solution made a specific prediction with Test time explainability, which returns a list of input features that influenced the prediction.

Overview of Test time explainability

When Test time explainability (TTE) is enabled on a classification solution, every prediction is accompanied by an explanation that lists each input feature along with a contribution score. Features with the largest contribution scores are the strongest drivers of that individual prediction.

Benefits of Test time explainability

- Transparency: Explanations turn scores into confident decisions.
- Accountability: Each prediction comes with a per-decision record of the factors that combined to shape the result.
- Faster troubleshooting: Unexpected predictions are easier to investigate using the list of factors and their influence.

Considerations for using Test time explainability

Be aware of the following considerations when using Test time explainability (TTE).

- TTE supports only workflow Classification solutions.
- TTE supports only the xgboost classifier method. Don't change the classifier_method when the TTE flag is enabled.
- TTE is turned off by default. You must set TTE to true during training and predicting.
- TTE can be applied to nominal (categorical) and numeric columns only, not text columns. If input features consist of a mix of text, nominal, and numeric columns, the text columns are dropped. If the input features consist of text columns only, the solution training fails.

Invoking Test time explainability

Test time explainability is set in two API calls: at the training stage, and at the prediction stage. When TTE is enabled, the prediction response includes an `explanation` object.

The following code snippet shows an example of defining a classification solution for training. The parameter test-time-explainability is set to true (default is false).

```
var mySolution = new sn_ml.ClassificationSolution({
    'label': 'telecom_customer_churn_with_tte',
    'dataset': myData,
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    'predictedFieldName': 'churn',
    'inputFieldNames': [
        'age',
        'contract',
        'monthly_charge',
        'tenure_in_months',
        'online_security',
        'online_backup'
        // ... additional input fields
    ],
    'test-time-explainability': true
});
```

The following code snippet shows an example of requesting explanations at prediction time, after the model has trained successfully. The option test_time_explainability is set to true (default is false).

```
var input = new GlideRecord('u_telecom_customer_churn_train');
input.get('07601c45ff9232107334fffffffff38'); // record must
 not be empty

var options = {};
options.apply_threshold = "false";
options.test_time_explainability = "true";
options.top_n = 100;

var solutionName = sn_ml.ClassificationSolutionStore.get(
    "ml_sn_global_global_telecom_customer_churn_with_tte"
);
var solutionVersion = solutionName.getLatestVersion();
gs.info(solutionVersion.predict(input, options));
```

The following snippet shows an example of the explanation in JSON format (trimmed for readability).

```
{
  "07601c45ff9232107334fffffffff38": [
    {
      "confidence": 99.53,
      "threshold": 1.61,
      "predictedValue": "0",
      "explanation": {
        "prediction": 0.0047,
        "base_value": -0.1806,
        "all_contributors": [
          { "feature": "contract",          "raw_value": "Two
 Year", "encoded_value": 2.0,  "shap_value": -3.4014 },
          { "feature": "monthly_charge",     "raw_value":
 "58.55",    "encoded_value": 0.212, "shap_value": -0.6699 },
          { "feature": "tenure_in_months",   "raw_value": "29",
      "encoded_value": 28.0,  "shap_value": -0.5553 },
          { "feature": "age",                "raw_value": "68",
      "encoded_value": 49.0,  "shap_value":  0.3234 }
        ]
      }
    }
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    ]
}
```

Following are the definitions of the fields in `explanation`.

Fields in the explanation response

Field	Definition
prediction	The model's output for this record after all feature contributions are applied.
base_value	The model's expected result before any feature contributions.
all_contributors	The full list of input features and their contribution to this prediction. • feature: The name of the input field. • raw_value: The original value from the record (for example, "Two Year" or "58.55"). • encoded_value: The internal numeric representation of the original value used by the model. • shap_value: The contribution score. A positive value pushes the prediction higher; a negative value pushes it lower. The larger the magnitude, the stronger the influence.

The contributors are ordered by influence, so the features at the top of `all_contributors` are the strongest drivers of the prediction. Starting from the `base_value`, each `shap_value` influences the result up (positive value) or down (negative value).

Configure XGBoost for classification or regression solutions

ClassificationSolution - Global

Create and train a similarity solution

Create and train a machine learning solution to collect and compare your existing records to new similar records. For example, you can compare the text in an open Incident record to a resolved Incident record to reuse its resolution.

Before you begin

- Role required: ml_admin or admin

Important: From the Washington DC release, models in the classification, clustering, and similarity frameworks use Workflow solutions. These are pre-trained, so a word corpus isn't needed for your new solutions. When your existing solutions with a word corpus are re-trained after upgrading, they become Workflow solutions, and the Word Corpus field is removed from the form.

About this task

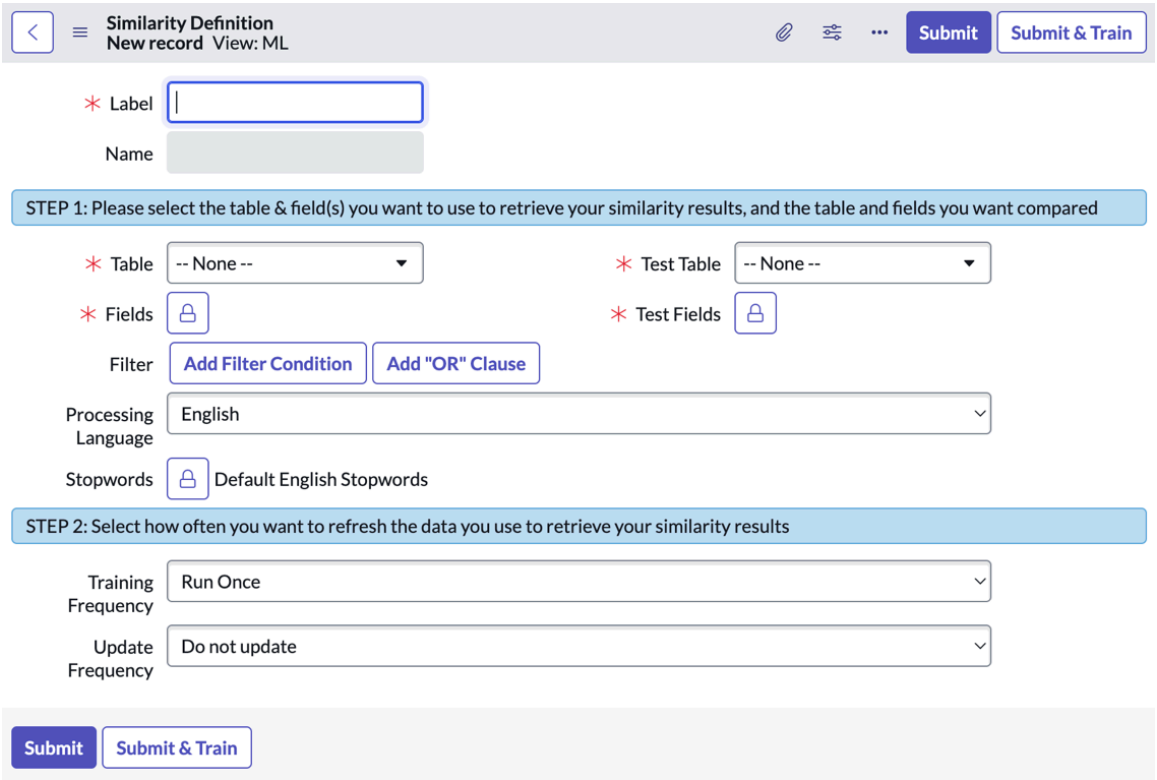
After comparing your existing records based on similarity, the system recommends examples that you can review and reuse in your solution.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When applied in your forms and flows, similarity solutions are domain-aware, so records from other domains on the instance are not displayed to users. For more information, see KB article Similarity prediction behavior in domain separated environment on Now Support.

For information on using encrypted training data, see Data Encryption in Predictive Intelligence.

In this example procedure, you're working on Incident records and you want to locate relevant Knowledge Base articles that could provide resolutions to those incidents.



Procedure

1. Ensure that you are in the application scope that you want for your solution definition, then navigate to **All** > **Predictive Intelligence** > **Similarity** > **Solution Definitions**.
2. In the Similarity Definitions list, select **New**.
3. On the Similarity Definition form, fill in the fields.

Field	Value
Label	Enter a unique name for your similarity solution. For example, in this use case you could enter `Match Knowledge Articles to Incidents`.
Name	As you enter a Label value, this field automatically populates with a system-assigned, read-only name based on your Label value.
Word Corpus	If you have a legacy similarity solution, you can select a relevant word corpus from the **Word Corpus** field in the definition form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
	Note: Starting from the Washington DC release, a word corpus is not required because a pre-trained model is used instead. The **Word Corpus** field is not visible in the definition form for pre-trained models. For more information, see Create a word corpus.
Table	In the Table field, select the table that contains records you want to use as an information source. In this use case you select the **Knowledge [kb_knowledge]** table, because its KB Article records might provide information relevant to the Incidents that you're trying to resolve. After you assign a Table, the number of records matching your filter conditions is displayed as a link. Select this link to view the list of records.
Test Table	In the Test Table field, select the table containing the records that you want to target. In this use case, you select the **Incident [incident]** table, as it contains the Incident records that you're trying to resolve. **Note:** You can select the same table for Table and Test Table. For example: using filter conditions, you could collect information from recent Incidents to help with target Incidents.
Fields	For the Table that you selected, enter fields that are likely to contain words and phrases relevant to the Incidents you're trying to resolve. In this example, you choose **Short description** and **Article body**. Including the article body increases your chances of capturing informative details regarding the subject. **Note:** **Journal Type** is not a supported data type.
Test Fields	For the Test Table that you selected, enter fields that contain text that you want to compare to other similar records. In this example, you choose the **Short description** of the Incident records you're trying to resolve.
Filter	Select **Add Filter Condition** to apply conditions to the Fields records you're using as an information source. For example, in this use case you could set a **workflow_state=published** condition to retrieve published KB articles only.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
	Note: Script includes can't be referenced from the Filter. Use database views as an alternative.
Processing Language	Select the dominant language of the dataset you're training on. Also, English processing is applied to all datasets by default. For example, if you select Italian, the system processes the data in both Italian and English. **Note:** The term processing indicates some of the language-specific steps used as part of training a solution, such as tokenizing words, removing stop words, and stemming.
Stopwords	When you select your processing language, the system automatically adds a Stopwords list for that language. For example, if your processing language is Italian, the **Default Italian Stopwords** list appears. The **Default English Stopwords** list is also included. To use a custom stopwords list, select the lock icon( ) and then search in the **Select target record** field.
Training Frequency	Select a retraining frequency. The available options range from **Run Once** up to **Every 180 days**.
Update Frequency	Select how often you want to refresh the data you use to retrieve your similarity results. For example, for open incident records, you could select an update frequency of **Every 15 minutes**, as new incidents typically occur frequently throughout the day. This frequency may increase the likelihood that newly opened records are included in the refresh. However, for KB Knowledge article records, which are typically not created often, you could choose a less frequent update frequency such as **Every 1 day**. **Note:** The ML scheduler limits the number of trainings an instance can commit to 50 new ML training requests per instance within a 24 hour window. This excludes scheduled re-training requests. In addition, clustering and similarity updates are also excluded from this limit, even if the new training requests exceed 50 within a 24 hour window.

4. Select the appropriate button for the solution definition.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
Save	Save your solution definition record so you can return to it later.
Submit & Train	Create your solution definition record and train it.

5. If you submitted the solution for training, select **OK** on the **Training Activation** window to confirm.

Result

- The system schedules the solution definition for processing with the nearest training service and sends you a notification when the training completes. The notification includes any errors that may have occurred during the training. Other users can subscribe to the Predictive Intelligence Notifications category.
- The trained solution delivers paired example records ranked by their degree of similarity. The list of examples is available from **Similarity Examples** under Related Links on your solution's form.
- When training completes, the system uploads the solution as an Attachment record.

What to do next

Review the similarity examples on the Related Links section of your Solution form. See Review solution similarity examples.

Update your similarity score threshold

After you review the similarity examples provided by the system, update your solution similarity score threshold if you want the results returned by the solution to be more or less similar.

Before you begin

- Review your similarity examples and their scores. For more information see Review solution similarity examples.
- Role required: ml_admin or admin

About this task

A deployed solution returns records only when the similarity score is higher than the **Similarity Score Threshold** value:

- The higher the threshold value, the higher the precision and the lower the coverage.
- The lower the threshold value, the lower the precision and the higher the coverage.

Procedure

1. Navigate to **All** > **Predictive Intelligence** > **Similarity** > **Solutions**.
2. In the ML Solutions list, locate your solution by filtering for the Solution Name, and open its active version.
3. On the solution form, locate and open the **Solution Statistics** tab.
4. In the **Similarity Score Threshold** field, enter a new numerical value that represents a percentage.
   For example, imagine that the current threshold is 80. In your similarity example review you decided to increase the accuracy of your similarity recommendations at the cost of lowering the prediction coverage. So you update the field by entering the higher value of 90.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. In the form's context menu (Additional actions), select **Save**.
   Your solution uses the new threshold value that you assigned to it and returns similar results that have a score higher than 90. If you set the threshold to 90, the similarity score must be 91% or above to return records.

Create and train a clustering solution

Group similar records into clusters so you can address them collectively or identify patterns.

Before you begin

Role required: ml_admin or admin

Important: In the Brazil release, models in the classification, clustering, and similarity frameworks use Workflow solutions. These are pre-trained, so a word corpus isn't needed for your new solutions. When your existing solutions with a word corpus are re-trained after upgrading, they become Workflow solutions, and the Word Corpus field is removed from the form.

About this task

In this example procedure, you're creating a solution to identify a major incident by grouping similar incidents that have occurred recently.

For information on using encrypted training data, see Data Encryption in Predictive Intelligence.

Procedure

1. Ensure that you are in the application scope that you want for your solution definition, then navigate to **All** > **Predictive Intelligence** > **Clustering** > **Solution Definitions**.
2. On the Clustering Definitions list, select **New**.
3. On the Clustering Definition form, configure the fields according to the following guidance.

Field	Value
Label	Enter a unique name for your clustering solution. For example, in this use case you could enter `Group Incidents to a Major Incident.`
Name	As you enter your solution Label, this field automatically populates with a system-assigned name based on your Label value.
Word Corpus	If you have a legacy clustering solution, you can select a relevant word corpus from the **Word Corpus** field in the definition form. **Note:** With the Brazil release, a word corpus is not required, because a pre-trained model is used instead. The **Word Corpus** field is not visible in the definition form for pre-trained models. For more information, see Create a word corpus.
Table	Select the table that contains record types that you want to group into one or more clusters. For example, in this use case you select the **Incident [incident]** table as it contains

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
	incident records you want to group together for a major incident analysis. When you assign a table value, a link appears in the form that shows the number of records that match your current conditions.
Fields	Select one or more input fields types that help the system identify the records you want to include in your cluster. In this use case, use **Short description**. **Note:** When selecting a reference type field, you must dot-walk to the field's property name. For example, instead of `short_description`, enter `short_description.name`.
Use Group By	Select this check box only if you want to group input records by a field before creating clusters. **Note:** Selecting this check box activates the **Group By** list. If you don't select the check box, all the table records are grouped into clusters.
Group By	Selecting a value from this list is optional. If you do so, the system groups records into one or more clusters based on your selection.
Purity Fields	Choose fields from your table that can help the system identify the class that is most frequent in the cluster. In this example scenario, select **Category** and **Assignment group.Name**.
Filter	Add filter conditions to apply to the input field records that you want to include in your clusters. ○ The maximum number of records for clustering is limited to 300,000. ○ For best results, aim for at least 2000 records as a minimum. **Note:** Script includes can't be referenced from the Filter. Use database views as an alternative.
Processing Language	Select the dominant language of the dataset you're training on the solution definition. If the dataset language is Italian, choose **Italian**. Also, English processing is applied to all datasets by default. For example, if you select Italian, the system processes the data in both English and Italian. **Note:** The term processing indicates some of the language-specific steps used as part of training a solution. For example, tokenizing words, removing stop words, and stemming.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
Stopwords	When you select your processing language, the system automatically adds a Stopwords list in that language. For example, if your processing language is Italian, the **Default Italian Stopwords** list appears. The **Default English Stopwords** list is also included. If you create a custom stopwords list, you can select it from the Stopwords field to add to your solution.
Update Frequency	Select how often you want the system to update your clusters with new and updated records. **Note:** The system pulls records based on the Group By filter conditions that you set on your clustering solution, if any. For example, if you select **Every 15 minutes**, the system identifies which records have arrived within that time frame. The system tries to assign them to the existing clusters, or creates a new cluster if possible. In this example, 20 new records arrive. If 16 of those records make it into an existing cluster and 4 don't, the system forms a new cluster for the four unassigned records. You can also choose not to update your clusters at all.
Training Frequency	Select how often you want the system to discard all previous cluster results and recreate clusters from the beginning. Your options range from daily, every third day, every seven days, or monthly. You can also choose to train your cluster once. **Note:** The ML scheduler limits the number of trainings an instance can commit to 50 new ML training requests per instance within a 24-hour window. The limit excludes scheduled retraining requests. In addition, clustering and similarity updates are also excluded from this limit, even if the new training requests exceed 50 within a 24-hour window.
Minimum number of records per cluster	Enter the minimum number of records you want a cluster to contain. The value you enter must be 2 or higher.

4. Select the appropriate context menu option or button for your solution definition.

Option	Description
Save or Save & Train	Save your solution definition record so you can return to it later, or save and submit it for training.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
Submit or Submit & Train	Create your solution definition record and submit it, or submit and train it.

5. If you submitted the solution for training, select **OK** on the Training Activation window to confirm.

Result

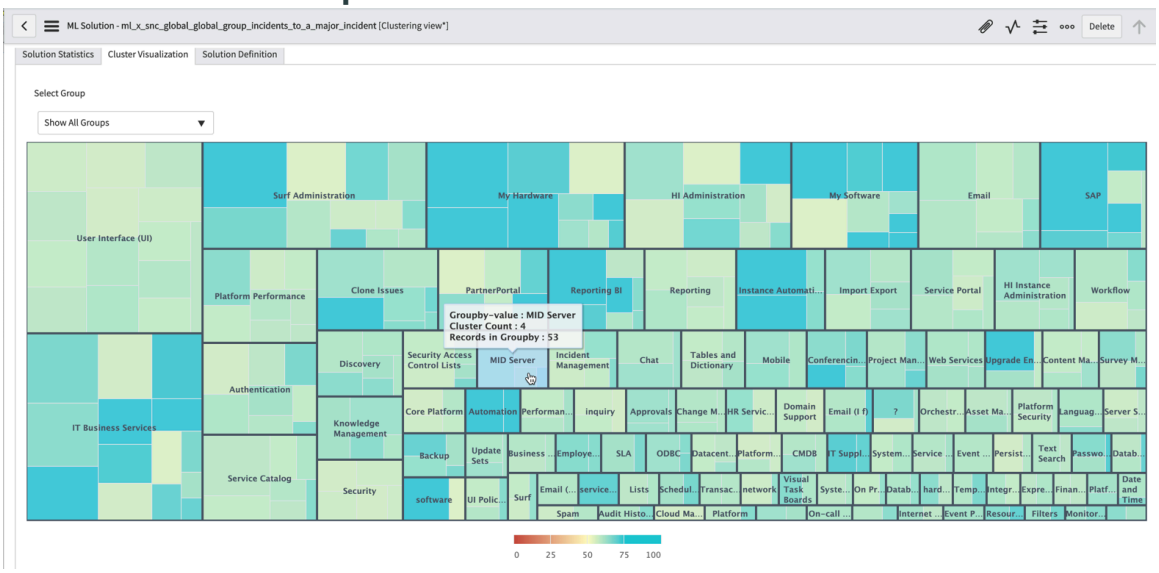
The system trains the solution and notifies you in real time when the training completes.

A treemap plot appears on the Cluster Visualization tab of your Clustering Solution Definition form. The plot shows the clusters the system formed for your solution in descending order from the top-left corner to the bottom-right corner. The treemap node labels are the Cluster Concept, which is created by the top words from the cluster, and helps you see the most prominent content found in each cluster.

Note: The Cluster Concept displays the top words from the processed input data, in the data's language. Depending on the language, the Cluster Concept may display words in their root form and so appear truncated.

Each node is colored from red to green depending on the cluster quality for that node. The Select Group filter appears only when you select the **Use Group By** and **Group By** fields on your Clustering Definition form. When you point to a cluster, you can see its Groupby value, Cluster Count, and Records in Groupby.

Cluster visualization example



To open a cluster, you can click it, or select it from the Show All Groups filter.

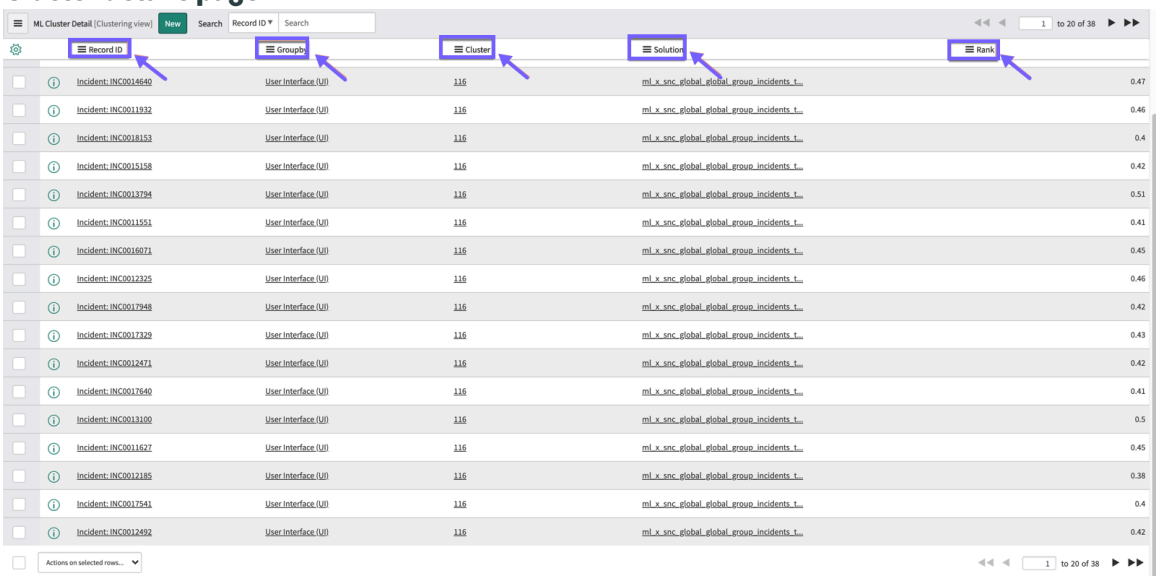
Inside the cluster grouping, you can filter the results further by using the two slide bars for cluster size and cluster quality, respectively. You can also navigate backward by clicking the Back button, which only appears when a clustering hierarchy is present. When you point to a cluster at this level, the Purity field percentile values appear along with the Cluster Concept, Quality, and Size values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cluster group example

When you click a cluster node, its ML cluster details appear in a list view format.

