Important: This generative AI skill is turned on by default. The skill will be automatically available to appropriate role users for the application. For more information, see AI agents, skills, and agentic workflows on by default.

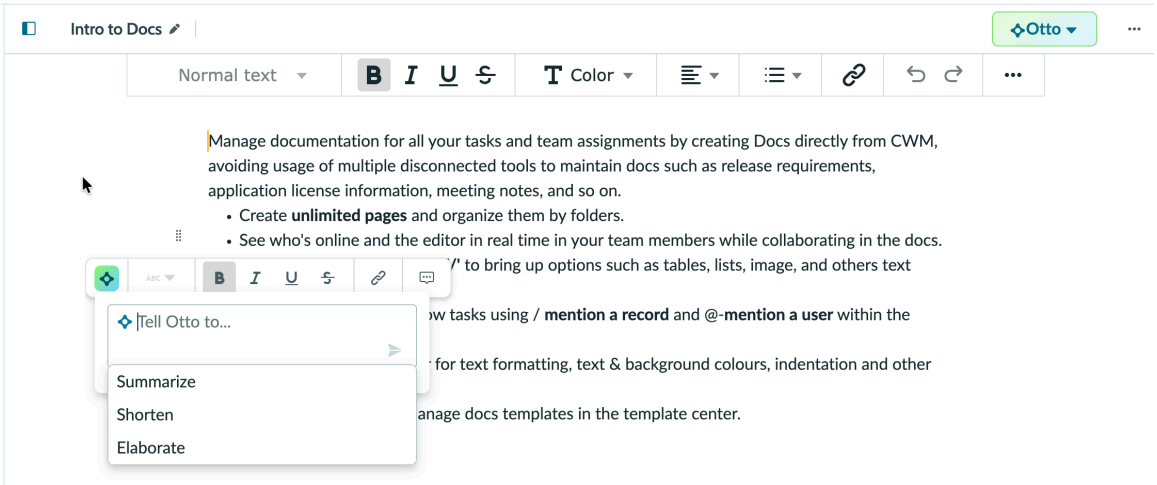
Note: Depending on your license, you will have access to certain application features, generative AI skills, agentic workflows, and AI agents. For more information, see ServiceNow product tiers.

- Create a Doc in EAP.
- Activate the EAP doc summarization ServiceNow Otto skill.

Role required: sn_apw_advanced.eap_user

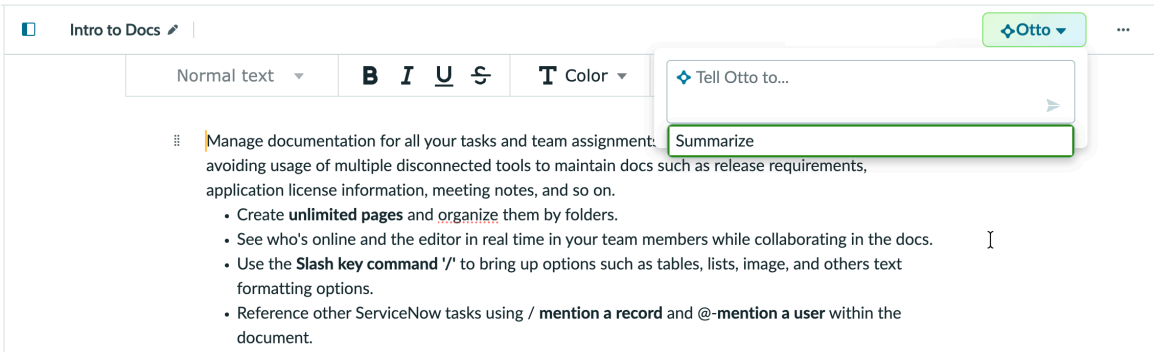
If you have custom roles that require access to this skill, update the ACLs for those roles that require access. For more information, see Implement access control in AI agents.

Procedure



1. Navigate to **Workspaces** > **Strategic Planning Workspace** > **Enterprise Agile Planning**.
2. Navigate to your Doc.

Type	Actions
Team Doc	**a.** Use the Agile structure in the navigation panel to open your team. **b.** Select the Docs tab and open your Doc.
Planning item Doc	**a.** From the Backlog or Planning board pages of a team, select a planning item. **b.** Select **Full details**. **c.** Select the Docs tab and open your Doc.

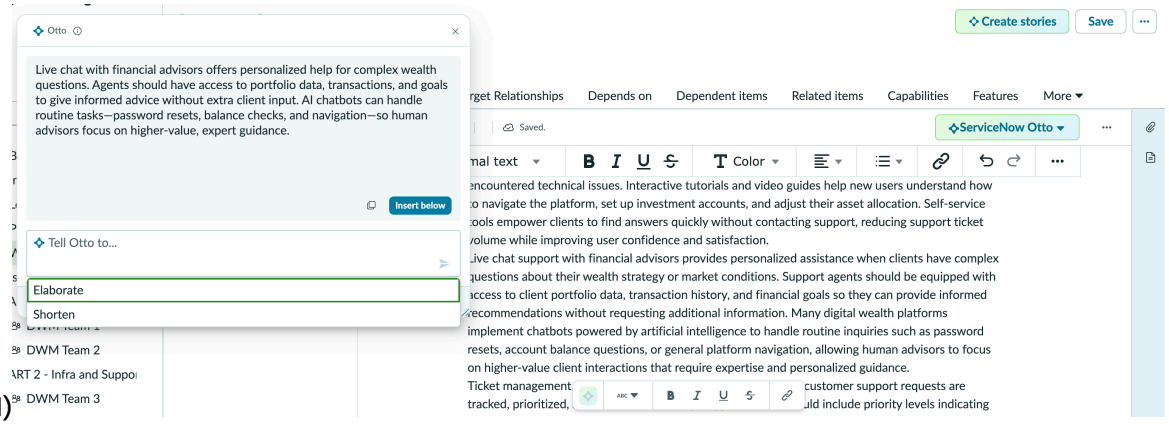


3. From your Doc, open the page you want to summarize or refine.
4. Choose to summarize the selected text on the page or the whole page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To refine the selected text:
  a. Select a single block or multiple blocks of content on the page.
  b. Select **ServiceNow Otto** and choose an option.
    i. **Summarize** to summarize the selected text.
    ii. **Elaborate** to lengthen the selected text based on the existing context.
    iii. **Shorten** to make the selected text concise.

- To summarize the entire content on the page, select **ServiceNow Otto** from the Doc header and select **Summarize**.



Tip: If there's more content to summarize, you can remove some text and retry.

ServiceNow Otto analyzes the text and generates an output in a separate pop-up.

5. **Optional:** Based on the output generated, you can further refine the result or insert the generated content into the Doc.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

(Optional)

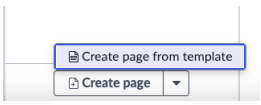
6. **Optional:** Copy the generated output by selecting the Copy to clipboard icon ( ) to use it for purposes such as sending an email, saving to notes, and others.

> **Important:** Because the output is AI-generated, review it to ensure accuracy.

Manage pages and subpages within a Doc in EAP

Flexibly organize information for your teams and work items by creating, duplicating, and deleting pages and subpages within a Doc in Enterprise Agile Planning workspace.

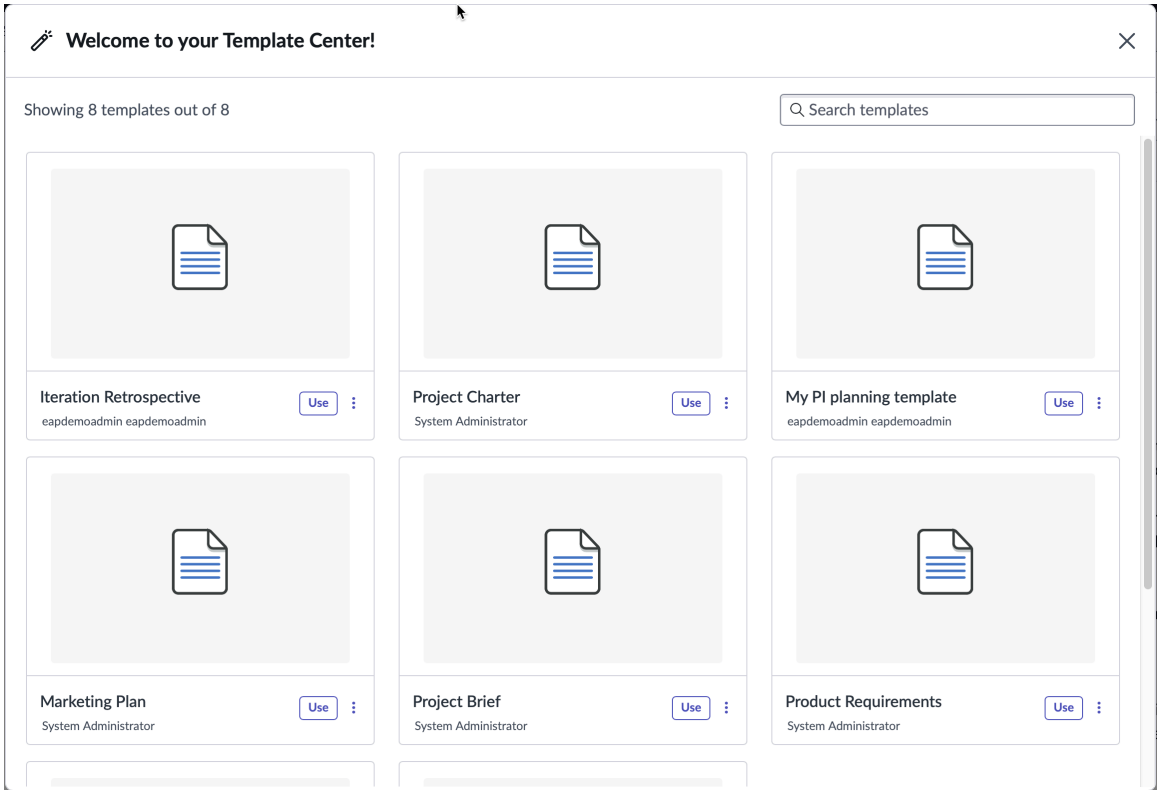
Before you begin



Role required: sn_apw_advanced.eap_user

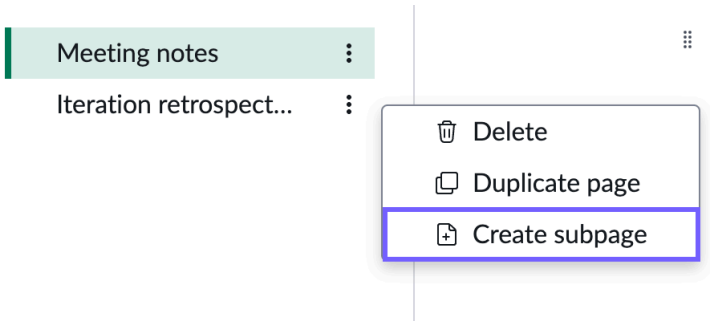
Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace** > **Enterprise Agile Planning**.
2. Navigate to your Doc.



Type	Actions
Team Doc	**a.** Use the Agile structure in the navigation panel to open your team. **b.** Select the Docs tab and open your Doc.
Planning item Doc	**a.** From the Backlog or Planning board pages of a team, select a planning item. **b.** Select **Full details**. **c.** Select the Docs tab and open your Doc.

3. To create a page, you can create a blank page or start with a predefined template.
   - For a blank page, select **Create page**.
   - To create from templates:
     a. Select **Create Page from template**.



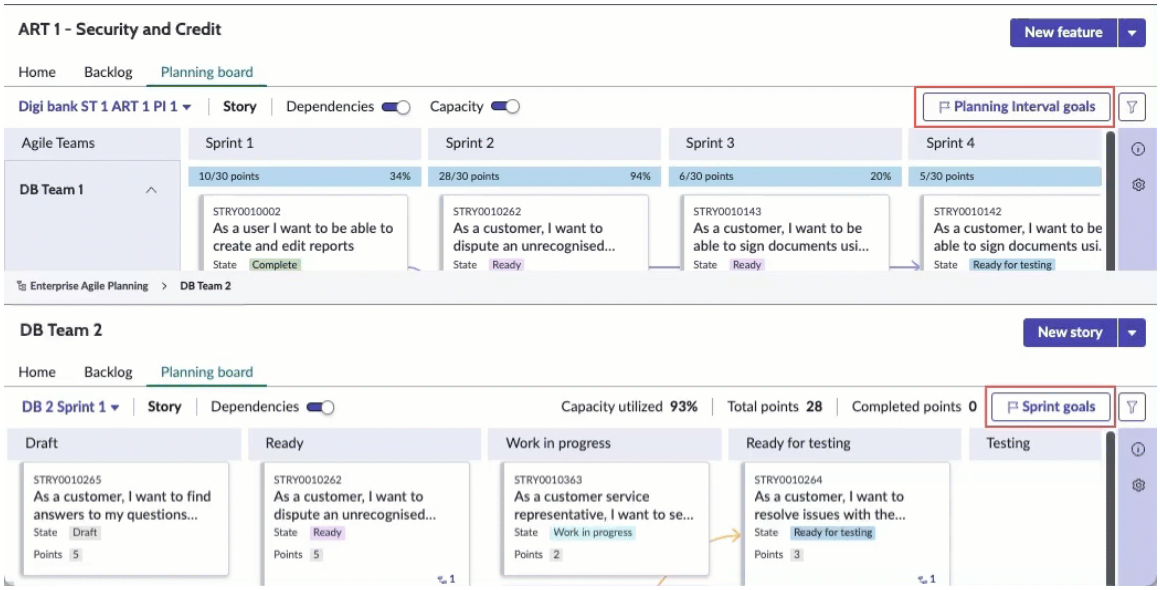
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. Select a template from the Template Center and select **Create page**.

The new page is created and added to your Doc with the name **Untitled**, which you can rename.

4. To create a subpage, select the **Page Actions** menu (⋮) and select **Create Subpage**.

5. To delete a page or a subpage, select the **Page Actions** menu (⋮) and select **Delete**.



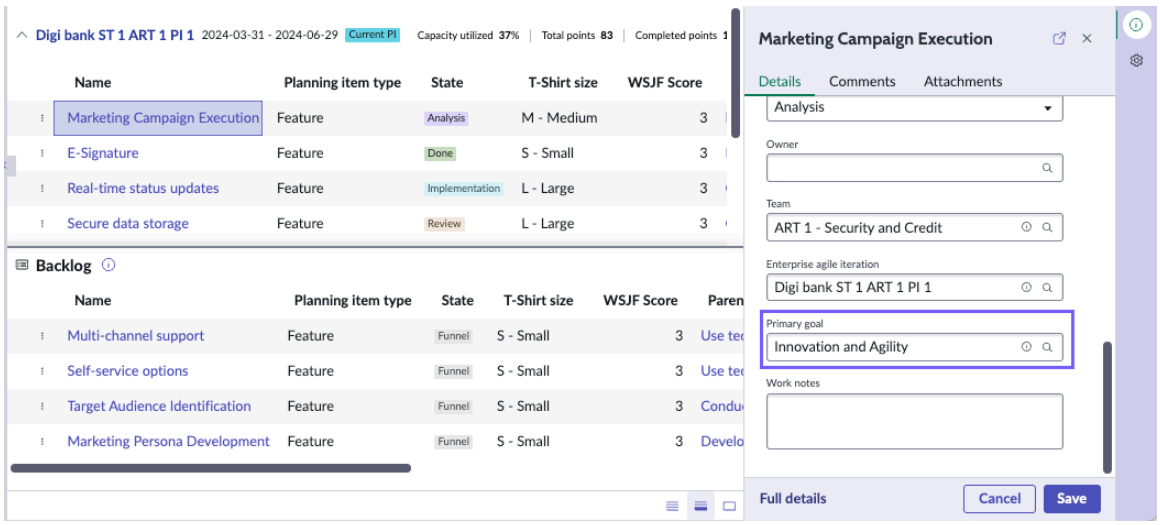
Iteration goals and work item goals in EAP

Within Enterprise Agile Planning, define PI-level or sprint level objectives or associate work items with enterprise goals.

Iteration goals

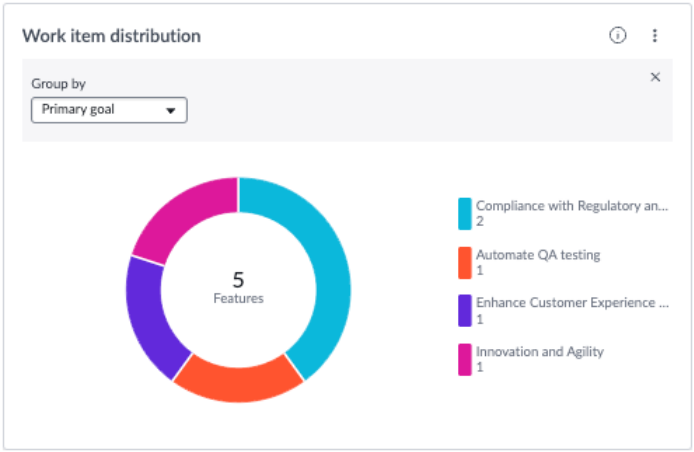
During planning interval (PI) or sprint planning, create functional goals for your team detailing what you plan to accomplish for the current iteration. Depending on your EAP configuration and team structure, you can create goals at the planning interval level or sprint level from the Planning board tab of a team.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



To learn how to create iteration goals in EAP, see Create iteration goals for a PI or sprint in EAP.

Work item goals



Establish a relationship between work items (Epic, Capability, Feature, or Story) with the portfolio-level or enterprise-level goals and OKRs. When goals are added to work items, the teams working on these items have greater visibility into the value that their work would contribute to.

Using the **Primary goal** field of the work item details, goals can be added to work items individually.

Product managers, team leads, or team members can also view their work distribution with respect to goals associated in the **Work item distribution** report of the dashboards.

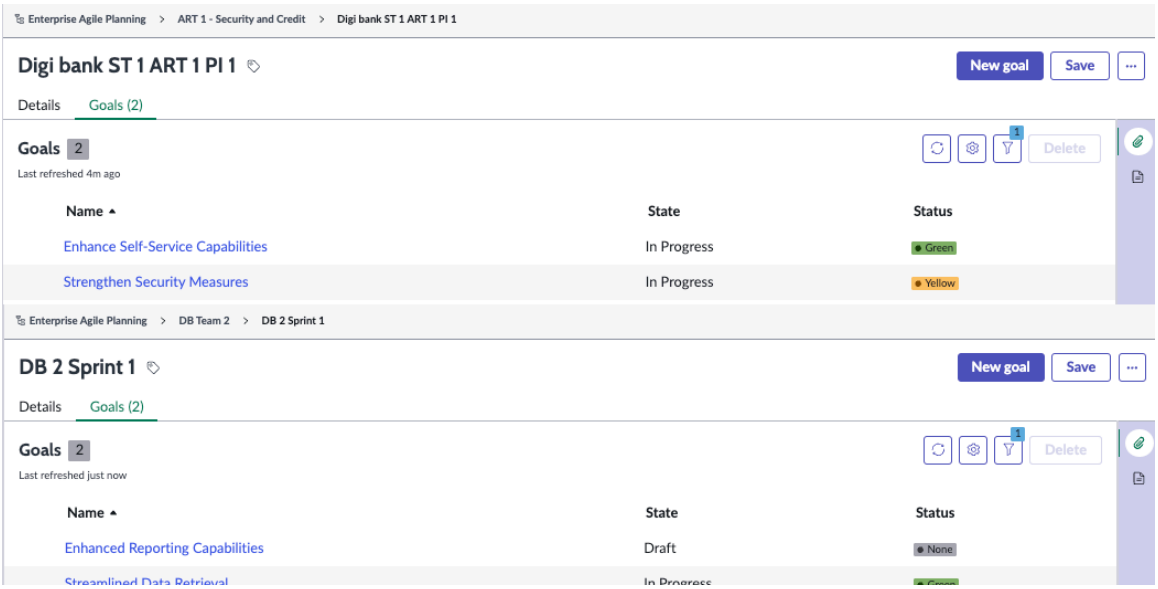
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create iteration goals for a PI or sprint in EAP

Create iteration goals for your Agile teams to highlight the overall objectives to be accomplished for a planning interval or sprint.

Before you begin

Role required: sn_apw_advanced.eap_user



Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace** > **Enterprise Agile Planning**.
2. From the Agile structure section of the left navigation panel, choose an ART or an Agile team and select **Planning Board**.
   - The Planning board shows the current iteration for the ART by default. You can select a different iteration.
   - The Planning board shows the current sprint for the Agile team by default. You can select a different sprint.
3. Depending on the Agile team level that you are at, select **Planning Interval goals** or **Sprint goals**.
   The **Goals** tab displays existing goals for the PI or sprint.
4. Select **New goal**.
5. In the New iteration goal dialog box, enter the name and a description for the goal.
6. Select **Save**.

Result

The goal is created for the PI or sprint and is displayed in the **Goals** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

You can add details to your goal or add sub-goals to it by updating its fields. For information on the form fields for a goal, see Goal form.

Connecting EAP with Collaborative Work Management

Enhance visibility and streamline planning for your Agile teams by connecting Enterprise Agile Planning (EAP) with Collaborative Work Management (CWM).

Overview of EAP-CWM connection

The EAP-CWM integration enables organizations to connect strategic program planning with team-level execution in a single system, eliminating silos and improving delivery predictability.

Using EAP, program managers and release train engineers can define Program Increment (PI) objectives, align Epics, Features, and Stories, create sprints for teams, and manage cross-team dependencies. After completing a PI, they can conduct PI retrospectives and update roadmaps for the next cycle. These capabilities ensure that enterprise priorities are clearly structured and traceable across all levels.

By linking EAP to CWM. Product owners and team members can plan and execute sprints. They can also manage agile stories alongside operational tasks such as incidents, track progress, and hold team-level retrospectives, all within the same workspace.

This connection between the applications reduces context switching and ensures that both planned and unplanned work is accounted for, without losing alignment to strategic goals. The result is end-to-end transparency where leadership can track progress against PI goals through EAP, while teams maintain flexibility to adapt to changing priorities.

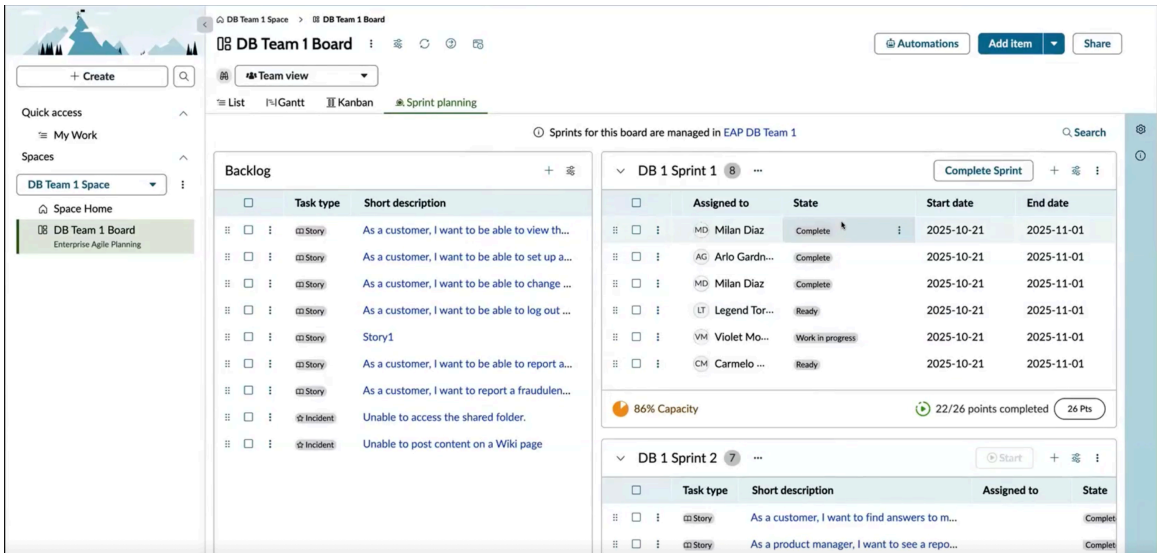
Workflow of EAP-CWM integration

1. EAP admin connects an EAP team to CWM. See Connect an EAP team with CWM.
2. A new Space and Board are created for this EAP team in the CWM workspace.
3. Existing work items assigned to this EAP team are brought over to the newly created CWM Board through Connected Work filters.
4. Sprint planning view is enabled for this CWM Board where the existing work items and sprints are automatically shown.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Check team's access to CWM and provide the CWM user [sn_cwm.cwm_user] to all team members.
6. EAP team can start creating more work, manage current work, and update progress directly from the CWM Board. See Sprint planning in CWM.
7. The team's progress and work status is reflected back on the Team dashboard in the EAP workspace. See EAP Agile Team dashboard

Creating or managing sprints for EAP teams in CWM



For EAP teams integrated with CWM, existing sprints and their scheduled work automatically sync to CWM. These details are displayed in the Sprint Planning view on the CWM Board.

As the team progresses through assigned work, they can update the work status directly in the Sprints section. The sprint can be marked **Complete** from this view and any incomplete work items can be moved either to the backlog or the next sprint, if it exists.

New sprints for the team must be created in EAP. After creating new sprints in EAP, they will sync to CWM, allowing the team to schedule work into these sprints from CWM.

When you change the start date or the end date of an iteration in EAP, the linked sprint in CWM is updated with the new dates. Sprints that don't follow a planning calendar entry sync by using the dates on the iteration record itself. A team on a configuration with a single level of iterations can connect to CWM and keep its own cadence. For more information, see Creating iterations for teams in EAP.

Note: Sprints for EAP teams are not created directly at the Agile team level. Sprints are created automatically when a Planning Interval (PI) is defined for the parent Agile Release Train (ART) in EAP and sync to CWM automatically. On a configuration that has a single level of iterations, an Agile Team creates its Sprints directly and those Sprints sync in the same way.

Backlog and Hierarchy tabs for connected teams

The Backlog and Hierarchy tabs in EAP remain available for teams connected to CWM, so you can continue to view and manage the team's work items in EAP.

Because sprints are started and completed from the CWM Board, the **Start Sprint** and **Complete Sprint** options are hidden in the EAP Backlog for these teams. For more information, see Start or complete iterations in EAP.

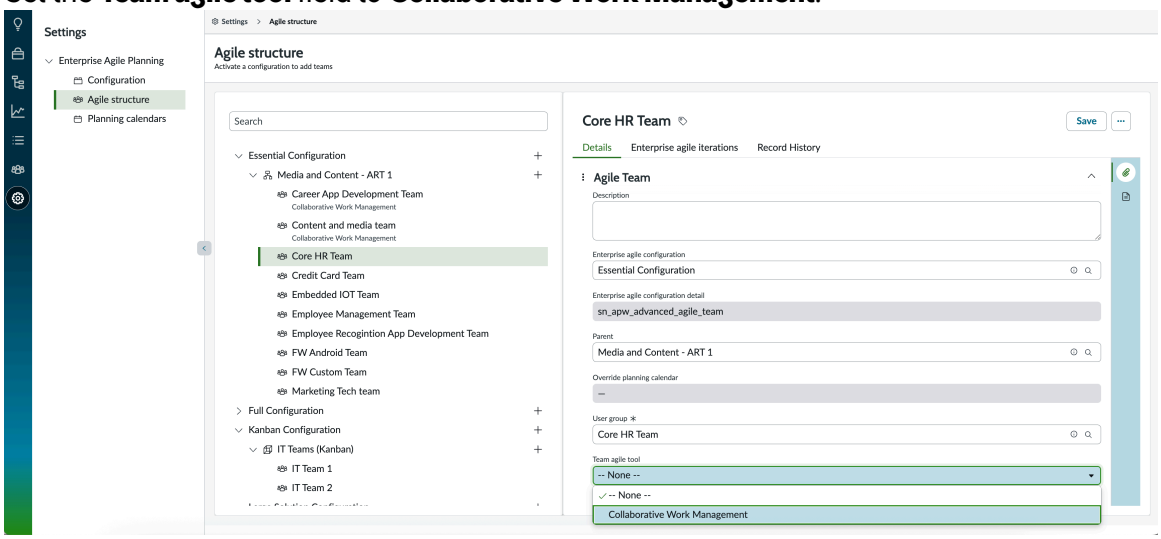
Connect an EAP team with CWM

Establish a connection to CWM by setting your EAP team's Agile tool to Collaborative Work Management.



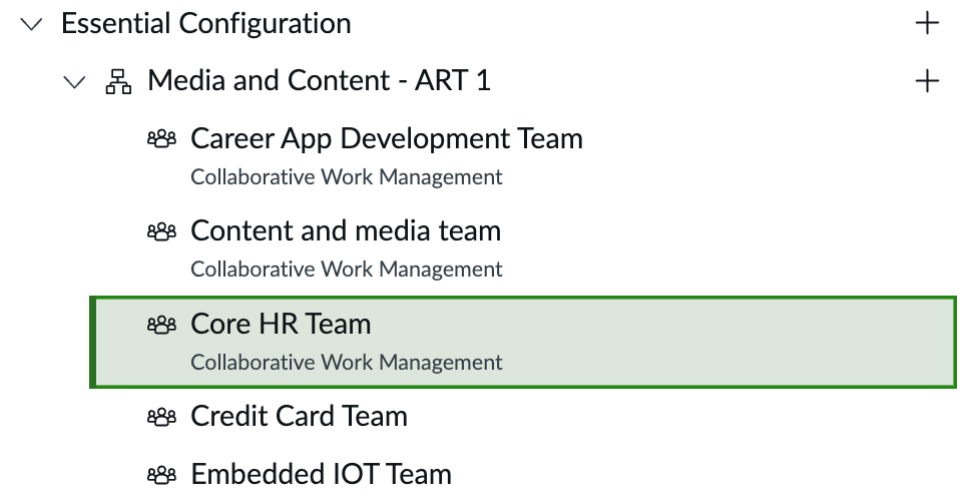
Before you begin

Ensure that **Application Scope** of your ServiceNow instance is set to **Strategic Planning**.

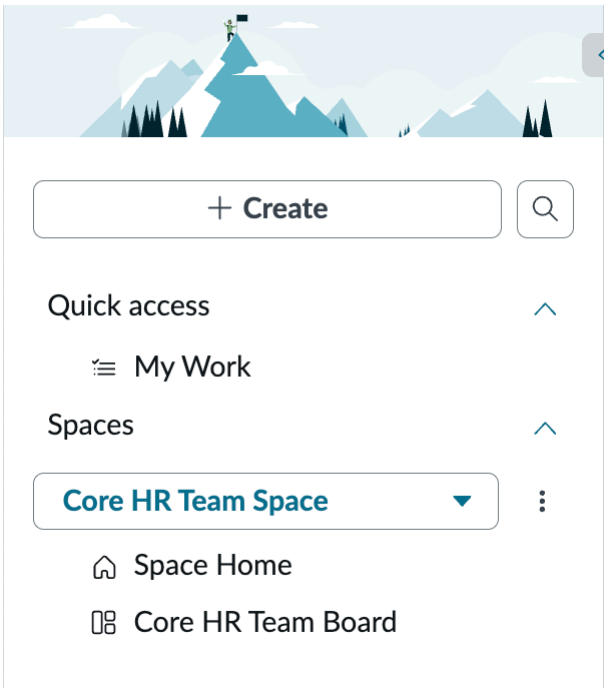
Role required: sn_apw_advanced.eap_admin

Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. From the **Settings** menu, select **Enterprise Agile Planning** > **Agile structure**.
3. Select an EAP team that you want to connect with CWM.
4. Set the **Team agile tool** field to **Collaborative Work Management**.



5. Select **Save**.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result

- Collaborative Work Management is displayed underneath this team in EAP.

- A Space and Board are created for this team in Collaborative Work Management.

- The Backlog and Hierarchy tabs remain available for this team in EAP, but the **Start Sprint** and **Complete Sprint** options are no longer available there. Start and complete sprints from the Collaborative Work Management Board instead.

What to do next

Navigate to **Workspaces** > **Collaborative Work Management** to start managing this team's work. To learn more, see Managing work using Boards in CWM and Sprint planning in CWM.

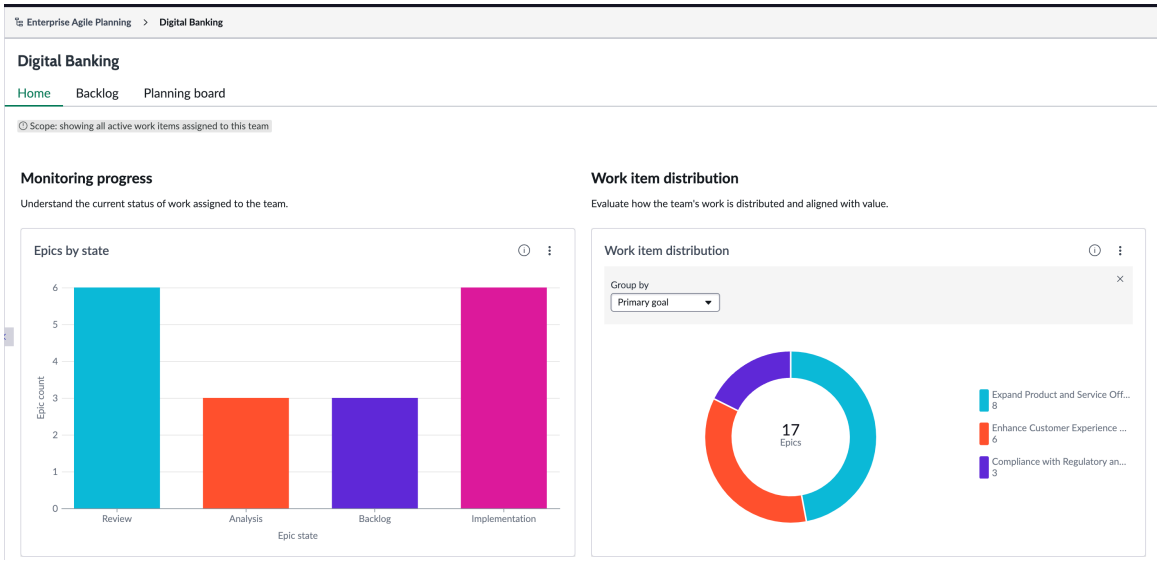
EAP reports and dashboards

Use the EAP dashboards to visualize metrics, identify blockers, and analyze performance trends for your Agile teams.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

As a portfolio manager, product manager, team lead, or a team member, get insights into the team performance using the EAP dashboard. EAP dashboards are available at each level of the Agile structure such as Portfolio, Solution Train, ART, or Team.

You can use a default dashboard or you can configure a custom dashboard and associate it with your Agile configuration. For more information, see Configuring custom dashboards in EAP.



EAP provides the following default Inline and Technical dashboards for different hierarchy levels based on your configuration.

Dashboard	Available with
EAP Portfolio dashboard	• Full Configuration • Portfolio Configuration
EAP Solution Train dashboard	• Full Configuration • Large Solution Configuration
EAP ART dashboard	• Full Configuration • Portfolio Configuration • Large Solution Configuration • Essential Configuration
EAP Agile Team dashboard The Agile Team dashboards consist of: • Agile Team Inline Dashboard • Agile Team Technical Dashboard • Agile Team Velocity Inline Dashboard	• Full Configuration • Portfolio Configuration • Large Solution Configuration • Essential Configuration
Kanban Portfolio Dashboard	Kanban configuration
Kanban Team Dashboard	Kanban configuration

EAP Portfolio dashboard

The Portfolio dashboard provides a high-level view of all the active work items in your portfolio.

			with different story points and analyze the trend in the time taken by the team to complete them. **Note:** The cycle time chart currently doesn't support selecting the story bubble to drill down into the stories.

Kanban Team dashboard in EAP

The Kanban Team Dashboard in EAP provides the work item status and progress metrics for the Agile teams following the Kanban configuration in the Enterprise Agile Planning (EAP) workspace.

The **Home** tab of an Agile Team whose planning methodology is Kanban shows this dashboard, plus the Collaborative Work Management (CWM) dashboard where it applies. Scrum teams don't see this dashboard. For more information, see Scrum and Kanban teams in an ART in EAP.

Required EAP roles

sn_apw_advanced.eap_read_only or the sn_apw_advanced.eap_user.

Access the Kanban Team dashboard

To open the dashboard:

1. Navigate to **Workspaces** > **Strategic Planning Workspace** > **Enterprise Agile Planning**.
2. From the Agile structure section of the navigation panel, choose your Kanban EAP Portfolio.
3. Select the **Home** tab.

Role title [name]	Description	Contains roles
EAP scrum master [sn_apw_advanced.eap_scrum_master]	• Can create, edit, and delete planning calendars and calendar spans • Can create and edit iterations such as Planning Intervals and Sprints. Only the EAP admin can delete them. • In the workspace Settings menu, can view only the Planning calendars sub-page • Is the only role that can change the start date or end date of an iteration	sn_apw_advanced.eap_user
EAP read-only role [sn_apw_advanced.eap_read_only]	Can view EAP planning items and stories across teams and iterations in the Backlog, planning board, hierarchy tabs, dashboard widgets on the Home tab, and team-level Docs.	• scrum_user • workspace_user • canvas_user

Tables installed

Table	Description
Agile Release Train [sn_apw_advanced_agile_release_train]	Stores information of all Agile Release Trains created for the Agile structure of an EAP configuration. This table extends the Enterprise agile team [sn_apw_advanced_eap_team] table.
Agile Team [sn_apw_advanced_agile_team]	Stores information of all Agile Teams created for the Agile structure of an EAP configuration. This table extends the Enterprise agile team [sn_apw_advanced_eap_team] table.
Capability [sn_align_core_capability]	Stores information of all Capability type of work items created in EAP. This table extends the EAP planning item [sn_align_core_eap_planning_item] table.
EAP planning item [sn_align_core_eap_planning_item]	Base table for all EAP work item types. This table extends the Planning Item Entry [sn_align_core_planning_item] table.
Enterprise agile calendar [sn_apw_advanced_eap_calendar]	Stores information of iteration types such as Planning Intervals and Sprints. This table extends the Business Calendar [business_calendar] table.
Enterprise agile calendar entry [sn_apw_advanced_eap_calendar_span]	Stores information of the timeline defined or date span for calendar entries of a business calendar span. For example, for a Sprint calendar type, six calendar entries spanning over three months can be created. This table stores the date spans for each of these Sprint calendar entries. This table extends the Business Calendar Entry [business_calendar_span] table.
Enterprise agile configuration (sn_apw_advanced_eap_configuration)	Stores information of agile configurations such as Full configuration, Portfolio configuration, and other default and custom configurations.
Enterprise agile configuration detail [sn_apw_advanced_eap_configuration_detail]	Stores the details of the default work item type and planning calendar associated with a team type for a configuration. It also stores:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
	• Team hierarchy in the Agile structure for a configuration. • Work item type available on the Backlog and Planning board pages.
Enterprise agile iteration [sn_apw_advanced_eap_iteration]	Stores the details of team-level iterations details such as capacity, total points, State, and others.
Enterprise agile iteration type [sn_apw_advanced_eap_iteration_type]	Stores the information about planning calendar types such as Planning Intervals or Sprints.
Enterprise agile team [sn_apw_advanced_eap_team]	Base table for all EAP teams such as ART, Solution Trains, Agile Release Trains, and Portfolios created in the Agile structure for a configuration.
Enterprise agile team structure [sn_apw_advanced_eap_team_structure]	Contains information of team hierarchy.
Enterprise agile work structure [sn_apw_advanced_eap_work_structure]	Contains information of work item type hierarchy.
Epic [sn_align_core_scrum_epic]	Stores information of all Epic work items created in EAP. This table extends the EAP planning item [sn_align_core_eap_planning_item] table.
Feature [sn_align_core_feature]	Stores information of all Feature work items created in EAP. This table extends the EAP planning item [sn_align_core_eap_planning_item] table.
Solution Train [sn_apw_advanced_solution_train]	Stores information of all Solution Trains created for the Agile structure of an EAP configuration. This table extends the Enterprise agile team [sn_apw_advanced_eap_team] table.
SAFe Portfolio [sn_apw_advanced_eap_portfolio]	Stores information of all Portfolios created for the Agile structure of an EAP configuration. This table extends the Enterprise agile team [sn_apw_advanced_eap_team] table.
Story [rm_story]	Stores information of all stories created.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scheduled jobs installed

Scheduled jobs installed with Enterprise Agile Planning

Scheduled job	Description
Populate parent level data for work item and stories	Populates the details of the parent work item up to seven levels.
Populate parent level data for work item and stories (Bulk)	Populates the details of the parent work item up to seven levels. Run this scheduled jobs when you have multiple stories that needs update to parent work item details at once.

Properties installed with Enterprise Agile Planning

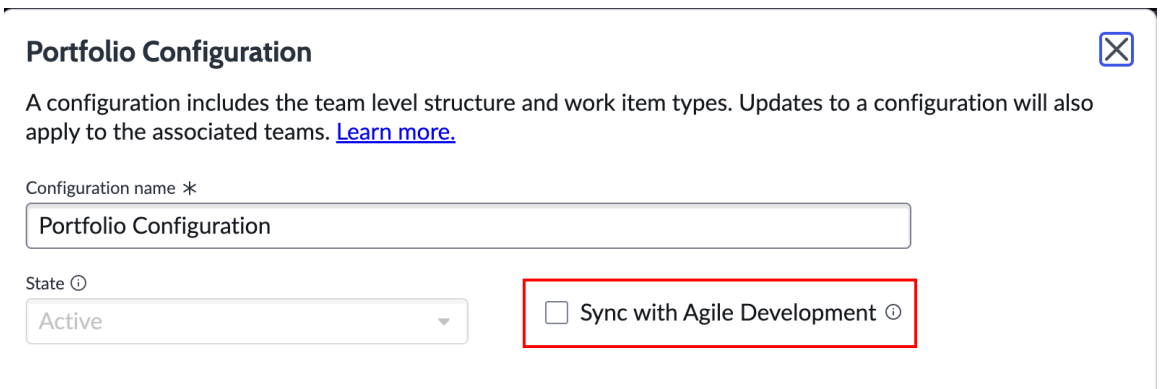
System properties that you can configure to modify the way your product manager or scrum team members view their work in the Enterprise Agile Planning (EAP) workspace.

These properties are available for Enterprise Agile Planning.

Note: To open the System Properties [sys_properties] table, enter `sys_properties.list` in the navigation filter.

Properties for Enterprise Agile Planning

Property	Description
sn_apw_advanced.eap_work_structure_allow_list	Enables viewing different work item types in the Backl for EAP teams. • Type: string • Default value: sn_align_core_scrum_epic,sn_align_core_capability **Important:** Any item, which is an extension o item [sn_align_core_eap_planning_item] table r **rm_story**. • Location: System Property [sys_properties] table • Learn more: Configure display of other work item typ
sn_apw_advanced.enable_hierarchy_view	Enables the Hierarchy view in Enterprise Agile Plannin expandable parent-child tree. • Type: true | false • Default value: false • Location: System Property [sys_properties] table



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties for Enterprise Agile Planning (continued)

Property	Description
	• Learn more: Enable Hierarchy tab in EAP This property is available only after the *Populate work item* fix script is run. For more information, s EAP.
sn_apw_advanced.show_inactive_items_in_backlog_list	Controls whether completed and cancelled work item of the EAP Backlog tab. • Type: true | false • Default value: false (the Backlog section shows only • Location: System Property [sys_properties] table • Learn more: Manage team backlog in EAP
sn_apw_advanced.show_inactive_items_in_iteration	Controls whether completed and cancelled work item (Sprints and Planning Intervals) of the EAP Backlog tal • Type: true | false • Default value: true (iteration sections show all work i cancelled) • Location: System Property [sys_properties] table • Learn more: Manage team backlog in EAP

Integration between EAP and Agile Development 2.0

While setting up a configuration in Enterprise Agile Planning, you can establish an integration with Agile Development 2.0. Learn more about the tables connected and the way you access the information.

In the EAP configuration form, when you enable the **Sync with Agile Development** option, information of the following tables is synced between the two apps.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

EAP tables	Agile Development 2.0 tables
Enterprise agile iteration [sn_apw_advanced_eap_iteration]	Sprint [rm_sprint]

When this sync is established for a configuration, the following are the functionality changes:

Sprint creation and updates

- Creating a Sprint is suggested to be done from EAP.
- Creating a Sprint in EAP creates a related Sprint in Agile Development 2.0.

  If the dates of the Sprint in EAP overlap with a record in the rm_sprint table, then a new Sprint isn't created for Agile Development 2.0. You can either choose to create sprints for non-overlapping dates or delete the existing sprint from the rm_sprint table.

- Fields of planned start and end dates for Sprints in Agile Development 2.0 become read-only, and are derived from the business calendar spans mapped to the iterations in EAP.

  If an iteration doesn't follow a calendar entry, the dates are derived from the start date and the end date on the iteration itself.

- Sprints that an Agile Team creates on a configuration with a single level of iterations sync to Agile Development 2.0 even though they don't follow a planning calendar entry. For more information, see Creating iterations for teams in EAP.
- Updating Sprint details in EAP updates the corresponding Sprint details in Agile Development 2.0.

  Changing the start date or the end date of an iteration updates the dates on the corresponding Sprint.

- Deleting Sprints from EAP deletes the corresponding record from the Sprint [rm_sprint] table.
- On the Sprint [rm_sprint] table, reference fields are created for parent of the EAP iteration and the EAP team this iteration belongs to.

Story creation and updates

- All Stories scheduled for any Sprints in this configuration can be accessed in Sprints of Agile Development 2.0.

  You can track the progress of this Sprint from the Agile board.

- Any changes made to the story details or its progress are visible in both the applications.
- On the Story [rm_story] table, reference fields are created for EAP team, iteration, configuration, and parent work item in the EAP fields related list.
- If a story is rescheduled to a different sprint or moved to the Backlog on the Agile board, it's updated in EAP and vice versa.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The Story records for EAP are by default saved in the Story [rm_story] table, which is installed with the Agile Development 2.0 plugin.

Team type form

Learn about the fields of the new table form that are required to add a new team type in Enterprise Agile Planning.

Table form

Field	Description
Label	Unique label for the table.
Name	This field is auto-generated from your input in the **Label field**.
Application	This field is automatically set to **Portfolio Planning Core** based on your scope. If this field shows a different value, then set the scope of your ServiceNow instance to **Portfolio Planning Core**.
Extends table	Select **Enterprise agile team**.

Controls section of the team type form

Field	Description
User role	Set this field to **sn_apw_advanced.eap_user** so that you grant access to the EAP user to this table.

Application Access section of the team type form

Application Access
Enable the **Can read**, **Can create**, **Can update**, and **Can delete** fields.

SAFe-EAP migration request form

Learn about the fields of SAFe-EAP migration form. Use this form to submit a request to migrate Scaled Agile Framework data to Enterprise Agile Planning.

SAFe-EAP migration request form

Field	Description
Request name	A unique name for the migration request.
EAP configuration	Configuration in EAP that matches with your SAFe configuration. For example, if you're using Portfolio SAFe in your ServiceNow instance, select **Portfolio configuration**.
SAFe table	Data from the SAFe table that you want to migrate to EAP. • If you select **Portfolio**, the data from SAFe Portfolio tables, their immediate child ARTs, SAFe teams, and the iterations and work items associated with them will be migrated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SAFe-EAP migration request form (continued)

Field	Description
	• If you select **ART**, the data from ART tables, their parent Portfolios, child SAFe teams, and the iterations and work items associated with them will be migrated.
Filter records	SAFe portfolios/ARTs that match the filter conditions will be displayed for selection.
Records available for migration	Records that match the filter conditions that you applied in the previous field are displayed in the Available list for you to choose from. Only the records that are moved to the Selected list are considered for migration.
PIs starting on or after	Program Increments with planned start date falling on or after the selected date are migrated.
Work items update after	Epics, Features and Stories updated after the selected date are migrated.
Status	Status of the migration request.

Enterprise Agile Planning Indicators

Indicators included in the EAP dashboard.

Indicator	Description	Version added
EAP: Sum of story points of completed stories in current iteration	Sum of story points of completed stories in current iteration is measured daily as unit.	Washington DC
EAP: Sum of story points of all stories in the current iteration	Sum of story points of all stories in the current iteration is measured daily as unit.	Washington DC
EAP: Sum of story points of active stories in the current iteration	Sum of story points of active stories in the current iteration is measured daily as unit.	Washington DC

For information about the metrics you can view on the EAP dashboard through these indicators, see EAP reports and dashboards.

Work item reorder errors in EAP Backlog

Review the scenarios when the reordering of work items can fail in the Backlog of Enterprise Agile Planning workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

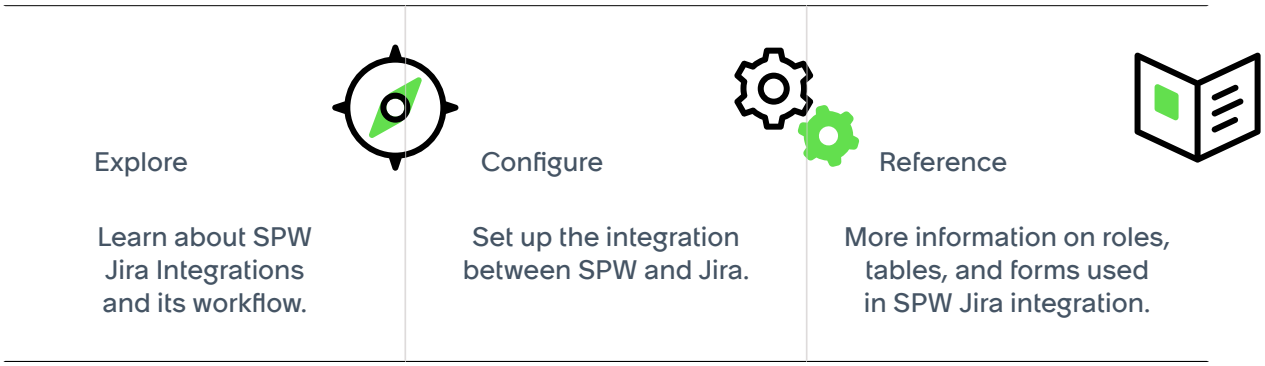
While reordering work items in different sections of the EAP Backlog, the reorder can fail due to an error in the ranking configuration. Following are the scenarios where reordering of work items can fail:

Scenario 1: Global ranking plugin is not active

Check if the Global Ranking Application plugin (com.snc.sdlc.ranking) is active in your ServiceNow instance. If not, contact your admin to activate it.

Scenario 2: Work item doesn't have a rank configuration

Check if all the work items that you are reordering have a rank configuration. If not, contact your admin to update rank configuration for these work item types.



Scenario 3: Target row doesn't have a global rank

Check if the work item before or after your target position to reorder has a global rank. If not, contact your system admin to generate a global rank for them.

SPW Jira Integrations

Improve visibility from strategy to execution with Jira Integration. This integration enables bi-directional syncing of Epics, Features, Capabilities, and Stories. While sprints are created in Enterprise Agile Planning (EAP) and synced to Jira, sprint status updates flow back from Jira to EAP.

Get started

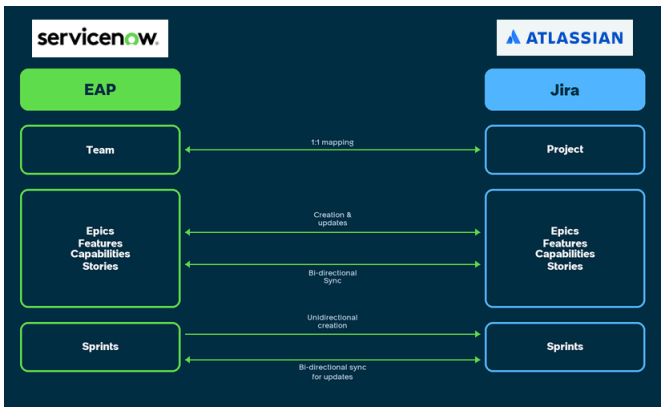
Exploring SPWJira integrations

Learn more about integrating Strategic Planning Workspace with Jira and review the benefits it can provide for different users in your organization.

SPW Jira integration overview

As a portfolio manager, you may rely on Strategic Planning Workspace (SPW) for roadmap planning, prioritization, and aligning work with strategic goals. However, your delivery teams could prefer using tools like Jira for the actual execution of work such as creating and managing stories and epics. This disconnect could create a visibility gap for portfolio managers, making it difficult to track progress and ensure alignment between strategy and execution.

The SPW-Jira integration helps solve this problem by providing seamless, bi-directional synchronization of key work items, including Epics, Features, Capabilities, and Stories. This synchronization ensures that updates made in either system are reflected in the other, giving portfolio managers real-time insight into execution without leaving SPW.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sprints are created in EAP and sync to Jira, while status updates flow back from Jira to maintain visibility. This approach enables comprehensive end-to-end planning in SPW with the ability to plan dependencies and capacities across teams and sprints in EAP.

By bridging the gap between strategic planning and operational execution, this integration provides end-to-end visibility, enabling better decision-making, improved collaboration, and stronger alignment across teams.

SPW Jira Integrations workflow

The following infographic shows how the integration between SPW and Jira work in both the applications.

- One-to-One Mapping: Each Jira Project is directly mapped to an EAP Team.
- Bidirectional Sync of Work Items:
  - Epics, Features, Capabilities, and Stories are synced both ways between SPW and Jira.
  - Sync applies to creation and updates.

    Example: A product owner creates an Epic in EAP and it appears in Jira. Team members update the Epic in Jira and the changes sync back to EAP.

    Note: If your Jira instance has state transition rules, the export sync from EAP to Jira might fail. For example, if a transition rule in Jira restricts a story or work item from moving directly to a **Complete** state without first passing through an **In Progress** state, and the story is marked **Complete** without that intermediate step, the sync fails.

- Sprint Management:
  - Sprints can only be created in EAP, then synced to Jira.
  - Updates to sprints can be made in either application and are synced bidirectionally.

What to explore next

To learn more about configuring and using SPW Jira Integrations, see:

- Configuring SPW Jira Integrations
- SPW Jira Integrations reference

Configuring SPW Jira Integrations

Configure the set up and implementation of SPW Jira Integrations. You can either follow the tasks listed in the configuration or use Guided Setup.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuration overview

1. Install SPW Jira Integrations.
2. Assign the Jira integration admin role. See Components installed with SPW Jira Integrations.
3. Set up a Jira instance.
4. Connect SPW to Jira.
5. Import Jira projects to SPW.
6. Configure Jira Project settings.
   a. Associate Jira projects with EAP teams.
   b. Review default mapping configuration for Jira projects in SPW.
   c. (Optional) Create custom mapping configuration.
   d. Enable bidirectional sync between SPW and Jira.
7. Import issues from Jira to SPW.
8. Repeat steps 6 and 7 for all imported Jira projects.
9. Activate Jira configuration in Enterprise Agile Planning.
10. Define team structure in Enterprise Agile Planning.

Using guided setup to implement SPW Jira Integrations

Guided setup provides a sequence of tasks that help you configure SPW Jira Integrations on your ServiceNow instance. To open guided setup for SPW Jira Integrations, navigate to **All** > **Strategic Planning** > **Jira integration** > **Guided Setup**.

Install SPW Jira Integrations

You can install the SPW Jira Integrations application (sn_spw_jira_int) if you have the admin role.The application installs related ServiceNow® Store applications and plugins if they are not already installed.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Review the SPW Jira Integrations application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.

Role required: admin

About this task

The following items are installed with SPW Jira Integrations:

- Store applications
- Roles
- Scheduled jobs
- Tables

For more information, see Components installed with SPW Jira Integrations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the SPW Jira Integrations application (sn_spw_jira_int) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

   A list of the versions available to you are displayed.
3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box, any dependencies installed with your application are listed.
4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
   Demo data are the sample records that describe application features for common use cases. Load the demo data when you first install the application on a development or test instance.
6. Select **Install**.

Setting up a Jira instance for SPW Jira Integrations

Establish a connection between Strategic Planning Workspace (SPW) and Jira using a Jira instance record.

Before connecting SPW and Jira, you need a Jira instance record and Jira connection alias in your ServiceNow instance.

Based on the type of your Jira instance, perform the following steps:

- For Jira Cloud:
  1. Create a child alias for the Jira Spoke alias.
  2. Integrate your ServiceNow instance with your Jira account using OAuth. See Option 1: Using OAuth authentication (Authorization Code grant type)

     Note: To create credential record and connection record in this task, use the child alias that you created earlier and not the parent Jira Spoke.
  3.
  4.
  5. Create a Jira instance record in ServiceNow AI Platform.
- For Jira Server or Data center:
  1. Create a child alias for the Jira Spoke alias.
  2. Set up a MID server. See Tips to set up your MID Server.
  3. Create Personal Access Token (PAT) in Jira.
  4. Using the PAT, set up connection & credentials for the child alias.
  5. Create a Jira instance record in ServiceNow AI Platform.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

After successfully setting up the Jira instance record, proceed to connect Strategic Planning Workspace and Jira. For more information, see Connect SPW to Jira.

Create a child alias for Jira Spoke alias for SPW Jira Integrations

Create a child connection & credential alias that will be used to connect to Jira later, to enable integration between Strategic Planning and Jira.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Connection & Credentials** > **Connection & Credential Aliases**.
2. From the list of aliases, open the alias based on your Jira instance type.
   - For Jira Cloud, open **sn_jira_spoke.Jira**.
   - For Jira Server/Data Center, open **sn_jira_int.Jira**.
3. Create a child alias.
   a. From the Child Aliases related list, select **New**.
   b. Enter a name.
   For example, **Jira instance – GenAI team**.
   c. Select **Submit**.

What to do next

- For Jira Cloud: .
- For For Jira Server/Data Center: Create PAT for Jira Server.

Create Personal Access Token in Jira for SPW Jira Integrations

Create a Personal Access Token (PAT) for your Jira Server/Data Center instance, which is later used to create a connection between Strategic Planning and Jira.

Before you begin

- Create a child alias for Jira Spoke alias for SPW Jira Integrations.
- Set up a MID server. See Tips to set up your MID Server.

Role required: NA

About this task

This task is performed outside the ServiceNow instance.

Important: A Jira Server account is used to create the PAT. After establishing the integration, any updates that are made in Strategic Planning Workspace will show up in Jira as done by this logged-in user. So, it is recommended that this account that is used to generate the PAT is either an admin or a placeholder user profile that is not used to make any updates in Jira once the integration is complete. If this user makes any updates in Jira, it may result in cyclic changes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Log into your Jira Server instance.
2. Navigate to your profile.
3. From your profile details, select **Personal Access Tokens** from the left navigation menu.
4. Select **Create token**.
5. Enter the details of name and expiry period.
6. Select **Create**.
7. Copy the created token and store it securely to retrieve it for later steps.

What to do next

Use this PAT as password while creating connection and credential for your Jira alias. See Create connection and credentials for SPW Jira Integrations.

Create connection and credentials for SPW Jira Integrations

Using your Jira instance details, create a connection and credential for the child alias. This alias is used to enable the two-way sync of work item updates between Strategic Planning Workspace and Jira.

Before you begin

1. Create a child alias for Jira Spoke alias for SPW Jira Integrations.
2. or Create Personal Access Token in Jira for SPW Jira Integrations.

Role required: admin or sn_jira_int.admin

About this task

This task is performed for Jira Server/Data Center type instances only. For Jira Cloud, follow the steps of OAuth authentication. For more information, see Option 1: Using OAuth authentication (Authorization Code grant type).

Procedure

1. Navigate to **All** > **Connection & Credentials** > **Connection & Credential Aliases**.
2. From the list of aliases, open **sn_jira_int.Jira**
3. From the Child Aliases related list, open the child alias record that you created earlier.
4. From the Connection & Credential Aliases form, select **Create New Connection & Credential** related link.
5. On the form, fill in the fields.
   For field information, see Create Connection & Credential form.
6. Select **Create**.

What to do next

Create Jira instance for SPW Jira Integrations.

Create Jira instance for SPW Jira Integrations

Create a Jira instance record which is later used to connect Strategic Planning Workspace and Jira.

Before you begin

Create connection and credentials for SPW Jira Integrations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: sn_jira_int.admin

Procedure

1. Navigate to **All** > **Strategic Planning** > **Jira Integration** > **Jira Instances**.
2. Select **New**.
3. On the form, fill in the fields.
   For field information, see Jira Instance form.
4. Select **Submit**.

What to do next

Connect SPW to Jira.

Connect SPW to Jira

Connect Strategic Planning Workspace to Jira to enable the integration between the applications.

Before you begin

Role required: sn_jira_int.user

Procedure

1. Navigate to **All** > **Strategic Planning** > **Jira Integration** > **Jira Instances**.
2. Select your Jira instance.
3. Click **Get Webhook Callback URL**.
4. Set up a webhook using this URL in Jira Administration.
   This action is done outside your ServiceNow instance.

   Registering a webhook via the Jira administration console
5. On the Jira instance form, select **Connect**.

Result

If the connection is successful, the **State** field on your Jira instance record shows **Connected**. A webhook is now registered in Jira to receive update events.

What to do next

Import Jira projects to SPW.

Import Jira projects to SPW

Discover and import all available Jira projects and boards into Strategic Planning Workspace to start using the integration between the two applications.

Before you begin

Connect SPW to Jira.

Role required: sn_jira_int.user

Procedure

1. Navigate to **All** > **Strategic Planning** > **Jira Integration** > **Jira Instances**.
2. Open your Jira instance record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select **Discover Projects**.

   This action creates requests to import Jira projects and boards, and to create mapping configuration for all these projects. You can view all the import requests in the Jira Import Requests related list and the initial state of all the requests would be **Requested**

Result

Once the status of each import request changes to **Complete**, you can see that the related lists of this Jira instance are populated as follows:

- Jira Projects: All available projects from Jira
- Jira Boards: All available boards from Jira
- Project Style Mappings: Mapping configuration for all the imported Jira projects.

What to do next

Configure integration settings for a Jira project.

Configuring Jira project settings in SPW

Configure integration settings for each Jira project before importing issues to ensure accurate and consistent visibility of work in both Strategic Planning Workspace and Jira. These settings such as team association and data mappings define how work items sync between both applications.

For each Jira project, perform the following tasks:

1. Associate the Jira project with an EAP team.

   Each Jira project must be associated with an EAP team so that work items brought in from Jira map to the right team in SPW.

2. Review default data mapping configurations.

   Predefined data mapping configurations for Epics, Sprints, and Stories between the two applications are available. However, if these default mappings don't fit your team's requirements, you can edit them or create new ones. See Create custom mapping configurations.

3. Enable bidirectional data sync.

   This step ensures updates done in either application are reflected in the other so that data is consistent across.

These steps must be completed for every Jira project that you plan to integrate. Doing so ensures that imported issues sync correctly and enables portfolio managers with real-time visibility into execution.

Associate Jira projects with EAP teams

Ensure work items from Jira are mapped to the right teams in Enterprise Agile Planning (EAP) by associating Jira projects with EAP teams.

Before you begin

Import Jira projects to SPW

Role required: sn_jira_int.user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Strategic Planning** > **Jira Integration** > **Jira Projects**.
2. Open your Jira project record.
3. From the Team Integration Settings related list, select **New**.
4. On the Team Integration Settings form, fill in the fields,
   For field information, see Team Integration Settings form.
5. Select **Submit**.

What to do next
Review default mapping configuration for Jira projects in SPW.

Review default mapping configuration for Jira projects in SPW

Verify that the default mapping configuration between work items in Strategic Planning Workspace (SPW) and Jira aligns with your team's processes.

Before you begin
Import Jira projects to SPW

Role required: sn_jira_int.user

About this task
Review the predefined table, field, and choice mapping configuration for a Jira Project. For more information on the default configuration for Epics, Stories, and Sprints, see Default mapping configuration for SPW Jira Integrations.

Procedure

1. Navigate to **All** > **Strategic Planning** > **Jira Integration** > **Jira Projects**.
2. Open your Jira project record.
3. From the Table Maps related list, review the list of mappings available between tables of Jira and SPW for this project.
4. Review the field mapping for each table map.
   a. Select a table mapping record to open it.
   b. From the Field Maps related list, review the mapping configuration of the fields between the tables.
5. Review the choice mapping for a field such as the State field.
   a. Select a field mapping record to open it.
   b. From the Choice Maps related list, review the mapping configuration of choices of the fields.
6. Repeat steps 3, 4, and 5 for all table maps of the Project.

What to do next
If the available mapping configuration doesn't fit your team's requirements or processes, you can create custom mappings between entities of Jira and SPW. For more information, see Custom mapping configuration for SPW Jira Integrations.

Custom mapping configuration for SPW Jira Integrations

Learn about creating custom mapping configurations to map Jira issue types, fields, and choices with SPW entities, to match your team's processes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Custom mapping configurations allow you to control how Jira issue types, fields, and values align with SPW planning items. While default mappings cover common use cases, they may not fit your team's processes or reporting needs. By creating custom mappings, you can:

- Ensure accurate synchronization of work items between Jira and SPW.
- Align data mapping to reflect your team's terminology and workflows.
- Support consistent reporting and visibility across strategy and execution.

This flexibility helps provides a tailored integration experience, so that portfolio managers and delivery teams work with information that matches their context.

Create custom table mapping for SPW Jira integrations

Create a custom mapping configuration between tables of Strategic Planning Workspace (SPW) and Jira.

Before you begin

Review default mapping configuration for Jira projects in SPW.

Role required: sn_jira_int.user

About this task

Choose one table from Jira and one from SPW to create a mapping between them.

For example, if your team uses an issue type like Feature that isn't mapped by default. You can create a new mapping between the Feature issue type in Jira and the Feature [sn_align_core_feature] table in SPW.

Procedure

1. Navigate to **All** > **Strategic Planning** > **Jira Integration** > **Jira Projects**.
2. Open your Jira project record.
3. From the Table Maps related list, select **New**.
4. On the Table Map form, fill in the fields.
   For field information, see Table Map form.
5. Select **Submit**.

What to do next

1. Validate your new table map configuration by clicking **Validate and fix mapping** from the Jira project form.
2. For this table map, create field mappings. See Create custom field mapping for SPW Jira integrations.

Create custom field mapping for SPW Jira integrations

Create a custom mapping configuration between fields of Strategic Planning Workspace (SPW) and Jira.

Before you begin

Role required: sn_jira_int.user

About this task

Select a Jira field and map it to a corresponding SPW field in the Table Map record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, a table mapping between the Story entity in Jira and the Story [rm_story] table in SPW is available by default. If you need to map additional fields, such as story points, create a custom Field Map record using the steps below.

Procedure

1. Navigate to **All** > **Strategic Planning** > **Jira Integration** > **Jira Projects**.
2. Open your Jira project record.
3. From the Table Maps related list, open a table map record for which you want to create field maps.
4. From the Field Map related list, select **New**.
5. On the form, fill in the fields.
   For field information, see Field Map form.
6. Select **Submit**.

What to do next

1. Validate your new mapping configuration by clicking **Validate and fix mapping** from the Jira project form.
2. (Optional) If your new field is of the type Choice, create custom choice mapping for it. See Create custom choice mapping for SPW Jira integrations.

Create custom choice mapping for SPW Jira integrations

Create a custom mapping configuration for field choices between Strategic Planning Workspace (SPW) and Jira.

Before you begin
Role required: sn_jira_int.user

About this task
Select a choice value from a Jira entity and map it to a corresponding choice value in an SPW table.

For example, Jira Stories include default states such as To Do, In Progress, and Done. If your team adds a custom state like Testing, you can map **Testing** in Jira to the **Ready for Testing** state in the Story [rm_story] table in SPW.

Procedure

1. Navigate to **All** > **Strategic Planning** > **Jira Integration** > **Jira Projects**.
2. Open your Jira project record.
3. From the Table Maps related list, open your table map record.
4. From the Field Maps related list, open a field map record for which you want to create choice maps.
5. From the Choice Map related list, select **New**.
6. On the form, fill in the fields.
   For field information, see Choice Map form.
7. Select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

1. Validate your new mapping configuration by clicking **Validate and fix mapping** from the Jira project form.
2. Enable bidirectional sync of work items between Jira projects and SPW.
3. Import issues from Jira to SPW.

Enable bidirectional sync between SPW and Jira

Enable import and export for a Jira project to ensure data is consistent across for all stakeholders using Strategic Planning Workspace and Jira.

Before you begin

Role required: sn_jira_int.user

Procedure

1. Navigate to **All** > **Strategic Planning** > **Jira Integration** > **Jira Projects**.
2. Open your Jira project record.
3. Select both the **Enable Import** and **Enable Export** options.
4. Select **Update**.

What to do next

Import issues from Jira to SPW.

Import issues from Jira to SPW

Import work items such as epics, features, capabilities, and stories from Jira to Strategic Planning Workspace (SPW) to enable end-to-end visibility in SPW.

Before you begin

Enable bidirectional sync between SPW and Jira

Role required: sn_jira_int.user

Procedure

1. Navigate to **All** > **Strategic Planning** > **Jira Integration** > **Jira Projects**.
2. Open your Jira project record.
3. Select **Import issues**.
4. Select a date range to import issues from your Jira project.
5. On the Import Request form, select **Submit**.
   An Import request is created and is shown in the Jira Import Requests related list of the Jira project.

Result

After the State of the import request changes to Complete. All the work items from Jira would have been imported into Strategic Planning Workspace tables, based on the mapping configuration defined for the project.

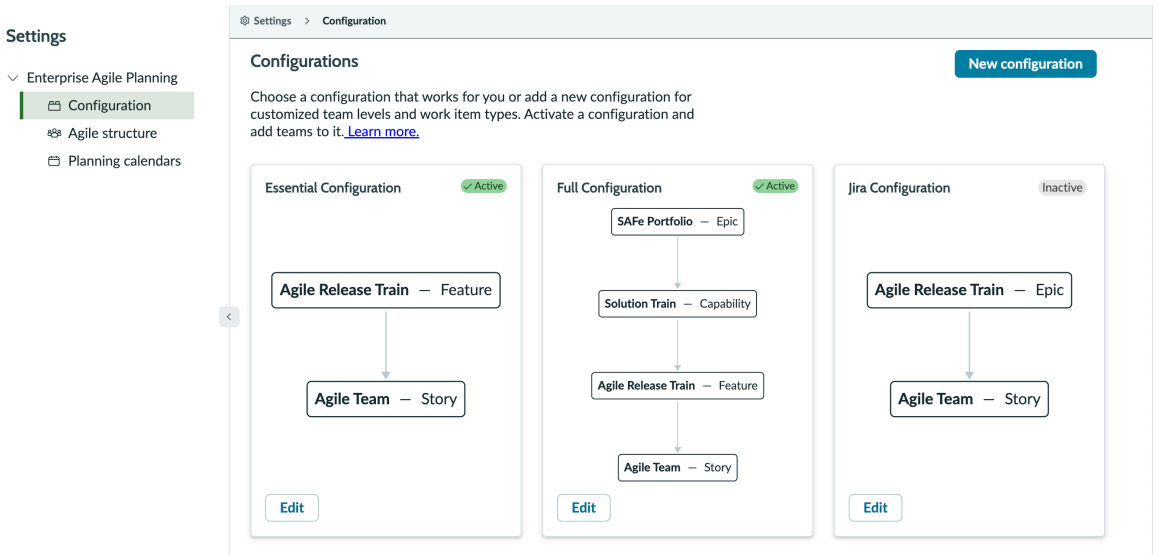
What to do next

1. Activate Jira configuration in Enterprise Agile Planning.
2. Define Agile structure in EAP for Jira Configuration

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Activate Jira configuration in Enterprise Agile Planning

Activate the Jira configuration so that EAP teams integrated with Jira projects can be shown in the Enterprise Agile Planning workspace.



Before you begin

Ensure that **Application Scope** of your ServiceNow instance is set to **Strategic Planning**.

Role required: sn_apw_advanced.eap_admin

Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. From the **Settings** menu, select **Enterprise Agile Planning** > **Configuration**.

3. On the Jira configuration card, select **Edit**.
4. On the configuration form, set the **State** field to **Active**.
5. Select **Save**.

What to do next

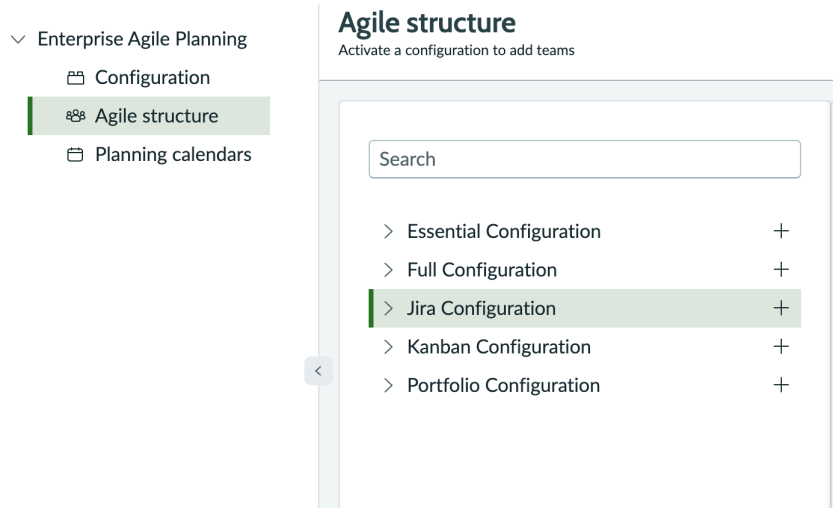
Define Agile structure in EAP for Jira Configuration.

Define Agile structure in EAP for Jira Configuration

Set up Agile team structures in Enterprise Agile Planning (EAP) for teams associated with Jira projects so that imported work items and updates from Jira display correctly in EAP.

Before you begin

Activate Jira configuration in Enterprise Agile Planning.



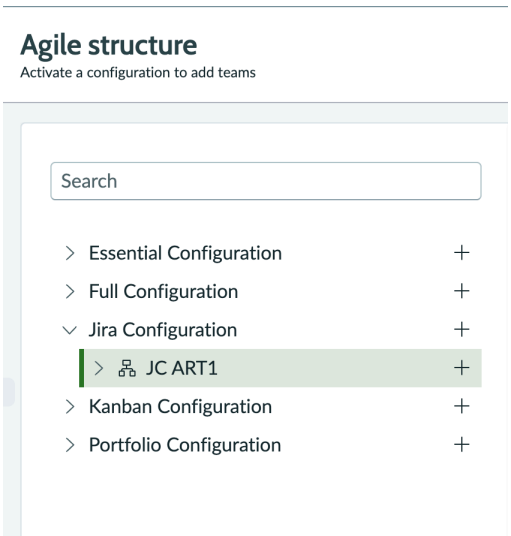
Ensure that **Application Scope** of your ServiceNow instance is set to **Strategic Planning**.

Role required: sn_apw_advanced.eap_admin

Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. From the **Settings** menu, select **Enterprise Agile Planning** > **Agile structure**.
3. Add an Agile Release Train (ART) by selecting the + icon (+) next to Jira Configuration.

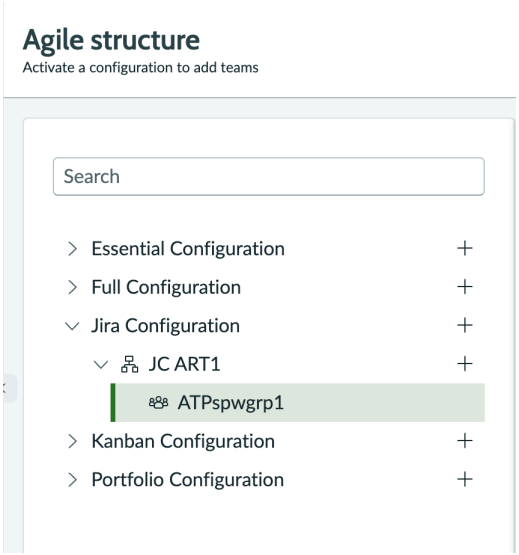
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



a. On the Agile Release Train form, fill in details such as name and description.

b. Select **Submit**.

c. Repeat the action to add as many ARTs as you need.



4. For each ART, add Agile Teams by selecting the + icon (+) next to the ART's name. If you cannot find your teams, contact your admin.

Result

An Agile structure is defined for Jira Configuration in EAP.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

Start using SPW and EAP with Jira integration.

eap-config-hierarchy

TBD TBD.

Before you begin

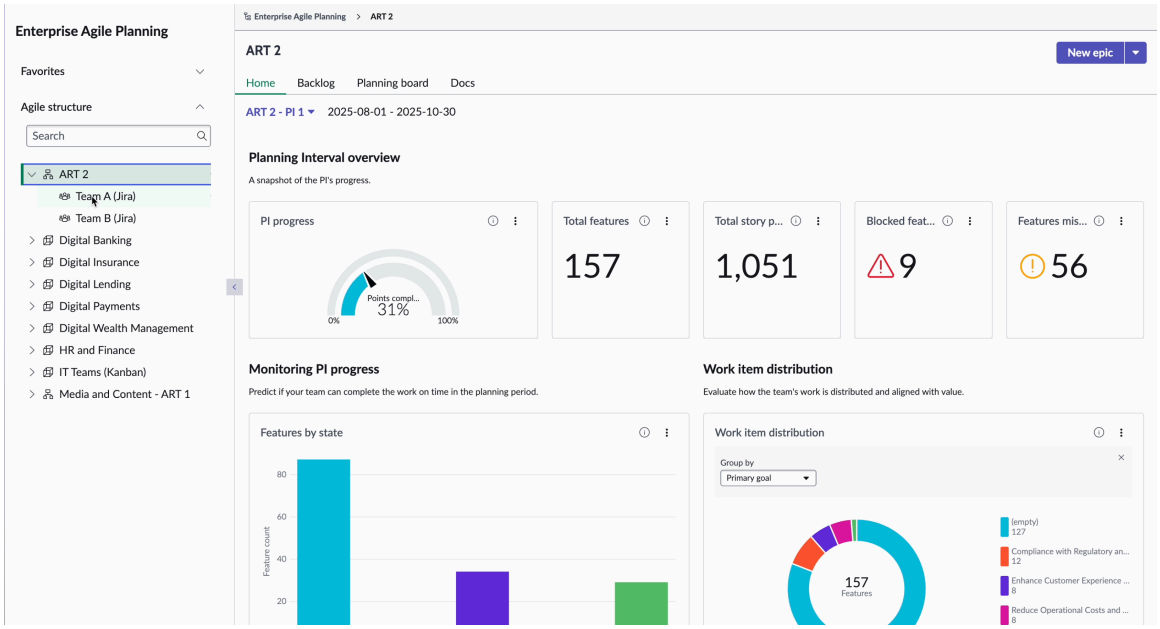
Role required: admin

Procedure

Navigate to **All** > > .

Using EAP with SPW Jira Integrations

After configuration is complete for SPW Jira Integrations, use Enterprise Agile Planning (EAP) to bridge strategy and execution. Plan and schedule work in EAP, let teams deliver in Jira, and see progress and performance flow back to EAP for accurate, real-time visibility.



Strategic planners such as portfolio managers and product owners can use EAP to define planning intervals and sprints. They can also create and prioritize epics and stories, and assign them to teams. These plans sync to Jira, where delivery teams execute and update work.

Changes made in Jira such as sprint updates, status changes, or newly scheduled work flow back into EAP, maintaining end-to-end visibility without switching tools.

From the EAP team's Home tab, you can view reports to track current-sprint status, overall execution health, and team performance.

This workflow enables you to plan in EAP, execute in Jira, and monitor outcomes in one place.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information on managing backlog and sprints using EAP, see Manage team backlog in EAP and Perform PI planning in EAP.

SPW Jira Integrations reference

Reference topics provide additional information about the lists and forms that you use to configure SPW Jira Integrations.

Components installed with SPW Jira Integrations

Learn about the roles and tables installed with the SPW Jira Integrations application.

Roles installed

Role title [name]	Description	Contains roles
Jira integration admin [sn_jira_int.admin]	Has complete access to the SPW Jira Integrations application	• sn_int_common.admin • sn_jira_int.user
Jira integration user [sn_jira_int.user]	• Sets up integration between Jira and Strategic Planning • Can create new or update the existing map configurations between Jira and Strategic Planning	• connection_admin • sn_int_common.user • credential_admin

Tables installed

Table	Description
Choice Map [sn_int_common_choice_map]	Stores the list of workflow state mapping for Jira projects.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
Event Type [sn_int_common_input_event_type]	Stores information of the type of webhook events such as create, update, or delete of a work item.
External Identifiers [sn_int_common_external_identifiers]	Stores the list of all Jira reference identifiers such as External ID, External Key, External Project, External URL, and so on.
External Project [sn_int_common_project]	Stores information of the Jira project such as project ID, the Jira instance of this project, project name, and so on.
External system [sn_int_common_external_system]	Stores information of Jira application used for the integration.
External System Version [sn_int_common_external_system_version]	Stores version information of Jira application used for the integration.
Field Map [sn_int_common_field_map]	Stores the list of field mapping of different issue types for Jira projects.
Jira Board [sn_jira_int_board]	Stores the list of imported boards from Jira.
Jira Import Request [sn_jira_int_import_request]	Stores the list of all import requests created to import projects, boards, and project style mappings from Jira.
Jira Instance [sn_jira_int_instance]	Stores the list of all Jira instances.
Jira Project [sn_jira_int_project]	Stores the list of all imported projects from Jira.
Team Integration Settings [sn_agile_jira_int_import_settings]	Stores the list of one-to-one relation between a Jira project, board, and an EAP Team.
Project Style Mapping [sn_jira_int_prj_style_mapping]	Store the list of map configuration templates per Jira project style.
Table Map [sn_int_common_table_map]	Stores the list of table maps for Jira projects.

Default mapping configuration for SPW Jira Integrations

Learn about the default mapping configuration of Epic, Story, and Sprint work types between Strategic Planning and Jira.

Epic mapping configuration

Epic [sn_align_core_scrum_epic] in Strategic Planning is mapped to Epic in Jira. The field mapping between these two tables is as follows.

Epic Table Map

Field in Strategic Planning	Field in Jira
approved_start_date	Start date
state	Status
short_description	Summary
approved_end_date	Due date

Story mapping configuration

Story [rm_story] in Strategic Planning is mapped to Story in Jira. The field mapping between these two tables is as follows.

Story Table Map

Field in Strategic Planning	Field in Jira
assigned_to	Assignee
description	Description
iteration	Sprint
parent_work_item	Parent
priority	Priority
short_description	Summary
state	Status

Sprint mapping configuration

Enterprise agile iteration [sn_apw_advanced_eap_iteration] in Strategic Planning is mapped to Sprint in Jira. The field mapping between these two tables is as follows.

Sprint Table Map

Field in Strategic Planning	Field in Jira
state	state
start_date	startDate
name	name
end_date	endDate

Exploring Dashboards in Strategic Planning Workspace

As a product and portfolio manager, use dashboards in Strategic Planning Workspace to monitor performance, track progress, and make informed decisions related to ideas, feedback, strategy, planning, and execution. These dashboards leverage Platform Analytics to provide a trend of historical data and regular reports.

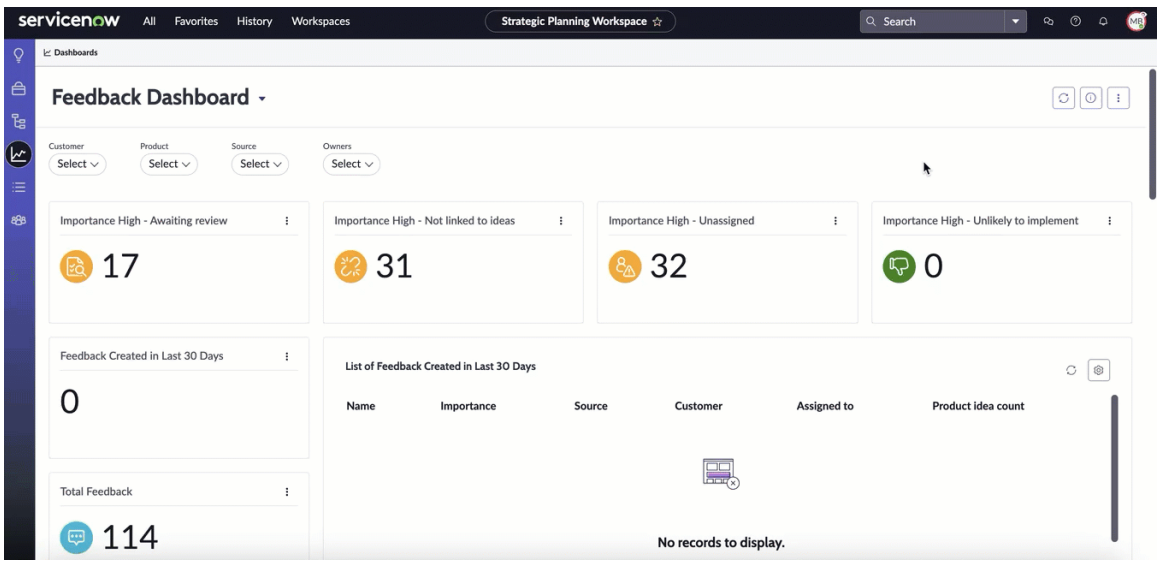
The following are four out-of-the-box dashboards available in the Strategic Planning Workspace:

- Product Idea Dashboard
- Feedback Dashboard
- Strategy Execution Dashboard
- Execution Dashboard

You can use the default dashboards or create your own dashboards to monitor performance and take informed decisions.

Benefits of dashboards

- Create data visualizations and add them to the dashboards using the Platform Analytics experience.
- Monitor performance, track progress, and make informed decisions related to ideas, feedback, strategy, planning, and execution.
- Duplicate existing dashboards and customize them as needed, without modifying the out-of-the-box dashboards.
- Use the out-of-the-box dashboards or configure your own dashboards as needed.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Share dashboards with stakeholders to enable collaboration.
- View relevant data by applying filters directly within a dashboard.
- Any filters applied are saved as part of user personalization and are available the next time you log in.

For guidance on using and managing dashboards in the Strategic Planning Workspace, see Using Dashboards in Strategic Planning Workspace.

Feedback Dashboard in Strategic Planning Workspace

The Feedback Dashboard helps product managers track feedback volume and stakeholder trends to surface recurring pain points, inform prioritization decisions, and demonstrate responsiveness.

Feedback Dashboard

Widget/Visualization	Description
Importance High - Awaiting review	Count of feedback items with high importance (1-High) and a state of either Submitted or Need More Information.
Importance High - Not linked to ideas	Count of feedback items with high importance (1-High) that aren't linked to any ideas.
Importance High - Unassigned	Count of feedback items with high importance (1-High) that aren't assigned to anyone.
Importance High - Unlikely to implement	Count of feedback items with high importance (1-High) and a state of Unlikely to Implement.
Feedback Created in Last 30 Days	Count of feedback items created within the last 30 days.
List of Feedback Created in Last 30 Days	List of feedback items created within the last 30 days, including details such as Name, Importance, Source, Customer, Assigned to, and Product idea count.
Total Feedback	Total number of feedback items received to date.

List of Ideas Created in Last 30 Days	List of ideas created within the last 30 days, including details such as Name, Planning state, Status, Owner, Product, and Customers.
Total Ideas	Total number of ideas received to date.
Breakdown of All Ideas	Visualization of all ideas with grouped by Planning state.
Breakdown: Ideas Not Linked to Feedback	Visualization of ideas not linked to feedback within the last 30 days and grouped by Planning state.
Idea Analyzer	Visualization of ideas with grouped by Impact and stacked by Priority.

Execution Dashboard in Strategic Planning Workspace

The Execution Dashboard helps portfolio and product managers gain real-time visibility into delivery progress across work items, enabling portfolio leads to detect delays, course-correct early, and keep the strategy on track.

The Execution Dashboard provides various analytics across different tabs, including Overview, Financial, Milestones & Dependency, Capacity, RIDAC, Data Quality, and Geo.

Widget/Visualization	Description
Upcoming Items with Resource Assignments That Are Unassigned, Unapproved, or Pending	List of upcoming planning items whose resource assignments status is Unassigned, Unapproved, or Pending.
Resource Assignments by Group, Role & Skill	Visualization of resource assignments count by their group, role, and skill.

RIDAC tab in the Execution Dashboard

Data Quality tab in the Execution Dashboard

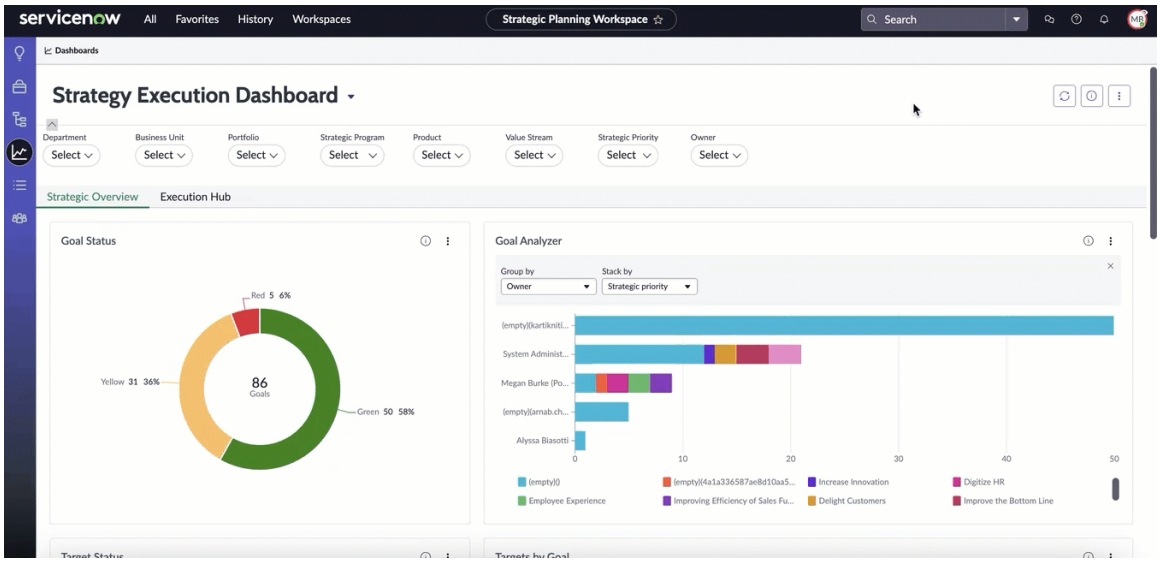
Widget/Visualization	Description
Alignment	
Not Aligned to Goal	Count of work items that aren't associated with any goal.
Financials	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Widget/Visualization	Description
No Planned Cost	Count of work items for which cost estimation is done yet for execution.
No Planned Benefit	Count of work items for which benefit estimation is done yet.
No ROI	Count of work items for which ROI isn't estimated yet.
Projects and Demands Without an Investment Type	Count of projects and demands for which Investment type isn't defined yet.
Monetary Benefit Plans Without a Planned Benefit	Count of monetary benefit plans for which benefit isn't defined yet.
Monetary Benefit Plans Without a Sponsor	Count of monetary benefit plans for which a sponsor hasn't been assigned yet.
Planning Items with Other Attributes	
No Resource Assignments	Count of planning items without resource assignments.
Unscheduled Items	Count of planning items not scheduled yet.
No Portfolio	Count of planning items with no portfolio defined.
No Program	Count of planning items with no program defined.
No Department	Count of planning items with no department populated.
No Business Unit	Count of planning items with no business unit populated.
No Owner	Count of planning items with no owner assigned.

Geo tab in the Execution Dashboard

Widget/Visualization	Description
Planned cost by location	Estimated cost by location for executing the plan.



Strategy Execution Dashboard in Strategic Planning Workspace

The Strategy Execution Dashboard helps portfolio managers monitor the alignment between strategy and business outcomes, and quickly assess goal progress to ensure high-impact delivery.

The Strategy Execution Dashboard provides various analytics through the tabs and Execution Hub.

Widget/Visualization	Description
Select a fiscal period to view relevant data	Option to select date range as **This year** or **Last year** to filter and display the data accordingly. Clearing the date range displays the data considering from the start date of the portfolio plan.
Planned Costs	Estimated cost for executing the plan.
Budget Costs	Estimated budget for executing the plan.
Actual Costs	Actual cost incurred during plan execution.
Planned Monetary Benefits	Monetary benefits that have been planned.
Actual Monetary Benefits	Monetary benefits that have been achieved.
Planned vs Budget vs Actual by Cost Type	Visualization of Planned vs Budget vs Actuals by Cost Type.
Budget by Investment type	Visualization of budget by Investment type.
Supplementary Data	
New and In-Review Items	Visualization of new and in-review planning items with grouped by Priority.
Prioritized Items	Visualization of prioritized planning items with grouped by Status.
Completed Items	Visualization of planning items whose state is Done.
Delayed Planning Items	Planning items that were prioritized but haven't started yet (no recorded actual start date), despite having an approved start date in the past.
Items Overdue	Prioritized planning items that remain incomplete (no recorded actual end date), despite having an approved end date in the past.
Dependencies whose provider planning item is in Red status	Dependencies that have a provider planning item in red status, affecting all dependent planning items.
Missed Key Milestones in Last 30 Days	Count of planning items whose key milestones were missed within the last 30 days.
Upcoming Milestones Likely to Be Missed	List of planning items whose key milestones about to be missed soon with details including Name, Type, Due date, Assigned to, Source item.
Resource Assignments Status	Visualization of resource assignments status.
Resource Assignments Ready for Review	Visualization of resource assignments count that is ready for review.
Upcoming Items with Resource Assignments That Are Unassigned, Unapproved, or Pending	List of upcoming planning items whose resource assignments status is Unassigned, Unapproved, or Pending.

Using Dashboards in Strategic Planning Workspace

Using the Platform Analytics dashboards in Strategic Planning Workspace, you can monitor performance, track progress, and make informed decisions related to ideas, feedback, strategy, planning, and execution.

Roles required for managing dashboards

Required roles to access out-of-the-box dashboards

Access level	Required roles
Read, duplicate, or share the Strategy Execution Dashboard and Execution Dashboard	sn_align_core.ap_read_only **Note:** To view data in financial-related and capacity-planning-related widgets, users must have the appropriate roles.
Read, duplicate, or share the Product Idea Dashboard and Product Feedback Dashboard	pf_read
Edit the Strategy Execution Dashboard and Execution Dashboard	admin
Edit the Product Idea Dashboard and Product Feedback Dashboard	admin

Required roles to create or edit dashboards (excluding out-of-the-box dashboards)

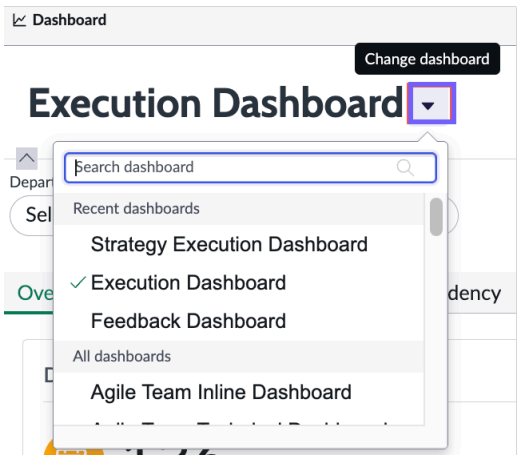
Access level	Required roles
Create dashboards	sn_align_core.apw_user
Edit dashboards	sn_align_core.apw_user **Note:** You can edit dashboards that you own or those you've been granted permission to edit.

Note: You can create widgets in dashboards by configuring any available data source table in the ServiceNow AI Platform. However, you must have read access to the source tables to view key data, metrics, or visualizations.

For example, if you create a widget in a dashboard configuring the Cost Plan Breakdown table to display budget data, the budget summary is visible on the dashboard only if you have read access to the Cost Plan Breakdown table. Similarly, when you share this dashboard with a stakeholder, the stakeholder must also have read access to the Cost Plan Breakdown table to view the budget summary.

For more information on the required roles to manage Platform Analytics dashboards, see Platform Analytics dashboard roles.

View a dashboard



View key data and metrics on a dashboard to monitor performance, track progress, and make informed decisions related to ideas, feedback, strategy, planning, and execution.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_align_core.ap_read_only

About this task
Dashboards consolidate data from multiple sources into a single, easily digestible format. Each widget within a dashboard displays key data and metrics and may include visualizations.

Procedure
1. Navigate to **Workspaces** > **Strategic Planning Workspace** > **Dashboards**.
   By default, the Execution Dashboard appears on the Dashboards page.
2. From the Change dashboard drop-down, select the dashboard you want to view.

   The selected dashboard appears.
3. **Optional:** Select a required tab that you want to view the key data and metrics for.
   Each widget within a dashboard displays key data and metrics and may include visualizations.
4. **Optional:** Select a widget to see more details of the data in list view.
   If you have edit access, you can update the details of an individual record directly from the list view when necessary.

Create a dashboard
In the Platform Analytics experience, you can create shareable dashboards with data visualizations, filters, and other elements. You can use the available elements in the inline editor to create different types of widgets as needed.

Before you begin
Role required: sn_align_core.apw_user

About this task
Dashboards consolidate data from multiple sources into a single, easily digestible format. Each widget within a dashboard displays key data and metrics and may include visualizations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace** > **Dashboards**.
   By default, the Execution Dashboard appears on the Dashboards page.
2. From the dashboard header, select the More actions icon (⋮) and then select **Create new**.
3. On the New dashboard window, fill the details.
   a. Enter a name for the dashboard in the **Name** field.
   b. **Optional:** Enter a brief description for the dashboard in the **Description** field.
   c. Select **Create new dashboard**.

Result
The dashboard has been created.

What to do next
Edit a dashboard as needed by adding sections, filters, images, lists, process mining maps, and rich text. For more information, see Edit a dashboard.

Edit a dashboard

Customize or edit a dashboard as needed by adding sections, filters, images, lists, process mining maps, and rich text. If the dashboard has been shared, any changes you make are applied globally.

Before you begin
Role required: sn_align_core.apw_user

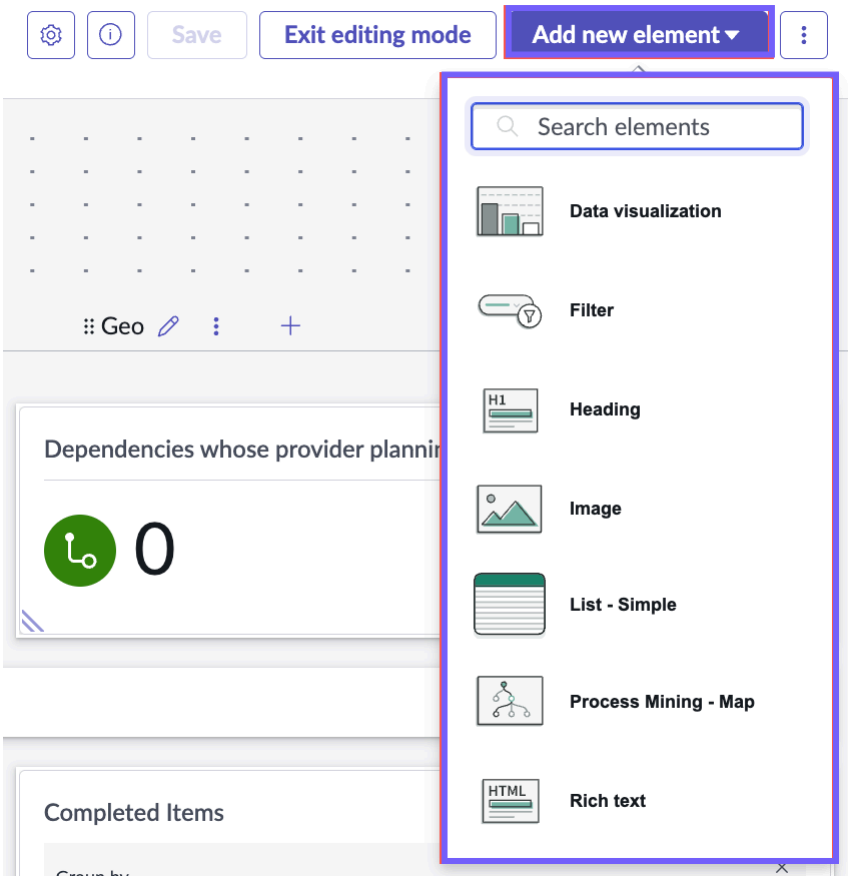
About this task

Note:

- You can edit dashboards that you own or those you've been granted permission to edit.
- Only an administrator can edit the out-of-the-box dashboards, including the Product Idea Dashboard, Feedback Dashboard, Strategy Execution Dashboard, and Execution Dashboard. However, you can duplicate an out-of-the-box dashboard and customize it as needed.

You can use the following elements to create or edit your dashboard.

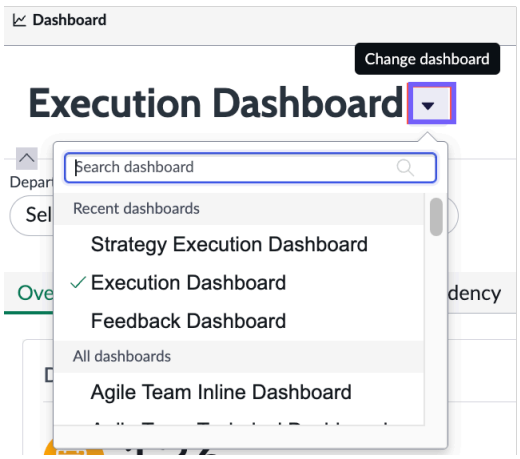
Dashboard elements in Strategic Planning



Element	Description
Data visualization	Enables you to present a visual representation of current instance data or temporary data that you've imported. Data visualizations include visualizations that you create in the dashboard

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dashboard elements in Strategic Planning (continued)



Element	Description
	designer and data visualizations from the library.
Filter	Enables you to filter the visualizations on a dashboard based on specified criteria. You can put filters either on the individual tabs or above the tabs so that the filter applies to elements every tab. Filters include both data filters and domain filters. You can create filters in the dashboard designer or select them from the library.
Heading	Provides a place for text at the top of a dashboard or section of a dashboard. Formatting for headings is limited to six heading levels.
Image	Holds static or animated images on the dashboard.
List - Simple	Shows table data that you can customize for the dashboard audience.
Process Mining - Map	Maps the different states that are part of your process and the transitions between those states. See which states the objects of the process are in and the speed with which they change state. Requires an existing Process Mining project.
Rich text	Holds text that you can format either as text or as html, including font selection, text size, highlighting, and hyperlinks. To edit HTML markup, open the HTML editor from the Configuration panel and select the Code tags < > icon.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace** > **Dashboards**.
   By default, the Execution Dashboard appears on the Dashboards page.
2. From the Change dashboard drop-down, select the dashboard you want to edit.

   The selected dashboard appears.
3. From the dashboard header, select **Edit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For this	Perform these steps
Add a tab	**a.** From the dashboard header, select **Add a tab**. A new tab appears with the default name New Tab. **b.** Select the Edit tab label icon and enter a name for the tab. **c.** Press Enter to update the name of the tab.
Add a dashboard element	**a.** From the dashboard header, select **Add new element**. A list of available elements appear in the drop-down. **b.** (For example) Select **Data visualization** to present a visual representation. The Add Visualization window appears. **i.** (For a new visualization) Select **New Visualization**. **ii.** (For an existing visualization) Select **Saved Visualization** and then select a saved visualization from the library. The visualization element appears in the tab and the **Configuration** side panel appears. **iii.** In the **Configuration** side panel, fill the required details in the **Visualization type**, **Header and border**, and **Data** and other relevant fields.

4. Drag to move the widget or resize it as required.
5. From the dashboard header, select **Save**.
6. From the dashboard header, select **Exit editing mode**.

Result

The dashboard is updated with the latest changes.

What to do next

- Add more elements and customize your dashboard as required.
- For detailed instructions on editing a dashboard using the Platform Analytics experience in Strategic Planning, see Edit Platform Analytics dashboards.

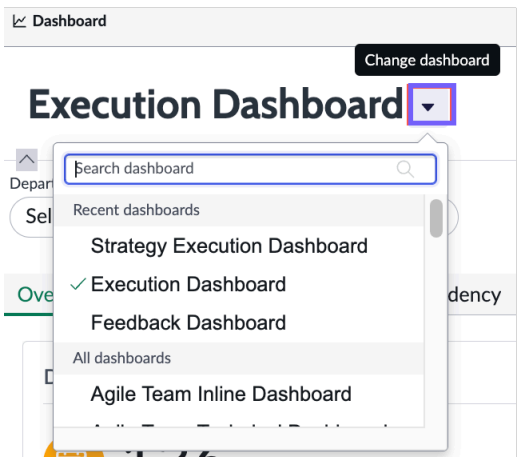
Duplicate a dashboard

Share a dashboard

Add a Platform Analytics dashboard

Duplicate a dashboard

If the dashboard you want to create is similar to an existing one, duplicating the existing dashboard saves your time. After duplicating the dashboard, you can customize the tabs and widgets as required.



Before you begin

- Users or groups that you want to share the dashboard with must have the sn_align_core.ap_read_only or sn_align_core.apw_user role to get the read or edit access to the portfolio plan respectively.
- When you duplicate a dashboard, you copy all settings and details of the original. Content that exists locally on the original dashboard is duplicated onto the new dashboard. If the original dashboard contains references to content in a library, such as a shared visualization, the references are duplicated. The role requirements for editing an element in a library apply to the latter.

Role required: sn_align_core.ap_read_only

Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace** > **Dashboards**.
   By default, the Execution Dashboard appears on the Dashboards page.
2. From the Change dashboard drop-down, select the dashboard that you want to duplicate.

   The selected dashboard appears.

3. From the dashboard header, select the More actions icon (⋮) and then select **Duplicate**.
4. On the Duplicating dashboard window, fill the details.

   a. Enter a name for the portfolio plan in the **New name** field.
   By default, the name is *ABC (Copy)* where ABC is the name of the dashboard you duplicated from.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. Optional: Enter a brief description of the goal in the **Description** field.

c. Select **Duplicate**.

Duplicating the dashboard may take some time. Select **Continue in background** to keep using the application in the meantime.

Result
The dashboard is copied with the new name. The appearance of the dashboard is identical to the original.

What to do next
Edit a dashboard as needed by adding sections, filters, images, lists, process mining maps, and rich text. For more information, see Edit a dashboard.

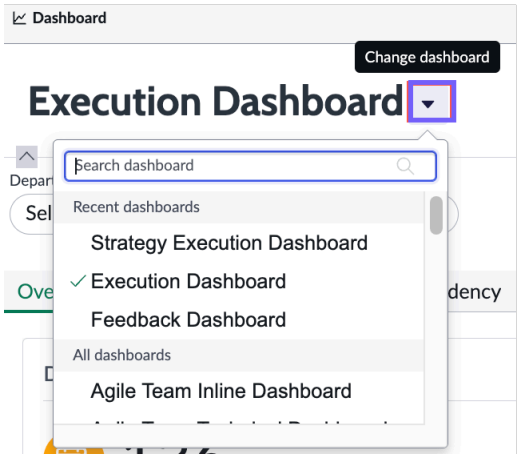
Share a dashboard

Share a dashboard with stakeholders, planning managers, portfolio managers, or product managers to provide visibility into work progress and foster collaboration. You can grant either view-only rights or both view and edit rights to a shared dashboard.

Before you begin
Role required: sn_align_core.ap_read_only



About this task
Users or groups you want to share the dashboard with must have the appropriate roles assigned to access shared dashboards:

Required roles to access dashboards

Dashboard	Role required
• Strategy Execution Dashboard • Execution Dashboard	sn_align_core.ap_read_only **Note:** To view data in financial-related and capacity-planning-related widgets, users must have the appropriate roles.
• Product Idea Dashboard • Product Feedback Dashboard	pf_read

Procedure
1. Navigate to **Workspaces** > **Strategic Planning Workspace** > **Dashboards**.
   By default, the Execution Dashboard appears on the Dashboards page.
2. From the Change dashboard drop-down, select the dashboard you want to share.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The selected dashboard appears.

3. From the dashboard header, select the More actions icon (⋮) and then select **Share**.
4. On the Share Dashboard window, fill the details.

   a. Enter a user name or group name in the **Grant access to** field to provide access to individual users or user groups, respectively.
   You can also select a role to grant dashboard access to all users assigned that role.

   b. **Optional:** Select **Allow recipients to add, edit, or delete sharing permissions associated with this dashboard** to enable users to grant access to new users and modify or remove existing permissions.

   c. Select **Add as viewer** or **Add as editor** as required.

      Note: You can select **Add as editor** only if you have the sn_align_core.apw_user role assigned to you.

      The selected users, groups, and roles appear under **Manage Access**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can also manage sharing permissions by selecting a user, group, or role and enabling the **Can share** option.

d. Select **Confirm**.

Result

The roles, groups, and users you have shared the dashboard with appear when you reopen the dialog, along with the rights you have given them.

What to do next

You can change the rights of whom you have shared the dashboard with in the Share Dashboard dialog, under the Can view/Can share list for each user, group, or role.

Add a Platform Analytics dashboard

If you have existing dashboards created using Platform Analytics, you can add them to the Strategic Planning Workspace to access them directly from a single location.

Before you begin

Role required: sn_align_core.apw_user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
You can add any Platform Analytics dashboard to Strategic Planning Workspace.

Procedure
1. Navigate to **All** > **Platform Analytics** > **Analytics Center**.
   The Dashboards section appears on the page.
2. Select a bookmarked or certified dashboard from the **Bookmarked** or **Certified** tabs, respectively.
   If the dashboard you want to add is not bookmarked or certified, select **View all** from the Dashboards section, and then select the dashboard from the Dashboards page.

   The selected dashboard appears.
3. From the dashboard header, select **Edit**.
4. From the dashboard header, select the View dashboard details icon ( ).
   a. In the Details side panel, fill in the **Dashboard visibility** field with Strategic Planning Workspace.
5. From the dashboard header, select **Save**.
6. From the dashboard header, select **Exit editing mode**.

Result
The dashboard appears in the Strategic Planning Workspace.

Exploring Next Experience for Demand Management

Next Experience for Demand Management enables you to create, evaluate, and prioritize demands, throughout the demand life cycle.

Next Experience for Demand Management overview

Next Experience for Demand Management is a centralized workspace experience that streamlines how your organizations can capture, evaluate, and progress demands through their life cycle. It brings together all demand-related activities such as intake, qualification, and task management into a single interface. By consolidating access to demands, tasks, resources, financials, and supporting records, the workspace means you don't have to navigate across multiple modules. You can define scope, assess capacity, estimate effort, and evaluate financial and strategic impact. Playbooks guide demands through each stage from intake to completion so your team follows a consistent process.

Next Experience for Demand Management users

Users

User	Description
Business user	Creates a demand using Service Catalog or Idea Portal.
Demand user	Creates a demand using Demand Management and adds required details. Cannot edit the demand details once the demand moves to the **Submitted** state.
Demand managers	Manages and prioritizes demands based on the available demand details. They can assign demand tasks to gather more details. Demand managers are also responsible for progressing the demand through the different stages in its life cycle.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Users (continued)

User	Description
Business stakeholders	Fills out the assessments for scoring and reviews demands before they are approved.
Demand approvers	Approves the demand to be converted into a work item.

Next Experience for Demand Management benefits

Next Experience for Demand Management provides benefits for demand managers and their users.

- Consistent demand intake and evaluation process: Next Experience for Demand Management enables a structured workflow. Demands progress through defined evaluation stages.
- Centralized visibility into demand information: Next Experience for Demand Management provides a single interface to view all demands and their associated details such as business cases, capacity, and financials. Demand managers can compile a complete picture of a demand without having to cross-reference multiple forms, modules, or applications to compile a complete picture of a demand.
- At-a-glance demand insights: The Demands Dashboard summarizes demand volume, financials, and data quality across three tabs, Overview, Financials, and Data Quality. Demand managers can monitor key metrics and drill into the underlying records without leaving the workspace.
- Playbook-guided demand life-cycle: Playbooks define the sequence of stages and activities that demands must go through such as creation, planning, assessment, and approval. Each stage contains a set of prescribed activities that must be completed before demands transition to the next stage. Using playbooks, your organization can define its own processes.
- Consolidated data for demand prioritization: Next Experience for Demand Management provides demand details, capacity and risk assessment outputs, and financial summaries in a unified view. Demand managers can compare, rank, and prioritize demands based on defined organizational criteria.
- Manage demand financials in one place: Using the Financials tab on the demand record, demand managers can view, plan, and define cost plans, benefit plans, and budgets. Filter by time scope and personalize grid columns without leaving the demand.
- Plan demand resources before project conversion: Using the Resources tab on the demand record, demand managers can view resource assignments against resource capacity. They can group assignments by primary group, role, or skill, and adjust allocations before the demand becomes a project.
- Tailor demand data capture by governance process: Using demand experiences, admins can configure the form view, modules, and dynamic attributes for different governance processes, such as Marketing or IT. This configuration does not require adding fields to the base demand form.
- Score and qualify demands: Using smart assessments, assessments are created, scored, and used to qualify a demand. The smart assessment form is intuitive and efficient for stakeholders to score.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- AI system integration through playbook activities: The AI playbook enables associating AI systems to demands through a playbook activity. This feature enables associating a demand with an AI system from directly within the demand workflow.
- AI-assisted demand skills: Using the AI skills, demand users and demand managers can expand or condense text content in text fields, summarize the demand, and identify the similar demand records.

Demand workflow

The demand workflow defines the stages a demand moves through, from initial intake to assessment, approval, and execution. At each stage, you can evaluate the demand, align it with business objectives, and set up the right processes before resources are assigned.

Workflow overview

The following table lists the end-to-end life cycle for managing demands. This workflow provides a process for demands so they are progressively refined, validated, and aligned with business and strategic objectives.

Note: This workflow describes the traditional demand management process. You can customize the states and activities by defining a custom playbook.

Demand workflow overview

Task	Description	Demand states involved	Roles involved
Create a demand	Demands enter the system via Service Catalog or Idea Portal, or being submitted directly by demand managers: • Business users can submit an idea via the Service Catalog or Idea Portal. The idea is then evaluated by demand managers after which they can promote it to a demand. • Business users can bypass the ideation process and submit	Draft	Business user, demand manager, demand user

Demand workflow overview (continued)

Task	Description	Demand states involved	Roles involved
Review demand	Stakeholders review the demand for approval or deferral.	Qualified	Stakeholder
Approve or defer a demand	The demand manager sets the demand to approved (moves forward for execution) or deferred (moves to the Deferred state).	Qualified → Approved or Deferred	Demand manager, demand approver
Convert demand to strategic/ operational entity	After the demand is approved, the demand manager creates the selected entity such as project, enhancement, or Enterprise Agile Planning (EAP) entities. The created entity is based on the values in the **Category** and **Type** fields of the Demand record. Depending on the type of record created, the demand data is migrated to the created entity.	Approved	Demand manager
Complete demands	Based on the selection in the **Close Demand** field, a demand is completed automatically when the converted entity is completed, or manually by the demand manager at any state.	Approved → Completed	Demand manager, Next Experience for Demand Management

Playbooks in Next Experience for Demand Management

Playbooks in Next Experience for Demand Management provide a guided, structured approach to managing a demand from initiation to completion. Playbooks focus specifically on helping demand teams follow the standard demand life cycle, verifying every demand progresses consistently and no critical steps are missed.

Purpose of Playbooks in Demand Management

Playbooks provide a structured way to manage work by guiding teams through predefined steps. They show what to do, when to do it, and where to find the tools or information required to complete each task. You can apply a playbook to processes such as managing a demand, resolving an issue, launching a product, onboarding new employees, or defining key steps of a process. For more information on playbooks and how to create them, see Workflow studio playbooks.

In Next Experience for Demand Management, playbooks help demand managers and reviewers in the following ways:

- Understand which activities must be completed at each demand stage.
- Track required inputs, approvals, and validations for demand progression.
- Verify that demand evaluation, prioritization, and planning follow the organization's standard governance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Provide built-in process guidance within the demand record, reducing the need to rely on informal or undocumented knowledge.
- Maintain process consistency across all demands regardless of the requester or manager.
- Define multiple standardized governance processes across the organization.

How Playbooks work for demands

When a playbook is applied to a demand, the following processes take place:

- Demand life-cycle stages such as ideation, assessment, prioritization, and planning are outlined.
- Stages contain activities and tasks tailored to demand requirements, such as defining scope, estimating effort, documenting benefits, or securing stakeholder approval.
- Demand managers are guided through dependencies before the demand can move forward.
- Demand records automatically capture progress and trigger actions such as assessments and approvals as the tasks are completed.

For example, a demand about a Customer Self-Service Portal enhancement uses a playbook to guide its progress as follows:

- The ideation stage prompts the demand manager to capture objectives and benefits.
- The assessment stage guides effort, cost, and risk evaluation.
- Prioritization helps validate scoring and funding.
- Planning finalizes the scope and links the demand to a potential work entity.

As each stage is completed, the playbook help verify that the demand follows the standard life cycle without missing any required steps.

In Demand Management, playbooks are triggered by record creation. A playbook is associated with demand records, and the Playbook page appears in the L-2 (level 2) menu when a demand meets the trigger condition.

Playbook benefits

Playbooks add value to demand management in the following ways:

- Standardizing demand intake: Establishing that required information is captured early.
- Providing step-by-step instructions: Guiding new demand managers or occasional users.
- Supporting governance: Providing stage gating for evaluation and approval.
- Improving visibility: Showing exactly where a demand sits in the life cycle and what is blocking its progress.
- Integrating workflows: Using Flow Designer to set up different business logic for each playbook flow.

Types of Playbooks

Next Experience for Demand Management includes two predefined playbooks available in Workflow Studio: the demand default playbook and the AI playbook.

Note: These playbooks are ready to use without any additional configuration. Configure playbooks only when you must customize an existing playbook or create one for your organization's specific demand workflows.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Demand default playbook - The default demand playbook is a stage-gate playbook in which each stage must be finished before moving to the next one. Stages are visible only when all activities in the previous stage are completed or skipped. After completing a stage, demand managers can still return to previous stages.

  You can create a demand playbook or customize the default demand playbook. For information about creating one, see Create and configure playbooks.

- AI playbook - This playbook has an additional AI checkpoint stage where you can associate new or existing AI systems to your demand. The AI Control Tower plugin must be installed. The investment type of the demand must be set to artificial intelligence.

  The demand AI playbooks is a standard playbook comprising the following stages:

  - Create demand brief
  - Define demand alignment
  - Estimate demand cost and effort
  - AI checkpoint
  - Confirm demand readiness for review
  - Approve and finalize demand
  - Complete demand

  Each stage includes activities, action items, or steps for completing the demand. You can view the **Playbook** menu only if the demand matches the trigger condition defined for that playbook.

Note: The AI checkpoint stage is available if the AI Control Tower plugin is installed and the investment type of the demand is set to artificial intelligence.

Note:

- You can activate a predefined playbook by defining an appropriate trigger condition. For more information, see Activate Playbooks and Triggers.
- You can enable multiple playbooks at a time. Define trigger conditions so that each demand maps to only one playbook type. For more information, see Create and configure playbooks.

Demand tasks

Demand tasks are units of work within a demand. Use them to plan and organize initial activities before converting the demand into a work entity such as a product, feature, or enhancement.

Demand task overview

Demand tasks organize and track early-stage planning activities within the demand record. Use them before converting a demand into a work entity such as a feature, product, or enhancement. Unlike project tasks, which track execution and drive project completion dates, demand tasks focus on planning and preparation. This difference shapes what demand tasks can do and how you use them.

Examples of demand tasks include:

- Gathering and documenting requirements from stakeholders
- Conducting design or architecture reviews
- Validating technical feasibility or dependencies
- Completing business case analysis or ROI assessment
- Conducting security, compliance, or impact assessments
- Assigning resources for discovery or planning phases

Demand tasks aren't appropriate for execution work. After the demand is approved and converted into a work entity such as a project or feature, execution work moves into project tasks.

Assigning resources and tracking effort

You can assign resources to demand tasks using the standard assignment fields. Resources assigned to demand tasks can submit time spent on them using a time card, enabling you to track actual effort and cost during the planning phase.

Resource assignments on demand tasks aren't transferred to the work entity created from that demand. If you later convert the demand into a project or work item, you must reassign resources in the new work entity. Similarly, the time and cost tracked on demand tasks remain within the demand record and don't transfer to the resulting work entity.

The actual cost for the demand task effort is derived from the hourly resource rate defined in the rate model, default labor rate, or default system property. The actual cost and effort for all demand tasks roll up to the associated demand. For more information, see Actual cost and effort calculations for demands.

Differences from project tasks

Because demand tasks are used for early-stage planning and not execution tracking so they don't support some features that project tasks do:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Planned dates, actual dates, and original dates aren't supported in demand tasks.
- The due date indicates when the task is targeted for completion and doesn't affect the demand workflow. Project tasks affect project completion dates when planned dates and actual dates are changed.
- Nested demand tasks aren't supported.
- Task constraints such as Start ASAP and Start on a specific date aren't supported.
- Execution types such as Agile, Waterfall, or Hybrid aren't supported.

Actual cost and effort calculations for demands

Actual cost and effort represent the realized cost and time spent on demands and demand tasks. Values are calculated from approved time cards and hourly rates.

Overview of calculation

Working on demands and demand tasks involves cost and time that add to the overall expenditure of converting a demand to a product, feature, or enhancement. Demand managers should track the actual cost and effort incurred in assessment and planning activities.

- The actual cost is calculated by multiplying the hours reported in the time card by the hourly rate of the resource.
- The actual effort for a demand task is calculated based on the hours reported in the time card.
- The actual effort and cost for demand tasks roll up to calculate the actual effort and cost for the demand.

Hourly rate calculation

The hourly rate for calculating actual cost is derived in the following order:

1. If a rate model is associated with the demand, the actual cost is calculated based on the hourly rate defined in the rate model.
2. If a rate model is absent or if an hourly rate isn't found in the rate model, the hourly rate is derived from the default labor rate.
3. If an hourly rate isn't found in the default labor rate, the hourly rate is derived from the default system property.

Resource assignments and time cards

Resource assignments created in the demand are used for resource estimation of the work entity created from the demand. These resource assignments automatically move to the resulting work entity when a demand is qualified and converted. However, any resource assignments for allocating resources or groups to a demand task aren't moved to the work entity.

When you submit a time card for a demand task, the actual effort and cost aren't reflected in the resource assignment. If a resource spends extra hours working on a demand that aren't associated with demand tasks, this time must also be recorded. The resource submits the time card for recording extra hours using the Time Sheet Portal. This extra cost and effort is added to the demand but isn't reflected in the actual cost and effort for the demand tasks.

Demand-level calculations

The actual cost and actual effort for the demand are calculated as follows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Demand Actual Cost = actual cost of all demand tasks + actual cost of extra activities
- Demand Actual Effort = actual effort of all demand tasks + actual effort of extra activities

If a demand has no task or assigned resource, you can capture the actual cost by submitting a time card against the demand. After the time card is approved, an expense line is created on the demand. The expense line is processed and the actual cost of work for that time card rolls up to the demand in the **Demand Actual Cost** column.

Cost and effort calculation example

This example demonstrates actual cost and effort calculation for demand tasks and roll up to the demand.

For demand D1, the demand manager creates three demand tasks (DT1, DT2, and DT3) and assigns resources R1, R2, and R3 to each task respectively.

Hourly resource rates

Resource	Hourly rate in the rate model	Hourly rate in the default labor rate	Hourly rate in the system property
R1	$200	$150	$50
R2	$250	$200	$50
R3	$150	$100	$50

Each resource spends eight hours on the assigned demand task and submits a time card.

Rate derived from the rate model

Actuals	Demand task DT1	Demand task DT2	Demand task DT3
Actual effort	8 hours	8 hours	8 hours
Actual cost	200 * 8 = $1600	250 * 8 = $2000	150 * 8 = $1200

Demand roll-up:

- Demand Actual Cost = $4,800
- Demand Actual Effort = 24 hours

Rate derived from default labor rate

(Rate model not associated with demand.)

Actuals	Demand task DT1	Demand task DT2	Demand task DT3
Actual effort	8 hours	8 hours	8 hours
Actual cost	150 * 8 = $1200	200 * 8 = $1600	100 * 8 = $800

Demand roll-up:

- Demand Actual Cost = $3,600
- Demand Actual Effort = 24 hours

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Rate derived from default system property
(Rate model not associated with demand and hourly rate not found in default labor rate.)

Actuals	Demand task DT1	Demand task DT2	Demand task DT3
Actual effort	8 hours	8 hours	8 hours
Actual cost	50 * 8 = $400	50 * 8 = $400	50 * 8 = $400

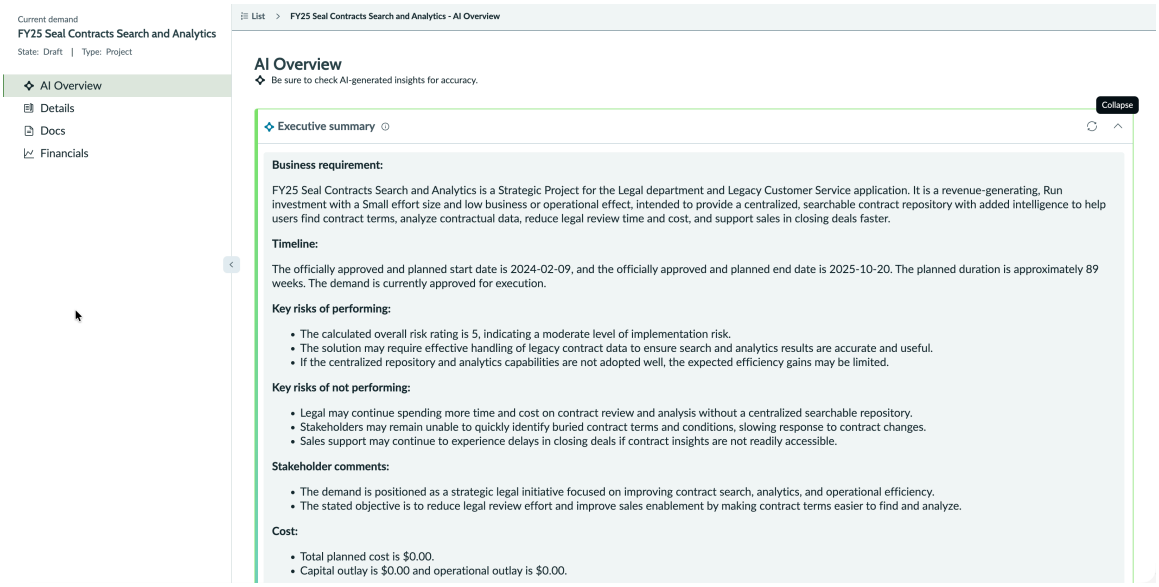
Demand roll-up:

- Demand Actual Cost = $1,200
- Demand Actual Effort = 24 hours

AI skills for Next Experience for Demand Management

ServiceNow Otto for Strategic Portfolio Management provides AI-powered skills for demand records that help you quickly understand demand details and refine records. These skills improve planning efficiency and support informed decision-making.

Starting with the September 2026 release, Gemma 4 joins our growing portfolio of open-weight models available through Now LLM Service. The latest industry advancements are available alongside sovereignty-focused options. All models are hosted and governed by ServiceNow with the same infrastructure and data protections. Older models will remain available for existing published AI skills, agents, and agentic workflows, but will no longer be available for new development or configuration. For details, see the KB3066214: ServiceNow Otto Model Upgrades article in the Now Support Knowledge Base.



Demand summarization

The demand summarization skill reviews the fields and related lists of a demand record and helps generate a clear executive summary. Use this skill to quickly understand the key details of a demand without reviewing individual fields, comments, and work notes. You can trigger the skill by selecting the **Summarize** button in **AI Overview**.

The generated summary is displayed in a summary card. You can copy the summary for further use.

For more information on, see Summarize demands with the demand summarization skill.

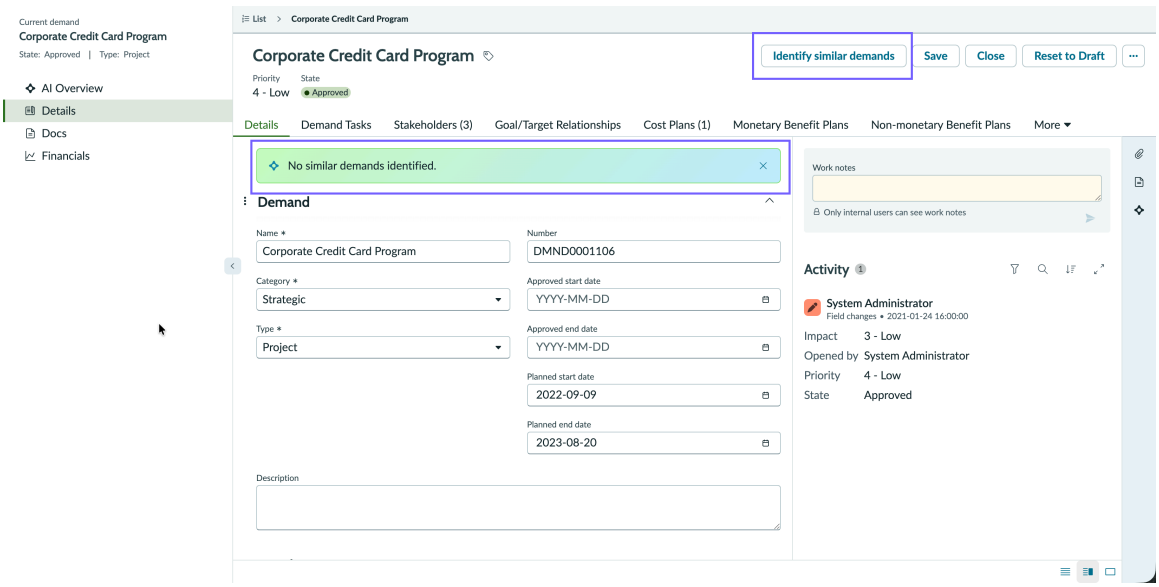
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Similar record identification

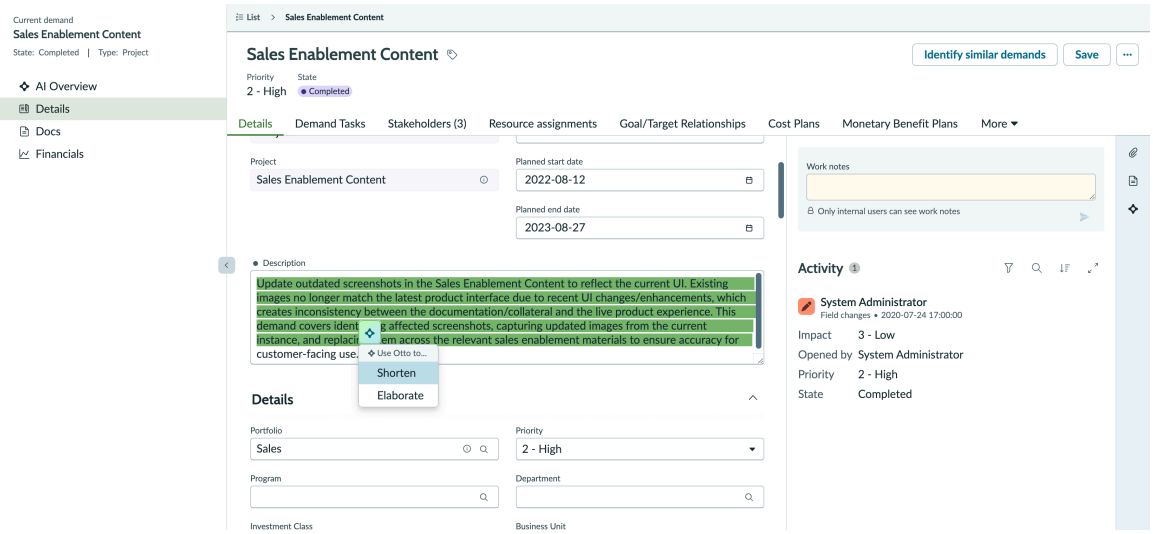
The identify similar records skill enables you to find demand records that are contextually similar to your demand. This skill helps reduce duplicate demands and improves planning efficiency.

This skill uses the name, description, and business case content of a demand to look for contextual similarity with other demand records using AI search. The skill identifies demands with a minimum 85% similarity threshold, excluding outdated and irrelevant records. You can trigger the skill by selecting the **Identify similar demands** button on the demand record page.

The similar demand records are displayed in a top banner and in the Similar Demands tab. This skill improves visibility into related initiatives, and enhances decision-making for demand users.

For more information, see Identify similar records using AI.

Refine records



The refine record skill improves demand quality by enabling AI-assisted text refinement directly within the text fields of demand records. You can elaborate on a brief description or shorten

lengthy content without losing key information. This feature helps verify demands are clear, complete, and actionable from the start.

The skill considers other fields in the demand form to generate contextually relevant content. It reduces rework caused by missing or unclear information and helps demand managers create well-structured records more efficiently.

For more information, see Improve data quality using the refine records skill.

Enterprise-Wide Deployment for demands

Enterprise-Wide Deployment (EWD) partitions demand data by criteria such as department. Demand experiences extends that by controlling each demand's fields, modules, and layout.

Demands support EWD in two complementary ways: partitioning, which controls who can see a demand, and demand experiences, which control what a demand looks like to users who can see it. For the full EWD concept, including partitions for other SPM tables, see Exploring SPM Enterprise-Wide Deployment.

Partitions and demand experiences are two independent, complementary layers, and the boundary between them is deliberate: partitions control who can see a demand and its dashboards; demand experiences control what a demand looks like and how it's navigated once you can see it. Partitions don't determine the record view, form fields, related lists, modules, or record tabs. Those are all controlled by the demand experience field.

Partitioning demands

The Demand [dmn_demand] table is one of the tables EWD supports for partitioning. Partitioning also applies to demand-related tables, such as demand tasks, cost plans, and resource assignments. For more information, see Supported tables for partition.

An administrator defines a partition criteria field on the Demand table, such as **Department**, and creates a partition for each value, such as **IT Operations** or **Finance**. When a demand is created, it's automatically stamped with the partition that matches its criteria field. A user then sees only the demands that belong to a partition their role grants them access to, across Strategic Planning Workspace, list views, search results, and dashboards.

An administrator can also configure a unique default dashboard for each partition; a user sees the default dashboard for their own partition automatically when they log in. For more information, see Map a dashboard to a partition.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Demand experiences

A demand experience controls the fields, modules, and layout a demand shows for a given governance process, such as Marketing or IT. See Demand experiences for how a demand experience is structured, including form view precedence when more than one view rule applies, and Create a demand experience for how to create one.

The following demand-record behaviors depend on a demand's experience:

- Modules available for a given demand experience
- Form layout for a given demand experience
- Dynamic fields when a demand experience has a dynamic category with configured dynamic attributes

When a demand experience includes dynamic fields, the demand record displays an **Additional Information** tab that shows those fields. The Enterprise-Wide Deployment application (`sn_spm_ewd`) must be installed for the **Additional Information** tab to appear.

Personas

Role	Function
EWD admin role [sn_spm_ewd.ewd_admin]	Creates and configures partitions for the Demand table, including the partition criteria field and the role assigned to each partition.
System admin role [sys_admin]	Creates dynamic categories from SPM Dynamic Categories.
PPS admin role [pps_admin]	Creates and manages demand experiences: selects the table, form view, optional dynamic category, and which modules are enabled.
EWD PMO role [sn_spm_ewd.ewd_pmo]	Views demands across all partitions, regardless of partition role assignment.
Demand user role [it_demand_user]	Creates and views demands in the partitions that their role grants access to. Doesn't administer experiences or dynamic categories. On a demand record, sees the modules enabled for that demand's experience and, when applicable, the **Additional Information** tab with its dynamic fields.

Demand data visibility

When EWD and demand experiences are both configured, a demand user sees:

- Only demands that belong to their assigned partitions in list views, search results, and dashboards, with no indication that demands in other partitions exist.
- A drop-down list of available views in the menu panel, when the user has access to more than one partition.
- Only the modules on a demand that are enabled for that demand's experience.
- An **Additional Information** tab on the demand record, only when the demand's experience has a dynamic category with configured dynamic attributes.

Demand experiences

A demand experience defines a governance process and controls which form view, modules, and dynamic attributes appear on a demand.

Different teams often need different governance processes for their demands. For example, a marketing team and an IT team may each need their own set of fields, modules, and layout. Each team captures the information that's relevant to their process. You can use a demand experience record to define one governance process, such as Marketing or IT. The experience controls the form view, modules, and dynamic attributes that appear on each demand that uses it.

A demand experience can optionally reference a dynamic category. The dynamic category defines the set of dynamic attributes that are relevant to that governance process. Only an administrator can create a dynamic category. When a demand experience with a dynamic category is selected on a demand, any dynamic attributes configured on that category are available on the demand.

Dynamic category

A dynamic category defines the custom fields for a specific demand experience. It belongs to the `Default SPM Dynamic Namespace` and groups the dynamic attributes that appear as custom fields on demand records of that experience. Custom fields are scoped to a specific experience and don't appear on records of other experiences or affect default fields.

- A dynamic category can have a parent category. A child category inherits the attributes of its parent, so you can define shared fields once and add experience-specific fields in each child category.
- Custom fields support the String, Boolean, Date, Date/Time, Integer, Decimal, Floating point, Choice, and Reference data types.
- Demand managers view and update custom fields in Demand Management.

For more information, see Create a dynamic category.

Form view precedence

Saving a demand experience automatically creates its view rule and workspace view rule. A demand's form view can be determined by more than one view rule [sysview_rule] record. When more than one view rule applies, the rule with the lower execution order takes effect. When a demand experience's view rule is in effect, users can't change the view themselves.

Additional Information tab

The demand record page in Next Experience for Demand Management can display a conditional **Additional Information** tab that shows a demand's dynamic attributes. The tab is displayed when both of the following are true:

- The demand has a dynamic category from its selected demand experience.
- That dynamic category has one or more dynamic attributes defined.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If the demand has no dynamic category, or a category with no dynamic attributes, the **Additional Information** tab isn't displayed. The tab shows the configured dynamic attributes as editable fields, and the values that you enter are saved to the demand. For more information, see Add dynamic attributes to a demand.

Enterprise-Wide Deployment for demands

Create a demand

Configuring Next Experience for Demand Management

Next Experience for Demand Management settings control how demands are evaluated and promoted to projects, enhancements, changes, defects, or Enterprise Agile Planning (EAP) entities.

Configuration overview

Define the following items for Next Experience for Demand Management.

- Set up Strategic Planning integration with Next Experience for Demand Management. See Configuring Strategic Planning with PPM, Agile 2.0, and SAFe.
- Define who can access and work in the Next Experience for Demand Management. Includes identifying workspace administrators, demand managers, approvers, and reviewers who participate in the demand process. See Assign a role to a user.
- Identify individuals or groups who review or need visibility into demand items. Stakeholders provide domain insight during evaluation. See Populate the stakeholder registry for demands.
- Specify the fields and attributes needed to capture demand data including form layouts, required fields, and custom data elements. See Information model.
- Define demand experiences to control the form view, modules, and dynamic attributes for different governance processes, such as Marketing or IT. See Demand experiences.
- Enable smart assessments to automatically create, score, and qualify demand assessments instead of manually creating and reviewing them. See Enable smart assessments.
- Enable the Resources tab so that demand managers can plan resources on a demand before it becomes a project. See Manage resources for demands.
- Define the metrics used to evaluate and compare demand items. Common criteria include business value, complexity, cost estimates, and alignment to strategy.
- Define demand playbooks that align with your organization's processes. See Playbooks in Next Experience for Demand Management.
- Determine what resource-related information must be associated with demand items, such as estimated effort or team availability.
- Define and configure the financials for a demand. See Configure financials for demands.
- Set the life-cycle stages for a demand item, from creation to review, approval, or conversion through Playbooks.
- Identify related workspaces or applications that are required with Next Experience for Demand Management such as Project Workspace or Resource Management Workspace to support consistent data across applications.

Populate the stakeholder registry for demands

Add users to the stakeholder registry so Next Experience for Demand Management can automatically populate the stakeholder list when someone creates a demand.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: pps_admin

About this task

Note: You can add multiple records for the same user to the stakeholder registry if the user has different portfolios.

Procedure

1. Navigate to **All** > **Project Administration** > **Settings** > **Stakeholders**.
2. Select **New**.
3. On the Stakeholder Register record form, fill in the fields.
   For a description of the field values, see Stakeholder register form.
4. Select **Submit**.

Configure a custom risk rank and risk value

Configure custom risk ranks and value scores to rate the impact and probability factors of risks. These values determine the degree of the risks associated with a demand.

Before you begin
Role required: pps_admin

Procedure

1. Navigate to **All** > **Project Administration** > **Settings** > **Risk Value Lookup**.
2. Select **New**.
3. On the Risk value lookup form, fill in the fields.
   For a description of the field names, see Risk value lookup form.
4. Select **Submit**.

Customize the demand record form

Customize the demand form in Next Experience for Demand Management to configure which fields appear when users create a demand.

Before you begin
Role required: admin

Note: If the demand also has a demand experience selected, the experience's own view rule may take precedence over this customization, depending on execution order. See Demand experiences.

Procedure

1. Navigate to **All** > **Demand** > **Demands** > **All**.
2. Select **New**.
3. In the form context menu in the record header, select **Configure** > **Form Layout**.
4. In the **View name** field, select **APW New**.
5. In response to the Form Builder prompt, select **Not Now**.
6. In the message regarding the application scope, select **Edit this section in Portfolio Planning**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Determine the fields you want to appear on the form by moving field names between the Selected and Available lists.
8. Set the field order in the Selected list using the up and down arrows.
9. Select **Save**.

Result

The customized form layout is applied to the demand record form, unless a demand experience with a lower-execution-order view rule takes precedence for a given demand. See Demand experiences.

Configure the landing page for created demand records

Configure a system property that controls which tab opens when a demand record is created. Set this property to match your team's workflow.

Before you begin

Role required: admin

Procedure

1. Select **All**.
2. Search for `sys_properties.list` in the filter navigator.
3. Select **New**.
4. Enter the system property form field values.

System property form fields

Field	Value
Name	`sn_align_ws.demand_record_landing_page`
Choices	Enter the following values, separated by commas: ◦ `playbook` ◦ `details` ◦ `docs` ◦ `financials`
Type	`string`
Value	A single value from the choices list — for example, `docs`. **Note:** The property defaults to `details` if the value is unset or invalid.

5. Select **Submit**.

What to do next

To change the landing page after setting this property, open the system property record, select a different value in the **Value** field, and select **Update**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related topics

Create a demand

Enable smart assessments

Enable the *sn_align_ws.enable_smart_assessments* property so demands use smart assessments instead of the classic assessment workflow, when they are moved to screening.

Before you begin

Role required: admin

About this task

Requires the Smart Assessment (*sn_smart_asmt*), Smart Assessment - Connected (*sn_smart_asmt_conn*), Smart Assessment Designer (*sn_smart_asmt_desg*), and Smart Scoring (*sn_smart_scoring*) plugins to be active. Portfolio Planning automatically installs these as dependencies.

Tip: Check **System Applications** > **All Available Applications** if smart assessments aren't triggered after enabling the property and verify that all required plugins are active.

Procedure

1. Navigate to **All** and enter `sys_properties.list` in the filter box.
2. Filter the Name column to locate and open the **sn_align_ws.enable_smart_assessments** property.
3. Enter `true` in the Value field.
4. Select **Update**.

Result

Demands route through smart assessments. No separate role assignment is needed for demand managers to read assessments. The *sn_smart_asmt.assessment_reader* and *sn_smart_asmt.template_reader* roles are inherited in the demand_manager role. Stakeholders still need the *sn_smart_asmt.actor* role to fill the assessments. For more information about user roles, see Smart assessment users.

Related topics

Use a custom smart assessment template for demands

Assess demands with smart assessments

Configuring Smart Assessment Engine

Use a custom smart assessment template for demands

Point the automatic demand to smart assessment trigger at a custom template by overriding the predefined *DemandSmartAssessmentUtils* script include provided for this customization.

Before you begin

A custom assessment template is created. For more information, see Create an assessment template

Role required: admin

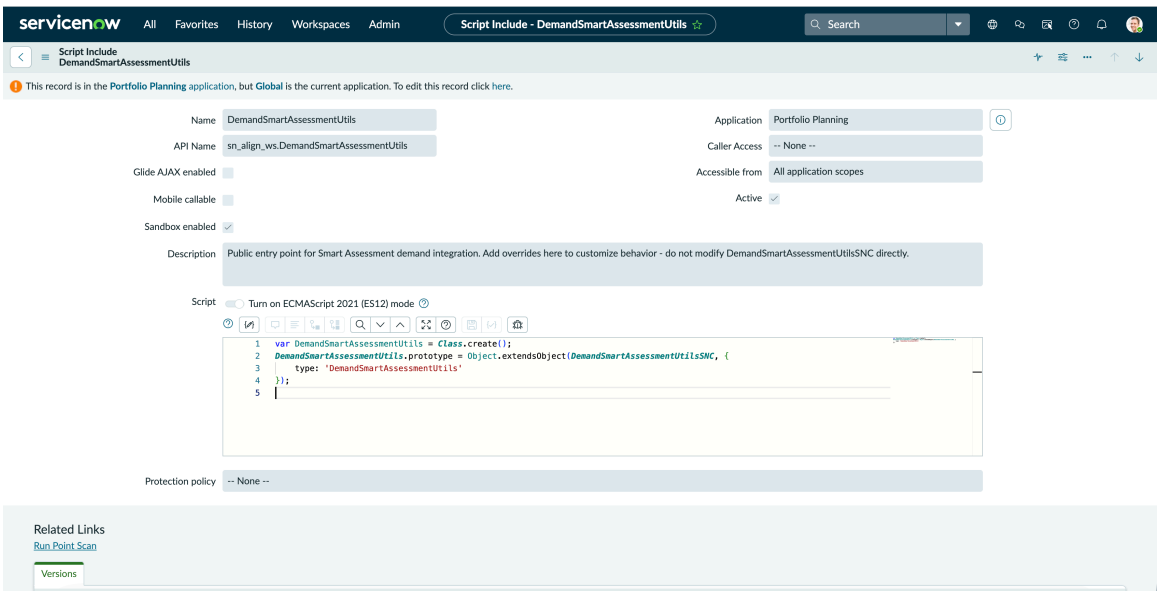
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Warning: The template's questions feed specific score fields on the demand (Size, Strategic Alignment, Risk, ROI, Cost) through metric mappings built for the predefined demand assessment template. A different template's questions and metrics aren't automatically remapped to those score fields, so scoring can silently stop working unless the replacement template is built with matching metrics. Test thoroughly in a non-production instance before doing this in production.

About this task

The demand to screening trigger, the assessment completion check, and assessment score population all use one hardcoded template ID. The predefined *DemandSmartAssessmentUtils* script include is provided to override this template ID and other behavior in the base implementation. This helps to keep the base implementation as-is without modifying it directly.

Procedure

1. Navigate to **All** > **System Definition** > **Script Includes**.
2. Search for `DemandSmartAssessmentUtils`.
3. Select the link in the alert to edit the record in the **Portfolio Planning** application scope.

4. Add a *SMART_ASMT_TEMPLATE_ID* property to the object passed to *Object.extendsObject* and set to your template's sys_id.

   As shipped, the script include has no overrides:

```
var DemandSmartAssessmentUtils = Class.create();
DemandSmartAssessmentUtils.prototype =
 Object.extendsObject(DemandSmartAssessmentUtilsSNC, {
    type: 'DemandSmartAssessmentUtils'
});
```

   Add the override:

```
var DemandSmartAssessmentUtils = Class.create();
DemandSmartAssessmentUtils.prototype =
 Object.extendsObject(DemandSmartAssessmentUtilsSNC, {
    SMART_ASMT_TEMPLATE_ID: '<your_template_sys_id>',
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    type: 'DemandSmartAssessmentUtils'
});
```

5. Add an override to the smart assessment metric map to support your template.

```
SMART_ASMT_SECTION_METRIC_MAP: {
        '6a5bcff4ff27031090effffffffff98': 'score_size',
        'e25bcff4ff27031090effffffffff91':
 'score_strategic_allignment',
        'ae5bcff4ff27031090effffffffff94': 'score_risk',
        '6e5bcff4ff27031090effffffffff89': 'score_value',
        '665bcff4ff27031090effffffffff84': 'score_cost'
    },
```

6. Select **Update**.

Result

New smart assessments triggered for demands now use the specified template. For more information about a template's expected sections, questions, and weights, see Assess demands with smart assessments.

Configuring demand experiences

Configure demand experiences so that each type of demand has its own custom fields, form view, and visible modules.

A demand experience combines a dynamic category, a form view, and module visibility settings. For an overview of these components, see Demand experiences.

To configure a demand experience, complete the following tasks:

- Create a dynamic category (optional)

  A default dynamic category is available in the base system, so a custom dynamic category isn't required to create a demand experience. Create one only when demands of a type require custom fields that the default category doesn't provide. See Create a dynamic category.

- Create a demand experience

  Create the demand experience and define its form view, dynamic category, and visible modules. See Create a demand experience.

Create a demand experience

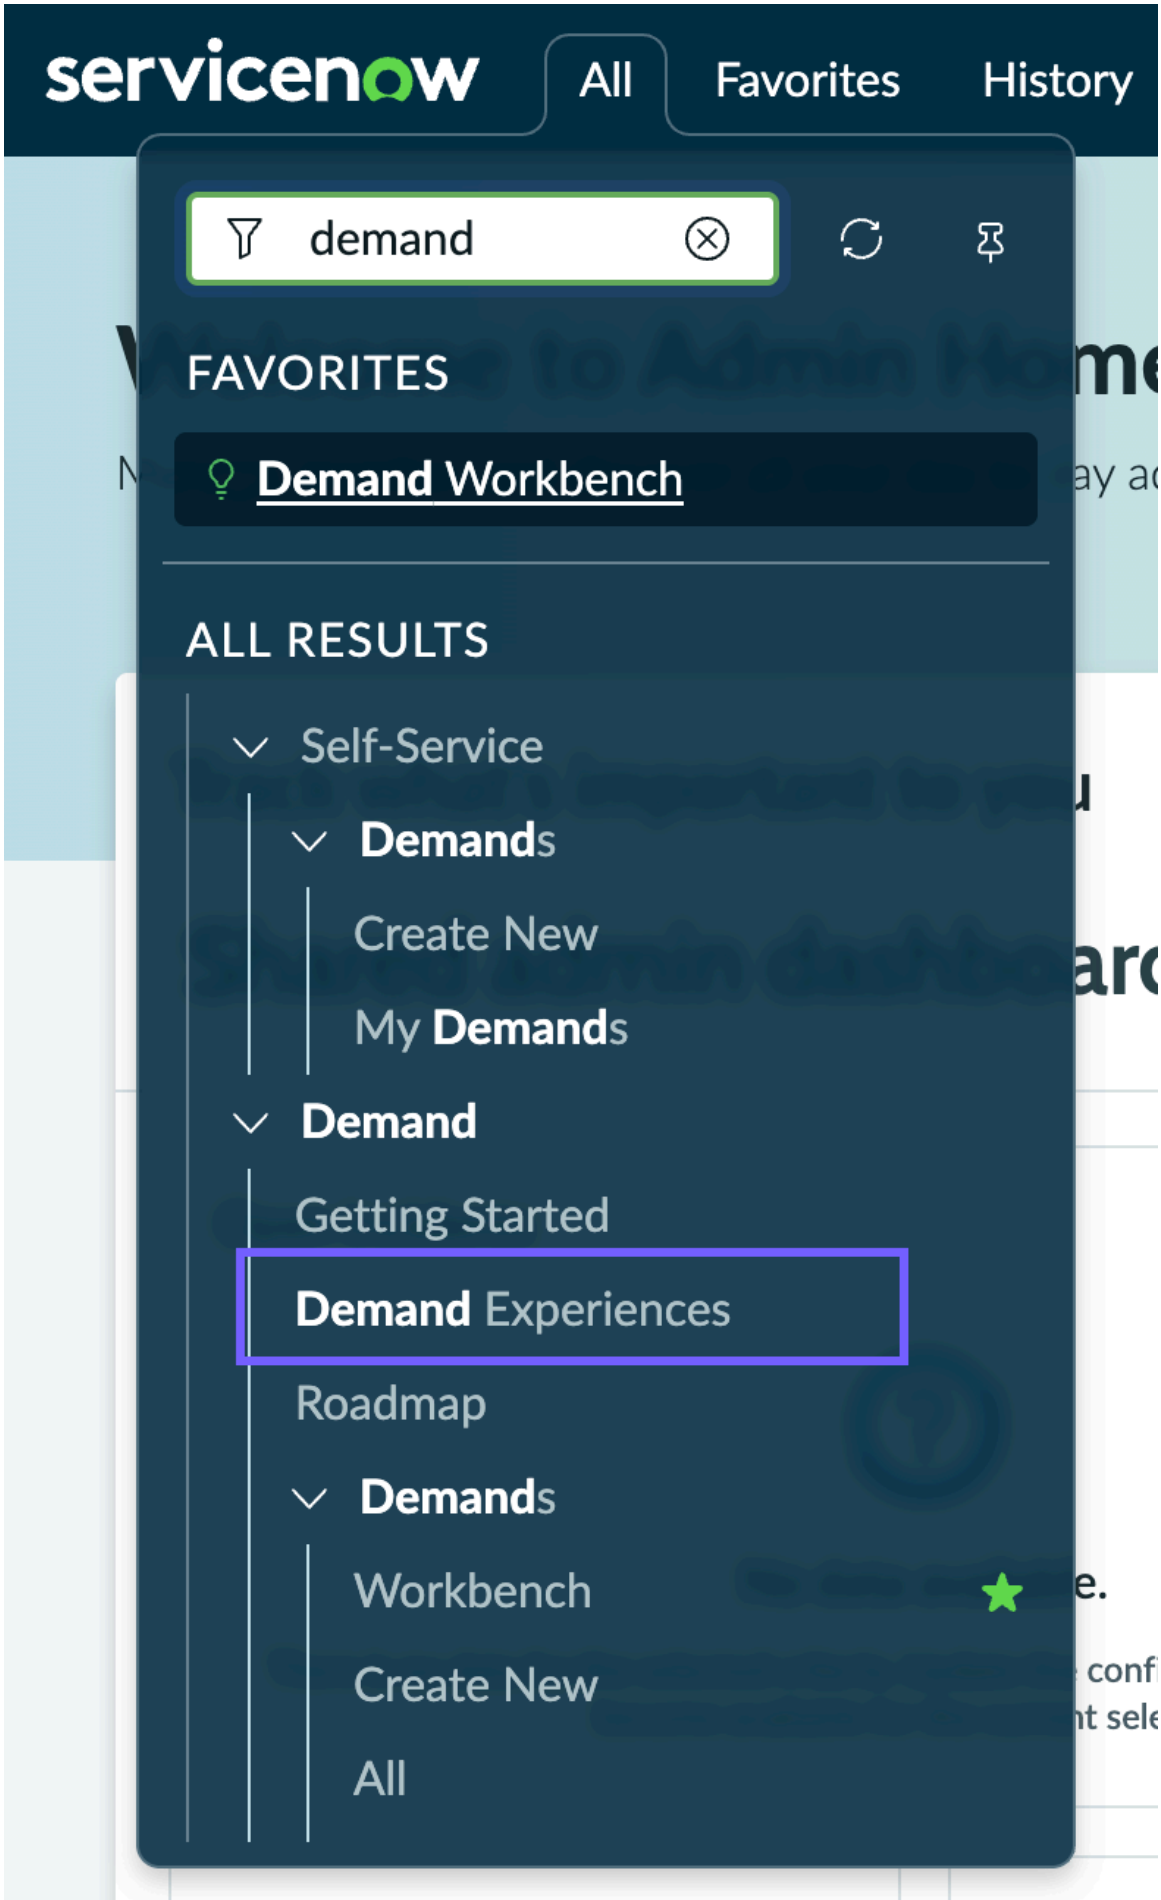
Create a demand experience to control the form view, demand modules, and dynamic attributes that appear on demands to support configuration independence across different types of demands.

Before you begin

If the demand experience uses a dynamic category, the dynamic category that defines its custom fields must already exist.

Role required: pps_admin

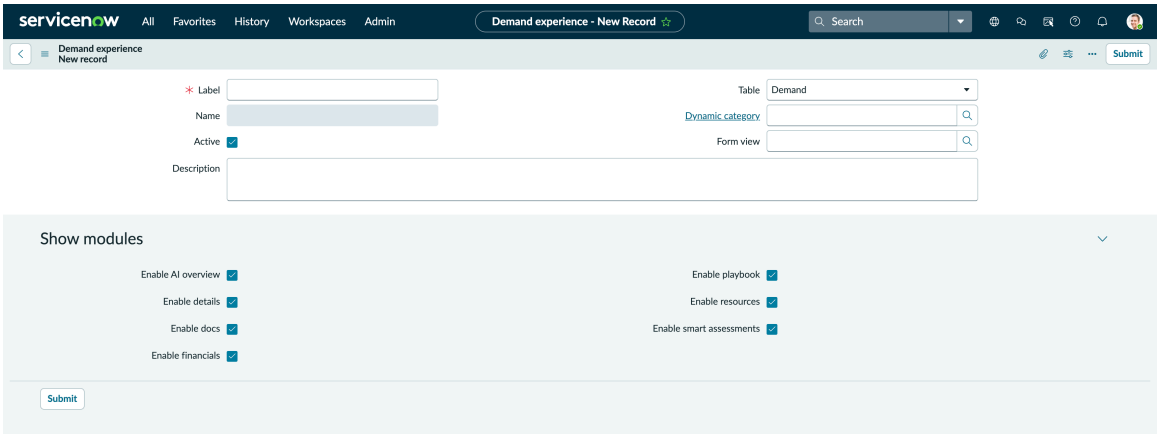
About this task



A demand experience consists of a custom form view, demand modules, and, optionally, a dynamic category that defines custom fields for that experience. For example, you can create experiences for Marketing or IT governance processes. For more information, see Demand experiences.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure



1. Navigate to **All** > **Demand Experiences**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Select **New**.
3. Fill in the fields on the form.
   For a description of the field values, see Demand experience form.

4. Under **Show modules**, clear the check box for any module that you don't want to show for demands that use this experience.
   Every module is selected by default.
5. Select **Submit**.

Result

The demand experience is available to select when a demand is created. Only the modules that you left selected are shown for demands that use this experience, and a view rule and workspace view rule are created automatically. If you selected a dynamic category with dynamic attributes, an **Additional Information** tab appears in the Details module, showing those attributes.

Related topics

Create a demand

Add dynamic attributes to a demand

Create a dynamic category

Create a dynamic category to define the custom fields that appear on demand records of a specific demand experience.

Before you begin

Identify the custom fields that demands of the demand experience need, and the data type of each field.

Role required: admin

About this task

A dynamic category groups the dynamic attributes that appear as custom fields on demand records. When you assign the dynamic category to a demand experience, demand managers can view and update those fields in Demand Management. A category can have a parent category, and it inherits the attributes of its parent.

Procedure

1. Navigate to **All** > **Enterprise-Wide Deployment** > **SPM Dynamic Categories**.

   The Default SPM Dynamic Namespace record opens.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Select the **Dynamic Categories** related list.
3. Select **New**.
4. On the form, fill in the fields.

Dynamic Category form

Field	Description
Namespace	Namespace that the dynamic category belongs to. This field is automatically set to Default SPM Dynamic Namespace.
Label	Display name of the dynamic category. Use a name that identifies the demand experience that the category supports.
Parent	Optional. Parent category whose attributes this category inherits. Leave this field empty to create a top-level category.
Name	Unique system name of the dynamic category.
Description	Brief description of the custom fields that the dynamic category provides.

5. Select **Submit**.
6. Open the dynamic category and add the dynamic attributes that define its custom fields.

   Supported data types are String, Boolean, Date, Date/Time, Integer, Decimal, Floating point, Choice, and Reference. For a Choice attribute, select the choice set that provides its values. To create a dynamic attribute, see Dynamic Schema.

Result
The dynamic category is available for demand experience configurations. Demands assigned to a demand experience that uses this category show its custom fields in Demand Management.

What to do next
Associate the dynamic category with a demand experience. For more information, see Create a demand experience.

Demand experiences

Configure financials for demands

Financial planning settings for demands include the financials view, planning attributes, and scheduled jobs.

Configuration overview

Define the following items for financials Next Experience for Demand Management.

- Define the multicurrency settings for the financials fields. See Multicurrency in Next Experience for Demand Management.
- Enable the budget allocation for demands. See Enable financial budget allocation for demands.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Define the budget allocation attribute to allocate budget by cost type or expense type. See Configure budget attribute at instance level.
- Enable monetary benefit plans for demands. See Enable monetary benefit plans for demands.

Multicurrency in Next Experience for Demand Management

Manage and track demand financials in your corporate currency, regional currency, or project currency using the multicurrency feature.

Overview of multicurrency

In global organizations, demands are often managed at one location and executed at another. Each location might use different currencies for budget spending, making it difficult to monitor and track financials.

The multicurrency feature in Next Experience for Demand Management enables you to manage and track demands from any geographic location in any currency. You can monitor demand financials in one defined currency, such as your functional currency or regional currency, while tracking the budget in another. You can also manage your demands in one currency and specify a different currency for managing your future projects.

Activation information

To enable multicurrency features in Next Experience for Demand Management, activate the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin. This activation:

- Enables the demand currency view in demand, cost plan, and benefit plan forms.
- Enables you to manage simple demand financials, cost plans, benefit plans, and budgets in the demand currency
- Automatically activates the PPM Standard (com.snc.financial_planning_pmo) plugin, giving you the option to switch between the default view and demand currency view

Currency preferences

You can specify your currency preference for managing demand financials: a functional currency, a regional currency, or a local currency. For more information, see Select demand currency preference.

Demand currency view

The Demand Currency view displays multicurrency fields in addition to the standard demand form fields. Enable this view from the form context menu.

You can designate a currency other than the functional currency as the processing demand currency. The **Demand currency** field appears on the Financials section of the Demand form, where you can select any active currency from the Currencies [fx_currency] table.

Note: The Demand currency field is set to read only after you create a cost plan, cost plan breakdown, benefit plan, or benefit plan breakdown for the demand.

Select demand currency preference

Set your currency preference for managing and tracking demand financials from the functional currency, regional currency, or local currency.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

The PPM Standard Multicurrency feature must have been installed. For more information, see Activate PPM Standard (Project Portfolio Management).

Role required: admin

Procedure

1. Navigate to **All** > **Project Administration** > **Settings** > **Preferences-Project**.
2. From the Demand currency setup list, select a currency option.

Demand currency preference	Currency option
Manage demands using the functional currency	**Follow functional currency**: Manage demands using your organization's functional currency. When you create a project from the demand, the project currency carries over to the Project form. You can change the project currency later. For example, if your functional currency is USD, both demands and projects use USD.
Manage demands using the same currency as the project currency	**Drive project currency**: Manage demands and projects using the same currency. This currency can be your functional currency or any other currency. For example, to manage demands and projects in GBP, select this option and specify GBP as your demand currency. The **Project Currency** field in the demand form automatically populates with GBP when you save the form.
Manage demands and projects in different currencies	**Flexi**: Manage your demands and projects created from the demand using different currencies. For example, to manage demands in USD and projects in GBP, select this option and specify USD as the demand currency and GBP as the project currency.

3. Select **Save**.

What to do next

Enable the multicurrency view in the demand form and other demand-related forms. For more information, see Enable the demand currency view.

Quick start tests for multicurrency in Next Experience for Demand Management

Quick tests enable you to validate that the multicurrency feature in Next Experience for Demand Management works correctly after configuration changes such as applying an upgrade or developing an application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Danger: By default, the system property that is used to run automated tests is disabled to prevent you from accidentally running these tests on a production system. To avoid data corruption or an outage, run tests only on development, test, and other non-production instances. See Enable or disable executing Automated Test Framework tests.

To use demand currency quick start tests, the PPM Standard Multicurrency – ATF Tests plugin (com.snc.ppm_multicurrency.atf) must have been activated.

For information about copying and then customizing quick start tests, see Quick start tests.

Demand currency test suites tests

Test	Description
Verify cost in demand currency on cost plan	Validates the calculation of cost plan breakdown with budget reference rate. Verifies the roll up to cost plan in demand currency.
Verify benefit in demand currency on benefit plan	Validates the calculation of the benefit plan breakdown with the budget reference rate. Verifies the roll up to benefit plan in demand currency.

Upgrade existing demands

Execute scheduled jobs to upgrade your existing active and inactive demands.

Before you begin

The PPM Standard Multicurrency feature must have been installed. For more information, see Activate PPM Standard (Project Portfolio Management).

Role required: admin

About this task

Note: Because these jobs can impact performance depending on the number of demands and cost plans, run the jobs only when necessary.

Procedure

1. Navigate to **All** > **System Definition** > **Scheduled Jobs**.
2. Search for and select the appropriate scheduled job for your demands.
   - For active demands: *`Upgrade demand currency fields for active demands`*

     The job copies all amounts in the cost-related fields of the demands to demand currency. The Baseline, Cost Plan, Cost Plan Breakdown, Benefit Plan, and Benefit Plan Breakdown fields also change to the demand currency. You can't edit the demand currency after the values are copied because the financial costs exist.

   - For inactive demands: *`Upgrade demand currency fields for inactive demands`*

     The job copies the values in the cost-related fields for inactive demands to the demand currency. The currency in the Baselines, Cost Plans, Cost Plan Breakdowns, Benefit Plans, Benefit Plan Breakdowns, and Expense Lines forms changes to the demand currency.
3. Select **Execute Now**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Enable financial budget allocation for demands

Enable allocation property after migrating to Next Experience to work on budget allocation for your demands.

Before you begin

- For new customers accessing financials in Next Experience, this property is enabled by default.
- Role required: admin

Procedure

1. Navigate to **All** and type in **sys_properties.list** in the filter box.
2. Filter the Name column to locate and open the **sn_invst_pln.enable_budget_allocation_v2** property.
3. Update the Value field to `True` and select **Update**.

What to do next

Configure budget attributes to work on managing budget of your planning items. For more information, see Configure budget attribute at instance level.

Configure budget attribute at instance level

Configure the budget attribute by expense type or cost type as an instance-level to work on budget allocations for your demands.

Before you begin

- Enable the budget allocation property to work on budgeting for demands. For more information, see Enable financial budget allocation for demands.
- Role required: admin

Important: Existing customers can't change the budget attribute to cost_type.

Procedure

1. Navigate to **All** > **System Properties** > **Properties**.
2. Filter the Name column to locate and open the **sn_invst_pln.budget_allocation_attribute** property.
3. Update the Value field to one of the following.
   - **cost_type** - view financials by cost types such as Hardware Opex, External labor Capex, Software Capex, Software Opex.
   - **expense_type** - view financials by expense types such as Capex and Opex.
4. Select **Update**.

Enable monetary benefit plans for demands

Enable the benefit plans property to create and manage benefit plans for demands.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** and type in `sys_properties.list` in the filter box.
2. Filter the Name column to locate and open the **sn_invst_pln.enable_benefit_plan_in_new_financials** property.
3. Enter `true` in the Value field.
4. Select the **Update** button.

Configure the demand AI skills

Configure the generative AI skills for demands by defining their triggers, display locations, and access settings to make it available to users.

Before you begin

Role required: sn_nowassist_admin.nsa_admin

About this task

Important: These generative AI skills are turned on by default. The skills will be automatically available to appropriate role users for the application. For more information, see AI agents, skills, and agentic workflows on by default.

Procedure

1. Navigate to **Admin** > **AI Admin Hub**.
2. Select **AI Skills**.
3. In the navigation panel, select **Technology** > **SPM**.
4. Select **Activate** from a skill card.
5. Review the input fields for the skill.
   For more information, see Inputs for AI skills.

   A check mark next to each step indicates whether the step is completed, partially completed, or not completed. After configuring a step, select **Save and continue** to go to the next step. Return to a previous step by selecting **Back**.

   Note: Some configuration options are read-only.

6. Define the trigger for the skill.
   - Automatic: The skill is initiated without user interaction.
   - User trigger: The skill is initiated when by an user action.

   For the demand summarization skill, the triggers behave in the following ways:

   - Automatic: The skill is initiated without user interaction. When users navigate to the **AI Overview** page of a demand, the summary of the record is auto-generated.
   - User trigger: The skill is initiated when users select the **Summarize** action on a demand record.

7. Define and review the user accesses.
8. Choose where to display the skill.
   The display options may vary from skill to skill.

   In-product desktop: When selected, the skill is displayed on forms and workspaces.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. Open the role selection list next to the Display toggle, and select the roles that can use the skill.
   The user roles added in the **Define access** page for each ACL can be selected in this step.
10. Review the configuration and select **Activate**.

Related topics

Summarize demands with the demand summarization skill

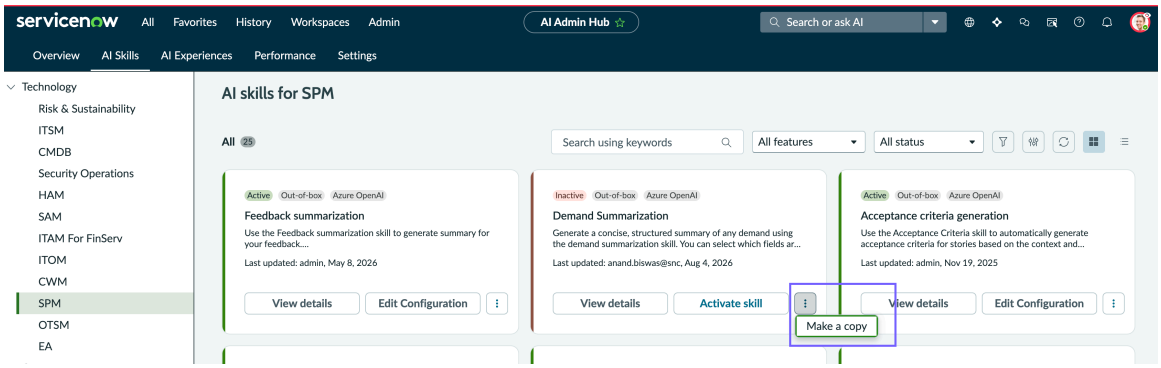
AI skills for Next Experience for Demand Management

Copy and customize the demand summarization skill

Copy the base demand summarization skill and customize it with your own fields, related entities, and prompt to summarize demands.

Before you begin

Role required: sn_nowassist_admin.nsa_admin



About this task

The demand summarization skill generates a summary of a demand record from a set of input fields and related lists. The base skill can be copied to include fields or related entities specific to your organization's demand process that aren't included in the base skill. Copying creates an independent copy that you can customize with your own fields, related entities, and prompt. The copied skill then summarizes demands using your configuration.

Note: The existing skill, either base or copy, are deactivated after a new copy is activated.

Procedure

1. Navigate to **Admin** > **AI Admin Hub**.
2. Select **AI Skills**.
3. In the navigation panel, select **Technology** > **SPM**.
4. Select the **Options** menu from the demand summarization skill card.

5. Select **Make a copy**.
6. Select **Make a copy** in the confirmation pop-up.
   The skill configuration setup opens.
7. Add or remove an input field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Goal	Action
Add a field	**a.** Select **Add additional input field**. **b.** Select a field from the Additional input field list. **c.** Provide a description for the field.
Remove a field	Select the cross icon next to an input field.

For more information on the default input fields and related tables, see Inputs for AI skills.

8. Add conditions for the skill.
9. Add or remove a field from a related table, add or remove a related table, or add rule conditions for each related table.

Goal	Action
Add a field from a related table	**a.** Select **Add field** for a related table. **b.** Select a field from the Related table field list. **c.** Provide a description for the field.
Remove a field from a related table	Select the cross icon next to a related table field.
Add a related table	**a.** Select **Add related table**. **b.** Select a table from the Related table list. **c.** Select a field from the Related table field list. **d.** Provide a description for the field.
Remove a related table	Select the cross icon next to a related table.
Add rule conditions for a related table	**a.** Select the **Add rule conditions** toggle. **b.** Define the rule conditions.

10. **Optional:** Add relationship table fields.
    a. Select **Add relationship table**.
    b. Select a field from the Relationship table field list.
11. Select whether any additional data source should be considered by the skill.

    A check mark next to each step indicates whether the step is completed, partially completed, or not completed. After configuring a step, select **Save and continue** to go to the next step. Return to a previous step by selecting **Back**.

    Note: Some configuration options are read-only.

12. Define the trigger for the skill.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Automatic**: The skill is initiated without user interaction. When users navigate to the **AI Overview** page of a demand, the summary of the record is auto-generated.
- **User trigger**: The skill is initiated when users select the **Summarize** action on a demand record.

13. Define and review the user accesses.
14. Choose where to display the skill.
    The display options may vary from skill to skill.

    In-product desktop: When selected, the skill is displayed on forms and workspaces.

15. Open the role selection list next to the Display toggle, and select the roles that can use the skill.
    The user roles added in the **Define access** page for each ACL can be selected in this step.
16. Review the configuration and select **Activate**.

Result

The copy of the demand summarization skill is activated. This will now be used to summarize demands.

What to do next

After cloning the demand summarization skill, you can create and customize prompts for the skill using the AI Skill Kit. You can use a base prompt and create a prompt of your own. For more information, see Create a prompt. This prompt will be applied to the skill in Next Experience for Demand Management.

Configure the questions for conversational demand creation

Add or modify an existing question for creating a demand through Agent assist in Virtual Agent using the conversational experience.

Before you begin

- Verify that AI Search is installed and provisioned for your instance by navigating to **All** > **AI Search** > **AI Search Status**.
- ServiceNow Otto for Virtual Agent is set up. See Assistants overview.
- Verify the following plugins are install.
  - ServiceNow Otto for Platform (v4.0.2)
  - ServiceNow Otto for IT Service Management (ITSM)
- Configure ServiceNow Otto in Conversational Catalog Request. See Configure ServiceNow Otto in Conversational Catalog Request

Role required: admin or catalog_admin

About this task

Note: If Microsoft Teams and Mobile are enabled as a display location for ServiceNow Otto for Virtual Agent, you can use the conversational experience to create a demand in those applications too.

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Administration** > **Conversational catalog overview**.
2. Select the **Create a New Demand** catalog item.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Identify any unsupported conversational catalog item question types and suggestions to make them conversational by selecting ServiceNow Otto for Virtual Agent.
   For information on unsupported fields, see Configure ServiceNow Otto in Conversational Catalog Request.
4. Select **Edit in advanced view**.
5. Review the existing questions in the **Variables** related list and add or modify questions.

Configure capacity for demands

Generate employee profiles for resources and map them with primary attributes to start capacity planning.

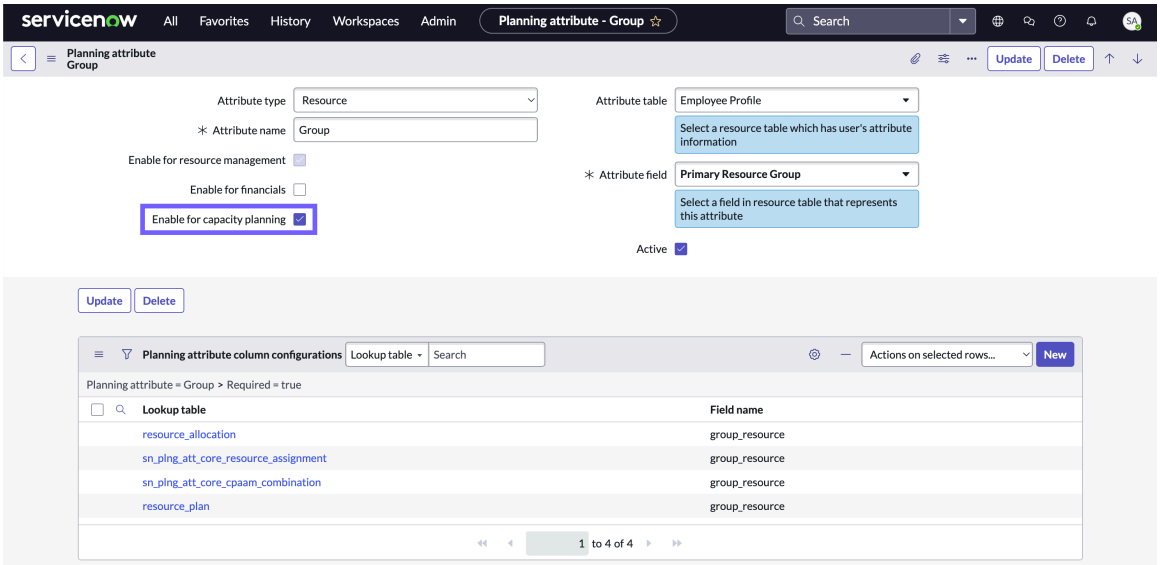
- Enable the planning attributes for capacity to map resources to a unique attribute. For more information, see Enable planning attributes for capacity in demands.
- Create resource assignments and generate employee profiles. For more information, see Generate employee profiles for resources.
- Map resources to a unique group, role, and skill to generate employee profiles. For more information, see Map primary attributes to resources.

Enable planning attributes for capacity in demands

Enable the planning attributes Group, Skill, and Role to view resource capacity details in demands.

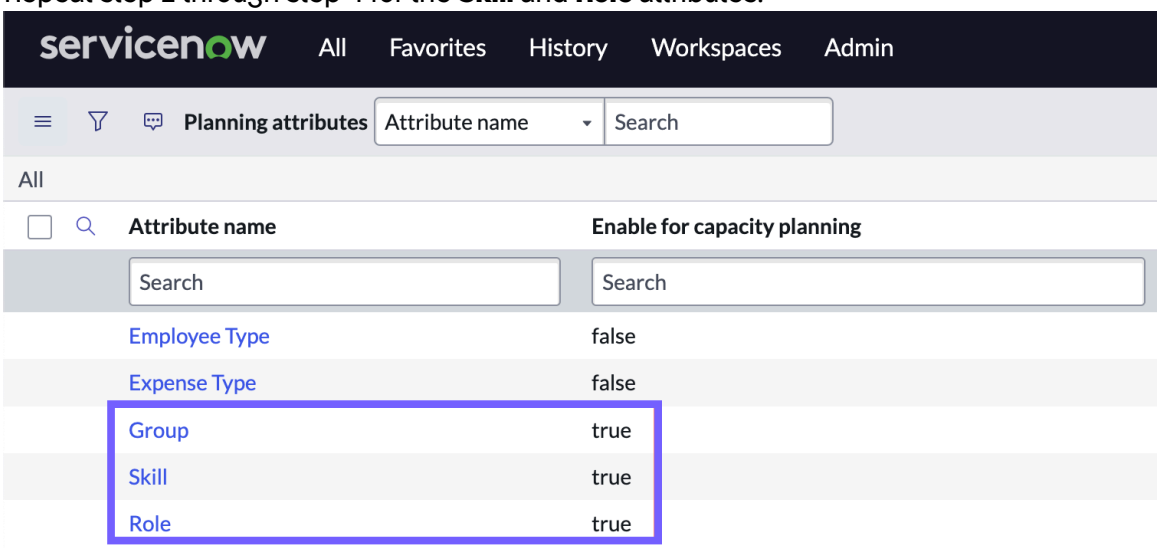
Before you begin

Role required: admin



Note: This activation is a one-time task to enable planning attributes to plan and work on resource capacity.

Procedure



1. Navigate to **All** > **Strategic Planning** > **Planning Attributes**.
2. Filter the Attribute name to locate and open the **Group** attribute.
3. Select the **Enable for capacity planning** check box.
4. Select **Update**.

Note: If an attribute is enabled for capacity planning, it is enabled for resource management by default.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Repeat step 2 through step 4 for the **Skill** and **Role** attributes.

You can create custom attributes and map them to resources. For more information, see Create or edit planning attributes.

6. Set the value of the Enable for capacity planning column for Group, Role, and Skill field to **true**.

What to do next

1. Configure attribute values: Navigate to **All** > **Strategic Planning** > **Planning Attributes** to view and manage attribute values. You can add, edit, or import attribute entries for Group, Skill, and Role.
2. Map attributes to resources: Assign the enabled planning attributes to your resources so they appear in capacity views. For custom attributes, see Create or edit planning attributes.
3. Start capacity planning: Navigate to the Resources tab in your demands to view resource capacity based on the enabled attributes.

Generate employee profiles for resources

Generate employee profiles for the resources to map against primary attributes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

Procedure
1. Navigate to **All** > **Employee Profile** > **Employee Definition**.
2. Filter the name to locate and open the sys_user table.
3. In the Employee Definition page, select **User** from the Table list.
4. Use the condition builder to filter the required resources and then select the update count icon ( ).
5. Select **Generate Employee Profiles** (Generate Employee Profiles).
6. In the Generate Employee Profiles window, select **Proceed**.

Result
Employee profiles for the selected resources are generated.

What to do next
Populate a primary group, primary role, and primary skill for the resources with employee profiles. For more information, see Map primary attributes to resources.

Map primary attributes to resources

Locate and map the primary group, primary role, and primary skill for the resources associated with existing employee profile tables.

Before you begin
Employee profiles are generated.

Role required: admin

Procedure
1. Navigate to **All** > **Employee Profile** > **Employee Profiles**.
2. Filter the User column to locate and open the resources with employee profiles.
3. Select the **Populate primary resource attributes** related link to auto-populate the attributes.
   - If an employee is assigned to a single group, role, and skill, the primary attributes are populated.
   - If an employee is assigned to multiple groups, skills, or roles, select the **Primary Resource Group**, **Primary Resource Role**, and **Primary Resource Skill**, using the lookup icon.
4. Select **Update**.

Activate a scheduled job to generate resource capacity

Activate the scheduled job to automatically generate the resource capacity at the required cadence.

Before you begin
Role required: admin

Procedure
1. Navigate to **All** > **System Definition** > **Scheduled Jobs**.
2. Filter the name field to locate and open **Generate Resource Capacity**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select the **Active** check box to activate the scheduled job.
4. Edit the fields on the Scheduled Script Execution form to customize the job and meet your requirements.
   For more information about the field description and scripts, see Automatically run a script of your choosing.
5. Select **Execute Now** to execute the scheduled job or select **Update** to save your changes.

Using Next Experience for Demand Management

Next Experience for Demand Management enables end-to-end planning and management of demands.

Overview of demand tasks

1. Create a demand

   Capture a new business need and start structured governance from intake.

2. Use Playbook in Next Experience for Demand Management

   Define governance processes for low-code or no-code demand changes.

3. Create demand tasks

   Add and manage work needed to progress a demand to approval or delivery readiness, including time card submissions.

4. Collaborate with docs in Next Experience for Demand Management

   Store and manage documentation for demands from a centralized location within the demand record.

5. Add dynamic attributes to a demand

   Capture governance-process-specific information on a demand using its Additional Information tab, without adding fields to the base demand form.

6. Assess demands with smart assessments

   Create, score, and qualify demand assessments using intuitive smart assessments forms.

7. Add risks to a demand

   Track risks, issues, and decisions related to a demand to maintain traceability and control.

8. Managing financials for demands

   Plan and control financials associated with a demand such as cost plans, labor costs, and expense lines.

9. Create and compare financial baselines for a demand

   Create and compare financial baselines to track variance over time.

10. Edit monetary benefit plans for a demand

    Create and manage monetary and non-monetary benefit plans for a demand and associate them to each other.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

11. Manage resources for demands

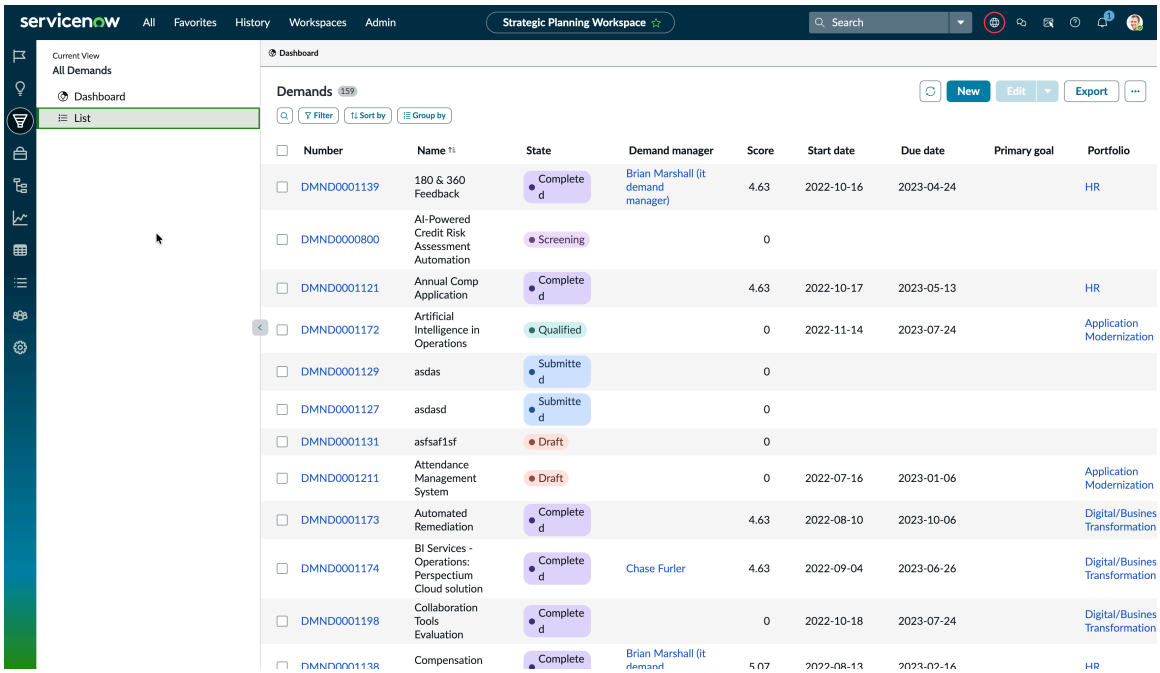
    Check resource availability against capacity in the Resources tab and adjust allocations before the demand becomes a project.

12. Create an entity from a demand

    Progress qualified demands into downstream delivery entities such as projects, enhancements, and change.

13. Summarize demands with the demand summarization skill

    Summarize demands and refine them using AI.



14. Associate AI systems with demands

    Link AI systems to a demand directly from Next Experience for Demand Management.

Managing demands in Next Experience for Demand Management

Next Experience for Demand Management is a workspace for creating, tracking, prioritizing, and approving demands.

From the **List** page, create, edit, or export demands.

List actions

Action	Description
Search	Search for demands by name.
Filter	Apply filters to the list. Selected filter preferences are retained in the filter criteria.
Sort by	Sort the demand list in ascending or descending order based on a selected field.
Group by	Group demands by a selected field, such as state or stage.
Refresh	Reload the list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column actions

Action	Description
Personalize fields	Customize the columns displayed in the demand list to show only relevant fields.
Group by	Group demands by a column using the column header action.
Rearrange columns	Drag columns to any position in the grid.

Create a demand

Create demands to capture the strategic and operational requirements and centralize information for stakeholder assessment and prioritization.

Before you begin

Role required: it_demand_manager, it_demand_user

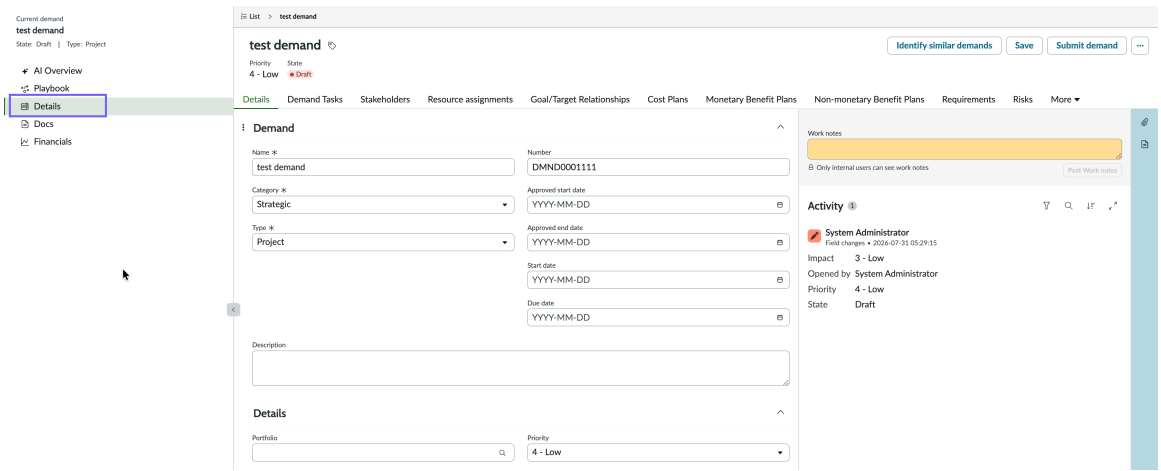
About this task

https://service-now.portal.trainn.co/share/Ppqi1zfBCoILW8NngQkgTg/embed?autoplay=false

By default, a new demand opens in its **Details** page. If you want your demands to land on a different page on creation, the related system property can be modified. See Configure the landing page for created demand records.

Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon  .
3. Select **New**.
4. On the Demand form, fill in the fields.



Demand form

Field	Description
Name	Name of the demand.
Demand experience	Demand experience to associate with this demand, which determines the demand's form view, the modules shown, and any dynamic attributes available. This is an optional field. If no value is selected in this field, the demand is displayed with the default form view and all modules.
Category	Category of the demand. The available values are: ○ Strategic: For demands for plans, such as projects or stories. These demands go through strategic evaluation and prioritization regardless of scope, from large initiatives, such as a project or epic, to smaller, well-defined changes, such as a story. ○ Operational: For demands for operational work, such as changes or defects. These demands address business-as-usual work that doesn't require strategic evaluation or prioritization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Type	The **Category** field selection determines the selections available in the **Type** field. ○ The following demand types are available if the demand category is Strategic: ▪ Enhancement ▪ Project ▪ Epic ▪ Story ▪ EAP Epic ▪ EAP Feature ▪ EAP Capability ▪ No Conversion ○ The following demand types are available if the category is Operational: ▪ Change ▪ Defect ▪ No Conversion The availability of these choices are also defined by the plugins installed in your instance. For more information, see Demand details form.
Description	Description of the demand.
Planned start date	The preliminary or estimated date when the work is initially planned to begin.
Planned end date	The preliminary or estimated date when the planned work is expected to be completed.

5. Select **Create**.
   The created demand opens in the **Details** page.

What to do next

Review and refine the demand details and progress the demand. See Update demand details.

Create demands by using the conversational experience in Virtual Agent

Use the conversational experience of ServiceNow Otto for Virtual Agent to create a demand from any application that supports Virtual Agent.

Before you begin

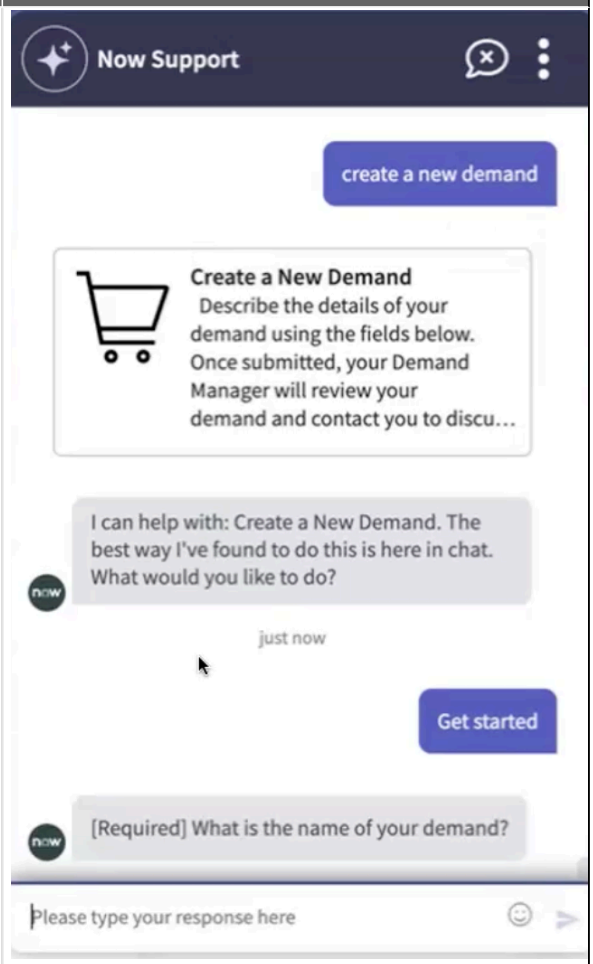
Note: Depending on your license, you will have access to certain application features, generative AI skills, agentic workflows, and AI agents. For more information, see ServiceNow product tiers.

- An application that supports Virtual Agent is installed.
- The conversational experience for demand creation is configured.

Role required: none

About this task

In the application that supports Virtual Agent, for example Employee Service Center, start with a prompt to create a demand in the chat. Through a series of questions, Virtual Agent prompts you to provide information for the questions that you configured for a catalog item. Virtual Agent understands the context and maps the information that you provide in response to a question to an appropriate catalog item, in this case, a demand.



Procedure

1. Navigate to **All** > **Self-Service** > **Employee Center**.
2. Select **Open chat window**.
3. Enter an instruction to start the conversation with Virtual Agent.

   You can start with a basic instruction such as **Create demand** or an elaborate instruction that includes the demand's information. The following examples show how each instruction is handled in the chat.

Instruction	Description
Short: **Create demand**	Virtual Agent starts a conversation to ask more information from you about the demand through a series of questions: ○ What is the name of your demand? ○ What is the reason for this demand? ○ What are the risks associated with performing this demand? The information you provide is used to fill in the fields of the Demand form. You can skip answering a question that is related to non-required fields by entering **skip**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Instruction	Description
	
Elaborate: **Create a demand with the name Upgrade MyApp and business justification as upgrade and risk of not performing as milestones will be missed.**	Using the context that you provided, Virtual Agent automatically matches it to the relevant field on the Demand form. It then instructs you to enter information of only those fields that you haven't provided, such as the risk associated with performing the demand, assumption, and others. You can skip answering a question that is related to non-required fields by entering **skip**.

4. Review the information that Virtual Agent filled in for the Demand form fields.
   You can choose to make changes or submit.
5. **Optional:** Add attachments for the demand.
   The information that you provided is submitted to create a demand. Virtual Agent creates a demand and provides the information such as its number, short description, and state.

   The conversation is now complete.

Identify similar records using AI

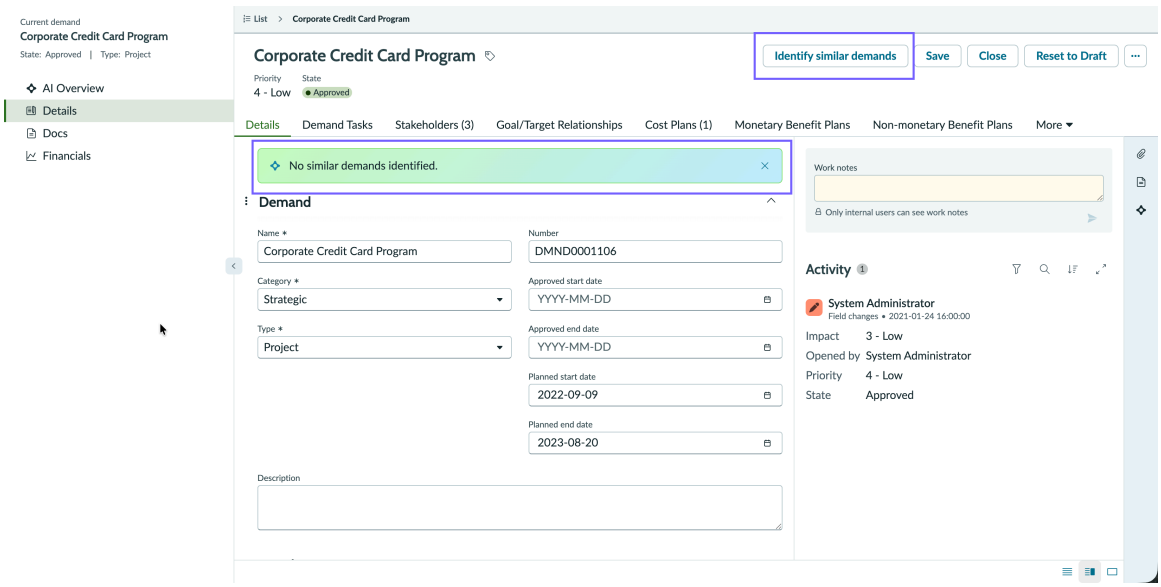
Use the identify similar records skill to find demand records with similar names, descriptions, or business case content.

Before you begin

Important: This generative AI skill is turned on by default. The skill will be automatically available to appropriate role users for the application. For more information, see AI agents, skills, and agentic workflows on by default.

If you have custom roles that require access to this skill, update the ACLs (access control lists) for those roles that require access.

Role required: it_demand_user



About this task

https://service-now.portal.trainn.co/share/EPDkOh2gE1692WtrJ7dN2Q/embed?autoplay=false

- If similar records exist, the related list displays them.
- If no similar records are found, a message appears and the related list remains empty.

Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon .
3. Open a demand from the **List** page.
4. Select **Details** from the navigation menu.
5. Select **Identify similar demands**.
   The similar demands identified by AI are displayed in the top banner and the **Similar Demands** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

To view full details of a similar demand record, select the demand number link from the **Similar Demands** tab.

Note: If the **Similar Demands** tab isn't visible, select **More** > **Similar Demands**.

Use Playbook in Next Experience for Demand Management

Use the default playbook or configure a custom one to capture required information for a demand and support governance processes.

Before you begin

Role required: it_demand_user or it_demand_manager.

About this task

https://player.vimeo.com/video/1220252736?h=57f2c77616&badge=0&autopause=0&player_id=0&app_id=58479

A playbook defines the standard stages of a demand (for example, Initiation, Planning, Execution, Monitoring, and Closure) and includes activities or action items to complete at each stage.

Note: This task describes how to use a playbook to manage demand information in a guided, stage-based workflow. To find out how to update demand information on the Details page of the demand record, see Update demand details.

Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon .
3. Open a demand from the **List** page.
4. Select the **Playbook** tab.
5. Select a stage to view its activities.
   Each activity displays its status (In Progress, Pending, or Complete) and the fields or lists to update.
6. Address the activities within each stage.
   - To mark the activity as done and move to the next activity, select **Mark Complete**.
   - To save your progress without completing the activity, select **Save**.
   - To bypass the activity and move to the next one, select **Skip**.
   - To revisit or edit completed or skipped activities. you have to select **Restart**. These states set the activity to read-only.

Note:

Some stages advance the state when all activities in the stage are complete and don't require manual action.

Update demand details

Update the details of a demand record in Next Experience for Demand Management to reflect any changes in scope, priority, or capacity.

Before you begin

Role required: it_demand_user, it_demand_manager

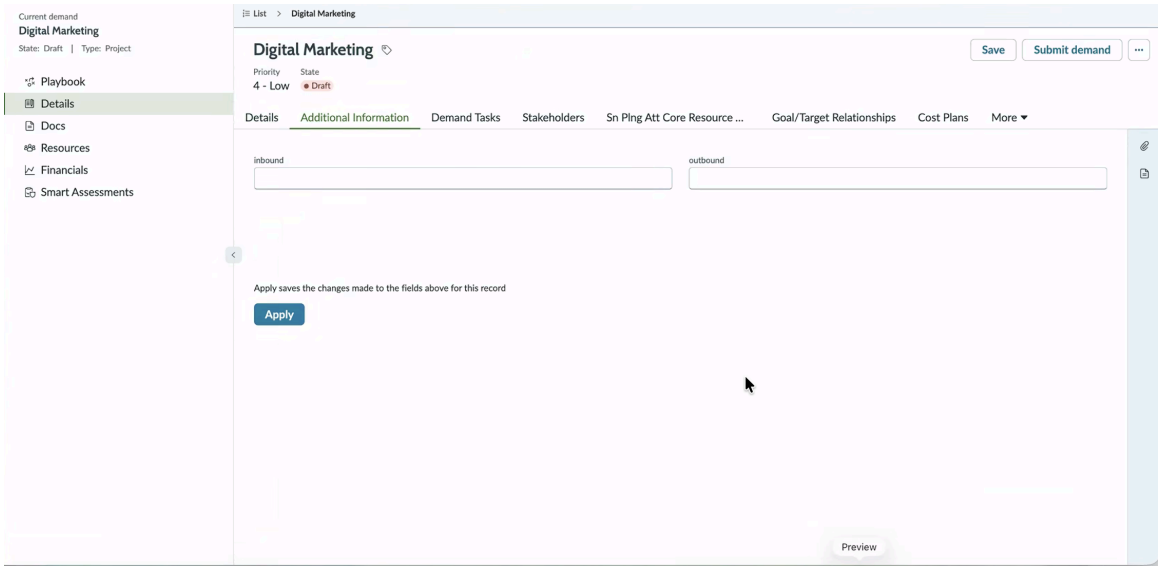
Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon  .
3. Open a demand from the **List** page.
4. Select the **Details** tab.
5. Make the required changes.
   For information on the field values, see Demand details form.
6. **Optional:** Change the form view to view the demand details in a different layout.
   a. Select the Additional actions icon.
   b. Select **View** and select a view from the available views.
7. Select **Save**.

Add dynamic attributes to a demand

Provide values for the dynamic attributes available on a demand through its Additional Information tab. This approach captures governance-process-specific information without affecting demands using other experiences.

Before you begin



The demand must have a dynamic category with one or more dynamic attributes defined through its selected demand experience. For more information, see Demand experiences.

Role required: it_demand_user or it_demand_manager

Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon  .
3. Open a demand from the **List** page.
4. Select the **Details** tab.
5. Select the **Additional Information** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Enter values in the dynamic attribute fields.
7. Select **Save**.

Result

The values that you entered are saved to the demand's dynamic attributes.

Demand experiences

Create demand tasks

Create tasks for a demand to delegate cost, effort, risk, and benefit assessment activities. Assign a resource or group to the demand task to track the time and effort spent performing the specified activities.

Before you begin

Role required: it_demand_manager

About this task

Create demand tasks to plan work for demands rather than for a target work entity such as a project, change, defect, or enhancement. Resources assigned to a demand task can submit time spent on the task using a time card. For more information, see Demand tasks.

To create, edit, or delete demand tasks, you can also use the **Add demand tasks** Playbook activity. For more information, see Use Playbook in Next Experience for Demand Management.

Note: If you're creating a demand task with the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin activated and Demand Currency view enabled, additional fields are available. For more information about the fields that are available only in the Demand Currency view, see Multicurrency in Next Experience for Demand Management reference.

Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon .
3. Open a demand from the **List** page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select **Details** from the navigation menu.
5. Select the **Demand Tasks** tab.

   Note: If the Demand Tasks tab isn't visible, select **More** and then select **Demand Tasks**.

6. Select **New**.
7. On the Demand Task form, fill in the fields.
   For a description of the field values, see Demand task form.
8. Select **Save**.

Result
The demand task is created and is accessible on the **Demand Tasks** tab. Team members can access demand tasks assigned to them from Collaborative Work Management. For more information, see Managing SPM work in Collaborative Work Management.

Submit a time card for a demand task

Record and submit the time spent on a demand task to calculate actual cost and effort. The reported hours are used to track work performed and support demand planning.

Before you begin
Role required: timecard_user

Procedure
1. Navigate to **All** > **Time Sheets** > **Time Sheet Portal**.
2. Create a time card.

Assignment type	Actions
Demand task assigned to you	**a.** Navigate to the necessary demand task under **Tasks**. **b.** Select the **Add to Time Sheet** link.
Demand task assigned to you as an additional assignee	**a.** Select the **Add unassigned tasks to Time Sheet** link next to **Logged Time Cards**. **b.** In the Add unassigned tasks to Time Sheet dialog box, search for and select the demand task from the Select Task list.

3. From the **Resource plan** drop-down, select a resource plan.
4. Provide the hours for each day spent working on the demand task.
5. Select **Submit**.

Result
The time card moves to the Submitted state and is sent to an approver for review. For details on the approval process, see Approve or reject a time card.

Add stakeholders to a demand

Delegate assignments and track demand progress by managing the stakeholders associated with a demand.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: it_demand_manager

About this task
A demand can have multiple stakeholders and a stakeholder can be associated with multiple demands.

To create, edit, or delete demand stakeholders, you can also use the **Add stakeholders** Playbook activity. For more information, see Use Playbook in Next Experience for Demand Management.

Procedure
1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon  .
3. Open a demand from the **List** page.
4. Select **Details** from the navigation menu.
5. Select the **Stakeholders** tab.

   Note: If the **Stakeholders** tab isn't visible, select **More** and then select **Stakeholders**.

6. Add a stakeholder, either from the stakeholder registry or as a new record.

Goal	Action
Add an existing stakeholder from registry	**a.** Select **Add Stakeholder**. **b.** Select one or more stakeholders from the list. For information about the stakeholder reg istry, see Populate the stakeholder registry for demands. **c.** Select **Add**.
Add a stakeholder to the registry	**a.** Select **New**. **b.** Fill in the fields on the demand stakeholder form For a description of the field values, see De mand stakeholder form. **c.** Select **Save**.

7. Remove a stakeholder's association with the demand.

   a. Select the check boxes for the required stakeholders.

   b. Select **Delete**.

   c. Select **Delete All** in the confirmation modal.
   This removes the stakeholder's association with this demand; it doesn't delete the stakeholder's entry from the registry.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add goal and target relationships for demands

Track and manage the relationship between demands and organizational goals or targets directly from the Next Experience for Demand Management. Linking demands to goals or targets supports alignment with strategic priorities and shows how each demand contributes to broader organizational objectives.

About this task

To create, edit, or remove goal/target relationship records, you can also use the **Add secondary goals** Playbook activity. For more information, see Use Playbook in Next Experience for Demand Management.

Before you begin

Role required: it_demand_manager

Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon  .
3. Open a demand from the **List** page.
4. Select **Details** from the navigation menu.
5. Select the **Goal/Target Relationships** tab.

   Note: If the **Goal/Target Relationships** tab isn't visible, select **More** and then select **Goal/Target Relationships**.

6. Select **Add**.
7. On the Goal/Target Relationship form, fill in the fields.
   For a description of the field values, see Goal/target relationship form.
8. Select **Save**.

Add requirements for a demand

Define and manage requirements for a demand to capture its functional and technical specifications. Demand managers can associate planned tasks with the requirement, and assign an owner responsible for verifying that requirements are met.

Before you begin

Role required: it_demand_manager

Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon  .
3. Open a demand from the **List** page.
4. Select **Details** from the navigation menu.
5. Select the **Requirements** tab.

   Note: If the **Requirements** tab isn't visible, select **More** > **Requirements**.

6. Select **New**.
7. On the Requirement form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For a description of the field values, see Requirement form form.

8. Select **Save**.

Improve data quality using the refine records skill

Use the refine records skill to shorten or elaborate text in demand records, helping demand managers and users improve clarity and completeness before saving.

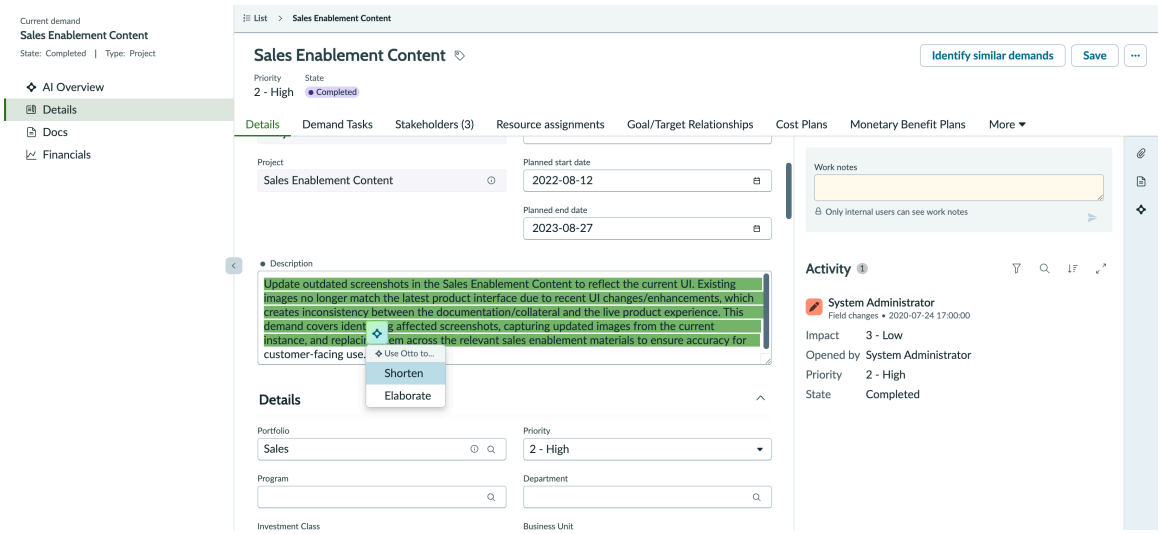
Before you begin

Important: This generative AI skill is turned on by default. The skill will be automatically available to appropriate role users for the application. For more information, see AI agents, skills, and agentic workflows on by default.