Cluster details page



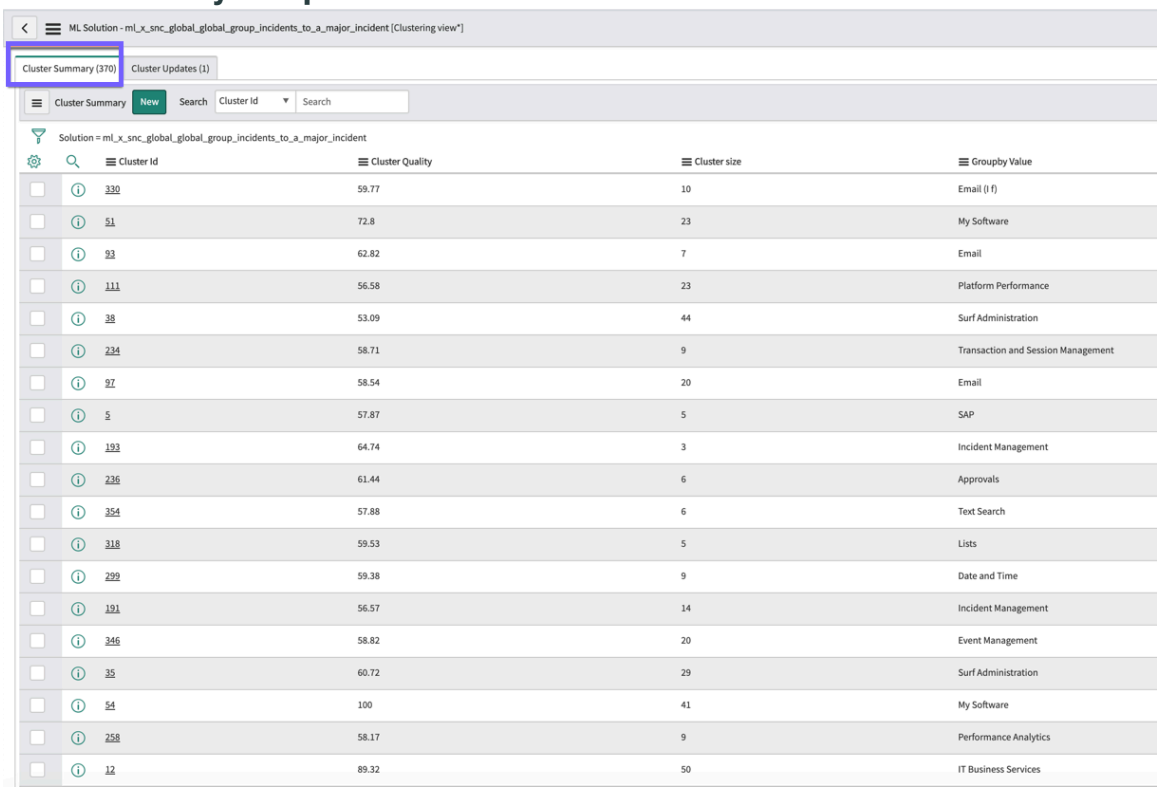
What to do next

- Review the solution output on the Solution Statistics tab of your solution. If you aren't satisfied with your clustering solution results, reconfigure the values you've set to your solution and retrain it until the results are to your satisfaction.

- Review the Cluster Summary tab for a list view of the cluster IDs, quality size, and Groupby values.

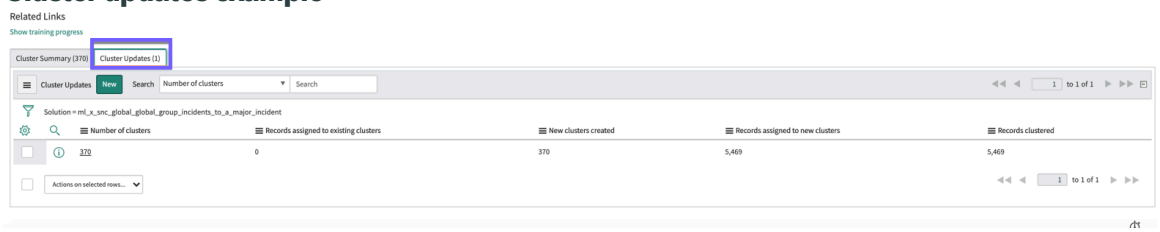
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cluster Summary example



- On the Cluster Updates tab, review the summary of changes to clusters for each cluster update interval you configured in the solution definition.

Cluster updates example



Assign a name to a cluster

Name your clusters to help identify and organize them.

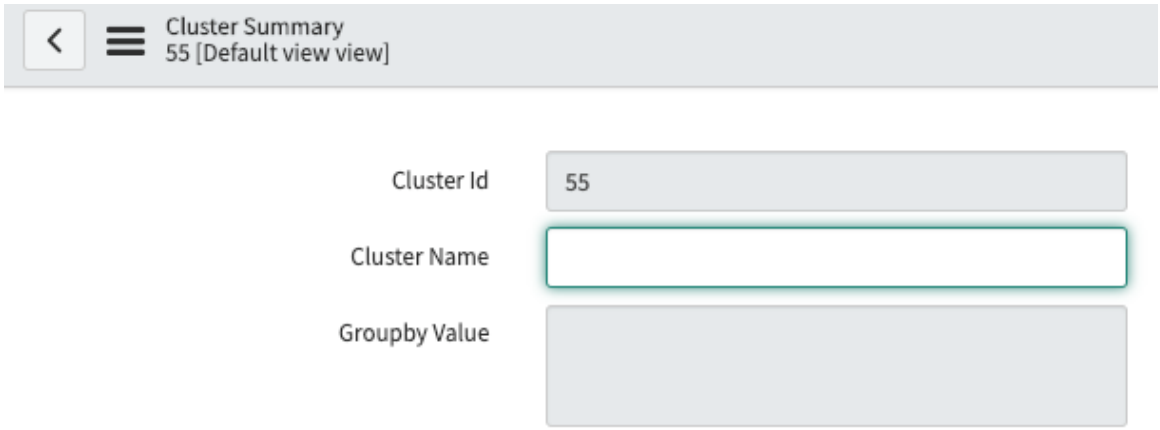
Before you begin

- Create a clustering solution definition or use an existing one.
- Role required: admin or ml_admin

Procedure

1. Navigate to **All** > **Predictive Intelligence** > **Clustering** > **Solutions**.
2. Select a solution.
3. Under the **Cluster Summary** related list, select a cluster ID.
4. Enter a name in the **Cluster Name** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. Select **Update**.

Generate a representative sample of a cluster

View the top 25 most representative records of a cluster.

Before you begin

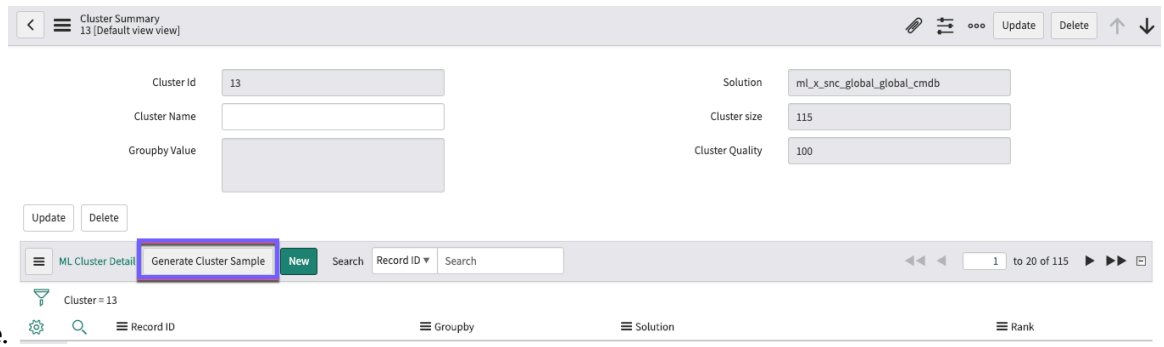
- Create a clustering solution definition or use an existing one.
- Role required: admin or ml_admin

About this task

Generating a sample of a cluster filters the records for that cluster. Generating a sample works on clusters with over 25 records.

Procedure

1. Navigate to **All** > **Predictive Intelligence** > **Clustering** > **Solutions**.
2. Select a clustering solution.
3. Under the **Cluster Summary** related list, select a cluster ID.
4. Select **Generate Cluster**



Sample.

Result

The **ML Cluster Detail** list shows the top 25 records in the cluster. The cluster sample also applies to the cluster visualization.

Apply purity on a clustering solution

Apply purity to learn details about the composition of each cluster. For example, see what percentage of incidents in a cluster have the same value for Assignment Group. You can specify which fields to focus on, or you can let auto-purity display fields by default.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Create a clustering definition solution or use an existing one.
- Role required: admin or ml_admin

About this task

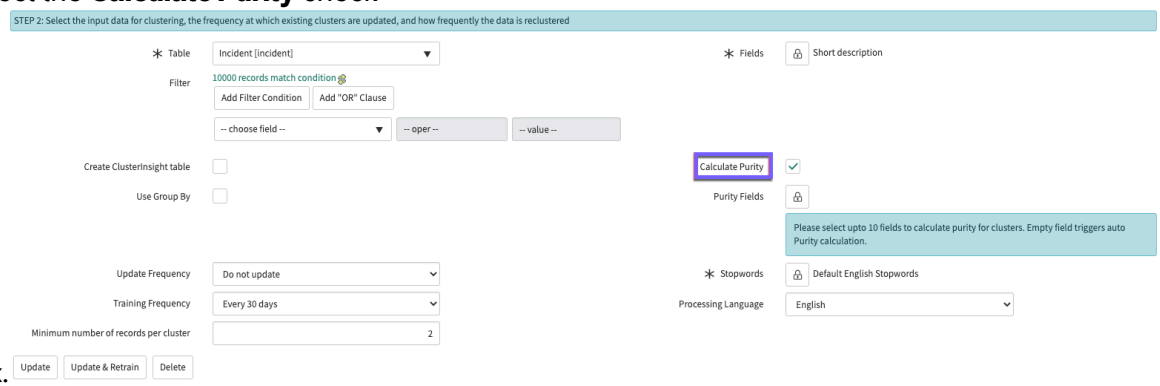
With purity, you can choose field distribution metrics for your clusters to display. The table assigned to your solution determines which fields are available. For more information about purity, see the following articles on ServiceNow Community:

- https://www.servicenow.com/community/intelligence-ml-articles/using-purity-fields-to-better-understand-your-clusters/ta-p/2302441
- https://www.servicenow.com/community/intelligence-ml-articles/predictive-intelligence-using-the-cluster-insight-table-to/ta-p/2301006

If you do not select any fields, auto-purity automatically determines which insights to show based on distribution significance. You can change the default auto-purity selections by editing the ML Auto Purity Configuration [ml_autopurity_config] table.

Procedure

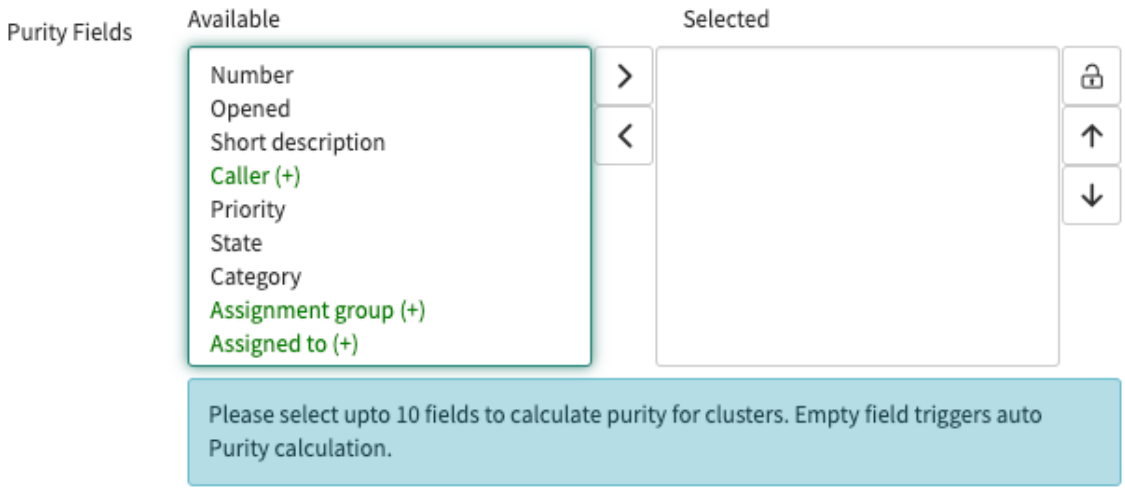
1. Navigate to **All** > **Predictive Intelligence** > **Clustering** > **Solution Definitions**.
2. Select a solution definition or create a new one.
3. Select the **Calculate Purity** check box.



4. **Optional:** Select the **Purity Fields** lock icon and choose the fields that you want displayed in cluster results.

> **Note:** If you don't select any fields, auto-purity displays the most significant fields based on distribution.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



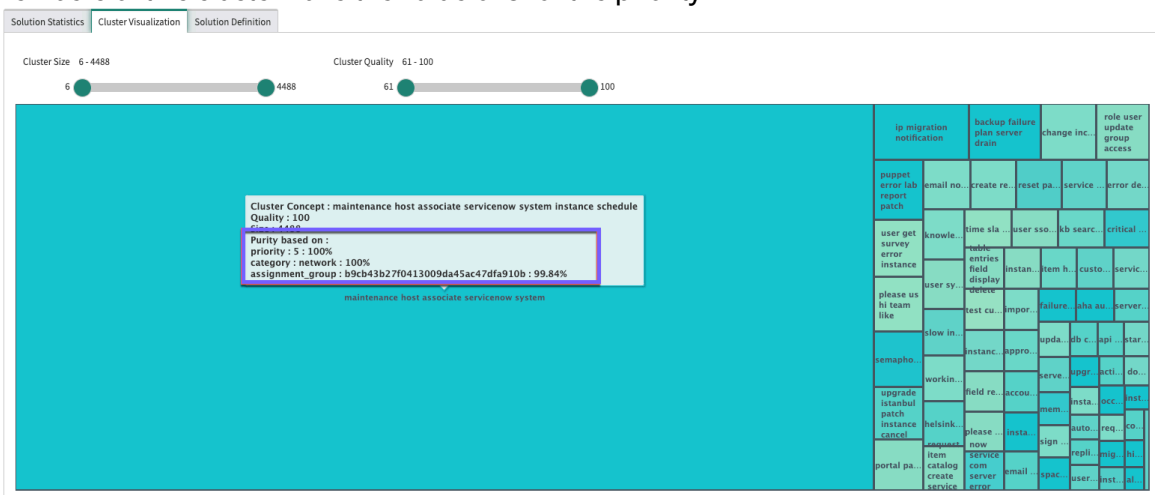
5. Select **Update** or **Update & Retrain**.

Result

View your insights by opening the **Cluster Visualization** tab of your retrained solution, then pointing to a cluster. Under **Purity based on**, the format displays as:

field name : value : percent.

For example, the row priority : 5 : 100% means that 100% of the members of this cluster have the value of 5 for the priority field.



Analyze a cluster with Cluster Insight

Analyze a cluster by a field available on the source table. With the Cluster Insight check box, you can add a filter condition on your input field when you review the list of results.

Before you begin

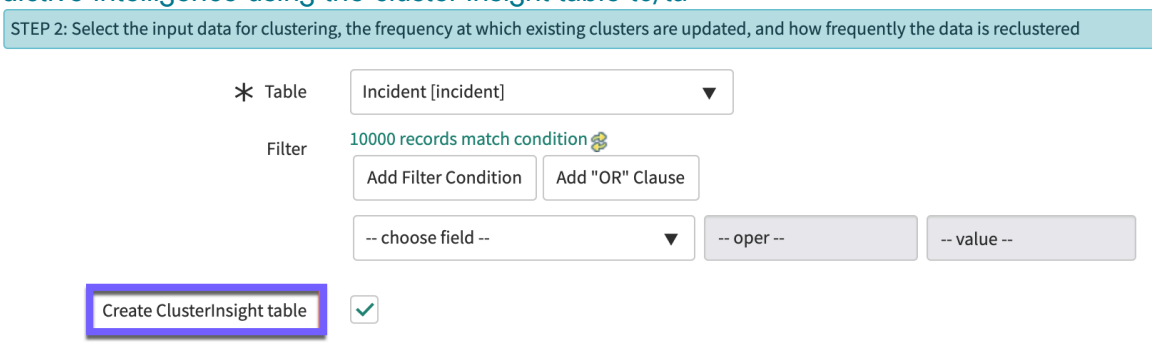
- Create a clustering solution definition or use an existing one.
- Role required: admin or ml_admin

About this task

Drill down into a cluster and filter its records with Cluster Insight. You can add cluster insight analysis when creating a solution or editing an existing solution. For more information, see https://www.servicenow.com/community/intelligence-

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ml-articles/predictive-intelligence-using-the-cluster-insight-table-to/ta-



p/2301006 .

Procedure

1. Navigate to **All** > **Predictive Intelligence** > **Clustering** > **Solution Definitions**.
2. Select a solution definition or create a new one.
3. On the definition form, select the **Create Cluster Insight table** check box, then update and retrain the model.

Result

In the **Solutions** [ml_solution] table, open the trained solution, then open the **Cluster Visualization** tab. When you select a cluster, all records included in the cluster are displayed as a list. Using the filter icon ( ), open the list's filter conditions. Search for the input field from your source table. For example, if your source table is Incident and the input field is Short Description, you could filter for records containing the word "help" in the Short Description.

To make other dimensions from your source table available for filtering, add them as input fields on the solution definition form.

Create and train a regression solution

Regression solutions have been deprecated. They could be used to predict numeric outputs, such as a temperature or a stock price.

Before you begin

Note: Support for new regression solutions is deprecated in the Brazil release. You can still edit and train any existing solutions, but you can't initiate new ones. The following information is provided for legacy context.

Role required: ml_admin or admin

About this task

Regression solutions enable you to predict a point estimate and prediction interval. The resulting model delivers the following statistics:

- Mean Absolute Error (MAE), which measures the mean deviation of a predicted value from the actual value. This metric is useful as it's easy to understand as its scale is the same as that of its target. However, MAE is unbounded, making it difficult to compare across models.
- Symmetric Mean Absolute Percentage Error (SMAPE) is a percentage value of the deviation from the predicted to the actual. SMAPE is a bounded version of MAE except that it has a value range between 0 and 100. The lower the SMAPE value, the better the model accuracy.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Range Accuracy is the percentage of actual values between a predicted range. In other words, it's the range between the upper and lower bounds of the prediction. For example, if four out of five actual values lie within the predicted range, the range accuracy is 80%.
- Average Interval Width is the difference between the upper and lower bounds of the prediction. This metric explains how informative the interval is. The smaller the average width, the better the model

When making predictions, regression also enables you to specify a confidence level for the prediction interval (range).

In this example procedure, you create and train a regression solution definition to predict the amount of time it takes to restore a cloud database.

Procedure

1. Navigate to **All** > **Predictive Intelligence** > **Regression** > **Solution Definitions**.
2. On the Regression Definitions list, select **New**.
3. On the Regression Definition form, configure these fields per the following guidance.

Field	Value
Label	Enter a unique name for your regression solution. For example, in this use case you could enter `Regression Test for DB Restore`.
Name	As you enter your solution Label value, this field automatically populates with a system-assigned name that's similar to your label value.
Word Corpus	Select an existing word corpus that's relevant to your solution. For example, in this use case you select a word corpus that has a title such as **Incidents in the last 3 months**. If you don't have a relevant word corpus, follow the steps to create a word corpus first. When the word corpus is complete, you can select it from the Word Corpus field in your Regression Definition form. However, the word corpus selection is optional. If your input data has text columns and you don't choose a word corpus, your regression solution trains a new word corpus model by using the text columns in your input data. The resulting word corpus can be reused in any other regression solution or other ML solution type. **Note:** A pre-trained model is used instead of the Word Corpus for users who activated Predictive Intelligence starting in the Utah release.
Table	Select the database table on which you're applying regression. The table should contain historical records the system can use to predict the length of time for its database restore.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
Output Field	Select the field whose value you want the predictive model to set. In general, a good output field is a numeric, integer, or floating point field. In this example scenario, you use the **Duration** field to measure a length of time. The output field should generate a numeric value.
Fields	Select one or more field types that help the system identify the records you want to train using regression. In this example scenario, you use **Short description**, **Source datacenter**, **Target datacenter**, and **Database size**. (short_description, Sourcedc, Targetdc, and Dbsize.) Input field types can be string, nominal, or numeric.
Filter	(Optional) Add filter conditions to the output field records that you want to train using regression. **Note:** ○ The minimum number of records for regression training is 10,000 records. ○ The maximum number of records for regression training is limited to 300,000.
Processing Language	Select the primary language of the dataset that you're training on the solution definition. If the dataset language is Italian, choose **Italian**. Also, English processing is applied to all datasets by default. For example, if you select Italian, the system processes the data in both English and Italian. **Note:** The term processing indicates some of the language-specific steps used as part of training a solution. These steps include tokenizing words, removing stop words, and stemming.
Stopwords	When you select your processing language, the system automatically adds a Stopwords list that uses the same language. For example, if your processing language is Italian, the **Default Italian Stopwords** list is displayed. The **Default English Stopwords** list also displays in your selection. If you create a custom stopwords list, you can select it from the Stopwords field to add it to your solution. In this scenario, you use the **Default English Stopwords** list.
Training Frequency	Select how often the system regenerates the solution based on records matching the **Filter**. Your options include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
	○ Run Once ○ Every 30 days ○ Every 60 days ○ Every 90 days ○ Every 120 days ○ Every 180 days In this scenario, you select Every 30 days By default, the system runs training once. This practice provides you time to review and update the solution definition as needed until it provides acceptable coverage and precision values. **Note:** ○ The minimum number of records required for regression solution training is set at 10,000. ○ The ML scheduler limits the number of trainings an instance can commit to 50 new ML training requests per instance within a 24-hour window. This limit excludes scheduled requests for retraining. In addition, clustering and similarity updates are also excluded from this limit, even if the new training requests exceed 50 within a 24-hour window.

4. Select the appropriate context menu option or button for your solution definition.

Option	Description
Save or Save & Train	Save your solution definition record so you can return to it later, or save and submit it for training.
Submit or Submit & Train	Create your solution definition record and submit it, or submit and train it.

5. If you submitted the solution for training, select **OK** on the **Training Activation** window to confirm.

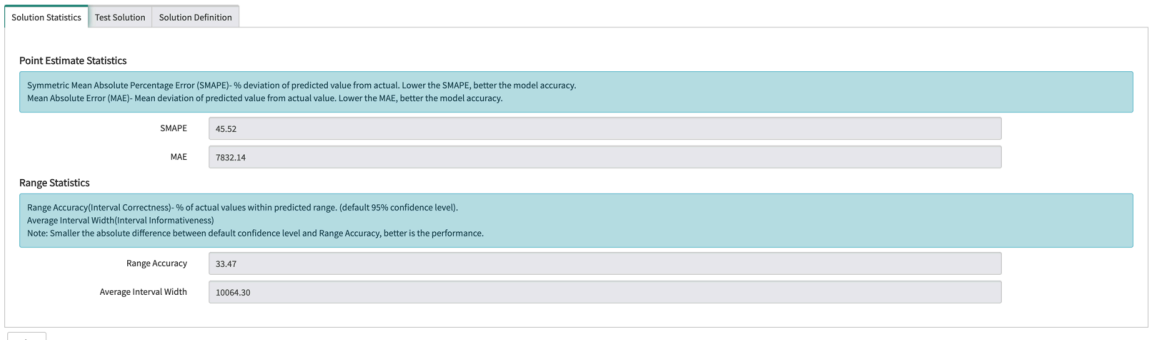
   The system schedules the solution for training with the nearest training service. The system sends you a notification when the training completes, including any errors that may have occurred in the training. Any other users can subscribe to the Predictive Intelligence Notifications category. When training completes, the system uploads the solution as an Attachment record.

What to do next

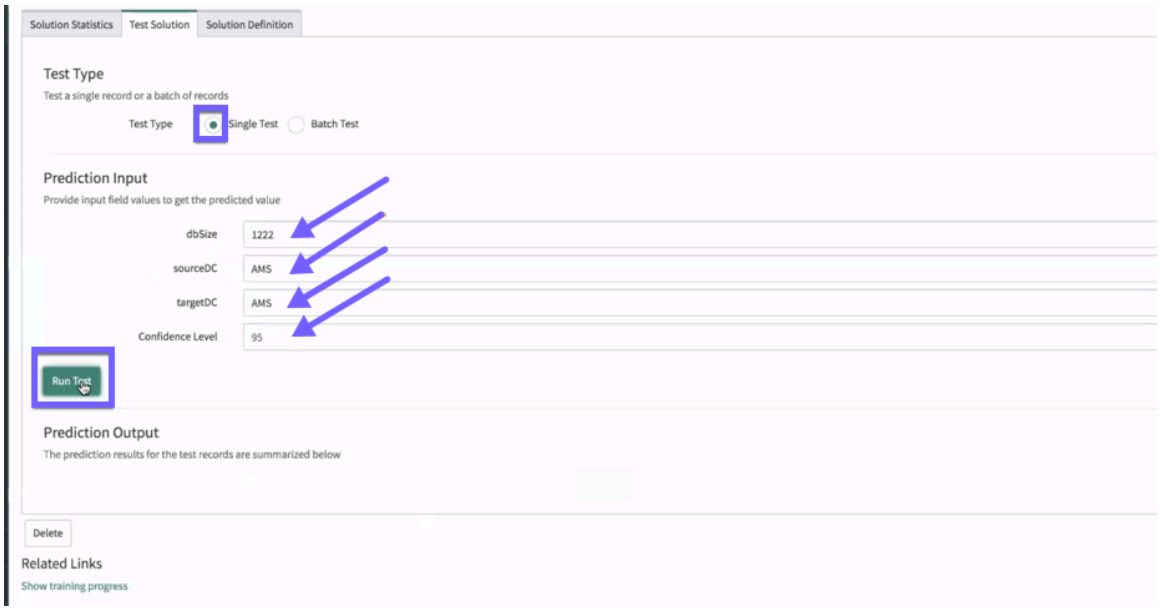
In this example scenario, you created an ML solution from your solution definition. The Solution Statistics, Test Solution, and Solution Definition tabs appear in the Related Links section of your ML solution.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

On the Solution Statistics tab, review the Point Estimate and Range (prediction interval) statistics generated by your solution.

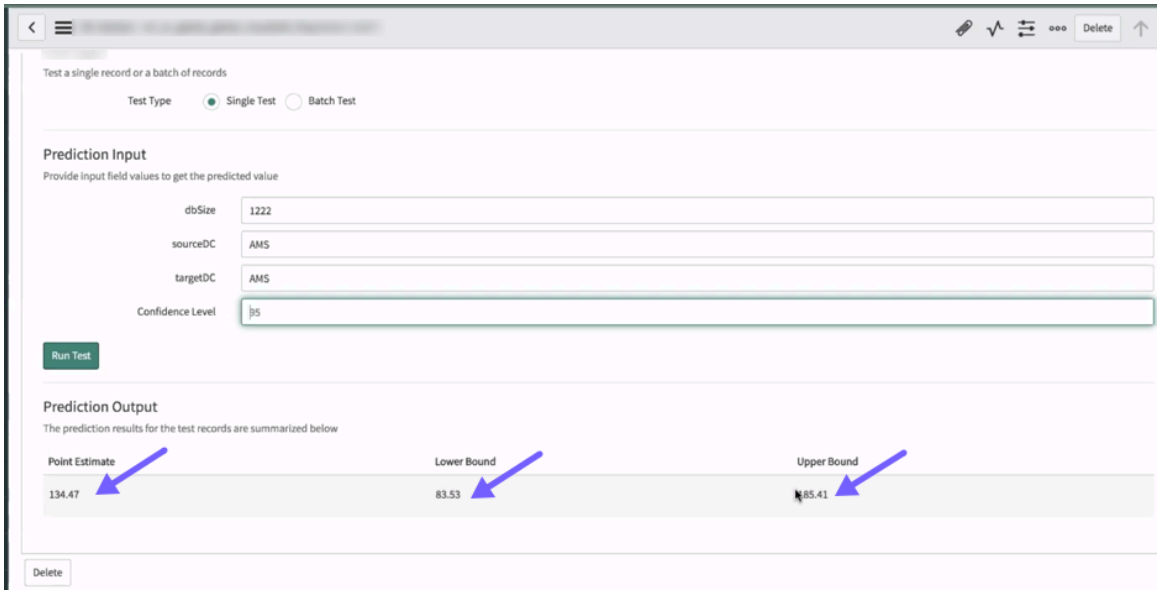


On the Test Solutions tab of your solution, you can test the prediction output for the records you used as input to the prediction by entering values for the input fields, such as the **Source datacenter**, **Target datacenter**, and **Database size**. You can also use the default prediction confidence level of 95, or enter a different level between 0 and 100. Using 95 as the value means that the system is 95% confident that the actual prediction falls within the prediction interval. Select the **Run Test** button to find the prediction output.



After you run the test, the prediction output statistics appear. The Point Estimate on the screen is a single value at one point in time. For example, the database restore takes 134.47 seconds to complete. The Lower and Upper bounds on the screen signify a range accuracy value. For example, the database restore takes from 84.53 to 185.41 seconds to complete.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



View solution training progress

View your solution training progress or statistics to determine if a solution is available, or how long the next training cycle might take to complete.

Before you begin

Role required: admin or ml_admin

About this task

Solution training involves these steps.

1. Fetching files for training. The system downloads the training records and sends them to the nearest training service.
2. Preparing the data. The system removes duplicate records from the training set.
3. Training the solution. The training service trains the solution.
4. Uploading the trained solution. The training service uploads the solution as attachment records.

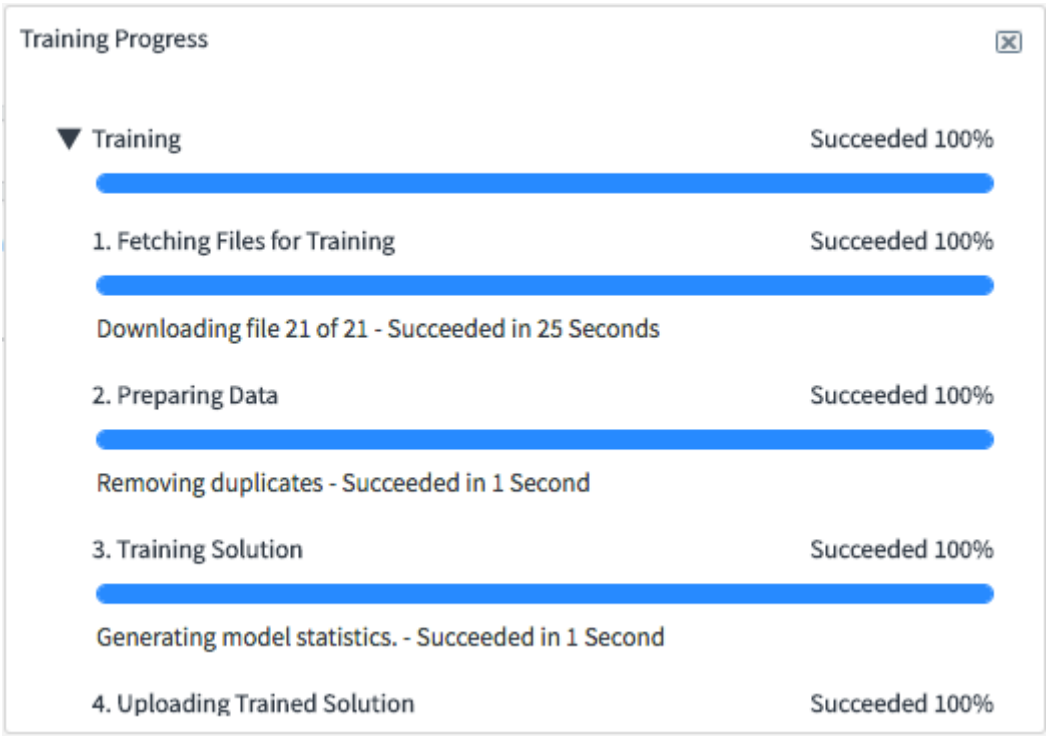
Procedure

1. Navigate to **All** > **Predictive Intelligence** > **Classification** > **Solutions** or **Predictive Intelligence** > **Similarity** > **Solutions**.
2. In the ML Solutions list, select the solution whose progress or statistics you want to view.

   Example
   For example, select **Incident Categorization** to see the training history.
3. In the **Related Links** section, click **Show training progress**.
   Training times vary based on the number of records and classes within the training set. The more records and classes you use, the longer the training can take. For example, a data set containing 100,000 records and several hundred classes can take around five hours to complete.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The system shows a Training Progress pop-up window.



What to do next

For classification solutions, see Review classification solution statistics.

For similarity solutions, see Review similarity solution examples and scores.

Review classification solution statistics

The Solution Statistics dashboard in Predictive Intelligence has been deprecated in the Xanadu release. It provided precision and coverage statistics for each class in a classification solution.

Before you begin

- Role required: admin, ml_admin, or ml_report_user

About this task

Important: With the Brazil release, the Solution Statistics dashboard is deprecated. Upgrading customers can continue to use their existing Solutions Statistics dashboards from the application menu. For new customers onboarding with the Brazil release, the Solutions Statistics dashboard is not available. The following information is provided for legacy context.

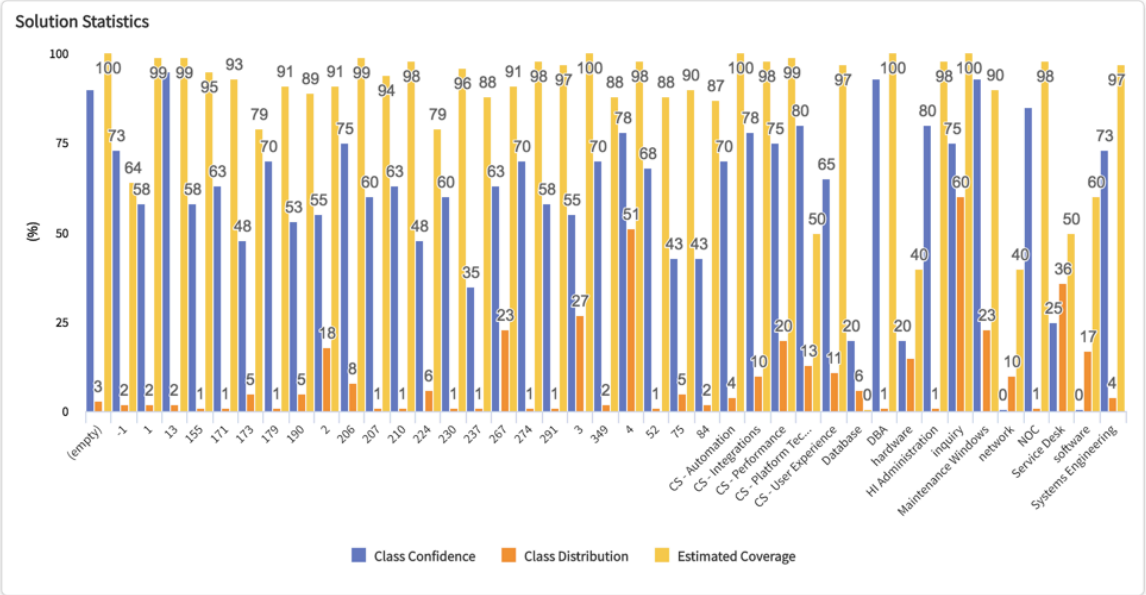
The Solution Statistics dashboard lists the precision, coverage, and distribution for each class of active solutions. The system uses the classes with the highest number of records when it builds a solution. The number of classes predicted may be less than 50, and may skip a class if there is not enough historical data to build a solution that can predict the class confidently.

The Solution Statistics dashboard is different from the Solution Statistics tab in an ML Solution record. For more information, see Create and train a classification solution.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Predictive Intelligence** > **Classification** > **Solution Statistics**.
2. From **Filter by solution**, select the solution whose statistics you want to review.
3. From **Filter by version**, select the solution version whose statistics you want to review.
4. Click **Apply.**
   The system updates the dashboard based on the filters selected.



5. Identify classes with unwanted combinations of precision, coverage, and distribution values.

   Example
   For example, identify classes that have low precision or coverage but a high distribution.

6. Identify any missing classes you want the model to include.

   Example
   For example, identify any missing incident categories from the Incident classification solution.

What to do next

If you're satisfied with the solution you've reviewed, the latest version is already active and ready to use. If you're not satisfied, you can choose a different version of the solution and make it active. You can also tune and retune the solution by configuring the class precision and coverage to use acceptable values.

Review solution similarity examples

Review the similarity examples generated during solution training to determine whether the similarity score threshold meets your business requirements.

Before you begin

- Train a similarity solution
- Role required: ml_admin or admin

About this task

Solution training generates a set of paired record examples. Each pair includes a percentile score that estimates the degree of similarity between the two records. The higher the score, the higher the similarity, as follows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- A score of 100 indicates identical records.
- A score of 0 indicates dissimilar records.

A deployed solution returns records only when the score is higher than the **Similarity Score Threshold** value:

- The higher the threshold value, the higher the precision and the lower the coverage.
- The lower the threshold value, the lower the precision and the higher the coverage.

On domain-separated instances, the following procedure displays records from all domains to ML admins. However, when solutions are applied in your forms and flows, similarity predictions are domain-aware. Examples from other domains on the instance are not displayed to users.

Note: The similarity filters specified in the solution definition aren't applied for similarity examples and are applied only during prediction.

Procedure

1. Navigate to **All** > **Predictive Intelligence** > **Similarity** > **Solutions**.
2. In the ML Solutions list, locate your solution by filtering for the Solution Name, and open the active version.
3. In the Related Links section of the form, select **Similarity Examples**.
   A list of paired records opens on the Similarity Examples (ml_similarity_example) table. By default the rows are sorted by the **Similarity Score** column in descending order.
4. Review the similarity examples for accuracy and coverage.
   Based on your review, determine whether to increase or decrease the Similarity Score Threshold value of your solution.

What to do next

If you decide to adjust the Similarity Score Threshold for your similarity solution, see update its similarity solution threshold.

Using Predictive Intelligence

Train and use Predictive Intelligence solutions to accomplish various tasks.

Overview of Predictive Intelligence

Predictive Intelligence is the interface by which you can train models on the ServiceNow AI Platform. These models enable you to predict, estimate, and identify patterns that can be used to route work, populate form fields, and more.

- Show suggestions for relevant articles.
- Assign, categorize, and prioritize tasks.
- Detect major incidents.
- Recommend case resolutions.
- Prevent duplicate articles and ideas.
- Detect phishing attempts.

For more information about the different types of solutions available, see Explore Predictive Intelligence.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Training your ML solutions

Predictive Intelligence enables you to train predictive models and machine-learning solutions that you can apply using data on your instances. The solutions you create use the frameworks to predict, recommend, and organize data. To get started, see Creating and training solutions.

You can also extend Predictive Intelligence to other processes and applications. For more information, see ServiceNow apps and features that use Predictive Intelligence.

Testing and monitoring predictions

After creating and training your solutions, call the Predictive Intelligence API to make a solution prediction. Use the results to gauge the performance of the solution and iterate as needed.

You can track the coverage and precision of deployed predictive models using the Solution Statistics dashboard, which provides reporting on these prediction areas by default.

Report	Description
Average Prediction Coverage (last 30 days)	The percentage of predictions that yielded an outcome out of the total number of predictions attempted. Select the coverage score to see a breakdown by class.
Daily Prediction Coverage	The percentage of records created on a given day in which the solution was able to predict an outcome.
Average Prediction Precision (last 30 days)	The percentage of predictions in which the predicted value was the same as the final value of the field when the record closed. Select the precision score to see a breakdown by class.
Daily Prediction Precision	The percentage of records closed on a given day in which the predicted field value was the same as the final value.

For more information, see Testing and monitoring predictions.

Preparing your instance

Preparation is the key to getting the most out of Predictive Intelligence. You don't need to write code or do calculations, but deciding what you hope to do with the solution definitions will make implementation easier.

- Identify the problems that you want to solve with Predictive Intelligence.
- Have 30,000–300,000 high-quality records from which Predictive Intelligence can learn.
- Set your expectations.

Note: Inconsistencies or gaps in training data can cause incorrect or unreliable predictions.

Implementation Process

Predictive Intelligence takes approximately 14 days to implement on a production instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Day 1: Clone production instance over to a non-production instance.
- Days 2–10: Create a solution definition, train it on historical records, and validate that the solution works as desired on the non-production instance.
- Days 11–13: Create import and update sets to move the solution to production, train and validate on the new instance, and set the retraining frequency.
- Day 14 and on: Monitor the solution.

In general, non-production environments are where workflows can be tested and formatted before being moved over to the production instance to further train models and test predictions.

For more information about getting started with Predictive Intelligence, see our guide on how to get started with Predictive Intelligence.

Using Machine Learning APIs

Use ServiceNow Machine Learning (ML) APIs to train Machine Learning models and run inferences.

ML APIs enable training solutions and managing solution versions. You can get and set active versions, monitor training status, and more. The ML API also provides encoders, which enable using term frequency–inverse document frequency (TF-IDF) as a word corpus. Predictability estimates enable assessing the predictive value of table columns.

Note: Predictive Intelligence APIs run with full privileges before the Vancouver Patch 7 Hotfix 2b and Washington DC Patch 7 releases. With later releases, grant access using ACLs. For more information see Query ACLs.

ML API class overview

This section briefly describes classes for training ML solutions and running inferences with trained solutions.

Datasets

A dataset is a set of records including a table name, columns, and row selection criteria to use as input for ML training algorithms. Datasets don't contain the actual data.

For more information, see DatasetDefinition.

ML objects – Solutions, Encoders, and Estimates

ML objects define a specific training configuration to apply on a dataset. Some operations are common across ML objects. Solution objects include classification, clustering, regression, and similarity.

Encoders are text processing objects that are either pre-trained or trained based on the language datasets you provide. You can train encoders that determine how the system interprets and processes text fields. For ML solutions that include text, you can train an encoder to specify how to process text and use the trained encoder in a solution.

PredictabilityEstimate objects estimate which fields in a dataset are predictable and the features on which this predictability is based.

For more information, see:

- ClassificationSolution
- ClusteringSolution

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Encoder
- PredictabilityEstimate
- RegressionSolution
- SimilaritySolution

Stores

ML objects are maintained in a specific store for each object type. Each store class includes methods for add, get, update, and delete operations.

For more information, see:

- ClassificationSolutionStore
- ClusteringSolutionStore
- EncoderStore
- PredictabilityEstimateStore
- RegressionSolutionStore
- SimilaritySolutionStore

Versions

Each trained object results in a new version that you can run tasks on. Use the version API to get any solution version and run tasks on it.

For more information, see:

- ClassificationSolutionVersion
- ClusteringSolutionVersion
- EncoderVersion
- PredictabilityEstimateVersion
- RegressionSolutionVersion
- SimilaritySolutionVersion

Putting it together: ML API flows

You can use the following flow to configure and train solutions, encoders, and predictability estimates:

1. Define a dataset (DatasetDefinition)
2. Create an ML object (Solution/Encoder/PredictabilityEstimate)
3. Add to store (Store)
4. Train (Solution/Encoder/PredictabilityEstimate)

Note: The encoder definitions support multiple dataset definitions, but have the same training flow.

To train a solution with an encoder, create the encoder first, then include the encoder in the solution configuration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Create an encoder (Encoder)
2. Define a dataset (DatasetDefinition)
3. Create solution specifying encoder (Solution)
4. Add to store (SolutionStore)
5. Train (Solution)

ML object encoder requirements:

- Required in similarity API solutions.
- Required in clustering API solutions, unless using the Levenshtein distance algorithm, in which case encoders are optional.
- Optional for classification and regression solutions.
- Unavailable for predictability estimates.

Getting started with ML API solution training

Follow this example procedure to learn how to configure and train a solution.

Configure and train a solution

1. Define a dataset using the *DatasetDefinition* API.

```
var myData = new sn_ml.DatasetDefinition({

  'tableName' : 'incident',
  'fieldNames' : ['assignment_group',
 'short_description', 'description'],
  'encodedQuery' : 'activeANYTHING'

});
```

2. Use the constructor to define the solution, including the dataset in the configuration.

```
var mySolution = new sn_ml.ClassificationSolution({

  'label': "my solution definition",
  'dataset' : myData,
  'predictedFieldName' : 'assignment_group',
  'inputFieldNames':['short_description']

});
```

   - *ClassificationSolution()*
   - *ClusteringSolution()*
   - *Encoder()*
   - *PredictabilityEstimate()*
   - *RegressionSolution()*
   - *SimilaritySolution()*

3. Add the solution definition to the store using the *add()* method.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var my_unique_name =
 sn_ml.ClassificationSolutionStore.add(mySolution);
```

- *ClassificationSolutionStore - add()*
- *ClusteringSolutionStore – add()*
- *EncoderStore - add()*
- *PredictabilityEstimateStore - add()*
- *RegressionSolutionStore - add()*
- *SimilaritySolutionStore - add()*

4. Train the solution using the *submitTrainingJob()* method. After training is complete, you can manage the trained solution using a solution version API. A solution can be retrained multiple times. Each training results in a new solution "version" on which you can run inferences.

```
var myClassifierVersion =
 mySolution.submitTrainingJob();
```

- *ClassificationSolution - submitTrainingJob()*
- *ClusteringSolutionVersion – submitTrainingJob()*
- *Encoder - submitTrainingJob()*
- *PredictabilityEstimate - submitTrainingJob()*
- *RegressionSolution - submitTrainingJob()*
- *SimilaritySolution - submitTrainingJob()*

View all classification solutions in a store

You can use the store *getAllNames()* method to see a list of all solutions that have been added to the store.

```
gs.print(JSON.stringify(JSON.parse(sn_ml.Classification
SolutionStore.getAllNames()), null, 2));
```

In the output, the system has named the solution `ml_x_snc_global_global_my_solution_definition`. Use this name in subsequent examples to get version information.

```
*** Script: [
  "ml_incident_assignment",
  "ml_x_snc_global_global_my_solution_definition",
  "ml_incident_categorization"
]
```

- *ClassificationSolutionStore - getAllNames()*
- *ClusteringSolutionStore – getAllNames()*
- *EncoderStore - getAllNames()*
- *PredictabilityEstimateStore - getAllNames()*
- *RegressionSolutionStore - getAllNames()*
- *SimilaritySolutionStore - getAllNames()*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Getting started with ML API solution versions

Follow these example breakdowns to learn how to manage trained solution versions.

Check training status

Get the classification solution from the store, choose a version, and check its training status. The methods used for checking training status are applicable to all ML object types.

1. Get the solution from the classification solution store using the *get()* method.

```
// Get the solution created in the previous example
 from the classification solution store
var mlSolution =
 sn_ml.ClassificationSolutionStore.get('ml_x_snc_globa
l_global_my_solution_definition');
```

   - *ClassificationSolutionStore - get()*
   - *ClusteringSolutionStore – get()*
   - *EncoderStore - get()*
   - *PredictabilityEstimateStore - get()*
   - *RegressionSolutionStore - get()*
   - *SimilaritySolutionStore - get()*

2. Access the most recent solution version using the *getLatestVersion()* solution method and get its training status using the *getStatus()* version method.

```
// Access the latest version of the solution and print
 its training status
gs.print(JSON.stringify(JSON.parse(mlSolution.getLates
tVersion().getStatus(), null, 2)));
```

   Output when training is complete:

```
*** Script:
 {"state":"solution_complete","percentComplete":"100",
"hasJobEnded":"true"}
```

getLatestVersion()	getStatus()
ClassificationSolution - getLatestVersion()	*ClassificationSolutionVersion - getStatus()*
ClusteringSolution – getLatestVersion()	*ClusteringSolutionVersion – getStatus()*
Encoder - getLatestVersion()	*EncoderVersion - getStatus()*
PredictabilityEstimate - getLatestVersion()	*PredictabilityEstimateVersion - getStatus()*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

getLatestVersion()	getStatus()
RegressionSolution - getLatestVersion()	*RegressionSolutionVersion - getStatus()*
SimilaritySolution - getLatestVersion()	*SimilaritySolutionVersion - getStatus()*

Get predictions using a solution version

After the solution has been trained, get the trained version and run a prediction on it. Get the solution you created from the store. Next, choose the trained version and predict the trained version.

Note: Predictions cannot be made on encoders and predictability estimates.

1. Get the solution from the classification solution store using the *get()* method.

```
// Get the solution created in the first example from
 the classification solution store
var mlSolution =
 sn_ml.ClassificationSolutionStore.get('ml_x_snc_globa
l_global_my_solution_definition');
```

2. Use the GlideRecord API *get()* method to provide a record from the Incident [incident] table.

```
// single GlideRecord input
var input = new GlideRecord("incident");
input.get("<sys_id>");
```

3. Optional. Configure the *ClassificationSolutionVersion - predict()* method *options* parameter to return the top three results and return all results.

```
// configure optional parameters
var options = {};
options.top_n = 3;
options.apply_threshold = false;
```

4. Declare a variable called `results` and assign it to the prediction job.
   To run the prediction job, get the most recent solution version using the *ClassificationSolution - getLatestVersion()* method and call the *ClassificationSolutionVersion - predict()* method on it.