If custom roles require access to this skill, update the ACLs (access control lists) for those roles.

Role required: it_demand_manager, it_demand_user

About this task



The refine records skill uses other fields in the form to generate content for rich or long text fields. You can select existing text or enter new text, then shorten or elaborate it without losing key information.

To shorten or elaborate text fields using Playbook activities, see Use Playbook in Next Experience for Demand Management.

Note: AI-generated content may be inaccurate or incomplete. Review all AI-generated text before saving the record.

Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon .
3. Open a demand from the **List** page.
4. Select **Details** from the navigation menu.
5. In a text field of your record, select the text to refine.
   For example, select the text in the **Description** field of a demand.

6. Refine the selected text.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Open the **Refine with AI** menu.

b. Select **Shorten** or **Elaborate**.

7. Select **Replace** to update the text field with the AI-generated content.
   The text field updates with the AI-generated content.

Add risks to a demand

Add a risk to a demand to identify, analyze, prioritize, plan, and track potential problems during any phase of the demand life cycle.

Before you begin
Role required: it_demand_manager

About this task
A risk is any uncertain event that can potentially impact the success or outcome of a demand. For example, an incorrect estimate of factors like financial outlay or resource assignments can cause schedule slippage.

Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon  .
3. Open a demand from the **List** page.
4. Select **Details** from the navigation menu.
5. Select the **Risks** tab.

   Note: If the **Risks** tab isn't visible, select **More** > **Risks**.

6. Select **New**.
7. On the Risk form, fill in the fields.
   For a description of the field values, see Risk form.
8. Select **Save**.

Add issues to a demand

Add an issue to a demand to escalate a risk or to track an unexpected problem. If the issue remains unresolved, unnecessary conflicts, delays, or even a failure can occur.

Before you begin
Role required: it_demand_manager

Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon  .
3. Open a demand from the **List** page.
4. Select **Details** from the navigation menu.
5. Select the **Issues** tab.

   Note: If the **Issues** tab isn't visible, select **More** > **Issues**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Select **New**.
7. On the Issue form, fill in the fields.
   For a description of the field values, see Issue form.
8. Select **Save**.

Add decisions to a demand

Add a decision to a demand to record the solution or plan for a risk or issue.

Before you begin

Role required: it_demand_manager

Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon  .
3. Open a demand from the **List** page.
4. Select **Details** from the navigation menu.
5. Select the **Decisions** tab.

   Note: If the **Decisions** tab isn't visible, select **More** > **Decisions**.

6. Select **New**.
7. On the Decision form, fill in the fields.
   For a description of the field values, see Decision form.
8. Select **Save**.

Add actions for a demand

Add actions required to resolve an issue or risk for a demand based on your analysis of the risk or issue.

Before you begin

Role required: it_demand_manager

Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon  .
3. Open a demand from the **List** page.
4. Select **Details** from the navigation menu.
5. Select the **Actions** tab.

   Note: If the **Actions** tab isn't visible, select **More** > **Actions**.

6. Select **New**.
7. On the Action form, fill in the fields.
   For a description of the field values, see Action form.
8. Select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add change requests for a demand

Add a change request as the outcome of an action taken to resolve an issue or mitigate a risk. The change request can affect the demand's scope, resource requirements, cost, or schedule.

Before you begin
Role required: it_demand_manager

Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon  .
3. Open a demand from the **List** page.
4. Select **Details** from the navigation menu.
5. Select the **Request Changes** tab.

   Note: If the **Request Changes** tab isn't visible, select **More** > **Request Changes**.

6. Select **New**.
7. On the Request Change form, fill in the fields.
   For a description of the field values, see Request change form.
8. Select **Save**.

Submit a demand

Submit a demand record after the required details are complete to progress the demand from the Draft state to the next states of its life cycle.

Before you begin
Role required: it_demand_manager, it_demand_user

About this task
The submit option is available only when the demand is in the Draft state.

Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon  .
3. Open a demand from the **List** page.
4. Select **Details** from the navigation menu.
5. Select **Submit demand**.

Approve demands

Approve qualified demands in Next Experience for Demand Management. Approving a demand moves it to the Approved state, where the demand manager can convert it into a work item such as a project or enhancement.

Before you begin
Demands must be in the Qualified state.

Role required: demand_approver (who can see only demands in the Qualified state) or it_demand_manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon  .
3. Open a demand from the **List** page.
4. Select **Details** from the navigation menu.
5. Select the **Approve** button.

Create an entity from a demand

Create an entity, such as a work item, from a demand so that you can track work on the demand.

Before you begin

A demand must have been created. For more information, see Create a demand.

The category and type of a demand and the applications you have installed determine the entity you can create from it. The following table lists the available entity types and the applications you must have installed to create them.

Entity	Required application
Enhancement, change, or defect	Project Portfolio Suite
Agile Development entities (story or epic)	Agile Development 2.0
Enterprise Agile Planning (EAP) entities (epic, feature, or capability)	Strategic Planning

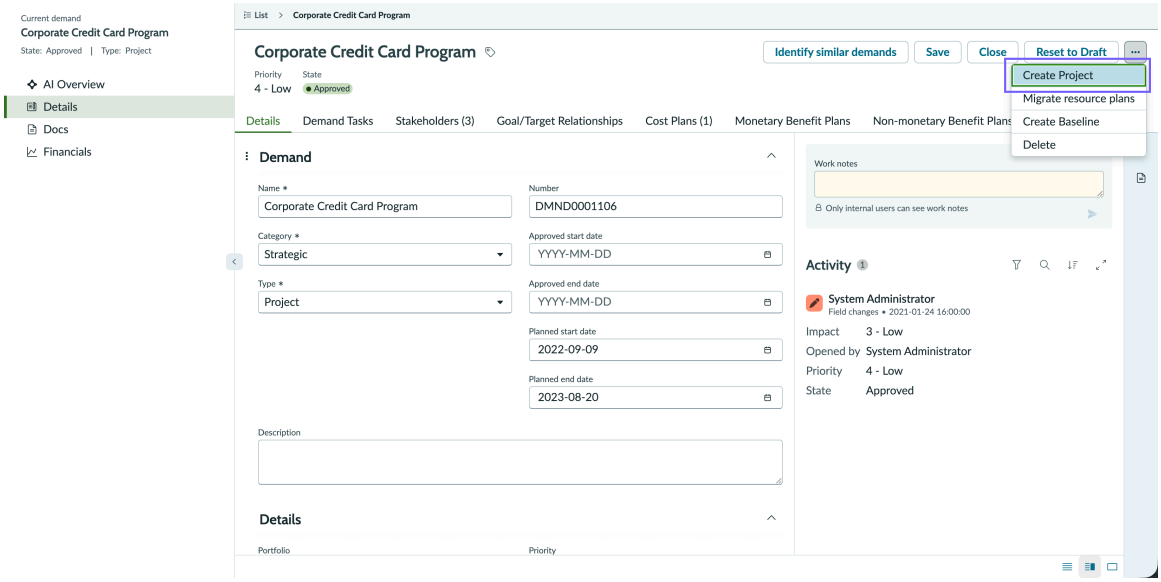
Role required: it_demand_manager

Note: The sn_apw_advanced.eap_user role is required to convert a demand to EAP entities.

About this task

To create an entity, you can also use the **Confirm details and convert to selected entity** Playbook activity. For more information, see Use Playbook in Next Experience for Demand Management.

Procedure



1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon  .
3. Open a demand from the **List** page.
4. Select **Details** from the navigation menu.
5. Verify that the values in the **Category** and **Type** fields are appropriate for the entity you want to create.
   The options in the Type list change according to the category that you select. For more information, see Demand details form.

   Note: The **Category** and **Type** fields are set to read only when an entity is created from a demand. If you delete the created entity, these fields are set to editable again.

6. Select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Select the More Actions option.
8. Select the appropriate option to create an entity.

Options vary depending on the category and type of the demand.

Option	Description
Create Project	This option appears if the **Category** field is set to **Strategic** and the **Type** field is set to **Project**. Creates a project that is associated with this demand. The number of the project record is displayed in the **Project** field. For more information, see Data migrated from a demand to a created project.
Create Enhancement	This option appears if the **Category** field is set to **Strategic** and the **Type** field is set to **Enhancement**. Creates an enhancement associated with this demand. Use enhancements to request improvements or new capabilities for existing features or services, for example, a request to add new UI elements. The number of the enhancement record is displayed in the **Enhancement** field.
Create Epic	This option appears if the **Category** field is set to **Strategic** and the **Type** field is set to **Epic**. Creates an Agile Development 2.0 epic that is associated with this demand. A **Demand** reference field is created in the Agile Development 2.0 Epic form.
Create Story	This option appears if the **Category** field is set to **Strategic** and the **Type** field is set to **Story**. Creates an Agile Development 2.0 story that is associated with this demand. A **Demand** reference field is created in the Agile Development 2.0 Story form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
Create EAP Epic	This option appears if the **Category** field is set to **Strategic** and the **Type** field is set to **EAP Epic**. Creates an Enterprise Agile Planning (EAP) epic that is associated with this demand. A **Converted from** reference field is created in the EAP epic form.
Create EAP Feature	This option appears if the **Category** field is set to **Strategic** and the **Type** field is set to **EAP Feature**. Creates an EAP feature that is associated with this demand. A **Converted from** reference field is created in the EAP feature form.
Create EAP Capability	This option appears if the **Category** field is set to **Strategic** and the **Type** field is set to **EAP Capability**. Creates an EAP capability that is associated with this demand. A **Converted from** reference field is created in the EAP capability form.
Create Change	This option appears if the **Category** field is set to **Operational** and the **Type** field is set to **Change**. Creates a change that is associated with this demand. The number of the change record is displayed in the **Change** field.
Create Defect	This option appears if the **Category** field is set to **Operational** and the **Type** field is set to **Defect**. Creates a defect that is associated with this demand. The number of the defect record is displayed in the **Defect** field.

Note: For EAP entities, select the team that you want the EAP entity to be assigned to, in the **Team** field in the **EAP Details** section in the demand form. This field is set to read-only once the entity is created.

Result
After the entity is created from the demand and associated with it, the demand type and category can't be changed. This restriction applies because work items are already linked to the demand once the artifact is created.

Reset a demand to draft state

Reset a demand to the Draft state when it has been moved past that state unintentionally or when changes to it are required. A demand can be reset to Draft until an entity is created from it or it has reached the Qualified state.

Before you begin
Role required: it_demand_manager

About this task
When a demand is set back to the Draft state:

- All score values in the **Assessment Results** tab are reset to default values.
- All active assessments for the demand are cancelled. The system triggers new assessments when the demand moves to the Screening state and if the Assessment Required field on the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

demand form is set to true. If smart assessments is enabled for the demand and it already has classic (non-smart) assessments on it, the reset is treated as a fresh assessment flow. Any open classic assessments are canceled, and a new smart assessment is triggered when the demand next reaches Screening. For more information, see Assess demands with smart assessments.

- All resource assignments are removed. Only the resource plans that don't have any reported active hours are available for allocation.

Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon  .
3. Open a demand from the **List** page.
4. Select **Details** from the navigation menu.
5. Select **Reset to Draft**.
   A confirmation message appears if the demand has any of the following.
   - Active assessments pending with stakeholders.
   - Resource assignments created for the demand.
6. **Optional:** Select the check box to replan the allocated resource plans that have no actual hours reported.
7. Select **OK**.

Defer demands

Defer demands in Next Experience for Demand Management to move them to the backlog when they aren't feasible to act on currently, such as when resources aren't available. After deferral, demands can be reviewed and moved to any other demand state.

Before you begin

Only demands in the Draft or Completed state can be deferred.

Role required: it_demand_manager

Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon  .
3. Open a demand from the **List** page.
4. Select **Details** from the navigation menu.
5. Select **Defer**.

Result

The deferred demand is moved to the Deferred state and can be revisited and reviewed in the future.

Delete demands

Delete demands to remove them from Next Experience for Demand Management. Demands can be deleted only while in the Pending state.

Before you begin

Role required: it_demand_user or it_demand_manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Deleting a demand removes all related data, including risks, demand tasks, requirements, and decisions. Stakeholders remain in the Stakeholder Register [dmn_stakeholders_register] table.

Any open assessments for the demand, classic or smart, are cancelled. For more information, see Assess demands with smart assessments.

If a project has already been created from a demand, its reference is removed from the project along with the data related to the demand.

Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon  .
3. Open a demand from the **List** page.
4. Select **Details** from the navigation menu.
5. Select the More Actions option.
6. Select the More Actions icon and select **Delete**.
7. Select **OK**.

Export demands

Share data with stakeholders or perform further analysis outside the platform by exporting demand records from Next Experience for Demand Management.

Before you begin

Role required: it_demand_manager

Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon  .
3. Select the demands that you want to export or select the check box in the column header to export all demands.
4. Select **Export**.
5. In the Export dialog box, select the export file type from the **File Type** drop-down list. The available values are Excel, CSV, JSON, or PDF.
6. Determine the delivery type in the **Delivery Type** field.
   - To deliver the export by email, select **Email** and provide an email address in the **Email** field.
   - To download the exported data to your system, select **Download**.
7. Select **Export**.

Create AI systems

Create AI systems from directly within the demand workflow and associate them with your demands.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- The AI Control Tower plugin must be installed. For more information, see Activation and installation of AI Control Tower.
- The investment type of the demand is set to artificial intelligence.
- Role required: sn_ai_steward

Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon  .
3. Open a demand from the **List** page.
4. Select **Details** from the navigation menu.
5. Select the **Create AI System** button to create an AI system in the AI Control Tower workspace. For more information on creating AI systems, see Create AI system assets.

What to do next

Associate your demands with the created AI systems:

- Using the AI checkpoint stage in your demand playbook. For more information, see Use Playbook in Next Experience for Demand Management.
- Using the **AI Associations** section in the **Details** tab.

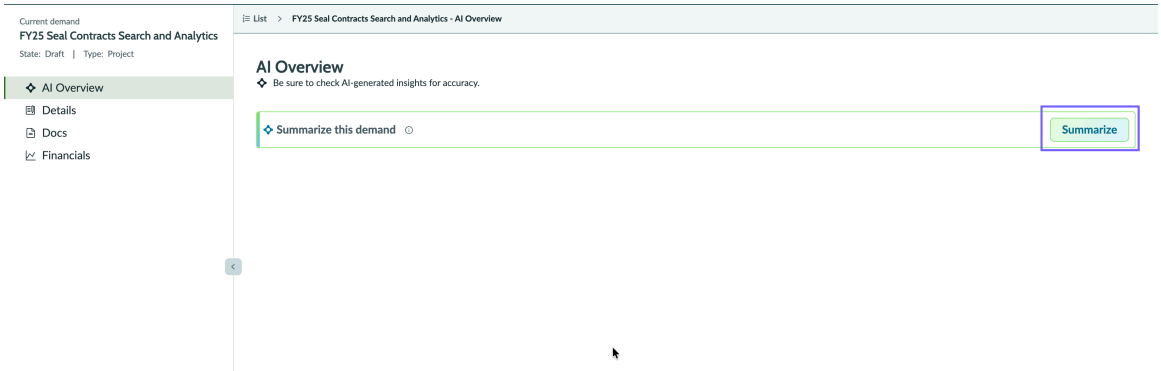
Summarize demands with the demand summarization skill

Summarize demand records using the demand summarization skill. The skill reviews the demand fields and related lists and helps create a clear summary of the demand.

https://service-now.portal.trainn.co/share/S1Y6UqNz4jwgScB9dhdvQA/embed?autoplay=false

Before you begin

Important: This generative AI skill is turned on by default. The skill will be automatically available to appropriate role users for the application. For more information, see AI agents, skills, and agentic workflows on by default.



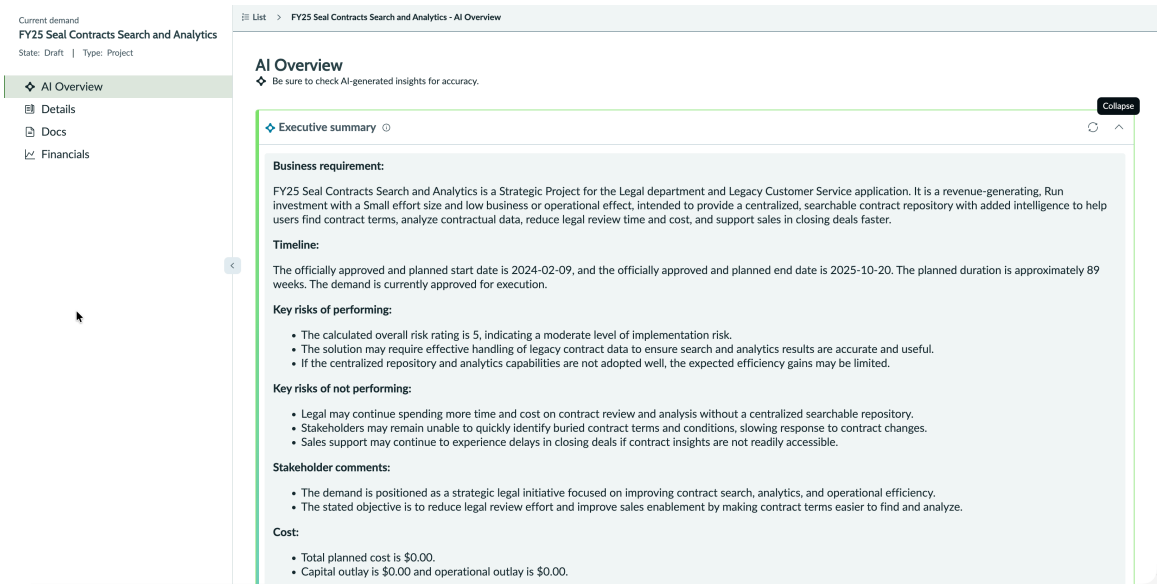
Role required: it_demand_user, it_demand_manager, sn_ppm_read

If you have custom roles that require access to this skill, update the ACLs (access control lists) for those roles that require access.

Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon  .
3. Open a demand from the **List** page.
4. Select **AI Overview** from the navigation menu.
5. Select **Summarize**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note:

- The summary of the record is auto-generated for demands if the skill trigger is selected as Automatic.
- The summary is initiated when users select the **Summarize** action on a demand record if the skill trigger is selected as User trigger.

Result
The executive summary generated by AI is displayed.

Important:

Generative AI may produce inaccurate or incomplete information. Always validate AI-generated content.

Note: Select the copy icon to copy the generated summary for further use.

Managing financials for demands

Financials in Next Experience for Demand Management covers budget, cost plans, expense lines, labor costs, and financial baselines.

The comprehensive financials view displays planned and actual costs for the selected item. Costs include Forecast, Remaining Estimates, and Actual. These were previously named EAC (Estimate At Completion), ETC (Estimate To Completion), and Actuals to date, respectively.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cost view

Forecast your planned costs, create, and manage cost plans and expense lines to track the financial performance of your demands.

In the Cost view, you can:

- View and manage financial data for a demand.
- Re-forecast cost plan values for future fiscal periods by selecting a value in the month or period time scale view.
- Manage cost plans for your demands. For more information, see Create cost plans for a demand.
- Add or edit expense lines for your demands to record any expenses. For more information, see Create expense lines for a demand.
- Generate labor costs for the fiscal period. For more information, see Generate labor costs for a demand.
- Create and compare baselines to capture the financial snapshot of your demands. For more information, see Create and compare financial baselines for a demand.

Users can filter the Financials tab grid by time scope to narrow cost plans, benefit plans, and baselines to a specific period.

Tip: Cost view gives you enhanced user experience to customize the left pane columns by using the personalize icon ( ). You can save user preferences to retain the customizations made to hide, view, or adjust columns, time scope viewing, and so on.

Multicurrency

The multicurrency feature enables you to manage the financials of your demands in two different currencies, Functional currency and Demand currency. Functional currency is typically defined by the admin as the primary currency, which is used for planning, budgeting, and tracking the financials of your planning items.

You can perform the following financial activities in Demand currency.

- Select the Demand currency.
- Track the planned and actual expenses.
- Allocate and manage the budget.
- View simple financials data.

Financial reporting at a global level includes real-time currency conversions of financial records.

Organizations operate at a global or multinational level. Work is planned and financed at one location and executed at another, often using a different currency from the planning phase. Multicurrency enables management and tracking of planning items in any currency.

You can monitor and track the financials in one currency, and capture the costs in a different currency. For more information, see Multicurrency in Next Experience for Demand Management.

Note: After a cost plan, benefit plan, expense line, or investment budget is created, the Demand currency cannot be changed. The Demand currency can be changed only when no financial records exist for the demand.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Display modes

The Display mode list on the Financials page of a demand lets you switch between modes to view financial information in different formats. Each view provides focused information for financial planning. The last selected view is saved as user preferences.

The available modes are:

- Forecast
- Budget allocation
- Planned vs Actuals
- Planned

Display modes

Mode	Description
Forecast	View Actuals, Remaining estimates, and Forecast for the entire scope of the demand. Use the time scale to view the actuals for the past fiscal periods and planned costs for the current and future fiscal periods.
Budget allocation	View the Budget, Actuals, and Variance for the fiscal periods and Forecast values for the entire scope of the demand. Using this mode, funding users can: • View the latest forecast and enter the budget that can be approved for the work item. • Analyze the variance for the past fiscal periods and work on budget allocation for future fiscal periods. • Compare latest forecast with approved budget and revise the budget, if necessary.
Planned vs Actuals	Compare the planned costs with actual expense for the past and current fiscal periods, and view planned costs for the future fiscal periods.
Planned	View only planned costs for the full range and manage the planned costs using the inline editing feature.

Note: If you don't see the Budget allocation mode, enable it for demands and configure the budget attribute at the instance level. For more information, see Enable financial budget allocation for demands and Configure budget attribute at instance level.

Cost plans

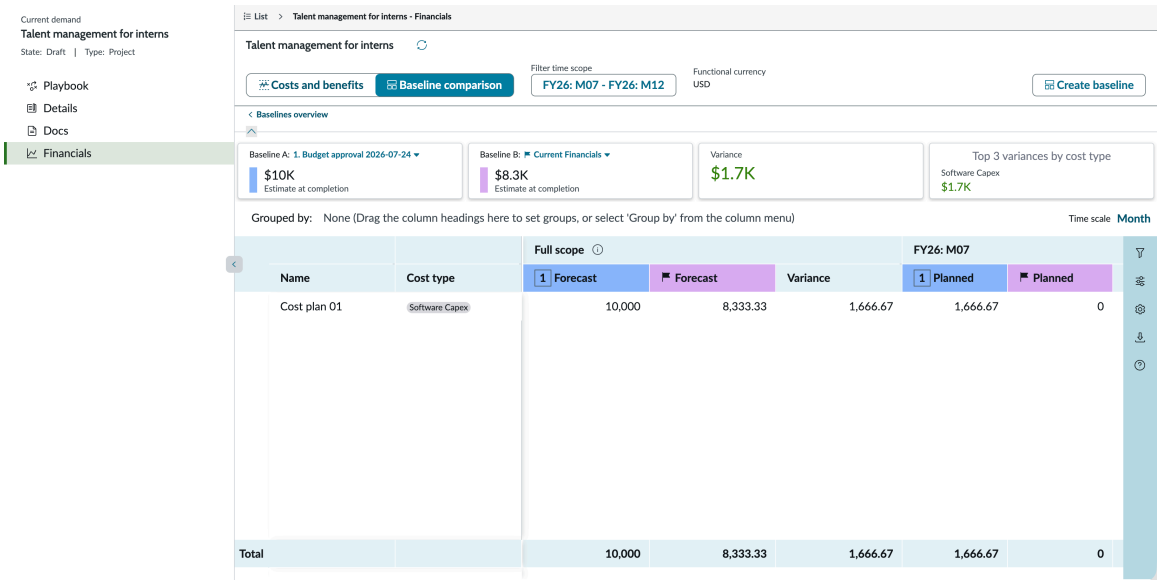
Cost plan breakdown records are created when you save a cost plan. The cost plan breakdowns are records that specify the estimated and actual costs and the budget at a granular level for

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

specific fiscal periods, such as FY16: M04 and FY16: M05. The demand cost plans are added to the parent program and portfolio. To use multiple currencies, create a cost plan for another currency.

If the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin is activated and the Demand Currency view is enabled, the fields in the **Financials** section differ from the Default view. For fields available only in the Demand Currency view, see Multicurrency in Next Experience for Demand Management reference.

Note: For projects, the cost plan breakdowns specify the estimated cost and actual cost at a granular level for a fiscal period of the demand cost plan. These breakdowns are recalculated in the project currency. Similarly, the estimated breakdown amounts of the planned benefit and actual benefit of the demand benefit plans are recalculated in the project currency. The project currency amounts are then rolled up to the cost plan, benefit plan, and the project records.



Baselines

Create a baseline to capture a snapshot of the financial changes for your demands. You can create on-demand baselines or at a cadence using a scheduler job. For more information, see Create a baseline.

Compare baselines to compare the difference in costs between any two baselines.

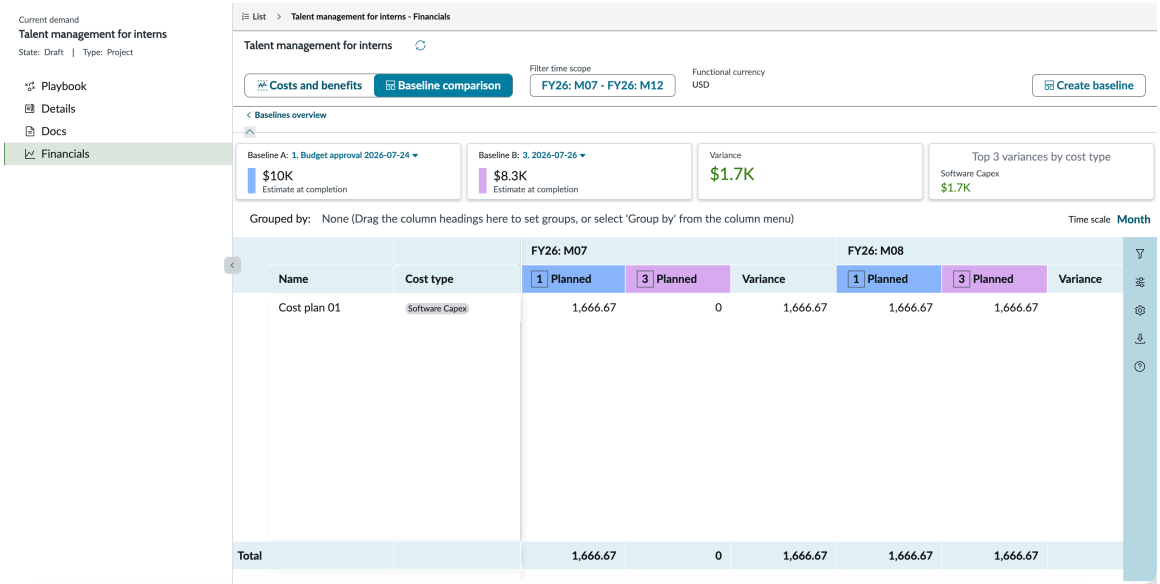
Note: Each baseline is tagged with a number based on the order that they're created. The Current Financials baseline captures the financials details in real-time and is represented with a flag icon .

The Baseline comparison view helps you to understand the variance between two baselines.

The following widgets are available:

- Two dedicated widgets for each baseline displaying the EAC.
- The Variance widget displays the total variance between the EAC values of the selected baselines.
- The Top 3 variances by cost type widget displays the top three variances contributing to the overall variance by cost type.

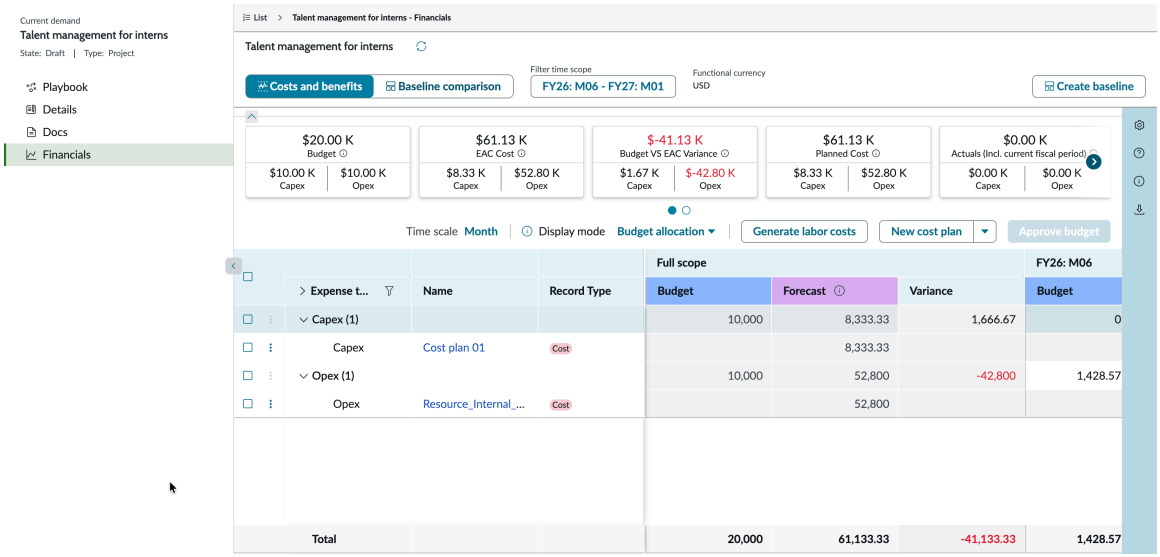
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The widgets and the header rows are color-coded to help you identify the selected baselines.

Tip: Switch between different baselines from the comparison view by selecting the name of a baseline from one of the widgets.

By default, the time scale of the breakdown view is set to Month. Use the **Time scale** option to view the comparison breakdown view at monthly, quarterly, and yearly levels.



Example: How planned costs are compared between two baselines captured at different timestamps

Consider a demand scoped from July 2026 to December 2026, Baseline A is created on 2026-07-24 and Baseline B is created on 2026-07-26. If you compare them in July 2026, you can see the variance between the two baselines for the planned cost.

Budget allocation

Portfolio managers can manage and approve the budget for demands. The approved budget helps demand managers to plan and meet the expenses to execute work. For more information, see Manage demand budgets.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Plan and approve the budget for a shorter planning cycle at monthly, quarterly, or yearly level using lean budgeting and funding feasibility. Lean budgeting helps portfolio managers track the value of the approved budget and plan for future fiscal periods. When budget is allocated monthly, the system rolls it up to quarterly and yearly levels. When budget is allocated at a quarterly or yearly level, the system distributes it equally at the monthly level.

Tip: In the budget allocation view, portfolio managers can review the EAC to understand the financial projections made by demand managers. Use the **Copy cost as budget** option to allocate the entire planned cost as budget.

Choose the cost type as the attribute to allocate and approve the budget for individual cost types such as labor, non-labor.

Budget distribution logic

The budget allocation approach introduces data-aware budget distribution, prioritizing actuals for completed periods and planned costs for future periods. Distribution strategies vary based on data availability. The strategy applied depends on whether actuals or Estimate at Completion (EAC) values exist, and whether the fiscal period is past, present, or future.

Budget allocation logic is divided into three focus areas: past fiscal periods, current fiscal periods, and future fiscal periods.

1. Past fiscal periods that have already ended.
   - If actuals exist, the budget is distributed proportionally to actual spending. If the total budget amount equals the total actuals, the distribution exactly matches the actual values.
   - If there are no actuals, the budget is distributed evenly across the past fiscal periods.
2. The current fiscal year is like a mid-year scenario where both past and future fiscal periods are available.
   - For past or completed fiscal periods, the system distributes the budget proportionally matching the actual expenses. If there are no actual expenses, budget is allocated as zero (0).
   - If planned costs exist for the current and future fiscal periods, the remaining budget is distributed proportionally based on the planned costs.
   - If planned costs don't exist for the current and future fiscal periods, budget is distributed evenly across the fiscal periods.
3. Future fiscal periods
   - If planned costs exist, the remaining budget is distributed proportionally based on planned costs.
   - If planned costs don't exist, the remaining budget is distributed evenly across the remaining fiscal periods.

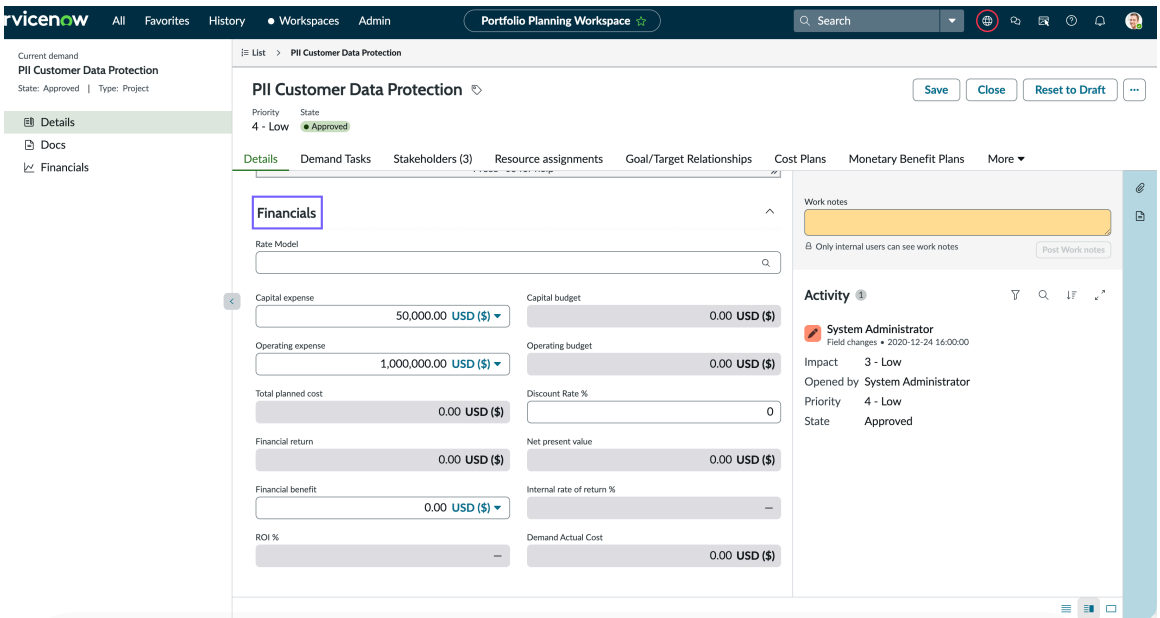
Budget distribution based on financial records

Fiscal periods	Available financial data	Distribution method
Past fiscal	Actual expenses	Proportional to actuals
Past fiscal	No financial records	No budget allocation
Current year – past fiscals	Actual expenses	Allocate budget proportionate to actual values
Current year – remaining months	Planned costs exists	Allocate budget proportionate to planned costs

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Budget distribution based on financial records (continued)

Fiscal periods	Available financial data	Distribution method
Current year – remaining months	No planned costs	Even distribution
Future fiscal periods	Planned costs exist	Allocate budget proportionate to planned costs
Future fiscal periods	No financial records	Even distribution



Benefit plans

Monetary benefit plans capture potential benefits accrued while executing a demand. Non-monetary benefit plans capture the potential non-financial benefits accrued while executing a demand. You can create and manage monetary and non-monetary benefit plans and to capture the potential benefits of your planning items. For more information, see Create a monetary benefit plan for a demand and Create a non-monetary benefit plan for a demand.

Manage cost plans and benefit plans from the **Costs and benefits** tab without switching between the financials record page and benefit plan tabs. Use the side panel and grids to forecast and track monetary benefit plans.

Simple financials

Simple financials enables you to enter preliminary high-level planned capex, opex, and benefit values from the Details page. You can do this without capturing cost plans from the Cost view. Update the simple financials values until you have the planned and actual costs captured.

Enable the demand currency view

Enable the demand currency view to track the planned costs of a demand in the selected demand currency.

Before you begin

The PPM Standard Multicurrency feature must have been installed. For more information, see Activate PPM Standard (Project Portfolio Management).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: it_demand_manager

About this task

The demand currency view enables you to see the planned cost fields in some demand forms in the selected demand currency. For more information about which fields are supported in the demand currency view, see Multicurrency fields in demand forms.

Procedure

1. Navigate to each form in which you want to enable the demand currency view.
   The demand currency view is available in the following forms: Demand, Demand Task, Cost Plan, Cost Plan Breakdown, Benefit Plan, Benefit Plan Breakdown, Expense Line, and Project Funding.
2. Select and hold (or right-click) the form header to display the context menu or select the additional actions icon.
3. Select **View**.
4. Select **Demand Currency** from the list.

What to do next

Review the form fields exclusive to the demand currency view. All other form tabs and fields remain the same in both default view and demand currency view.

Create cost plans for a demand

Create a cost plan for a specified duration to track planned and actual expenses. Edit cost plans to adjust planned expenses and delete descoped forecasts.

Before you begin

Role required: it_demand_manager

About this task

To create, edit, or delete cost plan records, you can also use:

- The **Cost Plans** related list in the **Details** tab.
- The **Estimate financial cost** Playbook activity. For more information, see Use Playbook in Next Experience for Demand Management.

Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon  .
3. Open a demand from the **List** page.
4. Select **Financials** from the navigation menu.
5. Create, edit, or delete a cost plan.

Goal	Actions
Create a cost plan	**a.** Select the **New cost plan** button. A side panel opens with the cost plan form. **b.** On the New cost plan form, fill the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Goal	Actions
	For a description of the field values, see Cost plan form. **c.** Select **Save** to save the cost plan and close the side panel or **Save and add new** to save the cost plan and create another one.
Edit a cost plan	Edit a cost plan in one of the following ways. ○ Select the name of the cost plan, edit the required details in the cost plan side panel, and select **Update**. ○ Double-click the cell for a future fiscal period and edit the cost plan value. ○ Select the row context menu ⋮ and edit the values in the future fiscal periods. **Note:** Use the keyboard Tab key to navigate to between the fiscal periods.
Delete a cost plan	**a.** Select the row context menu ⋮ against the cost plan name. **b.** Select **Delete Row**. **c.** On the Confirm deletion window, select **Delete**. **Note:** Deleted cost plans can't be recovered.

Note: After capturing the initial planned costs, create a baseline to capture a snapshot of planned costs. Use this baseline to compare it against baselines from later dates as the work progresses, to identify the variance between initial planned costs and actual expenses. This step helps you plan for future expenses and re-forecast planned costs. For more information, see Create financial baselines.

Create and compare financial baselines for a demand

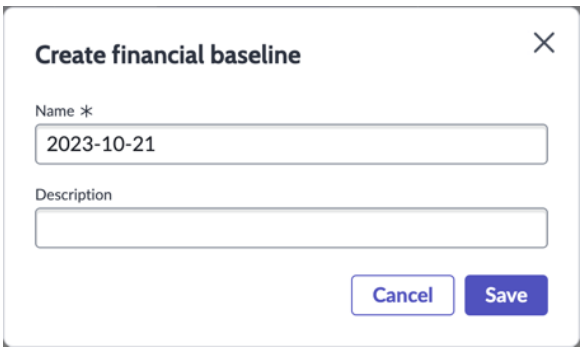
Create and compare financial baselines to get a snapshot of the demand expenses and compare the planned costs.

Before you begin

Role required: it_demand_manager

About this task

Multiple financial baselines help review the financials changes that have been made to the demand at different points. Any financial baseline doesn't capture the actual cost component of the demand.



To create financial baselines, you can also use:

- The **Create Baseline** option under More Actions in the **Details** tab.
- The **Demand Baselines** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon .
3. Open a demand from the **List** page.
4. Select **Financials** from the navigation menu.
5. Create or compare financial baselines.

Option	Steps
Create a baseline	**a.** Select the **Create baseline** button. Create financial baseline window appears with the Name field is auto-populated with current date. You can edit this field to name your baseline.  **b.** In the Description field, enter a brief de scription to identify this baseline. **c.** Select **Save**. A baseline is created capturing the planned costs.
Compare baselines	**a.** Select the **Baselines comparison** tab to view the list of baselines. **b.** Select any two baselines and select the **Compare baselines** button. Comparison view of the selected baselines is displayed. For more details, see Managing fi nancials for demands.

Tip: You can migrate existing financials baselines of your demands from Classic UI to Financials in Next Experience. For more information, see Migrate financial baselines of demands to Next Experience.

Manage demand budgets

Allocate, manage, and approve budget for your demands. Lean budgeting allocates budget for short planning cycles across fiscal periods, such as monthly, quarterly, or yearly. This approach differs from allocating budget to the complete duration of a demand.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Enable the property to work on budgeting. For more information, see Enable financial budget allocation for demands.
- Configure the attribute to allocate and approve budget by cost type or expense type. For more information, see Configure budget attribute at instance level.
- Role required: it_demand_manager

Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon  .
3. Open a demand from the **List** page.
4. Select **Financials** from the navigation menu.
5. Select **Budget allocation** from the Display mode list.
6. Manage the budget for the selected time scale at the monthly, quarterly, or yearly level using one of the following methods.
   - Double-click each cell in the Budget column and enter the value.
   - Select **Copy cost as budget** from the Budget column options to copy Forecast value as budget.
   - Edit the budget values using the in-grid editing feature after copying Forecast to budget.
   - Unapproved budget values are marked with the  icon.

   Note: Negative budget amounts are supported. If you enter a negative **Capex Budget** or **Opex Budget** amount, or the associated cost plan has a negative total planned cost, the demand budget is still distributed across the cost plan breakdowns and rolled up to the demand financials.

7. Select **Approve budget**.
   The Approve budget confirmation dialog opens. The **Create a financial baseline for this budget approval** option is selected by default. This option captures the latest budget and financial estimates.

   Tip: The financial baseline created while approving the budget can be compared with the future baselines once the actual expenses are captured to track financial performance.

8. In the confirmation dialog, select **Approve**.

Create expense lines for a demand

Create an expense line to capture the cost associated with a specific source, such as a user or a fixed asset, for a demand.

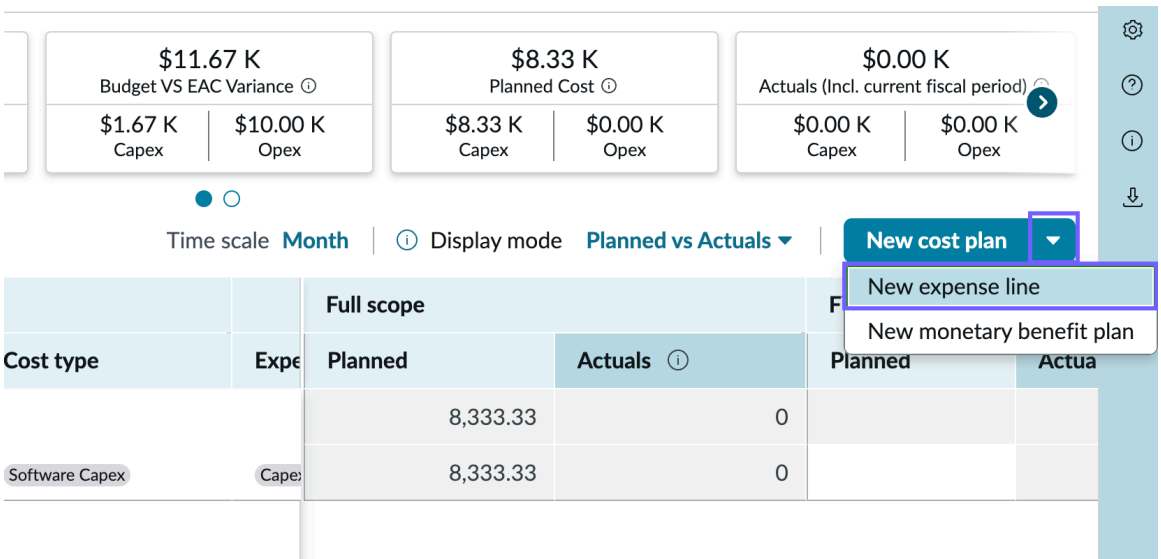
Before you begin

Role required: it_demand_manager

About this task

Expense lines on a demand record track the costs incurred during the demand evaluation process. You can add multiple expense lines to a single demand. Expense lines can be used only for evaluation costs and cannot be linked to cost plans. Only processed expense lines are

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



counted, and their total automatically rolls up to the **Demand actual costs** field on the demand record.

Note: After a demand is converted to a project, the expense lines remain with the demand, while the cost plans and budget are migrated to the project.

You can also create or edit expense lines from the **Expense Lines** tab in the Details page.

Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon .
3. Open a demand from the **List** page.
4. Select **Financials** from the navigation menu.
5. From the More actions menu, select **New expense line**.

6. On the New expense line form, fill in the fields.

   For a description of the field values, see Expense line form.

7. Select **Save**.

Generate labor costs for a demand

Generate labor costs to view the expenses of resources using resource assignments and cost plans for a demand.

Before you begin

Role required: it_demand_manager

About this task

When the effort distribution for a resource assignment changes without changing the total planned effort, labor costs are recalculated automatically. The recalculated costs align with the updated effort distribution. For example, consider a resource assignment of 100 hours: 60 hours in January and 40 hours in February. If you swap the efforts to 40 hours in January and 60 hours in February, labor costs are recalculated automatically. January then reflects the cost of 40 hours and February reflects the cost of 60 hours.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon  .
3. Open a demand from the **List** page.
4. Select **Financials** from the navigation menu.
5. Select **Generate labor costs**.
6. Select **Generate** in the Generate labor costs confirmation window.

> **Tip:** Configure a scheduled job to generate labor costs at the required cadence. For more information, see Activate a scheduled job to generate labor costs.

Create a monetary benefit plan for a demand

Create and manage monetary benefit plans to track potential monetary benefits during demand execution.

Before you begin

Enable the monetary benefit plans for demands. For more information, see Enable monetary benefit plans for demands.

Role required: it_demand_manager

About this task

The monetary benefit plan breakdown records are automatically created when you save the benefit plan. The monetary benefit plan breakdown records specify the estimated and actual benefits at a granular level for specific fiscal periods, such as FY16: M04 and FY16: M05. The **Monetary Benefit Plan Breakdowns** tab shows the aggregated benefits for estimated and actual benefits for each fiscal period for the demand.

> **Note:** Converting a demand to a project or EAP entity transfers the benefit plan from the demand to the target project or EAP entity.

Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon  .
3. Open a demand from the **List** page.
4. Create a monetary benefit plan using one of the following options.

Option	Procedure
Using the Monetary Benefit Plans tab	**a.** Select **Details** from the navigation menu. **b.** Select the **Monetary Benefit Plans** tab. **Note:** If the **Monetary Benefit Plans** tab isn't visible, select **More** > **Monetary Benefit Plans**. **c.** Select **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Procedure
Using the Financials page	**a.** Select **Financials** from the navigation menu. **b.** Select **New monetary benefit plan** from the More actions menu.

5. On the Benefit Plan form, complete the fields.
   For a description of the field names, see Monetary benefit plan form.
6. Select **Save**.

Edit monetary benefit plans for a demand

Edit a planned monetary benefit plan to revise the benefits, dates, and offset to keep financial records current.

Before you begin

A monetary benefit plan exists. For more information, see Create a monetary benefit plan for a demand.

Role required: it_demand_manager

Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon .
3. Open a demand from the **List** page.
4. Edit a monetary benefit plan using one of the following options.

Option	Procedure
Using the Monetary Benefit Plans tab	**a.** Select **Details** from the navigation menu. **b.** Select the **Monetary Benefit Plans** tab. **Note:** If the **Monetary Benefit Plans** tab isn't visible, select **More** > **Monetary Benefit Plans**. **c.** Select the name of a required benefit plan. **d.** Edit the required fields and select **Save**.
Using the Financials page	**a.** Select **Financials** from the navigation menu. **b.** Select the name of a required benefit plan. **c.** In the Edit monetary benefit plan side-panel, edit the required fields and select **Update**.

Capture actual monetary benefits for a demand

Capture actual benefits from planned benefits to measure revenue and calculate profits.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
A monetary benefit plan must exist. For more information, see Create a monetary benefit plan for a demand.

Role required: it_demand_manager

Procedure
1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon  .
3. Open a demand from the **List** page.
4. Select **Details** from the navigation menu.
5. Select the **Monetary Benefit Plans** tab.

   Note: If the **Monetary Benefit Plans** tab isn't visible, select **More** > **Monetary Benefit Plans**.

6. Select the name of a required benefit plan.
7. Select the **Monetary Benefit Plan Breakdowns** tab.
8. Select the value in the **Entered benefit** field.
9. **Optional:** Change the planned benefit in the **Entered benefit** field.
10. Enter the actual benefits from work execution in the **Actual benefit** field.
11. Select **Save**.

Create a non-monetary benefit plan for a demand

Create a non-monetary benefit plan to specify the estimated non-monetary benefit in a category for a fiscal period. Demand benefit plans capture the potential benefits accrued by the demand when the demand is executed.

Before you begin
Role required: it_demand_manager

About this task
The non-monetary benefit plan breakdown records are automatically created when you save the benefit plan by selecting **Automatic** or **Manual** in the **Breakdown Type** field. The non-monetary benefit plan breakdown records specify the estimated and actual non-financial benefits at a granular level for specific fiscal periods, such as FY16: M04 and FY16: M05. The **Non-monetary Benefit Plan Breakdowns** tab shows the aggregated benefits for estimated and actual non-financial benefits for each fiscal period of the demand.

Note: Converting a demand to a project or EAP entity transfers the benefit plan from the demand to the target project or EAP entity.

Procedure
1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon  .
3. Open a demand from the **List** page.
4. Select **Details** from the navigation menu.
5. Select the **Non-monetary Benefit Plans** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If the **Non-monetary Benefit Plans** tab isn't visible, select **More** > **Non-monetary Benefit Plans**.

6. Select **New**.
7. On the Benefit Plan form, fill in the fields.
   For more information on field values, see Non-monetary benefit plan form.
8. Select **Save**.

What to do next

Associate monetary and non-monetary benefit plans, so that you can capture the potential benefits (financial and non-financial) accrued by the demand for the hybrid benefit plans. For more information, see Associate monetary and non-monetary benefit plans.

Associate monetary and non-monetary benefit plans

Associate monetary and non-monetary benefit plans, so that you can capture the potential benefits (financial and non-financial) accrued by the demand.

Before you begin

Role required: it_demand_manager

About this task

Benefit plans can be associated in either direction — a monetary plan with a non-monetary plan, or a non-monetary plan with a monetary plan.

Note: When you delete a benefit plan, its relationship with the associated benefit plan (if any) is also removed.

To associate benefit plans with each other, you can also use the **Benefit estimate** Playbook activity. For more information, see Use Playbook in Next Experience for Demand Management.

Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon  .
3. Open a demand from the **List** page.
4. Select **Details** from the navigation menu.
5. Select the **Monetary Benefit Plans** or **Non-monetary Benefit Plans** tab.
6. Select the benefit plan that you want to associate.
7. On the Benefit Plan form, fill in the **Associated benefit** field with the benefit plan that you want to associate.
8. Select **Save**.
   The selected benefit plan is associated with this benefit plan.

Export demand financials as an Excel or CSV file

Export the costs or baseline comparison data for a demand to share with stakeholders.

Before you begin

Role required: it_demand_manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon .
3. Open a demand from the **List** page.
4. Select **Financials** from the navigation menu.
5. Select the Export icon.
6. In the Export side panel, select the file type as **Excel** or **CSV**.
7. Select the **Export** button.

The financials data is downloaded as an Excel or CSV file with `name_fin_mmddyy` naming convention. The breakdown of the naming convention:

name

Contains the first 10 characters of the planning item name.

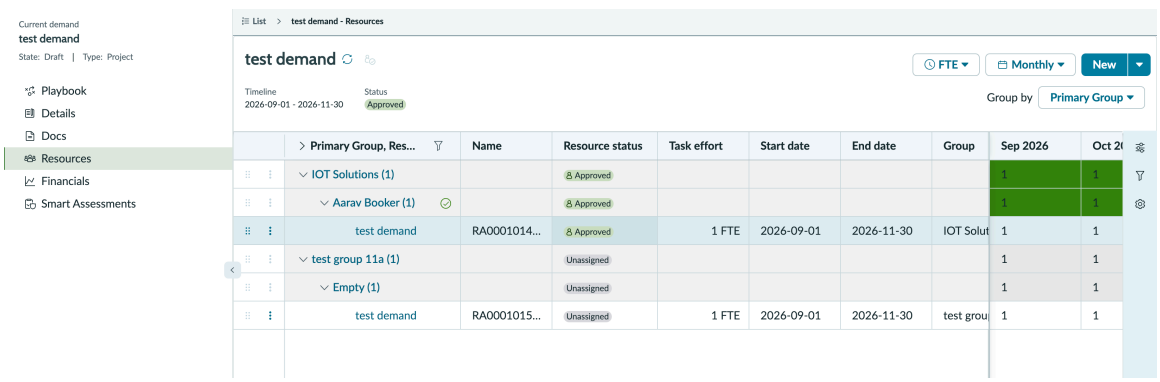
fin

Indicates that the file contains financial data.

mmddyy

System date when you export this data.

For example, if you're downloading financials data for a planning item named Documentation on January 26, 2024, then the file name reads `documentat_fin_012624`.



Note: You can export financials data from Cost view and Baselines comparison view.

Manage resources for demands

Plan resources for a demand from the **Resources** tab in Next Experience for Demand Management to confirm resource availability before converting the demand to a project.

Resources board

The Resources board shows the resource assignments of a demand in a single grid, along with their allocations and the capacity of the assigned resources. Assigned and unassigned resource assignments appear together in this grid. Unassigned assignments are listed under a resource row named **Empty**. Use it to check whether the resources a demand needs are available before you commit to the work. Set planned dates for the demand. If the planned dates aren't set, the resource grid isn't displayed. You must have the it_demand_manager role to view the Resources board.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The top of the tab shows the demand name and its **Timeline**, which is the date range that the grid covers. The grid covers the period spanning the planned dates of a demand.

Using this intuitive board, demand managers can:

- View the number of tasks assigned to a resource.
- Understand the type or state of the assignment, and track the changes made to assignments.

Indicator	Description
	Indicates that the resource allocation is within the available bandwidth.
	Indicates that the resource is over allocated for the available bandwidth.
	Indicates the work assignment is made for a group.
	Indicates changes to start or end date, allocated hours, and so on, to the approved resource assignments. **Note:** When these changes are made, the status of the assignment is moved to pending, indicating resource manager about the review required for the changes made. Once the changes are reviewed and the assignment is either approved or unapproved, this icon is no longer displayed.

- Understand of the status of the assigned tasks rolled up to resource level using the Resource status column.
- View the primary attributes such as Group, Role, and Skill of each resource in the grid. These are useful when reassigning a task to a different user with the same primary attributes.
- View the actual hours vs allocated hours for a task.

  Enable the **Show actuals** toggle () from the settings side panel () to view the efforts captured for a task via time cards. Approved time cards are reflected in the resource board view as actual hours.

- Get insights about the resource allocations using the new heatmap modal.
- Edit the task effort for any group allocations and approve it using the inline editing feature.

  Note: If you edit the allocations for any approved group assignment, a confirmation window appears. After approval, the state is changed to Pending.

- Assign the unassigned tasks.
- Approve the assigned tasks.
- Split a resource assignment into two for a single resource at the required date.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Personalize your resource board view

You can customize the resource board to personalize your view. These user preferences are saved to give you the same view every time.

- Change effort type: Switch between **Hours**, **FTE**, or **Person Days** effort types to view resource allocations based on the required effort type.
- Group By: Customize the view of your resource boards using the **Group By** feature to regroup the resources depending on your organization needs. You can group by **Primary Group**, **Primary Role**, **Primary Skill**, or **None**. By default, the grid is grouped by **Primary Group** because this grouping enables demand managers to view resources for a group and manage them efficiently.

  When the grid is grouped by **Primary Group**, an assignment for a named resource is grouped by the primary group in that resource's employee profile. The assignment is not grouped by the group on the assignment. If the resource doesn't have a primary group in their profile, the assignment is listed under the **Empty** group, even if the assignment has a group.

  You can't edit the **Empty** row itself or open a context menu on it. Expand it to work with the assignments listed under it.

  For example, an assignment is created for a user with the Database group. If this user doesn't have a primary group in the user profile, the assignment appears under the **Empty** group instead of Database.

  Assignments that don't have a named resource are grouped by the group, role, or skill on the assignment itself. For example, an unassigned assignment with the Database group appears under Database, in its **Empty** row.
- Time scale list: Shows one column per month with **Monthly**, or one column per week with **Weekly**.
- View or hide columns: Use the column config option ( ) to view or hide any columns on the resource board.

  To show the assignment **Name** column in the grid, an administrator can add it to the view of the resource assignment list.

Data grid filtering

Quick filters help you filter and build a personalized view to narrow down datasets instantly without refreshing the page or running complex queries on your resource board. You can filter lists, reference fields, strings, dates, and boolean values.

Resource allocations and heatmap view

The resource allocation view provides you with a nested view of the assigned work items rolling up to resource level. It also provides a resource allocation breakdown view based on the time-frame (weekly or monthly) and by work efforts (hours, FTE, or person days).

Select the arrow ( ) icon to get details at the individual demand level assigned to the resources. This provides a breakdown view to understand:

- Work assigned to a specific resource.
- The amount of time a resource is allocated to an individual task.

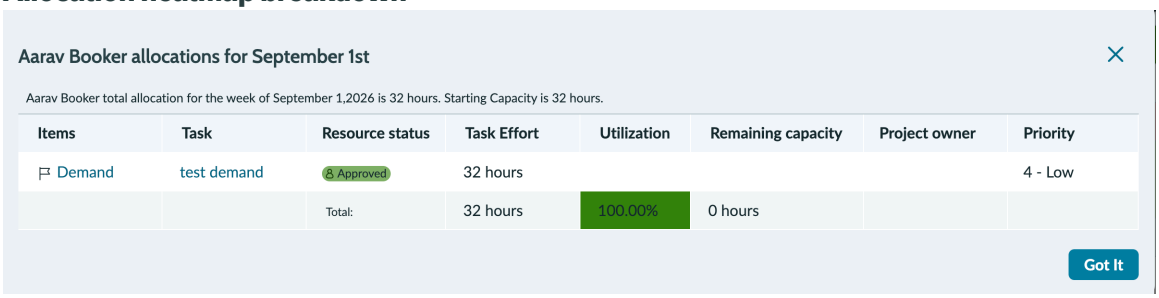
Tip: Switch between different efforts such as hours, FTE, or person days to view a resource allocation heatmap based on the selected effort type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can edit the resource assignments using the inline editing feature.

The Resource status column displays any Pending (Pending) or Unapproved (Unapproved) work items assigned to a resource.

Note: The status of the assigned work is rolled up to the resource level and the resource card level. If there are any pending or unassigned work items, the rolled up status at resource level and card level shows Pending.



Define custom statuses to calculate and view resource capacity in the allocation heatmap modal.

Allocation heatmap modal gives you an overview of the resource utilization to identify the over allocated and the available resources. The allocations are color-coded to display the availability of the resources and indicate the availability of the resource for the filtered time frame.

Very Over Utilized	150 +	%
Over Utilized	100 - 150	%
Full Utilization	100	%
Good Utilization	51 - 99	%
Under Utilized	0- 50	%

Empty rows aren't color-coded and appear gray, because the assignments under them aren't tied to one resource's capacity. Selecting a cell in an **Empty** row doesn't open the allocation details.

Allocation heatmap breakdown

From the preceding example, you can see the breakdown of the approved work items. This includes the rolled up efforts, Utilization percentage, and the Remaining capacity. A demand manager can use these insights to decide and allocate the pending work items to another resource with available effort.

Important: Resource efforts calculations are driven by the `com.snc.resource_management.exclude_status_from_capacity` property. Admin can configure this property to calculate efforts for certain defined resource assignments only. For more information, see Resource Management properties.

Using the `com.snc.resource_management.exclude_status_from_capacity` property, demand managers can customize to view the resource assignments with a specific state in their workspace and what to view in the total allocation modal. For example, you can view resource assignments in either Approved, Unapproved, and Pending resource assignments, or the ones in Approved and Pending states only.

After the property is set up, work items in a specific states to show up in the full capacity and full allocation rollup of a resource. The new allocation modal displays the allocation breakdown and the rollup values of the work items for the configured states.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When you group a resource board using the Group by option, the heatmap allocation modal for a group gives the following insights.

Resource finder

AI-powered resource matching

Resource Finder is a ServiceNow Otto for SPM skill that evaluates resources against the requirements of an unassigned assignment. The skill considers multiple dimensions simultaneously. These include whether a resource's planning attributes (role, skills, or group) align with the requirement of assignment, how much capacity the resource has during the assignment period. They also include the resource's historical allocation patterns compared to the requested effort.

Fit scoring

The fit score is a percentage representing how closely a candidate resource matches the requirements of an unassigned assignment. Fit score blends attribute alignment, temporal availability, and workload balance into one number so that you can compare candidates at a glance.

AI-generated rationale

Every recommended resource comes with a rationale which is a short and simple explanation of why the skill considers a resource as a good fit. The rationale references specific factors like availability windows and attribute matches.

Two operating modes

The AI Resource Finder adapts its behavior based on whether the skill is enabled on your instance.

With AI enabled, the experience is recommendation-driven. Candidates are ranked by fit score with rationale, and detailed availability data. You can view this using a toggle so the initial view stays focused on the AI insights. You can reveal period-by-period capacity whenever you want to cross-check the AI's recommendations against raw numbers.

Without AI enabled, the experience is data-driven. You see candidates listed with their availability data up front and a requested effort row appears immediately for side-by-side comparison. This mode functions as a streamlined staffing search tool without the scoring and reasoning layer.

Availability and effort comparison

Resource Finder lists each candidate's available capacity against the effort the assignment requires, giving you a quick comparison view. Effort values honors the user preferences configured in your workspace such as hours, FTE, or person days on a weekly or monthly basis.

The availability heatmap uses color coding to make this comparison instant. A green cell means the resource has enough capacity to meet the requested effort for that

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

period. A red cell means they fall short. For example, if the requested effort is 1 FTE per month and a candidate shows 1 for April and 0 for May. April appears green and May appears red, giving you the availability instantly without doing any mental math.

Resource efforts termination

Capacity is generated only for the date range between employment start date and employment end date specified in the employee profile. This information is available when the Employee Profile plugin is installed. If the start and end date are unavailable for an employee, manually specify these dates.

Availability for terminated resources is automatically updated to 0 when you run the resource termination handler job. This update occurs when the termination date is after the date on which the job is run. If resources are booked for a time period beyond the user's termination dates, those bookings are also updated to 0 in the resource assignments.

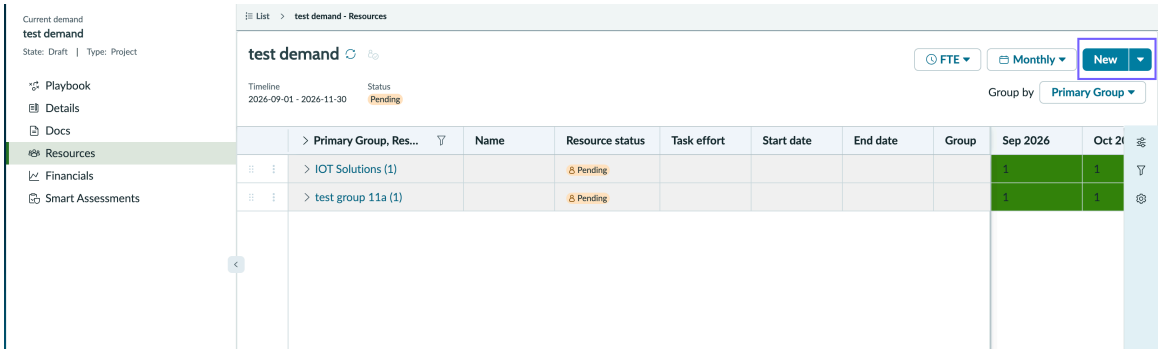
Create resource assignments for demands

Create and manage resource assignments for demands directly from Next Experience for Demand Management to efficiently manage the work on demands.

Before you begin

Role required: it_demand_manager

The demand must have planned dates.



About this task

- To create, edit, or remove resource assignment records, you can also use the **Estimate resource requirements** Playbook activity. For more information, see Use Playbook in Next Experience for Demand Management.
- To create, edit, or remove resource assignment records, you can also use the **Create resource assignments** tab in **Details**.

Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon  .
3. Open a demand from the **List** page.
4. Select the **Resources** tab.
   The resource grid opens for the demand's timeline, grouped by **Primary Group**.
5. **Optional:** To change the effort unit, select the effort unit list and then select **Hours**, **FTE**, or **Person Days**.
6. **Optional:** To change the time scale, select the time scale list and then select **Monthly** or **Weekly**.
7. **Optional:** To group the grid differently, select an option from the **Group by** list: **Primary Group**, **Primary Role**, **Primary Skill**, or **None**.
8. Select **New** or select **New Resource Assignment** from the more actions list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. On the New Resource Assignment form, fill in the fields.
   For a description of the field values, see Resource assignment form form.
10. Select **Submit**.

Result

The resource assignment appears in the grid. An assignment made for a resource from the resource board must be within the selected date range. If so, it shows up nested under the selected resource in real-time.

Copy a resource assignment for demands

Copy a resource assignment to create one with inherited values, then adjust the fields before submitting. This reduces repetitive data entry when similar assignments recur across plans.

Before you begin

Role required: it_demand_manager

About this task

Copying a resource assignment opens a new assignment form with values from the source. These values include named resource or resource attributes, demand link, date range, and the allocated effort. You can modify any field before saving. The copy is an independent record. Changes to the copy don't affect the source, and later changes to the source don't flow into copies that are already created.

Use copy when:

- The same resource continues onto a follow-on phase of work with a different date range or allocated effort.
- A different resource takes on a comparable block of work and you want a fast starting point.
- You want to split a single assignment into multiple shorter assignments by copying, then adjusting dates and effort on each.

Copy is not a substitute for split or reassign. Copying creates an independent new assignment rather than redistributing the original.

Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon .
3. Open a demand from the **List** page.
4. Select the **Resources** tab.
   The resource grid opens for the demand's timeline, grouped by **Primary Group**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select the row context menu (⋮) for the required task and select **Copy resource assignment**.
   Values are inherited from the source assignment.
6. Review and update the inherited fields as needed, including the date range and allocated effort.
   Verify that the demand link reflects the work the new assignment belongs to especially when copying across planning items.
7. Select **Submit**.

Result
A new resource assignment is created. The source assignment is unchanged.

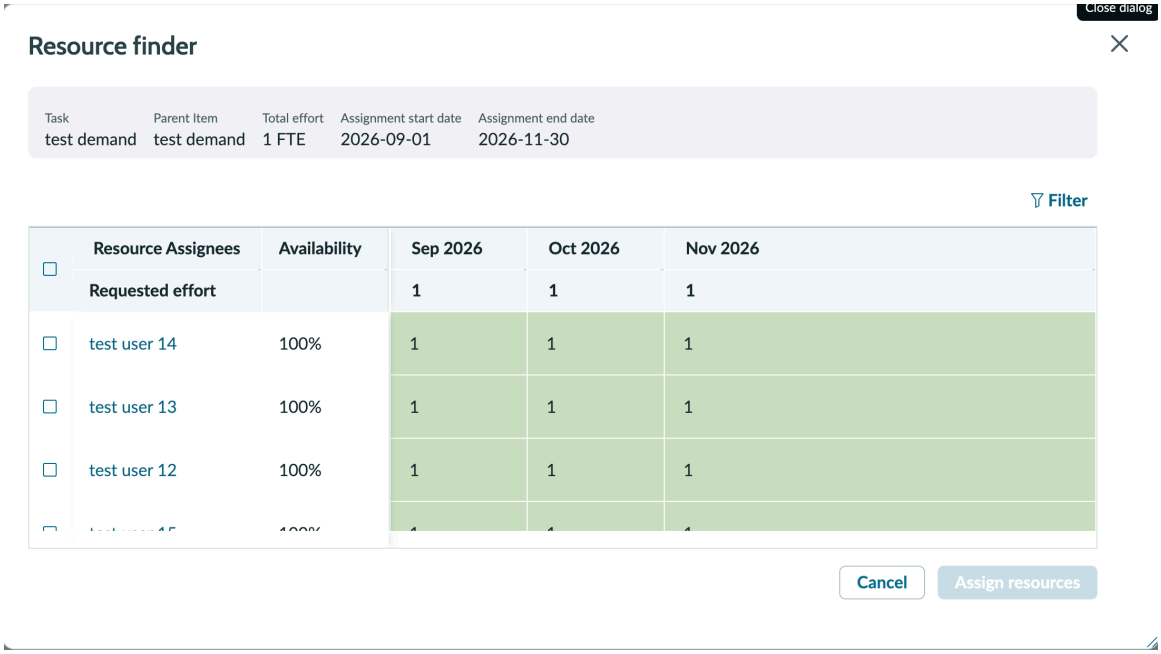
Assign unassigned work for demands using Resource finder

Assign a resource for unassigned work for a demand using the suggestions which match the skill-set and primary attributes requirements.

Before you begin
ServiceNow Otto for Strategic Portfolio Management must be installed for AI generated suggestions.

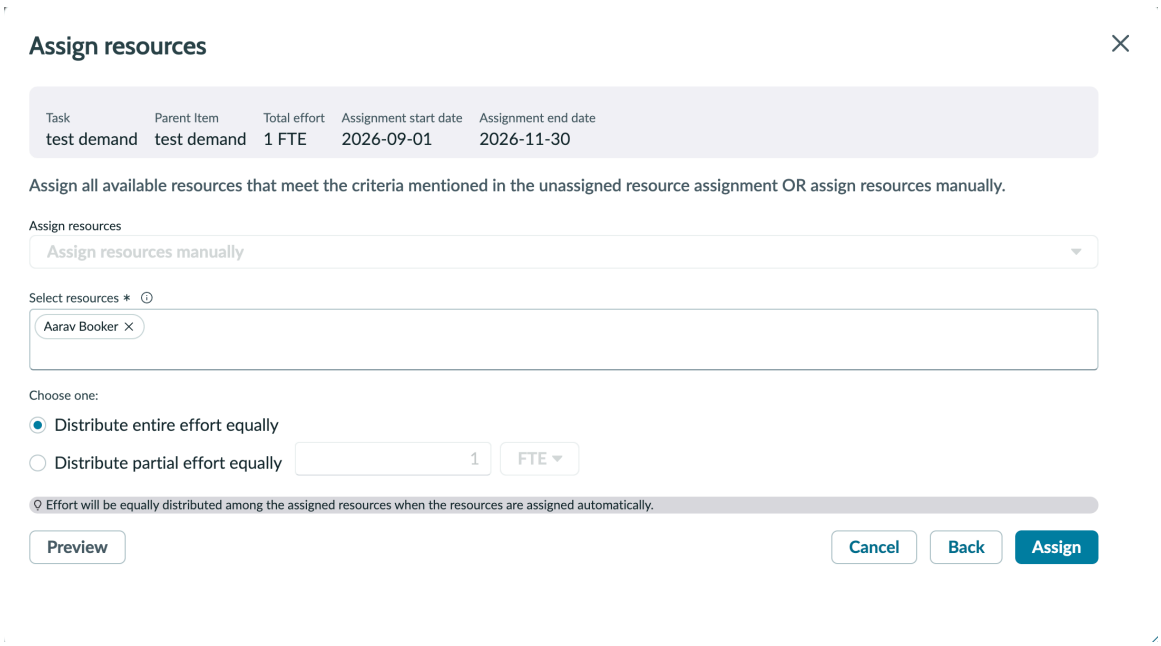
Role required: it_demand_manager

About this task
The resource finder uses generative AI to calculate AI rationale for available resources if ServiceNow Otto for Strategic Portfolio Management is installed. Otherwise, it generates only the fit scores and availability before assigning a resource. Selecting a resource opens the existing assign resources modal where you can review allocations and distributions before confirming the assignment.



The resource finder helps demand managers identify the best-fit resources for unassigned resource assignments in a demand. The fit score indicates how well a resource matches a task based on the availability, past experience, and similar work. Demand managers review the fit scores and rationale and decide which resource to assign to an unassigned assignment. The resource finder modal displays the following information for each resource:

- Fit score: Percentage match of a resource for the task. The Fit score is deterministic and is not generated using AI.
- Rationale: AI-generated explanation for the fit score. This field is available when ServiceNow Otto for Strategic Portfolio Management is installed.
- Availability: The availability of the resource for a task.



For more information about how the Resource finder works and the resources are mapped, see Manage resources for demands.

Procedure
1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon  .
3. Open a demand from the **List** page.
4. Select the **Resources** tab.
   The resource grid opens for the demand's timeline, grouped by **Primary Group**.
5. Select the row context menu (⋮) for any unassigned task and select **Resource finder**.
6. Select the resource assignee and select **Assign resources**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. From Assign resources modal, review the allocations and distributions and select **Assign**.

The resource is assigned to the task.

Assign and approve unassigned work

Filter the unassigned work to view priority requests and assign them to resources. Get additional insights and approve the assigned work using the inline editing feature.

Before you begin

Role required: it_demand_manager

Create an active employee definition for resources to view their allocation details on the Resources grids.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The assign logic provides you with the flexibility and control for users when assigning work to resources. It addresses the following goals:

- Efficiency: Quickly allocate unassigned tasks to available resources.
- Personalization: Enables you to configure how effort is distributed—either automatically or manually.
- Transparency: Provides a preview of the real-time breakdown of effort allocation before assigning the work to resources.
- Flexibility: Manual distribution supports custom selection of resources, which helps manage work allocations based on the availability and remaining capacity of the resources.
- Fairness: Distributes work equally among the resources maintaining a balanced work.

Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon  .
3. Open a demand from the **List** page.
4. Select the **Resources** tab.
   The resource grid opens for the demand's timeline, grouped by **Primary Group**.
5. Select the row context menu (⋮) for any unassigned task and select **Assign work**.
6. Assign resources manually or automatically.

Assign work choices	Description
Assign resources manually	Enables you to choose specific resources and decide how much effort to allocate. There are two suboptions. **a.** Select the required resources from the Select resources list. You can assign efforts using one of the following suboptions: **i.** Select the **Distribute entire efforts equally** option to distribute the entire requested effort equally among the selected users. **ii.** Select the **Distribute partial effort equally** option and enter the required efforts in the field. **b.** Partial Effort Equally: Assign only the entered efforts equally among the selected resources.
Assign resources automatically	The system automatically identifies all resources based on the selected primary attributes and distributes the work equally among the resources. In the Assign resources window, select **Assign resources automatically** from the Assign resources list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Remaining efforts after equally distributing the work among the users is retained as unassigned tasks. Demand managers can again allocate these efforts.

7. Select **Preview** to see the real-time allocations before assigning the work.
8. Select **Assign** to assign work to the resources.
   The assigned work is nested by resource view and is in the Pending state (Pending).
9. Expand a resource row using the chevron icon ( ) to view assigned tasks.
10. Double-click in the Resource status column and select **Approved** to confirm the assigned work so the resource can start working.

Choice	Description
Approved	Approve the assigned work to confirm the work.
Unapproved	Unapprove any efforts that don't require work due to a change of business need or priority planning.
Pending	Move approved or unapproved tasks to pend ing to reprioritize the work requests.

Iconography indicates if a resource is available ( ) or overutilized ( ), even in future periods.

Result

The assigned work items are Approved (Approved) or Unapproved (Unapproved) and the status of the work assignments is rolled up to the resource level.

What to do next

If there are no unassigned tasks, verify the following:

1. Verify the resource requests exist. Demand managers must create resource requests (resource assignments with status Requested) on demand tasks. Navigate to the demand details and verify resource requests exist on the Resource Assignments related list.
2. Check if primary attributes match. The resource card filter must match the primary attributes (Group, Skill, or Role) defined in the resource requests. Open your resource card and verify the filter criteria aligns with existing requests.
3. Check if the employee profiles are generated. Confirm that employee profile definitions have been generated for the resources in your view.
4. Request state is correct. Only resource requests in the Requested state appear as unassigned. Requests that are already Assigned, Approved, or Cancelled don't show.
5. Check the date range. Verify the resource card's date range overlaps with the resource request dates. Requests outside the visible time frame will not display.
6. Confirm the permissions. Confirm you have the it_demand_manager role, which is required to view and manage unassigned work.

Extend or reduce duration of an assignment

Extend or reduce the duration of an assignment from the grid view in Resources when the work duration shifts. When you extend or reduce the assignment duration, the assignment dates update and the allocated effort recalculates across the new date range based on the effort redistribution property.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: it_demand_manager

The com.snc.resource_management.redistribute_effort_on_extend_reduce property is enabled. For more information, see Resource Management properties.

Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon  .
3. Open a demand from the **List** page.
4. Select the **Resources** tab.
   The resource grid opens for the demand's timeline, grouped by **Primary Group**.
5. Select the chevron icon () to expand the resource view.
6. Locate the row for the resource assignment you want to update.
7. Update one or both of the following date fields to extend or reduce the assignment:
   - Start date: Move earlier to extend the assignment or later to reduce it.
   - End date: Move later to extend the assignment or earlier to reduce it.

Result
After the dates are updated, the initial effort is recalculated for the entire assignment duration including the new date range.

End a resource assignment

End a resource assignment at a specific date to release a resource from a task before the planned end date. Future effort is removed and the heatmap updates to reflect the resource's availability.

Before you begin

- You can end assignments on individual resource assignment rows. You can't end a child assignment.
- Role required: it_demand_manager

About this task
Use End Assignment when a resource completes their work before the task's planned end date. This releases the resource from the assigned task without changing the task plan. The assignment start date and any recorded actuals remain unchanged.

Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon  .
3. Open a demand from the **List** page.
4. Select the **Resources** tab.
   The resource grid opens for the demand's timeline, grouped by **Primary Group**.
5. Select the row context menu ( ) for any resource assignment row and select **End assignment**.
   The End Assignment modal opens with a date picker and a status list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Select an end date using the date picker.

   The default end date is latest of the following, irrespective of the assignment state.

   - Today's date
   - The assignment start date
   - Last recorded date of actuals

   For group assignments, the default end date is the latest of the following.

   - Today's date
   - Start date of the assignment
   - Latest date of recorded actuals among all the child assignments

   The following end dates aren't valid:

   - Before the assignment start date
   - After the task's planned end date
   - Before the end date of the last recorded actuals

7. **Optional:** Change the assignment status using the status list.
8. Select **Change End Date**.
   If the selected end date equals the assignment start date, a follow-up prompt appears. Select one of the following options:

   - **Keep Effort** — retains the effort allocated for that day.
   - **Remove Effort** — clears the effort for that day.

   Future effort from the new end date onward is removed and the heatmap updates to reflect the resource's released capacity. Recorded actuals aren't affected.

Edit allocated efforts for tasks with actual hours

Edit allocated efforts for tasks which have partial actual efforts logged directly from the grid view. This keeps reported time accurate without rolling back time entries through other channels.

Before you begin

Role required: it_demand_manager

About this task

The total allocated hours for a task appear in the Task effort column of the grid view for the corresponding period. You can edit these values directly in the grid, including the assignments for which partial actual efforts have been logged.

Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon  .
3. Open a demand from the **List** page.
4. Select the **Resources** tab.
   The resource grid opens for the demand's timeline, grouped by **Primary Group**.
5. Select the chevron icon () to expand the resource view.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Locate the row for the resource assignment you want to update.
7. Select the cell for the required period in the **Task effort** column to change the efforts and enter the updated hours.

Result
The allocated hours for the selected period are updated. If there are any actual efforts captured for the past fiscal periods, they won't be affected with this change.

Move a resource assignment

Move a resource assignment to different start and end dates depending on the availability of the resource.

Before you begin
Role required: it_demand_manager

About this task
- The resource assignment dates honor the task dates. The start and end dates of the resource assignments should be within the task start and end dates.
- When a resource assignment is moved beyond the task dates, the allocations outside the dates are cleared.
- A resource assignment cannot be moved if actual efforts are captured for the work.

  Use the **Show actuals** toggle () from the settings () side panel to view the efforts captured for an assignment via time cards.

Procedure
1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon  .
3. Open a demand from the **List** page.
4. Select the **Resources** tab.
   The resource grid opens for the demand's timeline, grouped by **Primary Group**.
5. Select the row context menu (⋮) for any resource assignment row and select **Move**.
6. In the move assignment modal, you can either enter or select the new start date using the date picker modal from the **New start date** field.
7. **Optional:** Change the assignment status using the **New status** list.
8. Select **Confirm**.

Example:
Consider a resource assignment for Website Overhaul task is assigned to Grace Lee. The task duration is from August 01, 2025 to August 31, 2025. The assignment duration is from August 01, 2025 to August 20, 2025. Now, when you move the assignment start date to August 15, 2025; the new assignment dates will honor the task dates and will auto-assign the work from August 15, 2025 to August 31, 2025. The remaining efforts of the resource are cleared and the cleared capacity is shown as available.

Reassign or unassign work using Resources grid

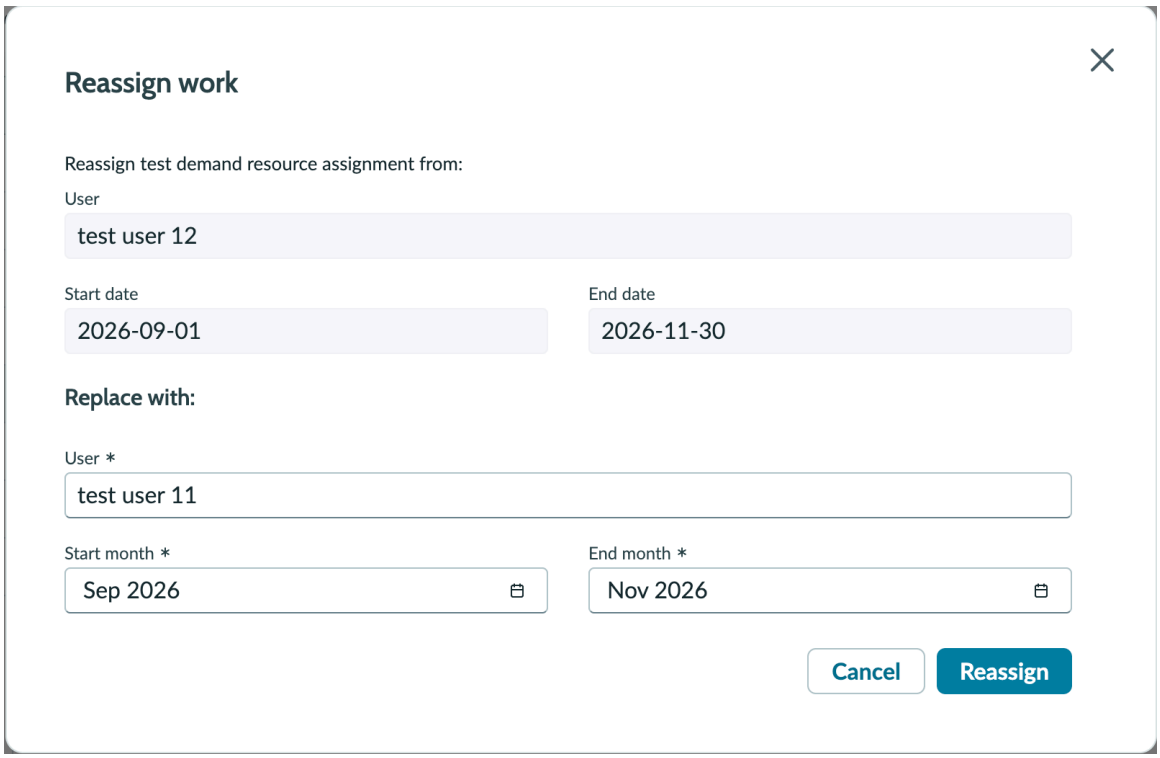
Reassign or unassign assigned work from the Resources grid of a demand. You can group the resource board by primary attributes to identify the resources with same primary attributes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- When you reassign work, both resources must have matching primary attributes. For more information about mapping primary attributes to resources, see Map primary attributes to resources.
- You can reassign a work item when actual hours aren't captured.
- You can't reassign a work item if it has associated actual hours captured for the entire duration.
- You can't unassign a work item if it has any associated actual hours captured.
- You can't unassign an assignment if it has any associated actual hours captured.
- You can't reassign or unassign group resource assignments.

Role required: it_demand_manager



Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon  .
3. Open a demand from the **List** page.
4. Select the **Resources** tab.
   The resource grid opens for the demand timeline, grouped by **Primary Group**.
5. Select the chevron icon () to expand the resource view.
6. To reassign any assigned work:
   a. Select the row context menu ( ) for the required work item.
   b. Select **Reassign**.

> **Tip:** Group the resources grid by the primary attributes to drag the resource assignments to another resource to completely reassign work.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. On the Reassign work window, enter a resource name in the **User** field to reassign work to and duration using the **Start month** and **End month** date picker.

7. Select **Reassign**.

Note: Use the reassign feature to assign part of a task among resources without overlapping the assignment dates.

The selected work item will be reassigned to the selected resource.

8. To unassign any assigned work:

a. Select the row context menu (⋮) for the required work item.

b. Select **Unassign**.
The selected work item is unassigned.

Example:
Consider a development task spanning from January 1, 2024 to September 30, 2024 which is assigned to Tom, a developer who has the following primary attributes.

- Primary Group - Development
- Primary Skill - Java
- Primary Role - Java Developer 1

Tom has actual hours captured from January 1, 2024 through March 31, 2024 and will be unavailable for next 2 months.

As a demand manager, you can either reassign this task in its entirety starting from April 1, 2024 till September 30, 2024 to Raj. Raj has the same primary attributes. Or reassign the task from April 1, 2024 to May 31, 2024 to Raj, leaving the rest of the assignment to Tom.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The actual hours captured by Tom are retained even though the task is reassigned. Raj can capture the actuals hours for the assigned period after completing the work.

What to do next

You can allocate the unassigned work and approve the reassigned work. For more information, see Assign and approve unassigned work.

Split resource assignments using Resources grid

Splitting a resource assignment at a specific date creates a resource assignment for the same user.

Before you begin

- When you split a resource assignment, a new assignment is created from the selected date. Both the assignments are assigned to the same user retaining the state of the assignment.
- When you split a resource assignment, a new assignment is created from the selected date. Both the assignments are assigned to the same user with Approved state.
- If a resource assignment has actuals captured for a certain duration, you can split the work only at the dates where there are no actuals captured.
- Role required: it_demand_manager

About this task

Use split when you need to divide a single resource's assignment into two time periods with different allocation levels, effort distributions, or tracking granularity. For example, split an assignment when a resource needs to reduce their allocation after a project milestone.

Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon  .
3. Open a demand from the **List** page.
4. Select the **Resources** tab.
   The resource grid opens for the demand timeline, grouped by **Primary Group**.
5. Select the chevron icon () to expand the resource view.
6. Select the row context menu ( ) for the required work item and select **Split**.
   The Split modal appears with task insights such as the task name, resource name, start date, and end date.
7. On the Split modal, select a date to split the resource assignment using the date picker.
8. Select **Split**.

Result

The resource assignment is split at the selected date and a copy of the resource assignment with new dates are displayed under the assignments of the selected resource.

Example:

Consider a resource assignment named Implement GenAI in docs assigned to Abel Tuter from July 16 through December 02. If you split the resource assignment at September 09, there will be two resource assignments with the same name and state assigned to Abel Tuter.
One resource assignment ranges from July 16 to September 09, and the other assignment ranges from September 10 to December 02.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Realign resource assignment dates for demands

Adjust the resource assignment dates to match the latest dates of your demands when priorities or timelines change.

Before you begin

Role required: it_demand_manager

Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon .
3. Open a demand from the **List** page.
4. Select **Details** from the navigation menu.
5. In the **Planned start date** field of the demand, modify the date.
6. Select **Save**.
7. Select the More Actions icon and select **Realign assignments to demand**.

Result

The start date of the resource assignments is aligned with the new value in the **Planned start date** field of the demand.

Recalculate costs of resource assignments of a demand

Recalculate the costs of active resource assignments of a demand when hourly rates change in the associated rate model.

Before you begin

The demand must be active with an active rate model.

Role required: it_demand_manager

About this task

To recalculate the costs of resource assignments, you can also use the **Estimate resource requirements** Playbook activity. For more information, see Use Playbook in Next Experience for Demand Management.

Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon .
3. Open a demand from the **List** page.
4. Select **Details** from the navigation menu.
5. Select the **Resource assignments** tab.

   Note: If the **Resource assignments** tab isn't visible, select **More** > **Resource assignments**.

6. Select a resource assignment record.
7. Select the More Actions icon and select **Recalculate Resource Cost**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. **Optional:** If you want to start the recalculation from a specific date or end it on a different date, adjust the values in the **Start date** and **End date** fields.
9. Select **OK**.

Result

The resource cost of the selected resource assignment is recalculated based on the hourly rates and is updated on the resource assignment form. The values in the cost fields of the demand are revised accordingly.

Collaborate with docs in Next Experience for Demand Management

Docs supports real-time collaboration on documentation such as meeting notes, demand requirements, and technical specifications.

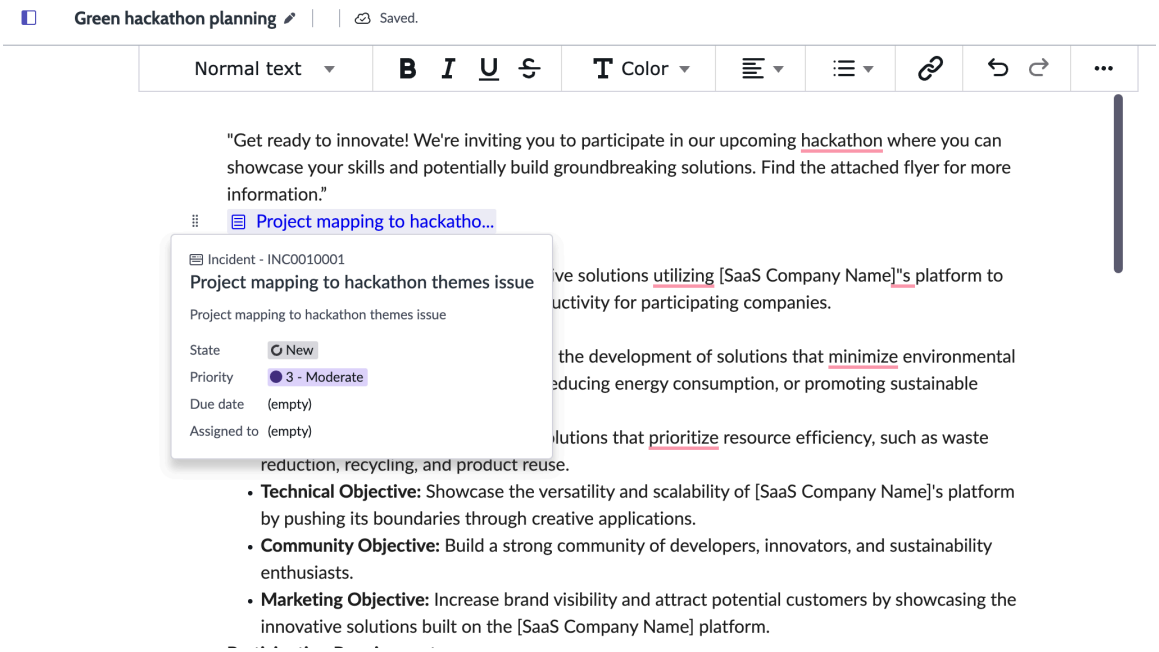
You can create multiple Docs for a demand and within each Doc, you can create unlimited pages to help you effectively organize your information.

Key features of Docs

- Auto save content.
- Live user presence: See who is viewing or editing the document in real time.
- Templates: Create and apply document templates.
- Rich text formatting: Headings, lists, alignment, and other paragraph styles.
- Block-level editing: Move text blocks to change placement.
- Cross-references: Add references to other ServiceNow AI Platform tables to connect work across teams.
- Copy and paste within Docs: Transfer text, images, lists, and tables between Docs pages.
- Table features such as size and color formatting and copy and paste between tables.

Images in Docs

You can insert images in or adding a web URL. You can also save images from your demand documents directly to your device, to share or use them outside Docs. For more information, see Add images in demand Docs or download them.



Dynamic data linking in Docs

Keep record information in your documentation current and reduce manual effort with the Dynamic data linking feature in Docs. You can automatically reflect the latest updates from ServiceNow application records or fields in a record by including references to them. You can add references from any ServiceNow table you have access to.

For example, if you add a reference to an Incident record, the reference shows the latest field information of the incident in Docs.

For more information, see Add dynamic data to demand Docs.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Real-time collaboration in Docs

Real-time collaboration enables multiple people to work on a doc page at the same time. Colored cursors denote the current location of each editor on the page. You can choose to show or hide these live presence indicators while working on or reviewing the content of the page through the More Actions menu.

Note: Application performance might be affected if many users are editing a doc at the same time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create pages and subpages in demand Docs

Store information related to your tasks, reference users and task records using pages and subpages in Docs. You can also collaborate on editing documents in real time.

Before you begin

Role required:

- Create and manage pages and subpages - it_demand_user, it_demand_manager, demand_approver
- Read pages and subpages - apw_read, ppm_read

About this task

https://xn--servicenow-wt6e.portal.trainn.co/share/NkDs9J1ujM1QnrGVd5LEGQ/embed?autoplay=false

Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon .
3. Open a demand from the **List** page.
4. Select **Docs** from the navigation menu.
5. Create a blank page, start with a predefined template, or duplicate a page.

Goal	Actions
Create a blank page	Select **Create page**.
Create a page from a template	**a.** Select **Create Page from template** from the **Create page** drop-down. **b.** In the card for the template that you want to use, select **Use**.
Duplicate a page	Select the **Page Actions** icon and then se lect **Duplicate page**.

The new page is created and added to your Doc.

6. Create a subpage by selecting the **Page Actions** icon and then selecting **Create subpage**.

Use templates with demand Doc pages

Apply a template to demand Doc pages to standardize content structure across demands or save a configured page as a reusable template for your team.

Before you begin

Role required: it_demand_user, it_demand_manager, or demand_approver

Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon .
3. Open a demand from the **List** page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select **Docs** from the navigation menu.
5. In the **Pages** tab, select the Product Requirements page actions icon ⋮.
6. Determine whether you want to apply a template to the doc or save the doc as a template.

Goal	Actions
Apply a template	**a.** Select **Apply template**. **b.** Select **Use** in the card for the template that you want to use.
Save the doc as a template	**a.** Select **Save as template**. **b.** Provide a name and description for the tem plate. **c.** Set the template visibility by selecting ei ther **Public** or **Private**. **d.** Select **Save**.

Add images in demand Docs or download them

Add images to demand Docs by uploading a file or embedding a URL. You can also download images from a Doc page to use outside Docs.

Before you begin

Role required: it_demand_user, it_demand_manager, or demand_approver

Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon  .
3. Open a demand from the **List** page.
4. Select **Docs** from the navigation menu.
5. Select the page or subpage where you want to insert the image.
6. Add an image to the Doc page either by pasting it directly, uploading it from your system, or by embedding a link.

Goal	Actions
Copy and paste an image from an external source or another page	Use your standard method to copy and paste the image.
Upload an image from your local system	**a.** From the Doc toolbar, select the more ac tions icon ••• and select **Image**. **b.** Select **Choose image**. **c.** Select the image from your local system and select **Open**.
Embed a link to your image	**Note:** Prior to this method, you must have found the image you want to use online and copied its URL.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Goal	Actions
	a. From the Doc toolbar, select the more actions icon ••• and select **Image**. **b.** Select **Embed link**. **c.** Paste the link to the image. ⚠ **Warning:** Google Images search result links might not work. **d.** Select **Insert image**.

The image is inserted in your doc page.

7. **Optional:** Select the image and then select the Download image icon in the toolbar.
   The image is downloaded to your local system.
8. Align an image by selecting the image and then selecting an alignment from the **Align image** list.
   This image does not really clearly show the user the alignment options so I suggest deleting it.

Add dynamic data to demand Docs

Add references to application records or fields in demand Docs to keep documentation current without manual updates. You can add references from any table on your ServiceNow instance you have access to.

Before you begin

Role required: it_demand_user, it_demand_manager, or demand_approver

About this task

Hovering over a reference in the Doc displays its data. Selecting the reference link opens its related record form.

Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon .
3. Open a demand from the **List** page.
4. Select **Docs** from the navigation menu.
5. Select the page or subpage where you want to add the dynamic data link.
6. Place the cursor where you want to add the dynamic data link and type the slash command (/).
7. Select the **Mention a record** option.
8. Select the record in a table or field in a record that you want to reference.
   a. In the Search field, enter the table or record name and select it.
   b. Continue navigating through the hierarchy of fields or related records to access the field or record you want to reference and select it.

Result

The record or record field is added to the doc.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Export a demand Doc as a PDF

Export demand Docs as PDF files to use them offline or share with stakeholders outside Next Experience for Demand Management.

Before you begin

Role required: it_demand_user, it_demand_manager, or demand_approver

Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon  .
3. Open a demand from the **List** page.
4. Select **Docs** from the navigation menu.
5. From the Doc header, select the More actions icon ••• and select **Export as PDF**.

Result

The PDF file is downloaded to your local system.

Assess demands with smart assessments

Smart assessments automatically gather structured, weighted feedback from a demand's stakeholders and scores the demand. Demand managers can qualify demands offhand and track every assessment from a single place.

Smart assessments replaces the manual assessment instances and assessment results workflow with an assessment workflow that runs automatically. Assessments are created, scored, and used to qualify the demand automatically, so demand managers no longer need to create an assessment or review its results manually.

When a demand moves from the Submitted to Screening state, an assessment is triggered for the demand's stakeholders who are added to the demand to be assessed.

If the demand does not require an assessment at all, it skips the assessments and moves directly to the Qualified state.

After every open assessment for the demand is completed or cancelled, the demand moves automatically to Qualified, and the individual section scores populate onto the demand. Apart from each assessment's own score, the demand's own **Score** field is calculated as the average of Risk, Size, and Value sections. Risk and size scores are inverted, so a lower risk or size score raises the demand's score. For more information, see Demand assessment template questions. Strategic Alignment and Cost sections populate onto the demand but aren't part of this calculation.

Benefits of smart assessments

- Enhanced assessment experience with a cleaner, more intuitive assessment form for stakeholders.
- Supports text-based questions for the assessments.
- Supports viewing of assessment results after filling.
- Supports a single view for all assessments assigned to you.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Enabling smart assessments

Smart assessments is controlled by the *sn_align_ws.enable_smart_assessments* system property, which ships as inactive (`false`) by default. When the property is set to false, demands continue to use the classic assessments.

When an administrator sets the property to true:

- Every newly created demand, and any demand currently in Draft or Submitted state, routes through smart assessments.
- A demand that already has an assessment instance triggered under the old workflow continues and completes using that same workflow. This applies as long as the demand isn't reset to Draft. For more information, see Deleting or resetting a demand.
- After the property is set to true, continue using the smart assessments for a demand over the classic assessments.

Smart assessment users

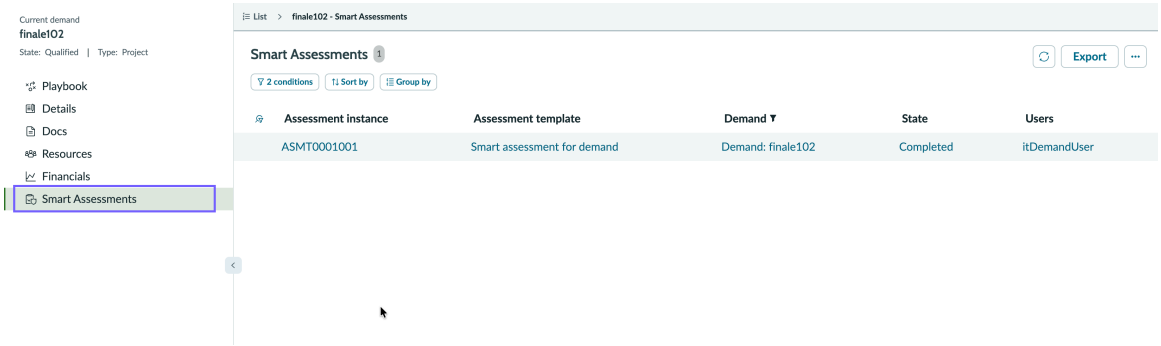
Smart assessment access works at three levels. The first is a top-level admin role that spans every template category. The second is a set of roles scoped to an individual template category. The third is template-level roles that control who can fill in or read an individual assessment. None of the category-level or top-level roles are assigned to any role automatically. You can decide who to assign them to, based on who should manage assessment templates in your instance.

Users

User	Description
Assessment admin (sn_smart_asmt.assessment_admin)	Can access and edit templates in every template category. Not assigned to any role by default. You can assign it to whichever user you choose.
Template manager (sn_smart_asmt.template_manager)	Can create and modify templates within a template category this user otherwise has access to. Not assigned to any role by default. You can assign it to whichever user you choose, such as an APW admin user.
Assessment actor (sn_smart_asmt.actor)	Stakeholders for the demand who fill in the smart assessments they're assigned. Separate assignment is required for each stakeholder by the admin.
Assessment reader (sn_smart_asmt.assessment_reader)	Demand managers who read smart assessments and their results on demands they manage. Contained automatically with the demand manager role with no separate assignment needed.
Template reader (sn_smart_asmt.template_reader)	Demand managers [demand_manager] who read the demand assessment template category. Contained automatically with the demand manager role with no separate assignment needed.

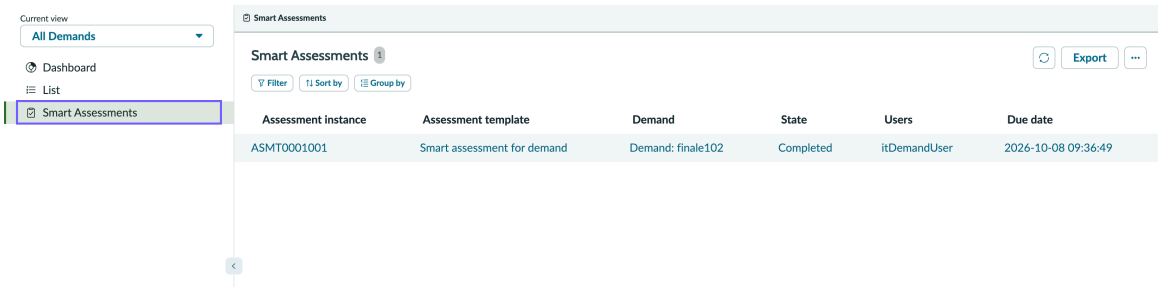
A user's access to an individual assessment determines whether they can fill it in or only view the responses. A user with the *sn_smart_asmt.actor* role who is assigned an open assessment can answer and save it. An admin user must individually assign this role to the stakeholders, including to demand managers if they are required to fill the assessments. For more information, see Assign a role to a user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



A user with only read access can view the responses without editing them. For the complete list of Smart Assessment Engine roles, including how template category roles combine with template manager, reader, and contributor roles, see Roles installed in Smart Assessment Engine.

Viewing smart assessments for demands

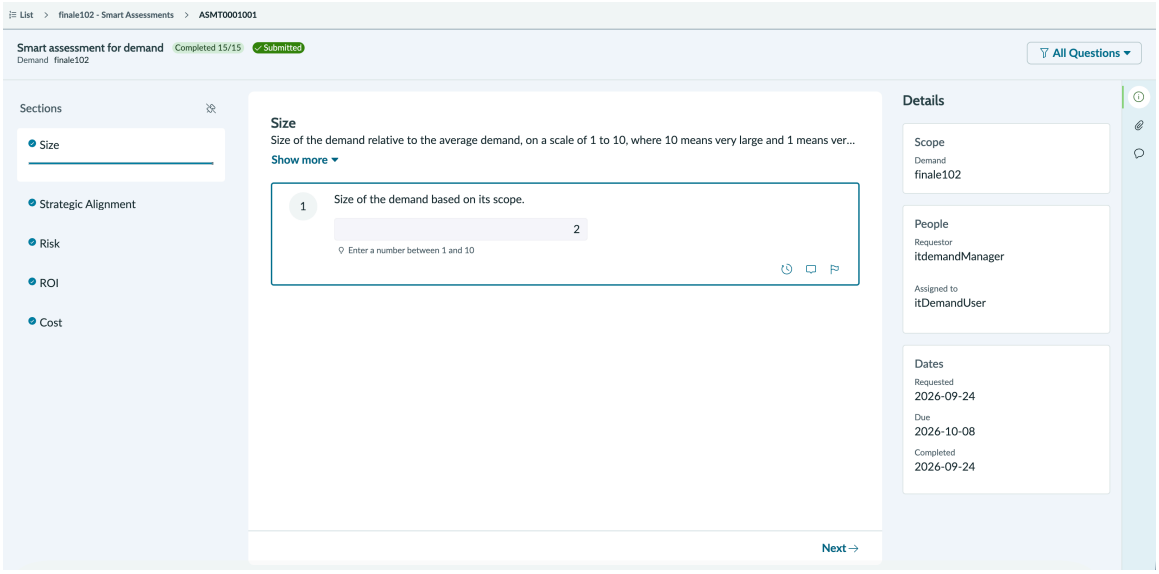


View smart assessments from a single demand, or across all your demands. The Smart Assessments grid displays the assessment instance, assessment template, demand, state, users, and due date columns. For more information on how to fill the assessment, see Fill out a smart assessment for a demand.

There are two ways to view Smart Assessments:

- From an individual demand, to see only that demand's assessments.

- From the main navigation menu, to see every smart assessment you have access to, across all demands.



Note: A demand manager sees every smart assessment across their demands; a stakeholder sees only the smart assessments they're assigned to.

Demand assessment template questions

The predefined Smart assessment template for demand scores a demand across five weighted sections. The purpose of the template is populated as Demand. It mirrors the metric categories used by the classic assessment workflow to compare demands.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Smart Assessment Engine calculates the value of each section per assessment instance using the question weights of the respective sections. For more information about how the Smart Assessment Engine uses section weights, see Scoring forms.

Demand assessment template sections and questions

Section	Description
Size	Size of the demand relative to the average size (scale of 1–10).
Strategic Alignment	Strategic alignment of the demand. Consists of the following attributes: • Priority of the demand based on its urgency and importance • Relation to a corporate initiative • Increasing job efficiencies • Increasing process consistency and optimization • Competitive advantage gain
Risk	Risk associated with the demand based on delays, compliance and regulatory requirements, infrastructure and business expansion, and dependencies.
ROI	Impact of the demand based on its expected effect on the business and financial return of the demand based on the projected value.
Cost	Labor cost, capital cost, and operational cost of the demand.

The Size, ROI, and Cost questions are answered automatically from existing demand field values. The remaining questions are scored on a scale of 1–10 by the person completing the assessment.

The predefined demand assessment template is the only template the automatic screening state trigger, completion check, and score population use. The template is hardcoded. A user with the *sn_smart_asmt.template_manager* role can create additional smart assessment templates in the Assessment Workspace. Using a different template for demands also requires customizing the *DemandSmartAssessmentUtils* script include to use it. For more information, see Create an assessment template and Use a custom smart assessment template for demands.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Deleting or resetting a demand

Deleting a demand, or resetting it to draft, automatically cancels any of its smart assessments that are still open. A warning message is displayed when you try to reset a demand to draft that has smart assessments triggered.

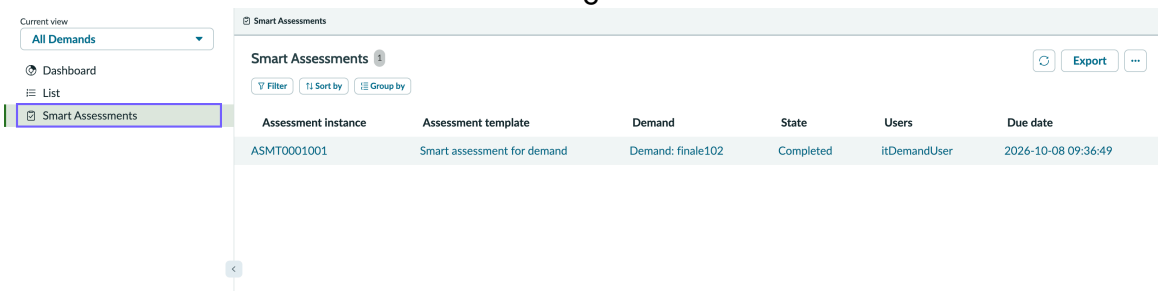
If a demand already has classic assessments on it and is reset to Draft, that reset is treated as a fresh assessment flow. It is not a continuation of the old one. Any open old assessments are cancelled. If smart assessments is enabled, a new smart assessment is triggered instead.

Fill out a smart assessment for a demand

Answer your assessment questions so your input counts toward the demand's score, helping it move through qualification without waiting on a manual review.

Before you begin

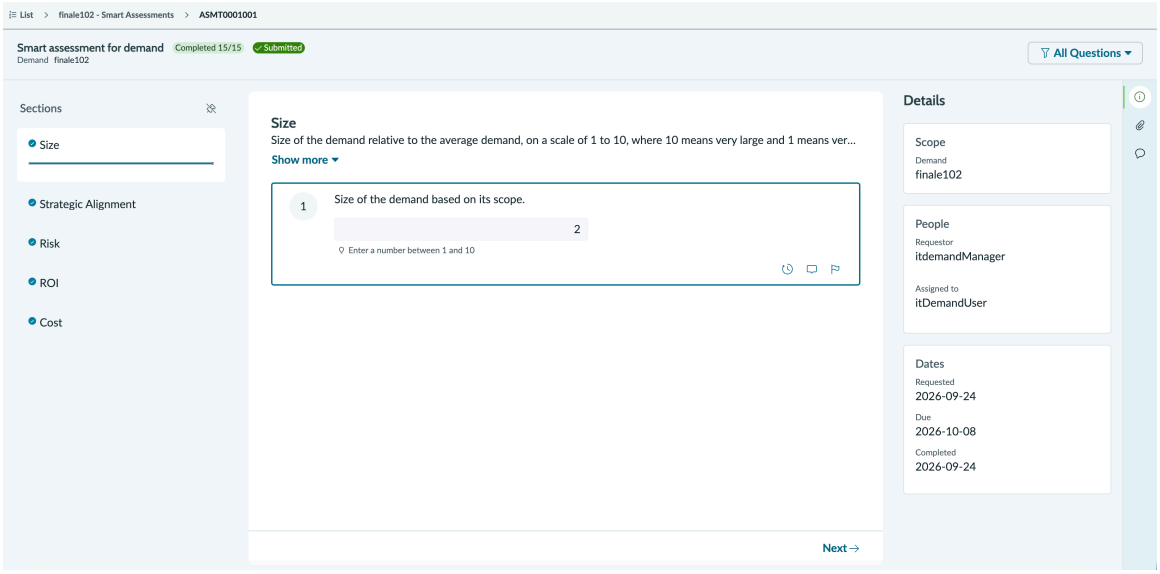
Role required:



- sn_smart_asmt.actor to fill an assessment
- sn_smart_asmt.assessment_reader for view-only access

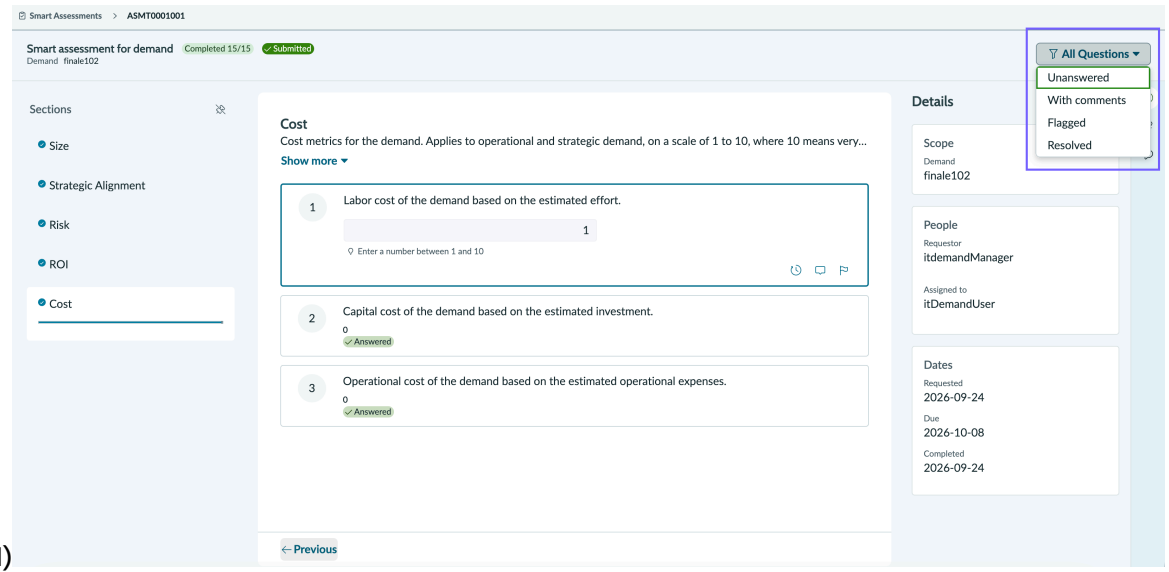
About this task

Smart assessments are available at a demand level and the entire demands module level. Use the module level Smart Assessments menu item to view all assessments assigned to you across demands. Demand managers can view all assessments assigned to users but can't make any edits.



Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon .
3. Select **Smart Assessments** from the main navigation menu.

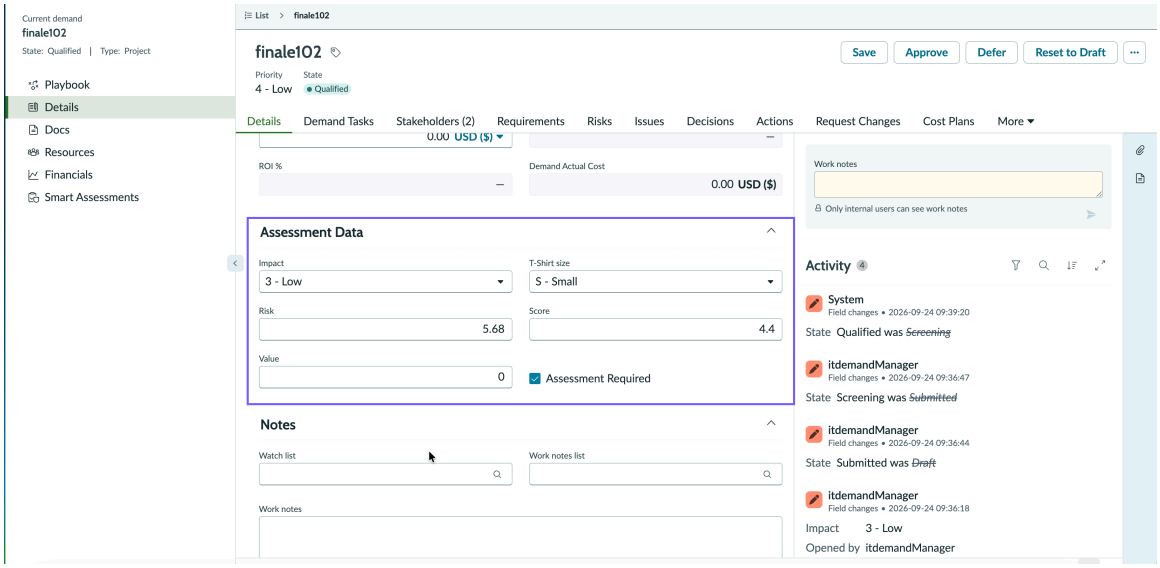


4. From the Smart Assessments list, select the assessment instance you want to open.
   The form displays the assessment questions and any answers already filled in.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. If you have access to fill in the assessment, answer the questions.
6. **Optional:** Select the All Questions drop-down list to filter the questions in the assessment.

(Optional)



7. Use the **Next** and **Previous** options to navigate between sections.
8. Select **Save**.

Result

After every stakeholder on the demand has completed their smart assessment, the scores populate onto the demand and the demand moves automatically to **Qualified**.

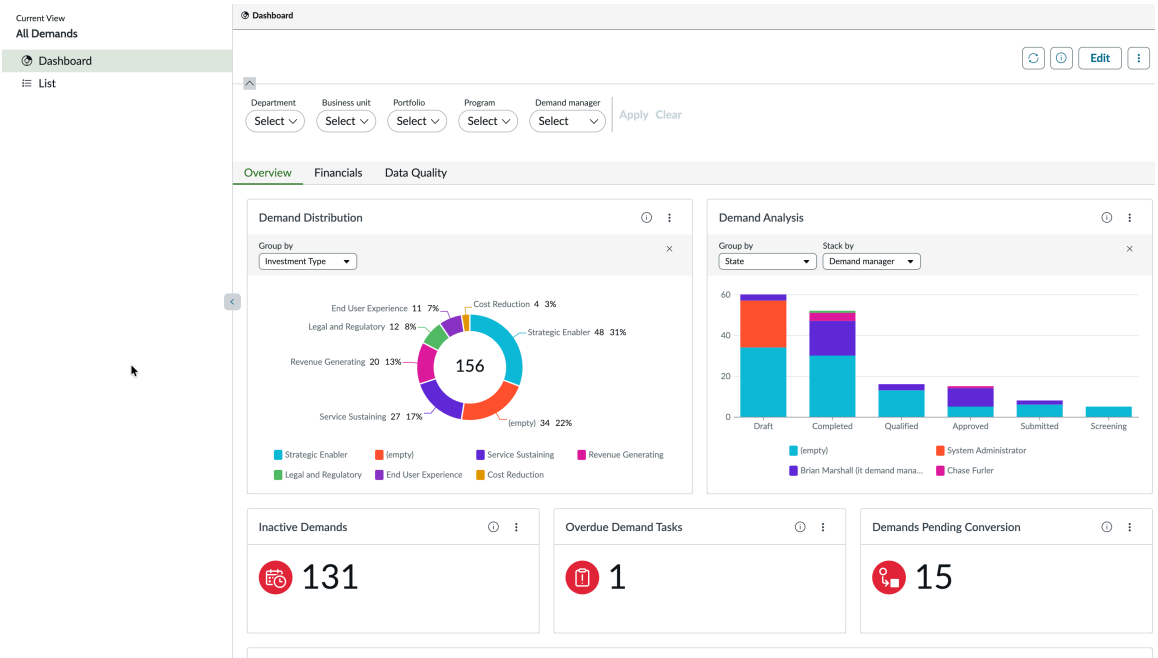
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Monitoring and tracking demands using the Demands Dashboard



The Demands Dashboard provides a visual summary of demand data directly in the Next Experience for Demand Management. The dashboard and demand list views are available from the same workspace, with filters that apply across all widgets.

Navigating to Demands from the main navigation menu opens the dashboard by default and organizes information into three tabs:

- The **Overview** tab summarizes demand distribution and analysis, inactive demands, overdue tasks, demands pending conversion, recently created demands, and risk vs. score.
- The **Financials** tab summarizes planned cost, financial benefit, and return on investment (ROI) by investment type.
- The **Data Quality** tab highlights demand records that are missing key information, organized into groups for demands, demands in screening and qualified states, demand tasks, and demand assessments.

Selecting a widget, or selecting **View all** on a list widget, opens the underlying records with the same filters applied.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Demands dashboard provides the following benefits:

- Summarizes demand volume, cost, benefit, and risk information without requiring you to open individual demand records.
- Filters data by department, business unit, portfolio, program, or demand manager, applying the selection to every widget on the dashboard.
- Drills from a demand table-related (dmn_demand) widget directly into the filtered list of demands associated with it.
- Drills from any other table-related widget into a filtered list of records in the classic UI in a new browser tab.

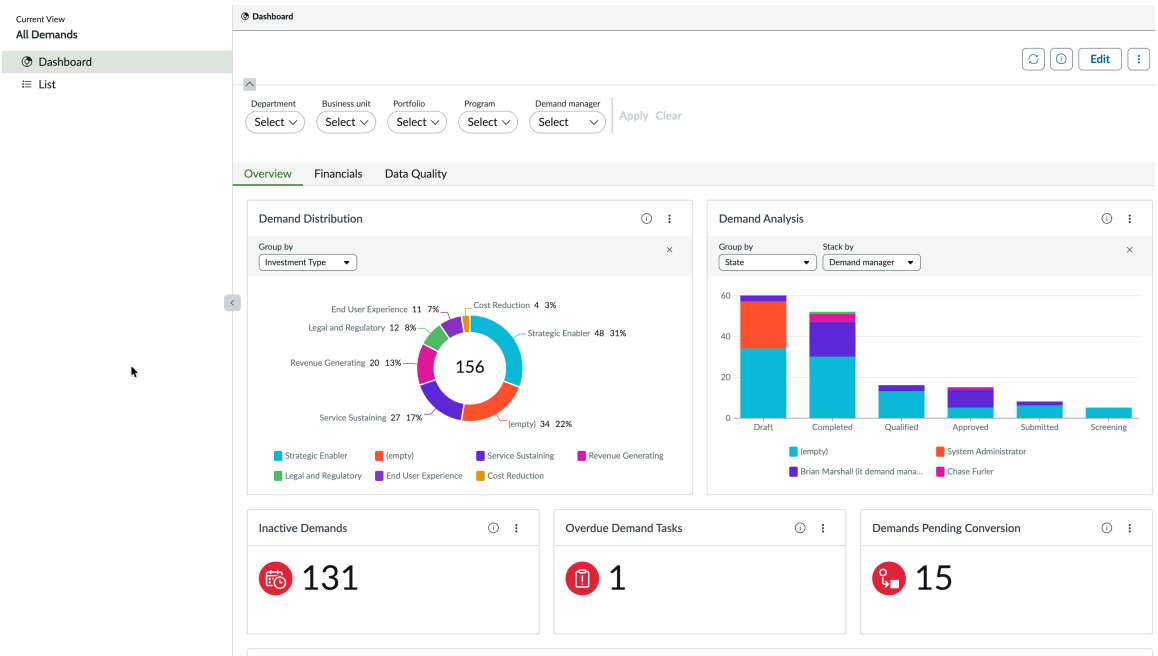
Explore dashboards

The Demands dashboard in Next Experience for Demand Management help demand users and managers monitor performance, track progress, and make informed decisions related to demands.

The Demands Dashboard is created from the Platform Analytics experience and uses the dashboard components to group and display the demands data.

Dashboard elements

Element	Description
Data visualization	Enables you to present a visual representation of current instance data or temporary data that you've imported. Data visualizations include visualizations that you create in the dashboard designer and data visualizations from the library.
Filter	Enables you to filter the visualizations on a dashboard based on specified criteria. You can put filters either on the individual tabs or above the tabs so that the filter applies to elements every tab. Filters include both data



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dashboard elements (continued)

Element	Description
	filters and domain filters. You can create filters in the dashboard designer or select them from the library.
Heading	Provides a place for text at the top of a dashboard or section of a dashboard. Formatting for headings is limited to six heading levels.
Image	Holds static or animated images on the dashboard.
List - Simple	Shows table data that you can customize for the dashboard audience.
Process Mining - Map	Maps the different states that are part of your process and the transitions between those states. See which states the objects of the process are in and the speed with which they change state. Requires an existing Process Mining project.
Rich text	Holds text that you can format either as text or as html, including font selection, text size, highlighting, and hyperlinks. To edit HTML markup, open the HTML editor from the Configuration panel and select the Code tags < > icon.

Overview tab

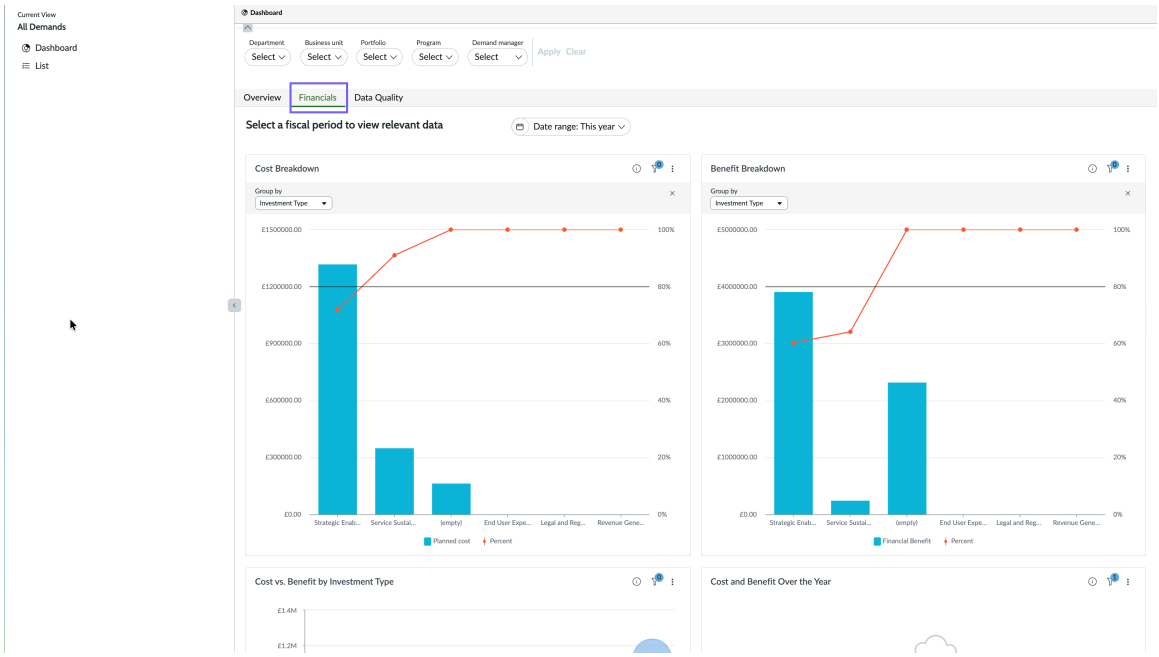
The Overview tab of the demand dashboard summarizes demand volume, activity, and risk across all demands.

Select any widget to see the records associated with it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Overview tab widgets

Widget	Description
Demand Distribution	Displays the total count of demands, grouped by a field you select. By default, demands are grouped by Investment Type. To regroup the data, select one of the following options: • Investment Type • Department • Investment Class • Primary goal • Business Unit
Demand Analysis	Shows demand counts as a stacked bar chart, grouped and optionally stacked by fields you select. By default, the grouping is by State and stacking is by Demand manager. Both controls offer the same set of options, along with the respective default values: • State • Category • Investment Class • Investment Type • Priority • T-Shirt size • Department • Primary goal • Strategic program • Product • Portfolio The Stack by control also offers the None value, which removes stacking from the chart.
Inactive Demands	Count of demands not updated in the last 30 days.
Overdue Demand Tasks	Count of demand tasks with a past due date as of the current date.
Demands Pending Conversion	Count of demands in the Approved state that are pending for conversion to work items.
Demands created - Last 30 days	Lists demands created in the last 30 days, with key fields such as number, name, state, demand manager, and score. The View all option displays the full list.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Overview tab widgets (continued)

Widget	Description
Risk vs. Score	Plots demand risk against demand score as a bubble chart. Select a bubble to see the underlying values and a link to the record list.

Financials tab

The Financials tab of the demand dashboard summarizes planned cost, financial benefit, and return on investment (ROI) across demands.

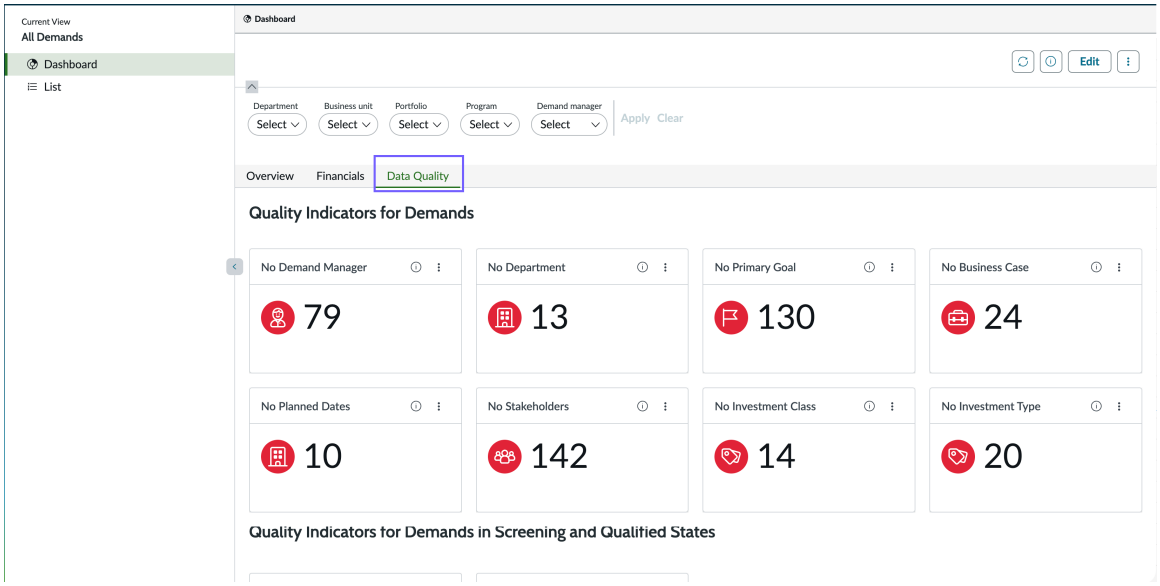
The widgets in the Financials tab consider demands in the Submitted, Screening, Qualified, or Approved states to display the data. You can further drill down on each widget to see the list of records associated with them.

The Date range widget scopes the data shown across all widgets on the Financials tab. The default range is the current year.

Financials tab widgets

Widget	Description
Cost Breakdown	Displays the planned costs grouped by dimension, with the cumulative percentage of total cost. By default, the costs are grouped by Investment Type. To regroup the data, select one of the following fields: • Investment Type (default) • Business Unit • Category • Department • Investment Class • Priority

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Financials tab widgets (continued)

Widget	Description
	• Primary goal • Product • Portfolio • Strategic program • T-Shirt size
Benefit Breakdown	Displays the benefits grouped by dimension, with the cumulative percentage of total benefit. By default, the costs are grouped by Investment Type. To regroup the data, select one of the following fields: • Investment Type (default) • Business Unit • Category • Department • Investment Class • Priority • Primary goal • Product • Portfolio • Strategic program • T-Shirt size
Cost vs. Benefit by Investment Type	Displays the financial benefit against total planned cost, grouped by investment type. Selecting a bubble displays the financial benefit, total planned cost, and investment type for that group, with a link to go to the underlying record list.
Cost and Benefit Over the Year	Displays the sum of cost and benefit plotted against each other across the calendar year. The values are derived from the cost plan breakdown and benefit plan breakdown tables. This widget is available only to users with the *it_demand_manager* role.
Demands by Investment Class and Investment Type	Displays the count, total cost, total benefit, and total ROI, organized by investment class (columns: Change, Run, and others) and investment type (rows), with a grand total row and column.

Data Quality tab

The Data Quality tab quantifies the demand, demand tasks, and assessment records that have missing information in key fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The dashboard displays metrics for:

- Data quality
- Areas requiring attention or improvement

You can further drill down on each widget to see the list of records associated with them.

Quality indicators for demands

Widget	Description
No Demand Manager	Count of demands that don't have an assigned demand manager.
No Department	Count of demands that don't have an assigned department.
No Primary Goal	Count of demands that don't have a set primary goal.
No Business Case	Count of demands that don't have a defined business case.
No Planned Dates	Count of demands that don't have set planned start and end dates.
No Stakeholders	Count of demands that don't have any assigned stakeholders.
No Investment Class	Count of demands that don't have a selected investment class.
No Investment Type	Count of demands that don't have an assigned investment type.

Quality indicators for demands in screening and qualified states

Widget	Description
No Cost Plans	Count of demands in the Screening or Qualified state that don't have a defined cost plan.
No Resource Assignments	Count of demands in the Screening or Qualified state that don't have defined resource assignments.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Quality indicators for demand tasks

Widget	Description
No Due Date	Count of demand tasks that don't have a set due date.
No Assignee	Count of demand tasks that don't have an assignee.
Overdue Demand Tasks	Count of demand tasks whose due date has passed as of the current date.

Note: These widgets report only on classic assessment instances.

Quality indicators for demand assessments

Widget	Description
No Due Date	Count of demand assessments that don't have a set due date.
No Assignee	Count of demand assessments that don't have an assignee.
Overdue	Count of demand assessments whose due date has passed as of the current date.

Using the Demands Dashboard

The Demands Dashboard provides a centralized view of demand data, metrics, and visualizations.

Roles required to manage dashboards

Access level	Required roles
Read, duplicate, or share the Demands Dashboard	*it_demand_manager*, *it_demand_user*, or *ppm_read* **Note:** To view data in financial-related widgets, users must have the appropriate roles.
Edit the Demands Dashboard	*admin* or *sn_align_core.apw_admin*
Create dashboards	*it_demand_manager*, *it_demand_user*
Edit dashboards	*it_demand_manager*, *it_demand_user* **Note:** You can edit dashboards that you own or those you have been granted permission to edit.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: You can create widgets in dashboards by configuring any available data source table in the ServiceNow AI Platform. However, you must have read access to the source tables to view key data, metrics, or visualizations.

For example, a widget configured to display data from the Cost Plan Breakdown table shows the budget summary only if you have read access to that table. Stakeholders you share the dashboard with must also have read access to the Cost Plan Breakdown table to view the budget summary.

For more information on the required roles to manage Platform Analytics dashboards, see Platform Analytics dashboard roles.

View the Demands Dashboard

Use the Demands Dashboard to monitor performance, track progress, and make informed decisions about demands.

Before you begin
Role required: it_demand_manager, it_demand_user, or ppm_read

About this task
Dashboards consolidate data from multiple sources into a single, easily digestible format. Each widget within a dashboard displays key data and metrics and may include visualizations.

Procedure
1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon.
3. **Optional:** Select a tab to view its data and metrics.
4. **Optional:** Select a widget to view more details in list view.
   If you have edit access, you can update the details of an individual record directly from the list view.

Create or manage a dashboard

In the Platform Analytics experience, you can create, duplicate, share, and export dashboards with data visualizations, filters, and other elements.

Before you begin
Role required: it_demand_manager, it_demand_user

About this task
The inline editor provides elements for adding widgets, filters, and visualizations to a dashboard.

Procedure
1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon.
3. From the dashboard header, select the More actions icon.
4. Create, duplicate, share, or export the dashboard.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Goal	Action
Create a dashboard	**a.** Select **Create new**. **b.** On the New dashboard window, enter the details: **i.** Select how you want to create your dash board. By default, the inline editor is se lected. **ii.** Enter a name for the dashboard in the **Name** field. **iii.** Enter a brief description for the dash board in the **Description** field. **iv.** Select **Create new dashboard**.
Duplicate a dashboard	**a.** Select **Duplicate**. **b.** On the Duplicating dashboard window, en ter the details: ▪ Enter a name for the dashboard in the **New name** field. By default, the name is *Demands dashboard - Copy*, where "Demands dashboard" is the name of the original dashboard. ▪ Enter a brief description of the goal in the **Description** field. **c.** Select **Duplicate**. The dashboard may take time to duplicate. Select **Continue in background** to keep using the application in the meantime.
Share a dashboard	**a.** Select **Share**. **b.** On the Share Dashboard window, enter the details: ▪ Enter a user name or group name in the **Grant access to** field. Use a user name for individual access or a group name for group access. To grant access to all users with a specif ic role, select that role. ▪ Select **Allow recipients to add, edit, or delete sharing permissions associated with this dashboard** to enable users to grant access to new users and modify or remove existing permissions. ▪ Select **Add as viewer** or **Add as editor**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Goal	Action
	The selected users, groups, and roles ap pear under **Manage Access**. To manage sharing permissions, select a user, group, or role and enable the **Can share** option. **c.** Select **Confirm**. To update sharing rights, open the Share Dashboard dialog. Under the **Can view** or **Can share** list, select a user, group, or role and adjust permissions.
Export a dashboard	**a.** Select **Export**. **b.** On the Export Dashboard window, enter the details: ▪ Select the file type as **PowerPoint** or **PDF**. ▪ Select or clear the toggles for **Export all tabs** and **Export with applied filters**. ▪ Select the delivery type as download or email. ▪ Optional: For email, enter the recipients and subject. **c.** Select **Export**. ○ For downloads, the file is downloaded to your local system. ○ For email deliveries, the file is sent to the re cipients.

Edit a dashboard

Customize or edit a dashboard by adding sections, filters, images, lists, process mining maps, and rich text. If the dashboard has been shared, any changes you make are applied globally.

Before you begin

Role required: admin or sn_align_core.apw_admin

Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace**.
2. Select the Demands icon  .
3. Select **Edit**.
4. Select **Add new element**.
   A list of available elements appear in the drop-down.
5. Select a widget type and configure it.
   For more information, see Edit Platform Analytics dashboards.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. **Optional:** Drag to move the widget or resize.
7. Select **Save**.
8. Select **Exit editing mode**.

Work with demands in Employee Slate

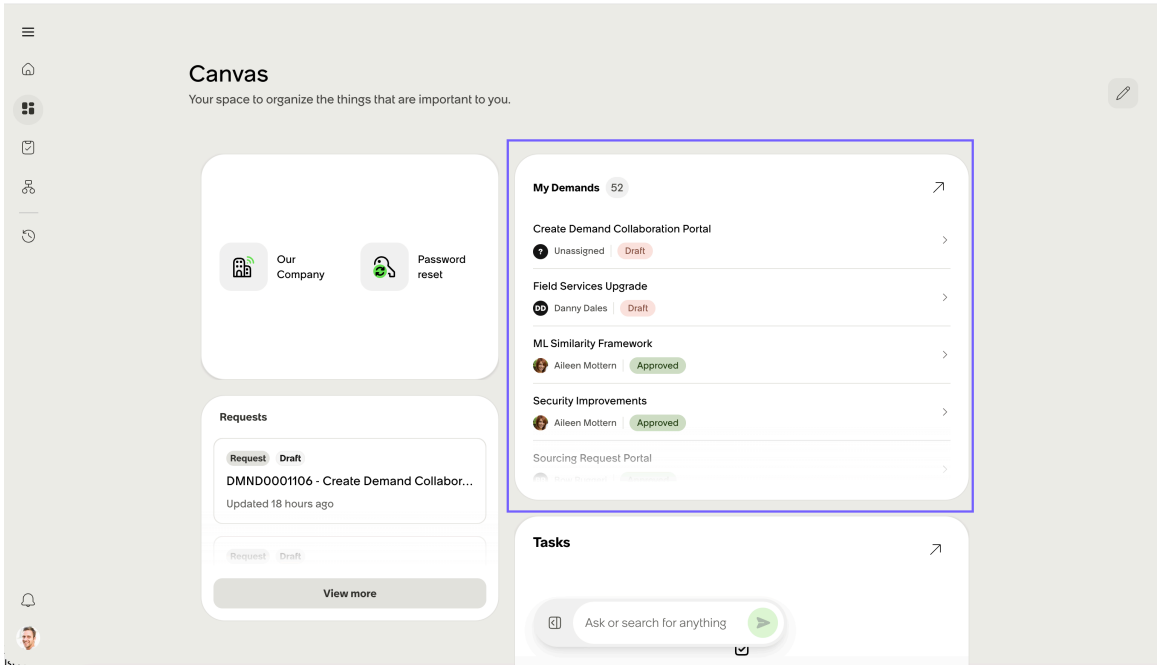
The My Demands widget and conversational experience in Employee Slate brings demand creation and tracking into a single, conversation-first workspace. Requesters can create demands through the conversational experience and track them using widgets.

Employee Slate is a conversation-first employee experience that combines intelligent assistance, employee communication, organizational navigation, task management, and other employee services to boost productivity. With the My Demands widget and conversational experience, the demand experience enables requesters to track demand status, activity, and progress in the same place they do other work. For more information about Employee Slate, see ServiceNow EmployeeWorks Web App.

Demands are available in Employee Slate if both Project Workspace and Employee Slate Core apps are installed.

Create demands with the conversational experience

You can create a demand through an Employee Slate conversation. Include relevant business context in your message if you have it. For example, enter a message such as "Upgrade system software." The relevant demand catalog items are identified and a demand form opens. If you include relevant business context in your message, matching fields (such as Business Case) are prepopulated on the form. If you don't include business context, the fields remain empty.

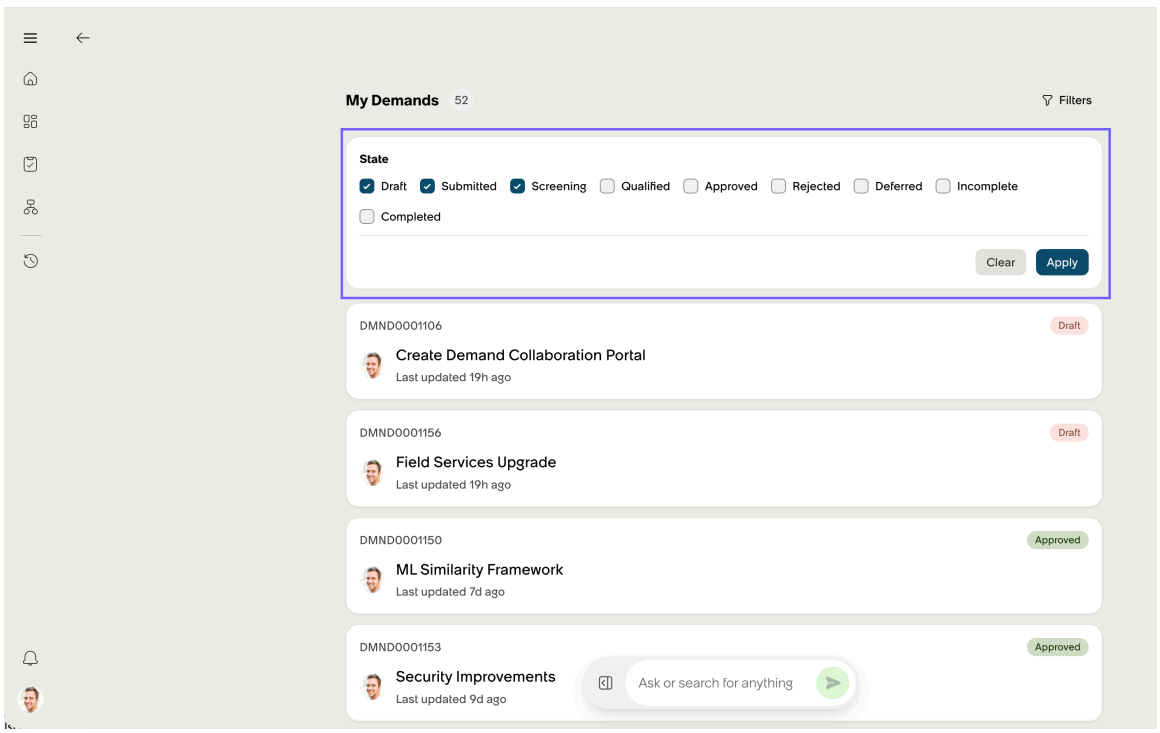


After the demand record is created, you can track the new demand from the My Demands and Requests widgets on your canvas. You can also track the status of the demand through the conversational experience by just asking about the state.

Track demands with the My Demands widget

The My Demands widget is a card on the Employee Slate canvas. It lists your ten most recently updated demands with a total count of your demands next to the **My Demands** heading. Each demand in the list appears as a row with its demand title, assignee avatar and name, and a color-coded status badge. If the demand does not have an assigned demand manager, the icon and label indicates it as unassigned.

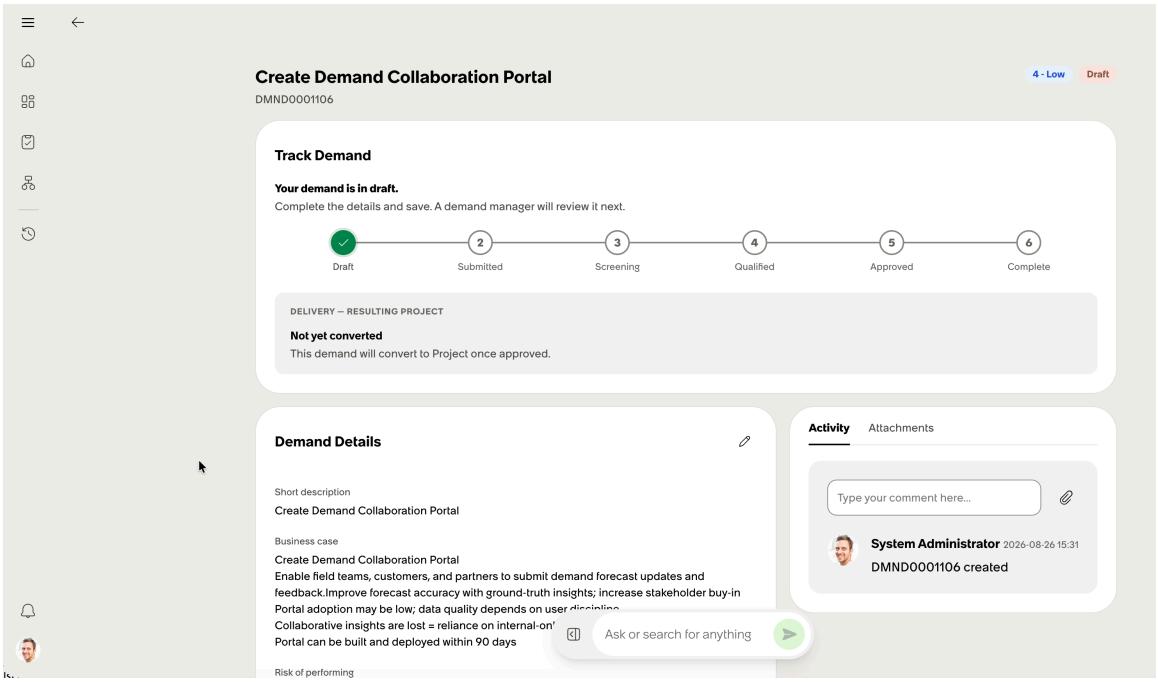
The widget is available in the canvas widget library. Add it to your canvas; it is retained for future sessions. For more information about how to add widgets to your canvas, see Customize canvas widgets.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The My Demands widget provides the following benefits:

- A unified requester experience for tracking demands alongside other Employee Slate requests.
- Improved transparency into demand lifecycle status, without needing to contact a demand manager.
- Faster collaboration when a demand manager requests for more information.

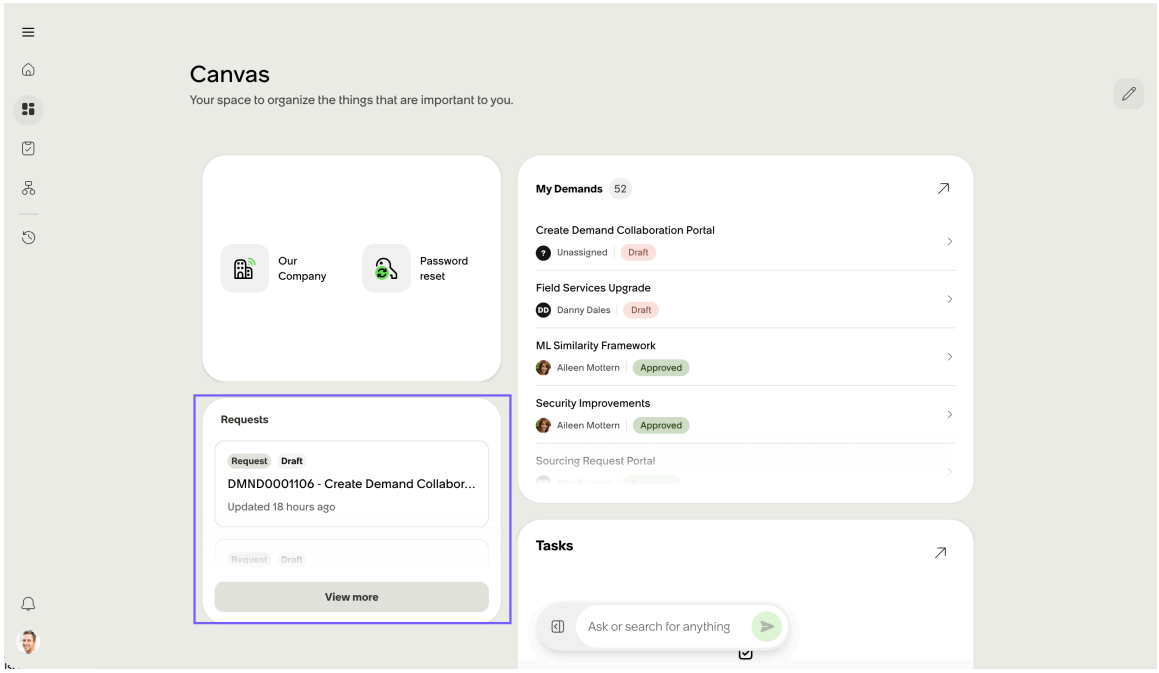


Select the Open full list icon ↗ on the widget to view the entire list of your demands or select an individual demand row to open its details page. You can filter demands by their state in the full list view and open a demand record by selecting it.

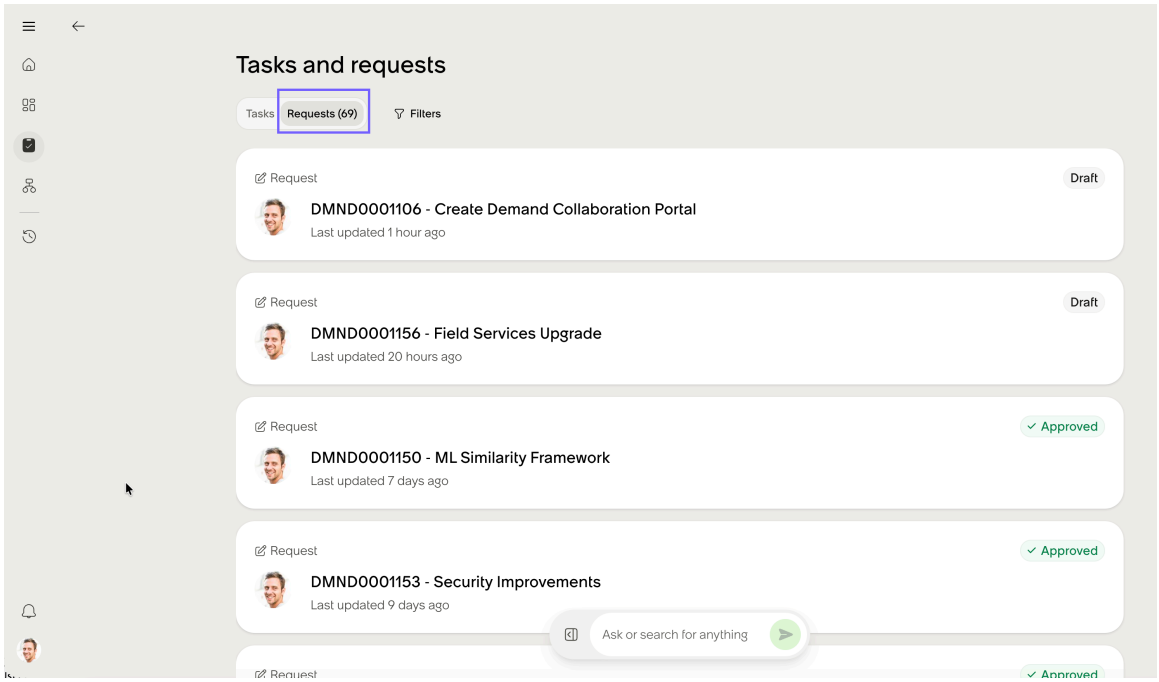
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A demand record page includes demand details, demand status tracker, delivery information, activity notes, and attachments. The Activity tab shows a chronological history of demand manager updates, state changes, and information requests. The Attachments tab lists the files associated with the demand. The demand fields shown are configurable by admin users. For more information, see Configure the demand details fields in Employee Slate.

The current state of the demand is highlighted. The delivery information indicates whether the demand is converted to a work item. After conversion, the card shows the resulting work item's name, type, state, planned or actual end date, and when it was last updated. For more information about demand states, see Demand workflow.



You can edit the demand values only while the demand is in the Draft state. After you submit a demand, you can no longer edit its field values, but you can still add activity notes and attachments. See Edit a draft demand in Employee Slate.



Track demands with the Requests widget

Demands also appear in the standard Requests widget, alongside your other requests. Selecting **View more** takes you to the Requests list. You can find your demands in this list even if you have not added the My Demands widget to your canvas.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can also view and edit demands by selecting a demand from the list.

Edit a draft demand in Employee Slate

Update the details of a draft demand in Employee Slate before submitting it for a demand manager's review.

Before you begin

Project Workspace and Employee Slate Core apps are installed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: snc_internal

Procedure

1. Navigate to **Employee Slate** > **Canvas**.
2. Open a demand from **My Demands** or **Requests**.

Goal	Action
From My Demands	○ Open a demand directly from the widget — select an individual demand row to open its details page. ○ Open a demand from the full list. **a.** Select the Open full list icon. **b.** Select a demand from the list.
From Requests	○ Open a demand directly from the widget — select an individual demand row to open its details page. ○ Open a demand from the Requests list. **a.** Select the **View more** option. **b.** Select a demand from the list.

3. In the Demand Details section, select the Edit icon.
4. Update the fields.
   For information on the field values, see Demand details form.
5. Select **Save**.

Result

After you submit the demand, the fields are set to read-only. You can still add comments and attachments.

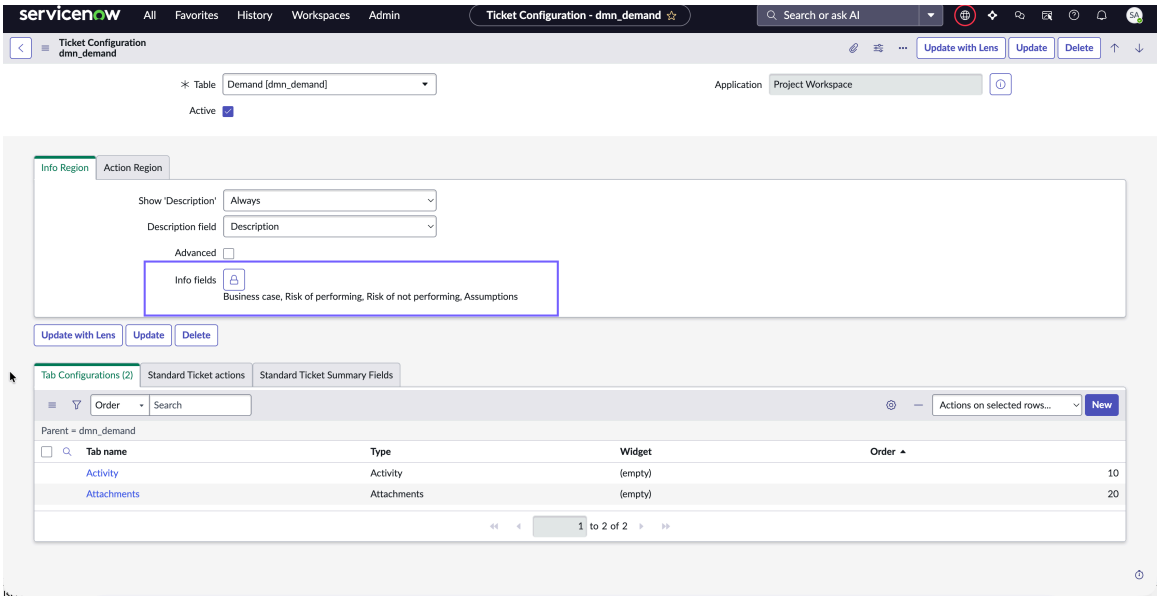
Configure the demand details fields in Employee Slate

Configure the fields that appear in the demand details ticket page in Employee Slate.

Before you begin

Role required: admin

About this task



The demand details ticket page is predefined. Administrators can modify it according to their use cases. By default, the following fields appear on the demand details ticket page in Employee Slate.

- Business case
- Risk of performing
- Risk of not performing
- Assumptions

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Standard Ticket** > **Standard Ticket Configuration**.
2. Select the dmn_demand record.
3. Select the Unlock Info fields icon beside **Info fields**.

4. Add or remove fields by selecting the **Add item** or **Remove item** arrows.
5. Reorder the fields by selecting the **Move up** or **Move down** arrows.
6. Select the Lock Info fields icon.
7. Select **Update**.

Next Experience for Demand Management reference

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Next Experience for Demand Management key terms

  Important terms in Next Experience for Demand Management are listed in the table.

Data migrated from demands to created entities

Data fields that are migrated from a demand to an entity when the selected entity is created from the demand.

Data migrated from a demand to a created project

Data fields are migrated from a demand to a project when the project is created from the demand.

Field type	Description
Demand	The following demand fields are migrated to a project: • Description • Business case • Investment Class • Investment Type • Risk of performing • Risk of not performing • Enablers • Barriers • In scope • Out of scope • Assumptions • Business Unit • Department • Impacted Business Units • Business Capabilities • Priority • Impact • Rate Model • Approved start date • Approved end date • Short description • Program • Domain • Goals • Strategies • Impacted Business Applications • Configuration item

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field type	Description
	• Company • Urgency • Project Manager • Project currency • Project calculation
Resource assignments	Resource assignments are migrated to a project by updating the task reference from the demand to the project. Resource assignments are migrated to a project by updating the task and planning item, if applicable, reference from the demand to the project. The start and end dates of the resource assignments are retained. The **Offset** of each assignment is the number of days between the start date of the task and the start date of the assignment. The offset is recalculated based on the project schedule. A demand does not have a schedule, so all days, including weekends, are counted in the offset. For a project, the offset for the associated resource assignments is calculated based on the working days defined in the project schedule. For more information about project schedules, see Project scheduling in Project Management. If actual hours are captured on a resource assignment, its offset is not recalculated, and a warning is added to the resource plan logs.
Requirements	Demand requirements.
Financial records	Financial records such as cost plans and breakdowns, benefit plans and breakdowns (monetary and non-monetary), and demand budgets are migrated to a project. This process updates the task reference from demand to project.
RIDAC	RIDAC entities are migrated to a project by updating the task reference from demand to project. The migrated entities include the risks, issues, decisions, project actions, request changes, and RIDAC_m2m records.
Assessment	The following assessment data fields are migrated to a project: • Risk • Value

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field type	Description
	• Score • T-Shirt size
Stakeholders	Stakeholder records.
Project Currency Financial	If the multicurrency feature is active, the project financial fields are calculated according to the project currency and reference rate.

Data migrated from demands to Enterprise Agile Planning (EAP) entities

Data fields are migrated from a demand to an EAP entity when the entity is created from the demand.

Data fields migrated from demand to EAP entity

Field type	Description
Demand	The following demand fields are migrated to the created entity: • Business Capabilities • Product • Primary target • Team • Demand manager • Description • Department • Priority • Approved start date • Approved end date • Short description • Primary goal • Strategic program • Service offering • Business service • Business applications • Score • Requested by • Capital expense • Operating expense • Start date • Program • Total planned cost

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data fields migrated from demand to EAP entity (continued)

Field type	Description
	• Investment Class • Portfolio • Investment Type • ROI % • Rate Model • Model ID • Expense type • Financial benefit
Resource assignments	The resource assignments of a demand are migrated to the created entity.
Financial records	Cost plans and breakdowns, benefit plans and breakdowns (monetary and non-monetary), and investment budgets are migrated to the created entity.
Attachments	Demand attachments.
Goal/target relationships	Goal/target relationships of the demand.

Multicurrency in Next Experience for Demand Management reference

The multicurrency features in Next Experience for Demand Management enable you to manage and track demand financials in multiple currencies. This section provides field references and explains how cost and benefit plan updates recalculate values in demand currency.

Multicurrency fields in demand forms

Multicurrency fields are available in the demand forms when the demand currency view is enabled.

Demand form

Demand form

Field	Description
Demand currency	Currency for managing and tracking the demand. This field is set to read-only after a cost plan, cost plan breakdown, benefit plan, or benefit plan breakdown is created.
Capital expense in demand currency	Capital expenditure (Capex) value of the demand.
Capital budget in demand currency	Total capital budget value allocated to the demand across all fiscal years.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Demand form (continued)

Field	Description
Operating expense in demand currency	Operational expenditure (Opex) value of the demand.
Operating budget in demand currency	Total operational budget value allocated to the demand across all fiscal years in the selected demand currency.
Total planned cost in demand currency	Estimated cost of the demand.
Financial return in demand currency	Estimated revenue of the demand.
Financial benefit in demand currency	Estimated revenue if the demand is approved.
Net present value in demand currency	Present value of future cash based on the annual interest rate. This field compares the money spent today against the financial benefits expected in the future. It enables evaluation of overall investment performance.
Actual cost in demand currency	Total cost incurred while working on a demand and its demand tasks.

Demand Task form

Demand task form

Field	Description
Demand currency	Currency for managing and tracking the demand. This field is set to read-only after a cost plan, cost plan breakdown, benefit plan, or benefit plan breakdown is created.
Actual cost in demand currency	Total cost incurred while working on a demand and its demand tasks.

Cost Plan form

Cost plan form

Field	Description
Demand currency	Currency for managing and tracking the demand. This field is set to read-only after a cost plan, cost plan breakdown, benefit plan, or benefit plan breakdown is created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cost plan form (continued)

Field	Description
Cost in demand currency	Rolled-up value from the **Entered cost** field of all cost plan breakdowns.

Cost Plan Breakdown form

Cost Plan Breakdown form

Field	Description
Demand currency	Currency for managing and tracking the demand. This field is set to read-only after a cost plan, cost plan breakdown, benefit plan, or benefit plan breakdown is created.
Cost in demand currency	Cost amount for the demand.
Demand currency exchange rate	Rate in effect for the period corresponding to the cost plan breakdown.
Demand currency exchange rate date	Reference date on which the currency exchange rate is applied for conversion.

Benefit Plan form

Benefit Plan form

Field	Description
Demand currency	Currency for managing and tracking the demand. This field is set to read-only after a cost plan, cost plan breakdown, benefit plan, or benefit plan breakdown is created.
Benefit in demand currency	Benefit incurred from the demand.
Actual benefit in demand currency	Actual benefit value of the demand.

Benefit Plan Breakdown form

Benefit Plan Breakdown form

Field	Description
Demand currency	Currency for managing and tracking the demand. This field is set to read-only after a cost plan, cost plan breakdown, benefit plan, or benefit plan breakdown is created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Benefit Plan Breakdown form (continued)

Field	Description
Benefit in demand currency	Benefit incurred from the demand.
Demand currency exchange rate	Rate in effect for the period corresponding to the benefit plan breakdown.
Demand currency exchange rate date	Reference date on which the currency exchange rate is applied for conversion.

Expense Line form

Expense Line form

Field	Description
Demand currency	Currency for managing and tracking the demand. This field is set to read-only after a cost plan, cost plan breakdown, benefit plan, or benefit plan breakdown is created.
Amount in demand currency	Expense cost amount for the expense line.

Project Funding form

Project Funding form

Field	Description
Capex budget in demand currency	Planned expense amount allocated for the capital expenditure of the demand.
Opex budget in demand currency	Planned expense amount allocated for the operating expenditure of the demand.
Total budget in demand currency	Sum of the Capex and Opex amounts.

Cost plan updates and cost recalculation in demand currency

Updating the unit cost, quantity, or fiscal period of a cost plan updates all related amount fields in the cost plan and its breakdowns. The amounts in the related demand fields are recalculated and reflected in the demand currency.

Unit cost, Quantity, and Recurring field changes

When you modify these fields in the Cost Plan form with multicurrency view enabled, the following values are recalculated:

- **Total planned cost** in demand currency.
- **Cost in demand currency** in the Cost Plan Breakdown.
- **Capital expense in demand currency**, **Operating expense in demand currency**, and **Total planned cost in demand currency** fields in the demand.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fiscal period changes

When you change the fiscal period (start date or end date) in the Cost Plan form, the following values are recalculated:

- **Total planned cost** and **Cost in demand currency** of the cost plan. Cost Plan Breakdown records can be added or removed.
- If the **Recurring** check box isn't selected, the **Cost in demand currency** value of each Cost Plan Breakdown record is recalculated.
- **Capital expense in demand currency**, **Operating expense in demand currency**, and **Total planned cost in demand currency** fields in the demand.

Cost plan breakdown changes

When you change the entered cost in an individual Cost Plan Breakdown record or manually add cost plan breakdowns to a cost plan, the following values are recalculated:

- **Total planned cost** of the cost plan in demand currency.
- **Capital expense in demand currency**, **Operating expense in demand currency**, and **Total planned cost in demand currency** fields in the demand.

Benefit plan updates and recalculation in demand currency

Updating the entered currency, entered benefit, offset type, or fiscal period of a benefit plan updates all related amount fields in the benefit plan and its breakdowns. The amounts in the related demand fields are recalculated and reflected in demand currency.

Entered currency, Entered benefit, and Recurring field changes

When you modify these fields in the Benefit Plan form with multicurrency view enabled, the following values are recalculated:

- **Total planned cost** in demand currency.
- **Benefit in demand currency** in the Benefit Plan Breakdown.
- **Financial benefit in demand currency** field in the demand.

Offset type changes

When you change the offset type (start date or end date) and specify the offset period and duration in the Benefit Plan form, the following values are recalculated:

- **Total planned benefit** and **Benefit in demand currency** of the benefit plan. Benefit Plan Breakdown records can be added or removed.
- If the **Recurring** check box isn't selected, the **Benefit in demand currency** value of each Benefit Plan Breakdown record is recalculated.
- **Financial benefit in demand currency** field in the demand.

Fiscal period changes

When you change the fiscal period (start date or end date) in the Benefit Plan form, the following values are recalculated:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Benefit in demand currency** and **Total planned benefit** of the benefit plan. Benefit Plan Breakdown records can be added or removed.
- If the **Recurring** check box isn't selected, the **Benefit in demand currency** of each Benefit Plan Breakdown record is recalculated.
- **Financial benefit in demand currency** field in the demand.

Benefit plan breakdown changes

When you change the entered benefit in an individual Benefit Plan Breakdown record, the following values are recalculated:

- **Benefit in demand currency** of the benefit plan.
- **Financial benefit in demand currency** field in the demand.

Inputs for AI skills

Learn about the inputs of each skill for the ServiceNow Otto for Strategic Portfolio Management application. By configuring the inputs for a skill, you can determine how and when a skill is used.

AI skill inputs overview

Depending on the selected skill, you can configure inputs. These settings determine how a skill is used. An input identifies the data that is used for a skill, such as the table and fields that are used to generate a demand summary. If you have the admin role and any input fields are editable, you can modify the input data for a skill.

Demand summarization skill inputs

The demand summarization skill includes the inputs that identify the table along with the fields and related lists that are used to generate the demand summary. The following table provides more details on the input data.

Input data for the demand summarization skill

Input	Description
Table	Demand [dmn_demand]
Fields	• Short description • Category • Type • Description • Investment Class • Investment Type • Submitted by • Demand manager • Expense type • Priority • Department • Business Unit

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Input data for the demand summarization skill (continued)

Input	Description
	• Business Capabilities • Impacted Business Applications • Risk of performing • Risk of not performing • Enablers • Barriers • In scope • Out of scope • Assumptions • Capital expense • Operating expense • Total planned cost • Financial return • Financial benefit • Capital budget • Operating budget • Impact • Risk • T-Shirt size • Value • Size • Score • Start date • Due date • Approved start date • Approved end date • Business case
Related lists	• Work notes • Demand tasks • Cost plans • Monetary benefit plans • Non-monetary benefit plans • Resource assignments

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Forms

Field information for forms used in Next Experience for Demand Management.

Action form

The action form enables you to create an action for a demand.

Action form

Field	Description
Number	System-generated number with a configurable prefix.
State	Current state of the action. Actions are created in the Open state. The available values are: • Pending • Open • Work in Progress • Closed Complete • Closed Incomplete • Closed Skipped
Priority	Urgency for implementing or approving the action based on impact. Actions are created with Low priority. The available values are: • Critical • High • Moderate • Low • Planning
Estimated Cost	Estimated cost generated by the action.
Impact	Impact of the action on the demand. Actions are created with Low impact. The available values are: • High • Medium • Low
Approval	Status of approval from the stakeholders. The available values are: • Not Yet Requested • Requested

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Action form (continued)

Field	Description
	• Approved • Rejected
Assigned to	Resource assigned to implement the action.
Due date	Requested date for action approval or implementation.
Parent	Demand associated with the action. This field is auto-populated.
Short description	Brief summary of the action.
Description	Brief description of the action and its impacts on the demand.
Work notes	Information about the action.

Cost plan form

The cost plan form enables you to create a cost plan for a demand.

Cost plan section

Field	Description
Name	Name of the cost plan.
Project/ Demand	Demand associated with the cost plan. This field is automatically set to the associated demand.
Start fiscal period	Starting fiscal period for the cost plan. When you change the start fiscal period, the associated cost breakdown values also change.
End fiscal period	Ending fiscal period for the cost plan. When you change the end fiscal period, the associated cost breakdown values also change.

Financials section

Field	Description
Entered currency	Currency to capture the unit cost value.
Total planned cost	Total planned cost value of the cost plan. • If the cost is recurring: Quantity × Unit cost × number of fiscal periods. • If the cost is non-recurring: Quantity × Unit cost.
Unit cost	Cost of single unit of the resource.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Financials section (continued)

Field	Description
Functional currency	Currency used for managing the demand.
Quantity	Quantity of units of resources.
Cost in functional currency	Total planned cost for the demand in functional currency. The value in this field changes if the entered currency is different from the functional currency.
Recurring	Indicates whether the cost is recurring for each fiscal period.
Total actual cost	Total actual cost of the cost plan. Value rolled up from cost breakdown.
Cost type	Category of cost associated with the plan.
Source	Funding entity funds. The field is available when you select a value in the **Source type** field. **Note:** This field appears only if the legacy Investment Funding (com.snc.investment_funding) plugin is activated or the Investment Funding (sn_invst_pln) application is installed.
Investment	Name of the investment created for the demand. **Note:** This field appears only if the legacy Investment Funding (com.snc.investment_funding) plugin is activated or the Investment Funding (sn_invst_pln) application is installed.
Source type	Funding entity type from which you request fund such as Project, Demand, and Epic. **Note:** This field appears only if the legacy Investment Funding (com.snc.investment_funding) plugin is activated or the Investment Funding (sn_invst_pln) application is installed.

Decision form

The decision form enables you to create a decision or plan for a demand to resolve or mitigate a risk or issue.

Decision form

Field	Description
Number	System-generated ID number with a configurable prefix.
State	Current state of the decision. Decisions are created in the Open state. The available values are: • Pending • Open

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Decision form (continued)

Field	Description
	• Work in Progress • Closed Complete • Closed Incomplete • Closed Skipped
Priority	Urgency of approving or implementing the decision based on the possible impact. Decisions are created with Low priority. The available values are: • Critical • High • Moderate • Low • Planning
Decision status	Status of the decision. The available values are Pending, Approved, and Rejected.
Impact	Impact of the decision on the demand. Decisions are created with Low impact. The available values are: • High • Medium • Low
Approval required	Indicates whether approval of the decision is required.
Estimated Cost	Estimated cost of implementing the decision.
Due date	Requested date for decision approval or implementation.
Assigned to	Resource assigned to work on the decision. The default value is the name of the user creating the decision is populated.
Parent	Demand associated with the decision. This field is auto-populated.
Short description	Brief summary of the decision.
Description	Brief description of the decision and its impacts on the demand.
Work notes	Information about the decision.

Demand experience form

The demand experience form information is used to create or update a demand experience.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Demand experience form fields

Field	Description
Label	Display name of the demand experience configuration.
Name	ID of the demand experience. Automatically derived from the Label field and is a read-only field.
Active	Indication of whether the demand experience is available to select on a demand. Active by default.
Description	Description of the demand experience configuration.
Table	Table this demand experience applies to. Defaults to the Demand [dmn_demand] table.
Dynamic category	Name of the dynamic category associated with this demand experience. The dynamic category defines the custom fields that appear alongside the default fields on demands that use this experience. These dynamic categories are configured by an EWD admin. For more information, see Create a dynamic category.
Form view	Form view that displays demand records that use this experience. If you don't select a form view, the APW Default view applies.

Show modules section of the demand experience form

Field	Description
AI overview	Option to show the AI overview module on demands that use this experience.
Details	Option to show the Details module on demands that use this experience.
Docs	Option to show the Docs module on demands that use this experience.
Financials	Option to show the Financials module on demands that use this experience.
Playbook	Option to show the Playbook module on demands that use this experience.
Resources	Option to show the Resources module on demands that use this experience.
Smart assessments	Option to show the Smart assessments module on demands that use this experience.

Note: Every module check box is selected by default when you create a demand experience. Clearing a check box hides that module in Next Experience for Demand Management for demands that use this experience.

Demand details form

The demand form information is used to update the Details tab of a demand.

Demand form fields

Field	Description
Name	Name of the demand.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Demand form fields (continued)

Field	Description
Category	Category of the demand: • Strategic: For demands for plans, such as projects or stories. These demands go through strategic evaluation and prioritization regardless of scope, from large initiatives, such as a project or epic, to smaller, well-defined changes, such as a story. • Operational: For demands for operational work, such as changes or defects. These demands address business-as-usual work that doesn't require strategic evaluation or prioritization.
Type	The **Category** field selection determines the selections available in the **Type** field. • The following demand types are available if the demand category is Strategic: ○ Enhancement ○ Project ○ Epic ○ Story ○ EAP Epic ○ EAP Feature ○ EAP Capability ○ No Conversion • The following demand types are available if the category is Operational: ○ Change ○ Defect ○ No Conversion If the Agile Development 2.0 application is active, the Story, Epic, Enhancement, and Defect options are available. If the Strategic Planning application is active, the EAP Epic, EAP Feature, and EAP Capability options are available. The No Conversion option enables you to use your demand to fund a large project that includes one or more projects, epic, or programs. A story represents a smaller strategic change that a product manager has scoped narrowly enough that it doesn't need further decomposition into an epic with child stories. The selections in the **Category** and **Type** field also determine the fields that are displayed in the Assessment Data section.
Project	Name of the project created from this demand. This read-only field is visible only when you convert the demand into a project.
Enhancement	Number of the enhancement created from this demand.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Demand form fields (continued)

Field	Description
	This read-only field is visible only when you convert the demand into an enhancement.
Epic	Name of the epic created from this demand. This read-only field is visible only when you convert the demand into an epic.
Story	Name of the story created from this demand. This read-only field is visible only when you convert the demand into a story.
Number	Unique, auto-generated identification number for the demand.
Approved start date	The formal date approved by stakeholders for starting the demand. This date is set after prioritization and stakeholder approval and represents the committed and authorized timeline for execution. It's used for governance and traceability. For example, the approved date to start the database upgrade is 2026-01-10. This field is carried forward to the **Approved start date** field of the Project form if the demand is converted to a project and remains unchanged, even if the project starts later. This field is highlighted in red if the date is different than the value in the **Start date** field. **Note:** If this field is empty while creating a demand, the date from the **Start date** field is inserted.
Approved end date	The formal date approved by stakeholders for completing the demand. This date is set after prioritization and stakeholder approval and defines the approved execution window and supports historical tracking. For example, the approved end date to complete the demand is 2026-02-15. This field is carried forward to the **Approved end date** field of the Project form if the demand is converted to a project and remains unchanged, even if the project ends later. This field is highlighted in red if the date in this field is different than the value in the **Due date** field. **Note:** If this field is empty while creating a demand, the date from the **Due date** field is inserted.
Planned start date	The preliminary or estimated date when the work is initially planned to begin. This date helps outline the intended timing for early demand planning and prioritization. You can set this date during initial demand creation or anytime in the planning phase when a rough idea forms. This date can be updated until the demand is officially approved. For example, you're planning for a database upgrade to start on 2025-11-01.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Demand form fields (continued)

Field	Description
Planned end date	The preliminary or estimated date when the planned work is expected to be completed. This date provides an expected completion window for planning and stakeholder communication. You can set this date anytime in the planning phase when a rough idea forms and can be updated until the demand is officially approved. For example, you're planning to complete the database upgrade by 2025-12-31.
Description	Description of the demand.

Details section of the Demand form

Field	Description
Portfolio	Portfolio indicating the business focus of the demand.
Program	Name of the program to which the demand belongs.
Investment Class	Type of investment class category assigned to the demand: • Run: Investment made to sustain the existing business. • Change: Investment made to implement a change in the business.
Investment Type	Investment type of the demand: • Cost Reduction • End User Experience • Legal and Regulatory • Revenue Generating • Service Sustaining • Strategic Enabler • Artificial Intelligence
Demand manager	Name of the demand manager.
Collaborators	Users who can edit or contribute to the demand. A demand requester can select any user as a collaborator.
Expense type	The type of the expense, either capex (capital expense) or opex (operational expense).
Priority	The priority of the demand.
Department	Department in a business unit to which the demand submitter belongs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Details section of the Demand form (continued)

Field	Description
	Note: If you don't select a department, the default value is the name of the department to which the submitter belongs.
Project Manager	Project manager that would be assigned to the project created from this demand. When a project is created, this field is set to read only. This field appears if the **Category** field is set to Strategic and the **Type** field is set to Project. If you delete the project created from this demand, this field becomes editable.
Business Unit	Business unit to which the demand submitter belongs.
Impacted Business Units	Business units affected by the submitted demand. The selected units could experience operational impact, process changes, technology adoption, and so on. For example, if a demand is submitted by the procurement business unit, it can impact the finance, legal, and IT business units.
Idea	Unique identification number of the idea from which the demand was created.
Business Capabilities	Business capabilities associated with the demand that links the demand to organizational goals and value. Business capabilities are defined in the Enterprise Architecture (formerly Application Portfolio Management) module.
Impacted Business Applications	If the demand is to change, enhance, or add one or more business applications, the applications associated with the demand. Business applications are defined in the Enterprise Architecture (formerly Application Portfolio Management) module. For more information, see Exploring business applications. You can select any business application in your enterprise regardless of whether it's related to a capability selected in the **Business Capabilities** field.
Business Applications	If the demand is to change, enhance, or add one or more business applications, the applications associated with the demand. Business applications are defined in the Enterprise Architecture (formerly

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Details section of the Demand form (continued)

Field	Description
	Application Portfolio Management) module. For more information, see Exploring business applications. You can select any business application in your enterprise regardless of whether it's related to a capability selected in the **Business Capabilities** field.

Business Case section of the Demand form

Field	Description
Strategic priority	Strategic objectives of the organization that the demand fulfills. A demand can fulfill multiple strategic objectives. If a business unit has been selected in the **Details** tab, the business strategies for the selected business unit along with other enterprise strategies are available for selection.
Primary goal	The primary goal associated with the strategy selected in the **Strategic priority** field. If a strategy hasn't been selected, all goals are available for selection.
Business case	Business arguments that support the demand.
Risk of performing	Risks if the demand is approved and implemented.
Risk of not performing	Risks if the demand isn't approved, for example, risk of loss of opportunity.
Enablers	Key enablers for the demand that would aid the demand to be completed. For example, clearly defined resource and cost plans.
Barriers	Major barriers to the demand that would obstruct the demand's completion. For example, incomplete or unclear demand details.
In scope	Scope of the demand, which is the set of boundaries that define the extent of a demand.
Out of scope	Activities or deliverables not in the scope of the demand. Anything not defined in the scope is out of scope.
Assumptions	Assumptions made for the demand. Assumptions help to define the scope and

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Business Case section of the Demand form (continued)

Field	Description
	risks, and fine-tune the estimates for time and cost.

Financials section of the Demand form

Field	Description
Rate Model	Rate model assigned to the demand. This setting is used to derive hourly rates for the associated resource assignments and time cards. For more information, see Rate Models. **Note:** If the rate model assigned to the demand is changed or removed, the cost fields on the associated resource assignments aren't recalculated.
Project Currency	Currency used to execute the project once the project is created from this demand. You can select any active currency from the values listed in the Currency [fx_currency] table. After you create a project in the selected project currency, you can't change the project currency in the Project form if the demand contains a cost plan, a benefit plan, or a project budget. If the demand has no attached plan or budget, you can change the project currency in the Project form. **Note:** The value of this field defaults to the **Project currency** field of the **Financials** tab in the project currency view of the Project form as well. This field is available only when the PPM Standard Multicurrency (com.snc.ppm_multicurrency) feature is activated and the **Demand Currency** view is enabled.
Capital expense	Capital expenditure (capex) for the demand.
Operating expense	Operational expenditure (opex) for the demand.
Total planned cost	Result calculated based on the values in the **Capital expense** and **Operating expense** fields.
Financial return	Result calculated based on the values in the **Total costs** and **Financial benefit** fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Financials section of the Demand form (continued)

Field	Description
Financial benefit	Estimate of revenue if the demand is approved. This value is rolled up from the benefit breakdown of the demand. You can also enter the value manually by selecting a currency icon and entering a value.
ROI %	ROI calculated based on the values in the **Total costs** and **Financial return** fields. This field is updated when a cost plan, benefit plan, or resource assignment is created or updated. The demand must be in the **Qualified** or **Approved** state.
Capital budget	Total capital budget allocated to the demand across all fiscal years. The value is rolled up from the capex budget of the demand.
Operating budget	Total operational budget allocated to the demand across all fiscal years. The value is rolled up from the opex budget of the demand.
Discount Rate %	Demand discount rate, which is the interest rate to determine the present value of future cash flows.
Net present value	Present value of future cash based on the given annual interest rate, a measure for comparing money spent today against future expected financial benefits. This value is useful when evaluating the overall investment performance. For example, at a 12% discount rate, $1.00 today is worth $0.80 in two years. Therefore, receiving $1.00 in two years is the same as receiving $0.80 today. Net present value (NPV) is calculated from total costs according to year, financial benefit per year, and the discount rate for the demand.
Internal rate of return %	Annual interest rate required to achieve an NPV of zero.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Financials section of the Demand form (continued)

Field	Description
	Internal rate of return (IRR) helps to determine which demands can deliver a higher rate of return in terms of revenue.
Demand Actual Cost	Total cost incurred while working on a demand and demand tasks. Demand actual cost is calculated after the assignee of the demand task creates and submits a time card. When the time card is approved, the resource rate, which is derived from the rate card, labor rate, or system properties, is used to populate this field.
Demand Actual Effort	Time accrued or spent by a resource while working on a demand or a demand task as derived from the submitted and approved time cards. This field isn't available on the Demand form by default.

Note: If you're creating a demand with the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin activated and the **Demand Currency** view enabled, then the fields in the **Financials** tab differ from the **Default** view. For more information about the fields that are available only in the Demand Currency view, see Multicurrency fields in demand forms.

Assessment Data section of the Demand form

Field	Description
Impact	Level of business impact created by the demand.
Risk	Risk value calculated from the demand assessment.
Value	Business value of the demand calculated from the **Impact** and **Financial return** fields.
T-Shirt size	Size of the demand. Before using this value as an indicator of demand size, consider creating and publishing definitions for each option outside the application. That process ensures that the values are interpreted correctly and consistently across the organization or department.
Score	The demand score is calculated based on the *risk*, *value*, and *size* attributes in the base system. The value of the *risk*, *value*, and *size* attributes are derived from the assessment

Assessment Data section of the Demand form (continued)

Field	Description
	metric category results. For more information, see assessment categories and assessment category results. • When the *risk* and *size* values are high, the score of the demand is low. • When the *value* setting is high, the score of the demand is high.
Assessment Required	Option for enabling the assessments for the demand. This option is active by default. Only a demand manager can update this value when the demand is in the Draft or Submitted state. **Note:** If this option isn't selected and you reset the demand to the Draft state, the option remains unselected. If smart assessments is enabled for the demand, this same field also determines whether a smart assessment is triggered when the demand reaches the Screening state. If this option isn't selected, the demand skips the assessment and moves directly to the Qualified state. For more information, see Assess demands with smart assessments

Note: The values in the **Value** and **Score** fields are updated when a cost plan, benefit plan, or resource assignment is created or updated for the Qualified or Approved demand. Updates stop after an artifact is created from the demand. Artifacts include projects, enhancements, defects, and changes.

Notes section of the Demand form

Field	Description
Watch list	The groups and users subscribed to the demand who can view the information in the **Additional comments** field.
Work notes list	The groups and users subscribed to the demand who can view the information in the **Work notes** field.
Work notes	Information about the demand. This information isn't visible to customers. Work notes are added throughout the demand management life cycle to communicate with other users associated with the demand.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Preferences section of the Demand form

Field	Description
Close Demand	Determines when to close the demand automatically if it's converted to a project. • **None**: Keeps the demand in the Open state after it's converted to a project. • **On creation of project**: Closes the demand when the demand is converted to a project. • **On closure of project**: Closes the demand when the project created from the demand is closed. **Note:** The **On creation of project** and **On closure of project** options appear when the value for the **Type** field is set to **Project**. If the **Type** field is set to **Enhancement**, the default setting is **None**.
Project calculation	Determines the calculation to use for task dependencies for the project when the demand is converted to a project. The default value is Automatic. • Manual: Task dates don't reflect any changes made to dependencies. • Automatic: Task dates are automatically updated to reflect any changes made to dependent or child tasks.

EAP Details section of the demand form

This section appears only if the selected type is an EAP entity.

Field	Description
Team	The planning team to which the created EAP entity is assigned. This field is set to read only after the EAP entity is created. This value is an optional value.
Converted to	The name of the created EAP entity. This field is read-only.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Associations section of the demand form

This section appears only if the AI Control Tower plugin is installed and the investment type of the demand is set to artificial intelligence.

Field	Description
Product	Product or system that the demand relates to.
Impacted AI systems	Impacted AI systems associated with the demand. You can select existing AI systems from the list or remove systems that are no longer relevant.

Demand stakeholder form

The Demand stakeholder form enables you to create a stakeholder record for a demand.

Demand stakeholder form

Field	Description
Stakeholder	Name of the stakeholder being added to the demand.
Demand	Demand to which the stakeholder is assigned.
Level of Interest	Level of interest that the stakeholder has in pursuing the demand. The available values are High, Medium, and Low.
Assessment recipient	Option that indicate whether the user is authorized to receive assessment questionnaires for a demand.
Approver	Option that indicates whether the user has authority to approve demands.
Influence	Level of influence the user has over the group assessing the demand. The available values are High, Medium, and Low.
Engagement	How the user is engaged with the demand. The available values are Supportive, Resistant, Neutral, and Leading.
Function	Optional description of the role or position of the stakeholder in the organization, such as portfolio manager, executive sponsor, or director of finance.

Demand task form

The Demand Task form enables you to create or modify a demand task.

Demand task form

Field	Description
Short description	Brief summary of the task.
Assignment group	Team or group responsible for handling the task.
Number	System-generated ID number with a configurable prefix.
Assigned to	Resource responsible for executing or progressing the task. The following conditions apply:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Demand task form (continued)

Field	Description
	• If an assignment group is defined, users in the assignment group are listed. • If skills are defined, users with those skills are listed. • Users with the timecard_user role are also listed.
Priority	Urgency and importance of the task such as high, moderate, or low.
Additional assignee list	Users assigned to the demand task and the single primary resource defined in the **Assigned to** field.
State	Current state of the demand task. All new demand task records are created in the **Open** state. The available values are: • Pending • Open • Work in Progress • Closed Complete • Closed Incomplete • Closed Skipped
Category	Category of the demand task. The available values are: • Initial review • Effort estimate • Cost estimate • Benefit estimate • Risk assessment
Due date	Expected completion date and time for the task.
Actual effort	Actual time spent on the demand task, derived from the approved time card. If this field doesn't appear by default, you need to customize the Demand Task form.
Actual cost	Actual cost of the demand task, derived from hours worked and the hourly rate defined in the rate card. If no rate card is defined, the hourly rate comes from the default labor rate card or default system property.
Description	Brief description of the demand task.
Work notes	Information about the demand task.

Expense line form

The expense line form enables you to create an expense line for the actual expenses for your demand.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Expense line

Field	Description
Number	Automatically generated number for the expense line.
Amount	Expense cost in the selected currency.
Date	Date on which the expense is generated.
Process date	Date on which the expense line is processed.
Rate card	Name of the rate card.
Inherited	Indicates whether the expense line is inherited from another expense line.
Parent	Parent expense line from which the expense line is inherited.
Rate type	Rate type for the expense line. This field is automatically populated based on the selection in the Rate card field.
State	State of the expense line. The available values are: • Pending • Processed
Source ID	Record that generated the associated cost.
Summary type	Business purpose of the expense line. The available values are: • Grow Business • Run Business • Transform Business
Cost plan	Associated cost plan name for recording the expense line. **Note:** This field does not apply to demands.
Expense type	Expense type of the expense line. The available values are: • Opex • Capex
Cost type	Cost type of the associated cost plan. **Note:** This field does not apply to demands.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Expense line (continued)

Field	Description
Short description	Brief summary of the expense line.
Source	Sources of the expense line. The available values are: • Asset • Configuration item • Fixed asset • Task • Contract • Cost center • User

Issue form

The issue form enables you to create an issue for a demand.

Issue form

Field	Description
Number	System-generated ID number with a configurable prefix.
State	Current state of the issue. Issues are created in the Open state. The available values are: • Pending • Open • Work in Progress • Closed Complete • Closed Incomplete • Closed Skipped
Priority	Urgency and importance of the issue based on the possible impact. Issues are created with Low priority. The available values are: • Critical • High • Moderate • Low • Planning
Estimated cost	Estimated cost generated by the issue.
Impact	Impact of the issue on the demand. Issues are created with Low impact.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Issue form (continued)

Field	Description
	The available values are: • High • Medium • Low
Due date	Requested date for issue resolution or closure. • If the issue has an assigned resource, the due date is for resolving the issue. • If the issue isn't assigned to any resource, the due date is for closing or addressing the issue.
Assigned to	Resource assigned to work on the issue.
Parent	Demand associated with the issue. This field is auto-populated.
Short description	Brief summary of the issue.
Description	Brief description of the issue and its impacts on the demand.
Work notes	Information about the issue.

Goal/target relationship form

The goal/target relationship form enables you to define how a goal relates to a demand.

Goal and target relationship form

Field	Description
Goal	Name of the goal.
Demand	Demand associated with the goal.
Target	Name of the target.
Primary	Option that indicates whether this goal is the primary goal associated with a demand. Only one can be designated as the primary goal.
Parent goal	Name of the parent goal that this goal contributes to.
Status	Status of the goal. The available values are Red, Yellow, Green, or None.
State	State of the goal. The available values are Draft, In progress, Approved, Complete, Pending, Achieved, or Not Achieved.
End date	End date for the goal. By default, the end date of the current quarter is populated. For a subgoal, the end date of its parent goal is populated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Goal and target relationship form (continued)

Field	Description
Start date	Start date for the goal. By default, the start date of the current quarter is populated. For a subgoal, the start date of its parent goal is populated.
Progress	Percentage completion for the goal. If the goal has subgoals or targets, the progress value is calculated automatically. For details about how the progress value is calculated, see Progress value calculation.
Category	Category of the goal. The available options are: • Total Applications • Total Cost • Opex • Capex • Cloud Applications • Homegrown Applications • Support Cost • Labor Cost • Standards Compliance • Strategic • Operational • Tactical • Artificial Intelligence

Monetary benefit plan form

The benefit plan form enables you to create monetary benefit plans for a demand.

Benefit plan form

Field	Description
Name	Name of the benefit plan.
Work	Demand associated with the cost plan. This field is automatically set to the associated demand.
Sponsor	Sponsor for the demand.
Category	Type of the monetary benefit. The available values are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Benefit plan form (continued)

Field	Description
	• Hard: Benefits measured in terms of revenue. • Soft: Benefits measured in terms of value.
Sub category	Subcategories of hard and soft benefits. The selection in the Category field determines the available options in this field.
Benefit type	Type of the benefit. The available values are: • Monetary benefits • Non-monetary benefits
Offset type	Indicates when the benefits start realizing. If the value in the selected offset type changes, the benefit plan start date shifts accordingly. The available values are: • None • Milestone • Start Date • End Date For example, set the offset type to End Date. If the demand due date changes, the benefit plan start date shifts to align with the new due date.
Start fiscal period	Starting fiscal period. Populated based on values in the Offset field relative to the selected demand start date or demand end date, and the Duration in period values. The field is editable if you select None in the Offset type field. When you change the start fiscal period, the associated benefit breakdown values also change.
End fiscal period	Ending fiscal period. When you change the end fiscal period, the associated benefit breakdown values also change.
Associated benefit	Benefits associated with this benefit plan.
Description	Summary of the benefit plan.

Financials section

Field	Description
Entered benefit	Estimated amount of the potential benefit.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Financials section (continued)

Field	Description
	Any change in the planned benefit on the benefit plan updates the associated benefit breakdown values for future fiscal periods.
Entered currency	Currency for the benefit plan. If the selected currency differs from the default currency configured in the Financial Management application, the budget reference rate is used to calculate the financial benefit of the demand. For more information, refer to budget reference rate.
Functional currency	Default currency configured in the Financial Management application and used for managing the demand.
Total planned benefit	Total benefit value rolled up from the benefit breakdown.
Benefit in functional currency	Benefit incurred from the demand in functional currency. The value in this field changes if the Entered currency differs from the functional currency.
Actual benefit	Actual benefit value rolled up from the actual benefit in the benefit breakdown.
Recurring	Indicates if the benefit is recurring for each fiscal period in the benefit breakdown.

Non-monetary benefit plan form

The non-monetary benefit plan form enables you to create non-monetary benefit plans for a demand.

Non-monetary benefit plan form

Field	Description
Name	Name of the benefit plan.
Work	Demand associated with the cost plan. This field is automatically set to the associated demand.
Sponsor	Sponsor for the demand.
Category	Type of the non-monetary benefit: • Hard: Benefits measured in terms of revenue. • Soft: Benefits measured in terms of value.
Sub category	Subcategories of hard and soft benefits. The selection in the Category field determines the available options in this field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Non-monetary benefit plan form (continued)

Field	Description
Benefit type	Type of the benefit. The available values are: • Monetary benefits • Non-monetary benefits
Offset type	Indicates when benefits start to accrue. If the value in the selected offset type changes, the benefit plan start date shifts accordingly. The available values are: • None • Milestone • Start Date • End Date For example, if the offset type is set to End Date and the demand due date changes, the benefit plan start date shifts accordingly.
Start fiscal period	Starting fiscal period. Populated based on values in the Offset field relative to the selected demand start date or demand end date, and the Duration in period values. The field is editable if you select None in the Offset type field. Changing the start fiscal period also updates the associated benefit breakdown values.
End fiscal period	Ending fiscal period. Changing the end fiscal period also updates the associated benefit breakdown values.
Associated benefit	Benefits associated with this benefit plan.
Description	Summary of the benefit plan.

Non-monetary details

Field	Description
Non-monetary entered benefit	Estimated amount of the potential benefit. Changes to the planned benefit update the associated benefit breakdown values for future fiscal periods.
Measure	Type of measure for the non-monetary benefit plan. The available values are: • Count • Percentage • Hours

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Non-monetary details (continued)

Field	Description
	• Days • Score The Yes/No options are used to track the benefits that aren't quantifiable. When this option is selected, the only field available is Benefits achieved. You can select the Benefits achieved check box to indicate that the benefits have been achieved.
Benefits achieved	Indicates whether the benefit is achieved.
Non-monetary planned benefit	Estimated value of the potential benefit. Changes to the planned benefit update the associated benefit breakdown values for future fiscal periods only.
Breakdown type	Type of breakdown creation when you save the benefit plan. The available values are: • None: No breakdowns are created. • Automatic: A non-monetary benefit plan breakdown record is created automatically with data. The breakdown is calculated linearly. • Manual: A non-monetary benefit plan breakdown record is created automatically but without data in the entered benefit column.
Non-monetary actual benefit	Actual benefit value rolled up from the actual benefit in the benefit breakdown.
Aggregation mode	Determines how the roll-up happens from breakdowns to the benefit plan and updates the values in the Non-monetary planned benefit and Non-monetary actual benefit fields. The available values are: • Sum: Aggregates data from all breakdowns. • Average: Average value from all breakdowns. • Most recent: Recent breakdown value. • Max: Maximum value among the breakdowns. • Min: Minimum value among the breakdowns.

Request change form

The request change form enables you to request for a change in the demand.

Request change form

Field	Description
Number	System-generated ID number with a configurable prefix.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request change form (continued)

Field	Description
State	Current state of the change request. Change requests are created in the Open state. The available values are: • Pending • Open • Work in Progress • Closed Complete • Closed Incomplete • Closed Skipped
Priority	Urgency for approving the requested changes based on impact. Change requests are created with Low priority. The available values are: • Critical • High • Moderate • Low • Planning
Estimated Cost	Estimated cost generated by the requested changes.
Impact	Impact of the change on the demand. Change requests are created with Low impact. The available values are: • High • Medium • Low
Approval	Status of approval from the stakeholders. The available values are: • Not Yet Requested • Requested • Approved • Rejected
Assigned to	Resource assigned to work on the change request.
Due date	Requested date to complete the change request.
Category	Entity associated with the change request. The available values are: • Resource • Scope

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request change form (continued)

Field	Description
	• Cost • Schedule
Parent	Demand associated with the change request. This field is auto-populated.
Title	Title for the change request.
Description	Brief description of the change request and its impacts on the demand.
Business Justification	Reason for requesting the proposed change to the demand.
Work notes	Information about the change request.

Requirement form

The requirement form enables you to create or modify requirements for a demand.

Requirement form

Field	Description
Number	Unique identification number for the requirement. This number is automatically generated when an entry is created.
Source	User requesting the requirement. This field is automatically set to the name of the user filling out the form. The source can be a different user who identified the requirement.
Owner	User responsible for managing or fulfilling the requirement. This field is automatically set to the name of the user filling out the form. The owner can be a different user who is identified to manage the requirement.
Estimated effort	Approximate effort required to fulfill the requirement and any associated tasks.
Priority	Urgency and importance of the requirement. Requirements are created with the Low priority. The available values are: • Critical • High • Moderate • Low • Planning
State	Current state of the requirement. Requirements are created in the Pending state. The available values are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Requirement form (continued)

Field	Description
	• Pending • Approved • Rejected **Note:** This state is independent of the demand state and the states of any planned tasks associated with the requirement. The demand can be completed without closing the requirement. Closing the demand doesn't change the state of the requirement.
Type	Type of the requirement. The available values are: • Business • Solution (Functional) • Solution (Non-Functional) • Quality • Stakeholder • Transition
Short description	Brief description of the requirement.
Description	Detailed description of the requirement and any associated tasks. For example, description of an expected outcome or result of the requirement.

Resource assignment form

The resource assignment form enables you to create a resource assignment record for a demand.

Resource assignment form

Field	Description
Assignment type	Type of the resource assignment, either User or Group.
Resource	Resource assigned to work on the demand. **Note:** This field is not available when the Assignment type value is Group.
Group	Group assigned to work on the demand. If a resource is selected, the primary group of the resource is populated by default.
Role	Primary role of the resource.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Resource assignment form (continued)

Field	Description
	If a resource is selected, the primary role of the resource is populated by default. This field is disabled for Group assignment.
Skill	Primary skill of the resource, such as Networking or UX design. The values listed in this field are dependent on the Group and Role fields.
Effort type	Type of effort requested from a resource. The available values are: • Hours • FTE **Note:** The value of a FTE (full time employee) unit is eight hours. • Person days
Effort	Count of the required effort in terms of hours, FTEs, or person days.
Name	Custom name of the resource assignment.
Task	Demand associated with the resource assignment. This field is auto-populated.
Start date	Start date of the resource to work on the demand. This field is populated with the planned start date of the demand by default.
End date	End date of the resource to work on the demand. This field is populated with the planned end date of the demand by default.
Resource status	Status of the resource assignment. The available values are: • Pending • Approved • Unapproved • Unassigned
Rate override	Option that indicates whether to override the resource rate to match the organization requirements.
Ready for review	Indicates whether the resource assignment request is finalized and ready for the resource

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Resource assignment form (continued)

Field	Description
	manager's review for allocation. The available values are Yes and No.
Notes	Information about the resource assignment.

Risk form

The risk form enables you to define a risk for a demand.

Risk form

Field	Description
Number	System-generated ID number with a configurable prefix.
State	Current state of the risk. Risks are created in the Pending state. The available values are: • Pending • Open • Work in Progress • Closed Complete • Closed Incomplete • Closed Skipped
Risk status	Status of the risk. Risks are created in the Pending status. The available values are: • Pending • Achieved • Not Achieved • Avoid • Mitigate • Transfer • Accept
Probability	The likelihood that the event described in the risk can occur. Risks are created with Low probability. The available values are: • Absolute • High • Moderate • Low
Impact	Impact of the risk on the demand. Risks are created with Low impact. The available values are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Risk form (continued)

Field	Description
	• High • Medium • Low
Estimated cost	Estimated cost generated by the risk.
Risk rank	Combination of value and color assigned to the risk. This value is calculated using the Probability and Impact values.
Risk owner	Resource responsible for monitoring and managing the risk.
Assigned to	Resource responsible for resolving or mitigating the risk.
Risk value	Value for the specified risk impact and probability combination.
Due date	Requested date for risk resolution or closure. • If the risk has an assigned resource, the due date is for resolving the risk. • If the risk isn't assigned to any resource, the due date is for closing or addressing the risk.
Task	Demand associated with the risk. This field is auto-populated.
Short description	Brief summary of the risk.
Description	Brief description of the risk and its impacts on the demand.
Mitigation plan	Brief description of the efforts taken to mitigate the risk.
Work notes	Information about the risk.

Risk value lookup form

The risk value lookup form information is used to rate the impact and probability of a risk.

Risk value matcher form

Field	Description
Impact	Impact value of the risk. The available values are: • 1 = High • 2 = Medium • 3 = Low
Application	The application to which these risk values belong.
Risk Rank Color	Color to indicate the severity of the risk.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Risk value matcher form (continued)

Field	Description
	Tip: You can enter variations of a color to differentiate between risks with similar impact and probability values. For example, you could enter light green to indicate a low-severity risk.
Risk Value	The value for the specified risk impact and probability combination. The available values are High, Medium, and Low. This value is displayed in the **Risk value** field of the Risk form.
Probability	Risk probability value associated with the impact value of the risk. The available options are Absolute, High, Moderate, and Low. The value in this field is multiplied by the value of the **Impact** field to generate the values for the **Risk rank** and corresponding **Risk value** fields in the Create New Risk form.
Probability Number	Numerical value to indicate the probability of the risk. This value is multiplied by the value of the **Impact** field to calculate the risk rank. The available values are: • 1 = Absolute • 1 = High • 2 = Moderate • 3 = Lows

Stakeholder register form

The stakeholder register form information is used to add users to the stakeholder registry.

Stakeholder register form

Field	Description
Number	Unique identification number for the stakeholder. This number is automatically generated when a new entry is created.
User	Name of the user being added to the stakeholder registry.
Portfolio	Portfolio to which the user is assigned.
Level of Interest	Level of interest that the stakeholder has in pursuing the demand. The available values are High, Medium, and Low.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Stakeholder register form (continued)

Field	Description
Assessment recipient	Indicates whether the user is authorized to receive assessment questionnaires for a demand.
Approver	Indicates whether the user has authority to approve demands.
Influence	Level of influence the user has over the group assessing the demand. The available values are High, Medium, and Low.
Engagement	Indicates how the user is engaged with the demand. The available values are Supportive, Resistant, Neutral, and Leading.
Function	Optional description of the role or position of the stakeholder in the organization, such as portfolio manager, executive sponsor, or director of finance.

Next Experience for Demand Management key terms

Important terms in Next Experience for Demand Management are listed in the table.

Next Experience for Demand Management Key Terms

Term	Description
Portfolio	A collection of demands managed as a group to achieve strategic and operational objectives.
Assessable record	A demand record that you want to evaluate for metric type demand. You evaluate the assessable records with metric categories and metrics, which define traits and values to assess.
Metric	A trait or value used to evaluate assessable records. A metric can measure subjective values in an assessment questionnaire or gather objective values in a database query run by a script. Examples of metrics include perceived value of demands and return on investment for a demand.
Metric type	A characteristic that defines a set of records you want to evaluate. Demand management comes with the metric type demand, which uses records from the Demand [`dmn_demand`] table.
Metric category	A theme for evaluating assessable records. Categories contain one or more individual metrics, which define specific traits or values that comprise the theme. Examples of categories include return on investment and cost. Set filter conditions to control which assessable records to evaluate for the metrics in a category.
Stakeholder	A person affected by the demand or who has interest in the demand.
Scorecard	A visual breakdown on performance of an assessable record based on assessment results.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Next Experience for Demand Management Key Terms (continued)

Term	Description
	Use scorecards to view various data summaries for one assessable record and to compare the ratings with other assessable records.
Requirement	An extra item that must be present or an extra action item that must be finished before a demand request closes.
Demand Task	A unit of work, created within a demand, to break down initial planning activities before converting the demand into a project. A demand task isn't a planned task like a project task.
Demand experience	A configuration record that defines a governance process, such as Marketing or IT. It controls the form view, modules, and dynamic attributes that appear on a demand using that experience. For more information,see Demand experiences.
Demand dynamic category	A set of dynamic attributes that can be applied to a demand through its selected demand experience.
Smart assessment	An assessment automatically created from a template and scored when a demand reaches the Screening state, replacing the classic assessment instances and assessment results workflow. For more information, see Assess demands with smart assessments.

RIDAC

RIDAC (Risk, Issue, Decision, Action, Change) in Strategic Planning Workspace gives you complete control over planning uncertainties across your entire organization. Create, track, and manage risks, issues, decisions, actions, and changes—from individual planning items and strategic goals to agile teams and portfolios. Get a unified view across your entire planning hierarchy, stay aligned with organizational strategy, and make informed decisions at every level.

Exploring RIDAC in Strategic Planning Workspace

RIDAC (Risk, Issue, Decision, Action, Change) in Strategic Planning Workspace provides a holistic, portfolio-wide view of all risks, issues, decisions, actions, and changes across your entire organization—from individual projects to programs and portfolios.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

RIDAC overview

RIDAC (Risk, Issue, Decision, Action, and Change request) in Strategic Planning Workspace provides a unified view of all RIDAC records across your portfolio hierarchy. Strategic Planning Workspace delivers a holistic perspective that helps teams identify and manage risks, resolve issues, document decisions, track actions, and monitor changes across all planning items, goals, and EAP (Enterprise Agile Planning) iterations—without navigating between multiple records.

RIDAC users

User	Description
Portfolio manager	Portfolio managers use the holistic RIDAC view in Strategic Planning Workspace to understand all risks, issues, decisions, actions, and changes across their entire portfolio. They monitor rolled-up RIDAC records from projects and programs to identify cross-project risks, validate portfolio-level decisions, and ensure alignment between operational activities and strategic objectives.
Program manager / PMO leader	Program managers create and manage RIDAC records on their programs and view RIDAC that rolls up from child projects. They assess how project-level risks, issues, and changes impact program delivery and strategic goals. PMO leaders use RIDAC to enforce governance, track decision documentation, and maintain issue resolution workflows across the organization.
Project manager / Team lead	Project managers create and manage RIDAC records on their projects. They track risks and issues affecting project delivery, document decisions that shape project direction, maintain action item lists, and register change requests. They can optionally associate RIDAC records with planning items, goals, or EAP iterations to link operational work to strategic priorities.
Strategy leader / Executive sponsor	Strategy leaders and executive sponsors use the unified RIDAC view to assess portfolio-wide risks to strategic objectives, review decisions that impact multiple initiatives, and monitor action status across the organization.

RIDAC benefits (continued)

Benefit	Feature	Users
Connect operational RIDAC to strategic objectives by linking to planning items, goals, or EAP iterations	RIDAC entity associations (planning items, goals, EAP iterations)	Project managers, program managers, strategy leaders
Track RIDAC across both alignment and execution project systems with automatic cross-system reference population	Execution and alignment integration for RIDAC	Project managers with dual project management systems

RIDAC integration with planning and execution Items

When integration is enabled, RIDAC items maintain a bidirectional link between planning items (demands and projects) and execution items (tasks). This means:

- **Create a RIDAC on a planning item** - Execution details from any linked execution task automatically populate on the RIDAC record.
- **Create a RIDAC on an execution item** - Planning item details automatically populate on the RIDAC record.

Because the link is bidirectional, a RIDAC item created from either context—planning or execution—contains both planning and execution information, giving stakeholders a complete view of risks, issues, decisions, actions, and changes across the planning and delivery lifecycle.

Example: If you add a RIDAC item to a project, you can view the same RIDAC item details in the project workspace. This ensures that planning stakeholders and execution teams see the same risk, issue, decision, action, or change data without duplicating work.

Comparing RIDAC feature between Strategic Planning and Portfolio Planning

Strategic Planning Workspace extends RIDAC capabilities beyond what is available in Portfolio Planning. The following comparison shows the key differences in supported entities and features.

- Portfolio Planning: Create and manage RIDAC items for projects and demands to track risks, issues, decisions, actions, and changes across your portfolio. For more information, see Using RIDAC in Strategic Planning Workspace.
- Strategic Planning: Create and manage RIDAC items for all planning item types (projects, demands, epics, capabilities, features, and custom planning items), goals, and EAP iterations. You also gain access to AI-generated RIDAC capabilities and expanded governance controls.

What to explore next

To learn more about configuring and using RIDAC Strategic Planning Workspace, see:

- Populate planning items on RIDAC records — Run the scheduled job to populate the planning item field on RIDAC records created before the latest release. This ensures legacy RIDAC records appear correctly in related lists and reports.
- View RIDAC records for planning items, goals, or EAP — View different RIDAC records by planning scope (All RIDAC, Project RIDAC, RIDAC by Portfolio, or RIDAC by Program) from a single centralized view.
- Create RIDAC for a planning item — Create and associate Risk, Issue, Decision, Action, or Change items directly with planning items (projects, demands, epics, features, or custom planning items) to manage planning uncertainties and dependencies.
- Create RIDAC for a goal — Create and associate Risk, Issue, Decision, Action, or Change items directly with portfolio plan goals or goals on a board (Strategy and Goals) to manage goal-level planning challenges.
- Create RIDAC for an EAP iteration — Create and associate Risk, Issue, Decision, Action, or Change items directly with Enterprise Agile Planning (EAP) iterations to manage iteration-level planning risks and agile execution challenges.
- Export RIDAC list — Export a filtered list of RIDAC records to Excel, PDF, CSV, or JSON format. You can download the file directly or send it via email to share RIDAC information with stakeholders.

Configuring RIDAC in Strategic Planning Workspace

Run the scheduled job to populate the planning item field on RIDAC records that were created before the Strategic Planning was installed. This job ensures legacy RIDAC records appear correctly in related lists and reports.

Configuration overview

The primary administrative task for RIDAC in Strategic Planning Workspace is to populate planning items on the existing RIDAC records. This ensures that all RIDAC items created in your system are properly linked to their associated planning items and appear correctly in the RIDAC home page, filter views, and integration points. For step-by-step instructions, see Populate planning items on RIDAC records.

RIDAC configuration benefits

Populating planning items on RIDAC records provides the following benefits:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Complete RIDAC visibility:** RIDAC items appear correctly in the RIDAC home page and all filter views (All RIDAC, Project RIDAC, Portfolio RIDAC, Program RIDAC).
- **Proper planning item linkage:** All RIDAC records are linked to their associated planning items (projects, demands, goals, iterations), ensuring data integrity across the system.
- **Accurate reporting and analysis:** Planning item information is populated on RIDAC records, enabling accurate filtering, sorting, and analysis across portfolio, program, and project hierarchies.
- **Seamless integration:** When integration is enabled, RIDAC items created on planning items automatically appear on execution tasks, and vice versa, maintaining bidirectional synchronization.
- **Legacy record support:** Legacy RIDAC records are properly integrated into the new RIDAC structure so they appear consistently across all views.

Populate planning items on RIDAC records

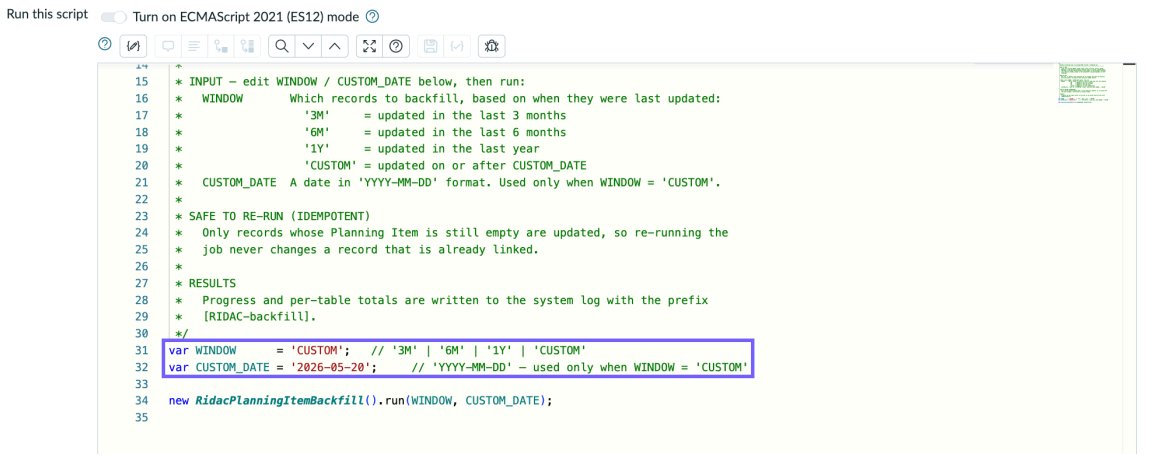
Run the scheduled job to populate the planning item field on RIDAC records that were created before the Strategic Planning was installed. This job ensures legacy RIDAC records appear correctly in related lists and reports.

Before you begin

Role required: admin

Important: This is a one-time job and is not meant to be run on a recurring schedule.

About this task



RIDAC records created before the Strategic Planning installation have an empty planning item field. These records don't appear in core project related lists until the planning item is populated. The *Update planning item on RIDAC tables* scheduled job automatically updates the planning item field on the existing RIDAC records based on a configurable time window.

Procedure

1. Navigate to **System Administration** > **Scheduled Jobs**.
2. Search and select the *Update planning item on RIDAC tables* scheduled job.
3. On the Scheduled Script Execution form, ensure that the **Run** field is set to **On Demand**.
4. Set the time window variable to control which RIDAC records are included in the backfill:
   a. **3M** — Update RIDAC records created or updated in the last 3 months
   b. **6M** — Update RIDAC records created or updated in the last 6 months
   c. **1 year** — Update RIDAC records created or updated in the last 12 months
   d. **Custom** — Specify a custom start date and time
   The time window filter helps optimize performance by limiting the backfill to recent records. If your organization has a large number of RIDAC records (for example, 700,000+), older records (>1 year old) may be stale. These older records may no longer require updating. Select the time window that best matches your organizational needs. When you select *CUSTOM*, you must also set the *CUSTOM_DATE* variable in the script to specify the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

start date in YYYY - MM - DD format. This variable is ignored for all other window options.

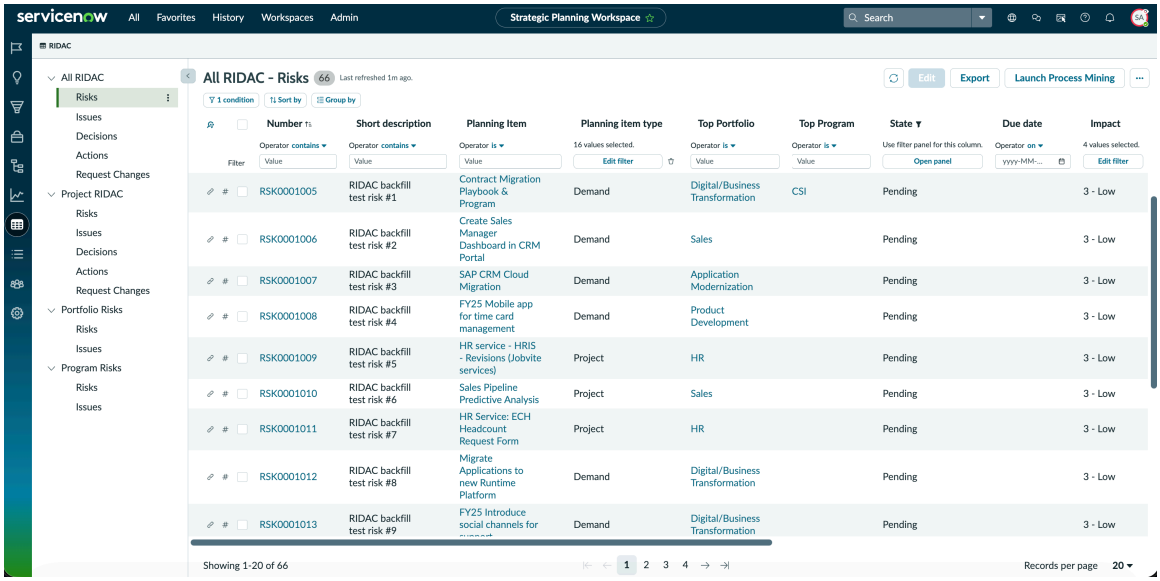
5. Select **Execute Now**.

Result

The scheduled job runs and stamps the planning item details on all existing RIDAC records that are part of the time periods selected in the time window variable.

Using RIDAC in Strategic Planning Workspace

Access and filter risks, issues, decisions, actions, and changes from a centralized RIDAC home page. Use multiple filtering levels organized by planning scope to focus on the RIDAC items most relevant to your role.



Roles required for using RIDAC

Access level	Required role
Read access to RIDAC	sn_align_ws.ridac_read_only
Edit access to RIDAC	sn_align_ws.ridac_user

Overview of RIDAC home page

The RIDAC home page provides a centralized view of all risks, issues, decisions, actions, and changes across your strategic planning portfolio. The interface is organized into four filtering tabs, each designed to help different roles quickly locate and focus on the RIDAC items most relevant to their planning responsibilities.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The RIDAC home page offers multiple filtering tabs to accommodate different roles and planning scopes. Project managers, portfolio managers, and program managers each need focused views of planning risks and issues. By providing separate tabs for project, portfolio, and program contexts—alongside a comprehensive all-items view—the interface makes it easier to filter and analyze RIDAC items relevant to your specific planning responsibilities.

Access and Visibility: Each RIDAC tab displays only the items you have access to based on your user permissions and role assignments. Your visibility is determined by your access to the underlying planning items and their associated RIDAC records.

The four RIDAC filtering tabs are:

- **All RIDAC** — Displays every risk, issue, decision, action, and change that you have access to across your entire planning portfolio. This view includes RIDAC items created on all planning item types—projects, demands, features, product areas, and more. Use this tab for a comprehensive overview of all planning uncertainties and dependencies you're responsible for, regardless of their planning scope or parent type.
- **Project RIDAC** — Shows only RIDAC items created on project planning items. Use this tab when you want to focus on risks, issues, decisions, actions, and changes specific to projects without viewing items from other planning item types.
- **RIDAC by Portfolio** — Displays risks, issues, and decisions at the portfolio level. These are created for execution items within the portfolio or roll up from them. All items shown have a portfolio as the top-level parent. Use this tab to review portfolio-level risks, decisions, and cross-project impacts.
- **RIDAC by Program** — Displays risks, issues, and decisions at the program level. These are created directly on the program or roll up from execution items within the program. All items shown have a program as the top-level parent. Use this tab to review program-level risks, decisions, and interdependencies.

Using RIDAC

Using RIDAC in Strategic Planning Workspace allows you to manage planning risks, issues, decisions, actions, and changes across your entire portfolio hierarchy. You can view RIDAC items from a centralized home page with multiple filtering options, or create new RIDAC items directly from planning items (projects, demands, epics, features, and custom planning items), strategic goals, or EAP iterations. Whether you're tracking cross-project impacts at the portfolio level or managing iteration-level execution challenges, RIDAC helps you maintain visibility of planning uncertainties and dependencies throughout your organization.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- View RIDAC records for planning items, goals, or EAP

  View different RIDAC records by planning scope (All RIDAC, Project RIDAC, RIDAC by Portfolio, or RIDAC by Program) from a single centralized view.

- Create RIDAC for a planning item

  Create and associate Risk, Issue, Decision, Action, or Change items directly with planning items (projects, demands, epics, features, or custom planning items) to manage planning uncertainties and dependencies.

- Create RIDAC for a goal

  Create and associate Risk, Issue, Decision, Action, or Change items directly with portfolio plan goals or goals on a board (Strategy and Goals) to manage goal-level planning challenges.

- Create RIDAC for an EAP iteration

  Create and associate Risk, Issue, Decision, Action, or Change items directly with Enterprise Agile Planning (EAP) iterations to manage iteration-level planning risks and agile execution challenges.

- Export RIDAC list

  Export a filtered list of RIDAC records to Excel, PDF, CSV, or JSON format. You can download the file directly or send it via email to share RIDAC information with stakeholders.

View RIDAC records for planning items, goals, or EAP

Access and view risks, issues, decisions, actions, and changes from the RIDAC home page. Filter RIDAC records by planning scope and type to focus on the items relevant to your needs.

Before you begin

Role required: sn_align_core.apw_user, sn_apw_advanced.spw_goal_user, or/and sn_apw_advanced.eap_user

About this task

The RIDAC home page provides a centralized view of all risks, issues, decisions, actions, and changes across your strategic planning portfolio. From this single view, you can access and filter RIDAC records by planning scope and type to focus on items relevant to your role and responsibilities.

Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace** > **RIDAC**.
   The RIDAC home page opens, displaying all RIDAC records you have access to in a list view.
2. From the left navigation panel, select a filtering option to view different RIDAC records:
   - **All RIDAC** — to view all risks, issues, decisions, actions, and changes across all planning item types, goals, and EAP iterations.
   - **Project RIDAC** — to view only RIDAC items created on project planning items.
   - **RIDAC by Portfolio** — to view only risks, issues, and decisions where a portfolio is the top-level parent.
   - **RIDAC by Program** — to view only risks, issues, and decisions where a program is the top-level parent.

   The RIDAC records are filtered based on your selection, and the list updates to show only the relevant items.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. **Optional:** Select the RIDAC type you want to view from the left navigation panel.
   Expand the selected filtering option to view records by specific RIDAC type (Risks, Issues, Decisions, Actions, or Request Changes).
   The view updates to show only RIDAC records of the selected type.
4. **Optional:** To further refine the view, use the filtering options at the top of the list:
   - Select **1 condition** to set conditions for filtering records (for example, by state, priority, or owner).
   - Select **Sort by** to sort records by a specific column (for example, by due date or impact).
   - Select **Group by** to group records by a specific field (for example, by planning item type or top portfolio).

   The list is filtered, sorted, or grouped based on your selections, making it easier to find and analyze the RIDAC records you need.
5. To view details of a specific RIDAC record, select the record's number or title in the list.
   The RIDAC record details page opens, displaying the full information about the selected RIDAC item.

Result
You can now view and access different RIDAC records from the RIDAC home page, filtering by planning scope and type to focus on items relevant to your needs.

Create RIDAC for a planning item

Create a Risk, Issue, Decision, Action, or Change item and associate it with a planning item in the Strategic Planning Workspace.

Before you begin
Role required: sn_align_core.apw_user

About this task
You can create a RIDAC item directly from a planning item to document and track risks, issues, decisions, actions, and changes that affect your strategic plans. RIDAC items help you manage planning uncertainties and dependencies across your portfolio.

Procedure
1. Navigate to **Workspaces** > **Strategic Planning Workspace** > **Portfolio Planning**.
   The Portfolio Planning view opens, displaying the list of portfolio plans.
2. From the list of portfolio plans, select one and then select **Planning**.
   The Planning view opens, showing the planning items within the selected portfolio.
3. From the **Prioritization**, **Roadmap**, **Kanban**, or **Hierarchy** tab, select a planning item to which you want to create a RIDAC item.
   If you selected the planning item from the **Roadmap** or **Kanban** tab, click **Full details** in the side panel to open the Details page of the planning item.
   The Details tab of the planning item opens.
4. On the planning item Details page, select the tab for the RIDAC type you want to create:
   - **Risks** — to create a risk item.
   - **Issues** — to create an issue item.
   - **Decision** — to create a decision item.
   - **Actions** — to create an action item.
   - **Request Changes** — to create a change item.

   The selected RIDAC tab opens.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select **New**.
   The RIDAC creation form opens with the planning item information automatically populated.
6. On the form, fill in the required fields for the RIDAC item.
   For a description of the field values, see the form.
   - For a Risk, see RIDAC Risk form.
   - For an Issue, see RIDAC Issue form.
   - For a Decision, see RIDAC Decision form.
   - For an Action, see RIDAC Action form.
   - For a Change Request, see RIDAC Change Request form.
7. Select **Save** to save the record.

Result
A RIDAC item has been created and is now associated with the planning item.

What to do next
After creating a RIDAC item, you can:

- Edit the RIDAC item to add more details, assign ownership, or set status and priority.
- View the RIDAC item in the RIDAC home page by filtering by the appropriate tab (All RIDAC, Project RIDAC, Portfolio RIDAC, or Program RIDAC).
- If integration is enabled and an execution task is linked to the planning item, view the RIDAC item on the execution task as well.

Create RIDAC for a goal

Create a Risk, Issue, Decision, Action, or Change item and associate it with a portfolio plan goal or a goal that is part of a board (Strategy and Goals).

Before you begin
Role required: sn_apw_advanced.spw_goal_user

About this task
You can create a RIDAC item directly from a goal to document and track risks, issues, decisions, actions, and changes that affect your strategic goals. Goals can be portfolio plan goals or goals that are part of a board (Strategy and Goals). RIDAC items help you manage planning uncertainties and dependencies across your goals.

Procedure
1. Navigate to the goal in one of the following ways:
   a. **For a portfolio plan goal:** Navigate to **Workspaces** > **Strategic Planning Workspace** > **Portfolio Planning**, select a portfolio plan, then select **Goals**.
   b. **For a goal on a board (Strategy and Goals):** Navigate to **Workspaces** > **Strategic Planning Workspace** > **Strategy and Goals**, select a board, then locate and select the goal.
   The goal details open.
2. On the goal Details page, select the tab for the RIDAC type you want to create:
   - **Risks** — to create a risk item.
   - **Issues** — to create an issue item.
   - **Decision** — to create a decision item.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Actions** — to create an action item.
- **Request Changes** — to create a change item.

The selected RIDAC tab opens.

3. Select **New**.
   The RIDAC creation form opens with the goal information automatically populated.
4. On the form, fill in the required fields for the RIDAC item.
   For a description of the field values, see the form.
   - For a Risk, see RIDAC Risk form.
   - For an Issue, see RIDAC Issue form.
   - For a Decision, see RIDAC Decision form.
   - For an Action, see RIDAC Action form.
   - For a Change Request, see RIDAC Change Request form.
5. Select **Save** to save the record.

Result
A RIDAC item has been created and is now associated with the goal.

What to do next
After creating a RIDAC item, you can:

- Edit the RIDAC item to add more details, assign ownership, or set status and priority.
- View the RIDAC item in the RIDAC home page by filtering by the appropriate tab (All RIDAC, Project RIDAC, Portfolio RIDAC, or Program RIDAC).
- If integration is enabled and an execution task is linked to the goal, view the RIDAC item on the execution task as well.

Create RIDAC for an EAP iteration

Create a Risk, Issue, Decision, Action, or Change item and associate it with an Enterprise Agile Planning (EAP) iteration.

Before you begin
Role required: sn_apw_advanced.eap_user

About this task
You can create a RIDAC item directly from an EAP iteration to document and track risks, issues, decisions, actions, and changes that affect your agile planning and execution. RIDAC items help you manage planning uncertainties and dependencies across your iterations.

Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace** > **Enterprise Agile Planning**.
   The Enterprise Agile Planning view opens.
2. From the Agile structure section of the left navigation panel, choose an ART or an Agile team and select **Planning Board**.
   The planning board for the selected ART or Agile team opens, displaying the planning items and iterations.
3. Select an iteration from the planning board to open its details page.
   The iteration Details page opens.
4. On the iteration Details page, select the tab for the RIDAC type you want to create:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Risks** — to create a risk item.
- **Issues** — to create an issue item.
- **Decision** — to create a decision item.
- **Actions** — to create an action item.
- **Request Changes** — to create a change item.

The selected RIDAC tab opens.

5. Select **New**.
   The RIDAC creation form opens with the EAP iteration information automatically populated.
6. On the form, fill in the required fields for the RIDAC item.
   For a description of the field values, see the form.
   - For a Risk, see RIDAC Risk form.
   - For an Issue, see RIDAC Issue form.
   - For a Decision, see RIDAC Decision form.
   - For an Action, see RIDAC Action form.
   - For a Change Request, see RIDAC Change Request form.
7. Select **Save** to save the record.

Result
A RIDAC item has been created and is now associated with the EAP iteration.

What to do next
After creating a RIDAC item, you can:

- Edit the RIDAC item to add more details, assign ownership, or set status and priority.
- View the RIDAC item in the RIDAC home page by filtering by the appropriate tab (All RIDAC, Project RIDAC, Portfolio RIDAC, or Program RIDAC).
- If integration is enabled and an execution task is linked to the iteration, view the RIDAC item on the execution task as well.

Export RIDAC list

Export a filtered list of RIDAC records to Excel, PDF, CSV, or JSON format. You can download the file directly or send it via email to share RIDAC information with stakeholders.

Before you begin
Role required: User with read or edit access to RIDAC records

Tip: You can export any filtered view of RIDAC records, including filtered by risk type, planning scope, state, or other criteria. Filter the RIDAC list first to export only the records you need.

About this task
Exporting RIDAC records allows you to share risk, issue, decision, action, and change information with team members, stakeholders, or external partners. You can choose to download the file directly or send it via email to one or more recipients.

Procedure

1. Navigate to **Workspaces** > **Strategic Planning Workspace** > **RIDAC**.
2. Select the RIDAC records you want to export or email.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, to export all risks, select **Risks** under **All RIDAC**. Filter the RIDAC list by planning scope (All RIDAC, Project RIDAC, RIDAC by Portfolio, RIDAC by Program) or by RIDAC type (Risks, Issues, Decisions, Actions, Request Changes).

3. Select **Export**.
4. On the Export dialog, configure the export options:

   a. **File type** — Select the format for the exported file: **Excel**, **PDF**, **CSV**, or **JSON**.

   b. **Delivery type** — Select how you want to receive the file.
      - **Download** — Select to download the file directly to your computer.
      - **Email** — Select to send the file via email. Enter one or more email addresses in the **Email** field to specify where the file should be sent.

5. Select **Export** to complete the export.

Result

The RIDAC records are exported to the selected file format. If you selected **Download**, the file is downloaded to your default downloads folder. If you selected **Email**, the file is sent to the specified email address(es).

The exported file contains all visible columns from the RIDAC list view, including Number, Short description, Planning Item, Planning Item type, State, Priority, Impact, and Due date.

RIDAC reference

Reference information to provide additional details about RIDAC such as the fields, user roles, tables, and system properties information.

Note: This section covers reference information specific to RIDAC, including user roles, tables, and system properties. For common reference information about tables, roles, and system properties installed with Strategic Planning, see Strategic Planning Workspace reference.

Components installed with RIDAC

A complete reference of RIDAC record fields, including data type, requirements, default values, and behavior notes for Strategic Planning Workspace.

Note: The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Note: This topic covers reference information specific to RIDAC, including user roles, tables, and system properties. For common reference information about tables, roles, and system properties installed with Strategic Planning, see Strategic Planning Workspace reference.

Roles installed with RIDAC in Strategic Planning Workspace

Role title [name]	Description	Contains roles
RIDAC reader	Can view RIDAC (Risk, Issue, Decision, Action, Change request) items on planning items, EAP iterations, and goals.	None

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role title [name]	Description	Contains roles
[sn_align_ws.ridac_read_only]		
RIDAC user [sn_align_ws.ridac_user]	Can create, update, and delete RIDAC (Risk, Issue, Decision, Action, Change request) items on planning items, EAP iterations, and goals.	None

Scheduled jobs installed with RIDAC in Strategic Planning Workspace

Scheduled job	Description
Update planning item on RIDAC tables	Populates the planning item field on RIDAC records that were created before the Strategic Planning was installed. This job ensures legacy RIDAC records appear correctly in related lists and reports.

RIDAC Action form

Use the RIDAC Action form to create and track action items related to your strategic planning items, goals, or EAP iterations. Manage action item ownership, status, and completion.

RIDAC Action form

Field	Description
Number	Unique identifier for the action. This field is auto-generated when the action is created.
State	Current status of the action. The available options are **Pending**, **Open**, **Work in Progress**, **Closed Complete**, **Closed Incomplete**, and **Closed Skipped**.
Short description	Brief, concise summary of the action item. This field is required and appears as the title of the action record.
Description	Detailed information about the action, including what needs to be done, why it is required, and any relevant context or background information.
Priority	Priority level of the action. The available options are **1 - Critical**, **2 - High**, **3 - Moderate**, **4 - Low**, and **5 - Planning**. This helps with action prioritization and scheduling.
Estimated Cost	Estimated cost in currency (for example, USD) to complete the action. Helps with financial tracking and planning.
Impact	Potential impact of the action item. The available options are **1 - High**, **2 - Medium**, **3 - Low**. This indicates the severity of the action on planning objectives.
Approval	Approval status of the action. Options include **Not Yet Requested**, **Requested**, **Approved**, and **Rejected**. Tracks whether the action item requires or has received approval.
Assigned to	User or team responsible for completing the action.
Due date	Target date by which the action should be completed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

RIDAC Action form (continued)

Field	Description
Planning Item	The planning item (project, demand, epic, feature, or custom planning item) that this action is associated with. This field is auto-populated when an action is created from a planning item context.
Parent	Execution item (such as a project or demand) that this RIDAC item was created on. This field is automatically populated with the execution item when you create the RIDAC item. The RIDAC item is then linked to the corresponding planning item, ensuring it appears in related lists at the execution level and in reports at the planning level.
Enterprise agile iteration	The EAP iteration associated with this action. This field is auto-populated when an action is created from an EAP iteration context.
Goal	The goal (portfolio plan goal or board goal) that this action is associated with. This field is auto-populated when an action is created from a goal context.
Work notes	Internal notes and updates about action progress, blockers, completion status, and any changes. Used to track work history and communication.

RIDAC Change Request form

Use the RIDAC Change Request form to document and track proposed changes to your strategic planning items, goals, or EAP iterations. Manage change requests and monitor implementation status.

RIDAC Change Request form

Field	Description
Number	Unique identifier for the change request. This field is auto-generated when the change request is created.
State	Current status of the change request. The available options are **Pending**, **Open**, **Work in Progress**, **Closed Complete**, **Closed Incomplete**, and **Closed Skipped**.
Title	Brief, concise summary of the proposed change. This field is required and appears as the title of the change request record.
Description	Detailed information about the proposed change, including the rationale, scope, expected benefits, and any relevant context.
Business Justification	Business rationale and justification for the proposed change. Explains why the change is needed and what problems it solves or opportunities it enables.
Priority	Priority level of the change request. The available options are **1 - Critical**, **2 - High**, **3 - Moderate**, **4 - Low**, and **5**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

RIDAC Change Request form (continued)

Field	Description
	- Planning. This helps with change prioritization and scheduling.
Estimated Cost	Estimated cost in currency (for example, USD) to implement the change. Helps with financial tracking and planning.
Impact	Potential impact of implementing the change. The available options are **1 - High**, **2 - Medium**, **3 - Low**. This helps assess the magnitude of change.
Approval	Approval status of the change request. Options include **Not Yet Requested**, **Requested**, **Approved**, and **Rejected**. Tracks whether the change request requires or has received approval.
Assigned to	User or team responsible for implementing the change.
Due date	Target date by which the change should be implemented.
Category	Category or type of change request. The available options are **Resource**, **Scope**, **Schedule**, and **Cost**. Helps classify and route change requests appropriately.
Parent	Execution item (such as a project or demand) that this RIDAC item was created on. This field is automatically populated with the execution item when you create the RIDAC item. The RIDAC item is then linked to the corresponding planning item, ensuring it appears in related lists at the execution level and in reports at the planning level.
Planning Item	The planning item (project, demand, epic, feature, or custom planning item) that this change request is associated with. This field is auto-populated when a change request is created from a planning item context.
Enterprise agile iteration	The EAP iteration associated with this change request. This field is auto-populated when a change request is created from an EAP iteration context.
Goal	The goal (portfolio plan goal or board goal) that this change request is associated with. This field is auto-populated when a change request is created from a goal context.
Work notes	Internal notes and updates about change implementation progress, approvals, and any modifications. Used to track work history and communication.

RIDAC Decision form

Use the RIDAC Decision form to document and track critical planning decisions related to your strategic planning items, goals, or EAP iterations. Manage decision rationale and implementation status.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

RIDAC Decision form

Field	Description
Number	Unique identifier for the decision. This field is auto-generated when the decision is created.
State	Current status of the decision. The available options are **Pending**, **Open**, **Work in Progress**, **Closed Complete**, **Closed Incomplete**, and **Closed Skipped**.
Short description	Brief, concise summary of the decision to be made. This field is required and appears as the title of the decision record.
Description	Detailed information about the decision, including the problem statement, decision context, available options, and any relevant background information.
Priority	Priority level of the decision. The available options are **1 - Critical**, **2 - High**, **3 - Moderate**, **4 - Low**, and **5 - Planning**. This helps with decision sequencing and resource allocation.
Decision status	Current status of the decision process. Options include **Pending**, **Approved**, and **Rejected**. This field tracks the approval status of the decision.
Impact	Potential impact of implementing the decision. The available options are **1 - High**, **2 - Medium**, **3 - Low**. This helps assess the magnitude of decision.
Approval Required	Indicates whether approval is required for the decision. Select **Yes** or **No** to specify if the decision needs formal approval from stakeholders or decision authority.
Estimated Cost	Estimated cost in currency (for example, USD) associated with implementing the decision. Helps with financial tracking and planning.
Due date	Target date for decision implementation or effective date.
Assigned to	User or team responsible for implementing the decision and tracking its outcomes.
Parent	Execution item (such as a project or demand) that this RIDAC item was created on. This field is automatically populated with the execution item when you create the RIDAC item. The RIDAC item is then linked to the corresponding planning item, ensuring it appears in related lists at the execution level and in reports at the planning level.
Planning Item	The planning item (project, demand, epic, feature, or custom planning item) that this decision is associated with. This field is auto-populated when a decision is created from a planning item context.
Enterprise agile iteration	The EAP iteration associated with this decision. This field is auto-populated when a decision is created from an EAP iteration context.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

RIDAC Decision form (continued)

Field	Description
Goal	The goal (portfolio plan goal or board goal) that this decision is associated with. This field is auto-populated when a decision is created from a goal context.
Work notes	Internal notes and updates about decision evaluation, discussions, approval status, and implementation progress. Used to track decision history and communication.

RIDAC Issue form

Use the RIDAC Issue form to create and manage issues that affect your strategic planning items, goals, or EAP iterations. Track planning challenges, obstacles, and problems that need resolution.

RIDAC Issue form

Field	Description
Number	Unique identifier for the issue. This field is auto-generated when the issue is created.
State	Current status of the issue. The available options are **Pending**, **Open**, **Work in Progress**, **Closed Complete**, **Closed Incomplete**, and **Closed Skipped**.
Short description	Brief, concise summary of the issue. This field is required and appears as the title of the issue record.
Description	Detailed information about the issue, including context, background, and any additional relevant details.
Priority	Priority level of the issue. The available options are **1 - Critical**, **2 - High**, **3 - Moderate**, **4 - Low**, and **5 - Planning**). This helps with issue prioritization and resource allocation.
Estimated Cost	Estimated cost in currency (for example, USD) to resolve the issue. Helps with financial tracking and planning.
Impact	Impact level if the issue is not resolved. The available options are **1 - High**, **2 - Medium**, **3 - Low**). This indicates the severity of the issue on planning objectives.
Due date	Target date by which the issue should be resolved.
Assigned to	User or team responsible for resolving the issue.
Parent	Execution item (such as a project or demand) that this RIDAC item was created on. This field is automatically populated with the execution item when you create the RIDAC item. The RIDAC item is then linked to the corresponding planning item, ensuring it appears in related lists at the execution level and in reports at the planning level.
Planning Item	The planning item (project, demand, epic, feature, or custom planning item) that this issue is associated with.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

RIDAC Issue form (continued)

Field	Description
	This field is auto-populated when an issue is created from a planning item context.
Enterprise agile iteration	The EAP iteration associated with this issue. This field is auto-populated when an issue is created from an EAP iteration context.
Goal	The goal (portfolio plan goal or board goal) that this issue is associated with. This field is auto-populated when an issue is created from a goal context.
Work notes	Internal notes and updates about the progress of issue resolution. Used to track work history and communication.

RIDAC Risk form

Use the RIDAC Risk form to identify and track potential risks that could impact your strategic planning items, goals, or EAP iterations. Manage risk mitigation strategies and monitor risk exposure.

RIDAC Risk form

Field	Description
Number	Unique identifier for the risk. This field is auto-generated when the risk is created.
State	Current status of the risk. The available options are **Pending**, **Open**, **Work in Progress**, **Closed Complete**, **Closed Incomplete**, and **Closed Skipped**.
Short description	Brief, concise summary of the potential risk. This field is required and appears as the title of the risk record.
Description	Detailed information about the risk, including triggers, potential consequences, and any relevant context or background information.
Mitigation plan	Detailed plan and timeline for implementing mitigation strategies. Includes specific steps, responsible parties, and completion dates for risk mitigation activities.
Probability	Likelihood of the risk occurring. The available options are **Absolute**, **High**, **Moderate**, and **Low**. This helps in risk assessment and prioritization of mitigation strategies.
Risk status	Current status of the risk. The available options are **Pending**, **Achieved**, **Not Achieved**, **Avoid**, **Mitigate**, **Transfer**, and **Accept**. This field tracks the lifecycle status of the risk separate from the overall State field.
Impact	Potential impact if the risk occurs. The available options are **1 - High**, **2 - Medium**, **3 - Low**. This indicates the severity of the risk on planning objectives.
Estimated Cost	Estimated cost in currency (for example, USD) to mitigate or resolve the risk. Helps with financial tracking and planning.

RIDAC Risk form (continued)

Field	Description
Risk rank	Calculated numeric ranking of the risk based on probability and impact. This field is auto-calculated and helps with risk prioritization (higher number indicates higher risk).
Risk owner	Individual or role designated as the risk owner who has overall accountability for risk management and mitigation.
Risk value	Overall risk assessment value derived from probability and impact evaluation. This field is auto-calculated to provide a composite risk score.
Assigned to	User or team responsible for risk mitigation and monitoring activities.
Task	Execution item (such as a project or demand) on which this RIDAC item was created. This field is the same as the Parent field and stores a reference to the execution item. When you create a RIDAC item on an execution item, this field is automatically populated. If the RIDAC item is created on a planning item, this field syncs to the related execution item.
Due date	Target date by which risk mitigation actions should be completed.
Planning Item	The planning item (project, demand, epic, feature, or custom planning item) that this risk is associated with. This field is auto-populated when a risk is created from a planning item context.
Enterprise agile iteration	The EAP iteration associated with this risk. This field is auto-populated when a risk is created from an EAP iteration context.
Goal	The goal (portfolio plan goal or board goal) that this risk is associated with. This field is auto-populated when a risk is created from a goal context.
Work notes	Internal notes and updates about risk mitigation progress, monitoring activities, and any changes to risk status. Used to track work history and communication.

ServiceNow Otto for Strategic Portfolio Management

Use the ServiceNow Otto for Strategic Portfolio Management application to summarize feedback in Strategic Planning or text in Docs, create a demand with a conversational experience, generate insights for projects, and generate stories from epics. Product, project, and demand managers can use the ServiceNow Otto skills and AI agents to streamline their projects and workflows.

Get started with AI

Use the ServiceNow Otto for Strategic Portfolio Management application to integrate generative AI capabilities into your daily workflow, thereby minimizing manual tasks while enhancing conformance visibility and optimization insights.

The ServiceNow AI Platform now brings you a new AI experience with three licensing tiers available:

- Foundation: AI basics to deliver insights
- Advanced: AI to boost productivity across relevant use cases
- Prime: Act autonomously with all AI assets, and create your own

For more information, see ServiceNow product tiers.

For information about AI assets that are available on the ServiceNow AI Platform, see the following topics:

- Generative AI skills
- Agentic workflows

Note: Depending on your license, you will have access to certain application features, generative AI skills, agentic workflows, and AI agents. For more information, see ServiceNow product tiers.

Important:

- Not all model providers are available for customers with in-country SKUs, and some AI products/features are currently unavailable for in-country customers. For more information, see the KB1584492 article in the Now Support Knowledge Base. Be sure to check for model provider availability updates in future releases.
- Some AI products/features are currently unavailable for customers in the FedRAMP, NSC DOD IL5, or Australia IRAP-Protected data centers, self-hosted customers, or in other restricted environments. For more information, see the KB0743854 article in the Now Support Knowledge Base. Be sure to check for availability updates in future releases.
- Some AI products/features are currently available only for customers in some regions. Be sure to check for availability updates in future releases.
- Some AI products and skills are not available in Regulated Markets. For more information, see KB2593939: Regulated Markets AI Products/Skills Not Available. Be sure to check for availability updates in future releases.

AI limitations

This application uses artificial intelligence (AI) and machine learning, which are rapidly evolving fields of study that generate predictions based on patterns in data. As a result, this application may not always produce accurate, complete, or appropriate information. Furthermore, there is no guarantee that this application has been fully trained or tested for your use case. To mitigate these issues, it is your responsibility to test and evaluate your use of this application for accuracy, harm, and appropriateness for your use case, employ human oversight of output, and refrain from relying solely on AI-generated outputs for decision-making purposes. This is especially important if you choose to deploy this application in areas with consequential impacts such as healthcare, finance, legal, employment, security, or infrastructure. You agree to abide by ServiceNow's AI Acceptable Use Policy, which may be updated by ServiceNow.

Data processing

This application requires data to be transferred from ServiceNow customers' individual instances to a centralized ServiceNow environment, which may be located in a different data center region from the one where your instance is, and potentially to a third-party cloud provider, such as Microsoft Azure. This data is handled per ServiceNow's internal policies and procedures, including our policies available through our CORE Compliance Portal.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data collection

ServiceNow collects and uses the inputs, outputs, and edits to outputs of this application to develop and improve ServiceNow technologies including ServiceNow models and AI products. In addition, this application will collect task data (for Case Assist) and chat transcripts (for Chat Assist). Customers can opt out of future data collection at any time, as described in the Now Assist Opt-Out page.

For more information, see the ServiceNow Otto documentation.

Exploring Collaborative Work Management

Collaborative Work Management (CWM) is a work management tool that centralizes tasks, documentation, and planning in a single workspace. It helps knowledge workers, project managers, and agile teams manage work without switching between applications.

Collaborative Work Management overview

Teams managing work across disconnected tools often lose context, duplicate effort, and struggle to maintain a clear picture of progress. Tasks live in one tool, documentation in another, and sprint planning in a third, with dependencies tracked in spreadsheets and status updates shared over email or chat.

CWM solves this by bringing tasks, documentation, and planning into a single workspace organized around Spaces. Each Space contains Boards for task and project management and Docs for documentation, so everything related to a team's work stays connected and accessible from one place.

Teams can choose how they work within CWM. Use a custom workflow for general task management, or run sprints end-to-end using the built-in Agile capabilities, including sprint planning, scrum tasks, and cross-team dependencies. Boards are highly configurable without admin involvement, and generative AI features help reduce manual overhead on task creation, formula building, and content generation.

CWM integrates with the broader ServiceNow AI Platform, connecting to other ServiceNow applications, records, and the Strategic Planning workspace so that team-level execution stays aligned with organizational goals.

Collaborative Work Management users

Users

User	Description
Knowledge worker/Team member	Creates and manages tasks on Boards, collaborates on Docs, and tracks personal work in My Space. Uses ServiceNow Otto for Collaborative Work Management (CWM) (CWM) to reduce manual overhead in task creation and formula building.
Project manager	Organizes work into Spaces and Boards, tracks progress across teams, and connects work to business goals and the Strategic Planning workspace.
Agile practitioner	Plans and runs sprints, manages backlogs, generates scrum tasks from user stories, and tracks cross-team dependencies.
SPM team member	Views and updates project and demand tasks from Project Workspace and Next Experience for Demand Management directly in CWM using the team member read or team member read-write role.

Collaborative Work Management benefits

Benefit	Feature	Users
Keep all team work in one place by organizing Boards and Docs into shared Spaces. Your team gets a single location to find tasks, documentation, and status without switching between tools. Use **My Space** as a personal space to manage any work assigned to you.	Spaces	All users
Get started without admin involvement by configuring your own workflow and organizing work the way your team needs it. • Create custom fields for task records. • Switch between Dashboard, List, Gantt, and Kanban views. • Create custom work item types. • Add a list of additional assignees to a task.	Boards	All users
Bring in tasks, Stories, or Epics from existing files such as Excel, Word, or PDF without recreating them row by row. ServiceNow Otto proposes the column mapping, you adjust it, preview the result, and confirm the import.	Import tasks into Boards	All users
Create CWM tasks and stories from open prompts or documents with ServiceNow Otto. Review the generated tasks and add them to your Board.	Create CWM tasks or stories from files or open prompts	All users
Create and collaborate on meeting notes, technical specifications, or feature requirements directly within your workspace, keeping documentation connected to the work it supports. • Create rich text docs and add action items to users from within and outside the team. • Collaborate on docs in real-time with multiple concurrent editors. • Use AI to summarize page content for quick insights. You can also generate and refine content using custom prompts, or generate tasks directly from the information in your Doc and add them to Boards.	Docs	Knowledge worker/ Team member

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Benefit	Feature	Users
Reduce repetitive setup and ensure consistency across your team by starting from predefined templates for Spaces, Boards, and Docs.	Templates for Spaces, Boards, and Docs	All users
Run sprints end-to-end in CWM without switching to a separate Agile tool. Plan work into sprints, manage backlogs, track progress through the sprint lifecycle, and conduct retrospectives, all within your Board.	Sprint planning in CWM	Agile practitioner
Break user stories into granular scrum tasks to improve sprint execution and estimation. Assign tasks to team members and track daily progress through a sprint. Using Now Assist to accelerate sprint preparation, you can generate acceptance criteria for your stories from the story description. Then, generate an initial set of scrum tasks based on that description and criteria. Review and refine both before adding them to your sprint, or create scrum tasks manually from the story form.	Scrum tasks	Agile practitioner
Link work items as prerequisites, dependents, or related to surface dependencies directly in CWM without tracking them in spreadsheets or notes. Blocked items are visible at a glance on the Kanban board to help teams spot bottlenecks and plan work in the right sequence.	Task dependencies and relationships	Agile practitioner
Visualize task and sprint progress at a glance with configurable widgets, such as charts, dials, and score cards, on a dedicated Dashboard view. Choose from a set of predefined widgets or build your own custom widgets bound to any column on the Board.	Dashboards	All users
Save and reuse filtered views of records from any table. Default lists such as My Epics, Stories, and Active Sprints are also available for quick access.	Lists	All users
Switch between Dashboard, List, Gantt, and Kanban view modes to visualize work in the format that fits your team's workflow. Save personalized views or create shared views	Board views	All users

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Benefit	Feature	Users
to give the whole team a consistent starting point.		
Add calculated columns to the List view that automatically compute values from your task data, such as totaling story points, calculating date differences, or deriving custom metrics. Build formulas manually using the Formula Builder panel. You can also describe your calculation in plain language and let AI generate the formula for you.	Formula columns	Knowledge worker/ team member, Project manager
Reduce manual overhead by automating repetitive processes such as sending notifications, reassigning tasks, or updating task priority when conditions are met, without involving an admin.	Automations	Project manager
Bring work from across your ServiceNow AI Platform applications onto a single CWM Board, giving your team one place to plan and manage cross-functional work without switching between applications.	Connected work in CWM	Project manager, SPM team member
Access and update project and demand tasks directly in CWM without requiring access to Project Workspace or Next Experience for Demand Management. View assigned work in **My Work** or pull tasks into a Board using **Connected Work**.	Team member roles for project work	SPM team member
Connect team execution to organizational strategy by surfacing CWM Boards in Strategic Planning portfolio plans, where work can be prioritized and roadmapped alongside other investments.	Connecting CWM with Strategic Planning or Portfolio Planning	Project manager
Reference live ServiceNow AI Platform records such as Incidents, Risks, or Issues directly in CWM Docs. References update automatically to reflect the latest record data, keeping documentation accurate without manual updates.	Collaborative documentation using CWM	Knowledge worker/ Team member
Share Board data with stakeholders outside CWM or prepare for offline analysis and	Export Board as CSV or Excel	Project manager

AI skills for Collaborative Work Management (CWM)

Learn more about the generative AI capabilities of ServiceNow Otto for CWM. These capabilities can help you save time and improve efficiency for the actions your team performs within the CWM workspace.

ServiceNow Otto introduced AI on the platform. As that experience has evolved, there's a new name for the experience. ServiceNow Otto® is the conversational AI platform integrated into ServiceNow workflows. It provides agentic capabilities, supports multimodal interactions across web, mobile, and messaging channels, and enables autonomous orchestration for cross-system workflows.

Note: Depending on your license, you will have access to certain application features, generative AI skills, agentic workflows, and AI agents. For more information, see ServiceNow product tiers.

Important:

- Not all model providers are available for customers with in-country SKUs, and some AI products/features are currently unavailable for in-country customers. For more information, see the KB1584492 article in the Now Support Knowledge Base. Be sure to check for model provider availability updates in future releases.
- Some AI products/features are currently unavailable for customers in the FedRAMP, NSC DOD IL5, or Australia IRAP-Protected data centers, self-hosted customers, or in other restricted environments. For more information, see the KB0743854 article in the Now Support Knowledge Base. Be sure to check for availability updates in future releases.
- Some AI products/features are currently available only for customers in some regions. Be sure to check for availability updates in future releases.
- Some AI products and skills are not available in Regulated Markets. For more information, see KB2593939: Regulated Markets AI Products/Skills Not Available. Be sure to check for availability updates in future releases.

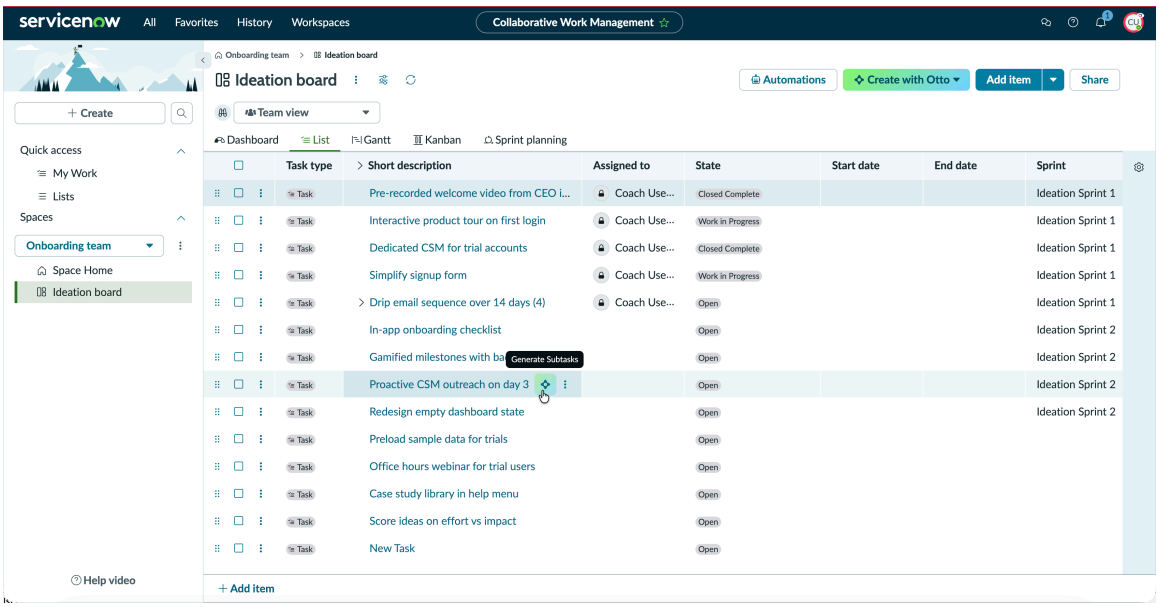
Skills

Generate scrum tasks for stories

Accelerate your sprint planning by using ServiceNow Otto to generate scrum tasks based on user story descriptions and acceptance criteria. Instead of manually creating each task, you receive a relevant set of scrum tasks as a starting point for further refinement.

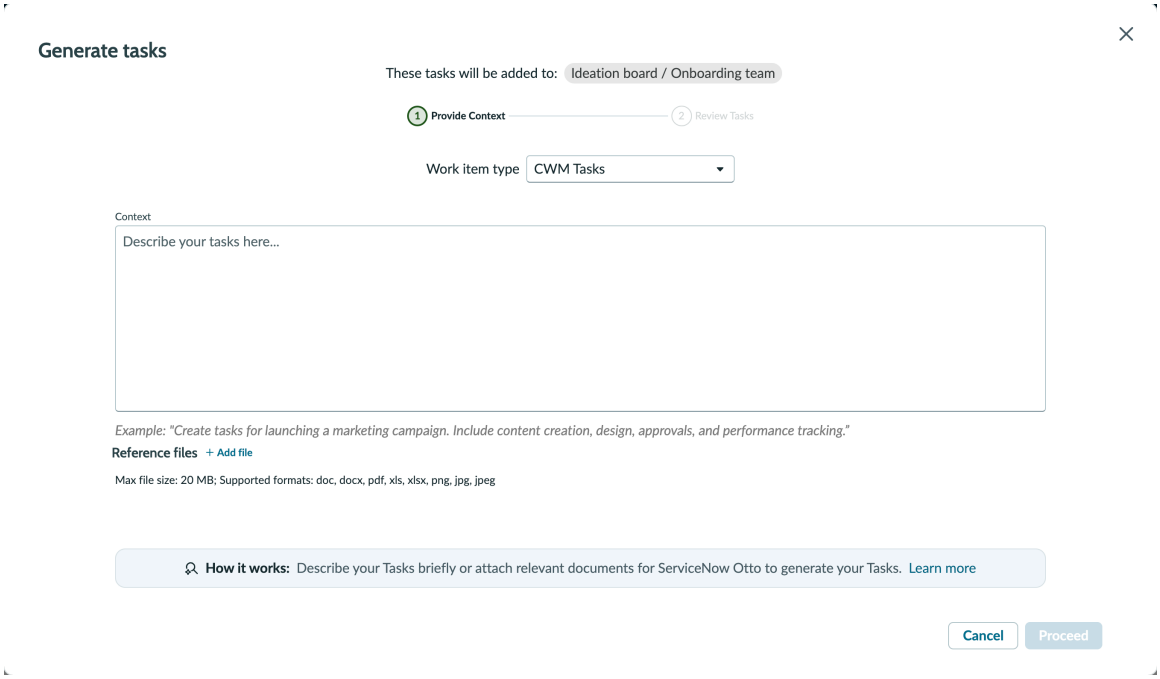


Generate scrum tasks from the story form or create them inline from the List or Sprint planning views. ServiceNow Otto analyzes the user story description and acceptance criteria to propose tasks that align with the required work. For stories that already have scrum tasks, ServiceNow Otto considers existing tasks when generating new ones to avoid duplication and maintain continuity.

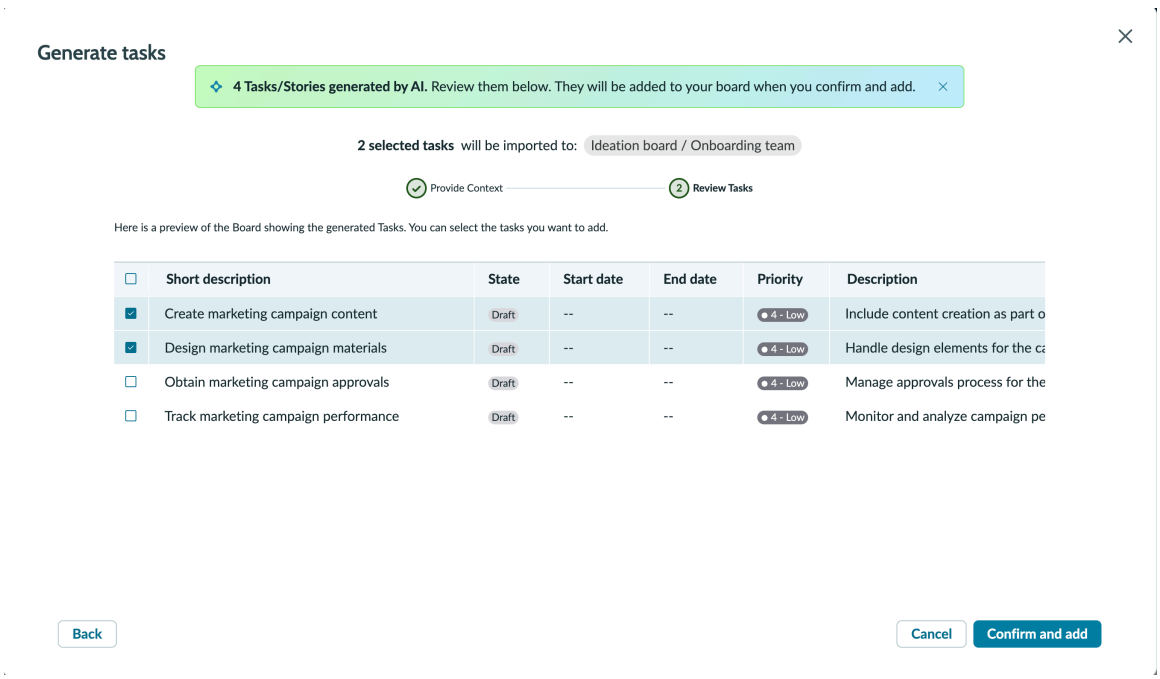
You can review and edit AI-generated tasks before adding them to your story. There is no limit on the number of tasks generated, giving you flexibility to capture all necessary work breakdown items. This capability reduces the time spent on repetitive task creation and helps teams establish a consistent starting point for sprint execution.

Create child tasks from CWM task types in List view

Break down a large and complex CWM task into smaller units of clear and assignable child tasks using AI. The parent task's short description and description are analyzed by AI to generate child tasks.



Generate child tasks inline from the List view by hovering over the short description of a task to display the Generate Subtasks icon. Child tasks are added as a hierarchy under the parent task in the List view.



Create CWM tasks or stories from files or open prompts

Turn an open prompt or an uploaded file into a batch of tasks for your Board, instead of creating each task individually. Describe the context for task generation, or attach a file such as meeting notes, brainstorming planning docs, or epic PRDs. The input is analyzed by AI and a list of tasks is proposed.

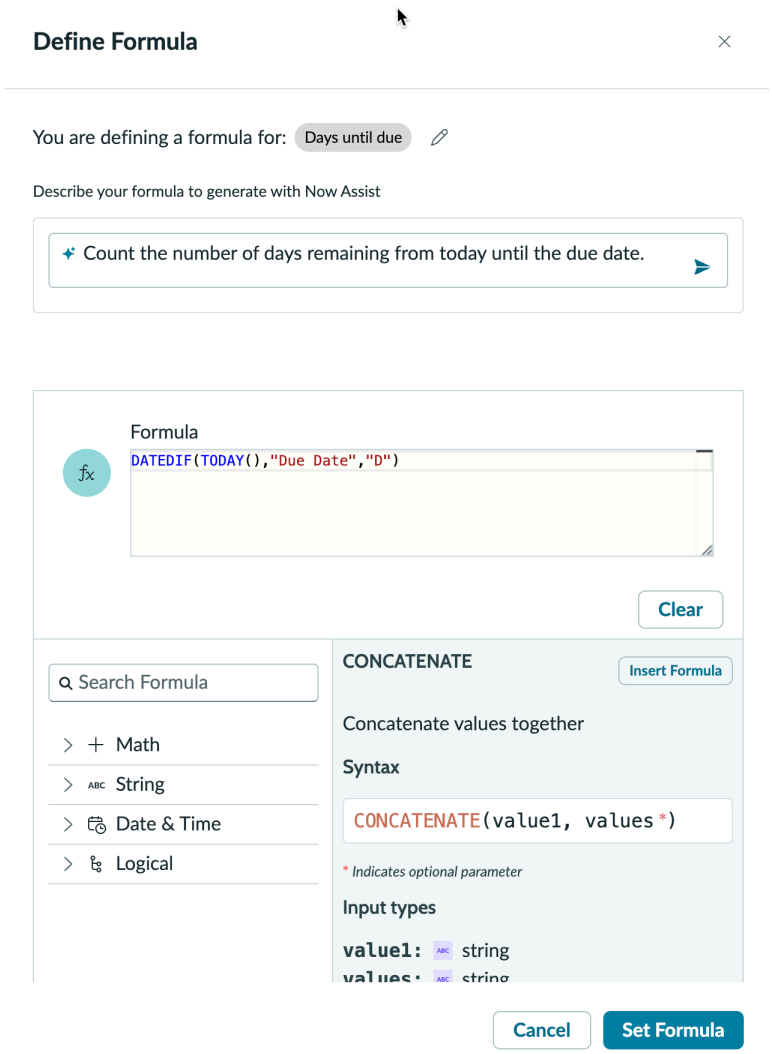
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Review the proposed tasks, select the ones you want, and add them to your Board in one action.

Generate formulas from natural language



Create formula columns faster by describing your calculation in natural language and letting ServiceNow Otto generate the formula for you.

Instead of manually building complex formulas, type what you want to calculate in the Formula Builder panel. For example, enter descriptions like `days between start date and end date` or `total estimated hours for all subtasks`. ServiceNow Otto analyzes your description and generates a valid formula using the available columns in your List view.

Review the generated formula to verify that it matches your intent. Insert the formula into the editor with a single click, then make any adjustments if needed.

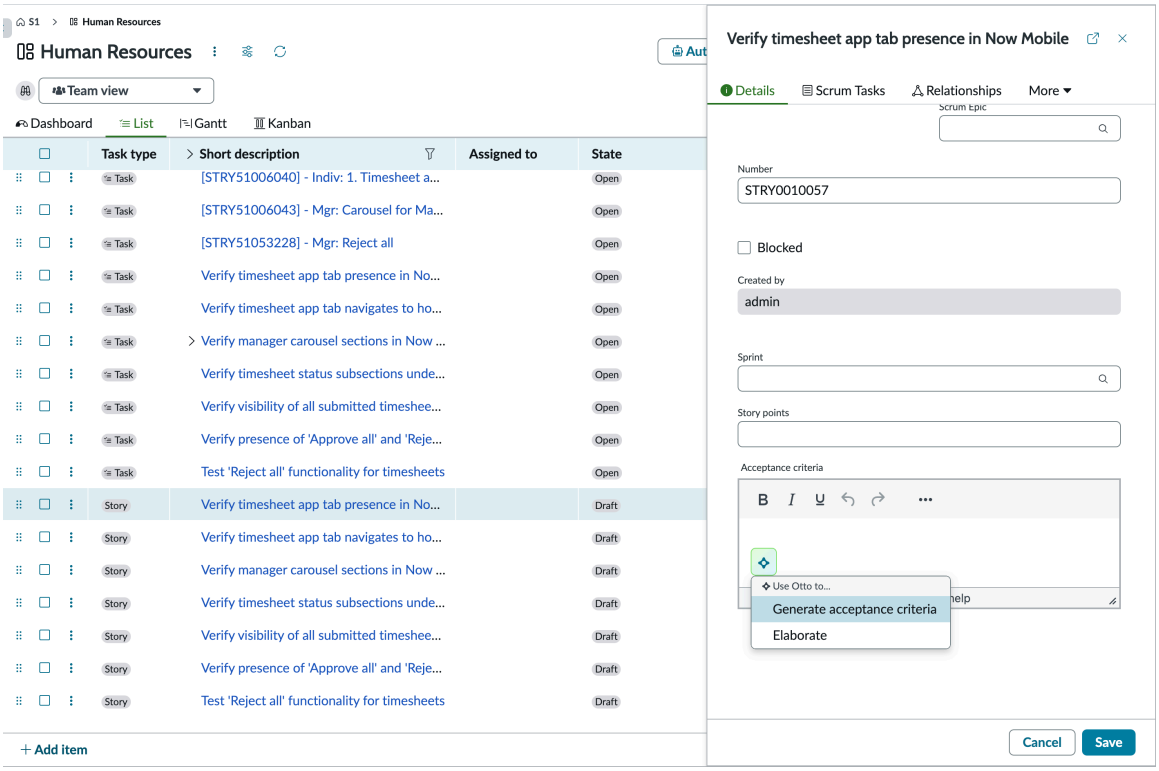
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This capability removes the need to memorize formula syntax, making calculated columns accessible to team members of all technical skill levels.



Generate acceptance criteria for stories

As a product manager, generate clear, comprehensive, and testable acceptance criteria for your user stories, instead of spending hours writing and refining them manually.

You can review and refine the suggested options to ensure they meet your story requirements without slowing down planning. By helping you streamline generating acceptance criteria as a process, this skill helps save time, improve quality, and speed up delivery with cleaner backlogs and better collaboration.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CWM Doc generation and insights

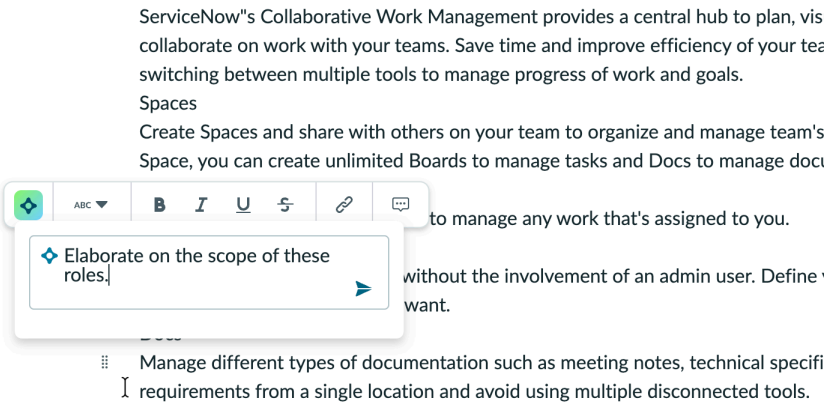
Generate content with ServiceNow Otto for CWM directly in your Docs using custom prompts. In addition, summarize existing sections, elaborate where needed, and refine drafts to help improve your productivity.

You can interact with ServiceNow Otto directly in your Doc to create content, add context, or improve existing sections. This helps you draft faster, refine ideas, and keep your work relevant without leaving the page.

Work with content of the whole page

Some examples are:

- For Marketing teams: `Create a compelling product launch announcement highlighting the key benefits and emotional appeal for our target audience.`
- For Legal teams: `Write a plain-language summary of the privacy policy in this doc, that customers can easily understand.`
- For product teams: `Analyze the customer feedback comments in this Doc, group into top 5 themes, and suggest top 3 enhancements for highest impact.`

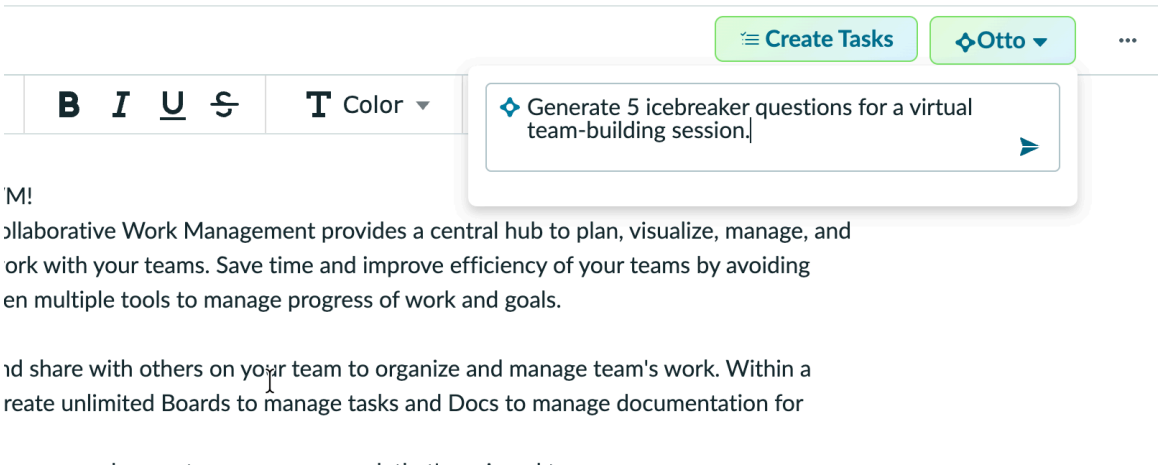


ServiceNow Otto uses the context from your Doc page to generate a response.

Refine, elaborate, or improve the existing content within the page

Some examples are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

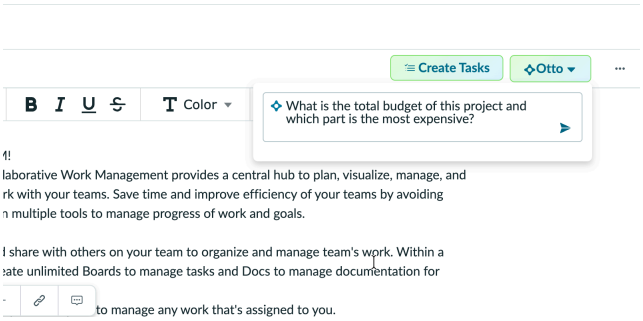


- If you have a list of stakeholders, you can ask `Elaborate on the scope of these roles.`
- `Rewrite this in a casual tone.`

Take assistance on a blank page

Some examples are:

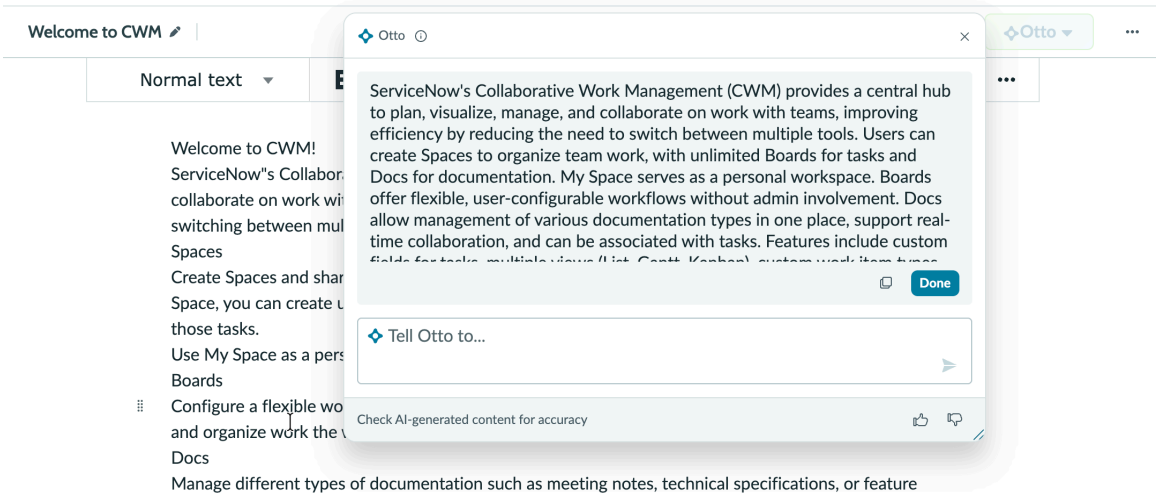
1. `Generate 5 icebreaker questions for a virtual team-building session.`
2. `Write a 3-paragraph blog post explaining why [industry trend] is changing how businesses operate.`
3. `Generate an outline for the Instagram campaign tasks for a Hackathon initiative.`



Answer questions in the context of this Doc

Whether the content in the Doc is added manually or generated using ServiceNow Otto, you can ask questions to find anything in the page's context.

For example, if you have a project charter document, you can try asking `What is the total budget of this project and which part is the most expensive?`

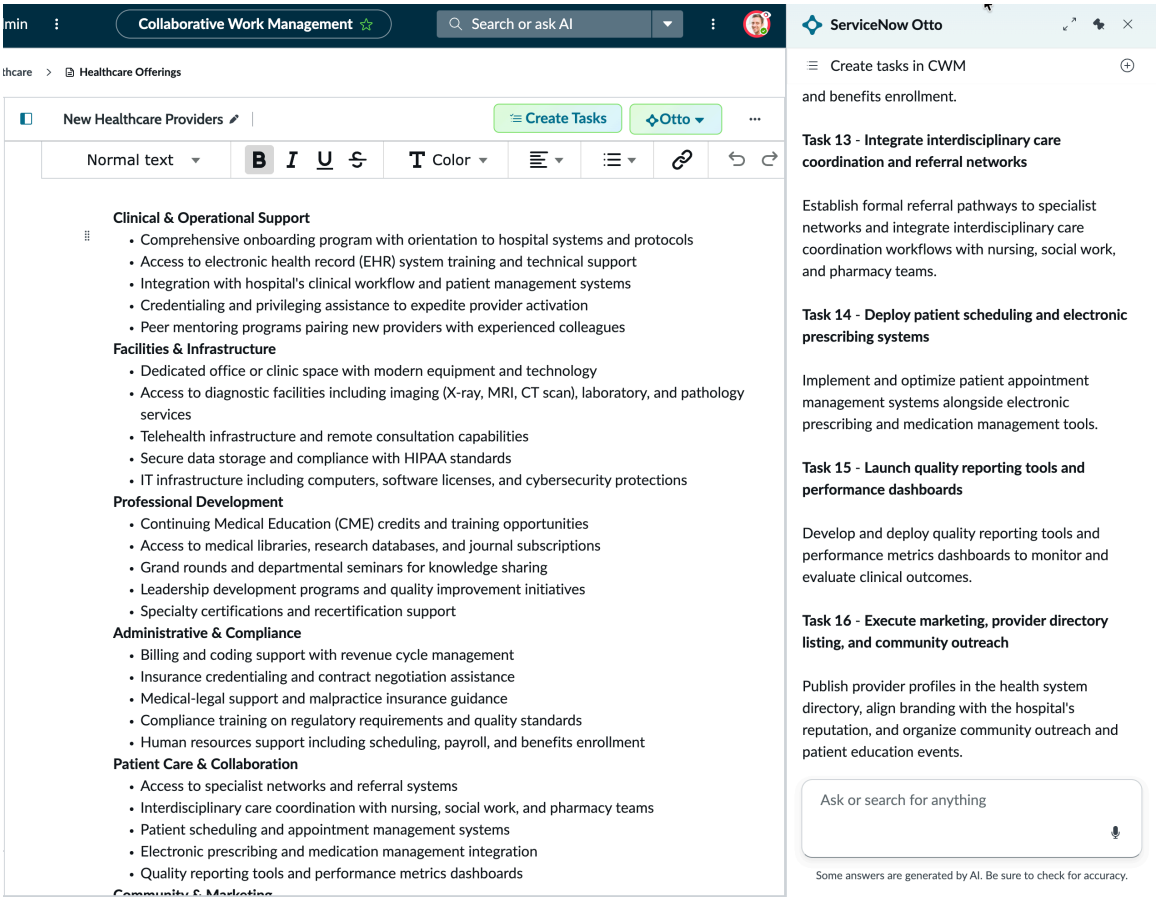


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Doc summarization

Gain insights into the contents of the page by summarizing it in CWM Docs. Whether you're reviewing long documents or preparing for meetings, Doc summarization skill helps you stay informed and efficient.

With the Doc summarization skill, you can also elaborate and shorten content, resulting in improved content quality in the CWM Doc pages. Quickly shorten lengthy paragraphs, paraphrase bullet points, or expand on key points ensuring that your content is tailored to specific needs.



Generate CWM Tasks from Docs

Creating tasks with detailed descriptions for your CWM Board requires significant time and manual effort. If the tasks aren't detailed enough, it can lead to confusion and misalignment within the team, affecting their understanding of the expected outcomes. To avoid this manual effort and improve time to value, ServiceNow Otto can generate tasks for your Board using the information in your Docs. This way, you can ensure clear and comprehensive task descriptions, allowing you to focus more on execution and less on the administrative work.

Based on the recommendations, you can ask ServiceNow Otto to perform one of the following:

- Generate task according to its original recommendations.
- Split a task recommendation into multiple tasks.
- Combine multiple task recommendations into one task.
- Remove any task recommendation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Thus, by using the Task generation skill within CWM, you can:

- Remove initial roadblocks to create tasks for a CWM Board.
- Save time and increase productivity by automating the task creation process.

You can use Now LLM Service, Azure OpenAI, Google Gemini or Anthropic Claude on AWS as the AI model provider for all generative AI skills and AI agents. Use the Configuration Controls in AI Control Tower to define which options are available, then set the skill-level preferences in the AI Admin Hub console. For more information, see Large language models on the ServiceNow AI Platform.

Important: Starting with the September 2026 release, Gemma 4 joins our growing portfolio of open-weight models available through Now LLM Service. The latest industry advancements are available alongside sovereignty-focused options. All models are hosted and governed by ServiceNow with the same infrastructure and data protections. Older models will remain available for existing published AI skills, agents, and agentic workflows, but will no longer be available for new development or configuration. For details, see the KB3066214: ServiceNow Otto Model Upgrades article in the Now Support Knowledge Base.

ServiceNow Otto console

An administrator can activate and manage ServiceNow Otto features and skills for the CWM workspace using the ServiceNow Otto console. For more information, see Overview tab in AI Admin Hub.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ServiceNow Otto panel in CWM workspace

A knowledge worker can use the ServiceNow Otto panel in CWM workspace. This conversational interface enables the user to generate CWM tasks from the context of a Doc page. For more information about the ServiceNow Otto panel, see ServiceNow Otto panel.

What to explore next

To learn more about configuring and using ServiceNow Otto, see:

- Configure ServiceNow Otto for Collaborative Work Management (CWM) (CWM)
- Create CWM tasks or stories from files or open prompts
- Generate tasks from Docs in Collaborative Work Management (CWM)

Configuring Collaborative Work Management

Plan and configure how your team can implement Collaborative Work Management.

Configuration overview

Use the following steps as guidelines to set up Collaborative Work Management. Steps 3–5 are optional and provide additional configuration options to make your CWM experience more connected with the ServiceNow AI Platform.

1. Install Collaborative Work Management.
2. Assign CWM roles to the relevant users. See Components installed with Collaborative Work Management.
3. Configure Strategic Planning to include CWM Boards for Prioritization, Roadmap, and Goals. See Connecting CWM with Strategic Planning or Portfolio Planning.
4. Configure the fields shown for CWM tasks and connected work items in the task side panel.

   (Optional) See Configure the form view for CWM tasks and connected work items.
5. Configure which columns are available for column personalization.

   (Optional) See Configure columns available for personalization in CWM.
6. Enable the **Request access** button for non-CWM users to request access to the CWM workspace.

   See Properties installed with Collaborative Work Management.

Install Collaborative Work Management

You can install the Collaborative Work Management (CWM) application (sn_cwm) if you have the admin role. The application includes demo data and installs related ServiceNow® Store applications and plugins if they are not already installed.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Review the Collaborative Work Management application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: admin

About this task

The following items are installed with Collaborative Work Management:

- Roles
- Tables
- System properties

For more information, see Components installed with Collaborative Work Management and Properties installed with Collaborative Work Management.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Collaborative Work Management application (sn_cwm) using the filter criteria and search bar.

   You can search for the application by its name or ID (sn_cwm). If you cannot find the application, you might have to request it from the ServiceNow Store.

   In the list next to the **Install** button, the versions that are available to you are displayed.
3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box, any dependencies installed with your application are listed.
4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
   Demo data are the sample records that describe application features for common use cases. Load the demo data when you first install the application on a development or test instance.
6. Select **Install**.

Configure ServiceNow Otto for Collaborative Work Management (CWM) (CWM)

If you have the admin role, you can configure the implementation for the ServiceNow Otto for CWM application. This lets your team members utilize generative AI skills in the CWM workspace.

Before you begin

- The minimum version of CWM application that is required to support ServiceNow Otto for CWM features is v6.0.0 and later. If you're on earlier versions, upgrade your app through Application Manager. See Update an application or plugin.
- Install the ServiceNow Otto for Collaborative Work Management (CWM) (CWM) plugin (sn_cwm_ai). See Install plugins for ServiceNow Otto.
- Activate the ServiceNow Otto panel standard chat.

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Use the AI Admin Hub console to configure ServiceNow Otto for SPM. All ServiceNow Otto for SPM skills are activated by default. If a skill isn't automatically activated or you want to update its configuration, follow the steps below.

Use the AI Admin Hub console to activate the following skills of ServiceNow Otto for CWM.

- CWM Doc generation and insights
- CWM Text to formula generation
- Acceptance criteria generation
- Tasks generation
- CWM Scrum tasks generation

Note: Now LLM Service is the default provider for ServiceNow Otto for Collaborative Work Management (CWM) application's skills, and Gemma 4 is the default model.

Procedure

1. Navigate to **All** > **ServiceNow Otto Admin** > **Skills**.
   The **ServiceNow Otto Skills** tab of the AI Admin Hub console is displayed.
2. From the **Technology** grouping, select **CWM**.
   The skills for CWM are displayed as tiles.
3. For the skill that you want to activate, select **Activate skill**.
4. Review the skill configuration settings from the following sections.

   To edit the inputs, switch your application scope to **ServiceNow Otto for Collaborative Work Management (CWM)**. For more information on these inputs, see Skill inputs for ServiceNow Otto for Collaborative Work Management (CWM) (CWM).

   Note: The display options are available based on the skill.

   a. Choose inputs: These are the skill settings for summarizing and refining selected content within a CWM Doc page.

      This section is not available for the Tasks generation skill.

   b. Select **Save and continue**.

   c. Define access: Review who has access to skills.

      - Configure ACLs or role-based permissions to ensure who can view or edit the skills.
      - Review role restrictions to skill.

   d. Page inputs: These are the skill settings for summarizing the whole content of a CWM Doc page.

   e. Select **Save and continue**.

   f. Select display:

      - In-product desktop: Enabling this option shows the skill within the CWM workspace.
      - ServiceNow Otto panel: Enabling this option shows the skill within the ServiceNow Otto panel.
      - ServiceNow Otto context menu: Enabling this option shows the skill within a form field in the CWM workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

g. Select **Save and continue**.

h. Review and activate: Review your selections for the skill.

5. Select **Activate**.

Result
The skill is successfully activated.

What to do next
Return to the CWM skill grouping and repeat the process to activate any remaining skills.

If you have custom roles that require access to a skill, update the ACLs for those roles that require access. For more information, see Implement access control in AI agents.

Skill inputs for ServiceNow Otto for Collaborative Work Management (CWM) (CWM)

Connecting CWM with Strategic Planning or Portfolio Planning

Configure Strategic Planning or Portfolio Planning to include CWM Boards so that you can plan, roadmap, and associate goals to Boards in a portfolio plan.

By adding CWM Boards to a lens configuration, you can access them in the Prioritization, Roadmap, and Goals pages of a portfolio plan as planning items.

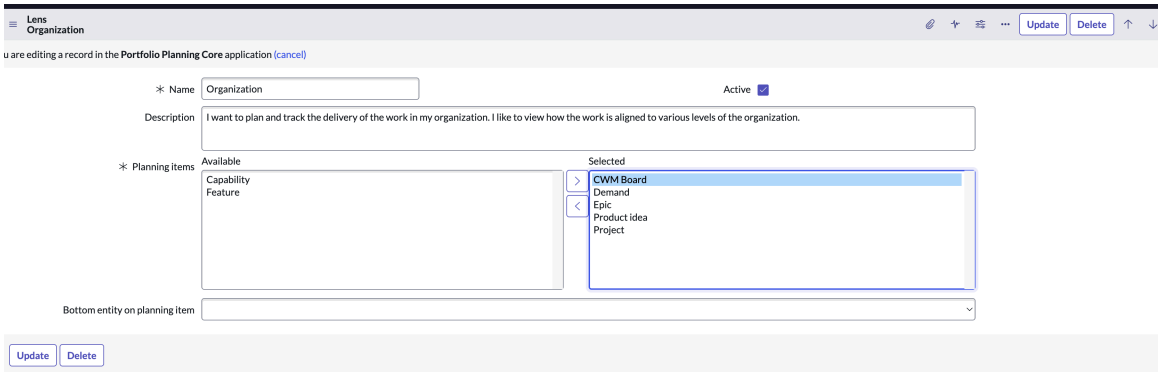
Note: This functionality requires installing the Strategic Planning or Portfolio Planning application from ServiceNow Store.

To successfully enable planning with CWM Boards in Strategic Planning or Portfolio Planning, complete the following tasks.

Add CWM Boards to lens configuration

For the lens that you want to use to build portfolio plans, update the configuration to include CWM Board as a planning item in Strategic Planning or Portfolio Planning.

Before you begin
Role required: admin



Ensure that the Application scope of your instance is set to **Portfolio Planning Core**.

About this task
All default lenses support CWM Board as a planning item. For example, if you are building portfolio plans using Organization lens, then you can add CWM Board as a planning item in the Organization lens configuration.

Procedure

1. Navigate to **All** > **Strategic Planning** > **Lenses**.
2. Select a lens.
3. From the Available list of planning items, move **CWM Board** to the Selected list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If you don't see CWM Board in the Available list, update the system property *sn_align_core.planning_item_types_allow_list* to allow it.

4. Select**Update**.

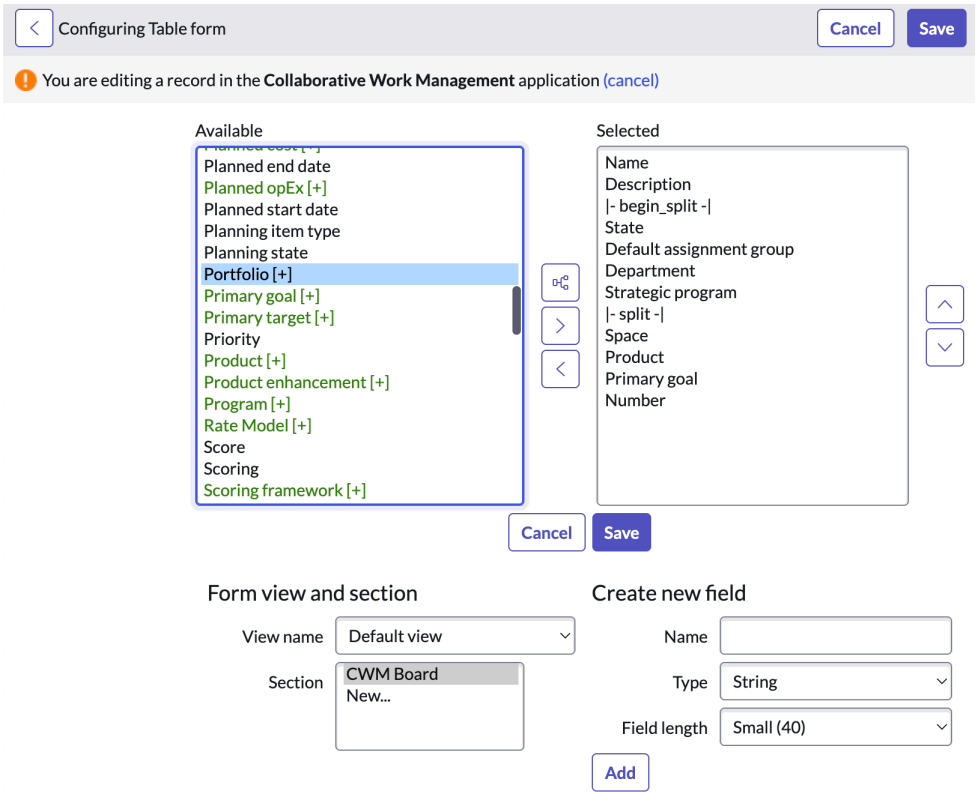
What to do next
Configure CWM Board form layout.

Configure CWM Board form layout

Add the lens entity field to the CWM Board form. This lets users link Boards and have them appear in the right portfolio plan in Strategic Planning or Portfolio Planning workspaces.

Before you begin
Role required: admin

Ensure that the Application scope of your instance is set to **Collaborative Work Management**.



About this task
Include the field for your lens entity in the CWM Board form. This allows CWM users to link their Boards to the lens entity so that the Boards appear in the corresponding portfolio plan. For example, using the project Portfolio lens, you could create a portfolio plan for the Technology portfolio. When CWM users associate their Boards with the Technology portfolio, those Boards will automatically show up in the Technology portfolio's portfolio plan.

Similarly, you can associate Boards to goals or portfolios. To ensure that your CWM users can perform this association, configure the Board form to include these fields.

Procedure

1. Navigate to **System Definition** > **Tables**.
2. From the list of tables, search for and select **sn_cwm_board**.
3. From the Related Links section, select **Layout Form**.
4. From the list of fields in the Available section, move your desired field to the Selected section. For example, move the **Portfolio** field to the Selected section.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Repeat this step for other fields that you want to add to the CWM Board form.
6. Select **Save**.

Result

The CWM Board form now shows the new fields added to its layout.

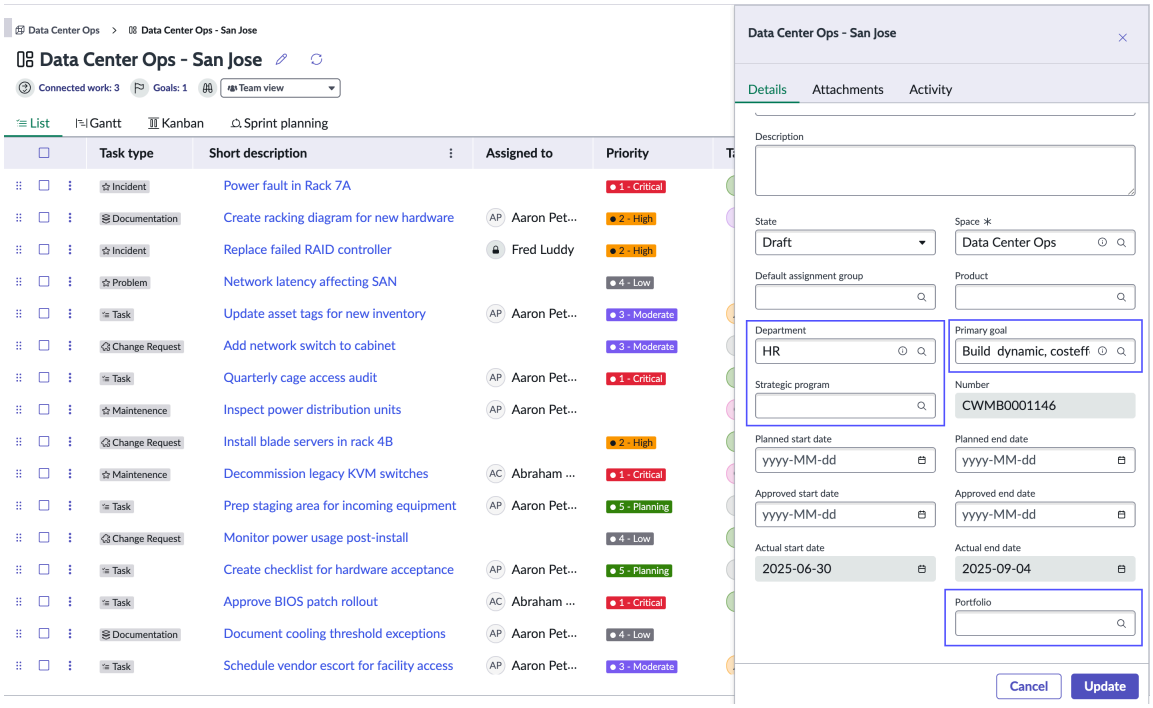
Your CWM users can add details of their departments, portfolios, or primary goals depending on the portfolio plans they want these Boards to show up in.

What to do next

Associate Boards with portfolio plan entities.

Associate Boards with portfolio plan entities

Link CWM Boards to a lens entity so that these Boards appear in the corresponding portfolio plans in Strategic Planning or Portfolio Planning workspaces.

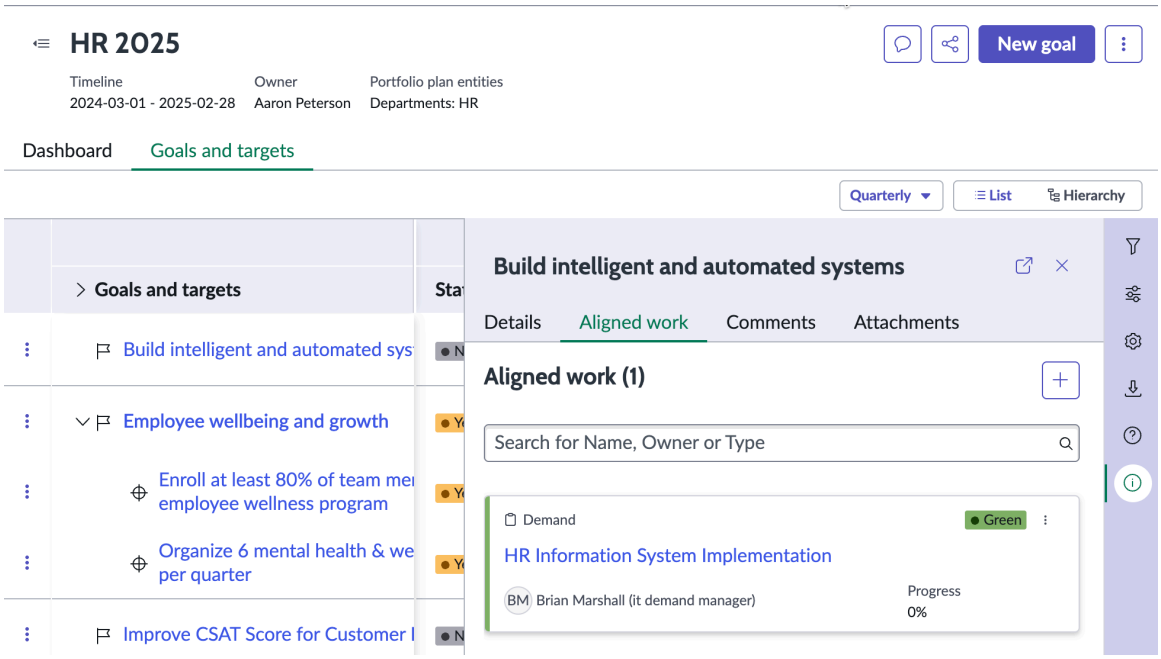


Before you begin

Role required: sn_cwm.cwm_user

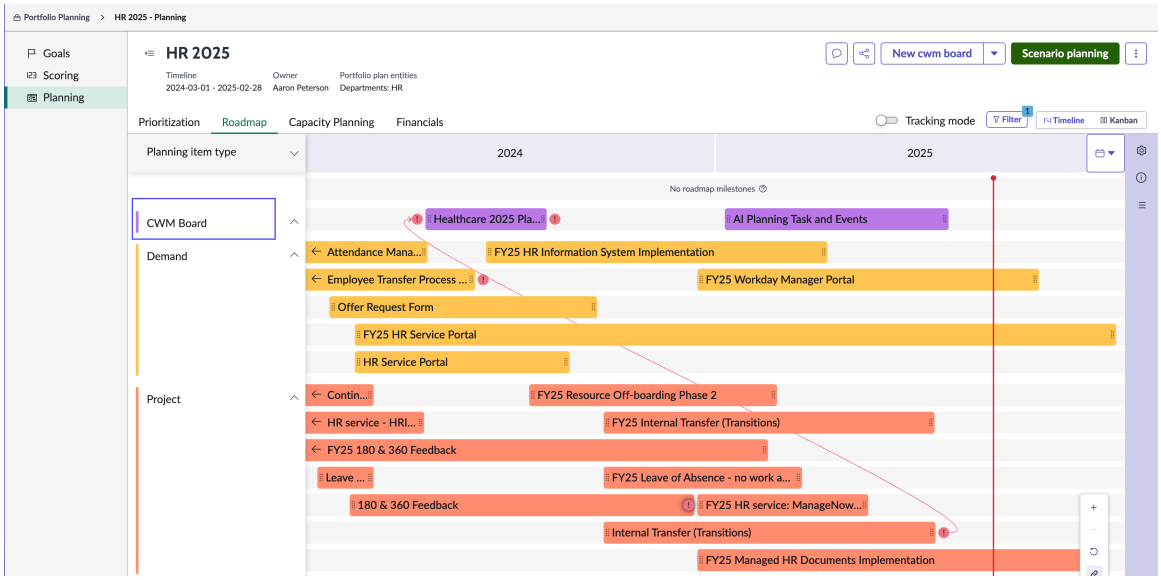
Procedure

1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. From a Space, select a Board.
3. From the Board header, select the Edit icon ( ).
4. In the Board form, select a department, primary goal, strategic program, or portfolio to associate with this Board.



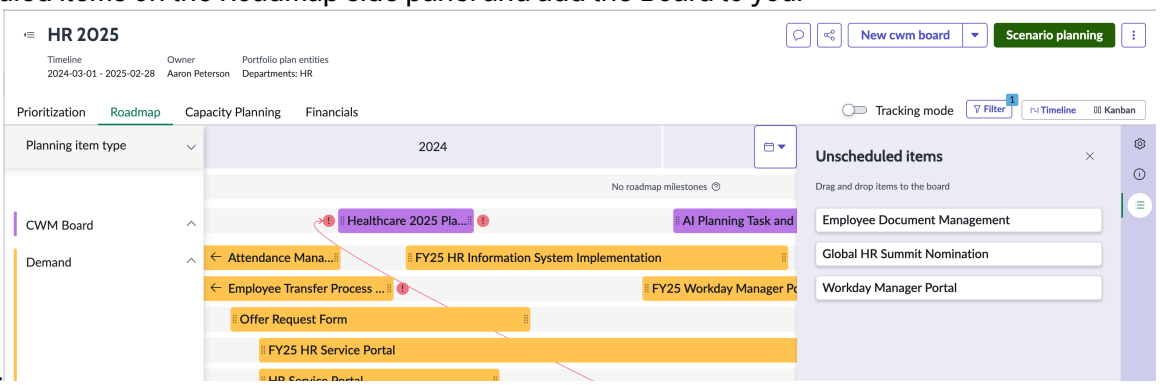
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select **Update**.



Result

- If a primary goal is added, this Board will show up in the aligned work for the selected goal in Strategic Planning workspace.



- If you add a department, and the Board's dates align with that department's portfolio plan, the Board will automatically appear as a planning item on the roadmap.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If a portfolio is added, and the Board's dates align with the portfolio plan, the Board will appear as a planning item in that portfolio plan's roadmap.

  If there are no dates added to your CWM Board, you can check for Unscheduled items on the Roadmap side panel and add the Board to your roadmap.

Configure the form view for CWM tasks and connected work items

Configure which fields appear when you open a CWM task or connected work item by customizing the default form view for the relevant table.

Before you begin

Role required: admin

About this task

CWM displays fields from the default view of a table's record form in the task side panel for CWM tasks and connected work items. For stories, CWM uses the CWM view of the form instead of the default view.

Procedure

1. Navigate to the list view of the table whose form you want to configure.

   For example, navigate to `incident.list` for the Incident table, `sn_cwm_task.list` for CWM tasks, or `rm_story.list` for stories.

2. Open any record in the table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Right-click the form to open the form context menu, and select **View** > **Default view**.

   For stories (`rm_story`), select **View** > **CWM view** instead.

4. Configure the form using Form Builder.

   For instances without Form Builder, use Form Design or Form Layout instead. For more information, see Configuring the form layout.

5. Add or remove the fields you want to display, and save your changes.

Result
The updated fields appear in the task side panel when you open tasks or connected work items from CWM Boards.

Related topics

- Configuring the form layout
- Show or hide fields on a form
- Update details of connected work items in CWM Boards

Configure columns available for personalization in CWM

Configure which columns are available in the column personalization panel in CWM by updating the default list layout for the relevant table.

Before you begin
Role required: admin

About this task
CWM displays columns from the default list view of a table as available options in the column personalization panel. For stories, CWM uses the CWM view of the list instead of the default view.

Procedure

1. Navigate to the list view of the table you want to configure.

   For example, navigate to `incident.list` for the Incident table, `sn_cwm_task.list` for CWM tasks, or `rm_story.list` for stories.

2. Right-click any row in the list to open the row context menu, and select **View** > **Default view**.

   For stories (`rm_story`), select **View** > **CWM view** instead.

   This step ensures you're configuring the list layout that CWM references for column personalization.

3. Select the header of any column, and from the column menu select **Configure** > **List Layout**.
4. Add or remove the columns you want to make available for personalization, and save your changes.

Result
Users can now select the updated columns when personalizing the display of CWM Boards. For more information, see Personalize List, Gantt and Kanban display for CWM Boards.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

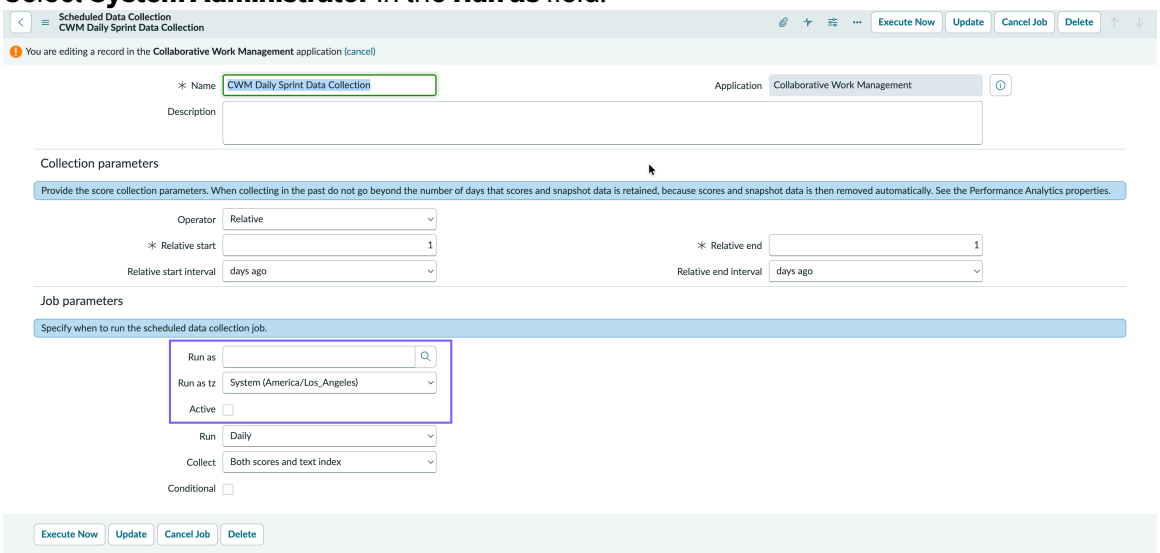
Configure the list layout

Personalize List, Gantt and Kanban display for CWM Boards

Activate the sprint data job for burnup and burndown widgets

Activate the CWM Daily Sprint Data Collection scheduled job to populate data in the predefined burnup and burndown charts in the Team sprint progress dashboard.

Before you begin



Role required: admin

About this task

After the job is active, data is collected daily for active sprints. Data appears in the burnup and burndown charts in Board dashboards starting the day after the job begins running.

Procedure

1. Navigate to **All** > **System Definition** > **Scheduled Jobs**.
2. Filter the **Name** field to locate and open **CWM Daily Sprint Data Collection**.
3. In the message regarding the application scope, select **Edit this record in Collaborative Work Management**.
4. Select **System Administrator** in the **Run as** field.

5. Select a time zone in the **Run as tz** field.
6. Select the **Active** check box.
7. Run the scheduled job by selecting **Execute Now**, or save the record by selecting **Update**.

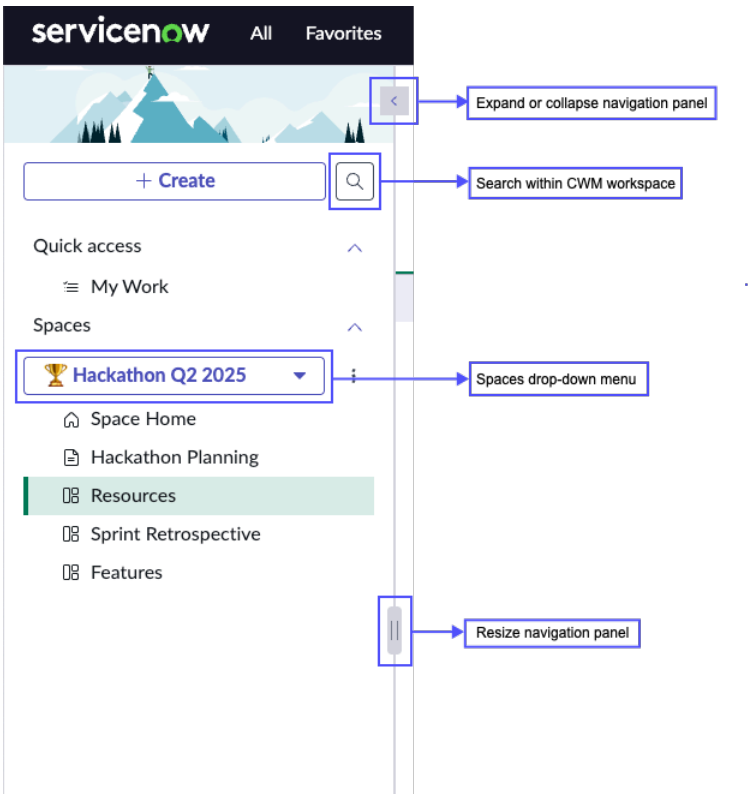
Using Collaborative Work Management

Use the different features of Collaborative Work Management (CWM) to collaborative with teams across your organizations and manage work in the way your teams want.

Collaborating with Spaces in CWM

Create collaborative Spaces for teams to work together on projects, goals, or assignments.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



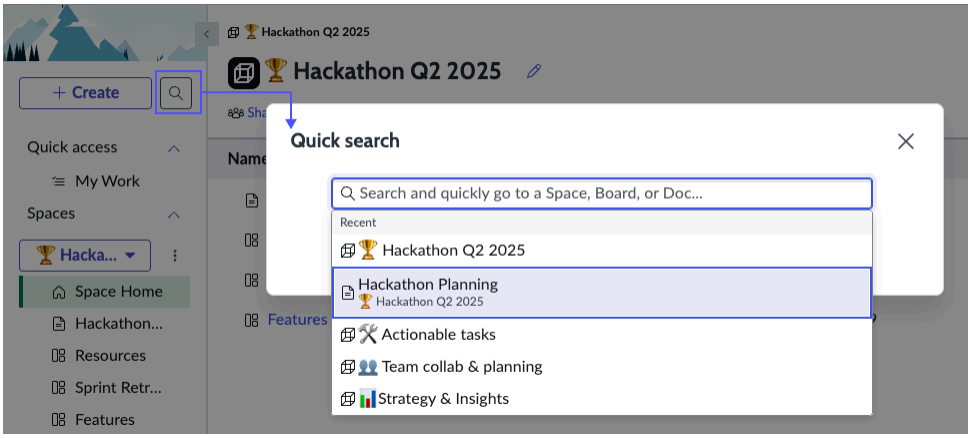
CWM provides two kinds of Spaces: A personal Space that can be accessed only by you and shared Spaces to collaborate with other users in your organization.

Navigation within the CWM workspace

Navigation panel

The CWM navigation panel provides a simpler and cleaner user interface. At a given time, the navigation panel shows the contents of just one Space to provide a distraction-free experience while you work.

Use the Spaces menu to choose a different Space. The Spaces you are part of are sorted by alpha in the Spaces dropdown menu. Additionally, you can also choose to resize the navigation panel or collapse it altogether to increase the working area for your Boards or Docs.



When you expand or collapse the Spaces menu, it's saved as your user preference and will remain so until you change it.

Search

Use the Search option to quickly find and open any Space, Board or Doc.

Also, the Search bar displays all the recent Spaces, Boards, and Docs that you've navigated to within the CWM workspace. You can quickly select from the recent items without having to search for them again.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Keyboard shortcuts

Use the following keyboard shortcuts to quickly perform actions within the workspace.

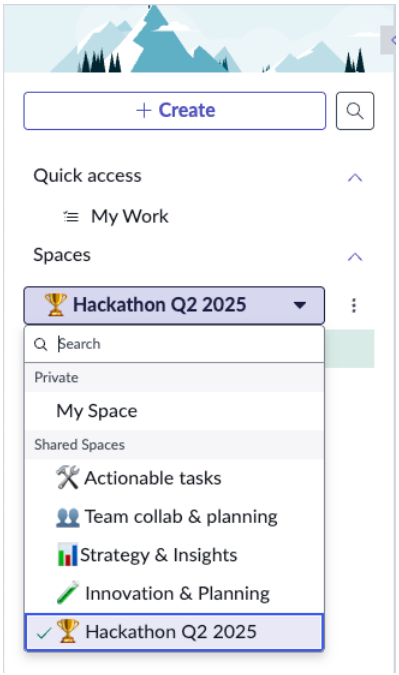
Keyboard shortcuts for CWM

Action	macOS shortcut	Windows OS shortcut
Search for a Space, Board, or Doc	Option + F	Alt + F
Create Space	Option + S	Alt + S
Create Board	Option + B	Alt + B
Create Doc	Option + D	Alt + D
Navigate to My Work	Option + M	Alt + M

My Space

By default, a Space and a sample Board are created for you so that you can get familiar with the features and options in the workspace. From your personal Space, you can browse through the **Intro to Docs** and **Welcome to CWM** documents for a high-level overview of what you can do with CWM.

Create more task Boards, docs, and organize them into folders to manage the work assigned to you.

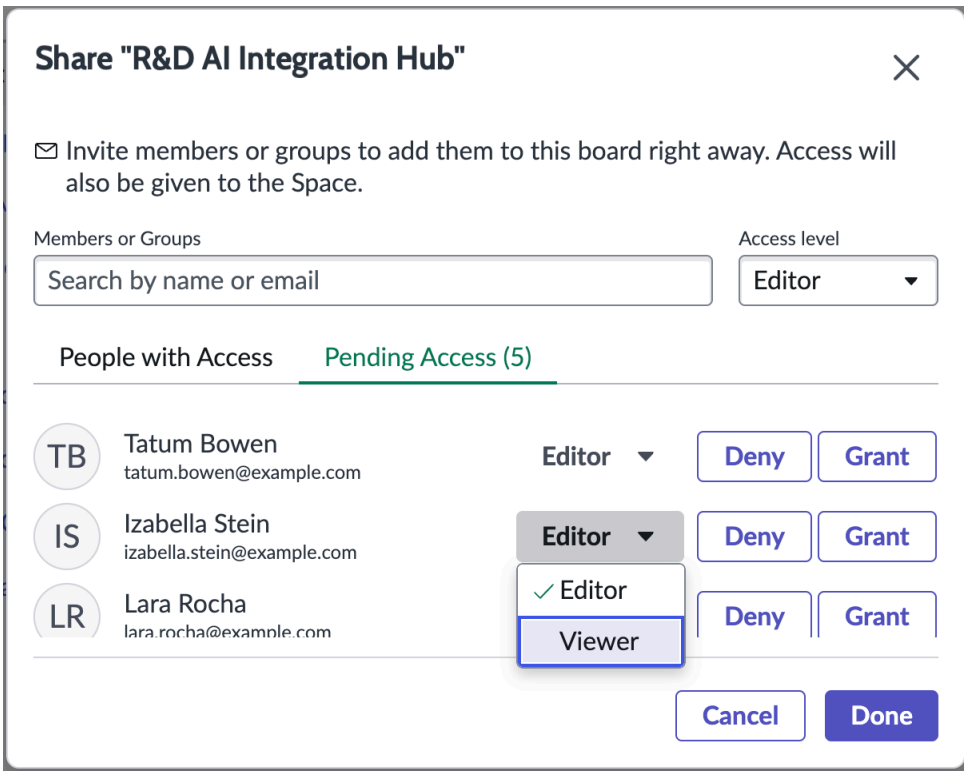


Shared Spaces

Collaborating with Spaces

Shared spaces act as a central location for cross-functional teams to come together and collaborate toward common goals. Plan for the next big release, prepare for a presentation, organize a conference, and do much more using task Boards and collaborative Docs.

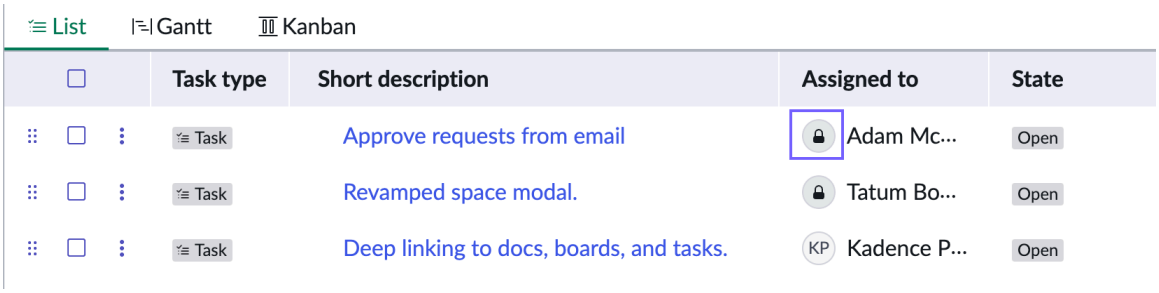
With the capability to connect to any record across the ServiceNow AI Platform, avoid the risk of having information scattered across multiple apps and missing unplanned tasks.



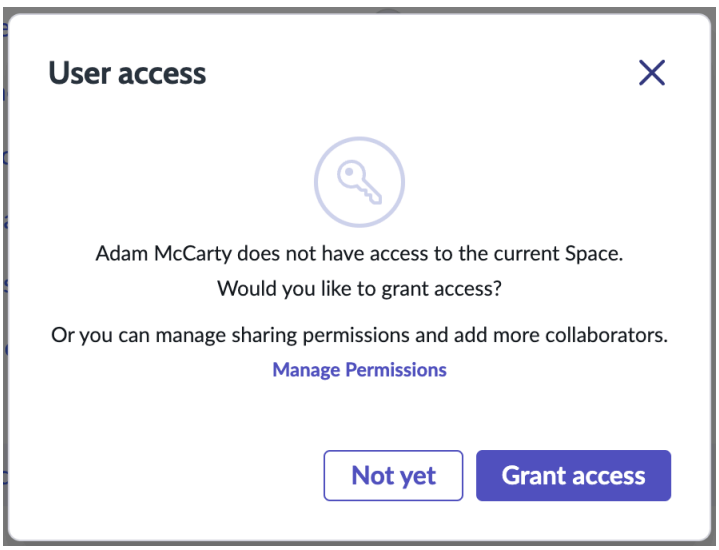
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Managing access in the Share permissions modal

As a Space owner or editor, you can manage access for existing users of your Space and review access requests from other users using the Share permissions modal.



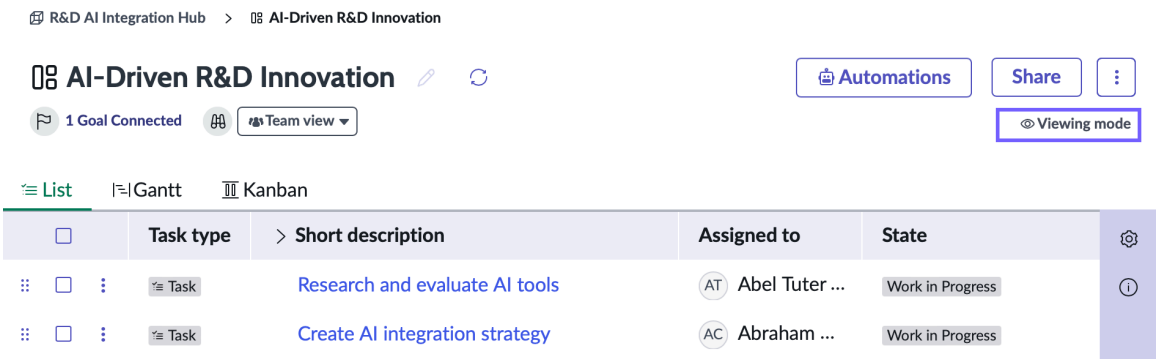
- People with Access section: Manage the access level of existing collaborators to Editor, Viewer, or Owner, or remove them from the Space.
- Pending Access section: Review requests from users and choose to grant or deny them access to your Space.



Managing Space permissions for task assignees and other users

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

As a Space owner or editor, while assigning tasks to your team members, you can identify users who don't have access to the workspace. A lock icon appears next to the user name for these users. This icon is visible in the List view of the Board in the columns of type People such as **Assigned to**, **Additional Assignee**, and **Assignment group**.



You can either use the workspace prompt to grant assignees Viewer access or choose to manage their access level later from the Share permissions modal. For more information on managing sharing permissions, see Share a Space in CWM and manage sharing permissions.

Requesting to elevate user access role to Editor

The Viewing mode indicator in the Board header indicates that you have only the Viewer role to the Space that you're in. As a Space viewer, you can send a request to Space owners and editors to request elevating your role to Editor by selecting the indicator.

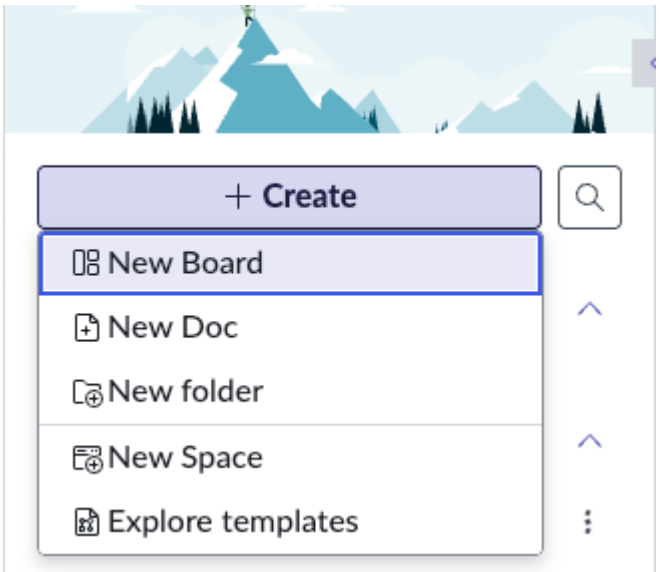
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Space owners and editors receive an email request from which they can choose to grant or deny access to the user.

Using the following sections, get started with shared Spaces in the workspace.

Create a Space in CWM

Create Spaces in Collaborative Work Management to enable cross-functional teams to come together and manage work tasks and documentation.



Before you begin

Install Collaborative Work Management.

Role required: sn_cwm.cwm_user

Procedure

1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. From the left side panel, select **+ Create** > **New Space**.

3. In the **Space name** field, enter a name for the Space.

4. Select **Create**.

Result

A new Space is created and added right below the **My Space** section. You can add as many Spaces as you need for each of your projects, teams, or other assignments.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

- Create a Board to organize and manage work for your team or projects. See Create a Board in CWM.
- Share the Space with others on your team. See Share a Space in CWM and manage sharing permissions.

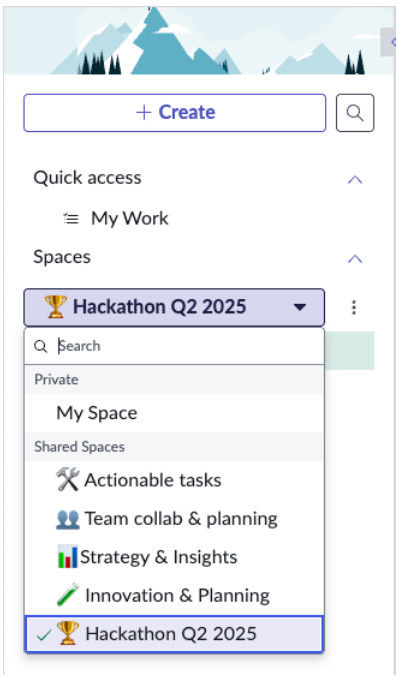
Share a Space in CWM and manage sharing permissions

Invite cross-team members to Collaborative Work Management Spaces to collaborate on tasks or projects. You can also manage permissions for users with existing access to your Space.

Before you begin

Create a Space in CWM.

Role required: sn_cwm.cwm_user



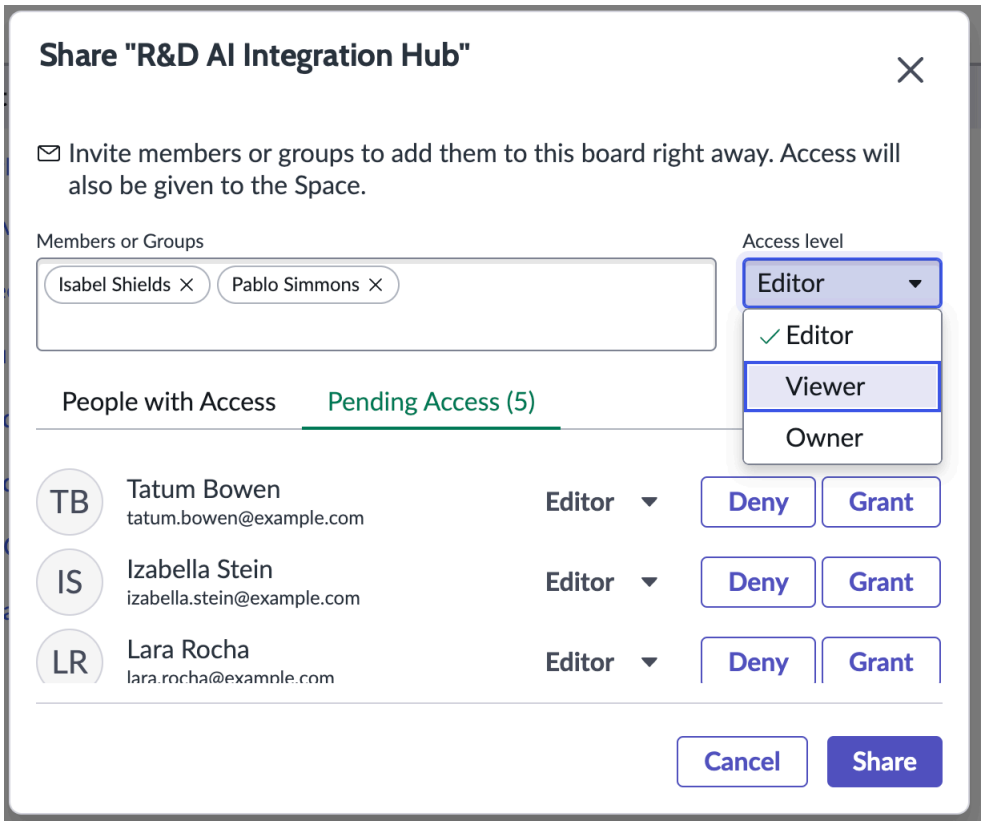
About this task

Sharing a Space with a user results in them gaining access to all Boards, Docs, and folders within that Space. Use the Share permissions modal from the Space or Board header to manage sharing permissions and access levels to your Space for your team.

Note: You can share a Space only with users within your organization. For more information about the two kinds of Spaces and organization-wide sharing, see Collaborating with Spaces in CWM.

Procedure

1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. From the left side panel, select a Space.



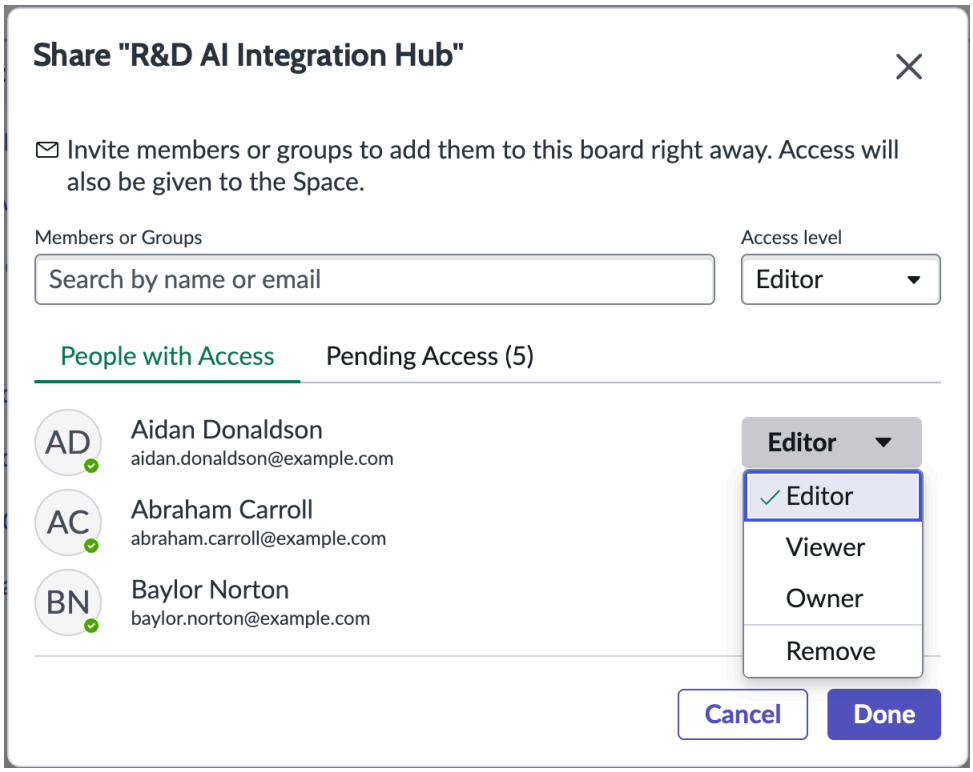
3. From the header of the Space, select **Share**.
   My Space is personal to you cannot be shared.
4. Add new users to the Space.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the **Members or Groups** field, enter the names of individual users or groups.

You can search for users and groups by email along with their name so that you choose the right collaborator.

b. From the **Access level** field, set the access required for these users.

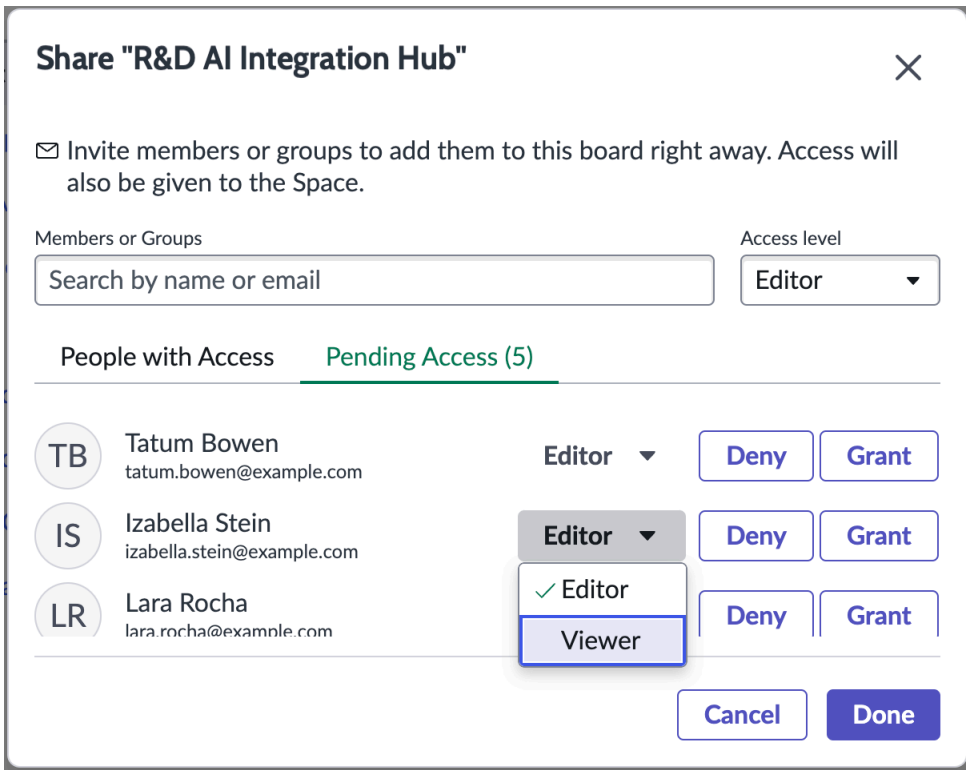


Type of access levels for a CWM Space

Access level	Description
Owner	This role is typically assigned to the creator of the space. They have the create, read, update, and delete access to Boards, Tasks, Columns, and Docs in the Space.
Editor	They have the create, read, update, and delete access to tasks in the Board and Docs in the Space. They can share the Board but can't delete it.
Viewer	They can view the data in the Space but can't update or delete it.

c. Select **Share**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. From the **People with Access** tab, manage permissions for existing users by changing their access level or removing a user from the Space.
   As the Owner or Editor of a Space, you can remove access for existing users of the Space or yourself at anytime. As a viewer, you can only remove access for yourself.

6. From the **Pending Access** tab, you can review the list of users who have requested access to your Space and choose to grant or deny them the access.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

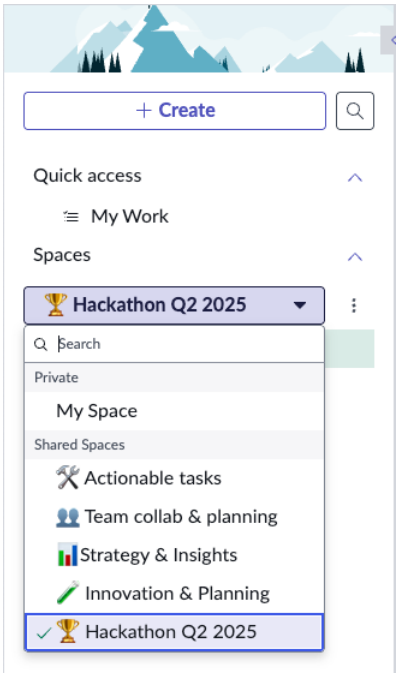
Before granting access to a user, you can modify their access level to Editor or View as necessary.

Result
An email invite is sent to the users that you shared this Space with.

What to do next
Start working on tasks for your team using Boards. See Managing work using Boards in CWM.

Create a folder in CWM

Organize Boards and Docs of a Space into folders in Collaborative Work Management Workspace.



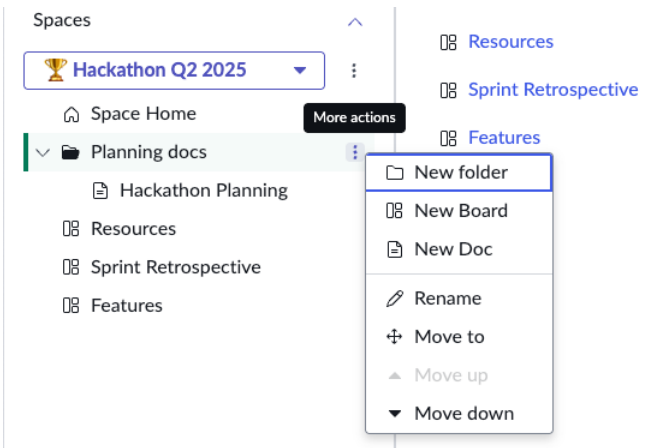
Before you begin
Create a Space in CWM.

Role required: sn_cwm.cwm_user

Procedure

1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. Open a Space that you want to create a folder in.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. From the More options menu of the Space ( ), select **New folder**.
4. In the **Folder name** field, enter a name for the folder.
5. Select **Create**.

Result

A new folder is created in the Space that you selected.

What to do next

- Create subfolders, Boards, and Docs in this new folder.
- Move any existing Boards, Docs, or folders into this new folder.

Managing work using Boards in CWM

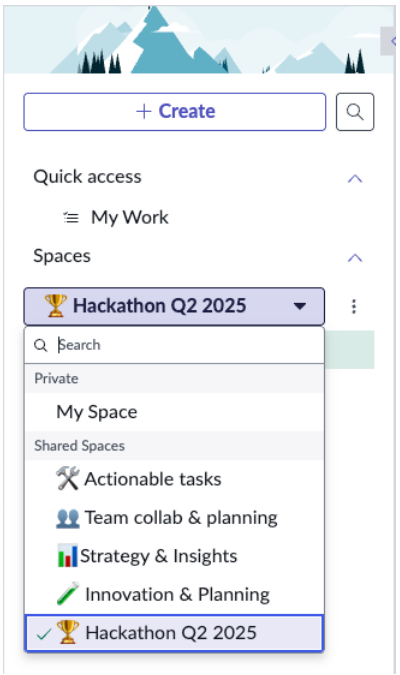
Use Boards in Collaborative Work Management to define and organize tasks. With views such as Dashboard, List, Kanban, and Gantt, configure your workspace based on the way you and your team work.

Using the following sections, get started with Boards in the CWM workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

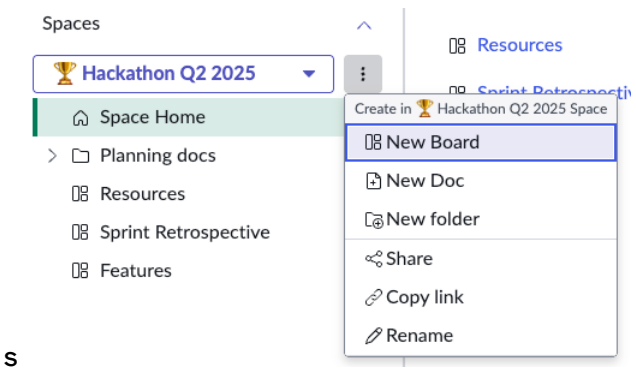
Create a Board in CWM

Manage work assigned to your team as tasks and track them to completion using customizable Boards for your shared Spaces in Collaborative Work Management.



Before you begin

Create a Space in CWM.



Role required: sn_cwm.cwm_user

Procedure

1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. From the Spaces menu, open a Space that you want to add a Board to.

3. From the More options menu of the Space ( ), select **New Board**

S

4. In the **Board name** field, enter a name for the Board.
5. Select **Create**.

Result

A Board is created within the Space that you selected and an empty Board is shown in the workspace. You can add unlimited Boards to a Space, based on how you choose to manage your workflows.

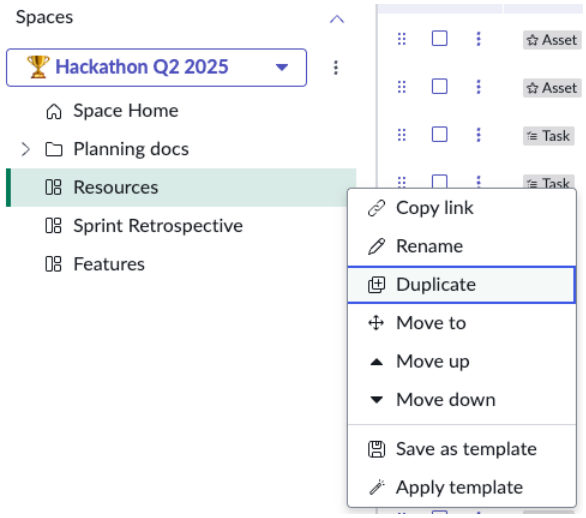
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

- Add tasks to the Board. See Add tasks to a CWM Board.
- Rename or edit other details of the Board using the Edit icon ( ) on the Board header.

Duplicate a Board in CWM

Save time by duplicating an existing Board to copy all the task and collaborator details without having to copy the information manually in the Collaborative Work Management workspace.



Before you begin

Create a Board in CWM.

Role required: sn_cwm.cwm_user

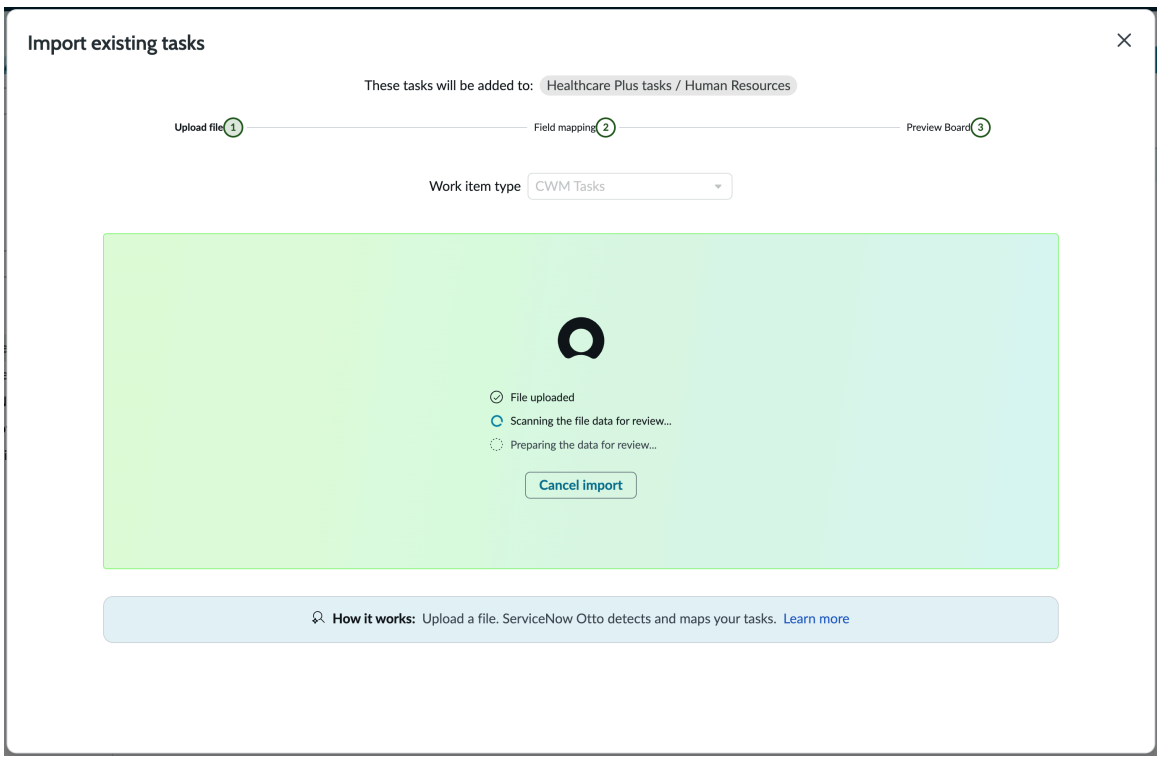
Procedure

1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. Navigate to the Space that your Board is in.
3. From the **More actions** menu of the Board, select **Duplicate**.

4. Provide a name for the new Board in the **Board name** field.
   The default name given is in the format of **(Copy) <Original Board name>**.
5. Select **Duplicate**.

Result

- The new Board is added to the same Space as the original Board.
- If your original Board was in a folder, the new Board is added to the same folder.
- If necessary, you can move it to a different Space or a different position in the same Space.
- The states of all the copied tasks are reset to the default (open) state in the new Board.
- All the assigned tasks are reset to unassigned.
- The start date for the tasks shift to the current date.
- Any custom columns in the original Board are copied to the new Board.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Task import into CWM Boards using ServiceNow Otto

Save time and effort by importing tasks or stories from a spreadsheet or document into a Collaborative Work Management Board. ServiceNow Otto proposes column mapping so you can bring existing work onto a Board without manually recreating each row.

Teams migrating to CWM from external task tracking tools often have months of structured work already documented in spreadsheets or documents. Recreating that work manually on a CWM Board is time-consuming and error-prone.

The import feature on a CWM Board lets you bring that existing work in from a file. ServiceNow Otto scans the file, identifies the tasks, and proposes how each source column maps to a column on your Board. You review and adjust the mapping, preview the tasks before they are created, and confirm to complete the import.

Key capabilities

AI-proposed column mapping

ServiceNow Otto analyzes your file and proposes a target Board column for each source column based on the data it detects. Because the mapping is AI-generated, review each proposal and adjust as needed before proceeding to the preview.

Manual mapping adjustments

For any source column, you can select a different target column from the list of available Board columns. Each source column must map to a unique target column.

Custom column creation

If a source column does not match any existing Board column, you can add it as a new custom column directly from the mapping step. You can choose the column type while adding.

Reset to AI mapping

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you have adjusted mappings manually and need to start over, you can reset the entire mapping to the original ServiceNow Otto proposal.

Preview before import

Before confirming, review the full list of tasks that will be created on the Board. You can deselect individual rows to exclude them from importing.

Background processing with notification

The import runs in the background after you confirm. A workspace notification reports the number of records added to your Board and flags any rows that could not be processed.

Record types

Each row of your file is imported as a record into CWM. Choose one of these record types in the upload step:

- CWM task
- Story

The available target columns in the mapping step depend on the record type that you choose.

Considerations

File limits

Each import accepts a single file with a maximum size of 10 MB, up to 100 rows, and up to 50 columns. Supported file types are .doc, .docx, .pdf, .xls, .xlsx, .png, .jpg, and .jpeg. For Excel files with multiple sheets, only the first sheet is imported.

Excel column header row

For Excel files (.xls or .xlsx), the first row must contain the column names. The AI always treats the first row as the header row. This requirement does not apply to image files, where the AI reads the content directly without relying on a header row.

Date format

Dates in the source file must match the format set in the `glide.sys.date_format` system property on your instance. Dates in any other format are silently left blank after import.

Required mapping

The **Short Description** column must be mapped before you can proceed to the preview step.

Access requirements

The **Import tasks** option, under **Create with Otto** in the Board header, is visible only on Boards where ServiceNow Otto for CWM is active. You need the sn_cwm_ai.cwm_ai_user and lens_user roles.

Single file per import

Each import session accepts one file at a time. Upload a separate file for each set of tasks you want to bring in.

CSV files aren't supported

CSV format is not a supported file type. To import tabular task data from a spreadsheet, use an .xls or .xlsx file instead.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tabular data required

The file must contain structured, tabular data with identifiable rows and columns. Files that contain only freeform or narrative text can't be processed, and the import fails if ServiceNow Otto can't detect any importable rows.

Import can't be reversed

After you confirm the import, records are created in the background. There is no option to undo or reverse a completed import but to delete the imported records from the Board.

Newly imported tasks aren't highlighted on the Board

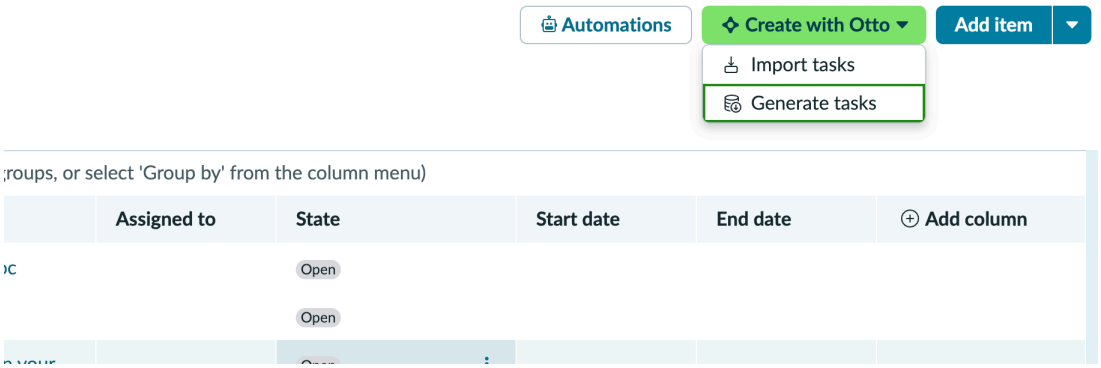
After the import completes, the imported tasks appear on the Board but aren't visually highlighted or grouped as a set. Use filters or sort options to locate them.

Get started

Import existing tasks into a CWM Board.

Import existing tasks into a CWM Board

Bring existing work from a spreadsheet or document into a CWM Board. Column mapping is generated automatically. Review the mapping, preview the result, and confirm the import.



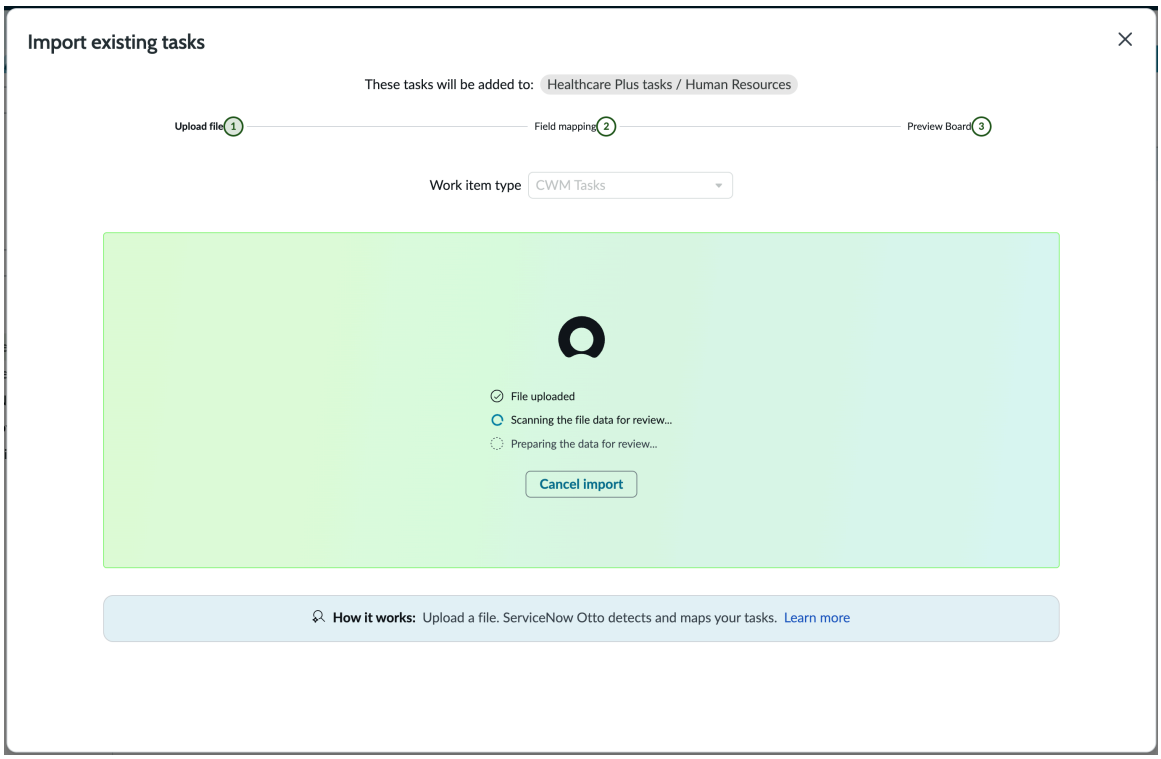
Before you begin

- Prepare a source file that meets these conditions:
  - One of these file types: .doc, .docx, .pdf, .xls, .xlsx, .png, .jpg, or .jpeg
  - 10 MB or less
  - A maximum of 100 rows and 50 columns
  - Includes a column that contains a task title or name, used as the short description during import.
  - For Excel files (.xls or .xlsx): place the column names in the first row. The AI always treats the first row as the header row.
  - If your file contains dates, the dates must match the format set in the `glide.sys.date_format` system property. Dates in other formats are silently left blank after import.
- Verify that ServiceNow Otto for CWM is active on your instance.
- Role required: sn_cwm_ai.cwm_ai_user or lens_user

Procedure

1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. From a Space, select a Board to import tasks into.
3. From the Board header, select **Create with Otto**, and then select **Import tasks**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



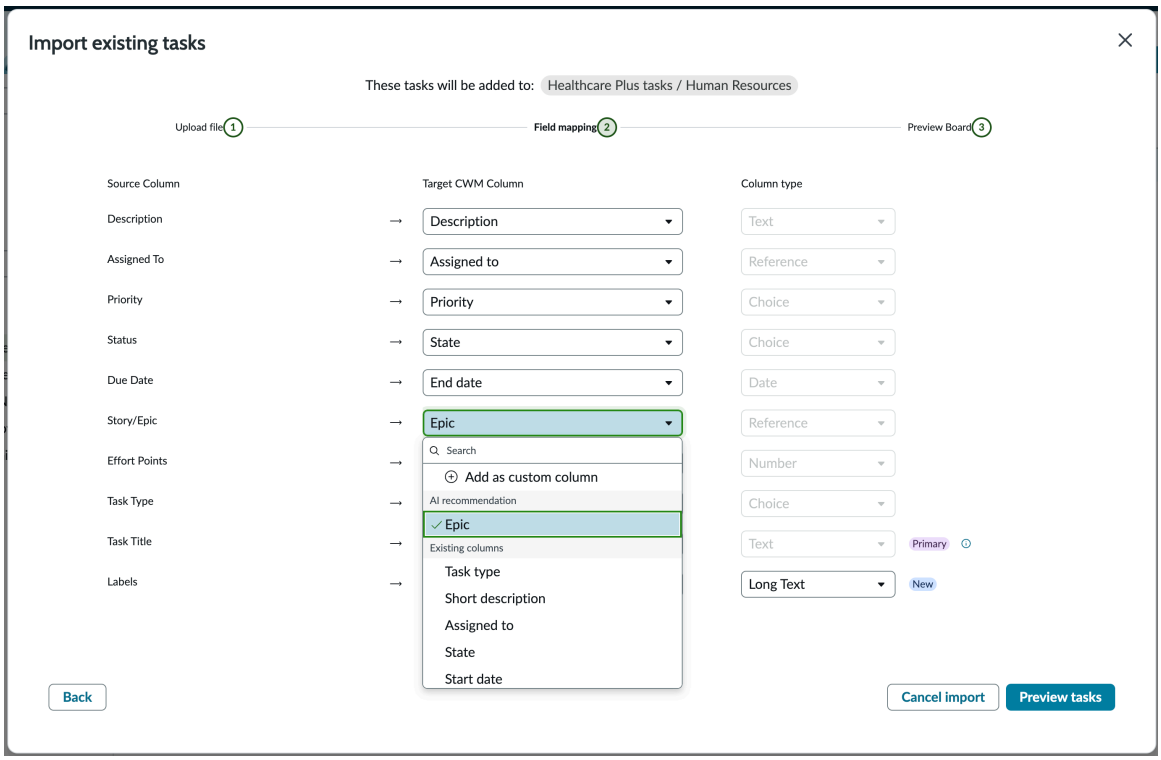
The import wizard opens with three steps: **Upload file**, **Field mapping**, and **Preview board**.

4. From the **Work item type** list, select the type of record to import tasks as.

   You can choose **CWM Tasks** or **Stories**. The source to CWM column mapping in the next step depends on this choice.

5. Upload your file by dragging it onto the upload area or by selecting **Select file**.

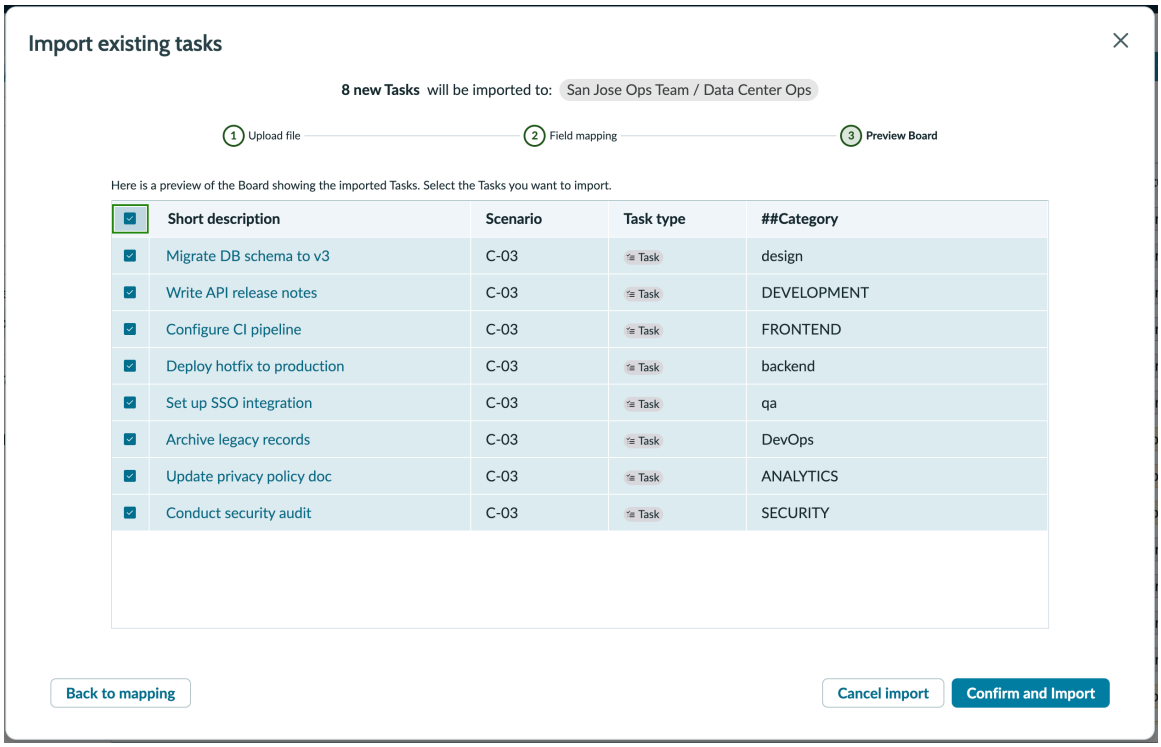
   The file is processed and the wizard advances to the **Field mapping** step automatically.



6. On the **Field mapping** step, review the proposed mapping.

   For each source column, a target column on your Board is suggested. Adjust the mapping in any of these ways:

   - To map a source column to a different existing column, select a value from the target list.
   - To add a new custom column on your Board, select **Add as new custom column**, and then choose the column type.
   - To return to the original column mapping, select **Reset to ServiceNow Otto mapping**.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Short description column is required. Each source column must map to a different target column.

7. Select **Preview tasks**.
8. On the **Preview board** step, review the tasks to import.

   Select all tasks at once or select the tasks to import.

9. Select **Confirm and Import**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

10. If you added any custom columns during the import, enable their display on the Board using the Personalize side panel and save the view.
    For more information on personalizing columns, see Personalize List, Gantt and Kanban display for CWM Boards.

Result

The wizard closes and the import runs in the background. A workspace notification confirms the outcome:

- If all tasks import successfully, the notification shows the count of records added to your Board.
- If some tasks import, the notification shows the count of records imported and indicates that some items were not processed.

What to do next

Open the Board to verify the imported records. Edit individual records from the side panel or by inline editing in the grid.

Add tasks to a CWM Board

Add tasks to a CWM Board and assign them to team members to plan and track work in a Collaborative Work Management workspace.

Before you begin

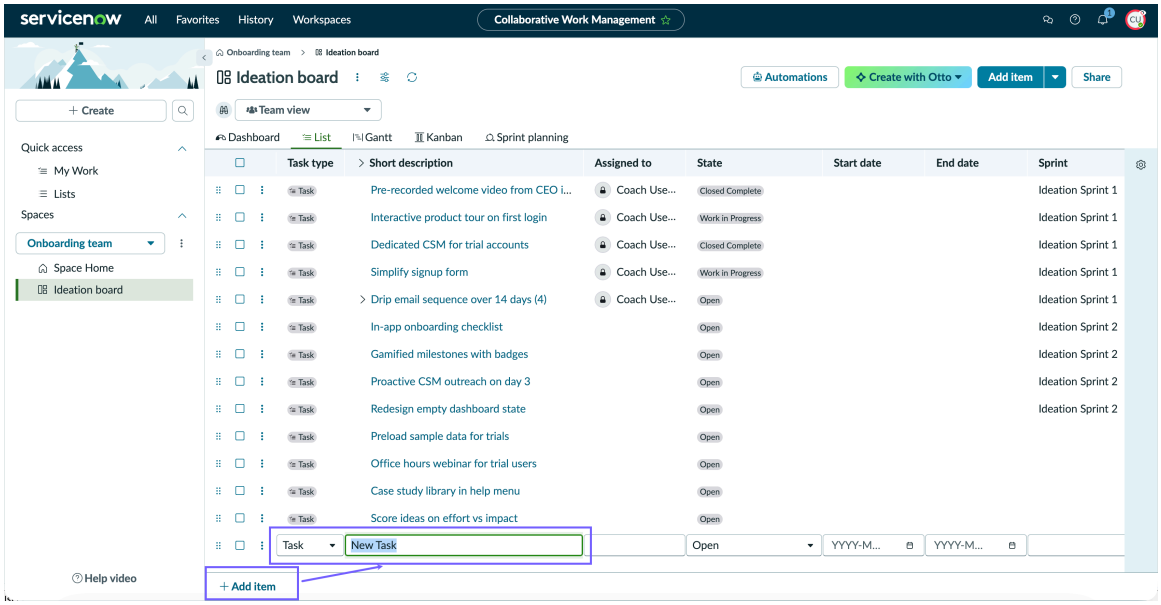
A Board is created before you add tasks. For details, see Create a Board in CWM.

Role required: sn_cwm.cwm_user

About this task

Each task on a Board is a unit of work that your team plans, assigns, and tracks to completion.

This procedure provides step by step guidance on how to add a single task to a CWM Board.



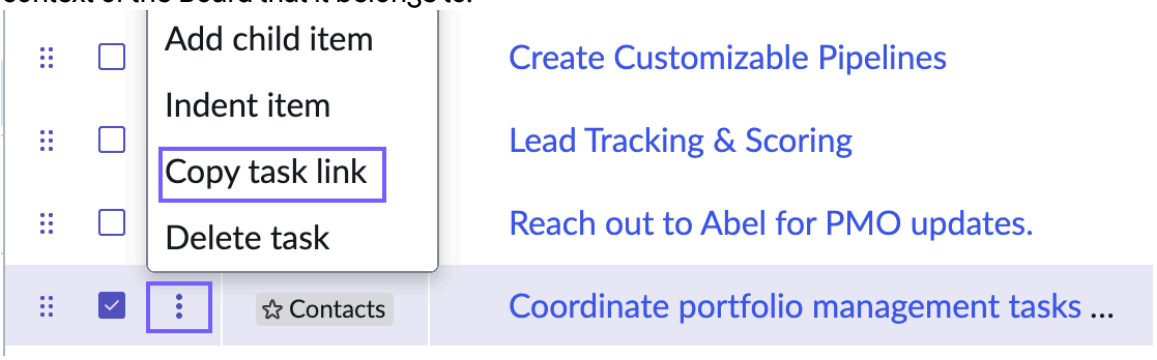
To bring in many tasks at once from an existing file such as Excel, Word, or PDF, import them individually using ServiceNow Otto instead of adding them individually. See Import existing tasks into a CWM Board.

To generate a batch of tasks from an open prompt or an uploaded document, use AI to generate tasks. See Create CWM tasks or stories from files or open prompts.

Procedure

1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. From a Space, select a Board that you want to add tasks to.
3. From the Board footer, select **+ Add item**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Fill in details such as the Type, Short description, Assigned to, dates, and others.

   The default work item types available in CWM are Task and Defect. If you want to create other work items such as Milestones or Events, you can create your own task type. See Create and manage custom work item types in CWM.

What to do next

- Add more tasks to the Board and assign them to yourself or members of your team.
- Edit task details from the side panel by selecting the short description.
- Edit task details directly in the grid using inline editing.
- Rearrange your tasks on the Board by using the drag-and-drop feature.
- Share tasks by their URL using the **Copy task link** option from the row context menu of the task. This way, when a user clicks the shared URL, the task opens in the side panel in the context of the Board that it belongs to.

To plan and manage tasks, you can also:

- Create additional columns for a task to add other details. See Add custom columns for tasks in a CWM Board
- Choose the columns to be displayed for the tasks on the Board. See Personalize List, Gantt and Kanban display for CWM Boards.
- Break a task down into smaller units of assignable work by using AI to generate child tasks. See Generate child tasks for CWM tasks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create CWM tasks or stories from files or open prompts

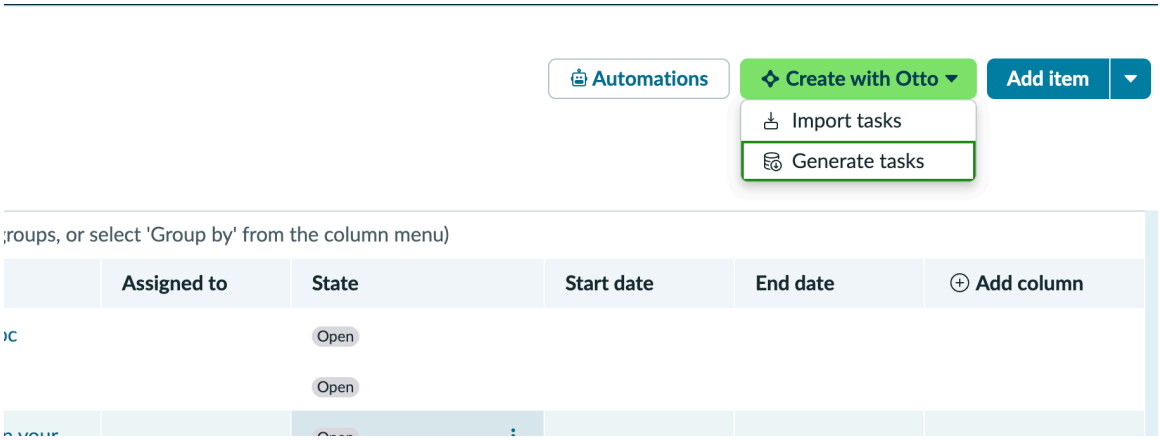
Generate tasks or stories for a Board by describing the work in a natural language prompt or by uploading a document. AI analyzes the input to propose a list of actionable tasks or stories for you to review and select, saving time and manual effort.

Before you begin

Important: This generative AI skill is turned on by default. The skill will be automatically available to appropriate role users for the application. For more information, see AI agents, skills, and agentic workflows on by default.

- Verify that ServiceNow Otto for CWM is active on your instance.
- A reference file in one of these formats: .pdf, .docx, .txt, .pptx, .png, or .jpg. Maximum file size: 50 MB.

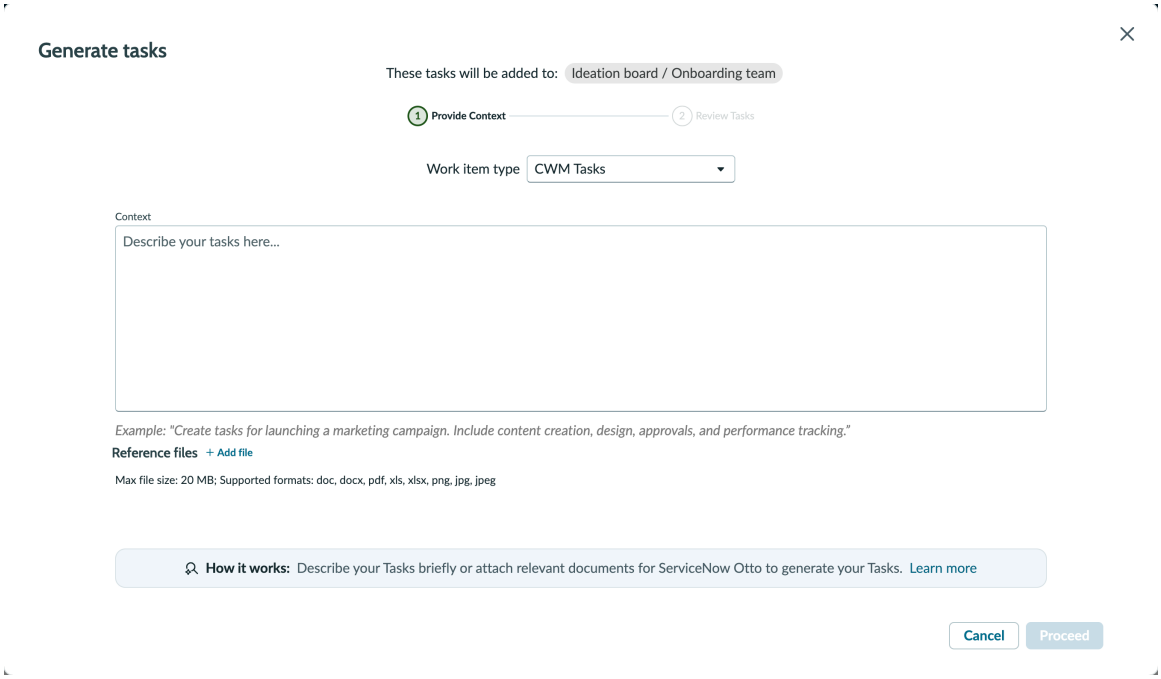
Role required: sn_cwm_ai.cwm_ai_user



About this task

Turn narrative or semi-structured content, such as meeting notes, brainstorming planning docs, or epic PRDs documents, into a list of actionable tasks or stories on a Board. The actionable work items are identified by AI and mapped to the appropriate CWM fields. The tasks are created with a short description, description, and predefined columns. If the context is sufficient, it can create custom columns and map the fields accordingly.

Note: AI-generated tasks are proposals based on the context you provide. Review each task for accuracy and completeness before adding it to the Board.



Procedure

1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. From a Space, select a Board to generate tasks for.
3. From the Board header, select **Create with Otto**.
4. Select **Generate tasks**.

The **Generate tasks** dialog opens with two steps: **Provide Context** and **Review Tasks**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. From the **Work item type** list, select the type of record to generate tasks as.

   You can choose **CWM Tasks** or **Stories**. The context to CWM column mapping in the next step depends on this choice.

6. In the **Context** field, describe the tasks you want to generate.

   For example: `6-month digital transformation to modernize legacy systems, migrate data to the cloud, and redesign the customer portal. Include tasks for change management and stakeholder communication.`

7. **Optional:** Select **Add file** to attach one or more reference documents for AI to analyze.

   Note: If a document can't be processed, an error message indicates the issue. Corrupted or password-protected files show a specific error rather than a generic failure message. Other common causes include files that are too large or too complex.

8. Select **Proceed**.
   AI analyzes your context and any attached documents, and the dialog advances to the **Review Tasks** step.
9. On the **Review Tasks** step, review the tasks to add.
   A banner displays the number of tasks generated. No tasks are selected by default.
10. Select the tasks to add.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

11. **Optional:** Select **Back** to return to the **Provide Context** step.
    Your context text, attached files, and selected documents are retained. You can add or remove files, modify your prompt, or select another work item type and proceed to generate them.
12. Select **Confirm and add**.

    The dialog closes. A banner confirms that task creation is underway in the background and that you will be notified when it's complete.

Result

A workspace notification confirms the outcome:

- If all tasks are added successfully, the notification shows the count of records added to your Board.
- If some tasks are added, the notification shows the count of records imported and indicates that some items were not processed.
- If task creation fails completely, the notification states that tasks could not be added to the Board.

What to do next

Open the Board to review the added tasks. Edit individual tasks from the side panel or by inline editing in the grid.

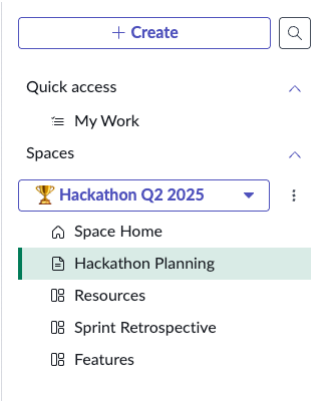
Generate tasks from Docs in Collaborative Work Management (CWM)

Use the generative AI capabilities of ServiceNow Otto to create tasks from the content of your Docs and help you add them to the required Board in CWM workspace.

Before you begin

Important: This generative AI skill is turned on by default. The skill will be automatically available to appropriate role users for the application. For more information, see AI agents, skills, and agentic workflows on by default.

Create a Doc in CWM



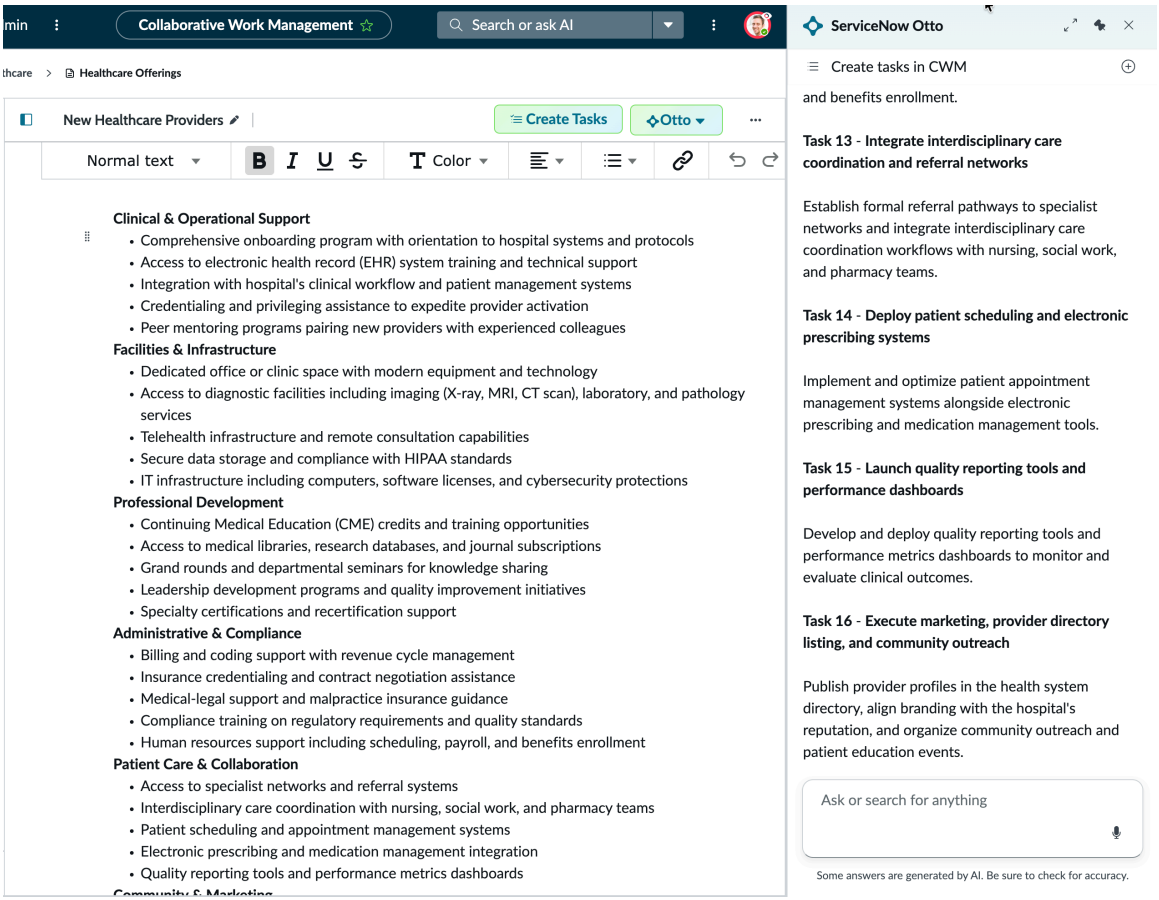
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: sn_cwm_ai.cwm_ai_user

About this task

Procedure

1. Navigate to **Workspaces** > *Collaborative Work Management*.
2. From the Spaces menu, navigate to the Space where your Doc is located and open it.



3. From the header of the Doc, select **Create Tasks**.
   The ServiceNow Otto panel opens up. ServiceNow Otto generates recommendations for tasks based on the information on your Doc page. So, to experience an easier interaction within the panel, you can pin it.
4. **Optional:** Go through the task recommendations and choose to refine or modify any task recommendation.
5. You can iterate on refining or modifying the tasks and when you're satisfied with the recommendations, select **Add to Board**.
6. Select the Space of the CWM Board to which you want to add these tasks to.
7. Select the Board to add these tasks to.

   ServiceNow Otto adds all the generated task recommendations to the selected Board. You can navigate to the Board through the link provided in the ServiceNow Otto message to review them.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If the Space you selected in Step 6 has just one Board, then you won't be asked to select a Board. The tasks are added to the Board directly.

Generate child tasks for CWM tasks

Use AI to create child tasks for a large and complex CWM task in the List view. Child tasks are generated from the task's short description and description, reducing manual work breakdown effort.

Before you begin

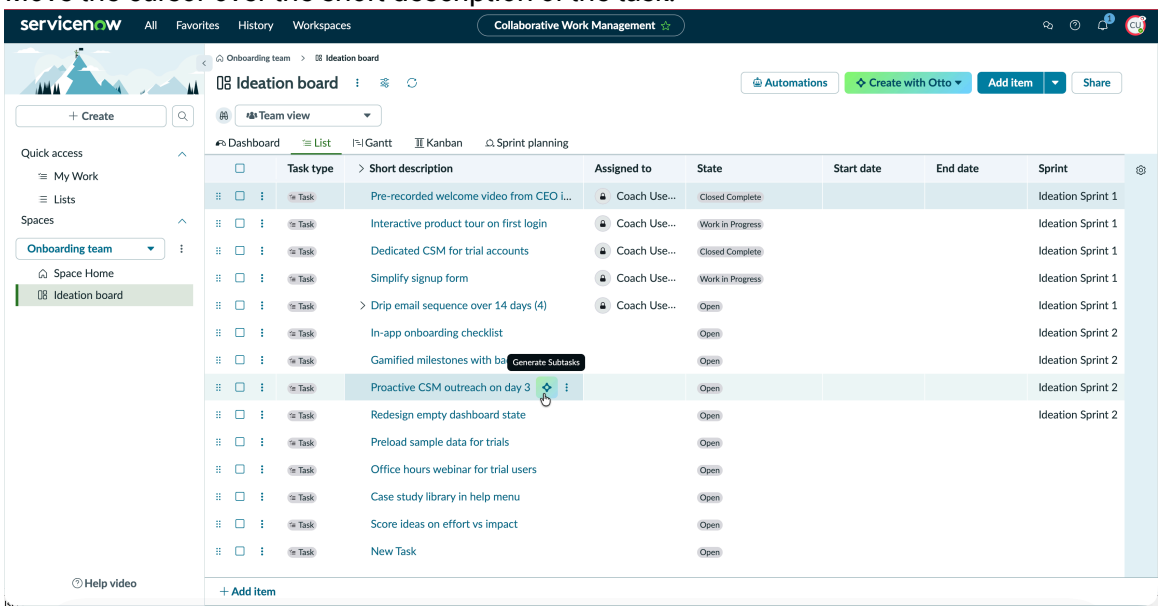
Important: This generative AI skill is turned on by default. The skill will be automatically available to appropriate role users for the application. For more information, see AI agents, skills, and agentic workflows on by default.

- Verify that ServiceNow Otto for CWM is active on your instance.
- A task must exist in the CWM board.

Role required: sn_cwm_ai.cwm_ai_user

About this task

AI generates child tasks from any CWM task type by analyzing the task's short description and description. If the task description doesn't provide enough context, child tasks can't be generated. Generated child tasks appear as a hierarchy under the parent task in the List view.



If a task has child tasks, the existing child tasks are analyzed and aren't duplicated when the skill runs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: It isn't supported for connected work items, such as incident, change, problem, or demand tasks.

Procedure

1. Navigate to **Workspaces** > *Collaborative Work Management*.
2. From a space, select a Board.
3. Select the **List** view.
4. Move the cursor over the short description of the task.

The Generate Subtasks icon appears on the row.

5. Select the Generate Subtasks icon.

The icon changes to a loading indicator while AI generates the child tasks, then returns to the original icon when the generation is complete.

Result

The generated child tasks are inserted as a hierarchy under the parent task in the List view.

Create and manage custom work item types in CWM

Create custom item types for Boards in Collaborative Work Management, so that you can organize and manage multiple types of tasks from a single location, regardless of the workflow.

Before you begin

Create a Board in CWM.

Role required: sn_cwm.cwm_user

Procedure

1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. Navigate to the Board that you want to add custom tasks to.
3. From the Board header, select the More actions icon ( ) and select **Manage item types**.
4. From the Default item types section, enable or disable Task or Defect to be available for your Boards.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. From the Custom work item types section, add a new item type.
   a. Select **Add new item type**.
   b. In the Item type name field, enter a name for the work item type.'
   c. Select an icon to represent the item type.
   d. Select the check box to make this item type available for use in the Board.
   e. Select **+ Add new item type** to repeat adding another item type.
6. After adding all required work item types, select **Save**.

What to do next

Add tasks of the new item type to your Board using the More actions menu () on the Board header.

Add custom columns for tasks in a CWM Board

Create custom fields in a Board so that you can organize all details of tasks at a single location. This improves task management and saves time by reducing dependency on system admin.

Before you begin

Create a Board in CWM.

Role required: sn_cwm.cwm_user

You need to have either Editor or Owner access to the Space to add a custom column.

About this task

Note: This procedure provides general instructions involved in creating custom column types for CWM Boards. To learn how to create a Formula type column, see Add a formula column in CWM Boards.

Procedure

1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. From a Space, select a Board that you want to add tasks to.
3. In the List view of the Board, select **Add column** from the column header and select a data type.
4. In the **Field name** field, enter the name for this new column and other details, if asked.
   - If you select the type as **Label** or **Dropdown**, you're prompted to enter the options for this field.
   - If you select **People**, you're prompted to select the type of users available for this field. Also, choose to allow input of single or multiple users in this field.
   - If you select **Reference**, you're prompted to select a table that you want to add as reference to the tasks.
5. Select **Add column**.

Result

The new column is added to the task and you can start entering the values for this column.

Note: Custom columns added for a task are local to the Board that they're created in and are not applicable to other Boards and Spaces in the workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you have the Owner access for this Space, you can delete any custom columns based on your changing requirements.

Add a formula column in CWM Boards

Gain deeper insights into your work by adding formula columns to your List view in CWM Boards. Create calculations that automatically compute values for your tasks, such as summing hours, calculating date differences, or deriving metrics from existing fields.

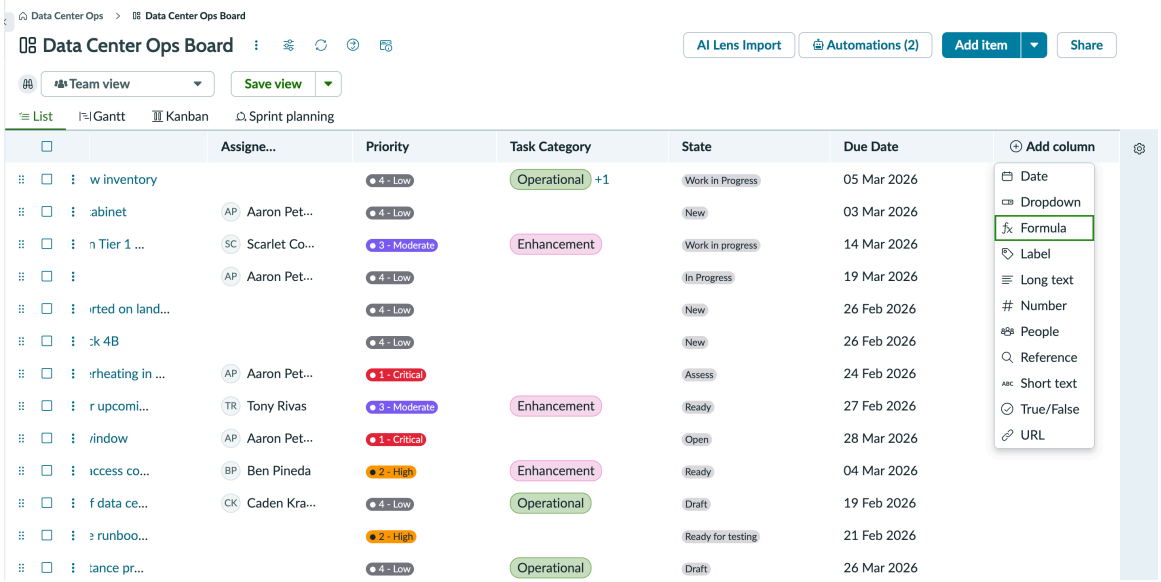
Before you begin

Create a Board in CWM.

Role required: sn_cwm.cwm_user

You need to have either Editor or Owner access to the Space to add a custom column.

About this task

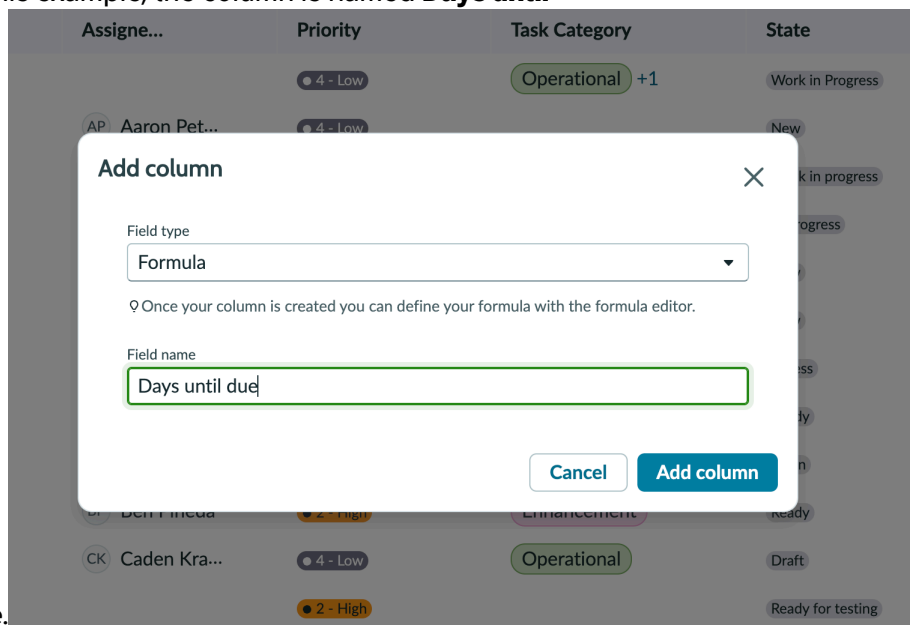


Formula columns in the List view of a CWM Board compute values from existing CWM columns. Examples include calculating date differences from existing Date columns or deriving metrics such as Profit from existing values of Revenue and Cost columns.

Use the built-in Math, String, Date & Time, and Logical functions in the Formula Builder side panel to define a formula expression. To automatically generate a formula from a plain language description using Now Assist instead, see Generate a formula using ServiceNow Otto.

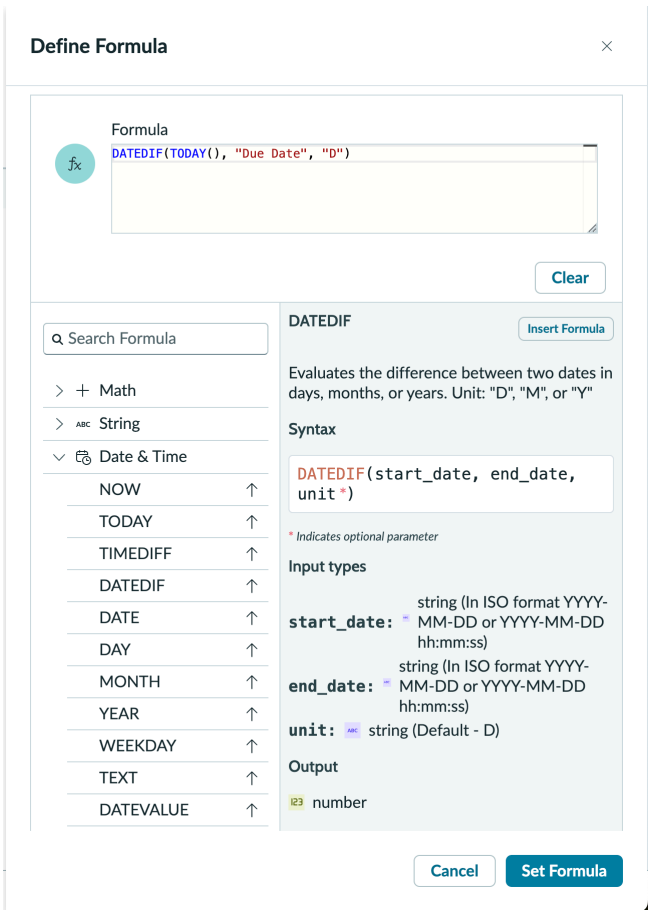
The steps in this procedure use the example of a formula column that calculates the number of days remaining until a task's due date. Follow the steps as guidelines to build a formula of your choice.

Procedure



1. Navigate to **Workspaces** > *`Collaborative Work Management`*.
2. From a Space, open the Board where you want to add a formula column.
3. In the List view of the Board, select **Add column** from the column header and select **Formula**.

4. Provide a name for your formula column.

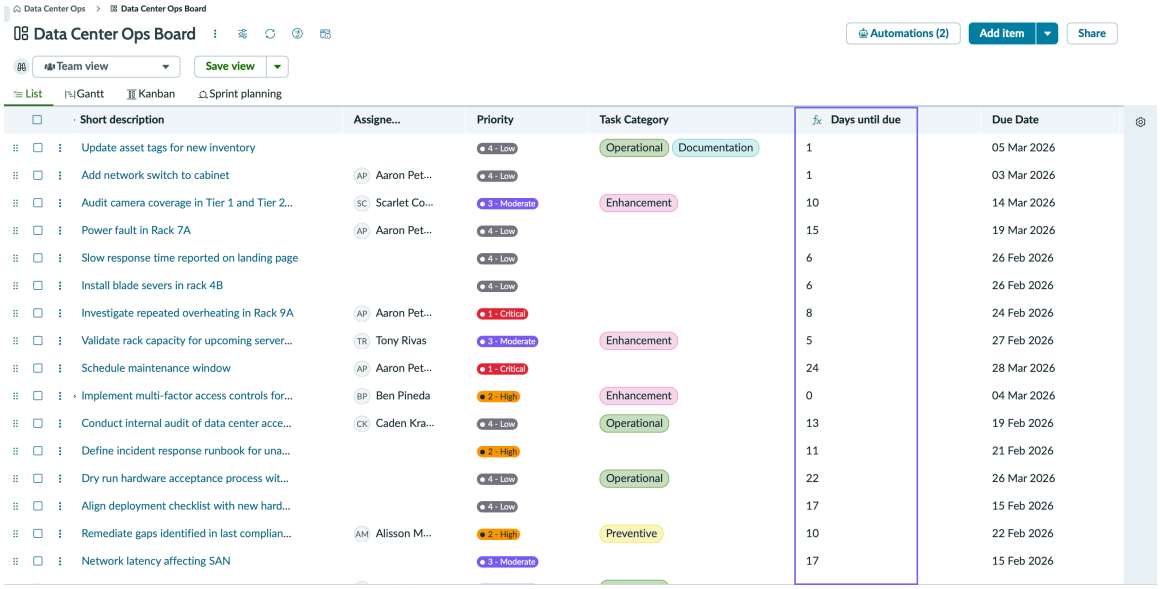


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In this example, the column is named **Days until due**.

5. In the Define Formula side panel, use the Math, String, Date & Time, and Logical functions to build your formula.
   To arrive at the number of days remaining from the due date, use the Date & Time functions to build a formula that calculates difference (in days) between the current day and the due date.

   DATEDIF(TODAY(),"Due Date","D")



6. Select **Set Formula** to save and apply the formula column.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result

- The Board refreshes to display the new formula column, and its values populated per the formula you defined.
- If your formula contains any syntax errors, you are notified of the same and then you can review it and correct it.

Add custom columns for tasks in a CWM Board

Generate a formula using ServiceNow Otto

Generate a formula using ServiceNow Otto

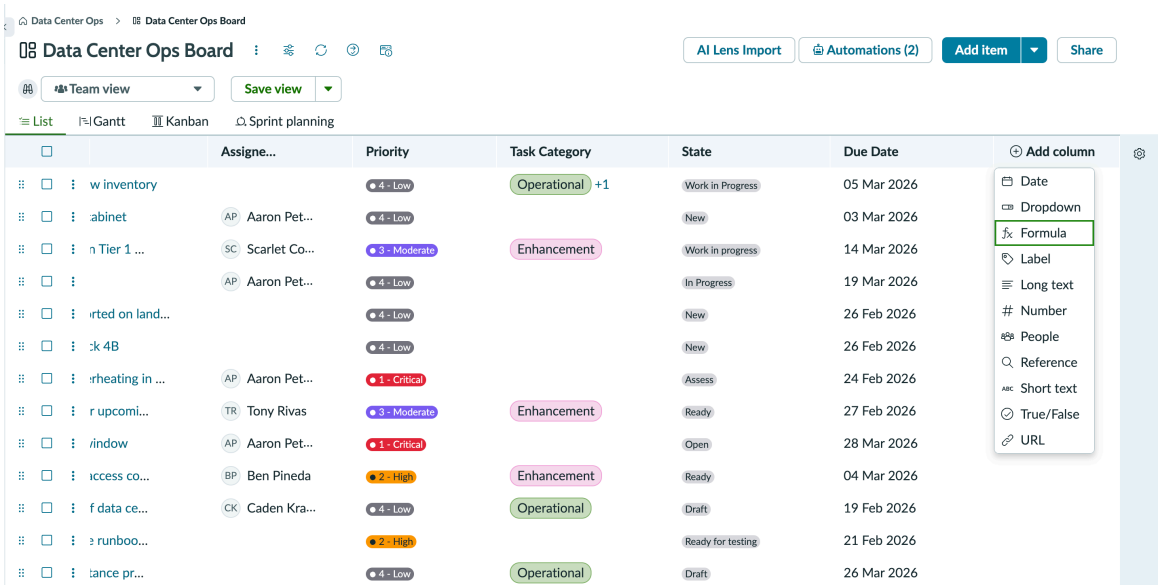
Use ServiceNow Otto to automatically generate formulas to compute values such as summing hours, calculating date differences, or deriving metrics from existing fields.

Before you begin

Role required: sn_cwm_ai.cwm_ai_user

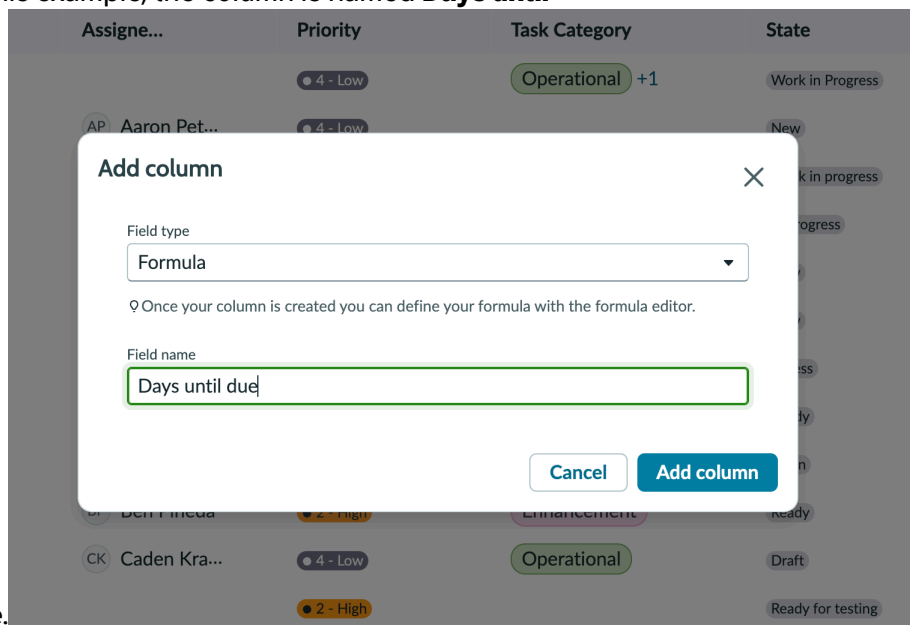
About this task

Formula columns in the List view of a CWM Board compute values from existing CWM columns. Examples include calculating date differences from existing Date columns or deriving metrics such as Profit from existing values of Revenue and Cost columns.



Instead of building the formula syntax manually, you can describe your calculation in plain language. ServiceNow Otto then generates a valid formula that you can insert directly into the column with a single click.

The steps in this procedure use the example of a formula column that calculates the number of days remaining until a task's due date. Follow the steps as guidelines to build a formula of your choice.

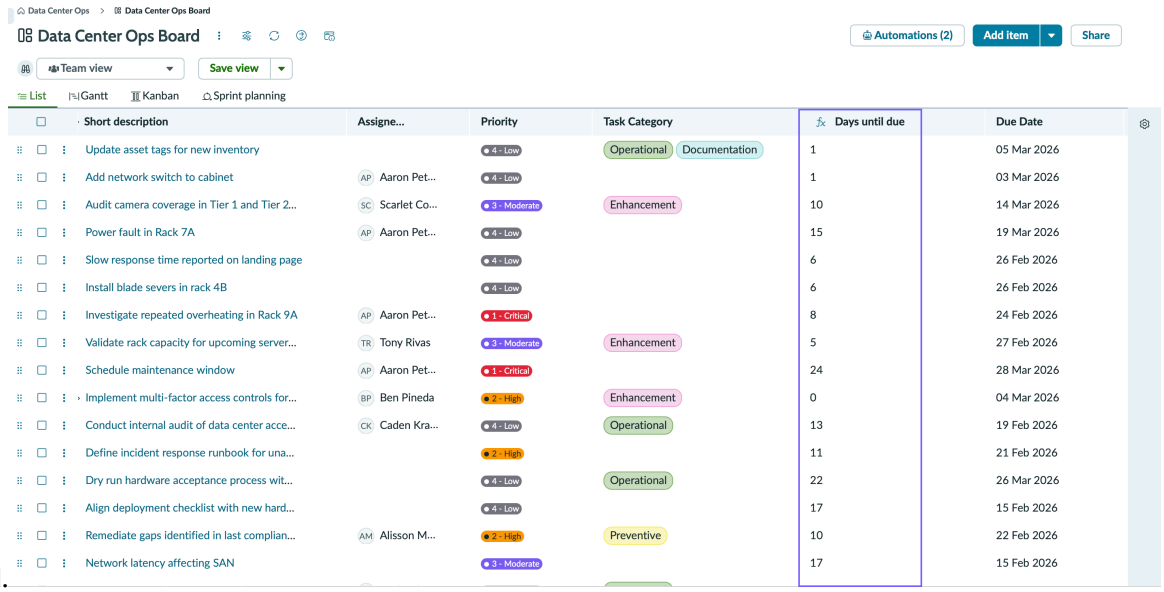


Procedure

1. Navigate to **Workspaces** > *`Collaborative Work Management`*.
2. From a Space, open the Board where you want to add a formula column.
3. In the List view of the Board, select **Add column** from the column header and select **Formula**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Provide a name for your formula column.
   In this example, the column is named **Days until due**.



5. In the Define Formula side panel, describe your formula in natural language in the ServiceNow Otto input field and submit.
   ServiceNow Otto generates a formula syntax based on your instruction.
6. Review the generated formula and select **Insert** to add it to the Formula field.
7. Select **Set Formula** to save and apply to the formula column.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result

The Board refreshes to display the new formula column, and its values populated per the formula you defined.

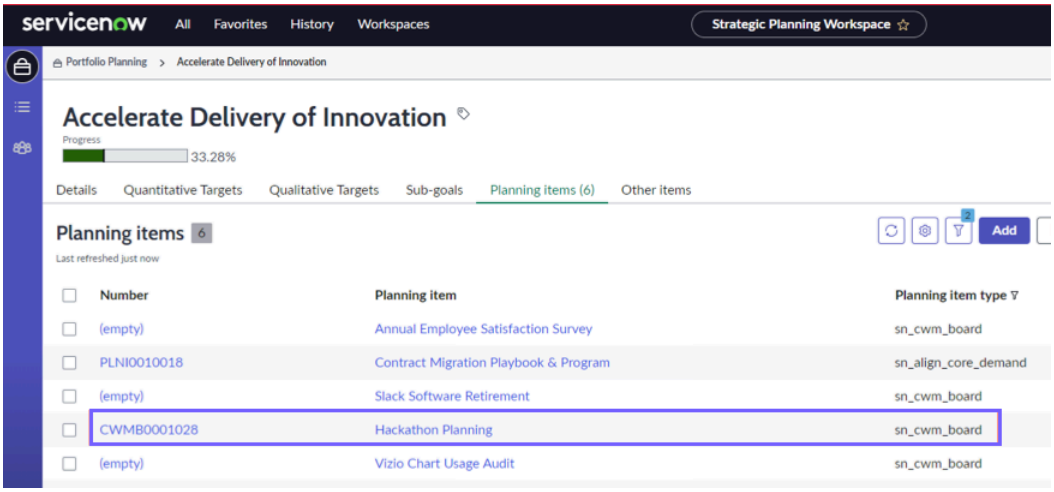
Add a goal to CWM Board

Associate a goal to your Board so that you can plan and track all the tasks and activities that contribute to this goal directly from the Collaborative Work Management workspace.

Before you begin

Create a Board in CWM.

Role required: sn_cwm.cwm_user



Procedure

1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. From a Space, select a Board that you want to add a goal to.
3. Edit the Board by selecting the Edit icon ( ) from the Board header.
4. In the Board form on the side panel, select a goal from the **Primary goal** field.
5. Select **Update**.

Result

- Within CWM workspace: The current Board is associated with the selected goal, and is shown in the Board details page.
- Within Strategic Planning workspace: If the goal that you selected is part of a portfolio plan within Strategic Planning Workspace, you can see that this CWM Board is added to the goal as a planning item.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: CWM Board must be configured as a planning item for the lens that is used to create the portfolio plan. For more information, see Connecting CWM with Strategic Planning or Portfolio Planning.

Board views in CWM

Create, customize, and switch seamlessly between Board display preferences such as column display, sorting, and filtering based on the audience and purpose in Collaborative Work Management (CWM).

With Board views, you can save your preferred data views or create shared views to ensure a consistent experience across sessions and for the entire team. Saved preferences include column display, column order, sorting, filters, view mode display, Kanban vertical lane selection.

You can create multiple views for Board display personalization and come back to the view of your choice, without having to rearrange columns on the Board every time. The following are some more advantages of Board views:

- Save Board display preferences as personal or shared views.
- Create shared views for the team so that all the team members consuming the data have the same experience.
- Create multiple views for the same Board so that you can display data in a way that is fit for your audience.
- Quickly switch between views to avoid manually updating display preferences each time the audience is changed.
- Update the view preferences anytime to adapt to changing processes.

Board views in CWM can be classified as personal and shared:

My views

The Board display settings that are personal to you and are only available for you to access are grouped into **My views**. You can create multiple personal views and switch between them depending on your workflow patterns.

Any display personalization settings that you have already applied to your Boards before upgrading to CWM version 4.0.1 are saved as your personal view, with the name **<Your name>'s view**.

Shared views

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Shared views are available to all members that have access to the Board or Space. You can create multiple shared views for a Board so that each type of audience has a view that is customized for them.

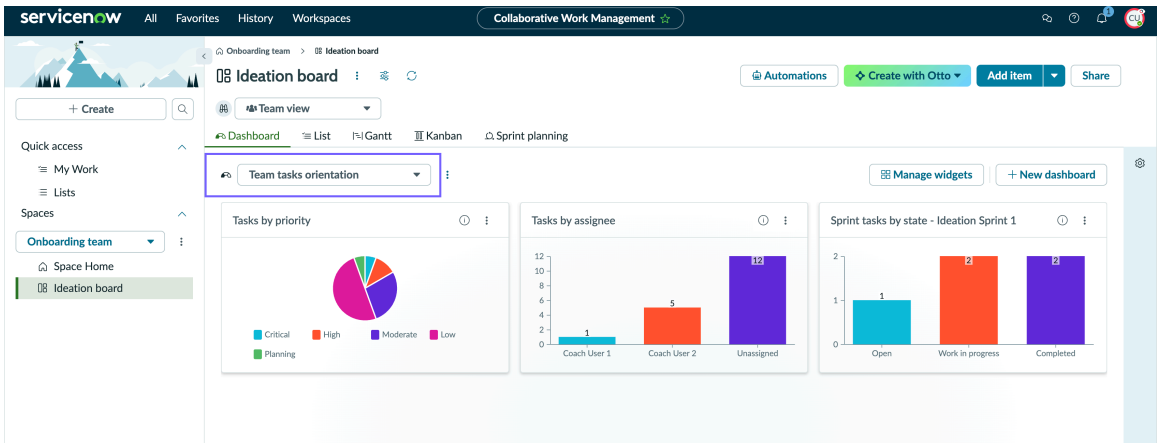
> **Note:** Shared views cannot be created in **My Space** because it's your personal Space.

When you save a Board with shared views as a template, the shared views are also saved as part of the template. For more information on templates, see Templates in CWM for Boards and Docs.

The view that you last visited for a Board is saved as your user preference and is selected the next time you reload the Board.

Use the following sections to learn more on how to make the most out of Board views and their customizations for your team.

Dashboard, List, Gantt, and Kanban views in CWM



Switch between Dashboard, List, Gantt, and Kanban views to manage and visualize work on a CWM Board in the way that best fits your team's workflow.

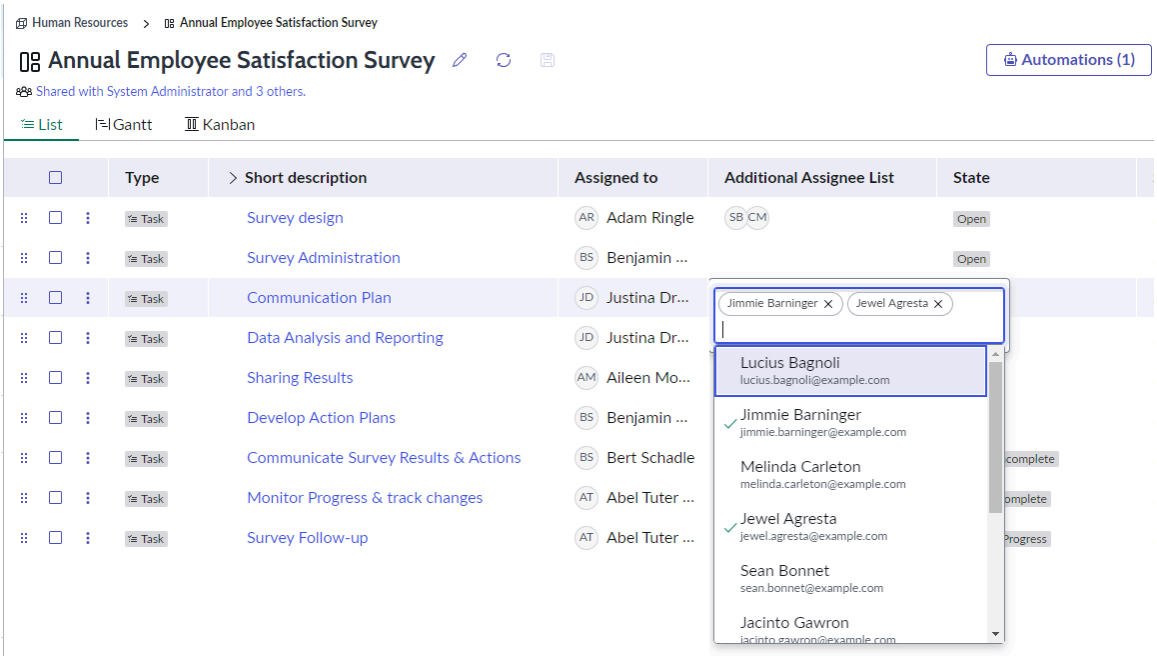
Each CWM Board supports four views: Dashboard, List, Gantt, and Kanban. You can switch between views at any time without losing data. The Dashboard view displays widgets that summarize Board data. List, Gantt, and Kanban views can each be personalized to show the columns and attributes most relevant to your team. For more information, see Personalize List, Gantt and Kanban display for CWM Boards.

Dashboard view

The Dashboard view displays widgets that give teams an at-a-glance summary of task progress, priorities, and assignments for the Board. The Dashboard tab is enabled by default for new and existing Boards.

Each Board can have multiple dashboards. Use the dashboard selector in the dashboard header to switch between them. The selector shows the name of the currently selected dashboard and lists the shared dashboards available on the Board.

Relationship between dashboards and Board views

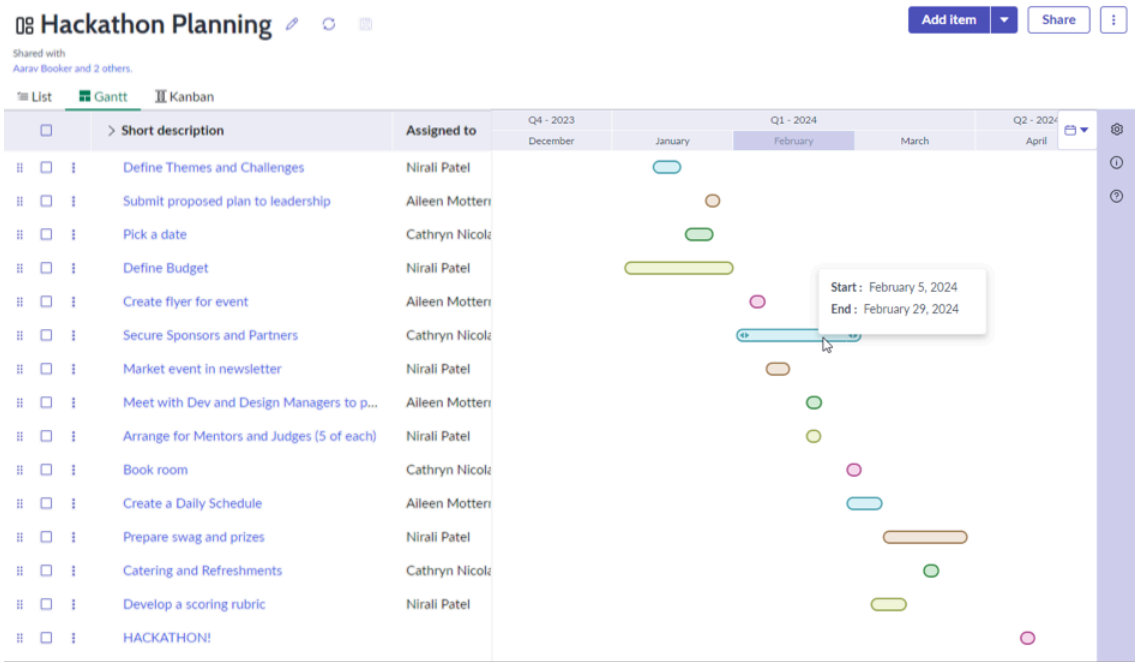


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The only Dashboard-related setting saved to a Board view is whether the Dashboard tab is shown or hidden. For more information, see Personalize List, Gantt and Kanban display for CWM Boards.
- Changes you make within a dashboard, such as adding widgets, are saved to the dashboard, not to the Board view.
- All Board views, shared and private, display the same dashboard data, unless a specific view has the Dashboard tab turned off.

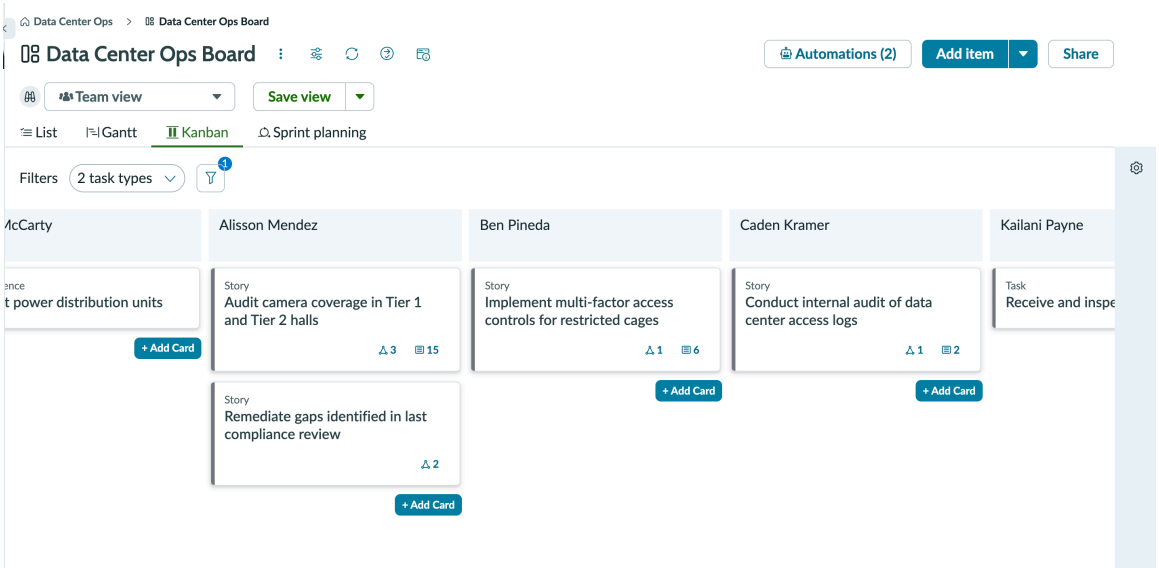
For more information about working with dashboards and widgets, see Monitor and track work using dashboards in CWM Boards.

List view



The List view displays all work items on a Board in a grid format. Use this view to review the status of work items at a glance, update fields inline, or assign items to team members quickly. The List view displays up to 1,000 work items by default.

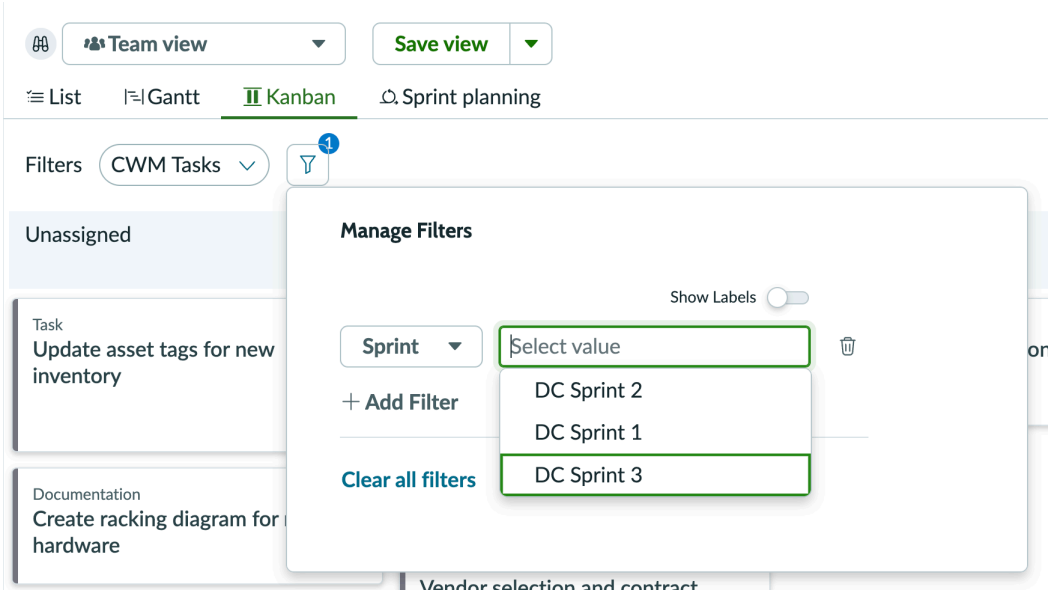
Gantt view



The Gantt view displays work items in a grid alongside a calendar timeline, making it easy to visualize schedules and reschedule items based on changing priorities. The Gantt view displays up to 1,000 work items by default.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Kanban view



The Kanban view organizes work items into columns and rows based on attributes you choose, such as **State** and **Assigned to**. Vertical lanes represent one attribute and horizontal swimlanes represent another, giving teams a visual overview of work distribution and status. Each axis supports up to 50 lanes by default.