```
var results =
 mlSolution.getLatestVersion().predict(input,
 options);
```

   - *ClassificationSolutionVersion - predict()*
   - *ClusteringSolutionVersion - predict()*
   - *RegressionSolutionVersion - predict()*
   - *SimilaritySolutionVersion - predict()*

5. Print the predicted results output.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
gs.print(JSON.stringify(JSON.parse(results), null,
 2));
```

Predicted results example output:

```
*** Script: {
  "<sys_id>": [
    {
      "confidence": 99,
      "threshold": 24.75,
      "predictedValue": "Email",
      "predictedSysId": ""
    },
    {
      "confidence": 5.88210244009169,
      "threshold": 100,
      "predictedValue": "Email (I/f)",
      "predictedSysId": ""
    },
    {
      "confidence": 2.3461203499840932,
      "threshold": 14.81,
      "predictedValue": "Authentication",
      "predictedSysId": ""
    }
  ]
}
```

Reviewing your ML solution training jobs

Use the ML Solutions (ML Training Jobs view) module to monitor the training status and progress for Predictive Intelligence solutions. The module displays training jobs for both user interface and API solutions.

Background and usage

When you submit an ML solution or ML solution definition for training, it goes to a ServiceNow data center for processing to predict and deliver a data outcome. Depending on the solution size, the training can take hours or sometimes days to complete. The ML Training Jobs view helps you stay on top of all in-progress and completed ML solution training jobs in your instance.

To access this view, you use the admin or ml_admin role and the following navigation path: **Predictive Intelligence** > **Training Jobs**.

Note: The ML scheduler limits the number of trainings an instance can commit to 50 new ML training requests per instance within a 24 hour window. This excludes scheduled re-training requests. In addition, clustering and similarity updates are also excluded from this limit, even if the new training requests exceed 50 within a 24 hour window.

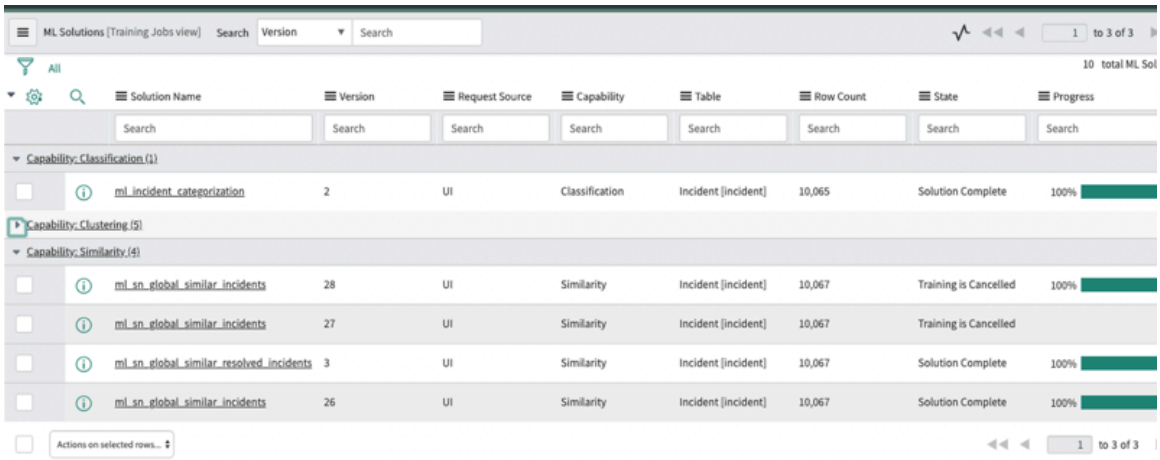
ML Training Jobs view summary

The view shows all ML training jobs grouped by the four Predictive Intelligence capability frameworks: classification, similarity, clustering, and regression.

Each record displays values such as solution name, version, training state, and training completion percentage.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you don't have any training jobs for a particular capability, the list doesn't display a group for that capability. For example, in this scenario, there is no group for regression because you don't have any regression solutions that you've submitted for training yet.



Select the Solution Name to see the details of the ML solution, as demonstrated in the images below.

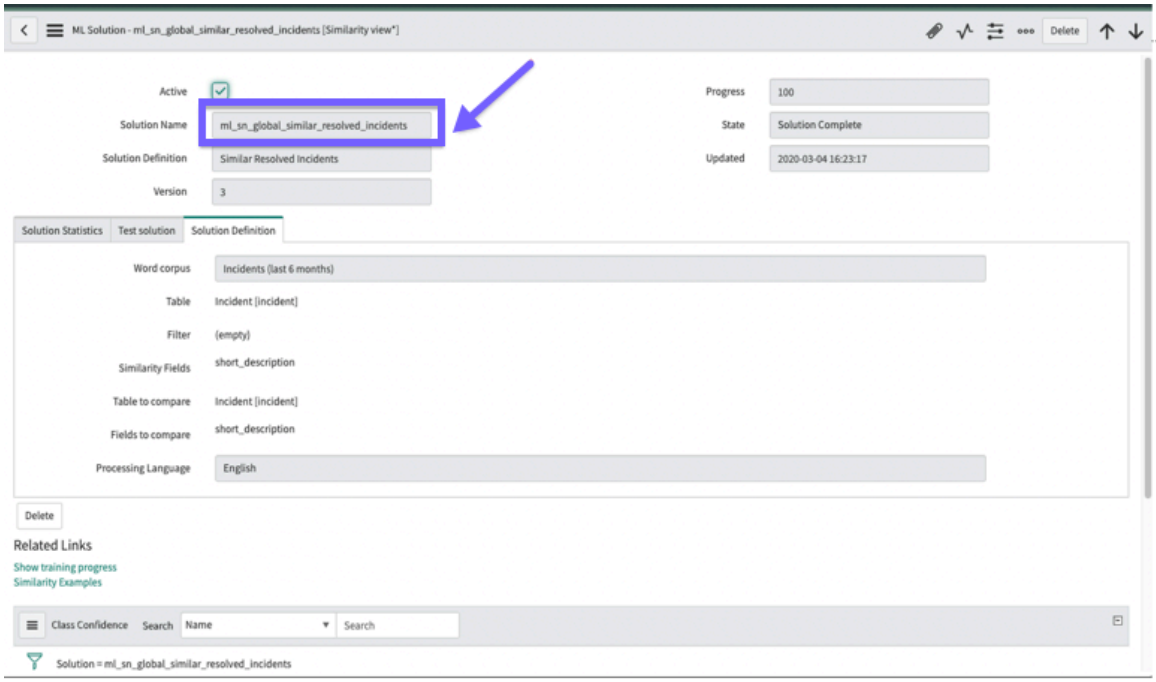
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Use Predictive Intelligence in Workflow Studio with ML actions

Use Predictive Intelligence actions in Workflow Studio to create flows that incorporate your model predictions.

Before you begin

- Make sure the following plugins are activated in your instance: Predictive Intelligence (com.glide.platform_ml) and Predictive Intelligence for Workflow Studio (com.snc.ml_flowdesigner).
- Create or use an existing trained Predictive Intelligence solution.
- Roles required: ml_admin or admin, and flow_designer or delegated_developer.

About this task

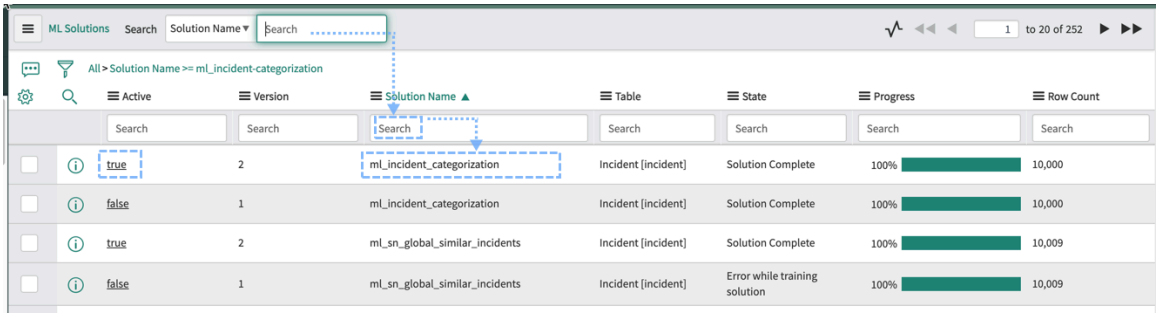
Workflow Studio enables you to automate complex processes. The first thing to identify is what process you want to automate. In this example scenario, you're automating the assignment of a Category to an incident record. When you complete the flow, the next incident record created in your instance updates the Category field in the record based on the text entered in the **Short description** field.

You can deploy any active and trained classification, similarity, or regression ML solution in your flow, as appropriate for your use case.

Note: The regression framework is deprecated in the Brazil release. You can continue to use existing regression solutions but you can't create new ones.

In this example procedure, you create a flow that implements the ml_incident_categorization solution in a Workflow Studio action. You can find this solution by searching on the ML Solutions [ml_solution] table, as shown in the image below. Confirm that the solution you use has been trained and its **Active** value is set to **true**.

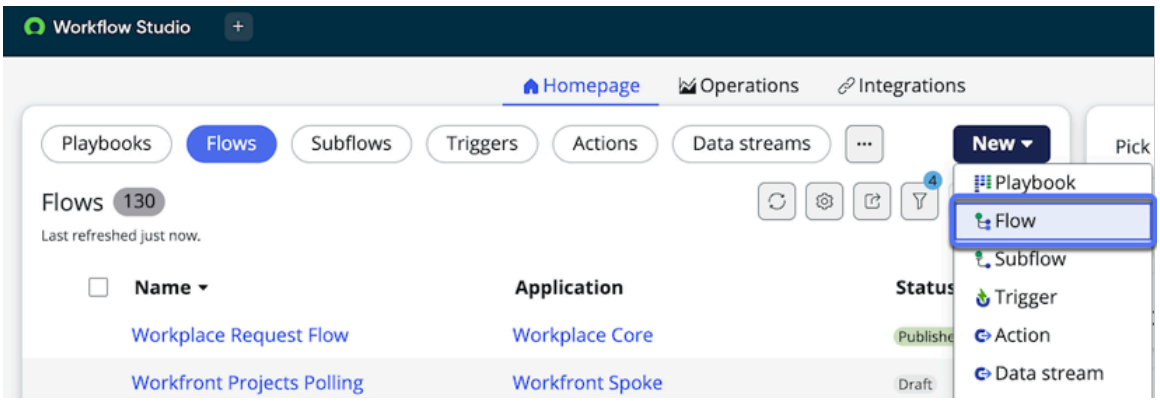
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



For more information on how to use Flow Designer in Workflow Studio, see Exploring flows. For information about the Actions included in Predictive Intelligence for Workflow Studio, see the Spoke actions table in Machine Learning solutions for Flow Designer.

Procedure

1. Navigate to **All** > **Process Automation** > *`Workflow Studio`*.
2. Select **New** > **Flow**.



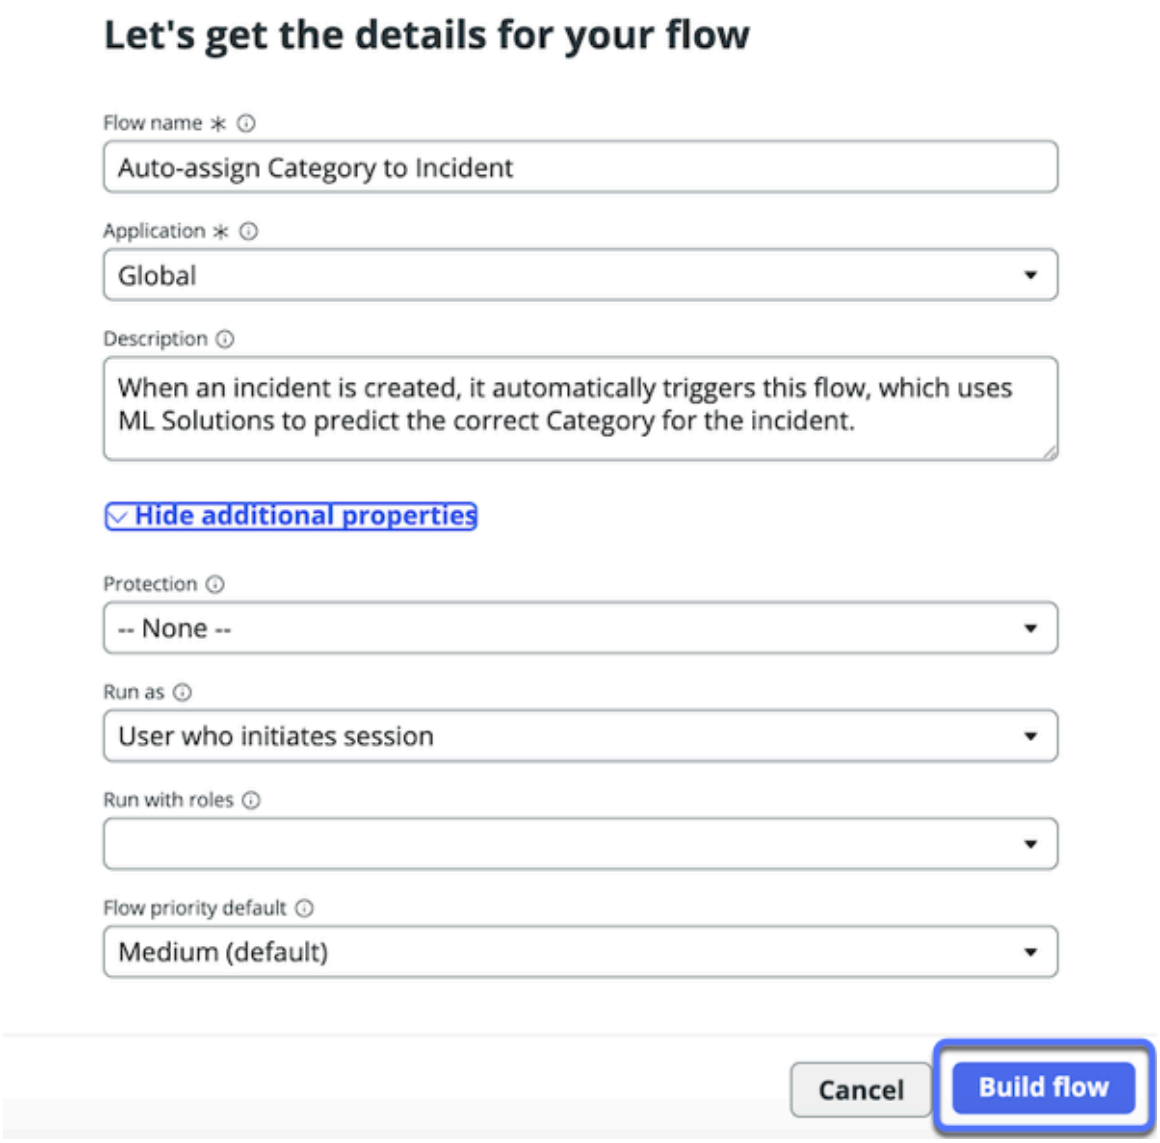
3. On the **Let's get the details for your flow** screen, configure the following fields. Expand **Show additional properties** to view all fields.

Field	Description
Flow Name	Provide a name for the flow. In this scenario, you enter `Auto-assign Category to Incident`.
Description	Enter a brief summary description of what the flow delivers. For example, you enter the following: `When an incident is created, it automatically triggers this flow, which uses ML Solutions to predict the correct Category for the incident.`
Application	Select **Global**.
Protection	Select **--None--** or **Read-only**. In this scenario, you select **--None--**.
Run As	Select **User who initiates session**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Run with role(s)	Leave blank.
Flow priority default	Medium (default).

4. Select **Build flow**.

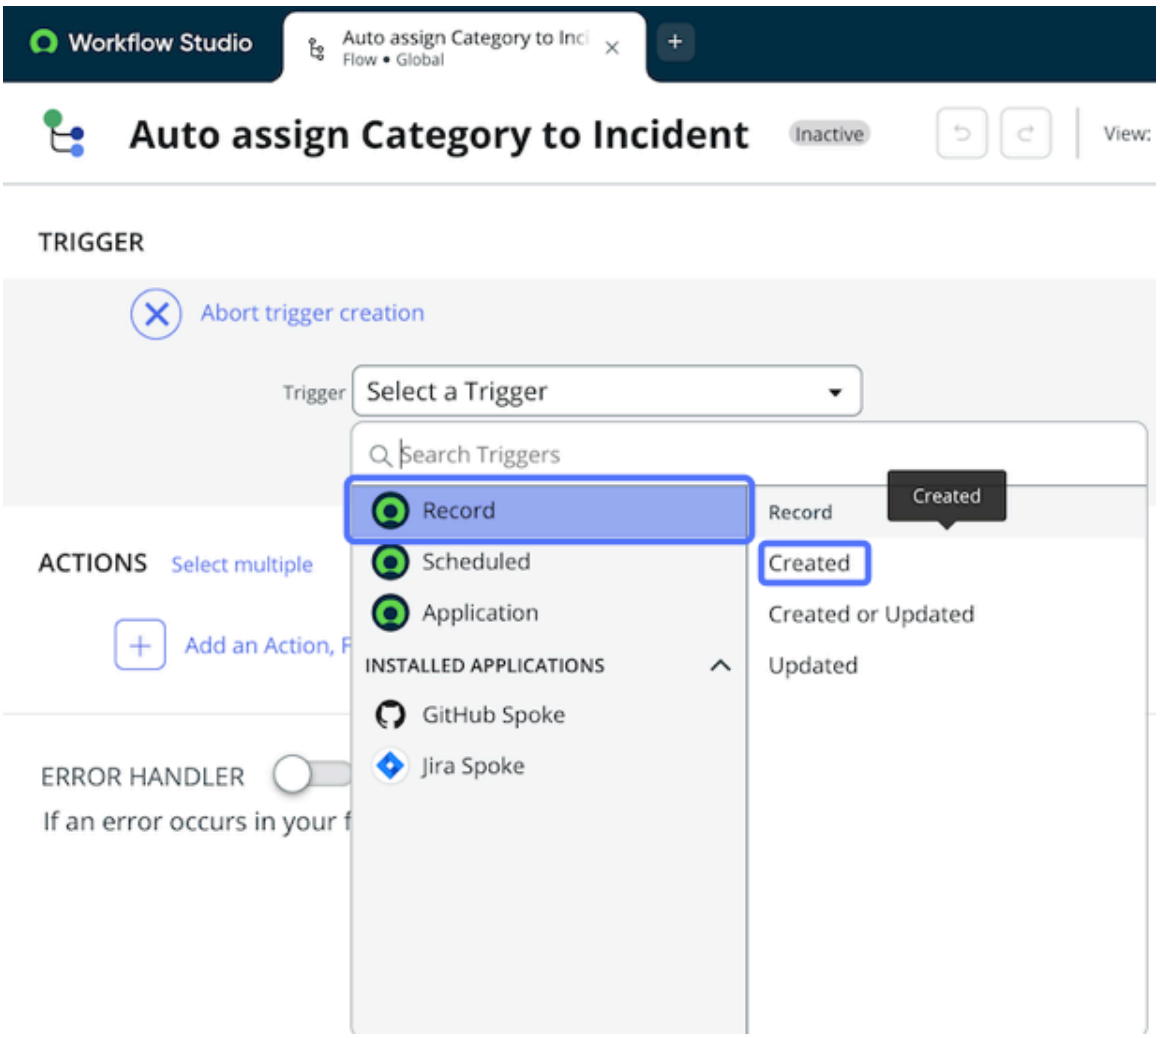


The Flow screen appears, showing the Auto-assign Category to Incident name you assigned to the flow. If a Getting started screen appears, select **Skip tour**.

5. In the TRIGGER section of the Flow screen, configure the following fields to create a trigger for the flow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

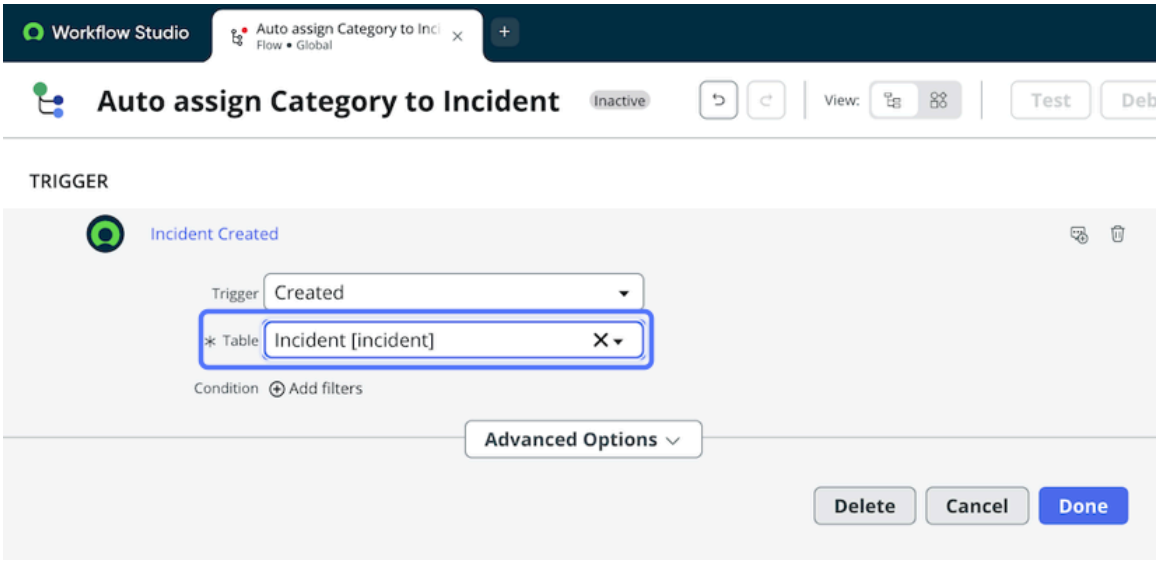
a. **Select a Trigger**: Select **Record**, then from the list of possible options for Record, select **Created**.



b. **Table**: Select **Incident [incident]**.

Note: After you configure both the **Trigger** and **Table** fields, record data pills appear in the **Data** section of the screen so you can use them in your flow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



c. **Condition**: Select **Add filters** if you want to add any conditions to the flow.

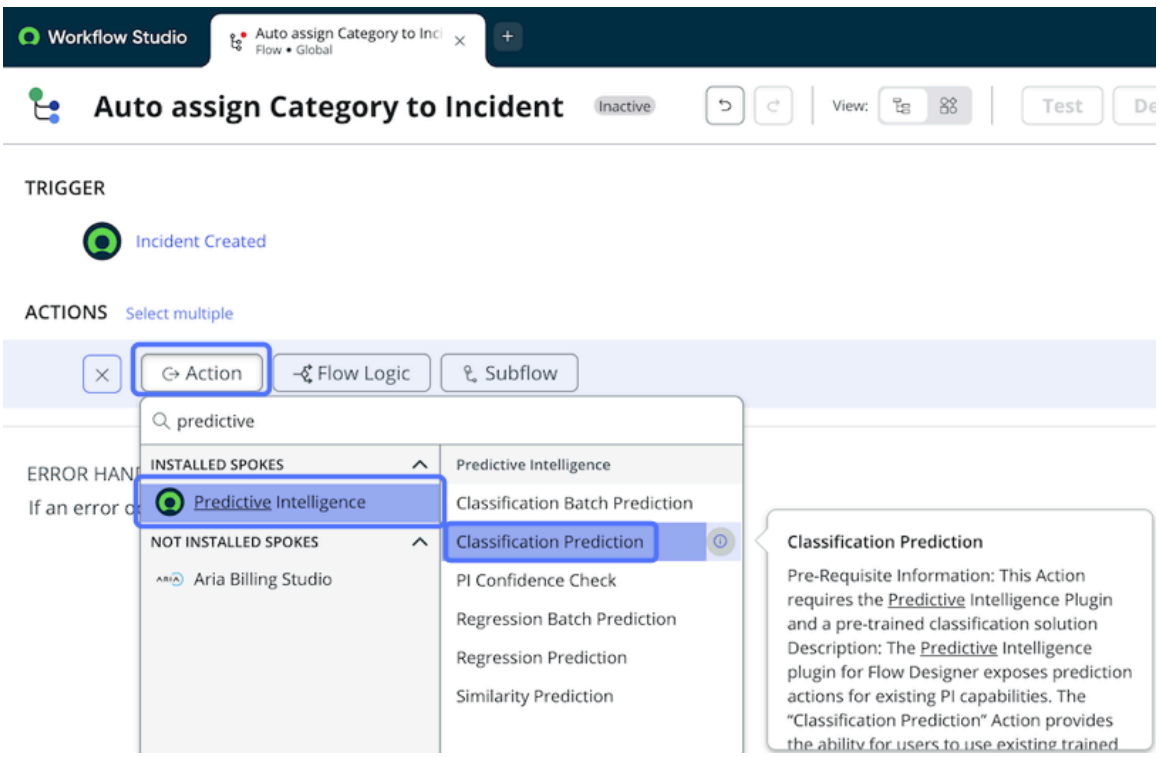
d. **Optional:** Open the **Advanced Options** panel to view additional conditions you can apply to the flow.

e. **Optional:** To close the panel, select **Advanced Options**.

f. Select **Done**.