Quick filters

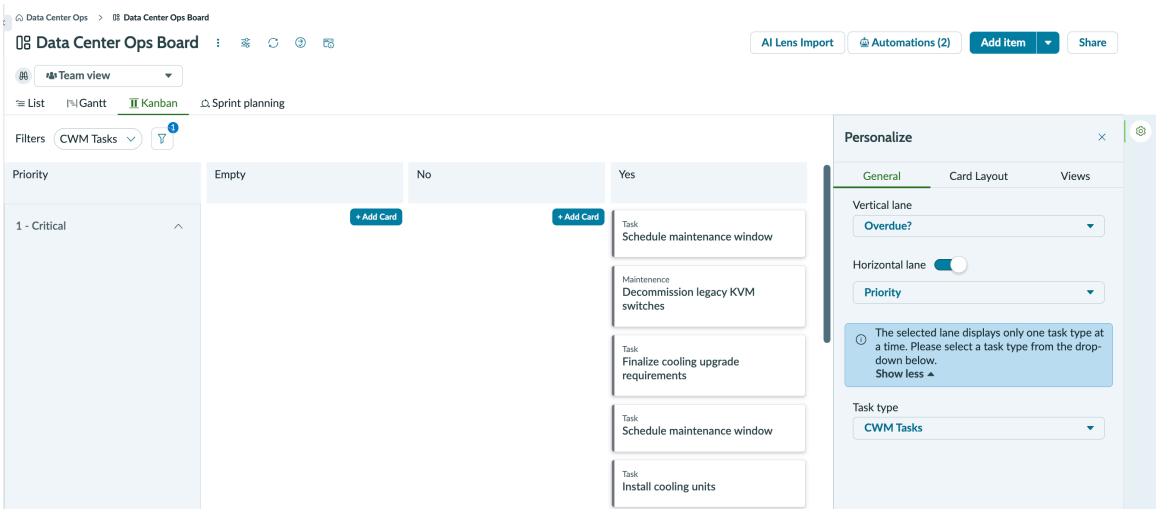
Use quick filters to focus the Kanban board on a specific sprint, state, or other column attribute. Multiple filters can be active at the same time, and a counter at the top of the board shows the number of active filters. For example, use quick filters for sprint-specific information during daily standups or sprint reviews.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can save these filters to a Board view of your choice and when you save this Board as a template, these filters get saved in the template.

Work item indicators on Kanban cards

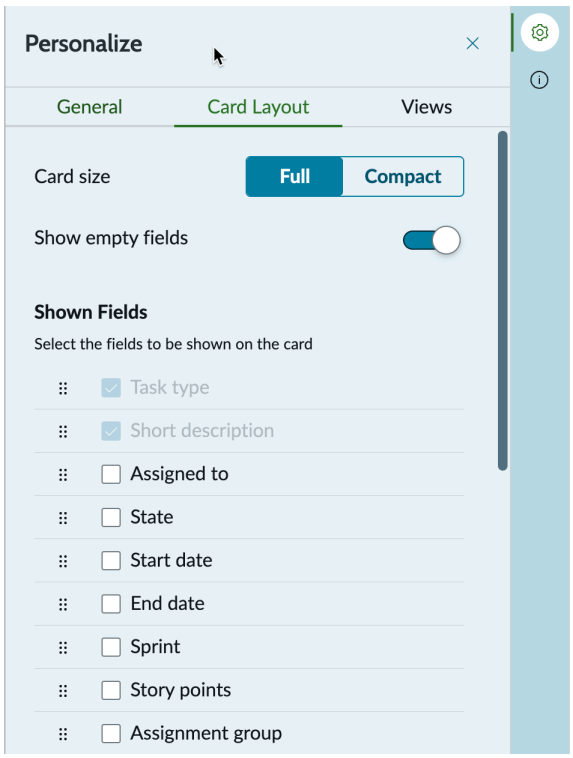
Kanban cards display indicators that give teams at-a-glance visibility into scrum tasks and relationships associated with a work item, without opening the item.



- **Scrum task indicator:** Appears on a story card when the story has one or more scrum tasks. Selecting the indicator opens the right side panel showing the scrum tasks for that story. For more information, see Scrum tasks for stories in CWM.
- **Relationship indicator:** Appears on a work item card when the item has one or more linked relationships, such as a prerequisite, dependent, or related-to item. Selecting the indicator opens the right side panel showing the related work items and their relationship types. For more information, see Task dependencies and relationships in CWM.

Formula column lanes

Use a Formula column as your vertical or horizontal lane to group tasks by the column's output values. Formula columns with conditional, string, or numeric outputs are supported.



For example, consider a formula column named **Overdue?** that outputs Yes or No based on whether a task's due date has passed. Set this column as the vertical lane and Priority as the horizontal lane. The board then groups tasks by overdue status and priority, giving you a quick view of which critical tasks need attention.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Kanban card layout options

Personalize Kanban cards to surface the information most relevant to your team using card layout settings. Select up to five fields to display on each card. Use the Compact layout to show only the work item name for a focused view. Use the Full layout to show all selected fields for more context directly on the card.

Kanban view with Connected work

If the Board includes Connected work items, you can use vertical and horizontal lane combinations to group and filter them. For example:

- Set the vertical lane to **State** and the horizontal lane to **Task type** to view all epics grouped by state, then filter to show only epics.
- Set the vertical lane to **Sprint** and the horizontal lane to **Task type** to view connected stories grouped by sprint.

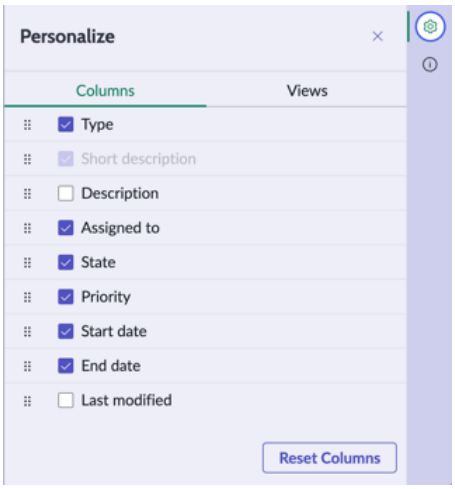
Personalize List, Gantt and Kanban display for CWM Boards

Show, hide, or rearrange columns and apply sorting or filters to personalize the way data is displayed in Collaborative Work Management Boards based on your workflow.

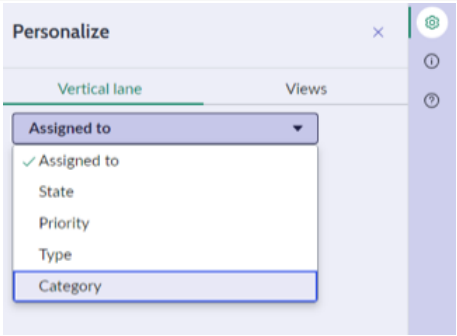
Before you begin

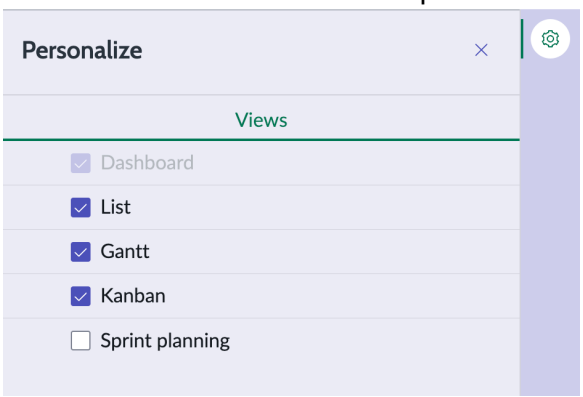
Create a Board in CWM.



Role required: sn_cwm.cwm_user

About this task





The columns available to show or hide are determined by the default list layout of the table. To configure which columns are available, see Configure columns available for personalization in CWM.

Procedure

1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. From a Space, select a Board that you want to personalize.
3. Select List, Gantt, or Kanban for the Board and select the Personalize icon ( ).
4. Update the display of the view on the Board or hide views.

Choice	Options
Personalize List and Gantt	○ Rearrange the order of the columns. ○ Show or hide the columns in the view. 
Personalize Kanban	Change the vertical categorization of task cards using the **Vertical lane** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Choice	Options
	
Show or hide views	Show or hide the Board views, including Dashboard, List, Gantt, and Kanban, from the Views tab of the Personalize side panel.  Turning off a view hides its tab from the tab strip for you on that Board. Re-enabling the view restores the tab without losing any data. Changing this setting is the only view-level change that triggers the **Save view** button. **Note:** If you turn off the Dashboard view and someone shares a direct link to a dashboard on that Board with you, opening the link opens the Board's de fault view instead of the dashboard.

5. For List and Gantt, use column actions ( ) such as pinning a column to the left of the grid, filtering the data from a column, and resetting the column size to default.

What to do next

After changing the way data is displayed on your Board. You have the option of saving it as a personal view for your reference or a shared view for your team or stakeholders. For more information, see Board views in CWM.

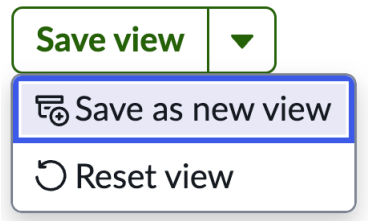
Create a custom view for CWM Boards

Modify Board display preferences and save them as custom personal or shared views that suit the working preferences for you and your team members in Collaborative Work Management (CWM).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

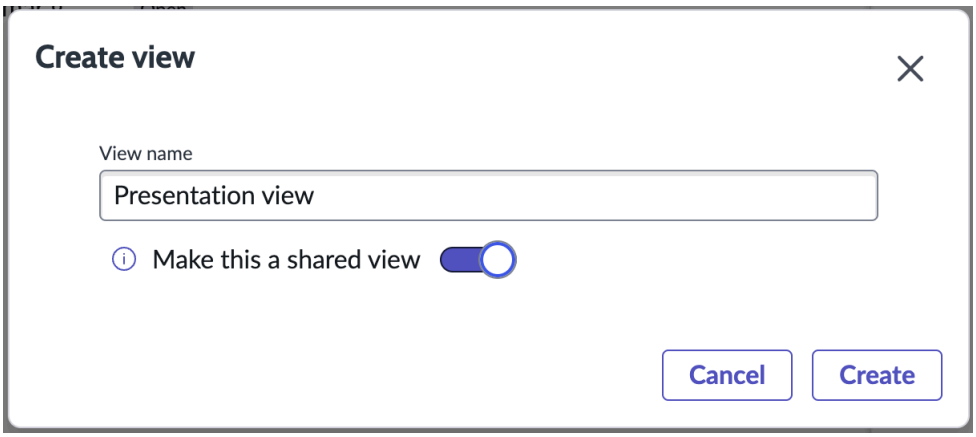
Before you begin

Create a Board in CWM.



Role required: sn_cwm.cwm_user

About this task

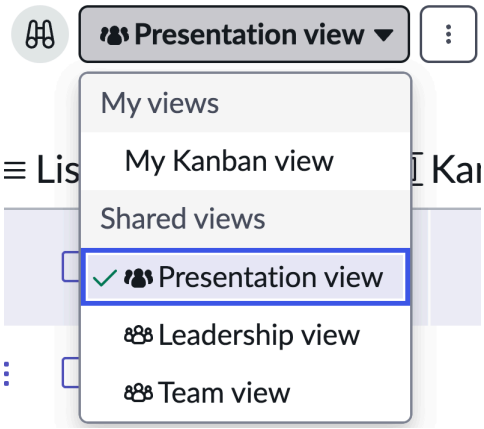


Use the personalization settings to change how the data is presented on a CWM Board and save the changes as a new view. You can create a different custom view for each of the List, Gantt, and Kanban view modes or save them all into a single view.

Procedure

1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. From a Space, select a Board that you want to create a view for.
3. Modify the display preferences of the Board data using the personalization settings, sorting, filtering, and adding custom columns.
   For more information, see Personalize List, Gantt and Kanban display for CWM Boards.
4. Select the More actions icon (▾) of the Save view menu and choose **Save as new view**.

5. Enter a name for this view and choose to make it a shared view or keep it a personal view. Shared views are available for all members who have access to this Board. Not selecting this option saves this view as a new personal view that's only available to you.



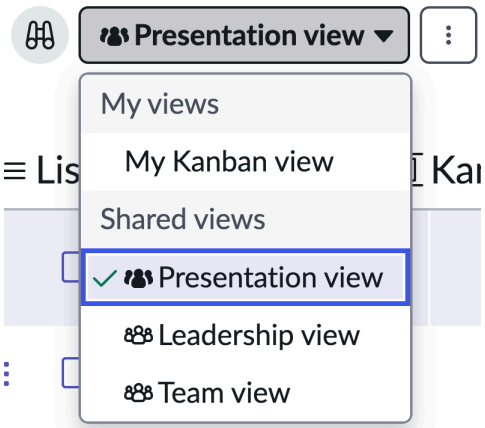
6. Select **Create**.

Result

The new view is available in the view switcher.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Update a CWM Board view



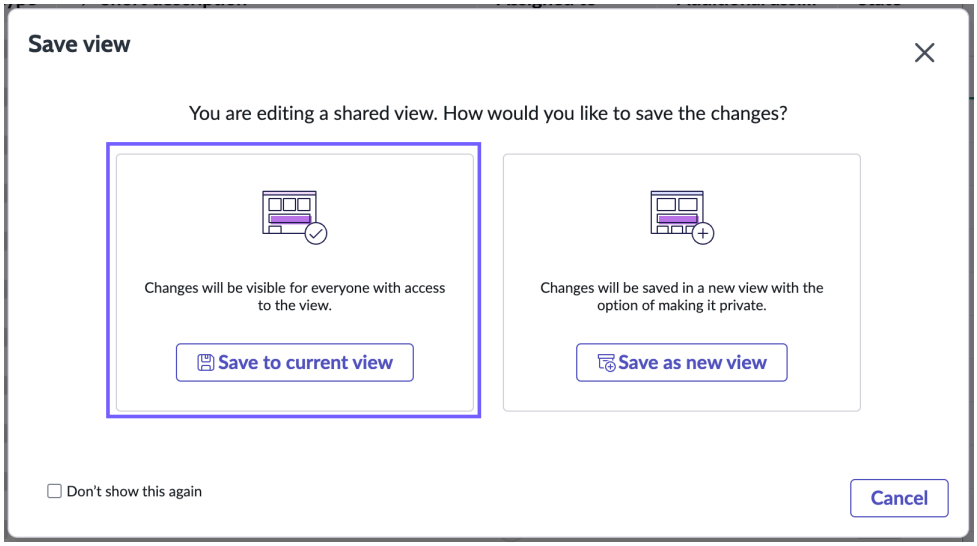
Modify the display preferences of your Collaborative Work Management (CWM)Boards and update the existing personal or shared views.

Before you begin

Role required: sn_cwm.cwm_user

Procedure

1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. From a Space, select a Board for which you want to update a view.
3. From the view switcher, select a view that you want to modify.

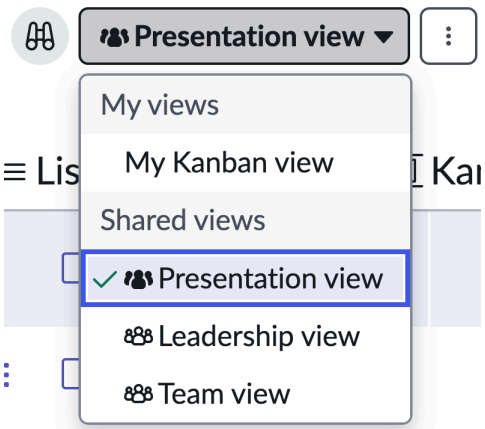


4. Modify the display preferences of the Board data using the personalization settings, sorting, filtering, and adding custom columns.
   For more information, see Personalize List, Gantt and Kanban display for CWM Boards.
5. Select **Save view**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Select **Save to current view**.

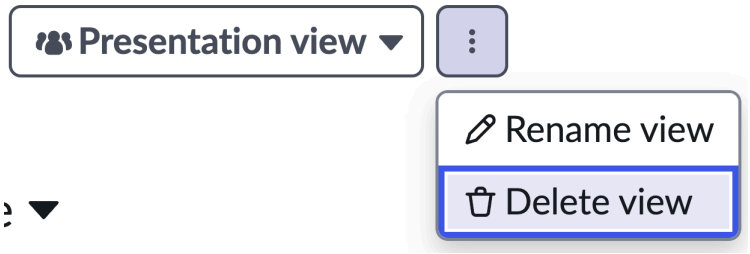
Note: If you select the **Don't show this again** checkbox, this dialog box doesn't appear the next time.



Result
The current view is updated with the changes that you made.

Delete a custom CWM Board view

Delete the custom personal or shared views for your CWM Boards and keep your Board views current for your workflow.



Before you begin
Role required: sn_cwm.cwm_user

Procedure
1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. From a Space, select a Board for which you want to delete a view.
3. From the view switcher, select a view that you want to delete.

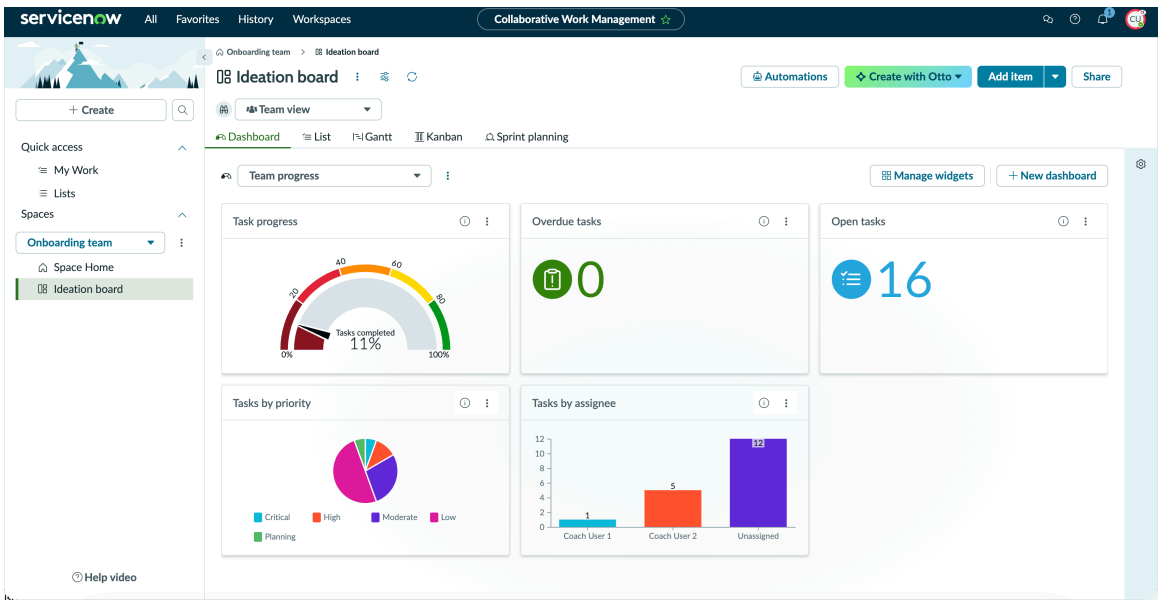
4. From the More view options menu ( ), select **Delete view**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select **Delete** to confirm.

Result
The view is deleted and no longer available in the view switcher for this Board.

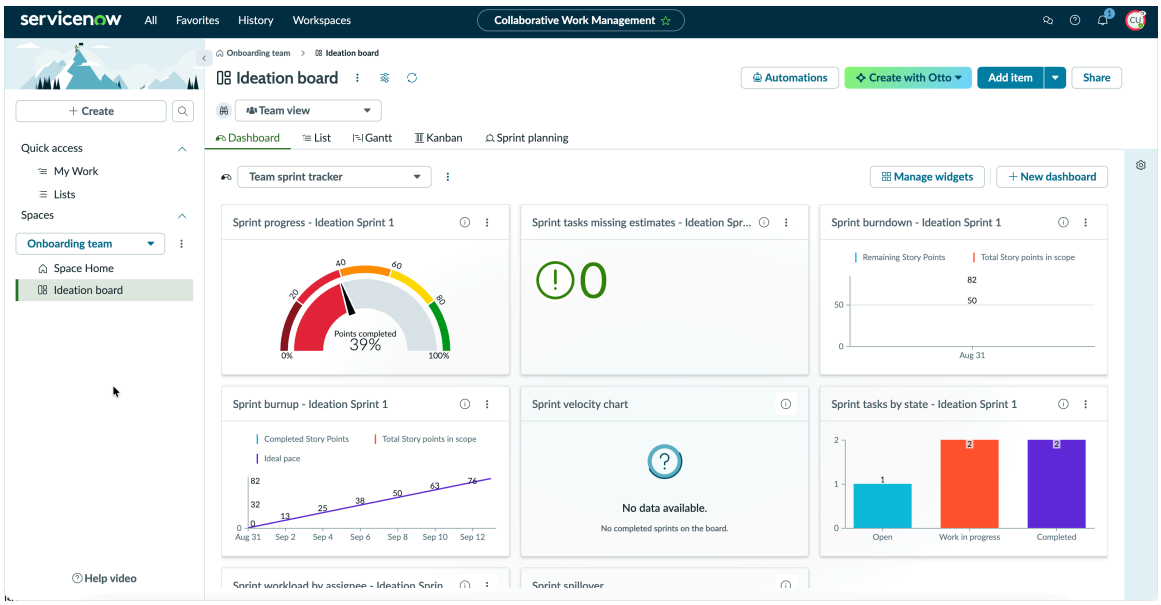
Monitor and track work using dashboards in CWM Boards



The Dashboard view displays a collection of widgets that visualize CWM Board data, giving teams an at-a-glance summary of task progress, priorities, and assignments.

Dashboard overview

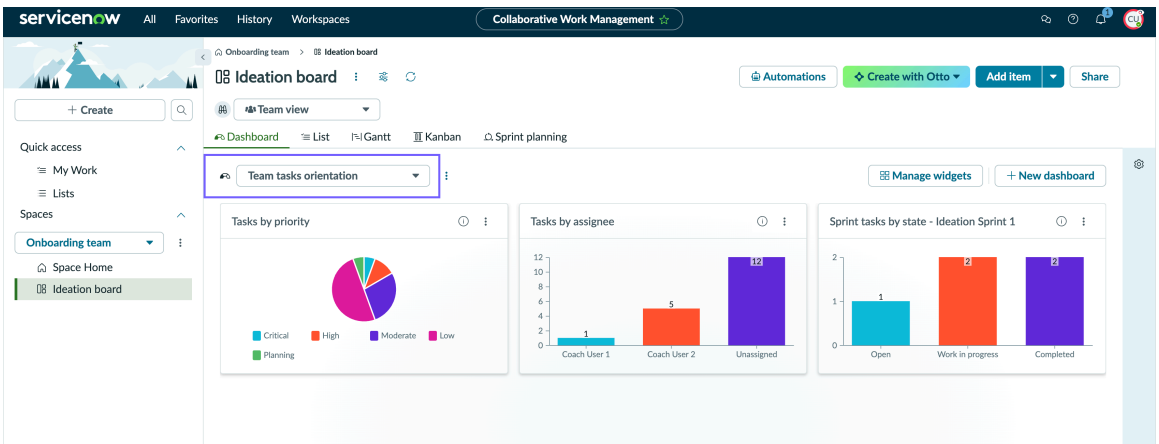
The Dashboard view is one of the views available on a CWM Board, alongside List, Gantt, Kanban, and Sprint planning. It displays widgets, such as charts and score dials, that summarize the work items on the Board without requiring you to open individual records.



Every Board is provisioned with two predefined shared dashboards with a set of predefined widgets configured for each.

- Team progress dashboard. See Team progress dashboard in Collaborative Work Management.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



- Team sprint tracker dashboard. See Team sprint tracker dashboard in Collaborative Work Management.

Existing Boards are configured with both predefined dashboards when your instance is upgraded.

Each Board can have multiple dashboards. Owners and editors can create dashboards and add predefined or custom widgets to them. They can also rename, duplicate, and delete dashboards. The predefined dashboards can't be renamed or deleted. All dashboards are shared with everyone who has access to the Board.

The dashboard selector in the dashboard header lets you switch between dashboards. The selector shows the name of the currently selected dashboard and lists the shared dashboards available on the Board. Widget data refreshes when you switch dashboards using the dashboard selector or reload the dashboard page. Widget data isn't updated in real-time while you're viewing a dashboard.

Benefits of dashboards

The benefits of Dashboards in CWM Boards are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Dashboards show the current and updated data points at any point in time.
- Teams don't have to leave the CWM Board for analysis, minimizing context switching.
- Custom widgets can be created for the CWM custom columns.

Access required for managing dashboards

Action	Role required
Create a dashboard	Space owners and editors
Add predefined or custom widgets to a dashboard	Space owners and editors
View a dashboard and its widgets	Space viewers
Rename or duplicate a dashboard	Space owners and editors
Delete a dashboard	Space owners and dashboard creators

Predefined widgets

Widgets are the building blocks of a dashboard. They visualize Board data as charts, score dials, and other categories. Each category includes predefined widgets and, for some categories, a custom option, and are available in the Add widgets or Manage widgets panel of a dashboard.

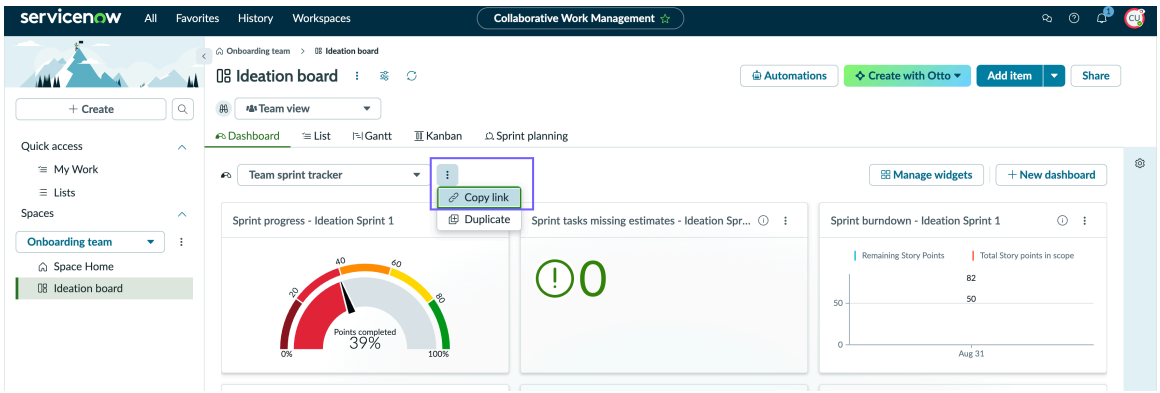
Widgets are organized into six chart-type categories. Some categories include both predefined widgets and a custom option that you can configure with your columns and data.

- Bar chart: Custom bar chart, Task by assignee, Sprint tasks by state, Sprint workload by assignee, Sprint spillover
- Pie chart: Custom pie chart, Tasks by priority
- Single score: Overdue tasks, Open tasks, Sprint tasks missing estimates
- Dial score: Sprint progress, Task progress
- Sprint charts: Sprint burndown, Sprint burnup, Sprint velocity chart

Custom widgets

Custom widgets let you chart any column on the Board, including custom columns and columns from Connected Work items. You can create a custom bar or pie widget and bind it to the column of your choice.

The column picker lists columns from three sources, with no restriction on which type of column you can chart:

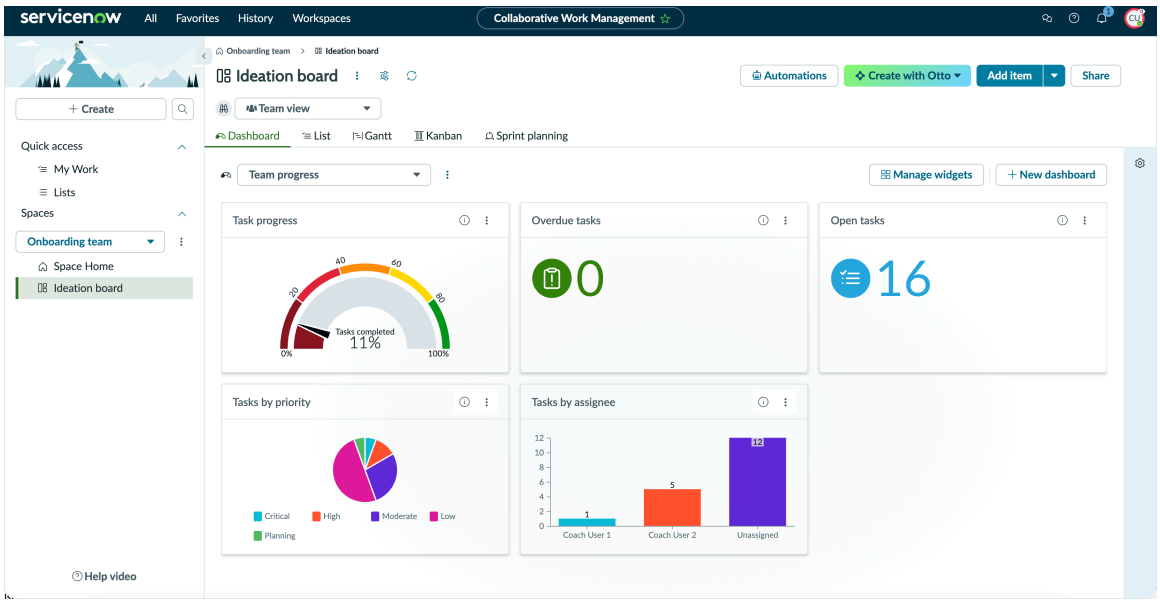


- Predefined columns common to CWM task types, such as assigned to or assignment group.
- Custom columns you have added to the Board.
- Columns from Connected Work items on the Board, such as caller on an incident.

Shareable dashboard links

A dashboard link can be shared with users who have at least viewing permissions to the Board where the dashboard is. A **Copy link** option is available under the Dashboard options menu. Selecting it copies the shareable link and displays a confirmation message.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Users without access can request access directly from the link. If the Dashboard tab is hidden from the recipient's view when they open the link, they land on the Board's default List view instead. Opening the link takes the recipient to the Board's Dashboard tab with that dashboard preselected, regardless of which dashboard they last viewed.

Team progress dashboard in Collaborative Work Management

The Team progress dashboard supports waterfall use cases and includes widgets that visualize task completion and workload for the whole Board.

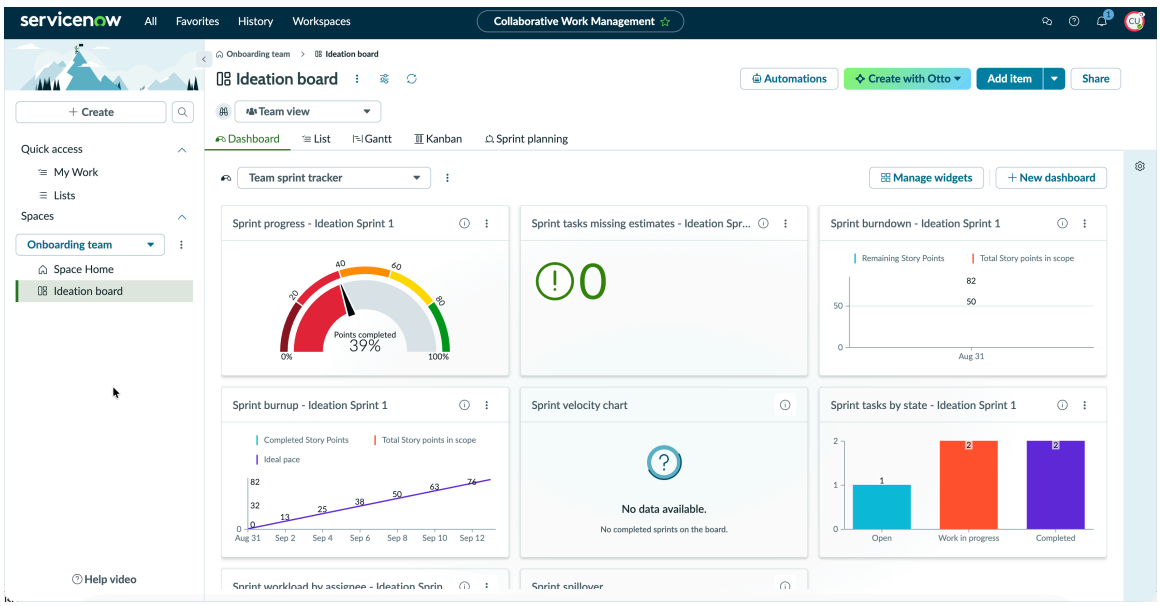
This dashboard appears by default the first time you open the Dashboard tab on a Board. After that first visit, the tab opens to the last dashboard you viewed.

Waterfall widgets

Widget	Description	Chart type
Task progress	Percentage of tasks completed against the total tasks on the Board.	Dial score
Overdue tasks	Tasks on the board past their due or end date that aren't yet complete.	Single score
Open tasks	Tasks on the Board that aren't yet complete.	Single score

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Waterfall widgets (continued)



Widget	Description	Chart type
Tasks by priority	Tasks on the Board, grouped by priority buckets. For more information about priority buckets, see Grouping of tasks in status reports of CWM My Work. **Note:** • Tasks with no priority set are grouped under **None**. • Tasks with custom or unrecognized priority values are grouped under **Other**.	Pie chart
Tasks by assignee	Tasks on the Board, grouped by the person they're assigned to. Unassigned tasks are grouped under **Unassigned**.	Bar chart

The Team progress dashboard under My Space is named My progress.

Team sprint tracker dashboard in Collaborative Work Management

The Team sprint tracker dashboard supports agile use cases with widgets that visualize sprint progress, workload, and trend data for agile teams.

This dashboard provides data for active sprints that have started and aren't yet complete.

Agile widgets

Widget	Description	Chart type
Sprint progress	Percentage of points completed out of the total scope for the active sprint. **Note:** Scrum tasks aren't considered for the Sprint Progress chart.	Dial score
Sprint tasks	Number of tasks, stories, or other work items scheduled for the active sprint that don't have story points set.	Single score

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agile widgets (continued)

Widget	Description	Chart type
missing estimates		
Sprint burnup	Burnup trend comparing the active sprint's ideal pace with the current pace to determine if the scope can be completed before the end of the sprint. The chart shows three lines to depict the completed points, total story points in scope and the ideal pace. **Note:** To view the Sprint burnup chart, the *CWM Daily Sprint Data Collection* scheduled job must be enabled and its **Run as** and **Run as tz** fields set. After the job is active, data for active sprints is collected daily, and chart data is available starting the day after the job first runs. For more information, see Activate the sprint data job for burnup and burndown widgets.	Sprint chart
Sprint burndown	Burndown trend comparing the active sprint's remaining work against the total sprint scope to determine if the scope can be completed before the end of the sprint. This tracks the daily progress of the active sprint. The chart shows two lines to depict the actual remaining work and total sprint scope. **Note:** To view the Sprint burndown chart, the *CWM Daily Sprint Data Collection* scheduled job must be enabled and its **Run as** and **Run as tz** fields set. After the job is active, data for active sprints is collected daily, and chart data is available starting the day after the job first runs. For more information, see Activate the sprint data job for burnup and burndown widgets.	Sprint chart
Sprint velocity	Trend of story points committed versus story points completed for the last six completed sprints, with a running average velocity line. **Note:** There must be at least one completed sprint for data to be displayed in this widget. If there are more than six completed sprints, it displays data only for the last six sprints.	Sprint chart
Sprint tasks by state	Tasks scheduled for the sprint, grouped by their current states: Open, Work in Progress, Completed and Other. For more information about state buckets, see Grouping of tasks in status reports of CWM My Work.	Bar chart
Sprint workload by assignee	Count of all tasks in the active sprint, grouped by assignee. Unassigned tasks are grouped under Unassigned.	Bar chart
Sprint spillover	Total story points carried over from the past sprints into the active sprint. Each bar denotes the total story points spilled over in a sprint.	Bar chart

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agile widgets (continued)

Widget	Description	Chart type
	Note: • There must be at least one completed sprint for data to be displayed in this widget. If there are more than six completed sprints, it displays data only for the last six sprints. • The widget shows accurate data only for sprints completed after the latest version upgrade (version 11.0.1) of Collaborative Work Management. Sprints completed in earlier versions show zero spillover as task spillover wasn't tracked earlier.	

The Team sprint tracker dashboard in My Space is named My sprint tracker.

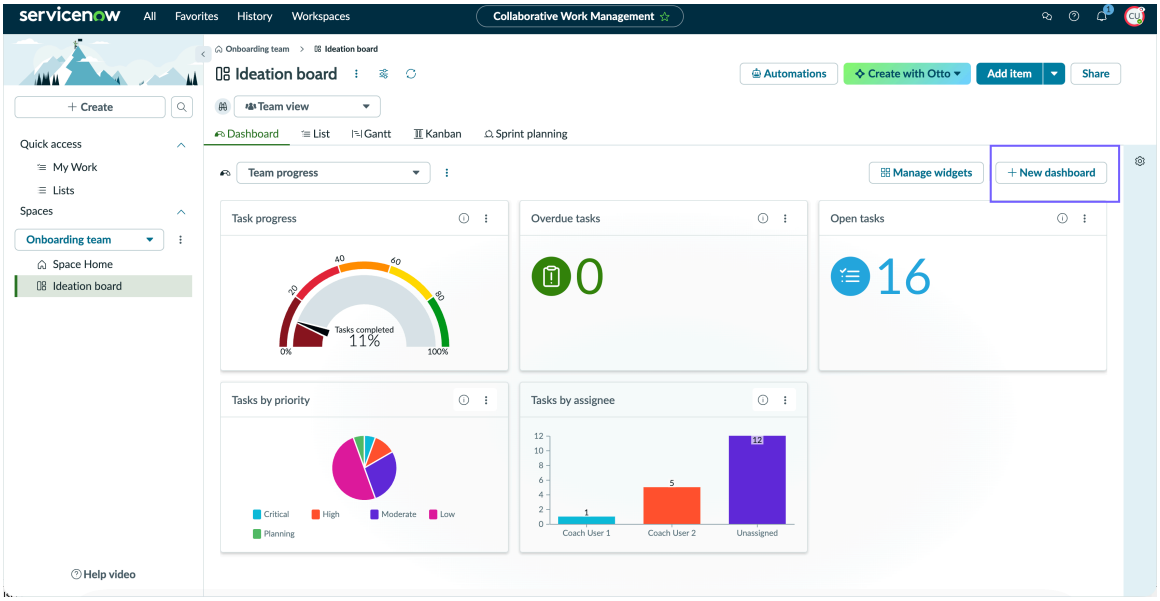
Create a dashboard for a CWM Board in Collaborative Work Management

Create a dashboard for a CWM Board to visualize work data using predefined or custom widgets. Track progress and spot issues without reviewing individual tasks or stories.

Before you begin

A board is created. For more information, see Create a Board in CWM.

Role required: sn_cwm.cwm_user

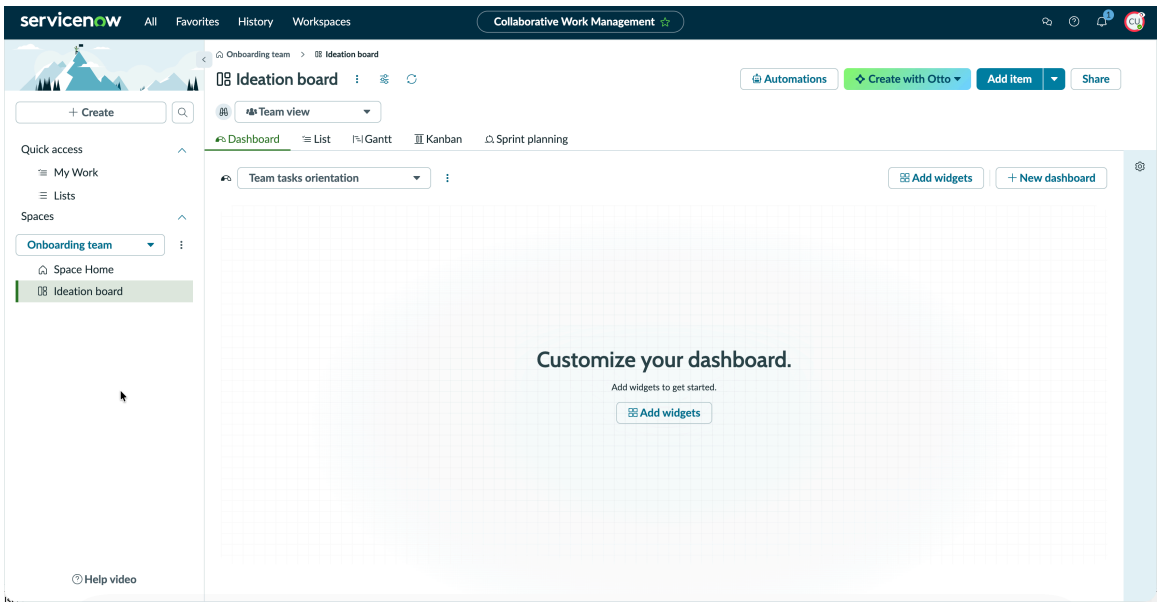


About this task

- All dashboards are shared with everyone who has access to the Board.
- Space owners and editors can create dashboards.
- Space viewers can only view existing dashboards.

Procedure

1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. From a Space, select a Board to add the dashboard to.
3. Select the **Dashboard** tab.
4. Select **New dashboard**.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Enter a name for the dashboard.
6. Select **Create**.

Result

The dashboard opens in an empty state with the **Add widgets** option.

What to do next

Add predefined or custom widgets to your dashboard. For more information, see Add widgets to a dashboard in Collaborative Work Management.

Add widgets to a dashboard in Collaborative Work Management

Add predefined or custom widgets to an empty state or existing dashboard on a CWM Board to visualize task and sprint data.

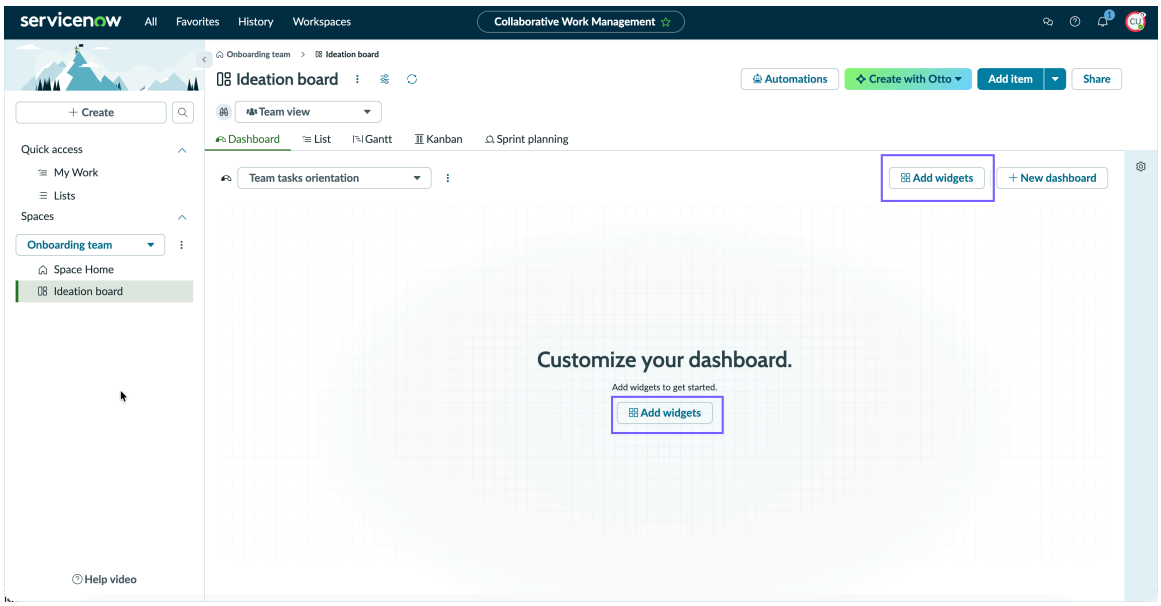
Before you begin

A dashboard is created. For more information, see Create a dashboard for a CWM Board in Collaborative Work Management.

Role required: sn_cwm.cwm_user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

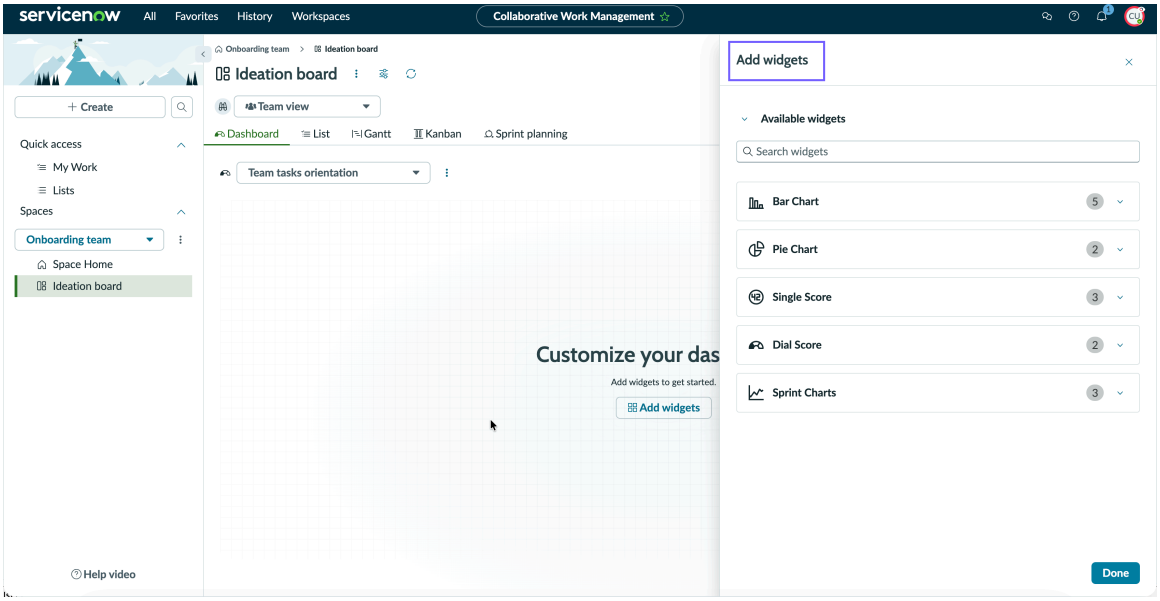


Space owners and editors can add or create widgets.

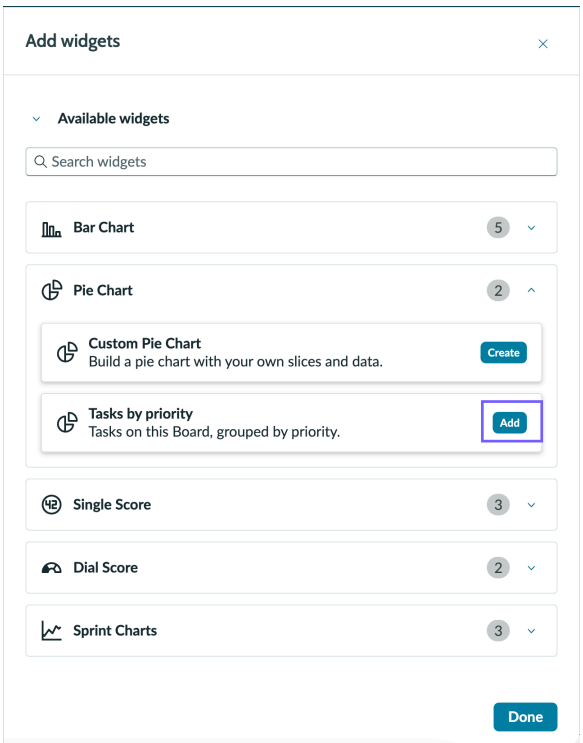
The Add widgets panel on an empty state dashboard changes to Manage widgets after at least one widget is added to it. For existing dashboards, the panel appears as Manage widgets and displays the **Included in this dashboard** section listing the widgets already on the dashboard. For information about dashboard panels, see Monitor and track work using dashboards in CWM Boards.

For custom widgets, the columns common to CWM task types and other work item types show only the column name, for example **Assigned to**. Columns specific to a connected work type show the column name followed by the work item type in parentheses, for example **Caller (Incident)**. All custom columns are also available for widget configuration.

Procedure



1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. From a Space, select the Board where your dashboard is.
3. Select the **Dashboard** tab.
4. Select the dashboard from the Shared dashboards list.
5. Select **Add widgets** for a new dashboard or **Manage widgets** for an existing dashboard.



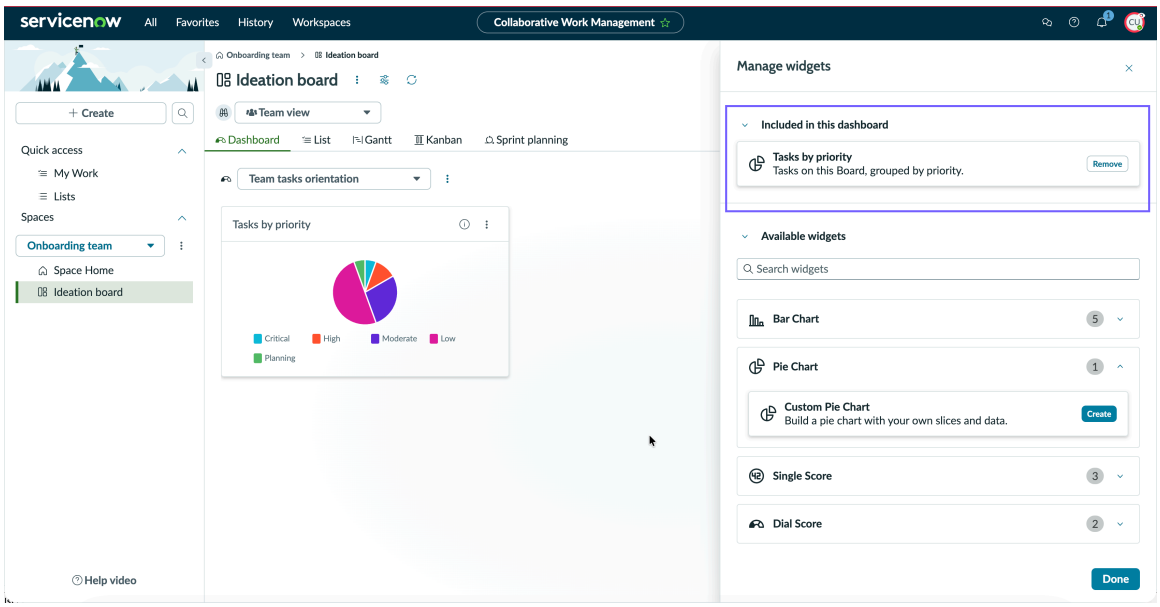
6. In the Add widgets or Manage widgets panel, browse the available widgets, organized by chart type.

> **Tip:** Use the search field in the widget panel to find a widget.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Add a predefined widget or create a custom one.

Goal	Action
Add a predefined widget	Select **Add** next to a predefined widget to add it to the dashboard as-is. 
Create a custom widget	**a.** Select **Create** next to a custom widget. **b.** Enter a name for the chart. **c.** Select the column to use for the widget. **Tip:** Use the search field in the col umn list to find a column quickly.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Goal	Action
	d. Select **Add**. This button is inactive until you enter a name and select a column.

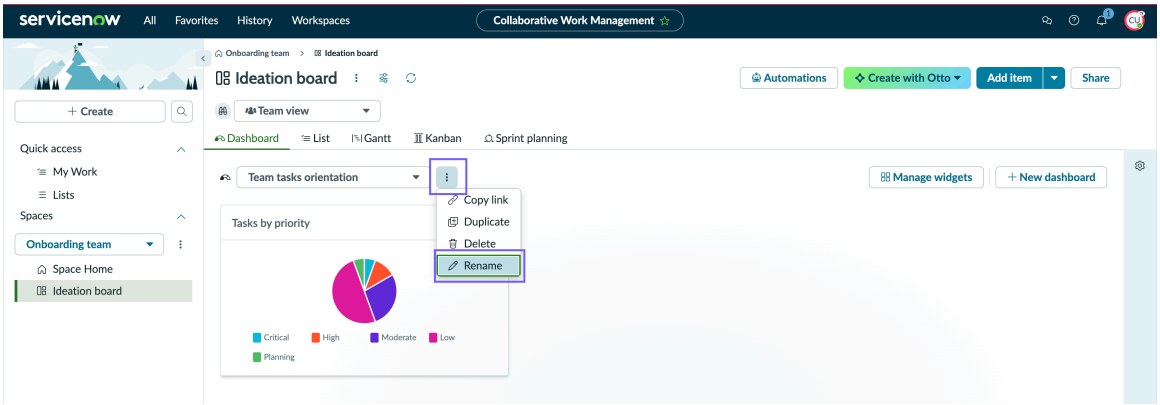
The widget is added to the dashboard.

8. Select **Done** to close the Add widgets or Manage widgets panel.

Result
The widget appears in the **Included in this dashboard** section of the Manage widgets panel.

Rename a dashboard in Collaborative Work Management

Rename a dashboard in a CWM Board so your team can easily identify it among shared dashboards for any specific requirement.



Before you begin
Confirm that a dashboard is created. For more information, see Create a dashboard for a CWM Board in Collaborative Work Management.

Role required: sn_cwm.cwm_user

About this task
Predefined dashboards — Team progress and Team sprint tracker — can't be renamed. Space owners and editors can rename dashboards.

Procedure
1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. From a Space, select the Board where your dashboard is.
3. Select the **Dashboard** tab.
4. From the Shared dashboards list, select the dashboard to rename.
5. Select the Dashboard options ⋮ menu.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

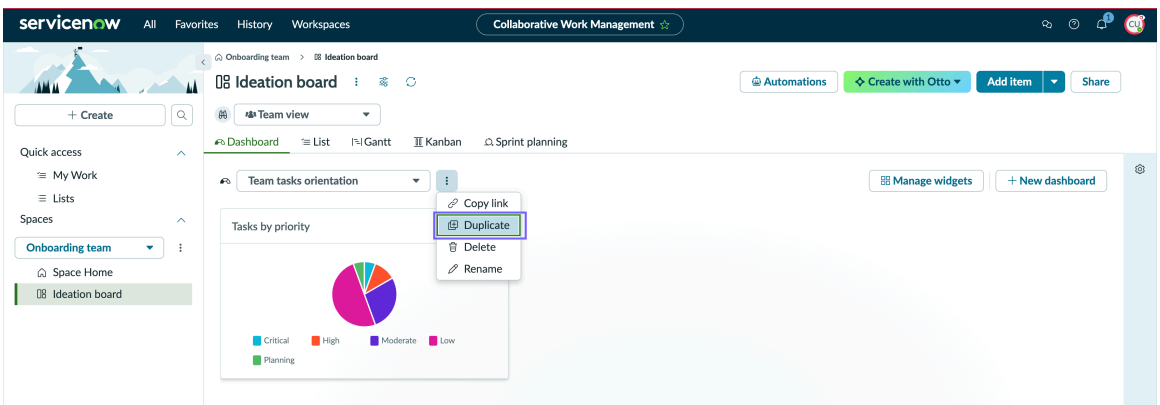
6. Select **Rename**.
7. Enter a new name for the dashboard.
8. Select **Save**.

Duplicate a dashboard in Collaborative Work Management

Duplicate a dashboard in a CWM Board to reuse an existing set of widgets in a new dashboard. This avoids rebuilding the same layout from scratch.

Before you begin

Confirm that a dashboard is created. For more information, see Create a dashboard for a CWM Board in Collaborative Work Management.



Role required: sn_cwm.cwm_user

About this task

Space owners and editors can duplicate dashboards.

Procedure

1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. From a Space, select the Board where your dashboard is.
3. Select the **Dashboard** tab.
4. From the Shared dashboards list, select the dashboard to duplicate.
5. Select the Dashboard options ⋮ menu.

6. Select **Duplicate**.
   The name of the new dashboard is populated as `Copy (original dashboard name)`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

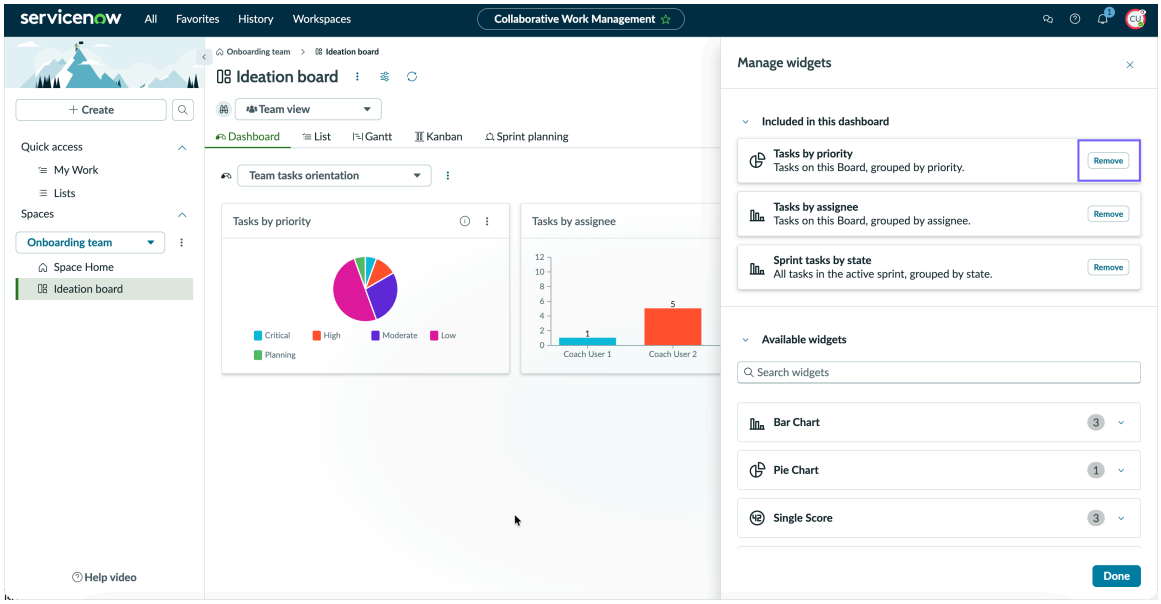
7. **Optional:** Enter a new name for the dashboard.
8. Select **Duplicate**.

Result
The duplicate dashboard is created and includes all widgets from the original dashboard.

What to do next
Add predefined or custom widgets to your duplicated dashboard or remove existing ones. For more information see Add widgets to a dashboard in Collaborative Work Management and Remove widgets from a dashboard in Collaborative Work Management.

Remove widgets from a dashboard in Collaborative Work Management

Remove widgets from a dashboard in a CWM Board to keep the dashboard focused on the metrics that still matter.



Before you begin
Confirm that a dashboard is created. For more information, see Create a dashboard for a CWM Board in Collaborative Work Management.

Role required: sn_cwm.cwm_user

About this task
Widgets can be added and removed only from the Manage widgets panel. There is no remove action on an individual widget.

Procedure
1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. From a Space, select the Board that contains your dashboard.
3. Select the **Dashboard** tab.
4. Select the dashboard from the Shared dashboards list.
5. Select **Manage widgets**.
6. In the Manage Widgets panel, select **Remove** next to a widget in the **Included in this dashboard** section.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Select **Done** to close the Manage widgets panel.

Delete a dashboard in Collaborative Work Management

Delete a dashboard in a CWM Board when your team no longer needs it.

Before you begin

Confirm that a dashboard is created. For more information, see Create a dashboard for a CWM Board in Collaborative Work Management.

Role required: sn_cwm.cwm_user

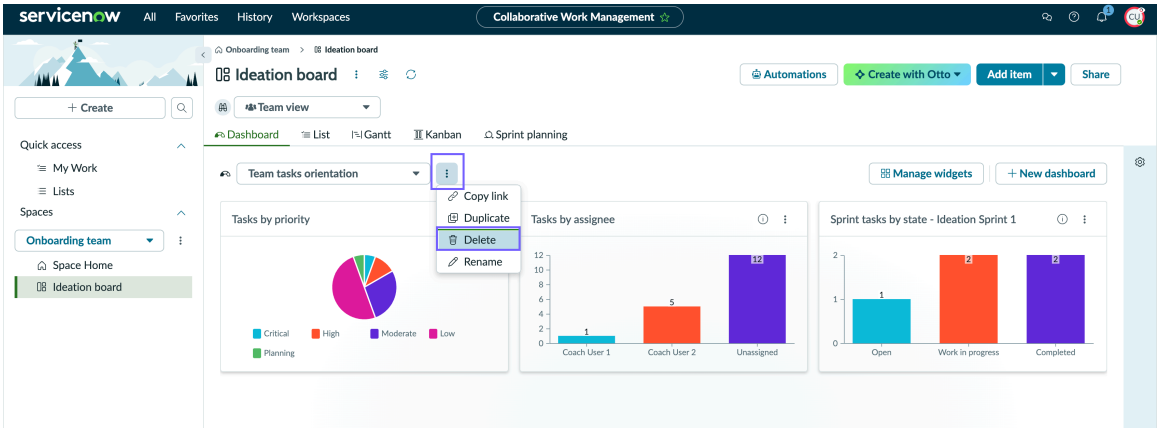
About this task

Space owner or the dashboard owner can delete a dashboard.

You can't delete the predefined dashboards: Team progress and Team sprint tracker.

Procedure

1. Navigate to **Workspaces** > **Collaborative Work Management**.



2. From a Space, select the Board where your dashboard is.

3. Select the **Dashboard** tab.

4. Select the dashboard from the Shared dashboards list.

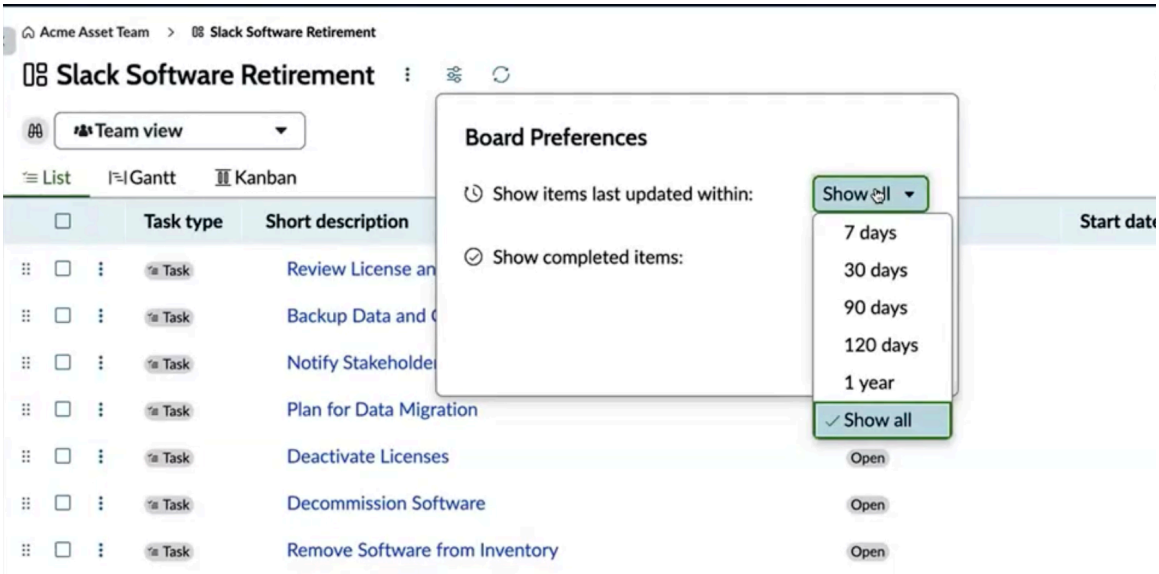
5. Select the Dashboard options ⋮ menu.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Select **Delete**.
7. Select **Delete** to confirm deletion.

Result

The dashboard is deleted. A confirmation message appears. The dashboard selector returns to the Team progress dashboard.

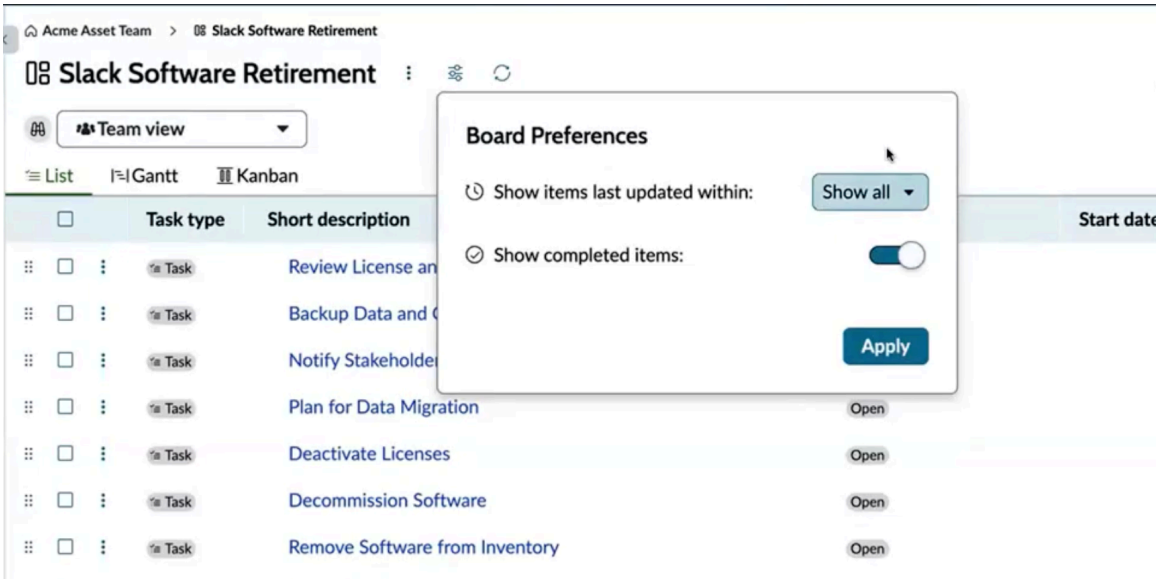


CWM Board preferences

Reduce cognitive load and focus on the most relevant and actionable tasks by filtering work items on Boards in Collaborative Work Management (CWM).

Use the **Board Preferences** menu on the Board header to show items that are your current focus.

Show items based on their last updated date



Filter work items based on their last updated date. You can choose to show items last updated within 7 days, 30 days, 90 days, 120 days, or 1 year.

Show or hide completed items

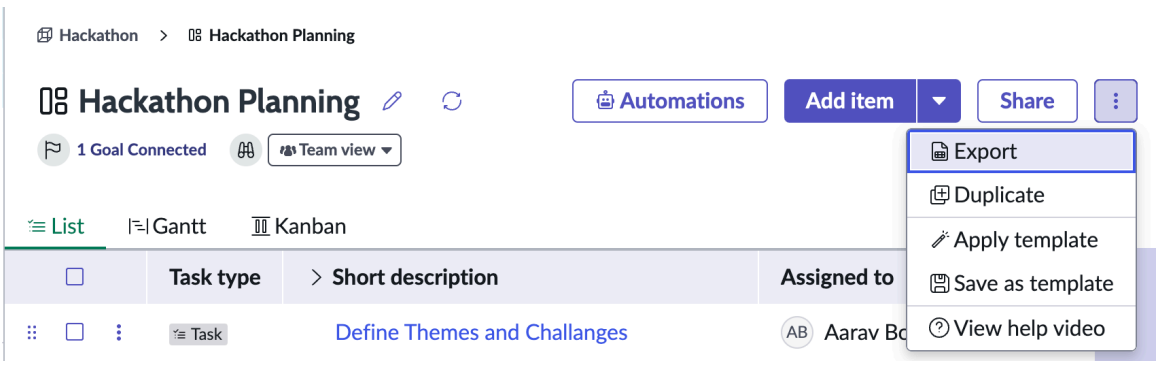
Choose to show or hide the work items that are marked as Closed complete.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Board preferences that you set are applied across the Dashboard, List, Gantt, and Kanban views.

Export a CWM Board to CSV or Microsoft Excel

Export the list view of Collaborative Work Management (CWM) Boards to CSV or Microsoft Excel. Use the data to obtain insights, share with stakeholders, and prepare for analysis or presentations.



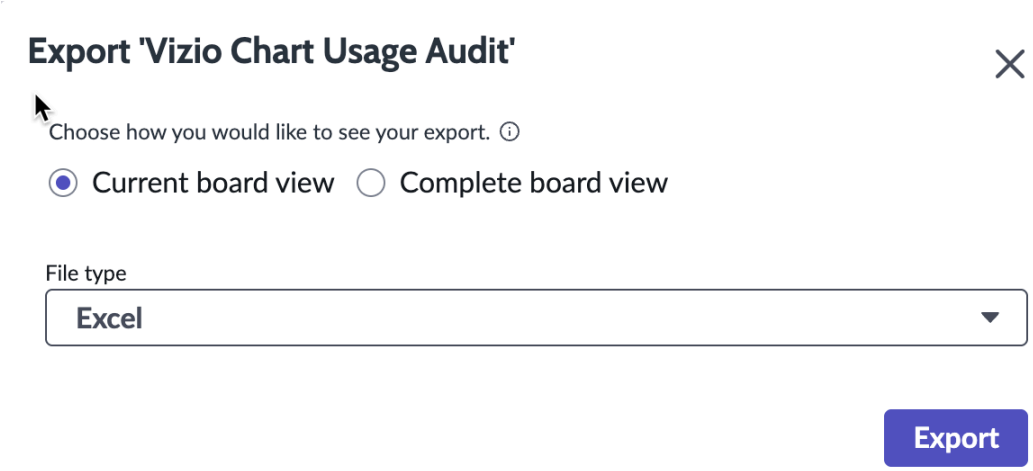
Before you begin

Create a Board in CWM

Role required: sn_cwm.cwm_user

Procedure

1. Navigate to **Workspaces** > *Collaborative Work Management*.
2. From a Space, select the Board that you want to export.
3. From the Board header, select the More options icon (⋮), and then select **Export**.



4. In the Export dialog, select the Board view that you want to export and the file type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
Current board view	○ **Current board view**: Exports only the cur rently displayed columns in the Board, in cluding any column sorting or filters. ○ From the File type drop-down list, select **CSV** or **Excel**.
Complete board view	○ **Complete board view**: Exports all the columns in the Board, including the columns that aren't displayed. ○ From the File type drop-down list, select **CSV** or **Excel**.

5. Select **Export**.

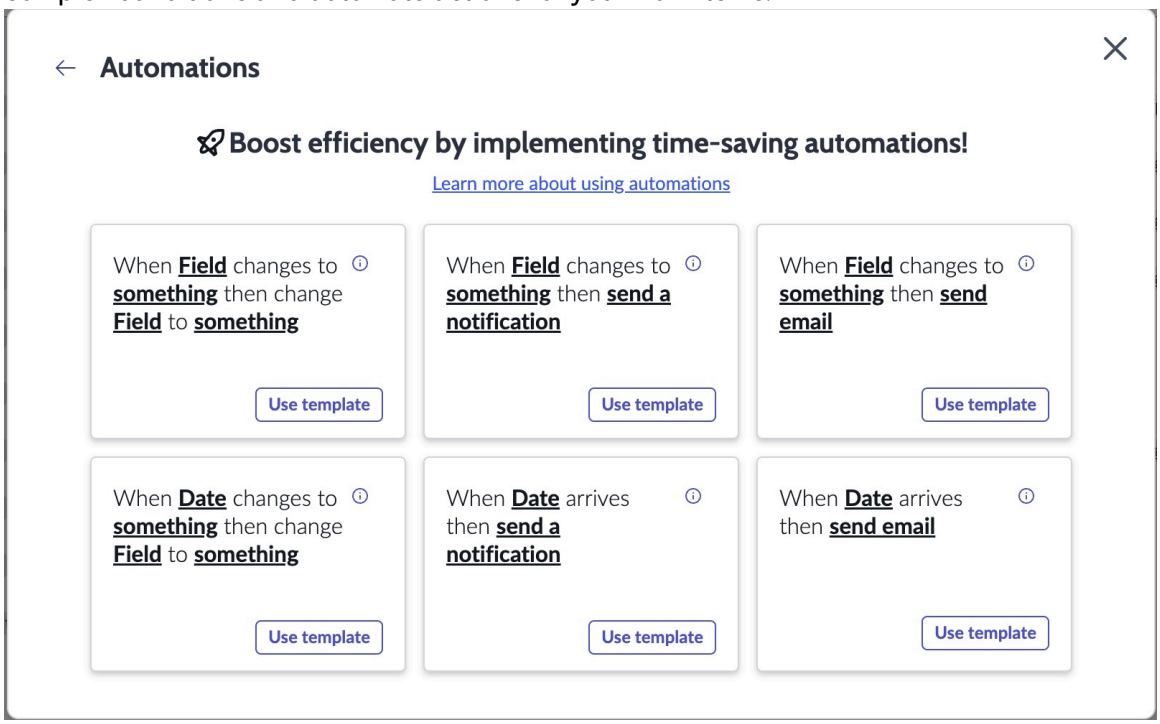
Note: The exported file doesn't retain the hierarchy of the tasks from the Board and all links, including URLs, references to records and assigned users, are converted to plain text.

Result
The file is downloaded and saved in your local system.

Work item automations in CWM

Boost team efficiency by automating monotonous actions such as sending notifications and emails, monitoring key dates, or reassigning tasks based on the conditions that suit the team's workflow.

When teams work together, they often spend much time and manual effort on workflow activities. To address this issue and help improve the overall team efficiency, team members can create automations for tasks in CWM Boards.



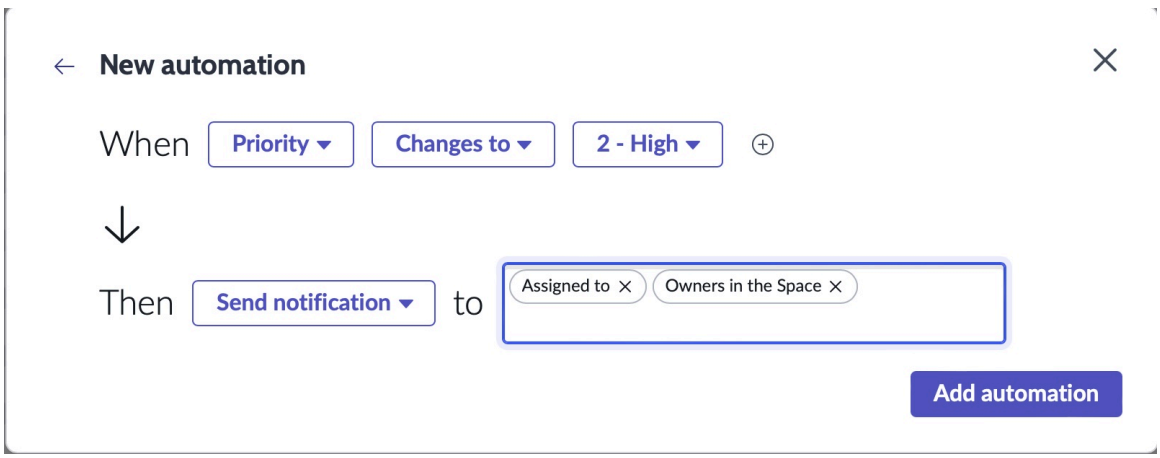
Automations in CWM are actions that are triggered when certain conditions are met. Once created, these automations are applicable to all work items in the Board that they're created in. Some examples of automated actions are:

- Sending an email when a task assignment is changed.
- Updating task priority when the due date is moved.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Reassigning tasks when the priority is changed.
- Sending a notification when a task is complete.
- Notifying a task assignee dynamically when the priority is changed.

Six predefined templates are provided in the application to help you build multiple simple or complex conditions and automate actions for your work items.



Based on the changing conditions of your team's workflow, you can edit, disable, or delete automations anytime later. For a Board, a maximum of 10 automations can be created, which includes all the active and inactive ones.

In this example automation, when the **Priority** of a task on this Board changes to **High**. The people in the **Assigned to** column of the task and the owners of this Space are notified of it.

Going forward, when the priority of any item of this Board changes to High, a notification is sent to the user assigned to that task and the Space owners. Thus this automation saves the time that it takes to perform this action manually instead.

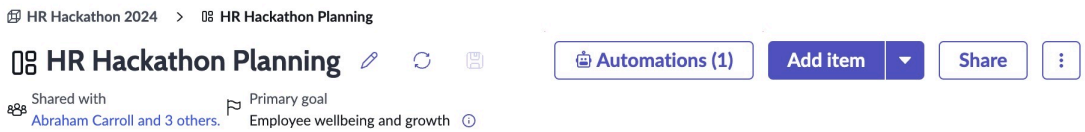
Note: You can also send notifications to any user if you've added a custom people column in addition to the default Assigned to or Additional Assignee.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Get started with automations in CWM. See Create automations in CWM.

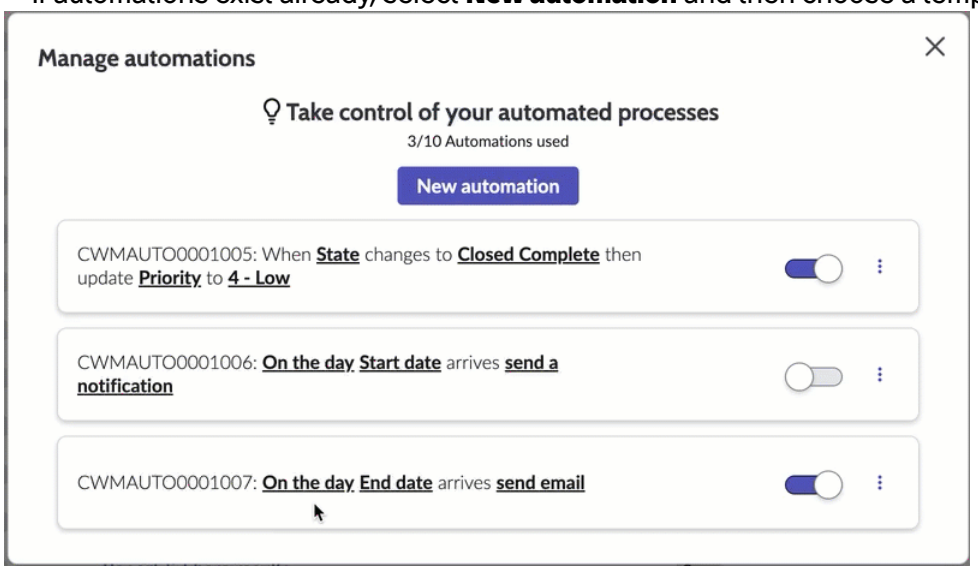
Create automations in CWM

Add conditions to build task automations for CWM Boards and help your team save time from manual task updates.



Before you begin

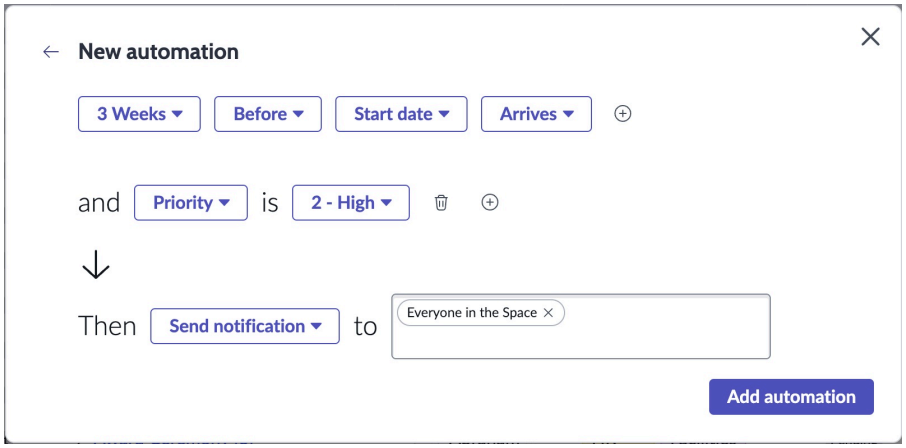
Create a Board in CWM.



Role required: sn_cwm.cwm_user

Procedure

1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. From a Space, select a Board that you want to create automations for.
3. From the Board header, select **Automations**.



4. Choose a predefined template.
   - If it's your first automation, choose a template to get started.
   - If automations exist already, select **New automation** and then choose a template.

5. Add conditions for automating the activities of updating a field, sending an email, or sending notifications.

   You can add multiple conditions to act as triggers to an automation. For example, an automation can be created to send a notification to everyone in the Space when it meets the following conditions:
   - Task priority is high.
   - The start date is three weeks away.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Select **Add automation**.
7. Repeat the steps to add more automations.

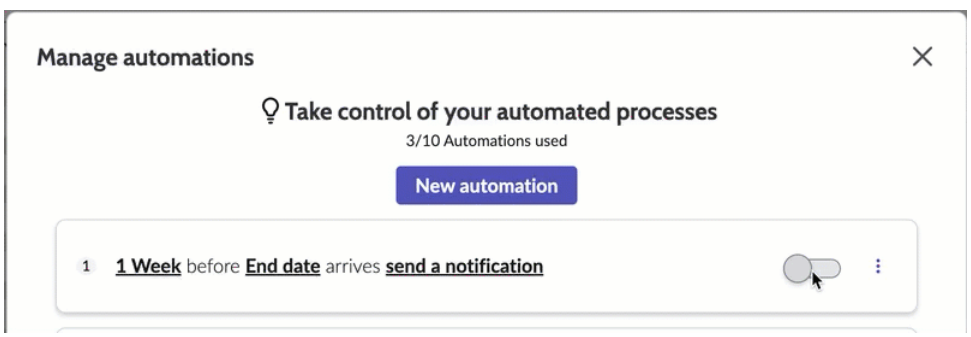
> **Note:** You can create up to 10 automations for a Board and the automations are applied only to CWM tasks and not any connected work items on the Board.

What to do next

Manage or delete automations in CWM.

Manage or delete automations in CWM

Edit, disable, or delete automations for your Boards in Collaborative Work Management based on the changing conditions of your team's workflow.



Before you begin

Create automations in CWM.

Role required: sn_cwm.cwm_user

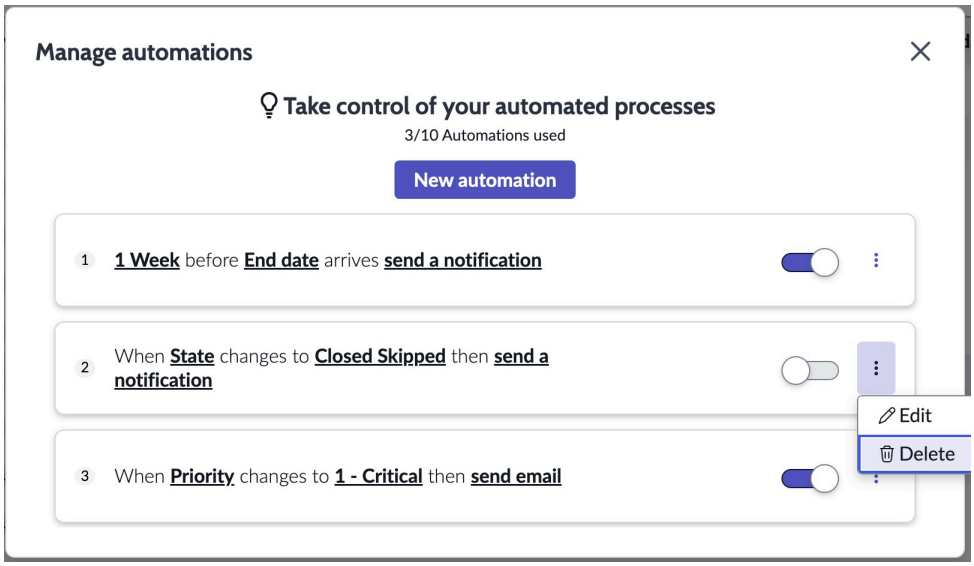
Procedure

1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. From a Space, select a Board that you want to edit the automations for.
3. From the Board header, select **Automations**.
4. Choose to enable, disable, edit, or delete an automation.
   - To disable an active automation, switch the toggle off.
   - To enable a disabled automation, switch the toggle on.

   - To edit an automation:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select **More actions** and select **Edit**.



b. Update the conditions.

c. Select **Save automation**.

- To delete an automation:

a. Select **More actions** and select **Delete**.

b. Confirm by selecting **Delete**.

Connected work in CWM

Streamline task management for teams by bringing in various work items from across ServiceNow applications into Boards in Collaborative Work Management.

https://vimeo.com/1142605644/a4e1a19040?share=copy&fl=sv&fe=ci

The Connected work feature in CWM enables bringing in all types of work items from applications across the ServiceNow AI Platform, thereby helping streamline collaboration, planning, and execution for all teams. Here's how it works:

Centralized view

Teams can connect various types of work from different ServiceNow applications to a single CWM board. By defining conditions for the work items, the teams can bring in only those work items that they need. This consolidation ensures that all relevant work is visible in one place, reducing the need to switch between multiple workspaces. For more information, see Connect work from other ServiceNow apps to CWM Boards.

Only those tables that you have access to and from the applications that are already installed and active in your ServiceNow instance are available for you.

Flexible planning

Once the work is connected, teams can plan and manage it efficiently. They can plan them into sprints for agile execution, or follow a free-flow methodology. This approach ensures that tasks are prioritized and tracked in the way that the teams choose to.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For sprint planning, the connected work items are automatically displayed in the Backlog pane of the Board's Sprint planning view. From here, the team can schedule work into sprints and proceed with execution. For more information, see Plan work items into sprints in CWM.

Real-time updates

Teams can update the status and other details of connected work items directly from the side panel within the CWM board. This real-time updating capability enhances transparency and keeps everyone involved on the same page. For more information, see Update details of connected work items in CWM Boards.

To customize the fields that appear in the side panel for CWM tasks and connected work items, see Configure the form view for CWM tasks and connected work items.

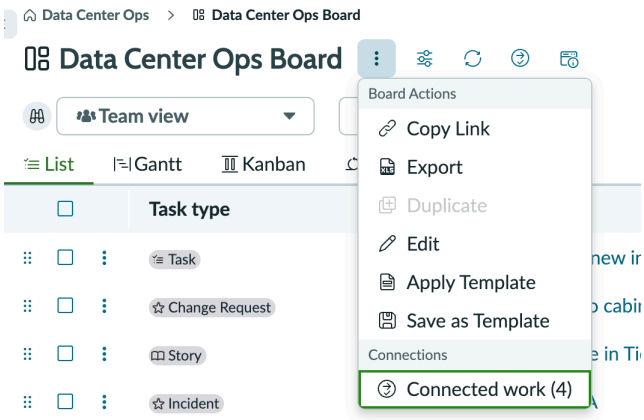
Deleting a connected work item record only removes it from the Board in CWM but doesn't delete the original record.

Improved efficiency

By centralizing work and providing a unified environment, Connected work helps teams stay focused and reduces the time spent navigating between different workspaces. This can help lead to increased productivity and collaboration.

Connect work from other ServiceNow apps to CWM Boards

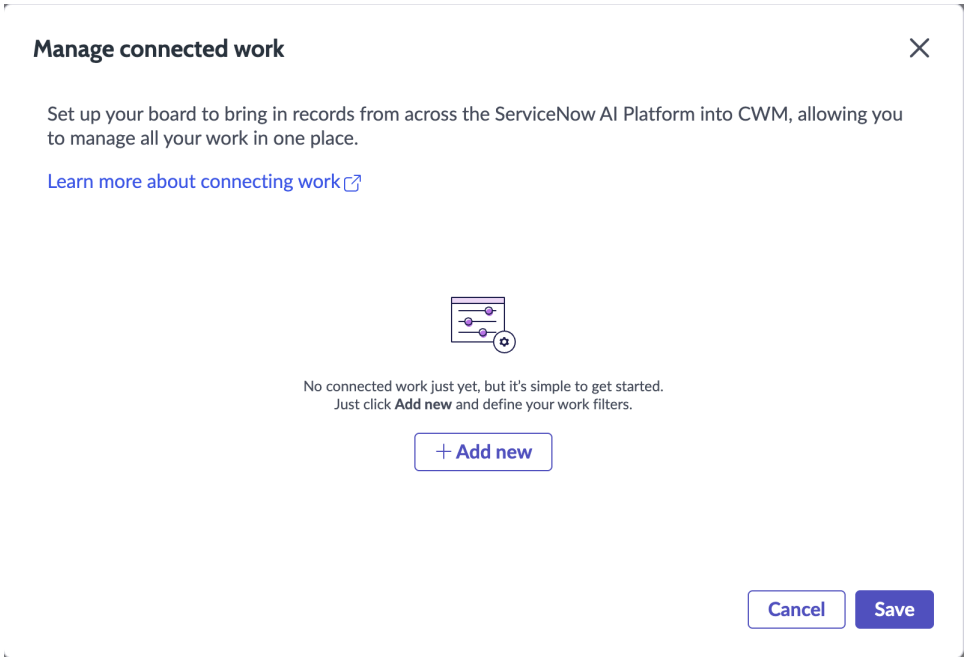
Enable a consolidated view of all relevant work by connecting work items from different ServiceNow applications to a Board in Collaborative Work Management.



Before you begin

Role required: sn_cwm.cwm_user

Procedure



1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. From a Space, select a Board that you want to connect work for.
3. From the Board header, select the Board more options icon ( ) and select **Connect work**.

   If you already have connected any work items, then this label is displayed as **Connected work**.

4. In the Manage connected work modal, select **+ Add new**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Choose a table and define the conditions to filter the records from the selected table.

   a. From the **Table** field, select a table.
   For example, to bring in all the incidents, select the Incident [incident] table. To bring project tasks onto the Board, select the Project Task [pm_project_task] table.

   > **Note:** Only those tables that you have access to and from the applications that are already installed and active in your ServiceNow instance are available for you.

   b. Change the value in the **Name** field according to your requirement.

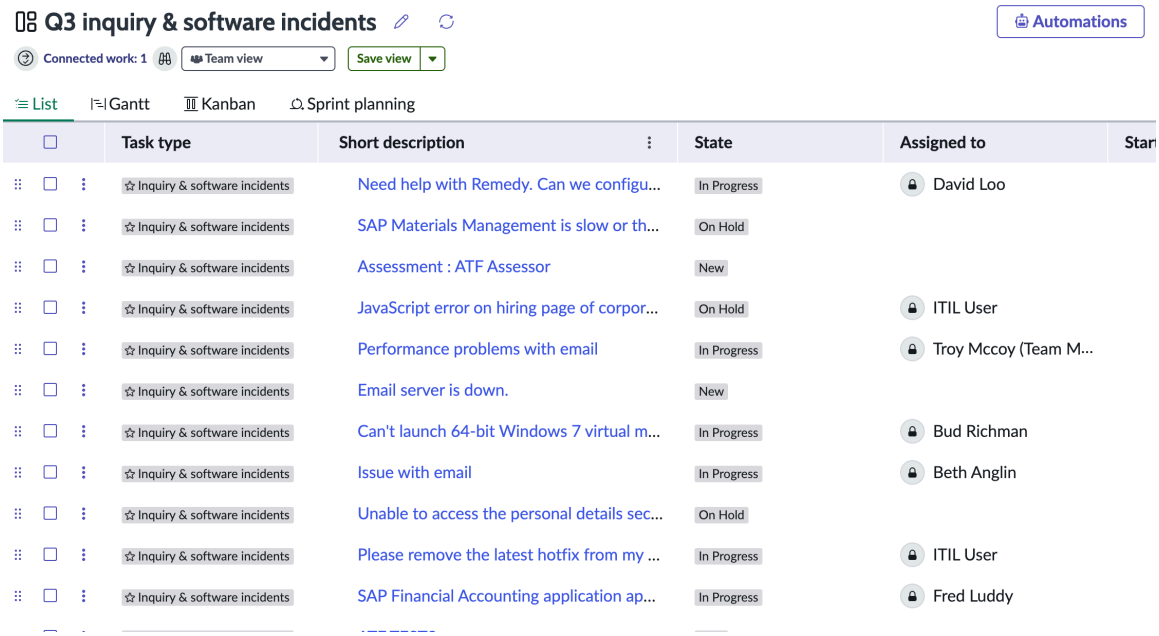
   c. Use the condition builder to add conditions and filter the records from the table you selected.
   For example, you'd like to bring in incidents that are active and belong to certain categories. Then, your condition set would be similar to the following:

   Active is true and **Category is Inquiry / Help** or **Category is Software**.

   d. Select the Update count icon ( ) to check the number of records that exist which match the filter criteria that you defined.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Ensure that the number of records available for your filter criteria are not more than 100. You can change this number by default to 500 by working with your admin to update the system property *sn_cwm.connect_work_import_limit*.



6. Select **Save**.
7. Repeat steps 4 through 6 to connect work items of other types.
   You can connect up to 10 work item types to a Board and you can add only one connected work configuration per table.
8. Select **Save**.

Result

- The Board is refreshed to load and display all the connected work items.
- Any existing information such as Assigned to, State, and Start and End dates is also shown on the Board.
- With the Sprint planning view enabled, you can see all these connected work items in the Backlog list. For more information about performing sprint planning, see Sprint planning in CWM.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

To enable additional fields from any connected work table, change the form layout configuration for the Default view of the table. You can then surface these fields as columns in CWM. For more information, see Show or hide fields on a form.

Related topics

- Manage connected work item types in CWM

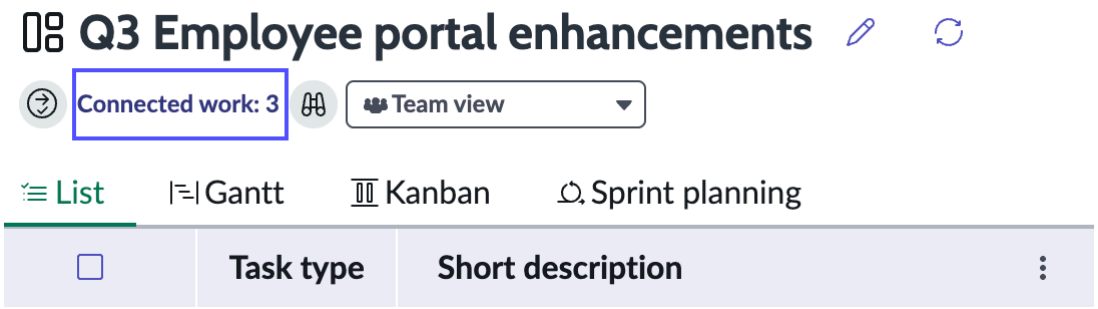
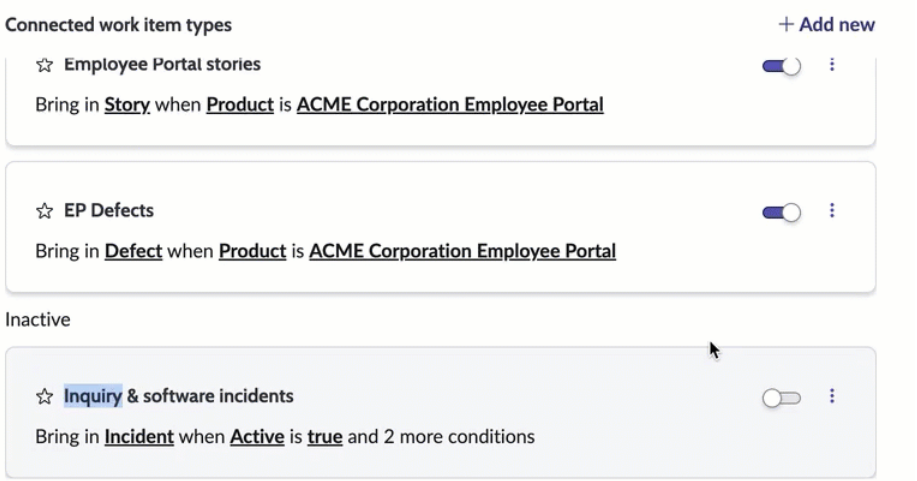
Manage connected work item types in CWM



Enable, disable, refresh data, or delete the connected work item types on your CWM Board to keep the work items up to date based on changing requirements.

Before you begin

Role required: sn_cwm.cwm_user



Procedure

1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. From a Space, select the Board that you want to manage the connected work item types for.
3. From the Board header, select **Connected work**.

4. From the Manage connected work modal, disable or enable any existing work item type.

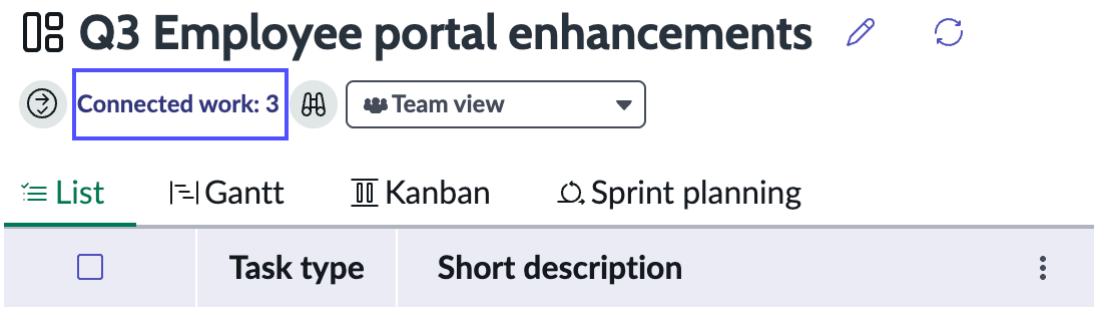
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Update the filter conditions for a work item type by selecting **Edit** from the More actions menu (⋮).
   For more information, see Update filter conditions for connected work in CWM.

6. Select **Refresh data** from the More actions menu (⋮) to fetch any latest records for the work item type that you defined.

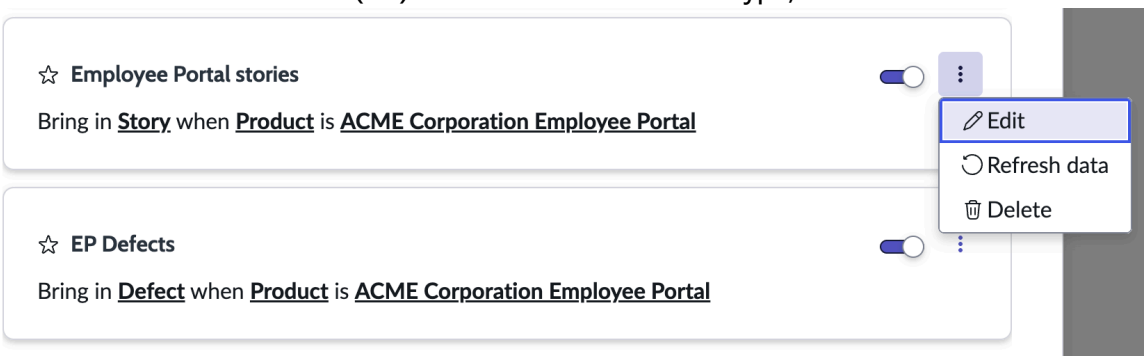
7. If the work item type is no longer necessary, you can delete it.
   a. From the More actions menu (⋮) of a work item type configuration, select **Delete**.
   b. From the Delete configuration modal, select **Confirm**.
8. After you have done all the required changes, select **Save**.

Result
The Board is refreshed to load the work items based on your changes.



Update filter conditions for connected work in CWM

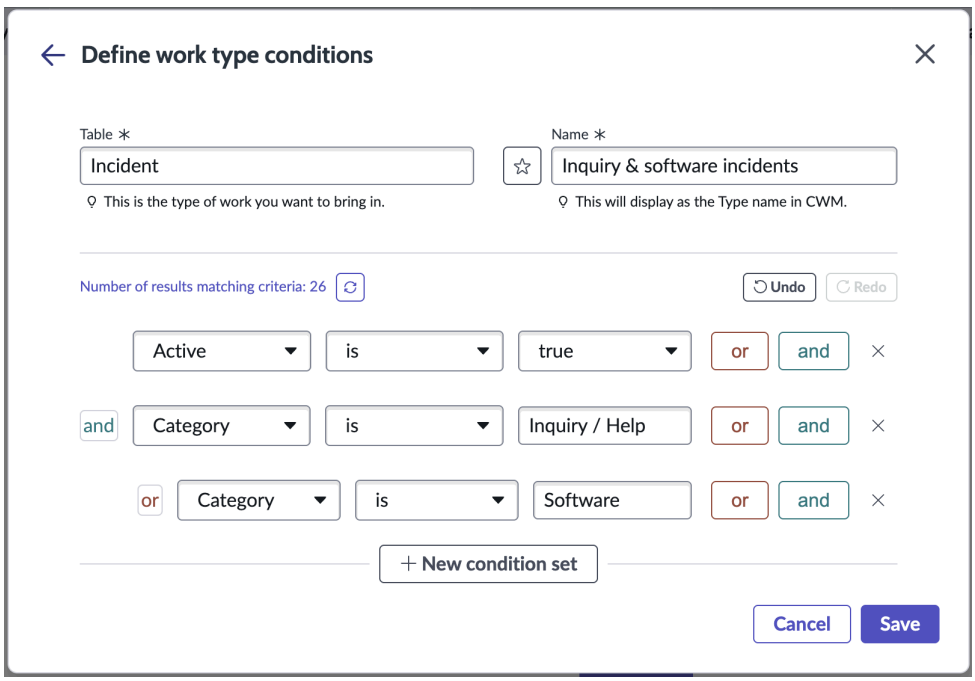
Update the filter conditions for connected work item types in Collaborative Work Management Boards so that the work items displayed in the Board reflect your team's current workload.



Before you begin
Role required: sn_cwm.cwm_user

Procedure
1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. From a Space, select the Board that you want to manage the connected work item types for.
3. From the Board header, select **Connected work**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. From the More actions menu (⋮) of a connected work item type, select **Edit**.

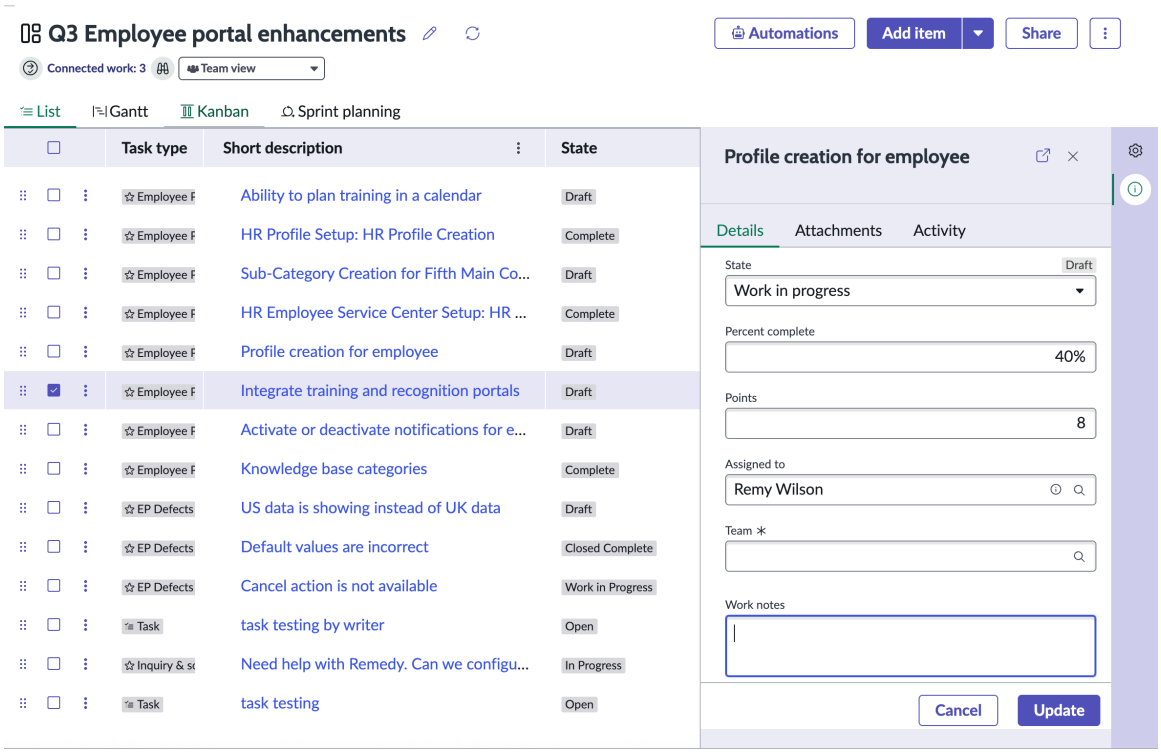
5. Use the condition builder to edit the defined conditions.
6. Select the Update count icon ( ) to check the number of records that exist which match the filter criteria that you updated.

Note: Ensure that the number of records available for your filter criteria are not more than 100.

7. Select **Save**.
8. Repeat steps 4 through 7 to update conditions of any other connected work item type.
9. After all required changes are made, select **Save** in the Manage connected work modal.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The Board is refreshed to load the work items based on your changes.



Update details of connected work items in CWM Boards

Learn how to update the status, assigned to, and other details for the work items that are brought into your Collaborative Work Management Board through Connected work.

Before you begin
Role required: sn_cwm.cwm_user

About this task
The details of connected work items can be updated only from the side panel and not through in-line editing in the grid. However, deleting the connected work items from the Board will only remove them from the Board but won't delete the original record.

Procedure
1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. From a Space, select the Board with connected work items that you want to update.
3. From the List, Gantt, Kanban, or Sprint planning view, open the item details in the side panel.
4. Update the required details.
   You can also choose to open the original record form and update the details from there using the Detailed form view icon ( ).

5. If you've edited the details in CWM, select **Update** or **Save**.

Result
The updated information is available on the work item both in CWM and in its parent application.

What to do next
To customize the fields that appear in the side panel for CWM tasks and connected work items, see Configure the form view for CWM tasks and connected work items.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Agile work management in CWM

Run your agile workflow in Collaborative Work Management (CWM), from building and refining a backlog to planning sprints, executing work as stories and scrum tasks, and collaborating with your team.

CWM is a unified workspace where agile teams can manage their delivery cycle. Teams transitioning to CWM can continue to run the Scrum workflow they're familiar with, which includes managing a backlog, planning and executing sprints, and tracking daily progress. They also benefit from CWM's flexible work item model, AI assistance, and broader collaboration features.

Agile workflow in CWM

The following end-to-end workflow shows how agile teams use CWM to plan and execute work.

Set up your workspace

Create a Space and a Board for your team. The Space is where all your work lives. CWM provides Stories, Scrum tasks, and CWM Tasks as default work item types. You can also define custom work item types to reflect your team's terminology, for example, Bugs. For more information, see Create a Board in CWM and Create and manage custom work item types in CWM.

Build and maintain your backlog

Add work items to your Board through the Sprint Planning view. All unscheduled work appears in the Backlog pane, giving your team a single place to groom, prioritize, and reorder items before pulling them into a sprint. For more information, see Add work items to Sprint planning Backlog in CWM.

Plan sprints

Create sprints by setting a duration, start and end dates, and story point capacity. Drag items from the Backlog into a sprint, or add them directly. Capacity indicators in each sprint section help teams avoid over-committing. For more information, see Create a sprint in CWM and Plan work items into sprints in CWM.

Execute and track work

Start the sprint and use the Kanban board to track work in progress. Team members move story cards across state lanes to update status. Use quick filters to focus the board on a specific sprint, state, or other columns to stay on top of what matters during the current sprint. For more information, see Start or complete a sprint in CWM.

Break stories into scrum tasks

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more granular daily execution, break user stories into scrum tasks. Scrum tasks are subtasks linked to a story, which help teams estimate effort, distribute work, and track daily progress. Create them manually from the story's Scrum tasks tab, or use Now Assist to generate them automatically based on the story context. When a story has scrum tasks, an indicator appears on the Kanban card so teams can quickly see stories that have been decomposed. For more information, see Scrum tasks for stories in CWM.

Track dependencies

Link work items to show how they relate to each other using three relationship types: prerequisite, dependent, and related to. These are informational relationships and don't block task progress. You can link work items across boards and spaces, enabling visibility into cross-team dependencies without needing to be on the same board. For more information, see Task dependencies and relationships in CWM.

Hold retrospectives

At the end of each sprint, create a retrospective board to capture what went well and what to improve for the next sprint. For more information, see Create a retrospective board for a sprint in CWM.

Bringing in work from other ServiceNow applications

Agile teams often work on more than just stories. Incidents must be resolved, defects must be fixed, and enhancement requests must be delivered. The Connected work feature in CWM lets you bring records from any ServiceNow application into your Board by defining filter conditions. Once connected, you can plan those records into sprints and manage them alongside your stories from a single backlog.

Teams who previously used the Unified Backlog and triage boards in Agile Development 2.0 to manage defects, incidents, and other work records. These teams can use Connected work to achieve a similar centralized view in CWM. For more information, see Connected work in CWM.

Comparing CWM to Agile Development 2.0

CWM covers the core Scrum workflow, but approaches some functional areas differently. The following describes how key Agile Development 2.0 concepts map to CWM.

Functional area	In Agile Development 2.0	In CWM
Work item hierarchy	Fixed hierarchy of Products, Epics, Stories, and Scrum Tasks.	Create custom work item types to build a hierarchy that fits your team. There are no built-in Products, Releases, or Themes. You can use Spaces to separate product areas and Goals to connect work to business objectives.
Unified backlog and triage	Triage boards filtered records from other apps and automatically created stories for triaged items.	The Connected work feature brings source records directly into the board backlog. So, no separate triage step required. Teams can plan them into sprints and update

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Functional area	In Agile Development 2.0	In CWM
		their status directly from the CWM Board. See Connected work in CWM.
Multi-team and program planning	Scrum Programs enabled coordination across multiple teams.	CWM is optimized for team-level execution. For program-level planning such as PI planning, use EAP. EAP teams can connect to CWM so teams execute sprint work in CWM while program-level visibility remains in EAP. See Connecting EAP with Collaborative Work Management.
Sprint data and classic UI	Sprint data is stored on the story record and is visible when you open the story in the classic UI.	Sprint, story points, and acceptance criteria in the CWM story panel are managed within CWM and are not written back to the classic story form. If you open a story using **Detailed Form View**, the Sprint field on the classic form appears empty. This is expected behavior.

Note: Do not use CWM and Agile Development 2.0 simultaneously for the same stories. If your team manages sprint work in CWM, use CWM as the primary workspace for those stories.

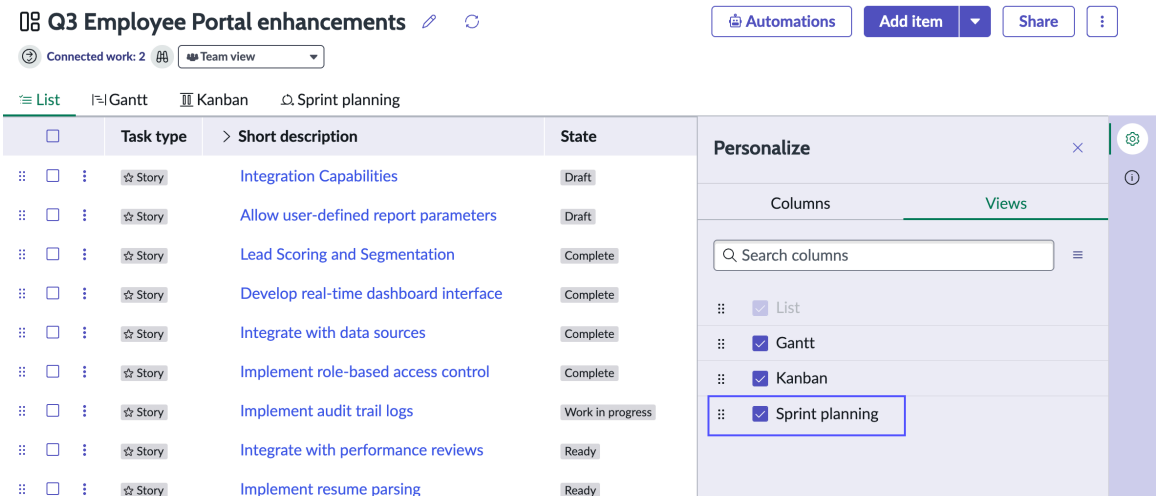
Sprint planning in CWM

Plan, track, and manage work for your teams in the Agile methodology using Sprint planning in Collaborative Work Management.

https://player.vimeo.com/video/1127930706?h=277a3826c5&badge=0&autopause=0&player_id=0&app_id=58479

Within the Sprint Planning view of your CWM Board, you can manage your team's backlog, create sprints, plan work into sprints, and execute them seamlessly. All existing work items on your CWM Board are automatically added to the Backlog pane in the Sprint Planning view. This means that whether the work items are old or new, they will all be visible in the Backlog. From this pane, you can easily schedule these items into sprints for execution.



You have the flexibility to create work items of various types, such as Stories. You can also use any other default and custom work types that are available on your CWM Board. This flexibility ensures that you can tailor your sprint planning to fit the specific needs of your team and projects.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

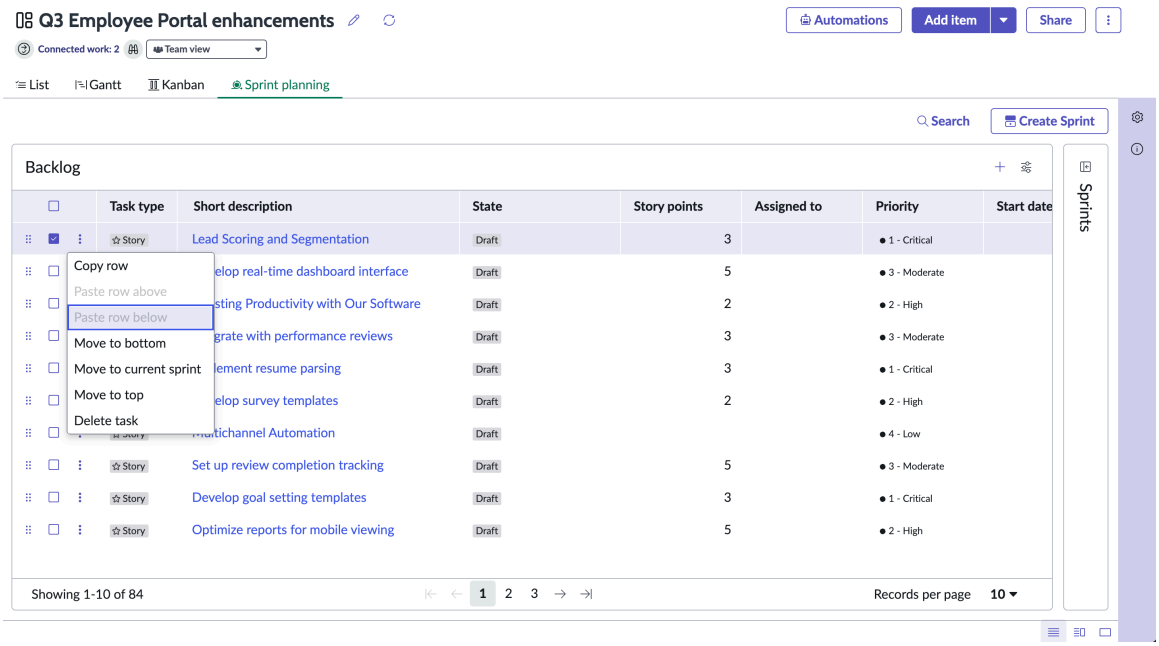
Enabling Sprint planning view

From the Views section of the Personalize ( ) side panel, select Sprint planning to enable the display of Sprint planning view on your CWM Board.

Note: Save your Board view to ensure that the Sprint planning view is always displayed on your Board.

Backlog

The Backlog pane displays all unplanned work items, including both newly added and older incomplete tasks. Completed work items are not shown, keeping your focus on what needs to be done. You can add work items directly to the Backlog from this view. You can also use the personalize side panel to show or hide columns within the Backlog pane, customizing the display to suit your needs.



Within the Backlog pane, you can do the following:

- Move work items to the top or bottom of the backlog based on the priority.
- Move items to the currently ongoing sprint.
- Move work items within the list by rearranging rows.
- Delete work items.
- Apply filters on any column. However, filters can't be applied on custom columns within Backlog.
- Change the number of items displayed per page.
- Duplicate work items by using **Copy row**.

  Note: You can duplicate only CWM tasks and Stories but not other connected work records.

- Drag and drop a single or multiple work items from Backlog to one of the sprints.

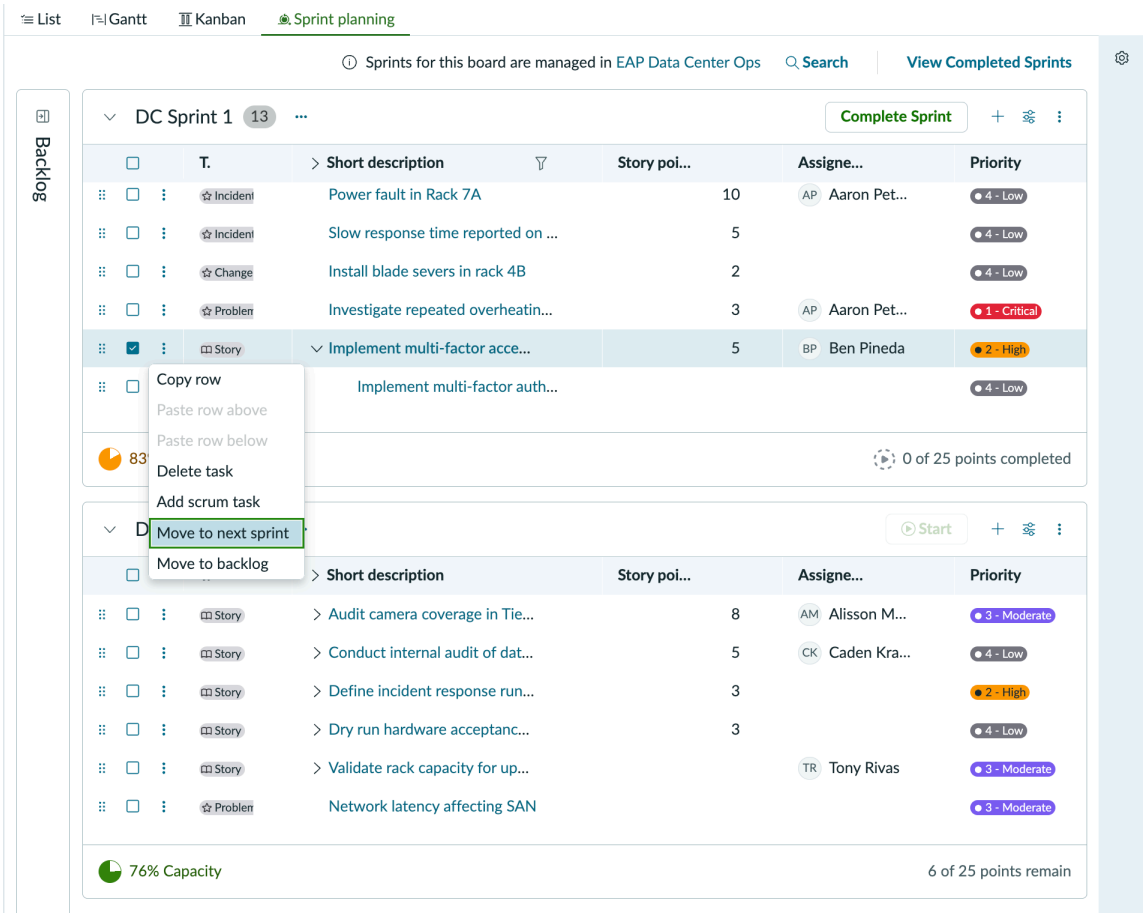
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Sprints

The Sprints section in your CWM Board displays the list of active sprints. If you haven't created any sprints yet, this section will show a form to help you get started. You can create a sprint by selecting the sprint duration, start and end dates, and story points capacity. To create additional sprints with the same settings, use the **Add another Sprint** option. For sprints with different durations or capacities, select **Create Sprint**. For more information, see Create a sprint in CWM.

Each sprint is a collapsible section where you can add work items directly and customize the view using the personalize side panel. Each sprint section also shows the percentage of utilized capacity and the remaining story points, helping you manage your team's workload effectively.

Personalizing Sprint Planning view

You can customize the columns displayed in the Backlog and Sprint panes using the Personalize ( ) side panel, allowing you to see the most relevant information. Any changes you make can be saved to the current Board view or as a new view, depending on your needs.

If you require more working area for the Backlog or Sprints within the Sprint planning view, you can toggle between the **Backlog**, **Sprints**, and **Backlog and Sprints** options.

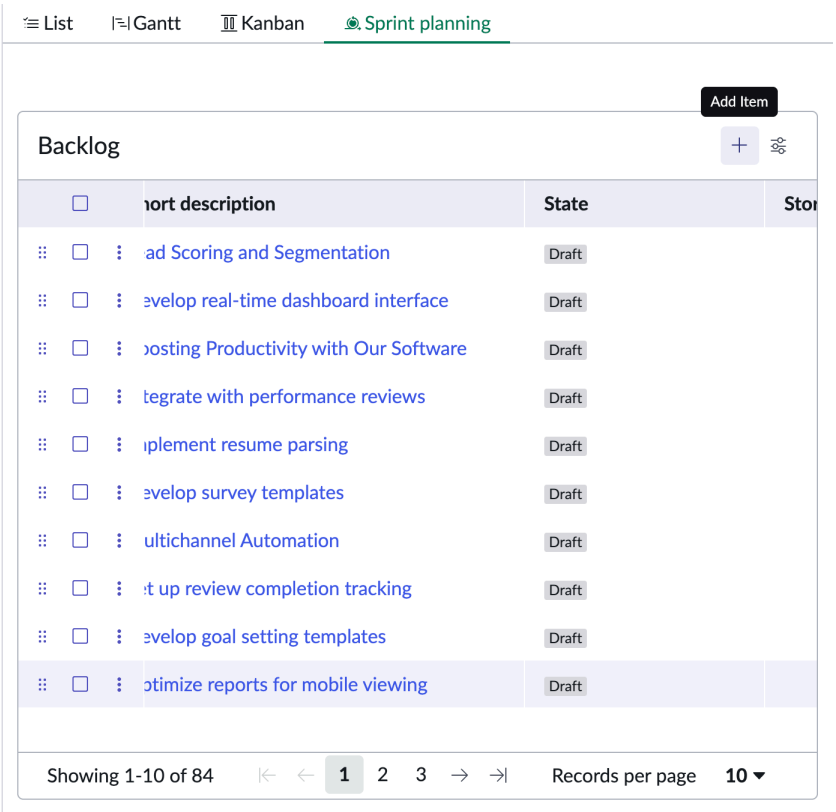
Add work items to Sprint planning Backlog in CWM

Create and add new work items to the Backlog directly from the Sprint planning view of Collaborative Work Management.



Before you begin

Role required: sn_cwm.cwm_user

Procedure

1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. From a Space, select a Board that you're performing sprint planning for.
3. Select the **Sprint planning** tab.
4. From the Backlog pane, select the Add item (+) icon.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select the work item type from the **Item type** drop-down list.
   The default work item type available is Task. You can enable other types such as Story or create a custom type. See Create and manage custom work item types in CWM.
6. On the form, fill in the details for the item such as short description, start and end dates, story points, and others.
7. Select **Submit**.

Result
The newly created work item is added to the Backlog.

What to do next
You can plan this item into one of the active sprints by dragging and dropping it into the Sprint section. See Plan work items into sprints in CWM.

Create a sprint in CWM

Create a sprint with custom duration and capacity to enable your team to plan and execute their work in an Agile methodology in Collaborative Work Management.

Before you begin
Role required: sn_cwm.cwm_user

Procedure
1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. From a Space, select a Board that you're performing sprint planning for.
3. Select the Sprint planning tab.
4. If there are no sprints in your CWM Board, you can use the **Plan a Sprint** form in the Sprints section.
5. If there are existing sprints, choose an option to create a new sprint.

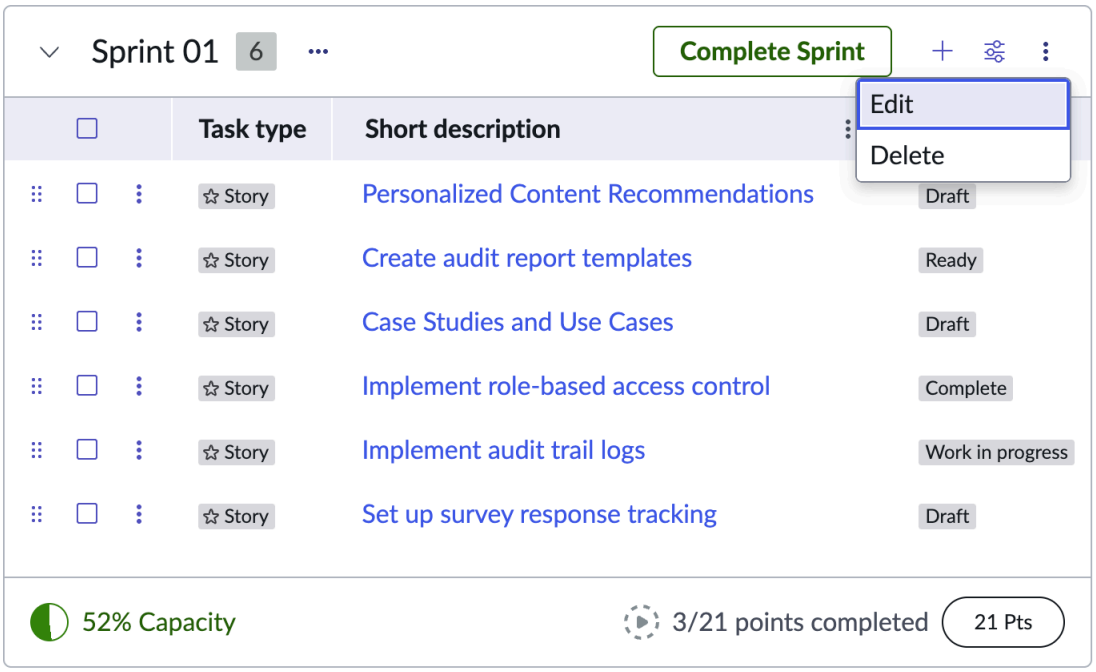
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Choice	Steps
Create a sprint with the same duration and story points capacity as the existing sprint	Select **Add another Sprint**.
Create a sprint with different duration or story point capacity	**a.** Select **Create Sprint**. **b.** Fill in the details. **c.** Select **Create Sprint**

What to do next

Plan work items into sprints in CWM.

Update sprint details in CWM



Modify the duration, capacity, and dates for a sprint in Collaborative Work Management.

Before you begin

Role required: sn_cwm.cwm_user

Procedure

1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. From a Space, select a Board that you're performing sprint planning for.
3. Select the Sprint planning tab.
4. From the sprint header, select the More options icon ( ) and select **Edit**.

5. Make the necessary edits to the sprint details.
6. Select **Save**.

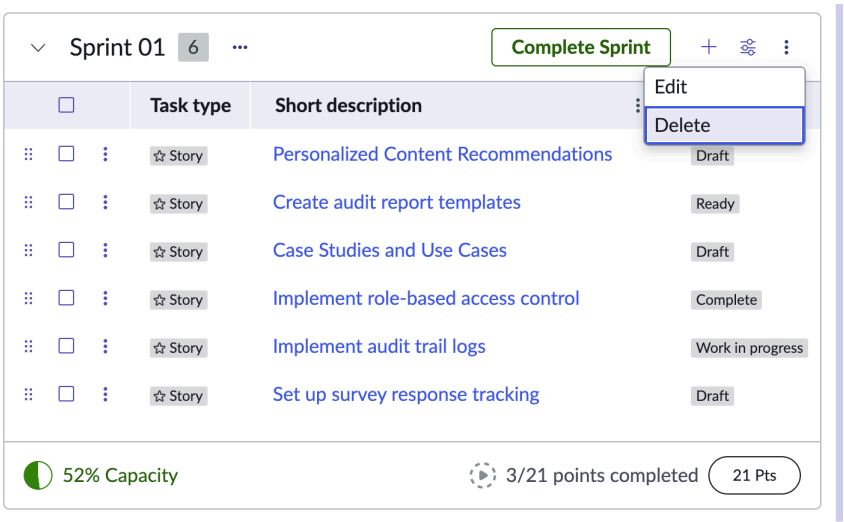
- Create work items for sprints in CWM
- Delete a sprint in CWM

Delete a sprint in CWM



Delete individual sprints from Sprint planning in Collaborative Work Management so that your Board reflects the changes in your planning priorities.

Before you begin

Role required: sn_cwm.cwm_user

Procedure

1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. From a Space, select a Board that you're performing sprint planning for.
3. Select the Sprint planning tab.
4. From the sprint header, select the More options icon ( ) and select **Delete**.

5. In the Delete Sprint confirmation modal, select **Delete**.

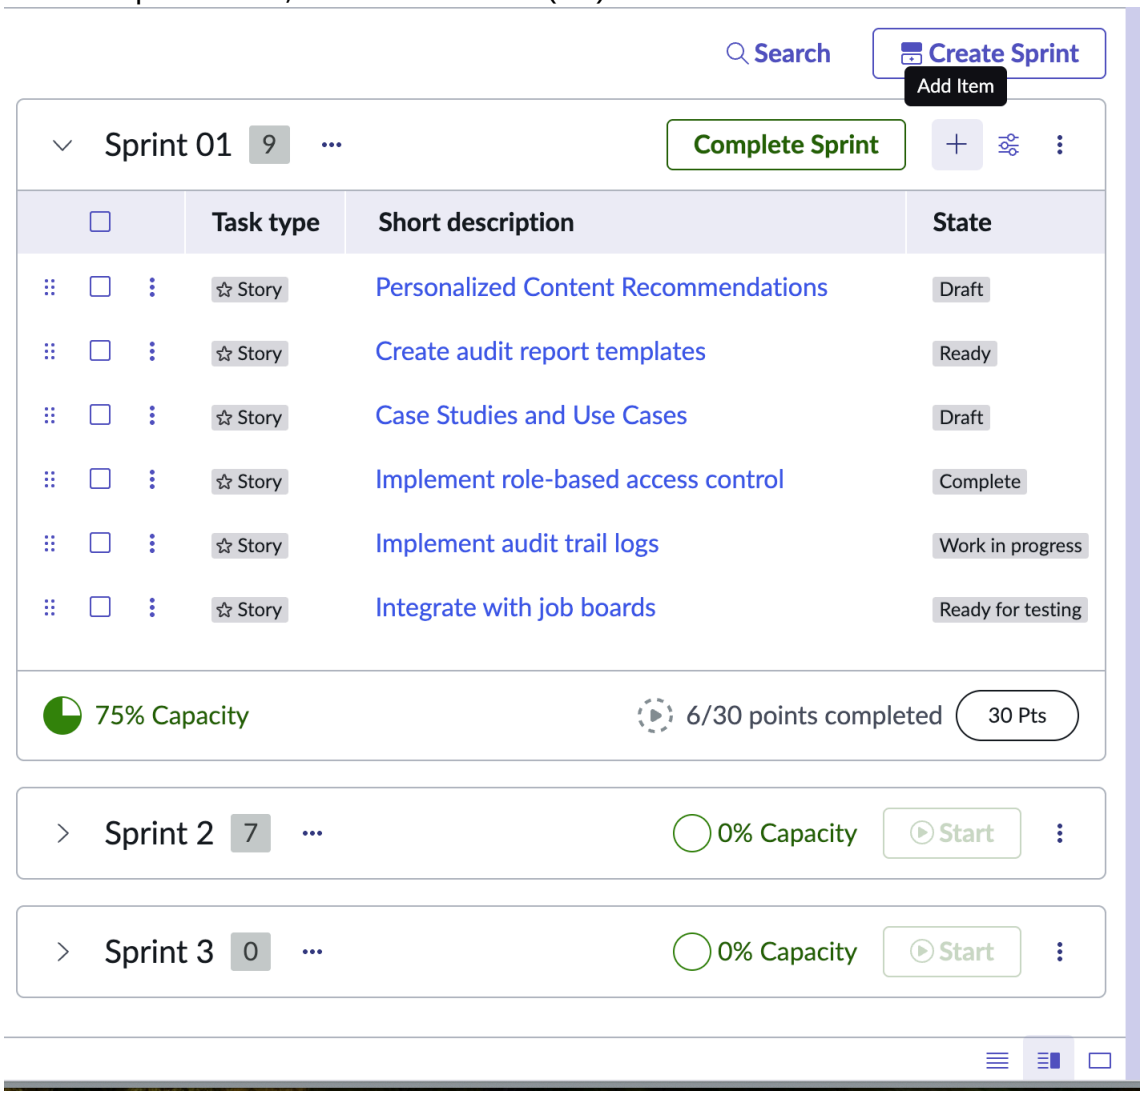
Result

The sprint is deleted and any active incomplete work items that were scheduled into this sprint are moved to the backlog.

Create work items for sprints in CWM

Create and add new work items to a sprint directly from the Sprint planning view of Collaborative Work Management.

Before you begin



Role required: sn_cwm.cwm_user

Procedure

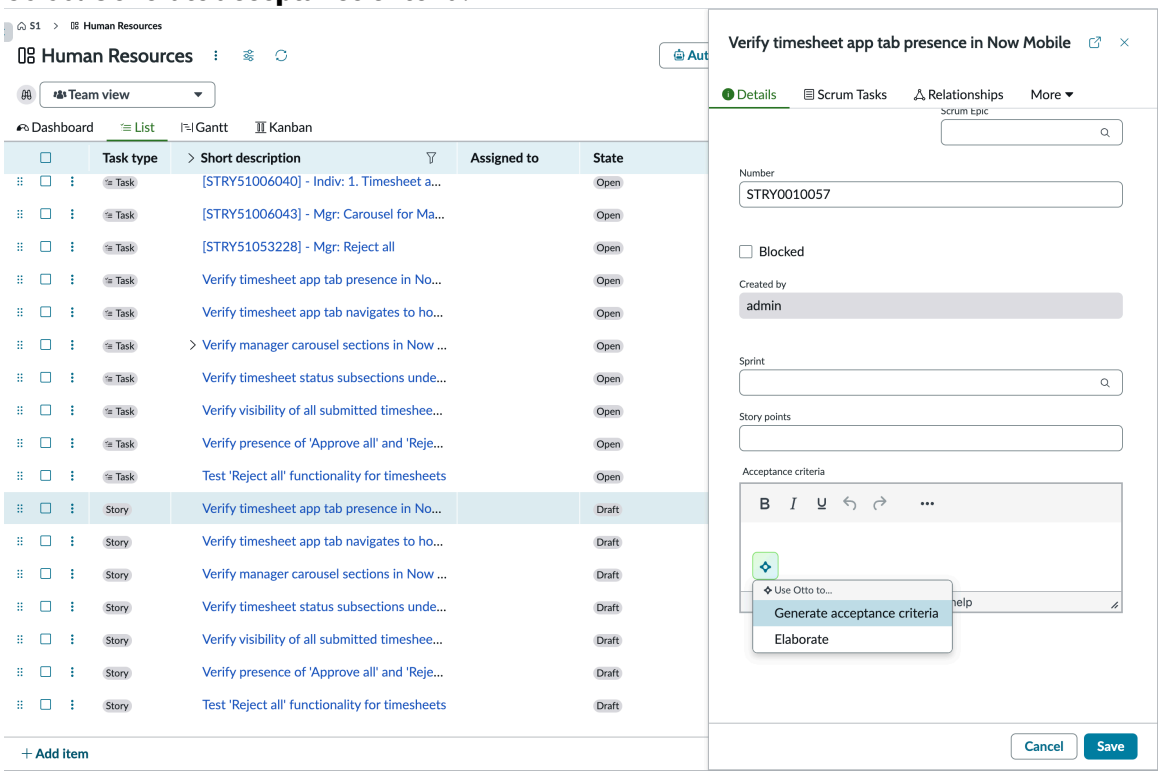
1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. From a Space, select a Board that you're performing sprint planning for.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select the Sprint planning tab.
4. From the sprint header, select the Add item (+) icon.

5. Select the work item type from the **Item type** drop-down list.
   The default work item type available is Task. You can enable other types such as Story or create a custom type. See Create and manage custom work item types in CWM.
6. On the form, fill in the details for the item such as short description, start and end dates, story points, and others.
7. Select **Submit**.

Generate acceptance criteria for stories in CWM



Create clear, comprehensive, and testable acceptance criteria for user stories without writing them manually in Collaborative Work Management (CWM). Review and refine suggested options to ensure they meet your requirements.

Before you begin
Role required: sn_cwm_ai.cwm_ai_user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. From the Spaces menu, navigate to the Board containing your story.
3. Select the story to open its details in the side panel.
4. From the Acceptance criteria field in the side panel, select the **Use ServiceNow Otto to...** menu ( ).
5. Select **Generate acceptance criteria**.

6. Review the generated acceptance criteria.
7. You can choose to further refine the generated content using the ServiceNow Otto context menu ( ) or generate a new criteria.
8. Select **Update** to save the acceptance criteria in the Story form.

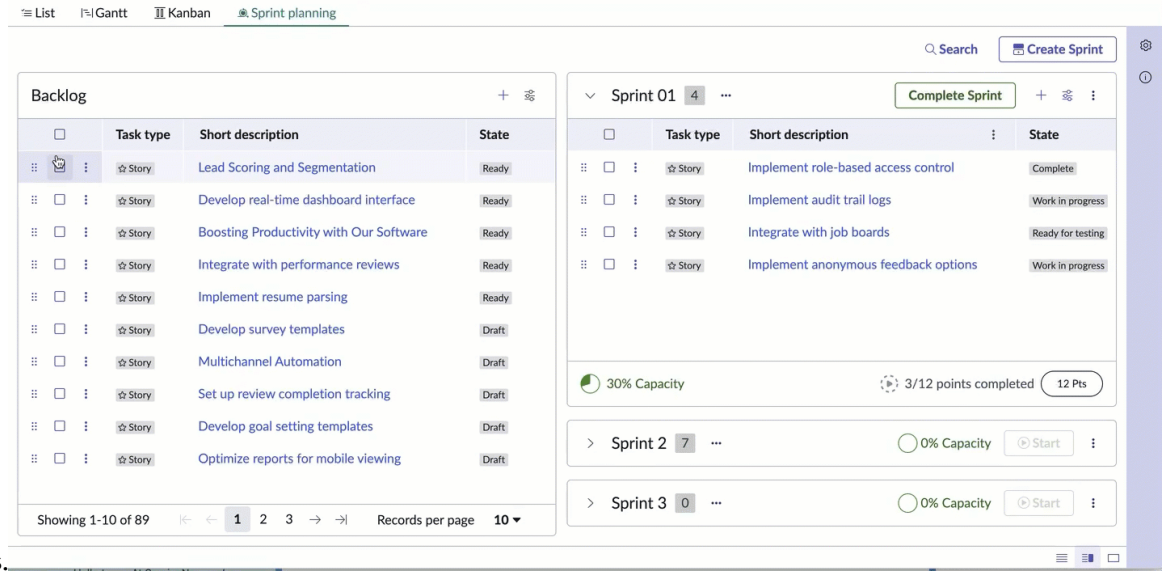
Plan work items into sprints in CWM

Schedule stories and other CWM tasks from the backlog into sprints or move work across sprints in Collaborative Work Management.

Before you begin

Role required: admin

Procedure



1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. From a Space, select a Board that you're performing sprint planning for.
3. Select the Sprint planning tab.
4. From the Backlog, select the work items that you'd like to schedule into a sprint.
5. Drag and drop them into the sprint of your choice.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can drag and drop the work items into sprints even when the sprint sections are collapsed.

6. To move the work items from one sprint to another, select them and drop them in the sprint of your choice.

   Here's a gif showing the drag and drop action between the backlog and sprint sections, and across sprints.

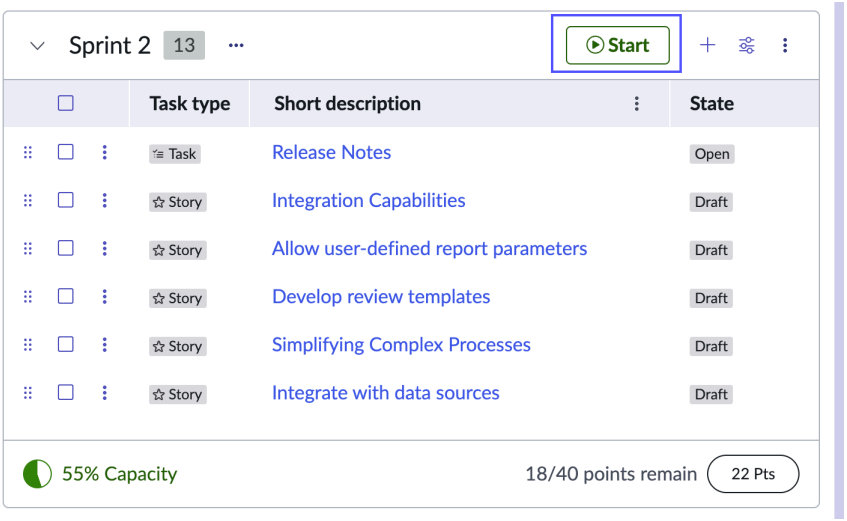
Start or complete a sprint in CWM

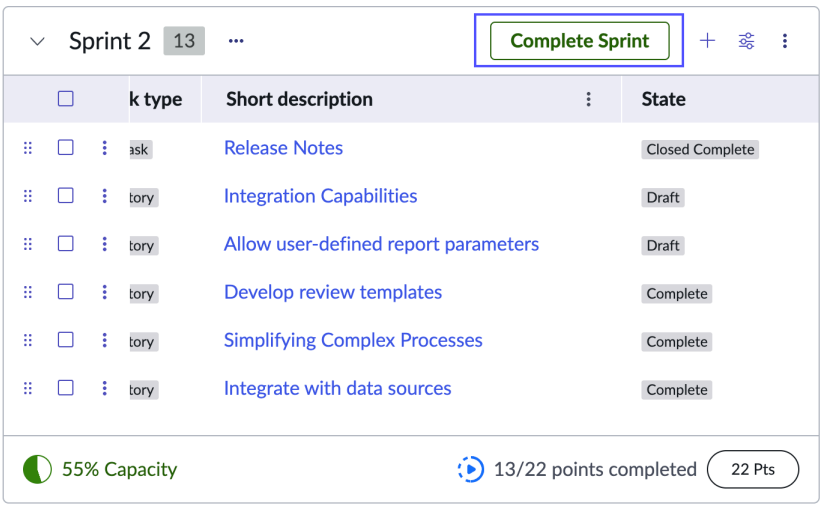
Start a sprint so that your team can start work on the planned items. After your team finishes the assigned work, you can mark this sprint complete, all directly from the Sprint planning view in Collaborative Work Management.



Before you begin

Role required: sn_cwm.cwm_user

Procedure



1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. From a Space, select a Board that you're performing sprint planning for.
3. Select the Sprint planning tab.
4. To start a sprint, select **Start** from the sprint header.

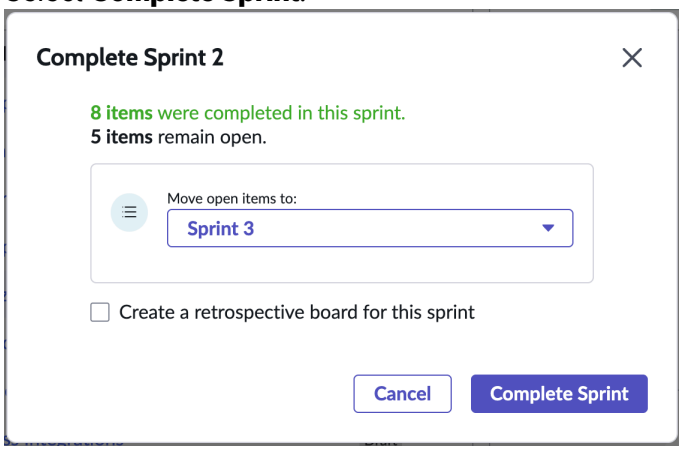
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Complete a sprint.

a. From the sprint header, select **Complete Sprint**.



b. Review the details of completed and open items for this sprint.

c. Move the incomplete items to the next sprint or the backlog.

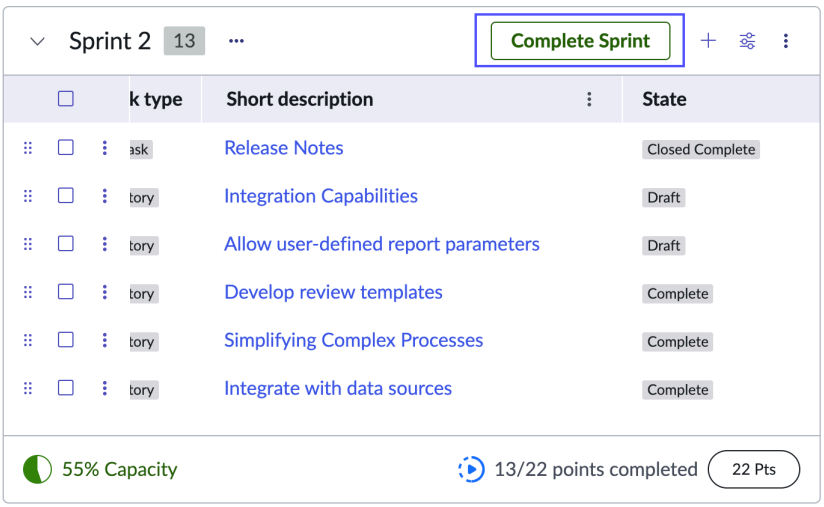
d. Choose to create a retrospective Board for this sprint to perform a sprint retrospective with your team.
For more info, see Create a retrospective board for a sprint in CWM.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

e. Select **Complete Sprint**.

The sprint is marked as complete and is no longer displayed on the Sprint planning view anymore. All the open items are moved into the next sprint or to the backlog based on your selection.

Create a retrospective board for a sprint in CWM

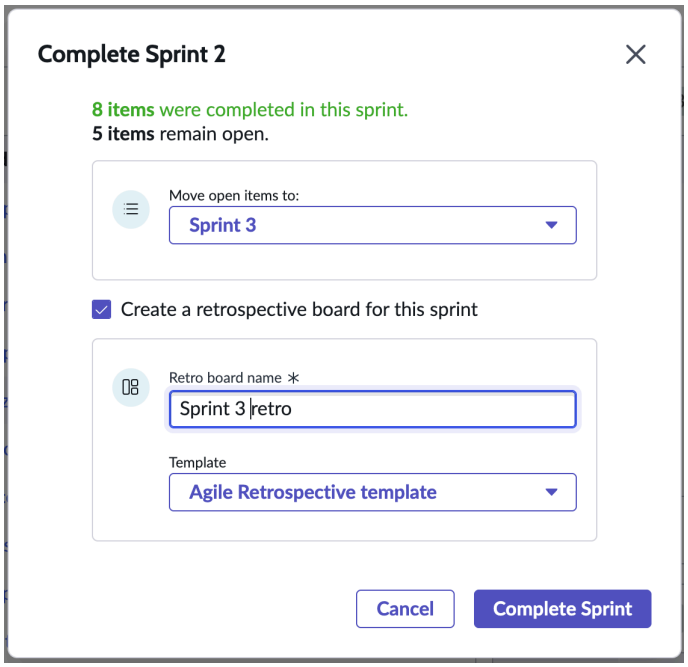


When marking a sprint complete, choose to create a sprint retrospective board for your team to collaborate and reflect on the recent sprint in Collaborative Work Management.

Before you begin

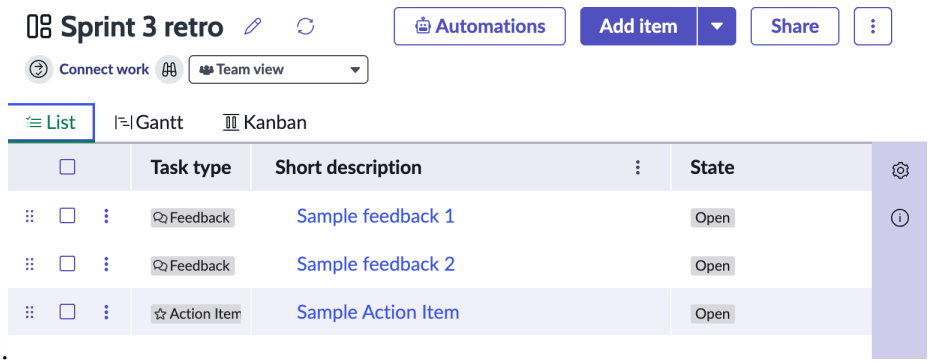
Role required: sn_cwm.cwm_user

Procedure



1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. From a Space, select a Board that you're performing sprint planning for.
3. Select the Sprint planning tab.
4. From the sprint header, select **Complete Sprint**.

5. Review the details of completed and open items for this sprint.
6. Move the incomplete items to the next sprint or the backlog.
7. Select the option create a retrospective Board for this sprint.
8. Provide a name for your Board.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. Select a template to apply to this Board.
   By default, the Agile Retrospective template is applied. If you want to create a different template depending on your requirements, see Templates in CWM for Boards and Docs.

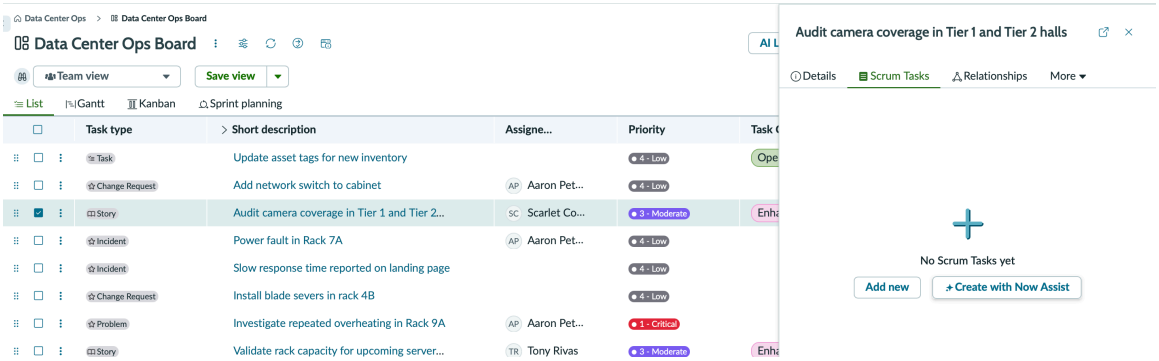
10. Select **Complete Sprint**.

Result
A new retrospective Board is created for the sprint that is just marked complete within the same Space. You can navigate to the new board from the success message or from the left navigation panel.

Scrum tasks for stories in CWM

Extend your agile workflow in CWM by breaking user stories into scrum tasks. This gives your team the granularity needed to estimate effort, distribute work, and track daily progress through a sprint.

In CWM, scrum tasks represent the individual units of work that make up a user story. While stories capture a feature or requirement from the user's perspective. Scrum tasks break that story into steps that team members can pick up and complete independently during a sprint. Scrum tasks are always associated with a parent story and aren't a standalone work items on the board.



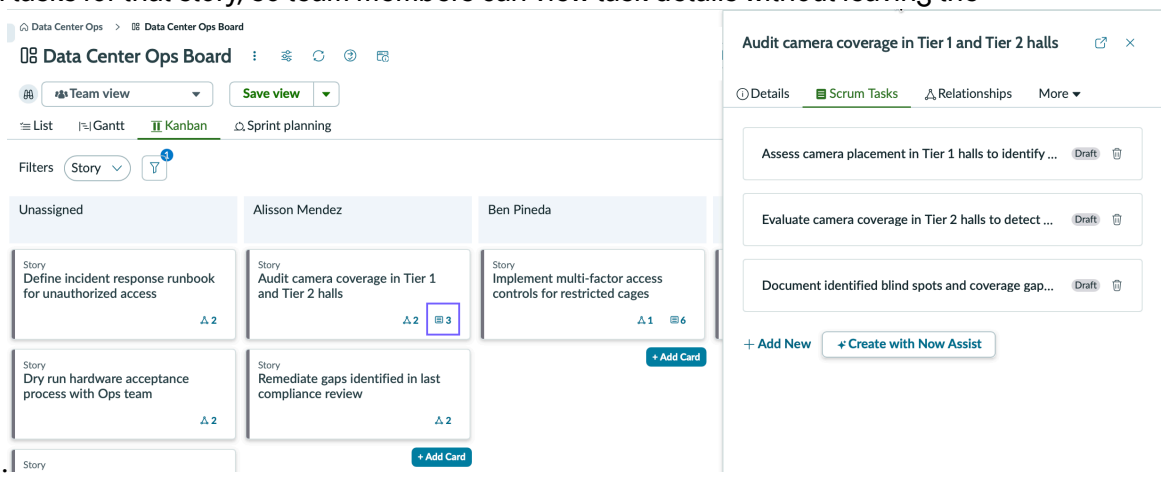
Creating scrum tasks

You can create scrum tasks manually or use ServiceNow Otto to generate them based on the story content.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Manual creation

After a story is saved, a Scrum Tasks tab is available on the story form. From this tab, you can add tasks by entering a title and any relevant details directly on the story. You can also create scrum tasks for stories inline from the List and Sprint planning views. For more information, see Add scrum tasks to a story in CWM.



AI-generated scrum tasks

ServiceNow Otto can analyze the story description and context to suggest a set of scrum tasks. The **Create with ServiceNow Otto** button on the story form and the inline sparkle button on the **Scrum tasks** tab both trigger generation. You can review the suggestions, regenerate if the results don't fit the story, and then insert the tasks. AI-generated tasks serve as a starting point and can be edited after they're created. For more information, see Generate scrum tasks for a story with ServiceNow Otto.

Scrum tasks on the Kanban board

When a story has one or more scrum tasks, a scrum task indicator icon appears on the story's Kanban card. Selecting the icon opens a side panel that shows the scrum tasks for that story, so team members can view task details without leaving the board.

Quick filters on the Kanban board let teams focus on specific sprints, states, or other columns. Multiple filters can be active at the same time, and a counter at the top of the board shows how many filters are currently applied. This makes it easier to track sprint-specific work during daily stand-ups and sprint execution.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scrum task considerations and limitations

- Scrum tasks belong to a parent story and can’t exist independently as standalone work items on the board.
  - When a story is moved from one sprint to another, the child scrum tasks also move to the new sprint.
  - You can reorder scrum tasks only within its parent story.
  - Scrum tasks can't be moved (drag and drop) or copied outside its parent story.
- Percent complete isn’t rolled up from scrum tasks to the parent story. Percent complete is tracked only for CWM tasks.
- When a story is imported through Connected work, its associated scrum tasks are brought in automatically along with it. Scrum tasks can’t be imported directly through Connected work.
- Scrum tasks can’t be assigned to a sprint independently. They inherit the sprint of their parent story. When you change the sprint for a story, all associated scrum tasks move to the new sprint automatically.
- Scrum tasks aren’t displayed in the Backlog section of the Sprint planning view. They’re shown only in the sprint section.
- Sprint information can't be edited on a scrum task record.
- Deleting a scrum task in CWM doesn’t delete the underlying record. It's only removed from viewing in CWM.
- You can't add scrum tasks if the scrum task work type is disabled in your ServiceNow instance.
- You can't add scrum tasks if you have just the Viewer access to the CWM Board.
- If scrum tasks were previously imported through Connected work before upgrading to v9.0.0. If stories are then imported through Connected work after the upgrade, duplicate scrum tasks may appear on the board. To resolve this, remove the existing configuration for scrum tasks in Connected work for your Board.

Agile work management in CWM

Task dependencies and relationships in CWM

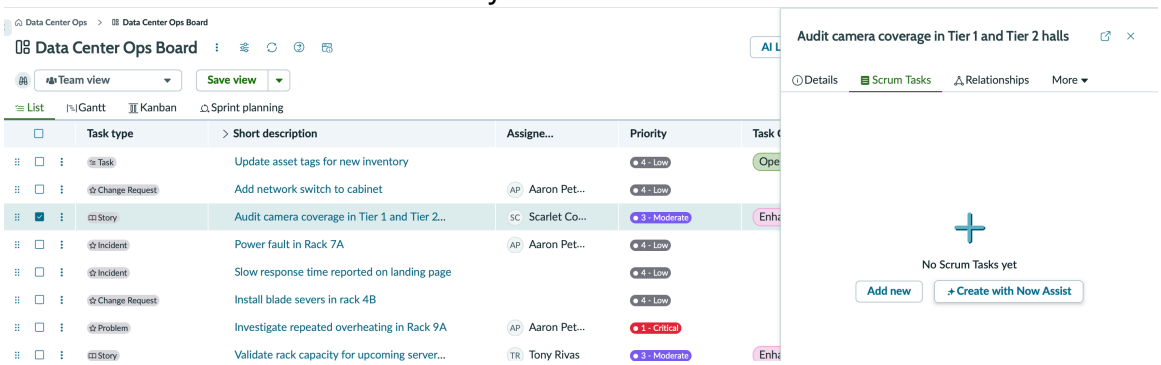
Add scrum tasks to a story in CWM

Break down a user story into scrum tasks in Collaborative Work Management (CWM) to distribute work across team members and track daily progress during a sprint.

Before you begin

Role required: sn_cwm.cwm_user

About this task

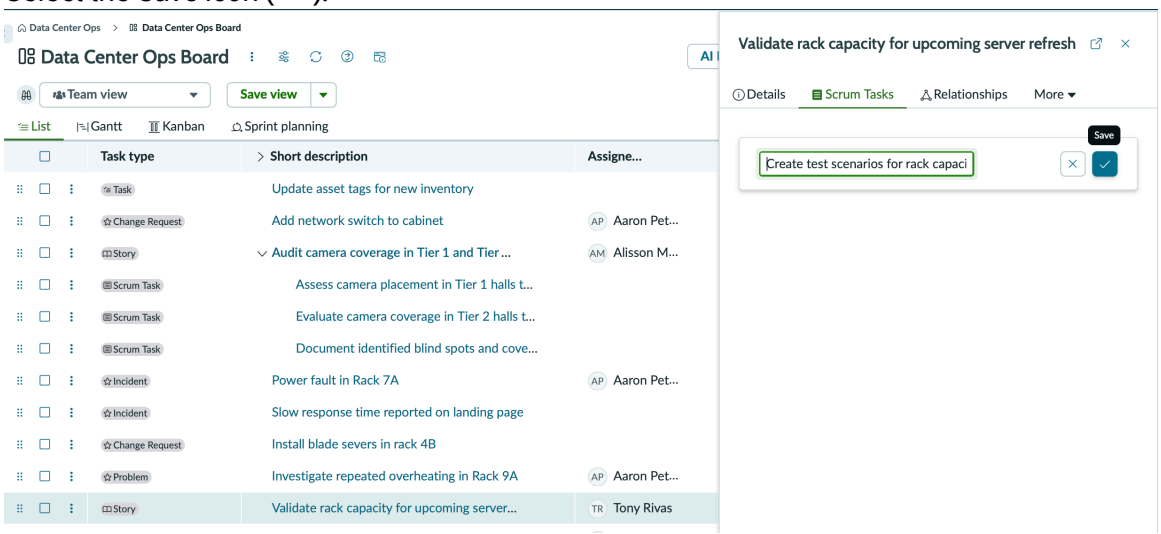


Scrum tasks are added one at a time from the **Scrum tasks** tab on a story form. To generate multiple scrum tasks at once based on the story description using Now Assist, see Generate scrum tasks for a story with ServiceNow Otto.

Procedure

1. Navigate to **Workspaces** > *Collaborative Work Management*.
2. From a Space, select a Board.
3. Open a story by selecting it from one of the views (List, Gantt, Kanban, or Sprint planning).

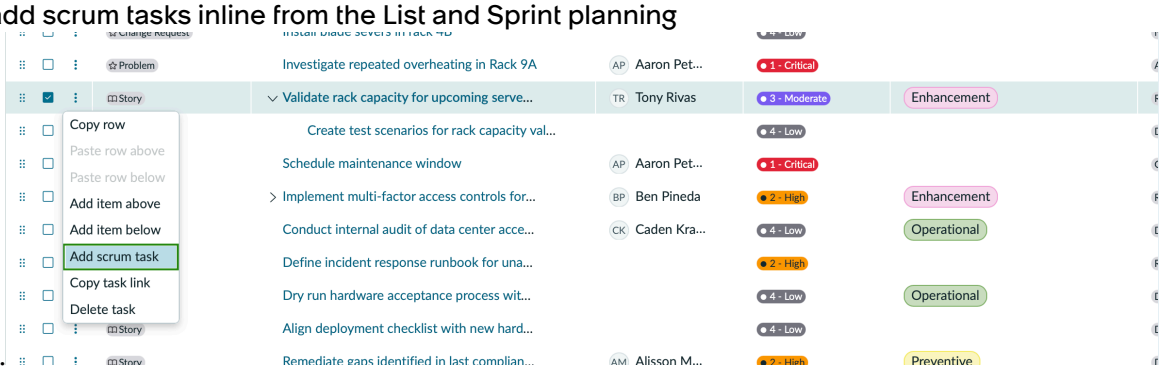
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Select the **Scrum Tasks** tab on the story form.

5. Select **Add new**.

6. Enter a name for the scrum task.



7. Select the Save icon ( ).

8. Select **+ Add new** to add more scrum tasks.

What to do next

To add more scrum tasks, repeat the previous steps. You can also add scrum tasks inline from the List and Sprint planning views.

To generate scrum tasks automatically based on the story content without manual work, see Generate scrum tasks for a story with ServiceNow Otto.

Related topics

Generate scrum tasks for a story with ServiceNow Otto

Use ServiceNow Otto to automatically generate scrum tasks for a story in Collaborative Work Management (CWM) based on the story's description and context, saving time on manual task breakdown.

Before you begin

Role required: sn_cwm_ai.cwm_ai_user

About this task

ServiceNow Otto generates scrum tasks by analyzing the story's description and context.
You can generate scrum tasks in two ways: with review, where you evaluate and approve the suggestions before they are added to the story. Without review, suggestions are generated and added to the story immediately using the inline ServiceNow Otto icon from the Board.

Procedure

1. Navigate to **Workspaces** > *Collaborative Work Management*.
2. From a Space, select a Board.
3. Open the story you want to generate scrum tasks for.

   You can open a story from any board view: List, Gantt, Kanban, or Sprint planning.
4. On the story form, select the **Scrum Tasks** tab.
5. Select **Create with ServiceNow Otto**.
6. Review the generated recommendations.

   If the suggestions don't match the story, select **Refine** > **Regenerate** to produce a new set of recommendations.
7. Select **Insert** to add the scrum tasks to the story.

Result

The generated scrum tasks are added to the story and appear in the **Scrum Tasks** tab. You can edit any of the generated tasks after they're added.

What to do next

Tip:

For a quicker path that skips the review step. Hover your cursor over the story's short description in the List, Gantt, or Sprint planning views to reveal the ServiceNow Otto scrum tasks icon () and select it. The scrum tasks are generated and added to the story immediately without a review step.

To add scrum tasks manually instead, see Add scrum tasks to a story in CWM.

Task dependencies and relationships in CWM

Increase visibility into how work is connected by linking work items directly in Collaborative Work Management (CWM), eliminating the need to track dependencies in spreadsheets or notes fields.

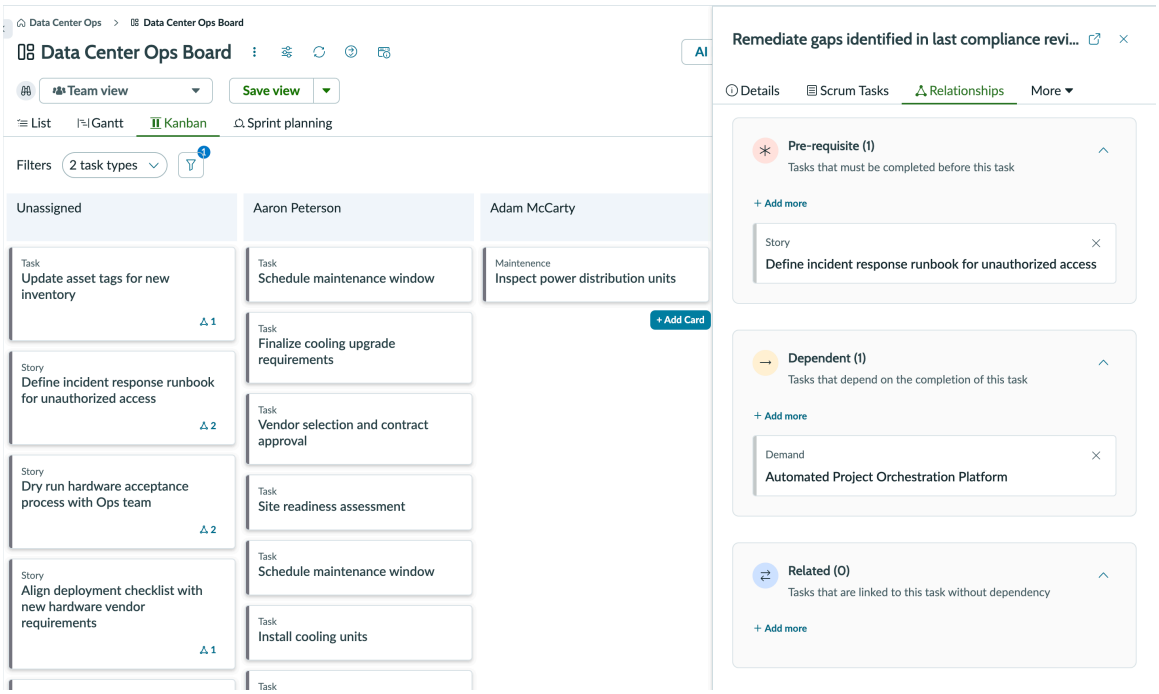
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In CWM, you can link any task-type work item to another to show how pieces of work relate to each other. Relationships are informational and team members can progress on a work item regardless of the state of its linked items. Relationships can be created across Boards and Spaces, giving teams visibility into cross-team dependencies for their work.

Relationship types

Work items in CWM support three relationship types.

Prerequisite



Indicates that another work item must be completed before this item can begin. Use this relationship to communicate sequencing and upstream dependencies to your team. Only task-type work items extending the Task [task] table and CWM tasks can be added as prerequisites. Planning items such as Epics aren't supported.

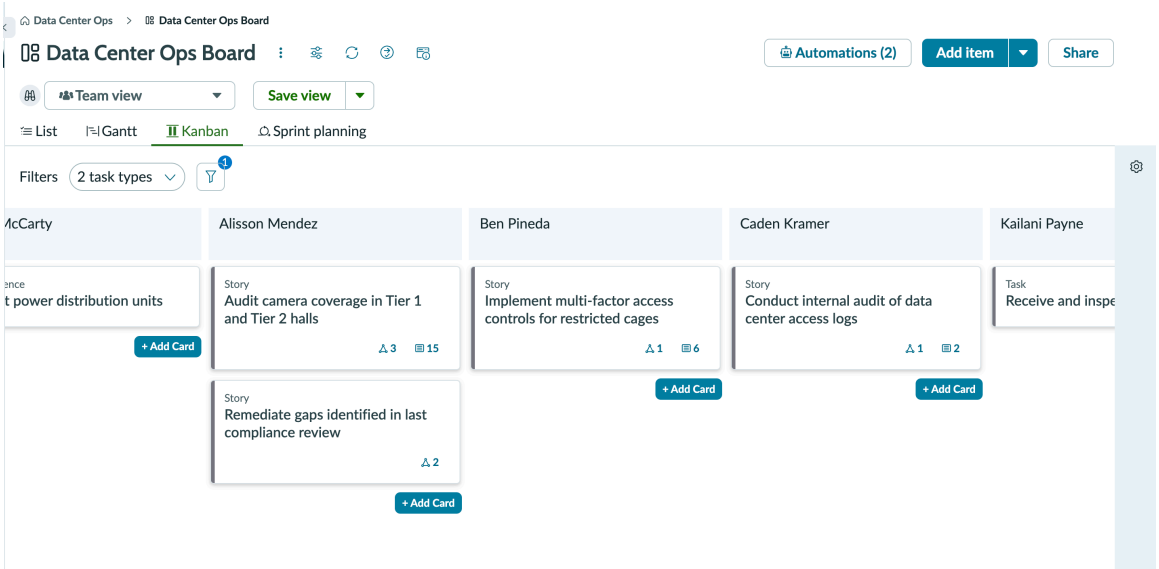
Dependent

Indicates that this work item must be completed before work on another item can begin. This is the inverse of a prerequisite relationship and communicates downstream impact to your team.

Related

Indicates a general connection between two work items without implying a specific order of execution. Use this relationship when items share context, overlap in scope, or are otherwise connected without one blocking the other.

Linking work items across boards and spaces



You can link any task-type work item to another across the ServiceNow AI Platform, regardless of which Board or Space it belongs to. To create a relationship, search for the work item by name and attach it. The search covers all task type work items that you have permission to view.

Note: Work items brought onto a Board through the Connected work feature don't display relationships on their original source record unless the relationship is added directly on that record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Relationships on the Kanban board

When a work item has one or more relationships, a relationships indicator icon appears on its Kanban card. Selecting the icon opens the right side panel showing the related work items and their relationship types, so team members can view dependency details without leaving the board.

Task dependency considerations and limitations

- Planning items such as Epics can't be added as prerequisites because they aren't derived from the Task [task] table.
- You can add a work item as a dependency on if you have permission to view that item.
- Relationships have no effect on percent complete calculations for CWM Tasks or Boards in Strategic Planning Workspace.
- If a story in the Story [rm_story] table already has prerequisite and dependent stories associated to it, those details are shown in CWM.
- Adding a story-type work item as a relationship to another story syncs with the prerequisite and dependent fields in the Story [rm_story] table.
- Adding a non-story-type work item as a relationship to a story does not sync with the Story [rm_story] table.

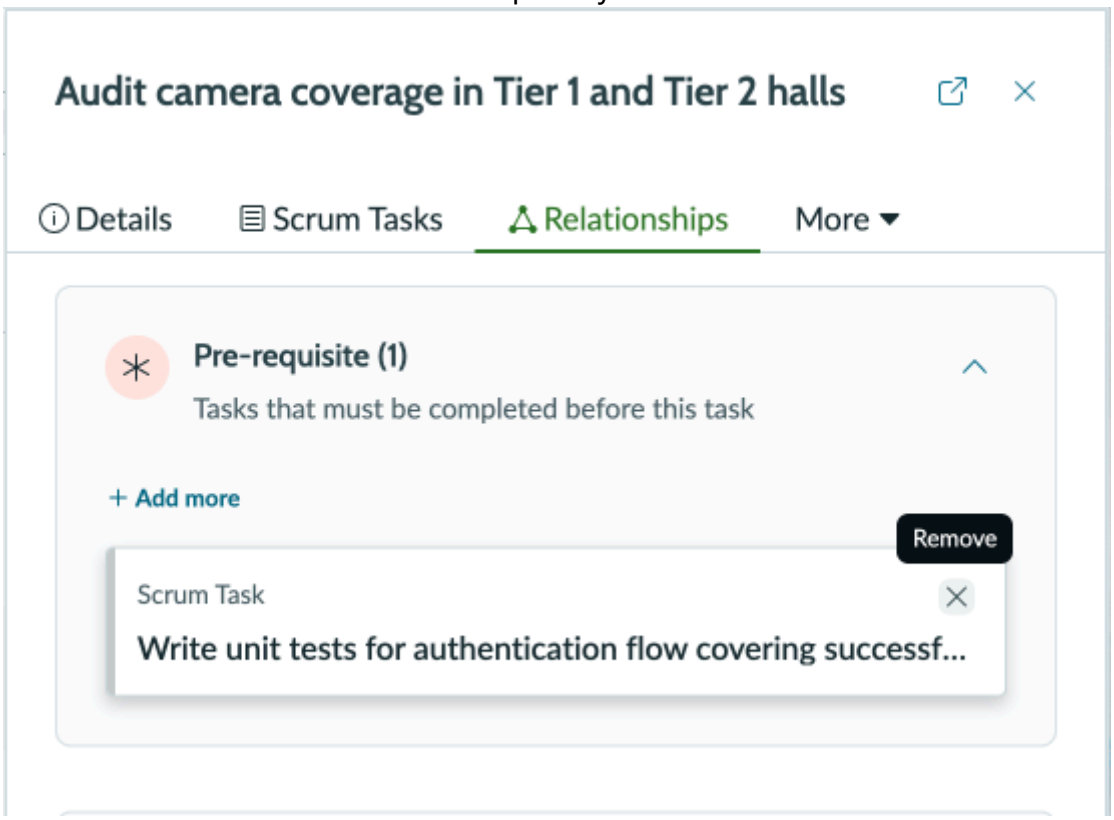
Remove a dependency from a work item in CWM

Unlink a relationship between work items in Collaborative Work Management (CWM) when it is no longer relevant or was added incorrectly.

Before you begin

Role required: sn_cwm.cwm_user

About this task



Relationships are removed from the **Relationships** tab on the work item form. Removing a relationship does not affect the work items themselves or their progress, it only removes the link between them.

Procedure

1. Navigate to **Workspaces** > *Collaborative Work Management*.
2. From a Space, select a Board.
3. Select a work item to open it in the side panel.
4. Select the **Relationships** tab.

Connecting EAP with Collaborative Work Management

Enhance visibility and streamline planning for your Agile teams by connecting Enterprise Agile Planning (EAP) with Collaborative Work Management (CWM).

Overview of EAP-CWM connection

The EAP-CWM integration enables organizations to connect strategic program planning with team-level execution in a single system, eliminating silos and improving delivery predictability.

Using EAP, program managers and release train engineers can define Program Increment (PI) objectives, align Epics, Features, and Stories, create sprints for teams, and manage cross-team dependencies. After completing a PI, they can conduct PI retrospectives and update roadmaps for the next cycle. These capabilities ensure that enterprise priorities are clearly structured and traceable across all levels.

By linking EAP to CWM, product owners and team members can plan and execute sprints, manage agile stories alongside operational tasks such as incidents. They can also track progress and hold team-level retrospectives, all within the same workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

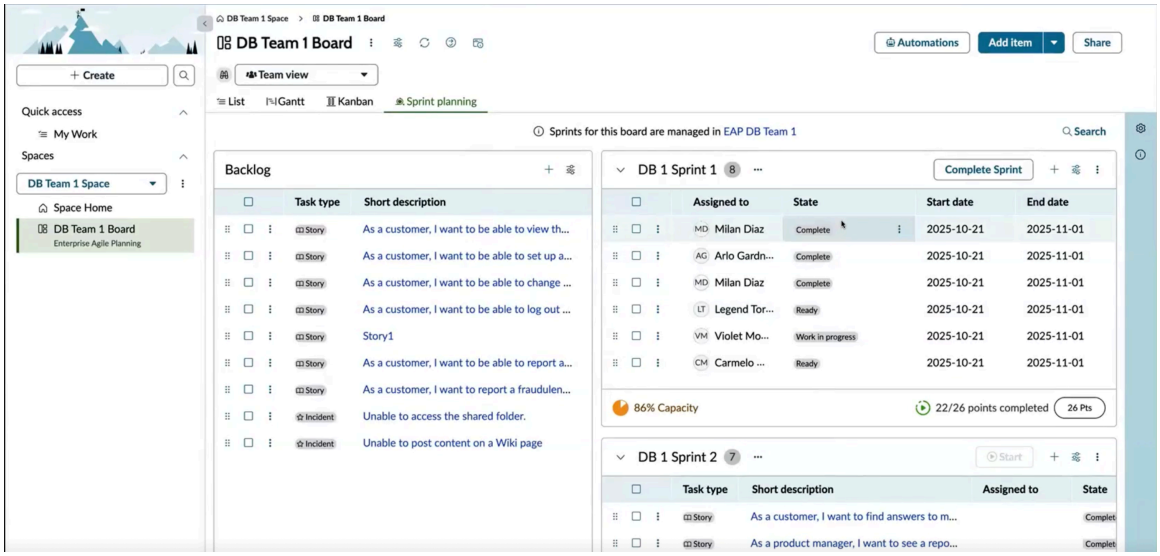
This connection between the applications reduces context switching and ensures that both planned and unplanned work is accounted for, without losing alignment to strategic goals. The result is end-to-end transparency where leadership can track progress against PI goals through EAP, while teams maintain flexibility to adapt to changing priorities.

Workflow of EAP-CWM integration

1. EAP admin connects an EAP team to CWM. See Connect an EAP team with CWM.
2. A new Space and Board are created for this EAP team in the CWM workspace.
3. Existing work items assigned to this EAP team are brought over to the newly created CWM Board through Connected Work filters.
4. Sprint planning view is enabled for this CWM Board where the existing work items and sprints are automatically shown.
5. Check team's access to CWM and provide the CWM user [sn_cwm.cwm_user] to all team members.
6. EAP team can start creating more work, manage current work, and update progress directly from the CWM Board. See Sprint planning in CWM.
7. The team's progress and work status is reflected back on the Team dashboard in the EAP workspace. See EAP Agile Team dashboard

Creating or managing sprints for EAP teams in CWM

For EAP teams integrated with CWM, existing sprints and their scheduled work automatically sync to CWM. These details are displayed in the Sprint Planning view on the CWM Board.



Sprint name, state, capacity, and dates all sync automatically from EAP to CWM, including for Agile teams that use non-calendar-based iterations.

As the team progresses through assigned work, they can update the work status directly in the Sprints section. The sprint can be marked **Complete** from this view and any incomplete work items can be moved either to the backlog or the next sprint, if it exists.

New sprints for the team must be created in EAP. After creating new sprints in EAP, they will sync to CWM, allowing the team to schedule work into these sprints from CWM.

Note: Sprints for EAP teams are not created directly at the Agile team level. Sprints are created automatically when a Planning Interval (PI) is defined for the parent Agile Release Train (ART) in EAP and sync to CWM automatically.

CWM integration with Project Workspace

View and manage project tasks alongside CWM work without switching applications. Team members can see assigned project tasks, break down work, and manage connections while project managers track execution in Project Workspace.

The Project Workspace integration with Collaborative Work Management (CWM) gives project managers and team members a shared view of work across both applications. Team members work inside CWM using Boards and My Work. Project managers track that same work inside Project Workspace.

Each CWM task or story can be linked to a project and a project task.

Enabling the integration

Both applications must be installed and active in your instance to use the integration.

- Collaborative Work Management (CWM) v10.2.0 and later. For installation, see Install Collaborative Work Management.
- Project Workspace v7.5.0 and later. For installation, see Install Project Workspace.

When both are active, the **Project** and **Project task** fields are available on CWM task records. The related row context menu options, such as **Add child CWM task** and **Add child story**, also are available in the List view.

Bring project tasks onto a Board

If a project task isn't already on your Board, you can add it as connected work. For the steps, see Connect work from other ServiceNow apps to CWM Boards.

Adding a project task to a Board doesn't bring across the CWM tasks or stories that are already linked to that project task. Each Board can have its own set of connected work items for the same project task. In Project Workspace, all of these connected items appear together under the project task.

How the integration supports collaborative work

The integration is designed so that team members and project managers can work in their preferred tools without losing visibility into each other's activity.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Stay in CWM for daily work

Create, update, and move CWM tasks and stories linked to a project task from Boards, list views, and My Work. You can also see which project task each work item supports without opening Project Workspace.

Break down work assigned to you

If you are an assignee on a project task, you can create additional CWM tasks and stories under it directly from a Board. New items are automatically linked to the project task and its project.

Give project managers direct visibility

Project managers see the CWM tasks and stories your team is executing directly under each project task on the planning page. They don't need Board access to review status, and a date-conflict indicator flags when a CWM item's planned dates fall outside the parent project task.

Share access through project permissions

Users with read or write access to a project or project task can view and edit the linked CWM tasks, even without Board membership. Team leads and project stakeholders can act on connected work without being added to every Board.

When a project or project task is deleted

Deleting a project or a project task doesn't delete the CWM tasks or stories connected to it. The connected CWM items stay on their Boards. Only the **Project** and **Project task** column values are cleared, and each affected item returns to the initial level on the Board.

A connected item doesn't automatically return to its earlier parent. For example, in a Website rebuild project, the CWM task **Draft homepage copy** starts as a child of another CWM task, **Content planning**. You then reconnect **Draft homepage copy** to the project task **Prepare launch content**. If **Prepare launch content** is later deleted, **Draft homepage copy** stays on the Board but moves to the initial level as an independent task. It doesn't return under **Content planning**.

What team members do in CWM

From within CWM, team members can perform the following actions:

- See the **Project** and **Project task** that each work item supports. For more information, see Show the Project and Project task columns in a CWM Board.
- Track project tasks assigned to them or to a group they belong to in My Work. For more information, see View project tasks assigned to you in CWM My Work.
- Create additional CWM tasks and stories under a project task they are assigned to. For more information, see Create a CWM task or story under a project task.
- Change or remove the project task connection on a CWM item. For more information, see Change or remove the project task connection for a CWM item.

Not every action is available on every project task. Assignee, hierarchy, and item-type conditions determine what's allowed. For details, see Project task hierarchy and permissions in CWM.

What the project manager sees in Project Workspace

Project managers can enable the display of connected tasks in the Planner tab of a project in Project Workspace. When connected tasks display is enabled, the CWM tasks and stories linked to project tasks are shown as child items under each project task in the Planner. However, inline editing of these CWM child rows is not supported. Only the first level of the CWM hierarchy appears in the Planner.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When a linked CWM task has a start date earlier or an end date later than the project task, the date conflict is indicated in red on the connected task row. The indicator clears when the dates are corrected.

For information on enabling and using these views, see Project Workspace integration with CWM.

Access through project permissions

Users who have read or write access to a project or a project task, and have the *sn_cwm.cwm_user* role, can view and edit the connected CWM tasks. For more information, see Project task access in CWM.

Project task hierarchy and permissions in CWM

Learn how assignee, hierarchy, and item-type conditions determine which project tasks accept CWM children and who can add or move them on a Board.

Adding or moving a CWM task or story under a project task is subject to assignee, hierarchy, and item-type rules. These rules determine which context menu options appear, which project tasks are available in the **Project task** column dropdown, and whether an action completes or displays an inline notification.

Project task assignees

A user counts as an assignee of a project task when at least one of the following is true:

- The user is listed in the **Assigned to** field on the project task.
- The user is listed as a resource assignee on the project task.
- The user is part of a resource assignment group on the project task.

Only assignees can create, indent, or drop CWM items under a project task. The **Add child CWM task** and **Add child story** options still appear for non-assignees, but selecting one displays an inline error notification instead of creating the item.

Hierarchy restriction on CWM child tasks

A project task can't accept CWM child tasks when the project task already has child project tasks. This rule applies to all users, including assignees. To see the existing child project tasks for a project task, open it in Project Workspace.

The **Project task** column dropdown on a Board excludes project tasks that already have child project tasks. So, those project tasks can't be selected as a new parent when a CWM item is moved.

Child task and story creation availability

Both the **Add child CWM task** and **Add child story** options appear on every project task, regardless of its phase type. Whether the action completes depends on the phase type:

- On an agile project phase, both **Add child CWM task** and **Add child story** complete successfully.
- On a project task with any other phase type, only **Add child CWM task** completes. Selecting **Add child story** displays an error notification instead of creating the story.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Restriction signals on the Board

Restrictions are surfaced in one of three ways, depending on the rule and the action:

Error notifications for non-assignees

For non-assignees, the **Add child CWM task** and **Add child story** options still appear, but selecting one displays an inline error notification instead of creating the item.

Dropdown exclusions

While associating a CWM task with a project and project task, the **Project task** column dropdown shows only those project tasks that don't already have child project tasks.

Inline notifications

If a project task already has child project tasks, then you can't associate additional CWM tasks or stories.

CWM integration with Project Workspace

Show the Project and Project task columns in a CWM Board

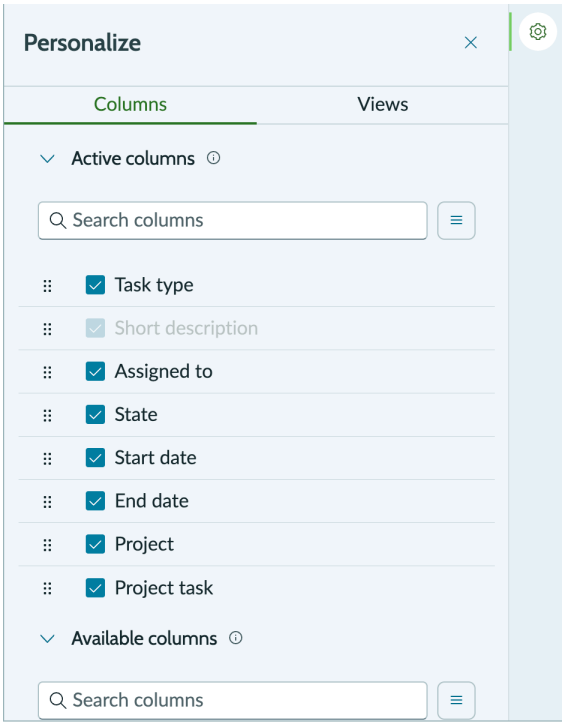
Display the **Project** and **Project task** columns on a CWM Board List view so that team members can see which project task each work item supports.

Before you begin

Role required: sn_cwm.cwm_user

About this task

The **Project** and **Project task** columns are shown in the default List view of a CWM Board. If the columns have been removed from a personalized view, use column customization to add them back.



The **Project** value is derived from the **Project task** value and updates automatically when the **Project task** value changes. You can also set the **Project** value directly, which clears the **Project task** value. For more information, see Change or remove the project task connection for a CWM item. You can open a linked project or project task directly from these columns.

Procedure

1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. Open the Space that contains your Board, and then open the Board in the List view.
3. Select the Personalize icon ( ).

   If the **Project** and **Project task** columns are already visible, skip to the last step.
4. Select the **Project** and **Project task** columns from the Available columns list to move them to the Active columns list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. **Optional:** Save the current view so the columns persist for the next session.

   (Optional) For more information about saving a view, see Update a CWM Board view.

6. To open the linked record, select the value in the **Project** or **Project task** column.

   The linked Project Workspace record opens in a new browser tab.

Result
The **Project** and **Project task** columns display for each work item on the Board. For work items with no connection to a project task, the columns are empty.

View project tasks assigned to you in CWM My Work

Track project tasks alongside your other CWM work from a single view in My Work. Project tasks show up when you're assigned to them directly or through a group.

Before you begin
Role required: sn_cwm.cwm_user

About this task
My Work shows a project task from Project Workspace when any of the following are true:

- You're listed in the **Assigned to** field on the project task.
- You're listed as a resource assignee on the project task.
- You belong to a group that is listed as a resource assignment group on the project task.
- You belong to a group that is listed in the **Assignment group** field on the project task.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Each team member sees only their own share of a group assignment. For general information about My Work, see My Work in CWM.

Procedure

1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. Open **My Work**.
3. To view only project tasks, from the task type filter, select **Project task**.

   The task type filter shows only the task types currently assigned to you. Project tasks appear when at least one is assigned through any of the routes listed in the context.

4. Select the **List** tab to review the full list of project tasks with columns for state, priority, and dates.
5. To open a project task in Project Workspace, select the value in the **Source** column.

My Work in CWM

CWM integration with Project Workspace

Create a CWM task or story under a project task

Break down a project task by creating child CWM tasks or stories under it on a Board. New child items are automatically linked to the parent project task and to its project.

Before you begin

You must be an assignee of the project task through one of the following:

- Listed in the **Assigned to** field on the project task.
- Listed as a resource assignee on the project task.
- A member of a group that is listed as a group resource assignee on the project task.

The project task must not already have child project tasks. When a project task has child project tasks, adding CWM child items is blocked for all users. For details on assignee and hierarchy rules, see Project task hierarchy and permissions in CWM.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: sn_cwm.cwm_user

Procedure

1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. Open the Board that shows the project task, and switch to the List view.
3. Open the context menu for the project task row.
4. Select one of the following options:
   - **Add child CWM task** to create a task.
   - **Add child story** to create a story.

   Both **Add child CWM task** and **Add child story** appear to all users, whether or not you're an assignee. The child item is created only if you're an assignee of the project task, and the project task doesn't already have child project tasks. Otherwise, selecting either option displays an inline error notification instead of creating the child.

   Add child story completes only when the project task's phase type is Agile. On a project task with any other phase type, selecting **Add child story** displays an error notification instead of creating the story.

   For the full assignee and hierarchy rules, see Project task hierarchy and permissions in CWM.
5. Enter the details for the new task or story inline.
6. Press the **Enter** key or click anywhere outside the row to save the new item.

   The new child item is created with the **Project task** field set to the parent project task and the **Project** field set to that project task's project.

Result

The new CWM task or story is displayed as a child row under the project task. The child item inherits the connection to the project task's project.

Related topics

CWM integration with Project Workspace

Change or remove the project task connection for a CWM item

Project task hierarchy and permissions in CWM

Change or remove the project task connection for a CWM item

Reassign a CWM task or story to a different project task, or break the connection to a project task entirely, from the List view of the CWM Board.

Before you begin

The target project task must not have child project tasks. When a project task has child project tasks, moving a CWM item under it is blocked for all users. For details on assignee and hierarchy rules, see Project task hierarchy and permissions in CWM.

Role required: sn_cwm.cwm_user

About this task

Use one of the following approaches based on what you want to change:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To move a CWM item to a different project task, update the **Project task** column value from the List view.
- To remove the connection to a project task without moving the item elsewhere, use the un-indent option from the context menu.

The **Project task** column dropdown lists only project tasks that do not have child project tasks. Project tasks with children are excluded because they cannot accept CWM child items.

Procedure

1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. Open the Board that contains the item, and switch to the List view.
3. To move the item to a different project task, in the **Project task** column for the item, select the new project task from the dropdown.

   The item is re-parented on the Board under the new project task. The **Project** column updates automatically to reflect the new parent's project.
4. To change only the project without selecting a new project task, in the **Project** column, select a different project.

   When the project changes, the **Project task** value is cleared for the item.
5. To break the connection entirely, open the context menu for the child item and select **Un-indent item**.

   The **Project task**, **Project**, and parent fields are cleared. The item is no longer displayed under a project task on the Board.

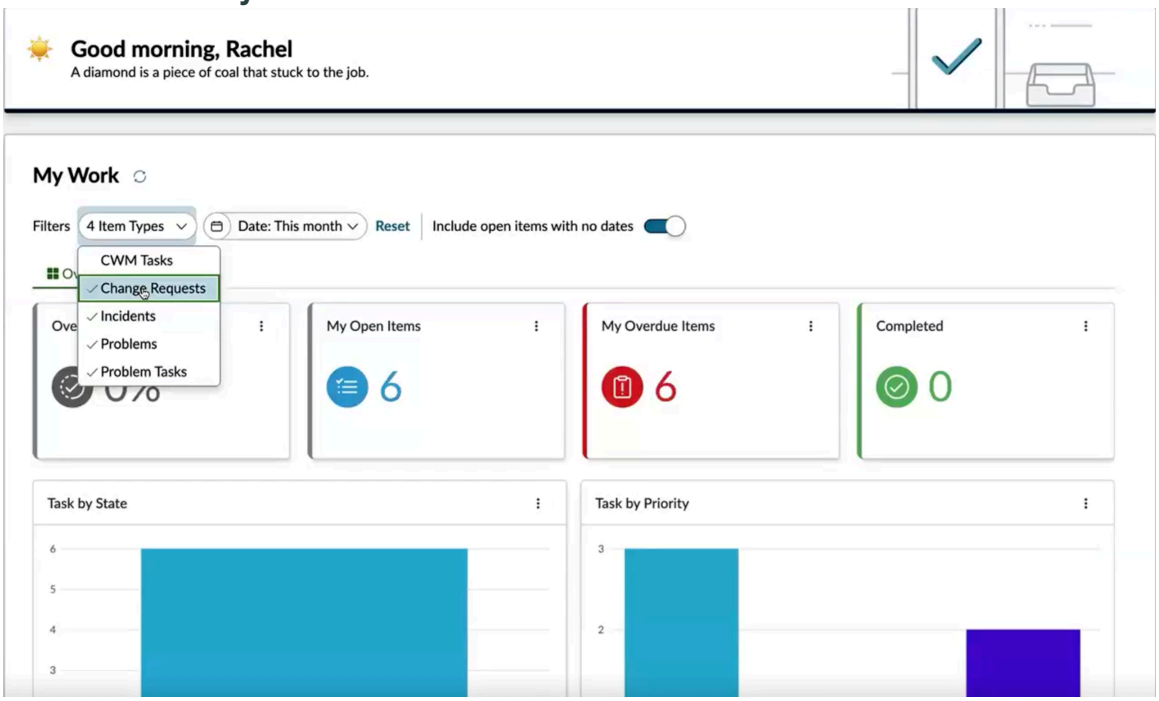
My Work in CWM

Manage your work from all ServiceNow applications from a centralized view in the Collaborative Work Management workspace.

My Work provides a centralized view of all your assigned tasks, including project tasks, problems, and incidents. It also offers visualizations that group items by state, priority, and status, such as open or overdue.

Work items from all ServiceNow applications assigned to you're displayed in My Work. If you receive a work item on the CWM Board via Connected Work, those items appear here as well. This ensures you have a single source for all assigned work without the need to switch between applications.



Project tasks from Project Workspace also appear in My Work when they are assigned to you directly or through a group. For details on the assignment paths that surface project tasks, see View project tasks assigned to you in CWM My Work.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- Any task record created in a table that doesn't extend the Task [task] table, such as VTask, won't show up in My Work.
- If you're added as **Additional assignee** to a task, work with your admin to enable the display of such tasks in My Work. See Properties installed with CWM.

Overview tab of My Work

The following are the filters available on My Work:

- Task type filter displays a list of all task types that are assigned to you currently.
- Date filter lets you select predefined or custom date ranges.
- You can choose to include open items that don't have start or end dates.

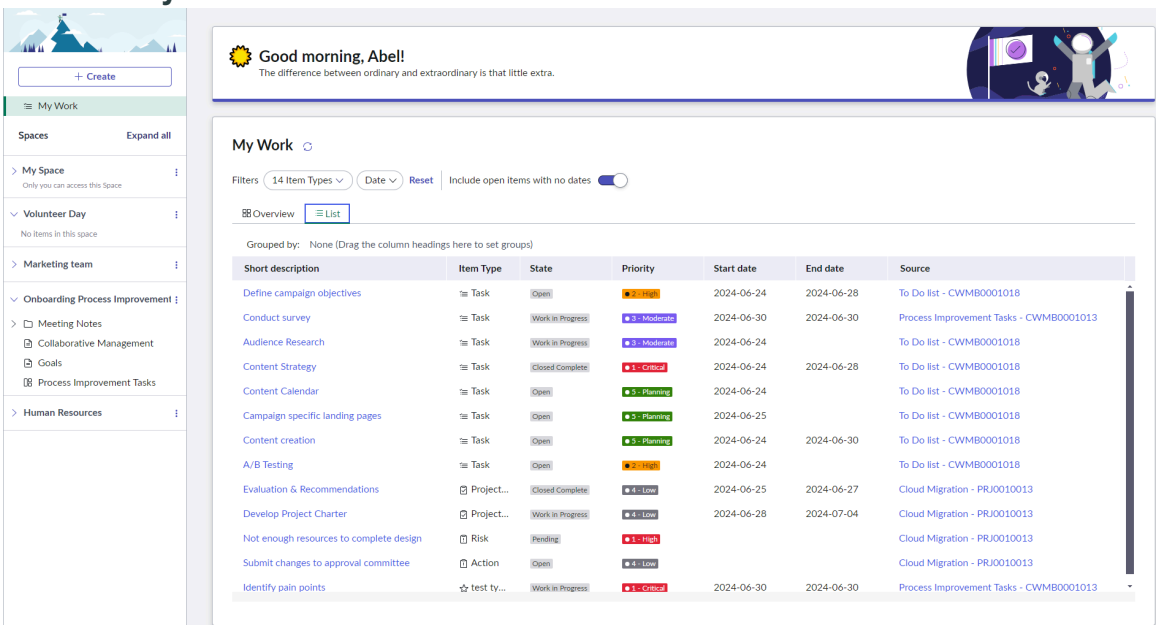
My Work page has two views, Overview and List.

- Overview tab shows multiple widgets that provide information related to the progress of your work. It also enables you to apply filters on the type of tasks that you want to view.
- List tab shows all open work items assigned to you in a list or grid format, where you can apply the group by and filter options on the columns.

  List view also provides a link back to the source of the work item. For example, if your work item is a Risk, the Source column in the List view provides a navigation to the RIDAC page of the Project Workspace application.

Overview tab of the My Work page in CWM

Widget or option	Description
Work item type filter	Choose the type of work items that you want to view in My Work. For example, if your current assignments consist of CWM tasks, Projects, and Incidents,



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Overview tab of the My Work page in CWM (continued)

Widget or option	Description
	then the Task type filter only shows these three options to select from. Also, CWM tasks of all types, including custom CWM tasks, will be grouped as **CWM Tasks** type.
Date	Filter the tasks by their start and end dates.
Include open items with no dates	Enable display of work items that have no start date, end date, or both.
Overall Progress	Percentage of work that is completed
My Open Items	Number of work items that are pending. SelectingClicking the number opens a list view of all work items assigned to you and are in the **Pending** state.
My Overdue Items	Number of work items that are overdue. Clicking the number opens a list view of all work items assigned to you that are past their due date.
Completed	Number of work items that are complete. Clicking the number opens a list view of all work items assigned to you that are in the **Closed Complete** state.
Task by State	Bar chart that groups all work items assigned to you by their current state. Clicking a bar opens a list of tasks that meet the filter criteria for the corresponding bar. For more information on how the tasks are grouped by state, see Grouping of tasks in status reports of CWM My Work.
Task by Priority	Bar chart that groups all work items assigned to you by their priority. Clicking a bar opens a list of tasks that meet the filter criteria for the corresponding bar. For more information on how the tasks are grouped by priority, see Grouping of tasks in status reports of CWM My Work.

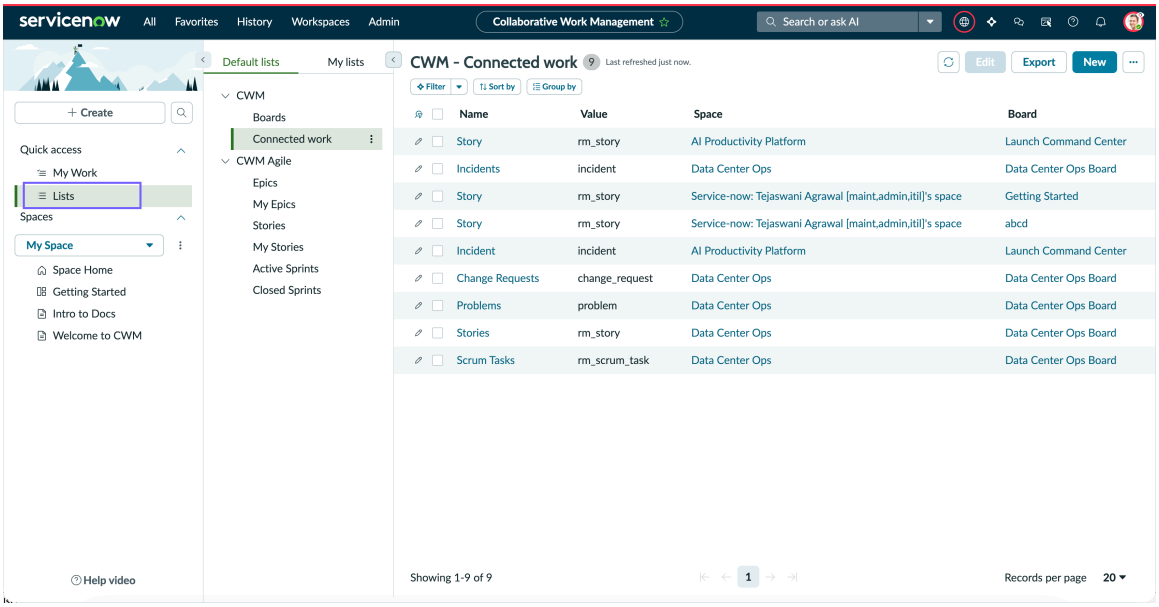
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

List tab of My Work

The List view shows all open work items assigned to you. Select the **Short description** of a work item to view its details in a modal pop-up. Select the **Source** of a work item to open the work item in a new tab.

Note:

- The list view displays all the tasks with start or end dates that fall within the range of the date filter.
- Any closed task that doesn't have dates populated isn’t shown in My Work.
- You can't perform bulk editing of state, priority, or date values of the tasks through My Work.



Manage lists in Collaborative Work Management

Access predefined lists and your own custom lists of records from any table, without leaving Collaborative Work Management (CWM).

Lists in CWM

Lists is available under the Quick access section in the CWM left navigation, alongside **My Work**. Open predefined lists or build and save custom lists without navigating to **All** each time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Key benefits

Lists provide the following benefits:

- Access predefined lists of frequently needed Agile and Connected Work records, organized by category.
- Build a custom list from any table, such as the Incident table, with the columns and conditions that matter to your team.
- Save custom lists for quick access instead of rebuilding the same filter each time.

How it works

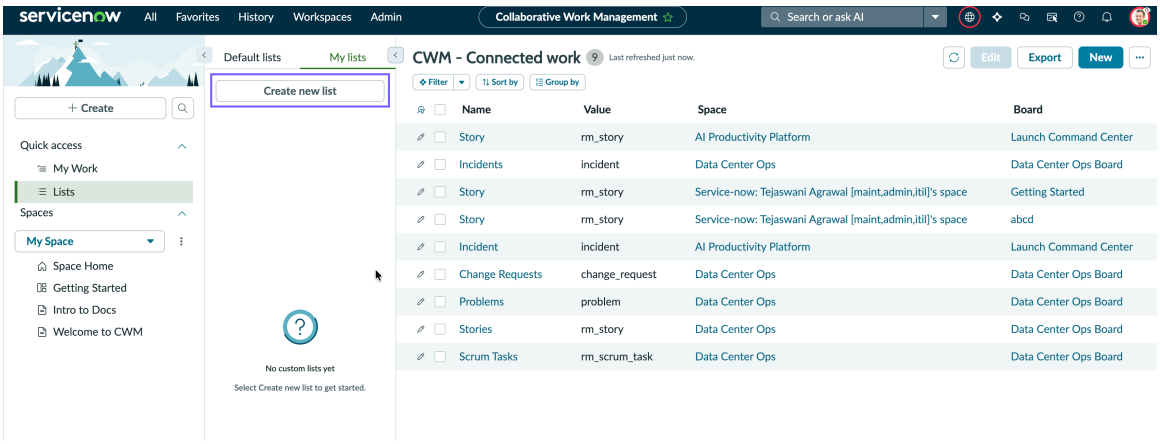
Tip: Open the Lists panel using the keyboard shortcut **Alt+L**.

The Lists panel has two tabs:

- **Default lists** shows predefined lists organized into categories. It is further divided into the CWM and CWM Agile categories.
  - CWM includes Boards and Connected work.
  - CWM Agile includes Epics, My Epics, Stories, My Stories, Active Sprints, and Closed Sprints lists.
- **My lists** shows the custom lists that you create. This tab is empty until you create your first custom list. For more information, see Create a custom list in My lists.

Selecting any list, predefined or custom, opens its records in the main list view. From there, you can filter, sort, and group the records. Selecting the name of a record opens it in a new tab. You can also create records and edit them using the lists. Share the link for a list with users who have the appropriate permissions to view it.

Create a custom list in My lists



Create a custom list of records from any table in your ServiceNow AI Platform instance to access a saved, filtered view of records from the Lists panel in Collaborative Work Management (CWM).

Before you begin
Role required: sn_cwm.cwm_user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. Select **Lists** under from the Quick access section of the navigation panel.
3. Select the **My lists** tab.
4. Select **Create new list**.

5. Create a version of an existing list or define a new list.

Goal	Action
Create a version of an existing list	**a.** Select a list from the list. **b.** Edit the name of the list. **c.** Select the columns to display in the list. **d.** Add filter conditions that determine which records appear in the list.
Define a new list	**a.** Enter a name for the list. **b.** Select the source table for the list. Select any table available in your instance, such as the Incident [incident] table. Columns are selected based on the source table. **c.** Add or remove the columns to display in the list. **d.** Add filter conditions that determine which records appear in the list.

6. Select **Create**.

Result

The list appears under the **My lists** tab for quick access. You can return to this list at any time without reapplying the columns or conditions.

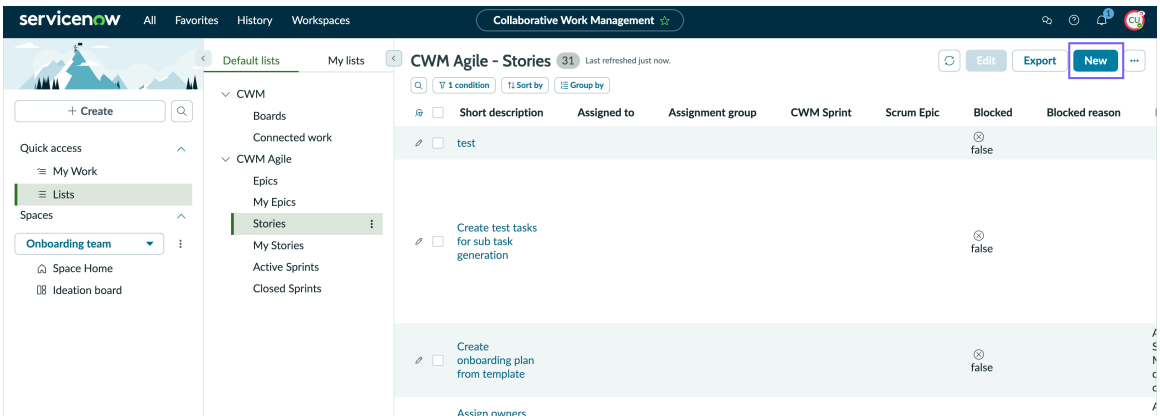
What to do next

After creating a custom list, you can:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Add a record to the custom list. The record is added to the source table directly from the list view. For more information, see Add a record to a list
- Edit a record from the custom list to update record details without leaving the list view. For more information, see Edit a record from a list in CWM.
- Export a list to download or share the list records in Excel, CSV, JSON, or PDF format. For more information, see Export a list in CWM.

Add a record to a list in CWM



Use CWM Lists to add a record to the source table of a predefined or custom list, without leaving the CWM workspace.

Before you begin

Role required: sn_cwm.cwm_user

Procedure

1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. Select **Lists** under **Quick access**.
3. Select a list from **My lists** or **Default lists**.
4. Select **New**.

The record form for the list's source table opens in a new browser tab.

5. Complete the record form.
6. Select **Submit**.

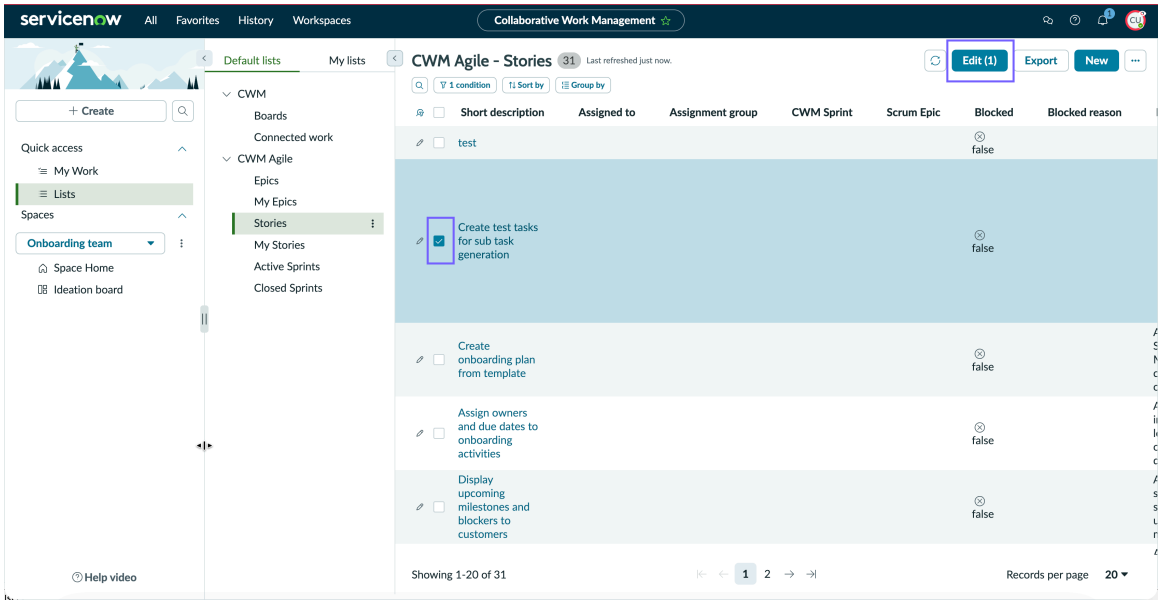
Result

The record is created and appears in the respective list in CWM.

Edit a record from a list in CWM

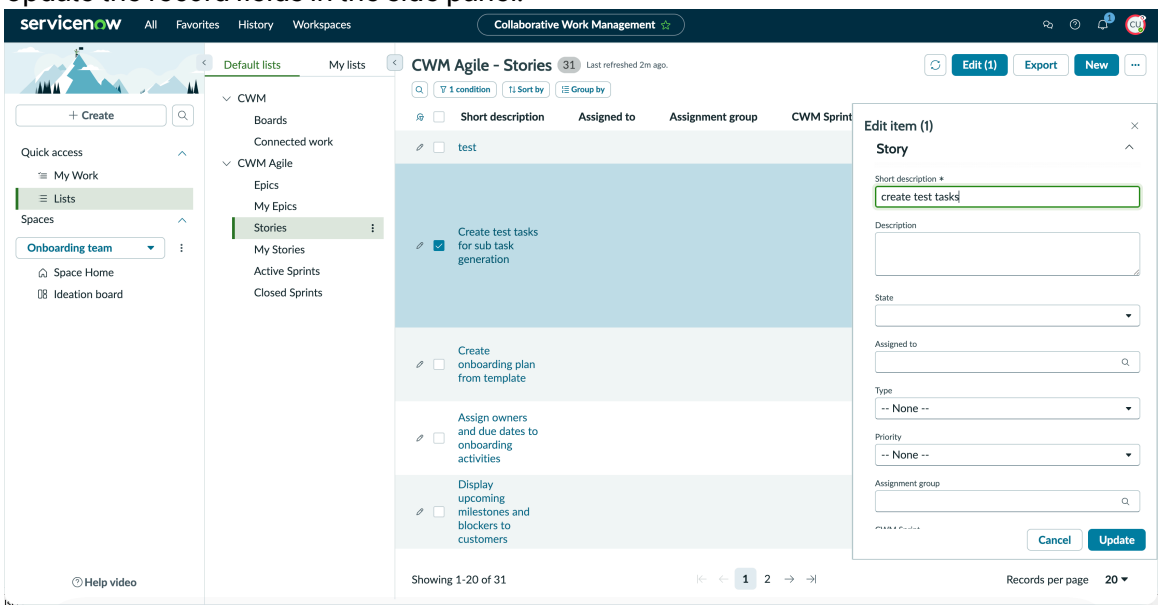
Edit a record in a default or custom list without leaving the list view in CWM.

Before you begin



Role required: sn_cwm.cwm_user

Procedure



1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. Select **Lists** under **Quick access**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select a list from **My lists** or **Default lists**.
4. Select the check box next to the record.
5. Select **Edit**.

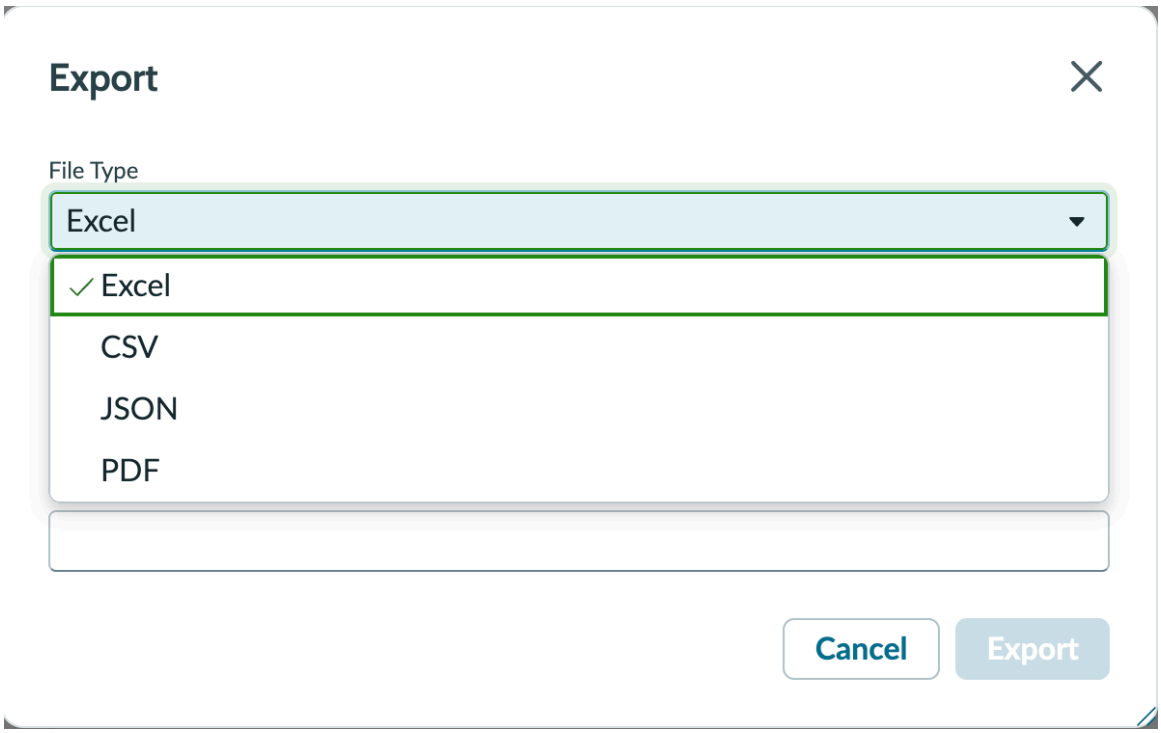
6. Update the record fields in the side panel.

7. Select **Update**.

Result
The record is updated in the list.

Export a list in CWM

Export the records in a default or custom list in Collaborative Work Management to Excel, CSV, JSON, or PDF, either as a direct download or delivered by email.



Before you begin
Role required: sn_cwm.cwm_user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. Select **Lists** under **Quick access**.
3. Select the **My lists** or **Default lists** tab.
4. Open the list that you want to export.
5. Select **Export**.
6. In the **Export** dialog, select a **File Type**.

   You can export to Excel, CSV, JSON, or PDF.

7. If you're exporting a PDF, select an orientation such as **Landscape**.
8. If you're exporting an accessible PDF, select the **Accessible PDF** check box.
9. Under **Delivery Type**, select **Download** or **Email**.
10. If you select **Email**, enter an email address in the **Email** field.
11. Select **Export**.

Result

Depending on the delivery type you selected, the file downloads directly on your system or is sent to the email address you entered.

Managing SPM work in Collaborative Work Management

Team members can view and update project tasks and demand tasks directly in Collaborative Work Management (CWM) using team member roles, without requiring access to Project Workspace or Next Experience for Demand Management.

Collaborative Work Management application provides roles that give team members access to project tasks and demand tasks within CWM. Using these roles, team members can manage their assigned work through CWM features such as My Work and Connected Work. They can also submit time cards against the project tasks and demand tasks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Team member roles

The following roles are available for team members:

Team member read [sn_stm.team_member_read]

Allows users to view project tasks and demand tasks, and leave comments on them.

Team member read-write [sn_stm.team_member_read_write]

Allows users to view and edit project tasks and demand tasks.

For the full list of access permissions for each role, see Team member role access permissions in CWM.

Note: Assigning one of these team member roles automatically grants the CWM user role [sn_cwm.cwm_user] and Time card user role [timecard_user].

Accessing project and demand tasks in CWM

After a team member role is assigned, users can view and manage project and demand tasks in CWM through the following features:

- **My Work**: View all project and demand tasks assigned to you in one place. For more information, see My Work in CWM.
- **Connected Work**: Pull project and demand tasks into CWM Boards using flexible filters, such as tasks assigned to you, your assignment group, or other criteria. You can edit and update tasks directly from the board.

  For more information, see Connected work in CWM

By default, team member roles provide broad access to the tasks assigned to them. Administrators can configure additional ACLs to restrict access to specific tasks.

Accessing My Calendar

Users assigned these team member roles can access My Calendar and perform the following actions:

- View My calendar
- Edit My calendar
- Create Events on calendar
- Delete their own events

Note: Users can see only events that they created.

Considerations

The following limitations apply to team member roles in this release:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Team member roles don't grant access to Project Workspace or Next Experience for Demand Management.
- The SPM applications such as Project Workspace and Next Experience for Demand Management must be present in your ServiceNow AI Platform instance for team members to be able to access those work items from CWM.
- The Timecard Management application must be installed to for team members to create timecards against their project tasks or demand tasks.

Managing SPM work in Collaborative Work Management

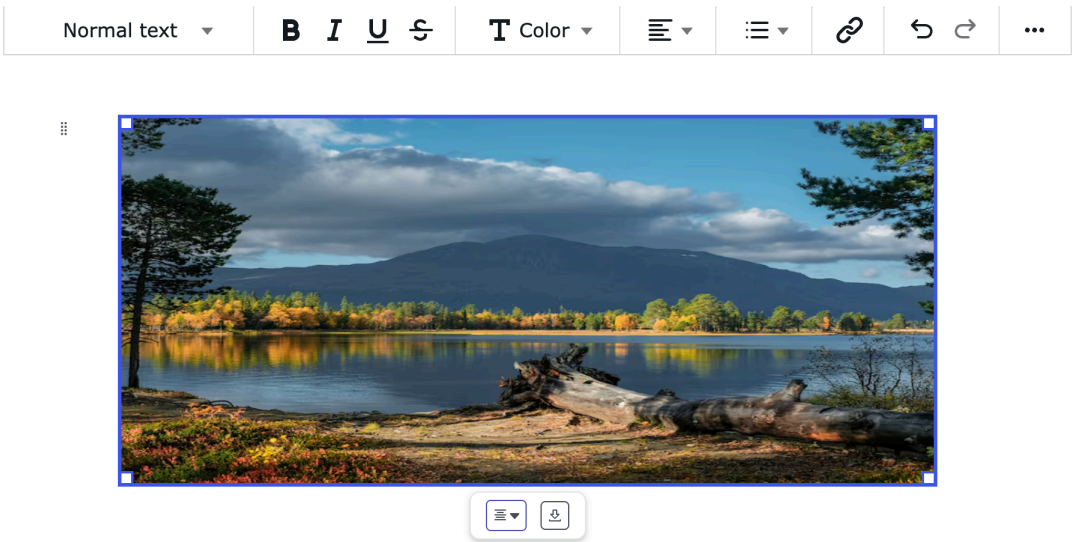
Collaborative documentation using CWM

Manage all kinds of documentation for work such as meeting notes, project requirements, or technical specifications using rich text Docs with real-time collaboration.

Docs can be created within a Space, and organized into folders. Within a Space, you can create multiple Docs and within each Doc, you can create unlimited pages to help you effectively organize your information.

Key features of Docs

- Auto-save content.
- Live user presence: See who is viewing or editing the document in real time.
- Inline comments: Leave comments on text in a document. Supported text types include plain text, hyperlinks, dynamic data, and text inside table cells.
- Comment notifications: Get notified via email when someone @-mentions you in a comment or when a reply is added to a comment you created in a document.
- Templates: Create and apply document templates.
- Rich text formatting: Headings, lists, alignment, and other paragraph styles.
- Block-level editing: Move text blocks to change placement.
- Cross-references: Add references to other ServiceNow AI Platform tables to connect work across teams.
- Slash command (**/**) for more options:
  - Insert tables quickly
  - Mention a record. See Dynamic data linking.
  - Insert a list.
  - Choose formatting options.
- Copy and paste within Docs: Transfer text, images, lists, and tables between Docs pages. Comments on text are retained when you copy or cut and paste within the same document but aren't carried over when pasting into a different document.
- Table features:



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Resize column width
- Add color to single or multiple cells
- Select multiple cells using mouse or **Shift + arrow** keys
- Delete content from multiple cells using **Backspace** or **Delete** keys.
- Copy and paste cell content:
  - Copy from one cell and paste into multiple cells.
  - Copy from multiple cells and paste into another set of cells.
  - Copy multiple cells and paste as a new table in an empty block.

Images in Docs

Insert images into your Docs by uploading a file from your device or adding a web URL. Note that inserting Google Images links might not work.

Save images from your CWM documents directly to your device, making it easier to share or use them outside of the Docs environment. Click an image to access the download icon (), then click the icon to save it to your device. Alternatively, right-click the image and use your browser's built-in save option.

Inline comments

Add comments to specific text in documents to collaborate with other users, provide feedback, or track discussions without modifying the document content.

Visual indication

Commented text displays with a yellow highlight and underline. Selecting the text darkens the highlight and opens a comment popover showing the comment thread. The popover closes when you click outside of it.

Add a comment

Select text and select the Add comments icon from the inline toolbar. You can include hyperlinks by typing or pasting URLs directly into your comment. These links are automatically converted to a clickable format when you post the comment.

Mention users

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Type @ followed by a name to mention someone in your comment. Select the user from the lookup that appears. Only users can be mentioned in a comment. Mentions are highlighted in the posted comment, and the mentioned users are notified by email.

Edit your comments

If you're the owner of the comment, you can modify your comment text. Edited comments display an **Edited** indicator to show they have been updated.

Comments on dynamic data

Add comments to dynamic data elements, such as references, links, and blocks of text that contain dynamic data. Click once to open the comment popover and click again to navigate to the referenced content.

Comment restrictions

Overlapping comments on the same text are not supported—reply to existing threads instead. Comments cannot be added to non-text elements such as images and table cells, empty table cells, or selections that include multiple table cells.

Show or hide highlights

Turn comment highlights on or off using the **Hide comment highlights** option in the three-dot menu. Switch between a marked-up view and a clean reading view.

Export or duplication behavior

Comments and highlights are excluded when you export a document to PDF or duplicate it.

Read-only access

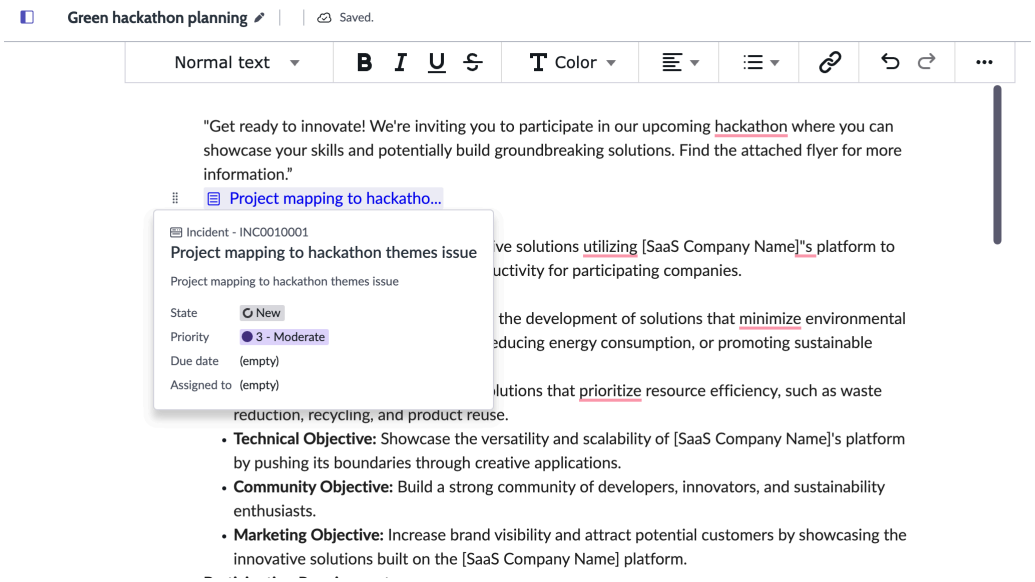
You can add and manage comments on a document if you have read-only access to the document.

Email notifications

Users are notified via email about the following comment activity on a document they are associated with.

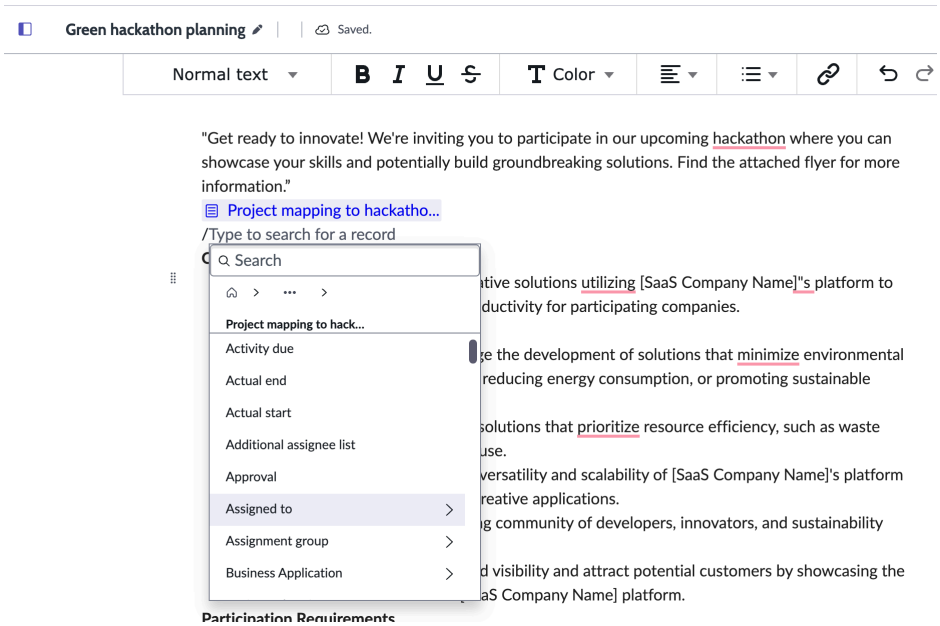
- When a reply is added to your comment by another user.
- When a user is @-mentioned in a comment. Each mentioned user receives a separate notification. If you edit a comment to add @mention, only the newly mentioned user is notified.

The notification includes up to 140 characters of the comment text and include the document name, workspace name, and the document path in the workspace hierarchy. Each notification includes a **View** button, selecting which takes you to the respective comment in the document.



Dynamic data linking in Docs

Keep record information in your documentation current and reduce manual effort with the Dynamic data linking feature in Docs. You can now reference any ServiceNow application record and Docs will automatically reflect the latest updates from those records.



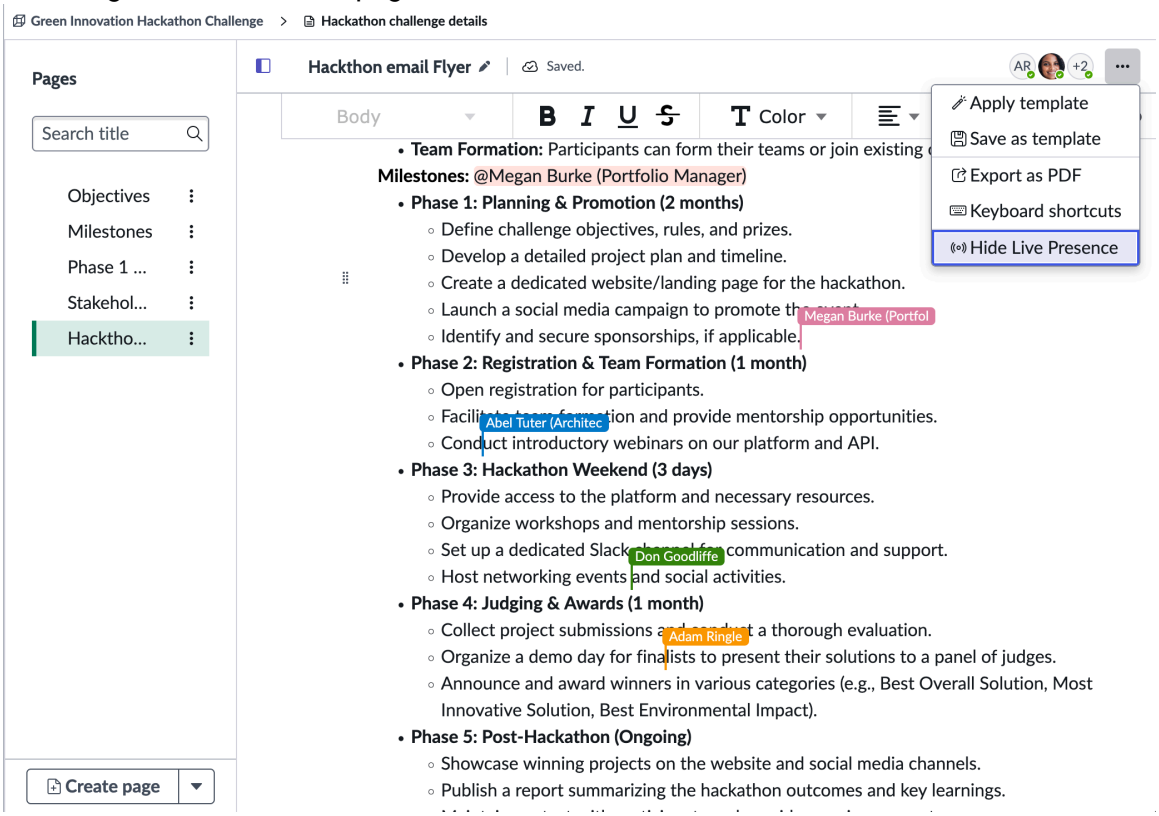
For example, if you add a reference to an Incident record, the reference shows the latest field information of the incident in Docs without requiring manual edits. Selecting the incident reference opens up the incident form so that you can view the full details of the incident and make any necessary changes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A hover popover displays the details of the mentioned record, providing quick access to additional information without leaving the current context. Dynamic data without a comment opens on the first click. Keyboard navigation is supported.

Dynamic linking also enables adding references to a particular field of a record, such as Assigned to of an Incident record.

You can add references from any ServiceNow table you have access to, with no setup or configuration needed.



This feature reduces the need to switch between multiple ServiceNow applications within your instance. It maintains a single, reliable source of truth for collaborative work, keeping teams aligned and informed.

Real-time collaboration within CWM Docs

With the feature of real-time collaboration, edit a Doc page concurrently with multiple other editors. Colored cursors denote the current location of each editor on the page. You can choose

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

to show or hide these live presence indicators based on your preference while working on or reviewing the content of the page.

Note: Application performance may degrade with a large number of concurrent editors.

Draft content using ServiceNow Otto for CWM

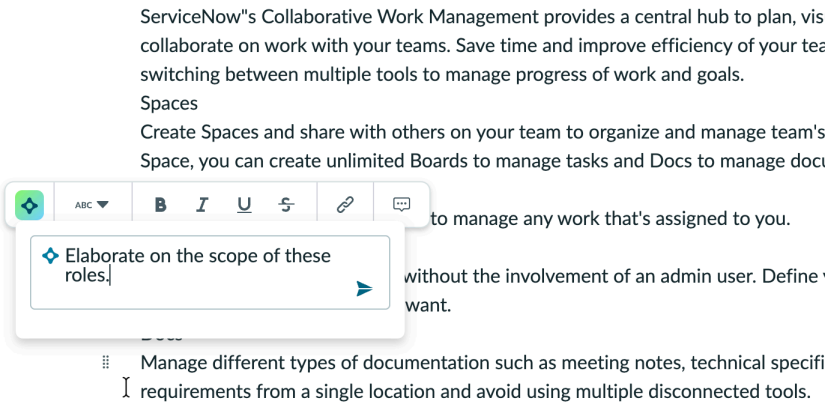
Generate content with ServiceNow Otto for CWM directly in your Docs using custom prompts. In addition, summarize existing sections, elaborate where needed, and refine drafts to help improve your productivity.

You can interact with ServiceNow Otto directly in your Doc to create content, add context, or improve existing sections. This helps you draft faster, refine ideas, and keep your work relevant without leaving the page.

Work with the content of the whole page

Some examples are:

- For Marketing teams: **Create a compelling product launch announcement highlighting the key benefits and emotional appeal for our target audience.**
- For Legal teams: **Write a plain-language summary of the privacy policy in this doc, that customers can easily understand.**
- For product teams: **Analyze the customer feedback comments in this Doc, group into top 5 themes, and suggest top 3 enhancements for highest impact.**

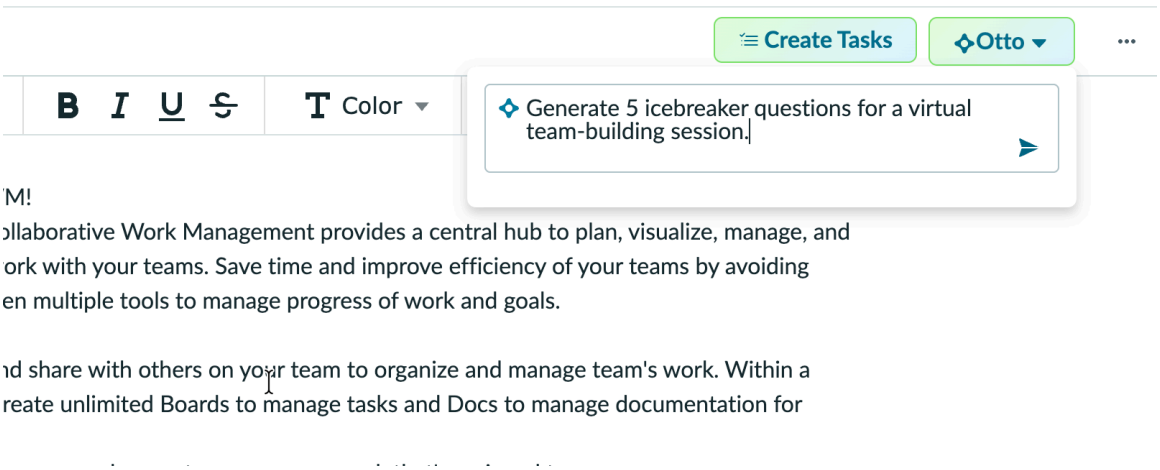


ServiceNow Otto uses the context from your Doc page to generate a response.

Refine, elaborate, or improve the existing content within the page

Some examples are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

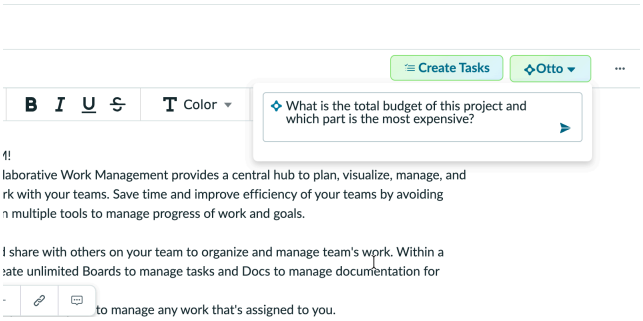


- If you have a list of stakeholders, you can ask **Elaborate on the scope of these roles.**
- **Rewrite this in a casual tone.**

Take assistance on a empty page

Some examples are:

1. **Generate 5 icebreaker questions for a virtual team-building session.**
2. **Write a 3-paragraph blog post explaining why [industry trend] is changing how businesses operate.**
3. **Generate an outline for the Instagram campaign tasks for a Hackathon initiative.**



Answer questions in the context of this Doc

Ask questions to find anything in the page's context. This works whether content is added manually or generated using AI.

For example, in a project charter document, you can ask **What is the total budget of this project and which part is the most expensive?**

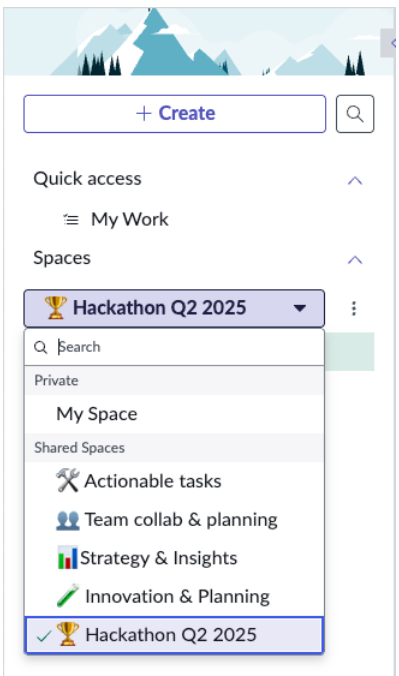
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Generate tasks from Docs and add them to Board using ServiceNow Otto for CWM

Use the generative AI capabilities of ServiceNow Otto to create tasks from the context of your Docs. From the Doc header, select **Create Tasks** and ServiceNow Otto generates task recommendations for you and walks you through to add them to the required Board in CWM workspace.

Create a Doc in CWM

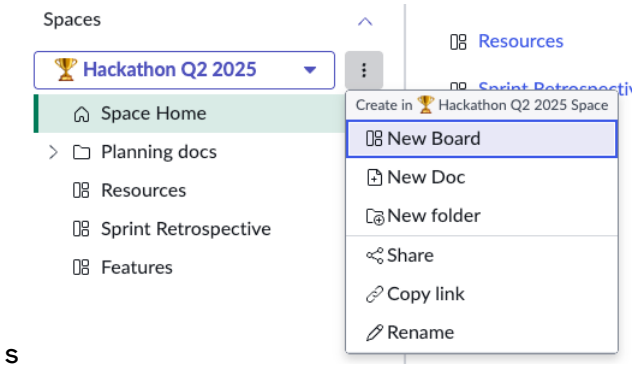
Store information related to your tasks, reference users and task records, and collaborate in real-time using Docs in Collaborative Work Management workspace.



Before you begin

Create a Space in CWM.

Role required: sn_cwm.cwm_user



Procedure

1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. Open a Space that you want to create a document in.
3. From the Spaces menu, open a Space that you want to add a Board to.

4. From the More options menu of the Space ( ), select **New Doc**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

s

5. In the **Doc name** field, enter the name for the document.
   For example, **Meeting notes**.
6. Select **Create**.

Result

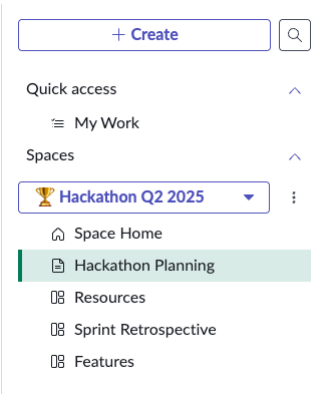
A new Doc is created for the current Space, and an untitled page is opened for you to start drafting your content.

What to do next

Use the rich-text formatting options of the Doc to draft information relevant for your team or type **/** to explore other options.

Manage pages and subpages in CWM Docs

Flexibly organize information for your teams and work items by creating, duplicating, and deleting pages and subpages within a Doc in Collaborative Work Management (CWM) workspace.

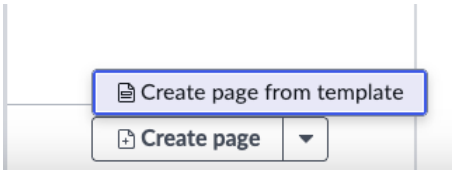


Before you begin

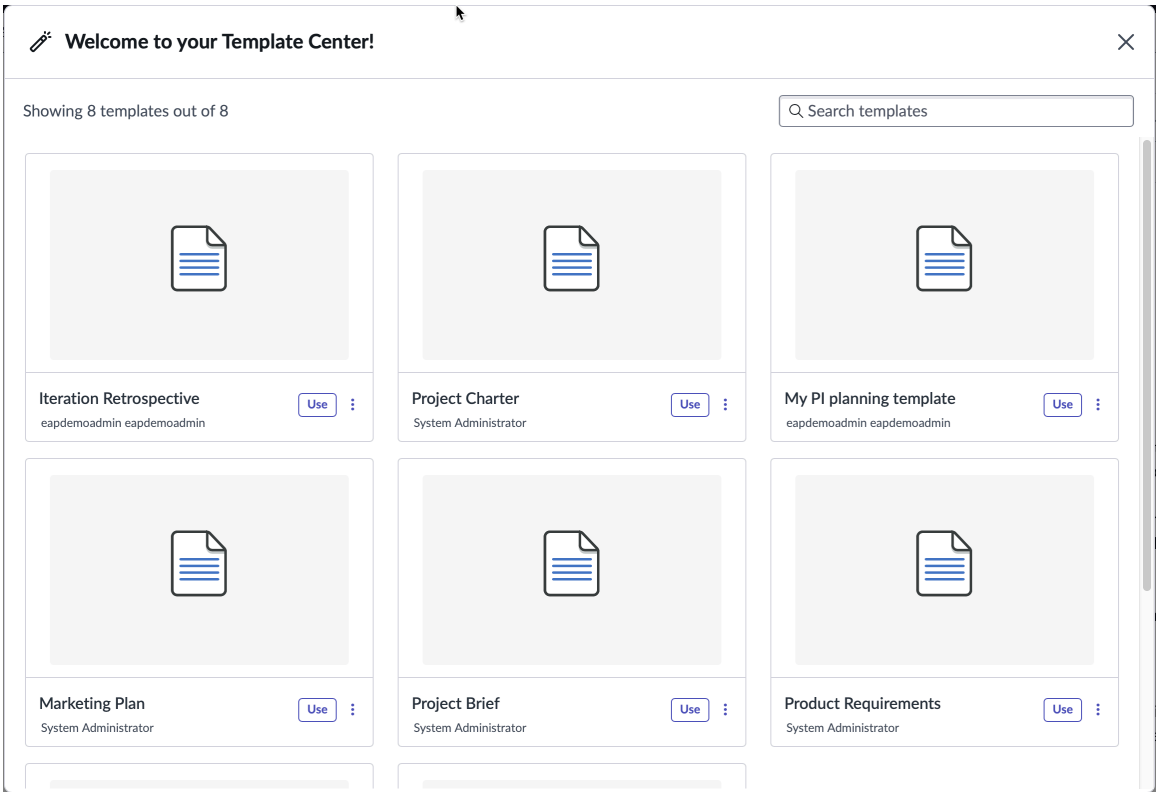
Create a Doc in CWM

Role required: sn_cwm.cwm_user

Procedure



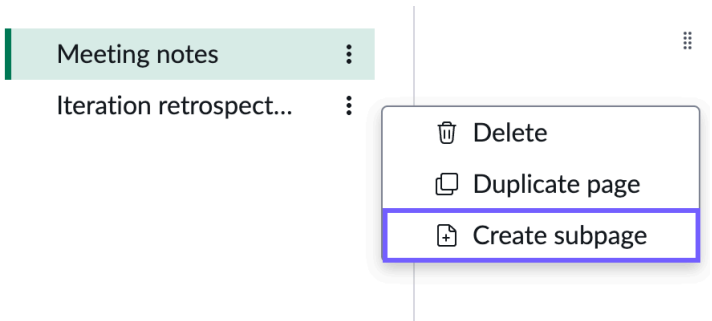
1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. From the Spaces menu, navigate to the Space where your Doc is located and open it.



3. To create a page, you can create a blank page or start with a predefined template.
   - For a blank page, select **Create page**.
   - To create from templates:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select **Create Page from template**.



b. From a template card that you want to use, select **Use**.

The new page is created and added to your Doc.

4. To create a subpage, select the **Page Actions** menu (⋮) and select **Create Subpage**.

5. To delete a page or a subpage, select the **Page Actions** menu (⋮) and select **Delete**.

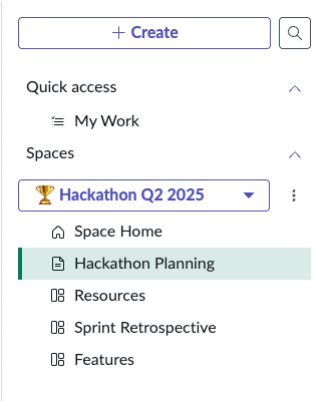
Only a user with Editor or Owner access to the Space can delete Doc pages. If there's only one page left in the Doc, it can't be deleted by any user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Refine content of a Doc page in Collaborative Work Management (CWM)

Gain insights into the page content by summarizing it or improve content quality by refining it in CWM Docs.

Before you begin

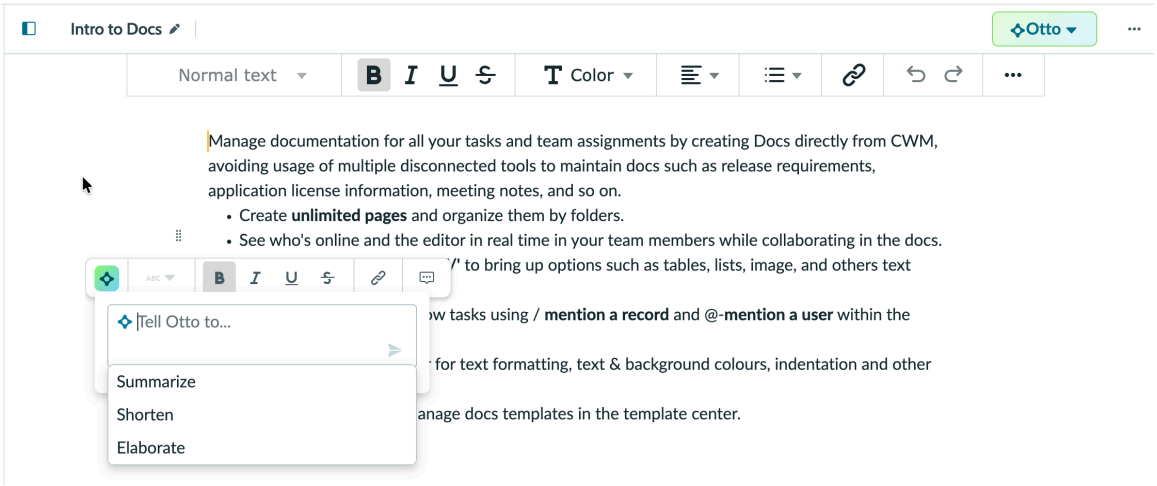


Create a Doc in CWM.

Important: This generative AI skill is turned on by default. The skill will be automatically available to appropriate role users for the application. For more information, see AI agents, skills, and agentic workflows on by default.

Role required: sn_cwm_ai.cwm_ai_user

Procedure



1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. From the Spaces menu, navigate to the Space where your Doc is located and open it.

3. From your Doc, open the page you want to summarize or refine.
4. Choose to summarize the selected text on the page or the whole page.
   - To refine the selected text:
     a. Select a single block or multiple blocks of content on the page.
     b. Select **ServiceNow Otto** and choose an option.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Summarize** to summarize the selected text.
- **Elaborate** to lengthen the selected text based on the existing context.
- **Shorten** to make the selected text concise.

Tip: If there's more content to summarize, you can remove some text and retry.

ServiceNow Otto analyzes the text and generates an output in a separate pop-up.

5. **Optional:** Based on the output generated, you can further refine the result.
6. **Optional:** Copy the generated output by selecting the copy to clipboard icon ( ) to use it for purposes such as sending an email, saving to notes, and others.

Important: Because the output is AI-generated, review it to ensure accuracy.

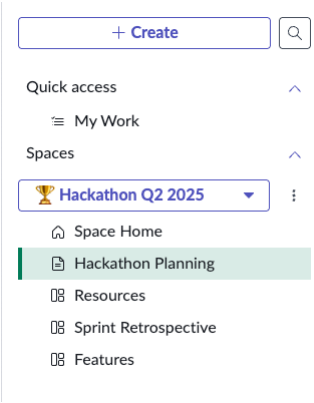
Generate and improve Docs content with ServiceNow Otto (CWM)

Use ServiceNow Otto within your Docs to generate new content, summarize or expand sections, and refine drafts. Avoid starting Docs from scratch, save time, and keep your content relevant.

Before you begin

Important: This generative AI skill is turned on by default. The skill will be automatically available to appropriate role users for the application. For more information, see AI agents, skills, and agentic workflows on by default.

Role required: sn_cwm_ai.cwm_ai_user

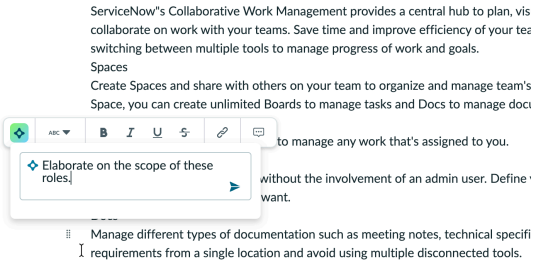


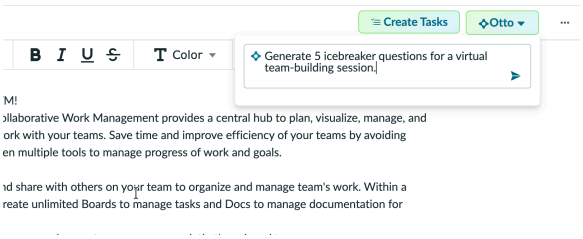
About this task

You can interact with ServiceNow Otto directly in your Doc to create content, add context, or improve existing sections. This helps you draft faster, refine ideas, and keep your work relevant without leaving the page.

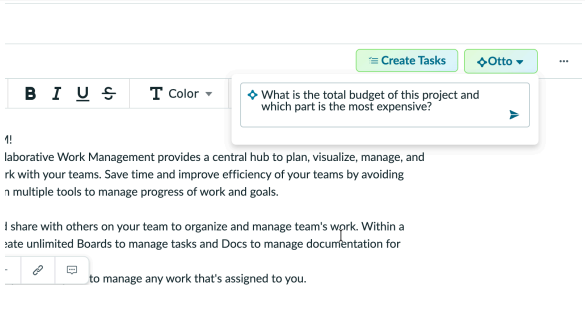
Procedure

1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. From the Spaces menu, navigate to the Space where your Doc is located and open it.





© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. From your Doc, open the page you want to work with and use ServiceNow Otto for any of your use cases.

Choice	Steps
Work with content of the whole page	**a.** From the page header, select **ServiceNow Otto**. **b.** In the text box, enter your prompt. Some examples are: ▪ For Marketing teams: **Create a compelling product launch announcement highlighting the key benefits and emotional appeal for our target audience.** ▪ For Legal teams: **Write a plain-language summary of the privacy policy in this doc, that customers can easily understand.** ▪ For product teams: **Analyze the customer feedback comments in this Doc, group into top 5 themes, and suggest top 3 enhancements for highest impact.** **Note:** ServiceNow Otto uses the context from your Doc page to generate a response.
Refine, elaborate, or improve the existing content within the page	**a.** Select the content blocks that you'd like to work on. **b.** Select the ServiceNow Otto icon . **c.** In the box, enter your prompt. Some examples are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Choice	Steps
	▪ If you have a list of stakeholders, you can ask **Elaborate on the scope of these roles.** ▪ **Rewrite this in a casual tone.** 
Take assistance on a blank page	**a.** From the page header, select **ServiceNow Otto**. **b.** Enter a prompt with context for ServiceNow Otto to create your first draft. Some examples are: **i. Generate 5 icebreaker questions for a virtual team-building session.** **ii. Write a 3-paragraph blog post explain ing why [industry trend] is changing how businesses operate.** **iii. Generate an outline for the Instagram campaign tasks for a Hackathon initia tive.** 
Answer questions in the context of this Doc	Whether the content in the Doc is added man ually or generated using ServiceNow Otto, you can ask questions to find anything in the page's context. For example, if you have a project charter doc ument, you can try asking **What is the total budget of this project and which part is the most expensive?**

© 2026 ServiceNow, Inc. All rights reserved.

Choice	Steps
	

ServiceNow Otto analyzes the text and generates an output in a separate pop-up.

4. **Optional:** Based on the output generated, you can further refine the result.
5. **Optional:** Copy the generated output by selecting the copy to clipboard icon ( ) to use it for purposes such as sending an email, saving to notes, and others.

Important: Because the output is AI-generated, review it to ensure accuracy.

Add comments to Docs

Add a comment to specific text in a Doc to share feedback or start a discussion without modifying the Doc content.

Before you begin

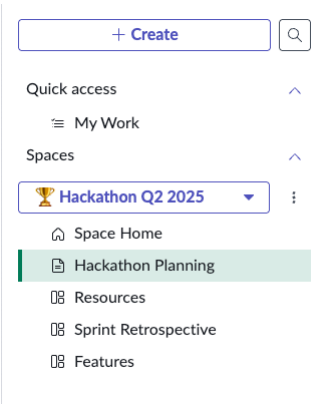
Create a Doc in CWM.

Role required: sn_cwm.cwm_user

About this task

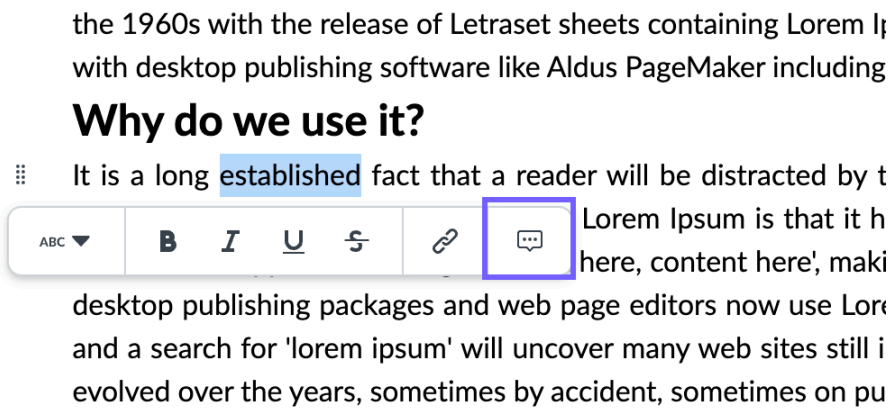
https://service-now.portal.trainn.co/share/slc5EX9LJzcwauoECwtmvQ/embed?autoplay=false

You can add comments to plain text, hyperlinks, dynamic data, and text inside table cells. Comments are not supported on images, empty table cells, or selections that include multiple table cells. You can mention users using @ in comments and add text and hyperlinks. You can't mention a table or an image in comments.



Overlapping comments on the same text aren't supported. To add to an existing discussion on already-commented text, reply to the existing thread instead. For more information, see Manage comments in Docs.

Note: Users can add and manage comments if they have read-only access to a document.

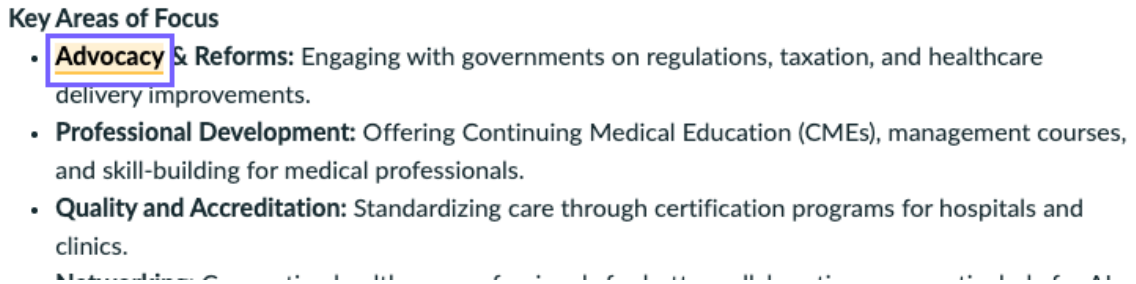


Procedure

1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. From the Spaces menu, navigate to the Space where your Doc is located and open it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select the text you want to comment on.
4. Select the Add comments icon from the inline toolbar.



5. In the comment popover, provide your comment.

6. Select **Post**.

Result
The selected text is highlighted with a yellow underline, indicating that a comment has been added. Email notifications are sent to users who are @-mentioned in the comment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Key Areas of Focus

- **Advocacy & Reforms:** Engaging with governments on regulations, taxation, and healthcare delivery improvements.
- **Professional Development:** Offering Continuing Medical Education (CMEs), management courses, and skill-building for medical professionals.
- **Quality and Accreditation:** Standardizing care through certification programs for hospitals and clinics.

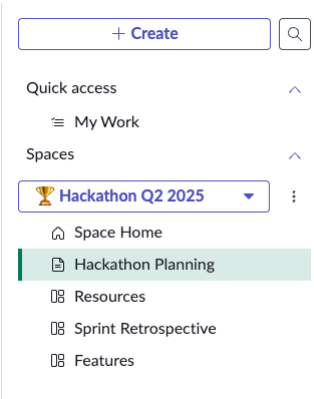
Manage comments in Docs

Edit, reply to, or delete comments in Docs to maintain relevant discussions and keep your documentation organized.

Before you begin

Add comments to Docs.

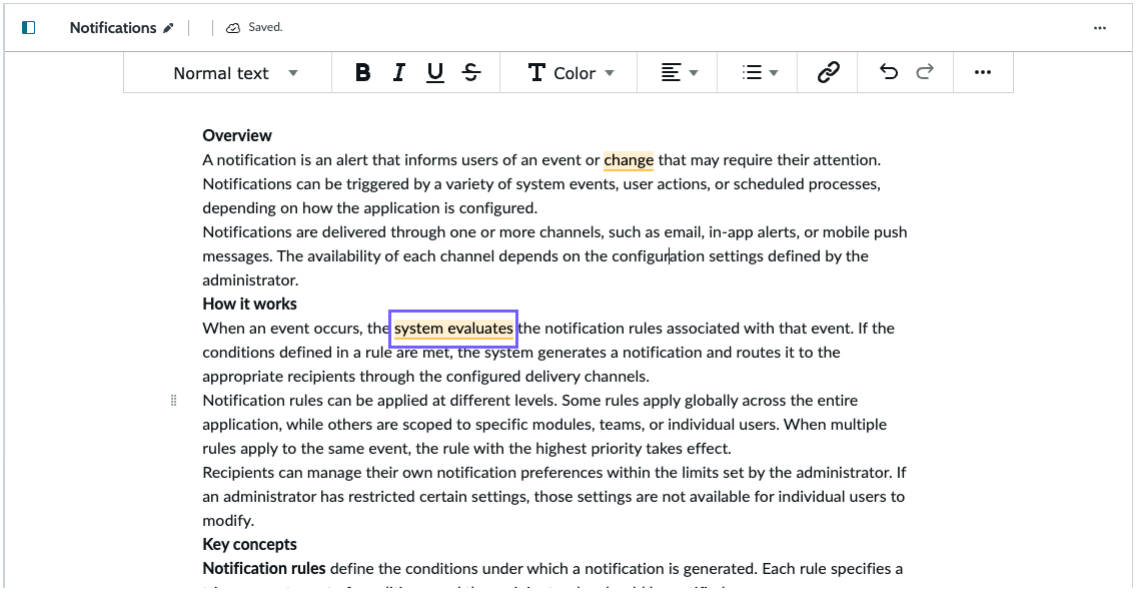
Role required: sn_cwm.cwm_user



About this task

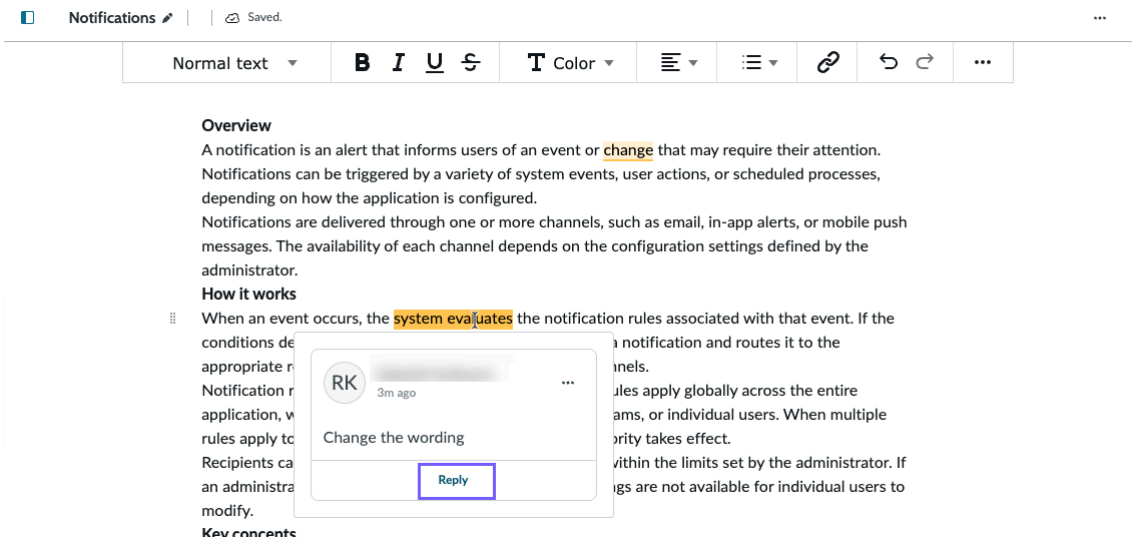
You can manage existing comments in Docs by editing your own comments, replying to comments from other users, or deleting comments when they are no longer needed.

Note: Users can manage comments, if they have read-only access to a doc.



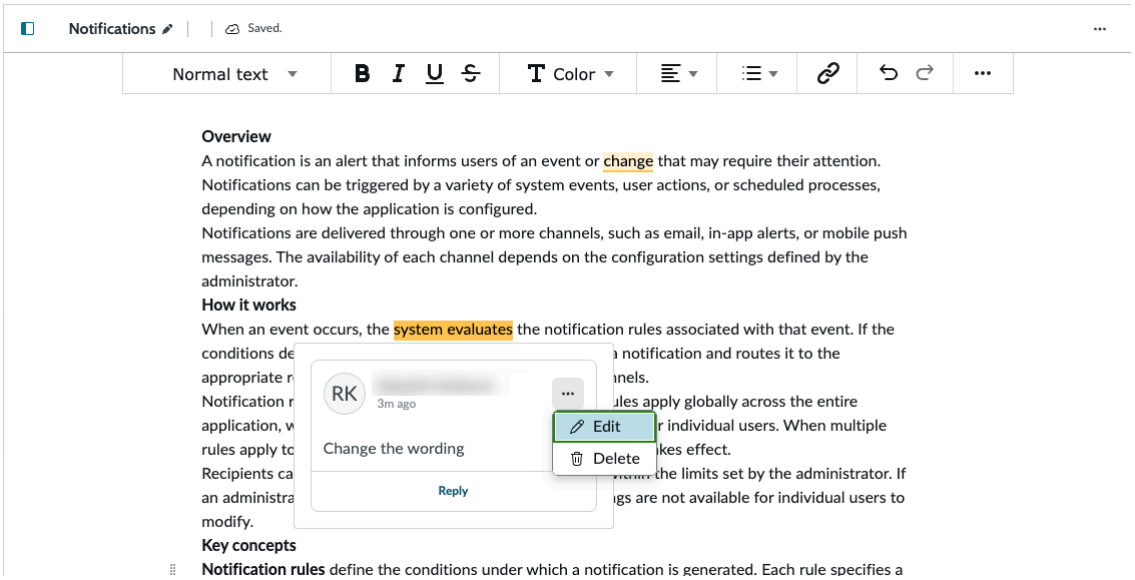
Procedure

1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. From the Spaces menu, navigate to the Space where your Doc is located and open it.



3. Locate the commented text, which appears with a yellow underline.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note: If a part of a hyperlink is selected for a comment, only that part is highlighted.

4. Click the commented text to open the comment thread.
   The comment popover displays all comments for the selected text.
5. To reply to a comment, select **Reply**.

   a. Enter your response in the comment field at the bottom of the thread.
   b. Select **Post**.
6. To edit a comment, select the More actions icon ··· on the comment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: You can only edit comments that you created.

a. Select **Edit**.

b. Edit your comment.

c. Select **Done**.

7. To delete a comment, select the More actions icon ··· on the comment.

   a. Select Delete

8. To delete a comment thread, select the More actions icon ··· of the parent comment.

   a. Select **Delete thread**.

   b. Select **Delete** in the confirmation dialog.

Note:

- You can only delete comments that you created.
- Deleting a parent comment removes it and all its replies from the comment thread. You can undo a parent comment deletion to restore the comment thread.
- If the text that had the comment is deleted, the comments are deleted. If text that has comments is replaced by AI-generated text, the comments are deleted.
- Copying content with comments to a new location does not duplicate the comments.

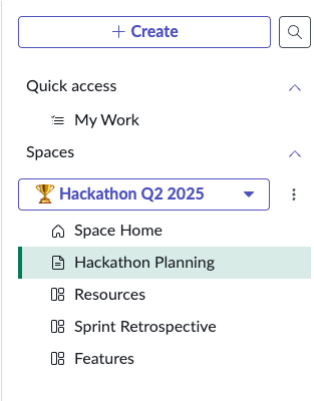
Hide or show comment highlights in Docs

Toggle comment highlight visibility in Docs to switch between a clean reading view and a markup view.

Before you begin

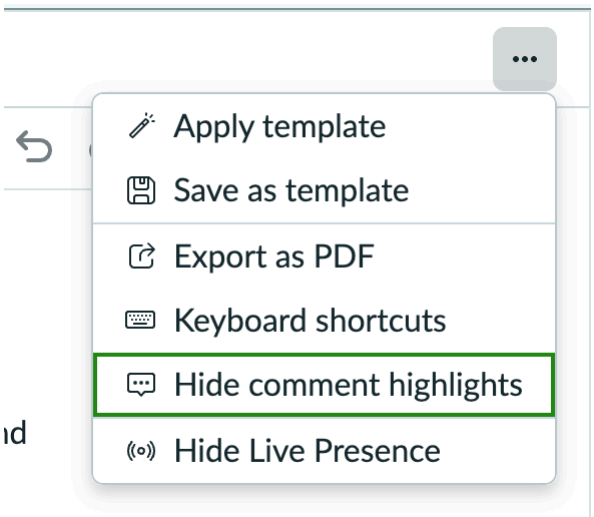
Add comments to Docs.

Role required: sn_cwm.cwm_user



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

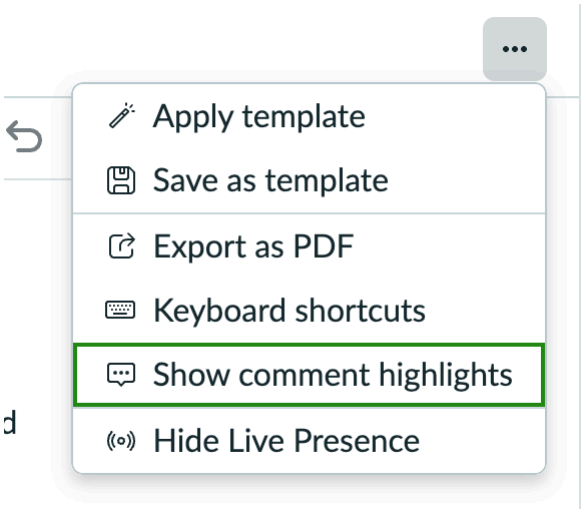
About this task



Hiding comment highlights switches the Doc to a clean reading view without markup. This is a personal preference setting and does not affect how other users view the Doc. You can enable the highlights when you want to view the comments.

Procedure

1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. From the Spaces menu, navigate to the Space where your Doc is located and open it.



3. From the Doc header, select the More actions icon ••• .
4. Select **Hide comment highlights** to hide the comment highlights from the text.

The comment highlights are hidden from the document.

5. Select **Show comment highlights** to view the comments in the text.

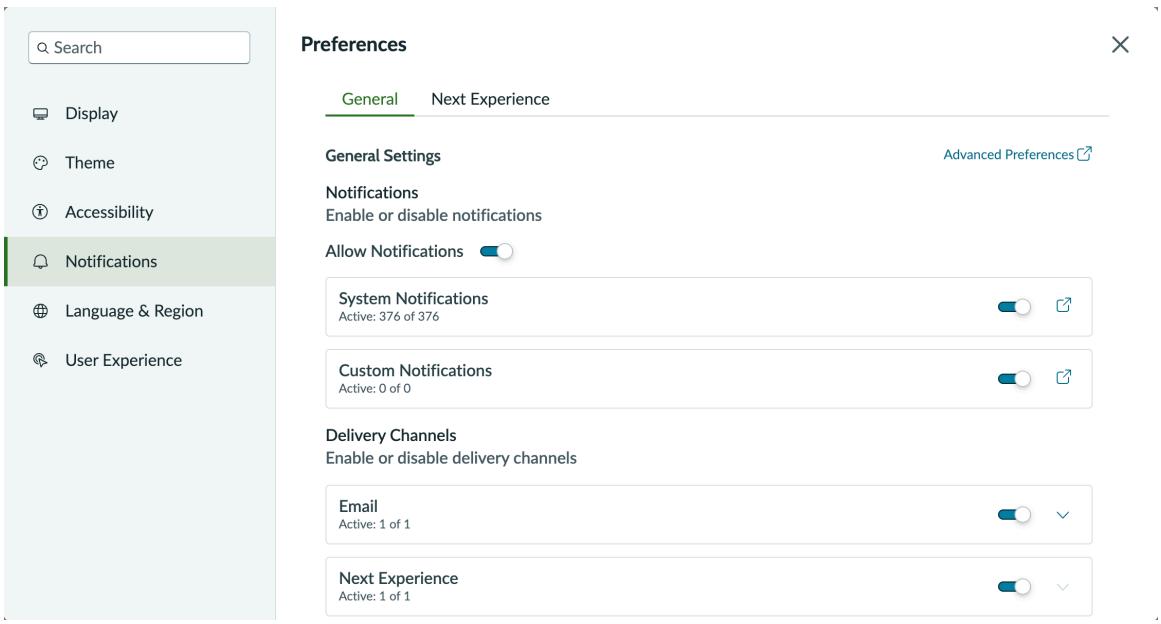
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The comment highlights are displayed in the document.

Disable comment notifications in Docs

Turn off email notifications for comment activities in Docs to manage which comment events you're notified about.

Before you begin

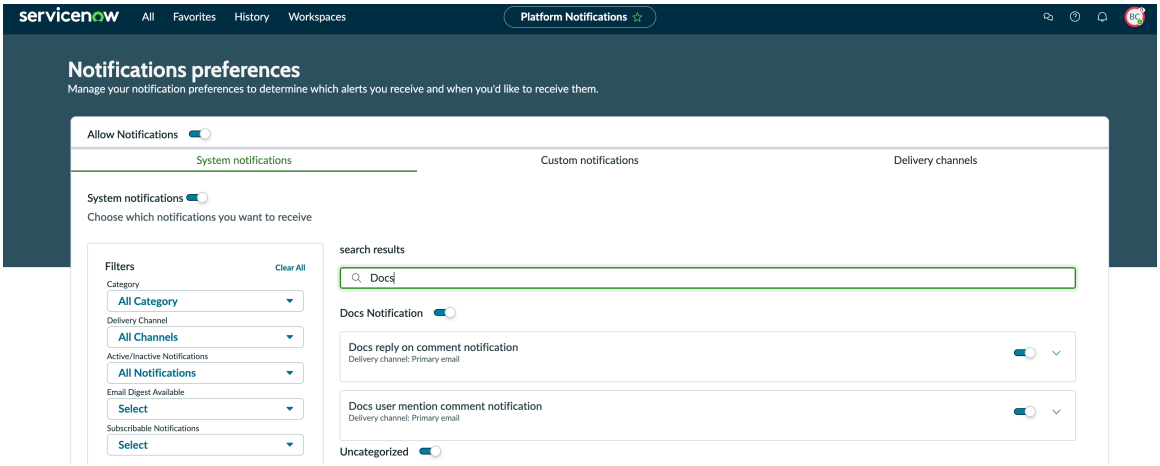


Role required: sn_cwm.cwm_user

About this task

You receive email notifications when a comment or reply is added to a doc that you are associated with and when you are @-mentioned.

Procedure



1. From your user profile, navigate to **Preferences** > **Notifications**.

2. Select the launch icon to navigate to **System notifications**.

3. Search for Docs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Docs notification settings are listed.

4. Toggle the **Docs reply on comment notification** and **Docs user mention comment notification** settings off.
5. Close the system notifications window and return to your main tab.
   Your notification preferences are updated.

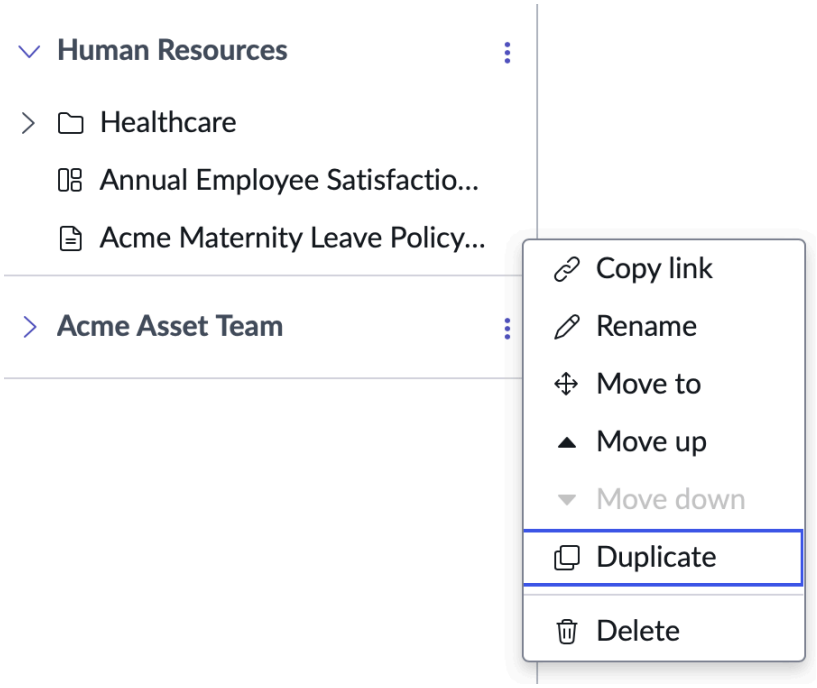
Result

You no longer receive email notifications for any comment activity on Docs. You can still view comments directly in the Docs interface and re-enable notifications at any time by toggling the settings on.

Duplicate a Doc in CWM

Save time by duplicate an existing Doc to copy all its pages and content without having to copy the information manually in the Collaborative Work Management workspace.

Before you begin



Create a Doc in CWM.

Role required: sn_cwm.cwm_user

Procedure

1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. Navigate to the Space that your Doc is in.
3. From the **More actions** menu of the Doc, select **Duplicate**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

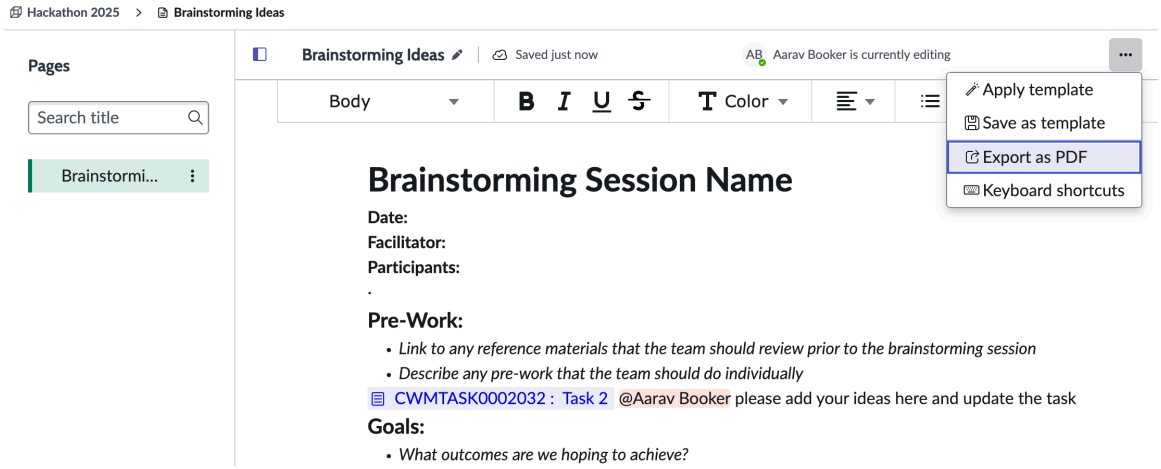
4. Provide a name for the new Doc in the **Doc name** field.
   The default name given is in the format of **(Copy) <Original Doc name>**.
5. Select **Duplicate**.

Result
The new Doc is added to the same Space as the original Doc. If necessary, you can move it to a different Space or a different position in the same Space.

Export a Doc in CWM to a PDF file

Use the Docs offline, and share with teams or stakeholders outside Collaborative Work Management (CWM) by exporting Docs as PDF.

Before you begin
Create a Doc in CWM



Role required: sn_cwm.cwm_user

About this task
If there are inline comments present in the Doc, they aren't highlighted or marked in the PDF output.

Procedure
1. Navigate to **Workspaces** > *Collaborative Work Management*.
2. From a Space, select the Doc that you want to export.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. From the Doc header, select the More actions icon (•••), and then select **Export as PDF**.

Result
The Doc is exported and saved in your local system as a PDF file.

Templates in CWM for Boards and Docs

By enabling creation of Boards and Docs from predefined or custom templates, Collaborative Work Management (CWM) helps improve efficiency, save time, and reduce inconsistencies in format.

https://player.vimeo.com/video/1054556151?h=84dc648b21&badge=0&autopause=0&player_id=0&app_id=58479

Creating Boards and Docs from scratch across similar processes often consumes time and effort, and could also lead to differences in their structure. With templates in CWM, you get a predefined format for Boards and Docs, which you can use as-is or customize to suit your workflow. You can use templates for new Boards and Docs or apply them to existing ones. You can also save an existing Board or Doc in its current format as templates.

Template Center provides a centralized space where you can manage all templates for Boards and Docs. From the Template Center, you can:

- Explore predefined templates for Boards and Docs.
- Filter for available templates by Owner or Type.
- Search for templates using its title.
- View details for all available templates where you can see a preview of the Board or Doc format.
- Delete templates that you own.

Templates for Boards

When you use a template for a Board, any template tasks, custom columns, and shared columns that the template contains are applied to the Board. The Board data is displayed with all the custom columns available as part of the template.

Templates for Docs

When you use a template for a Doc, any template pages and content formatting is applied to the Doc.

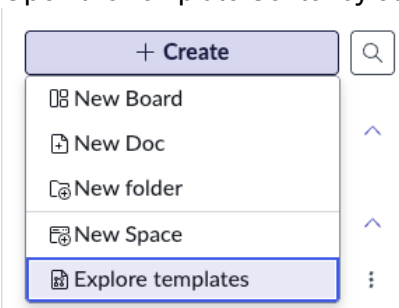
To access templates, you can choose one of the following ways:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- For creating a Board or Doc from template, use these options:
  - **Explore templates** from the main Create menu.
  - **Use templates** from the New Board or New Doc modal.
  - **Apply template** from the More actions menu or in the header of the Board or Doc.
- For saving a Board or Doc as a template: Use the **Save as template** option from the More actions menu or in the header of the Board or Doc.

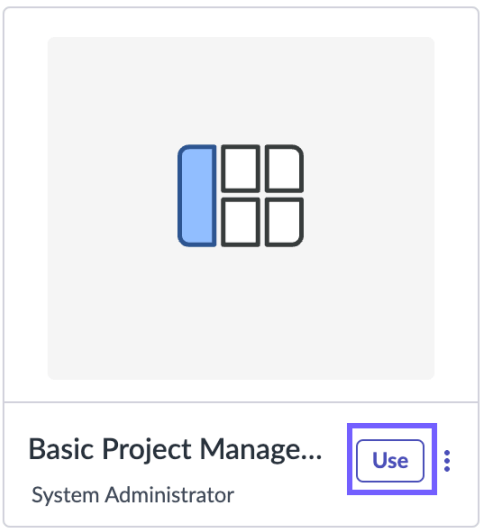
The following sections help you get started with templates in CWM.

Create a Board or Doc from a template in CWM



Create Boards or Docs using predefined or custom templates from the Template Center.

Before you begin



Role required: sn_cwm.cwm_user

Procedure

1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. Select **+Create**.
3. Open the Template Center by selecting **Explore templates**.

4. Locate the template that you want to use.
   - Filter the available templates by Owner or Type
   - Search for the template using its title or keyword.
5. From the template card that you want to apply, select **Use**.

6. Enter the Board or Doc name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Select the Space that you want to create this Board or Doc in.
8. Select **Save**.

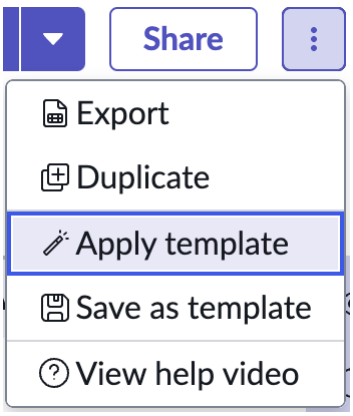
Result

The Board or Doc is created in the Space that you selected.

- For a Board, any template tasks and custom columns that the template contains are applied to the Board. To learn more about Board views, see Board views in CWM.
- For a Doc, any template pages and content formatting is applied to the Doc.

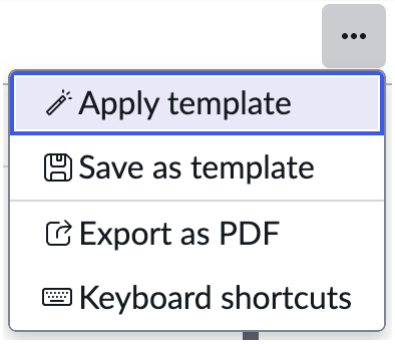
Apply a template to existing Board or Doc in CWM

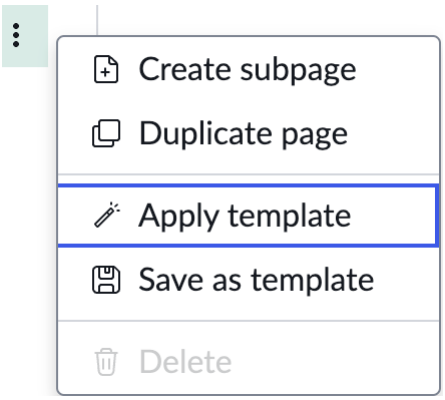
Apply predefined or custom templates to existing Boards or Docs in Collaborative Work Management workspace so that you can avoid inconsistencies in structure and format across your processes.



Before you begin

- Create a Board in CWM
- Create a Doc in CWM





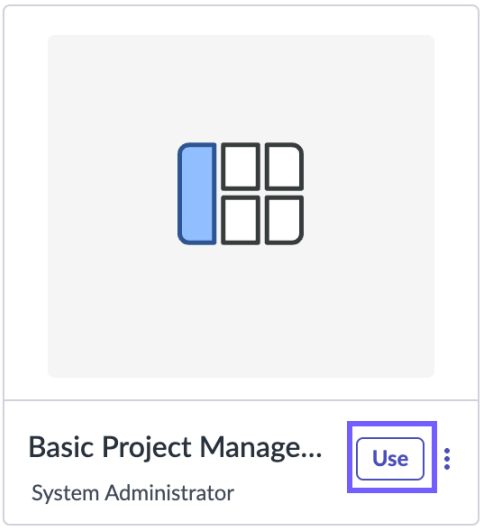
Role required: sn_cwm.cwm_user

Procedure

1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. Open the Board or Doc that you want to apply a template to.
3. You can apply template to a Board, Doc, or a single page in a Doc.

Choice	Action
Apply template to Board	From the Board header, select the More options icon ( ) and select **Apply template**.  The Template Center shows only the Board templates.
Apply template to Doc	From the Doc header, select the More actions icon ( ) and select **Apply template**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Choice	Action
	 The Template Center shows only the Doc tem plates.
Apply template to a Doc page	From the page options, select the Page Ac tions icon (⋮) and select **Apply template**.  The Template Center shows only the Doc page templates.

4. Locate the template that you want to use.
   - Filter the available templates by Owner. The Type filter is automatically set based on your choice in the earlier steps.
   - Search for the template using its title.
5. **Optional:** Check the details of the template by selecting **View details** from the Template actions menu (⋮).
   For a Board template, you can view the details of the number of Board views and custom task types that you get if you apply this template. You can also review the information on which of the List, Gantt, Kanban, and Sprint planning views are enabled in this template.

   (Optional) Only those custom columns that are part of these views are brought over when you apply this template.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. From the template card that you want to apply, select **Use**.

Result

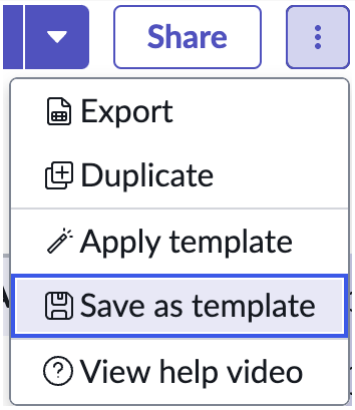
The selected template is applied to your Board, Doc, or page and the data is displayed according to the template.

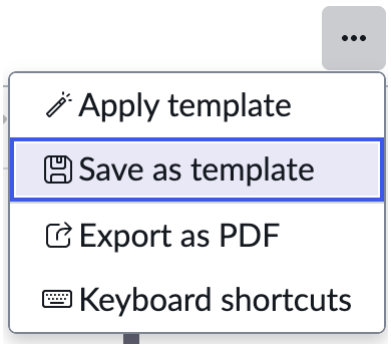
Save a CWM Board or Doc as a template

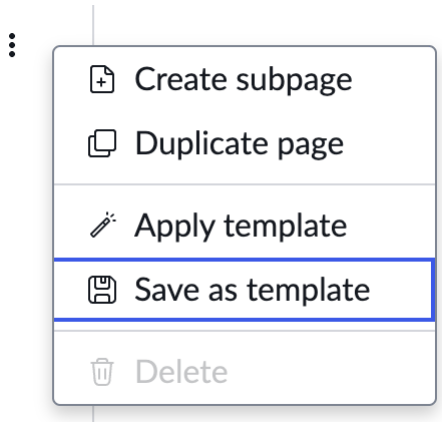
Save a Board or Doc, which you created or personalized, as a template. This lets you reuse the same structure and format for other Boards and Docs in the future.

Before you begin

- Create a Board in CWM
- Create a Doc in CWM







Role required: sn_cwm.cwm_user

Procedure

1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. Open the Board or Doc that you want to save as a template.
3. You can save a Board, a Doc, or a single Doc page as a template.

Choice	Action
Save a Board as template	From the Board header, select the More options icon ( ) and select **Save as template**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Choice	Action
	
Save a Doc as template	From the Doc header, select the More actions icon (•••) and select **Save as template**. 
Save a Doc page as template	From the page options, select the Page Actions icon (⋮) and select **Save as template**. 

4. Enter a name and description for the template.
5. From the Share with selection, select the access level for the template.
6. From the Board Views to Save selection, choose to include all shared views or just the current view of the Board.
7. Review the number of Board views and custom task types that will be included into this template.
8. Select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The saved template is added to the Template Center.

Update a template in CWM

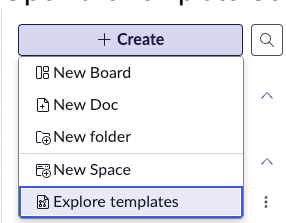
Update sharing permissions for a Board template or edit the format of a Doc template using the Template Center in Collaborative Work Management (CWM).

Before you begin
Role required: sn_cwm.cwm_user

You must be the owner of the template to update its details.

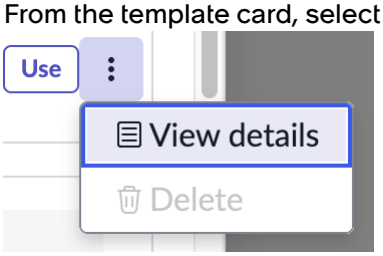
About this task

Updating Board templates



You can only modify the sharing permissions, template name, and the description of a Board template. The tasks, column order, sorting, custom columns, or any other preferences within the template can't be updated.

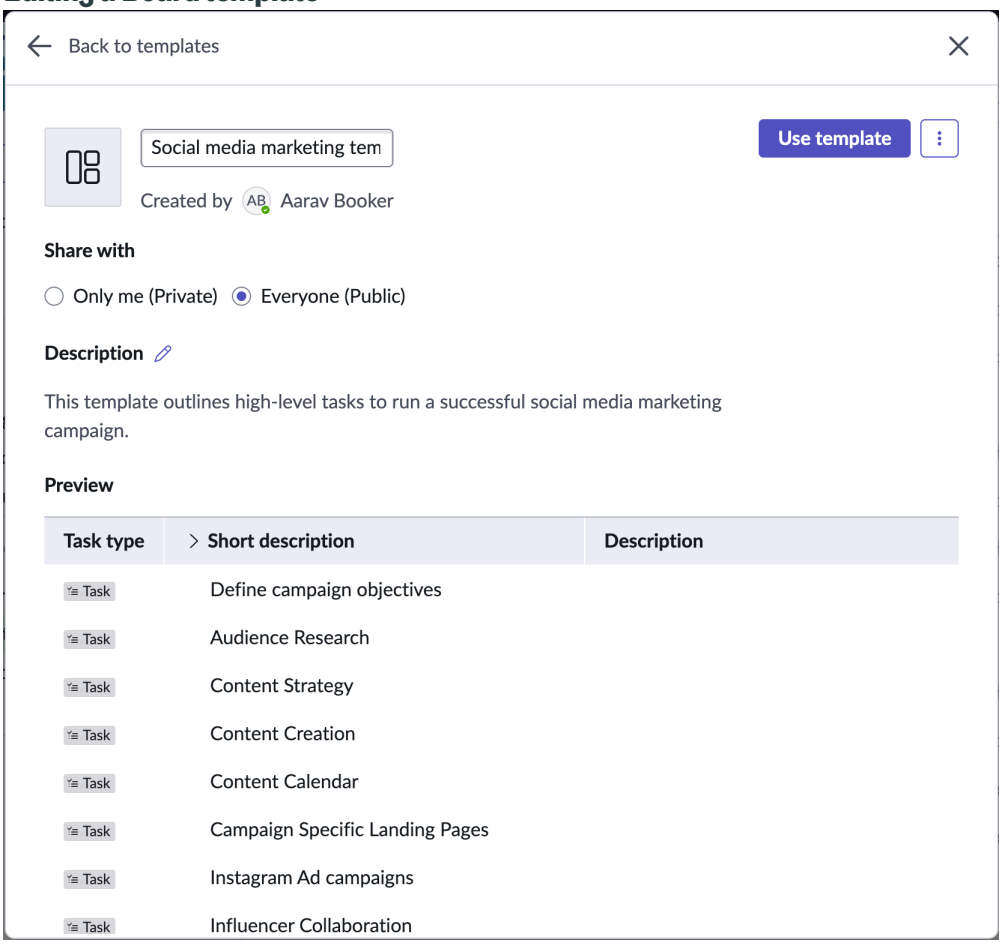
Updating Doc templates



You can modify sharing permissions along with the format, structure, and pages for a Doc template.

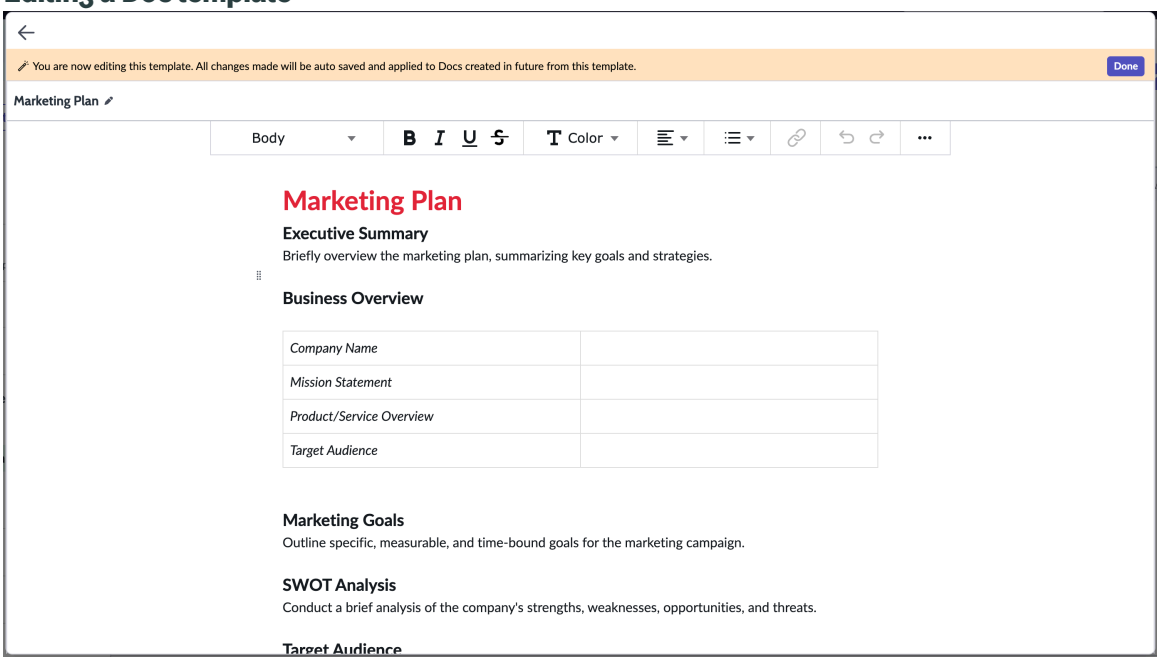
Procedure

1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. Select **+Create**.
3. Open the Template Center by selecting **Explore templates**.



4. Locate the template that you want to edit.
   - Filter the available templates by Owner or Type
   - Search for the template using its title or keyword.
5. From the template card, select the Template actions menu (⋮) and select **View details**.

6. Modify the template title, the **Share with** access, or the description.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Editing a Board template

7. For a Doc template, select **Edit** to edit the content of the template.

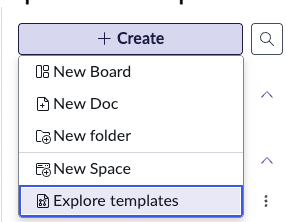
Editing a Doc template

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. After making your changes, select **Done** to close the template editor.
   The changes are automatically saved to the template and they are applied to any Docs that you create from this template in the future.

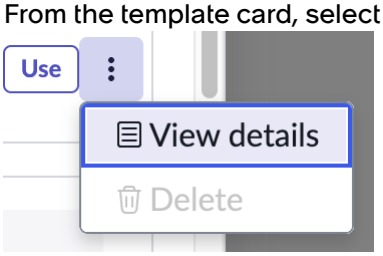
Delete a Board or Doc template in CWM

Delete any custom templates that are no longer necessary for your workflows using the Template Center in Collaborative Work Management (CWM).



Before you begin

Role required: sn_cwm.cwm_user



You must be the owner of the template to delete it.

Procedure

1. Navigate to **Workspaces** > **Collaborative Work Management**.
2. Select **+Create**.
3. Open the Template Center by selecting **Explore templates**.

4. Locate the template that you want to use.
   - Filter the available templates by Owner or Type
   - Search for the template using its title or keyword.
5. From the template card, select the Template actions (⋮) menu and select **Delete**.

6. Select **Delete** to confirm.

Result

The template is deleted and is no longer available for you or your team to use.

Collaborative Work Management reference

Reference topics provide details on the roles, tables, and properties installed with Collaborative Work Management (CWM).

Components installed with Collaborative Work Management

Several types of components are installed with activation of the Collaborative Work Management application, including tables and user roles.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles installed

Role title [name]	Description	Contains roles
CWM user [sn_cwm.cwm_user]	The basic role required to access the CWM workspace.	spm_agile_common_user
CWM admin [sn_cwm.cwm_admin]	Admin role to modify and update any system properties for functionality across CWM.	sn_cwm.cwm_user
Docs admin [sn_docs.docs_admin]	Admin role to modify and update any system properties for functionality in Docs.	None
Team member read [sn_stm.team_member_read]	Allows users to view project tasks and demand tasks, and add comments to them.	• sn_cwm.cwm_user • timecard_user
Team member read-write [sn_stm.team_member_read_write]	Allows users to view and edit project tasks and demand tasks.	sn_stm.team_member_read
CWM AI user [sn_cwm_ai.cwm_ai_user]	Enables users to use the generative AI skills that are available with the ServiceNow Otto for CWM application.	sn_cwm.cwm_user

Tables installed

Table	Description
CWM Automation [sn_cwm_automation]	Stores data of automation conditions for Boards.
CWM Board [sn_cwm_board]	Contains all tasks, views, and column configuration.
CWM Column Choice [sn_cwm_col_choice]	Stores data for choices and labels created for custom columns.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
CWM Column Usage [sn_cwm_columns_usage]	Stores usage of custom columns and its type.
CWM Content Tree Preference [sn_cwm_content_tree_preference]	Stores user preference of left navigation menu in the expanded or collapsed state.
CWM Document [sn_cwm_doc]	Stores the information of all Docs created within CWM.
CWM Document page [sn_cwm_doc_page]	Stores the information of pages and subpages created for a Doc within CWM.
CWM Document relationship [sn_cwm_doc_m2m]	Stores relation between Docs and Doc pages
CWM Import Configuration [sn_cwm_import_config]	Stores the configuration of tasks imported into My Work.
CWM Menu Item [sn_cwm_menu_item]	Stores the content hierarchy for Boards, Docs, and folders within a Space.
CWM Notification Digest [sn_cwm_notification_digest]	Stores information of notifications sent to CWM users.
CWM Permission [sn_cwm_permission]	Stores different level of permissions for the users and groups for the Spaces.
CWM Space [sn_cwm_space]	Stores information of all CWM Spaces.
CWM Space Access Request [sn_cwm_space_access_request]	Stores the list of users who requested access to the Space.
CWM Sprint [sn_cwm_sprint]	Stores information of sprints created in CWM.
CWM Task	Stores tasks data.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
[sn_cwm_task]	
CWM Task Relationship [sn_cwm_m2m]	Stores information of the relationships for the CWM tasks such as prerequisites, dependencies, and related tasks.
CWM Template [sn_cwm_template]	Stores information of Board and Doc templates within CWM workspace.
CWM Template Board Metadata [sn_cwm_template_board_metadata]	Stores metadata of CWM Board templates such as work types, automations, and others.
CWM Template Board Views [sn_cwm_template_board_view]	Stores information of views within Board templates.
CWM Template Column Choice [sn_cwm_template_column_choice]	Stores information of column choices within Board templates.
CWM Template Custom Column Label [sn_cwm_template_custom_column_label]	Stores information of custom column labels within Board templates.
CWM Template Document Page [sn_cwm_template_doc_page]	Stores information of pages within Doc templates.
CWM Template Task [sn_cwm_template_task]	Stores information of tasks within Board templates.
CWM User Preference sn_cwm_user_preference	Stores user preferences such as last selected Board, Agile preferences, and others.
CWM View Preferences [sn_cwm_view_preference]	Stores information of view preferences for Boards.
CWM Views sn_cwm_view	Stores information of all Board views within CWM.
CWM Work Type [sn_cwm_work_type]	Stores work types for task allowed within a Space.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
MyWork Table Mapping [sn_cwm_mywork_table_mapping]	Stores information of tasks shown in My Work such as dates, states, and assigned users.

Properties installed with Collaborative Work Management

System properties that you can configure to include other ServiceNow AI Platform records in CWM Docs and modify the way non-CWM users request access to the workspace.

These properties are available for Collaborative Work Management.

Note: To open the System Properties [sys_properties] table, enter `sys_properties.list` in the navigation filter.

Properties for Collaborative Work Management

Property	Description
sn_cwm.request_role_access	Property to show or hide the **Request Access** button for non-CWM users in the workspace. By default, the button is hidden. When this property is set to true, an event *sn_cwm.REQUEST_ROLE_ACCESS* is raised. Admins can configure this event to trigger one of the following workflows, allowing the non-CWM user to request access to the workspace. • Raising a Service Catalog request. • Sending an email. • Type: true | false • Default value: false • Location: System Property [sys_properties] table • Role needed: sn_cwm.cwm_admin
sn_cwm.record_mention_config	Property to configure mentioning any ServiceNow AI Platform record within Docs pages of CWM workspace. • Type: string • Default value: `[{"sourceTable":"sn_cwm_task","label":"CWM Task","fields":["short_description","number"]}]` By default, this property is configured to include CWM task records. • Location: System Property [sys_properties] table • Role needed: sn_cwm.cwm_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties for Collaborative Work Management (continued)

Property	Description
	To include any other ServiceNow AI Platform record, update the property. For example, to reference the Incident records in the Docs pages, update the **Value** field of this property to include the Incident table. The updated **Value** field would include the configuration for CWM task records and Incident records: `[{"sourceTable":"sn_cwm_task","label":"CWM Task","fields":["short_description","number"]},{"sourceTable":"incident","label":"Incident","fields":["short_description","number"]}]`
sn_cwm.include_additional_assignee	Property to display tasks assigned to the user in My Work, when the user is added to the **Additional assignee** field. By default, My Work displays only tasks where the user is listed in the **Assigned to** field. When this property is set to true, it includes all tasks assigned to the user through either the **Assigned to** field or the **Additional assignee** field. • Type: true | false • Default value: false • Location: System Property [sys_properties] table • Role needed: sn_cwm.cwm_admin
sn_cwm.connect_work_import_limit	Property to configure the maximum number of items that can be imported to a CWM Board for the first time when using the Connected work feature. • Type: integer • Default value: 100 • Location: System Property [sys_properties] table • Role needed: sn_cwm.cwm_admin
sn_cwm.agile_enabled	Property to control Agile-related features for CWM. If set to true, then agile items like Story and Epic can be created in a CWM Board and Sprint planning feature will be enabled. • Type: true | false • Default value: true • Location: System Property [sys_properties] table • Role needed: sn_cwm.cwm_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties for Collaborative Work Management (continued)

Property	Description
sn_docs.is_live_presence_enabled	Property to enable live presence indicators of users on a Doc page. • Type: true | false • Default value: true • Location: System Property [sys_properties] table • Role needed: sn_docs.docs_admin
sn_cwm.enable_granular_security	Property to enforce field-level access control on native CWM tables when data is loaded on a Board. The property applies to the `sn_cwm_task`, `rm_story`, and `rm_scrum_task` tables. When set to true, per-row field write access is evaluated for each work item on a Board, based on the accessibility configured for the fields for that user. When set to false, the cells on the CWM Board still appear editable, but edits to read-only fields are not saved. • Type: true | false • Default value: false • Location: System Property [sys_properties] table • Role needed: sn_cwm.cwm_user

Skill inputs for ServiceNow Otto for Collaborative Work Management (CWM) (CWM)

Learn about the inputs of each skill of ServiceNow Otto for CWM. By configuring inputs for a skill, you can determine how and when a skill is used within the CWM workspace.

Acceptance criteria generation skill inputs

The Acceptance criteria generation skill includes the inputs that identify the fields that are used as context to generate acceptance criteria for a story. The following table provides more details on the input data.

Story input data for Generate acceptance criteria skill

Input	Description
Table	Story [rm_story] This value can't be changed.
Fields	Short description, Description

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Story input data for Generate acceptance criteria skill (continued)

Input	Description
	You can choose to add more fields to serve as context to generate acceptance criteria.
Acceptance criteria template	A default template is provided. You can choose to modify the existing template or define a new template based on your team's requirements.
Reference stories	Tag a story as a reference when it contains ideal acceptance criteria. These tagged stories serve as examples for Now Assist, giving it additional context to generate well-structured acceptance criteria for new stories.

Configure ServiceNow Otto for Collaborative Work Management (CWM) (CWM)

Grouping of tasks in status reports of CWM My Work

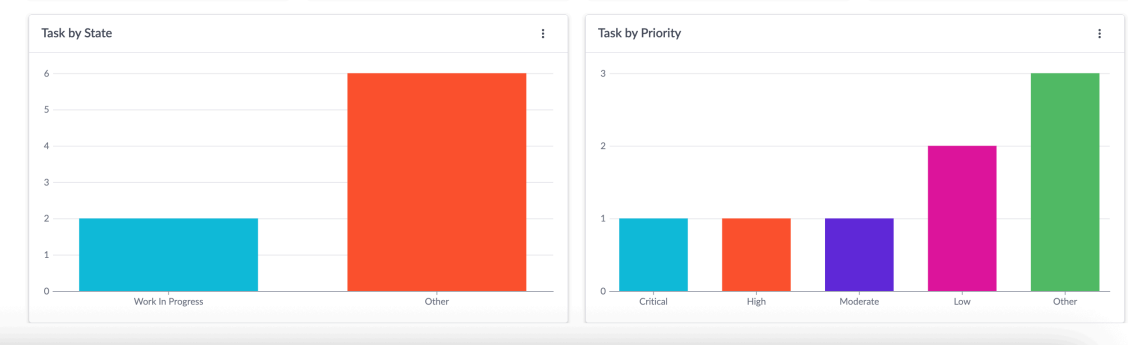
Learn how various tasks assigned to you are grouped based on their State and Priority in My Work reports of Collaborative Work Management (CWM).

State buckets

State buckets represent the lifecycle stage of different tasks. Existing state values from different task types are automatically mapped into these buckets based on meaning and also internal value of any task type. In My Work, all states are automatically grouped into three standard State Buckets.

- Open: Represents tasks not yet started. For example, states of Draft, Pending, and Ready.
- Work in Progress: Represents tasks currently being worked on. For example, states of In Progress, Implement, and Testing.
- Closed: Represents tasks that are finished or no longer active. For example, states of are Complete, Cancelled, and Closed Skipped.

Priority buckets



Priority buckets provide a unified way to understand the urgency of tasks. Priority buckets are created by mapping existing priority values from the Task table. All tasks are automatically grouped into five Priority Buckets.

- Planning: Not yet prioritized.
- Low: Minimal urgency.
- Moderate: Medium priority tasks.
- High: Important tasks that require attention soon.
- Critical: Most urgent tasks.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Custom State and Priority values

Your ServiceNow instance may have some extended task types that have custom state or priority values. These custom values may not align with the default values of the Task table. These work items with these non-default State or Priority values appear as **Others** in the bar graphs in My Work. This method ensures reporting accuracy instead of forcing a state/priority into the wrong bucket.

Project task access in CWM

Learn how project users and CWM users can access project tasks and CWM tasks within the Collaborative Work Management workspace.

Access to CWM tasks for project users

Access to a CWM task is granted through either of the following paths:

- Being a member in the Space that contains the Board where the task lives. This requires the sn_cwm.cwm_user role and is the typical CWM access path. For more information about roles for team members, see Team member role access permissions in CWM.
- Read or write access to the project task referenced by the **Project task** field on the CWM task, along with the sn_cwm.cwm_user role.

Either path allows access and the project user can perform the corresponding action on the CWM task.

Access matrix

Access to project tasks in CWM

Access to project task in Project Workspace	Access in CWM	Effective access of project task in CWM
Read	• sn_cwm.cwm_user • No Space access	View in My Work

SPM Enterprise-Wide Deployment

SPM Enterprise-Wide Deployment (EWD) provides data partitioning capabilities for Strategic Portfolio Management (SPM) tables that enable organizations to separate and control record visibility across functions such as departments and business units.

For additional security, you can install the Extended Security for Enterprise-Wide Deployment (Extended Security for EWD) application. It expands partition access controls across APIs, agentic workflows, indirect references, and unpartitioned parent tables.

Exploring SPM Enterprise-Wide Deployment

SPM Enterprise-Wide Deployment (EWD) partitions SPM tables data so that you can restrict record access by department, business unit, or other function.

https://player.vimeo.com/video/1206553784?h=03ade3782d&badge=0&autopause=0&player_id=0&app_id=58479

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

EWD is a Strategic Portfolio Management (SPM) product for enterprise-scale organizations that must balance centralized platform management with department-level data isolation. Administrators can create and configure partitions that separate data across functions such as IT Operations, HR, and Finance. Each partition is governed by a dedicated role that determines which records users can access, reducing the need for separate ServiceNow instances for each function.

EWD supports key SPM tables, including projects, demands, programs, and portfolios. Partition logic extends automatically to related records such as cost plans, resource plans, and planning items through automatic partition stamping. For the complete list of supported tables and related entities, see Supported tables for partition.

Partitions

A partition is a vertical data separation unit that controls which users and roles can access specific records within supported tables. Partitions are configured at the function level using a partition criteria field such as Department. Each partition is assigned a dedicated role that governs record visibility for users in that department.

For example, an organization can create separate partitions for IT Operations and HR Learning and Development. A user assigned to the IT Operations partition accesses only IT Operations projects, demands, and related records. That user can't access records belonging to the HR partition.

After a partition is configured, access control is enforced automatically at runtime. Partition criteria and role assignments determine data visibility without additional configuration.

This enforcement applies consistently across Project Workspace, Resource Management Workspace, Portfolio Planning Workspace, and Strategic Planning Workspace.

Partition criteria

Partition criteria define the reference column that determines which partition a record belongs to. When a record is created, the application evaluates the value in the criteria column — such as **Department**, **Portfolio**, or **Investment Type** — and stamps the record with the matching partition.

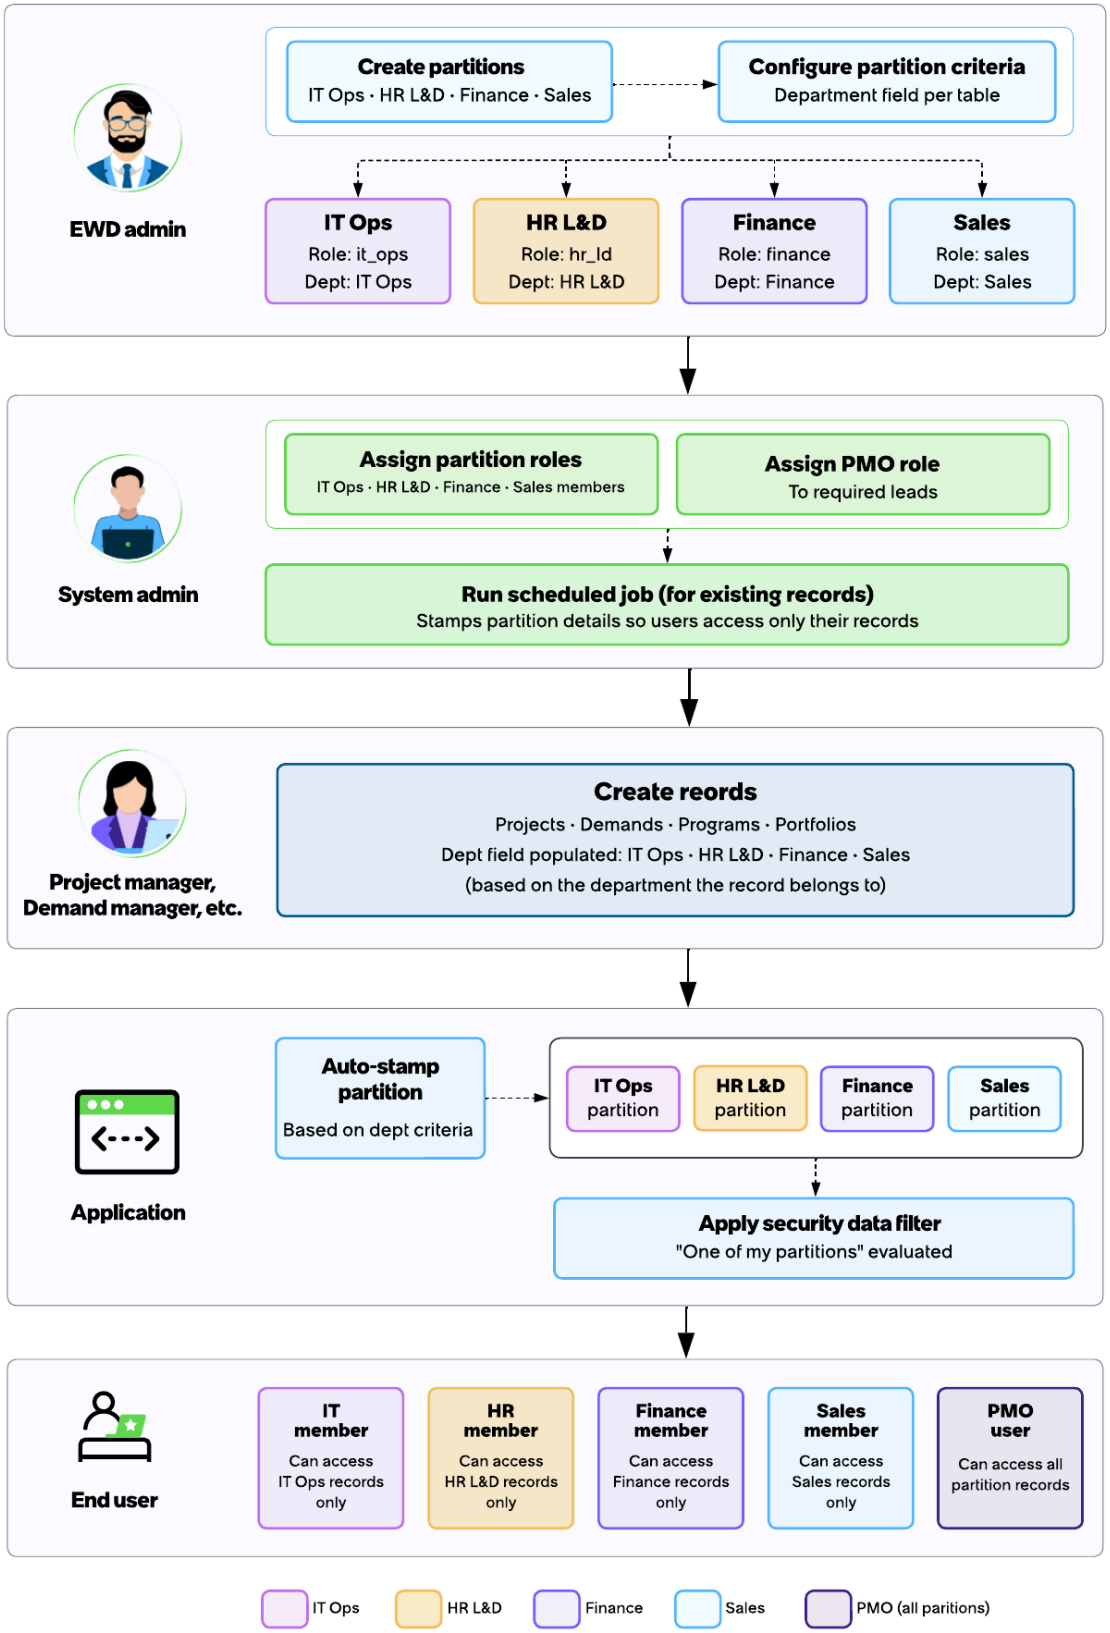
Each supported table uses a single criteria column across all its partitions, so that records are segregated consistently throughout the SPM data model. When set, the criteria column is locked for that table to maintain consistency across existing and future partitions.

Automatic partition stamping

When a record is created in a supported table, the application evaluates the partition criteria and stamps the partition value on the record. Partitions are assigned automatically — no manual assignment is required.

For related records and subentities such as cost plans, resource plans, and planning items, the partition value is automatically inherited from the parent record. This maintains data consistency across the full SPM data model without manual intervention.

For existing records created before partition configuration, an administrator can run a backfill job to stamp partition values on historical records.



How partitions control access

Partitions enforce data visibility through Security Data Filters using a dynamic filter called **One of my partitions**. When a user accesses a record, the system evaluates their assigned partition role and returns only the records that match their partition criteria.

The following diagram shows the end-to-end flow of partition setup and access control across four departments: IT Ops, HR L&D, Finance, and Sales.

End-to-end flow of partition setup and access control

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

An EWD admin creates partitions for each department and configures the partition criteria using a reference field such as Department on each supported table. An administrator assigns partition roles to department members and assigns the EWD PMO role to organization leads who require visibility across all partitions. For records created before partition configuration, a scheduled job stamps existing records with the correct partition value.

When a record such as a project, demand, program, or portfolio is created, the application stamps it with the correct partition based on the department field. The **One of my partitions** filter then evaluates the partition at runtime, so each user sees only the records in their assigned partition. Users with the PMO role can access records across all partitions.

The following examples show how partition access works at runtime:

- A user assigned to the IT Ops partition can access only IT Ops projects and demands in all workspaces. No HR L&D, Finance, or Sales data is visible in list views, search results, or dashboards.
- A user assigned to the HR L&D partition can access only HR L&D records. No other partitioned data is visible anywhere in the application.
- A user with roles for multiple partitions, such as a portfolio lead, can access records from all assigned partitions. Records appear across all views — workspaces, list views, search results, and dashboards — with no duplication or data merging.

Partition access also applies to the partitions themselves. When users select a partition from the **Current view** list on the Demands page in Strategic Planning Workspace, only the partitions they have access to are available. For example, a demand manager in the HR partition sees only the HR partition, not the IT Ops or Finance partitions. Users with the EWD admin or EWD PMO role can see all partitions.

Extended Security for Enterprise-Wide Deployment (Extended Security for EWD) provides additional security for partitioned tables. It extends partition access controls across APIs, agentic workflows, indirect references, and unpartitioned parent tables. For details, see Additional security with Extended Security for EWD.

Workspace support

EWD partition enforcement applies across the following workspaces:

- Project Workspace — Partition enforcement applies across all tabs, including the **Details**, **Planning**, **Resources**, **Financials**, **RIDAC**, and **Status Reports** tabs.
- Portfolio Planning Workspace (PPW) — Partition enforcement applies to projects, demands, roadmaps, scenario planning, financial planning, resource capacity, and dashboards.
- Strategic Planning Workspace (SPW) — Partition enforcement applies to planning item types — project and demand — when the *ServiceNow Internal* Alignment integration is enabled. When a user populates the partition criteria field on either the planning item or its linked execution record, the partition details are stamped on both records. This bidirectional behavior helps strategic and operational teams work from the same data while maintaining departmental data separation. Partition support also extends to dashboards. On the Demands page, users can select a partition from the **Current view** list to see the dashboard mapped to that partition and only the demands in that partition.
- Resource Management Workspace — Partition enforcement applies to resource plans, allocations, capacity views, and time cards linked to partitioned records.

EWD roles

EWD includes two roles that govern partition creation, access, and record visibility:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

EWD admin [sn_spm_ewd.ewd_admin]

Grants access for creating and configuring partitions. Users with this role can create partitions, define a role for each partition, configure partition criteria for each supported table, and manage partition settings. This role grants no elevated privileges outside the partition configuration scope.

EWD PMO [sn_spm_ewd.ewd_pmo]

Grants visibility across all partitions regardless of the assigned partition role. When the **One of my partitions** dynamic filter detects this role, all partition records are returned. Use this role for PMO users who require enterprise-wide visibility across all departments.

Scope and limitations

Partition enforcement applies to classic form views, list views, search results, and dashboards. The following limitations apply:

- Partition criteria can be defined only on reference columns available on the partitioned table.
- All partitions on the same table must use the same reference column. For example, if Department is set as the criteria for the Project table, all subsequent partitions on the Project table must also use Department.
- Different supported tables can each have their own criteria field defined independently — for example, the Demand table can use a different reference column than the Project table.
- Only one condition per partition is supported.
- Changing partition criteria after data has been populated requires deleting and recreating the affected partitions.
- Partitioning is supported only on the Project [pm_project], Portfolio [pm_portfolio], Demand [dmn_demand], and Program [pm_program] tables.
- Partition enforcement does not apply to indicator-based reports and widgets that calculate scores from a separate table. Users may see unfiltered data in indicator-based widgets regardless of their partition assignment.

Comparing EWD with Extended Security for EWD

- EWD: Partition SPM records by function so that users can access only the records in their assigned partitions.
- Extended Security for EWD: Extend partition access controls across APIs, agentic workflows, indirect references, and unpartitioned parent tables.

Comparison of EWD and Extended Security for EWD features

Feature	Enterprise-Wide Deployment	Extended Security for Enterprise-Wide Deployment
Create and configure partitions	✓	✓
Assign partition role for access to the partition	✓	✓
Assign PMO role for visibility across all partitions	✓	✓

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Comparison of EWD and Extended Security for EWD features (continued)

Feature	Enterprise-Wide Deployment	Extended Security for Enterprise-Wide Deployment
Update partition details for existing records	✓	✓
Enable additional security for partitions	✗	✓

Note: The Extended Security for Enterprise-Wide Deployment application is an extension to the Enterprise-Wide Deployment application. When you install the Extended Security for Enterprise-Wide Deployment application, you get all the features of Enterprise-Wide Deployment and the additional security for partitioned tables feature.

Additional security with Extended Security for EWD

Additional security is an ACL (Access Control List) enforcement feature available with Extended Security for Enterprise-Wide Deployment that applies partition-based access control to four partitioned tables: Project, Demand, Program, and Portfolio.

What is additional security

Additional security is an optional feature that strengthens access control in Enterprise-Wide Deployment by enforcing partition-based ACL rules at the table level. When enabled for a table, users can only read, create, update, or delete records within their assigned partition, regardless of their role or existing table permissions.

This provides a second layer of protection beyond traditional role-based access control (RBAC), ensuring that partition boundaries are enforced at the database level.

Supported tables

Additional security is available for four tables in Strategic Portfolio Management with Extended Security for EWD.

- Project (pm_project) — Work initiatives and deliverables
- Demand (dmn_demand) — Work requests and capacity planning
- Program (pm_program) — Collections of related projects
- Portfolio (pm_portfolio) — Strategic collections of programs and projects

You can enable additional security for any combination of these tables. Each table can be configured independently.

How it works

When additional security is enabled for a table, every database operation is subject to partition-based ACL validation:

- **Read:** Users see only records assigned to their partition
- **Create:** New records are automatically assigned to the user's partition
- **Update:** Users can modify only records in their partition
- **Delete:** Users can delete only records in their partition

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ACL enforcement occurs at the database level and is independent of role assignments, ensuring consistent access control regardless of how permissions are configured.

When to use additional security

Enable additional security when:

- Your organization requires strict data isolation between partitions (business units, geographic regions, or separate entities)
- Compliance regulations mandate partition-level access controls (SOX, GDPR, HIPAA, etc.)
- You operate a multi-tenant deployment where customer data must remain segregated
- You want to prevent accidental cross-partition data visibility through role-based permissions

Access model

Additional security does not replace partition assignments. Users must still be explicitly assigned to partitions through:

- Role assignments linked to partitions
- Team membership with partition scoping
- Direct partition assignment in the user record

When additional security is enabled, users can only access tables and records within the partitions they are assigned to. Enterprise administrators with access to multiple partitions can see records from all their assigned partitions.

Configuration

Additional security is configured on a per-table basis in the SPM Configure console under **Partitions** > **Enable additional security**. Each table has a checkbox; when checked, partition-based ACL enforcement is enabled for that table.

Changes take effect immediately after save. Existing records retain their partition assignment; access restrictions apply to all future queries. For instructions to enable additional security, see Enable additional security for partitions.

Configuring SPM Enterprise-Wide Deployment

Configuring Enterprise-Wide Deployment (EWD) involves creating partitions, defining partition criteria for supported tables, and assigning partition roles to users or user groups to enforce function-level data separation.

High-level configuration process

EWD configuration is an administrative activity that requires planning before implementation. To achieve data separation with EWD, complete the following steps in order:

1. Create a partition record with assigning a new or existing role to it. For details, see Create and configure a partition.
2. Configure partition criteria for each supported table that you want to define data partitioning for that partition. For details, see Assign partition role for access to the partition.
3. Assign the partition role associated with the partition record to the users or user groups who should have access to those partitioned tables. For details, see Verify partition configuration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Repeat this process for each function partition you need to create. For example, create separate partitions for IT Operations and HR Learning and Development.

4. Update the existing records in the project, demand, programs, portfolios, and planning item tables with partition details by running the scheduled job. For details, see Update partition details for existing records.
5. Enable the additional security that extends partition access controls across APIs, agentic workflows, indirect references, and unpartitioned parent tables. This configuration requires installation of Extended Security for Enterprise-Wide Deployment. For details, see Enable additional security for partitions.
6. Optional: Map a dashboard to each partition for an experience, such as Demand Management. For details, see Map a dashboard to a partition.

Important: Apply partition configuration changes and role assignments during a maintenance window when users are not accessing the instance, to ensure record visibility updates take effect correctly.

Partition configuration checklist

Before configuring Enterprise-Wide Deployment, ensure the following are in place:

- The EWD admin [sn_spm_ewd.ewd_admin] role assigned to you.
- The reference column to use as the partition criteria field is identified. All partitions on the same table must use the same reference column — for example, Department for all partitions on the Project table.
- The users or user groups that should have access to each partition are identified.
- A plan for handling existing records is in place. After configuring partitions, run the *Update existing records with partition details* scheduled job to populate partition values on historical records.

Important: Once partition criteria is configured for a table, the criteria field becomes read-only and cannot be changed for subsequent partitions on that table. Plan your partition structure accordingly before creating partitions.

Supported tables for partition criteria

Partition criteria can be configured for the following core tables:

- Project [pm_project]
- Demand [dmn_demand]
- Program [pm_program]
- Portfolio [pm_portfolio]

Related records and sub-entities for these tables automatically inherit the partition value from the parent record. For a full list of tables in scope, see Supported tables for partition.

Supported workspace versions

Partition enforcement is supported in the following workspaces. For partition enforcement to function in a workspace, that workspace must be installed at the specified minimum version:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Project Workspace (7.3.0)
- Portfolio Planning Workspace (8.15.0)
- Strategic Planning Workspace (4.15.0)
- Resource Management Workspace (5.7.0)

Install SPM Enterprise-Wide Deployment

You can install the SPM Enterprise-Wide Deployment application (sn_spm_ewd) if you have the admin role.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Review the SPM Enterprise-Wide Deployment application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.

Note: SPM Enterprise-Wide Deployment is installed automatically if any of the following applications are already installed on your instance at the specified version or later. Verify the installation status before proceeding:

- Project Workspace (7.3.0)
- Portfolio Planning Workspace (8.15.0)
- Strategic Planning Workspace (4.15.0)
- Resource Management Workspace (5.7.0)

Role required: admin

About this task

The following items are installed with Enterprise-Wide Deployment:

- Roles
- Scheduled jobs
- Tables

For more information, see Components installed with Enterprise-Wide Deployment.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the SPM Enterprise-Wide Deployment application (sn_spm_ewd) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

   A list of the versions available to you are displayed.
3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box, any dependencies installed with your application are listed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. Select **Install**.

Related topics

https://store.servicenow.com/store/apps?q=enterprise-wide%20deployment

Install Extended Security for Enterprise-Wide Deployment

You can install the Extended Security for Enterprise-Wide Deployment application (sn_spm_ewd_sec) if you have the admin role.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Review the Extended Security for Enterprise-Wide Deployment application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.

Role required: admin

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Extended Security for Enterprise-Wide Deployment application (sn_spm_ewd_sec) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you can't find the application, you might have to request it from the ServiceNow Store.

   A list of the available versions available are displayed.
3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box, any dependencies installed with your application are listed.
4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. Select **Install**.

Configure administrator access to all partitions

Enable or disable the system property to control whether system administrators can access all partitioned data across your enterprise deployment, or only their assigned partitions.

Before you begin

Role required: admin or sn_spm_ewd.ewd_admin

About this task

The *sn_spm_ewd.allow_admin_access_to_all_partitions* system property controls whether administrators with the appropriate role can access all partitions across the deployment, or only the partitions they are explicitly assigned to.

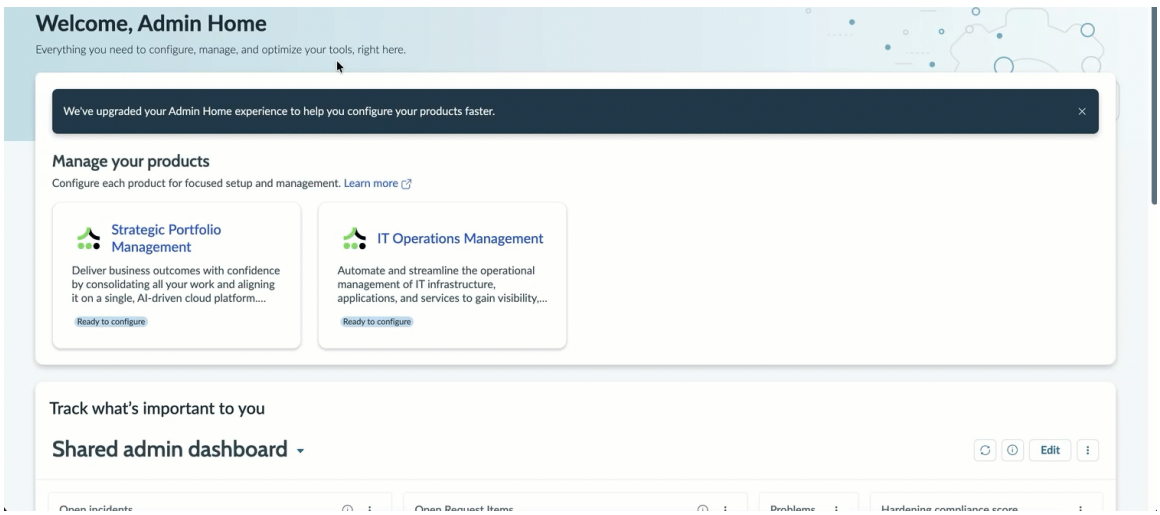
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Default behavior (false):** Administrators can only access partitions they are assigned to. This provides data isolation and governance.
- **Enterprise access (true):** Administrators can view and manage all partitions across the entire deployment. This is useful for enterprise-wide system administration tasks.

Procedure

1. Navigate to **All** > **System Properties** > **All Properties**.
2. Search and open the *sn_spm_ewd.allow_admin_access_to_all_partitions* system property.
3. In the **Value** field, provide the input as `true` or `false`.
   The default value is **false**.
4. Select **Update** to save the changes.
   The new setting takes effect immediately for new administrator sessions.

Result



Enable additional security for partitions

Enable additional ACL enforcement for partitioned tables to strengthen access control validation. Select the tables where you want to apply enhanced security.

About this task

You can enable additional security for the four tables.

- Project (pm_project)
- Demand (dmn_demand)
- Program (pm_program)
- Portfolio (pm_portfolio)

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. From the Admin Home page, select **Strategic Portfolio Management** to navigate to the Strategic Portfolio Management page.
2. Select **Configure** next to "Configure your product".
   The Configure SPM console opens, showing configuration options for your SPM deployment.
3. Under **Partitions**, select **Enable additional security**.
   The Enable additional security page opens, displaying a table with the four available tables and check boxes for each.
4. Review the table descriptions and select the tables where you want to enforce partition-based ACL checks.

   Important: Enabling additional security may restrict access for existing users who previously had cross-partition visibility through role assignments. Review your user access model before enabling so that users retain necessary access to their assigned partitions.

5. Select the check box next to each table where you want to enable additional security.

   A check mark indicates that additional ACL enforcement is enabled or disabled for that table. Leave unchecked any tables where you want to maintain cross-partition visibility.

6. Select **Save** to apply the settings.

   The additional security settings take effect immediately. Any subsequent queries or record access will enforce the new partition-based ACL rules.

Create and configure a partition

Create a partition to control record visibility for users within a specific function, such as a department or business unit.

Before you begin

- Identify the reference field, such as Department or Business Unit, to use as the partition criteria for each supported table. The reference field can be different for each table within the same partition.
- Create a dedicated role for this partition to control record visibility for its users. For details, see Create a role.

Role required: sn_spm_ewd.ewd_admin

About this task

Partitions are created per function — such as a department, business unit, or investment type — based on your organization's needs. Each partition requires a unique label and a dedicated role. After a partition is created, the partition criteria field selected for a partitioned table is set to read-only and can't be changed. Plan your partition structure before creating partitions. Changing the partition criteria field to a different function type — for example, from department to business unit — after data has been populated requires deleting and recreating the affected partitions.

https://player.vimeo.com/video/1204269851?h=7607951920&badge=0&autopause=0&player_id=0&app_id=58479

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Enterprise-Wide Deployment** > **Partitions**.
   A list of partitions appears.
2. Select **New**.
3. Fill in the fields on the partition form.

Partition form

Field	Description
Label	Display name of the partition. For example, enter `IT Ops` for the IT Operations department partition.
Name	Name of the partition stored in the system. This field is automatically set to the label value, with underscores replacing spaces.
Partition role	Role assigned to this partition. Determines which users can access records associated with this partition.

4. From the Additional actions (☰), select **Save**.
   Partitioned table records for Project [pm_project], Demand [dmn_demand], Program [pm_program], and Portfolio [pm_portfolio] are automatically generated without partition criteria.
5. Configure partition criteria for the required tables.

   a. From the Partitioned tables list, select a table.
   For example, select Program [pm_program]. The partitioned table record opens.

   b. Fill in the fields on the partitioned table form.

Partitioned table form

Field	Description
Partition	Name of the partition associated with this partitioned table.
Active	When selected, the partitioned table is active on this partition.
Table	Name of the table associated with this partitioned table record.
Partition criteria	Condition that determines which records belong to this partition. Use the **Field**, **Operator**, and **Value** fields to build the condition. Select a reference field such as **Department**, **Portfolio**, or **Investment Type** as the field, then select a partition value. The following example shows the Field set to Department and the Value set to IT Ops. All programs with the Department field set to IT Ops belong to this partition.  **Note:** After you save the partition criteria record for a table, the criteria field is locked for that table. All subsequent partitions on the same table must use the same criteria field. This maintains consistency across all partitions for the same table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Select **Update**.

d. Repeat steps a through c for Demand [dmn_demand], Project [pm_project], and Portfolio [pm_portfolio] as needed.

Partition criteria is configured for each supported table for this partition.

What to do next

Assign the partition role to the relevant users or groups so they can access records within this partition. For details, see Assign partition role for access to the partition.

Note: If your instance has existing records to associate with the new partition, run the partition backfill job. For details, see Update partition details for existing records.

Optionally, map a dashboard to the partition for an experience, such as Demand Management. For details, see Map a dashboard to a partition.

Map a dashboard to a partition

Give a partition its own dashboard for an experience, such as Demand Management, so that users who select the partition see the dashboard mapped to it.

Before you begin

- Make sure the partition that you want to map the dashboard to exists. For details, see Create and configure a partition.
- Make sure the **Experience** field is set to **Strategic Planning Workspace** in the PAR Dashboard Visibility [par_dashboard_visibility] table for the dashboard that you want to map to the partition.
- In the PAR Dashboard Permission [par_dashboard_permission] table, make sure the dashboard has at least one **User**, **Group**, or **Role** field populated.

Role required: sn_spm_ewd.ewd_admin

About this task

You can map a dashboard when you create a partition or later from an existing partition. Dashboard mappings are stored in the Partition Dashboard [sn_spm_ewd_partition_dashboard] table. You can map one dashboard to a partition for each experience.

In Strategic Planning Workspace, users select a partition from the **Current view** list on the Demands page. When a partition is selected, the **Dashboard** tab displays the dashboard mapped to that partition, and the **List** tab shows only the demands in that partition. The **Current view** list includes only the partitions that the user has access to.

Procedure

1. Navigate to **All** > **Enterprise-Wide Deployment** > **Partitions**.
2. Select the partition that you want to map a dashboard to.
   For example, select **HR**.
3. Select the **Partition Dashboards** tab.
4. Select **New**.
   The Partition Dashboard form opens with the **Partition** field set to the current partition. The **Partition** field is read-only.
5. Fill in the fields on the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Partition Dashboard form

Field	Description
Experience	Experience that the dashboard applies to, such as **Demand Management**.
Dashboard	Dashboard to map to the partition for the selected experience.

6. Select **Submit**.
   The dashboard appears in the **Partition Dashboards** list for the partition. If a dashboard is already mapped to the partition for the same experience, the mapping isn't saved and an error message appears.

Assign partition role for access to the partition

Assign a partition role to users or user groups to grant them access to records within a specific partition.

Before you begin

- The partition and its associated role have been created and partition criteria have been configured for all supported tables. For details, see Create and configure a partition.
- You have identified the users or user groups that should have access to the partition. If you want to create a specific user group for the partition you want to provide access to, create a user group. For details, see Creating groups.

Role required: admin

About this task

Role assignments determine what each user can see at runtime. Users assigned a partition role see only the records from their department's partition. Users assigned roles for multiple partitions see records from all their assigned partitions in a single view, with no duplication or data merging.

For example, assigning the `it_ops` partition role to a user means they see only IT Operations projects, demands, and related records. Assigning both the `it_ops` and `hr_ld` partition roles to a user such as a portfolio lead means they see records from both the partitions.

Procedure

1. Navigate to the **All** > **User Administration** > **Users**.
   A list of users appear.
2. Search for and open the user record to whom you want to assign the partition role.
3. On the user record, select the Roles related list and select **Edit**.
4. In the **Collection** list, select the desired partition role(s), and then select **Add**.
   For example, search for and add the `it_ops` role to assign Dennis Jackson access to the IT Operations partition. Search for and add the `hr_ld` role to assign John Smith access to the HR Learning and Development partition.
5. Select **Save** to update the configuration.
   The partition role is assigned to the user. The user can now access only the records that belong to their assigned partition across all workspaces and all tables in scope.
6. Repeat steps 2 through 5 for each user or user group that requires access to this partition.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

- Grant the EWD PMO [sn_spm_ewd.ewd_pmo] role to users who require visibility across all partitions, such as PMO leads and portfolio managers who need enterprise-wide access across all functions. For details, see Assign PMO role for visibility across all partitions.
- Verify that the role assignment is working correctly by impersonating the user and confirming that record visibility matches the expected access level for the assigned role. For details, see Verify partition configuration.

Assign PMO role for visibility across all partitions

Grant users or user groups access to partitioned records in Enterprise-Wide Deployment by assigning the appropriate EWD PMO role.

Before you begin

Role required: admin

About this task

You can assign the EWD PMO [sn_spm_ewd.ewd_pmo] role to individual users or user groups. Applying this role to a group grants access to all members of that group. The role grants edit access to the data across all partitions regardless of the assigned partition role. This is intended for PMO users who require enterprise-wide visibility across all functions.

Important: Assign the EWD PMO role only to users who need cross-partition access, as it grants visibility to data across all partitions. This role does not replace base role requirements. Users must still have the appropriate base roles — for example, it_project_manager — to access projects and related records.

For more information on roles installed with Enterprise-Wide Deployment, see the Roles table in Components installed with Enterprise-Wide Deployment.

Procedure

1. Navigate to **All** > **User Administration** > **Users**.
2. Search for the user record or user group to which you want to assign the EWD PMO (sn_spm_ewd.ewd_pmo) role.
3. In the Roles related list, select **Edit**.
4. In the **Collection** list, select the required EWD PMO role — *sn_spm_ewd.ewd_pmo* and then select **Add**.
5. Select **Save**.
   The selected EWD PMO role is assigned to the user or user group. The user can access partitioned records according to the permissions of the assigned role.

What to do next

Verify that the role assignment is working correctly by impersonating the user and confirming that record visibility matches the expected access level for the assigned role. For details, see Verify partition configuration.

Verify partition configuration

Verify that partitions are configured correctly by impersonating users with different partition roles and checking that record visibility is enforced across all workspaces.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- You have completed all partition configuration steps:
  - Partitions created and partition criteria configured for all supported tables. For details, see Create and configure a partition.
  - Partition roles are assigned to the relevant users or user groups. For details, see Assign partition role for access to the partition.
- You have access to impersonate users in the system.
- Test records exist in the supported tables for each partition — for example, projects and demands created for both IT Operations and HR Learning and Development departments.

Role required: admin

Procedure

1. Impersonate a user assigned to the first partition role and confirm workspace visibility.

   Example
   For example, impersonate a user assigned the `it_ops` role for the IT Operations partition.

   a. Open **Project Workspace** and confirm that only records from the user's partition are visible in list views, search results, and dashboards.
   Only IT Operations projects and demands are visible. No records from other partitions, such as HR Learning and Development, appear.

2. Stop impersonating, then impersonate a user assigned to a different partition role and repeat the workspace checks.

   Example
   For example, impersonate a user assigned the `hr_ld` role for the HR Learning and Development partition.
   Only HR Learning and Development records are visible. No IT Operations records appear in any workspace, list view, search result, or dashboard.

3. Stop impersonating, then impersonate a user assigned to roles for multiple partitions and confirm workspace visibility.

   Example
   For example, impersonate a portfolio lead who has both the `it_ops` and `hr_ld` roles assigned.

   a. Open **Project Workspace** and confirm that records from all the user's assigned partitions are visible in a single view, with no duplication.

4. Stop impersonating, then impersonate a user with the EWD PMO [sn_spm_ewd.ewd_pmo] role.

   a. Open **Project Workspace** and confirm that records from all partitions are visible, regardless of department.

Result

Partition configuration is complete when all of the following conditions are met:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Users see only the records belonging to their assigned partition across all supported views and tables.
- Users assigned to multiple partitions see records from all their assigned partitions, with no duplication.
- Users with the EWD PMO role have visibility across all partitions.

Update partition details for existing records

Update existing records in the project, demand, programs, portfolios, and planning item tables with partition details by running the *Update existing records with partition details* scheduled job.

Before you begin

Role required: admin

Important: This is a one-time job and is not meant to be run on a recurring schedule. Run it after you have completed partition configuration and assigned partition roles to users or user groups.

About this task

- Existing records in the project, demand, and planning item tables don't have partition details stamped. Run this scheduled job to update those records with the correct partition details based on the partition criteria EWD admin has configured.
- Running this job enables segmentation for access control and configuration mapping on the updated tables, ensuring that existing records are subject to the same partition-based visibility rules as newly created records.
- If you add new related tables to your partition configuration, you can clone this job and modify it to stamp partition values on records in those newly added tables.

Procedure

1. Navigate to **All** > **System Definition** > **Scheduled Jobs**.
2. Search for and select the *Update existing records with partition details* scheduled job.
3. On the Scheduled Script Execution form, ensure that the **Run** field is set to **On Demand**.
4. Select **Execute Now**.
   The scheduled job runs and stamps partition details on all existing records in the project, demand, and planning item tables based on the configured partition criteria. After the job completes, segmentation for access control and configuration mapping is enabled on the updated records.

SPM Enterprise-Wide Deployment reference

Reference information to provide additional details about Enterprise-Wide Deployment and Extended Security for Enterprise-Wide Deployment such as the fields, user roles, tables, scheduled jobs, and system properties information.

Components installed with Enterprise-Wide Deployment

Several types of components are installed with installation of the Enterprise-Wide Deployment application, such as user roles, tables, and scheduled jobs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles installed

The following roles are installed with Enterprise-Wide Deployment and govern partition creation, access, and visibility.

EWD roles

Role title [name]	Description
EWD Admin [sn_spm_ewd.ewd_admin]	Can create and configure partitions. Users with this role can define partition criteria, associate a role with the partition, and manage all partition settings.
EWD PMO [sn_spm_ewd.ewd_pmo]	Grants visibility across all partitions regardless of the assigned partition role. This role is intended for PMO users who require enterprise-wide visibility.

Tables installed

Table [ID]	Description
Partition [sn_spm_ewd_partition]	Stores partition details that define a data separation boundary, with an assigned role association and criteria configuration.
Partitioned table [sn_spm_ewd_partitioned_table]	Stores partitioned table details that define the scope of data separation, with a criteria field configuration that controls record visibility for each supported table.
Partition Dashboard [sn_spm_ewd_partition_dashboard]	Stores the mapping between a partition and a dashboard for an experience, such as Demand Management.

Scheduled jobs installed

The following scheduled jobs are installed with Enterprise-Wide Deployment.

EWD scheduled jobs

Job name	Description
Update existing records with partition details	Populates partition values on existing records — projects, demands, programs, and portfolios — that were created before partition configuration was completed. Run this job after defining partitions to associate historical records with the correct partition.

System properties installed

The following system properties are installed with Enterprise-Wide Deployment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

EWD system properties

System property name	Description
sn_spm_ewd.allow_admin_access_to_all_partitions	Determines whether system administrators bypass partition role requirements to access partitioned data. Default: **false** — System administrators must have the appropriate partition role to access partition-protected data. Set to **true** to grant administrators access to all partitioned data without partition role assignment.

Supported tables for partition

Several tables are supported for partition using Enterprise-Wide Deployment, including direct and indirect related tables for each entity.

The following tables list the tables and their related entities that are supported for segregating data using the partition feature in Enterprise-Wide Deployment.

Parent tables supported for partition

Table label	Table ID

Learn the features and key benefits	Activate AI skills for CWM

ServiceNow Otto introduced AI on the platform. As that experience has evolved, there's a new name for the experience. ServiceNow Otto® is the conversational AI platform integrated into ServiceNow workflows. It provides agentic capabilities, supports multimodal interactions across web, mobile, and messaging channels, and enables autonomous orchestration for cross-system workflows.

Note: Depending on your license, you will have access to certain application features, generative AI skills, agentic workflows, and AI agents. For more information, see ServiceNow product tiers.

Important:

- Not all model providers are available for customers with in-country SKUs, and some AI products/features are currently unavailable for in-country customers. For more information, see the KB1584492 article in the Now Support Knowledge Base. Be sure to check for model provider availability updates in future releases.
- Some AI products/features are currently unavailable for customers in the FedRAMP, NSC DOD IL5, or Australia IRAP-Protected data centers, self-hosted customers, or in other restricted environments. For more information, see the KB0743854 article in the Now Support Knowledge Base. Be sure to check for availability updates in future releases.
- Some AI products/features are currently available only for customers in some regions. Be sure to check for availability updates in future releases.
- Some AI products and skills are not available in Regulated Markets. For more information, see KB2593939: Regulated Markets AI Products/Skills Not Available. Be sure to check for availability updates in future releases.

You can use Now LLM Service, Azure OpenAI, Google Gemini or Anthropic Claude on AWS as the AI model provider for all generative AI skills and AI agents. Use the Configuration Controls in AI Control Tower to define which options are available, then set the skill-level preferences in the AI Admin Hub console. For more information, see Large language models on the ServiceNow AI Platform.

AI limitations

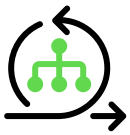
This application uses artificial intelligence (AI) and machine learning, which are rapidly evolving fields of study that generate predictions based on patterns in data. As a result, this application may not always produce accurate, complete, or appropriate information. Furthermore, there is no guarantee that this application has been fully trained or tested for your use case. To mitigate these issues, it is your responsibility to test and evaluate your use of this application for accuracy, harm, and appropriateness for your use case, employ human oversight of output, and refrain from relying solely on AI-generated outputs for decision-making purposes. This is especially important if you choose to deploy this application in areas with consequential impacts such as healthcare, finance, legal, employment, security, or infrastructure. You agree to abide by ServiceNow's AI Acceptable Use Policy, which may be updated by ServiceNow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data processing

This application requires data to be transferred from ServiceNow customers' individual instances to a centralized ServiceNow environment, which may be located in a different data center region from the one where your instance is, and potentially to a third-party cloud provider, such as Microsoft Azure. This data is handled per ServiceNow's internal policies and procedures, including our policies available through our CORE Compliance Portal.

Data collection



ServiceNow collects and uses the inputs, outputs, and edits to outputs of this application to develop and improve ServiceNow technologies including ServiceNow models and AI products. In addition, this application will collect task data (for Case Assist) and chat transcripts (for Chat Assist). Customers can opt out of future data collection at any time, as described in the Now Assist Opt-Out page.

For more information, see the Now Assist documentation.

Retail Strategic Portfolio Management Suite

Retail Strategic Portfolio Management Suite (SPM Retail) helps retail organizations plan, manage, and track strategic initiatives across their operations.

project managers a ready-made, step-by-step roadmap for every store scenario. As a result, they execute consistently and never have to invent the sequence or approvals.

Retail projects

Retail customers regularly execute standard store-related operations such as opening new stores, closing under performing stores, refurbishing existing stores, and relocating stores. These are recurring, high-volume activities common across the retail industry. Retail customers often manage these store operations across many disconnected tools, creating three pain points:

- Senior executives and management don't have a single platform to see all store-related projects in one place. They also can't track any underlying milestones like signing a lease or grand opening dates.
- Project managers coordinate manually across scattered tools, chasing multiple stakeholders and managing spreadsheets instead of using a single workflow.
- Delivery teams such as IT deployment, construction, and procurement don't have easy access to complete their assigned work and report status to leadership.

To learn more about retail projects, see Explore retail projects.

Playbooks for retail projects

Playbooks give retail organizations a prescribed, repeatable way to guide store life-cycle projects through every stage from initiation to closeout. The right activities are executed by the right teams at the right time.

Without a prescribed playbook, retail organizations face three pain points:

- Project managers rely on incomplete knowledge or personal checklists to decide what activities to run, in what order, and when to involve which team.
- Critical activities such as compliance sign-offs, lease approvals, asset recovery confirmations, and final readiness reviews are skipped, delayed, or completed in the wrong sequence.
- New project managers and delivery teams have no documented guidance to learn from, so onboarding to retail store operations is slow and inconsistent.

These playbooks work as stages, prescribed activities, approvals, and checkpoints to tailor them specifically for retail store operations. Each playbook is attached to its corresponding project type and guides every persona through the same sequence on one platform.

To learn more about playbooks, see Explore playbooks for retail projects.

Explore retail projects

Retail Strategic Portfolio Management Suite enables retail organizations to plan, execute, and track store life cycle projects such as new store openings, closures, refurbishments, relocations, and technology refreshes.

Retail Strategic Portfolio Management Suite overview

Retail Strategic Portfolio Management Suite is a purpose-built extension of the Strategic Portfolio Management workspace that gives retail organizations a structured, repeatable way to manage store life cycle projects. It brings together project templates, retail-specific project fields, and stage-gate playbooks into a single interface. By consolidating project planning, milestone tracking, and portfolio visibility, the suite means you don't have to coordinate across disconnected tools or spreadsheets. You can select a project type, apply a predefined template, capture key dates, and guide your team through each stage from initiation to completion.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Playbooks verify that every store project follows a consistent governance process regardless of the project manager or store location.

Retail projects in Retail Strategic Portfolio Management Suite are structured, template-driven work items that guide teams through store life cycle scenarios.

The Retail Strategic Portfolio Management Suite works as an extension to the existing SPM capabilities such as project templates, project fields, playbooks, and workflows to tailor them specifically for retail store operations giving all the personas a connected experience on one platform.

Retail companies run hundreds of store projects every year. A large grocery chain might be opening 40 new stores, refurbishing 120 others, closing 15, and refreshing technology in 200, all in the same fiscal year. These projects typically have three core problems.

- No standardization across projects: Every project manager builds their own project plan, task lists, and approval checkpoints. Store #412 might open with a 47-task plan and store #413 with a 62-task plan, created by different project managers. There is no consistency when reporting progress and updates to leadership because every project is structured differently.
- Manual coordination across teams: a single new store opening touches verticals such as real estate, construction, IT deployment, procurement, compliance, store operations, marketing, HR, and finance. Project managers handle this manually through emails and significant human effort, with no automation or connected workflow.

  For example: If the IT team doesn't get notified that construction is complete, POS installation sits idle for weeks.

- No visibility at the portfolio level: executives need to know how all store projects are progressing against timeline, budget, and completion targets. Without a common data model (shared fields, shared milestones, shared project types), rolling up status, comparing progress, or spotting risks across the portfolio is difficult.

Common project structure for every store scenario

When starting a new project, users select a project type such as **New Store Opening** or **Store Closure**. That selection filters the project to a set of predefined project templates containing the right tasks, milestones, dependencies, and durations for that specific scenario. Every new store opening starts from the same foundation. Every closure follows the same sequence.

For example, a New Store Opening template comes preloaded with tasks organized across phases like initiation, design and permitting, procurement, site readiness, construction, IT setup, fixtures, and go-live.

Make project tasks visible to store teams

Some of the work in a store life cycle project is completed by the store itself rather than by a headquarters team. Set the **Visible to customer** field on a project task to let the assigned store team see that task and act on it in Retail. A project task without this field set remains visible only to headquarters.

Store personas see only the project tasks for the retail organization that they belong to, so a task that is tagged to one store isn't visible to the staff of another store. For information about how store teams work these tasks, see Project tasks in Retail.

Retail-specific project fields that enable structured tracking

Each project type consists of custom fields to the project record that capture the key dates and milestones specific to that scenario. These project fields capture meaningful data points.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- For a New Store Opening, you get fields such as Site approval date, Construction start date, IT installation date, and Store go-live date.
- For a Store Closure, you get fields such as Closure decision date, Last trading day, Asset recovery completion date, and Closure confirmation date.
- For a Technology Refresh, you get fields such as Refresh approval date, Installation scheduled date, Installation completion date, and Store handover date.

These fields serve two purposes: they give project managers a clear dashboard of where the project stands at key inflection points. They also give leadership a set of consistent, comparable data points across every project of the same type. When every store closure captures a Last trading day in the same field, you can report on that across the entire portfolio.

Portfolio-level visibility across all store projects

Every project of a given type shares the same fields, templates, and milestones, enabling a consistent reporting layer. With the Retail Strategic Portfolio Management Suite offering, status updates are available automatically without manually gathering and organizing data from differently structured project plans.

Life-cycle scenarios offered with the retail suite

Each scenario has its own template, its own set of project fields, and its own guided playbook. These aren't five separate products; they're five configurations of the same underlying framework, all managed within the Workspace sharing the same reporting infrastructure and visible in a single portfolio view.

Store life-cycle scenarios

Scenario	Offerings	Key milestones offered
New Store Opening	End-to-end from business case through grand opening and handover	Site approval date, Construction start date, IT installation date, Store go-live date
Store Refurbishment	Temporary shutdown, renovation, technology re-enablement, and reopening of an existing store	Refurbishment approval date, Decommissioning start date, Fit-out completion date, Re-opening date
Store Closure	Controlled wind-down from closure decision through asset recovery, decommissioning, and financial reconciliation	Closure decision date, Last trading day, Asset recovery completion date, Closure confirmation date
Store Relocation	Decommissioning the current store, preparing the new site, transferring operations	Relocation approval date, Current store closure date, New site readiness date, Relocation completion date
Technology Refresh	Replacing aging IT hardware (POS, routers, network) in an operational store	Refresh approval date, Installation scheduled date, Installation completion date, Store handover date

© 2026 ServiceNow, Inc. All rights reserved.

Retail Strategic Portfolio Management Suite benefits

Retail Strategic Portfolio Management Suite provides benefits for retail project managers and their organizations.

- Standardized project structure for every store scenario: Retail Strategic Portfolio Management Suite provides predefined project templates for each store life cycle scenario.
- Milestone tracking for store scenarios: Each project type includes custom fields that capture the key dates and milestones specific to that scenario. These dates include site approval date, construction start date, IT installation date, and store go-live date. These fields give leadership a consistent, comparable set of data points across every project of the same type.
- Playbook-guided store life cycle: Stage-gate playbooks define the sequence of stages and activities that each store project must complete before advancing. Project managers are guided through required inputs, approvals, and validations at every stage, from initiation through handover.
- Portfolio-level visibility across all store projects: Because every project of a given type shares the same fields, templates, and milestones, status updates are available automatically. Executives can compare progress, identify risks, and report on the portfolio without manually gathering data from differently structured project plans.

What to explore next

- Configure Retail Strategic Portfolio Management Suite
- Using Retail Strategic Portfolio Management Suite
- Retail Strategic Portfolio Management Suite References

Explore playbooks for retail projects

Playbooks in Retail Strategic Portfolio Management Suite provide a guided, structured approach to managing store life cycle projects from initiation to completion, helping project teams follow a consistent process across every store scenario.

Without prescribed playbooks, high-volume store projects typically have three core problems.

- No prescribed workflow: Every project manager decides their own activity sequence, and approval points. Store #412 might run a permit check before site survey and store #413 might run them in reverse, created by different project managers. There is no consistency in how activities are executed or when stage transitions occur.
- Activities executed at the wrong time or skipped entirely: a single new store opening requires dozens of coordinated activities such as site approval, lease execution, fit-out sign-off, IT readiness, and pre-opening compliance. Without a playbook enforcing sequence and completion, activities get skipped, executed out of order, or repeated unnecessarily.

  For example: If the pre-opening compliance check happens before fixtures are installed, the inspection has to be redone, delaying the grand opening.

- No embedded approvals and checkpoints: leadership needs gated approval points to control go/no-go decisions on capital spend, lease commitments, and store readiness. Without a playbook (shared stages, shared approvals, shared exit criteria), enforcing consistent governance across every store project is difficult.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Common playbook structure for every store scenario

When a project of a given type is created, the corresponding playbook attaches automatically and guides the project through a predefined sequence of stages. Each stage contains the prescribed activities, approvals, and exit criteria for that scenario. Every new store opening follows the same playbook sequence. Every closure follows the same wind-down playbook.

For example, a New Store Opening playbook comes preloaded with stages such as initiation, design and permitting, procurement, site readiness, construction, IT setup, fixtures, and go-live. Each stage contains the prescribed activities that must be completed before transitioning to the next stage.

Retail-specific playbook stages that enable guided execution

Each playbook is organized into stages tailored to the scenario, with the prescribed activities and approvals that must be completed at each stage.

- For a New Store Opening, you get stages such as Site selection and approval, Lease execution, Design and permitting, Construction, IT and fixtures, and Pre-opening readiness.
- For a Store Closure, you get stages such as Closure planning, Customer and employee communication, Final trading, Asset recovery and decommissioning, and Financial reconciliation.
- For a Technology Refresh, you get stages such as Refresh planning, Hardware procurement, Installation scheduling, On-site installation, and Store handover.

Store life-cycle playbooks

Scenario	Playbook coverage	Key stages offered
New Store Opening	End-to-end guided execution from business case through grand opening and handover	Site selection and approval, Lease execution, Design and permitting, Construction, IT and fixtures, Pre-opening readiness, Go-live
Store Refurbishment	Guided sequence for temporary shutdown, renovation, technology re-enablement, and reopening of an existing store	Refurbishment planning, Decommissioning, Fit-out and renovation, Technology re-enablement, Reopening readiness
Store Closure	Controlled wind-down playbook from closure decision through asset recovery, decommissioning, and financial reconciliation	Closure planning, Customer and employee communication, Final trading, Asset recovery and decommissioning, Financial reconciliation
Store Relocation	Guided sequence for decommissioning the current store, preparing the new site, and transferring operations	Relocation planning, Current store wind-down, New site readiness, Operations transfer, Relocation closeout
Technology Refresh	Guided sequence for replacing aging IT hardware (POS, routers, network) in an operational store	Refresh planning, Hardware procurement, Installation scheduling, On-site installation, Store handover

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

These stages serve two purposes: they give project managers a prescribed sequence of activities to execute without inventing the process. They also give leadership consistent stage-based status across every project of the same type. When every new store opening progresses through the same Pre-opening readiness stage, you can report on stage-level progress across the entire portfolio.

Embedded approvals and exit criteria at every stage

Every playbook stage includes the approvals, sign-offs, and exit criteria required before the project can transition to the next stage. With the Retail Strategic Portfolio Management Suite playbooks, governance is built into the project flow rather than relying on offline review meetings or ad hoc emails, so capital commitments, lease decisions, and go-live readiness are gated consistently across every project.

Portfolio-level visibility across all playbook stages

Every project of a given type runs the same playbook with the same stages and activities, enabling a consistent stage-based reporting layer. With the Retail Strategic Portfolio Management Suite playbooks, stage progress and activity completion rollups are available automatically without manually gathering status from differently structured project plans.

Purpose of playbooks in Retail Strategic Portfolio Management Suite

Playbooks provide a structured way to manage store life cycle projects by guiding project teams through predefined stages and activities. They show what to do, when to do it, and what information is required to complete each step. For more information on playbooks and how to create them, see Workflow studio playbooks.

In Retail Strategic Portfolio Management Suite, playbooks help project managers and delivery teams in the following ways:

- Understand which activities must be completed at each stage of a store project.
- Track required inputs, approvals, and validations before a project can progress to the next stage.
- Verify that every store project follows the organization's standard governance process regardless of the project manager or store location.
- Provide built-in process guidance within the project record, reducing dependency on informal or undocumented knowledge.
- Maintain consistency across all store projects of the same type, whether a new store opening or a technology refresh.
- Define multiple standardized governance processes to support different store life cycle scenarios.

How playbooks work for store projects

When a playbook is applied to a store project, the following processes take place:

- Store project life cycle stages such as initiation, site readiness, construction, IT setup, and go-live are outlined.
- Stages contain activities and tasks tailored to the specific store scenario, such as obtaining site approval, scheduling IT installation, or confirming asset recovery.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Project managers are guided through stage dependencies before the project can advance to the next phase.
- Project records automatically capture progress and trigger actions such as service requests and approvals as tasks are completed.

For example, a New Store Opening project uses a playbook to guide its progress as follows:

- The initiation stage prompts the project manager to capture the site approval date and confirm the project scope.
- The construction stage tracks the construction start date and triggers a service request to the IT deployment team when the construction milestone is complete.
- The IT setup stage guides the team through various stages such as POS installation, network configuration, and system testing.
- The go-live stage confirms the store go-live date and finalizes the handover to store operations.

As each stage is completed, the playbook helps verify that the project follows the standard life cycle without missing any required steps.

In Retail Strategic Portfolio Management Suite, playbooks are triggered by project creation. A playbook is associated with a project record based on the selected project type. The Playbook page appears in the project record when the trigger condition is met.

Playbooks for store life cycle scenarios

Retail Strategic Portfolio Management Suite includes predefined playbooks for each store life cycle scenario, available in Workflow Studio. Each playbook is a stage-gate playbook in which each stage must be finished before moving to the next one. Stages are visible only after all activities in the preceding stage are completed or skipped.

Note: These playbooks are ready to use without additional configuration. Configure playbooks only when you must customize an existing playbook or create one for your organization's specific store workflows.

- New Store Opening playbook — Guides the project team from business case approval through site readiness, construction, IT installation, and store go-live.
- Store Refurbishment playbook — Covers the temporary shutdown, renovation, technology re-enablement, and reopening of an existing store.
- Store Closure playbook — Manages the controlled wind-down from closure decision through last trading day, asset recovery, and closure confirmation.
- Store Relocation playbook — Guides decommissioning of the current store, preparation of the new site, and transfer of operations.
- Technology Refresh playbook — Covers the replacement of aging IT hardware such as POS systems, routers, and network equipment in an operational store.

Playbook benefits

Playbooks add value to store life cycle management in the following ways:

- Standardizing project intake: Confirming that required information such as project type, key dates, and site details is captured at the start of every project.
- Providing step-by-step guidance: Supporting project managers and delivery teams through each stage of a store project.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Supporting governance: Providing stage gating for approvals, site readiness checks, and handover confirmations.
- Improving portfolio visibility: Showing exactly where each store project sits in its life cycle and what is blocking its progress.

Explore Retail Strategic Portfolio Management Suite

Configure Retail Strategic Portfolio Management Suite

Configure Retail Strategic Portfolio Management Suite (SPM Retail) to manage store life cycle projects such as new store openings, closures, refurbishments, relocations, and technology refreshes. Follow the configuration overview or use guided setup to get started.

1. Install the Retail Strategic Portfolio Management Suite from the ServiceNow Store.

   For more information, see Install Retail Strategic Portfolio Management Suite.

2. Add members to Retail HQ Group who can receive playbook stage approval requests.

   For more information, see Add members to HQ group to complete playbook.

Install Retail Strategic Portfolio Management Suite

Install Retail Strategic Portfolio Management Suite from the ServiceNow to add retail workforce management capabilities to your instance. You need the admin role to complete this task.

Before you begin

- Install Enterprise-Wide Deployment app (sn_spm_ewd) from the ServiceNow® Store.
- Install Project Workspace app (sn_pw) from the ServiceNow® Store.
- Install Business Location app (app-business-location) from the ServiceNow® Store.
- Install Customer Service app (app-csm-ppm) from the ServiceNow® Store.
- Role required: admin

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Retail Strategic Portfolio Management Suite application using the filter criteria and search bar.

   Alternatively, you can:

   - Use the link to download the application, https://store.servicenow.com/sn_appstore_store.do#!/store/application/edaa84c493faf2107f0914cbe9373cfe/2.0.0
   - Search for the application by its name or ID (sn_spm_retail). If you can't find an application, you may have to request it from ServiceNow store.

3. In the Application installation dialog box, review the application dependencies.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If your application requires other applications, install them first if they aren't already installed. Installing your application also automatically installs the dependent applications or plugins if they aren't installed already.

4. If you want to install demo data, select **Load demo data**.
   Demo data includes sample records that describe application features for common use cases. Load demo data when you first install the application on a development or test instance.
5. Select **Install**.

Add members to HQ group to complete playbook

Add approvers to the Retail HQ Governance group so the system can send playbook stage approval requests when all sections are marked complete or skipped.

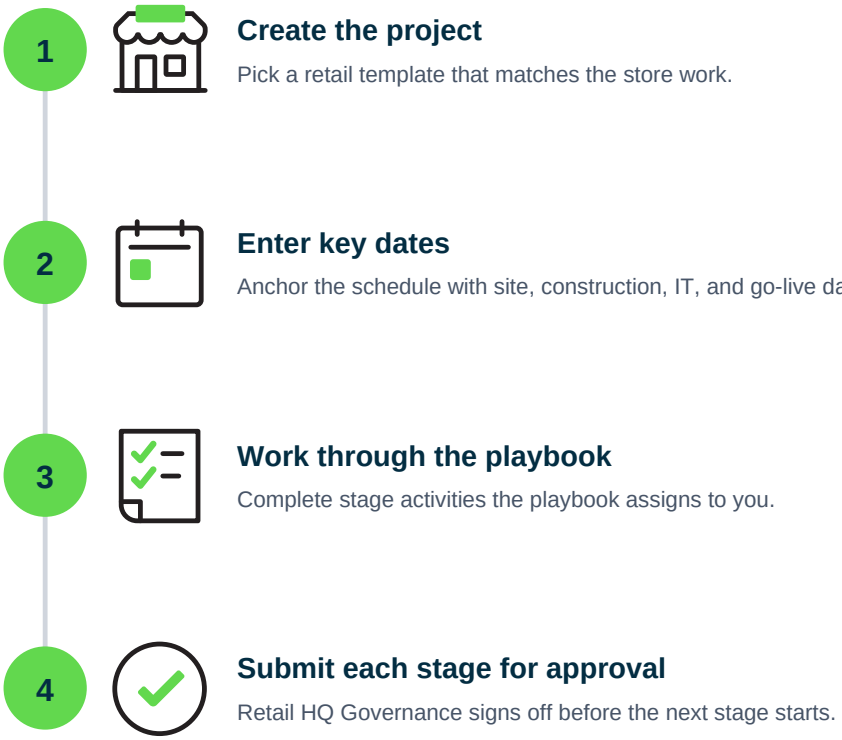
Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System Security** > **Users and Groups** > **Groups.**.
2. Filter the Name field to locate and open **Retail HQ Governance**.
3. In the Group Members related list, select **Edit**.
4. Add required members who can approve the playbook stages from Collection to Group Members List and select **Save**.
5. Select **Update** in the Retail HQ Governance group record page.

Result
The selected members are added to the Retail HQ Governance group and can receive playbook stage approval requests.

Using Retail Strategic Portfolio Management Suite



ServiceNow Retail Strategic Portfolio Management Suite (SPM Retail) is a retail-focused extension to the Strategic Portfolio Management's workspace facilitating customers to manage the retail stores.

Overview of creating and managing retail projects

To set up and manage retail projects in Retail Strategic Portfolio Management Suite, follow the process shown in this infographic.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Creating and managing a retail project

1. Create a retail project

   Create a retail project from a template that matches the store work, such as a new store opening, relocation, refurbishment, technology refresh, or closure.

2. Enter project type fields

   Capture the key project dates such as site approval, construction start, IT installation, and store go-live — to categorize and track the project.

3. Use playbooks

   Work through the stage-gate playbook assigned to the project, completing activities and submitting each stage for approval before moving to the next.

Playbooks for retail projects

Each project template in Retail Strategic Portfolio Management Suite is paired with a stage-gate playbook that walks the project manager through the work from start to finish. When you create a project from a template, the respective playbook is reflected automatically based on the project type. Selecting the Retail New Store Opening template applies the New Store Opening playbook.

Within each stage, the playbook lists the activities the project manager reviews or enters, including checklists for work performed by store operations, IT, finance, or real estate teams. It also includes field inputs for key project dates like the site approval, store go-live, last trading day, or installation completion. Each stage closes with an approval step, where the project manager submits the stage to the leadership for sign-off before the project moves forward.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following playbooks are available, one for each retail project template:

- New store opening
- Store relocation
- Store refurbishment
- Store technology refresh
- Store closure

Create a retail project

Set up a retail project from a template to plan and track store operations, including store openings, relocations, refurbishments, technology refreshes, and closures.

Before you begin

Role required: sn_spm_retail.project_manager

Procedure

1. Navigate to **Workspaces** > *Project Workspace*.
2. Create a retail project using one of the options.
   - Select **New project**.
   - Select **New project from template**.
3. Select **Customer Project** from the Project class.
4. Select a project template using the **Project type** list that matches the type of store work from the following options.
   - **Retail New Store Opening** to open a new store.
   - **Retail Store Relocation** to move an existing store to a new location.
   - **Retail Store Refurbishment** to refurbish an existing store.
   - **Retail Store Technology Refresh** to upgrade in-store technology, for example POS systems, security cameras, or network connectivity.
   - **Retail Store Closure** to close a store.
5. Enter a unique name in the **Project name** field.
6. Select the planned date to start work using the **Planned start date** calendar palette.
7. Select **Confirm**.
8. Select the **Details** menu from the menu.
9. Select the name of the store for which the project is being executed using the **Service organization** field.

Result

A project is created based on the selected project template with tailored project task and playbook. You will see a the Planning page with prepopulated project tasks and their dependent tasks.

What to do next

Enter the key dates of your work in Project Type list from the Details tab. For more details, see Enter project type fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Enter project type fields

Define the key dates to categorize and manage retail projects using the Retail Strategic Portfolio Management Suite.

Before you begin

Role required: sn_spm_retail.project_manager

Procedure

1. Navigate to **Workspaces** > *Project Workspace* and open an existing retail project.
2. Select **Details** tab from the side pane and select the **Project Type** related list.
3. Enter the dates for the selected project type.
   Each project template displays fields specific to that project type. For more information about the fields and their descriptions, see Project Type Fields form.
4. Select **Apply** or **Save** to save the entered dates.

What to do next

- Manage tasks and track project health using baselines and status reports. For more information, see Managing projects with Project Workspace.
- Assign tasks and work items to resources by creating resource assignments. For more information, see Resource planning with Project Workspace.
- Create and track financial records for your project expenses using the Financials tab. For more information, see Managing financials for your projects.

Use playbooks

Use a playbook to guide a retail store project through each stage of its life cycle, from initiation to go-live or closure. Playbooks provide step-by-step activities within each stage, confirming that required information is captured and governance processes are followed.

Before you begin

Role required: sn_spm_retail.project_manager

About this task

A playbook defines the stages of a retail store project and includes action items to complete at each stage. The Retail Strategic Portfolio Management Suite, includes predefined playbooks for each store life cycle scenario and is triggered automatically when a project is created. For more information about the available playbooks, see Explore playbooks for retail projects.

Note: The playbook presents project information in a guided, stage-based workflow.

Procedure

1. Navigate to **Workspaces** > *Project Workspace*.
2. Open an existing retail project or create one.
   For more information on creating retail projects, see Create a retail project.
3. Select **Playbooks** from the L-2 (level 2) navigation menu.
4. Select a stage to view its activities.
   Each activity displays its status (**In Progress**, **Pending**, or **Complete**) and the fields or lists to update.

   Note: The default playbook is a stage-gate playbook, that is, a stage is unlocked only when its prior stages are marked as completed or skipped.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Complete the activities within each stage.
   - Select **Mark Complete** to mark the activity as done and move to the next activity.
   - Select **Save** to save your progress without completing the activity.
   - Select **Skip** to bypass the activity and move to the next one.

   Note: When all sections in a stage are marked complete or skipped, the system sends an approval request to members of the Retail HQ Governance group.

   Admins can create a playbook by defining the trigger condition in Workflow Studio. For more information, see Triggers.

   For more information on how to create and use playbooks, see Building Playbooks and Designing Playbook Experience.

Work with retail project tasks in Employee Slate

The My Retail Project Tasks widget shows employees a quick view of the customer project tasks assigned to them on the Employee Slate.

The My Retail Project Tasks widget is a canvas widget on the Employee Slate for the Retail Strategic Portfolio Management Suite. It gives employees visibility into their customer project tasks without leaving their dashboard.

The widget displays count of the tasks assigned to the logged-in user. Each task in the list shows its short description, current status, and the project it belongs to.

From the widget, employees can take two actions:

- Select a task to open its task details.
- Select the expand icon to open the full list of assigned customer project tasks.

If an employee has no assigned customer project tasks, the widget displays an empty state message instead of a list. If the task data fails to load, the widget displays an error message.

Users need sn_csm_ppm.viewer role to view the widget and sn_csm_ppm.project_task_writer to edit the task records.

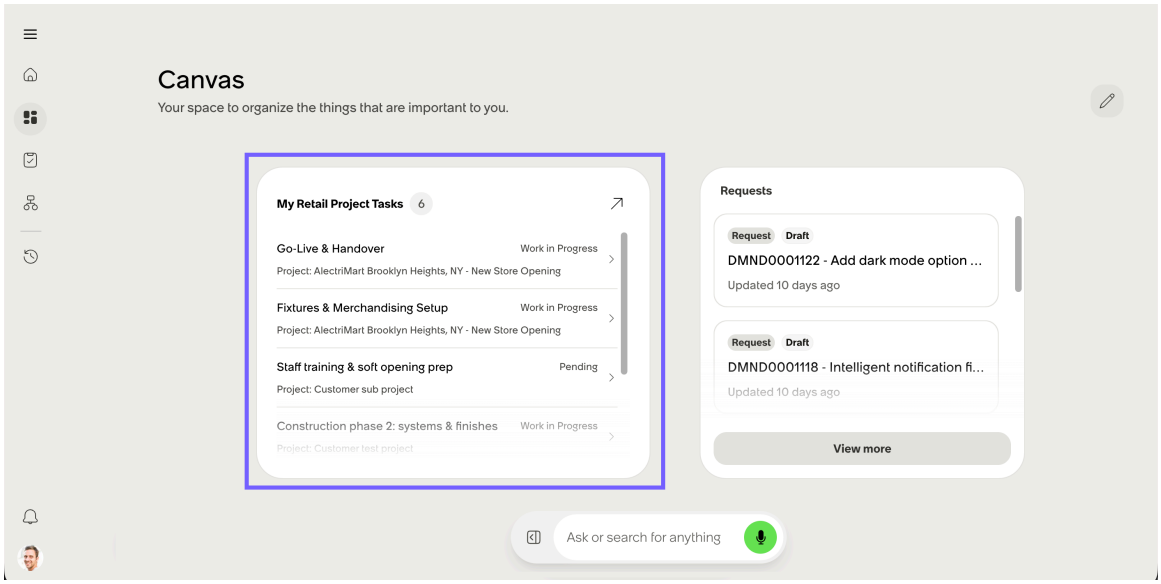
Manage a customer project task in Employee Slate

Add work notes, attachments, or edit the customer project tasks details using the My Retail Project Tasks widget on your Employee Slate.

Before you begin
Role required: sn_csm_ppm.project_task_writer

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure



1. Navigate to Employee late using the following URL.

   ```
   https://<instance-name>.service-now.com/aiux/employeeslate/home
   ```

   Note: The URL may change based on your configuration in Branding and Theme.

2. Select **Canvas** from the side menu.
3. If you don't see the My Retail Project Tasks widget, add the widget as follows.
   a. Select the **Edit** icon.
   b. Select **Add item**.
   c. Select the check box against My Retail Project Tasks widget and select **Add item**. Widget is added to your canvas and it lists all the task which are assigned to you.
4. Select a task name from the widget to review or update a task.

   To view all of your assigned customer project tasks, select the open full list icon in the widget header.

   The task detail page opens for the selected task.
5. Edit the required fields from Task details, Activity, Attachments, Checklist, or Dependencies section and select **Save**.

Store refurbishment form fields

Field	Description
Refurbishment approval date	Date on which the store refurbishment receives formal approval to proceed.
Decommissioning start date	Date on which decommissioning of the existing store setup is scheduled to begin.
Fit-out completion date	Date on which the store fit-out work is scheduled to be complete.
Re-opening date	Date on which the refurbished store is scheduled to reopen for operations.

Store technology refresh project type form fields

Technology refresh form fields

Field	Description
Refresh approval date	Date on which the technology refresh receives formal approval to proceed.
Installation scheduled date	Date on which the installation of new technology is scheduled to begin.
Installation completion date	Date on which the technology installation is scheduled to be complete.
Store handover date	Date on which the store is handed over after the technology refresh is complete.

Store closure project type form fields

Store closure form fields

Field	Description
Closure decision date	Date on which the decision to close the store is formally made.
Last trading day	Date on which the store is scheduled to trade for the last time.
Asset recovery completion date	Date on which the recovery of store assets is scheduled to be complete.
Closure confirmation date	Date on which the store closure is formally confirmed.

Goal Framework and Goal Framework for SPM

Create goals, set targets for them, and evaluate the progress of the goals and targets to accomplish your organizational plans and drive business outcomes using ServiceNow® Goal Framework.

The ServiceNow® Goal Framework for Strategic Portfolio Management (SPM) application (formerly known as Advanced Goal Framework) enables you to automate the actual value of your targets. The Goal Framework for SPM application is an extension to the Goal Framework

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

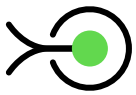
application. When you install the Goal Framework for SPM application, you get all the features of Goal Framework as well as the target automation feature.

Using Goal Framework, you can define strategic priorities and associated goals for your organization as part of strategic plans. After goals are created, you can then associate work, planning items, and strategic items such as demand, project, epic, program, and initiative.

The ServiceNow® Strategic Planning users can define personalized portfolio plans using lenses for your organization and use them to align your goals according to your organization's portfolio plans. For information on how a portfolio plan is defined using a lens, see Lens and portfolio plans. You can also create strategic plans, capturing the vision, mission, and values for your organization.

Key benefits of Goal Framework:

- Helps ensure that the entire organization focuses efforts on the same strategic priorities.
- Makes goals that align and focus effort visible.
- Enables the association of work or planning items with goals so that the work being done to accomplish goals and meet targets is easily visible.
- Provides real-time checkpoints for goals over weekly, monthly, and quarterly durations.
- Provides an end-to-end view of goal performance to users with the sn_gf.epmo_strategy_planner role.



Key benefits of Goal Framework for SPM:

- Enables you to automate the actual value of your targets by collecting the actuals from different target sources such as benefit plans, cost plans, assessments/surveys, and PA Indicators.
- Enables you to configure any table or combination of tables that are present on the ServiceNow AI Platform® as a target source.

Exploring Goal Framework and Goal Framework for SPM

The Goal Framework application helps you create goals, set targets for them, and evaluate the progress of the goals and targets to accomplish your organizational plans and drive business outcomes.

The Goal Framework for Strategic Portfolio Management (SPM) application enables you to automate the actual value of your targets by collecting the actuals from different target sources such as benefit plans, cost plans, assessments/surveys, and PA Indicators.

Goal Framework key components:

- Strategic priorities: Actions of a strategic plan that help to orient your organizational strategic plan toward your goal.
- Goals: Objectives that you want to reach based on your strategic plans.
- Targets: Targets for goals to track and measure the progress of the goals.

Goal Framework for SPM key component:

Target source is the key component of Goal Framework for SPM. Target source is a configuration for a target that is used to auto-update the actual value of the target, so that the progress of the target and its goal is auto-updated.

Strategic priorities

Strategic priorities are the objectives of your organizational plans. Strategic priorities help you to achieve your goals over a designated time period. The strategic priorities are also known as focus areas or long-term strategies. Defining strategic priorities helps to orient your organizational strategic plans toward your goals.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Goals

Goals refer to objectives that an organization sets for itself to accomplish their organizational plans. Goals are typically qualitative in nature. Goals should be ambitious and are expected to motivate and challenge your teams. Some examples of goals are as follows:

- Using renewable energy by the end of the year 2022.
- Increase diversity in the workplace by 50 percent.

A goal can also have sub-goals. You can also associate work and planning items to a goal so that you can track who is responsible for fulfilling the goal.

If you use Goal Framework with other products, you can also do the following:

- If you're a ServiceNow® Project Portfolio Management user, you can associate demands, projects, and programs with a goal to capture the work being done to meet your goal.
- If you're a ServiceNow® Agile Development 2.0 user, you can associate scrum epics with a goal to capture the work being done to meet your goal.
- If you're a ServiceNow® Scaled Agile Framework (SAFe) user, you can associate SAFe epics and SAFe features with a goal to capture the work being done to meet your goal.
- If you're a Strategic Planning user, you can associate planning items - Demand, Project, and Epic, and strategic items - Program and Initiative - with a goal to capture the work being done to meet your goal.

Targets

Targets help you to measure your goal. For example, to meet the goal of increasing diversity in the workplace by 50 percent, the target can be to hire a 30 percent-diverse workforce by the first quarter of 2022.

Targets can be set as a quantitative or qualitative by defining the unit of measure for the target. Quantitative targets are numbers-based, countable, and measurable. Qualitative targets are interpretation-based, descriptive, typically yes or no type.

You can also breakdown a target into smaller periods (example, Quarterly) which helps you set a target for each quarter and focus on the specific breakdown targets. The target breakdowns are automatically created based on the breakdown interval set for the target. For details on how the target breakdowns feature works, see Target breakdowns.

Qualitative targets

Qualitative targets are typically non-measurable but can be tracked whether the target has been achieved. The available unit of measure for qualitative targets is Yes/No. You can also define a custom unit of measure (for the available choice set) for qualitative targets as per your need and set qualitative targets for your goals.

For example, to achieve a target of conducting hackathon in Q2-2023, the target can be set as conduct hackathon in Q2-2023 with the unit of measure Yes/No. Base and target value of the target can be No and Yes respectively. After the target is successful with the hackathon event, the target value can be updated to Yes.

Target sources

Target source is a configuration for a target that is used to auto-update the actual value of the target, so that the progress of the target and its goal is auto-updated. Any table or a combination of tables (for example, benefit plans, cost plans, surveys, incidents, and PA indicators) present on the ServiceNow AI Platform® can be configured as a target source.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following target source types are supported for automating the actual value of a target.

- PA Indicator: Updates the **Actual value** field on the target form by fetching the required data from the PA Indicator.
- Assessment/Survey: Updates the **Actual value** field on the target form by fetching the required data from the Assessment metric type and Assessment metric category records.
- Custom script: The Custom script fetches the required data from any ServiceNow AI Platform table that is configured. With the Custom script option, any table or a combination of tables present on the ServiceNow AI Platform can be configured as a target source.

  Predefined target automation script for benefit plans: The predefined, default script is a target source that updates the **Actual value** field on the target form by fetching the value from the **Actual benefit** field or **Non-monetary actual benefit** field from the monetary or non-monetary benefit plans of relevant work items.

  Context variable

  The context variable is an additional configuration for the target source. The context variable provides information that can be used on the target form to fetch the required data and update the **Actual value** field on the Target form. The context variable is required for target source types Assessment/Survey and PA Indicator. If the Goal Framework for SPM scope is selected while creating a target source, the context variable is automatically created for the target source (of type Assessment/Survey and PA Indicator). For more information on context variables, see Context variable in target source.

Benefits and workflow

Use the Goal Framework or Goal Framework for SPM application to do the following activities:

- Create a strategic plan for your organization (If Strategic Planning is installed). For more information, see Create a strategic plan.
- Create a strategic priority to orient your organization strategic plan toward your goal. For more information, see Create a strategic priority for a strategic plan.
- Create a goal. For more information, see Create a goal.
- (For Goal Framework users) Set targets for a goal to track and measure the progress of the goal. For more information, see Set targets for a goal.
- (For Goal Framework for SPM users) Set targets and automate the actual value of the targets. For more information, see Configuring target source for target automation using Goal Framework for SPM.
- Create a goal relationship with a work, planning, strategic, or any other item to identify and associate your current or future work and achieve your goals. For more information, see Associate a work or planning item with goals or targets.
- Associate the primary goal for a work and planning item. For more information, see Associate the primary goal for work and planning items.

For an example of the structure of a strategy from the strategic plan level down to targets, see Enterprise strategy example.

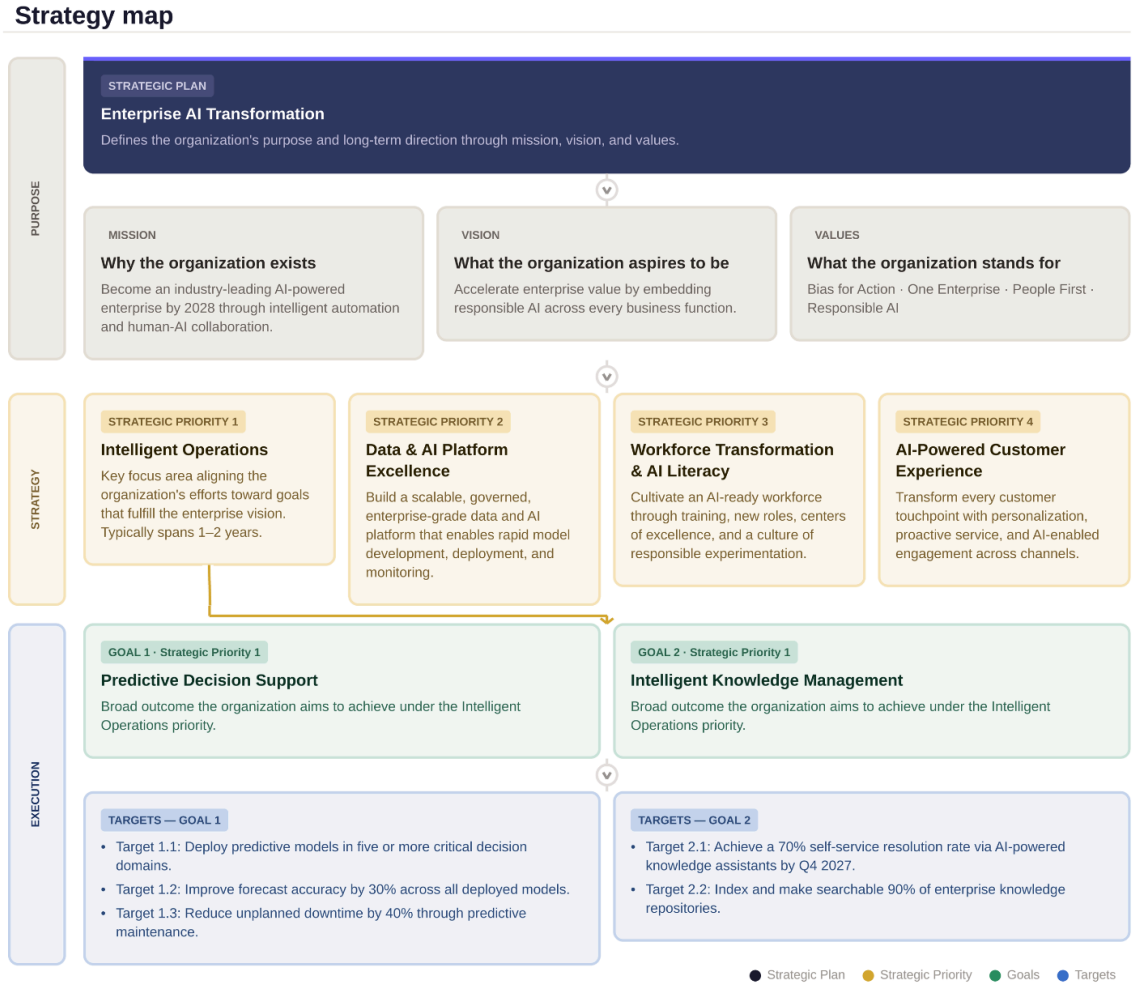
Comparing Goal Framework with Goal Framework for SPM

- Goal Framework: Create goals, set targets for them, and evaluate the progress of the goals and targets to accomplish the organizational plans and drive business outcomes.
- Goal Framework for SPM: Automate the actual value of your targets by collecting the actuals from different target sources such as benefit plans, cost plans, assessments/surveys, and PA Indicators.

Comparison of Goal Framework and Goal Framework for SPM features

Feature	Goal Framework	Goal Framework for SPM
Create strategic plans	✗	✓
Create strategic priorities	✓	✓
Create goals	✓	✓
Set targets	✓	✓
Set target breakdowns	✗	✓
Associate work with goals	✓	✓
Automate actual value of targets	✗	✓
Monitor goals and strategies in ServiceNow AI Control Tower	✓	✓



Note: The Goal Framework for SPM application is an extension to the Goal Framework application. When you install the Goal Framework for SPM application, you get all the features of Goal Framework as well as the target automation feature.

Enterprise strategy example

For defining an enterprise strategy, you can start by creating a strategic plan that captures your organization's mission, vision, and values. You then define strategic priorities that align with your mission and vision of your organization, and create goals under each priority to establish what your organization wants to achieve. For each goal, you can set targets to track and measure progress toward achieving it.

The following illustration provides an example of a strategic plan, including its strategic priorities, goals, and targets.

Target types and achievement strategies

The types define how goal achievement is measured: growth, reduction, staying within limits, or a yes/no milestone.

Target types at a glance

Target types define the direction and measurement approach for your goals. Each type has a specific formula for calculating achievement and progress. When you create a target, select the type that best reflects your goal's strategic intent, as described in the following table.

Target types and use cases

Target type	Best use case	Achievement criteria
Maximize	Goals to grow or increase a metric: revenue, customer satisfaction, productivity, market share, employee engagement	Progress increases as the actual value moves from the start value toward the target value. Status is Green at 90% or higher.
Minimize	Goals to reduce or decrease a metric: costs, defects, environmental impact, customer churn, incident count	Progress increases as actual values decrease toward the target value. Status is Green at 90% or higher.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Target types and use cases (continued)

Target type	Best use case	Achievement criteria
Maintain above	Goals where a metric must stay at or above a threshold: service uptime, compliance rating, customer retention rate, system availability	A period is met when its actual value is greater than or equal to its planned target. Progress is the percentage of periods met, up to the latest period with an actual value.
Maintain below	Goals where a metric must stay at or below a cap: operating costs, error rate, support ticket backlog, environmental emissions	A period is met when its actual value is less than or equal to its planned target. Progress is the percentage of periods met, up to the latest period with an actual value.
Maintain constant	Goals requiring stability: staffing levels, quality scores, inventory levels, process consistency	A period is met when its actual value is within the tolerance band around its planned target (±5% by default). Progress is the percentage of periods met, up to the latest period with an actual value.
Milestone	Qualitative goals with yes/no outcomes: project completion, regulatory approval, capability certification, system deployment	Binary achievement (Yes = Green, No = Red). No Yellow status available

Maximize targets

Maximize targets measure progress toward increasing a metric from a baseline to a higher target value. Use this type when success means growing or improving a value.

How achievement is calculated:

```
Achievement % = ((Actual to date – Start Value) ÷ (Final target
 value – Start Value)) × 100
```

Example — Revenue growth:

- Start value: $1,000,000
- Final target value: $1,500,000
- Current actual: $1,350,000
- Achievement: (($1,350,000 – $1,000,000) ÷ ($1,500,000 – $1,000,000)) × 100 = 70%
- Status: Red (70% is below the Yellow threshold which is 75%)

When to use: Revenue, market share, customer satisfaction, productivity metrics, employee retention rate.

Minimize targets

Minimize targets measure progress toward decreasing a metric from a baseline to a lower goal. Use this type when success means reducing or eliminating an undesirable value.

How achievement is calculated:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
Achievement % = ((Start Value – Actuals to date) ÷ (Start Value
 – Final target value)) × 100
```

Example — Cost reduction:

- Start Value: $500,000
- Final Target Value: $400,000
- Current Actual: $420,000
- Achievement: (($500,000 – $420,000) ÷ ($500,000 – $400,000)) × 100 = 80%
- Status: Yellow (within 75–89% threshold)

When to use: Cost reduction, defect elimination, incident reduction, environmental emissions targets, customer complaints.

Maintain targets

Maintain targets focus on keeping a metric stable or within acceptable boundaries rather than progressing toward a new value. Use these types for governance, compliance, and operational consistency goals.

For Maintain types, the planned target of every target breakdown equals the final target value. The **Actuals to date** value of the target is the actual value entered for the latest breakdown period, not a sum of all periods. Progress stays empty until you enter an actual value for at least one period. A period without an actual value that falls before the latest period with an actual value counts as not met. The **Target value distribution** field is hidden for Maintain types.

Maintain above targets

A Maintain above target succeeds when the actual value stays at or above a specified threshold across reporting periods.

How achievement is calculated:

```
Progress % = (Number of periods met ÷ Number of periods up to
 the latest period with an actual value) × 100
```

Example — Service uptime:

- Target type: Maintain above
- Final target value (Threshold): 98% uptime
- Check-in frequency: Monthly (12 periods)
- Uptime by month: Jan–Oct all ≥98%, Nov <98%, Dec ≥98% (11 of 12 months pass)
- Achievement: (11 ÷ 12) × 100 = 92%

When to use: Service level agreements (SLAs), compliance ratings, uptime targets, customer retention rates, system availability.

Maintain below targets

A Maintain below target succeeds when the actual value stays at or below a specified threshold (cap) across reporting periods.

How achievement is calculated:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
Progress % = (Number of periods met ÷ Number of periods up to
 the latest period with an actual value) × 100
```

Example — Operating cost cap:

- Target type: Maintain below
- Final target value (Cap): $1,500,000 per quarter
- Check-in frequency: Quarterly (4 periods)
- Quarterly costs: Q1=$1.2M, Q2=$1.1M, Q3=$1.3M, Q4=$1.5M (all ≤ $1.5M)
- Achievement: (4 ÷ 4) × 100 = 100%

When to use: Cost caps, budget limits, error rate limits, support ticket backlog targets, emission caps.

Maintain constant targets

A Maintain constant target succeeds when the actual value stays within a tolerance band around the planned target. The band is ±5% by default. Administrators can change it with the *sn_gf.maintain_constant_tolerance_percent* system property. Use this type for metrics that require stability and consistency.

Tolerance band calculation:

```
Success range = [Planned target − (|Planned target| × Tolerance
 %), Planned target + (|Planned target| × Tolerance %)]
```

How achievement is calculated:

```
Progress % = (Number of periods met ÷ Number of periods up to
 the latest period with an actual value) × 100
```

Example — Employee headcount:

- Target type: Maintain constant
- Final target value: 250 employees
- Tolerance band: 237.5–262.5 employees (±5% of 250)
- Check-in frequency: Monthly (12 periods)
- Headcount by month: 11 months within 237.5–262.5 range, 1 month at 268 (outside range)
- Achievement: (11 ÷ 12) × 100 = 92%

When to use: Staffing stability, quality score consistency, inventory levels, process performance, team capacity management.

Milestone targets

Milestone targets are binary (yes/no) and measure qualitative achievement rather than numeric progression. A milestone is either complete (Green) or incomplete (Red).

Achievement logic:

- Yes = Green (100% achievement)
- No = Red (0% achievement)
- Yellow status is not available for milestones

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example — Project go-live milestone:

- Target: "Complete system deployment by Q4 2026"
- Unit of Measure: Yes/No
- Target Type: Milestone (automatically set for Yes/No metrics)
- Result: Green if the deployment is complete; otherwise, Red.

When to use: Project milestones, regulatory approvals, capability certifications, system implementations, go-live dates, governance checkpoints.

Progress and status calculation

For Maximize and Minimize targets, progress is calculated as a percentage and compared against the default thresholds in the following table to assign a status.

Default status thresholds for quantitative targets

Status	Default threshold	Meaning
Green	90% or higher	Target is on track or exceeded
Yellow	75–89%	Target is at risk; achievement below expectations
Red	Less than 75%	Target is significantly behind; immediate action needed

Status is automatically calculated when you enter actual values. For Maintain targets, each breakdown period is Green when it meets its planned target and Red when it doesn't. The target status is based on the progress percentage, which is compared against the same thresholds as Maximize and Minimize targets (90% for Green and 75% for Yellow by default), so the target status can be Green, Yellow, or Red.

For detailed calculation examples for all target types, see Automatic status calculation for targets.

Target type selection

Ask yourself these questions when deciding on a target type:

1. **Is your goal about growing or reducing a metric?** Choose **Maximize** (growth) or **Minimize** (reduction).
2. **Is your goal about keeping something stable or within limits?** Choose one of the Maintain types:
   - **Maintain above**: Must stay at or above a minimum
   - **Maintain below**: Must stay at or below a maximum
   - **Maintain constant**: Must stay within a range
3. **Is your goal qualitative with a yes/no outcome?** Choose **Milestone**.
4. **Do you need to track performance across multiple time periods?** Add a check-in frequency (Daily, Weekly, Monthly, Quarterly, Yearly) to any target type. Maintain targets especially benefit from check-in frequency to measure consistency across periods.

For examples of different scenarios and target type recommendations, see Add targets for a goal in Strategic Planning.

Changing the type of a target

You can change the type of a target that already has actual values. A confirmation message appears before the change is applied.

- When you change from one Maintain type to another, the actual values are kept and progress is recalculated.
- When you change between **Maximize**, **Minimize**, and a Maintain type, the actual value and progress of the target are cleared, and any target breakdowns are regenerated without actual values.
- When you change to **Milestone**, any target breakdowns are deleted.

For the steps, see Change the type of a target.

Target types and target automation

All target types support target automation, which auto-populates the **Actuals to date** field from a configured data source. Target automation is especially useful in the following scenarios:

- Minimize targets pulling defect counts from issue tracking systems
- Maximize targets pulling revenue figures from financial systems
- Maintain targets pulling operational metrics from monitoring systems

For configuration guidance, see Target actuals automation in Strategic Planning.

Change the type of a target

Target breakdowns

Automatic status calculation for targets

Configure the tolerance for Maintain constant targets

Automatic status calculation for targets

Target status is calculated automatically from achievement percentages when you enter actual values, and it rolls up to goals using Green, Yellow, and Red thresholds.

What is automatic status calculation?

When you enter actual values for a target period or a target breakdown, the system compares actual achievement against planned targets. The comparison uses predefined thresholds to automatically assign a status (Green, Yellow, or Red).

Key benefits:

- Eliminates manual status selection for every target entry
- Applies status consistently across the goal hierarchy
- Reduces subjective judgment and data entry mistakes
- Provides real-time status updates as actual values are entered
- Supports better portfolio visibility and decision-making

Status calculation formulas

The system calculates target achievement percentage using a standardized formula that accounts for the start value (baseline) and planned target. The formula application depends on whether the target type is Maximize, Minimize, or one of the Maintain types:

Maximize targets (revenue, growth, performance)

For targets where higher values are better, the standard achievement formula applies:

```
Achievement % = ((Actual to date – Start Value) ÷
 (Final target value – Start Value)) × 100
```

Example: Revenue target from $1M (start) to $1.5M (final target), actuals achieved $1.35M = 70% achievement

Minimize targets (costs, defects, risk)

For targets where lower values are better, the formula inverts to measure reduction:

```
Achievement % = ((Start Value – Actuals to date) ÷
 (Start Value – Final target value)) × 100
```

Example: Cost reduction from $500K (start) to $400K (final target), actuals achieved $420K = 80% achievement

Maintain targets (Maintain above, Maintain below, Maintain constant)

For targets where a metric must be maintained at a specific level or within a range, progress is calculated differently. Achievement is based on how many breakdown periods meet their planned target. A period is met based on the target type: at or above the planned target (Maintain above), at or below the planned target (Maintain below), or within the tolerance band of the planned target (Maintain constant). Periods after the latest period with an actual value aren't counted; earlier periods without an actual value count as not met:

```
Progress % = (Number of periods met ÷ Number of periods
 up to the latest period with an actual value) × 100
```

Maintain above example: Service uptime target to maintain above 98% over 12 months. Actuals are entered for all 12 months, and uptime was at or above 98% in 10 of them = (10 ÷ 12) × 100 = 83% progress

Maintain below example: Operating cost target to maintain below $5M over 4 quarters. Actuals are entered for all 4 quarters, and costs stayed at or below $5M in 3 of them = (3 ÷ 4) × 100 = 75% progress

Maintain constant example: Employee headcount target to maintain at 250 staff (default ±5% tolerance = 237.5–262.5) over 12 months. Actuals are entered for all 12 months, and headcount was within range for 11 of them = (11 ÷ 12) × 100 = 92% progress

The resulting achievement percentage is compared against configured thresholds to assign the status.

For Maintain targets, each breakdown period is Green when it meets its planned target and Red when it doesn't. The target status is based on the progress percentage, which is compared against the same thresholds, so the target status can be Green, Yellow, or Red. For Maintain constant targets, the tolerance band is ±5% by default and is set by the *sn_gf.maintain_constant_tolerance_percent* system property.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Default thresholds

Status	Default threshold	Meaning
Green	90% or higher	Target is on track or exceeded
Yellow	75–89%	Target is at risk; achievement below expectations
Red	Less than 75%	Target is significantly behind; immediate action needed

Administrators can customize threshold percentages to align with organizational governance policies and risk tolerance. Use the system property *sn_gfa.target.auto_status.thresholds* to adjust values.

System property configuration:

```
{"enabled": true, "thresholds": {"green": 90, "yellow": 75}}
```

For instructions on system property configuration, see Configure automatic status calculation for targets.

Status calculation scenarios

Status calculation applies to three target configurations:

- **Targets without breakdowns:** Status is calculated once based on overall actual performance against the final target value. For Maintain-type targets, the status is Green when the actual value meets the final target value (at or above for Maintain above, at or below for Maintain below, or within the tolerance band for Maintain constant) and Red when it doesn't.
- **Targets with breakdowns (check-ins):** Status is calculated for each check-in period (such as weekly, monthly, or quarterly) based on that period's achievement. For Maintain-type targets, each period is marked Green or Red depending on whether it meets its planned target. The target status is based on progress, which is the percentage of periods met, compared against the same thresholds.
- **Targets without check-in frequency:** Status is calculated from the actual values directly, without period-based accumulation.

For Maximize and Minimize targets, the same achievement formula and thresholds apply in all scenarios. The difference is in how actual values are entered and aggregated across time periods. For more details on how the status is calculated for different scenarios, see Status calculation specifications and examples.

Milestone targets

Milestone targets track qualitative progress with a Yes or No value instead of a numeric formula. You determine whether the milestone has been achieved:

- **Green:** If the target is achieved, the value is set to **Yes**.
- **Red:** If the target isn't achieved, the value is set to **No**.

Yellow status is not available for milestone targets. Examples include project readiness gates, regulatory approvals, or capability certifications where achievement is binary (complete or not complete). Though not automatically calculated, milestone targets roll up from the target to its goal, and from the goal to parent goals if any, using worst-wins logic.

Manual override

Target owners can override the automatically calculated status values for a target breakdown, target, or goal when business circumstances require a different assessment. When you manually override a status:

- The manually selected status displays in place of the calculated status
- If you update the actual value after a manual override, the system recalculates the status automatically based on the new achievement percentage
- The recalculated status may differ from your previous manual selection

Manual override provides flexibility while maintaining the ability to recalculate based on new data.

Manual override

Target owners can override the automatically calculated status values for a target breakdown, target, or goal when business circumstances require a different assessment. When you manually override a status:

- The manually selected status displays in place of the calculated status
- If you update the actual value after a manual override, the system recalculates the status automatically based on the new achievement percentage
- The recalculated status may differ from your previous manual selection

Manual override provides flexibility while maintaining the ability to recalculate based on new data.

Automatic status rollup

Status automatically rolls up through three hierarchical layers:

1. **Breakdown → Target:** Status rolls up from individual check-ins to the target level. When a target has period-based breakdowns (such as quarterly check-ins), each breakdown period receives its own status calculation. The target's overall status is then determined by aggregating these individual breakdown statuses. How the statuses are aggregated depends on whether the target's breakdowns are cumulative or non-cumulative:
    - **Cumulative breakdowns:** Status uses latest-wins logic. The most recent period's status determines the target status.
    - **Non-cumulative breakdowns:** The target's overall status is based on the combined performance across all reported breakdown periods.
2. **Target → Goal:** Status rolls up from targets to goals using a worst-wins logic. The lowest-performing target status determines the goal status.
3. **Goal → Parent goal:** Status rolls up from goals through parent goals using worst-wins logic.

Because of this three-layer rollup, a Red target status appears at the parent goal level, which helps portfolio leaders focus on at-risk goals.

Custom status values

In addition to automatic Green/Yellow/Red status, target owners can apply custom status values to reflect business context that the achievement formula may not capture. Custom statuses are

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

retained even when automatic calculation is re-enabled, allowing manual judgment to coexist with system-driven calculations.

Related topics

- Configure automatic status calculation for targets
- Status calculation specifications and examples

Status calculation specifications and examples

Formulas and worked examples show how target status is calculated for each target type and how status rolls up from breakdowns to goals.

Status calculation for targets without breakdowns

For targets without period-based breakdowns, status is calculated once using the overall actual value against the final target value:

```
Achievement % = ((Actuals to date – Start value) ÷ (Final target
 value – Start value)) × 100
Status = Green if Achievement % ≥ 90; Yellow if 75–89; Red if <
 75
```

Example: Achieve $1,000,000 revenue by year-end

- Start value (baseline): $0
- Final target value: $1,000,000
- Actuals to date (year-end): $700,000
- Achievement % = (($700,000 – $0) ÷ ($1,000,000 – $0)) × 100 = 70%
- **Status: Red** (70% < 75%)

Status calculation for targets with cumulative breakdowns

For cumulative targets with period-based breakdowns, each period's start value carries forward from the previous period's actual value. Status is calculated for each check-in period independently based on that period's start value and planned target. The achievement percentage is recalculated for each period as new data is reported, and the most recent period's status determines the target status.

```
Achievement % (for period) = ((Period actual value – Period
 start value) ÷ (Period planned target value – Period start
 value)) × 100
Status (for period) = Green if Achievement % ≥ 90; Yellow if
 75–89; Red if < 75
```

Example: Annual revenue target with cumulative quarterly check-ins (Planned target and Actual values shown are cumulative amounts)

In this example, each quarter's achievement is measured from a start value of $0, comparing the cumulative actual revenue to the cumulative planned target. The "Start value" column shows $0 for Q1, then carries forward the previous quarter's cumulative actual for reference purposes (Q2: $220K from Q1, Q3: $480K from Q2, Q4: $710K from Q3), but the formula always uses cumulative amounts from the $0 baseline.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Quarter	Start value	Planned target	Actual	Achievement %	Status
Q1	$0	$250,000	$220,000	88%	Yellow
Q2	$220,000	$500,000	$480,000	96%	Green
Q3	$480,000	$750,000	$710,000	94.7%	Green
Q4	$710,000	$1,000,000	$968,000	96.8%	Green

In this scenario, each quarter is evaluated cumulatively from a start value of $0. Achievement % is calculated by comparing cumulative actual revenue to cumulative planned target: Q1: $220K ÷ $250K = 88% (Yellow). Q2: $480K ÷ $500K = 96% (Green). Q3: $710K ÷ $750K = 94.7% (Green). Q4: $968K ÷ $1,000K = 96.8% (Green). The most recent period (Q4) determines the target status, which is Green. Overall, the target is progressing at 96.8% achievement against the $1,000,000 annual goal.

How breakdown statuses roll up to the target status

The target's overall status is determined using latest-wins logic: the status of the most recently reported breakdown period becomes the target status.

- Q1 status: Yellow (88%)
- Q2 status: Green (96%)
- Q3 status: Green (94.7%)
- Q4 status: Green (96.8%) ← **Most recent**
- **Target status: Green** (determined by Q4, the latest reported quarter)

The target displays Green status even though Q1 was Yellow, because Q4's Green status is the most current indicator of performance. If Q4's actual had fallen short and resulted in Yellow or Red, the target status would reflect that latest assessment.

Status calculation for targets with non-cumulative breakdowns

For non-cumulative targets with period-based breakdowns, each period is independent and does not carry forward the previous period's actual value. Status is calculated as a window aggregating all periods with actual values from the first period to the most recent period. The achievement percentage is recalculated each time a new period is reported.

```
Window = Sum of all Actuals (Q1 through most recent quarter) ÷
 Sum of all Planned (Q1 through most recent quarter)
Achievement % = (Total actuals ÷ Total planned) × 100
Status = Green if Achievement % ≥ 90; Yellow if 75–89; Red if <
 75
```

Example: Annual revenue target ($0 start, $1,000,000 final target) with non-cumulative quarterly check-ins

Quarter	Planned (this quarter)	Actual (this quarter)	Breakdown status	Total actual	Total planned	Target window %
Q1	$250,000	$220,000	88% (Yellow)	$220,000	$250,000	88%
Q2	$250,000	$240,000	96% (Green)	$460,000	$500,000	92%
Q3	$250,000	$200,000	80% (Yellow)	$660,000	$750,000	88%

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Quarter	Planned (this quarter)	Actual (this quarter)	Breakdown status	Total actual	Total planned	Target window %
Q4	$250,000	$230,000	92% (Green)	$890,000	$1,000,000	89% (Yellow)

Although Q4's individual breakdown shows Green (92%), the target displays Yellow (89%) because the target's status reflects the overall cumulative performance across all four quarters. Individual breakdown statuses show period-by-period progress, while the target status shows how the team is tracking toward the full-year goal.

Key differences from cumulative: In cumulative, each quarter's start value is the previous quarter's actual ($220K → $480K → $710K), and each quarter's status is calculated individually. In non-cumulative, each quarter's Planned and Actual are independent ($250K planned each quarter). Each quarter's status is also calculated independently: Q1 = 88% Yellow, Q2 = 96% Green, Q3 = 80% Yellow, Q4 = 92% Green. However, the target's overall status is determined by the cumulative window across all quarters: ($220K + $240K + $200K + $230K) ÷ ($250K + $250K + $250K + $250K) = 89% Yellow. The target can show Yellow status even when the latest quarter (Q4) shows Green—it reflects overall annual progress, not the most recent period alone.

How breakdown statuses roll up to the target status

The target's overall status is determined by aggregating all periods into a cumulative window. The target status is not determined by the most recent breakdown; instead, it reflects the cumulative performance across all reported periods.

- Q1 status: Yellow (88% independent)
- Q2 status: Green (96% independent)
- Q3 status: Yellow (80% independent)
- Q4 status: Green (92% independent)
- **Target window:** ($220K + $240K + $200K + $230K) ÷ ($250K + $250K + $250K + $250K) = $890K ÷ $1,000K = 89%
- **Target status: Yellow** (89% determined by cumulative window, not by latest breakdown)

Status calculation for Maintain-type targets

The following example shows status calculation for a Maintain above target. For Maintain above targets, the planned target of every breakdown period defaults to the final target value of the target, and you can edit it for each period. Each period is evaluated on its own: it is Green when the actual value is greater than or equal to the planned target, and Red when the actual value is lower. Progress is the percentage of periods that meet the planned target, counted up to the latest period with an actual value. The target status is based on this progress, compared against the same thresholds as other target types (90% for Green and 75% for Yellow by default).

```
Period status = Green if Actual ≥ Planned target; Red if Actual
 < Planned target
Progress % = (Number of periods met ÷ Number of periods up to
 the latest period with an actual value) × 100
Target status = Green if Progress % ≥ 90; Yellow if 75–89; Red
 if Progress % < 75
```

Example: Keep API uptime at or above 99.5% through year-end, with quarterly check-ins

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: Maintain above
- Final target value: 99.5%
- Planned target for each quarter: 99.5%

Quarter	Planned target	Actual	Period status	Periods met	Progress	Target status
Q1	99.5%	99.6%	Green	1 of 1	100%	Green
Q2	99.5%	99.3%	Red	1 of 2	50%	Red
Q3	99.5%	99.7%	Green	2 of 3	66.7%	Red
Q4	99.5%	99.8%	Green	3 of 4	75%	Yellow

In this scenario, the Q1 actual of 99.6% is greater than the planned target of 99.5%, so Q1 is Green. The target has met 1 of 1 reported periods, so progress is 100%. The Q2 actual of 99.3% is lower than the planned target, so Q2 is Red. The target has now met 1 of 2 reported periods, so progress is 50%. Because 50% is below the Yellow threshold of 75%, the **target status is Red**. The Q3 actual of 99.7% meets the planned target, so Q3 is Green, but the target has met only 2 of 3 reported periods. Progress is 66.7%, which is still below 75%, so the target status stays Red. The Q4 actual of 99.8% also meets the planned target, so the target has met 3 of 4 periods. Progress is 75%, which falls in the 75–89% range, so the **target status changes to Yellow**. Because the target status is based on progress rather than on the latest period alone, a Red period doesn't keep the target Red: the target status improves as more periods meet the planned target.

Status rollup mechanics

Status automatically rolls up through three hierarchical layers:

Layer 1 for cumulative targets: Breakdown → Target (latest-wins logic)

When a target has multiple check-in periods, the status of the target is determined by the most recent period's status:

- If the March check-in status is Red, the target status is Red.
- If the February check-in status is Yellow and the March status is Green, the target status is Green because the most recent period determines it.

Layer 1 for non-cumulative targets: Breakdown → Target (cumulative window aggregation)

For non-cumulative targets with period-based breakdowns, the target's overall status is determined by aggregating all periods into a single cumulative window. The target status is determined by the cumulative performance across all reported breakdown periods.

- Q1 status: Yellow (88% independent) — Actual: $220K, Planned: $250K
- Q2 status: Green (96% independent) — Actual: $240K, Planned: $250K
- Q3 status: Yellow (80% independent) — Actual: $200K, Planned: $250K
- Q4 status: Green (92% independent) — Actual: $230K, Planned: $250K
- **Target window calculation:** Total Actuals ($220K + $240K + $200K + $230K = $890K) ÷ Total Planned ($250K + $250K + $250K + $250K = $1,000K) = 89%
- **Target status: Yellow** (89% from cumulative window, even though Q4 is Green)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The key distinction: individual breakdowns may show Green (Q4 at 92%), but the target displays Yellow because the cumulative performance across all quarters (89%) determines the target status. This reflects overall annual progress, not just the most recent period.

Layer 2: Target → Goal (worst-wins logic)

When a goal has multiple targets, the goal status is determined by the lowest-performing target:

- Target 1 status = Green (90%)
- Target 2 status = Red (60%)
- **Goal status = Red** (worst-wins)

Layer 3: Goal → Parent goal (worst-wins logic)

Goals roll up to parent goals using worst-wins logic:

- Goal 1 (Parent goal) status = Yellow
- Goal 1.2 (Child goal) status = Red
- Target 1.2.1 status = Yellow

As a result, the parent goal (Goal 1) status is Red because the Red status of the child goal rolls up to the parent goal.

Status rollup example across three layers

This example shows how status cascades through all three layers:

```
LAYER 1 — Check-ins roll up to Targets (Latest-wins):
  Q1 Revenue Target:
    Week 1: Green (92%)
    Week 2: Yellow (78%)
    Week 3: Green (91%)  ← Most recent; Target Status = Green

LAYER 2 — Targets roll up to Goals (Worst-wins):
  Annual Growth Goal:
    Q1 Revenue Target: Green (91%)
    Q1 Cost Target: Red (60%)
    ├── Goal Status = Red (cost target drags down entire goal)

LAYER 3 — Goals roll up to Parent goals (Worst-wins):
  Strategic Goals:
    Growth Goal: Red (from Annual Growth Goal)
    Efficiency Goal: Green (80%)
    Innovation Goal: Yellow (78%)
    ├── Parent goal Status = Red (single red target/child goal
 cascades to parent goal)
```

Special status calculation cases

Manual override then recalculation

If you manually override status to Red, the override applies immediately. However, if you later update the actual value such that the achievement percentage would calculate as Green (95%), the system recalculates and displays Green. Manual overrides don't persist through data updates.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Milestone targets (qualitative goals)

Milestone targets use a binary Yes/No status assignment instead of numeric formulas. You determine whether the milestone has been achieved: Yes = Green status, No = Red status. Yellow is not available. Examples: project readiness gates, regulatory approvals, capability certifications. Though not automatically calculated, milestone targets roll up from the target to its goal, and from the goal to parent goals if any, using worst-wins logic.

Better together with other ServiceNow applications

The integration of Goal Framework or Goal Framework for SPM with other ServiceNow applications helps portfolio, product, and program managers to optimize planning and track goals for their products.

Goal Framework with AI Control Tower workspace

The ServiceNow® AI Control Tower workspace enables you to track and monitor all your strategic priorities, goals, and targets categorized as Artificial Intelligence in Goal Framework.