6. In the ACTIONS section of the screen, configure the following fields to create a Classification Prediction action.

a. **Action** tab: Select **Action** > **Predictive Intelligence** > **Classification Prediction**.



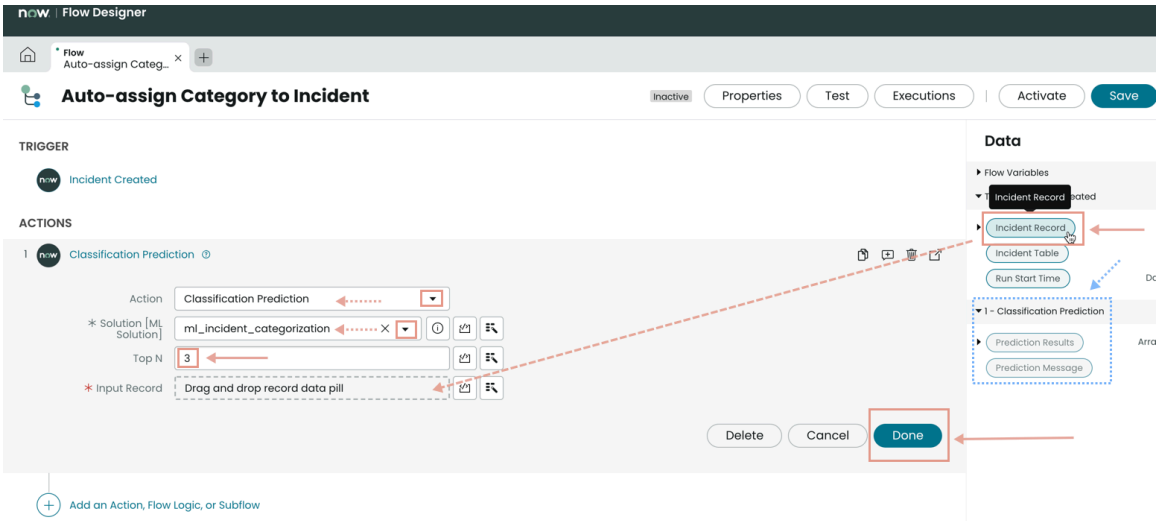
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Select the information icon ( ) to see the description of a Classification Prediction.

b. Solution [ML Solution]: Select **ml_incident_categorization**.

c. Top N: Enter 3 for the example scenario.
When you enter a number, such as 3, the system uses the top three ML predictions that have the highest prediction confidence score. If you don't enter anything, the system sets the default value to 1.

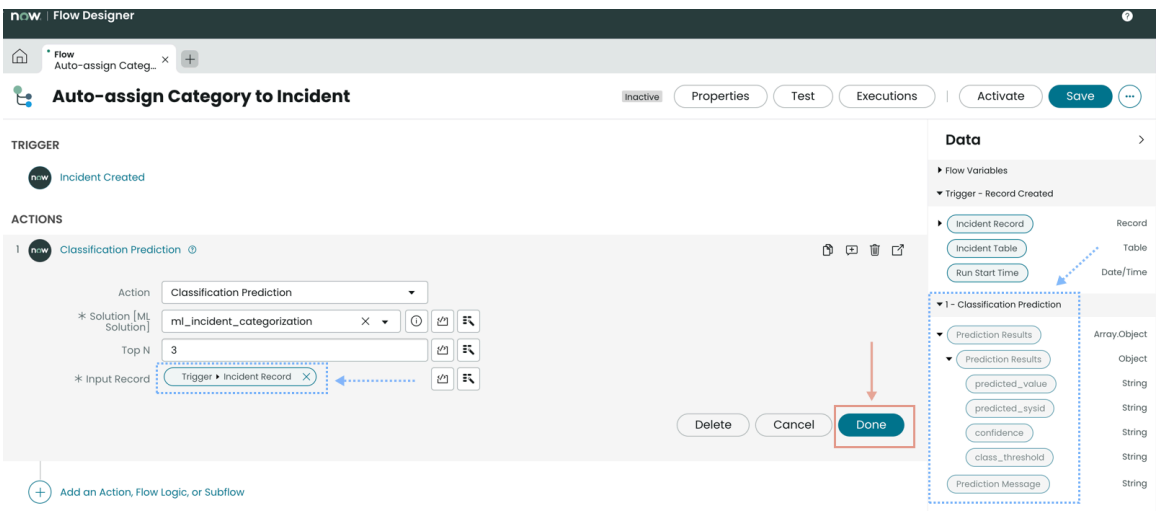
d. Input Record: Drag and drop your **Trigger → Incident Record** data pill into the Input Record field.



The Action, Solution Name, Top N, and Input Record values provide a base for the Category prediction.

Note: The data pill you drop into this record must also be a record. For example, don't try to drop a table pill or a date/time pill into the Input Record field.

e. Select **Done**.
Result: The Classification Prediction action is completed in the flow and its data pills appear in the Data section of the screen.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. In the ACTIONS section of the screen, use the following steps to create actions and flow logic for the incident's Prediction Results.

   Note: Although you can use a loop to iterate through every prediction result, the scenario shown in this documentation uses a relatively small number of actions. For more advanced flow configurations, see the Flow Designer.

   a. **For each item in list of items**: Drag and drop the **Prediction Results** data pill into the **Items** field.

   Note:

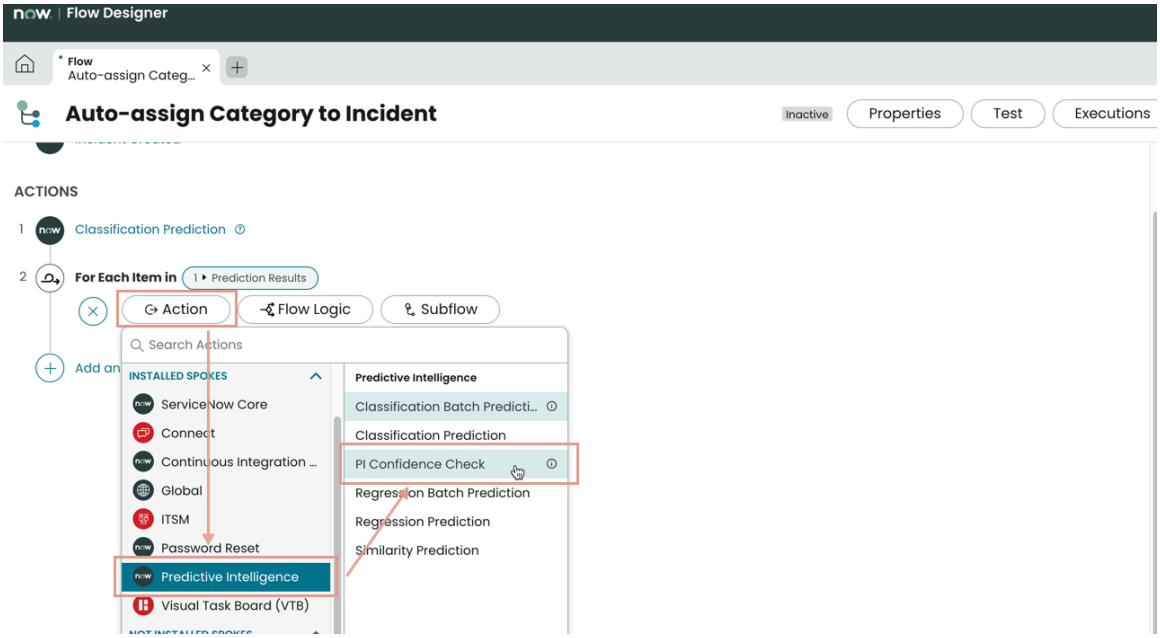
   In order to access the list of items in the Regression Prediction action, you don't need the **For Each Item in** flow logic.

   (The regression framework is deprecated in the Brazil release. You can continue to use existing regression solutions but you can't create new ones.)

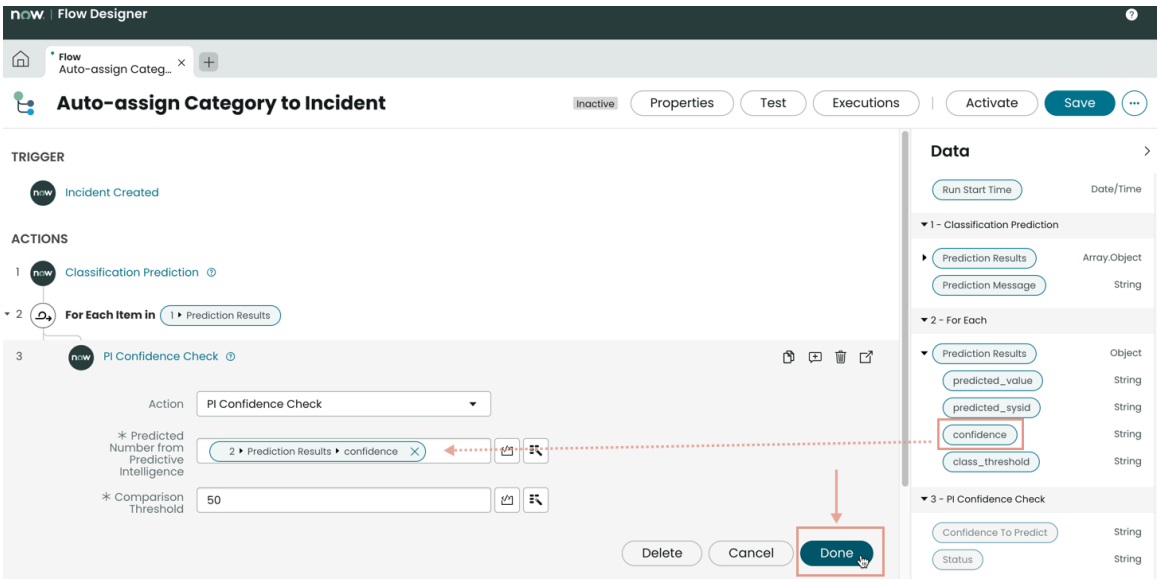
   b. Select **Done**.
   Result: The Prediction Results action is started in the flow and its data pills appear in the Data section of the screen.

8. In the ACTIONS section of the screen, select **Action** > **Predictive Intelligence** > **PI Confidence Check**.
   The PI Confidence Check is a tool you can use to compare values in a flow. In this use case, it compares prediction result values, and the output from the check is either True or False.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

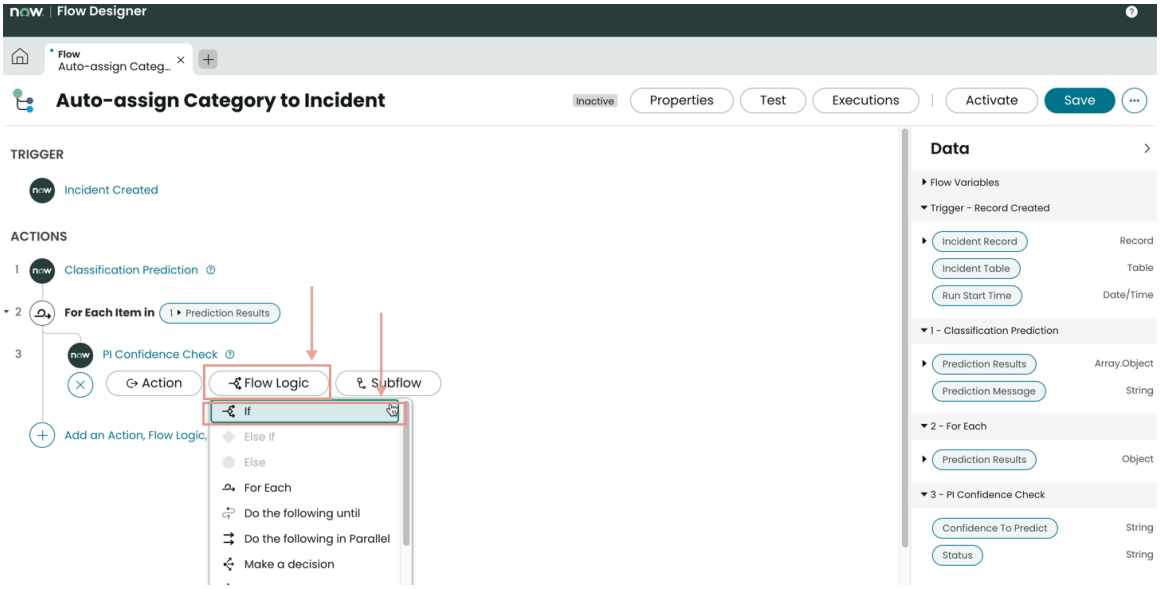


9. Drag and drop the **confidence** data pill into the **Predicted Number from Predictive Intelligence** field.
10. Enter 50 in the **Comparison Threshold** field.
    In this example scenario, you enter the number 50, which tells the system to use predictions that have a confidence score above 50%.
11. Select **Done**.



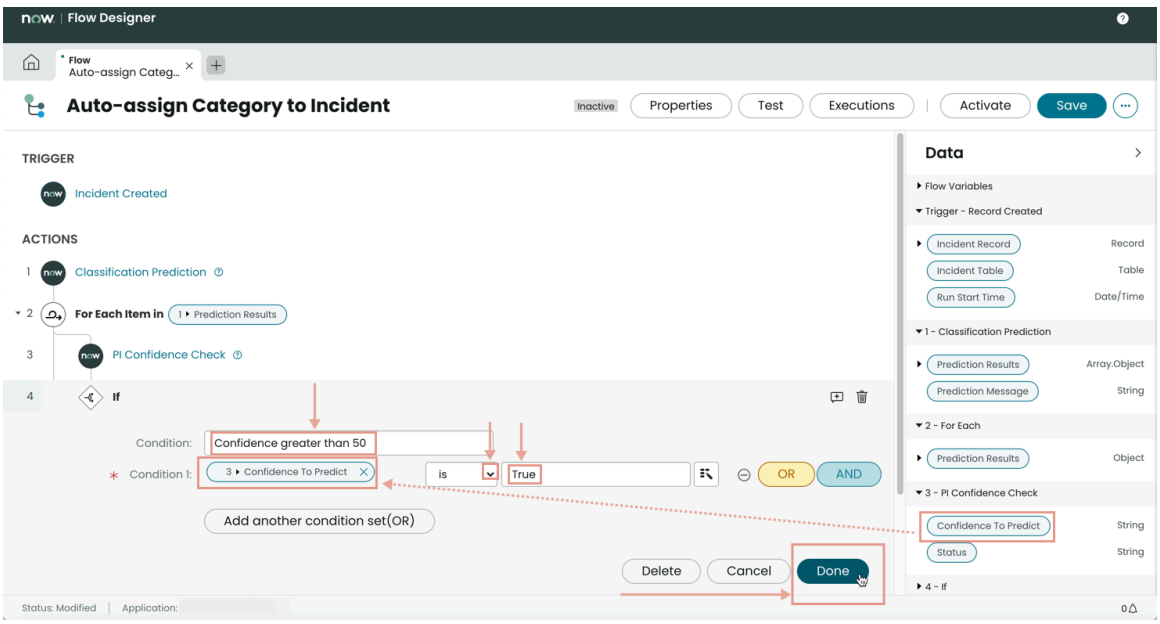
12. Select **Flow Logic** > **If** to add a condition to the flow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



13. Configure the following fields to define the first part of the condition flow logic.

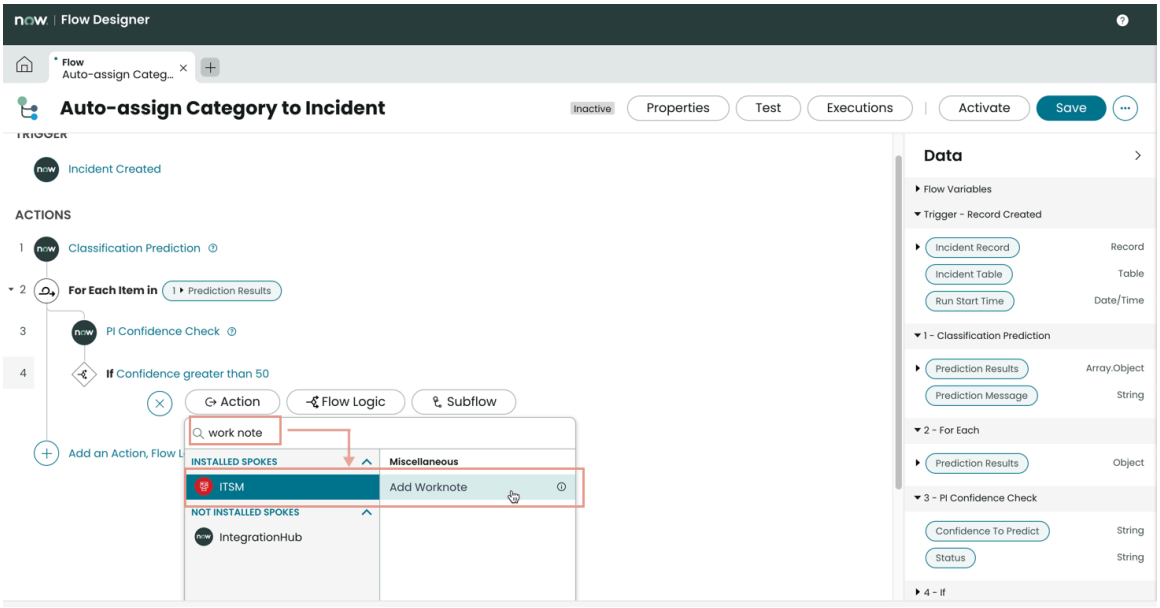
- **Condition**: Enter a name for the condition that defines what it does. In this example scenario, you enter `Confidence greater than 50`.
- **Condition 1**: Drag and drop the **Confidence To Predict** data pill into the field. Select **is**, and enter the value `True`. This step completes the first part (the antecedent) of the condition flow logic.
- Select **Done**.



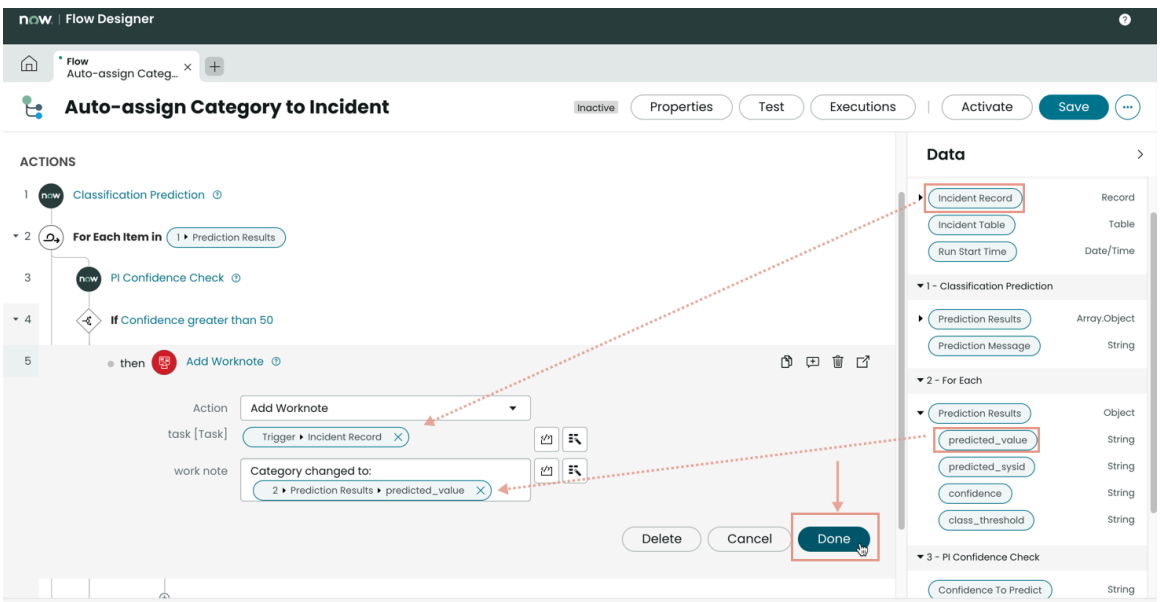
14. Select **Action** and enter `worknote` into the search field.

15. Select **ITSM** > **Add Worknote** to add a work note as the second part (the conclusion) of the condition.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

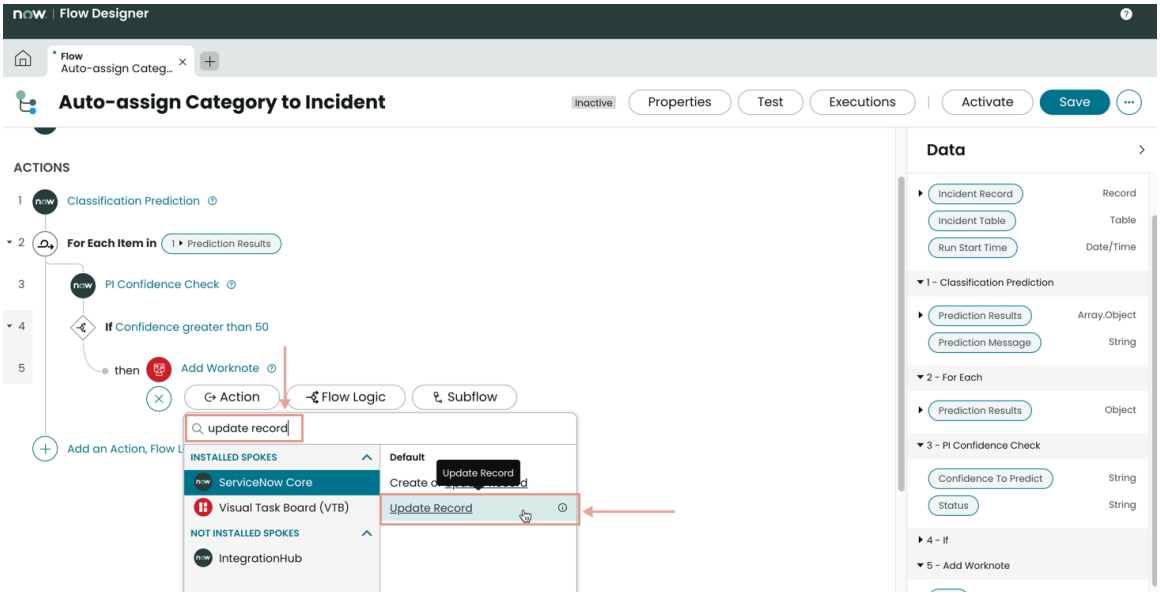


16. Configure the following fields to define the second and final part of the condition flow logic.
    - **Action**: As a result of Step 14 above, **Add Worknote** appears automatically in this field.
    - **task [task]**: Drag and drop the **Incident Record** data pill into the field.
    - **work note**: Drag and drop the **predicted_value** data pill into the field. This step completes the condition flow logic conclusion.
    - Select **Done**.



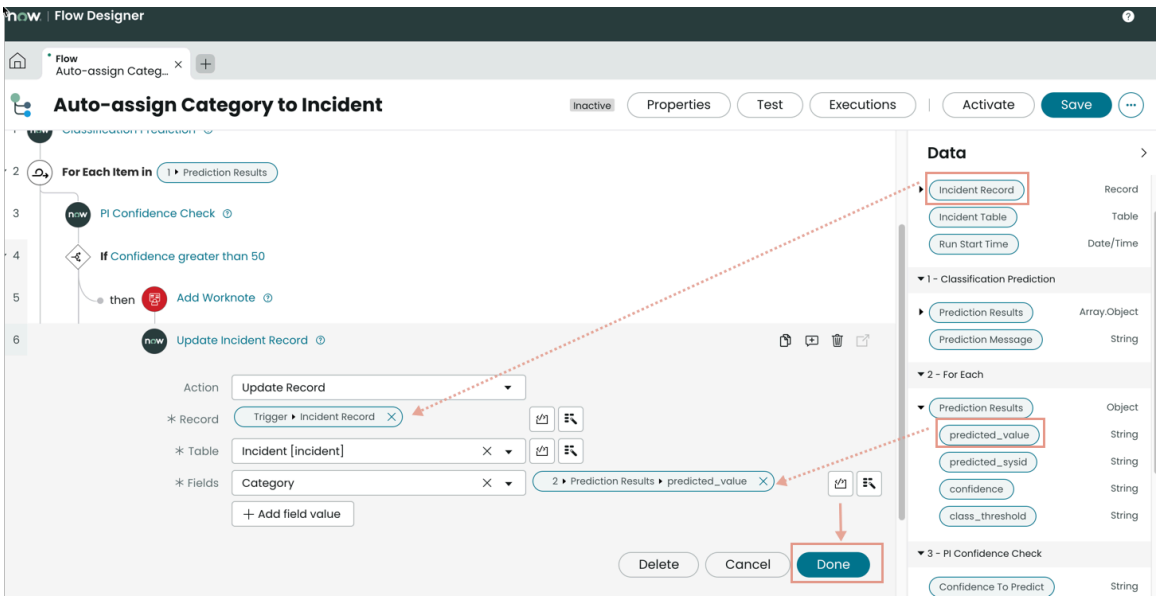
17. Select **Action** and enter `update record` into the search field.
18. Select **Update Record**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



19. Configure the following fields to update the Incident Record.

- **Action**: As a result of Step 16 above, **Update Record** appears automatically in this field.
- **Record**: Drag and drop the **Incident Record** data pill into this field.
- **Table**: Select **Incident [incident]**.
- **Fields**: Select **Category**. Then drag and drop the **predicted_value** data pill into this field, next to the **Category** value.
- Select **Done**.



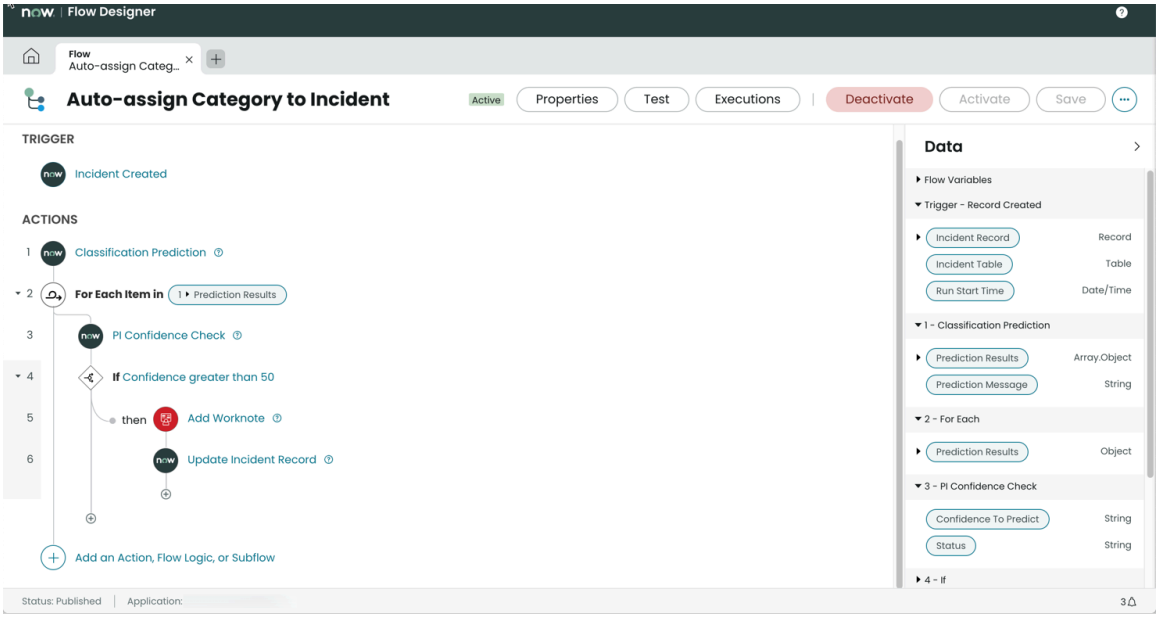
20. Select **Save**.

21. Select **Activate**.

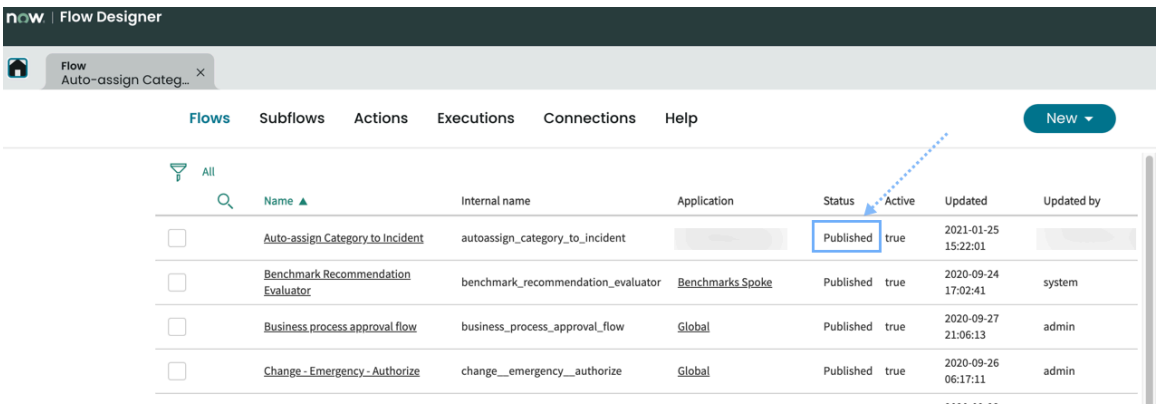
Result

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Your Auto-assign Category to Incident flow is activated and complete.

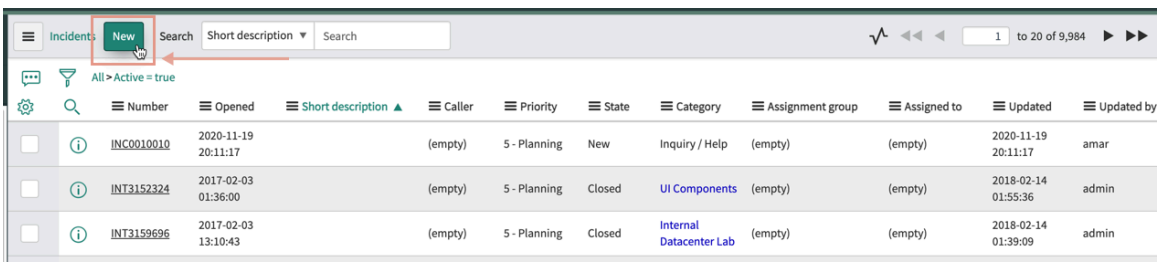


- It also appears as published in the Flows column on the Workflow Studio home screen.



22. Navigate to **Incidents**.

23. Select **New** to create a test incident record in the Incidents table.
In this example scenario, you create record INC0010011.

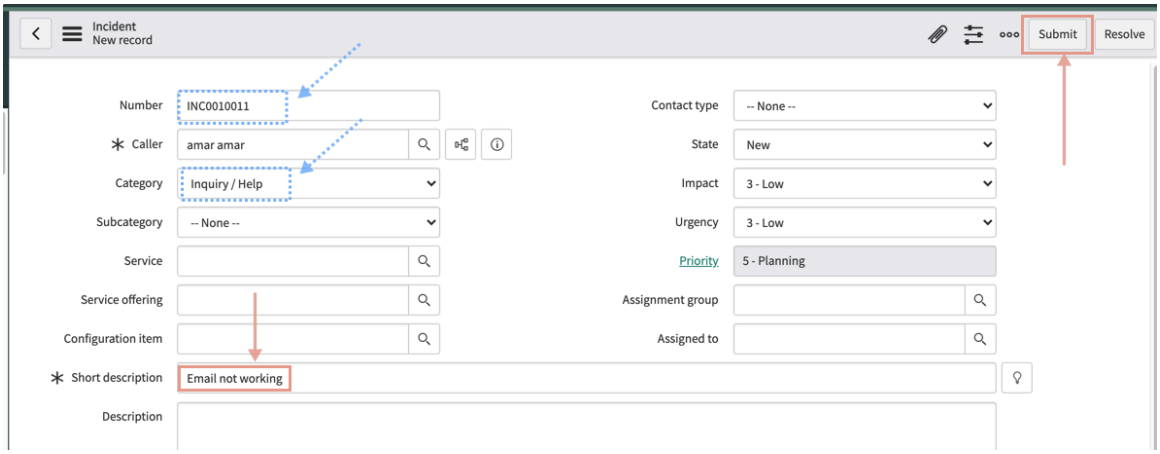


24. In the record you created, note in the following image that the Category value is set to **Inquiry / Help**.

25. In the **Short description** field, enter `Email not working`.

26. Select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Result

The system updates the incident record to show that its Category value has changed from **Inquiry / Help** to **Email**.

Using MLSolutionFactory scriptable objects

MLSolutionFactory scriptable objects enable defining ML functionality. You can use the APIs to compose data-driven functionality, such as subclustering large clusters or clusters with multiple PRBs attached.

You can use scriptable objects in a scripted extension point to modify the Predictive Intelligence REST API method to address unique business use cases.

ServiceNow applications on the NOW platform can call scriptable objects and script includes. External applications can call scripted REST APIs. By default, the Predictive Intelligence REST API - Prediction for multiple solutions (GET) method uses the MLSolutionUtil scripted extension point to take a list of active solution names, run predictions on them given the input, and return results. The MLSolutionUtil extension point enables creating custom implementations for specific usage scenarios, for example, running a second solution prediction only after the condition of a first solution prediction is satisfied.

Here's the high-level process for creating a custom usage scenario.

1. Developers customize a MLSolutionUtil scripted extension point implementation using the MLSolutionFactory scriptable object.
   - Listed as global.MLSolutionUtil in the Extension Point [sys_extension_point] table
   - See Register a custom script include
2. The MLSolutionUtil scripted extension point implementation uses `MLSolutionFactory` to get the scriptable object, and invokes prediction methods on that object.
3. The Predictive Intelligence REST API - Prediction for multiple solutions (GET) method invokes the `MLSolutionUtil extension point` implementation, depending on the scope of the request.
4. Applications call the Predictive Intelligence REST API - Prediction for multiple solutions (GET) end point from a script include form.

For more information, see

- Predictive Intelligence REST API
- MLSolutionFactory - Global

Preserve ML solutions during a system clone

Save your trained machine-learning (ML) solution data during a system clone.

Before you begin

Role required: clone_admin or admin

About this task

The system stores trained ML solutions as Attachment records. These records include your solution artifacts, such as solution definitions, template records, and predictive model statistics, all of which are required components of the Predictive Intelligence prediction functionality. To preserve these records, follow the high-level steps below each time you run a system clone.

Note:

For troubleshooting common issues with cloning solutions, see the Predictive Intelligence Common issues [KB0781893] article in the Now Support Knowledge Base.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Enter `sys_properties.list` in the application navigator to access the System Properties list.
2. Ensure the *glide.platform_ml.clone_artifacts* system property is set to **True**.
3. If you want to preserve only the ML solution records and not the numerous other records in the sys_attachments table, exclude the sys_attachments table from your clone run.
4. Request a system clone.
   The system preserves your ML solution records during the system clone.

Testing and monitoring predictions

Evaluate the coverage and precision of your machine-learning (ML) solutions by testing them. Once deployed, track their performance over time. Improve predictions by using performance information to refine your solutions.

Testing solutions

After your ML solutions are trained, you can call on the Predictive Intelligence API to make a solution prediction. Use the API to test the following solutions:

- Test a classification solution prediction
- Test a similarity solution prediction

Monitoring predictions

For classification predictions, use the Prediction Results dashboard to track the coverage and precision of predictions over time.

To learn how, see Track classification prediction results over time.

Prediction troubleshooting

For troubleshooting common issues with solution predictions, see the Predictive Intelligence Common issues [KB781893] article in the Now Support Knowledge Base.

Test a classification solution prediction

Once your machine-learning (ML) solutions are trained, you can call on the Predictive Intelligence API to make a solution prediction. In this example procedure, we use the REST API Explorer to test a classification solution prediction for incident categorization.

Before you begin

Train your ML solution prior to testing a prediction.

Role required: web_service_admin, rest_api_explorer, or admin or ml_admin

About this task

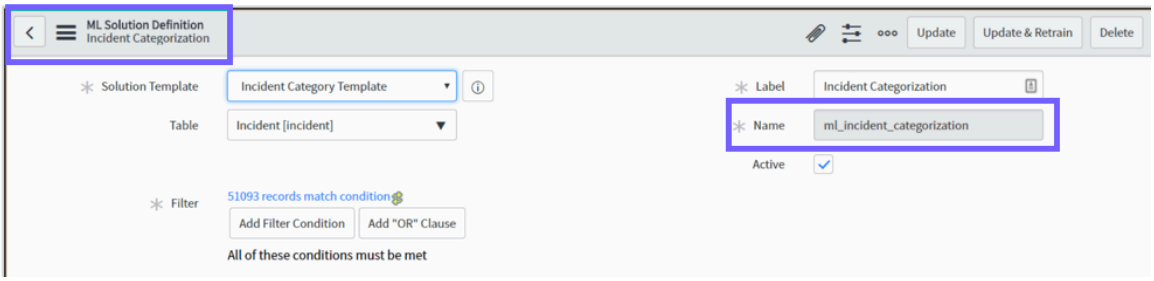
This procedure uses sample data to illustrate what you can do in your instance, and may not represent data or records that are actually in your instance.

This scenario illustrates a classification solution prediction for a hypothetical ML solution that you have previously created and trained. You can also use the REST API Explorer to test a similarity solution prediction.

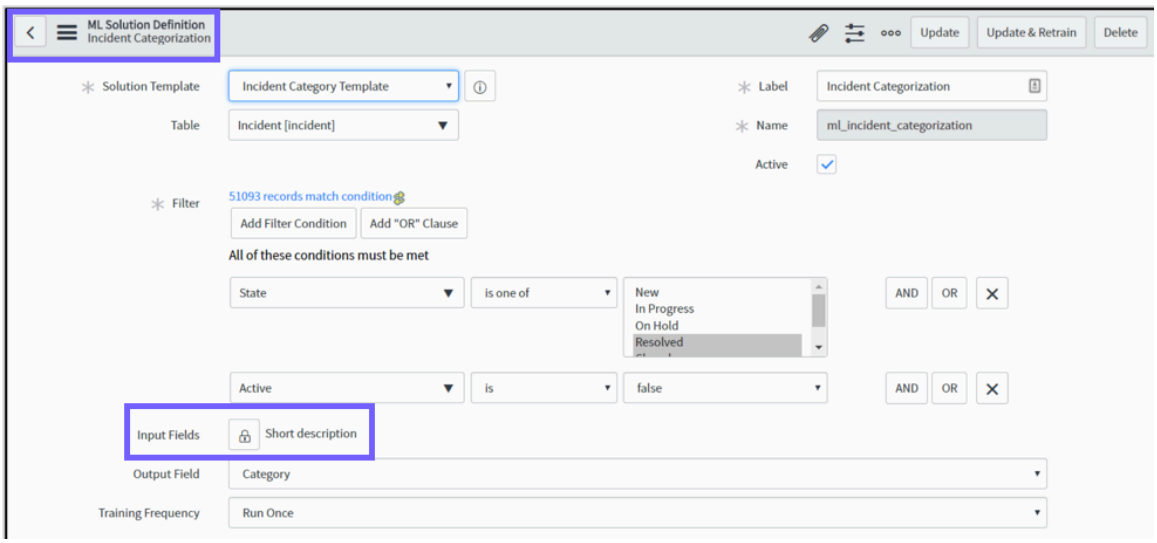
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Predictive Intelligence** > **Classification** > **Solution Definitions**.
2. Locate the ML solution definition whose prediction you want to test, and copy its **Name** value to your clipboard or a Notepad file.
   In this case, use the **Name** field value in your ML Solution Definition Incident Categorization record, as illustrated in the following example.



3. Write down and save the **Input Fields** used in your ML Solution Definition record that you want the REST API Explorer to use in its call to the Predictive Intelligence API.
   In this case, we use the **short _description** field, as the prediction model has been trained to use this field to learn its category definition.



4. Navigate to **System Web Services** > **REST** > **REST API Explorer**.
5. Set these choice fields as follows.

Field	Value
Namespace	now (leave as default)
API Name	Predictive Intelligence
API Version	latest (leave as default)

   The Predictive Intelligence form appears. You use this form to prepare your call request to the Predictive Intelligence API.
6. In the solution-name **Value** field, type `ml_incident_categorization`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: This is the Name value you captured in Step 1 of this procedure.

7. Click **Add query parameter**.
   The Predictive Intelligence form refreshes to show the **Query parameters** section.
8. Type `short_description` in the first field.

   Note: This is the input field you captured in Step 2 of this procedure.

9. Type a short description of an incident in the second field.
   For instance, type `Unable to connect`.
10. Click the **Send** button.
    The REST API Explorer sends your request to the Predictive Intelligence API.
    The system predicts the output value in the Response Body section of the API output. You can use other short descriptions to test what the solution is predicting.
11. **Optional:** Send a different request to the Predictive Intelligence API so that you can test the prediction model again.

    a. Return to the **Query parameters** section of the Predictive Intelligence form.

    b. Type a short description that references a different kind of incident in the second field.
    For example, type `Unable to connect to MSSQL`.

    c. Click the **Send** button.

    The Response Body section may refresh to show a different outcome than what you saw in Step 9, depending on which incident categories you configured in your solution definition setup. In other words, changing the short description text can recategorize the incident as a different kind of issue.

Example:
You can also test the Predictive Intelligence prediction model when you create a new incident record using the incident form.

1. Navigate to **Incident** > **Create New**.
2. In the new Incident form that loads, set the fields as follows.
   - **User:** Enter the Caller name.
   - **Category:** Leave as default.
   - **Short description:** Enter a short description that you want to test.
3. Submit the incident form.

Result: When the form refreshes, an information message appears with the incident category automatically set to a specific value.

Note: For some short descriptions, the prediction might not process because the solution does not have enough confidence in predicting the value for this input.

Test a similarity solution prediction

Once your machine-learning (ML) solutions are trained, you can call on the Predictive Intelligence API to make a solution prediction. In this example procedure, we use the REST API Explorer application to test a similarity solution prediction for resolved incident recommendations.

Before you begin

Train your ML solution prior to testing a prediction.

Role required: web_service_admin, rest_api_explorer, or admin or ml_admin

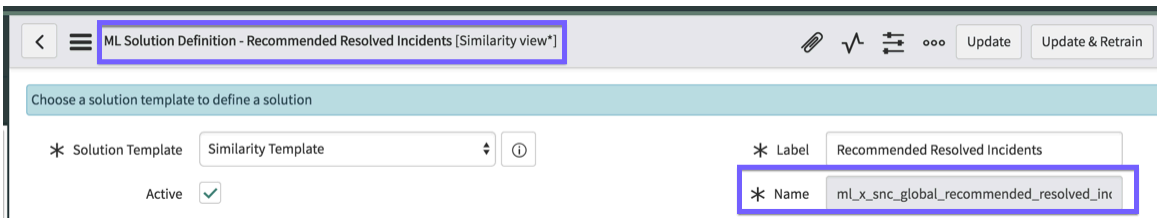
About this task

This procedure uses sample data to illustrate what you can do in your instance, and may not represent data or records that are actually in your instance.

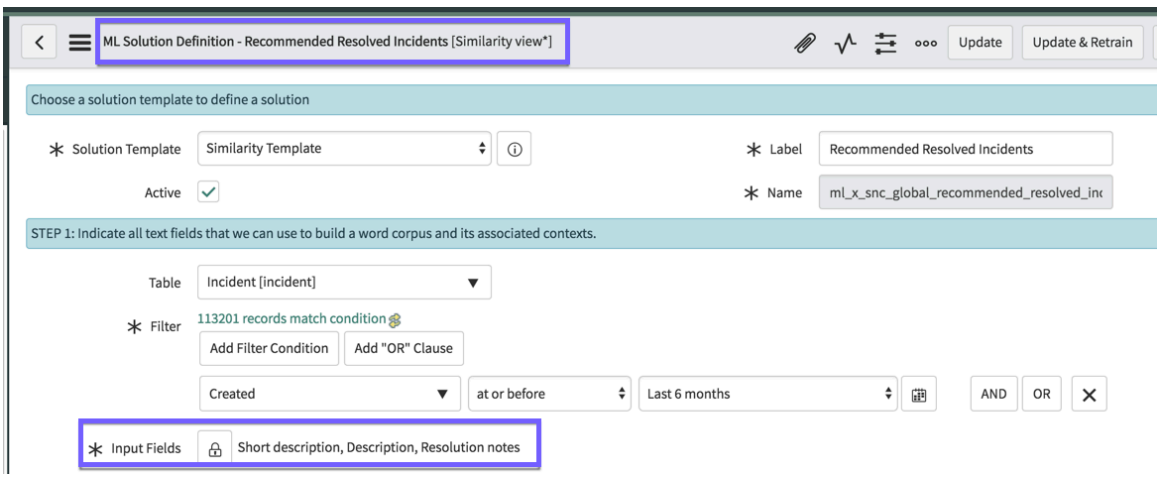
This scenario illustrates a similarity solution prediction for a hypothetical ML solution that you have previously created and trained. You can also use the REST API Explorer to test a classification solution prediction.

Procedure

1. Navigate to **All** > **Predictive Intelligence** > **Similarity** > **Solution Definitions**.
2. Locate the ML solution definition whose prediction you want to test, and copy its **Name** value to your clipboard or a Notepad file.
   In this case, we use the **Name** field value in your ML Solution Definition Recommended Resolved Incidents record, as illustrated in the following example.



3. Copy the **Input Fields** value(s) used in your ML Solution Definition record that you want the REST API Explorer to use in its call to the Predictive Intelligence API.
   In this case, we use the **Short description** field type, as the prediction model has been trained to use this field to learn, pair, and recommend similar records for your review.



4. Right-click the browser tab you're using to view your instance, and select **Duplicate**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. In the duplicate browser tab, navigate to **System Web Services** > **REST** > **REST API Explorer**.
6. Click **Explore**.
7. Set these choice fields as follows.

Field	Value
Namespace	now (leave as default)
API Name	Predictive Intelligence
API Version	latest (leave as default)

The Predictive Intelligence form appears. You use this form to prepare your call request to the Predictive Intelligence API.

8. In the solution-name **Value** field, enter `ml_x_snc_global_recommended_resolved_incidents`.

Note: This is the Name value you captured in Step 2 of this procedure.

9. Click **Add query parameter**.
10. In the Query parameters section, enter the value of one of the Input Fields from the solution you're testing.

a. In the first field, paste `short_description`.

Note: This is one of the input fields you captured in Step 2 of this procedure.

You can use other field types, such as **Description** or **Resolution notes** to test what the solution is predicting.

b. In the second field, enter some text that you might find in an incident record.
For instance, enter `Discovery errors`.

11. Click the [+] button to create a second query condition that defines the number of results you want to query.

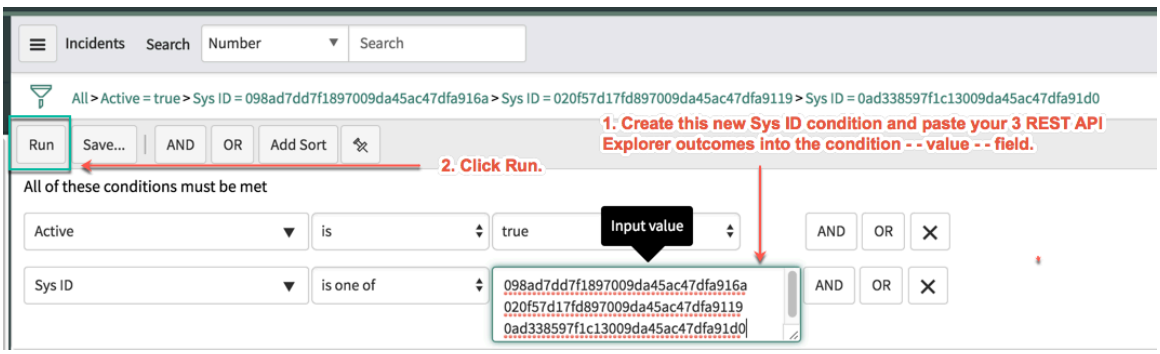
a. In the first field, enter `top_n`.

b. In the second field, enter `3`.
These conditions set the query to retrieve the top three most similar incident records.

12. Click **Send**.
The REST API Explorer sends your request to the Predictive Intelligence API.
13. In the Response body section, copy the three outcome values that your API call returned, as illustrated in the image below.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

14. In your original browser tab, navigate to **Servicedesk** > **Incidents**.
15. As shown in the image below, set filter conditions for the three REST API outcomes to the Incidents table list view.
    a. Add the Active and Sys ID conditions below to the Incidents list view Filter icon.
    b. Paste the three REST API outcomes into the **Input value** field of the Sys ID condition that you created.
    c. Click **Run**.



16. Per the image below, compare the returned list of incidents with the input for the prediction output in the REST API Explorer.

Track classification prediction results over time

Use the Prediction Results dashboard to determine if classification solution predictions are improving over time. Identify solutions that need refining or retraining.

Before you begin

- Role required: admin, ml_admin, or ml_report_user

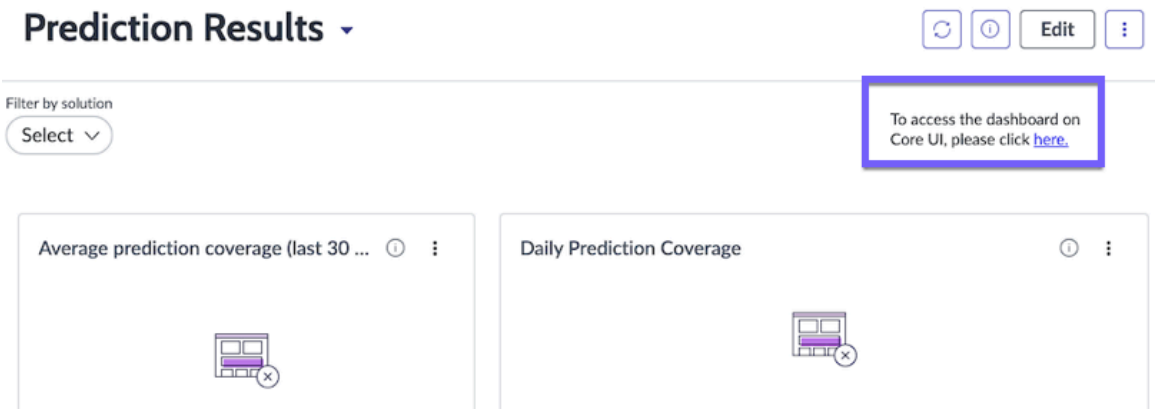
About this task

The Prediction Results dashboard reports on coverage, precision, and recall over time for classification solutions.

With the Xanadu release, this dashboard has been migrated to the Next Experience UI. Customers upgrading from previous releases

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

can access the Core UI version from the current dashboard.



On the Prediction Results dashboard, statistics are provided in two timeframes: the average for the past 30 days, and daily. The indicators coverage, precision, and recall are defined as follows.

Prediction Results indicators

Report type	Definition
Coverage	The percentage of predictions that yielded an outcome out of the total number of predictions that were attempted.
Precision	The percentage of predictions where the predicted value was the same as the final value of the field when the report closed.
Recall	The percentage of correct predictions that yielded an outcome out of the total number of predictions that were attempted.

Procedure

1. Navigate to **All** > **Predictive Intelligence** > **Classification** > **Prediction Results Report**.
2. In the Prediction Results dashboard **Filter by solution** prompt, select the solution statistics you want to review.
   The system updates the dashboard based on the solution you selected.
3. Identify classes with anomalous coverage, precision, or recall values.

   Example
   For example, identify solutions where coverage, precision, or recall is declining over time.

What to do next

Refine the solution definition filter by including or excluding classes as needed. After updating, retrain the solution.

Reviewing prediction errors with the Observability Dashboard

The Observability Dashboard offers a unified view and actionable insights for errors detected in Predictive Intelligence. Use this dashboard to visualize logged errors and gain information on prediction reliability and potential problem areas.

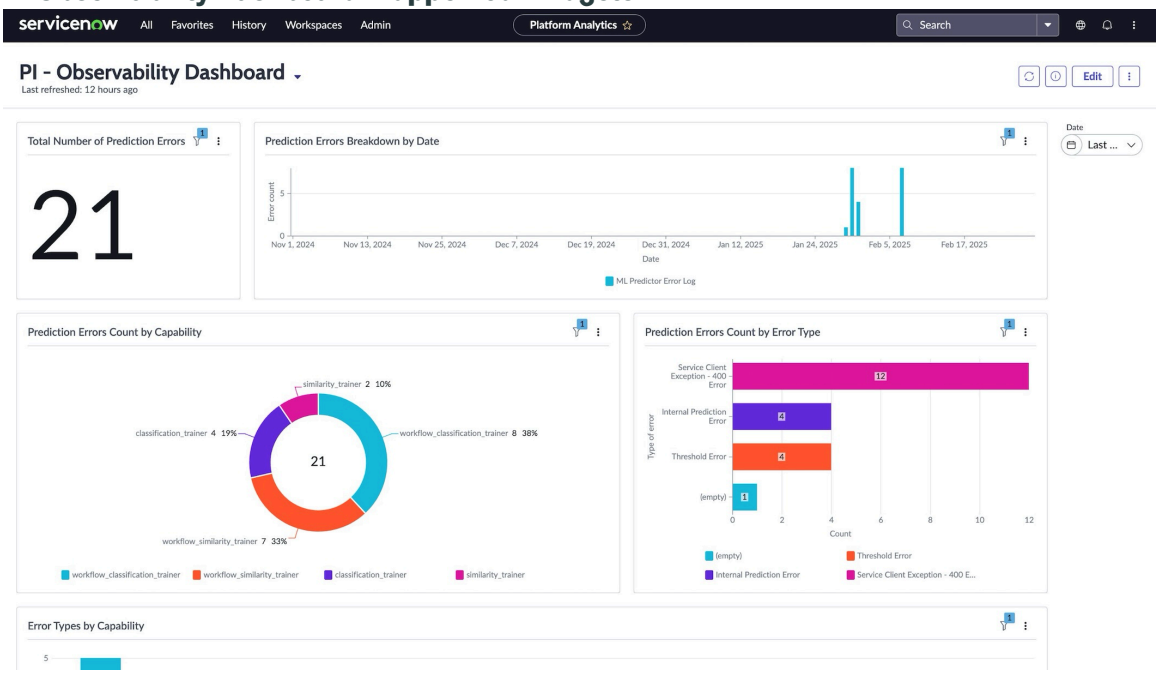
View the PI - Observability Dashboard by navigating to **Predictive Intelligence** > **Dashboards** > **Observability**. The dashboard contains the following widgets.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Total Number of Prediction Errors
- Prediction Errors Breakdown by Date
- Prediction Errors Count by Capability
- Prediction Error Count by Error Type
- Error Types by Capability
- Successful and Unsuccessful Predictions Breakdown by Date

You can drill down to the underlying records from the widget graphics. You can also change the date range of all widgets by selecting **Date** to open the selector.

PI Observability Dashboard — upper four widgets



The PI - Observability Dashboard draws from a table dedicated to logging prediction errors: **ML Predictor Error Logs** [ml_predictor_error_logs].

- Fields in the table include Error Type, Error Message, Status code, Solution, and Capability.
- View this table's records directly by entering `ml_predictor_error_logs.list` in the navigator.
- Roles required to access the table: ml_report_user or ml_admin.

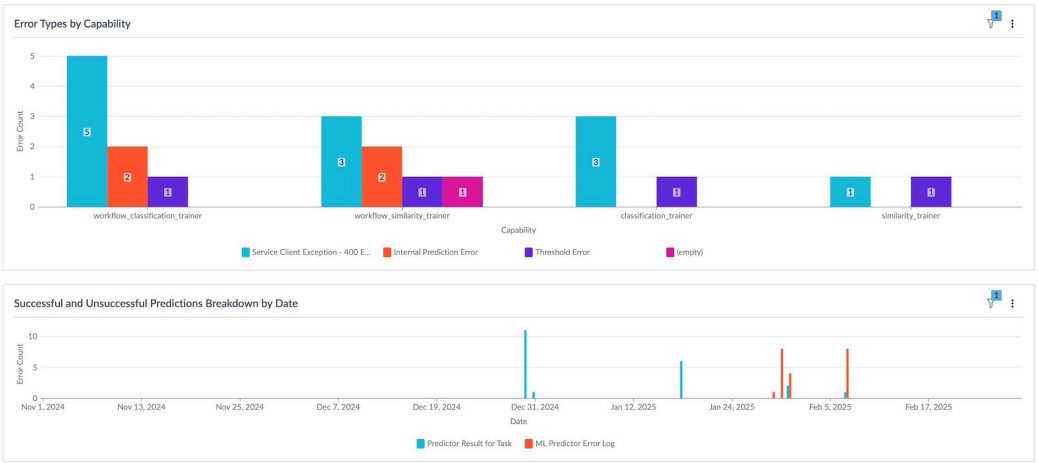
The table logs the following types of granular errors.

- Client-side issues (400 Series) — captures request errors such as timeouts and invalid inputs.
- Server-side issues (500 Series) — tracks internal server errors encountered during prediction.
- Internal prediction failures — identifies instances when the model was unable to generate a prediction.
- Low confidence predictions — records log results falling below a defined confidence threshold.

Note: Errors in training aren't included in this table. For a dashboard reporting on training errors, see Predictive Intelligence Usage Analytics dashboard.

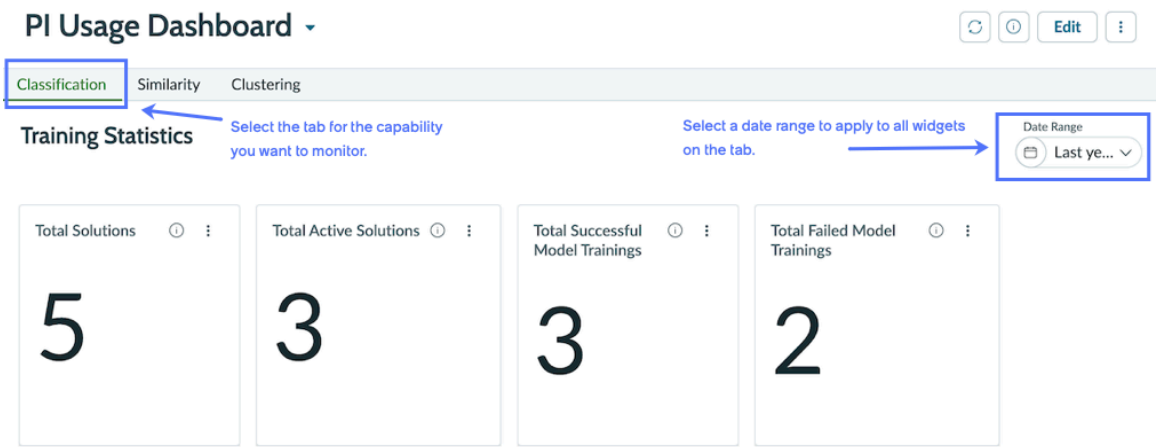
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

PI Observability Dashboard — lower two widgets



Predictive Intelligence Usage Analytics dashboard

The Predictive Intelligence Usage Analytics dashboard is a central location to understand the effectiveness and overall value of all your Predictive Intelligence solutions. View metrics for model training successes and failures. Monitor prediction statistics including breakdowns by individual model.



For your models in the Classification, Similarity, and Clustering capabilities, the Predictive Intelligence Usage Analytics dashboard gives you visibility into training and predictions. You can specify the time periods to report on, as well as select specific solutions for a deep dive.

With the ml_report_user or ml_admin role, view the Predictive Intelligence Usage Analytics dashboard by navigating to **Predictive Intelligence** > **Dashboards** > **Monitoring**.

The dashboard has separate tabs for each capability. The Classification tab opens by default, or you can select Similarity or Clustering. Each tab contains a set of reports in the form of widgets.

You can drill down into the underlying records by selecting a report's chart or graph, which opens a query-filtered list. Many reports in the Training Statistics section of PI Usage Dashboard are drawn from the ml_solution table. Reports in the Prediction Statistics section are drawn from the ml_predictor_results table.

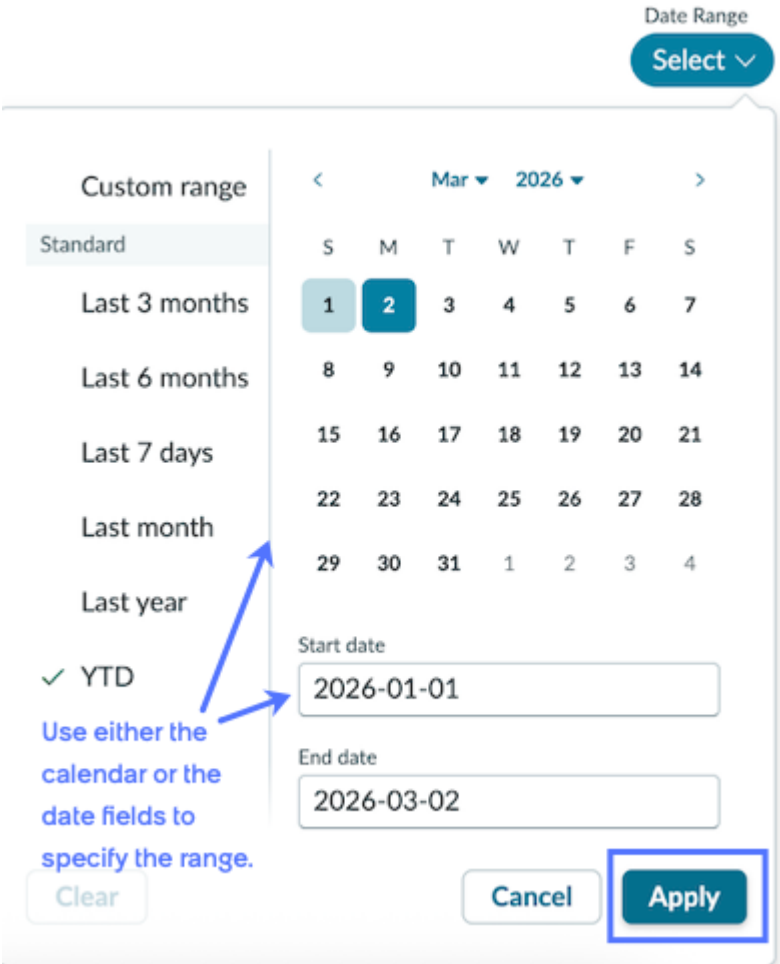
Date Range

The **Date Range** selector opens a calendar picker where you can select the time frame for the reports. Your selected date range applies to all widgets on the current tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The calendar picker offers a variety of preset dates under its **Standard** subhead. Choose from **Last 3 months**, **Today**, **YTD** (year to date, from January 1 of the current calendar year), and so forth.

You can also choose **Custom range** to select your own dates. Enter dates directly into the **Start date** and **End date** fields, or select a date range using the calendar. Then select **Apply** to update the reports in all widgets on the page.



Available metrics for Classification and Similarity

The following tables describe the widgets available on both the Classification and Similarity tabs, unless otherwise noted. The Clustering capability has different widgets, so refer to the **Available metrics for Clustering** section on this page.

Widgets available in Training Statistics for Classification and Similarity solutions

Widget	Description
Total Solutions	Total number of Classification (or Similarity) solutions created.
Total Active Solutions	Total number of Classification (or Similarity) solutions that are active.
Total Successful Model Trainings	The number of Classification (or Similarity) jobs that have been successfully completed in the instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Widgets available in Training Statistics for Classification and Similarity solutions (continued)

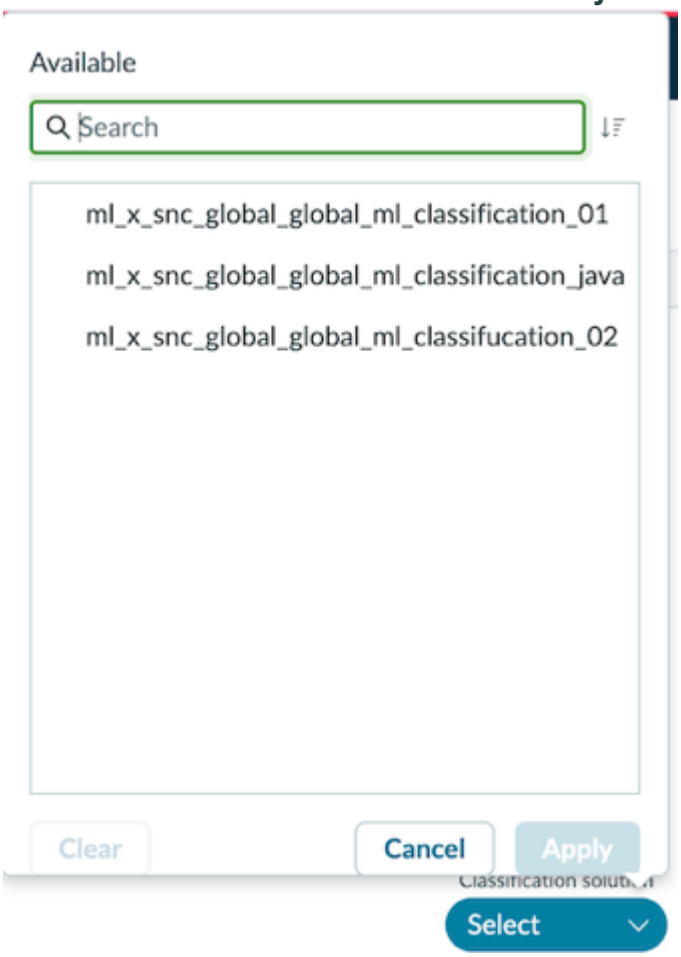
Widget	Description
Total Failed Model Trainings	The number of Classification (or Similarity) jobs that have failed in the instance.
Trained Solutions - By Month	Total trained Classification (or Similarity) solutions aggregated monthly.
Active Solutions - By Month	Total active Classification (or Similarity) solutions aggregated monthly.
Classification (or Similarity) Training Status	The distribution of Classification (or Similarity) model training states.
Active Status Distribution	The distribution of active versus inactive records. The "true" portion indicates active items, while "false" represents inactive ones.
Training Frequency Distribution	The training frequency distribution across all Classification (or Similarity) solutions. The available options range from **Run once** up to **Every 180 days**.
Update Frequency Distribution (Similarity only)	The update frequency distribution across all similarity solutions. The available options range from **Run once** up to **Every 180 days**.

Prediction Statistics

Widget	Description
Total Successful Predictions - By Month	Count of total Classification (or Similarity) predictions calculated per month.
Total Successful Predictions	Total number of successful predictions made on all Classification (or Similarity) solutions.
Total Failed predictions	Total number of failed predictions made on all Classification (or Similarity) solutions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Solution selector for Classification or Similarity



For the following widgets, use the selector labeled **Classification solution** or **Similarity solution** to choose an individual model.

Selected Active Classification Solution Details

Widget	Description
Successful Predictions per Solution	The number of successful predictions for the selected Classification (or Similarity) solution.
Failed Predictions per Solution	The number of failed predictions for the selected Classification (or Similarity) solution.

Available metrics for Clustering

The following table describes metrics available on the Clustering tab of the Predictive Intelligence Usage Analytics dashboard.

Training statistics for Clustering

Widget	Description
Total Solutions	The total number of clustering solutions created in the instance.
Total Active Solutions	The number of active clustering solutions in the instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Training statistics for Clustering (continued)

Widget	Description
Total Successful Model Trainings	The number of clustering jobs that have been successfully completed in the instance.
Total Failed Model Trainings	The number of clustering jobs that have failed in the instance.
Trained Solutions - By Month	The number of clustering trainings triggered per month.
Active Solutions - By Month	The number of active clustering solutions trained per month.
Clustering Training Status	A pie chart showing the training status distribution across all clustering solutions in the instance.
Active Status Distribution	A pie chart showing the distribution of active and inactive clustering solutions.
Training Frequency Distribution	The percentage of training frequencies set across the clustering solutions.
Update Frequency Distribution	The percentage of update frequencies set across the clustering solutions.

For the following widgets, use the selector labeled **Clustering solution** on the Clustering tab to pick an individual model.

Selected Cluster Solution Breakdown

Widget	Description
Cluster details	The details of each cluster created in the specified solution.
Number of clusters	The number of clusters created in the specified clustering solution.
Total Records Clustered	The total number of records clustered in the specified clustering solution.
Number of updates completed (in last 7 days)	The number of update jobs completed for a specified clustering solution.
Details of Last Update (in last 7 days)	When the clustering solution was last updated, number of new clusters created, records assigned to existing clusters, and new clusters in the last update.

Domain separation and Predictive Intelligence

Domain separation is supported in the Predictive Intelligence application. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Standard

- Includes all aspects of **Basic** level support.
- Application properties are domain-aware as needed.
- Business logic: The service provider (SP) creates or modifies processes per customer. The use cases reflect proper use of the application by multiple SP customers in a single instance.
- The instance owner must configure the minimum viable product (MVP) business logic and data parameters per tenant as expected for the specific application.

Sample use case: An admin must be able to make comments required when a record closes for one tenant, but not for another.

For more information on support levels, see Application support for domain separation.

Overview of domain separation and Predictive Intelligence

With Predictive Intelligence, you can create machine learning solutions using historic datasets. A machine learning solution is created and trained in the global domain, and that solution's predictions can be applied in any domain on the instance.

Similarity solutions are domain-aware when applied in your forms and flows, so records from other domains on the instance are not displayed to users. For more information, see KB article Similarity prediction behavior in domain separated environment on Now Support.

How domain separation works in Predictive Intelligence

An instance owner can train a machine learning (ML) solution for each domain by creating a solution definition for each domain and training those solutions. In this way each solution uses data specific to the corresponding domain.

- Data can be domain separated
- Domain column is present for base system application tables
- Domain-specific configuration is managed by instance owner
- Tenant domains can manage their own application data
- Application properties are domain-aware when needed

Data Encryption in Predictive Intelligence

Learn which types of encryption are supported for training Predictive Intelligence solutions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Predictive Intelligence support for encrypted training data

Encryption type	Supported	Notes
Field Encryption	Yes	Ensure the sharedservice.worker user has the same encryption module role that's been used for encryption.
Edge Encryption	No	None.
FDE (Full Disc Encryption)	Yes	None.

Predictive Intelligence language support

Predictive Intelligence provides international language support. Learn which languages are available to Predictive Intelligence solutions.

When you create a Predictive Intelligence solution, you can choose the language you want the system to use for processing your training records. English is the default language.

For an example of how to assign a language to a solution, see the Processing Language section in Step 3 of the Create and train a classification solution documentation.

You can also create custom stopwords lists for a language. For more information, see Create a custom stopwords list.

Language support coverage

The current available languages for Predictive Intelligence solutions and stopwords lists are as follows: Brazilian Portuguese, Chinese (simplified), Danish, Dutch, English, Finnish, French, French Canadian, German, Italian, Japanese, Korean, Norwegian, Polish, Portuguese, Spanish, and Swedish.

Predictive Intelligence properties

The properties for Predictive Intelligence control certain parameters of its machine-learning solutions, solution training process, and caching.

Using the maint role, navigate to **Predictive Intelligence** > **Configuration** to review or edit.

Note: Most of the properties related to training require the maint role to review or edit. Some properties may require other roles.

Predictive Intelligence properties

Property	Property Name	Description
Override ml_solution_definition record's readonly state during training	glide.platform_ml.override_training_lock	• True: Overrides the **readonly** state during training, enabling you to edit ml_solution_definition. • False: ml_solution_definition remains in the **readonly** state.

Task Intelligence

Task Intelligence uses machine learning to train solutions with your data and achieve important outcomes.

Overview of Task Intelligence

Task Intelligence enables you to set up machine learning models to automate task creation, triage, and investigation. You can then track and assess the performance of your solutions to optimize their potential to help you work more efficiently and lowering the mean time to resolve (MTTR).

Get started

Explore	Install	Configure
Explore Task Intelligence and machine learning models.	Install Task Intelligence and related applications.	Configure machine learning models.

Exploring Task Intelligence

Learn more about Task Intelligence and how machine learning models can learn from your data to make predictions and achieve important outcomes.

Task Intelligence overview

With Task Intelligence, you can easily set up machine learning solutions that interact with your data. Then, track how the solutions are impacting creation, deflection, triage, remediation, and optimization moments. With automated task creation, triage, and investigation, agents spend less time receiving and preparing information, so tasks can proceed faster. These models can help you work more efficiently, helping to lower the mean time to resolve (MTTR) of tasks.

With Task Intelligence, agents:

- Solve issues faster for better service and experiences
- Focus on meaningful, high-value work
- Reduce error rates and drive down costs
- Improve time to value with intuitive experiences

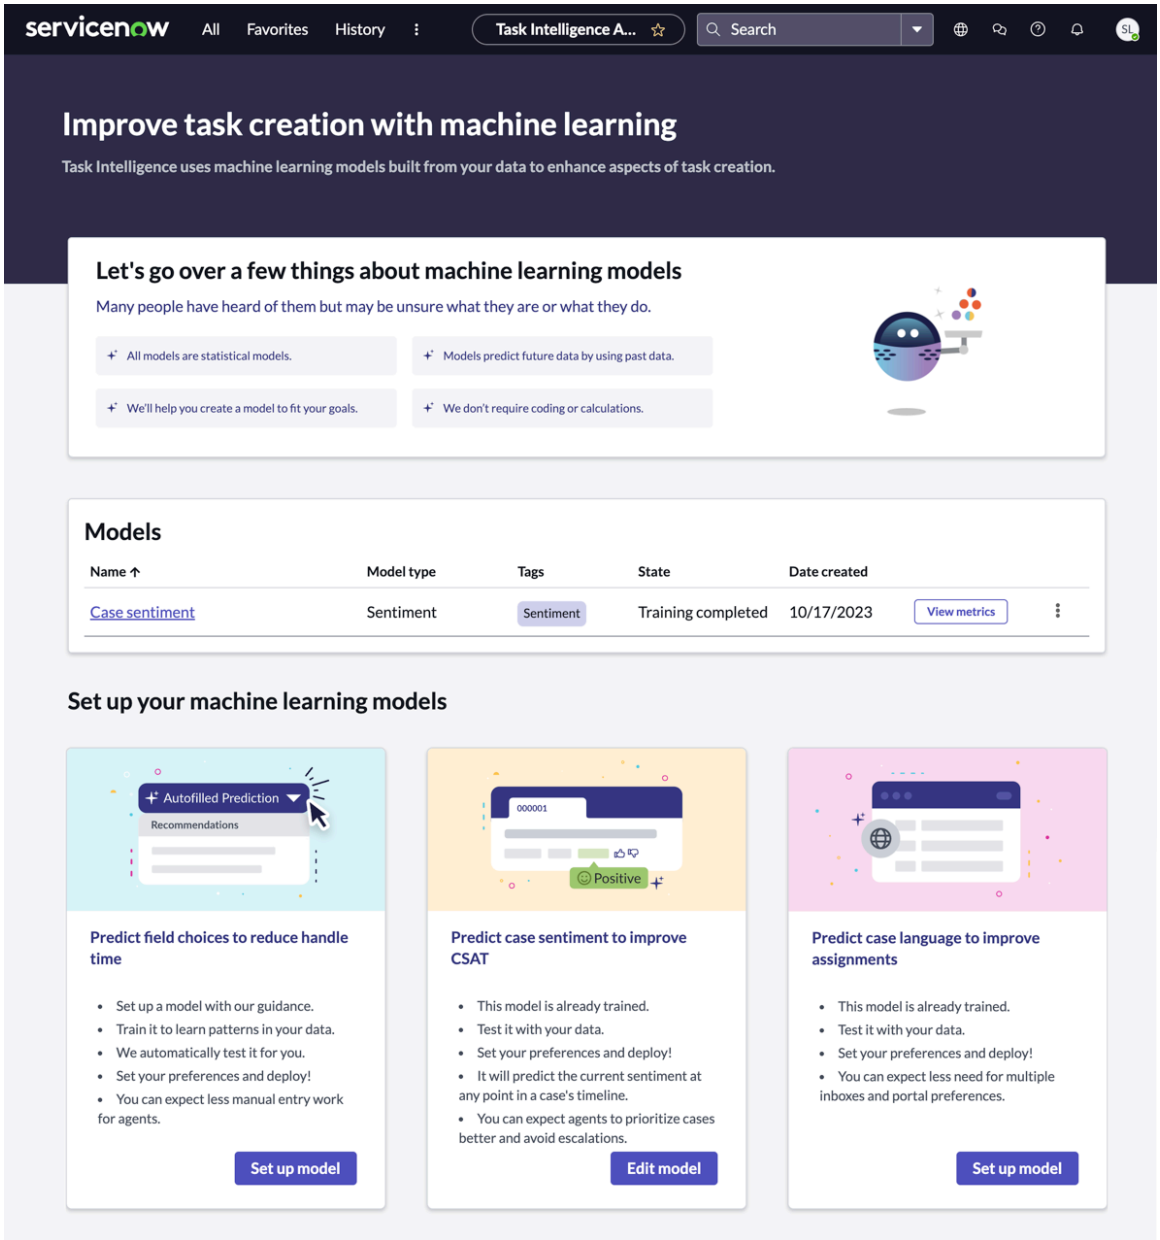
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The Admin Console supports the following model types:

Model	Application	Description
Incident field prediction	Task Intelligence for ITSM	Create an incident field prediction model
Similarity model management	Task Intelligence for ITSM	Create a similar records prediction model in Task Intelligence for ITSM
Case field prediction	Task Intelligence for CSM	Predicts output fields on case forms, including categorization. Record categorization

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Model	Application	Description
Sentiment prediction	Task Intelligence for CSM	Predicts current and trending user sentiment. **Note:** Model is pre-trained but can be tested and edited. Only one sentiment model can be configured.
Language detection	Task Intelligence for CSM	Detects language which language is being used. **Note:** Model is pre-trained but can be tested and edited. Only one language detection model can be configured.

Task Intelligence workflow

The Task Intelligence Admin Console uses machine learning models. The models are statistical and can predict future data by training with your past data.

With the Admin Console, create, configure, train, test, and deploy predictive models used for automation in other ServiceNow features and applications, such as Customer Service Management (CSM).

Training a machine learning model is when the model learns patterns in past data to make predictions for new data. Models are trained using a lot of data so that they can learn patterns and the large data set makes the learned patterns statistically significant. By answering questions about your information systems, business process, and service operations, the system actively learns from your responses.

Task Intelligence benefits

The Task Intelligence Admin Console provides admins with a no-code experience for deploying Task Intelligence solutions. The seamless experience helps you automate and optimize task creation, deflection, triaging, and resolution.

Features are implemented by two applications: Task Intelligence for Customer Service and Task Intelligence for ITSM.

Benefit	Feature	Users
Predict form field values to auto-populate or recommend as suggestions	Create a field prediction model	Admins, agents
Categorize emails and cases based on language and attachment content	Record categorization	Agents
Predict incident category and priority based on previous incidents to lower time to resolution	Create an incident prediction model	Agents
Analyze initial and ongoing sentiment during customer service cases	Sentiment Analysis	Agents
Identify the language used to create customer service cases	Language detection	Agents

Benefit	Feature	Users
Analyze and assess the performance of models	Task Intelligence Analytics and Monitoring	Admins

Configure Task Intelligence

Configure and install the Task Intelligence Admin Console and its related applications.

Configuration overview

The Task Intelligence Admin Console is installed along with Task Intelligence for CSM or Task Intelligence for ITSM. See Install Task Intelligence Admin Console for more details.

Configure Task Intelligence for ITSM

Configure Task Intelligence for ITSM so that agents can use the application to fulfill their requirements efficiently.

Configure Task Intelligence for Customer Service

Install the Task Intelligence for Customer Service application and configure the different features: case categorization, language detection, sentiment analysis, and Document Intelligence for Customer Service.

Install Task Intelligence Admin Console

You can install the Task Intelligence application (sn_ti_admin) if you have the admin role. The application includes demo data and installs related ServiceNow® Store applications and plugins if they are not already installed.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Review the Task Intelligence Admin Console application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.

Role required: admin

About this task

The following items are installed with Task Intelligence Admin Console:

- Roles
- Tables

For more information, see Task Intelligence roles.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Task Intelligence Admin Console application (sn_ti_admin) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In the list next to the **Install** button, the versions that are available to you are displayed.

3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box, any dependencies installed with your application are listed.

4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
   Demo data are the sample records that describe application features for common use cases. Load the demo data when you first install the application on a development or test instance.
6. Select **Install**.

Manage machine learning models with Task Intelligence

Create, edit, train, and assess machine learning models to make predictions for customer service cases and incidents.

Managing Task Intelligence for ITSM models

Use the machine learning capabilities of Task Intelligence for ITSM to predict and recommend incident field information and help with incident categorization.

Use Task Intelligence for Customer Service

Use the Task Intelligence features to create field prediction and sentiment models for cases, and review Task Intelligence analytics and prediction history.

Create a Task Intelligence model

Create machine learning models to predict field values, analyze case sentiment, or detect case language.

Create a model to predict incident fields

Create and deploy incident-prediction, solution-based models to predict incident fields for new IT service incidents.

Create a model to predict record fields

Create and train a model to predict fields for customer service cases.

Edit a Task Intelligence model

Retrain your machine learning models or edit what they predict to better align with your business goals.

Edit a model to predict incident fields

Edit the incident prediction model that has already been trained and deployed. Change the model configurations, view the updated training results, and redeploy the model.

Create and edit a case field prediction model

Create, train, and edit a model to predict fields for customer service cases.

Create a model to predict case sentiment

Edit and test the pre-trained sentiment model to predict sentiment for customer service cases.

Create a model to detect case language

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

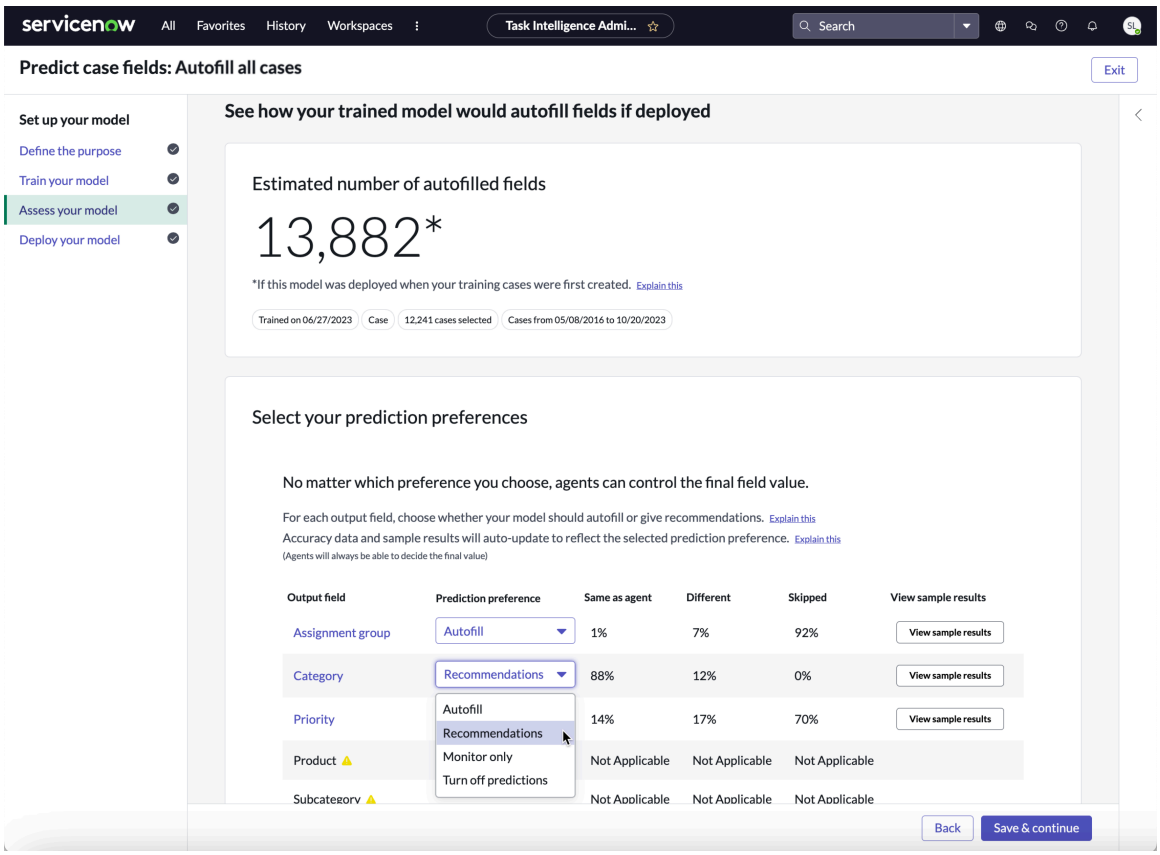
Edit and test the pre-trained model to detect the language used to create customer service cases.

Assess a Task Intelligence model

Assessing a machine learning model's performance helps determine how to use and train the model to achieve your desired outcomes.

The Assess Your Model screen allows you to evaluate the model's performance. After training or retraining your model, the Assess Your Model screen will show an estimate of the model's average performance against your most recent data.

Note: It is normal to see some variability in model performance from day to day. Performance tends to average out to the estimated performance over time.



The Assess Your Model screen also allows you to view example predictions on a sample of records. These examples demonstrate the predictions but do not necessarily reflect the quality or average performance of the model. The estimates provided on the Assess Your Model screen as well as the reports on the **Monitoring** page are calculated from a much larger number of cases.

You can also use the Assess Your Model screen to choose one of the following preferences for each field:

- **Autofill** the predicted value in the field.
- **Recommendations** are provided for the predicted value in the field.
- **Monitor only** and run the prediction model for the field only in the background.
- **Turn off predictions** for the field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Monitoring mode

Monitoring mode allows you to monitor the performance of a model at the field level without the predictions being applied to records. The model runs in the background only and can be trained and retrained until you are satisfied with its performance. You can set the model fields to Monitoring mode from the Assess Your Model screen when editing your model.

You can view and track model performance with the Task Intelligence Admin Console. See Task Intelligence Analytics and Monitoring.

Assess field-level accuracy for multi-output models

Evaluate the performance of your model by field.

Before you begin

Role required: admin

About this task

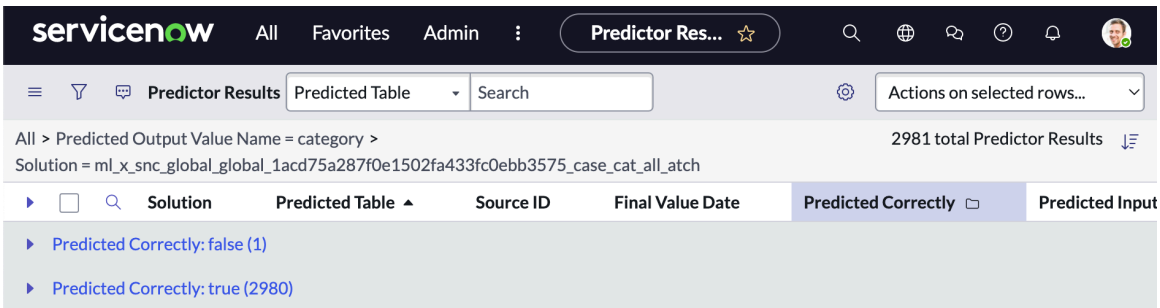
After you have created and tested your model, assess its performance to evaluate how well it's predicting what you want it to predict. For multi-output models that predict multiple fields, you may want to assess the performance of each field individually.

If you have not already created a model, see either Create a model to predict record fields or Create a model to predict incident fields to make one.

Your model must be in Monitoring mode. You can set Monitoring mode on the Assess Your Model screen. For more details, see the Set your preferences step in Create a case field prediction model or Create a model to predict incident fields model.

Procedure

1. Navigate to the **Predictor Results** (ml_predictor_results_task) by entering `ml_predictor_results_task.list` in the Application navigator.
2. Filter the **Predicted Output Value Name** for the name of the field you want to assess, such as "product" or "category."
3. Group the list by **Predicted Correctly** by selecting the list controls icon in the top left corner of the screen.

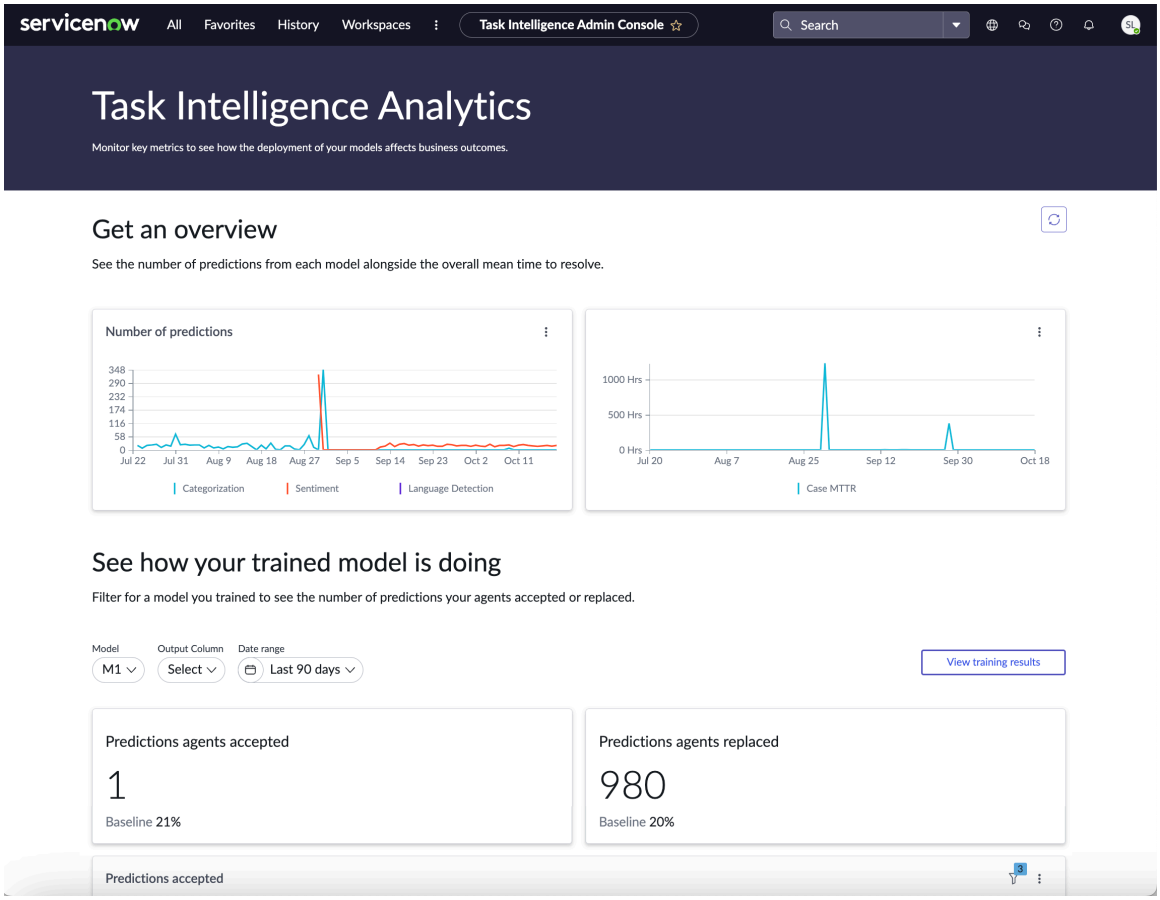


4. Divide the number of records where **Predicted Correctly** is **true** by the total number of records. This represents your accuracy for the specific field.
5. Follow steps 2-4 for each field in which you would like to calculate the accuracy.
6. **Optional:** View the performance of your model on the Monitoring screen.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Navigate to **Task Intelligence for Customer Service** > **Monitoring** in the Application navigator.

(Optional) The Monitoring screen allows you to select the model, field, and date range to display in the charts. Accuracy is measured based on whether the top autofilled value or the top 3 recommendations are correct.



b. Select a model.

c. Select an output column for the field.

d. Select a date range.

What to do next

If the accuracy of each field is acceptable, transition your model from monitoring mode to real-time predictions and deploy. If the accuracy of a specific field is not acceptable, you can remove that output field from your model, retrain, and deploy. See Edit a Task Intelligence model for more information on editing your model.

Task Intelligence Analytics and Monitoring

Use the Task Intelligence Admin Console to monitor, analyze, and assess the performance of your machine learning model.

Task Intelligence for ITSM Analytics and Monitoring

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

View the impacts of your Task Intelligence models. Monitor model performance overtime, track business value, and view what predictions your agents did and didn't use.

View Analytics for Task Intelligence for CSM

View Task Intelligence for Customer Service analytics and see how your machine learning models are working.

View Task Intelligence prediction history

View details about historical predictions in the Predictor Results for CSM models.

Export a Task Intelligence model

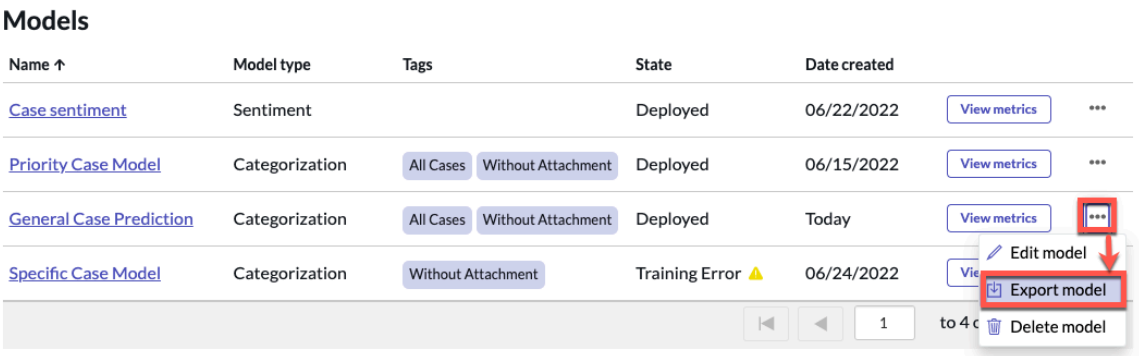
Export a Task Intelligence model to another instance.

Before you begin

Role required: admin or tia_admin

Procedure

1. Navigate to **All** > **Task Intelligence for CSM** > **Setup** or **All** > **Task Intelligence for ITSM** > **Setup**, depending on which application and context you want to export for.
2. In the **Models** list, click the more options menu of the model you want to export.



3. Click **Export model**.
   A new tab opens with authentication steps.
4. Click **Allow**.

Result

The XML file downloads to your browser.

What to do next

You can use the XML file to easily transfer the model to another instance using update sets. To learn more, see System update sets.

Languages supported by Task Intelligence

The Task Intelligence application provides support for predictions in different languages.

Each of the supported languages has an associated two-character code. For example, `English - en`.

The following table lists the languages supported for Task Intelligence along with the models they support.

Note: Only languages included in the training dataset are supported.

Language name	Language code	Incident fields (ITSM)	Case fields (CSM)	Sentiment prediction (CSM)	Language detection (CSM)
Arabic	ar				X
Brazilian Portuguese	pb	X			
Chinese (simplified)	zh	X			X
Czech	cs				X
Danish	da	X			
Dutch	nl	X			X