Populate the **Type** field for strategic priorities and the **Category** field for goals with the **Artificial Intelligence** option to monitor their progress in the AI Control Tower workspace. For more information, see Create a strategic priority and Create a goal.

When AI Control Tower is installed, the **AI strategy** tab appears in the AI Control Tower workspace, featuring different widgets for AI strategies, goals, and targets details. For more information, see AI strategy tab in AI Control Tower.

Goal Framework with Operational Sustainability Workspace

With the integration of ServiceNow Operational Sustainability Workspace with Goal Framework, you can create environmental, social, and governance (ESG) goals to track your progress toward your chosen material topics. You can also create an environmental, social, and social (ESG) target to help track the progress toward your ESG goal. For more information, see Create an Operational Sustainability Management (formerly ESG Management) goal and Create an Operational Sustainability Management (formerly ESG Management) target.

Goal Framework for SPM with Strategic Planning

Use the ServiceNow Strategic Planning Workspace to visualize the progress of your targets graphically and update the target actuals with ease.

You can create a goal or target relationship with a planning item or any other item to identify and associate your current or future work and achieve your goals and targets. You can also associate a primary goal or target for the planning items where the items contribute to achieving the goal or target. For more information, see Managing portfolio plan goals in Strategic Planning Workspace.

Note: When you install Strategic Planning, you get all the features of the Goal Framework and Goal Framework for SPM applications.

Configuring Goal Framework and Goal Framework for SPM

As an administrator, use this section to set up the Goal Framework and Goal Framework for SPM applications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Install Goal Framework and Goal Framework for SPM

You can install the Goal Framework (sn_gf) and Goal Framework for SPM (sn_gfa) applications if you have the admin role.

Before you begin

Ensure that the applications and all associated store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.

When you install the Goal Framework for SPM application, you get all the features of Goal Framework as well as the target automation feature.

Role required: admin

Important: You can install the Goal Framework for SPM application only when you own the Strategic Portfolio Management (SPM) Pro license.

Procedure

1. Navigate to **System Applications** > **All Available Applications** > **All**.
2. Find the Goal Framework or Goal Framework for SPM application using the filter criteria and search bar.
   You can search for the application by its name or ID (sn_gf or sn_gfa). If you can't find an application, you may have to request it from ServiceNow store. Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.
3. Click **Install**.
4. In the Application installation dialog box, review the application dependencies.

   If your application requires other applications, install them first if they aren't already installed.

   Installing your application also automatically installs the dependent applications or plugins if they aren't installed already.
5. Click **Install**.

Result

The following components are installed with installation of the Goal Framework or Goal Framework for SPM application:

- Roles
- Tables
- Scheduled jobs
- Target automation script for benefit plans (installed with Goal Framework for SPM)

As part of Goal Framework for SPM installation, components of both Goal Framework and Goal Framework for SPM are installed. See Components installed with Goal Framework and Goal Framework for SPM for more information.

Migrate existing goals data to Goal Framework tables

If your organization uses the legacy goal and strategy tables (Goal, Enterprise Strategy, Business Unit Strategy, and Strategic Objective), you can migrate the existing data to the Goal Framework tables by running the scheduled job.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

About this task
Use the scheduled job to migrate legacy goals and strategy data to the Goal Framework tables. The migration includes the following:

- Migrates all existing goal records from the Goal [goal] table to the Goal [sn_gf_goal] table. Corresponding target records are automatically created in the Target [sn_gf_goal_target] table.
- Migrates all existing strategy records from the Enterprise Strategy [enterprise_strategy], Business Unit Strategy [business_unit_strategy], and Strategic Objective [strategic_objective] tables to the Strategic Priority [sn_gf_strategy] table.

Note: Migrating data to the Goal Framework tables is a one-time job, and not meant to be on a schedule.

Procedure
1. Navigate to **All** > **System Definition** > **Scheduled Jobs**.
2. Search for and click the **Migrate Goal, Strategy, and Work item data to the Goal Framework and related Planning item tables** scheduled job.
3. On the Scheduled Script Execution form:
   a. Ensure that the frequency is selected as **On Demand** in the **Run** field.
   b. Set the value to **true** for the required parameters in the **Run this script** field.
   For parameters information, see Migrate Goal, Strategy, and Work item data to the Goal Framework and related Planning item tables.
4. Click **Execute Now**.

Configure goal preferences

Configure goal preferences to manage goals such as the calendar type used for goal setting, weighted average calculation for goal progress, and deletion of goals and targets.

Before you begin
Role required: sn_gf.goal_admin

Procedure
1. Navigate to **All** > **Enterprise Goal Management** > **Preferences**.
2. On the Goal Preferences form, configure the properties.
   For properties information, see Goal Preferences form.
3. Click **Save**.

Configure a table for an assigned entity

Configure a table for an assigned entity type so that the goal user can associate goals with the required assigned entity.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- By default, with the installation of Goal Framework, the assigned entities, Business Unit [business_unit], Department [cmn_department], and Company [core_company] are installed.
- With the activation of PPM Standard (Project Portfolio Management), the Portfolio [pm_portfolio] assigned entity is installed.
- With the installation of Strategic Planning, the assigned entities, Product Model [cmdb_model], Value Stream [cmn_value_stream], Initiative [sn_align_core_initiative], and Strategic Program [sn_align_core_program] are installed.

Role required: sn_gf.goal_admin

About this task

An assigned entity is an organizational unit or structure that a goal can be associated with, such as a business unit or department. Assigned entities provide context for goals by linking them to the relevant part of your organization, making it easier to track and manage goals at any level.

Procedure

1. Navigate to **All** > **Enterprise Goal Management** > **Assigned Entities**.
2. Click **New**.
3. On the form, fill in the fields.
   For a description of the field values, see Goal Assigned Entity Configuration form.
4. Click **Submit**.

Import goals and targets data from a spreadsheet

With the admin role, you can import your existing goals and targets data from a spreadsheet to the Goal Framework tables.

Before you begin

- On a successful job run, the goals data from your spreadsheet is imported to the Goal [sn_gf_goal] table.
- On a successful job run, the targets data from your spreadsheet is imported to the Target [sn_gf_goal_target] table.

Note: Because the targets are associated to a goal, you should import the goals first and then the targets.

Important: Goals and targets data in the spreadsheet must be in the supported format. For details on the supported data format to import goals and targets data from a spreadsheet, see Import goals and targets data [KB1191233].

Role required: admin

Procedure

1. Navigate to **All** > **System Import Sets** > **Load Data**.
2. From the Import set table drop-down list, select **Goal Import Set [imp_sn_gf_goal]** or **Target Import Set [imp_sn_gf_goal_target]**.
3. From the **Source of the import** option, select **File**.
4. In the **File** option, click **Choose** and select your spreadsheet to import the data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:

- Goals and targets data in the spreadsheet must be in a specific format. For details on the supported data format, see Import goals and targets data [KB1191233].
- Don't modify the names in the header row of the spreadsheet because the data is imported to the respective fields in the goal and target tables based on the header title of each column.

5. Click **Submit**.
6. On the Progress page, click **Run Transform**.
7. On the Specify Import set and Transform map page, click **Transform**.
8. Click **Transform history** and verify that the State column is set to **Complete** in the Import Set Runs related list.
   Depending on the option that you selected from the Import set table drop-down list, your goals or targets data is imported to the Goal [sn_gf_goal] or Target [sn_gf_goal_target] tables.

   If the job is failed, click **Transform history** and refer to the details.

Note: The Import operation can be used for inserting new data or updating the existing data in the tables. By default, the Name and Owner values are the primary keys used for updating the existing records. You can also add additional fields as primary key for inserting new data or updating the existing data. For details on how to add additional fields as primary key, see Import goals and targets data [KB1191233].

Update scheduled job to automate target actuals

Use the Goal Framework for SPM application to modify the run time for the scheduled job according to your preference to auto-update the actual value of the targets for which a target source has been configured.

Before you begin

Role required: admin

About this task

By default, the scheduled job runs daily at 00:00:00 AM (System Time Zone).

Procedure

1. Navigate to **All** > **System Definition** > **Scheduled Jobs**.
2. Search for and click the **Update Actual value of the targets using Goal Framework for SPM** scheduled job.
3. Ensure that the **Active** check box is selected to run the job at a scheduled time.
4. Edit the details of the **Run** and **Time** fields according to your preference.
5. Click **Update**.
   To learn more about scheduled jobs, see Scheduled jobs.

Configuring target source for target automation using Goal Framework for SPM

Configure target sources for target automation so that the goal user can define a target source when setting a target for the goal. Defining a target source for a target updates the actual value of the target automatically.

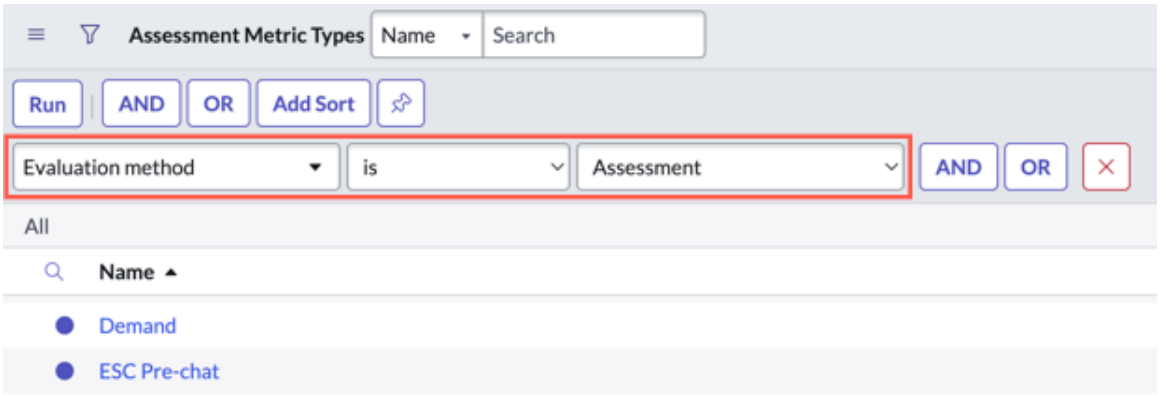
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use the following steps as guidelines for setting targets and automating the actual value of the targets using Goal Framework for SPM. Some of these steps require the sn_gf.goal_user role and some require the sn_gf.goal_admin role.

1. Create a target source for a target to configure it as a source to update the actual value of the target. For more information, see Create a target source.

   The context variable is required for target source types Assessment/Survey and PA Indicator. The mandatory context variables are automatically created while creating a target source with the type selected as Assessment/Surveys or PA Indicator. For more information on when the mandatory context variables are created, see Context variable in target source.

2. If required, create context variables for the target source so that the required data is fetched from the context variables to update the actual value of the target. For more information, see Create context variables for a target source.



Context variable in target source

The context variable is an additional configuration for the target source that can be used on the Target form to fetch the required data and auto-update the **Actual value** field on the Target form. A context variable is required for target source types Assessment/Survey and PA Indicator.

The context variable is automatically created (with the **Mandatory** field set to **true** on the context variable form) for the target source (of type Assessment/Survey and PA Indicator) when the Goal Framework for SPM scope is selected before creating a target source. The context variables created automatically are also known as mandatory context variables.

The mandatory context variables are created when you've selected the Goal Framework for SPM scope and you've met one of the following conditions:

- (For target source type, Assessment/Survey) On the Target Source form, the **Type** field is set to **Assessment/Survey** and the **Assessment Metric Types** field is populated with a metric type of **Evaluation method = Assessment**.

- (For target source type, PA Indicator) On the Target Source form, the **Type** field is set to **PA Indicator** and the value populated in the **Breakdown** field isn't of Choice list type.

  To create a context variable for the target source type, PA Indicator, where the Breakdown field is of Choice list type, see Create a context variable for a PA Indicator target source.

Note: Mandatory context variables can't be deleted.

You can also create context variables manually for a target source and use them to configure for fetching the required data and auto-updating the **Actual value** field on the Target form. For more information on how to create a context variable manually, see Create context variable for a target source.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a target source to automate target actual values

Create a target source so that the goal user can configure it for the targets to automate the Actual value of the targets.

Before you begin

Select the Goal Framework for SPM scope for the application.

Role required: sn_gf.goal_admin

About this task

The context variable is required for target source types Assessment/Survey and PA Indicator. The mandatory context variables are automatically created while creating a target source with the type selected as Assessment/Surveys or PA Indicator. For more information on when the mandatory context variables are created, see Context variable in target source.

Procedure

1. Navigate to **All** > **Enterprise Goal Management** > **Target Sources**.
2. Click **New**.
3. On the form, fill in the fields.
   For a description of the field values, see Target Source form.
4. Click **Submit**.

Create context variable for a target source

Create a context variable manually if you want to configure more context variables for a target source.

Before you begin

Select the Goal Framework for SPM scope for the application.

Role required: sn_gf.goal_admin

About this task

The Context variable provides information that can be used to fetch the required data and auto-update the Actual value on the target form. After a context variable is created for the target source, the goal user can configure the Actual Value Source Configuration section on the Target form so that the Actual value gets auto-updated.

Creating a context variable is similar to creating a column on a table.

To create a context variable for the target source type PA Indicator and the breakdown is of Choice list type, see Create a context variable for a PA Indicator target source.

Procedure

1. Navigate to **All** > **Enterprise Goal Management** > **Target Sources**.
2. Open the required target source that you want to create a context variable for.
3. In the Context Variables related list, click **New**.
4. On the form, fill in the fields.
   For a description of the field values, see Context Variable form.
5. Click **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a context variable for a PA Indicator target source

Create a context variable manually for the target source type PA Indicator if the breakdown is of Choice list type.

Before you begin

Select the Goal Framework for SPM scope for the application.

Role required: sn_gf.goal_admin

About this task

The context variable provides information that can be used to fetch the required data and auto-update the Actual value on the Target form. After a context variable is created for the target source, the goal user can configure the Actual Value Source Configuration section on the Target form for the Actual value to get auto-updated.

Creating a context variable is similar to creating a column on a table.

Procedure

1. Navigate to **All** > **Enterprise Goal Management** > **Target Sources**.
2. Open the required target source that you want to create a context variable for.
3. In the Context Variables related list, click **New**.
4. On the form, fill in the **Type** field as Choice and the other fields as needed.
   For a description of the field values, see Context Variable form.
5. Click **Submit**.
   A context variable of choice type is created.
6. In the Choices related list of the context variable you created, click **New**.

   Note: If you don't see the Choices related list on the Context Variable form, add it by navigating to **Configure** > **Related Lists** on the form.

7. On the form, fill in the fields.

Choice form

Field	Description
Table	Name of the context variable for which the choice is created.
Element	Column name in the context variable form for which the choice is created.
Label	Name of the choice.
Value	Sys_id of the choice value for which the context variable is created. You can copy the sys_id from the Choices related list of the Dictionary Entry [sys_dictionary] table.

8. Click **Submit**.
9. **Optional:** Repeat the steps 6 through 8 to create more choices for the context variable.

What to do next

The goal user can configure these choices as context variables on the Target form for which the target source is configured.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Migrate target breakdowns

After upgrading to Goal Framework for SPM v2.3.0 or later, run the **Migrate BreakdownInterval To Checkinfrequency** scheduled job to migrate the existing values from the **Review frequency** field to the **Check-in frequency** field in the target records.

About this task

After running the job, the value in the **Check-in frequency** field for a target is populated based on the existing value in the **Review frequency** field of the target. If the existing value in the **Review frequency** field was set to any option other than **None**, then target breakdowns will be created for such targets based on the value in the existing check-in frequency of the target. For more information on how these values are migrated for targets with different values, see Target breakdowns migration.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Scheduled Jobs**.
2. Search for and select the **Migrate BreakdownInterval To Checkinfrequency** scheduled job.
3. On the Scheduled Script Execution form, ensure that the frequency is selected as **On Demand** in the **Run** field.
4. Select **Execute Now**.

Target breakdowns migration

As an administrator, when you run the **Migrate BreakdownInterval To Checkinfrequency** scheduled job, the existing values in the **Review frequency** and **Breakdown interval** fields are migrated to the **Check-in frequency** field in the target records.

The value in the **Actual to date** field for the target and values in the **Planned target value** and **Actual** fields for the target breakdowns are populated based on the current actual value of the target and values in the existing target breakdowns.

Target breakdowns migration for targets with breakdown interval set to None

After running the job, the value in the **Check-in frequency** field for a target is populated based on the existing value in the **Review frequency** field of the target. If the existing value in the **Review frequency** field was set to any option other than **None**, then target breakdowns will be created for such targets based on the existing review frequency of the target. Even though **Breakdown interval** was set to **None** for a target, target breakdowns will be created for the target based on the existing review frequency of the target.

The following table describes how the check-in frequency value is populated for targets with different values in the **Review frequency** and **Breakdown interval** fields.

Target breakdowns migration with breakdown interval set to None

Review frequency (Before upgrade)	Breakdown interval (Before upgrade)	Check-in frequency (After upgrading and running the job)
Yearly	None	Yearly
Quarterly	None	Quarterly
Monthly	None	Monthly

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Target breakdowns migration with breakdown interval set to None (continued)

Review frequency (Before upgrade)	Breakdown interval (Before upgrade)	Check-in frequency (After upgrading and running the job)
Fortnightly	None	Fortnightly The Fortnightly option is retained and no target breakdowns will be created because the Fortnightly option is no longer supported. After the owner or a contributor of the target updates the check-in frequency for the target, the target breakdowns will be created accordingly.
Weekly	None	Weekly
Daily	None	Daily
None	None	None In this case, no target breakdowns will be created.

For example, consider a scenario where details of a target are as follows before upgrade:

- The base value and target value of the target is 0 and 100, respectively
- The review frequency is set to **Monthly** and Breakdown interval was set to **None**
- The start date and end date of the target are 2024-01-01 and 2024-12-31, respectively
- The current actual value of the target is 60 and the current month is August

In this case, after running the scheduled job 12 monthly target breakdowns are created for the target and the current actual value as 60 is populated in the August monthly breakdown. Also, the planned target value is populated for each breakdown.

Target breakdowns migration for targets with breakdown interval set to Quarterly or Yearly

After running the job, the value in the **Check-in frequency** field for a target is populated based on the existing value in the **Review frequency** field of the target. Then, target breakdowns are created for the targets based on the existing review frequency of the target.

The following table describes how the check-in frequency value is populated for targets with different values in the **Review frequency** and **Breakdown interval** fields.

Target breakdowns migration with breakdown interval set to Quarterly or Yearly

Review frequency (Before upgrade)	Breakdown interval (Before upgrade)	Check-in frequency (After upgrading and running the job)
Quarterly	Quarterly	Quarterly

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Target breakdowns migration with breakdown interval set to Quarterly or Yearly (continued)

Review frequency (Before upgrade)	Breakdown interval (Before upgrade)	Check-in frequency (After upgrading and running the job)
Quarterly	Yearly	Quarterly

Note: For targets with breakdowns interval set to Yearly, irrespective of the target is of type cumulative or non-cumulative, after running the scheduled job quarterly target breakdowns will be created and the Target value distribution is set to **Spread linearly across the time period (cumulative)** for the target.

For example, consider a scenario where details of a target are as follows before upgrade:

- The base value and target value of the target is 0 and 80, respectively
- The review frequency is set to **Quarterly** and Breakdown interval was set to **Yearly**
- The start date and end date of the target are 2023-01-01 and 2024-12-31, respectively
- The target is of type non-cumulative
- The actual value achieved in each quarter is 10 starting from Q1-2023 till Q2-2024
- The current total actual value of the target is 60 and the current quarter is Q2-2024

In this case, after running the scheduled job 8 quarterly breakdowns are created and the Target value distribution is set to **Spread linearly across the time period (cumulative)** for the target. The current actual value for Q1-2023, Q2-2023, Q3-2023, Q4-2023, Q1-2024, and Q2-2024 quarterly target breakdowns are populated as 10, 20, 30, 40, 50, and 60, respectively. Also, the planned target value is populated for each breakdown.

Defining a custom unit of measure

Defining a custom unit of measure helps the goal users to set the unit of measure for targets as per their choice. Unit of measures are two types, quantitative and qualitative.

By default, the available unit of measures for quantitative targets are **#**, **$**, **%**, **Days**. By default, the available unit of measure for qualitative targets is **Yes/No**.

As an administrator, you must create custom unit of measures so that the goal user can use them for setting a unit of measure for their targets:

- For quantitative targets, you can define a custom unit of measures from the Unit [sn_gf_unit] table.
- For qualitative targets, you must first create a choice set and then create a choice list for the choice set.

Configure automatic status calculation for targets

Configure system-wide automatic status calculation settings to determine target and goal status automatically based on achievement percentages. Enable or disable automatic calculation and customize Green, Yellow, and Red threshold values to align with your organizational governance policies.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Administraotrs can enable or disable the automatic status calculation feature. They can also customize the threshold percentages to align with organizational governance policies. Use the system property *sn_gfa.target.auto_status.thresholds* to adjust threshold values.

Default system property value:

```
{"enabled": true, "thresholds": {"green": 90, "yellow": 75}}
```

- `enabled`: Set to `true` to enable automatic status calculation. Set to `false` to disable and revert to manual status selection.
- `green`: Threshold percentage for Green status (default: 90)
- `yellow`: Threshold percentage for Yellow status (default: 75)

Procedure

1. Navigate to **All** > **System Definition** > **System Properties**.
2. Search for and open the *sn_gfa.target.auto_status.thresholds* system property.
3. In the **Value** field, input as `true` or `false` as needed.
   The default value is **true**.

   Customize the threshold percentages for Green and Yellow statuses as needed.
4. Select **Update** to save the changes.

Configure the tolerance for Maintain constant targets

Set the tolerance percentage for Maintain constant targets to define the range of acceptable actual values and control how progress and status are calculated.

Before you begin

Role required: sn_gf.goal_admin or admin

About this task

A Maintain constant target is met for a period when the actual value is within the tolerance band around the planned target. The *sn_gf.maintain_constant_tolerance_percent* system property sets the tolerance percentage for all Maintain constant targets on the instance. The value is a whole number, and the default value is 5.

For example, with the default tolerance of 5 and a planned target of 50, actual values from 47.5 through 52.5 meet the target. For more information, see Target types and achievement strategies.

Procedure

1. Navigate to **All** > **System Definition** > **System Properties**.
2. Search for and open the *sn_gf.maintain_constant_tolerance_percent* system property.
3. In the **Value** field, enter the tolerance percentage as a whole number.
   For example, enter `10` for a tolerance of 10 percent.
4. Select **Update**.

Result

The new tolerance is used the next time progress is calculated for each Maintain constant target, for example, when an actual value is entered or changed. Progress that was already calculated is not recalculated until then.

© 2026 ServiceNow, Inc. All rights reserved.

Change the number prefix for goals and targets

Change the prefix of the Number field for goals and targets, for example, from GOAL and TRGT to OBJ and KR when your organization uses objectives and key results, and apply the new prefix to existing records.

Before you begin
Role required: admin

About this task
Each goal and target has a unique identifier in the **Number** field. By default, goal numbers start with GOAL and target numbers start with TRGT, for example, GOAL0001234 and TRGT0005678. You can change the prefixes, for example, to OBJ and KR, and then run a scheduled job that applies the new prefixes to existing goals and targets.

The scheduled job keeps the numeric part of each number. For example, GOAL0001234 becomes OBJ0001234. Records that already have the new prefix are skipped, so you can run the job again safely. The job does not run business rules or change the updated date of the records.

Procedure

1. Navigate to **All** > **System Definition** > **Number Maintenance**.
2. Open the number record for the Goal Core [sn_gf_core_goal] table.
3. In the **Prefix** field, enter the new prefix for goals, for example, `OBJ`, and then select **Update**.
4. Open the number record for the Target [sn_gf_goal_target] table, enter the new prefix for targets in the **Prefix** field, for example, KR, and then select **Update**.
5. Navigate to **All** > **System Definition** > **Scheduled Jobs**.
6. Open the **GF - Override Goal and Target Number fields with customized prefixes** scheduled job.
7. Select **Execute Now**.

Result
Existing goals and targets show the new prefix in the **Number** field, and new goals and targets are numbered with the new prefix.

Managing goals using Goal Framework or Goal Framework for SPM

Understand the process required to define goals using Goal Framework.

Use the following steps as guidelines for defining your goals. Some of these steps require the sn_gf.strategy_planner role and some require the sn_gf.goal_user role. If you're an Goal Framework for SPM user, you need the sn_gf.goal_admin role to configure the target automation feature. All steps are the same for defining goals using either Goal Framework or Goal Framework for SPM.

1. Create a strategic plan to define the purpose - vision, mission, and values - of your organization. For more information, see Create a strategic plan.

   You can create strategic plans only when Strategic Planning is installed. Creating a strategic plan isn't required to define goals.

2. Create a strategic priority to orient your organization's strategic plan to your goal. For more information, see Create a strategic priority.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Create a goal. For more information, see Create a goal.
4. Create targets for goals to track and measure the progress of the goals. For more information, see Set targets for a goal using Goal Framework.
5. (For Goal Framework for SPM users only) Set targets for goals and configure the target sources for the targets to auto-update the actual value of the targets. After the progress of a target is updated, the target's progress is rolled up to its goal. For more information, see Configuring target source for target automation using Goal Framework for SPM .
6. Create a goal or target relationship with a work or strategic item. For more information, see Associate work or strategy with goals or targets.
7. Set a goal or target as primary for the work and planning items where the items contribute to achieving the goal. For more information, see Associating the primary goal or target for work and planning items.

Create a strategic plan

As a strategy planner, you can create and manage strategic plans for your organization. Create a strategic plan to define the purpose of your organization, its strategic priorities, and the associated goals.

Before you begin

Install Strategic Planning on your ServiceNow instance.

Role required: sn_gf.strategy_planner

Procedure

1. Navigate to **All** > **Strategy** > **Strategic Plans**.
2. Click **New**.
3. On the form, fill in the fields.
   For field information, see Strategic Plan form.
4. Click **Submit**.

What to do next

From the Values related list, capture values for your organization such as Integrity, Commitment to customers, and Trust.

Create a strategic priority for a strategic plan

As a strategy planner, you can create and manage the strategic priorities for the strategic plans for your organization. Create a strategic priority to orient your organization strategic plan toward your goal.

Before you begin

Role required: sn_gf.strategy_planner

About this task

The strategic priorities are also known as focus areas or long-term strategies.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Create a strategic priority for a strategic plan using one of the following options.

Option	Steps
From the Strategic Priorities related list	**a.** Navigate to **Strategy** > **Strategic Plans**. **b.** Open the required strategic plan that you want to create a strategic priority for. **c.** In the Strategic Priorities related list, click **New**.
From the Strategic Priorities module	**a.** Navigate to **Strategy** > **Strategic Priorities**. **b.** Click **New**.

2. On the form, fill in the fields.
   For field information, see Strategic Priority form.
3. Click **Submit**.

What to do next
Define goals and set targets for them to accomplish the strategic priorities.

Create a goal

Create goals and set targets to measure overall goal progress and evaluate them to align with the organizational strategic priorities.

Before you begin
Role required: sn_gf.goal_user or sn_gf.goal_admin

About this task
Goals are typically qualitative in nature. Goals should be ambitious and are expected to motivate and challenge the teams.

Procedure

1. Navigate to **All** > **Enterprise Goal Management** > **Goals**.
2. Click **New**.
3. On the form, fill in the fields.
   For field information, see Goal form.
4. Click **Submit**.

What to do next
Set targets for the goals.

Create targets for a goal using Goal Framework or Goal Framework for SPM

Create SMART targets for goals to track and measure the progress of the goals.

Before you begin
Role required: sn_gf.goal_user or sn_gf.goal_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

SMART targets are specific, measurable, attainable, relevant, and time-bound. When selecting a target type, consider your goal's direction:

- **Maximize**: Use for goals when the goal is to increase a metric (for example, revenue, customer satisfaction).
- **Minimize**: Use for goals when the goal is to decrease a metric (for example, costs, defects).
- **Maintain above**: Use for goals where a metric must stay above a threshold (for example, service uptime, compliance rating).
- **Maintain below**: Use for goals where a metric must stay below a threshold (for example, operating costs cap).
- **Maintain constant**: Use for goals where a metric must stay stable within a tolerance range (for example, staffing levels, quality scores).
- **Milestone**: Use for qualitative goals with Yes/No achievement status (for example, project completion, regulatory approval).

Note:

- Only the owner or contributors of the goal can create targets for the goal.
- You can also restrict access to a target record to specific users by selecting the **Confidential** check box on the Target form if the Operational Sustainability Management application is installed.

Procedure

1. Create a target for a goal using one of the following options.

Option	Steps
From the Targets related list	**a.** Navigate to **Enterprise Goal Management** > **Goals**. **b.** Open the required goal that you want to set a target for. **c.** In the Quantitative Targets or Qualitative Targets related list, click **New**.
From the Targets module	**a.** Navigate to **Enterprise Goal Management** > **Targets**. **b.** Click **New**.

2. On the form, fill in the fields.
   For a description of the field values, see Target form. In the **Type** field, select the target type that matches the direction of your goal.
3. For Maintain-type targets, set up the check-in frequency to track performance across time periods.

   Maintain-type targets require periodic check-ins to track how often the metric stays within, above, or below the threshold. For example:

   - Maintain above service uptime: Set check-in frequency to **Monthly** to track monthly uptime performance.
   - Maintain constant staffing: Set check-in frequency to **Quarterly** to verify headcount stays within the tolerance band each quarter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For Maximize and Minimize targets, check-in frequency is optional.

4. Click **Submit**.

Result

The target progress records are automatically created when you save the target post populating the **Actuals to date** field. The target progress records specify the progress of each target for the goal.

Note: When you delete a goal, its associated targets (if any) and their progress records are also deleted even though the **Allow the deletion of targets** property is set to **No**.

What to do next

Update the progress of the target manually if the target is not enabled for target automation. For Maintain-type targets with check-in frequency, enter the actual value for each time period to track achievement across the breakdown periods.

Update the progress of a manual target

Update the progress of a target when its status is changed.

Before you begin

Role required: sn_gf.goal_user or sn_gf.goal_admin

About this task

Note: Only the owner or contributors of the goal can update targets of the goal.

Procedure

1. Open the target record of the goal using one of the following options.

Option	Steps
From the Targets related list	**a.** Navigate to **Enterprise Goal Management** > **Goals**. **b.** Open the required goal whose progress of the target you want to update. **c.** In the Quantitative Targets or Qualitative Targets related list, click **New**.
From the Targets module	**a.** Navigate to **Enterprise Goal Management** > **Targets**. **b.** Open the required target record.

2. On the Target form, update the **Actuals to date** field and add a business justification in the **Remark** field.
   For field information, see Target form.
3. Click **Update**.

Result

Once the **Actuals to date** field is updated, the progress value for the target is auto-updated. For information on how the progress value is calculated, see progress value calculation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related topics

Update the progress of a target using Goal Framework for SPM

Update the actual value of a target breakdown

Update the progress of a target using Goal Framework for SPM

Update the progress of a target using the **Update Actual value** related link on the Target form.

Before you begin

Role required: sn_gf.goal_user or sn_gf.goal_admin

About this task

Note: Only the owner or contributors of the goal can update targets for the goal.

Procedure

1. Open the target record of the goal using one of the following options.

Option	Steps
From the Targets related list	**a.** Navigate to **Enterprise Goal Management** > **Goals**. **b.** Open the required goal with the target progress that you want to update. **c.** From the Quantitative Targets or Qualitative Targets related list, open the required tar get record.
From the Targets module	**a.** Navigate to **Enterprise Goal Management** > **Targets**. **b.** Open the required target record.

2. On the Target form, click the **Update Actual value** related link.
   For a description of the field values, see Target form.

Result

After the **Actuals to date** field is updated, the progress value for the target and its goal are auto-updated. For information on how the progress value is calculated, see progress value calculation. For information on how the progress value is calculated for a target that has target breakdowns, see Target breakdowns.

Update the progress of a manual target

Update the actual value of a target breakdown

Change the type of a target

Change the type of an existing target when the way that you measure the target changes, for example, from Maximize to Maintain above. Depending on the old and new types, the change can clear the actual value and progress of the target.

Before you begin

Role required: sn_gf.goal_user or sn_gf.goal_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You must be the owner or a contributor of the goal that the target belongs to.

About this task

You can change the **Type** field of a target at any time, including after actual values are recorded. What happens to the existing values depends on the old and new types:

Effect of changing the target type

Change	Effect on the target
From one Maintain type to another, for example, from **Maintain above** to **Maintain constant**	The actual values are kept, and progress is recalculated for the new type.
Between **Maximize**, **Minimize**, and a Maintain type	The actual value and progress of the target are cleared. If the target has target breakdowns, they are regenerated with planned targets for the new type and no actual values.
To or from **Milestone**	The **Unit of measure** field changes to match the new type: a qualitative unit of measure for **Milestone**, and a quantitative unit of measure for the other types. When you change to **Milestone**, any target breakdowns are deleted.

When the change clears or resets values, a confirmation message appears before the change is applied. If you rely on the existing actual values, record them before you continue.

Procedure

1. Navigate to **Enterprise Goal Management** > **Targets**.
2. Open the target that you want to change.
3. In the **Type** field, select the new type.
   For information on choosing a type, see Target types and achievement strategies.
4. If a confirmation message appears, select **OK** to apply the new type.
   To keep the previous type, select **Cancel**. The **Type** field returns to its previous value, and the target is not changed.
5. Select **Update**.

Result

The target uses the new type to calculate progress. If the target has target breakdowns and the new type is a Maintain type, the planned target of every target breakdown is set to the final target value.

What to do next

If the actual value was cleared, enter the actual values again. For more information, see Update the progress of the target or Update the actual value of a target breakdown.

Change the type of a target

Change the type of an existing target when the way that you measure the target changes, for example, from Maximize to Maintain above. Depending on the old and new types, the change can clear the actual value and progress of the target.

If the actual value was cleared, enter the actual values again. For more information, see Update the progress of the target or Update the actual value of a target breakdown.

Target breakdowns

Breaking down a target into smaller periods (for example, Monthly) helps you set a target value for each month and focus on that specific monthly target. The target breakdowns are automatically created based on the Check-in frequency and Target value distribution set for the target.

The check-in frequency for a target can be set to Daily, Weekly, Monthly, Quarterly, or Yearly. Based on the Check-in frequency of the target, the corresponding target breakdowns are created. For example, if the Check-in frequency is set to Monthly for a target spanning for a year,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

12 monthly target breakdowns are created. Planned target values are automatically set for each target breakdown based on the Target value distribution setting of the target.

Note: The target breakdowns feature isn't supported for qualitative targets.

The following examples help you understand how the target progress is calculated for targets with different target distribution type.

Example 1: Acquire 1200 new customers in the calender year 2025 (Track non-cumulatively)

In this example, you want to achieve a target of acquiring 1200 new customers in the calender year 2025 and track the progress monthly (non-cumulatively), then you can set the target as the following:

- Set the start date and end dates to 2025-01-01 and 2025-12-31, respectively
- Set the start value and final target values to 0 and 1200, respectively
- Set the Check-in frequency for the target to Monthly
- Set the Target value distribution to Split equally across the time period (non-cumulative)

  This Target value distribution means that the final target value is divided into 12 equal values (planned target value for each target breakdown) which aggregates to the final target value. You can edit the planned target value later from the respective target breakdown record as needed.

In this case, the application creates 12 target breakdowns (January, February, ……., and December) for calender year 2025 and sets the Planned target value for each target breakdown to 100 (Final target value divided by the number of target breakdowns).

Because the application sums up the actual value entered in each monthly target breakdown, you must enter the actual value that is achieved in the particular month for the target breakdown. For example, you acquired 100 customers in January, then enter 100 as the actual value in the January target breakdown. And, you acquired another 100 customers in February, then enter 100 as the actual value in the February target breakdown. Similarly, if you acquired another 100 in March and 100 in April, then enter 100 as the actual value in both the March and April target breakdowns.

The application sums up the actual values entered in each monthly target breakdown and rolls up the sum value to the actual value of the main target. Then, the progress of the target and its goal are auto-updated.

Example 2: Acquire 1200 new customers in the calender year 2025 (Track cumulatively)

In this example, you want to achieve a target of acquiring 1200 new customers in the calender year 2025 and track the progress monthly (cumulatively), then you can set the target as the following:

- Set the start date and end dates to 2025-01-01 and 2025-12-31, respectively
- Set the start value and final target values to 0 and 100, respectively
- Set the Check-in frequency for the target to Monthly
- Set the Target value distribution to Spread linearly across the time period (cumulative)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This Target value distribution means that the final target value is divided linearly into 12 planned target values (such a way that the value for the last monthly breakdown is equal to the final target value). You can edit the planned target value later from the respective target breakdown record as needed.

In this case, the application creates 12 target breakdowns (January, February,……., and December) for calender year 2025 and sets the Planned target value for the January, February,……., and December breakdowns to 100, 200,……., and 1200 respectively.

Because the application considers only the actual value entered in the latest monthly target breakdown, you must enter the cumulative actual value in the latest monthly target breakdown. For example, you acquired 100 customers in January, then enter 100 as the actual value in the January target breakdown. And, you acquired another 100 customers in February, then enter 200 as the actual value in the February target breakdown. Similarly, if you acquired another 100 in March and 100 in April, then enter 300 and 400 as the actual value in the March and April target breakdowns, respectively.

The application considers the actual value entered in the latest monthly target breakdown and rolls up to the actual value of the main target. Then, the progress of the target and its goal are auto-updated.

Benefits of target breakdowns

The target breakdowns feature helps you when you want to set a target for a period but want to track the progress of the target in smaller periods such as daily, weekly, monthly, quarterly, and yearly. For example, you have set a target for a year with start value and final target values of 0 and 1200, respectively. Also, you want to set monthly targets of 100 for each quarter. In this case, you can break down the target into monthly targets and set a target value for each month so that you can focus on the specific monthly target and update your actuals against those monthly targets.

The target breakdowns feature has the following benefits:

- Break down the long-term targets into short-term intervals such as Daily, Weekly, Monthly, Quarterly, and Yearly for a better tracking or reporting of your progress
- Set or modify a planned target value for each target breakdown as needed
- Update the actual value for each target breakdown and track the progress of the main target
- Focus on the specific short-term target (target breakdown) rather than the whole target
- Track the progress of your short-term and long-term targets cumulatively or non-cumulatively

Target breakdowns for Maintain type targets

When the **Type** field of a target is set to **Maintain above**, **Maintain below**, or **Maintain constant**, the planned target of every target breakdown, at every level, is set to the final target value. If the final target value is empty, the planned targets are set to 0. You can edit the planned target of a breakdown later. The **Target value distribution** field doesn't apply to Maintain types.

For example, if you set a Maintain above target of 75 with a quarterly check-in frequency for 2026, four quarterly breakdowns are created, each with a planned target of 75.

Enter the actual value that you measured in each breakdown period. The **Actuals to date** value of the target shows the actual value of the latest breakdown period that has an actual. Parent

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

breakdowns, such as a year above its quarters, also take the actual value of their latest child breakdown.

When you change a Maintain-type target, its breakdowns are updated as follows:

- Start date moved later or end date moved earlier: the breakdowns that fall outside the new date range are removed. The remaining breakdowns keep their planned targets and actuals.
- Start date moved earlier or end date moved later: breakdowns are added for the new periods, with the planned target set to the final target value and no actual value.
- Final target value changed: the planned target of every breakdown is updated to the new final target value, and the status and progress are recalculated.
- Check-in frequency changed: the breakdowns are regenerated for the new frequency. Where the old and new breakdowns share a period, such as the same month or quarter, the latest actual value and status from that period are copied to the new breakdowns.

For how progress is calculated from the breakdowns, see Target types and achievement strategies. To change the type of a target that already has breakdowns, see Change the type of a target.

How the actual value is calculated when the check-in frequency set to None

When the check-in frequency is set to None for a target, the actual value must be entered in the **Actuals to date** field in the main target record. The actual value entered must be cumulative irrespective of the time period of the target. Target breakdowns aren't created when the check-in frequency is set to None.

Target breakdowns in target automation

If you've enabled the target automation feature for a target and set the check-in frequency and Target value distribution, the target automation feature automatically updates the actual value in the respective target breakdown based on the check-in due date. After the actual value of a target breakdown is updated, the value is rolled up to rolls up to the actual value of the main target. Then, the progress of the target and its goal are auto-updated.

Update the actual value of a target breakdown

Update the actual value of a target breakdown when its status is changed. Updating the actual value of a target breakdown automatically updates the actual value of its target. After the **Actual** field of the target is updated, the progress value for the target and its goal is auto-updated.

Before you begin
Role required: sn_gf.goal_user

About this task

Note: Only the owner or contributors of the goal can update the target breakdowns.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Open the target record of the goal using one of the following options.

Option	Steps
From the Targets related list	**a.** Navigate to **Enterprise Goal Management** > **Goals**. **b.** Open the required goal whose progress of the target you want to update. **c.** From the Quantitative Targets related list, open the required target record.
From the Targets module	**a.** Navigate to **Enterprise Goal Management** > **Targets**. **b.** Open the required target record.

2. On the Target form, update the **Actual** field and add a business justification in the **Remark** field.
   For field information, see Target Breakdown form.
3. Select **Update**.

Result

After the **Actual** field is updated, the progress value for the target and its goal is auto-updated. For information on how the progress value is calculated, see Progress value calculation. For information on how the actual value of the target breakdown is rolled up to its target, see Target breakdowns.

Associate a work or planning item with goals or targets

Create a goal or target relationship with a work, planning, strategic, or any other item to identify and associate your current or future work and achieve your goals and targets.

Before you begin

Role required: sn_gf.goal_user

About this task

You can associate a goal or target with only one of the work items (Project, Demand, Program, Scrum Feature, Scrum/SAFe Epic), or SAFe Feature, planning items (Project, Demand, or Epic), or strategic items (Program or Initiative) at a time. To associate more than one item with a goal or target, create one goal or target relationship record for each item.

- You can associate a goal or target with the Project, Demand, and Program work items only when PPM Standard (Project Portfolio Management) is installed.
- You can associate a goal or target with the Scrum Feature and Scrum Epic work items only when Agile Development 2.0 is installed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- You can associate a goal with the SAFe Epic and SAFe Feature work items only when Scaled Agile Framework (SAFe) is installed.
- You can associate a goal or target with the planning items (Project, Demand, and Epic) and strategic items (Program and Initiative) only when Strategic Planning is installed.

Note:

- Depending on the plugin that is installed - PPM or Strategic Planning - the respective related list appears on the Goal and Target form. If PPM is installed, the Project, Demand, and Program work item related lists appear on the Goal and Target form. If only Strategic Planning is installed or both PPM and Strategic Planning are installed, the Planning items and Other items related lists appear on the Goal and Target form respectively.
- When a goal or target relationship is created with a work item (Project, Demand, Program, Scrum Feature, Scrum/SAFe Epic, or SAFe Feature), the record appears on the respective related list on the Goal or Target form. When a goal or target relationship is created with a planning item (Project, Demand, or Epic), the record appears in the Planning items related list on the Goal or Target form. When a goal or target relationship is created with a strategic item (Program or Initiative) or any other item, the record appears in the Other items related list on the Goal or Target form respectively.

Procedure

1. Navigate to **All** > **Enterprise Goal Management** > **Goals**.
2. Open the required goal or target.
3. Create a goal or target relationship with a work or planning item using the following options.

Option	Steps
To create a relationship with a project	**a.** (For PPM users) Click the Projects related list. **b.** (For Strategic Planning users) Click the Plan ning items related list. **c.** Click **Add**. **d.** (For PPM users) On the Goal/Target Rela tionship form, enter the required project in the **Project** field. **e.** (For Strategic Planning users) On the Goal/ Target Relationship form: **i.** From the **Planning item type** drop-down list, select **Project [sn_align_core_ project]**. **ii.** In the **Planning item** field, enter the re quired project.
To create a relationship with a demand	**a.** (For PPM users) Click the Demands related list. **b.** (For Strategic Planning users) Click the Plan ning items related list. **c.** Click **Add**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Steps
	d. (For PPM users) On the Goal/Target Relationship form, enter the required demand in the **Demand** field. **e.** (For Strategic Planning users) On the Goal/Target Relationship form: **i.** From the **Planning item type** drop-down list, select **Demand [sn_align_core_demand]**. **ii.** In the **Planning item** field, enter the required demand.
To create a relationship with a program	**a.** (For PPM users) Click the Programs related list. **b.** (For Strategic Planning users) Click the Planning items related list. **c.** Click **Add**. **d.** (For PPM users) On the Goal/Target Relationship form, enter the required program in the **Program** field.
To create a relationship with a scrum feature	For Agile Development 2.0 users only. **a.** Click the Features related list. **b.** Click **Add**. **c.** On the Goal/Target Relationship form, enter the required scrum feature in the **Feature** field.
To create a relationship with a scrum or SAFe epic	**a.** (For Agile Development 2.0 or SAFe users) Click the Epics related list. **b.** Click **Add**. **c.** (For Strategic Planning users) Click the Planning items related list. **d.** (For Agile Development 2.0 and SAFe users) On the Goal/Target Relationship form, enter the required scrum or SAFe epic in the **Epic** field. **e.** (For Strategic Planning users) On the Goal/Target Relationship form: **i.** From the **Planning item type** drop-down list, select **Epic [sn_align_core_scrum_epic]**. **ii.** In the **Planning item** field, enter the required epic.
To create a relationship with a SAFe Feature	**a.** (For Agile Development 2.0 or SAFe users) Click the Features related list. **b.** Click **Add**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Steps
	c. (For Strategic Planning users) Click the Planning items related list. **d.** (For Agile Development 2.0 and SAFe users) On the Goal/Target Relationship form, enter the required scrum or SAFe feature in the **Feature** field.
To create a relationship with any item other than work, planning, or strategic item	**a.** Click the Other items related list. **b.** Click **Add**. **c.** On the Goal/Target Relationship form: **i.** From the **Table** drop-down list, select a table. **ii.** In the **Document ID** field, enter the document ID of the column for the selected reference table.

4. Click **Submit**.

Associating the primary goal or target for work items

You can associate a goal or target as the primary for the work and planning items where the items contribute to achieving the goal or target. You need different roles to set a goal or target as the primary for work and planning items.

You can associate a goal or target as primary to work and planning items by populating the **Primary goal** and **Primary target** fields on the Project, Demand, Program, Feature, Epic, and Planning item forms.

You can also associate non-primary goals or targets to work and planning items from the Goal/Target Relationships related list on the Project, Demand, Program, Feature, Epic, and Planning item forms.

Once you associate work and planning items to goals or targets, you can check these relationships directly in the goal's or target's related list or in the respective work or planning item's related list.

The following table describes how the primary goal or target can be set for each work and planning item.

Work / Planning item	Plugin required	Role required	Steps to associate the primary goal
Project	PPM Standard	project_manager	**1.** Open the required project. **2.** On the form, enter the goal or target that you want to associate to the project in the **Primary goal** and **Primary target** fields respectively.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Work / Planning item	Plugin required	Role required	Steps to associate the primary goal
Demand	PPM Standard	demand_manager	**1.** Open the required demand. **2.** On the form, enter the goal or target that you want to associate to the demand in the **Primary goal** and **Primary target** fields respectively.
Program	PPM Standard	program_manager	**1.** Open the required program. **2.** On the form, enter the goal that you want to associate to the program in the **Primary goal** and **Primary target** fields respectively.
Feature	Agile Development 2.0	rm_feature_admin	**1.** Open the required feature. **2.** On the form, enter the goal or target that you want to associate to the feature in the **Primary goal** and **Primary target** fields respectively.
SAFe Feature	Scaled Agile Framework	safe_art_user or safe_admin	**1.** Open the required feature. **2.** On the form, enter the goal or target that you want to associate to the feature in the **Primary goal** and **Primary target** fields respectively.
Scrum Epic	Agile Development 2.0	scrum_story_creator	**1.** Open the required epic. **2.** On the form, enter the goal or target that you want to associate to the epic in the **Primary goal** and **Primary target** fields respectively.
SAFe Epic	Scaled Agile Framework	safe_art_user	**1.** Open the required epic. **2.** On the form, enter the goal or target that you want to associate to the epic in the **Primary goal** and **Primary target** fields respectively.
Planning item (Project, Demand, and Scrum/SAFe Epic)	Strategic Planning	sn_align_core.apw_user	**1.** Open the required planning item. **2.** On the form, enter the goal or target that you want to associate to the planning item in the **Primary goal** and **Primary target** fields respectively.

Goal Framework and Goal Framework for SPM reference

Reference information to provide additional details about Goal Framework and Goal Framework for SPM such as the fields, user roles, and tables.

Components installed with Goal Framework and Goal Framework for SPM

Several types of components are installed with the installation of the Goal Framework and Goal Framework for Strategic Portfolio Management (SPM) applications, including user roles, scheduled jobs, tables, and scripts.

Roles installed

Role	Description	Contains roles
sn_gf.goal_user_read	Can view the goals. This role can be given to users such as the project user and demand user.	sn_gf.strategy_planner_read
sn_gf.goal_user	• Can create, view, edit, and delete goals, sub-goals, and associated targets. **Note:** ◦ A goal or sub-goal can be deleted only by the owner and contributors of the goal or its immediate parent goal when the **sn_gf.allow_goal_deletion** system property is set to **Yes**. ◦ An associated target can be deleted only by the owner and contributors of the target or its goal when the **sn_gf.allow_goal_deletion** system property is set to **Yes**. ◦ A goal can be edited only by the owner and contributors of the goal or its immediate parent goal. ◦ A target can be edited only by the owner and contributors of the target or its goal. • Can remove the existing goal relationships between work item and goal, from	sn_gf.goal_user_read

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role	Description	Contains roles
	the Goal Relationship [sn_gf_goal_m2m_relationship] table.	
sn_gf.goal_admin	• Create goals and targets. • Edit goals and targets created by other users. • Can update the goal preferences. • Can create target sources and context variables as part of enabling the target automation feature. **Note:** Creating target sources and context variables is available when Goal Framework for SPM is installed.	• assessment_admin • sn_apw_advanced.spw_goal_user • sn_gf.goal_user
sn_gf.strategy_planner_read	Can view all strategic plans and strategic values.	None
sn_gf.strategy_planner	Can create, view, edit, and delete strategic plans and strategic values. **Note:** • A strategic plan can be edited only by the owner and sponsor of the strategic plan. • A strategic value can be edited only by the sponsor of the strategic plan.	sn_gf.strategy_planner_read
sn_gf.epmo_strategy_planner	Can create, view, edit, and delete any goal.	• sn_gf.strategy_planner • sn_gf.goal_user

Scheduled jobs installed

Goal Framework scheduled jobs

Scheduled job	Description
Migrate Goal, Strategy, and Work item data to the Goal Framework and	Migrates the existing goals data to the Goal Framework tables. For information on what data is migrated and how the data can be migrated, see goal data migration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Goal Framework scheduled jobs (continued)

Scheduled job	Description
related Planning item tables	
Migrate goal relationships for assigned entities	(For Strategic Planning users) Populates the fields, **Assigned entity type** and **Assigned entity** on the Goal form based on the data in the Goal Relationship [sn_gf_goal_m2m_relationship] table if you have created m2m relationship with lens entities other than **Company**, **Business Unit**, **Department**, and **Portfolio**.
Copy Goal Assigned Entity To Target	Populates the Assigned entity field on the targeted record with the value from the corresponding goal record.
GF - Override Goal and Target Number fields with customized prefixes	Applies the prefixes that are set in the number records for goals and targets to the **Number** field of existing goals and targets, and keeps the numeric part of each number. For more information, see Change the number prefix for goals and targets.

Goal Framework for SPM scheduled jobs

Scheduled job	Description
Update Actual value of the targets using Goal Framework for SPM	Updates the actual value of the targets by collecting the data from the respective target sources, so that the progress of the targets is updated and then the targets' progress is rolled up to the goals.
Migrate BreakdownInterval To Checkinfrequency	Migrates the existing values from the **Review frequency** field to the **Check-in frequency** field in the target records. For more information, see Migrate target breakdowns.

Tables installed

Goal Framework tables

Display name [Table name]	Description
Goal [sn_gf_goal]	Stores the goal details.
Goal Core [sn_gf_core_goal]	Stores the core (basic) details for the goal. The Goal [sn_gf_goal] table extends the Goal Core [sn_gf_core_goal] table.
Target [sn_gf_goal_target]	Stores the target details for the goal.
Units [sn_gf_units]	Stores the available units for measuring the progress of targets.
Target Progress	Stores the target progress details for the goal.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Goal Framework tables (continued)

Display name [Table name]	Description
[sn_gf_goal_target_progress]	
Goal Relationship [sn_gf_goal_m2m_relationship]	Defines the relationship between a goal and items (Project, Demand, Program, Scrum Epic, Scrum Feature, and Planning item).
Strategic Plan [sn_gf_strategic_plan]	Stores the strategic plans defined for each planning organization hierarchy. **Note:** This table is visible only when Alignment Planner Workspace (APW) is installed.
Strategic Priority [sn_gf_strategy]	Stores the strategic priorities defined for the organization.
Strategy Value [sn_gf_strategy_value]	Stores the strategic values for strategic plans. **Note:** This table is visible only when APW is installed.

Goal Framework for SPM tables

Display name [Table name]	Description
Context Variable [sn_gfa_context_variable]	Stores the context variable details for the target source.
Target Breakdown [sn_gfa_target_breakdown]	Stores the target breakdown details for the target that were created based on the breakdown intervals specified for the target.
Target Source [sn_gfa_target_source]	Stores the target source configuration details for automating the actual value of the targets.

Custom scripts installed

Goal Framework for SPM custom scripts

Name	Description
Benefit Plans A target source with predefined script.	Predefined script that updates the **Actual value** field on the target form by fetching the required value from the **Actual benefit** field or **Non-monetary actual benefit** field from the monetary or non-monetary benefit plan records. For the script template, see Target automation script for benefit plans. **Note:** You can use the Benefit Plans custom script only when PPM Standard (Project Portfolio Management) is installed.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

System properties installed

Goal Framework system properties

Name	Description
glide.ui.sn_gf_goal_target_activity.field	Option to enable activity stream for fields of the targets.
sn_gf.allow_goal_deletion	Option to enable deletion of goals. The default value is true.
sn_gf.allow_target_deletion	Option to enable deletion of targets. The default value is true.
sn_gf.goal_calendar_type	Option to set calender type for setting goals. The available calendar types are Gregorian Calendar and Fiscal Period. The default value is Gregorian Calendar.
sn_gf.maintain_constant_tolerance_percent	Tolerance percentage that is used to determine whether the actual value of a Maintain constant target meets the planned target. The default value is 5. For more information, see Configure the tolerance for Maintain constant targets.
sn_gf.weighted_average_enabled	Option to enable the weighted average logic to calculate the progress of goals from their subgoals and targets.

Goal Framework for SPM system properties

Name	Description
sn_gfa_disable_target_breakdown	Option to enable the target breakdowns feature at the instance level. The default value is false.
sn_gfa.target_breakdown_decimals	Option to define the number of decimals to show for target values while generating the target breakdowns. The default value is 2.
sn_gfa.weeklyCheckInDayToMapMonth	Option to define end day of the week for weekly target breakdowns mapping to month. The default value is Friday.

Context Variable form

Use the Context Variable form to create a context variable for a target source for calculating the actual value of the target based on the configured input values.

Context Variable form

Field	Description
Type	Context variable type. For information about the different field types, see Field types.
Application	Name of the application scope.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Context Variable form (continued)

Field	Description
Label	Name of the label that the context variable type is created for.
Column name	ID of the context variable for which the context variable type is created.
Choice List Specification	Option to display the context variables on the Target form in the Actual Value Source Configuration section.
Default value	Default value to consider for updating the actual value of the target.

Goal Assigned Entity Configuration form

Use the Goal Assigned Entity Configuration form to configure a table for an assigned entity type so that the goal user can associate goals with the required assigned entity.

Goal Assigned Entity Configuration form

Field	Description
Assigned entity table	Entity table that a goal is assigned to.
Application	Name of the application scope.
Assigned entity field	Reference field on the goal form.

Goal form

Use the Goal form to create goals for your organizational strategic priorities.

Note: For Operational Sustainability Workspace and Strategic Planning users, to view the other fields (that aren't added to the default or your custom form view) on the form in the workspace, configure the default/custom form layout. For information on how to configure the form layout, see Configuring the form layout.

Goal form

Field	Description
Number	Unique identifier of the goal. The number is generated automatically, for example, GOAL0001234. An administrator can change the prefix. For more information, see Change the number prefix for goals and targets.
Name	Name of the goal.
State	State of the goal. The state can be **Draft**, **In progress**, **Approved**, **Complete**, **Pending**, **Achieved**, **Not Achieved**, or **Cancelled**.
Parent goal	Name of the parent goal that this goal contributes to.
Strategic priority	Name of the strategic priority that this goal is created for.
Start date	Start date for the goal. By default, the start date of the current quarter is populated. For a subgoal, start date of its parent goal is populated.
End date	End date for the goal. By default, the end date of the current quarter is populated. For a subgoal, the end date of its parent goal is populated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Goal form (continued)

Field	Description
Owner	Owner of the goal. By default, the name of the user creating the goal is populated.
Category	Category of the goal. The available options are: • **Total Applications** • **Total Cost** • **Opex** • **Capex** • **Cloud Applications** • **Homegrown Applications** • **Support Cost** • **Labor Cost** • **Standards Compliance** • **Strategic** • **Operational** • **Tactical** • **Artificial Intelligence**
Status	Status of the goal. Status can be **Red**, **Yellow**, **Green**, or **No status**.
Contributors	Users who contribute to the achievement of the goal.
Team	Assignment group responsible for different activities in achieving the goal.
Impact on parent goal	A numerical value that represents the importance of this goal relative to sibling goals or other goals under its parent goal. By default, the value is (1) Neutral. The available options are: • **(0) No impact** • **(1) Neutral** • **(2) Moderate** • **(3) High** • **(4) Very high** • **(5) Maximum** **Note:** This field is available only when the **sn_gf.weighted_average_enabled** system property is set to **Yes**.
Progress	Percentage complete for the goal. The progress value is calculated automatically if the goal has sub-goals or/and targets. For more information on how the progress value is calculated, see Progress value calculation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Goal form (continued)

Field	Description
Assigned entity type	Entity type to which the goal is assigned. For example, Business Unit, Department, Company, or Portfolio.
Assigned entity	Entity to which the goal is assigned.
Comments	Detailed comments for the goal to facilitate collaboration.
Classification	Goal classification type. The available options are **Environmental**, **Social**, and **Governance**. This field is applicable only for the Operational Sustainability Workspace users.

Goal/Target Relationship form

Use the Goal/Target Relationship form to create a relationship between a goal and planning item, strategic item, or any other item.

Note: If Goal Framework for SPM is not installed, the form name appear as Goal Relationship.

Goal/Target Relationship form - Fields for planning and strategic item

Field	Description
Planning item type	Type of planning item.
Planning item	Planning item with which a goal relationship is created with the goal.

Goal/Target Relationship form - Fields for planning and strategic item - Fields for an item (that is of entity type, Product Model)

Field	Description
Table	Name of the reference table.
Document ID	Document ID of the column from the selected reference table. The suggested values in this field depend on the reference table selected in the **Table** field.

Goal Preferences form

Use the Goal Preferences form to manage goals such as the calendar type used for goal setting, weighted average calculation for goal progress, and deletion of goals and targets.

Goal Preferences form

Property	Description
Enable the weighted average logic to calculate the progress of goals from their sub-goals and targets.	When enabled, the fields, **Impact on parent goal** and**Impact on goal** appear in the Goal [sn_gf_goal] and Target [sn_gf_goal_target] tables respectively. The progress value of the parent goal is calculated by applying the Weighted Average logic.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Goal Preferences form (continued)

Property	Description
	The default value is **Yes**. The progress value of a parent goal is calculated based on the progress value and the value defined in the **Impact on parent goal** and**Impact on goal** fields for sub-goals and targets respectively. For more information on how the progress value is calculated, see progress value calculation.
Allow deletion of goals.	Can delete the goals. The default value is **Yes**.
Allow deletion of targets.	Can delete the targets. The default value is **Yes**. **Note:** When you delete a goal, its associated targets (if any) are also deleted even though the **Allow the deletion of targets** property is set to **No**.
Calendar type used for setting goals.	Calendar type that is used for setting goals. The available calendar types are Gregorian calendar and Fiscal period. The default value is **Gregorian calendar**.
Disable target breakdowns at the instance level.	Can disable the target breakdowns feature. When the feature is enabled, target breakdowns are automatically created based on the breakdown interval set for the target. The default value is false.

Progress value calculation

The progress or percentage complete value of goals is auto-calculated using different formulas. The formula depends on whether the goal has only targets, a combination of sub-goals and targets, and if it has weighted average calculation enabled.

Scenario	Formula used to calculate the progress value of the goal
• The goal has targets. • The goal doesn't have sub-goals. • The **Impact on goal** field is defined for targets.	`Progress value of the goal = Sum of progress values of its associated targets / number of targets`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scenario	Formula used to calculate the progress value of the goal
• The goal has sub-goals and targets. • The **Impact on parent goal** and **Impact on goal** fields are defined for sub-goals and targets respectively.	`Progress value of the goal = Sum of progress values of its sub-goals and associated targets / number of sub-goals and targets`
• The goal has two targets (target 1 and target 2). • The goal doesn't have sub-goals. • The **Impact on goal** field is defined for targets and the **sn_gf.weighted_average_enabled** system property is set to **Yes**.	`Progress value of the goal = [(Progress of target 1 * Weight scale of target 1) + (Progress of target 2 * Weight scale of target 2)] / (Weight scale of target 1 + Weight scale of target 2)`
• The goal has two targets (target 1 and target 2). • The goal has two sub-goals (sub-goal 1 and sub-goal 2). • The **Impact on parent goal** and **Impact on goal** fields are defined for sub-goals and targets respectively and the **sn_gf.weighted_average_enabled** system property is set to **Yes**.	`Progress value of the goal = [(Progress of sub-goal 1 * Weight scale of sub-goal 1) + (Progress of sub-goal 2 * Weight scale of sub-goal 2) + (Progress of target 1 * Weight scale of target 1) + (Progress of target 2 * Weight scale of target 2)] / (Weight scale of sub-goal 1 + Weight scale of sub-goal 2 + Weight scale of target 1 + Weight scale of target 2)`

Consider a scenario where a goal (G1) has two targets (T1 and T2) and the **Impact on goal** field for T1 and T2 is set to 2 and 3 respectively. The current Progress values of T1 and T2 are 40% and 20% respectively. In this case, the progress value for G1 is calculated as follows:

- Contribution of T1 towards G1 progress = 2/(2+3)*40 = 16%
- Contribution of T2 towards G1 progress = 3/(2+3)*20 = 12%
- Therefore, Progress of G1 = 16% +12% = 28%

Scheduled Script Execution form

Scheduled Jobs are automated pieces of work that can be performed at a specific time or on a recurring schedule.

Migrate Goal, Strategy, and Work item data to the Goal Framework and related Planning item tables

Use the **Migrate Goal, Strategy, and Work item data to the Goal Framework and related Planning item tables** job to migrate the legacy goals data to the Goal Framework tables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scheduled Script Execution form

Parameter	Description
migrateGoalData	• Migrates all existing goal records from the Goal [goal] table to the Goal [sn_gf_goal] table. The sys_id remains the same. The corresponding target records will be created in the Target [sn_gf_goal_target] table. • Creates the existing relationship between the goal and work items (Project, Demand, Program) in the Goal Relationship [sn_gf_goal_m2m_relationship] table with the first goal (from the order in the glide list) as the primary goal.
migrateStrategyData	Migrates all existing strategy records from the Enterprise Strategy [enterprise_strategy], Business Unit Strategy [business_unit_strategy], and Strategic Objective [strategic_objective] tables to the Strategic Priority [sn_gf_strategy] table. The sys_id remains the same.
migratingGoalStrategyM2Mdata	In Goal Framework, a goal can be mapped to only one strategy. If an existing goal has two strategies mapped to it, a clone of the goal will be created (one as a generic goal and another as a sub-goal) with the same strategy populated for both. And, for the sub-goal, the first goal will be set as the parent goal. For example, consider a scenario where an existing goal (G1) is mapped to five strategies (S1, S2, S3, S4, and S5). Then, four clones of G1 will be created as sub-goals (G2, G3, G4, and G5) and the parent goal is populated as G1. For the parent goal (G1) and the sub-goals (G2, G3, G4, and G5), the **Strategy** field is populated respectively (S1, S2, S3, S4, and S5). **Note:** The name of the cloned sub-goal will be prefixed with `Cloned SubGoal:`, followed by the parent goal name.
migrateStrategyWorkItemRelData	• Migrates the existing relationship of strategy and work items (Project, Demand, Program) to the Goal Relationship [sn_gf_goal_m2m_relationship] table. • If a goal doesn't have an association between the strategy (as current strategy) and the work item in the Goal Relationship [sn_gf_goal_m2m_relationship] table, a dummy goal will be created with a strategy value of current strategy. And, a goal relationship is created with the dummy goal and the work item in the Goal Relationship [sn_gf_goal_m2m_relationship] table. **Note:** The name of the dummy goal will be prefixed with `Goal:`, followed by the strategy name.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Migrate goal relationships for assigned entities

Use the **Migrate goal relationships for assigned entities** job to populate the fields, **Assigned entity type** and **Assigned entity** on the Goal form based on the existing values in the legacy fields, **Business Unit**, **Department**, **Company**, **Portfolio**, and any customized entity field.

Scheduled Script Execution form

Parameter	Description
Migrate goal relationships for assigned entities	(For Strategic Planning users) Populates the fields, **Assigned entity type** and **Assigned entity** on the Goal form based on the data in the Goal Relationship [sn_gf_goal_m2m_relationship] table if you've created an m2m relationship with lens entities other than **Company**, **Business Unit**, **Department**, and **Portfolio**. If users had already created m2m relationship, they may use this script to move those relationships from the m2m table to the goals table to access and manage those goals in the respective portfolio plans. If the goal has only one relationship with an assign entity table type, the **Assign entity type** and **Assign entity** fields are populated on the Goal [sn_gf_goal] table based on the Goal Relationship [sn_gf_goal_m2m_relationship] table. If the goal has multiple relationships with an assign entity table type, number of relationships (n) cloned sub-goals will be created and the **Assign entity type** and **Assign entity** fields are populated on the Goal [sn_gf_goal] table based on the data in the Goal Relationship [sn_gf_goal_m2m_relationship] table for each cloned sub-goal.

Strategic Plan form

Use the Strategic Plan form to define the purpose of your organization, its strategic priorities, and the associated goals.

Strategic Plan form

Field	Description
Name	Name of the strategic plan.
Sponsor	Sponsor for the strategic plan.
Start date	Start date for the strategic plan.
End date	End date for the strategic plan.
Description	A detailed description of the strategic plan.
Vision	A brief description about where your organization's business will be at some point in the future, based on its strategies and associated goals.
Mission	A brief description about what your organization's objectives are and its approach to reach those objectives.

Strategic Priority form

Use the Strategic Priority form to orient your organization strategic plan toward your goal.

Strategic Priority form

Field	Description
Name	Name of the strategic priority.
Parent	Name of the parent strategic priority that this strategic priority contributes to.
Owner	Owner of the strategic priority. By default, the name of the user creating the strategy is populated.
Start date	Start date for the strategic priority.
End date	End date for the strategic priority.
Type	Strategic priority type categorizes the strategic priority by its nature and organizational intent. Classifying priorities by type helps your organization distinguish different focus areas within a strategic plan and align goals across different dimensions of your strategy. The available options are: • **Key Initiative** • **Shared Vision** • **Strategic Target** • **Operating Principle** • **Relationship Strategy** • **Environmental** • **Social** • **Governance** • **Artificial Intelligence**
Status	Status of the strategic priority. Status can be **Red**, **Yellow**, **Green**, or **No status**.
Strategic Plan	Name of the strategic plan for which this strategic priority is created.
Description	A detailed description of the strategic priority. You can refine strategic priority description using the Refine records skill, if the ServiceNow Otto for SPM application is installed.

Target automation script for benefit plans

Use the predefined Benefit Plans script as a target source to automate the actual value of your targets from the benefit plans of relevant work items.

Use the following predefined benefit plans script to configure the target source for your targets. The script fetches the required data for monetary or non-monetary benefit plans and updates the actual value for the target. You can use this script as is or you can also modify it according to

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

your requirement. You can also create context variables and configure them for this target source (Benefit Plans).

```
result = '';
var benefitPlans = new
 GlideRecord(sn_gfa.GFAdvancedConstants.BENEFIT_PLAN_TABLE);
benefitPlans.addQuery('sys_id', 'IN', benefit_plan);
benefitPlans.query();

var nonMonetaryBenefitSum = 0;
var monetaryBenefitSum = 0;
var hasMonetary = false;
var hasNonMonetary = false;
while (benefitPlans.next() && !(hasMonetary && hasNonMonetary))
 {
    if (!gs.nil(benefitPlans.getValue('currency'))) {
        monetaryBenefitSum +=
 parseInt(benefitPlans.getValue('actual_benefit'));
        hasMonetary = true;
    } else {
        nonMonetaryBenefitSum +=
 parseInt(benefitPlans.getValue('nm_actual_benefit'));
        hasNonMonetary = true;
    }
}

if (hasMonetary && hasNonMonetary)
    gs.addErrorMessage(gs.getMessage('The Benefit Plan list can
 contain either monetary or non-monetary benefit plans.'));
else
    result = hasMonetary ? monetaryBenefitSum :
 nonMonetaryBenefitSum;
```

Target Breakdown form

Use the Target Breakdown form to track and measure the progress of the target and its goal.

The form is available when the Goal Framework for SPM application is installed.

Target Breakdown form

Field	Description
Breakdown period	Period of the target breakdown.
Parent breakdown	Year of the target breakdown.
Target	Parent target of the target breakdown.
Status	Status of the target breakdown. The status can be **Red**, **Yellow**, **Green**, or **No status**.
Breakdown	Breakdown interval specified in the parent target.
Planned target	Target value for the target breakdown.
Actual	Actual value for the target breakdown.

© 2026 ServiceNow, Inc. All rights reserved.

Target Breakdown form (continued)

Field	Description
Remark	Remark entered by the user for business justification when updating the actuals.

Target form

Use the Target form to track and measure the progress of the goals.

Some of the fields on the form is available when the Goal Framework for SPM application is installed.

Note: For Operational Sustainability Workspace and Strategic Planning users, to view the other fields that aren't added to the default view or your custom form view on the form in the workspace, configure the default or custom form layout. For information on how to configure the form layout, see Configuring the form layout.

Target form

Field	Description
Number	Unique identifier of the target. The number is generated automatically, for example, TRGT0005678. An administrator can change the prefix. For more information, see Change the number prefix for goals and targets.
Name	Name of the target.
Goal	Name of the associated goal. This field is auto-populated when creating a target from the Targets related list on the Goal form.
Description	Brief description of the target. You can refine target description using the Refine records skill, if the ServiceNow Otto for SPM application is installed.
State	State of the target. The state can be **Draft**, **In progress**, **Approved**, **Complete**, **Pending**, **Achieved**, **Not Achieved**, or **Cancelled**.
Status	Status of the target. The status can be **Red**, **Yellow**, **Green**, or **No status**.
Progress	Percentage of target execution that is complete. The value is calculated automatically. If the **Type** field is set to **Maximize**, the progress value is calculated using the following formula. `Progress = (Actual value - Base value) / (Target value - Base value) x 100` If the **Type** field is set to **Minimize**, the progress value is calculated using the following formula. `Progress = (Base value - Actual value) / (Base value - Target value) x 100` If the **Type** field is set to **Maintain above**, **Maintain below**, or **Maintain constant**, the progress is 100% or 0% for a target without target breakdowns, based on whether the actual value meets the final target value. For a target with target

Target form (continued)

Field	Description
	breakdowns, the progress is the percentage of target breakdown periods in which the target is met. For more information, see Target types and achievement strategies. For more information on how the progress value is calculated when weight scale is defined, see progress value calculation.
Impact on goal	A numerical value that represents the importance of the target relative to the other targets of the goal. If there are any sub-goals present, they are also considered for relative weights and consequent progress calculation. By default, the value is (1) Neutral. The available options are: • **(0) No impact** • **(1) Neutral** • **(2) Moderate** • **(3) High** • **(4) Very high** • **(5) Maximum** **Note:** This field is available only when the **sn_gf.weighted_average_enabled** system property is set to **Yes**.
Assigned entity type	Entity type to which the target is assigned. For example, Business Unit, Department, Company, or Portfolio.
Assigned entity	Entity to which the target is assigned.
Owner	Owner of the target. By default, the name of the user creating the target is populated.
Contributors	Users who contribute to the achievement of the target. By default, the contributors of the associated goal are populated.

Duration section of the Target form

Field	Description
Start date	Start date for the target. By default, the start date of its associated goal is populated.
End date	End date for the target. By default, the end date of its associated goal is populated.

Metrics section of the Target form

Field	Description
Unit of measure	Measure type for the specified value. Usage of the measure such as cost, time, and rate.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Metrics section of the Target form (continued)

Field	Description
	The available measure types are stored in the Units [sn_gf_units] table. Unit of measure defines the type of the target as qualitative or quantitative. The available unit of measures for quantitative target are **#**, **$**, **%**, and **Days**. The available unit of measure for qualitative target is **Yes/No**.
Type	Target type that signifies the direction of achievement. • **Maximize**: The direction of the progress is toward the target value from the base value where the base value must be less than the target value. • **Minimize**: The direction of the progress is toward the target value from the base value where the target value must be less than the base value. • **Maintain above**: The actual value must stay at or above the final target value in each period. • **Maintain below**: The actual value must stay at or below the final target value in each period. • **Maintain constant**: The actual value must stay within a tolerance band around the final target value in each period. • **Milestone**: Fixed type. Only the qualitative target values are allowed (that are set in the **Unit of measure** field for the target) to capture the achievement of the target. The **Milestone** option is applicable only for qualitative targets. The **Type** and **Unit of measure** fields stay in sync. When you select **Milestone**, the **Unit of measure** field is set to a qualitative unit of measure, **Yes/No** by default. When you select any other type, the **Unit of measure** field is set to the last quantitative unit of measure used for the target, or to **Count(#)** if none was used. You can change the type of a target that already has actual values. A confirmation message appears before the change is applied. When you change between two Maintain types, the actual value is kept. When you change between **Maximize**, **Minimize**, and a Maintain type, the actual value and progress of the target are cleared, and any target breakdowns are regenerated. When you

Metrics section of the Target form (continued)

Field	Description
	change to **Milestone**, any target breakdowns are deleted.
Start value	Start value of the target. The start value can also be considered as the present or current value. This field becomes read-only when a value is entered in the **Actual value** field. Clear the **Actual value** field to update a value in the **Base value** field. This field is available when the **Type** field is set to **Maximize** or **Minimize**.
Final target value	Final target value of the target. The target value should be aspirational and should challenge the teams. This field is available when the **Type** field is set to **Maximize**, **Minimize**, **Maintain above**, **Maintain below**, or **Maintain constant**.
Baseline reference	Past achievement of the target to provide reference for future performance. This value is only for reference purpose and not considered for target progress calculation.
Actuals to date	Actual value of the target at a given time. This field is available when the **Type** field is set to **Maximize**, **Minimize**, **Maintain above**, **Maintain below**, or **Maintain constant**. For a Maintain type target with target breakdowns, this value is the actual value of the latest target breakdown that has an actual value.
Check-in frequency	Option to specify breakdown intervals for the target and how frequently the owner or contributor should update the actual value of the target. Breaking down the target into smaller periods helps you set a target for smaller periods and focus on the specific breakdown targets. The available options are **Daily**, **Weekly**, **Monthly**, **Quarterly**, and **Yearly**. Target breakdowns are automatically created when you set this field to any of the available options other than **None**. For more details on target breakdowns, see Target breakdowns in Strategic Planning. **Note:** The target breakdowns feature isn't supported for qualitative targets.

Metrics section of the Target form (continued)

Field	Description
Target value distribution	Option to specify the target to be calculated cumulatively or non-cumulatively. The available options are **Split equally across the time period (non-cumulative)** and **Spread linearly across the time period (cumulative)**. This field is available only when the **Check-in frequency** field is set to any of the available options other than **None**. This field is hidden and cleared when the **Type** field is set to **Milestone**, **Maintain above**, **Maintain below**, or **Maintain constant**.
Remark	Remark entered by the user for business justification when updating the actuals.
Check-in due date	Due date that the owner or contributor of the target must update the actual value of the target to.
Confidential	Option to restrict the access for this target record to the specific users populated in the **Allowed groups** and **Allowed users** fields. This field is available when the Operational Sustainability Management application is installed and the *sn_grc.enable_record_confidentiality* property is enabled. This field is applicable only when the **Classification** field in the goal form of the target is populated as Environmental, Social, or Governance. The required role to configure this field is sn_esg.reader. **Note:** Irrespective of the target record set to confidential or not, the target progress value rolls up to its goal for calculating the progress value of the goal.
Allowed groups	User groups who can access the target record. This field is applicable only for the Operational Sustainability Workspace users. Even though a user group is populated in this field, the users can access the confidential record only if the user group has the sn_esg.reader role. This field is available when the **Confidential** field is set to **true**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Metrics section of the Target form (continued)

Field	Description
Allowed users	Users who can access the target record. This field is applicable only for the Operational Sustainability Workspace users. Even though a user name is populated in this field, the user can access the confidential record only if the user has the sn_esg.reader role. This field is available when the **Confidential** field is set to **true**.
Comments	Detailed comments for the target to facilitate collaboration.

Target Automation section of the Target form

Field	Description
Automate actual value	Option to enable the target automation feature for the target.
Actual value source	Target source table that the data is fetched from to auto-update the actual value of the target on the target's review due date. This field is available when the **Automate actual value** field is set to **true**.

Variables section of the Target form

This section appears based on the context variables available in the target source that is selected in the **Actual value source** field.

When you select Actual value source as Benefit Plans (predefined target automation script for benefit plans), the **Benefit Plan** field appears in this section, from which you can select the required benefit plans for automating the actual value of the target.

Note: You can use the Benefit Plans custom script only when PPM Standard (Project Portfolio Management) is installed. If you can't find the benefit plan that you want to select, you can find and select the same from Heisenberg UI by navigate to **Enterprise Goal Management** > **Targets** and opening the Target form.

Target Source form

Use the Target Source form to create and configure a source for your targets so that the actual value of the target is auto-updated.

Target Source form

Field	Description
Name	Name of the target source.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Target Source form (continued)

Field	Description
Active	Option to activate this target source for use.
Type	Type of target source. Available options: • **Assessment/Survey** • **PA Indicator** • **Custom script**
Advanced	Enables the **Custom script** option for the target source type **Assessment/Survey** with the pre-defined script. This field is available when the **Type** field is set to **Assessment/Survey**.
Assessment metric type	Assessment metric type for the target source. **Tip:** A context variable is automatically created for the target source if the field is populated with a metric type of Evaluation method = Assessment. This field is available when the **Type** field is set to **Assessment/Survey**.
Assessment metric category	Assessment metric category for the assessment metric type. This field is available when the **Type** field is set to **Assessment/Survey**.
Description	Brief description of the target source.
PA Indicator	PA Indicator for the target source. This field is available when the **Type** field is set to **PA Indicator**.
Breakdown	Breakdown for the PA Indicator. This field is available when the **Type** field is set to **PA Indicator**.
Custom script	Custom script to fetch the required data from any ServiceNow AI Platform table for the target source. This field is available when the **Type** field is set to **Custom**. Or, when the **Type** field is set to **Assessment/Survey** and the **Advanced** field is set to **true**.

Domain separation and Goal Framework

Domain separation is supported for Goal Framework and Goal Framework for SPM. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

How domain separation works in Goal Framework and Goal Framework for SPM

After you enable domain separation on your ServiceNow instance, the Goal Framework and Goal Framework for SPM data is automatically domain separated. The goals and targets data of portfolio plans for different domains are visible to only those users who have access to these domains.

Project Portfolio Management

ServiceNow® Project Portfolio Management (PPM) provides a simplified, team-oriented approach to managing projects, portfolios, their resources and financials by combining several individual applications.

Customers who already have Project Portfolio Management can upgrade to PPM Standard. New customers must purchase PPM Standard.

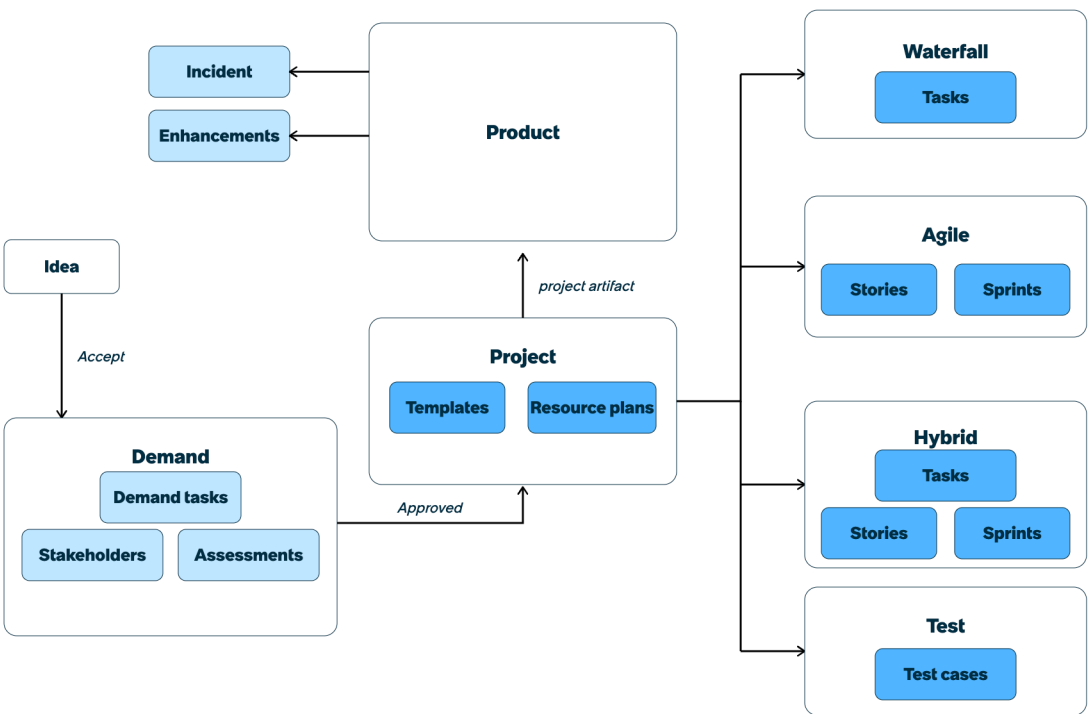
Troubleshoot and get help

- Ask or answer questions in the Strategic Portfolio Management forum on the ServiceNow Community
- Search the Known Error Portal for known error articles
- Contact Customer Service and Support

Explore Project Portfolio Management



Learn more about Project Portfolio Management (PPM) with a sample workflow and review the benefits it can provide for different users in your organization.

Project Portfolio Management overview

PPM is a collection of multiple applications that help you analyze and approve ideas and demands, convert them to projects and manage them through completion. You can manage resources and financials of individual projects or the ones that are rolled up to a program or portfolio. PPM enables your teams to plan and execute work in traditional waterfall methodology or combine an Agile approach to execute using a hybrid methodology.

Project Portfolio Management workflow

Project execution in a Waterfall, Agile, or Hybrid approach using PPM

The project manager (project_manager role) includes all the manager roles for the applications included in the PPM suite.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Project Portfolio Management benefits

Benefit	Feature	Users
Gather and evaluate of ideas and promote accepted ideas to demand, story, epic, or project.	Innovation Management	Project Teams, Demand Manager
Assessing, approve, and promote demands to strategic and operational demands.	Demand Management	Demand Manager
Manage projects, tasks, and resources.	Project Management	Project Manager, Project Team
Manage programs, the projects under a program and its tasks.	Program Management	Program Manager
Manage your projects and programs of different portfolios.	Portfolio Management	Portfolio Manager
Create resource plans and request resources.	Resource Management classic	Resource Manager
Track time on a daily basis against tasks	Time Card Management	
Gain visibility into the status and health of programs, projects, and demands.	Project Portfolio Management Platform Analytics Solutions	Project, Program, or Portfolio Manager or Business stakeholder

Integration with Digital Portfolio Management

Digital Portfolio Management (DPM) provides a unified workspace for owners to view and collectively manage their services and applications through the full life cycle. Installing DPM and Project Portfolio Management enables the integration with Project Management and Demand Management. With this integration, DPM managers can view project data that may impact a business application and create demands on a business application in DPM.

For more information, see Exploring Digital Portfolio Management.

Integration with Agile 2.0

TBD.

Integration with Test Management 2.0

TBD.

Domain separation

Domain separation provides complete data isolation for domain-specific users. Project Portfolio Management supports domain separation with a few limitations. For more information, see Domain separation and Project Portfolio Management.

PPM Standard (Project Portfolio Management)

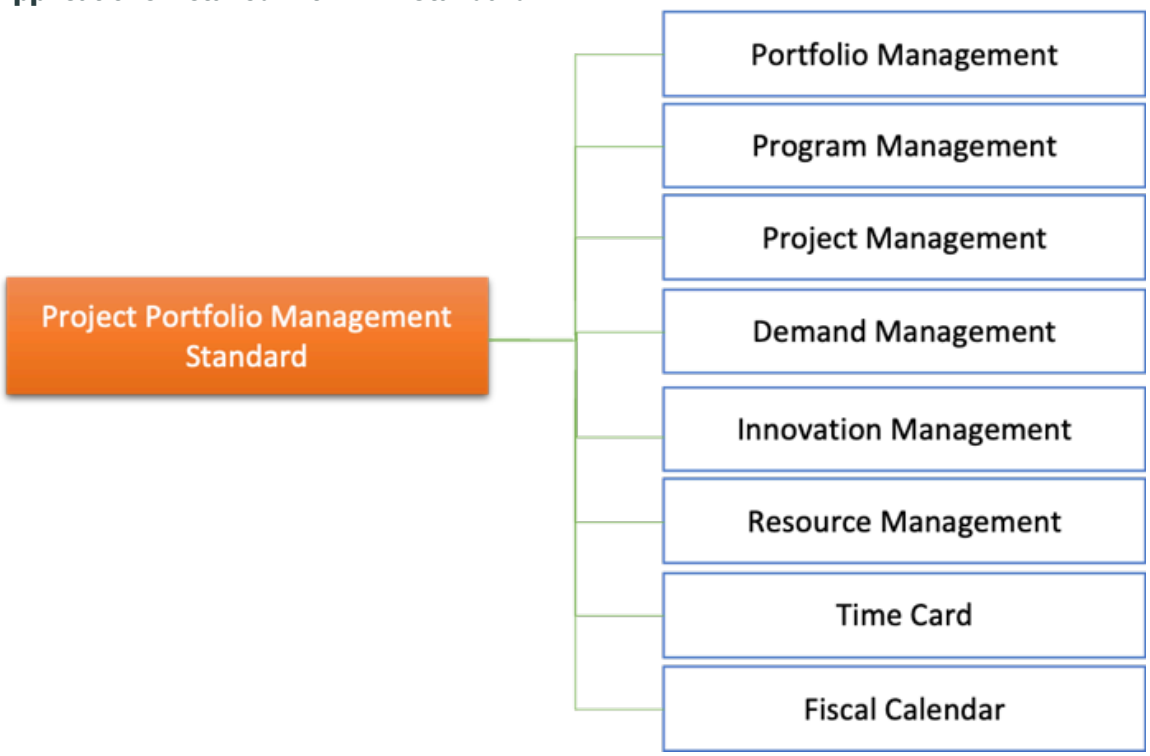
The ServiceNow® PPM Standard, earlier known as Project Portfolio Suite with Financials, application integrates Financial Management and Project Portfolio Management.

PPM Standard automatically activates Financial Management if it is not already active.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The integration enables project and portfolio managers to perform the following activities:

- Determine overall cost requirements for all demands and projects in portfolios
- Establish resource requirements and track costs for demands and projects
- Track actual amounts spent compared to an approved budget



Upgrades and new customers

Customers who already have Project Portfolio Suite with Financials can upgrade to PPM Standard. New customers must purchase PPM Standard.

PPM Standard applications

The PPM Standard plugin installs Financial Management and Project Portfolio Suite. The following diagram illustrates the applications that are available.

Applications installed with PPM Standard

PPM Standard additions

PPM Standard adds the portfolio workbench, that you can use to perform all aspects of financial planning. You can also perform financial planning and budgeting using UI actions on related lists, but the workbench is the preferred method. See Legacy portfolio workbench for more information. See Legacy- Plan the portfolio for information on how to plan end-to-end finances for projects and portfolios, including tracking actual costs and creating budgets as part of the Financial Management application.

Get started with project management

PPM Standard provides comprehensive capabilities for project planning and execution. Use the following topics to get started:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Project creation and planning:** Create projects, define work breakdown structures, set milestones, and plan timelines. See the Project Management documentation.
- **Resource management:** Allocate resources to projects, manage capacity, and track utilization. See Resource Management Workspace.
- **Financial planning:** Create cost plans, track budgets, and manage investment funding. See Financial planning for portfolios.
- **Portfolio management:** Prioritize demands, manage portfolios, and track portfolio performance. See Portfolio Management.
- **Installed components:** Review the roles, tables, and configurations installed with PPM Standard. See Roles installed with PPM Standard.

Project Portfolio Management

Activate Investment Funding for projects and demands

Activate the Investment Funding (com.snc.investment_funding) plugin if you have the admin role. This plugin includes demo data and activates related plugins if they aren't already active.

Before you begin

Ensure that the PPM Standard (com.snc.financial_planning_pmo) plugin is installed.

Role required: admin

About this task

The Investment Funding (com.snc.investment_funding) plugin enables you to request or allocate funds for your projects and demands.

The plugin activates the related plugins if they are not already active. It also adds the sn_invst_pln_investment_user role to the following roles:

- project_manager
- demand_manager
- portfolio_manager
- program_manager

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.

3. Select **Install** to start the installation process.

   Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

List of plugins (Brazil)

Currencies and budget reference rates

The support for use of multiple currencies provides conversions for budget items in different currencies.

Currency support

The application can use a base currency, also called the reporting currency that you specify with system properties. You can also specify other currencies for budgets and budget items.

Currency usage

Item	Currency used
Budget plan	A currency that you specify on the Budget Plan form. When the plan is converted to a forecast, the application converts the currency to the reporting currency.
Budget plan items	A currency that you specify on the Budget Item form. If the budget plan item has currency different from the budget plan currency, the budget plan item amount is converted to the budget plan currency.
Budget forecast	The reporting currency.

Budget reference rates

Budget reference rates are exchange rates between currencies. Each reference rate is valid for a specified time period. The application uses budget reference rates when budget items are in a different currency from the budget plan and forecast. The application automatically converts budget item currency values to a global system currency value. This conversion occurs when it calculates the Budget Amount on a Budget Plan and when it shows values on budget forecasts.

Note: Currency support is for budgets only. You can't create allocations in multiple currencies.

Test Management 2.0 integration with Project Portfolio Management

Test Management 2.0 integration with Project Portfolio Management enables you to carry out testing activities on projects.

After activating both the Test Management 2.0 and Project Portfolio Management applications, you can:

- Add a test phase to a project.
- Assign a test execution suite to the test phase.
- View the tests associated with the test execution suite.
- Assign tests to testers.
- Perform tests and record results.
- Track the progress using the **Percentage complete** field in the timeline.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

As testers perform tests and record results, the information is updated to the test, test phase, and then to the project.

Note: If you're an existing user, the integration between Project Portfolio Management and Test Management 1.0 continues to work the same. You can still create test phases, associate test phases to a test plan, and perform testing activities.

Agile Development 2.0 integration with Project Portfolio Management

Project Portfolio Management leverages the Agile Development 2.0 application to combine the Scrum methodology with project-based IT development.

IT organizations typically work on multiple projects with shorter time schedules. The project planning and tracking is done using waterfall, but the group prefers scrum methodologies to carry out their work. It then becomes a challenge to track project status when there is an agile development phase. This integration between Agile Development 2.0 with Project Portfolio Management facilitates a combination of waterfall and agile methods for project management and development.

The flow described below is applicable when Agile Development 2.0 is activated along with Project Portfolio Management.

- Create a group to represent a Scrum team.
- Add members to the group.
- Create sprints.
- Assign groups to projects from the Project Workbench.
- Maintain group and project backlogs. Multiple projects can be under development and groups can be assigned to multiple projects. Each project and each group has its own backlog. The project backlog includes all stories related to a project. The group backlog includes stories from multiple projects that have been assigned to the group.
- Perform group sprint planning. The group refines the combined backlog, ranks the stories and assigns points, and adds stories to sprints based on priority.
- Create stories, including one-off stories that are not related to projects.
- Track progress in stories, phases, and projects.

Create and manage agile projects

An overview of the tasks involved in creating an agile project.

The following tables, arranged by task group, list the tasks involved in creating an agile project.

Set up a development group

Task	How do I do this?
Define an Agile group	Navigate to **Agile Development** > **Create Agile Group** and click **New**.
Add group members	Navigate to the **Group members** related list on the Group form and click **Edit**.
Decide the capacity of a group	Navigate to **Agile Development** > **Groups**, select the desired group, and enter a number in the **Group capacity (points)** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create sprints

Task	How do I do this?
Create a sprint	Use the **Create Sprints** related link on the Group form to create multiple sprints or use the **Sprints** related list to create individual sprints.
View the created sprints	Use the **Sprints** related list on the Group form.

Create a new project

Task	How do I do this?
Create a project	• Navigate to **Project** > **Projects** > **Create New**. • Navigate to **Project** > **Projects** > **Project Workspace** and click **New Project**.

Open an existing project

Task	How do I do this?
Open an existing project	• Click the **Project Workspace** related link on the Project form. • Navigate to **Project** > **Projects** > **Project Workspace** and select the project from the **Select Projects** choice list in the workspace header.

Add phases to a project from the project workbench

Task	How do I do this?
Create an agile phase for a project	Click the Add phase icon (+) and select **Agile** from the Phase Type choice list. **Note:** This option appears only when both the Project Portfolio Management and Agile Development 2.0 applications are installed.
Create a test phase for a project	Click the Add phase icon (+) and select **Test** from the Phase Type choice list. **Note:** This option appears only when both the Project Portfolio Management and Test Management 2.0 applications are installed.

Add details to a project phase from the project workbench

Task	How do I do this?
View phase details in list view or VTB	Click the **List** or **VTB** button in the project workbench header.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add details to a project phase from the project workbench (continued)

Task	How do I do this?
Assign a group to an agile phase	Edit the Agile phase and select a group in the **Group** field.
Select sprints for an agile phase	Edit the Agile phase, ensure that a group has been assigned, and select a **Start Sprint** and **End Sprint**.
Create stories for an agile phase	Click the Agile phase in the project workbench and click **New** in the detail view header.
Refine stories for one project	Click the **Manage Stories** button to open the Manage Stories dialog box. **Note:** You can also use the **Agile Planning & Tracking** related link on the Project form to view your backlog, assign stories to the projects, or create new stories for the project.
Refine stories across multiple projects	Click the **Manage Stories** related link on Group form.
Assign a group to an agile phase	Click the Agile phase edit icon and select the group from the **Group** choice list.

Add milestones to a project from the project workbench

Task	How do I do this?
Add milestones to a project	Click the Add phase icon (+) and then click **Milestone** at the top of the Add Phase pop-up window.

Plan sprints

Task	How do I do this?
Start sprint planning	Navigate to **Agile Development** > **Groups**, open the desired group, and click the **Sprint Planning** related link.
Add stories to the sprint	Navigate to **Agile Development** > **Groups**, open the desired group, click the **Sprint Planning** related link, and click **Create story**.

Testing process (Only when Test Management 1.0 is activated)

Task	How do I do this?
Create a test plan	Navigate to **Test Management** > **Test Execution** > **Test Plans** > **New**.
Add test cases to a test plan	Click the **Add Test Cases from Test Suite** related link on the Test Plan form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Testing process (Only when Test Management 1.0 is activated) (continued)

Task	How do I do this?
Assign test cases to testers	Select a user in the **Assigned to** field on the Test Case form.
Notify testers to start testing	Click the **Notify testers** to start testing related link on the Test Plan form.
Tester performs tests and submits results	Navigate to **Self-Service** > **My Tests** or **Self-Service** > **My Assessments**.
Monitor the testing progress	The Test Plans list, Test Plan form, and Test Case form all display results for test cases and individual tests.
Testing sign-off	Click the **Sign-off Test Plan** related link on Test Plan form.

Testing process (Only when Test Management 2.0 is activated)

Task	How do I do this?
Create a test execution suite	Navigate to **Test Management 2.0** > **Test Execution Suites**, and click **New**.
Add tests to a test execution suite	Open a test execution suite, and click **Add tests**. From the **Tests** list, select the required tests and click **Add to Execution Suite**.
Assign tests to testers	Open a test execution suite. In the **Test execution assignments** related list, assign tests to testers. **Note:** Only the tests in the Ready state can be assigned.
Tester performs tests and submits results	Navigate to **Test Management 2.0** > **Tests Assigned to me**. Select the required tests and click **Run**.

Define an Agile group

Create an agile assignment group to later assign the work of an agile project.

Before you begin

Role required: admin

About this task

Assignment groups in Agile Development 2.0

Procedure

1. Navigate to **All** > **Agile Development** > **Groups**.
2. Click **New**.
3. On the form, fill in the fields:

Group form

Field	Description
Name	Enter the name of the group.
Manager	Select the manager of the group.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Group capacity (points)	Enter the projected capacity of the group in story points for each sprint.
Group email	Email address of the group.
Description	A brief description of the group.

Related links of the Group form

Field	Description
Create Sprints	Access the **Create Sprints for Team** dialog box. Fill in the fields and then click **OK** to create multiple sprints for the current group. The new sprints are added to the **Sprints** related list.
Sprint Planning	Access the **Sprint Planning** tab on the Agile Board.
Group Velocity	Access a chart which shows how the story points in a project are allotted across sprints.

4. Click **Submit**.

Add group members

Add members to the group who are later assigned tasks of an agile project.

Before you begin
Role required: none

Procedure

1. Navigate to **All** > **Agile Development** > **Groups**.
2. Open the desired group.
3. Click **New** in the **Group Members** related list.
4. Add the name of the group member in the **Name** field.
5. Select a **Scrum Role** for the group member.
6. Click **Submit**.

Decide the capacity of a group

Decide the capacity of a group based on the historical velocity of the group for each sprint.

Before you begin
Role required: scrum_master

Procedure

1. Navigate to **All** > **Agile Development** > **Groups**.
2. Open the desired group.
3. Decide the group capacity in points and enter the number in the **Group capacity (points)** field.
4. Click **Update**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Convert a release team to an agile group

Convert a release team to an agile group to later assign the work of an agile project.

Before you begin
Role required: project_manager

About this task
This section is applicable only if you have upgraded from Agile Development 1.0 to Agile Development 2.0.

Procedure

1. Navigate to **All** > **Agile Development** > **Groups**.
2. Click the **Convert Release Teams to Groups** related link.
3. Select the team that you want to convert to an agile group.
4. Click **Convert to Group**.

Create a sprint

Create a sprint to plan the work for an agile phase of a project.

Before you begin
Role required: none.

Procedure

1. Navigate to **All** > **Agile Development** > **Groups**.
2. Open the desired group.
3. Click **New** in the Sprints related list.
4. Fill in the following fields on the Sprint form:
   - **Short description**: Name or a brief description of the sprint
   - **Planned start date**: Start date for this sprint
   - **Planned end date**: End date for this sprint
   - **Group capacity (points)**: Projected capacity of the group in story points
5. Click **Submit**.

Create multiple sprints

Create multiple sprints to plan the work for an assignment group.

Before you begin
Role required: none.

Procedure

1. Navigate to **All** > **Agile Development** > **Groups**.
2. Open the desired team.
3. Click the **Create Sprints** related link to open the Create Sprints for Team dialog box.
4. In the Sprint form, fill in the fields:
   - **Name**: the name of the sprint.
   - **Starting Number**: the number of the first sprint to be created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Start date**: the start date for the first sprint to be created.
- **Duration**: the number of days in a sprint.
- **Number of sprints**: the number of sprints to be created.

5. Click **OK**.
   The new sprints are added to the **Sprints** related list on the Team form.

Assign a group to a project

Assign a group to a project so that the group later works on the tasks of the assigned project.

Before you begin

Role required: it_project_manager

Procedure

1. NavNavigate to **All** > **Project** > **Projects** > **All**.
2. Select your project to open its form.
3. From the **Assignment group** field, select a group to assign this project.
   If you don't see the group that you need, work with your admin to create it. See Define an Agile group.
4. Save the project form.

Add stories to a project

Create stories and associate them to a project or add existing stories to your project.

Before you begin

Role required: it_project_manager

About this task

- The stories list displays current active stories. You can create a story from this list or view the story form for a current story. You can also add scrum tasks from the story form and view the story and task progress boards.
- Stories can be associated to projects, but is not mandatory. While creating a story, if a project has only one phase then the story automatically gets tagged to the only phase.
- One-off stories can be created without a link to a product or a project. One-off stories are created with only a short description, and can be assigned to a group.S
- Stories can be added to only those projects that have the **Execution type** field set to **Hybrid** or **Agile**.

Procedure

1. Navigate to **All** > **Projects**.
2. Open a project that you want to add stories.
3. From the Stories related list, select one of the following:
   - **Add Existing** to add existing stories to this project.
   - **New** to create a story and add it to this project.

     For information on the form fields, see the descriptions in Story form.
4. Save the project form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

- Create scrum tasks for this story. See Create a scrum task for Agile Development 2.0 stories.
- Use the related links and lists of the story for more actions that you can perform. See Related links and lists for a Story in Agile Development 2.0.
- Add dependencies for Agile Development 2.0 stories
- You can create a story with the same details as this story by using the **Insert** or **Insert and Stay** options from the story additional actions (☰).

  When you use **Insert and Stay**, the form of the newly created story stays open. You can modify the details of the story or create more stories with these details. On the Agile board, the new story is positioned right below the original story. The global rank of the new story is set accordingly.

  Note: Set the *glide.ui.task.insert* and *glide.ui.advance* properties to **true** to access these actions. These actions are not allowed on stories added from the triage board.

Plan sprints

Streamline your sprint planning and completion activities using the **Sprint Planning** tab.

Before you begin

Role required: scrum_admin, scrum_master, or scrum_sprint_planner

Procedure

1. Navigate to **All** > **Agile Development** > **Groups**.
2. Open the desired group.
3. Select the **Plan Sprints** related link.
   The Agile Board, **Sprint Planning** tab appears.
4. Use either of options to view all the active stories assigned to the team, but not assigned to any sprint in the Backlog section.

Action	Description
Using the drag feature	This option can be used to move stories with in the backlog, move stories from the backlog to any sprint, or move stories from one sprint to another. Point to a story in the backlog and drag it to the required location.
Using the keyboard	This option can be used to move stories only within a backlog or a sprint.

Note:

- If the backlog contains more than 50 stories, pagination control appears at the bottom of the list. You can navigate to the previous, next, first, or last pages in the list.
- Rearranging stories in the backlog changes the ranking of stories. Ranks are stored in the global_rank column in the Story [rm_story] table. When you move a story within a backlog, its rank changes relative to the stories within the same backlog. Thus, if the story exists in some other backlog, its ranking might change but position in the backlog would remain the same.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. To start a sprint, select **Start** that appears at right-corner of the first or top sprint.
   The**Sprint Tracking** tab appears.
6. To complete a sprint, select **Complete Sprint** that appears at right-corner of the first or top sprint.

   a. Move incomplete stories, if any, to the backlog or a future sprint.

   b. Select **Complete**.
   The sprint disappears from the **Sprint Planning** tab and appears in the Sprint list as complete.

Track progress

Track the progress of an agile phase from the Project Workbench timeline.

Before you begin
Role required: none

About this task
Stories are assigned to a project and are tied to an agile development phase in the Project Workbench. As stories are completed, the story points and the story status get rolled up to the sprint and project phase. In turn, the phase gets rolled up to the project.

Procedure

1. Navigate to the Project Workbench timeline.
2. The color in the phase bar increases to show progress and the **Percentage complete** field is updated.

Activate PPM Standard (Project Portfolio Management)

Activate the PPM Standard plugin (com.snc.financial_planning_pmo) if you have the admin role. This plugin installs the Project Portfolio Management applications.

Before you begin
Role required: admin

About this task
The PPM Standard is the basic plugin for the PPM (Project Portfolio Management) applications.

Procedure

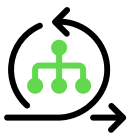
1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.

3. Select **Install** to start the installation process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`



You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Result
All PPM applications are installed in your ServiceNow instance, along with their user roles and tables. For more information, see Components installed with Project Portfolio Management (PPM) Standard.

Innovation Management

The Innovation Management enables you to gather and evaluate ideas efficiently, and to quickly identify and process the ideas with the greatest potential for implementation.

Get started

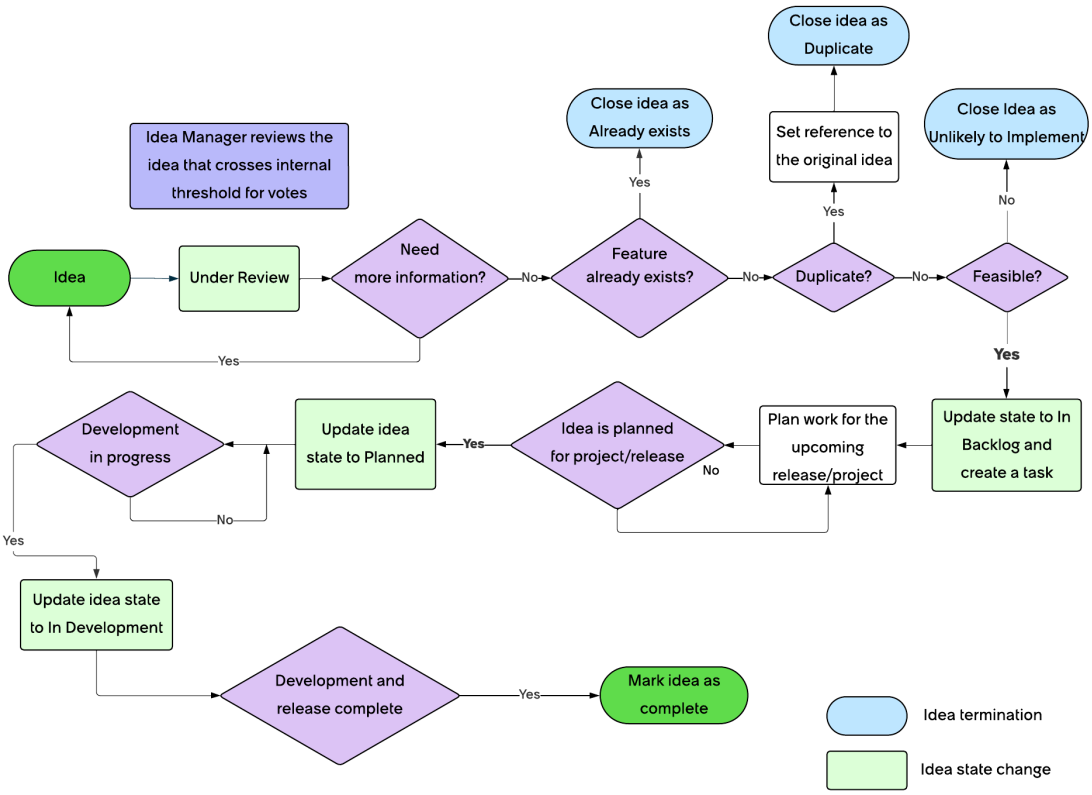
Explore 	Configure 	Use 
Integrate 	Reference 	

The Idea Portal accelerates and organizes idea gathering, evaluation, selection, and execution. The idea manager or demand manager evaluates submitted ideas and promotes accepted ideas to demands, epics, features, or stories.

Exploring Innovation Management

The Innovation Management application is a central repository to gather and evaluate ideas to determine which ideas are most likely to be implemented.

Innovation Management overview



The process of innovation management includes managing an organization's innovation from the initial ideation phase to the final implementation. It includes the decisions, activities, and practices involved in devising and implementing an innovation strategy. The Innovation Management application enables you to submit, track, view, discuss, filter, and vote on ideas.

Predictive Intelligence for Innovation Management

The Predictive Intelligence for Innovation Management capability uses machine-learning algorithms to search and display similar ideas while submitting a new idea.

The PPM Predictive Intelligence Workbench includes a prebuilt use case template that systematically guides you through the process of creating and training new predictive models, evaluating and testing them, and finally adding them to your business process to add value to your Idea, Demand, and Project Management.

Once you train your custom use cases, they are usable immediately. No prior knowledge or experience with artificial intelligence or machine learning is required when you use the PPM Predictive Intelligence Workbench.

The application includes templates with prebuilt guidance to assist you in creating, training, evaluating, testing, and producing your unique predictive models.

Predictive Intelligence for Innovation Management has the following benefits:

- Improves the quality of your idea database by avoiding duplicate ideas.
- Suggests related ideas to help you identify similar ideas and merge duplicate ideas.

Activation information

Activate the following plugins before using the Predictive Intelligence Workbench:

- Predictive Intelligence for PPM (com.snc.ppm_ml) plugin
- Predictive Intelligence for Ideation (com.snc.innovation_management_ml) plugin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Solution definitions for Predictive Intelligence for Innovation Management

The solution definitions for Predictive Intelligence for Innovation Management capability are available in the Predictive Intelligence for Ideation plugin (com.snc.innovation_management_ml). For more information about Predictive Intelligence, see Predictive Intelligence.

Solution Definition for Innovation Management

Solution Definition	Solution Type	Description
Similar Ideas **Note:** This solution definition is available as a template on instances where the following plugins are active: • Predictive Intelligence • PPM Standard (com.snc.financial_planning_pmo) • Predictive Intelligence for Ideation (com.snc.innovation_management_ml)	Similarity	Suggests related ideas based on the **Title** and **Description** fields. You can see the results in the following places: • The Related Ideas section on the Create an Idea form when creating an idea in the Idea Portal. • The Related Ideas section on the Ideas page in the Idea Portal.

Related topics

Predictive Intelligence

Submit an idea using the supplier catalog

PPM PIWB template - Find similar ideas

Configuring Innovation Management

Configure Innovation Management application to analyze, track, and promote ideas to a task, demand, or project. This application is available with Strategic Portfolio Management.

Install Idea Manager dashboard

You can install the Idea Manager dashboard application from ServiceNow Store if you have the admin role. This application includes demo data and installs the related plugins if they are not already installed.

Before you begin

Note: Starting with version 2.0.0, the Idea Manager dashboard is available in the Next experience UI Framework which can be accessed from Analytics Idea Manager.

- Ensure that the application and all of its associated store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- If the application requires plugins or other store applications, install them first if they are not already installed. For the Idea Manager dashboard application, the following plugins are required:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- PPM Standard plugin (com.snc.financial_planning_pmo)

  For information on activation steps, see Activate PPM Standard (Project Portfolio Management).

Role required: admin

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the application using the filter criteria and search bar.

   You can search for the application by its name or ID. If you cannot find an application, you may have to request it from the ServiceNow Store.

   Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.
3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box, any dependencies installed with your application are listed.
4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
   Demo data are the sample records that describe application features for common use cases. Load the demo data when you first install the application on a development or test instance.
6. Select **Install**.

Result

You can access the Idea Manager dashboard by navigating to **Ideas** > **Idea Manager Dashboard**.

What to do next

Run the following Performance Analytics data collector jobs before using the Idea Manager dashboard.

- *`[PA PPM IMD] Historic Data Collection`*: Collects historical data related to ideas and runs on demand to update data for dashboard.
- *`[PA PPM IMD] Daily Data Collection`*: Collects data for daily indicators and runs daily to update data for dashboard.

Configure idea categories

Map an idea category table with an Idea module to specify the category options listed on the Idea Portal and the create an idea form.

Before you begin

- Role required: idea_admin
- Identify the Idea module and idea category table that you want to use.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Configuring idea category with the Idea module is required to fetch the list of categories in the Idea Portal. If you have created static categories, use the Idea Category [im_category] table to configure the mapping between the idea module and idea category table.
Use your existing product or department table to define dynamic idea categories. The dynamic categories are derived from specific columns and fields of the parent table.

Note: You can map only one category table with an Idea module.

Procedure

1. Navigate to **All** > **Ideas** > **Idea Category Config** > **New**.
2. On the form, fill in the fields.
   For more information, see Idea Category Configuration form.
3. **Optional:** Create filter conditions to determine the idea categories to be listed on the Idea Portal.
4. Select **Submit**.

Configure idea categories for transferring request as Idea

Configure idea states to use when directly transferring an HR case, incident, or a custom task from your department as an idea.

Before you begin

Role required: admin

About this task

When an idea is created in the Idea Portal, it must be associated with at least one or multiple categories. Create mapping between your department-specific primary ticket and idea category to be used when a service ticket is transferred as an idea to another department.

Procedure

1. Navigate to **All** > **Universal Request** > **Administration** > **Direct Transfer Configuration**.
2. Follow the steps as described in Direct transfer mapping.
3. Select **Submit**.

Migrating from the legacy Ideas application to Idea Portal

If you are upgrading to the Brazil release, complete the migration tasks after the upgrade to start using the new Idea Portal.

Review the following information and make any necessary changes to your configuration:

Idea States

The new Idea Portal provides new idea states such as Completed, Under Review, and In Backlog, which are mapped with your existing idea states. The following tables provide a comparison to the existing idea states and the equivalent new states with their values.

Legacy Ideas application

Idea State	Value
Draft	-5

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Legacy Ideas application (continued)

Idea State	Value
Submitted	1
NA	NA
NA	NA
Accepted	2
NA	NA
NA	NA
Closed complete	3
Closed skipped	7
NA	NA
NA	NA

Idea Portal

Idea State	Value
Draft	-5
Submitted	1
Under Review	-1
Need more information	-2
In Backlog	2
Planned	4
In Development	5
Completed	3
Unlikely to Implement	7
Duplicate	8
Already Exists	9

Starting with the Brazil release, idea states are stored in and retrieved from the Idea [im_idea_core] table. You can continue to use your existing idea states along with the new idea states. However, if you want to use only these new states for managing your ideas, navigate to the Choice [sys_choice] table and delete the old idea states.

Idea categories

Organize your ideas using categories, for example, to group ideas that are relevant to a particular product, department, or business unit. If your existing ideas are not associated with any category, create new categories or select an existing table to define categories to which you can map your ideas. The Ideas application also installs a set of default new categories to which you can associate your existing ideas.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If your ideas are already associated with categories and you want to use the new categories, you can map your existing idea categories to the default new categories. You then write and use a script to create m2m mapping between existing ideas and categories.

Note: You must map an existing idea with appropriate categories for your ideas to appear in the Idea Portal.

Converting ideas to demands or project, stories, initiatives, and epics

You can convert an idea into work entities other than demands. The **Create Task** button enables you to convert an idea into a project, epic, or story as well as a demand becomes available in the Idea form.

You must have the required Agile plugins Agile Development 2.0 and Scaled Agile Framework (SAFe) and Continual Improvement Management installed to view these options.

If you want to allow conversion of ideas only to a demand, disable the **Create Task** button and continue using the **Accept** button or disable the **Accept** and **Defer** buttons to use other options. For more information see, Using the form designer.

Business rules

Review the existing business rules in the idea table. Set the business rules that you don't want to apply as False.

Navigation for legacy Idea application

To encourage your users to submit ideas through the new Idea Portal, remove navigation for old Idea application from the application menu and deactivate the Submit an Idea option from the Service Catalog. For more information see, Enable or disable an application menu or module.

Managing ideas using Innovation Management

Use the features and capabilities of Innovation Management to capture, analyze, and manage your ideas. As an idea manager, manage submitted ideas by reviewing them, making modifications, or deleting outdated ones, identifying duplicates, and updating and tracking their state.

Innovation Management reference

Submit an idea

Submit an idea for a product, feature, enhancement, or change in the Idea Portal for others to vote on. Select categories relevant to the idea and, if useful, attach files to add details.

Before you begin

Role required: None

About this task

The Idea Portal is where you share your product, feature, change, or enhancement ideas. Submit your ideas, view, and subscribe to the ideas of other users, and track the progress of a subscribed idea. For more information, see View, filter, and sort ideas and Collaborate on ideas. New ideas are created in the **Submitted** state. You can edit your submitted idea in the Idea Portal after it has been submitted until the state is changed to **Completed**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Ideas** > **Idea Portal** > **Create an Idea**.
2. On the form, fill in the fields.
   For more information on fields and description, see Create an Idea form.
3. **Optional:** If you have attachments related to the idea, select **Add attachments** and attach them.
4. Select **Create**.

What to do next

- View, filter, and sort ideas
- Collaborate on ideas
- Manage ideas
- Evaluate an idea
- Create a task for an idea

View, filter, and sort ideas

View ideas submitted by you or all submitted ideas. Filter and sort the ideas based on idea state, category, or date.

Before you begin
Role required: None

About this task
You can view the following information for an idea:

- Title
- Number of votes
- Name of the submitter
- Age
- Current state
- Category to which the idea belongs.

Procedure

1. Navigate to **All** > **Ideas** > **Idea Portal**.
2. Perform the following tasks on My Ideas and All Ideas tab.

My Ideas and All Ideas tab

Task	Steps
View your own submitted ideas.	Navigate to **Idea Portal** > **My Ideas**.
View all submitted ideas.	Navigate to **Idea Portal** > **All Ideas**.
View details of an idea.	Select the title of the idea.
Filter the ideas based on the idea state.	Select a state from the State list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Task	Steps
Filter the ideas based on idea categories.	Select a category from the Category list.
Sort the ideas based on the most recent ideas, the number of votes, or the date of creation.	Select an option from the Sort by list.

Collaborate on ideas

Use the comment option to discuss ideas and exchange information about ideas. Up-vote or down-vote an idea to register your level of interest and support for an idea. Subscribe to an idea to track its progress.

Before you begin
Role required: None

About this task
You cannot comment and vote for ideas that are in the **Completed**, **Unlikely to implement**, **Duplicate**, or **Already exists** state.

Procedure

1. Navigate to **All** > **Ideas** > **Idea Portal**.
2. Select the title of an idea to view its details.
3. Review the idea details and then choose which action to perform on the idea.
   For more information on actions and steps, see Collaborate on idea.

Manage ideas

As an idea manager, manage submitted ideas by reviewing them, making modifications, or deleting outdated ones, identifying duplicates, and updating and tracking their state.

Before you begin
Role required: idea_manager

About this task
The idea manager reviews submitted ideas and, if necessary, requests more information, and then chooses to accept or reject the idea. The number of votes on an idea helps in assessing the popularity and demand for the idea. Change the state of the idea to reflect its status. Changing the state helps in notifying the idea submitter and subscribers about the progress of the idea.

Note: The idea submitter and all the subscribers receive a notification email whenever there is a change in the state of an idea. A notification email is also sent whenever a user comments on an idea or replies to a comment.

Procedure

1. Navigate to **All** > **Ideas** > **Idea Portal**.
2. Select the title of an idea to view its details.
3. Select the more options icon ( ), and then select the **Open in platform** option to open the idea in the form view.
4. Review the idea details and then choose which action to perform on the idea.
   For more information on actions and steps, see Manage ideas.
5. Select **Update**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next
Convert selected ideas into tasks such as demand, project, stories, and epics.

Evaluate an idea

Review submitted ideas and then accept or reject them.

Before you begin
Role required: idea_manager

About this task
As an idea manager, evaluate an idea and then decide whether to accept or reject an idea. If an idea cannot be implemented right away, move the idea to the backlog and pick it up later. Accept the ideas that are feasible for implementation and create a task such as a demand, project, or story from it. Plan and work on these tasks to develop an idea into a new feature, product, or enhancement.

Procedure

1. Navigate to **All** > **Ideas** > **Idea Portal**.
2. Select the title of an idea to view its details.
3. Open the idea in form view by selecting the more options (···) icon, and selecting the **Open in platform** option.
4. Review the idea details and then choose which action to perform on the idea.
   For more information, see Evaluate ideas.
5. Select **Update**.
   Convert the accepted ideas to a demand, epic, story, or feature based on how you would like to execute your idea. Use relevant options such as Epic, SAFe epic, or Improvement initiative based on the plugins installed such as PPM Standard, Agile Development 2.0 and Scaled Agile Framework (SAFe). After creating a demand or a project, change the state of the idea to track its status during different stages of development.

Create a task for an idea

Create a task for planning and developing an accepted idea.

Before you begin
Role required: idea_manager or idea_manager_professional

About this task
Create a task such as a demand, project, story, SAFe epic, SAFe feature, or SAFe story for an accepted idea. Plan and work on these tasks to develop an idea into a new feature, product, or enhancement.

Procedure

1. Navigate to **All** > **Ideas** > **Idea Portal**.
2. Select the title of an idea that you want to create a task for.
3. Open the idea in form view by clicking the more options (···) icon, and selecting the **Open in platform** option.
4. Select an appropriate state for the idea from the State list based on the priority of the idea.
   For more information about different idea states, see Manage ideas.
5. Select **Create Task**.
6. In the **Convert Idea to task** dialog box, select a task type from the Select task type list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The available task types are:

- Demand
- Project
- Epic
- Story
- SAFe epic
- SAFe feature
- SAFe story

These task options are based on the installed plugins such as PPM Standard, Agile Development 2.0, and Scaled Agile Framework (SAFe).

Note: You must also have the appropriate role based on the plugins to create these task types.

Train the similarity solution for Innovation Management to find similar ideas

Train the Similar Ideas solution definition included within the Predictive Intelligence for Ideation capability to find related ideas when submitting an idea or viewing ideas in the Idea Portal.

Before you begin

Ensure that the Predictive Intelligence plugin (com.glide.platform_ml), PPM Standard plugin (com.snc.financial_planning_pmo), and Predictive Intelligence for Ideation plugin (com.snc.innovation_management_ml) are activated. For more information about Predictive Intelligence, see Predictive Intelligence.

Role required: admin

Procedure

1. Navigate to **All** > **Predictive Intelligence** > **Similarity** > **Solution Definitions**.
2. In the Similarity Definitions list, search for and select the Similar Ideas solution definition (ml_sn_global_similar_ideas).
3. On the Similarity Definition form, verify the default field values for ideas.
   For more information about the Similarity Definition form fields, see Create and train a similarity solution.
4. Click **Update & Retrain**.
5. Open the Similarity Definition form for the Similar Ideas solution definition (ml_sn_global_similar_ideas).
6. In the ML Solutions related list, view the training solution progress in the **Progress** column.

Note: Alternatively, you can click the link for the solution in the **Active** column. On the ML Solution form, click the **Show training progress** related link to check the training solution progress.

Result

When the solution is complete, the similar ideas appear in the Related Ideas section on the Create an Idea form and Related Ideas section on the Ideas page in the Idea Portal.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

- Review similarity examples: On the Similarity Definition form, in the ML Solutions related list, when **Progress** is 100%, in the **Active** column, click the link for the solution. On the ML Solution form, click the **Similarity Examples** related link to view the Similarity Examples list.
- Update the similarity score threshold: On the ML Solution form, on the **Solution Statistics** tab, enter the required value in the **Similarity Score Threshold** field. Right-click the ML Solution form and click **Save**.
- Test the prediction output for the records: On the ML Solution form, on the **Test solution** tab, enter your text in the **Short description** field and the maximum number of expected results in the **Top N** field, and then click **Run test**. The results above the similarity score threshold value are displayed.

Predictive Intelligence for Innovation Management

Submit an idea

PPM PIWB template - Find similar ideas

Use a guided template that walks you through training the Similar Ideas solution definition for finding similar ideas.

Before you begin

Activate the following plugins before using the Predictive Intelligence Workbench:

- Predictive Intelligence for PPM (com.snc.ppm_ml) plugin
- Predictive Intelligence for Ideation (com.snc.innovation_management_ml) plugin

Role required: piwb_manager

Procedure

1. Navigate to **All** > **Predictive Intelligence Workbench** > **Use Cases** > **Create New from Template**.
2. Select the **Similar Ideas** template.
3. Click **Start**.
   The use case set up window opens displaying the name and description of the use case.
4. Click **Take me there**.
   The **ServiceNow Machine Learning Solutions** page opens and displays all the available solutions.
5. Expand the **Similarity** solution to see the available solution definitions.
   Configure or train the **Similarity** solution for finding similar ideas.
   - To configure the Similar Ideas solution definition (ml_sn_global_global_similar_ideas), click **Configure**. For more information, see Train the similarity solution for Innovation Management to find similar ideas.
   - To train the Similar Ideas solution definition (ml_sn_global_global_similar_ideas), click **Train**.

Managing Idea Portal

The Idea Portal is your central location to collect, curate, and promote ideas into demand, project, epic, or story. It enables integration of key feedback and requests into your product planning and development process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Idea Portal enables you to do the following:

- View, submit, vote, and subscribe to ideas.
- Collaborate using comments to discuss and exchange information on ideas.
- Users who submit, comment, or subscribe to an idea receive a notification for any state change, comment, or reply to that idea keeping them informed about its status and progress.
- View the details of an idea and ask or answer questions and exchange information about an idea using comments. Comments maintain a trail of discussion and help to identify key contributors for an idea or reasons for its success and failure.

Idea and demand managers use the Idea Portal to do the following:

- Manage submitted ideas.
- Review and evaluate the submitted ideas and select the ideas that meet their requirements.
- Assess the popularity and demand of an idea from the number of votes.

The selected ideas are converted into tasks for planning and then developed into a new product, feature, or enhancement.

Maintain separate data storage and control access

You can use the Idea module to do the following:

- Store ideas and categories belonging to different departments, products, or business units separately.
- Store and organize ideas, enable voting, and, if your organization is large, you can configure different portal pages with unique sets of categories, for example, for HR, IT, and Support.
- Control access, allowing only the users of a specific business unit or department to submit and view ideas belonging to a specific category through the Idea Portal by creating access-control lists in the table that you want to use for categories. For example, if you do not want users outside the Payroll department to view the ideas associated with the category Salary, create ACLs with read access, at least, to the employees of Payroll department in the parent table that is used to derive the category Salary. The ACLs restrict the employees outside the Payroll department from viewing the ideas associated with the category Salary. For more information, see Create an Idea module.

Note: Innovation Management supports basic level of domain separation. For more information about domain separation, see Application support for domain separation and Domain separation and Project Portfolio Management.

Idea Portal administration

Idea Portal enables end users to view, submit, filter, sort, comment, and vote on ideas. Idea managers use the Idea Portal to review, evaluate, collaborate on, and manage ideas. An idea admin configures an Idea module, maps idea categories to the Idea module, and adds navigation for the Idea Portal page.

The Managing Idea Portal retrieves data from the Idea module, therefore, you must configure an Idea module first. Consider configuring separate Idea modules for your product, department, or business unit. Review, plan, and identify the following items before configuring an Idea Portal:

- Idea table
- Idea module
- Idea categories
- Navigation to the Idea Portal page

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Complete the following tasks to set up and configure an Idea Portal for your product, department, or business unit:

Idea Portal navigation

Configure the Idea Portal URL to enable access to the Idea Portal from the application navigator.

Before you begin
Role required: idea_admin

About this task
Enable access to the Idea Portal module using the Application Menus module.

Procedure

1. Open the **Ideas** application menu record and add the Idea Portal to the navigation menu.
   For information about how to add Idea Portal to the navigation menu, see Create a module.
2. In the Module form, set the value of the **Link type** field as **URL (from arguments)**.

   Use the Module Id as a parameter in the URL to specify the Idea module that you want to associate with the Idea Portal.

   For example, if you created an Idea module for your HR department and used **hr** as the **Module Id**, the URL to access the Idea Portal would be as follows: `/idea/?id=ideas_list&sysparm_module_id=hr`.

Create an Idea module

An Idea module defines the ideas and categories that are displayed in the Idea Portal. Create an Idea module to store and group ideas, and define categories based on product, department, or business unit.

Before you begin

- Identify an idea table to store your ideas. Use an existing table or create a new table to extend the Idea [im_idea_core] table.

  Use a different idea table for each Idea module. Separate idea tables ensure that ideas for different modules are stored separately.

- Role required: idea_admin

Procedure

1. Navigate to **All** > **Ideas** > **Settings** > **Idea Module** > **New**.
2. On the form, fill in the fields.
   For more information on fields and description, see Idea module form.
3. Select **Submit**.

What to do next
Define new idea categories or use an existing table to derive the categories from specified columns and map it with your idea module. For more information, see Configure idea categories.

Define idea categories

Create idea categories that a user can select to associate with a submitted idea. You can also add custom idea categories.

Before you begin
Role required: idea_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The default Idea Category [im_category] table stores the user-defined idea categories. Define new idea categories if you don't want to use an existing table or if you want to use custom idea categories. Create nested idea categories for defining a hierarchy of the idea categories.

You can use multiple idea categories with an Idea module, however, you can map only one category table with an Idea module.

Procedure

1. Navigate to **All** > **Ideas** > **Idea Category** > **New**.
2. On the form, fill in the fields.
   For more information, see Idea category form.
3. Select **Submit**.
   An idea category represents a theme for organizing idea submissions. All ideas submitted through the Idea Portal must be associated with at least one idea category. You can use values from an existing table or create idea categories for organizing your idea. Users select one or more idea categories, configured by an admin, to associate with their idea when they submit it. For more information, see Create an Idea module, and Idea category configuration.

What to do next

Map idea categories with your idea module. For more information see, Configure idea categories.

Adding Idea Portal to Employee Center

Improve engagement experience for your employees by enabling navigation to Idea Portal from Employee Center.

On the Employee Center portal, add the following links to Idea Portal so that employees can easily navigate to it.

Header menu item on the Employee Center portal

Configure a menu item for the Idea Portal page on the Employee Center portal header. Follow steps 1 through 5 in Create employee forum menu item in the Employee Center menu.

Quick link on the Employee Center portal

Create a quick link to the Idea Portal page using the quick links module in Employee Center. Follow the procedure in Create a quick link.

Managing ideas using Innovation Management

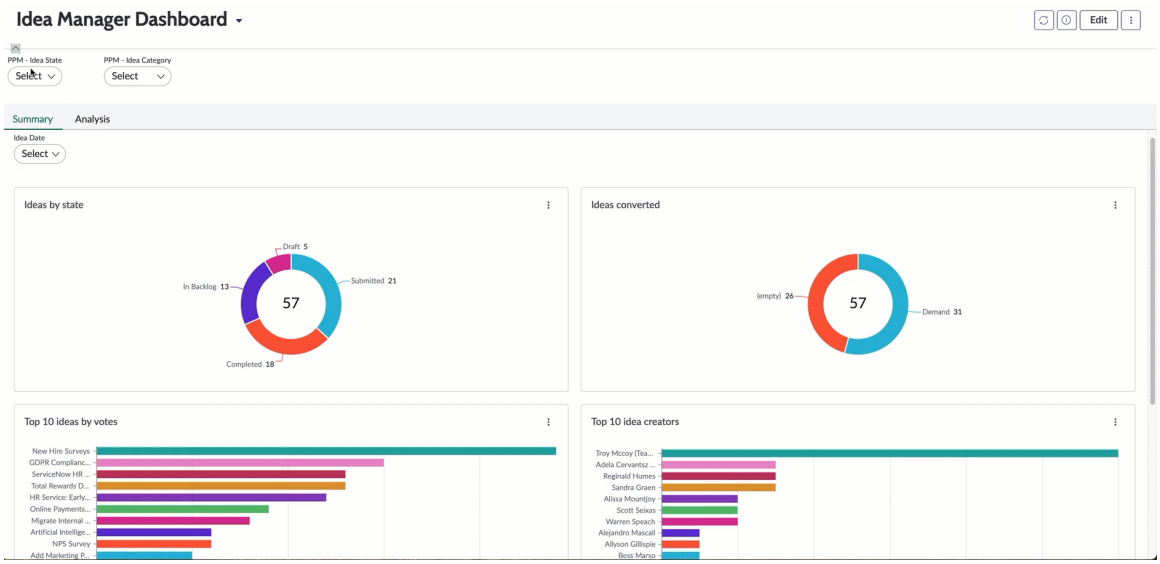
Managing Idea Portal

Analyzing idea metrics using Idea Manager dashboard

Integrating Innovation Management with Universal Request

Analyzing idea metrics using Idea Manager dashboard

Review, analyze, and manage your ideas effectively by using the Idea Dashboard manager.



The Idea Manager dashboard provides summary of idea metrics and trends such as ideas in different states, age of ideas, categories, and ideas converted to different work entities.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Starting with version 2.0.0, the Idea Manager dashboard is available in the Next experience UI Framework which can be accessed from Analytics Idea Manager. The Ideas pane in **Analysis** tab is not supported in the Next experience.

Idea Manager dashboard in Next experience UI

The Idea Manager dashboard provides comprehensive reports to the idea manager and users with read-only roles for ppm (sn_ppm_read). The dashboard uses Performance Analytics to provide a trend of historical data as well as regular reports. It provides you an overview of ideas, number of ideas converted into work entities, and trends based on categories, idea submitters, and votes. It helps you to review and analyze ideas and enables you to take required actions for managing your ideas effectively.

End user and roles

End user and goal	Required role
Idea Manager - Needs visibility into ideas in different states, number of ideas created, and age of ideas.	idea_manager
Read only roles for PPM - Needs visibility into ideas in different states, number of ideas created, and age of ideas.	sn_ppm_read

Use case

The dashboard displays ideas related to Project Portfolio Management.

Only ideas associated with categories are displayed in the dashboard. Ideas marked for deletion are not displayed. By default, the dashboard displays one-year data. Use the interactive date filter to view monthly, quarterly, or yearly data.

You can drill down within an idea indicator data for further analysis by navigating to Idea Portal from the dashboard. For example, to view individual records of Open ideas in the Idea Portal, click the **Open ideas** indicator value to open the Analytics Hub. In the Analytics Hub, click **Show Records** to view the list of open ideas, open an idea in the form view, and then click the **Idea Portal** related link to view the idea record in the Idea Portal.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Indicators

The Summary and Analysis tabs in the dashboard contain the following indicators. The data for ideas is collected from the [idea] table.

Open Ideas

Count of the ideas that are in Submitted, Need more information, or Under Review state for the current month.

Average Age of Open Ideas

The average age of ideas that are in Submitted, Need more information, or Under Review state since their creation, in days, as calculated by the formula `[[PPM:Total Age of Open Ideas]]/[[PPM:Open Ideas]]/24`.

Ideas Converted

Count of ideas converted into different work entities such as demand, project, story, or epic based on other plugins.

% of Ideas Converted

The percentage of ideas converted into different work entities such as demand, project, story, or epic based on other plugins, as calculated by the formula `[[PPM:Ideas Converted]/[PPM:Active Ideas]] *100`.

Ideas

Count of ideas that are in different states. You can view the count of ideas, in different states, created in week, month, quarter, and year.

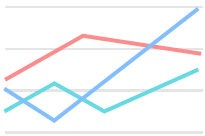
Active Ideas

Count of ideas in Submitted, Need more information, Under review, in backlog, planned and in development state. This indicator is not displayed in dashboard but is used in formula.

Total Age of Open Ideas

Total number of days an idea is in state Submitted, Need more information, and Under review before conversion to a work entity. This indicator is not displayed in dashboard but is used in formula.

Breakdowns



- PPM - Idea Category
- PPM - Idea State

Data visualizations

The dashboard includes the following visualizations:

Title	Type	Description
Ideas by state	Pie chart 	Breakdown of the number of ideas in each of the different states.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Title	Type	Description
Ideas converted	Pie chart 	Breakdown of the number of ideas converted into work entities such as demand and project.
Top 10 ideas by votes	Horizontal bar chart 	Top 10 ideas based on the total number of up-votes.
Top 10 idea creators	Horizontal bar chart 	Top 10 users based on the number of ideas submitted.
Ideas trended by categories	Line chart 	Trend of the total number of ideas submitted under various categories. The trend is displayed on a monthly basis.
Top 10 categories by ideas	Horizontal bar chart 	Top 10 categories based on the number of ideas submitted under each category.

Integrating Innovation Management with Universal Request

Integration of Innovation Management with Universal Request extends the capabilities of Universal Request and enables your employees and agents to create an idea from a universal request.

Integrate Innovation Management with the Universal Request application to provide a consistent ticketing experience and facilitate inter-department request transfers.

A Universal Request is created from an Interaction Record or New Call record when an agent determines that a new task record must be created for any of the following reasons:

- Resolve the Universal Request immediately without assigning it to a specific department.
- Transfer the Universal Request to a different department by assigning it to a Tier 1 assignment group.

Universal Request serves as a parent record for other records created as child records, such as INC, HRC, and custom task types. It is also used for all cross-departmental reporting. For more information about universal request, see Exploring Universal Request.

Features

The integration provides the following functionalities:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Create an idea from a universal request: When a universal request is created, an agent analyses the request. If the request can result in a new product, feature, or change, the agent creates an idea from that universal request.

  The idea manager then reviews submitted ideas and, if necessary, requests more information, and then chooses to accept or reject the idea. Accepted ideas are then converted to a demand, epic, story, or feature.

  The relevant information of the universal request such as details from the **Short description** and **Description** fields are copied to the **Title** and **Idea Description** fields of the idea.

  Also, the idea created from the universal request becomes the primary ticket for the universal request and the **Primary Ticket** field is populated with the idea number.

- Transfer the idea to another department with or without resolution: If the idea is rejected or cannot be implemented, the routing agent can transfer the idea to another department.

  When an idea is transferred to another department, the idea is closed and a new record is created. For example, a universal request related to HR process improvement can be converted to an idea and then transferred to the HR department as an HRC when the idea is deemed not feasible.

  Note: When the idea created from a universal request is transferred to another department, the resulting INC, HRC, or custom task becomes the primary ticket for the parent universal request.

Plugin requirements

Activate the following plugins if you have the admin role. These plugins are not active by default, and you must install them to integrate Innovation Management with Universal Request applications.

- PPM Standard plugin (com.snc.financial_planning_pmo).
- Universal Request plugin (com.snc.universal_request). For activation information, see Activate Universal Request.

Activate other related plugins such as Human Resources Scoped App: Core (com.sn_hr_core), and Employee Center (com.snc.employee_center) plugins to facilitate inter-department transfers of ideas.

Create an Idea from Universal Request

Create an idea from a universal request after initial evaluation for a new product, feature, enhancement, or change.

Before you begin

Role required: sn_uni_req.request_write or ITIL

- Activate the Universal Request (com.snc.universal_request) and PPM Standard (com.snc.financial_planning_pmo) plugins

About this task

New idea is created in the **Submitted** state. You can edit your submitted idea in the Idea Portal after it has been submitted until the state is changed to **Completed**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Universal Requests** > **All**.
2. Open the universal request record from which you want to create an idea.
3. Select **Create Idea**.
4. On the form, fill in the fields.
   For more information, see Create an Idea form.
5. **Optional:** If you have attachments related to the idea, select **Add attachments** and attach them.
6. Select **Create**.
   The universal request number from which the idea is created appears in the header of the Idea form. The idea number appears in the **Primary Ticket** field on the Universal Request form.

What to do next

Evaluate an idea and create a task from an idea, if selected for execution. If the idea cannot be implemented, transfer the idea to the relevant department as an INC, HRC, or custom task.

Idea state mapping

Map your idea states to the Universal Request states to provide a better user experience during the idea state transition and to track the progress of the idea.

Before you begin

Role required: admin

About this task

Mapping the states of the idea to the universal request state ensures that the status of idea is also reflected on the state of universal request. As the idea moves through different stages of the life cycle, the state of the universal request also gets updated to reflect the change.

For example, consider a universal request that has an idea attached to it as a primary ticket. When the state of idea changes from **Submitted** to **Need more information**, the state of the universal ticket state is also updated to **Awaiting Response**.

The following image is an example of a default state mapping. The **Submitted**, **Under Review**, **In Backlog**, **Planned** and **In Development** states of an idea are mapped to **In Progress** state of a Universal Request.

The following table lists the default mapping of different idea states with the universal request states.

Default mapping of Idea states with universal request states

Idea state	Universal Request state
Submitted	In Progress
Under Review	In Progress
In Backlog	In Progress
Planned	In Progress
In Development	In Progress
Unlikely to implement	Closed
Duplicate	Closed

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Default mapping of Idea states with universal request states (continued)

Idea state	Universal Request state
Already exists	Closed
Completed	Closed
Need more information	Awaiting Response

Procedure

1. Navigate to **All** > **Universal Request** > **Administration** > **State Mapping**.
2. Select **New**.
3. On the form, fill in the fields.
   For more information, see State mapping form.

Transfer an Idea to another department

Transfer an idea to another department with or without resolution if the idea is rejected or cannot be implemented.

Before you begin

Confirm that the following requirements are met:

- The idea is created from a universal request.
- The idea is associated with a category.
- Personalize the Create an Idea form to add the **Assigned to** field.
- The idea is assigned to an agent.
- Additional plugins required for transfer are active. For example, if the idea is being transferred as an HR case (HRC), activate the Human Resources Scoped App: Core (com.sn_hr_core), and Employee Center (com.snc.employee_center) plugins.

Role required: Agent to whom the idea is assigned or is a part of the assigned work group.

About this task

If the idea is rejected or cannot be implemented, transfer the idea to another department as an HRC, incident, or a custom task.
When an idea is transferred to another department, the idea is closed and a new record is created. For example, a universal request related to HR process improvement can be converted to an idea and then transferred to the HR department as an HRC when the idea is deemed not feasible.

Procedure

1. Navigate to **All** > **Ideas** > **Idea Portal**.
2. Select the title of an idea to view its details.
3. Select the more options icon (···), and then select the **Open in platform** option to open the idea in the form view.
4. Select **Transfer**.
5. In the **Transfer Ticket** dialog box, provide the following details.
   - **Department**: Select the department from the list.
   - **Transfer reason**: Select the reason from the list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Transfer notes**: A brief description for transferring the idea that you want to pass to the UR Routing agent.
- **Copy additional comments and attachments**: Clear the check box if you do not want to transfer the idea with additional comments and attachments.

6. Select **Transfer**.
   The idea is transferred to the selected department and the state of the idea is changed to **Unlikely to implement**.
7. Provide information about why the idea was rejected or closed in the **Close notes** field.
8. Select **Update**.

Result

The idea is transferred to the selected department. The **Primary Ticket** field of the parent universal request is updated with the INC, HRC, or custom task number created as a result of the transfer.

Create an Idea form fields

Field	Description
Title	Brief description of the idea. As you start typing the title for your idea, the **Related Ideas** section appears and displays existing ideas that potentially match your idea.
Category	The category to associate with your idea. You can select multiple categories for an idea. Categories are also visible to other users in the Idea Portal when viewing submitted ideas.
Description	Detailed description of the idea. Consider including details such as why is it useful, who would benefit from it, and how it would work. You can use the formatting toolbar to format text and add images or web links.

Idea Category Configuration form

Learn about the fields of the idea category configuration form. Use this form to create or edit the details of an idea category configuration in Innovation Management.

Idea Category Configurations form fields

Field	Description
Category table	The parent table to derive idea categories from. To use static idea categories, select the default Idea Category [im_category] table. To use dynamic idea categories, select an existing table. For example, to use department names as idea categories, select the table that contains details of all the departments.
Category Field	Field from the category table from which to derive the idea category. The corresponding value of this field in the category table is listed in the **Category** field on the Idea Portal. For example, to list department names as category options, set the value of this field to **Name**. The system searches for and fetches the department names from the parent table and lists all the department names as category options.
Parent Field	If you are using nested idea categories, specify the field in the category table to be used to fetch the parent category. **Note:** Leave this field blank if you are not using nested idea categories. For example, to list Department 1 and 2 as subcategories of Department A, set the value of this field as **Parent**. The system searches for and fetches values from the parent table and lists Department 1 and 2 as subcategories of Department A.
Module	The Idea module to which this idea category belongs.

Idea Category form fields

Field	Description
Category name	Name for the idea category. Use a name that clearly identifies the entity for which you are creating the category list. For example if you are creating a category option for your departments, use the department name such as HR, Support, and IT.
Active	Option for activating the idea category. If activated, the idea category appears in the Create an Idea form and the Category list of the Idea Portal. Default: Selected
Module	The module to which this idea category belongs.
Parent	The parent idea category for which this category is a subcategory. For example, to list Department 1 and 2 as subcategories of Department A, select Department A in the **Parent** field for Department 1 and 2.
Domain	The domain to which the idea category belongs.

Collaborate on idea

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Manage ideas (continued)

Action	Steps
	• **In Development**: Work has started on the task created from the idea. • **Unlikely to implement**: Does not meet requirements, is not feasible, or is not popular. The idea is set to inactive and closed for comments and votes. • **Duplicate**: A similar idea exists in the database. The duplicate idea is associated with the original idea and is inactive and closed for comments and votes. • **Already exists**: Already developed at the time of idea submission or is close to being developed.
Mark as a duplicate	When you mark an idea as a duplicate, one idea is marked as the **Original idea** and the other as a **Duplicate idea**. A comment is logged in both the ideas with this information. The idea marked as a duplicate is set to inactive and closed for comments or votes. **1.** In the State list, set the status of the idea to **Duplicate**. **2.** Search for and select the idea that you want to mark as original in the **Duplicate** field. **3.** Enter a justification in the **Close notes** field.
Delete an idea	Remove an idea from the database when it is no longer relevant or is set to old. Deleting an idea removes all its details such as comments, attachments, and votes from the database. To delete an idea and all the details associated with it: • Select the idea. • Select **Delete**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Evaluate ideas

Action	Steps
Accept	If the idea seems interesting with the potential for developing into a new feature, product, or enhancement, accept the idea. It then moves to the backlog, from which you can pick it up at an appropriate time. To accept an idea, set the status of the idea to **In Backlog** from the State list. If you want to implement the idea relatively soon, create a task for it. For more information, see Create a task for an idea.
Request more information	If the information provided with the idea at the time of submission is insufficient request more information about the idea by setting the status **Need more information** from the State list.
Reject	If an idea is not feasible or has been already implemented, reject the idea by setting its state to **Unlikely to implement** or **Already exists**. The idea becomes inactive and is closed for comments and votes.
Close an idea when implemented	When an idea is implemented successfully, mark the idea as completed and close the idea for further comments and vote. To mark an idea as completed: 1. Set the status of the idea to **Completed** from the State list. 2. Provide information about how the idea was implemented in the **Close notes** field.

Demand Management

The Demand Management application consists of tools for capturing, centralizing, and assessing strategic and operational demands. It also provides a single location for managing all the demand information.

Demand Management overview

Important:

Demands are available in the Next Experience for Demand Management. For more information, see Next Experience for Demand Management.

The workspace provides additional value beyond the legacy experience, including Playbook, Docs, and the ability to define different governance processes using playbooks.

If you have Portfolio Planning Workspace or Strategic Planning Workspace, you can use the Next Experience for Demand Management to create and manage your demands.

- New customers: Use Next Experience for Demand Management to create and manage your demands.
- Existing customers: If you already have demands in the classic UI, you can continue using it. However, we recommend moving to the Next Experience for Demand Management, as your existing demands are automatically available there.

Get started

Explore  Learn the features and business value of Demand Management	Configure  Learn how to configure Demand Management
Use  Create and manage demands with Demand Management	Reference  Learn about the forms and fields of Demand Management

Troubleshoot and get help

- Search the Known Error Portal for known error articles
- Contact Customer Service and Support

A typical workflow for you as the demand manager is as follows:

- Work on a demand to assess the feasibility, effort, and cost of the demand and create a business case for approval of the demand.
- Create demand tasks, such as an initial feasibility review, cost estimate, and effort estimate, to delegate activities to specialized resources or groups. For example, a demand manager can create demand tasks for assessing the cost associated with a software upgrade and the resources required.
- Assign demand tasks to a business analyst, resource user, or an appropriate group. The assigned resource or group then creates a cost plan and resource assignment to help the demand manager assess and qualify the demand. For more information, see Demand tasks.

Basics of Demand Management

- Set up the application: Plan, create stakeholders and assessment categories, and create bubble charts.
- Assess ideas: Review and analyze submitted ideas before promoting ideas to demands.
- Create and add details to the demands: Create demands and add demand tasks, stakeholders and assessments, and evaluate and qualify demands.
- Use the Demand Management application or the demand workbench to compare and assess demands, and promote demands to projects, enhancements, changes, or defects.

Exploring Demand Management

Learn more about Demand Management and its process flow, and reviewing its benefits to your organization.

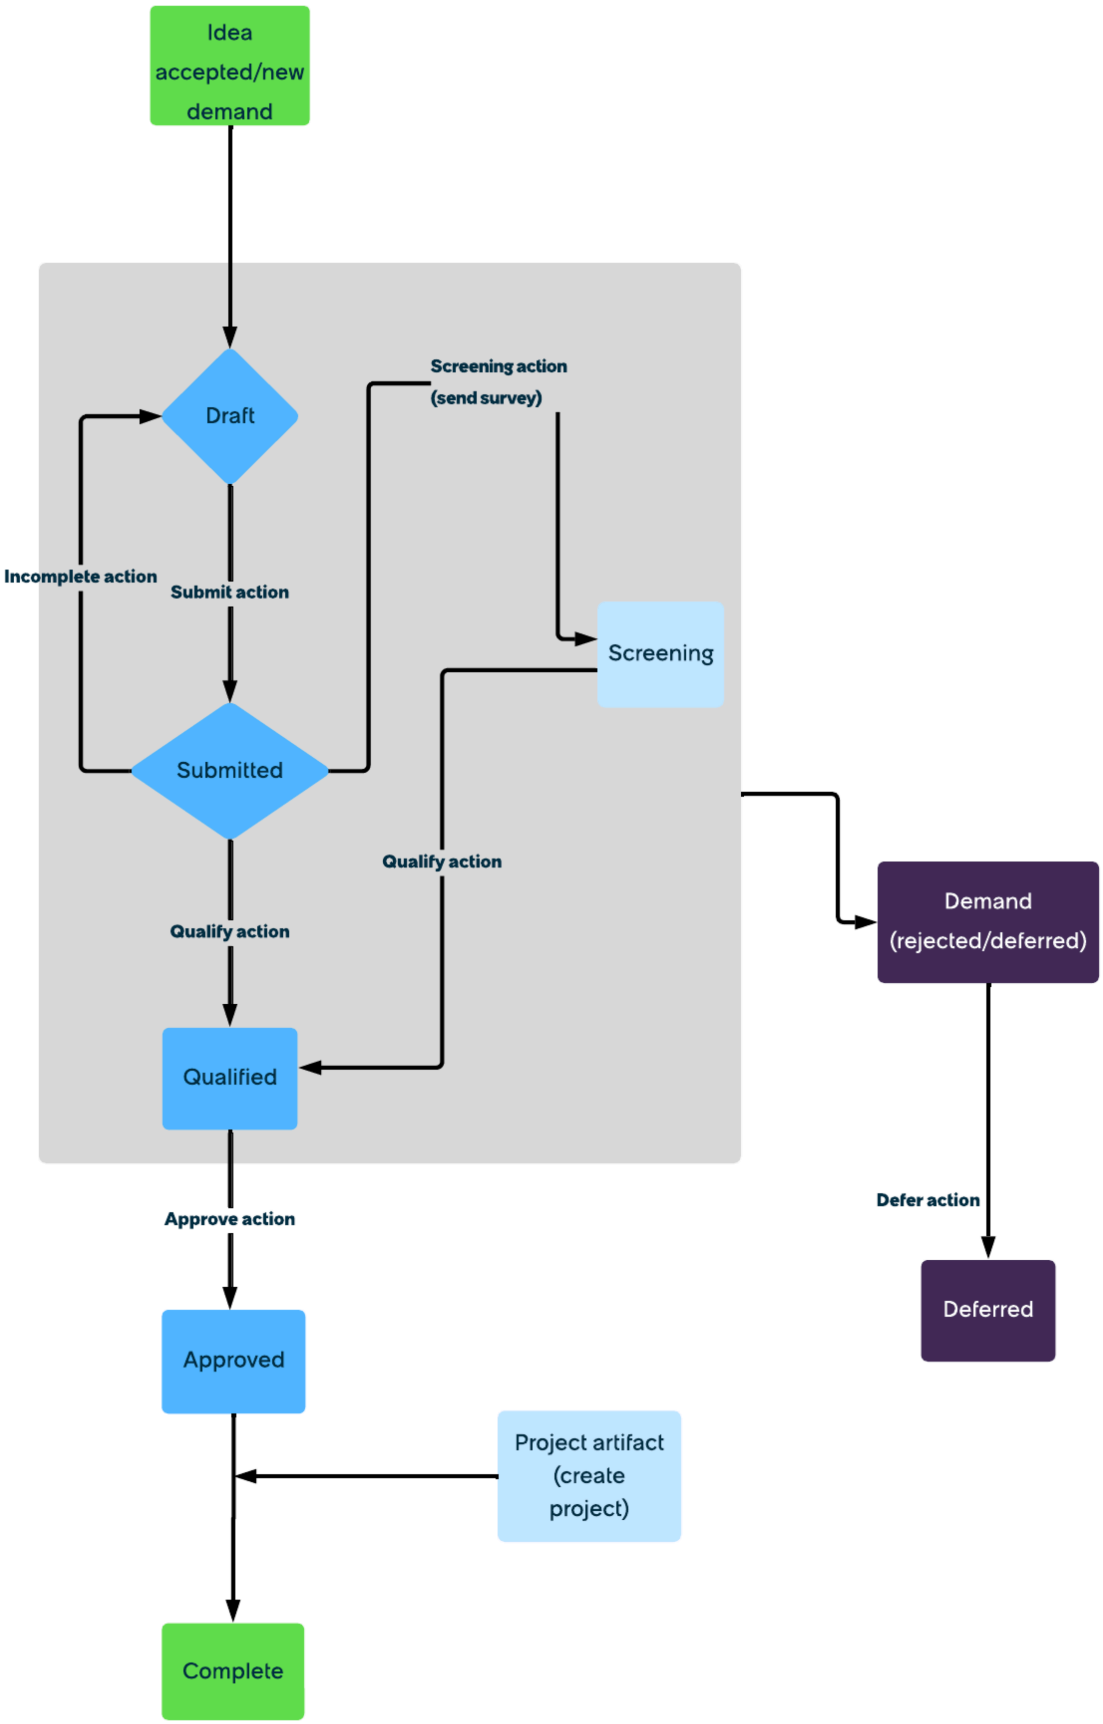
Demand Management overview

In Demand Management assess the ideas submitted through the Idea Portal or ideation module and promote the feasible ideas to demands. Track the progress of an accepted idea as it moves through the demand life cycle (idea to a demand, to a project, enhancement, change, or defect).

Important:

Demands are available in the Next Experience for Demand Management. For more information, see Next Experience for Demand Management.

The workspace provides additional value beyond the legacy experience, including Playbook, Docs, and the ability to define different governance processes using playbooks.



If you have Portfolio Planning Workspace or Strategic Planning Workspace, you can use the Next Experience for Demand Management to create and manage your demands.

- New customers: Use Next Experience for Demand Management to create and manage your demands.
- Existing customers: If you already have demands in the classic UI, you can continue using it. However, we recommend moving to the Next Experience for Demand Management, as your existing demands are automatically available there.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The demand states are Draft, Submitted, Screening, Approved, and Completed. For more information, see Use Demand Management.

Demand Management benefits

Benefit	Feature	Users
View and assess ideas that have been approved to be demands in a central location.	Demand workbench	Demand Manager
Track the progress of an accepted idea as it moves through the demand life cycle (idea to a demand, to a project, enhancement, change, or defect).		
Manage and track the financials of your demands in corporate, regional currency, or the same currency that you want to use for managing the project	Multicurrency in Demand Management	Demand Manager
Add users to the stakeholder registry so that demand and project management can automatically populate the stakeholder list when a user creates a demand or project.	Populate the stakeholder registry	Demand Manager

Demand Management process flow

The Demand Management process flow consists of the following tasks.

Important:

Demands are available in the Next Experience for Demand Management. For more information, see Next Experience for Demand Management.

The workspace provides additional value beyond the legacy experience, including Playbook, Docs, and the ability to define different governance processes using playbooks.

If you have Portfolio Planning Workspace or Strategic Planning Workspace, you can use the Next Experience for Demand Management to create and manage your demands.

- New customers: Use Next Experience for Demand Management to create and manage your demands.
- Existing customers: If you already have demands in the classic UI, you can continue using it. However, we recommend moving to the Next Experience for Demand Management, as your existing demands are automatically available there.

Demand Management Process Flow

Task	Description
Submitting ideas	Any user can submit ideas from the following locations: • **Service Catalog** > **Can We Help You** > **Submit Idea**. • **Self-Service** > **Ideas** > **Create New**. **Note:** Submitters or collaborators can edit their ideas as long the idea is in the Submitted state.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Demand Management Process Flow (continued)

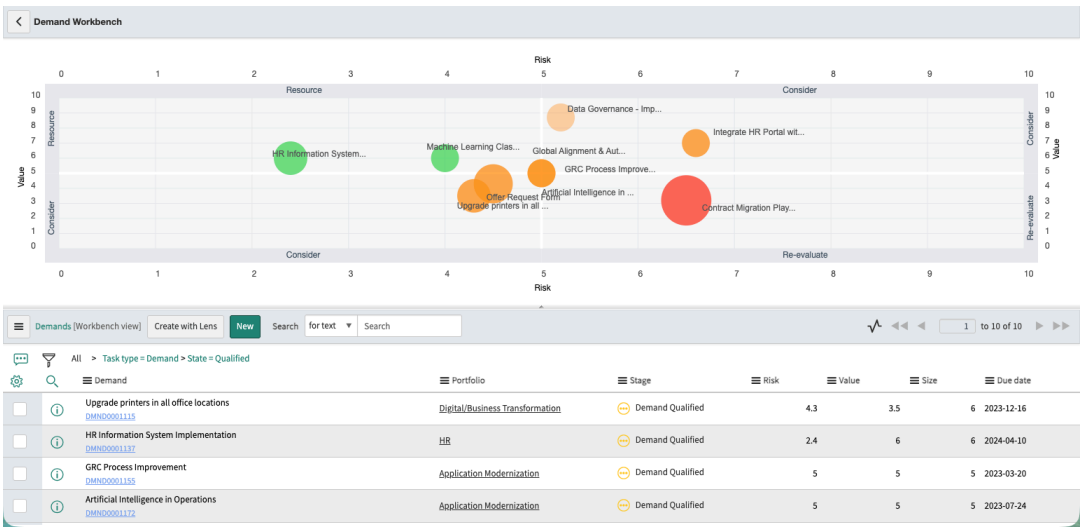
Task	Description
Creating demands	Demand managers and demand users can create demands using the Demand Management application. Alternatively, any user can create demands from the following locations: • **Service Catalog** > **Can We Help You** > **Create a new demand**. • **Self-Service** > **Demands** > **Create New**. **Note:** Requesters or collaborators can edit their demands as long as the demand is in the Draft state.
Adding details to demands	Demand managers can add details to a demand request by adding demand tasks, stakeholders, requirements, risks, decisions, and resource assignments.
Assessing demands	Decision makers can use assessment results and the demand backlog when determining which demands to approve or reject. Demand managers can decide if the assessment should be triggered for the demand using the **Assessment Required** field on the demand form.
Completing demands	Demand managers can set a demand to Completed when work on the demand is complete.

Demand workbench

The demand workbench provides a central location for viewing and assessing business demands.

The demand workbench makes it easy to manage demands by presenting multiple interactive views of demand information on one page. The workbench is split into two panes: the top pane presents an interactive bubble chart for assessing demands and the bottom pane displays the demand details in a list view.

The demand workbench provides real-time interaction between the two panes. Modifying a demand in the bubble chart automatically updates the values in the demand record. Similarly, changes made to a demand record are automatically reflected in the bubble chart.



By default, the workbench displays demands screened by stakeholders or qualified by the demand manager. With the demand manager role, you can use the workbench to:

- View, evaluate, and update demands
- Create demands
- Create artifacts from demands, including projects, enhancements, changes, and defects

With the demand manager role, you can view and evaluate demands.

Demand Workbench

The demand workbench includes the following components:

- The top pane displays demands in a bubble chart.
- The bottom pane displays demands in a list view.
- The header includes a back button ( ) that opens the Demands list.

Demand workbench bubble chart

The interactive bubble chart on the demand workbench is a dynamically updated graph that plots metrics for multiple demand records.

Demand managers can use bubble charts to visualize, compare, and evaluate the relative standing of demands in three categories: risk, value, and size. The X-axis represents the risk of a demand, the Y-axis represents the value, and the Z-axis represents the size. Demands are plotted as circles, or bubbles, which vary in size according to the size of the demand. All three measurements are based on values between 0 through 10. This scale enables demand managers to see how one demand compares to other demands in the chart.

The bubble chart contains four quadrants, with each quadrant representing the value versus risk tradeoff for the demand. The quadrants are labeled along the edges of the bubble chart to represent this combination of value versus risk. The color of the bubbles displayed in each quadrant also represents the value versus risk tradeoff.

- The upper left quadrant, labeled **Resource**, contains demands with high value and low risk. Green bubbles represent demands in this quadrant.
- The lower left and upper right quadrants, labeled **Consider**, contain demands that require further evaluation. The lower left quadrant contains demands with low risk but low value while the upper right quadrant contains demands with high value but high risk. Orange bubbles represent demands in these quadrants.
- The lower right quadrant, labeled **Re-evaluate**, contains demands with low value and high risk. Red bubbles represent demands in this quadrant.

Each bubble also includes a label with the name of the demand.

From the demand workbench bubble chart, you can perform the following actions:

- Hover over a bubble to view a summary of the demand, including the demand name and the risk, value, and size.
- Select a bubble to open a sizing window and change the size of the demand.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Select and drag a bubble to increase or decrease the risk or value of the demand.
- Right-click a bubble to view the demand, create an artifact, or view an artifact that has been created from a demand.

> **Note:** If Agile Development 2.0 isn't activated, you won't find the options to create an enhancement or a defect

Changes made to a demand in the bubble chart are automatically updated in the demand record.

Demand workbench list view

The lower pane of the demand workbench displays a list of the demands shown in the bubble chart.

The bubble chart list view displays up to 20 demands at a time. Page forward and back through the list to display additional demands.

The **Demand** column displays the demand number, which provides a link to the Demand form. The **Stage** column displays the status or progress of the demand. For more information, see Stage Fields.

The interactive bubble chart is updated whenever you change a demand in the list view. If you create a demand from the demand workbench, it's created in a qualified state and appears on the bubble chart. When a demand is promoted to a project, enhancement, change request, defect, or Enterprise Agile Planning (EAP) entity, it's removed from the bubble chart.

Performing the following tasks in the list view affects the demands displayed in the bubble chart:

- Searching or filtering the records in the list view displays the bubbles for those demands that meet the search or filter criteria.
- Adding or deleting records in the list view adds or deletes the corresponding bubbles.
- Paginating the list view by selecting any of the page arrow icons displays the bubbles for the demands that appear on the current page.

Predictive Intelligence for Demand Management

The Predictive Intelligence for Demand Management capability uses machine-learning algorithms to search and display similar demands while creating a demand in the Demand form.

The PPM Predictive Intelligence Workbench includes a prebuilt use case template that guides you through creating, training, evaluating, and testing predictive models. After testing, add the models to your business process to add value to your Idea, Demand, and Project Management workflows.

Once you train your custom use cases, they're usable immediately. No prior knowledge or experience with artificial intelligence or machine learning is required when you use the PPM Predictive Intelligence Workbench.

The application includes templates with prebuilt guidance to assist you in creating, training, evaluating, testing, and producing your unique predictive models.

Predictive Intelligence for Demand Management has the following benefits:

- Improves the quality of your database by avoiding duplicate demands.
- Helps you in planning your demand. You can view details of similar demands that were submitted and executed in the past.

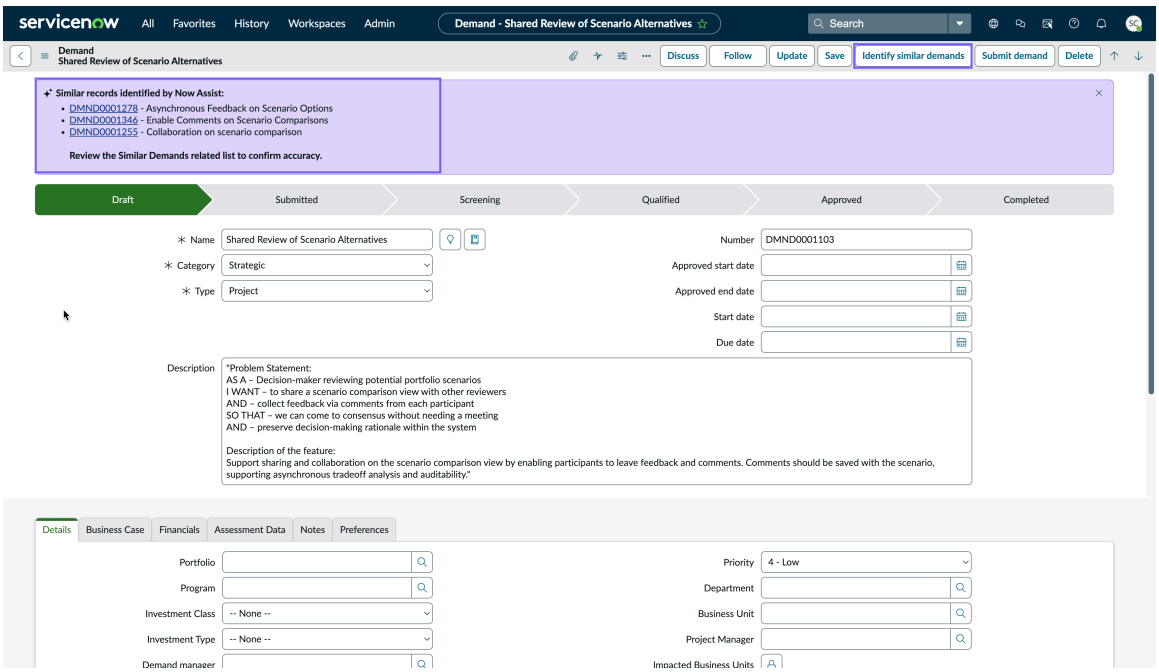
Create a demand

AI skills for Demand Management

ServiceNow Otto for Strategic Portfolio Management provides AI-powered skills for demand records that help you quickly understand demand details and identify related records. These skills improve planning efficiency and support informed decision-making.

Similar record identification



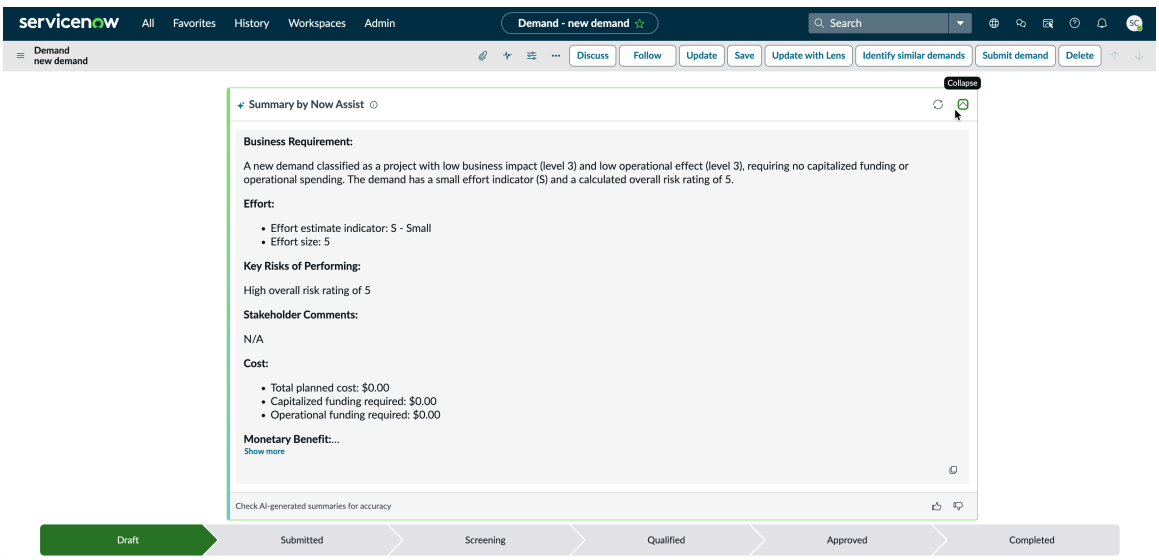
The identify similar records skill enables you to find demand records that are contextually similar to your demand. This skill helps reduce duplicate demands and improves planning efficiency.

This skill uses the name, description, and business case content of a demand to look for contextual similarity with other demand records using AI search. The skill identifies demands with a minimum 85% similarity threshold, excluding outdated and irrelevant records. You can trigger the skill by selecting the **Identify similar demands** button on the demand record page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The similar demand records are displayed in a top banner and in the Similar Demands related list. This skill improves visibility into related initiatives, and enhances decision-making for demand users.

For more information, see Identify similar records using AI.



Demand summarization

The demand summarization skill reviews the fields and related lists of a demand record and helps generate a clear executive summary. Use this skill to quickly understand the key details of a demand without reviewing individual fields, comments, and work notes. You can trigger the skill by selecting the **Summarize** button on the demand form.

The generated summary is displayed in a summary card on the demand record. You can copy the summary for further use.

For more information on, see Summarize demands with the demand summarization skill.

Configuring Demand Management

Configure your Demand Management application to assess and promote demands to projects, enhancements, changes, defects, or Enterprise Agile Planning (EAP) entities.

Configuration overview

Important:

Demands are available in the Next Experience for Demand Management. For more information, see Next Experience for Demand Management.

The workspace provides additional value beyond the legacy experience, including Playbook, Docs, and the ability to define different governance processes using playbooks.

If you have Portfolio Planning Workspace or Strategic Planning Workspace, you can use the Next Experience for Demand Management to create and manage your demands.

- New customers: Use Next Experience for Demand Management to create and manage your demands.
- Existing customers: If you already have demands in the classic UI, you can continue using it. However, we recommend moving to the Next Experience for Demand Management, as your existing demands are automatically available there.

Multicurrency in Demand Management

The multicurrency feature tracks demand financials in the corporate currency, regional currency, or the project currency. Corporate policy typically governs this preference.

Important:

Demands are available in the Next Experience for Demand Management. For more information, see Next Experience for Demand Management.

The workspace provides additional value beyond the legacy experience, including Playbook, Docs, and the ability to define different governance processes using playbooks.

If you have Portfolio Planning Workspace or Strategic Planning Workspace, you can use the Next Experience for Demand Management to create and manage your demands.

- New customers: Use Next Experience for Demand Management to create and manage your demands.
- Existing customers: If you already have demands in the classic UI, you can continue using it. However, we recommend moving to the Next Experience for Demand Management, as your existing demands are automatically available there.

In global or multinational organizations, demands are often managed and tracked at one geographic location and executed at a different geographic location. As each location might use a different currency to spend the budget, this difference in geographic location makes it difficult to monitor and track financials for such demands.

The multicurrency feature in Demand Management enables you to manage and track demands from any geographic location in any currency. Monitor financials in one currency while spending the budget in another, such as the functional currency or regional currency. You can also manage demands in one currency and specify a different currency for future projects.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Activation information

Activate the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin to enable the multicurrency features in Demand Management. Activating the plugin enables the demand currency view in demand, cost plans, and benefit plans forms. With the demand currency view, you can manage your simple demand financials, cost plans, benefit plans, and budgets in the demand currency.

Note: Activating this plugin automatically activates the PPM Standard (com.snc.financial_planning_pmo) plugin and therefore you get the option to switch between the default view and the demand currency view.

Currency Preferences

After activating the multicurrency plugin, specify your currency preference for managing your demand financials. You can select your functional currency, a regional currency, or a local currency. For more information, see Select demand currency preference.

Demand currency view

In addition to the default view in the Demand form, the Demand Currency view enables you to view the multicurrency fields. You can enable this view from the form context menu.

You can designate a currency other than the functional currency as the processing Demand Currency for a demand. The **Financials** tab of the Demand form has the **Demand currency** field. You can select an active currency from the Currencies [fx_currency] table.

Note:

The **Demand currency** field of a demand becomes read only once you create a cost plan, cost plan breakdown, benefit plan, or benefit plan breakdown for the demand.

Multicurrency in Demand Tasks

Track the expenses incurred while performing the demand tasks in demand currency. After a demand task time card is submitted and processed, the actual cost is calculated. The calculation uses the rate model, the default labor rate, or the rate defined in the system property. View this actual cost in the Demand Task form in the **Demand currency** and **Actual cost in demand currency** fields. For more information, see Demand tasks.

Multicurrency in Demand Baseline

Compare the financial baselines of your demands to track the performance of a demand over time. Baseline comparison enables you to identify and review the financial changes made to the demand at various stages of the demand life cycle. With the multicurrency feature, you can view the financial information in the demand currency when you compare the baselines. You can also configure the baseline view to add additional fields and view details in demand currency. For more information, see Compare financial baselines of a demand.

Select demand currency preference

Set your currency preference to use for managing and tracking the financials of your demands from the functional currency, regional currency, or local currency.

Before you begin
Activate the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin.

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Project Administration** > **Settings** > **Preferences-Project**.
2. Select a currency option for managing your demands from the Demand currency setup list.

Demand currency preference	Currency Option
Manage demands using the functional currency	Select the **Follow functional currency** option to manage your demands using the functional currency of your organization. The project currency is carried over to the Project form when you create a project from the demand in the future. You can change the project currency for managing your projects later. For example, if the functional currency of your organization is USD, then USD is set as the currency for both demands and projects.
Manage demands using the same currency as the project currency	Select the **Drive project currency** option to manage your demands and projects using the same currency. This currency can be your functional currency or any other currency. For example, to manage your demand and project in GBP, select this option and specify GBP as your demand currency. The **Project Currency** field in the demand form is automatically populated with GBP on saving the form.
Manage demands and projects in different currencies	Select **Flexi option** to manage your demands and projects, created from the demand, using different currencies. For example, to manage your demands in USD and projects in GBP, select this option. Specify USD as the demand currency and GBP as the project currency.

3. Select **Save**.

What to do next

Enable the multicurrency view in the Demand and other demand-related forms. For more information, see Enable demand currency view.

Enable demand currency view

Switch to the demand currency view to track the planned costs of a demand in the selected currency.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:

Demands are available in the Next Experience for Demand Management. For more information, see Next Experience for Demand Management.

The workspace provides additional value beyond the legacy experience, including Playbook, Docs, and the ability to define different governance processes using playbooks.

If you have Portfolio Planning Workspace or Strategic Planning Workspace, you can use the Next Experience for Demand Management to create and manage your demands.

- New customers: Use Next Experience for Demand Management to create and manage your demands.
- Existing customers: If you already have demands in the classic UI, you can continue using it. However, we recommend moving to the Next Experience for Demand Management, as your existing demands are automatically available there.

Before you begin

Activate the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin.

Role required: admin or it_demand_manager

About this task

Demand currency fields are added to the following tables. These tables include the cost details and financials tab, and support demands in a currency different from the functional currency:

Tables with demand currency fields

Table name	Description
Demand [dmn_demand] table	Track a demand in a different currency. Create a demand and select another currency by navigating to the **Financial** tab and selecting a currency in the **Demand Currency** field. To create a demand, see Create a demand.
Demand Task [dmn_demand_task] table	Demand tasks are used to delegate the cost, effort, risk, and benefit assessment activities. To create a demand task, see Create a demand task.
Cost Plans [cost_plan] table	Cost plans capture the costs of demands. To navigate to the Cost Plan form, see Create a demand cost plan.
Cost Plan Breakdown [cost_plan_breakdown] table	Cost plan breakdowns specify the estimated cost and actual cost at a granular level for a fiscal period. To navigate to the Cost Plan Breakdown form, see Create a demand cost plan.
Benefit Plan [benefit_plan] table	If you open the demand form in **Demand Currency** view, then by default the fields related to the demand currency appear in the Benefit Plans related list. To create a demand benefit plan, see Create a monetary benefit plan for a demand.
Benefit Plan Breakdowns [benefit_plan_breakdown] table	Benefit plans capture the potential benefits accrued by the demand when the demand is

Tables with demand currency fields (continued)

Table name	Description
	executed. To update a benefit plan breakdown, see Create a monetary benefit plan for a demand.
Expense Line [fm_expense_line] table	Expense lines are part of the demand cost plans and stores cost associated with a specific resource. To navigate to the Expense line form, see Create an expense line for a demand.
Project Funding [project_funding] table	Stores the demand target and budget expense values for both capital and operating expenses for a single fiscal period. To allocate the budget for a demand, see Allocate budget to a demand.

Procedure

1. Navigate to the respective form.
2. Right-click the context menu of the form.
3. Select **View**.
4. Select **Demand Currency** from the list.

What to do next

Refer to the form fields that are exclusive to the **Demand Currency** view that you have selected. All the other form tabs and fields remain the same both for the default view and the demand currency view. Continue to enter values in the fields as you would for the default view.

Multicurrency fields in demand-related forms

When you enable the **Demand Currency** view in a Demand, Cost Plan, and Cost Plan Breakdown forms, you can observe the multicurrency fields in the Financials section of the forms.

Financials tab of the demand form

Demand form

Field	Description
Demand currency	Currency in which you want to manage and track the demand.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Demand form (continued)

Field	Description
	Note: The ability to select a demand currency depends on the currency option you selected in **Preferences-Project** under **Project Administration**. For more information, see Select demand currency preference. The **Demand currency** field of a demand becomes read only once you create a cost plan, cost plan breakdown, benefit plan, or benefit plan breakdown.
Project currency	Currency in which you want to implement the project when this demand is converted to a project. **Note:** The **Project currency** field in the Project form of Project Management is carried over from the demand when it's converted.
Capital expense in demand currency	Capital expenditure (Capex) for the demand.
Capital budget in demand currency	Total capital budget allocated to the demand across all fiscal years. The value is rolled up from the capital expenditure (Capex) budget of the demand.
Operating expense in demand currency	Operational expenditure (Opex) for the demand in the selected demand currency.
Operating budget in demand currency	Total operational budget allocated to the demand across all fiscal years in the selected demand currency. The value is rolled up from the Opex budget of the demand.
Total planned cost in demand currency	Estimated cost of the demand in demand currency.
Financial return in demand currency	Estimate of the revenue based on the **Total planned costs in demand currency** and **Financial benefit in demand currency** fields.
Financial benefit in demand currency	Estimate of revenue if the demand is approved in the selected demand currency.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Demand form (continued)

Field	Description
	This value is rolled up from the benefit breakdown of the demand.
Net present value in demand currency	Present value of future cash based on the given annual interest rate in the selected demand currency. It's a measure for comparing money spent today against future expected financial benefits. It helps when evaluating the overall investment performance.
Actual cost in demand currency	Total cost incurred while working on a demand and demand tasks in the selected demand currency.

Multicurrency fields of the Demand Task form

Demand Task form

Field	Description
Demand currency	Currency that you specified in the **Demand currency** field of the Demand form.
Actual cost in demand currency	Total cost incurred while working on a demand tasks in the selected demand currency. Actual cost comes after the assignee of the demand task creates and submits a time card. When the time card is approved, the resource rate, derived from the rate card, labor rate, or system properties, is used to populate this field.

Financials section of the Cost Plan form

Cost Plan form

Field	Description
Demand currency	Currency that you specified in the **Demand currency** field of the Demand form.
Cost in demand currency	Value that is rolled up from the **Entered cost** field of all cost plan breakdowns.

Note: Any change that you make to the unit cost, quantity, or fiscal period of a cost plan has the amounts recalculated in demand currency. See Cost plan updates and cost recalculation in demand currency.

Multicurrency fields in the Cost Plan Breakdown form

Cost Plan Breakdown form

Field	Description
Demand currency	Currency that you specified in the **Demand currency** field of the Demand form.
Cost in demand currency	Breakdown amount in demand currency.
Demand currency exchange rate	Rate in effect for the period corresponding to the cost plan breakdown in the demand currency.
Demand currency exchange rate date	The reference date on which the currency exchange rate is applied for conversion.

Financials section of the Benefit Plan form

Benefit Plan form

Field	Description
Demand currency	Currency that you specified in the **Demand currency** field of the Demand form.
Benefit in demand currency	Benefit incurred from demand in demand currency.
Actual benefit in demand currency	Actual benefit value rolled up from the actual benefit in the benefit breakdown.

Multicurrency fields in the Benefit Plan Breakdowns form

Benefit Plan Breakdowns form

Field	Description
Demand currency	Currency that you specified in the **Demand currency** field of the Demand form.
Benefit in demand currency	Benefit incurred from demand in demand currency.
Demand currency exchange rate	Rate in effect for the period corresponding to the benefit plan breakdown in demand currency.
Demand currency exchange rate date	The reference date on which the currency exchange rate is applied for conversion.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Multicurrency fields in the Expense Line form

Expense Line form

Field	Description
Demand currency	Currency that you specified in the **Demand currency** field of the Demand form.
Amount in demand currency	Expense cost in demand currency. Amount entered in the Amount field is converted to demand currency.

Multicurrency fields in the Demand Budget form

Demand Budget form

Field	Description
Capex budget in Demand Currency	Planned expense amount allocated for capital expenditure in the selected currency.
Opex budget in Demand Currency	Operating expense amount in the selected currency in the selected currency.
Total Budget in Demand Currency	Sum of Capex and Opex amounts in the selected currency.

Allocate demand budget in demand currency

Set the capital expense (Capex) and operating expense (Opex) budgets in demand or functional currency according to the fiscal years. The sum of the Capex and Opex budgets is calculated as the total budget in demand currency.

Before you begin

Role required: it_demand_manager

About this task

Allocate the budget in a similar manner as you do with functional currency. For more information, see Allocate budget to a demand.

Enable the **Demand Currency** view in the Demand form to allocate the budget in demand currency.

Procedure

1. Navigate to **All** > **Demand** > **Demands** > **All**.
2. Select the demand to which you want to allocate the budget.
3. Select the **Create Demand Budget** related link of the Demand form.

   The **Demand Budget** dialog box opens.
4. On the Demand Budget dialog box, fill in the fields.
   For detailed description of the field names, see Demand Budget form.
5. Select **OK**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result

The demand budget for the selected year appears in the Demand Budget related list. Select the amounts in the list to revise them.

Cost plan updates and cost recalculation in demand currency

Updating the unit cost, quantity, or fiscal period of a cost plan updates all the related amount fields in the cost plan and its breakdowns. Also, the amounts in the related fields of the demand, to which the cost plan is rolling up, are recalculated and reflected in the demand currency.

Changes in Unit cost, Quantity, and Recurring check box of a cost plan

When you change the values of any of these fields in the Cost Plan form with multicurrency view enabled, the following values are recalculated:

- When you modify the **Unit cost** field, **Quantity** field, or **Recurring** check box of the Cost Plan form, the total planned cost is recalculated in demand currency.
- The **Cost in demand currency** in the Cost Plan Breakdown is also recalculated.
- The values in the **Capital expense in demand currency**, **Operating expense in demand currency**, and the **Total planned cost in demand currency** fields of the demand are recalculated.

Changes in the fiscal period of a cost plan

When you change the fiscal period, either the start date or end date in the Cost Plan form, the following values are recalculated:

- The **Total planned cost** and the **Cost in demand currency** of the cost plan are recalculated. Therefore, the Cost Plan Breakdown records may be added or removed.
- If the **Recurring** check box isn't selected, then the **Cost in demand currency** of each Cost Plan Breakdown record is recalculated.
- The values in the **Capital expense in demand currency**, **Operating expense in demand currency**, and the **Total planned cost in demand currency** fields of the demand are recalculated.

Changes in the entered cost of a cost plan breakdown or manual addition of a breakdown

When you change the entered cost in an individual Cost Plan Breakdown record or manually add cost plan breakdowns to a cost plan, the following values are recalculated:

- The **Total planned cost** of the cost plan is recalculated in demand currency.
- The values in the **Capital expense in demand currency**, **Operating expense in demand currency**, and the **Total planned cost in demand currency** fields of the demand are recalculated.

Benefit plan updates and recalculation in demand currency

Changes to the entered currency, benefit, offset type, or fiscal period of a benefit plan update all related amount fields and breakdowns. The related demand fields are recalculated and reflected in demand currency.

Changes in entered currency, entered benefit, and recurring check box of a benefit plan

When you change the values of any of these fields in the Benefit Plan form with multicurrency view enabled, the following values are recalculated:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- When you modify the **Entered currency** field, **Entered benefit** field, or **Recurring** check box of the Benefit Plan form, the total planned benefit is recalculated in demand currency.
- The **Benefit in demand currency** in the Benefit Plan Breakdown is recalculated.
- The value in the **Financial benefit in demand currency** field of the demand is recalculated.

Changes in the offset type of a benefit plan

When you change the offset type for the benefit plan, either the start date or end date and specify the offset period and duration of such periods in the Benefit Plan form, the following values are recalculated:

- The **Total planned benefit** and the **Benefit in demand currency** of the benefit plan are recalculated. Therefore, the Benefit Plan Breakdown records may be added or removed.
- If the **Recurring** check box isn't selected, then the **Benefit in demand currency** of each Benefit Plan Breakdown record is recalculated.
- The value in the **Financial benefit in demand currency** field of the demand is recalculated.

Changes in the fiscal period of a benefit plan

When you change the fiscal period, either the start date or end date in the Benefit Plan form, the following values are recalculated:

- The **Benefit in demand currency** and the **Total planned benefit** of the benefit plan are recalculated. Therefore, the Benefit Plan Breakdown records may be added or removed.
- If the **Recurring** check box isn't selected, then the **Benefit in demand currency** of each Benefit Plan Breakdown record is recalculated.
- The value in the **Financial benefit in demand currency** field of the demand is recalculated.

Changes in the entered benefit of a benefit plan breakdown

When you change the entered benefit in an individual Benefit Plan Breakdown record, the following values are recalculated:

- The **Benefit in demand currency** of the benefit plan is recalculated in demand currency.
- The value in the **Financial benefit in demand currency** field of the demand is recalculated.

Quick start tests for Multicurrency in Demand Management

Validate that the multicurrency in Demand Management still works after you make any configuration change such as applying an upgrade or developing an application. Copy and customize these quick start tests to pass when using your instance-specific data.

Danger: By default, the system property that is used to run automated tests is disabled to prevent you from accidentally running these tests on a production system. To avoid data corruption or an outage, run tests only on development, test, and other non-production instances. See Enable or disable executing Automated Test Framework tests.

Demand currency quick start tests require activating the PPM Standard Multicurrency – ATF Tests plugin (com.snc.ppm_multicurrency.atf).

Quick start tests

Upgrade existing demands

Execute scheduled jobs to upgrade your existing active and inactive demands, respectively, after activating the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin.

Before you begin

Activate the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin.

Role required: admin

About this task

Run these scheduled jobs on demand to upgrade your existing active and inactive demands in demand currency only when necessary.

Note: The jobs may have a performance impact depending on the number of demands and cost plans, therefore run the jobs only when necessary.

Procedure

1. Navigate to **All** > **System Definition** > **Scheduled Jobs**.
2. Execute a scheduled job to upgrade your existing active and inactive demands.

Demand type	Steps
Active demands	**a.** Find the **Upgrade demand currency fields for active demands** scheduled job and open. **b.** Select **Execute Now** Executing the job copies all amounts in the cost-related fields of the demands in demand currency. The Baseline, Cost Plan, Cost Plan Breakdown, Benefit Plan, Benefit Plan Break down fields are also changed to the demand currency. You can't edit the demand curren cy after the values in the functional curren

Demand type	Steps
	cy fields are copied to the demand currency fields since the financial costs exist.
Inactive demands	**a.** Find the **Upgrade demand currency fields for inactive demands** scheduled job and open. **b.** Select **Execute Now**. Executing the job copies the values in the cost-related fields for all existing inactive de mands to the demand currency. The currency in the Baselines, Cost Plans, Cost Plan Break downs, Benefit Plans, Benefit Plan Break downs, Expense Lines forms changes to de mand currency.

Set up Demand Management

Perform these tasks to set up Demand Management.

Important:

Demands are available in the Next Experience for Demand Management. For more information, see Next Experience for Demand Management.

The workspace provides additional value beyond the legacy experience, including Playbook, Docs, and the ability to define different governance processes using playbooks.

If you have Portfolio Planning Workspace or Strategic Planning Workspace, you can use the Next Experience for Demand Management to create and manage your demands.

- New customers: Use Next Experience for Demand Management to create and manage your demands.
- Existing customers: If you already have demands in the classic UI, you can continue using it. However, we recommend moving to the Next Experience for Demand Management, as your existing demands are automatically available there.

Before using Demand Management, PPS admin performs several setup tasks.

Planning for Demand Management

Plan the listed items before setting up Demand Management.

Demand Management Planning

Name	Description
Roles	Determine who has the demand manager [it_demand_manager] and demand user [it_demand_user] roles.
Portfolios	Determine how you want to group or categorize demands, and then have a user with the project manager [it_project_manager] role create portfolios based on those groupings.
Stakeholders	Identify individuals who have the appropriate domain knowledge to evaluate demands related to each portfolio. Then make them stakeholders for that portfolio.
Assessments	Consider using assessments to facilitate the information gathering process. Define metric categories and assessment metrics to develop and distribute assessments to the appropriate audience.
Bubble chart definitions	Identify metrics that are important to stakeholders, departments, and the organization. Use these metrics to create bubble charts that visually compare demands. For example, when considering which projects to undertake many organizations compare metrics such as risk rating, return on investment, and cost.
Resource assignments	Consider creating resource assignments to help the organization understand the time and resource costs associated with the demand. Any resource assignment attached to the demand propagates to the project. Resource assignments require that the Resource Management Workspace application is active.
Enhancement and defect requests	Determine if you need the ability to manage enhancement and defect requests as demands. This functionality requires that the Agile Development application is active.

Populate the stakeholder registry

Add users to the stakeholder registry so that demand and project management can automatically populate the stakeholder list when a user creates a demand or project.

Before you begin
Role required: it_pps_admin

Procedure

1. Navigate to **All** > **Project Administration** > **Settings** > **Stakeholders**.
   You can also scroll to the **Stakeholders** related list on the Demand or Project form and select **New** to create a record.
2. Select **New** to create a record.
3. On the stakeholder register form, fill in the fields.

   For a description of the field names, see Stakeholder Register Form.

   Note: When adding a user to the stakeholder registry, the combination of the user and the assigned portfolio must be unique. However, there can be more records for the same user but with a different portfolio.

View an assessment metric category

View assessment metric categories that are used with assessment metric types and assessment metrics in generating the bubble charts on the Demand Workbench. The bubble charts help the demand managers to assess the demands visually.

Before you begin
Role required: it_pps_admin

About this task
The Demand Management application comes with an assessment metric type named **Demand**, five default assessment metric categories, and assessment metrics.

Procedure

1. Navigate to **All** > **Project Administration** > **Settings** > **Assessments Metric Categories**.
2. Open an assessment metric category to review it.
   The following default assessment metric categories are available with the Demand Management.

Demand assessment metric categories

Assessment metric category	Data source	Description
Size	**T-Shirt size** field on the Demand form.	Assesses demand size relative to the size of other demands.
Strategic Alignment	View an assessment category result field in the assessment category result for the Strategic Alignment metric category.	Assesses how closely the demand aligns with strategic goals of the organization compared to other demands.
Risk	**Rating** field in the assessment category result for the Risk metric category.	Assesses demand risks compared to other demands.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Assessment metric category	Data source	Description
ROI	**Impact** and **Financial return** fields on the Demand form.	Assesses demand return on investment compared to other demands.
Cost	**Labor costs**, **Capital expense**, and **Operating expense** fields on the Demand form.	Assesses demand cost compared to other demands.

Configure a widget for the financial metrics of a demand

Configure a widget to view and track the financial metrics of a demand on the Demand Financials page.

Before you begin
Role required: pps_admin

Procedure
1. Navigate to **All** > **Project Administration** > **Widgets**.
2. Select **New**.
3. On the Widget form, fill in the fields.
   For a description of the field names, see Widget form.

What to do next
Associate the widget to the Demand table.

Associate a widget to the Demand table

After you configure a widget, associate it with the Demand table to show the financial data of a demand.

Before you begin
You must configure a widget before you can associate it with the Demand [dmn_demand] table.

Role required: pps_admin

Procedure
1. Navigate to **All** > **Project Administration** > **Widgets**.
2. Open a widget to associate with the Demand table.
3. In the Widget associations related list, select **New**.
4. On the Widget Association form, fill in the fields.
   For a description of the field names, see Widget Association form.

Configure demand workbench

Update the demand workbench to configure parameters such as bubble chart.

Before you begin
Role required: it_pps_admin

About this task
You can configure the parameters of the demand workbench provided with the base system.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Bubble charts are useful for comparing demands based on common metrics such as risk rating, return on investment, and cost. Decision makers can use bubble charts when considering which demands to approve or reject.

Procedure

1. Navigate to **All** > **Project Administration** > **Settings** > **Workbench Config - Demand**.
2. Open the **Demand Workbench** record.
3. Update the required settings and select **Update**.

Configure the demand AI skills

Configure the generative AI skills for demands by defining their triggers, display locations, and access settings to make it available to users.

Before you begin

Role required: sn_nowassist_admin.nsa_admin

About this task

Important: These generative AI skills are turned on by default. The skills will be automatically available to appropriate role users for the application. For more information, see AI agents, skills, and agentic workflows on by default.

Procedure

1. Navigate to **Admin** > **AI Admin Hub**.
2. Select **AI Skills**.
3. In the navigation panel, select **Technology** > **SPM**.
4. Select **Activate** from a skill card.
5. Review the input fields for the skill.
   For more information, see Inputs for AI skills.

   A check mark next to each step indicates whether the step is completed, partially completed, or not completed. After configuring a step, select **Save and continue** to go to the next step. Return to a previous step by selecting **Back**.

   Note: Some configuration options are read-only.

6. Define the trigger for the skill.
   - Automatic: The skill is initiated without user interaction.
   - User trigger: The skill is initiated when by an user action.

   For the demand summarization skill, the triggers behaving in the following ways:

   - Automatic: The skill is initiated without user interaction. When users navigate to a demand record page, the summary of the record is auto-generated.
   - User trigger: The skill is initiated when users select the **Summarize** action on a demand record.

7. Define and review the user accesses.
8. Choose where to display the skill.
   The display options may vary from skill to skill.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In-product desktop: When selected, the skill is displayed on forms and workspaces.

9. Open the role selection list next to the Display toggle, and select the roles that can use the skill.
   The user roles added in the **Define access** page for each ACL can be selected in this step.
10. Review the configuration and select **Activate**.

Related topics

Summarize demands with the demand summarization skill

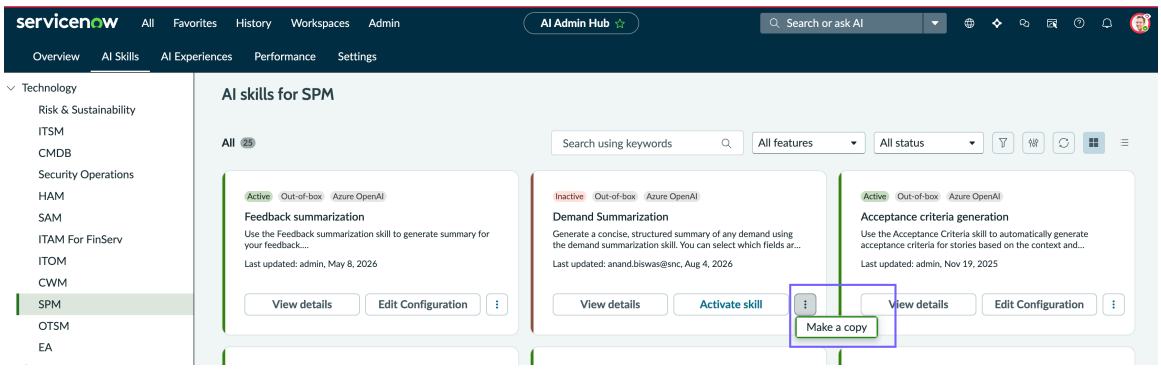
AI skills for Demand Management

Copy and customize the demand summarization skill

Copy the base demand summarization skill and customize it with your own fields, related entities, and prompt to summarize demands.

Before you begin

Role required: sn_nowassist_admin.nsa_admin



About this task

The demand summarization skill generates a summary of a demand record from a set of input fields and related lists. The base skill can be copied to include fields or related entities specific to your organization's demand process that aren't included in the base skill. Copying creates an independent copy that you can customize with your own fields, related entities, and prompt. The copied skill then summarizes demands using your configuration.

Note: The existing skill, either base or copy, are deactivated after a new copy is activated.

Procedure

1. Navigate to **Admin** > **AI Admin Hub**.
2. Select **AI Skills**.
3. In the navigation panel, select **Technology** > **SPM**.
4. Select the **Options** menu from the demand summarization skill card.

5. Select **Make a copy**.
6. Select **Make a copy** in the confirmation pop-up.
   The skill configuration setup opens.
7. Add or remove an input field.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Goal	Action
Add a field	**a.** Select **Add additional input field**. **b.** Select a field from the Additional input field list. **c.** Provide a description for the field.
Remove a field	Select the cross icon next to an input field.

For more information on the default input fields and related tables, see Inputs for AI skills.

8. Add rules or conditions for the skill.
9. Add or remove a field from a related table, add or remove a related table, or add rule conditions for each related table.

Goal	Action
Add a field from a related table	**a.** Select **Add field** for a related table. **b.** Select a field from the Related table field list. **c.** Provide a description for the field.
Remove a field from a related table	Select the cross icon next to a related table field.
Add a related table	**a.** Select **Add related table**. **b.** Select a table from the Related table list. **c.** Select a field from the Related table field list. **d.** Provide a description for the field.
Remove a related table	Select the cross icon next to a related table.
Add rule conditions for a related table	**a.** Select the **Add rule conditions** toggle. **b.** Define the rule conditions.

10. **Optional:** Add relationship table fields.
    a. Select **Add relationship table**.
    b. Select a field from the Relationship table field list.
11. Select whether any additional data source should be considered by the skill.

    A check mark next to each step indicates whether the step is completed, partially completed, or not completed. After configuring a step, select **Save and continue** to go to the next step. Return to a previous step by selecting **Back**.

    Note: Some configuration options are read-only.

12. Define the trigger for the skill.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Automatic**: The skill is initiated without user interaction. When users navigate to a demand record page, the summary of the record is auto-generated.
- **User trigger**: The skill is initiated when users select the **Summarize** action on a demand record.

13. Define and review the user accesses.
14. Choose where to display the skill.
    The display options may vary from skill to skill.

    In-product desktop: When selected, the skill is displayed on forms and workspaces.
15. Open the role selection list next to the Display toggle, and select the roles that can use the skill.
    The user roles added in the **Define access** page for each ACL can be selected in this step.
16. Review the configuration and select **Activate**.

Result

The copy of the demand summarization skill is activated. This will now be used to summarize demands.

What to do next

After cloning the demand summarization skill, you can create and customize prompts for the skill using the AI Skill Kit. You can use a base prompt and create a prompt of your own. For more information, see Create a prompt. This prompt will be applied to the skill in Demand Management.

Use Demand Management

Users with the demand manager role can create, view, and modify demands using the Demand Management application.

Important:

Demands are available in the Next Experience for Demand Management. For more information, see Next Experience for Demand Management.

The workspace provides additional value beyond the legacy experience, including Playbook, Docs, and the ability to define different governance processes using playbooks.

If you have Portfolio Planning Workspace or Strategic Planning Workspace, you can use the Next Experience for Demand Management to create and manage your demands.

- New customers: Use Next Experience for Demand Management to create and manage your demands.
- Existing customers: If you already have demands in the classic UI, you can continue using it. However, we recommend moving to the Next Experience for Demand Management, as your existing demands are automatically available there.

You can also approve demands and create the following artifacts from the approved demands:

- Project
- Change
- Enhancement
- Defect
- Enterprise Agile Planning (EAP) entities (epic, feature, and capability)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The type of artifact created from a demand depends on the selections in the **Category** and **Type** fields on the Demand form.

Note:

- Enhancements and defects can be created when the administrator has activated the SDLC-SCRUM plugin.
- EAP entities can be created when the Strategic Planning plugin is activated.

Demand Management Life Cycle

The demand management life cycle can be simplified as follows:

- Creating a demand: The user submits an idea and the demand manager approves the idea, automatically creating a demand from that idea.
- Viewing a list of demands: The demand manager views demands on the demand workbench or from a list view.
- Enhancing a demand: The demand manager can send the demand to screening, which sends assessments to stakeholders.
- Assessing a demand:
  - The demand manager can screen the demand and send surveys to stakeholders to complete assessments.
  - The demand manager can set the state of the demand to qualify, defer, or incomplete.
  - Demands can be analyzed and approved using the demand workbench.
- Creating an artifact: The demand manager creates a project, enhancement, change, defect, or EAP entities.

The demand management application uses the following simplified demand states.

Demand States

State	Description
Draft	The demand manager accepts a submitted idea. After reviewing or editing the record, select one of these buttons: • **Update**: The demand record is updated, but the demand remains in the current state. • **Submit demand**: The demand is moved to the submitted state. • **Delete**: The demand record is deleted.
Submitted	An accepted idea creates a demand record and the demand manager submits the demand. After reviewing or editing the record, select one of these buttons: • **Update**: The demand record is updated, but the demand remains in the current state. • **Screen**: The demand is moved to the screening state. • **Qualify** The demand is moved to the qualified state. • **Defer**: The demand is moved to the deferred state.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Demand States (continued)

State	Description
	• **Reset to Draft**: The demand is moved back to the draft state. • **Delete**: The demand record is deleted.
Screening	Stakeholder assessments are initiated for the demand. After reviewing or editing the record, select one of these buttons: • **Update**: The demand record is updated, but the demand remains in the current state. • **Qualify** The demand is moved to the qualified state. • **Defer**: The demand is moved to the deferred state. • **Reset to Draft**: The demand is moved back to the draft state. • **Delete**: The demand record is deleted.
Qualified	The demand has been qualified and is ready for review. After reviewing the record, select one of these buttons: • **Update**: The demand record is updated, but the demand remains in the current state. • **Approve**: The demand is moved to the approved state. • **Defer**: The demand is moved to the deferred state. • **Delete**: The demand record is deleted.
Deferred	The demand has been put on hold. The demand can be revisited in future and reviewed. After reviewing the record, select one of these buttons: • **Update**: The demand record is updated, but the demand remains in the current state. • **Approve**: The demand is moved to the approved state. • **Delete**: The demand record is deleted.
Approved	The demand is approved After reviewing or editing the record, select one of these buttons: • **Update**: The demand record is updated, but the demand remains in the current state. • **Close**: The demand is moved to the closed state. • **Reset to Draft**: The demand is moved back to the draft state. • **Delete**: The demand record is deleted.
Completed	The demand is moved to the completed state. After reviewing the record, select one of these buttons:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Demand States (continued)

State	Description
	• **Update**: The demand record is updated, but the demand remains in the current state. • **Reset to Draft**: The demand is moved back to the draft state. • **Delete**: The demand record is deleted.

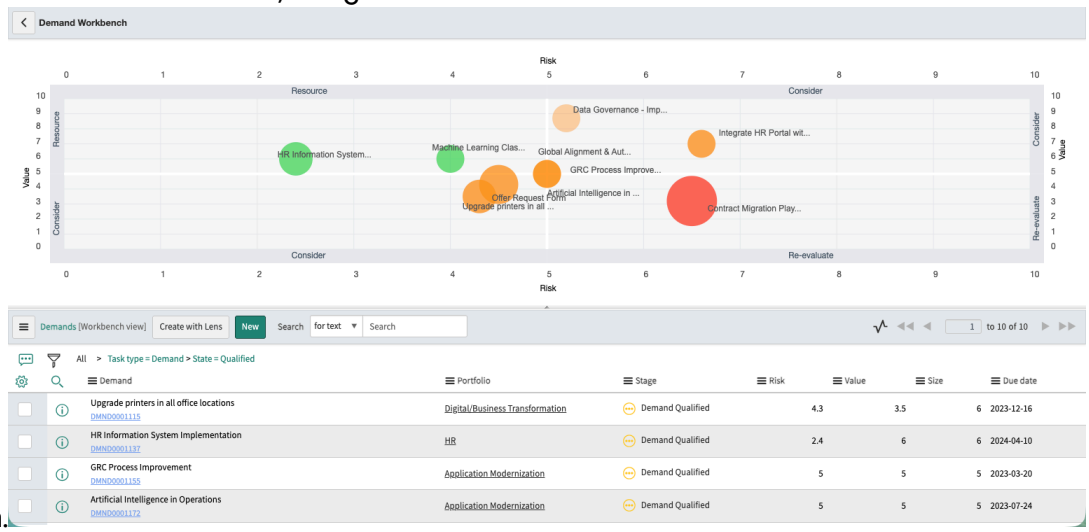
These states appear in the process flow indicator at the top of the Demand form. The process flow indicator:

- Highlights the current state of the demand.
- Checks off the states that a demand has passed through.
- Leaves empty the states that have been skipped.

Assess demands

The Demand Management application comes with two demand visualization tools that can aid decision makers with demand assessment.

The demand workbench provides a single point of engagement for assessing and approving demands and creating projects, enhancements, changes, or defects. This page combines multiple views of demand information, including an interactive bubble chart and a detail area that displays the list of current demands. The demand roadmap is a visual representation of demands over time for an organization.



Using the Demand Workbench

A bubble chart is a graph that plots multiple demands based on three categories: risk, value, and size. Each demand is represented on the bubble chart by a circle, which varies in size and color depending on the average of the scores for these categories. The bubble chart in the demand workbench displays all qualified demands and is dynamically updated as demands are created and assessed. This chart makes a useful tool for demand managers, stakeholders, and decision makers to assess visually and compare demands.

The list view on the demand workbench displays a list of the qualified demands that appear in the bubble chart. Selecting a demand from this list highlights the demand in the bubble chart and displays the demand form. The list view is also integrated with Live Feed so users can see current activity for a demand.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To access the demand workbench, navigate to **All** > **Demand** > **Demands** > **Workbench**.

Using the Roadmap

The roadmap is an interactive visualization tool that shows all demands that are currently in an active state. You can modify the look of the backlog using the Settings pane. The Settings pane enables you to change between the two-dimensional (2D) and three-dimensional (3D) view, filter demands by portfolio, or open the demands in a list view. While in list view, you can reassign panel colors, create filters to limit the records that are used for lanes and panels, and apply sorting. To use the roadmap, navigate to **All** > **Demand** > **Roadmap**.

Create a demand

Create demands to capture your strategic and operational requirements and centralize information for stakeholder assessment and prioritization.

Before you begin

Role required: snc_internal

Procedure

1. Access the Demand New record form in one of the following ways.
   - Navigate to **All** > **Demand** > **Demands** > **Create New**.
   - Navigate to **Self-Service** > **Demands** > **Create New**.
   - If you have the it_demand_manager role, navigate to **All** > **Demand** > **Demands** > **Workbench** > **New**.

     Note: Demands created from the Demand Workbench are in the Qualified state.

2. On the Demand New record form, fill in the fields.
   For a description of the field values, see Demand form.
3. Select **Save**.

   Note: Requester or collaborators can edit their demand as long as the demand is in the Draft state.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

- Review and refine the demand details.
- When all required information is complete, move the demand to the Submitted state by selecting **Submit demand**. The demand then enters the formal evaluation workflow involving the demand manager and stakeholders.

Create a qualified demand

The demand manager can create a qualified demand from the demand workbench list view.

Before you begin
Role required: it_demand_manager

About this task
Saving the demand adds it to the Demands list and adds a bubble representing the demand in the bubble chart.

Procedure

1. Navigate to **All** > **Demand** > **Demands** > **Workbench**.
2. Select **New** at the top of the list view.
3. Fill in the fields on the Demand form.
   For information about the fields, see Creating Demands.

Create a demand task

Create tasks for a demand to delegate cost, effort, risk, and benefit assessment activities. Assign a resource or group to the demand task to track the actual time and effort spent on performing the specified activities.

Before you begin
Role required: it_demand_manager

About this task
You create demand tasks to plan the work for demands rather than for the target work entity such as a project, change, defect, or enhancement. For more information, see Demand tasks.

- Planned dates, actual dates, and original dates are part of project tasks not demand tasks.
- The due date indicates the date on which the task is targeted for completion and doesn't affect the demand workflow. Project tasks, however, affect the project completion dates if the planned dates and actual dates are changed.
- Don't support the creation of nested demand tasks.
- Don't support task constraints such as the settings Start ASAP and Start on a specific date.
- Don't support an execution type such as Agile, Waterfall, or Hybrid.
- You assign resources for a demand task use the **Assigned to** field, **Additional Assignee** list, and **Assignment Group** fields.

Resources assigned to a demand task can submit the time spent on it using a time card.

If the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin is activated and the Demand Currency view is enabled, additional fields become available beyond the Default view. For more information about fields available only in the Demand Currency view, see Multicurrency in Demand Management and Multicurrency fields in demand-related forms.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Demand** > **Demands** > **All**.
2. Select the demand to which you want to add tasks.
3. Add or edit a demand task from the **Demand Tasks** related list:
   - To add a demand task, select **New**.
   - To update the details of an existing demand task, select the record and then select **Edit**.
4. On the Demand Task form, fill in the fields.
   For a description of the field names, see Demand task form.
5. Select **Save**.
   After completing your work on the demand task, select **Update** to return to the demand page.

> **Note:** Team members can access demand tasks assigned to them from Collaborative Work Management. For more information, see Managing SPM work in Collaborative Work Management.

What to do next

Create resource assignments and add cost plans, benefit plans, and risks to the demand depending on your role. Use the following related links to access these tasks.

Demand Task form related links

Related Links	Description
Add Cost Plan to Demand	Add a cost plan to capture the costs of demands. Create a cost plan to specify the unit cost of a cost type for a fiscal period. This link appears if the **Category** value is set to Cost estimate and the user has the `it_project_manager` or `it_demand_manager` role. Select the link to open the cost plan form and fill in the details. For more information, see create a cost plan.
Add Resource Plan to Demand	Create a resource plan to find the availability of resources and add the resource plan to the demand. This link appears if the **Category** value is set to Effort estimate and the user has the `it_resource_user` role. Select the link to navigate to the Resource Plans page and request resources. For more information, see Create and manage resource assignments for a demand.
Add Benefit Plan to Demand	Create a benefit plan to capture the potential benefits accrued by the demand when the demand is executed. This link appears if the **Category** value is set to Benefit estimate and the user has `it_project_manager` or `it_demand_manager` role. Select the link to open the benefit plan form and fill in the details. For more information, see Create a monetary benefit plan for a demand.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Demand Task form related links (continued)

Related Links	Description
Add Risk to Demand	Add risks that can potentially impact the success or outcome of the execution of the demand. This link appears if the **Category** value is set to Risk estimate and the user has `it_project_manager` or `it_demand_manager` role. Select the link to open the risk form and fill in the details. For more information see, add a risk.

Submit a time card for a demand task

The resources assigned to a demand task create and submit a time card or time sheet to record the time spent on a demand task. The reported hours are used to calculate the actual cost and effort for a demand task.

Before you begin

Role required: timecard_user

About this task

The resource submits the time card or time sheet to record and track the work performed on a demand task. An appropriate approver then has to approve the submitted time card or time sheet.

Procedure

1. Navigate to **All** > **Time Sheets** > **Time Sheet Portal**.
2. Create a time card.

Demand task assignment	To create a time card
If a demand task is assigned to you	**a.** Navigate to the task that you want to add to the time sheet. **b.** Select the **Add to Time Sheet** link in the task.
If a demand task is assigned to you as an ad ditional assignee	**a.** Select the **Add unassigned tasks to Time Sheet** link next to Logged Time Cards **b.** In the **Add unassigned tasks to Time Sheet** window, search for and select the demand task from the **Select a Task** list.

3. Fill in the hours for each day spent working on the demand task.
4. Select **Submit**.

Create an artifact from a demand

Create an artifact, such as a work item, from a demand so that you can track work on the demand.

Before you begin

A demand must have been created. For more information, see Create a demand.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The category and type of a demand and the applications you have installed determine the artifact you can create from it. The available artifact types and the applications you must have installed to be able to create them are listed in the following table.

Artifact	Required application
Enhancement, change, or defect	Project Portfolio Suite
Agile Development entities (story or epic)	Agile Development 2.0
Scaled Agile Framework (SAFe)SAFe entities (story, feature, or epic)	Essential SAFe or Portfolio SAFe
Enterprise Agile Planning (EAP) entities (epic, feature, or capability)	Strategic Planning
Improvement initiatives	Continual Improvement Management

Role required: it_demand_manager

Note:

- The sn_apw_advanced.eap_user role is required to convert a demand to EAP entities.
- The safe_art_user role is required to create a SAFe story.

Procedure

1. Navigate to **All** > **Demand** > **Demands** > **All**.
2. Open the demand for which you want to create an artifact.
3. Verify that the values in the **Category** and **Type** fields are appropriate for the artifact you want to create.
   The options in the Type list change according to the category that you select. For more information, see Demand form.

   Note: The **Category** and **Type** fields are set to read only when an artifact is created from a demand. If you delete the created artifact, these fields become editable again.

4. Select **Update**.
5. Create the artifact by selecting the appropriate related link.
   Depending on the category and type of the demand, links related to the artifact you can create become available.

Related link	Description
Create Project	This link appears if the **Category** field is set to **Strategic** and the **Type** field is set to **Project**. Creates a project that is associated with this demand. The number of the project record is displayed in the **Project** field. For more information, see Data migrated from a demand to a created project.
Create Enhancement	This link appears if the **Category** field is set to **Strategic** and the **Type** field is set to **Enhancement**. Creates an enhancement associated with this demand. Use enhancements to request improvements or new capabilities for

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related link	Description
	existing features or services, for example, a re quest to add new UI elements. The number of the enhancement record is displayed in the **Enhancement** field.
Create Epic	This link appears if the **Category** field is set to **Strategic** and the **Type** field is set to **Epic**. Creates an Agile Development 2.0 epic that is associated with this demand. A **Demand** ref erence field is created in the Agile Develop ment 2.0 Epic form.
Create Story	This link appears if the **Category** field is set to **Strategic** and the **Type** field is set to **Story**. Creates an Agile Development 2.0 story that is associated with this demand. A **Demand** ref erence field is created in the Agile Develop ment 2.0 Story form.
Create EAP Epic	This link appears if the **Category** field is set to **Strategic** and the **Type** field is set to **EAP Epic**. Creates an Enterprise Agile Planning (EAP) epic that is associated with this de mand. A **Converted from** reference field is created in the EAP epic form.
Create EAP Feature	This link appears if the **Category** field is set to **Strategic** and the **Type** field is set to **EAP Fea ture**. Creates an EAP feature that is associat ed with this demand. A **Converted from** refer ence field is created in the EAP feature form.
Create EAP Capability	This link appears if the **Category** field is set to **Strategic** and the **Type** field is set to **EAP Ca pability**. Creates an EAP capability that is as sociated with this demand. A **Converted from** reference field is created in the EAP capabili ty form.
Create SAFe Story	This link appears if the **Category** field is set to **Strategic** and the **Type** field is set to SAFe **Story**. Creates a Scaled Agile Framework (SAFe) story that is associated with this de mand. A **Demand** reference field is created in the SAFe Story form.
Create SAFe Epic	This link appears if the **Category** field is set to **Strategic** and the **Type** field is set to **SAFe Epic**. Creates an SAFe epic that is associated with this demand. A **Demand** reference field is created in the SAFe Epic form.
Create SAFe Feature	This link appears if the **Category** field is set to **Strategic** and the **Type** field is set to **SAFe Feature**. Creates a SAFe feature that is associ ated with this demand. A **Demand** reference field is created in the SAFe Feature form.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related link	Description
Create Improvement Initiative	This link appears if the **Category** field is set to **Strategic** and the **Type** field is set to **Continual Improvement Management**. Creates an improvement initiative that is associated with this demand. Demand record to which the improvement initiative is linked is added to the **Source/Parent** field in the Details tab. **Note:** When the improvement is closed, the demand record is set to complete.
Create Change	This link appears if the **Category** field is set to **Operational** and the **Type** field is set to **Change**. Creates a change that is associated with this demand. The number of the change record is displayed in the **Change** field.
Create Defect	This link appears if the **Category** field is set to **Operational** and the **Type** field is set to **Defect**. Creates a defect that is associated with this demand. The number of the defect record is displayed in the **Defect** field.

Create an Enterprise Agile Planning (EAP) entity from a demand

Create an Enterprise Agile Planning (EAP) entity, such as an epic, feature, or capability, from a demand so that you can start to work on these entities in Enterprise Agile Planning.

Before you begin

The Strategic Planning application must be installed.

Role required: sn_apw_advanced.eap_user

Note: A demand manager requires the sn_apw_advanced.eap_user role to convert a demand to an EAP entity.

Procedure

1. Navigate to **All** > **Demand** > **Demands** > **All**.
2. Open the demand that you want to convert into an artifact.
3. Set the demand category and type for EAP entities.
   a. From the Category list, select **Strategic**.
   b. From the Type list, select **EAP Epic**, **EAP Feature**, or **EAP Capability**.
4. **Optional:** In the EAP Details section, select the team that you want the EAP entity to be assigned to in the **Team** field.
   This field becomes read-only once the entity is created.
5. Save the demand by selecting **Save**.
6. Create an entity that will be associated with this demand by selecting the appropriate related link.

Note: The related links aren't available once the demand is converted to the selected entity.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The available related links are:

- Create EAP Epic
- Create EAP Feature
- Create EAP Capability

Result

The EAP entity is created successfully and the demand is moved to the Completed state. A message with a link to the created entity in Strategic Planning Workspace that enables you to immediately view or work on the entity is displayed.

For information about the data migrated from the demand to the EAP entity, see Data migrated from demands to Enterprise Agile Planning (EAP) entities.

What to do next

To view and work on the new entity in Strategic Planning Workspace right away, select the link to the entity in the confirmation message.

Note: To access the entity at a later time, in the demand form, select the entity name in the **Converted to** field in the EAP Details section.

For more information, see Strategic Planning and Enterprise Agile Planning in Strategic Planning.

Create a monetary benefit plan for a demand

Demand benefit plans capture the potential benefits accrued by the demand when the demand is executed. Create a monetary benefit plan to specify the estimated benefit in a category for a fiscal period.

Before you begin

Role required: it_demand_manager

About this task

The monetary benefit plan breakdown records are automatically created when you save the benefit plan. The monetary benefit plan breakdown records specify the estimated and actual benefits at a granular level for specific fiscal periods, such as FY16: M04 and FY16: M05. The Monetary Benefit Plan Breakdowns related list shows the aggregated benefits for estimated and actual benefits for each fiscal period for the demand.

Note: Converting a demand to a project or EAP entity transfers the benefit plan from the demand to the target project or EAP entity.

If the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin is activated and the Demand Currency view is enabled, the fields in the **Financials** section differ from the Default view. For fields available only in the Demand Currency view, see Multicurrency fields in demand-related forms.

Procedure

1. Navigate to **All** > **Demand** > **Demands** > **All**.
2. Open the required demand form.
3. Select the Monetary Benefit Plans related list.
4. To create a monetary benefit plan, select **New**.

Note: To create a monetary benefit plan from the **Financials Summary** page, select **Manage**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. On the Monetary Benefit Plan form, fill in the fields.

   For a description of the field names, see Monetary Benefit Plan form.

   Note: When you move the demand dates, the associated benefit plans also change accordingly based on whether the benefit plan is tied to the demand start date, or end date. The project property **Change Resource Plan, Cost Plan and Benefit Plan Start Date with Demand or Project Start Date Change** controls the behavior for demand date changes.

6. Select **Submit**.

What to do next
On the Benefit Plan form, view the benefit breakdown by fiscal period in the Monetary Benefit Plan Breakdowns related list.

Update a monetary benefit plan breakdown for a demand

Update a monetary benefit plan breakdown record that specifies the estimated and actual benefits, at a granular level, for specific fiscal periods.

Before you begin
Role required: it_demand_manager

Procedure
1. Navigate to **All** > **Demand** > **Demands** > **All**.
2. Open the required demand.
3. Select the Monetary Benefit Plans related list.
4. Open the required monetary benefit plan.
5. In the Monetary Benefit Plan Breakdowns related list, select the information icon for a monetary benefit plan breakdown.
6. Select **Open Record**.
7. On the Monetary Benefit Plan Breakdown form, view and update the enabled fields.
   For a description of the field names, see Monetary Benefit Breakdown form.
8. Select **Update**.

Create a non-monetary benefit plan for a demand

Create a non-monetary benefit plan to specify the estimated benefit in a category for a fiscal period. Demand benefit plans capture the potential non-financial benefits accrued by the demand when the demand is executed.

Before you begin
Role required: it_demand_manager

About this task
The non-monetary benefit plan breakdown records are automatically created when you save the benefit plan by selecting **Automatic** or **Manual** in the **Breakdown Type** field. The non-monetary benefit plan breakdown records specify the estimated and actual non-financial benefits at a granular level for specific fiscal periods, such as FY16: M04 and FY16: M05. The Non-monetary Benefit Plan Breakdowns related list shows the aggregated benefits for estimated and actual non-financial benefits for each fiscal period for the demand.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Converting a demand to a project or EAP entity transfers the benefit plans from the demand to the target project or EAP entity.

Procedure

1. Navigate to **All** > **Demand** > **Demands** > **All**.
2. Open the required demand form.
3. Select the Non-Monetary Benefit Plans related list.
4. To create a non-monetary benefit plan, select **New**.
5. On the form, fill in the fields.

   For a description of the field names, see Non-monetary Benefit Plan form.

   Note: When you move the demand dates, the associated benefit plans also change accordingly based on whether the benefit plan is tied to the demand start date, or end date. The project property **Change Resource Plan, Cost Plan and Benefit Plan Start Date with Demand or Project Start Date Change** controls the behavior for demand date changes.

6. Select **Submit**.

What to do next

- On the Benefit Plan form, view the benefit breakdown by fiscal period in the Non-monetary Benefit Plan Breakdowns related list.
- Associate monetary and non-monetary benefit plans, so that you can capture the potential benefits (financial and non-financial) accrued by the demand for the hybrid benefit plans.

Update a non-monetary benefit plan breakdown for a demand

Update a non-monetary benefit plan breakdown record that specifies the estimated and actual benefits, at a granular level, for specific fiscal periods.

Before you begin

Role required: it_demand_manager

Procedure

1. Navigate to **All** > **Demand** > **Demands** > **All**.
2. Open the required demand.
3. Select the Non-monetary Benefit Plans related list.
4. Open the required non-monetary benefit plan.
5. In the Non-monetary Benefit Plan Breakdowns related list, select the information icon (ⓘ) against a non-monetary benefit plan breakdown.
6. Select **Open Record**.
7. On the Non-monetary Benefit Plan Breakdown form, view and update the enabled fields.
   For a detailed description of the field names, see Non-monetary Benefit Plan Breakdown form.
8. Select **Update**.

Associate monetary and non-monetary benefit plans

Associate monetary and non-monetary benefit plans, so that you can capture the potential benefits (financial and non-financial) accrued by the demand.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: it_demand_manager

About this task
You can associate a monetary benefit plan with a non-monetary benefit plan and vice versa.

Note: When you delete a benefit plan, its relationship with the associated benefit plan (if any) is also removed.

Procedure
1. Navigate to **All** > **Demand** > **Demands** > **All**.
2. Open the required demand form.
3. Select the Monetary Benefit Plans or Non-monetary Benefit Plans related list.
4. Select the name of a benefit plan that you want to associate.
5. Associate a monetary or non-monetary benefit plan.

Option	Action
Associate an existing benefit plan	On the Benefit Plan form, fill in the **Associated benefit** field with the benefit plan that you want to associate.
Associate a new benefit plan	**a.** On the Benefit Plan form, select **Associate new benefit**. **b.** On the form, fill in the fields. For details, see Create a monetary benefit plan for a demand and Create a non-monetary benefit plan for a demand.

6. Select **Save**.

Result
The selected benefit plan is associated with another plan.

What to do next
Select the **View Associated benefit plan** related link to view the associated benefit plan.

Create a demand cost plan

Demand cost plans capture the costs of demands. Create a cost plan to specify the unit cost of a cost type for a fiscal period.

Before you begin
Role required: it_demand_manager

About this task
The application automatically creates cost plan breakdown records when you save the cost plan. The cost plan breakdowns are records that specify the estimated and actual costs and the budget at a granular level for specific fiscal periods, such as FY16: M04 and FY16: M05. The demand cost plans are added to the parent program and portfolio.

Cost plan breakdowns for each fiscal period are recalculated in the project currency. This recalculation applies to estimated and actual costs in the demand cost plan, and to estimated and actual benefit amounts in the demand benefit plans. The project currency amounts roll up to the cost plan, benefit plan, and project records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you want to use multiple currencies, create a cost plan for another currency.

If the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin is activated and the Demand Currency view is enabled, the **Financials** section fields differ from the Default view. For fields available only in the Demand Currency view, see Multicurrency fields in demand-related forms.

Procedure

1. Navigate to **All** > **Demand** > **Demands** > **All** and open the required demand form.
2. In the related links, select **Cost Plans**.
3. To view the Financials Summary page in a grid, select **Manage**.
4. Add or edit a cost plan from the Cost Plans related list:
   - To add a cost plan, select **New**.
   - To update the details of an existing cost plan, select the record and then select **Manage**.
5. In the cost plan form, fill in the fields.

   For a description of the field names, see Cost plan form.

   Note: When you change the planned start date of a demand, the associated cost plans and resource assignments also change. The project property **Change Resource Plan and Cost Plan Start Date with Demand or Project Start Date Change** controls the behavior for demand date change.

6. Select **Submit**.

What to do next

- On the Demand form, view the breakdowns by fiscal period in the **Cost Breakdown** related list.
- To recalculate the value in the **Forecast** field, use the **Calculate Forecast Amount** related link.

View financial summary of cost and monetary benefit plans

View a breakdown of the cost and benefit components of a demand to track the financials of your demands. The financial summary enables you to assess the progress of the demand and track financial changes and their impact on the demand over a period.

Before you begin

Role required: it_demand_manager

About this task

View a detailed breakdown of the cost components of a demand using the **Financial Summary** tab. The total planned cost, budget cost, actual cost, and planned returns with their breakdowns are displayed in the form of read-only cards. The cost plans, benefit plans, and their breakdowns are provided in an editable grid view.

Procedure

1. Navigate to **All** > **Demand** > **Demands** > **All**.
2. Open a demand.
3. On the Demand form, select the **Cost Plans** or **Monetary Benefit Plans** related list.
4. Select **Manage**.
5. **Optional:** Add additional fields, view plan details, or reorganize the financial data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Action	Steps
Create a baseline or compare available baselines	Select the baseline information icon and then select **Create New Baseline** or **Com pare Baselines** option respectively. For more information, see Create a baseline of a de mand.
Create a cost plan or benefit plan for the de mand	In the **Cost Plans** or **Benefits Plans** tab, se lect **New**.
View a cost plan or benefit plan details in a form	Select the information icon available in the **Name** column of the grid.
View a cost plan or benefit plan details in yearly, quarterly, or monthly format	Select the **Year**, **Quarter**, or **Month** views re spectively. You can also edit the breakdown values of a cost plan or benefit plan without opening the plan in a form. Inline edit is available only in the **Monthly** view.
Toggle the widgets on the Financial Summa ry section or add more fields	**a.** Select the widgets icon and then select the **Show Widgets** option. **b.** Select additional fields to show, clear them to hide. **Note:** ▪ By default, all the fields are select ed. ▪ The selected field preferences are saved and are available when you reopen the **Financial Summary** tab. ▪ If the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plug in is activated, additional fields are available: Benefit in demand curren cy, Actual Cost in demand currency, and Financial return in demand cur rency.
Show or hide columns in the grid	Select the configuration icon and select the field names. **Note:** You can't hide the grouped columns.
Reset to the default grid column layout	Select **Reset to defaults**.
Export financial information	Select **Export to csv**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Action	Steps
View the demand costs and benefits in demand currency	**a.** Select the configuration icon . **b.** Select additional fields to show demand currency amounts. **Note:** If the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin is activated, you can add additional fields. You can view both the functional and demand currencies in the currency indicator. The Financial Summary grid view includes demand currency column heads on the cost plan and benefit plan tabs. These include **Cost in demand currency** and **Demand currency**.
View details of an item in the grid	Select the expand icon or collapse icon .

Create an expense line for a demand

A demand expense line is the cost associated with a specific source, such as a user or a fixed asset. Expense lines are part of demand cost plans.

Before you begin

Role required: it_demand_manager
Application required: Project Portfolio Management with Financials

About this task

Only processed expense lines are considered for demands. You can create multiple expense lines for a project or demand.

Expense lines on the demands are used to record any expense incurred during demand evaluation only. You can't associate expense lines to cost plans on demands. The actual cost incurred from the expense lines tied to the demand rolls up to the **Demand actual costs** field.

When a demand is converted to a project, the expense lines remain with the demand, while the cost plans and budget are moved over to the project.

Procedure

1. Navigate to **All** > **Demand** > **Demands** > **All** and open the demand form.
2. In the Expense Lines related list, select **New**.
3. On the expense line form, fill in the fields.
   For a description of the field names, see Expense line form.
4. Select **Submit**

Create and manage resource assignments for a demand

As a resource requester, find the availability of the resources, and create and manage the resource assignments for a demand.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: it_demand_manager

Procedure
1. Navigate to **All** > **Demand** > **Demands** > **All**.
2. Open the required demand form.
3. Select the **Resource assignments** related list and select **New**.
4. On the Resource assignment new record form, fill in the fields.
   For a description of the field names, see New Resource Assignment form.
5. Select **Submit**.

Recalculate costs of resource assignments of a demand

Recalculate the costs of all active resource assignments of a demand after hourly rates change in the associated rate model. Recalculating keeps plan costs up to date.

Before you begin
Confirm the following setup:

- The demand must be active.
- The demand must have an active rate model assigned.

Role required: demand_manager

About this task
This option recalculates the costs of all resource assignments of the demand at once. You can also open a resource assignment from the **Resource assignments** related list to recalculate the resource costs of an individual resource assignment.

Procedure
1. Navigate to **All** > **Demand** > **Demands** > **All**.
2. Open a demand.
3. On the Demand form, right-click on the header bar and select the **Recalculate Resource Costs**.
4. In the Recalculate Resource Cost form, fill in the fields.
   For a description of the field names, see Recalculate resource costs form.
5. Select **OK**.

Result
- Recalculates the selected resource costs of all the applicable resource assignments in the demand based on the latest hourly rates. The hourly rates are derived from the rate model associated with the demand.
- Updates the recalculated resource costs on the respective cost fields on the resource assignment form and the Resource assignments related list.
- Reflects the revised values in the respective cost fields of the demand.

Generate labor costs

Generate labor costs to view the expenses of resources using resource assignments and cost plans.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: it_demand_manager

Procedure
1. Navigate to **All** > **System Definition** > **Scheduled Jobs**.
2. Open the **Generate labor costs for demands and projects** scheduled job.
3. Select **Active**.
4. On the Scheduled Script Execution form, fill the fields.
   For a description of the field names, see Scheduled Script Execution Form.
5. Select **Update**.

> **Tip:** Alternatively, as an admin, you can activate and define a scheduled job to generate labor costs at the required frequency. For more information, see Activate a scheduled job to generate labor costs.

Migrate budget of active demands to Next Experience

Migrate your demand budget to Next Experience to manage the financials using Project Workspace.

Before you begin
Role required: it_demand_manager

Procedure
1. Navigate to **All** > **Demand** > **Demands** > **All**.
2. Migrate baselines using one of the following options.

Choice	Description
Using list actions	**a.** Select the required demands from the projects list. **b.** Select the **Actions on selected rows...** list and select **Migrate Budget**. **c.** On the migrate budget confirmation win dow, select **OK**.
Using related links	**a.** Open the required demand. **b.** Select the **Migrate Budget** related link. **c.** On the migrate budget confirmation win dow, select **OK**.
Activate a scheduled job	**a.** Navigate to **All** > **System Definition** > **Scheduled Jobs**. **b.** Filter the Name field to locate the **Migrate budget for active demands and projects** scheduled job and open it. **c.** Select **Active** and on the Scheduled Script Execution form, fill the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Choice	Description
	For a description of the field names, see Scheduled Script Execution Form. **d.** Select **Update**.

Note: After migration, you won't be able to view the budget on Classic UI. You're encouraged to manage budget using the Financials in Next Experience.

Migrate financial baselines of demands to Next Experience

Migrate the financial baselines of demands to Next Experience to manage the financial using Project Workspace.

About this task

Next Experience uses new data model that has two new tables Investment Baselines (`sn_invst_pln_invst_investment_baseline`) and Investment Baseline Header (`sn_invst_pln_invst_investment_baseline_header`) which are used to capture financial baselines. The financial baselines created for demands in classic experience aren't visible in Next Experience. You can migrate the existing baselines from classic to Next Experience as an on-demand activity for the required demands, or as bulk by activating and running a scheduled job.

Baselines view in the Next Experience provides better insights to view and analyze the financial performance of your demands.

Unlike the financial baselines created using Next Experience, the financial baselines created in the Classic UI don't capture the actual expenses along with planned costs as a default behavior. To support baselines comparison, actual costs are captured during baseline migration. The migration uses processed expense lines as of the financial baseline creation date.

For detailed information and use cases on using financials in Next Experience, see Managing financials for planning items in Portfolio Planning.

Note: Starting March 2026 release, for customers using multicurrency, migration of financial baselines updates the baseline data in project currency to investment currency.

1. Existing demands that have only financial baselines but no investment baselines. With the migration, financial baseline will be migrated to investment baseline and you can view the migrated baseline from the `sn_invst_pln_invst_investment_baseline` table list view.
2. Existing demands that have both project and investment baselines. Run the scheduled job to populate the investment currency fields in the baselines with values from project currency. For more information, see Activate scheduled job to populate to multicurrency fields.

Before you begin

The data in project currency fields will be migrated to investment currency fields on migrating baselines for customers using multicurrency.

Role required: it_demand_manager

Procedure

1. Navigate to **All** > **Demand** > **Demands** > **All**.
2. Migrate baselines using one of the following options.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Choice	Description
Using list actions	**a.** Select the required demands from the projects list. **b.** Select the **Actions on selected rows...** list and select **Migrate Financial Baselines**. **c.** Select **OK** on the Migrate Financial Base lines confirmation window.
Using related links	**a.** Open the required demand. **b.** Select the **Migrate Financial Baselines** re lated link.
Activate a scheduled job	**a.** Navigate to **All** > **System Definition** > **Scheduled Jobs**. **b.** Filter the Name field to locate the **Migrate financial baselines to Next Experience** scheduled job and open it. **c.** Select **Active** and on the Scheduled Script Execution form, fill the fields. For a description of the field names, see Scheduled Script Execution Form. **d.** Select **Update**.

Tip: After migration, you're encouraged to create financial baselines using the Financials in Next Experience.

Result

Financial baselines for the selected demands are migrated to Next Experience and you can view them in the Baselines view.

What to do next

View and compare the migrated baselines with any existing baselines or current baseline ( ).

Allocate budget to a demand

Set the budget of a demand according to the fiscal years.

Before you begin

Role required: it_portfolio_manager

Procedure

1. Navigate to **All** > **Demand** > **Demands** > **All** and open the demand form.
2. In the related links, select **Demand Budget**.
   The **Demand Budget** dialog box opens.
3. Select the fiscal year for which you want to set the budget for the demand.

Tip: You can work on allocating lean budgets at the fiscal period level using the Investment Budget. For more information, see Enable lean budgeting for demands.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Enter the amounts for **Capex Budget** and **Opex Budget**.
   The **Total Budget** is updated with the sum of capex and opex amounts.
5. Select **OK**.

Note:

- If the demand doesn't have a cost plan, start date, and due date, the demand budget is distributed from the current month. Distribution continues until the end of the demand budget fiscal year.
- If the demand doesn't have a cost plan and a due date but has a start date, then the demand budget is distributed from either:
  - Start date (if the start date falls in the given budget fiscal year) until the end of the demand budget fiscal year.
  - Start of the demand budget fiscal year until the end of the demand budget fiscal year.
- If the demand doesn't have a cost plan and a start date but has a due date, then the demand budget is distributed from either:
  - Current month until due date (if the due date falls in the given budget fiscal year).
  - Current month until the end of demand budget fiscal year.

If the demand has a cost plan associated, then demand budget is distributed by honoring the cost plan fiscal periods.

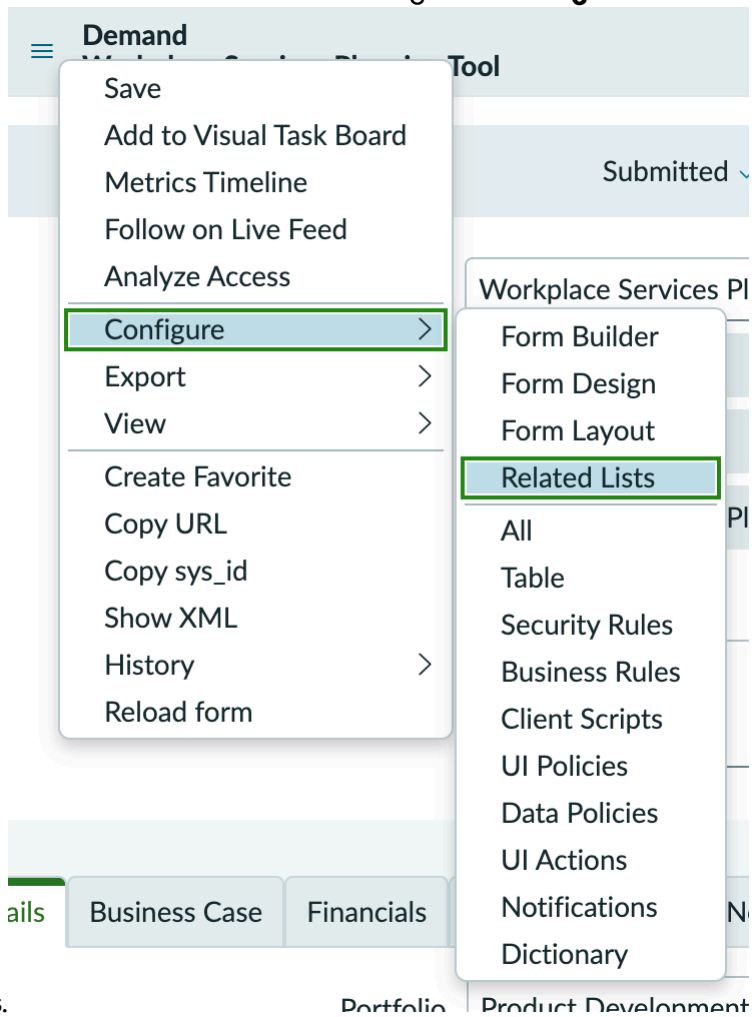
Result

The demand budget for the selected year appears in the **Demand Budget** related list. You can select the amounts in the list to revise them.

Enable lean budgeting for demands

Enable the Investment Budget option to allocate budgeting for demands at fiscal period.

Before you begin



Role required: admin

Procedure

1. Navigate to **All** > **Demands** > **Demand** > **All**.
2. Open the required demand.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select the Additional actions and navigate to **Configure** > **Related Lists**.

4. Select **Investment Budget** from the Available column and add it to Selected column.
5. Select **Save**.

Manage lean budgeting for demand

Allocate budget for demands at each fiscal period instead of the entire fiscal year to reduce the overhead costs associated with traditional approach.

Before you begin

- Enable lean budgeting for demands
- Role required: sn_invst_pln.sn_spm_funding_user

  Any user role with this specific role attached can add or manage the investment budgets.

Procedure

1. Navigate to **All** > **Demands** > **Demand** > **All**.
2. Open the required demand.
3. In the Investment Budget related list, select **New**.
4. On the Investment Budget form, fill in the fields.
   For more information about the fields and their description, see Investment Budget form.
5. Select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The allocated budget for a fiscal period is displayed in the Investment Budget related list.

Create a baseline of a demand

Create a financial baseline of a demand to capture a snapshot of cost plan, benefit plan, and demand-level financial metrics at a specific point in time.

Before you begin
You can create as many financial baselines as necessary and review the financials changes that have been made to the demand since the previous baseline. Any financial baseline doesn't capture the actual cost component of the demand.

Role required: it_demand_manager

Procedure
1. Navigate to **All** > **Demand** > **Demands** > **All**.
2. Select the required demand.
3. To create a financial baseline of a demand, use either of the options.

Option	Steps
From a related link	**a.** Select the **Create Baseline** related link. **b.** In the Create Baseline pop-up, enter a suit able description. **c.** Select **Save**.
From a related list	**a.** Select the **Demand Baselines** related list. **b.** Select the **Create Baseline** button. **c.** In the Create Baseline pop-up, enter a suit able description. **d.** Select **Save**.

Compare financial baselines of a demand

You can compare baselines to review the variances in the financial data of a demand and see what changed.

Before you begin
Role required: it_demand_manager

About this task
You can create multiple baselines at various stages of a demand's life cycle. For example, at the end of each phase or after every calendar month or quarter. Each baseline captures the financial data of the demand at a particular moment. Use baselines to identify and review changes made to the demand. Having multiple baselines and comparing them helps you track the performance of your demand.

With the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin activated and Demand Currency view enabled, you can view and compare demand financial details in baselines using the demand currency. For fields available only in the Demand Currency view, see Multicurrency in Demand Management.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. To compare financial baselines of a demand, perform one of the following options.

Option	Steps
From the Demand form	**a.** Navigate to **All** > **Demand** > **Demands** > **Workbench**. **b.** Open a demand. **c.** On the Demand form, select the **Cost Plans** or **Benefit Plans** related list. **d.** Select **Manage**. **e.** On the Demand Workbench, select the baseline information icon ( ) and then select **Compare Baselines**.
From the Baseline form	**a.** Navigate to **All** > **Demand** > **Demands** > **All**. **b.** Open a demand. **c.** On the Demand form, select the **Demand Baselines** related link. **d.** Open a baseline. **e.** On the Baseline form, select the **View Financial Baseline** related link.

2. On the Financial Baseline form, select the baselines you want to compare from the two lists. By default, the current and the most recent baselines are selected.
3. Select **Compare**.
   The comparative data of the baselines are displayed in the following two sections:
   - The **Financial Baseline Summary** section displays three widgets: the first two widgets contain the financial data of the two baselines, and the third widget contains their variance.
   - The **Financial Baseline Details** section displays the cost plans and benefit plans of the two baselines in two different grids. Each plan type has two rows corresponding to each baseline data.

     Note: To see the color code of rows representing each baseline, select the baseline legend icon ( ).

4. **Optional:** Add additional fields or reorganize the comparative data on the **Financial Baseline Summary** section of the form.
   - To toggle viewing the **Financial Baseline Summary** section, select the **Collapse** icon or **Expand** icon .
   - To show or hide additional fields on the widgets in the **Financial Baseline Summary** section, select the configuration icon and select the field names.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin is activated, you can add additional fields to the baseline such as Total planned cost in demand currency, Operating budget in demand currency, and Financial return in demand currency.

The selected field preferences are saved and are available when you reopen the Financial Baseline form.

- To reset to the default widget layout, select **Reset to defaults**.
- To view the financial information of the baselines in demand currency, toggle the **Show Widgets in Demand Currency** button.

Note: This button is available only when the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin is activated.

5. **Optional:** View details of financial data of the cost and benefit plans on the **Financial Baseline Details** section of the form.
   - To view a cost plan or benefit plan comparative data in yearly, quarterly, or monthly format, select the **Year** or **Quarter** or **Month** views respectively.
   - To view details of a fiscal year, select the **Expand** icon or **Collapse** icon .

Realign resource assignments with demand

Planning and execution of your roadmap involves change in priority or timelines of your work. In such cases, you can adjust the resource assignment dates to match with the latest dates of your demands.

Before you begin

Migrate resource plans to resource assignments

Role required: it_demand_manager

Procedure

1. Navigate to **All** > **Demand** > **Demands** > **All**.
2. Open the required demand.
3. Change the **Approved start date** and **Planned start date** to meet your organizational priorities.
4. Select **Save**.
5. Select the **Realign assignments to demand** related link.

Result

In the Resource assignments related list, you can see the Start date of the resource assignments aligned with the demand start dates.

Identify similar records using AI

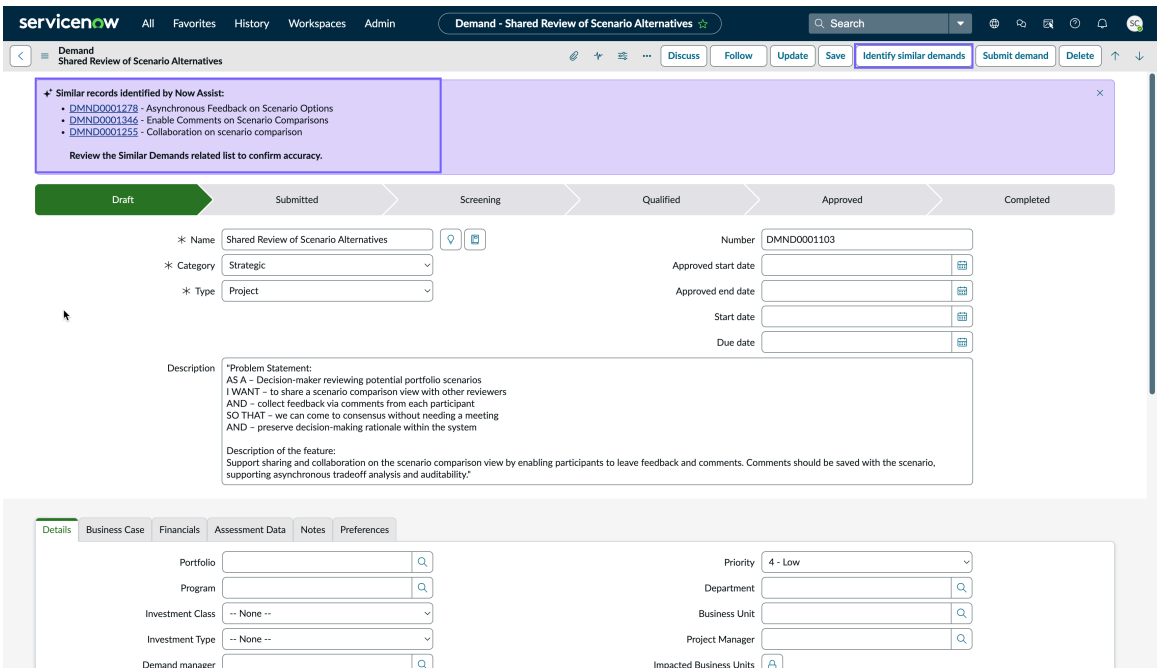
Use the identify similar records skill to find demand records with similar names, descriptions, or business case content.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Important: This generative AI skill is turned on by default. The skill will be automatically available to appropriate role users for the application. For more information, see AI agents, skills, and agentic workflows on by default.

If you have custom roles that require access to this skill, update the ACLs (access control lists) for those roles that require access.



Role required: it_demand_user

About this task

- If similar records exist, the related list displays them.
- If no similar records are found, a message appears and the related list remains empty.

Procedure

1. Navigate to **All** > **Demand** > **Demands** > **All**.
2. Select a demand from the **Demands** list.
3. Select the **Identify similar demands** button to detect similar demand records.
   The similar demands identified by AI are displayed in the top banner and the Similar Demands related list.

What to do next

To view full details of a similar demand record, select the demand number link from the Similar Demands related list.

Summarize demands with the demand summarization skill

Summarize demand records using the demand summarization skill. The skill reviews the demand fields and related lists and helps create a clear summary of the demand.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Important: This generative AI skill is turned on by default. The skill will be automatically available to appropriate role users for the application. For more information, see AI agents, skills, and agentic workflows on by default.

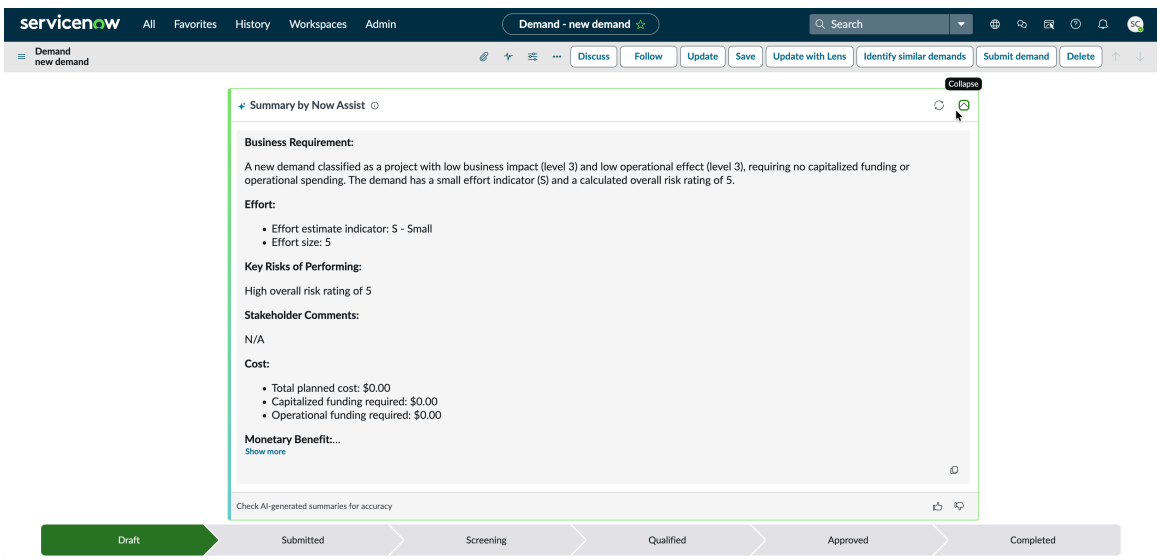
Role required: it_demand_user, it_demand_manager

If you have custom roles that require access to this skill, update the ACLs (access control lists) for those roles that require access.

Procedure

1. Navigate to **All** > **Demand** > **Demands** > **All**.
2. Select a demand from the **Demands** list.
3. Select the **Summarize** button on the demand form.

Note:



- The summary of the record is auto-generated for demands if the skill trigger is selected as Automatic.
- The summary is initiated when users select the **Summarize** action on a demand record if the skill trigger is selected as User trigger.

Result

The executive summary generated by AI is displayed in the summary card.

Important:

Generative AI may produce inaccurate or incomplete information. Always validate AI-generated content.

Note: Select the copy icon to copy the generated summary for further use.

View demands

You can view existing demands at any time.

Before you begin

Role required: it_demand_manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The **Project** field displays the project name after the demand manager creates a project from the demand. The **Risk**, **Value**, and **Size** fields display assessment metrics for the demand. This information appears on the Demands list.

Procedure

1. View demands using one of the following options.

   a. **All** > **Demand** > **Workbench**.
   The bubble chart and the list view on the demand workbench display all qualified demands.

   b. **All** > **Demand** > **Demands** > **All**.
   Displays the Demands list.

2. Select the **Number** field on the Demands list to view the Demand form.
3. View the status of the demand using the **Stage** field.

   This field is updated as the demand moves through the life cycle, from an idea to a demand to the resulting project, enhancement, change, defect, or planning item. At a glance, users can use this field to track the progress of a demand.

4. Hover over the **Stage** field on the Demands list to view the progression of the idea along with the value of the **State** field for each step in the progression:
   - **Idea**: If an idea is being evaluated, the pop-up window displays the current state of the idea.
   - **Demand**: if an idea is promoted to a demand, the pop-up window displays the current state of the demand as well as the idea.
   - **Project**, **Enhancement**, **Change**, or **Defect**: If a demand is accepted, the pop-up window displays the current state of the resulting artifact in addition to the demand and idea.

View an artifact created from a demand

As the demand manager, you can view an artifact created from a demand.

Before you begin

Role required: it_demand_manager

Procedure

1. Navigate to **All** > **Demand** > **Demands** > **Workbench**.
2. Right-click a bubble that has an associated artifact.
3. Select **View <artifact>**.
   This action displays the artifact form for the selected demand in a new tab.

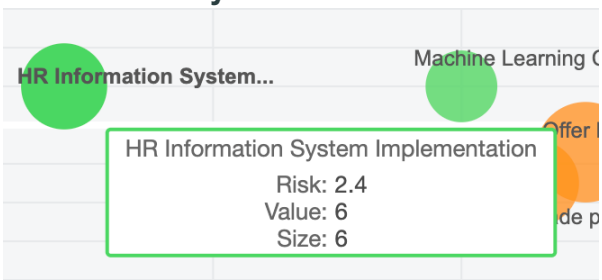
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

View a demand summary

Hover over a bubble in the demand workbench bubble chart to display a summary of the demand information.

Before you begin



Role required: it_demand_manager

Procedure

1. Hover over a demand in the bubble chart to highlight the bubble and its label.

   A bubble summary window also shows the demand name and the risk, value, and size data. Hovering over the bubble also highlights the corresponding demand row in the list view. Hovering over a demand in the list view highlights the corresponding bubble in the bubble chart.

   Bubble Summary Window

   Note: When hovering over a bubble, scroll down in the list view to see the corresponding highlighted demand row. If necessary, adjust the height of the list view or the bubble chart.

2. For multiple demands, some bubbles or labels overlap and are difficult to see.

   Hover over a label to highlight the corresponding bubble.

   Use when:

   - Two or more bubbles have the same metrics and overlap directly.
   - Several bubbles intersect and overlap.
   - A bubble is only partially visible on the edge of the bubble chart.

Add details to demands

The demand manager typically works with a business relationship manager to identify stakeholders and elicit requirements, risks, and other important information.

The Demand Management application streamlines the stakeholder identification process. Auto-populating the list of stakeholders from the portfolio the user selects when filling out the demand form in the service catalog or in the Demand Management application. The Demand Management application also enables you to use assessments to automate some of the information gathering process.

Add demand tasks

Demand managers analyze business demands, approve demands, and create projects and enhancements. Many times activities such as effort, cost, risk, and benefit estimates are required to analyze a demand and create a business case for approval of the demand. A demand

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

manager can create demand tasks and assign these tasks to individual resources or a group to perform these activities.

The resources assigned to the demand tasks then post time spent while working on a demand or demand task using a time card. The time card data is used to calculate actual effort and cost incurred on the demand task as well as demand.

To create demand tasks, scroll to the **Demand Tasks** related list on the Demand form and select **New** to create a record.

Add stakeholders

When a demand is submitted, the demand stakeholder list is populated automatically from the associated portfolio. You can also add stakeholders. To add a person to the stakeholder list, scroll to the *Stakeholders* related list on the Demand form, select **Create new** to create a record, and fill in the form. To add existing stakeholders to the demand, select **Add existing**.

When adding a stakeholder from the demand form, the **Portfolio** field displays the portfolio that was selected on the Demand form.

A demand can have multiple stakeholders and a stakeholder can be associated with multiple demands.

The newly added stakeholder is automatically associated with the current demand and any other demands that use the same portfolio.

Add requirements

Demand managers can create as many requirements as needed, but requirements aren't required. Typically, the stakeholders associated with a demand request have insights into what the requirements are for a demand request to be completed.

Demand managers use the Requirement form to describe the requirement and assign an owner who is responsible for making sure that the requirement is met. When a requirement is complex, demand managers can associate planned tasks, such as project tasks, with the requirement. The demand manager assigns and tracks the tasks until they're complete.

To add a requirement to a demand, follow these steps:

1. Open a Demand form and select **New** from the Requirements related list.
2. On the Requirement form, fill in the fields. For a description of the field names, see Requirement form.

Add resource assignments

Resource assignments are another source of information that decision makers can use when evaluating demands. You can create resource assignments for a demand from the **Resource assignments** related list, which appears only if the Resource Management Workspace application is activated.

To add a resource assignment to the demand, scroll to the *Resource assignments* related list on the Demand form and select **New** to create a record.

Add and recalculate strategy and goal allocations

The Strategy Allocations related list displays the percentage of the demand's total cost and benefits allocated toward the achievement of the associated strategies. The Goal Allocations related list displays the percentage of demand's total cost and benefits allocated toward

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

achievement of goals associated with the demand. For more information, see Allocate or modify the strategy and goal percentage for a demand.

Recalculate and update cost field values in the Strategy and Goal Allocation tabs. Use the Recalculate Strategy and Goal Allocation related link to update the demand's total cost and benefits when strategy and goal allocations for the demand are changed. For more information, see Strategic Spend Tracking for PPM.

Note: These related lists and related links appears only when Strategic Spend Tracking for PPM is installed. This application is available on ServiceNow Store. You must switch to the **Strategic Alignment** view to see them. If these lists and links aren't available on the form view that you're using, ask your administrator to configure the demand form to add them. For more information, see Install Strategic Spend Tracking for PPM.

Add goal/target relationships

The Goal/Target Relationships related list displays the relationship between a goal and a planning item, strategic item, or any other item such as a demand.

Allocate funds

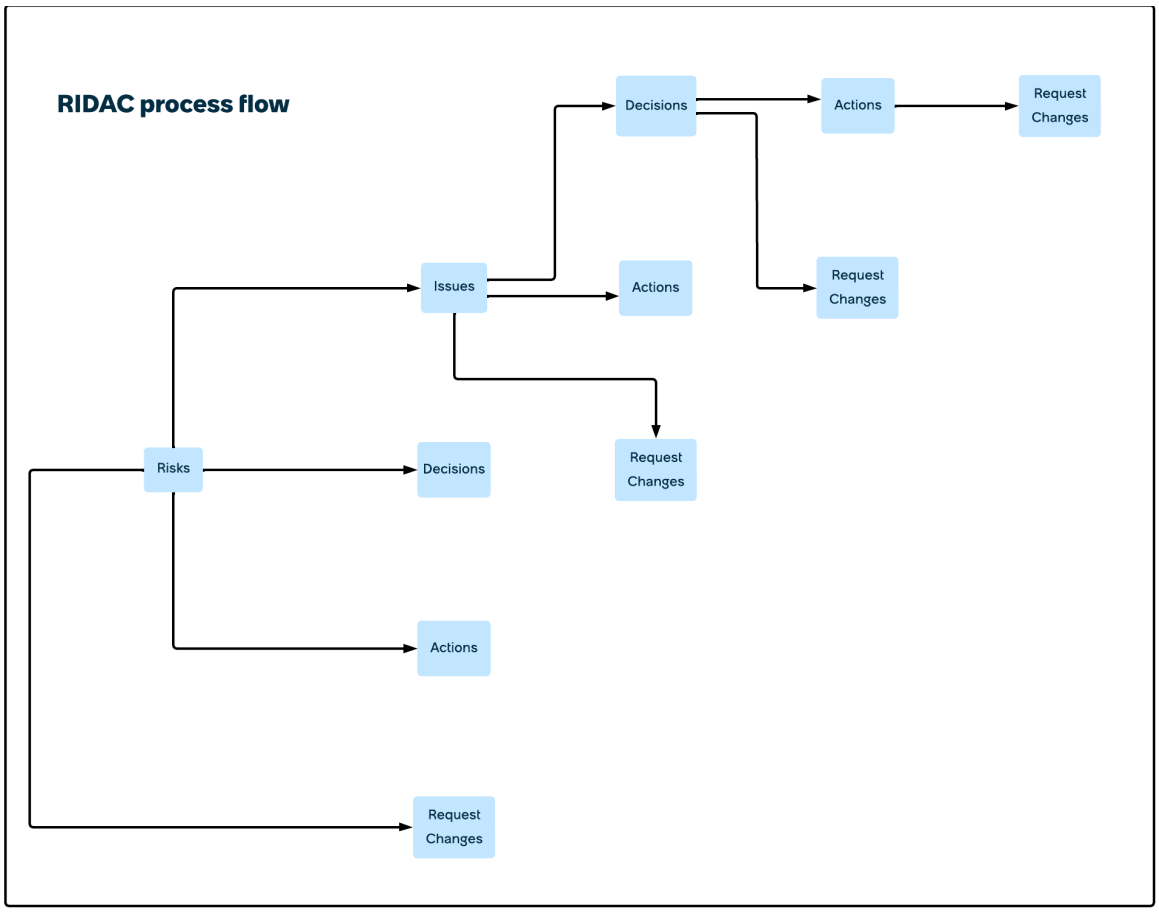
If your demand represents a significant, multi-year investment and you must distribute funding across related work, you can allocate funds from your demand. By allocating funds, you can directly support one or more projects, epics, or programs linked to the approved demand.

This link appears only if you have the Investment Funding plugin activated, an existing corresponding investment record for this demand, and the investment_user role.

RIDACs records for a demand

RIDAC is an acronym for Risk, Issue, Decision, Action, and Request Changes records. Create a risk for your demand that you can convert to other records during the demand life cycle. Track issues and avoid manual copying of relevant details in related records.

As a demand progresses through the demand life cycle, a risk might result in an issue or a new issue might occur. Once you have a risk record, you convert that record into related records such as issues, actions, or decisions. This conversion and association of records helps you analyze and identify patterns, trends, and probable resolution for planning future demands. The ability to convert records provides you with the following advantages:



- Ability to create related records without having to enter the relevant information manually.
- Helps you analyze and identify patterns, trends, and probable resolution for planning future demands.
- Enables you to view a consolidated list of all converted RIDAC records using the **View RIDAC** related link on the Demand form.

Consider the following points before converting or associating RIDAC records:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- You can convert one record to another only in the RIDAC sequence. For example, you can convert a risk to an issue, decision, action, or request change but you can't convert an issue to a risk or a decision to an issue. The following diagram illustrates the RIDAC process flow.

RIDAC flow

- You can convert one record into multiple RIDAC records. For example, you can create multiple issue records from one risk record.
- You can associate one record with multiple different records. For example, you can link one issue record to multiple different risk, decision, action, or request change records. For more information, see Associate existing RIDAC records for a demand.

Add risks for a demand

Add a risk to a demand to identify, analyze, prioritize, plan, and track a risk during any phase of the demand life cycle. Assess potential problems and the severity of their impact to take informed decisions about the demand.

Before you begin

Role required: it_demand_manager

About this task

A risk is any uncertain event that can potentially impact the success or outcome of a demand. For example, an incorrect estimate of factors like financial outlay or resource assignments can cause schedule slippage. Another example of a risk is a change in demand requirements. Recording risks ensures that decision makers have all relevant information when assessing a demand's progress. The demand risks are added to the parent program and portfolio.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Demand** > **Demands** > **All**.
2. Select the demand to which you want to add risks.
3. From the Risks related list, select **New**.
4. On the Risk form, fill in the fields.
   For a description of the field names, see Risk form.
5. Select **Submit**.

What to do next

- Convert an existing risk to an issue, decision, action, or request change and close the risk. For more information, see Convert one RIDAC record to another for a demand.
- Associate the risk with existing issues so you can track dependencies and recognize trends for the future. For more information, see Associate existing RIDAC records for a demand.

Configure a custom Risk rank and Risk value

Configure custom risk rank and value scores (such as High-Medium, Medium-Low, or Absolute-Low) to rate the impact and probability factors for a risk.

Before you begin

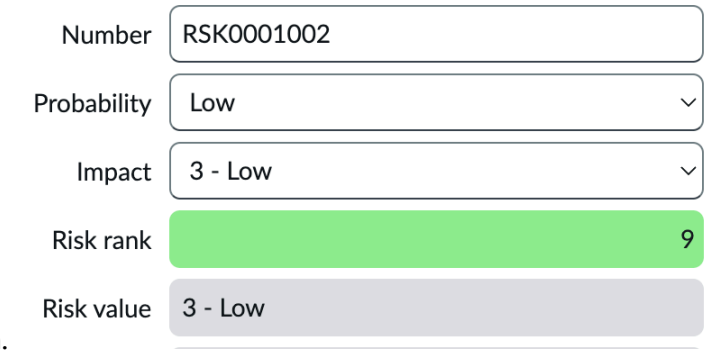
Role required: pps_admin

About this task

Use the Risk Value Lookup module to set up the risk rank and risk value for a specific combination of risk impact and probability. The system uses these values to determine the degree of risk (Absolute, High, Medium, Low) based on the impact and probability factors of a risk.

The value in the **Probability** field is multiplied by the value of the **Impact** field to generate the values for the **Risk rank** and corresponding **Risk value** in the Risk form.

By default, you can use the following impact, value, and probability scores for a risk to create a risk rank and risk value score:



- Absolute
- Low
- Medium or Moderate
- High

For example, a risk might have high probability and medium impact but you might want to consider it as an overall low risk for the demand. In that case, you would configure the Risk Value Matcher form with the following values:

- Impact = 2 Medium
- Risk Rank Color = Green
- Probability = High
- Probability Number = 1
- Risk Value = 3 Low

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following image illustrates a Risk

form.

Procedure

1. Navigate to **All** > **Project Administration** > **Settings** > **Risk Value Lookup**.
2. Select **New**.
3. On the risk value matcher form, fill in the fields.
   For a description of the field names, see Risk value matcher form.
4. Select **Submit**.

Add issues for a demand

Add an issue to a demand to escalate a risk or to track an unexpected problem. For example, a technical malfunction or resource unavailability that occurs during any phase of the demand life cycle. If the issue remains unresolved, unnecessary conflicts, delays, or even a failure can occur.

Before you begin

Role required: it_demand_manager

Procedure

1. Navigate to **All** > **Demand** > **Demands** > **All**.
2. Select the demand to which you want to add an issue.
3. From the Issues related list, select **New**.
4. On the Issue form, fill in the fields.
   For a description of the field names, see Issue form.
5. **Optional:** Search in the knowledge base for any article related to the issue.

   a. Select the search knowledge icon .

   b. If you find relevant articles, select the title of an article to view its content.

   c. If you want to include the content of the article in the issue, select **Attach to Issue**.
   The article content is copied in to the **Description** field of the Issue form. You can modify the text if necessary.

6. Select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

- Convert an existing issue to a decision, action, or request change and close the issue. For more information, see Convert one RIDAC record to another for a demand.
- Associate the issue with your existing risks so you can track dependencies and recognize trends for the future. For more information, see Associate existing RIDAC records for a demand.

Add decisions for a demand

As a demand manager, develop a plan to manage risks and issues proactively with solutions. Add the solution for a risk or issue to a demand in the form of a decision. You can also convert a risk or an issue to a decision or a decision to an action or a request change.

Before you begin

Role required: it_demand_manager

Procedure

1. Navigate to **All** > **Demand** > **Demands** > **All**.
2. Select the demand to which you want to add a decision.
3. From the Decisions related list, select **New**.
4. On the Decision form, fill in the fields.
   For a description of the field names, see Decision form.
5. **Optional:** Search in the knowledge base for any article related to the decision.

   a. Select the search knowledge icon  .

   b. If you find relevant articles, select the title of an article to view its content.

   c. If you want to include the content of the article in the issue, select **Attach to Decision**.
   The article content is copied in to the **Description** field of the Decision form. You can modify the text if necessary.

6. Select **Submit**.

What to do next

- Convert a decision to an action or request change and close the decision. For more information, see Convert one RIDAC record to another for a demand.
- Associate the decision with your existing issues and risks so you can track dependencies and recognize trends for the future. For more information, see Associate existing RIDAC records for a demand.

Add actions for a demand

Add actions that are required for resolving an issue or risk for a demand. You can also convert a risk, issue, or decision to an action based on your analysis and plan for resolution of a risk or issue.

Before you begin

Role required: it_demand_manager

About this task

After analyzing the risks and issues and taking a decision on how to manage those risks and issues, add an action for resolving the risk or issue.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Demand** > **Demands** > **All**.
2. Select the demand to which you want to add an action.
3. From the Actions related list, select **New**.
4. On the Action form, fill in the fields.
   For a description of the field names, see Action form.
5. **Optional:** If the action requires approval from other stakeholders, request approval with a due date using the **Approval** and **Due date** fields.
6. Select **Submit**.

What to do next

- Convert an action to a request change and close the action. For more information, see Convert one RIDAC record to another for a demand.
- Associate the action with your existing risk, issue, and decision records so you can track dependencies and recognize trends for the future. For more information, see Associate existing RIDAC records for a demand.

Add Request Changes to a demand

As a demand manager, you might create a request change as the outcome of the action taken to resolve an issue or mitigate a risk. The request change might result in changing the demand's scope, resource requirement, cost, or schedule to minimize the impact of a risk or issue.

Before you begin

Role required: it_demand_manager

Procedure

1. Navigate to **All** > **Demand** > **Demands** > **All**.
2. Select the demand to which you want to add a request change.
3. From the Request Changes related list, select **New**.
4. On the Request Change form, fill in the fields.
   For a description of the field names, see Request change form.
5. Select **Submit**.

What to do next

Associate the request change with your existing risk, issue, decision, and action records so you can track dependencies and recognize trends for future. For more information, see Associate existing RIDAC records for a demand.

Convert one RIDAC record to another for a demand

Convert one RIDAC record to another to retain record information and track issues without creating a record manually.

Before you begin

Role required: it_demand_manager

About this task

When you convert a RIDAC record to another record, the values for the **Short description**, **Requester**, and **Assigned to** fields are carried forward.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can also specify to close the parent record on creation of the new record instead of manually closing the parent record.

To view all converted RIDAC records, select the **View RIDAC** related link on the Demand form. You can also access this list from **View RIDAC** in the Demand module application navigator.

Procedure

1. Navigate to **All** > **Demand** > **Demands** > **All**.
2. Select the demand for which you want to convert a risk, issue, decision, action, or request change record to another RIDAC record.
3. From the Demand form related list, select the risk, issue, decision, action, or request change record to open the form view.
4. Select the **Convert to RIDAC** related link on the form.
5. **Optional:** On the Convert dialog box, from the select task type list, select the RIDAC record to which you want to convert the selected record.
   For example, if you wanted to convert a risk to an issue, you would select **Issue**.
6. **Optional:** Modify the text in the **Short description** field, which is copied from the parent record.
7. **Optional:** Change the default assignment copied from the parent record in the **Assigned to** field by selecting the lookup icon and selecting a different user.
8. **Optional:** If you want to close the parent RIDAC record on creation of the new record, select the close parent record option.
   The label of the close parent record option changes depending on the parent record type. For example, if the parent record is Risk and you're converting it to an issue record, the close record option would appear as **Close Risk**.
9. Select **OK**.

Associate existing RIDAC records for a demand

Link existing RIDAC records (risks, issues, actions, decisions, and request changes) to one another for your demand. Associating RIDAC records with each other enables you to keep a record of risks or issues and their outcome for analysis at demand closure and planning. It also helps to track the risks and issues throughout the demand life cycle.

Before you begin

Role required: it_demand_manager

About this task

You can associate one record with multiple different records. For example, you can link one issue record to multiple risk, decision, action, or request change records. Additionally, you can view the converted RIDAC records such as risks converted to issues, decisions, actions, and changes, using the View RIDAC related link.

Procedure

1. Navigate to **All** > **Demand** > **Demands** > **All**.
2. Select the demand for which you want to associate one RIDAC entry to another.
3. In the Demand form related list, select the RIDAC record.
4. On the form, select the **Associate RIDAC** related link.
5. In the Associate dialog box, from the Select type list, select the RIDAC record to which you want to associate the selected record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, if you wanted to associate a risk to an issue, you would select **Issue**.

6. Select the record number to which you want to associate the selected record from the Associate to list.
   For example, if you wanted to associate the selected risk to issue (ISU0010003), you would select **ISU0010003**.
7. Select **OK**.

Reset a demand to Draft state

A demand can be moved back to the Draft state, if necessary.

Before you begin
Role required: it_demand_manager

About this task
A demand can be reset to Draft from the Completed, Approved, Screening, or Submitted states. This option is unavailable after an artifact such as a project or enhancement is created, or if the demand is in the Qualified state.

Procedure

1. Navigate to **All** > **Demand** > **Demands** > **All**.
2. Open the required demand form.
3. Select **Reset to Draft**.
   A confirmation message appears if there are:
   - Active assessments pending with stakeholders, or
   - Resource assignments are created for the demand
4. Select the check box to replan the allocated resource plans that have no actual hours reported.
5. Select **OK**.

Result

- The demand is moved to the Draft state.
- All the score values in **Assessment Data** tab are reset to default.
- All active assessments for the demand are canceled. New assessments are triggered when the demand moves to the Screening state and if the **Assessment Required** field on the demand form is set to true.

Delete demands

Demands can be deleted only while in the *Pending* state.

Before you begin
Role required: it_demand_manager or it_demand_user

About this task
When you delete a demand, all data related to the demand, such as risks, demand tasks, requirements, and decisions are deleted. However, the stakeholders aren't deleted from the Stakeholder Register [dmn_stakeholders_register] table.

If a project is already created from a demand, its reference is removed from the project along with the data related to the demand. However, the project isn't deleted from the database.

To delete a demand:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

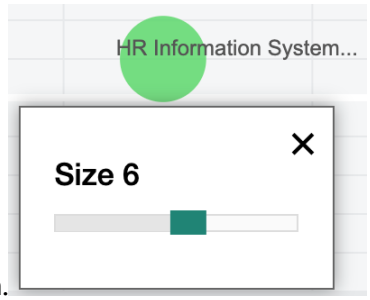
Procedure

1. Navigate to **All** > **Demand** > **Demands** > **All**.
2. Do:
   - Select the demand to open the demand form and then select **Delete**.
   - Select the check box next to the demand and then select **Delete** from the **Actions** list.

Move and resize a demand

As the demand manager, you can move and resize bubbles in the bubble chart.

Before you begin



Role required: it_demand_manager

About this task

Moving and resizing bubbles in the bubble chart updates the corresponding values for the demands in the list view.

Procedure

1. Select and drag a bubble left or right along the horizontal axis to decrease or increase the risk of the demand.
   The new risk for the demand is updated in the **Risk** column.
2. Select and drag a bubble up or down along the vertical or Y axis to increase or decrease the value of the demand.
   The new value for the demand is updated in the **Value** column.
3. Select a bubble to open a sizing window where you can increase or decrease the size of the bubble.

The new size of the demand is updated in the **Size** column.

Train the similarity solution for Demand Management to find similar demands

Train the Similar Demands solution definition is included within the Predictive Intelligence for PPM capability to find related demands when creating a demand.

Before you begin

Confirm that the Predictive Intelligence for Contextual Search plugin (com.snc.contextual_search_ml), PPM Standard plugin (com.snc.financial_planning_pmo), and Predictive Intelligence for PPM plugin (com.snc.ppm_ml) are activated. For more information about Predictive Intelligence, see Predictive Intelligence.

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Predictive Intelligence** > **Similarity** > **Solution Definitions**.
2. In the Similarity Definitions list, search for and select the Similar Demands solution definition (ml_sn_global_global_similar_demands).
3. On the Similarity Definition form, verify the default field values for demands.
   For more information about the Similarity Definition form fields, see Create and train a similarity solution.
4. Select **Update & Retrain**.
5. Open the Similarity Definition form for the Similar Demands solution definition (ml_sn_global_global_similar_demands).
6. In the ML Solutions related list, view the training solution progress in the **Progress** column.

> **Note:** Alternatively, you can select the link for the solution in the **Active** column. On the ML Solution form, select the **Show training progress** related link to check the training solution progress.

Result

When the solution is complete, the similar demands appear in the Similar demands section on the Demand form.

What to do next

- Review similarity examples: On the Similarity Definition form, in the ML Solutions related list, when **Progress** is 100%, in the **Active** column, select the link for the solution. On the ML Solution form, select the **Similarity Examples** related link to view the Similarity Examples list.
- Update the similarity score threshold: On the ML Solution form, on the **Solution Statistics** tab, enter the required value in the **Similarity Score Threshold** field. Right-click the ML Solution form and select **Save**.
- Test the prediction output for the records: On the ML Solution form, on the **Test solution** tab, enter your text in the **Short description** field and the maximum number of expected results in the **Top N** field, and then select **Run test**. The results above the similarity score threshold value are displayed.

The use case set up window opens displaying the name and description of the use case.

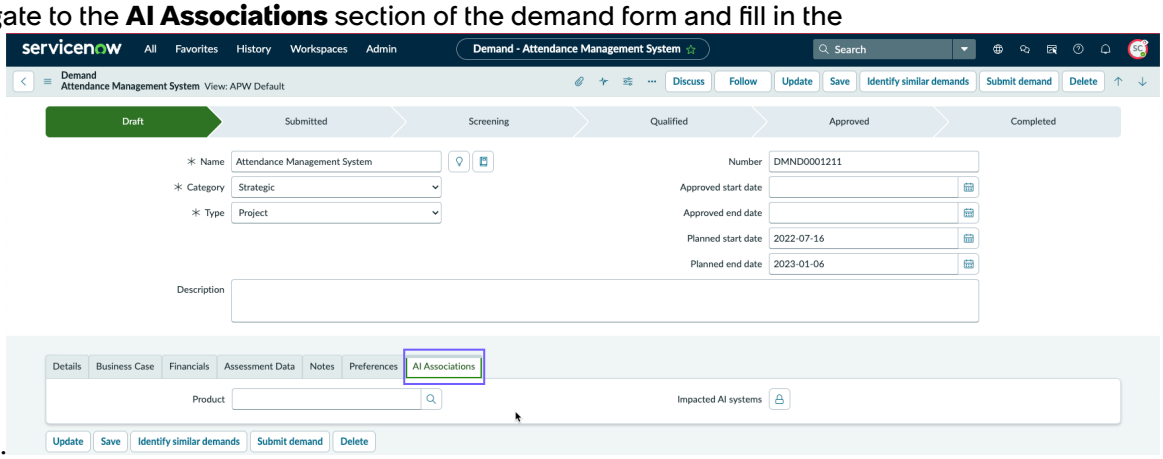
4. Click **Take me there**.
   The **ServiceNow Machine Learning Solutions** page opens and displays all the available solutions.
5. Expand the **Similarity** solution to see the available solution definitions.
   Configure or train the **Similarity** solution for finding similar demands.
   - To configure the Similar Demands solution definition (ml_sn_global_global_similar_demands), click **Configure**. For more information, see Train the similarity solution for Demand Management to find similar demands.
   - To train the Similar Demands solution definition (ml_sn_global_global_similar_demands), click **Train**.

Associate AI systems with demands

Add and manage AI system associations directly from the **AI Associations** tab in Demand Management.

Before you begin

- The AI Control Tower plugin must be installed. For more information, see Activation and installation of AI Control Tower.
- The investment type of the demand is set to artificial intelligence.
- Role required: it_demand_user, it_demand_manager



About this task

Add and manage AI system associations directly from the AI Associations tab in a demand form.

You can select the impacted AI systems for the demand. If the required AI systems aren't available, you can create AI systems using the **Create AI System** related link directly within the demand workflow. You're navigated to the AI Control Tower to create the AI system. The created AI system is then available for selection in the **Impacted AI Systems** list on the demand form.

Procedure

1. Access the demand form in one of the following ways.
   - Navigate to **All** > **Demand** > **Demands** > **Create New**.
   - Navigate to **All** > **Demand** > **Demands** > **All** and select a demand.
2. Navigate to the **AI Associations** section of the demand form and fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Associations section

Field	Description
Product	Product or system that the demand relates to.
Impacted AI systems	Impacted AI systems associated with the demand. You can select existing AI systems from the list or remove systems that are no longer relevant.

3. Save the demand by selecting **Save**.
4. **Optional:** Select the **Create AI System** related link to create an AI system in the AI Control Tower.

   Note: This related link is available for users with the sn_ai_steward role.

   For more information on creating AI systems, see Create AI system assets.

Work with demands in Employee Slate

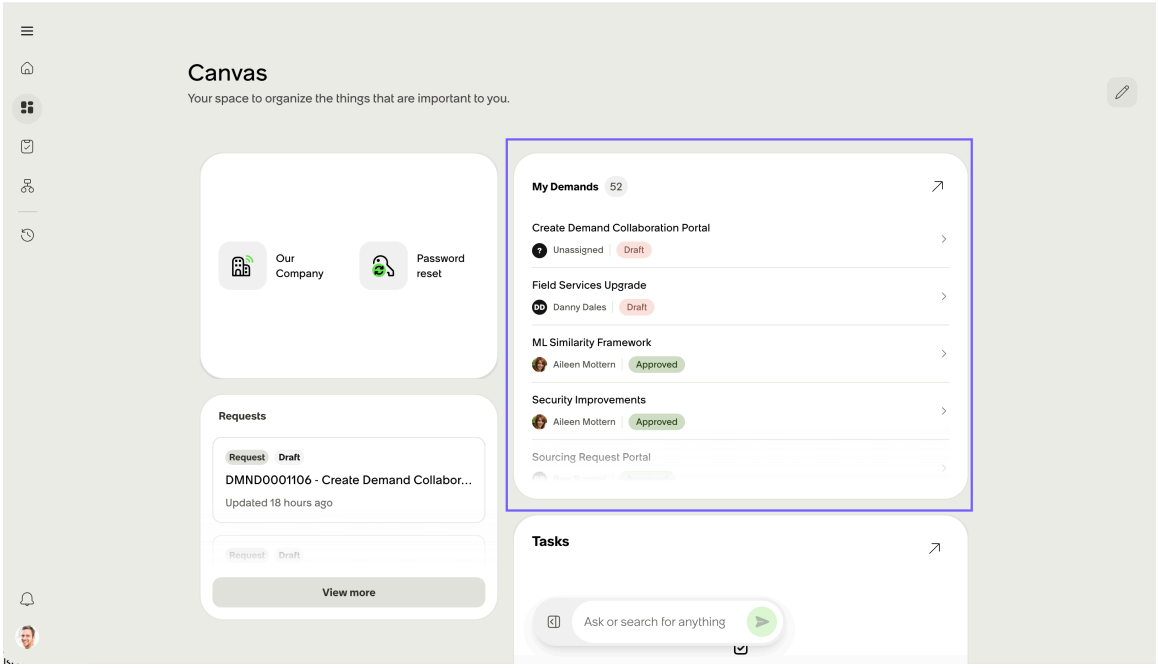
The My Demands widget and conversational experience in Employee Slate brings demand creation and tracking into a single, conversation-first workspace. Requesters can create demands through the conversational experience and track them using widgets.

Employee Slate is a conversation-first employee experience that combines intelligent assistance, employee communication, organizational navigation, task management, and other employee services to boost productivity. With the My Demands widget and conversational experience, the demand experience enables requesters to track demand status, activity, and progress in the same place they do other work. For more information about Employee Slate, see ServiceNow EmployeeWorks Web App.

Demands are available in Employee Slate if both Project Workspace and Employee Slate Core apps are installed.

Create demands with conversational experience

You can create a demand through an Employee Slate conversation. Include relevant business context in your message if you have it. For example, enter a message such as "Upgrade system software." The relevant demand catalog items are identified and a demand form opens. If you include relevant business context in your message, matching fields (such as Business Case) are prepopulated on the form. If you don't include business context, the fields remain empty.



After the demand record is created, you can track the new demand from the My Demands and Requests widgets on your canvas. You can also track the status of the demand through the conversational experience by just asking about the state.

Track demands with My Demands widget

The My Demands widget is a card on the Employee Slate canvas. It lists your ten most recently updated demands with a total count of your demands next to the **My Demands** heading. Each demand in the list appears as a row with its demand title, assignee avatar and name, and a color-coded status badge. If the demand does not have an assigned demand manager, the icon and label indicates it as unassigned.

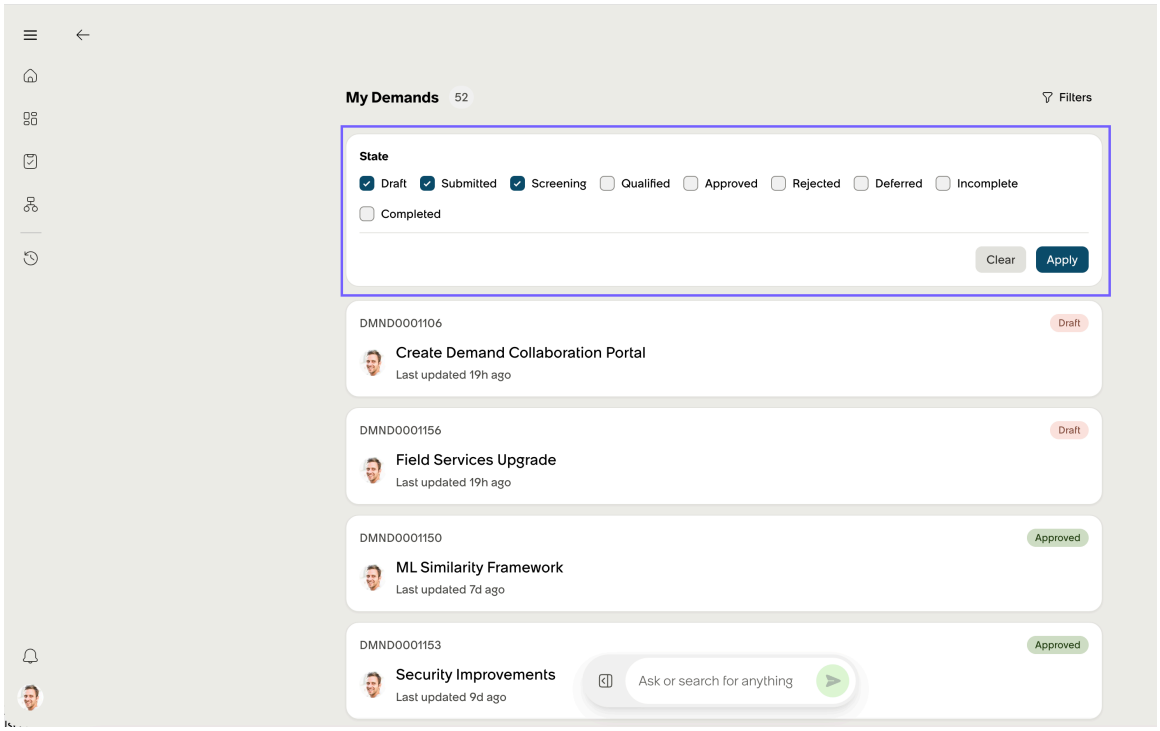
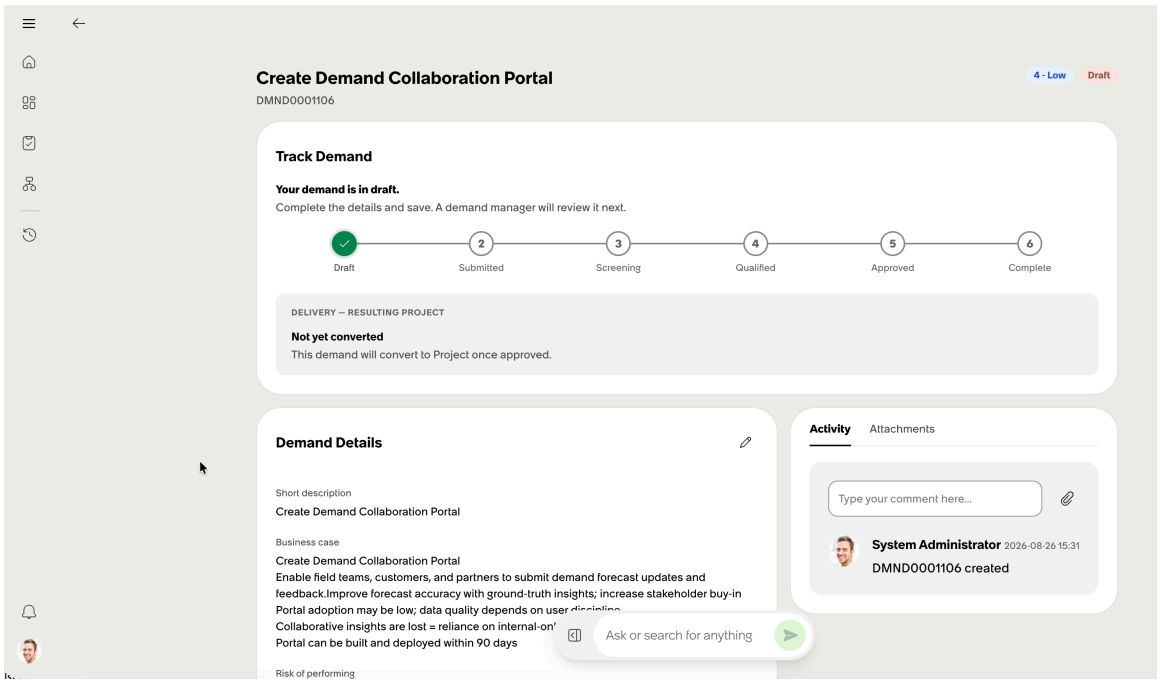
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The widget is available in the canvas widget library. Add it to your canvas; it is retained for future sessions. For more information about how to add widgets to your canvas, see Customize canvas widgets.



The My Demands widget provides the following benefits:

- A unified requester experience for tracking demands alongside other Employee Slate requests.
- Improved transparency into demand lifecycle status, without needing to contact a demand manager.
- Faster collaboration when a demand manager requests for more information.



Select the Open full list icon on the widget to view the entire list of your demands or select an individual demand row to open its details page. You can filter demands by their state in the full list view and open a demand record by selecting it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A demand record page includes demand details, demand status tracker, delivery information, activity notes, and attachments. The Activity tab shows a chronological history of demand manager updates, state changes, and information requests. The Attachments tab lists the files associated with the demand. The demand fields shown are configurable by admin users. For more information, see Configure the demand details fields in Employee Slate.

The current state of the demand is highlighted. The delivery information indicates whether the demand is converted to a work item. After conversion, the card shows the resulting work item's name, type, state, planned or actual end date, and when it was last updated. For more information about demand states, see Demand Management process flow.

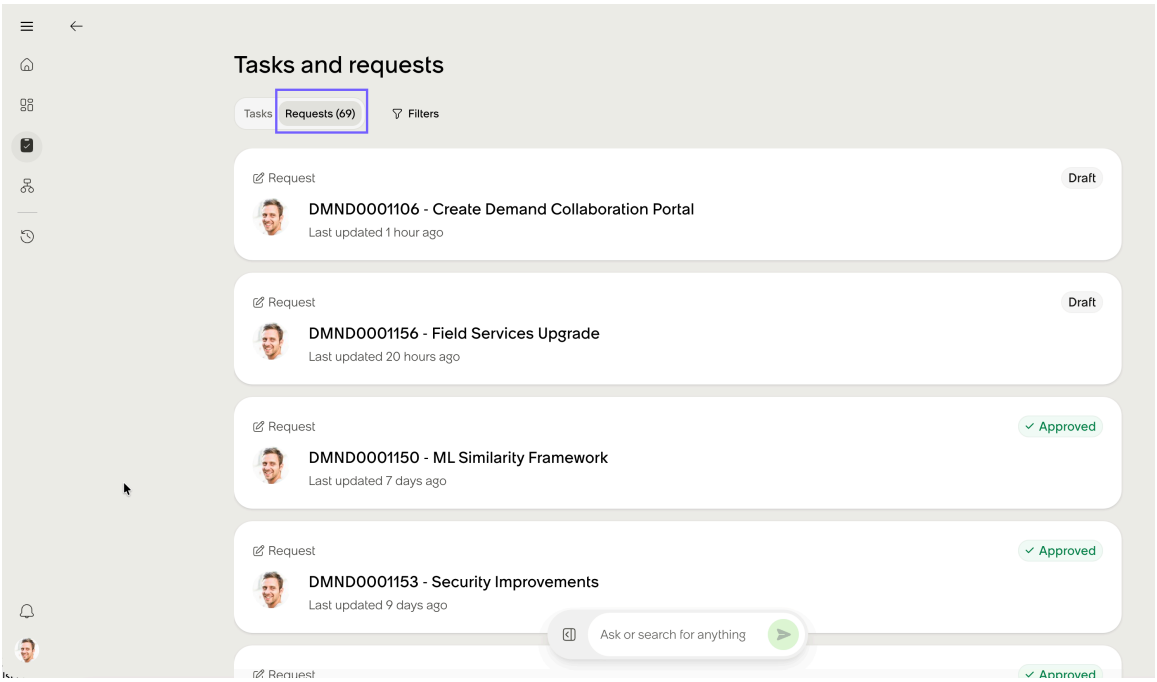
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



You can edit the demand values only while the demand is in the Draft state. After you submit a demand, you can no longer edit its field values, but you can still add activity notes and attachments. See Edit a draft demand in Employee Slate.

Track demands with Requests widget

Demands also appear in the standard Requests widget, alongside your other requests. Selecting **View more** takes you to the Requests list. You can find your demands in this list even if you have not added the My Demands widget to your canvas.

You can also view and edit demands by selecting a demand from the list.

Edit a draft demand in Employee Slate

Update the details of a draft demand in Employee Slate before submitting it for a demand manager's review.

Before you begin

Project Workspace and Employee Slate Core apps are installed.

Role required: snc_internal

Procedure

1. Navigate to **Employee Slate** > **Canvas**.
2. Open a demand from **My Demands** or **Requests**.

Goal	Action
From My Demands	○ Open a demand directly from the widget — select an individual demand row to open its details page. ○ Open a demand from the full list. **a.** Select the Open full list icon. **b.** Select a demand from the list.
From Requests	○ Open a demand directly from the widget — select an individual demand row to open its details page. ○ Open a demand from the Requests list. **a.** Select the **View more** option. **b.** Select a demand from the list.

3. In the Demand Details section, select the Edit icon.
4. Update the fields.
   For information on the field values, see Demand form.
5. Select **Save**.

Result

After you submit the demand, the fields are set to read-only. You can still add comments and attachments.

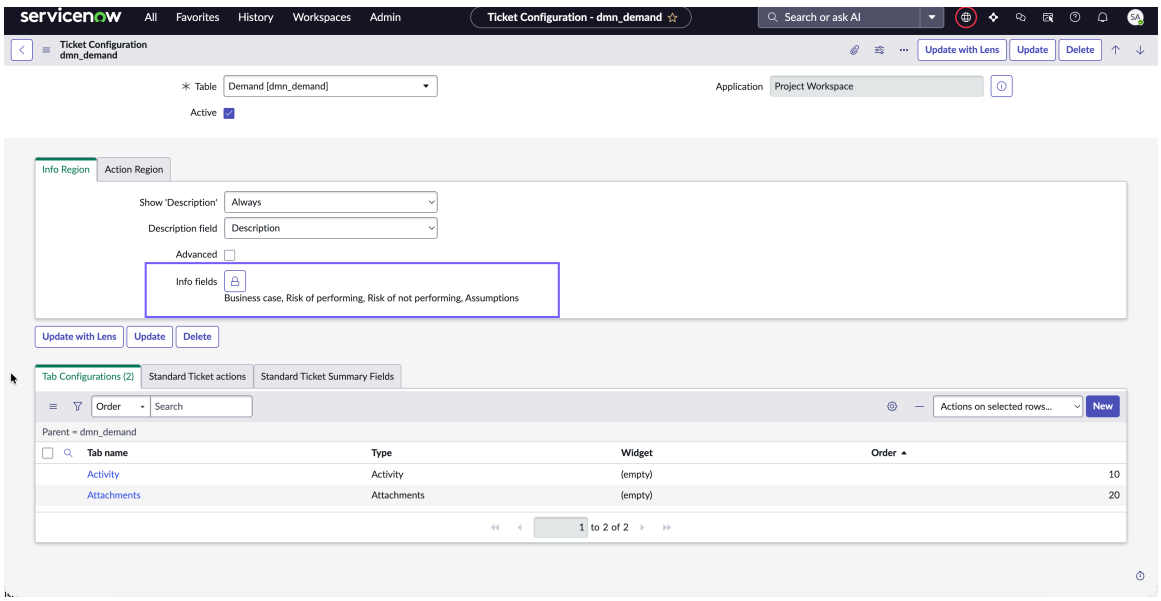
Configure the demand details fields in Employee Slate

Configure the fields that appear in the demand details ticket page in Employee Slate.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



About this task

The demand details ticket page is predefined. Administrators can modify it according to their use cases. By default, the following fields appear on the demand details ticket page in Employee Slate.

- Business case
- Risk of performing
- Risk of not performing
- Assumptions

Procedure

1. Navigate to **All** > **Standard Ticket** > **Standard Ticket Configuration**.
2. Select the dmn_demand record.
3. Select the Unlock Info fields icon beside **Info fields**.

4. Add or remove fields by selecting the **Add item** or **Remove item** arrows.
5. Reorder the fields by selecting the **Move up** or **Move down** arrows.
6. Select the Lock Info fields icon.
7. Select **Update**.

Demand Management reference

Reference information to provide additional details about Demand Management such as the fields, user roles, tables, guidelines, and domain separation information.

Demand tasks

A demand task is a unit of work created within a demand. Use demand tasks to break down planning activities before converting the demand into a project, change, enhancement, or defect.

You can create a demand task from the **Demand Tasks** related list to delegate activities that are helpful for assessing demand feasibility. Demand tasks differ from project tasks in the following aspects:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Planned dates, actual dates, and original dates are part of project tasks not demand tasks.
- The due date indicates the date on which the task is targeted for completion and doesn't affect the demand workflow. Project tasks, however, affect the project completion dates if the planned dates and actual dates are changed.
- Don't support the creation of nested demand tasks.
- Don't support task constraints such as the settings Start ASAP and Start on a specific date.
- Don't support an execution type such as Agile, Waterfall, or Hybrid.

Resource assignment

Assign resources for a demand task using the **Assigned to**, **Additional Assignee list**, and **Assignment Group** fields. Don't create and use resource assignments to allocate resources or groups to a demand task or submit the time spent on the demand. If you associate a resource assignment with a demand task, the associated resource plan isn't transferred to the work entity created from that demand.

Resource assignments aren't associated with the demand by default. Don't use resource assignments created for the future work entity to submit time spent on a demand.

When you submit a time card for a demand, the time and cost incurred aren't transferred to the work entity created from the demand. The time and cost remain within the demand as the demand cost and effort.

Resources assigned to a demand task can submit the time spent on it using a time card. For more information, see Submit a time card for a demand task.

Actual cost and effort for a demand task

The actual effort of the work performed on the demand task is derived from the time card. The actual cost is derived from the hourly resource rate defined in the rate model, default labor rate, or default system property. The actual cost and effort for a demand task are then rolled up to derive the actual cost and effort for the associated demand. For more information, see Actual cost and effort calculation for a demand and demand task.

Add work items to a Demand

Based on the selected demand task category and role assigned to you, you can use the demand task form to:

- Add a cost plan to a Demand
- Add a resource assignment to a Demand
- Add a benefit plan to a Demand
- Add risks to a Demand

Actual cost and effort calculation for demands

The actual cost and effort are realized cost incurred and time spent for the work performed on a demand and demand task during a specific time period. Calculations are based on approved time cards and the hourly rate for each resource. The hourly rate determines how actual cost and effort vary.

Working on a demand task and demand involves cost and time, which add to the overall expenditure of converting a demand to a product, feature, or enhancement. Demand managers must therefore know the actual cost and effort incurred in assessing and planning activities for a

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

demand. The calculation for actual cost is derived by multiplying the hours reported in the time card by the hourly rate of the resource. The actual effort for a demand task is calculated based on the hours reported in the time card.

The actual effort and cost for the demand tasks are then rolled up for calculating the actual effort and cost for the demand. The calculation of the actual cost and hourly rate for a resource is derived as follows:

- If a rate model is associated with the demand, the actual cost is calculated based on the hourly rate defined in the rate model.
- If a rate model is absent or if an hourly rate isn't found in the rate model, then the hourly rate is derived from the default labor rate.
- If an hourly rate isn't found in the default labor rate, then the hourly rate is derived from the default system property.

Don't create and use resource assignments for allocating resources or groups to a demand task. The resource assignments that you create in the demand are used for the resource estimation of the work entity that would be created from the demand. These resource assignments are automatically moved to the resulting work entity when a demand is qualified and converted.

When you submit a time card for a demand, the actual effort and cost aren't reflected in the resource assignment. Resource assignments aren't associated with the demand by default. The actual cost and actual effort remain with the demand. They aren't transferred to the project created from the demand, even if you manually associate a resource assignment with the demand.

If a resource spends extra hours working on a demand that aren't associated with demand tasks, then this time must also be recorded. The resource submits the time card for recording the extra hours spent on the demand using the Time Sheet Portal. This extra cost and effort is added to the demand but isn't reflected in the actual cost and effort for the demand tasks.

The actual cost and actual effort for the demand as derived from the time card data is added to the total actual cost and effort for the demand tasks. The values in the **Demand Actual Cost** and **Demand Actual Effort** fields are calculated as follows:

- Demand Actual Cost: actual cost of all the demand tasks + actual cost of extra activities
- Demand Actual Effort: actual effort of all the demand tasks + actual effort of extra activities

If a demand has no task or assigned resource, you can capture the actual cost by submitting a time card against the demand. Once the time card is approved, an expense line is created on the demand. The expense line is then processed and the actual cost of work for that time card is rolled up to the demand into the Demand Actual Cost column.

The following example demonstrates the actual cost and effort calculation for a demand task and its rollup to the demand.

Example: Actual cost and effort calculation based on the demand tasks

For a demand (D1), the demand manager delegates activities such as initial assessment, cost estimate, and effort estimate. To delegate these activities, the demand manager creates three demand tasks (DT1, DT2, and DT3) and assigns resources R1, R2, and R3 to each demand task respectively.

The hourly rate defined for the resources in the rate model, default labor rate, and default system property are listed in the following table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Hourly resource rate

Resource	Hourly rate in the rate model	Hourly rate in the default labor rate	Hourly rate in the system property
R1	$200	$150	$50
R2	$250	$200	$50
R3	$150	$100	$50

Each resource spends a total of eight hours while working on the assigned demand task and submits a time card.

Actual cost and effort calculation for demand task: The demand task actual cost and effort are calculated and displayed on the **Demand Task** form. The totals differ depending on the method used to derive them.

Scenario 1 shows how the total is calculated if the resource hourly rate is derived from the rate model.

Rate derived from the rate model

Actuals	Demand task DT1	Demand task DT2	Demand task DT3
Actual effort	8 hours	8 hours	8 hours
Actual cost	200 * 8 = $1600	250 * 8 = $2000	150 * 8 = $1200

Scenario 2 shows how the total is calculated when the rate model isn't associated with the demand. In this case, the resource hourly rate is derived from the default labor rate.

Rate derived from the default labor rate

Actuals	Demand task DT1	Demand task DT2	Demand task DT3
Actual effort	8 hours	8 hours	8 hours
Actual cost	150 * 8 = $1200	200 * 8 = $1600	100 * 8 = $800

Scenario 3 shows how the total is calculated when the rate model isn't associated with the demand. In this case, the resource hourly rate is derived from the default system property.

Rate derived from the default system property

Actuals	Demand task DT1	Demand task DT2	Demand task DT3
Actual effort	8 hours	8 hours	8 hours
Actual cost	50 * 8 = $400	50 * 8 = $400	50 * 8 = $400

Example: Actual cost and effort roll up to a demand

The **Demand Actual Cost** and **Demand Actual Effort** fields on the Financials tab of the Demand form are populated with the sum of actual costs and actual effort of all the demand tasks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. If the resource rate for the demand task is derived from the rate model (Scenario 1), the value in the Demand Actual Cost field is displayed as $4800. The value in the Demand Actual Effort field is displayed as 24 hours.
2. If the resource rate for the demand task is derived from the default labor rate (Scenario 2), the **Demand Actual Cost** field displays $3600. The **Demand Actual Effort** field displays 24 hours.
3. If the resource rate for demand task is derived from the default system property (Scenario 3), the value in the Demand Actual Cost field is displayed as $1200. The value in the Demand Actual Effort field is displayed as 24 hours.

Demand Management key terms

Important terms in Demand Management are listed in the table.

Demand Management Key Terms

Term	Description
Portfolio	A collection of demands managed as a group to achieve strategic and operational objectives.
Assessable record	A demand record that you want to evaluate for metric type demand. You evaluate the assessable records with metric categories and metrics, which define traits and values to assess.
Metric	A trait or value used to evaluate assessable records. A metric can measure subjective values in an assessment questionnaire or gather objective values in a database query run by a script. Examples of metrics include perceived value of demands and return on investment for a demand.
Metric type	A characteristic that defines a set of records you want to evaluate. Demand management comes with the metric type demand, which uses records from the Demand [dmn_demand] table.
Metric category	A theme for evaluating assessable records. Categories contain one or more individual metrics, which define specific traits or values that comprise the theme. Examples of categories include return on investment and cost. Set filter conditions to control which assessable records to evaluate for the metrics in a category.
Stakeholder	A person affected by the demand or who has interest in the demand.
Scorecard	A visual breakdown on performance of an assessable record based on assessment results. Use scorecards to view various data summaries for one assessable record and to compare the ratings with other assessable records.
Requirement	An extra item that must be present or an extra action item that must be finished before a demand request closes.

Demand Management Key Terms (continued)

Term	Description
Demand Task	A unit of work, created within a demand, to break down initial planning activities before converting the demand into a project. A demand task isn't a planned task like a project task.

Inputs for AI skills

Learn about the inputs of each skill for the ServiceNow Otto for Strategic Portfolio Management application. By configuring the inputs for a skill, you can determine how and when a skill is used.

AI skill inputs overview

Depending on the selected skill, you can configure inputs. These settings determine how a skill is used. An input identifies the data that is used for a skill, such as the table and fields that are used to generate a demand summary. If you have the admin role and any input fields are editable, you can modify the input data for a skill.

Demand summarization skill inputs

The demand summarization skill includes the inputs that identify the table along with the fields and related lists that are used to generate the demand summary. The following table provides more details on the input data.

Input data for the demand summarization skill

Input	Description
Table	Demand [dmn_demand]
Fields	• Short description • Category • Type • Description • Investment Class • Investment Type • Submitted by • Demand manager • Expense type • Priority • Department • Business Unit • Business Capabilities • Impacted Business Applications • Risk of performing • Risk of not performing • Enablers

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

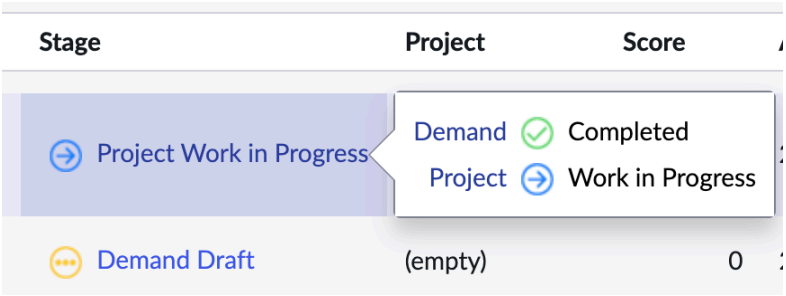
Input data for the demand summarization skill (continued)

Input	Description
	• Barriers • In scope • Out of scope • Assumptions • Capital expense • Operating expense • Total planned cost • Financial return • Financial benefit • Capital budget • Operating budget • Impact • Risk • T-Shirt size • Value • Size • Score • Start date • Due date • Approved start date • Approved end date • Business case
Related lists	• Work notes • Demand tasks • Cost plans • Monetary benefit plans • Non-monetary benefit plans • Resource assignments

Stage fields

The Stage field on the Ideas list displays the current state of an idea as it moves through the demand life cycle. The current state includes from an idea to a demand and then to the resulting project, enhancement, change, or defect.

The result of an idea depends on the initial settings in the **Category** and **Type** fields on the Demand form. The **Stage** field also appears on the Demands list. The **Stage** field is a display only field and can't be searched or sorted.



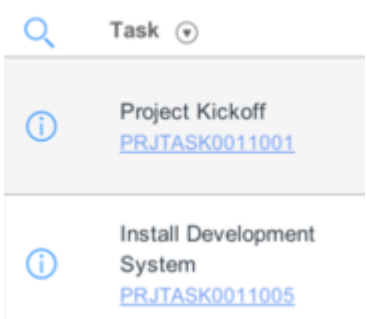
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important: The **Stage** fields are no longer available starting from the New York release. Any instance provisioned in New York or later won't have a Stage field on the Idea table. However, the **Stage** fields are available if you're upgrading from an older release to New York or later.

A new idea is created in the **Submitted** state. An accepted idea is updated to the **Accepted** state and a deferred idea is updated to the **Skipped** state. When a demand is closed, the associated idea is marked as **Complete**.

Hovering over the **Stage** field displays a pop-up window that shows the progression of the idea along with the value of the **State** field for each step in the progression.

- **Idea:** if an idea is being evaluated, the pop-up window displays the current state of the idea.
- **Demand:** if an idea is promoted to a demand, the pop-up window displays the current state of the demand as well as the idea.
- **Project**, **Enhancement**, **Change**, or **Defect**: if a demand is accepted, the pop-up window displays the current state of the resulting project, enhancement, change, or defect in addition to the demand and idea.



Composite Fields

A composite field combines information from two fields in a table to form a single field.

For example, the **Task** field on the Project Tasks list displays the short description and the project task number. The short description appears above the project task number. The project task number appears and is a link to the Project Task form.

Composite field

Use a composite field

- Editing a composite field changes the short description. Editing the short description changes the composite field.
- Sorting on a composite field is based only on the short description and not the number.
- Searching on a composite field is enabled for both the short description and the number:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To search by the number using the list header, enter an asterisk (*) before the search term. For example, *PRJTASK0010016.
- To search by the number using the filter, create a condition similar to: [Task] [contains] [PRJTASK0010016].

Domain separation and Demand Management

Domain separation is supported in Demand Management. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

Data fields migrated from demand to EAP entity (continued)

Field type	Description
	• Program • Total planned cost • Investment Class • Portfolio • Investment Type • ROI % • Rate Model • Model ID • Expense type • Financial benefit
Resource assignments	The resource assignments of a demand are migrated to the created entity.
Financial records	Cost plans and breakdowns, benefit plans and breakdowns (monetary and non-monetary), and investment budgets are migrated to the created entity.
Attachments	Demand attachments.
Goal/target relationships	Goal/target relationships of the demand.

Demand Management forms

Field information for forms used in the Demand Management application.

Action form

Use an action form to add an action to a demand.

Action form

Field	Description
Number	System-generated number with a configurable prefix.
State	Current state of the action. All new action records are created with the state set to Open. The available states are: Pending, Open, Work in Progress, Closed Complete, Closed Incomplete, and Closed Skipped
Priority	Urgency for implementing or approving the action based on impact.
Estimated Cost	Estimated cost the action generates.
Impact	The impact on the outcome of the demand if you don't implement the action.
Approval	Status of approval from the stakeholders for the action. The available options are: Not Yet Requested, Requested, Approved, and Rejected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Action form (continued)

Field	Description
Assigned to	Primary resource assigned to implement the action.
Due date	Requested date on which the action must be approved or implemented.
Parent	The demand to which this action belongs.
Short description	Brief description of the action such as what the action entails, how to implement the action, who it affects, and the action outcome. Select the Suggestion icon  to select a description from the list of predefined actions.
Description	Details of the action and its potential impact.
Work notes	Information about the action. Add work notes to communicate about the status of action approval, rejection, or implementation with other users.

Cost plan form

Use the cost plan form to capture the costs of demands.

Cost plan form

Field	Description
Name	Descriptive name for the cost plan.
Project/ Demand	Demand number to which the cost plan belongs.
Start fiscal period	Starting fiscal period. When you change the start fiscal period, the associated cost breakdown values also change.
End fiscal period	Ending fiscal period. When you change the end fiscal period, the associated cost breakdown values also change.
Group	This field is a read-only field.

Financials section of the Cost plan form

Field	Description
Entered currency	Currency for the cost plan. If the selected currency is different from the default currency configured in the Financial Management application, the budget reference rate is used to calculate the cost of the demand.
Unit cost	Cost of single unit of the resource.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Financials section of the Cost plan form (continued)

Field	Description
Quantity	Quantity of resource required.
Recurring	Indicates if the cost is recurring for each fiscal period. **Quantity** x **Unit cost** value is incurred for every fiscal period.
Cost type	Cost type of the plan. See Create a cost type definition.
Investment	Name of the investment created for the project. This field appears only if the legacy Investment Funding (com.snc.investment_funding) plugin is activated or the Investment Funding (sn_invst_pln) application is installed.
Source type	Funding entity to associated with the project investment for funding. This field appears only if the legacy Investment Funding (com.snc.investment_funding) plugin is activated or the Investment Funding (sn_invst_pln) application is installed.
Source	Funding entity value from which you request fund. The field is available when you select a value in the Source type field. This field appears only if the legacy Investment Funding (com.snc.investment_funding) plugin is activated or the Investment Funding (sn_invst_pln) application is installed.
Total planned cost	Total planned costs of the cost plan. If the cost is recurring, the calculation is **Quantity** x **Unit cost** x **number of fiscal periods**. If the cost is non-recurring, the calculation is **Quantity** x **Unit cost**. This value is rolled up from cost breakdown.
Functional currency	The default currency configured in the Financial Management application and used for managing the demand or project.
Cost in functional currency	The total planned cost for the demand in functional currency. The value in this field

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Financials section of the Cost plan form (continued)

Field	Description
	changes if the **Entered currency** is different from the functional currency.
Total actual cost	Total actual costs of the cost plan. This value is rolled up from cost breakdown.

Decision form

Use a decision form to add a decision to a demand.

Decision form

Field	Description
Number	System-generated ID number with a configurable prefix.
State	Current state of the decision. All new decision records are created with Open state. The available states are: Pending, Open, Work in Progress, Closed Complete, Closed Incomplete, and Closed Skipped
Priority	Urgency of approving or implementing the decision based on possible impact.
Decision status	Status of the decision. The available options are: Pending, Approved, and Rejected.
Impact	Impact on the outcome of the demand if you don't implement the decision.
Approval required	Option for determining whether approval of the decision is required.
Estimated Cost	Estimated cost of implementing the decision.
Due date	Requested date on which the decision must be approved or implemented.
Assigned to	Primary resource assigned to work on the decision. The default value is the name of the user creating the decision record.
Parent	Demand number to which this decision belongs.
Short description	Brief description of the decision such as what the decision is about, who made it, what it affects, and the decision outcome. As you start entering the title for your decision, related decisions that potentially match your decision are displayed. Select the Suggestion icon () to select a description from the list of predefined decision descriptions.
Description	Details of the decision and its potential impact.
Work notes	Information to record and track the status of decision implementation or approvals.

Demand Budget form

Use the Demand Budget form to allocate a budget to your demand.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Demand Budget form

Field	Description
Fiscal Year	The fiscal year for which you want to set the budget for the demand.
Currency	Currency in which you want to allocate the budget for the demand. If the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin is active, then you can allocate the budget in demand currency or functional currency.
Capex Budget in Demand Currency	Planned expense amount allocated for capital expenditure in the selected currency.
Opex Budget in Demand Currency	Operating expense amount in the selected currency.
Total Budget in Demand Currency	Sum of Capex and Opex amounts.

Demand form

The demand form information is used to create a demand.

Demand form fields

Field	Description
Name	Name of the demand.
Category	Category of the demand: • Strategic: For demands for plans, such as projects or stories. These demands go through strategic evaluation and prioritization regardless of scope, from large initiatives, such as a project or epic, to smaller, well-defined changes, such as a story. • Operational: For demands for operational work, such as changes or defects. These demands address business-as-usual work that doesn't require strategic evaluation or prioritization.
Type	The **Category** field selection determines the selections available in the **Type** field. • The following demand types are available if the demand category is Strategic: ○ Continual Improvement Management ○ Enhancement ○ Project ○ Epic ○ Story ○ EAP Epic ○ EAP Feature

© 2026 ServiceNow, Inc. All rights reserved.

Demand form fields (continued)

Field	Description
	○ EAP Capability ○ SAFe Epic ○ SAFe Story ○ SAFe Feature ○ No Conversion • The following demand types are available if the category is Operational: ○ Change ○ Defect ○ No Conversion If the Agile Development 2.0 application is active, the Story, Epic, Enhancement, and Defect options are available. If the Strategic Planning application is active, the EAP Epic, EAP Feature, and EAP Capability options are available. If the Essential SAFe or Portfolio SAFe features are active, the SAFe Story, SAFe Feature, and SAFe Epic options are available. The No Conversion option enables you to use your demand to fund a large project that includes one or more projects, epic, or programs. A story represents a smaller strategic change that a product manager has scoped narrowly enough that it doesn't need further decomposition into an epic with child stories. The selections in the **Category** and **Type** field also determine the fields that are displayed in the Assessment Data section.
Project	Name of the project created from this demand. This read-only field is visible only when you convert the demand into a project.
Enhancement	Number of the enhancement created from this demand. This read-only field is visible only when you convert the demand into an enhancement.
Epic	Name of the epic created from this demand. This read-only field is visible only when you convert the demand into an epic.
Story	Name of the story created from this demand. This read-only field is visible only when you convert the demand into a story.
Number	Unique, auto-generated identification number for the demand.
Approved start date	The formal date approved by stakeholders for starting the demand. This date is set after prioritization and stakeholder approval and represents the committed and authorized timeline for execution. It's used for governance and traceability.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Demand form fields (continued)

Field	Description
	For example, the approved date to start the database upgrade is 2026-01-10. This field is carried forward to the **Approved start date** field of the Project form if the demand is converted to a project and remains unchanged, even if the project starts later. This field is highlighted in red if the date is different than the value in the **Start date** field. **Note:** If this field is empty while creating a demand, the date from the **Start date** field is inserted.
Approved end date	The formal date approved by stakeholders for completing the demand. This date is set after prioritization and stakeholder approval and defines the approved execution window and supports historical tracking. For example, the approved end date to complete the demand is 2026-02-15. This field is carried forward to the **Approved end date** field of the Project form if the demand is converted to a project and remains unchanged, even if the project ends later. This field is highlighted in red if the date in this field is different than the value in the **Due date** field. **Note:** If this field is empty while creating a demand, the date from the **Due date** field is inserted.
Start date	The preliminary or estimated date when the work is initially planned to begin. This date helps outline the intended timing for early demand planning and prioritization. You can set this date during initial demand creation or anytime in the planning phase when a rough idea forms. This date can be updated until the demand is officially approved. For example, you're planning for a database upgrade to start on 2025-11-01. This date is changed to **Planned start date** when the demand is converted to a project. **Note:** • When you change the planned start date of a demand or project, the associated cost plans and resource assignments also change. The **Change Resource Plan and Cost Plan Start Date with Demand or Project Start Date Change** property controls the behavior for a demand date change. This property isn't enabled by default. For more information, see Properties installed with Project Management. • The **Start date** column label is changed to **Planned start date**. This change is applicable only for new customers who begin using the Brazil version. To ensure continuity, if you're upgrading to the Brazil release from an earlier release, you'll continue to see the prior labels.

Demand form fields (continued)

Field	Description
Due Date	The preliminary or estimated date when the planned work is expected to be completed. This date provides an expected completion window for planning and stakeholder communication. You can set this date anytime in the planning phase when a rough idea forms and can be updated until the demand is officially approved. For example, you're planning to complete the database upgrade by 2025-12-31. **Note:** • The **Due date** column label is changed to **Planned end date**. This change is applicable only for new customers who begin using the Brazil version. To ensure continuity, if you're upgrading to the Brazil release from an earlier release, you'll continue to see the prior labels. • This date is changed to **Planned end date** when the demand is converted to a project.
Description	Description of the demand.
Similar demands	Demands that have similar values for the **Short description** fields using predictive intelligence and machine-learning algorithms. For more information, see Predictive Intelligence for Demand Management.
Related Search	Search results matching the specified term. The default is the value in the **Name** field.

Details section of the Demand form

Field	Description
Portfolio	Portfolio indicating the business focus of the demand.
Program	Name of the program to which the demand belongs.
Investment Class	Type of investment class category assigned to the demand: • Run: Investment made to sustain the existing business. • Change: Investment made to implement a change in the business.
Investment Type	Investment type of the demand: • Cost Reduction • End User Experience • Legal and Regulatory • Revenue Generating • Service Sustaining

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Details section of the Demand form (continued)

Field	Description
	• Strategic Enabler • Artificial Intelligence
Demand Manager	Name of the demand manager.
Collaborators	Users who can edit or contribute to the demand. A demand requester can select any user as a collaborator.
Expense type	The type of the expense, either capex (capital expense) or opex (operational expense).
Priority	The priority of the demand.
Department	Department in a business unit to which the demand submitter belongs. **Note:** If you don't select a department, the default value is the name of the department to which the submitter belongs.
Project Manager	Project manager that would be assigned to the project created from this demand. When a project is created, this field becomes read only. This field appears if the **Category** field is set to Strategic and the **Type** field is set to Project. If you delete the project created from this demand, this field becomes editable.
Business Unit	Business unit to which the demand submitter belongs.
Impacted Business Units	Business units affected by the submitted demand. The selected units could experience operational impact, process changes, technology adoption, and so on. For example, if a demand is submitted by the procurement business unit, it can impact the finance, legal, and IT business units.
Idea	Unique identification number of the idea from which the demand was created.
Business Capabilities	Business capabilities associated with the demand that links the demand to organizational goals and value. Business capabilities are defined in the Enterprise Architecture (formerly Application Portfolio Management) module.
Impacted Business Applications	If the demand is to change, enhance, or add one or more business applications, the applications associated with the demand.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Details section of the Demand form (continued)

Field	Description
	Business applications are defined in the Enterprise Architecture (formerly Application Portfolio Management) module. For more information, see Exploring business applications. You can select any business application in your enterprise regardless of whether it's related to a capability selected in the **Business Capabilities** field.
Business Applications	If the demand is to change, enhance, or add one or more business applications, the applications associated with the demand. Business applications are defined in the Enterprise Architecture (formerly Application Portfolio Management) module. For more information, see Exploring business applications. You can select any business application in your enterprise regardless of whether it's related to a capability selected in the **Business Capabilities** field.

Business Case section of the Demand form

Field	Description
Strategic priority	Strategic objectives of the organization that the demand fulfills. A demand can fulfill multiple strategic objectives. If a business unit has been selected in the **Details** tab, the business strategies for the selected business unit along with other enterprise strategies are available for selection.
Primary goal	The primary goal associated with the strategy selected in the **Strategic priority** field. If a strategy hasn't been selected, all goals are available for selection.
Business case	Business arguments that support the demand.
Risk of performing	Risks if the demand is approved and implemented.
Risk of not performing	Risks if the demand isn't approved, for example, risk of loss of opportunity.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Business Case section of the Demand form (continued)

Field	Description
Enablers	Key enablers for the demand that would aid the demand to be completed. For example, clearly defined resource and cost plans.
Barriers	Major barriers to the demand that would obstruct the demand's completion. For example, incomplete or unclear demand details.
In scope	Scope of the demand, which is the set of boundaries that define the extent of a demand.
Out of scope	Activities or deliverables not in the scope of the demand. Anything not defined in the scope is out of scope.
Assumptions	Assumptions made for the demand. Assumptions help to define the scope and risks, and fine-tune the estimates for time and cost.

Financials section of the Demand form

Field	Description
Rate Model	Rate model assigned to the demand. This setting is used to derive hourly rates for the associated resource assignments and time cards. For more information, see Rate Models. **Note:** If the rate model assigned to the demand is changed or removed, the cost fields on the associated resource assignments aren't recalculated.
Project Currency	Currency used to execute the project once the project is created from this demand. You can select any active currency from the values listed in the Currency [fx_currency] table. After you create a project in the selected project currency, you can't change the project currency in the Project form if the demand contains a cost plan, a benefit plan, or a project budget. If the demand has no attached plan or budget, you can change the project currency in the Project form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Financials section of the Demand form (continued)

Field	Description
	Note: The value of this field defaults to the **Project currency** field of the **Financials** tab in the project currency view of the Project form as well. This field is available only when the PPM Standard Multicurrency (com.snc.ppm_multicurrency) feature is activated and the **Demand Currency** view is enabled.
Capital expense	Capital expenditure (capex) for the demand.
Operating expense	Operational expenditure (opex) for the demand.
Total planned costs	Result calculated based on the values in the **Capital expense** and **Operating expense** fields.
Financial return	Result calculated based on the values in the **Total costs** and **Financial benefit** fields.
Financial benefit	Estimate of revenue if the demand is approved. This value is rolled up from the benefit breakdown of the demand. You can also enter the value manually by selecting a currency icon and entering a value.
ROI %	ROI calculated based on the values in the **Total costs** and **Financial return** fields. This field is updated when a cost plan, benefit plan, or resource assignment is created or updated. The demand must be in the **Qualified** or **Approved** state.
Capital budget	Total capital budget allocated to the demand across all fiscal years. The value is rolled up from the capex budget of the demand.
Operating budget	Total operational budget allocated to the demand across all fiscal years. The value is rolled up from the opex budget of the demand.
Discount Rate %	Demand discount rate, which is the interest rate to determine the present value of future cash flows.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Financials section of the Demand form (continued)

Field	Description
Net present value	Present value of future cash based on the given annual interest rate, a measure for comparing money spent today against future expected financial benefits. This value is useful when evaluating the overall investment performance. For example, at a 12% discount rate, $1.00 today is worth $0.80 in two years. Therefore, receiving $1.00 in two years is the same as receiving $0.80 today. Net present value (NPV) is calculated from total costs according to year, financial benefit per year, and the discount rate for the demand.
Internal rate of return %	Annual interest rate required to achieve an NPV of zero. Internal rate of return (IRR) helps to determine which demands can deliver a higher rate of return in terms of revenue.
Demand Actual Cost	Total cost incurred while working on a demand and demand tasks. Demand actual cost is calculated after the assignee of the demand task creates and submits a time card. When the time card is approved, the resource rate, which is derived from the rate card, labor rate, or system properties, is used to populate this field.
Demand Actual Effort	Time accrued or spent by a resource while working on a demand or a demand task as derived from the submitted and approved time cards. This field isn't available on the Demand form by default.

Note: If you're creating a demand with the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin activated and the **Demand Currency** view enabled, then the fields in the **Financials** tab differ from the **Default** view. For more information about the fields that are available only in the Demand Currency view, see Multicurrency in Demand Management.

Assessment Data section of the Demand form

Field	Description
Impact	Level of business impact created by the demand.
Risk	Risk value calculated from the demand assessment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Assessment Data section of the Demand form (continued)

Field	Description
Value	Business value of the demand calculated from the **Impact** and **Financial return** fields.
T-Shirt size	Size of the demand. Before using this value as an indicator of demand size, consider creating and publishing definitions for each option outside the application. That process ensures that the values are interpreted correctly and consistently across the organization or department.
Score	The demand score is calculated based on the *risk*, *value*, and *size* attributes in the base system. The value of the *risk*, *value*, and *size* attributes are derived from the assessment metric category results. For more information, see assessment categories and assessment category results. • When the *risk* and *size* values are high, the score of the demand is low. • When the *value* setting is high, the score of the demand is high.
Assessment Required	Option for enabling the assessments for the demand. This option is active by default. Only a demand manager can update this value when the demand is in the Draft or Submitted state. **Note:** If this option isn't selected and you reset the demand to the Draft state, the option remains unselected.

Note: The values in the **Value** and **Score** fields are updated when a cost plan, benefit plan, or resource assignment is created or updated for the demand in the Qualified or Approved state. The values in the fields are updated only until an artifact such as project, enhancement, defect, or change is created from the demand.

Notes section of the Demand form

Field	Description
Watch list	The groups and users subscribed to the demand who can view the information in the **Additional comments** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Notes section of the Demand form (continued)

Field	Description
Work notes list	The groups and users subscribed to the demand who can view the information in the **Work notes** field.
Work notes	Information about the demand. This information isn't visible to customers. Work notes are added throughout the demand management life cycle to communicate with other users associated with the demand.

Preferences section of the Demand form

Field	Description
Close Demand	Determines when to close the demand automatically if it's converted to a project. • **None**: Keeps the demand in the Open state after it's converted to a project. • **On creation of project**: Closes the demand when the demand is converted to a project. • **On closure of project**: Closes the demand when the project created from the demand is closed. **Note:** The **On creation of project** and **On closure of project** options appear when the value for the **Type** field is set to **Project**. If the **Type** field is set to **Enhancement**, the default setting is **None**.
Project Calculation	Determines the calculation to use for task dependencies for the project when the demand is converted to a project. The default value is Automatic. • Manual: Task dates don't reflect any changes made to dependencies. • Automatic: Task dates are automatically updated to reflect any changes made to dependent or child tasks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

EAP Details section of the demand form

This section appears only if the selected type is an EAP entity.

Field	Description
Team	The planning team to which the created EAP entity is assigned. This field becomes read only once the EAP entity is created. This value is an optional value.
Converted to	The name of the created EAP entity. This field is read-only.

AI Associations section of the demand form

This section appears only if the AI Control Tower plugin is installed and the investment type of the demand is set to artificial intelligence.

Field	Description
Product	Product or system that the demand relates to.
Impacted AI systems	Impacted AI systems associated with the demand. You can select existing AI systems from the list or remove systems that are no longer relevant.

Demand task form

Use the demand task form to create tasks for a demand.

Demand Task form

Field	Description
Short description	Name of the demand task.
Assignment group	Group assigned to the demand task.
Assigned to	Primary resource assigned to the demand task. The following conditions apply: • If an assignment group is defined, only users in the assignment group are listed. • If skills are defined, only users with those skills are listed. • If no assignment groups or skills are defined, only users with one of the Project Management application user roles are listed. • Users with `timecard_user` role are also listed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Demand Task form (continued)

Field	Description
Additional assignee list	Users assigned to the demand task in addition to the single primary resource defined in the **Assigned to** field.
Category	Category of the demand task: • Initial review • Effort estimate • Cost estimate • Benefit estimate • Risk assessment The **Category** field selection determines the links available in the related links. For example, the **Add Resource Plan to Demand** related link appears when you set the **Category** value to Effort estimate. Users must have the appropriate role to use these related links.
Actual effort	The actual time spent working on the demand task, which is derived from the approved time card for this demand task. Because this field doesn't appear by default on the Demand Task form, you must add it by personalizing the form.
Description	Brief description of the demand task.
Number	System-generated ID number with a configurable prefix.
Priority	Sequence in which the task must be completed based on impact and urgency.
State	Current state of the demand task. The states include Pending, Open, Work in Progress, Closed Complete, Closed Incomplete, and Closed Skipped.
Due date	The date by which the task is targeted for completion.
Actual cost	The actual cost of the demand task derived from the number of hours worked and hourly rate of the resource as defined in the rate card. In the absence of a rate card, the hourly rate is derived from the default labor rate card or default system property.
Work notes	Information about the demand task. Work notes are added throughout the demand management life cycle to communicate with other users associated with the demand.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Demand Task form (continued)

Field	Description
	Note: Users with the business stakeholder role for PPM can view this field. For more information, see Business stakeholder role for PPM.

Expense line form

Use the expense line form to associate specific costs to a demand.

Expense line form

Field	Description
Number	Auto-generated number.
Amount	Select a currency type and enter the expense cost.
Date	Date of the expense generated.
Process date	Date on which the expense line was processed.
Source ID	Record that generated the associated cost.
State	State of the expense line. The state can be Pending or Processed. The cost roll-up happens only if the expense line is processed.
Cost plan	Name of the cost plan against which you want to create the expense line.
Summary type	Select the category that you want to group the expense under.
Cost type	Select the cost type.
Expense type	Select **Capex** for a capital expense or **Opex** for an operating expense.
Short description	Enter a short description of the expense type.
Sources	Select the records for the sources of the expense line. These sources include: • **Assets** • **Fixed assets** • **Contracts** • **Users** • **Configuration items** • **Tasks** • **Cost centers**

Investment Budget form

Use the Investment Budget form to allocate budget for a demand for each fiscal period.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Investment Budget form details

Field	Description
Amount	Enter the budget amount.
Fiscal period	Select the fiscal period to allocate the budget.
Investment	Select the planning item to allocate this budget. The existing budget is selected by default.
Expense type	Select expense type from the list. • Select **Capex** to allocate your budget to capital expenses. • Select *Opex* to allocate your budget to operational expenses.

Issue form

Use the issue form to add an issue to a demand.

Issue form

Field	Description
Number	System-generated ID number with a configurable prefix.
State	Current state of the issue. All new issue records are created in the Open state. The available states are: Pending, Open, Work in Progress, Closed Complete, Closed Incomplete, and Closed Skipped
Priority	Urgency of resolving or managing the issue based on possible impact.
Estimated cost	Estimated cost the issue generates.
Impact	Impact on the outcome of the demand if the issue remains unresolved.
Due date	Requested date for the assigned resource to resolve the issue or the date on which the issue must be closed or addressed if not assigned to any resource.
Assigned to	Primary resource assigned to work on the issue resolution.
Parent	Demand to which this issue belongs.
Short description	Brief description of the issue and its potential impact on the success of the demand. As you start entering the title for your issue, related issues that potentially match your issue are displayed. Select the suggestion icon ( ) to select from the list of predefined issue descriptions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Issue form (continued)

Field	Description
Description	Details of the issue and its potential impact.
Work notes	Information to record and track the work accomplished for resolving the issue.

Monetary Benefit Breakdown form

Use the Monetary Benefit Breakdown form to update the estimated and actual financial benefits for a specific fiscal year.

Monetary Benefit Breakdown form

Field	Description
Task	Task to which the benefit plan breakdown belongs.
Portfolio	Portfolio to which the benefit plan breakdown belongs.
Entered currency	Currency specified in the benefit plan.
Exchange rate	Rate in effect for the period corresponding to the benefit plan breakdown. When the period corresponding to the benefit plan breakdown has multiple rates, the rate in effect on the first date of that period is used. Exchange rate is used to convert the entered benefit into the functional benefit. It's obtained from the itfm_fx_rate [budget_reference_rates] table.
Actual benefit	Actual benefit that is incurred from the project or demand.
Benefit plan	Benefit plan to which the benefit plan breakdown belongs.
Fiscal period	Fiscals generated at the period level. For information on periods, see fiscal calendars.
Entered benefit	Benefit in entered currency.
Functional benefit	Functional benefit obtained by multiplying the exchange rate with the entered benefit.
Exchange rate date	First date of the fiscal period corresponding to the benefit plan breakdown.

Monetary Benefit Plan form

Use the Monetary Benefit Plan form to specify the estimated benefit accrued by a demand for a fiscal period.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Monetary Benefit Plan form

Field	Description
Name	Descriptive name of the benefit plan.
Work	Demand number to which the benefit plan belongs.
Sponsor	Sponsor for the demand.
Category	Type of benefit: • **Hard**: Benefits that can be measured in terms of revenue. • **Soft**: Benefits that are measured in terms of value.
Sub category	Subcategories of hard and soft benefits. The selection in **Category** field determines the selections available in this field.
Benefit type	Type of benefit. Select **Monetary benefits**.
Offset type	Offset type field indicates when the benefits start realizing. If the value in the selected offset type changes, the benefit plan start date shifts accordingly. For example, if the offset type is set to **End Date** and the demand due date changes, the benefit plan start date shifts to match the new due date.
Work start date	Start date of the demand. The field appears if you select **Start Date** in the **Offset type** field.
Work end date	End date of the demand. The field appears if you select **End Date** in the **Offset type** field.
Offset	Number of periods before or after the offset type when the benefit plan starts. For example, if the offset type is set to **End Date** and the offset is -2, the benefit plan is two periods before the demand end date. If the demand end date shifts, the benefit plan start date shifts to two periods before the new demand due date.
Duration in periods	The length, in periods, of the benefit plan.
Start fiscal period	Starting fiscal period. Populated based on values in the Offset field relative to the selected Project or Demand start date or Project or Demand end date, and the Duration in period values. The field is editable if you select **None** in the **Offset type** field. When you change the start fiscal period, the associated benefit breakdown values also change.
End fiscal period	Ending fiscal period. When you change the end fiscal period, the associated benefit breakdown values also change.
Associated benefit	Non-monetary benefit that is associated with this monetary benefit plan.
Description	Description of the monetary benefit plan.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Financials section of the Monetary Benefit Plan form

Field	Description
Entered benefit	Estimated amount of the potential benefit. Any change in the planned benefit on the benefit plan updates the associated benefit breakdown values for future fiscal periods.
Entered currency	Currency for the benefit plan. If the selected currency is different from the default currency configured in the Financial Management application, the budget reference rate is used to calculate the financial benefit of the demand.
Functional currency	The default currency configured in the Financial Management application and used for managing the demand or project.
Total planned benefit	Total benefit value that is rolled up from the benefit breakdown.
Benefit in functional currency	Benefit incurred from demand in functional currency. The value in this field changes if the **Entered currency** is different from the functional currency.
Actual benefit	Actual benefit value that is rolled up from the actual benefit in the benefit breakdown.
Recurring	Check box to indicate if the benefit is recurring for each fiscal period in the benefit breakdown.

Non-monetary Benefit Plan Breakdown form

Use the Non-monetary Benefit Breakdown form to update the estimated and actual non-financial benefits for a specific fiscal year.

Non-monetary Benefit Plan Breakdown form

Field	Description
Task	Task to which the benefit plan breakdown belongs.
Portfolio	Portfolio to which the benefit plan breakdown belongs.
Measure	Measure type specified in the benefit plan.
Actual benefit	Actual benefit that is incurred from the project or demand.
Benefit plan	Benefit plan to which the benefit plan breakdown belongs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Non-monetary Benefit Plan Breakdown form (continued)

Field	Description
Fiscal period	Fiscals generated at the period level. For information on periods, see fiscal calendars.
Entered benefit	Benefit in entered value.
Variance	The difference between the estimated and actual benefit.

Non-monetary Benefit Plan form

Use the Non-monetary Benefit Plan form to specify the potential non-financial benefits accrued by the demand, when it's executed.

Benefit Plan form

Field	Description
Name	Descriptive name of the benefit plan.
Work	Demand number to which the benefit plan belongs.
Sponsor	Sponsor for the demand.
Category	Type of benefit: • **Hard**: Benefits that can be measured in terms of revenue. • **Soft**: Benefits that are measured in terms of value.
Sub category	Subcategories of hard and soft benefits. The selection in the **Category** field determines the selections available in this field.
Benefit type	Type of benefit. Select **Non-monetary benefits**.
Offset type	Field to indicate when the benefits start to be realized. If the value in the selected offset type changes, the benefit plan start date shifts accordingly. For example, if the offset type is set to **End Date** and the demand due date changes, the benefit plan start date shifts to match.
Work start date	Start date of the demand. This field appears only when **Start Date** is selected from the **Offset type** field.
Work end date	End date of the demand. This field appears only when **End Date** is selected from the **Offset type** field.
Offset	Number of periods before or after the offset type when the benefit plan starts. For example, if the offset type is set to **End Date** and the offset is -2, the benefit plan is two periods before the demand end date. If the demand end date shifts, the benefit plan start date shifts to two periods before the new demand due date.
Duration in periods	The length, in periods, of the benefit plan.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Benefit Plan form (continued)

Field	Description
Start fiscal period	Starting fiscal period. Populated based on the value in the **Offset** field relative to the selected **Project/Demand start date** or **Project/Demand end date**, and the **Duration in periods** field values. The field is editable if you select **None** in the **Offset type** field. When you change the start fiscal period, the associated benefit breakdown values also change.
End fiscal period	Ending fiscal period. When you change the end fiscal period, the associated benefit breakdown values also change.
Associated benefit	Monetary benefit that is associated with this non-monetary benefit plan.
Description	Description of the non-monetary benefit plan.

Non-monetary Details section of the Benefit Plan form

Field	Description
Measure	Type of measure for the non-monetary benefit plan. The measure types are Count, Percentage, Hours, Days, and Score. Select the option **Yes/No** to track the benefits that aren't quantifiable. When this option is selected, the only field available is **Benefits achieved**. You can select the check box to indicate that the benefits have been achieved.
Non-monetary entered benefit	Estimated value of the potential benefit. Any change in the planned benefit on the benefit plan updates the associated benefit breakdown values for future fiscal periods only.
Non-monetary planned benefit	Benefit value that is rolled up from the benefit breakdown.
Benefits achieved	Option to indicate if the benefit is achieved.
Breakdown type	Type of breakdown creation when you save the benefit plan. • **None**: No breakdowns are created. • **Automatic**: A Non-monetary Benefit Plan Breakdown record is created automatically with data. The breakdown is calculated linearly.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Non-monetary Details section of the Benefit Plan form (continued)

Field	Description
	• **Manual**: A Non-monetary Benefit Plan Breakdown record is created automatically but without data in the entered benefit column.
Aggregation mode	Determines how the roll-up happens from breakdowns to the benefit plan and updates the values in the **Non-monetary planned benefit** and **Non-monetary actual benefit** fields. • **Sum**: Aggregates data from all breakdowns. • **Average**: Average value from all breakdowns. • **Most recent**: Recent breakdown value. • **Max**: Maximum value among the breakdowns. • **Min**: Minimum value among the breakdown
Non-monetary actual benefit	Actual benefit value that is rolled up from the actual benefit in the non-monetary benefit plan breakdown.

Recalculate resource costs form

Use the recalculate resource costs form to make sure that the resource assignment costs are up to date.

Recalculate Resource Costs dialog box

Field	Description
Start date	Start date of the time period for which the costs are recalculated. By default, the field shows the current date.
End date	End date of the time period for which the costs are recalculated. By default, the field shows the due date of the demand. If the due date isn't specified for the demand, the field is empty.
Planned costs for Requested Resource plans	Option for recalculating the planned cost of Requested resource plans.
Confirmed/Allocated costs for Confirmed/ Allocated resource plans	Option for recalculating the confirmed or allocated cost of confirmed or allocated resource plans.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Recalculate Resource Costs dialog box (continued)

Field	Description
Planned costs for Confirmed/Allocated resource plans	Option for including the planned cost of a confirmed or allocated plan. The option is enabled if the **Confirmed/ Allocated costs for Confirmed/Allocated resource plans** option is selected. By default, the option isn't selected.

Request change form

Use the request change form to change the metrics of a demand, such as demand scope, resource requirement, cost, or schedule.

Request Change form

Field	Description
Number	System-generated ID number with a configurable prefix.
State	Current state of the request change. All new request change records are created in the Open state. The available states are: Pending, Open, Work in Progress, Closed Complete, Closed Incomplete, and Closed Skipped
Priority	Urgency for approving the requested changes based on impact.
Estimated Cost	Estimated cost the requested changes generate.
Impact	Impact on the outcome of the demand if you don't approve the requested changes.
Approval	Status of approval from the stakeholders for the requested changes.
Assigned to	Primary resource assigned to work on the request change.
Due date	Requested date to complete the request change.
Category	Entity for which you're creating the request change. The options are: Resource, Scope, Cost, and Schedule.
Parent	Demand to which this request change belongs.
Title	Title for the change request.
Description	Details of the request change and its potential impact.
Business Justification	Reason for requesting the proposed change in the demand and its impact on the business.
Work notes	Additional information to indicate progress on the demand request change.

Requirement form

Use the requirement form to add a new requirement to a demand.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Requirement form

Field	Description
Number	Unique identification number for the requirement. This number is automatically generated when a new requirement record is created.
Source	User requesting the requirement. This field is automatically populated with the name of the person filling out the form, but the source could be a different person who identified the requirement.
Owner	User who is responsible for managing the requirement or making sure that the requirement is met.
Estimated effort	Approximate amount of time to complete the requirement and any associated tasks.
Priority	Importance of the requirement as it applies to the overall demand.
State	Status of the requirement can be **Pending**, **Approved**, or **Rejected**. **Note:** The request state is independent of the demand request state and of the states of any planned tasks associated with the requirement. The request can be closed without the requirement state being closed. Likewise, closing the request doesn't change the state of the requirement.
Type	Type of requirement can be: **Business**, **Solution (Functional)**, **Solution (Non-Functional)**, **Quality**, **Stakeholder**, or **Transition**.
Short description	Brief description of the requirement.
Description	Detailed description of the requirement and any associated tasks. For example, you can use this field to describe an expected outcome or result.

Risk form

Use the risk form to add a risk to a demand.

Risk form

Field	Description
Number	System-generated ID number with a configurable prefix.
State	Current state of the risk. All new risks are created in the Pending state. The available states are: Pending, Open, Work in Progress, Closed Complete, Closed Incomplete, and Closed Skipped
Risk status	Status of the risk. The available options are: Pending, Achieved, Not Achieved, Avoid, Mitigate, Transfer, and Accept.
Probability	The likelihood that the event described in the risk occurs. The available options are: Absolute, High, Moderate, and Low
Impact	Impact of the risk event on the outcome of the demand.
Estimated cost	Estimated cost the risk event generates.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Risk form (continued)

Field	Description
Risk rank	A value and color assigned to the risk. This value is calculated using risk probability and impact. You can configure the color and value using Risk Value Lookup. For more information, see Configure a custom Risk rank and Risk value.
Risk owner	Primary resource who is responsible for monitoring and managing the risk.
Assigned to	Primary resource assigned to work on the risk.
Risk value	A value calculated from Risk Value Lookup. For more information see,Configure a custom Risk rank and Risk value.
Due date	Requested date for the assigned resource to resolve the risk or the date on which the risk must be closed or addressed if not assigned to any resource.
Task	Demand to which this risk belongs.
Short description	Brief description of the event and its potential impact on the success of the demand.
Description	Details of the event and its potential impact.
Mitigation plan	Brief description of the efforts taken to mitigate the risk.
Work notes	Information to record and track the work accomplished for resolving the risk.

Risk value matcher form

Use the risk value matcher form to rate the impact and probability of a risk.

Risk Value Matcher form

Field	Description
Impact	Impact value of the risk. The default values are: • 1 = High • 2 = Medium • 3 = Low
Application	The application to which these risk values belong.
Risk Rank Color	Color to indicate the severity of the risk. **Tip:** You can enter variations of a color to differentiate between risks with similar impact and probability values. For example, you could enter **lightgreen** to indicate a low-severity risk.
Risk Value	The value for the specified risk impact and probability combination. The options are: High, Medium, and Low.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Risk Value Matcher form (continued)

Field	Description
	This value is displayed in the **Risk value** field of the Risk form.
Probability	Risk probability value is associated with the impact value of the risk. The options are: Absolute, High, Moderate, and Low.
Probability Number	Numerical value to indicate the probability. This value is multiplied by the value of the **Impact** field for calculating risk rank. The default values are: • 1 = Absolute • 1 = High • 2 = Moderate • 3 = Low The calculated risk rank and the risk rank color are displayed in the **Risk rank** field of the Risk form.

Stakeholder Register Form

Use the Stakeholder Register form to add users to the Stakeholder Registry.

Stakeholder Register Form fields

Field	Description
Number	Unique identification number for the stakeholder. This number is automatically generated when a new entry is created.
User	Name of user being added to the stakeholder registry.
Portfolio	A group of activities managed to align to business or operational objectives. Typically, portfolios are named according to the business units of an organization.
Level of Interest	Level of interest that the stakeholder has in pursuing the demand or project.
Assessment recipient	Indication of whether the user is authorized to receive assessment questionnaires for a demand.
Approver	Indication of whether the user has authority to approve demands or change requests in projects.
Influence	Level of influence the user has over the group assessing the demand or project.
Engagement	Indication of the way the user is engaged with the demand or project.
Function	Function of user in the demand or project process.

Widget Association form

Use the Widget Association form to associate your widget to a demand.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Widget association form

Field	Description
Association ID	Record to associate with the widget. To access the relevant records, you must select the Tables [sys_db_objects] table in the **Table name** list and the Demand [dmn_demand] table in the **Document** list.
Association table	Table to associate with the widget. You must select the Tables [sys_db_objects] table from the list.
Widget	Unique name of the widget.
Order	Position of the widget in relation to other widgets on the Demand Financials page. Widgets appear in numeric order, with the smallest number listed first.
Display on card	Option to display the widget on the Demand Financials page.
Include by default	Option to show the widget by default on the Demand Financials page.

Widget form

Use the widget form to configure a new widget.

Widget form

Field	Description
Name	Unique name for the widget.
Scripted	Option for indicating the value on the widget is from a code script. By default, this option is selected and is read-only.
Show Label	Option for displaying either the label or the color indicator. If you clear the check box, the **Color** field appears and you can set the color.
Active	Option for indicating the status of the widget. Only active widgets are shown on the Demand Financials page.
Parent widget	Widget that is the parent of the current widget. The current widget displays in the Child widgets related list of the selected widget. You can add a maximum of three child widgets for a parent widget.
Formatter required	Option for specifying whether a currency formatter is required for the widget.
Script	Code script that returns a requested metric value that is displayed on the widget. In the script, use the context and filter objects. The context object contains all the demand financial fields, such as total_costs, irr_value, and capital_budget.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Widget form (continued)

Field	Description
	The following sample script returns the capital budget metric value of a demand to appear on the widget. `var context = JSON.parse(context);` `var filter = context.filters;` `var now_GR = new GlideRecord('dmn_demand');` `gr.addEncodedQuery(filter['dmn_demand']);` `gr.query();` `if(gr.next())` `gr.getValue('capital_budget');` `Collapse`
Short description	Description of the widget.

Project Management

The ServiceNow® Project Management application is a suite of tools that aids in managing projects, tasks, and resources. You can create and manage small projects with a few tasks to large portfolios that contain complex tasks with various relationships and dependencies.

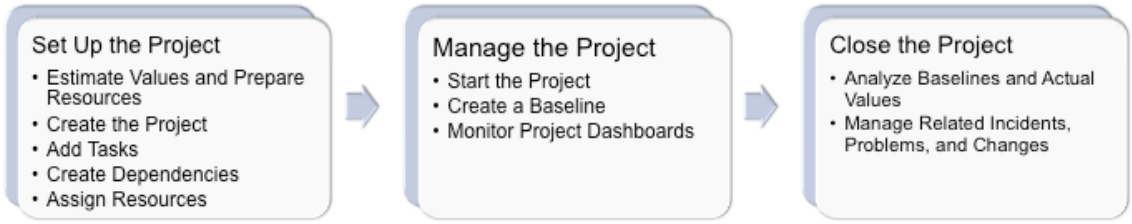
Exploring Project Management

Create, view, and manage projects using Project Management (PM) application.



Project Management overview

A project is any planned, collaborative effort that is designed to achieve an objective. The Project Management application not only helps you plan and track projects, it integrates with other applications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

There are several paths available to manage a project. The best path usually depends on business needs. The phases in the graphic are designed to get a project up and running with the minimum amount of effort.

Project phases

Project Management benefits

Project Management benefits

Benefit	Feature	Users
Starting a project	Start a project after setting up the project, populating it with tasks, and assigning resources.	it_project_manager
Create a project task from a project	Create project tasks from project form.	it_project_manager
Create baseline of a project	Capture planned dates of all tasks and milestones of a project using baseline.	pps_admin
Create a milestone	Use milestones to mark key dates in your project, such as key decision points, approvals, and holidays.	it_project_manager
Create a monetary benefit plan for a project	Capture the benefits accrued by the project when the project is executed by creating monetary benefit plan.	it_project_manager
Create a non-monetary benefit plan for a project	Capture the non-financial benefits accrued by the project when the project is executed by creating non-monetary benefit plan.	it_project_manager
Create a project cost plan	Create a cost plan to specify the unit cost of a cost type for a fiscal period.	it_project_manager
Adding RIDAC records for a project	Create Risk, Issue, Decision, Action, and Request Change records (RIDAC) and identify issues or risks for your project.	it_project_manager
Applying templates to projects	Create, save, and reuse project structure using project templates.	it_project_manager

This application provides a simplified, team-oriented approach to IT development by combining several individual applications and integrating the different components of the project development life cycle.

What to explore next

To learn more about configuring and using Project Management, see:

- Configuring Project Management
- Using Project Management
- Project Management reference

Basics of Project Management

Learn about the basic terms used in Project Management.

Bottom-up Tasking

Bottom-up (tactical) tasking means that you plan small, individual units of work that are required, then build a project up to include larger phases. Take this approach when you know what individual tasks are required to be accomplished and you're more flexible about overall project duration and estimated cost. Use this approach to see how much a project costs and how long it takes if you include every task. Project management supports tactical tasking by using rollup calculations on several project fields, such as project duration, so that the project adjusts to the tasks it contains. It is the recommended approach for the Project Management application.

Top-down Tasking

Top-down (strategic) tasking means that you plan high-level tasks first, then break down the work into smaller units. Take this approach when you want to build a project with fixed or inflexible time and budgetary constraints and well-defined phases. Establish well-defined milestones and dependencies between tasks that you consider from the beginning. Gradually add smaller tasks to the project later. This approach avoids including all possible tasks in a project and stays flexible with what tasks are included.

Note: When you use this method, the Project Management application still rolls up several values, such as task duration. Creating a task with a longer duration than the project, expands to cover the entire duration of the task, and defeats the purpose of using this approach. Values are not rolled down from parent tasks, nor are there any restrictions on creating child tasks that are longer than specified duration of the parent.

Project relationships and dependencies

The Project Management application enables you a create parent-child relationships between tasks and dependencies, such as finish-to-start and finish-to-finish, between tasks. A task dependency is created when one task is prevented from starting or finishing based on its relationship with the preceding and succeeding tasks.

Project relationships and dependencies

Concept	Description
Finish-to-start dependency	A dependency that indicates that a task must not be started until its predecessor finishes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Project relationships and dependencies (continued)

Concept	Description
Start-to-start dependency	A dependency that indicates that a successor task must not be started until the predecessor task has started.
Start-to-finish dependency	A dependency that indicates that a successor must not be finished until the predecessor task starts.
Finish-to-finish dependency	A dependency that indicates that a task must not be finished until another task finishes.
Lag time	A manually specified time break between predecessor and successor tasks.
Parent task	A project task with smaller tasks, referred to as child tasks, underneath it. Child tasks break down the work of a parent task into more manageable subsets. Certain fields for child tasks, such as planned end date, roll up and affect the same field in the parent task.
Child task	A project task that is a subset of a larger task. Child task start dates can't occur before the start date of the parent task.
Rollup task	Another term for a parent task in the context of aggregating child task items, such as effort or resources, into a larger parent task calculation. All fields on rollup task forms are read-only.
Roll down	State changes roll down from the project to project tasks, and from parent tasks to child tasks.

Note: Only one relationship can exist between two tasks.

The Project Management application provides several properties that control how tasks are calculated and behave. See Project property for more information.

Task time constraints

The Project Management application supports several types of dependencies.

The Project Task form includes a **Time Constraint** field, which can be one of the following values:

- If a task is set to **Start ASAP**: The task appears on the Gantt chart as starting when the dependency allows it. However, a task can start on a later date when a lag value is set for the relationship.
- If a task is set to **Start on specific date**: The task appears on the Gantt chart as starting on the constraint date. The start date of such a task is not impacted even after you put the task in a relation to another task, for example, FS relation.
- If a task is set to **Start no earlier than**: The task appears on the Gantt chart as starting on or after the constraint date. If the task has no predecessor, the task starts on the specified date. The start date changes to a later date based on the predecessor task end date. The start date also changes when the task is in a relation to another task, for example, FS relationship.
- If a task is set to **Start no later than**: The task appears on the Gantt chart as starting on or before the constraint date. If the task has any predecessor task, the dependency on the predecessor task determines when the task can start. A scheduling conflict occurs if the predecessor task attempts to move the task beyond the date specified in the **Constraint date** field.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The project property **Retain start on constraint on tasks after adding relations** controls the behavior for **Start on** selection. The property is set to True by default and is not editable.

- A task that is not honoring dependency is indicated with a red calendar icon on the Planning Console. If you want the task to honor the dependency and adjust the start accordingly, change the constraint type of the task to **Start ASAP**.

Parent-child task relationships

If a task is relatively large and requires several users with different skills to manage, break the task into subtasks and create parent-child relationships. A child task is a relatively smaller, manageable size of work.

When you group child tasks together under a parent, values such as **Estimated cost** aggregate and roll up to the parent task. So the parent task takes on the form of a summary task or rollup task for its child tasks. **Planned start date** and **Planned end date** rollup occurs when you create child tasks: the duration of the parent automatically adjusts to cover its child tasks.

A parent-child relationship is different from a dependency relationship. In a dependency, one task must finish before another begins. In a parent-child relationship, any number of tasks can be nested under a parent task with or without any dependencies. When you create a parent-child relationship, the parent task number is saved in the **Parent** field in the Project Tasks table. All project management tasks have a parent: either another project task or the project itself.

Unlike a dependency, a parent-child relationship is not saved as a record in any table. The only modification that takes place when a parent-child relationship is modified is the **Parent** field in the child task record.

You can create predecessor-successor relationships between child tasks with different parents, between two different parent tasks, or between a child task and another parent task. However, if the predecessor task finishes after the successor task starts, creating a dependency between child tasks that have different parents is not allowed.

Note: On the Gantt chart, you can drag-and-drop the parent task to move the entire hierarchy to a new location on the schedule.

Time constraints in parent-child relationships

Parent-child task relationships have several effects on task time constraints.

When a child task is set to Start ASAP

The child task starts at the same time as the parent task. If Project itself is set as a parent, the task starts on the date set in the **Constraint Date** field. This applies when the task has no dependencies with other child tasks.

When a parent task is set to Start ASAP and child tasks are set to Start on specific date:

- The earliest child task start date determines the start date of the parent, assuming no other dependencies.
- In this case, the **Time constraint** field of the parent remains **Start ASAP**, but the actual start date is changed to the start date of the earliest child task.

When a parent task is set to Start ASAP and child tasks are set to Start on specific date:

Child precedence also applies to end dates. If the estimated end date of the child task is later than the end date of the parent task, the estimated end date extends to

© 2026 ServiceNow, Inc. All rights reserved.

cover the child. For actual values, a parent has the same start date as the earliest start date of its children. The latest actual end date is the latest end date of its children. Assuming the child tasks are **Closed Complete**. If the child tasks are not in the **Closed Complete** state, the actual end date of the parent is empty.

For the planned start date of the parent task:

- The planned start date is the earliest planned start date of all the children that don't have an actual start date.
- If all child tasks have actual start dates, the planned start date of the parent task is set to the actual start date.

For the planned end date of the parent task: The latest planned end date or actual end date of the child tasks determines the planned end date of the parent.

A task with **Start no later than** or **Start on specific date** time constraint cannot be a parent task. When a new child task is added to a task with these time constraints, the time constraint for the parent task is changed to **Start ASAP**.

Top-down and bottom-up planning

- For top-down planning, create a task that you already know includes several child tasks. Then create the child tasks and specify that they are child tasks of the first task you created.
- For bottom-up planning, create tasks for the smallest units of work first. Then you can create intermediary parent tasks that cover a group of related child tasks. For example, if there are five sequential tasks that comprise a phase of a project called install database, create the five tasks first. Then create another task called Database installation and make it the parent task of the five tasks. Rollup calculations, such as **Planned duration**, for the Database installation task are automatically calculated based on the child tasks.

It is easiest to build task relationships and dependencies while creating sets of tasks.

- A dependency means that a task relies on other tasks to be performed (completely or partially) before it can be performed.
- A relationship means a parent-child relationship whereby several subtasks are configured under a parent task or phase, which rolls up fields like **Planned duration** and **Estimated cost**.

  Use the Gantt chart with task forms and related lists to build relationships. Add milestones based on the major events of a project and create dependencies between milestones and tasks, if necessary.

  Also set up notifications to alert project task assignees when their tasks move to the **Work in Progress** state. See Creating Project Tasks for more information on creating tasks.

Date changes, stage changes, and value calculations roll up from child tasks to parent tasks.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Date changes involve modifying the planned start or end date of a parent task based on those values in child tasks.
- State changes involve modifying the state of the project record or parent task records when all child records are set to a certain state.
- Calculations involve summing the values of child tasks and then automatically updating the parent to reflect a new total.

The following fields change on rollup tasks:

- **Planned Start date**: Set to read only for parent tasks. Remains editable for the project record (also considered the top-level task).
- **Planned End Date**: Becomes read only.
- **Planned Duration**: Becomes read only.
- **Actual Start Date**: Becomes read only.
- **Actual end date**: Becomes read only.
- **State**: Becomes read only.

Duration Rollups

Rollups are calculated for the following items:

- **Planned duration and planned effort**: the sum of all planned duration and planned effort values for all child tasks.
- **Actual duration and actual effort**: the sum of all actual duration and actual effort values. Actual duration and actual effort values are calculated when all child tasks are in the **Closed Complete** state. Actual effort values can include rollups from time cards.

Note: Verify that the time card property **com.snc.time_card.update.effort** is enabled. Navigate to **System Properties** > **All Properties** to enable this property.

Cost Rollups

Cost calculations roll up when the costing add-on is active.

- **Estimated cost**: The sum of all cost estimates at the beginning of a project. Estimated costs of child tasks roll up to parent tasks and to the project.
- **Actual cost**: By default for the project, the sum of all costs of all the expense lines, and are typically associated with a time card and a labor rate. To track costs, you can derive rates using any of the following options:
  - Associate a rate model to the project.
  - Define rate cards for the task and labor expenses.
  - Associate rate at the resource plan level.

  These rates automatically generate expense lines showing actual expenditures, which are associated with the projects. If rate cards are defined, the task expense lines are generated as each project task closes, and labor expense lines are generated when time cards are approved. Expense lines are visible in the **Expense Lines** related list, which requires the **Advanced view** on both Project and Project Task forms.

To ensure actual costs of child tasks correctly roll up to the project and added to project expense lines, the following must be true:

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The `com.snc.project.rollup.cost` property must be set to **true**. To enable this property, navigate to **Project Administration** > **Settings** > **Preferences - Project** and select the **Enable project cost rollup** check box.
- The `glide.cost_mgmt.process_task_top_task` property must be set to false. Go to the costing properties in the Cost Management application. Check the **When creating a task expense line should the system also create expense lines for the task's top task box** is not checked.
- The `glide.cost_mgmt.calc_actual_cost` property must be set to true. Go to the costing properties in the Cost Management application. Check the **For planned tasks types, calculate the actual cost field using the total of expense lines for the task** box.

Project State Rollups and Roll Downs

Project task states roll up. The state of parent tasks becomes read only, and changes automatically when you change the states of child tasks.

Project task states can roll up if:

- The state of the child task is manually changed and there are no other conditions on the parent task.
- The state of the child task is changed to **Work in Progress** or **Closed**. These states roll up to the parent. **Pending** and **Open** do not roll up to the parent task.

Project states can also roll down. If you change the state of a project to closed, all tasks under it change to the default closed value (**Closed Complete**). If a closed project or closed task is reopened, all tasks under it change as follows:

- Project or parent changed from closed to **Pending** or **Open**: Child tasks change to **Open**.
- Project or parent changed from closed to **Work in Progress**:
  - Child tasks with a **Start on** date that has passed are changed to start **ASAP** and the state is changed to **Work in Progress**.
  - Child tasks with a **Start on** date that has not yet passed retain the same start on date but the state is changed to **Open**.

Project tasks

Create project tasks in several ways, even from other applications in the instance.

Before you begin

Role required: it_project_manager

About this task

You can create a project task using any of the following options.

Procedure

- Use the Project Tasks related list.
  This related list is available from both a project record and a project task record. You can use the **New** UI action or insert a new row in the related list.
- Use the planning console.
- Use the project task creator.
  Use a dialog box to create multiple tasks at one time. The project task creator is available from both a project record and a project task record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- By copying an existing project or task.
  This option copies a selected task, or even a whole project, including all child tasks.
- From an incident, problem, or change request.
  The Project Task related list is also available from the Incident, Problem, and Change Request forms. The tasks you create from these forms makes the project task a child of the incident, problem, or change, rather than a project.

Link change requests to a project task

Schedule conflicts between project tasks

Scheduling conflict helps you to identify project tasks that are not honoring dependencies. A scheduling conflict occurs when one project task prevents other task from starting on the specified date because of dependencies or constraint types.

A scheduling conflict occurs when any action such as applying a dependency, changing constraint type, or constraint date causes the task start date to violate the project's constraint date.

When a scheduling conflict occurs, the system warns you about the conflict. You can choose to cancel the action that is causing the conflict or continue with the conflict. If you choose to continue with the conflict, the constraint date is given highest precedence and dates are recalculated. The start date is moved till allowed by the task constraint date, but dependency is not honored.

For example, consider the following scenario:

For a project with project task's **Constraint date** set as 20 January, there are two tasks:

- T1 with constraint type set to As soon as possible and start date of 20 January.
- T2 with constraint type set to Start no later than and start date of 20 January.

If you add an FS dependency between tasks T1 and T2, the task T2 should start on 21 January, but due to Start no later than constraint, task T2 cannot start on 21 January. This inability of starting task T2 on the specified date is an example of conflict.

In this example, if you choose to proceed with the conflict, the start date of task T2 is moved to 20 January which is the constraint date.

Scheduling conflict between tasks is shown for tasks with **Start no later than** and **Start on specific date** time constraints.

If you want the task to honor the dependency and adjust the start accordingly, change the constraint type of the task to **Start ASAP**.

When a scheduling conflict is identified, you can identify such tasks in the planning console.

- The client-side planning console displays a pop-up message with an option to proceed with the conflict or cancel the action. If you proceed with the conflict, the constraint type is applied or date is changed appropriately to the next feasible date.
- The calendar icon ( ) on the client side planning console changes to red ( ) to indicate the conflict.
- The calendar icon on the server side planning console changes to red ( ) to indicate the conflict.

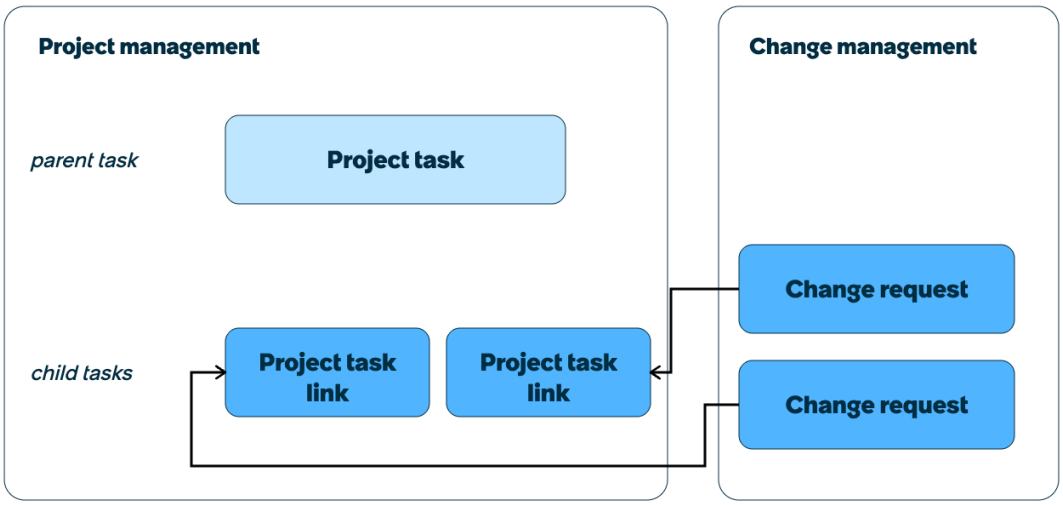
Change requests and project tasks

Large-scale changes approved by your change approval board (CAB) require new or existing projects to be implemented.

To bridge the gap between change management and project management, the instance allows you to link one or more change requests to a project task. You can link an existing change request to a project task or create a new change request directly from a project task.

When you link a project task to a change request record, a new project task link record is created. It provides the actual link between the project task record and the change request record. The project task link copies all attributes of the change request record. It then becomes a child task of the project task that you linked to the change request. The rules that govern the relationship between the project task and the project task link are the same as the rules for all parent and child tasks.

Project tasks linked to change requests



Note: A project task cannot have both task link records and child project tasks. When a project task is linked to a change request, you cannot also create child tasks for that project task. Likewise, when a project task has child tasks, you cannot link the parent project task to a change record.

The project task link record is read only. You can view the project task links from a related list on the Project Task form.

You can also link multiple change requests to a single project task. In this case, a project task link record is created for each link and all the project task link records become child tasks of the project task.

Project tasks links

Change request project task relationship

The rules that apply to all parent-child tasks also govern the relationship between project task and the project task link. The project task link inherits start and end dates from the change request. However, the Project Management application adjusts the dates when these situations occur:

Start and end dates:

- If the project task and the change request have different planned start dates, the project task link uses the later of the two dates. For example, if the project task starts on October 1 but the change request starts on October 2, the project task link changes to October 2.
- If the change request has an earlier start date, the **Time constraint** value for the project task link becomes **Start ASAP** when the link is created. The end date remains the same as the end date specified in the change request record.
- If the change request starts and ends before the project start date, the project task link has a duration of zero (0). It also appears as a milestone that occurs when the project starts.
- If a change request is scheduled to start during non-work time according to the project schedule, the planned start date of the project task link ignores the schedule. It also starts at the time specified by the change request. However, the duration of the project task link does take the schedule into consideration. For example: the project uses the default schedule, which specifies that work hours are Monday to Friday from 08:00 to 17:00 with an hour break from noon to 13:00. A change request with a 13-hour duration starts at midnight. The project task link starts at midnight and continues through the start of the schedule at 08:00. It stops at noon for one hour, and continues from 13:00 until 14:00. The total duration would be 13 hours.

Project Task Duration

The duration of the change request determines the duration of the project task link. That duration is rolled up to the parent project task just as all child task durations roll up to parent tasks. The **Planned start date** and **Planned end date** in the Change Request form **Schedule** section are the fields that determine the duration. If there are no planned dates on the Change Request form, the default duration is one project day. The project has a schedule or 24 hours when the project has no schedule.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Multiple Linked Change Requests

If you link additional change requests to a project task, additional project task links are created. All become child tasks of the project task. The dates roll up to the parent task. For example, if a linked project task is planned to finish on October 30. You link a new change request scheduled to finish on November 30, a new project task link is created. The parent task planned end date extends to November 30 to cover the duration of both project task links. A change request can only be linked to one project task. It cannot be linked to multiple tasks in the same project or across multiple projects. A project task that has one or more child tasks cannot also have a project task link connecting it to a change request.

Project Task State

If the state of a change request changes to **Pending**, **Open**, or **Work in Progress**, the state of the project task link changes accordingly. If the state of the change request changes to any of the closed states, the state of the project task link changes to **Closed Complete**.

How Modifications Propagate Between Change Requests and Project Tasks

Modifications to a linked change request propagate to the project task link. However, the reverse is not true. You cannot modify the change request record from the Project Management application.

Modifications to the following fields propagate from the change request to the project task link:

- **Planned start date**
- **Planned end date**
- **State**

These change request settings also roll up to the project task that is the parent of the project task link, and also up to the project record. Consider the following example: a project has not yet been started and all its tasks are in the **Pending** state. If you changed the state of a linked change request record from **Open** to **Work in Progress**, the project task link, its parent task, and the project itself all change to **Work in Progress**.

When you start a project, tasks that have **Start ASAP** as the time constraint and have no other start dependencies start immediately. However, project tasks with linked change requests do not start automatically. The project manager must start the task manually by changing the **State** field to **Work in Progress**.

Modifications made in the Project Management application do not propagate to a linked change request record, so closing a project does not close a linked change. When you successfully implement a change and close the project it belongs to, you must go to the change request record and manually change the state to **Closed**.

Project task checklists

A project task checklist gives you the ability to track activities that must be completed on a task.

For a project task to be considered complete, you can track activities that do not require separate subtasks. For example, you have a human resources-related project that includes a task for interviewing candidates. You can also track booking a meeting room or getting an interview confirmation from the candidate. Create a checklist item for each and mark when they have been completed.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Checklist items do not have start or end dates, nor do they track effort or cost. By default, a checklist item record provides only a name and a Complete field, which can be set to true or false. The state of the project task is independent of the state of the Complete field on the checklist item.

Checklists, as well as tasks, are copied into a project template. You also have access to all checklist templates from any project task form.

Note: Checklists are available for any form that is based on a table extended from the Task table. Administrators can add or remove checklists as needed.

Project and project task states

In the base system, the states in project and project task inherit the states in Task table.

The states are grouped into different categories as shown below:

State	Label	Category
-5	Pending	Pending
1	Open	Open
2	Work in Progress	Work in Progress
3	Closed Complete	Closed
4	Closed Incomplete	Closed
7	Closed Skipped	Closed

The category information for the states is declared in dictionary override of State column in Planned task (`planned_task`) table in **Attributes** field. Planned task is the parent table for project and project task tables.

The start and end dates are displayed based on the project or task status:

- Pending/Open: Planned start date is displayed.
- Open/Work in Progress: Actual start date is displayed.
- Closed: Actual end date is displayed.

Customize a state for project or project task

Composite Fields

A composite field combines information from two fields in a table to form a single field.

For example, the **Task** field on the Project Tasks list displays the short description and the project task number. The short description appears above the project task number. The project task number appears and is a link to the Project Task form.

Composite field

Use a composite field

- Editing a composite field changes the short description. Editing the short description changes the composite field.
- Sorting on a composite field is based only on the short description and not the number.
- Searching on a composite field is enabled for both the short description and the number:
  - To search by the number using the list header, enter an asterisk (*) before the search term. For example, *PRJTASK0010016.
  - To search by the number using the filter, create a condition similar to: [Task] [contains] [PRJTASK0010016].

Cost plan breakdown

A cost plan breakdown captures the estimated cost and actual cost for every fiscal period. Cost plan, project, demand, program, and portfolio are the breakdowns types that are available.

Requirement

Requirement corresponds to a single cost plan. For example, for a regular calendar and a cost plan spanning across one year, 12 breakdowns would appear.

Task

Task corresponds to a project or a demand. The cost across all the cost plans per period is rolled up to the project or demand level. These records have breakdown type set to **Task**. There would be only one record of type **Task** per period. The number of records of type **Task** that are created depends on the duration of the project or demand, and the requirements planned in the project or demand. For example, for a regular calendar and a project with three cost plans, 12 breakdowns appear.

Program

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If a project or a demand is part of a program, the breakdown type of **Program** provides the aggregate of program level costs per period.

Portfolio

If a project or a demand is part of a portfolio, the breakdown type of **Portfolio** provides the aggregate of portfolio level costs per period.

System-generated cost plans

When an expense line is created without populating the **Cost Plan** field, system-generated cost plans are created automatically.

The orphan expense lines are associated to the system-generated cost plans. This association ensures that the project actuals shown on the widgets match the aggregate of the cost plan actuals on the grid. The grid is shown on the Project Financials page and Investment Portal.

Note: System-generated cost plans are created only when the project has a minimum of one cost plan.

System-generated cost plans are created for any of the following reasons:

- When you create an expense line without populating the **Cost Plan** field.
- When you create a time card and approve it.

There are two system-generated cost plans, CapEx and OpEx. Depending on the type of expense selected while creating an expense line, the type of system-generated cost plan is created. The following are the name formats for the system-generated cost plans:

- <project number> System generated CapEx costplan
- <project number> System generated OpEx costplan

When you create a time card and approve it, an expense line of type CapEx is created. The orphan expense line is then associated to the system-generated cost plan of type CapEx. The system-generated cost plans are created to ensure that none of the expense lines are left without being associated to a cost plan. The system-generated cost plans are read-only.

For customers upgrading to Brazil, you can run the project diagnostics, **Associate orphan expense lines to the system generated cost plan**, to associate orphan expense lines to a system-generated cost plan. The diagnostic scan lists the expense lines that are not associated to any cost plan. When you run the fix script, system-generated cost plans are created, and the orphan expense lines are associated to the system-generated cost plans.

Actual project costs

Actual project costs come after you create expense lines for cost plans or after human resources use time cards to create expense lines.

The system captures actual project costs from expense lines:

- **Expense lines from cost plans**: You can create expense lines from a cost plan. Allows you to specify the amount and date when the expense was incurred. The actual amount incurred is included in the cost plan after the expense line is processed.
- **Expense lines from timecards**: Human resources can record time for project work by using time cards. When time cards are approved, the system generates expense lines. After the expense lines are processed, the actual costs are recorded for the project. If you provide a resource plan when creating time cards, the cost plan name is derived from resource plan and cost is captured against the resource plan. If you do not provide a resource plan, the cost is captured against the project.

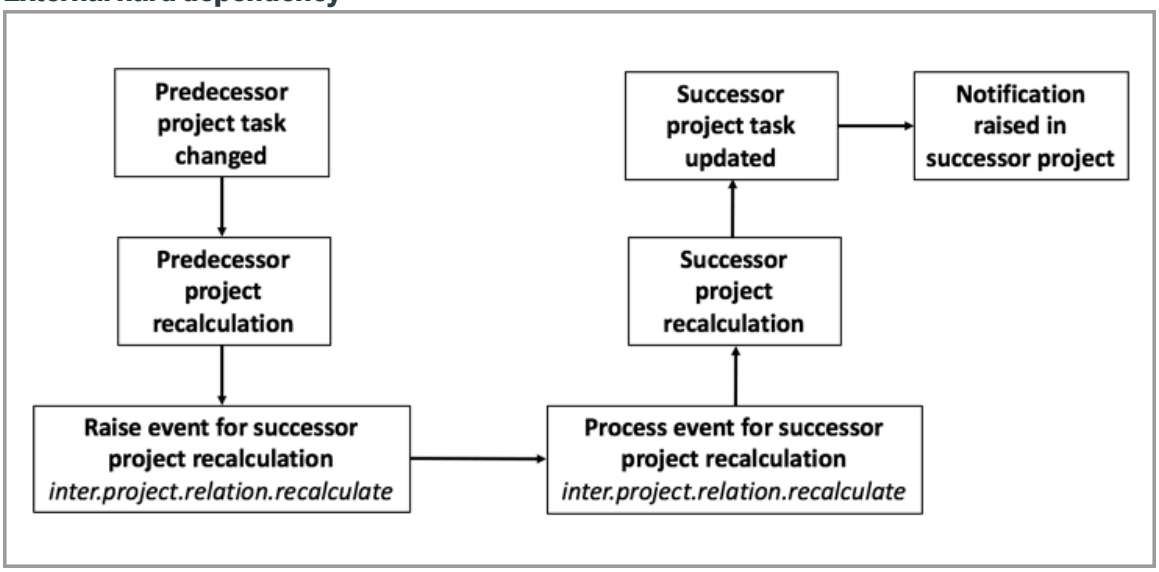
View actual project costs

Types of external dependencies



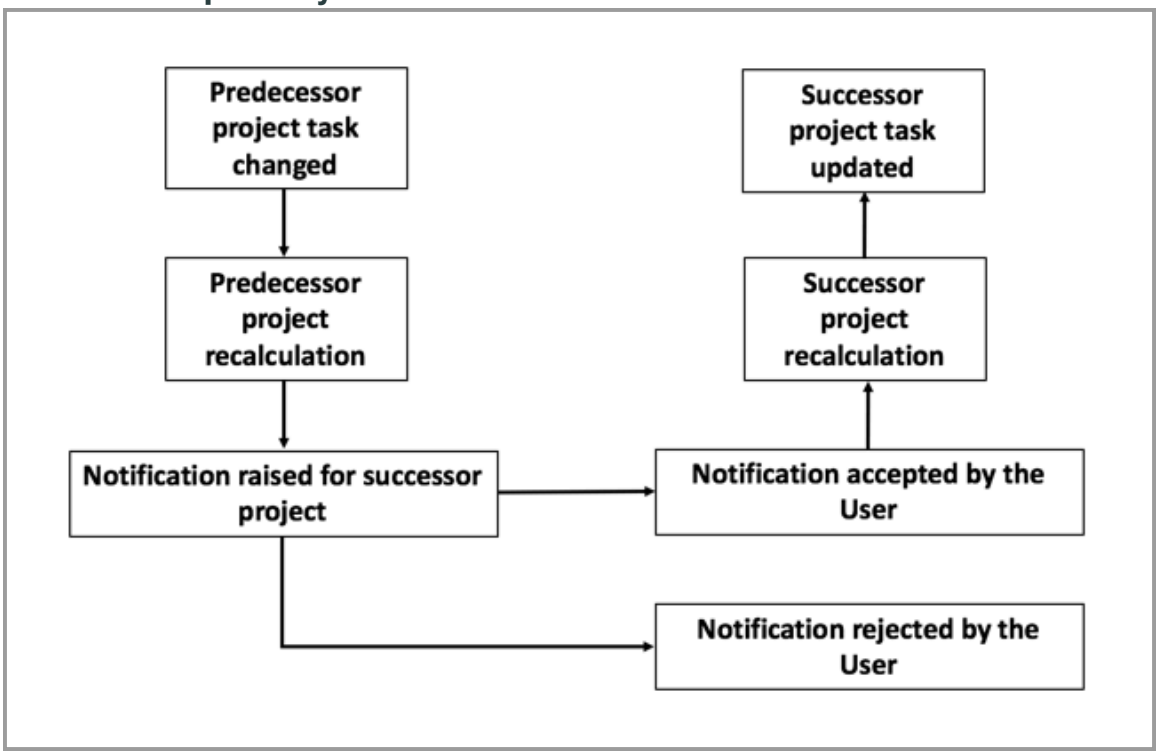
The Project management application supports two types of external dependencies - hard and soft.

The type of external dependency can be set during adding a dependency between two projects tasks on the planning console.

Hard dependencies

In a hard dependency, any changes made in the predecessor project are automatically propagated to the successor project. A notification for the changes made is triggered in the successor project. The following image shows the process flow for a hard dependency type:

External hard dependency



Soft dependencies

In a soft dependency, any changes made in the predecessor project trigger a notification in the successor project. As the project manager of the successor project, you can choose to accept or reject the changes in the notification. If you accept the notification changes, the changes in the predecessor project are synced to the successor project and the project is recalculated. If you reject the notification changes, the changes are not propagated to the successor project. The following image shows the process flow for a soft dependency type:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

External soft dependency

Project and portfolio funding

Specify the amount of money that projects and portfolios are allowed to have.

You can fund projects and portfolios when you activate PPM Standard with Financials.

The funding process follows these steps:

1. Identify the costs for time, such as a financial year, by creating cost plans at the project or demand level. These costs roll up to the portfolio Cost Plans related list. Cost plans automatically include cost plan breakdowns for each fiscal period. See Create a project cost plan and Create a demand cost plan.
2. Enter the target cost values for operational and capital expenses for the portfolio. See Create a portfolio and Legacy- Plan the portfolio.
3. Create budget plans for the projects in your portfolio and promote the plans to forecasts. See Legacy- Create and promote a budget plan and Promote a budget plan.

Project scheduling in Project Management

Define how tasks are sequenced, timed, and connected to determine when a project starts and finishes with Project scheduling.

Project scheduling overview

Learn the relationship between the project start date, task scheduling modes, and task links helps you build accurate, flexible project plans in Project Management.

Project start date and finish date

When you create a project, the start date determines the schedule. By default, all tasks begin on the project start date. As you add tasks and connect them to one another, individual task start times adjust, and the last task to finish determines the project finish date.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For both manually scheduled and automatically scheduled tasks with no dependencies or constraints, the project duration equals the duration of the longest task.

Comparing Scheduling Approaches: Start Date and Finish Date

Most projects are scheduled from a known start date, which provides maximum scheduling flexibility. You can schedule from a finish date in the following situations:

- You should determine when the project must start to meet a required completion date.
- The project start date is uncertain, such as when work depends on an external source.
- Your project management method requires finish-date scheduling.

When you schedule from a finish date, Project applies the As Late As Possible (ALAP) constraint to automatically scheduled tasks.

- Dragging a Gantt bar to change a task's finish date automatically applies a Finish No Later Than (FNLT) constraint.
- Switching from start-date to finish-date scheduling removes leveling delays and splits from automatically scheduled tasks. Manually scheduled tasks are not affected.
- Automatic leveling adds delays after tasks rather than before them.

Task scheduling modes

Project supports two task scheduling modes:

- Automatically scheduled tasks: Project calculates start and finish dates based on dependencies, constraints, and the project calendar.
- Manually scheduled tasks: You control the start and finish dates. Manually scheduled tasks do not move automatically when linked tasks change.

Critical path

When tasks are linked, Project sets a critical path, the longest sequence of dependent tasks that determines the project's completion date. Delays on this path can directly delay the project finish.

Related topics

Schedule a project from a start date

Task link types

Task constraints

Task constraints define the earliest or latest dates a task can start or finish in an automatically scheduled project. Apply constraints to align the schedule with resource availability, contract milestones, and external deadlines.

Types of constraints

Flexible constraints: These constraints do not require an associated date and allows the scheduling engine to place tasks as early or as late as possible within the boundaries set by dependencies and other constraints. As Soon As Possible (ASAP) and As Late As Possible (ALAP) are flexible constraints.

Semi-flexible constraints: These constraints require an associated date that defines the earliest or latest allowed start or finish date for a task. The task can complete at any time, as long as it

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

meets the defined boundary. For example, a Start No Earlier Than (SNET) constraint set to May 20 helps avoid the task from starting before that date, even if its predecessor finishes earlier.

Inflexible constraints: These constraints require an associated date and anchor the task to a specific start or finish date, overriding task dependencies. For example, a Must Start On (MSO) constraint set to September 20 schedules the task on that date regardless of when its predecessor finishes.

How constraints interact with dependencies

When a task has both a dependency and a constraint, the behavior depends on the constraint type:

- Flexible constraints respect the dependency. The task starts as soon as its predecessor finishes.
- Semi-flexible constraints enforce the date boundary. If the predecessor finishes before the constraint date, the task waits until the constraint date is reached.
- Inflexible constraints override dependencies. The task is fixed to the specified date, regardless of when the predecessor finishes.

Related topics

Apply or change a task constraint

Multicurrency in Project Management

Use the multicurrency feature to execute a project or part of a project in a different geographic location that has a different local currency.

The feature helps you to view the cost details of the project in a currency that is different from your functional currency. The values in the project's cost plans, benefit plans, and corresponding cost fields of the project form are also converted to a currency that you specify as project currency. Therefore, you don't need to convert the project currency to the functional currency of the project when the project is executed at a location that uses a currency different than your functional currency.

Activation information

Activate the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin to enable the multicurrency features in Project Management. Activating the plugin enables the project currency view in project, cost plans, and benefit plans forms. With the project currency view, you can manage your project financials and cost plans in multiple project currencies.

Note: Activating this plugin automatically activates PPM Standard (com.snc.financial_planning_pmo) plugin and therefore you get the option to switch between the default view and the project currency view.

Project currency view

In addition to the default view in the Project form, there is Project Currency view, which you can optionally enable to view the multicurrency fields. You can enable this view from the form context menu. The view appears only when you activate the PPM Standard Multicurrency (com.snc.ppm_multicurrency) plugin.

Unlike the Default view, the Project Currency view contains multicurrency-related fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can designate a currency other than the functional currency as the processing Project Currency for a project. The **Financials** tab of the Project form has the **Project currency** field. You can select an active currency from the Currencies [fx_currency] table.

Note:

The **Project currency** field of a project becomes read-only field and locked down for updating the currency once you create a cost plan, cost plan breakdown, benefit plan, benefit plan breakdown, or an expense line for the project.

Specify project currency in Demand

You can specify the project currency that you want to use for managing a project when you convert a demand to a project. You can continue to manage the demand using your functional currency, project currency, or a local currency. For more information, see Multicurrency in Demand Management.

Projects in Project Workspace

Track your projects in project currency in the Project Workspace. Create and monitor the cost plans and benefit plans for a project in project currency. For more information on project workspace, see Project Workspace.

To view the cost component in project currency at the grid level and at the breakdown level, see Create and manage cost plans and benefit plans for a project.

Project status reports

To view the planned and actual cost status of your projects in project currency, open the overview and cost sections of project status reports.

Updates in cost plan and recalculation of cost in project currency

If the unit cost, quantity, or fiscal period of a cost plan are updated, then all the related amount fields in the cost plan, its breakdowns, and the project to which it is rolling up are recalculated in project currency.

Changes in Unit cost, Quantity, and Recurring check box of a cost plan

When you modify the **Unit cost** field, **Quantity** field, or **Recurring** check box of the Cost Plan form, the Total planned cost is recalculated in project currency. Similarly, the **Cost in project currency** in the Cost Plan Breakdown is also recalculated. Therefore, the values in the **Planned capital in project currency**, **Planned operating in project currency**, and the **Total planned cost in project currency** fields of the project are also recalculated.

Changes in the fiscal period of a cost plan

When you change the fiscal period, either the start or end dates in the Cost Plan form, the **Total planned cost** and the **Cost in project currency** of the cost plan are recalculated. Therefore, the Cost Plan Breakdown records may be added or removed. If the **Recurring** check box is not selected, then the **Cost in project currency** of each Cost Plan Breakdown record is recalculated. In line with this, the values in the **Planned capital in project currency**, **Planned operating in project currency**, and the **Total planned cost in project currency** fields of the project are also recalculated.

Changes in the entered cost of a cost plan

If you change the **Entered cost** in an individual Cost Plan Breakdown record, then the **Total planned cost** of the cost plan is recalculated in project currency.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Therefore, the values in the **Planned capital in project currency**, **Planned operating in project currency**, and the **Total planned cost in project currency** fields of the project are also recalculated.

Addition of breakdowns to a cost plan

If you manually add cost plan breakdowns to a cost plan, then the **Total planned cost** of the cost plan is recalculated in project currency. Therefore, the values in the **Planned capital in project currency**, **Planned operating in project currency**, and the **Total planned cost in project currency** fields of the project are also recalculated.

Predictive Intelligence for Project Management

The Predictive Intelligence for Project Management capability uses machine-learning algorithms to search and display similar projects while defining a new project using the project form. You can also search for existing projects and compare similar projects for project planning.

The PPM Predictive Intelligence Workbench includes a prebuilt use case template that systematically guides you through the process of creating and training new predictive models. You can evaluate and test them, and then add them to your business process to add value to your Idea, Demand, and Project Management.

Once you train your custom use cases, they are usable immediately. No prior knowledge or experience with artificial intelligence or machine learning is required when you use the PPM Predictive Intelligence Workbench.

The application includes templates with prebuilt guidance to assist you in creating, training, evaluating, testing, and producing your unique predictive models.

Predictive Intelligence for Project Management has the following benefits:

- Improves the quality of your database by avoiding duplicate projects.
- Helps you in planning your project. You can view planning details of similar projects that were created and executed in the past.

Activation information

Activate the following plugins before using the Predictive Intelligence Workbench:

- Predictive Intelligence for PPM (com.snc.ppm_ml) plugin
- Predictive Intelligence for Ideation (com.snc.innovation_management_ml) plugin

Solution definitions for Predictive Intelligence for Project Management

The solution definition for Predictive Intelligence for Project Management capability is available in the Predictive Intelligence for PPM plugin (com.snc.ppm_ml). For more information about Predictive Intelligence, see Predictive Intelligence and Contextual search.

Solution Definition for Project Management

Solution Definition	Solution Type	Description
Similar Projects	Similarity	View similar projects based on the **Project Name** and **Description** fields. You can

Predictive Intelligence

Train the similarity solution for Project Management to find similar projects

Starting a project

Configuring Project Management

Learn about the process required to set up and configure Project Management to enable your project managers initiate and plan projects.

Configuration overview

With the Project Management application, you can plan, organize, and manage projects and resources more effectively, making it easier and faster to complete projects. To use the Project Management application, you need to install the PPM Standard plugin. For more information, see PPM Standard (Project Portfolio Management).

Upgrade existing projects on activating multicurrency plugin

Execute the *PM upgrade project currency for active projects* and *PM upgrade project currency for inactive projects* scheduled jobs to upgrade your active and inactive projects, respectively, after you activate the multicurrency plugin. Select the scheduled jobs and run them on demand to upgrade your projects in project currency only when necessary.

Before you begin

Role required: admin or it_project_manager

Procedure

1. Navigate to **All** > **System Definition** > **Scheduled Jobs**.
2. Click the *PM upgrade project currency for active projects*.
3. Click **Execute Now** to upgrade all your existing active projects to project currency.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

On execution of the job, all amounts in the cost-related fields of the Project, Project Task, Baseline, Cost Plan, Cost Plan Breakdown, Benefit Plan, Benefit Plan Breakdown forms are copied from functional currency to project currency fields. Once the values of functional currency fields are copied to the project currency fields project currency cannot be edited since the financial costs already exist.

4. To upgrade your inactive projects, click *PM upgrade project currency for inactive projects*.
5. Click **Execute Now**.

   On executing the scheduled job, the project currency value for all existing projects is set to the functional currency. The project currency in the Project Tasks, Baselines, Cost Plans, Cost Plan Breakdowns, Benefit Plans, Benefit Plan Breakdowns, Expense Lines forms is set to functional currency.

   Note: The jobs may have performance impact depending on the number of projects and cost plans, hence run the jobs only when necessary.

Using Project Management

Use Project Management to plan, manage, and track projects effectively.

Plan the project

Before creating a project, consider the following questions and issues:

- Do you want a top-down or bottom-up approach to tasking?

  Top-down tasking involves creating a project first, then identifying major project phases. Later on, phases can be broken down into tasks and subtasks. The emphasis is on creating estimates for high-level items such as phases and parent tasks and then building the project down from there toward a more detailed level. Use caution when creating tasks for top-down tasking. Creating a task under a project that has a start-on date later than the start date of the project, the project shifts to the later start date. The Project Management application supports bottom-up tasking better.

  Bottom-up tasking involves creating several sets of small tasks and estimating task items such as effort, cost, and duration. These estimations are then aggregated into high-level parent tasks (rollup tasks) and phases. The emphasis is on estimating smaller chunks of work as accurately as possible first, then letting those estimations roll up into parent tasks, phases, and the project itself.

- Is the project part of a larger portfolio of projects?

  Also consider portfolio planning and how the project relates to similar projects or initiatives.

- What types of dependencies do the tasks have with other tasks?

  The Project Management application supports various dependencies.

- Can milestones and project baselines help manage a project?

  A milestone is a project task with a duration of 0. Use milestones to indicate important dates in a project. If necessary, create dependencies between tasks and milestones so that a task does not start until a milestone has been reached.

  A baseline is a snapshot of the current planned start and end dates at the time the baseline was created for each task. A line appears under each task on the Gantt chart for the original

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

planned start and end dates. The line appears shifted to the left or right depending on whether the task was started early or late. If tasks slip to later dates, the baseline indicator provides an easy way to see how severe the delays are.

- Have the necessary skills, groups, and resources been created in ServiceNow?

  If project tasks are assigned to different groups or individual resources with the required skills, create users and groups and configure the Skills Management application.

- Does an existing incident, problem, or change justify creating a project to track it?

  Of these record types, a change is most likely to lead to activities that are tracked as a project.

- Do you want to track project costs?

  Estimate group resource costs before starting the project. Then track the actual cost of each user resource from time cards. The Project Management application can also calculate the costs of affected CIs in a project. The Project Management Costing add-on is required to track costs.

- What goals do you want the project to achieve?

  Every project has at least one goal. Project goals are saved in the Goal table and can link to any task. In a typical scenario, link one goal to each project and keep the **State** field of the goal up to date.

Assign resources or assignment groups to the tasks

User resources are the individuals in an organization who are assigned to project tasks. You can manage your resources with resource plans in the Resource Management application.

Add the project to a portfolio

A portfolio is a group of related projects. If the project is related to other projects, create a portfolio and add the project. The Project Management application provides a useful portfolio view that makes it easy to report on the status of all projects in a portfolio. Portfolios also include demands.

Starting a project

Initiate a project by changing the project state to **Work in Progress**. Define important aspects of your Agile, Waterfall, or Hybrid project such as the duration, estimated cost, and net value to your organization to efficiently track the project's progress.

Before you begin

Role required: it_project_manager

About this task

When you change the **State** field on the Project form to **Work in Progress**, the Actual start date of the project changes to the planned start date.

You can create a project from the Projects list or from the Project Workspace. You must have the Agile Development 2.0 plugin to create an Agile or Hybrid project and the Test Management plugin to create a test phase for your project.

Note: You can also create a project from the demand workbench.

After you start the project:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The read-only **Actual start date** field of the project is populated with the planned date.
- If a task or set of tasks are scheduled to start immediately upon project start, their actual start dates also get populated with the planned date. This applies when their time constraints are set to **Start ASAP** and they have no other start dependencies.
- The planned start dates of all other tasks adjust accordingly based on the time you started the project. Their new planned start dates depend on several factors, including dependent relationships with other tasks and the duration for each task.

Note: Once a project is in the **Work in Progress** state, it does not mean that the state of every task will start updating automatically based on planned start date. Other than the project tasks that you schedule to start **ASAP** when the project starts, project tasks aren't started automatically. Continue to manage the project and change the state of each task to **Work in Progress**.

You can also use the multi-currency feature to create a project in a local currency different from your functional currency. You must enable the PPM Standard Multicurrency plugin (com.snc.ppm_multicurrency) and switch to the Project Currency view for the additional fields in the **Financials** tab of the Project form. For more information, see Multi-currency in project financials.

Procedure

1. Create a project in any of the following ways.

Location	Steps
From the Projects list	**a.** Navigate to **All** > **Project** > **Projects** > **All**. **b.** In the Project list, select **New**. **New**.
From the project workspace	**a.** Navigate to **All** > **Project** > **Projects** > **Project Workspace**. **Note:** Starting with Brazil release, Project Workspace opens in Next Ex perience view. **b.** Select **New Project**. **c.** In the Create a project modal, fill in the de tails and select **Confirm**.

2. On the form, fill in the fields.
   For field information, see Project form.
3. Select **Submit**.

Create a project task from a project

Create tasks from the project form to break down project objectives into manageable units of work.

Before you begin
Role required: it_project_manager

Procedure

1. Navigate to **All** > **Project** > **Projects** > **All**.
2. Select the project from the list.
3. In the **Project Tasks** related list, select **New**.
4. On the form, fill in the fields.
   For more information on project task form, see Project task form.
5. Select **Submit**.

Result
The new task appears in the **Project Task** related list on the Project form. If time cards are in use, the application creates a time card for the resource.

What to do next
The value in the **Percent complete** field is related to the **State** field in the v3 application. If you change the percentage complete from **0** to any other value, the state of the task changes to **Work in progress** when you save or update the record. Likewise, if you change the state of the task to **Closed complete**, the **Percent complete** field is set to **100** and becomes read-only.

If you change the state of a project task from **Work in progress** to **Closed Skipped** or **Closed Incomplete**, the **Percent complete** field retains the current value and becomes read-only.

The **Percent complete** field appears in the Gantt chart for parent tasks as a light-colored bar (the part of the task that is complete). The bar overlaps the darker, underlying bar (the full task). For example, a Demo project is 5.41% complete as shown in a pop-up window. The **Phase 1** task is about 50% complete (not shown in the pop-up window).

The Project Tasks list and the Project Tasks related list on the Project form include a **Dependency** field. Any dependencies for a task, such as a parent task, are displayed in this field. Click a dependency record. See Predecessor dependencies in the planning console for a description of what you see in this column.

Create a task from an incident, problem, or change request

You can create a new project task from the Project Task related list on the Incident, Problem, and Change Request forms. The tasks you create from these forms makes the project task a child of the incident, problem, or change, rather than a project.

Before you begin
Role required: it_project_manager

Procedure

1. Navigate to the Incident, Problem, or Change Request form.
2. Configure the form to add **Project Task** > **Parent** if the related list is not already present.
3. In the **Projects** related list, select **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Fill in the project form.

   The project task becomes a child task of the incident, problem, or change record.

Create tasks from project task creator

Use the project task creator to create multiple tasks at once.

Before you begin
Role required: it_project_manager

Procedure

1. In the Project form, right-click the header bar and select **Project task creator**.
2. Enter the number of tasks to create.
3. Select the **Create FS dependency** check box to create a finish-to-start dependency between these tasks (when the first task finishes, the next task starts).
   Clear the check box to create the tasks with no dependencies.
4. Select **OK**.
   The new tasks appear in the **Project Tasks** related list. The application automatically creates a task **Number** and a **Short Description** that starts with **Auto Created Task**, followed by a number when more than one task is created.

Insert a row into the project tasks list

You can create a new project task from the Project Task related list on the Project form. Administrators must enable this task-creation feature.

Before you begin
Role required: it_project_manager

Procedure

1. In the Project form, navigate to the Project Tasks related list.
2. Double-click **Insert a new row**.
3. Select the green check mark.
4. Open the new task and edit the record as required.

Copy an existing task or project

Save time when building a project by copying tasks from other projects.

Before you begin
Role required: it_project_manager

About this task
The **Copy partial project** option copies a selected task and its child tasks into the project, or all project tasks into a sub-project. It also preserves all dependencies and relationships among the copied tasks and their child tasks. Any relationships or dependencies that involve tasks outside of the scope of the copied task are not preserved.

Procedure

1. In the Project or Project Task form, right-click the header bar and select **Copy partial project**.
2. In the **Task** field, select a project task or project to copy.
   By default, projects begin with PRJ and project tasks begin with PRJTASK.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Enter a **Name** for the new project or task.
4. Select **OK**.

   The copied task is added to the current task or project. If a project was copied, then all the tasks are inserted into a new sub-project.

Result

The copied tasks are inserted as a child of whatever task or project that you are currently viewing. Actual duration and the actual start and end dates are reset to null values. The state is set to **New** and percent complete is set to **0**.

By default only the short description, planned dates and duration fields are copied from source project to the target project. If additional columns must be copied, they should be declared in the project property **List of attributes that will be copied from the originating project task**.

Related topics

Change default values of copied fields

Change default values of copied fields

Change the default values of in the new partial project.

Before you begin

Role required: admin

About this task

Actual duration and the actual start and end dates are reset to null values. The state is set to **New** and percent complete is set to **0**. Administrators can modify UI pages to determine which fields are reset or to change the default values.

Procedure

1. Navigate to **All** > **System UI** > **UI Pages**.
2. Open the copy_partial_project record.
3. Use the following script if in the **Processing script** field:

```
/* resetFields is the array containing the list of names of
 fields that need to be erased from the copied project tasks
    * defaultFields is the array containing the key, value
 pairs of field names and values that need to be set on the
 copied tasks
    */var resetFields =new Array();var defaultFields ={};
  resetFields.push("work_start","work_end","work_duration");
  defaultFields["state"]="-5";
  defaultFields["percent_complete"]="0";
```

Related topics

Copy an existing task or project

Create a task from a project task template

You can save a project task as a template and reuse it when creating a task.

Before you begin

Role required: it_project_manager
You must have a template from an existing project task that has the required field values. See Templates for more information on this platform feature.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Project** > **Tasks** > **All**.
2. Select **New**.
3. If the templates do not appear at the bottom, select the ellipsis (···) icon at the top of the form, and select **Toggle Template Bar**.
4. Select the template link in the template bar at the bottom of the form.

The template is applied to the project.

View default project and project task state categories

View category information for the default project and project task states. In the base system, the states in project and project task inherit the states in Task table.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Dictionary**.
2. Update the filter with the following AND conditions:
   a. **[Table] [is] [task]**
   b. **[Column name] [is] [state]**
3. Run the filter.
4. Select the task table, and then choose **planned_task** table in **Dictionary Overrides** related list.

Result
The **Attributes** field displays different states and the categories for a state as shown below. It also displays the default state value for each category.

```
close_states=3;4;7,default_close_state=3,default_work_state=2,default_open_st
```

Related topics

Project and project task states

Customize a state for project or project task

Add or modify a state of project or project task using dictionary override.

Before you begin
Role required: admin

About this task
As an example, the steps for adding custom states for **Work in progress** state category for Project task are described. In this example,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- the existing **Work in Progress** state is removed and following three new states are added:

State	Label	Category
10	Design	Work in Progress
11	Development	Work in Progress
12	Testing	Work in Progress

- the default **Work in Progress** is kept as `10` (`Design`).

Procedure

1. Define a new dictionary override for `pm_project_task` table under Task - State dictionary.
2. Specify the override attributes for the dictionary override in **Attributes** field as follows:
`close_states=3;4;7,default_close_state=3,default_work_state=10,default_open`

Result

- As specified in Step 2, the `default_work_state` is declared as 10 and the `work_in_progress_states` as 10, 11, and 12. Now whenever a project task changes to any of the new **Work in Progress** states, its parent also moves to corresponding **Work in progress** state.

  Suppose that a project task has two children records, and if the first child record moves to **Development** state, the parent also moves to **Development** state. Now if the second child record moves to **Design** state, the two children records under the project task are in two different work in progress states. In such cases, the parent record moves to the default work in progress state. In this case, the parent record moves to **Design** as the `default_work_state` is specified as `10` (`Design`).

- The project states can also be customized using the same steps.

Related topics

Project and project task states

Link change requests to a project task

Link change requests to tasks on the Project Task form. You can link change requests only to project tasks that have no child tasks.

Before you begin

Role required: it_project_manager

About this task

You can link any change request record to a project task, regardless of the change request schedule or state. However, as a good practice, consider:

- **Change Schedule:** The change request has a schedule that falls within the time frame of the project it links to. Or, it has no values in the **Planned start date** and **Planned end date** fields in the **Schedule** section of the Change Request form.
- **Change State:** An **Open** or **Pending** state is required when linking a change request. Changes that are already in progress or closed can be stopped and copied to a new change request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Open a project task that does not have any child tasks.
   You can cannot link change request to the tasks that already have child tasks.
2. Select one of the following related links:
   - **Link an Existing Change Request to Project Task**:

     In the dialog box that appears, enter or select the change that you want to link.
   - **Create Change and link from Project Task**:

     The Change Request form appears. Enter the information in the form. The short description of the change request is taken from the project task.

Note: These related links are available only when the **Phase type** of the project task is waterfall.

Result

On the Project Task form, a notification appears at the top specifying that the task is linked to one or more change requests.

Related topics

Change requests and project tasks

Accept or reject project task notifications

Approve or reject the changes in a notification for an external soft dependency.

Before you begin

Role required: it_project_manager

About this task

The **Notifications** related list on the project record lists the external dependency related notifications raised in the successor project. The notifications are triggered as a result of changes made in the predecessor project that can impact successor project or task.

- The notifications for the hard dependency have the**State** set to Processed by default.
- The notifications for the soft dependency have the **State** set to New by default. As the project manager of the successor project, you can choose to accept or reject the changes in the notification.

Procedure

1. Open the project form.
2. Select the **Notifications** related list.
3. Select the reference icon to open the project task notification record for an external soft dependency.
4. Select **Approve** or **Reject**.

Result

- The **Status** of the notification record changes to Accept or Reject.
- The **State** of the notification record changes to Processed.

Use a project task checklist

You can create a checklist in a project task to track items that must be completed in the task.

Before you begin

Role required: it_project_user, it_project_manager

Procedure

1. Navigate to a project task.
2. To create a checklist for the project task, select **Create new** in the **Checklist** section and specify a name for the checklist.
3. To remove a checklist from the project task, select the down arrow next to **Checklist** and select **Remove Checklist**.
4. **Note:** This option appears when there is at least one checklist in the **Checklist** section.

   To save a checklist as a template, select the down arrow next to **Checklist** and select **Save as Template**.

Related topics

Project task checklists

Save a checklist as a template

Save a checklist as a template

After you create a checklist on a project task, you can save it as a template and reuse it on other tasks.

Before you begin

Role required: it_project_manager

Procedure

1. Navigate to a project task.
2. Select the down arrow next to **Checklist**.
3. Select **Save as Template**.
4. Enter a name for the checklist.
5. Select **Save**.

Project task checklists

Use a project task checklist

Create a parent-child relationship on the Project Task form

Create a child task from any project task form.

Before you begin

Role required: it_project_manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to the parent task in the relationship.
2. In the **Project Tasks** related list, select **New**.
3. Create the task and select **Submit**.
   The newly created task becomes the child task in the relationship.

What to do next

To help remember what the parent of any task is, view the breadcrumb at the top of the Project Task form. It is also helpful to configure the form layout to include the **Parent** field. You can also change the parent task from this field.

Create a monetary benefit plan for a project

Create a monetary benefit plan to specify the estimated benefit in a category spanning one or more fiscal periods. Project benefit plans capture the potential benefits accrued by the project when the project is executed.

Before you begin

Role required: it_project_manager

About this task

The monetary benefit plan breakdown records are automatically created when you save the benefit plan.

Procedure

1. Navigate to **All** > **Project** > **Projects** > **All**.
2. Open the required project.
3. In the **Monetary Benefit Plans** related list, select **New**.

   Note: To create a monetary benefit plan from the **Financials** tab in Project Workspace, select **Manage**.

4. On the form, fill in the fields.

   For field information, see Benefit Plan form.

   Note: When you move the project or the milestone date, the associated benefit plans also change accordingly based on whether the benefit plan is tied to the project start date, end date, or one of the project milestones. The project property **Change Resource Plan, Cost Plan and Benefit Plan Start Date with Demand or Project Start Date Change** controls the behavior for project date changes.

5. Select **Submit**.

What to do next

On the Benefit Plan form, view the benefit breakdown by fiscal period in the Monetary Benefit Plan Breakdowns related list.

Update a monetary benefit plan breakdown for a project

Update a monetary benefit plan breakdown record that specifies the estimated and actual benefits, at a granular level, for specific fiscal periods.

Before you begin

Role required: it_project_manager

Procedure

1. Navigate to **All** > **Project** > **Projects** > **All**.
2. Open the required project.
3. Select the Monetary Benefit Plans related list.
4. Open the required monetary benefit plan.
5. In the Monetary Benefit Plan Breakdowns related list, select the information icon (ⓘ) for a monetary benefit plan breakdown.
6. Select **Open Record**.
7. On the Monetary Benefit Plan Breakdown form, view and update the enabled fields. For more information, see Monetary Benefit Plan Breakdown form.
8. Select **Update**.

Note: Changing benefit plan start and end date is not possible if the recorded actual benefits are outside of the date range.

Related topics

Create a monetary benefit plan for a project

Create a non-monetary benefit plan for a project

Create a non-monetary benefit plan for a project

Create a non-monetary benefit plan to specify the estimated benefit in a category spanning one or more fiscal periods. Project benefit plans capture the potential non-financial benefits accrued by the project when the project is executed.

Before you begin

Role required: it_project_manager

About this task

The non-monetary benefit plan breakdown records are automatically created when you save the benefit plan by selecting **Automatic** or **Manual** in the **Breakdown Type** field. The non-monetary benefit plan breakdown records specify the estimated and actual non-financial benefits at a granular level for specific fiscal periods, such as FY16: April and FY16: May. The Non-monetary Benefit Plan Breakdowns related list shows the aggregated benefits for estimated and actual non-financial benefits for each fiscal period for the project.

Procedure

1. Navigate to **All** > **Project** > **Projects** > **All**.
2. Open the required project.
3. Select the Non-monetary Benefit Plans related list.
4. To create a non-monetary benefit plan, select **New**.
5. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information, see Non-monetary benefit plans form.

Note: When you move the project or the milestone date, the associated benefit plans also change accordingly based on whether the benefit plan is tied to the project start date, end date, or one of the project milestones. The project property **Change Resource Plan, Cost Plan and Benefit Plan Start Date with Demand or Project Start Date Change** controls the behavior for project date changes.

6. Select **Submit**.

What to do next

- On the Benefit Plan form, view the benefit breakdown by fiscal period in the Non-monetary Benefit Plan Breakdowns related list.
- Associate monetary and non-monetary benefit plans, so that you can capture the potential benefits (financial and non-financial) accrued by the project for the hybrid benefit plans.

Related topics

Update a non-monetary benefit plan breakdown for a project

Update a non-monetary benefit plan breakdown for a project

Update a non-monetary benefit plan breakdown record that specifies the estimated and actual benefits, at a granular level, for specific fiscal periods.

Before you begin

Role required: it_project_manager

Procedure

1. Navigate to **AllProject** > **Projects** > **All**.
2. Open the required project.
3. Select the Non-monetary Benefit Plans related list.
4. Open the required non-monetary benefit plan.
5. In the Non-monetary Benefit Plan Breakdowns related list, select the information icon (ⓘ) for a non-monetary benefit plan breakdown.
6. Select **Open Record**.
7. On the Non-monetary Benefit Plan Breakdown form, view and update the enabled fields.

Field	Description
Task	Task to which the benefit plan breakdown be longs.
Portfolio	Portfolio to which the benefit plan breakdown belongs.
Measure	Measure type specified in the benefit plan.
Actual benefit	Actual benefit that is incurred from the project or demand.
Benefit plan	Benefit plan to which the benefit plan break down belongs.

Create a non-monetary benefit plan for a project

Associate monetary and non-monetary benefit plans

Associate monetary and non-monetary benefit plans, so that you can capture the potential benefits (financial and non-financial) accrued by the project for the hybrid benefit plans.

Before you begin

Role required: it_project_manager

About this task

You can associate a monetary benefit plan with a non-monetary benefit plan and vice versa.

Note: When you delete a benefit plan, its relationship with the associated benefit plan (if any) is also removed.

Procedure

1. Navigate to **All** > **Project** > **Projects** > **All**.
2. Open the required project form.
3. Select the Monetary Benefit Plans or Non-monetary Benefit Plans related list.
4. Select the information icon (ⓘ) for a benefit plan that you want to associate.
5. Select **Open Record**.
6. Associate a monetary or non-monetary benefit plan.

Option	Action
Associate an existing benefit plan	On the Benefit Plan form, fill in the **Associated benefit** field with the benefit plan that you want to associate.
Associate a new benefit plan	a. On the Benefit Plan form, select **Associate new benefit**. b. On the form, fill in the fields. For details, see Create a monetary benefit plan for a project and Create a non-monetary benefit plan for a project.

7. Select **Save**.

Create a project cost plan

Create a cost plan to specify the unit cost of a cost type for a fiscal period. Project cost plans capture the costs of projects.

Before you begin
Role required: it_project_manager
Application required: Project Portfolio Management with Financials

About this task
The application automatically creates cost plan breakdown records when you save the cost plan. Cost plans can also have associated expense lines.

Note: Cost plans are automatically created for resource plans that are associated to projects and project tasks.

To use multiple currencies, create a new cost plan for another currency.

Procedure
1. Open the project form.
2. From the related links, select **Cost Plans**.
3. Select **New**.

   Note: To create a cost plan from the **Financials** tab in Project Workspace, select **Manage**.

4. On the form, fill in the fields.

   For field information, see Cost Plan form.

   Note: When you change the planned start date of a project, the associated cost plans and resource plan also change. The project property **Change Resource Plan and Cost Plan Start Date with Demand or Project Start Date Change** controls the behavior for project start date change.

5. Select **Submit**.

What to do next
To recalculate the values in the **Estimate at Completion** field, use the **Calculate Estimate at Completion** related link. To view the cost plan breakdowns, select the **Cost Plan Breakdowns** related list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

View actual project costs

When you are using Project Portfolio Management with Financials, you can view actual project costs on cost plans and projects.

Before you begin
Role required: it_project_manager

About this task
An expense line has to be processed to be considered for actual cost. The actual cost is recorded against the creation date of the expense line, not the processed date. The expense lines are created only for approved time cards.
Actual costs for projects also roll up to portfolios in the same way.

Procedure
1. Navigate to **Project** > **Projects** > **All**.
2. Open the project for which you want to view the actual costs.
3. Select the **Cost Plans** related list.

Related topics
Actual project costs

Recalculating costs of all resource plans in a project

Recalculate resource costs for all resource plans in a project when hourly rates change in the associated rate model.

Before you begin
Ensure the following setup:

- The project must be active.
- The project must have an active rate model assigned.
- The resource plans must be in the Planned, Requested, Confirmed, or Allocated state.

Role required: project_manager

About this task
This option recalculates the costs of all resource plans of the project at once. You can also open a resource plan from the **Resource Plans** related list to recalculate the resource costs of an individual resource plan.

Procedure
1. Navigate to **All** > **Project** > **Projects** > **All**.
2. Open a project.
3. On the Project form, right-click on the header bar and select the **Recalculate Resource Costs** option.
4. In the Recalculate Resource Cost dialog box, fill in the fields.

Recalculate Resource Costs dialog box

Field	Description
Start date	Start date of the time period for which the costs are recalculated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	By default, the field shows the current date.
End date	End date of the time period for which the costs are recalculated. By default, the field shows the end date of the project.
Planned costs for Requested Resource plans	Option for recalculating the planned cost of Requested resource plans.
Confirmed/Allocated costs for Confirmed/ Allocated resource plans	Option for recalculating the confirmed or allocated cost of Requested resource plans.
Planned costs for Confirmed/Allocated resource plans	Option for including the planned cost of a Confirmed or Allocated plan. The option is enabled if the **Confirmed/ Allocated costs for Confirmed/Allocated resource plans** option is selected. By default, the option is not selected.

5. Select **OK**.

Result

- Recalculates the selected resource costs of all the applicable resource plans in the project based on the latest hourly rates. The hourly rates are derived from the rate model associated with the project.
- Updates the recalculated resource costs on the respective cost fields on the resource plan form and the Resource Plans related list.
- Reflects the revised values on the respective cost fields of the project.

Create an expense line

A project expense line is cost associated with a specific source, such as a user, fixed asset, or a CI. Expense lines are part of project cost plans.

Before you begin

Role required: it_project_manager
Application required: Project Portfolio Management with Financials

About this task

Only processed expense lines are considered for projects, project tasks, and demands. You can create multiple expense lines for a project or demand.

Procedure

1. Open the project form.
2. In the related lists, select **Cost Plans**.
3. Right-click on a cost plan.
4. Select **Create Expense Line**.
5. On the form, fill in the details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information, see Expense line form.

6. Select **Submit**.

Note:

- Imported processed expense lines aren't rolled up to the Total actual cost field in Cost Plans.
- If you change the **Amount** of a Pending expense line and change the state to Processed, the latest value is captured in the expense line. This value is rolled up to Total actual costs in Cost Plans.

Result
Once the expense line is processed, the actual amount incurred becomes part of the cost plan. The actual amount spent is recorded against the project cost plan under the appropriate expense type: **Capex** or **Opex**. Not providing a cost plan reference when creating an expense line, the actual cost is recorded at the project level in the cost plan related list.

If you create an expense line without populating the **Cost Plan** field, a system-generated cost plans is created.

Create and manage waterfall projects

Plan, create, and manage projects using the Waterfall methodology.

The following tables, arranged by task group, list the tasks involved in creating a waterfall project.

Create a new project

Task	Steps
Create a new project	Navigate to **All** > **Project** > **Projects** > **Create New**.

Open an existing project

Task	Steps
Open a project in the project workbench	Select the **Project Workbench** related link on the Project form.

Add phases to a project from the project workbench

Task	Steps
Create a waterfall phase for a project	Select the Add phase icon (+) and select **Waterfall** from the Phase Type choice list.
Create a test phase for a project	Select the Add phase icon (+) and select **Test** from the Phase Type choice list.

Edit a project phase from the project workbench

Task	Steps
Edit a waterfall phase for a project	Select the Edit phase icon ( ) on a project phase and make the required changes in the details of the project phase.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Edit a project phase from the project workbench (continued)

Task	Steps
Edit a test phase for a project	Select the Edit phase icon ( ) on the test phase and make the required changes in the details of the test phase.

Add milestones to a project from the project workbench

Task	Steps
Add milestones to a project	Select the Add phase icon ( ) and then select **Milestone** at the top of the Add Phase pop-up window.

Set up manual testing

Task	Steps
Create a test plan	Navigate to **All** > **Test Management** > **Test Execution** > **Test Plans** > **New**.
Add test cases to a test plan	Select the **Add Test Cases from Test Suite** related link on the Test Plan form.
Create a test phase	Select the **Add Phase** button on the project workbench.
Add a test plan to a test phase	Select the Edit Phase icon ( ) for the test phase and enter the name of the **Test Plan**.
Assign test cases to testers	Select a user in the **Assigned to** field on the Test Case form.
Notify testers to start testing	Select the **Notify testers** to start testing related link on the Test Plan form.
Monitor the testing progress	The Test Plans list, Test Plan form, and Test Case form all display results for test cases and individual tests.
Testing sign-off	Select the **Sign-off Test Plan** related link on Test Plan form.

Schedule a project from a start date

Schedule a project from a start date and plan tasks and milestones based on your project requirements.

Before you begin

Role required: it_project_manager

Procedure

1. Navigate to **All** > **Project** > **Projects** > **Create New**.
2. On the Project form, enter the project name.
3. From Dates related list, select **Schedule** and select **Approved start date**.
   All tasks without dependencies or constraints are set to start on the project start date.
4. Select **Submit**.

Task link types

Apply or change a task constraint

Apply a constraint to control when an automatically scheduled task starts or finishes. Set the constraint type and the associated constraint date if required.

Before you begin

Role required: it_project_manager

Verify that the task is set to automatic scheduling. Constraints apply only to automatically scheduled tasks.

Procedure

1. Navigate to **All** > **Project** > **Projects** > **All**.
2. Open a project and select Gantt Chart view.
3. Select the task for which you want to set a constraint.

Related topics

Task constraints

Update a project

Update the project and make adjustments in fields to handle scope, cost, and schedule. While a project is underway, keep actual values as current as possible. Continue to measure actual values, analyze the impact of any potential project risks.

Before you begin

Role required: it_project_manager

Procedure

1. Open a project in the **Work in Progress** state.
2. Keep the following fields up to date:
   While the status of the project is **Work in Progress**, keep these fields up to date:
   - **Priority**: the priority of the project, especially as it relates to other projects in the portfolio.
   - **Net value**: the value of the project to the company expressed in expected revenue.
   - **Risk cost**: the sum of all costs involved with potential project risks. Although this field is not related to cost management, you can use this field to estimate the costs of risks that arise during the project.
   - **Configuration item**: the CI related to the project.
   - **Schedule**: the type of work schedule.
   - **Work notes**: a useful record of notes and comments related to the project.
   - **Live feed**: a record of the collaboration between various project stakeholders.

   For project tasks, keep these fields up to date:

   - **State**: remember to change project task states to **Work in Progress** when the task should begin (for tasks that have a specified start date) and **Closed** when the task is finished. Task states do not change automatically except when the time constraint of the task is set to **Start ASAP** and the state of the predecessor task is changed to one of the closed states.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Assignment group**: the group of resources currently working on the task.
- **Assigned to**: the individual assigned to the task.
- **Time cards**: the amount of time resources work on a project, which roll up into **Actual effort**. If a labor rate is configured for a time card, changes to the time cards affect the**Actual cost** of the project.

3. Select **Update** to save the record.

Related topics

Track project comments and collaborate with stakeholders

Track project comments and collaborate with stakeholders

When a project is in progress, you can take advantage of two platform features that help project participants interact and collaborate: journal fields and live feed. Two useful journal fields are Comments and Work notes.

Before you begin
Role required: it_project_manager

Procedure

- To add journal fields to a project form:
  1. Configure any project form to show **Comments** and **Work notes** .
- To add live feed to a project form:
  1. Navigate to **All** > **System Definition** > **Dictionary**.
  2. Select the **pm_project** table name that has no corresponding **Column name**.
  3. In the **Attributes** field, enter `live_feed=true`.
  4. Select **Update**.
  5. Navigate to **All** > **System Definition** > **UI Actions**.
  6. Open the **Follow on Live Feed** list action.
  7. In the **Table** field, select the [pm_project] table.
  8. Right-click the header and select **Insert** to create a copy of the UI action for the [pm_project] table.
  9. Repeat the steps for the UI actions for the **Show Live Feed** form action.
  10. Personalize the Project form and add **Activities (filtered)**, which is the activity formatter, to the desired location on the Project form.

Related topics

Update a project

Copy a project

Another option for creating a project is to copy an existing project with all its tasks and relationships. After you specify the start date for the copy, the system adjusts all task start and end dates automatically.

Before you begin
Role required: it_project_manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. On the Project form, select additional actions icon (☰) and select **Copy Project**.
2. On Copy the selected project modal, enter the **New Project Name**.
3. Select a **Start date** and select **OK**.
   Copy partial project, which is available from the Project Task form, provides similar functionality. It copies all task or project relationships and children from the selected project and inserts them into the current project. In this case, a new project record is not created.

Result

Actual duration and the actual start and end dates are reset to null values. The state is set to **New** and percent complete is set to **0**.

By default only the short description, planned dates and duration fields are copied from source project to the target project. If additional columns must be copied, they should be declared in the project property **List of attributes that will be copied from the originating project task**.

Related topics

Change default values of copied project

Change default values of copied project

Reset or change the default values for copied fields in the new copied partial or complete project.

Before you begin

Role required: admin

About this task

Child tasks are defined with the same relationships, each lasting for the same duration as the original tasks. All project tasks are set to **Pending**. Actual duration and the actual start and end dates are reset to null values. The state is set to **New** and percent complete is set to 0. Administrators can override the Script Include CopyProjectFieldOverride to determine which fields are reset or to change the default values.

Procedure

1. Navigate to **All** > **System UI** > **Script Include**.
2. Open the CopyProjectFieldOverride record.
3. Add the method to override the method defined in the CopyProjectFieldOverrideSNC script for resetting or defaulting the values.

   For example, to copy partial project:

```
    /* getResetFieldsForCopyPartialProject method returns the
array containing the list of names of fields that need to be
erased from the copied project tasks
                    * getDefaultObjectForCopyPartialProject
method returns the object containing the key, value pairs of
field names and values that need to be set on the copied tasks
                    */var CopyProjectFieldOverride =
Class.create();
                    CopyProjectFieldOverride.prototype =
Object.extendsObject(CopyProjectFieldOverrideSNC, {
                    getResetFieldsForCopyPartialProject:
function() {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
                    return ['work_start', 'work_end',
'work_duration'];
                    },
                    getDefaultObjForCopyPartialProject:
function() {
                    return {'state': -5,'percent_complete: 0'};
                },
                type: 'CopyProjectFieldOverride'
                });
```

To copy complete project:

```
/* getResetFieldsForCopyProject method returns the array
 containing the list of names of fields that need to be erased
 from the copied project tasks
            * getDefaultObjectForCopyProject method returns
 the object containing the key, value pairs of field names and
 values that need to be set on the copied tasks
            */var CopyProjectFieldOverride = Class.create();
            CopyProjectFieldOverride.prototype =
 Object.extendsObject(CopyProjectFieldOverrideSNC, {
            getResetFieldsForCopyProject: function() {
                    return
 ['work_start' ,"work_end","work_duration"];},
                    getDefaultObjForCopyProject: function()
                    {
                        return {'state': -5, 'percent_complete:
 0'};
                     },
                    type: 'CopyProjectFieldOverride'
                  });
```

4. Select **Update**.

Copy a project

Assign a project schedule

Assign a schedule to a project so that task durations and dates reflect real working days and hours.

Before you begin

Role required: it_project_manager

A project uses a schedule to determine which days and hours count as working time. Without an assigned schedule, a project treats every day as a full 24 hours, which makes task durations and the finish date unrealistic. Assign a schedule to base the project on real working time. If the schedules in the base system don't fit your needs, define a new one.

Procedure

1. Open a project.
2. If the **Default** view is active, right-click the header bar and select **View** > **Advanced**.
3. Select a schedule in the **Schedule** field and select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create baseline of a project

Create a schedule baseline and financial baseline of a project. A schedule baseline captures planned dates of all tasks and milestones at a particular moment in time. A financial baseline captures benefit and financial metric information (snapshot of cost plan, benefit plan, and project-level financial metrics) at a particular moment in time.

Before you begin

Role required: it_project_manager

About this task

Schedule baseline

You can create as many schedule baselines as necessary and review the changes that have been made to the project since the previous baseline. If a project is not on schedule, you can create a schedule baseline to know how much schedule slippage has occurred. It also helps to view the real-time deviations between actual and planned values.

The baseline appears as a set of gray lines below the bars that represent the actual tasks on the Gantt chart. These baselines represent planned dates, while the task bars represent the actual dates. If the project tasks are shifted to the right of the baselines, the project is running behind schedule.

Financial baseline

You can create as many financial baselines as necessary and compare them to review the financial changes that have been made to the project since the previous baseline. Any financial baseline does not capture actual cost component of the project.

Note: Nested projects cannot have baselines. Baselines are allowed for the top-level projects only.

Procedure

1. Navigate to **All** > **Project** > **Projects** > **All**.
2. Select the required project.
3. To create schedule and financial baselines of a project, use any of the following options.

Option	Steps
From the Financials tab	**a.** Open a project from planning page in Project Workspace. **b.** Select the **Financials** and select **Create baseline**. **c.** In the Create Baseline pop-up, enter a suit able name and description. **d.** Select **Save**.
From the Project Workspace	**a.** Open a project from planning page in Project Workspace. **b.** Select the baseline icon ( ). **c.** In the Create Baseline pop-up, enter a suit able name and description. **d.** Select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Steps
From a related link	**a.** Select the **Create Baseline** related link. **b.** In the Create Baseline pop-up, enter a suit able description. **c.** Select **Save**.
From a related list	**a.** Select the **Baselines** related list. **b.** Select the **Create Baseline** button. **c.** In the Create Baseline pop-up, enter a suit able name and description. **d.** Select **Save**.

Note: In the Create Baseline pop-up, the **Create Schedule Baseline** and the **Create Financial Baseline** check boxes are selected by default. Clear a check box if you do not intend to create a specific baseline.

Related topics

Compare financial baselines of a project

Compare schedule baselines of a project

Compare financial baselines of a project

Compare baselines to review the variances in the financial data of a project and see what changed.

Before you begin

Role required: it_project_manager

About this task

You can create multiple baselines at various stages of a project, for example, at the end of each phase or after every calendar month or quarter. Each baseline captures the financial data of the project at a particular moment. This provides a basis from which you can identify and review the changes made to the project. Having multiple baselines and comparing them helps you track the performance of your projects.

Procedure

1. To compare the financial baselines of a project, use one of the following options.

Option	Steps
From the Project Workspace	**a.** Navigate to **All** > **Project** > **Projects** > **Project Workspace**. **b.** Open a project. **c.** Select the **Financials** tab. **d.** Select the **Baselines** from header and then select **Compare baselines**.
From the Project form	**a.** Navigate to **All** > **Project** > **Projects** > **All**. **b.** Open a project.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Steps
	c. On the Project form, select the **Cost Plans** or **Benefit Plans** related list. **d.** Select **Manage**. **e.** On the **Financials** tab, select the baseline information icon (⋯) and then select **Compare Baselines**.
From the Baseline form	**a.** Navigate to **All** > **Project** > **Projects** > **All**. **b.** Open a project. **c.** On the Project form, select the **Baseline** related list. **d.** Open a baseline. **e.** On the Baseline form, select the **View Financial Baseline** related link.

2. On the Financial Baseline form, select the baselines you want to compare from the two choice lists.
   By default, the current and the most recent baselines are selected.
3. Select **Compare**.
   The comparative data of the baselines display in the following two sections:
   - The **Financial Baseline Summary** section displays four widgets. The first two widgets contain the financial data of the two baselines. The third widget contains their variance, and the fourth widget contains the actual costs to date of the project.
   - The **Financial Baseline Details** section displays the cost plans and benefit plans of the two baselines in two different grids. Each plan type has two rows corresponding to each baseline data.

     Note: Select the baseline legend icon (ⓘ) to see the color code of rows representing each baseline.

4. **Optional:** Review additional fields or reorganize the comparative data on the form.
   - To show or hide additional fields on the widgets in the **Financial Baseline Summary** section, select the configuration icon (⋯) and select the field names.

     The selected field preferences are saved and are available when you reopen the Financial Baseline form. To reset to the default widget layout, select **Reset to defaults**.
   - To view cost plan or benefit plan comparative data in yearly, quarterly, or monthly format, select the **Year** or **Quarter** or **Month** views respectively.
   - To toggle viewing the **Financial Baseline Summary** section, select the **Collapse** icon (^) or **Expand** icon (›).

Compare schedule baselines of a project

Compare baselines to review variance between tasks and identify which task has variance from the current planned end date and the baseline end date. The baseline variance column displays the amount of variance between the two date comparisons.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: it_project_manager

About this task
Create schedule baselines at various stages of a project, for example, at the end of each phase or after every calendar month or quarter. Each baseline captures the schedule information of project tasks at a particular moment. This snapshot provides a basis for comparison and helps you to identify and review the changes made to the project. Having multiple baselines and comparing them helps you track the performance of your projects.

Procedure
1. To compare the schedule baselines of a project, use one of the following options.

Option	Steps
From the Planning Console	**a.** Navigate to **All** > **Project** > **Projects** > **All**. **b.** Open the project for which you want to com pare baselines. **c.** On the Project form, select the **Planning Console** related link. **d.** On the Planning Console, select the more actions icon (···) and then from the Base lines list, select a baseline.
From the Baseline form	**a.** Navigate to **All** > **Project** > **Projects** > **All**. **b.** Open the project for which you want to com pare baselines. **c.** On the Project form, select the Baselines re lated list. **d.** Open a baseline. **e.** On the Baseline form, select the **View Base line on Planning Console** related link.

   The Planning Console displays the selected schedule baseline.
2. On the Planning Console, select different baselines to view schedule variance information of project tasks.
   The following columns display the baseline information:
   - **Baseline start date**: The planned start date for the task.
   - **Baseline end date**: The planned end date for the task.
   - **Baseline variance**: The difference between the baseline end date and planned end date. The value of this field column if there are any changes made to the project tasks or project. If the planned end date for a task is prior to the baseline date, the variance is shown as a negative value. For example, for a task with the planned end date of April 24 and the baseline created on April 17 means it is past due or late. The Baseline variance column in this case displays a value of -5 days.

   Note: Use the show or hide columns in gantt icon (⚙) to add these columns to the Planning Console.

Create baseline of a project

Create a milestone

A milestone is a project task with a duration of zero (0). Use milestones to mark key dates in your project, such as key decision points, approvals, and holidays. Milestones are treated like any other project task and you can create dependencies between tasks and milestones.

Before you begin
Role required: it_project_manager

About this task

Note: Milestones cannot be shared between projects unless one project is nested under another project.

Procedure

1. Create a project task and give the **Duration** field a value of **0**.
2. Open the planning console Gantt chart and verify that it appears as a diamond.
   You can also convert a task to milestone through Planning console tasks.

Activate project task email notifications

The following email notifications for the Project Management application are available by default, but are inactive. You must activate them manually.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System Notification** > **Email** > **Notifications**.
2. Activate the following notifications:

Email Notifications

Notification	Table	Field	Condition	Description
Project task assigned	pm_project_task	Assigned to	Inserted or updated	Sends an email notification when a task is assigned to a resource or the assigned resource is changed.
Project task started	pm_project_task	State	Changes to **Work in Progress**	Sends an email notification when the project task starts.
Project task commented	pm_project_task	Additional comments	Any changes occur	Sends an email notification when the comment field is updated.

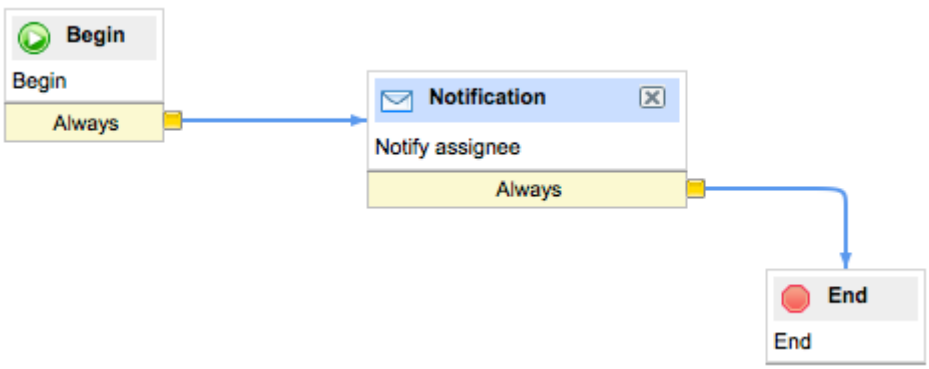
Set up project notifications with the workflow tool

Use the workflow tool, for example, to set up a workflow that sends an email notification when the state of a project task becomes **Work in Progress**.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure



1. Create a workflow with the following attributes:
   - **Name:** Notify assignee
   - **Table:** Project task [pm_project_task]
   - **If condition matches:** Run if no other workflows matched yet
   - **Condition:** State is **Work in Progress** and **Assigned to** is not empty

   Note: Do not modify other attributes in this example.

2. Add a single Notification activity between the Start and End activities.

   Drag the activity onto the connector line until it changes color. The attributes of the activity are similar to the following example:

   - **Name:** Notify assignee
   - **To:** ${assigned_to}
   - **Subject:** Project task ${number} has been activated and is assigned to you
   - **Message:**Project task ${number} has been activated and is assigned to you
     - Number: ${number}
     - Short description: ${short_description}
     - Planned start date: ${start_date}
     - Planned end date: ${end_date}
     - Planned duration: ${duration}

Activate project task email notifications

Change the planned start date of a project

Adjust the schedule of a project by changing the planned start date of a project and shifting it later or earlier than the current planned schedule.

Before you begin

Role required: it_project_manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Changing the planned start date of a project to a new date also moves all its tasks and subprojects relative to the updated start date of the project. You can change the planned start date of a project when the following conditions are true:

- The **State** of the project is Pending or Open.
- To move the start date of a project in WIP state, set the **Enable move project for WIP projects** property (*com.snc.project.move_project.wip*) to true. The default value of this property is false.
- No project_funding records are selected for execution.
- The project actual dates are not populated.

Note:

- The **Move project** option is available for a project only when it has a task or subproject.
- If an agile phase with sprints is associated to the project, changing the planned start date also clears the sprint start and end dates.

Procedure

1. Change the planned start date of a project using either of the following options.

Option	Steps
From the Planning console	**a.** Navigate to **All** > **Project** > **Projects** > **Project Workspace**. **b.** Open the project for which you want to change the planned start date. **c.** In the Planning Console, select the more actions icon (•••) and then select the **Move project** option.
From the Project form	**a.** Navigate to **All** > **Project** > **Projects** > **All**. **b.** Open a project for which you want to change the planned start date. **c.** On the Project form, select the **Move project** related link.

2. In the dialog box, pick a date.
3. Select or clear the **Move all tasks regardless of constraint type** check box.
   - Clearing the check box moves the tasks with Start ASAP constraint only to the new project date.
   - Selecting the check box moves all project tasks to the new project date with the same offset, regardless of their constraints. Tasks with Start ASAP constraint are excluded.

   This check box is selected by default.

   Note: The tasks in WIP and Close states are not moved.

4. Select **OK**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result

- The planned start date of the project is updated to the new date.
- Program dates are updated relative to the project start date.
- If the **Move all tasks regardless of constraint type** check box is selected, all project tasks with Start on specific date and Start no earlier than constraints are moved to a new start date by the same offset as from the earlier project start date. The constraint date is also moved by the same offset.

  For example, say a project is starting on November 10 with a Start On task starting on November 15, giving an offset of five days. If you move the project start date to November 20, the task start date moves to November 25. This maintains the five-day offset from the project start date.

- All project tasks with Start ASAP constraint are moved to the new start date based on the **Constraint Date** field on the project form. The tasks must be in the Open or Pending state.
- If the **Change Resource Plan and Cost Plan Start Date with Demand or Project Start Date Change** property is selected, all related entities like cost plan, resource plan, and benefit plans are moved relative to the project start date. For more information on how to set this property, see Properties installed with Project Management.

Pre-date a project task

Starting a project

Pre-date a project task

Move the planned start date of a task before the planned start date of a project. Adding a pre-dated task allows you to accommodate tasks which need to start before the planned start date of a project.

Before you begin

You should have created or added project tasks to your project.

Role required: it_project_manager

About this task

Before pre-dating a project task, note the following conditions:

- The property project.rollup_project_start_date should be set to true.
- Pre-dating a task's planned start date also moves the project's planned start date.
- The start date of a child task can't be moved before the parent task's start date. For example, a parent task with Start no earlier than constraint starts on the 20th and the child task starts on the 30th. The start date of the child task can only be moved up to the 20th.

Procedure

1. Navigate to **All** > **Project** > **Projects** > **All**.
2. Select the project from the list.
3. On the Project form, update the planned start date for a project task using either of the following options.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Steps
From the Project Task form	**a.** In the Project Tasks related list, select the project task which you want to pre-date. **b.** On the Project Task form, select the **Dates** tab and update the **Planned start date** for the task.
From the Planning Console	**a.** On the Project form, select the **Planning Console** related link. **b.** In the Planning Console, update the start date of the project task under the **Planned start date** column.

4. In the Move date dialog box, select **OK**.

Create a cost type definition

Create a cost type definition to associate a cost type, operating, or capital, to an account in the General Ledger from the Financial Management application. Create a cost type definition if you are using Project Portfolio Management with Financials.

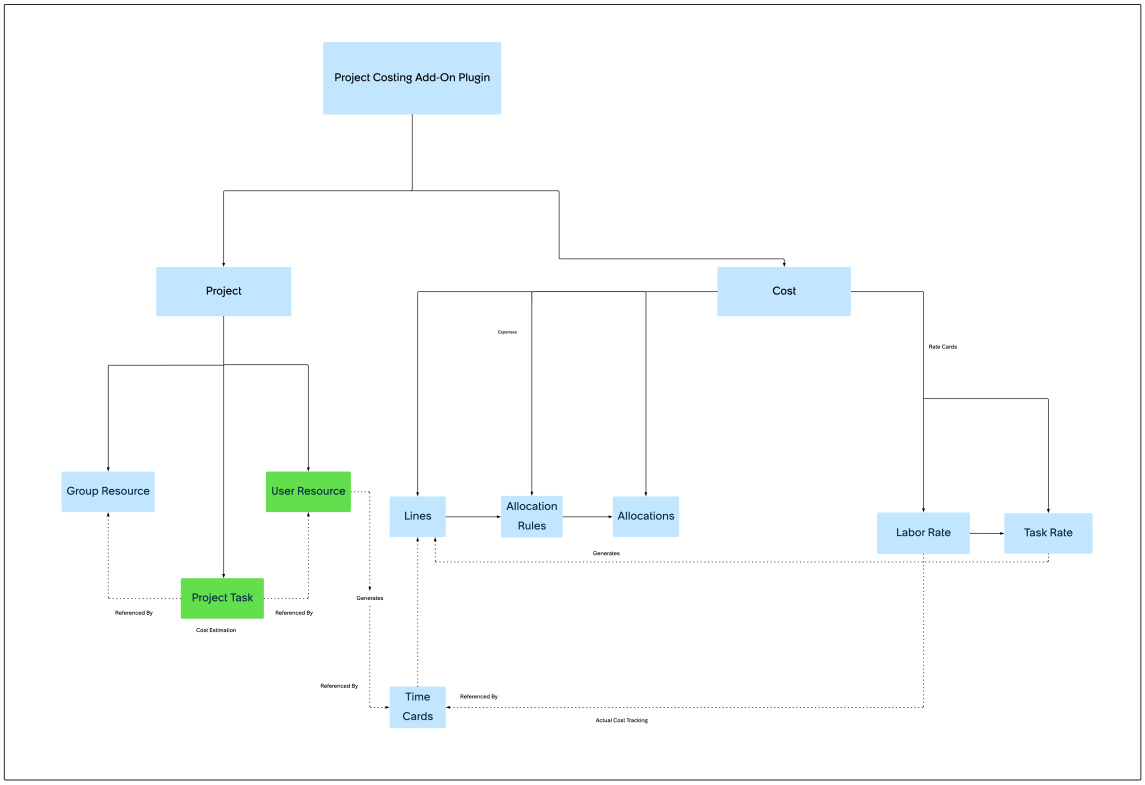
Before you begin
Role required: it_pps_admin

Procedure

1. Navigate to **All** > **Project Administration** > **Settings** > **Cost Type Definitions**.
2. Select **New** and enter name.
3. Select an account from the General Ledger Account [itfm_gl_accounts] table.
4. Select **Capex** if a capital expense or **Opex** if an operating expense.
5. Select **Submit**.

Costing add-on in Project Management

The Project Management costing add-on connects the Project Management application to the Cost Management application to allow for estimating and tracking the costs associated with projects.



This plugin enables the following project costing features:

- Estimate group resource costs during project planning.
- Tracking the actual cost of each user resource for a project.
- Track actual project task costs from time cards and other project expenses.
- Allocate project costs to the business.
- Represent project costs to the CIs that the project affects.
- Rollups of actual task expenses to parent tasks and the project record.

Costing add-on business rules

Name	Table	Description
Project Cost Rollup	Planned task [planned_task]	Default: **true**. This property is from Cost Management. When an expense line is created against any task of **planned_tasktype** and this property is true, the system calculates the total cost. The system gets a sum of the costs for all expense lines and sets the total in the **work_cost** field.
Process Top Task Parent	[fm_expense_line]	Default: **true**

Generate labor costs

Generate labor costs based on the planning attributes configured for financials in the planning attributes page for the resource assignments in a project.

Before you begin

- Review the planning attributes enabled for financials. For more information, see Using the Planning attributes.
- Role required: it_project_manager

Procedure

1. Navigate to **All** > **Project** > **Projects** > **All** and select the required project.
   Make sure that the resource assignments are finalized to generate cost plans. If there are no resource assignments for the project, migrate the resource plans to resource assignments. For more information, see Migrate resource plans and cost plans.
2. Generate labor costs using one of the following options.

Choice	Description
Using link from Financials Summary view	**a.** Select **Project Workbench** related link. **b.** Select **Financials** tab and select **Cost Plans**. **c.** Select **Generate Labor Costs**.
Using related links	Select the **Generate Labor Costs** related link.

Create a project status report

Create project status report from the related lists of the project form. The project status report created for the most recent status date updates the status of the project in portfolios.

Before you begin
Role required: it_project_manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The project status report shows snapshot status of RIDAC (Risk, Issues, Decisions, Actions, and Request Changes) records, key milestones,and charts only.

To include RIDAC records in the status report, select the **Show on project status report** option on individual RIDAC forms.

You can also print a project status report from project workspace. To print a report, select the print icon () in the header of **Status Report** tab.

Procedure

1. Create a project status report.

Option	Steps
From project workspace	**a.** Navigate to **All** > **Project** > **Projects** > **Project Workspace**. **b.** In **My Projects Space** page, select a project to open it in project workspace. **c.** Select the **Status Report** tab and select **Create new** in the header. **Note:** Alternatively, select a status report and select **Copy** from the choice list next to **Create new**. This option copies the selected status report including all fields into the new report.
From project record	**a.** Navigate to **All** > **Project** > **Projects** > **All**. **b.** In the project list, open a project record. **c.** Select the **Status Report** related link and select **New**.

2. On the status report form, fill in the details.
   For more information, see Status report form.
3. Select **Submit**.

Project status reports provide the most recent, at-a-glance progress of a project displayed in several categories.

Before you begin

Role required: it_project_manager

About this task

The project status report acts as a snapshot, meaning the report preserves the status of various parameters for the date and time when the status report is generated and does not display the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

status of various parameters dynamically. For example, the project status report created last week retains the same status as it was for that week and does not update the status dynamically. You can use the project status reports to compare the progress of your project. Generate a new project status report for your recent changes to reflect on the report.

The project status report shows snapshot status of RIDAC (Risk, Issues, Decisions, Actions, and Request Changes) records, key milestones, and charts only.

Procedure

1. Open a project status report.

Option	Steps
From project workspace	**a.** Navigate to **Workspaces** > **Project Work space**. **b.** From Projects page, select a project to open. **c.** Select the **Status Report** tab. **d.** Select a status report from the list to view its contents.
From project record	**a.** Navigate to **All** > **Project** > **Projects** > **All**. **b.** In the project list, open a project record. **c.** Select the **Status Report** related link. **d.** Select a status report from the list.
From Project Status form	**a.** Navigate to **All** > **Project** > **Projects** > **All**. **b.** In the project list, open a project record. **c.** Select the **Status Report** related list. **d.** Select **New** and create a project status re port. **e.** Select **Save**. **f.** Select **View**.

2. Review project status in the following sections.

Project status report sections

Section	Description
Overview	Provides a general overview about the project such as: ○ **Project Name**: Name of the project. ○ **Project Manager**: Project manager assigned to the project. ○ **Portfolio**: Primary portfolio to which the project belongs. ○ **State**: Current state of the project. ○ **Phase**: Current phase of the project such as Initiating, Planning, and Executing. ○ **% Complete**: Percentage of the project completed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Section	Description
	○ **Planned Start Date**: Intended date the project begins. ○ **Planned End Date**: Intended date the project ends. ○ **Planned Cost**: Estimated cost of the project. ○ **Actual Start Date**: Date on which the project began. ○ **Actual End Date**: Actual end date of the project. ○ **Actual Cost**: Actual cost of the project. This information is rolled up from the project form. If you had set your preference as project currency in the **Status report currency** field of the Project form, then the **Overview** tab displays the following project currency fields: ○ **Planned Cost in Project Currency**: Estimated cost of the project in project currency. ○ **Actual Cost in Project Currency**: Cost of the project in project currency. **Note:** The above fields appear when you enable the PPM Standard Multicurrency plugin (com.snc.ppm_multicurrency) and switch to the Project Currency view. For more information, see Multi-currency in project financials.
Summary	Provides information about the overall health of the project. ○ **Executive Summary**: Brief summary and analysis of the project. ○ **Last Week's Achievements**: Progress of the project in the previous week. ○ **Key Activities Planned**: Next planned activities for the project.
Cost (Planned vs. Actual) chart	If you have enabled the Project Currency view, then the Cost in Project Currency (Planned vs. Actual) section provides information about the actual cost versus the planned cost in project currency. This information is rolled up from the cost plan for the project. ○ **Planned**: Approved cost for the project. ○ **Actual**: Actual cost for the project is derived from the expense line created for the project cost plan and from the time cards created for the project.
Resource (Allocated vs. Actual) chart	Provides information about the actual resource hours used versus the allocated hours. This information is rolled up from the resource plan for the project. ○ **Allocated**: Resource hours that have been allocated to execute the project. ○ **Actual**: The actual time spent is taken from the processed time cards created for the project.
Current Status	Provides the status related to overall health, schedule, cost, resources, and scope of the project. This information is populated from the most recent status entered by the project manager for the project. ○ **Status**: Color indicator to signify the status. ○ **Comments**: Comments for the status.
Status History	Provides the trend of overall health, schedule, cost, resources, and scope of the project. The Status reports can have maximum 9 entries in the status history

© 2026 ServiceNow, Inc. All rights reserved.

Allocate budget to a project

Set the budget of a project according to the fiscal years.

Before you begin
Role required: it_portfolio_manager

Procedure

1. Open the project form.
2. In the related links, select **Project Budget**.
   The **Project Budget** dialog box opens.
3. Select the fiscal year for which you want to set the budget for the project.
4. Enter the amounts for **Capex Budget** and **Opex Budget**.
   The **Total Budget** is updated with the sum of capex and opex amounts.
5. Select **OK**.
   - If the project does not have any cost plan associated, then project budget is distributed by honoring planned start and end dates of the project.
   - If the project has any cost plan associated, then project budget is distributed by honoring the cost plan fiscal periods.

> **Note:** Negative budget amounts are supported. If you enter a negative **Capex Budget** or **Opex Budget** amount, or the associated cost plan has a negative total planned cost, the project budget is still distributed across the cost plan breakdowns and rolled up to the project financials.

Result
The project budget for the selected year appears in the **Project Budget** related list. You can select the amounts in the list to revise them.

Migrate budget of active projects to Next Experience

Migrate the project budget to Next Experience to manage the financials using Project Workspace.

Before you begin
Role required: it_project_manager

Procedure

1. Navigate to **All** > **Project** > **Projects** > **All**.
2. Migrate baselines using one of the following options.

Choice	Description
Using list actions	**a.** Select the required projects from the projects list. **b.** Select the **Actions on selected rows...** list and select **Migrate Budget**. **c.** On the migrate budget confirmation win dow, select **OK**.

Migrate financial baselines of projects to Next Experience

Migrate financial baselines of projects to Next Experience

Migrate the financial baselines of your project to Next Experience to manage the financial using Project Workspace.

About this task

Next Experience uses new data model that has two new tables Investment Baselines (`sn_invst_pln_invst_investment_baseline`) and Investment Baseline Header (`sn_invst_pln_invst_investment_baseline_header`) which are used to capture financial baselines. The financial baselines created for demands in classic experience aren't visible in Next Experience. You can migrate the existing baselines from classic to Next Experience as an on-demand activity for the required projects, or as bulk by activating and running a scheduled job.

Baselines view in the Next Experience provides better insights to view and analyze the financial performance of your projects.

Unlike the financial baselines created using Next Experience, the financial baselines created in the Classic UI don't capture the actual expenses along with planned costs as a default behavior. To have relevant information for baselines comparison, the baseline migration captures the actual costs. The migration uses the processed expense lines as of the baseline creation date of the financial baseline.

For detailed information and use cases on using financials in Next Experience, see Managing financials for planning items in Portfolio Planning.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Starting March 2026 release, for customers using multicurrency, migration of financial baselines updates the baseline data in project currency to investment currency.

1. Existing projects that have only project baselines but no investment baselines. With the migration, project baseline will be migrated to investment baseline and you can view the migrated baseline from the `sn_invst_pln_invst_investment_baseline` table list view.
2. Existing projects that have both project and investment baselines require a scheduled job. Run the scheduled job to populate the investment currency fields in the baselines with the values from project currency. For more information, see Activate scheduled job to populate to multicurrency fields.

Before you begin

The data in project currency fields will be migrated to investment currency fields on migrating baselines for customers using multicurrency.

Role required: it_project_manager

Procedure

1. Navigate to **All** > **Project** > **Projects** > **All**.
2. Migrate baselines using one of the following options.

Choice	Description
Using list actions	**a.** Select the required projects from the projects list. **b.** Select the **Actions on selected rows...** list and select **Migrate Financial Baselines**. **c.** Select **OK** on the Migrate Financial Base lines confirmation window.
Using related links	**a.** Open the required project. **b.** Select the **Migrate Financial Baselines** re lated link.
Activate a scheduled job	**a.** Navigate to **All** > **System Definition** > **Scheduled Jobs**. **b.** Filter the Name field to locate the **Migrate financial baselines to Next Experience** scheduled job and open it. **c.** Select **Active** and on the Scheduled Script Execution form, fill the fields. For a description of the field names, see Scheduled Script Execution Form. **d.** Select **Update**.

Tip: After migration, you're encouraged to create financial baselines using the Financials in Next Experience.

Migrate budget of active projects to Next Experience

Adding external dependencies for projects

As a project manager, you can use an external dependency to set up a dependency from a task in one project to a task in another project.

External dependencies help you to see the impact of changes in project schedules when a predecessor project changes.

How external dependencies work

To define the external dependency, select a project task from the predecessor project to be linked to the task in the successor project. When an external dependency is added, the system adds shadow tasks in both the successor and predecessor projects.

A shadow task is a read-only task in the respective project. It has the database attribute **shadow** set to true and **orig_sys_id** pointing to the **sys_id** of its original task. The shadow task is kept in sync with its original task whenever the relations are processed.

In addition to the shadow tasks, two shadow relations are also added in the planned_task_rel_planned_task table. These relations are shadows of the original relations.

For example, for two projects, project P1 is the predecessor project, and P2 is the successor project. Project P1 has a task T1, and project P2 has a task T2.

If an external dependency is created from T1 to T2, the following tasks are added in the two projects:

Project	Task
P1	Shadow of T2
P2	Shadow of T1

After adding the external dependency, the following shadow relation records are created in the planned_task_rel_planned_task table:

Parent	Child	Project	External
T1	T2		True
Shadow of T1	T2	P2	False
T1	Shadow of T2	P1	False

Where:

- `Parent` is the predecessor project.
- `Child` is the successor project.

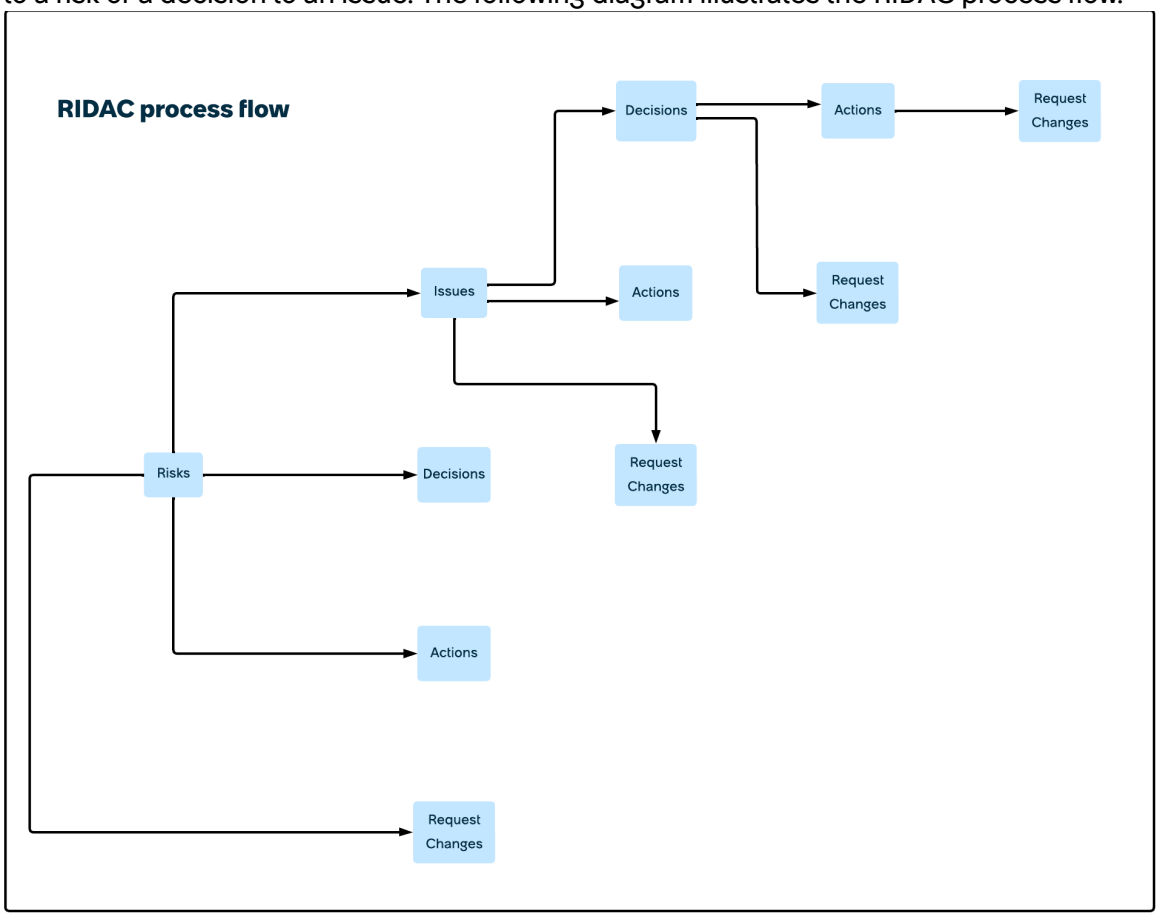
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- `Project` is the project where the relation is seen.
- `External` is the external dependency.

Adding RIDAC records for a project



Create a risk record for your project that you can convert to other records during the project life cycle. Track issues and avoid copying relevant details in the related records.

As a project progresses through the project life cycle, a risk might result in an issue, or a new issue might occur. After you have a risk record, you can convert that record into related records such as issues, actions, or decisions. The conversion and association of records helps you analyze and identify patterns, trends, and probable resolution for planning future projects.

Plan and manage all RIDAC records on a single RIDAC page in Project Workspace. This page enables you to create, edit, convert, and associate RIDAC records on a central location. Navigate to the RIDAC page or Classic Project Workspace from Project Workspace interface.

Consider the following points before converting or associating RIDAC records in Project Workspace:

- You can convert one record to another only in the RIDAC sequence. For example, you can convert a risk to an issue, decision, action, or request change. You can't convert an issue to a risk or a decision to an issue. The following diagram illustrates the RIDAC process flow.

- You can convert one record into multiple RIDAC records. For example, you can create multiple issue records from one risk record.

  For converting RIDAC records in Classic Project Workspace, see Convert RIDAC records for a project. For converting RIDAC records in Project Workspace, see Convert one RIDAC record to another for a project in Project Workspace.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- You can associate one record with multiple different records. For example, you can link one issue record to multiple different risk, decision, action, or request change records.

  For associating RIDAC records in Classic Project Workspace, see Associate existing RIDAC records for a project. For associating RIDAC records in Project Workspace, see Associate existing RIDAC records for a project in Project Workspace.

Add risks for a project

Add a risk to a project to identify, analyze, prioritize, plan, and track a risk during any phase of the project life cycle. Assess potential problems and the severity of their impact to take informed decisions about the project.

Before you begin

Role required: it_project_manager

About this task

A risk is any uncertain event that can potentially impact the success or outcome of a project. For example, an incorrect estimate of factors like financial outlay or resource assignments can cause schedule slippage. Another example of a risk is a change in project requirements. Recording risks ensures that decision makers have all relevant information when assessing a project's progress. A project manager can add risks to a project and assess them. While adding risks, the project manager can add risks from an existing library of project risks that are applicable for their unique projects.

Procedure

1. Navigate to **All** > **Project** > **Projects** > **All**.
2. Select the project to which you want to add risks.
3. In the Risks related list, select **New**.
4. Alternatively, select **Create from Library** if you have the Advanced Risk plugin activated.
   a. Select the risk statements as required.
   b. Select **Create Risks**.
   Only the risks statements that belong to the Project category are displayed for the user.
5. On the Risk form, fill in the fields.

   For more information, see Risk, issues, decisions, actions, and request change (RIDAC) form.

   Note: The Risk Assessment Summary section only appears when the *Enable Advanced Risk PPM Integration* property is enabled.

6. Select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

- Assess the risks that have been added. For more information, see Assign project risks to stakeholders for assessment
- Convert an existing risk to an issue, decision, action, or request change and close the risk. For more information, see Convert RIDAC records for a project.
- Associate the risk with existing issues so you can track dependencies and recognize trends for the future. For more information, see Associate existing RIDAC records for a project.

Adding RIDAC records for a project

Configure custom Risk rank and Risk value for a project

Convert RIDAC records for a project

Associate existing RIDAC records for a project

Configure custom Risk rank and Risk value for a project

Configure custom risk rank and value scores (such as High-Medium, Medium-Low, or Absolute-Low) to rate the impact and probability factors for a risk.

Before you begin

Role required: pps_admin

About this task

Use the Risk Value Lookup module to set up the risk rank and risk value for a specific combination of risk impact and probability. The system uses these values to determine the degree of risk (Absolute, High, Medium, Low) based on the impact and probability factors of a risk.

The value in the **Probability** field is multiplied by the value of the **Impact** field to generate the values for the **Risk rank** and corresponding **Risk value** in the Risk form.

By default, you can use the following impact, value, and probability scores for a risk to create a risk rank and risk value score:

- Absolute
- Low
- Medium or Moderate
- High

For example, a risk might have high probability and medium impact but you might want to consider it as an overall low risk for the project. In that case, you would configure the Risk Value Matcher form with the following values:

- Impact = 2 Medium
- Risk Rank Color = Green
- Probability = High
- Probability Number = 1
- Risk Value = 3 Low

Add issues for a project

Add an issue to a project to escalate a risk or track an unexpected problem. Unresolved issues can cause conflicts, delays, or project failure.

Before you begin
Role required: it_project_manager

Procedure

1. Navigate to **All** > **Project** > **Projects** > **All**.
2. Select the project to which you want to add an issue.
3. In the Issues related list, select **New**.
4. On the Issue form, fill in the fields.

   For more information, see Risk, issues, decisions, actions, and request change (RIDAC) form.
5. **Optional:** Search in the knowledge base for any article related to the issue.

   a. Select the search knowledge icon ( ).

   b. If you find relevant articles, select the title of an article to view its content.

   c. If you want to include the content of the article in the issue, select **Attach to Issue**.
   The article content is copied in to the **Description** field of the Issue form. You can modify the text if necessary.
6. Select **Submit**.

What to do next

- Convert an existing issue to decision, action, or request change and close the issue. For more information, see Convert RIDAC records for a project.
- Associate the issue with your existing risks so you can track dependencies and recognize trends for future. For more information, see Associate existing RIDAC records for a project.

Add decisions for a project

As a project manager, develop a plan to manage risks and issues proactively with solutions. Add the solution for a risk or issue to a project in the form of a decision. You can also convert a risk or an issue to a decision or a decision to an action or a request change.

Before you begin

Role required: it_project_manager

Procedure

1. Navigate to **Project** > **Projects** > **All**.
2. Select the project to which you want to add a decision.
3. In the Decisions related list, select **New**.
4. On the Decision form, fill in the fields.

   For more information, see Risk, issues, decisions, actions, and request change (RIDAC) form.
5. **Optional:** Search in the knowledge base for any article related to the decision.

   a. Select the search knowledge icon ().

   b. If you find relevant articles, select the title of an article to view its content.

   c. If you want to include the content of the article in the issue, select **Attach to Decision**. The article content is copied in to the **Description** field of the Decision form. You can modify the text if necessary.
6. Select **Submit**.

What to do next

- Convert a decision to an action or request change and close the decision. For more information, see Convert RIDAC records for a project.
- Associate the decision with your existing issues and risks so you can track dependencies and recognize trends for future. For more information, see Associate existing RIDAC records for a project.

Related topics

Adding RIDAC records for a project

Add actions for a project

Add actions that are required for resolving an issue or risk for a project. You can also convert a risk, issue, or decision to an action based on your analysis and plan for resolution of a risk or issue.

Before you begin

Role required: it_project_manager

About this task

After analyzing the risks and issues and taking a decision on how to manage them, add an action to resolve the risk or issue.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Project** > **Projects** > **All**.
2. Select the project to which you want to add an action.
3. From the Actions related list, select **New**.
4. On the Action form, fill in the fields.

   For more information, see Risk, issues, decisions, actions, and request change (RIDAC) form.
5. **Optional:** If the action requires approval from other stakeholders, request approval with a due date using the **Approval** and **Due date** fields.
6. Select **Submit**.

What to do next

- Convert an action to a request change and close the action. For more information, see Convert RIDAC records for a project.
- Associate the action with your existing risk, issue, and decision records so you can track dependencies and recognize trends for future. For more information, see Associate existing RIDAC records for a project.

Adding RIDAC records for a project

Create a request change

As a project manager, you might create a request change as the outcome of the action taken to resolve an issue or mitigate a risk. The request change might result in changing the project's scope, resource requirement, cost, or schedule to minimize the impact of a risk or issue.

Before you begin

Role required: it_project_manager

Procedure

1. Navigate to **Project** > **Projects** > **All**.
2. Select the project to which you want to add a request change.
3. In the Request Changes related list and select **New**.
4. On the form, fill in the fields.

   For more information, see Risk, issues, decisions, actions, and request change (RIDAC) form.
5. Select **Submit**.

What to do next

- Associate the request change with your existing risk, issue, decision, and action records so you can track dependencies and recognize trends for future. For more information, see Associate existing RIDAC records for a project.
- Create tasks for working on the change request. For more information see, Create a task from an incident, problem, or change request.

Convert RIDAC records for a project

Convert one RIDAC record (risk, issue, action, decision, and request changes) to another to retain the record information and track the issue.

Before you begin
Role required: it_project_manager

About this task
When you convert a RIDAC record to another record, the values for the **Short description**, **Requester**, and **Assigned to** fields are carried forward.

You can also specify to close the parent record on creation of the new record instead of manually closing the parent record.

You can also view the consolidated list of all converted RIDAC records using the **View RIDAC** related link on the Project form. You can also access this list using **View RIDAC** in the application navigator of the Project module.

Procedure

1. Navigate to **Project** > **Projects** > **All**.
2. Select the project for which you want to convert a risk, issue, decision, action, or request change record to another RIDAC record.
3. From the Project form related list, select the risks, issues, decisions, actions, or request changes record to open the form view.
4. Select the **Convert to RIDAC** related link on the form.
5. **Optional:** On the Convert dialog box, from the Select task type list, select the RIDAC record to which you want to convert the selected record.
   For example, if you wanted to convert a risk to an issue, you would select **Issue**.
6. **Optional:** Modify the text in the **Short description** field, which is copied from the parent record.
7. **Optional:** Change the default assignment copied from the parent record in the **Assigned to** field by selecting the lookup icon ( ) and selecting a different user.
8. **Optional:** If you want to close the parent RIDAC record on creation of the new record, select the close parent record option.
   The label of the close parent record option changes depending on the parent record type.
   For example, if the parent record is Risk and you're converting it to an issue record, the close record option would appear as **Close Risk**.
9. Select **OK**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

You can associate one record with multiple different records. For example, you can link one issue record to multiple risk, decision, action, or request change records.

Procedure

1. Navigate to **Project** > **Projects** > **All**.
2. Select the project for which you want to associate one RIDAC entry to another.
3. In the Project form related list, select the RIDAC record.
4. On the form, select the **Associate RIDAC** related link.
5. In the Associate dialog box, from the Select type list, select the RIDAC record to which you want to associate the selected record.
   For example, if you wanted to associate a risk to an issue, you would select **Issue**.
6. Select the record number to which you want to associate the selected record from the Associate to list.
   For example, if you wanted to associate the selected risk to issue (ISU0010003), you would select **ISU0010003**.
7. Select **OK**.

Applying templates to projects

A project template defines the basic structure of a project.

Project templates can include project tasks and subtasks, attachments, checklists, and other project information. Because projects often get repeated, templates enable you to create, save, and reuse project structure. You can also modify existing templates, create projects from templates, and apply templates to empty projects. A project is considered empty when it does not contain any subtasks.

With the project manager role, you can:

- Create project templates
- Use templates to create a project

With the PPS admin role, you can modify the project template configuration.

Create a project template

Create a template from an existing template or a project.

Before you begin

Role required: it_project_manager

About this task

When you create a template from a project, all the project attachments and checklists are copied to the template. You can add or remove attachments from the template using the Project Template form. A project template created from an off-schedule project honors the off-schedule tasks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Create a template.

Option	Steps
From an existing template	**a.** Navigate to **All** > **Project** > **Projects** > **Templates**. **b.** Open the desired project template. **c.** Select the **Copy Template** related link at the bottom of the form. **d.** The Copy Template dialog box opens. The **Template** field is auto-filled with the current template name.
From a project	**a.** Navigate to **All** > **Project** > **Projects** > **All**. **b.** Open the desired project. **c.** Select the **Save as New Template** related link at the bottom of the form. **d.** The Create Template dialog box opens.

2. Fill in the following fields:
   - **Template name**: enter a unique name for the new template.
   - **Description**: enter a brief description of the new template.
3. Select **OK**.
   The project template form opens for the newly created template.
4. Make any desired changes to the fields on the project template form.
   The top section of the Project Template form includes basic template information, such as the template name and description. The middle section of the project template form defines the specific data included in the template. The information in this section is built from fields on the project [pm_project] table that the user selects and the values for those fields that the user defines.
5. Select **Update**.

Related topics

Applying templates to projects

Add an attachment to a project template

Attach a file to a project template just as you can attach a file to a project or task.

Before you begin

Role required: it_project_manager

Procedure

1. Navigate to **All** > **Project** > **Projects** > **Templates**.
2. Open the desired template.
3. Select the **Attachments** tab to open the related list.
4. Select **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select **Browse** on the Attachments dialog box and select a file.
6. If desired, select **Add Another Attachment** to select another file.
7. Select **Attach**.
   The selected file appears in the Attachments related list.

Apply a template on the Project form

While creating a project using the Project form, you can apply a project template to include project tasks and subtasks, attachments, checklists, and other project information. You can apply a project template to a new project or an existing project.

Before you begin
Role required: it_project_manager

About this task
A project created from the off-schedule project template honors the off-schedule tasks and adjusts the dates according to the given start date.
When applying a template to a project, the project state is set to the default state. Activate the default project state (pm_project.state = -5), and use it as the default value as it is Out Of The Box. You can update the label for the **State** field to meet your requirements if **Pending** doesn't fit well.

Procedure
- To apply a template on the blank project form:

  1. Navigate to **All** > **Project** > **Projects** > **Create New**.
  2. Select the link next to **To create project from a template**.
     The **Apply Template** window appears.
  3. Enter the project name, select the start date, and select a project template.

- To apply a template to an existing project without any project tasks or subprojects:

  1. Navigate to **All** > **Project** > **Projects** > **All** and select a project.
  2. Select the **To apply template click here** link.
     The **Apply Template** window appears.
  3. Select the start date and select a project template.

Apply template to an existing project

Apply one or multiple project templates to an existing project from the project form or Planning Console.

Before you begin
Role required: it_project_manager

About this task
A project created from the off-schedule project template honors the off-schedule tasks and adjusts the dates according to the given start date.
When applying a template to a project, the project state is set to the default state. Activate the default project state (pm_project.state = -5), and use it as the default value as it is Out Of The

Box. You can update the label for the **State** field to meet your requirements if **Pending** doesn't fit well.

Important: Application of template on a project having project tasks does not apply header information and only appends project tasks after the last project task of the project.

Procedure

1. Apply project template to an existing project from any of the following locations.

Location	Step
From Project form	**a.** Navigate to **All** > **Project** > **Projects** > **All**. **b.** Open the project to which you want to ap ply project template. **c.** In the Project form, based on the existing project tasks or subprojects, apply the tem plate using any of the following options: ▪ If there are no tasks or subprojects, se lect the **To apply template click here** link. ▪ If there are tasks or subprojects, select the **Apply Template** related link.
From Planning Console	**a.** Navigate to **All** > **Project** > **Projects** > **All**. **b.** Open the project to which you want to ap ply project template. **c.** In the Project form, select the **Planning Con sole** related link. **d.** In the Planning Console, select the more ac tions icon ( ) and select **Apply Template** option.

2. In the Apply template dialog box, from the Project template list, select a project template.
3. Select **Save**.
4. **Optional:** To apply multiple project templates, repeat the steps 1 to 3.
   Tasks from the template are added at the end of the last task.

Apply template to a blank project in project workspace

When you create a new project in the project workspace, you can apply a template.

Before you begin

Role required: it_project_manager

About this task

A project created from the off-schedule project template honors the off-schedule tasks and adjusts the dates according to the given start date.
When applying a template to a project, the project state is set to the default state. Activate the default project state (pm_project.state = -5), and use it as the default value as it is Out Of The Box. You can update the label for the **State** field to meet your requirements if **Pending** doesn't fit well.

Starting a project

Project template configuration

The Project Template Configuration list defines the items that are included in a template.

Navigate to **All** > **Project Administration** > **Settings** > **Template Config** to display the Project Template Configuration list. Each item in this list has:

- A defined parent table. The exception is pm_project, which is the root or top-level object in the template.
- A link element. A field that links the parent table and the child table.
- A list of fields to include in the template. The fields defined in this column are the fields that are copied to a project template.

The Project Template Configuration list contains three default template configuration items: project, project task, and project subtask. You can modify these default items or create additional items from this list.

Default Project Template Configuration Items

Item	Definition	Parent	Link Element
pm_project	Project object	None. This object does not have a parent because it is the root level.	None. This object does not have a link element because it is at the root level.
pm_project_task	Project task object	pm_project	Parent. Because this task object is one level below the root level, it uses the parent table as a link element.
pm_project_task	Project subtask object	pm_project_task	Parent. Because this subtask object is two levels below the root level, it uses the parent table as a link element.

Select an item in the Project Template Configuration list to open the project Template Configuration form. For more information, see Project template configuration form.

Project Template Configuration form

Add a project template configuration item

Add a project template configuration item to include in a template.

Before you begin

Role required: it_pps_admin

Procedure

1. Navigate to **All** > **Project Administration** > **Settings** > **Template Config**.
2. Select **New**.
3. Fill in the fields on the Project Template Configuration form.
   For more information, see Project template configuration form.
4. Select **Submit**.
   For example, to add a requirement object to the project template configuration, fill in the fields as follows:
   - **Table**: Requirement [dmn_requirement]
   - **Parent table**: Project [pm_project]
   - **Link element**: Parent
   - **Active**: Enable this check box
   - **Elements**: short_description, description, priority, type, state

Project template configuration

Modify a project template configuration item

Modify a project template configuration item included in a template.

Before you begin

Role required: it_pps_admin

Procedure

1. Navigate to **All** > **Project Administration** > **Settings** > **Template Config**.
2. Select a configuration item from the list.
3. Make any desired changes to the fields on the Project Template Configuration form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select **Update**.
   To delete a project template, select a configuration item from the list and select **Delete**. Do not delete any of the default template configuration items: project, project task, or project subtask. Doing so affects the ability to create project templates.

Importing and exporting projects

You can manage projects using both Microsoft Project and the ServiceNow Project Management application.

Project Import

Users with it_project_manager role can import projects and project tasks from Microsoft Project into ServiceNow Project Management.

Create a project or update an existing project by importing the project data from Microsoft Project into your ServiceNow instance. For more information, see Project import from Microsoft Project.

While importing a project into your ServiceNow instance, you can also specify the calculation method for calculating project dates. You can import the project tasks with different constraint types using Manual or Automatic calculation. For information about supported constraints and their conversion, see Project import from Microsoft Project.

You can create custom fields in your ServiceNow instance and map these fields with your Microsoft Project while importing a project. For more information, see Map custom fields for Microsoft Project import.

You can import project tasks for multiple projects in one time using data files and transform maps. For more information, see Import project tasks for multiple projects.

Some calendar elements are not imported from Microsoft Project into Project Management. For information about calendar elements and schedules, see Calendars and schedules- Limitations.

Project Export

If you have the it_project_manager role, you can export project data. The project data, such as project tasks and task constraints, can be exported as an export file. Use this export file to import the projects into other ServiceNow instances.

If you're managing your projects using Microsoft Project, you can export your ServiceNow projects using the export functionality.

You can choose to export the project data in MPP, XML, or CSV file formats. For more information, see Project export to Microsoft Project.

If your project in the ServiceNow instance contains dates with any of the supported constraint types, these constraints are also exported. For more information, see Project export to Microsoft Project.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported versions

Projects created in the following versions of Microsoft Project can be imported into the ServiceNow Project Management application.

- Microsoft Project 2003
- Microsoft Project 2007
- Microsoft Project 2010
- Microsoft Project 2013
- Microsoft Project 2016

Project field mapping

During an import, values from Microsoft Project overwrite fields in project records.

Project Field Mapping

Microsoft Project fields	Project Management fields
Task Name	Short description. The field is overwritten only while you import the first time.
Note	Description
Start	Planned start date
Finish	Planned end date
Duration	Planned duration
Actual Start	Actual start date
Actual Finish	Actual end date
Actual Duration	Actual duration
% Complete	Percent complete (personalize the form to add this field)
Predecessor Lag	Lag time between predecessor and successor
WBS	WBS
Critical	Critical path
Rollup	Rollup
Text10 (Field used for syncing purposes)	Task Sys_Id
Project Header Title	Project name
Project Header Subject (Field used for syncing purposes)	Top Task Sys_Id
Resource	Assigned to [assigned_to] **Note:** During import, if there are multiple resources assigned to a task in Microsoft Project: • The first resource is added to the **Assigned to** field. • The rest of the resources are added to the **Additional assignee list** field.

Map custom fields for Microsoft Project import

Map custom fields from Microsoft Project to ServiceNow fields before importing a project.

Before you begin

Create custom fields in your ServiceNow instance before mapping them with Microsoft Project. For more information, see Add and customize a field in a table.

Role required: it_pps_admin

About this task

Map the custom fields that you create in your ServiceNow instance with custom fields in the Microsoft Project file you plan to import.

The supported data types for field mapping between Microsoft Project and ServiceNow instances are:

- True/False
- Calendar
- Date/Time
- Choice
- Color
- Currency
- Decimal
- Due Date
- Floating Point Number
- Date
- Date/Time
- Duration
- List
- Time
- HTML
- Integer
- Long
- Percent Complete
- Phone Number (E164)
- Reference
- Name -Value Pairs
- String

- Translated HTML
- Translated Text
- URL
- Wiki

Procedure

1. Navigate to **All** > **Project Administration** > **Project - MSP Import Field Mappings**.
2. Select **New**.
3. From the Table list, select the table in which you created the custom field.

Task	Steps
If you created a field in the project table	Select **Project** from the Table list.
If you created a field in the project task table	Select **Project Task** from the Table list.

4. In the **Microsoft Project Column** field, enter the name of the custom field in your Microsoft Project file that you want to map.
5. In the Destination Column list, select the custom ServiceNow field that you want to map to the Microsoft Project field while importing a project.
6. Select **Submit**.

What to do next

- Import the Microsoft Project file. For more information, see Import a Microsoft Project file with the Import module.
- Configure the Project form to add the custom fields that you want to see. For more information, see Form configuration .

Related topics

Importing and exporting projects

Project import from Microsoft Project

Import Microsoft project files into the ServiceNow Project Management application.

Users with the project manager role can import a project using:

- Import module
- Project form
- Planning Console

When you import a project as a new project or into an existing project, the projects are updated as follows:

- New project: A new record is created in the Project [pm_project] table. The tasks associated with the project are added to the Project Task [pm_project_task] table.

  Only the common or mapped fields are imported. Imported projects are brought into the instance with both Priority and Risk set to Low.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Existing project: The instance checks the Text10 field in the top-level Microsoft Project task. If the Text10 field contains a recognizable sys_id, it means that the project was previously exported from a ServiceNow instance. In this case, the values from the project overwrite the values for the existing project.

You can also specify the schedule calculation type as **Automatic** or **Manual** for the imported tasks. When you import a project into the instance, project constraints are converted as follows:

- The time constraint for all imported tasks, when you select calculation type as **Manual**, is set to **Start on specific date** irrespective of their constraint type in Microsoft Project.
- The following constraint types are supported when you select calculation type as **Automatic**:
  - **Start on specific date**
  - **As soon as possible**
  - **Start no later than**
  - **Start no earlier than**

  Tasks with other constraint types are converted to **Start on specific date**.

Note: The resource name in Microsoft Project should map to the name of the user in the instance.

Related topics

Importing and exporting projects

Import a Microsoft Project file with the Import module

Use the Import module to import a Microsoft project file as a new project into the Project Management application.

Before you begin

Role required: it_project_manager

About this task

Before importing a Microsoft Project file into the ServiceNow instance, consider the following information.

- Microsoft Project project imported into a teamspace is only available to users who can access the teamspace.
- To import custom fields in your Microsoft project, create those custom fields in your ServiceNow instance first, and then create mapping between these fields before importing the project. For more information, see Map custom fields for Microsoft Project import.

  Note: You can also use the Scripted Extension Points for importing custom fields without creating and mapping the custom fields manually. Use the *`MSProjectImportTaskFormatter`* Extension Point to create a script include and map custom fields in Microsoft Project and ServiceNow. You can also use this Extension Point to modify the data while importing a project.

- If the calculation type is set as **Manual**, recalculation does not happen on project tasks when they are imported from the Microsoft Project file. Once the project is in the ServiceNow system, it would be treated as a manual project.
- Importing a Microsoft Project project with inter-project dependencies, does not import the shadow tasks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Only the subprojects (header and parent task) get imported into the ServiceNow instance, the child tasks aren't imported.
- While importing a Microsoft Project file into ServiceNow, the import fails:
  - If the project with tasks was created in ServiceNow instance before the import.
  - If you reimport a project that was imported from Microsoft Project file earlier and you create and add tasks in ServiceNow instance.

    Note: To retain the project tasks that were created in the ServiceNow instance, you must export that project first into the Microsoft Project file. Then, reimport the file back into ServiceNow instance.

  - If the task being deleted due to import has any of the related entities: Cost plan, Benefit plan, Resource plan, Time card, or Expense lines.
  - If the values for lag or lead time dependencies aren't in the supported format.
    - Positive lag time dependency values for days, hours, and minutes are allowed. Negative lag time dependencies are allowed only for days.
    - All other elapsed duration types from Microsoft Project such as emin, eday, eweek, emon, eyr, or % aren't allowed for import.

Procedure

1. Navigate to **All** > **Project** > **Projects** > **Import**.
2. Select **Choose File** to select a Microsoft Project (mpp) file.
3. To import the Microsoft project as a new project, select the **Create new project** option.
4. **Optional:** In the **Project name** field, specify a name for the new project.
5. To import the Microsoft project as a subset of an active, existing project:
   a. Select **Update an existing project**.
   b. Select the reference lookup icon () and select a project or task.
   Only active projects appear in the list.
6. Select one of the following options to specify the method for calculating schedule:
   - **Automatic**: Select this option to apply the scheduling engine while importing the project tasks. The supported constraint types are imported with same constraints applied to them while other constraint types are converted to **Start on specific date**.
   - **Manual**: Select this option to import all project tasks with **Start on specific date** constraint type irrespective of their constraint type in Microsoft Project.

   For more information about supported constraint types, see Project import from Microsoft Project.
7. Select **Import**.

Result

- A project task that was imported earlier and has associated time cards, resource plans, cost plan, benefit plan, or expense lines is retained on reimport. The task is retained even if it is deleted from Microsoft Project.
- Dates in the ServiceNow project remain same as the dates in the Microsoft Project file.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- In a ServiceNow project with subprojects, the following details change:
  - The WBS order of imported tasks is regenerated after import.
  - The **Planned Start Date** and **Planned End Date** of the parent project are rolled up.
  - The **State** of the parent project and tasks are rolled up.
  - The % Complete on the top task is rolled up.

Importing and exporting projects

Update a project using a Microsoft Project file

Import project data, from a Microsoft Project file, into an existing project in your ServiceNow instance using the Project form or Planning Console.

Before you begin

Create a project.

Role required: it_project_manager

Procedure

1. Navigate to **All** > **Project** > **Projects** > **All**.
2. Open the project which you want to update.
3. Import the Microsoft Project file to update the selected project from any of the following screens:
   - In the Project form, select **Import from MS Project** from the context menu.
   - In the Planning Console, select the more actions icon ( ) and select the **Import from MS Project** option.
4. In the Microsoft Project Import dialog box, select the Microsoft Project file and calculation type:

   a. Select **Choose File** to select a Microsoft Project (mpp) file.

   b. Select one of the following options to specify the method for calculating the schedule:
      - **Automatic**: Select this option to apply the scheduling engine while importing the project tasks. The supported constraint types are imported with the same constraints applied to them while other constraint types are converted to **Start on specific date**.
      - **Manual**: Select this option to import all project tasks with the **Start on specific date** constraint type irrespective of their constraint type in Microsoft Project.

      For more information about the supported constraint types, see Project import from Microsoft Project.

5. Select **Import**.

Result

- A project task that was imported earlier and has associated time cards, resource plans, cost plan, benefit plan, or expense lines is retained on reimport. This occurs even if the task is deleted from Microsoft Project.
- Dates in the ServiceNow project remain same as the dates in the Microsoft Project file.
- In a ServiceNow project with subprojects, the following details change:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The WBS order of imported tasks is regenerated after import.
- The **Planned Start Date** and **Planned End Date** of the parent project are rolled up.
- The **State** of the parent project and tasks are rolled up.
- The **% Complete** on the top task is rolled up.

Related topics

Importing and exporting projects

Import project tasks for multiple projects

Import project tasks for multiple projects from an external file system or data source using import sets and transform maps.

Before you begin
Role required: import_transformer, import_admin, or admin

Procedure

1. Navigate to **All** > **System Import Sets** > **Load Data**.
2. Select the **Existing table** option.
3. From the Import set table list, select the **Import planned task [imp_planned_task]** option.
4. In the **Source of the import** field, select File, and then select **Choose File** to select the source Excel spreadsheet.
5. **Optional:** If required, specify the Work sheet and Header row number.
6. Select **Submit**
   The imported data is available in the selected Import Set table.
7. **Optional:** Create field mappings for custom columns.
   For more information, see Create field mappings.
8. Transform the data from the import set table to the target table.
   For more information, see Run an import.

Importing and exporting projects

Project export to Microsoft Project

If you are using Microsoft Project to manage project activities, you can export a project to Microsoft Project (mpp) file, an XML file, or a CSV file.

Users with the project manager role can export a project using:

- Export module
- Project form
- Planning Console

You can also specify the format in which you want to export project data, the available options are:

- **XML**: Suitable, if you want to import the project data into other ServiceNow instance.
- **CSV**: Suitable for exporting project data from Planning Console as is and viewing project data using other applications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Microsoft Project**: Suitable, if you want to import the project data into Microsoft Project.

Note: The option for exporting project data in CSV and Microsoft Project format is available when exporting a project from Planning Console.

If tasks in your project contain any of the supported constraints, then the constraints are also exported when you export the project. This export of constraints helps you in maintaining project dates when you import the project to another ServiceNow instance. The following constraints are supported:

- **Start on specific date**: Mapped with Must start on constraint when exported to Microsoft project.
- **As soon as possible**
- **Start no later than**
- **Start no earlier than**

Note: Shadow tasks and external dependencies are not exported when you export the project data.

Related topics

Importing and exporting projects

Export project data

Export the project data using the Export module, Project form, or Planning Console. Save the export file to a folder on your system in the Microsoft Project (MPP), XML, or CSV format.

Before you begin

Role required: it_project_manager

About this task

Projects must use either the Project Management Schedule or the Default MS Project schedule before they can be exported.

The option for exporting the project data in MPP and CSV format is available when exporting a project from the Planning Console. Only the columns which are visible in the Planning Console are exported.

Procedure

1. Export the project data from any of the following options.

Location	Steps
From the Export module	**a.** Navigate to **All** > **Project** > **Projects** > **Export**. **b.** Select a project From the Project to export list and select **Export**.
From the Project form	**a.** Navigate to **All** > **Project** > **Projects** > **All**. **b.** Open the project that you want to export. **c.** In the Project form, select **Export to MS Project** from the context menu.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Location	Steps
From the Planning Console	**a.** Navigate to **All** > **Project** > **Projects** > **All**. **b.** Open the project that you want to export. **c.** In the Project form, select the **Planning Con sole** related link. **d.** In the Planning Console, select the more actions icon ( ) and select the **Export** op tion. **e.** In the Microsoft Project Export dialog box, select the file format. **f.** Select **OK**.

2. **Optional:** A dialog box might prompt you to save the export file.
   Save the file as an XML file. If you are exporting the project from the Planning Console and selected the CSV option, you can save the file in CSV format.

   Note: Depending on your browser setting, the browser might automatically save the file to your Download folder.

What to do next

- Use the MPP file to import the project data into a Microsoft Project.
- Use the XML file to import the project data into other ServiceNow instances or Microsoft Project.
- Use the CSV file to view project data using other applications.

Related topics

Importing and exporting projects

Export project tasks

The task being exported must be associated with a project that uses either the Project Management Schedule or the Default MS Project schedule.

Before you begin

Role required: it_project_manager

Procedure

1. Navigate to **Project** > **Projects** > **All**.
2. Open the project.
3. Scroll to the **Project Tasks** related list and select a task number to open the Project Task form.
4. Right-click the form header and select **Export Task to MS Project** from the context menu.

   The task is exported to a folder on your system.
5. Open Microsoft Project to import the exported project task files.
   Refer to Microsoft product documentation for instructions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Calendars and schedules- Limitations

Some calendar elements from Microsoft Project are not imported into the Project Management application.

- Project calendars
- User calendars
- Schedules

The imported project uses the default schedule of a Monday to Friday workday from 8 A.M. to 5 P.M. with an hour break for lunch, starting with the v3 application.

Manage status of your projects using Project Status application

The Project Status mobile app enables you to track the status of your projects, collaborate with stakeholders to resolve exceptions, and take timely actions regardless of your location.

Important:

Starting with the Australia release, the Project Status mobile application is being prepared for future deprecation. It will be hidden and no longer available for installation but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support knowledge base. Use Project Workspace to generate status reports while tracking project health, metrics, risks, issues, and milestones.

You can use the Project Status features to do the following:

- View the latest status of your projects
- View the latest status report of your projects
- Review risks and decisions
- Collaborate with other stakeholders on a project
- Receive mobile notifications when the project status changes or other users add comments or notes

Activation information

The Project Status mobile application runs on the ServiceNow® mobile platform. To enable the Project Status app, activate the PPM Mobile plugin (com.sn_ppm_mobile) if you have the admin role.

Related topics

Activate Mobile Project Status

Activate the MobilenProject Status application from ServiceNow Store, earlier known as PPM Mobile (com.sn_ppm_mobile), if you have an admin role. Installing this application also activates related plugins if they are not already active.

Before you begin

Role required: admin

About this task

Mobile: Project Status activates the following related plugin if it is not already active.

Plugin for PPM Mobile

Plugin	Description
Project Portfolio Suite with Financials [com.snc.financial_planning_pmo]	Enables you to manage your demands, resources, portfolios and projects. It also helps you plan, track, and manage the cost and budget of projects and demands in a portfolio to strike a balance between investment and returns.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

   Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

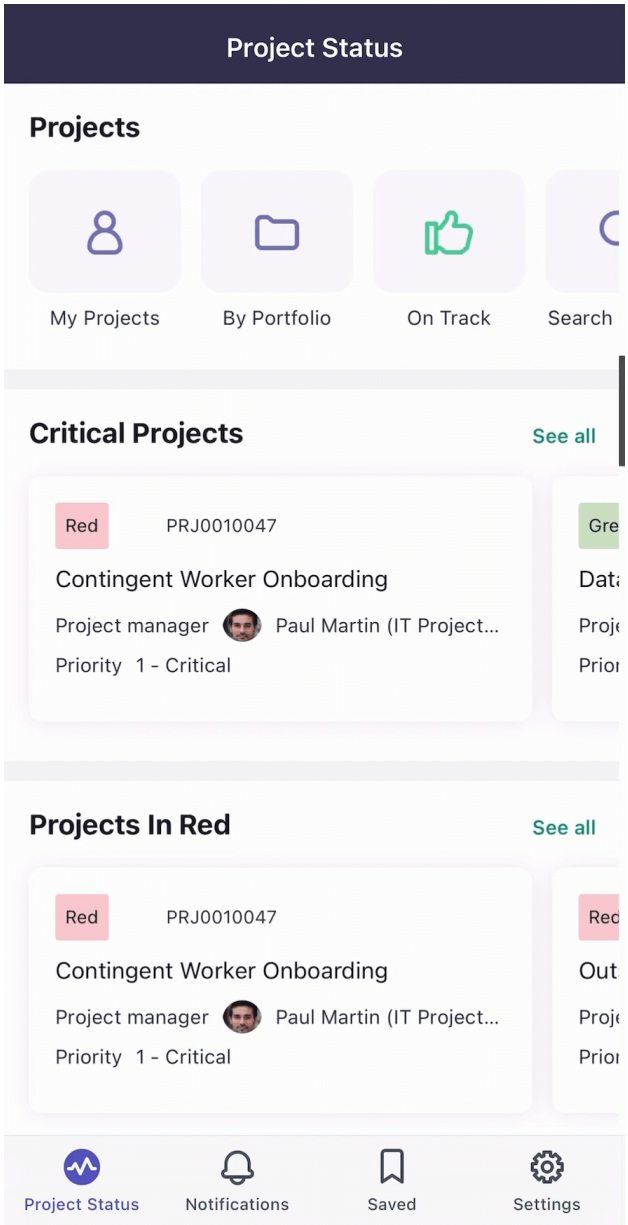
Create RIDAC records

You can create Risk, Issues, Decisions, Actions, and Request Changes records for your project through the mobile app.

Before you begin

Role required: portfolio_manager or project_manager or project_user



About this task

Analyze the impact of the risks on the project and create RIDAC records to track risks, issues, and their probable resolution for planning future projects. For more information see, Adding RIDAC records for a project.

Procedure

1. Navigate to the Project Status application on your mobile app.
2. Open a project for which you want to create a RIDAC record using one of the following options.
   - Tap to open an applet and then tap on a project.
   - Tap **My Projects** applet to view your projects.
   - Tap on the **Search Projects** applet to find a specific project.
   - In the **Critical Projects** or the **Project in Red** lists, tap on a project.
3. Create a RIDAC record using one of the following options.
   - Tap the more action icon (•••) and select one of the options:
     - New Risk
     - New Issue
     - New Decision
     - New Action
     - New Request Changes

4. Based on the option that you selected, fill in the fields on the form.

RIDAC record	Description
New Risk	Fill the fields on the Risk form. For more information, see Add risks for a project.
New Issue	Fill the fields on the Issue form. For more information, see Add issues for a project.
New Decision	Fill the fields on the Decision form. For more information, see Add decisions for a project.
New Action	Fill the fields on the Action form. For more information, see Add actions for a project.
New Request Changes	Fill the fields on the Request Changes form. For more information, see Create a request change.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Alternatively, open a RIDAC record and create a new RIDAC record.
   - **a.** Tap the **RIDAC** tab.
   - **b.** Tap the right arrow for a RIDAC record to view its details.
   - **c.** Tap the more action icon (...), and then tap **New Risk**, **New Issue**, **New Decision**, **New Action**, or **New Request Changes** option based on the selected record.
   - **d.** Fill in the fields on the form.

Manage status of your projects using Project Status application

Collaborate with project stakeholders

Collaborate with the project manager and other stakeholders on a project to provide project updates, share documents, or send emails through the mobile app.

Before you begin

Role required: portfolio_manager or project_manager or project_user

Procedure

1. Navigate to the Project Status application on your mobile app.
2. Open a project for which you want to view the details using one of the following options:
   - Tap on the **Search Projects** applet to find a specific project.
   - In the **Critical Projects** or the **Project in Red** lists, tap on a project.
3. Collaborate with the project manager and other stakeholders on a project status report in any of the following ways:
   - Add activities to a project status report such as the ability to add work notes or comments, select and upload a picture, or attach photos and files.
     - **a.** Tap the **Activity** tab.
     - **b.** Tap the add activity icon (⊕) and select one of the options:
       - Add Work Notes
       - Add Additional Comments
       - Open Camera
       - Open Library
       - Attach File
   - Send an email to the project manager for additional details of the project.
     - **a.** Tap the **Details** tab.
     - **b.** Tap the send email icon (✉).
     - **c.** In the email application, compose the email, add addresses, and send.

       By default, the **To** field is populated with the email ID of the project manager. You can add other stakeholders.

Result

When you add an activity or change the status in a project, the project manager receives a mobile notification. The project manager should have installed the Project Status app and enabled notifications to receive notifications on the mobile device.

Using the Planning attributes

Planning attributes are designed to define and work on attribute-based resource mapping in Resource Management and to generate labor costs for these resources in financials.

An attribute is a property or a characteristic defined as a resource or a task type, which is considered for attribute-based planning. These attributes can be used for resource management and financial planning.

After the planning attributes are identified, as an admin, you can create or edit planning attributes based on project requirements and metadata available from the resource table. Working on creating planning attributes involves identifying and defining the attributes to use for a project planning process.

Role-based advantages of using planning attributes

Role	Advantages
Resource Manager (Resource Management)	• Add any resources to a planning level. • Use the resource grid to plan any attribute or make the required detailed changes. • Allocate a heatmap to view and manage weekly or monthly allocation conflicts.
Project Manager (Project Financials)	• Attribute-based creation of labor costs based on the new Resource Management. • Automatically generate labor costs for the external resources. • View the labor costs by the expense type based on the tasks assigned to your resources. • View the financial forecasts for split up labor costs.

The following attributes are enabled by default for attribute-based resource mapping and to generate labor costs using financials.

Planning attributes

Attribute name	Resource Management	Financials
Employee Type	✓	✓
Expense Type	✗	✓
Group	✓	✗
Role	✓	✓

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Planning attributes (continued)

Attribute name	Resource Management	Financials
Skill		

Related topics

Create or edit planning attributes

Create or edit planning attributes

Create or edit planning attributes to plan and forecast your resources and financials for a project.

Before you begin

Role required: pps_admin, sn_align_core.apw_admin

Procedure

1. Navigate to **All** > **Project Administration** > **Planning attributes**.
2. Use the following options to create or edit a planning attribute.

Option	Description
To create an attribute	**a.** Select **New**. **b.** On the Planning attribute form, fill the fields. For a description of the field values, see Planning attribute form. **c.** Select **Submit**. The attribute is created and the planning at tributes screen is displayed. **d.** Open the newly created attribute. **e.** Enter field names for the lookup table val ues in the Planning attribute column config urations table. **f.** Set the planning attribute to active using the **Active** option to enable it for resource or financial planning.
To update an attribute	**a.** Select the required attribute name. **b.** On the Planning attribute form, fill in the fields.

3. Enter field names for the lookup table values in **Planning attribute column configurations** table.
4. **Optional:** To add new configurations to the default column configuration list for any tables containing the financials or resource management attributes:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select **New**.

b. Select a lookup table from the list.

c. Select a field name from the list and select **Submit**.
For example: If you want to create an attribute for the Location field, add the location-related columns to the selected lookup table.
The selected item is added to the column configuration list with an auto-generated field description.

5. Select **Update**.

Important: If you're creating an attribute for resource management, make sure that you add the Attribute field to the *resource_allocation*, *resource_plan*, and *sn_plng_att_core_resource_assignment* lookup tables. Similarly, if you're creating an attribute for financials, add the Attribute field to the *cost_plan* lookup table along with the resource management lookup tables.

Using Teamspaces in Project Management

A teamspace appears as an application in the instance application navigator. The teamspace includes module links that come from the Project Portfolio Management applications, such as the Project, Idea, Demand, Program and Portfolio applications.

Use teamspaces to provide functional and data separation of these applications between different teams in your organization. The following is an example teamspace for a marketing team:

Example teamspace

Teamspace activation

You must activate a teamspace plugin to use the teamspace feature. Following teamspace plugins are available:

- **Project Management TeamSpace 1** (`com.snc.ppm_teamspace_1`)
- **Project Management TeamSpace 2** (`com.snc.ppm_teamspace_2`)
- **Project Management TeamSpace 3** (`com.snc.ppm_teamspace_3`)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Project Management TeamSpace 4** (`com.snc.ppm_teamspace_4`)
- **Project Management TeamSpace 5** (`com.snc.ppm_teamspace_5`)

The teamspaces loaded with these plugins contain the same components, but the components have different prefixes. For example, teamspace 1 includes a project table named **Teamspace_1 Project [tsp1_project]** and teamspace 5 includes a project table named **Teamspace_5 Project [tsp5_project]**.

You can enable any or all of these teamspaces and assign the teamspace specific roles to relevant users in the group that should use the teamspace. Maximum five teamspaces can be created through plugins.

Teamspace customization

You can customize the Project and Demand portions of a teamspace without affecting other teamspaces. This table summarizes what you can customize:

Teamspace customization

Customization to Project or Demand within a teamspace	Supported?
Data model changes, such as adding a field to the Project or Demand form.	Yes
Changes to business rules, UI actions, UI policies, security rules, data policies, and workflows.	Yes
Changes to shared roles, such as project_manager, demand_manager, and so on.	Yes
Form and list layouts, list controls, and related lists	Yes
Dictionary overrides	Yes

Related topics

Activate teamspaces

Activate teamspaces

You can activate one or all teamspace plugins to use the teamspaces feature.

Before you begin
Role required: admin

About this task
You must activate a teamspace plugin to use the teamspace feature. Following teamspace plugins are available:

- **Project Management TeamSpace 1** (`com.snc.ppm_teamspace_1`)
- **Project Management TeamSpace 2** (`com.snc.ppm_teamspace_2`)
- **Project Management TeamSpace 3** (`com.snc.ppm_teamspace_3`)
- **Project Management TeamSpace 4** (`com.snc.ppm_teamspace_4`)
- **Project Management TeamSpace 5** (`com.snc.ppm_teamspace_5`)

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.

3. Select **Install** to start the installation process.

   Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Installed with teamspaces

The tables and roles that are installed with project teamspaces are prefixed with an abbreviation based on the name of teamspace.

Tables

The tables are extended from the Project, Idea, and Demand base application tables.

Tables installed with teamspaces

Tables	Description
Idea [prefix_idea]	Stores ideas.
Demand [prefix_demand]	Stores demands.
Project [prefix_project]	Store projects.
Portfolio [prefix_portfolio]	Stores portfolios.
Project Task [prefix_project_task]	Stores project tasks.
Portfolio Goal [prefix_portfolio_goal]	Stores portfolio goals.
Portfolio Issues [prefix_portfolio_issue]	Stores portfolio issues.
Portfolio Risk [prefix_portfolio_risk]	Stores portfolio risks.
Portfolio Project [prefix_portfolio_project]	Stores portfolio projects.
Project Template [prefix_project_template]	Stores project templates. **Note:** Project templates that are created in a teamspace area are not available in the main Project Management application any longer. They are only available to the teamspace in which they were created.
Project Template Task [prefix_project_template_task]	Stores project template tasks.
Stakeholder Register [prefix_stakeholder_register]	Stores the stakeholders.
Program [prefix_pm_program]	Stores programs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tables installed with teamspaces (continued)

Tables	Description
Program Task [prefix_pm_program_task]	Stores program tasks.
Program Task [prefixpm_program_task project_status]	Stores program task project status.

Roles

Roles installed with teamspaces

Role	Description
prefix_demand_manager	Managers of the demand features for the teamspace.
prefix_demand_user	Users of the demand features for the teamspace.
prefix_project_manager	Managers of the project features for the teamspace.
prefix_project_portfolio_user	Users of the project portfolios for the teamspace.
prefix_project_user	Users of the project features for the teamspace.
prefix_program_manager	Managers of the program features for the teamspace.
prefix_portfolio_manager	Managers of the portfolio features for the teamspace.

The teamspace application uses the same views that are provided in the Project, Idea, and Demand base applications.

Note: Default client scripts that these base applications use are inherited by the extended tables in the teamspace application. If you created custom client scripts for any of the base applications, select the **Inherited** options on each Client Script form before you create the teamspace.

Related topics

Using Teamspaces in Project Management

Configure teamspace settings

Configure teamspace settings after you activate a teamspace plugin.

Before you begin

Role required: it_pps_admin

Procedure

1. Navigate to **All** > **Project Administration** > **Settings** > **TeamSpaces**.
2. Select a teamspace name.
3. Change the teamspace name if necessary.
   Changing the name only changes the title that appears in the application menu. It does not modify the names of other components, such as table names or role names.
4. On the Tables, Roles, and Application Menu related lists, you can add or modify the tables, roles, and application modules for the teamspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The teamspace becomes available in the menu. The records that are assigned to the teamspace, such as projects, portfolios, demands, are automatically added to the teamspace.

What to do next
Assign the teamspace roles to the users of that teamspace. Do not assign the general roles that come with the applications in the Project Portfolio Suite.

Related topics
Using Teamspaces in Project Management

Project reporting
Get an at-a-glance view of projects with reports, the portfolio dashboard, and project views. You can see information such as projects with slipped milestones, graphs of resources by project, and projects listed by percentage complete.

Note: Much of information available on reports, dashboards, and views is customizable. The examples below derive from default settings.

The application provides several global reports, both lists and charts, that show the status of projects at a glance. You can also create custom reports or create reports that can be viewed by certain groups. The following Project Management reports are available in the base system:

- Active Project Unassigned Tasks 30 Days: list report: list report
- Projects (by priority): bar chart
- Projects (by priority): list report
- Projects (by risk): list report
- Projects (by risk): bar chart
- Projects (by state): list report
- Projects (by state): bar chart
- Active projects: list report
- Pending projects: list report
- Active Projects by Manager: bar chart

Reporting

Enable project currency view in project-related forms
Switch over to the project currency view to track the planned costs of a project in the selected project currency.

Before you begin
Role required: it_project_manager

About this task
To manage your projects in local currency and to create a project from a demand, the project currency fields are added in the following tables that have cost details and financials tab:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tables with project currency fields

Table name	Description
Demand [dmn_demand] table	To create a project from a demand in project currency. Specify the currency that you want to use to manage your project by navigating to the **Financials** tab of the Demand form and selecting a currency in the **Project Currency** field. **Note:** You can specify the project currency only when you switch to the Demand Currency view. For more information, see Multicurrency in Demand Management. To create a demand, see Create a demand.
Project [pm_project] table	To navigate to the Project form, see Project form.
Cost Plans [cost_plan] table	To navigate to the Cost Plan form, see Create a project cost plan.
Cost Plan Breakdown [cost_plan_breakdown] table	To navigate to the Cost Plan Breakdown form, see Update a cost plan breakdown.
Benefit Plan [benefit_plan] table	If you open the project form in Project Currency view, then by default the project currency related fields appear in the Benefit Plans related list. To create a project benefit plan, see Create a project benefit plan.
Benefit Plan Breakdowns [benefit_plan_breakdown] table	To update a benefit plan breakdown, see Update a benefit plan breakdown.
Expense Line [fm_expense_line] table	Expense lines are part of project cost plans and stores cost associated with a specific resource. To navigate to the Expense line form, see Create an expense line.
Project Funding [project_funding] table	Stores the project target and budget expense values for both capital and operating expenses for a single fiscal period.

Procedure

1. Navigate to the respective form.
2. Right-click the context menu of the form.
3. Click **View**.
4. Select **Project Currency** from the list.

What to do next

Refer to the form fields that are exclusive to the Project Currency view that you have selected. All the other form tabs and fields remain same both for the default view and the project currency view. Continue to enter values in the fields as you would for the default view.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Track project budget in project currency

Allocate budget to a project and enter amounts for capital expense budget (Capex) and operating expense (Opex) budget in project currency. The sum of the Capex and Opex budgets are calculated as total budget in project currency.

Before you begin

Role required: it_portfolio_manager

About this task

Allocate budget in a similar manner as you do with functional currency. For more information, see Allocate budget to a project.

Enable the project currency view of the Project form to allocate budget in project.

Procedure

1. Click the Project Budget related link of the Project form.

Project Budget form

Field	Description
Currency	Currency in which budget is allocated for a project. If you activate multicurrency plugin, then you have the option to budget in project currency or functional currency.
Capex Budget in Project Currency	Planned expense amount allocated for capital expenditure in the selected currency.
Opex Budget in Project Currency	Operating expense amount in the selected currency.
Total Budget in Project Currency	Sum of Capex and Opex amounts. The total project funding budget amount rolls up to the **Budget cost in project currency field**.

2. Click **OK**.
3. Click the Project Budget related list to update or view the record.

What to do next

The project target and budget expense values for both capital and operating expenses for a single fiscal period is stored in the Project Funding [project_funding] table. When you update the project funding record, the amounts are converted to project currency.

Closing a project

Closing the project involves more than just changing the project state to closed.

Before you begin

Role required: it_project_manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Post-project activities include viewing baselines and actual values to evaluate how much the project slipped from its original estimates. They also include following up on related incidents, problems, or changes that are linked to the project through the instance.

When you close a project, all project tasks and sub-projects associated with the project are closed automatically. Normally, you should not reopen a project after it is closed. Updating the project state from Closed to Work In Progress, Pending, or Open is not allowed. If you still need to reopen a closed project, reopen an existing project task or add a new task to the project. This action for a task moves the project from Closed to Work in Progress state without affecting the other closed tasks.

When a project is in the closed state, the Project Management application calculates actual values like **Actual duration**. You can cancel the associated future resource plans and complete the allocated resource plans for a closed project.

Procedure

1. Verify that the work is completed for all tasks in the project.
2. On the Project form, change the **State** field to one of the closed states:
   - **Closed Complete**: The project is finished and all tasks are complete.
   - **Closed Incomplete**: The project is finished, but tasks remain unfinished.
   - **Closed Skipped**: The project was abandoned.

   Alternatively, close every project task first, starting with the lowest-level child tasks. The closed states roll up to parent tasks, and when all highest-level parent tasks are closed, the project state changes to closed. However, the default closed states for parent tasks and for the project is **Closed Complete**. Therefore, even if you change any or all project tasks to **Closed Incomplete** or **Closed Skipped**, the project state is changed to **Closed Complete**.

   Also, change the **Phase** value to **Closing**. The project phase is for reference only and is not linked to or dependent on the **State** field.

   If your project contains sub-projects, you can close the sub-project without affecting the parent project. Change the **State** of the sub-project to any closed state to close the sub-project. Closing the sub-project closes or changes the state of all the tasks associated with the sub-project. Also, changing the state of the sub-project to Work in Progress, moves all the associated tasks to Work in Progress state.

   If there are project tasks associated with the parent project that are not closed, the parent project remains in the Open, Work in Progress, or Pending state. If the tasks associated with the parent project are closed, the state of the parent project also changes to **Closed Complete**.
3. After the project is complete, create a final baseline to see how closely the project's actual values came to the estimated values.

   Note: Baselines compare only planned start and end date values with actual start and end date values. Use reports to compare the effort and cost.

Result

For projects created from an incident, problem, or change, updating the project state does not automatically update the related incident, problem, or change request record. You must update the related record manually. For example, if the completion of a project also means that a related Change can be closed, go to the Change record and modify its **State** field. It is also a good idea to update the work notes field on the related record to include any relevant information about the project. If the project was successful and can be used as a template for future projects, make a

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

copy of it. If the project was created from a change, incident, or problem record, there are several other activities to perform in ServiceNow.

What to do next

- Cancel the resource plans associated with the project in any of the following conditions:
  - There is a corresponding resource plan in the Confirmed, Planning, or Requested state.
  - There is a resource plan in the Allocated state with the start date later than the project end date.
- Complete the resource plans associated with the project in the following conditions:
  - There is a corresponding resource plan in the Allocated state.
  - The start date of the resource plan is on or before the actual end date of the project or task.

Project Diagnostics

Project Diagnostics enables you to detect corrupt data in a project such as task validity, dependencies, and relationships using diagnostic scans that execute diagnostic scripts. You can also fix corrupt data using fix scripts.

Data might become corrupt or invalid for various reasons, such as:

- Incorrect field mapping during project import
- Incorrect scheduling of tasks
- Incorrect dependency and relationship definitions

Project Diagnostics uses diagnostic scans and fix scripts to detect and fix corrupt data in your projects. It enables you to do the following action:

- Create and add diagnostic features
- Add diagnostic and fix scripts to fix corrupt or invalid project data
- Create Diagnostic scans and map related scripts
- Define fields for users to create specific filter conditions. The diagnostic scripts use the results of these filter conditions as input for detecting any corrupt or invalid data.

Project Diagnostics page provides the default scans described in the following table.

Project Diagnostics default scans

Diagnostic Scan Name	Description
Tasks with invalid top task	Lists the tasks that have an invalid top task. A task has an invalid top task when the top task value is set to **Null**. A task also has an invalid top task when it is mapped to a different task in the hierarchy.
Tasks with invalid top portfolio	Lists the tasks that have an invalid top portfolio. A task is considered to have an invalid top portfolio if it belongs to a different portfolio or is not associated with any portfolio.
Tasks with invalid top program	Lists the tasks that have an invalid top program. A task is considered to have an invalid top program if it belongs to a different program in the same portfolio or is not associated with any program.
Invalid relations	Lists the invalid relations in a project.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Project Diagnostics default scans (continued)

Diagnostic Scan Name	Description
	A relation is considered invalid if the predecessor or successor is not part of the project (unless it is an external relation). A relation is also invalid if the predecessor or successor record does not exist in the system.
Validate parent tasks	Lists the tasks that have empty or invalid parents.
Check for tasks with cyclic dependencies	Checks for any cyclic relations, which aren't permitted, in a project. For example, suppose you have a project in which Task A is related to Task B. A reverse relation from Task B to Task A would be considered a cyclic dependency.
Recalculate project	Recalculates task dates in a project. ⚠ **Warning:** Performing this action might change the dates in a project.
Check duplicate/redundant relationships	Lists tasks that have duplicate or redundant relations in the selected projects.
Cost plans with no start and end fiscal period	Checks and lists cost plans with no start and end fiscal period within the selected projects.
Validate project task constraints in project	Lists all tasks with invalid constraint types. For example, a task with Start no later than set as a parent. Also lists tasks where the **Constraint date** field is empty for a task with Start no earlier than and Start no later than constraint.
Validate tasks with invalid state	Lists all tasks with invalid WIP or Closed state based on actual dates.
Identify projects with negative planned cost for any year where the budget was not allocated to the corresponding fiscal periods	Checks and lists the projects that have negative fiscal year project budgets.
Identify discrepancies in project budget	Checks and lists the projects for which project funding does not match with the sum of task type breakdown cost or fiscal year project budget.
Identify cost plan breakdowns with invalid fiscal periods	Checks and lists the cost plan breakdowns with invalid fiscal periods.
Identify duplicate task type breakdowns for an expense type and a fiscal period	Checks and lists the duplicate task type breakdowns.
Associate orphan expense lines to the system generated cost plan	Lists the expense lines that are not associated to any cost plan. When you run the fix script, these orphan expense lines are associated to a system-generated cost plan and then to the respective breakdowns of the system-generated cost plan.

Use Project Diagnostics to detect corrupt project data

Project Diagnostics uses the Application Diagnostics Tool to detect corrupt project data. Examples include tasks with invalid parents, tasks without top tasks, and invalid or cyclic relations.

Before you begin

Role required: it_pps_admin

About this task

Project Diagnostics can also detect whether date calculations in a project appear to be incorrect. It can also identify when the planning console does not open for a project or when tasks or relationships don't appear in the planning console.

Procedure

1. Determine whether you want to run a diagnostic scan on a single project or multiple projects.

Scope	Steps
All Projects	Navigate to **All** > **Project Administration** > **Project Diagnostics**.
Single Project	**a.** Navigate to **All** > **Project** > **Projects** > **All**. **b.** Select the project. **c.** On the Project form, select the **Project Diagnostics** related link.

2. On the Application Diagnostics Tool page, select a diagnostic feature.
3. Use the Feature Inputs fields to specify filter conditions.
4. From the **Diagnostics** section, run a single diagnostic scan or multiple scans on the projects matching the filter criteria.

Task	Steps
Run multiple diagnostic scans	**a.** Select the diagnostic scans that you want to run on the filtered projects. **b.** Select **Run Diagnostics** at the top-right corner of the page.
Run a specific diagnostic scan	**a.** Select the single diagnostic scan that you want to run on the filtered projects. **b.** Select **Run Diagnosis**.

5. View the results of the scans.

What to do next

Add your own diagnostic scans and fix scripts.

Create and add diagnostic features

Create and add diagnostic features, which consist of single or multiple diagnostic scans that execute mapped scripts to detect data corruption or invalid data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: adt_admin

Procedure

1. Navigate to **All** > **Application Diagnostics Tool** > **Features**.
2. Select **New**.
3. On the form, fill in the fields.
   For more information, see Diagnostics Feature form.
4. Define the fields available to users for specifying filter conditions in the **Diagnostics Inputs** section.

   The fields that you configure in the **Diagnostics Inputs** section appear in the **Feature Inputs** section of the Application Diagnostics Tool page.
5. Select **Submit**.

What to do next
Create diagnostic scripts and add fix scripts to use with the diagnostic feature. For more information, see Add diagnostic and fix scripts.

Add diagnostic and fix scripts

Add diagnostic scripts to scan the data in your application for any corruption. You can also attach fix scripts to rectify the corrupt or invalid data identified by the diagnostic script.

Before you begin
Role required: adt_admin

About this task
The results of the filter conditions that you specify in a diagnostic feature are used as an input for the diagnostic script while executing. You can also use the result of one script in subsequent scripts.

Procedure

1. Navigate to **All** > **Application Diagnostics Tool** > **Scripts**.
2. Select **New**.
3. On the form, fill in the fields.
   For more information, see Diagnostic Scripts form.
4. **Optional:** Include a script for fixing the corrupt or invalid data identified by the diagnostic script.
   a. Select the **Has Fix script** check box.
   b. Select the Edit User Roles icon ( ) and choose the roles that can access the diagnostic script.
   c. In the **Fix script** section, add the code for the fix script.
5. Select **Submit**.

Create Diagnostic scans and map related scripts

Once you have created diagnostic features and scripts, map them to a diagnostic scan to check the health of data in your application. Use fix scripts to rectify any corrupt or invalid data that the diagnostic scan identifies.

Before you begin

In order to create a diagnostic scan, you must have already created diagnostic features and scripts For more information, see Create and add diagnostic features and Add diagnostic and fix scripts.

Role required: adt_admin

About this task

You can map multiple scripts with each diagnostic scan and define the order of their execution.

Procedure

1. Navigate to **All** > **Application Diagnostics Tool** > **Diagnostics**.
2. Select **New**.
3. On the form, fill in the fields.
   For more information, see Diagnostics form.
4. Select the Roles icon ( ) and move the desired roles to the Selected list.
   The users with the selected roles can access the diagnostic script.
5. Search for and select diagnostic scripts to map with the diagnostic scan in the **Diagnostics and Script Mappings** section.
6. Select **Submit**.

What to do next

- Create related link for navigating to the diagnostic features and scans in the application. For more information, see Create a UI action.
- Run diagnostic scan and view results. For an example of how the diagnostics scan work, see Use Project Diagnostics to detect corrupt project data.

Diagnostics form

Using Work breakdown structure (WBS) - Legacy

The work breakdown structure (WBS) is a hierarchical representation of all the tasks in your project.

Important:

Work breakdown structure (WBS) is being prepared for future deprecation. It will be hidden and no longer available for installation but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support knowledge base. Use new Project Workspace with enhanced UI to help you efficiently manage your projects.

Use the WBS to get a quick overview of the entire project, including the tasks and subtasks nested in the project. The Gantt chart gives you a similar overview using graphical elements like lines and bars to show dependencies and lengths of tasks. The WBS is more data-driven, presenting a wide variety of task information in expandable rows.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can view the WBS on the planning console, or as a related list on the Project or Project Task form. See Open the project planning console or Access the WBS as a related list.

When the WBS is viewed as a related list on the Project or Project task form, several important columns from the table appear by default.

Important columns

Column Name	Description
WBS	The number of the task in the WBS hierarchy. The first task in the hierarchy is assigned the number 1. Subtasks increment the number in the tenth place, such as 1.1 and 1.2. The numbers are read-only.
WBS Order	A number that represents the task in relation to its parent. The first subtask under a task has an WBS Order of 1, and the next task 2. If you edit a number, all tasks are moved accordingly after you refresh the list.
Number	The task ID number, which should not be changed.

Other useful information also appears by default, such as the description and percentage complete. You can personalize the list like any other list by selecting the personalize list icon ( ) and selecting the columns you want to view.

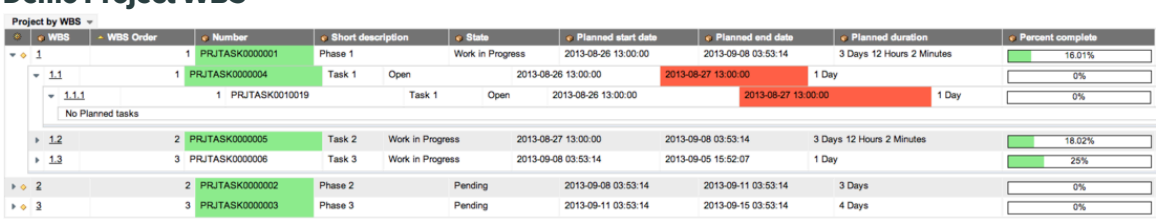
Related topics

Access the WBS as a related list

Access the WBS as a related list

You can view the WBS as a related list on both the Project and Project Task forms.

Before you begin
Role required: it_project_manager



About this task
You can view the full WBS list by navigating to a Project form and selecting the **Planning Console** related link. See Planning console tasks for a list of the things you can do with the WBS on the planning console.

You can also view the WBS as a related list on the Project or Project Task form.

Procedure

1. Navigate to a Project or Project Task form.
2. Right-click the header and select **View > WBS**.
   WBS List appears as a related list.
3. On the WBS, select the arrow icon ( ) to expand a task and view child tasks.

Demo Project WBS

Using Work breakdown structure (WBS) - Legacy

Using Project workbench - Legacy

The project workbench provides a central location for creating and managing projects.

Important:

Starting Australia, Project Workbench is no longer deployed, enhanced, supported or available for activation. For details, see the Deprecation Process [KB0867184] article in the Now Support knowledge base.

Existing customers: If you have Project Workbench implemented in your instance, you can continue using it. The application remains in your instance and your data is intact. However, it is treated as custom code. ServiceNow Technical Support will no longer provide fixes, patches, or upgrades for any issues.

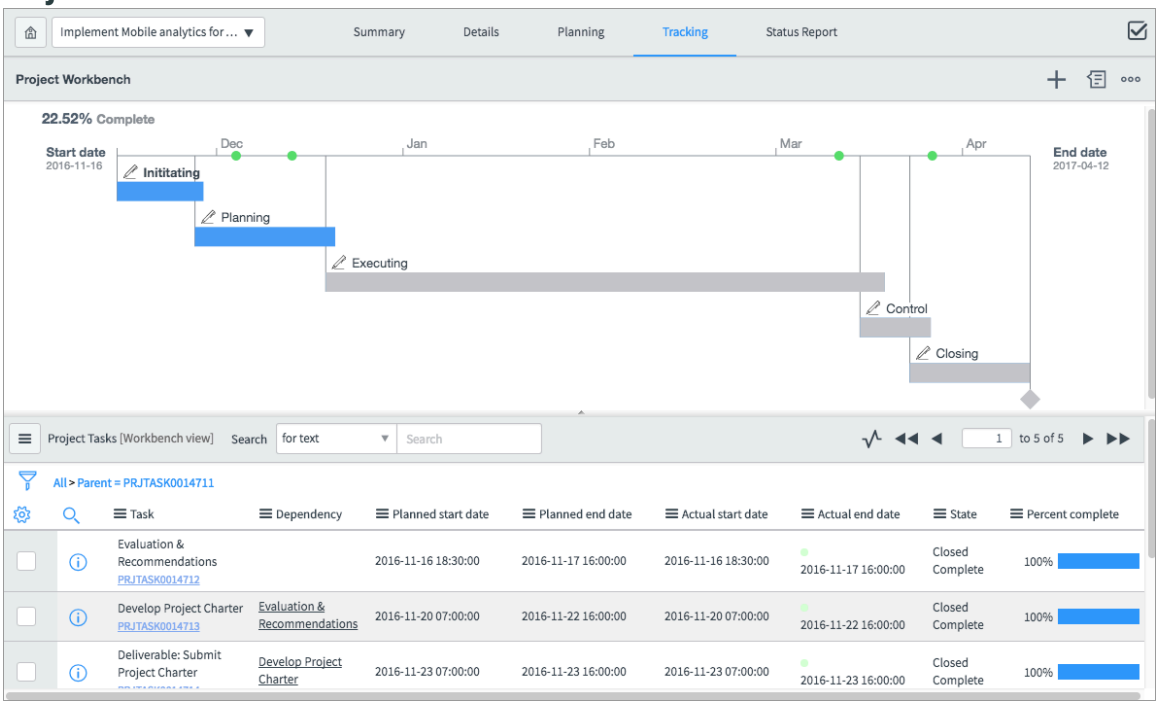
The workbench supports the Project Management and application life cycle management applications, allowing for a hybrid approach to project management. Project managers can create projects that combine both waterfall and agile methodologies and add waterfall, agile, and test phases to these projects.

The project workbench makes it easy to manage projects by presenting project information in two panes. The top pane displays a timeline with the project phases and milestones. The bottom pane displays details for the phase selected in the timeline. The project workbench provides real-time interaction between the timeline, the list view, and the visual task board.

The project workbench also supports the following features:

- **Project templates**: Project managers can quickly and easily create projects based on templates, which define the basic structure of a project.
- **Manual project calculation**: The workbench adds the capability of creating projects that use manual calculation. Project managers can also create auto calculation projects from the Project Management application.
- **Composite fields**: The field type combines information from two fields in a table to form a single field.

With the project manager role, you can use the project workbench to:



- Manage projects.
- Create and update project phases and milestones.
- Create and update project tasks, stories, and test cases.
- Attach test plans to a test phase.
- View and manage project details from a list view or visual task board.

The project workbench displays project information in two distinct areas. The top pane displays the project visualization, and the bottom pane displays phase details in a list view or visual task board. There is also a header above the workbench that includes several buttons and controls.

The project workbench scales to fit the available browser height. If necessary, scroll bars are added to display the workbench details.

Project Workbench

Access the project workbench

Access the project workbench from the Project form or from the application navigator.

Before you begin

Role required: it_project_manager

Procedure

Access the project workbench in one of the following ways.

Option	Steps
From Planning Console	**1.** Open a project record in project workspace. **2.** Select the **Planning** tab. **3.** Select the **Planning Console** selection ar row on the banner and select **Project Work bench**.
From a project record	**1.** Navigate to a project record in **Details** tab in project workspace. **2.** Select the **Project Workbench** related link.

Note: If the project workbench opens with no associated sys_id or an incorrect sys_id, an error message appears. Select a project from the project choice list in project workspace banner.

Related topics

Using Project workbench - Legacy

© 2026 ServiceNow, Inc. All rights reserved.

Components of project workbench

The project workbench displays project information in two distinct areas. The top pane displays the project visualization, and the bottom pane displays phase details in a list view or visual task board. There is also a header above the workbench that includes several buttons and controls.

The project workbench scales to fit the available browser height. If necessary, scroll bars are added to display the workbench details.

Header

The header is a gray bar that runs across the top of the project workbench.

The first time a user accesses the project workbench from the Project menu, the header displays the following components:

After a project is opened, the header displays additional components, depending on the type of project selected.

- Back ( ): takes the user to the Project form to view the project details.
- **Select Project**: displays the current project name. Click the down arrow to select a new project.
- Add phase icon ( ): adds a phase or milestone to the timeline.
- **Apply Template**: opens a dialog box for setting a start date and adding a template to the project. This button appears for new or blank projects that have no phases.
- **Manage Stories**: under the Options icon ( ) displays the story backlog for this project.
- **List**: under the Options icon ( ) displays additional details in list view about the currently selected phase. This button appears if a project has one or more phases.
- **VTB**: under the Options icon ( ) displays additional details in the Visual Task Board about the currently selected phase. This button appears if a project has one or more phases.

Timeline

The top pane of the project workbench displays the project timeline. The timeline uses monthly or quarterly markers to represent time. If the duration of a project is less than 500 days, these markers represent months and if the duration is greater than 500 days, these markers represent quarters.

The project timeline displays the following project information:

- Project name: the name assigned to the project. Point to the project name to see a message about the project date calculation method used for this project.
- Percentage complete: the percentage of the project that has been completed. This percentage is based on the duration and the percentage complete of the individual phases.
- Project start and end dates: the dates specified in the **Planned start date** and **Planned end date** fields for this project.
- Project phases: colored bars that represent the different phases of the project.
- Milestones: colored and dynamic circles on the timeline that represent important dates in the project life cycle.

Phases in timeline

A project phase is represented in the timeline by a horizontal bar. The bar is connected to the timeline by a thin vertical line that indicates the phase start date. The name of the phase appears

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

just above the horizontal bar. Project phases are stacked in the timeline by start date, phase, and the earliest start date appearing at the top. If there are phases than can fit on the timeline, a scroll bar appears on the right side.

The color of the horizontal bar changes incrementally to reflect the completion percentage of the phase. The percentage completion is calculated based on the phase type:

- **Waterfall**: includes project tasks. The completion percentage is based on the number of project tasks that have been completed.
- **Agile**: includes stories. The completion percentage is based on the number of story points that have been completed.
- **Test**: includes test cases. The completion percentage is based on the number of test cases that have been completed.

The available phases depend on how Project Management is installed. When Project Management is installed as a standalone app, the project manager can only create and edit the Waterfall phase type. When Project Management is installed as part of the Project Portfolio Management (PPS), the project manager can create and edit all phase types (Waterfall, Agile, and Test).

When you point to a phase, the cursor changes from an arrow to a hand and a pop-up window displays the phase name and the start and end dates. Clicking a phase in the timeline displays the corresponding task information in the bottom pane of the project workbench.

Milestones in timeline

Milestones indicate important dates in a project and are represented along the timeline by colored circles. Three colors are available for milestones: green, yellow, and red. The project manager determines how the colors are used.

Pointing to a milestone changes the cursor from an arrow to a hand and displays a pop-up window with the short description and planned start date.

Select a milestone to update the milestone information. You can also drag a milestone along the timeline to change the date. Milestones can be dragged to any point on the timeline within the boundaries of the project start and end dates.

Detail view

The bottom pane of the project workbench displays detailed information for the phase currently selected in the timeline. The information displayed varies by the phase type selected:

- **Waterfall**: displays the project tasks associated with the phase.
- **Agile**: displays the stories assigned to the phase.
- **Test**: displays the test cases for the testing phase.

Information in the bottom pane can be displayed in list view or in a visual task board. The **List** and **VTB** buttons in the Project Workbench header control how this information is displayed.

Project calculation

When creating a project, the project manager can select the type of calculation to use: manual or automatic (default).

The project workbench displays help text that explains whether the current project is calculated automatically or manually. The help text appears when the project workbench page loads and also when the user points to the project name in the upper left corner.

For manual calculation:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Dates on tasks do not automatically reflect any changes from dependent tasks.
- New projects created from the project workbench and projects created from demands are set to manual calculation by default. Projects created as manual can be changed to automatic.
- The project timeline reflects the earliest planned start date and latest planned end date based on the project tasks.
- The constraint type cannot be changed.
- Only **Start on specific date** constraint type is allowed for project tasks.

For automatic calculation:

- A task automatically reflects any changes from its dependent and child tasks.
- New projects created from the Project Management application are set to automatic calculation by default.

Note:

- A project created as automatic with one or more tasks cannot be converted to manual.
- Percentage completion and states for phases are updated automatically for both manual and auto calculation.

Managing Project workbench

The project workbench allows project managers to manage all aspects of a project.

Open a project in the project workbench

The project manager can open an existing project in the project workbench.

Before you begin
Role required: it_project_manager

Procedure

1. In the project workspace banner above the project workbench header, select the down arrow in the project selector box.
2. Select a project from the choice list.
   The selected project opens in the project workbench under **Planning** tab in project workspace.

Related topics

Create a project task in the project workbench

Create a project task in the project workbench

Create a project task for a waterfall phase.

Before you begin
Role required: it_project_manager

About this task
While creating a project task in the project workbench, the time constraint type is defaulted based on the project type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- For a manual project, the default constraint is Start On and can't be changed.
- For an automatic project, the default constraint is Start ASAP and can be changed to Start On if required.
- When the constraint is Start ASAP, the **Planned start date** is disabled.
- When you create an agile phase and associate a sprint, the task start date is set from the sprint start date. The constraint is set to Start On automatically.

Procedure

1. Select a waterfall phase in the project workbench timeline.
2. Select **New** in the detail view.
3. Fill out the Project Task form.
4. Select **Submit**.

Managing Project workbench

Using Planning console - Legacy

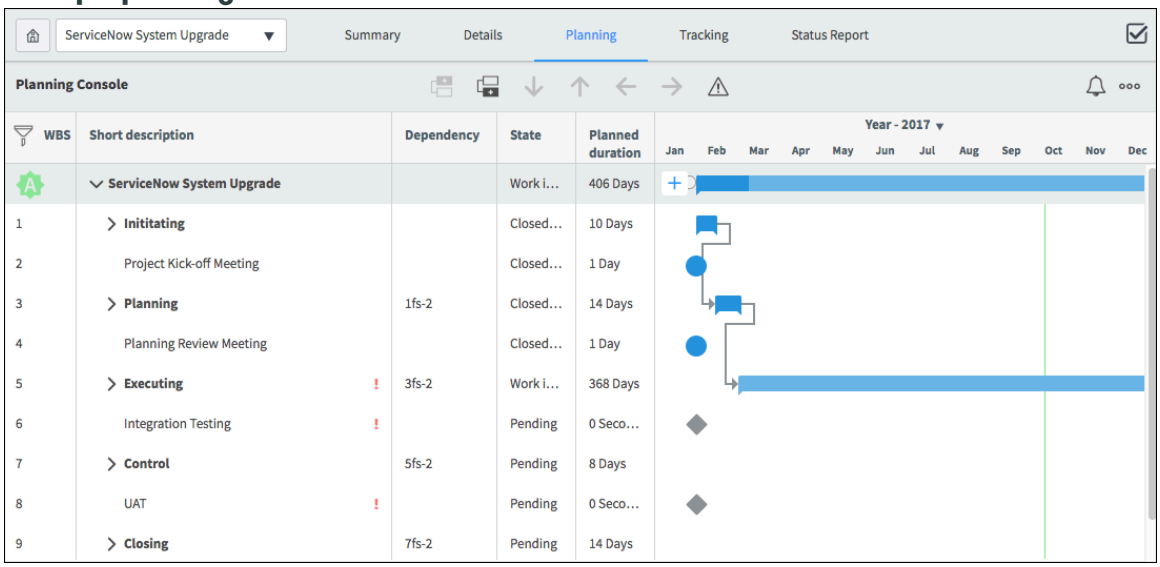
The planning console is a centralized interface for the Project Management application.

Important:

Starting Brazil release, Planning console is no longer deployed, enhanced, supported or available for activation. For details, see the Deprecation Process [KB0867184] article in the Now Support knowledge base. You're encouraged to use Project Workspace For more information, see manage projects with Project Workspace

Existing customers: If you have Project Workbench implemented in your instance, you can continue using it. The application remains in your instance and your data is intact. However, it is treated as custom code. ServiceNow Technical Support will no longer provide fixes, patches, or upgrades for any issues.

The planning console gives project managers a comprehensive view of all aspects of a project. This includes a hierarchical list of sub-projects, if any, project tasks that appear in a work breakdown structure (WBS) list, and the project Gantt chart. The console also integrates with Live Feed so your users can collaborate on projects.



Sections in the planning console

The planning console is divided into the following sections:

- A list of the project tasks if you open the planning console for a project.
- The Gantt chart.
- Banner icons and lists for performing tasks on the console.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example planning console

For more information on the Gantt chart and the task relationships and dependencies that you can build, see Gantt chart and Parent-child rollup task calculations.

Note: The resources in the **Assigned to** column of the planning console can be constrained to be derived only from the allocated resource plans associated to the project or any of its tasks.

Business rules

By default, the business rules are not triggered during an operation in the planning console. You can enable the business rules using *`Enable firing of Business Rules`* property.

Note: To enable this property, you must clear the **Enable Client Side Planning** check box.

You can also enable business rules when defining the columns for planning console using the **Fire BR on Save** field.

Client side planning console

Build your project structure quickly on the client side without having to save details in the server for each interaction in planning console. Enabling **Client side planning console** prevents any time lags that occur after you perform any actions in planning console, and improves the scheduling performance.

Automatic and manual projects

In an **automatic** project, any change to the dates, duration, or relationships of a project task automatically updates all the tasks in the entire project. This includes the project record, as necessary. The automatic project icon ( ) appears adjacent to the project name.

In a **manual** project, changes to the dates, duration, or relationships of a project task do not automatically update all tasks. So parent task dates don't reflect any changes made to dependents or child tasks. The only change that is made automatically is when a task date or duration change updates dates and duration of the project record. In a manual project, any update to actual start date does not update the planned end date of the project or project task. However, enabling the project property **Enable alter of planned date with Actual for Manual Project** updates the planned end date from actual start date and planned duration. The manual project icon ( ) appears adjacent to the project name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can specify if a project is automatic or manual in the **Calculation** field on the Project form. This field becomes read-only when the project starts.

Tutorial

A tutorial walk through is available in the console. It shows you all the features of the console and how to use them. Access the walk through within the help icon ( ).

Open the project planning console

Access the planning console to perform the planning for the project.

Before you begin
Role required: it_project_manager

Procedure

Open the planning console using any of the following methods.

Option	Steps
From project workspace	**1.** Open a project record in project workspace. **2.** Select the **Planning** tab.
From a project record	**1.** Navigate to a project record in **Details** tab in project workspace. **2.** Select the **Planning Console** related link.
From Project Workbench	**1.** Select the **Project Workbench** selection ar row on the workbench banner. **2.** Select **Planning Console** from the list.

Planning console tasks

You can perform several tasks on the planning console that you can perform on lists and forms, such as creating project tasks and copying projects. You can also perform several tasks unique to the console.

General console settings tasks

Task	Steps
Display a project in the planning console	Select the project from the list in the project workspace banner.

WBS hierarchy tasks

Task	Steps
Create a project task	Select the add task below icon on the row to create a new task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

WBS hierarchy tasks (continued)

Task	Steps
	You can also select an existing task to determine the insertion point for the new task, and then select the add task above icon or the add task below icon.
Move a task up or down in the hierarchy	Select an existing task, and then select the move up or move down icons.
Indent or unindent a task in the hierarchy	Select an existing task, and then select the unindent or indent icons.
Edit a task record	Right-click a task and select **Edit**. The Project Task form appears in the overlay. You can also edit a field directly in one of the columns in the planning console. You can also edit project tasks that represent phases in the project workbench.
Edit the **State** field	Double-click the value in the **State** column to select a new state. The value of the **State** field also changes automatically when % complete is changed for a task.
View and modify task status	View the status of the project task based on the difference of the planned end date of the task from the current date. The status of the task updates automatically from Green to Yellow to Red as the planned end date approaches. You can manually update the task status by double-clicking the **Status** column and selecting a different task status. For more information, see **Status** field description in the Create a project task from a project topic.
Add an agile phase or a test phase	Right-click a project and select **Add Agile Phase** or **Add Test Phase**. The agile phase icon or test phase icons appear next to the task in the **Name** column. See phase icons.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

WBS hierarchy tasks (continued)

Task	Steps
	Note: • The **Add Agile Phase** option is available only for Agile and Hybrid projects. You must also have the Agile Development 2.0 plugin installed. • You can add multiple agile phases and multiple test phases to a project. • You can add only one test phase for a test plan in a project. You must have the Test Management plugin installed to view the **Add Test Phase** option. • An agile phase cannot overlap another agile phase for an assignment group in a project. • While creating a story, if a project has only one phase, then the story is tagged to the phase.
Open a test plan or story	Right-click a task (a task that represents a phase in the workbench) and then select **Manage Test Plan**. Select **View Stories** to view the stories list. If you have the scrum_product_owner role, select **View Stories** to navigate to the **Backlog** tab of the **Agile Board**. **Note:** The **View Stories** option is available only for Agile and Hybrid projects. You must also have the Agile Development 2.0 plugin installed.
Cancel a resource plan for a Closed project	Right-click the project and select **Cancel Resource Plans**. All past and future allocations for the selected resource plan are canceled. The option is available only for a project in any of the Closed states.
Complete a resource plan for a Closed project	Right-click the project and select **Complete Resource Plans**. All the requested and resource allocations for the resource plan post the completion date are deleted. The option to complete resource plans is available only for a project in any of the Closed states.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

WBS hierarchy tasks (continued)

Task	Steps
Add an external dependency between tasks of different projects	Right-click a task and select **Add External Dependency**. Select the project and task to which the dependency is added.
View the project name of an external dependency	Point to the link icon beside the external dependency task to display a tooltip which shows the name of the project to which the external dependency is added.
Change the time constraint for a task	Double-click a task under the **Constraint type** column and select an option: **Start ASAP**, **Start on specific date**, **Start no earlier than**, or **Start no later than**. • You can change the **Constraint type** for Automatic projects only. • When you change the time constraint for a task from **Start on specific date** to **Start ASAP** or vice versa, the planned start date and planned end date of the task are recalculated accordingly. • The **Constraint date** column displays the start date for all the constraint types other than **Start ASAP** tasks. This column is not available by default, you must add this column to the Planning Console from the Configuration menu. • The option is not available for a parent task. If a task has child tasks, the option is available only for the child tasks. • You cannot create a parent task with **Start no later than** or **Start on specific date** time constraint. When a new child task is added to a task with these time constraints, the time constraint for the parent task is converted to **Start ASAP**. • You cannot change constraint type for projects with **Calculation** type set as Manual.
Allow task dates outside schedule	Right-click a project task and select **Allow outside schedule**. The selected task is allowed to start and end on a non-schedule day (outside the regular project schedule) such as on a weekend. The off schedule task icon appears next to the task in the **Short description** column. For example, if you use the project schedule Monday to Friday, 8:00 to 17:00 and a project task of duration 2 days should start on

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

WBS hierarchy tasks (continued)

Task	Steps
	Saturday, then an off-schedule task is allowed to be scheduled on Saturday and end on Sunday. Similarly, if a task of duration 3 days starts on Friday, then an off-schedule will end on Sunday as opposed to ending on Tuesday. • The option is not available for a parent task. When a task is made off-schedule, its parent also becomes off-schedule. The project also operates as out of schedule if any of the children is set to out of schedule. • Once a task is allowed outside the schedule, the **Follow schedule** option is available for the task. Right-click the task and select **Follow schedule** to follow the schedule for the task. **Note:** • There is no difference between an off-schedule and an on-schedule task if there is no schedule defined at the project level. • 1 day is 8 hours for a task in a regular schedule and 24 hours for a task outside the schedule.
Convert a task to milestone	Right-click a task and select **Convert to milestone**. • You can convert a task to a milestone only until it is not in **Work in Progress** state. Once work in progress, the option appears as greyed out for the task. • The option is not available for a parent task. If a task has child tasks, the option is available only for the child tasks.
Show or hide external dependencies	Select the more options icon, and then select the **Hide External Dependencies** switch. When this option is enabled, the external dependencies are not displayed when you add an external dependency between two projects. However, the **Dependency** column in the WBS section of the successor project still shows the value of external dependency.
Show external dependency notifications	Select the notification bell icon to display the notifications raised in the successor project. The notifications are triggered as a result of changes made in the predecessor project.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

WBS hierarchy tasks (continued)

Task	Steps
	• For a soft dependency, select **Accept** or **Reject** to accept or reject the changes in the notification. • For a hard dependency, view the displayed notification to review the changes in the notification.
Save changes to the server	Select the save icon to commit changes made in the planning console. The option is available only when Client Side Planning Console is enabled.
Expand or contract column width	Select the side of the column and drag it right or left.
Show or hide columns in the planning console	Select the show or hide columns in gantt icon, and then select or clear the check boxes for the columns available. Admin can customize which columns appear in this list. The selection is saved in the user preference. The next time you open the planning console, the same columns you selected will appear.
Select WBS levels to show	Select the show or hide columns in gantt icon, and then select the level from the WBS **Depth** list.
Expand or collapse sublevels for any level	Select the arrow to expand or collapse any task that has one or more subtasks.

Gantt chart tasks

Task	How to perform the task
View a summary of a task	Point to a task.
Change the planned start or end dates of a task	Select the task, and then drag the left or right edge of the task bar.
Move a task to a new date	Select the task, and then drag the whole task bar to a new location.
Create a dependency between tasks	Find the successor task in the relationship and double-click the value in the **Predecessor** column and enter a value that specifies the relationship. See Predecessor dependencies in the planning console for examples. Alternatively, you can create a relationship between two tasks by connecting the ends of the corresponding task bars in the timeline view.

Gantt chart tasks (continued)

Task	How to perform the task
Select a baseline	Select the more options icon, and then select a baseline from the baselines list.
Create a baseline	Select the more options icon, and then select **Create new baseline**. See Create baseline of a project for more information.
Compare schedule baselines	Select the more options icon, and then select a schedule baseline from the baselines list. Select the show or hide columns in gantt icon, and then select the following columns to compare schedule baselines: • Baseline start date • Baseline end date • Baseline variance
Display the critical path	Select the critical path icon. For more information on the critical path, see Gantt chart.
Show date change	Select the more options icon, and then select the **Show Date Change** switch. When this option is enabled, the start and end dates of the task are displayed when you drag the task bar.
Show duration change	Select the more options icon (), and then select the **Show Duration Change** switch. When this option is enabled, the duration of the task is displayed when you drag either end of the task bar.
Show weekends on the calendar	Select the more options icon, and then select the **Show Weekends** switch. The weekends appear as light-blue vertical bars in the Gantt chart.
Zoom the calendar in or out	On the top of the calendar, select one of the time periods, such as the month or day. Then select a **Zoom Level** from the calendar.When the zoom level in calendar is selected as **Auto Fit**, the Gantt view fits in one page to display the entire timeline for the project in one go without using the scrollbar.
Open the tutorial	Select the more options icon (), and then select **Walkthrough**.
Open list of keyboard shortcuts	Select the more options icon, and then select **Keyboard Shortcuts**.

Using Planning console - Legacy

Client side planning console

Build your project structure quickly on the client side (browser) without saving details to the server for each interaction. This prevents time lags after you perform actions in the planning console and improves scheduling performance.

For example, when a project manager changes dates on a project task in the planning console, the system must re-calculate dates for dependent tasks and the project. This re-calculation can cause time lag if each interaction is saved to the server. Similarly, when a new task or a dependency is created, there can be a time lag before the new dates are displayed. This occurs if they are saved on the server side each time.

When client side planning is enabled, the changes such as re-calculation of dates aren't posted to the server immediately. All the changes in planning console are kept on client side until the user explicitly saves the changes to be committed to the server.

Exceptions

There are a few actions for which you must save your changes immediately to the server side before proceeding such as:

- Create baseline
- Copy project

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Copy partial project
- Add child tasks
- Add external dependency
- Edit Assigned to
- Edit Additional Assignees

In addition, if you enable custom business rules on any of the columns, those columns are also part of exceptions.

Related topics

Using Planning console - Legacy

Enable client side planning

Enable client side planning in planning console to enable project scheduling at the client side.

Before you begin

Role required: pps_admin

About this task

Build your project structure quickly on the client side without having to save details in the server for each interaction in planning console.

Procedure

1. Navigate to **All** > **Project Administration** > **Settings** > **Planning Console**.
2. In the Planning Console list, expand **Context: default** and select `Project[pm_project]`.
3. Select the **Enable Client Side Planning** check box to enable project scheduling at client side.

> **Note:** To enable this check box, the project property **Enable firing of Business Rules on save from Planning Console** must be set to false.

Related topics

Using Planning console - Legacy

Gantt chart

A Gantt chart on the planning console is a visual representation of a project timeline that shows start and end dates of tasks, and the dependencies between tasks.

Use Gantt charts to add and delete tasks, change task dates and dependencies, and assess the progress of the overall project.

The critical path

The critical path is highlighted in red on the Gantt chart to differentiate critical path tasks from standard tasks in blue. Not all tasks are part of the critical path, only those tasks that directly affect the finish date. Use the critical path to determine which tasks are driving the finish date. If schedule adjustments are necessary, consider making resource or other changes to those tasks on the critical path.

The tasks that aren't part of the critical path and can therefore be delayed are commonly called **slack** or **float** tasks. The Gantt chart shows the slack/float tasks by default. However, calculations that deal with these tasks, such as how long they can be delayed without impacting the project, aren't available.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Milestones

A milestone is a project task with a duration of **0**. Use milestones to indicate important dates in a project. If necessary, create dependencies between tasks and milestones so that a task does not start until a milestone has been reached.

Color coding

The colors of the task bars on the Gantt chart are based on the percent complete and state of the task. The default color coding available for project and tasks is shown:

Color coding of project tasks

Color	Explanation
Light blue bar	Task is pending or open.
Dark blue bar (full or partial)	The percentage complete is between 1% and 100%. The dark blue section indicates the percentage complete. The task can be in the Work in Progress state or Completed state.

Note: The colors of the task bars on the Gantt chart can be configured from program workbench.

SDLC phases

Icons appear next to tasks to indicate what phase they belong to.

Phase icons

Icon	Phase
Agile phase icon	Agile phase.
Testing phase icon	Testing phase.

Note: Tasks in the waterfall phase do not display an icon.

Gantt chart options

Use the Gantt chart to quickly change task attributes, such as start and end time, rather than opening every Task form and modifying field values one by one.

From a Gantt chart, you can modify the following task attributes:

Modify tasks

Attribute	Description
Planned start date for project tasks	Move the task along the timeline to change the start time and to impose a *Time constraint* of *Start on a specific date*. You can also drag a task to change its start date if the task *Time constraint* is set to *Start on a specific date* (not *Start ASAP*) and the task has not yet started. The start date of a task cannot be modified if the task already started (has an actual start date), the task has already ended (has an actual end date), or the task time constraint is set to *Start ASAP*. You can also modify the dates in the **Planned start date** column on the console.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Modify tasks (continued)

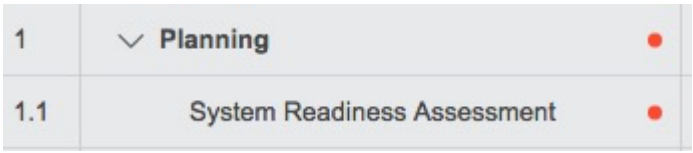
Attribute	Description
Planned start date for the project	Modify the dates in the **Planned start date** column on the console. You can add tasks that start earlier than the project's planned start date. By default, the planned start date shifts earlier or later when you add tasks to align with the earliest task start date. However, you can enable the project property **Rollup project start date from tasks** to retain the planned start date of the project even if you add tasks with a planned start date that is earlier or later.
Planned end date	Drag the right edge of the task bar to extend the planned end date. You can extend the planned of date only for tasks that are not parent tasks and that have not yet ended.
Dependencies	To edit or delete a dependency, double-click an existing dependency connector line between two tasks and update the settings in the Planned Task Relationship popup. The relationship *Type* for planned tasks is *Predecessor of::Successor of* and should not be changed.
Lag time and lead time	Lag time is an interval of time between the end of a predecessor task and the start of a successor task. The lag time delays the predecessor by an amount that you specify. Lead time is an interval of time that the predecessor task is allowed to start before it normally would. It is essentially a negative lag time. The value in the **Lag** field specifies both lag and lead time. To edit the **Lag** value, double-click a connector and update the settings in the Planned Task Relationship form. Enter a negative value to specify a lead time.
Resources	To change a user resource for an existing task or add a resource to a new task, double-click the task bar and edit the *Assigned to* field in the Project Task form. **Note:** The resources in **Assigned to** column can be constrained to be derived only from the allocated resource plans associated with the project or any of its task.

The Project Management application provides several properties that control how tasks are calculated and behave. See Project property for more information.

Create a parent-child relationship on the planning console

The WBS section of the planning console allows you to create parent-child relationships for new tasks or move around existing tasks in a new parent-child relationship. The position of a task in the hierarchy and the level of indentation determine the parent-child relationship it has with the tasks above or below it.

Before you begin



Role required: it_project_manager

About this task

In this example, the System Readiness Assessment task is a child of the Planning task because it is one level below the Planning task and is indented.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parent-child relation for tasks

Procedure

1. Select a task in the WBS section of the planning console to highlight it.
2. Select a combination of any of the following icons to create the task and move it or move the other tasks to create the required hierarchy:

Creating parent-child relationships

Icon	Action
Add task above icon ( )	Create a task above the highlighted task.
Add task below icon ( )	Create a task below the highlighted task.
Indent icon ( )	Makes the highlighted task a child of the task above it.

Predecessor dependencies in the planning console

In the WBS section of the planning console, you can create dependencies between tasks by specifying a series of values.

The **Predecessor** column on the planning console can specify dependencies between tasks. The values that you put in this column must be in the following format:

`{WBS_number}{dependency_type}+{lag_time}`

Where

- `WBS_number` is the number of the predecessor task in the relationship.
- `dependency_type` is one of the types of dependencies that the application supports.
- `lag_time` is the amount of time, in days, to delay the start of the dependent task. This value can be positive or negative integers.

The values are entered without the curly braces {}. See the examples in the table.

Note: You can also edit tasks from the Gantt chart by clicking the relationship line. See Gantt chart options and Modify a project task dependency for details.

Project task dependency values

Dependency type	Example	Additional information
Finish to start	**1.1fs+0**	The task you are editing starts when task 1.1 is finished.
Start to start	**1.1ss+0**	Task 1.1 cannot finish until the task you are editing finishes.
Start to finish	**1.1sf+0**	Task 1.1 cannot start until the task you are editing finishes.

Custom columns in the planning console

In addition to the regular columns that are provided in the base system, as the PPS admin, you can configure which columns appear in the planning console.

You can define the columns that are available in the project planning console, program workbench, planning and tracking views in portfolio workbench, and the release management Gantt chart. From this list of defined columns, you can select the columns that you want to view in these planning console UIs at any time.

These tables are used for custom column configuration:

- **Planning Console [pm_console]**: Stores the definition for planning consoles such as Project and Portfolio.
- **Planning Console Display Column [pm_console_display_column]**: Stores the planning console display columns such as Short Description, WBS, and Priority.

  A console stored in `[pm_console]` has multiple display columns that are stored in `[pm_console_display_column]`.

  Note: You cannot edit list of column if the column refers to a table other than the [sys_user] table.

- **Planning Console Table [pm_console_table]**: Contains a list of tables which provide data to a console.

  A console sources the data from multiple tables. For example, Project console `[pm_project]` pulls data from `pm_project` and `pm_project_task` table. This list of tables is maintained in `[pm_console_table]`.

- **Planning Console Column [pm_console_columnn]**: Maintains the columns that should be pulled from each table and the mapping of the column in `pm_console_display_column`.

Add a custom column to the planning console

Define the columns that you want to make available in the project planning console, portfolio workbench, program workbench, and the release management Gantt chart.

Before you begin

Role required: it_pps_admin

Procedure

1. Navigate to **All** > **Project Administration** > **Settings** > **Planning Console**.
2. Add a custom display column for planning console.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the Planning Console list, select a console to which you want to add the custom column. For example, select `Project [pm_project]` to add a column to the project planning console.

b. To create a display column for the selected console, select **New** in the **Planning Console Display Column** related list.

c. On the Planning Console Display Column form, fill in the fields.

Planning Console Display Column form

Field	Description
Label	Label for the column to be displayed in the planning console.
Type	Data type of the column.
JSON Column	The JSON column name used internally by the Gantt chart when data is sent. **Note:** Leave blank. This field is auto-populated when you add a column for the display column in step 3.
Order	Position at which the column appears in the planning console.
Include in Tooltip	Check box for the column to be shown in tooltip in timeline in the planning console.
Width	Default width of the column in planning console.
Fire BR on Save	Option if the business rules should be triggered when the column is modified in the planning console. **Note:** The field is not visible on the form by default. Configure the form to add this field.
Trigger recalculation	Option if the recalculation of date and duration should be triggered when the column is modified in the planning console. **Note:** The field is not visible on the form by default. Configure the form to add this field.

d. Select **Submit**.

The column is added in the `Planning Console Display Column [pm_console_display_column]` table.

3. Map the planning console display column created in step 2 to a column in a table defined in `Planning Console Table [pm_console_table]`.

a. In the **Planning Console Display Column** related list, open the display column record.

b. To create a record of actual column in the `Planning Console Column [pm_console_column]` table, select **New** in **Planning Console Columns** related list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. On the Planning Console Column form, fill in the fields.

Planning Console Column form

Field	Description
Display Column	Display column created in the Planning Console Display Column `[pm_console_display_column]` table.
Console Table	Console table to be mapped to the display column.
Table	Actual table from where the data is pulled in the display column. The field is auto-populated when you select a Console Table. For example, select a table from `[pm_project]` or `[pm_project_task]` for a display column added in the Project planning console `Project [pm_project]`.
Column	Actual column in the **Table** from where data comes for the display column.
Editable	Check box to make the column editable in the planning console.

d. Select **Submit**.

Result

The display column appears in the column filter list ( ) in the planning console.

Related topics

Using Planning console - Legacy

Create a dependency from the planning console

Create a dependency between two tasks on the planning console.

Before you begin

Role required: it_project_manager

About this task

You can create any type of dependency. See Parent-child rollup task calculations for an explanation of each type.

You can also create dependencies by using the Predecessor column on the Planning Console. See Predecessor dependencies in the planning console for more information.

Procedure

1. Select a task on the Gantt chart portion of the planning console.
   A white circle appears on either end of the task, one at the start of the task and the other at the end of the task.
2. To create a dependency, select one of the white circles and drag it to the start or end of another task.
3. Double-click the dependency line to see the dependency on the Planned Task Relationship form.
4. Confirm that your dependency is correct.
   You can make changes to the dependency as needed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related topics

Modify a project task dependency

Add an external dependency on planning console

Add an external dependency between two projects on the planning console. Use the work breakdown structure (WBS) column of the planning console to create a dependency between the different projects tasks.

Before you begin

Role required: it_project_manager

Procedure

1. Right-click a task in the WBS column of the planning console.
2. Select **Add External Dependency**.
3. On the Add dependency form, fill in the following fields:
   - Project: The predecessor project that the dependency is added from.
   - Task: The task in the predecessor project that the dependency is added from.
   - Dependency Type: The type of external dependency: **Hard** or **Soft**.
4. Select **OK**.

Result

- A shadow task corresponding to the predecessor task appears in the WBS section of the planning console of the successor project. A similar shadow task corresponding to the successor task appears in the WBS section of the planning console of the predecessor project.

  A shadow task is shown as a grayed out task in WBS column.

- A shadow task corresponding to the predecessor task appears in the **Project Tasks** related list on the successor project form. A similar shadow task for the successor task appears in the **Project Tasks** related list on the predecessor project form.
- The **Dependency** column in WBS column of the planning console of the successor project shows the external dependency value between the projects and tasks. The external dependency value has the following format:

  `{project_number}\{WBS_number}{dependency_type}+{lag_time}`

  Where
  - `project_number` is the number of the predecessor project.
  - `WBS_number` is the number of the predecessor task in the relationship.
  - `dependency_type` is the **finish to start** dependency type that the application supports.
  - `lag_time` is the amount of time, in days, to delay the start of the dependent task. This value can be positive or negative integers.

Note: The external dependencies are displayed only when the **Hide External Dependencies** switch on the planning console is turned off. However, the **Dependency** column in the WBS section of the successor project still shows the value of the external dependency.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

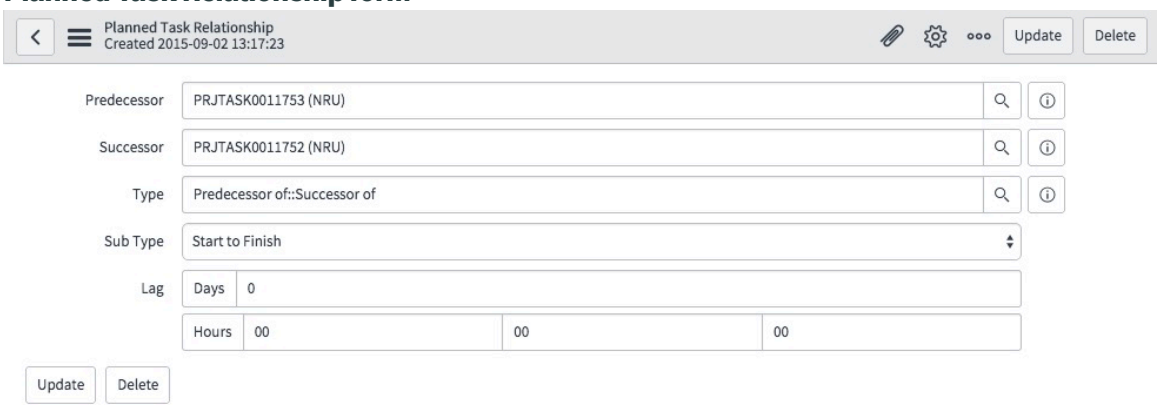
Example:
In the example below, an external dependency is created between two projects P1 and P2. P1T1 is a shadow task of predecessor project P1, and PRJ0010127\1fs+0 is the external dependency value in **the Dependency** column of the planning console of the successor project P2.

What to do next
Check for any external dependency related notifications that may impact the project or its tasks.

Modify a project task dependency

Modify a dependency when editing the tasks that are linked in the dependency, the dependency type, or the lag time.

Before you begin
Role required: it_project_manager



About this task
Project task dependencies are saved on the Planned Task Relationship [planned_task_rel_planned_task] table. You can access dependencies from the planning console.

Procedure

1. Double-click a dependency on the Gantt chart of the planning console.
2. On the form, fill in the details.

   For more information, see Planned Task Relationship form.

Planned Task Relationship form

3. Select **Update**.

   You can view dependencies in the Project Task related list on a Project or Project Task form and from the Project Tasks list on the workbench. These columns show the dependencies:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The **Dependency** column shows the successor task in the relationship.
- The **Dependencies** column shows the dependency value. See Predecessor dependencies in the planning console for a description of what you see in this column.

Related topics

Train the similarity solution for Project Management to find similar projects

Train the Similar Projects solution definition included within the Predictive Intelligence for PPM capability to find related projects when defining a project.

Before you begin

Ensure that the Predictive Intelligence for Contextual Search plugin (com.snc.contextual_search_ml), PPM Standard plugin (com.snc.financial_planning_pmo), and Predictive Intelligence for PPM plugin (com.snc.ppm_ml) are activated. For more information about Predictive Intelligence, see Predictive Intelligence.

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Predictive Intelligence** > **Similarity** > **Solution Definitions**.
2. In the Similarity Definitions list, search for and select the Similar Projects solution definition (ml_sn_global_global_similar_projects).
3. On the Similarity Definition form, verify the default field values for projects.
   For more information about the Similarity Definition form fields, see Create and train a similarity solution.
4. Click **Update & Retrain**.
5. Open the Similarity Definition form for the Similar Projects solution definition (ml_sn_global_global_similar_projects).
6. In the ML Solutions related list, view the training solution progress in the **Progress** column.

> **Note:** Alternatively, you can click the link for the solution in the **Active** column. On the ML Solution form, click the **Show training progress** related link to check the training solution progress.

Result

When the solution is complete, the similar projects appear in the Similar projects section on the Project form.

What to do next

- Review similarity examples: On the Similarity Definition form, in the ML Solutions related list, when **Progress** is 100%, in the **Active** column, click the link for the solution. On the ML Solution form, click the **Similarity Examples** related link to view the Similarity Examples list.
- Update the similarity score threshold: On the ML Solution form, on the **Solution Statistics** tab, enter the required value in the **Similarity Score Threshold** field. Right-click the ML Solution form and click **Save**.
- Test the prediction output for the records: On the ML Solution form, on the **Test solution** tab, enter your text in the **Short description** field and the maximum number of expected results in the **Top N** field, and then click **Run test**. The results above the similarity score threshold value are displayed.

Predictive Intelligence for Project Management

Starting a project

Collaborate with your project teams using PPM Collaboration application

Collaborate with your project team on a common enterprise messaging platform such as Slack or Microsoft Teams using the PPM Collaboration application. Facilitate active and timely communication about the project among the project's team members, be involved in critical discussions on your project, and receive real-time updates on the project's status.

By using a project-specific channel on Slack, or a team on Microsoft Teams, decisions taken or updates made for the project would effectively reach all the team members. The team would have easy access to its past communication through the chat history and shared project documents all at one place. By doing so, the project manager and the team members can save the time spent on emails and other offline communication.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

PPM Collaboration advantages

A project collaboration channel or team provides the following advantages for the project managers and the team members:

PPM Collaboration advantages for project managers and team members

Project Manager	Team member
• Start your day with a detailed status of the project that you're managing • Using the status details, choose to follow up with relevant team members through your preferred mode of communication • Open the project directly from the collaboration channel or team to drill down into further details	• Communicate with the team members to resolve an issue you're facing • Receive status updates from the team members • Contribute to the discussions regarding the project

- Real-time updates on changes to milestones, risks, issues, decisions, actions, and change requests (RIDAC), and project financials.
- Automatic addition and removal of members of the collaboration channel or team based on who the project tasks are assigned to.

Note: PPM Collaboration is not supported for teamspaces.

Setup tasks	Description
Verify that the Microsoft Teams Graph spoke (sn_msteams_ahv2) plugin is activated, for collaboration with Microsoft Teams.	Navigate to **All** > **Subscription Management** > **Subscriptions** in your instance. The list displays the subscriptions that your organization has purchased.
Verify that the Microsoft Azure AD spoke (com.sn.azure_ad.spoke) plugin is activated, for collaboration with Microsoft Teams.	Navigate to **All** > **Subscription Management** > **Subscriptions** in your instance. The list displays the subscriptions that your organization has purchased.

Note: Activation of the PPM Standard, Microsoft Teams, and Slack spoke plugins on production instances may require separate licenses. Contact ServiceNow Customer Support for details.

- Ensure that the PPM Collaboration application and all of its associated store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.

Role required: admin

Procedure

1. Navigate to the ServiceNow Store.
2. In the ServiceNow Store, search for PPM Collaboration.
3. Select the application tile.
   You can view detailed information about the application. Consider reading the Other Requirements and Dependencies sections, as applicable.
4. Select **Get** and enter your Now Support login credentials.
5. Select **Request Install**.
6. In the **Instance Name** field, enter your details and select **Validate Instance**.
7. In the **Reason for the Instance** field, enter your details and select **Request**.
   You receive an email with detailed installation instructions.
8. Log in to the instance on which you want to install the PPM Collaboration application.
9. Select **System Applications** > **All Available Applications** > **All**.
10. Locate the application using the filter criteria and search bar, select it, and select **Install**.

Result

The following components are installed with installation of the application:

- Roles
- Tables

For more information, see Components installed with PPM Collaboration.

What to do next

Setting up PPM collaboration for Slack.

Components installed with PPM Collaboration

Roles and tables are installed with activation of the PPM Collaboration application.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Roles installed

Role	Description
Collaboration user [SN_collab_common.collab_user]	Users with this role have read-only access to the Entity Channel table. This role is automatically assigned to project managers and task assignees.
Collaboration owner [SN_collab_common.collab_owner]	Users with this role have complete create, read, update, and delete access to the Entity Channel table. This role is automatically assigned to project managers.

Tables installed

Table	Description
Entity Channel [sn_collab_common_entity_channel]	Stores the list of IDs and names of the Slack channels that are created for the projects.

Install PPM Collaboration

Collaborate with your project teams using PPM Collaboration application

Setting up PPM collaboration for Microsoft Teams

Integrate your ServiceNow instance with your organization's Microsoft Teams to enable collaboration of your projects in Microsoft Teams.

PPM Collaboration uses the Microsoft Teams Graph and Microsoft Azure AD spoke actions such as creating a team for your project, adding or removing your project team members, archiving the team when the project is closed, posting a message when a record is updated, and so on. To enable these spoke actions, you must integrate your ServiceNow instance with Microsoft Teams Graph and Microsoft Azure AD to authenticate ServiceNow requests. For more information, see the Set up Microsoft Teams Graph spoke and Set up Microsoft Azure AD spoke topics.

Important: When you activate the Microsoft Teams Graph and Microsoft Azure AD spokes, a Connection & Credential alias for Microsoft Teams Graph and Microsoft Azure AD is created by default with the IDs *sn_msteams_ahv2.Microsoft_Teams_Spoke* and *sn_azure_ad_spoke.AzureAD* respectively. The connection that is active (the Active field is set to *true*) in Connections related list of this alias uses this default ID to connect your ServiceNow instance to Microsoft Teams Graph and Microsoft Azure AD. Therefore, you can have multiple connections associated with this alias but ensure that only one connection is active at any given time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Setting up PPM collaboration for Slack

Integrate your ServiceNow instance with your organization's Slack to enable collaboration of your projects in Slack.

PPM Collaboration uses the Slack spoke actions such as creating a channel for your project, adding or removing your project team members, archiving the channel when the project is closed, posting a message when a record is updated, and so on. To enable these spoke actions, you must integrate your ServiceNow instance with Slack to authenticate ServiceNow requests. For more information, see Set up Slack spoke.

Important: When you activate Slack spoke, a Connection & Credential alias for Slack is created by default with the ID *sn_slack_ah_v2.Slack*. The connection that is active (the Active field is set to *true*) in Connections related list of this alias uses this default ID to connect your ServiceNow instance to Slack. Therefore, you can have multiple connections associated with this alias but ensure that only one connection is active at any given time.

Flows designed to synchronize projects with your collaboration tool

Understand the flows designed for the PPM Collaboration application so that you can edit the configurations as required.

PPM Collaboration flows

Slack Flow [Name]	Microsoft Teams Flow [Name]	Description
Action Slack [action_slack]	Action Teams [action_teams]	Posts a message to the project channel or team whenever an Action is created with priority **1-Critical** or **2-High** or if the priority of an existing Action is updated to **1-Critical** or **2-High**.
Add Assigned Users To Channel [add_assigned_users_to_channel]	Add Assigned Users To MS Group [add_assigned_users_to_ms_group]	Handles adding the users in the **Assigned to** or **Additional Assignee list** fields of the project tasks to the project channel or team.
Archive Project Channel [archive_project_channel]	Archive MS Group [archive_group]	Handles archival of the project channel or team based on the count of number of days from which the project is moved to a closed state. This flow is set to run daily at 08:00 AM.
Change Request Slack [cr_updated_slack]	Change Request Teams [change_request_teams]	Posts a message to the project channel or team whenever a Change request with priority **1-Critical** or **2-High** is created or if the priority of an existing Change request record is updated to **1-Critical** or **2-High**.
Daily Project Status Slack [daily_project_status]	Daily Project Status Teams [daily_project_status_teams]	Triggers a message about the overall status of the project to the project channel or team everyday at 08:00 AM.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

PPM Collaboration flows (continued)

Slack Flow [Name]	Microsoft Teams Flow [Name]	Description
Decision Slack [decision_updated_slack]	Decision Teams [decision_teams]	Posts a message to the project channel or team whenever a Decision with priority **1-Critical** or **2-High** is created or if the priority of an existing Decision is updated to **1-Critical** or **2-High**.
Issue Slack [issue_updated_slack]	Issue Teams [issue_teams]	Posts a message to the project channel or team whenever an Issue with priority **1-Critical** or **2-High** is created or if the priority of an existing Issue is updated to **1-Critical** or **2-High**.
Milestone/ KeyMilestone Slack [milestonekeymilestone]	Milestone/ KeyMilestone Teams [milestonekeymilestone_teams]	Posts a message to the project channel or team whenever a Milestone or a Key Milestone task is moved to the closed state.
Project Manager Changes Slack [project_manager_changes]	Project Manager Changes MS Teams [project_manager_changes_ms_teams]	Handles adding the new project manager as a member to the project channel or team. This flow also checks if the user who was the old project manager is assigned to any project tasks and if not assigned to any task, removes the user from the channel.
Project Status Slack [project_status_slack]	Project Status Teams [project_status_teams]	Posts a message to the project channel or team in the following three scenarios: • **State** field is updated to Closed Complete, Closed Incomplete, or Close Skipped states • **Status** fields is updated • Project manager changes for this project
Risk Flow Slack [risk_created_slack]	Risk Flow Teams [risk_created_teams]	Posts a message to the project channel or team whenever a Risk with probability **High** or **Absolute** is created or if the probability of an existing risk is updated to **High** or **Absolute**.

All the flows, except the subflows, are inactive by default. Enable the collaboration between PPM and Slack or Microsoft Teams for a specific action by activating these flows. You can view all these flows by navigating to **Flow Designer** > **Designer** and filtering the flows by the PPM collaboration application. For more information, see Activate a flow.

If you want to update the configuration for any of these flows, you can edit them. For example, if you want to update the time of daily status update from 8:00 AM to 9:00 AM, you can edit the Daily Project Status Slack [daily_project_status] or Daily Project Status Teams [daily_project_status_teams] flow. For more information, see Edit a flow.

Create a Microsoft team for your project

Create a Microsoft team for your project to start collaborating with your team and receive timely updates of the project.

Before you begin

Ensure that the project for which you want to create a team is active and not in a closed state.

Role required: it_project_manager

Important: You must be the designated project manager for this project in addition to having the it_project_manager role.

Procedure

1. Navigate to **All** > **Project** > **Projects** > **All**.
2. Open the project for which you want to create a team.

   Ensure that you are the project manager for the project you open.
3. Enable collaboration for the project by selecting the **Enable MS Teams Collaboration** related link.

Result

- A Microsoft team is created for the project. You can see the team's name in the success message on your project form. You can also view a link in the project form to access your MS team group, selecting on the link will navigate you to the MS team group for your project.
- You and the administrator are added as owners in the team.
- Any assignees and additional assignees of active project tasks for this project are added as members to this team.

  Assignees and additional assignees of project tasks that you create later will be automatically added as members to this team if you enable the Add Assigned Users To MS Group flow. However, new or existing stakeholders added to the project are not added as members to this channel.

  Note: Users assigned to the tasks (assignee and additional assignee) from Planning Console will not be added automatically to the Microsoft team.

- Once a team is successfully created for a project, the **Enable MS Teams Collaboration** related link is removed from that project. Collaboration cannot be enabled for both Slack and Microsoft Teams for the same project. If you have selected on the **Enable MS Teams Collaboration** related link for a project, and you select the **Enable Slack Collaboration** related link before the MS team is created, a message will be displayed specifying that MS Teams creation is in progress.

If you are unable to create a team, retry the procedure after sometime. If the issue persists, contact your system administrator.

Notifications for project updates in your collaboration tool

Receive updates related to your project on your Slack channel or Microsoft team. Analyze the delayed and overdue tasks, follow closure of milestones, and monitor changes to risk, issue, decision, action, and change request (RIDAC) items of your project.

Using the automatic project status updates on the project collaboration channel or team, project managers can take informed decisions about project planning, resource management, finance allocation. The team members can understand updates made to the project and actively collaborate on any delayed or overdue tasks.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Project managers can reach out to their system administrators to configure the application settings for these notifications according to their preferences.

Daily notification on project status

A notification with the consolidated project status is sent to the project's channel daily at 8:00 AM which consists of the following information.

Project overview

- A direct URL of the project. Selecting this URL opens the project in your ServiceNow instance.
- Name of the project.
- Planned start and end dates of the project.
- State of the project, for example, Work in Progress.
- Status of the project, for example, Green.
- Percentage of project completion.

Project tasks due today

List of project tasks that have planned end date marked as today and are in the Work in Progress state. The list displays only five project tasks that are sorted alphabetically by their short description.

Overdue tasks

List of project tasks which have a planned start date before today but are not in either the Work in Progress or Closed states. The list displays only five project tasks that are sorted in an ascending order of the planned start dates so that you get high visibility into the tasks that are overdue for a longer period.

Delayed tasks

List of project tasks which have a planned start date before today and are in the Work in Progress state. The list displays only five project tasks that are sorted in ascending order of the planned end dates so that you get high visibility into the tasks that have been delayed for a longer period.

Project tasks due within seven days

List of five of the following project tasks that have a planned end date within seven days from today. All these tasks are displayed in ascending order of their due dates so that you get high visibility into the tasks that are due soon.

Note: Tasks that in Closed state are not displayed in the list.

- High priority risks, issues, and action items
- Milestone or key milestone tasks

Other updates

Notifications are sent to the project channel for the following scenarios.

- Cost estimate at completion (EAC) exceeds the planned cost of the project
- Planned end date is later than the approved end date

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Project did not start on the planned start date
- Project is not complete by the planned end date

Notification regarding change of project manager

When there is a change in the manager of your project, an update is made to the Project manager field of the project record.

- A notification including the project URL is sent to your project channel on this update.
- New project manager is added as a member of the channel.
- If no project tasks are assigned to the old project manager, this user is removed as a member of the channel.

Notification for other updates to the project

Project's status

When an update is made to the Status field of the project, a notification including the project URL is sent to your project channel.

RIDAC records

You receive notifications in your project channel when a new RIDAC record is added to or an existing RIDAC record is updated in the project for the following scenarios. With every notification, you receive a direct URL to the corresponding record.

- Risk
  - New risk is created with the priority field set to **High** or **Absolute**
  - Updates are made to the State or Risk status fields for an existing risk
- Issue, Decision, Action, and Change request
  - New record is created with the priority field set to **1-Critical** or **2-High**
  - Priority of an existing record is updated to **1-Critical** or **2-High**

Milestones

Whenever a key milestone is closed, you are notified about the closure and the user who closed it, with a direct URL to the milestone task.

Related topics

Collaborate with your project teams using PPM Collaboration application

Archiving your project collaboration channel or team

Understand how your project Slack channel or Microsoft team is archived when your project is moved to a closed state.

Moving the project to a closed state

When the project manager moves the project to Closed Complete, Closed Incomplete, or Closed skipped state, the following actions are triggered:

- A notification about project closure is sent to the channel or team immediately.
- The channel or team is archived within 15 days from the day the project is moved to a closed state.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This duration of 15 days helps the project members to bring any pending communication to closure or share any pending project documentation.

Project managers can contact their administrator to update this duration of 15 days to a value of their choice.

Deletion of a project task

When a project task is deleted, the members in the corresponding Slack channel or Microsoft team are not removed automatically. To remove the members on deletion of a project task, you must enable the **Remove Users From Slack/Teams Channel** business rule. This business rule is created on the Project Task table and is not enabled by default. For more information, see Business rules.

Deletion of the project channel or team

If the channel is deleted in the Slack application, or the team is deleted in the Microsoft Teams application, the PPM Collaboration application does not handle the deletion of the project's reference in the Entity Channel [sn_collab_common_entity_channel] table automatically. So, the project manager cannot see the **Enable Slack Collaboration** or **Enable MS Teams Collaboration** related link on the project form again.

If the project manager wants to create a channel or team again for this project, administrator must manually delete the project's reference from the Entity Channel table. Then, the related link to enable collaboration appears on the project form.

Virtual Agent for PPM

ServiceNow® Virtual Agent for PPM enables project managers to get quick answers to business-related queries by interacting with a virtual agent through various messaging services.

Virtual Agent for PPM helps project managers view business-related information quickly in a single step rather than having to navigate through various lists. For example, you can get the list of all your project tasks that are overdue.

The base system provides the following predefined Virtual Agent topics (chatbot conversations):

- Project and Task status
  - All active projects
  - Projects with status red
  - Projects ending next week and % complete less than 60%
  - Overdue milestones/ key milestones
  - Overdue tasks
  - Delayed tasks
- Resources
  - Resource plans with actual hours greater than allocated hours
  - Unallocated resource plans starting next week
  - Unallocated resource plans with requested extension
- Financials

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

  - My active projects
  - Projects with EAC greater than planned cost
  - Projects with EAC greater than budget
- RIDAC (Risk, Issue, Decision, Action, and Request Changes)
  - Absolute and high probability risks due this week
  - Critical and high priority issues due this week
  - Critical and high priority action items due this week
- Data quality
  - Projects without business case
  - Projects without strategy
  - Projects without program or portfolio

A topic defines the dialog between the Virtual Agent (chat support bot) and user, which enables you to gather information for a specific business need. For more information, see Virtual Agent.

Integration with messaging applications

You can run Virtual Agent bot conversations for PPM using third-party messaging applications like Slack or Microsoft Teams.

Use the Virtual Agent integration app to configure the messaging apps for your instance.

For more information, see Virtual Agent integration with messaging apps.

For more information on integrating with Slack or Microsoft Teams, see Setting up Virtual Agent notifications.

Name	Description
Virtual Agent for PPM (com.sn_ppm_va)	Activates a conversational bot platform for providing user assistance through conversations within a messaging interface for PPM.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the application using the filter criteria and search bar.
   You can search for the application by its name or ID. If you cannot find an application, you may have to request it from ServiceNow store.

   Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.
3. Select **Install**.
4. In the Application installation dialog box, review the application dependencies.

   Dependent plugins and applications are listed if they will be installed, are currently installed, or need to be installed. If there are any plugins or applications that need to be installed, you must install them before you can install Virtual Agent for PPM.
5. **Optional:** If demo data is available and you want to install it, select**Load demo data**.

   (Optional) Demo data comprises sample records that describe application features for common use cases. Load demo data when you first install the application on a development or test instance.

   Important: If you don't load the demo data during installation, it's unavailable to load later.
6. Select **Install**.

Reusable PPM Virtual Agent topic blocks

PPM Virtual Agent conversation flows

Virtual Agent for PPM provides several predefined topic conversations to enable project managers to gather information on their business-related tasks.

The following predefined topic conversations are available to view if you have the it_project_manager role.

Project and task status

Project and task-related information like active projects, projects that are in the red state, projects due to end in the near future, and projects with overdue tasks and milestones. This information helps you track and plan projects per set milestones.

Resources

Resource-related information such as resource plans containing actual hours greater than allocated hours, or unallocated resource plans that are due to start in the coming week or have an extension requested. You can then manage resources and act on resource plans that are not progressing as planned.

Financials

Finance-related information such as projects where the estimate at completion amount is greater than the planned cost or projects where the estimate at completion amount is greater than the budget amount. This information helps you understand the financial performance of your projects.

RIDAC

RIDAC (Risks, Issues, Decisions, Actions, and Request Changes) related information like projects with absolute or high probability risks due in the coming week, or projects with critical or high probability issues and actions due in the current week. This information helps you analyze and identify patterns, trends, and probable resolution for planning future projects.

Data quality

Quality-related information like projects that do not have a business case, strategy, program, or portfolio assigned to them. This information helps you evaluate projects that are not aligned to any strategy, business case, program, or portfolio.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	move the projects which are in WIP state. **Note:** When a project is moved, only tasks in open and pending state are moved and the project takes the rolled up dates from all the project tasks. Default value: false
Calculate ROI percentage based on a project's estimated cost and its net value com.snc.project.calculate_roi	If set to true, this property calculates the return on investment using the (net value/ estimated cost) x 100 formula. This field is only available from the Advanced view of the Project form. Default value: true
Enable alter of planned date with Actual for Manual Project com.snc.project.change_planned_date_from_actual_for_manual	If set to true, the property recalculates the planned end date of a manual project from actual start date and planned duration. Default value: false
Enable project cost rollup (estimated and actual) – updating the cost of a project task will update the cost of its parent com.snc.project.rollup.cost	If set to true, this property updates the cost of a parent project task if the cost of the child task is updated. Default value: false
Roll up project start date from tasks com.snc.project.rollup_project_start_date	If set to true, the project planned start date rolls up from the planned start date of the earliest task. Disable this property if you want the project planned start date to remain the same despite the start date of the earliest task. Default value: true

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
Automatically close project milestone tasks when they change to work state com.snc.project.auto_close_milestones	If set to true, this property closes milestones automatically so you do not have to close them manually. Default value: false
Enable altering of planned date(s) for task in WIP/Closed com.snc.project.enable_alter_of_planned_dates	If set to true, this property enables you to change the planned start date for tasks even if they are in the Work in progress state or any of the closed states. Default value: false
Change Resource Plan, Cost Plan and Benefit Plan Start Date with Demand or Project Start Date change. Benefit Plan Start Date will change only if the offset type for the plan is not None com.snc.project.date_change_cascade	If set to true, this property changes the start dates for a resource plan, cost plan, and benefit plan when there is a change in the project or demand start dates. **Note:** The start date of benefit plans with the offset type **None** does not change with the project or demand date change. Default value: true
Retain users & resource plan state as confirmed / allocated when project moves com.snc.project.date_change_cascade_persist_resource_plan_state	If set to true, this property retains the confirmed or allocated state of a resource plan, booked resources, and planned daily contour when a property is moved. On moving the project, the resource plan is reallocated or reconfirmed based on the availability of the resources in the future time period to which the project is moved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	Note: This property is enabled only when the **Change Resource Plan, Cost Plan and Benefit Plan Start Date with Demand or Project Start Date Change** property has been set to true. Default value: true
Create project(s) on confirming demands from portfolio workbench com.snc.project.portfolio_workbench.confirm_to_create_project	If set to true, this property converts all selected demands in a portfolio to projects. Default value: false
List of attributes (comma-separated) that will be copied from the originating project task com.snc.project.copy.additional_attributes	By default, the **Copy Project** and **Copy partial project** options only copy the short description, planned dates, and duration fields from source project to the target project. If additional columns must be copied, they should be declared in this property. Default value: blank
Default the expense type for a new project. sn_plng_att_core.default.expense_type	When a new project is created in the Project Workspace, expense type of the project is marked as Opex.

The following project properties are available in system property [sys_properties] table. Only pps_admin can edit these properties.

Property	Description
Retain start on constraint on tasks after adding relations com.snc.project.allow_start_on_relations	The property keeps the **Start on** selection of a task even after you put the task in a relation to another task, for example, FS relation. Default value: true

Property	Description
Max duration (in days) allowed for a project/project task com.snc.project.task.max_task_duration	The property governs the max duration of a project task or the overall project. **Note:** If your project includes milestones, the duration is calculated taking holidays and weekends into account. Default value: 2600 **Warning:** Increasing the value of the property to more than 2600 will have an impact on memory usage of the platform. A very high value causes out of memory error, for example, if you try to create a project or a project task with 15000 days duration.
Max date span into future or past from the current date for the project/project task com.snc.project.task.check_date_span_years	The property governs the max date in future when entering the planned dates of a project or a project task. Default value: 10 **Warning:** Increasing the value of the property to more than 10 will have an impact on memory usage of the platform. A very high value causes out of memory error.
Synchronize the planned and original dates when creating or updating a project or task com.snc.project.sync_original_dates_with_planned_dates	If set to true, this property synchronizes the planned and original dates. Default value: true
Use a predefined template when generating a status report sn_pw.project_status_report_default_templateId	The property specifies the default template used for generating project status reports. You can replace the existing default template with your desired template and set it as default by updating the sys id in value field of project status report default template property.
Generate the status report as read-only sn_pw.doc_status_report_read_only	The property restrict edits in the status report. The property sets the status report to read-only.

Benefit Plan form

Learn about the fields of benefit plan form.

Benefit Plan form

Field	Description
Name	Descriptive name of the benefit plan.
Work	Project or demand to which the benefit plan belongs.
Sponsor	Sponsor for the project.
Category	Type of benefit: • **Hard**: Benefits that can be measured in terms of revenue. • **Soft**: Benefits that are measured in terms of value.
Sub category	Sub-categories of hard and soft benefits.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Benefit Plan form (continued)

Field	Description
	The selection in **Category** field determines the selections available in this field.
Benefit type	Type of benefit. Select **Monetary benefits**.
Offset type	Field to indicate when the benefits start realizing. Select any of the following options: • **None**: The default value is None. When you select None, you need to manually enter the benefit plan start and end fiscal periods. • **Milestone**: After completion of a milestone. • **Start Date**: At the start of the project. • **End Date**: After the project ends. If the value in the selected offset type changes, the benefit plan start date shifts accordingly. For example, if the offset type is set to **End Date** and the end date of the project changes, the benefit plan start date shifts to align with the new end date of the project.
Milestone	**Note:** The field appears if you select **Milestone** in the **Offset type** field. Project milestones to which the benefit plan belongs.
Milestone start date	**Note:** The field appears if you select **Milestone** in the **Offset type** field. Start date of the selected milestone.
Work start date	**Note:** The field appears if you select **Start Date** in the **Offset type** field. Start date of the project or demand.
Work end date	**Note:** The field appears if you select **End Date** in the **Offset type** field. End date of the project or demand.
Offset	Number of periods before or after the offset type when the benefit plan starts. For example, if the offset type is selected as **End Date** and the offset is -2, the benefit plan is two periods prior to the project end date. If the project end date shifts, the benefit plan start date shifts to two periods prior to the new project due date.
Duration in periods	The length, in periods, of the benefit plan.
Start fiscal period	Starting fiscal period. Populated based on the value in the Offset field relative to the selected Milestone, Project or Demand start date, or Project or Demand end date, and Duration in period values. The field is editable if you select **None** in the **Offset type** field. When you change the start fiscal period, the associated benefit breakdown values also change.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Benefit Plan form (continued)

Field	Description
End fiscal period	Ending fiscal period. Populated based on the value in the Offset field relative to the selected Milestone, Project or Demand start date, or Project or Demand end date, and Duration in period values. The field is editable if you select **None** in the **Offset type** field. When you change the end fiscal period, the associated benefit breakdown values also change.
Associated benefit	Non-monetary benefit that is associated to this monetary benefit plan.

Financials details

Field	Description
Entered benefit	Benefit incurred from the project or demand specified in terms of entered currency. If the selected currency is different from the functional currency, the corresponding budget reference rate is used to calculate the **Total planned benefit** of the project.
Entered currency	Currency in which you want the benefit plan to be created.
Functional currency	Currency that is obtained from the **glide.system.locale** property. For upgraded customers, if the selected currency is different from the functional currency configured in the Financial Management application, the corresponding budget reference rate is used to calculate the **Total planned benefit** of the project.
Total planned benefit	Estimated amount of potential benefit of the project or demand.
Benefit in functional currency	Benefit incurred from project or demand in terms of functional currency.
Actual benefit	Actual benefit that is incurred from the project or demand. This value is rolled up from the **Actual benefit** field of all the benefit plan breakdowns.
Recurring	Check box to indicate that the benefit is recurring for all the fiscal periods in the benefit plan.

Cost Plan form

Learn about the fields of cost plan form.

Cost Plan form

Field	Description
Name	Descriptive name of the cost plan.
Project/ Demand	Project or demand to which the cost plan belongs.
Start fiscal period	Indicates the starting fiscal period. When you change the start fiscal period, the associated cost plan breakdowns also change. Start fiscal period also changes when you create cost plan breakdowns earlier than the start fiscal period.
End fiscal period	Indicates the ending fiscal period. When you change the end fiscal period, the associated cost plan breakdowns also change. End fiscal period also changes when you create cost plan breakdowns later than the end fiscal period.

Financials section of the Cost Plan form

Field	Description
Entered currency	Currency in which you want the cost plan to be created. If the selected currency is different from the functional currency, the corresponding budget reference rate is used to calculate the total planned cost, planned capital, planned operating of the project.
Unit cost	Cost of a single unit of the resource, which is in terms of entered currency.
Quantity	Quantity of the resource that is required.
Recurring	Option to indicate that the cost is recurring for each fiscal period. **Quantity** x **Unit cost** incurred for every fiscal period.
Cost type	Cost type definition.
Investment	Name of the investment created for the project. This field appears only if the legacy Investment Funding (com.snc.investment_funding) plugin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Financials section of the Cost Plan form (continued)

Field	Description
	is activated or the Investment Funding (sn_invst_pln) application is installed.
Source type	Funding entity to associated with the project investment for funding. This field appears only if the legacy Investment Funding (com.snc.investment_funding) plugin is activated or the Investment Funding (sn_invst_pln) application is installed.
Source	Funding entity value from which you request fund. The field is available when you select a value in the **Source type** field. This field appears only if the legacy Investment Funding (com.snc.investment_funding) plugin is activated or the Investment Funding (sn_invst_pln) application is installed.
Total planned cost	Total estimated cost of the cost plan. If the cost is recurring, the calculation is **Quantity** x **Unit cost** x **number of fiscal periods**. If the cost is non-recurring, the calculation is **Quantity** x **Unit cost**.
Functional currency	Currency that is obtained from the **glide.system.locale** property. For upgraded customers, if the selected currency is different from the functional currency configured in the Financial Management application, the corresponding budget reference rate is used to calculate the total planned cost, planned capital, planned operating of the project. **Note:** If budget reference rates are not defined, then exchange rate is considered as 1. For example, if functional currency is USD, entered cost is EUR, and no exchange rate is defined, then 1000 USD equals to 1000 EUR.
Cost in functional currency	Value that is rolled up from the **Functional cost** field of all cost plan breakdowns.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Financials section of the Cost Plan form (continued)

Field	Description
Total actual cost	Value that is rolled up from the **Actual cost** field of all cost plan breakdowns.
Estimate at Completion	Sum of all actuals for past fiscal periods added to the functional cost for future fiscal periods. For example, the duration of a project is from January 01 to December 31, and if you check the Estimate at Completion in the month of May, it is calculated as: `Sum of actuals from Jan to April + Sum of functional cost from May to December`.

Benefit Plan form

Field	Description
Name	Descriptive name of the benefit plan.
Work	Project or demand to which the benefit plan belongs.
Sponsor	Sponsor for the project.
Category	Type of benefit: • **Hard**: Benefits that can be measured in terms of revenue. • **Soft**: Benefits that are measured in terms of value.
Sub category	Subcategories of hard and soft benefits. The selection in the **Category** field determines the selections available in this field.
Benefit type	Type of benefit. Select **Non-monetary benefits**.
Offset type	Field to indicate when the benefits start to be realized. Select any of the following options: • **None**: The default value is None. When you select **None**, you must manually enter the benefit plan start and end fiscal periods. • **Milestone**: After completion of a milestone. • **Start Date**: At the start of the project. • **End Date**: After the project ends. If the value in the selected **Offset type** field changes, the benefit plan start date shifts accordingly. For example, if the **Offset type** field is set to **End Date** and the

Benefit Plan form (continued)

Field	Description
	end date of the project changes, the benefit plan start date shifts to align with the new end date of the project.
Milestone	Project milestones to which the benefit plan belongs. This field appears only when **Milestone** is selected from the **Offset type** field.
Milestone start date	Start date of the selected milestone. This field appears only when **Milestone** is selected from the **Offset type** field.
Work start date	Start date of the project or demand. This field appears only when **Start Date** is selected from the **Offset type** field.
Work end date	End date of the project or demand. This field appears only when **End Date** is selected from the **Offset type** field.
Offset	Number of periods before or after the offset type when the benefit plan starts. For example, if the offset type is selected as **End Date** and the offset is -2, the benefit plan is two periods prior to the project end date. If the project end date shifts, the benefit plan start date shifts to two periods prior to the new project due date.
Duration in periods	The length, in periods, of the benefit plan.
Start fiscal period	Starting fiscal period. Populated based on the value in the **Offset** field relative to the selected **Milestone**, **Project/Demand start date**, or **Project/Demand end date**, and **Duration in periods** field values. The field is editable if you select **None** in the **Offset type** field. When you change the start fiscal period, the associated benefit breakdown values also change.
End fiscal period	Ending fiscal period. Populated based on the value in the Offset field relative to the selected Milestone, Project or Demand start date, or Project or Demand end date, and Duration in period values. The field is editable if you select **None** in the **Offset type** field. When you change the end fiscal period, the associated benefit breakdown values also change.
Associated benefit	Monetary benefit that is associated to this non-monetary benefit plan.

Non-monetary Details

Measure	Type of measure for the non-monetary benefit plan. The measure types are Count, Percentage, Hours, Days, and Score. Select the option **Yes/No** to track the benefits that are not quantifiable. When this option is selected, the only field available is **Benefits achieved**. You can select the check box to indicate that the benefits have been achieved.

Non-monetary Details (continued)

Non-monetary entered benefit	Estimated value of the potential benefit. Any change in the planned benefit on the benefit plan updates the associated benefit breakdown values for future fiscal periods only.
Non-monetary planned benefit	Benefit value that is rolled up from the benefit breakdown.
Benefits achieved	Option to indicate if the benefit is achieved.
Breakdown type	Type of breakdown creation when you save the benefit plan. • **None**: No breakdowns are created. • **Automatic**: A Non-monetary Benefit Plan Breakdowns record is created automatically with data. The breakdown is calculated linearly. • **Manual**: A Non-monetary Benefit Plan Breakdown record is created automatically but without data in the **Entered benefit** column.
Aggregation mode	Determines how the roll-up happens from breakdowns to the benefit plan and updates the values in the **Non-monetary planned benefit** and **Non-monetary actual benefit** fields. • **Sum**: Aggregates data from all breakdowns. • **Average**: Average value from all breakdowns. • **Most recent**: Recent breakdown value. • **Max**: Maximum value among the breakdowns. • **Min**: Minimum value among the breakdowns.
Non-monetary actual benefit	Actual benefit value that is rolled up from the actual benefit in the non-monetary benefit plan breakdown.

Project form

Field	Description
Project Name	Name of the project.
Project manager	Project manager assigned to the project.
Status	Current status of the project. This information is retrieved from the **Overall health** field in the most recent project status report of the project. • **No status**: This is unset state indicating that a project has not been assigned a status value or status has not been determined. • **Green**: The planned end date for the project task is more than the offset working days that you defined. • **Yellow**: The planned end date for the project task is less than the offset working days that you defined. • **Red**: The planned end date for the project task is past the offset working days that you defined.
Number	System-generated number with a configurable prefix.
Percent complete	Percentage of the project that has been completed.
State	Current state of the project. All new projects begin as **Pending**. The state of the project can be set on the Project form or derived from the task state. The default available states are: Pending, Open, Work in Progress, Closed Complete, Closed Incomplete, and Closed Skipped. You can also create a custom state for each state type by overriding the state dictionary attributes. For example, say that for the project tasks you have created a custom state called **Testing** for the **Work in Progress** state type. When you update the project task state to **Testing**, the project state is also updated to **Testing**. However, if you have not created a **Testing** state for the **Work in Progress** state type, the project state is updated to the default **Work in Progress** state.
Description	Detailed description of the project.

Project form (continued)

Field	Description
	Note: Special characters are not supported in the project description. Also, avoid copying text from text processor as it ma cause issues while displaying project information on the planning console.
Similar projects	Displays projects that have similar values for the **Description** and **Short Description** fields using predictive intelligence and machine-learning algorithms. For more information, see Predictive Intelligence for Project Management.
Related Search	Displays search results matching the **Name** field by default. You can use this field to search for matching projects using other terms also.

Dates section of the Project form

Field	Description
Schedule	Work schedule to be used for this project. The default schedule is an 8-hour work day (from 8 a.m. to 12 p.m. and 1 p.m. to 5 p.m.). A day is considered to be a work day and not a 24-hour day.
Approved start date	The date to start the project. This field retains the demand approved start date if the project is converted from a demand. The project schedule is not applied to this date and the date remains unchanged when you add project tasks to your project. This field is highlighted with red color if the date in this field is set to a date later than the **Planned start date** field. **Note:** The approved start date of the project is also carried forward to any sub-project associated with the project.
Approved end date	The date when this project ends. This field retains the demand approved due date if the project is converted from a demand. The project schedule is not applied to this date and the date remains unchanged when you add project tasks to your project. This field is highlighted with in red if the date in this field is set prior to the date in the **Planned end date** field.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dates section of the Project form (continued)

Field	Description
	Note: The approved end date of the project is also carried forward to any sub-project associated with the project.
Planned start date	The start date of the project tasks within the project. This date is rolled up from the project tasks. This date is copied from the **Approved start date**. After planned tasks are added, this value is set to the earliest time that the project schedule allows. For example, if the project task is created at 3 a.m. and the default schedule is in use (which has an 8 a.m. start date), then the default task start is 8 a.m. the next day. **Note:** The planned start date must be within 10 years of the current date. The project property **Max date span into future or past from the current date** controls the behavior for project planned start date. When you convert a demand to a project, the start date of the demand is carried forward as the **Planned start date** for the project. If the demand start date is a weekend and your project follows a project schedule, the **Planned start date** is adjusted to the first working day of the week. When you create the project from My Projects Space page, the **Planned start date** field is automatically populated. You must select the calendar icon and select a date to start the project. Projects do not automatically start on the planned start date.

Dates section of the Project form (continued)

Field	Description
	Note: • When you change the planned start date of a project, the associated cost plans and resource plan also change. The project property **Change Resource Plan and Cost Plan Start Date with Demand or Project Start Date Change** controls the behavior for project start date change. • This field is not available when creating a project by default. Use the **Approved start date** field to specify the project start date. Configure the form to display this field. However, this field is available for existing projects and projects converted from a demand.
Planned end date	The end date of the project tasks within the project. After you add tasks, the value in the field is calculated from the tasks. For a manual project, any update to the actual start date does not update the planned end date of the project. Enable the project property **Enable alter of planned date with Actual for Manual Project** to update the planned end date from the actual start date and planned duration. **Note:** This field is not available when creating a project by default, use the **Approved end date** field to specify the project end date. Configure the form to display this field. When you convert a demand to a project, the due date of the demand is carried forward as the **Planned end date** for the project. If the demand due date is a weekend and your project follows a project schedule, the **Planned end date** is adjusted to the first working day of the week.
Planned duration	Expected duration of the tasks within the project. After you add tasks, the value in the field is calculated from the duration of the tasks. The duration also considers the project schedule, accounting for any non-work time in the schedule.

Dates section of the Project form (continued)

Field	Description
	Note: The project property **Max duration (in days) allowed for a project/ project task** controls the behavior for project planned duration. For example, if the default schedule is used, with a standard 8-hour work day, a project that starts at 8 a.m. on 1 July and ends at noon on 2 July is calculated as 1 day and 4 hours, not 28 hours.
Planned effort	Estimate of the time that it takes to complete the project. This calculation sums up planned effort values for all tasks and stories (in the case of Agile and Hybrid projects) in this project. After you add tasks, this field becomes a read-only, roll-up calculation and overwrites any earlier entry that you made.
Actual start date	Date on which the planned tasks start. The time component in the actual start and end dates depends on the value of the **Derive time component from planned dates** field in the **Preferences** tab when you manually populate the actual dates. However, when you change the **State** or **Percent complete** of the project, the actual dates are auto-populated with the time component copied from the planned dates. The value of the **Derive time component from planned dates** field has no effect on the time component of actual dates in this case.
Actual end date	Date on which the planned tasks ends.
Actual duration	Duration of the project tasks from project start to project closure. As with the planned duration, the actual duration shows the total project time and takes the project schedule into consideration.
Actual effort	Actual number of hours charged to the resources on this project. If you are using the Time Cards application, it automatically calculates the value for this field. It uses the totals for the time worked from the approved time cards of all the resources who worked on a project and all its tasks.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dates section of the Project form (continued)

Field	Description
	Note: The actual effort from the stories for Agile and Hybrid projects is also rolled up to the project's actual effort. The field is not editable if the **Update actual effort from time card** field is set to **Yes** on the **Preferences** tab.

Details section of the Project form

Field	Description
Portfolio	Primary portfolio to which the project belongs. A project can belong to multiple portfolios. **Note:** • If a project, for which the **Portfolio** field is not set is associated to a portfolio using the portfolio form, then the portfolio name is populated in the **Portfolio** field. • If a portfolio is deleted, the portfolio name is removed from the **Portfolio** field on the Project form.
Program	Program to which the project belongs. **Note:** If the **Portfolio** field is not set, you can select from the list of all programs in the system. If the **Portfolio** field is set, you cannot select programs that belong to other portfolios.
Investment Class	Type of investment class category assigned to the project: • **Run**: Investment made to sustain the existing business. • **Change**: Investment made to implement a change in business.
Investment Type	Investment type of the project. • Cost Reduction • End User Experience • Legal and Regulatory • Revenue Generating • Service Sustaining

Details section of the Project form (continued)

Field	Description
	• Strategic Enabler • Artificial Intelligence
Execution Type	Execution methodology used to run the project: **Waterfall**, **Agile**, and **Hybrid**. The default value is **Waterfall**. The **Execution Type** field selection determines the related links and related lists that are available. For example, the **Agile Planning & Tracking** related link appears when you set the Execution Type value to **Agile**. You must have the appropriate plugins such as Agile Development 2.0 and Test Management to view these related links and related lists. Also, you must have the appropriate role to use these related links and related lists.
Demand	Demand from which the project was created. The field is visible only if the project has a demand associated to it. **Note:** When a demand gets converted into a project, the data on **Business Case** tab gets carried forward from demand to project.
Phase	Current phase of the project. In addition to the **Phase** field, the different project phases are also shown at the top of each project record. The selected phase is highlighted. The default phases are **Initiating**, **Planning**, **Executing**, **Delivering**, and **Closing**.
Department	Department in a business unit to which the project belongs.
Business Unit	Business unit to which the project belongs.
Impacted Business Units	Business unit that is impacted by the project.
Business Capabilities	If the project is to change, enhance, or add one or more business capabilities, those capabilities can be associated with the project. Business capabilities are defined in the Application Portfolio Management module.
Business Applications	If the project is to change, enhance, or add one or more business applications, those

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Details section of the Project form (continued)

Field	Description
	applications can be associated with the project. Business capabilities are defined in the Application Portfolio Management module. You can select any business application in your enterprise regardless of whether it is related to the capability selected in the **Business Capabilities** field.

Business case section of the Project form

Field	Description
Strategies	Strategic objectives of the organization that the project fulfills. A project can fulfill multiple strategic objectives. If a **Business Unit** for the project is selected in **Details** tab, then the list displays the business strategies for the selected business unit along with other enterprise strategies.
Goals	Goals associated with the selected strategy. A project can fulfill multiple goals. If a strategy is not selected, then all goals are displayed in the list.
Business case	Business arguments that support the project.
Risk of performing	Risks associated if the project is carried out.
Risk of not performing	Risks associated if the project is not carried out, for example, risk of loss of opportunity.
Enablers	Key enablers for the project.
Barriers	Major barriers to the project.
In scope	Scope of the project. The scope is the set of boundaries that define the extent of a project.
Out of scope	Activities or deliverables that are not in the scope of the project. Anything that is not defined in the scope is out of scope.
Assumptions	Assumptions made for the project. Assumptions help define scope and risks, and fine-tune the estimates for time and cost.

Financials section of the Project form

Field	Description
Rate Model	Rate model assigned to the project. The rate model is used to derive hourly rates for the associated resource plans and time cards. When you create a project from a demand, the rate model is copied from the demand to the project. The subprojects in a project derive their resource plan calculations from the rate model associated with the top task. If the assigned rate model is removed or replaced or the hourly rates in the rate model are changed, the cost fields on the associated resource plans are not recalculated automatically. You must update costs of all resource plans in the project using the **Recalculate Resource Costs** menu option to reflect new rates from the rate model. You can also update costs of a single resource plan one at a time.
Total planned cost	Estimated cost of the project. If an operational expenditure, capital expenditure, or both are associated with the project, then the planned cost is the sum of the operational expenditure and capital expenditure, which is in the selected currency for the project. For Agile and Hybrid projects, the planned cost for stories is considered when the resource plan is created for Agile assignment group. **Note:** To create a resource plan for Agile assignment group, you must assign the pps_resource role to the group.
Planned capital	Capital expenditure (Capex) for the project. If no cost plans are associated with the project, the **Planned capital** field is editable. Select a currency type and enter a value.
Planned operating	Operational expenditure (Opex) for the project. If no cost plans are associated with the project, the **Planned operating** field is editable. Select a currency type and enter a value.

Financials section of the Project form (continued)

Field	Description
Budget cost	Budgeted cost for this project. This field is automatically populated from the project budget breakdowns in the cost plan breakdown table. When project funds are allocated for a fiscal year, the cost plan breakdown stores the budget allocation for each fiscal period. These amounts are rolled up and stored in the budget cost. To manually enter a value, select a currency icon and enter the value.
Actual cost	Actual cost of this project. Select a currency icon and enter a value.
Estimate at completion	Sum of all actuals for past fiscal periods added to the planned cost for future fiscal periods. **Note:** The current month is considered as a future month for EAC calculation purposes. For example, if the duration of a project is from January 01 to December 31 and you check the Estimate at Completion in the month of May, it is calculated as: `Sum of actuals from Jan to April + Sum of planned cost from May to December`.
Planned benefit	Planned benefit for the project. This value is rolled up from the benefit breakdown of the project. You can also enter the value manually. Select a currency icon and enter a value.
Planned return	The **Planned return** value is derived from the difference between the **Planned benefit** and **Planned cost** values: (The value in the **Planned benefit** field – the value in the **Planned cost** field.)
Planned ROI%	The ROI (return on investment) percentage result is calculated based on values in the **Planned return** and **Estimated cost** fields. `(Planned return/Estimated cost x 100)`
Discount Rate %	Project discount rate.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Financials section of the Project form (continued)

Field	Description
	The discount rate is the interest rate to determine the present value of future cash flows.
Net present value	Present value of future cash based on the given annual interest rate. This value is a measure for comparing money spent today against future expected financial benefits. This information is useful when evaluating the overall investment performance. For example, at 12% discount rate, $1.00 today is worth $0.80 in two years. Therefore, expecting to receive $1.00 in two years is the same as receiving $0.80 today. Net present value (NPV) is calculated from the estimated cost per year, the planned benefit per year, and the discount rate for the project.
Internal rate of return %	Annual interest rate required to achieve an NPV of zero. Internal rate of return (IRR) helps to determine which projects can deliver a higher rate of return in terms of revenue.
Estimate to completion	Sum of all planned costs for future fiscal periods. You can define the frequency to calculate EAC and ETC values to match with the expense lines. Navigate to **System Definition** > **Scheduled Jobs**, select the **Calculate Project Completion Estimates** job, and set the frequency using the Run list. **Note:** The current month is considered as a future month for ETC calculation purposes.

Score section of the Project form

Field	Description
Risk Score	Calculated based on the project risk.
Value Score	Calculated based on the ROI% of the project.
Size Score	Calculated based on the value in the **Planned Cost** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Score section of the Project form (continued)

Field	Description
Score	Calculated based on the individual scores of the attributes **Risk Score**, **Value Score**, and **Size Score**, which in turn are calculated based on the risk, planning ROI%, and estimated cost attributes on a project, respectively. **Note:** • You can configure the formula for score calculation. • When a demand is converted to a project, the score calculated on the demand is carried forward to the project.

Notes section of the Project form

Field	Description
Watch list	Users who have subscribed to project notifications.
Work notes list	Users who have chosen to receive email notifications when the work notes on the project are updated.
Activity / Work notes	Information about the milestones, impediments, or changes as the project progresses. Enter the notes in the **Activity** field and select **Work notes**. The text appears in the feed.

Preferences section of the Project form

Field	Description
Allow time card reporting on	Level at which the time cards for project tasks can be created: • **Project only**: All time cards for the project are created at the project level only. For example, if a user is assigned to multiple tasks in a project, then the time spent on all tasks is recorded under one time card only for the project.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Preferences section of the Project form (continued)

Field	Description
	Note: In the Time Sheet Portal, tasks, the project are listed on the **Tasks** tab. For these tasks, the **Add to Time Sheet** and **Add selected to Time Sheet** options are not available. Only the **Quick Add** option is available. On selecting **Quick Add**, a time card is created against the top project, not against the task. • **Project tasks only**: Separate time cards are created corresponding to each planned task. **Note:** In the Time Sheet Portal, the **Add to Time Sheet**, **Quick Add**, and **Add selected to Time Sheet** options are not available for the project. • **Project and project tasks**: Time cards can be created at the project level as well as the project task level. The default value is **True**. • **No time reporting**: No time cards are created for the project. If the user submits the time card manually, the business rules prevent the user from submitting the time card. **Note:** In the Time Sheet Portal, the **Add to Time Sheet**, **Quick Add**, and **Add selected to Time Sheet** options are not available for both project and project tasks.
Update actual effort from time card	Determines whether the **Actual effort** field on the **Dates** tab should be updated based on the hours entered in the time cards for the project. If the field is set to **Yes**, then the **Actual effort** field is not editable. If it is set to **No**, then the actual hours from time cards are not rolled up to the project and task. By default, the field is set to **No**.
Calculation	Type of calculation to use for task dependencies:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Preferences section of the Project form (continued)

Field	Description
	• **Manual**: Task dates do not reflect any changes made to dependencies. • **Automatic**: Task dates are automatically updated to reflect any changes made to dependent or child tasks.
Show on Program Status Report	Option to specify whether the project and its key aspects such as cost, resource, scope, and schedule should be included in the status report of the program to which the project belongs. Default: Selected
Constraint date	A read-only field that displays the project's planned start date. The date in this field is used for calculate the start date of the tasks with **Start ASAP** constraint. Use the **Move Project** related link to change the constraint date. Changing this date also changes the start date for all the tasks with **Start ASAP** constraint. For more information, see Change the planned start date of a project.
Derive assignee list from resource plan	Option to constrain the resources in the **Assigned to** and **Additional assignee list** fields on the project and project task forms to be derived only from the associated allocated resource plans.
Recalculate score on project change	Determines whether to recalculate and update the project score. • If the value of the field is set to **Yes**, the project score is recalculated when the projects planned ROI%, estimated cost, or risk is modified. • If the value of the field is set to **No**, the project score remains the same even if the project's planned ROI%, estimated cost, or risk is modified. The value of the field can be set to **No** when the user wants to preserve the score value while converting the project to a demand.
Project schedule date format	Determines whether the dates in the planning console should be displayed with the time component. The default is **Date**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Preferences section of the Project form (continued)

Field	Description
Derive time component from planned dates	Determines whether the time component in the actual start and end dates should be copied from the time component in the planned start and end dates. By default, it is set to **True**. If the **Project schedule date format** field is set to **Date**, this option is selected and inactivated. **Note:** When you change the **State** or **Percent complete** value for the project, the actual dates are auto-populated with the time component copied from the planned dates. The value of the **Derive time component from planned dates** field has no effect on the time component of the actual dates in this case. The value of the field affects the time component only when you populate the actual dates manually.

Risk Overview section of the Project form

Field	Description
Inherent risk	Score of inherent risk automatically calculated from risk assessment.
Residual risk	Score of residual risk automatically calculated from risk assessment.
Inherent Heatmap	Heatmap of the inherent risks.
Residual Heatmap	Heatmap of the residual risks.

Starting a project

Project task form

Learn about the fields of project task form. The fields appear when the Project Portfolio Management is active and the Project form is in the **Basic** view. Configure the form to display the fields.

Project Task form

Field	Description
Short description	Brief description of the project task.
Number	System-generated number with a configurable prefix.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Project Task form (continued)

Field	Description
Status	Status of the project task. The status updates automatically based on the difference of the planned end date of the task from the current date. The color of the status changes as the planned end date approaches: • **Green**: The planned end date for the project task is more than the offset working days that you defined. • **Yellow**: The planned end date for the project task is less than the offset working days that you defined. • **Red**: The planned end date for the project task is past the offset working days that you defined. The default offset for status calculation is 3 working days. You can update the *com.snc.ppm.yellow_status_duration* property to change the offset duration. Your project schedule determines the working days. **Important:** The status of the project task does not affect the overall status of the project, meaning the project task status does not roll up to the project. Also, the status of the child tasks does not affect the status of the parent task. Execute the *Update Active Project Task Status* scheduled job to update the status of your existing tasks. This scheduled job runs daily by default, however you can execute this job on demand also. If you do not want the status of a task to update automatically, you can change the status of the task manually. Changing the status manually, overrides the automatic update and the execution of the scheduled job does not change the status of the project task. **Note:** Configure the property *com.snc.status_process_planned_task_entities* to include or exclude task types for automatic status updates.
Override status	Indicates if the project task status is updated manually. By default, this check box is deselected. When you change the **Status** field manually, this check box becomes selected.
State	Current state of the project. The states include: *Pending*, *Open*, *Work in Progress*, *Closed Complete*, *Closed Incomplete*, *Closed Skipped*. The state is automatically rolled up from the project tasks. For more information, see Project calculation and Parent-child rollup task calculations.
Description	Detailed description of the project task.
Assigned to	User assigned to the project task. The following conditions apply: • If an assignment group is defined, only users in the assignment group appear in the lookup list. • If skills are defined, only users with those skills appear in the lookup list.

Project Task form (continued)

Field	Description
	• If no assignment groups or skills are defined, only users with one of the Project Management application user roles appear in the lookup list. • Users with `timecard_user` role also appear in the lookup list.
Assignment group	User group assigned to the project task.
Additional assignee list	Additional users assigned to the project task.
Percent complete	Percentage of the work that has been completed for the project task.

Details tab

Field	Description
Milestone	Option for converting the task to a milestone.
Key milestone	Option for converting the task to a key milestone.
Allow dates outside schedule	Indicates whether the project task is set to start and end on a non-schedule day (outside regular project schedule) such as on a weekend. An off-schedule task can start any time during the day and on any day of the week. For example, if you use the project schedule Monday to Friday, 8:00 to 17:00 and a project task of duration 2 days should start on Saturday, then an off-schedule task is allowed to be scheduled on Saturday and end on Sunday. Similarly, if a task of duration 3 days starts on Friday, then an off-schedule will end on Sunday instead of ending on Tuesday. The option is not enabled for a parent task. The value of this field on the parent task is derived from the child tasks. **Note:** • There is no difference between an off-schedule and an on-schedule task if there is no schedule defined at the project. • 1 day is 8 hours for a task in regular schedule and 24 hours for a task outside schedule.

Dates tab

Field	Description
Planned start date	Estimated date and time for the project task to start. You can edit this date when the **Time constraint** is **Start on Specific Date**, **Start no earlier than**, or **Start no later than**. If the constraint type is **Start ASAP** or **Start no later than**, changing the planned start date for a task changes the constraint type to **Start no earlier than**.
Planned end date	Estimated date and time for the project task to end. For a manual project, any update to the actual start date does not update the planned end date of the project task. Enable the project property **Enable alter of planned date with Actual for Manual Project** to update planned end date from the actual start date and planned duration.
Planned duration	Estimated length of time (from start time to end time) of the project task.
Planned effort	Estimate of how much time it will take to complete this task. After you add child tasks, this field becomes read-only, rolls-up calculation and overwrites any earlier entry that you made.
Constraint date	A read-only field that determines the start date for tasks with **Start no earlier than**, **Start no later than**, and **Start on specific date** constraints. Use the **Move project** related link to change this date. For more information, see Change the planned start date of a project.
Original start date	Original planned date and time for the task to start.
Actual start date	Date on which the project task started. The task is set to **Work in Progress** when the actual start date is populated. When you change the **State** or **Percent complete** of the task, the actual dates are auto-populated with the date component copied from the planned dates. When you populate the actual start and end dates, the time component in actual dates is defaulted to the date component in planned dates when the derive time component from

Dates tab (continued)

Field	Description
	planned dates field on Project form is set to True.
Actual end date	Date on which the project task ended. The task is set to **Closed Complete** when the actual end date is populated.
Actual duration	Duration of the task from task start to task closure. As with planned duration, the actual duration shows total task time.
Actual effort	Actual number of hours charged from the resources on this project task. If you are using the Time Card Management application, the value for the field comes from the application automatically. The application calculates the actual effort on the task by taking the total time worked from all approved time cards of all resources who worked on the task.
Time constraint	When the project task begins: • **Start ASAP**: The task starts as soon as possible as determined by the relationships and dependencies. The dates for these tasks are derived from the constraint date of the project. • **Start on specific date**: The task starts on a date that you specify. The task dependencies are not considered for date calculation. • **Start no earlier than**: The task starts on or after the constraint date. • **Start no later than**: The task starts on or before the constraint date. The start date is determined by the relationships and dependencies. **Note:** If the **Calculation** field on the Project form is set to Manual, you cannot change the constraint type for such projects. To change the constraint type, change the project to Automatic.
Original end date	Original planned date and time for the task to end.

Project Template Form

Learn about the fields of project template form.

Project Template Form Fields

Field	Description
Name	The name of the project template.
Table	Display only. Templates are based on the Project table.
Description	A brief description of the project template.
Template	Includes columns of fields and field values to be included in the template. Select a field in the left column and select the desired field name, then select the field in the right column to enter the field value. If additional information for the field is required, a field appears in the third column. For example, to identify the currency in a money field. • Select the **X** to the right of a field to remove that field from the template. • Use the blank field at the bottom of the list to add new fields.

Related Links

Field	Description
Create Project	Creates a project from this project template.
Copy Template	Creates a copy of this project template.

Related Lists

Field	Description
Project Template Tasks	The project template task list.

Related Lists (continued)

Field	Description
Attachments	The files attached to the template.

Project Template Configuration form fields

Field	Definition
Table	The entity to be parameterized in the template.
Parent table	The parent table for this item.
Link element	The field that links the table with the parent table.
Active	A check box that indicates this item is included in a template.
Elements	A comma-separated list of fields from the table selected in the **Table** field that are included in the template.

Planning attribute form

Use the Planning attribute form fields to modify a planning attribute.

Planning attribute form

Field	Description
Attribute type	Attribute type list. • Resource: To use the attribute for resources or financials for your project. • Task: To use the attribute to generate labor costs only.
Attribute name	Name of the attribute.
Enable for resource management	Option to enable the attribute for resource planning. This option is selected by default.
Enable for financials	Option to enable/disable the attribute for financial planning. **Note:** • To enable an attribute for financials, it should be enabled for resource management. • To disable an attribute for financials for an ongoing project: Delete all the existing labor cost plans, disable the attribute for financials, and regenerate labor cost plans.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Portal board widget form

Field	Description
Name	Unique name for the widget you are configuring.
Order	The order in which your widgets appear on both your Investment Board and the Investment Portal page. Lower numbers are placed ahead of higher numbers. For example, a widget with an order set to 100 appears before a widget with an order set to 200.
Aggregate type	Type of aggregation applied for the investment widget calculation: **Sum**, **Average**, **Minimum**, **Maximum**, and **Count**. For example, you are aggregating the actual cost of three projects, A, B, and C, surfaced by a filter. Actual costs are 1000 for project A, 2000 for project B, and 3000 for project C. If sum is selected as the aggregate type, then the actual cost metric value would be 6000. If average is selected as the aggregate type, then the actual cost metric value would be 2000. If minimum is selected as the aggregate type, then the actual cost metric value would be 1000. If maximum is selected as the aggregate type, then the actual cost metric value would be 3000. If count is selected as the aggregate type, then the actual cost metric value would be 3.
Scripted	Check box to specify a script for the investment widget calculation.
Show Label	Check box to display either the label or the color indicator. If you clear the check box, the **Color** field displays, which allows you to set the color.
Active	Check box to indicate that the investment widget is active.
Display on board	Check box to display the investment widget on your investment board.
Parent widget	Parent widget for this investment metric widget. A parent widget can have up to a maximum of three child widgets.
Include by default	Check box to show an active investment widget by default on: • new boards • existing boards that do not have widget selection configured The check box is selected by default. For more information on configuring widgets on an investment board, see Widget Configuration.
Short description	Brief description about the investment widget.
Script	Script written for the dynamic calculation of investment widget. This field is displayed only when the **Scripted** check box is selected. The following script returns a string containing the desired output to be displayed on widget. Five variables (which are programmatically introduced to the script) are available:
