These relationships are created to support Azure Functions discovery:

CI	Relationship	CI
Azure Functions [cmdb_ci_cloud_function]	Hosted on::Hosts	Azure datacenter [cmdb_ci_azure_datacenter]

Connections found by Service Mapping during top-down discovery

Service Mapping can discover the following connections:

- Connections to the following databases: MSSql, MySql, MongoDB, and Documentum.
- HTTP connections belonging to Azure Functions environment, for example, https://scenario4-hop1-azure-function.azurewebsites.net.

> **Note:** Service Mapping does not scan java classes/jars and binary files for possible information about outgoing HTTP connections of Azure Functions. If java classes/jars and binary files are the only source of information about some outgoing HTTP connections, Service Mapping does not find such HTTP connections.

Azure hardware type pattern-based discovery

Discovery and Service Mapping Patterns finds Azure hardware type configurations on your cloud environment. Discovering some of these resources might require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Discovery uses the Azure - Hardware Type (LP) pattern to discover available Azure hardware type configurations (VM sizes) from your Azure account.

When using the Hardware Type [cmdb_ci_compute_template] table to store the hardware types, you may notice an unusually large number of records. To avoid this issue, you can store the

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

discovered hardware types in the Cloud Hardware Type [cmdb_ci_cloud_hardware_type] table. When enabled, Discovery launches the Azure - Cloud Hardware Type (LP) pattern to populate the Cloud Hardware Type [cmdb_ci_cloud_hardware_type] table. For more information, see Enable the Cloud Hardware Type class extension.

Pattern-based discovery and mapping requirements

Verify the Azure discovery prerequisites section in Microsoft Azure Cloud discovery using patterns.

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the Azure hardware type patterns.

Hardware Type [cmdb_ci_compute_template] or Cloud Hardware Type [cmdb_ci_cloud_hardware_type]

Field	Description
Name [name]	The name of the hardware type configuration. For example: **Standard_A1_v2** or **Standard_D2s_v3**.
Object ID [object_id]	The name of the hardware type configuration. For example: **Standard_A1_v2** or **Standard_D2s_v3**.
Cores [cores]	The number of CPU cores available for this hardware type configuration.
Memory MB [memory_mb]	The amount of memory available for this hardware type configuration, in megabytes (MB).
vCPUs [vcpus]	The number of Virtual Central Processing Units (vCPUs) available for this hardware type configuration.
Local Storage GB [local_storage_gb]	The size of the temporary disk (resource disk) available for this hardware type configuration, in gigabytes (GB).
Provider [provider]	The cloud provider, which is **AZURE**. This field is only populated in Cloud Hardware Type [cmdb_ci_cloud_hardware_type] table.

CI relationships

The Azure hardware type patterns create these relationships to support Azure hardware type discovery.

CI	Relationship	CI
Hardware Type [cmdb_ci_compute_template] or Cloud Hardware Type [cmdb_ci_cloud_hardware_type]	Hosted on::Hosts	Azure Datacenter [cmdb_ci_azure_datacenter]

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure Host pattern-based discovery

Discovery and Service Mapping Patterns finds Azure Hosts on your cloud environment. Discovering some of these resources might require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Pattern-based discovery and mapping requirements

Verify the Azure discovery prerequisites section in Microsoft Azure Cloud discovery using patterns.

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the Azure - Host (LP) pattern.

Host [cmdb_ci_cloud_host]

Field	Description
Name [name]	The Name or ID if no Name is specified for the host.
Object ID [object_id]	A unique identifier, allocated by Azure for this resource.
Host Type [host_type]	The Stock Keeping Unit (SKU) name of the dedicated host.
Cloud Vendor [cloud_vendor]	The cloud vendor: **Azure**.
Is Virtual [virtual]	Indicates whether this is a virtual host. Value is set to false.
Install Status [install_status]	Install status of the resource. Default value is Installed.

CI relationships

The Azure - Host (LP) pattern creates these relationships to support Azure Host discovery.

CI	Relationship	CI
Host [cmdb_ci_cloud_host]	Hosted on::Hosts	Azure Datacenter [cmdb_ci_azure_datacenter]
Resource Group [cmdb_ci_resource_group]	Contains::Contained by	Host [cmdb_ci_cloud_host]
Virtual Machine Instance [cmdb_ci_vm_instance]	Runs on::Runs	Host [cmdb_ci_cloud_host]
Key Value [cmdb_key_value]	References	Host [cmdb_ci_cloud_host] or Virtual Machine Instance [cmdb_ci_vm_instance]

Azure Tag discovery

The pattern extension sections discover Bring Your Own License (BYOL) or the included licenses for Windows VMs, and collect Azure resource tags from Hosts.

Key Value [cmdb_key_value]

Field	Description
Key [key]	The key is one of the following options:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Key Value [cmdb_key_value] (continued)

Field	Description
	• Tags: Azure resource tag name • License: Windows_OS_License_Type_automatic
Value [value]	The value is one of the following options: • Tags: Azure resource tag value • Azure Hybrid Benefit: BYOL • pay-as-you-go: License Included
Configuration item [configuration_item]	• Tags: References the Host [cmdb_ci_cloud_host] table • License: References the Virtual Machine Instance [cmdb_ci_vm_instance] table

Azure Key Vault pattern-based discovery

Discovery and Service Mapping Patterns finds Azure services on your cloud environment. Discovering some of these resources might require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Pattern-based discovery and mapping requirements

Verify the Microsoft Azure discovery prerequisites

For more information, see the prerequisites section in Microsoft Azure Cloud discovery using patterns.

Remove resources from the Resource Inclusion List table

Verify that the relevant resource isn't listed in the Resource Inclusion List [sa_cloud_inventory_resource_whitelist] table to avoid duplicate discovery. For more information on removing resources from the Resource Inclusion List, see Microsoft Azure resource inventory discovery.

Enable the relevant pattern

The pattern for this service is disabled by default. Starting with Visibility Content version 6.28.0, activating or deactivating a pattern won't be considered a customization, and it will continue to receive updates. Patterns that were previously activated or deactivated will reset to the latest predefined version after upgrading while retaining the last active field value. For more information on enabling patterns, see Activate a disabled pattern.

Configure the Discovery schedule to support GovCloud

Discovering Azure GovCloud (US) accounts requires using a datacenter URL when setting up an Azure service account. For more information, see Set up Azure service accounts.

Discovery and Service Mapping Patterns application populates data in both CMDB and non-CMDB tables.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data stored in non-CMDB tables

Discovery and Service Mapping Patterns application populates data in the non-CMDB table when running the Azure - Key Vault - Extended Inventory(LP) pattern.

You can review the non-CMDB Azure tables by navigating to **All** > **Configuration** > **Azure**. You can also search the navigation filter for the specific pattern name.

Azure Key Vault [cmdb_azure_key_vault_key_vault]

Field	Description
Kind [kind]	The specific form or variant of the resource type.
Location [location]	The geographical location where the resource is hosted.
Object Id [object_id]	The unique identifier of the resource.
Provisioning State [provisioning_state]	The current provisioning status of the resource.
Public Network Access [public_network_access]	Indicates whether the resource is accessible over a public network.
Resource Group [resource_group]	Name of the resource group.
Subscription ID [subscription_id]	The subscription ID.
Tenant ID [tenant_id]	The unique identifier of the Azure Active Directory tenant to which the resource belongs.
Configuration Item [configuration_item]	References the Cloud Resource [cmdb_ci_cmp_resource] table.

Data stored in CMDB tables

Discovery and Service Mapping Patterns application populates data in the CMDB when running the Azure - Key Vault - Extended Inventory(LP) pattern.

Cloud Resource [cmdb_ci_cmp_resource]

Field	Description
Install Status [install_status]	Install status of the resource. Default value is Installed.
Location [location]	The geographical location where the resource is hosted.
Name [name]	The name assigned to the resource.
Object ID [object_id]	The unique identifier of the resource.
Operational status [operational_status]	Operational status of the resource. Default value is Operational.
Resource type [resource_type]	Type of resource. The value is set to **microsoft.keyvault/vaults**.
Description [short_description]	Description of the resource or service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CI relationships

The pattern creates these relationships to support discovery.

CI	Relationship	CI
Resource Group [cmdb_ci_resource_group]	Contains::Contained by	Cloud Resource [cmdb_ci_cmp_resource]
Cloud Resource [cmdb_ci_cmp_resource]	Hosted on::Hosts	Azure Datacenter [cmdb_ci_azure_datacenter]
Azure Key Vault [cmdb_azure_key_vault_key_vault]	References	Cloud Resource [cmdb_ci_cmp_resource]

Azure tag discovery

The pattern collects tags and populates them in the Key Value [cmdb_key_value] table.

Key Value [cmdb_key_value]

Field	Description
Key [key]	Tag name.
Value [value]	Tag value.

Azure Key Vault Key pattern-based discovery

Discovery and Service Mapping Patterns finds Azure Key Vault Keys on your cloud environment. Discovering some of these resources might require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Pattern-based discovery and mapping requirements

Verify the Microsoft Azure discovery prerequisites

For more information, see the prerequisites section in Microsoft Azure Cloud discovery using patterns.

Remove resources from the Resource Inclusion List table

Verify that the relevant resource isn't listed in the Resource Inclusion List [sa_cloud_inventory_resource_whitelist] table to avoid duplicate discovery. For more information on removing resources from the Resource Inclusion List, see Microsoft Azure resource inventory discovery.

Enable the relevant pattern

The pattern for this service is disabled by default. Starting with Visibility Content version 6.28.0, activating or deactivating a pattern won't be considered a customization, and it will continue to receive updates. Patterns that were previously activated or deactivated will reset to the latest predefined version after upgrading while retaining the last active field value. For more information on enabling patterns, see Activate a disabled pattern.

Configure the Discovery schedule to support GovCloud

Discovering Azure GovCloud (US) accounts requires using a datacenter URL when setting up an Azure service account. For more information, see Set up Azure service accounts.

Discovery and Service Mapping Patterns application populates data in both CMDB and non-CMDB tables.

Data stored in non-CMDB tables

The Discovery and Service Mapping Patterns application populates data in the non-CMDB table when running the Azure - Key Vault Key - Extended Inventory(LP) pattern.

You can review the non-CMDB Azure tables by navigating to **All** > **Configuration** > **Azure**. You can also search the navigation filter for the specific pattern name.

Azure Key Vault - Key [cmdb_azure_key_vault_key]

Field	Description
Name [name]	Name of the Key Vault Key.
Object Id [object_id]	Unique identifier for the Key Vault Key, in the format of the Azure Resource Manager (ARM) resource ID followed by /keys/<key-name>. For example: **/subscriptions/<subscription-id>/resourceGroups/<resource-group>/providers/Microsoft.KeyVault/vaults/<vault-name>/keys/<key-name>**.
Key ID [key_id]	The versioned URI of the key in Azure Key Vault.
Key Type [key_type]	The cryptographic algorithm of the key. For example: RSA or EC.
Curve [curve]	The elliptic curve name for EC keys. For example: P-256 or P-384.
Key Ops [key_ops]	The operations permitted for the key. For example: **sign,verify** or **sign,verify,wrapKey,unwrapKey,encrypt,decrypt**.
Key Size [key_size]	The size of the key in bits.
Enabled [enabled]	Indicates whether the key is enabled.
Recovery Level [recovery_level]	The deletion recovery level for the key. For example: Recoverable, Purgeable, or Recoverable+Purgeable.
Created Date [created_date]	Date and time when the key was created.
Updated Date [updated_date]	Date and time when the key was last updated.
Expiration Date [expiration_date]	Date and time when the key expires.
Configuration Item [configuration_item]	References the Cloud Resource [cmdb_ci_cmp_resource] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data stored in CMDB tables

The Discovery and Service Mapping Patterns application populates data in the CMDB when running the Azure - Key Vault Key - Extended Inventory(LP) pattern.

Cloud Resource [cmdb_ci_cmp_resource]

Field	Description
Name [name]	Name of the Key Vault Key.
Object ID [object_id]	Unique identifier for the Key Vault Key, in the format of the ARM resource ID followed by /keys/<key-name>. For example: **/subscriptions/<subscription-id>/resourceGroups/<resource-group>/providers/Microsoft.KeyVault/vaults/<vault-name>/keys/<key-name>**.
Resource type [resource_type]	The Azure resource type: **microsoft.keyvault/vaults/keys**.
Install Status [install_status]	Install status of the resource. Default value is Installed.
Operational status [operational_status]	Operational status of the resource. Default value is Operational.

CI relationships

The Azure - Key Vault Key - Extended Inventory(LP) pattern creates the following relationships and references to support Azure Key Vault Key discovery. References link to records in other tables and don't appear in the CI Relationship [cmdb_rel_ci] table.

CI relationships

CI	Relationship	CI
Cloud Resource [cmdb_ci_cmp_resource]	Hosted on::Hosts	Azure Datacenter [cmdb_ci_azure_datacenter]
Cloud Resource [cmdb_ci_cmp_resource]	Members::Member of	Cloud Resource [cmdb_ci_cmp_resource]

CI references

CI	Field	Referenced CI
Azure Key Vault - Key [cmdb_azure_key_vault_key]	Configuration Item [configuration_item]	Cloud Resource [cmdb_ci_cmp_resource]
Key Value [cmdb_key_value]	Configuration item [configuration_item]	Cloud Resource [cmdb_ci_cmp_resource]

Azure Tag discovery

The Azure - Key Vault Key - Extended Inventory(LP) pattern collects tags and populates them in the Key Value [cmdb_key_value] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Key Value [cmdb_key_value]

Field	Description
Key [key]	Tag name.
Value [value]	Tag value.
Configuration item [configuration_item]	References the Cloud Resource [cmdb_ci_cmp_resource] table.

Azure Local Network Gateway pattern-based discovery

Discovery and Service Mapping Patterns finds Azure Local Network Gateway resources on your cloud environment. Discovering some of these resources might require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Pattern-based discovery and mapping requirements

Verify the Azure discovery prerequisites section in Microsoft Azure Cloud discovery using patterns.

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the Azure - Local Network Gateway (LP) pattern.

Virtual Private Gateway [cmdb_ci_virtual_pvt_gateway]

Field	Description
Object ID [object_id]	The unique Azure resource identifier for the Local Network Gateway.
Name [name]	The name of the Local Network Gateway resource.
State [state]	The operational state of the Local Network Gateway.
IP Address [ip_address]	The IP address of the on-premises VPN device that the Local Network Gateway connects to.
Install Status [install_status]	Install status of the resource. Default value is Installed.

CI relationships

The Azure - Local Network Gateway (LP) pattern creates these relationships to support Azure Local Network Gateway discovery.

CI	Relationship	CI
Resource Group [cmdb_ci_resource_group]	Contains::Contained by	Virtual Private Gateway [cmdb_ci_virtual_pvt_gateway]
Azure Datacenter [cmdb_ci_azure_datacenter]	Hosted on::Hosts	Virtual Private Gateway [cmdb_ci_virtual_pvt_gateway]

Azure Log Analytics - Workspace [cmdb_azure_log_analytics_workspace]

Field	Description
Object Id [object_id]	The unique identifier of the Azure resource.
Kind [kind]	The specific kind or variant of the resource.
DC Location [location]	The geographical region where the resource is deployed.
Resource Group [resource_group]	The Azure resource group to which the resource belongs.
Subscription Id [subscription_id]	The unique identifier of the Azure subscription containing the resource.
Tenant Id [tenant_id]	The identifier of the Azure Active Directory tenant associated with the resource.
Provisioning State [provisioning_state]	The current lifecycle state of the resource. For example: Succeeded, Creating, or Failed.
Configuration Item [configuration_item]	References the Cloud Resource [cmdb_ci_cmp_resource] table.
Customer Id [customer_id]	The unique identifier of the Log Analytics workspace or customer instance.

Data stored in CMDB tables

Discovery and Service Mapping Patterns application populates data in the CMDB when running the Azure - Log Analytics Workspace - Extended Inventory(LP) pattern.

Cloud Resource [cmdb_ci_cmp_resource]

Field	Description
Object ID [object_id]	The unique identifier of the Azure resource.
Name [name]	The name of the resource.
Location [location]	The geographical region where the resource is deployed.
Install Status [install_status]	Install status of the resource. Default value is Installed.
Operational status [operational_status]	Operational status of the resource. Default value is Operational.
Resource type [resource_type]	Type of resource. The value is set to **microsoft.operationalinsights/workspaces**.

CI relationships

The Azure - Log Analytics Workspace - Extended Inventory(LP) pattern creates these relationships to support Azure Log Analytics Workspace discovery.

Data stored in non-CMDB tables

Discovery and Service Mapping Patterns application populates data in the non-CMDB table when running the Azure - Logic App - Extended Inventory(LP) pattern.

You can review the non-CMDB Azure tables by navigating to **All** > **Configuration** > **Azure**. You can also search the navigation filter for the specific pattern name.

Azure Logic App [cmdb_azure_logic_app_logic_app]

Field	Description
Access Endpoint [access_endpoint]	The endpoint URL used for accessing the resource.
Identity [identity]	The identity associated with the resource for access and security purposes.
Kind [kind]	The specific subcategory or variant of the resource.
Location [location]	The geographical region where the resource is deployed.
Object Id [object_id]	The unique identifier of the resource.
Provisioning State [provisioning_state]	The current provisioning state of the resource.
Resource Group [resource_group]	Name of the resource group.
State [state]	The overall current operational state of the resource.
Subscription Id [subscription_id]	The subscription ID.
Tenant Id [tenant_id]	The identifier of the tenant that owns the resource.
Type [type]	The type or category of the resource.
Configuration Item [configuration_item]	References the Cloud Function [cmdb_ci_cloud_function] table.

Data stored in CMDB tables

Discovery and Service Mapping Patterns application populates data in the CMDB when running the Azure - Logic App - Extended Inventory(LP) pattern.

Cloud Function [cmdb_ci_cloud_function]

Field	Description
Install Status [install_status]	Install status of the resource. Default value is Installed.
Location [location]	The geographical region where the resource is deployed.
Name [name]	The name assigned to the resource.
Object ID [object_id]	The unique identifier of the resource in the following format: **/subscriptions/{subscriptionId}/resourceGroups/**

© 2026 ServiceNow, Inc. All rights reserved.

Patterns that were previously activated or deactivated will reset to the latest predefined version after upgrading while retaining the last active field value. For more information on enabling patterns, see Activate a disabled pattern.

Configure the Discovery schedule to support GovCloud

Discovering Azure GovCloud (US) accounts requires using a datacenter URL when setting up an Azure service account. For more information, see Set up Azure service accounts.

Discovery and Service Mapping Patterns application populates data in both CMDB and non-CMDB tables.

Data stored in non-CMDB tables

Discovery and Service Mapping Patterns application populates data in the non-CMDB table when running the Azure - Managed Identity User Assigned Identity - Extended Inventory(LP) pattern.

You can review the non-CMDB Azure tables by navigating to **All** > **Configuration** > **Azure**. You can also search the navigation filter for the specific pattern name.

Azure Managed Identity - User Assigned Identity [cmdb_azure_managed_identity_user_assigned_identity]

Field	Description
Client ID [client_id]	The unique identifier for an Azure Active Directory (Azure AD) application, also known as a client.
Location [location]	The geographical region where the resource is deployed.
Object Id [object_id]	The unique identifier of the resource.
Principal ID [principal_id]	The unique identifier of the principal service or user associated with the resource.
Resource Group [resource_group]	Name of the resource group.
Tenant ID [tenant_id]	The unique identifier of the Azure AD tenant.
Configuration Item [configuration_item]	References the Cloud Resource [cmdb_ci_cmp_resource] table.

Data stored in CMDB tables

Discovery and Service Mapping Patterns application populates data in the CMDB when running the Azure - Managed Identity User Assigned Identity - Extended Inventory(LP) pattern.

Cloud Resource [cmdb_ci_cmp_resource]

Field	Description
Install Status [install_status]	Install status of the resource. Default value is Installed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cloud Resource [cmdb_ci_cmp_resource] (continued)

Field	Description
Location [location]	The geographical region where the resource is deployed.
Name [name]	The name of the resource.
Object ID [object_id]	The unique identifier of the resource.
Operational status [operational_status]	Operational status of the resource. Default value is Operational.
Resource type [resource_type]	Type of resource. The value is set to **microsoft.managedidentity/ userassignedidentities**.

CI relationships

The pattern creates these relationships to support discovery.

CI	Relationship	CI
Resource Group [cmdb_ci_resource_group]	Contains::Contained by	Cloud Resource [cmdb_ci_cmp_resource]
Cloud Resource [cmdb_ci_cmp_resource]	Hosted on::Hosts	Azure Datacenter [cmdb_ci_azure_datacenter]
Azure Managed Identity - User Assigned Identity [cmdb_azure_managed_identity_user_assigned_identity]	References	Cloud Resource [cmdb_ci_cmp_resource]

Azure tag discovery

The pattern collects tags and populates them in the Key Value [cmdb_key_value] table.

Key Value [cmdb_key_value]

Field	Description
Key [key]	Tag name.
Value [value]	Tag value.

Azure Marketplace pattern-based discovery

Discovery and Service Mapping Patterns finds Azure Marketplace products in your cloud environment. Discovering some of these resources might require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

The Azure - Marketplace LB (LP) pattern discovers the following Azure Marketplace products:

- SaaS
- Azure Application

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Virtual Machine

Note: The pattern discovers only virtual machines (VMs) created from third-party or commercial marketplace images.

Azure Marketplace data model

The Azure - Marketplace LB (LP) pattern introduces the following CI class that extends an existing CMDB class.

CI class introduced by this pattern

CI class	Extends from
Deployed Marketplace Product [cmdb_ci_deployed_marketplace_product]	Virtual Machine Object [cmdb_ci_vm_object]

Pattern-based discovery and mapping requirements

Verify the Microsoft Azure discovery prerequisites

For more information, see the prerequisites section in Microsoft Azure Cloud discovery using patterns.

Configure the Discovery schedule to support GovCloud

Discovering Azure GovCloud (US) accounts requires using a datacenter URL when setting up an Azure service account. For more information, see Set up Azure service accounts.

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the Azure - Marketplace LB (LP) pattern.

Deployed Marketplace Product [cmdb_ci_deployed_marketplace_product]

Field	Description
Name [name]	Name of the Cloud resource, usually the marketplace offering or SKU name.
Object ID [object_id]	A unique resource ID of the Cloud resource.
Resource Type [resource_type]	The type of the resource in the Cloud Marketplace. For example: `microsoft.compute/virtualmachines`.
Plan Name [plan_name]	Billing or SKU plan for a resource from the Cloud Marketplace. For example: Pay as You Go.
Market [market]	International Organization for Standardization (ISO) code of the geographical market where the resource is sold. For example: US or EU.
Organization Id [organization_id]	A unique identifier for the organization or publisher that owns the marketplace resource.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Marketplace Product Details [marketplace_product_details]

Field	Description
Product Code [product_code]	A unique product code of the resource within the Cloud Marketplace.
Publisher Name [publisher_name]	The organization or individual responsible for creating and offering the product or service.
Version [version]	Release number or iteration of the product.
Deployed On [deployed_on]	References the Deployed Marketplace Product [cmdb_ci_deployed_marketplace_product] table.

CI relationships and references

The Azure - Marketplace LB (LP) pattern creates the following relationships and references to support Azure Marketplace discovery. References link to records in other tables and don't appear in the CI Relationship [cmdb_rel_ci] table.

CI relationships

CI	Relationship	CI
Resource Group [cmdb_ci_resource_group]	Contains::Contained by	Deployed Marketplace Product [cmdb_ci_deployed_marketplace_product]
Deployed Marketplace Product [cmdb_ci_deployed_marketplace_product]	Hosted on::Hosts	Azure Datacenter [cmdb_ci_azure_datacenter]
Deployed Marketplace Product [cmdb_ci_deployed_marketplace_product]	Hosted on::Hosts	Cloud Service Account [cmdb_ci_cloud_service_account]*

* This relationship is created only for resources with a global region.

CI references

CI	Field	Referenced CI
Marketplace Product Details [marketplace_product_details]	Deployed On [deployed_on]	Deployed Marketplace Product [cmdb_ci_deployed_marketplace_product]
Key Value [cmdb_key_value]	Configuration item [configuration_item]	Deployed Marketplace Product [cmdb_ci_deployed_marketplace_product]

Azure Tag discovery

The Azure - Marketplace LB (LP) pattern collects tags and populates them in the Key Value [cmdb_key_value] table.

Key Value [cmdb_key_value]

Field	Description
Key [key]	Tag name.
Value [value]	Tag value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Key Value [cmdb_key_value] (continued)

Field	Description
Configuration item [configuration_item]	References the Deployed Marketplace Product [cmdb_ci_deployed_marketplace_product] table.

Azure NAT Gateway pattern-based discovery

Discovery and Service Mapping Patterns finds Azure NAT Gateway resources on your cloud environment. Discovering some of these resources might require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Pattern-based discovery and mapping requirements

Verify the Azure discovery prerequisites section in Microsoft Azure Cloud discovery using patterns.

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the Azure - NAT Gateway (LP) pattern.

NAT Gateway [cmdb_ci_nat_gateway]

Field	Description
Object ID [object_id]	The unique Azure resource identifier for the NAT Gateway.
Name [name]	The name of the NAT Gateway resource.
State [state]	The operational state of the NAT Gateway.
Install Status [install_status]	Install status of the resource. Default value is Installed.

CI relationships

The Azure - NAT Gateway (LP) pattern creates these relationships to support Azure NAT Gateway discovery.

CI	Relationship	CI
Resource Group [cmdb_ci_resource_group]	Contains::Contained by	NAT Gateway [cmdb_ci_nat_gateway]
NAT Gateway [cmdb_ci_nat_gateway]	Hosted on::Hosts	Azure Datacenter [cmdb_ci_azure_datacenter]
Cloud Subnet [cmdb_ci_cloud_subnet]	Uses::Used by	NAT Gateway [cmdb_ci_nat_gateway]
Key Value [cmdb_key_value]	References	NAT Gateway [cmdb_ci_nat_gateway]

Azure Tag discovery

The Azure - NAT Gateway (LP) pattern collects tags and populates them in the Key Value [cmdb_key_value] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Key Value [cmdb_key_value]

Field	Description
Key [key]	Tag name.
Value [value]	Tag value.
Configuration item [configuration_item]	References the NAT Gateway [cmdb_ci_nat_gateway] table.

Azure Network and Subnet pattern-based discovery

Discovery and Service Mapping Patterns finds Azure virtual networks, subnets, and virtual network peerings on your cloud environment. Discovering some of these resources might require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Pattern-based discovery and mapping requirements

Verify the Microsoft Azure discovery prerequisites

For more information, see the prerequisites section in Microsoft Azure Cloud discovery using patterns.

Configure the Discovery schedule to support GovCloud

Discovering Azure GovCloud (US) accounts requires using a datacenter URL when setting up an Azure service account. For more information, see Set up Azure service accounts.

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the Azure - Network and Subnet (LP) pattern.

Cloud Network [cmdb_ci_network]

Field	Description
Name [name]	The Name or ID if no Name is specified for the cloud network.
Object ID [object_id]	A unique identifier, allocated by Azure for this resource.
State [state]	The current state of the network.
Cidr [cidr]	Classless Inter-Domain Routing (CIDR) representation of the network. For example: 10.0.0.0/24.
Install Status [install_status]	Install status of the resource. Default value is Installed.

Cloud Subnet [cmdb_ci_cloud_subnet]

Field	Description
Name [name]	The Name or ID if no Name is specified for the cloud subnet.
Object ID [object_id]	A unique identifier, allocated by Azure for this resource.
State [state]	The current state of the subnet.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cloud Subnet [cmdb_ci_cloud_subnet] (continued)

Field	Description
CIDR [cidr]	CIDR representation of the subnet. For example, 10.0.0.0/24.
Install Status [install_status]	Install status of the resource. Default value is Installed.

Virtual Network Peering [cmdb_ci_vnet_peering]

Field	Description
Name [name]	The Name or ID if no Name is specified for the virtual network peering.
Object ID [object_id]	A unique identifier, allocated by Azure for this resource.
State [state]	The current state of the virtual network peering.
Use Remote Gateways [use_remotegateways]	Indicates whether remote gateways are used for this peering.
Install Status [install_status]	Install status of the resource. Default value is Installed.

CI relationships

The Azure - Network and Subnet (LP) pattern creates the following relationships and references to support Azure Network and Subnet discovery. References link to records in other tables and don't appear in the CI Relationship [cmdb_rel_ci] table.

CI relationships

CI	Relationship	CI
Cloud Network [cmdb_ci_network]	Hosted on::Hosts	Azure Datacenter [cmdb_ci_azure_datacenter]
Resource Group [cmdb_ci_resource_group]	Contains::Contained by	Cloud Network [cmdb_ci_network]
Cloud Network [cmdb_ci_network]	Contains::Contained by	Cloud Subnet [cmdb_ci_cloud_subnet]
Cloud Network [cmdb_ci_network]	Contains::Contained by	Virtual Network Peering [cmdb_ci_vnet_peering]

CI references

CI	Field	Referenced CI
Key Value [cmdb_key_value]	Configuration item [configuration_item]	Cloud Network [cmdb_ci_network]

Azure Tag discovery

The Azure - Network and Subnet (LP) pattern collects tags and populates them in the Key Value [cmdb_key_value] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Key Value [cmdb_key_value]

Field	Description
Key [key]	Tag name.
Value [value]	Tag value.
Configuration item [configuration_item]	References the Cloud Network [cmdb_ci_network] table.

Azure Networks IP Group pattern-based discovery

Discovery and Service Mapping Patterns finds Azure services on your cloud environment. Discovering some of these resources might require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Pattern-based discovery and mapping requirements

Verify the Microsoft Azure discovery prerequisites

For more information, see the prerequisites section in Microsoft Azure Cloud discovery using patterns.

Remove resources from the Resource Inclusion List table

Verify that the relevant resource isn't listed in the Resource Inclusion List [sa_cloud_inventory_resource_whitelist] table to avoid duplicate discovery. For more information on removing resources from the Resource Inclusion List, see Microsoft Azure resource inventory discovery.

Enable the relevant pattern

The pattern for this service is disabled by default. Starting with Visibility Content version 6.28.0, activating or deactivating a pattern won't be considered a customization, and it will continue to receive updates. Patterns that were previously activated or deactivated will reset to the latest predefined version after upgrading while retaining the last active field value. For more information on enabling patterns, see Activate a disabled pattern.

Configure the Discovery schedule to support GovCloud

Discovering Azure GovCloud (US) accounts requires using a datacenter URL when setting up an Azure service account. For more information, see Set up Azure service accounts.

Discovery and Service Mapping Patterns application populates data in both CMDB and non-CMDB tables.

Data stored in non-CMDB tables

Discovery and Service Mapping Patterns application populates data in the non-CMDB table when running the Azure - Networks IP Group - Extended Inventory(LP) pattern.

You can review the non-CMDB Azure tables by navigating to **All** > **Configuration** > **Azure**. You can also search the navigation filter for the specific pattern name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure Networks - IP Group [cmdb_azure_networks_ip_group]

Field	Description
Location [location]	The geographic region where the resource is hosted.
Object Id [object_id]	A unique identifier for the resource within Azure.
Resource Group [resource_group]	Name of the resource group.
Subscription ID [subscription_id]	The subscription ID.
Tenant ID [tenant_id]	The identifier for the Azure Active Directory tenant associated with the resource.
Configuration Item [configuration_item]	References the Cloud Resource [cmdb_ci_cmp_resource] table.

Data stored in CMDB tables

Discovery and Service Mapping Patterns application populates data in the CMDB when running the Azure - Networks IP Group - Extended Inventory(LP) pattern.

Cloud Resource [cmdb_ci_cmp_resource]

Field	Description
Install Status [install_status]	Install status of the resource. Default value is Installed.
Location [location]	The geographic region where the resource is hosted.
Name [name]	The name assigned to the resource.
Object ID [object_id]	A unique identifier for the resource within Azure.
Operational status [operational_status]	Operational status of the resource. Default value is Operational.
Resource type [resource_type]	Type of resource. The value is set to **microsoft.network/ipgroups**.

CI relationships

The pattern creates these relationships to support discovery.

CI	Relationship	CI
Resource Group [cmdb_ci_resource_group]	Contains::Contained by	Cloud Resource [cmdb_ci_cmp_resource]
Cloud Resource [cmdb_ci_cmp_resource]	Hosted on::Hosts	Azure Datacenter [cmdb_ci_azure_datacenter]
Azure Networks - IP Group [cmdb_azure_networks_ip_group]	References	Cloud Resource [cmdb_ci_cmp_resource]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure tag discovery

The pattern collects tags and populates them in the Key Value [cmdb_key_value] table.

Key Value [cmdb_key_value]

Field	Description
Key [key]	Tag name.
Value [value]	Tag value.

Azure NIC pattern-based discovery

Discovery and Service Mapping Patterns finds Azure network interfaces Controller (NIC) on your cloud environment. Discovering some of these resources might require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Pattern-based discovery and mapping requirements

Verify the Microsoft Azure discovery prerequisites

For more information, see the prerequisites section in Microsoft Azure Cloud discovery using patterns.

Configure the Discovery schedule to support GovCloud

Discovering Azure GovCloud (US) accounts requires using a datacenter URL when setting up an Azure service account. For more information, see Set up Azure service accounts.

(Optional) Exclude temporary Azure Databricks VMs

Starting with Discovery and Service Mapping Patterns version 1.30.2, you can reduce short-lived configuration item (CI) records by excluding temporary Azure Databricks VMs. For more information, see Exclude temporary Azure Databricks virtual machines.

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the Azure - NIC (LP) pattern.

Cloud Mgmt Network Interface [cmdb_ci_nic]

Field	Description
Name [name]	The Name or ID if no Name is specified for the network interface.
Object ID [object_id]	A unique identifier, allocated by Azure for this resource.
MAC Address [mac_address]	The MAC address of the network interface.
State [state]	The current state of the network interface.
NIC Status [status]	The provisioning state of the network interface as returned by Azure.
Private IP [private_ip]	The IPv4 address of the network interface within the subnet.
Public IP [public_ip]	The address of the Elastic IP address bound to the network interface.
Public DNS [public_dns]	The public DNS name of the network interface.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cloud Mgmt Network Interface [cmdb_ci_nic] (continued)

Field	Description
Install Status [install_status]	Install status of the resource. Default value is Installed.

CI relationships

The Azure - NIC (LP) pattern creates the following relationships and references to support Azure NIC discovery. References link to records in other tables and don't appear in the CI Relationship [cmdb_rel_ci] table.

CI relationships

CI	Relationship	CI
Cloud Mgmt Network Interface [cmdb_ci_nic]	Hosted on::Hosts	Azure Datacenter [cmdb_ci_azure_datacenter]
Resource Group [cmdb_ci_resource_group]	Contains::Contained by	Cloud Mgmt Network Interface [cmdb_ci_nic]
Cloud Subnet [cmdb_ci_cloud_subnet]	Contains::Contained by	Cloud Mgmt Network Interface [cmdb_ci_nic]

CI references

CI	Field	Referenced CI
Key Value [cmdb_key_value]	Configuration item [configuration_item]	Cloud Mgmt Network Interface [cmdb_ci_nic]

Azure Tag discovery

The Azure - NIC (LP) pattern collects tags and populates them in the Key Value [cmdb_key_value] table.

Key Value [cmdb_key_value]

Field	Description
Key [key]	Tag name.
Value [value]	Tag value.
Configuration item [configuration_item]	References the Cloud Mgmt Network Interface [cmdb_ci_nic] table.

Azure OS image pattern-based discovery

Discovery and Service Mapping Patterns finds Azure OS images on your cloud environment. Discovering some of these resources might require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Pattern overview

Discovery uses the Azure - Image (LP) pattern to discover Azure OS images from your Azure account.

When using the Image [cmdb_ci_os_template] table to store Cloud OS images, you may notice an unusually large number of records. To avoid this issue, you can store the discovered OS images in the Cloud Image [cmdb_ci_cloud_os_image] table. When enabled, Discovery launches the Azure - Cloud OS Image (LP) pattern, which populates the Cloud Image [cmdb_ci_cloud_os_image] table. For more information, see Enable Cloud OS Image discovery.

Pattern-based discovery and mapping requirements

Verify the Azure discovery prerequisites section in Microsoft Azure Cloud discovery using patterns.

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the Azure OS image patterns.

Image [cmdb_ci_os_template] or Cloud Image [cmdb_ci_cloud_os_image]

Field	Description
Name [name]	Name of the image resource.
Object ID [object_id]	Azure resource ID of the image.
Image Source [image_source]	Azure resource ID of the image.
Guest OS [guest_os]	Operating system type of the image.
Provider [provider]	The cloud provider, which is **AZURE**. This field is only populated in Cloud Image [cmdb_ci_cloud_os_image] table.

CI relationships

The Azure OS image patterns create these relationships to support Azure OS image discovery.

CI	Relationship	CI
Image [cmdb_ci_os_template] or Cloud Image [cmdb_ci_cloud_os_image]	Hosted on::Hosts	Azure Datacenter [cmdb_ci_azure_datacenter]
Resource Group [cmdb_ci_resource_group]	Contains::Contained by	Image [cmdb_ci_os_template] or Cloud Image [cmdb_ci_cloud_os_image]
Key Value [cmdb_key_value]	References	Image [cmdb_ci_os_template] or Cloud Image [cmdb_ci_cloud_os_image]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure Tag discovery

The Azure OS image patterns collect tags and populate them in the Key Value [cmdb_key_value] table.

Key Value [cmdb_key_value]

Field	Description
Key [key]	Tag name.
Value [value]	Tag value.
Configuration item [configuration_item]	References the Image [cmdb_ci_os_template] table or the Cloud Image [cmdb_ci_cloud_os_image] table.

Azure Private DNS Zone pattern-based discovery

Discovery and Service Mapping Patterns finds Azure Private DNS Zone resources on your cloud environment. Discovering some of these resources might require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Pattern-based discovery and mapping requirements

Verify the Azure discovery prerequisites section in Microsoft Azure Cloud discovery using patterns.

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the Azure - Private DNS Zone (LP) pattern.

DNS Zone [cmdb_ci_dns_zone]

Field	Description
Object ID [object_id]	The unique Azure resource identifier for the Private DNS Zone.
Name [name]	The name of the Private DNS Zone resource.
State [state]	The operational state of the Private DNS Zone.
Number Of RecordSets [number_of_recordsets]	The number of DNS record sets within the Private DNS Zone.
Install Status [install_status]	Install status of the resource. Default value is Installed.

CI relationships

The Azure - Private DNS Zone (LP) pattern creates these relationships to support Azure Private DNS Zone discovery.

CI	Relationship	CI
Resource Group [cmdb_ci_resource_group]	Contains::Contained by	DNS Zone [cmdb_ci_dns_zone]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CI	Relationship	CI
DNS Zone [cmdb_ci_dns_zone]	Connected by::Connects	Cloud Network [cmdb_ci_network]
Key Value [cmdb_key_value]	References	DNS Zone [cmdb_ci_dns_zone]

Azure Tag discovery

The Azure - Private DNS Zone (LP) pattern collects tags and populates them in the Key Value [cmdb_key_value] table.

Key Value [cmdb_key_value]

Field	Description
Key [key]	Tag name.
Value [value]	Tag value.
Configuration item [configuration_item]	References the DNS Zone [cmdb_ci_dns_zone] table.

Azure Private Gateway pattern-based discovery

Discovery and Service Mapping Patterns finds Azure virtual network gateways on your cloud environment. Discovering some of these resources might require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Pattern-based discovery and mapping requirements

Verify the Microsoft Azure discovery prerequisites

For more information, see the prerequisites section in Microsoft Azure Cloud discovery using patterns.

Configure the Discovery schedule to support GovCloud

Discovering Azure GovCloud (US) accounts requires using a datacenter URL when setting up an Azure service account. For more information, see Set up Azure service accounts.

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the Azure - Private Gateway (LP) pattern.

Virtual Private Gateway [cmdb_ci_virtual_pvt_gateway]

Field	Description
Name [name]	The Name or ID if no Name is specified for the private gateway.
Object ID [object_id]	A unique identifier, allocated by Azure for this resource.
Connection Type [connection_type]	Type of VPN connection the gateway supports.
Operational status [operational_status]	Operational status of the resource. Default value is Operational.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Virtual Private Gateway [cmdb_ci_virtual_pvt_gateway] (continued)

Field	Description
Comments [comments]	Identifier for internal usage (deletion strategy).
Install Status [install_status]	Install status of the resource. Default value is Installed.

Virtual Private Gateway Endpoint [cmdb_ci_endpoint_vpg]

Field	Description
Name [name]	The Name or ID if no Name is specified for the endpoint.
Object ID [object_id]	A unique identifier, allocated by Azure for this resource.
Region [region]	The Azure region in which the endpoint is located.

CI relationships

The Azure - Private Gateway (LP) pattern creates the following relationships and references to support Azure Private Gateway discovery. References link to records in other tables and don't appear in the CI Relationship [cmdb_rel_ci] table.

CI relationships

CI	Relationship	CI
Virtual Private Gateway [cmdb_ci_virtual_pvt_gateway]	Hosted on::Hosts	Azure Datacenter [cmdb_ci_azure_datacenter]
Virtual Private Gateway Endpoint [cmdb_ci_endpoint_vpg]	Implement End Point To::Implement End Point From	Virtual Private Gateway [cmdb_ci_virtual_pvt_gateway]
Cloud Network [cmdb_ci_network]	Use End Point To::Use End Point From	Virtual Private Gateway Endpoint [cmdb_ci_endpoint_vpg]
Resource Group [cmdb_ci_resource_group]	Contains::Contained by	Virtual Private Gateway [cmdb_ci_virtual_pvt_gateway]

CI references

CI	Field	Referenced CI
Key Value [cmdb_key_value]	Configuration item [configuration_item]	Virtual Private Gateway [cmdb_ci_virtual_pvt_gateway]

Azure Tag discovery

The Azure - Private Gateway (LP) pattern collects tags and populates them in the Key Value [cmdb_key_value] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Key Value [cmdb_key_value]

Field	Description
Key [key]	Tag name.
Value [value]	Tag value.
Configuration item [configuration_item]	References the Virtual Private Gateway [cmdb_ci_virtual_pvt_gateway] table.

Azure Private Link Private Endpoint pattern-based discovery

Discovery and Service Mapping Patterns finds Azure services on your cloud environment. Discovering some of these resources might require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Pattern-based discovery and mapping requirements

Verify the Microsoft Azure discovery prerequisites

For more information, see the prerequisites section in Microsoft Azure Cloud discovery using patterns.

Remove resources from the Resource Inclusion List table

Verify that the relevant resource isn't listed in the Resource Inclusion List [sa_cloud_inventory_resource_whitelist] table to avoid duplicate discovery. For more information on removing resources from the Resource Inclusion List, see Microsoft Azure resource inventory discovery.

Enable the relevant pattern

The pattern for this service is disabled by default. Starting with Visibility Content version 6.28.0, activating or deactivating a pattern won't be considered a customization, and it will continue to receive updates. Patterns that were previously activated or deactivated will reset to the latest predefined version after upgrading while retaining the last active field value. For more information on enabling patterns, see Activate a disabled pattern.

Configure the Discovery schedule to support GovCloud

Discovering Azure GovCloud (US) accounts requires using a datacenter URL when setting up an Azure service account. For more information, see Set up Azure service accounts.

Discovery and Service Mapping Patterns application populates data in both CMDB and non-CMDB tables.

Data stored in non-CMDB tables

Discovery and Service Mapping Patterns application populates data in the non-CMDB table when running the Azure - Private Link Private Endpoint - Extended Inventory(LP) pattern.

You can review the non-CMDB Azure tables by navigating to **All** > **Configuration** > **Azure**. You can also search the navigation filter for the specific pattern name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure Private Link - Private Endpoint [cmdb_azure_private_link_private_endpoint]

Field	Description
Kind [kind]	The specific category or variant of the resource type.
Location [location]	The geographic region where the resource is deployed.
Object Id [object_id]	The unique identifier for the resource.
Provisioning State [provisioning_state]	The current provisioning or deployment state of the resource.
Resource Group [resource_group]	Name of the resource group.
Subscription ID [subscription_id]	The subscription ID.
Tenant ID [tenant_id]	The identifier for the tenant associated with the resource.
Configuration Item [configuration_item]	References the Cloud Resource [cmdb_ci_cmp_resource] table.

Data stored in CMDB tables

Discovery and Service Mapping Patterns application populates data in the CMDB when running the Azure - Private Link Private Endpoint - Extended Inventory(LP) pattern.

Cloud Resource [cmdb_ci_cmp_resource]

Field	Description
Install Status [install_status]	Install status of the resource. Default value is Installed.
Location [location]	The geographic region where the resource is deployed.
Name [name]	The name of the resource.
Object ID [object_id]	The unique identifier for the resource.
Operational status [operational_status]	Operational status of the resource. Default value is Operational.
Resource type [resource_type]	Type of resource. The value is set to **microsoft.network/privateendpoints**.

CI relationships

The pattern creates these relationships to support discovery.

CI	Relationship	CI
Resource Group [cmdb_ci_resource_group]	Contains::Contained by	Cloud Resource [cmdb_ci_cmp_resource]

CI	Relationship	CI
Cloud Resource [cmdb_ci_cmp_resource]	Hosted on::Hosts	Azure Datacenter [cmdb_ci_azure_datacenter]
Azure Private Link - Private Endpoint [cmdb_azure_private_link_private_endpoint]	References	Cloud Resource [cmdb_ci_cmp_resource]

Azure tag discovery

The pattern collects tags and populates them in the Key Value [cmdb_key_value] table.

Key Value [cmdb_key_value]

Field	Description
Key [key]	Tag name.
Value [value]	Tag value.

Azure Public IP pattern-based discovery

Discovery and Service Mapping Patterns finds Azure public IP addresses on your cloud environment. Discovering some of these resources might require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Pattern-based discovery and mapping requirements

Verify the Microsoft Azure discovery prerequisites

For more information, see the prerequisites section in Microsoft Azure Cloud discovery using patterns.

Configure the Discovery schedule to support GovCloud

Discovering Azure GovCloud (US) accounts requires using a datacenter URL when setting up an Azure service account. For more information, see Set up Azure service accounts.

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the Azure - Public IP (LP) pattern.

Cloud Public IP Address [cmdb_ci_cloud_public_ipaddress]

Field	Description
Name [name]	The Name or ID if no Name is specified for the IP address.
Object ID [object_id]	A unique identifier, allocated by Azure for this resource.
State [state]	The current state of the IP address.
Public IP Address [public_ip_address]	The address of the Elastic IP address.
Public DNS [public_dns]	The public DNS name.
Install Status [install_status]	Install status of the resource. Default value is Installed.

more information on removing resources from the Resource Inclusion List, see Microsoft Azure resource inventory discovery.

Enable the relevant pattern

The pattern for this service is disabled by default. Starting with Visibility Content version 6.28.0, activating or deactivating a pattern won't be considered a customization, and it will continue to receive updates. Patterns that were previously activated or deactivated will reset to the latest predefined version after upgrading while retaining the last active field value. For more information on enabling patterns, see Activate a disabled pattern.

Configure the Discovery schedule to support GovCloud

Discovering Azure GovCloud (US) accounts requires using a datacenter URL when setting up an Azure service account. For more information, see Set up Azure service accounts.

Discovery and Service Mapping Patterns application populates data in both CMDB and non-CMDB tables.

Data stored in non-CMDB tables

Discovery and Service Mapping Patterns application populates data in the non-CMDB table when running the Azure - Recovery Services Vault - Extended Inventory(LP) pattern.

You can review the non-CMDB Azure tables by navigating to **All** > **Configuration** > **Azure**. You can also search the navigation filter for the specific pattern name.

Azure Recovery Services - Vault [cmdb_azure_recovery_services_vault]

Field	Description
Object Id [object_id]	The unique resource identifier for the Azure resource.
Kind [kind]	The resource kind, indicating its specific variant or implementation.
DC Location [location]	The Azure region where the resource is deployed.
Resource Group [resource_group]	The name of the resource group containing the resource.
Subscription Id [subscription_id]	The Azure subscription ID under which the resource exists.
Tenant Id [tenant_id]	The Azure Active Directory tenant ID associated with the resource.
Provisioning State [provisioning_state]	The current provisioning state of the resource. For example: Succeeded, Failed, or Updating.
Configuration Item [configuration_item]	References the Cloud Resource [cmdb_ci_cmp_resource] table.

Data stored in CMDB tables

Discovery and Service Mapping Patterns application populates data in the CMDB when running the Azure - Recovery Services Vault - Extended Inventory(LP) pattern.

Cloud Resource [cmdb_ci_cmp_resource]

Field	Description
Object ID [object_id]	The unique resource identifier for the Azure resource.
Name [name]	The name assigned to the resource.
Location [location]	The Azure region where the resource is deployed.
Install Status [install_status]	Install status of the resource. Default value is Installed.
Operational status [operational_status]	Operational status of the resource. Default value is Operational.
Resource type [resource_type]	Type of resource. The value is set to **microsoft.recoveryservices/vaults**.

CI relationships

The Azure - Recovery Services Vault - Extended Inventory(LP) pattern creates these relationships to support Azure Recovery Services Vault discovery.

CI	Relationship	CI
Resource Group [cmdb_ci_resource_group]	Contains::Contained by	Cloud Resource [cmdb_ci_cmp_resource]
Cloud Resource [cmdb_ci_cmp_resource]	Hosted on::Hosts	Azure Datacenter [cmdb_ci_azure_datacenter]
Azure Recovery Services - Vault [cmdb_azure_recovery_services_vault]	References	Cloud Resource [cmdb_ci_cmp_resource]

Azure tag discovery

The pattern collects tags and populates them in the Key Value [cmdb_key_value] table.

Key Value [cmdb_key_value]

Field	Description
Key [key]	Tag name.
Value [value]	Tag value.

Azure Recovery Services Vault Backup Item pattern-based discovery

Discovery and Service Mapping Patterns finds Azure services on your cloud environment. Discovering some of these resources might require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Pattern-based discovery and mapping requirements

Verify the Microsoft Azure discovery prerequisites

Remove resources from the Resource Inclusion List table

Verify that the relevant resource isn't listed in the Resource Inclusion List [sa_cloud_inventory_resource_whitelist] table to avoid duplicate discovery. For more information on removing resources from the Resource Inclusion List, see Microsoft Azure resource inventory discovery.

Enable the relevant pattern

The pattern for this service is disabled by default. Starting with Visibility Content version 6.28.0, activating or deactivating a pattern won't be considered a customization, and it will continue to receive updates. Patterns that were previously activated or deactivated will reset to the latest predefined version after upgrading while retaining the last active field value. For more information on enabling patterns, see Activate a disabled pattern.

Configure the Discovery schedule to support GovCloud

Discovering Azure GovCloud (US) accounts requires using a datacenter URL when setting up an Azure service account. For more information, see Set up Azure service accounts.

Discovery and Service Mapping Patterns application populates data in both CMDB and non-CMDB tables.

Data stored in non-CMDB tables

Discovery and Service Mapping Patterns application populates data in the non-CMDB table when running the Azure - Recovery Services Vault Backup Item - Extended Inventory(LP) pattern.

You can review the non-CMDB Azure tables by navigating to **All** > **Configuration** > **Azure**. You can also search the navigation filter for the specific pattern name.

Azure Recovery Services - Vault Backup Item [cmdb_azure_recovery_services_vault_backup_item]

Field	Description
Object Id [object_id]	The unique identifier of the Azure resource.
Kind [kind]	The specific kind or sub-type of the resource.
DC Location [location]	The Azure region where the resource is deployed.
Resource Group [resource_group]	The name of the resource group containing the resource.
Subscription Id [subscription_id]	The unique identifier of the Azure subscription.
Tenant Id [tenant_id]	The unique identifier of the Azure Active Directory tenant.
Backup Management Type [backup_management_type]	The method or platform by which backups are managed.
Configuration Item [configuration_item]	References the Cloud Resource [cmdb_ci_cmp_resource] table.
Last Backup Status [last_backup_status]	The result or outcome of the most recent backup operation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure Recovery Services - Vault Backup Item [cmdb_azure_recovery_services_vault_backup_item] (continued)

Field	Description
Policy Name [policy_name]	The name of the backup policy associated with the resource.
Protection State [protection_state]	The operational state of backup protection on the resource.
Protection Status [protection_status]	The current protection status assigned to the resource.
Virtual Machine Id [virtual_machine_id]	The unique identifier of the associated virtual machine.
Workload Type [workload_type]	The type of workload or application being protected by the backup.

Data stored in CMDB tables

Discovery and Service Mapping Patterns application populates data in the CMDB when running the Azure - Recovery Services Vault Backup Item - Extended Inventory(LP) pattern.

Cloud Resource [cmdb_ci_cmp_resource]

Field	Description
Object ID [object_id]	The unique identifier of the Azure resource.
Name [name]	The name of the Azure resource.
Location [location]	The Azure region where the resource is deployed.
Comments [comments]	The unique identifier of the backup vault associated with the resource.
Install Status [install_status]	Install status of the resource. Default value is Installed.
Operational status [operational_status]	Operational status of the resource. Default value is Operational.
Resource type [resource_type]	Type of resource. The value is set to **microsoft.recoveryservices/vaults/backupfabrics/protectioncontainers/protectedItems**.

CI relationships

The Azure - Recovery Services Vault Backup Item - Extended Inventory(LP) pattern creates these relationships to support Azure Recovery Services Vault Backup Item discovery.

CI	Relationship	CI
Resource Group [cmdb_ci_resource_group]	Contains::Contained by	Cloud Resource [cmdb_ci_cmp_resource]

Azure Resource Group pattern-based discovery

Discovery and Service Mapping Patterns finds Azure Resource Groups in your cloud environment. Discovering some of these resources might require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Pattern-based discovery and mapping requirements

Verify the Microsoft Azure discovery prerequisites

For more information, see the prerequisites section in Microsoft Azure Cloud discovery using patterns.

Configure the Discovery schedule to support GovCloud

Discovering Azure GovCloud (US) accounts requires using a datacenter URL when setting up an Azure service account. For more information, see Set up Azure service accounts.

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the Azure - Resource Group (LP) pattern.

Resource Group [cmdb_ci_resource_group]

Field	Description
Name [name]	The Name or ID if no Name is specified for the resource group.
Object ID [object_id]	A unique identifier, allocated by Azure for this resource.
State [state]	The current state of the resource group.
Install Status [install_status]	Install status of the resource. Default value is Installed.
Location [location]	References the Azure Datacenter [cmdb_ci_azure_datacenter] table.

CI relationships and references

The Azure - Resource Group (LP) pattern creates the following relationships and references to support Azure Resource Group discovery. References link to records in other tables and don't appear in the CI Relationship [cmdb_rel_ci] table.

CI relationships

CI	Relationship	CI
Azure Datacenter [cmdb_ci_azure_datacenter]	Contains::Contained by	Resource Group [cmdb_ci_resource_group]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CI references

CI	Field	Referenced CI
Key Value [cmdb_key_value]	Configuration item [configuration_item]	Resource Group [cmdb_ci_resource_group]
Resource Group [cmdb_ci_resource_group]	Location [location]	Azure Datacenter [cmdb_ci_azure_datacenter]

Azure Tag discovery

The Azure - Resource Group (LP) pattern collects tags and populates them in the Key Value [cmdb_key_value] table.

Key Value [cmdb_key_value]

Field	Description
Key [key]	Tag name.
Value [value]	Tag value.
Configuration item [configuration_item]	References the Resource Group [cmdb_ci_resource_group] table.

Microsoft Azure resource inventory discovery

The ServiceNow Discovery application uses the Azure Resource Inventory (LP) pattern to find resources available through Azure that don't have a dedicated pattern. Discovering some of these resources might require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

You can discover up to 10 thousand resources using the Azure Resource Inventory (LP) pattern.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Prerequisites

Azure service principal

Verify the Azure service principal is configured. For more information, see Discovery for Microsoft Azure

Privileges

For versions 1.3.0 and later:

On the Microsoft Azure Console, provide a user with the API Management Service Reader role with permissions to run the following REST POST request:

```
"https://management.<resource url>/providers/
microsoft.resourcegraph/resources?api-version=2022-10-01"
```

<resource url> – The URL varies based on the Azure account type, like "azure.com" or government site address.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For versions 1.0.99 and earlier:

On the Microsoft Azure Console, provide a user with the API Management Service Reader role with permissions to run the following REST GET request:

`"https://management.azure.com/subscriptions/<subscription id>/resources"`

Create a Cloud Discovery schedule

Create a schedule for the relevant Azure service account as described in Create Discovery schedules for cloud resources

Fine-tune Azure inventory discovery using the Resource Inclusion List

If your deployment has custom patterns for Azure discovery, ensure that you don't discover Azure resources twice.

Note: Leaving the [pre_resource_whitelist] table empty causes the Pattern to populate all resources and it might cause performance issues.

1. Ensure that the application scope is Discovery and Service Mapping Patterns:
   a. Navigate to **Settings** > **Developer**.
   b. Select `Discovery and Service Mapping Patterns` from the **Application** list.
2. Navigate to **System Definitions** > **Tables**.
3. Open the Cloud Inventory Resource Inclusion List [sa_cloud_inventory_resource_whitelist] table.
4. Under **Related Links**, click **Show List**.
5. Select resource types for which you have custom patterns, and select `Delete` from the **Actions on selected rows** list.

The Cloud Inventory Resource Inclusion List is predefined with common services. You can expand the inclusion list with additional resource types that you want the pattern to discover. The names of these resource types must conform to the appropriate vendor naming conventions.

Note: When you modify the out-of-the-box inclusion list, it is no longer updated automatically in application updates. You must maintain the customized list on your own.

1. Open the Cloud Inventory Resource Inclusion List [sa_cloud_inventory_resource_whitelist] table.
2. Click **New**.
3. Fill in the form, and then click **Submit**.

Field	Description
Cloud Vendor	The vendor of the resource type: Azure.
Resource Type	The Azure resource type value.
Application	The application scope: Discovery and Service Mapping Patterns.

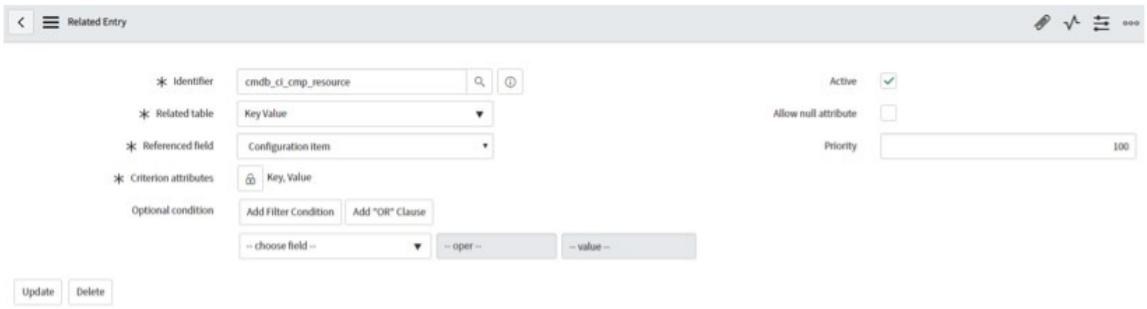
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The changes are applied the next time you run the pattern.

Modify the ServiceNow related entries

1. Navigate to **Related Entries**.
2. Click **New**.
3. For the identifier, enter **cmdb_ci_cmp_resource**.
4. For the related table, select **Key Value [cmdb_key_value]**.
5. For the referenced field, select **Configuration Item**.
6. For the criterion attributes, add **Key** and **Value**.

   You may need to click the lock icon to view and change the criterion attributes.



Data collected by Discovery during horizontal discovery

Table and field	Additional information
Cloud Resource [cmdb_ci_cmp_resource]	
Name	A descriptive name used to identify the Azure resource.
Resource type	The type of the resource, for example network, load balancer.
Object ID	The ID of the Azure resource.
Description	The text populated during discovery that specifies that this resource is available from Azure.
Key Value [cmdb_key_value]	
Key	The Azure tag key name.
Value	The Azure tag value name.

CI relationships

These relationships are created to support Azure resource inventory discovery:

Pattern-based discovery and mapping requirements

Verify the Microsoft Azure discovery prerequisites

For more information, see the prerequisites section in Microsoft Azure Cloud discovery using patterns.

Remove resources from the Resource Inclusion List table

Verify that the relevant resource isn't listed in the Resource Inclusion List [sa_cloud_inventory_resource_whitelist] table to avoid duplicate discovery. For more information on removing resources from the Resource Inclusion List, see Microsoft Azure resource inventory discovery.

Enable the relevant pattern

The pattern for this service is disabled by default. Starting with Visibility Content version 6.28.0, activating or deactivating a pattern won't be considered a customization, and it will continue to receive updates. Patterns that were previously activated or deactivated will reset to the latest predefined version after upgrading while retaining the last active field value. For more information on enabling patterns, see Activate a disabled pattern.

Configure the Discovery schedule to support GovCloud

Discovering Azure GovCloud (US) accounts requires using a datacenter URL when setting up an Azure service account. For more information, see Set up Azure service accounts.

Discovery and Service Mapping Patterns application populates data in both CMDB and non-CMDB tables.

Data stored in non-CMDB tables

Discovery and Service Mapping Patterns application populates data in the non-CMDB table when running the Azure - Service Bus Queue - Extended Inventory(LP) pattern.

You can review the non-CMDB Azure tables by navigating to **All** > **Configuration** > **Azure**. You can also search the navigation filter for the specific pattern name.

Azure Service Bus - Queue [cmdb_azure_service_bus_queue]

Field	Description
Enable Batched Operations [enable_batched_operations]	Indicates whether batched operations are enabled for the queue.
Enable Partitioning [enable_partitioning]	Indicates whether message partitioning is enabled for load distribution across multiple message brokers.
DC Location [location]	The geographic region where the Service Bus queue is deployed.
Max Message Size In KB [max_message_size_in_kb]	The maximum allowed size of a single message in kilobytes (KB).
Max Size In MB [max_size_in_mb]	The maximum storage size of the queue in megabytes (MB).
Object Id [object_id]	The unique identifier for the Service Bus queue.
Resource Group [resource_group]	Name of the resource group.
Subscription ID [subscription_id]	The subscription ID.
Status [status]	The current status of the Service Bus queue.
Configuration Item [configuration_item]	References the Cloud Messaging Service [cmdb_ci_cloud_messaging_service] table.

Data stored in CMDB tables

Discovery and Service Mapping Patterns application populates data in the CMDB when running the Azure - Service Bus Queue - Extended Inventory(LP) pattern.

Cloud Messaging Service [cmdb_ci_cloud_messaging_service]

Field	Description
Install Status [install_status]	Install status of the resource. Default value is Installed.
Location [location]	The geographic region where the Service Bus queue is deployed.
Name [name]	The name of the Service Bus queue.
Object ID [object_id]	The unique identifier for the Service Bus queue.
Operational status [operational_status]	Operational status of the resource. Default value is Operational.
Type [type]	Type of resource. The value is set to **Microsoft.ServiceBus/namespaces/queues**.

CI relationships

The pattern creates these relationships to support discovery.

CI	Relationship	CI
Cloud Resource [cmdb_ci_cmp_resource]	Contains::Contained by	Cloud Messaging Service [cmdb_ci_cloud_messaging_service]
Resource Group [cmdb_ci_resource_group]	Contains::Contained by	Cloud Messaging Service [cmdb_ci_cloud_messaging_service]
Cloud Messaging Service [cmdb_ci_cloud_messaging_service]	Hosted on::Hosts	Azure Datacenter [cmdb_ci_azure_datacenter]
Azure Service Bus - Queue [cmdb_azure_service_bus_queue]	References	Cloud Messaging Service [cmdb_ci_cloud_messaging_service]

Azure Service Bus Topic pattern-based discovery

Discovery and Service Mapping Patterns finds Azure services on your cloud environment. Discovering some of these resources might require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Pattern-based discovery and mapping requirements

Verify the Microsoft Azure discovery prerequisites

For more information, see the prerequisites section in Microsoft Azure Cloud discovery using patterns.

Remove resources from the Resource Inclusion List table

Verify that the relevant resource isn't listed in the Resource Inclusion List [sa_cloud_inventory_resource_whitelist] table to avoid duplicate discovery. For more information on removing resources from the Resource Inclusion List, see Microsoft Azure resource inventory discovery.

Enable the relevant pattern

The pattern for this service is disabled by default. Starting with Visibility Content version 6.28.0, activating or deactivating a pattern won't be considered a customization, and it will continue to receive updates. Patterns that were previously activated or deactivated will reset to the latest predefined version after upgrading while retaining the last active field value. For more information on enabling patterns, see Activate a disabled pattern.

Configure the Discovery schedule to support GovCloud

Discovering Azure GovCloud (US) accounts requires using a datacenter URL when setting up an Azure service account. For more information, see Set up Azure service accounts.

Discovery and Service Mapping Patterns application populates data in both CMDB and non-CMDB tables.

Data stored in non-CMDB tables

Discovery and Service Mapping Patterns application populates data in the non-CMDB table when running the Azure - Service Bus Topic - Extended Inventory(LP) pattern.

You can review the non-CMDB Azure tables by navigating to **All** > **Configuration** > **Azure**. You can also search the navigation filter for the specific pattern name.

Azure Service Bus - Topic [cmdb_azure_service_bus_topic]

Field	Description
Enable Batched Operations [enable_batched_operations]	Indicates whether batched operations are enabled for the topic.
Enable Partitioning [enable_partitioning]	Specifies if the topic is partitioned to support scalability.
DC Location [location]	The geographical region where the topic is deployed.
Max Message Size In KB [max_message_size_in_kb]	The maximum size of any message that can be sent to the topic, measured in kilobytes (KB).
Max Size In MB [max_size_in_mb]	The maximum storage limit for the topic in megabytes (MB).
Object Id [object_id]	The unique identifier for the topic resource.
Status [status]	The status of the topic resource. For example: Active or Disabled.
Subscription Count [subscription_count]	The number of active subscriptions associated with the topic.
Resource Group [resource_group]	Name of the resource group.
Subscription ID [subscription_id]	The subscription ID.
Configuration Item [configuration_item]	References the Cloud Topic [cmdb_ci_cloud_topic] table.

Data stored in CMDB tables

Discovery and Service Mapping Patterns application populates data in the CMDB when running the Azure - Service Bus Topic - Extended Inventory(LP) pattern.

Cloud Topic [cmdb_ci_cloud_topic]

Field	Description
Install Status [install_status]	Install status of the resource. Default value is Installed.
Location [location]	The geographical region where the topic is deployed.
Name [name]	The name of the topic within the Service Bus namespace.
Object ID [object_id]	The unique identifier of the resource in the following format: **/subscriptions/{subscriptionId}/resourceGroups/{resourceGroupName}/providers/Microsoft.ServiceBus/namespaces/{namespaceName}/topics/{topicName}**
Operational status [operational_status]	Operational status of the resource. Default value is Operational.
Description [short_description]	Description of the resource or service.

Azure Service Endpoint Policy pattern-based discovery

Discovery and Service Mapping Patterns finds Azure services on your cloud environment. Discovering some of these resources might require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Pattern-based discovery and mapping requirements

Verify the Microsoft Azure discovery prerequisites

For more information, see the prerequisites section in Microsoft Azure Cloud discovery using patterns.

Remove resources from the Resource Inclusion List table

Verify that the relevant resource isn't listed in the Resource Inclusion List [sa_cloud_inventory_resource_whitelist] table to avoid duplicate discovery. For more information on removing resources from the Resource Inclusion List, see Microsoft Azure resource inventory discovery.

Enable the relevant pattern

The pattern for this service is disabled by default. Starting with Visibility Content version 6.28.0, activating or deactivating a pattern won't be considered a customization, and it will continue to receive updates. Patterns that were previously activated or deactivated will reset to the latest predefined version after upgrading while retaining the last active field value. For more information on enabling patterns, see Activate a disabled pattern.

Configure the Discovery schedule to support GovCloud

Discovering Azure GovCloud (US) accounts requires using a datacenter URL when setting up an Azure service account. For more information, see Set up Azure service accounts.

Discovery and Service Mapping Patterns application populates data in both CMDB and non-CMDB tables.

Data stored in non-CMDB tables

Discovery and Service Mapping Patterns application populates data in the non-CMDB tables when running the Azure - Service Endpoint Policy - Extended Inventory(LP) pattern.

You can review the non-CMDB Azure tables by navigating to **All** > **Configuration** > **Azure**. You can also search the navigation filter for the specific pattern name.

Azure Service Endpoint Policy [cmdb_azure_service_endpoint_policy_service_endpoint_policy]

Field	Description
Object Id [object_id]	The unique identifier of the Azure resource.
Kind [kind]	The specific kind or stock-keeping unit (SKU) of the resource.
DC Location [location]	The geographic region where the resource is deployed.
Resource Group [resource_group]	The name of the resource group containing the resource.
Subscription Id [subscription_id]	The Globally Unique Identifier (GUID) of the subscription that owns the resource.
Tenant Id [tenant_id]	The GUID of the Azure AD tenant the resource belongs to.
Provisioning State [provisioning_state]	The current provisioning status of the resource.
Configuration Item [configuration_item]	References the Cloud Resource [cmdb_ci_cmp_resource] table.

Azure Service Endpoint Policy Definition [cmdb_azure_service_endpoint_policy_definition]

Field	Description
Object Id [object_id]	The unique identifier of the Azure resource.
Name [name]	The name assigned to the resource.
Type [type]	Type of resource. The value is set to **microsoft.network/serviceendpointpolicies**.
Provisioning State [provisioning_state]	The current provisioning status of the resource.
Configuration Item [configuration_item]	References the Cloud Resource [cmdb_ci_cmp_resource] table.
Service [service]	The specific Azure service related to the resource.

Data stored in CMDB tables

Discovery and Service Mapping Patterns application populates data in the CMDB when running the Azure - Service Endpoint Policy - Extended Inventory(LP) pattern.

Cloud Resource [cmdb_ci_cmp_resource]

Field	Description
Object ID [object_id]	The unique identifier of the Azure resource.
Name [name]	The name assigned to the resource.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cloud Resource [cmdb_ci_cmp_resource] (continued)

Field	Description
Location [location]	The geographic region where the resource is deployed.
Install Status [install_status]	Install status of the resource. Default value is Installed.
Operational status [operational_status]	Operational status of the resource. Default value is Operational.
Resource type [resource_type]	Type of resource. The value is set to **microsoft.network/serviceendpointpolicies**.

CI relationships

The Azure - Service Endpoint Policy - Extended Inventory(LP) pattern creates these relationships to support Azure Service Endpoint Policy discovery.

CI	Relationship	CI
Azure Service Endpoint Policy Definition [cmdb_azure_service_endpoint_policy_definition]	References	Cloud Resource [cmdb_ci_cmp_resource]
Cloud Subnet [cmdb_ci_cloud_subnet]	Uses::Used by	Cloud Resource [cmdb_ci_cmp_resource]
Resource Group [cmdb_ci_resource_group]	Contains::Contained by	Cloud Resource [cmdb_ci_cmp_resource]
Cloud Resource [cmdb_ci_cmp_resource]	Hosted on::Hosts	Azure Datacenter [cmdb_ci_azure_datacenter]
Azure Service Endpoint Policy [cmdb_azure_service_endpoint_policy_service_endpoint_policy]	References	Cloud Resource [cmdb_ci_cmp_resource]

Azure tag discovery

The pattern collects tags and populates them in the Key Value [cmdb_key_value] table.

Key Value [cmdb_key_value]

Field	Description
Key [key]	Tag name.
Value [value]	Tag value.

Azure SQL Server pattern-based discovery

Discovery and Service Mapping Patterns finds Azure SQL Server virtual machines in your cloud environment. Discovering some of these resources might require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Pattern-based discovery and mapping requirements

Verify the Microsoft Azure discovery prerequisites

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information, see the prerequisites section in Microsoft Azure Cloud discovery using patterns.

Configure the Discovery schedule to support GovCloud

Discovering Azure GovCloud (US) accounts requires using a datacenter URL when setting up an Azure service account. For more information, see Set up Azure service accounts.

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the Azure - SQL Server (LP) pattern.

Virtual Machine Instance [cmdb_ci_vm_instance]

Field	Description
Object ID [object_id]	A unique identifier, allocated by Azure for this resource.

CI relationships and references

The Azure - SQL Server (LP) pattern creates the following relationships and references to support Azure SQL Server discovery. References link to records in other tables and don't appear in the CI Relationship [cmdb_rel_ci] table.

CI relationships

CI	Relationship	CI
Virtual Machine Instance [cmdb_ci_vm_instance]	Hosted on::Hosts	Azure Datacenter [cmdb_ci_azure_datacenter]

CI references

CI	Field	Referenced CI
Key Value [cmdb_key_value]	Configuration item [configuration_item]	Virtual Machine Instance [cmdb_ci_vm_instance]

Azure License discovery

The pattern extension section discovers SQL Server license information and populates the license type in the Key Value [cmdb_key_value] table.

Key Value [cmdb_key_value]

Field	Description
Key [key]	SQL_Server_License_Type_automatic
Value [value]	The license model, which is one of the following: • Azure Hybrid Benefit: **BYOL** • Pay-as-you-go licensing: **License Included**
Configuration item [configuration_item]	References the Virtual Machine Instance [cmdb_ci_vm_instance] table.

Azure Storage Account pattern-based discovery

Discovery and Service Mapping Patterns finds Azure Storage Accounts in your cloud environment. Discovering some of these resources might require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Pattern-based discovery and mapping requirements

Verify the Microsoft Azure discovery prerequisites

For more information, see the prerequisites section in Microsoft Azure Cloud discovery using patterns.

Configure the Discovery schedule to support GovCloud

Discovering Azure GovCloud (US) accounts requires using a datacenter URL when setting up an Azure service account. For more information, see Set up Azure service accounts.

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the Azure - Storage Account (LP) pattern.

Cloud Storage Account [cmdb_ci_cloud_storage_account]

Field	Description
Name [name]	The Name or ID if no Name is specified for the storage account.
Object ID [object_id]	A unique identifier, allocated by Azure for this resource.
Sku Name [sku_name]	The name of the stock keeping unit (SKU) for backup frequency.
State [state]	The current state of the storage account. Possible values are: available, starting, error, cancelled, or off.
Blob Service [blob_service]	Indicates whether the storage account has a Blob service endpoint. If a blob endpoint exists, the value is set to true.
File Service [file_service]	Indicates whether the storage account has a File service endpoint. If a file endpoint exists, the value is set to true.
Table Service [table_service]	Indicates whether the storage account has a Table service endpoint. If a table endpoint exists, the value is set to true.
Queue Service [queue_service]	Indicates whether the storage account has a Queue service endpoint. If a queue endpoint exists, the value is set to true.
Install Status [install_status]	Install status of the resource. Default value is Installed.

Cloud Object Service [cmdb_ci_cloud_object_service]

Field	Description
Name [name]	Name of the blob service. The value is set to **default**.
Object ID [object_id]	A unique identifier for this blob service.
Install Status [install_status]	Install status of the resource. Default value is Installed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cloud File Service [cmdb_ci_cloud_file_service]

Field	Description
Name [name]	Name of the file service. The value is set to **default**.
Object ID [object_id]	A unique identifier for this file service.
Install Status [install_status]	Install status of the resource. Default value is Installed.

Cloud Table Service [cmdb_ci_cloud_table_service]

Field	Description
Name [name]	Name of the table service. The value is set to **default**.
Object ID [object_id]	A unique identifier for this table service.
Install Status [install_status]	Install status of the resource. Default value is Installed.

Cloud Queue Service [cmdb_ci_cloud_queue_service]

Field	Description
Name [name]	Name of the queue service. The value is set to **default**.
Object ID [object_id]	A unique identifier for this queue service.
Install Status [install_status]	Install status of the resource. Default value is Installed.

CI relationships and references

The Azure - Storage Account (LP) pattern creates the following relationships and references to support Azure Storage Account discovery. References link to records in other tables and don't appear in the CI Relationship [cmdb_rel_ci] table.

CI relationships

CI	Relationship	CI
Cloud Storage Account [cmdb_ci_cloud_storage_account]	Hosted on::Hosts	Azure Datacenter [cmdb_ci_azure_datacenter]
Resource Group [cmdb_ci_resource_group]	Contains::Contained by	Cloud Storage Account [cmdb_ci_cloud_storage_account]
Cloud Storage Account [cmdb_ci_cloud_storage_account]	Contains::Contained by	Cloud Object Service [cmdb_ci_cloud_object_service]*
Cloud Storage Account [cmdb_ci_cloud_storage_account]	Contains::Contained by	Cloud File Service [cmdb_ci_cloud_file_service]*
Cloud Storage Account [cmdb_ci_cloud_storage_account]	Contains::Contained by	Cloud Table Service [cmdb_ci_cloud_table_service]*
Cloud Storage Account [cmdb_ci_cloud_storage_account]	Contains::Contained by	Cloud Queue Service [cmdb_ci_cloud_queue_service]*

* These relationships are created only if the corresponding service endpoint exists on the storage account.

CI references

CI	Field	Referenced CI
Key Value [cmdb_key_value]	Configuration item [configuration_item]	Cloud Storage Account [cmdb_ci_cloud_storage_account]

Azure Tag discovery

The Azure - Storage Account (LP) pattern collects tags and populates them in the Key Value [cmdb_key_value] table.

Key Value [cmdb_key_value]

Field	Description
Key [key]	Tag name.
Value [value]	Tag value.
Configuration item [configuration_item]	References the Cloud Storage Account [cmdb_ci_cloud_storage_account] table.

Azure Storage Containers pattern-based discovery

Discovery and Service Mapping Patterns finds Azure Storage Containers in your cloud environment. Discovering some of these resources might require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Pattern-based discovery and mapping requirements

Verify the Microsoft Azure discovery prerequisites

For more information, see the prerequisites section in Microsoft Azure Cloud discovery using patterns.

Configure the Discovery schedule to support GovCloud

Discovering Azure GovCloud (US) accounts requires using a datacenter URL when setting up an Azure service account. For more information, see Set up Azure service accounts.

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the Azure - Storage Container(LP) pattern.

Storage Container [cmdb_ci_storage_container]

Field	Description
Name [name]	The name of the storage container.
Object ID [object_id]	A unique identifier for the storage container.
State [state]	The lease state of the storage container.
Comments [comments]	Identifier for internal usage (deletion strategy).
Install Status [install_status]	Install status of the resource. Default value is Installed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CI relationships

The Azure - Storage Container(LP) pattern creates the following relationships to support Azure Storage Containers discovery.

CI relationships

CI	Relationship	CI
Cloud Object Service [cmdb_ci_cloud_object_service]	Contains::Contained by	Storage Container [cmdb_ci_storage_container]

Azure Storage Volume pattern-based discovery

Discovery and Service Mapping Patterns finds Azure Storage Volumes (managed disks) in your cloud environment. Discovering some of these resources might require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Pattern-based discovery and mapping requirements

Verify the Microsoft Azure discovery prerequisites

For more information, see the prerequisites section in Microsoft Azure Cloud discovery using patterns.

Configure the Discovery schedule to support GovCloud

Discovering Azure GovCloud (US) accounts requires using a datacenter URL when setting up an Azure service account. For more information, see Set up Azure service accounts.

(Optional) Exclude temporary Azure Databricks VMs

Starting with Discovery and Service Mapping Patterns version 1.30.2, you can reduce short-lived configuration item (CI) records by excluding temporary Azure Databricks VMs. For more information, see Exclude temporary Azure Databricks virtual machines.

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the Azure - Storage Volume (LP) pattern.

Storage Volume [cmdb_ci_storage_volume]

Field	Description
Name [name]	The Name or ID if no Name is specified for the storage volume.
Object ID [object_id]	A unique identifier, allocated by Azure for this resource.
Volume ID [volume_id]	The resource ID of the storage volume.
State [state]	The current state of the storage volume. Possible values are: Available or Leased.
Storage type [storage_type]	The storage type. The value is set to **PageBlob**.
Size [size]	The size of the volume in GB.
Size bytes [size_bytes]	The size of the volume in bytes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Storage Volume [cmdb_ci_storage_volume] (continued)

Field	Description
Comments [comments]	Identifier for internal usage (deletion strategy).
Install Status [install_status]	Install status of the resource. Default value is Installed.

CI relationships and references

The Azure - Storage Volume (LP) pattern creates the following relationships and references to support Azure Storage Volume discovery. References link to records in other tables and don't appear in the CI Relationship [cmdb_rel_ci] table.

CI relationships

CI	Relationship	CI
Resource Group [cmdb_ci_resource_group]	Contains::Contained by	Storage Volume [cmdb_ci_storage_volume]
Storage Volume [cmdb_ci_storage_volume]	Hosted on::Hosts	Azure Datacenter [cmdb_ci_azure_datacenter]

CI references

CI	Field	Referenced CI
Key Value [cmdb_key_value]	Configuration item [configuration_item]	Storage Volume [cmdb_ci_storage_volume]

Azure Tag discovery

The Azure - Storage Volume (LP) pattern collects tags and populates them in the Key Value [cmdb_key_value] table.

Key Value [cmdb_key_value]

Field	Description
Key [key]	Tag name.
Value [value]	Tag value.
Configuration item [configuration_item]	References the Storage Volume [cmdb_ci_storage_volume] table.

Azure sub account pattern-based discovery

Discovery and Service Mapping Patterns finds Azure subscriptions and management groups on your cloud environment. Discovering some of these resources might require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure Management Groups data model

The Azure Management Groups pattern extension introduces the following CI class that extends an existing CMDB class.

CI class introduced by the Azure Management Groups pattern extension

CI class	Extends from
Azure Management Group [cmdb_ci_azure_management_group]	Configuration Item [cmdb_ci]

Pattern-based discovery and mapping requirements

Verify the Microsoft Azure discovery prerequisites

For more information, see the prerequisites section in Microsoft Azure Cloud discovery using patterns.

Configure the Discovery schedule to support GovCloud

Discovering Azure GovCloud (US) accounts requires using a datacenter URL when setting up an Azure service account. For more information, see Set up Azure service accounts.

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the Azure - Sub Account (LP) pattern.

Cloud Service Account [cmdb_ci_cloud_service_account]

Field	Description
Name [name]	Name of the subscription or service account.
Object ID [object_id]	The subscription ID, allocated by Azure for this resource.
Account Id [account_id]	The subscription ID of the service account.
Datacenter Type [datacenter_type]	Type of datacenter associated with the service account. The value is set to **cmdb_ci_azure_datacenter**.
Datacenter URL [datacenter_url]	The URL of the datacenter associated with the service account.
Is management account [is_master_account]	Boolean attribute indicating whether this is the management account. The value is set to **false** for discovered sub-accounts.
Discovery credentials [discovery_credentials]	Reference field to the related Azure credentials.
Parent account [parent_account]	Reference to the primary account, if it exists.
Operational status [operational_status]	Operational status of the subscription, derived from its Azure state. For example: Operational or Non-Operational.
Life Cycle Stage [life_cycle_stage]	Life cycle stage of the subscription, derived from its Azure state. For example: Operational, End of Operation, or End of Life.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cloud Service Account [cmdb_ci_cloud_service_account] (continued)

Field	Description
Life Cycle Stage Status [life_cycle_stage_status]	Life cycle stage status of the subscription, derived from its Azure state. For example: In Use, Action Required, On Hold, Billing Past Due, or Retired.
Install Status [install_status]	Install status of the resource. Default value is Installed.

Discovery populates the data in the CMDB when running the Azure Management Groups pattern extension.

Azure Management Group [cmdb_ci_azure_management_group]

Field	Description
Name [name]	Management group name.
Object ID [object_id]	Management group name and tenant ID in the following format: `name+@+tenantId`. For example: itomMgmtGroup@8bcff-vdc-btrv.
Parent [parent]	References the direct parent Azure Management Group [cmdb_ci_azure_management_group] table.
Install Status [install_status]	Install status of the resource. Default value is Installed.
Operational status [operational_status]	Operational status of the resource. Default value is Operational.

Cloud Organizations [cmdb_ci_cloud_org]

Field	Description
Name [name]	Tenant ID or name. • Tenant ID: When using management-level credentials • Tenant name: When using tenant-level credentials
Object ID [object_id]	Tenant ID.
DNS Domain [dns_domain]	Domain name entered during registration, for example: servicenow.com. This field is populated only when tenant-level credentials are used.

CI relationships and references

The Azure - Sub Account (LP) pattern creates the following references to support Azure Sub Account discovery. References link to records in other tables and don't appear in the CI Relationship [cmdb_rel_ci] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CI references

CI	Field	Referenced CI
Key Value [cmdb_key_value]	Configuration item [configuration_item]	Cloud Service Account [cmdb_ci_cloud_service_account]

The Azure Management Groups pattern extension creates the following relationships and references to support Azure Sub Account discovery. References link to records in other tables and don't appear in the CI Relationship [cmdb_rel_ci] table.

CI relationships

CI	Relationship	CI
Azure Management Group [cmdb_ci_azure_management_group]	Contains::Contained by	Cloud Service Account [cmdb_ci_cloud_service_account]
Cloud Organizations [cmdb_ci_cloud_org]	Contains::Contained by	Azure Management Group [cmdb_ci_azure_management_group]
Azure Management Group [cmdb_ci_azure_management_group]	Contains::Contained by	Azure Management Group [cmdb_ci_azure_management_group]

CI references

CI	Field	Referenced CI
Azure Management Group [cmdb_ci_azure_management_group]	Parent [parent]	Azure Management Group [cmdb_ci_azure_management_group]*

* Only references the direct parent-child management group relationship.

Azure Tag discovery

The Azure - Sub Account (LP) pattern collects tags and populates them in the Key Value [cmdb_key_value] table.

Key Value [cmdb_key_value]

Field	Description
Key [key]	Tag name.
Value [value]	Tag value.
Configuration item [configuration_item]	References the Cloud Service Account [cmdb_ci_cloud_service_account] table.

Azure Subscriptions Discovery For Management Group pattern-based discovery

Discovery and Service Mapping Patterns finds Azure Subscription entities under Management Groups on your cloud environment. Discovering some of these resources might require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Pattern-based discovery and mapping requirements

Verify the Azure discovery prerequisites section in Microsoft Azure Cloud discovery using patterns.

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the Azure Subscriptions Discovery For Management Group pattern.

Cloud Service Account [cmdb_ci_cloud_service_account]

Field	Description
Account Id [account_id]	Subscription name or account ID. • Subscription account: The Azure subscription name • Management account: The management group account ID
Name [name]	Name of the account. • Subscription account: The display name of the subscription • Management account: The service account name
Discovery credentials [discovery_credentials]	Azure credential from the Credentials [discovery_credentials] table.
Datacenter URL [datacenter_url]	The Azure management endpoint URL for the account.
Datacenter Type [datacenter_type]	The type of datacenter: **Azure Datacenter [cmdb_ci_azure_datacenter]**.
Parent account [parent_account]	References the Cloud Service Account [cmdb_ci_cloud_service_account] table (Management account).
Is management account [is_master_account]	Indicates whether this is a management group account. • **true**: Management account • **false**: Subscription account
Object ID [object_id]	Subscription name or account ID. • Subscription account: The Azure subscription name • Management account: The management group account ID

CI relationships

The Azure Subscriptions Discovery For Management Group pattern creates these references to support Azure Subscriptions Discovery For Management Group discovery.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CI	Relationship	CI
Cloud Service Account [cmdb_ci_cloud_service_account] (Subscription account)	References	Cloud Service Account [cmdb_ci_cloud_service_account] (Management account)
Key Value [cmdb_key_value]	References	Cloud Service Account [cmdb_ci_cloud_service_account] (Subscription account)

Azure Tag discovery

The Azure Subscriptions Discovery For Management Group pattern collects tags and populates them in the Key Value [cmdb_key_value] table.

Key Value [cmdb_key_value]

Field	Description
Key [key]	Tag name.
Value [value]	Tag value.
Configuration item [configuration_item]	References the Cloud Service Account [cmdb_ci_cloud_service_account] table (Subscription account).

Azure virtual machine pattern-based discovery

Discovery and Service Mapping Patterns finds Azure virtual machines (VMs) on your cloud environment. Discovering some of these resources might require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Pattern-based discovery and mapping requirements

Verify the Microsoft Azure discovery prerequisites

For more information, see the prerequisites section in Microsoft Azure Cloud discovery using patterns.

(Optional) Exclude temporary Azure Databricks VMs

Starting with Discovery and Service Mapping Patterns version 1.30.2, you can reduce short-lived configuration item (CI) records by excluding temporary Azure Databricks VMs. For more information, see Exclude temporary Azure Databricks virtual machines.

Create Server CIs during cloud discovery without running IP-based discovery

Starting with Discovery and Service Mapping Patterns version 1.31.0, you can create Server CIs during cloud discovery without running IP-based discovery. For more information, see Server CI population during cloud discovery.

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the Azure - Virtual Machine (LP) pattern.

Virtual Machine Instance [cmdb_ci_vm_instance]

Field	Description
Name [name]	Name of the virtual machine.
Object ID [object_id]	A unique identifier allocated by Azure for this virtual machine.
VM Instance ID [vm_inst_id]	The unique virtual machine identifier assigned by Azure.
State [state]	Power state of the virtual machine. Possible values include: On, Off, or Terminated.
Memory (MB) [memory]	Memory capacity of the virtual machine in megabytes (MB).
CPUs [cpus]	Number of virtual CPUs (vCPUs) allocated to the virtual machine.
Disks [disks]	Total number of disks attached to the virtual machine, including OS disk and data disks.
Disk size [disks_size]	Total size of all disks attached to the virtual machine in gigabytes (GB).
Network adapters [nics]	Number of network interface cards (NICs) attached to the virtual machine.
Install Status [install_status]	Install status of the resource. Default value is Installed.

Instance Scale Set [cmdb_ci_instance_scale_set]

Field	Description
Object ID [object_id]	A unique identifier allocated by Azure for this Virtual Machine Scale Set instance.

Storage Volume [cmdb_ci_storage_volume]

Field	Description
Object ID [object_id]	A unique identifier for the managed disk.
Name [name]	Name of the managed disk.

Block Endpoint [cmdb_ci_endpoint_block]

Field	Description
Object ID [object_id]	A unique identifier for the disk endpoint.
Name [name]	Name of the disk endpoint.
Host [host]	The virtual machine object ID to which this disk endpoint is attached.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cloud Mgmt Network Interface [cmdb_ci_nic]

Field	Description
Object ID [object_id]	A unique identifier for the NIC.
Primary [primary]	Indicates whether this NIC is the primary network interface.

VNIC Endpoint [cmdb_ci_endpoint_vnic]

Field	Description
Object ID [object_id]	A unique identifier for the virtual network interface endpoint.
Name [name]	Name of the virtual network interface endpoint.

Availability Zone [cmdb_ci_availability_zone]

Field	Description
Object ID [object_id]	A unique identifier for the availability zone in the format: region-zone.
Name [name]	A unique identifier for the availability zone in the format: region-zone.
Install Status [install_status]	Install status of the resource. Default value is Installed.

Image [cmdb_ci_os_template] or Cloud Image [cmdb_ci_cloud_os_image]

Field	Description
Object ID [object_id]	A unique identifier for the OS image or custom image.
Name [name]	Name of the OS image or custom image.
Provider [provider]	Cloud provider. The value is set to **AZURE**. This field is only populated in the Cloud Image [cmdb_ci_cloud_os_image] table.

Note: When using the Image [cmdb_ci_os_template] table to store Cloud OS images, you may notice an unusually large number of records. To avoid this issue, you can store the discovered OS images in the Cloud Image [cmdb_ci_cloud_os_image] table. For more information, see Enable Cloud OS Image discovery.

Hardware Type [cmdb_ci_compute_template] or Cloud Hardware Type [cmdb_ci_cloud_hardware_type]

Field	Description
Object ID [object_id]	The VM size Stock Keeping Unit (SKU) name.
Provider [provider]	Cloud provider. The value is set to **AZURE**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Hardware Type [cmdb_ci_compute_template] or Cloud Hardware Type [cmdb_ci_cloud_hardware_type] (continued)

Field	Description
	This field is only populated in the Cloud Hardware Type [cmdb_ci_cloud_hardware_type] table.

Note: When using the Hardware Type [cmdb_ci_compute_template] table to store the hardware types, you may notice an unusually large number of records. To avoid this issue, you can store the discovered hardware types in the Cloud Hardware Type [cmdb_ci_cloud_hardware_type] table. For more information, see Enable the Cloud Hardware Type class extension.

CI relationships

The Azure - Virtual Machine (LP) pattern creates these relationships to support Azure VM discovery.

CI	Relationship	CI
Virtual Machine Instance [cmdb_ci_vm_instance]	Managed by::Manages	Instance Scale Set [cmdb_ci_instance_scale_set]
Virtual Machine Instance [cmdb_ci_vm_instance]	Hosted on::Hosts	Azure Datacenter [cmdb_ci_azure_datacenter]
Virtual Machine Instance [cmdb_ci_vm_instance]	Provisioned From::Provisioned	Hardware Type [cmdb_ci_compute_template] or Cloud Hardware Type [cmdb_ci_cloud_hardware_type]
Storage Volume [cmdb_ci_storage_volume]	Hosted on::Hosts	Azure Datacenter [cmdb_ci_azure_datacenter]
Block Endpoint [cmdb_ci_endpoint_block]	Implement End Point To::Implement End Point From	Storage Volume [cmdb_ci_storage_volume]
Virtual Machine Instance [cmdb_ci_vm_instance]	Use End Point To::Use End Point From	Block Endpoint [cmdb_ci_endpoint_block]
Virtual Machine Instance [cmdb_ci_vm_instance]	Use End Point To::Use End Point From	VNIC Endpoint [cmdb_ci_endpoint_vnic]
VNIC Endpoint [cmdb_ci_endpoint_vnic]	Implement End Point To::Implement End Point From	Cloud Mgmt Network Interface [cmdb_ci_nic]
Resource Group [cmdb_ci_resource_group]	Contains::Contained by	Virtual Machine Instance [cmdb_ci_vm_instance]
Virtual Machine Instance [cmdb_ci_vm_instance]	Provisioned From::Provisioned	Image [cmdb_ci_os_template] or Cloud Image [cmdb_ci_cloud_os_image]
Image [cmdb_ci_os_template]	Hosted on::Hosts	Azure Datacenter [cmdb_ci_azure_datacenter]

CI	Relationship	CI
or Cloud Image [cmdb_ci_cloud_os_image]		
Availability Zone [cmdb_ci_availability_zone]	Contains::Contained by	Virtual Machine Instance [cmdb_ci_vm_instance]
Azure Datacenter [cmdb_ci_azure_datacenter]	Contains::Contained by	Availability Zone [cmdb_ci_availability_zone]
Availability Set [cmdb_ci_availability_set]	Contains::Contained by	Virtual Machine Instance [cmdb_ci_vm_instance]
Key Value [cmdb_key_value]	References	Virtual Machine Instance [cmdb_ci_vm_instance]

Azure Tag discovery

The Azure - Virtual Machine (LP) pattern collects tags and populates them in the Key Value [cmdb_key_value] table.

Key Value [cmdb_key_value]

Field	Description
Key [key]	Tag name.
Value [value]	Tag value.
Configuration item [configuration_item]	References the Virtual Machine Instance [cmdb_ci_vm_instance] table.

Azure BYOL discovery

The pattern extension section discovers the following license types for Windows and Red Hat Enterprise Linux (RHEL) VMs:

- Bring Your Own License (BYOL)
- License included

The pattern stores the license type and model in the Key Value [cmdb_key_value] table.

Note:

- For Windows VM using a custom image, Discovery populates key values only when the primary OS disk details are available.
- For RHEL VMs, Discovery populates information only for VMs that use Marketplace images.

Key Value [cmdb_key_value]

Field	Description
Key [key]	The license type key, which is one of the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Key Value [cmdb_key_value] (continued)

Field	Description
	• Windows_OS_License_Type_automatic • RHEL_OS_License_Type_automatic
Value [value]	The license model, which is one of the following: • BYOL • License Included
Configuration item [configuration_item]	References the Virtual Machine Instance [cmdb_ci_vm_instance] table.

Exclude temporary Azure Databricks virtual machines

Reduce short-lived configuration item (CI) records by excluding temporary Azure Databricks virtual machines (VMs).

Before you begin

Verify that you have at least version 1.30.2 of Discovery and Service Mapping Patterns.

Role required: admin

About this task

By default, Discovery includes temporary Azure Databricks VMs in discovery results. The *glide.discovery.cloud.filterout_databrick_vms* system property controls whether these VMs are excluded from the CMDB. The default value is **false**. When set to true, Discovery excludes Azure Databricks VMs during pattern-based discovery, reducing the number of short-lived CI records in your CMDB.

Procedure

1. In the navigation filter, enter `sys_properties.list`.
2. In the **Name** column, search for `glide.discovery.cloud.filterout_databrick_vms`.
3. Select the **glide.discovery.cloud.filterout_databrick_vms** system property.
4. In the **Value** field, enter **true**.
5. Select **Update**.

Microsoft Azure Cloud discovery using patterns

Azure Virtual Machine Scale Sets (VMSS) Instance discovery

The Discovery and Service Mapping Patterns application uses the Azure - VM Scale Set (LP) and the Azure VM Instance - Uniform Scale Set patterns to find Azure Virtual Machine Scale Sets (VMSS). Discovering some of these resources might require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

VMSS let you create and manage a group of load balanced virtual machines (VMs). The number of VM instances can automatically increase or decrease in response to demand or a defined schedule. There Uniform Orchestration modes Flexible and achieve.

- VMSS with Flexible Orchestration achieves high availability at scale with identical or multiple virtual machine types. With Flexible orchestration, Azure provides a unified experience across the Azure VM ecosystem.
- VMSS with Uniform Orchestration optimized for large-scale stateless workloads with identical instances. VMSS with Uniform orchestration use a virtual machine profile or template to scale up to desired capacity. While there is some ability to manage or customize individual virtual machine instances, Uniform uses identical VM instances.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

To learn about VMSS and their versions that you can discover, refer to Detailed information on products discovered by ITOM Visibility.

Prerequisites

Verify the Microsoft Azure discovery prerequisites

For more information, see the prerequisites section in Microsoft Azure Cloud discovery using patterns.

Create Server CIs during cloud discovery without running IP-based discovery

Starting with Discovery and Service Mapping Patterns version 1.31.0, you can create Server CIs during cloud discovery without running IP-based discovery. For more information, see Server CI population during cloud discovery.

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the Azure - VM Scale Set (LP) Pattern.

Instance Scale Set [cmdb_ci_instance_scale_set]

Field	Description
Install Status [install_status]	Install status of the instance scale set. Default value is Installed.
State [state]	Provisioning state of the instance scale set. Possible values are Available or Terminated.
Object ID [object_id]	A unique identifier for the instance scale set.
Name [name]	Name of the instance scale set.

Discovery populates the data in the CMDB when running the Azure VM Instance - Uniform Scale Set pattern.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Virtual Machine Instance [cmdb_ci_vm_instance]

Field	Description
Network adapters [nics]	Number of Network Interface Cards (NICs) attached to the virtual machine (VM) instance.
State [state]	Current state of the instance. For example: On, Off, or Terminated.
Install Status [install_status]	Install status of the instance. Default value is Installed.
Operational status [operational_status]	Operational status of the instance. Default value is Operational.
Disks [disks]	Number of disks attached to the instance.
Disks size (GB) [disk_size]	Total storage capacity of all disks attached to the VM, in gigabytes (GB).

Storage Volume [cmdb_ci_storage_volume]

Field	Description
Name [name]	Name or ID for the storage volume.
Object ID [object_id]	A unique identifier, allocated by Microsoft Azure for this resource.
Install Status [install_status]	Install status of the storage volume. Default value is Installed.
Operational status [operational_status]	Operational status of the storage volume. Default value is Operational.

Cloud Mgmt Network Interface [cmdb_ci_nic]

Field	Description
Name [name]	Name or ID for the network interface.
Object ID [object_id]	A unique identifier, allocated by Microsoft Azure for this resource.
Install Status [install_status]	Install status of the network interface. Default status is Installed.
Operational status [operational_status]	Operational status of the network interface. Default status is Operational.

VNIC Endpoint [cmdb_ci_endpoint_vnic]

Field	Description
Name [name]	Name or ID for the endpoint.
Object ID [object_id]	A unique identifier, allocated by Microsoft Azure for this resource.

Image [cmdb_ci_os_template]

Field	Description
Name [name]	Name or ID for the image.
Object ID [object_id]	A unique identifier, allocated by Microsoft Azure for this resource.
Install Status [install_status]	Install status of the image. Default value is Installed.
Operational status [operational_status]	Operational status of the image. Default value is operational.

Note: When using the Image [cmdb_ci_os_template] table to store Cloud OS images, you may notice an unusually large number of records. To avoid this issue, you can store the discovered OS images in the Cloud Image [cmdb_ci_cloud_os_image] table. For more information, see Enable Cloud OS Image discovery.

Hardware Type [cmdb_ci_compute_template]

Field	Description
Name [name]	Name of the hardware type.

Note: When using the Hardware Type [cmdb_ci_compute_template] table to store the hardware types, you may notice an unusually large number of records. To avoid this issue, you can store the discovered hardware types in the Cloud Hardware Type [cmdb_ci_cloud_hardware_type] table. For more information, see Enable the Cloud Hardware Type class extension.

CI relationships

Discovery creates these relationships to support the VMSS discovery, when running the Azure - VM Scale Set (LP) pattern.

CI	Relationship	CI

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the Azure - Virtual Network Gateway Connection (LP) pattern.

Virtual Network Gateway Connection [cmdb_ci_vpc_gateway_connection]

Field	Description
Object ID [object_id]	The unique Azure resource identifier for the Virtual Network Gateway Connection.
Name [name]	The name of the Virtual Network Gateway Connection resource.
State [state]	The operational state of the connection.
Protocol [protocol]	The connection protocol used by the gateway connection.
Connection Status [connection_status]	The status of the gateway connection. For example: Connected, Disconnected, or NotConnected.
Connection Type [connection_type]	The type of gateway connection. For example: IPsec, ExpressRoute, or Vnet2Vnet.
Install Status [install_status]	Install status of the resource. Default value is Installed.

CI relationships

The Azure - Virtual Network Gateway Connection (LP) pattern creates these relationships to support Azure Virtual Network Gateway Connection discovery.

CI	Relationship	CI
Resource Group [cmdb_ci_resource_group]	Contains::Contained by	Virtual Network Gateway Connection [cmdb_ci_vpc_gateway_connection]
Virtual Network Gateway Connection [cmdb_ci_vpc_gateway_connection]	Hosted on::Hosts	Azure Datacenter [cmdb_ci_azure_datacenter]

Value [value]	Tag value.
Configuration item [configuration_item]	References the Virtual Network Gateway Connection [cmdb_ci_vpc_gateway_connection] table.

Azure Web Application Firewall Policy pattern-based discovery

Discovery and Service Mapping Patterns finds Azure services on your cloud environment. Discovering some of these resources might require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Pattern-based discovery and mapping requirements

Verify the Microsoft Azure discovery prerequisites

For more information, see the prerequisites section in Microsoft Azure Cloud discovery using patterns.

Remove resources from the Resource Inclusion List table

Verify that the relevant resource isn't listed in the Resource Inclusion List [sa_cloud_inventory_resource_whitelist] table to avoid duplicate discovery. For more information on removing resources from the Resource Inclusion List, see Microsoft Azure resource inventory discovery.

Enable the relevant pattern

The pattern for this service is disabled by default. Starting with Visibility Content version 6.28.0, activating or deactivating a pattern won't be considered a customization, and it will continue to receive updates. Patterns that were previously activated or deactivated will reset to the latest predefined version after upgrading while retaining the last active field value. For more information on enabling patterns, see Activate a disabled pattern.

Configure the Discovery schedule to support GovCloud

Discovering Azure GovCloud (US) accounts requires using a datacenter URL when setting up an Azure service account. For more information, see Set up Azure service accounts.

Discovery and Service Mapping Patterns application populates data in both CMDB and non-CMDB tables.

Data stored in non-CMDB tables

Discovery and Service Mapping Patterns application populates data in the non-CMDB table when running the Azure - Web Application Firewall Policy - Extended Inventory(LP) pattern.

You can review the non-CMDB Azure tables by navigating to **All** > **Configuration** > **Azure**. You can also search the navigation filter for the specific pattern name.

Azure Web Application Firewall - Policy [cmdb_azure_web_application_firewall_policy]

Field	Description
Object Id [object_id]	The unique identifier of the resource.
Kind [kind]	The specific kind or variant of the resource.
DC Location [location]	The Azure region where the resource is deployed.
Resource Group [resource_group]	The name of the resource group containing the resource.
Subscription Id [subscription_id]	The subscription ID associated with the resource.
Tenant Id [tenant_id]	The Azure Active Directory tenant ID associated with the resource.
Provisioning State [provisioning_state]	The latest provisioning status of the resource.
Configuration Item [configuration_item]	References the Web ACL [cmdb_ci_web_acl] table.
Policy State [policy_state]	The current state of the policy applied to the resource.

Data stored in CMDB tables

Discovery and Service Mapping Patterns application populates data in the CMDB when running the Azure - Web Application Firewall Policy - Extended Inventory(LP) pattern.

Web ACL [cmdb_ci_web_acl]

Field	Description
Object ID [object_id]	The unique identifier of the resource.
Name [name]	The name of the resource.
Location [location]	The Azure region where the resource is deployed.
Default Action [default_action]	Indicates the effective operation mode of the web application firewall (WAF) policy. Possible values are allow and detect. • allow: policy is running in **Prevention** mode and is blocking traffic • detect: policy is running in **Detection** mode and is logging only
Install Status [install_status]	Install status of the resource. Default value is Installed.
Operational status [operational_status]	Operational status of the resource. Default value is Operational.

Web ACL [cmdb_ci_web_acl] (continued)

Field	Description
Description [short_description]	Type of resource. The value is set to **microsoft.network/applicationgatewaywebapplicationfirewallpolicies**.

CI relationships

The Azure - Web Application Firewall Policy - Extended Inventory(LP) pattern creates these relationships to support Azure Web Application Firewall Policy discovery.

CI	Relationship	CI
Cloud Load Balancer [cmdb_ci_cloud_load_balancer]	Protected by::Protects	Web ACL [cmdb_ci_web_acl]
Resource Group [cmdb_ci_resource_group]	Contains::Contained by	Web ACL [cmdb_ci_web_acl]
Web ACL [cmdb_ci_web_acl]	Hosted on::Hosts	Azure Datacenter [cmdb_ci_azure_datacenter]
Azure Web Application Firewall - Policy [cmdb_azure_web_application_firewall_policy]	References	Web ACL [cmdb_ci_web_acl]

Azure tag discovery

The pattern collects tags and populates them in the Key Value [cmdb_key_value] table.

Key Value [cmdb_key_value]

Field	Description
Key [key]	Tag name.
Value [value]	Tag value.

Azure WebSite pattern-based discovery

Discovery and Service Mapping Patterns finds Azure App Service web applications in your cloud environment. Discovering some of these resources might require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

This pattern discovers Azure App Service web applications only. For Azure Functions discovery, see Microsoft Azure Functions discovery with Patterns.

Pattern-based discovery and mapping requirements

Verify the Microsoft Azure discovery prerequisites

For more information, see the prerequisites section in Microsoft Azure Cloud discovery using patterns.

Configure the Discovery schedule to support GovCloud

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Discovering Azure GovCloud (US) accounts requires using a datacenter URL when setting up an Azure service account. For more information, see Set up Azure service accounts.

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the Azure WebSite (LP) pattern.

Cloud WebServer [cmdb_ci_cloud_webserver]

Field	Description
Name [name]	The name of the Azure web application.
Object ID [object_id]	A unique identifier, allocated by Azure for this resource.
Fully qualified domain name [fqdn]	The fully qualified domain name (FQDN) of the web application.
IP Address [ip_address]	The inbound IP address of the web application.
State [state]	The current state of the web application. Possible values are: available or terminated.
Operational status [operational_status]	The operational status of the web application. The value is 1 (Operational) when the state is available, or 2 (Non-Operational) otherwise.
Vendor [vendor]	The vendor of the web application. The value is set to **Microsoft**.
Install Status [install_status]	Install status of the resource. Default value is Installed.

IP Address [cmdb_ci_ip_address]*

Field	Description
Name [name]	The name of the web application associated with this IP address.
IP Address [ip_address]	The inbound IP address of the web application.
Fully qualified domain name [fqdn]	The fully qualified domain name (FQDN) of the web application.
Netmask [netmask]	The netmask of the IP address. The value is set to **0.0.0.0**.
Vendor [vendor]	The vendor of the web application. The value is set to **Microsoft**.

* Populated only when the web application has a non-empty inbound IP address.

CI relationships and references

The Azure WebSite (LP) pattern creates the following relationships and references to support Azure WebSite discovery. References link to records in other tables and don't appear in the CI Relationship [cmdb_rel_ci] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CI relationships

CI	Relationship	CI
Cloud WebServer [cmdb_ci_cloud_webserver]	Hosted on::Hosts	Azure Datacenter [cmdb_ci_azure_datacenter]
Cloud WebServer [cmdb_ci_cloud_webserver]	Owns::Owned by	IP Address [cmdb_ci_ip_address]*

* This relationship is created only when the web application has a non-empty inbound IP address and an FQDN.

CI references

CI	Field	Referenced CI
Key Value [cmdb_key_value]	Configuration item [configuration_item]	Cloud WebServer [cmdb_ci_cloud_webserver]

Azure Tag discovery

The Azure WebSite (LP) pattern collects tags and populates them in the Key Value [cmdb_key_value] table.

Key Value [cmdb_key_value]

Field	Description
Key [key]	Tag name.
Value [value]	Tag value.
Configuration item [configuration_item]	References the Cloud WebServer [cmdb_ci_cloud_webserver] table.

Connections found by Service Mapping during top-down discovery

The Azure WebSite TD pattern discovers the following connections during top-down discovery: Microsoft SQL Server, MySQL, Redis, and NoSQL (Cosmos DB).

Oracle Cloud Infrastructure (OCI) discovery

ServiceNow Discovery uses the Oracle Cloud Infrastructure (OCI) discovery patterns to provide real-time elasticity for enterprise applications by combining Oracle autonomous services, integrated security, and cloud compute. Discovering some of these resources might require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Starting with version 1.29.0, Discovery and Service Mapping Patterns supports the discovery of OCI GovCloud accounts.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Prerequisites

Verify that the following applications are installed

Verify that the following applications are installed and up to date:

- Cloud Access Interface (starting from version 1.0.0)
- Visibility Content
- CMDB CI Class Models
- Discovery and Service Mapping Patterns

Configure Oracle API credentials

Ensure that your OCI credentials are configured and that your private and public keys are converted to the RSA format. For more information, see Create Oracle API credentials.

Create OCI service account

For more information, see Create OCI service accounts.

Create a cloud discovery schedule

To run a cloud discovery at scale, see Create an OCI Discovery schedule in Discovery Admin Workspace.

Create a discovery schedule to run LDCs on.

1. Navigate to **Discovery** > **Discovery Schedules**.
2. Select **Cloud Discovery**.
3. In the **Provider** field, select **OCI**. Fill in the form to create an account or select an existing one. For more information, see Create OCI service accounts.
4. On the **Select Datacenters** page, filter which LDCs you want to run the discovery.
5. When you're finished, navigate to the **Create Schedule** page and select **Finish and Run**.

(Optional) Populate Service Account and Logical Datacenter fields in cloud CIs

Starting with Discovery and Service Mapping Patterns version 1.30.2, you can improve query performance by populating Service Account and Logical Datacenter fields directly in cloud CIs. For more information, see Improved query performance with direct field population in CI tables.

Verify the REST API permissions

Download the Cloud Discovery patterns spreadsheet so you can grant user permissions required for running the Discovery patterns. In addition to permissions, the spreadsheet also includes useful information such as pattern names, types, CI Classes, and links to vendor documentation. New patterns are available quarterly, so check periodically to be sure you have the latest version of the spreadsheet.

Data collected by Discovery during horizontal discovery

The discovered Oracle configuration data includes the following table and fields.

Field	Description
Cloud Database (cmdb_ci_cloud_database)	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
name	The name of the database.
object_id	Unique identifier of the database.
operational_status	Operational status of the database.
vendor	The vendor, **Oracle**.
type	The Oracle database type.
version	Version of the database.
state	State of the database.
comments	The attribute is issued for the delete strategy.
install_status	Install status.
Image (cmdb_ci_os_template)	
name	The image name.
object_id	Unique identifier of the image.
version	The version of the guest OS.
guest_os	The name of the guest OS.
Service Account (cmdb_ci_cloud_service_account)	
name	The account name.
datacenter_type	Datacenter type.
account_id	Unique identifier of the account.
object_id	Unique identifier of the account (same value as the account id).
discovery_credentials	The credentials related to the service account.
is_master_account	**true** when it is the root compartment. **false** when it is not the root compartment.
Network (cmdb_ci_network)	
name	The network name.
object_id	Unique identifier of the network.
cidr	The cidr of the network.
domain_name	The domain name.
state	The state of the network.
NIC (cmdb_ci_nic)	
name	The NIC name.
object_id	Unique identifier of the NIC.
public_ip	The public IP address.
mac_address	The MAC address.
primary	Set **true**/**false** according to the setup.
private_ip	The private ip address.
state	The state of the NIC.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Storage Volume (cmdb_ci_storage_volume)	
name	The name of the storage volume.
object_id	Unique identifier of storage volume.
state	The state of the storage volume.
volume_id	Unique identifier of the storage volume (same value as the account id).
size	The storage volume size.
size_bytes	The storage volume size in bytes.
Subnet (cmdb_ci_cloud_subnet)	
name	The name of the subnet.
object_id	Unique identifier of subnet.
cidr	The cidr of the subnet.
domain_name	The domain name.
state	The state of the subnet.
Virtual Machine (cmdb_ci_vm_instance)	
name	The VM name.
object_id	Unique identifier of VM.
state	The state of the VM.
memory	Memory size.
cpus	Number of CPUs.

Tags are populated to the **cmdb_key_value** table and related to the relevant cmdb ci resource. In order to support it, the extension sections were created for the following resources:

- Autonomous DB
- Exadata DB
- Image
- Network
- NIC
- Storage Volume
- Account
- Subnet
- Virtual Machine

CI Relationships

Relationships discovered using the Oracle OCI - Availability Domain (LP) pattern

CI	Relationship	CI

OCI cloud hardware type pattern-based discovery

Discovery and Service Mapping Patterns finds OCI cloud hardware types (called shapes in OCI) in your Cloud environment. Discovering some of these resources might require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Pattern-based discovery and mapping requirements

Verify the OCI discovery prerequisites

For more information, see the prerequisites section in Oracle Cloud Infrastructure (OCI) discovery.

Configure the Discovery schedule to support GovCloud

Discovering OCI GovCloud accounts requires using a datacenter URL when setting up an OCI service account. For more information, see Create OCI service accounts.

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the Oracle OCI - Cloud Hardware Type (LP) pattern.

Cloud Hardware Type [cmdb_ci_cloud_hardware_type]

Field	Description
Name [name]	Name of the shape.
Object ID [object_id]	Name of the shape.
VCPUs [vcpus]	Number of virtual CPUs (vCPU) available to the shape.
Memory (MB) [memory_mb]	Amount of memory available to the shape, in megabytes (MB).
Cores [cores]	Number of physical cores available to the shape.
Provider [provider]	Cloud provider, which is **OCI**.

CI relationships and references

The Oracle OCI - Cloud Hardware Type (LP) pattern creates the following relationships to support OCI cloud hardware type discovery. References link to records in other tables and don't appear in the CI Relationship [cmdb_rel_ci] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CI relationships

CI	Relationship	CI
Cloud Hardware Type [cmdb_ci_cloud_hardware_type]	Hosted on::Hosts	OCI Datacenter [cmdb_ci_oci_datacenter]

OCI OS image pattern-based discovery

Discovery and Service Mapping Patterns finds OCI OS images on your cloud environment. Discovering some of these resources might require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Pattern overview

Discovery uses the Oracle OCI - Image (LP) pattern to discover OCI OS images from your Oracle account.

When using the Image [cmdb_ci_os_template] table to store Cloud OS images, you may notice an unusually large number of records. To avoid this issue, you can store the discovered OS images in the Cloud Image [cmdb_ci_cloud_os_image] table. When enabled, Discovery launches the Oracle OCI - Cloud OS Image (LP) pattern, which populates the Cloud Image [cmdb_ci_cloud_os_image] table. For more information, see Enable Cloud OS Image discovery.

Pattern-based discovery and mapping requirements

Verify the OCI discovery prerequisites

For more information, see the prerequisites section in Oracle Cloud Infrastructure (OCI) discovery.

Configure the Discovery schedule to support GovCloud

Discovering OCI GovCloud accounts requires using a datacenter URL when setting up an OCI service account. For more information, see Create OCI service accounts.

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the OCI OS image patterns.

Image [cmdb_ci_os_template] or Cloud Image [cmdb_ci_cloud_os_image]

Field	Description
Name [name]	Name of the image resource.
Object ID [object_id]	A unique identifier, allocated by Oracle Cloud Infrastructure for this resource.
Guest OS [guest_os]	Operating system type of the image.
Version [version]	Version of the operating system.
Provider [provider]	The cloud provider, which is **OCI**. This field is only populated in the Cloud Image [cmdb_ci_cloud_os_image] table.
Install Status [install_status]	Install status of the resource. Default value is Installed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Image [cmdb_ci_os_template] or Cloud Image [cmdb_ci_cloud_os_image] (continued)

Field	Description
Operational status [operational_status]	Operational status of the resource. Default value is Operational.

CI relationships and references

The OCI OS image patterns create the following relationships and references to support OCI OS image discovery. References link to records in other tables and don't appear in the CI Relationship [cmdb_rel_ci] table.

CI relationships

CI	Relationship	CI
Image [cmdb_ci_os_template] or Cloud Image [cmdb_ci_cloud_os_image]	Hosted on::Hosts	OCI Datacenter [cmdb_ci_oci_datacenter]

CI references

CI	Field	Referenced CI
Key Value [cmdb_key_value]	Configuration item [configuration_item]	Image [cmdb_ci_os_template] or Cloud Image [cmdb_ci_cloud_os_image]

OCI Tag discovery

The OCI OS image patterns collect tags and populate them in the Key Value [cmdb_key_value] table.

Key Value [cmdb_key_value]

Field	Description
Key [key]	Tag name.
Value [value]	Tag value.
Configuration item [configuration_item]	References the Image [cmdb_ci_os_template] or Cloud Image [cmdb_ci_cloud_os_image] table.

OCI virtual machine pattern-based discovery

Discovery and Service Mapping Patterns finds OCI virtual machines (VMs) in your cloud environment. Discovering some of these resources might require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Pattern-based discovery and mapping requirements

Verify the OCI discovery prerequisites

For more information, see the prerequisites section in Oracle Cloud Infrastructure (OCI) discovery.

Configure the Discovery schedule to support GovCloud

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Discovering OCI GovCloud accounts requires using a datacenter URL when setting up an OCI service account. For more information, see Create OCI service accounts.

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the Oracle OCI - Virtual Machine (LP) pattern.

Virtual Machine Instance [cmdb_ci_vm_instance]

Field	Description
Name [name]	The display name of the VM instance.
Object ID [object_id]	A unique identifier, allocated by Oracle OCI for this resource.
CPUs [cpus]	The number of Oracle CPU (OCPUs) available to the instance.
Memory (MB) [memory]	The amount of memory available to the instance, in gigabytes.
IP Address [ip_address]	The private IP address of the primary network interface attached to the instance.
State [state]	The current state of the virtual machine instance. For example: on, off, starting, stopping, scheduled, terminated, or error.
Install Status [install_status]	Install status of the resource. Default value is Installed.
Operational status [operational_status]	Operational status of the resource. Default value is Operational.

Image [cmdb_ci_os_template] or Cloud Image [cmdb_ci_cloud_os_image]

Field	Description
Object ID [object_id]	A unique identifier, allocated by Oracle OCI for this image.
Provider [provider]	The cloud provider, which is **OCI**. This field is only populated in the Cloud Image [cmdb_ci_cloud_os_image] table.

Note: When using the Image [cmdb_ci_os_template] table to store Cloud OS images, you may notice an unusually large number of records. To avoid this issue, you can store the discovered OS images in the Cloud Image [cmdb_ci_cloud_os_image] table. For more information, see Enable Cloud OS Image discovery.

CI relationships and references

The Oracle OCI - Virtual Machine (LP) pattern creates the following relationships and references to support OCI VM discovery. References link to records in other tables and don't appear in the CI Relationship [cmdb_rel_ci] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CI relationships

CI	Relationship	CI
Virtual Machine Instance [cmdb_ci_vm_instance]	Hosted on::Hosts	OCI Datacenter [cmdb_ci_oci_datacenter]

OCI Tag discovery

The Oracle OCI - Virtual Machine (LP) pattern collects tags and populates them in the Key Value [cmdb_key_value] table.

Key Value [cmdb_key_value]

Field	Description
Key [key]	Tag name.
Value [value]	Tag value.
Configuration item [configuration_item]	References the Virtual Machine Instance [cmdb_ci_vm_instance] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

OCI BYOL discovery

Starting with Discovery and Service Mapping Patterns version 1.35.0, the pattern extension section discovers the following license types for Windows VMs:

- Bring Your Own License (BYOL)
- License included

The pattern stores the license type and model in the Key Value [cmdb_key_value] table.

Key Value [cmdb_key_value]

Field	Description
Key [key]	The license type key, which is **Windows_OS_License_Type_automatic**.
Value [value]	The license model, which is one of the following: • BYOL • License Included
Configuration item [configuration_item]	References the Virtual Machine Instance [cmdb_ci_vm_instance] table.

OpenStack resource discovery

The ServiceNow Discovery application uses OpenStack resource discovery patterns to find OpenStack resources through REST API calls. Discovering some of these resources might require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Discovery uses OpenStack resource discovery patterns to run horizontal discovery.

Starting with the Discovery and Service Mapping Patterns August 2024 store release, OpenStack resource discovery patterns support both private and public cloud discovery.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Prerequisites

OpenStack requirements

- In the OpenStack Identity service catalog, find the access URL that is used as the OpenStack identity service endpoint. For example: https://<openstack dns>:<port>.
- Configure an OpenStack user with permissions to generate a project scope token. Setting Domain ID, User Name, Project Name, and Password values is required for generating a token.

MID Server requirements

Deploy and connect a dedicated MID Server for cloud discovery.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The dedicated MID Server must have access to OpenStack and an open port for each OpenStack service to be discovered.

Credentials

On the ServiceNow AI Platform, create OpenStack credentials for the ServiceNow cloud service account. Enter the Domain ID, User Name, Project Name, and Password values you've configured in OpenStack requirements. For more information, see Create and test your credentials.

Service account

On the ServiceNow AI Platform, configure a ServiceNow cloud service account using the created OpenStack credentials and the OpenStack datacenter details. In the **Account Id** field, provide the Project ID of the OpenStack Project to be discovered.

Create a discovery schedule

For more information, see Create an OpenStack Discovery schedule in Discovery Admin Workspace.

Create an automatic discovery schedule for OpenStack service accounts—for private cloud only

Create an automatic serverless discovery schedule for OpenStack service accounts using the OpenStack - Discover Service Accounts pattern. For more information, see the Auto Cloud discovery schedule for Open stack [KB1638685] article in the Now Support Knowledge Base.

(Optional) Populate Service Account and Logical Datacenter fields in cloud CIs

Starting with Discovery and Service Mapping Patterns version 1.30.2, you can improve query performance by populating Service Account and Logical Datacenter fields directly in cloud CIs. For more information, see Improved query performance with direct field population in CI tables.

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the OpenStack resource discovery patterns.

Virtual Machine Instance [cmdb_ci_vm_instance]

Field	Description
Object ID [object_id]	Server UUID.
Name [name]	Server name.
Status [status]	Server status.
Description [short_description]	(Optional) Server description.
CPUs [cpus]	Number of virtual CPUs (vCPUs) from the Flavor that the VM instance is provisioned with.
Disks [disks]	Number of all managed volumes by Cinder that are returned from the VM instance.
Disks size (GB) [disk_size]	Total amount of all managed volumes by Cinder that are used by the VM instance measured in gigabytes (GB).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Virtual Machine Instance [cmdb_ci_vm_instance] (continued)

Field	Description
Memory (MB) [memory]	The **ram** value from the Flavor that the VM instance is provisioned with, measured in megabytes (MB).
Network adapters [nics]	Number of unique interfaces configured in the VM instance.
State [state]	Mapped status value returned for the VM instance. The OpenStack Server statuses and their related ServiceNow **State** values are: • ACTIVE: on • RESCUED: on • PAUSED: paused • SUSPENDED: off • STOPPED: off • SOFT_DELETED: terminated • HARD_DELETED: terminated • RESIZED: off • ERROR: error • INITIALIZED: starting For any **status** value not listed, the default value is off.

Cloud Key Pairs [cmdb_ci_cloud_key_pair]

Field	Description
Object ID [object_id]	Keypair UUID.
Name [name]	Keypair name that is used to reference it.
Finger print [finger_print]	Keypair fingerprint.

Cloud Load Balancer [cmdb_ci_cloud_load_balancer]

Field	Description
Object ID [object_id]	Load balancer ID.
Name [name]	Human-readable resource name.
Description [short_description]	(Optional) Human-readable resource description.
Install Status [install_status]	Resource provisioning status.
Operational Status [operational_status]	Resource operational status.

Load Balancer Listener [cmdb_ci_lb_listener]

Field	Description
Object ID [object_id]	Listener ID.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Load Balancer Listener [cmdb_ci_lb_listener] (continued)

Field	Description
Name [name]	Human-readable name of the resource.
Install Status [install_status]	Provisioning status of the resource.
Listener Protocol [listener_protocol]	Protocol for the resource. One of HTTP, HTTPS, TCP, TERMINATED_HTTPS, or UDP.
Listener Port [listener_port]	Protocol port number for the resource.
Operational status [operational_status]	Resource operational status.
Description [short_description]	(Optional) Human-readable resource description.

Load Balancer Pool [cmdb_ci_lb_pool]

Field	Description
Object ID [object_id]	Pool ID.
Name [name]	Human-readable resource name.
Install Status [install_status]	Resource provisioning status.
Operational Status [operational_status]	Resource operational status.
Description [short_description]	(Optional) Human-readable resource description.
Load Balancing Method [load_balancing_method]	Load balancing algorithm for the pool. One of these values: LEAST_CONNECTIONS, ROUND_ROBIN, SOURCE_IP, or SOURCE_IP_PORT.

Load Balancer Pool Member [cmdb_ci_lb_pool_member]

Field	Description
Object ID [object_id]	Pool member ID.
Name [name]	Human-readable resource name.
Install Status [install_status]	Resource provisioning status.
IP address [ip_address]	Back-end member server IP address.

Storage Volume [cmdb_ci_storage_volume]

Field	Description
Object ID [object_id]	Volume UUID.
Name [name]	Volume name.
Status [status]	Volume status.
Description [short_description]	(Optional) Human-readable description.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Storage Volume [cmdb_ci_storage_volume] (continued)

Field	Description
Storage type [storage_type]	Associated volume type.

Storage Volume Snapshot [cmdb_ci_storage_vol_snapshot]

Field	Description
Object ID [object_id]	Volume UUID.
Name [name]	Volume name.
Status [status]	Volume status.
Description [short_description]	(Optional) Human-readable description.

Image [cmdb_ci_os_template]

Field	Description
Object ID [object_id]	User-defined image UUID.
Name [name]	Image name. The value can be null (the JSON Null data type).
Status [status]	Image status.

Cloud Network [cmdb_ci_network]

Field	Description
Object ID [object_id]	Network ID.
Name [name]	Human-readable network name.
Operational Status [operational_status]	Network status. Possible values: ACTIVE, DOWN, BUILD, or ERROR.
Description [short_description]	(Optional) Human-readable description.

Cloud Subnet [cmdb_ci_cloud_subnet]

Field	Description
Object ID [object_id]	Subnet ID.
Name [name]	Human-readable resource name.
DHCP enabled [is_dhcp_enabled]	Whether DHCP is enabled or disabled for the subnet.
Description [short_description]	(Optional) Human-readable description.

Compute Security Group [cmdb_ci_compute_security_group]

Field	Description
Object ID [object_id]	Security group ID.
Name [name]	Human-readable resource name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Compute Security Group [cmdb_ci_compute_security_group] (continued)

Field	Description
Description [short_description]	(Optional) Human-readable description.

Security Group Rule [cmdb_ci_compute_security_group_rule]

Field	Description
Name [name]	This field has the same value as the object_id field.
Object ID [object_id]	Security group rule ID.
Description [short_description]	(Optional) Human-readable description.
Ethertype [ethertype]	Ethertype. Must be IPv4 or IPv6. Addresses represented in CIDR must match the ingress or egress rules.
Port range max [port_range_max]	The last port of the range to which the rule applies. This value is the maximum port number in the range that is matched by the security group rule. • If the protocol is TCP, UDP, DCCP, SCTP or UDP-Lite, this value must be greater than or equal to the port_range_min attribute value. • If the protocol is ICMP, this value must be an ICMP code.
Port range min [port_range_min]	The first port of the range to which the rule applies. This value is the minimum port number in the range that is matched by the security group rule. • If the protocol is TCP, UDP, DCCP, SCTP or UDP-Lite, this value must be less than or equal to the port_range_max attribute value. • If the protocol is ICMP, this value must be an ICMP type.

OpenStack Domain [cmdb_ci_cloud_openstack_domain]

Field	Description
Object ID [object_id]	Domain ID.
Name [name]	Domain name.
Description [short_description]	(Optional) Human-readable description.
Enabled [enabled]	Defines whether the domain is enabled or disabled. • True - The domain is enabled. • False - The domain is disabled.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

OpenStack Service [cmdb_ci_cloud_openstack_service]

Field	Description
Object ID [object_id]	Service ID.
Name [name]	Service name.
Description [short_description]	(Optional) Human-readable description.
Type [type]	Service type. Describes the API implemented by the service. Possible values: Compute, ec2, identity, image, network, or volume.
Catalog enabled [enabled]	Defines whether the service and its endpoints appear in the service catalog. • True - The service and its endpoints appear in the service catalog. • False - The service and its endpoints do not appear in the service catalog.

OpenStack Endpoint [cmdb_ci_cloud_openstack_endpoint]

Field	Description
Object ID [object_id]	Endpoint ID.
Name [name]	Service name.
Interface [interface]	Interface type that describes the visibility of the endpoint. Possible values: • Public - Visible by end users on a publicly available network interface. • Internal - Visible by end users on an unmetered internal network interface. • Admin - Visible by administrative users on a secure network interface.
Catalog enabled [enabled]	Defines whether the service and its endpoints appear in the service catalog. • True - The service and its endpoints appear in the service catalog. • False - The service and its endpoints do not appear in the service catalog.

Cloud Hardware Type [cmdb_ci_cloud_hardware_type]

Field	Description
Name [name]	The **name** field of OpenStack Flavor.
Object ID [object_id]	The **id** field of OpenStack Flavor.
vCPUs [vcpus]	The **vcpus** field of OpenStack Flavor.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cloud Hardware Type [cmdb_ci_cloud_hardware_type] (continued)

Field	Description
Memory MB [memory_mb]	The **ram** field of OpenStack Flavor.
Local Storage GB [local_storage_gb]	The **disk** field of OpenStack Flavor.

The discovered data includes the OpenStack Hypervisor View [cmdb_ci_openstack_hypervisor_view] table and its fields for private cloud only.

OpenStack Hypervisor View [cmdb_ci_openstack_hypervisor_view] table fields

Field	Description
Name [name]	Concatenated value of **hypervisor_type** and **hypervisor_hostname** fields. For example: QEMU@host.acmecorp.com.
IP Address [ip_address]	The value of **host_ip** field.
Hypervisor technology [hypervisor_technology]	The value of **hypervisor_type** field.
Object ID [object_id]	The value of **id** field.
State [state]	The value of **state** field.
Version [version]	The value of **hypervisor_version** field.

The Dependency Views map shows all discovered OpenStack resources in your organization that are available through REST API calls and the relationships between them.

cmdb_ci_cloud_key_pair	Hosted on::Hosts	cmdb_ci_openstack_datacenter
cmdb_ci_os_template	Hosted on::Hosts	cmdb_ci_openstack_datacenter
cmdb_ci_vm_instance	Provisioned from::Provisioned	cmdb_ci_os_template
cmdb_ci_vm_instance	Virtualized by::Virtualizes	cmdb_ci_server

The relationships listed in the following table are created to support OpenStack resource discovery in private cloud only.

CI	Relationship	CI
cmdb_ci_vm_instance	Registered on::Has registered	cmdb_ci_openstack_hypervisor_view
cmdb_ci_openstack_hypervisor_view	Hosted on::Hosts	cmdb_ci_openstack_datacenter
cmdb_ci_openstack_hypervisor_view	Uses::Hosts Used by	cmdb_ci_server

Configuring Pattern Designer and related applications

Install the latest available versions of the ServiceNow applications to use the latest discovery patterns.

The Pattern Designer (com.snc.pattern.designer) application provides the UI for creating or customizing discovery patterns. Pattern Designer is automatically installed with Discovery or Service Mapping. The patterns themselves are released using dedicated pattern applications.

The following user roles have access to Pattern Designer and can perform various actions. Note that customizing patterns requires basic knowledge of programming.

Pattern Designer users and access

User	Description
PD user	Has read-only access to **Discovery Pattern Log**.
PD admin	Can view, create, edit, and publish patterns.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Pattern Designer users and access (continued)

User	Description
PDE viewer	Starting with Pattern Designer Enhancements version 3.9.0, users can view **Command Validation Tasks**, **Command Validation Tasks Results**, and **Command List**. The pde_viewer can view the **Command Validation Tool** modules and related tables, but doesn't have permissions to modify or edit them. The pde_viewer role can view the following tables only: • Command List [pd_command_list] • Command Validation Task [pd_command_validation] • Command Validation Task Results [pd_command_validation_results] • Pattern Shared Library Mapping [pd_pattern_to_shared_library_mapping] • Temporary Variable Mappings [pd_temp_variable_value_mapping]
PD MID	Not assigned to a user directly but to the MID Server record or the user under which the MID Server runs. The role enables the MID Server to interpret and run pattern-based probes.

ServiceNow releases all discovery patterns using the following applications:

Discovery and Service Mapping Patterns (sn_itom_pattern)

This application provides the latest versions of discovery patterns the original version of which ServiceNow released on ServiceNow Store.

Visibility Content (sn_pattern_design)

This application supplies the updated version of the patterns that were part of the family releases up until Tokyo.

You can install the latest available versions of the pattern applications from the ServiceNow Store. Alternatively, you can install these applications as plugins on your ServiceNow instance.

Check which plugin contains a required pattern

Since ServiceNow releases discovery patterns using two different plugins, you may need to check which plugin to install or upgrade.

Before you begin

Role required: service_mapping_admin

About this task

ServiceNow releases all discovery patterns using the following applications:

Discovery and Service Mapping Patterns (sn_itom_pattern)

This application provides the latest versions of discovery patterns the original version of which ServiceNow released on ServiceNow Store.

Visibility Content (sn_pattern_design)

This application supplies the updated version of the patterns that were part of the family releases up until Tokyo.

Procedure

1. Navigate to **All** > **Pattern Designer** > **Discovery Patterns**.
2. Display the **Application** column.

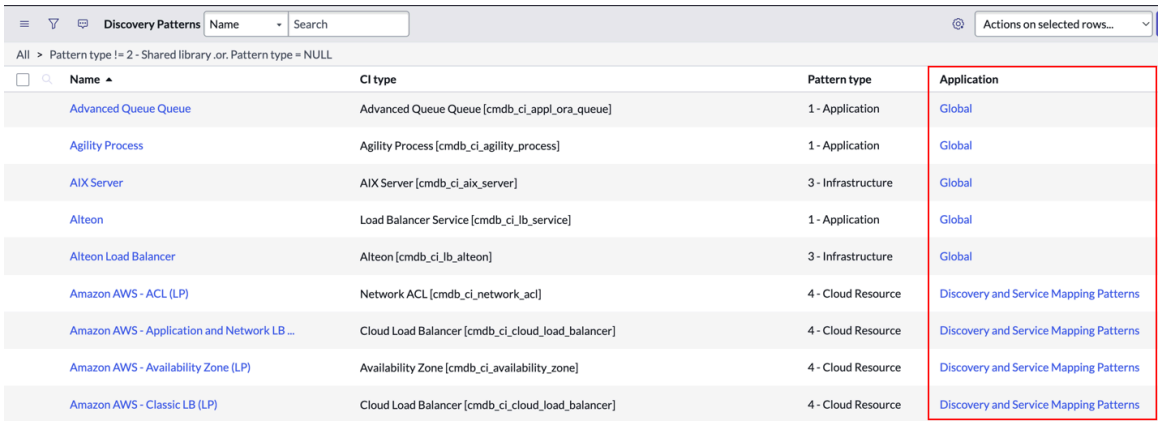
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Click **Personalize List**.

b. In the Personalize List Columns dialog box, select **Application** under **Available**, and click the right arrow.

3. **Optional:** You can filter out shared libraries to see only patterns in the list.
4. Search for the relevant pattern in the list.
5. Check to which application it belongs.

   Global stands for Visibility Content.



Install Discovery and Service Mapping Patterns

You can install the Discovery and Service Mapping Patterns application (sn_itom_pattern) if you have the admin role.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Review the Discovery and Service Mapping Patterns application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.

Role required: admin

About this task

Multiple tables are installed with Discovery and Service Mapping Patterns.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Discovery and Service Mapping Patterns application (sn_itom_pattern) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

   In the list next to the **Install** button, the versions that are available to you are displayed.

3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box, any dependencies installed with your application are listed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. Select **Install**.

Install Visibility Content

You can install the Visibility Content application (sn_pattern_design) if you have the admin role.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Review the Visibility Content application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.

Role required: admin

About this task

Multiple tables are installed with Visibility Content.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Visibility Content application (sn_pattern_design) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

   In the list next to the **Install** button, the versions that are available to you are displayed.
3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box, any dependencies installed with your application are listed.
4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. Select **Install**.

Password2 encryption for patterns

The Password (two-way encrypted) field type is used to encrypt and decrypt data. The field type works in accordance with NIST 800-57 guidelines and provides FIPS 140-2-L3 protection.

Password2 is a text field that stores sensitive data with two-way encryption. The two-way encryption stores the data as a secure encrypted value that can be decrypted within the ServiceNow AI Platform instance.

From Quebec, Key Management Framework enables you to manage keys used for Password2 fields. However, the implementation of Password2 is required on a ServiceNow AI Platform using the Rome release or later.

Note: Only newly created records containing Password2 fields are two-way encrypted. Existing data is not automatically converted to use Password2 encryption.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Verify Password2 implementation

Discovery and Service Mapping Patterns store app

Verify that the Discovery and Service Mapping Patterns store app (version 1.0.76) is installed.

Verify Password2 is included in XML records

View the XML records in the ServiceNow AI Platform instance, and verify that the encryption looks similar to this example:

Create CI types for Service Mapping and Discovery

Create CI types (or CI classes) for applications and devices, which Service Mapping and Discovery do not support by default.

Before you begin

Role required: service_mapping_admin, personalize_dictionary, or admin
Verify that there is no existing CI type for this application or device.

About this task

All applications and hosts in your organization must have a corresponding configuration item (CI) type, which is necessary for discovering and processing applications and hosts correctly.

Note: The Discovery and the CMDB interface refers to CI types as CI classes.

A wide range of preconfigured CI types that cover most commonly used applications are available to you. If your organization uses a less known or proprietary application that does not have a corresponding CI type, you must create it.

A CI type is a generic notion that is used by several ServiceNow applications, but there are some attributes that are specific to Service Mapping and Discovery.

A CI type (or class) contains several important definitions that apply to all CIs belonging to it, such as:

- CI attributes are added as fields to the CMDB tables.
- Identifiers help Service Mapping and Discovery to differentiate between new and existing CIs. For example, if there is an Apache Web Server CI type defined in the CMDB, and Service Mapping and Discovery both discover an Apache Web Server CI, it processes it using identifiers. It then recognizes it as an updated version of the Apache Web Server CI that already exists in the system, not a new Apache Web Server CI.
- There are reconciliation rules that help the ServiceNow platform to consolidate CI attributes received from different applications correctly. These rules are necessary for organizations where more than one application participates in the discovery process. Reconciliation rules define how attributes of the same CI discovered by different discovery sources are merged. For example, Service Mapping discovers the version and home directory attributes of an Apache Web Server CI, while Discovery discovers the version and patch level attributes for the same Apache Web Server CI. The ServiceNow AI Platform applies the reconciliation rule and as a result Service Mapping does not overwrite the attributes found by Discovery.
- Related items, both CIs and non-CIs, serve as a reference and provide additional information about the CI. For example, you can define a serial number, a port and an network APR table as related items for a hardware server. The system does not use these items for identification. After you configure related items for the CI type, you can use horizontal discovery for CIs of this

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

type together with their related items. For information, see Discover related items together with the main CI.

Note: Non-CIs are items that do not extend the Configuration Item [cmdb_ci] table. Examples of non-CIs are ports, serial numbers, or Network ARP tables.

- CMDB stores CI class in the form of a hierarchy where some CI classes are parents to other CI classes, who automatically derive their parent's attributes in addition to attributes you configure specifically for child CI classes. CI class hierarchy is used widely for configuring CI behavior, relationships, and display. In this example, the Apache Web Server CI is a child of the Web Server CI and derives many attributes from its parent, such as name, version, model ID. By default, child CI classes inherit identifiers from their parent CI classes.

In addition to these CI type definitions, the horizontal discovery process uses a CI classification to define to which CI type a CI belongs. Create a device CI classification if you create a CI type for devices using SNMP and a process CI classification for an application CI type.

Procedure

1. Navigate to **All** > **Configuration** > **CI Class Manager**.
2. To use an existing CI type as a parent for the new CI type, select **Hierarchy** to display the CI Classes list.
3. Select the context menu for the required CI type and select **Add Child Class**.
4. Create a table to store the CI type attributes:

Table form fields

Field	Description
Label	CI type name. For example, Apache Web Server.
Name	The table name. For example, cmdb_ci_apache_web_server. Use a name similar to the other CMDB classes (for example, `u_cmdb_ci_laptop`).
Extends table	The table name of the parent CI type. All CI types are extensions of the Configuration Item [cmdb_ci] table or its child tables. For example, if the new class is Laptops, which is a subclass of Computers, select the cmdb_ci_computer table. If the new class is a top-level class, select the cmdb_ci table. The most commonly used parent CI types are: ○ cmdb_ci - basic ○ cmdb_ci_database - for databases ○ cmdb_ci_app_server - for application servers ○ cmdb_ci_infra_service - for infrastructure services ○ cmdb_ci_endpoint_inclusion - for entry points of the inclusion type ○ cmdb_ci_appl - for applications ○ cmdb_ci_web_server - for web servers

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ cmdb_ci_lb - for load balancers ○ cmdb_ci_endpoint - for entry points

5. Configure how the instance determines if a discovered CI is an upgraded CI existing in the instance or a brand new CI.
See Create or edit a CI identification rule for detailed procedure.

> **Warning:** If there is no CI identification rule for a CI type, Service Mapping discovers CIs belonging to this type, but cannot interpret the results of the discovery process. In this case, the ServiceNow AI Platform rejects the discovery results for these CIs and their information is not updated.

a. On the **Identifiers** page, configure the parameters as follows:

Identifier form

Field	Description
Name	Use a meaningful name.
Applies to	Enter the CI type.
Active	Select the check box.
Independent	Clear the check box.

b. Configure the identifier entry parameters as follows:

Identifier entry form

Field	Description
Criterion attributes	Select the attribute that you want to use for identifying the CI. For example, **Class**, **Installation directory**, or **Serial number**.
Allow null attribute	Select the check box.
Priority	If there is more than one identifier entry, add priority to determine the order in which Service Mapping applies these entries. If none of the identification criteria matches the discovered CI, this CI is new.

6. **Optional:** Configure references to other CIs or non-CIs as related items for the CI type.

Related Entry form

Field	Description
Active	Check box that specifies that the related entry is active.
Related table	A related table that references the CI that is being matched.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Referenced field	A referenced field in **Related table** that should store the referenced CI. This field always references the cmdb_ci table, or a descendent of the cmdb_ci table.
Priority	Priority of the related entry for the specified **Related table**. Rules with lower priority numbers are given higher priority while matching a related item for specific related table. Related entries for the specified related table with identical priorities are applied randomly. You can keep gaps between the priority numbers, so you can assign the unused priority numbers to new entries without modifying the existing priority order.
Criterion attributes	The set of attributes to uniquely identify the related item. Attributes can belong to the current class, or to a parent class. **Note:** It is possible to add reference fields as a criterion attribute. However, such fields might not always be effective: ○ Reference fields store *sys_id*s that point to a record in another table, and thus is considered a weak criterion attribute (in terms of uniqueness) for the current table. ○ The system detects and then replaces invalid values in a reference field with 'Unknown'. For example, an invalid *Model ID* value is replaced with the value 'Unknown'. Also, if several CIs end up having that same reference field set to 'Unknown', then these CIs become duplicate CIs. Select the lock icon to view, add, or remove attributes from the identification rule.
Allow null attribute	If at least one criterion attribute in the related table is not null, allow to attempt matching with an identifier entry even if there are criterion attributes which are null.
Filter conditions	Add conditions to construct a filter to narrow the set of records that will be searched for a matching related item.

7. **Optional:** Configure the instance to consolidate CI attributes received from different data sources correctly.
   See Create or edit a CI reconciliation rule.

   Configure the following Service Mapping related parameters correctly:

   Reconciliation Definition form

Field	Description
Data source	Select `ServiceWatch`.
Applies to	Select the relevant CI type.
Optional condition	Set a condition if necessary.

   Note: If you do not create a CI reconciliation rule, data discovered by patterns is used to update CI attributes.

8. Configure the CI classification for your CI type:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- For CI types representing applications, perform configuration as described in Create a Discovery process classification.
- For CI types representing SNMP devices, perform configuration as described in Create a Discovery CI classification.

Note: There is no need to create CI classifications for hosts because these classifications are included in the base system.

9. For CI types that represent inclusions, define the hierarchy for the new CI type.

   Clear the **Reverse Relationship Direction** check box while performing this configuration.

   See Create dependent relationships.

10. If necessary, customize icons that represent CIs in maps.
    See Create or modify map icons.

Create entry point types for Service Mapping

An entry point is a point where clients access a service instance. Service Mapping starts the mapping process for every application service from the entry point you define for it. Service Mapping includes a wide range of preconfigured entry point types that cover most commonly used applications. If your organization uses a less known or proprietary application that does not have a corresponding entry point type in Service Mapping, you must create it.

Before you begin

If your ServiceNow instance uses domain separation and you have access to the global domain, log in to the relevant domain. The selected domain must be a domain without any child domains.

Role required: service_mapping_admin or admin

About this task

In addition to starting the mapping process from entry points, Service Mapping patterns use entry points to discover CI outbound connections.

Entry points are modeled in the ServiceNow CMDB as CIs of endpoint type. Entry points are stored as records in the Endpoint [cmdb_ci_endpoint] tables.

Like any other CI type, an entry point contains several important definitions that apply to all CIs belonging to it:

- CI attributes are added as fields to the CMDB tables.
- Identifiers help Service Mapping and Discovery to differentiate between new and existing CIs. For example, if there is an endpoint CI type for Active Directory Forest in the CMDB 360, and Service Mapping discovers an Active Directory Forest CI. Service Mapping processes this CI using identifiers and recognizes it as an updated version of the Active Directory Forest CI that exists in the system, not a new Active Directory Forest CI.
- CI type hierarchy. CMDB stores CI class in the form of a hierarchy where some CI classes are parents to other CI classes, who automatically derive their parent's attributes in addition to attributes you configure specifically for child CI classes. CI class hierarchy is used widely for configuring CI behavior, relationships, and display. Create standard entry points as child CIs for the endpoint CI type, which creates an extension for the cmdb_ci_endpoint table. For entry points of inclusion type create child CIs for the inclusion endpoint CI type extending the cmdb_ci_endpoint_inclusion table. In an inclusion, a server hosts applications that are treated as independent objects.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Configuration** > **CI Class Manager**.
2. Select **Open Hierarchy**.
3. To create a standard entry point, right-click **Endpoint** from the **Class Hierarchy** pane and select **Add Child Class**.
4. To create an entry point of the inclusion type, right-click **Inclusion Endpoint** from the **Class Hierarchy** pane and select **Add Child Class**.
5. Define the parameters for the new entry point type as described in Create a CI class.

Map a single application service using classic Service Mapping

Create CI types for Service Mapping and Discovery

Create or customize patterns

Create or modify a discovery pattern and define its basic attributes.

Before you begin

Make sure that the application for which you want to create a pattern, has a corresponding configuration item (CI) type and a CI classification. If the CI type you require is not in the list, create it as described in Create CI types for Service Mapping and Discovery.

If your ServiceNow instance uses domain separation and you have access to the global domain, log in to the relevant domain. The selected domain must be a domain without any child domains.

Role required: pd_admin

Basic knowledge of programming is desirable.

About this task

Patterns can be of the infrastructure or application type. Infrastructure patterns are used only by Discovery for creating lists of devices. Application patterns serve both Service Mapping and Discovery, which use the same application patterns for their purposes.

Procedure

1. Navigate to **All** > **Pattern Designer** > **Discovery Patterns**.
2. Click **New** or select the relevant pattern from the list.
3. Define the basic pattern attributes on the **Basic** tab.

Field	Description
Pattern type	○ Select **Application** for an application pattern. It can be used both for top-down discovery performed by Service Mapping and horizontal discovery performed by Discovery. ○ Select **Infrastructure** for an infrastructure pattern used for the horizontal host discovery performed by Discovery.
Name	Enter the pattern name. This name must be unique to this pattern. Use self-explanatory names such as `Apache on Unix pattern`.
CI type	Select the CI type which you want this pattern to discover.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: Discovery can find multiple CIs that belong to the same CI type.
Operating system [Application patterns only]	Select the operating system that the selected CI runs: ○ Click **All** if the CI runs on more than one operating system. Or ○ Select the relevant operating systems from the list.
Run Order [Application patterns only]	For an application pattern used by Service Mapping, define when the pattern runs **a.** Select the order in which this pattern always runs: ▪ **Before** ▪ **After** **b.** Then select the other applicable pattern. This field is only relevant if a particular pattern can be confused with another pattern. For example, both IIS and MS Exchange applications have an HTTP entry point. However MS Exchange uses some of the components of IIS. Therefore, if the IIS pattern ran first, discovery might incorrectly identify MS Exchange as IIS. To prevent this error, in the **Run Order** field in the MS Exchange pattern definition, select **Before** and **IIS**.
Description	Provide a description for this pattern.

4. **Optional:** When creating an application pattern, make the MID Server run this pattern only if the process identified on a CI matches the classification criteria for this pattern, select **Enforce Process Classification**.
   All simplified patterns created from generic applications, have this attribute enabled. For more information about creating process classification, see Discovery classifiers.
5. Define a set of identification steps for every incoming connection of a configuration item (CI) as described in KB1698521: Create or customize patterns.
6. If necessary, create more identification sections.
7. Save the pattern.
8. **Optional:** To test the pattern, select **Debug Mode** and enter the IP address of the host.
9. Upload the updated set of patterns onto the MID Server:
   a. Navigate to **Discovery** > **MID Servers**.
   b. Alternatively, navigate to **Service Mapping** > **MID Servers**.
   c. Select **Pattern Sync to Mid**.

What to do next

For application type patterns, continue with creating a connection section as described in the KB article KB1698521: Create or customize patterns.

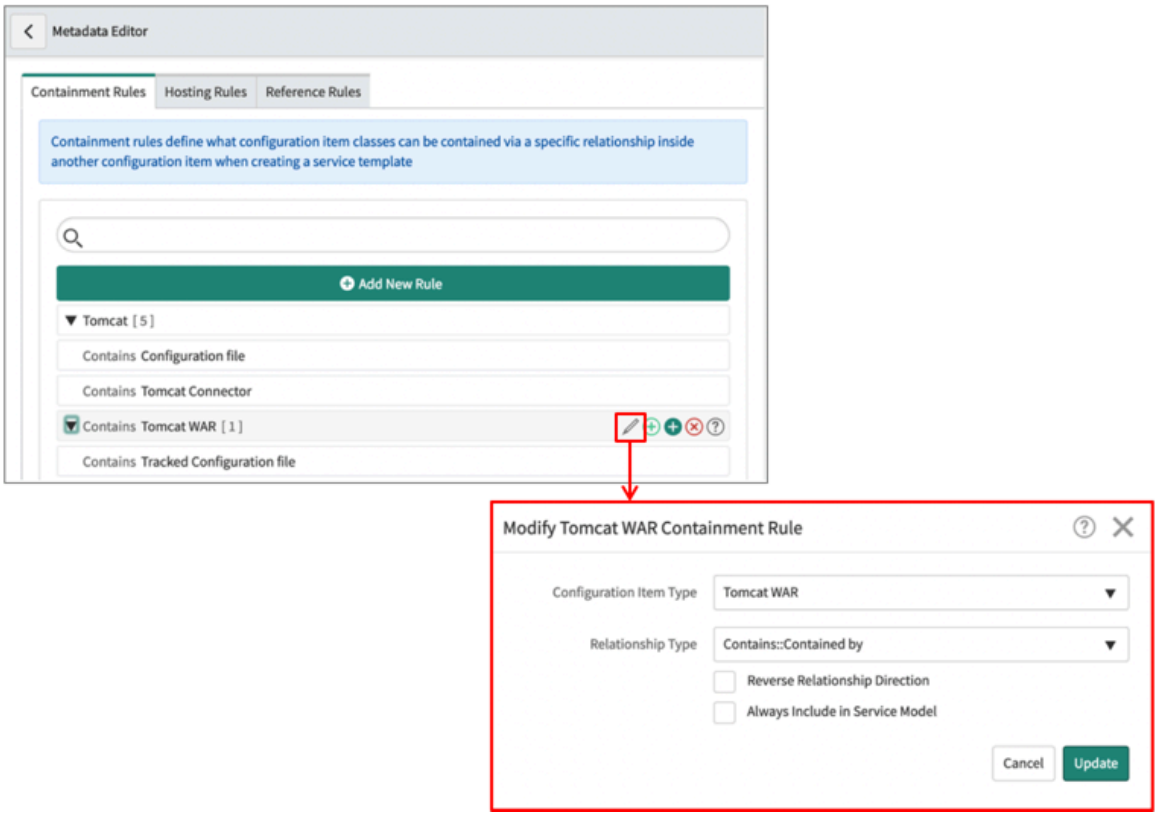
Discover related items together with the main CI

Add related items to the patterns to perform horizontal discovery of configuration items with all their related items: CIs or non-CIs, like ports or serial numbers.

Before you begin

1. (Optional) Check if the CI is dependent: The system uses the identification rules to identify the CI independently of other CIs. Refer to Create or edit a CI identification rule.
2. (Optional) To understand the model better, check dependent relationship rules which define the dependency structure of the CI types and the relationship types in these service definitions. For example, you can discover a Tomcat server with Tomcat WARs belonging to it. For more information, refer to Dependent relationship rules.

Example of the Containment rule for Tomcat WAR



3. To add a non-CI to the pattern, add it as a related item for the CI type to which the main CI belongs. For more information on adding related items for the CI type, see Configure references to other CIs or non-CIs as related items for the CI type.

Role required: pd_admin

About this task

Related items, both CIs and non-CIs, serve as a reference and provide additional information about the CI. For example, you can define a serial number, a port and an network APR table as related items for a hardware server. The system does not use these items for identification. After you configure related items for the CI type, you can use horizontal discovery for CIs of this type together with their related items.

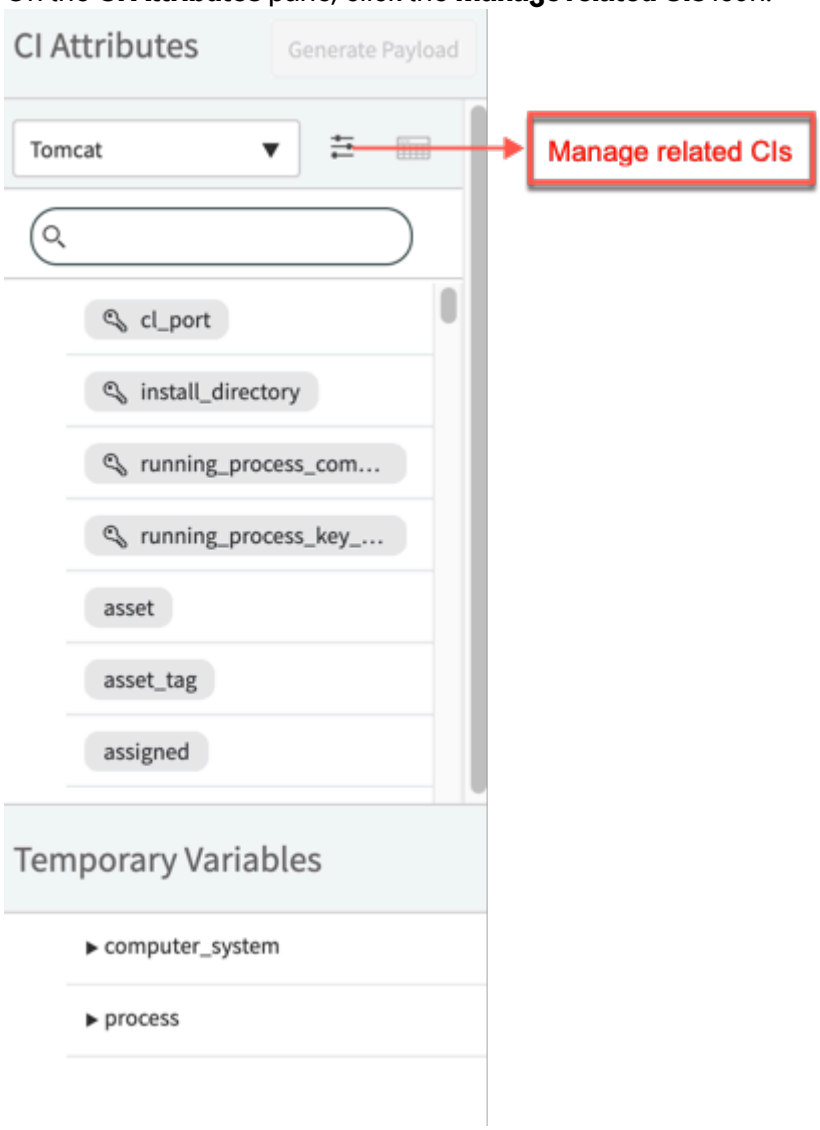
Note: Non-CIs are items that do not extend the Configuration Item [cmdb_ci] table. Examples of non-CIs are ports, serial numbers, or Network ARP tables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Pattern Designer displays attributes of related CI types, which you added to the pattern in the CI attributes pane. You can view and use these attributes while creating or modifying the main CI pattern.

Procedure

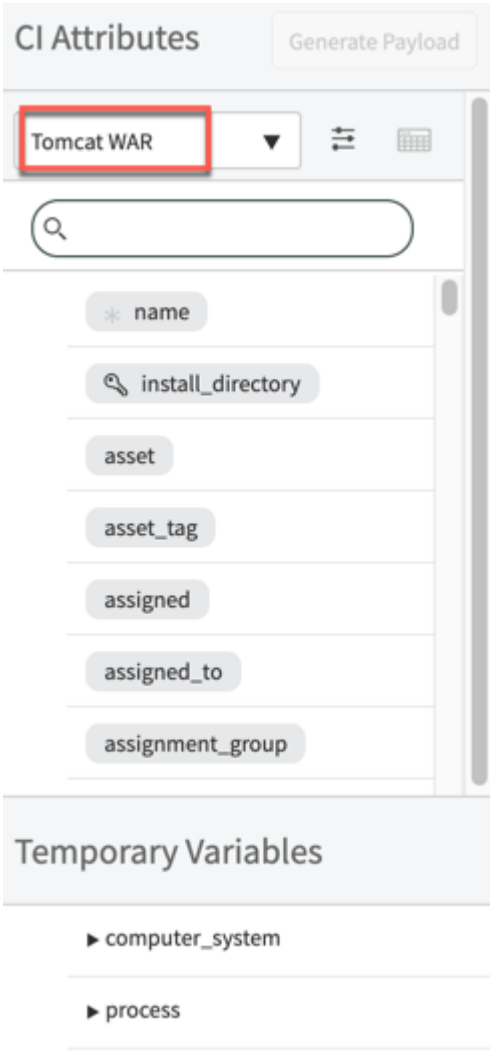
1. Navigate to **All** > **Pattern Designer** > **Discovery Patterns**.
2. Select the relevant pattern.
3. On the pattern form, select the relevant identification section.
4. Make sure that you are not in Debug mode.
5. On the **CI Attributes** pane, click the **Manage related CIs** icon.



6. Select the relevant related CI type.
   You can use the search box to locate a specific CI type.
7. Click the Plus icon.
   The new related CI type is added to the list.
8. **Optional:** Add other related CI types.
9. Click **OK**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

New tabs for related CI types you added appear under the tab for the main CI:



What to do next

Continue editing the pattern by adding more steps as necessary. To view or use attributes of a related CI type, click the relevant tab in the **CI Attributes** pane.

Enhance patterns without modifying identification sections

Enable patterns to search for additional attributes and modify pattern discovery logic defined in identification sections by using extension sections. Each extension section contains a preconfigured set of discovery steps referred to as a shared library.

Before you begin

If your ServiceNow instance uses domain separation and you have access to the global domain, log in to the relevant domain. The selected domain must be a domain without any child domains.

Basic knowledge of programming is desirable.

Role required: pd_admin

About this task

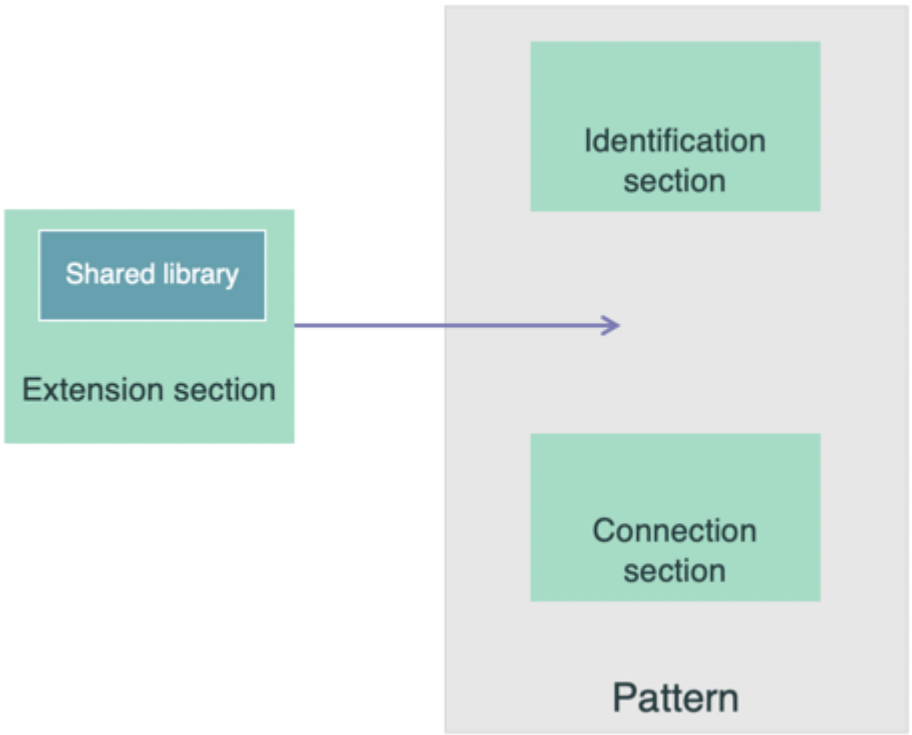
Patterns can be of the infrastructure or application type. Infrastructure patterns are used only by Discovery for creating lists of devices. Application patterns serve both Service Mapping and Discovery, which use the same application patterns for their purposes. Each pattern including

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

its identification and connection sections is an individual file. There are also reusable sequences of discovery steps referred to as shared libraries. Each shared library is an individual file, but it is always part of the infrastructure or application pattern and is not used as a standalone pattern. Records for both patterns and shared libraries reside in the Discovery Patterns [sa_pattern] table.

To modify the discovery logic in identification sections without changing the identification sections themselves, you can add extension sections to the pattern. Every extension section consists of a shared library, either new or existing.

Adding an extension section to a pattern



When you create or modify a shared library in the extension section, you save changes only to the shared library, not to the pattern containing this extension section.

Warning: The changes to the shared library affect all patterns using this shared library.

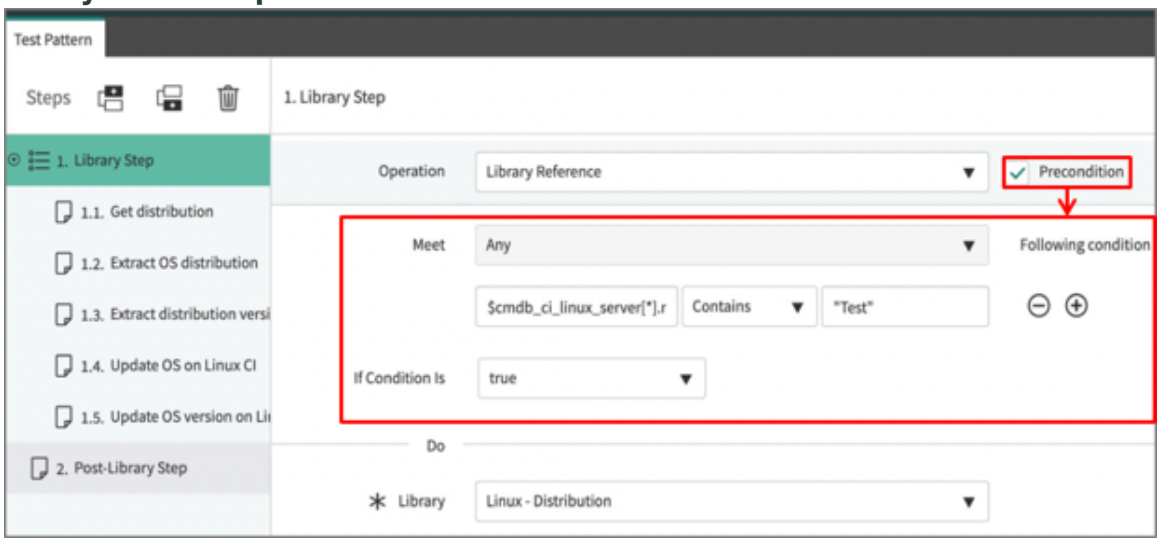
The MID Server runs extension sections after identification sections and only if at least one identification section completes successfully.

If there are more than one extension sections associated with this pattern, define the order in which the MID Server runs these extension sections.

You can deactivate shared libraries, so that patterns using them, skip steps in deactivated shared libraries. For more information, see Discovery Configuration Console. If a precondition defined for a shared library step is not fulfilled, the pattern skips all steps belonging to this shared library. For example, if the file, to which the variable points, does not contain "test", the pattern does not run the shared library steps 1-1 to 1-5. The precondition exists only for the pattern within which you created it. The precondition does not affect other patterns using this shared library.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Library Reference operation form



Procedure

1. Navigate to **All** > **Pattern Designer** > **Discovery Patterns** and open the required pattern from the pattern list.

   The pattern can be of the Infrastructure or Application type.

2. To create an extension section and define discovery steps for its shared library.

   a. Click **New** under **Extension section**.

   b. Enter the name of this extension section.

   c. Click **Done**.
   The pattern form displays the new section under **Extension section**.

   d. Click the name of the new extension section.

   The Pattern Designer opens showing the Steps tree on the left.

   If no discovery steps have been identified for this pattern, the **Untitled Step** appears in the Steps tree in the left pane of the window.

   e. Define discovery steps.

   f. Click **Save** to save the extension section and make Service Mapping and Discovery use it. You do not publish extension sections.

3. To use an existing shared library for the new extension section:

   a. Click **Add** under **Extension section**.

   b. Select the shared library from the name list.

4. If there are more than one extension sections, define the order in which the MID Server runs the extension section.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select the check box next to the extension section.

b. Click **Edit** under **Extension section**.

c. Enter a number that determines the order in the **Order** field.
If there is only one extension section, its order is **1** by default.

The section with the lowest order number is used first.

d. Click **Done**.

What to do next
Click **Debug** to run the newly created extension section. Pattern Designer runs extension sections after running identification sections.

Fine-tune patterns using traffic-based discovery

Improve existing patterns so that Service Mapping can find configuration item (CI) connections previously found using traffic-based discovery.

Before you begin
Role required: pd_admin

Basic knowledge of programming is desirable.

About this task
Service Mapping can discover and map configuration items (CIs) following their traffic-based connections. This method is referred to as traffic-based mapping and complements pattern-based mapping.

Using traffic-based discovery, Service Mapping may discover an important CI connection. In this case, you can make sure that this connection is always found for all CIs belonging to the same CI type. You do that by modifying the pattern used to discover CIs of that CI type. A pattern is a sequence of commands designed to detect attributes of a CI and its outbound connections.

You can search CI configuration files to locate data discovered using traffic-based discovery, for example IP address and port. If there are configuration files containing this data, you create a pattern step to parse this file. Next time Service Mapping discovers this CI using the modified pattern, it extracts the information about this connection directly from the configuration file.

Procedure
1. Navigate to **Service Mapping** > **Services** > **Application Services**.
2. Select **View Map** next to the relevant service instance.
3. Right-click the relevant CI.
4. Select **Show traffic based connections**.
The Traffic Based Connections List displays the following information:

Traffic Based Connections List (when discovery based on Predictive Intelligence is disabled)

Field	Description
IP	The IP address of the application connected to the selected CI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Port	The port on the selected CI that is used to communicate to the other application.
Process	The ID of the process in the selected CI.
Already on map	○ **Yes** — if this connection shows on the map. ○ **No** — if this connection is not part of the service instance and not on the map.
System decision	The setting defines if Service Mapping keeps the discovered traffic-based connection or removes it. The value comes from the algorithm that Service Mapping uses.
User decision	(Optional) The setting overrides the System decision setting, which defines if Service Mapping keeps the discovered traffic-based connection or removes it. For example, if the System decision setting for a connection is Keep, and you want to remove this connection, select `Remove`.

Note: There may be a case when you can see traffic-based connections on the map, but the Traffic Based Connections list does not display them. It happens for the connections that have been removed from the TCP Connection [cmdb_tcp] table less than three days.

5. Double-click the connection you want to use to create a pattern step.
6. If there are multiple patterns used to discover this CI, select the pattern for which you want to create the step, and click **OK**.

   Pattern Designer creates a temporary connection section for this pattern with a new step.

   The Debug Connection Section window is displayed with some fields automatically populated.

7. Click **Connect**.

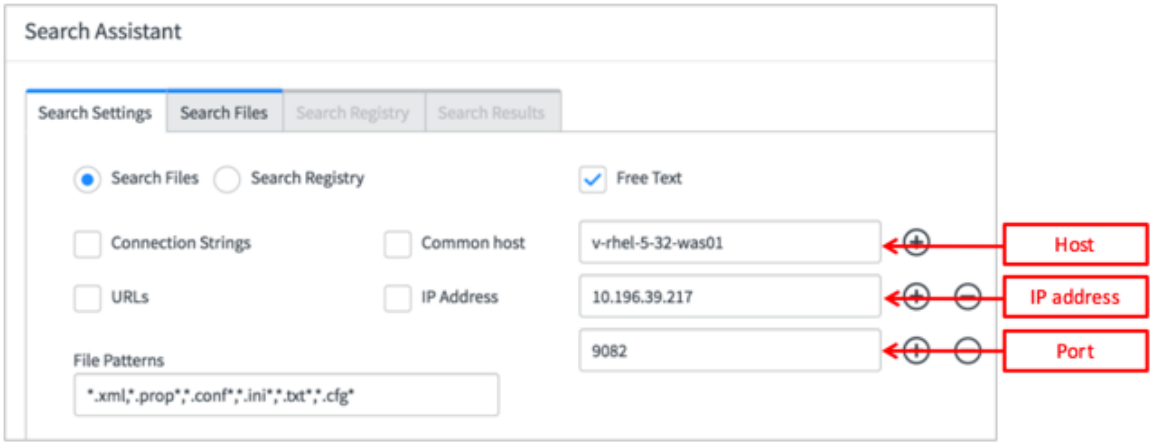
   The Debug mode is activated.

   The Search Assistant window opens.

8. Search CI configuration files for data received using traffic-based discovery:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Under **Free Text**, review data automatically filled in from the Traffic Based Connections List.



The File Patterns field displays file types in which Pattern Designer performs the search.

b. Click the **Search Files** tab and review files.
If necessary, you can remove irrelevant files from the search by clicking the Minus icon.

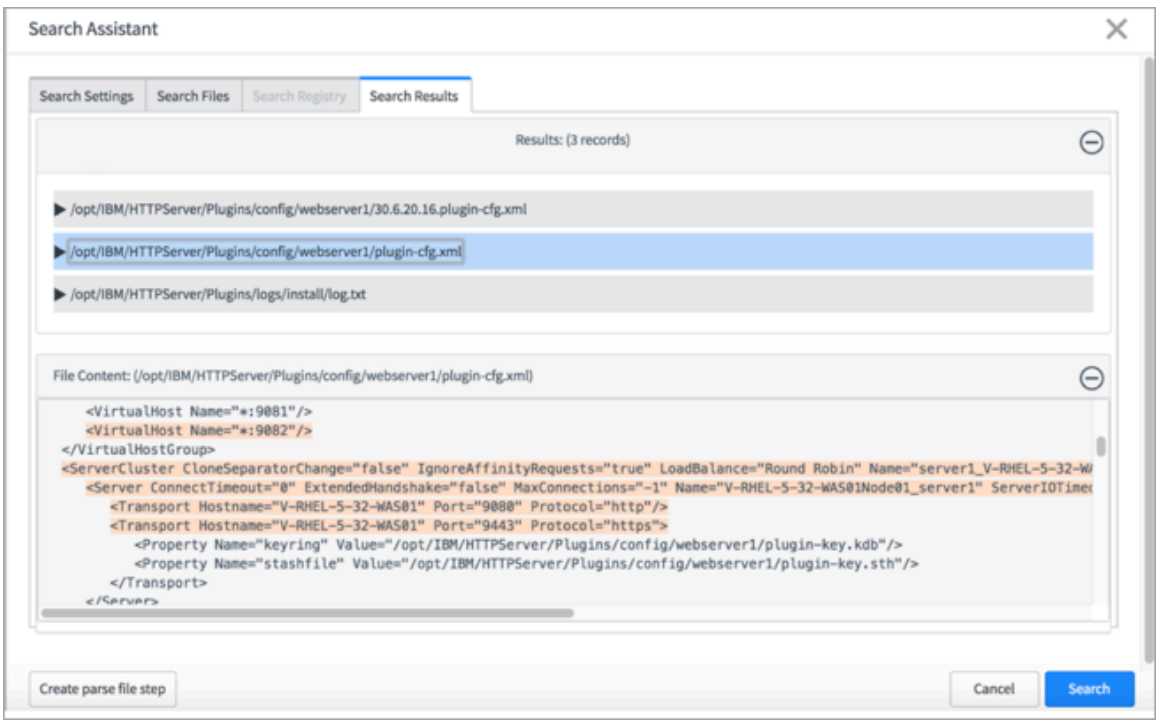
c. Click **Search**.

After search completes, the **Search Result** tab opens with the list of files in which any of the search criteria was found.

9. Create a pattern step for parsing the configuration file containing information about the connection:

a. On the Search Result tab, click one of the files and review connection data found in this file.

b. Wait for the file content to load and select the relevant entry under the file name:

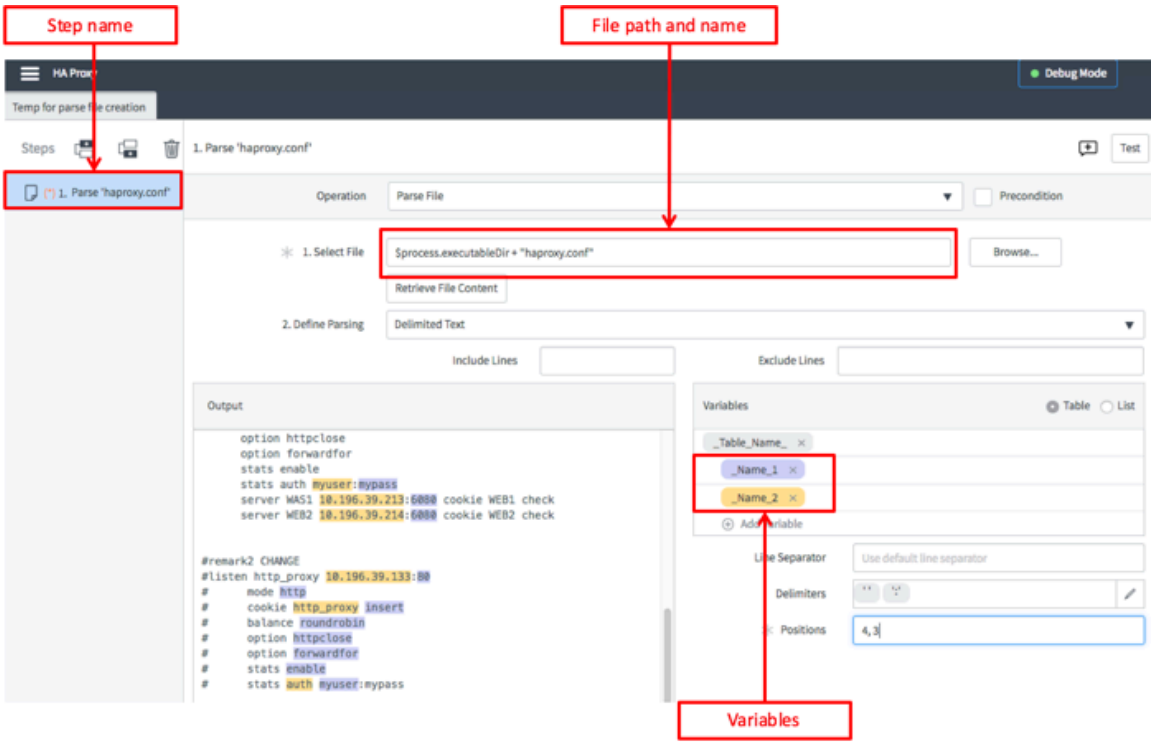


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. To use this data to create the pattern step, click **Create parse file step**.

Pattern Designer shows the new step with the Parse File operation. It automatically assigns this step the name in the following format: Parsing <file name>.

Pattern Designer automatically sets the file name, file path, and parsing strategy for the step. It also creates variables that contain data you searched for. If there is a variable, which contains the file path, Pattern Designer enters this variable for the path.



d. Optional: If necessary, you can modify parsing strategy.

e. Rename the section to provide a meaningful name, for example Discover HA Proxy client connection.
Or

Copy and past the step into the relevant connection section.

10. Complete modifying the pattern as described in Finalize a pattern.

Related topics

Discovery patterns used by ITOM Visibility

Finalize a pattern

After you finish defining your pattern, make it ready for use by Service Mapping and Discovery.

Before you begin

Role required: pd_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

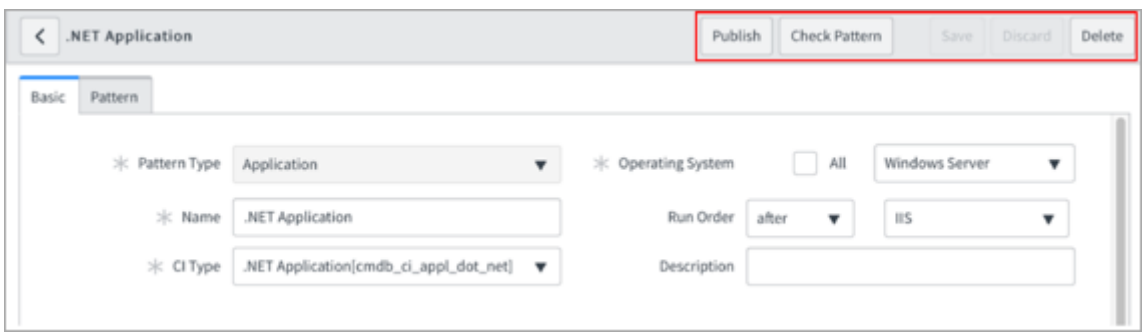
There are several ways to finalize a pattern after creating or modifying it:

- Saving — Save all the information you defined for the pattern creating a draft. You can continue working on the pattern draft at any time. Service Mapping and Discovery do not use the pattern draft for discovery and mapping.
- Discarding changes — If you realized that the changes you made to a pattern are incorrect, you can discard them.
- Checking — Actually run the pattern on the relevant configuration item (CI) to check that the operations that you defined for it are correct. Check your pattern before activating it. This option is available only for application patterns used by Service Mapping.
- Publishing — Make Service Mapping and Discovery use this pattern for discovery and mapping. A new version of this pattern is created. The state of the pattern version used previously changes to History.

Procedure

1. On the pattern definition form, complete your pattern definition by performing one or more of the following actions.

To accomplish this	Do this
Save the pattern	Click **Save**.
Discard unwanted changes	Click **Discard**.
Check the pattern **(only for application patterns used by Service Mapping)**	**a.** Click **Check Pattern**. **b.** Enter parameters for connecting to this CI. **c.** Click **Connect**. **d.** Wait for Pattern Designer to run the pattern and check that there are no errors. **e.** Troubleshoot any errors. If there are no errors, you can publish or save your pattern.
Publish the pattern	Click **Publish**.



2. Close the Pattern Designer tab.

Copy patterns from one instance to another

To copy patterns from one instance to another, create an update set containing new or modified patterns with their related items in your development instance. Then, import the update set into your production instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: pd_admin

About this task
Typically, you maintain two ServiceNow instances in your organization: for production and for development. Create or modify patterns, test them, and verify results in the development instance. When you are satisfied with the discovery results, export relevant patterns from the development instance to create an update set.

Update sets is a ServiceNow feature for transferring customizations from one instance to another. Each update set is stored in the Update Set [sys_update_set] table. Specific customizations associated with the update set are the entries in the Customer Update [sys_update_xml] table, and they appear as a related list on the update set record. The method of creating update sets for patterns is different from creating update sets for other types of customizations.

Warning: Always follow this procedure to create update sets for patterns. Do not use the standard platform procedure for creating update sets.

Depending on the extent of the changes, you can use the following pattern export methods:

Export patterns

This option creates a new, customized version of the pattern and its related items necessary for the patterns to function properly. It then links them to the update set. The related items include:

- Extension sections
- Tracked files
- Related CI types
- Classification records
- Associated scripts

Note: Update sets do not include changes in script includes used in patterns.

Export patterns with CMDB items

This option creates a new, customized version of the pattern and its related items from the previous option, including any associated CMDB items. It then links all of these to the update set. The CMDB items include:

- Main CI type
- Entry point types
- Lookup tables
- Identifiers
- Hosting and reconciliation rules

The update set is an XML file with the following name convention: sys_remote_update_set<random alphanumeric string>.xml.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the development instance, perform these steps to export patterns:
   a. Navigate to **Pattern Designer** > **Discovery Patterns**.
   b. Select application or infrastructure patterns that you want to export.
      Note: You cannot export shared libraries.
   c. At the bottom of the window, click the **Actions on selected rows** button.
      Note: You cannot use more than 20 patterns at a time for the **Export patterns with CMDB items** method.
   d. Click **Export patterns** or **Export patterns with CMDB items**.
   e. When the system finishes exporting patterns, it creates the update set.
   f. To view the list of items included in the update set, click **View Logs** in the success message.
   g. Click **Close**.
      The update set file in XML format is automatically downloaded on the computer.
   h. Save the update set file locally for future use.
2. In the production instance, perform these steps to import the customized patterns:
   a. Elevate privileges to the security_admin role.
   b. Navigate to **System Update Sets** > **Retrieved Update Sets**.
   c. Select the link **Import Update Set from XML**.
   d. Select **Choose File** and select an XML file.
   e. Select **Upload**.
      The customization is now available as a retrieved update set with state *Loaded*.
3. Preview the imported update set.
   The system scans and validates the update set and displays its contents on the **Customer Updates** tab.
4. Commit the update set.
5. Click **Close** in the success message.
   The production instance contains all new or modified patterns with related items from the update set.
6. Upload the updated set of patterns and related items onto the MID Server:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Navigate to **Discovery** > **MID Servers**.

b. Alternatively, navigate to **Service Mapping** > **MID Servers**.

c. Click **Pattern Sync to Mid**.

7. If the discovery fails or the result is not as expected, restart the MID Server to make sure that the MID Server runs the latest set of patterns.

System update sets

Choose the pattern version

Every time you modify and save a pattern, you create a version of this pattern. Choose which pattern version Service Mapping and Discovery use for discovery.

Before you begin

Role required: admin

About this task

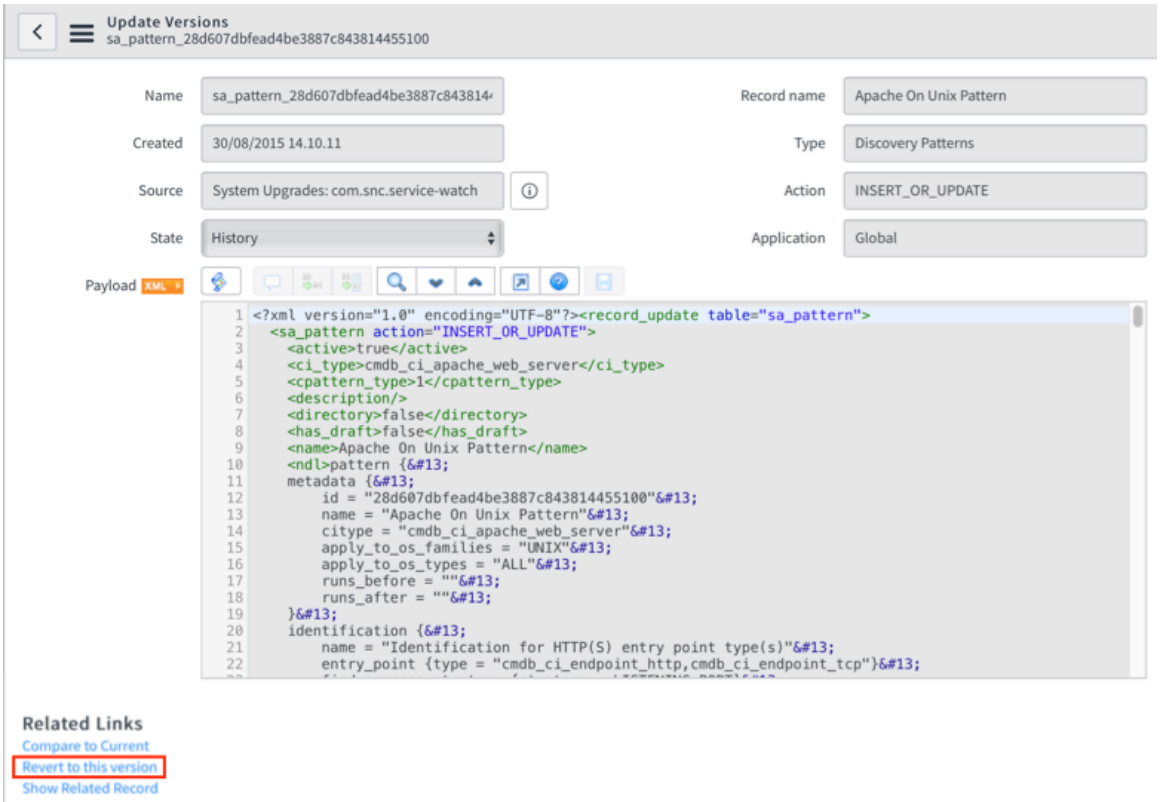
By default, the latest version is used for discovery, but you can choose any other version to use.

If necessary, you can compare pattern versions.

Procedure

1. Navigate to **All** > **Pattern Designer** > **Discovery Patterns**.
2. Click the required pattern.
   The form for this pattern opens.
3. Click the **Pattern** tab.
4. Scroll down to the **Versions** section.
   The state of the active pattern version that Service Mapping and Discovery use is **Current**.
5. Click the version you want to use.
6. Click **Revert to this version** under **Related Links**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



This pattern version becomes the active version that Service Mapping and Discovery use. Its state changes to Current.

Compare pattern versions

If you have multiple versions of the same pattern, you can compare them to decide which pattern version to use for discovery.

Before you begin

Role required: pd_admin

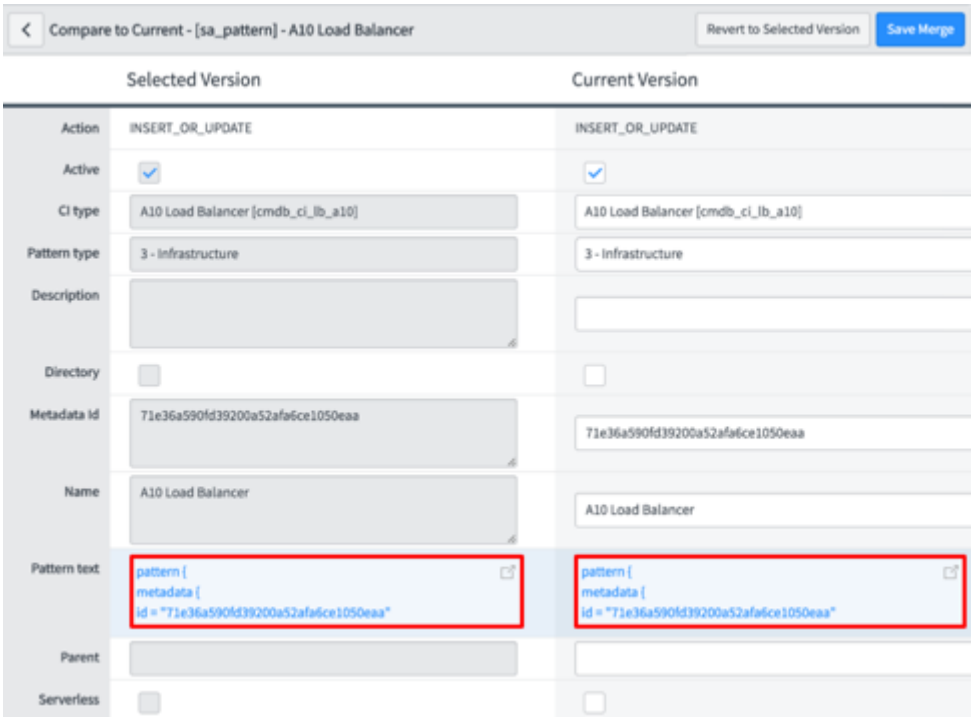
About this task

Service Mapping and Discovery use patterns in their discovery process. Every time you modify and save a pattern, you create a version of this pattern.

Procedure

1. Navigate to **All** > **Pattern Designer** > **Discovery Patterns**.
2. Click the required pattern.
   The form for this pattern opens.
3. Click the **Pattern** tab.
4. Scroll down to the **Versions** section.
   The state of the active pattern version that Service Mapping and Discovery use is **Current**.
5. Click the previous pattern version, which you want to compare to the current version.
6. Click **Compare to Current** under **Related Links**.
7. In the Compare to Current window, click the **Pattern text** pane either under **Selected Version** or **Current Version**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

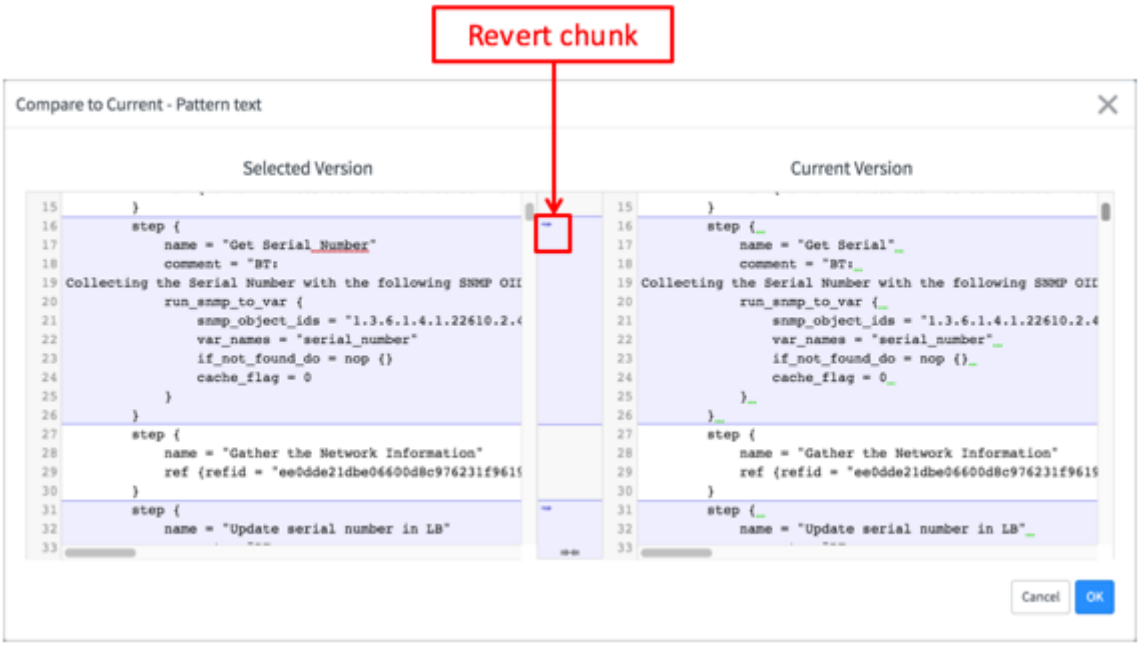


The text comparison view opens showing the text of the selected pattern version and the current pattern version side by side. The step containing a difference appears highlighted.

Highlight colors indicate the type of change:

- Updated step — purple
- New line or characters — green
- Deleted line or characters — red

8. Review the differences in the pattern versions.
9. If necessary, click **Revert chunk** to replace the step in the current version with the step from the previous version.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

10. Click **OK** when done.
11. If you copied any steps from the previous version and want to save the change, click **Save Merge**.

Activate a disabled pattern

If you want to use a pattern for discovery that's disabled by default, activate it manually.

Before you begin

Role required: discovery_admin

About this task

Starting with Visibility Content version 6.28.0, activating or deactivating a pattern won't be considered a customization, and it will continue to receive updates. Patterns that were previously activated or deactivated will reset to the latest predefined version after upgrading while retaining the last active field value.

Procedure

1. Navigate to **All** > **Pattern Designer** > **Discovery Patterns**.
2. In the **Name** field, search for the relevant pattern.
3. Select the pattern.
4. Select the **Active** check box.
5. Select **Update**.

Enable the Cloud Hardware Type class extension

Enable the Cloud Hardware Type [cmdb_ci_cloud_hardware_type] table to store the predefined virtual machine (VM) hardware type records for Amazon AWS Cloud Microsoft Azure Cloud and Google Cloud Platform (GCP). This class extension helps prevent duplication of the VM hardware type records in the Hardware Type [cmdb_ci_compute_template] table, which improves performance for Discovery and related flows.

Before you begin

- Veirfy that the latest versions of the following applications are installed:
  - CMDB CI Class Models
  - Discovery and Service Mapping Patterns

    If the version of Discovery and Service Mapping Patterns is earlier than 1.6.0, see the Knowledge Base article KB0955939.
- Ensure that the application scope is the Discovery and Service Mapping Patterns application.

Role required: admin

About this task

Each cloud service provider offers several predefined VM hardware types, such as t1.micro (AWS), and so on. You can also create your own. By default, Discovery stores the discovered VM hardware types in the Hardware Type [cmdb_ci_compute_template] table. This table is a "child" of the cmdb_ci_logical_datacenter class, so the attributes in the Hardware Type table includes the attributes in the cmdb_ci_logical_datacenter class.

This model might create duplicate records for each discovered VM hardware type:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The count of records for each discovered VM hardware type is determined by the number of service accounts multipled by the Number of logical datacenters.

For example, let's assume an organization has an AWS account of t1.micro VM. The organization has 3000 service accounts and 10 Logical Data Centers (LDCs), such as West US. Your next discovery can detect the VM hardware type and create 30,000 records in the Hardware Type [cmdb_ci_compute_template] table.

This approach could slow down your discovery and related flows.

Avoid these issues by storing the predefined AWS and GCP VM hardware types in the Cloud Hardware Type [cmdb_ci_cloud_hardware_type] table.

This table extends the Hardware Type [cmdb_ci_compute_template] table. Because it's not tied to any LDC or service account, Discovery avoids adding many VM hardware type records to the Hardware Type [cmdb_ci_compute_template] table.

The Cloud Hardware Type [cmdb_ci_cloud_hardware_type] table uses the object_id and the provider fields in the identification rule.

Note: In AWS environments, the discovery pattern discovers hardware types only to the master account's datacenter. It then creates relationships of the discovered hardware types to the corresponding regions in member accounts.

- If a discovery schedule is run for both a master account and member accounts, the pattern discovers only the master account's datacenter hardware type.
- If a discovery schedule is run for a standalone member account, the pattern discovers that member account's datacenter and its hardware type.
- If a discovery schedule is run for a master account after a standalone member account has already been discovered, the pattern doesn't rediscover the hardware type for the member account. Instead, it discovers the hardware type for the master account and maps the relationships between the master and member accounts.

Procedure

1. In the navigation filter, enter `sys_properties.list`.
2. In the **Name** field, search for `sn_itom_pattern.use a single hardware type for cloud data centers`.
3. Select the *`sn_itom_pattern.use a single hardware type for cloud data centers`* property.
4. In the **Value** field, enter `true`.
5. Select **Update**.

What to do next

1. Clean up the Hardware Type records. For more information, see the Knowledge Base article KB1285337.

   Important: The cleanup removes all the existing compute profiles from the CMDB. Therefore, if you have manually added a hardware template to the Hardware Type [cmdb_ci_compute_template] table, you must manually add it to the Cloud Hardware Type [cmdb_ci_cloud_hardware_type] table.

2. Rerun the Cloud Discovery.

Enable Cloud OS Image discovery

Enable the Cloud OS Image [cmdb_ci_cloud_os_image] table to store the cloud OS image records for Amazon AWS Cloud, Microsoft Azure Cloud, Google Cloud Platform (GCP), Oracle Cloud Infrastructure (OCI), and IBM Cloud.

Before you begin

- Ensure that the latest versions of the following applications are installed:
  - Discovery and Service Mapping Patterns
  - CMDB CI Class Models
- Ensure that the application scope is the CMDB CI Class Models application.

Note: Cloud Provisioning and Governance (CPG) doesn't support the New Cloud Image (cmdb_ci_cloud_os_image) table. If you're currently utilizing CPG Provisioning flows or have intentions to do so, don't migrate to the new Image Model.

Role required: admin

About this task

Each cloud service provider offers OS images to launch a Compute/VM instance. Cloud Discovery stores the discovered Image [cmdb_ci_os_template] table. This table is a dependent class on [cmdb_ci_logical_datacenter] or [cmdb_ci_cloud_service_account]. The new Image model creates one record for each public Image (object id) irrespective of the service account and populates them in the Cloud Image [cmdb_ci_cloud_os_image] table. There for, the new model reduces the number of records in the CMDB

Note: If you have Discovery and Service Mapping Patterns version 1.10.0- November 2023, proceed to the following procedure. If you have an earlier version, see the Knowledge Base article KB1000183.

Procedure

1. In the navigation filter, enter `sys_properties.list`.
2. In the **Name** field, search for `sn_cmdb_ci_class.use_single_cloud_os_image`.
3. Select the *`sn_cmdb_ci_class.use_single_cloud_os_image`* property.
4. In the **Value** field, enter `true`.
5. Select **Update**.

What to do next

1. Clean up the Image records. For more information, see the Knowledge Base article KB1537376.
2. Rerun the Cloud Discovery.

Discover datacenters only for new cloud accounts

If you have multiple cloud accounts and datacenters in AWS and Azure, you can discover datacenters for new cloud accounts only, instead of refreshing the entire list.

Before you begin

- Verify that you're using at least Zurich Patch 2.
- Verify that the **glide.discovery.cdu.auto_refresh_sub_accounts_and_ldcs** system property is set to true. For more information, see Create Discovery schedules for cloud resources.

Role required: discovery_admin

Procedure

1. Navigate to **All** > **System Properties** > **All Properties**.
2. In the **Name** column, search for `cloud.discovery.refresh_datacenter_for_new_member_account`.
3. Select the **cloud.discovery.refresh_datacenter_for_new_member_account** property.
4. In the **Value** field, enter **true**.
5. Select **Update**.

What to do next

Either execute discovery immediately or wait until the predefined schedule triggers the discovery. For more information, see Create a discovery schedule in Cloud Discovery Workspace.

Improved query performance with direct field population in CI tables

The **Populate Service Account and LDC IN CMDB** scheduled job populates the Service Account and Logical Datacenter fields in cloud configuration item (CI) tables, and the Virtual Machine Object field in the Hardware [cmdb_ci_hardware] table. This direct population reduces query complexity and improves query performance.

Cloud Service Account and Logical Datacenter information is stored separately from cloud CIs. To retrieve account or datacenter information for a cloud resource, queries require joins across multiple tables, including the relationship table that connects CIs. Similarly, Virtual Machine Object information is stored separately from the Hardware CI, requiring additional joins to retrieve data from the Virtual Machine Object [cmdb_ci_vm_object] table. With potentially millions of records in the relationship table, these joins could increase query time for teams working with cloud infrastructure data.

Starting with the Discovery and Service Mapping Patterns version 1.30.2, you can enable a feature that denormalizes cloud CI tables by populating the **Service Account** [cloud_service_account] and **Logical Datacenter** [logical_datacenter] fields directly in cloud CI tables. The scheduled job also references tables extended from the Virtual Machine Object [cmdb_ci_vm_object] table via the Virtual Machine Object reference field in the Hardware [cmdb_ci_hardware] table. Populating these fields directly reduces the need for complex joins, supporting more efficient queries for reporting, analytics, and operational workflows involving cloud resources. After you enable this feature, Discovery populates these fields for both existing and newly discovered CIs.

Enable direct field population for query performance

Populate Service Account, Logical Datacenter, and Virtual Machine Object fields in configuration item (CI) tables to improve query performance.

Before you begin

Verify that you have at least version 1.30.2 of Discovery and Service Mapping Patterns.

Role required: discovery_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Definition** > **Scheduled Jobs**.
2. In the **Name** column, search for `Populate Service Account and LDC IN CMDB`.
3. Select the **Populate Service Account and LDC IN CMDB** job.
4. Select the **Active** check box.
5. Select an option to run the job:
   - Select **Update** to enable the job to run on its configured schedule.
   - Select **Execute Now** to run the batch job immediately.

Related topics

Improved query performance with direct field population in CI tables

Available cloud discovery patterns

Set the Populate Service Account and LDC job stale threshold

Trigger a full CI table resync for direct field population

Set the Populate Service Account and LDC job stale threshold

Configure the number of days before a running *`Populate Service Account and LDC IN CMDB`* job is considered stale and canceled. Increase this value if a large configuration item (CI) dataset causes the job to be canceled before a full run completes.

Before you begin

Verify that you have at least version 1.30.2 of Discovery and Service Mapping Patterns.

Role required: admin

About this task

The *`sn_itom_pattern.populate_saldc.stale_job_threshold_days`* system property controls how long the *`Populate Service Account and LDC IN CMDB`* scheduled job can run before the system considers it stale. If the job exceeds this threshold, the system automatically cancels it and starts a new run. The default value is two days. If your instance has many CI records, you can increase this value to give the job more time to complete.

Procedure

1. In the navigation filter, enter `sys_properties.list`.
2. In the **Name** field, search for `sn_itom_pattern.populate_saldc.stale_job_threshold_days`.
3. Select the *`sn_itom_pattern.populate_saldc.stale_job_threshold_days`* property.
4. In the **Value** field, enter the number of days after which the job is considered stale.
5. Select **Update**.

What to do next

Wait for the next scheduled run of the *`Populate Service Account and LDC IN CMDB`* job, or execute it immediately. For more information, see Enable direct field population for query performance.

Trigger a full CI table resync for direct field population

Trigger the *Populate Service Account and LDC IN CMDB* scheduled job to reprocess all configuration item (CI) records. Configure the *sn_itom_pattern.populate_saldc_full_resync* system property when service accounts or logical datacenters have incorrect or corrupted values for a CI.

Before you begin

Verify that you have at least version 1.35.0 of Discovery and Service Mapping Patterns.

Role required: admin

About this task

The scheduled job normally processes only CI records created since its last run. Setting the *sn_itom_pattern.populate_saldc_full_resync* property to true configures the next job run to reprocess all CI records. The system automatically resets the property to false after the resync completes.

Procedure

1. In the navigation filter, enter `sys_properties.list`.
2. In the **Name** field, search for `sn_itom_pattern.populate_saldc_full_resync`.
3. Select the *sn_itom_pattern.populate_saldc_full_resync* property.
4. In the **Value** field, enter `true`.
5. Select **Update**.

What to do next

Wait for the next scheduled run of the *Populate Service Account and LDC IN CMDB* job, or execute it immediately. For more information, see Enable direct field population for query performance.

Server CI population during cloud discovery

Cloud discovery can populate Server CIs without running IP-based discovery, reducing discovery time in large environments.

Server CI cloud discovery overview

By default, cloud discovery creates Virtual Machine (VM) Instance CIs only. To populate Server CIs, organizations run IP-based discovery, which triggers a separate schedule that discovers servers alongside applications and other data. In large environments, IP-based discovery schedules can take a long time. Some organizations require only server records from their cloud environment, without discovering application data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Starting with Discovery and Service Mapping Patterns version 1.31.0, cloud discovery can create Windows Server CIs, Linux Server CIs, or both alongside Virtual Machine Instance CIs, without running IP-based discovery. The *sn_itom_pattern.cloud_discovery_populate_server_ci* system property controls whether Server CIs are created. By default, the property is set to none and Server CIs aren't created. For more information, see Configure Server CI creation during cloud discovery.

The following patterns support Server CI population during cloud discovery:

- Azure – Virtual Machine (LP)
- Azure VM Instance – Uniform Scale Set

Note: Use either Server CI population during cloud discovery or IP-based discovery for the same VMs, but not both. Running both may result in conflicting attribute values.

For AWS Server CI creation, see AWS Linux Server pattern-based discovery and AWS Windows Server pattern-based discovery.

Data collected by Discovery during horizontal discovery

Discovery populates the following data when running the Azure – Create Server CI pattern extension. Virtual Desktop Infrastructure (VDI) instances can't be distinguished from other VMs and are registered as Windows Server or Linux Server CIs.

Windows Server [cmdb_ci_win_server]/Linux Server [cmdb_ci_linux_server]

Field	Description
Name [name]	Hostname of the server. The name is sourced from one of the following options: • If the VM is running: the VM computer name • If the VM is stopped: the OS profile computer name • If the VM is stopped and the Server CI already exists in the CMDB: the existing name is retained
Object ID [object_id]	A unique identifier for the server, matching the Azure VM object ID.
CPU Core Count [cpu_core_count]	Number of CPU cores, derived from the VM size.
CPU Count [cpu_count]	Number of CPUs. Default value is 1.
Disk Space (GB) [disk_space]	Total storage capacity of all disks attached to the VM, in gigabytes (GB).
Install Status [install_status]	Install status of the server. Default value is Installed.
IP Address [ip_address]	IP address of the server, sourced from the primary VM network interface.
Is Virtual [virtual]	Indicates the server is a virtual machine. Default value is true.
Operating System [os]	Operating system name.
Operational Status [operational_status]	Operational status of the server. Default value is Operational.
OS Version [os_version]	Operating system version, if available.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Windows Server [cmdb_ci_win_server]/Linux Server [cmdb_ci_linux_server] (continued)

Field	Description
RAM (MB) [ram]	Memory capacity in megabytes (MB), derived from the VM size.
Serial Number [serial_number]	Unique identifier for the server, sourced from the Azure VM ID.

Serial Number [cmdb_serial_number]

Field	Description
Serial Number [serial_number]	Unique identifier, sourced from the Azure VM ID.
Serial Number Type [serial_number_type]	Type of serial number. Default value is uuid.
Valid [valid]	Indicates the serial number is valid. Default value is true.
Configuration Item [cmdb_ci]	References the Windows Server [cmdb_ci_win_server] or Linux Server [cmdb_ci_linux_server] table.

CI relationships

The Azure – Create Server CI pattern extension creates the following relationships and references to support Server CI discovery. References link to records in other tables and don't appear in the CI Relationship [cmdb_rel_ci] table.

CI relationships

CI	Relationship	CI
Windows Server [cmdb_ci_win_server]	Virtualized by::Virtualizes	Virtual Machine Instance [cmdb_ci_vm_instance]
Linux Server [cmdb_ci_linux_server]	Virtualized by::Virtualizes	Virtual Machine Instance [cmdb_ci_vm_instance]

CI references

CI	Field	Referenced CI
Serial Number [cmdb_serial_number]	Configuration Item [cmdb_ci]	Windows Server [cmdb_ci_win_server]
Serial Number [cmdb_serial_number]	Configuration Item [cmdb_ci]	Linux Server [cmdb_ci_linux_server]

Azure Virtual Machine Scale Sets (VMSS) Instance discovery

Oracle Wallet authentication for database discovery

With Oracle Wallet authentication, Discovery reads database credentials directly from the target server. This approach keeps credentials within the target environment instead of storing them on the ServiceNow AI Platform.

How Oracle Wallet authentication works

Oracle database discovery uses SQL queries that require database credentials to authenticate against the target Oracle instance. By default, Discovery uses applicative credentials, which uses a database username and password stored on the ServiceNow AI Platform. Oracle Wallet authentication is supported on UNIX and Windows as an alternative to applicative credentials.

Oracle Wallet stores credentials in a wallet on the target server. Discovery reads credentials from the wallet at runtime rather than passing them from the ServiceNow AI Platform. Credentials remain in the target environment and are managed through the native Oracle mechanism.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Minimum application versions for Oracle Wallet authentication

OS	Minimum Visibility Content version	Minimum Discovery and Service Mapping Patterns version	Minimum Data Collection for Oracle Global Licensing and Advisory Services version
UNIX	6.32.0	1.31.0	1.12.0
Windows	6.35.0	1.35.0	1.13.0

For information on enabling Oracle Wallet authentication, see Enable Oracle Wallet authentication for discovery.

Supported discovery types

Oracle Wallet authentication is supported for the following Oracle database discovery types:

- Standard Oracle database discovery. For more information, see Oracle database discovery.
- Container and pluggable database (CDB/PDB) discovery. For more information, see Oracle pluggable database and container database discovery.
- Oracle Global Licensing and Advisory Services (GLAS) discovery. For more information, see Oracle GLAS data collection using patterns.

Enable Oracle Wallet authentication for discovery

Enable Oracle Wallet authentication to use credentials stored on the target server during Oracle database discovery.

Before you begin

For Oracle database discovery on UNIX systems, verify the following requirements:

- The configured Discovery user can connect via SSH to the host.
- Oracle Wallet is configured on the target server for the Discovery user. For more information, see Using Oracle Wallet authentication for Oracle Discovery on Unix/Linux [KB3059862].
- The following applications are up to date:
  - Visibility Content starting with version 6.32.0
  - Discovery and Service Mapping Patterns starting with version 1.31.0
  - For Oracle GLAS discovery: Data Collection for Oracle Global Licensing and Advisory Services starting with version 1.12.0

For Oracle database discovery on Windows systems, verify the following requirements:

- The configured Discovery user can reach and authenticate to the Windows host.
- Oracle Wallet is configured on the target server for the Discovery user. For more information, see Oracle Wallet Authentication for Discovery (Windows) [KB3150013].
- The following applications are up to date:
  - Visibility Content starting with version 6.35.0
  - Discovery and Service Mapping Patterns starting with version 1.35.0
  - For Oracle GLAS discovery: Data Collection for Oracle Global Licensing and Advisory Services starting with version 1.13.0

Role required: discovery_admin

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Oracle Wallet stores database credentials directly on the target server. When the *glide.discovery.oracle_wallet_authentication* property is set to true, discovery reads credentials from Oracle Wallet instead of from applicative credentials stored on the instance. The property is set to false by default.

Procedure

1. In the navigation filter, enter `sys_properties.list`.
2. In the **Name** column, search for `glide.discovery.oracle_wallet_authentication`.
3. Select the *glide.discovery.oracle_wallet_authentication* system property.
4. In the **Value** field, enter `true`.
   To switch back to applicative credentials, set the value to `false`.
5. Select **Update**.

What to do next

To apply the changes, run Discovery.

Reference the main CI on discovered IP addresses

Populate the **Owned By Configuration Item** field on discovered IP address records with a direct reference to the main CI, instead of requiring a dot-walk through the network adapter. Populating the reference is supported only for AIX Server discovery.

Before you begin

Verify that you have at least version 1.35.0 of Discovery and Service Mapping Patterns.

Role required: discovery_admin

About this task

By default, the relationship between a discovered IP address and its main CI is available only through a dot-walk via the Network Adapter [cmdb_ci_network_adapter] table (nic.configuration_item). When the *add.owned.by.attribute* system property is set to true, the **Owned By Configuration Item** field on the IP Address [cmdb_ci_ip_address] table is populated with a direct reference to the main CI. The default value is false. When enabled, any existing **Owned By Configuration Item** references are cleared and recreated for the discovered IP addresses.

Procedure

1. In the navigation filter, enter `sys_properties.list`.
2. In the **Name** column, search for `add.owned.by.attribute`.
3. Select the *add.owned.by.attribute* system property.
4. In the **Value** field, enter `true`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To revert to the default behavior and leave the **Owned By Configuration Item** field unpopulated, set the value to `false`.

5. Select **Update**.

What to do next

Run Discovery again to apply the change.

AIX server discovery

Cryptographic Asset Compliance

ServiceNow Cryptographic Asset Compliance helps you inventory, assess, and manage cryptographic assets across cloud and on-premises environments to support post-quantum cryptography (PQC) readiness and help maintain security compliance.

Cryptographic Asset Compliance helps organizations in their goals to future-proof their cryptographic assets like digital certificates and cloud keys. Because quantum computing advances are anticipated to threaten traditional cryptographic algorithms, this application provides visibility and control for PQC migration preparation.

Key capabilities

Description	Capability
Inventory the cryptographic assets that ServiceNow Certificate Inventory and Management and ServiceNow Discovery find, including certificates (on-premises and URL-based) and keys (from AWS KMS, and Azure Key Vault).	Multi-source inventory
Track cryptographic assets at risk with policy-based risk indicators such as outdated algorithms, quantum vulnerability, and expiring certificates.	Risk indicator monitoring
Track PQC compliance and quantum vulnerability through dashboards so you can make data-driven decisions and plan migration to quantum-resistant algorithms.	Post-quantum readiness
Leverage artificial intelligence to analyze cryptographic assets and identify necessary actions.	AI-powered risk assessment

Get started

Explore

Exploring Cryptographic Asset Compliance

Cryptographic Asset Compliance provides centralized visibility and control of cryptographic assets for proactive risk assessment and post-quantum cryptography (PQC) readiness.

Cryptographic Asset Compliance overview

As quantum computing advances are anticipated to threaten traditional cryptographic algorithms, organizations need comprehensive visibility into their cryptographic assets. Cryptographic Asset Compliance addresses this challenge by automatically inventorying cryptographic assets like certificates, AWS KMS keys, and Azure Key Vault keys across cloud and on-premises environments. This visibility helps you assess your PQC readiness and plan migration strategies.

Cryptographic Asset Compliance workflow

The typical workflow when implementing Cryptographic Asset Compliance includes the following activities:

1. Set up discovery: Set up certificate discovery in ServiceNow Certificate Inventory and Management and cloud discovery in ServiceNow Discovery (for AWS and Azure) so cryptographic assets can be found. A scheduled job then syncs the discovered assets into Cryptographic Asset Compliance.
2. Review inventory: Analyze discovered cryptographic assets in the inventory, including certificates and keys across all connected sources.
3. Assess risks: Review the risk indicators identified for your assets, such as weak or quantum-vulnerable algorithms and certificate authority trust or ownership gaps. Use the AI-generated summary and recommendations to understand each asset's risk.
4. Monitor and maintain: Use dashboards to track cryptographic asset health, PQC compliance status, and quantum vulnerable algorithms.

Cryptographic Asset Compliance users

User	Description
SecOperations Engineer	Need visibility into cryptographic asset inventory to identify keys and certificates for PQC migration planning. They monitor asset health, identify vulnerable algorithms, and prioritize remediation.
Compliance and Governance Manager	Require audit-ready reports of cryptographic assets and quantum risk exposure to meet regulatory requirements. They

What to explore next

- Post-quantum cryptography overview
- Cryptographic risk indicators
- About Policy as Code Engine policies

Post-quantum cryptography overview

Post-quantum cryptography (PQC) represents new encryption algorithms that can strongly resist quantum computer attacks, addressing the urgent need for quantum-resistant security.

PQC is a new generation of cryptographic algorithms that resists attacks from quantum computers. Unlike current encryption methods such as Rivest-Shamir-Adleman (RSA) and Elliptic Curve Cryptography (ECC), PQC algorithms can strongly resist computational power of quantum computers using Shor's algorithm.

Quantum computer threat

Quantum computers pose a significant threat to current cryptographic standards with their capability to break traditional encryption methods that protect most digital communications. This

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

vulnerability creates a security concern related to attacks that collect encrypted data with the intention of decrypting it after quantum computers are available.

PQC regulations

Cryptographic Asset Compliance checks PQC compliance against the following regulation standards:

1. NIST FIPS 204 (ML-DSA): Module-Lattice-Based Digital Signature Algorithm
2. NIST FIPS 203 (ML-KEM): Module-Lattice-Based Key-Encapsulation Mechanism
3. ISO/IEC 27001 Annex A 8.24: Information security control for the use of cryptography

Cryptographic agility

Cryptographic Asset Compliance supports the ability to quickly and efficiently transition between cryptographic algorithms without significant changes to system architecture. It provides comprehensive visibility into your organization's cryptographic landscape, which enables you to understand your current cryptographic dependencies before transitioning to quantum-resistant algorithms.

With Cryptographic Asset Compliance, your organization can identify which systems and applications rely on vulnerable algorithms, prioritize migration efforts based on risk assessment, and track progress throughout the PQC transition.

Cryptographic risk indicators

Risk indicators highlight cryptographic assets that need attention so you can prioritize remediation and track compliance.

Cryptographic Asset Compliance evaluates assets against policies and raises a risk indicator when an asset meets a risk condition. Risk indicators are based on policies, and each indicator points to a specific weakness, such as a weak algorithm or a missing owner. For more information, see About Policy as Code Engine policies. For more information about risk detection criteria, see Risk indicator definitions.

Supported risk indicators

For certificates:

- Weak algorithm: Uses a deprecated or quantum-vulnerable algorithm.
- Trusted CA risk: Issued by an untrusted or unrecognized certificate authority. For more information, see Configure trusted certificate authorities.
- No owner: Has no assigned owner or responsible party.
- No environment: Is not classified by environment.
- No renewal process: Has no defined renewal workflow.

For AWS KMS keys and Azure Key Vault keys:

- Weak algorithm: Uses a weak or insufficient algorithm or key size.
- Not PQC ready: Does not use a post-quantum-safe algorithm.
- Not rotated (AWS KMS keys): Has not been rotated within the recommended period.
- Pending deletion (AWS KMS keys): Is scheduled for deletion.
- Expired (Azure Key Vault keys): Is expired or lacks a proper expiration date.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Risk levels

Each asset is assigned an overall risk level, calculated from its active indicators. The available risk levels are:

- Critical: Severe vulnerabilities requiring immediate attention.
- High: Significant weaknesses that should be addressed promptly.
- Medium: Moderate concerns that require monitoring and planning.
- Protected: Quantum-safe, or no active risk indicators.

About Policy as Code Engine policies

Cryptographic Asset Compliance uses Policy as Code Engine (PaCE) policies to evaluate your cryptographic assets and flag risk.

Policies evaluate cryptographic assets and raises a risk indicator when an asset meets a risk condition. Separate policies apply to certificates, AWS KMS keys, and Azure Key Vault keys. Note that some policies calculate the overall risk level for an asset by combining the results of the other policies rather than raising an indicator of their own. For more information, see Cryptographic Asset Compliance policies.

Most policies are active by default and run automatically, so you don't have to set them up. However, the certificate authority trust policy is inactive by default because it depends on the certificate authorities that your organization trusts. You activate it after you add those authorities. For more information, see Configure trusted certificate authorities.

Managing policies

You can manage policies using PaCE. You can activate or deactivate a policy and edit its configuration, including the risk criticality that it assigns and review or revert your changes. For more information, see Manage PaCE policies.

Note: Because a change affects how risk is calculated for the assets that the policy evaluates, avoid changing a policy, other than adding trusted certificate authorities.

Configuring Cryptographic Asset Compliance

Set up cryptographic asset discovery and configure trusted certificate authorities (CAs) to prepare for your organization's cryptographic asset monitoring needs.

Configuration overview

Configuring Cryptographic Asset Compliance involves the following actions:

- Configuring the discovery of cryptographic assets- Configuring the discovery of cryptographic assets involves setting up certificate and cloud discovery.
- Configure trusted certificate authorities- Configure certificate authorities (CAs) that your organization trusts and activate the certificate authority trust policy so that certificates from other authorities are flagged as untrusted.

Configuring the discovery of cryptographic assets

Configuring the discovery of cryptographic assets involves setting up certificate and cloud discovery.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cryptographic Asset Compliance inventories the assets that ServiceNow Certificate Inventory and Management and ServiceNow Discovery discovers rather than running discovery of cryptographic assets itself.

You must configure the discovery of cryptographic assets:

- Certificate discovery in Certificate Inventory and Management to catalog certificates (on-premises and URL-based). For more information, see Visibility to TLS certificates.
- Cloud discovery in Discovery to catalog keys from AWS KMS and Azure Key Vault. For more information, see Discovery for cloud environment.

After discovery is set up, a scheduled job syncs discovered assets into Cryptographic Asset Compliance periodically.

Onboarding from the Home page

The Home page includes a guided onboarding that helps you configure cloud and certificate discovery. The banner is collapsible and is displayed until the discovery of all cryptographic assets is configured.

The Certificates card indicates whether certificate discovery is configured by displaying either the Setup required or Configured states.

The Keys card indicates whether cloud discovery is configured by displaying the following states.

- Setup required: Cloud discovery is not configured for AWS KMS and Azure Key Vault.
- Partially configured: Cloud discovery is configured for either AWS KMS or Azure Key Vault.
- Configured: Cloud discovery is configured for both AWS KMS and Azure Key Vault.

Configure trusted certificate authorities

Configure certificate authorities (CAs) that your organization trusts and activate the certificate authority trust policy so that certificates from other authorities are flagged as untrusted.

Before you begin

Role required: Cryptographic Asset admin (sn_itom_cac.admin)

Procedure

1. Navigate to **All** > **Cryptographic Asset Compliance**.
2. Select the Settings icon .
3. In the **Settings** tab, select **Policies** if it is not already selected.
4. In the Policy page, select **Certificate authority trust**.
5. Select the **Policy builder** tab.
6. In the Data sources panel, select **Add**.
7. In the Add API Variable dialog box, fill in the fields.

Field	Description
Label	Display name for the variable, for example`Trusted CA List`.
Name	Internal name that the policy uses to reference the variable.
Type	Data type of the variable, which should be Data Array.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Mandatory	Option that determines whether a value is required for the variable.
Description	Optional notes about the variable.
Default value	The CAs that your organization trusts, as a list of quoted names. For example, `["Test CA 1","Test CA 2"]`.

8. Select **Save**.
9. Publish the policy version by selecting **Publish**.
10. Activate the policy by selecting **Activate**.
11. Confirm the activation by selecting **Activate** in the **Activate Policy** dialog box.

Result
The Certificate authority trust policy is active with the list of CAs that your organization trusts. Certificates issued by an authority not in your trusted list are flagged with the trusted CA risk indicator.

Key Metrics

- Cryptographic assets: The total number of inventoried assets.
- PQC compliant: Assets that use post-quantum-safe algorithms.
- At critical risk: Assets that need immediate attention.
- Asset Type: A breakdown of assets by type (Certificate, AWS KMS Key, and Azure Key Vault Key), with colors indicating the risk level: Protected, Medium, High, or Critical.

Recent risk indicators

Recent risk indicator cards summarize current risk conditions such as assets using weak or outdated algorithms or assets with no assigned owners. Each indicator provides an actionable recommendation.

Compliance status

The compliance status is the percentage of PQC compliance for each supported regulation: NIST FIPS 204/ML-DSA, NIST FIPS 203/ML-KEM, and ISO/IEC 27001 Annex A 8.24. The available compliance statuses are: Not compliant, Partially compliant, and Compliant.

Quantum-vulnerable algorithms

Quantum-vulnerable algorithms are ranked by the number of affected assets, with guidance to plan replacement by 2035 per NIST IR 8547. You can select the number of assets to view a filtered list of the assets on the **Inventory** page. For more information, see View and manage cryptographic assets.

Cryptographic asset breakdown

Per-asset-type counts with key risk indicators.

- Certificates: The total, at critical risk, weak algorithm, and trusted CA risk assets.
- AWK KMS Keys: The total, weak algorithms, and pending deletion assets.
- Azure Key Vault Keys: The total, critical risk, weak algorithm, and expired assets.

View and manage cryptographic assets

View details of cryptographic assets and filter the data to focus on specific assets, analyze risk indicators, and export details from the Inventory page.

Before you begin

- Discovery of cryptographic assets must have been set up. For more information, see Configuring the discovery of cryptographic assets.
- Role required: Cryptographic Asset admin (sn_itom_cac.admin) or Cryptographic Asset user (sn_itom_cac.user)

Procedure

1. Navigate to **All** > **Cryptographic Asset Compliance**.
2. In the main navigation, select the Inventory icon .
3. Review the assets' key metrics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Metric	Description
Cryptographic assets	Total number of discovered cryptographic assets.
PQC compliant	Total number of PQC-compliant and quantum-safe assets.
Not compliant	Total number of cryptographic assets that aren't PQC-compliant.
Critical risk	Total number of cryptographic assets requiring immediate attention.

4. **Optional:** View the assets related to the metric by selecting the metric.
5. **Optional:** Focus on specific assets by applying filters in the **Quick filters** section.

Filter	Description
Asset Type	Filter by asset type: Certificate, AWS KMS Key, Azure Key Vault Key.
Risk level	Filter by risk severity: Protected, Medium, High, and Critical.
Risk indicators	Filter by specific risk conditions, such as outdated algorithm and non-compliant.
Algorithm	Filter by cryptographic algorithm, such as RSA-2048 or ECDSA P-384.
PQC compliant	Filter by whether the assets are PQC compliant.

6. **Optional:** Apply complex filters using a condition builder by selecting **Filter**.
7. **Optional:** Sort the list of assets by a specific category in an ascending or descending order by selecting **Sort by**.
8. **Optional:** Group the list of assets by a specific category by selecting **Group by**.
9. **Optional:** Export data for external analysis or reporting.
   a. Select **Export**.
   b. Select the export format in the **File Type** field.
   The available options are Excel, CSV, JSON, or PDF.
   c. Select whether you want to download or email the file in the **Delivery Type** field.
   d. If you selected the email delivery type, in the **Email** field, enter the email address you want to send the email to.
   e. Select **Export**.
10. View more details about the asset by selecting an asset name.
    For more information, see View cryptographic asset details.

View cryptographic asset details

View detailed information about an individual cryptographic asset, including its risk indicators, cryptographic properties, AI-generated insights, and dependencies.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- The discovery of cryptographic assets is set up. For more information, see Configuring the discovery of cryptographic assets.
- Role required: Cryptographic Asset admin (sn_itom_cac.admin) or Cryptographic Asset user (sn_itom_cac.user)

Procedure

1. Navigate to **All** > **Cryptographic Asset Compliance**.
2. In the main navigation, select the Inventory icon .
3. Select the asset name.
4. Select the **Details** tab and review the following information.

Metric	Description
PQC compliant	Whether the asset uses post-quantum-safe algorithms.
Risk indicators	The active risk indicators detected for the asset, such as a weak algorithm or trusted CA risk.
AI Insights	An AI-generated analysis of the asset's risk. For more information, see AI insights and dependency details.
Details	Key attributes of the asset, such as validity dates, owner, team, and environment.
Cryptographic summary	The cryptographic properties of the asset. The displayed fields vary by asset type. For more details, see Cryptographic summary fields.
Lifecycle metrics	The creation, expiry, and last attested date of a certificate. This field is displayed only if the cryptographic asset is a certificate.

5. Review where the asset is used by selecting the **Dependency graph** tab.
   For more information, see AI insights and dependency details.

AI insights and dependency details

Analyze an individual cryptographic asset with AI insights powered by ServiceNow Otto and a dependency graph, which shows where the asset is used.

AI Insights

The AI Insights section in the **Details** tab of an asset displays an AI-generated analysis. It includes an overview of the risk on the asset, the probable cause of each risk indicator, and recommended actions to address it. You can refresh these insights to reflect the latest state of an asset.

You can copy these insights to the clipboard for reuse.

Dependency graph

The **Dependency graph** tab of an asset displays a graph that shows where a cryptographic asset is used. For example, the graph shows the infrastructure on which the asset is deployed on and the applications that use it. You can search the nodes in the graph by their label. The relationships displayed depend on the asset type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For Azure Key Vault keys, the relationships displayed are:

- Key Vault: The key vault the key is stored in.
- Datacenter: The datacenter the key is hosted in.
- Applications: The applications that use the key.
- Resource Group: The resource group the key belongs to.
- Service Account: The cloud service account the key is managed by.

For AWS KMS keys, the relationships displayed are:

- Datacenter: The datacenter the key is hosted in.
- Applications: The applications that use the key.
- Cloud Service Account: The cloud service account the key is managed by.

For certificates, the relationships displayed are:

- Infrastructure: The infrastructure that the certificate is deployed on.
- Applications: The applications that use the certificate.
- Other relations: Other CIs the certificate is related to, for example, a manual endpoint.

Note: URL-based certificates have no dependent infrastructure, so the graph does not display any infrastructure details.

Risk indicator definitions

Risk indicators are used to identify security vulnerabilities and compliance issues in cryptographic assets.

Certificate risk indicators

Risk Indicator	Description	Detection Criteria
Weak algorithm	Certificate uses cryptographic algorithms that are deprecated or considered weak by current security standards	MD5, SHA-1, RSA < 2048 bits, DSA < 2048 bits, DES, 3DES, RC4
Trusted CA risk	Certificate is not issued by a trusted certificate authority or has CA-related trust issues	Self-signed certificate, CA not in trusted root store, or CA not in organizational trust policy
No owner	Certificate has no identified owner or responsible party	Owner field is empty or not assigned
No environment	Certificate lacks environment classification	Environment field is empty or not specified
No renewal process	Certificate has no defined renewal process or workflow	No renewal process documented or automated workflow configured

Key risk indicators

Risk Indicator	Description	Applies to
Weak algorithm	Key uses a weak or insufficient algorithm or key size	AWS KMS keys, Azure Key Vault keys
Not PQC ready	Key does not use a post-quantum-safe algorithm	AWS KMS keys, Azure Key Vault keys
Not rotated	Key has not been rotated within the recommended period	AWS KMS keys
Pending deletion	Key is scheduled for deletion	AWS KMS keys
Expired	Key is expired or lacks a proper expiration date	Azure Key Vault keys

Cryptographic Asset Compliance policies

Cryptographic Asset Compliance uses policies to evaluate cryptographic assets and flag risk. The policies are available on the Settings page.

Policy name	Description
AWS KMS cumulative risk level calculation	Calculates the risk level for AWS KMS keys based on all risk indicators.
AWS KMS key rotation check	Checks whether AWS KMS keys have been rotated within the recommended period.
AWS KMS PQC readiness	Checks whether an AWS KMS key uses post-quantum-safe algorithms.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Policy name	Description
AWS KMS weak algorithm detection	Identifies AWS KMS keys that use weak or insufficient key algorithms.
Azure Key Vault cumulative risk level calculation	Calculates the risk level for Azure Key Vault keys based on all risk indicators.
Azure Key Vault key expiration check	Checks whether Azure Key Vault keys have proper expiration dates and are not expired.
Azure Key Vault PQC readiness	Checks whether an Azure Key Vault key uses post-quantum-safe algorithms.
Azure Key Vault weak algorithm detection	Identifies Azure Key Vault keys that use weak or insufficient key algorithms and sizes.
Certificate authority trust	Verifies that certificates are issued by trusted, PQC-capable authorities. For more information, see Configure trusted certificate authorities.
Cryptographic inventory & Ownership policy	Identifies unknown or unmanaged certificates.
Cumulative risk level calculation	Calculates the risk level for certificates based on all risk indicators.
PQC readiness	Checks whether a certificate is PQC compliant.
Quantum-vulnerable algorithm detection	Identifies certificates that use cryptographic algorithms that are potentially breakable by quantum computers.

Cryptographic summary fields

The fields displayed in the Cryptographic summary of an asset vary by asset type.

Certificate

Field	Description
Quantum resistant	Whether the certificate uses a quantum-resistant algorithm.
Algorithm	Signing algorithm of the certificate, such as SHA1withRSA.
Key strength	Size of the key in bits.
Hash function	Hash function used by the certificate, such as SHA-384.

AWS KMS key

Field	Description
Object ID	Unique identifier of the key.
Key usage	Cryptographic operations the key supports.
Key state	Current state of the key in AWS KMS.
Origin	Source of the key material.
MAC algorithms	Message Authentication Code (MAC) algorithms associated with the key.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Key ID	Identifier of the key in AWS KMS.
Multi region	Whether the key is a multi-region key.
Multi region key type	Type of multi-region key, such as primary or replica.

Azure Key Vault key

Field	Description
Object ID	Unique identifier (URI) of the key in Azure Key Vault.
Key type	Type of cryptographic key, such as RSA.
Key size	Size of the key in bits.
Curve	For elliptic curve fields the elliptic curve of the key.
Algorithm	Cryptographic algorithm associated with the key.
Key operations	Operations the key can perform, such as encryption and decryption.
Enabled	Whether the key is enabled in the source.
Recovery level	Azure Key Vault recovery level, which indicates whether the key can be recovered or is purge able after deletion.
Vault URI	URI of the Azure key vault that stores the key.

AI Agent Topology Mapping

With AI Agent Topology Mapping, you can use patterns to identify AI infrastructure components across cloud platforms in your organization. Discover your AI agents, models, and prompts, and get centralized CMDB visibility to track security compliance and vulnerabilities across your AI deployments.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Exploring AI Agent Topology Mapping

Learn how AI Agent Topology Mapping discovers AI infrastructure components across cloud platforms using patterns.

AI Agent Topology Mapping overview

AI Agent Topology Mapping extends the pattern-based discovery framework to identify and track AI-specific components in your environment. The application uses patterns to discover AI components from cloud platforms, populating the CMDB with configuration items (CIs). This approach provides centralized visibility into your AI infrastructure alongside traditional IT assets. For more information about how patterns work, see Discovery patterns used by ITOM Visibility.

AI Agent Topology Mapping discovers the following AI components:

- AI Agents: Intelligent entities that perform tasks and orchestrate AI workflows
- AI Models: Foundational models that power AI capabilities, such as large language models
- AI Prompts: Instructions and configurations that guide agent behavior and responses

AI Agent Topology Mapping users

The following user roles have access to patterns or pattern-related modules and can perform various actions. Note that customizing patterns requires basic knowledge of programming.

AI Agent Topology Mapping users and access

User	Description
Discovery admin	Can view, create, edit, and publish patterns. The role enables users to run discovery, migrate probes or CAPI to patterns, and access discovery logs and dashboards.
PD user	Has read-only access to **Discovery Pattern Log**.
PD admin	Can view, create, edit, and publish patterns.
PDE viewer	Starting with Pattern Designer Enhancements version 3.9.0, users can view **Command Validation Tasks**, **Command Validation Tasks Results**, and **Command List**. The pde_viewer can view the **Command Validation Tool** modules and related tables, but doesn't have permissions to modify or edit them. The pde_viewer role can view the following tables only: • Command List [pd_command_list] • Command Validation Task [pd_command_validation] • Command Validation Task Results [pd_command_validation_results] • Pattern Shared Library Mapping [pd_pattern_to_shared_library_mapping] • Temporary Variable Mappings [pd_temp_variable_value_mapping]
PD MID	Not assigned to a user directly but to the MID Server record or the user under which the MID Server runs. The role enables the MID Server to interpret and run pattern-based probes.
MID Server	Can grant the MID Server access to the instance.

AI Agent Topology Mapping workflow

The following workflow describes how a discovery administrator uses AI Agent Topology Mapping to discover and track AI infrastructure components.

1. Install AI Agent Topology Mapping patterns from the ServiceNow Store.
2. Configure cloud credentials with appropriate permissions for AI platforms.
3. Create or update discovery schedules for environments containing AI resources.
4. Run discovery to identify AI components and populate the CMDB.
5. View discovered AI agents, models, and prompts in CMDB and non-CMDB tables.
6. Monitor discovery logs to verify successful pattern execution.
7. Schedule recurring discovery to maintain up-to-date AI infrastructure inventory.

AI Agent Topology Mapping benefits

AI Agent Topology Mapping benefits

Benefit	Description
Centralized AI infrastructure visibility	Visibility into AI agents, models, and prompts alongside other IT assets in the CMDB, supporting AI Control Tower outcomes.
Automated discovery	Patterns automatically discover AI agents from supported cloud platforms during scheduled runs and populate the CMDB.
Multi-cloud support	Discovery of AI resources across multiple cloud platforms using a single application.
Security and compliance	Tracking of AI component versions and configurations to help maintain governance and compliance requirements for AI deployments.
Vulnerability management	Tracking of AI component versions and dependencies to identify security risks.
Change impact analysis	Near real-time visibility into AI agent dependency and topology relationships to support ITSM and AIOps use cases.
Business context and service mapping	Discovered AI assets serve as the foundation for building tag-based service maps

AI Agent Topology Mapping benefits (continued)

Benefit	Description
	aligned with the Common Service Data Model (CSDM).

What to explore next

To learn more about configuring and using AI Agent Topology Mapping, see:

- Configuring AI Agent Topology Mapping
- AI Agent Topology Mapping reference

Configuring AI Agent Topology Mapping

Install AI Agent Topology Mapping from the ServiceNow Store and configure discovery schedules to identify AI infrastructure components.

Configuration overview

1. Install AI Agent Topology Mapping.

   Install the application from the ServiceNow Store to enable AI agent discovery patterns.

2. Review required credentials and permissions.

   See pattern reference topics in AI Agent Topology Mapping reference for credential and permission requirements for your AI platforms.

3. Configure discovery schedules.

   Create discovery schedules for your AI platforms. Patterns run during scheduled discovery to identify AI components and populate CMDB and non-CMDB tables. For more information, see cloud discovery schedule topics in Discovery for cloud environment.

4. View discovery results.

   After discovery runs, view discovered AI components in CMDB and non-CMDB tables. See pattern reference topics in AI Agent Topology Mapping reference for details on data collected.

Install AI Agent Topology Mapping

You can install the AI Agent Topology Mapping application (sn_itom_agnt_ptrn) if you have the admin role.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Review the AI Agent Topology Mapping application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.
- Verify that you have at least version 1.30.2 of Discovery and Service Mapping Patterns.

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Multiple tables are installed with AI Agent Topology Mapping.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the AI Agent Topology Mapping application (sn_itom_agnt_ptrn) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

   A list of the versions available to you are displayed.
3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box, any dependencies installed with your application are listed.
4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. Select **Install**.

AI Agent Topology Mapping reference

Reference topics provide pattern information for AI Agent Topology Mapping, including prerequisites, tables, fields, and relationships.

Amazon Bedrock pattern-based discovery

AI Agent Topology Mapping discovers Amazon Bedrock AI services, agents, and models during horizontal discovery.

Request new or enhanced Patterns on the ServiceNow® Store

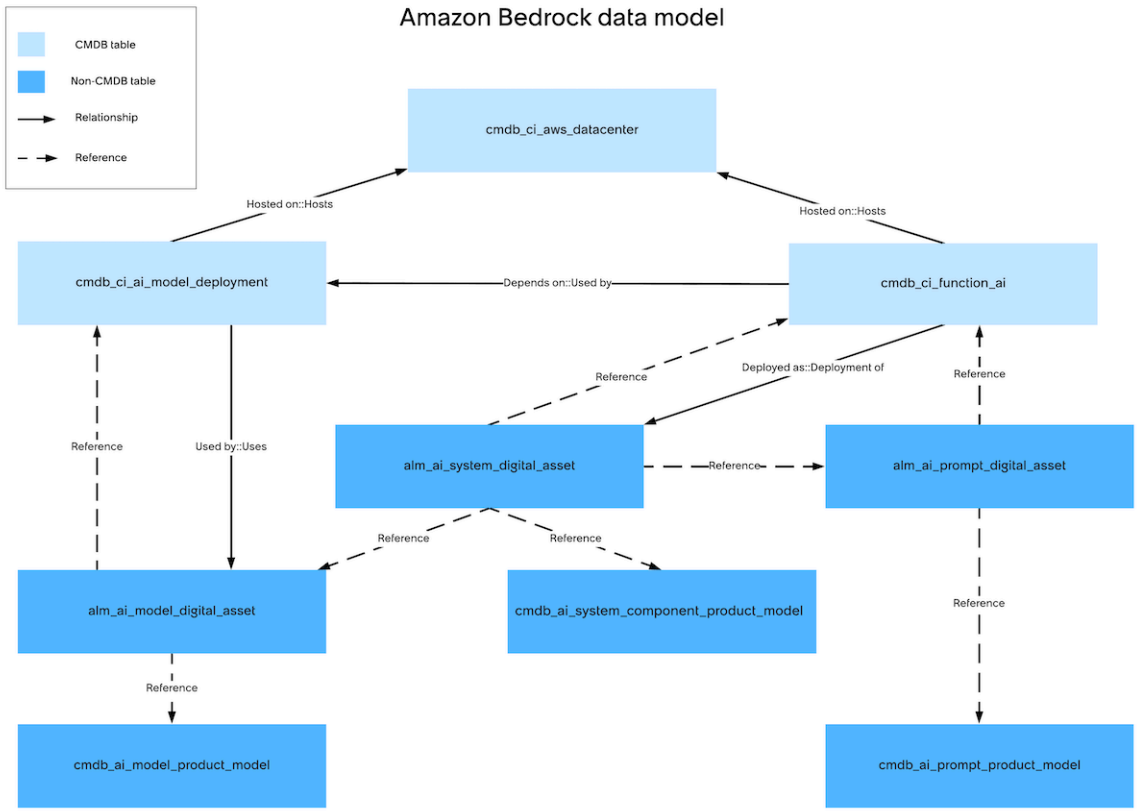
Visit the ServiceNow Store to view all the available updates and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Amazon Bedrock data model

The following diagram illustrates the tables and relationships that the AI Agent Topology Mapping application creates when discovering Amazon Bedrock resources.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tables and relationships populated during Amazon Bedrock discovery



Discovery requirements

Verify the REST API permissions

Download the Cloud Discovery patterns spreadsheet so you can grant user permissions required for running the Discovery patterns. In addition to permissions, the spreadsheet also includes useful information such as pattern names, types, CI Classes, and links to vendor documentation. New patterns are available quarterly, so check periodically to be sure you have the latest version of the spreadsheet.

Verify that the applications are up to date

Discovering these resources may require updating to the latest version of the following applications from the ServiceNow Store:

- AI Agent Topology Mapping
- Discovery and Service Mapping Patterns
- Visibility Content
- CMDB CI Class Models
- Data Foundation Model (at least version 1.13.2)

Update the method used for pointed discovery for the AWS CloudFormation Template (CFT) stack

If you use Cloud Provisioning and Governance, you must update the *`getOperationGR(type)`* method. This update enables the pointed discovery to list the resources correctly for the AWS CFT stack after provisioning. For further information about the steps required to update this method, see the Knowledge Base article KB0858437.

Activate the cloud-related CI relationships

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To include discovered components into service instances, enable CI relationships used in tag-based discovery by Service Mapping. These CI relationships are available from the 1.0.68 release on the ServiceNow Store. For operational steps, see Tag-based discovery configuration.

Set up service accounts on the AWS Management Console

An AWS Organization is a collection of AWS accounts under a single account. In AWS Organizations, parent accounts are called management accounts. The sub-accounts that belong to a management account are called member accounts.

The advantages of using management accounts in Discovery are:

Easy population of member accounts

After you configure the management account and supply the necessary credentials, you can test the connection to the account. If the test succeeds, Discovery returns a list of the member accounts in that management account. From this list, you can choose one or more member account to include in the Discovery of the management account.

(Optional) Discover member resources using dynamically acquired credentials

When you run Discovery on your cloud resources, you don't need separate credentials for each member account. The Cloud Discovery process handles credentials automatically by acquiring a temporary credential for each member via an AWS API. You can elect to use the default configuration or customize the MID Server to assume other roles for additional controls and security.

For more information, see Setup AWS service accounts.

Use IAM user policy on the AWS Management Console

To use the IAM user policy instead of credentials during discovery, configure the MID Server for AWS IAM roles. For more information, see configure the MID Server for AWS IAM roles.

To create the IAM user policy for provisioning AWS resources, see Control AWS access and permissions using policies.

Configure access to the AWS resources

To discover a single account, create an IAM account in the AWS Management Console, and verify that it has the "ReadOnlyAccess" policy applied. To discover several member or child accounts, configure the credentials as described in Access setup for AWS service accounts.

Configure the Discovery schedule to support GovCloud

Discovering AWS GovCloud (US) accounts requires using a datacenter URL when setting up an AWS service account. For more information, see Create AWS service accounts.

Configure a discovery schedule

Create an AWS Discovery schedule in Discovery Admin Workspace.

(Optional) Discover datacenters only for new members

Starting with Zurich Patch 2, you can discover datacenters only for new members added since the last discovery. For more information, see Discover datacenters only for new cloud accounts.

Optimize discovery by including only datacenters with resources

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can optimize discovery by limiting it to only AWS datacenters with resources.

- Verify that your service account has the following IAM permissions to access the Resource Explorer API (starting with Discovery and Service Mapping Patterns version 1.35.0).

  Resource Explorer API permissions and coverage

IAM permission	Coverage
`resource-explorer-2:Search`	Partial
`resource-explorer-2:Search` + `iam:CreateServiceLinkedRole`	Full

  For more information, go to the AWS Documentation and search for the "Getting started with Resource Explorer" article.

- Discover only datacenters with resources by setting the *mid.cloud.discovery.sonar.discover_all_aws_datacenters* MID Server property to **false**. For more information, see Limit AWS discovery to datacenters with resources.
- To exclude specific resource types from AWS datacenter discovery, configure the *sn_itom_pattern.discovery.aws.ldc.excluded_resource_types* system property with a comma-separated list of resource types to exclude (starting with Discovery and Service Mapping Patterns version 1.35.0). For more information, see Exclude AWS resource types from datacenter discovery.

Note: Discovery and Service Mapping Patterns versions 1.29.0 through 1.32.0 used the AWS Config service instead of the Resource Explorer API to determine datacenter activity. For instructions on configuring AWS Config recorder, go to the AWS Documentation and search for the "Recording resources in the AWS Config console" article.

For more information, see the **AWS resources discovery by datacenters** section in AWS discovery using patterns.

(Optional) Populate Service Account and Logical Datacenter fields in cloud CIs

Starting with Discovery and Service Mapping Patterns version 1.30.2, you can improve query performance by populating Service Account and Logical Datacenter fields directly in cloud CIs. For more information, see Improved query performance with direct field population in CI tables.

Data collection

The AI Agent Topology Mapping application includes the following patterns for Amazon Bedrock discovery:

- Amazon AWS - Bedrock Agents
- Amazon AWS - Bedrock Foundation Model

The Amazon AWS - Bedrock Agents pattern collects AI System Digital Assets, AI Prompt Digital Assets, and Key Value information. You can view this information in the **Related Links** section of the CI record by navigating to **All** > **Configuration** > **AWS** > **AWS Bedrock Agents** and selecting the relevant record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Amazon AWS - Bedrock Foundation Model pattern collects AI Model Digital Assets. You can view this information in the **Related Links** section of the CI record by navigating to **All** > **Configuration** > **AWS** > **AWS Bedrock Models** and selecting the relevant record.

AI Agent Topology Mapping application populates data in both CMDB and non-CMDB tables.

Data stored in non-CMDB tables

The AI Agent Topology Mapping application populates data in non-CMDB tables when running the Amazon Bedrock patterns.

If you have the AI Control Tower application, you can view the information in the AI Control Tower Workspace.

AI System Digital Asset [alm_ai_system_digital_asset]

Field	Description
Display name [display_name]	Display name of the Bedrock agent.
External record reference [external_ref_id]	Amazon Resource Name (ARN) of the Bedrock agent.
Model [model]	References the AI System Component Product Model [cmdb_ai_system_component_product_model] table.
Asset type [model_category]	Asset type of the agent. Value is set to **Agentic AI**.
State [install_status]	State of the agent. Value is set to **Deployed**.
Vendor [vendor]	Vendor of the agent. The value is set to **Amazon**.
AI prompts [ai_prompts]	References the AI Prompt Digital Asset [alm_ai_prompt_digital_asset] table.
AI models [ai_models]	References the AI Model Digital Asset [alm_ai_model_digital_asset] table.
Configuration Item [ci]	References the AI Function [cmdb_ci_function_ai] table.

AI System Component Product Model [cmdb_ai_system_component_product_model]

Field	Description
Name [name]	Name of the Bedrock agent.
Short description [short_description]	Description of the Bedrock agent.
Status [status]	Operational status of the agent as returned by Bedrock. For example: PREPARED.
Version [version]	Version of the Bedrock agent.
Manufacturer [manufacturer]	Name of the company defined in the *glide.appcreator.company.friendly_name* system property.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI System Component Product Model [cmdb_ai_system_component_product_model] (continued)

Field	Description
Model categories [cmdb_model_category]	Model category. Value is set to **Agentic AI**.

AI Prompt Digital Asset [alm_ai_prompt_digital_asset]

Field	Description
Prompt information [prompt_info]	Instruction text defined for the Bedrock agent.
Model [model]	References the AI Prompt Product Model [cmdb_ai_prompt_product_model] table.
Asset type [model_category]	Asset type of the prompt. Value is set to **AI prompt**.
Vendor [vendor]	Vendor of the prompt. The value is set to **Amazon**.
Configuration Item [ci]	References the AI Function [cmdb_ci_function_ai] table.

AI Prompt Product Model [cmdb_ai_prompt_product_model]

Field	Description
Name [name]	Name of the Bedrock agent, used to identify the associated prompt model.
Manufacturer [manufacturer]	Name of the company defined in the *`glide.appcreator.company.friendly_name`* system property.

AI Model Digital Asset [alm_ai_model_digital_asset]

Field	Description
Display name [display_name]	Name of the foundation model.
External record reference [external_ref_id]	ARN of the foundation model.
Model [model]	References the AI Model Product Model [cmdb_ai_model_product_model] table.
Asset type [model_category]	Asset type of the model. Value is set to **AI model**.
Vendor [vendor]	Provider of the foundation model.
Configuration Item [ci]	References the AI Model Deployment [cmdb_ci_ai_model_deployment] table.

AI Model Product Model [cmdb_ai_model_product_model]

Field	Description
Name [name]	Name of the foundation model.
Model number [model_number]	Model ID assigned by Amazon Bedrock.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Model Product Model [cmdb_ai_model_product_model] (continued)

Field	Description
Description [description]	Description of the foundation model.
Manufacturer [manufacturer]	Provider of the foundation model.
Model categories [cmdb_model_category]	Model category. Value is set to **AI model**.

Data stored in CMDB tables

AI Agent Topology Mapping populates the data in the CMDB when running the Amazon Bedrock patterns.

AI Function [cmdb_ci_function_ai]

Field	Description
Name [name]	Name of the Bedrock agent.
Object ID [object_id]	Concatenation of the agent ARN and version. For example: **arn:aws:bedrock:us-east-1:123456789012:agent/AGENTID123/versions/DRAFT**.
Description [short_description]	Description of the Bedrock agent.
Model number [model_number]	Agent ID assigned by Amazon Bedrock.
Operational status [operational_status]	Operational status of the resource. Default value is set to **Operational**.
Install Status [install_status]	Install status of the resource. Default value is set to **Installed**.
Product instance identifier [product_instance_id]	Version of the Bedrock agent.
Comments [comments]	Resource type identifier. Value is set to **AWS::Bedrock::Agent**.
Manufacturer [manufacturer]	Manufacturer of the resource. Value is set to **AWS**.

AI Model Deployment [cmdb_ci_ai_model_deployment]

Field	Description
Name [name]	Name of the Amazon Bedrock foundation model.
Object ID [object_id]	ARN of the foundation model.
Description [short_description]	Description of the foundation model.
Model number [model_number]	Model ID assigned by Amazon Bedrock.
Manufacturer [manufacturer]	Provider of the foundation model.
Attributes [attributes]	Lifecycle status of the model as reported by the API. For example: ACTIVE or LEGACY.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Model Deployment [cmdb_ci_ai_model_deployment] (continued)

Field	Description
Comments [comments]	Resource type identifier. Value is set to **AWS::Bedrock::Foundation Model**.
Operational status [operational_status]	Operational status of the resource. Default value is **Operational**.
Install Status [install_status]	Install status of the resource. Default value is **Installed**.

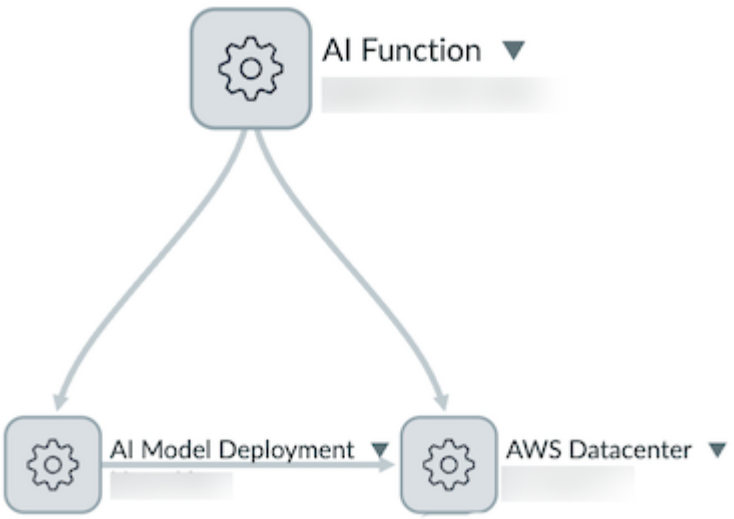
Dependency Views map

On the Dependency Views map, you can view discovered Amazon Bedrock resources and the relationships between them.

Note: The following relationships are stored in the Asset-CI Relationship [cmdb_rel_asset_ci] table and aren't represented in the Dependency View map:

- The **Deployed as::Deployment of** relationship between AI Function [cmdb_ci_function_ai] and AI System Digital Asset [alm_ai_system_digital_asset].
- The **Used by::Uses** relationship between AI Model Deployment [cmdb_ci_ai_model_deployment] and AI Model Digital Asset [alm_ai_model_digital_asset].

Amazon Bedrock dependency view



CI relationships and references

The Amazon Bedrock patterns create the following relationships and references to support Amazon Bedrock discovery. References link to records in other tables and don't appear in the CI Relationship [cmdb_rel_ci] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CI relationships

CI/Table	Relationship	CI/Table
AI Function [cmdb_ci_function_ai]	Deployed as::Deployment of	AI System Digital Asset [alm_ai_system_digital_asset]
AI Function [cmdb_ci_function_ai]	Hosted on::Hosts	AWS Datacenter [cmdb_ci_aws_datacenter]
AI Function [cmdb_ci_function_ai]	Depends on::Used by	AI Model Deployment [cmdb_ci_ai_model_deployment]
AI Model Deployment [cmdb_ci_ai_model_deployment]	Hosted on::Hosts	AWS Datacenter [cmdb_ci_aws_datacenter]
AI Model Deployment [cmdb_ci_ai_model_deployment]	Used by::Uses	AI Model Digital Asset [alm_ai_model_digital_asset]

CI references

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Download the Cloud Discovery patterns spreadsheet so you can grant user permissions required for running the Discovery patterns. In addition to permissions, the spreadsheet also includes useful information such as pattern names, types, CI Classes, and links to vendor documentation. New patterns are available quarterly, so check periodically to be sure you have the latest version of the spreadsheet.

Verify that the applications are up to date

Discovering these resources may require updating to the latest version of the following applications from the ServiceNow Store:

- AI Agent Topology Mapping
- Discovery and Service Mapping Patterns
- Visibility Content
- CMDB CI Class Models
- Data Foundation Model (at least version 1.13.2)

Activate the cloud-related CI relationships

To include discovered components into service instances, enable CI relationships used in tag-based discovery by Service Mapping. These CI relationships are available from the 1.0.68 release on the ServiceNow Store. For operational steps, see Tag-based discovery configuration.

Azure Availability Set

Wait for the **Clean-Up job for Availability zone to clear availability set record** schedule job to delete all the pre-populated Configuration Items (CIs) in the **cmdb_ci_azure_availability_set** table.

Azure Availability Zone

To run a discovery with Azure Availability Zone, register the subscription ID to the **AvailabilityZonePeering** feature with AZ CLI using `az feature register -n AvailabilityZonePeering --namespace Microsoft.Resources` to use the Check Zone Peering API. Check the status with `az feature show -n AvailabilityZonePeering --namespace Microsoft.Resources` before running discovery.

Set up Azure service accounts

Enable Cloud Discovery to access your Azure environment.

Discovering Azure GovCloud (US) accounts requires using a datacenter URL when setting up an Azure service account. For more information, see Set up Azure service accounts.

Create an Azure cloud discovery schedule

For more information, see Create an Azure Discovery schedule in Discovery Admin Workspace.

(Optional) Discover datacenters only for new subscriptions

Starting with Zurich Patch 2, you can discover datacenters only for new subscriptions added since the last discovery. For more information, see Discover datacenters only for new cloud accounts.

(Optional) Populate Service Account and Logical Datacenter fields in cloud CIs

Starting with Discovery and Service Mapping Patterns version 1.30.2, you can improve query performance by populating Service Account and Logical Datacenter fields directly in cloud CIs. For more information, see Improved query performance with direct field population in CI tables.

Data collection

The AI Agent Topology Mapping application includes the following patterns for Microsoft Foundry discovery:

- Azure - AI Foundry Agents
- Azure - AI Service Foundry
- Azure - AI Service Foundry Project
- Azure - AI Foundry Models

The Azure - AI Foundry Agents pattern collects AI System Digital Assets, AI Prompt Digital Assets, and Key Value information. You can view this information in the **Related Links** section of the CI record by navigating to **All** > **Configuration** > **Azure** > **Azure AI Foundry Agents** and selecting the relevant record.

The Azure - AI Foundry Models pattern collects AI Model Digital Assets. You can view this information in the **Related Links** section of the CI record by navigating to **All** > **Configuration** > **Azure** > **Azure AI Foundry Models** and selecting the relevant record.

The AI Agent Topology Mapping application populates data in both CMDB and non-CMDB tables.

Data stored in non-CMDB tables

The AI Agent Topology Mapping application populates data in non-CMDB tables when running the Microsoft Foundry patterns.

If you have the AI Control Tower application, you can view the information in the AI Control Tower Workspace.

AI System Digital Asset [alm_ai_system_digital_asset]

Field	Description
Display name [display_name]	Display name of the Microsoft Foundry assistant.
External record reference [external_ref_id]	Unique identifier of the Microsoft Foundry assistant.
Asset type [model_category]	Asset type of the assistant. Value is set to **Agentic AI**.
State [install_status]	State of the assistant. Value is set to **Deployed**.
Vendor [vendor]	Vendor of the assistant.Value is set to **Azure**.
Model [model]	References the AI System Component Product Model [cmdb_ai_system_component_product_model] table.
AI prompts [ai_prompts]	References the AI Prompt Digital Asset [alm_ai_prompt_digital_asset] table.
AI models [ai_models]	References the AI Model Digital Asset [alm_ai_model_digital_asset] table.
Configuration Item [ci]	References the AI Function [cmdb_ci_function_ai] table.

AI Model Product Model [cmdb_ai_model_product_model]

Field	Description
Name [name]	Name of the foundation model.
Model number [model_number]	Model ID assigned by Microsoft Foundry.
Version [version]	Version of the foundation model.
Description [description]	Description of the foundation model.
Manufacturer [manufacturer]	Provider of the foundation model.
Model categories [cmdb_model_category]	Model category. Value is set to **AI model**.

Data stored in CMDB tables

The AI Agent Topology Mapping application populates data in the CMDB when running the Microsoft Foundry patterns.

AI Function [cmdb_ci_function_ai]

Field	Description
Name [name]	Name of the Microsoft Foundry assistant.
Object ID [object_id]	Unique identifier of the Microsoft Foundry assistant.
Description [short_description]	Description of the Microsoft Foundry assistant.
Manufacturer [manufacturer]	Cloud provider of the resource. Value is set to **Azure**.
Operational status [operational_status]	Operational status of the resource. Default value is **Operational**.
Install Status [install_status]	Install status of the resource. Default value is **Installed**.
Comments [comments]	Resource type identifier. Value is set to **Azure::Foundry::Agent**.

Azure AI Foundry [cmdb_ci_azure_ai_foundry]

Field	Description
Name [name]	Name of the Microsoft Foundry service.
Object ID [object_id]	Unique identifier of the Microsoft Foundry service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure AI Foundry [cmdb_ci_azure_ai_foundry] (continued)

Field	Description
Description [short_description]	Description of the resource. Value is set to **Azure Foundry Service**.
Operational status [operational_status]	Operational status of the resource. Default value is **Operational**.
Install Status [install_status]	Install status of the resource. Default value is **Installed**.
Azure Service Type [azure_service_type]	Azure resource type. For example: microsoft.cognitiveservices/accounts.
Azure Service Kind [azure_service_kind]	Resource kind of the Microsoft Foundry service. For example: AIServices.

Azure AI Project [cmdb_ci_azure_ai_project]

Field	Description
Name [name]	Name of the Microsoft Foundry project.
Object ID [object_id]	Unique identifier of the Microsoft Foundry project.
Comments [comments]	Azure region where the Microsoft Foundry project is deployed.
Operational status [operational_status]	Operational status of the resource. Default value is **Operational**.
Install Status [install_status]	Install status of the resource. Default value is **Installed**.
Model number [model_number]	Internal identifier of the Microsoft Foundry project.
Azure Project Kind [azure_project_kind]	Resource kind of the Microsoft Foundry project. For example: AIServices.

AI Model Deployment [cmdb_ci_ai_model_deployment]

Field	Description
Name [name]	Name of the AI model available in Microsoft Foundry.
Object ID [object_id]	Resource identifier of the AI model.
Description [short_description]	Description of the AI model.
Model number [model_number]	Model name, used as an identifier.
Manufacturer [manufacturer]	Provider of the AI model. For example: Microsoft, Anthropic, or OpenAI.
Attributes [attributes]	Lifecycle status of the model as reported by the API.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Model Deployment [cmdb_ci_ai_model_deployment] (continued)

Field	Description
	For example: Stable or Deprecated.
Comments [comments]	Azure resource type identifier. Value is set to **Microsoft.CognitiveServices/locations/models**.
Operational status [operational_status]	Operational status of the resource. Default value is **Operational**.
Install Status [install_status]	Install status of the resource. Default value is **Installed**.

Dependency Views map

On the Dependency Views map, you can view discovered Microsoft Foundry resources and the relationships between them.

Note: The following relationships are stored in the Asset-CI Relationship [cmdb_rel_asset_ci] table and aren't represented in the Dependency View map:

- The **Deployed as::Deployment of** relationship between AI Function [cmdb_ci_function_ai] and AI System Digital Asset [alm_ai_system_digital_asset].
- The **Used by::Uses** relationship between AI Model Deployment [cmdb_ci_ai_model_deployment] and AI Model Digital Asset [alm_ai_model_digital_asset].

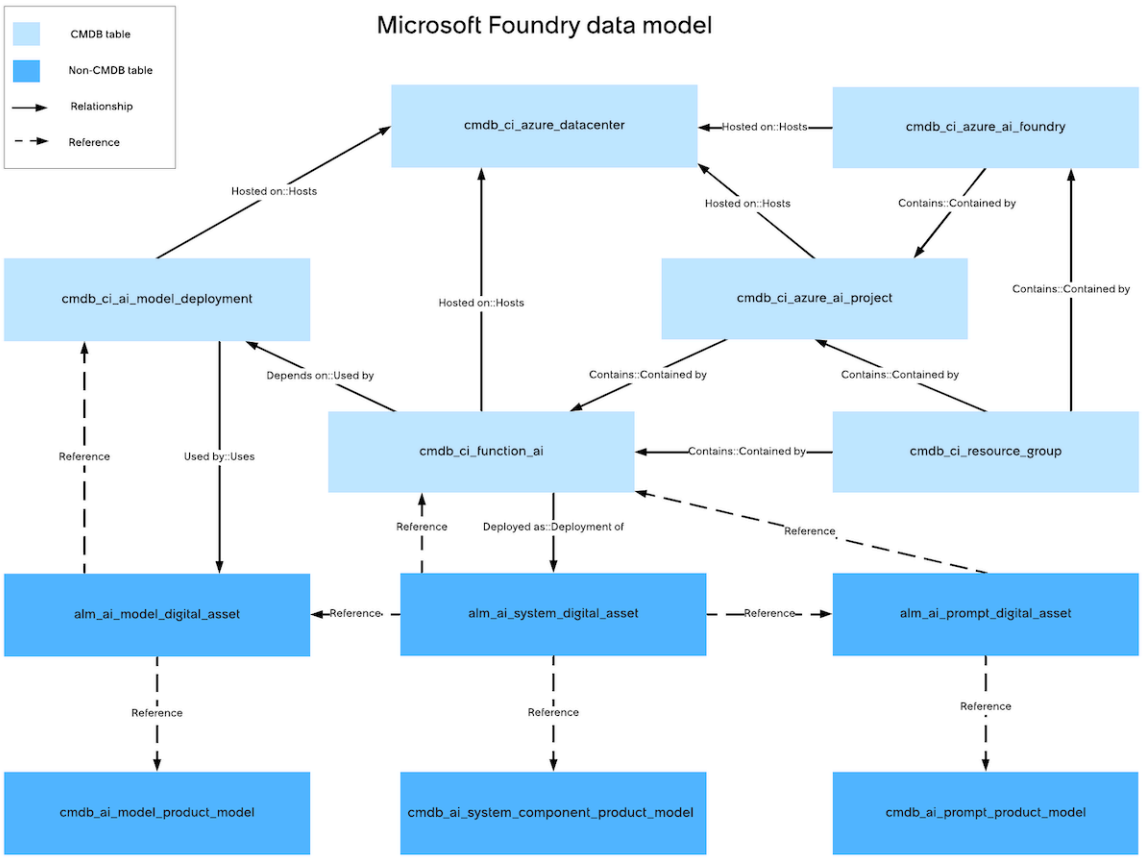
Tables and relationships populated during Microsoft Foundry discovery



Discovery requirements

Verify the REST API permissions

Download the Cloud Discovery patterns spreadsheet so you can grant user permissions required for running the Discovery patterns. In addition to permissions, the spreadsheet also includes useful information such as pattern names, types, CI Classes, and links to vendor documentation. New patterns are available quarterly, so check periodically to be sure you have the latest version of the spreadsheet.

Verify that the applications are up to date

Discovering these resources may require updating to the latest version of the following applications from the ServiceNow Store:

- AI Agent Topology Mapping
- Discovery and Service Mapping Patterns
- Visibility Content
- CMDB CI Class Models
- Data Foundation Model (at least version 1.13.2)

Activate the cloud-related CI relationships

To include discovered components into service instances, enable CI relationships used in tag-based discovery by Service Mapping. These CI relationships are available from the 1.0.68 release on the ServiceNow Store. For operational steps, see Tag-based discovery configuration.

Azure Availability Set

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Wait for the **Clean-Up job for Availability zone to clear availability set record** schedule job to delete all the pre-populated Configuration Items (CIs) in the **cmdb_ci_azure_availability_set** table.

Azure Availability Zone

To run a discovery with Azure Availability Zone, register the subscription ID to the **AvailabilityZonePeering** feature with AZ CLI using `az feature register -n AvailabilityZonePeering --namespace Microsoft.Resources` to use the Check Zone Peering API. Check the status with `az feature show -n AvailabilityZonePeering --namespace Microsoft.Resources` before running discovery.

Set up Azure service accounts

Enable Cloud Discovery to access your Azure environment.

Discovering Azure GovCloud (US) accounts requires using a datacenter URL when setting up an Azure service account. For more information, see Set up Azure service accounts.

Create an Azure cloud discovery schedule

For more information, see Create an Azure Discovery schedule in Discovery Admin Workspace.

(Optional) Discover datacenters only for new subscriptions

Starting with Zurich Patch 2, you can discover datacenters only for new subscriptions added since the last discovery. For more information, see Discover datacenters only for new cloud accounts.

(Optional) Populate Service Account and Logical Datacenter fields in cloud CIs

Starting with Discovery and Service Mapping Patterns version 1.30.2, you can improve query performance by populating Service Account and Logical Datacenter fields directly in cloud CIs. For more information, see Improved query performance with direct field population in CI tables.

Data collection

The AI Agent Topology Mapping application includes the following patterns for Microsoft Foundry discovery:

- Azure - AI New Foundry Agents
- Azure - AI Service Foundry
- Azure - AI Service Foundry Project
- Azure - AI Foundry Models

The Azure - AI New Foundry Agents pattern collects AI System Digital Assets, AI Prompt Digital Assets, and Key Value information. You can view this information in the **Related Links** section of the CI record by navigating to **All** > **Configuration** > **Azure** > **Azure AI Foundry Agents** and selecting the relevant record.

The Azure - AI Foundry Models pattern collects AI Model Digital Assets. You can view this information in the **Related Links** section of the CI record by navigating to **All** > **Configuration** > **Azure** > **Azure AI Foundry Models** and selecting the relevant record.

The AI Agent Topology Mapping application populates data in both CMDB and non-CMDB tables.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data stored in non-CMDB tables

The AI Agent Topology Mapping application populates data in non-CMDB tables when running the Microsoft Foundry patterns.

If you have the AI Control Tower application, you can view the information in the AI Control Tower Workspace.

AI System Digital Asset [alm_ai_system_digital_asset]

Field	Description
Display name [display_name]	Display name of the Microsoft Foundry agent.
External record reference [external_ref_id]	Unique identifier of the Microsoft Foundry agent.
Asset type [model_category]	Asset type of the agent. Value is set to **Agentic AI**.
State [install_status]	State of the agent. Value is set to **Deployed**.
Vendor [vendor]	Vendor of the agent. Value is set to **Azure**.
Model [model]	References the AI System Component Product Model [cmdb_ai_system_component_product_model] table.
AI prompts [ai_prompts]	References the AI Prompt Digital Asset [alm_ai_prompt_digital_asset] table.
AI models [ai_models]	References the AI Model Digital Asset [alm_ai_model_digital_asset] table.
Configuration Item [ci]	References the AI Function [cmdb_ci_function_ai] table.

AI System Component Product Model [cmdb_ai_system_component_product_model]

Field	Description
Name [name]	Name of the Microsoft Foundry agent.
Short description [short_description]	Description of the Microsoft Foundry agent.
Status [status]	Operational status of the agent. Value is set to **PREPARED**.
Version [version]	Version of the Microsoft Foundry agent.
Manufacturer [manufacturer]	Name of the company defined in the *glide.appcreator.company.friendly_name* system property.
Model categories [cmdb_model_category]	Model category. Value is set to **Agentic AI**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Prompt Digital Asset [alm_ai_prompt_digital_asset]

Field	Description
Prompt information [prompt_info]	Instruction text defined for the Microsoft Foundry agent.
Asset type [model_category]	Asset type of the prompt. Value is set to **AI prompt**.
Vendor [vendor]	Vendor of the prompt. Value is set to **Azure**.
Model [model]	References the AI Prompt Product Model [cmdb_ai_prompt_product_model] table.
Configuration Item [ci]	References the AI Function [cmdb_ci_function_ai] table.

AI Prompt Product Model [cmdb_ai_prompt_product_model]

Field	Description
Name [name]	Name of the Microsoft Foundry agent, used to identify the associated prompt model.
Manufacturer [manufacturer]	Name of the company defined in the *glide.appcreator.company.friendly_name* system property.
Model categories [cmdb_model_category]	Model category. Value is set to **AI prompt**.

AI Model Digital Asset [alm_ai_model_digital_asset]

Field	Description
Display name [display_name]	Name of the foundation model.
External record reference [external_ref_id]	Resource identifier of the foundation model.
Asset type [model_category]	Asset type of the model. Value is set to **AI model**.
Vendor [vendor]	Provider of the foundation model.
Model [model]	References the AI Model Product Model [cmdb_ai_model_product_model] table.
Configuration Item [ci]	References the AI Model Deployment [cmdb_ci_ai_model_deployment] table.

AI Model Product Model [cmdb_ai_model_product_model]

Field	Description
Name [name]	Name of the foundation model.
Model number [model_number]	Model ID assigned by Microsoft Foundry.
Version [version]	Version of the foundation model.
Description [description]	Description of the foundation model.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Model Product Model [cmdb_ai_model_product_model] (continued)

Field	Description
Manufacturer [manufacturer]	Provider of the foundation model.
Model categories [cmdb_model_category]	Model category. Value is set to **AI model**.

Data stored in CMDB tables

The AI Agent Topology Mapping application populates data in the CMDB when running the Microsoft Foundry patterns.

AI Function [cmdb_ci_function_ai]

Field	Description
Name [name]	Name of the Microsoft Foundry agent.
Object ID [object_id]	Unique identifier of the Microsoft Foundry agent.
Description [short_description]	Description of the Microsoft Foundry agent.
Manufacturer [manufacturer]	Cloud provider of the resource. Value is set to **Azure**.
Operational status [operational_status]	Operational status of the resource. Default value is **Operational**.
Install Status [install_status]	Install status of the resource. Default value is **Installed**.
Product instance identifier [product_instance_id]	Version of the Microsoft Foundry agent.
Comments [comments]	Resource type identifier. Value is set to **Azure::Foundry::NewAgent**.

Azure AI Foundry [cmdb_ci_azure_ai_foundry]

Field	Description
Name [name]	Name of the Microsoft Foundry service.
Object ID [object_id]	Unique identifier of the Microsoft Foundry service.
Description [short_description]	Description of the resource. Value is set to **Azure Foundry Service**.
Operational status [operational_status]	Operational status of the resource. Default value is **Operational**.
Install Status [install_status]	Install status of the resource. Default value is **Installed**.
Azure Service Type [azure_service_type]	Azure resource type. For example: microsoft.cognitiveservices/accounts.
Azure Service Kind [azure_service_kind]	Resource kind of the Microsoft Foundry service. For example: AIServices.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure AI Project [cmdb_ci_azure_ai_project]

Field	Description
Name [name]	Name of the Microsoft Foundry project.
Object ID [object_id]	Unique identifier of the Microsoft Foundry project.
Comments [comments]	Azure region where the Microsoft Foundry project is deployed.
Operational status [operational_status]	Operational status of the resource. Default value is **Operational**.
Install Status [install_status]	Install status of the resource. Default value is **Installed**.
Model number [model_number]	Internal identifier of the Microsoft Foundry project.
Azure Project Kind [azure_project_kind]	Resource kind of the Microsoft Foundry project. For example: AIServices.

AI Model Deployment [cmdb_ci_ai_model_deployment]

Field	Description
Name [name]	Name of the AI model available in Microsoft Foundry.
Object ID [object_id]	Resource identifier of the AI model.
Description [short_description]	Description of the AI model.
Model number [model_number]	Model name, used as an identifier.
Manufacturer [manufacturer]	Provider of the AI model. For example: Microsoft, Anthropic, or OpenAI.
Attributes [attributes]	Lifecycle status of the model as reported by the API. For example: Stable or Deprecated.
Comments [comments]	Azure resource type identifier. Value is set to **Microsoft.CognitiveServices/locations/models**.
Operational status [operational_status]	Operational status of the resource. Default value is **Operational**.
Install Status [install_status]	Install status of the resource. Default value is **Installed**.

Dependency Views map

On the Dependency Views map, you can view discovered Microsoft Foundry resources and the relationships between them.

The AI Agent Topology Mapping application populates data in both CMDB and non-CMDB tables.

Data stored in non-CMDB tables

The AI Agent Topology Mapping application populates data in non-CMDB tables when running the Microsoft Foundry Hub patterns.

If you have the AI Control Tower application, you can view the information in the AI Control Tower Workspace.

AI System Digital Asset [alm_ai_system_digital_asset]

Field	Description
Display name [display_name]	Display name of the Microsoft Foundry Hub assistant.
External record reference [external_ref_id]	Unique identifier of the Microsoft Foundry Hub assistant.
Asset type [model_category]	Asset type of the assistant. Value is set to **Agentic AI**.
State [install_status]	State of the assistant. Value is set to **Deployed**.
Vendor [vendor]	Vendor of the assistant. Value is set to **Azure**.
Model [model]	References the AI System Component Product Model [cmdb_ai_system_component_product_model] table.
AI prompts [ai_prompts]	References the AI Prompt Digital Asset [alm_ai_prompt_digital_asset] table.
AI models [ai_models]	References the AI Model Digital Asset [alm_ai_model_digital_asset] table.
Configuration Item [ci]	References the AI Function [cmdb_ci_function_ai] table.

AI System Component Product Model [cmdb_ai_system_component_product_model]

Field	Description
Name [name]	Name of the Microsoft Foundry Hub assistant.
Short description [short_description]	Description of the Microsoft Foundry Hub assistant.
Status [status]	Operational status of the assistant. Value is set to **PREPARED**.
Manufacturer [manufacturer]	Name of the company defined in the *glide.appcreator.company.friendly_name* system property.
Model categories [cmdb_model_category]	Model category. Value is set to **Agentic AI**.

AI Prompt Digital Asset [alm_ai_prompt_digital_asset]

Field	Description
Prompt information [prompt_info]	Instruction text defined for the Microsoft Foundry Hub assistant.
Asset type [model_category]	Asset type of the prompt. Value is set to **AI prompt**.
Vendor [vendor]	Vendor of the prompt. Value is set to **Azure**.
Model [model]	References the AI Prompt Product Model [cmdb_ai_prompt_product_model] table.
Configuration Item [ci]	References the AI Function [cmdb_ci_function_ai] table.

AI Prompt Product Model [cmdb_ai_prompt_product_model]

Field	Description
Name [name]	Name of the Microsoft Foundry Hub assistant, used to identify the associated prompt model.
Manufacturer [manufacturer]	Name of the company defined in the *glide.appcreator.company.friendly_name* system property.
Model categories [cmdb_model_category]	Model category. Value is set to **AI prompt**.

AI Model Digital Asset [alm_ai_model_digital_asset]

Field	Description
Display name [display_name]	Name of the foundation model.
External record reference [external_ref_id]	Resource identifier of the foundation model.
Asset type [model_category]	Asset type of the model. Value is set to **AI model**.
Vendor [vendor]	Provider of the foundation model.
Model [model]	References the AI Model Product Model [cmdb_ai_model_product_model] table.
Configuration Item [ci]	References the AI Model Deployment [cmdb_ci_ai_model_deployment] table.

AI Model Product Model [cmdb_ai_model_product_model]

Field	Description
Name [name]	Name of the foundation model.
Model number [model_number]	Model ID assigned by Microsoft Foundry.
Version [version]	Version of the foundation model.
Description [description]	Description of the foundation model.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

AI Model Product Model [cmdb_ai_model_product_model] (continued)

Field	Description
Manufacturer [manufacturer]	Provider of the foundation model.
Model categories [cmdb_model_category]	Model category. Value is set to **AI model**.

Data stored in CMDB tables

The AI Agent Topology Mapping application populates data in the CMDB when running the Microsoft Foundry Hub patterns.

AI Function [cmdb_ci_function_ai]

Field	Description
Name [name]	Name of the Microsoft Foundry Hub assistant.
Object ID [object_id]	Unique identifier of the Microsoft Foundry Hub assistant.
Description [short_description]	Description of the Microsoft Foundry Hub assistant.
Manufacturer [manufacturer]	Cloud provider of the resource. Value is set to **Azure**.
Operational status [operational_status]	Operational status of the resource. Default value is **Operational**.
Install Status [install_status]	Install status of the resource. Default value is **Installed**.
Comments [comments]	Resource type identifier. Value is set to **Azure::FoundryHub::Agent**.

Azure AI Project [cmdb_ci_azure_ai_project]

Field	Description
Name [name]	Name of the Microsoft Foundry Hub project.
Object ID [object_id]	Unique identifier of the Microsoft Foundry Hub project.
Comments [comments]	Azure region where the Microsoft Foundry Hub project is deployed.
Operational status [operational_status]	Operational status of the resource. Default value is **Operational**.
Install Status [install_status]	Install status of the resource. Default value is **Installed**.
Azure Project Kind [azure_project_kind]	Resource kind of the Microsoft Foundry Hub project. For example: Project.
Attributes [attributes]	Resource type identifier. Value is set to **Azure::FoundryHub::Project**.

AI Model Deployment [cmdb_ci_ai_model_deployment]

Field	Description
Name [name]	Name of the AI model available in Microsoft Foundry Hub.

AI Model Deployment [cmdb_ci_ai_model_deployment] (continued)

Field	Description
Object ID [object_id]	Resource identifier of the AI model.
Description [short_description]	Description of the AI model.
Model number [model_number]	Model name, used as an identifier.
Manufacturer [manufacturer]	Provider of the AI model. For example: Microsoft, Anthropic, or OpenAI.
Attributes [attributes]	Lifecycle status of the model as reported by the API. For example: Stable or Deprecated.
Comments [comments]	Azure resource type identifier. Value is set to **Microsoft.CognitiveServices/locations/models**.
Operational status [operational_status]	Operational status of the resource. Default value is **Operational**.
Install Status [install_status]	Install status of the resource. Default value is **Installed**.

Dependency Views map

On the Dependency Views map, you can view discovered Microsoft Foundry Hub resources and the relationships between them.

Note: The following relationships are stored in the Asset-CI Relationship [cmdb_rel_asset_ci] table and aren't represented in the Dependency View map:

- The **Deployed as::Deployment of** relationship between AI Function [cmdb_ci_function_ai] and AI System Digital Asset [alm_ai_system_digital_asset].
- The **Used by::Uses** relationship between AI Model Deployment [cmdb_ci_ai_model_deployment] and AI Model Digital Asset [alm_ai_model_digital_asset].

Microsoft Azure Cloud discovery using patterns

ITOM Content Service

ServiceNow® ITOM Content Service offers extensive visibility of products in your infrastructure. The classification of processes identified by Predictive Intelligence enables wider discovery and weekly updates of new configuration items in the CMDB. Use the Discovery Admin Workspace to review and manage ITOM Content Service suggestions.

ITOM Content Service Model

About ITOM Content Service

ITOM Visibility offers multiple methods of discovering products in your infrastructure. When running discovery with Discovery and Service Mapping Patterns for example, each pattern searches for one version of a product and can offer in-depth visibility of the product's information.

While your infrastructure is growing at scale, and new IT products are rapidly released to the market, you must have wider, rapidly updating visibility. Every week, ITOM Content Service identifies products that you're currently using and delivers new Configuration Items (CI) for your usage. The latest version of Discovery Admin Workspace enables you to refresh the content service suggestions manually before reviewing them.

ITOM Content Service provides the following benefits:

- Reviews the products that you're currently using every week and delivers new configuration items (CIs).
- Based on AI, it helps you identify running processes fingerprints and SNMP System OIDs and create the CIs you need for monitoring your infrastructure.
- Identifies irrelevant processes that aren't suitable candidates for CIs.
- Discovers a higher number of products by using AI capabilities that cluster and classify running application processes.

Benefits of Software Asset Management integration with ITOM Content Service

ITAM Software Asset Management (SAM) users benefit from the integration with ITOM Content Service in multiple ways.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Gain visibility on the processes currently running on the installed software. This also enables you to find out which installed software doesn't have running processes and might be redundant.
- ITOM Content Service compliments Software Asset Management in cases of services that don't require installation, for example, an Oracle database that runs as a service and isn't installed. In cases like this, ITOM Content Service creates the installed software record based on combining the process fingerprint data with the data discovered by SAM. Without ITOM Content Service, you can't gain this kind of visibility.
- Using file-based discovery capabilities, ITOM Content Service can discover a running system file that is identified with an app. For example, ITOM Content Service can match an installed software record to an Apache Kafka running an `exe` file. For more information, see File-based Discovery.

For more information on Software Asset Management, see Software Asset Management Content Service.

Benefits of using Service Mapping with ITOM Content Service

With the latest version of ITOM Content Service, Service Mapping users can leverage Service Fingerprints suggestions to identify and select application services based on classified components. By viewing component details such as product, product category, publisher, and description, you can make informed decisions about which candidates to convert into application services. You can also see which additional processes can be integrated into the service, as certain processes collectively build a comprehensive service when combined.

Both ITOM Content Service suggestions and Service Fingerprints offer automated, weekly suggestions for candidates, but they differ in a few ways.

Comparison between ITOM Content Service suggestions and Service Fingerprints

Name	Type	Identifies	Focus	Details on publisher	Location
ITOM Content Service suggestions	Process fingerprints	Individual processes, which could be components of a service or standalone.	Specific actions of a process, offering higher granularity.	Process's publisher. If a process is part of a service but has a different publisher, the process provides details only about its own publisher.	**Content service suggestions** tab in Discovery Admin Workspace Content 360
Service Fingerprints	Service fingerprints	Services based on classified components.	The service as a whole, providing a broader perspective.	Service's publisher. If a process is part of a service but has a different publisher, the service fingerprint provides details only about the service's publisher.	**Service Fingerprints** tab in Service Mapping workspace

For more information about using Service Fingerprints in Service Mapping, see Map application services based on Automated Service Suggestions.

Managing ITOM Content Service with the Discovery Admin Workspace

Review recommended actions and application suggestions and configure discovery through Discovery Admin Workspace.

Note that the Discovery Admin Workspace is supported starting with the Vancouver release.

For more information, see Discovery Admin Workspace Content 360.

Sharing data on the CDS

The Continuance Delivery System (CDS) is a ServiceNow® technology that synchronizes data between the Data Services instance that stores and distributes data and the customer instances.

Opting in to sharing application fingerprint process data with ITOM Content Service through the CDS enables them to be tagged and classified by AI librarians. ITOM Content Service then delivers new CIs every week. Your data is shared with your ServiceNow® instance in a safe environment. You can control access to your data by setting permissions in the Discovery Admin Workspace.

The three options for sharing your data are:

- Sharing the running processes fingerprint data, which enables access to the Process Groups [cmdb_process_groups] table.
- Sharing the SNMP System OIDs data, which enables access to the SNMP OID [discovery_snmp_oid] table.
- Sharing the Service Info data of mapped candidates, which enables access to the Application Service Candidate [application_service_candidate] table (starting with ITOM Content Service version 1.6.2 and Discovery Admin Workspace version 1.11.0).

For more information on setting the permissions, see Share data on ITOM Content Service

ITOM Content Service use case

This ITOM Content Service use case demonstrates how organizations can achieve enhanced visibility into their environment.

Use case overview

The Application Configuration Items (CIs) class is a key component of an organization's data platform within the Common Service Data Model (CSDM). Application CIs help log software activities and support critical IT operations.

Many products and applications rely on application CIs for essential tasks. A few key examples are:

- Service Mapping: Uses application CIs to create service maps
- ITOM AIOps: Monitors application health and resolves incidents using application CIs
- IT Asset Management (ITAM): Tracks and manages software applications and their associated licenses with application CIs
- IT Service Management (ITSM): Analyzes service impact and calculates blast radius with application CIs
- Enterprise Architecture (EA): Leverages application CIs to generate business outcomes

Challenge

A large organization with numerous applications requires accurate discovery. Managing application CIs is essential, yet the IT team finds it challenging to maintain visibility over its growing infrastructure.

ITOM Visibility offers several methods for discovering products within an organization's infrastructure, such as Discovery and Service Mapping Patterns. This method provides detailed visibility into a product's information. When a wide range of applications is in use, not all can have a dedicated pattern. If an application does not have a dedicated pattern, discovery populates only the Running Process [cmdb_running_process] table without identifying the product or creating a CI for it.

Without an application CI, the organization lacks accurate visibility into its infrastructure and might struggle to optimize the following essential actions:

- Bind CIs with monitoring alerts and open incidents regarding the CIs
- Schedule automated software upgrades
- Automate scripts to optimize or troubleshoot the product
- Perform impact assessments and change impact analysis
- Create security workflows

Solution

ITOM Content Service enhances the discovery process by tagging and classifying process fingerprints. This service provides details about the publisher, product, and the essential component of the CI. Unlike pattern-based discovery, ITOM Content Service identifies applications directly within the organization's environment without requiring published pattern classifiers. This approach enables the continuous delivery of content without being constrained by a scheduled release cycle.

For example: Discovery identifies the Elipse Software E3 Database Engine process (E3DBEngine.exe) and lists it in the Running Process [cmdb_running_process] table. If the E3DBEngine.exe process classification condition isn't set to trigger a pattern, it doesn't launch a pattern and a CI isn't created. However, with ITOM Content Service, the E3DBEngine.exe process is tagged and classified, enabling Discovery to turn the process into a CI during the next scan.

Result

Discovery using ITOM Content Service creates a CI record by tagging and classifying the publisher, product, and essential component for all applications in the organization's environment. This method provides enhanced and continuous visibility into the application landscape, enabling effective monitoring, proactive actions, and ongoing optimization.

Install ITOM Content Service

Install the ITOM Content Service application (sn_smart_content) to manage and monitor the creation of configuration items based on application fingerprints.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Review the ITOM Content Service application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: admin

About this task

The following plugins are activated with ITOM Content Service:

- Discovery (com.snc.discovery)
- Normalization Data Services Client (com.glide.data_services_canonicalization.client)
- File Based Discovery (com.snc.discovery.file_based_discovery)—starting with ITOM Content Service version 1.5.1

Note: The ITOM Smart Content plugin (com.snc.itom.smart.content) is available starting with XP5. This plugin is optional and can be requested through ServiceNow personnel. For more information, see Request a plugin.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the ITOM Content Service application (sn_smart_content) using the filter criteria and search bar.

   You can search for the app by its name or ID.

   In the list next to the **Install** button, the versions that are available to you are displayed.
3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box, any dependencies installed with your application are listed.
4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. Select **Install**.

What to do next

Share data on ITOM Content Service

ITOM Content Service

Enable discovery with ITOM Content Service

Review the ITOM Content Service suggestions for application discovery and activate the discovery classifiers to enable the creation of configuration items.

Before you begin

Ensure that the following application and plugin are installed:

- ITOM Content Service (sn_smart_content)
- Discovery Admin Workspace (com.snc.itom.daw)

Ensure that ITOM Content Service is active. For more information, see Share data on ITOM Content Service.

Role required: discovery_admin

Procedure

1. Navigate to **Workspaces** > **Discovery Admin Workspace** > **Content 360**.
2. Select the **Content service suggestions** tile.
3. Manually sync with suggestions from your system by selecting **Sync candidates**.

   Note: If a message appears about the application scope, select **OK** to exit the message. Then, change the scope by selecting the application scope icon ( ) and selecting **Global**.

4. In the Sync candidates confirmation window, select **Yes**.
5. Review the Content Service suggestions for discovery by product.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To filter the list, select the products from the **Content service suggestions** tab.
- To review a product's description and details, select the link from the **Name** column.

6. Select the product you want to enable discovery for.
7. Activate discovery classifiers by product categories.

Note: The number of classifiers that will be activated is indicated in the **Activate** button.

- To enable the discovery by product categories, select the product categories check boxes, select the check box next to the **Name** column, and select **Activate**.
- To enable the discovery by individual products, select the product from the **Name** column and select **Activate**.

Result

The new configuration items are added to the CMDB the next time Discovery runs a schedule. The Discovery Admin Workspace then lists the added CIs and removes them from the suggested applications list.

Discover installed software data with ITOM Content Service

Use ITOM Content Service and ITSM Software Asset Management to discover version-less installed software that isn't discovered automatically with Software Asset Management Core or Software Asset Management Professional or file-based Discovery.

Before you begin

Ensure that the following application and plugins are installed:

- ITOM Content Service (sn_smart_content)
- Software Asset Management Core (com.snc.sam.core) or Software Asset Management Professional (com.snc.samp)
- File Based Discovery (com.snc.discovery.file_based_discovery)

Ensure that ITOM Content Service is active. For more information, see Share data on ITOM Content Service.

Ensure that the content service suggestions in the relevant category are activated. For more information, see Enable discovery with ITOM Content Service.

Role required: discovery_admin

Procedure

1. Navigate to **All** > **Discovery Smart Content** > **Smart Content Categories**.
2. Activate the relevant category.
   a. In the **Name** column, search for the relevant category.
   b. Double-click (or use the keyboard shortcut) the **Create Installed Software** column.
   c. In the list, select **true**.
   d. Verify the value by selecting the green check mark.

What to explore next

To learn more about configuring and using Tag Governance, see:

- Configuring Tag Governance
- Using Tag Governance
- Tag Governance reference

Discovering tags

The Discovery and Cloud Discovery features discover all resources in the CMDB as well as cloud resources from cloud providers such as Amazon AWS Cloud, Microsoft Azure Cloud, and Google Cloud Platform (GCP).

The role of discovery

Discovery and Cloud Provisioning and Governance can discover tags that are used by all major cloud providers and container ecosystems through Service Mapping patterns. Once the tags are discovered, Service Mapping can create application services that are based on the tags. Typically, organizations use tagging in virtualized, hyper-converged, or multi-cloud infrastructures. For examples of the infrastructure types and tags used for them, see Tag-based discovery in Service Mapping.

Discovery also collects cloud tags that are specific to each virtual machine (VM) and saves them to the Key Value [cmdb_key_value] table.

The discovery process also detects tags that are associated with CIs. If your organization does not use consistent tagging standards or terms (key-value pairs), however, managing CIs with tags becomes difficult.

View Tag Governance metrics

View metrics like tag policy coverage, compliance status, and usage trends on the Tag Governance Insights dashboard.

Before you begin

Verify the following:

- To be able to configure reports, log in as a Tag Governance admin (sn_itom_tag.tag_governance_admin).
- To be able to view reports, log in as a report viewer (sn_itom_tag.tag_reports_viewer).
- Tag policies must be configured and audits must be run to populate data. For more information, see Configure tag policies.

Access the dashboard

To access the dashboard, navigate to **Tag Governance** > **Dashboard**.

Dashboard details

The Tag Governance Insights dashboard displays metrics that help you make data-driven decisions, like identify tag compliance gaps, introduce tag policy adoption initiatives, assess tag compliance status, and more. For example, you can view the least used tags and decide whether they require remediation or deprecation. You can also drill down into each widget to view a list of relevant configuration items (CIs) and edit, save, or export them.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The dashboard displays results from tag audit runs on discovered CIs from the CMBD CI [cmdb_ci] table.

Data visualization widgets

Widget	Type	Description
Tag policy coverage	Pie chart	Displays the total count of discovered CIs and CIs that are governed and ungoverned by a tag policy. Hover over a pie segment to view the total count and percentage of CIs for that category. Select it to view the detailed tag quality state list.
Overall compliance status across CIs	Pie chart	Displays the overall compliance status of all discovered CIs. The possible statuses are: • Non Compliant: CIs that don't meet any tag policy requirements. • Partially Compliant: CIs that meet some tag policy requirements. • Fully Compliant: CIs that meet all tag policy requirements. Hover over a pie segment to view the total count and percentage of CIs for that category. Select it to view the tag policy health list. You can filter by cloud accounts, datacenters, and policy type for specific results. For example, you can combine filters to view the tag compliance status for virtual machine instances mapped to a specific cloud account in a relevant datacenter. **Note:** The dashboard fetches cloud account and datacenter records directly from the Tag Compliance Aggregate Counts [sn_itom_tag_widget_aggregate_counts] table, displaying only cloud accounts and datacenters that have associated compliance CIs.
CI compliance by infrastructures	Stacked bar chart	Displays the compliance distribution across datacenters and cloud accounts. Each bar represents an infrastructure location with each bar segment representing their CI compliance status. Hover over a bar segment to view the total count and percentage of CIs for that category. Select it to view the tag policy run list. **Note:** The chart displays the data of top ten datacenters or cloud accounts by CI count. If there are more than ten infrastructure locations, the remaining data is combined into one bar.
Compliance trends over	Line trend report	Displays the compliance performance trends over the previous 90 days for CIs according to their compliance status.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data visualization widgets (continued)

Widget	Type	Description
the past 90 days		Hover over a point on the line trend to view the total count and percentage of CIs for that category. Select it to view the tag policy run list.
Most used tags in the past 90 days	Pareto chart	Displays the most used tags across all CIs over the previous 90 days. Hover over a bar to view the total count and percentage of CIs for that category. Select it to view the tag report key counts list. **Note:** The chart displays the data of top ten tags by CI count. If there are more than ten tags, the remaining data is combined into one bar.
Least used tags	Horizontal bar chart	Displays the least used tags across all CIs. Hover over a bar to view the total count and percentage of CIs using the tag. Select it to view the tag report key counts list. **Note:** The chart displays the data of the ten least used tags by CI count. If there are more than ten tags, the remaining data is combined into one bar.

For more information about tag audit results and non-compliant CIs, see Preview and remediate tag audit failures.

Tag Categorization in Tag Governance

By automatically grouping similar tag keys into predefined categories, Tag Categorization streamlines the management of configuration items (CIs) and cloud resources while promoting clear and consistent tagging practices.

Tag categorization requirements

Note:

The Tag Categorization feature in Tag Governance leverages the CI tag category [svc_tag_categories] and the CI tag key [svc_tag_names] tables in Service Mapping. Full access to these tables requires installation of the version 1.16.3 or later of Service Mapping Plus. Without it, access to these tables might be limited, affecting your ability to recategorize tags, modify tag definitions, or fully use the feature. For more information, see Install Service Mapping Plus.

Tag Categorization overview

Tag Categorization helps streamline and improve the accuracy of tag management by providing preconfigured categories to help you group tags for your CIs. A daily scheduled job categorizes newly added tags and maps any unrecognized tag keys to the appropriate category. For more information about the predefined tag categories, see Components in Tag Governance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can modify the tag category definitions, create your own categories, or add additional tag keys as needed. For more information, see Modify tag category information for Tag Categorization.

The Tag category policy confirms that all categories are properly mapped and up-to-date. It retrieves records and checks for category mappings to identify any missing categories. CIs that are missing a category are marked as non-compliant, which helps you address and remediate any tag category issues.

The system uses the *sn_itom_tag.recategorization_required* property to determine whether recategorization is needed. By default, this property is set to false. When a change to a category occurs, a business rule sets the property to true, indicating that recategorization is needed. A daily scheduled job then checks this property and if it is set to true, begins the recategorization process. This process automatically updates the tag mappings within 24 hours of the change, but you can also initiate recategorization to apply the changes immediately. All changes and updates are stored in the CI tag category table.

Tag Categorization and domain separation

Tag Categorization supports domain-specific management. If an instance isn't domain-separated, the categories are added to the global domain. For domain-separated instances, the categories are added to each leaf domain. When you access or manage tags, the system gets domain information from the CI and adds tag mappings to the matching category in the appropriate domain. For general information about domain separation with Tag Governance, see Domain separation in Tag Governance.

Configuring Tag Governance

Install the Tag Governance app to execute tag audits, view the Tag Data Governance dashboard, and perform tag remediation.

Configuration overview

- Domain separation in Tag Governance

  Domain separation is supported in Tag Governance. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

- Install the application

  Install the Tag Governance app to execute tag audits, view the Tag Data Governance dashboard, and perform tag remediation.

  To view the list of plugins and applications installed with Tag Governance, including any dependencies, see Plugins or applications installed with ITOM Visibility.

Install the application

Install the Tag Governance app to execute tag audits, view the Tag Data Governance dashboard, and perform tag remediation.

Before you begin

- Ensure that you use the Discovery and Service Mapping Patterns for tag-based discovery.
- Install the ServiceNow Cloud Access Interface app for cloud remediation.

Role required: sn_itom_tag.tag_governance_admin, admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Applications** > **ServiceNow Store**.
2. Use the search box to find the Tag Governance application and select **Install**.

What to do next

Configure Tag Governance policies to run on discovered resources. See Configure tag policies.

Using Tag Governance

Use the ServiceNow® Tag Governance app to identify and remediate on-premises or cloud resources that are inconsistent and don't comply with the tag policies of your organization.

Tag governance tasks

- Establishing Tag Governance policies

  Configure tag policies that define the criteria for tag audits on discovered cloud resources or CIs. View audit results on tag quality and compliance on the Tag Health dashboard. You establish tag policies that support the scale and needs of the various groups in your organization so all users can benefit.

- Configure tag policies

  Configure tag policies that define the criteria for tag audits on discovered cloud resources or CIs. View audit results on tag quality and compliance on the Tag Health dashboard.

- Configure remediation policies for tag audit findings

  Configure and preview remediation options, generate keys, and perform actions to remediate non-compliance or failures that are based on tag audit reports.

- Preview and remediate tag audit failures

  Based on the tag policies that you create, you can preview remediation flows and auto-generate missing tags for non-compliant CIs.

- Performing real-time updates to tags for cloud resources

  You can set up cloud events processing and map a tag policy to update tags for cloud resources in real-time.

Establishing Tag Governance policies

Configure tag policies that define the criteria for tag audits on discovered cloud resources or CIs. View audit results on tag quality and compliance on the Tag Health dashboard. You establish tag policies that support the scale and needs of the various groups in your organization so all users can benefit.

Considerations

Follow a methodical approach when defining tagging standards to keep the count of tags low. Standardized tag policies improve the power of the Tag Governance app to monitor and manage tags across CIs in your organization.

You might need extensive discussions and research to understand the needs of all the varied teams in your organization. For example, finance teams might want CIs to be tagged based on cost-center allocations, applications assignments, and business purpose. In contrast, IT security

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

teams might want CIs categorized by OS and security patch level as part of their vulnerability management plan.

Before you finalize your tagging approach, ensure that you have considered the following issues:

- Tag filters that various teams will use.
- The level of access that different users need.
- Whether you need real-time checks.
- Whether you need to synchronize tags with cloud resources.

Related topics

Configure tag policies

Configure remediation policies for tag audit findings

Configure tag policies

Configure tag policies that define the criteria for tag audits on discovered cloud resources or CIs. View audit results on tag quality and compliance on the Tag Health dashboard.

Before you begin

Role required: sn_itom_tag.tag_governance_admin, admin.

About this task

You can specify filters that narrow the scope of an audit, for example, to audit only service accounts and datacenters.

Procedure

1. Navigate to **All** > **Tag Governance** > **Policies**.
2. Select **New** and then fill in the Tag Policies form.
   The form fields are described in Tag Policies form.
3. Select **Submit**.
   - The Tag Policy Runs related list displays the list of tag audit runs with their corresponding state, created, and updated timestamps.
   - The Latest Policy Run Findings related list displays the results of the tag audit run.

What to do next

- Select the **Show Audit Results** related link to view all audit results.
- Select the **Run Point Scan** related link to execute all applicable checks against the record.
- For more information see, Flows and Subflows.

Configure remediation policies for tag audit findings

Configure and preview remediation options, generate keys, and perform actions to remediate non-compliance or failures that are based on tag audit reports.

Before you begin

Ensure that tag policies are configured and in Active state.

Role required: sn_itom_tag.tag_governance_admin, admin

About this task

You can run remediation automatically if you map a remediation policy to a tag policy. You can also update the tags of non-compliant CIs at the cloud provider's end in real time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure remediation policies and logic and also enable updating tags on cloud resources associated with the following CMDB classes:

- Virtual Machines
- Compute Security Groups
- Storage Volumes
- Cloud Networks
- Cloud Subnet
- Network Interfaces
- Load Balancers
- Availability Zones
- Public IP addresses
- Storage Accounts
- Resource Groups

The list of CMDB classes for which you can update tags on CIs in the CMDB as well as cloud resources also displays on the Tag Remediation form. If you select the **Update Tags in Cloud** check box in the Remediation form, remediation will only preview CI failures belonging to the CMDB classes listed.

Procedure

1. Navigate to **All** > **Tag Governance** > **Remediation**.
2. Select **New** to create a new record.
3. In the **Name** field, provide a unique descriptive name.
4. In the **Policy** field, select the lookup icon.

   Note: The **Policy Type** field is automatically populated after you select a policy from the lookup list.

5. In the Tag Policies list, configure a remediation policy in one of the following ways:
   - Select an existing tag policy from the lookup list.
   - Select **New**. Fill in fields on the Tag Policies form (the fields are described in Tag Policies form.

     Note: If you are creating a new tag policy, you must run an audit before you can run remediation flows.

   You have created or selected a policy for the remediation record.
6. **Optional:** Select the **AutoRemediation** check box to automatically run remediation on non-compliant CIs.
   When an audit run finishes, remediation runs on all CIs with policy failures.
7. **Optional:** Select the **Update Tags in Cloud** check box to apply remediation and update the tags in the relevant cloud provider environment for supported CMDB CI classes.

   Important: The **Update Tags in Cloud** feature works only for AWS and Microsoft Azure Cloud resources for CMDB classes listed in the Tag Remediation form. See Performing real-time updates to tags for cloud resources.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. On the Tag Remediation form, select **Submit**.
   The remediation policy is configured. The Tag Remediations list opens.

Preview and remediate tag audit failures

Preview audit reports for resources that tag policies identify as non-compliant. Remediate failures by adding or updating tags.

Before you begin

Configure tag policies and remediation policies. See Configure tag policies and Configure remediation policies for tag audit findings.

Note: The update to cloud works only for AWS and Microsoft Azure Cloud resources for CMDB classes listed in the Tag Remediation form.

Role required: sn_itom_tag.tag_admin, admin

About this task

Based on the tag policies that you create, you can preview remediation flows and auto-generate missing tags for non-compliant CIs. The Tag Remediation Preview related list displays this information. See Flows and Subflows.

Note:

- If you select the **Update Tags in Cloud** check box while configuring remediation, the Preview audit filters failures belonging to the listed CI classes.
- If you selected both the **Auto-Remediate** and **Update Tags in Cloud** settings while configuring remediation, then tags are updated both in the CMDB and in cloud resources (only for supported CMDB CI classes).
- If you select only **Auto-Remediate**, the remediation runs and updates tags in the CMDB alone.

Procedure

1. Navigate to **All** > **Tag Governance** > **Remediation**.
2. From the Tag Remediations list, select the record that you want to view.
3. Select the **Preview Remediation** related link.
   The Tag Remediation Previews related list displays the non-compliant CIs.
4. Select the Tag Remediation Previews related list to identify the missing tags and their values.
5. On the Tag Remediation Keys related list, select **New** to create a tag remediation key.
   The fields on the Tag Remediation Key form are described in Tag Remediation Key form.
6. Select **Submit**.
   You have created the Tag Remediation keys associated with the policy.
7. **Optional:** Select the **Generate Keys** related link, if you have run the **Tag Key Policy**.
   The **Generate Keys** related link appears only for the *`Tag Key Policy`* policy type. Because the policy specifies the expected tags, you can select the **Generate Keys** related link to generate the keys that you need for remediation instead of manually adding them in the Tag Remediation Keys related list.
8. **Optional:** Select the **Generate Key Values** related link, if you have run the **Tag Key & Value Policy**.
   The **Generate Key Values** related link appears only for the *`Tag Key and Value Policy`* policy type. Because you have already specified the values you are looking for in the tag policy, you can select the **Generate Key Values** related link to add the expected key values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. Select the **Remediate Tags** related link.
   The remediation flow to add missing tags initiates. A relevant information message displays on the form when the Remediation is active. Select the **More Info** link on the message to navigate to the default flow context.

Result

Based on the tag audit result findings and the Tag Remediations Keys that you create, the remediation flow adds missing tags to the non-compliant CIs to achieve policy compliance.

Performing real-time updates to tags for cloud resources

You can set up cloud events processing and map a tag policy to update tags for cloud resources in real-time.

Prerequisites

- Cloud events table [sn_cmp_cloud_events] table does not have any records in the *processed* state.
- CIs impacted by tag change events are identified by either CAPI or Discovery and Service Mapping patterns.
- Configured at least one tag policy.
- Select the **Run on cloud events** check box in the tag policy you create.

Instructions depend on the cloud provider

See the following setup instructions for cloud event processing:

- AWS events-driven discovery
- Configure the Microsoft Azure Alert service to auto-update the CMDB
- Configure the Google Cloud's Operations Suite Logging service to auto-update the CMDB

Process cloud events related to changes in tags and execute tag audits on the events in real time.

Unlike regular tag audits, where the audit is performed on all CIs in the CMDB that the tag policy applies to, tag events are processed per CI. Based on the prerequisites, tag event processing occurs on events that are identified with a tag change. The impacted CI is identified and, if the associated policy is applicable to the CI, the tag policy is run on the identified CI.

If the **Run on cloud events** check box is selected during policy creation, the policy is selected to run an audit on tag change events. If the check box is cleared, the audit is not run on the CI even if there are tag change cloud events.

View the change type that applies to the tag (the change that triggered the audit) in the Tag Change Log [sn_itom_tag_change_log] table. The records in the table are stored for 90 days by default. The change log records appear whether a remediation run or an event triggered the change on the CI. You can also view tags that were added or updated as part of the change.

Optimizing performance

High event inflow or many tag policies can decrease performance. You can modify the following system properties to confirm acceptable performance:

- [sn_itom_tag.azure_window_size] - This system property is configurable (in minutes).
- [sn_itom_tag.max_audit_lag_ratio] - Specify the lag between tag audits that are already running, before the audit triggers on the records ready for audit.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- [sn_itom_tag.policy_batch_size] - Batch size on which the tag audit is run.
- [sn_itom_tag.event_batch_size] - Event batch size to be processed.

Modify tag category information for Tag Categorization

Modify tag category definitions to support Tag Categorization and ensure that tag categories align with your requirements for data management and classification.

Before you begin

Verify that you have installed version 1.16.3 of Service Mapping Plus to access to the CI tag category and CI tag key tables. For more information, see Install Service Mapping Plus.

Role required: tag_governance_admin

Procedure

1. Navigate to **All** > *Tag Governance* > **Tag Categories**.
2. Verify that you're in the leaf domain.
   a. In the page header, select the globe icon ( ).
   b. Select **Domain scope**, and choose the appropriate leaf domain.
3. Select the category definition for the tag category you want to modify.
4. In the **Regex** field, modify the definition.
   You can delete an existing value (regex) or add a new value (regex) in this field.
5. **Optional:** Enter a value in the **Priority** field to set a priority for this tag category.
   Because a tag key can belong to multiple categories. setting the priority ensures that Tag Categorization maps CIs to the correct category.
6. Select **Update** to save the changes.
7. If you want to apply your changes immediately rather than waiting for the automatic update within 24 hours, select the **Re-Categorize Tags** button.

Add or delete tag categories for Tag Categorization

Add or delete tag categories for improved tagging of your organization's configuration items (CIs) and cloud assets.

Before you begin

Verify that you have installed version 1.16.3 of Service Mapping Plus to access to the CI tag category and CI tag key tables. For more information, see Install Service Mapping Plus.

Role required: tag_governance_admin

Procedure

1. Navigate to **All** > **Tag Governance** > **Tag Categories**.
2. Verify that you're in the leaf domain.
   a. In the page header, select the globe icon ( ).
   b. Select **Domain scope**, and choose the appropriate leaf domain.
3. Add or delete a tag category.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Action	Description
Add a tag category	**a.** Select **New**. **b.** Enter the category name in the **Tag category name** field. **c.** Select the Lookup using list icon . **d.** Select **New** in the Tag Category Definitions window. **e.** Enter the value for the category definition in the **Regex** field. **Note:** The regex identifies the tag values that are included in the category. Separate multiple values with a vertical slash (|). **f.** Update the priority value. **g.** Select **Submit**. **h.** Select **Submit** on the CI tag category - New Record page.
Delete a tag category	**a.** Select the check box next to the tag category. **b.** In the **Actions on selected rows** menu, select **Delete**.

4. If you want to apply your changes immediately rather than waiting for the automatic update within 24 hours, select the **Re-Categorize Tags** button.

Set the priority for tag category definitions for Tag Categorization

Set the priority for tag category definitions to ensure that tag keys belonging to multiple categories are properly categorized.

Before you begin

Verify that you have installed version 1.16.3 of Service Mapping Plus to access to the CI tag category and CI tag key tables. For more information, see Install Service Mapping Plus.

Role required: admin

About this task

A tag key can belong to multiple categories. Setting the priority ensures that Tag Categorization maps Configuration Items (CIs) and cloud resources to the correct category.

For example, the tag key Application might belong to both the Application and Cost Center tag categories. Set the priorities for the Cost Center and Application tag categories to 100 and 101, respectively, to prioritize mapping to the Application category. If a conflict occurs, this setting ensures that the Application category has higher priority and automatically maps the tag key to it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Tag Governance** > **Tag Categories**.
2. Verify that you're in the leaf domain.
   a. In the page header, select the globe icon ( ).
   b. Select **Domain scope**, and choose the appropriate leaf domain.
3. Select the category definition for the tag category whose priority you want to set.
4. In the Priority field, set the value.
5. Select **Update** to save the change.
6. If you want to apply your changes immediately rather than waiting for the automatic update within 24 hours, select the **Re-Categorize Tags** button.

Add or delete tag keys for Tag Categorization

Tag keys define the values available within a tag category. Add or delete tag keys to keep your tag categorization structure current as data management and classification requirements change.

Before you begin

Verify that you have installed version 1.16.3 of Service Mapping Plus to access to the CI tag category and CI tag key tables. For more information, see Install Service Mapping Plus.

Role required: tag_governance_admin

Procedure

1. Navigate to **All** > *Tag Governance* > **Tag Categories**.
2. Verify that you're in the leaf domain.
   a. In the page header, select the globe icon ( ).
   b. Select **Domain scope**, and choose the appropriate leaf domain.
3. Select the tag category to which you want to add or delete tag keys.
4. Under **CI tag keys**, either add a tag key or delete an existing tag key.

Action	Steps
Add a tag key	**a.** Double-click the empty row under **Tag key**, where you see **Insert a new row**. **b.** In the field, add a key name. **c.** Select the check mark icon ( ) to save the tag key. **d.** Repeat the previous steps to add more tag keys. **e.** Select **Update** to save your changes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Action	Steps
Delete a tag key	**a.** Under **Tag key**, select the delete icon (⊗) next to the tag key you want to remove. **b.** Select **Update** to save your changes.

5. If you want to apply your changes immediately rather than waiting for the automatic update within 24 hours, select the **Re-Categorize Tags** button.

Tag Governance reference

Reference topics provide additional information on Tag Governance forms and other resources.

Domain separation in Tag Governance

Domain separation is supported in Tag Governance. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

Domain separation

You can identify CIs or cloud resources that are inconsistent and do not comply with the policies that you configure to govern tag data. In Tag Governance, domain separation targets tenant domain requester use cases in an application. The application has been designed to support requester activities within tenant domains. Logic is in place to route data to tenant domains, based on applicable use cases. The owner of the instance must be able to set up the application to function normally across multiple tenants. The application handles data routing to domains.

All tables in Tag Governance support data separation only; delegated domain separation is not supported.

To ensure that domain-sensitive information is not available at a global domain, ensure that you create policies at a domain level and not at a global level. While managing service providers, create policies at the service provider level. If you create policies at a global level instead, when you run the audit, the "run" findings are created in the Global domain instead of respective domains.

Tag policies and remediation for AWS

Tag audits apply policies to discovered CIs to determine tag compliance; existence of tags, appropriate count of tags, and the presence of specified key-value pairs.

Tag policies

Run a tag audit to audit discovered CIs for the following tag policy types:

- Tag Count: Checks CIs for the tag key count that you specify
- Tag Presence: Checks CIs for the presence of the tag key values that you specify
- Tag Key & Value: Checks CIs for the presence of key-value pairs that you specify.

Specify string value or tag keys that you are looking for in a comma-separated format in the Tag Presence policy type. You can also specify a number in the Tag Count check policy type to identify CIs with one or more tags. After you run the tag audits, you can view audit results and configure remediation measures that are based on the compliance index quality. Optionally, you can also assign remediation tasks for non-compliant CIs to user groups and users for follow-on tasks.

Auto-remediation works with the Assume Role on AWS to automate the tagging of cloud resources, by following the steps in Configure temporary credential access for trusted AWS accounts.

The Assume Role must have the following permissions (policy) for remediation to work:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "tag:TagResources",
            "Resource": [
                "arn:aws:ec2:*:*:instance/*",
                "arn:aws:ec2:*:*:security-group/*",
                "arn:aws:ec2:*:*:volume/*",
                "arn:aws:ec2:*:*:vpc/*",
                "arn:aws:ec2:*:*:subnet/*",
                "arn:aws:ec2:*:*:network-interface/*",

 "arn:aws:elasticloadbalancing:*:*:loadbalancer/*",
                "arn:aws:ec2:*:*:availability-zone/*",
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
                "arn:aws:ec2:*:*:public-ip/*",
                "arn:aws:storagegateway:*:*:gateway/*",
                "arn:aws:resource-groups:*:*:group/*"
            ]
        }
    ]
}
```

Note:

While performing tag remediation, if it is found that Discovery is credential-less, MID Server with Tag Management capability is picked. Hence, add Tag Management capability to the correct MID Server with service account IAM role attached. This action is essential because there might be several accounts that IAM role MID Servers must choose from.

Note: You must have the ITOM Visibility entitlements to run remediation on CIs in the CMDB. For more information, contact Customer Service and Support.

Tag Policies form

You use the Tag Policy form to configure tag compliance and health policies that are used in tag audits runs on discovered cloud resources or CIs.

Tag Policies form

Field	Description
Name	Unique and descriptive name for the policy.
Short Description	A short summary that describes the policy.
Policy Type	Policy type selection for the tag compliance and health audit. • Tag Count Policy: Check for a specific count of tags for CIs. • Tag Key Policy: Check for tags with specific values (string expressions). • Tag Key & Value Policy: Check for key-value pair and value strings. • Tag Category Policy: Check for tags with a specific category. **Important:** You must work in a leaf domain to use the Tag Category Policy. Based on your selection, you will specify additional values.
Expected Tag Count	This field appears only when the **Tag Count Policy** policy type is selected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tag Policies form (continued)

Field	Description
	CIs with fewer tags than the specified number are considered as failed or non-compliant. CIs that meet the value are considered certified against this policy. For example, if you specify `4`, the policy checks whether the CIs have at least four tags specified.
Expected Tag Keys	This field appears only when the **Tag Key Policy** policy type is selected. Policy that checks discovered CIs for the tags specified in the **Expected Tag Keys** field. Specify multiple tags or string expressions in a comma-separated list. For example, if you specify `prod,finance,cost center` the policy checks whether the CIs have all the specified tags. CIs that have all the specified tags as certified or fully compliant. If CIs are missing any of the listed tags, they're considered failed or non-compliant.
Tag Key & Value Checks	Execute this policy to check discovered CIs for the tag key and values specified in the **Tag Keys & Value Checks** field. You can specify multiple tag key & value pairs or specify a script to check for a collection of values. For example, you can specify `user` in the **Key** field, and `admin` in the **Value** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tag Policies form (continued)

Field	Description

	Note:
	The **Script** field appears only when **Tag Key & Value Policy** is selected in the **Policy Type** field. Use the **Script** field to specify multiple values to return a string set.
	Example code
	`// The script should return a string set to tagValues variable.`
	`// the code sets the tagValues array with name of the CI`
	`// by this the check will be done for the tag to match the CI's name`
	`tagValues = [ci.name.toString()];`

Active	Option to activate or deactivate the run schedule.
Run on cloud events	Option to enable real-time audit runs when cloud events occur. **Note:** Ensure that you have configured auto-updating the CMDB with cloud events for the relevant cloud provider.
Save cert audit result	Option to save the certification audit findings and incorporate tag audit outcomes in a CI's health calculations. **Note:** This option can be activated if there is a business need to incorporate tag audit outcomes in CI health calculations.
Run	Frequency at which the tag audit runs. • **Daily** • **Monthly** • **Weekly**

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tag Policies form (continued)

Field	Description
	• **Periodically** • **Once** • **On Demand** **Note:** To run an audit immediately after configuring the policy, select the **On Demand** option. • **Business Calendar: Entry Start** • **Business Calendar: Entry End**
Next scheduled run date	Date and time on which the tag audit is next scheduled to run. This field appears only for scheduled runs and not for on-demand runs.
Filters	Condition statements with a series of contextually generated fields. Use lookup lists to build conditions and filter the CIs eligible for audit. Dynamic conditions and filters you specify to fetch the desired tags based on service accounts and associated datacenters.
Table	Displays the *Configuration Item [cmdb_ci]* table to which filters are applied.
Policy Criteria	Other policy criteria that you can configure using dynamically populated reference lookup lists. The Configuration Item [cmdb_ci] table populates the data for this lookup list. For more information, see the Reference lookup.
Tag Filter	Filter CIs further based on **Key**, **Keywords**, and **Value** that you specify. Use the condition builder to customize a filter.
Task Assignment	Option to assign follow-on tasks to users or user groups.
Create Tasks	Option to create follow-on tasks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tag Policies form (continued)

Field	Description
	Note: If there is an existing task mapped to a CI and tag policy, the *sn_itom_tag.allow_new_cert_follow_on_tas* system property determines whether to create a new task or update an existing one when there is a compliance failure: • To update the existing task with the compliance failure details but not create a new task, set the property to false (default) • To create a new task, set the property to true.
Group	This field appears only when you select the **Create Tasks** check box. Assignment group to which to assign the task. Use lookup lists to select a group.
User	Specific user from the assignment group to whom you want to assign the task. Use lookup lists to select a user. This field appears only when you select the **Create Tasks** check box.

Tag Remediation Key form

You use the Tag Remediation Key form to create a tag remediation key.

Tag Remediation Key form

Field	Description
Key	Tag key value that is used to remediate non-compliant CIs. For example, if the remediation preview shows the value as `cost center`, you can specify `cost center` as a new remediation key if it doesn't exist.
Order	Order of execution that the system considers when you initiate remediation. For example, you can run a tag count policy for four tags and identify CIs that are missing two tag keys. If you've configured multiple remediation keys, the system considers the two keys with the lowest values in the order field.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tag Remediation Key form (continued)

Field	Description
Remediation	Remediation name and record preview.
Value Type	Type of the value that you specify in the **Value** field — **Static** or **String**. Based on your selection, you must specify a script or a value for the tag key.
Value	String value for the key that you're creating. This field appears only when **String** is selected in the **Value Type** field.
Script	Script code to generate values for the key. This field appears only when **Script** is selected in the **Value Type** field.

Components in Tag Governance

Several key components are installed with, or linked to, the Tag Governance plugin to help standardize and manage your organization's tags.

Roles installed

Role title	Description	Contains roles
[tag_governance_admin]	Sets up and manages the tag governance application. Defines and enforces tag policies, manages tag categories and values, and promotes compliance with organizational standards. Performs advanced configuration and customization of tag governance features. Assign this role to application administrators.	• [itil] • [certification_admin] • [discovery_admin] • [flow_operator]
[tag_reports_viewer]	Views and analyzes tag reports related to tag usage and compliance. Assign this role to users who monitor and analyze tag data.	[cmdb_read]

Tag categories installed

Starting with version 1.7.0, the predefined categories listed in the table are installed with Tag Governance and require the installation of at least Service Mapping Plus version 1.16.3. For more information see Install Service Mapping Plus.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tag category	Definition (Regex)
Application ID	applicationid|application-id|app-id|appid|application id|app id
Assignment Group	assignment-group|assignment_group|assignment group|assignmentgroup|assign group
Cost Center	costcenter|cost-center|cost_centre|costcentre|cost-centre|cost centre
Environment	env|envt|environ|environment
Owner	own|owner|owners|ownership|owned

Properties installed

Property	Description
sn_itom_tag.glide.script.block.client.globals	Controls the access client-side scripts have to global variables for enhanced security. If set to true, these scripts can't access global variables. • **Type:** boolean • **Value:** true/false • **Default value:** False
sn_itom_tag.allow_new_cert_follow_on_task	Enables the creation of new certification follow-up tasks for each audit in Tag Governance. • **Type:** boolean • **Value:** true/false • **Default value:** False
sn_itom_tag.azure_window_size_in_mins	Time window size, in minutes, to check for changes in Azure Resources. This value helps determine the start and end times for the check: **Start time:** The time the event occurred minus the time window size. **End time:** The time when the event occurred plus the time window size. • **Type:** integer • **Default value:** 10
sn_itom_tag.performance.config.bulksize	Sets the number of app data items to process at one time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	• **Type:** integer • **Default value:** 5000
sn_itom_tag.last_event_processed	Indicates the last tag event successfully processed to verify that the system is up to date with the latest changes. • **Type:**string • **Default value:**
sn_itom_tag.max_audit_lag_ratio	Sets the maximum acceptable ratio of delay for tag audits to confirm that tag policy audits are performed within a specified time frame. • **Type:** integer • **Default value:** 2
sn_itom_tag.tag_event_batch_size	Sets the number of tag events, such as the creation, update, or deletion of tags, processed together in a single batch. • **Type:** integer • **Default value:** 500
sn_itom_tag.policy_batch_size	Sets the number of items processed together in a single batch when a tag policy audit is run. • **Type:** integer • **Default value:** 1000

Cloud Discovery Workspace

Cloud Discovery Workspace offers a comprehensive solution to manage the cloud operations of your organization.

Important: Cloud Discovery Workspace is now deprecated and no longer supported or available for new activation. Discovery Admin Workspace provides the latest experience for this functionality. For details, see the Application/Plugin Deprecation Process [KB0867184] article in the Now Support knowledge base.

Get Started

Choose one of these tiles to get started.

- Search the Known Error Portal for known error articles
- Contact Customer Service and Support

Install Cloud Discovery Workspace

You can install the Cloud Discovery Workspace application (com.cloud_operations_workspace) if you have the admin role.

Before you begin

Important: Cloud Discovery Workspace is now deprecated and no longer supported or available for new activation. Discovery Admin Workspace provides the latest experience for this functionality. For details, see the Application/Plugin Deprecation Process [KB0867184] article in the Now Support knowledge base.

When Cloud Discovery Workspace is installed, several plugins and applications are also installed. For more information, see Plugins or applications installed with ITOM Visibility.

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Cloud Discovery Workspace requires the following plugin. Ensure that the following plugin is activated before you install Cloud Discovery Workspace.

  Required ServiceNow plugins

  Discovery (com.snc.discovery)

  ServiceNow Cloud Discovery finds applications and devices on your network, and then updates the CMDB 360 with the information it finds. For more information on activating Discovery, see Request Discovery.

Role required: admin

About this task

When you install the Cloud Discovery Workspace application, it automatically installs the following role:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cloud Discovery Workspace role

Role name	Description and tasks	Nested roles
sn_cloud_ops_ws.cloud_ops_admin	The Cloud Discovery Workspace admin can perform the following actions: • View the Cloud Discovery Workspace dashboard • Create Cloud Discovery schedules • Monitor Cloud Discovery operations • View Cloud Discovery reports	• sn_itom_ui_comp.itom_component_user • discovery_admin • cloud_admin

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Cloud Discovery Workspace application (com.cloud_operations_workspace) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

   Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.
3. In the Application installation dialog box, review the application dependencies.

   Dependent plugins and applications are listed if they will be installed, are currently installed, or need to be installed. If any plugins or applications need to be installed, you must install them before you can install Cloud Discovery Workspace.
4. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
   Demo data are the sample records that describe application features for common use cases. Load the demo data when you first install the application on a development or test instance.
5. Select **Install**.

Cloud Discovery Workspace dashboard

The ServiceNow® Cloud Discovery Workspace dashboard provides a summary of the cloud operations of your organization and shows the ServiceNow applications that you can use to manage them.

Important: Cloud Discovery Workspace is now deprecated and no longer supported or available for new activation. Discovery Admin Workspace provides the latest experience for this functionality. For details, see the Application/Plugin Deprecation Process [KB0867184] article in the Now Support knowledge base.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Required ServiceNow AI Platform roles

sn_cloud_ops_ws.cloud_ops_admin.

Access the Cloud Discovery Workspace dashboard

To open the dashboard, navigate to **All** > **Cloud Discovery Workspace**.

Use cases

User	Dashboard use
sn_cloud_ops_ws.cloud_ops_admin	• Gain insight into the trend of CI discovery, trend of Cloud Discovery events, and Cloud Discovery errors • Select the cloud provider of your organization. • Access the applications that you can use to manage the cloud operations of your organization.

Indicators

Discovery errors today: Count of all Cloud Discovery errors that occurred during the scheduled discoveries over the last 24 hours.

Reports

The following reports are available in the Cloud Discovery Workspace dashboard:

Title	Type	Source table	Description
Total configuration items	Line and area chart 	cmdb_ci	This report displays the number of CIs discovered over time. Select the report to view the list of all the configuration items discovered so far. You can select any CI record to view more information about the CI and its multi-source data if available.
Events by provider - last 24 hours	Line chart	sn_cmp_cloud_event_list	This report displays the trend of the cloud events received over the last 24 hours. The report contains a separate trend line for each cloud provider.

In addition, the dashboard cards display the applications that you can use to manage the cloud operations of your organization. Use the Cloud provider selection page to select the cloud providers of your organization. The selection helps to customize the menus of the Cloud Discovery Workspace applications and display only the cloud providers that are relevant for your organization.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Access the UI Builder in Cloud Discovery Workspace

Access your Configurable Workspace experience in UI Builder for editing.

Before you begin

Role required: ui_builder_admin or admin

Procedure

1. In the navigation filter, navigate to **All** > **Now Experience Framework** > **UI Builder**.
2. Select **Experiences**.
3. Select your experience.

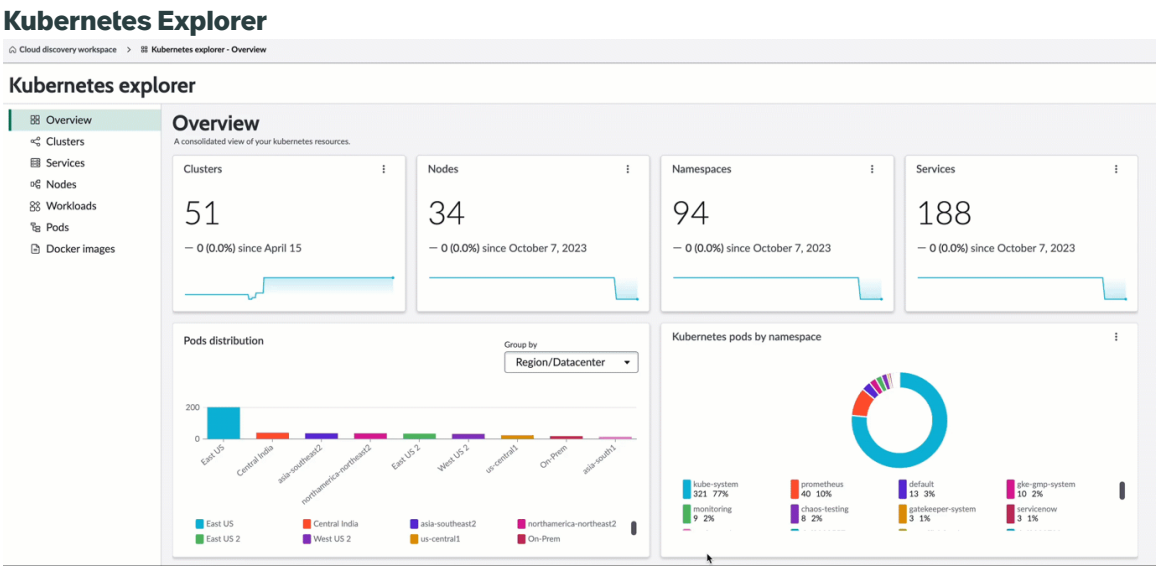
Result

Your configurable experience opens in UI Builder.

Kubernetes Explorer

Use the ServiceNow® Kubernetes Explorer to drill-down and view the Kubernetes environments and resources of your organization.

Important: Cloud Discovery Workspace is now deprecated and no longer supported or available for new activation. Discovery Admin Workspace provides the latest experience for this functionality. For details, see the Application/Plugin Deprecation Process [KB0867184] article in the Now Support knowledge base.



The Kubernetes Explorer supports the following cloud providers:

- Amazon Web Services (AWS): Amazon Elastic Kubernetes Service (EKS)
- Microsoft Azure Cloud: Azure Kubernetes Service
- Google Cloud Platform (GCP): Google Kubernetes Engine (GKE)
- OpenShift

Important: In the Kubernetes Explorer, any Kubernetes resource hosted on OpenShift is considered on-prem. Whereas, any Kubernetes resource hosted on Amazon Web Services (AWS), Microsoft Azure, and Google Cloud Platform (GCP) is considered cloud hosted.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Required ServiceNow AI Platform roles

The sn_cloud_ops_ws.cloud_ops_admin role is required to view the Kubernetes Explorer.

Access the Kubernetes Explorer

To open the dashboard, navigate to **All** > **Cloud Discovery Workspace** > **Kubernetes Explorer**.

Important: Starting with the Zurich release, Cloud Discovery Workspace is being prepared for future deprecation. It will be hidden and no longer activated on new instances, but will continue to be supported. Discovery Admin Workspace provides the latest experience for this functionality. For details, see the Application/Plugin Deprecation Process [KB0867184] article in the Now Support knowledge base.

Use cases

For examples of how different people in your organization would use this dashboard, see these use cases.

User	Dashboard use
Application owner	Review the statistics of the applications and workloads running on the Kubernetes clusters.
IT admin, cloud admin	• Review the statistics of the Kubernetes infrastructure: Clusters, Nodes, Namespaces, Services, Pods, and Workloads. • Review the distribution of the pods across dimensions such as region/datacenter, geo location, or country. • Review the distribution of the pods across namespaces. • Review the list of Kubernetes docker images used in your organization.

Indicators

Clusters

A Kubernetes cluster is a set of nodes that run containerized applications. The Clusters indicator displays the daily total count and discovery trend of the Kubernetes clusters discovered across the Kubernetes deployments of your organization.

The Kubernetes Explorer reads the Kubernetes Cluster Analytics [sn_cow_k8s_cluster_analytics] table to compute the Clusters indicator.

Nodes

A node is a worker machine in Kubernetes and may be either a virtual or a physical machine, depending on the cluster. The Nodes indicator displays the daily total count and discovery trend of the Kubernetes nodes discovered across the Kubernetes deployments of your organization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Kubernetes Explorer reads the Kubernetes Node Analytics [sn_cow_k8s_node_analytics] table to compute the Nodes indicator.

Namespaces

Kubernetes namespaces provides a mechanism for isolating groups of resources within the cluster. The Namespaces indicator displays the daily total count and discovery trend of the Kubernetes namespaces discovered across the Kubernetes deployments of your organization.

The Kubernetes Explorer reads the Kubernetes Namespace Analytics [sn_cow_k8s_namespace_analytics] table to compute the Namespaces indicator.

Services

Kubernetes service is an abstraction which defines a logical set of pods and a policy by which to access them (sometimes this pattern is called a micro-service). The Services indicator displays the daily total count and discovery trend of the Kubernetes services discovered across the Kubernetes deployments of your organization.

The Kubernetes Explorer reads the Kubernetes Service Analytics [sn_cow_k8s_service_analytics] table to compute the Services indicator.

The Services indicator is also available on the Services tab of the Kubernetes Explorer.

Breakdowns

- Pod distribution: This breakdown displays the distribution of Kubernetes pods hosted on the on-prem infrastructure and the cloud infrastructure.

  You can filter the breakdown across the following dimensions:

  - Region/Datacenter
  - Geo Location
  - Country

  The Pod distribution breakdown is available on the Overview tab of the Kubernetes Explorer.

- Kubernetes services by platform or Kubernetes services by type: This breakdown displays the distribution of Kubernetes services across dimensions such as platform and type.
- Nodes by region: This breakdown displays the distribution of the Kubernetes nodes across hosting regions.

Filter

You can filter the list by interacting with the data visualizations such as donut and single score card.

Total pods	List	Kubernetes Pod Analytics [sn_cow_k8s_pod_analytics]	This report lists the Kubernetes pods discovered across the Kubernetes deployments of your organization. This report is available on the Pods tab. When you click the pod name, the Dependency Views map appears for Cluster Configuration Item.
Docker images	List	Kubernetes Image Analytics [sn_cow_k8s_img_analytics]	This report lists the Docker images discovered across the Kubernetes deployments of your organization. This report is available on the Docker images tab. When you click the doker image name, the Dependency Views map appears for Cluster Configuration Item. You can download the SBOM. To generate the SBOM, see Download a software bill of materials (SBOM).

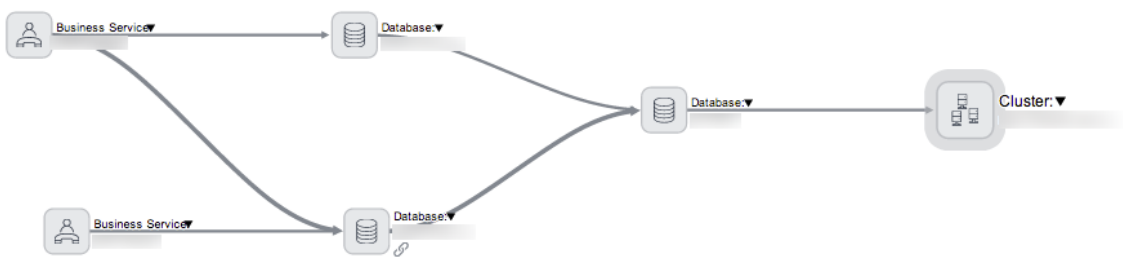
Dependency Views map

ServiceNow® The Dependency Views map shows an overall top-down Kubernetes perspective, starting from a top-level cluster to the container and within the container.

A Dependency Views map has one starting point, called the root CI or root node of the map. The root CI is surrounded by a darker frame that repaints itself with a pulsing effect drawing the attention to the root CI. The maps can show both upstream and downstream dependencies for the root CI. By default the Dependency Views map displays three levels, both upstream and downstream relationships. Administrators can configure the number of levels displayed. The map collapses and expands clusters to make them easier to view. By default, clusters are collapsed.

The Dependency Views module is active in all instances, and includes demo data.

Dependency Views sample map



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In a Dependency Views map, map indicators indicate if a CI has any active, pending issues. You can investigate the tasks that are connected to a CI to get more details. When you return to the map from another form, the system restores the last map viewed, using the default filter and layout settings.

Many of the relationships in the map are created through the discovery process. You can also create, define, and delete CI relationships in the map. You can display the map from different perspectives and open specific records that relate to configuration items. The system refreshes the map automatically to reflect changes to the CMDB.

Note: CIs not extended from the Configuration Item [cmdb_ci] table, aren't displayed in Dependency Views maps and in CI relation formatters.

Roles

Users with the itil and ecmdb_admin roles can view maps and perform all actions in the map. Actions include access to the map views and saved filters, both from the lists in the map and from the **Saved Filters** module.

Cloud License Estimator

Cloud License Estimator estimates the resource count for all cloud resources eligible for licensing.

Explore	Configure	Generate Reports
Learn about Cloud License Estimator.	Set up credentials and configure accounts.	Generate reports with Cloud License Estimator.

Cloud License Estimator features

Learn about Cloud License Estimator features.

Use Cloud License Estimator to get the estimated resource count for all cloud resources eligible for licensing based on ITOM and CCM licensing rules. It validates the cloud account details provided by the user and estimates the resource count based on the prevailing licensing rules.

Cloud License Estimator provides the count of cloud resources along with the required license estimates. CLE supports AWS and Azure cloud environments, but not government cloud services. You can create a configuration by providing the necessary details and then run the license estimator to get the report. You can also download the report in PDF format.

Configure Cloud License Estimator

Set up the accounts and credentials needed for Cloud License Estimator.

Configure Azure Credentials for Cloud License Estimator

Configure Azure Service Principal credentials for Cloud License Estimator. If credentials are already configured in the ServiceNow instance, those credentials can be used.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

Procedure

1. Navigate to **Filter Navigation** > **All** > **ITOM Cloud License Estimator** > **Home**.
2. On the Home page, select **Go to Credentials** to open the **Credentials (discovery_credentials)** page.
3. Select **New** > **Azure Service Principal** and enter the Azure Service Principal Account details.

Result
A **Credential ID** is generated, which is required when creating configurations.

Create an Azure account configuration and generate CLE reports

Create an Azure account configuration to estimate the cloud resource count for licensing. Management accounts include all subscriptions under that account.

Before you begin
Role required: admin

Procedure

1. Navigate to **Filter Navigation** > **All** > **ITOM Cloud License Estimator** > **Home**.
2. On the Home page, select **Create Configuration** to open the Create Configuration dialog.
3. Enter the following details:
   - **Name**: Enter a name for the configuration.
   - **Cloud Provider**: Choose **Azure** from the list. Fill in the additional fields that appear.
   - **Account ID**: Enter the management account ID or subscription ID.
   - **Management group**: Select this checkbox if the Account ID is a management account.
   - **Credentials**: Select the Azure Service principle credentials configured in Configure Azure Credentials for Cloud License Estimator.
   - **Activate**: Enable this option.
4. Select **Save and run license estimator**.

   The configuration is saved and the tool generates the report. You are redirected to the **Report** page where the status of the report generation can be tracked.

5. From the **Report** page, select **Download resource report** to download a PDF of the report.

service accounts. At least one service account must have credentials to generate temporary credentials.

Procedure

1. Navigate to **Filter Navigator** > **All** > **ITOM Cloud License Estimator** > **Home**.
2. On the Home page, select **Go to Credentials** to open the **Credentials (discovery_credentials)** page.
3. Select **New** > **AWS Credentials** and enter the requisite information.
   A **Credential ID** is generated, which is used when creating configurations.

Configure AWS service accounts for Cloud License Estimator

There are several ways to configure AWS Service Accounts depending on the credentials and master accounts.

Before you begin
Role required: admin

About this task
You can configure service accounts with these options:

- Configure a service account with permanent credentials. When an account is configured with permanent credentials, it is referred to as an accessor account. This account can be either a management account or member account.
- Configure a management account with the IAM role.
- Configure a member account with a custom IAM role. If the member account uses the default IAM Role (OrganizationAccountAccessRole) to generate temporary credentials, configuring a service account for the member account is not required.

Procedure

1. Navigate to **Filter Navigation** > **All** > **ITOM Cloud License Estimator** > **Home**.
2. Select the **Service Account List** icon.
3. On the **Service account** page, select **Create New**.
4. **Optional:** To configure a service account with permanent credentials, enter the following information:
   - (Optional) **Name**: Enter the AWS account name.
   - (Optional) **Cloud provider**: Select AWS.
   - (Optional) **Account ID**: Enter the AWS account ID.
   - (Optional) **Master account**: Select if this is a management account.
   - (Optional) **Credentials**: Select the AWS Credential ID created for permanent credentials.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- (Optional) **Master account**: Leave blank if not applicable.
- (Optional) **Accessor Account and Accessor role ARN**: Not applicable for permanent credentials.

5. **Optional:** To configure a management account with the IAM role, enter the following information:
   - (Optional) **Name**: Enter the AWS account name.
   - (Optional) **Cloud provider**: Select AWS.
   - (Optional) **Account ID**: Enter the AWS account ID.
   - (Optional) **Master account**: Select if this is a management account.
   - (Optional) **Credentials**: Leave blank. No credentials are required for this account.
   - (Optional) **Master account**: Leave blank.
   - (Optional) **Accessor Account**: Select the account that has a trust relationship with this management account's IAM role.
   - **Accessor role ARN:** Enter the full ARN of the IAM role.
6. **Optional:** To configure a member account with a custom IAM role, enter the following information:
   - (Optional) **Name**: Enter the AWS account name.
   - (Optional) **Cloud provider**: Select AWS.
   - (Optional) **Account ID**: Enter the AWS account ID.
   - (Optional) **Master account**: Do not select this, as this is a member account.
   - (Optional) **Credentials**: Leave blank. No credentials are required for this account.
   - (Optional) **Master account**: Select the management account from the list.
   - (Optional) **Accessor Account**: Choose the account that has a trust relationship with this member account's IAM role. This can be either the management account or another member account.
   - **Accessor role ARN:** Enter the full ARN of the IAM role.
7. After providing the relevant information for your account type, select **Save**.

Create an AWS account configuration and generate CLE reports

Create an AWS account configuration to estimate the cloud resource count for licensing. Management accounts include all subscriptions under that account.

Before you begin

Role required: admin

Procedure

1. Navigate to **Filter Navigation** > **All** > **ITOM Cloud License Estimator** > **Home**.
2. On the Home page, select **Create Configuration** to open the Create Configuration dialog.
3. Enter the following details:
   - **Name**: Enter a name for the configuration.
   - **Cloud Provider**: Choose **AWS** from the list. If you choose the credential based option, additional fields appear.
   - **Account ID**: Enter the AWS Account ID.
   - **Management group**: Select this checkbox if the Account ID is a management account.
   - **Credentials**: Select the AWS credentials configured for this account.
     - **Config aggregator account**: Enter the Account ID where the aggregator is created.
     - **Config aggregator name**: Enter the name of the AWS Config Aggregator.
     - **Config aggregator region**: Enter the AWS Region where the aggregator is created.
   - **Activate**: Enable this option.
4. Select **Save and run license estimator**.

   The configuration is saved and the tool generates the report. You are redirected to the **Report** page where the status of the report generation can be tracked.

5. From the **Report** page, select **Download resource report** to download a PDF of the report.

Related topics

Generate Cloud License Estimator reports

Generate Cloud License Estimator reports

Cloud License Estimator reports provide an overview of account information.

The downloaded PDF of the resource report contains an overview of the account's information, such as the Cloud Provider, Account Configuration name, and total resource count.

The report distinguishes between CCM Licensable Resources and ITOM Licensable Resources. On the following pages, the report contains tables of the CCM and ITOM resources.

ITOM Infra Services Workspace

The dashboard integrates several tables so that issues can be monitored and resolved. The workspace provides real-time monitoring, proactive alerts, automation of common tasks, and centralized diagnostics to reduce downtime and support tickets.

© 2026 ServiceNow, Inc. All rights reserved.

Explore	Configure	Workspace applications
Learn about ITOM Infra Services Workspace.	Set up your workspace.	Monitor your applications.

Explore ITOM Infra Services Workspace

The ITOM Infrastructure Services Workspace provides real-time monitoring, proactive alerts, automation of common tasks, and centralized diagnostics to reduce downtime and support tickets.

The ITOM Infrastructure Services Workspace dashboard provides an overview of applications, such as your active MID Servers and ACC agents, and their issues. The dashboard enables you to drill into issues by category and take corrective actions.

For example, selecting a MID Server card shows a table of MID Servers. Then the **Server Actions** drop-down menu enables you to perform any available action such as validating or re-keying the MID Servers. The **Server Actions** menu enables you to perform corrective actions to multiple MID Servers at once from the overview.

The ITOM Infrastructure Services dashboard also displays the top three ACC errors on the ACC agent card. You can view the error and have a quick glance at its details. Select **View all** to see all the errors.

Configure ITOM Infra Services Workspace

The dashboard provides real-time monitoring, proactive alerts, automation of common tasks, and centralized diagnostics to reduce downtime and support tickets.

The ITOM Infra Services Workspace is available out of the box with the Australia family release, and is available as a Store release in the Yokohama and Zurich family releases.

The ITOM Infra Services Workspace and MID Server workspace are provided by default. Additional applications are installed if you have the corresponding plug-ins on the instance.

Use ITOM Infra Services Workspace

The dashboard integrates different applications to provide real-time monitoring, proactive alerts, automation of common tasks, and centralized diagnostics to reduce downtime and support tickets.

MID Server Workspace

See a concise overview of MID Server activity. The workspace provides real-time monitoring and enables corrective actions across multiple MID Servers.

ITOM Infrastructure Services dashboard

The MID Server panel is displayed on the ITOM Infrastructure Services dashboard to provide an overview of MID Server issues.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Selecting any of the cards in the MID Server panel, such as **Servers down** or **Servers with issues**, takes you to that detailed table.

This page also provides a set-up link to Download a MID Server.

MID Servers tables

Navigate to the MID Servers workspace either by selecting its icon from the application list or by selecting a card from the dashboard. Each of the cards on the dashboard corresponds to the cards in this workspace view.

Selecting a card shows a table of MID Servers filtered by category. You can customize the filter by selecting the filter icon, and save the filters with the **Saved filters** drop-down menu. Group and sort the results by selecting the **Show column filter row** icon in the category row.

On the **Total MID Servers** table, a banner enables you to quickly filter for MID Servers that have been created in the past week. Use this filter to monitor new MID Servers and diagnose any issues from their deployment.

Server Actions

MID Servers can be selected by the check box on the table, then the **Server Actions** drop-down menu enables you to perform any available action. These actions include Validating or Rekeying the MID Servers. This **Server Actions** menu enables you to perform corrective actions to multiple MID Servers at once from the overview.

Detailed view

Selecting a MID Server's name navigates to a detailed view of that MID Server. On the Status, Validated, and Unresolved Issues cards, relevant correction actions are shown such as upgrading or validating the MID Server. If the MID Server has any alerts, they are shown in a banner.

If the user has the SOAP ECC queue role, then the View ECC Queue button becomes visible, which navigates to the ECC Queue table.

In the **MID Server details** view, selected from the context menu, you can edit the **Purpose** field to save any notes about the MID Server's purpose. This field is only a text note and does not change anything about the MID Server.

The **Purpose** field can be viewed from the dashboard tables by adding it to the **Personalize fields** menu, accessed through the three-dot menu beside the **Server Actions** menu.

The **MID Server configuration** and **Troobleshooting** sections of the context menu show the records assigned to this MID Server. You can access the MID Server properties or logs. Use the **Create** button to create new records, or the **Manage** button to manage existing ones. You can filter the list of records by selecting the filter icon.

Use the Agent Client Collector (ACC) admin workspace

Use the Agent Client Collector (ACC) admin workspace to monitor the status of your agents.

Before you begin

Role required: agent_client_collector_admin

About this task

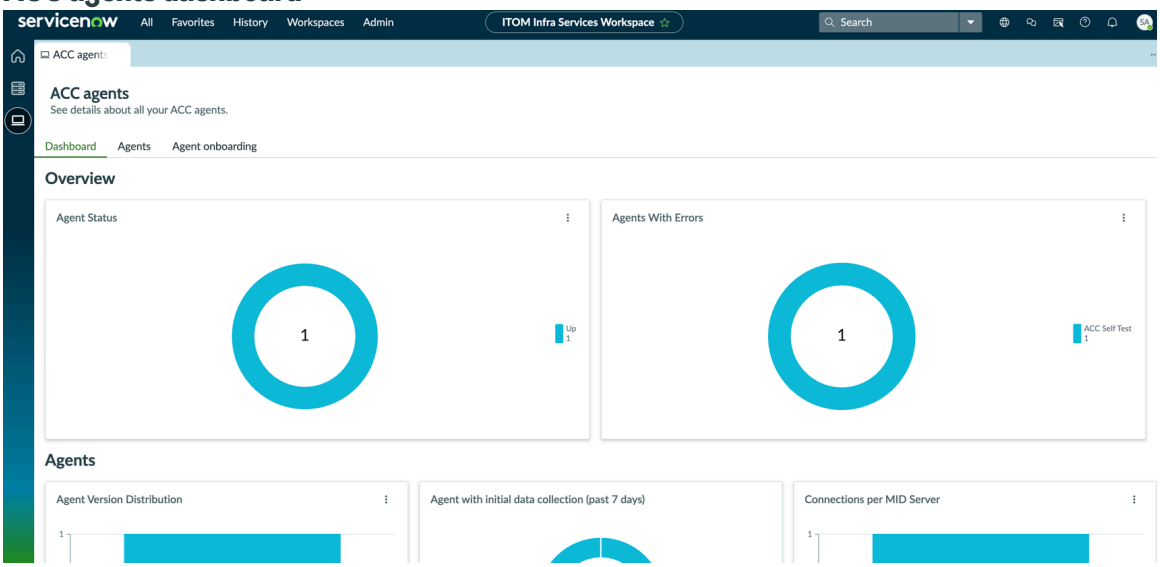
For details on the information accessible on the ACC admin workspace, see Agent Client Collector (ACC) admin workspace information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **ITOM Infra Services Workspace**.
2. Select the **ACC agents** icon .
   The ACC agents page appears, displaying an overview of the agents in your system on the Dashboard tab.

ACC agents dashboard



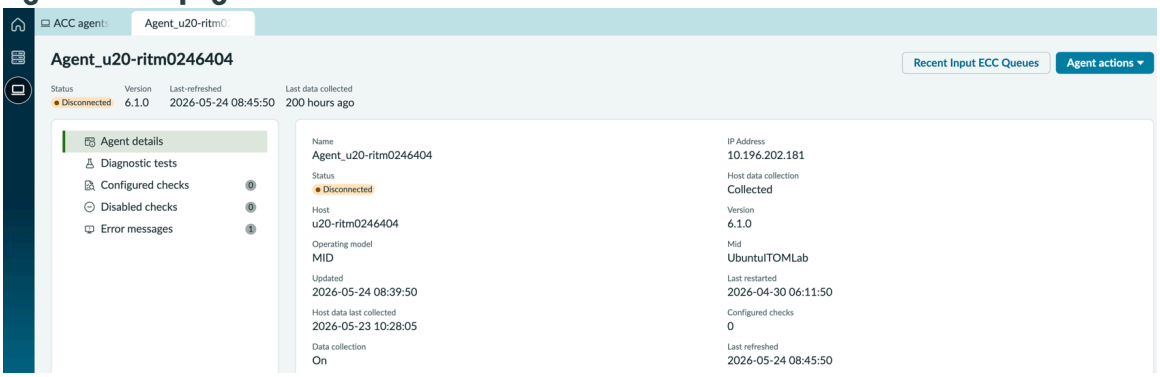
3. Select the **Agents** tab to view a list of the agents.

ACC agents page in Workspace

   You can filter the displayed agents by selecting one of the boxes at the top of the page. For example, select **Agents down** to filter the list by agents that are currently down.
4. Select an agent in the agents list to view details of the agent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agent details page



5. **Optional:** Select the **Agent actions** button and select from actions to perform on the agent. For details on the available actions, see Agent Client Collector (ACC) admin workspace agent actions.

> **Note:** The **Agent actions** button displays only when you have installed Agent Client Collector Framework version 6.0.0 or higher.

Generate an Agent Client Collector installation plan

Configure and deploy new agents in your environment, using the Agent Onboarding guide. The Agent Onboarding guide generates a customized installation plan for deploying the Agent Client Collector on your endpoints or servers.

Before you begin

Ensure that you have installed Agent Client Collector admin workspace version 1.1.0.

Role required: agent_client_collector_admin

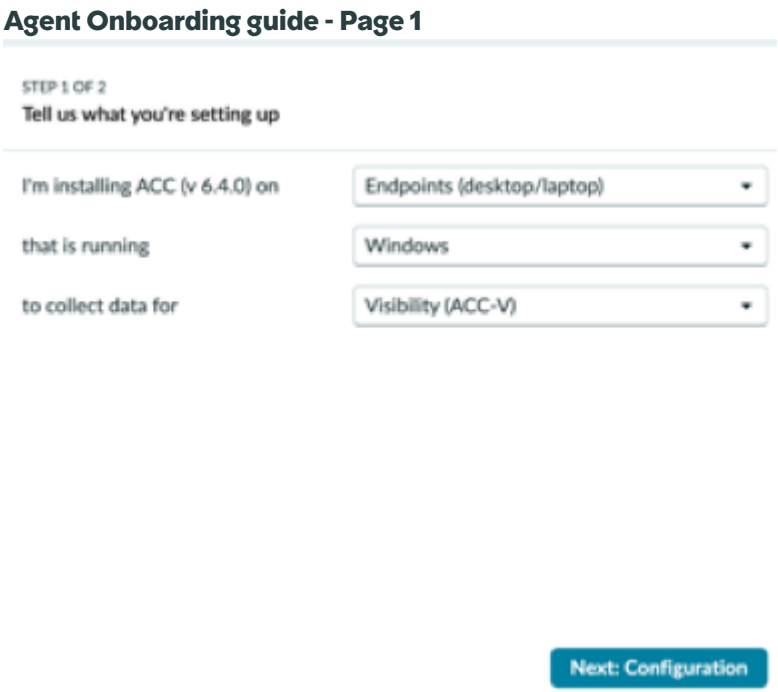
About this task

The Agent Onboarding guide generates a customized installation plan based on your deployment type, operating system, and use case. The plan includes the commands and configuration steps required to install the Agent Client Collector on your endpoints or servers.

Procedure

1. Navigate to **Workspaces** > **ITOM Infra Services Workspace**.
2. Select the **ACC agents** icon .
3. Select the **Agent onboarding** tab.
   Page 1 of the Agent Onboarding guide opens.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Configure the fields on the page.

Agent Onboarding guide fields

Field	Description
I'm installing ACC <version number> on	Place where you're installing your agent, either endpoints or servers.
that is running	Platform on which the agents are running.
to collect data for	Component for which the agent is collecting data.

5. Select **Next: Configuration**.
   Page 2 of the Agent Onboarding guide opens, displaying default configuration settings for the component for which you're collecting data.
6. Activate the toggle switch for a setting to enable customizing the value.
   For details on the available settings, see Agent onboarding configuration settings.
7. Select the **Next: Installation plan** button to view the agent installation plan, based on your configured settings.
   For details on the displayed agent installation plan steps and the commands required to be carried out for each, see Agent installation plan steps.

   The settings configured for your agent appear in the Agent configuration panel.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agent configuration panel

8. **Optional:** Select **Export plan** to download and print the installation plan.

Result

The installation plan is generated and ready to use. Each step in the plan includes the commands or configuration actions required to deploy the Agent Client Collector on your endpoints or servers.

What to do next

After completing the installation plan steps, verify that the agent is running and connected to the ServiceNow instance, on the ACC agents page.

Run diagnostics on an Agent Client Collector agent

Run automated self-tests on an Agent Client Collector (ACC) agent from the ITOM Infra Services Workspace to identify and address agent issues. View agent errors and invoke the relevant remediation steps.

Before you begin

- Agent Client Collector Framework version 6.2.0 or higher must be installed.
- The agent status must be Up to start a diagnostic run.
- Role required: agent_client_collector_admin

About this task

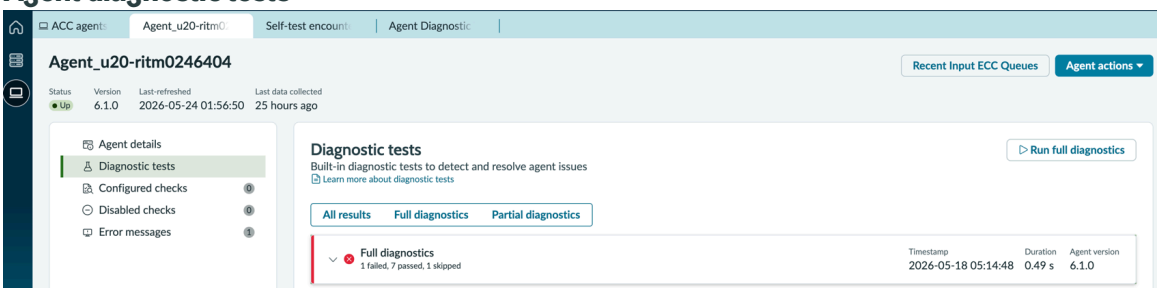
Agent diagnostics runs automated self-tests on an ACC agent directly from the agent record. After a run completes, results appear on the **All Results**, **Full Diagnostics**, and **Partial Diagnostics** tabs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **ITOM Infra Services Workspace**.
2. Select **Manage ACC agents** to view the list of ACC agents.
3. Select an agent on the **Agents** tab to open the agent record.
4. In the agent feature tree, select **Diagnostic tests**.

Agent diagnostic tests



5. Select **Run full diagnostics**.
   Results populate across the All Results, Full Diagnostics, and Partial Diagnostics tabs after the run completes. Runs can take up to 60 seconds.

   If results don't appear within 60 seconds, the run timed out. Refresh the page and check for any errors.

   If the MID Server associated with the agent is not reachable, diagnostic runs cannot complete. Verify that the MID Server is running before retrying.

6. **Optional:** Select an individual test to open its detail page.
   The detail page shows the following information:

Test detail page

Area	Description
Summary fields	Severity, last result, last run timestamp, and the agent the test ran on.
Result History tab	A chronological list of past runs with status and expandable log output. Log lines can be copied to the clipboard.
Troubleshooting Guide tab	Step-by-step remediation suggestions. (Optional) Appears only when the test has a known error code with linked guidance.

7. **Optional:** Select **Run this test** to run the single test from the page.
8. **Optional:** To rerun only the failed tests, select **Rerun failed tests**.
   This button appears only when the run produced failures. Selecting it re-executes only the failed tests and leaves passing tests unchanged.

Learning Enhanced Automation Platform (LEAP)

LEAP application uses AI-driven insights and automation to help manage IT operations.

Supported LLMs for ServiceNow Otto for ITOM

You can use Azure OpenAI, Google Gemini or Anthropic Claude on AWS as the AI model provider for ServiceNow Otto for ITOM skills and AI agents. You can set skill-level preferences in the AI Admin Hub console. For more information, see Large language models on the ServiceNow AI Platform.

Important:

- Not all model providers are available for customers with in-country SKUs, and some AI products/features are currently unavailable for in-country customers. For more information, see the KB1584492 article in the Now Support Knowledge Base. Be sure to check for model provider availability updates in future releases.
- Some AI products/features are currently unavailable for customers in the FedRAMP, NSC DOD IL5, or Australia IRAP-Protected data centers, self-hosted customers, or in other restricted environments. For more information, see the KB0743854 article in the Now Support Knowledge Base. Be sure to check for availability updates in future releases.
- Some AI products/features are currently available only for customers in some regions. Be sure to check for availability updates in future releases.
- Some AI products and skills are not available in Regulated Markets. For more information, see KB2593939: Regulated Markets AI Products/Skills Not Available. Be sure to check for availability updates in future releases.

AI limitations

This application uses artificial intelligence (AI) and machine learning, which are rapidly evolving fields of study that generate predictions based on patterns in data. As a result, this application may not always produce accurate, complete, or appropriate information. Furthermore, there is no guarantee that this application has been fully trained or tested for your use case. To mitigate these issues, it is your responsibility to test and evaluate your use of this application for accuracy, harm, and appropriateness for your use case, employ human oversight of output, and refrain from relying solely on AI-generated outputs for decision-making purposes. This is especially important if you choose to deploy this application in areas with consequential impacts such as healthcare, finance, legal, employment, security, or infrastructure. You agree to abide by ServiceNow's AI Acceptable Use Policy, which may be updated by ServiceNow.

Data processing

This application requires data to be transferred from ServiceNow customers' individual instances to a centralized ServiceNow environment, which may be located in a different data center region from the one where your instance is, and potentially to a third-party cloud provider, such as Microsoft Azure. This data is handled per ServiceNow's internal policies and procedures, including our policies available through our CORE Compliance Portal.

Data collection

ServiceNow collects and uses the inputs, outputs, and edits to outputs of this application to develop and improve ServiceNow technologies including ServiceNow models and AI products. In addition, this application will collect information about scripts (and associated script records) in which ServiceNow Otto for ITOM for code generation is called. Customers can opt out of future data collection at any time, as described in the Now Assist Opt-Out page.

For more information, see the Now Assist documentation.

Exploring LEAP

LEAP categorizes similar incidents into groups and uses AI to generate resolution steps, problem records, AI-enhanced knowledge base articles, and playbooks.

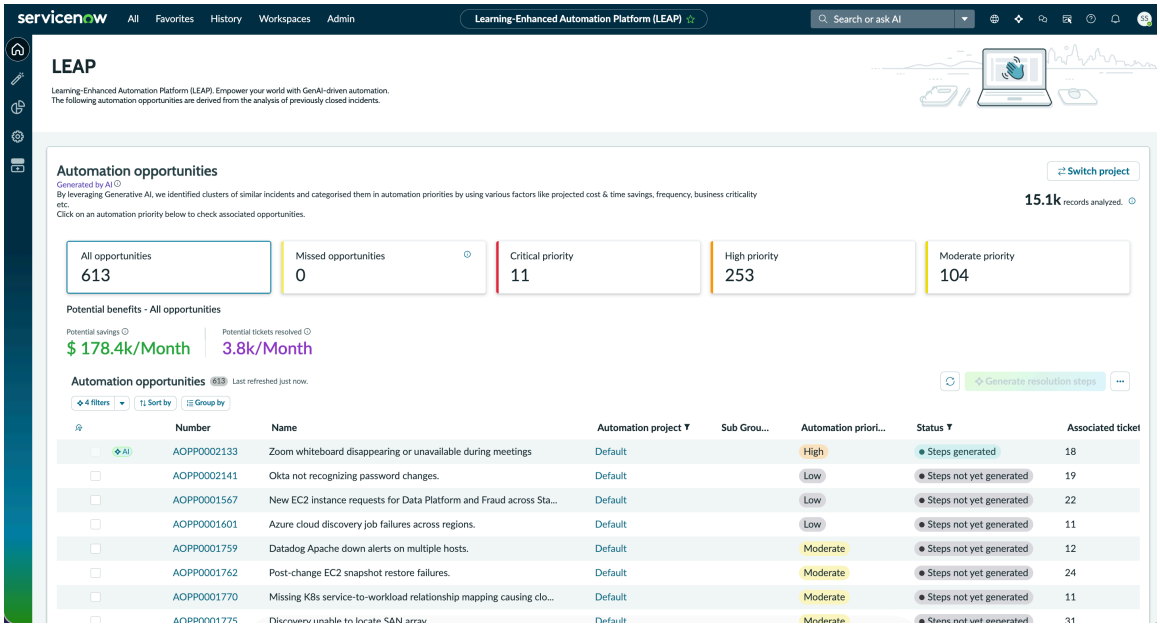
LEAP overview

LEAP helps you manage incidents and operational tasks efficiently. It uses AI to gather information from existing incidents and generates resolutions that can be automated. The LEAP automation provides tools to manage incidents early, speed up resolution, use prebuilt automation, and follow clear steps to handle issues. These tools help support smooth operations.

Note:

- The plugin name has been updated from AIOps Learning Enhanced Automation Playbook to Learning Enhanced Automation Platform (LEAP) to reflect its expanded capabilities and strategic direction.
- Now Assist is renamed to ServiceNow Otto.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The landing page displays the number of records analyzed in the Automation opportunities section. The tooltip provides details about the duration considered for record analysis.

When the LEAP homepage loads, it displays a banner that you can use to connect Ansible Automation Platform. The banner makes the Ansible automation integration discoverable so that you can connect the automation tool and map playbooks to resolution steps. Select **Connect** to open the LEAP settings page and configure the connection. To dismiss the banner, select **Remind me later**. The banner reappears when you refresh the homepage until a connection is configured. After you connect Ansible, the banner no longer appears on the homepage.

Grouping of automation opportunities in LEAP

GAF (Group Action Framework) is the clustering engine that LEAP uses to group incidents into Automation Opportunities (AOs). GAF analyzes incident records using the short description field and applies ML-powered clustering to group incidents that share similar problem patterns. LEAP surfaces recurring issue types as discrete automation opportunities (AOs) rather than treating every incident in isolation.

GAF runs on a scheduled job, by default monthly. The schedule is configured during LEAP skill activation through the installer. On the first run, GAF processes up to six months of historical incident data using the filter set in the installer.

Before clustering begins, GAF selects the top N incidents from the eligible incident pool, where N is configurable and can be set to a maximum of 50. This selection confirms that clustering focuses on the most relevant and recent incidents within the defined scope. You can configure the fields GAF considers during analysis such as tables and columns in the LEAP settings. You can also modify the schedule run frequency in the LEAP settings.

LEAP users

User roles

Role	Description
LEAP admin	You have full control over LEAP capabilities, including the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

User roles (continued)

Role	Description
	• Turn features on and off • Execute scheduled jobs • Manage LEAP tables and the LEAP Workspace • Generate and update resolution steps • Generate AI-enhanced knowledge base articles, problem records, and playbooks from automation opportunities (AO)
LEAP viewer	You can access and view data related to LEAP, including tables, the workspace, and problems originating from AOs.
LEAP agent	You can access the LEAP menu from the Service Operations Workspace (SOW) and trigger LEAP executions directly from within SOW.

These roles work together to create a streamlined and secure approach for managing automation, resolving incidents, and sharing knowledge across teams.

Personas in LEAP

LEAP supports different personas who can have different roles assigned to enhance IT Operations Management.

LEAP personas

Persona	Description	Responsibility
Automation architect	An automation architect is a senior technical expert who designs and develops automation solutions, scaling them when required. They're a bridge between IT operations, business needs, and automation strategy. The automation architect streamlines manual, repetitive, and error-prone tasks.	• Identifies high-impact areas for automation • Develops automation scripts, integrate AI-driven insights, and maintain scalable automation frameworks • Extracts patterns from historical ticket data to optimize future resolutions • Refines automation solutions based on feedback and evolving business needs. • Collaborates with different business units to align automation with enterprise objectives.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

LEAP personas (continued)

Persona	Description	Responsibility
IT operator	An IT operator includes all L1 and L2 incident handlers who support day-to-day IT operations.	• Uses AI-generated playbooks to resolve incidents • Accesses the Knowledge Base
Buyer, Business goal owner	A buyer or a business goal owner gains strategic and operational advantages using LEAP.	• Uses LEAP to improve IT operations • Optimizes resource allocation • Automates recurring issue resolution

An automation architect can use LEAP to gather feedback and refine solutions. In a similar manner, IT operators will use LEAP to detect recurring issues and LEAP displays suggestions for preventive automation. This enables faster resolution and operators can resolve more incidents independently leading to improved efficiency and service quality.

LEAP benefits

LEAP benefits

Benefit	Feature
Promotes automation culture	Interpret data and automate records
Drives incident resolution	Measure and enhance performance
Targets Outcomes for L1 Operators	Interpret data and automate records
Improves MTTR	Measure and enhance performance
Optimize Resource Allocation	Identify and prioritize high impact areas
Provides cost predictability	Fixed pricing model for incident analysis operations

What to explore next

To learn more about configuring and using LEAP, see:

- Configuring LEAP
- Using LEAP
- LEAP reference

LEAP features

LEAP includes features such as grouping incidents, creating problem records, and generating playbooks.

Identify and prioritize high impact areas

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

LEAP uses data-driven analytics to help users identify critical issues and prioritize high-impact automation opportunities. This ensures that resources are prioritized for the areas that deliver the highest operational efficiency and business value.

Measure and enhance performance

LEAP helps improve Mean Time to Repair (MTTR) and operational efficiency by using advanced analytics and AI-driven insights to continuously monitor and optimize IT processes.

Interpret data and automate records

LEAP automatically generates problem records and executes automated playbooks by analyzing historical data patterns, enabling faster root cause identification and reducing manual intervention across complex IT environments.

Generate AI-enhanced knowledge base articles

LEAP uses AI to transform resolution steps into complete, structured knowledge base articles. Generated articles include all required sections and auto-populated metadata. Articles are published to the Knowledge Center through the standard approval workflow.

Savings metrics

LEAP tracks two types of savings metrics, projected and actual, across all automation outcome types including ServiceNow playbooks, Ansible playbooks, KB articles, and problem records.

LEAP savings metrics overview

When you use LEAP to identify and act on automation opportunities, the platform tracks savings at two stages of the workflow:

- Projected savings — displayed on the LEAP home page before you automate, based on historical incident data.
- Actual savings — recorded after automation executes, across all active outcome types including ServiceNow playbooks and Ansible playbook executions.

Both metrics are important. Projected savings help you prioritize which opportunities to pursue. Actual savings help you measure the real return on your automation investment across all outcome types.

Projected savings

Projected savings represent the estimated value that could be realized if an automation opportunity is adopted. These figures appear on the LEAP home page and on individual automation opportunity cards.

LEAP calculates projected savings using the following inputs from your historical incident data:

- Historical incident volume (number of incidents per month)
- Average manual resolution time (mean time to resolve, or MTTR)
- Estimated automation rate
- Cost per hour of IT labor

The formula is:

```
Projected savings = incident volume × Avg. manual resolution
 time × Estimated automation rate × Cost per hour
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Projected savings update dynamically as new incidents are ingested and clustered. Because they are based on estimates and historical patterns, they represent a potential value, not a guaranteed outcome.

Note: The savings number displayed on the LEAP home page is a projected value. It indicates the potential savings if all identified automation opportunities were fully adopted.

Actual savings

Actual savings represent the realized value recorded when automation executes and resolves incidents. These figures reflect real, measured outcomes and accumulate over time. LEAP tracks actual savings separately for each outcome type.

LEAP calculates actual savings per outcome type using the following inputs:

- Number of incidents resolved by the playbook or automation
- Time saved per automated resolution (manual time minus automated time)
- Cost per hour of IT labor

The formula is:

```
Actual savings = Sum of (Time saved per automated resolution ×
 Cost per hour) across all completed executions for an outcome
 type
```

Actual savings are visible in the LEAP value dashboard. The **Overview** tab shows total savings from playbook executions in the **Savings by playbooks** section. The **Ansible playbooks** tab shows cost savings and agent-hours saved specifically from Ansible-driven resolutions.

Projected and actual savings comparison

The following table summarizes the key differences between the two savings metrics.

Projected and actual savings

	Projected savings	Actual savings
Definition	Estimated value based on historical incident data, displayed on the LEAP home page before automation executes.	Realized value recorded when automation executes and resolves incidents, tracked separately per outcome type (ServiceNow playbooks, Ansible playbooks).
Data source	Historical incident volume, MTTR, and manual effort estimates.	Playbook and Ansible execution logs, time saved per automated resolution, and resolution outcomes per outcome type.
Where displayed	LEAP home page and automation opportunity cards.	**Savings by playbooks** section on the value dashboard **Overview** tab; **Cost savings via Ansible** and **Total agent-hours saved via Ansible** on the **Ansible playbooks** tab.
When calculated	Continuously, as new incidents are ingested and clustered.	Per resolution, upon successful execution.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Projected and actual savings (continued)

	Projected savings	Actual savings
Formula	Incident volume × Avg. manual resolution time × Estimated automation rate × Cost per hour.	Sum of (Time saved per automated resolution × Cost per hour) across completed executions for an outcome type.

Use case: Password reset automation

This walkthrough follows a realistic scenario to show how projected and actual savings are calculated at each stage of the LEAP workflow.

The scenario: Your IT service desk receives approximately 1,200 password reset requests every month. Each request currently takes an agent about 15 minutes to resolve manually. Your organization values IT labor at $50 per hour.

Stage 1: LEAP analyzes your incident history.

LEAP ingests your historical incident data and identifies a cluster of 1,200 recurring password reset incidents per month. It recognizes this as an automation opportunity and displays it on the home page with a priority level based on the automation priority matrix.

Stage 2: LEAP calculates projected savings.

Using historical data, LEAP estimates how much time and money your team could save if this incident type were automated.

The calculation: 1,200 incidents × 15 minutes each = 18,000 minutes = 300 hours per month. At $50 per hour, that equals **$15,000 per month** or **$180,000 per year** in projected savings.

The LEAP home page displays "Projected savings: $15,000/month" on the automation opportunity card. This is an estimate based on historical patterns.

Stage 3: You create and activate a playbook.

Based on the automation opportunity, LEAP generates resolution steps for password resets. You review them, create a playbook, and activate it. From this point forward, incoming password reset incidents that match the cluster are handled by the playbook automatically.

Stage 4: Playbook runs and LEAP records actual savings.

Over the next month, the playbook executes against real incidents. LEAP measures the actual time saved for each automated resolution.

- Coverage: The playbook successfully automates 1,040 of the 1,200 incidents (87%). The remaining 160 incidents require manual handling due to edge cases such as locked accounts, expired tokens, or multi-factor authentication issues.
- Time per automated incident: Each automated resolution takes about 2 minutes (versus 15 minutes manually), saving 13 minutes per incident.
- Actual calculation: 1,040 automated incidents × 13 minutes saved = 13,520 minutes = 225 hours. At $50 per hour = **$11,267 actual savings** for the month.

Stage 5: Compare projected and actual savings.

After one month of operation, you can compare the two numbers side by side to understand the real impact of automation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scenario summary: Projected and actual

Metric	Projected (before automation)	Actual (after automation)
Time saved per incident	15 minutes (estimated)	13 minutes (measured)
Monthly time savings	300 hours	225 hours
Monthly cost savings	$15,000	$11,267
Annual cost savings	$180,000	$135,204

Why projected and actual savings differ

A gap between projected and actual savings is normal and expected. The most common reasons include:

- Automation coverage: Not every incident matches the playbook. Edge cases, exceptions, and unusual incident variations still require manual handling.
- Processing overhead: Automated resolutions are fast but not instant. The playbook takes some time per incident rather than zero.
- Ramp-up period: Early in deployment, coverage is typically lower. As playbooks are refined and edge cases are addressed, actual savings trend closer to projected values over time.

Tip: Over time, as playbooks are refined and coverage expands, actual savings typically trend closer to projected values. Regularly review your resolution reports to track this improvement.

Projected savings tell you the potential value of an automation opportunity and help you prioritize which opportunities to pursue. Actual savings tell you the real value being delivered and help you measure return on investment. Both metrics are important, projected savings guide your decisions, and actual savings validate them.

LEAP prioritization logic and cost savings calculation

LEAP uses built-in prioritization logic to identify the highest-impact automation opportunities. This logic helps you focus on the most valuable automation tasks. The calculations provide an estimate of potential cost and time savings. It's best to validate these values in a non-production environment before implementing them in production.

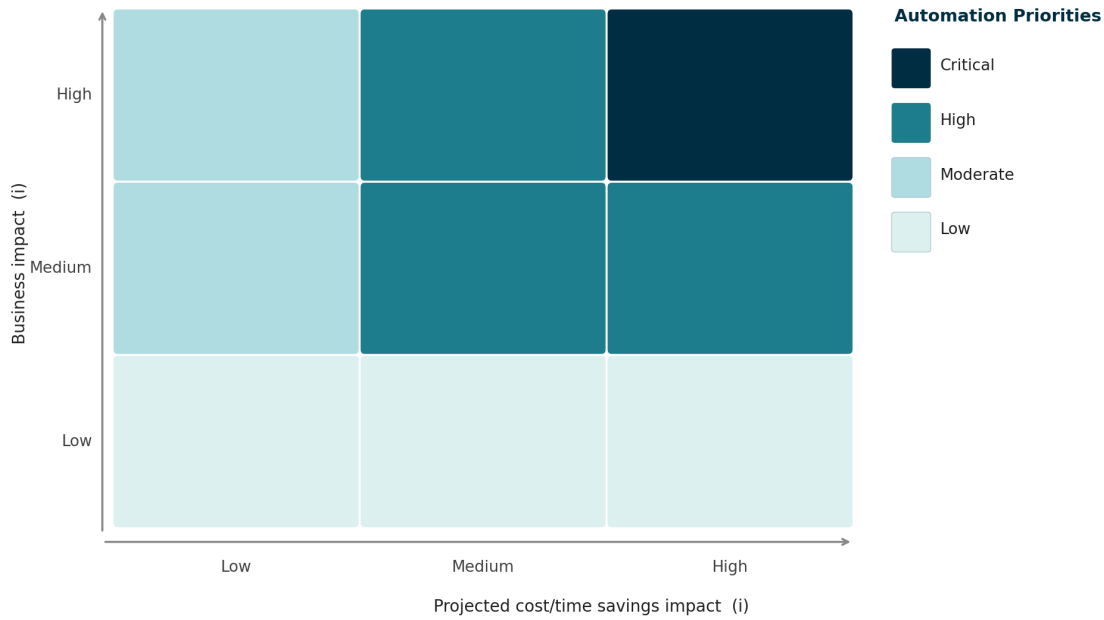
The automation priority is calculated by combining the following key factors:

- Business impact
- Projected cost/time savings

The priority for an automation opportunity is determined using the following chart.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Automation opportunity priority



The key factors are evaluated for each group of related incidents, called#automation opportunities, and the results help teams focus on high-value areas.

Business impact

Each automation opportunity is a cluster of tickets. Every ticket is scored based on the following factors:

- Business criticality
- Major incident status
- Impact level

These factors are given values. Example values for#criticality:

- Most Critical = 100%
- Somewhat Critical = 75%
- Less Critical = 50%
- Not Critical = 25%

Properties table

Key	Default value	Description
ohf_p4	0.8	Overhead factor for P4 records.
ohf_p5	0.4	Overhead factor for P5 records.
ohf_p1	1.8	Overhead factor for P1 records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties table (continued)

Key	Default value	Description
ohf_p2	1.4	Overhead factor for P2 records.
cost_per_entry	20	Cost in dollars associated with adding a work note entry to a record.
ohf_p3	1.1	Overhead factor for P3 records.
time_per_entry	0.5	Time in hours associated with adding a work note entry to a record.
first_run_group_limit	0	Total number of groups for which resolution steps are generated in the initial run.
gaf_mapping_min_threshold	0.2	Minimum ratio of incidents pointing to an active group that is considered for remapping after clustering.

Note:

- You can modify the values in the LEAP settings page. However, the calculations will differ when you change the values.
- The values in the LEAP settings page should be modified before activating LEAP.
- If you modify the values in the LEAP settings page, you need to rerun the calculation. For this, you must deactivate and reactivate the LEAP installer skill.

Each factor is weighted. For example, say that Criticality = 0.8, Major Incident = 0.2, and Impact = 0.4.

```
Ticket Score = (Criticality × 0.8 + Major Incident × 0.2 +
 Impact × 0.4) ÷ 3
```

The average of all ticket scores in the group becomes the Business Impact Score. Based on this score, automation opportunities are labeled as high impact (the top 33%), medium impact (next 33%), and low impact (remaining 33%).

Projected cost or time savings impact

LEAP estimates how much time and cost can be saved by automating a group of incidents with historical ticket data.

The key inputs for cost and time savings are the following:

- Frequency of Incidents (FOI): Average number of similar incidents per month
- Average Manual Work Notes Count (AWNC)
- Overhead Factor (OHF): varies by incident priority based on the priorities table

LEAP uses the following formulas to calculate the projected cost or time savings:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- `Projected Cost Savings = Σ (FOI × OHF) × AWNC × Cost per Work Note`
- `Projected Time Savings = Σ (FOI × OHF) × AWNC × Agent Time per Entry`

Each ticket's projected savings is calculated. The average for the group becomes the Projected Cost/Time Savings Score, which is also categorized as High, Medium, or Low. The automation opportunities are sorted in descending order based on the projected cost or time savings.

Determining overall priority

After calculating the values for the business impact and the projected cost/time savings, LEAP assigns a priority level to each automation opportunity using this matrix:

Automation priority matrix

Business impact	Projected cost/time savings	Automation priority
High	High	Very High
Medium	High	High
High	Medium	High
Medium	Medium	Medium
Medium	Low	Low
Low	Medium	Low
Low	Low	Very Low

These prioritized automation opportunities are displayed on the LEAP home page.

Tracking the actual cost and time savings

After automation is implemented, LEAP tracks actual cost and time savings and displays them on the LEAP Value Dashboard, helping you measure impact and make decisions.

Key metrics:

- Additional Work Notes (AWN): Manual entries after playbook execution
- Overhead Factor (OHF) by Priority: For example, P1 = 1.8x

Formulas:

- `Saved Work Notes (SWNs) = AWNC – AWN`
- `AWN = SWN × OHF`
- `Actual Cost Savings = AWN × Cost per Work Note`
- `Actual Time Savings = AWN × Agent Time per Entry`

Example projected cost and time savings calculations

A cluster has 20 AWNC and is mapped to a P2 incident with 6 AWN. The cost per work note is $20, and the agent time per entry is 0.5 hours.

According to the formulas, the SWN count is `(20 - 6) = 14`. According to the properties tables, the OHF = 1.4.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

`SWN x OHF = AWN` so `14 x 1.4 = 19.6`

This value can be rounded off to 20 AWN. Each AWN entry represents $20 of savings.

The actual cost savings post automation = `AWN x Cost per Work Note` = `20 x 20 = $400`.

So, if you use automation, then the projected cost savings can be up to $400. Thus, the calculation provides actionable insights for ongoing process improvement and resource allocation.

AI agent

Enhance IT operations with AI-driven, autonomous artifact creation such as problem records, knowledge base articles, and playbooks using LEAP AI agent.

Important:

Generative AI may produce inaccurate or incomplete information. Always validate AI-generated content before you publish or act on it.

Generate LEAP artifacts

AI agent	AI agent role
LEAP AI agent	Uses the automation opportunities created by LEAP analysis, and creates artifacts (problem records, knowledge base articles, or playbooks) requested by users.

Important: This AI agent is turned on by default. For more information, see AI agents, skills, and agentic workflows on by default.

What the LEAP AI agent does

The LEAP AI agent autonomously scans active automation opportunities and acts on the ones that have resolution steps. IT operations teams spend less time triggering automation manually. The agent provides the following capabilities:

Create knowledge base articles

The agent is triggered when resolution steps for automation opportunities are generated successfully. It documents and generates a draft knowledge base article that includes the automation opportunity title, resolution steps, and related incident context. You review the draft and publish it. Each published article remains traceable to its source automation opportunity. The agent doesn't create a knowledge base for an automation opportunity that is already linked to an open KB.

Create problem records

The agent is triggered when resolution steps for automation opportunities are generated successfully and automatically creates a problem record. Each problem record is populated with the related incident count, the automation opportunity detail, and the associated resolution notes, which mirrors the manual **Create Problem** action. The agent doesn't create a problem record for an automation opportunity that is already linked to an open problem. Each problem record remains traceable to its source automation opportunity.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Eligibility thresholds

An automation opportunity is eligible for knowledge base article and problem record creation when it has a minimum of 15 incidents or a severity of Critical or High. You can change the incident count threshold (default: 15) and the severity threshold (default: Critical and High) on the LEAP Settings page. For the list of settings, see LEAP settings fields.

Identify AI-created artifacts

Artifacts that the LEAP AI agent creates are marked with an AI indicator on the home page and the automation opportunity details page, so that you can tell AI-created artifacts apart from those created manually. For more information, see LEAP AI indicators.

Activate or deactivate the LEAP AI agent

The LEAP AI agent is active by default. To change the activation status, navigate to **All** > **AI Agent Studio** > **Overview**, select the LEAP AI agent, then go to **Agent** > **Select channels and status** and toggle the **activation status** control.

- Active: The agent scans automation opportunities and creates artifacts automatically.
- Inactive: The agent stops scanning automation opportunities and no longer creates artifacts.

Automation projects

Use Automation projects to analyze multiple sets of incident data independently, so different teams or business units can derive separate insights and automation opportunities.

An Automation project defines the scope and configuration for LEAP analysis. Each project runs independently and can target specific assignment groups, time periods, or filtered sets of incidents. By creating multiple Automation projects, you can analyze different categories of incidents separately and generate automation opportunities tailored to each context.

Benefits of Automation projects

Automation projects provide the following benefits:

- Team-specific insights: Different teams or business units can work on separate projects concurrently without affecting each other's analysis, metrics, or automation opportunities.
- Analyze multiple data sets independently: Create separate projects to analyze different groups of incidents based on assignment groups, time periods, or other criteria. For example, analyze the last 6 months of Human Resources incidents in one project while creating a focused project for last month's spike in cases.
- Flexible taxonomy configuration: Select one or more taxonomies per project to group incidents according to your team's classification needs. Multiple projects can use the same taxonomy when analyzing different subsets of data.
- Real-time dashboard views: Switch between projects to view project-specific metrics, reports, and automation opportunities in the dashboard.
- Configurable analysis schedule: Schedule analysis jobs to run at specified frequencies for each project independently.

Each Automation project has its own independent configuration: incident, filter, grouping column, taxonomy selection, job frequency, and settings. Projects run without affecting each other.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When to use Automation projects

The following examples illustrate common scenarios where creating multiple Automation projects provides more relevant and actionable results than a single shared project.

Per-team automation

A large IT organization wants Network team incidents grouped and automated separately from Database team incidents. Because issue patterns, root causes, and resolution steps differ significantly between teams, each team gets its own project instead of a single mixed pool of recommendations.

Per-region automation

A global company wants automation tuned separately for APAC and EMEA support teams. Ticket volume, categories, and SLAs vary by region, so separate projects confirm that grouping and recommendations reflect each region's specific incident patterns.

Per-service-tier automation

A customer wants to separate automation for critical Tier-1 services, such as banking systems and core infrastructure, from general Tier-2 and Tier-3 services. Keeping high-priority incidents in a dedicated project prevents lower-priority noise from diluting the grouping and resolution logic for business-critical systems.

Controlled pilot before a wider rollout

A customer wants to try LEAP automation on one team's data first before expanding to the rest of the organization. Creating a separate project for the pilot team keeps the trial isolated from the default project that is already running in production.

Business unit isolation

A company with multiple business units, each using ServiceNow with different assignment groups, wants each unit to see automation results relevant only to their own incidents. Separate projects scoped by assignment group ensure that each business unit's recommendations are not mixed with those of other units.

Testing and sandbox configuration

An administrator wants to test grouping or filter changes safely before applying them to the production setup. A separate project scoped to a small filtered set of records acts as a sandbox, leaving the default project and its running jobs unaffected.

Default Automation project

The Default Automation project is shipped with the LEAP. The Default project represents the existing pre-multi-project setup and has no taxonomy configuration and is read-only. You can view its configuration but can't edit it from the Automation project details page. To change the default configuration, use the AI Admin Workspace.

Note:

- The initial setup experience for LEAP remains unchanged. When you first activate LEAP, you must still configure the default project through the AI Admin Workspace. Automation projects is an additional capability that is available after the default project is set up.
- Skill activation occurs in the AI Admin workspace.

Automation projects are an opt-in capability. Existing deployments continue to work without modification. You don't have to migrate your current configuration to use Automation projects. Adding a new project does not change the Default Automation project or any currently running analysis jobs.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Automation project lifecycle

Managing Automation projects involves creating new projects, running analysis jobs, and switching between projects to view different automation opportunities. The following workflow describes the complete lifecycle:

1. Create the project: Define the project name, description, table, filter, grouping column, topic column, taxonomy/assignment group, and job frequency. The project is created in a **ready (editable)** state and can be viewed directly on the projects details screen or the homepage. No analysis runs at this point.
2. Start the grouping job: After the project configuration is complete, start the analysis job. Starting the job clones the required skills in the back end and activates the scheduled job. Once analysis begins, the project configuration can't be edited until the job completes or the job status is ready or failed.
3. Review automation opportunities: After the analysis completes, review automation opportunities, create resolution steps, and measure impact. The day-to-day experience is the same as the standard LEAP workflow.
4. Switch between projects: Switch between projects to view different sets of automation opportunities. Switching between projects updates data on every page and the LEAP value dashboard to reflect the selected project's data set.
5. Edit project configurations: Edit project configurations as needed. You can only edit a project when its job status is ready or failed.

Configuration constraints

When configuring an Automation project, be aware of the following constraints:

- The taxonomy field is multi-select. You can select one or more taxonomies to define which incident groups the project analyzes.
- Multiple projects can use the same taxonomy. When an incident matches multiple projects, playbooks from all matching projects are displayed.
- Filter queries are limited to 300 characters. Filters that return zero records are marked as an error before the project is saved.
- This release supports only the incident table.

Taxonomy filtering

Selected taxonomies dictate the filter query for an Automation project. For example, if you select assignment groups AG1 and AG2, the system creates a filter where the assignment group is one of AG1 or AG2.

Prediction logic

When an incident is created or updated, LEAP determines which Automation projects run predictions based on the incident's assignment group:

- The Default Automation project always runs predictions regardless of the assignment group.
- If an incident has a specific assignment group, predictions run on the Default project plus any Automation projects that match that assignment group.

Automation opportunities

LEAP groups similar incidents into automation opportunities and uses AI to generate resolution artifacts that help reduce manual effort and repeat incidents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

An automation opportunity is a group of similar incidents that LEAP identifies through AI-driven analysis. For each group, LEAP generates resolution artifacts — such as resolution steps, knowledge base articles, problem records, and playbooks — that operators can use to resolve recurring incidents faster.

Automation opportunity lifecycle

When the Group Action Framework (GAF) process re-runs, it can identify new patterns in incident data. If remapping is successful, LEAP archives automation opportunities that contain resolution steps and transfers their artifacts to newly identified opportunities. Archived automation opportunities are hidden by default in the user interface to help you focus on actionable opportunities.

The automation opportunity details page displays banner messages that indicate the archiving and remapping status:

- Archived automation opportunities display a message indicating that artifacts were remapped to a new opportunity, with a link to the new opportunity
- New automation opportunities that received artifacts display a message indicating the source archived opportunity, with a link to the archived opportunity

The Action Insights panel on the details page also shows the relationship between archived and new automation opportunities.

Managing automation opportunities

The automation opportunity details page provides tools to review and act on identified opportunities. From this page you can:

- Review the incidents grouped into the opportunity
- Generate or regenerate resolution steps, knowledge base articles, problem records, and playbooks
- Create sub-groups for large opportunities to produce more targeted resolutions
- Track missed opportunities where automation artifacts were available but not used

Automation opportunity sub-groups

Large automation opportunities in LEAP can be broken into smaller, more manageable sub-groups to achieve more granular and accurate incident resolution.

Large automation opportunities with over 150 records tend to generate overly lengthy resolution steps that lack precision and focus. These opportunities often represent a collection of related problems and issues that should be subdivided to produce more targeted and relevant solutions.

Breaking them into smaller sub-groups lets users obtain more refined resolutions for recurring issues. The Action Insights panel on the automation opportunity details page offers recommendations to create these sub-groups for opportunities containing large record volumes.

Sub-grouping example

A large automation opportunity containing 300 password reset incidents might include a mix of VPN password resets, Active Directory account lockouts, and SSO token expiry. While these are all password-related, each requires different resolution steps. LEAP displays suggestions for breaking the automation opportunity into three sub-groups. Each group receives targeted resolution steps — for example, one sub-group with VPN-specific steps, another with AD unlock procedures, and a third with SSO token refresh instructions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Automatic reorganization

During scheduled LEAP analysis reruns, clusters are automatically reorganized based on newly observed incident patterns. LEAP preserves existing artifacts and links them to updated automation opportunities rather than overwriting them.

The following table describes how each artifact type is handled during reorganization:

Artifact behavior during reorganization

Artifact	Behavior during rerun
Resolution steps	Appended to the new matching automation opportunity. Users can keep the existing steps or select **Regenerate** to create fresh ones.
Playbooks	Remain active and are linked to the new matching automation opportunity. Existing playbook configurations and execution history are preserved.
Knowledge base articles	Remain active and retain their association with the automation opportunity.
Problem records	Remain active and are linked to the new matching automation opportunity.

Automation opportunities that no longer have any associated artifacts after reorganization are marked as deactivated. Opportunities that contain resolution steps, playbooks, or other artifacts remain active and are linked to newly identified matching automation opportunities.

For example: An automation opportunity for "email delivery failures" has resolution steps and a playbook created in the previous analysis run. When LEAP reruns the analysis and reorganizes clusters, this opportunity is matched to a new cluster. The existing resolution steps are appended to the new automation opportunity. The user can review the appended steps and decide whether to keep them or regenerate new ones based on the updated cluster data.

Benefits of sub-grouping

- Provides more focused and contextual resolution steps
- Offers more targeted solutions for similar issues
- Improves incident resolution
- Enables more effective management of large automation opportunities
- Supports operational efficiency by reusing prior resolutions where appropriate

For detailed steps, see Create sub-groups for automation opportunities.

Missed automation opportunities

Track instances where users could have benefited from generated resolution steps, knowledge base articles, or playbooks but didn't have access to them.

Missed automation opportunities occur when users working on incidents could have benefited from existing LEAP automation artifacts that aren't available.

LEAP automatically logs missed opportunities when there are no artifacts recommended in Service Operations Workspace. These artifacts include resolution steps, knowledge base articles, and playbooks that could have assisted with faster incident resolution. The system

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

helps administrators identify these gaps in automation coverage and prioritize them for future improvements.

How missed opportunities are tracked

When an incident occurs and appears in SOW, and the Recommendation section of the incident does not show any artifacts, the automation opportunity is marked as 'missed automation'.

Missed opportunities are logged in a dedicated table that captures:

- incident details
- Available automation artifacts that could have helped
- User information and timing data

Types of missed opportunities

LEAP tracks several types of missed automation opportunities:

Resolution steps

Generated step-by-step procedures that could have guided incident resolution.

Knowledge base articles

Relevant documentation and solutions that could have provided immediate answers but were not consulted during incident resolution.

Playbooks

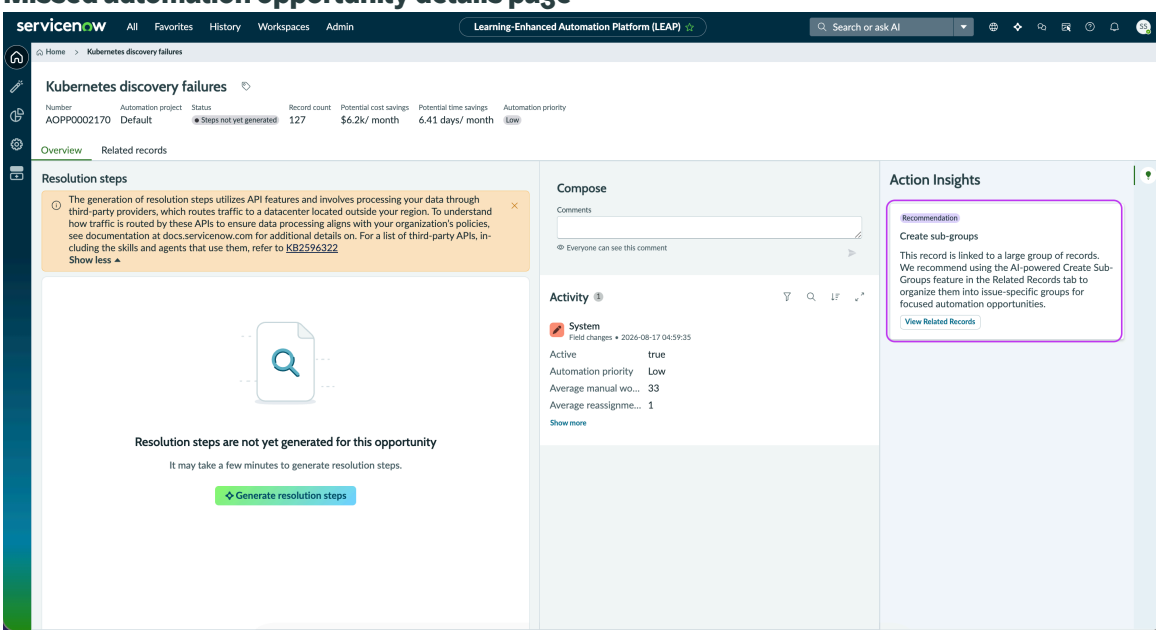
Automated workflows that could have streamlined the resolution process.

Viewing missed opportunities

The LEAP homepage displays the missed automation opportunities card.

Select the number on the missed opportunities card to filter and view only the automation opportunities that missed automation. On the details page for each automation opportunity, you can see how many times an artifact was not available when it could have assisted with incident resolution.

Missed automation opportunity details page



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

LEAP administrators can use missed opportunity data to identify patterns and improve automation coverage. This helps determine where additional automation artifacts might be beneficial.

Regular review of missed opportunities enables administrators to identify gaps in automation coverage for common incident types and prioritize creation of new automation artifacts based on potential impact.

Benefits of tracking missed opportunities

Tracking missed automation opportunities provides valuable insights for continuous improvement of automation strategies:

- Identifies high-impact areas where automation could provide the greatest benefit
- Helps justify investment in additional automation development
- Provides data-driven insights for improving user adoption of existing automation
- Enables measurement of automation program effectiveness and ROI
- Supports strategic planning for future automation initiatives

LEAP MCP Server

External AI clients can query LEAP automation data using Model Context Protocol (MCP) tools exposed through the ITOM MCP Server.

Overview of LEAP with MCP

LEAP exposes automation capabilities as MCP tools within the ITOM AIOps MCP Server. External AI clients such as Claude, ChatGPT, Copilot, and Gemini can invoke these tools using the Model Context Protocol (MCP), a standardized protocol for AI client integration.

MCP tools provide a governed, product-supported path for connecting external AI clients to LEAP automation workflows. Without MCP tools, the integration path is a manual process with no authentication guardrails or ServiceNow support coverage.

All MCP tool invocations use OAuth 2.0 authentication. Access to specific tools is controlled by the LEAP AI SKU tier assigned to your instance.

How MCP tools work

LEAP MCP tools are registered on the shared ITOM MCP Server (`sn_genai.itom_mcp_server`). When an external AI client connects to the server and calls `tools/list`, the LEAP tools appear alongside tools from other ITOM products. The server URL takes the form:`https://<instance>.service-now.com/sncapps/mcp-server/mcp/sn_genai_itom_mcp_server`

> ⚠ **Warning:** LEAP specific MCP tool invocations require the sn_itom_leap.leap_viewer role at minimum. Other tools on the ITOM MCP Server might still work, but LEAP specific tools fail with an unauthorized error if the user lacks this role: `User is missing required role: sn_itom_leap.leap_viewer`.

The following describes the invocation flow:

1. The external AI client authenticates to the ITOM MCP Server using an OAuth 2.0 token.
2. The client calls a LEAP MCP tool with the required input parameters.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. The MCP Server routes the request to the underlying LEAP API.
4. The server returns a structured JSON response to the client.

Tool categories

LEAP MCP tools are registered as **Action** tools on the ITOM MCP Server and are organized into three categories:

LEAP MCP tools

Tools	Description
LEAP - Get App setup status	Reports LEAP setup and grouping pipeline readiness. Use this tool to check whether LEAP is configured before invoking automation opportunity tools. For example, if an AO query returns no data, `get_app_setup_status` can confirm whether setup is incomplete and return the URL of the setup page.
LEAP - Get property or setting	Retrieves specific LEAP configuration properties by key. Only properties on an explicit allow-list are accessible. For example, retrieve `missed_opportunity_threshold` (the number of missed opportunities above which an AO is flagged as high priority) or `default_resolution_steps_filter` (the encoded query that controls which AOs receive AI-generated resolution steps).
LEAP - Get automation opportunities	Provides read-only access to automation opportunity data. External clients can query for lists of AOs, retrieve full details for a specific AO, and filter results by keyword, status, or linked artifacts. For example, an AI client can ask for all AOs related to Discovery issues that have a KB article generated, or retrieve details for a specific AO number such as AOPP0000173.

Set up the MCP connection

To connect an external AI client to LEAP MCP tools, you must configure OAuth authentication on the ITOM MCP Server. A banner on the MCP Server Console confirms when OAuth setup is required. For setup instructions, see Activate the ITOM MCP Server Console.

What to explore next

- Exploring LEAP
- Automation opportunities

Ansible automation integration

The Ansible automation integration connects LEAP with Ansible Automation Platform to enable AI-driven discovery of relevant job templates and automated incident remediation from the Service Operations Workspace.

The Ansible automation integration addresses the critical operational gap of lack of automated remediation capabilities during incident resolution.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Key capabilities

The integration provides these core capabilities:

AI-driven automation discovery

LEAP automatically identifies relevant Ansible job templates for automation opportunities using semantic analysis.

Step-to-job mapping

The integration enables LEAP administrators to map discovered Ansible job templates to specific resolution steps through an intuitive UI.

Automated incident remediation

The integration allows incident responders to execute mapped Ansible automations directly from the Service Operations Workspace during incident resolution.

Manual step handling

The integration supports mixed workflows where some steps require manual intervention while others can be automated.

Integration architecture

The integration uses these key components:

- Ansible discovery agent: Analyzes automation opportunities and identifies candidate job templates
- Ansible execution agent: Executes mapped automation opportunities during incident remediation
- Ansible MCP server: Provides secure API access to Ansible Automation Platform
- Step-to-job mapping store: Maintains the relationship between resolution steps and Ansible job templates

Workflow overview

The integration follows this high-level workflow:

1. The Ansible discovery agent analyzes automation opportunities and discovers relevant job templates
2. LEAP administrators map discovered job templates to specific resolution steps
3. When incidents occur, LEAP predicts the automation opportunity group
4. If mappings exist, automation options are presented to incident responders
5. The Ansible execution agent launches selected automations and reports status

Benefits

The Ansible automation integration provides these benefits:

- Reduces mean time to resolution (MTTR) by automating incident remediation
- Eliminates the requirement to search for relevant job templates or automation playbooks
- Increases automation utilization across the organization
- Provides structured linkage between automation opportunities and Ansible job templates
- Enables consistent, repeatable incident resolution processes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Ansible discovery agent

The Ansible discovery agent analyzes automation opportunities and identifies relevant Ansible job templates using AI-powered semantic matching and historical execution patterns.

The Ansible discovery agent automates the process of finding relevant Ansible job templates for automation opportunities. The agent eliminates the manual effort required by automation engineers to search and identify appropriate automation resources.

Discovery process

The Ansible discovery agent follows this process to identify relevant job templates:

1. Parses the problem description of the automation opportunity for keywords and context
2. Queries Ansible Automation Platform via the Ansible MCP server to retrieve available job templates
3. Applies AI-powered matching to identify relevant job templates based on problem description similarity using semantic natural language processing
4. Presents discovered job templates to the LEAP administrator for step-to-job mapping

Matching capabilities

The agent uses these techniques to match automation opportunities with job templates:

Semantic analysis

Analyzes the meaning and context of problem descriptions to identify relevant automation patterns.

Keyword extraction

Identifies key terms and technical concepts from automation opportunity descriptions.

Integration points

The Ansible discovery agent integrates with these components:

- AI Teammate Dashboard: Entry point for automation engineers and LEAP administrators.
- Ansible MCP server: Secure API access to Ansible Automation Platform job templates.
- LEAP clustering engine: Source of automation opportunity data and problem descriptions.
- Step-to-job mapping UI: Destination for discovered job template recommendations.

AI in LEAP

AI-powered features in LEAP help administrators generate resolution steps, create problem records, publish knowledge base articles, build playbooks, and discover and execute Ansible automations.

LEAP includes several AI-powered features. All features require ServiceNow Otto for IT Operations Management (ITOM) to be installed.

Note: Depending on your license, you will have access to certain application features, generative AI skills, agentic workflows, and AI agents. For more information, see ServiceNow product tiers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI features in LEAP

AI feature	Description	Use case	Resources
AI-generated resolution steps	Uses generative AI to analyze grouped incidents and generate structured resolution steps for each automation opportunity. Resolution steps can be reviewed and modified before use.	A LEAP administrator wants to produce actionable resolution guidance for a recurring incident pattern without manually authoring steps from scratch.	Generate and modify resolution steps in LEAP
LEAP AI agent	Uses automation opportunities created by LEAP analysis to generate artifacts — problem records, AI-enhanced knowledge base articles, or playbooks — based on user requests. The agent is turned on by default.	A LEAP administrator wants to convert a recurring incident pattern into a problem record, a structured knowledge base article, or a playbook without manually authoring each artifact.	• AI agent • Create LEAP problem records • Generate LEAP knowledge base articles • Generate LEAP playbooks
Ansible discovery agent	Analyzes automation opportunities and uses AI-powered semantic matching to identify relevant Ansible job templates from Ansible Automation Platform. Presents discovered templates to the LEAP administrator for step-to-job mapping.	A LEAP administrator wants to find the most relevant Ansible job templates for an automation opportunity without manually searching the Ansible catalog.	• Ansible automation integration • Ansible discovery agent
Ansible execution agent	Automatically launches mapped Ansible job templates during incident remediation in the Service Operations Workspace. Reports execution status back to the incident responder.	An incident responder wants to trigger an Ansible automation directly from the Service Operations Workspace during active incident resolution, without switching to the Ansible platform.	• Ansible automation integration • Execute Ansible automations for incidents

Configuring LEAP

You can download and install LEAP application from the ServiceNow® Store to manage your IT operations efficiently.

Configuration overview

1. Install LEAP

   Install LEAP if you have the admin role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Setup LEAP properties

   View and modify the LEAP LEAP properties as per your requirements.

3. Activate LEAP

   Activate LEAP to enable grouping of incidents, create problem records, and generate resolution playbooks.

4. Change LEAP large language model (LLM)

   Modify the LLM model to suit your requirements.

5. Configure Ansible automation integration

   Configure the integration between LEAP and Ansible Automation Platform to enable automated discovery and execution of Ansible job templates.

Install LEAP

You can install the LEAP application using ServiceNow Otto for IT Operations Management (ITOM) (sn_itom_gen_ai) if you have the admin role. The application installs related ServiceNow® Store applications and plug-ins if they aren't already installed.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Review the LEAP application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.

Role required: System admin

About this task

The following items are installed with LEAP:

- Roles
- Scheduled jobs
- Tables

For more information, see Components installed with LEAP.

Procedure

1. Go to the ServiceNow Store website.
2. In the search bar, enter ServiceNow Otto for IT Operations Management (ITOM) and then select **Search**.
3. Select the ServiceNow Otto for IT Operations Management (ITOM) widget and then select **Get** to make this application available for installation on your instances.
4. Install the ServiceNow Otto for ITOM application.
   a. Navigate to **All** > **System Definition** > **Plugins**.
   b. Search for ServiceNow Otto for IT Operations Management (ITOM).
   c. Select **Install**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Setup LEAP properties

Configure LEAP properties to estimate cost and time savings calculations for your organization.

Before you begin

Role required: LEAP admin

Each knowledge base you plan to use in LEAP must have the correct Can Contribute permissions configured before you set up knowledge base routing. See Knowledge base permissions for LEAP.

About this task

If you are a first-time user of LEAP, review the default values before making changes.

Settings include three configuration areas: cost and time savings estimation, AI agent behavior, and knowledge base routing. AI agent configuration controls the conditions under which the LEAP AI agent automatically creates problem records and knowledge base articles, such as minimum incident count and severity thresholds. Knowledge base routing controls where articles are stored when created by the LEAP AI agent or manually from an automation opportunity. Selecting a default knowledge base is mandatory — you cannot save settings without one. For details on all fields, see LEAP settings fields.

Procedure

1. Select **Configure settings**.
2. On the settings page, choose one of the following options:
   - Fresh Install
     a. Select **Configure settings**.
     b. Review the default values for each property.
     c. Select **Save**.

     Note: LEAP recommends using default values initially to view and understand the cost and time savings estimates.

   - Upgrade
     a. Select **Configure settings**.
     b. Review the default values for each property.
     c. Modify values as needed.
     d. Select **Save**.

   You are redirected to the LEAP landing page. For details on each field, see LEAP settings fields
3. Activate LEAP.

Activate LEAP

Activate the LEAP skill after installing the application to assemble and categorize incidents.

Before you begin

Role required: System admin or LEAP admin

and the application scope must be LEAP.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **LEAP**.
2. Select **Admin** > **AI Admin Hub**.
3. Select **AI Skills** > **Platform** > **LEAP**.
4. On the LEAP Installer card, select **Activate**.
5. In the LEAP installer input section, enter the details for LEAP to run scans on existing records, and select **Save and continue**.
   For details on installer fields, see LEAP Installer fields
6. In the Define access section, select the role to whom you want to provide access to LEAP skills.
7. In the Select display section of *`LEAP installer`*, select the required display and select **Save and continue**.
8. In the Review and activate section of *`LEAP installer`*,review the selections, and select **Activate**.
9. Select **Return to LEAP** on the success message.
10. The grouping job starts and proceeds to group records into automation opportunities.

   If errors are encountered, then LEAP provides links to knowledge base articles to understand the root cause and steps to resolve issues.

Change LEAP large language model (LLM)

LEAP allows you to change the default LLM provider from the Now LLM to your required LLM.

Before you begin

Role required: admin

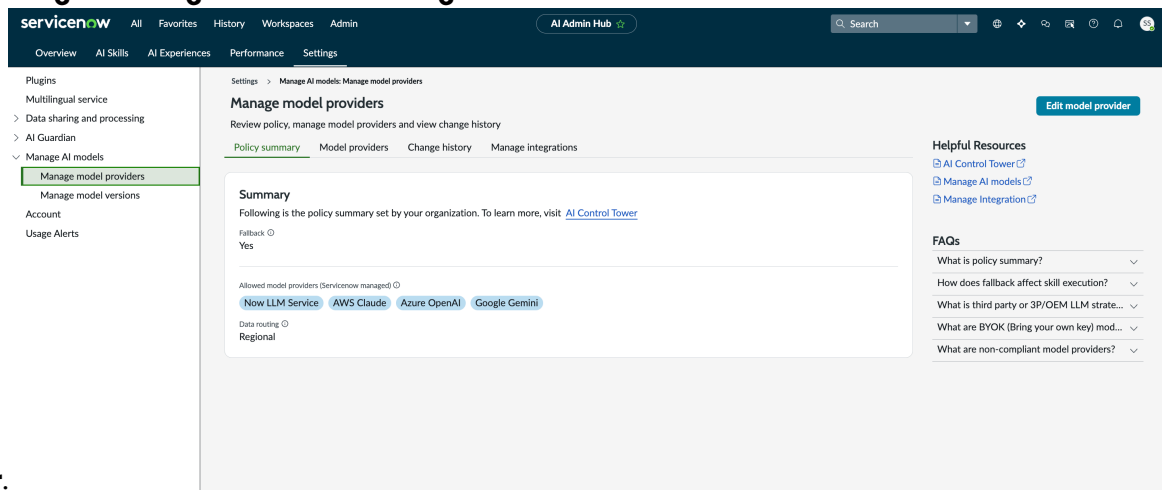
About this task

If you change the LLM model, the LEAP skills should be reapplied to the selected model. Because the LEAP skills aren't applied automatically to an instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

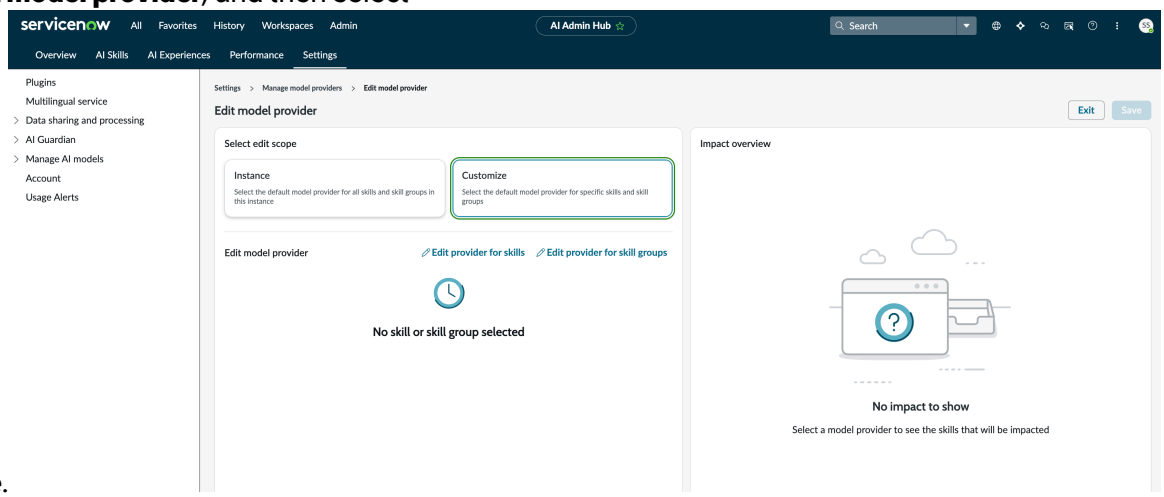
Procedure

1. Access **Admin** > **AI Admin Hub** in your workspace.
2. Select **Settings** > **Manage AI model** > **Manage model**



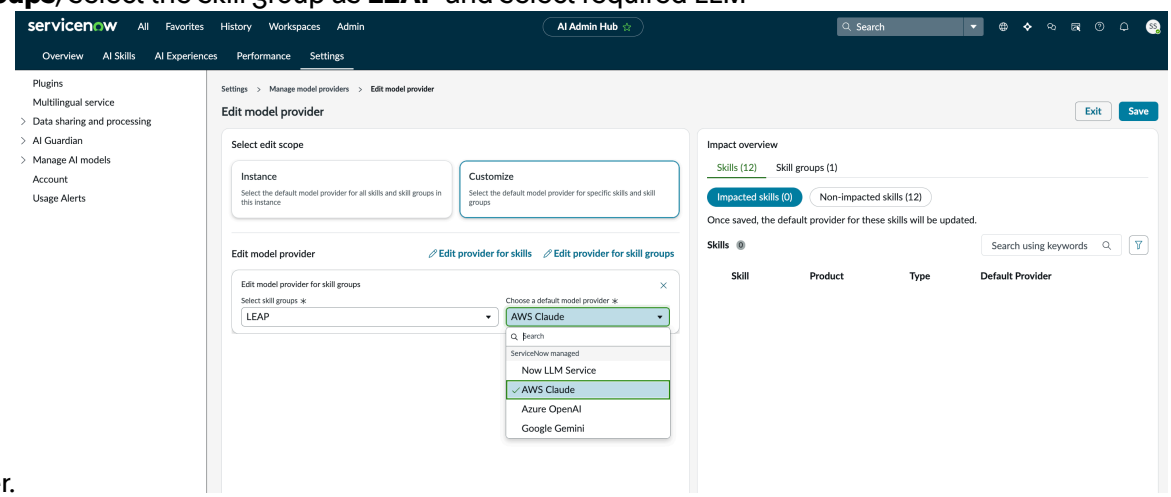
provider.

3. Select **Edit model provider**, and then select



Customize.

4. In the *`Edit model provider`* section, select **Edit provider for skill groups**, select the skill group as **LEAP** and select required LLM



provider.

5. Select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure Ansible automation integration

Connect LEAP to Ansible Automation Platform so the Ansible Discovery and Execution Agents can automatically identify job templates and launch them during incident remediation.

Before you begin

Confirm that you have the following components installed and configured:

- LEAP application activated
- Ansible Automation Platform with MCP Server Console configured

  The MCP Server is the middle ware component that helps communication between LEAP and Ansible Automation Platform.

- Network connectivity between ServiceNow and Ansible Automation Platform
- API token for the MCP Server Console

Role required: *sn_itom_leap.leap_admin*

About this task

The Ansible Automation integration requires configuration of the MCP Server Console connection and agent to enable communication between LEAP and Ansible Automation Platform.

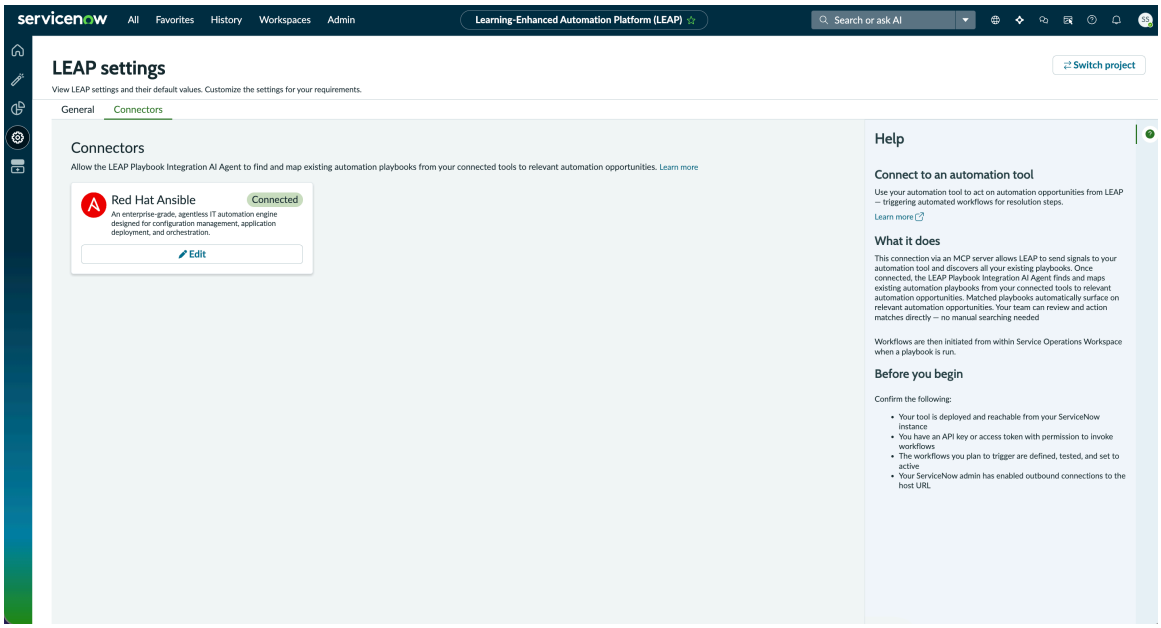
For more details about the integration, select **Help** on the Connectors page, and then select **Learn more** to open the LEAP and Ansible MCP server guide.

Procedure

1. On the LEAP homepage, navigate to **SettingsConnectors**, and select **Connect**.

   Note:

   Another way to start this configuration is by selecting **Connect** in the Ansible connection banner on the LEAP homepage.



2. Configure the Ansible MCP Server Console connection by completing these fields:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Ansible MCP Server Console connection fields

Field	Description
MCP Server URL	The URL of the Ansible MCP Server Console endpoint.
Authentication Method	API key authentication method.

3. In the Token field, enter the API token used for authentication.
4. Assign the required roles to users who will work with Ansible integration:
   - sn_itom_leap.leap_admin = For LEAP administrators who configure step-to-job mappings
   - sn_itom_leap.leap_agent = For incident responders who execute Ansible automations
5. Select **Save** to apply the configuration.

Result
After you configure the Ansible Automation Integration, the Ansible discovery agent analyzes automation opportunities and identifies relevant job templates. When resolution steps are generated for a critical automation opportunity, the Ansible agent is triggered which launches mapped automation for incident remediation.

The configured connection appears in the Connectors table on the LEAP settings page.

Using LEAP

Use LEAP to analyze automation opportunities (AOs), generate resolution steps and playbooks, create problem records, build knowledge base articles, and execute Ansible automations during incident remediation.

LEAP tasks

AOs are categorized depending on how critical the services are, number of hand offs, and incident information:

- Critical
- High
- Moderate
- Low

LEAP groups incidents into AOs categorized by priority. Use AOs to research incidents, identify root causes, and develop resolutions. You can also map AOs to Ansible job templates and execute automated remediation directly from the SOW.

AOs enable you to create problem records for deeper analysis, knowledge base articles for future reference, and playbooks that give IT operators access to resolution steps.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Ask Otto feature of ServiceNow Otto streamlines artifact creation. Select

to open the ServiceNow Otto panel, where a workflow menu guides you through creating the artifacts you need. You can also generate artifacts using the **Actions** button.

1. Generate and modify resolution steps in LEAP

   Generate resolution steps for automation opportunity and when required get focused solutions by modifying the resolution steps.

2. Create sub-groups for automation opportunities

   Create granular automation opportunities to get targeted resolutions for similar looking issues.

3. Monitor automation outcomes with the LEAP value dashboard

   View and understand how automation helps LEAP to achieve cost and time savings.

4. Create LEAP problem records

   Create a problem record using the resolution steps of an AO. The problem record helps you perform an in-depth analysis to find the root cause of the incident.

5. Generate LEAP knowledge base articles

   Generate AI-enhanced, publication-ready knowledge base articles from resolution steps. Generated articles include structured sections, auto-populated metadata, and a link to the originating incident. Articles are routed through the standard knowledge base approval workflow and published to the Knowledge Center.

6. View LEAP resolution step recommendations in SOW

   View resolution step recommendations in SOW.

7. Generate LEAP playbooks

   Generate automated playbooks that use the resolution steps to resolve similar incidents.

8. Use LEAP playbooks in Service Operations Workspace SOW

   Use LEAP generated playbook to resolve incidents in SOW.

9. Map Ansible jobs to resolution steps

   Create mappings between automation opportunity resolution steps and Ansible job templates to enable automated incident remediation.

10. Execute Ansible automations for incidents

    Use the Ansible Execution Agent to launch mapped Ansible job templates during incident remediation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Manage Automation projects

Create and manage Automation projects to run LEAP across multiple incident taxonomies independently.

Before you begin

Role required: LEAP admin (`sn_itom_leap.leap_admin`)

The default Automation project must be activated through the AI Admin Workspace before you can create additional Automation projects. If you have not yet activated LEAP, complete the initial setup first.

About this task

After activating the default Automation project, use the following procedures to create and manage additional Automation projects:

Procedure

1. Create an Automation project.
2. Start the analysis job.
3. Switch between Automation projects.
4. Edit an Automation project.

Create an Automation project

Create an Automation project to run LEAP analysis on a specific set of incident data.

Before you begin

Role required: LEAP admin (`sn_itom_leap.leap_admin`)

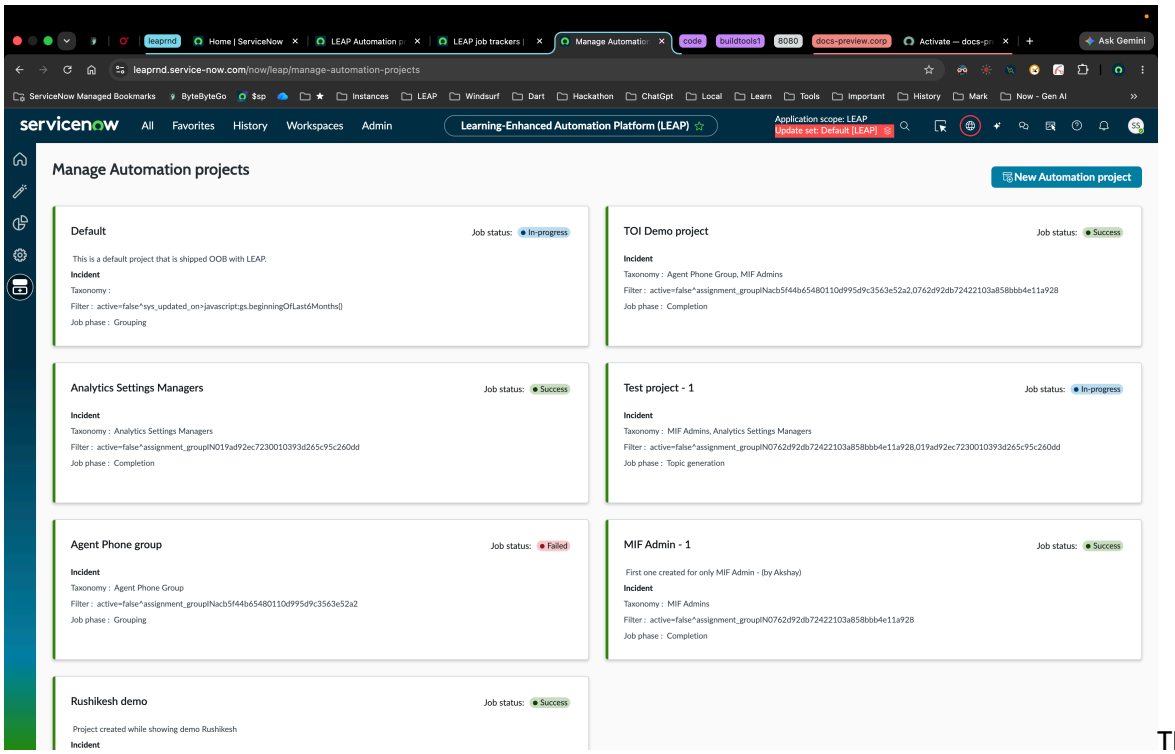
About this task

Each Automation project runs LEAP analysis independently on a specific set of incident data. You can create multiple projects to analyze different incident categories, assignment groups, or time periods. Multiple projects can use the same taxonomy when analyzing different data sets.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

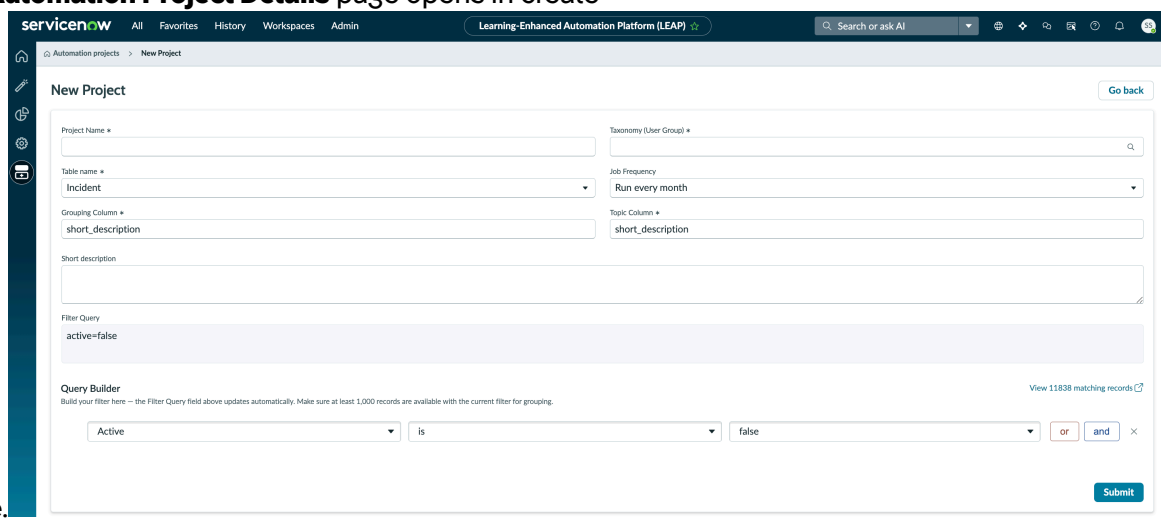
Procedure

1. Navigate to the **Manage Automation projects** page.



The page displays all existing Automation projects as cards, including the Default Automation project.

2. Select **New configuration**.
   The **Automation Project Details** page opens in create mode.



3. Complete the following fields:
   - Name: Enter a unique name for the project.
   - Description: (Optional) Describe the purpose of this project.
   - Table: Select the incident table to analyze. Only the incident table is supported in this release.
   - Filter: Define a filter to scope the incidents for this project. The filter must return at least one thousand records and can't exceed 300 characters.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Grouping column: Select the column used to group incidents.
- Topic column: Select the column used to generate topics.
- Taxonomy: Select one or more taxonomies for this project. The taxonomy field is multi-select. Multiple projects can use the same taxonomy.
- Job frequency: Select how often the analysis job runs.

Mandatory fields must be filled and the filter must return at least one record before you can start the job. Validation errors are displayed inline.

4. Select **Submit**.
   The project is created in ready status. The analysis job has not started yet. You can edit the project configuration before starting the job.

What to do next
After creating the project, start the analysis job to begin generating automation opportunities.

Start the analysis job

Start the analysis job for an Automation project to begin generating automation opportunities and insights.

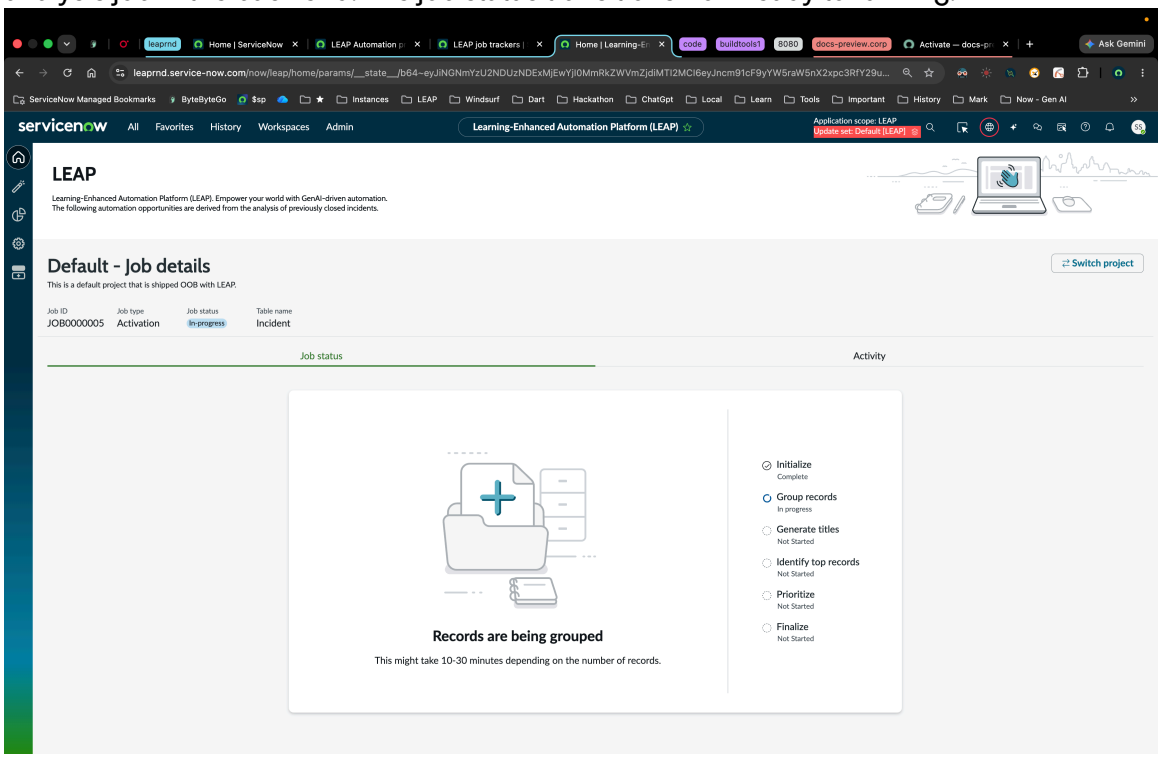
Before you begin
Role required: LEAP admin (`sn_itom_leap.leap_admin`)

About this task
After creating an Automation project, you must start the analysis job to activate the scheduled analysis and begin generating automation opportunities. The project configuration is locked once the job starts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

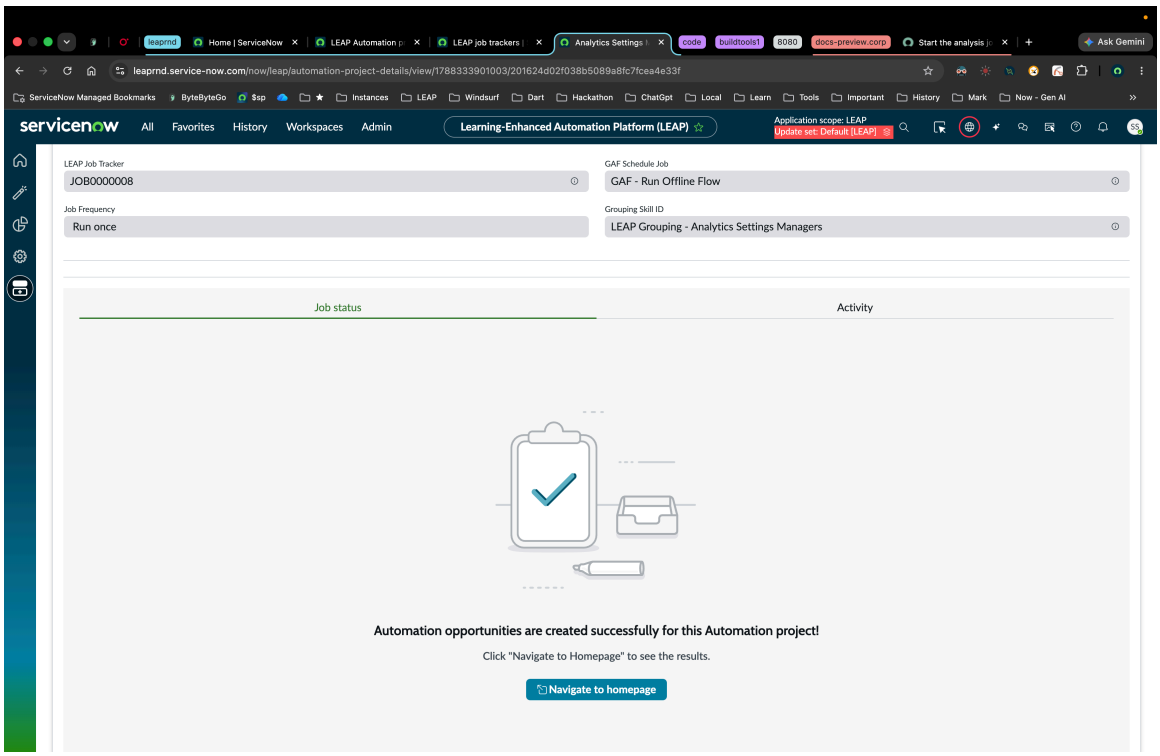
Procedure

1. Open the Automation Project in the **Automation Project Details** page.
2. Select **Start analysis**.
   LEAP generates the required grouping skills and activates the scheduled analysis job in the back end. The job status transitions from ready to running.



Result

When the job completes, automation opportunities and insights for this project are available in the LEAP workspace.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Switch between automation projects

Switch between Automation Projects to view metrics, reports, and automation opportunities scoped to a specific project.

Before you begin

Role required:

- LEAP viewer `sn_itom_leap.leap_viewer`

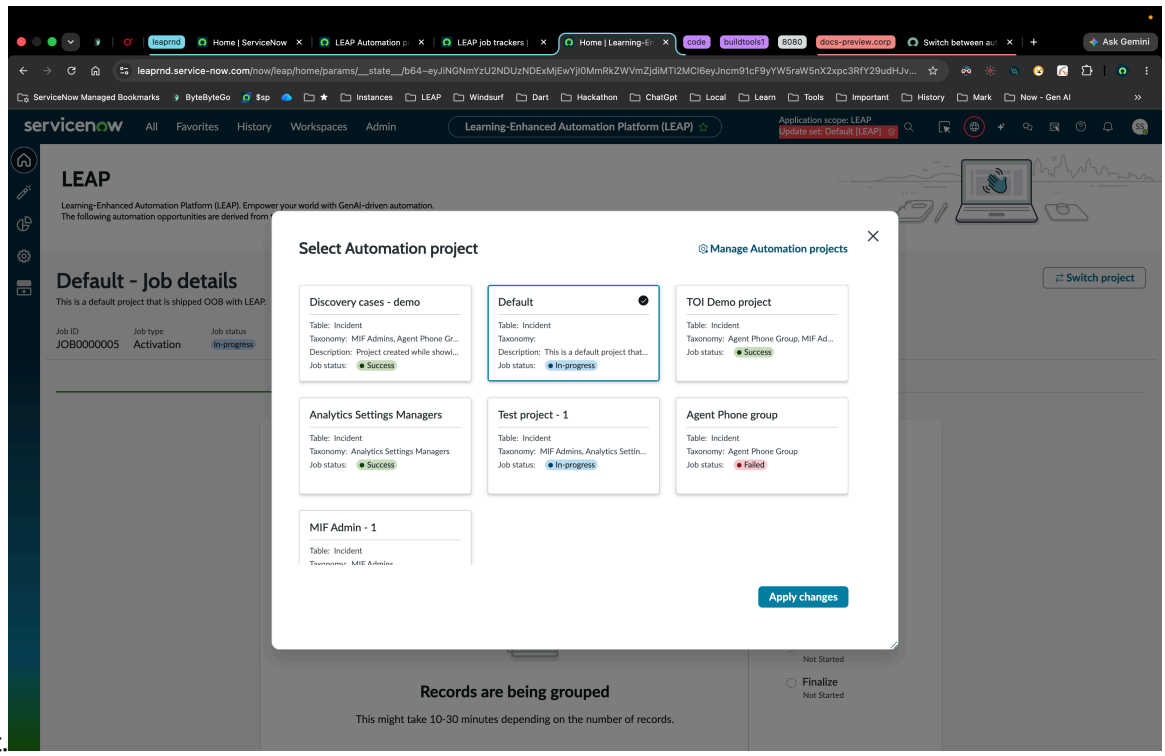
About this task

When you have multiple Automation Projects configured, you can switch between them to view project-specific data.

Note: Switching projects does not affect other projects or their running analysis jobs.

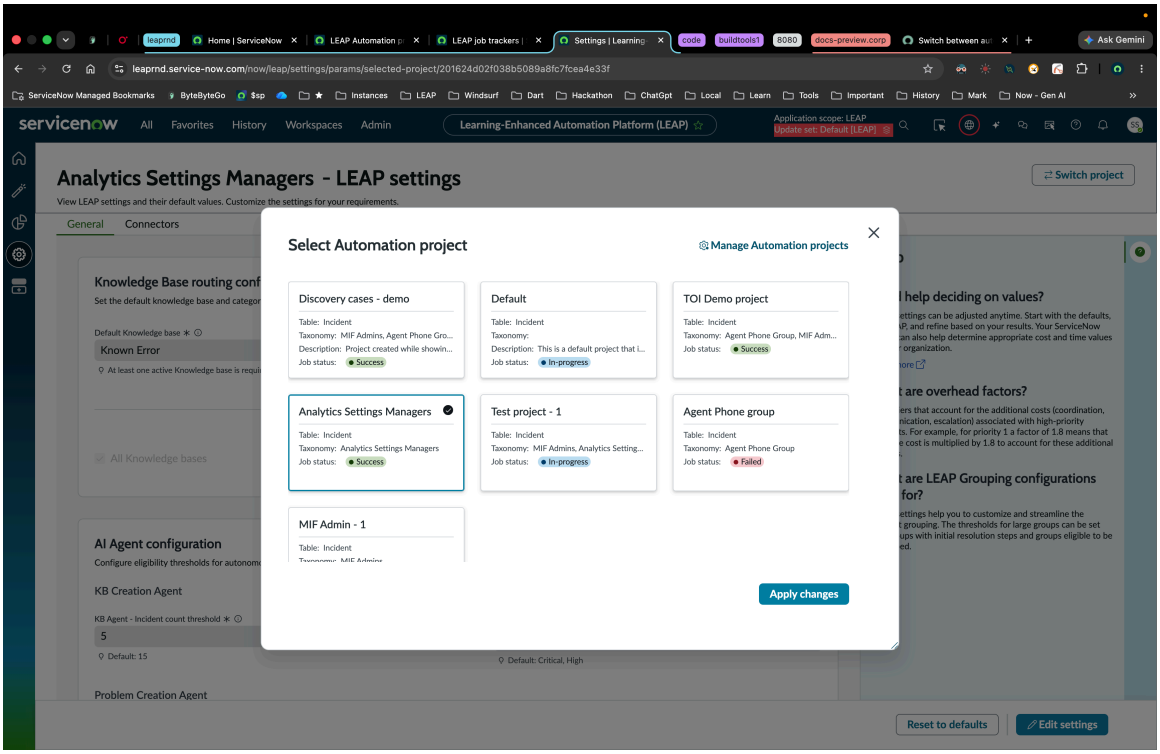
Procedure

1. On any LEAP page that displays a project selector, open the **Switch project** menu.
   The project selector appears on all LEAP pages. It displays the name of the currently active Automation Project.



2. Select the Automation Project you want to switch to.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The page refreshes to display metrics or reports or automation opportunities scoped to the selected project.

Edit an Automation Project

Edit an Automation Project configuration when the analysis job is in ready status.

Before you begin

Role required: LEAP admin (`sn_itom_leap.leap_admin`)

About this task

Procedure

1. Open the Automation Project from the **Manage Automation Projects** page.
2. Select **Edit**.

   Note: You can only edit a project when its job status is ready. Projects with a running or completed analysis job can't be edited.

3. Update the fields as needed, then select **Save**.

Generate and modify resolution steps in LEAP

Learn how to generate, edit, and track AI-generated resolution steps for automation opportunities in LEAP.

About this task

Resolution steps are actions that resolve issues identified by an automation opportunity. During the initial run, GAF generates these steps by analyzing work notes and historical resolutions.

The **Generate resolution steps** button creates resolution steps as required. As your system processes new incidents and records, regenerate these steps to maintain solution accuracy. LEAP provides three search capabilities: AI search, KB search, and web search.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- AI search: Scans records within your existing instance to identify relevant resolutions.
- KB search: Searches knowledge base resources external to your organization to suggest more effective resolution steps.
- Web search: Queries web resources beyond your organization's systems to find comprehensive solutions, broadening the scope of potential resolutions.

Note:

- Regenerating resolution steps incurs chargeable transactions. Exercise caution and careful planning before using the regenerate button to avoid unexpected costs.
- Only a system administrator or a LEAP admin with system administrator access can enable these additional sources of searches. Users with agent or viewer access must contact their administrator to activate these features. Once enabled, LEAP expands its search capabilities to deliver more comprehensive and effective resolution steps.

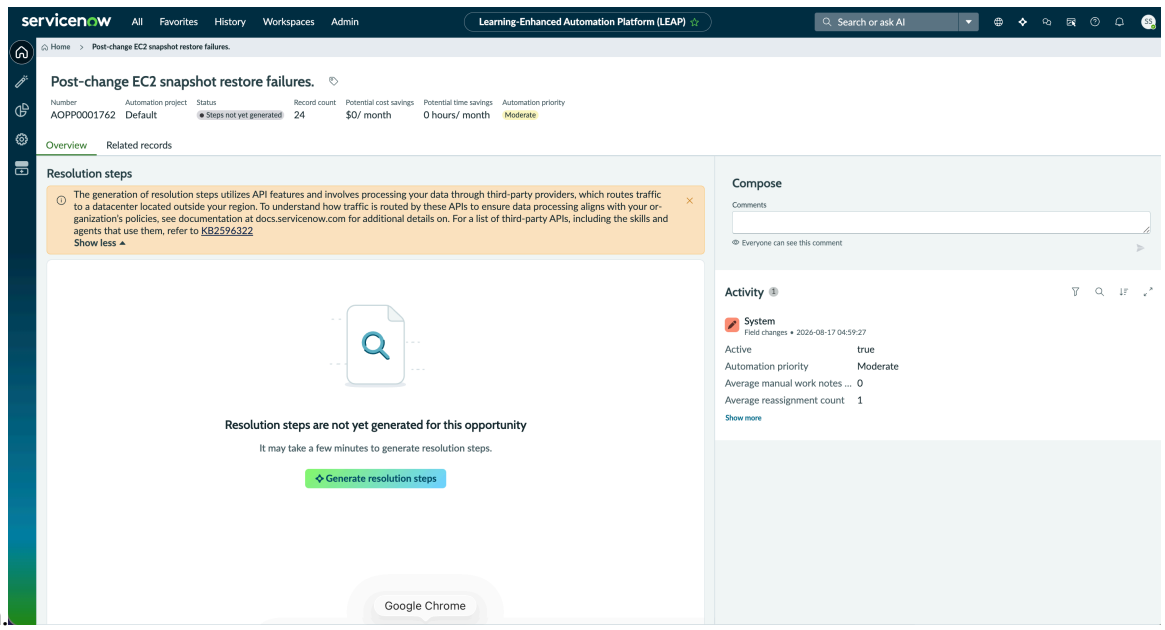
Resolution steps are generated only for automation opportunities that match the **Default resolution steps filter** configured in LEAP settings. The default filter is set to Critical priority (`automation_priority=40`). Items are processed in batches in the background, so performance is not affected during generation. To change the priority filter, update the condition builder in LEAP settings fields.

Before you begin

Role required: LEAP admin

Procedure

1. Select **Workspaces** > **LEAP**.
2. On the LEAP landing page, select the required automation opportunity.
3. If resolution steps are unavailable in the Overview section, select **Generate resolution steps**.
4. If resolution steps are available, and you want to get alternative resolution steps, then use the **Regenerate** button.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- The Regenerate button is turned off while manual editing is in progress.
- Resolution steps are generated based on the capability enabled either using AI search or Knowledge Base or Web search.

5. To manually modify resolution steps, select the edit icon.
   Each update to the resolution steps is recorded in the LEAP Outcome Snapshots table for traceability.
6. To revert to the last generated resolution steps, use the **Revert to AI generated steps** button.

Result

Create sub-groups for automation opportunities

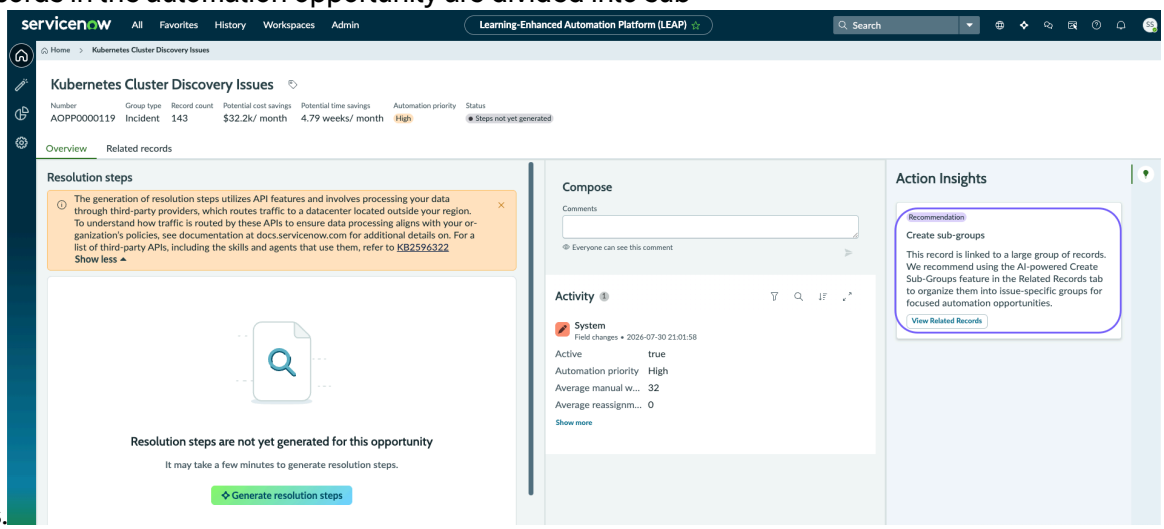
Large automation opportunities in LEAP are broken into smaller, more manageable sub-groups to support focused and contextual incident resolution steps.

Before you begin

Role required: LEAP admin

Procedure

1. Navigate to LEAP landing page, and select the automation opportunity that you want to refine.
2. Select **Related records** tab.
3. Select **Create Sub Groups**.
   The records in the automation opportunity are divided into sub-groups.



4. Select the **Sub Groups** tab to view the child sub-groups created.
   Each child sub-group has it own ID and you can generate focused resolution steps with only the records in the sub-group. On the LEAP landing page, the parent automation opportunity shows child automation opportunity in the *Sub Groups* column.

Monitor automation outcomes using the LEAP value dashboard

Use the LEAP value dashboard to monitor automation outcomes across ServiceNow playbooks, Ansible playbooks, KB articles, and problem records.

Before you begin

Role required: LEAP admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The LEAP value dashboard tracks automation outcomes across all outcome types that LEAP produces. Use the **Overview** tab to monitor cross-outcome metrics and identify high-value automation opportunities.

Procedure

1. Navigate to the LEAP dashboard by selecting the dashboard icon .

   The **Default - LEAP value dashboard** page opens. To view a different automation project dashboard, select **Switch project** in the upper-right corner.

   The **Overview** tab opens by default, displaying grouping statistics and a summary of all automation outcomes.

2. Review the **Grouping value** section to understand the scope and results of the analysis.

   This section displays key grouping metrics and analysis metadata:

   - **Records analyzed** - total number of records that LEAP processed in the current analysis run.
   - **Total groups** and **Average group size** - clusters of similar incidents that LEAP identified as candidates for automation.
   - **Large groups** - groups that exceed the automation threshold and represent high-value automation opportunities.
   - **Table analyzed** - the ServiceNow table that LEAP used as the data source, for example, Incident.
   - **Last run** - the date of the most recent GAF analysis run.
   - **Record date range** - date range of records included in the analysis.

3. Review the **LEAP artifacts metrics** section.

   Use the **Time Period** list in the upper-right of this section to filter all artifact counts by a time range. The default is **Last 6 months**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Review the four artifact summary cards: **ServiceNow playbooks**, **Ansible playbooks**, **KB articles created**, and **Problem records created**.
Each card shows the total count of that artifact type that LEAP created in the selected time period.

You can see a cross-outcome summary of all artifacts that LEAP generated.

4. Review the **Outcome by type** section.

a. Review the **Playbooks** donut chart.
The chart breaks down total playbooks by type: **ServiceNow playbooks** and **Ansible playbooks**. The center value shows the combined total.

b. Review the **Automated Opportunities** donut chart.
The chart shows the proportion of automation opportunities that are automated compared to those that are not automated. The center value shows the total number of groups.

5. Review the **Savings by playbooks** section.

a. Check **Total savings by playbooks** and **Total agent-hours saved by playbooks**.
These values show realized savings from ServiceNow and Ansible playbook executions.

b. Review the **Savings distribution** chart.
The chart shows how total savings are distributed across playbook types.

You can see quantified savings from playbook-driven automation for the selected time period.

Result

The **Overview** tab provides a cross-outcome snapshot of all artifacts that LEAP generated and the total savings from playbook automation. To review detailed metrics for a specific outcome type, see the related tasks: Review ServiceNow playbook metrics, Review Ansible playbook metrics, Review KB article metrics, and Review problem record metrics.

Review ServiceNow playbook metrics

Use the **ServiceNow playbooks** tab on the LEAP value dashboard to review execution trends, playbook status, and top-performing playbooks.

Before you begin

Role required: LEAP admin

About this task

The **ServiceNow playbooks** tab shows execution volume, status breakdown, and top-performing playbooks for the selected time period. Use the **Time Period** list in the upper-right corner to filter all metrics by a date range. The default is **Last 6 months**.

Procedure

1. Open the LEAP value dashboard and select the **ServiceNow playbooks** tab.
The **ServiceNow playbooks executions overview** section opens.
2. Review the **Tickets resolved by playbooks - Monthly trend** chart.
The bar chart shows the number of tickets resolved by ServiceNow® playbooks each month over the selected time period.
3. Review the three donut charts **Playbooks by status**, **Published playbooks by automation priority**, and **Playbooks utilization overview**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Playbooks by status** — shows the split between draft and published playbooks.
- **Published playbooks by automation priority** — shows published playbooks grouped by priority level, such as, Critical.
- **Playbooks utilization overview** — shows the ratio of executed to unexecuted playbooks.

4. Review the tables **Top 10 Playbooks – by tickets resolved** and **Top 10 Playbooks – by time savings**.
   Each table lists playbooks by LEAP number and group description. Select a LEAP number to open the automation opportunity detail page.

Result
You can see execution volume, status breakdown, and the top-performing ServiceNow playbooks for the selected time period.

Review Ansible playbook metrics

Use the **Ansible playbooks** tab on the LEAP value dashboard to review Ansible execution counts, agent-hours saved, and top automation opportunities resolved by Ansible.

Before you begin
Role required: LEAP admin

About this task
The **Ansible playbooks** tab shows how Ansible automation is contributing to ticket resolution and time savings. Use the **Time Period** list in the upper-right corner to filter all metrics by a date range. The default is **Last 6 months**.

Procedure

1. Open the LEAP value dashboard and select the **Ansible playbooks** tab.
   The **Ansible playbooks executions overview** section opens.
2. Review the four metric cards at the top of the section.
   - **Ansible playbooks executed** - total Ansible playbook executions triggered by LEAP in the selected time period.
   - **Total agent-hours saved via Ansible** - cumulative agent time saved through Ansible automation.
   - **Tickets resolved by Ansible** - total tickets resolved by Ansible playbook execution.
   - **Cost savings via Ansible** - total cost savings from Ansible-driven resolutions.
3. Review the **Ansible executions - monthly trend** chart.
   The bar chart shows the number of Ansible executions per month over the selected time period.
4. Review the **Top 10 Automation Opportunities – by ticket resolved using Ansible playbooks** and **Top 10 Automation Opportunities – by time savings using Ansible playbooks** tables.
   Both tables list automation opportunities by name. Select an automation opportunity name to open its detail page.

Result
You can see how Ansible automation is contributing to ticket resolution and time savings across your automation opportunities.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Review KB article metrics

Use the **KB articles** tab on the LEAP value dashboard to review the volume of knowledge base articles that LEAP created and identify which automation opportunities are generating the most knowledge content.

Before you begin
Role required: LEAP admin

About this task
The **KB articles** tab shows KB article creation trends and which automation opportunities are producing the most knowledge content. Use the **Time Period** list in the upper-right corner to filter all metrics by a date range. The default is **Last 6 months**.

Procedure

1. Open the LEAP value dashboard and select the **KB articles** tab.
   The **KB articles overview** section opens.
2. Check the **KB articles created – monthly trend** chart.
   The `bar chart` shows the number of KB articles that LEAP created each month over the selected time period.
3. Review the **KB articles created by source** donut chart.
   The chart shows the proportion of KB articles created by the LEAP AI agent compared with KB articles created manually.
4. Review the **Top 10 opportunities that generated KB articles** table.
   The table lists automation opportunities that produced KB articles, with a link to each generated knowledge article in the **Knowledge** column. Select an automation opportunity number to open its detail page.

Result
You can see the volume of AI-generated versus manually created KB articles and identify which automation opportunities are producing the most knowledge content.

Review problem record metrics

Use the **Problems** tab on the LEAP value dashboard to review the volume of problem records that LEAP created and identify which automation opportunities are driving root cause investigation.

Before you begin
Role required: LEAP admin

About this task
The **Problems** tab shows problem record creation trends and which automation opportunities are generating the most root cause investigation. Use the **Time Period** list to filter all metrics by a date range. The default is **Last 6 months**.

Procedure

1. Open the LEAP value dashboard and select the **Problems** tab.
   The **Problem records overview** section opens.
2. Review the **Problem records created – monthly trend** chart.
   The bar chart shows the number of problem records that LEAP created each month over the selected time period.
3. Review the **Problem records created by source** donut chart.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The chart shows the proportion of problem records created by the LEAP AI agent compared to those created manually.

4. Review the **Top 10 opportunities that generated Problem records** table.
   The table lists automation opportunities that produced problem records, with a link to each problem record in the **Problem** column. Select the automation opportunity number to open its detail page.

Result

You can see the volume of AI-generated versus manually created problem records and identify which automation opportunities are driving root cause investigation.

Create LEAP problem records

Create problem records for LEAP from available incident clusters, also known as automation opportunities, for further analysis.

Before you begin

Role required: LEAP admin

About this task

The problem record creation process automatically transfers critical information from incidents to problem records. When a problem record is created, LEAP includes all relevant information. This information includes:

- incident group description
- incident group link
- resolution steps

The automated data transfer is characterized with:

Root cause documentation

LEAP populates the cause notes section of the problem record with the same details as available in existing incident records.

Incident attachment

All incidents associated with the group are automatically linked to the problem record for comprehensive tracking.

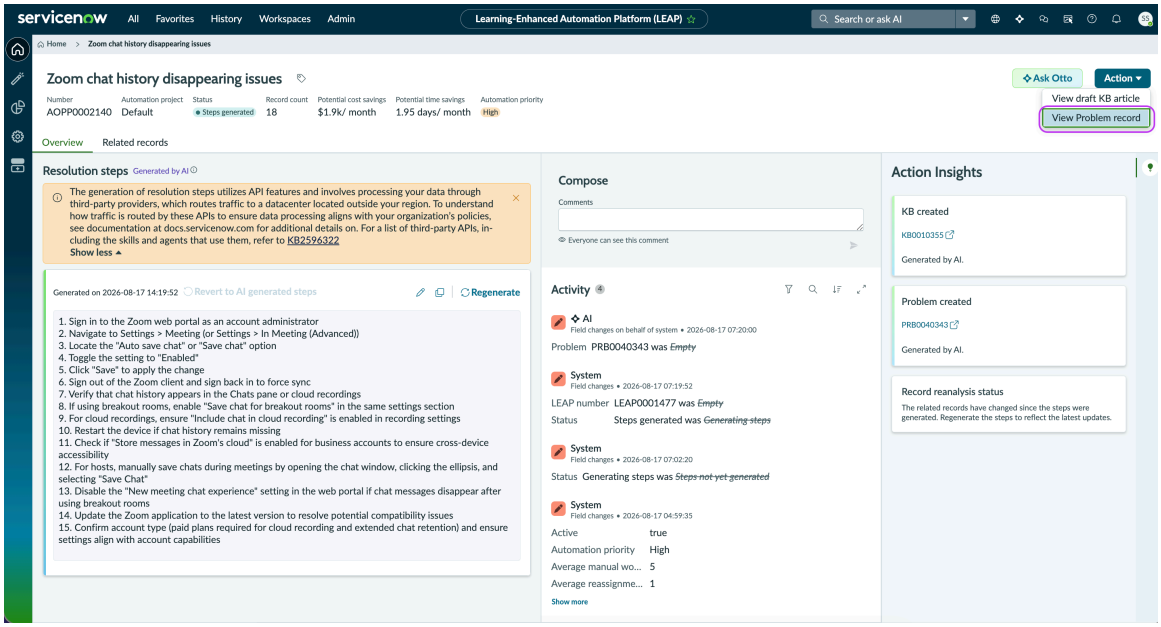
Async processing

Problem records are generated efficiently without manual intervention even during high-volume scenarios.

Procedure

1. Select **Workspaces** > **LEAP**.
2. On the LEAP landing page, select an automation opportunity.
3. If resolution steps don't appear in the Overview section, select **Generate resolution steps**.
4. Select **Actions** > **Create problem record** button to create a record for further in-depth analysis.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Another option is to invoke the LEAP AI agent by selecting the

Ask Otto button and creating problem record.

Generate LEAP knowledge base articles

Generate AI-enhanced knowledge base articles from automation opportunity resolution steps to share structured, publication-ready knowledge across your organization.

Before you begin

Resolution steps must exist for the automation opportunity before generating a knowledge base article.

Role required: LEAP admin

A default knowledge base must be configured in LEAP properties before LEAP AI agent creates knowledge base articles. See LEAP settings fields.

Each knowledge base used in LEAP must have the correct Can Contribute permissions configured. See Knowledge base permissions for LEAP.

About this task

LEAP uses AI to transform resolution steps into a complete, structured knowledge base article. The generated article includes these sections:

- Summary
- Symptoms — inferred from incident data and resolution context
- Resolution steps — expanded with sub-steps and code or command formatting
- Related resources
- Metadata — including Article Number, Product, Category, Visibility, and Valid To date

The article is created in Draft state and routed through the standard knowledge base approval workflow before publication. Each generated article maintains a link to the originating automation opportunity and is suggested when similar incidents occur.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When the LEAP AI agent automatically creates an article, it is routed to the default knowledge base and category configured in LEAP properties. When you create an article manually using the **Actions** menu, a dialog opens where you can select the knowledge base and category before the article is created.

Note: AI-generated content may be inaccurate. Review the generated article before submitting it for approval to confirm it reflects the correct resolution information.

Procedure

1. Navigate to **Workspaces** > **LEAP**.
2. On the LEAP landing page, select the automation opportunity for which you want to generate a knowledge base article.
3. If resolution steps are unavailable in the Overview section, select **Generate resolution steps** and wait for the steps to be generated.
4. Select **Actions** > **Draft KB article**.

   A dialog opens to configure the location and category of the knowledge base where the article created should reside.

   Tip: You can also generate a knowledge base article by selecting the button to open the ServiceNow Otto panel and selecting the **draft KB article** option from the menu. Articles created this way route to the default knowledge base configured in LEAP properties.

5. In the dialog, select a knowledge base from the **Select knowledge base** list.
   The list shows only the knowledge bases selected in the **Eligible knowledge bases** field in LEAP properties. If no eligible knowledge bases are configured, all active knowledge bases are shown.
6. Select a category from the **Category** list.
   Categories are filtered based on the knowledge base you selected.
7. In the **KB Meta** field, add or remove tags to improve the discoverability of the article for virtual agents and search.
   Meta tags help virtual agents find the correct knowledge base article. Tags are pre-populated based on the automation opportunity context. You can add new tags or remove existing ones as needed.
8. Select **Draft KB article**.
   LEAP generates a complete knowledge base article and opens it in the Knowledge Center in draft state.
9. Review the generated article, including all sections and automatically populated metadata, and make any corrections.
   Technical commands and code snippets are formatted with monospace font and include platform-specific context where applicable.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

10. Submit the article through the knowledge base approval workflow.
    After approval, the article is published to the Knowledge Center. It is linked to the originating incident record and suggested when similar incidents occur.

View LEAP resolution step recommendations in SOW

Use LEAP to view AI-generated resolution step recommendations that match the incident description in SOW to resolve incidents more efficiently.

Before you begin
Role required: LEAP agent

About this task
When you work on an incident in SOW, LEAP compares the incident short description against existing resolution steps. Only the steps relevant to the incident description appear in the **Recommendations** tab under LEAP Resolution Steps. Steps that don't match the incident description are filtered out. If fewer steps appear than expected, this indicates successful filtering of irrelevant steps.

Note: AI-generated content may contain inaccuracies. Review all recommended resolution steps before applying them to verify their accuracy and suitability for your environment.

Procedure

1. Open an incident in SOW.
2. In the insights panel, select the **Recommendations** tab.
   LEAP displays resolution steps that match the incident's short description.
3. Review the recommended resolution steps.
   If fewer steps appear than expected, LEAP filters out steps that don't match the incident description.
4. Apply the resolution steps to resolve the incident.

Generate LEAP playbooks

Create standard, dynamic, and automated playbooks using LEAP to promote fast incident resolution and response time.

Before you begin
Role required: LEAP admin

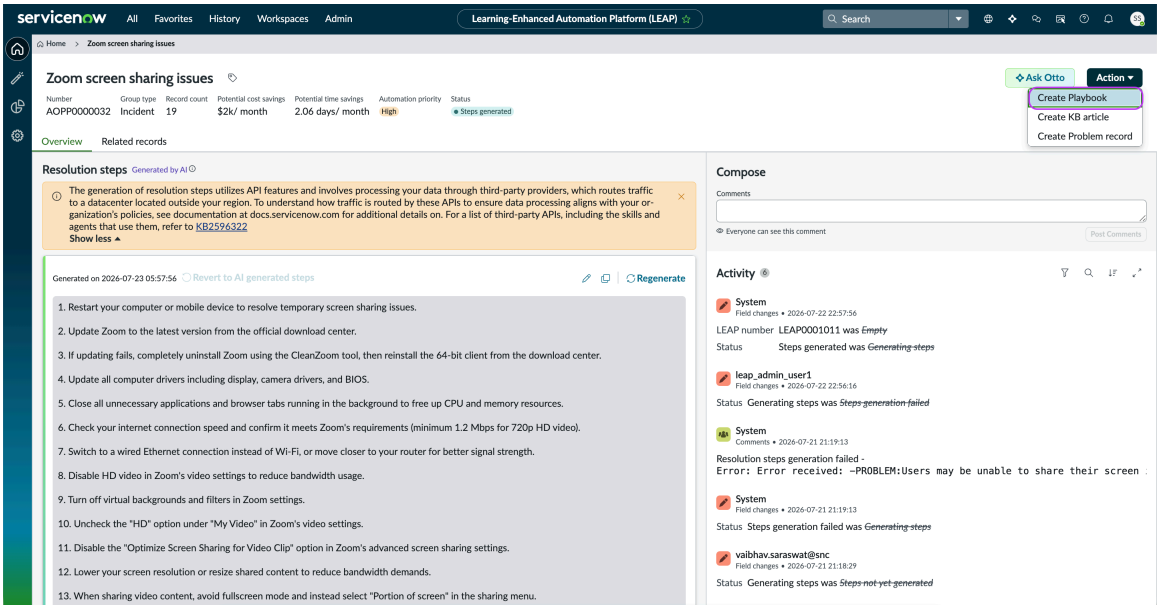
Procedure

1. Select **Workspaces** > **LEAP**.
2. On the LEAP landing page, select the required automation opportunity to create a playbook.
3. If resolution steps are unavailable in the Overview section, select **Generate resolution steps**.
4. Select one of the following options to create playbook.

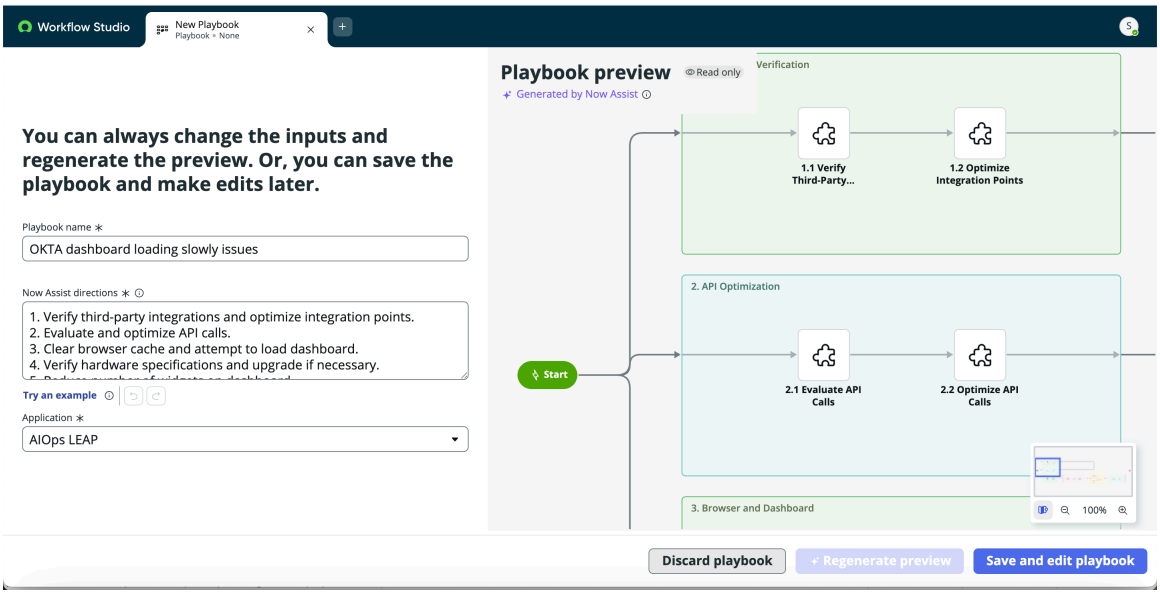
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

UI option	Steps
Actions	Select Actions button , and select **Create Playbook**.
Ask Otto	**a.** Select button. **b.** In the ServiceNow Otto panel, select **Create playbook**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Workflow Studio opens and the playbook generation process starts. The **Playbook name** and **directions** fields are pre-filled with the problem record title and the generated resolution steps.



Use LEAP playbooks in Service Operations Workspace SOW

Use LEAP playbooks in the SOW.

Before you begin

Role required: LEAP admin

Procedure

1. Navigate to **All** > **LEAP**.
2. Select the required automation opportunity.
3. Generate LEAP playbooks.
4. Open the SOW interface using the Workspaces menu.
5. Select the required incident, and access the insights' panel.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Select the playbook icon

.
7. If a LEAP playbook is available for the selected incident, review the AI-filtered resolution steps and use them to resolve the issue.

Map Ansible jobs to resolution steps

Create mappings between automation opportunity resolution steps and Ansible job templates to enable automated incident remediation.

Before you begin

Before mapping Ansible jobs to resolution steps:

- The automation opportunity must have generated resolution steps
- The Ansible discovery agent must have analyzed the automation opportunity
- Job templates related to the resolution steps must exist and be available in your connected Ansible Automation Platform instance.
-

Role required: LEAP admin

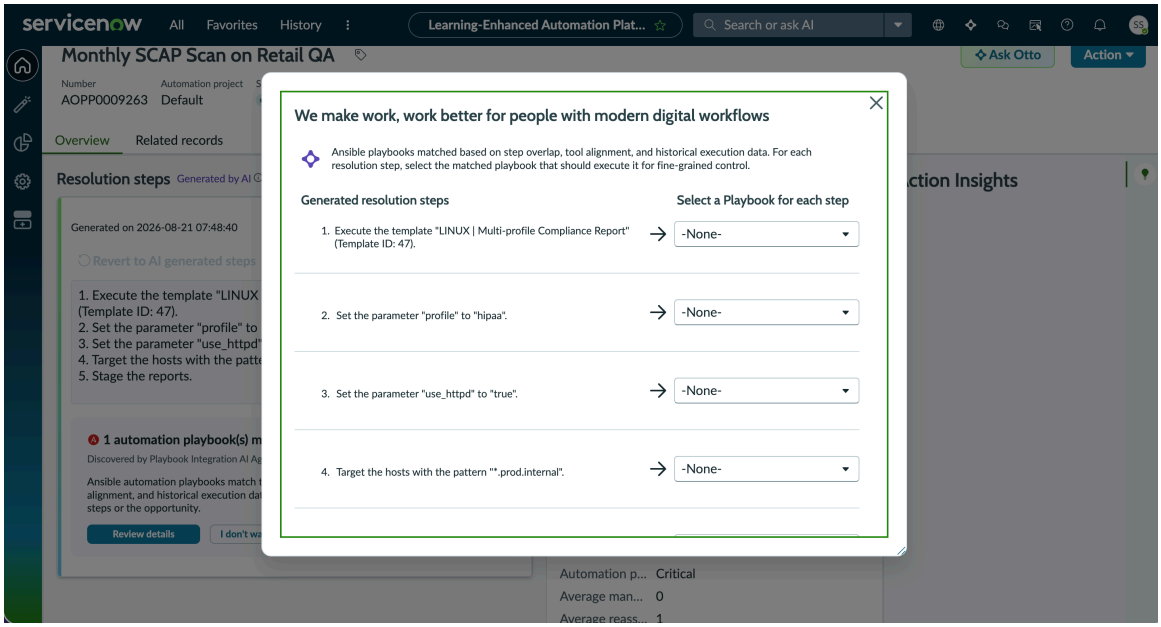
About this task

Step-to-job mapping creates the relationship between specific resolution steps and Ansible job templates. This mapping enables the Ansible execution agent to automatically launch the appropriate automation during incident remediation. At remediation time, the Ansible execution agent reads this mapping to determine which job template to launch for each step, in sequence.

Procedure

1. Navigate to **Learning-Enhanced Automation Platform(LEAP)**.
2. Locate the automation opportunity that you want to configure for Ansible integration.
3. In the automation opportunity details page, the *`Ready for review`* section displays whether there are Ansible playbooks detected.
4. Select **Review details** to open the mapping modal.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



This button appears only after the Ansible discovery agent has analyzed the automation opportunity and identified candidate job templates. If the button does not appear, confirm that the Ansible discovery agent has completed analysis.

5. Review the resolution steps displayed in the mapping modal.
   The modal parses the resolution steps and displays each step with a numbered index.
6. For each resolution step, select the appropriate Ansible job templates from the drop-down list:
   - Select a job template for the step to be automated.

     A step can be automated if a matching job template exists.
   - Leave the drop-down empty if the step requires manual intervention.

   The drop-down is populated with job templates discovered by the Ansible discovery agent. Each job template shows:

   - Job template name
   - Description
7. Review your mappings to verify that:
   - Automated steps have appropriate job template selected.
   - Manual steps are left unmapped (empty drop-down).
   - The sequence of steps makes logical sense for incident remediation.
8. Select **Save** to create the mapping.
   The mapping is saved to the `sn_itom_leap_ansible_mapping` table.

Result
The step-to-job mapping is created. The automation opportunity detail page now displays each resolution step with its mapped job template. Manual steps are indicated with **(manual)**. The mapping is available for incident remediation in Service Operations Workspace.

Example: Step-to-job mapping

After saving a mapping, the automation opportunity displays resolution steps like this:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
Step 1: Restart the nginx service
  ▶ nginx-restart-playbook

Step 2: Flush DNS cache
  (manual)

Step 3: Verify service health
  ▶ health-check-playbook
```

What to do next

After creating the mapping:

Note: If resolution steps are regenerated after saving, this mapping is deleted and must be recreated.

Editing replaces the existing mapping. Don't edit a mapping while it is in use during an active incident remediation.

Execute Ansible automations for incidents

Use the Ansible Execution Agent to automatically launch mapped Ansible job templates during incident remediation in the Service Operations Workspace, reducing manual effort and accelerating mean time to resolution.

Before you begin

Before executing Ansible automations:

- The Ansible Execution Agent must be configured and enabled
- Step-to-job mappings must exist for the predicted automation opportunity group

  For more information, refer to Map Ansible jobs to resolution steps.

Role required: LEAP agent

About this task

When an incident arrives in SOW, LEAP predicts the automation opportunity group using existing clustering. For critical automation opportunities where resolution steps are generated, if step-to-job mappings exist for that group, automation options are presented to incident responders for execution.

Procedure

1. In SOW, select the incident.
2. In the **Recommendations** section, review the available automation options.
   This section appears only if LEAP has predicted a critical automation opportunity group with step-to-job mappings.
3. Select the required method to complete the resolution

Method	Steps
Manual	**a.** Review the manual step description provided by the agent. **b.** Perform the required manual actions. **c.** Select **Step Completed** to confirm that the manual step is finished.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Method	Steps
Automated	**a.** Select **Execute Ansible Playbook**. **b.** Provide the required inputs when prompted and confirm to proceed.

4. Monitor job execution status and respond to agent prompts:
5. Review the execution summary when all steps are completed.
   The agent provides a summary including total steps processed, jobs launched with their Ansible Job IDs, manual steps completed, and any failures or errors.
6. Update the incident record with the remediation results and close the incident if resolution is successful.

Result

The mapped Ansible automations are executed in sequence, with manual steps completed as needed. The incident is remediated using the automated workflow defined in the step-to-job mapping.

Example: Example execution flow

For a database connectivity incident, the execution might proceed as follows:

1. Agent: "Step 1: 'Restart the nginx service' — launching nginx-restart-playbook"
2. Agent: "Launched successfully. Ansible Job ID: 12345. Status: Running"
3. Agent: "Job completed successfully. Proceeding to next step."
4. Agent: "Step 2: 'Flush DNS cache' — this step has no playbook mapped. Please complete this step manually."
5. User: "Step completed" (after manually flushing DNS cache)
6. Agent: "Step 3: 'Verify service health' — launching health-check-playbook"
7. Agent: "All steps completed. Summary: 2 jobs launched, 1 manual step completed."

What to do next

After execution:

- Review the Ansible job logs in Ansible Automation Platform for detailed execution information.
- Document any issues or improvements for future automation opportunity mappings.
- Consider updating step-to-job mappings based on execution results and feedback.

LEAP reference

These topics provide detailed field description information required during LEAP installation.

LEAP Installer fields

Field values that you configure when installing LEAP using the LEAP Installer.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

LEAP Installer skill activation form

Field	Description
Run frequency	Frequency at which LEAP runs on the configured table. This field is automatically set to Run every month.
Group records from this table	Table from which LEAP queries and filters records for grouping. This field is automatically set to Incident.
Use this column for grouping	Column from the selected table used to read records for grouping. This field is automatically set to Short description.
Use this filter	Condition filter used to select records for grouping. The default filter is `active=false^ORactive=true`. Modify this filter to change the scope of records that LEAP processes. **Note:** By default, incidents are grouped and filtered for the last 6 months.
Use this column for topic generation	Column from the selected table used to generate titles for the created groups. This field is automatically set to Short description.

Define access

Field	Description
Roles	Roles assigned to the ACL entry that determine who can access the skill. This field is automatically set to `sn_itom_leap.leap_genai_worker`. Roles selected here are available in the Select display step.

Components installed with LEAP

Several types of components are installed with activation of the plugin, including tables, user roles, and scheduled jobs.

Roles installed

Role title [name]	Description
LEAP admin [sn_itom_leap.leap_admin]	You have full control over LEAP capabilities, including the following: • Turn features on and off • Execute scheduled jobs • Manage LEAP tables and the LEAP Workspace

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role title [name]	Description
	• Generate and update resolution steps • Create and view problems and generate LEAP playbooks from automation opportunities (AO)
LEAP viewer [sn_itom_leap.leap_viewer]	You can access and view data related to LEAP, including tables, the workspace, and problems originating from AOs.
LEAP agent [sn_itom_leap.leap_agent]	You can access the LEAP menu from the Service Operations Workspace (SOW) and trigger LEAP executions directly from within SOW.

Scheduled jobs installed

Scheduled job	Description
Populate Record Metrics Aggregate Records	Runs once per day to populate the LEAP aggregate metrics table by time periods.
Update Record Metrics Table with Calculated Metrics	Runs daily to calculate and update the records in the LEAP Record Metrics table for all the records where the metrics haven't been calculated yet.
GAF- Run Offline Flow	Runs monthly to group the tasks using the task data provided in the skill configuration while activating the LEAP skill.

Tables installed

Table	Description
LEAP aggregate metrics	Contains metrics, like cost savings, time savings, and record count, for each time period. This data is used in the LEAP report page in the workspace.
LEAP feedback	Stores the feedback given by the agent to the playbooks that are run to fix the tasks.
LEAP GAF mapping	Maintains a map between the GAF groups and the published LEAP instances to retain information in the subsequent GAF clustering runs.
LEAP group	Stores the LEAP group details, like group description, resolution steps, and whether the LEAP is automated or not.
LEAP group ranking	Maintains data, like business impact, projected cost savings, problem record, and status, that is used in the Automation Opportunities page of the workspace.
LEAP properties	Sets custom values to the properties that are used in LEAP.
LEAP job tracker	Maintains the status of background jobs init, grouping, processing, and completion phases.
LEAP outcome snapshot	Maintains snapshots of automation outcomes generated by AI or edited by users.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
LEAP Integration Project	Maintains record of integration projects that organize LEAP functionality and properties.
LEAP record metrics	Maintains data that's used in the Published LEAP page in the workspace. It contains calculated data, like time saved, tickets resolved, and rating trend.
LEAP missed opportunity	Maintains record of missed automation opportunity artifact creation of type; resolution steps, kb article, or playbook.
LEAP group strategy	Maintains the strategic data for automation opportunities, including the association of records and GAF group.
LEAP Hierarchical job	Records hierarchical job execution status with GAF group associations.
LEAP Ansible Agent status	Records Ansible agent execution and conversation status for playbook runs.
LEAP Ansible Step Mapping	Maintains record of the step to job mapping performed by LEAP.
Discovered Job Catalog	Maintains record of discovered Ansible jobs and their associations with automation opportunities.

LEAP settings fields

LEAP settings page field values help estimate cost and time savings when automation is used. These settings support cost predictability.

LEAP settings fields

Overhead factors are multipliers that are used for critical priority incidents and represent hidden costs.

Field	Description
Cost per work note ($)	Represents the cost for each work note, including labor and operational expenses for every incident. This value calculates total cost savings when automation reduces the number of work notes. Example: If your organization spends an average of $50 per work note entry, including analyst time and overhead, enter 50.
Time per work note (hrs)	Average time spent on each work note entry and helps estimate the total time impact across incidents. Example: If analysts spend an average of 30 minutes on each work note, enter 0.5. For a cluster of 100 incidents with 4 work notes each, LEAP estimates 200 hours of time savings when automation is applied.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
P1 - High priority incidents	Priority 1 incidents often require more coordination, communication, and escalation — beyond just the direct work notes. For P1 incidents, the base cost is multiplied by 1.8 to reflect the additional impact. Example: If the base cost per work note is $50 and a P1 incident has 4 work notes, the adjusted cost is $50 × 4 × 1.8 = $360.
P2 - High priority incidents	For priority 2 incidents, the base cost is multiplied by 1.4 to reflect the additional impact. Example: If the base cost per work note is $50 and a P2 incident has 4 work notes, the adjusted cost is $50 × 4 × 1.4 = $280.
P3 - Moderate priority incidents	For priority 3 incidents, the base cost is multiplied by 1.1 to reflect the additional impact. Example: If the base cost per work note is $50 and a P3 incident has 4 work notes, the adjusted cost is $50 × 4 × 1.1 = $220.
P4 - Low priority incidents	For priority 4, the base cost is multiplied by 0.8 to reflect the additional impact. Example: If the base cost per work note is $50 and a P4 incident has 4 work notes, the adjusted cost is $50 × 4 × 0.8 = $160.
P5 - Planning incidents	For priority 5, the base cost is multiplied by 0.4 to reflect the additional impact. Example: If the base cost per work note is $50 and a P5 incident has 4 work notes, the adjusted cost is $50 × 4 × 0.4 = $80.
Grouping configuration	
Large group threshold	Groups that have more incidents than the threshold set are marked as large groups. The default value set is 100 incidents. The threshold helps LEAP prioritize high-volume clusters for automation analysis. **Example:** If the threshold is set to 200, any group containing more than 200 incidents is flagged as a large group.
Initial run: Groups with resolution steps	The maximum number of groups for which resolution steps are generated in the first run of LEAP. The default is 500. Increasing this value generates broader coverage but may extend processing time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Example: If set to 500, LEAP generates resolution steps for up to 500 groups in the first run.
Remapping eligibility threshold	The minimum ratio of incidents to group size required for a group to be eligible for remapping. The default is 0.2, which represents 20% of the group size. Higher values result in more selective remapping. Increasing this value limits remapping to only well-populated groups, reducing noise from small or transient clusters. **Example:** If set to 0.2, a group must contain at least 20% of the expected group size before it's eligible for remapping.
Default resolution steps filter	A condition builder filter that determines which automation opportunities are eligible for resolution step generation. By default, this filter is set to 'Critical priority' (automation_priority=40). Therefore, resolution steps are generated only for critical automation opportunities. To include additional priorities, update the filter in the condition builder. The condition builder is accessible when you edit LEAP settings. Example: To generate resolution steps for both Critical and High priority automation opportunities, update the filter to select both Critical and High priority. 
LEAP AI agent settings fields

LEAP AI agent settings

Field	Description
Problem creation agent	
Problem agent: Minimum incident count	Minimum number of incidents a cluster must contain before the LEAP Problem creation agent autonomously creates a Problem record. The default value is 15.
Problem agent: Severity	Automation opportunity severity levels that make a cluster eligible for problem record creation by the LEAP Problem creation agent. You can select multiple severity levels. The default values are Critical and High.
Knowledge base agent	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

LEAP AI agent settings (continued)

Field	Description
KB agent: Minimum incident count	Minimum number of incidents a cluster must contain before the LEAP AI agent autonomously creates a knowledge base article. The default value is 15.
KB agent: Severity	Automation opportunity severity levels that make a cluster eligible for knowledge base article creation by the LEAP AI agent. You can select multiple severity levels. The default values are Critical or High.
Knowledge base routing	
Default knowledge base	The knowledge base where articles created automatically by the LEAP AI agent are stored. This field is mandatory. You can't save settings without selecting a value. Articles created through the ServiceNow Otto panel are also routed to this knowledge base.
Default category	The category within the default knowledge base where articles created by the LEAP AI agent are stored. The available categories are filtered based on the selected default knowledge base.
Eligible knowledge bases	The knowledge bases that users can select from when manually creating a knowledge base article from an automation opportunity using **Actions** > **Draft KB article**. When specific knowledge bases are selected, only those appear in the knowledge base selection dialog. If this field is not configured, all active knowledge bases are shown.

LEAP AI indicators

AI indicators mark the artifacts that the LEAP AI agent creates. They appear on the home page list and on the automation opportunity details page.

Where AI indicators appear

The following table describes where the AI indicator appears and how it behaves.

AI indicator locations

Location	Behavior
Home page list	An AI icon AI column identifies the automation opportunities that have artifacts created by the LEAP AI agent. When you hover over the AI icon, a pop up card appears with information related to the agent-generated problem (PRB) and knowledge base (KB) records:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI indicator locations (continued)

Location	Behavior
	• Select the PRB link to open the record in the Service Operations Workspace. • Select kb link to open the article in the Knowledge Center.
Automation opportunity details page	The Action insights section for agent-generated artifact appears in a gradient style.

Automation opportunity details page

The automation opportunity details page displays resolution steps, activity, and action insights for a selected automation opportunity (AO). The page also indicates whether an AO is active or archived.

Page overview

The details page for an automation opportunity is divided into three panels:

- **Resolution steps** — displays AI-generated steps for resolving the incidents grouped in the AO. Steps carry a **Generated by AI** label and a generation timestamp. You can regenerate steps or revert to the original AI-generated version.
- **Compose** — use this panel to add comments visible to all users.
- **Action Insights** — displays contextual information about the AO, including its relationship to other AOs and any reanalysis alerts.

AO details fields

The following fields appear in the AO header.

AO details fields

Field	Description
Number	Unique identifier for the AO (for example, AOPP0000107).
Group type	The type of records grouped in the AO (for example, Incident).
Record count	The number of records associated with the AO.
Potential cost savings	The estimated monthly cost savings if the AO is actioned.
Potential time savings	The estimated monthly time savings if the AO is actioned.
Automation priority	The priority level assigned to the AO (for example, Critical or High).
Status	The current state of resolution step generation.

Resolution steps panel

The **Resolution steps** panel displays AI-generated steps to help resolve incidents in the AO. The panel includes the date and time the steps were generated.

The following actions are available on an active AO:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Regenerate** — generates a fresh set of resolution steps based on the latest record data.
- **Revert to AI generated steps** — restores the original AI-generated steps if you have manually edited them.

Warning: The generation of resolution steps involves processing your data through third-party providers, which routes traffic to a datacenter outside your region.

Resolution steps on an archived AO are read-only. The **Regenerate** and **Revert to AI generated steps** actions are not available on archived AOs.

Action Insights panel

The **Action Insights** panel displays contextual cards based on the state of the AO.

Action Insights cards

Card	Description
Archived AO	Appears on an archived AO that has no successor, or on an archived AO whose artifacts have been reassigned to a new AO. When a successor exists, links to the new active AO and includes the AO number and the timestamp of the reassignment.
New AO	Appears on a new AO that includes artifacts from an archived AO. Links to the archived AO and includes the AO number and the timestamp of the reassignment.
KB created	Appears when a knowledge base article has been created for the AO. Links to the KB article.
Problem created	Appears when a problem record has been created for the AO. Links to the problem record.
Record reanalysis status	Appears when the records associated with the AO have changed since the resolution steps were generated. Prompts you to regenerate the steps to reflect the latest data.

Banner messages

Banner messages appear at the top of the details page to indicate the AO's relationship to other AOs.

Banner messages

Message	When it appears
"This automation opportunity is archived."	Appears on an archived AO that has no successor AO yet.
"This automation opportunity is archived. Its artifacts were reassigned to: [AO link]"	Appears on an archived AO whose artifacts have been reassigned to a new active AO. The link navigates to the new AO.
"This automation opportunity includes artifacts from the archived AO: [AO link]"	Appears on a new AO that includes artifacts from an archived AO. The link navigates to the archived AO.

Knowledge base permissions for LEAP

To use a knowledge base with LEAP, the Can Contribute field must be set to allow users with the knowledge role to submit content. If this is not configured correctly, LEAP cannot route articles to the intended knowledge base.

LEAP routes knowledge base articles to the knowledge bases configured in LEAP properties. If the Can Contribute permission is not set correctly on a knowledge base, routing fails and the following error is displayed:

```
KB creation failed. Verify that the 'Can Contribute' field in the
selected knowledge base is set to 'Users with 'knowledge' role'.
```

Knowledge base permission requirements

Field	Location	Required value	Impact if not set
Can Contribute	**Knowledge** > **Administration** > **Knowledge Bases** > **Can Contribute tab** > **Collection**	Users with 'knowledge' role	LEAP cannot route articles to the knowledge base and displays a KB creation error.

Configure this permission on every knowledge base you plan to use in LEAP, including the default knowledge base and any knowledge bases configured in the **Eligible knowledge bases** field. Once configured, proceed to set up knowledge base routing in LEAP properties. See LEAP settings fields.

ITOM Visibility reference

Reference topics provide additional information about mapping and fine-tuning application services using ITOM Visibility lists and forms.

Data collected by ITOM Visibility

ITOM Visibility collects unique data for each type of device and stores it in dedicated tables, fields, and relationships.

Operating system

Operating system

Find servers and computers based on the machine's operating system:

- Windows
- Solaris
- Linux
- Mac (OS/X) discovery
- HP-UX
- AIX

Detailed information on products discovered by ITOM Visibility

Discovery and Service Mapping can discover a wide range of operating systems and applications.

Discovery finds computers, servers, printers, a variety of IP-enabled devices, and the applications that run on them. It can then update the configuration items (CIs) in your Configuration Management Database (CMDB) with the data it collects. This discovery method is referred to as horizontal discovery. Service Mapping maps dependencies, based on a connection between devices and applications. This method is referred to as top-down mapping. The top-down mapping helps you immediately see the impact of a problematic object on the rest of the service instance operation.

On top of hosts and applications supported by default, you can discover additional hosts and applications by deploying patterns available on Store. For reference information on store released patterns, see Available on-premise discovery patterns.

If your organization uses devices or applications, which are not supported by default or using patterns available at ServiceNow Store, you can configure Discovery and Service Mapping to discover them as described in Discovery patterns used by ITOM Visibility.

Cloud Discovery Patterns find the cloud resources of AWS, Azure, Google Cloud Platform (GCP), IBM, and Oracle.

If you want to validate the necessary pattern commands before running discovery, use the Command Validation Tool. For more information, see Validate commands used in pattern-based discovery.

ITOM Content Service Provides visibility to your applications by using AI capabilities that cluster and classify running application processes. For more information, see ITOM Content Service.

Verify the REST API permissions

Download the Cloud Discovery patterns spreadsheet so you can grant user permissions required for running the Discovery patterns. In addition to permissions, the spreadsheet also includes useful information such as pattern names, types, CI Classes, and links to vendor documentation. New patterns are available quarterly, so check periodically to be sure you have the latest version of the spreadsheet.

Name	Platform	Version	Protocol	Discovery type	Pattern (or probe if indicated)

Cloud resource discovery references

ITOM Visibility discovers resources on cloud platforms.

Verify the REST API permissions

Download the Cloud Discovery patterns spreadsheet so you can grant user permissions required for running the Discovery patterns. In addition to permissions, the spreadsheet also includes useful information such as pattern names, types, CI Classes, and links to vendor documentation. New patterns are available quarterly, so check periodically to be sure you have the latest version of the spreadsheet.

Data collected for Amazon AWS Cloud Discovery

Discovery collects information about cloud resources in AWS datacenters. Discovering some of these resources might require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Prerequisites

Verify that the applications are up to date.

- Discovery and Service Mapping Patterns.
- CMDB CI Class Models.
- Visibility Content.

Configure a discovery schedule

Create a discovery schedule in Cloud Discovery Workspace

Verify the REST API permissions

Download the Cloud Discovery patterns spreadsheet so you can grant user permissions required for running the Discovery patterns. In addition to permissions, the spreadsheet also includes useful information such as pattern names, types, CI Classes, and links to vendor documentation. New patterns are available quarterly, so check periodically to be sure you have the latest version of the spreadsheet.

Note: You can test the AWS REST APIs using Postman API platform. For more information, see the How to test AWS REST API using POSTMAN [KB0782183] article in the Now Support Knowledge Base.

Data collected for AWS Cloud Discovery

The following tables show examples of data collected during AWS Cloud Discovery.

AWS Datacenter [cmdb_ci_aws_datacenter]

Label	Field Name
Name	name
Region	region
Object ID	object_id

Availability Zone [cmdb_ci_availability_zone]

Label	Field Name
Name	name

Virtual Machine Instance [cmdb_ci_vm_instance]

Label	Field Name
Name	name
State	state

IP address	ip_address

Cloud DataBases [cmdb_ci_cloud_database]

Label	Field Name	Description
Name	name	The name of the database that you created in AWS.
Object ID	object_id	This is also the name of the database.
Type	Type	The type of database you created.
Fully qualified domain name	fqdn	The FQDN that AWS assigned to your database. An example format for AWS is as follows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cloud DataBases [cmdb_ci_cloud_database] (continued)

Label	Field Name	Description
		`database-name.{random-number}.{datacenter}.rds.amazonaws.com`
State	state	The state of the database: whether it is Available or Terminated.
TCP port(s)	tcp_port	The TCP port that the database communicates through.
Category	category	The instance class of the database, for example: db.t2.micro.
Automated Backups	automated_backup	Indicates whether automated backups are enabled and the retention period.

Cloud WebServer [cmdb_ci_cloud_webserver]

Label	Field Name
Name	name
Install status	install_status
Vendor	vendor
Fully qualified domain name	fqdn
Operational status	operational_status
State	state

Kubernetes Clusters [cmdb_ci_kubernetes_cluster]

Label	Field Name	Description
Name	name	The name of the kube-controller-manager leader.
Port	port	The identifier for the Kubernetes apiserver port.
Kubernetes UID	k8s_uid	The unique identifier for the Kubernetes Cluster.
Vendor	vendor	The vendor of the Kubernetes Cluster.
Fully qualified domain name	fqdn	The fully qualified domain name of the Kubernetes apiserver.

Data collected for Microsoft Azure Cloud Discovery

Discovery collects information about cloud resources in Microsoft Azure datacenters. Discovering some of these resources might require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Prerequisites

Verify that the applications are up to date

- Discovery and Service Mapping Patterns
- CMDB CI Class Models
- Visibility Content

Create Azure cloud credentials

Create Microsoft Azure credentials that can access the Microsoft Azure account. For more information, see Create Azure cloud credentials.

Configure a discovery schedule

Create a discovery schedule in Cloud Discovery Workspace

Verify the REST API permissions

Download the Cloud Discovery patterns spreadsheet so you can grant user permissions required for running the Discovery patterns. In addition to permissions, the spreadsheet also includes useful information such as pattern names, types, CI Classes, and links to vendor documentation. New patterns are available quarterly, so check periodically to be sure you have the latest version of the spreadsheet.

How Discovery finds Microsoft Azure resources

Discovery uses the Cloud Provisioning and Governance API and Discovery and Service Mapping Patterns to find cloud resources.

Default patterns

Pattern	Description
Azure DataBase (LP)	Discovers database types of: • Microsoft.sql/servers • microsoft.sql/managedInstances • microsoft.dbformysql • microsoft.documentdb/databaseaccounts • microsoft.cache/redis • microsoft.dbforpostgresql/servers • microsoft.dbformysql/servers

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Default patterns (continued)

Pattern	Description
	• microsoft.dbformysql/flexibleservers • microsoft.dbforpostgresql/flexibleservers Populates the [cmdb_ci_cloud_database] table.
Azure LoadBalancer TD	Retrieves Microsoft Azure load balancers and populates the cmdb_ci_lb_service table. This pattern is only used by Service Mapping for top-down discovery, not by the Discovery application for horizontal discovery.
Azure WebSite (LP)	Retrieves Microsoft Azure web servers and populates the Cloud WebServers [cmdb_ci_cloud_webserver] and IP address [cmdb_ci_ip_address] tables.

Data collected by Discovery during horizontal discovery

Azure Datacenter [cmdb_ci_azure_datacenter]

Label	Field Name
Name	name

Name	name
Netmask	netmask
MAC Address	mac_address
MAC Manufacturer	mac_manufacturer
Status	install_status

Cloud Load Balancers [cmdb_ci_cloud_load_balancer]

Label	Field Name
Name	name
Object ID	object_id
State	state

Azure Deployments [cmdb_ci_azure_deployment]

Label	Field Name
Name	name
Provisioning state	provisioning_state

Note: This table is only available for Discovery when the Cloud Provisioning and Governance plugin is activated.

Resource Groups [cmdb_ci_resource_group]

Label	Field Name
Name	name
Object ID	object_id
State	state
Operational Status	operational_status
Install Status	install_status

Note:

- When a resource group is discovered for the first time, the **State** field is set to **Available**, **operational_status=Operational**, and **Status=Installed**; based on the response mapping.
- When a resource group is terminated on Microsoft Azure, the CMPReconciler scripts set the **State** field to **Terminated**, and **operational_status=Non-Operational** and **Status=Absent**.

Google Cloud Platform (GCP) Cloud discovery using Patterns

Service Graph Connector for GCP

Agent Client Collector Discovery

Data collected for IBM Cloud Discovery

Discovery collects information about cloud resources in the IBM Cloud Platform and creates relationships between the CIs it finds. Discovering some of these resources might require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Prerequisites

Verify that the applications are up to date.

- Discovery and Service Mapping Patterns.
- CMDB CI Class Models.
- Visibility Content.

Configure a discovery schedule

Create a discovery schedule in Cloud Discovery Workspace

Verify the REST API permissions

Download the Cloud Discovery patterns spreadsheet so you can grant user permissions required for running the Discovery patterns. In addition to permissions, the spreadsheet also includes useful information such as pattern names, types, CI Classes, and links to vendor documentation. New patterns are available quarterly, so check periodically to be sure you have the latest version of the spreadsheet.

Load balancers

Data collected for load balancers

Table	Field Name / Description
Cloud Load Balancer [cmdb_ci_cloud_load_balancer]	**object_id**: The load balancer's unique identifier.
	name: Name of the load balancer.
	fqdn: Address (Host name) of the load balancer. This is the fully qualified domain name of the load balancer.
	dns_name: Address (Host name) of the load balancer.
	short_description: Description of the load balancer.
	operational_status: The operational status of the load balancer, either **ONLINE** or **OFFLINE**.
	location: References the load balancer's location with type.
	state: Provisioning status of the load balancer, either **Available** or **Terminated**.
Load Balancer Service [cmdb_ci_lb_service]	**object_id**: Unique identifier of the load balancer service.
	name: Name created by the pattern that contains the following: • Load balancer name • Protocol • Port • Resource type: **-listener**
	port: Listener's protocol port number.
	front_end_port: Listener's protocol port number.
	listener_protocol: Listener's protocol, either **TCP**, **HTTP**, or **HTTPS**.
	operational_status: The provisioning status of the listener.
Load Balancer Pool [cmdb_ci_lb_pool]	**object_id**: Unique identifier of the load balancer pool.
	name: Name created by the pattern that contains the following: • Load balancer name • Protocol • Port • Resource type: **-pool**
	port: Protocol port of the back end.
	pool_status: Provisioning status of a load balancer pool.

Data collected for load balancers (continued)

Table	Field Name / Description
	load_balancing_method: Method used to load balance the pool.
Load Balancer Pool Member [cmdb_ci_lb_pool_member]	**object-id**: Unique identifier of the pool member, created from the ID of the member and the listener ID.
	name: Name created by the pattern that contains the following: • Load balancer name • Protocol • Port • Resource type: **-member** • IP address of the pool member
	ip_address: IP address of a load balancer member.
	server_id: ID of the member in the IBM Cloud.
	load_balancer: Name of the related load balancer.
Load Balancer Health Service [cmdb_ci_lb_health_service]	**object_id**: Unique identifier of the healthservice check.
	name: Name created by the pattern that contains the following: • Load balancer name • Protocol • Resource type: **Health Check** • Resource ID
	monitor_type: Type of health check. Valid values are **TCP**, **HTTP**, or **HTTPS**.
	timeout_sec: Timeout in seconds to wait for the health check response.
	check_interval_sec: Interval in seconds to perform the health check.

Data collected for IBM Cloud virtual servers (continued)

Table	Fields

	• **fqdn**: IP address of the virtual machine.
	• **short_description**: Notes attached to the virtual machine on the IBM console.
	• **cpus**: Number of CPUs on the virtual machine.
	• **memory**: Amount of memory on the virtual machine.
	• **disks**: Number of disks used by the virutal machine.
	• **state**: The running state of the virtual machine. The choices are:
	  ○ **Running**
	  ○ **Halted**
	• **placement_group_id**: Name of the IBM placement group containing the virtual machine.
	• **nics**: Number of network interfaces on the virtual machine.

Cloud Mgmt Network Interface [cmdb_ci_nic]	• **name**: Name and port of the NIC, in the format **<name><port>**. • **ip_address**: IP address configured on the NIC. • **mac_address**: MAC address of the NIC. • **netmask**: Netmask of the NIC. • **object_id**: ID of the NIC. • **status**: State of the NIC - AVAILABLE.
Image [cmdb_ci_os_template]	• **name**: Long description of the template. For example: **CentOS 7.0-64 Minimal for VSI**. • **version**: Operating system version. For example, **7.0-64 Minimal for VSI**. • **object_id**: ID of the image. • **guest_os**: Operating system of the virtual machine, such as Windows, Ubuntu, or CentOS.
Cloud Key Pair [cmdb_ci_cloud_key_pair]	• **name**: The key label. • **object_id**: ID of the key.
Compute Security Group [cmdb_ci_compute_security_group]	• **name**: Security group name. • **object_id**: ID of the security group • **short_description**: Security group notes.

Data collected for VMware Cloud Discovery

Discovery collects information about VMware resources in your cloud service accounts.

Distributed Resource Scheduler (DRS) discovery

VMware Discovery collects these DRS settings and saves them to the DRS VM Config [cmdb_ci_drs_vm_config] table:

- DRS settings of vCenter clusters.
- DRS settings of VMs configured to override cluster behavior.

DRS VM Config [cmdb_ci_drs_vm_config]

Field label and Name	Description
Cluster [cluster]	The vCenter cluster that the VM belongs to.
DRS behavior [drs_behavior]	The VM-level Distributed Resource Scheduler behavior that overrides cluster defaults.
DRS enabled [drs_enabled]	Indicates whether DRS is active for the VM.
Virtual machine [virtual_machine]	The VM instance using these DRS settings.

VMware tags

VMware Cloud Discovery finds VMware tags from vCenter and saves them to the Key Value [cmdb_key_value] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Key Values [cmdb_key_value]

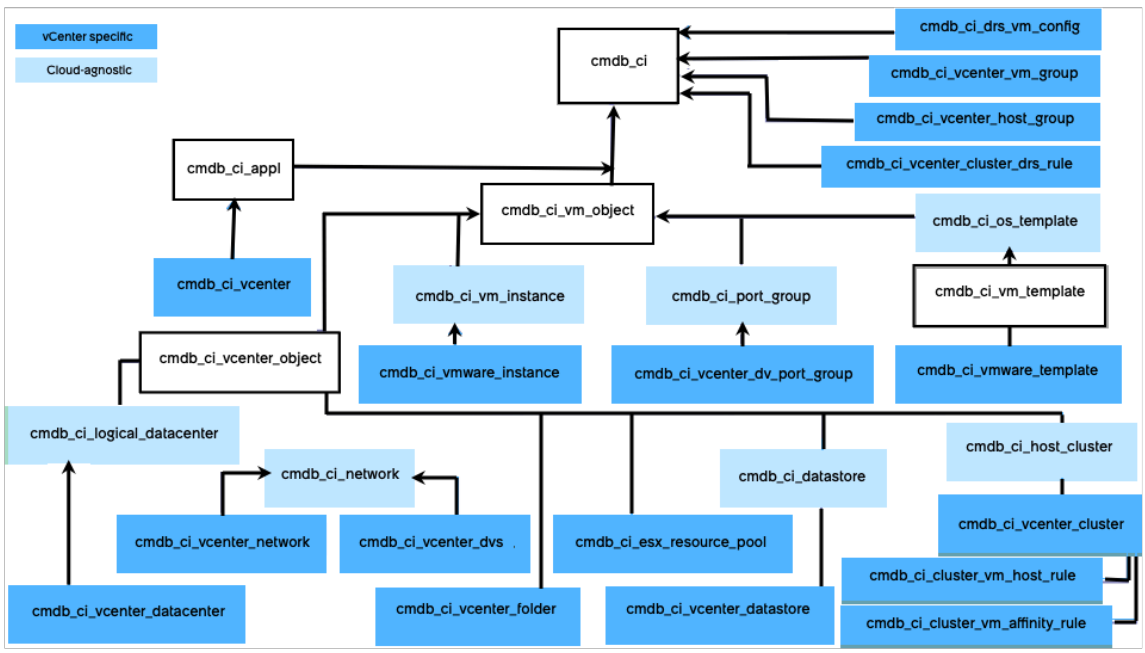
Field label and Name	Description
Configuration item [configuration_item]	Referenced VM with tag attached in vCenter.
Key [key]	Category name of the tag applied to the resource in vCenter.
Tag [tag]	Source in vCenter from which tags are fetched. In this case, the value is always **Tags**.
Value [value]	Tag name that's applied to the resource in vCenter.

Data collected for VMware vCenter Server

Discovery identifies and classifies information and data about VMware vCenter servers.

The vCenter table schema is illustrated in the following diagram:

vCenter table schema



Several tables are cloud-agnostic tables, meaning that they can be populated for any cloud resource, not just vCenter resources. Look in the sub tables that extend the cloud-agnostic tables to find discovered configuration items (CIs).

Cloud-agnostic table	Look in this vCenter-specific table
Virtual Machine Instance [cmdb_ci_vm_instance]	VMware Virtual Machine Instance [cmdb_ci_vmware_instance]
Operating System Template [cmdb_ci_os_template]	VMware Virtual Machine Template [cmdb_ci_vmware_template]
Logical Datacenter [cmdb_ci_logical_datacenter]	VMware vCenter Datacenter [cmdb_ci_vcenter_datacenter]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cloud-agnostic table	Look in this vCenter-specific table
Cloud Networks [cmdb_ci_network]	VMware vCenter Network [cmdb_ci_vcenter_network]
Datastore [cmdb_ci_datastore]	VMware vCenter Datastore [cmdb_ci_vcenter_datastore]
Host Cluster [cmdb_ci_host_cluster]	VMware vCenter Cluster [cmdb_ci_vcenter_cluster]

vCenter data

Discovery uses multiple vCenter probes to collect this data from vCenter. The data is saved in tables extend from the Configuration item [cmdb_ci] table.

VMware vCenter Instance [cmdb_ci_vcenter]

Field label and Name	Description
Name [name]	The display name of the vCenter instance.
IP Address [ip_address]	The IP address of the vCenter server.
API version [api_version]	The version of the vCenter API in use.
Full name [fullname]	The full vCenter instance name returned by VMware.
Instance UUID [instance_uuid]	A unique identifier assigned to the vCenter instance.
URL [url]	The endpoint URL used to connect to vCenter.
Fully qualified domain name [fqdn]	The fully qualified domain name of the vCenter server.

The combination of the vCenter instance in the cmdb_ci_vcenter table and the object ID in the cmdb_ci_vm_object table identifies a specific vCenter.

The tables extend from the Virtual Machine Objects [cmdb_ci_vm_object] table, which holds object IDs for all cloud-based resources, except virtualization servers.

DRS VM Config [cmdb_ci_drs_vm_config]

Field label and Name	Description
Cluster [cluster]	The vCenter cluster that the VM belongs to.
DRS behavior [drs_behavior]	The VM-level Distributed Resource Scheduler behavior that overrides cluster defaults.
DRS enabled [drs_enabled]	Indicates whether DRS is active for the VM.
Virtual machine [virtual_machine]	The VM instance using these DRS settings.

This table stores DRS behavior for the VMs that override the cluster behavior. For more information on DRS, see VMware's documentation on Distributed Resource Scheduler.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

VMware vCenter VM Group [cmdb_ci_vcenter_vm_group]

Field label and Name	Description
Cluster [cluster]	The cluster that this VM group is associated with.

The VMware vCenter VM group [cmdb_ci_vcenter_vm_group] table has Contains::Contained by relationship with cmdb_ci_vmware_instance. This group has a set of VMs.

VMware vCenter Host Group [cmdb_ci_vcenter_host_group]

Field label and Name	Description
Cluster [cluster]	The cluster that this host group belongs to.

The VMware vCenter Host Group [cmdb_ci_vcenter_host_group] table has Contains::Contained by relationship with cmdb_ci_vmware_instance. This group has a set of hosts.

VMware vCenter Cluster DRS Rule [cmdb_ci_vcenter_cluster_drs_rule]

Field label and Name	Description
Rule UUID [rule_uuid]	Unique identifier for the DRS rule in vCenter.
Active [active]	Whether the rule is currently enforced.
Cluster [cluster]	The cluster that the rule applies to.

VMware Virtual Machine Instance [cmdb_ci_vmware_instance]

Field label and Name	Description
Name [name]	VM name as discovered from vCenter.
Template [template]	Indicates whether this VM is based on a template.
CPUs [cpus]	Number of assigned virtual CPUs.
Disks [disks]	Number of virtual disks attached to the VM.
Disks size (GB) [disks_size]	Combined size of all VM disks.
Memory (MB) [memory]	Memory allocated to the VM.
Network adapters [nics]	Number of virtual NICs attached.
Image path [image_path]	Path to the VM's image on the datastore.
State [state]	Current VM power or operational state.
vCenter Instance UUID [vcenter_uuid]	Unique ID of the vCenter instance managing this VM.
vCenter Reference [vcenter_ref]	Reference to the vCenter record in CMDB.
BIOS UUID [bios_uuid]	Hardware-level VM UUID from VMware.
VM Instance UUID [vm_instance_uuid]	VMware-provided VM unique ID.
IP address [ip_address]	Primary IP detected for the VM.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

VMware Distributed Virtual Port Groups [cmdb_ci_vcenter_dv_port_group]

Field label and Name	Description
Name [name]	Name of the port group.
vCenter Instance UUID [vcenter_uuid]	vCenter instance that manages this port group.
Distributed Virtual Switch Reference [dvs_ref]	Reference to the switch that the port group belongs to.

VMware Virtual Machine Template [cmdb_ci_vmware_template]

Field label and Name	Description
Name [The template name from VMWare.]	Template name in vCenter.
CPUs [cpus]	Number of CPUs assigned when deployed.
Disks size (GB) [disks_size]	Disk size of the template.
Guest ID [guest_id]	VMware guest OS identifier.
Memory (MB) [memory]	Allocated template memory.
Image path [image_path]	Path to the template image.
vCenter Instance UUID [vcenter_uuid]	vCenter instance where the template resides.
vCenter Reference [vcenter_ref]	CMDB reference to vCenter record.
Network adapters [nics]	Number of NICs defined in the template.
Base name [base_name]	The base name used for naming VMs created from this template.
VM namer [vm_namer]	VMware auto-naming method for derived VMs.
BIOS UUID [bios_uuid]	Template UUID.
VM Instance UUID [vm_instance_uuid]	Unique template instance ID.

VMware vCenter Object [cmdb_ci_vcenter_object]

Field label and Name	Description
Managed object reference ID [morid]	Unique Managed Object Reference ID in vCenter.
vCenter Instance UUID [vcenter_uuid]	vCenter that owns this object.
vCenter Reference [vcenter_ref]	CMDB reference to the vCenter record.

VMware vCenter Datacenter [cmdb_ci_vcenter_datacenter]*

Field label and Name	Description
Region [region]	Geographic or logical region of the datacenter.
Managed object reference ID [morid]	VMware Managed Object Reference ID.
vCenter Instance UUID [vcenter_uuid]	vCenter that manages this datacenter.
vCenter Reference [vcenter_ref]	CMDB reference back to vCenter.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

VMware vCenter Datacenter [cmdb_ci_vcenter_datacenter]* (continued)

Field label and Name	Description
Top-level folder for VMs [folder_moreid]	Top-level folder where VMs reside.
Top-level folder for hosts [host_morid]	Top-level folder for hosts.

*The VMware vCenter Datacenter [cmdb_ci_vcenter_datacenter] table is extended from the [cmdb_ci_logical_datacenter] table.

VMware vCenter Network [cmdb_ci_vcenter_network]*

Field label and Name	Description
Managed object reference ID [morid]	Object reference ID in vCenter.
vCenter Instance UUID [vcenter_uuid]	Parent vCenter instance.
vCenter Reference [vcenter_ref]	CMDB reference to vCenter.
Network accessible by either hosts or virtual machines [accessible]	Whether hosts or VMs can connect to the network.

*The VMware vCenter Network [cmdb_ci_vcenter_network] table is extended from the [cmdb_ci_network] table.

VMware Distributed Virtual Switch [cmdb_ci_vcenter_dvs]

Field label and Name	Description
VMCount [vm_count]	Number of VMs attached to the switch.
Host count [host_count]	Number of ESXi hosts connected.

VMware vCenter Folder [cmdb_ci_vcenter_folder]

Field label and Name	Description
Managed object reference ID [morid]	VMware folder identifier.
vCenter Instance UUID [vcenter_uuid]	vCenter managing the folder.
vCenter Reference [vcenter_ref]	CMDB reference to vCenter.
Full path [fullpath]	Full folder hierarchy path.

ESX Resource Pool [cmdb_ci_esx_resource_pool]

Field label and Name	Description
Managed object reference ID [morid]	VMware Managed Object Reference ID.
vCenter Instance UUID [vcenter]	vCenter that manages this pool.
vCenter Reference [vcenter_ref]	CMDB reference.
Owner [owner]	The VM or host that owns the pool.
Owner Managed Object Reference ID [owner_morid]	Managed Object Reference of the owner.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ESX Resource Pool [cmdb_ci_esx_resource_pool] (continued)

Field label and Name	Description
CPU expandable [cpu_expandable]	Whether CPU resources can exceed limits.
CPU limit (MHz) [cpu_limit_mhz]	Max CPU allocation in MHz.
CPU reserved (MHz) [cpu_reserved_mhz]	CPU reserved for the pool.
CPU shares [cpu_shares]	CPU scheduling weight.
Full path [fullpath]	Location path in vCenter hierarchy.
Memory expandable [mem_expandable]	Whether memory can exceed the configured maximum.
Memory limit (MB) [mem_limit_mb]	Memory limit in MB.
Memory reserved (MB) [mem_reserved_mb]	Memory guaranteed for the pool.
Memory shares [mem_shares]	Memory scheduling weight.

VMware vCenter Datastore [cmdb_ci_vcenter_datastore]

Field label and Name	Description
Managed object reference ID [morid]	ID of the datastore in vCenter.
vCenter Instance UUID [vcenter_uuid]	Parent vCenter ID.
Accessible [accessible]	Indicates if hosts can access it.
vCenter Reference [vcenter_ref]	CMDB reference.
Type [type]	Filesystem type (NFS, VMFS, etc.).
Capacity (GB) [capacity]	Total datastore capacity.
Free space (GB) [freespace]	Remaining space.
URL [url]	Unique locator.
Clustered [clustered]	Whether it belongs to a storage pod.

The VMware vCenter Datastore [cmdb_ci_vcenter_datastore] table is extended from the [cmdb_ci_datastore] table.

VMware vCenter Cluster [cmdb_ci_vcenter_cluster]*

Field label and Name	Description
Managed object reference ID [morid]	Cluster ID.
vCenter Instance UUID [vcenter_uuid]	Parent vCenter ID.
Effective hosts [effectivehosts]	Number of functioning hosts.
vCenter Reference [vcenter_ref]	CMDB reference.
Effective CPU [effectivecpu]	Available CPU capacity.
Effective memory [effectivememory]	Available RAM.
Number of effective hosts [effectivehosts]	Count of hosts contributing resources.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

VMware vCenter Cluster [cmdb_ci_vcenter_cluster]* (continued)

Field label and Name	Description
Number of hosts [numhosts]	Total hosts.
Total CPU [totalcpu]	Total CPU capacity.
Total memory [totalmemory]	Total memory.
Number of CPU cores [numcpucores]	Total core count.
Number of CPU threads [numcputhreads]	Total thread count.
DRS Behavior [drs_behavior]	Cluster-level DRS settings.
DRS Enabled [drs_enabled]	Whether DRS is active.
DRS VMotion Rate [drs_vmotion_rate]	vMotion automation aggressiveness level.

*The VMware vCenter Cluster [cmdb_ci_vcenter_cluster] table is extended from the [cmdb_ci_host_cluster] table.

Cluster VM Host Rule Info [cmdb_ci_cluster_vm_host_rule]

Field label and Name	Description
VM Group [vm_group]	VM group to which the rule applies.
Host Group [host_group]	Host group associated with the rule.
Mandatory [mandatory]	Indicates whether the rule must be strictly enforced.
Affinity [affinity]	Whether VMs must run together or be separated.

Cluster VM Affinity Rule Info [cmdb_ci_cluster_vm_affinity_rule]

Field label and Name	Description
Affinity [affinity]	Defines whether grouped VMs must stay together.

The Cluster VM Affinity Rule Info [cmdb_ci_cluster_vm_affinity_rule] table has Contains::Contained by relationship with cmdb_ci_vmware_instance. This group has a set of VMs for which this affinity is applied.

VMWare Distributed Virtual Switch [cmdb_ci_vcenter_dvs]

Field label and Name	Description
Name [name]	The name of the distributed virtual switch as defined in vCenter.
VMCount [vm_count]	The number of virtual machines currently connected to this distributed switch.
Host count [host_count]	The number of ESXi hosts participating in this distributed switch.

Discovery also maps the relationships to VMs and to distributed virtual port groups.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

VMware Distributed Virtual Port Group [cmdb_ci_vcenter_dv_port_group]

Field label and Name	Description
Name [name]	The name of the port group that provides network configuration for connected VMs.
vCenter Instance UUID [vcenter_uuid]	The VMware-generated UUID of the vCenter instance that manages this port group.
Distributed Virtual Switch Reference [dvs_ref]	The switch to which this port group belongs.

Discovery also maps the relationship to the distributed virtual switch.

You can add these related lists to view additional discovered data:

- **Storage Volumes**

  The virtual disks for this virtual machine. This data is saved in the Storage Volume [cmdb_ci_storage_volume] table with the value `type=v Disk`.

Storage Volume [cmdb_ci_storage_volume]

Field label and Name	Description
Name [name]	Name of the storage volume.
Size [size]	Size of the disk/volume.

- **Network Adapters**

  The virtual network adapters for the virtual disks. This data is saved in the Network Adapter [cmdb_ci_network_adapter] table.

Network Adapter [cmdb_ci_network_adapter]

Field label and Name	Description
Name [name]	NIC name.
IP Address [ip_address]	Assigned IP.
MAC address [mac_address]	NIC MAC address.
Netmask [netmask]	Subnet mask.

vCenter discovery with Software Asset Management

If Software Asset Management is active, Discovery populates these vCenter tables using the VMWare - vCenter ESX Hosts License probe.

VMWare License Key [samp_vmware_license_key]

Field label and Name	Description
vCenter Reference [vcenter_ref]	The reference link to the vCenter instance that owns this license.
Cost Unit [cost_unit]	The unit used by VMware to measure license cost.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

VMWare License Key [samp_vmware_license_key] (continued)

Field label and Name	Description
Edition [edition]	The edition level of the VMware product.
Features [features]	The list of capabilities enabled by this license.
License Key [license_key]	The VMware-issued alphanumeric software license key.
Product Name [product_name]	The VMware product that the license applies to.
Product Version [product_version]	The version of the licensed product.
Rights Owned [rights_owned]	Total entitlements purchased under this license.
Rights Used [rights_used]	Entitlements currently consumed by vCenter hosts.

VMWare License Key Usage [samp_vmware_license_key_usage]

Field label and Name	Description
Rights Used [rights_used]	Number of license units currently in use.
Expiration Date [expiration_date]	The date the license expires.
Used Features [used_features]	The specific product features being used.
License Key [license_key]	The license key to which this usage record applies.
Software Install [software_install]	The installation record tied to the consumed license.
Used By [used_by]	The asset or component consuming the license.

vCenter relationships

Discovery automatically creates relationships for vCenter components using data from a key class. Subsequent discoveries use the same key class to automatically validate and remove relationships that are no longer valid.

vCenter CIs can be members of folders or clusters, which affect how Discovery creates their relationships.

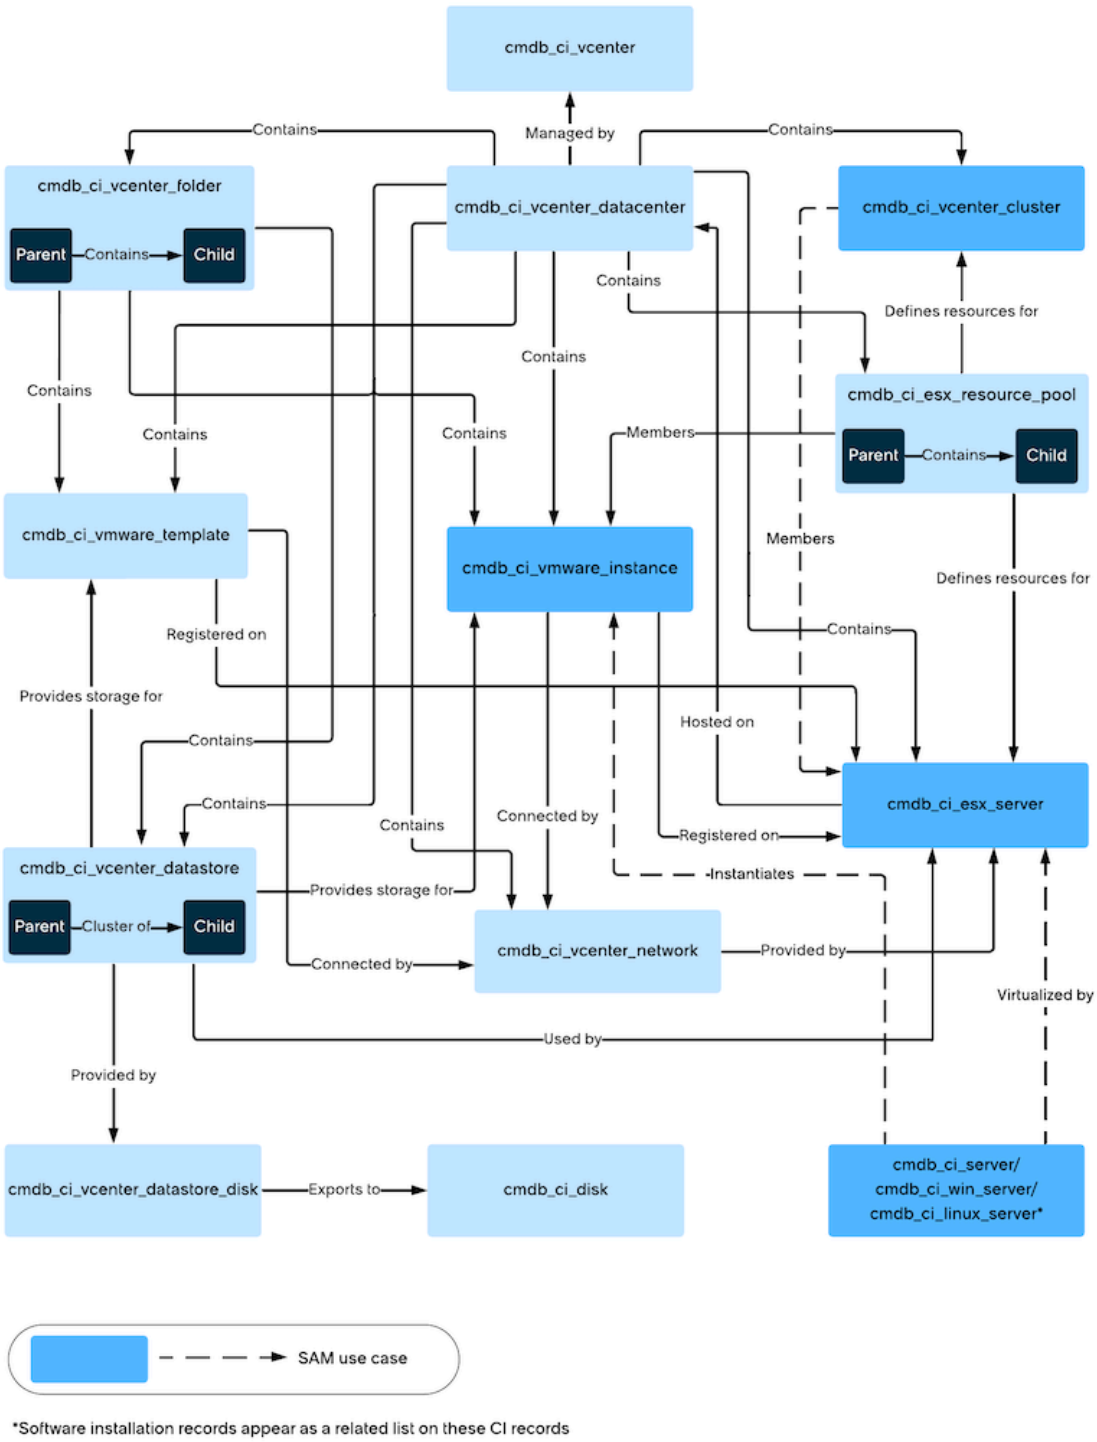
- If a CI is in a folder, Discovery creates a relationship between that CI and the folder. If that CI isn't in a folder, Discovery creates the relationship between the CI and the datacenter. These vCenter CIs can be in a folder:
  - VM Instance
  - VM Template
  - vCenter Network
  - Datastore
  - vCenter Folder
  - vCenter Cluster

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If an ESX server is in a cluster, Discovery creates a relationship between the ESX server and the cluster. If an ESX server isn't a member of a cluster, then Discovery creates a relationship to the datacenter.
- If a resource pool is in a cluster, Discovery creates a relationship between the resource pool and the cluster. If the resource pool isn't a member of a cluster, then Discovery creates a relationship to the ESX server.

This diagram illustrates vCenter relationships:

vCenter relationships



*Software installation records appear as a related list on these CI records

VMware tags

You can attach tags to vSphere objects, such as virtual machines, through the vSphere interface. The tags can then be grouped into categories. Objects with tags are sortable and searchable based on the parameters that you give the tags and categories. The VMWare — vCenter VM Tags probe discovers these tags. You can view the discovered tags by opening the virtual machine record in **cmdb_ci_vmware_instance**. Then go to the **Key Values** tab.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Key Values [cmdb_key_value]

Field label and Name	Description
Configuration item [configuration_item]	Referenced VM with tag attached in vCenter.
Key [key]	Category name of the tag applied to the resource in vCenter.
Tag [tag]	Source in vCenter from which tags are fetched. In this case, the value is **Tags**.
Value [value]	Tag name that's applied to the resource in vCenter.

Datastore data collected by Discovery

Discovery identifies each datastore in the system and creates the relationships with the virtual machines and the ESX servers that use these datastores. Discovery uses the VMWare - vCenter Datastores probe to collect this data.

Field label and Name	Table Name	Description
Accessible [accessible]	VMware vCenter Datastore [cmdb_ci_vcenter_datastore]	Whether the datastore is collected or not
Capacity (GB) [capacity]	VMware vCenter Datastore [cmdb_ci_vcenter_datastore]	Amount of space provided by the datastore.
Clustered [clustered]	VMware vCenter Datastore [cmdb_ci_vcenter_datastore]	When the datastore is clustered (belongs to a storage pod).
Free space (GB) [freespace]	VMware vCenter Datastore [cmdb_ci_vcenter_datastore]	Amount of space still available on the datastore.
Type [type]	VMware vCenter Datastore [cmdb_ci_vcenter_datastore]	The type of file system volume, such as WFS or NFS.
URL [url]	VMware vCenter Datastore [cmdb_ci_vcenter_datastore]	The unique URL locator for the datastore.

HostMounts

Discovery uses both the VMWare - vCenter ESX Hosts and VMWare - vCenter Datastores probes to collect datastore host mount data.

Field label and Column	Table	Description
Accessible [accessible]	VMware Datastore HostMount [vcenter_datastore_hostmount]	Whether the ESXi host can access the datastore.
Access Mode [access_mode]	VMware Datastore HostMount [vcenter_datastore_hostmount]	The mode in which the ESXi host accesses the datastore.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field label and Column	Table	Description
VMware vCenter Datastore [datastore]	VMware Datastore HostMount [vcenter_datastore_hostmount]	The datastore mounted on this ESXi host.
ESX Server [esx_server]	VMware Datastore HostMount [vcenter_datastore_hostmount]	The ESXi host that the datastore is mounted on.
vCenter Reference [vcenter_ref]	VMware Datastore HostMount [vcenter_datastore_hostmount]	The vCenter instance that manages this mount.

Datastore Discovery

A datastore is a collection of one or more physical disks, such as an iSCSI disk, and can be used by more than one ESXi host. However, a physical disk can only connect to one datastore. Because ESXi hosts can share datastores, it's easy to move virtual machines between hosts that have a common datastore.

Note: From the perspective of a virtual machine attached to a datastore, storage is provided by a single disk.

The advantages to connecting a datastore to multiple disks are:

- The ability to mirror the disks for failover protection.
- The ease of adding storage to the datastore.

For information about the tables used by Discovery to store data for physical disks and their relationship to datastores and ESXi hosts, see, ESXi server discovery.

In this example configuration, two ESXi hosts share a common datastore that uses different types of storage.

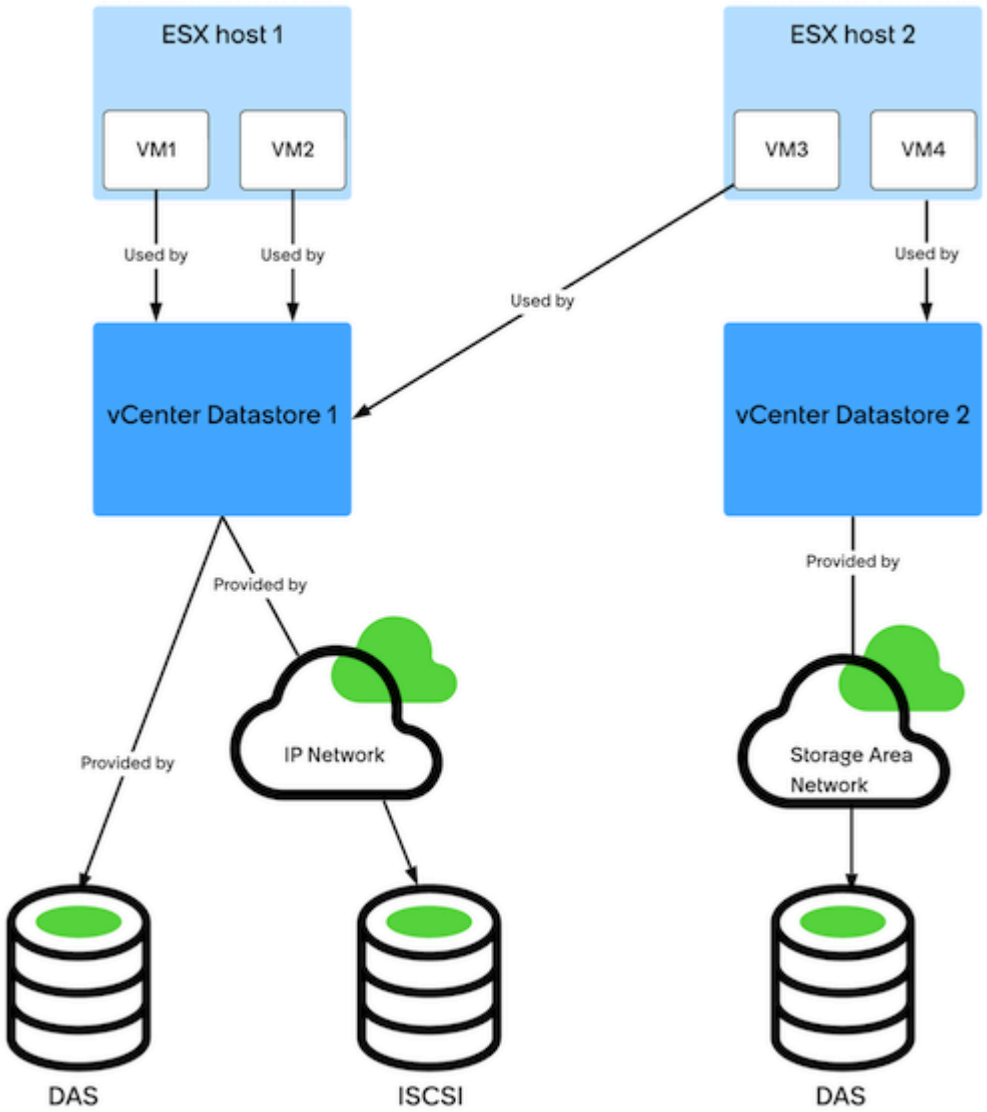
Datastore Discovery with different storage types



Relationships

ServiceNow provides tables that contain the relationships between an ESXi host and its datastore and the specific disks to which the datastore is connected.

ServiceNow Discovery establishes the relationships between a datastore, the disks attached to the datastore, and the ESXi server that hosts the virtual machines using that datastore. From the perspective of the ESXi host, iSCSI and fibre channel disks connected to the datastore are treated as physical disks. Discovery doesn't show the direct relationship of the storage disks to the ESXi host.

Note: Storage can be hosted on computers that aren't discovered by Discovery. ESXi hosts are discovered through vCenter, and storage is discovered separately through CIM. The system can only establish the relationship between the two when storage is discovered before ESXi.

Datastore tables

Table	Description
cmdb_ci_vcenter_datastore_disk	Stores the relationship of the physical disk to the datastore.
vcenter_datastore_hostmount	Stores the relationship between the datastore and the ESXi server to which it's connected.
cmdb_ci_disk	Contains the physical disks connected directly to the datastore. This table also contains a reference to the ESXi host.
cmdb_ci_fc_disk	Contains the fibre channel disks in a storage area network (SAN) connected to the datastore. This table also contains a reference to the ESXi host.
cmdb_ci_iscsi_disk	Contains the iSCSI disks in an IP network connected to the datastore. This table also contains a reference to the ESXi host.

VM Instance state and status fields

These tables represent the state and status of the cmdb_ci_vm_instance in various flows such as vCenter Discovery and vCenter Events and the business rules which are triggered.

vCenter Discovery that change various states and status fields related to Virtual Machine Instance

Source	Script or Event name	Field name	VM previous state	VM new state
vCenter Discovery	VCenterVMsSensor	Install Status	Retired	Installed
vCenter Discovery	VCenterDatacentersSensor	Install Status State Operational status	Installed	Retired Terminated Non-operational

vCenter Events that change various states and status fields related to Virtual Machine Instance

Source	Script or Event name	Field name	VM previous state	VM new state
vCenter events	VCenterVmStateUpdater powerOnEvtsToUse = ['VmPoweredOffEvent', 'VmPowerOffOnIsolationEvent', 'VmShutdownOnIsolationEvent', 'VmSuspendedEvent'],	Install Status State	Installed Any	Installed ON

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

vCenter Events that change various states and status fields related to Virtual Machine Instance (continued)

Source	Script or Event name	Field name	VM previous state	VM new state
vCenter events	powerOffEvtsToUse = ['VmPoweredOnEvent', 'DrsVmPoweredOnEvent', 'VmRestartedOnAlternateHostEvent', 'VmSuspendedEvent'],	Install Status State	Installed Any	Installed OFF
vCenter events	suspendEvtsToUse = ['VmPoweredOnEvent', 'DrsVmPoweredOnEvent', 'VmRestartedOnAlternateHostEvent', 'VmPoweredOffEvent', 'VmPowerOffOnIsolationEvent']	Install Status State	Installed Any	Installed Paused
vCenter events	VmRemovedEvent	Install Status State	Installed Any	Retired Terminated

Business rules that change various states and status fields related to Virtual Machine Instance and related Server

Business rule	Field name	Plugin name
Cascade Operational Status to vminstance	cmdb_ci_server: Operational status	Pattern Designer
Sync Ops Status for CMDB CI	• cmdb_ci: Operational status, Install Status • cmdb_ci_hardware: Operational status, Hardware Status, Substatus	CMDB

ESXi server discovery

Discovery identifies and classifies information about ESXi servers and ESXi resource pools through the discovery of vCenter and not from the direct discovery of any ESXi servers.

Important: ESXi server discovery is done through vCenter. Don't specify the IP address of the ESXi server in a Discovery Schedule. Instead, discover the vCenter through the Discovery Schedule.

Required Roles

Users with the *itil* and *asset* roles can access ESXii and ESXi configuration item (CI) records. To run discovery on vCenter servers, users must have the *discovery_admin* role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Credentials

To run a complete Discovery of vCenter/ESXi servers, you need vCenter credentials. If the vmapp port probe is turned off, you must use Windows credentials to access the Windows host on which the vCenter server runs.

Note: Make sure to select a credential *Type* of *VMware*.

ESXi server Discovery Components

Discovery identifies ESXi servers based on the correlation ID (BIOS UUID), when the hardware manufacturer is on a certified inclusion list. So if the manufacturer is in the compatible manufacturers list, the correlation-id must be unique. If the manufacturer isn't on the certified inclusion list, we check for the Managed Object Reference ID (MORID) and Serial Number as well. After running the vCenter classifier, Discovery launches the VMware - vCenter datacenters probe, which launches the probes that explore the ESXi server. For the complete list of vCenter probes, see List of Discovery probes.

Component and Name	Description
Classifier [vCenter]	Classifies standalone vCenter servers.
Probe [VMWare - vCenter ESX Hosts]	Creates records for ESXi servers and host mounts. Creates relationships between ESXi servers and vCenter components. Triggers probes for storage Discovery.
Probe [VMWare - vCenter ESX Hosts Storage]	Creates records for ESXi host hardware: network adapters, disks, HBAs, FC ports, iSCSI, and FC disks. Creates relationships between DAS/iSCSI/FC disks and datastore disks.

Data collected

Basic server data from ESXi hosts is collected by the VMware - vCenter ESX Hosts probe.

Data collected by Discovery on ESXi hosts

Field label and Name	Table Name	Description
Operating System [os]	cmdb_ci_esx_server	The OS version running on the ESXi host.
OS Version [os_version]	cmdb_ci_computer	Detailed OS build or release information.
Name [name]	cmdb_ci_esx_server	Hostname of the ESXi server.
DNS domain [dns_domain]	cmdb_ci_esx_server	Domain associated with the ESXi host.
Manufacturer [manufacturer]	cmdb_ci_computer	Hardware vendor of the ESXi host.
Serial number [serial_number]	cmdb_ci_computer	Physical server hardware serial number.
CPU type [cpu_type]	cmdb_ci_esx_server	The CPU model used by the ESXi host.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data collected by Discovery on ESXi hosts (continued)

Field label and Name	Table Name	Description
CPU speed (MHz) [cpu_speed]	cmdb_ci_esx_server	Clock speed of the processors.
CPU count [cpu_count]	cmdb_ci_esx_server	Number of physical CPUs.
CPU core count [cpu_core_count]	cmdb_ci_computer	Total number of cores across all CPUs.
CPU manufacturer [cpu_manufacturer]	cmdb_ci_esx_server	Vendor of the CPU hardware.
Model ID [model_id]	cmdb_ci_computer	Hardware model identifier.
RAM (MB) [ram]	cmdb_ci_esx_server	Total physical memory installed.
Disk space (GB) [disk_space]	cmdb_ci_esx_server	Total disk capacity available.
Type [type]	cmdb_ci_disk	Type of disk.
Model ID [model_id]	cmdb_ci_disk	Hardware identifier for the disk.
Disk space (GB) [disk_space]	cmdb_ci_disk	Disk capacity of the individual disk.
Name [name]	cmdb_ci_disk	Disk name as detected by ESXi.
Name [name]	cmdb_ci_network_adapter	Network adapter name.
IP address [ip_address]	cmdb_ci_network_adapter	IP assigned to the NIC.
MAC address [mac_address]	cmdb_ci_network_adapter	Hardware address of the NIC.
Netmask [netmask]	cmdb_ci_network_adapter	Subnet mask of the NIC.
Managed object reference ID [morid]	Visualization Server [cmdb_ci_virtualization_server]	Managed Object Reference ID.
Serial Number [serial_number]	Serial Number [cmdb_serial_number]	Serial number record for CMDB correlation.

Relationships

Discovery collects the following relationship data for ESXi servers.

Base Class	Relationship	Dependent Class
ESXi Resource Pool [cmdb_ci_esx_resource_pool]	Defines resources for:Gets resources from	ESXi Server [cmdb_ci_esx_server]
VM Instance [cmdb_ci_vmware_instance]	Registered on:Has registered	ESXi Server [cmdb_ci_esx_server]
ESXi Server [cmdb_ci_esx_server]	Provides storage for:Stored on	VM Template [cmdb_ci_vmware_template]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Base Class	Relationship	Dependent Class
ESXi Server [cmdb_ci_esx_server]	Provided by:Provides	Networks [cmdb_ci_vcenter_network]
ESXi Server [cmdb_ci_esx_server]	Members of:Members	Cluster [cmdb_ci_vcenter_cluster]
ESXi Server [cmdb_ci_esx_server]	Contains:Contained by	Datacenter [cmdb_ci_vcenter_datacenter]

ESXi resource pools

Resource pools are configured in vCenter and define the maximum amount of resources that virtual machines using that pool can consume. If the ESXi server has additional resources to spare, an ESXi server property enables resource pools to expand. The **Name** and **Owner** fields of each resource pool on the ESXi server must be configured within the ServiceNow AI Platform

in the ESXi Resource Pool [cmdb_ci_esx_resource_pool] table. When Orchestration for VMware executes its manual provisioning tasks, the provisioner must select the proper resource pool for the virtual server requested. Discovery finds resource pools on ESXi machines and populates the fields on the ESXi Resource Pool form automatically. For more information, see Configure ESXi resource pools.

ESXi resource pools require the Orchestration - VMware Support plugin.

Note: Confirm that vCenter and the ESXi server have been fully configured, including the creation of the templates and resource pools.

Data collected

Field label and Name	Table	Source	Description
CPU expandable [cpu_expendable]	ESXi Resource Pool [cmdb_ci_esx_resource_pool]	VMWare - vCenter Clusters probe	Whether the resource pool can exceed CPU allocation limits.
CPU limit (MHz) [cpu_limit_mhz]	ESXi Resource Pool [cmdb_ci_esx_resource_pool]	VMWare - vCenter Clusters probe	Maximum CPU allocation.
CPU reserved (MHz) [cpu_reserved_mhz]	ESXi Resource Pool [cmdb_ci_esx_resource_pool]	VMWare - vCenter Clusters probe	CPU guaranteed to the pool.
CPU shares [cpu_shares]	ESXi Resource Pool [cmdb_ci_esx_resource_pool]	VMWare - vCenter Clusters probe	CPU priority weight.
Full path [fullpath]	ESXi Resource Pool [cmdb_ci_esx_resource_pool]	VMWare - vCenter Clusters probe	vCenter folder path.
Memory expandable [mem_expandable]	ESXi Resource Pool [cmdb_ci_esx_resource_pool]	VMWare - vCenter	Whether memory can exceed the configured maximum.

Data collected (continued)

Field label and Name	Table	Source	Description
		Clusters probe	
Memory limit (MB) [mem_limit_mb]	ESXi Resource Pool [cmdb_ci_esx_resource_pool]	VMWare - vCenter Clusters probe	Maximum memory.
Memory reserved (MB) [mem_reserved_mb]	ESXi Resource Pool [cmdb_ci_esx_resource_pool]	VMWare - vCenter Clusters probe	Memory guaranteed to the pool.
Memory shares [mem_shares]	ESXi Resource Pool [cmdb_ci_esx_resource_pool]	VMWare - vCenter Clusters probe	Memory scheduling weight.
Owner [owner]	ESXi Resource Pool [cmdb_ci_esx_resource_pool]	VMWare - vCenter Clusters probe	Host or VM owning the pool.
Owner Managed Object Reference ID [owner_morid]	ESXi Resource Pool [cmdb_ci_esx_resource_pool]	VMWare - vCenter Clusters probe	VMware reference ID of the owner.

Standalone ESXi discovery

Standalone ESXi discovery supports discovery of individual ESXi servers that host virtual machines (VMs) and related components without a vCenter. Various CIs and relationships are discovered as part of a discovery schedule.

Required roles:

Users with the *itil* and *asset* roles can access ESXi configuration item (CI) records. To run a standalone ESXi discovery, users must have the *discovery_admin* role.

VMware credentials

To run a standalone ESXi discovery, you need VMware credentials. Create the credentials by navigating to **Discovery** > **Credentials** > **VMware Credentials.**

If you use a domain account to access the ESXi host, specify the domain with the user name in the credential record. Use one of the supported formats, such as **Domain\UserName**.

Note: The VMware credentials must have a read-only role in the ESXi host.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Requirements

- Make sure the Discovery (com.snc.discovery) plugin is installed and activated and that you have upgraded to Brazil or later.
- Activate the ESXi trigger probe. Navigate to the Trigger Probe [trigger_probe_m2m] table. The esxi record is inactive by default. Mark Active as true to enable Standalone ESXi discovery.
- Create a Discovery schedule for the host with the appropriate IP address of the ESXi host.

Note: If both SSH and ESXi are triggered, SSH is launched first and may cause Discovery to complete with the message "ESX Discovery is only supported through the vCenter." In this case, open the UNIX - Classify probe and set ESX - OS inactive.

ESXi server Discovery Components

Discovery identifies ESXi servers based on the correlation ID (BIOS UUID), when the hardware manufacturer is on a certified inclusion list. If the manufacturer is on the list, the correlation ID must be unique. If the manufacturer isn't on the certified inclusion list, the Managed Object Reference ID (MORID) and Serial Number are checked as well.

After Shazzam runs, it checks for the port probe esxi. Discovery then launches the VMWare - Standalone ESXi Server probe, which then launches the probes that explore the ESXi server. Other existing Discovery probes are also launched. For the complete list of probes, see List of Discovery probes.

ESXi server Discovery Components

Component and Name	Description
IP Service [ESXi]	IP Service ESXi - VMWare VM console is defined for the Port 902.
Port Probe [esxi]	ESXi Server Appliance web user interface. It's triggered by the IP Service ESXi and it triggers the probe VMWare - Standalone ESXi Server.
Probe [VMWare - Standalone ESXi Server]	Probe to get information about an ESXi server.
Probe [VMWare - vCenter ESX Hosts]	Creates records for ESXi servers and host mounts. Triggers other probes. • VMware - vCenter ESX Hosts Storage • VMware - vCenter Datastores • VMware - vCenter Networks • VMware -vCenter VMs
Probe [VMWare - vCenter ESX Hosts Storage]	Creates records for ESXi host hardware: network adapters, disks, HBAs, FC ports, iSCSI, and FC disks. Creates relationships between DAS/iSCSI/FC disks and datastore disks.

Basic server data from ESXi hosts is collected by the VMware - vCenter ESX Hosts probe.

ESXi Standalone server data

Discovery uses multiple existing probes to collect this data from ESXi. The data is saved in various tables. Some of the CIs, which have the "server" field have a reference to ESXi Host (for example, cmdb_ci_esx_server).

VMware Virtual Machine Instance [cmdb_ci_vmware_instance]

Field label and Name	Description
Name [name]	VM name.
Memory (MB) [memory]	RAM assigned.
CPUs [cpus]	Number of vCPUs.
Disks [disks]	Number of VM disks.
Network adapters [nics]	Count of NICs.
Object ID [object_id]	Unique object ID.
Server [server]	ESXi host running the VM.
State [state]	Power state.
Correlation ID [correlation_id]	Unique VM identifier for correlation.
VM Instance UUID [vm_instance_uuid]	ESXi VM ID.
Status [install_status]	CMDB install status.

VMware vCenter Datastore [cmdb_ci_vcenter_datastore]

Field label and Name	Description
Name [name]	Datastore name.
Capacity (GB) [capacity]	Total storage size.
Free space (GB) [freespace]	Available storage.
Accessible [accessible]	Whether the datastore is reachable.
Type [type]	Filesystem type.
Object ID [object_id]	Unique datastore ID.
Server [server]	ESXi host providing the datastore.
URL [url]	Datastore path.
Status [install_status]	CMDB install status.

VMware vCenter Network [cmdb_ci_vcenter_network]

Field label and Name	Description
Name [name]	Network name.
Object ID [object_id]	Unique network ID.
Server [server]	ESXi host providing network connectivity.
Status [install_status]	CMDB install status.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

VMware Network Adapter [cmdb_ci_vmware_nic]

Field label and Name	Description
Name [name]	NIC name.
MAC Address [mac_address]	NIC hardware address.
IP Address [ip_address]	Assigned IP.
Netmask [netmask]	Subnet mask.
Configuration Item [cmdb_ci]	CI that owns this NIC.
Object ID [object_id]	Unique NIC ID.
Mac manufacturer [mac_manufacturer]	Vendor of the NIC.
DHCP Enabled [dhcp_enabled]	Whether DHCP is active.
Status [install_status]	CMDB install status.

VMware Datastore HostMount [vcenter_datastore_hostmount]

Field label and Name	Description
VMware vCenter Datastore [datastore]	Mounted datastore.
ESX Server [esx_server]	Host using the datastore.
Accessible [accessible]	Whether the datastore is accessible.
Access Mode [access_mode]	Read/write permissions.

Datastore Disk [cmdb_ci_vcenter_datastore_disk]

Field label and Name	Description
Name [name]	Disk name.
Manufacturer [manufacturer]	Disk vendor.
Location [location]	Disk physical/virtual location.
Description [short_description]	Short description.
Class [sys_class_name]	CMDB class.
Updated [sys_updated_on]	Timestamp of last update.
Maintenance schedule [maintenance_schedule]	Maintenance timing.
Correlation ID [correlation_id]	Identifier linking disk to datastore.
Datastore [datastore]	Associated datastore.
Status [install_status]	CMDB status.

ESX Resource Pool [cmdb_ci_esx_resource_pool]

Field label and Name	Description
Name [name]	Resource pool name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ESX Resource Pool [cmdb_ci_esx_resource_pool] (continued)

Field label and Name	Description
CPU reserved (MHz) [cpu_reserved_mhz]	Guaranteed CPU.
CPU limit (MHz) [cpu_limit_mhz]	Maximum CPU.
CPU shares [cpu_shares]	CPU priority.
Memory reserved (MB) [mem_reserved_mb]	Guaranteed memory.
Memory limit (MB) [mem_limit_mb]	Maximum memory.
Memory shares [mem_shares]	Memory weight.
Object ID [object_id]	Unique pool ID.
Server [server]	ESXi host.
Managed object reference ID [morid]	Managed Object Reference ID.
Status [install_status]	CMDB install status.

ESX Server [cmdb_ci_esx_server]

Field label and Name	Description
Name [name]	ESXi hostname.
Manufacturer [manufacturer]	Vendor name.
Model ID [model_id]	Server hardware model.
Operating System [os]	OS version.
OS Version [os_version]	Detailed OS version.
Description [short_description]	Summary information.
Class [sys_class_name]	CMDB class.
Status [install_status]	CMDB status.

Network Adapter [cmdb_ci_network_adapter]

Field label and Name	Description
Name [name]	NIC name.
Mac Address [mac_address]	NIC hardware address.
Netmask [netmask]	Subnet mask.
Configuration Item [cmdb_ci]	The CI owning this adapter.
Mac manufacturer [mac_manufacturer]	NIC vendor.
DHCP Enabled [dhcp_enabled]	Whether DHCP is used.
Status [install_status]	CMDB install status.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Disk [cmdb_ci_disk]

Field label and Name	Description
Name [name]	Disk name.
Computer [computer]	System owning the disk.
Size [size]	Disk capacity.
Manufacturer [manufacturer]	Disk vendor.
Model ID [model_id]	Model identifier.
Status [install_status]	CMDB install status.

Storage HBA [cmdb_ci_storage_hba]

Field label and Name	Description
Name [name]	HBA name.
Model ID [model_id]	HBA model number.
Computer [computer]	ESXi host.
WWNN [wwnn]	Worldwide Node Name.
Status [install_status]	CMDB install status.

Fibre Channel Port [cmdb_ci_fc_port]

Field label and Name	Description
Name [name]	Port name.
WWNN [wwnn]	Node Name.
WWPN [wwpn]	Port Name.
Speed [speed]	Link speed.
Controller [controller]	HBA controller.
Computer [computer]	Host system.
Status [install_status]	CMDB status.

iSCSI Disk [cmdb_ci_iscsi_disk]

Field label and Name	Description
Name [name]	Disk name.
Computer [computer]	Host accessing the disk.
Size [size]	Disk size.
Provided by [provided_by]	Storage system provider.
IQN [iqn]	iSCSI Qualified Name.
Device LUN [device_lun]	Logical Unit Number.
Storage type [storage_type]	Storage type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

iSCSI Disk [cmdb_ci_iscsi_disk] (continued)

Field label and Name	Description
Status [install_status]	CMDB status.

Fibre Channel Disk [cmdb_ci_fc_disk]

Field label and Name	Description
Name [name]	Disk name.
Computer [computer]	Host using this disk.
Size [size]	Disk capacity.
Provided by [provided_by]	Storage array.
Device LUN [device_lun]	LUN identifier.
WWN [wwn]	Worldwide Name.
Status [install_status]	CMDB install status.

IP Address [cmdb_ci_ip_address]

Field label and Name	Description
IP Address [ip_address]	Assigned network address.
IP version [ip_version]	IPv4 or IPv6.
Netmask [netmask]	Subnet mask.
Nic [nic]	NIC owning the IP.
Status [install_status]	CMDB status.

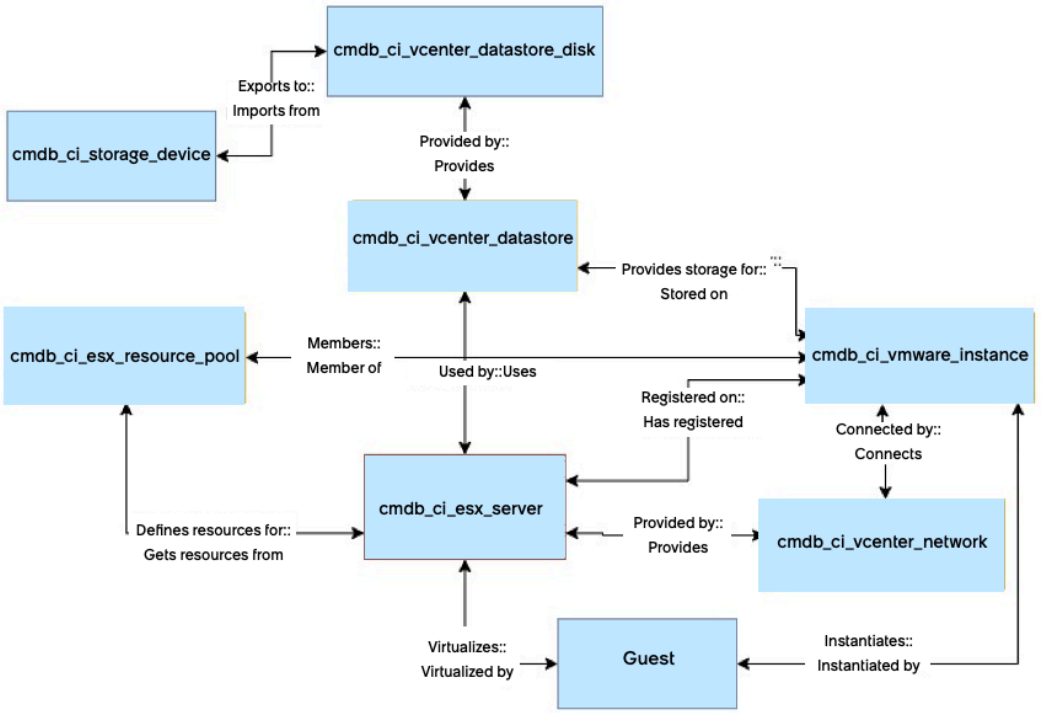
Relationships

Standalone ESXi discovery relationships



Resource pools

Standalone ESXi discovery also fetches the resource pools on the host including the root resource pool. This root resource pool is hidden for every ESXi host. The root resource pool may not be visible in the VSphere web client for the ESXi host, but you can view it using the mob browser.

Navigate to this URL: **<domain name/or ip_address>/mob/?moid=ha-root-pool**

The root resource pool groups the resources of that host. Other child resource pools can also be created from the root resource pool. The root is identified in the ESXi host with the Managed Object ID: ha-root-pool.

Forward migration

If you were using standalone ESXi discovery and now the same ESXi is part of vCenter, you can use vCenter discovery instead. Create a vCenter discovery schedule and trigger it. Triggering a vCenter discovery creates duplicate CIs in the following tables as the identifiers for the CIs are different when ESXi is standalone or part of vCenter:

- VMware VCenter Network [cmdb_ci_vcenter_network]
- ESX Resource Pool [cmdb_ci_esx_resource_pool]
- VMware VCenter Datastore [cmdb_ci_vcenter_datastore]
- Datastore Disk [cmdb_ci_vcenter_datastore_disk]

To avoid duplicates, you must mark the CIs created by standalone ESXi discovery in the above four tables as retired. When vCenter discovery is triggered, the vCenterESXHostsSensor script

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

include checks for all the ESXi servers whether they were previously discovered as standalone ESXi server. If yes, it automatically triggers the ESXMigrationUtil script to mark all the previously discovered duplicate CIs as retired.

Note: If you want to trigger migration manually, you can do so by executing the following script from the background script: // @params esx_sys_ids – array of sys ids of all the ESXi servers that must be migrated.

```
ESXMigrationUtil.
 retireCIsForESXForwardMigration(esx_sys_ids)
```

Once an ESXi server is migrated to vCenter, triggering a standalone ESXi discovery schedule on the same ESXi host results in an error. Discovery is aborted with an error message that "This ESXi is part of vCenter <IP_address of Vcenter> discovery schedule. Aborting discovery".

Operating systems discovery

Discovery identifies the following computers, clusters, and virtual machines.

AIX server discovery

Discovery identifies and classifies information about AIX servers.

Pattern-based discovery and mapping requirements

Configure SSH credentials

For more information, see SSH credentials.

Verify that you're using at least version 7.5.102 of OpenSSH

Use OpenSSH starting with version 7.5.102 for AIX machines since lower versions of OpenSSH can impact the discovered devices that are encountered with Discovery.

Verify privileged commands for AIX discovery

For a list of privileged commands that you need for Discovery and Service Mapping, see Service Mapping commands requiring a privileged user. This list includes commands that require elevated rights to discover and map Unix-based hosts in your organization.

Reference the main CI on discovered IP addresses

Starting with Discovery and Service Mapping Patterns version 1.35.0, you can populate the **Owned By Configuration Item** field on discovered IP address records with a reference to the main CI by setting the *add.owned.by.attribute* property to true. For more information, see Reference the main CI on discovered IP addresses.

Discover only the latest OS patch versions

Starting with Visibility Content version 6.35.0, you can collect only the current operating system patch level by setting the *sn_itom_pattern.discover_latest_os_patches* MID Server property to true. For more information, see Discover only the latest operating system patch versions.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Apache HBase instance discovery

Discovery creates or updates a CMDB record when it detects a running instance of HBase on a UNIX server.

Note: See the knowledge article KB0687582 for information on model_id and manufacturer.

In the following table, the `HBase Instance@`*`hostname`* source may contain the information on whether the instance is a primary or a secondary instance. The name contains *`Hmaster`* if the instance is a primary instance. The name contains *`HRegionServer`* if the name is a secondary instance.

Data collected

Hyper-V discovery

The ServiceNow Discovery application finds Microsoft Hyper-V hypervisors in your environment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Hyper-V is a hypervisor developed by Microsoft that enables you to create and manage virtual machines (VMs) on a physical server or computer. It enables hardware virtualization, enabling multiple virtual machines to run on a single physical machine while sharing the underlying hardware resources, such as CPU, memory, storage, and networking.

Note: See the knowledge article KB0687582 for information on model_id and manufacturer.

Hyper-V supports the following functionality:

- Failover clustering: Failover is managed with Failover Cluster Manager.
- Live migration: Virtual machines can be moved between failover cluster nodes without bringing down the virtual machine.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Supported versions

Discovery is supported for Hyper-V running on the following Windows Server versions:

- 2008
- 2012
- 2012 R2
- 2016
- 2019
- 2022
- 2025

Important: Discovery of Hyper-V running on Windows starting from version 2016 supports pattern discovery only. If you upgraded and are still using probes and sensors for discovery, see KB0694773 for instructions on configuring Hyper-V probes.

Hyper-V data models

There are 2 types of Hyper-V:

- Hyper-V on Windows Server: This model, installed as a server role on Windows Servers, is designed for enterprises needing both virtualization and other server roles (for example: file servers, Active Directory, web servers) on the same machine.
- Hyper-V Server (Standalone): A free, lightweight version of Windows Server specifically designed for virtualization. It includes only the Hyper-V hypervisor and no graphical user interface (GUI) or additional server roles.

Discovery supports identifying and mapping both types of Hyper-V environments. However, the CMDB data models differ between the two deployment types.

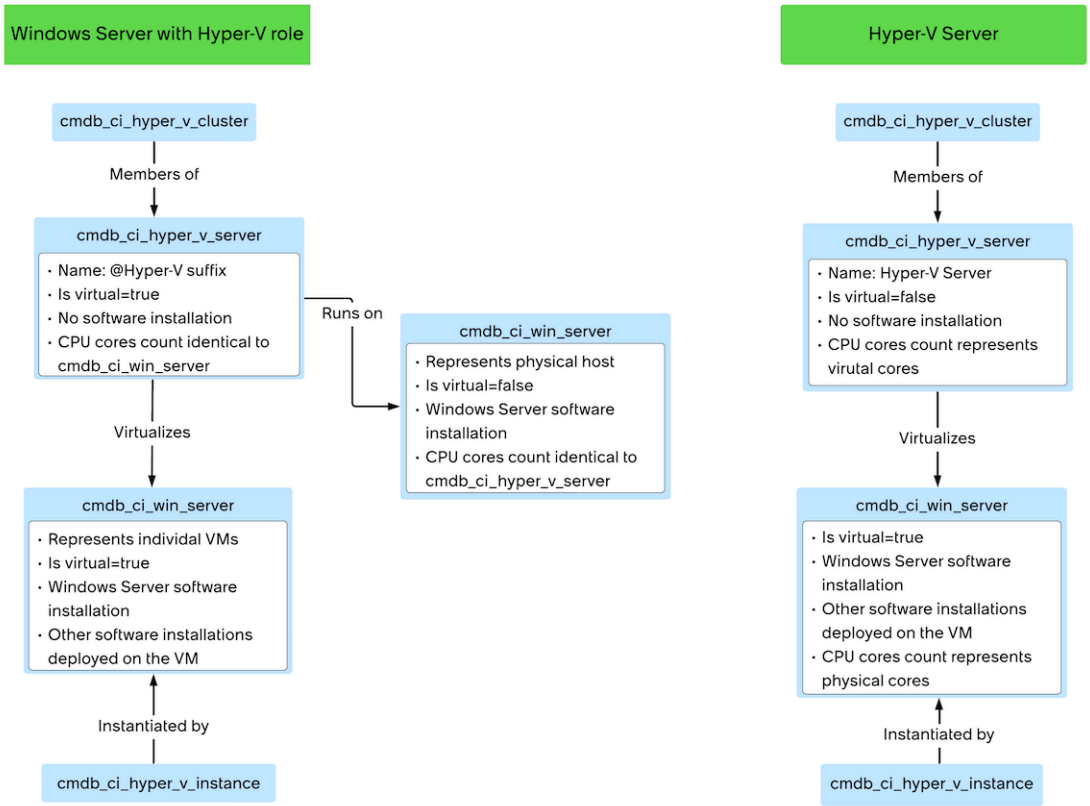
Example of Windows Server with Hyper-V role vs. Hyper-V Server (VM shown with Windows OS)



Comparison between Windows Server with Hyper-V role and Hyper-V Server

Key aspects	Windows Server with Hyper-V role	Hyper-V Server
Hyper-V Server CI	• Name of the CI includes the **@Hyper-V Server** suffix. For example: hyperv1@Hyper-V Server. • The **Windows Host** field references the parent Windows Servers table, which represents the physical host of the Hyper-V Server.	Name of the CI is the Hyper-V Server.
Hyper-V Cluster has **Members::Member of** relationship with Hyper-V Server	Yes The Hyper-V Server table: • Has **Is virtual** field set to true • Doesn't have software installation	Yes The Hyper-V Server table: • Has **Is virtual** field set to false • Doesn't have software installation
Hyper-V Server has **Runs on::Runs** relationship with Windows Server	Yes The Windows Server table:	No

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Comparison between Windows Server with Hyper-V role and Hyper-V Server (continued)

Key aspects	Windows Server with Hyper-V role	Hyper-V Server
	• Represents the physical host • Has **Is virtual** field set to false • Has Windows Server software installation	
Operating system (OS) installed on the VM has **Virtualized by::Virtualizes** relationship with Hyper-V Server	Yes The OS table (for example: Windows Server/Linux Server): • Represents the individual virtual machines (VMs) • Has **Is virtual** field set to true • Has OS software installation, such as Windows or Linux Server • Has other software installations deployed on the VM	Yes The OS table (for example: Windows Server/Linux Server): • Has **Is virtual** field set to true • Has OS software installation, such as Windows or Linux Server • Has other software installations deployed on the VM
OS installed on the VM has **Instantiates::Instantiated by** relationship with Hyper-V Virtual Machine Instance	Yes	Yes
CPU cores count	Is identical between the physical Windows Server host and the Hyper-V Server	The parent Windows Servers table reflects the physical cores, while the Hyper-V Server table displays the virtual cores

Credentials

Configure Windows credentials with Domain administrator rights. You should also Enable PowerShell for the MID Server used to discover Hyper-V servers and instances.

Classifier, probes, and pattern

Classifier	Probes	Pattern
Hyper-V Server The classification applies to standalone Hyper-V servers only (servers NOT running on Windows 2008).	• Horizontal discovery probe: Launches patterns • Windows - ADM^ • Windows - Installed Software^ • Hyper-V - Cluster* • Hyper-V - Resource Pools* • Hyper-V - Virtual Machines*	Hyper-V Server

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Classifier	Probes	Pattern
	• Hyper-V - Virtual Networks* • Several other Windows probes also run, such as Windows - Identity, Windows - software, and so on.*	

*These probes aren't active on the classifier, as Discovery uses patterns by default for these discoveries.

^These probes remain active by default, even when Discovery uses pattern discovery.

To use patterns, verify that the correct pattern is specified in the horizontal pattern probe on the classifier. See Add the Horizontal Pattern probe to a classifier for instructions.

Data collected by Discovery during horizontal discovery

Virtual instances

Label	Field Name	Data Description	Stored in Table
Object ID ^	object_id	ID	cmdb_ci_hyper_v_instance
Name^	name	name	cmdb_ci_hyper_v_instance
State	state	• On • Off	cmdb_ci_hyper_v_instance*
CPUs	cpus	Count	cmdb_ci_hyper_v_instance*
Memory	memory	Quantity in MB	cmdb_ci_hyper_v_instance*
Network adapters	nics	Count	cmdb_ci_hyper_v_instance*
Disks	disks	Count+	cmdb_ci_hyper_v_instance*
Disks size	disks_size	Capacity in GB+	cmdb_ci_hyper_v_instance*
Virtual Base Board Serial Number	baseboard_serial	Virtual serial number	cmdb_ci_hyper_v_instance
BIOS Serial Number	bios_serial	Virtual serial number	cmdb_ci_hyper_v_instance
Chassis Serial Number	chassis_serial	Virtual serial number	cmdb_ci_hyper_v_instance
BIOS GUID	bios_guid	Globally unique identifier (GUID)	cmdb_ci_hyper_v_instance

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

*Attributes that are put in the `cmdb_ci_hyper_v_instance` table when using the Hyper-V Server pattern. For upgrades, probes and sensors continue to put these attributes in the `cmdb_ci_vm_instance` table.

^Newly discovered attribute when using the Hyper-V Server pattern.

+Discovery can only return this information if the virtual machine is running.

Virtual servers

Label	Field	Store in table
Name	name	`cmdb_ci_hyper_v_server`
Chassis type	chassis_type	`cmdb_ci_hyper_v_server`
Description	short_description	`cmdb_ci_hyper_v_server`
OS Address Width (bits)	os_address_width	`cmdb_ci_hyper_v_server`
Operating System	OS	`cmdb_ci_hyper_v_server`
Host name	hostname	`cmdb_ci_hyper_v_server`
IP Address	ip_address	`cmdb_ci_hyper_v_server`
OS Version	os_version	`cmdb_ci_hyper_v_server`
OS Service Pack	os_service_pack	`cmdb_ci_hyper_v_server`
Is virtual	virtual	`cmdb_ci_hyper_v_server`

Virtual networks

Label	Field Name	Data Description	Stored in Table
Name	name	Name of the virtual network	`cmdb_ci_hyper_v_network` *
ID	object_id	Globally unique identifier (GUID)	`cmdb_ci_hyper_v_network` *

*Attributes that are put in the `cmdb_ci_hyper_v_network` table when using the Hyper-V Server pattern. For upgrades, probes and sensors continue to put these attributes in the `cmdb_ci` table (name) and the `cmdb_ci_vm_object` table (object_id).

Resource pools

Label	Field Name	Data Description	Stored in Table
Name^	name	Name of the resource pool.	`cmdb_ci_hyper_v_resource_pool`
ID	object_id	Globally unique identifier (GUID)	`cmdb_ci_hyper_v_rpool_comp`
Capacity	capacity	Maximum amount of the appropriate allocation unit	`cmdb_ci_hyper_v_rpool_comp`
Allocation units	allocation_units	Units of measurement used (for example, MB or GB)	`cmdb_ci_hyper_v_rpool_comp`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Resource pools (continued)

Label	Field Name	Data Description	Stored in Table
Resource type	resource_type	Type of resource discovered (for example, memory, or hard drive space)	cmdb_ci_hyper_v_rpool_comp

Clusters

Label	Field Name	Data Description	Stored in Table	Reference Table
Windows Cluster	name	Reference field displaying the Windows Cluster on which the Hyper-V cluster resides.	cmdb_ci_hyper_v_cluster	cmdb_ci_win_cluster

Relationships

Discovery creates records in the CMDB for the host machine, the parent partition running Windows Server 2008, and all the virtual machines running on the Hyper-V server. Discovery finds the stored templates and maps all the relationships between components.

The instance modifies these tables for use with multiple virtualization products:

Table	Purpose
Virtualization Server [cmdb_ci_virtualization_server]	Contains data on all discovered virtualization servers.
Virtual Machine Instance [cmdb_ci_vm_instance]	Contains data on all discovered virtual machine instances.
Virtual Machine Object [cmdb_ci_vm_object]	Contains data about various objects associated with a Hyper-V server, such as partitions, networks, resource pools, and clusters.

Parent table	Relationship	Child table
Hyper-V Virtual Machine Instance [cmdb_ci_hyper_v_instance]	Registered on::Has registered	Hyper-V Server [cmdb_ci_hyper_v_server]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parent table	Relationship	Child table
Hyper-V Virtual Machine Instance [cmdb_ci_hyper_v_instance]	Connected by ::Connects	Hyper-V Network [cmdb_ci_hyper_v_network]
Hyper-V Network [cmdb_ci_hyper_v_network]	Provided::Provides	Hyper-V Server [cmdb_ci_hyper_v_server]
Hyper-V Resource Pool [cmdb_ci_hyper_v_resource_pool]	Defines resources for:Gets resources from	Hyper-V Server [cmdb_ci_hyper_v_server]
Hyper-V Resource Pool Components [cmdb_ci_hyper_v_rpool_comp]	Contained by::Contains	Hyper-V Resource Pool [cmdb_ci_hyper_v_resource_pool]
Hyper-V Cluster [cmdb_ci_hyper_v_cluster]	Members::Member of	Hyper-V Server [cmdb_ci_hyper_v_server]
Hyper-V Server [cmdb_ci_hyper_v_server]	Runs on::Runs	Windows Servers [cmdb_ci_win_server]
Windows Servers [cmdb_ci_win_server]	Instantiates::Instantiated by	Hyper-V Virtual Machine Instance [cmdb_ci_hyper_v_instance]
Windows Servers [cmdb_ci_win_server]	Virtualized by::Virtualizes	Hyper-V Server [cmdb_ci_hyper_v_server]

Clone Hyper-V virtual machines

When importing (cloning) Hyper-V virtual machines, make sure each virtual machine has a unique ID. Discovery identifies virtual machines with duplicate IDs as the same machine.

1. Export the virtual machine from the Hyper-V server.
2. Import the virtual machine into a different server, making one of the these choices:
   - Move or restore the virtual machine: This selection clones the image, using the same ID, and moves it to another server. The original image remains on the Hyper-V server.
   - Copy the virtual machine: This selection copies the virtual machine, using a different ID, and moves it from the Hyper-V server. This is the best selection and does not require any further action before you run Discovery.
3. If you import the Hyper-V clone using the **Move or restore** selection, be sure to delete the original image from the Hyper-V server.

   When Discovery encounters two virtual machines with the same equivalent serial numbers, it creates only one configuration item (CI).

Red Hat JBoss server discovery

Discovery can detect JBoss application servers running on Linux and Windows systems.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Requirements

For JBoss application servers running on Linux systems.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Set probe permissions to use these Bourne shell commands: *find*, *cat*, and *dirname*.
- Enable SSH on the JBoss application server. The SSH credential must also have read permissions on the `web.xml` and `jboss-service.xml` files.

For JBoss application servers running on Windows systems, enable PowerShell on the MID Server.

Note: See the knowledge article KB0687582 for information on model_id and manufacturer.

Credentials

- Applicative credentials
- Windows credentials
- SSH credentials

For a list of privileged commands that you need for Discovery and Service Mapping, see Service Mapping commands requiring a privileged user. This list includes commands that require elevated rights to discover and map Unix-based hosts in your organization.

Classifiers, patterns, and probes

Classifier	Trigger probes	Patterns
JBoss Server	• Horizontal Pattern: launches patterns • Windows - JBoss Find web.xml List* • Windows - JBoss Get jboss-service.xml* • JBoss - Find web.xml List* • JBoss - Get jboss-service.xml*	JBoss pattern

*For new instances, these probes are inactive on the classifier. Discovery uses patterns for discovery.

To use patterns, verify that the correct pattern is specified in the horizontal pattern probe on the classifier. See Add the Horizontal Pattern probe to a classifier for instructions.

Data collected

Discovery populates the following fields in the JBoss [cmdb_ci_app_server_jboss] table:

Label	Field name
Name	name
Category	category
Version	version

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Label	Field name
TCP port(s)	tcp_port

Discovery populates the following fields on the Web Service [cmdb_ci_web_service] and Web Application [cmdb_ci_web_application] servers tables:

Label	Table name	Field name	Source
Name	cmdb_ci_web_service	name	jboss-service.xml
App server	cmdb_ci_web_service	app_server	Internal reference
Description	cmdb_ci_web_application	short_description	web.xml
Name	cmdb_ci_web_application	name	web.xml
Document base	cmdb_ci_web_application	document_base	web.xml
App server	cmdb_ci_web_application	app_server	web.xml
Servlet Name*	cmdb_ci_web_application	servlet_name	web.xml
Servlet Class*	cmdb_ci_web_application	servlet_class	web.xml

*Windows servers only

Relationships

Relationships created

Parent class	Relationship	Child class
cmdb_ci_web_service	Runs on::Runs	cmdb_ci_windows_server
cmdb_ci_app_server_jboss	Contains::Contained by	cmdb_ci_web_application
cmdb_ci_app_server_jboss	Runs:Runs on	cmdb_ci_web_application
cmdb_ci_app_server_jboss	Runs:Runs on	cmdb_ci_web_service

Legacy: JBoss probes and sensors

Discovery identifies a Linux JBoss application server using probes and sensors.

Linux

This process describes the use of probes, which are active on your instance if you upgrade. For new instances, Discovery uses the JBoss pattern.

1. The UNIX - Active Processes probe detects a running process that matches an `org.jboss.main` entry point parameter.
2. If there's a match, a record is created in the JBoss Application Server [cmdb_ci_app_server_jboss] table. The following probes are also triggered:
   - JBoss - Find web.xml list: The sensor of this probe populates information in the Web Application [cmdb_ci_web_application] table if applicable.
   - JBoss - Get jboss-service.xml: The sensor of this probe populates information in the Web Service [cmdb_ci_web_service] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. The JBoss - Find web.xml list probe searches for the `web.xml` files of JBoss application server. The probe uses the *`classpath`* parameter in the running process, and then searches in the related `server\default\deploy` directory for the JBoss installation.
4. If associated web applications reside in the `server\default\deploy` directory, the JBoss - Get web.xml probe triggers for each application. This probe reads the `web.xml` file for each web application and the sensor populates additional information to the Web Service [cmdb_ci_web_service] table.
5. The Boss - Get jboss-service.xml probe uses the *`classpath`* parameter in the running process to search for the `jboss-service.xml` file in the related `server\default\conf\` directory for the JBoss installation.
6. If the probe successfully finds the `jboss-service.xml` file in the `server\default\conf\` directory, the sensor reads the contents of the XML file. It then creates additional records in the Web Service [cmdb_ci_web_service] table as necessary.

Windows

This process describes the use of probes, which are active on your instance if you upgrade. For new instances, Discovery uses the JBoss pattern.

1. The Windows - Active Processes probe detects a running process that matches an *`org.jboss.main`* entry point parameter.
2. If there's a match, a record is created in the JBoss Application Server [cmdb_ci_app_server_jboss] table. The following probes are also triggered:
   - JBoss - Find web.xml list: The sensor of this probe populates information in the Web Application [cmdb_ci_web_application] table if applicable.
   - JBoss - Get jboss-service.xml: The sensor of this probe populates information in the Web Service [cmdb_ci_web_service] table.
3. The JBoss - Find web.xml list probe searches for the `web.xml` files of JBoss application server. The probe uses the *`classpath`* parameter in the running process, and then searches in the related `server\default\deploy` directory for the JBoss installation.
4. If associated web applications reside in the `server\default\deploy` directory, the JBoss - Get web.xml probe triggers for each application. This probe reads the `web.xml` file for each web application and the sensor populates additional information to the Web Service [cmdb_ci_web_service] table.
5. The Boss - Get jboss-service.xml probe uses the *`classpath`* parameter in the running process to search for the `jboss-service.xml` file in the related `server\default\conf\` directory for the JBoss installation.
6. If the probe successfully finds the `jboss-service.xml` file in the `server\default\conf\` directory, the sensor reads the contents of the XML file. It then creates additional records in the Web Service [cmdb_ci_web_service] table as necessary.

Linux discovery

Discovery and Service Mapping applications use probes and patterns to discover and map information about Linux computers and servers. The information is populated in the CMDB. Discovering some of these resources might require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Supportability details

The Linux server pattern can discover only English-based Linux.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported Linux operating systems

For IPv4 discovery:

- Red Hat
- Oracle
- Fedora
- Debian
- SUSE
- CentOS
- Ubuntu
- Rocky Linux
- AlmaLinux OS
- Debian GNU/Linux
- VMware Photon OS
- Amazon Linux
- Alpine Linux (starting from Visibility Content version 6.30.0)*

* Operating System and OS Version only

For IPv6 discovery:

- CentOS 7
- Ubuntu 20

The following operating systems or devices haven't been verified for IPv6 discovery:

- Red Hat cluster
- Oracle Clusterware
- Linux Pacemaker cluster
- Network storage

Classifier, probes, and pattern

Classifier	Probes	Pattern
Linux (Unix classification)	• Horizontal discovery probe: Launches patterns • Linux - Installed Software^ • Unix - ADM^ • Linux - Identity* • Linux - CPU* • Linux - Distribution* • Linux - Find FQDN* • Linux - Memory* • Linux - Memory Modules*	Linux Server

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Classifier	Probes	Pattern
	• Linux - Network ARP Tables* • Linux - Storage* • Linux - Amazon EC2* • Unix - OS Uptime* • UNIX - OS Filesystems* • UNIX - Find FQDN* • Unix - ADM Enhanced*	

*These probes aren't active on the classifier, as Discovery uses patterns by default for these discoveries.

^These probes remain active by default, even when Discovery uses pattern discovery.

To use patterns, verify that the correct pattern is specified in the horizontal pattern probe on the classifier. See Add the Horizontal Pattern probe to a classifier for instructions.

Request new or enhanced Patterns on the ServiceNow® Store

Visit the ServiceNow Store to view all the available updates and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Requirements for Linux discovery

Before running a discovery, you must verify that all the required configurations are complete.

Verify the plugins installation and activation

- Plugins or applications installed with ITOM Visibility
- Install Discovery and Service Mapping Patterns
- Install Visibility Content

Verify the required credentials configuration

Configure the credentials by the required SSH permissions. Discovering sensitive Linux data may require a user with appropriate sudo privileges to run the sudo commands. To configure the required sudo privileges, modify the `/etc/sudoers` file to include the commands that Discovery needs. For `/etc/sudoers` line examples for each command, see Privileged SSH commands for probe-based discovery.

For more information about the commands that require a user with elevated rights, refer to the following documents.

- Commands that require root privileges for Discovery, Orchestration, and Integration Hub.
- For a list of privileged commands that you need for Discovery and Service Mapping, see Service Mapping commands requiring a privileged user. This list includes commands that require elevated rights to discover and map Unix-based hosts in your organization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- MID Server privileged commands
- View Patterns commands through the Discovery Patterns module
- Validate commands used in pattern-based discovery

SSH private key credentials are preferable over SSH password credentials for security reasons.

Configure PermitTTY for SSH sessions

Set `PermitTTY yes` in `/etc/ssh/sshd_config` on the target Linux server. This setting is required for privileged commands such as `dmidecode` to run successfully.

Verify the MID Server configuration

For detailed information, see:

- Test MID Server connectivity
- MID Server properties

Verify the configuration of the discovery schedule

For information on creating a discovery schedule, see Schedule a horizontal discovery.

Define IP ranges so that only the specified network adapters and their primary IP addresses are used during Linux discovery. You can configure **Quick Ranges** by entering comma-separated IPv4 address ranges or single IPv6 address.

Alternatively, you can use the *`network_adapter_exclusion_list`* property to limit Linux discovery to specific network adapters and their primary IP addresses. For more information, see Omit network adapter secondary IP addresses in Linux discovery.

(Optional) Populate Virtual Machine Object field in Hardware [cmdb_ci_hardware] table

Starting with Discovery and Service Mapping Patterns version 1.30.2, you can improve query performance by populating the Virtual Machine Object field in the Hardware [cmdb_ci_hardware] table. For more information, see Improved query performance with direct field population in CI tables.

Set the preferred IP address version for network adapter discovery

Starting with Visibility Content version 6.32.0, if your network adapters support both IPv4 and IPv6, the IPv4 address is populated by default in the IP address [ip_address] field on the Network Adapter [cmdb_ci_network_adapter] table. To control which IP version is populated, see Set the preferred IP version for network adapter discovery.

Configure the serial number type

Starting with Visibility Content version 6.35.0, you can populate a specific serial number type instead of the first available one. For more information, see Configure the serial number type for Linux Server discovery.

Data collected

The Linux classifier triggers probes that perform the discovery. Several probes are launched during the discovery. See the classifier for a list of the trigger probes.

Note: See the knowledge article KB0687582 for information on model_id and manufacturer.

* The value in the **disk_space** field is an aggregation of the total capacity (to include used space) for all non-removable disks, including both directly attached and SAN storage.

** Starting with Visibility Content version 6.32.0, for network adapters that support both IPv4 and IPv6, the IPv4 address is populated by default. Before this release, the populated value was selected randomly. To control which IP version is populated, see Set the preferred IP version for network adapter discovery.

Note: Make sure to define unique serial numbers for the RAMs on the Linux server.

Discovery also identifies and classifies information about Linux KVM. Discovery identifies Linux kernel-based virtual machines (KVM) when the process classifier detects `libvirtd` running on a Linux server. The classification triggers the creation of a cmdb_ci_kvm record and launches the SSH Command probes to explore the Linux server with `virsh`, `lbvert` utility, and virtual machine configuration data.

Discovery creates a [cmdb_ci_kvm_instance] record for each virtual machine on the server. It then matches the [cmdb_ci_kvm_instance] record to a corresponding [cmdb_ci_computer] record using the MAC addresses of installed network adapters.

Tables used by Discovery on Linux KVM

Table name	Extends	Description	Source

Linux Red Hat cluster discovery

Discovery can find Linux Red Hat clusters that offer high availability and load balancing.

Required credentials

Configure SSH credentials.

Additional requirements

You also need permissions to read the `/etc/hosts/` and `/etc/cluster/cluster.conf` file, which associates host names with IP addresses.

The following commands are run for Oracle clusterware:

Command
`ps -ef | grep corosync | grep -v grep`
`clustat -x`
`ifconfig | grep 'inet addr:' |awk '{print $1, $2 }'`
`hostname -s`
`hostname -s`

Sudo permission to run: `sudo /u01/app/12.1.0.2/grid/bin/ocrcheck | egrep -v 'error|return code'`

Omit network adapter secondary IP addresses in Linux discovery

Limit Linux discovery to specific network adapters and their primary IP addresses to improve performance by ignoring secondary IP addresses.

About this task

Configuring the *network_adapter_exclusion_list* system property ensures that only specified network adapters and their primary IP addresses are used during Linux discovery. Secondary IP addresses that are not named are automatically omitted.

Before you begin

Role required: admin

Procedure

1. In the navigation filter, enter `sys_properties.list`.
2. In the **Name** field, search for `network_adapter_exclusion_list`.
3. Select the *network_adapter_exclusion_list* property.
4. In the **Value** field, enter the network adapter associated with the NIC IP address to exclude it from deletion.

   The network adapter must be entered in one of the formats listed in the following table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Format	Description
Single name	Single adapter name. For example: `bond0`.
Regular expression matching multiple adapter names	Regular expression that matches multiple adapter names ending with one or more digits. For example: `bond\d+`.
Multiple adapter names	Multiple adapter names, separated by commas, including regular expression. For example: `nic1,bond\d+`.

5. Select **Update**.

Result
When the predefined schedule triggers the Linux server discovery or a scheduled horizontal discovery runs, only the specific network adapters and their primary IP addresses are included in the discovery process.

For more information, see Schedule a horizontal discovery.

Linux discovery

Configure the serial number type for Linux Server discovery

Control which serial number type populates the **Serial Number** field on discovered Linux server CIs by configuring the *sn_itom_pattern.linux_server_preferred_serial_number_type* system property.

Before you begin
Verify that you have at least version 6.35.0 of Visibility Content.

Role required: admin

About this task
By default, Discovery populates the **Serial Number** field on the Linux Server [cmdb_ci_linux_server] table with the first available serial number found on each discovery run. The *sn_itom_pattern.linux_server_preferred_serial_number_type* system property enables you to specify which serial number type to use. If the preferred type isn't found on a given host, Discovery falls back to the first available serial number. The value is empty by default.

Procedure
1. In the navigation filter, enter `sys_properties.list`.
2. In the **Name** column, search for `sn_itom_pattern.linux_server_preferred_serial_number_type`.
3. Select the *sn_itom_pattern.linux_server_preferred_serial_number_type* system property.
4. In the **Value** field, enter one of the following serial number types:
   - `system`
   - `chassis`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- `board`
- `bios`

To revert to the default behavior and use the first available serial number, leave the value empty.

5. Select **Update**.

What to do next

Run Discovery again to apply the change.

Solaris discovery

Discovery identifies and classifies information about Solaris computers.

Note: See the knowledge article KB0687582 for information on model_id and manufacturer.

Supported operating systems

- Oracle Solaris 10
- Oracle Solaris 11

Prerequisites

Handle truncated command line parameters

Discovery stores data in the [cmdb_running_process] table with command line parameters truncated to 80 characters. This can cause multiple applications to be merged into one CI. To get the full command line and prevent this issue, run `pargs -a` and parse the result.

Install SNEEP

To use patterns to find Solaris computers, install SNEEP. Without it, Discovery cannot find the serial number.

Configure unique serial numbers for Solaris zones

Configure each zone to return a unique serial number. If zones return the same number, CI identification fails.

Note: Solaris discovery only supports local zones installed on the same host as the global zone. If the local zone is installed on a different host from the global zone, the `zoneadm list -cip` command can't retrieve the UUID for the local zone.

Install the LSOF command

The Solaris - ADM probe requires the LSOF command to be installed.

Configure SSH credentials

Configure SSH credentials for the systems you are discovering.

For a list of privileged commands that you need for Discovery and Service Mapping, see Service Mapping commands requiring a privileged user. This list includes commands that require elevated rights to discover and map Unix-based hosts in your organization.

Set the preferred IP address version for network adapter discovery

Starting with Visibility Content version 6.32.0, if your network adapters support both IPv4 and IPv6, the IPv4 address is populated by default in the IP address [ip_address] field on the Network Adapter [cmdb_ci_network_adapter] table. To control which IP version is populated, see Set the preferred IP version for network adapter discovery.

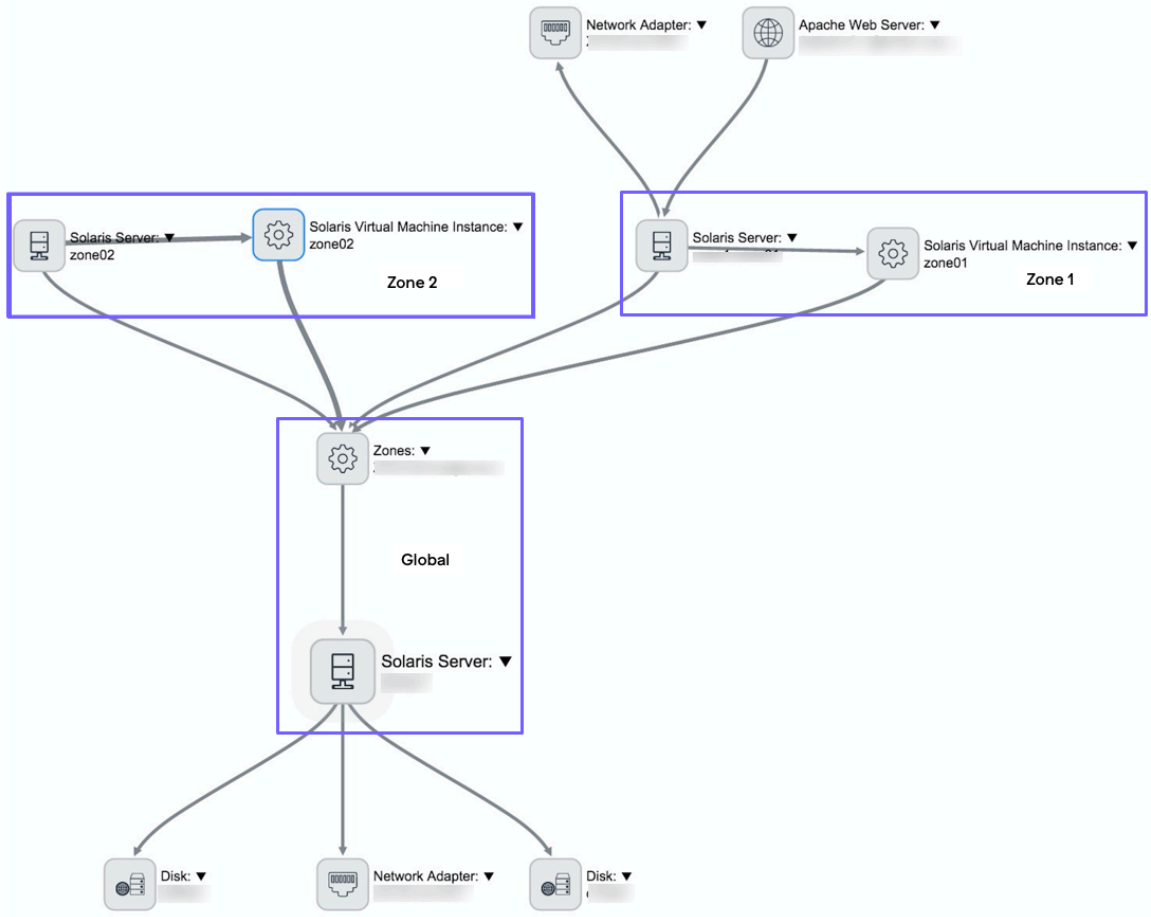
Solaris zone discovery

Discovery maps the relationships between global and local Solaris zones upon detection.

In the following example, a Solaris global zone contains two local zones: zone01 and zone02. Each local zone is represented by a physical Solaris CI record and a Virtual Machine Instance record. Each of the local zones is tied to a Zone Server, demonstrating how virtualization relates to the global zone (mmp1).

Solaris zone relationship map



The TCP connection and process information for local zone servers must be collected by running commands on their parent global zone. The relationship path between the local and global zone physical machines must be established before TCP connection and process information for local zone servers can be collected.

Case 1: Global zone is discovered first.

- The system creates the Solaris server CI for the global zone.
- Discovery detects the local zones, creates a hypervisor zone server record, and creates a virtual machine instance record for each Solaris device in the local zone.
- Discovery creates the relationship between the hypervisor record and the VM instance record.

Case 2: Local zone is discovered first.

- The system creates the Solaris server CI for the local zone.
- Discovery sets the correlation ID, so that it can be reconciled during later global zone discoveries.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Case 3: Global zone is discovered after local zone Solaris server CIs are created.

- Global zone Discovery detects local zones.
- Discovery creates a hypervisor zone server record, and creates a virtual machine instance record for each Solaris device in the local zone.
- Discovery creates the relationship between the hypervisor record and the VM instance record. In addition, it creates the relationship between the physical local zone VM and its virtual machine instance record.
- The global zone runs the Solaris - ADM probe on itself, filtering by the local zone, and updates the physical local zone VMs with this data.

Case 4: The relationship path between physical local and global zone machines is established.

Subsequent discoveries of the global zone refresh the TCP connection and process information for the contained local zones.

When the system discovers a global zone, the Solaris - Zones & ADM Launcher probe triggers the Solaris - ADM probe to explore the global zone and each local zone found. Because the Solaris - ADM probe must run on the global zone to detect TCP connection and process information from its local zones, you might see multiple ECC queue records that appear identical.

ECC queue entries for a zone Discovery

Discovery for VMware vCenter

Discovery can explore the VMware vCenter process running on a Windows or Linux host. IPv6 is supported for discovery in VMware vCenter.

Note:

If a Windows or Linux server is running vCenter application, after creating the vCenter CI, a "Runs on" relationship to the Windows or Linux server host is created.

When a vCenter application is running on a dedicated vCenter appliance, a "Runs on" relationship to the vCenter CI isn't created.

Tested vCenter versions

The ServiceNow® platform supports vCenter API versions 4.0 and higher. The following versions were tested with the Brazil release:

- vCenter versions 9.0 and earlier
- vCenter appliance version 6.7 and earlier

For installations based on the vCenter appliance, a server CI is created for the vCenter appliance and the following fields are populated:

- NameIP
- AddressMAC
- AddressDiscovery
- Source

Note: If you're discovering SUSE Linux hosts for vCenter appliances, version 6.0 and earlier, observe these SSH restrictions.

See Data collected for VMware Cloud Discovery for a description of the VMware architecture and component relationships.

vCenter discovery process

After classifying vCenter, Discovery launches the VMware - vCenter Datacenters probe, which in turn launches specific probes that return information about ESX machines, virtual machines, and other vCenter objects. The vmapp port probe is also configured to launch the VMware - vCenter Datacenters probe.

Note: For accurate relationship mapping between server CIs and vCenter resources (such as ESX hosts and datastores), you should initiate discovery of the vCenter environment before discovering Server CIs. This approach helps Discovery associate servers with their corresponding vCenter-managed infrastructure more effectively.

VMWare credentials

To access vCenter with a domain account, specify the domain with the user name in the credential record using a supported format, such as **Domain\UserName** or **username@domain**. The VMware credentials must have a read-only role in vCenter. For Software Asset Management (SAM) tracking, the credentials also require the "Assign license" privilege in vCenter, also known as the License Admin privilege.

Important: Windows credentials aren't necessary for vCenter Discovery when valid VMware credentials are used.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Updating the CMDB with vCenter event collector

In addition to finding vCenter data through the standard discovery process, Discovery can also update the CMDB by detecting vCenter events through a MID Server extension called the vCenter event collector.

The event collector allows the CMDB to be updated with changes to virtual machines (VMs), in addition to the updates detected by Discovery. A change to a VM is sent as an event from the vCenter server to the vCenter event collector. When an event is received, the CMDB is updated accordingly. Full vCenter Discovery does not need to rerun. For some events, such as powered on and powered off events, Discovery does not need to run again at all. For most events, Discovery runs only on the necessary vCenter resource.

For instructions on configuring vCenter events, see Configure and run the vCenter event collector extension.

VM deleted from vCenter

If the VM is deleted from vCenter, the cmdb_ci_vm_instance state changes to terminated and the Status field changes to retired.

CIs removed from vCenter

When a vCenter CI, such as a virtual machine, is removed, the ServiceNow instance marks it as "stale" in the CMDB, using either of these procedures:

- When Discovery runs, it creates an audit record in the Components installed with CMDB Health table for the missing CI and marks the CI "stale".
- If the instance is configured to collect vCenter events, the system can also create a "stale" audit record for the CI in the CMDB Health Result [cmdb_health_result] table from the VmRemovedEvent event, without having to run Discovery.

Note: When the **Staleness** setting is configured, the dependency view (BSM map) grays out stale CIs in its relationship diagram to indicate that they were removed from vCenter.

To avoid stale CI health indicators from being generated during VMware discovery, set the system property *glide.cmdb.health.src.cmdb_health_audit_only* to **true**. This disables stale CI reporting from the VMware discovery source, enabling you to manage the CI life cycle through other means. For more information, see CMDB Health system properties.

You have the option of creating a CMDB remediation rule to automatically execute a remediation workflow that can, for example, delete stale CIs. For more information on stale CIs, see CMDB Health Metrics.

vCenter Discovery on Windows host

Windows credentials aren't necessary for vCenter Discovery, when valid VMware credentials are used.

Discovery for VMware virtual machines

Discovery gathers information about virtual machines managed by VMware vCenter.

The Discovery product can extract information from VMware configuration items (CI), including their relationships. Discovery is configured to work with the Orchestration VMware Support Plugin, which enables the automatic cloning of virtual machines by an ESX server managed by vCenter. For information about data collected by Discovery on vCenter, see Data collected for VMware Cloud Discovery.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Windows discovery

Discovery identifies and classifies information about Windows computers that use IPv4 addresses, IPv6 addresses, or both.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Note: admin$ share access is required for Windows discovery from Madrid P3 and later. A Remote Access role must be configured in the target Windows Server to enable connectivity with ServiceNow Discovery.

Supported Windows versions

For IPv4 discovery:

- Windows Workstation 7, 8, 10
- Windows Server versions:
  - 2008
  - 2008R2
  - 2012R2
  - 2016
  - 2019
  - 2022
  - 2025

For IPv6 discovery:

- Windows 2019 (10.0.17763)
- Windows Server 2016
- Windows Desktop 10
- Windows 2019 Datacenter

Note: For fiber channel discovery on a Windows 2008 host, the Microsoft Fibre Channel Information Tool (`fcinfo.exe`) must be installed on that machine. The `fcinfo` executable should be available on the environment path. The Microsoft Fibre Channel Information Tool tool is available for download at http://www.microsoft.com.

IPv6 supportability limitations

The following device types haven't been verified for IPv6 discovery:

- Printers
- Network Storage (NFS, CIFS, NAS, FC, ISCSI)
- Azure virtual machines (IPv6 native mode isn't supported by Microsoft)

Requirements

Verify PowerShell support

ServiceNow now supports PowerShell 3.0 up to 5.1.

Configure Windows credentials

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information, see Windows credentials.

Verify user access

Verify that the user configured for the credential has the following permissions:

- Local admin access to the Windows machine.
- Access to the WMI service to the current namespace and subnamespaces.
- Access to the PowerShell service.
- Membership in the Distributed COM Users local security group.

(Optional) Populate Virtual Machine Object field in Hardware [cmdb_ci_hardware] table

Starting with Discovery and Service Mapping Patterns version 1.30.2, you can improve query performance by populating the Virtual Machine Object field in the Hardware [cmdb_ci_hardware] table. For more information, see Improved query performance with direct field population in CI tables.

Set the preferred IP address version for network adapter discovery

Starting with Visibility Content version 6.32.0, if your network adapters support both IPv4 and IPv6, the IPv4 address is populated by default in the IP address [ip_address] field on the Network Adapter [cmdb_ci_network_adapter] table. To control which IP version is populated, see Set the preferred IP version for network adapter discovery.

* Core counts and threads per core might not be accurate, due to issues with Microsoft reporting.

** The value in the **disk_space** field is an aggregation of the total capacity (to include used space) for all non-removable disks, including both directly attached and SAN storage.

*** Starting with Visibility Content version 6.32.0, for network adapters that support both IPv4 and IPv6, the IPv4 address is populated by default. Before this release, the populated value was selected randomly. To control which IP version is populated, see Set the preferred IP version for network adapter discovery.

The Windows registry

Discovery can find software that has been installed on a Windows machine by looking at the Windows Registry. Discovery can find the following attributes of discovered software:

- **Product Name**: Combination of name and version, such as Windows Imaging Component 3.0.
- **Name**: Name of the product only without the version.
- **Version**: Version of the product.
- **Uninstall String**: Path to the uninstaller, such as `C:\Program Files\Notepad++\uninstall.exe`.
- **Part of**: Update for which this registry is a part, such as Windows Internet Explorer 8 - Software U.
- **Install Date**: The date the software was installed. The Windows - Installed Software sensor appends a timestamp of 00:00:00 to the install_date retrieved from the registry. The installation time of all Windows software is independent of the time zone and is set to midnight

of the day it was installed. For example, an install date of **2.19.2017** in the Windows registry appears as **2.19.2017 00:00:00** in the CMDB.

- **Installed on**: The name of the asset on which the software is installed.

Related topics

Windows probes and permissions

Windows server cluster discovery

Discovery establishes the relationships between a Windows server cluster and its nodes.

When a Windows server is found, and Discovery detects that it is part of a cluster, the system launches the Windows - Cluster probe. Navigate to **Discovery Definition** > **Probes** and open the record for the Windows - Cluster probe to see the specific data Discovery collects.

Note: Discovery collects cluster resources based on the MSCluster_ResourceType WMI class. To see a list of default cluster resources, see Resource Types. To understand how cluster resources are related to process classifiers, see Relate the process classifier to Windows cluster resources.

Cluster data tables

Discovery creates CIs for clusters in these tables:

- Windows Cluster [cmdb_ci_win_cluster]
- Windows Cluster Resource(s) [cmdb_ci_win_cluster_resource]
- Windows Cluster Node(s) [cmdb_ci_win_cluster_node]
- Cluster Node Resource(s) [cmdb_ci_cluster_node_resource]
- Cluster Virtual IP(s) [cmdb_ci_cluster_vip]

Cluster relationships

Discovery creates a CI Relationship [cmdb_rel_ci] record for each node, using these relationships:

- **Cluster of::Cluster**: Relationship between the cluster nodes and the cluster. Service Mapping uses this relationship to map the Windows cluster and it's nodes.
- **Members::Member of**: Relationship between the cluster and the cluster node.
- **Hosted on::Hosts**: Relationship between the cluster nodes and the Windows server.
- **Uses::Used by**: Cluster VirtualIP and Windows Cluster Node.
- **Defines resources for::Gets resources from**: Windows Cluster Resources and Windows Cluster.
- **Defines resources for::Gets resources from**: Windows Cluster Resources and Windows Cluster Node.

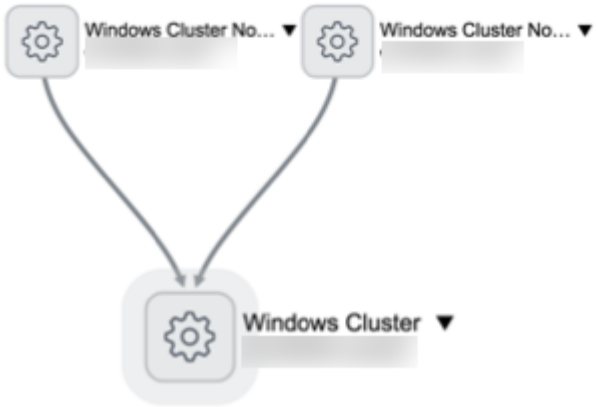
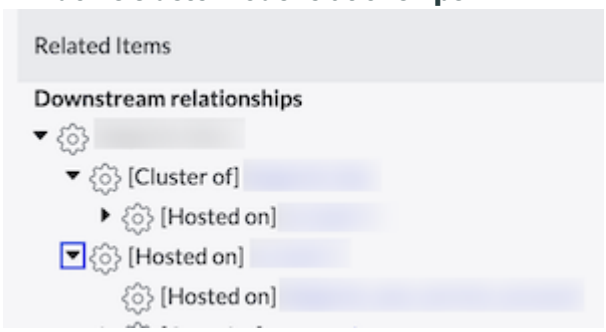
Windows cluster map



Windows cluster node relationships



Cluster references

Discovery creates the following cluster references:

- From Windows Cluster Nodes to the associated Windows Cluster.
- From Windows Cluster Resources to the associated Windows Cluster.
- From Cluster Virtual IPs to the associated Windows Cluster.
- From Cluster Node Resources to the associated Windows Cluster Node.
- From Cluster Virtual IPs to the associated Windows Cluster Node.

Note: References are maintained in Discovery to provide backward compatibility for systems that use them.

z/OS discovery

Discovery and Service Mapping Patterns finds computers running the z/OS operating system using the IBM zOS Server pattern. Discovering some of these resources might require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Request new or enhanced Patterns on the ServiceNow® Store

Visit the ServiceNow Store to view all the available updates and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The IBM zOS Server pattern performs infrastructure-level discovery for z/OS servers. To discover applications on z/OS, use application patterns, such as DB2 on Linux, WMQ On Unix, or Websphere On Unix. For more information, see IBM z/OS Discovery requirements and expectations [KB0623031] article in the Now Support Knowledge Base.

Prerequisites

Verify that the UNIX System Services (USS) is running on port 22

Verify that the USS service is running on port 22 on z/OS.

Verify the required commands on the host machine

Verify that you can run the following commands on the host machine:

- `uname`
- `hostname`
- `sysvar SYSNAME`
- `netstat`
- `df`
- `ls`
- `cat`
- `grep`
- `ps`
- `cut`

Verify required permissions

Verify that you have the following permissions:

- Write permission to `/tmp`
- Read access to all user processes
- Ability to run REXX scripts

Create SSH credentials

For more information, see SSH credentials.

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the IBM zOS Server pattern. The pattern discovers USS-mounted file systems.

IBM zOS server [cmdb_ci_ibm_zos_server]

Field	Description
Name [name]	Hostname of the z/OS system.
OS Version [os_version]	z/OS operating system version. For example: V2R5 or 3.1.
Operating System [os]	Operating system type. The value is set to **IBM_ZOS**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

IBM zOS server [cmdb_ci_ibm_zos_server] (continued)

Field	Description
Manufacturer [manufacturer]	Hardware manufacturer. The value is set to **IBM**.
Serial number [serial_number]	Hardware chassis serial number.
Model ID [model_id]	Hardware model display name based on model code lookup. For example: z14, z15, or zEnterprise 196. If the model code isn't in the lookup table, this field remains empty.
IP Address [ip_address]	Management IP address used for discovery connection.

IP Address [cmdb_ci_ip_address]

Field	Description
IP Address [ip_address]	IPv4 or IPv6 address.
Netmask [netmask]	Network mask for the IP address. The value is set to **0.0.0.0**.
MAC Address [mac_address]	Hardware MAC address. If unavailable, the value is set to **NOT_FOUND**.
Nic [nic]	References the Network Adapter [cmdb_ci_network_adapter] table.

Network Adapter [cmdb_ci_network_adapter]

Field	Description
Name [name]	Network interface name. If unavailable, the value is set to **VIP**.
IP Address [ip_address]	IPv4 or IPv6 address assigned to this network adapter.
Netmask [netmask]	Network mask for the adapter. The value is set to **0.0.0.0**.
MAC Address [mac_address]	Hardware MAC address for the network adapter. If unavailable, the value is set to **NOT_FOUND**.
Configuration Item [cmdb_ci]	References the IBM zOS server [cmdb_ci_ibm_zos_server] table.

File System [cmdb_ci_file_system]

Field	Description
Name [name]	Name of the USS file system set to the mount point path. For example: `/`, `/tmp`, or `/u`.
Volume ID [volume_id]	Volume identifier, set to the mount point path.
Mount point [mount_point]	Directory path where the file system is mounted in the USS hierarchy.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

File System [cmdb_ci_file_system] (continued)

Field	Description
File system [file_system]	USS dataset name of the zFS file system. For example: OMVS . ROOT . ZFS or OMVS . TMP . ZFS.
Size bytes [size_bytes]	Total capacity of the file system in kilobytes (KB), as retrieved by the *df -Pkv* command.
Free space bytes [free_space_bytes]	Available free space in the file system in KB, as retrieved by the *df -Pkv* command.
Computer [computer]	References the IBM zOS server [cmdb_ci_ibm_zos_server] table.

CI relationships and references

The IBM zOS Server pattern creates the following relationships and references to support z/OS discovery. References link to records in other tables and don't appear in the CI Relationship [cmdb_rel_ci] table.

CI relationships

CI	Relationship	CI
IBM zOS server [cmdb_ci_ibm_zos_server]	Owns::Owned by	Network Adapter [cmdb_ci_network_adapter]
IBM zOS server [cmdb_ci_ibm_zos_server]	Owns::Owned by	IP Address [cmdb_ci_ip_address]
IBM zOS server [cmdb_ci_ibm_zos_server]	Contains::Contained by	File System [cmdb_ci_file_system]

CI references

CI	Field	Referenced CI
IP Address [cmdb_ci_ip_address]	Nic [nic]	Network Adapter [cmdb_ci_network_adapter]
Network Adapter [cmdb_ci_network_adapter]	Configuration Item [cmdb_ci]	IBM zOS server [cmdb_ci_ibm_zos_server]
Serial Number [cmdb_serial_number]	Configuration item [cmdb_ci]	IBM zOS server [cmdb_ci_ibm_zos_server]
File System [cmdb_ci_file_system]	Computer [computer]	IBM zOS server [cmdb_ci_ibm_zos_server]

Set the preferred IP version for network adapter discovery

Control which IP version Discovery populates on a Network Adapter CI during Linux, Windows, and Solaris discovery.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Verify that you have at least version 6.32.0 of Visibility Content.

Role required: discovery_admin

About this task
When a network adapter supports both IPv4 and IPv6, Discovery populates the IP Address [ip_address] field on the Network Adapter [cmdb_ci_network_adapter] CI with one IP address. Before Visibility Content version 6.32.0, Discovery selected the value randomly. Starting from this release, IPv4 is populated by default. Use the *network_adaptor_preferred_ip_version* MID Server property to specify which IP version to populate.

Procedure
1. Navigate to **All** > **MID Server** > **Properties**.
2. In the **Name** column, search for `network_adaptor_preferred_ip_version`.
3. Select the *network_adaptor_preferred_ip_version* property.
4. In the **Value** field, enter the accepted value for the IP version to populate.

   Values are case-sensitive. Use only the accepted values listed in the table.

   Accepted IP version values

IP version	Accepted values
IPv4	ipv4, IPv4, or v4.
IPv6	ipv6, IPv6, or v6.

5. Select **Update**.

What to do next
Run discovery again or wait for the scheduled run to apply the changes.

Related topics

Linux discovery

Solaris discovery

Windows discovery

Discover only the latest operating system patch versions

Collect only the current operating system patch level by configuring the *sn_itom_pattern.discover_latest_os_patches* MID Server property. Collecting only the current patch is supported only for AIX Server discovery.

Before you begin
Verify that you have at least version 6.35.0 of Visibility Content.

Role required: discovery_admin

About this task
By default, Discovery adds a record to the Patches [cmdb_ci_patches] table for every patch reported by the server, including older patch versions. The *sn_itom_pattern.discover_latest_os_patches* MID Server property controls this behavior; the default value is false. When set to true, Discovery evaluates all patches reported

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

by the server and identifies the latest patch level. Only that patch is populated as active in the CMDB.

Procedure

1. Navigate to **All** > **MID Server** > **Properties**.
2. In the **Name** column, search for `sn_itom_pattern.discover_latest_os_patches`.
3. Select the *`sn_itom_pattern.discover_latest_os_patches`* MID Server property.
4. In the **Value** field, enter `true`.
   To revert to the default behavior and collect all patch versions on each run, set the value to `false`.
5. Select **Submit**.

What to do next

Run Discovery again to apply the change.

Related topics

AIX server discovery

Operating system-level virtualization discovery

Discovery can collect image and container information from Operating system-level virtualization (OS-level virtualization) engines.

Discovery can determine container status and size and identify images and their tags provided by operating-system-level virtualization.

Note: Currently, the ServiceNow® platform supports the discovery of Docker virtualization containers only.

Table schema

Table	Description
cmdb_ci_oslv_engine	Base table for all OSLV engines.
cmdb_ci_oslv_image	Base table for globally unique OSLV images.
cmdb_ci_oslv_local_image	Base table for local instances of OSLV images.
cmdb_ci_oslv_image_tag	Base table for tags on OSLV images.
cmdb_ci_oslv_container	Base table to store containers found on the host.

Data collected

Docker virtualization

Discovery uses the *Docker Pattern* to collect data about specific objects in a Docker engine, running on a Linux host.

The ServiceNow® platform supports the discovery of Docker release 1.11.0 or later.

Discovery runs the Docker Engine process classifier in the network. If the classifier identifies the **dockerd** or **docker daemon** process, the classifier triggers the Horizontal Pattern (HorizontalDiscoveryProbe) probe, which launches the Docker Pattern and begins collecting data from Docker components.

Starting with Discovery and Service Mapping Patterns version 1.31.0, you can choose to discover Docker image CIs only, without discovering Docker container CIs. Check your entitlements to determine whether you have access to 2026 Packaging SKU. For more information, see Disable Docker container CI discovery.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Prerequisites

User privileges

The user whose credentials are used to perform Docker Discovery must have privileges defined by one of these methods:

- Provide a user with elevated rights for running commands, since the Docker daemon runs as the root user. The Docker pattern supports the use of privileged commands, such as *sudo* or *pbrun*, to run as the root user.
- Assigned to a group named **docker**, which has special privileges for running Docker commands. For instructions on setting up a group, see documentation on Docker.

Latest patterns

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Deploy the latest Discovery and Service Mapping Patterns application from ServiceNow Store.

Docker restrictions and considerations

When using Docker virtualization, consider the following:

- The initial Discovery process scan can identify an application in a container and classify it correctly. However, subsequent probes launched to explore that application cannot see inside the container and cannot return details about the application.
- Discovery scans all containers it finds, including inactive containers, which can slow down Discovery. You should delete containers that are not running.
- Before setting *sn_itom_pattern.manifest_digest_image_id* property to **true** and running discovery: prevent duplicate Docker records from being created by deleting all Docker image records.
- Only one Docker engine is permitted per computer (on either a physical or virtual machine).

Data collected by Discovery during horizontal discovery

These attributes are discovered, in addition to the attributes derived from the parent OSLV tables.

Table and fields	Description
Docker Engine [cmdb_ci_docker_engine]	
Name [name]	Stores information about instances of the Docker engine.

Command [command]	
Container created [container_created]	
Status [status]	

The *Collect Container Repository* extension section discovers this information.

Container Repository [cmdb_ci_container_repository]

Field	Description
Name [name]	The name of the container repository.

Container Repository Entry [cmdb_ci_container_repository_entry]

Field	Description
Name [name]	The name of the container repository entry.
Category [category]	The category of the container repository entry.

CI relationships

The Docker Pattern identifies the following relationships between discovered CIs.

CI	Relation	CI
cmdb_ci_server	Runs::Runs On	cmdb_ci_docker_engine
cmdb_ci_docker_engine	Manages::Managed By	cmdb_ci_docker_container
cmdb_ci_docker_engine	Manages::Managed By	cmdb_ci_docker_local_image
cmdb_ci_docker_image	Instantiates::Instantiated By	cmdb_ci_docker_container

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CI	Relation	CI
cmdb_ci_docker_local_image **Note:** The direction of this relation is the opposite for all store versions earlier than 1.0.99, February 2023.	Instantiates::Instantiated By	cmdb_ci_docker_container
cmdb_ci_docker_image_tag	Registered On::Has Registered	cmdb_ci_docker_local_image
cmdb_ci_docker_local_image	Instantiates::Instantiated By	cmdb_ci_docker_image

The *Collect Container Repository* extension section of the Docker Pattern identifies these relationships.

CI	Relationship	CI
Docker Image [cmdb_ci_docker_image]	Provisioned From::Provisioned	Container Repository Entry [cmdb_ci_container_repository_entry]
Container Repository Entry [cmdb_ci_container_repository_entry]	Hosted on::Hosts	Container Repository [cmdb_ci_container_repository]

Identification, containment, and hosting rules

Discovery uses an application rule identifier to find the Docker engine and then applies other rules to identify specific Docker objects.

Application rule identifier

The system creates the cmdb_ci_docker_engine configuration item (CI) during process classification. Based on this, Discovery uses the Application Rule identifier on the Application [cmdb_ci_appl] table to identify the particular Docker engine encountered. After establishing this identity, Discovery applies the relationships defined in the containment and hosting rules. It then creates and updates the individual Docker component CIs related to that engine.

Identifiers

Name	Table	Attributes
Docker Container	Docker Container [cmdb_ci_docker_container]	container_id
Docker Global Image	Docker Image [cmdb_ci_docker_image]	image_id
Docker Local Image	Docker Local Image [cmdb_ci_docker_local_image]	image_id
Docker Image Tag	Docker Image Tag [cmdb_ci_docker_image_tag]	repository, tag

Containment and hosting rules

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Docker Discovery uses these Create or edit a collection of containment rules and Create or edit a collection of hosting rules rules to create configuration items (CI) from the data returned by the Docker Pattern. After Discovery identifies the Docker engine by its relationship to the Application [cmdb_ci_appl] table, it uses these rules to identify the specific CIs connected to that engine from their relationships to one another. By connecting the components to one another in this fashion, from the application down, starting with the engine, Discovery avoids creating duplicate CIs for components from other Docker engines that use the same name or image_id.

Containment rule

Parent	Child	Relationship
Docker Local Image	Docker Image Tag	Has registered

Hosting rules

Parent	Child	Relationship
Docker Container	Docker Engine	Managed by
Docker Local Image	Docker Engine	Managed by

Software discovery

Discovery identifies several types of software.

Active Directory Domain Controller discovery

The Discovery and Service Mapping Patterns application uses the Active Directory Domain Controller On Windows pattern to find Active Directory domain controllers running on a Windows server. Discovering some of these resources might require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

When discovery runs on a domain controller, the pattern also creates LDAP endpoint connections to child domains in the same forest. This triggers discovery of those domain controllers as well.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Prerequisites

Verify that the applications are up to date

- Discovery and Service Mapping Patterns
- Visibility Content

Verify an LDAP or TCP entry point is configured

Verify that the relevant port is open and listening on the domain controller.

Create Windows credentials with WMI access

Verify that the credentials have permission to run WMI queries on the `\\root\CIMV2` namespace. For more information, see Windows credentials.

Schedule a horizontal discovery

For more information, see Schedule a horizontal discovery.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the Active Directory Domain Controller On Windows pattern.

Active Directory Domain Controller [cmdb_ci_ad_controller]

Field	Description
Name [name]	Name of the domain controller, which is the domain name.
Domain name [domain_name]	Name of the Active Directory domain.
Domain Controller name [domain_controller_name]	Name of the domain controller server.
Forest name [forest_name]	DNS name of the Active Directory forest.

CI relationships

The Active Directory Domain Controller On Windows pattern creates the following relationships to support Active Directory Domain Controller discovery.

CI relationships

CI	Relationship	CI
Active Directory Domain Controller [cmdb_ci_ad_controller]	Runs on::Runs	Windows Server [cmdb_ci_win_server]

Adobe JRun discovery

Discovery creates or updates a CMDB record when it detects a running instance of Adobe JRun.

By default, Discovery uses the *Jrun* pattern to perform the Discovery.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Privileged commands

For a list of privileged commands that you need for Discovery and Service Mapping, see Service Mapping commands requiring a privileged user. This list includes commands that require elevated rights to discover and map Unix-based hosts in your organization.

Data collected for Adobe JRun

The following data is collected in the Jrun `[cmdb_ci_app_server_jrun]` table:

Label	Field Name
Name	name
Version	version
Installation directory	install_directory
Configuration directory	config_directory

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Label	Field Name
Configuration file	config_file

Apache web server discovery

Discovery identifies and classifies information about Apache web servers on both Windows and Linux computers.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Credentials

- Applicative credentials
- Windows credentials
- SSH credentials

For a list of privileged commands that you need for Discovery and Service Mapping, see Service Mapping commands requiring a privileged user. This list includes commands that require elevated rights to discover and map Unix-based hosts in your organization.

Classifier, patterns, and probes

Classifier	Trigger probes	Patterns
Apache Server	• Horizontal discovery probe: Launches patterns • Apache - Version* • Apache - Get Configuration* • Apache - Get JK ModuleApache - Get Proxy Module*	• Apache On Windows Pattern • Apache On Unix Pattern

*For new instances, these probes are inactive on the classifier. Discovery uses patterns for discovery.

To use patterns, verify that the correct pattern is specified in the horizontal pattern probe on the classifier. See Add the Horizontal Pattern probe to a classifier for instructions.

Data collected using probes

Discovery collects the following data on the Apache [cmdb_ci_apache_web_server] table for both Unix and Windows:

Label	Field name
Name	name
Version	version
Description	description

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Label	Field name
TCP port(s)	tcp_port

Connections found by Service Mapping during top-down discovery

Service Mapping uses discovery patterns to discover the following connections:

- Any application using java
- Any application using the LDAP port
- Oracle WebLogic Module Oracle, and WebLogic Server (version 10.3)
- (On Windows only) Jiva applications
- (On Windows only) Tomcat server
- (On UNIX only) Applications discovered using the mod_jk process
- (On UNIX only) Hosts to which the Apache web server is connecting in the load balancing mode
- (On UNIX only) Epic application

Apache mod_jk and mod_proxy discovery

Discovery uses SSH to find Apache connectors mod_jk and mod_proxy.

Discovery uses the **Unix - Active Processes** probe to identify an Apache web server process by matching one of the following criteria: the **name** of the process is:

- `httpd`, or
- `apache`, or
- `httpd2`, or
- `httpd2-prefork`
- `httpd.worker`

If there is a match on one of these criteria, a record is created in the Web Server [cmdb_ci_web_server] table if one does not already exist for that running process.

The following probes are triggered after classification:

Apache web server probes

Probe	Description	Commands
Apache – Version	The sensor of this probe populates the Apache version information in the Web Server record.	httpd
Apache – Get Configuration	This probe contains a Bourne shell script and an argument that determines the path of the Apache configuration file. The sensor of this probe populates some additional information in the Web Server record.	echo, sed, httpd, cut, grep, egrep (within the Borne shell script)

The sensor processing of the **Apache – Get Configuration** probe identifies whether either the mod_jk or mod_proxy modules are present and triggers the appropriate probe.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Apache module probes

Probe	Description	Commands
Apache – Get JK Module	If the mod_jk module is running as a load balancer on the server, the sensor of this probe populates the information in the Load Balancer Service [cmdb_ci_lb_service], Load Balancer Pool [cmdb_ci_lb_pool] and Load Balancer Pool Member [cmdb_ci_lb_pool_member] tables.	echo, sed, httpd, cut, grep, egrep (within the Borne shell script)
Apache – Get Proxy Module	If the mod_proxy module is running as a load balancer on the server, the sensor of this probe populates the information in the Load Balancer Service [cmdb_ci_lb_service], Load Balancer Pool [cmdb_ci_lb_pool] and Load Balancer Pool Member [cmdb_ci_lb_pool_member] tables.	grep, egrep (within the Borne shell script)

In addition to data population, the following relationships are created in the CI Relationship [cmdb_rel_ci] table:

- The records in the cmdb_ci_lb_appl table run on the cmdb_ci_web_server table records.
- The records in the cmdb_ci_lb_service table use the cmdb_ci_lb_pool table records.
- The records in the cmdb_ci_lb_pool table are used by the cmdb_ci_service table record.
- The records in the cmdb_ci_lb_pool table are members of the cmdb_ci_lb_pool_member table.
- The records in the cmdb_ci_lb_pool_member table are members of the cmdb_ci_lb_pool table.

Legacy: Add sudo access for the Unix - Active Processes probe

The Unix - Active Processes probe requires sudo privileges on Apache web servers.

Before you begin

Role required: admin

About this task

You can configure the Unix - Active Processes probe to elevate privileges.

Procedure

1. Navigate to **All** > **Discovery** > **Probes**.
2. In the **Search** field, search for `Unix - Active Processes`.
3. Select the **Unix - Active Processes** link from the table.
4. In the **Probe Parameters** related list, select **New**.
5. Use the following information to fill out the form:

Probe	Commands
Name	must_sudo
Value	true

6. Select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data collected by Mod_jk module

The Apache mod_jk module forwards requests from the Apache web server to a Servlet container, such as Tomcat.

Additional mod_jk directives can also manage load balancing. Discovery populates the CMDB when it detects an Apache Server. If the mod_jk module is running on the web server as a load balancer, Discovery populates the related information to the CMDB.

- The MID Server user account to explore the target server must have access to the httpd.conf configuration file in the /etc/httpd/conf/ folder.
- Discovery uses secure shell (SSH) commands to identify the following associated elements:
  - Apache Get Configuration
  - Apache Version
  - Apache Get JK Module
- The following probes require execute privileges to run commands:

Probes that require execute privileges

Probe	Command
Apache – Get Configuration	echo, sed, httpd, cut, grep, egrep (within the Borne shell script)
Apache – Version	httpd
Apache – Get JK Module	echo, sed, httpd, cut, grep, egrep (within the Borne shell script)

Probes and sensors

Discovery uses the Unix - Active Processes probe to identify an Apache server that contains the mod_jk module:

1. The Unix - Active Processes probe detects a running process that matches one of the following criteria:
   - The name of the process is httpd.
   - The name of the process is apache.
2. If there is a match on one of these criteria, a record is created in the Web Server table [cmdb_ci_web_server] if one does not already exist for that running process. The following probes are also triggered:
   - Apache – Version: the sensor of this probe populates the Apache version information in the Web Server record.
   - Apache – Get Configuration: this probe contains a Bourne shell script and an argument that determines the path of the Apache configuration file. The sensor of this probe populates some additional information in the Web Server record.
3. The sensor processing of Apache – Get configuration probe results triggers the following probes if the mod_jk module is running on the web server:

   Apache – JK Module:

   If the mod_jk module is running as a load balancer on the server, the sensor of this probe populates information in the following tables. The Load Balancer Service [cmdb_ci_lb_service], Load Balancer Pool [cmdb_ci_lb_pool], and Load Balancer Pool Member [cmdb_ci_lb_pool_member] tables are populated.

Data Collected

For the mod_jk module with no load balancer, the following data is collected by default:

Default Data Collected by Discovery

Table Name	Field and Label Name	Probe
cmdb_ci_web_server	Name [name]	Apache – Get Configuration
cmdb_ci_web_server	Version [version]	Apache – Version
cmdb_ci_web_server	Description [short_description]	Apache – Version

If the mod_jk module is enabled for load balancing, Discovery connects the following data:

Data Collected by Discovery When the mod_jk Module is Identified as a Load Balancer

Table Name	Field and Label Name	Probe
cmdb_ci_lb_appl	Name [name]	Apache – Apache - Get JK Module
cmdb_ci_lb_appl	IP Address [ip_address]	Apache – Apache - Get JK Module
cmdb_ci_lb_appl	Last Discovered [last_discovered]	Apache – Apache - Get JK Module
cmdb_ci_lb_pool_member	Name [name]	Apache – Apache - Get JK Module
cmdb_ci_lb_pool_member	Last Discovered [last_discovered]	Apache – Apache - Get JK Module
cmdb_ci_lb_pool_member	IP Address [ip_address]	Apache – Apache - Get JK Module
cmdb_ci_lb_pool_member	Load Balancer [load_balancer]	Apache – Apache - Get JK Module
cmdb_ci_lb_pool_member	Port [port]	Apache – Apache - Get JK Module
cmdb_ci_lb_service	Input URL [Input_url]	Apache – Apache - Get JK Module
cmdb_ci_lb_service	Last Discovered [last_discovered]	Apache – Apache - Get JK Module
cmdb_ci_lb_service	IP Address [ip_address]	Apache – Apache - Get JK Module
cmdb_ci_lb_service	Name [name]	Apache – Apache - Get JK Module
cmdb_ci_lb_service	Load Balancer [load_balancer]	Apache – Apache - Get JK Module
cmdb_ci_lb_service	Port [port]	Apache – Apache - Get JK Module

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data Collected by Discovery When the mod_jk Module is Identified as a Load Balancer (continued)

Table Name	Field and Label Name	Probe
cmdb_ci_lb_pool	Last Discovered [last_discovered]	Apache – Apache - Get JK Module
cmdb_ci_lb_pool	Load balancing Method [load_balancing_method]	Apache – Apache - Get JK Module
cmdb_ci_lb_pool	Load Balancer [load_balancer]	Apache – Apache - Get JK Module
cmdb_ci_lb_pool	Name [name]	Apache – Apache - Get JK Module

Relationships

In addition to data population, the following relationships are created in the CI Relationship [cmdb_rel_ci] table:

- The records in the cmdb_ci_lb_appl table run on the cmdb_ci_web_server table records.
- The records in the cmdb_ci_lb_service table use the cmdb_ci_lb_pool table records.
- The records in the cmdb_ci_lb_pool table are used by the cmdb_ci_service table record.
- The records in the cmdb_ci_lb_pool table are members of the cmdb_ci_lb_pool_member table.
- The records in the cmdb_ci_lb_pool_member table are members of the cmdb_ci_lb_ pool table.

Data collected by Mod_proxy module

The Apache mod_proxy module implements a proxy, gateway, or cache for the Apache web server.

An additional mod_proxy_balancer can also manage load balancing. Discovery populates the CMDB when it detects an Apache server. When the Apache Web Server process is detected, if the mod_proxy module is running on the web server as a load balancer the related information populates to the CMDB.

Consider the following requirements for discovering an Apache server that contains the mod_proxy module:

- The MID Server user account to explore the target server must have access to the [httpd.conf] configuration file in the /etc/httpd/conf/ folder.
- Discovery uses secure shell (SSH) commands to identify the following associated elements:
  - Apache Get Configuration
  - Apache Version
  - Apache Get Proxy Module
- The following probes require execute privileges to run commands:

Data collected from the mod_jk module

Probe	Commands
Apache – Get Configuration	echo, sed, httpd, cut, grep, egrep (within the Borne shell script)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Probe	Commands
Apache – Get Proxy Module	grep, egrep (within the Borne shell script)
Apache – Version	httpd

Probes and sensors

Discovery uses the Unix - Active Processes probe to identify an Apache server that contains the mod_proxy module. The probes and sensors operate in the following manner:

1. The Unix - Active Processes probe detects a running process that matches one of the following criteria:
   - The name of the process is httpd.
   - The name of the process is apache2.
2. If there is a match on one of these criteria, a record is created in the Web Server table [cmdb_ci_web_server] if one does not already exist for that running process. The following probes are also triggered:
   - Apache – Version: the sensor of this probe populates the Apache version information in the Web server [cmdb_ci_web_server] record.
   - Apache – Get Configuration: this probe contains a Bourne shell script and an argument that determines the path of the Apache configuration file. The sensor of this probe populates some additional information in the Web server [cmdb_ci_web_server] record.
3. The sensor processing of the Apache – Get configuration probe results triggers the following probes if the mod_proxy module is running on the web server:

   Apache - Get Proxy Module:

   If the mod_proxy module is running as a load balancer on the server, the sensor of this probe populates information in the following tables. Load Balancer Service [cmdb_ci_lb_service], Load Balancer Pool [cmdb_ci_lb_pool], and Load Balancer Pool Member [cmdb_ci_lb_pool_member].

Data Collected

For the mod_proxy module with no load balancer, the following data is collected by default:

Data collected by Discovery by default

Table Name	Field and Label Name	Probe
cmdb_ci_web_server	Name [name]	Apache – Get Configuration
cmdb_ci_web_server	Version [version]	Apache – Version
cmdb_ci_web_server	Description [short_description]	Apache – Version

If the mod_proxy module is enabled for load balancing, Discovery connects the following data:

Data collected by Discovery if the mod_proxy module is identified as a load balancer

Table Name	Field and Label Name	Probe
cmdb_ci_lb_appl	IP Address [ip_address]	Apache - Get Proxy Module

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data collected by Discovery if the mod_proxy module is identified as a load balancer (continued)

Table Name	Field and Label Name	Probe
cmdb_ci_lb_appl	Last Discovered [last_discovered]	Apache - Get Proxy Module
cmdb_ci_lb_pool_member	Name [name]	Apache - Get Proxy Module
cmdb_ci_lb_pool_member	Last Discovered [last_discovered]	Apache - Get Proxy Module
cmdb_ci_lb_pool_member	IP Address [ip_address]	Apache - Get Proxy Module
cmdb_ci_lb_pool_member	Load Balancer [load_balancer]	Apache - Get Proxy Module
cmdb_ci_lb_pool_member	Port [port]	Apache - Get Proxy Module
cmdb_ci_lb_service	Input URL [Input_url]	Apache - Get Proxy Module
cmdb_ci_lb_service	Last Discovered [last_discovered]	Apache - Get Proxy Module
cmdb_ci_lb_service	IP Address [ip_address]	Apache - Get Proxy Module
cmdb_ci_lb_service	Name [name]	Apache - Get Proxy Module
cmdb_ci_lb_service	Load Balancer [load_balancer]	Apache - Get Proxy Module
cmdb_ci_lb_service	Port [port]	Apache - Get Proxy Module
cmdb_ci_lb_pool	Last Discovered [last_discovered]	Apache - Get Proxy Module
cmdb_ci_lb_pool	Load balancing Method [load_balancing_method]	Apache - Get Proxy Module
cmdb_ci_lb_pool	Load Balancer [load_balancer]	Apache - Get Proxy Module
cmdb_ci_lb_pool	Name [name]	Apache - Get Proxy Module

Relationships

In addition to data population, the following relationships are created in the CI Relationship [cmdb_rel_ci] table:

- The records in the cmdb_ci_lb_appl table run on the cmdb_ci_web_server table records.
- The records in the cmdb_ci_lb_service table use the cmdb_ci_lb_pool table records.
- The records in the cmdb_ci_lb_pool table are used by the cmdb_ci_service table records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The records in the cmdb_ci_lb_pool are members of the cmdb_ci_lb_pool_member table records.
- The records in the cmdb_ci_lb_pool_member is a member of the cmdb_ci_lb_pool table records.

Application Mapping for UNIX discovery

To perform the mapping that establishes application relationships, Discovery must be able to detect TCP connections.

The best way to accomplish this is to run the lsof command on target machines. For AIX machines, Discovery is configured to use the active connection probe for AIX targets. However, the user that executes the shell script on AIX machines might require additional privileges to execute commands, such as kdb, employed in the script.

On Linux machines, Discovery uses the `lsof` command (installed by default on Linux) to detect TCP connections. The Linux classification probe triggers the Linux - Active Connections probe, which uses `lsof` to discover application relationships and does not produce any pauses. The `lsof` command is the recommended method of returning active TCP connections and can be installed on Solaris and AIX target machines to eliminate any issues produced by the shell script.

Note: Discovery of active connections on HP-UX is not supported.

Using the lsof Command

Use the ls of command to return active TCP connections and can be installed on Solaris and AIX target machines.

Before you begin

Role required: admin

Procedure

1. Install `lsof` on the Solaris and AIX machines on which you want to gather application relationship data.
2. In the instance, navigate to **Discovery Definition** > **CI Classification** > **UNIX**.
3. Select **Solaris** from the list.
4. In the UNIX Classification form for Solaris, select the **Triggers probes** related list, and then select **Edit**.
5. Move **Linux - Active Connections** from the Collections list to the Triggers probe List.
   This probe is configured to use `lsof`.
6. Select **Save**.
7. Repeat this procedure for the AIX classification probe.

Citrix License Server and Delivery Controller discovery

Discovery can find Citrix License Server instances and Delivery Controller components that run on Windows machines.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Requirements

- Configure Windows administrative credentials to access the host machine.
- Make sure that PowerShell for Discovery is installed on your MID Servers. The patterns used for Citrix discovery require the ability to run PowerShell commands.
- For OS users, make sure you can execute “Get-XDSite.” The Citrix Studio Admin should provide permissions.
- (Optional) For top-down discovery with Service Mapping, on Citrix Delivery Controller, install the Citrix.Broker module.
- (Optional) For top-down discovery with Service Mapping, a user with permission to run PowerShell commands.
- (Optional) (Optional) For discovering using the WinRM protocol, see Configure WinRM trusted hosts on MID Server.

Patterns

Discovery uses these patterns to perform horizontal discovery:

Pattern	Process detected
Citrix License Server	lmadmin.exe
Delivery Controller	BrokerService

Data collected and relationships

Table	Fields
Citrix License Server [cmdb_ci_appl_license_server]	Name [name] TCP ports [tcp_port] Operational status [operational_status]
Citrix Delivery Controller [cmdb_ci_appl_delivery_controler]	Name [name] Version [version] Operational status [operational_status]

CI	Relationship	CI
Citrix License Server [cmdb_ci_appl_license_server]	Runs on::Runs	Windows Server [cmdb_ci_win_server]
Citrix Delivery Controller [cmdb_ci_appl_delivery_controler]	Runs on::Runs	Windows Server [cmdb_ci_win_server]

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Clustered application discovery on Windows

A process and its corresponding resource information can be used to determine whether the process is a clustered process.

The **Microsoft SQL Server** process classifier that comes with your instance identifies clustered SQL Servers. You can leverage the same technique to detect other clustered applications on Windows using Discovery.

To detect Windows clustered applications with Discovery, you create a process classifier that detects whether a process is a clustered process. Perform the following steps:

Create a classifier for clustered processes

To detect Windows clustered applications, create a process classifier for that CI type.

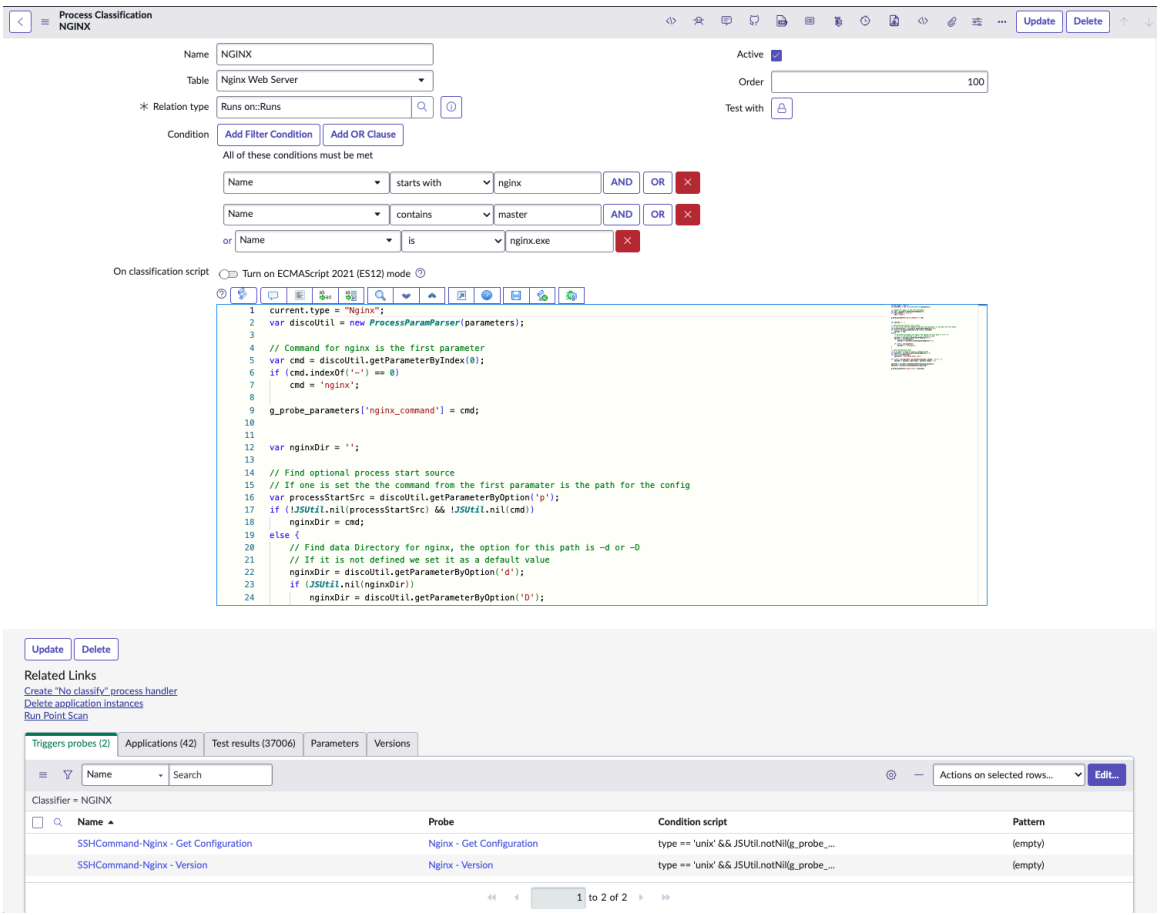
Before you begin

Role required: discovery_admin

Procedure

1. Navigate to **All** > **Discovery Definition** > **CI Classification** > **Processes**.
2. Click **New**.
3. Fill out the form using the fields from the table.
4. Click **Submit**.

Process Classification form



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Process classification form

Field	Description
Name	A unique name for the process classifier.
Table	Select **Application**.
Relation type	Select the CI relationship type for this classification. The relationship field is only available for Process and Scan Application classifications. Discovery process classifications typically use one of these relationship types: ○ **Runs on::Runs**: Defines the relationship of an application to the host on which it runs. This relationship is expressed from the perspective of the host and the application. For example: My database application runs on server001::server001 runs my database application. ○ **Depends on::Used by**: Defines the relationship of an application that communicates with another application. This relationship is expressed from the perspective of each application. For example: The Tomcat application depends on the MySQL database:: The MySQL database is used by Tomcat. ○ **Virtualized by::Virtualizes**: Defines the relationship of a virtual machine to its host. This relationship is expressed from the perspective of the virtual machine and of the host. For example: server001 is virtualized by ServerESX::Server ESX virtualizes server001. ○ **Cluster of::Cluster**: Defines the relationship of a cluster node to the cluster to which it belongs. This relationship is expressed from the perspective of the cluster node and of the cluster. ○ **Hosted on::Hosts**: Defines the relationship of a cluster node and the Windows host. This relationship is expressed from the perspective of the cluster node and of the Windows host.
Active	Select this box to activate the process classification. Deselect to deactivate it.
Order	Enter the order in which Discovery should run this process classification when there are multiple classifications available for a table. Discovery runs process classifications from the lowest to the highest order.
Test with	Lists the host CI where an automatically generated process classification conditions were met. Use this field to test changes to the process classification to ensure that the updated classification behaves as expected.
Condition	Configure the appropriate condition. The example screenshot triggers this process classification when the process command contains the string `MSFT SQL Server 2000`.

Relate the process classifier to Windows cluster resources

In the second step, relate the process classifier to the information that is in the Windows Cluster resources table.

Before you begin

Role required: admin

About this task

The Windows Cluster resources table is cmdb_ci_win_cluster_resource. This relationship is built through JavaScript.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate back to the process classification you just made.
2. Select the **Parameters** tab.
3. Select **New**.
4. Fill out the fields on the form.

Classifier parameter form

Field	Description
Name	Select a unique name.
Application	Select **Global**.
Type	Enter **Cluster**.
Value	This field defines two JavaScript objects, called `resourceType` and `isMatch`. For more information, see Populate the Value field on the Classifier Parameter form.

5. Select **Submit**.

Populate the Value field on the Classifier Parameter form

The value field defines two JavaScript objects, called `resourceType` and `isMatch`.

Before you begin
Role required: admin

About this task
The `resourceType` value refers to the Resource Type column in the Windows Cluster Resources table [cmdb_ci_win_cluster_resource]. The `resourceType` value can't be empty or null.

Procedure

1. Navigate to a Windows cluster page to access the Windows Cluster Resources table.
2. Select the **Windows Cluster Resources** tab.

Example:
The **isMatch** value evaluates whether the process is a clustered process.

- An evaluation that returns **true** indicates the process is a clustered application, and the process is classified as a clustered application in the cluster.
- An evaluation that returns **false** classifies the process as a regular application running on the cluster node.

The **isMatch** value is a function that contains two input variables, process and resource:

- process: Process is the GlideRecord of the process application. It is determined by the **Table** field in the classifier. In this example, it is the GlideRecord entry of the Application table (cmdb_ci_app) for the process that is being classified. You have access to any field values for the CI type such as name or version.
- resource: Resource is the GlideRecord entry in the Windows Cluster Resource table after the resourceType condition has been applied. In the example, it is the GlideRecord entry of the sixth row.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Examples of JavaScript for the Value field.

In the following example code: resourceType: "SQL Server" the query filters the Windows Cluster Resources table entry for the Resource Type field that has a value that is equal to SQL Server. In the following example table, the sixth record would be returned.

The following script indicates that if there is a resource of type SQL Server, the process is classified as a clustered application.

```
resourceType: "SQL Server"
isMatch: function(process, resource) {
    return true;
}
```

The following script indicates that if there is a resource of type SQL Server, and the application name is equal to the resource name, then the process is classified as a clustered application.

```
resourceType: "SQL Server"
isMatch: function(process, resource) {
    if (process.name == resource.name)
        return true;
}
```

If there are multiple matches to the resourceType condition, the matching function is called multiple times. For example, if there are two entries with the same resource type (such as Physical Disk), the matching function runs twice—once for each matching entry (for example, Cluster Disk 1 and Cluster Disk 2).

Discovery with Software Asset Management

The table structure for managing software installations behaves differently when the Software Asset Management (SAM) application is activated.

The presence of this application affects the way Discovery stores the software installation data it returns from a scan and require additional configuration within configuration item (CI) records.

The following tables are created when the Software Asset Management plugin is activated:

- Software Discovery Model [cmdb_sam_sw_discovery_model]
- Software Model [cmdb_software_product_model]
- Software Installation [cmdb_sam_sw_install]

> **Note:** The original schema used by previous versions is not affected when the Software Asset Management plugin is not activated.

When it runs, Discovery populates the Software Installation [cmdb_sam_sw_install] table. The appropriate configuration item (CI) references the software data. A business rule on this table runs, searching for a matching record on the Software Discovery Model [cmdb_sam_sw_discovery_model] table. If a record exists in the Software Discovery Model table, then the Software Installation table updates the record. If no record exists in the Software Discovery Model table, then one is created.

These tables are not used by Discovery with Software Asset Management:

- Software [cmdb_ci_spkg]
- Software Model [cmdb_software_product_model]

> **Important:** When SAM is installed, the Software Installation [cmdb_sam_sw_install] table is the appropriate source for all current software data. This means you need to update any related lists or customized reference fields you added to CI records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Starting with the Kingston release, the Discovery populates the VMWare License Key [samp_vmware_license_key] and VMWare License Key Usage [samp_vmware_license_key_usage] tables. See Data collected for VMware Cloud Discovery for more information on where Discovery saves vCenter data.

Configure a CI to display Software Asset Management data

Configure computer configuration item (CI) forms to display data from the Software Installations [cmdb_sam_sw_install] table.

Before you begin

Confirm you have installed and activated the Software Asset Management (com.sn_samp_master_ws) plugin.

Role required: admin

Procedure

1. Navigate to **All** > **Configuration** > **Servers** > **All**.
   Alternatively, enter `cmdb_ci_computer.list` in the filter navigator to open the Computer [cmdb_ci_computer] table list view.
2. Select a **Name** from the list to open any computer CI record.
3. Right-click in the header of the record and select **Configure** > **Related Lists** from the context menu.
   The Configuring related lists on Computer form page displays.
4. Scroll through the Available list and select **Software Installation->Installed on**.
5. Select the add icon.
   Software Installation->Installed on now displays in the Selected list.
6. Select **Save**.
7. Select the back icon to return to the computer record.
   The Software Installations tab now displays in the record's related list.

Microsoft Exchange Client Access Server discovery

Discovery creates or updates a CMDB record when it detects a running instance of Microsoft Exchange Client Access Server (Microsoft Exchange CAS).

By default, Discovery uses the *CAS On Windows* pattern to discover the Exchange Client Access Server.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Data collected by Discovery on the Exchange Client Access Server

The following data is collected on the Exchange Client Access Server `[cmdb_ci_exchange_cas]` table:

Label	Field Name
Name	name
Version	version
Class	sys_class_name
Fully qualified domain name	fqdn

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Label	Field Name
IP Address	ip_address
Installation directory	install_directory
Type	type

Exchange Hub Transport Servers discovery

Discovery creates or updates a CMDB record when it detects a running instance of Exchange Hub.

By default, Discovery uses the Hub Transport Server On Windows pattern to discover Exchange Hub Transport Servers.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the Hub Transport Server On Windows pattern.

ExchangeHub [cmdb_ci_exchange_hub]

Label	Field Name
Name	name
Version	version
Class	sys_class_name
Fully qualified domain name	fqdn
IP Address	ip_address
Installation directory	install_directory
Type	type

CI relationships

The Hub Transport Server On Windows pattern doesn't discover any relationships.

Exchange MailBox discovery

Discovery creates or updates a CMDB record when it detects a running instance of Exchange Mailbox.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Prerequisites

The `Microsoft.Exchange.Management.PowerShell` module must be installed on the server that you want to discover.

The service `winRM` must be running on the host machine. Run the following command in the Powershell window to verify: `New-PSSession -ConfigurationName`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
Microsoft.Exchange -ConnectionUri "http://$hostname/PowerShell/"
-Authentication Kerberos
```

Pattern

By default, Discovery uses the *MailBox On Windows* pattern to discover Exchange MailBox.

Credentials

Configure these credentials:

Credential type	Additional notes
Applicative credentials	The user must be able to run Powershell commands against the Exchange hosts. Use **Exchange Mailbox** as the CI type for the applicative credential. **Important:** Do not use the **Exchange Mailbox server** CI type.
Windows credentials	The OS user must be a domain user, not a local user for the server.

Data collected

The following data is collected on the Exchange Mailboxes [cmdb_ci_exchange_mailbox] table:

Label	Field Name
Name	name
Version	version
Class	sys_class_name
Fully qualified domain name	fqdn
IP Address	ip_address
Installation directory	install_directory
Type	type

General software package discovery

General software packages are collections of programs that work together, often with similar user interfaces. Examples include Microsoft Office 365 (Word, Excel, PowerPoint), and Apple's iWork (Pages, Numbers, Keynote). Discovery identifies and classifies information about general software packages. Data it collects include, Name, Version, Install Count, License Count, Installation Date, Software, and more.

Data collected by Discovery on General Software Packages

Label	Table name	Field name	Source
Name	cmdb_ci_spkg	name	Various
Version	cmdb_ci_spkg	version	Various

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data collected by Discovery on General Software Packages (continued)

Label	Table name	Field name	Source
Install count	cmdb_ci_spkg	install_count	Various
License count	cmdb_ci_spkg	license_count	Various
Microsoft SMS ID	cmdb_ci_spkg	msft_sms_id	Various
Installed on	cmdb_software_instance	installed_on	Various
Software	cmdb_software_instance	software	Various

GlassFish Server discovery

Discovery creates or updates a CMDB record when it detects a running instance of GlassFish Server.

By default, Discovery uses the following patterns to perform the discovery: *GlassFish Server* and *GlassFish WAR*.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Data collected by Discovery for GlassFish

The following data is collected in the GlassFish [cmdb_ci_appl_glassfish] table:

Label	Field name
Inst name	inst_name
Port	port
Class	sys_class_name
Version	version
Configuration file	config_file
Domain directory	domain_directory
Install Status	install_status
Installation directory	install_directory
PID	pid
Running process	running_process
Running process command	running_process_command
Running process key parameters	running_process_key_parameters
TCP port(s)	tcp_port
Operational status	operational_status

The following data is collected in the GlassFish War [cmdb_ci_appl_glassfish_war] table:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Label	Field name
Name	name
Class	class

HP Operations Manager discovery

Discovery creates or updates a CMDB record when it detects a running instance of HP Operations Manager.

By default, Discovery uses the *HP Operations Manager for Windows* pattern to discover the HP Operations Manager.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Data collected by Discovery for HP Operations Manager

The following data is collected in the HP Operations Manager `[cmdb_ci_appl_hp_operations]` table:

Label	Field Name
Name	name

HP Service Manager discovery

Discovery creates or updates a CMDB record when it detects a running instance of HP Service Manager.

By default, Discovery uses the *HP Service Manager Application Server* pattern to discover HP Service Manager.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Data collected by Discovery for HP Service Manager

The following data is collected on the HP Service Manager `[cmdb_ci_appl_hp_service]` table.

Label	Field Name
Name	name
Vendor	vendor

IBM App Connect Enterprise and HTTP listener discovery

Discovery and Service Mapping Patterns application uses the WMB patterns to discover Integration Bus (formerly WebSphere Message Broker and IBM Integration Bus) and HTTP listeners running on both Linux and Windows. Discovering some of these resources might require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request new or enhanced Patterns on the ServiceNow® Store

Visit the ServiceNow Store to view all the available updates and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

By default, Discovery uses the following patterns to perform the discovery:

- WMB On UNIX
- WMB On Windows
- WMB HTTP Listener On UNIX
- WMB HTTP Listener On Windows

For a list of privileged commands that you need for Discovery and Service Mapping, see Service Mapping commands requiring a privileged user. This list includes commands that require elevated rights to discover and map Unix-based hosts in your organization.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

To learn about IBM WebSphere Message Broker (WMB) and WMB HTTP Listener components and versions that you can discover, see Detailed information on products discovered by ITOM Visibility.

Prerequisites

Verify the applications are up to date

- Discovery and Service Mapping Patterns
- Visibility Content

Data collected by Discovery during horizontal discovery

Resources discovered by the WMB On UNIX pattern

IBM WebSphere Message Broker [cmdb_ci_appl_ibm_wmb]

Field	Description
Name [name]	Name of the message broker
Installation directory [install_directory]	Install directory of the message broker
Version [version]	Version of the message broker

Resources discovered by the WMB On Windows pattern

IBM WebSphere Message Broker [cmdb_ci_appl_ibm_wmb]

Field	Description
Name [name]	Name of the message broker
Installation directory [install_directory]	Install directory of the message broker
Version [version]	Version of the message broker

Resources discovered by the WMB HTTP Listener On UNIX pattern

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

IBM WMB Http Listener [cmdb_ci_appl_ibm_wmb_listener]

Field	Description
Name [name]	Name of the HTTP listener
Installation directory [install_directory]	Install directory of the HTTP listener

Resources discovered by the WMB HTTP Listener On Windows pattern

IBM WMB Http Listener [cmdb_ci_appl_ibm_wmb_listener]

Field	Description
Name [name]	Name of the HTTP listener
Installation directory [install_directory]	Install directory of the HTTP listener

IBM MQ discovery

The ServiceNow Discovery application uses the WMQ On Unix and WMQ On Windows patterns to find IBM MQ (formerly IBM WebSphere MQ) resources. Discovering some of these resources might require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Discovery uses the following patterns to perform horizontal discovery:

- *WMQ On Unix*
- *WMQ On Windows*

For a list of privileged commands that you need for Discovery and Service Mapping, see Service Mapping commands requiring a privileged user. This list includes commands that require elevated rights to discover and map Unix-based hosts in your organization.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Data collected by Discovery for IBM MQ

Discovery populates the data in the CMDB when running the WMQ patterns.

IBM MQ Manager (formerly IBM WebSphere MQ) [cmdb_ci_appl_ibm_wmq]

Label	Field Name
Name	name
Version	version
Installation directory	install_directory
Class	sys_class_name

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Microsoft IIS server discovery

Discovery identifies and classifies information about Microsoft IIS servers.

Prerequisites

Install IIS Management Scripts and Tools on a Microsoft IIS Server.

Credentials

Configure these credentials:

- Applicative credentials
- Windows credentials

Classifier, pattern, and probe

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Discovery uses these classifiers, probes, and patterns for IIS discovery:

Classifier	Trigger probes	Pattern
Microsoft IIS Server	• Horizontal discovery probe: launches patterns • Windows - Get IIS Information*	IIS

*Probes inactive on new instances.

To use patterns, verify that the correct pattern is specified in the horizontal pattern probe on the classifier. See Add the Horizontal Pattern probe to a classifier for instructions.

Data collected by Discovery for IIS Web Server

The following data is collected in the IIS Web Server [cmdb_ci_microsoft_iis_web_server] table.

Label	Field name
Name	name
Version	version
Type*	type
Running process command	running_process_command
Running process key parameters	running_process_key_parameters

*The Type is always IIS.

The following data is collected in the Web site [cmdb_ci_web_site] table.

Label	Field name	Source
Name	name	wmi

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Label	Field name	Source
TCP Port	tcp_port	wmi

Connections found by Service Mapping during top-down discovery

When top-down discovery reaches an IIS server, Service Mapping identifies the specific website and application or virtual directory serving the entry point, not just the IIS server itself. Service Mapping creates a connection from the entry point to the matching IIS Virtual Directory [cmdb_ci_iisdirectory] CI. The resulting service map shows the application running on IIS rather than a generic host-level node.

Microsoft SharePoint discovery

Discovery creates or updates a CMDB record when it detects a running instance of Microsoft SharePoint.

By default, Discovery uses the *SharePoint* pattern to discover Microsoft SharePoint. For information on supported Microsoft SharePoint versions, see Detailed information on products discovered by ITOM Visibility.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Data collected by Discovery for Microsoft SharePoint

The following data is collected in the SharePoints `[cmdb_ci_appl_sharepoint]` table:

Label	Field Name
Name	name
Class	sys_class_name
Fully qualified domain name	fqdn
IP Address	ip_address
Version	version

NGINX web server discovery

NGINX is an open source web server with a load balancer. Discovery identifies the web server and information related to the load balancer.

Discovery identifies NGINX server software using the following process:

1. The NGINX Process Classifier detects a running process that matches the following criteria during the exploration of a Linux server:
   - Name starts with nginx
   - Name contains master
2. If there is a match:
   - A record is created in the NGINX Web Server [cmdb_ci_nginx_web_server] table.
   - A Runs on relationship is created in the CI Relationship [cmdb_rel_ci] table for a Linux server (Linux Server [cmdb_ci_linux_server]) and for an NGINX web server (NGINX Web Server [cmdb_ci_nginx_web_server]).

     The following two probes are triggered:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- NGINX – Version: This probe contains a Bourne shell script. It determines the version of NGINX and populates the NGINX Web Server [cmdb_ci_nginx_web_server] table.
- NGINX – Get Configuration: This probe contains a Bourne shell script and an argument that determines the path of the NGINX configuration file. The probe identifies configuration parameters based on keywords within the configuration file and returns them as a single payload result.

The sensor on the ServiceNow instance parses the payload result and populates the CMDB.

You must have the following requirements to discover an NGINX webserver:

- NGINX is installed and running on the server.
- The MID Server has access to the NGINX configuration file, which is `/etc/nginx/nginx.conf` by default.

Requirements

For NGINIX servers:

- Ensure that the NGINX software is installed and running on the server.
- Grant the MID Server has access to the NGINX configuration file, which is `/etc/nginx/nginx.conf` by default.
- Enable secure shell (SSH) commands to identify the following associated elements:
  - NGINX Version
  - NGINX Get Configuration

The following probes require execute privileges to run commands:

Commands

Probe	Commands
Nginx – Version	nginx
Nginx – Get Configuration	echo, sed, httpd, cut, grep, egrep (within the Bourne shell script)

Note: The Nginx pattern performs top-down discovery on both Windows and Linux servers. For information on prerequisites for top-down discovery for NGINX web servers, see Prerequisites for performing top-down discovery using Service Mapping.

Probes and Sensors

Discovery identifies NGINX server software using the following process:

1. The Nginx Process Classifier detects a running process that matches the following criteria during the exploration of a UNIX server:
   - The name of the process starts with `nginx`.
   - The name of the process contains `master`.
2. If there is a match:
   - A record is created in the Web Server [cmdb_ci_web_server] table.
   - A Runs on relationship is created in the CI Relationship [cmdb_rel_ci] table for the Linux Server [cmdb_ci_linux_server] table and the Web Server [cmdb_ci_web_server] table.
3. The following two probes are triggered:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Nginx – Version**: this probe contains a Bourne shell script. It determines the version of NGINX and populates the Web Server [cmdb_ci_web_server] table.
- **Nginx – Get Configuration**: this probe contains a Bourne shell script and an argument that determines the path of the NGINX configuration file. The probe identifies configuration parameters based on keywords within the configuration file and returns them as a single payload result.

4. The sensor on the ServiceNow instance processes the payload and populates the CMDB.

Data Collected

Discovery creates or updates CMDB records when it detects a running NGINX process. The following data is collected.

Data Collected by Discovery for NGINX

Table Name	Field and Label Name	Probe
Name	cmdb_ci_lb_appl [name]	Nginx– Get Configuration
IP Address	cmdb_ci_lb_appl [ip_address]	Nginx– Get Configuration
Last Discovered	cmdb_ci_lb_appl [last_discovered]	Nginx– Get Configuration
Version	cmdb_ci_lb_appl [version]	Nginx– Version
Name	cmdb_ci_lb_pool_member [name]	Nginx– Get Configuration
Last Discovered	cmdb_ci_lb_pool_member [last_discovered]	Nginx– Get Configuration
IP Address	cmdb_ci_lb_pool_member [ip_address]	Nginx– Get Configuration
Load Balancer	cmdb_ci_lb_pool_member [load_balancer]	Nginx– Get Configuration
Fully Qualified Domain Name	cmdb_ci_lb_pool_member [fqdn]	Nginx– Get Configuration
Port	cmdb_ci_lb_pool_member [port]	Nginx– Get Configuration
Last Discovered	cmdb_ci_lb_service [last_discovered]	Nginx– Get Configuration
IP Address	cmdb_ci_lb_service [ip_address]	Nginx– Get Configuration
Name	cmdb_ci_lb_service [name]	Nginx– Get Configuration
Load Balancer	cmdb_ci_lb_service [load_balancer]	Nginx– Get Configuration
Input URL	cmdb_ci_lb_service [input_url]	NGINX – Get Configuration

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Relationships

In the table [cmdb_rel_ci] the following relationships are populated:

- The records in the cmdb_ci_lb_appl table run on the cmdb_ci_web_server table records.
- The records in the cmdb_ci_lb_service table use the cmdb_ci_lb_pool table records.
- The records in the cmdb_ci_pool table are used by the cmdb_ci_service table records.
- The records in the cmdb_ci_pool table are members of the cmdb_ci_pool_member table.
- The records in the cmdb_ci_pool_member table are members of cmdb_ci_pool table.

Oracle Tuxedo discovery

The ServiceNow Discovery application uses the Tuxedo pattern to find Oracle Tuxedo resources. Discovering some of these resources might require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Discovery uses the **Tuxedo** pattern to run horizontal discovery.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Data collected by Discovery for Oracle Tuxedo

Discovery populates the data in the CMDB when running the Tuxedo pattern.

Tuxedo [cmdb_ci_appl_tuxedo]

Name	Description
Port [port]	The network communication port used by Oracle Tuxedo services and processes for network communication.
Domain [domain]	The logical grouping of Oracle Tuxedo components and services operating within a defined environment.
Installation directory [install_directory]	The location that contains all binaries and configuration files necessary for running Oracle Tuxedo.
Log dir [log_dir]	The directory that stores all log files generated by Oracle Tuxedo for monitoring and troubleshooting.
Version [version]	The specific release of Oracle Tuxedo that is installed and currently in use.
Mode [mode]	The definition of the interaction protocol between Oracle Tuxedo and various clients or other domains, such as Jolt, Workstation, or Domain Gateway, based on the operational configuration.

Puppet automation software discovery

Discovery identifies Puppet Masters running on UNIX servers.

Discovery uses secure shell (SSH) commands to collect information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To access Puppet Master records, navigate to **All** > **Configuration** > **Automation Servers** > **Puppet Masters**. You can view the resources in the related list of the Puppet Master record.

How the Puppet Master probe works

Discovery identifies the Puppet Master using the following process:

1. The **UNIX - Active Processes** probe detects a running process that matches one of the following criteria:
   - The name of the process is `pe-httpd`.
   - The name of the process is `ruby` and the parameters of the process contain *`puppet master`*.
2. If there is a match on one of these criteria:
   - A record is created in the Puppet Master table [cmdb_ci_puppet_master] if one does not already exist for that running process.
   - The **Puppet - Master Info** probe is triggered. The sensor of this probe populates additional information in the Puppet Master [cmdb_ci_puppet_master] record.

Requirements to discover a Puppet master

By default, Discovery identifies Puppet Masters running on UNIX servers. Discovery uses secure shell (SSH) commands to collect information.

The credentials used to discover the UNIX server must have privileges to execute the following commands. The use of sudo is supported, but you must add the *`must_sudo`* parameter to the probe.

Probe	Commands
Puppet – Master Info	puppet, echo, hostname (within the Borne shell script)
Puppet – Certificate Requests	puppet
Puppet – Manifests	echo, sed, find (within the Bourne shell script)
Puppet – Modules	puppet

Data collected

Data collected by Discovery for Puppet automation software, by default

Name	Puppet Master [cmdb_ci_puppet_master]	name	Puppet - Master Info
Configuration directory	Puppet Master [cmdb_ci_puppet_master]	config_directory	Puppet - Master Info
Manifest directory	Puppet Master [cmdb_ci_puppet_master]	manifestdir	Puppet - Master Info
Module path	Puppet Master [cmdb_ci_puppet_master]	modulepath	Puppet - Master Info
Fully qualified domain name	Puppet Master [cmdb_ci_puppet_master]	fqdn	Puppet - Master Info

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data collected by Discovery for Puppet automation software, by default (continued)

IP Address	Puppet Master [cmdb_ci_puppet_master]	ip_address	Puppet - Master Info
Version	Puppet Master [cmdb_ci_puppet_master]	version	Puppet - Master Info

Add the must_sudo parameter to the Puppet probe

To use the Puppet probe with sudo, you must add the *must_sudo* parameter to each probe that requires it.

Before you begin
Role required: admin

About this task
You add the must_sudo parameter for each Puppet probe.

Procedure

1. Navigate to **All** > **Discovery** > **Probes**.
2. In the **Search** field, search on the name **Puppet**.
3. Click the name of the probe.
   For example, **Puppet Master - Info**.
4. In the **Related Links** pane, select the **Probe parameters** tab.
5. Click **New**.
6. In the **Name** field, enter `must_sudo`
7. In the **Value** field, enter `true`.
8. Click **Submit**.

SAP products discovery

ITOM Visibility can discover SAP applications, SAP HANA Database, and SAP HANA DB Catalog. Discovering some of these resources might require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Request new or enhanced Patterns on the ServiceNow® Store

Visit the ServiceNow Store to view all the available updates and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

To learn about the SAP components and their versions that you can discover, refer to Detailed information on products discovered by ITOM Visibility.

Prerequisites

Verify that the applications are up to date

Discovery and Service Mapping Patterns

Visibility Content

CMDB CI Class Models

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Verify the configuration of the credentials

- (If hosted on a UNIX server) On the ServiceNow AI Platform, configure applicative credentials and SSH credentials. The SSH credentials are used to create connections from SAP Central Instance (CI) to other applications and devices. In addition, provide the user elevated rights to be able to run commands requiring a privileged user: Service Mapping commands requiring a privileged user.
- (If hosted on a Windows server) On the ServiceNow AI Platform, configure Windows credentials to create connections from SAP CI to other applications and devices.
- (Optional) For discovering using the WinRM protocol, see Configure WinRM trusted hosts on MID Server.
- (Optional for top-down discovery by Service Mapping) Provide a user with permissions to run SOAP on RFC read table function.
- (Optional for top-down discovery by Service Mapping) If your organization deploys SAP Digital Business Services using web services and you want to map all connected services, perform the following actions:
  - Configure applicative credentials for a user with permissions to access the following tables: CVERS, DBCONS, and RFCDES.
  - Ensure that you have the web service URL. For information on how to create web services, see https://blogs.sap.com/2012/10/24/how-to-create-web-services-abap-based/.

SAP HANA 2.0 DB Catalog on UNIX

Verify that the Applicative Credentials for **SAP HANA DB App Creds** are configured with **SAP Hana Db [cmdb_ci_appl_sap_hana_db]** as CI type.

Verify the permissions to run Service Mapping commands

Service Mapping commands not requiring a privileged user

Verify the user has the permissions to run the Patterns queries

The following commands are executed when running the SAP HANA DB and SAP HANA DB Catalog Patterns.

- `select * from schemas;`
- `select * from M_HOST_INFORMATION where upper(KEY) like '%TIMEZONE%';`
- `select SCHEMA_NAME, round(sum(TABLE_SIZE) /1024/1024) from M_TABLES GROUP BY SCHEMA_NAME`

The query type	Fallback commands executed in order
Schemas Info	1. `$hdbsql_path + " -n " + $entry_point.ip_address + ":" + $query_port + " -i " + $digits + " -u '$$username$$' -p '$$password$$' \"select * from schemas;\""`

Table and field	Description
Installation directory [install_directory]	
SAP SID [cmdb_ci_sap_sid]	
Name [name]	Data collected for the SAP System Identification (SID) code is a unique identification code for an SAP R/3 installation. An SID is a three-character code like D10, PRD, or E56. An R/3 installation consists of a database server plus several application servers. ITOM Visibility uses the SAP SID shared library pattern to discover SIDs for SAP applications.
Version [version]	
Patch Level Info [sap_patch_info]	

Data collected by the SAP HANA DB Catalog on UNIX pattern during horizontal discovery

SAP HANA Catalog [cmdb_ci_db_hana_catalog]

Field	Description
Catalog Owner [catalog_owner]	The user ID of the schema owner.
Catalog Create Time [catalog_create_time]	The catalog creation time.
Disk Allocated Size (MB) [disk_allocated_size_mb]	The allocated Disk size in MB.
Database Reference [database_instance]	The reference to the SAP HANA DB.

CI Relationships

The SAP SID shared library pattern creates CI relationships between all major CI applications and SAP System ID.

CI	Relationship	CI
SAP ERS Application [cmdb_ci_appl_sap_ers]	Uses::Used by	SAP SID [cmdb_ci_sap_sid]
SAP DI Applications [cmdb_ci_appl_sap_di]	Uses::Used by	SAP SID [cmdb_ci_sap_sid]
SAP ASCS [cmdb_ci_appl_sap_ascs]	Uses::Used by	SAP SID [cmdb_ci_sap_sid]
SAP CI Application [cmdb_ci_appl_sap_ci]	Uses::Used by	SAP SID [cmdb_ci_sap_sid]
SAP SCS Application [cmdb_ci_appl_sap_scs]	Uses::Used by	SAP SID [cmdb_ci_sap_sid]
SAP JC Application [cmdb_ci_appl_sap_jc]	Uses::Used by	SAP SID [cmdb_ci_sap_sid]

SAP HANA DB Catalog on UNIX CI relationships

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CI	Relationship	CI
SAP HANA DB [cmdb_ci_appl_sap_hana_db]	Contains::Contained by	SAP HANA DB Catalog [cmdb_ci_db_hana_catalog]

Limitations

Service Mapping can map only one instance of ASCS per deployment.

The SAP HANA DB Catalog pattern can only run on UNIX.

Map application services containing SAP applications

Map a service instance containing an SAP application and verify that Service Mapping discovered all SAP components correctly.

Before you begin

Role required: service_mapping_admin

Procedure

1. Create a service instance.
   a. Navigate to **All** > **Service Mapping** > **Service Instances**.
   b. Select **New**.
   The **Discoverable by Service Mapping** option is selected by default.
   c. In the **Name** field, enter a descriptive name for the service instance.
2. Define the entry point for this application service:
   a. Select the **SAP application** tile.
   The **Discoverable by Service Mapping** option is selected by default.
   b. Define the entry point as follows:
      - A URL to any SAP module
      - A TCP connection to any SAP module
      - To discover environments with connected services, provide the URL to the web service in the following format:

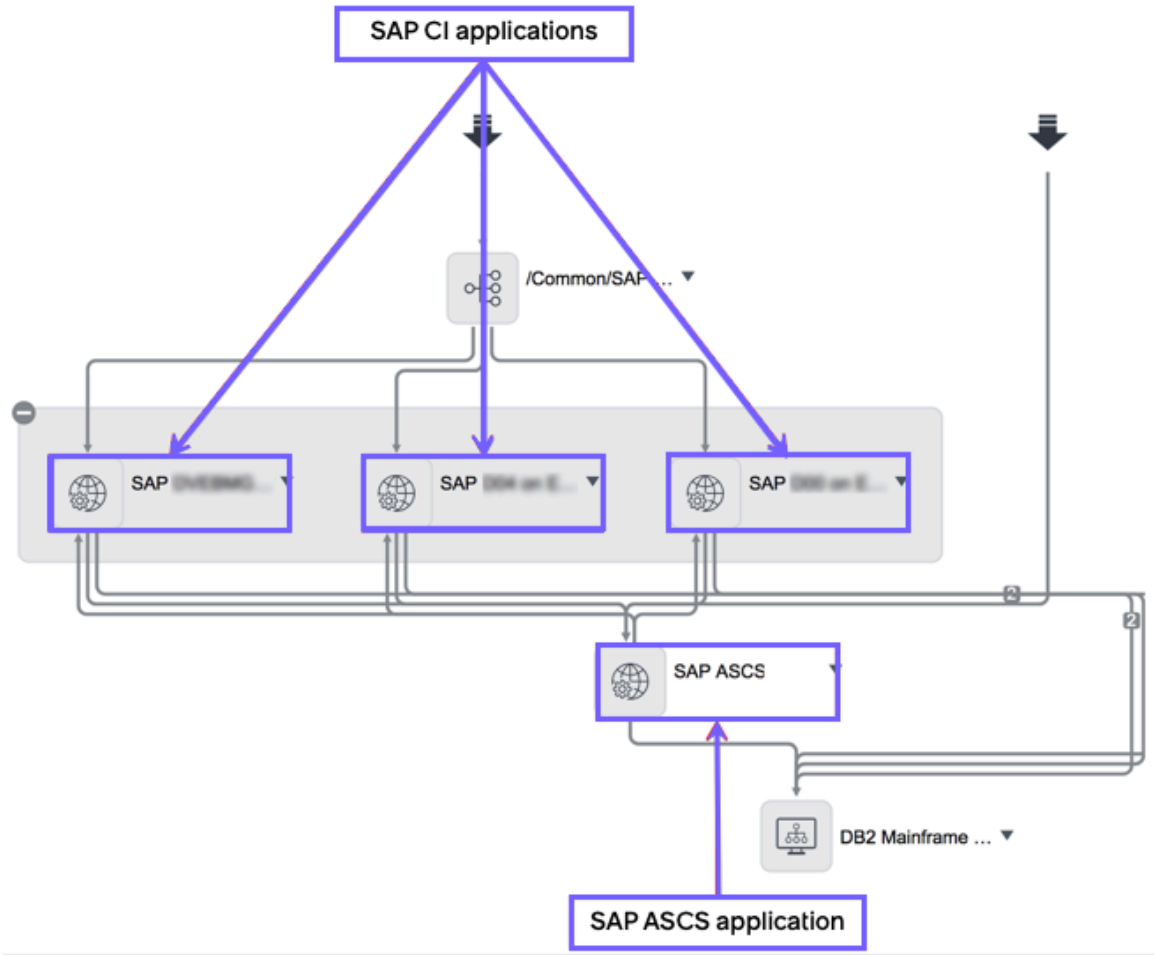
```
 http://<hostname>:<port>/sap/bc/srt/scs/sap/z_servicenow_read?sap-client=003
```

   c. Select **Add**.
   d. Select **Save**.
3. Select **Additional Info** on the left and clear the **Traffic based discovery** check box.
4. Select **Update**.
5. Verify that the mapping result is satisfactory:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

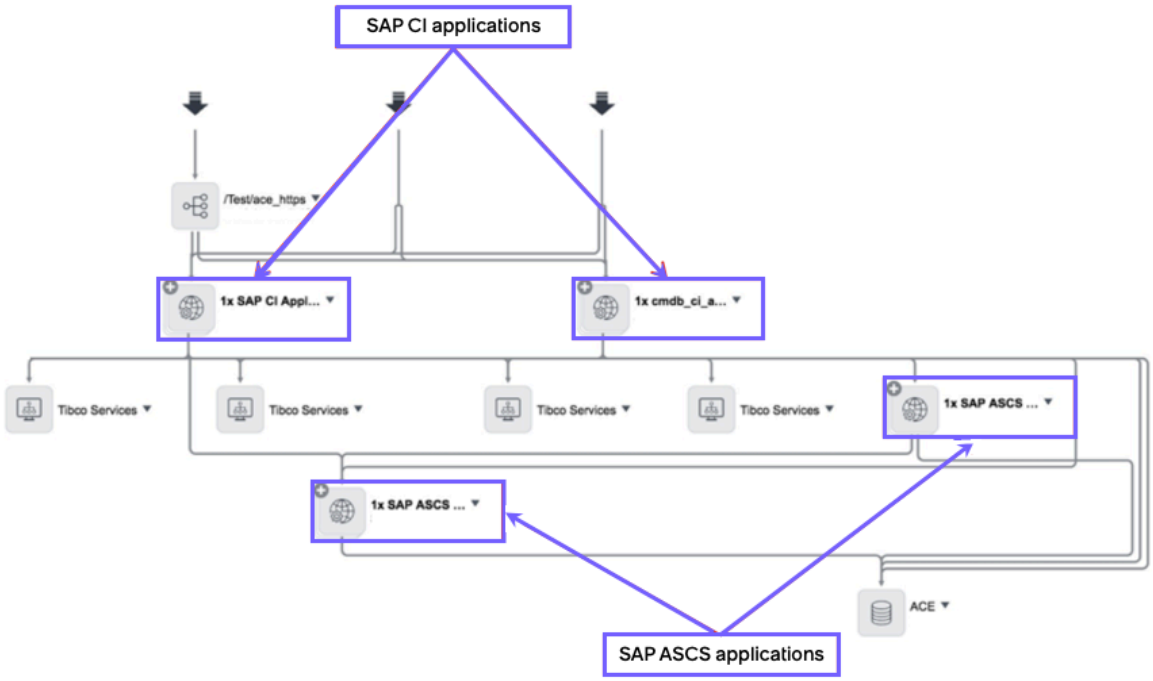
a. Select **View Map** and wait until the mapping is complete.
It may take a few minutes.

b. Review the application service map and make sure that the service layout is as in the following examples.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If the SAP environment integrates SAP components with Tibco services, you can expect this mapping result:



Troubleshoot application services containing SAP applications

Fix basic discovery issues based on the symptoms and discovery messages.

Symptom

The application service map in Service Mapping displays the following message `Failed to discover <SAP component name>.`

Cause

The CI failed to identify, and process detection retrieves the process attributes.

Solution

Perform the following steps:

1. Open the failed pattern step in Debug mode:
   a. On the business service or service instance map, right-click the error message and select **Show discovery log**.

      The Discovery Log window opens.

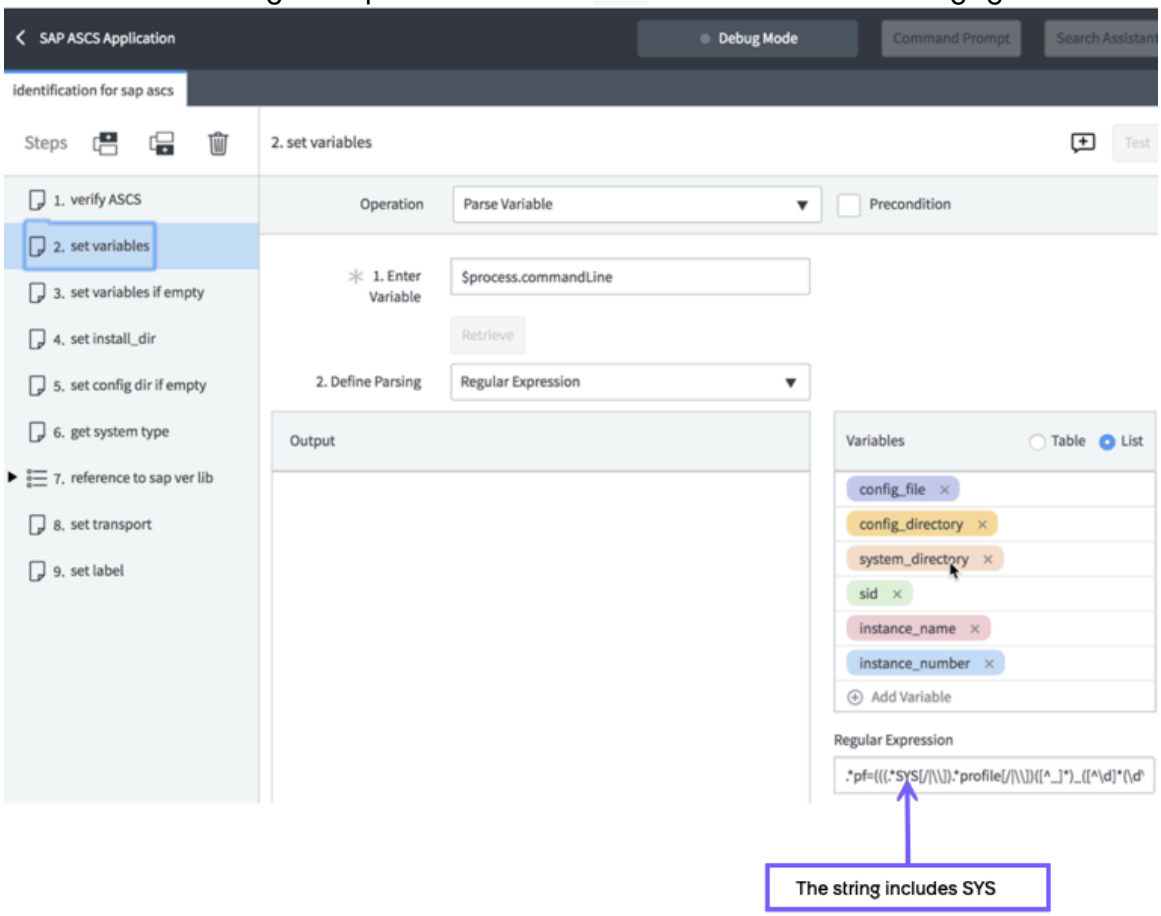
   b. In the right pane, locate the failed identification section and the failed step within this section.
   c. Select this failed identification section and click **Debug**.

      The Debug Identification Section window opens.

   d. If necessary, fill in the required details and click **Connect**.
2. Click the **set variables** step under **Steps**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

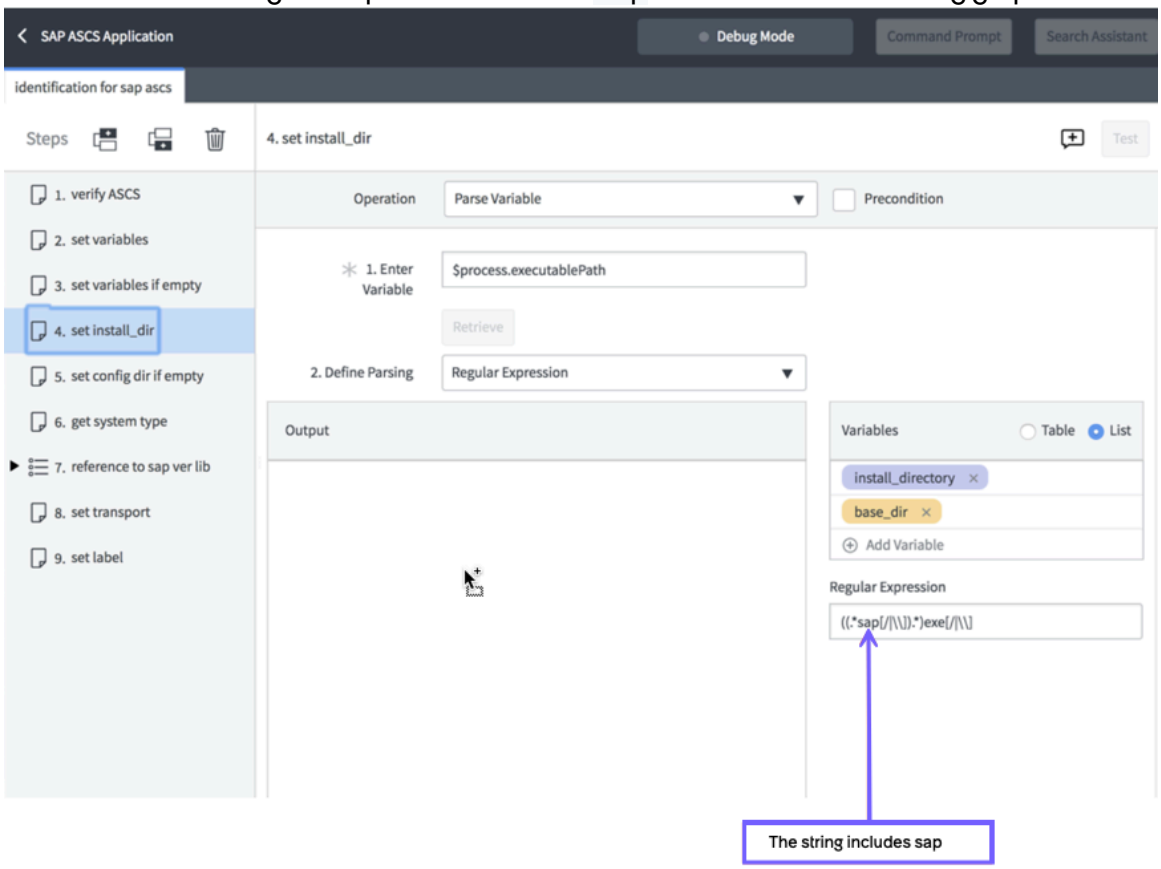
3. Make sure that the regular expression includes SYS as shown in the following figure.



4. Click the **set install_dir** step under **Steps**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Make sure that the regular expression includes `sap` as shown in the following graphic.



Symptom

Service Mapping fails to discover the web service your organization uses to deploy SAP digital business services.

Cause 1

The pattern fails at the EVAL function for identifying the web service.

Solution 1

1. Verify that the format of the entry point is the URL to the web service as described in the mapping procedure.
2. Verify that you configured the necessary applicative credentials as described in the mapping procedure.
3. Check that the discovery log contains the following message: GROOVE_CODE_FAILURE: No such property: com for class: Script1.
4. Open the failed pattern step in Debug mode:
   a. On the business service or service instance map, right-click the error message and select **Show discovery log**.

      The Discovery Log window opens.

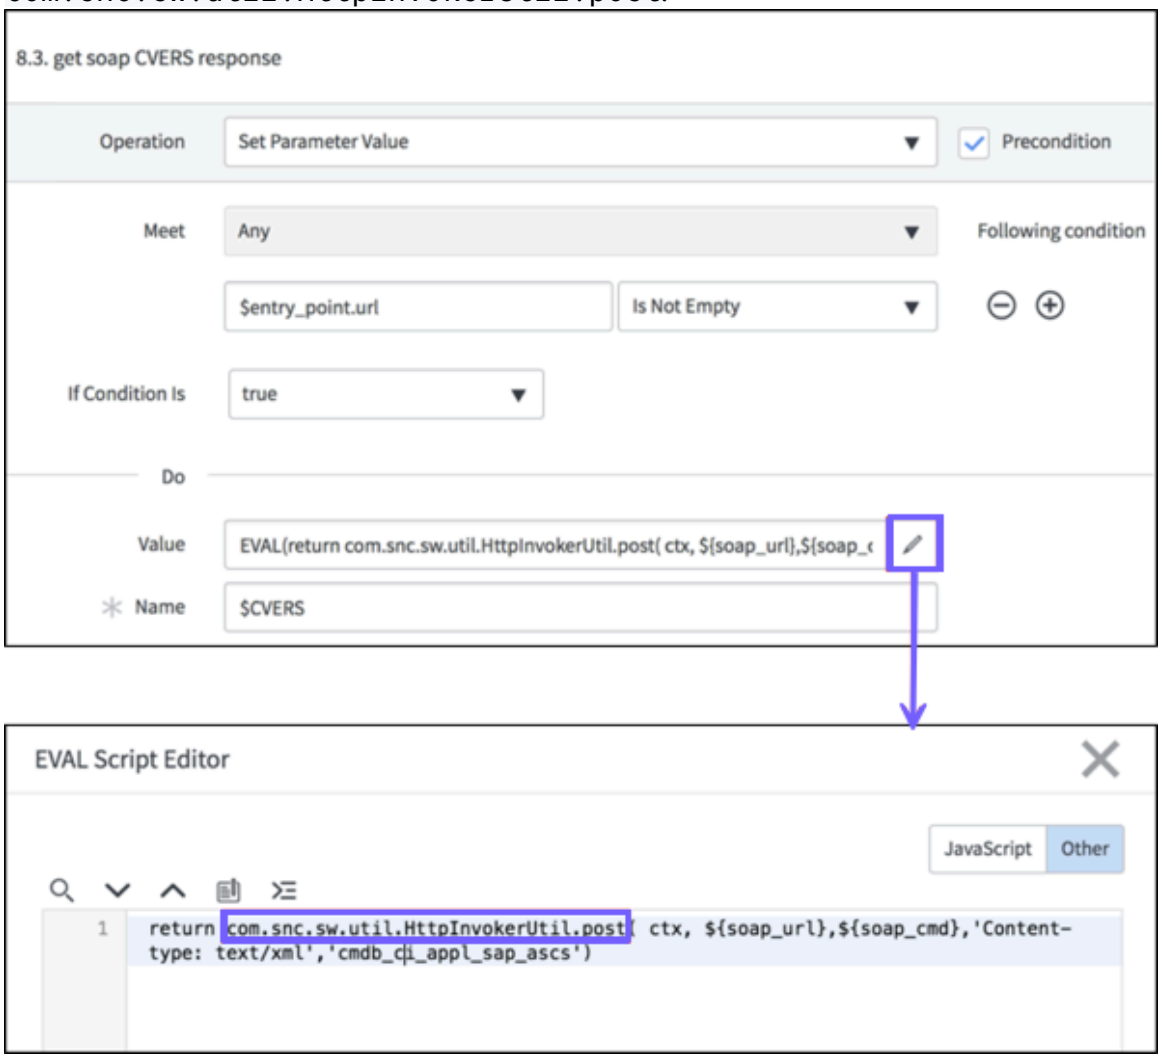
   b. In the right pane, locate the failed identification section and the failed step within this section.
   c. Select this failed identification section and click **Debug**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Debug Identification Section window opens.

d. If necessary, fill in the required details and click **Connect**.

5. Pattern Designer opens showing the selected identification section.
6. Select the failed step on the right.
7. Verify that the function running on EVAL is `com.snc.sw.util.HttpInvokerUtil.post`.



8. Try to map the application service again and check the result.

Cause 2

The pattern fails at the EVAL function for identifying the web service, because the web service was configured incorrectly.

Solution 2

1. Verify that the format of the entry point is the URL to the web service as described in the mapping procedure.
2. Verify that you configured the necessary applicative credentials as described in the mapping procedure.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Check that the discovery log contains the following message: "Debug run railed: Test step failed. GROOVE_CODE_FAILURE: All command implementations (HTTP) failed on host 10.x.x.x. Host must be down or unreachable. ()"
4. Recreate the web service as described in https://blogs.sap.com/2012/10/24/how-to-create-web-services-abap-based/ .
5. Try to map the application service again and check the result.

Cause 3

The pattern fails at the EVAL function for identifying the web service. This occurs because the URL configured in the entry point is not correct or because the MID Server cannot access this URL.

Solution 3

1. Verify that the format of the entry point is the URL to the web service as described in the mapping procedure.
2. Verify that you configured the necessary applicative credentials as described in the mapping procedure.
3. Check that the discovery log contains the following message: "Debug run railed: Test step failed. GROOVE_CODE_FAILURE: All command implementations (HTTP) failed on host 10.x.x.x. Host must be down or unreachable. ()"
4. Verify that you used the correct URL for the service entry point:
   a. In the TCode SOAMANAGER, navigate to **Simplified Web Service Configuration**.
   b. On the **Configuration** tab of the Simplified Service Configuration window, search for the web service that is part of the service instance.
   c. Click the check box under **User Name/Password (Basic)** for this web service.
   d. Click **Show Details**.
   e. On the Details of the Service Definition window, verify the actual URL of the web service under WSDL URLs.
   f. If necessary, fix the URL you configure for the entry point and try to map the service instance again.

Cause 4

MID Server cannot access this URL configured in the entry point of the service instance.

Solution 4

1. Verify that the format of the entry point is the URL to the web service as described in the mapping procedure.
2. Verify that you configured the necessary applicative credentials as described in the mapping procedure.
3. Check that the discovery log contains the following message: "Debug run failed: Test step failed. GROOVE_CODE_FAILURE: All command implementations (HTTP) failed on host 10.x.x.x. Host must be down or unreachable. ()"
4. Verify that you used the MID Server that can access the URL you configured in the service entry point:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Log into the MID Server host remotely.

b. Open a browser.

c. Paste the URL into the browser address bar and press Enter.

d. If the page does not open, it means that there is a network issue, for example, there is a firewall that prevents the MID Server from accessing this URL.

5. Resolve the network issue and verify that the MID Server can access the URL as described in step 4.

Cause 5

MID Server cannot access this URL configured in the entry point of the service instance.

Solution 5

1. Verify that the format of the entry point is the URL to the web service as described in the mapping procedure.
2. Verify that you configured the necessary applicative credentials as described in the mapping procedure.
3. Check that the discovery log contains the following message: "Debug run railed: Test step failed. GROOVE_CODE_FAILURE: All command implementations (HTTP) failed on host 10.x.x.x. Host must be down or unreachable. ()"
4. Verify that the applicative credentials you configured on the ServiceNow AI Platform for the web service are valid:

   a. Log into the MID Server host remotely.

   b. Open a browser.

   c. Paste the URL into the browser address bar and press Enter.

   d. The browser page displays the credentials pop-up window.

   e. Enter the credentials and check that the page opens.

   The page does not open, it means that the configured applicative credentials are incorrect.

5. Find out the right credentials.
6. Verify the new credentials as described in step 4.
7. If the page opens after you use the new credentials, configure these credentials as applicative credentials on the ServiceNow AI Platform.

Cause 6

MID Server cannot access this URL configured in the entry point of the service instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Solution 6

1. Verify that the format of the entry point is the URL to the web service as described in the mapping procedure.
2. Check that the discovery log contains the following message: "Debug run railed: Test step failed. GROOVE_CODE_FAILURE: Missing applicative credentials for CI type <name of the CI type>".
3. Verify that you defined applicative credentials for the relevant CI according as described in Map application services containing SAP applications.

SQL Server Analysis Services (SSAS) discovery

The Discovery and Service Mapping application uses the SSAS pattern to find SQL Server Analysis Services (SSAS) on your infrastructure. Discovering some of these resources might require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store..

Request new or enhanced Patterns on the ServiceNow® Store

Visit the ServiceNow Store to view all the available updates and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Prerequisites

Verify the applications are up to date.

Discovery and Service Mapping Patterns

CMDB CI Class Models

Visibility Content

Verify the configuration of credentials

On the ServiceNow AI Platform®, verify the configuration of the Windows credentials. For more information, see Windows credentials

Data collected during horizontal discovery

Discovery populates the following data when running the SSAS pattern.

SQL Server Analysis Services [cmdb_ci_db_mssql_analysis]		
Label	**Field**	**Description**
Name	name	The SSAS on the Windows sever name
IP Address	ip_address	The SSAS IP address
Version	version	The SSAS version
Edition	edition	The SSAS edition
Installation directory	install_directory	The SSAS install directory
Instance Name	instance	The SSAS instance name
TCP port(s)	tcp_port	The SSAS TCP port

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Microsoft SQL Server Integration Services (SSIS) discovery

The Discovery and Service Mapping application uses the SSIS pattern to find SQL Server Integration Services (SSIS) on your infrastructure. Discovering some of these resources might require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Request new or enhanced Patterns on the ServiceNow® Store

Visit the ServiceNow Store to view all the available updates and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Prerequisites

Verify the plugins setup

Discovery and Service Mapping Patterns

CMDB CI Class Models

Visibility Content

Verify the configuration of credentials

On the ServiceNow AI Platform®, verify the configuration of the Windows credentials. For more information, see Windows credentials

Data collected during horizontal discovery

Discovery populates the following data when running the SSIS pattern.

SQL Server Integration Services [cmdb_ci_db_mssql_integration_list]		
Label	**Field**	**Description**
Name	name	The SSIS on the Windows sever name
IP Address	ip_address	The SSIS IP address
Version	version	The SSIS version
Edition	edition	The SSIS edition
Installation directory	install_directory	The SSIS install directory
Instance Name	instance	The SSIS instance name

Sun Java Enterprise System (JES) discovery

Discovery creates or updates a CMDB record when it detects a running instance of Sun Java Enterprise System (JES).

By default, Discovery uses the *Sun JES pattern* pattern to discover Sun Java Enterprise System.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Data collected by Discovery for Sun Java Enterprise System

The following data is collected in the JES [cmdb_ci_email_server_jes] table:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Label	Field Name
Name	name
IP Address	ip_address
Class	sys_class_name
Fully qualified domain name	fqdn

Tomcat server discovery

Discovery identifies and classifies information about Tomcat server Web applications running on UNIX machines.

Discovery can identify and classify Web applications present in either the `CATALINA_BASE` directory or the `CATALINA_HOME` directory.

The classifier that finds Tomcat server processes uses the condition: [Parameters] [contains] [org.apache.catalina.startup.Bootstrap].

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Credentials

Configure these credentials:

- Applicative credentials
- SSH credentials

For a list of privileged commands that you need for Discovery and Service Mapping, see Service Mapping commands requiring a privileged user. This list includes commands that require elevated rights to discover and map Unix-based hosts in your organization.

Classifier, pattern, and probes

Classifier	Trigger probes	Pattern
Tomcat	• Horizontal pattern: launches patterns • SSHCommand-Tomcat - Find web.xml List* • SSHCommand-Tomcat - Get server.xml* • SSHCommand-Tomcat - Get Version*	Tomcat

*Probes inactive on new instances.

To use patterns, verify that the correct pattern is specified in the horizontal pattern probe on the classifier. See Add the Horizontal Pattern probe to a classifier for instructions.

Data collected

Discovery collects the following data on the Tomcat [cmdb_ci_app_server_tomcat] table for both Unix and Windows:

Label	Field name	Source
Name	name	server.info
Install Directory	install_directory	server.xml
Version	version	server.info
Server Port	server_port	server.xml
Attributes	attributes	server.xml

The following data is collected on the Tomcat Connector [cmdb_ci_tomcat_connector] table for both Unix and Windows:

Label	Field name	Source
Tomcat	tomcat	server.xml
Port	port	server.xml

The following data is collected on the Web Application [cmdb_ci_web_application] table for both Unix and Windows:

Label	Field name	Source
Description	description	web.xml
Document base	document_base	web.xml
App server	app_server	web.xml

Relationships

Parent class	Relationship	Child class
cmdb_ci_app_server_tomcat	Contains::Contained by	cmdb_ci_web_application

WebLogic application server discovery

Discovery creates or updates a CMDB record when it detects an instance of an Oracle or BEA Weblogic application server running on a Windows or Linux system.

Requirements

For Windows

- PowerShell must be enabled on the MID Server.
- The WebLogic Administration Server instances that start via WebLogic NodeManager must have the `-Dweblogic.RootDirectory=<path>` parameter defined upon server startup. The Windows credential must also have read permissions on the `config.xml` file.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For Linux

- Discovery requires the use of these Bourne shell commands:
  - `find`
  - `cat`
  - `dirname`
- WebLogic administration server instances started via NodeManager must have the *`-Dweblogic.RootDirectory=<path>`* parameter defined and visible through the Linux *`ps process stat`* command (for each AdminServer) for the rest of the Linux WebLogic application server and web application information to be populated in the CMDB.
- The following configuration must be set on the sudorers file:

  `User ALL=(root) NOPASSWD: /bin/sh *`

  `User` is the user name on the SSH credential that you create for this discovery.
- This command must be able to be run:

  `/bin/sh /tmp/snc-*-findcat.sh * *"`

  Do not make any changes to `findcat.sh`.
- If you are using probes, not patterns, for Weblogic discovery, the *`Linux - Weblogic - Find config.xml`* probe must specify this parameter and value: *`must_sudo`* = *`true`*

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Credentials

- Applicative credentials
- Windows credentials
- SSH credentials

Classifier, pattern, and probes

Classifier	Trigger probes	Pattern
Weblogic Server	• Horizontal Pattern: launches patterns • Windows - Weblogic - Get web.xml* • Windows - Weblogic - Find config.xml* • Linux - Weblogic - Find config.xml*	WebLogic

Parent class	Relationship type	Child class
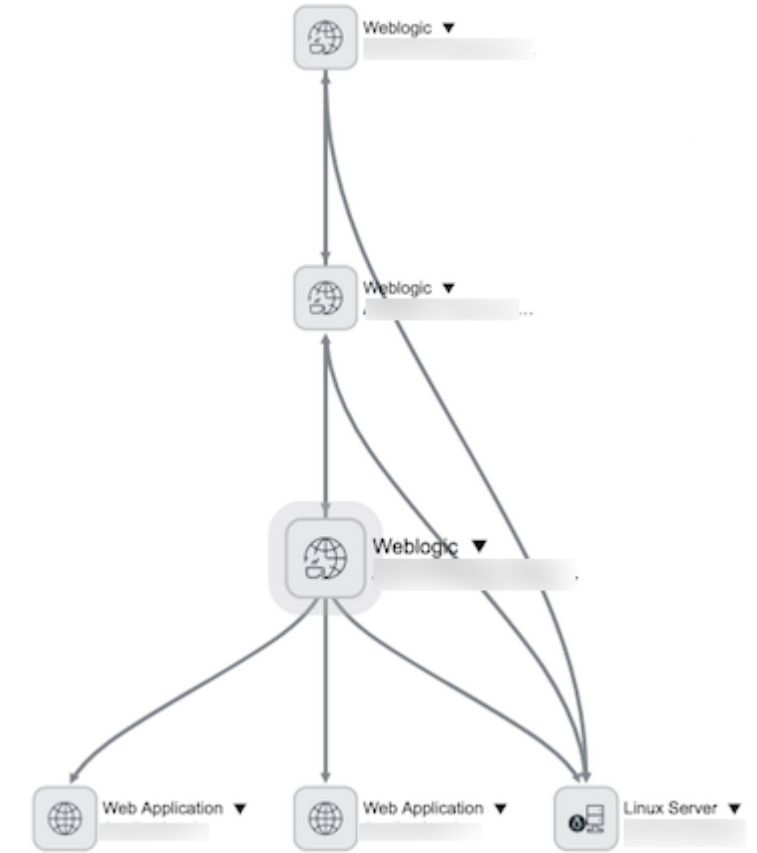
cmdb_ci_app_server_weblogic	Depends on::Used by	cmdb_ci_app_server_weblogic This relationship is made between an AdminServer and any managed servers it encapsulates.

Example Weblogic relationships



Add sudo access for the Weblogic - Find config.xml probe

If you are not using the Weblogic pattern, you can add sudo privileges to the Linux, the Weblogic - Find config.xml probe.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Discovery Definition** > **Probes**.
2. Search for and select the **Linux - Weblogic - Find config.xml** probe.
3. In the **Probe Parameters** related list, click**New**
4. Use the following information to complete the form

Probe	Commands
Name	must_sudo

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Probe	Commands
Value	true

5. Click **Submit**

Identifying Windows WebLogic application servers

If you are not using the Weblogic pattern, Discovery follows this process when it uses the Windows - Active Processes or Linux - Active Processes probes.

This process describes the use of probes, which are active on your instance if you upgrade. For new instances, Discovery uses the Weblogic pattern.

1. The Windows - Active Processes probe or Linux - Active Processes detects a running process that matches one of the follow criteria:
   - The parameters of the process contain *`weblogic.Server`*.
   - The parameters of the process contain *`-Dweblogic.name`*.
2. If there is a match on one of the criteria:
   - A record is created in the BEA Weblogic [cmdb_ci_app_server_weblogic] table. The record is populated with the server name and TCP port, which is gathered from the running process.
   - The Windows - Weblogic - Find config.xml probe or the Linux - Weblogic - Find config.xml probe triggers. The sensor of this probe populates additional information in the BEA Weblogic [cmdb_ci_app_server_weblogic] record and the Web Application [cmdb_ci_web_application] record if applicable.
3. The Windows - Weblogic - Find config.xml probe or the Linux - Weblogic - Find config.xml probe attempts to find the related `config.xml` file for the server by:
   - Using the *`-Dweblogic.RootDirectory=<path>`* parameter defined in the running process.
   - [Windows] Searching for `config.xml` files under the *`-Dplatform.home=<path>`* parameter defined in the running process (not as efficient using the parameters of the process).
   - [Linux] Searching for the parent process that started the WebLogic server. This is viable only if the weblogic jvm was started via the *`startWeblogic.sh`* or related custom script and not the init process.
4. If there are associated web applications found in the WebLogic `config.xml` file, the Windows – Weblogic find web.xml probe triggers for each application. This probe reads the WebLogic `web.xml` file for each web application and the sensor, and then populates additional information.

IBM WebSphere server discovery using probes

The IBM WebSphere application server is a software framework with middleware that hosts Java-based web applications. Discovery creates or updates a CMDB record when it detects an instance of a WebSphere application server running on a Windows or Linux system.

Note: Starting with Visibility Content version 6.1.0, pattern-based discovery is the default method for discovering IBM WebSphere Application Servers. The WebSphere probes are disabled by default. For more information, see IBM WebSphere Application Server discovery using patterns.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Websphere discovery on Windows

Requirements for discovery:

For WebSphere application servers running on Windows systems, enable PowerShell on the MID Server.

Websphere discovery on Linux

Requirements for discovery:

- Enable SSH on the WebSphere Application Server.
- Set execute privileges to enable the following probes to run commands:
  - WebSphere - Get serverindex.xml: cat/read permissions on the `serverindex.xml` file
  - WebSphere - Get cell.xml: cat/read permissions on the `cell.xml` file
  - WebSphere - Get server.xml: cat/read permissions on the `server.xml` file

For a list of privileged commands that you need for Discovery and Service Mapping, see Service Mapping commands requiring a privileged user. This list includes commands that require elevated rights to discover and map Unix-based hosts in your organization.

Probes and sensors

Discovery uses this process to identify Linux WebSphere application servers:

1. The Unix - Active Processes probe detects a running process that matches the *`com.ibm.ws.runtime.WsServer`*. For example, the *`...com.ibm.ws.bootstrap.WSLauncher com.ibm.ws.runtime.WsServer`* process output has a parameter of */opt/IBM/WPS/profiles/ccmdb/config localhostNode01Cell ccmdb01 server1*. The values are:
   - last parameter = server_name = server1
   - last parameter - 1 = node_name = ccmdb01
   - last parameter - 2 = cell_name = localhostNode01Cell
   - last parameter - 3 = config_path = '/opt/IBM/WPS/profiles/ccmdb/config'
2. If there is a match, a record is created in the IBM Websphere [cmdb_ci_app_server_websphere] table. The following probes are triggered:
   - WebSphere - Cell
   - WebSphere - Web Applications
   - WebSphere –Web Services
3. The WebSphere - Cell probe searches for the `cell.xml` file for the instance by using the parameters in the running process, and then searching in the related `<config_path>\cells\<cell_name>\` directory.
4. If the probe successfully finds the `cell.xml` file, the sensor reads its contents and populates additional Websphere Cell [cmdb_ci_websphere_cell] table records as necessary.
5. If the probe successfully finds the `serverindex.xml` file, the sensor reads its contents and populates additional Web Application [cmdb_ci_web_application] table records as necessary.
6. If the probe successfully finds the `server.xml` file, the sensor reads its contents and populates additional Web Service [cmdb_ci_web_service] table records as necessary.

Discovery uses this process to identify Windows WebSphere application servers:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. The Windows - Active Processes probe detects a running process that matches the *com.ibm.ws.runtime.WsServer*. For example, the *...com.ibm.ws.bootstrap.WSLauncher com.ibm.ws.runtime.WsServer* process output has a parameter of */opt/IBM/WPS/profiles/ccmdb/config localhostNode01Cell ccmdb01 server1*. The values are:
   - last parameter = server_name = server1
   - last parameter - 1 = node_name = ccmdb01
   - last parameter - 2 = cell_name = localhostNode01Cell
   - last parameter - 3 = config_path = '/opt/IBM/WPS/profiles/ccmdb/config'
2. If there is a match, a record is created in the IBM Websphere [cmdb_ci_app_server_websphere] table. The following probes are triggered:
   - Windows - WebSphere - Cell
   - Windows - WebSphere - Web Applications
   - Windows - WebSphere –Web Services
3. The Windows - WebSphere - Cell probe searches for the `cell.xml` file for the instance by using the parameters in the running process, and then searching in the related `<config_path>\cells\<cell_name>\` directory.
4. If the probe successfully finds the `cell.xml` file, the sensor reads its contents and populates additional Websphere Cell [cmdb_ci_websphere_cell] table records as necessary.
5. The Windows - WebSphere - Web Applications probe searches the `serverindex.xml` file for the instance by using the parameters in the running process, and then searching in the related `<config_path>\cells\<cell_name>\nodes\<node_name>` directory.
6. If the probe successfully finds the `serverindex.xml` file, the sensor reads its contents and populates additional Web Application [cmdb_ci_web_application] table records as necessary.
7. The Windows WebSphere - Web Services probe searches for the `server.xml` file for the instance by using the parameters in the running process, and then searching in the related `<config_path>\cells\<cell_name>\nodes\<node_name>\servers\<server_name>` directory.
8. If the probe successfully finds the `server.xml` file, the sensor reads its contents and populates additional Web Service [cmdb_ci_web_service] table records as necessary.

cmdb_ci_web_service	Runs on::Runs	cmdb_ci_app_server_websphere
cmdb_ci_websphere_cell	Contains::Contained by	cmdb_ci_app_server_websphere

Database discovery

Discovery can find database applications, such as MySQL, Oracle, and MongoDB. Discovery can also find database management system software, such as MSSQL Server.

Database catalog discovery

The database catalog lists all the catalog objects, or databases, discovered for an instance of a database.

Databases vs. catalogs

Most database manufacturers use the term catalog to mean database, while Microsoft SQL uses the term database. Database catalogs can be imported into your instance from a third-party discovery tool, entered into the platform manually, or found by Discovery.

Important: Discovery does not support MySQL database catalog discovery in the base system. The Oracle DB on Unix and Oracle DB on Windows patterns discover Oracle catalog objects through the pattern extension Get Catalog info. The MSSql DB On Windows and MSSql 2000 DB patterns discover both database instances and catalogs and store them in the database instance records.

For more information about Oracle catalog discovery, see Oracle Catalog discovery.

For more information about Microsoft SQL database instances, see Microsoft SQL Server and Cluster discovery.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you discovered database catalogs using probes before migrating to patterns, you can view the probe-based database catalogs by navigating to **All** > **Configuration** > **Database Catalogs** and selecting a database.

Database Administrator (DBA) report discovery

Discovery and Service Mapping uses the Patterns extension sections to provide a Database Administrator report (DBA report) for the Apache Cassandra, Microsoft SQL, MySQL, MongoDB, and Oracle databases. The extension sections for each DB pattern populate the related entries tables. Discovering some of these resources might require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Request new or enhanced Patterns on the ServiceNow® Store

Visit the ServiceNow Store to view all the available updates and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Prerequisites

Verify the plugins setup

- CMDB CI Class Models 1.49.0 (September 2023)
- Discovery and Service Mapping Patterns 1.8.0 (September 2023)

Verify the system properties are enabled

By default, the system properties for DBA reports are set to **false**. To enable the report collection, verify that the system properties value for each pattern is set to **true**.

Pattern	System property
Cassandra	cassandra_dba_report_enabled
MongoDB	mongo_dba_report_enabled
MSSQL DB On Windows	mssql_dba_report_enabled
My SQL server On Windows and Linux	mysql_dba_report_enabled
Oracle DB	oracle_dba_report_enabled

Verify the configuration of the credentials

For more information, see Applicative credentials.

MongoDB execute command	Applicative credentials should have read access to run `"getSiblingDB (databaseName)"`
Apache Cassandra execute command	Discovery credentials should have read access to `"nodetool"`
MySQL tables and execute commands	Discovery credentials should have read access to:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

	• `"information_schema.tables"` table • run `"show databases"` command
Microsoft SQL tables	Discovery credentials should have read access to the following tables: • *master.sys.databases* • *sys.sysprocesses* • *sys.dm_os_sys_info* • *sys.dm_os_ring_buffers* • *msdb.dbo.backupset* • *master.dbo.sysdatabases* • *master..sysprocesses* • *msdb..sysjobactivity* • *sys.master_files* • *sys.dm_tran_session_transactions* • *sys.dm_os_sys_memory* • *sys.database_files*
Oracle DB tables and execute commands	Discovery credentials should have read access to: • Run `"lsnrctl services"` and `"sqlplus"` commands • *dba_data_files* table • *dba_segments* table • *v$database* table • *gv$instance* table • *dba_hist_osstat* table • *dba_hist_snapshot* table • *v$asm_disk* table • *v$asm_diskgroup* table • *dba_audit_session* table • *gv$session_longops* table • *gv$session* table • *gv$sqlarea* table • *gv$process* table

Verify that a Discovery schedule is configured

For more information, see create a discovery schedule

Microsoft SQL Server and Cluster discovery

The Discovery and Service Mapping Patterns application uses the MSSql DB On Windows pattern to find Microsoft SQL DB servers and clusters on your infrastructure. Discovering some of these resources might require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Request new or enhanced Patterns on the ServiceNow® Store

Visit the ServiceNow Store to view all the available updates and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

For detailed information on SQL Server supported versions see: Detailed information on products discovered by ITOM Visibility

Prerequisites

Verify that the following applications are up to date

- Discovery and Service Mapping Patterns starting with version 1.7.0 (August 2023)
- Visibility Content starting with version 6.12.1 (August 2023)

Create Windows credentials

After verifying that the MID Server is connected to the target Windows server, create Windows credentials on the ServiceNow AI Platform. For more information, see Windows credentials.

Create applicative credentials when using SQL authentication

For more information, see Applicative credentials.

Verify the configuration of the MID Server

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Verify that the MID Server has the necessary permissions to read the Windows Registry on a remote mode. The MSSql DB On Windows pattern uses registry values to discover SQL cluster details.

Verify SQL Server discovery report is active

Verify that the SQL Server discovery report is active on your server. Discovery uses the SQL Server discovery report to discover Microsoft SQL Server components.

Verify the permissions to run WMI queries

Verify remote read-only access to the following WMI namespaces:

- `Root\CIMv2`
- `Root\Microsoft\SqlServer\ComputerManagement*`

Verify the SQL Server table permissions

The MSSql DB On Windows pattern requires read-only permissions to read the following tables:

- `@@version`
- `sys.configurations`
- `sys.dm_exec_sessions`
- `sys.dm_os_schedulers`
- SERVERPROPERTY

Verify availability group table permissions

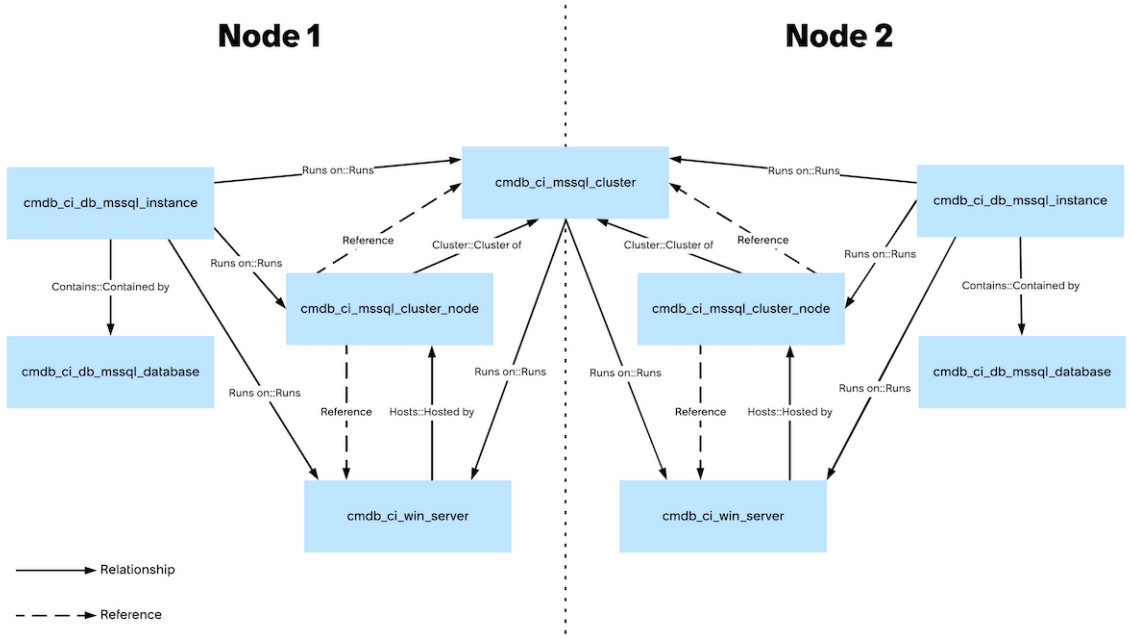
Verify the following table permissions to discover Microsoft SQL Server Always On availability groups:

- **VIEW SERVER STATE** access to the `sys.dm_hadr_availability_group_states` table
- Read access permission to the following tables:
  - `sys.availability_groups`
  - `sys.availability_group_listeners`
  - `sys.availability_group_listener_ip_addresses`

SQL failover cluster instance (FCI)

Starting with version 1.6.1 of the Patterns available from the ServiceNow® Store (August 2023), discovery of Always On availability group details and SQL Failover Clusters is supported. When a failover scenario occurs, the MSSql DB On Windows pattern discovers the failover cluster (Node 2). A new MSFT SQL instance and databases are then created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The following procedure enables appropriate visibility of the SQL clusters.

1. Set the *sn_itom_pattern.discover_mssql_cluster.load_cluster_name_from_registry=true* MID Server property to **true** to enable the **Collect MSSQL Cluster info- MSSQL Cluster** extension section.
2. Ensure that an `sqlservr.exe` process to trigger the MSSql DB On Windows pattern is running on the server.
3. Run a CI discovery.

   For more information, see Running discoveries in your network.
4. Either keep duplicate instances and databases or delete them.
   - To keep the duplicate instances and databases, keep the default configuration.
     - The install status of the nodes of the passive cluster changes to **Absent**.
     - The install status of the nodes of the active cluster changes to **Installed**.
   - To delete the passive instances and databases, set the *discovery.mssql.cluster.instance.postsensor.delete* system property to **True**.

Microsoft SQL Server Always On availability groups support

Starting from Discovery and Service Mapping Patterns version 1.27.0, the MSSql DB On Windows pattern extension **Collect MSSQL HADR - Availability Group Info** supports the discovery of Microsoft SQL Server Always On availability groups.

The Collect MSSQL HADR - Availability Group Info pattern extension introduces the following CI classes that extend existing CMDB classes:

CI classes introduced by this pattern

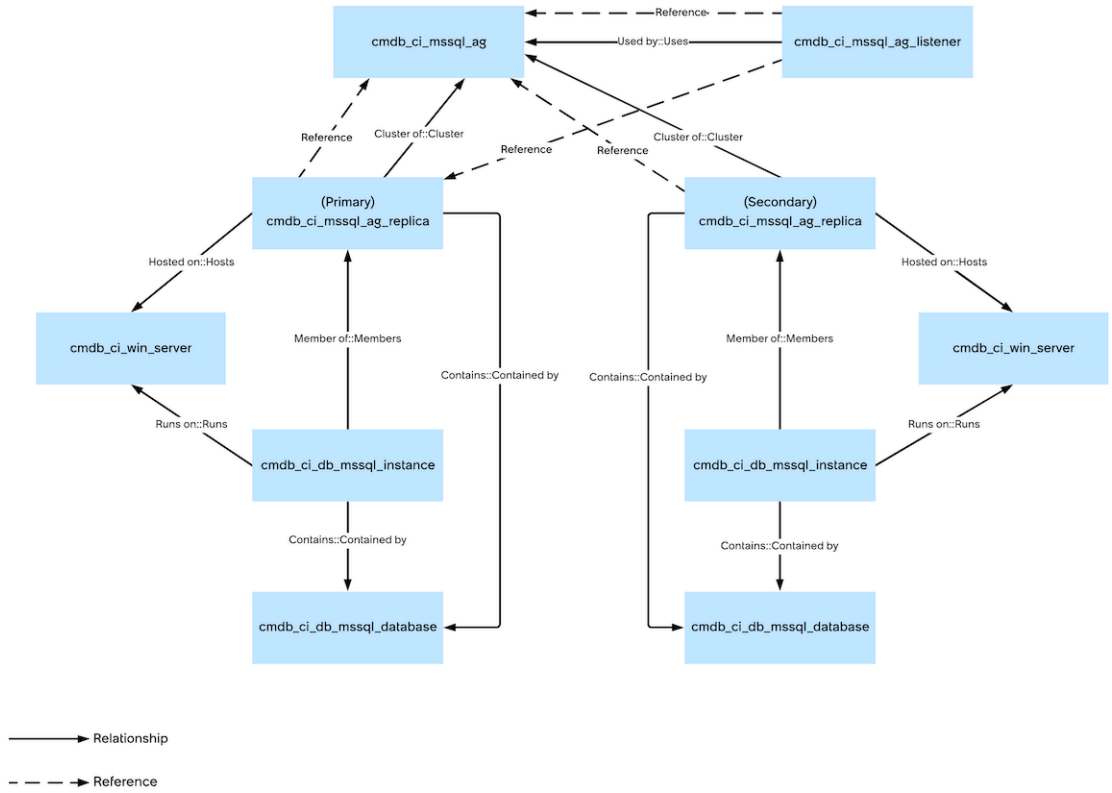
CI class	Extends from
MSSQL Availability Group [cmdb_ci_mssql_ag]	Cluster [cmdb_ci_cluster]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CI classes introduced by this pattern (continued)

CI class	Extends from
MSSQL Availability Group Listener [cmdb_ci_mssql_ag_listener]	Endpoint [cmdb_ci_endpoint]
MSSQL Availability Group Replica [cmdb_ci_mssql_ag_replica]	MSSQL Cluster Node [cmdb_ci_mssql_cluster_node]

Data model of Collect MSSQL HADR - Availability Group Info



Prerequisites

Verify availability group table permissions

Discovered resources

Resources discovered by the pattern extension: Collect MSSQL HADR - Availability Group Info

Discovered relationships

Relationships discovered by the pattern extension: Collect MSSQL HADR - Availability Group Info

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the MSSql DB On Windows pattern.

MSFT SQL instance [cmdb_ci_db_mssql_instance]

The data collected for the running processes of the database (the actual SQL server) is referred to as the database instance

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Name [name]	The field name. For example: MSSQLSERVER@windows_server_name
Instance Name [instance_name]	The SQL server instance name. For example: MSSQLSERVER
Is clustered [is_clustered]	Indicates the type of installation: • If this value is set to **true**,the SQL server is a part of a cluster, and the failover mechanism is enabled. • If this value is set to **false**, the SQL server is a standalone deployment and the failover mechanism is disabled.
Comments [comments]	The type of instance: • standalone_instance • failover_cluster • always_on
Version [version]	The SQL server version number. For example: 16.0.1000.6
Version Name [version_name]	The SQL server version by release dates. For example: The value **2022** represents version **16.0.1000.6**
Service Pack [service_pack]	The service pack version. For example: SP2.
Edition [edition]	The type of the edition. For example: Enterprise Edition.
TCP Port [tcp_port]	The TCP port that the MSSQL instance uses to accept connections.
Install Status [install_status]	The install status of the instance: **Installed**- The instance is currently running. **Absent**- The instance isn't running and it's the backup instance for a failover scenario.

MSSQL database [cmdb_ci_db_mssql_database]

Field	Description
Name [name]	The name of the database. For example: msdb.
Install Status [install_status]	The install status of the database.
Instance name [instance_name]	References the MSFT SQL instance [cmdb_ci_db_mssql_instance] table.

MSSQL Cluster Node [cmdb_ci_mssql_cluster_node]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Name [name]	The server host name
IP Address [ip_address]	The hosting Windows server's IP address
Cluster [cluster]	Reference to the SQL cluster record.
Server [server]	Reference to the hosting Windows server record.

MSSQL Cluster [cmdb_ci_mssql_cluster]

Field	Description
Name [name]	The SQL cluster network name
IP Address [ip_address]	The SQL cluster's virtual IP address.

MSSQL Service Info [mssql_sqlservice_info]

Field	Description
Description [description]	Describes the MSSQL service. For example: "Provides storage, processing, and controlled access of data and rapid transaction processing."
Service Name [service_name]	The MSSQL service name as presented on the server. For example: MSSQL$NAMEDMSSQL2016
Binary Path [binary_path]	The file path of the service. For example: `C:\Program Files\Microsoft SQL Server\MSSQL13.NAMEDMSSQL2016\MSSQL\Binn\sqlservr.exe`
CI [ci]	Reference the MSFT SQL instance [cmdb_ci_db_mssql_instance] table.
Installed On [installed_on]	Reference to the Windows server record [cmdb_ci_win_server] **Note:** This field isn't populated for standalone deployments.

MSSQL Components Info [mssql_components_info]

Field	Description
Install Path [install_path]	The install path of the component service. Foe example: `C:\Program Files\Microsoft SQL Server\MSSQL16.SQLEXPRESS\MSSQL`
Service Name [service_name]	The components service type of the server. For example: **Database Engine Services**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
SKU Name [sku_name]	The MSSQL version of the component service. For example: **Express Edition (64-bit)**
Version [version]	The MSSQL version number of the component service
CI [ci]	Reference the MSFT SQL instance [cmdb_ci_db_mssql_instance] table.
Installed On [installed_on]	Reference to the Windows server record [cmdb_ci_win_server]. **Note:** This field is populated only for SQL Clusters and not for standalone deployments.

MSSql DB On Windows pattern extension: Collect MSSQL HADR - Availability Group Info

MSSQL Availability Group [cmdb_ci_mssql_ag]

Field	Description
Cluster ID [cluster_id]	Globally unique identifier (GUID) of the availability group.
Name [name]	Cluster name.
IP Address [ip_address]	IP address of the cluster.

MSSQL Availability Group Replica [cmdb_ci_mssql_ag_replica]

Field	Description
Replica ID [replica_id]	Unique ID of the replica.
Role [role]	Role of the replica. Possible values are: • Primary • Secondary • Resolving
Availability Mode [availability_mode]	Availability mode of the replica. Possible values are: • Asynchronous Commit • Synchronous Commit • Configuration Only
Failover Mode [failover_mode]	Failover mode of the availability replica. Possible values are: • Automatic • Manual

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MSSQL Availability Group Replica [cmdb_ci_mssql_ag_replica] (continued)

Field	Description
Readable Secondary [readable_secondary]	Whether an availability replica that's performing the secondary role can accept connections from clients. Possible values are: • true • false
Availability Group [availability_group]	References the MSSQL Availability Group [cmdb_ci_mssql_ag] table.
Name [name]	Name of the replica server.
Serial number [serial_number]	Unique ID of the replica.
State [state]	Failover state. Possible values: • Pending • Online • Offline • Failed • Failed No Quorum

MSSQL Availability Group Listener [cmdb_ci_mssql_ag_listener]

Field	Description
Name [name]	Name of the availability group listener.
Listener ID [listener_id]	Resource globally unique identifier (GUID) from Windows Server Failover Clustering (WSFC) cluster.
IP Subnet Mask [ip_subnet_mask]	IP subnet mark for the IPv4 address, if any, that's configured for the availability group listener.
Availability Group [availability_group]	References the MSSQL Availability Group [cmdb_ci_mssql_ag] table.

CI relationships and references

The MSSql DB On Windows pattern creates the following relationships and references to support Microsoft SQL Server and Cluster discovery. References link to records in other tables and don't appear in the CI Relationship [cmdb_rel_ci] table.

CI relationships

CI	Relationship	CI
Windows Server [cmdb_ci_win_server]	Runs::Runs on	MSSQL Cluster [cmdb_ci_mssql_cluster]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CI relationships (continued)

CI	Relationship	CI
MSFT SQL instance [cmdb_ci_db_mssql_instance]	Runs::Runs on	MSSQL Cluster [cmdb_ci_mssql_cluster]
MSSQL Cluster Node [cmdb_ci_mssql_cluster_node]	Cluster::Cluster of	MSSQL Cluster [cmdb_ci_mssql_cluster]

Add the Horizontal Pattern probe to a classifier

Horizontal Pattern probe

Database Administrator (DBA) report discovery

MySQL discovery

Discovery can identify an instance of MySQL that is running on UNIX or Windows operating systems.

Requirements

Discovery searches for the MySQL configuration file location from the following areas:

- UNIX: Discovery searches for the MySQL configuration file location from the mysqld process, or port 3306.
- Windows: Discovery searches for the MySQL configuration file location from the mysqld.exe process, or port 3306.

For each process, the following process parameters are explored in the following order:

--defaults-extra-file

--defaults-file

If the MYSQL configuration file location is not found from that search, then the following occurs:

- UNIX: The configuration file location defaults to `/etc/my.cnf`.
- Windows: No default configuration file location exists, and the probe to read the configuration file location is skipped.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Credentials

Configure these credentials:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Windows credentials
- SSH credentials
- Applicative credentials (When applications require credentials in addition to the credentials the that host machine requires.)

Note: There's no need to configure applicative credentials unless your Discovery prerequisites mention them.

For a list of privileged commands that you need for Discovery and Service Mapping, see Service Mapping commands requiring a privileged user. This list includes commands that require elevated rights to discover and map Unix-based hosts in your organization.

Classifiers, patterns, and probes

Discovery uses these classifiers, probes, and patterns for MySQL discovery:

Classifier	Trigger probes	Pattern
MySQL Server	• Horizontal Pattern: launches patterns • Windows - MySQL Configuration* • Windows - MySQL Version* • MySQL - Configuration* • MySQL - Version*	My SQL server On Windows and Linux Pattern

*For new instances, these probes are inactive on the classifier. Discovery uses patterns for discovery.

To use patterns, verify that the correct pattern is specified in the horizontal pattern probe on the classifier. See Add the Horizontal Pattern probe to a classifier for instructions.

Data collected

Discovery populates these fields in the MySQL Instance [cmdb_ci_db_mysql_instance] table:

Label	Field name	Source
MySQL configuration	myconf	my.cnf
TCP port(s)	tcp_port	running_process
Version	version	mysqld

Related topics

Database Administrator (DBA) report discovery

MongoDB discovery

Discovery creates or updates a CMDB record when it detects a running instance of MongoDB.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Credentials

Configure SSH credentials.

For a list of privileged commands that you need for Discovery and Service Mapping, see Service Mapping commands requiring a privileged user. This list includes commands that require elevated rights to discover and map Unix-based hosts in your organization.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

The following data is collected:

Data Collected by Discovery on MongoDB instances

Label	Table Name	Field Name	Source
Version	cmdb_ci_db_mongodb_instance	version	mongod (UNIX) or mongod.exe (Windows)
Mongo configuration	cmdb_ci_db_mongodb_instance	mongodb_conf	mongod.conf
TCP port(s)	cmdb_ci_db_mongodb_instance	tcp_port	Process Classification or mongod.conf

PostgreSQL discovery

Discovery can find running instances of PostgreSQL on Windows and Linux systems.

Credentials and other prerequisites

Create SSH credentials for PostgreSQL discovery

For more information, see SSH credentials.

Verify root-level access to the database

The user must have root-level access to the database to access the `postgresql.conf` file.

Verify privileged commands for for PostgreSQL discovery

For a list of privileged commands that you need for Discovery and Service Mapping, see Service Mapping commands requiring a privileged user. This list includes commands that require elevated rights to discover and map Unix-based hosts in your organization.

Differentiate multiple PostgreSQL instances on the same host by port number

Starting with Discovery and Service Mapping Patterns version 1.35.0, you can make multiple PostgreSQL instances on the same host distinguishable by port number by creating the *`mid.discovery.postgresql.include_port_in_name`* MID Server property. For more information, see Include the port number in PostgreSQL instance names.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Classifiers, patterns, and probes

Classifier	Trigger probes	Patterns
PostgreSQL Instance	• Horizontal Pattern: launches patterns • PostgreSQL - Configuration* (add the *must_sudo* parameter to this probe) • PostgreSQL - Version*	PostgreSQL DB

*For new instances, these probes are inactive on the classifier. Discovery uses patterns for discovery.

To use patterns, verify that the correct pattern is specified in the horizontal pattern probe on the classifier. See Add the Horizontal Pattern probe to a classifier for instructions.

Data collected

Discovery populates the data in the CMDB when running the PostgreSQL DB pattern.

The following fields gather specified information from the target. If the source is not configured, it brings back default information. For instance, for PostgreSQL Instance@hostname (default name), the source needs to be modified. If not, all the "PostgreSQL Instance@hostname" will be added in the source for the PostgreSQL Instance [cmdb_ci_db_postgresql_instance] table.

PostgreSQL Instance [cmdb_ci_db_postgresql_instance]

Field	Description
Name [name]	The display name of the PostgreSQL instance.*
Data Directory [data_dir]	The data directory of the PostgreSQL instance, parsed from the process command line.
TCP port(s) [tcp_port]	The port on which the PostgreSQL instance is listening, determined from the running process.
Config File [postgres_conf]	The path to the `postgresql.conf` configuration file.
Version [version]	The PostgreSQL version, retrieved from the process executable.

* To populate the **Name** field in the format **instance-port-tcp_port@hostname** instead of the default **instance@hostname**, create the *mid.discovery.postgresql.include_port_in_name* MID Server property. For more information, see Include the port number in PostgreSQL instance names.

Relationships

CI	Relationship	CI
PostgreSQL Instance [cmdb_ci_db_postgresql_instance]	Runs on::Runs	Windows Server [cmdb_ci_windows_server]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CI	Relationship	CI
		or Linux Server [cmdb_ci_linux_server]

Include the port number in PostgreSQL instance names

You can make multiple PostgreSQL instances on the same host distinguishable by port number by creating the *mid.discovery.postgresql.include_port_in_name* MID Server property. This property is supported for UNIX hosts only.

Before you begin

Verify that you have at least version 1.35.0 of Discovery and Service Mapping Patterns.

Role required: mid_server, agent_admin, or agent_security_admin

About this task

By default, Discovery assigns every PostgreSQL instance the display name **instance@hostname**, regardless of port, making multiple instances on the same host indistinguishable in list views. The *mid.discovery.postgresql.include_port_in_name* MID Server property controls this behavior. When created and set to true, Discovery uses the format **instance-port-tcp_port@hostname** instead (for example, **postgres-port-5432@host**). Existing CI records aren't affected.

Procedure

1. Navigate to **All** > **MID Server** > **Properties**.
2. Select **New**.
3. On the form, fill in the fields.

MID Server Property New record fields

Field	Description
Name	Enter `mid.discovery.postgresql.include_port_in_name`.
Value	Enter `true`.
MID server	MID Servers to use for the property. Leave this field empty to apply the property to all MID Servers.

4. Select **Submit**.

What to do next

Run Discovery again to apply the change.

Related topics

PostgreSQL discovery

Oracle database discovery

Discovery can identify an Oracle database instance that is running on UNIX or Windows operating systems. It can also find Oracle clusterware, which runs Real Application Clusters (RAC).

Patterns perform the discovery of Oracle installations. These patterns replace several probes for new instances. If you want to continue to use probes, you can deactivate the Horizontal discovery probe, which launches the pattern, and then activate the necessary probes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Oracle DB on Unix and Oracle DB on Windows do not support RAC single-node discovery.

The Oracle DB on Unix and Oracle DB on Windows patterns discover Oracle catalog objects through the pattern extension Get Catalog info. For more information, see Oracle Catalog discovery. For general information about database catalog discovery, see database catalogs.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Credentials

Configure these credentials:

Credential type	Additional information
Applicative credentials	Applicative credentials are mandatory for two use cases: • Executing SQL queries against the remote Oracle DB Instance • Creating connections to database links • Software Asset Management activated You must add the database user you configured during Oracle database installation. Specify `Oracle instance [cmdb_ci_db_ora_instance]` as the CI type. The user must also have access to the *`tnsnames.ora`* parameters file. Make sure that the tnsnames.ora is configured correctly and exists in the Oracle path on the target Windows host. Also, verify that the utilized Discovery Credentials can read tnsnames.ora file. The user needs permissions for the SQL*Plus command line tool and permissions to execute SELECT queries against the following tables: • PRODUCT_COMPONENT_VERSION • V$VERSION • V$DATABASE • V$PARAMETER
Oracle Wallet authentication	You can use Oracle Wallet instead of applicative credentials.
Windows credentials	Required for Windows targets. The user must have read permissions to the `tnsnames.ora` file. For a list of privileged commands that you need for Discovery and Service Mapping, see Service Mapping commands requiring a privileged user. This list includes commands that require elevated rights to discover and map Unix-based hosts in your organization.
SSH credentials	Required for UNIX targets. The user must have read permission to the `oratab` file and read permission to the System Parameter file. For a list of privileged commands that you need for Discovery and Service Mapping, see Service Mapping commands requiring a privileged user. This

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Credential type	Additional information
	list includes commands that require elevated rights to discover and map Unix-based hosts in your organization.

Additional requirements

Discovery identifies a running instance of an Oracle database on UNIX from the process that starts with `ora_pmon_`. Ensure this process is running in the IP range you designate for Discovery. Discovery identifies a running instance of an Oracle database on Windows from the `oracle.exe` process. Ensure this process is running in the IP range you designate.

For Oracle clusterware, you also need permissions to read the `/etc/hosts/` file, which associates host names with IP addresses.

The following commands are run for Oracle clusterware:

Command	Description
`ps -ef | grep 'crsd.bin' |grep -v grep`	Verifies if Oracle CRS process is running.
`ps -ef |grep LISTENER | grep -v $$ | head -1 | awk '{print $8}'`	Gets Oracle home from the listener process path. Used when the ORACLE_HOME environment variable is unavailable.
`ps -ef | grep 'd.bin' | grep -v grep | grep -v bash | awk '{print $8}'`	Gets Oracle Grid home from the CRS daemon process path.
`/u01/app/12.1.0.2/grid/bin/olsnodes -c | egrep -v 'error|return code'`	Gets Oracle CRS cluster name.
`sudo /u01/app/12.1.0.2/grid/bin/ocrcheck | egrep -v 'error|return code'`	Gets Oracle CRS cluster ID.
`/u01/app/12.1.0.2/grid/bin/crsctl query crs softwareversion| egrep -v 'error|return code'`	Gets Oracle CRS version.
`/u01/app/12.1.0.2/grid/bin/olsnodes | egrep -v 'error|return code'`	Gets Oracle CRS nodes.
`/u01/app/12.1.0.2/grid/bin/crsctl status server | egrep -v 'error| return code'`	Gets Oracle CRS node status.
`/u01/app/12.1.0.2/grid/bin/crsctl stat res -f | tr '\n' '#'`	Gets Oracle CRS resources.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Command	Description
`/u01/app/12.1.0.2/grid/bin/crsctl stat res -p | grep -v CHECK_R |grep -v error |grep -v failed`	Gets Oracle CRS VIP resources.
`/u01/app/12.1.0.2/grid/bin/srvctl config scan | tr '\n' ' '`	Gets Oracle RAC SCAN VIP configurations.
`/u01/app/12.1.0.2/grid/bin/srvctl config vip -node ol7-121-rac1| egrep ' Name' | awk '{print $3}'`	Gets Oracle CRS VIPs name.
`/u01/app/12.1.0.2/grid/bin/srvctl config vip -node ol7-121-rac1| grep ' IPv4 Address:' | awk '{print $4}'`	Get Oracle CRS VIPs ip_address.

Important: Sudo permission are required to run `sudo /u01/app/12.1.0.2/grid/bin/ocrcheck | egrep -v 'error|return code'`.

Classifiers, patterns, and probes

Discovery uses these classifiers, probes, and patterns for Oracle database discovery:

Classifier	Trigger probes	Pattern
Oracle Instance	• Horizontal discovery probe: launches patterns • Powershell-Oracle - Instance PFile (for Windows)* • Powershell-Oracle - Instance Version (for Windows)* • SSHCommand-Oracle - Instance Details (for Linux)*	Application patterns: • Oracle DB On Windows Pattern • Oracle DB on UNIX Pattern This shared library pattern used by the Linux Server pattern: UNIX Cluster - ORACLE Clusterware **Note:** This shared library pattern is triggered if the `crsd.bin` process is running on the Oracle database server.
Oracle Listener	SSHCommand-Oracle - Listener Details	none

*Probes inactive for new instances.

To use patterns, verify that the correct pattern is specified in the horizontal pattern probe on the classifier. See Add the Horizontal Pattern probe to a classifier for instructions.

Data collected

The following data is collected on the Oracle Instances [cmdb_ci_db_ora_instance] table for both UNIX and Windows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data collected on UNIX machines

Label	Field name	Additional information
SID	sid	Obtained from the name of the process that starts with `ora_pmon_`
Install directory	install_directory	Obtained from the path of ORA_HOME
Version	version	Obtained in this order: • From the output of the `ORA_HOME/bin/sqlplus /NOLOG` command • From the output of the `ORA_HOME/bin/lsnrctl` status command • From the path of ORA_HOME
Parameter file	pfile	The following locations are explored for the location of the System Parameter File. If this file does not exist in one of the explored locations, Discovery does not find the file and reports an error. • *oracle_home*/dbs/spfile*SID*.ora • *oracle_home*/dbs/spfile.ora • *oracle_home*/dbs/init*SID*.ora
Oracle Home	oracle_home	Obtained from the *ORATAB* file.
Edition	edition	Obtained from the `context.xml` file.
Name	name	Combination of SID name Host name in the format *SID@HOST_NAME*.
TCP port(s)	tcp_port	Obtained from the `tnsnames.ora` file, or *lsnrctl* status command. If no valid information is retrieved, the default port 1521 is assigned.

Note: See Oracle options for pattern extensions and additional information collected.

Data collected on Windows machines

Label	Field name	Additional information
SID	sid	Obtained from the process parameter that is passed to the *oracle.exe* process.
Install directory	install_directory	
Version	version	Obtained from the output of the *ORA_HOME/bin/sqlplus.exe -V* command.
Parameter file	pfile	The following locations are explored for the location of the System Parameter File. If this file does not exist in one of the explored locations, Discovery does not find the file and reports an error.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data collected on Windows machines (continued)

Label	Field name	Additional information
		• *oracle_home*\database\spfile*SID*.ora • *oracle_home*\database\spfile.ora • *oracle_home*\database\init*SID*.ora
Oracle Home	oracle_home	Parsed from the path of *oracle.exe*
Edition	edition	

Note: See Oracle options for pattern extensions and additional information collected.

Oracle options

For general information on Oracle options, see https://docs.oracle.com/en/.

Discovery can also find the Oracle options that you enable on the instance using the legacy pattern extension, Oracle option extension for Windows/Unix. Note that to discover Oracle options, the Software Asset Management Professional for Oracle (com.snc.samp.oracle) plugin is required.

Oracle Options [samp_oracle_options]

Label	Field name
Instance	instance
Option	option
Licensable	licensable
Currently used	currently_used
First usage date	first_usage
Last usage date	last_usage
Last sample date	last_sample
Detected usage	detected_usage
Sample interval	sample_interval

Table privileges needed	Additional information
The following tables are accessed as part of the Oracle option extension for UNIX and Windows: • DBA_FEATURE_USAGE_STATISTICS • CDB_FEATURE_USAGE_STATISTICS • V$DATABASE • V$VERSION • GV$PARAMETER	The following pattern extensions use the Oracle script: options_packs_usage_statistics.sql. This sql script is for DB Server version 11.2 and later. You need the **Select any dictionary** privilege to execute the script. See the support document ID13172651.1 on https://support.oracle.com/portal/ for more information about usage scripts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table privileges needed	Additional information
• V$CONTAINERS • V$INSTANCE	• Oracle option extensions for UNIX • Oracle option extensions for Windows

Data collected on clusterware

Table	Labels and field names
Unix Cluster [cmdb_ci_unix_cluster]	Name [name] Cluster status [cluster_status] Cluster type [cluster_type] IP address [ip_address] Short description [short_description] Cluster ID [cluster_id] Cluster version [cluster_version]
cmdb_ci_unix_cluster_node	Name [name] Node state [node_state] IP address [ip_address] Node status [node_status]
cmdb_ci_unix_cluster_resource	Name [name] Resource type [resource_type] Resource status [resource_status] Properties [properties]
cmdb_ci_cluster_vip	Name [name] IP address [ip_address] Cluster name [cluster_name] Cluster ID [cluster_id]

On the dependency view, a **+1** on an Oracle database server signifies that it is part of a cluster.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Extend Oracle instance extension

Note: Discovery can also find additional attributes for the instance using the Extend Oracle instance extension. See the Oracle website for more information on options https://docs.oracle.com/en/. Discovery saves these attributes to the Oracle Instances [cmdb_ci_db_ora_instance] table.

Label	Field name
Instance	instance
Host Name	host_name
IS_CDB	cdb_yn
DB Unique Name	db_unique_name
DB Name	database_name
Replication Enabled	replication_enabled

Table privileges needed	Additional information
The following tables are accessed as part of the Extend Oracle Instance extension for UNIX and Windows: • V$DATABASE • V$INSTANCE	The Extend Oracle Instance extension needs to be installed. This extension is included in the Discovery and Service Mapping Patterns application, version 1.0.72 or higher, which can be downloaded from the ServiceNow Store.

Oracle instances on virtual machines

When Oracle instances are hosted on virtual machines, the system creates relationships between CIs.

CI	Relationship	CI
Oracle instance	Hosted on	Computer [cmdb_ci_computer] or Server [cmdb_ci_server] **Note:** This is a virtual machine. The **Is virtual** field is **true**.
Computer [cmdb_ci_computer] or Server [cmdb_ci_server] **Note:** This is a virtual machine. The **Is virtual** field is **true**.	Virtualized by	Computer [cmdb_ci_computer] or Server [cmdb_ci_server] **Note:** This is not a virtual machine.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Oracle instances on virtual machines that are hosted on AWS or Azure clouds

Base class	Relationship	Dependent class
Oracle instance	Hosted on	Computer [cmdb_ci_computer] **Note:** This is a virtual machine. The **Is virtual** field is **true**.
Computer [cmdb_ci_computer] **Note:** This is a virtual machine. The **Is virtual** field is **true**.	Virtualized by	Computer [cmdb_ci_computer] **Note:** This is not a virtual machine.
Computer [cmdb_ci_computer] **Note:** This is a virtual machine. The **Is virtual** field is **true**.	Virtualized by	Virtual Machine Instance [cmdb_ci_vm_instance] **Note:** The vCPU count is populated in this table.
Virtual Machine Instance [cmdb_ci_vm_instance]	Hosted on	AWS Datacenter [cmdb_ci_aws_datacenter] or Azure Datacenter [cmdb_ci_azure_datacenter]

SAP Sybase ASE discovery

Discovery and Service Mapping uses the Sybase pattern to find SAP Sybase Adaptive Server Enterprise (ASE) databases and catalogs in your infrastructure. Discovering some of these resources might require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Request new or enhanced Patterns on the ServiceNow® Store

Visit the ServiceNow Store to view all the available updates and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Prerequisites

Verify that the applications are up to date.

Discovery and Service Mapping Patterns

CMDB CI Class Models

Visibility Content

For details on the product discovered see Detailed information on products discovered by ITOM Visibility

Note: Discovery finds Sybase Catalog that run on Linux only.

Verify the configuration of OS server credentials.

Verify the configuration of the Applicative Credentials

When configuring the Applicative Credentials, make sure you specify `Sybase Instance [cmdb_ci_db_syb_instance]` as the CI type.

For more information on Applicative Credentials, see Applicative credentials

Verify that the user have permission to run the following commands

Execute the *`isql`* command.

Have the Sybase environment run one of the commands:

- `"echo -ne 'set nocount on select name from sysdatabases \ngo\n' | " + $isql_path + " -U $$username$$ -P '$ $password$$' -S " + $instance + " -w 999 -b -y " + $process.environmentVariables.SYBASE.value`
- `"export SYBASE=" + $process.environmentVariables.SYBASE.value + " && . " + $process.environmentVariables.SYBASE.value`

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
+ "/SYBASE.sh && echo -ne 'set nocount on
select name from sysdatabases\ngo\n' | " +
$isql_path + " -U $$username$$ -P '$$password
$$' -S " + $instance + " -w 999 -b -y " +
$process.environmentVariables.SYBASE.value
```

Verify the configuration of a Discovery schedule

For detailed information, see Running discoveries in your network

Data collected during Horizontal discovery

Discovery populates the following data in the CMDB when running the Sybase pattern.

Sybase instance [cmdb_ci_db_syb_instance]	
Label	**Field Name**
Name	name
Version	version
Installation directory	install_directory
Instance name	Instance
Configuration file	config_file

Sybase Catalog [cmdb_ci_db_syb_catalog]	
Label	**Field Name**
Name	name

CI relationships

These relationships are created to support the Sybase ASE discovery.

CI	Relationship	CI
[cmdb_ci_db_syb_instance]	Contains::Contained by	[cmdb_ci_db_syb_catalog]

Network device discovery

Discovery identifies several network devices, including load balancers, routers, TCP connections, IP networks, and so on. It can find devices through traditional port probes, and then through identifications and exploration probes, or through patterns. It also supports discovery by identifying HTTP and TCP connections.

Note: See the knowledge article KB0687582 for information on model_id and manufacturer.

Load balancer discovery

Discovery can collect data about network routers, switches, and applications.

Discovery supports data collection from the following applications and hardware:

- A10
- Apache mod_jk and Apache mod_proxy

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Big-IP F5 Traffic Manager
- Cisco
- Citrix NetScaler
- HAProxy
- NGINX
- Alteon
- ACE
- Radware

Important: Discovery treats load balancers as licensable entities and attempts to discover them primarily using SNMP. If a load balancer in your system, running on a Linux host, has SNMP and SSH ports open, Discovery might classify it based on the SSH port. This classification has priority over SNMP. To ensure that Discovery properly classifies your hardware load balancers, create a Discovery behavior for load balancers that includes SNMP but not SSH. Software load balancers are treated as applications.

Load balancer patterns

Starting with the Jakarta release, Discovery uses out-of-box patterns to find some types load balancers for new instances (see table).

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Load balancer	Pattern names and description	Main CI table populated
A10	A10 LoadBalancer	A10 Load Balancer [cmdb_ci_lb_a10]
ACE	ACE Load Balancer by SSH (formerly ACE Load Balancer)	ACE [cmdb_ci_lb_ace]
Alteon	Alteon Load Balancer	Alteon [cmdb_ci_lb_alteon]
F5 BIG-IP	F5 - HD, F5 Load Balancer	F5 BIG-IPs [cmdb_ci_lb_bigip]
NetScaler	Netscaler Load Balancer	Citrix NetScalers [cmdb_ci_lb_netscaler]
Radware - AppDirector	AppDirector Load Balancer	Radware Load Balancer [cmdb_ci_lb_radware]
HAProxy load balancer discovery with patterns	HA Proxy	HAProxy Load Balancer [cmdb_ci_lb_haproxy]

To use patterns, verify that the correct pattern is specified in the horizontal pattern probe on the classifier. See Add the Horizontal Pattern probe to a classifier for instructions.

Load balancer discovery, Service Mapping, and customized CI fields

Discovery collects information about the install status and operational status of load balancers. If you are using Discovery with Service Mapping, do not customize the [operational_status] or [install_status] fields. By default, Service Mapping ignores all host CIs for which the value of the *[operational_status]* field is not *1* (Operational) or the value of the status

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

[install_status] field is *100* (absent). For additional information, see Preparing customized ServiceNow deployments to work with Service Mapping [KB0647574] in the HI Knowledge Base.

A10 load balancer discovery

Discovery and Service Mapping uses patterns to collect information about A10 load balancers.

Note: Probe-to-pattern migration is supported for the New York release and later. See the knowledge article KB0694477 for more information.

The following patterns support the A10 load balancer discovery:

- A10 Load Balancer
- A10 Load Balancer SSH
- A10

The A10 IP Source NAT (Network Address Translator) is an extension of the A10 Load Balancer Pattern. The IP Source NAT Pattern extension discovers IP Source NAT pools. This extension is available on Store from the February 2023 release, Store version 1.0.98.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Prerequisites

Credentials

Configure SNMP credentials or (optionally) SSH credentials.

Discovery and Service Mapping Patterns application

To discover A10 load balancer partitions, deploy Discovery and Service Mapping Patterns application 1.0.98 release from the ServiceNow Store.

Data collected by Discovery during horizontal discovery

Table and field	Description
A10 Load Balancer [cmdb_ci_lb_a10]	
Serial number [serial_number]	Serial number of the load balancer.
Load Balancer Interface [cmdb_ci_lb_interface]	
Name [name]	Name of the load balancer interface.
MAC Address [mac_address]	MAC address of the load balancer interface, in the following format: 55:0d:f9:98:3i:ae.
Operational status [operational_status]	Operational status of the load balancer interface.
Load Balancer Pool [cmdb_ci_lb_pool]	
Name [name]	Name of the load balancer pool.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

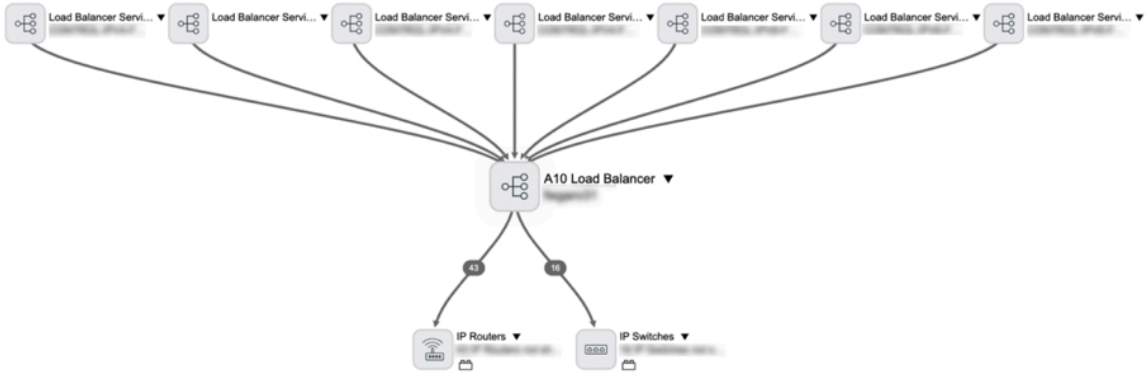
Table and field	Description
Load balancing method [load_balancing_method]	The method used by the load balancer.
Load Balancer Pool Member [cmdb_ci_lb_pool_member]	
Name [name]	Name of the pool member.
IP Address [ip_address]	IP address of the pool member host.
Service port [service_port]	Port used by the pool member.
Operational status [operational_status]	Operational status of the load balancer pool members.
Pool [pool]	Pool member.
Load Balancer Services [cmdb_ci_lb_service]	
Name [name]	Name of the load balancer, in the following format: <LB name>:<LB port>.
IP Address [ip_address]	IP address of the FQDN.
Port [port]	Port of the load balancer.
Operational status [operational_status]	Operational status of the load balancer service.
Install Status [install_status]	Install status of the load balancer service.
Pool [pool]	Pool member of the load balancer service.
DNS [cmdb_ci_dns_name]	
Name [name]	DNS name.
IP Address [ip_address]	DNS IP address.
A10 Load Balancer Partition [cmdb_ci_lb_a10_partition]	
Name [name]	Name of the partition.
Index [index]	Partition ID. An admin assigns this ID in the process of creating a partition.
Max Aflex [max_aflex]	Maximum number of aFleX scripts that can belong to the partition.
Admin Count [admin_count]	Number of admins assigned to the partition.
L3V [l3v]	Value indicating whether Layer 2/3 virtualization is enabled for the partition.
Network Adapter [cmdb_ci_network_adapter]	
Operational status [operational_status]	Operational status of the network adapter.
Mac address [mac_address]	MAC address of the network adapter.
Alias [alias]	Alias of the network adapter.
IP Address [ip_address]	IP address of the network adapter.
Name [name]	Name of the network adapter.
Netmask [netmask]	Netmask of the network adapter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table and field	Description
PrimaryIP [primaryIP]	PrimaryIP address of the network adapter.
IP Address [cmdb_ci_ip_address]	
IP Address [ip_address]	IP address.
Netmask [netmask]	Netmask to which the IP address belongs.
Version [version]	IP version.
Operational Status [operational_status]	Operational status of the IP address.
SNAT IP Pool [cmdb_ci_snat_ip_pool]	
NAT Pool Failed [nat_pool_failed]	The total misses in the pool.
HA Group [ha_group]	High Availability group number associated with the NAT pool.
NET Mask [net_mask]	Netmask of the NAT pool address range.
NAT Pool Total Free [nat_pool_total_free]	The total of free addresses in the pool.
NAT Pool Total Used [nat_pool_total_usage]	The total of used addresses in the pool.
NAT Pool Port Usage [nat_pool_total_used]	The total port usage in the pool.
NAT Pool End Address [nat_pool_end_address]	The IP NAT pool end address (IPv4 or IPv6).
NAT Pool Start Address [nat_pool_start_address]	The IP NAT pool start address (IPv4 or IPv6).
Object ID [object_id]	A unique identifier for the NAT pool, assigned by the A10 device.
Configuration Item [cmdb_ci]	References the A10 Load Balancer [cmdb_ci_lb_a10] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dependency Views showing A10 load balancer and connected components and applications



CI relationships

These relationships are created to support A10 load balancer discovery:

CI	Relationship	CI
Router Interface [dscy_router_interface]	Uses::Used by	Load Balancer Pool [cmdb_ci_lb_pool]
Load Balancer Interface [cmdb_ci_lb_interface]	Owns::Owned by	Load Balancer Pool [cmdb_ci_lb_pool]
Load Balancer Pool Member [cmdb_ci_lb_pool_member]	Owns::Owned by	Load Balancer Pool [cmdb_ci_lb_pool]
Load Balancer Services [cmdb_ci_lb_service]	Used by::Uses	Load Balancer Pool [cmdb_ci_lb_pool]
Load Balancer Services [cmdb_ci_lb_service]	Runs on::Runs	Load Balancer Pool [cmdb_ci_lb_pool]
Load Balancer Pool [cmdb_ci_lb_pool]	Owns::Owned by	Load Balancer Pool [cmdb_ci_lb_pool]
DNS Name[cmdb_ci_dns_name]	Used by::Uses	IP Address [cmdb_ci_ip_address]
Network Adapter [cmdb_ci_network_adapter]	Owns::Owned by	Load Balancer Pool [cmdb_ci_lb_pool]
Load Balancer Pool [cmdb_ci_lb_pool]	Owns::Owned by	IP Address [cmdb_ci_ip_address]
A10 Load Balancer [cmdb_ci_lb_a10]	Owns::Owned by	Source NAT IP Pool [cmdb_ci_snat_ip_pool]

Data collected by Service Mapping during top-down discovery

Service Mapping discovers the connections between the A10 load balancers and applications in the deployment.

Cisco ACE load balancer discovery

Discovery identifies and classifies information about ACE load balancers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Credentials

Configure SNMP credentials and SSH credentials.

Classifier, pattern, and probe

Classifier	Trigger probes	Pattern
ACE Load Balancer	Horizontal discovery probe: launches patterns	ACE Load Balancer by SSH (formerly ACE Load Balancer)

Cisco GSS load balancer discovery

Discovery of Cisco GSS load balancers is performed by both SNMP and SSH.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Classifiers

Discovery uses the Cisco GSS Load Balancer classifier, which contains the condition: `sysdescr contains Global Site Selector` to classify the device.

Probes

Discovery uses several probes, including an SNMP probe to discover the specific GSS device and a **Serial Number** probe to identify the serial number of the device. See the table below for the list of related probes.

Warning: You must have SNMP and SSH credentials configured correctly for the GSS load balancers on your network.

The following probes are triggered after classification:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Probe	Description	Type
Cisco GSS - Identity	A multiprobe that identifies the GSS device and serial number.	MultiProbe
Cisco GSS - Network	This is included in the Cisco GSS - Identify probe.	Java-SNMP
Cisco GSS - Serial Number	This is included in the Cisco GSS - Identify probe.	JavaScript
Cisco GSS - Get Domains	A probe that discovers global domain names corresponding to the device.	JavaScript

Tables

Discovery creates a record for each GSS device in the Cisco GSS [cmdb_ci_lb_cisco_gss] table. Domains are populated in the DNS Names [cmdb_ci_dns_name] table. Host names and IP addresses are stored in the IP Address to DNS Name [cmdb_ip_address_dns_name] table. Service Mapping uses this information. You can see the DNS name information on the **DNS Names for CIs** related list of the Load Balancer form.

Note: The Cisco GSS pattern is available by default to use with the Pattern Designer.

Cisco CSS load balancer

Discovery of Cisco CSS load balancers is performed by SNMP.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Classifiers

Discovery uses the Cisco CSS Load Balancer classifier, which contains the OID Classification: 1.3.6.141.9.9.368.4.5.

Probes

The following probes are triggered:

Probe	Description	Type
SNMP - Load Balancer - Identity	A multiprobe that identifies load balancers.	Java-SNMP
Cisco CSS - Get Services	A Java probe that includes the Cisco CSS sensor to identify services defined on the load balancer in the Load Balancer Services [cmdb_ci_lb_service] table. For every service, Discovery populates **Name**, **ip_address**, and **port**.	Java-SNMP

Tables

Discovery creates a record for each CSS device in the Cisco CSS [cmdb_ci_lb_cisco_css] table, which includes the device's **Name**, **Model**, **Serial Number**, **Manufacture**, and **NIC** (ip_address). It also creates a record for each service in the Load Balancer Services [cmdb_ci_lb_service] table.

.

Citrix NetScaler load balancer discovery

Discovery and Service Mapping find Citrix NetScaler load balancers including Server Load Balancing (GSLB).

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Requirements and support

Important: Discovery treats load balancers as licensable entities and attempts to discover them primarily using SNMP. If a load balancer in your system, running on a Linux host, has SNMP and SSH ports open, Discovery might classify it based on the SSH port. This classification has priority over SNMP. To ensure that Discovery properly classifies your hardware load balancers, create a Discovery behavior for load balancers that includes SNMP but not SSH. Software load balancers are treated as applications.

Virtual NetScaler load balancers are not fully supported. Discovery supports local server load balancers and GSLB.

Credentials

- Configure SNMP credentials. The SNMP community string requires read-only access to the Citrix NetScaler MIB (`1.3.6.1.4.1.5951`).

  Note: You also have the option of using SSH credentials. The SSH user requires permission to run NetScaler `show` commands only. However, if the payload size of the data that's returned to the instance is large, the discovery process can fail. In this case, use SNMP credentials instead.

- (Optional) When using the NS.CONF pattern, provide a user with read-only access to the *NS.conf* configuration file if you don't want to provide SNMP or SSH credentials.
- Use basic authentication credentials for discovery via REST. Configure the credential as a credential alias. The NITRO API user requires read-only access to the following resources:
  - `lbvserver`
  - `csvserver`
  - `service`
  - `servicegroup`
  - `interface`
  - `lbvserver_binding`
  - `csvserver_binding`
  - `nspartition`
  - `nshardware`
  - `nshostname`
  - `nsconfig`
  - `hanode`

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For a list of privileged commands that you need for Discovery and Service Mapping, see Service Mapping commands requiring a privileged user. This list includes commands that require elevated rights to discover and map Unix-based hosts in your organization.

Classifier, pattern, and probes

Classifier	Trigger probes	Patterns

NetScaler Load Balancer	• Horizontal discovery probe: launches patterns (see the Patterns column)
	• NetScaler - Network Path Information (multiprobe)
	  ○ NetScaler - ARP Information
	  ○ NetScaler - Route Information
	• SNMP - NetScaler - Identity
	• SNMP - NetScaler - Identity - Serial
	• SNMP - NetScaler - Identity Info
	• SNMP - NetScaler - System
		• NetScaler Load Balancer
		• NetScaler Load Balancer NS.CONF
		• NetScaler Load Balancer SSH
		• Netscaler Loadbalancer NITRO

To use probes for the horizontal discovery, make sure that the *NetScaler - Network Path Information* multiprobe is active on the **Trigger probes** related list for the *NetScaler Load Balancer* classifier. Then deactivate or remove the *Horizontal discovery* probe from the **Trigger probes** related list.

To use patterns, verify that the correct pattern is specified in the horizontal pattern probe on the classifier. See Add the Horizontal Pattern probe to a classifier for instructions.

Note: When using probes and sensors and the system properties *glide.discovery.hostname.snmp_trusted* and/or *glide.discovery.hostname.dns_nbt_trusted* are set to false, the system uses *dns_name* as the load balancer name. When using the Netscaler Load Balancer pattern, the system currently doesn't recognize these system properties when they are set to false.

Connections discovered by Service Mapping during the top-down discovery

Service Mapping performs the top-down discovery of the NetScaler Global Server Load Balancer in the context of application services. It discovers configured URLs of the NetScaler Global Server Load Balancer.

Data collected by Discovery during horizontal discovery

Table and field	Description
DNS name [cmdb_ci_dns_name]	
Name [name]	The name or the DNS name alias of the NetScaler Global Server Load Balancing (GSLB).
IP address [ip_addresses]	Management IP address of the NetScaler Global Server Load Balancing (GSLB).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table and field	Description
Port [port]	The DNS port that Global Server Load Balancer listens to.
Citrix NetScaler [cmdb_ci_lb_netscaler]	
Serial Number [serial_number]	The serial number of the NetScaler device and its current operational status.
Operational Status [operational_status]	
Load Balancer Pool [cmdb_ci_lb_pool]	
Name [name]	The name of the pool and the method of load balancing it enables.
Load Balancing Method [load_balancing_method]	
Load Balancer Pool Member [cmdb_ci_lb_pool_member]	
Name [name]	The name, IP address and service port that each pool member uses.
IP Address [ip_address]	
Service Port [service_port]	
Load Balancer VLAN [cmdb_ci_lb_vlan]	
Name [name]	The name of the VLAN and the tag that is associated with this VLAN to identify it.
Tag [tag]	
Load Balancer Services [cmdb_ci_lb_service]	
Name [name]	Details about the service running on the load balancer, including
IP Address [ip_address]	
Port [port]	
Operational Status [operational_status]	
Install Status [install_status]	
Hit count [hit_count]	
Exit Interface Routing Rules [dscy_route_interface]	
Router Interface [router_interface]	Details about the routing rules for the exit interface, including the interface on the router that ...
Configuration item [cmdb_ci]	
Destination IP network [dest_ip_network]	
Next Hop Routing Rules [dscy_route_next_hop]	
Next hop IP address [router_interface]	Details about the routing rules on the load balancer, including the IP addresses of the next hop router on the network. The Configuration item field is the router which is the next hop device.
Router Interface [router_interface]	
Configuration item [cmdb_ci]	
Destination IP network [dest_ip_network]	

cmdb_ci_lb_netscaler

Column name	Type	Reference
ip_address	IP Address (Validated IPV4, IPV6)

services [cmdb_ci_lb_service]	Runs on::Runs	Netscaler [cmdb_ci_lb_netscaler]

NetScaler device sysName

To verify the NetScaler device sysName, check the snmp mib and verify the sysName value by running the command: *`show snmp mib`*.

To change the value of the sysName, run the command: *`set mib -name <DNS_NAME or NAME_OF_THE_NETSCALER_LB>`* to set the name of the SNMP MIB.

F5 BIG-IP load balancer discovery

Discovery and Service Mapping can find F5 BIG-IP load balancers via SNMP, SSH, and through the REST API.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Important: Discovery treats load balancers as licensable entities and attempts to discover them primarily using SNMP. If a load balancer in your system, running on a Linux host, has SNMP and SSH ports open, Discovery might classify it based on the SSH port. This classification has priority over SNMP. To ensure that Discovery properly classifies your hardware load balancers, create a Discovery behavior for load balancers that includes SNMP but not SSH. Software load balancers are treated as applications.

You can download VMware images of BIG-IP with a free 90-day trial from https://www.f5.com/trial.

For F5 Global Traffic Manager (GTM) BIG-IP load balancers, Discovery resolves DNS names for the F5 GTM hardware and all associated servers that receive distributed traffic. To view this data, navigate to **All** > **Configuration** > **Load Balancers** > **LB Hardware**, open the F5 load balancer record, and select the **DNS Names for CIs** related list. Service Mapping uses this information to map F5 relationships.

Note: If your F5 BIG-IP device is part of a failover cluster, it can be associated with two cluster nodes. In this case, one of the nodes appears as Operational in the **Operational Status** field, and the other appears as Non-Operational.

Prerequisites

- Verify that the following applications are up to date:
  - Discovery and Service Mapping Patterns
  - Visibility Content
  - CMDB CI Class Models
- To successfully discover the load balancer pool members, set the **display service names** option (*`bigpipe.displayservicenames`*) of the load balancer to **false** on the F5 load balancer.
- For F5 Load Balancer pattern:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Configure SNMP credentials on the ServiceNow AI Platform.
- (Optional) If there are iRules or SNMP community credentials aren't enough for discovering outgoing connections, configure SSH credentials.

  Note: If you don't want to use SSH credentials, you can use the REST API to create a connection to F5 BIG-IP devices.

  Service Mapping uses the SSH credentials to retrieve connections that aren't from CMDB. Discovering connections using the SSH protocol is a failover mechanism for the SNMP-based discovery.

- For F5 Load Balancer SSH pattern:
  - Configure SSH credentials.
  - Verify permissions for the following SSH commands. In newer versions of F5 BIG-IP, only A-type GTM pools are supported.
    - `list auth partition all`
    - `list sys global-settings`
    - `show sys hardware`
    - `list sys db failover.state`
    - `list net self one-line`
    - `show sys mac-address | grep interface`
    - `show net interface field-fmt`
    - `show net self | grep -e 'Mac Address' 'IP:'`
    - `list ltm pool | grep -e 'pool' 'mode'`
    - `list ltm pool /<partition_name>/* | grep -e 'pool' 'mode'`
    - `show ltm pool | grep -e 'Ltm::' 'Total Connections'`
    - `show ltm pool /<partition_name>/* |grep -e 'Ltm::' 'Total Connections'`
    - `list sys db bigpipe.displayservicenames | grep value`
    - `show /net vlan | grep -e 'Interface Name' 'Mac' 'Tag'`
    - `show ltm virtual detail | grep -e 'Server:' 'State' 'Pool:' 'Destination' 'Total Connections'`
    - `show ltm virtual detail /<partition_name>/* | grep -e 'Server:' 'State' 'Pool:' 'Destination' 'Total Connections'`
    - `show gtm wideip | grep -e 'WideIp' 'State'`
    - `list wideip a /<partition_name>/* | grep -e 'WideIp' 'State'`
    - `show gtm wideip all | grep -e 'WideIp' 'State'`
    - `list gtm wideip`
    - `list gtm wideip all`
    - `list gtm pool one-line`
    - `list gtm pool a one-line`
    - `list gtm pool /<partition_name>/* one-line`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- `list gtm pool a /<partition_name>/* one-line`
- `list gtm server one-line`

- For F5REST pattern:
  - For horizontal discovery using Discovery, provide read-only permissions to run the following APIs:
    - `"https://" + $ipAddress + "/mgmt/tm/ltm/pool"`
    - `"https://" + $ipAddress + "/mgmt/tm/sys/global-settings"`
    - `"https://" + $ipAddress + "/mgmt/tm/sys/hardware"`
    - `"https://" + $ipAddress + "/mgmt/tm/sys/failover"`
    - `"https://" + $ipAddress + "/mgmt/tm/net/self"`
    - `"https://" + $ipAddress + "/mgmt/tm/ltm/virtual?$select=destination,mask,vlans"`
    - `"https://" + $ipAddress + "/mgmt/tm/net/interface"`
    - `"https://" + $ipAddress + "/mgmt/tm/net/interface/stats"`
    - `"https://" + $ipAddress + "/mgmt/tm/net/trunk"`
    - `"https://" + $ipAddress + "/mgmt/tm/net/vlan"`
    - `"https://" + $ipAddress + "/mgmt/tm/net/vlan/"+<vlan id>+"/interfaces"`
    - `"https://" + $ipAddress + "/mgmt/tm/gtm/wideip"`
    - `"https://" + $ipAddress + "/mgmt/tm/cm/traffic-group/"`
    - `"https://" + $ipAddress + "/mgmt/tm/cm/device"`
    - `"https://" + $ipAddress + "/mgmt/tm/gtm/server"`

    - For BIG-IP starting with version 12:
      - `"https://" + $ipAddress + "/mgmt/tm/gtm/pool/a"`
      - `"https://" + $ipAddress + "/mgmt/tm/gtm/pool/aaaa"`
      - `"https://" + $ipAddress + "/mgmt/tm/gtm/pool/cname"`
      - `"https://" + $ipAddress + "/mgmt/tm/gtm/pool/mx"`
      - `"https://" + $ipAddress + "/mgmt/tm/gtm/pool/naptr"`
      - `"https://" + $ipAddress + "/mgmt/tm/gtm/pool/srv"`
      - `"https://" + $ipAddress + "/mgmt/tm/gtm/wideip/a"`
      - `"https://" + $ipAddress + "/mgmt/tm/gtm/wideip/aaaa"`
      - `"https://" + $ipAddress + "/mgmt/tm/gtm/wideip/cname"`
      - `"https://" + $ipAddress + "/mgmt/tm/gtm/wideip/mx"`
      - `"https://" + $ipAddress + "/mgmt/tm/gtm/wideip/naptr"`
      - `"https://" + $ipAddress + "/mgmt/tm/gtm/wideip/srv"`
  - Create basic authentication credentials.
- For F5 REST OAuth 2.0 authentication pattern:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Verify read-only permission for the following APIs:
  - "https://" + $ipAddress + "/mgmt/shared/authn/login"
  - "https://" + $ipAddress + "/mgmt/tm/ltm/pool"
  - "https://" + $ipAddress + "/mgmt/tm/sys/global-settings"
  - "https://" + $ipAddress + "/mgmt/tm/sys/hardware"
  - "https://" + $ipAddress + "/mgmt/tm/sys/failover"
  - "https://" + $ipAddress + "/mgmt/tm/net/self"
  - "https://" + $ipAddress + "/mgmt/tm/ltm/virtual?$select=destination,mask,vlans"
  - "https://" + $ipAddress + "/mgmt/tm/net/interface"
  - "https://" + $ipAddress + "/mgmt/tm/net/interface/stats"
  - "https://" + $ipAddress + "/mgmt/tm/net/trunk"
  - "https://" + $ip_address + "/mgmt/tm/net/vlan"
  - "https://" + $ipAddress + "/mgmt/tm/net/vlan/"+<vlan id>+"/interfaces"
  - "https://" + $ipAddress + "/mgmt/tm/gtm/wideip"
  - "https://" + $ipAddress + "/mgmt/tm/cm/traffic-group/"
  - "https://" + $ipAddress + "/mgmt/tm/cm/device"
  - "https://" + $ipAddress + "/mgmt/tm/gtm/server"

  - For BIG-IP starting with version 12:
    - "https://" + $ipAddress + "/mgmt/tm/gtm/pool/a"
    - "https://" + $ipAddress + "/mgmt/tm/gtm/pool/aaaa"
    - "https://" + $ipAddress + "/mgmt/tm/gtm/pool/cname"
    - "https://" + $ipAddress + "/mgmt/tm/gtm/pool/mx"
    - "https://" + $ipAddress + "/mgmt/tm/gtm/pool/naptr"
    - "https://" + $ipAddress + "/mgmt/tm/gtm/pool/srv"
    - "https://" + $ipAddress + "/mgmt/tm/gtm/wideip/a"
    - "https://" + $ipAddress + "/mgmt/tm/gtm/wideip/aaaa"
    - "https://" + $ipAddress + "/mgmt/tm/gtm/wideip/cname"
    - "https://" + $ipAddress + "/mgmt/tm/gtm/wideip/mx"
    - "https://" + $ipAddress + "/mgmt/tm/gtm/wideip/naptr"
    - "https://" + $ipAddress + "/mgmt/tm/gtm/wideip/srv"
- Create basic authentication credentials.
- Create a credential alias for the basic authentication credential.
- Create a serverless discovery schedule.

- For top-down discovery using Service Mapping, provide permissions to run the following APIs:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- `https://" get_attr {"managementIP"}"/mgmt/tm/ltm/"get_attr {"irule"}`
- `https://" get_attr {"managementIP"}"/mgmt/tm/ltm/virtual/~Common~"get_attr {"vip_name"}`
- `https://" get_attr {"computer_system.managementIP"}"/mgmt/tm/ltm/pool/"get_attr {"pool_name"}"/members?`

- (Optional) For top-down discovery with Service Mapping, configure applicative credentials.
- (Optional) For top-down discovery with Service Mapping, provide a user with permissions to run the following commands:
  - bigpipe commands (for BIG-IP LTM F5 or BIG-IP GTM F5 version 9)
  - bigpipe and Traffic Management Shell (TMSH) commands (for BIG-IP LTM F5 or BIG-IP GTM F5 version 10)
  - Traffic Management Shell (TMSH) commands (for BIG-IP LTM F5 or BIG-IP GTM F5 version 11)
  - Traffic Management Shell (TMSH) advanced commands (for BIG-IP LTM F5 or BIG-IP GTM F5 version 10, 11, and 12)
  - The *`show cm traffic-group - get command`* for discovering F5 BIG-IP Device Service Clustering
- (Optional) For top-down discovery with Service Mapping, give the user elevated rights to be able to run Service Mapping commands requiring a privileged user.

F5 cluster discovery

The horizontal discovery process can find F5 clusters. To discover clusters, the credentials must have read permission to traffic groups. For SNMP, this is the regular read permission. For SSH, you need to have **Traffic Management Shell (TMSH shell)** enabled and accessible.

Note: Because F5 clusters share the same virtual IPs and addresses for all devices, the horizontal discovery process cannot find specific IP addresses for each device.

Classifier, patterns, and probes

Discovery uses these classifiers, probes, and pattern for F5 discovery:

Classifiers	Trigger probes	Patterns
F5 BIG-IP Load Balancer	Horizontal discovery probe: launches patterns	These patterns are used for standard horizontal discovery including identifying clusters: • F5 Load Balancer • F5 Load Balancer SSH • F5REST • F5 REST OAuth 2.0 authentication

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Classifiers	Trigger probes	Patterns
		Note: The F5 Load Balancer and F5 Load Balancer SSH patterns include the extension section that discovers F5 certificates.
F5 HTTP	The F5 HTTP classifier does not use a trigger probe. It triggers the F5 Load Balancer REST pattern to perform data collection via REST.	These patterns use iRules to get information via REST. Service Mapping uses these patterns for top-down discovery: • F5 Load Balancer REST • F5 BigIP GTM • F5 BigIP LTM

To use patterns, verify that the correct pattern is specified in the horizontal pattern probe on the classifier. See Add the Horizontal Pattern probe to a classifier for instructions.

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the F5 patterns.

F5 BIG-IP [cmdb_ci_lb_bigip]

Field	Description
Name [name]	The name of the load balancer CI.
Serial number [serial_number]	The serial number of the load balancer hardware.
Operational status [operational_status]	The operational status of the load balancer.

Load Balancer Interface [cmdb_ci_lb_interface]

Field	Description
Name [name]	The name of the load balancer interface.
MAC Address [mac_address]	The MAC address of the interface.
Operational status [operational_status]	The operational status of the interface.

Load Balancer Pool [cmdb_ci_lb_pool]

Field	Description
Name [name]	The name of the load balancer pool. GTM pool names end with the suffix **- GTM** to differentiate them from LTM pools with the same name.
Load balancing method [load_balancing_method]	The method used to distribute traffic across pool members.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Load Balancer Pool Member [cmdb_ci_lb_pool_member]

Field	Description
Name [name]	The name of the pool member.
IP Address [ip_address]	The IP address of the pool member.
Service port [service_port]	The port on which the pool member receives traffic.
Pool [pool]	The load balancer pool that this member belongs to.

Load Balancer VLAN [cmdb_ci_lb_vlan]

Field	Description
Name [name]	The name of the VLAN.
Tag [tag]	The tag that identifies the VLAN.
MAC Address [mac_address]	The MAC address associated with the VLAN.

Load Balancer Service [cmdb_ci_lb_service]

Field	Description
Name [name]	The name of the load balancer service.
IP Address [ip_address]	The IP address of the load balancer service.
Port [port]	The port on which the load balancer service receives traffic.
Operational status [operational_status]	The operational status of the load balancer service.
Hit count [hit_count]	The number of connections the load balancer service has received.

DNS Name [cmdb_ci_dns_name]

Field	Description
Name [name]	The DNS name associated with the load balancer or its GTM WideIPs.
IP Address [ip_address]	The IP address associated with the DNS name.

Network Adapter [cmdb_ci_network_adapter]

Field	Description
Name [name]	The name of the network adapter.
IP Address [ip_address]	The IP address of the network adapter.
Netmask [netmask]	The netmask of the network adapter.
MAC Address [mac_address]	The MAC address of the network adapter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cluster [cmdb_ci_cluster]

Field	Description
Name [name]	The name of the cluster.
Cluster status [cluster_status]	The status of the cluster.
Cluster ID [cluster_id]	The unique identifier of the cluster.
IP Address [ip_address]	The IP address of the cluster.

Cluster Node [cmdb_ci_cluster_node]

Field	Description
Name [name]	The name of the cluster node.
Cluster ID [cluster_id]	The unique identifier of the cluster this node belongs to.
Cluster status [cluster_status]	The status of the cluster node.

CI relationships

The following relationships are created to support F5 BIG-IP load balancer discovery.

CI	Relationship	CI
Cluster [cmdb_ci_cluster]	Hosts::Hosted on	F5 BIG-IP [cmdb_ci_lb_bigip]
Cluster Node [cmdb_ci_cluster_node]	Hosted on::Hosts	F5 BIG-IP [cmdb_ci_lb_bigip]
Cluster Node [cmdb_ci_cluster_node]	Cluster of::Cluster	Cluster [cmdb_ci_cluster]
F5 BIG-IP [cmdb_ci_lb_bigip]	Owns::Owned by	DNS Name [cmdb_ci_dns_name]

Connections discovered by Service Mapping during the top-down discovery

Service Mapping performs the top-down discovery of the GTM BIG-IP load balancer in the context of application services. It discovers configured URLs of the GTM BIG-IP load balancers.

Create a serverless schedule for F5 BIG-IP REST OAuth 2.0 authentication-based discovery

Create a serverless discovery schedule to discover F5 BIG-IP load balancers through REST OAuth 2.0 authentication (tokens).

Before you begin

- Verify you have the IP address for the F5 BIG-IP load balancer.
- Create a basic authentication credential. For more information, see Basic authentication credentials.
- Create a alias for the basic authentication credential. For more information, see Credential aliases for Discovery.

Role required: discovery_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Discovery** > **Discovery Schedules**.
2. Create the discovery schedule record.
   a. Select **New**.
   b. On the form, fill in the fields.

Discovery Schedule New record form

Field	Description
Name	Unique name for this discovery schedule.
Discover	Scan type, which should be Serverless.
MID server	Name of the MID Server to use for this schedule.
Active	Enables this schedule for discovery.

   c. Select **Submit**.
3. Create the execution pattern.
   a. In the Discovery Schedules page, select the record you created.
   b. In the **Serverless Execution Patterns** tab, select **New**.
   c. On the form, fill in the fields.

Serverless Execution Pattern New record form

Field	Description
Name	Descriptive name for this record.
Pattern	Pattern to be used for this schedule, which should be the F5 REST OAuth 2.0 authentication pattern.
Proxy Host	Fully qualified domain name of the machine on which you're installing the proxy server, which should be Global.
Active	Enables this schedule for discovery.

   d. Select **Submit**.
4. Set the pattern launcher parameters.
   a. In the **Discovery Pattern Launcher Parameters** tab, select the record you created.
   b. On the form, fill in the fields.

Parameter	Value
ip_address	IP address of the F5 BIG-IP load balancer.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter	Value
credential_alias	Name of the credential alias you created.

c. Select **Submit**.

What to do next

Either execute discovery immediately by selecting **Discover now** or wait until the predefined schedule triggers the discovery.

HAProxy load balancer discovery using probes

Discovery of HAProxy Community edition load balancers is performed by SSH.

Note: Starting with Discovery and Service Mapping Patterns 1.15.0 version, pattern-based discovery is the default method for discovering HAProxy load balancers.

- For information about enabling probe-based discovery, see Enable HAProxy load balancer discovery with probes.
- For information about the HA Proxy pattern, see HAProxy load balancer discovery with patterns.
- For information about Probe to Pattern migration see the knowledge article KB0694477.

HAProxy is an open-source load balancer that can manage any TCP service. It is particularly suited for HTTP load balancing because it supports session persistence and Layer 7 processing. Discovery supports HAProxy for HTTP load balancing. TCP load-balancing is not supported.

Consider the following requirements for discovering the HAProxy:

- The HAProxy software is installed and running on a Linux server.
- The MID Server is deployed to explore the server and the MID Server has access to the server HAProxy configuration file.
- The configuration probe checks for the `haproxy.cfg` file using one of the following methods:
  - Using the *`f`* parameter for the HAProxy process output.
  - Using the default `/etc/haproxy/haproxy.cfg` path.
- The HAProxy probes require credentials and execute privileges to run commands.

Discovery uses the **Unix - Active Processes** probe to identify an HAProxy load balancer when the name of the process is *`haproxy`*. If this criterion matches, a record is created in the HAProxy Load Balancers [cmdb_ci_lb_haproxy] table if one does not already exist for that running process.

The following probes are triggered after classification:

HAProxy probes

Probe	Description	Commands
HAProxy – Version	The sensor of this probe populates the HAProxy version in the HAProxy Load Balancers [cmdb_ci_lb_haproxy] table.	haproxy
HAProxy – Get Configuration	The sensor of this probe populates additional information in the HAProxy Load Balancers [cmdb_ci_lb_haproxy] table. The probe also populates information in the Load Balancer Service [cmdb_ci_lb_service], Load Balancer Pool [cmdb_ci_lb_pool], Load	echo, sed, cut, grep, egrep (within

Probe	Description	Commands
	Balancer Pool Member [cmdb_ci_lb_pool_member], Load Balancer Interface [cmdb_ci_lb_interface], and Load Balancer Application [cmdb_ci_lb_appl] tables.	the Borne shell script)

In addition to populating the data, the following relationships records are created in CI Relationships [cmdb_rel_ci] table:

- The records in the cmdb_ci_lb_appl table run on the cmdb_ci_web_server table records.
- The records in the cmdb_ci_lb_service table use the cmdb_ci_lb_pool table records.
- The records in the cmdb_ci_pool table are used by the cmdb_ci_service table records.
- The records in the cmdb_ci_pool table are members of the cmdb_ci_pool_member table records.
- The records in the cmdb_ci_pool_member table are members of the cmdb_ci_pool table records.

Enable HAProxy load balancer discovery with probes

If you prefer not to start using the default HAProxy pattern-based discovery, enable probe-based HAProxy discovery to continue using it instead.

Before you begin

Role required: discovery_admin

Procedure

1. Navigate to **All** > **Discovery Definition** > **CI Classification** > **Processes**.
2. In the **Name** field, search for `HAProxy`.
3. Select the HAProxy classifier.
4. In the **Triggers probe** related list, select **Edit**.
5. Remove **Horizontal Pattern** from the Triggers probes List.
6. From the Collection list, add **HAProxy - Get Configuration** and **HAProxy - Version** to the Triggers probe list.
7. Select **Save**.

What to do next

Schedule a horizontal discovery to discover HAProxy load balancer with probes. For more information, see Schedule a horizontal discovery.

Related topics

HAProxy load balancer discovery using probes

NGINX load balancer discovery

Discovery of NGINX load balancers is performed by SSH.

NGINX is an open source web server with a load balancer. Discovery identifies the web server and information related to the load balancer.

Consider the following requirements for discovering NGINIX servers:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Ensure that the NGINX software is installed and running on the server.
- Grant the MID Server has access to the NGINX configuration file, which is `/etc/nginx/nginx.conf` by default.
- Enable secure shell (SSH) commands.
- The NGINX probes require credentials and execute privileges to run commands.

For a list of privileged commands that you need for Discovery and Service Mapping, see Service Mapping commands requiring a privileged user. This list includes commands that require elevated rights to discover and map Unix-based hosts in your organization.

The Nginx Process Classifier detects a running process that matches the following criteria during the exploration of a UNIX server:

- The name of the process starts with *`nginx`*.
- The name of the process contains *`master`*.

Both of these conditions must match:

- A record is created in the Web Server [cmdb_ci_web_server] table.
- A **Runs on** relationship is created in the CI Relationship [cmdb_rel_ci] table for the Linux Server [cmdb_ci_linux_server] table and the Web Server [cmdb_ci_web_server] table.

The following probes are triggered after classification:

NGINX probes

Probe	Description	Commands
Nginx – Version	This probe contains a Bourne shell script. It determines the version of NGINX and populates the Web Server [cmdb_ci_web_server] table.	nginx
Nginx – Get Configuration	This probe contains a Bourne shell script and an argument that determines the path of the NGINX configuration file. The probe identifies configuration parameters based on keywords within the configuration file and returns them as a single payload result.	echo, sed, cut, grep, egrep (within the Bourne shell script)

In addition to populating the data, the following relationships records are created in CI Relationships [cmdb_rel_ci] table:

- The records in the cmdb_ci_web_server table run on the cmdb_ci_linux_server table records.
- The records in the cmdb_ci_lb_service table use the cmdb_ci_lb_pool table records.
- The records in the cmdb_ci_pool table are used by the cmdb_ci_service table records.
- The records in the cmdb_ci_pool table are members of the cmdb_ci_pool_member table records.
- The records in the cmdb_ci_pool_member table are members of the cmdb_ci_pool table records.

Radware Alteon load balancer discovery

Discovery identifies and classifies information about Alteon load balancers.

Radware-appDirector load balancer discovery

Discovery of Radware load balancers is performed by SNMP.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Requirements

Important: Discovery treats load balancers as licensable entities and attempts to discover them primarily using SNMP. If a load balancer in your system, running on a Linux host, has SNMP and SSH ports open, Discovery might classify it based on the SSH port. This classification has priority over SNMP. To ensure that Discovery properly classifies your hardware load balancers, create a Discovery behavior for load balancers that includes SNMP but not SSH. Software load balancers are treated as applications.

Credentials

Configure SNMP credentials.

Load balancer fields and probes

Discovery stores load balancer information in several tables.

The information in this topic pertains to discovery with probes and sensors only. If you are using patterns, such as to discover F5 Big-IP load balancers, see the relevant topic for that type of load balancer.

Note: By default, the system uses the discovered IP address of a load balancer for the CI record. This can be the management IP created for the device that is used in the Discovery schedule. For instructions on how to force Discovery to use the IP address of the load balancer's NIC rather than that of a management IP, see IP address selection properties.

Apache web server data

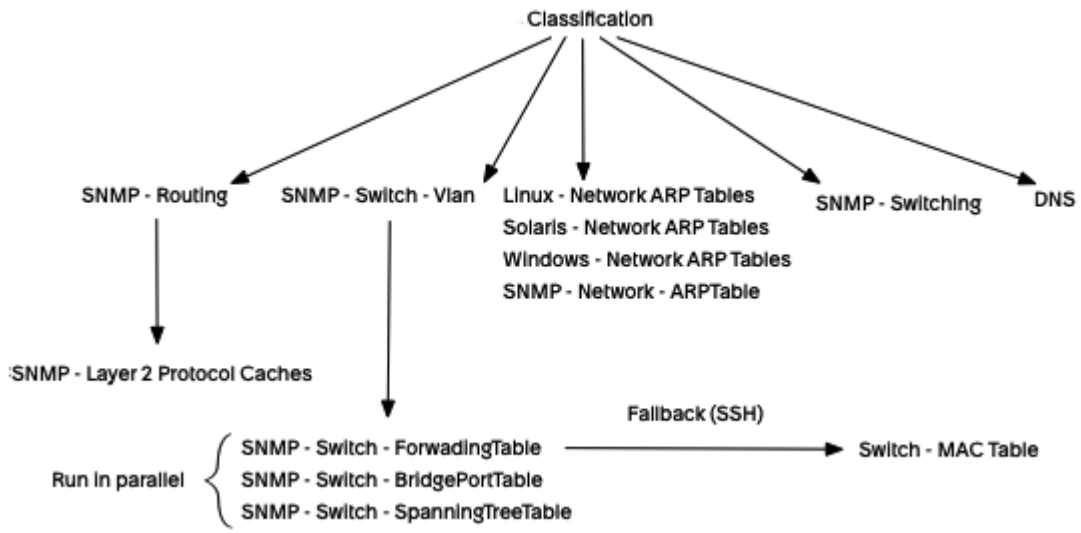
Discovery also collects data on Apache web serer load balancing modules using SSH. See Apache mod_jk and mod_proxy discovery for more information on probes for Apache web server data. For information on the tables, fields, and data sources that discovery populates for Apache web servers, see Apache web server discovery.

Layer 2 discovery

Discovery can detect the physical connections, known as layer 2, between network devices.

Layer 2 discovery process

Discovery uses multiple probes to gather information about network adapters and their Layer 2 connections. The following diagram shows the probes that Discovery launches for network Discovery, including those used for Layer 2 Discovery.



For example, if Discovery finds a switch in a network, it triggers the *SNMP - Switch - Vlan* probe and the *SNMP - Network - ARPTable* probe. For every Vlan that Discovery finds, it triggers various switch probes. If a switch has routing capabilities, Discovery triggers

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

the *SNMP - Routing* probe to collect network adapter information in the Network Adapter [cmdb_ci_network_adapter] table. If Discovery finds a server, it triggers the appropriate Address Resolution Protocol (ARP) probe for that operating system. Discovery also supports the use of patterns, such as the *Network Switch* and *Network Router* patterns, which are available by default in Discovery. See Network switch and router discovery for more information.

During the discovery of a network device, Discovery creates records in the Router Interface [dscy_router_interface] table and the Switchport [dscy_switchport] table. This information contains network adapter information for that device. For SNMP-enabled devices, Discovery gathers the information from a routing probe during the exploration phase. The Layer 2 protocol cache probe runs next to collect neighbor data from the device.

Retrieving neighbor data

As Discovery gathers network information from the probes on a device, the SNMP - Layer 2 Protocol Caches identifies device neighbors via CDP and LLDP. This probe updates the Device Neighbors [discovery_device_neighbors] table, which contains the Layer 2 connections between switches. Sometimes, the neighbors of this device might not yet be known to the instance. The neighbor's interface cannot be resolved to a record until Discovery eventually finds the neighbor's side of the relationship. When Discovery runs on the neighboring device, Discovery completes the information for the neighbor's interface for the original reporting device.

Discovery can retrieve neighbor data from these caches on a network device:

- Cisco Discovery Protocol (CDP): Cache on Cisco devices that contains device neighbor information in the form of a protocol specific neighbor ID. Cisco Discovery Protocol (CDP).
- Link Layer Discovery Protocol (LLDP): Generic cache that contains device neighbor information in the form of a protocol specific neighbor ID.
- Address Resolution Protocol (ARP): Cache that contains the IP and MAC addresses of all connecting devices and servers.

How Layer 2 Discovery works

When device discovery is complete, the system runs the Service Discovery - Device Complete business rule on the Device [discovery_device_history] table. This business rule uses several strategies, together with information from various tables to create *Connects to:Connected by* relationships in the CMDB. Relationships can be created between:

- A server and a switch
- Two switches
- A device and the port of another device
- The ports of two devices

In the following example, Discovery found a server running AIX, and was also able to find two IP switches on the network. These relationships were created:

- A *Connects to* relationship between the AIX Server and the two IP switches A and B.
- A reference between the AIX server and its own network adapter.
- A *Connects to* relationship between the adapters on the two IP switches (not shown in the following image).
- A *Connects to* relationship between the network adapter of the AIX server and the switch port of IP switch A (highlighted in red). This kind of relationship is created by default.

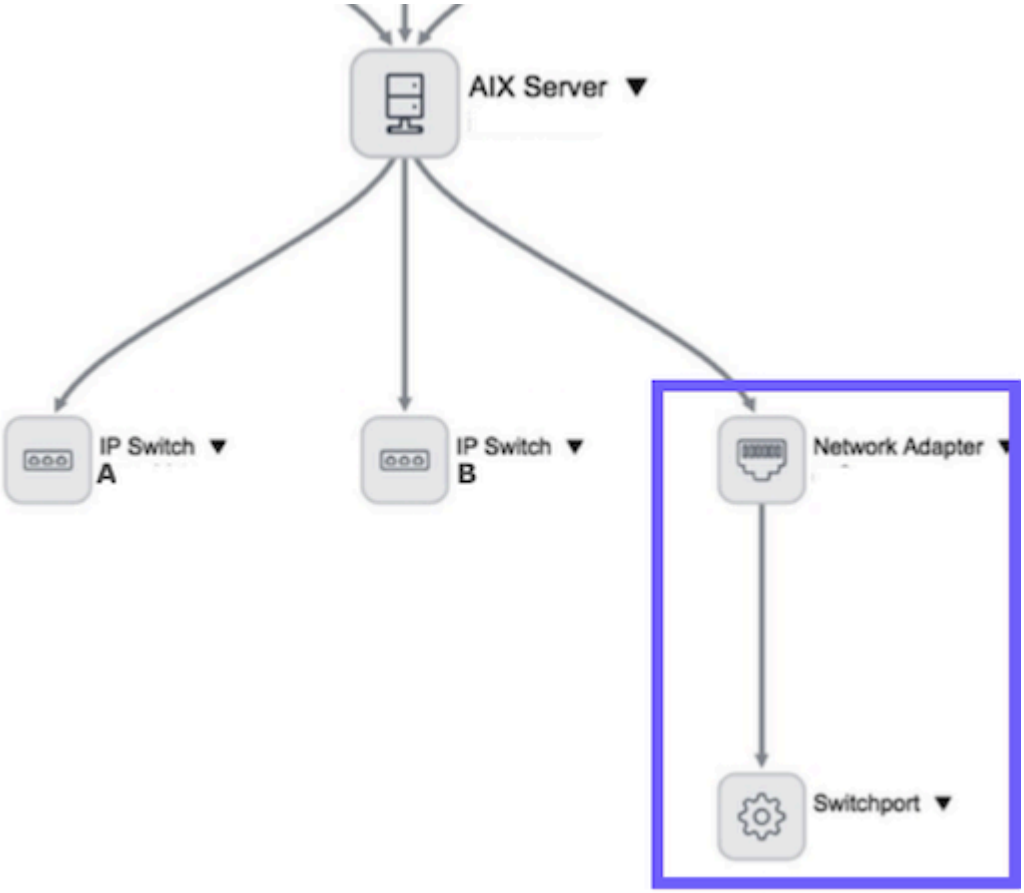
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



To view these relationships, open the dependency view for the server. To view the relationship between the two IP switches, open the dependency view from one of the switches and select the **Physical Network Connections** option for the **Dependency Type** in the map settings.

Layer 2 connection strategies

Layer 2 Discovery uses the following strategies to create relationships between devices in a network:

PhysicalHostConnectionStrategy

This strategy creates a connection between a discovered server, which is not a network device, and a network device. This strategy can only create a Layer 2 connection if there is a single MAC address on the port in the switch's forwarding table. If the port has multiple MAC addresses, Discovery does not create a connection between the server and the switch.

If the switch's port is identified, Discovery creates a **Connects to::Connected by** relationship between the server adapter and the switch port. Otherwise, Discovery creates a **Connects to::Connected by** relationship between the server adapter and the switch itself.

VMLayer2ConnectionStrategy

This strategy creates a connection between a VM and a network device. If the number of exceptional MAC addresses is very low (less than 3 and less than 15% of all MAC address of the ESX server and its VMs), Discovery creates a Layer 2 connection.

NetworkDeviceLayer2ConnnectionStrategy

This strategy creates a connection between a network device and its neighbors. Discovery creates a Layer 2 connection if there is a single neighbor with a neighbor

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

address, a neighbor interface, or both. If the neighbor's interface exists, Discovery creates a **Connects to::Connected by** relationship between the origin interface and the neighbor's interface. Otherwise, Discovery creates a **Connects to::Connected by** relationship between the origin interface and the switch with the neighbor's address.

SpanningTreeLayer2ConnectionStrategy

This strategy creates a connection between a network device and the parent of the network device in the spanning tree.

JavaScriptLayer2ConnectionStrategy

This strategy calls a Javascript function with empty implementation. This allows for the creation of an additional strategy.

Address Resolution Protocol (ARP) in Layer 2 discovery

The probes for Address Resolution Protocol (ARP) map the IP address of a computer or network device to a MAC address. These probes retrieve the IP address and MAC address for a CI from the Network Infrastructure Item [dscy_net_base] table. Devices that support SNMP, such as Linux computers and network devices, cache two types of address information:

- **Static**: Manually added address resolutions.
- **Dynamic**: Hardware name and IP address pairs added to the cache by previous, successful ARP resolutions.

When the ARP table Discovery completes, the system collects all static and dynamic table entries from devices via SNMP. If a new ARP entry is available, it is added to the Network ARP Table [discovery_net_arp_table]. If any previously discovered ARP entries are no longer cached in the device ARP table, the system removes the corresponding records from the CMDB using the reconciliation process.

Note: If new ARP entries are created after Discovery runs, they are not discovered until the next Discovery schedule. If ARP entries are removed from the device after Discovery runs, the CMDB ARP table is not updated until Discovery runs again.

Discovery provides these probes for extracting IP and MAC address resolution information:

Probe	ECC queue topic	Command	Description
Linux - Network ARP Tables	SSHCommand	sh ${file:linux_arp.sh} This runs a script file to try the net-tools command (arp -n) first. If that fails, it will then try the iproute2 command (ip neighbor).	SSH command probe that retrieves the network information from the ARP table on a Linux server.
Solaris - Network ARP Tables	SSHCommand	arp -an	SSH command probe that retrieves the network information from the ARP table on a Solaris server.
Windows - Network ARP Table	Powershell	arp -a	Powershell probe that retrieves the network information

Spanning tree data returned (continued)

Fields populated	• cmdb_ci • port • port_state • port_enable • designated_root • designated_bridge_mac

SNMP - Switch - ForwardingTable

This probe returns information from a switch's forwarding table.

Forwarding table data returned

Table	Switch Forwarding Table [discovery_switch_fwd_table] This is the forwarding table for the switches.
OIDs	These OIDs are built as needed by the *`DiscoveryVlanSwitchProcessor`* script include. • **Non-Cisco**: ◦ **Q-BRIDGE MIB**: `oid_spec_list = 'table iso.org.dod.internet.mgmt.mib-2.dot1dBridge.qBridgeMIB dot1qTpFdbAddress.' + vlanIndex + ',dot1qTpFdbPort.' + vlanIndex + ',dot1qTpFdbStatus.' + vlanIndex;` ◦ **BRIDGE MIB**: oid_spec_list = 'table iso.org.dod.internet.mgmt.mib-2.dot1dBridge.dot1dTp.dot1dTpFdbTable dot1dTpFdbAddress,dot1dTpFdbPort,dot1dTpFdbStatus'; • **Cisco BRIDGE MIB**: `oid_spec_list = 'table iso.org.dod.internet.mgmt.mib-2.dot1dBridge.dot1dTp.dot1 dot1dTpFdbAddress,dot1dTpFdbPort,dot1dTpFdbStatus';`
Additional probe called	The SSH probe `Switch - MAC Table` can be triggered by the *`DiscoveryVlanSwitchProcessor`* script include to populate additional Layer 2 data. If you are missing Layer 2 data after you run discovery on multiple VLANs, you should enable the triggering of the `Switch - MAC Table` probe and run discovery again. To do this, add this property to the System Property [sys_properties] table: `glide.discovery.sensors.forwardingtable.ssh`. Set the value of the property to **true**. By default this property is false.
Command	show mac address-table

Port tables

These port tables are populated during horizontal Discovery of a device:

- Network Adapter [cmdb_ci_network_adapter]
- Switchport [dscy_switchport]
- Router Interface [dscy_router_interface]
- Load Balancer Interface [cmdb_ci_lb_interface]

TCP connection discovery

Discovery identifies and classifies information about TCP connections using the ADM and ADME probes.

Discovery populates this data in the TCP Connections [cmdb_tcp] table.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Label	Table Name	Field Name	Description
Absent	cmdb_tcp	absent	If the process is no longer running on this device. The first time the process is detected, the value is not selected (meaning that it is not absent). If Discovery runs again and does not detect the process, it is selected.
Computer	cmdb_tcp	computer	The device that is connected to or is listening on the TCP port.
IP	cmdb_tcp	ip	The IP address that this device or process is listening on or is connected to. If the IP address is 127.0.0.1, it is the host computer itself.
PID	cmdb_tcp	pid	The ID of the process that is connecting to or listening on this device (IP address).
Port	cmdb_tcp	port	The port number through which TCP traffic was detected.
Process	cmdb_tcp	process	The process that is connecting to or listening on the port.
Type	cmdb_tcp	type	• **Listening on**: the process is listening to the device via TCP. • **Connecting to**: if the process is connected to this device via TCP.
count	cmdb_tcp	count	The number of times that Discovery detects a specific TCP connection. This field is used by ADM enhanced probes.

Discovery populates this data in the Running Process [cmdb_running_process] table.

Label	Field Name	Description
Name	name	The name of the running process.
Computer	computer	The device that the process is running on.
Parent	parent	The parent process of this process, if any.
Listening on	listening_on	The ports that the processes is listening on.
Connected to	connected_to	The ports that the processes is connected to.
Command	command	The command for this process, including the path.
PID	pid	The ID for the process.
PPID	ppid	The ID for the parent process.
Absent	absent	If the process is no longer running on this device. The first time the process is detected, the value is not selected (meaning that it is not absent). If Discovery runs again and does not detect the process, it is selected.
Classify	classify	If the running process should be classified.
Key parameters	key_parameters	The key parameters for the command.

Label	Field Name	Description
Parameters	parameters	The parameters for the command.
Count	count	The number of times that Discovery detects a specific TCP connection. This field is used by ADM enhanced probes.

Standard ADM probes

Discovery launches these probes with standard ADM discovery:

Name	Description	Includes these sub-probes
AIX - ADM	Queries for information about active (running) AIX processes and active connections - the information required to perform application dependency mapping.	• AIX - Active Connections • AIX - Active Processes
HP-UX - ADM	Queries for information about active (running) HP-UX processes and active connections - the information required to perform application dependency mapping. This probe requires that lsof be installed and the UNIX - Active Connections probe be activated, which is inactive by default.	• UNIX - Active Connections • HP-UX - Active Processes
Solaris - ADM	Queries for information about active (running) Solaris processes and active connections - the information required to perform application dependency mapping. This probe is triggered by the Solaris Zones probe. The system triggers an ADM probe for each local zone contained in a global zone. This probe requires that lsof be installed on the global zone.	• Solaris - Active Processes • Solaris - Active Connections
UNIX - ADM	Queries for information about active (running) UNIX processes and active connections - the information required to perform application dependency mapping.	• UNIX - Active Connections • UNIX - Active Processes
Windows - ADM	Queries for information about active (running) Windows processes and active connections - the information required to perform application dependency mapping.	• Windows - Active Connections • Windows - Active Processes
UNIX - ADM netstat	Performs the same functions as the UNIX ADM probe relying on netstat to support continuous TCP-based discovery. Service Mapping uses this probe for traffic-based discovery.	• UNIX - Active Connections with Netstat. This probe retrieves TCP connections to populate the cmdb_tcp and

Name	Description	Includes these sub-probes
		cmdb_tcp_connection tables. • UNIX - Active Processes. This probe retrieves TCP processes and populates the cmdb_running_process table.

Enhanced ADM probes

Discovery launches these probes when enhanced ADM is activated:

Probe	Description
Windows - ADM Enhanced	Performs the same functions as the Windows ADM probe with additional parameters to control continuous TCP-based discovery. This probe is compatible with WinRM and non-WinRM supported MID Servers. Configure your MID Server using the `mid.windows.management_protocol` parameter. See MID Server parameters for the values you can use for this parameter.
UNIX - ADM Enhanced	Performs the same functions as the UNIX ADM probe with additional parameters to control continuous TCP-based discovery.

Use these probe parameters with the enhanced ADM probes:

Parameter	Description
mid.adme.max_result_size	Control the size of the TCP tracking file.
max.adme_result_payload_size	Controls the size of the result, including the payload. **Note:** If this is greater than the MID Server properties mid.discovery.max_payload_size, a configuration error can occur.

Network switch and router discovery

Discovery identifies and classifies information about network switches and routers.

Network switches and routers often have very similar capabilities. It is very common for some switches known as Layer 3 switches to have IP routing. Larger routers with optional modules might accept switching modules. Because of these overlaps and the resulting ambiguity of a particular device's classification, Discovery collects the same data for both routers and switches, if it is available in any given device. For details on how Discovery collects data about connections between network devices and other components, see Layer 2 discovery.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Prerequisites

- The router or switch needs to have IP Address information.
- The system property glide.discovery.L3_mapping is set to true to discover routers and switches.
- The router or Layer 3 switch that provides the IP Address needs to have been successfully discovered with populated Exit Interface Routing Rules.
- If you must populate the [discovery_device_neighbors] table during horizontal layer 2 discovery of the bgp-enabled devices, set the **BGP router exploration disable** property to **No**. Notice that enabling this property can cause performance issues including out-of-memory issues on the MID Server.

System properties

You can configure many aspects of Discovery to work according to your personal preferences. The following properties apply to network routers and switches. To view the properties, navigate to **Discovery Definition** > **Properties** unless indicated otherwise.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
glide.discovery.L3_mapping	This creates IP Connecton::IP Connection relation between servers and network devices. • **Type:** string • **Default value:** true • **Location:** System Property [sys_properties] table
glide.discovery.max_concurrent_invocations_per_schedule	Sets a maximum number of scheduled invocations of the same Discovery schedule. It prevents a backlog of scheduled runs if Discovery does not finish before the next invocation is scheduled to run. The value is an integer that represents the max number of automated invocations of the same schedule that may proceed at one time. If the limit has been reached, subsequent scheduled invocations are canceled. A value of 0 or any negative number disables this property. • **Type:** integer • **Default value:** 3 • **Location: Discovery Definition > Properties** **Note:** This property does not apply to schedules that have a 'Run after' configuration set to 'Even if canceled'.

For a list of properties used in discovery in general, see Discovery properties.

Credentials

Discovery explores many kinds of devices, such as switches, routers, and printers, using the SNMP protocol. SNMP Community Credentials do not include a user name, just a password, which is the community string. The default read-only community string for many SNMP devices is public, and Discovery will try that automatically. SNMPv3 credentials require a user name and a key, depending on the protocol selected. Enter the appropriate SNMP credentials if they differ from the public community string.

Note: SSH is not supported for routers and switches, but is supported for load balancers.

Classifier, pattern, and probes

Classifiers	Trigger probes	Pattern
Standard Network Router Standard Network Switch	• Horizontal Pattern: launches patterns • SNMP-Routing^ • DNS* • SNMP-Identity* • SNMP-Switch-Vlan* • SNMP-Switching* • SNMP - Network - ArpTable* (Standard Network Switch only)	Network Router Network Switch

*For new instances, these probes are inactive on the classifier. Discovery uses patterns for discovery.

^This probe remains active by default for the Standard Network Router classifier, even when Discovery uses pattern discovery.

To use patterns, verify that the correct pattern is specified in the horizontal pattern probe on the classifier. See Add the Horizontal Pattern probe to a classifier for instructions.

Discovering stacked switches

The Network Switch shared library supports Cisco stacked switches. The CI table for this is IP Switch [cmdb_ci_ip_switch]. Multiple switches in the stack are identified by the primary IP address. Each member of the stack is identified by a combination of elements, including the primary IP address, a name associated with the switch, and the stack mode. The relationship is created between a primary and all of the secondaries. The primary switch has all the fields listed in the table below. The secondary switch has name, serial_number, model_id, manufacturer, stack, and stack_mode.

Note: If all the ports on a switch are open for port 161, that switch will have multiple IPs (one for each port) but the serial number for all the ports is the same. The CI identification is performed based on the serial number, therefore the same record is updated every time instead of creating a new record.

Turn off collection of port data for SNMP network devices

In some environments you may not want to collect the port data for SNMP network devices.

Before you begin

Role required: admin

About this task

Network devices can contain an extremely large number of ports. If each individual port's information is not critical to the overall management of the devices, you may not want to collect the port data for SNMP network devices. This would affect records from being created in the Switchports table (dscy_switchport). This process only impacts probe discovery.

Procedure

1. Navigate to **Discovery Definition** > **Probes**.
2. Go to the **SNMP - Switching** probe.
3. In the **SNMP Fields** tab, find the field named **ports**, double-click the value in the **Active** column, and change the value to **false**.
   The collection and processing of ports information for switches is then disabled. The **ports** field for the switch CI should have the correct ports count even though the related list **switchports** is empty.
4. Click the check mark to save the change.

IP service and daemon discovery

IBM WebSphere DataPower discovery

ITOM Visibility discovers IBM WebSphere DataPower. The Discovery feature uses the DataPower Server pattern for horizontal discovery. The Service Mapping feature uses the DataPower pattern for top-down discovery.

Prerequisites

Configure the following credentials before discovering the IBM WebSphere DataPower devices:

SNMP credentials

SNMP credentials are necessary for using the following SNMP queries:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- For horizontal discovery of the Data Power Hosting Server [cmdb_ci_datapower_server]:
  - 1.3.6.1.2.1.1.1
  - 1.3.6.1.2.1.1.5
  - 1.3.6.1.2.1.4.20.1
  - 1.3.6.1.2.1.2.2.1
  - 1.3.6.1.4.1.14685.3.1.196.1
  - 1.3.6.1.4.1.14685.3.1.11.1
  - 1.3.6.1.4.1.14685.3.1.112.1
- For top-down discovery of the Data Power [cmdb_ci_datapower_server]:
  - 1.3.6.1.2.1.1.1
  - 1.3.6.1.2.1.1.5
  - 1.3.6.1.4.1.14685.3.1.11.1

Applicative credentials

Together with SNMP credentials, applicative credentials are required to discover DataPower application domains, otherwise known as logical CIs.

In addition, SNMP and applicative credentials are used for top-down discovery of applicative relationships (corresponding application DataPower domain).

User with permissions to run SOAP

Permissions to run SOAP queries are necessary for top-down discovery of the DataPower Web Service and MQ connection.

Data collected by Discovery during horizontal discovery

By default, Discovery uses the DataPower Server pattern to perform the discovery.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Table and field	Description
Data Power Hosting Server [cmdb_ci_datapower_server]	
Model number [model_number]	The model of the server hosting the WebSphere DataPower.
Host name [host_name]	The host name of the server hosting the WebSphere DataPower.
Serial number [serial_number]	The serial number of the server hosting the WebSphere DataPower.
IP Address [cmdb_ci_ip_address]	
IP Address [ip_address]	The IP address of the server hosting the WebSphere DataPower.
Netmask [netmask]	The netmask of the server hosting the WebSphere DataPower.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table and field	Description
Network Adapters [cmdb_ci_network_adapter]	
MAC address [mac_address]	The MAC address of the network adapter.
Name [name]	The name of the network adapter.

CI Relationships

CI	Relationship/Reference	CI
Data Power Hosting Server [cmdb_ci_datapower_server]	Owns::Owned by	IP Address [cmdb_ci_ip_address]
Network Adapters [cmdb_ci_network_adapter]	Owns::Owned by	Data Power Hosting Server [cmdb_ci_datapower_server]

Data collected by Service Mapping during top-down discovery

Table and field	Description
Data Power [cmdb_ci_app_server_datapower]	
Host name [host_name]	The attributes of the DataPower application.
SOAP URL [soap_url]	
Version [version]	
IP address [ip_address]	
Name [name]	
Domain [domain]	

Cisco Unified Computing System (UCS)-HD device discovery

Discovery and Service Mapping Patterns application uses the to find Cisco UCS equipment, including chassis and blades. Discovering some of these resources might require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Prerequisites

Create SNMP credentials

For more information, see SNMP credentials.

Create applicative credentials

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create applicative credentials for the **Cisco UCS Equipment [cmdb_ci_ucs_equipment]** CI type. For more information, see Applicative credentials.

Verify network connectivity

Verify that the MID Server has HTTPS access to the UCS Manager on port 443 and is able to reach the management IP address of the UCS equipment.

Verify UCS Manager account requirements

Verify that the account has at least the **read-only** role in UCS Manager and has permissions to execute XML API queries for the following object classes:

- `computeRackUnit`
- `equipmentChassis`
- `computeBlade`
- `mgmtIf`
- `topSystem`
- `versionEp`
- `equipmentFan`

Classifier, pattern, and OIDs

The UCS classifier uses HorzontalDiscoveryProbe to launch the UCS - HD pattern. The classifier also uses these SNMP OIDs, which specify the Cisco UCS Equipment `[cmdb_ci_ucs_equipment]` table:

OID	Manufacturer	Model	Table
1.3.6.1.4.1.9.12.3.1.3.847	Unified Computing Cisco UCS 6120XP 20-Port Fabric Interconnect	1.4(3u)(NX-OS) 5.0 Aggregation Switch	Cisco UCS Equipment
1.3.6.1.4.1.9.12.3.1.3.899	Unified Computing Cisco UCS 6140XP 40-Port Fabric Interconnect	1.4(3u)(NX-OS) 5.0 Aggregation Switch	Cisco UCS Equipment
1.3.6.1.4.1.9.12.3.1.3.1062	Unified Computing Cisco UCS 6248UP 48-Port Fabric Interconnect	2.0(1t)(NX-OS) 5.0.2 Aggregation Switch	Cisco UCS Equipment
1.3.6.1.4.1.9.12.3.1.3.1063	Unified Computing Cisco UCS 6296UP 96-Port Fabric Interconnect	2.0(1t)(NX-OS) 5.0.2 Aggregation Switch	Cisco UCS Equipment

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the UCS - HD pattern pattern. Only B-series devices are discovered. The UCS - HD pattern does not find C, S, or E series devices.

Dell Remote Assistant Card discovery

The Dell™ Remote Assistant Card (DRAC) and Integrated Remote Assistance Card (iDRAC) provide users with tools and functionality to monitor, troubleshoot, and repair servers. You can generate DNS URLs to access out-of-band devices when security prevents access from IP addresses.

To identify the DRAC, Discovery uses the **SNMP – DRAC** probe. This probe uses SNMPv1 and SMNPv2c. Out-of-band devices have a dedicated management channel for device maintenance. System administrators can remotely monitor and manage devices with the dedicated management channel, including hardware sensor monitoring, access to local media drives, or adjusting BIOS settings. DNS URLs can be generated for out-of-band devices to access the out-of-band device page when the SSL certificate forbids navigating through the IP address.

Prerequisites

Create SNMP credentials

SNMP credentials are required to discover DRAC devices. For more information, see SNMP credentials.

Run network discovery

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For information on configuring and running network discovery to discover DRAC devices, see Run network Discovery.

Data collected

Data collected by Discovery for Dell DRAC

Label	Table	Name	Command
Firmware version	cmdb_ci_outofband_device	firmware_version	SNMP walk: drsFirmwareVersion (racFirmwareVersion for iDRAC7)
Host *	cmdb_ci_outofband_device	host	SNMP walk: drsSystemServiceTag (systemServiceTag for iDRAC7)
IP Address	cmdb_ci_outofband_device	ip_address	DNS probe
Name	cmdb_ci_outofband_device	name	SNMP Identity probe
Product version	cmdb_ci_outofband_device	product_version	SNMP walk: drsProductVersion (racVersion for iDRAC7)
Type	cmdb_ci_outofband_device	type	SNMP walk: drsProductType (racType for iDRAC7)
URL	cmdb_ci_outofband_device	url	SNMP walk: drsProductURL (racURL for iDRAC7)

* **Host** is a reference to the cmdb_ci_computer table via the serial number. For the cmdb_ci_outofband_device.host field to be populated correctly, the host machine must be discoverable or exist within the CMDB with the appropriate serial number.

Out-of-band devices

A **DNS URL** is generated for configuration items in the **Out-Of-Band Device** list if the configuration item has a **Name** and **DNS Domain**. The **DNS URL** enables you to access the out-of-band device page when the SSL certificate forbids navigating through the **IP URL**. The **DNS URL** has the format `https://Name.DNS_Domain`. If either the **Name** or **DNS Domain** field is empty, the **DNS URL** contains the value in the **URL** field.

HTTP device discovery

Discovery can find devices that use the HTTP protocol.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Classifier, probes, and patterns

HTTP discovery relies on a the *HTTP* port probe, which Discovery runs after trying to run SSH and SNMP port probes. This port probe launches the *HTTP - Classify* probe which runs an HTTP GET request for every entry in the HTTP classification table. You should configure your own classifications that the *HTTP - Classify* probe can access.

The HTTP port probe uses mappings between a protocol and port number in the IP Service [cmdb_ip_service] table. You can add additional port-to-protocol definitions in this table, or you can override the protocol used for a specific HTTP classifier.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Classifier	Probes	Pattern
	HTTP (port probe): this probe launches the HTTP - Classify probe, which runs an HTTP GET request for every entry in the HTTP classification table.	

Run discovery through an HTTP or HTTPS REST call

Discovery can classify devices using the HTTP(S) protocol. You can create your own HTTP classifier to find devices and access them with Basic Auth credentials, rather than using SNMP or SSH credentials.

Before you begin

Role required: discovery_admin

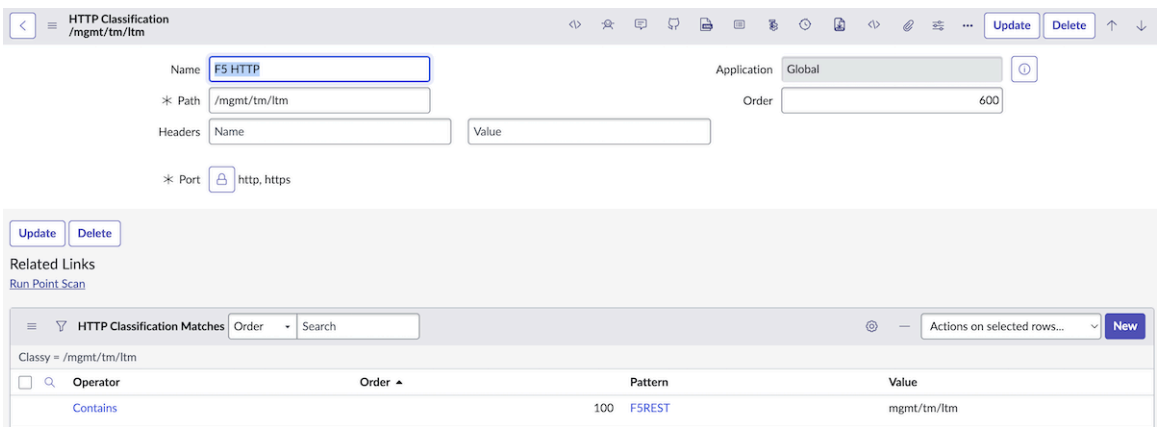
Procedure

1. Navigate to **All** > **Discovery** > **Credentials**.
2. Select **New**.
3. Select **Basic Auth Credentials**.
   In most cases, you can use Basic Auth Credentials to access a device through an HTTP or HTTPS REST call.

   Important: The HTTP Classify probe no longer attempts credentials over the HTTP protocol by default. To override this behavior, you can enable *mid.http_classy.allow_credentials_over_http*. However, enabling this setting can expose credentials to man-in-the-middle (MitM) attacks. Therefore, it's strongly recommended to keep this property set to **false** and use HTTPS whenever possible.

4. Add the user name and password that you need to access the device.
5. Select **Submit**.
6. Set up an HTTP classifier by navigating to **Discovery Definition** > **CI Classification** > **HTTP**.
7. Select **New**.
8. Fill out the form fields (see table):

The F5 HTTP classification



Field	Description
Name	Enter a name for the classifier.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

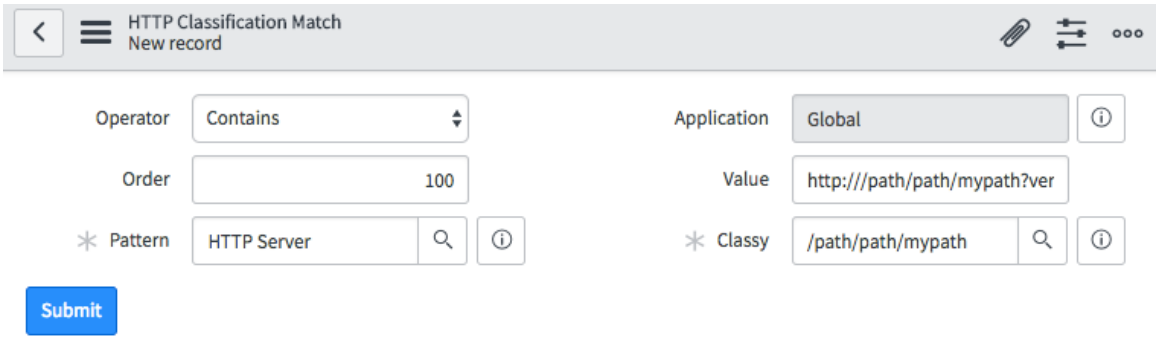
Field	Description
Path	Enter the path for the HTTP GET request.
Headers	Add an option header with a value. You can use a variable in the format `${variable}` instead of a static value. Supported headers depend on the REST web service provider that you want to connect to. See the documentation for your web service provider to identify which headers are valid or required.
Port (IP Service)	If you want this classifier to use a custom port that is not already a default value in the IP Service [cmdb_ip_service] table, do the following: **a.** Select the lookup icon to see the list of IP Services. **b.** Select **New** and create a port-to-protocol mapping. **c.** Select that port-to-protocol mapping for this **Port** field. Many commonly used protocols are already mapped to ports by default, such as `http` to port 80 and the `https` to port 443. If you want to use one of these default port-to-protocol mappings, don't enter any values in the **Port** field. The HTTP port probe uses the correct one by default.
Order	Enter a number that represents the priority of this classifier. If Discovery finds more than one classifier that applies, it uses the classifier with lower **Order** number.
Protocol [optional] This field isn't visible by default. You must configure the form to add it.	If you configure a unique port-to-protocol mapping for the **Port** field, enter an optional protocol override that Discovery uses with this classifier. For example, if you want to use port 5000 and the HTTP protocol, add the 5000/HTTP port-to-protocol mapping to the **Port** field, and then choose **http** in the **Protocol** field.

9. Right-click the header and select **Save**.
   The HTTP Classification Match related list appears. This related list shows criteria that you can configure to match against the body of the response to the GET Request that Discovery sent.
10. In the HTTP Classification Match related list, define the match criteria and specify the pattern to launch for this classifier:

    a. Select **New**.

    b. On the HTTP Classification Match form, fill in the form fields (see table).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Field	Description
Operator	Choose the operator that the system uses to evaluate the condition: ▪ **Contains** ▪ **Equals** ▪ **Regex**
Order	Enter a number that represents the priority of this condition. If Discovery finds more than one condition that applies, it uses the condition with lower Order number.
Pattern	Specify the pattern to launch upon a correct match. This pattern must use HTTP to discover the device.
Value	Enter the value that the body of the returned REST method must have.

c. Select **Submit**.

d. Define as many HTTP Classification Matches as necessary.
You might want to do this if there are different patterns for different versions of the device you're trying to discover.

Example:
In this example, HTTP classification is configured to use the F5 load balancer API:

What to do next
If you don't have other types of credentials that can find devices, such as Linux credentials or SNMP credentials, you can see how the Discovery application processes HTTP discovery:

1. Navigate to **Discovery** > **Discovery Schedules** and run a discovery.
2. After the discovery process completes, check the ECC Queue to see the results of the HTTP discovery.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You should see that after the Shazzam probe was launched, and that UNIX and SNMP classification probes failed. Both the HTTP - Classify probe and the pattern that you specify in the HTTP classification record should launch.

Topic	Name	Source	Queue
Multiprobe	Unix - Classify	10.196.39.128	input
Multiprobe	Unix - Classify	10.196.39.128	output
SNMP	SNMP - Classify	10.196.39.128	output
SNMP	SNMP - Classify 108 OIDs	10.196.39.128	input
HTTPClassyProbe	HTTPClassyProbe	10.196.39.128	input
HTTPClassyProbe	HTTPClassyProbe	10.196.39.128	output

Shazzam	wmi,snmp,ssh,wins,dns,slp,wbem,vmapp,win..	See Payload	output

Storage discovery

Discovery collects information on Direct Attached Storage (DAS), Storage Area Networks (SAN), and Network Attached Storage (NAS).

Storage can be located on specialized devices, such as Storage Arrays, Fibre Channel Switches, iSCSI disks, or on host operating systems, including Windows, Linux, and Solaris.

Discovery finds and maps dependencies for the following types of storage:

- Direct-attached storage (DAS), network-attached storage (NAS), or storage area network (SAN).
- NAS or SAN storage that is discovered via a Storage Management Initiative Specification (SMI-S) and Common Information Model (CIM).
- Virtual storage for VMware ESX servers and Linux Kernel-based Virtual Machines (KVM). Discovery maps this storage to the underlying physical storage.

Discovery of storage via a host reconciles data and creates relationships between the host's file systems and associated local storage devices. The local storage devices represent the storage available to the host, whether it's directly attached or provided by Fibre Channel or iSCSI. This reconciliation assumes that the storage server has been discovered first.

Note: Tape storage drivers are not discovered.

Discovery collects and creates CIs in the CMDB for the following information:

- File systems (local and NAS).
- Disks (both SAN disks and DAS drives).
- Fibre Channel (FC) HBAs and ports.
- Linux Volume Manager (LVM) volumes. LVM volume data resides in the Storage Pool [cmdb_ci_storage_pool] table.
- Veritas Volume Manager disks, subdisks, disk groups, plexes, and volumes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: For details about the discovery of direct attached or multipath block storage provisioned on a Linux host, see KB0622583.

Probes, sensors, and patterns

- KVM - Storage Pools: identifies storage attached to KVM virtual machines.
- Linux - Storage: identifies storage attached to systems running the Linux operating system.
- Solaris - Storage: identifies storage attached to systems running the Solaris operating system.
- Windows - Storage 2008: identifies storage attached to systems running Windows 2008.
  - Windows - Storage 2008 - PS: identifies storage attached to systems running Windows 2008, using the PowerShell.
  - Windows - Storage 2008 - WMI: identifies storage attached to systems running Windows 2008, using WMI Runner.
- Windows - Storage 2012: identifies storage attached to systems running Windows 2012 and later.
  - Windows - Storage 2012 - PS: identifies storage attached to Windows systems, using PowerShell.
  - Windows - Storage 2012 - WMI: identifies storage attached to Windows systems, using WMI Runner.
- VMWare - vCenter ESX Hosts Storage: collects information about ESX servers and creates relationships from datastores to underlying disks.
- Patterns for NetApp storage discovery:
  - NetApp 7-mode: finds NetApp servers via REST with two nodes.
  - NetApp cluster mode: finds NetApp servers via REST when more than two nodes are connected through a cluster interconnect switch.

Note: For information on Probe to Pattern migration see the knowledge article KB0694477.

Requirements

Windows

- Supports the following configurations:
  - Windows Server 2012, DAS or NAS with Fibre Channel (FC) or Internet Small Computer System Interface (iSCSI).
  - Windows Server 2008, DAS or NAS with FC or iSCSI.
- Install the `fcinfo.exe` tool on Windows 2008 and 2012 servers that attach to storage via FC.
- Install Windows Management Instrumentation (WMI).
- Enable Powershell on the MID Server host server.
- Provide the instance with the necessary credentials to the host server.
- Put the MID Server and the target machine in the same domain or add the target machine to the trusted host list on the MID Server machine.
- Optionally, install Windows Remote Management (WinRM) on the host server to discover Fibre Channel information. WinRM is on by default for Windows 2012 and Windows 2016 machines, but not for Windows 2008.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Linux

- Supports the following configurations:
  - Solaris, DAS, NAS, or SAN with iSCSI
  - CentOS, DAS, NAS, or SAN with FC or iSCSI
  - Ubuntu Server, DAS, NAS, or SAN with iSCSI
- Provide the device with SSH credentials that have root or sudo access.
- Provide the MID Server with the necessary credentials to the host server.

Relationships

Discovery creates the following relationships for storage CIs:

Parent Component	Relationship	Child Component
Storage Export [cmdb_ci_storage_export]	Exports to::Imports from	Storage Device [cmdb_ci_storage_device]
Fibre Channel Disk [cmdb_ci_fc_disk]	Provides::Provided by	File System [cmdb_ci_file_system]
iSCSI Disk [cmdb_ci_iscsi_disk]	Provides::Provided by	File System [cmdb_ci_file_system]

Configure discovery of hosts with attached storage

Discovery can find information about UNIX, Linux, and Windows hosts with attached storage.

Configure Discovery for UNIX or Linux hosts with attached storage

Discovery can find information about a UNIX or Linux host and attached storage.

Before you begin

Role required: discovery_admin

Procedure

1. **Optional:** On the host, assign elevated privileges to the account that Discovery will use.
2. On the ServiceNow instance, add credentials to the Discovery Credentials table.
3. Create a Discovery Schedule for each host IP address.
4. **Optional:** Create a behavior that uses a functionality definition with a wbem port probe to make the initial port-scanning phase (Shazzam) more efficient.
5. Run network discovery.

> **Note:** If the host also connects to a NAS or SAN storage array, set up the SMI-S Provider and CIM credentials.

Configure Discovery for Windows hosts with attached storage

Discovery can find information about a Windows host and attached storage.

Before you begin

Role required: discovery_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Follow the steps if you're using the Windows 2008 servers that is attached to storage:
   a. Download and install the Microsoft Fibre Channel Information Tool from http://www.microsoft.com and search the website for Microsoft Fibre Channel Information Tool.
   b. Set the environment path for the fcinfo executable and run the `fcinfo.exe` file.

   Note: For servers that are using newer operating systems, similar functionality is present with the operating system; this step is not required.

2. For all Windows hosts including Windows 2008, add Windows credentials to the Discovery Credentials table.
3. On the ServiceNow instance, create a Discovery Schedule for each host IP address.
4. **Optional:** Create a behavior that uses a functionality definition with a wbem port probe to make the initial port-scanning phase (Shazzam) more efficient.
5. Run network discovery.

   Note: If the host also connects to a NAS or SAN storage array, set up the SMI-S Provider and CIM credentials.

Discovery data collected for storage via a host

Discovery gathers information about storage units that connect to Linux, Solaris, and Windows hosts via a local I/O port or Host Bus Adapter (HBA).

Probes used to discover storage from a host

Table	Probes

Storage Discovery via SMI-S and CIM

Discovery can explore storage devices that contain a Storage Management Initiative Specification (SMI-S) provider that is a specialized Common Information Model (CIM) server.

To see the current list of vendors and products conforming to SMI-S as tested by SNIA, see the SNIA website.

Other types of storage, such as storage that is attached via a host, VM storage that is available on VMware ESX servers, and storage for Kernel VM (KVM), use a separate set of probes and sensors.

Discovery collects information about storage area networks (SAN) and network-attached storage (NAS) from specialized devices, such as storage arrays and Fibre Channel (FC) switches. Discovery collects and creates CIs in the CMDB for the following information items:

- Array disks, pools, and volumes
- Fibre Channel HBAs, ports, and controllers
- FC exports
- Fabrics, including endpoints, zoning, and switches
- Dependencies between storage sub-components

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

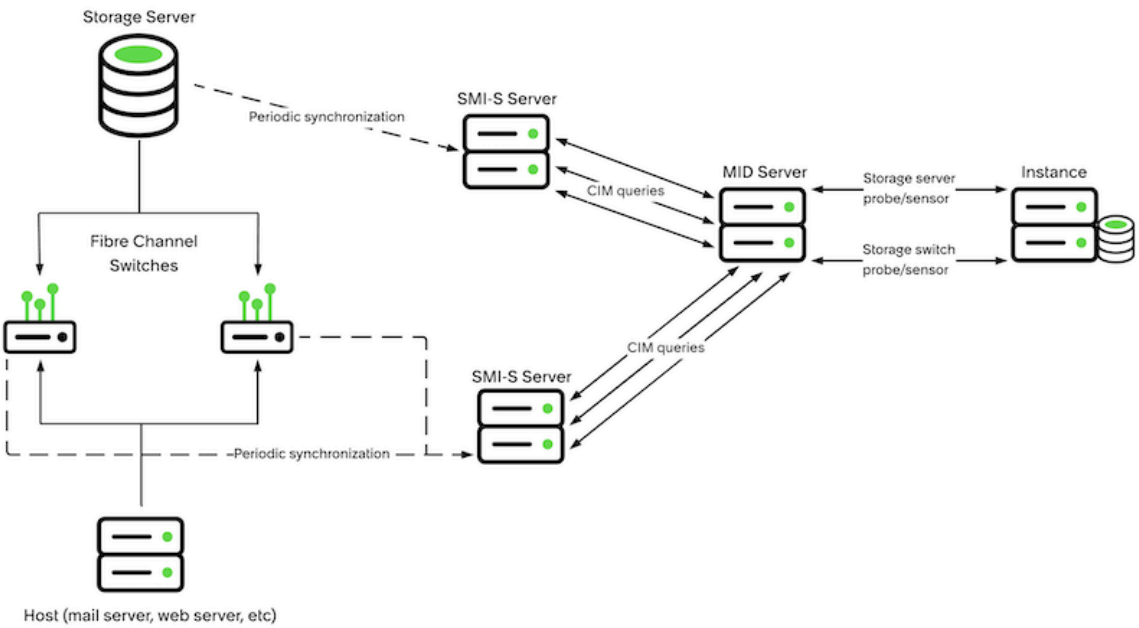
Note: For more information on storage discovery and using the CIM Query tool for troubleshooting, see the knowledge article KB0782305.

Requirements

- A CIM server using SMI-S 1.4 or later.
- One or more CIM server per storage vendor.
- NAS and SAN systems from major vendors such as EMC, Hitachi, HP, and NetApp. SAN storage devices must use FC.
- FC switches from major vendors such as Brocade and Cisco.
- The CIM credentials must be available for SMI-S configuration. The CIM credentials can be different than the credentials for the system hosting the CIM server.
- Ensure that SMI-S is enabled for your storage product.
- Ensure the connectivity between the MID Server and CIM server.
- New CIM credentials need to be configured in the instance. CIM server credentials could be different from the system hosting the prerequisite CIM server.

Note: Because the SMI-S Provider caches storage device information, the Discovery query to the provider does not affect storage device performance.

SMI-S Discovery architecture



CIM architecture

CIM probes can explore any device based on the Common Information Model (CIM) by querying a CIM server, also referred to as a CIMOM - Common Information Model Object Manager. By default, Discovery uses CIM probes to explore storage systems as well as to get the serial numbers of ESX servers.

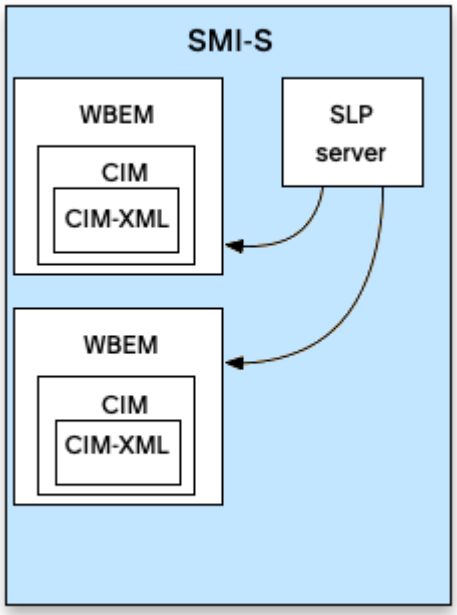
Discovery queries SMI-S compliant storage devices using CIMIQL queries.

The following components are part of CIM:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Common Information Model (CIM): CIM allows multiple parties to exchange information about managed elements. CIM represents these managed elements and the management information, while providing the mechanism to actively control and manage the elements.
- Storage Management Initiative Specification (SMI-S): SMI-S is a standard of use that describes methods for storage discovery on the vendor's side. ServiceNow uses SMI-S to determine how to discover CIM. SMI-S is based on the Common Information Model (CIM) and the Web-Based Enterprise Management (WBEM) standards, which define management functionality via HTTP. The main objective of SMI-S is to enable management of dissimilar storage products. ServiceNow supports SMI-S version 1.4 or higher.

CIM SMI-S Standard Diagram



- Web-Based Enterprise Management (WBEM): WBEM defines a particular implementation of CIM, including protocols for discovering and accessing each CIM implementation.
- Service Location Protocol (SLP): SLP is an ad hoc protocol for retrieving and associating configuration information about CIM servers, such as default paths, capabilities, and the exact interop namespace. Discovery retrieves the interop namespace of a CIM server via SLP and passes that information to the CIM Classify probe. SLP, referred to here as the SLP server, uses service agents (SA) to gather and disseminate information about a CIM server on a subnet. A subnet can have multiple service agents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

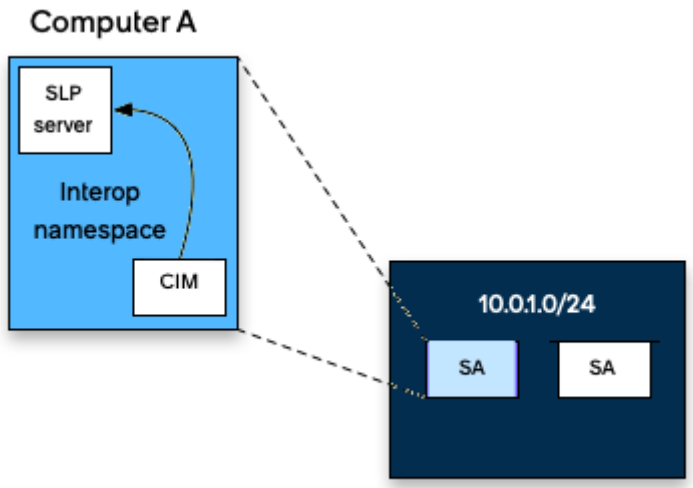
Note:

The `mid.cim.interop.namespace` system property defines four default storage namespaces:

- interop
- root/interop
- root/pg_interop
- pg_interop

If you're using multiple storage vendors with custom namespaces not specified as one of the defaults, add the new namespaces to the comma-separated list in this property. If you intend to continue using any of the default namespaces, make sure to include them in the property.

CIM Agents Diagram



SLP and WBEM support

SLP is required for CIM Discovery as it is part of the Storage Management Initiative Specification (SMI-S) stack. Some storage devices may support the WBEM protocol, but may not support SLP.

You can manually register the WBEM services on SLP using a common Linux tool like `slptool`. This tool has a command line interface that you can use to make SLPv2 User Agent (UA) requests, which usually come with the SLP daemon package. To register a service, provide a URL and list of attributes. An example can be extracted from a working SLP server by using the same tool.

Storage Discovery table schema

This diagram displays the disk hierarchical schema for storage Discovery.

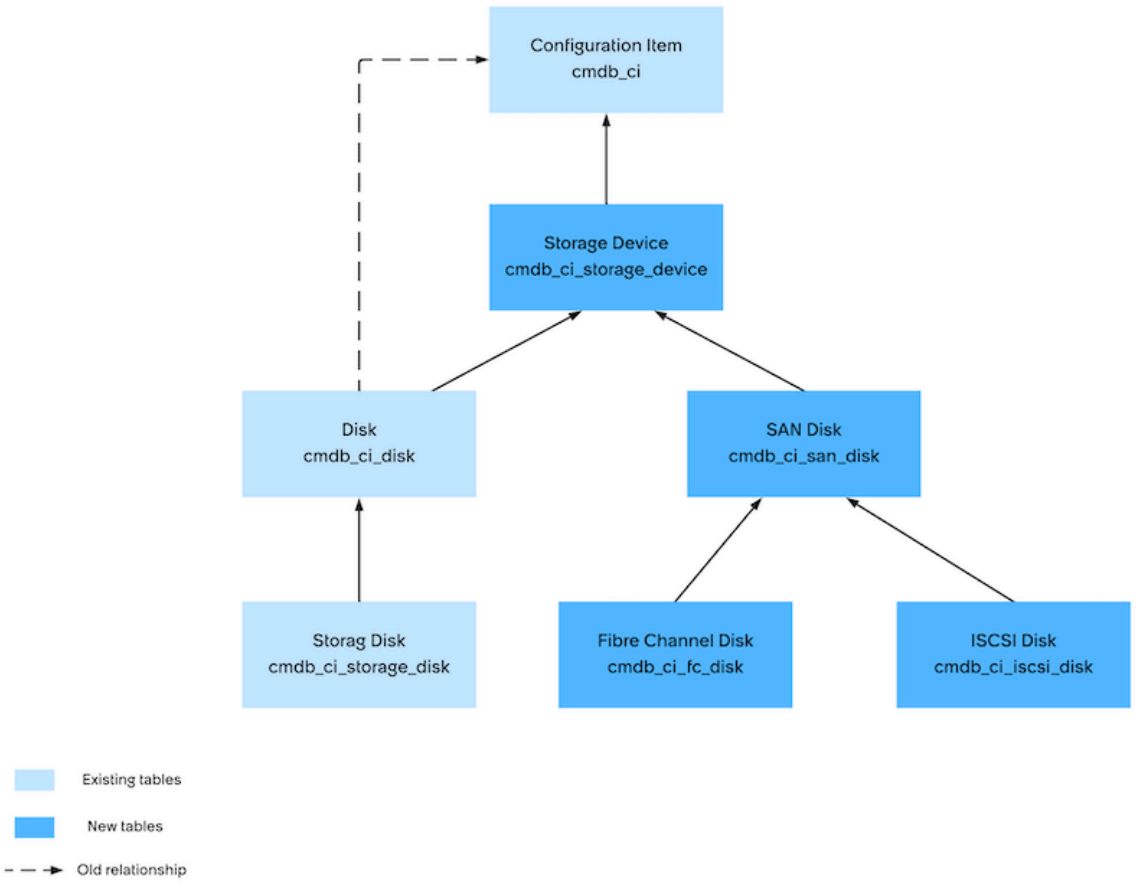
Disk hierarchical schema



Storage Discovery tables and probes

Discovery uses the following tables and probes to gather information about storage devices that are managed by a SMI-S provider.

Data Collected

Table	Probe
Disk [cmdb_ci_disk]	SMI 1.5 - Storage Server
Fibre Channel Export [cmdb_ci_fc_export]	SMI 1.5 - Storage Server
Fibre Channel Port [cmdb_ci_fc_port]	SMI 1.5 - Storage Server
SAN Export [cmdb_ci_san_export]	SMI 1.5 - Storage Server
Storage Controller [cmdb_ci_storage_controller]	SMI 1.5 - Storage Server
Storage Export [cmdb_ci_storage_export]	SMI 1.5 - Storage Server
Storage File Share [cmdb_ci_storage_fileshare]	SMI - Array - File Shares
Storage Pool [cmdb_ci_storage_pool]	SMI 1.5 - Storage Server
Storage Server [cmdb_ci_storage_server]	CIM - Identity
Storage Switch [cmdb_ci_storage_switch]	CIM - Identity
Storage Volume [cmdb_ci_storage_volume]	SMI 1.5 - Storage Server
Storage Device [cmdb_ci_storage_device]	SMI 1.5 - Storage Server

Data Collected (continued)

Table	Probe
Storage Area Network [cmdb_ci_san]	SMI - Fabric
SAN Connection [cmdb_ci_san_connection]	SMI - Fabric
SAN Endpoint [cmdb_ci_san_endpoint]	SMI - Fabric
SAN Fabric [cmdb_ci_san_fabric]	SMI - Fabric
SAN Zone [cmdb_ci_san_zone]	SMI - Fabric
SAN Zone Alias [cmdb_ci_san_zone_alias]	SMI - Fabric
SAN Zone Alias Member [cmdb_ci_san_zone_alias_member]	SMI - Fabric
SAN Zone Member [cmdb_ci_san_zone_member]	SMI - Fabric
SAN Zone Set [cmdb_ci_san_zone_set]	SMI - Fabric

These probes are available but not currently used:

- SMI - Storage Server
- SMI - Array - Controllers
- SMI - Array - Disks
- SMI - Array - Pools
- SMI - Array - Ports
- SMI - Array - Volumes

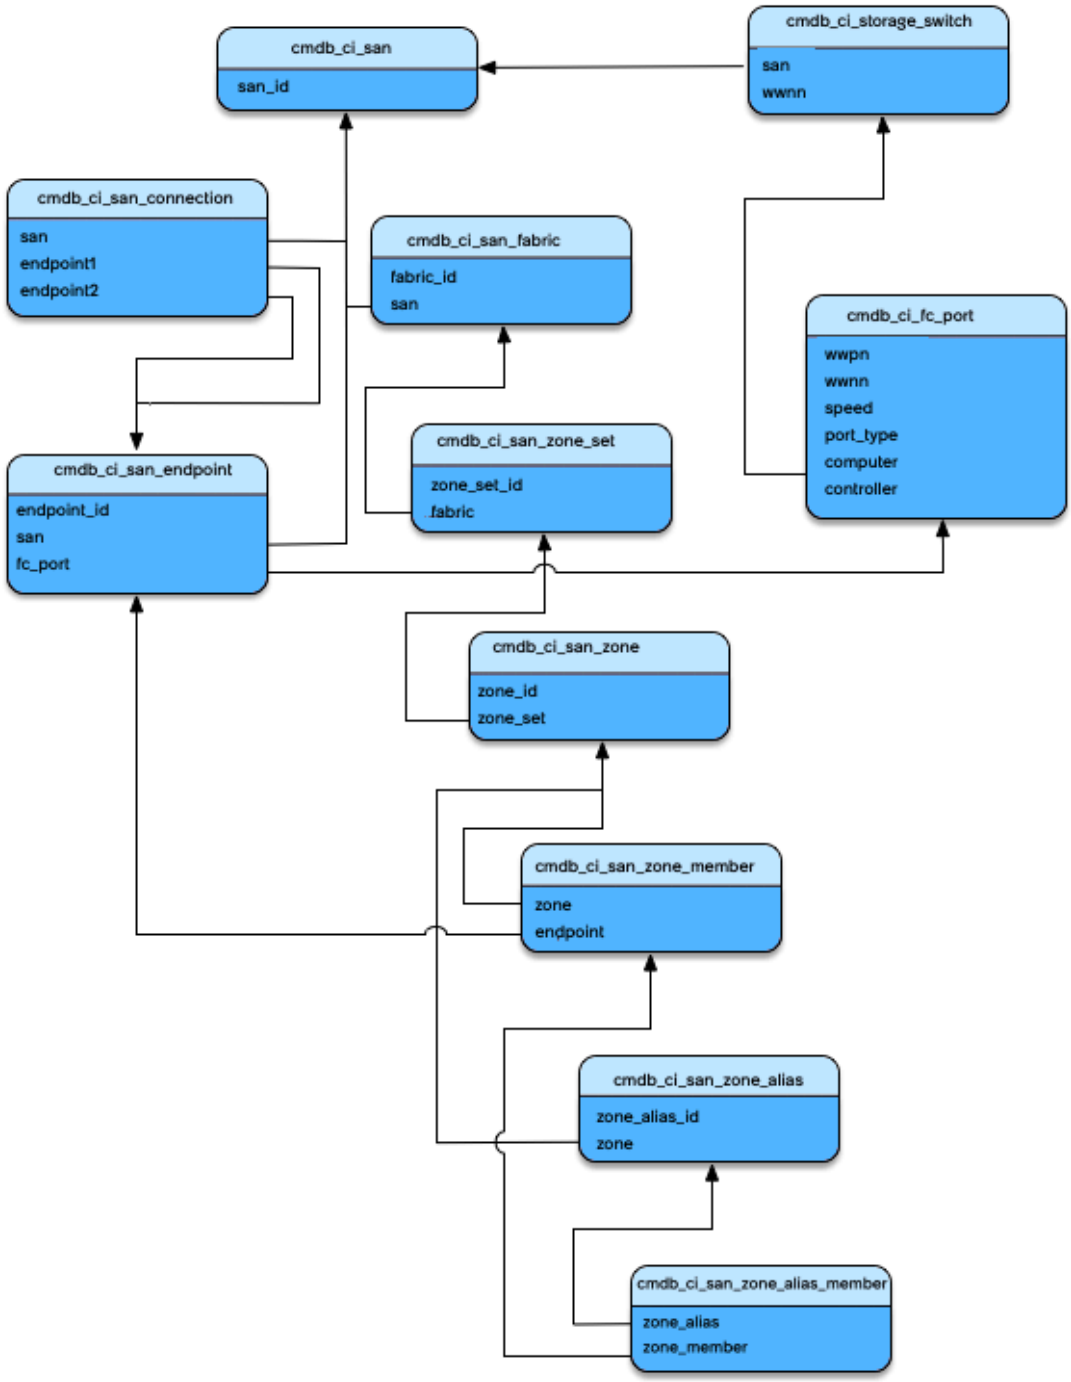
Discovery of storage area networks (SAN)

Discovery collects information about storage area networks from specialized devices, such as storage arrays and Fibre Channel (FC) switches. Discovery creates specific references between the tables in the SAN schema.

ServiceNow SAN schema

This diagram shows the tables in the SAN schema and the default references defined between them.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Multipath SAN storage example

This diagram shows the relationship of SAN storage volumes to a host computer. Storage accessible to the Linux host consists of two physical fibre channel (FC) disks, mpatha and mpathb, connected to the host via a multipath FC SAN. The two HBAs on the host interface are connected with two fibre cables each to separate FC switches for failover capability. The FC fabric switches are connected to two FC storage processors on the storage server. In this example, each storage processor is connected to the storage volume's, **LUN 1** and **LUN 2**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

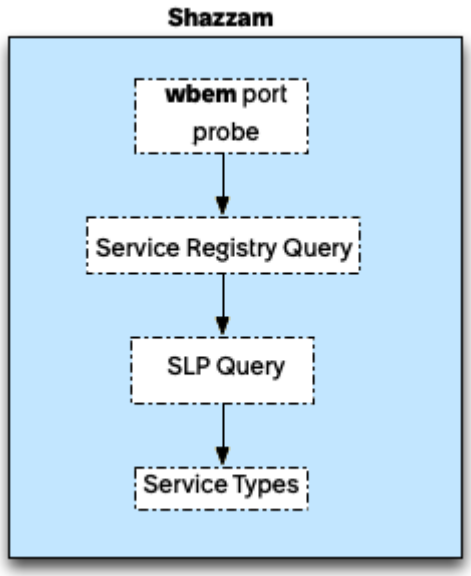
Processing flow

1. The Shazzam probe launches the wbem port probe as part of network discovery.
2. The wbem port probe detects activity on target ports SLP 427, CIM 5989 and 5988, and then examines the **Service Registry Queries** related list, at **Discovery Definition** > **Port Probes**, for the SLP query. The base system provides this query to detect the service:wbem service type, which indicates the presence of an SLP server.
3. The Shazzam probe launches a scanner for the WBEM service type. The scanner retrieves:
   - The attributes of the service from the SLP server.
   - The interop namespaces of CIM servers in the network.
4. The scanner appends the namespace values it finds to the port probe results.
5. The wbem port probe appends the SLP data it carries to the CIM Classify probes.
6. The CIM Classify probe uses that information to explore the CIM servers.

CIM Shazzam Processing Diagram



The wbem port Probe

The **wbem** probe stores the data it retrieves in the CIM Classification `[discovery_classy_cim]` table. To view the wbem port probe, navigate to **Discovery Definition** > **Port Probes**.

© 2026 ServiceNow, Inc. All rights reserved.

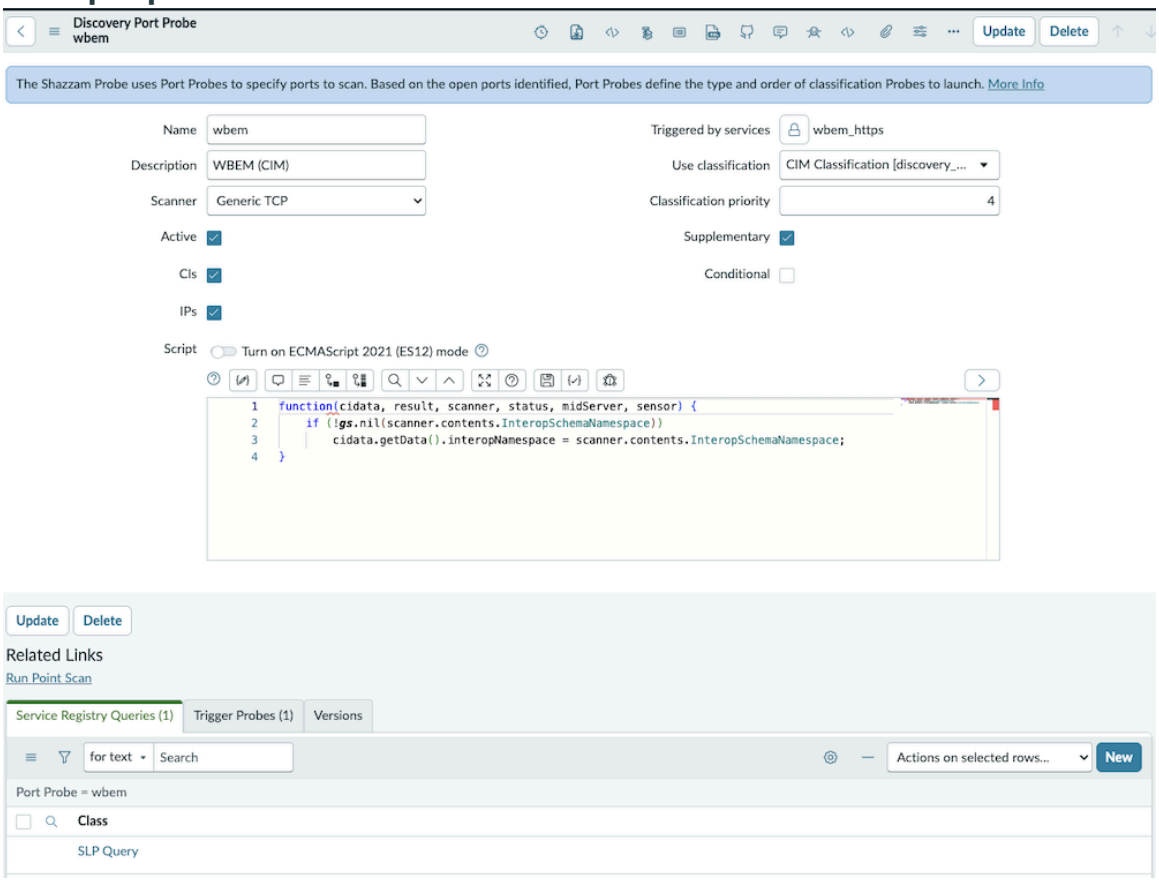
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

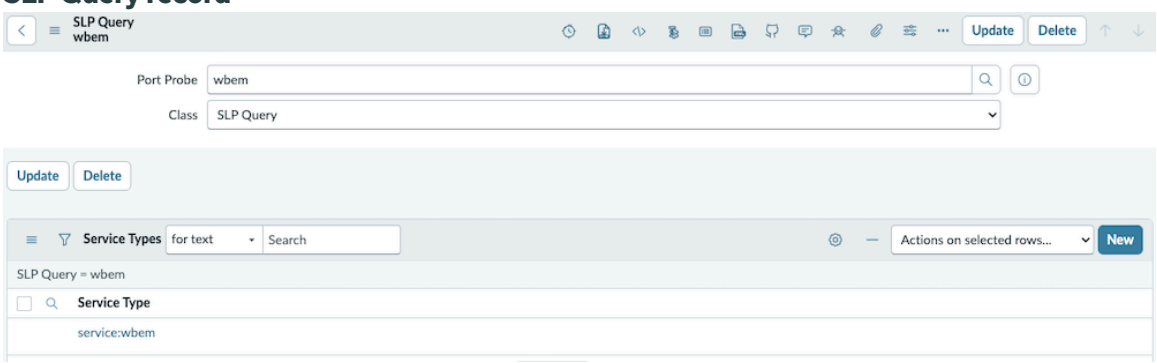
wbem port probe record



SLP query

The SLP query detects the wbem service (service:wbem) on an SLP server and gathers the attributes of the service. To view the SLP Query record, open the wbem port probe record and select **SLP Query** from the **Service Registry Queries** related list.

SLP Query record



CIM - Classify probe

The wbem port probe appends the SLP data it carries, including namespaces, to the CIM - Classify probe before launching it. The CIM classification probe extracts VMware ESX serial numbers and connector relationships between the SAN and NAS components from CIM Servers in the network.

To access the CIM classification probe, navigate to **Discovery Definition** > **Probes** and select **CIM - Classify** from the list of probes.

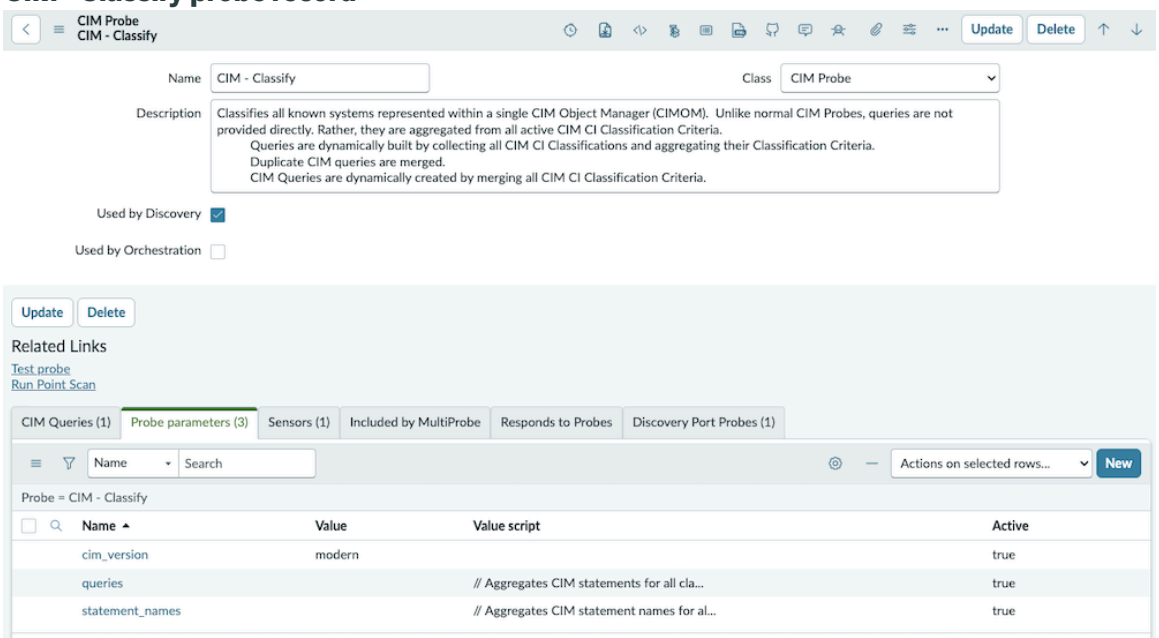
Note:

The `mid.cim.interop.namespace` system property defines four default storage namespaces:

- interop
- root/interop
- root/pg_interop
- pg_interop

If you're using multiple storage vendors with custom namespaces not specified as one of the defaults, add the new namespaces to the comma-separated list in this property. If you intend to continue using any of the default namespaces, make sure to include them in the property.

CIM - Classify probe record



SMI-S and CIM probes and sensors

SMI-S and CIM probes and sensors

Probe/Sensor	Description
CIM - Identity	Identifies a system via CIM per SMI-S.
SMI - Array - Controllers	Retrieves controller information.
SMI - Array - Disks	Retrieves storage disk information.
SMI - Array - File Shares	Enumerates NAS file shares from a storage server.
SMI - Array - Pools	Retrieves storage pools.
SMI - Array - Ports	Retrieves storage ports.
SMI - Array - Volumes	Retrieves storage volumes.
SMI - Fabric	Retrieves SANs, fabrics, zone sets, zones, zone aliases, endpoints, and connections.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SMI-S and CIM probes and sensors (continued)

Probe/Sensor	Description
SMI - Fibre Channel Switch	Retrieves FC switches.
SMI - NAS Head - Component Systems	Retrieves all virtual file servers in a NAS head profile.
SMI - NAS Head - File Server IPs	Retrieves IP addresses for each NAS file server.
SMI - NAS Head - File Servers	Retrieves NAS file servers such as Common Internet File System (CIFS) and Network File System (NFS).
SMI - NAS Head - File Shares	Retrieves file shares for each NAS file server.
SMI - Storage Server	Retrieves SAN and NAS arrays and servers.
SMI - WBEM Service	Retrieves WBEM Service information such as profiles and SMI-S version.

Configure SMI-S Provider for storage Discovery

Use this procedure for configuring a standalone storage device with the required SMI-S Provider for Discovery.

Before you begin

Role required: admin

Procedure

1. On the storage device, if the SMI-S Provider is not present, install the SMI-S Provider software. The SMI-S Provider software is often part of the device management software. For more information, download the SMI-S Provider instructions from the storage provider manufacture.
2. For NetApp storage devices, install the SMI-S agent on the storage device host.

   Note: Discovery can also perform native discovery of NetApp servers without accessing the SMI-S server. See NetApp Server and Cluster discovery for more information.

3. Start the SMI-S Provider service.
4. In the SMI-S Provider or agent, configure the **Discovery Interval** with a synchronization rate that allows the wbem probe to receives the most current information during discovery.
5. On the ServiceNow instance, set up CIM credentials.
6. Create a Discovery Schedule with the IP addresses of each SMI-S Provider.
7. **Optional:** Create a Discovery behavior that uses a functionality definition with a *wbem* port probe to make the initial port-scanning phase (Shazzam) more efficient.
8. Run a basic IP address Discovery.

Data collected by Discovery on storage devices

Discovery identifies and classifies information about storage devices.

© 2026 ServiceNow, Inc. All rights reserved.

Resources discovered on the Storage Disks [cmdb_ci_storage_disk] table

Field	Description
Name	Name of the storage disk.
Computer	Reference to the host CI.
Interface	Interface type with which the storage disk is connected to the host.
Size	Size of the storage disk.
Free disk space (GB)	Free space in GV available on the disk.
Manufacturer	Manufacturer of the storage disk.
Model ID	Model name of the disk.

Resources discovered on the Storage File Shares [cmdb_ci_storage_fileshare] table

Field	Description
Name	Name of the CI.
Path	Path to the file share.

Resources discovered on the Storage Pools [cmdb_ci_storage_pool] table

Field	Description
Name	Name of the storage pool.
Size	Size of the storage pool.
Free space	Free space available in the pool.
Hosted by	Reference to the CMDB CI.

Resources discovered on the Storage Ports [cmdb_ci_storage_port] table

Field	Description
Name	Name of the storage port.
WWPN	Unique Worldwide Port Name (WWPN) for the storage port.
Speed	Speed of the storage port.

Resources discovered on the Storage HBAs [cmdb_ci_storage_hba] table

Field	Description
Name	Name of the Storage Host Bus Adapter (HBA).
Model ID	Model name of the HBA.
Computer	Reference to the computer CI.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Resources discovered on the Storage Servers [cmdb_ci_storage_server] table

Field	Description
Name	Name of the CI.
Manufacturer	Manufacturer of the storage server.
Model ID	Model name of the storage server.
Operating System	Operating system (OS) of the storage server.
OS Version	OS version of the storage server.
Description	Short description of the storage server.

Resources discovered on the Storage Volumes [cmdb_ci_storage_volume] table

Field	Description
Name	Name of the storage volume.
Object ID	Unique ID for the storage volume.
State	State of the storage volume.
Size	Size of the storage volume.
Storage Type	Type of storage volume.

Storage relationships

Discovery creates relationships for storage CIs running on Storage Area Networks (SAN) and Network Attached Storage (NAS).

SAN relationships

Discovery creates the following relationships for storage CIs running on Storage Area Networks.

SAN CI relationships

Parent Component	Relationship	Child Component
Storage Volume [cmdb_ci_storage_volume]	Exports to::Imports from	Fibre Channel Disk [cmdb_ci_fc_disk]
Storage Volume [cmdb_ci_storage_volume]	Exports to::Imports from	iSCSI [cmdb_ci_iscsi_disk]

NAS relationships

Discovery maps NAS file shares by resolving the hostname of a remotely mounted disk on the client computer to an IP address. It then matches the IP address to the storage server that provides the exported file system.

Discovery extracts the hostname or IP address from the NAS path to identify the storage server. If the NAS path contains a hostname, Discovery resolves it to an IP address and stores the value in the *nas_ip_address* field of the NAS File System [cmdb_ci_nas_file_system] table.

Discovery creates the following relationships for storage CIs running on Network Attached Storage (NAS). These relationships are the same for Linux and Windows hosts.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NAS CI relationships

Parent Component	Relationship	Child Component
NAS File System [cmdb_ci_nas_file_system]	Allocated from::Allocated to	Storage File Share [cmdb_ci_storage_fileshare]

Data collected for Veritas Volume Manager on Linux

Discovery collects disk and volume information for Veritas Volume Manager (VxVM) on Linux hosts and maps file systems mounted on Veritas volumes to the upstream storage provider.

Note: Ensure that VxVM is correctly installed and configured. If you are using 3rd party drivers, you must configure sudo permission for *vxdmpadm*.

Table schema

VxVM tables

Table	Extends table
Veritas Disk [cmdb_ci_veritas_disk]	Storage Pool [cmdb_ci_storage_pool]
Veritas Disk Group [cmdb_ci_veritas_disk_group]	Configuration Item [cmdb_ci]
Veritas Plex [cmdb_ci_veritas_plex]	Storage Pool [cmdb_ci_storage_pool]
Veritas Subdisk [cmdb_ci_veritas_subdisk]	Storage Pool Member [cmdb_ci_storage_pool_member]
Veritas Volume [cmdb_ci_veritas_volume]	Storage Pool [cmdb_ci_storage_pool]

Data collected

VxVM data collected

Table	Fields	Relationship
Veritas Disk [cmdb_ci_veritas_disk]	• name • size_bytes • disk_group	Provided by::Provides relationship to the physical disk.
Veritas Disk Group [cmdb_ci_veritas_disk_group]	name	Contains::Contained by relationship to Veritas Disks in the group.
Veritas Plex [cmdb_ci_veritas_plex]	• name • size_bytes • layout (CONCAT, STRIPE, RAID)

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

VxVM data collected (continued)

Table	Fields	Relationship
Veritas Subdisk [cmdb_ci_veritas_subdisk]	• partition_number • source_start_offset: Offset in the disk from which this subdisk is partitioned. • source_end_offset: Offset in the disk from which this subdisk is partitioned. • start_offset: Offset of this subdisk in the plex that is using it. • end_offset: Offset of this subdisk in the plex that is using it. • size_bytes	
Veritas Volume [cmdb_ci_veritas_volume]	name	Stored on::Provides storage for relationship to Veritas Disks on which the volume is stored.

Displaying data

VxVM Discovery maps file systems to the disks that supply storage. By default this is the only information displayed in the UI. The file system to disk relationship is shown as an upstream **Stored on** relationship on the File System form. To see the remainder of the information that Discovery captures for VxVM, you must add the appropriate related list to the Linux Server form. The available lists are:

- Veritas Disk Group
- Veritas Disk
- Veritas Plex
- Veritas Subdisk (Computer)

NetApp Server and Cluster discovery

Discovery and Service Mapping find NetApp servers and clusters using patterns. Discovering some of these resources might require updating to the latest version of the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Request new or enhanced Patterns on the ServiceNow® Store

Visit the ServiceNow Store to view all the available updates and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

NetApp discovery isn't supported for NetApp servers in the AWS cloud. To learn about the components and versions of NetApp servers and clusters that you can discover, refer to Detailed information on products discovered by ITOM Visibility.

NetApp Server and Cluster discovery methods

Method	Supported modes	Upgrades
Discovery with patterns using ONTAP API. These patterns support native discovery of NetApp servers without requiring the discovery of the SMI-S server.	• NetApp 7-Mode • NetApp Cluster-Mode	Active by default.
Discovery with patterns using HTTP REST API.	NetApp Cluster-Mode	Available on Discovery and Service Mapping Patterns store application starting August 2023.
Discovery with probes and sensors using SMI-S.	• NetApp 7-Mode • NetApp Cluster-Mode	Legacy

NetApp discovery properties

To use discovery with patterns, navigate to **Discovery Definition** > **Properties** and enable these properties:

Property label	Name
For 7-Mode NetApp storage servers, use native discovery instead of SMI-S.	glide.discovery.sensors.netapp_native_7mode
For Cluster-Mode NetApp storage servers, use native discovery instead of SMI-S.	glide.discovery.sensors.netapp_native_cluster_mode

The following patterns support the NetApp storage discovery:

- NetApp Storage 7-Mode
- NetApp Storage Cluster-Mode
- NetApp Storage Cluster-Mode - HTTP

The Cluster-Mode patterns support chassis and disk shelf chassis discovery through an extension section.

Note: If you have already performed NetApp discovery with Probes and then enable these properties, a migration script runs the next time you perform NetApp discovery. This script could delete configuration items (CIs) for items like storage pools, which probes discover but the patterns don't. It also creates relationships.

SNMP-based discovery prerequisites

Configure SNMP community credentials

Configure SNMP community credentials to classify the NetApp server. For more information, see SNMP community credentials.

Enable read-only access to the ONTAP API

Enable **read-only** access to the ONTAP API on the NetApp server.

- NetApp Storage 7-Mode: The user must have a custom role with the following capabilities:
  - `login-snmp, login-ndmp, login-sp, and login-http-admin`
  - `Api-*`
- NetApp Storage Cluster-Mode: The user can have a read-only role with default access.

Verify read-only permission for ONTAP SDK APIs

Verify that the user has **read-only** permissions for the following ONTAP SDK APIs:

- NetApp Storage 7-Mode:
  - `aggr-list-info`
  - `cifs-share-list-iter-start`
  - `disk-list-info`
  - `fcp-adapter-initiators-list-info`
  - `fcp-adapter-list-info`
  - `igroup-list-info`
  - `iscsi-node-get-name`
  - `lun-list-info`
  - `lun-map-list-info`
  - `net-config-get-active`
  - `nfs-exportfs-list-rules`
  - `system-get-info`
  - `system-get-version`
  - `volume-list-info`
- NetApp Storage Cluster-Mode:
  - `aggr-get-iter`
  - `cifs-share-get-iter`
  - `cluster-identity-get`
  - `fcp-interface-get-iter`
  - `fcp-initiator-get-iter`
  - `igroup-get-iter`
  - `iscsi-initiator-get-iter`
  - `lun-get-iter`
  - `lun-map-get-iter`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- `net-interface-get-iter`
- `net-port-get-iter`
- `storage-disk-get-iter`
- `storage-pool-get-iter`
- `storage-shelf-info-get-iter`
- `system-get-node-info-iter`
- `system-get-version`
- `system-node-get-iter`
- `volume-get-iter`
- `vserver-get-iter`

Configure basic authentication credentials

Configure basic authentication credentials for the read-only user. For more information, see Basic authentication credentials.

REST-based discovery prerequisites

Disable SNMP-based discovery

For more information, see Disable SNMP-based NetApp storage cluster discovery.

Verify read-only role and permissions

Verify that the user has **read-only** role and permissions for the following ONTAP REST APIs:

- `/api/cluster`
- `/api/cluster/chassis?fields=nodes.name,nodes.uuid,id`
- `/api/cluster/nodes?fields=name,serial_number,model,system_id,controller,version`
- `/api/cluster/nodes?fields=name,state`
- `/api/cluster/nodes?fields=name,uuid,model`
- `/api/network/ethernet/ports?fields=mac_address,name,node.name`
- `/api/network/fc/interfaces?fields=svm.name,wwnn,wwpn,port_address,name,location.node.name`
- `/api/network/fc/logins?fields=initiator,interface.name`
- `/api/network/ip/interfaces?fields=ip.netmask,svm.name,ip.address,location.home_node.name,location.`
- `/api/network/ip/interfaces?fields=location,svm,state`
- `/api/network/ip/interfaces?fields=name,ip,state,enabled,svm,location`
- `/api/protocols/cifs/shares?fields=path,name,svm.name`
- `/api/protocols/san/igroups?fields=initiators.name,name,os_type,svm.name`
- `/api/protocols/san/iscsi/sessions?fields=svm.name,initiator.alias`

- `/api/protocols/san/lun-maps?fields=svm.name,lun.uuid,lun.name,lun.node.name,logical_unit_number,igr`
- `/api/storage/aggregates?fields=space.block_storage.size,space.block_storage.available,node.name`
- `/api/storage/disks?fields=sector_count,bytes_per_sector,node.name,serial_number,model,type`
- `/api/storage/luns?fields=space.used,space.size,svm.name,location.volume.name,location.vol`
- `/api/storage/pools?fields=name,capacity.total,capacity.remaining,nodes.name`
- `/api/storage/shelves?fields=name,model,serial_number,paths.node.name,id`
- `/api/storage/volumes?fields=aggregates.name,space.size,space.available,svm.name&return_timed`
- `/api/svm/svms?fields=name,subtype`
- `/api/svm/svms?fields=subtype,name`

Configure basic authentication credentials

Configure basic authentication credentials for the read-only user. For more information, see Basic authentication credentials.

General prerequisites

Verify that the following applications are up to date

- Discovery and Service Mapping Patterns
- Visibility Content

Disable SSLv3 and enable TLS for the target NetApp server

Disable SSLv3 and enable TLS for the target NetApp server, as the Java Runtime used by the MID Server doesn't enable SSLv3 by default. The key to encrypt the certificate must be at least 1024 bits.

Schedule a horizontal discovery

To run discovery using Patterns, create a Discovery schedule that targets the management IP address of the NetApp server. For more information, see create a discovery schedule.

Note: NetApp creates different storage volume identifiers when running with different protocols. When running discovery with HTTP after running discovery with SNMP, duplicate CIs are created for the same storage volume. One CI is created for the unique identifier (UUID) NetApp ONTAP API provides, and one CI is created for the unique identifier (UUID) NetApp HTTP REST API provides.

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the NetApp patterns.

Storage Server [cmdb_ci_storage_server]

Field	Description
Name [name]	Name of the NetApp storage server or Storage Virtual Machine (SVM)
Manufacturer [manufacturer]	Manufacturer of the storage server. The value is set to NetApp.
Model ID [model_id]	Model identifier of the storage server. For SVMs in Cluster-Mode, the value is set to SVM.
Firmware version [firmware_version]	ONTAP firmware version running on the storage server.
Serial number [serial_number]	Unique serial number of the storage server.
Description [short_description]	Full version information of the ONTAP software.
IP Address [ip_address]	Management IP address of the storage server.
Cluster [cluster]	References the Storage Cluster [cmdb_ci_storage_cluster] table.
Physical Capacity (GB) [physical_capacity]	Total amount of physical storage space available within the NetApp system, measured in gigabytes (GB). This capacity includes both allocated and unallocated storage resources.
Free Physical Capacity (GB) [free_physical_capacity]	Available physical storage space within the NetApp system, measured in GB.
Used Physical Capacity (GB) [used_physical_capacity]	Used physical storage space within the NetApp system, measured in GB.

Storage Cluster [cmdb_ci_storage_cluster]

Field	Description
Description [short_description]	Full version information of the ONTAP software running on the cluster.
Name [name]	Name of the NetApp storage cluster.
Correlation ID [correlation_id]	Unique identifier (UUID) of the cluster.
IP Address [ip_address]	Cluster management IP address.
Manufacturer [manufacturer]	Manufacturer of the storage server. The value is set to NetApp.
Serial number [serial_number]	Unique serial number of the cluster, constructed from cluster UUID and name. This field is applicable to HTTP pattern only.
Cluster Version [cluster_version]	ONTAP version running on the cluster, for example: 9.14.1P4.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Storage Cluster [cmdb_ci_storage_cluster] (continued)

Field	Description
	This field is applicable to HTTP pattern only.

Storage Cluster Node [cmdb_ci_storage_cluster_node]

Field	Description
Name [name]	Name of the cluster node.
Operational status [operational_status]	Operational status of the cluster node. Default status is Operational.
Cluster [cluster]	References the Storage Cluster [cmdb_ci_storage_cluster] table.
Server [server]	References the Storage Node Element [cmdb_ci_storage_node_element] table.

Storage Node Element [cmdb_ci_storage_node_element]

Field	Description
Name [name]	Name of the storage node element.
Manufacturer [manufacturer]	The hardware manufacturer of the node element, which is: NetApp. This field is applicable to HTTP pattern only.
Model ID [model_id]	Model identifier of the node hardware.
Serial number [serial_number]	Serial number of the physical node.
Description [short_description]	Full version information of the ONTAP software running on the node.
RAM (MB) [ram]	Memory size of the node in megabytes (MB).
CPU core count [cpu_core_count]	The total number of CPU cores in the node element.
CPU type [cpu_type]	The processor type used in the node element.
CPU manufacturer [cpu_manufacturer]	References the Company [core_company] table.
Chassis [chassis]	References the Chassis [cmdb_ci_chassis] table. This field is applicable to Cluster-Mode patterns only.

Network Adapter [cmdb_ci_network_adapter]

Field	Description
Name [name]	Name of the network adapter port.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Network Adapter [cmdb_ci_network_adapter] (continued)

Field	Description
MAC Address [mac_address]	MAC address of the network adapter.
IP Address [ip_address]	IP address.
Netmask [netmask]	Network subnet mask for the IP address.
Configuration Item [cmdb_ci]	References the Storage Server [cmdb_ci_storage_server] or Storage Node Element [cmdb_ci_storage_node_element] table. Physical resources are owned by Storage Node Elements, while logical resources are owned by Storage Servers.

IP Address [cmdb_ci_ip_address]

Field	Description
Name [name]	IP address.
IP Address [ip_address]	IP address.
Netmask [netmask]	Network subnet mask for the IP address.
MAC Address [mac_address]	MAC address of the network adapter.
Nic [nic]	References the Network Adapter [cmdb_ci_network_adapter] table.
IP version [ip_version]	Indicates whether the IP address is IPv4 or IPv6. This field is applicable for storage 7-Mode pattern only.

Disk [cmdb_ci_disk]

Field	Description
Name [name]	Name of the disk in ONTAP format.
Device ID [device_id]	Device identifier of the disk.
Manufacturer [manufacturer]	Manufacturer name of the disk.
Model ID [model_id]	The model identifier for the disk.
Serial number [serial_number]	Serial number of the disk.
Size bytes [size_bytes]	The total capacity of the disk in bytes.
Device interface [device_interface]	The interface type used to connect the disk.
Interface [interface]	Interface type of the disk.
Drive type [drive_type]	Drive type. The value is set to disk.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Disk [cmdb_ci_disk] (continued)

Field	Description
Storage type [storage_type]	The type of storage used by the disk. The value is set to disk.
Disk space (GB) [disk_space]	The total capacity of the disk in GB.
Size [size]	Display value of the total disk capacity in GB or terabytes (TB).
Computer [computer]	• Storage 7-Mode pattern: References the Storage Server [cmdb_ci_storage_server] table • Cluster-Mode patterns: References the Storage Node Element [cmdb_ci_storage_node_element] table.
Diskshelf chassis [diskshelf_chassis]	References the Disk Shelf Chassis [cmdb_ci_diskshelf_chassis] table. This field is applicable to Cluster-Mode patterns only.

Storage Pool [cmdb_ci_storage_pool]

Field	Description
Name [name]	The unique name of the storage pool.
Description [short_description]	A brief summary describing the storage pool.
Pool ID [pool_id]	The unique identifier assigned to the storage pool.
Size bytes [size_bytes]	The total capacity of the storage pool, in bytes.
Free space bytes [free_space_bytes]	The amount of available space in the pool, in bytes.
Size [size]	Display value of the total storage pool capacity in GB or TB.
Free space [free_space]	Display value of the available storage pool capacity in GB or TB.
Hosted by [hosted_by]	References the Storage Server [cmdb_ci_storage_server] or Storage Node Element [cmdb_ci_storage_node_element] table. Physical resources are owned by Storage Node Elements, while logical resources are owned by Storage Servers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Storage Volume [cmdb_ci_storage_volume]

Field	Description
Name [name]	Name of the storage volume.
Object ID [object_id]	Unique object identifier (UUID) for the storage volume. This field is applicable to Cluster-Mode patterns only.
Volume ID [volume_id]	The UUID of the storage volume.
LUN [lun]	The logical unit number (LUN) associated with the volume.
Size bytes [size_bytes]	Total capacity of the volume in bytes.
Free space bytes [free_space_bytes]	Available free space in the volume in bytes.
Size [size]	Display value of the total storage volume capacity in GB or TB.
Consumable Size [free_space]	Display value of the available storage volume capacity in GB or TB.
Provided by [provided_by]	References the Storage Pool [cmdb_ci_storage_pool] table.
Computer [computer]	References the Storage Server [cmdb_ci_storage_server] table.

Storage File Share [cmdb_ci_storage_fileshare]

Field	Description
Path [path]	The file system path or mount location of the shared storage.
Name [name]	The unique name identifying the file share.

Storage Controller [cmdb_ci_storage_controller]

Field	Description
Name [name]	Name of the initiator group (igroup) that acts as the storage controller.
Device ID [device_id]	UUID of the LUN associated with this storage controller.
Computer [computer]	References the Storage Server [cmdb_ci_storage_server] table.

Fibre Channel Port [cmdb_ci_fc_port]

Field	Description
Name [name]	The name identifying the Fibre Channel (FC) port.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fibre Channel Port [cmdb_ci_fc_port] (continued)

Field	Description
WWNN [wwnn]	The World Wide Node Name (WWNN) of the FC port.
WWPN [wwpn]	The World Wide Port Name (WWPN) of the FC port.
Speed [speed]	Speed of the FC port in Gigabit Fibre Channel (GFC).
Computer [computer]	References the Storage Server [cmdb_ci_storage_server] table.

iSCSI Export [cmdb_ci_iscsi_export]

Field	Description
Name [name]	The name of the iSCSI export target.
LUN [lun]	The LUN mapped to the iSCSI export.
Export ID [export_id]	Unique identifier combining LUN path and controller name.
Initiator IQN [initiator_iqn]	The iSCSI Qualified Name of the connecting initiator.
IQN [iqn]	The iSCSI Qualified Name of the target being exported.
Exported by [exported_by]	References the Storage Controller [cmdb_ci_storage_controller] table.
Hosted by [hosted_by]	References the Storage Server [cmdb_ci_storage_server] table.
Storage [storage]	References the Storage Volume [cmdb_ci_storage_volume] table.

Fibre Channel Export [cmdb_ci_fc_export]

Field	Description
Name [name]	Name of the FC export combining LUN path and initiator WWPN.
LUN [lun]	LUN ID number for the FC export.
Export ID [export_id]	Unique identifier combining LUN path and controller name.
Initiator WWPN [initiator_wwpn]	The WWPN of the Fibre Channel initiator.
Exported by [exported_by]	References the Storage Controller [cmdb_ci_storage_controller] table.
Hosted by [hosted_by]	References the Storage Server [cmdb_ci_storage_server] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fibre Channel Export [cmdb_ci_fc_export] (continued)

Field	Description
Storage [storage]	References the Storage Volume [cmdb_ci_storage_volume] table.

Discovery populates the data in the CMDB when running the NetApp Cluster-Mode Patterns Only.

Chassis [cmdb_ci_chassis]

Field	Description
Name [name]	Name of the cluster that the chassis belongs to.
Manufacturer [manufacturer]	The value is set to NetApp.
Model ID [model_id]	Model identifier of the chassis hardware.
Serial number [serial_number]	Serial number of the chassis.
Description [short_description]	The value is set to NetApp Storage Chassis.

Disk Shelf Chassis [cmdb_ci_diskshelf_chassis]

Field	Description
Name [name]	Identifier of the disk shelf.
Manufacturer [manufacturer]	The value is set to NetApp.
Model ID [model_id]	Model identifier of the disk shelf.
Serial number [serial_number]	Serial number of the disk shelf.
Description [short_description]	The value is set to NetApp Storage Disk Shelf Chassis.
Chassis [chassis]	References the Chassis [cmdb_ci_chassis] table.

Note: For more information on NetApp discovery with CIM, see Storage Discovery via SMI-S and CIM.

CI relationships and references

The NetApp Storage patterns create the following relationships and references to support NetApp Server and Cluster discovery. References link to records in other tables and don't appear in the CI Relationship [cmdb_rel_ci] table.

CI relationships

CI	Relationship	CI
Storage Cluster Node [cmdb_ci_storage_cluster_node]	Hosted on::Hosts	Storage Node Element [cmdb_ci_storage_node_element]
Storage Cluster Node [cmdb_ci_storage_cluster_node]	Cluster of::Clusters	Storage Cluster [cmdb_ci_storage_cluster]
Storage Node Element [cmdb_ci_storage_node_element]	Managed by::Manages	Storage Cluster [cmdb_ci_storage_cluster]

* The CI table (Storage Server or Storage Node Element) is determined by the resource type and owner information returned by the NetApp ONTAP API. Physical resources are owned by Storage Node Elements, while logical resources are owned by Storage Servers.

** The CI table (Storage Server or Storage Node Element) is determined by the pattern type. The Storage 7-Mode pattern uses the Storage Server table, while the Cluster-Mode patterns use the Storage Node Element table.

Discovery creates these relationships and references when running the NetApp Cluster-Mode patterns only.

CI relationships

CI	Relationship	CI
Storage Node Element [cmdb_ci_storage_node_element]	Hosted on::Hosts	Chassis [cmdb_ci_chassis]
Disk Shelf Chassis [cmdb_ci_diskshelf_chassis]	Hosted on::Hosts	Chassis [cmdb_ci_chassis]
Disk [cmdb_ci_disk]	Hosted on::Hosts	Disk Shelf Chassis [cmdb_ci_diskshelf_chassis]

CI references

CI	Field	Referenced CI

Disk [cmdb_ci_disk]	Diskshelf chassis [diskshelf_chassis]	Disk Shelf Chassis [cmdb_ci_diskshelf_chassis]

* The CI table (Chassis or Disk Shelf Chassis) is determined by the serial number type field.

Disable SNMP-based NetApp storage cluster discovery

Disable the default SNMP-based NetApp storage cluster discovery and use REST-based discovery instead for enhanced security.

Before you begin

Role required: discovery_admin

Procedure

1. Navigate to **All** > **Discovery Definition** > **CI Classification** > **SNMP**.
2. In the **Name** field, search for `NetApp Storage Server Cluster-Mode`.
3. Select the NetApp Storage Server Cluster-Mode record.
4. Clear the **Active** check box.
5. Select **Update**.

NetApp Server and Cluster discovery

Manage large storage payloads in Linux and Solaris

Large payloads for Linux and Solaris direct attached storage can cause out of memory errors if not configured to serialize the processing of the payload.

Before you begin

Role required: discovery_admin or admin

About this task

When Linux or Solaris storage sensors process payloads from large disk arrays, worker threads run simultaneously and can run an instance node out of memory, requiring a restart. To prevent this, the [discovery_sensor_yield] table controls the behavior of worker threads used to process large payloads. When Discovery processes a sensor, it checks the [discovery_sensor_yield] table for that sensor. If the sensor is listed in the table, and if the payload size exceeds the configured limit in the table, then the worker attempts to secure a lock before processing the payload. If the lock is not available because another worker is already processing a large payload, the waiting worker re-schedules the next job for 30 seconds later and moves on to other tasks. The job then waits in the Schedule Item [sys_trigger] table for an idle worker to pick it up. This serialization occurs per node, enabling multiple nodes to process large payloads simultaneously. The processing interval of 30 seconds is not configurable.

Important: These threshold values were created for Linux and Solaris storage sensors only and, in most cases, should not be changed. If your instance is running out of memory while simultaneously processing multiple, large storage payloads, consider scheduling Discovery of these systems to times of lower activity. If this is not possible, examine the ECC queue to determine which storage sensor might be causing the issue and note the size of the payload. If the payload size is below that of the threshold in the [discovery_sensor_yield] table, lower the threshold value enough to serialize that payload. If a sensor other than the Linux or Solaris storage sensor is responsible, you can add that sensor to the [discovery_sensor_yield] table. Make sure to set the threshold value correctly for the payload size. Serializing sensor processing can slow Discovery.

Procedure

1. In the application navigator filter, enter **discovery_sensor_yield.list**.
   The base Discovery system serializes these sensors when their payloads exceed 512 KB:
   - **Solaris - Storage**
   - **Linux - Storage**
   - **Unix - ADM Enhanced**
   - **Windows - ADM Enhanced**
2. To change the threshold, double-click in the **Value** column in the list and edit the size.

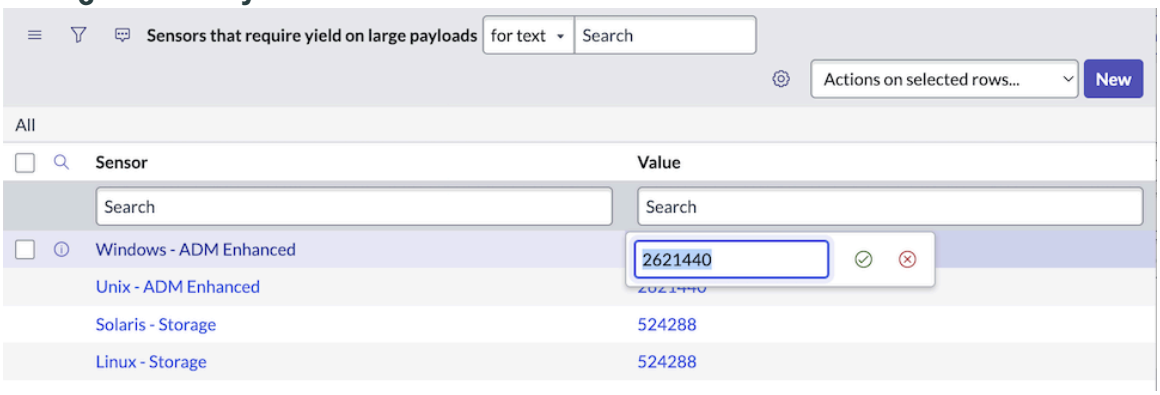
Editing the sensor yield threshold



3. To add another sensor and configure it for payload serialization, click **New** and complete the fields in the form.
   - **Sensor**: Storage sensor to configure.
   - **Value**: Threshold size for the sensor.
4. Click **Submit**.

Storage discovery examples

Discovery creates configuration items (CIs) and CI relationships for physical and logical storage components. Storage can be attached directly to servers or through fibre channel switched fabric.

Direct attached storage

In this example of direct attached storage (DAS), a SCSI drive with two partitions, `/dev/sda1` and `/dev/sda2`, is attached to a Linux host. The `/dev/sda1` partition is bootable and supports the system software. The `/dev/sda2` partition contains a logical volume configured as a storage pool and mounted to the Linux root file system by Logical Volume Management (LVM). The storage pool uses only 1.5GB of the partition, leaving 13GB of storage available for additional logical volumes.

CIs and relationships created for direct attached storage (DAS) (continued)

Configuration item	Description	Tables	Key reference and Relationships
/dev/sda1	Partition 1 on the SCSI storage device	• [cmdb_ci_partition] • [cmdb_ci_storage_volume] • [cmdb_ci_file_system] • [cmdb_rel_ci]	[cmdb_ci_file_system] • **Mount point**: /boot • **File system**: Ext4 [cmdb_rel_ci] • **Provides**: /dev/sda • **Provided by:**/dev/sda1
/dev/sda2	Partition 2 on the SCSI storage device	• [cmdb_ci_partition] • [cmdb_ci_storage_pool_member]	[cmdb_ci_storage_pool_member] • **Pool**: /dev/mapper/lvm-root-333-0 • **Storage**: /dev/sda2
/dev/mapper/lvm-root-333-0	Linux logical volume, mapped with LVM to a physical disk storage partition.	• [cmdb_ci_storage_device] • [cmdb_ci_storage_volume] • [cmdb_ci_file_system] • [cmdb_ci_storage_pool] • [cmdb_ci_storage_pool_member] • [cmdb_ci_lvm_pool] • [cmdb_ci_lvm_pool_member] [cmdb_rel_ci]	[cmdb_ci_file_system] • **Mount point**: / • **File system**: Ext4 [cmdb_rel_ci] • **Provides**: /dev/sda • **Provided by:**/dev/mapper/lvm-root-333-0 [cmdb_ci_storage_pool_member] • **Pool**: /dev/mapper/lvm-root-333-0 • **Storage**: /dev/sda2

Multipath fibre channel storage

In this example of a fibre channel storage area network (SAN), two physical storage devices, `mpatha` and `mpathb`, are attached to a Linux host through fibre switches. The fibre switches provide failover capabilities. The `mpatha` drive contains two partitions, `mpatha1` and `mpatha2`. The first partition is mounted directly to `/boot` on the Linux host. Three logical volumes are mapped to the `mpatha2` partition and to the physical device `mpathb`. The logical volumes are mounted as Ext4 file systems in folders on the Linux root structure. This example shows the CIs that Discovery manages for each component and the mounting points for the logical volumes on the Linux host.

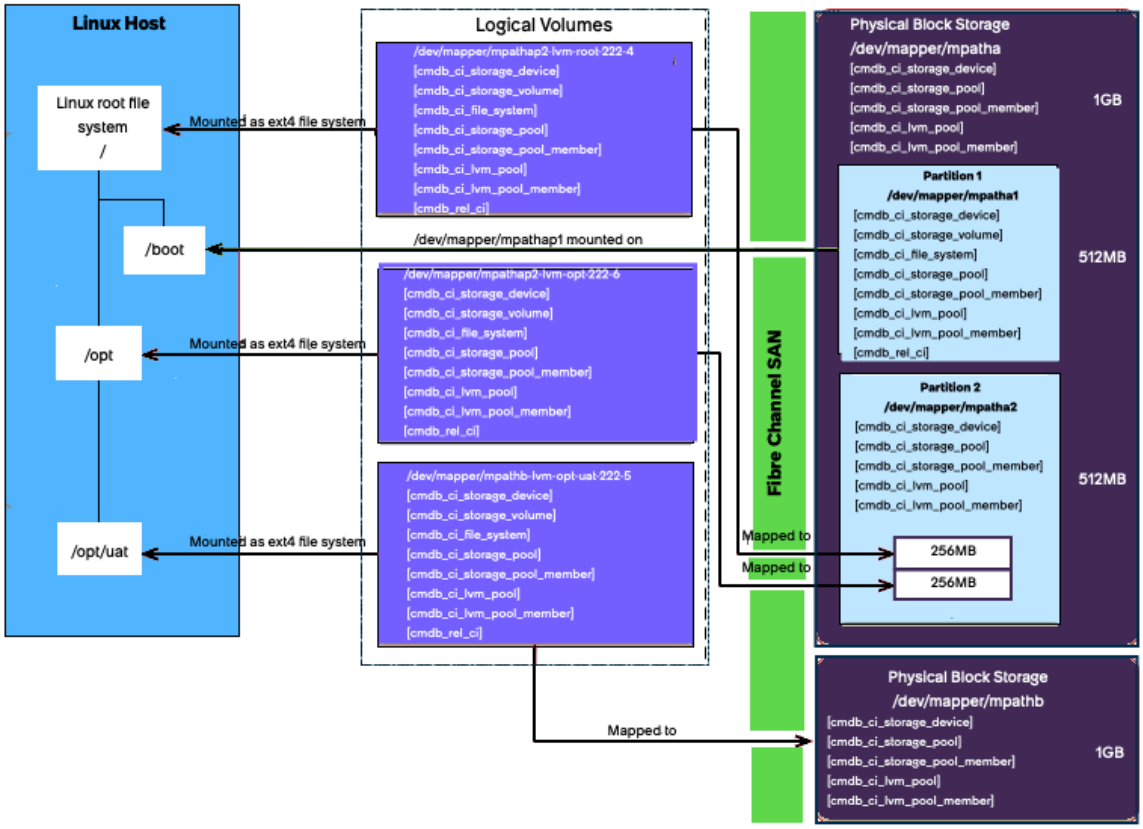
Multipath fibre channel storage example



Switched fibre fabric details

Discovery creates CIs for the logical sub-components in NAS and SAN environments, such as fibre channel disks and pool components. Discovery also creates CIs for host bus adapters (HBA) and physical block storage. In multipath environments, Discovery creates CI relationships within the switched fibre fabrics that connects the Linux host to the physical storage devices. In this diagram, the fibre fabrics have redundant paths that the SAN environment can use for failover if connections fail.

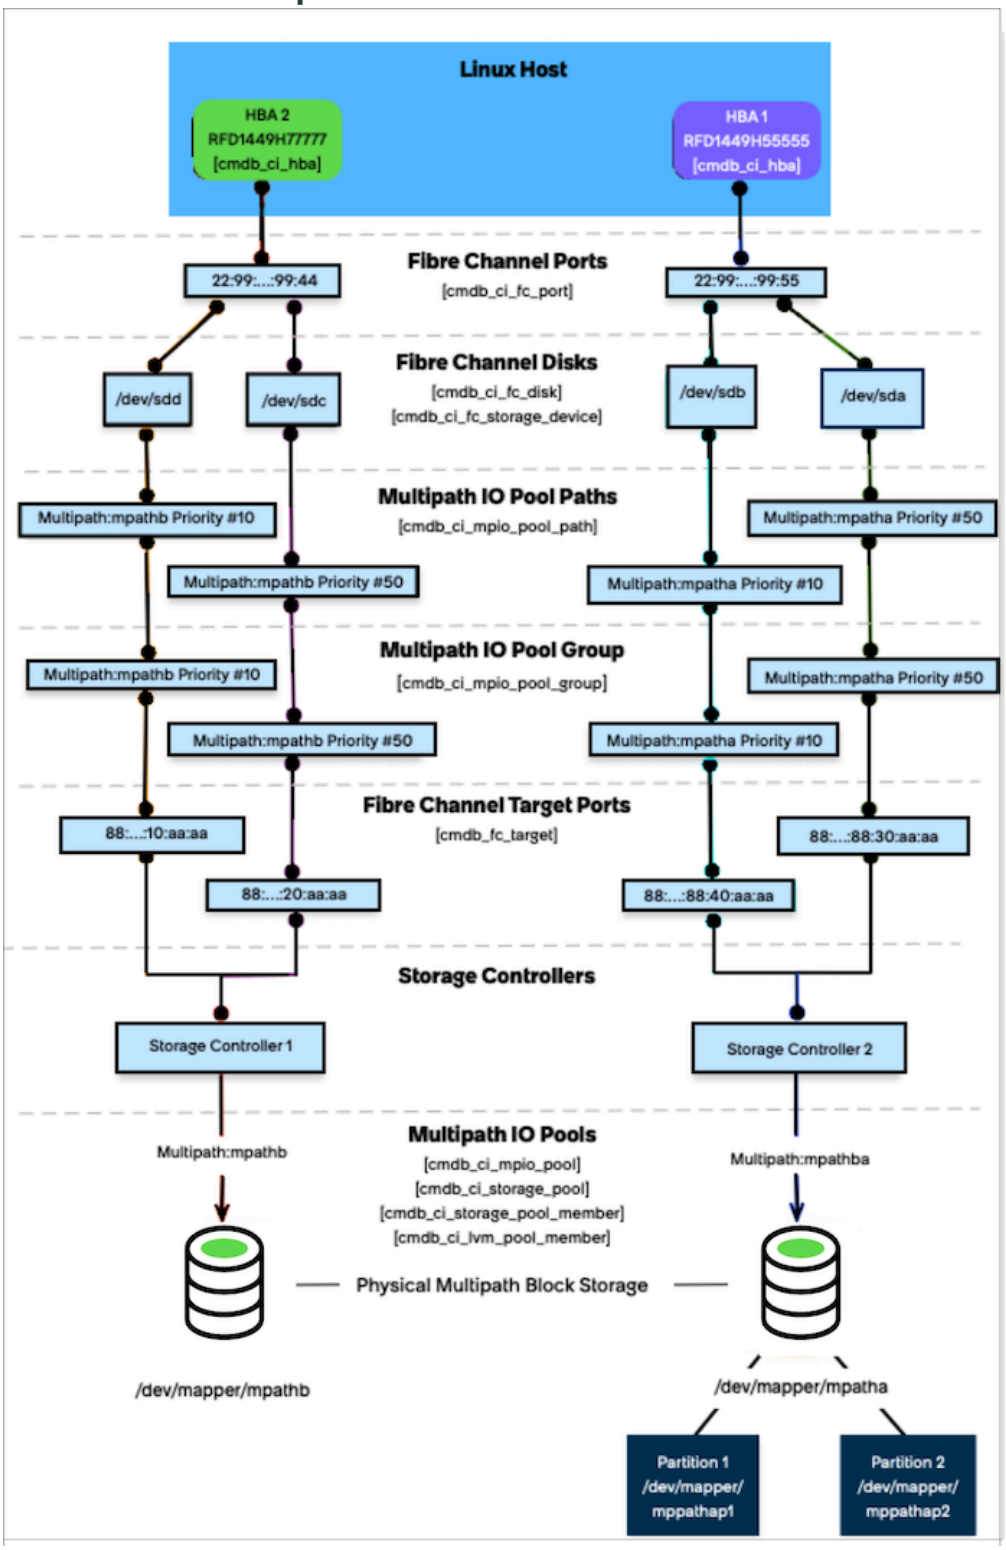
Fibre fabric redundant paths



ITOM Visibility and CSDM reference

ITOM Visibility consists of two ServiceNow products: Discovery and Service Mapping. These products are responsible for creating Configuration Items (CIs) in the CMDB and relating them. The goal of this product view is to help you to understand how ITOM Visibility works with the core CSDM framework.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Aspects of ITOM Visibility

Discovery

Discovery finds computers, servers, printers, a variety of IP-enabled devices, and the applications that run on them. It can then update the CIs in your CMDB with the collected data.

Service Mapping

Service Mapping discovers all application services in your organization and builds a comprehensive map of all devices, applications, and configuration profiles that support the associated business services.

Service Mapping maps dependencies based on the connections between devices and applications. This method, called top-down mapping, helps you immediately see the impact of a problematic object on the rest of the application services.

Implementing CMDB data

For details on implementing CMDB data to conform with the CSDM framework, see Implementing the CSDM framework in stages.

Service Mapping.

ITOM Visibility and CMDB tables

ITOM Visibility manages and uses CMDB tables. Several ServiceNow products benefit from and add value to ITOM Visibility.

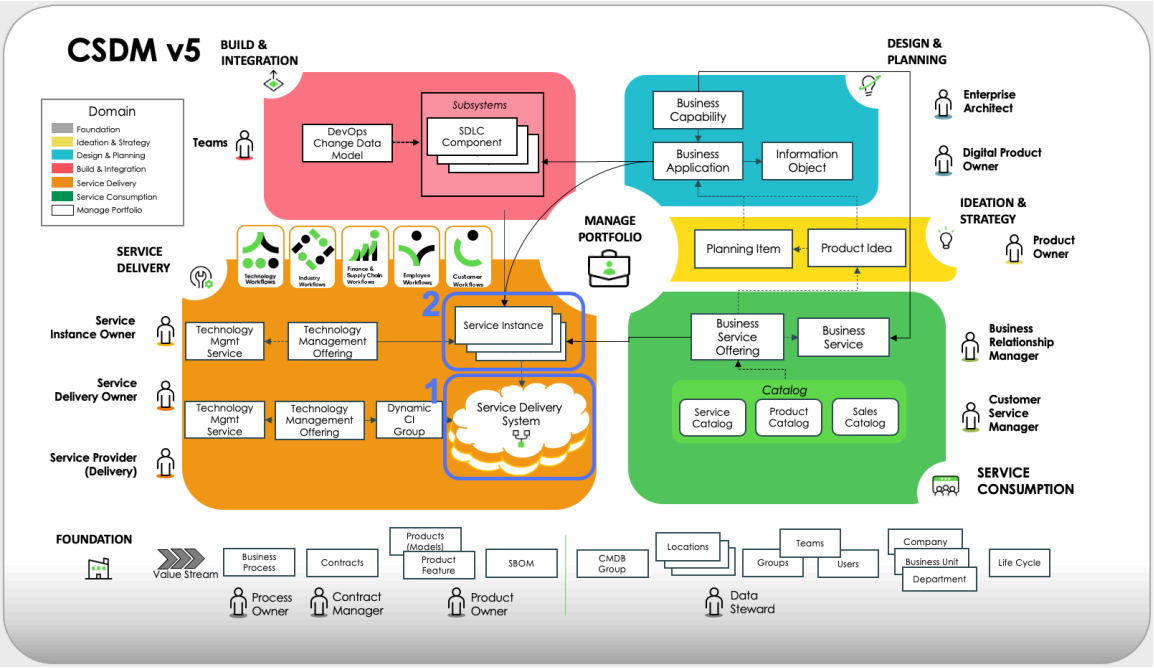
Tables that ITOM Visibility manages



Mapped application service tables

The tables that ITOM Visibility manages depend on the method used to map the service instance (the label for the table was formerly application service) . You can use the Application Service wizard to populate an application service.

- Map the Service instance using top-down discovery of CI connections. This method requires Service Mapping, the sm_admin role, and the current domain must be a leaf domain. This is the best option for accuracy and complete mapping. ITOM Visibility manages the Mapped Application Service table [cmdb_ci_service_discovered]
- Map the service instance using a tag list or tag family. This method requires Service Mapping and is preferred for public or private cloud where tags are typically used. ITOM Visibility manages the tag-based maps table [cmdb_ci_service_by_tags].
- Manually map the service instance. This method requires that you select specific CIs — no automation is used. ITOM Visibility manages the service maps table [cmdb_ci_service_manual].
- Use Dynamic Service to synchronize manually-created CI relationships to a Service Map view.

Configuration items (CIs) tables [cmdb_ci_*]

- Application table [cmdb_ci_appl]
- Server table [cmdb_ci_server]
- Virtual machines table [cmdb_ci_vm_instance]
- Load balancer table [cmdb_ci_lb]
- Network gear table [cmdb_ci_netgear]

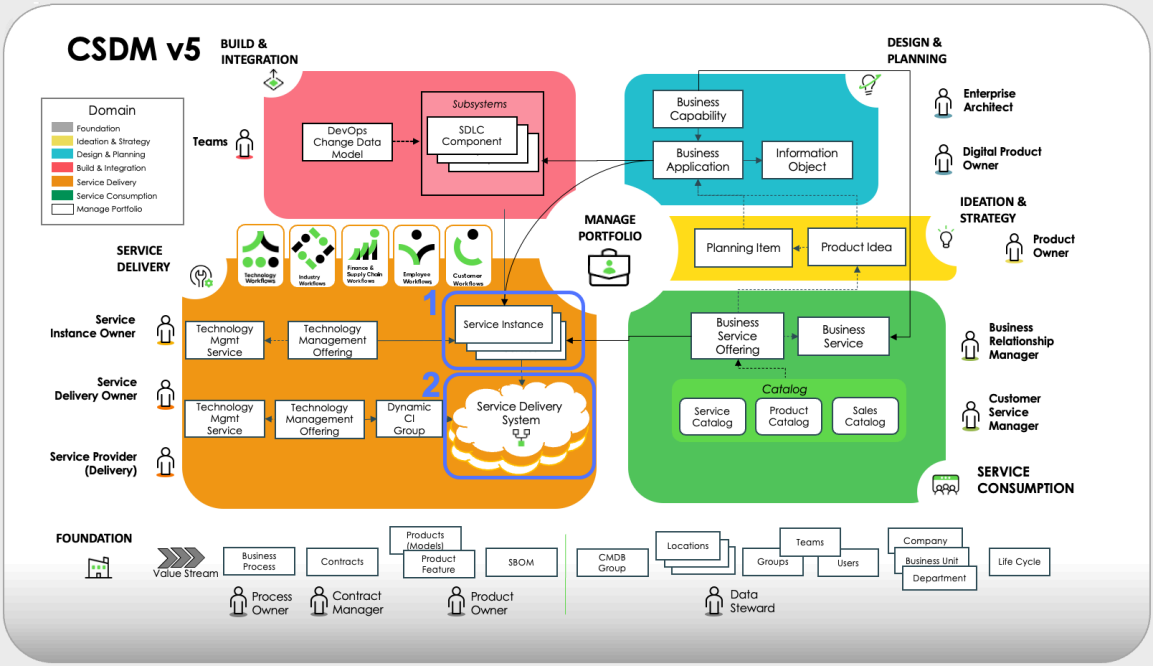
Tables that ITOM Visibility uses

1. Dynamic CI Group table [cmdb_ci_query_based_service]
2. Product model tables (for Technology Portfolio Management [TPM]) software and hardware models

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Products that benefit from ITOM Visibility

- IT Service Management
- Customer Service Management (CSM)
- Event Management
- Cloud Management
- Asset Management (Hardware Asset Management and Software Asset Management)
- Strategic Portfolio Management (Financial Management — Showback statements, Application Portfolio Management [APM])
- Security Operations (Incident Response, software vulnerability management)

Implementing CMDB data

For details on implementing CMDB data to conform with the CSDM framework, see Implementing the CSDM framework in stages.

ITOM Visibility use case

The ITOM Visibility use cases are described in this section.

Discovery use case

- Gain increased visibility into your on-premises and cloud resources.
- Keep track of changes in your on-premises, cloud, and serverless infrastructure in the Configuration Management Database (CMDB).
- Set a strong foundation with accurate data and relationship views for ServiceNow products, including Change Management, Software Asset Management, Customer Service Management (CSM), and Security Operations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Key features of the Discovery use case

- Set up and manage Discovery jobs.
- See IT resources and dependencies at-a-glance.
- Build queries to validate discovered IT resources.
- Manage your public key infrastructure (PKI) certificates in one dashboard.

Results of the Discovery use case

The CSDM framework gives Discovery a prescribed model for how infrastructure and software CIs relate to other areas, such as application services, business applications, and assets.

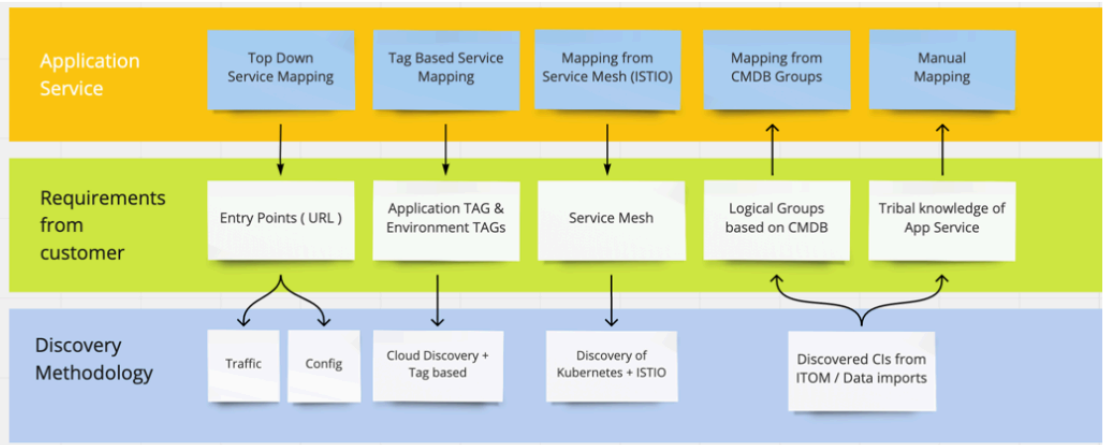
Service Mapping use case

You can create application services manually, using an API, or by having Service Mapping discover them. Regardless of creation method, all application services are stored in the Mapped Application Service table [cmdb_ci_service_discovered].

Results of the Service Mapping use case

Service Mapping automates a critical aspect of CSDM. It provides a consistent, automated approach to connect the logical layer of the CSDM model to the physical model CIs in the CMDB. This approach lets you more effectively manage your business applications. You can automate modeling of your business applications for impact assessment and analysis. For impact assessments and analysis, you can use a number of ServiceNow products including Change Management, Incident Management, or the CMDB Query Builder.

Application Services flow



Application services view in Operator Workspace

You can specify a life-cycle status for an application service. Application services with an Operational life-cycle status can be used on service maps for the relevant workflows, such as Artificial Intelligence for IT Operations (AIOPs) workflows.

ITOM Visibility considerations for CSDM framework

Consider these points while implementing the CSDM framework.

You can use Service Mapping to define application services.

Here are alternative methods for defining application services:

- Define manually.
- Use a Dynamic CI group, based on a query.
- Use a tag-based approach (commonly used for Cloud integrations).

For more information about creating application services, see Create an application service.

Run options for discovery schedules

Both horizontal and top-down discovery use these run options.

Discovery schedule run options

Run option	Description
On Demand	Doesn't run on a schedule. Select **Discover now** to run Discovery. This is the default
Daily	Runs every day. Use the **Time** field to specify the time of day.
Weekly	Runs on one designated day of each week. Use the **Time** field to specify the time of
Monthly	Runs on one designated day of each month. Use the **Day** field to select the day of th specify the time of day. If the designated day doesn't occur in the month, the schedu example, if you designate day 30, the schedule doesn't run in February.
Periodically	Runs every designated time. Use the **Repeat Interval** field to define the time in days, The first Discovery runs at the point in time defined in the **Starting** field. The subsequ **Repeat Interval** period passes. **Note:** For schedules configured as "Periodically", the "Time" column won't disp time. To determine the next execution time for schedule that is configured to run Schedule [sys_trigger] table and locate the corresponding schedule record. The the next scheduled run.
Once	Run one time as designated by the date and time defined in the **Starting** field.
Weekdays	Runs every Monday, Tuesday, Wednesday, Thursday, and Friday. Use the **Time** field t
Weekends	Runs every Saturday and Sunday. Use the **Time** field to select the time of day.
Month Last Day	Run the last day of every month. Use the **Time** field to select the time of day.
Calendar Quarter End	Runs on March 31, June 30, September 30, and December 31. Use the **Time** field to s the dates, modify the *DiscoveryScheduleRunType* script include.
After Discovery	Allows you to sequentially stagger the schedule. Use this option to run this schedule in the **Run after** field finishes. Select the **Even if canceled** check box to designate tha even if the **Run after** Discovery is canceled before it finishes. • This option isn't valid when Discovery is started via DiscoverNow, or when using th • You can't designate an inactive Discovery schedule. • You can't create a loop by designating the run after Discovery to be the same Disc • This Discovery doesn't run if the **Run after** Discovery doesn't finish, with the excep check box is selected and the Discovery is canceled.

Discovery

Plugins or applications installed with Discovery (com.snc.discovery)

Plugin or application name	Description
Cloud Provisioning and Governance Core (com.snc.cloud.core)	Contains resource blocks and cloud Application Programming Interface (cloud API) mappings related to Cloud API-based discovery and events processed by either response mapping or calling patterns.
Service Watch Suite commons (com.snc.service-watch.commons)	Contains common UI components for Discovery and Service Mapping.
Discovery - IP Based (com.snc.discovery.ip_based)	Contains shared components of horizontal discovery used by Discovery and Service Mapping.

Discovery Admin Workspace

Plugin activated with Discovery Admin Workspace (sn_disco_workspace)

Plugin or application name	Description
Discovery (com.snc.discovery)	Finds applications and devices on your network, and then updates the CMDB with the information it finds.

Service Mapping

Plugins or applications installed with Service Mapping (com.snc.service-mapping)

Plugin or application name	Description
Service Mapping – Map (com.itom-map-app)	A dependent internal plugin necessary to support the core components of the Service Mapping, Event Management, and Service Operations Workspace ITOM applications.
Discovery (com.snc.discovery)	Finds applications and devices on your network, and then updates the CMDB with the information it finds.
Event Management and Service Mapping Core (com.snc.service-watch)	Comprises the common components of Event Management and Service Mapping.
Cloud Provisioning and Governance Core (com.snc.cloud.core)	Contains resource blocks and cloud Application Programming Interface (cloud API) mappings related to Cloud API-based discovery and events processed by either response mapping or calling patterns.
Pattern Designer (NG version) (com.snc.ng.pattern.designer)	The next generation (NG) version of the Pattern Designer that enables you to create, edit, and debug patterns used by horizontal and top-down discovery.
Service Mapping Plus (sn_sm_scoped_app)	Offers extended features for Service Mapping, and if related ServiceNow® Store applications and plugins aren't already installed, it installs them.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tag Governance

Plugins or applications installed with Tag Governance (sn_itom_tag)

Plugin or application name	Description
Cloud Access Interface (sn_cai)	Provides easy access to the cloud through scripting. You can use this ServiceNow Store application to perform actions on virtual machines provisioned on Amazon Web Services (AWS) and Microsoft Azure.
Certification Core (com.snc.certification_core)	Contains core certification structures such as filters and templates, and provides compliance functionality.
ITOM Visibility License (com.snc.itom.vis.license)	Enables the activation of any ServiceNow Store application that requires ITOM Visibility licensing.
ITOM/OT SU Licensing (sn_itom_licensing)	Calculates and displays how many subscriptions for ITOM applications your organization purchases and consumes.
Discovery (com.snc.discovery)	Finds applications and devices on your network, and then updates the CMDB with the information it finds.
Flow Designer Action Step - Script on MID (com.glide.hub.action_step.script_mid)	Provides an action step to execute custom JavaScript within a reusable action on a MID Server.

Cloud Discovery Workspace

Plugins or applications installed with Cloud Discovery Workspace (sn_cloud_ops_ws)

Plugin or application name	Description
Discovery and Service Mapping Patterns (sn_itom_pattern)	Provides the latest versions of the Discovery and Service Mapping Patterns released on the ServiceNow Store. ServiceNow releases new patterns on the ServiceNow® Store on a monthly basis, enabling your organization to discover the latest industry-standard devices and applications.
Cloud Provisioning and Governance Core (com.snc.cloud.core)	Contains resource blocks and cloud Application Programming Interface (cloud API) mappings related to Cloud API-based discovery and events processed by either response mapping or calling patterns.
Performance Analytics Content Pack for Cloud Resources (sn_disco_cd)	Displays the aggregated view of all your Cloud Resources. It also provides analytics tables and views that associate tags with resources, enabling you to build your own custom dashboards and reports.
Pattern Designer (NG version) (com.snc.ng.pattern.designer)	The next generation (NG) version of the Pattern Designer that enables you to create, edit, and debug patterns used by horizontal and top-down discovery.

Agent Client Collector for Visibility Content

Plugins or applications installed with Agent Client Collector for Visibility Content (sn_acc_vis_content)

Plugin or application name	Description
Agent Client Collector for Visibility Content Content (sn_acc_vis_content)	Provides agent-based infrastructure discovery and collects Software Asset Management (SAM) metrics to support Discovery and Digital End-User Experience (DEX) applications.
Discovery (com.snc.discovery)	Finds applications and devices on your network, and then updates the CMDB with the information it finds.
Agent Client Collector Framework (sn_agent)	Manages Agent Client Collector on the ServiceNow instance and the MID Server.
CMDB CI Class Models (sn_cmdb_ci_class)	Adds class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and dependent relationships if applicable. Applications such as Discovery and Service Mapping can use these class extensions to populate configuration items (CIs) and discover various technologies and software.

Agent Client Collector for Visibility Content Content

Plugins or applications installed with Agent Client Collector for Visibility Content Content (sn_acc_vis_content)

Plugin or application name	Description
Expanded Model and Asset Classes (sn_ent)	Provides new, expanded model classes, asset classes, and model categories that come with the base system, defined by ServiceNow. Install the Asset Management (com.snc.asset_management) plugin as a prerequisite for using this application.
Discovery – IP Based (com.snc.discovery.ip_based)	Contains shared components of horizontal discovery used by Discovery and Service Mapping.
Agent Client Collector Framework (sn_agent)	Manages Agent Client Collector on the ServiceNow instance and the MID Server.
CMDB CI Class Models (sn_cmdb_ci_class)	Adds class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and dependent relationships if applicable. Applications such as Discovery and Service Mapping can use these class extensions to populate configuration items (CIs) and discover various technologies and software.

a. Select the Application manager icon ( ).

b. On the Application manager page, select **Install**.

Both plugins are installed and listed in the **Installed** tab in the IT Operations Management page.

Exploring ITOM AIOps

Overview of ITOM AIOps applications and capabilities that enable proactive IT operations management through AI-powered monitoring, analytics, and automation.

ITOM AIOps overview

ITOM AIOps enables IT operations teams, site reliability engineers, and DevOps professionals to proactively monitor, analyze, and optimize the health and performance of their IT infrastructure and services.

ServiceNow® ITOM AIOps provides AIOps capabilities that transform how organizations manage IT operations. By combining advanced analytics, machine learning, and automation, ITOM AIOps helps teams avoid service outages, reduce mean time to resolution, and optimize infrastructure performance.

Service Operations Workspace

Network Operations Center (NOC) operators and IT operations teams use Service Operations Workspace as their primary interface for managing IT operations powered by ITOM AIOps. The workspace consolidates alerts, incidents, and operational data from multiple AIOps applications into unified dashboards and workflows.

Operators use the workspace to monitor service health across the entire IT infrastructure, investigate alerts with full context from multiple data sources, and coordinate response activities. The workspace presents correlated events, suggested remediation actions, and service impact information in a single interface. This enables operators to quickly understand and respond to issues.

The workspace integrates data from all AIOps products to provide operators with comprehensive situational awareness and streamlined incident management capabilities.

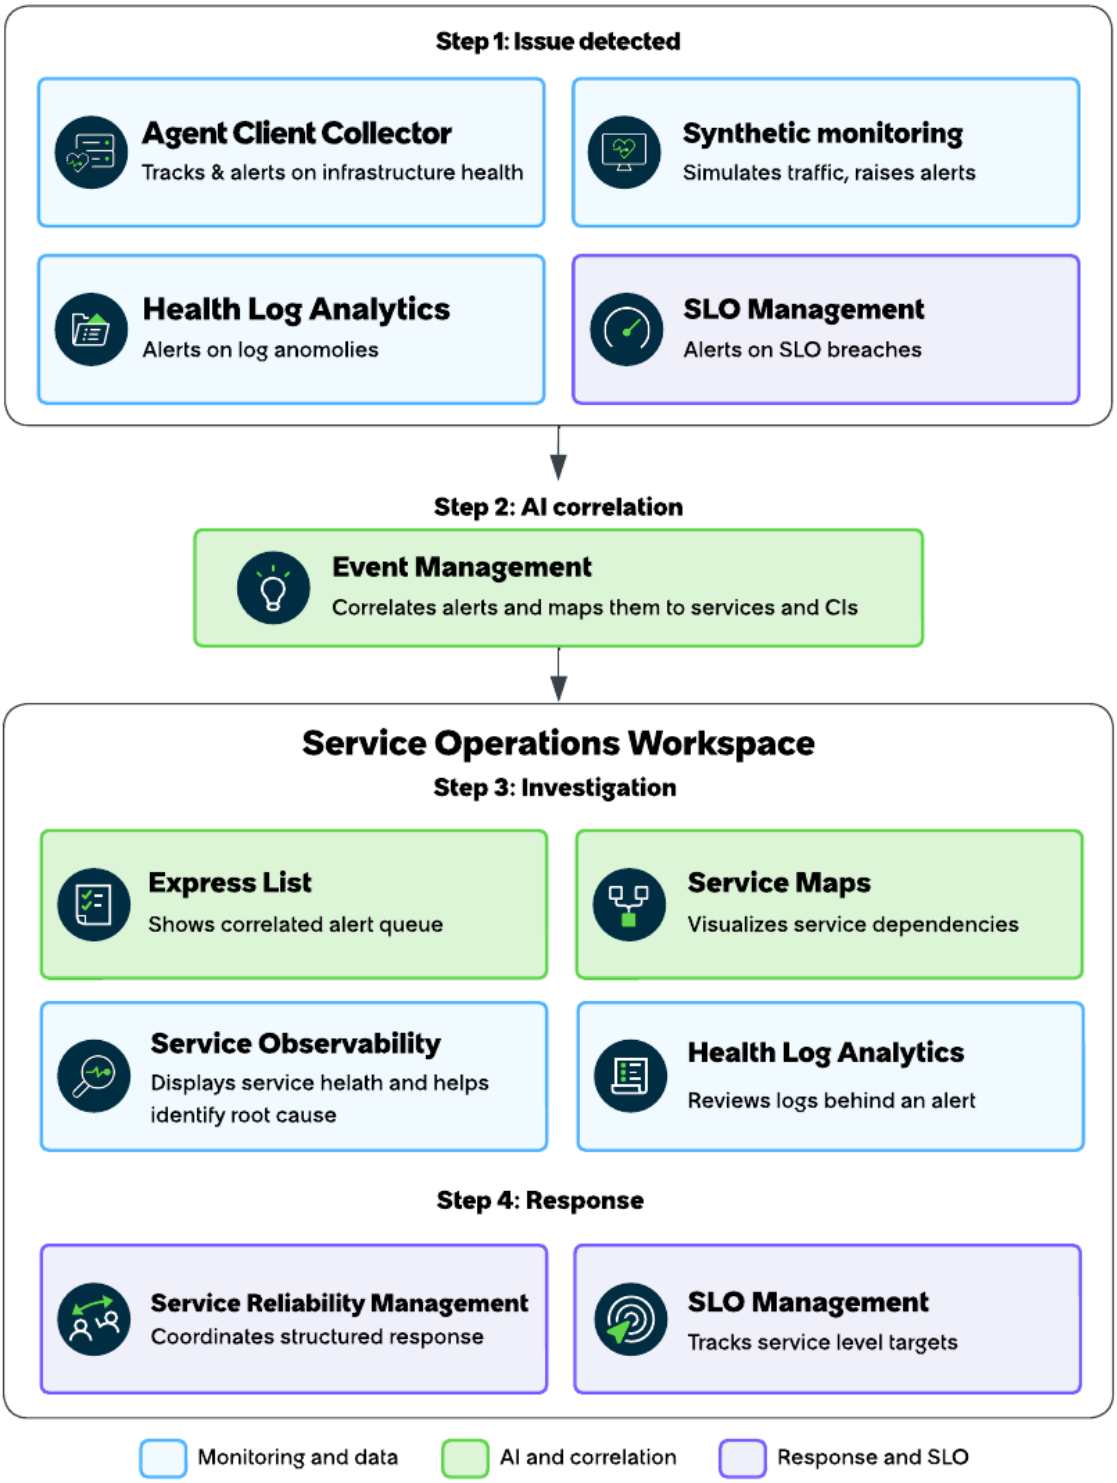
ITOM AIOps workflow

Each AIOPs application focuses on specific aspects of IT operations while contributing to a unified AIOps



platform.

Agent Client Collector

Monitors service availability and infrastructure performance in real-time. Combined with Metric Intelligence, it establishes dynamic thresholds and detects anomalies that may indicate potential service outages before they occur.

Synthetic monitoring

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Monitors critical services by simulating user transactions on API endpoints, identifying performance bottlenecks and helping maintain optimal user experiences. It provides early warning of service degradation before real users are affected.

Health Log Analytics

Collects log data in real time and uses machine learning to identify patterns and detect anomalies. It typically ingests logs through the MID Server, identifies normal operating patterns, and using Event Management, raises actionable alerts when it detects significant deviations that might indicate emerging issues.

Event Management

Serves as the central nervous system for your IT operations. It receives alerts from monitoring tools and correlates related events to reduce noise. The system maps alerts to configuration items in the Configuration Management Database (CMDB) and calculates business impact using service dependencies from Service Mapping. This correlation transforms hundreds of individual alerts into prioritized, context-rich incidents that focus teams on the most critical issues.

Express List

Provides the Service Operations Workspace view into Event Management, enabling operators to efficiently monitor systems and services, resolve alerts, evaluate the alert impact, track issues, and report incidents.

Service Observability

Combines external observability telemetry with Configuration Management Database (CMDB) data, to reveal dependencies that may not be obvious from individual alerts. Charts provide critical insights by showing how infrastructure components may be affecting a single service.

Service Reliability Management

Enables teams to respond to incidents with structured workflows, automated escalation, and collaborative tools that streamline incident response.

SLO Management

Helps organizations define, monitor, and report on service level objectives and service level indicators. It provides automated SLO tracking and alerting when services approach or breach defined thresholds, enabling proactive service quality management.

ITOM AIOps users

Role	Description
Admin [evt_mgmt_admin]	Configures and sets up Event Management properties and rules.
Operator [evt_mgmt_operator]	Manages alerts, including closing and acknowledging them.
User [evt_mgmt_user]	Manages the lifecycle of alerts, including performing basic operations such as viewing and acknowledging them.

ITOM AIOps benefits

Benefit	Feature	Users
Predictive issue detection	• Health Log Analytics • Synthetic monitoring	Admin, operator
Automated alert response	Alert automation in Service Operations Workspace for ITOM	Admin
Performance optimization	Exploring Agent Client Collector	Admin, operator
Service health and investigation	Exploring Service Observability	Admin, operator
Service level management	• Exploring Service Reliability Management • Exploring SLO Management	Admin, operator

Products that add value to ITOM AIOps

In the context of ITOM AIOps, which focuses on maintaining the health and performance of IT systems and infrastructure, there are several ServiceNow products that can add significant value:

Discovery

Discovery automatically identify and collect information about IT assets, configurations, and relationships, providing organizations with a comprehensive inventory to effectively manage and monitor their IT infrastructure.

Service Mapping

Service Mapping provides information about application instance services within the [cmdb_ci_service_discovered] table. This data helps establish connections between infrastructure and application configuration items (CIs) stored in the [cmdb_ci_appl] table, enhancing visibility into IT environments and facilitating efficient management and monitoring processes.

Service Portfolio Management

Service Portfolio Management (SPM) offers the associated product model, while Software Asset Management (SAM) and Hardware Asset Management (HAM) provide lifecycle data for Technology Lifecycle Management (TLM). Together, they enable comprehensive management of IT assets, ensuring effective utilization, compliance, and optimization throughout their life cycles.

Products that benefit from ITOM AIOps

Incident Management

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Incident Management tools use downstream information from Event Management to create incidents swiftly, ensuring timely resolution of issues.

Customer Service Management (CSM)

Customer Service Management (CSM) systems benefit from ITOM AIOps by utilizing application service impact data to identify affected users promptly, enhancing customer support efficiency and satisfaction.

What to know before you begin

Before implementing ITOM AIOps, verify that your instance has the necessary prerequisites and that you understand the configuration requirements for each application.

A well-populated Configuration Management Database (CMDB) is crucial to get the most out of AIOps. ITOM AIOps relies on accurate configuration item data to map events to infrastructure components, calculate service impact, and provide context for alert correlation. Use Discovery to populate your CMDB with current infrastructure data before activating AIOps applications.

Configure the MID Web Server extension to enable ITOM AIOps features. The MID Web Server is an extension that enables external clients to push metric data and events to the MID Server. This extension is required for Event Management, and many instances of Agent Client Collector, and Health Log Analytics.

ServiceNow Otto for Setup provides a sequence of tasks that help you configure Event Management on your ServiceNow instance. For more information about using the ServiceNow Otto for Setup, see Configure Event Management using ServiceNow Otto for Setup.

Service Operations Workspace for ITOM

ServiceNow® Service Operations Workspace (SOW) is a configurable workspace designed to streamline IT Operations Management (ITOM) workflows, offering a unified experience for multiple IT operational processes. Configurable and user-friendly, it consolidates various tasks into a single interface, allowing seamless navigation and easy access to tools and information.

By centralizing workflows, it enhances collaboration, facilitates efficient task management, and provides real-time insights through different metrics. Highly customizable, it enables you to tailor the workspace to your specific needs, optimizing productivity and workflow efficiency. With its comprehensive set of features, including generative AI assistance, automation and collaboration tools, Service Operations Workspace empowers users to work more effectively across different workflows, boosting productivity organization-wide. Scalable to accommodate evolving business needs, it ensures continued support for IT environments of all sizes, delivering superior services and driving operational excellence.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For information regarding subscriptions for ITOM Service Operations Workspace, check the ITOM AIOps subscription at Subscription ITOM AIOps.

When setting up the Service Operations Workspace, it's crucial to configure both IT Operations Management (ITOM) for managing alerts and IT Service Management (ITSM) for resolving incidents and delivering services. This integrated setup ensures access to the full range of features, facilitating comprehensive management of IT operations and service quality.

To know about the ITSM features, see Service Operations Workspace for ITSM.

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Troubleshoot and get help

Contact Customer Service and Support

Service Operations Workspace for ITOM user interface

Explore the interface to understand how an operator can prioritize tasks and offer solutions.

Access Service Operations Workspace

Open the workspace by navigating to **Workspaces** > **Service Operations Workspace**.

Home page

The **Overview** tab is your team's command center. It gives you a real-time snapshot of alert activity, workload distribution, and the impact AI is having on your team's performance — all in one place. Spanning four areas—AI efficiency, team workload, severity, and assignments—this reveals AI's impact on resolution speed and workflow bottlenecks.

Use it to spot imbalances, track resolution speed, and see at a glance whether your team is keeping up with incoming alerts.

Use the assignment group filter (for example, em_admin — 19 items selected) to filter your view. If you're an evt_admin, you can filter by groups you manage and groups you're a member of. If you're an aiops_manager, you can filter only by groups you manage. Use the **Teammates** list to filter by teammate.

You can also reach the homepage by navigating to **All** > **Event Management** > **Operational Home Pages** > **AIOps Managers**.

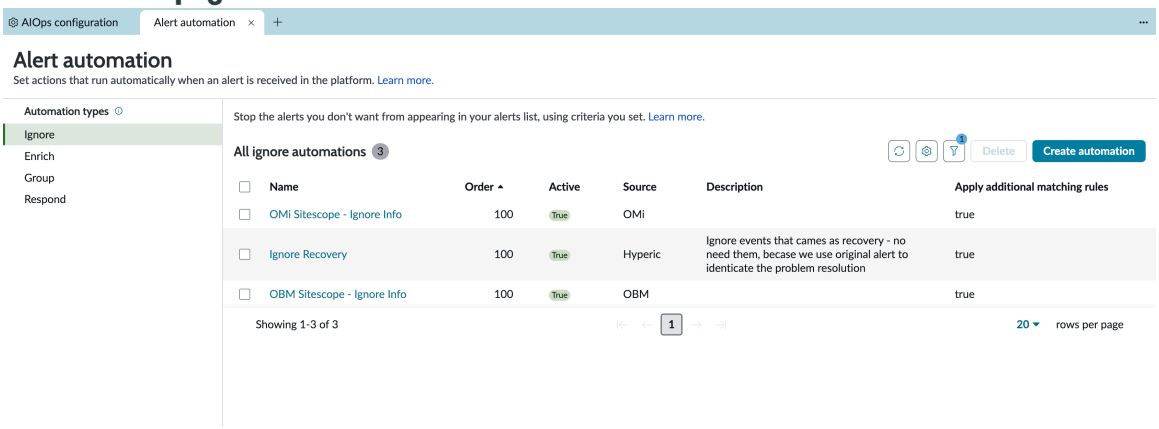
Automations page

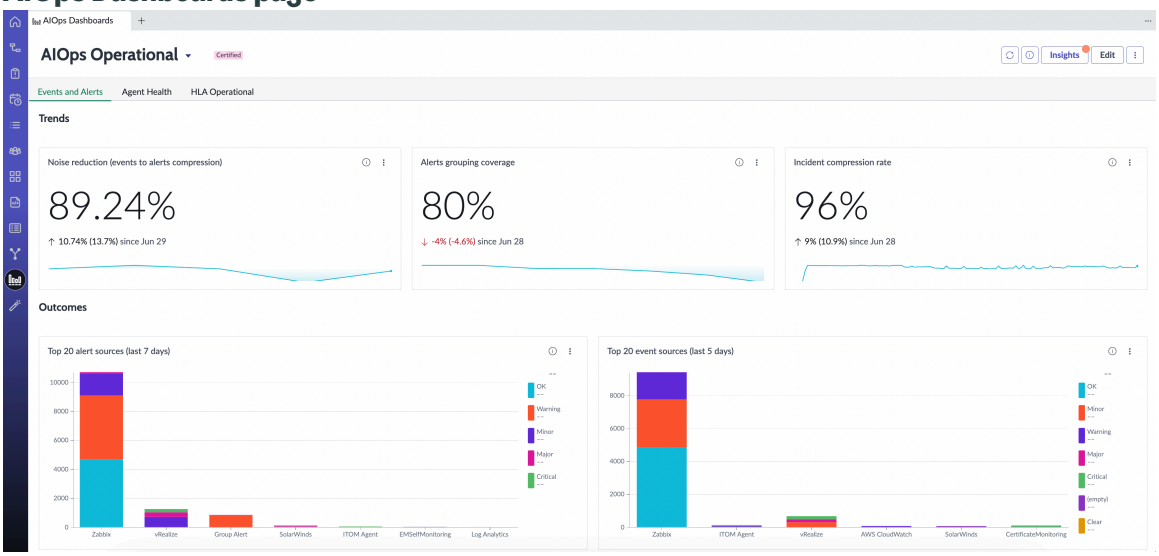


AIOps Dashboards

The AIOps dashboards offer comprehensive visualizations of critical operational data. You can monitor KPIs, track service health, and gain valuable context on the IT environment, enabling proactive responses to issues.

To access information on dashboards, select the AIOps Dashboards icon ( )

AIOps Dashboards page



Admin configuration use case for AIOps

Learn how IT administrators configure and optimize ITOM AIOps for enterprise environments. This use case demonstrates the setup journey for a multi-cloud financial services organization.

This use case demonstrates how IT administrators configure ITOM AIOps to transform operations from reactive to proactive. The scenario follows an IT administrator implementing AIOps capabilities for a global financial services company with hybrid cloud infrastructure.

Configuration scenario

The IT administrator is responsible for implementing ITOM AIOps across a complex environment including on-premises data centers and cloud services. The organization runs critical trading applications, customer-facing banking services, and internal business systems that require 99.9% availability.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The configuration goals include reducing alert noise, enabling predictive issue detection, and providing unified visibility across all environments. The goals also include empowering NOC operators with intelligent workflows and AI-powered insights.

Phase 1: Event sources and intelligent correlation

The administrator configures Event Management to aggregate and intelligently correlate alerts from multiple monitoring tools and data sources.

Event source integration

The administrator integrates existing monitoring tools including network monitoring systems, application performance monitoring platforms, and infrastructure monitoring solutions. The administrator also integrates cloud-native monitoring services. Each integration is configured with appropriate event parsing rules and severity mappings.

Correlation rules configuration

Intelligent correlation rules are established based on CMDB relationships, time-based patterns, and business service dependencies. The administrator configures advanced correlation algorithms that consolidate related infrastructure alerts into a single root cause alert.

Alert prioritization

Trading system alerts are automatically designated as Priority 1 with immediate escalation during market hours. Customer-facing banking services receive Priority 2 classification with 15-minute response requirements. Internal tools receive lower priority during business hours with standard response times. Business service criticality scoring uses revenue impact, customer count, and regulatory requirements as weighting factors.

Phase 2: Predictive analytics and machine learning

The administrator configures advanced analytics capabilities that enable proactive issue detection and intelligent insights for operational teams.

Health Log Analytics setup

HLA is configured to ingest log data from critical applications and infrastructure components. The administrator sets up log parsing rules, anomaly detection thresholds, and predictive models. These models learn normal operational patterns and identify deviations that indicate potential issues.

Metric Intelligence configuration

Machine learning algorithms are trained on historical performance data to establish baseline behaviors for key metrics. The administrator configures anomaly detection sensitivity.

Synthetic monitoring

Synthetic transactions are configured to continuously test critical user journeys through API endpoints. The administrator sets up monitoring with 5-minute frequency intervals.

Service Reliability Management configuration

Service Reliability Management is configured to establish incident response workflows, collaboration channels, and automated remediation capabilities. The administrator sets up on-call schedules, escalation policies, and integration with communication platforms. This enables rapid response when alerts require immediate attention.

Service Level Objective Management setup

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SLO targets are defined for critical business services based on customer expectations and business requirements. The administrator configures SLO monitoring for availability, performance, and error rate metrics. The administrator establishes error budgets and burn rate alerts that provide early warning when services risk missing reliability targets.

Service Observability integration

Service Observability is configured to combine Observability telemetry from external monitoring tools with CMDB relationship data. This data integration enables rapid identification of issues in specific microservices and their related entities without having to use an external tool.

Phase 3: Unified workspace and user experience

The administrator configures the Service Operations Workspace to provide role-based dashboards and workflows that enable efficient operations management.

Dashboard customization

Role-specific dashboards are created for different user types including NOC operators, incident managers, and executive stakeholders. Each dashboard displays relevant metrics, alerts, and service health information appropriate for the user's responsibilities and decision-making needs.

Workflow integration

Automated workflows are configured for common operational scenarios including alert escalation, and notification routing. The administrator establishes integration with IT Service Management (ITSM) processes. This creates seamless handoffs between monitoring and service management.

AI-Powered assistance

ServiceNow Otto for IT Operations Management (ITOM) is configured to provide intelligent alert analysis, recommended actions, and contextual guidance. AI models use organization-specific knowledge including historical incident patterns, common error code translations, and proven remediation procedures to provide insights. Approval workflows are established for high-risk AI-recommended actions while allowing automatic execution of low-risk remediation steps.

Phase 4: Performance tuning and optimization

After initial deployment, the administrator continuously optimizes the system based on operational feedback and performance data to maximize effectiveness and user adoption.

Alert tuning

Based on operator feedback and false positive analysis, the administrator refines correlation rules and adjusts thresholds. The administrator optimizes alert prioritization to reduce noise while maintaining comprehensive coverage of critical issues.

Machine learning model refinement

Anomaly detection models are tuned based on operational patterns and seasonal variations. The administrator adjusts sensitivity settings, incorporates feedback on false positives, and expands training data sets. This improves prediction accuracy.

Configuration outcomes

The comprehensive ITOM AIOps configuration delivers measurable improvements in operational efficiency and service reliability:

Alert reduction

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert volume reduced through intelligent correlation and noise suppression

Proactive detection

Critical issues identified and resolved before customer impact during typical operational shifts

Faster resolution

Mean time to resolution reduced through AI-powered insights and automated workflows

Unified visibility

Single pane of glass for hybrid cloud and on-premises infrastructure

Predictive capabilities

Capacity issues and performance degradation predicted in advance

Business alignment

Alert prioritization and impact analysis directly tied to business service criticality

This configuration enables the operational workflows demonstrated in the NOC operator use case for AIOps. The configuration transforms reactive operations into intelligent, proactive service management.

Related topics

NOC operator use case for AIOps

ITOM AIOps

Service Operations Workspace for ITOM

NOC operator use case for AIOps

Follow a typical NOC operator through their daily workflow using ITOM AIOps capabilities to transform reactive operations into proactive, intelligent IT management.

This use case demonstrates how ITOM AIOps transforms a Network Operations Center (NOC) operator's daily workflow from reactive firefighting to proactive, intelligent operations management. The scenario follows a senior NOC operator at a global financial services company through a typical shift managing critical trading applications and customer-facing banking services.

Starting the shift with unified visibility

At 9:00 a.m., the operator begins the shift by logging into the Service Operations Workspace for ITOM. This unified dashboard consolidates all AIOps capabilities, providing immediate visibility into:

- Alert prioritization showing active alerts with intelligent ranking
- Service health overview with color-coded status of critical business services
- Trending anomalies detected by Metric Intelligence
- Predicted issues identified by Health Log Analytics

Instead of checking multiple monitoring tools, the operator has one consolidated view with intelligent prioritization. This enables faster situational awareness and decision-making.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Proactive issue detection with predictive analytics

At 9:15 a.m., the operator notices a warning on the Health Log Analytics dashboard indicating unusual patterns in trading application logs. The system detects:

- Increasing error rates in authentication services
- Memory utilization patterns that historically precede outages
- Database connection pool exhaustion warnings

The operator drills down into the anomaly. Health Log Analytics provides root cause analysis pointing to a recent configuration change, predicts high probability of service degradation within 45-60 minutes, and recommends specific remediation actions. This enables the operator to address the issue before it impacts users, preventing a potential trading system outage during market hours.

Intelligent alert correlation and impact analysis

At 10 a.m., multiple alerts flood in from various monitoring tools. These alerts concern network latency, application response time degradation, and infrastructure CPU spikes. Event Management uses CMDB topology data to:

- Correlate individual alerts to a single root cause: failed network switch
- Map the impact to affected business services using service topology
- Prioritize based on business criticality with trading applications marked as Priority 1

The operator sees one consolidated alert with full impact analysis. The operator uses the Service Operations Workspace to acknowledge the alert, run automated diagnostics, and initiate network team escalation workflows. This reduces multiple alerts to one actionable item with clear business context.

Performance monitoring with synthetic transactions

At 11:30 a.m., synthetic monitoring alerts the operator that the customer mobile banking application is experiencing issues. These include transaction failures and API response times exceeding SLA thresholds.

The operator uses the Service Operations Workspace to view the realted alerts and starts an investigation. The operator creates an incident with pre-populated impact assessment. Issues are detected before customers contact the help desk.

AI-powered alert analysis and resolution

At 1:15 p.m., a complex alert from the core banking system arrives with cryptic error codes. The operator uses ServiceNow Otto for IT Operations Management (ITOM) to receive:

- Human-readable explanation of database connection timeout caused by connection pool exhaustion
- Historical context showing similar patterns occurred three times in past six months
- Recommended step-by-step remediation actions with risk assessment

Following the AI-recommended steps, the operator resolves the issue. Complex technical issues are resolved quickly without escalation using AI-powered insights from historical data patterns.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Proactive capacity management with machine learning

At 3:00 p.m., Agent Client Collector and Metric Intelligence alert the operator to unusual storage growth patterns, CPU utilization trending toward critical thresholds, and memory consumption anomalies.

The operator reviews anomaly details, creates a proactive capacity planning ticket, and schedules automated cleanup jobs for non-critical data. Proactive capacity management helps prevent weekend outages and emergency procurement needs.

Complex incident resolution with unified telemetry

At 3:30 p.m., a critical incident affects the loan processing application. The operator uses Service Observability to combine observability telemetry from external monitoring tools with CMDB relationship data. The operator correlates performance metrics with infrastructure health data.

The operator quickly identifies the issue in a specific microservice and its database dependency, enabling faster resolution by the development team. Complex distributed system issues are resolved with unified telemetry and topology views.

Key business outcomes achieved

This use case demonstrates how ITOM AIOps transforms NOC operations by delivering:

- Proactive issue prevention with three issues resolved before user impact
- Alert noise reduction with 70+ individual alerts consolidated into eight actionable items
- Faster resolution times reduced from 45 minutes average to 12 minutes
- Enhanced context with every alert including business impact and recommended actions
- Unified operational experience replacing multiple disparate tools
- AI-powered insights using historical patterns and machine learning predictions
- Automated workflows freeing operator time for strategic activities

The transformation from reactive firefighting to proactive, intelligent operations management enables NOC operators to maintain higher service levels. This reduces operational overhead and improves job satisfaction.

Applying the CSDM guidelines to ITOM AIOps

ITOM AIOps helps you track and maintain the health of services in your organization. ITOM AIOps CSDM reference serves as a foundational blueprint for maintaining optimal IT operations by standardizing data models and processes. The main goal is to help you understand the two main capabilities that work together within the CSDM framework.

ITOM AIOps consists of two main capabilities that use the CSDM framework.

Event Management

Event Management gathers alerts from infrastructure events captured by third-party monitoring tools. Event Management uses IT-related information gathered by Discovery to map alerts to CIs. Based on the collected information, Event Management then provides dashboards showing a consolidated view of all service-impact events.

Metric Anomaly Detection

Proactively analyzes your IT infrastructure to spot issues and prevent service outages. Using advanced machine learning to analyze information about your IT

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

infrastructure, the application automatically determines dynamic thresholds and identifies anomalies that may indicate potential service outages.

For CSDM set-up information, see Implementing the CSDM framework in stages.

For more information on CSDM framework, see Exploring the CSDM model.

ITOM AIOps considerations for CSDM framework

ITOM AIOps aligns with CSDM framework to ensure standardized data management and optimize IT operations.

Key considerations for implementing ITOM AIOps for CSDM framework include the following.

Identifying necessary Configuration Items (CIs) for optimal Event Management benefits

Event Management utilizes Configuration Items (CIs) monitored by the operations team to correlate alerts with the appropriate CI and assess their impact on the monitored service.

Defining Technical Services within Event Management

Dynamic CI Group services, formerly known as Technical Services, leverage the CMDB CI Group capability to query the CMDB. This enables efficient grouping of Configuration Items (CIs) for various operational purposes.

Recognizing common use cases for the Dynamic CI Group service

In Event Management (EM), the Dynamic CI Group service functions as a logical grouping mechanism for Configuration Items (CIs). It offers technology or service owners insight into the health status of the grouped entities.

CMDB tables used by ITOM AIOps

ITOM AIOps relies on accurate data in CMDB tables to function as expected. Following CSDM guidelines when populating these tables improves the accuracy of service mapping and helps route alerts and incidents correctly.

ITOM AIOps uses the following CMDB tables:

- Mapped Application Service table `[cmdb_ci_service_discovered]`

  Note: With CSDM v5, the label for the table has changed from Application Service to Service Instance.

- Configuration Item table `[ci_*]`
- Dynamic CI Group table `[cmdb_ci_query_based_service]`

The diagram shows a conceptual map of CMDB tables and their relationships, structured according to CSDM guidelines. ITOM AIOps uses only the highlighted elements: the Service Instance table `[cmdb_ci_service_discovered]` and the Dynamic CI Group table `[cmdb_ci_query_based_service]`. The Configuration Item table `[ci_*]` is not highlighted separately, as it represents the broader CI class hierarchy that underlies most elements in the model. The remaining elements in the model support other ServiceNow products and processes, and are shown here for reference only.

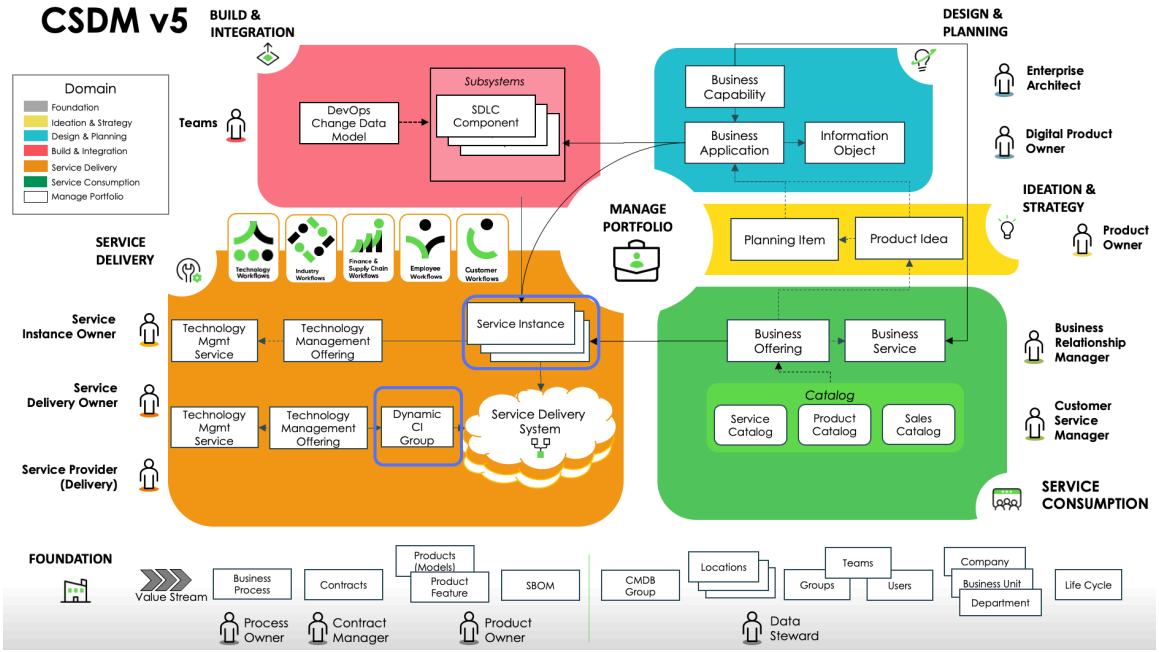
CMDB tables used by ITOM AIOps within the CSDM v5 model



For more information on the CSDM framework, see Exploring the CSDM model.

Plugins or applications installed with ITOM AIOps

Tables that list the plugins or applications that are installed with ITOM AIOps applications. When you update your application, any newly required application dependencies are installed.

Event Management

Plugins or applications installed with Event Management (com.glideapp.itom.snac)

Plugin or application name	Description
Alert Management Content (com.em-alert-mgmt-content)	Contains all the necessary base system subflows that can be used for alert remediation.
ITOM Licensing (com.snc.itom.license)	Central components for the ITOM Licensing Model, which calculates and displays how many subscriptions for ITOM applications your organization purchases and consumes.
Mid Web Server (com.snc.sa.mid.webserver)	A MID Server extension that enables developing REST APIs to send events and metrics to the MID Server. The plugin also enables the communication between the MID Server and Agent Client Collector.
Service Analytics (com.snc.sa.analytics)	Provides alert analytics based on machine learning (ML) and topology learning.
Event Management and Service Mapping Core (com.snc.service-watch)	Comprises the common components of Event Management and Service Mapping.
Tag Based Alert Clustering Engine (sn_em_tbac)	Provides a zero-code method that helps simplify alert grouping and performs alert correlation without the need for CMDB, model training, or fine-tuning.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Plugins or applications installed with Event Management (com.glideapp.itom.snac) (continued)

Plugin or application name	Description
Alert Rules Management (sn_em_arm)	Enables Event Management users to respond automatically to alerts. An alert management rule determines the required alert response.

Health Log Analytics

Plugins or applications installed with Health Log Analytics (sn_occ)

Plugin or application name	Description
Integration Commons for CMDB (sn_cmdb_int_util)	Contains a collection of utility functions that provide a common methodology for the processing of key CMDB attributes and is available to all CMDB certified integrations.
ITOM Cloud Services Core (sn_itom_cloud_svc)	Generates relevant topics for tenants, enabling them to transmit data from their customer infrastructure to ServiceNow automatically. These topics are predominantly intended for use with the Hermes Messaging Service.
Service Operations Workspace ITOM Apps (sn_sow_itom_cont)	A configurable workspace that provides a unified experience for multiple IT Operations Management workflows. You can manage the life cycle of alerts in IT Operations Management workflows through simple, intuitive, and clear user interface, automated recommendations, and targeted experience.
Health Log Analytics Core (com.glideapp.itom.occultus)	Essential components for the Health Log Analytics scoped application.
Microsoft Teams Spoke for ServiceNow IntegrationHub (com.sn.ms_teams.ah)	Provides actions that a process analyst can use when designing flows to automate sending messages about ServiceNow incident and problem records to a Microsoft Teams channel.
Slack Webhooks Spoke for ServiceNow IntegrationHub (com.sn.slack.ah)	Use Slack webhooks to post messages and record details for ServiceNow incidents, problems, and changes to Slack channels.
Normalization Data Services Client (com.glide.data_services_canonicalization.client)	Helps maintain consistency by checking that records for a given company match the list of standard company names. If the plugin finds a company-name field with a variant of that name, it substitutes the standard name in its place.

© 2026 ServiceNow, Inc. All rights reserved.

Service Reliability Management

Plugins or applications installed with Service Reliability Management (sn_sow_srm)

Plugin or application name	Description
Service Operations Workspace Service Reliability Management (SRM) Common (sn_sow_srm_common)	Delivers common utilities and configuration settings used by Service Reliability Management such as core functionality related to managing teams and services, and metric calculation for services.
Service Reliability Management (Global dependencies) (com.snc.srm)	Supports global scripts and utilities for Service Reliability Management for Service Operations Workspace.
Event Management (com.glideapp.itom.snac)	Helps you to identify health issues across business services and infrastructure on a single management console. Event Management provides intelligent event and alert processing, including automatic alert remediation, aggregation, and root cause analysis (RCA)
Service Operations Workspace ITOM Apps (sn_sow_itom_cont)	A configurable workspace that provides a unified experience for multiple IT Operations Management workflows. You can manage the life cycle of alerts in IT Operations Management workflows through simple, intuitive, and clear user interface, automated recommendations, and targeted experience.
On-Call Scheduling (com.snc.on_call_rotation)	Provides the ability to create on-call schedules and escalation trees. When an incident is created, you can dynamically route the escalation to an on-call resource.
SOW - Alert Automation (sn_sow_alert_rules)	Provides operators in Service Operations Workspace with the ability to create and manage alert automation for their team. This automation can be used to enrich, process, and group alerts.
Service Level Objective Management for Service Operations Workspace (sn_sow_slo)	Includes features to monitor and manage service health using Service Level Indicators (SLIs), Service Level Objectives (SLOs), and error budgets.

Service Operations Workspace for ITOM

Plugins or applications installed with Service Operations Workspace ITOM Apps (sn_sow_itom_cont)

Plugin or application name	Description
Service Operations Workspace Core (sn_sow)	Core capabilities and workspace configurations for Service Operations Workspace.
Event Management Core (sn_em_ai)	Enables you to track and monitor alerts in the ServiceNow Agent Workspace.
Service Operations Workspace Integrations	Provides a new and enhanced experience for viewing, configuring, and managing all your available ITOM AIOps integrations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Plugins or applications installed with Service Operations Workspace ITOM Apps (sn_sow_itom_cont) (continued)

Plugin or application name	Description
launchpad (sn_itom_integ_app)	
Service Operations Workspace Alert Mngmt (sn_sow_em)	A detailed alert record page with supplementary data such as Quick Overview, Playbook, and Metrics tabs.
Service Operations Workspace Express List (sn_itom_aiops_list)	A centralized and consolidated platform that enables operators to triage, analyze, and remediate alerts, all in one place. Express List provides a live view of alerts, dynamic filtering, a preview panel with additional context and essential details about each alert, and automated technical analysis using AI.
Service Operations Workspace Log Analytics (sn_sow_hla)	A log viewer in Service Operations Workspace. The application also includes the custom Elasticsearch data source for Performance Analytics (PA) dashboards.
AIOps Dashboards (sn_aiops_dashboard)	Offers comprehensive visualizations of critical operational data and actionable insights that facilitate proactive responses to potential issues. The application targets multiple ITOM personas with different needs. You can monitor key performance indicators (KPIs), track service health, and gain valuable context on the overall IT environment.
Event Management Connectors (sn_em_connector)	A collection of predefined interfaces (connectors) for ingesting events from third-party monitoring tools or Agent Client Collector into a ServiceNow instance.
Service Operations Workspace UI Components (sn_itom_uib_comp)	A joined repository for holding common internal UI components.

Metric Intelligence

Plugins activated with Metric Intelligence (com.snc.sa.metric)

Plugin name	Description
Operational Intelligence - Extension Health Monitoring (com.snc.sa.metric.health)	Contains some features that enable self-monitoring capabilities for the Metric Intelligence components in the MID Server.
Highcharts Reporting (com.glide.highcharts)	Provides some UI functionality to Metric Intelligence.
Event Management (com.glideapp.itom.snac)	Helps you to identify health issues across business services and infrastructure on a single management console. Event Management provides intelligent event and alert processing, including automatic alert remediation, aggregation, and root cause analysis (RCA)
ITOM UI Components (com.snc.itom.ui)	Shared UI components for ITOM products that provide some UI functionality to Metric Intelligence.

Plugins activated with Metric Intelligence (com.snc.sa.metric) (continued)

Plugin name	Description
MID Server Distributed Cluster (com.snc.agent.distributed.cluster)	Enables management of the mid cache component of Metric Intelligence from the ServiceNow instance.
List v3 Components (com.glide.ui.list_v3_components)	Provides some UI functionality to Metric Intelligence and components required for List v3, including REST endpoints, directives, and templates.
MetricBase (com.snc.clotho)	The database where the raw metric data such as CPU usage and Disk Free is saved and where model fitting for anomaly detection occurs.
Mid Web Server (com.snc.sa.mid.webserver)	A MID Server extension that enables developing REST APIs to send events and metrics to the MID Server. The plugin also enables the communication between the MID Server and Agent Client Collector.

Agent Client Collector

Plugins or applications installed with Agent Client Collector Framework (sn_agent)

Plugin or application name	Description
Agent Client Collector Global Utilities (com.snc.sa.accutils)	A set of globally scoped utilities that facilitates cross-scope transactions between Agent Client Collector Framework and a ServiceNow instance.
Configuration Management For Scoped Apps (CMDB) (com.snc.cmdb.scoped)	Provides scoped applications with access to Identification Engine APIs.
Mid Web Server (com.snc.sa.mid.webserver)	A MID Server extension that enables developing REST APIs to send events and metrics to the MID Server. The plugin also enables the communication between the MID Server and Agent Client Collector.

Plugins or applications installed with Agent Client Collector Monitoring (sn_itmon)

Plugin or application name	Description
Agent Client Collector Framework (sn_agent)	Manages Agent Client Collector on the ServiceNow instance and the MID Server.
Metric Intelligence (sn_metrics_ng)	A companion application to the family Metric Intelligence plugin that provides additional functionality and enhancements.
Service Operations Workspace Metric Explorer (sn_itom_metric_exp)	Enables operators to investigate metric behavior and compare and correlate different metrics across hosts, applications, and services so they can troubleshoot issues and find the root cause.
Event Management (com.glideapp.itom.snac)	Helps you to identify health issues across business services and infrastructure on a single management console. Event Management

Plugins or applications installed with Agent Client Collector Monitoring (sn_itmon) (continued)

Plugin or application name	Description
	provides intelligent event and alert processing, including automatic alert remediation, aggregation, and root cause analysis (RCA)
Metric Intelligence (com.snc.sa.metric)	Provides the ability to capture, explore and analyze application metrics data, identifying and indicating anomalies. Metric Intelligence generates anomaly alerts, which can be promoted to IT alerts and appear on the Service Operations Workspace and Service Health dashboard.

Plugins or applications installed with Agent Client Collector for Visibility Content (sn_acc_vis_content)

Plugin or application name	Description
Agent Client Collector for Visibility Content Content (sn_acc_vis_content)	Provides agent-based infrastructure discovery and collects Software Asset Management (SAM) metrics to support Discovery and Digital End-User Experience (DEX) applications.
Discovery (com.snc.discovery)	Finds applications and devices on your network, and then updates the CMDB with the information it finds.
Agent Client Collector Framework (sn_agent)	Manages Agent Client Collector on the ServiceNow instance and the MID Server.
CMDB CI Class Models (sn_cmdb_ci_class)	Adds class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and dependent relationships if applicable. Applications such as Discovery and Service Mapping can use these class extensions to populate configuration items (CIs) and discover various technologies and software.

Applications installed with Agent Client Collector Log Analytics (sn_accl)

Application name	Description
Agent Client Collector Monitoring (sn_itmon)	Provides the ability to monitor your configuration items (CIs). This application comes with predefined monitoring checks and policies that are applied on the agent.
Health Log Analytics (sn_occ)	Helps you solve issues faster by ingesting, analyzing, and correlating machine-generated log data in real-time to predict IT issues before they affect you.

Plugins or applications installed with Agent Client Collector Security Incident Response (sn_secops_acc)

Plugin or application name	Description
Security Incident Response (sn_si)	Enables you to manage and automate the life cycle of your security incidents from initial prioritization to containment and resolution. Use the automated workflows to respond quickly and consistently, and understand trends and

Plugins or applications installed with Agent Client Collector Security Incident Response (sn_secops_acc) (continued)

Plugin or application name	Description
	bottlenecks through the data provided by analytics-driven dashboards and comprehensive reporting systems.
Security Support Orchestration (sn_sec_cmn_orch)	Dependency for the Vulnerability Response and Security Incident Response applications.
Threat Intelligence Support Common (sn_ti)	Enables you to find Indicators of Compromise (IoCs) and enrich security incidents with threat intelligence data. Threat Intelligence enables you to access and provide a reference point for your company's Structured Threat Information Expression (STIX) data.
Agent Client Collector Spoke (sn_acc_spoke)	Provides a framework to write customized workflows or automations to execute on agents or CIs.
Security Support Core (com.snc.security_support.core)	Provides a robust core data model and UI framework specifically for security operations integrations. This comprehensive model serves as the backbone for seamlessly integrating various security tools and systems, promoting smooth data flow and efficient operations.
Security Support Common (sn_sec_cmn)	Enables core functionality used by the Security Operations applications.
Security Integration Framework (sn_sec_int)	Manages the common functionality for Security Operations integrations including both Security Incident Response and Vulnerability Response. Security Integration Framework enables you to use existing features and functionality without having to reimplement them.
Agent Client Collector Framework (sn_agent)	Manages Agent Client Collector on the ServiceNow instance and the MID Server.
Vulnerability Response Dependencies (com.snc.si_dep)	Activates all the dependent plugins required to support the Vulnerability Response application.

Service Observability

Plugins or applications installed with Service Observability (sn_service_obs)

Plugin or application name	Description
Service Observability UI (sn_service_obs_ui)	Enables you to use Service Observability in the Service Operations Workspace (SOW) and the SOW Admin Center.
Service Reliability Management (sn_sow_srm)	Service Reliability Management and Service Observability display service performance metrics together to give a holistic view into service health.
Platform Analytics (sn_app_analytics_w)	Enables customizing the dashboards.

AI in ITOM AIOps

AI features in ITOM AIOps help operators triage alerts, investigate incidents, analyze service health, and improve service reliability using generative AI and agentic workflows.

AI features in ITOM AIOps span several products. The following tables summarize all available AI features by type and product.

Note: Depending on your license, you will have access to certain application features, generative AI skills, agentic workflows, and AI agents. For more information, see ServiceNow product tiers.

Agentic workflows

ServiceNow Otto for ITOM includes agentic workflows that use AI agents to complete alert management and investigation tasks autonomously or with minimal operator input.

Agentic workflows in ITOM AIOps

Product	AI feature	Description	Use case	Resources
Event Management, Express List	Analyze alert impact agentic workflow	Uses observability AI agents to investigate an alert and surface information about its severity, impact, ownership, and potential root causes. Integrates with observability tools such as Dynatrace, Kentik, and New Relic.	An operator selects an alert from an observability-connected source and wants to understand its blast radius, identify responsible teams, and find potential root causes before escalating.	• Analyze alert impact agentic workflow • Analyze alert impact in the ServiceNow Otto panel
Event Management, Express List	Manage alerts autonomously agentic workflow	Provides a unified AI-driven process that automates alert triage, impact analysis, and root cause investigation. Generates reports, summarizes key insights and possible next steps, and stores structured findings in the alert record. Also analyzes Health Log Analytics alerts in	An operations team wants alerts to be triaged, analyzed, and summarized automatically as they	• Manage alerts autonomously agentic workflow • Configure the manage alerts autonomously

Agentic workflows in ITOM AIOps (continued)

Product	AI feature	Description	Use case	Resources
		an alert group and can classify alerts as proactive or reactive.	arrive, with AI insights available in Express List without manual intervention.	agentic workflow • Review AI-generated alert insights in Express List
Event Management, Express List	Analyze potential impact agentic workflow	Analyzes how a change request might affect relevant servers and services. The agent verifies prerequisites, retrieves the change request, selects up to 10 affected servers, identifies matches with suggested services, and displays an impact analysis in the ServiceNow Otto panel. The analysis is also saved to the change request work notes. Includes Service Mapping Candidate and Service Mapping Candidates Impact skills.	An operator or change manager wants to assess the risk of a change request before approving it, without manually reviewing all affected CIs.	• Analyze potential impact agentic workflow • Assess a change request with the Analyze potential impact workflow

AI agents

Standalone AI agents in ITOM AIOps run autonomously on a schedule or in response to a trigger, without requiring user input.

AI agents in ITOM AIOps

Product	AI feature	Description	Use case	Resources
Service Reliability Management	SLO creator agent	Runs every 14 days and processes up to 25 services or CIs that do not already have auto-generated SLOs. Analyzes historical alerts, incidents, and outages to generate one SLO per service or CI with up to 10 service level indicators (SLIs). Generated SLOs are active by default. Email notifications are sent to team managers when SLOs are generated and when the error budget falls to 25% or lower. Requires ServiceNow Otto for ITOM and Service Reliability Management.	A team wants to adopt SLOs without manually defining them, using historical incident and alert data to generate a starting point for each service.	Generating service level objectives

Generative AI skills

Generative AI skills in ITOM AIOps are discrete, on-demand capabilities that operators invoke to generate analyses, summaries, or descriptions for a specific alert, group, or service.

Generative AI skills in ITOM AIOps

Product	AI feature	Description	Use case	Resources
Event Management, Express List	Alert analysis skill	Generates a human-readable brief of an alert and additional technical information to support investigation. Available in the ServiceNow Otto panel, on the alert Overview tab in Service Operations Workspace, and in the Express List preview panel. Analyses are provided in English regardless of the language used in the alert description.	An operator opens an alert and wants a quick summary of what it means and what to investigate next.	• View an alert analysis by ServiceNow Otto in Service Operations Workspace • View an alert analysis by ServiceNow Otto in Express List
Express List	Alert group analysis skill	Generates a simplified, human-readable description of an alert group and technical information to support investigation. Available in the Express List preview panel.	An operator selects an alert group and wants to understand its overall significance before deciding how to respond.	View an alert group analysis by ServiceNow Otto in Express List
Express List	Alert group description generation skill	Generates a comprehensive description of an alert group that encompasses all alerts within the group. The generated description replaces the original alert group description.	An operator wants to replace a system-generated alert group description with a meaningful, AI-generated summary that reflects the full scope of the group.	Generate an alert group description in Express List using ServiceNow Otto
Event Management, Express List	Past incident analysis skill	Queries historical records to find related past incidents and analyzes their frequency, criticality, work notes, and resolution. Presents a summary of the most relevant incidents in the ServiceNow Otto panel, including resolution strategies	An operator is investigating an alert and wants to know whether similar issues have occurred before and	• Accelerate alert resolution with past incident analysis

Generative AI skills in ITOM AIOps (continued)

Product	AI feature	Description	Use case	Resources
		and contact details for teams who resolved similar incidents.	how they were resolved.	• Generate a ServiceNow Otto summary of past related incidents
Express List	AI-generated incident creation skill	Creates an incident with a human-readable, AI-generated description directly from an alert in Express List.	An operator determines that an alert requires an incident and wants the incident description generated automatically rather than written manually.	Create an incident from an alert with ServiceNow Otto in Express List
Service Observability	Analyze dashboard skill	Summarizes a single Service Observability dashboard using generative AI, including calling out insights found in the charts. The skill analyzes data within the selected time period and reports any insights it finds. Results remain available for one hour. Requires manual activation.	An operator wants a quick orientation to an unfamiliar dashboard or needs to identify anomalies in chart data without manually reviewing each chart.	• Activate the analyze Service Observability dashboard skill • Analyze a dashboard in Service Observability
Service Observability	Analyze service health skill	Analyzes all available Service Observability dashboards for a selected service. Detects insights, reports on general service health, and helps operators assess service impact, identify root causes, and streamline incident response. When activated, the skill also runs automatically during incident investigation from the **Investigate** tab. Requires manual activation.	An operator is triaging an incident and needs to quickly assess service impact, identify root causes, and determine next steps across all dashboards for the affected service.	• Activate the analyze service health skill • Analyze service health in Service Observability

Configuring Service Operations Workspace for ITOM

Configure Service Operations Workspace for ITOM so that you can manage IT alert volumes efficiently and customize the workspace to enhance service delivery and operational visibility.

The Service Operations Workspace for ITOM is a centralized hub designed to optimize IT Operations Management by focusing on the handling and resolution of alerts. By leveraging this workspace, administrators can streamline the process of monitoring, triaging, and resolving alerts, thus enhancing service delivery and operational efficiency.

Note: Installing the AIOps Experience application [sn_sow_aiops] provides you with Service Operations Workspace for ITOM.

If you want information regarding subscriptions for ITOM Service Operations Workspace, check the ITOM AIOps subscription at Subscription for ITOM Health.

When setting up the Service Operations Workspace, it's crucial to configure both IT Operations Management (ITOM) for managing alerts and IT Service Management (ITSM) for resolving incidents and delivering services. This integrated setup ensures access to the full range of features, facilitating comprehensive management of IT operations and service quality.

To know about the ITSM configurations, see Configuring Service Operations Workspace for ITSM.

Install Service Operations Workspace for ITOM application

You can install the AIOps Experience [sn_sow_aiops] application to get Service Operations Workspace for ITOM if you have the admin role.The application includes demo data and installs related ServiceNow® Store applications if they are not already installed.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Review the AIOps Experience application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.
- For a list of plugins or applications installed with Service Operations Workspace for ITOM, see Plugins or applications installed with ITOM AIOps.
- Service Operations Workspace supports domain separation. For details, see Domain separation and Event Management.

Role required: admin

About this task

The following items are installed with AIOps Experience [sn_sow_aiops] plugin.

- Roles
- Plugins

For more information, see Components installed with AIOps Experience.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the AIOps Experience [sn_sow_aiops] using the filter criteria and search bar.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

In the list next to the **Install** button, the versions that are available to you are displayed.

3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box, any dependencies installed with your application are listed.

4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
   Demo data are the sample records that describe application features for common use cases. Load the demo data when you first install the application on a development or test instance.
6. Select **Install**.

ITOM AIOps configuration center

The ITOM AIOps configuration center is a centralized hub to manage AIOps settings. It helps you integrate monitoring tools, optimize alerts, metrics, and logs, manage services, dashboards, teams, and authorization—streamlining event-to-response workflows for better visibility, noise reduction, and operational efficiency.

Navigate to **Workspaces** > **Service Operations Workspace**. Select the ITOM AIOps configuration center icon ( ) at the bottom of the left navigation pane.

The ITOM AIOps configuration center page appears. On the ITOM AIOps configuration center page, under the **Optimize** > **Dashboards** section, select the dashboard.

Note: The ITOM AIops configuration center is accessible only to evt_mgmt_admin.

The AIOps configuration center provides a single interface to configure and administer AIOps capabilities in Service Operations Workspace (SOW). You can:

- Integrate monitoring tools to bring in events, logs, and metrics.
- Optimize how alerts are enriched, grouped, ignored, and responded to.
- Fine-tune metrics and log rules for accurate anomaly detection and alerting.
- Set up synthetic monitoring for app uptime.
- Manage services (service monitoring dashboards, SLIs/SLOs, error budgets) for Service Observability and Service Reliability Management.
- Access AIOps dashboards to track performance, operations, and business value.
- Configure authorization for admins, integrations, APIs, and notifications.
- Govern teams and approvals for service creation and on-call schedules.

The AIOps configuration center consolidates all administrative tasks needed to set up and operate ITOM AIOps effectively. It streamlines monitoring, improves incident response, and maintains service reliability.

Configure observability agents for ServiceNow Otto

Configure observability agents for third-party application performance monitoring (APM) or network performance monitoring (NPM) vendors. These agents are invoked by the analyze alert

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

impact agentic workflow. You must configure connections to those vendors before they can be invoked.

Important: This AI agent is turned on by default. For more information, see AI agents, skills, and agentic workflows on by default.

After you configure the agent(s), they can surface information from alerts generated by third-party systems to help you investigate alerts and incidents in the Service Operations Workspace.

Connections to vendors use MCP when possible, otherwise they use an API connection. You need connection and credential information to complete the connection process as shown in the following tables.

Note: These agents are different from the data sources used in the Service Observability dashboards.

Before you begin

Before configuring the integration agents, you must do the following:

- Install ServiceNow Otto for IT Operations Management (ITOM).
- Integrate third-party alerts with Event Management.
- Copy the connection requirements for the vendor as noted in the following tables. You will need these to create credentials and connections to the third-party vendor.

Role required: connection_admin and credential_admin

AWS CloudWatch MCP

Connection information	Value
Agent name	AWS CloudWatch MCP Server Agent
Overview of data returned	Alarm details, metric trend analysis, CloudWatch logs (anomalies, error patterns, log insights queries), CMDB resource context, correlated service metrics, and root cause analysis with recommended next steps
Credential & Connection Alias name	AWS CloudWatch MCP server
Connection type	MCP
Returned data type	APM
Connection URL	`https://your-mcp-server-host/mcp` This assumes you have deployed the CloudWatch MCP server using a MID Server instead of a publicly exposed EC2 instance. For more information about deploying the MCP server, see the AWS CloudWatch MCP Server — MID Server Deployment Guide [KB3030674] article in the Now Support Knowledge Base.

Connection information	Value
	• `teams_read` • `slos_read` • `metrics_read` • `cloud_cost_management_read` • `incident_read` • `monitors_read`

Dynatrace

Connection information	Value
Agent name	Dynatrace MCP Server Agent
Overview of data returned	Insights about logs, topology, recent changes, root causes, impacted entities, and environments.
Credential & Connection Alias name	Dynatrace MCP server
Connection type	MCP
Returned data type	APM
Connection URL	URL of your Dynatrace instance. Dynatrace URLs follow this format: `https://<your-resource-name>.apps.dynatrace.com/platform-reserved/mcp-gateway/v0.1/servers/dynatrace-mcp/mcp`
Required credentials	Platform token (must be prefixed with `Bearer`). For example, `Bearer dt0s01.STABCDEF12345.G3HIJKLMNOP`.
Required scope	IAM policy and group assignment that allows the following scopes: • `davis-copilot:nl2dql:execute` • `davis-copilot:dql2nl:execute` • `davis-copilot:conversations:execute` • `davis:analyzers:read` • `davis:analyzers:execute` • `mcp-gateway:servers:invoke` • `mcp-gateway:servers:read` • `storage:buckets:read` • `storage:logs:read` • `storage:events:read`

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection information	Value
	• `storage:security.events:read` • `storage:metrics:read` • `storage:bizevents:read` • `storage:spans:read` • `storage:entities:read` • `storage:smartscape:read` • `storage:system:read`
Required Dynatrace Intelligence settings	• Enable generative AI • Enable document suggestions • Enable environment-aware queries

Google Cloud

Note: Before configuring this connection, create a keystore file by following the steps in Create a Java KeyStore certificate.

Connection information	Value
Agent name	Gemini Cloud Assist A2A Investigation Agent
Overview of data returned	Summary, findings, root-cause hypotheses, next steps, impact on affected Google Cloud resources, ownership, recommended actions, supporting evidence, and sources
Credential & Connection Alias name	Google Gemini Cloud Assist Agent
Connection type	Agent-to-agent
Returned data type	APM
Required credentials	• Google Project ID • Service Account Email • Private Key ID • Keystore Password • Keystore file (`.jks`)
Required scope	Google Cloud IAM permissions: • Assign the Investigation Creator role to the service account • Give the service account read-access to the resources that you want it to investigate

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection information	Value
Required Google Cloud settings	• Enable the required APIs for your Google Cloud project: `logging.googleapis.com`, `monitoring.googleapis.com`, `cloudresourcemanager.googleapis.com`, and `geminicloudassist` • Gemini Cloud Assist must be set up in the Google Cloud project

Kentik

Connection information	Value
Agent name	Kentik analysis AI agent
Overview of data returned	Service network performance, connectivity, DDOS attacks, and anomalies
Credential & Connection Alias name	Kentik analysis AI agent
Connection type	API
Returned data type	APM
Connection URL	URL of your Kentik instance. Kentik URLs follow this format: `https://<your-resource-name>.api.kentik.com`
Required credentials	• User email • API token
Required scope	Can view devices

LogicMonitor

Connection information	Value
Agent name	LogicMonitor API Agent
Overview of data returned	Alert details, metric trend analysis, device properties and classification, collector health, SDT/maintenance windows, related entity topology, CMDB service associations, recent ServiceNow Change records, top processes, and root cause analysis with verdict (degraded / healthy / cleared-and-sustained / likely-false-positive / inconclusive) and recommended next steps.
Credential &	LogicMonitor API connection

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection information	Value
Connection Alias name	
Connection type	API
Returned data type	APM
Connection URL	`https://<account>.logicmonitor.com/santaba/rest` Replace `<account>` with your LogicMonitor portal subdomain.
Required credentials	API bearer token: An LMv2 personal access token
Required scope	LogicMonitor API v3 read-only access: Devices (view), Alerts (view), Dashboards/ Metrics (view), Collectors (view), SDTs (view), Device Groups (view). The API token inherits the creating user's role. Any user with the default read only or administrator role has sufficient access.

Microsoft Azure

Connection information	Value
Agent name	Azure Monitor MCP Agent
Overview of data returned	Alert details, resource health status, activity logs, Log Analytics query results, metric trend analysis, CMDB resource context, correlated service metrics, and root cause analysis with recommended next steps
Credential & Connection Alias name	Azure Monitor MCP Connection
Connection type	MCP
Returned data type	APM
Connection URL	`http://<your-azure-mcp-server>`
Required credentials	• Azure connection URL • Azure username • Azure password
Required scope	• Reader role on target Azure subscriptions • Log Analytics Reader role on target Log Analytics workspaces

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection information	Value
Required Microsoft Azure settings	• Microsoft Azure MCP Server must be deployed and reachable • Log Analytics workspaces must exist in the target subscription • Azure Monitor must be enabled for target resources

New Relic

Connection information	Value
Agent name	New Relic MCP Server Agent
Overview of data returned	Service and user impact, root cause theories, and responsible teams.
Credential & Connection Alias name	New Relic MCP Connection
Connection type	MCP
Returned data type	APM
Connection URL	`https://mcp.newrelic.com/mcp/`
Required credentials	API key (also known as "User Key") Header name: `api-key`
Required scope	N/A

Prometheus

Connection information	Value
Agent name	Prometheus API Agent
Overview of data returned	PromQL metric queries (CPU, memory, disk, network), active alerts, alert rule definitions, and scrape target health
Credential & Connection Alias name	Prometheus connection
Connection type	API
Returned data type	APM
Connection URL	`https://<your-onprem-prometheus-server>`
Required credentials	• MID Server Prometheus is installed on • User name (for outbound connection) • Password (for outbound connection)

Connection information	Value
Required scope	N/A

SolarWinds

Connection information	Value
Agent name	SolarWinds analysis AI agent
Overview of data returned	On-premises data from SolarWinds Orion: node health/status, CPU/memory, packet loss/latency, interface utilization/errors/discards, active alerts/history, affected entities/services, and trend/baseline metrics used for root-cause investigation
Credential & Connection Alias name	SolarWinds AI Agent
Connection type	API
Returned data type	NPM
Connection URL	`https://<your-onprem-solarwinds-server>`
Required credentials	• MID Server SolarWinds is installed on • User name • Password
Required scope	SolarWinds Orion API/SWQL read access (NPM/APM) via MID Server

Splunk

Connection information	Value
Agent name	Splunk MCP Server Agent
Overview of data returned	SPL query results from Splunk indexes, index/sourcetype metadata, and structured investigation findings including affected entities, root cause analysis, and recommended actions
Credential & Connection Alias name	Splunk MCP Connection
Connection type	MCP

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection information	Value
Returned data type	APM
Connection URL	`https://<your-splunk-instance>.splunkcloud.com`
Required credentials	Splunk MCP token
Required scope	For Splunk token generation: • `mcp_user` role (or any role with `mcp_tool_execute`) required for all MCP tool calls • Search capability and read access to the relevant indexes for running queries • Knowledge object read permissions for Get Knowledge Objects • Token must be generated using the Splunk MCP Server app with `audience = mcp` (not a standard Splunk API token)

ThousandEyes

Connection information	Value
Agent name	ThousandEyes MCP Server Agent
Overview of data returned	Test configuration and status, aggregated metrics (response time, packet loss, latency, jitter, throughput, availability), metric anomalies with deviation analysis, network events and routing changes, ISP/network outages with provider and ASN details, hop-by-hop path visualization, and root cause analysis with ranked probable causes and recommended next steps
Credential & Connection Alias name	ThousandEyes MCP Connection
Connection type	MCP
Returned data type	NPM
Connection URL	`https://api.thousandeyes.com/mcp`
Required credentials	API key prefixed with `Bearer`. For example, `Bearer <api-key>`.
Required scope	ThousandEyes API access with permissions to read tests, metrics, anomalies, events, outages, and path visualization data

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **sys_alias.LIST**.
2. Search for and select the vendor's connection name as shown in the preceding tables.
3. Select **Create New Connection & Credential**.
4. Fill in the form, using the information in the preceding tables.
5. Select **Create**.

   Your connection appears in the **Connections** tab.

The agents are now ready to be used by the analyze alert impact agentic workflow

Customize the Service Operations Workspace for ITOM home page

You can customize the data displayed in sub pages of the home page that is available in the base system. For any visual styling changes, you need to create a copy of that landing page and edit it.

Modify the greeting text on the landing page

Customize the header message that is a part of the greeting text on the home page. This creates a personalized user experience and sets the right tone for the information presented.

Before you begin

Role required: evt_mgmt_admin or admin

About this task

The Get service desk agent shift data broker server script calls the `SOWServiceDeskAgentShift` script includes to display the shift information in the greeting text.

You can customize the display text for the default landing page. To change the visual styling of the text, create a copy of the landing page.

Suppose you are on call until Monday, March 21. You can update your greetings to reflect your on-call status.

Header

Procedure

1. Navigate to **All** > **Service Operations Workspace Admin Center** > **Overview**.
2. On the **Overview** tab, from the **Initial Setup** section, select the **Configure the landing page** option.
3. On the Landing Page form, select **Configure** next to **Greetings**.
   The Script Includes form is displayed for SOWServiceDeskAgentShift, which internally calls the SOWServiceDeskAgentShiftSNC
4. Copy the **Script** value of SOWServiceDeskAgentShiftSNC.

6. Select **Update**.

Modify the first-level cards in the Service Operations Workspace for ITOM Overview section

Customize the data displayed in the first-level cards in the Overview section. Configure parameters such as the header label, data source, metric, group by field, and viewAllQuery for a tailored display.

Before you begin
Role required: evt_mgmt_admin

Procedure

1. Navigate to **sys_ux_client_script_include.list**.
2. From the UX Client Script Includes list, select SowEMLandingPageUtilsSNC client script include definition.
3. On the UX Client Script Include form, edit the **Script** field.
   For example:

```
  }
    };
   const labelMap = {
       'em_alert': {
           'alerts_assigned_to_you': {
               '1': 'Alerts assigned to you - Urgent',
               '2': 'Alerts assigned to you - High',
               '3': 'Alerts assigned to you - Moderate',
               '4': 'Alerts assigned to you - Low'
           },
           'open_alerts': {
               '1': 'Open alerts - Urgent',
               '2': 'Open alerts - High',
               '3': 'Open alerts - Moderate',
               '4': 'Open alerts - Low'
           },
           'team_alerts_assigned': 'Assigned team alerts - to
',
           'team_alerts_unassigned': {
               '1': 'Unassigned team alerts - Urgent',
               '2': 'Unassigned team alerts - High',
               '3': 'Unassigned team alerts - Moderate',
               '4': 'Unassigned team alerts - Low'
           }
       }
```

4. Click **Update**.

Create a copy of the Service Operations Workspace for ITOM landing page

Make visual styling changes to the sub-pages in the home page. This will enhance the overall user experience by providing a consistent and visually appealing interface, improving navigation, and ensuring that key information is easily accessible and engaging.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: evt_mgmt_admin or ui_builder_admin

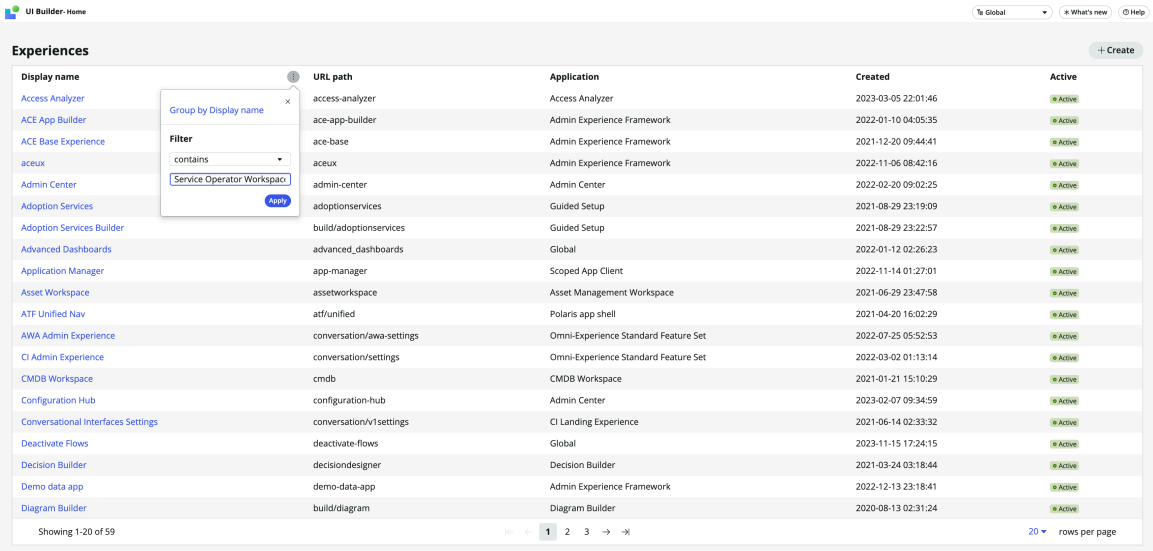
About this task

A page is content that lives at a specific URL. When a user opens the URL, they will see a different variant of this page based on the audience, conditions, and order that you set.

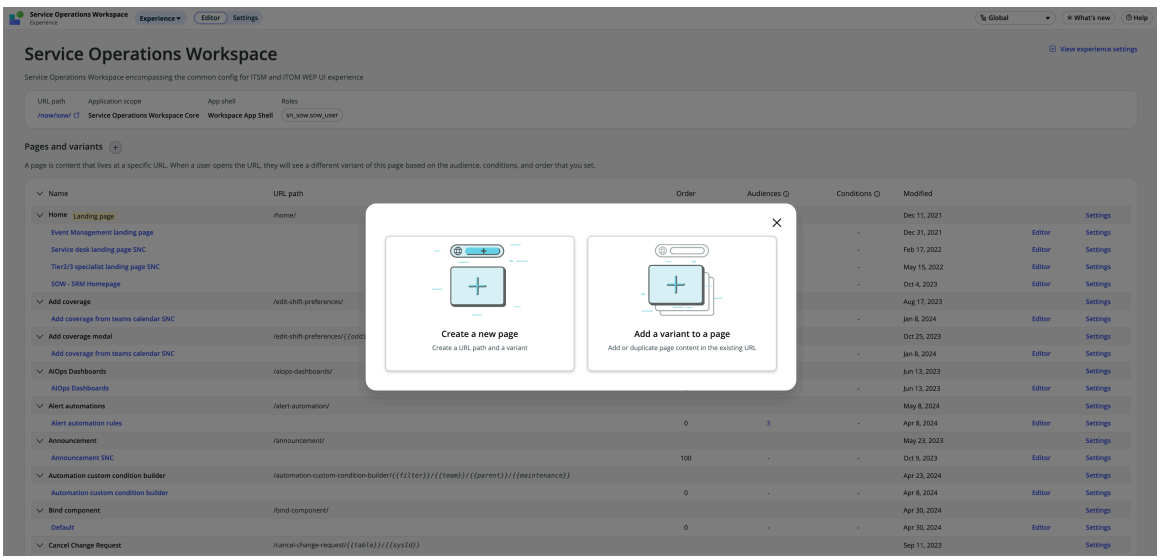
Procedure

1. Navigate to **All** > **Now Experience Framework** > **UI Builder**.
2. From the **Display name** field, filter and search for **Service Operations Workspace**.

   The Experiences page opens.



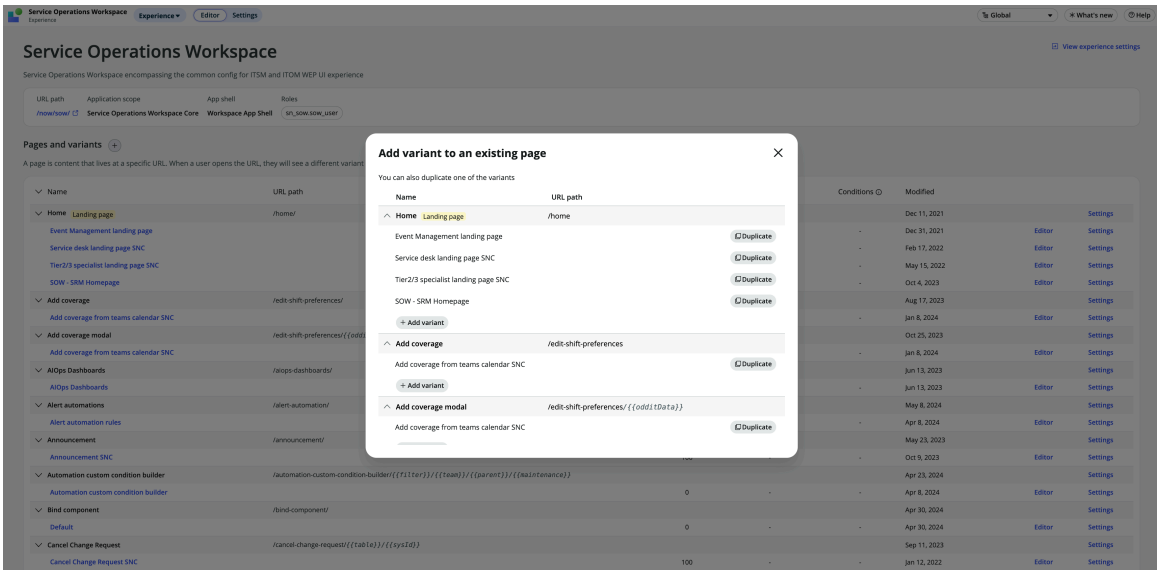
3. Open **Service Operations Workspace** by selecting it.
4. Next to **Pages and variants**, select the plus icon (⊕).



5. Select **Add a variant to a page**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Add variant to an existing page window opens.



6. To create a duplicate page content in the existing URL path, select **Duplicate** and follow the steps.

Open your configurable workspace experience in UI Builder

Access your Configurable Workspace experience in UI Builder for editing.

Before you begin

Role required: ui_builder_admin or admin

Procedure

1. In the navigation filter, navigate to **All** > **Now Experience Framework** > **UI Builder**.
2. Select **Experiences**.
3. Select your experience.

Result

Your configurable experience opens in UI Builder.

Redirect to the Service Operations Workspace home page

Enable quick task prioritization by directing agents to the homepage immediately upon logging into the ServiceNow instance. This improves workflow efficiency by granting agents immediate access to essential tools and information, facilitating the timely resolution of critical tasks and issues.

Before you begin

Ensure that the value of the *`glide.login.home property`* is set to `/now/nav/ui/home`. This property specifies the default homepage that is displayed upon logging in.

Role required: evt_mgmt_admin

Procedure

1. Select **All** and then search for `sys_properties.list`.
2. Add the *`sn_sow.service_desk_groups`* property.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the **Value** field, enter the sys_id of the user group to which the operator belongs.

   Note: If you want to specify multiple service desk groups, add a comma-separated list of group sys_ids in the value field.

4. Select **Update**.

Open your Configurable Workspace experience in UI Builder

Access your Configurable Workspace experience in UI Builder for editing.

Before you begin

Role required: ui_builder_admin or admin

Procedure

1. In the navigation filter, navigate to **All** > **Now Experience Framework** > **UI Builder**.
2. Select **Experiences**.
3. Select your experience.

Result

Your configurable experience opens in UI Builder.

Service Operations Workspace

The Service Operations Workspace monitors services within your Event Management environment, enabling you to review their status and identify those at risk of suboptimal performance. This empowers you to promptly address any issues.

Note: The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

You can configure the Service Operations Workspace to remain logged in for up to 24 hours. For more information, see Manage user sessions.

View application service health information in Service Operations Workspace

Monitor the health of services and filter the information that you want to view, allowing you to focus on the most relevant data and make informed decisions quickly.

Before you begin

Role required: evt_mgmt_user or evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the left navigation bar, select the Service Dashboard icon: .
   The Service Dashboard page appears.

   Note: The application services that appear in the Service Dashboard are those added to the Impact Filter Services list. For more information, see Add application services for impact calculation.

3. Perform the following actions as required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Features and actions

Features	Actions
Make the tile size larger or smaller.	**a.** Select the Display settings icon ( ). **b.** From the **Display settings** pop-up window, select the size. Group services by selected criteria	Select the arrow next to **Group By** and then select the criteria by which you want to group services. Group order	Select the arrow next to **Group order** and then select the criteria by which you want to group services. Segment each group by	Segment each group by severity, business criticality, and cost to categorize and organize them into distinct groups based on these attributes. Filter information	Filter the information displayed on the dashboard ensuring you focus on relevant data for effective monitoring.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Features	Actions
	○ To set a global filter, select the Filter icon ( ) and set the global filter condition, add filter conditions, and then select **Apply**.  ○ To exclude a severity from the display, select it in the **Severity Breakdown** ribbon. Filtered-out severities will appear dimmed. To restore a dimmed severity to the display, simply select it again. 
Create a user view in Service Operations Workspace

Create and customize a user view in the Service Operations Workspace to enable viewing information in the format you want.

Before you begin

Note: The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the left navigation bar, select the Service Dashboard icon: .
   The Service Dashboard page appears.

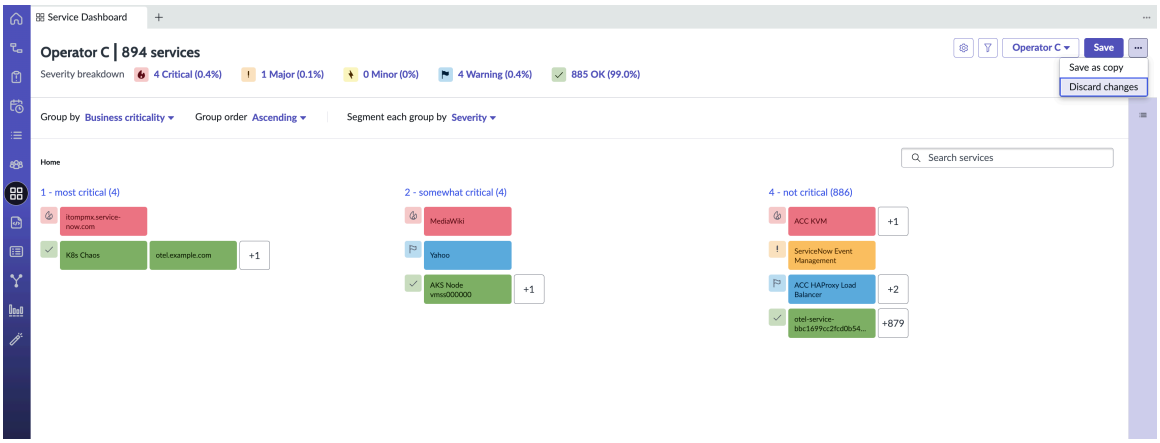
   Note: The application services that appear in the Service Dashboard are those added to the Impact Filter Services list. For more information, see Add application services for impact calculation.

3. Customize the dashboard appearance by selecting output criteria from the **Group by**, **Group order**, or **Segment each group by** filters, or by selecting the relevant **Severity breakdown**. Selecting **Service group** > **All** in the **Group by** filter displays all service groups.
4. Configure the information for the view to display by clicking the filter services icon ( ) and setting a global filter.

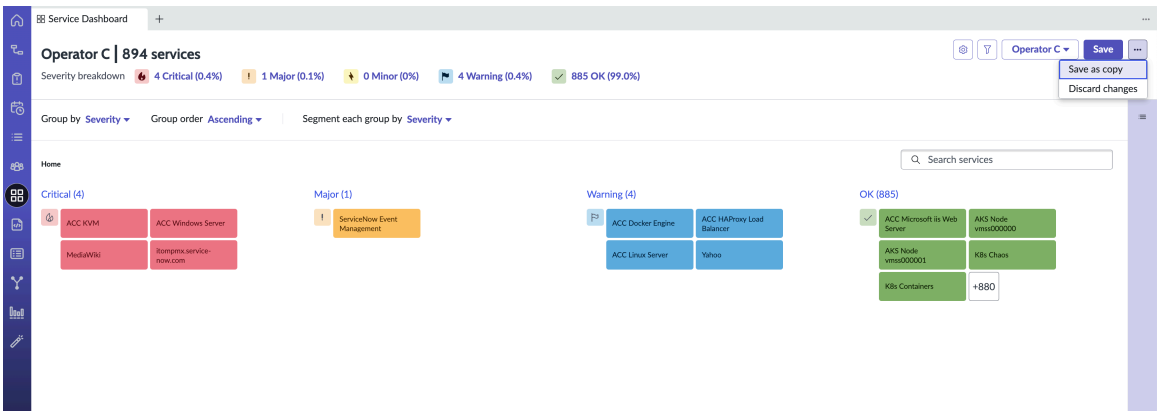
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, you can configure a filter to display only those services assigned to a specific user.

Note: To discard your changes and revert to the view's most recently saved state, select the More actions icon (•••) and select **Discard changes**.



5. Save your new view by clicking the More actions icon (•••) next to the **Save** button and select **Save as copy**.



6. In the Save as copy dialog box, enter the name of your view in the **View name** field.

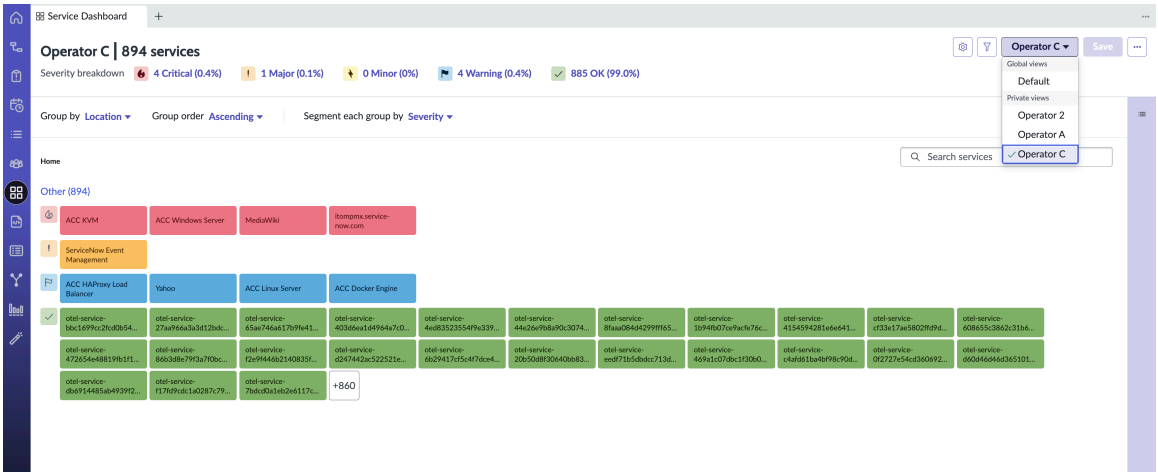
   The view is saved as a **Private view** (visible only to the logged-in user) and is available for use.

   Views are grouped in the following categories:

   - **Global views**: Visible to all users. Only an Event Management administrator can create a global view.
   - **Private views**: Visible only to the logged-in user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: You can switch between different views by selecting a view from the list next to the **Save** button.



Delete a user view in Service Operations Workspace

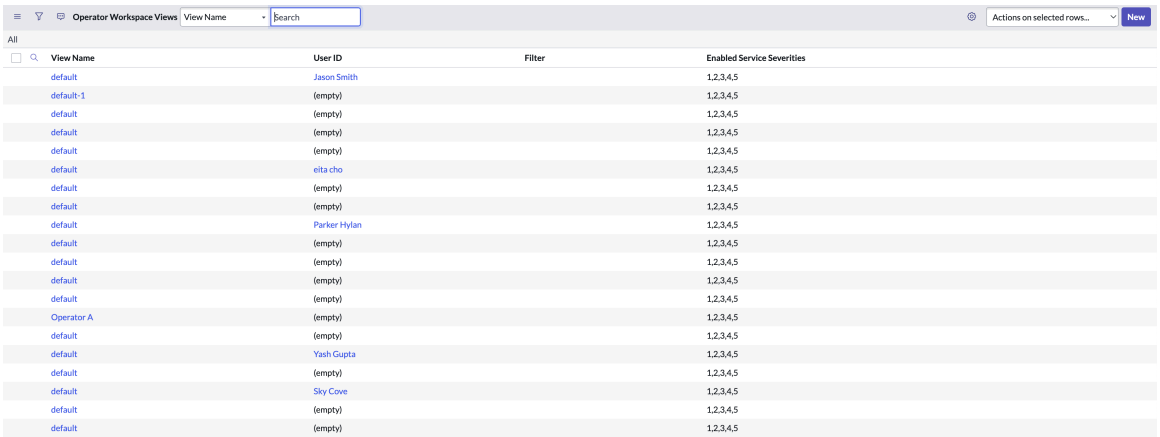
Delete a Service Operations Workspace user view you no longer need. You perform this action from the Event Management menu, outside of Service Operations Workspace.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. In your Event Management instance, in the navigation pane, search for *`noc_user_view.list`*.
   The Operator Workspace Views page opens.



View Name	User ID	Filter	Enabled Service Severities
default	Jason Smith		1,2,3,4,5
default-1	(empty)		1,2,3,4,5
default	(empty)		1,2,3,4,5

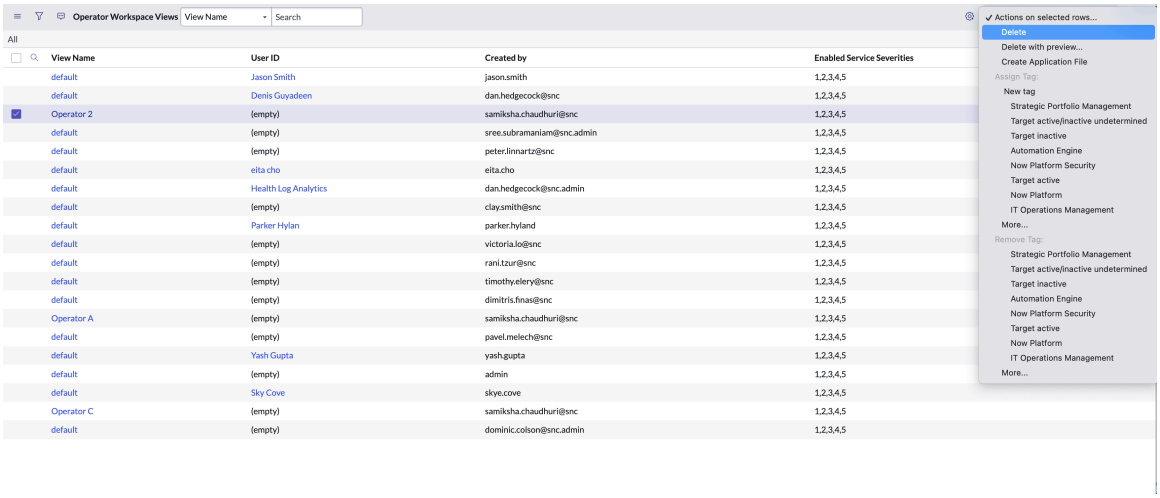
default	Sky Cove		1,2,3,4,5
default	(empty)		1,2,3,4,5
default	(empty)		1,2,3,4,5

2. Select the check box next to the view you want to delete.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the **Actions on selected rows** list, select **Delete**.



View application service details in Service Operations Workspace

View comprehensive information about an application service, including its name, business criticality, ownership, process and operational status, traffic-based discovery details, discovery status, and relevant comments. This enables thorough analysis of the application service's current state and usage, provides clarity on ownership and criticality, and facilitates effective prioritization of resources and actions.

Before you begin

Role required: evt_mgmt_user, evt_mgmt_operator, or evt_mgmt_admin

About this task

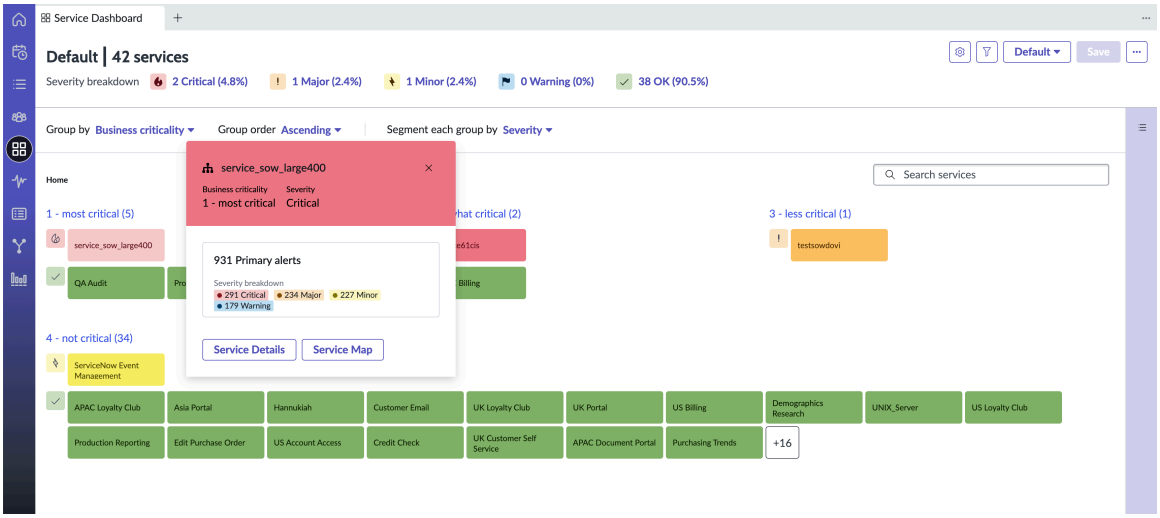
Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the left navigation bar, select the Service Dashboard icon: .
   The Service Dashboard page appears.

   Note: The application services that appear in the Service Dashboard are those added to the Impact Filter Services list. For more information, see Add application services for impact calculation.

3. Select a service tile.
   A pop-up window displays the business criticality and severity of a service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Select **Service Details**.
   By default, the **Details** tab is selected.

   The details page provides comprehensive information about an application service.

   For information on the fields, see Application service details page.

View primary alerts associated with a service

View the primary alerts associated with a service to help troubleshoot issues with the service.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the left navigation bar, select the Service Dashboard icon: .
   The Service Dashboard page appears.

> **Note:** The application services that appear in the Service Dashboard are those added to the Impact Filter Services list. For more information, see Add application services for impact calculation.

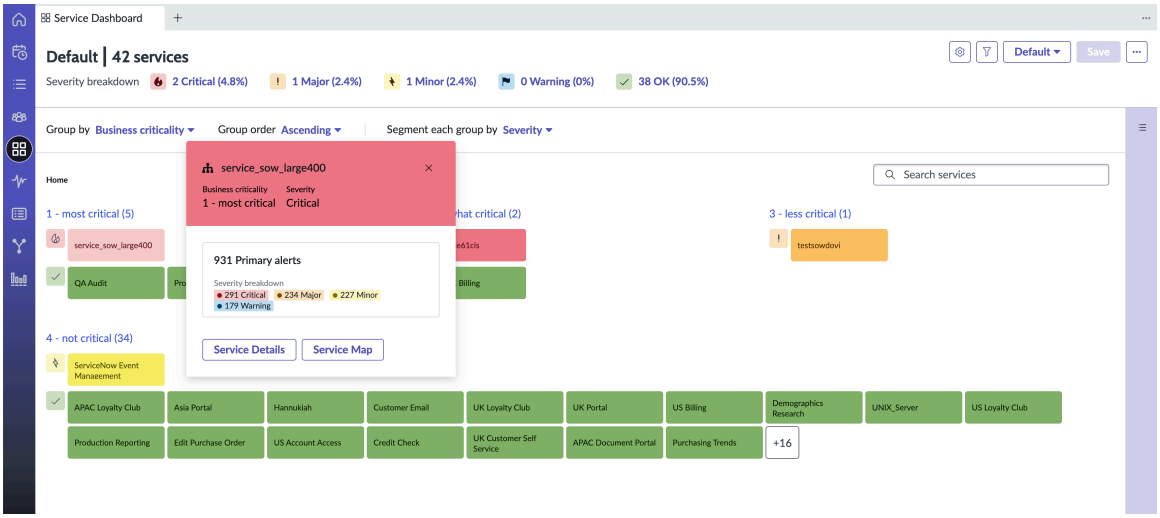
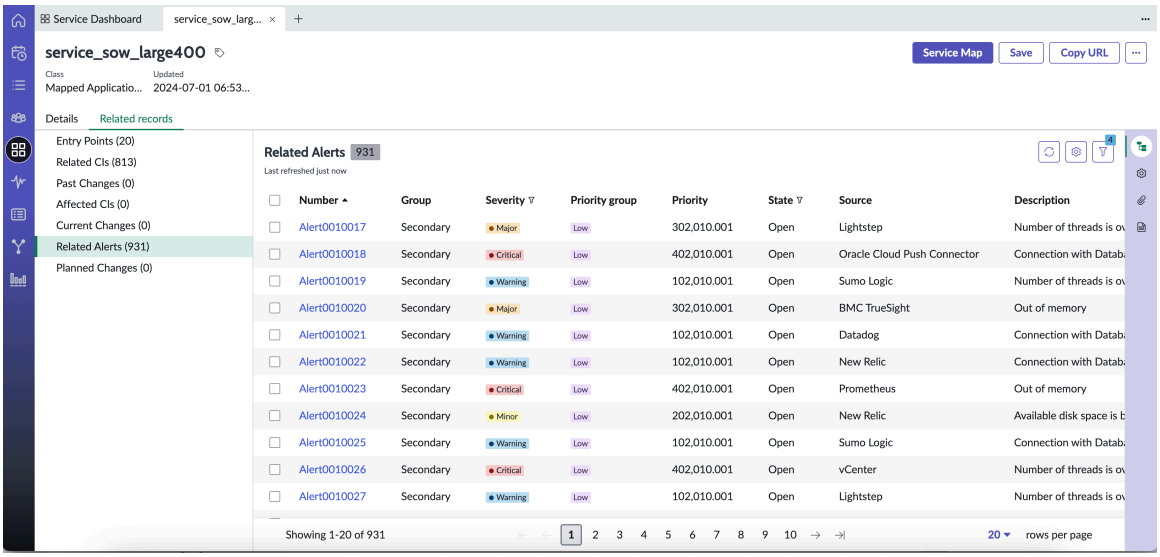
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select a service tile.
   A pop-up window displays the business criticality and severity of a service.



4. Select **Service Details**.
   By default, the **Details** tab is selected.
5. Select the **Related records** tab.
6. From the left pane, select **Related Alerts**.



View details about an alert by selecting its number in the **Number** column.

Create a list in Service Operations Workspace for ITOM

Customize lists in Service Operations Workspace by creating new lists, changing their order, modifying their content, or deleting lists as needed. This flexibility allows operators to organize information according to their specific requirements, facilitating easier navigation, quicker access to relevant data, and streamlined workflow management.

Before you begin

Role required: itil

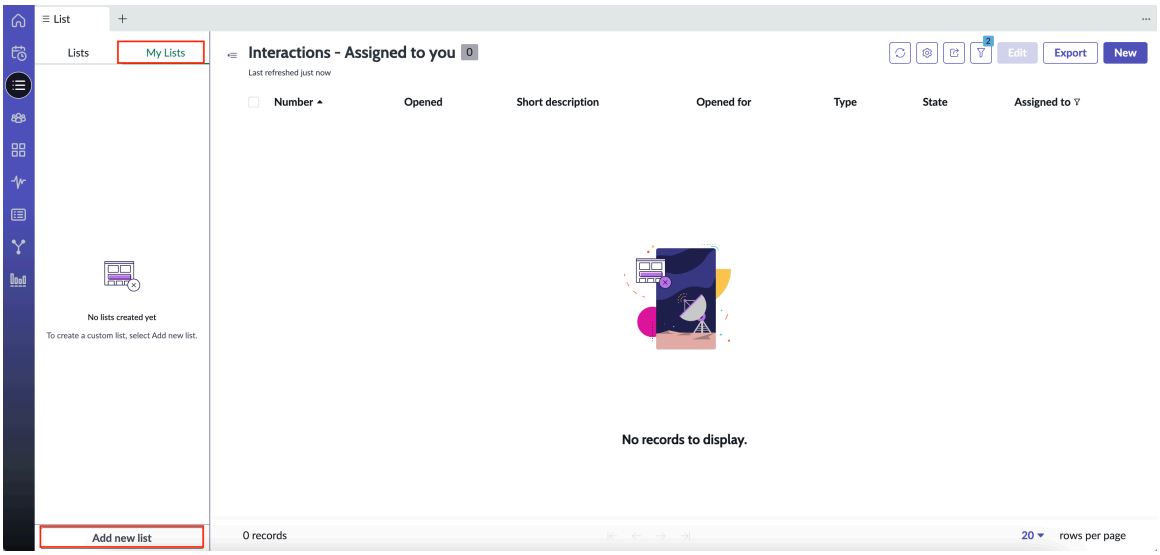
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Create custom groupings of records listed under the **Lists** tab, such as incidents tied to a specific company. Customize existing lists or create new ones exclusively visible under the **My Lists** tab for personalized organization.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the List icon: .
3. Select the **My Lists** tab.
4. Select **Add new list**.



5. Create a list by either basing it on an existing list or creating a new one.
   - To base your list on an existing list, select **Start from existing**.
   - To begin a new list, select **Create your own.**
6. On the form, fill in the fields.
   For more information on the fields, see Create list fields.
7. Select **Create**.
   The list appears in the **My Lists** tab.

Rename a list in Service Operations Workspace for ITOM

Rename a list to better reflect its content or purpose. This customization allows operators to align list names with their workflow terminology, improving clarity and usability.

Before you begin

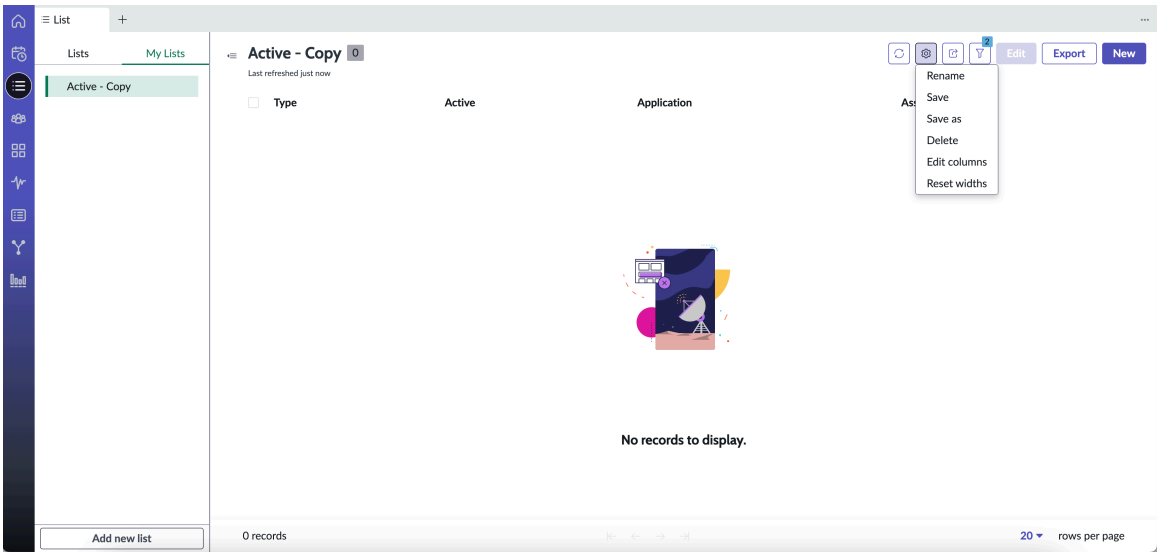
Role required: itil

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the List icon: .
3. Select the **My Lists** tab.
4. Select the list you wish to rename.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select the settings icon ( ) and then select **Rename**.



6. In the **Rename** pop-up window, in the **Title** field, rename the name of the list and select **Save**. The list is renamed.

Reorder list in Service Operations Workspace for ITOM

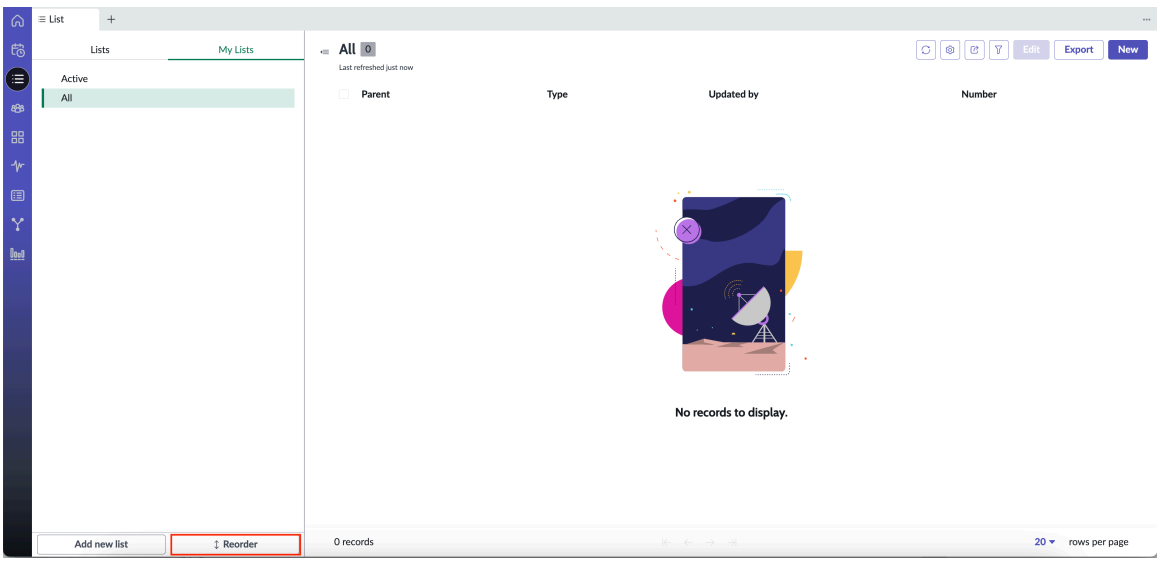
Reorder lists to prioritize information and enhance workflow organization.

Before you begin

Role required: itil

Procedure

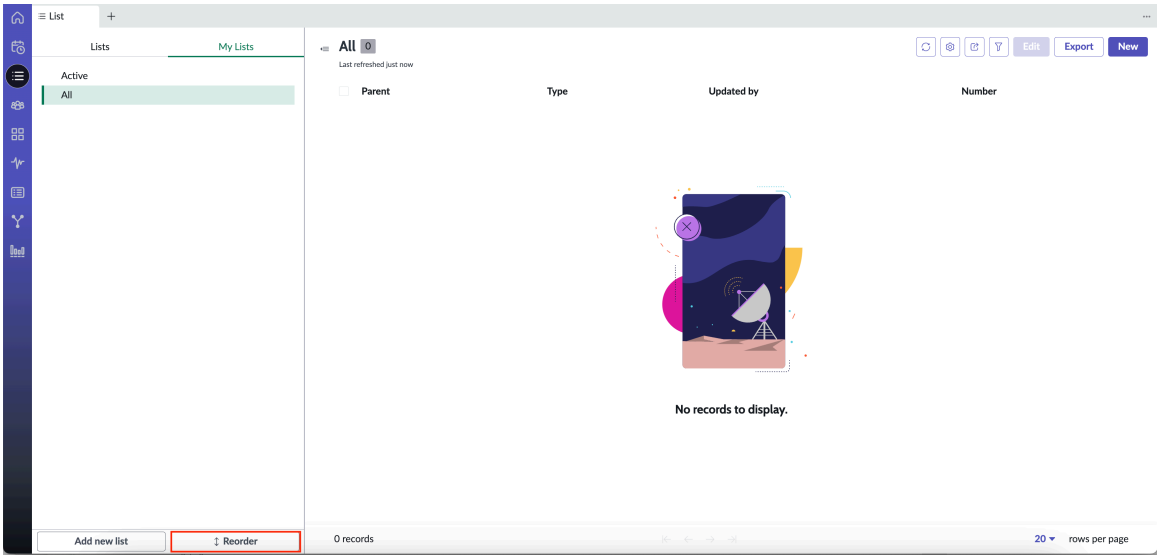
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the List icon: .
3. Select the **My Lists** tab.



4. Select the list you want to reorder.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select **Reorder** to adjust the position of the list.



Delete a list in Service Operations Workspace for ITOM

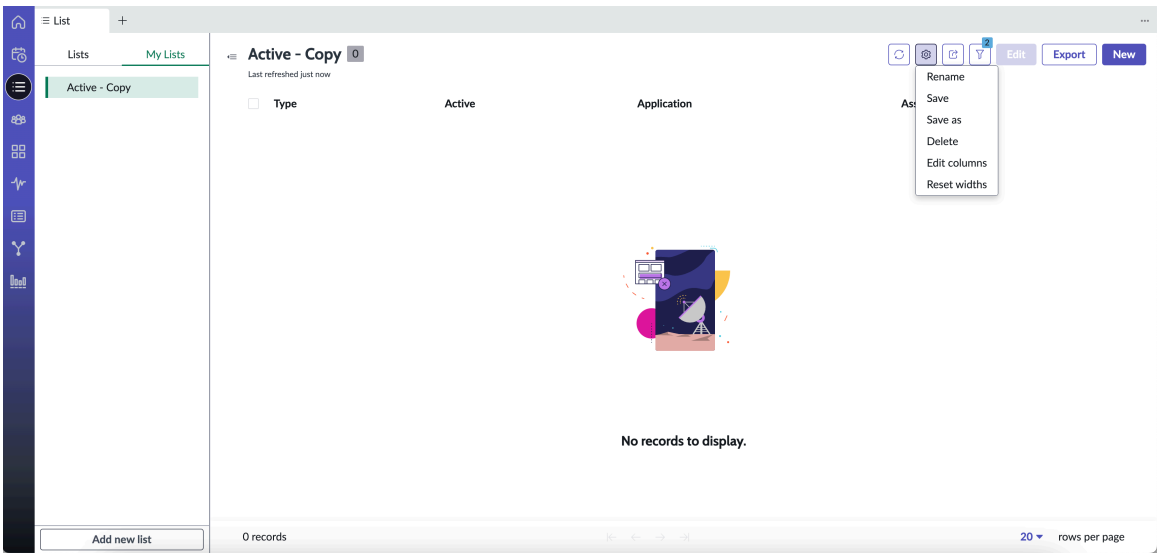
Delete a list to efficiently manage data sets, declutter your workspace, and maintain organized information.

Before you begin

Role required: itil

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the List icon: .
3. Select the **My Lists** tab.
4. Select the list you wish to delete.
5. Select the settings icon ( ) and then select **Delete**.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. In the confirmation pop-up window, select **Delete**.
   The list is delete.

View unified service map and the impact paths in Service Operations Workspace

Visualize relationships between Configuration Items (CIs) and alerts with real-time updates and detailed impact paths. Enhance troubleshooting and proactive management by quickly identifying root causes and dependencies for both discovered services and application services.

Before you begin

Role required: evt_mgmt_user, evt_mgmt_operator, or evt_mgmt_admin

About this task

The enhanced service map in Service Operations Workspace displays the impacted path of an alert to enable you to quickly assess its impact on a service. You can access the enhanced service map directly from the Service Dashboard, or from the preview panel or from an impacted service in the Express List.The service map has several modes of display:

- For a service with up to 60 CIs, regardless of alert status, the map shows all CIs.
- For a service with more than 60 CIs without alerts, the map shows up to 60 CIs.
- For a service with more than 60 CIs with alerts, the map shows the impacted path of the most recent alert with the highest severity.

You can also investigate a wider view of the service topology on the service map for up to 250 CIs regardless of alerts. For a broader view, select **Clear** and choose a mode of either up to 60 or up to 250 nodes.

Note: Admins can continue using the legacy service map to manage the propagation of severity. Access the map by navigating to **Services** > **Application Services**.

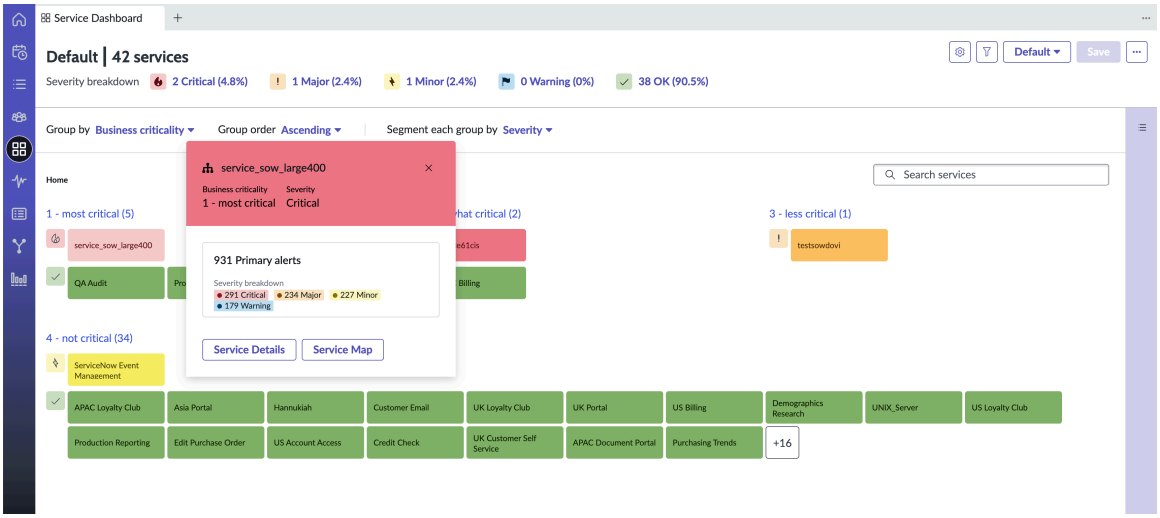
Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the left navigation bar, select the Service Dashboard icon: .
   The Service Dashboard page appears.

   Note: The application services that appear in the Service Dashboard are those added to the Impact Filter Services list. For more information, see Add application services for impact calculation.

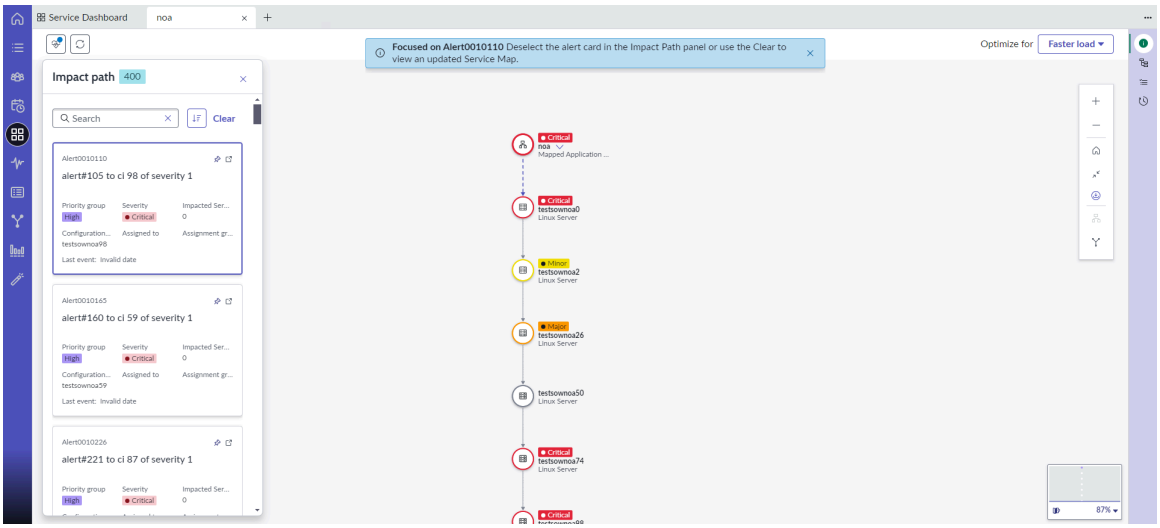
3. Select a service tile.
   A pop-up window displays the business criticality and severity of a service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



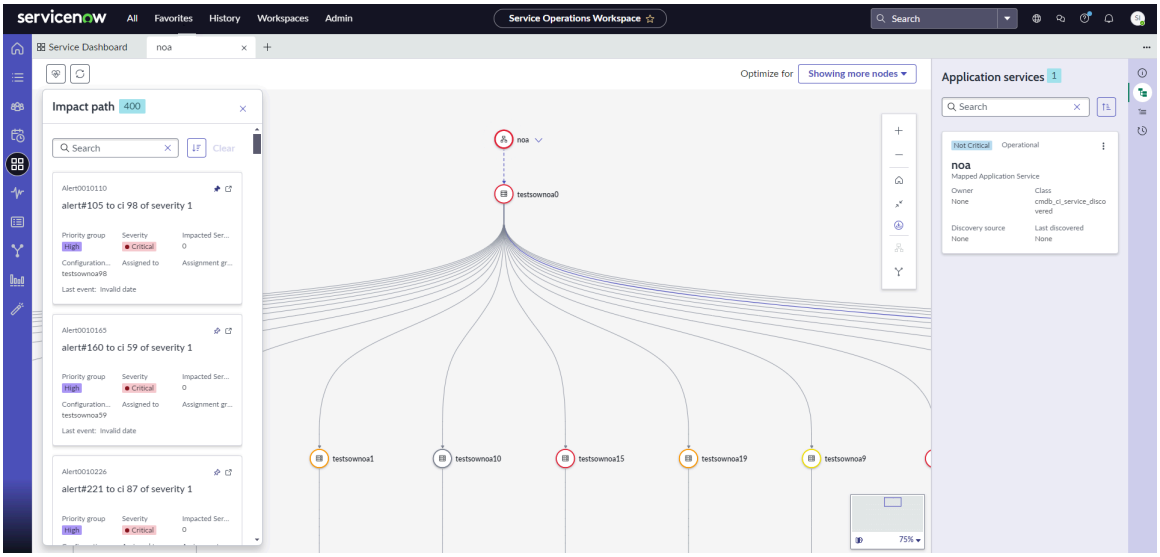
4. Select **Service Map**.

The application map along with the CI relationships appears.



Note: Depending on the size of the service, the unified map either shows the full map (if it contains up to 60 CIs) or an Impact Path leading to the most critical alert (for maps with over 60 CIs). For large maps, you can reveal more CIs by clearing the existing selecting and navigating to the **Showing more nodes** optimization option.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

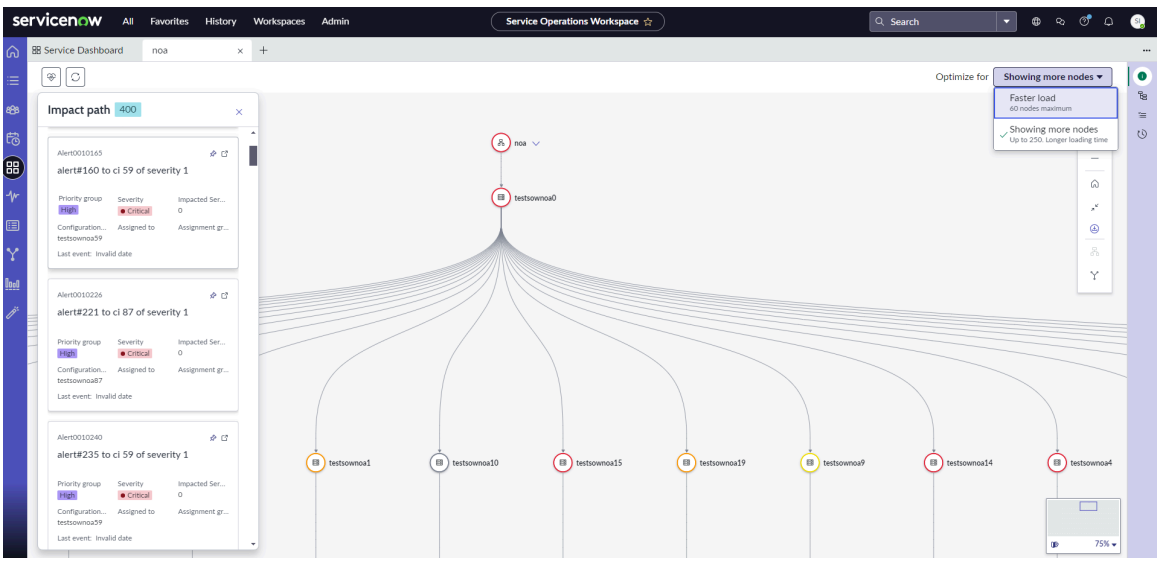


If the impact path panel is closed, you can open it by selecting the Impact path icon ( ).

5. Navigate between alerts by selecting an alert card.

   Alternatively, use the search function to find an alert by description, CI, or alert number and focus on its impact path.

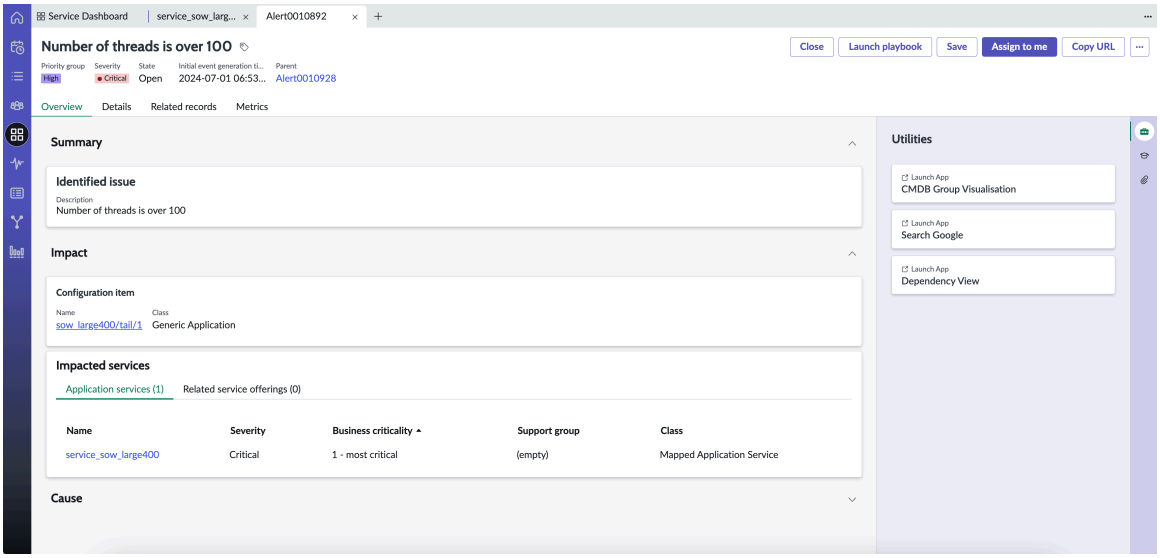
   Selecting any alert tile displays the unified map for that alert. To return to the full map for the service, select **Clear**.



6. To view alert details, select the Open Record Form icon ( ) on the alert card.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The alert details page opens.



Configure live updates for alert lists

Choose live updates for alert lists to receive real-time updates, or disable live updates and refresh the alert list manually.

Before you begin

Role required: evt_mgmt_user, evt_mgmt_operator, or evt_mgmt_admin

About this task

By default, the toggle for live updates is off, and you must enable it to receive live alert updates. Once enabled, the alert list automatically updates whenever an action is performed on an alert. Live updates enhance the accuracy and timeliness of the information displayed, enabling quicker response times, and improving overall system reliability and performance.

To update the alert list manually, you can switch the live updates toggle to off. Manual updates are useful when many alerts are being processed continuously, to avoid excessive refreshing.

Note: Set Read Role permissions to the Event Management user (evt_mgmt_user). Otherwise, the property won't be available.

If an alert is updated and, as a result, no longer matches the active filter, Live List grays it out.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the List icon: .
3. Select the **Default lists** tab.
4. Under **Alerts**, select the list where you want to enable or disable live updates.

   Note: Live updates aren't available for the **All Alert** list.

5. At the top of the alert list, select the toggle switch to turn live updates on or off.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- When live updates are turned on, the setting is saved for future logins by the same user.
- When live updates are off, the refresh button displays a counter to show the number of changes since the last refresh. You can select the refresh button anytime to update the list manually.

Configure alert metrics

Configure the metrics you want to be visible for Service Operations Workspace alerts or use the metrics configured with the base system to focus on relevant data for faster troubleshooting.

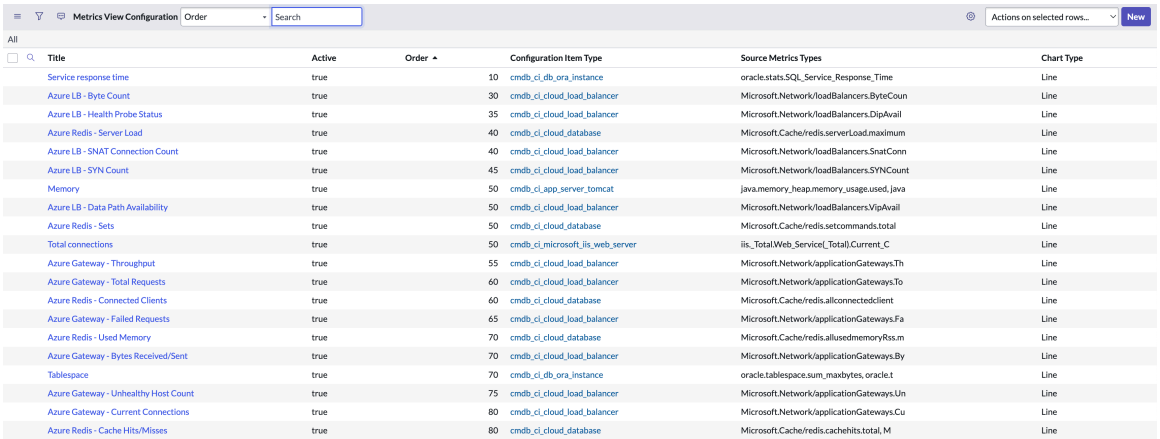
Before you begin

Ensure you have the Metric Intelligence (sn_metrics_ng) plugin installed.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Metrics View Configuration**.



Title	Active	Order	Configuration Item Type	Source Metrics Types	Chart Type

2. On the Metrics View Configuration page, select **New**.
3. On the form, fill in the fields.
   For information on the fields, see Metrics View Configuration form fields.
4. Select **Submit**.

View CI health in Metric Explorer

View the health and performance of an alert's CI using Metric Explorer, to help troubleshoot problematic areas in the CI.

Before you begin

All plugins related to Event Management, Metric Intelligence, and Metric Explorer, are required.

Roles required:

- To access Metric Intelligence metrics in Metric Explorer, the workspace_agent and itil roles are required.
- To configure the set of metrics that appears in Metric Explorer for a class, the admin or evt_mgmt_admin role is required.

About this task

Metric Explorer displays the following Metric Intelligence data:

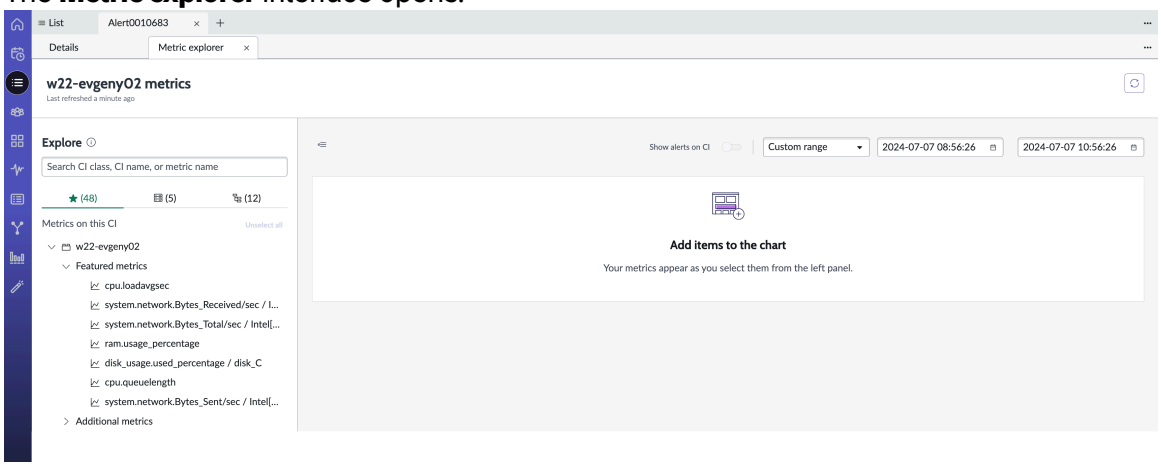
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Charts, control bounds, and aggregations for key metrics for Configuration Items (CIs), in a single location.
- Aggregation of metrics for CIs with resources, in a single consolidated time series.
- Ability for administrators to configure which metric types appear for each CI class.

Metrics are displayed only for alerts containing a CI.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the List icon: .
3. Select **Lists** > **Alerts** > **All Alerts**.
   The Alerts - All Alerts page opens.
4. Select the alert number to open it.
   The alert opens in a separate tab, displaying the **Overview** tab.
5. Select the **Metrics** tab.
6. Select the **Metric explorer** button.
   The **Metric explorer** interface opens.



> **Note:** You can also access the **Metrics** subtab and **Metric Explorer** button when selecting a CI.

7. Select metrics in the Explore section to display the metrics in graph format in the **Custom chart** section.
   Metrics are divided according to the following subtabs:

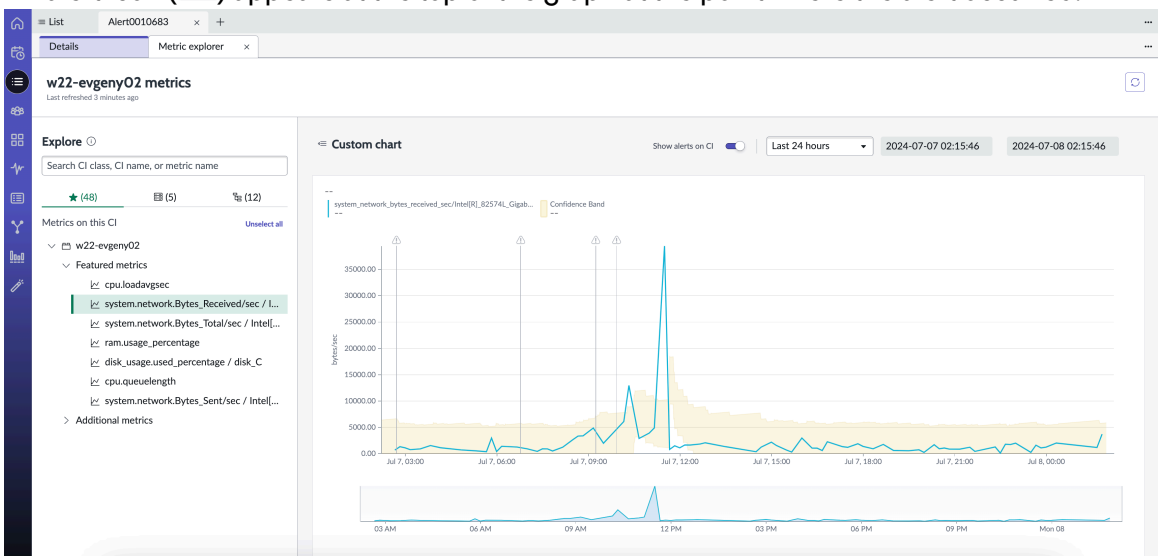
Explore section subtabs

Subtab	Description
★	Displays metrics on the current CI.
	Displays metrics on other CIs on the same host.
	Displays metrics on entry points that relate to the service that the CI is impacting.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Subtab	Description
	Note: When working with large quantities of entry points (100K or more), collecting entry point metrics may cause system degradation. To prevent this, create the *sn_disable_selection_entry_point* property (**All** > **System Properties** > **All Properties**) and set it to **true** to turn off metric collection for entry points.

8. In the **Custom chart** section, configure a time range for which you want to view the displayed metrics.
9. Label alerts on the Custom chart by turning on the **Show alerts on CI** option.
   An alert icon ( ) appears at the top of the graph at the point where the alert occurred.



View alert metric trends in Service Operations Workspace

View the metrics for an alert and adjust the time range to see the trends for the alert or its associated Configuration Item (CI).

Before you begin

Ensure you have the Metric Intelligence (sn_metrics_ng) plugin installed.

Configure the metrics to be displayed for the alert, as described in Configure alert metrics.

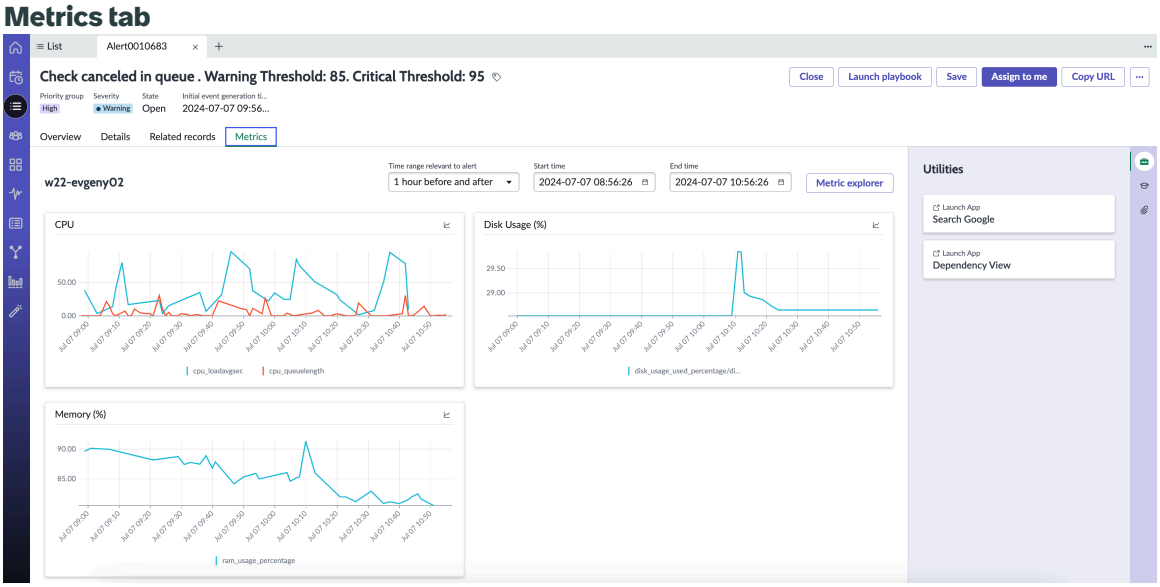
Role required: evt_mgmt_admin

Procedure

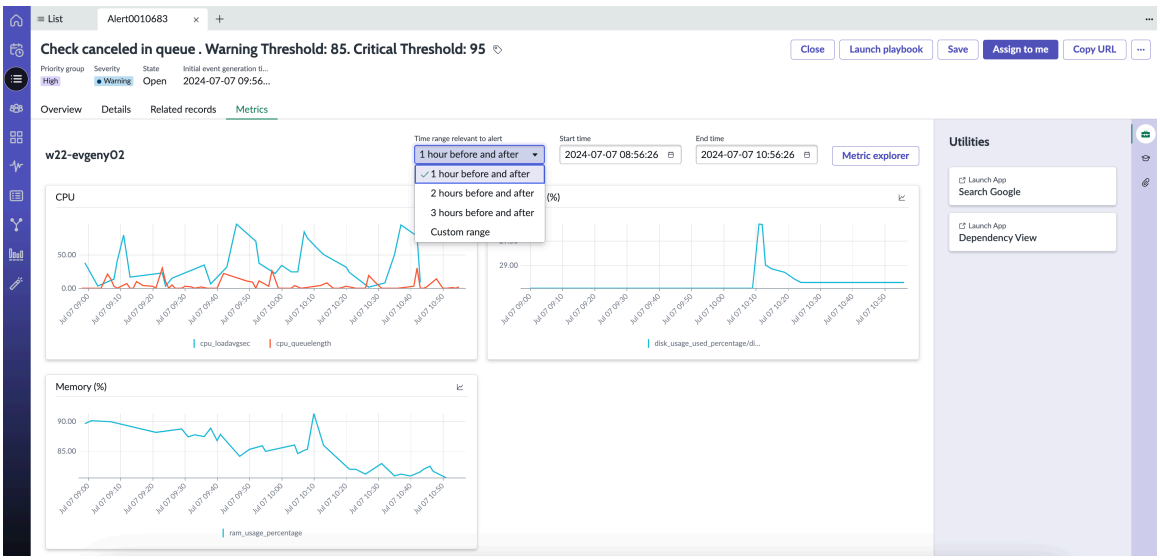
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the List icon: .
3. Select **Lists** > **Alerts** > **All Alerts**.
   The Alerts - All Alerts page opens.
4. Select the alert number to open it.
   The alert opens in a separate tab, displaying the **Overview** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select the **Metrics** tab.



6. In the fields above the metric charts, configure the time range for the alert's metrics.



To customize the metrics display, configure the following properties on the **System Properties** > **All Properties** page:

- *ws_metric.widgets_number_limit*: Specify the number of widgets/records that can be displayed on the metrics tab.
- *ws_metric.datasets_per_widget_limit*: Specify the number of charts/datasets that can be displayed on a chart.

Field name	Description
Time range relevant to alert	Duration for calculating metrics around the alert.
Start time	Start date and time for metric calculations.
End time	End date and time for metric calculations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Select a parameter below a chart to hide the specified parameter's data on the chart.
8. **Optional:** Select the **Insights Explorer** button to view metrics by dragging and dropping them onto a timeline.
9. Select **Save**.
10. **Optional:** View a time range for an alert's CI.

    a. Select the **Overview** tab.

    b. Under the Impact section, on the **Configuration item** card, select the link to the CI that appears under the **Name** field.

    c. Select the **Metrics** tab.

    d. Select **Save**.

On-call scheduling in Service Operations Workspace for ITOM

ITOM Service Operations Workspace supports creating and managing your on-call shifts and schedules. On-call schedule determines who is on-call at a given time. Learn how to configure on-call calendars and escalation policies to ensure timely responses to critical issues, reducing downtime and maintaining service continuity. Streamlining these processes enhances team readiness, minimizes disruptions, and improves service reliability.

Getting started with on-call scheduling

To enable on-call scheduling for alerts, first incorporate the Alert table [em_alert] into the Trigger Rule Table Config list. For more information, see Add alert table to enable on-call scheduling for Service Operations Workspace for ITOM.

Teams in Service Operations Workspace

Use the Teams menu ( ) in Service Operations Workspace to view all teams. Select a team card to view and manage a team's schedule, define escalation policies, and team preferences for the selected shift. This feature verifies that your team knows who is on call, is accountable, and is confident that critical alerts or incidents are acknowledged. For information on creating a shift, see Create on-call shift for your team .

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add alert table to enable on-call scheduling for Service Operations Workspace for ITOM

Enable on-call scheduling by incorporating the Alert table [em_alert] into the Trigger Rule Table Config list. This allows for creating shifts and implementing escalation triggers and policies, ensuring teams can promptly respond to alerts and maintain operational continuity.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** and in the search field, type `trigger_rule_table_cfg.list`.
   The Trigger Rule Table Configs page opens.
2. On the form, fill in the fields with the following values.

   - In the **Table** field, select **Alert [em_alert]**.
   - In the **Trigger group** field, select **Assignment group**.
   - In the **Trigger user** field, select **Assigned to**.
   - In the **Journal** field, select **Work notes**.
3. Select **Submit**.

What to do next

Create on-call shift for your team.

AIOps Dashboards in Service Operations Workspace for ITOM

The AIOps dashboards offer comprehensive visualizations of critical operational data. You can monitor key performance indicators (KPIs), track service health, and gain valuable context on the overall IT environment. These dashboards provide actionable insights that facilitate proactive responses to potential issues.

Key benefits of using the AIOps dashboards:

- Configure the dashboards to focus on the metrics and data most relevant to your role.
- Enjoy interactive visual representations of critical operational data.
- Monitor KPIs, service health metrics, and other important performance data at a glance.
- Leverage actionable insights derived from data analysis for better decision-making.

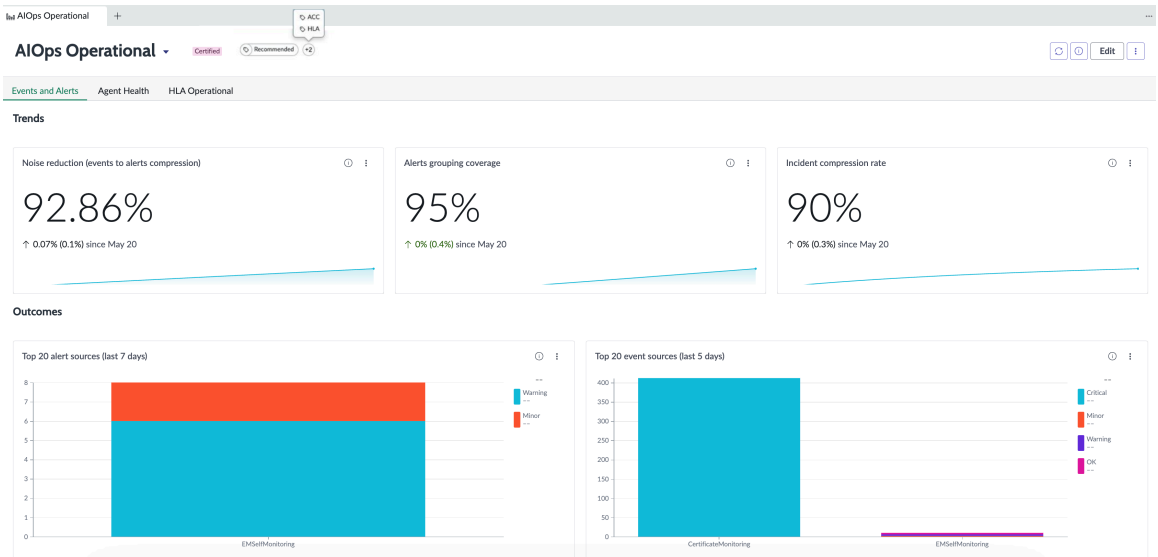
Note: Opening a set of dashboards shows the most recently accessed dashboard in that category.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

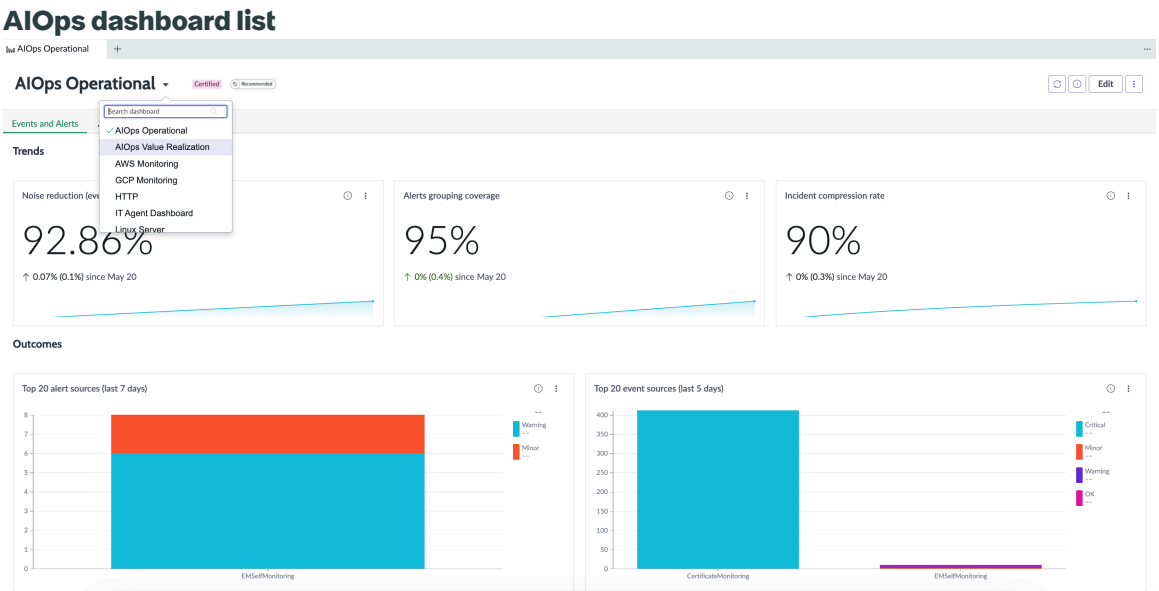
Access the AIOps Operational dashboard

To open the dashboard, navigate to **Workspaces** > **Service Operations Workspace**. From the bottom of the navigation pane, select the AIOps configuration center icon .The AIOps configuration center page appears. On the ITOM AIOps configuration center page, under the **Optimize** > **Dashboards** section, select **View AIOps Operational dashboard**.

AIOps Dashboard home page



To view AIOps Operational dashboards, such as AIOps Value Realization, select the AIOps Operational list and then select the dashboard name.



AIOps 360 overview dashboard

The AIOps 360 Overview dashboard offers a unified view of value and performance across IT operations, helping teams track efficiency, monitor alert handling, and assess automation outcomes. It enhances visibility into AIOps impact, supports informed decisions, and drives faster, smarter operations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Prerequisites

Ensure that the Event Management application is installed.

Required ServiceNow AI Platform roles

- evt_mgmt_admin
- evt_mgmt_operator

Access the AIOps 360 overview dashboard

To open the dashboard, navigate to **Workspaces** > **Service Operations Workspace**. From the left navigation pane, select the AIOps Dashboard icon ( ). The AIOps 360 overview dashboard page opens.

Breakdowns

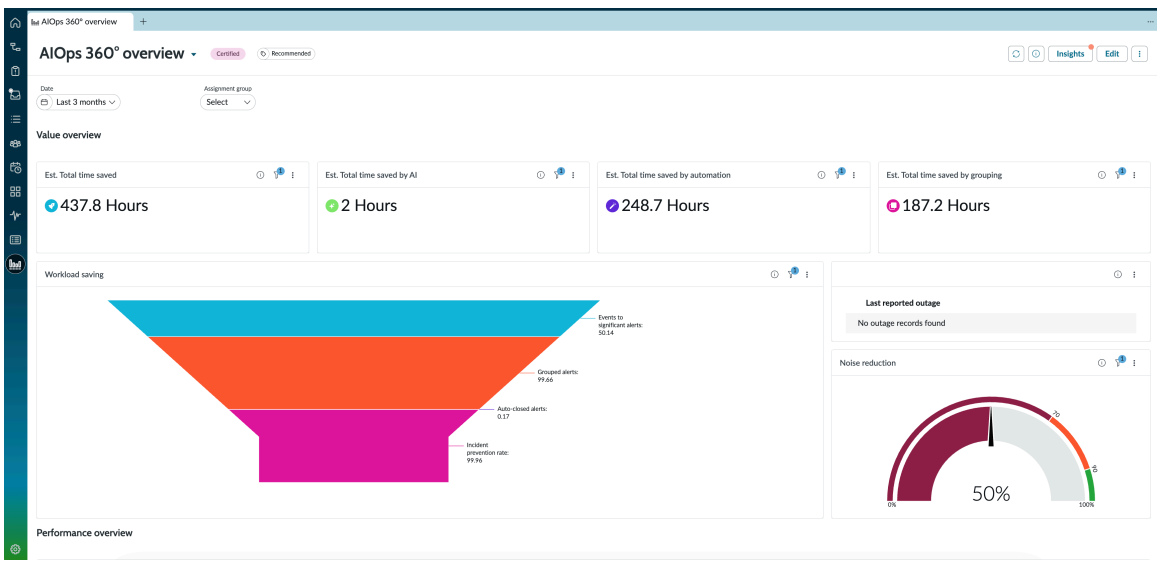
Breakdowns available in the AIOps 360 overview dashboard are:

- Value overview
- Performance overview

Value overview section

Use filters such as **Date** and **Assignment Group** to customize the dashboard view and focus on specific time periods and teams. This helps you pinpoint trends, identify areas for improvement, and make data-driven decisions tailored to your operational needs.

The Value overview section highlights the overall impact of AIOps on operational efficiency. It showcases how much manual effort has been reduced through automation and intelligent alert grouping. It also reflects noise reduction levels, outage history, and overall workload savings—giving a clear picture of time and cost benefits realized.



Metrics	Description
Est. Total time saved	Sum of time saved through alert automation and alert grouping, calculated in hours.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

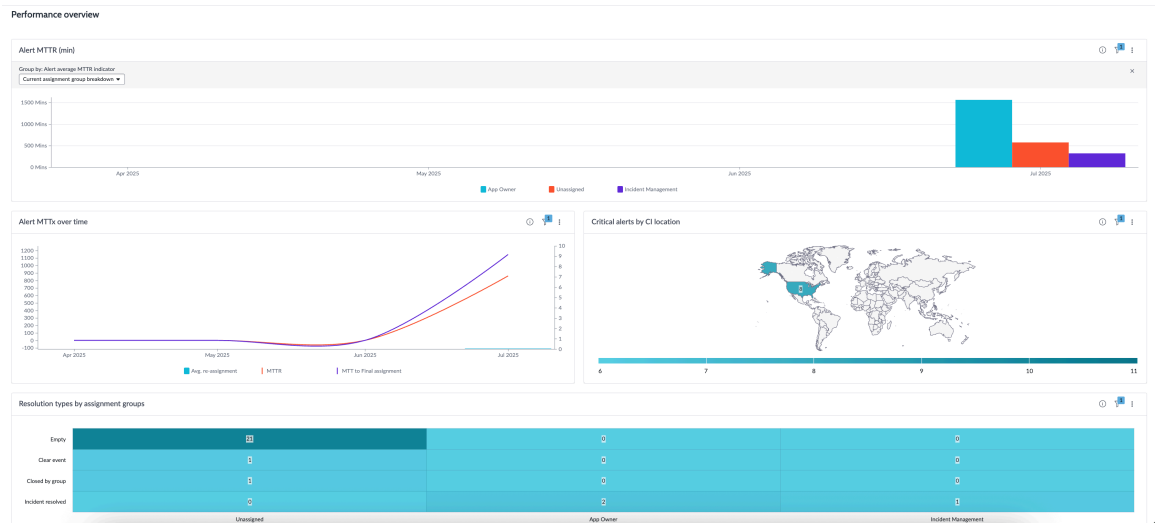
Metrics	Description
Est. Total time saved by AI	Sum of time saved through AI-driven actions such as automatic noise classification and AI-generated analysis, calculated in hours. This is distinct from time saved by rule-based alert automation and grouping.
Est. Total time saved by automation	Time saved based on the number of alert automation rules executed multiplied by the mean resolution time per alert, calculated in hours. The mean resolution time can be adjusted by administrators in **All** > **System Properties** > **All Properties**. Use the *sn_aiops_dashboard.ITOM.Dashboard.Avg_time_* property to get the actual time saved by automation, in minutes, as used by the Automation Time Saved indicator. By default, it's set to 5 minutes.
Est. Total time saved by grouping	Time saved based on the number of alerts grouped versus the time required to triage each alert individually, calculated in hours. The mean resolution time can be adjusted by administrators in **All** > **System Properties** > **All Properties**. Use the *sn_aiops_dashboard.ITOM.Dashboard.MTTR_for_* property to define the MTTR (in minutes) used in the alert grouping time saved calculation. By default, it's set to 5 minutes.
Workload saving	Measures the reduction in manual effort by filtering, grouping, automating alert closures, and preventing incident escalations. • Events to significant alerts: Percentage of events that were filtered out and did not convert into alerts, reduced through AIOps settings like ignore automations. • Grouped alerts: Percentage reduction in the number of stand-alone alerts due to grouping rules defined in alert grouping automations. • Auto-closed alerts: Percentage of alerts automatically closed by Respond

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Metrics	Description
	automation, Clear event actions, or closed as part of alert group resolution. • Incident prevention rate: Percentage of alerts resolved successfully without needing escalation to incidents.
Last reported outage	Most recent date of a major outage (e.g., CMDB) affecting a service or server, based on reported outages on all classes inherited from cmdb_ci_service or cmdb_ci_server.
Noise reduction	Percentage effectiveness in ignoring duplicate and meaningless events. Typical customer value exceeds 90%.

Performance Overview section

This section focuses on how effectively alerts and incidents are being handled. It includes metrics like resolution times across groups, trends in detection and response, automation usage, and the distribution of resolution ownership. It helps identify performance gaps, track improvements, and optimize response strategies across the organization.



Metrics	Description
Alert MTTR	Alert resolution time by assignment group to identify slower-responding teams and enforce SLAs. Can also be grouped by severity using the grouping drop-down menu.
Alert MTTx over time	MTTR (mean time to resolve), MTTA (mean time to final group assignment), and average group reassignment count tracked over time. Indicates assignment efficiency and the ability to resolve alerts within a single group.
Critical alert by CI location	Critical alerts on a geographic map based on the physical or logical location of Configuration Items (CIs). Helps identify

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Metrics	Description
	recurring hotspots for retrospective analysis and to spot regional trends.
Resolution types by assignment groups	Closure reasons by top assignment groups, highlighting automation closures (within 10 minutes of execution) to encourage quick resolution, and time threshold closures (after the auto-close interval), which indicate unattended alerts. You should consider the number of alerts that are automatically closed when they reach their time limit. This figure can reveal if your team is unable to resolve or close all alerts, leaving some unaddressed.

Note: If you're starting with Brazil, some charts, graphs, or metrics in the dashboard may appear blank or show limited data. This is expected if there's no historical data or only a few weeks or months of data available. As your system continues to collect and process alerts, the dashboard will populate with more complete insights over time.

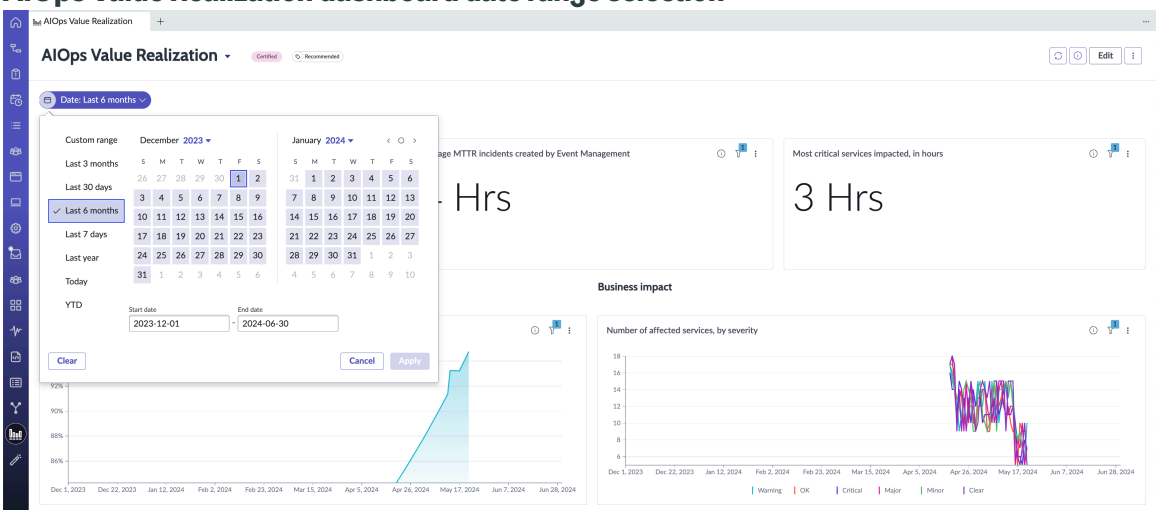
If you want to know about funnel visualization, see Create a funnel visualization.

AIOps Value Realization dashboard

The AIOps Value Realization dashboard uses Performance Analytics to offer comprehensive visibility into the business outcomes of alerts, events, and incidents. It features metrics such as noise reduction (events to alerts compression), average MTTR for incidents created by Event Management[var.event-mgmt], and the most critical services impacted by hours.

The AIOps Value Realization dashboard includes a calendar feature that enables users to select various date ranges such as custom dates, the last 3 months, the last 30 days, the last 6 months, the last 7 days, the last year, today, and year-to-date (YTD). You can specify a custom start and end date and apply these selections to view reports specifically for the chosen date range. This feature facilitates tailored analysis and reporting based on specific time periods of interest.

AIOps Value Realization dashboard date range selection



The AIOps Value Realization dashboard offers key insights and metrics crucial for operational efficiency and business impact assessment. It includes features such as noise reduction to enhance focus on critical issues by reducing event-to-alert conversions. Tracking average

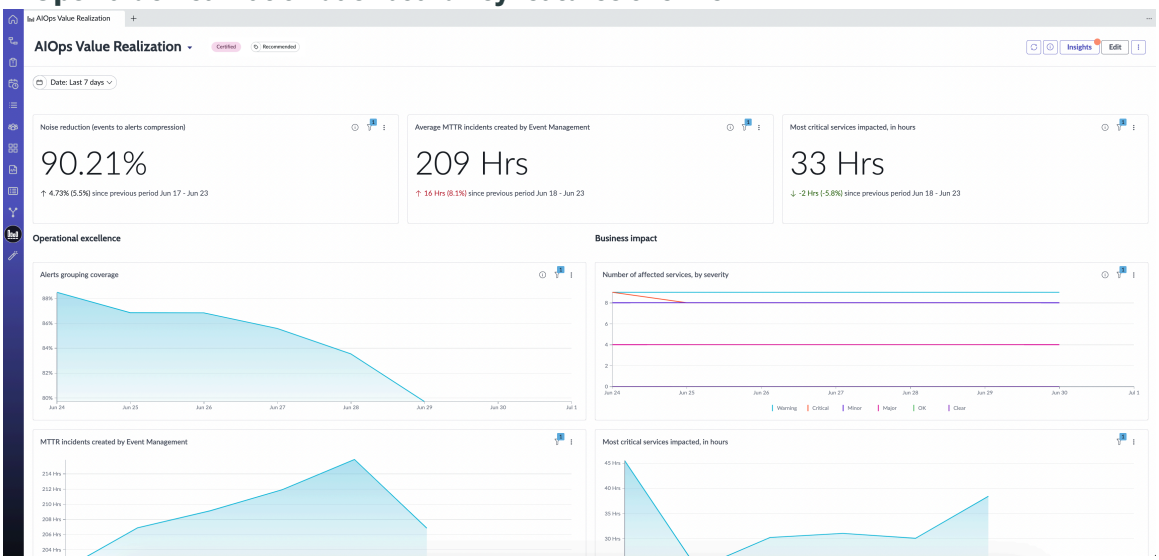
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MTTR for incidents and measuring downtime on critical services aids in improving operational efficiency and prioritizing resolutions. The dashboard is categorized into Operational Excellence and Business Impact sections. It provides detailed coverage on alerts grouping, swift resolution of critical incidents reported by users, and quantifying service impacts by severity to optimize operational stability.

Run the [PA EM] Historic Data Collection job once to enable the partial collection of historical Event Management data:

1. Navigate to **All** > **Performance Analytics** > **Data Collector** > **Jobs**.
2. Select [PA EM] Historic Data Collection.
3. Select **Execute Now**.

AIOps Value Realization dashboard key features overview



Prerequisites

Ensure that the Event Management application is installed.

Required ServiceNow AI Platform roles

- evt_mgmt_admin
- evt_mgmt_operator

Access the AIOps Value Realization dashboard

To open the dashboard, navigate to **Workspaces** > **Service Operations Workspace**. From the bottom of the navigation pane, select the AIOps configuration center icon .The AIOps configuration center page appears. On the ITOM AIOps configuration center page, under the **Optimize** > **Dashboards** section, select **View AIOps Value Realization dashboard**.

Use cases

For examples of how different people in your organization would use this dashboard, refer to these use cases.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

User	Dashboard use
evt_mgmt_admin or admin	Edit the dashboard and grant view and share permissions.
evt_mgmt_operator or admin	View the dashboard and review record details to visualize and track the business impact of alerts, events, and incidents.

Breakdowns

Breakdowns available in the AIOps Value Realization dashboard are:

- Operational Excellence
- Business Impact

Reports

Title	Type	Description
Noise reduction (events to alerts compression)	Line graph	The compression rate from events to alert creation: a higher number indicates fewer alerts are being created.
Average MTTR incidents created by Event Management	Line graph	The average Mean Time to Repair (MTTR) of an incident created by Event Management: a lower number indicates greater efficiency of your IT team.
Most critical services impacted, in hours	Line graph	The total time your organization's most critical business services are impacted: a higher number indicates more time critical services are affected by open alerts.
Alerts grouping coverage	Line graph	The percentage of total alerts that are grouped: a higher number indicates more alerts are being correlated and grouped within an alert group.
Number of affected services, by severity	Line graph	The number of services impacted by alerts, grouped by severity, such as the count of services experiencing critical issues per day.
Number of new P1 incidents on monitored services created by users	Line graph	The number of incidents created on services monitored by Event Management: a lower number indicates fewer users are being impacted

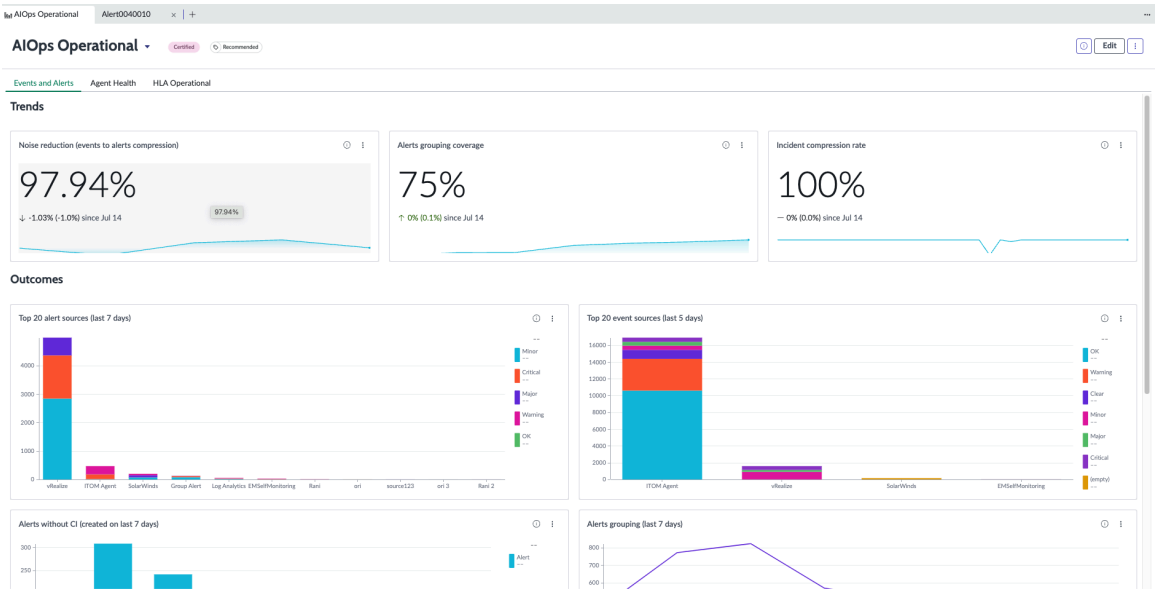
Title	Type	Description
		by a service outage or performance degradation.

Event and Alert dashboard

The Event and Alert dashboard uses Performance Analytics to provide real-time visibility into events and alerts in Event Management, showcasing key trends, outcomes, and the most impacted configuration items. It highlights metrics such as noise reduction, alert grouping coverage, and top alert sources.



Run the [PA EM] Historic Data Collection job once to enable the partial collection of historical Event Management data:

1. Navigate to **All** > **Performance Analytics Administration** > **Data Collector** > **Jobs**.
2. Select [PA EM] Historic Data Collection.
3. Select **Execute Now**.

Prerequisites

Ensure that the AIOps Experience [`sn_sow_aiops`] application is installed. The application installs the Event Management and Performance Analytics components required for the dashboard. For installation instructions, see Install Service Operations Workspace for ITOM application.

Required ServiceNow AI Platform roles

- evt_mgmt_admin
- evt_mgmt_operator

Access the Events and alerts dashboard

To open the dashboard, use one of the following methods:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Navigate to **All** > **AIOps Dashboards** > **AIOps Operational** > **Events and Alerts**.
- Navigate to **Workspaces** > **Service Operations Workspace** and select the AIOps Dashboards icon ( ).

  By default, the **Events and Alerts** tab is selected.

Use cases

For examples of how different people in your organization would use this dashboard, see these use cases.

User	Dashboard use
evt_mgmt_admin or admin	Edit the dashboard and grant view and share permissions.
evt_mgmt_operator or admin	View the dashboard and details of the records contained in it to visualize and track events, alerts, trends, outcomes, and the most impacted Configuration Items in your organization.

Breakdowns

Breakdowns available in the Event and Alert dashboard are:

- Trends
- Outcomes

Reports

Title	Type	Description
Noise reduction (events to alerts compression)	Line graph	The compression rate from events to alert creation. The higher the number, the fewer alerts are being created.
Alerts grouping coverage	Line graph	The percentage of alerts aggregated into grouped alerts over time.
Incident compression rate	Line graph	The percentage of alerts that did not result in incident creation. A higher percentage means more alerts were resolved without generating incidents.
Top 20 alert sources (last 7 days)	Bar chart	The number of alerts per source categorized by severity over the last 7 days.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Title	Type	Description
Top 20 event sources (last 5 days)	Bar chart	The number of events per source categorized by severity over the last 5 days.
Alerts without CI (created on last 7 days)	Line graph	The number of alerts without CI binding created over the last 7 days.
Alerts grouping (last 7 days)	Bar chart	The distribution of grouped alerts over the last 7 days.

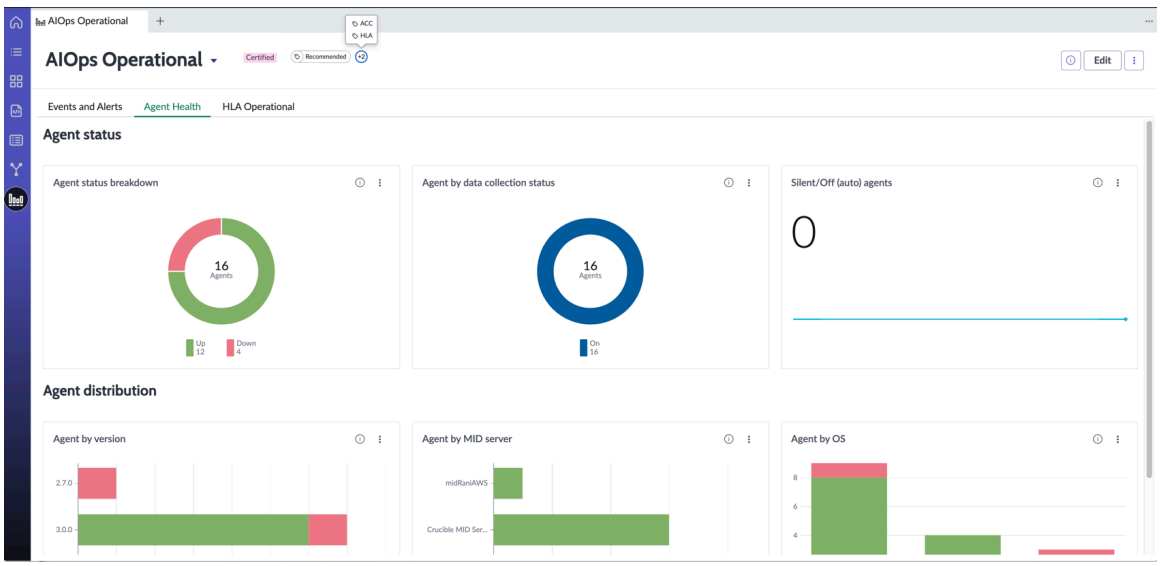
Most impacted Configuration Items

The Most Impacted Configuration Items section of the Event and Alert dashboard provides a comprehensive overview of the configuration items (CIs) that are most impacted by the issue. This section lists key details such as the name of each CI, the number of associated alerts, their classification (such as application service), and location. Additionally, it identifies the owner and support group responsible for each CI, facilitating targeted and efficient incident resolution. By highlighting the most impacted CIs, this section helps prioritize critical assets and resources. This approach confirms that the most significant issues are addressed promptly to maintain system stability and performance.

Agent Health dashboard

The Agent Health dashboard provides visibility into the status and distribution of agents installed in your system. It allows you to quickly assess the number of deployed agents and their distribution, helping you prioritize your work more efficiently.

The following example shows the agents in your system that are currently up, which agents are configured to collect data, and which agents have stopped data collection due to having reached their CPU threshold (Silent/Off). It also displays the agents according to their version, OS, and connected MID Server.



Prerequisites

The Agent Client Collector application must be installed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Required ServiceNow AI Platform roles

A user must have the agent_client_collector_admin role to see all the widgets in the dashboard.

Access the Events and alerts dashboard

To open the dashboard, use one of the following methods:

- Navigate to **All** > **AIOps Dashboards** > **AIOps Operational** > **Agent Health**.
- Navigate to **Workspaces** > **Service Operations Workspace** and select the AIOps Dashboards icon ( ) and then select the **Agent Health** tab.
- After upgrading to Discovery Admin Workspace version 1.3.1 (August 2024 Store), you can navigate to **Workspaces** > **Discovery Admin Workspace** > **Insights** and use the enhanced dashboard.

Use case

For examples of how different people in your organization would use this dashboard, see the use case in the following table.

Dashboard use case

User	Dashboard use
admin	Visibility into the status of the agents.

Breakdowns

Breakdowns available in the Agent Health are:

- Agent status: The status of the agents currently deployed in your system.
- Agent distribution: The distribution of the agents by the agent version number, the MID Server that the agent is assigned to, and the OS that the agent is working on.

Reports

Title	Type	Description
Agent status breakdown	Pie chart	Agents deployed in your system that are up and down. Select the relevant color in the widget to display a list of up or down agents.
Agent by data collection status	Pie chart	Agents deployed in your system with data collection turned on and off. Select the relevant color in the widget to display a list of agents with data collection on or off.
Silent/Off (auto) agents	Line graph	Agents that automatically stopped collecting data after

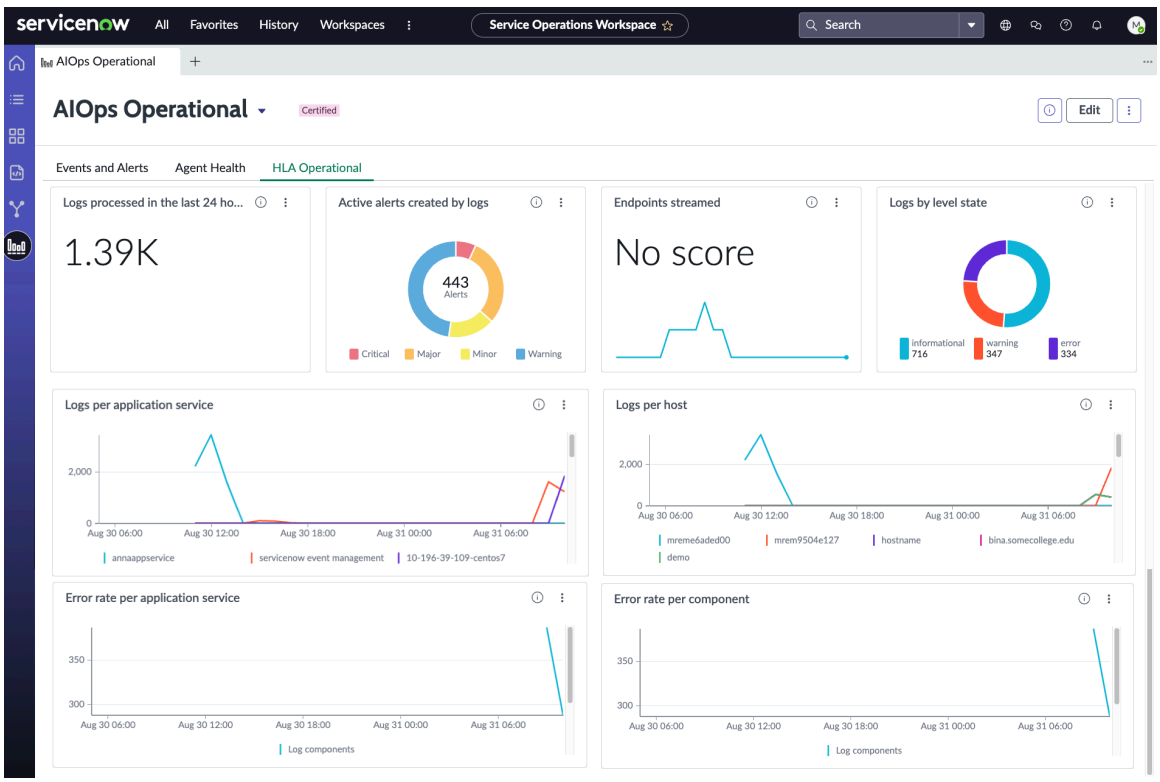
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Title	Type	Description
		crossing the CPU usage threshold. The CPU usage threshold is configurable in the `acc.yml` configuration file. For more information on the `acc.yml` configuration file, see Configuration file options.
Agent by version	Bar chart	Breakdown of your deployed agents by their version numbers.
Agent by *`MID Server`*	Bar chart	Breakdown of the deployed agents according to the *`MID Server`* they're assigned to.
Agent by OS	Bar chart	Breakdown of your deployed agents according to the operating systems they are working on.

HLA Operational dashboard

The Health Log Analytics Operational dashboard uses Performance Analytics to monitor log data, alerts, and error rates in Service Operations Workspace.



Prerequisites

Ensure that the Health Log Analytics application is installed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Required ServiceNow AI Platform roles

- evt_mgmt_admin
- evt_mgmt_operator

Access the HLA Operational dashboard

To open the dashboard, use one of the following methods:

- Navigate to **All** > **AIOps Dashboards** > **AIOps Operational** > **HLA Operational**.
- Navigate to **Workspaces** > **Service Operations Workspace** and select the AIOps Dashboards icon ( ), then display the HLA Operational dashboard.

Use cases

These use cases provide examples of how different people in your organization would use this dashboard.

User	Dashboard use
evt_mgmt_admin	Edits the dashboard and grants view and share permissions.
evt_mgmt_operator or evt_mgmt_admin	Monitors the dashboard to visualize and track HLA log and alerts data, error rates, and other relevant information.

Breakdowns

Breakdowns available in the HLA Operational dashboard are:

- HLA Overview
- Error rate

Reports

Title	Type	Description
Logs processed	Bar chart	The number of logs that were processed and analyzed in the selected period. By default, the dashboard visualizes log data that was ingested in the last 24 hours.
Active alerts created by logs	Table	Detailed data on all currently active alerts.
Endpoints streamed	Line graph	The number of endpoints (IPs, networks, and devices) that are streaming into Health

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Title	Type	Description
		Log Analytics, by application service.
Logs by level state	Bar chart	The severity level of the logs for the streaming sources.
Logs per application service	Line graph	The number of logs streamed for each application service in the selected period. Monitor this data to ensure that log data is streaming as expected for each application service.
Logs per host	Line graph	The number of processed logs for each host in the selected period. Monitor this data to detect hosts that are logging more or less data than expected.
Error rate per application service	Line graph	The number of logs with errors for each application service analyzed in the selected period. Monitor this data to further investigate the errors. **Note:** Health Log Analytics automatically creates alerts for Error anomalies.
Error rate per component	Line graph	The number of logs with errors for each component analyzed in the selected period. Monitor this data to ensure that the error rate for each component is normal.

Data visualization in ITOM

Gain insights faster with data visualization in IT Operations Management (ITOM). Visualize metrics, logs, events, and alerts through intuitive dashboards and charts to identify trends, monitor performance, and resolve issues proactively.

Anyone with access to data can create a visualization of that data on a dashboard that they own.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a funnel visualization

A funnel visualization shows how data progresses through sequential stages, helping you identify drop-offs or bottlenecks at each step. Use it to track conversions, workflows, or process completion rates. You can add a funnel visualization to an existing dashboard or to a new dashboard.

Before you begin

Role required: report_user, admin, or viz_creator

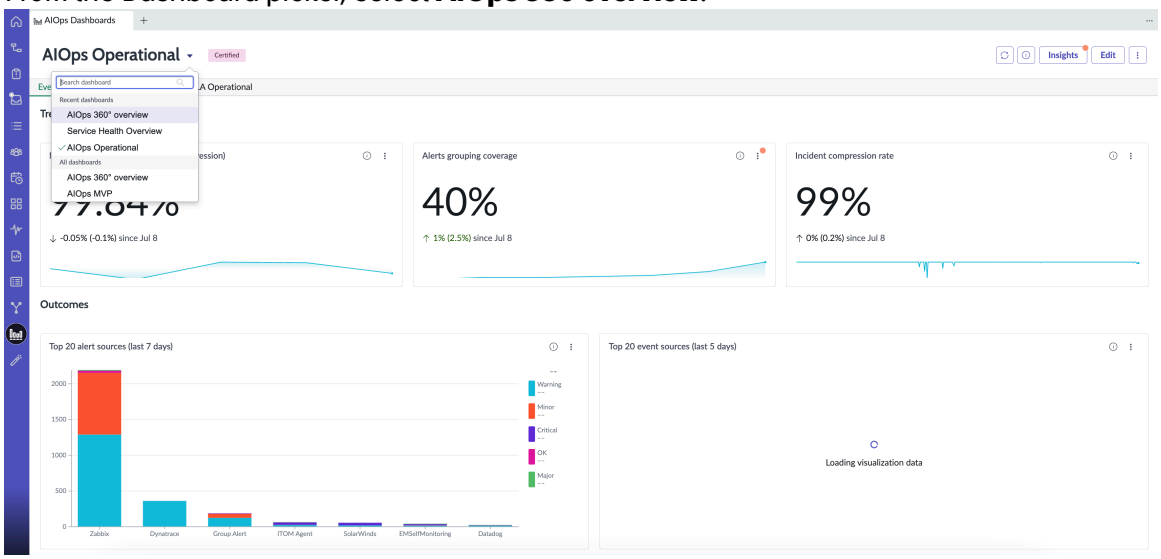
Ensure you have an admin role or permission from the dashboard owner to edit the dashboard.

About this task

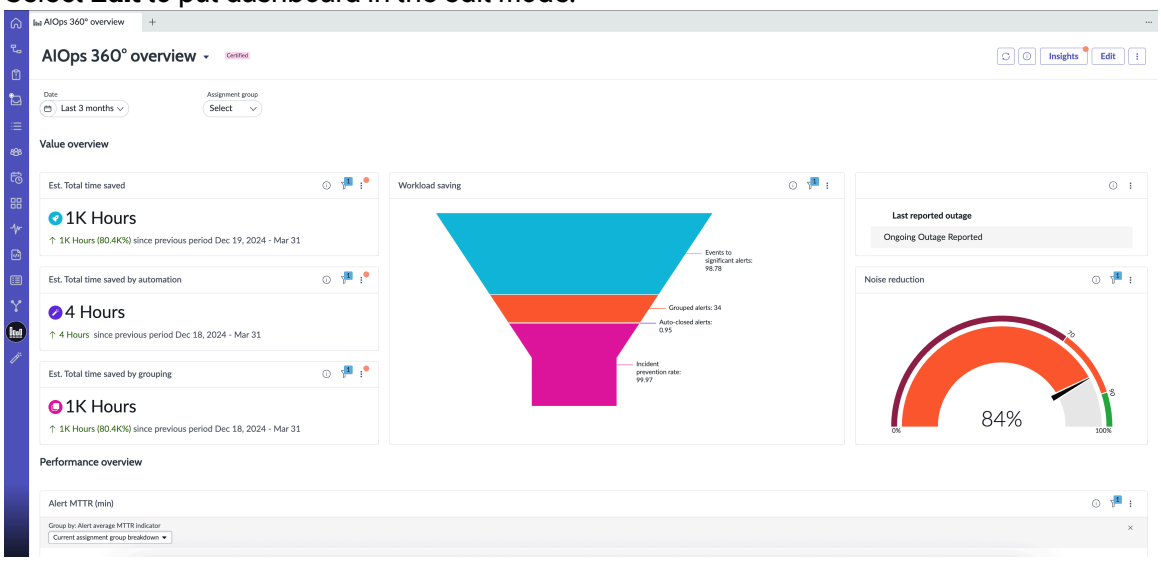
If you have the appropriate role, you can add and edit funnel reports on a dashboard. The **Edit** button is not available on the ITOM dashboards unless the user has rights to edit it. For more details on creating dashboards, see Common dashboard tasks in the in-line editor.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace** and select the AIOps Dashboards icon ( ).
2. From the Dashboard picker, select **AIOps 360 overview**.

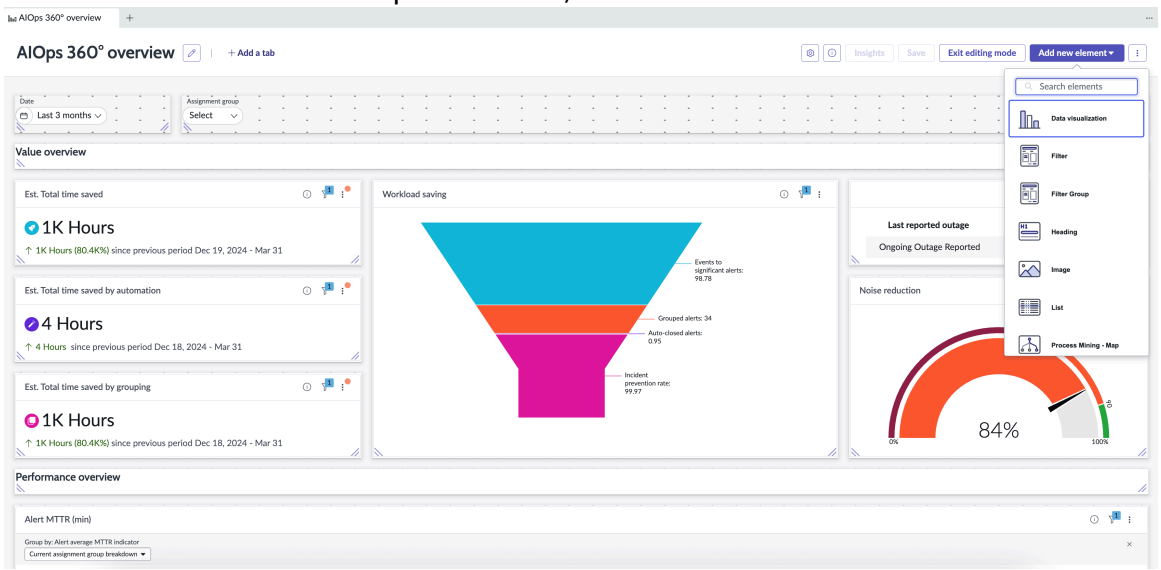


3. Select **Edit** to put dashboard in the edit mode.

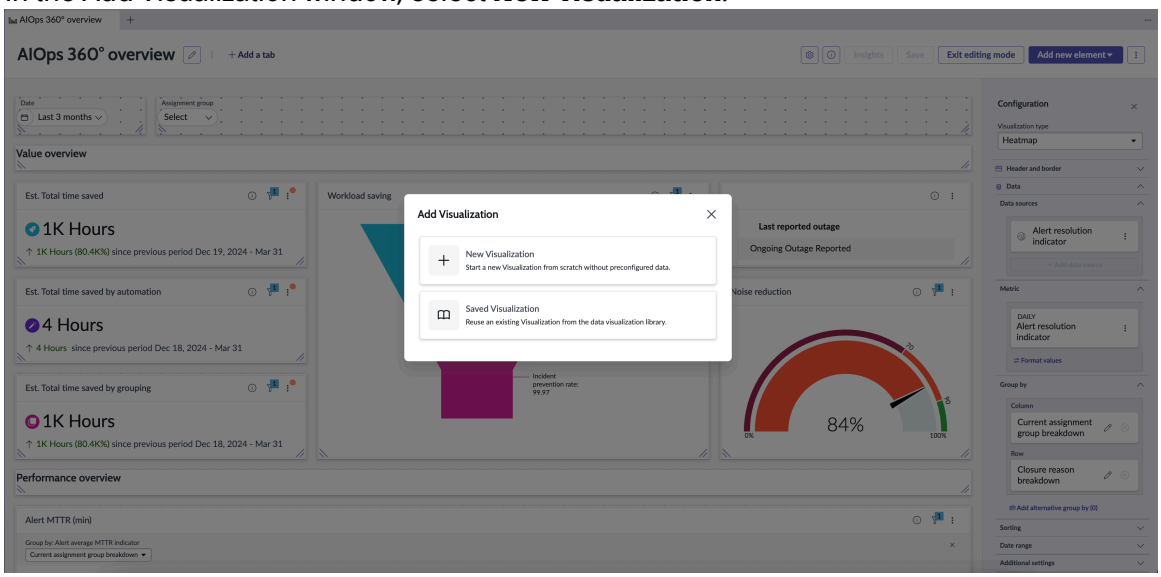


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

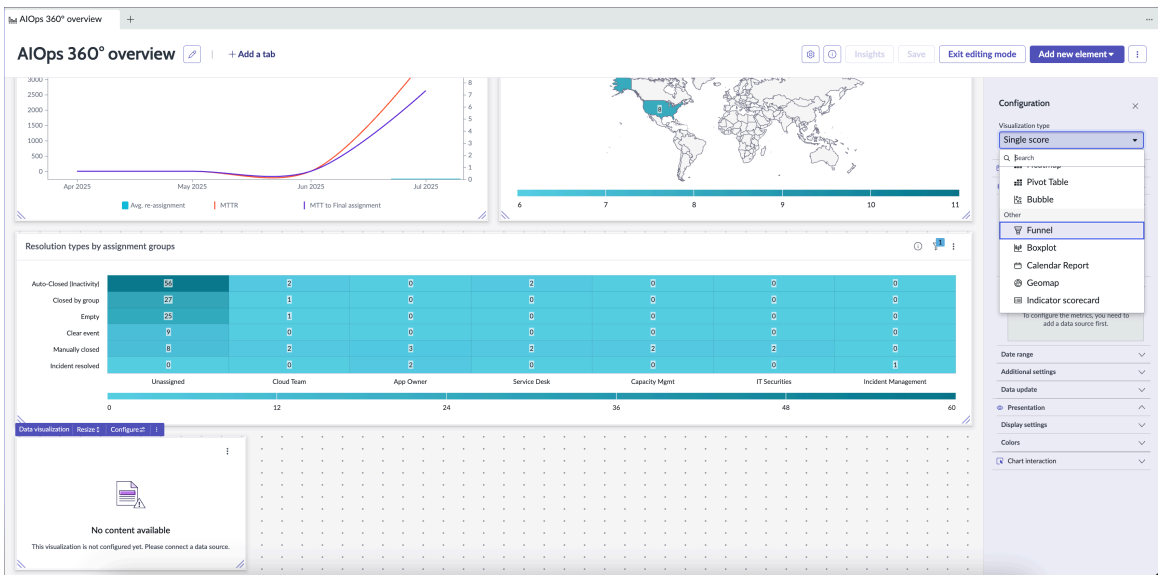
4. From the **Add new element** drop-down menu, select **Data visualization**.



5. In the Add Visualization window, select **New visualization**.



6. From the **Visualization type** field, select **Funnel**.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The **Funnel** visualization type is currently available only to customers who have the ITOM plugin installed.

7. Under **Data sources**, select **+ Add data source**.
   There are two kinds of data sources avail for the **Funnel** visualization type: Table and Indicator. Visualizations based on table data show a snapshot of the state of that data. Indicator visualizations reflect data over time based on data collection jobs. You can configure funnel stages using indicators in one of the following ways:

   You can configure funnel stages using indicators in one of the following ways:

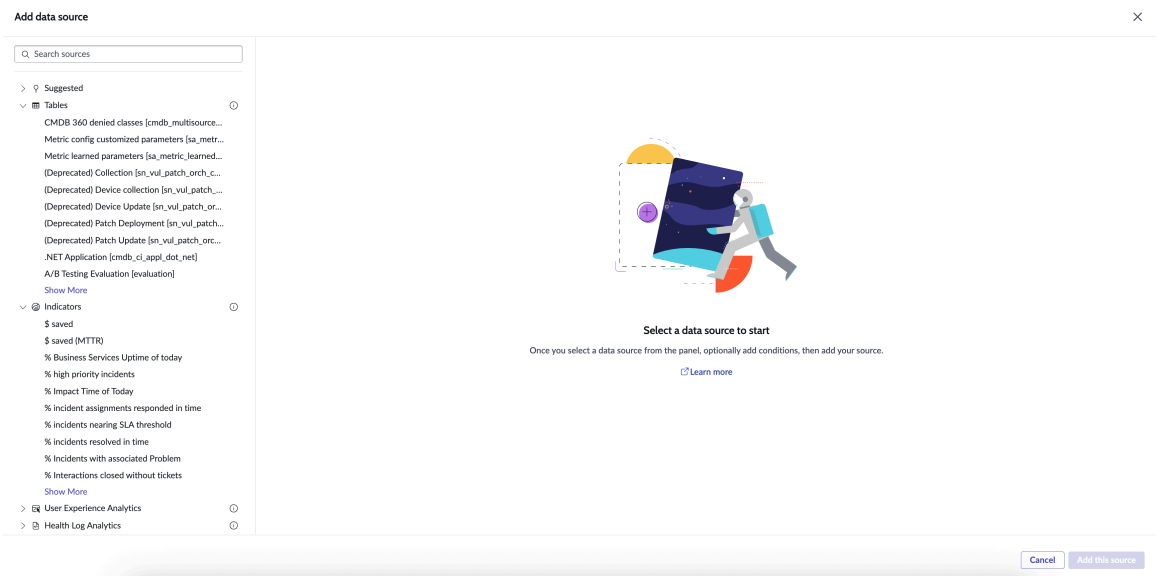
   - Option 1: Use a single indicator or table with a breakdown

     Select a single indicator or table, and then define the breakdown using the Group by field. The breakdown values are used as the funnel stages.

     Note: If you select only one indicator without a breakdown, the visualization displays an error: `Invalid configuration. A 'Group By' must be selected for the visualization to render.`

   - Option 2: Use multiple indicators without a breakdown

     Select multiple indicators without setting a breakdown. In this case, each indicator's value represents a stage in the funnel.



8. Select the required data source and select **Add this source**.

   When you select a table or indicator data source for a funnel visualization, refer to the following topics for the available data configuration options:

   - Table data options for funnel visualizations
   - Indicator data options for funnel visualizations

9. Select **Save**.

Table data options for funnel visualizations

When you select a table data source for the funnel visualization, the following data configuration options are available.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data configuration options

Field	Description
Predefined conditions	Preset filters to quickly narrow down data based on common criteria.
+ Add custom conditions	Custom filters based on user-defined criteria.
Header and border	
Show header	The visualization header, including title and icons.
Show header separator	Option to display a line separating the header from the rest of the component.
Chart title	Text shown as the title of the chart.
Description	Optional explanatory text shown below the title.
Wrap title	Option to wrap long titles onto multiple lines.
Show border	Option for border visibility setting for the widget container.
Header background color	Background color setting for the header area.
Data	
Data sources	Available inputs that supply data to the visualization.
Metric	
Label	Custom name for the selected metric. By default, the label matches the data source name.
Select an aggregation	Aggregation type applied to the metric (e.g., sum, average). The default is Count, which displays the number of records selected. **Note:** Select **Count Distinct** to count only unique records. For example, when generating a report of users with one or more roles from a list, you count each user only once. Without this option, users with multiple roles are counted more than once.
Field	Source field from the data set for the selected metric. **Note:** The data appears in a format that matches the field type. For example, an integer field like **Priority** is shown as a number. A duration field like **Business duration** from the [Incident] table is displayed in days, hours, and minutes. If function fields were created in Report Designer for the table, they are available in the drop-down list. For more information, see Report on function fields.
Format values	Formatting style for displaying metric values. Select to open the Formatting values dialog. For more information, see Value formatting in reports.
Group	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data configuration options (continued)

Field	Description
Field for incident	Field used specifically to group incident data.
Max number of groups	Limit on the number of groups shown in the visualization.
Show others	Option to group excess data into an **Others** category.
Data update	
Follow filter	Follows filters set at the page level. When selected, the visualization reflects workspace filters. When not selected, the visualization ignores all page-level filters.
Show filter icon	Option to display the filter icon and the number of filters affecting the visualization. If the check box is not selected, the icon and filter count are hidden.
Refresh after being away for X min	Trigger based on time spent away from the dashboard within the same workspace, including the Platform Analytics experience. Defines the number of minutes after which the visualization automatically refreshes when you return. Do not confuse this setting with **Scheduled repetition** on inline dashboards, which refreshes the entire dashboard only while it remains open.
Info messages	
Set custom message when no data	Custom text displayed when no data is available for the visualization.
Colors	
Set color type	Color scheme applied to different data values or ranges.
Chart interaction	User actions supported within the chart, such as hover or select.

Indicator data options for funnel visualizations

When you select an indicator data source for the funnel visualization, the following data configuration options are available.

You can select a single indicator and use the **Group by** field to calculate stage values. Alternatively, select multiple indicators without a breakdown, where each indicator's value represents a funnel stage.

Data configuration options

Field	Description
Breakdown	Provides a way to segment data using fields like Alert Severity or Alert Status. Each condition includes a **Breakdown** field, an **Operator**, and an **Element** that defines the target value. All

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data configuration options (continued)

Field	Description
	conditions are applied using AND logic, meaning data must meet every specified criterion to be included in the visualization.
Header and border	
Show header	Option for visibility setting for the widget header.
Show header separator	Option to display a dividing line below the header.
Chart title	Text shown as the title of the chart.
Description	Optional explanatory text shown below the title.
Wrap title	Option to wrap long titles onto multiple lines.
Show border	Option for border visibility setting for the widget container.
Header background color	Background color setting for the header area.
Data	
Data sources	Available inputs that supply data to the visualization.
Metric	
Label	Custom name for the selected metric. By default, the label matches the data source name.
Select an aggregation	Aggregation type applied to the metric (e.g., sum, average). The default is Count, which displays the number of records selected. **Note:** Select **Count Distinct** to count only unique records. For example, when generating a report of users with one or more roles from a list, you count each user only once. Without this option, users with multiple roles are counted more than once.
Field	Source field from the data set for the selected metric. **Note:** The data appears in a format that matches the field type. For example, an integer field like **Priority** is shown as a number. A duration field like **Business duration** from the [Incident] table is displayed in days, hours, and minutes. If function fields were created in Report Designer for the table, they are available in the drop-down list. For more information, see Report on function fields.
Format values	Formatting style for displaying metric values. Select to open the Formatting values dialog. For more information, see Value formatting in reports.
Group	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data configuration options (continued)

Field	Description
Field for incident	Field used specifically to group incident data.
Max number of groups	Limit on the number of groups shown in the visualization.
Show others	Option to group excess data into an **Others** category.
Data update	
Follow filter	Follows filters set at the page level. When selected, the visualization reflects workspace filters. When not selected, the visualization ignores all page-level filters.
Show filter icon	Option to display the filter icon and the number of filters affecting the visualization. If the check box is not selected, the icon and filter count are hidden.
Refresh after being away for X min	Trigger based on time spent away from the dashboard within the same workspace, including the Platform Analytics experience. Defines the number of minutes after which the visualization automatically refreshes when you return. Do not confuse this setting with **Scheduled repetition** on inline dashboards, which refreshes the entire dashboard only while it remains open.
Info messages	
Set custom message when no data	Custom text displayed when no data is available for the visualization.
Colors	
Set color type	Color scheme applied to different data values or ranges.
Chart interaction	User actions supported within the chart, such as hover or select.

Event Management

ServiceNow® Event Management is a robust application that helps keep your IT systems healthy by spotting problems quickly and fixing them. It collects events from different sources, figures out what's causing the issues, and converts them into alerts. These alerts are then analyzed, grouped, and acted upon to resolve issues and maintain system health.

Event Management seamlessly integrates with various monitoring tools via connectors and listeners, enabling comprehensive data collection and correlation. Available as a separate subscription from the main ServiceNow platform, Event Management allows organizations to tailor their usage to specific needs, ensuring effective and efficient incident management without unnecessary overhead.

Exploring Event Management

Explore Event Management to understand its overview, process flow, user roles, and benefits for comprehensive IT issue monitoring and resolution.

Event Management provides comprehensive monitoring, analysis, and remediation of IT issues by effectively managing various components within an IT environment. These components include discovered services, application services, dynamic CI groups, and alert groups.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Discovered Services: Defined by interrelated Configuration Items (CIs) from the CMDB, a discovered service is identified through Service Mapping. It includes a service map with mapping relationships, an impact tree showing outage severity, active and related alerts, and CI properties. This service information is displayed on dashboards, the Alerts list, and the Events list.
- Application Services: Created by selecting specific CIs, application services allow for targeted monitoring and management. For more details, refer to the Application Services documentation.
- Dynamic CI Groups: These are collections of CIs grouped based on shared criteria, such as location. Dynamic CI groups help populate application services, simplifying management.
- Alert Groups: Alert groups organize sets of alerts to streamline maintenance and management, making it easier to respond to IT issues efficiently.

Process flow

Event Management receives external events and generates alerts based on predefined rules. The MID Server polls external event tracking tools and sends data to Event Management for storage and processing. Events are stored in the Event [em_event] table, and alerts are created by matching event rules. Alerts are then transformed and enriched with additional content, accumulated if thresholds are met, and mapped to specific fields. The system searches for matching message keys to update existing alerts or create new ones, associating related events under a single alert. Alerts are bound to specific Configuration Items (CIs) for root cause analysis. For more information, see Event Management process flow.

Users

Role title [name]	Description
Admin [evt_mgmt_admin]	Has read and write access to all Event Management features to configure Event Management. **Note:** Exercise caution with the evt_mgmt_admin role, as it can be elevated to the admin role. A user with the evt_mgmt_admin role has the ability to add and modify scripts that run on a global scope. Ensure proper access control. With this role, the user can create and/or update the following scripts: • Alert correlation rules • Alert management rules • Maintenance rules • Advanced scripts • Event field mapping • Pre- and post-binding scripts
Operator [evt_mgmt_operator]	Manages alerts, including closing and acknowledging them. Oversees the overall Event Management process, ensuring events are properly categorized, prioritized, and routed for resolution.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role title [name]	Description
Team Operator [evt_team_operator]	Manages Event Management operations within a specific team as defined in the **Assignment Group** field. This role allows the operator to read and write alerts exclusively for their assigned team. Additionally, the operator can make configuration changes specific to their team, including updates to Alert Automation and the Integrations Launchpad. **Note:** The evt_team_operator role must be assigned to an assignment group to view and manage alerts for that group. If the role is created but not associated with any groups that have alerts assigned, the operator cannot see any alerts.
User [evt_mgmt_user]	Manages the lifecycle of alerts, including performing basic operations such as viewing and acknowledging them.

Benefits

- Rapid Issue Detection: Quickly identifies and highlights potential IT issues.
- Efficient Alert Handling: Aggregates and correlates alerts for streamlined management.
- Automated Actions: Initiates automatic remediation processes to speed up issue resolution.
- Comprehensive Monitoring: Integrates with multiple tools for a complete system overview.
- Root Cause Analysis: Offers tools to identify underlying causes of issues.
- Customizable Rules: Tailors event and alert management rules to specific needs.
- Reduced Downtime: Minimizes system downtime with prompt problem resolution.
- Enhanced Visibility: Real-time dashboards offer insights into system health.
- Cost Efficiency: Lowers operational costs by preventing prolonged issues.

Event Management process flow

Event Management collects, analyzes, and converts events into alerts, enabling efficient tracking and remediation.

Event Management receives external events and generates alerts based on event and alert management rules. Events are sent directly to your instance via email server, script, SNMP trap, or web service API. The corresponding alerts appear on dashboards for tracking and remediation purposes.

As the computer, software, or service generates events, the MID Server polls the external event tracking tool. The MID Server, maintaining a connection to Event Management, sends the information to your instance for storage, processing, and remediation.

The instance stores events in the Event [em_event] table and attempts to generate alerts based on predefined rules and event mappings. Regardless of whether an alert is generated, the original event is available for review and remediation. Alerts are generated according to the following process flow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Match Event Rule: Find the best matching event rule for an event.

   A rule is matched if the source of the event matches the source specified in an existing rule. Additionally, a rule is matched if the event matches the optional rule filter and the event additional_info value matches the rule Additional Information filter. A rule without any filter is ignored, such as when the source filter or Additional Information filter is missing. If multiple rules are defined for the same type of event, use the rule order to determine the sequence of rule application.

2. Ignore Rule: If the rule **Ignore** check box is selected, no alert is generated. However, the event is still available for review and remediation.
3. Apply Transforms:
   - If transforms have been defined, apply them.
   - If compose parameters are set, apply the additional content to display to the user in the alert.
4. Threshold Accumulation: If Active in the threshold section is selected, accumulate all events until the threshold is met, then generate a single alert for the events.
5. Event Field Mapping
   - Search for an event field mapping even if there was no event rule.
   - If an event field mapping is found, apply the mapping information.
   - If the event has no severity after the event transformations, retain the event for reference purposes and do not generate an alert.
6. Alert Generation
   - Search the Alert [em_alert] table for a matching message key.
   - If a matching message key exists, update the alert according to the event information.
   - If a matching message key does not exist, create an alert.
   - If another event has the same matching key, associate the events under a single alert.
   - For root cause analysis purposes, bind the alert to a specific Configuration Item (CI).

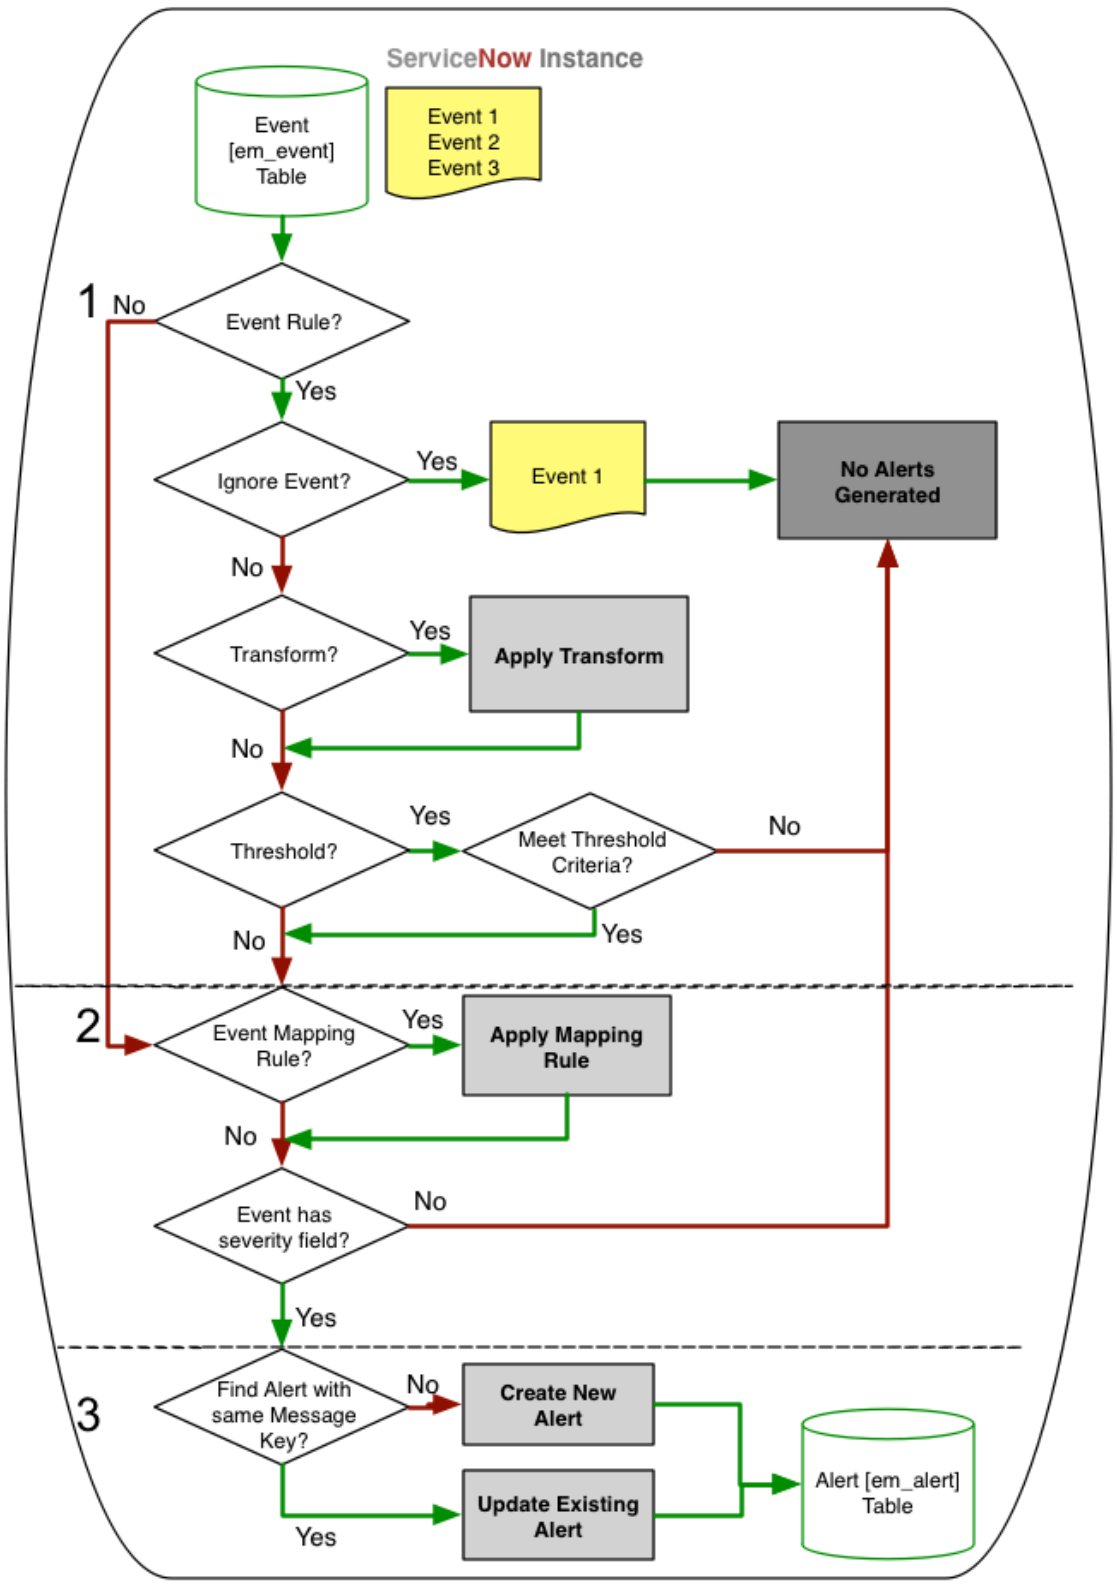
Event workflow



Event Management architecture

Event Management architecture integrates data collection, processing, and alerting into a unified system for streamlined IT issue detection and resolution.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Architecture

As events occur on various systems, the MID Server connector instance sends them to the main instance. Event Management generates alerts, applies alert management rules, and prioritizes alerts for remediation and root cause analysis. This information can be viewed on dashboards, the alert list in Alert Intelligence, or from a service map.

Configuring Event Management

Event Management administrators administer events, manage and monitor alerts, aggregate alerts, and work review and monitor services' status with the Operator Workspace service monitor.

Event Management operators find alerts, analyze them, and take action to resolve the underlying issue.

Configure Event Management using ServiceNow Otto for Setup

The ITOM Configuration console gives administrators a single place to complete all Event Management setup steps — from installing plugins to configuring alert automations.

The console contains two modules: Discovery and Event Management.

Discovery guides you through the end-to-end setup of your IT infrastructure scanning. It covers assigning administrators, deploying and validating MID servers, configuring IP and cloud credentials, scheduling discovery runs, and reviewing schedules. It also includes diagnostics to identify discovery errors and detect anomalies, ensuring your environment is fully validated. It also includes diagnostics to identify discovery errors and detect anomalies. This ensures your environment is fully validated before you promote your configuration to production.

Event Management helps you take control of your IT alerts from start to finish. It begins with assigning administrators, setting up integration accounts, and installing the necessary integrations to connect your monitoring tools. From there, you can review and enrich incoming alerts, create incidents automatically, and reduce noise by grouping, ignoring, or delaying alerts. The platform also provides structured training for your operations team on key tools such as Service Operations Workspace, Express List, and Service Dashboard. Finally, built-in dashboards help you report on outcomes and measure progress before promoting your configuration to production.

Access Event Management configuration console

Access the IT Operations Management configuration console to set up Event Management and configure AIOps capabilities.

Before you begin

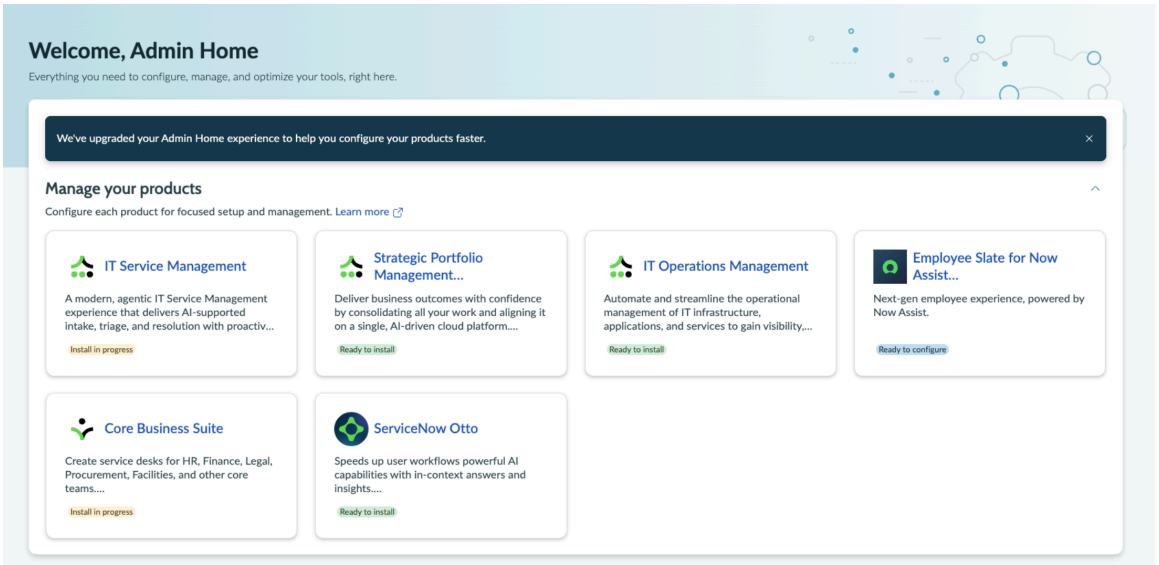
Verify you have installed the ITOM AIOps and ServiceNow Otto for IT Operations Management (ITOM) plugins.

Role required: evt_mgmt_admin

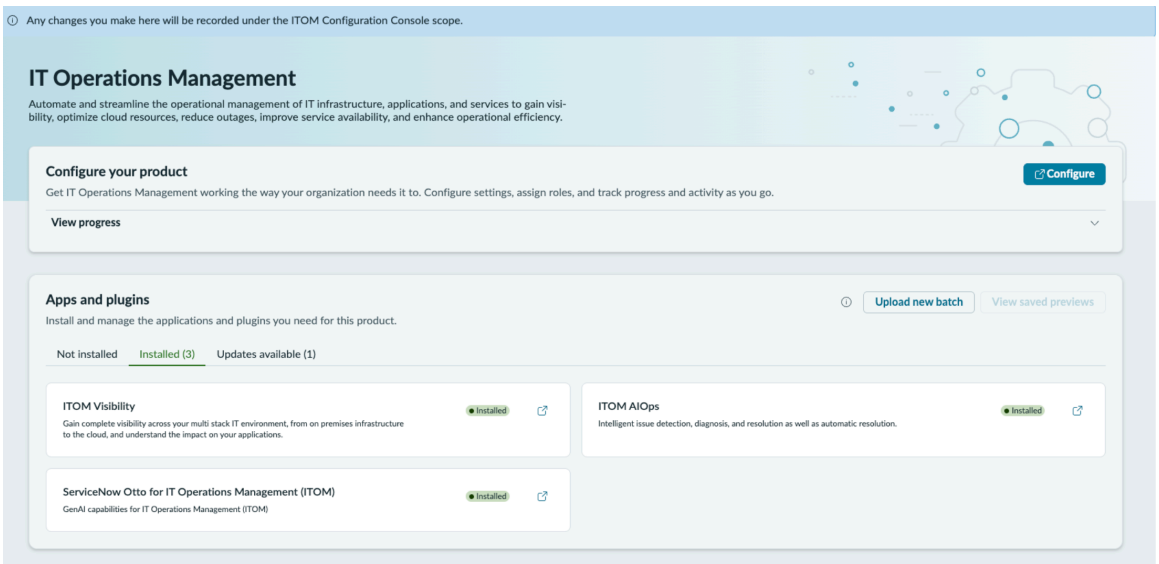
Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
   The Admin Home page opens.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

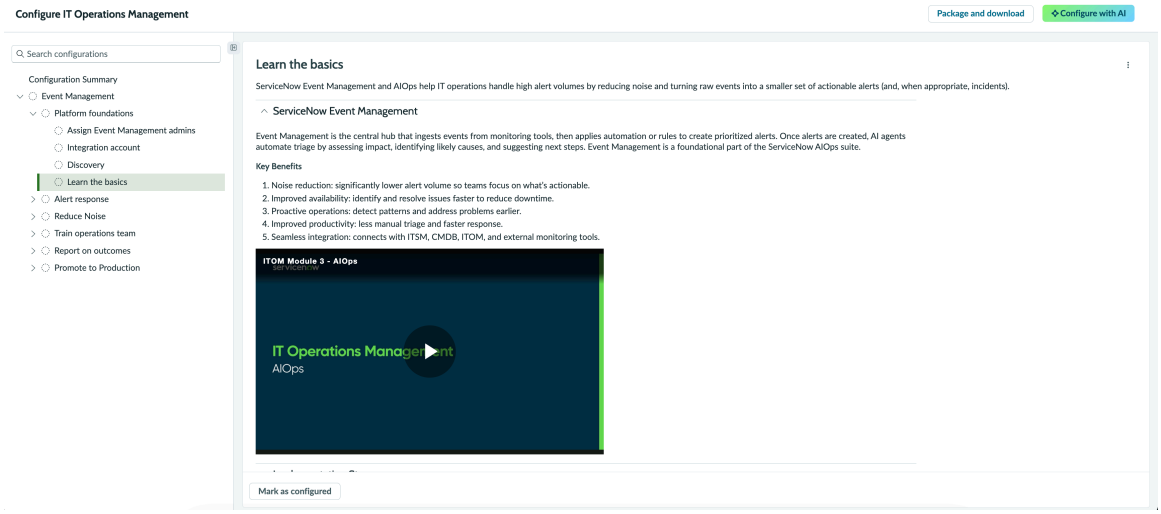


2. In the IT Operations Management tile, select **View product overview**.
3. In the IT Operations Management page, select **Configure**.



The Configure IT Operations Management page opens.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note: The **Configure with AI** UI action appears only after you install both the ServiceNow Otto for ITOM and ServiceNow Otto plugins. This action lets you set up AI-powered alert handling.

Access Configuration Console from AIOps Configuration Center

Access ITOM Configuration Console to set up Event Management and configure AIOps capabilities.

Before you begin

Verify that the ITOM AIOps and ServiceNow Otto for ITOM plugins are installed.

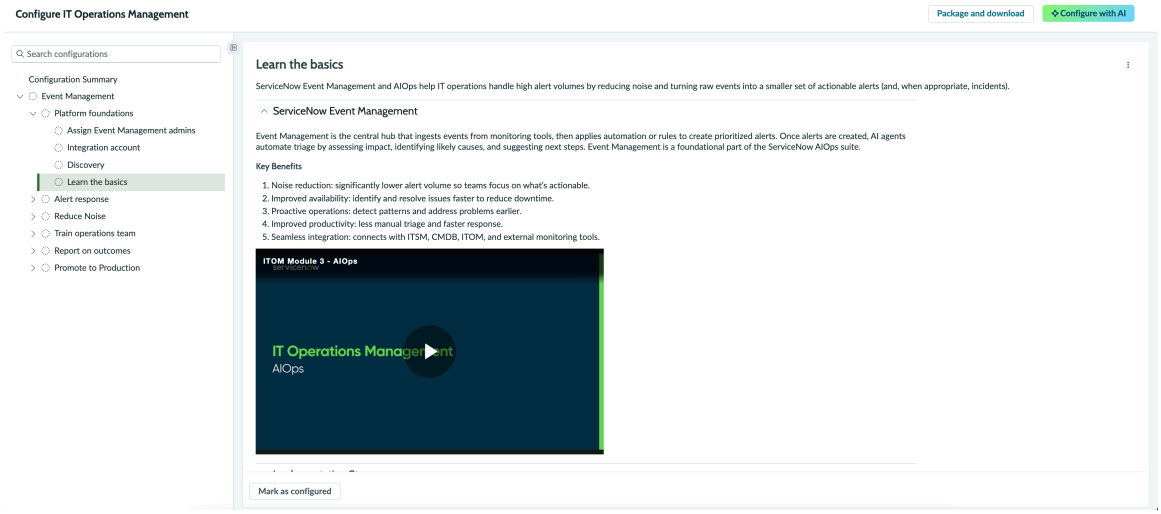
Role required: evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. On the ITOM AIOps configuration center page, under **Setup** > **Get started** section, select **Event Management Onboarding**.

   The Configure IT Operations Management page opens.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note: The **Configure with Otto** UI action appears only after you install both the ServiceNow Otto for ITOM and ServiceNow Otto plugins. This action lets you set up AI-powered alert handling.

Assign Event Management admin role to group

Assign the evt_mgmt_admin role to users who will be in charge of configuration and operational control.

Before you begin

Verify you have installed the ITOM AIOps and ServiceNow Otto for IT Operations Management (ITOM) plugins.

Ensure you're in the Configure IT Operations Management page.

Role required: evt_mgmt_admin

About this task

The evt_mgmt_admin role provides groups with the necessary permissions to configure and manage Event Management settings, including alert processing, incident creation, and operational controls.

Procedure

1. Navigate to **Configuration Summary** > **Event Management** > **Platform foundations**.
2. Expand **Platform foundations**.
3. Select **Assign Event Management admins**.
4. Select **Add group**.
   By default, the **Assign role to existing group** is selected.
5. **Optional:** If you want to create your group, select **Create new group** and perform the following steps:
   a. In the **Group name** field, enter the name of the group.
   b. In the **Description** field, enter a description.
   c. In the **Users** field, select the users to add to the group.
   d. Select **Save**.
6. In the **Group** field, select the group to assign the evt_mgmt_admin role to.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Select **Save**.
   The role is assigned to the selected group.
8. To complete the setup, select **Mark as configured**.

Delete group from Event Management admin role

Delete group from the evt_mgmt_admin role when you no longer need them.

Before you begin

Verify that you have installed the ITOM AIOps and ServiceNow Otto for IT Operations Management (ITOM) plugins.

Ensure you're in the Configure IT Operations Management page.

Role required: evt_mgmt_admin or evt_team_operator

Procedure

1. Navigate to **Configuration Summary** > **Event Management** > **Platform foundations**.
2. Expand **Platform foundations**.
3. Select **Assign Event Management admins**.
4. Select and open the group you want to delete.
5. On the Edit group page, select **Delete Group**.
6. In the confirmation window, select **Delete Group**.
   The group is removed from the list of Assign Event Management admins page.

Delete admin role from group

Delete the evt_mgmt_admin role from a group when you no longer need them.

Before you begin

Verify that you have installed the ITOM AIOps and ServiceNow Otto for IT Operations Management (ITOM) plugins.

Ensure you're in the Configure IT Operations Management page.

Role required: evt_mgmt_admin or evt_team_operator

Procedure

1. Navigate to **Configuration Summary** > **Event Management** > **Platform foundations**.
2. Expand **Platform foundations**.
3. Select **Assign Event Management admins**.
4. Select and open the group from which you want to remove the evt_mgmt_admin role.
5. On the Edit group page, select **Remove role from group**.
6. In the confirmation window, select **Remove role**.
   The evt_mgmt_admin role is removed from the specific group.

Create integration account

Create a dedicated account with the evt_mgmt_integration role for third-party monitoring systems to push events to ServiceNow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Verify you have installed the ITOM AIOps and ServiceNow Otto for IT Operations Management (ITOM) plugins.

Ensure you're in the Configure IT Operations Management page.

Role required: evt_mgmt_admin

About this task
A dedicated integration account ensures third-party monitoring systems have secure, stable, and appropriately scoped access to push events into ServiceNow without relying on personal user accounts.

Note: Create an integration account user only if you plan to use basic authentication. This step is not required if you're using API keys or OAuth. If you prefer those methods, refer to the corresponding documentation for setup instructions.

Procedure
1. Navigate to **Configuration Summary** > **Event Management** > **Platform foundations**.
2. Expand **Platform foundations**.
3. Select **Integration account**.
4. Select **Create account**.
   The Create integration account page opens.
5. In the **User ID** field, enter the account id or the name of the account.
6. In the **Password** field, enter the password for the integration account.
7. Select **Create account**.
   The integration account is created.
8. To complete the setup, select **Mark as configured**.

Install Discovery

Configure Discovery to lay the groundwork for AIOps success by establishing a key foundation for your team.

Before you begin
Verify that the ITOM AIOps and ServiceNow Otto for IT Operations Management (ITOM) plugins are installed.

Ensure you're in the Configure IT Operations Management page.

Role required: evt_mgmt_admin

About this task
Discovery is the source of truth for IT operations, automatically identifying, mapping, and cataloging infrastructure components and relationships to enable faster root cause analysis and reduced operational noise.

Procedure
1. Navigate to **Configuration Summary** > **Event Management** > **Platform foundations**.
2. Expand **Platform foundations**.
3. Select **Discovery**.
4. Select **Configure Discovery**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If the Discovery plugin is installed, the system takes you to the Assign Discovery Admins page where you can assign users to the discovery admin role (discovery_admin). If the Discovery plugin is not installed, you're directed to the IT Operations Management page. Install the ITOM Visibility plugin, which also installs the Discovery plugin automatically.

5. To complete the setup, select **Mark as configured**.

Learn the basics

ServiceNow® Event Management and AIOps help IT operations teams manage high alert volumes by reducing noise and turning raw events into prioritized, actionable alerts. This section covers core concepts, implementation stages, CMDB considerations, prerequisites for setup, and resources to help you get started quickly and confidently.

ServiceNow Event Management

Event Management is the central hub that ingests events from monitoring tools, applies automation and rules to create prioritized alerts, and uses AI agents to automate triage. It reduces noise, improves availability, and seamlessly integrates with ITSM, CMDB, ITOM, and external monitoring tools — making it a foundational part of the ServiceNow AIOps suite.

Implementation Stages

Deploy Event Management using a phased approach, starting with a single high-value service and progressing through four stages — basic alert response, noise reduction, faster MTTR, and proactive operations.

Should I Wait for CMDB

Deploy Event Management and improve your CMDB in parallel to show value quickly. Modern observability tools already provide useful event metadata. Use Alert Automations to improve alert deduplication and grouping without waiting for full CMDB population. Then you can strengthen results by adding Discovery and Service Mapping over time to improve CI/service context.

Prerequisites for Setup

Before implementation, gather credentials for your monitoring tools and submit any necessary access requests to Network and Security teams to avoid delays. If your setup requires pull-based integrations, Agent Client Collector, or Health Log Analytics, a MID Server will also need to be deployed and configured in advance.

How to get help

A curated set of resources is available to support your implementation journey — including training courses, workshop presentations, implementation guides, official documentation, community forums, and video content. You can also reach out to your account team or raise a ticket through the ServiceNow Support Portal at any time.

- Event Management Fundamentals – ServiceNow University course to build a strong foundation in setup, operations, and optimization.
- Event Management Workshop Presentation - slide deck for onboarding and staff training
- Event Management Implementation Guide - Detailed guidance to implement Event Management
- Event Management Documentation - official reference for configuration, administration, and troubleshooting.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Event Management Forum – Post questions, share knowledge, and join discussions.
- ServiceNow YouTube Channel - Official video content, demos, and event recordings.

Install integrations

Access Integrations Launchpad to configure and install integrations for Event Management monitoring tools.

Before you begin

Verify you have installed the ITOM AIOps and ServiceNow Otto for IT Operations Management (ITOM) plugins.

Ensure you're in the Configure IT Operations Management page.

Role required: evt_mgmt_admin or evt_team_operator

Procedure

1. Navigate to **Configuration Summary** > **Event Management** > **Alert response**.
2. Expand **Alert response**.
3. Select **Install integrations**.
4. Select **Install integrations in Integration Launchpad**.
   The Integrations Launchpad page opens.
5. Follow the steps in Integrations Launchpad in Service Operations Workspace for ITOM that apply to your integration installation.
6. To complete the setup, select **Mark as configured**.

Review alerts

Access the Express List interface to review and manage alerts in your Event Management system.

Before you begin

Verify you have installed the ITOM AIOps and ServiceNow Otto for IT Operations Management (ITOM) plugins.

Ensure you are in the Configure IT Operations Management page.

Role required: evt_mgmt_admin or evt_team_operator

About this task

When reviewing alerts, validate the following to ensure your event pipeline is healthy and alerts are actionable:

- Check CI binding. Alerts should populate the cmdb_ci field. If there is no CI, your binding rules need tuning.
- Verify severity spread. If everything lands as Critical or Info, your mapping needs work.
- Confirm that clear events close alerts. Trigger a condition, then resolve it at the source. The alert should auto-close.
- Spot-check key fields. Ensure node, source, resource, and message_key are meaningfully populated (not blank or generic).
- Review Error events. Check em_event status = Error for parsing or mapping issues.
- Check the alert count. Make sure it matches in both your source system and in ServiceNow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Configuration Summary** > **Event Management** > **Alert response**.
2. Expand **Alert response**.
3. Select **Review alerts**.
4. Select **Review alerts in Express List**.
   Express List opens with a list of active alerts.

   Note: To get more information on alerts so you can more efficiently monitor systems and services, resolve alerts, evaluate the alert impact, track issues, and report incidents, see Express List in the Service Operations Workspace for ITOM.

5. To complete the setup, select **Mark as configured**.

Alert enrichment automations

Configure alert enrichment rules to automatically add context and metadata to incoming alerts for better analysis and response.

Before you begin

Verify you have installed the ITOM AIOps and ServiceNow Otto for IT Operations Management (ITOM) plugins.

Ensure you're in the Configure IT Operations Management page.

Role required: evt_mgmt_admin or evt_team_operator

About this task

Alert enrichment rules automatically enhance incoming alerts with additional context such as configuration item details, service mappings, and operational metadata. This enrichment helps operations teams understand the business impact and take appropriate action more quickly.

Procedure

1. Navigate to **Configuration Summary** > **Event Management** > **Alert response**.
2. Expand **Alert response**.
3. Select **Enrich alerts**.
   A list of enrich alert automations appear.
4. Select **+Create automation**.
   The Enrich alerts page opens.
5. Follow the steps in Create Enrich automation.
6. To complete the setup, select **Mark as configured**.

Create incidents

Configure automation rules to automatically create incidents from alerts that require immediate attention and resolution.

Before you begin

Verify you have installed the ITOM AIOps and ServiceNow Otto for IT Operations Management (ITOM) plugins.

Ensure you are in the Configure IT Operations Management page.

Role required: evt_mgmt_admin or evt_team_operator

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
Incident creation rules automatically generate incident records from alerts that meet specific criteria. This automation ensures that critical issues are promptly escalated to the appropriate teams for resolution while reducing manual effort in the incident management process.

Procedure
1. Navigate to **Configuration Summary** > **Event Management** > **Alert response**.
2. Expand **Alert response**.
3. Select **Create incidents**.
   A list of respond alert automations appears.
4. Select **+Create automation**.
   The Respond to alert page opens.
5. Follow the steps in Create Respond automation.
6. To complete the setup, select **Mark as configured**.

Alert ignore automations

Configure ignore rules to automatically suppress alerts that are not actionable or relevant to your operations team.

Before you begin
Verify you have installed the ITOM AIOps and ServiceNow Otto for IT Operations Management (ITOM) plugins.

Ensure you are in the Configure IT Operations Management page.

Role required: evt_mgmt_admin or evt_team_operator

About this task
Ignore rules help reduce alert noise by automatically suppressing alerts that match specific criteria. This allows operations teams to focus on actionable alerts while filtering out known non-critical events, maintenance notifications, or false positives.

Procedure
1. Navigate to **Configuration Summary** > **Event Management** > **Reduce Noise**.
2. Expand **Reduce Noise**.
3. Select **Ignore alerts**.
   A list of ignore alert automations appears.
4. Select **+Create automation**.
   The Ignore alerts page opens.
5. Follow the steps in Create Ignore automation.
6. To complete the setup, select **Mark as configured**.

Alert group automations

Configure grouping rules to automatically consolidate related alerts into single actionable items for more efficient incident management.

Before you begin
Verify you have installed the ITOM AIOps and ServiceNow Otto for IT Operations Management (ITOM) plugins.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Ensure you're in the Configure IT Operations Management page.

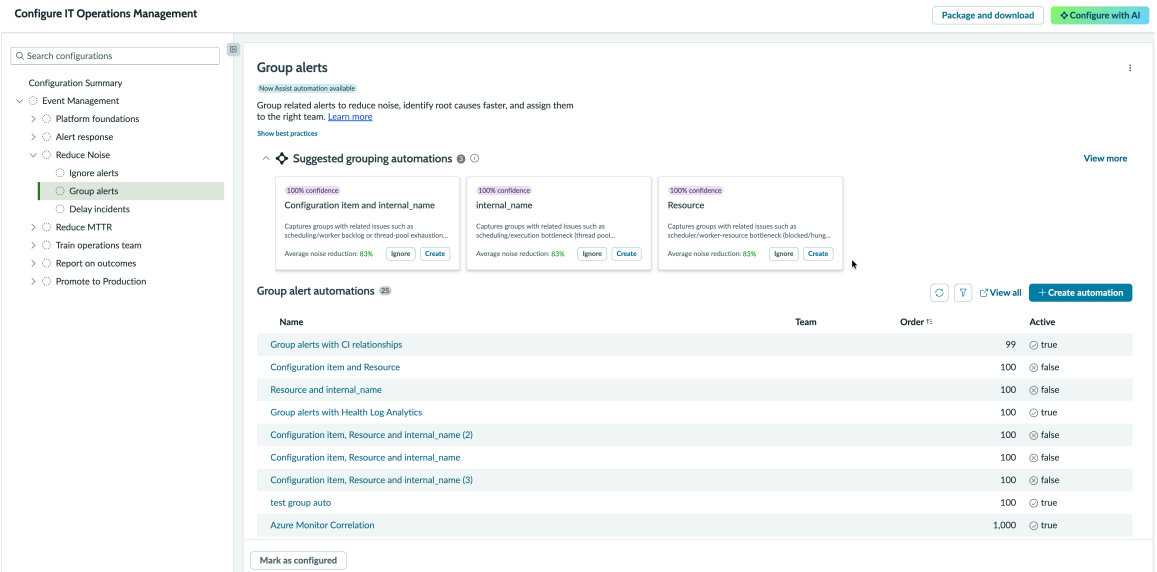
Role required: evt_mgmt_admin or evt_team_operator

About this task

Alert grouping rules automatically combine related alerts that represent the same underlying issue or event. This reduces alert volume and helps operations teams focus on resolving the root cause rather than managing multiple individual alerts for the same problem.

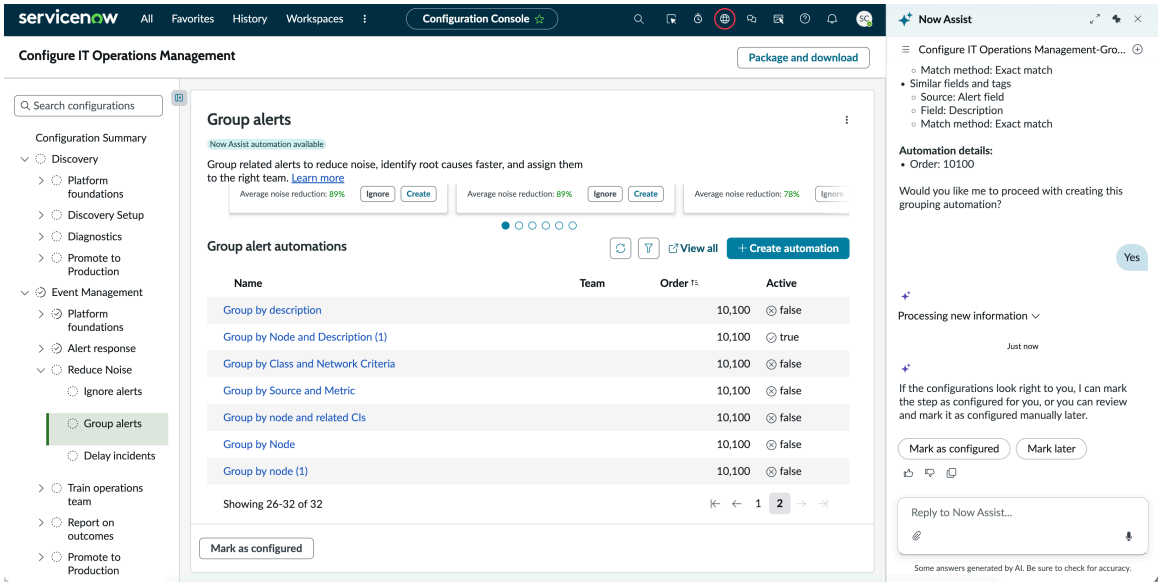
Procedure

1. Navigate to **Configuration Summary** > **Event Management** > **Reduce Noise**.
2. Expand **Reduce Noise**.
3. Select **Group alerts**.
   A list of group alert automations appears.
4. Select **+Create automation**.
   The Group alerts page opens.



You can use the suggested grouping automations to create your grouping automation. If you have the ServiceNow Otto for IT Operations Management (ITOM) plugin installed, select **Configure with AI** from the top-right of the page and ask the ServiceNow Otto chatbot to create an automation. The created automation appears in the list of automations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



For more information on group automation, see Create Group automation.

5. To complete the setup, select **Mark as configured**.

Delay incidents

Configure delay rules to postpone incident creation for alerts that may resolve automatically or represent transient conditions.

Before you begin

Verify you have installed the ITOM AIOps and ServiceNow Otto for IT Operations Management (ITOM) plugins.

Ensure you're in the Configure IT Operations Management page.

Role required: evt_mgmt_admin or evt_team_operator

About this task

Delay incident rules help reduce unnecessary incident creation by waiting for a specified period before generating incidents from alerts. This is particularly useful for flapping conditions or transient issues that may resolve automatically, preventing ticket creation for self-resolving problems.

Procedure

1. Navigate to **Configuration Summary** > **Event Management** > **Reduce Noise**.
2. Expand **Reduce Noise**.
3. Select **Delay incidents**.
   A list of respond alert automations appears.
4. To create an automation and set a wait time before incident creation, select **+Create automation**.
   The Respond to alerts page opens.
5. Follow the steps in Create Respond automation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: To modify the wait time in an existing automation, open the automation and update the wait time under **Create incident and other response actions**. Ensure you select **Create Incident (Advanced)** — the delay configuration form is only available through this option.

6. To complete the setup, select **Mark as configured**.

Run remediation actions

Run remediation actions automatically or trigger them manually from the Express List to speed up alert investigation and resolution.

Before you begin

Verify you have installed the ITOM AIOps and ServiceNow Otto for IT Operations Management (ITOM) plugins.

Ensure you are in the Configure IT Operations Management page.

Role required: evt_mgmt_admin or evt_team_operator

About this task

Procedure

1. Navigate to **Configuration Summary** > **Event Management** > **Reduce MTTR**.
2. Expand **Reduce MTTR**.
3. Select **Remediation actions**.
   A list of respond alert automations appears where the **Response subflow** field in the Respond alert automation is set to anything other than **Create incident (advanced)**.
4. Select **+Create automation**.
5. Follow the steps in Create Respond automation.
6. To complete the setup, select **Mark as configured**.

Training operations team

Get your L1/L2 operators up to speed with Event Management. This section walks through the key concepts, tools, and workflows they need to confidently triage alerts, understand service impact, and take action from day one.

Event Management Operator Essentials course

Designed for IT operations professionals, this course covers the full alert lifecycle in Event Management. You learn to navigate the Service Operations Workspace and manage alerts using Express List and AIOps Dashboards. You also use Alert Automation and AI to reduce noise and accelerate resolution. You gain hands-on experience with the four-stage automation pipeline (Ignore, Enrich, Group, and Respond) and earn a digital badge upon completion. Select the **Event Management Operator Essentials** tile to open and start the course.

Service Operations Workspace

An integrated environment where IT operations and service management converge — alerts, incidents, services, and operational context all in one place. Key highlights include a shift-start landing page for quick situational awareness and shared context (CIs, changes, related records) visible without tool-switching. Playbooks and remediation actions are built in, and cross-team alignment makes acknowledgements and escalations immediately visible to teammates.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Express List

A live, continuously updating alert queue designed for active triage. Operators are coached to prioritize by business impact over raw severity, work alert groups rather than individual alerts, and use AI alert analysis for plain-language summaries. They also acknowledge purposefully, escalate quickly when stuck, and document work notes to avoid repeated investigation by the next tier.

Service Dashboard

The business-impact lens on what's firing. While the Express List shows what is alerting, the Service Dashboard shows what it means for the business. It surfaces service health tiles, business criticality ratings, CI topology maps, and service dependencies. This transforms 'I have 15 alerts' into actionable service-level awareness for operators and leadership alike.

Dashboards

Access AIOps dashboards in Service Operations Workspace to monitor the health, performance, and availability of your IT resources in real-time.

To get to the AIOps dashboards in Service Operation Workspace page, navigate to **Configuration Summary** > **Event Management** > **Report on outcomes** > **Dashboards**.

AIOps dashboards

The Dashboards section surfaces three purpose-built AIOps dashboards inside Service Operations Workspace, each serving a different reporting need:

- AIOps 360° Overview: A comprehensive view of AIOps activities and their overall impact, including time saved through automation and grouping, workload savings, and incident prevention rates.
- AIOps Value Realization: Focused on business value metrics, helping stakeholders see the tangible ROI of AIOps adoption.
- AIOps Operational: A monitoring view of AIOps system behavior and operations, useful for admins tracking how the system is performing day to day.

To open a dashboard, select its tile.

Learn how to deploy Event Management to production

Understand the process and considerations for deploying Event Management configurations from development to production environments using update sets.

Deploying Event Management configurations to production requires careful planning and execution to maintain system stability and performance. Update sets provide a controlled method for moving configurations between environments.

Deployment planning

Before deploying to production, verify that all configurations work correctly in your development or staging environment. Test alert automation rules, integration accounts, and role assignments to confirm they function as expected.

Update set process

Update sets capture configuration changes made in your development environment and allow you to transfer them to production. This includes Event Management automation rules, user roles, integration settings, and custom configurations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The deployment process automatically records changes as update sets, so you don't need to create them manually. To deploy, export the recorded update set and import it into your production environment. Always review the update set contents before deployment.

Update set: included and excluded components

Category	Components
Included in update sets	• Custom tables and fields • Form and list layouts, form sections • Business rules, client scripts, UI actions, UI policies, UI pages, UI macros, and UI scripts • Script includes and workflows • System properties (except those tagged as Private) • Reports and views • Access Control Lists (ACLs)
Not included in update sets	• Transactional data records (incidents, problems, change requests, knowledge articles) • Users, groups, and group memberships • Configuration Items (CIs) and CMDB data • Scheduled jobs and schedulesHomepages (unless manually added) • Email and notification logs • Number counter records (sys_number_counter) • System properties tagged as Private • Plugin-specific elements and business rules in deactivated applications

Deployment considerations

- Schedule deployments during maintenance windows to minimize impact on operations
- Back up your production environment before applying updates
- Test automation rules in production with a limited scope before full activation
- Verify that integration accounts and credentials are properly configured in production
- Confirm that all required plugins are installed in the production environment
- Review role assignments to confirm they align with your production security model

Post-deployment verification

After deployment, monitor your Event Management system to confirm that alerts are processed correctly and automation rules function as expected. Check integration connections and verify that incidents are created appropriately.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Additional resources

For detailed guidance on update sets and deployment procedures, refer to the ServiceNow documentation on application deployment and change management processes.

Assign Event Management operator role to group

Assign the evt_mgmt_operator role to groups to enable operations teams to work with alerts and manage Event Management workflows.

Before you begin

Verify you have installed the ITOM AIOps and ServiceNow Otto for IT Operations Management (ITOM) plugins.

Ensure you are in the Configure IT Operations Management page.

Role required: evt_mgmt_admin or evt_team_operator

About this task

The evt_mgmt_operator role provides the necessary permissions for operations teams to view alerts, manage incidents, and use Event Management tools. Assign this role to groups that contain your L1 and L2 operations staff who will be working with alerts on a daily basis.

Procedure

1. Navigate to **Configuration Summary** > **Event Management** > **Platform foundations**.
2. Expand **Platform foundations**.
3. Select **Assign Event Management operators**.
4. Select **Add group**.
   By default, the **Assign role to existing group** is selected.
5. **Optional:** If you want to create your group, select **Create new group** and perform the following steps:
   a. In the **Group name** field, enter the name of the group.
   b. In the **Description** field, enter a description.
   c. In the **Users** field, select the users to add to the group.
   d. Select **Save**.
6. In the **Group** field, select the group to assign the evt_mgmt_operator role to.
7. Select **Save**.
   The role is assigned to the selected group.
8. To complete the setup, select **Mark as configured**.

Assign AIOps NOC managers to group

Assign the evt_aiops_manager role to the group that is responsible for managing NOC operators and AIOps AI specialists.

Before you begin

Verify you have installed the ITOM AIOps and ServiceNow Otto for IT Operations Management (ITOM) plugins.

Ensure you are in the Configure IT Operations Management page.

Role required: evt_mgmt_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The evt_aiops_manager role provides the permissions that operations leaders need to oversee alert handling, manage team assignments, and configure Event Management tools. Assign this role to groups that contain your operations managers and team leads who supervise L1 and L2 staff and own alert-handling outcomes.

Procedure

1. Navigate to **Configuration Summary** > **Event Management** > **Promote to Production**.
2. Expand **Promote to Production**.
3. Select **Assign AIOps NOC managers**.
4. Select **Add group**.
   By default, the **Assign role to existing group** is selected.
5. **Optional:** If you want to create your group, select **Create new group** and perform the following steps:
   a. In the **Group name** field, enter the name of the group.
   b. In the **Description** field, enter a description.
   c. In the **Users** field, select the users to add to the group.
   d. Select **Save**.
6. In the **Group** field, select the group to assign the evt_aiops_manager role to.
7. Select **Save**.
   The role is assigned to the selected group.
8. To complete the setup, select **Mark as configured**.

Request Event Management

AIOps Experience plugin (`sn_sow_aiops`) requires a separate subscription and must be activated by ServiceNow personnel. This plugin includes the required Event Management components.

Before you begin

Role required: admin

About this task

To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization's production and subproduction instances, generally within a few days.

If you don't have an account manager, decide to delay activation after purchase, or want to evaluate the product on a subproduction instance without charge, follow these steps.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Select **Request plugin** to open the **Activate Plugin** form on Now Support.
3. On the **Activate Plugin** form, provide the following information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Activate Plugin form

Field	Description
What is your target instance	Select the instance that you want to activate the plugin on.
Which plugin would you like to activate	Select the name of the plugin to activate. **Note:** If the system doesn't list the plugin you want or if you're activating the plugin on an OEM or on-premise instance, select the **Plugin I'm looking for is not listed** check box and then enter the name of the plugin.
Select Maintenance Date and Time	Select the date and time to activate the plugin.

Example

For example, see the following form to activate the Event Management plugin on an instance named SNC Instance.

4. Select **Submit**.
   After the maintenance window, the system installs the plugin on your instance. To confirm the installation, go to the Installed tab in the Application Manager.

Install Event Management

Retrieve the most updated apps for the Event Management application (com.glideapp.itom.snac) in the ServiceNow® Store. Periodically check the ServiceNow® Store for new app versions.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Role required: admin

About this task

The following items are installed with Event Management:

- Roles
- Scheduled jobs
- Tables

For more information, see Components installed with Event Management.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the ITOM AIOps application using the filter criteria and search bar.

   If you cannot find the application, request it from the ServiceNow Store.
3. In the Application installation dialog box, review the application dependencies.

   Dependent plugins and applications are listed if they will be installed, are currently installed, or need to be installed. If any plugins or applications need to be installed, you must install them before you can install Event Management.
4. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.

   (Optional) Demo data comprises sample records that describe application features for common use cases. Load demo data when you first install the application on a development or test instance.

   Important: If you don't load the demo data during installation, it's unavailable to load later.
5. Select **Install**.

Enhance Event Management performance

The Event Management Performance Accelerator plugin helps maintain Event Management performance at a high level. This plugin is optional.

Before you begin
Role required: admin

About this task
The *em_alert_history* and *em_impact_status* tables can grow very large, negatively impacting Event Management performance. The Event Management Performance Accelerator plugin includes fix scripts that populate missing data, update key fields to maintain data accuracy, and create indexes to enhance performance. These actions help optimize large datasets and reduce the impact on query speed and overall system responsiveness.

When upgrading from an earlier version with more than 5 million records in either the *em_alert_history* or *em_impact_status* tables, you must activate this plugin manually. When there are fewer than 5 million records, it activates automatically. You can customize this number by modifying the *evt_mgmt.plugin_activation.table_max_size* property.

To evaluate the Event Management Performance Accelerator plugin on a subproduction instance, install the plugin in Application Manager. For instructions, see Install an app or plugin.

Procedure

Activate the Event Management Performance Accelerator plugin.

Event Management setup

After activating Event Management, set it up to receive and process events, and generate and analyze alerts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Event Management setup without using guided setup

Set up Event Management by completing these tasks in the following order:

1. Configure a MID Server to receive and process events via the MID Server.
2. Configure the MID Web Server extension.
3. Configure Configure Event Management connectors.
4. Configure event field mappings and Binding alerts to CIs to manage alert generation.
5. Alert management rules for resolving alerts, perform, and CI remediation for alert management.
6. Request Service Mapping and get a top-down discovery to receive CI relationships for software and hardware.
7. Configure impact calculation for services, to establish priority for alert resolution.
8. Configure alert groups to consolidate related alerts.
9. Configure the Predictive Intelligence plugin (com.glide.platform_ml) to enable machine learning and finding similar alerts.
10. Configure any other general tasks that appear in this section as appropriate.

Note: Event Management does not support creating incidents on remote instances.

Event Management configuration using Setup Hub

ITOM configuration console provides a sequence of tasks to help you configure Event Management. For more information, see Configure Event Management using ServiceNow Otto for Setup.

Event Management during a platform upgrade

During a platform upgrade Event Management jobs whose **Upgrade safe** flag is marked as `true` remain running.

During an upgrade of the platform, the Event Management connectors are working and continue to retrieve events. The events are being processed, transformed to an alert using event rules and if there is a suitable alert management rule, a task is created. However, the impact calculation is not supported during the platform upgrade. When applying configuration changes or upgrades, all impacted MID Servers restart.

Note: Event Management jobs that started running before the platform upgrade commenced continue to run during the upgrade.

The following Event Management jobs remain running as their **Upgrade safe** flag is marked as `true` :

- Event Management - Connector execution
- Event Management - Update stuck connect
- Event Management - Alert Priority Queue
- Event Management - Close flapping alerts
- Event Management - Close threshold alert
- Event Management - Evaluate Scoped Alert Rules Management0
- Event Management - Maintenance Calculator
- Event Management - Process events

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

During the platform upgrade, all other Event Management jobs wait for the platform upgrade to finish.

Note: During an Event Management plugin upgrade, all Event Management jobs do not work.

MID Web Server

The MID Web Server is part of the common infrastructure of the MID Server.

The MID Web Server extension provides options for authentication and data security, and runs for as long as it is enabled. The extension starts a web server on the MID Server to handle web requests from external systems. The raw data is pushed to the extension, either from a client or with a customized script. The data is collected by the MID Server and is transmitted to the ServiceNow instance.

The MID Web Server extension supports MID Server clusters that are configured for failover. When selecting a MID Server cluster option, an algorithm determines which MID Server in the cluster runs the extension. The extension can run on only one MID Server. If the primary MID Server goes down, the extension automatically starts to run on the secondary MID Server.

Related topics

Configure the MID Web Server extension

Configure a secure MID Web Server extension

Configure the MID Web Server extension

The MID Web Server is a MID Server extension that enables developing REST APIs to send events and metrics to the MID Server. The extension is leveraged by other MID Server extensions, such as Metric Intelligence, MID WebService Event Listener, and the Agent Client Collector websocket endpoint extension.

Before you begin

- Deploy and start a MID Server.
- Enable the MID Web Server [com.snc.sa.mid.webserver] plugin.

Role required: agent_admin.

About this task

Agent Client Collector supports the following authentication strategies:

- **Keybased**: For backwards (pre-Brazil release) compatibility only. See Configure key-based MID Web Server authentication.
- **API key**: See Configure MID Web Server API key authentication.
- **mTLS**: See MID Web Server and agent mTLS Authentication.

Procedure

1. Navigate to **All** > **MID Server** > **Extensions** > **MID Web Server**.
2. In the MID Web Server Contexts list, click **New**.
3. Fill in the values on the Event Management MID Web Server extension form.
4. Click **Save** to save the data.
5. Restart the MID Web Server extension to apply your changes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Navigate to **All** > **MID Server** > **Extensions** > **MID Web Server** and select the MID Server you just created.
7. In the **Related Links** section, click **Start** to start the extension.

Configure a secure MID Web Server extension

Configure a TLS listener for extra security and encryption of data transferred to and from the MID Web Server extension. Access a private key and certificate (or certificate chain) from a Java keystore. The keystore is used during the TLS handshake where the MID Web Server and the client acknowledge each other.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. Navigate to **MID Server** > **Extensions** > **MID Web Server**.
2. Select **New**.
3. In the **Authentication Type** field, select an authentication type to be used.
   - Keybased – See Configure key-based MID Web Server authentication
   - Basic – Standard username/password authentication
   - API key – See Configure MID Web Server API key authentication
   - mTLS – See MID Web Server and agent mTLS Authentication
4. Select either the MID unified keystore or the web server keystore.
   The MID Web Server unified keystore is the most efficient option. To enable backward compatibility and store keypairs in an additional keystore, use the Web server keystore. The Web server keystore allows you to use the MID unified keystore as well.

Option	Description
MID unified keystore	**a.** Select the **Use MID Unified Keystore** check box **b.** Enter an alias name in the **Keystore Certificate Alias** field or leave the field empty to use the keystore's default alias. For more information, see the **Install custom certificates in the MID Server unified key store** section in MID Server unified key **Important:** Leaving the **Keystore Certificate Alias** field empty causes connecting clients to skip certificate verification. Instead, the MID Server uses its own self-signed certificate.
Web server keystore	**a.** Clear the **Use MID Unified Keystore** check box. **b.** Specify an alias name in the **Keystore Certificate Alias** field or leave the field empty if you have a single alias in that keystore.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	c. If the password to the private key of the re quired alias is different from the keystore password, specify the alias in the **Keystore Key Password** field. **d.** Enter the keystore password in the **Key store Password** field.

Related topics

Connect the agent to the MID Server using mTLS

Configure key-based MID Web Server authentication

Provide added security to your MID Web Server extension by using key-based authentication. Generate an authentication token to be sent in the Authorization header of incoming client requests.

Before you begin

Note: This procedure is only for compatibility with releases prior to Brazil. For details on the procedure in the Brazil release for configuring the MID Web Server, see Configure the MID Web Server extension.

- Deploy and start a MID Server.
- Configure a MID Web Server extension and select Keybased as the authentication type. For details, see Configure the MID Web Server extension.

Role required: agent_admin

Procedure

1. Using a script program, create a token by constructing a string using defined elements of the HTTP/HTTPS request (HTTP verb, content type header, and request path, received from the client accessing the MID Web Server extension endpoints).
2. Create an HMAC (Hash Message Authentication Code) of the string by signing the generated string with the auto-generated secret key that is displayed in the **Secret Key**.
   This key is unique per context.
3. Provide information to send this authentication token in the request Authorization header.

Item	Value
Path to a web service API for sending raw data	URL format: `https://<MID Server IP address>:<port number>/api/mid/sa/metrics` Use a port number that matches one of the port numbers set up in the Web Server extension. Example: `http://10.10.10.10:8097/api/mid/sa/metrics`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Item	Value
Request type	POST
Date format	`yyyy-MM-dd'T'HH:mm:ss.SSS'Z'` For example: 2016-06-08T20:54:58.917Z
Content-Type	application/json

Use the following request elements to generate the required string: HTTP-Verb, Content-Type, Date, and request path. Specify these elements and place them in this order:

- HTTP-Verb + "\n" +
- Content-Type + "\n" +
- Date + "\n" +
- Request-Path

For this example, the request string is:

`POST\napplication/json\n2016-06-08T20:54:58.917Z\n/api/mid/sa/metrics`

For the timestamp requirement, a valid timestamp that uses HTTP date header is required for authenticating the request. Ensure that the timestamp is within 15 minutes of the MID Server.

Example: How to generate the HMAC of the string that uses defined elements of the HTTP/HTTPS request, using Java

```
package sample;
import com.glide.util;
import java.security.SignatureException;

import javax.crypto.Mac;
import javax.crypto.spec.SecretKeySpec;

public class AuthUtil {

private static final String HMAC_SHA1_ALGORITHM = "HmacSHA1";

/***
 * Generates base64-encode the HMAC(Hash Message Authentication
 Code) of input data
 *
 * @param data
 * @param key
 * @return
 * @throws java.security.SignatureException
 */
public static String signData(String data, String key) throws
 java.security.SignatureException {
 String result;
 try {
  // get an hmac_sha1 key from the raw key bytes
  SecretKeySpec signingKey = new SecretKeySpec(key.getBytes(),
 HMAC_SHA1_ALGORITHM);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  // create hmac_sha1 Mac instance and initialize with the
 signing key
  Mac = Mac.getInstance(HMAC_SHA1_ALGORITHM);
  mac.init(signingKey);

  // compute the hmac on input data bytes
  byte[] rawHmac = mac.doFinal(data.getBytes("UTF-8"));

  // base64-encode the hmac
  result = Base64.encode(rawHmac);

 } catch (Exception e) {
  throw new SignatureException("Failed to generate HMAC : " +
 e.getMessage());
 }
 return result;
}
}
```

Configure MID Web Server API key authentication

Authenticate incoming requests from clients to the MID Web Server extension using API key authentication. API authentication is a secure and simple way to authenticate your request. You can create or modify a MID Web Server API key.

Before you begin

Create a MID Web Server extension to use API Key authentication, as described in Configure the MID Web Server extension. Ensure that you select **API Key** in the extension's **Authentication Type** field.

Role required: event_mgmt_admin

About this task

By default, the maximum number of API keys you can create on an instance is 10. To change this number, modify the *mid.webserver.max.api.keys* property value on the System Properties page.

When working in the global domain while Domain Separation is enabled, API keys are available to all extensions, regardless of their domain. When working in a specific domain, API keys are available to extensions in that domain, its parent domains, and the global domain.

You can configure API keys to expire on a specified date.

When creating or updating an extension to use API key authentication, the system checks for an available API key. If none is available, the system creates one.

Procedure

1. Navigate to **All** > **MID Server** > **Profiles and Deployments** > **MID Web Server API Key**.
2. Either create a new API key or modify an existing API key.
   - To create a new API key:
     a. Select **New**.
     b. On the MID Web Server API Key form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MID Web Server API Key form

Field	Description
Name	Name for the API key.
Active	Option for activating the API key.
Authentication key	Read-only encoded value of the authentication key. No value appears until after you configure the key.
Expires	Option for setting an expiration date for the API key. Expired, deactivated, or deleted API keys are not accepted by the web server extension.

c. Select **Submit** to save the API key.

The API key appears on the Mid Web Server API Keys page.

- To modify an existing API key:

a. Navigate to **MID Server** > **Profiles and Deployments** > **MID Web Server API Key**.

b. Select an API key on the page.

c. In the **Related Links** section, select **View API Key**.

d. Copy the API key that appears in the MID Web Server dialog box.

When connecting to a MID Web Server extension configured with API Key authentication, place an API key in the Authorization header. The API key must be one that the extension has access to. Use the following format:

`Key <API_KEY>`

where `<API_KEY>` is the value of the API key displayed after selecting **View API Key**.

e. Select **Submit**.

MID Web Server and agent mTLS Authentication

Mutual authentication using the Transport Layer Security protocol (mTLS) is a secure, certificate-based authentication scheme. With mTLS, the server (the MID Web Server extension) and the client (the agent) authenticate each other.

TLS authentication occurs when a client (such as a web browser) authenticates the server it's accessing by validating the certificate presented by the server. The client verifies that the certificate (or certificate chain) is signed by a trusted certificate authority (CA). The client must have access to a bundle of CA certificates, which it uses to validate the server certificate.

When mTLS is configured, the client presents a certificate or certificate chain to the server. The server authenticates the client in the same way that the client authenticates the server (mutual authentication).

In addition to verifying the certificate signature, some TLS implementations also check the revocation status of the certificate. In these cases, the Online Certificate Status Protocol (OCSP) is used. In this protocol, the verifying party sends a request to the OCSP responder set up by the

CA that issued the presented certificate. (The responder's address is typically embedded in the CA-issued certificates). The response indicates whether the presented certificate is revoked.

Before enabling mTLS, you must first create keys and certificates, install the .pem file on your MID Server, and connect the agent to your MID Server.

Related topics

Configure the MID Web Server extension

Configure mTLS authentication for a MID Web Server

Create keys and certificates

Create keys and certificates in your root directory to enable Transport Layer Security (TLS) setup. TLS setup is required before you can configure mTLS on the MID Web Server and agent.

Before you begin

- Ensure that there are no keys installed in the MID unified keystore by running the following command:

  ```
  bin/scripts/manage-certificates.(sh/bat) -l
  ```

  When there are no keys installed, the output is: `defaultsecuritypairhandle`

- Invalidate your MID Server.

  If additional keys exist in the output, reinstall those keys after invalidating the MID Server.

- Ensure that the MID Server is connected to the instance.
- Select a directory in which you want to create certificates, to be called the *root* directory.
- For Windows environments only: Install Win32/Win64 OpenSSL with all dependencies and ensure it is on the system PATH.

Note: This procedure includes commands for both CentOS 7/Linux and Windows Server environments. Select the commands relevant for your host operating system. If working with another Linux distribution, adapt the commands as needed for your specific OS.

Role required: agent_client_collector_admin

Procedure

1. In a Linux environment:

   a. Create subdirectories for your certificates in your root directory.

   ```
   mkdir -p labca labmid labacc;
   ```

   b. Generate the EC key pair.

   ```
   openssl ecparam -list_curves;
   openssl ecparam -out labca/ec-labcakey.pem -name prime256v1
    -genkey;
   ls labca/;
   ```

   The generated output is the `ec-labcakey.pem` file.

   c. Create the root CA certificate.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
openssl ecparam -in labca/ec-labcakey.pem -text -noout;
openssl req -x509 -new -nodes -key labca/ec-labcakey.pem
 -sha512 -days 365 -out labca/labcacert.pem -subj
 "/C=<country>/ST=<state>/L=<location>/O=<organization>
 Lab/OU=<organization unit>/CN=<cn abbreviation>";
openssl verify labca/labcacert.pem;
```

Generated output:

- `labca/labcacert.pem: C = <country>, ST = <state>, L = <location>, O = <organization> Lab, OU = <organization unit>, CN = <cn abbreviation>`
- `OK`

d. Import the CA certificate into the system trust store.

```
sudo cp -a
 labca/labcacert.pem /etc/pki/ca-trust/source/anchors/;
sudo update-ca-trust extract;
openssl verify labca/labcacert.pem
```

Generated output: `labca/labcacert.pem: OK`

e. Obtain the fully qualified domain name (FQDN) for the host.

```
hostname --all-fqdns;
```

f. Generate the server certificate signing request (CSR) and sign it with the CA.

Enter the FQDN as the `<hostname>` value in the following commands. If more than one FQDN value is returned, use the value with the following format: `hostname.domain.domain.com`.

```
openssl req -new -newkey rsa:4096
 -keyout labmid/rsa-labmidkey.pem
 -sha512 -nodes -out labmid/mid.csr -subj
 "/C=<country>/ST=<state>/L=<location>/O=<organization>/OU=<o
rganization unit>/CN=<hostname>";
openssl x509 -req -days 365 -in labmid/mid.csr -CA
 labca/labcacert.pem -CAkey labca/ec-labcakey.pem
 -CAcreateserial -extensions SAN -extfile
 <(cat /etc/pki/tls/openssl.cnf <(printf
 "\n[SAN]\nsubjectAltName=DNS:<hostname>")) -out
 labmid/mid.crt;
```

Generated output:

```
Signature ok
subject=/C=<country>/ST=<state>/L=<location>/O=<organizatio
n>/OU=<organization unit>/CN=<mid server host fqdn>
Getting CA Private Key
```

g. Combine the key and certificate files into one file, named `mid.pem`.

```
cat labmid/rsa-labmidkey.pem labmid/mid.crt > labmid/mid.pem;
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. In a Windows environment:

   a. Create subdirectories for your certificates in your root directory.

   ```
   mkdir labca labmid labacc
   ```

   b. Generate the EC key pair.

   ```
   openssl ecparam -list_curves
   openssl ecparam -out labca\ec-labcakey.pem -name prime256v1
    -genkey
   dir labca
   ```

   The generated output is the `ec-labcakey.pem` file.

   c. Create the root CA certificate.

   ```
   openssl ecparam -in labca\ec-labcakey.pem -text -noout
   openssl req -x509 -new -nodes -key labca\ec-labcakey.pem
    -sha512 -days 365 -out labca\labcacert.pem -subj
    "/C=<country>/ST=<state>/L=<location>/O=<organization>
    Lab/OU=<organization unit>/CN=<cn abbreviation>"
   openssl verify labca\labcacert.pem
   ```

   Generated output: `C=<country>, ST=<state>, L=<location>, O=<organization> Lab, OU=<organization unit>, CN=<cn abbreviation>`

   d. Import the CA certificate into the system trust store.

   ```
   certutil -addstore -f "Root" labca\labcacert.pem
   openssl verify -CAfile labca\labcacert.pem
    labca\labcacert.pem
   ```

   Generated output: `labca/labcacert.pem: OK`

   e. Obtain the fully qualified domain name (FQDN) for the host.

   ```
   net config workstation | findstr /C:<Full Computer name>
   ```

   The `Full Computer name` value returned is the FQDN to use as the `<hostname>` later in this procedure.

   f. Create the SAN (Subject Alternative Name) configuration file.

   ```
   copy "%ProgramFiles%\OpenSSL-Win64\bin\cnf\openssl.cnf"
    openssl-san.cnf
   echo.>>openssl-san.cnf
   echo [SAN]>>openssl-san.cnf
   echo subjectAltName=DNS:<hostname>>>openssl-san.cnf
   ```

   Adjust the source `openssl.cnf` path to match your OpenSSL installation location if it differs from the default.

   g. Generate the server certificate signing request (CSR) and sign it with the CA.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Enter the FQDN as the `<hostname>` value in the following commands. If more than one FQDN value is returned, use the value with the following format: `hostname.domain.domain.com`.

```
openssl req -new -newkey rsa:4096
 -keyout labmid\rsa-labmidkey.pem
 -sha512 -nodes -out labmid\mid.csr -subj
 "/C=<country>/ST=<state>/L=<location>/O=<organization>/OU=<o
rganization unit>/CN=<hostname>"
openssl x509 -req -days 365 -in labmid\mid.csr -CA
 labca\labcacert.pem -CAkey labca\ec-labcakey.pem
 -CAcreateserial -extensions SAN -extfile openssl-san.cnf
 -out labmid\mid.crt
```

Generated output:

```
Signature ok
subject=/C=<country>/ST=<state>/L=<location>/O=<organizatio
n>/OU=<organization unit>/CN=<mid server host fqdn>
Getting CA Private Key
```

Note: With OpenSSL 3.x (the Win32/Win64 installer), the `Getting CA Private Key` line may not appear in the output, but `Signature ok` and the correct `subject=` line are still present. To confirm the certificate was signed correctly, verify `labmid\mid.crt` directly:

```
openssl x509 -in labmid\mid.crt -noout -subject -dates
```

This command shows the subject you specified and valid `notBefore`/`notAfter` dates.

h. Combine the key and certificate files into one file, named `mid.pem`.

```
copy /b labmid\rsa-labmidkey.pem+labmid\mid.crt
 labmid\mid.pem
```

What to do next

Set up the MID Web Server with a .pem file.

Set up the MID Web Server with a .pem file

Install the .pem file into the MID unified keystore and set up the MID Web Server to enable configuring mTLS on your MID Web Server and agent.

Before you begin

Copy the `labmid/mid.pem` file (created in the Create keys and certificates procedure) to your MID Web Server host directory.

Note: This procedure includes commands for both CentOS 7/Linux and Windows Server environments. Select the commands relevant for your host operating system. If working with another Linux distribution, adapt the commands as needed for your specific OS.

Role required: agent_client_collector_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In a Linux environment:

   a. Access the agent subdirectory under the MID Server's host directory.

   b. Import the .pem file into the MID unified keystore.

   ```
   bin/scripts/manage-certificates.sh -a midwss /<path>/mid.pem;
   bin/scripts/manage-certificates.sh -l;
   ```

   Replace `<path>` with the directory where you copied the mid.pem file.

   The relevant part of the output is: `"defaultsecuritypairhandle,midwss"`

   c. Validate your MID Server on the instance.

   d. Select the MID Server on the instance and select **Setup ACC listener**.
   A new MID Web Server is created.

   e. Navigate to the newly created MID Web Server record
   (*ecc_agent_ext_context_webserver*) on the instance.

   f. Select the MID Web Server and set the Keystore certificate alias value to `midwss`.

   g. Select **Save**.

   h. Restart the MID Web Server.

2. In a Windows environment:

   a. Access the agent subdirectory under the MID Server's host directory.

   b. Import the .pem file into the MID unified keystore.

   ```
   bin\scripts\manage-certificates.bat -a midwss <path>\mid.pem
   bin\scripts\manage-certificates.bat -l
   ```

   Replace `<path>` with the directory where you copied the mid.pem file.

   The relevant part of the output is: `"defaultsecuritypairhandle,midwss"`

   c. Validate your MID Server on the instance.

   d. Select the MID Server on the instance and select **Setup ACC listener**.
   A new MID Web Server is created.

   e. Navigate to the newly created MID Web Server record
   (*ecc_agent_ext_context_webserver*) on the instance.

   f. Select the MID Web Server and set the Keystore certificate alias value to `midwss`.

   g. Select **Save**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

h. Restart the MID Web Server's Windows service using one of the following methods:

- Use the Services app on the Windows host.
- Use the command line with the MID Server's configured service name:

```
net stop AgentClientCollector
net start AgentClientCollector
```

What to do next

Connect the agent to the MID Web Server using TLS.

Connect the agent to the MID Web Server using TLS

Connect the agent to the MID Web Server to enable configuring mTLS on your MID Web Server and agent.

Before you begin

Ensure that you have installed the .pem file and set up the MID Web Server. For details, see Set up the MID Web Server with a .pem file.

Note: This procedure includes commands for both CentOS 7/Linux and Windows Server environments. Select the commands relevant for your host operating system. If working with another Linux distribution, adapt the commands as needed for your specific OS.

Role required: agent_client_collector_admin

Procedure

1. In a Linux environment:

a. Add the `labcacert.pem` file to your agent host's trust store.

```
sudo cp
 -a /<path>/<to>/labcacert.pem /etc/pki/ca-
trust/source/anchors/;
sudo update-ca-trust extract
openssl verify /<path>/<to>/labcacert.pem
```

The generated output is: `/<path>/labcacert.pem: OK`

b. Configure the `acc.yml` file to use TLS.

i. Set the *`insecure-skip-tls-verify`* property to `false`.

ii. Set the *`backend-url`* property to use the MID Server's FQDN.

```
backend-url="wss://<mid server fqdn>:<mid web server
 port>/ws/events"
```

c. Restart the agent.

```
systemctl restart acc;
```

d. Verify in the logs that the agent is connected to the MID Server.

2. In a Windows environment:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Add the `labcacert.pem` file to your agent host's trust store by importing it into the Windows Certificate Store.

```
certutil -addstore -f "Root" <path>\labcacert.pem
openssl verify -CAfile <path>\labcacert.pem
 <path>\labcacert.pem
```

The generated output is: `<path>\labcacert.pem: OK`

b. Configure the `acc.yml` file (`C:\ProgramData\servicenow\agent-client-collector\config\acc.yml`) to use TLS.

i. Set the *`insecure-skip-tls-verify`* property to `false`.

ii. Set the *`backend-url`* property to use the MID Server's FQDN:

```
backend-url:
 - "wss://<mid server fqdn>:<mid web server port>/ws/events"
```

c. Restart the agent using one of the following methods:

- Command line:

```
net stop AgentClientCollector
net start AgentClientCollector
```

- Services app: Select and hold the **Agent Client Collector** entry and select **Restart**.

d. Verify in the logs that the agent is connected to the MID Server.

Logs are located at: `C:\ProgramData\ServiceNow\agent-client-collector\log\acc.log` (or the location set by the *`log-file`* configuration parameter).

What to do next

Configure mTLS authentication for a MID Web Server.

Configure mTLS authentication for a MID Web Server

Enhance security in your MID Web Server extension by enabling mTLS authentication.

Before you begin

Ensure that you have enabled Transport Layer Security (TLS) on the agent. For details, see Connect the agent to the MID Server using mTLS.

Ensure that the *`insecure-skip-tls-verify`* parameter in the `acc.yml` configuration file is set to `false`. For details on the `acc.yml` file, see Configuration file options.

Note: This procedure includes commands for both CentOS 7/Linux and Windows Server environments. Select the commands relevant for your host operating system. If working with another Linux distribution, adapt the commands as needed for your specific OS.

Role required: agent_client_collector_admin

About this task

The MID Web Server extension searches the following locations (in the specified order) to access the truststore location and password:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Truststore location: The *mid.webserver.truststore.path* JVM system property.

  If that property is empty, the extension retrieves the location from the *javax.net.ssl.trustStore* JVM system property.

  If no location is specified, the truststore location defaults to the absolute path of the `cacerts` file of the JRE running the MID Server.

- Truststore password: The **Truststore Password** field on the extension form in the instance.

  If that field is empty, the system retrieves the password from the *javax.net.ssl.trustStorePassword* JVM system property.

  If no location is specified, the password defaults to *changeit*.

Procedure

1. In a Linux environment:

   a. Navigate to the root folder of your MID Server.

   b. Run the following command to add your certificate to the MID trust store:

   ```
   ./jre/bin/keytool -importcert
    -file /etc/pki/ca-trust/source/anchors/labcacert.pem
    -destkeystore ./jre/lib/security/cacerts -alias mtlsca
   ```

   c. Enter `changeit` when prompted for a password.

   d. Select **yes** on the confirmation message window to indicate that you trust the certificate.

   e. Run the following command to verify that your certificate was successfully added to the MID trust store:

   ```
   ./jre/bin/keytool -list -keystore ./jre/lib/security/cacerts
    -alias mtlsca
   ```

   f. Enter `changeit` when prompted for a password.

   g. In the MID Server wrapper override configuration file (`wrapper-override.conf`, located in the `conf` directory under the MID Server's home directory), configure the revocation of client certificates using the *mid.webserver.cert.revocation.check.enabled* property.

   If you have a custom internal certificate, set it to `false` by adding the following line to `conf/wrapper-override.conf` on the MID Server:

   ```
   wrapper.java.additional.4=-Dmid.webserver.cert.revocation.che
   ck.enabled=false
   ```

   When enabling this property (`true`), configure the *mid.webserver.ocsp.responder.url* property with the OCSP responder URL. This value overrides any URL embedded in the certificate.

   h. If you have changed properties in the wrapper override configuration file, restart the MID Server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

i. Access the MID Server record on your ServiceNow instance and change the value of the **Authentication type** field to **mTLS**.

j. Restart the MID Web Server.

k. Verify that the MID Web Server and websocket endpoint are up and running.

2. In a Windows environment:

a. Navigate to the root folder of your MID Server.

b. Run the following command to add your certificate to the MID trust store:

```
jre\bin\keytool.exe -importcert -file <path>\labcacert.pem
 -destkeystore jre\lib\security\cacerts -alias mtlsca
```

c. Enter `changeit` when prompted for a password.

d. Select **yes** on the confirmation message window to indicate that you trust the certificate.

e. Run the following command to verify that your certificate was successfully added to the MID trust store:

```
jre\bin\keytool.exe -list -keystore jre\lib\security\cacerts
 -alias mtlsca
```

f. Enter `changeit` when prompted for a password.

g. In the MID Server wrapper override configuration file (`wrapper-override.conf`, located in the `conf` directory under the MID Server's home directory), configure the revocation of client certificates using the *`mid.webserver.cert.revocation.check.enabled`* property.

- If you have a custom internal certificate, set it to `false` by adding the following line to `conf\wrapper-override.conf` on the MID Server:

```
wrapper.java.additional.4=-Dmid.webserver.cert.revocation.ch
eck.enabled=false
```

- When enabling this property (`true`), configure the *`mid.webserver.ocsp.responder.url`* property with the OCSP responder URL. This value overrides any URL embedded in the certificate.

h. If you changed properties in the wrapper override configuration file, restart the MID Server using one of the following methods:

- Windows Services app
- Command line using the MID Server's configured service name:

```
net stop AgentClientCollector
net start AgentClientCollector
```

i. Access the MID Web Server record on your ServiceNow instance and change the value of the **Authentication type** field to **mTLS**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

j. Restart the MID Web Server.

k. Verify that the MID Web Server and websocket endpoint are up and running.

What to do next

Connect the agent to the MID Server using mTLS.

Connect the agent to the MID Server using mTLS

Before configuring mTLS authentication on the agent, you must run a series of commands that enable configuring Transport Layer Security (TLS) authentication.

Before you begin

Ensure that you have performed the following tasks:

1. Create keys and certificates
2. Set up the MID Web Server with a .pem file
3. Connect the agent to the MID Web Server using TLS
4. Configure mTLS authentication for a MID Web Server
5. Connect the agent to the MID Server using mTLS

Role required: agent_client_collector_admin

Procedure

1. Generate a key for your agent.

```
openssl ecparam -out labacc/acc.key -name prime256v1 -genkey
```

2. Generate a certificate request for your agent, according to the following format:

```
openssl req -new -key labacc/acc.key -out labacc/acc.csr -subj
 "/C=<country>/ST=<state>/L=<location>/O=<organization>/OU=<org
anization unit>/CN=<cn abbreviation>/emailAddress=<email
 address>"
```

   For example:

```
openssl req -new -key labacc/acc.key -out labacc/acc.csr
 -subj "/C=US/ST=NC/L=Raleigh/O=ServiceNow/OU=ITOM
 Lab/CN=acclinux/emailAddress=john.smith@servicenow.com"
```

3. Generate a signed certificate for your agent.

```
openssl x509 -req -days 365 -in labacc/acc.csr -CA
 labca/labcacert.pem -CAkey labca/ec-labcakey.pem
 -CAcreateserial -extensions client -out labacc/acc.crt
```

4. In the `labacc` folder, copy your key and certificate files to the agent host's virtual machine.

```
cp ./acc.key <agent host config folder>
cp ./acc.crt <agent host config folder>
```

   The configuration folder paths depend on your OS.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Linux: `/etc/servicenow/agent-client-collector/`
- Windows: `C:\ProgramData\servicenow\agent-client-collector\config\`
- macOS: `/Library/Application\ Support/servicenow/agent-client-collector/`

5. Navigate to the location where you copied the `.key` and `.crt` files from.
6. Run the following commands to update the files' read permissions and enable the agent to read from them.
   - Linux:
     a. `chown servicenow:servicenow acc.key`
     b. `chmod 0400 acc.key`
   - Windows:
     a. Select and hold (or right-click) the `.key` file and select the **Security** tab from the file properties.
     b. Add the *`servicenow`* user to the list of users with read access to the file.
   - macOS:
     a. `chown _servicenow:_servicenow acc.key`
     b. `chmod 0400 acc.key`

   Note: The agent must be run with the default servicenow user.

7. In the acc.yml configuration file, add the following parameters to specify the path to your key and certificate files.

```
key-file: "<path to acc.key file>/acc.key"
cert-file: "<path to acc.cert file>/acc.crt"
```

8. Restart the agent.
   - Linux: `systemctl restart acc`
   - Windows:
     a. Open the Services application.
     b. Select and hold (or right-click) the Agent Client Collector entry and select **Restart**.
   - macOS:
     a. `launchctl unload -w /Library/LaunchDaemons/com.sn.acc.plist`
     b. `launchctl load -w /Library/LaunchDaemons/com.sn.acc.plist`
9. Check the logs to verify that the agent was able to connect to the instance using TLS.

   Agent Client Collector logs are accessible from:

   - Linux: `/var/log/servicenow/agent-client-collector/acc.log`
   - Windows: The location specified by the `log-file` configuration flag. The default location is: `C:/ProgramData/ServiceNow/agent-client-collector/log/acc.log`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If the C : /ProgramData directory is hidden (such as on older Windows versions), change the Explorer filter to show hidden elements.

- macOS: The default location is: /Library/Application\ Support/servicenow/agent-client-collector/log/acc.log

MID Web Server and agent mTLS Authentication

Event Management configuration preferences

Preferred settings of properties and general configuration.

Use the Known Error Portal and the Community to further help you find information issues.

General preferences

Self-health

By default, the self-health monitoring feature is not enabled. To enable it, navigate to **Event Management** > **Settings** > **Properties** and select **Yes** for the *Enable Event Management self-health monitoring* (evt_mgmt.self_health_active) property. Use this feature to monitor and track many Event Management features.

Note: CIs used in the self-health service are created in the CMDB.

Use the following settings to help with preventing performance degradation.

Topic	Details
Business rules	• Avoid writing business rules for event [em_event] tables, as they do not run in the current default REST URL that is used for event injection. • Business rules that are written for alert [em_alert] tables must be highly efficient or they may result in performance degradation. Instead of writing a business rule, consider whether it is more appropriate to write a job. An inefficient business rule can cause incident creation for an alert to fail and the alert impact calculation to fail. • Do not write async business rules for alert tables. • Business rules must not change the **Category** field on event [em_event] tables.
Scaling up	Check the average event processing time before scaling up event throughput when first starting with Event Management. Do this check after an initial flow of events and all rules are in place. If processing time takes over a few milliseconds per event, determine the cause for the processing slowdown before continuing to scale. Performance duration can be checked in the Performance Statistics [sa_performance_statistics] table.

Topic	Details
Configure for large-scale environments	• Set the **Enable multi node event processing** (*evt_mgmt.event_processor_enable_multi_node*) property to **Yes**. Enable multi-node in production environments and set values based on the size of the deployment and expected event rate. • Set the **Number of scheduled jobs processing events** (*evt_mgmt.event_processor_job_count*) property to 4. • If you are sending events from a custom source, verify that events have**Message Key** or **Source**, **Node**, **Type**, and **Resource** data.
Latency issues for receiving events	Check the following settings: • Verify that the **Bucket** field in the event [em_event] table is set to a value that is greater than zero (*0*). • Navigate to **System Scheduler** > **Scheduled Jobs** and search for *- process events**. Check that all *- process events** jobs exist according to the **Number of scheduled jobs processing events** (*event_processor_job_count*) property configuration. Verify that the **State** is *Running* or *Ready*. If the state is *Queued* or *Error*, set the job state to *Ready*.
Archive events	• Avoid changing the default retention time for events. • To log events for a longer time, create an archive table and a job that copies new events to it. Do this by scheduling a job to regularly back up events [em_event] to a custom table. • Do not extend table rotation by adding more days.

Event integration

SNMP traps

- Use a monitoring tool to send SNMP traps, rather than sending them directly from devices.
- To avoid having to rewrite event rules, upload MIBs prior to defining the event rules.

Web service API

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Using a web service API for integration can reduce the number of event rules needed. This action avoids having to transform events (prepared data is sent in an event to the instance).
- Use dedicated credentials for integration. Optionally, designate credentials specific to each event source.

CloudWatch

Use dedicated credentials for integrating CloudWatch with ServiceNow.

Email

Use email only if the source has a low volume and other options are not available, such as, running a script or forwarding an SNMP trap.

Event rules

Configuration settings when creating event rules:

- Write Event Rules to apply to the broadest number of events possible. More specific rules can then be created as necessary and should use a lower-order value.
- If a more general rule can achieve the same outcome, avoid writing Event Rules that apply only to a certain subset of events.
- When Event Rules are applied to events, no changes are made to the original event. All processing occurs in memory, so use the **Processing Notes** field and/or use the **Check Process of Event** UI action link to troubleshoot.
- If you change a rule/transform that has existing mapping rules, you should review and retest with events that are either actual or simulated.
- Ensure that the **From** field value exactly matches a string in the JSON in the *additional_info* field of an event. This matching happens when a rule has been configured based on information in a MIB file. If the MIB file is not uploaded, the JSON for the SNMP trap shows varbinds (variable binding) with dotted names, instead of the translated name in the MIB. The event field mapping rule then fails to be applied.
- Establish a consistent naming convention. A common convention is: *<customer acronym>.<Event Source>.<Description>*. For example, *ACME.OEM.Normalize*
- If two Event Rules have similar conditions set, use the **Order** field to control which Event Rule runs.
- Use Event Rules to associate an alert with a CI.

Additional settings for constructing event rules:

Desired result	Required activity
Effective de-duplication and enabling efficient parallel event processing	Populate the **Source**, **Node**, **Type**, **Resource**, **Metric Name** fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Desired result	Required activity
CI binding	• Bind to host - by populating the **Node** field and optionally **CI identifiers**. • Binding to application and / or device – by populating the **CI Identifiers** field and the **Additional information** field.
Alert Correlation, using alert aggregation	Populate the **Resource** and **Metric Name** fields. **Note:** If CI is also bound, Alert Correlation is improved.

Custom event fields

Include additional fields in the **Additional information** field of the event only.

Do not add additional fields to an event by adding a custom field to the event [em_event] table.

Do not add columns to the event [em_event] table.

For information about how to include additional fields in events, see Custom alert fields.

De-Duplication

Configuration settings for de-duplication.

- The **message_key** field is used for De-Duplication. If reliable message key values are not provided with the source event, it is important to have a well-defined plan for constructing these identifiers.
- If the message key is not defined, then the default message key is *<Source + Node + Type + Resource + Metric Name>*.
- The guideline is to have the event source populate the *<Source + Node + Type + Resource + Metric Name>* fields out-of-the-box and populate the message key. This action enables a better distribution of event processing among instance workers and nodes.
- If the source event does not have values for these fields, make sure to populate them using transform rules. This action does not affect event processing, but is used for de-duplication. Populate as many of these fields as possible before they are sent to the instance. This action provides better distribution of events over the processor workers, and therefore better throughput and scale.

CI binding

- Where possible, always attempt to bind an alert to a CI.

  Note: Although Event Rules are defined on events, CIs are bound to alerts that result from those events, and are not bound to the event.

- To bind a host, machine or any device with an IP, populate the event **Node** field with a unique host name, FQDN, IP, or MAC address.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If other identifiers are necessary to identify a host, then populate the ci_identifiers field with a JSON format. The JSON format must contain the **CMDB** field name and value to perform the match.

Note: The event **Node** field must be populated from an event rule or populated with a unique host name from the source before the event is inserted.

- The primary binding strategy is to use the **Node** field. If the **Node** field is not pre-populated in the event, it can be populated using event rules.

Alert settings

Alert lifecycle

General alert functionality:

- An alert is opened when an event is not ignored or its threshold is exceeded by an event rule. De-duplication must not identify the event as belonging to an existing alert.
- An alert is closed when a closing event is sent on the same message key, or the alert is closed manually.
- An alert is reopened if an opening alert that has the same message key is sent within the timeframe defined in properties (default is one hour).
- If an alert is opened and closed at a high rate, as defined in properties, it becomes flapping. When this opening and closing rate stops, the alert goes out of flapping state.
- If an incident is opened from an alert, that alert remains open as long as the incident remains open. By default, when either the incident or the alert is closed the other is closed as well. This behavior can be configured using properties.
- Do not close an alert when creating a corresponding incident.
- Do not delete an open alert. Close an alert first and then delete it.
- Use `Acknowledge` to denote that the alert is known, and can temporarily be ignored.
- Do not use `Acknowledge` to mark an alert as needing attention.
- Do not create alerts in any of these states:
  - `Closed`
  - `OK`
  - `Open`
- The `evt_mgmt.alert_auto_close_interval` property automatically closes alerts after the specified period. Do not specify 0, as this value disables the feature and may lead to performance degradation.
- Do not create alerts in OK state. In some monitoring systems OK denotes that an issue has been resolved, while in other monitoring systems OK is used to denote events that are not of operational significance. For the former case, use `Clear` instead of OK using a Mapping Rule. For the latter case, have an Ignore rule, unless the events are of specific value.

Alert management rules

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Use alert management rules to define automated responses to alerts, such as opening incidents, running subflows, and launching applications or URLs. For more information, see Alert management rules for resolving alerts.
- Use alert filters to specify which alerts the rule applies to. For more information, see Create an alert management rule.
- Use the **Order** field to control which alert management rule runs first when rules have similar conditions. For more information, see Create an alert management rule.
- Use subflows to customize alert handling. For example, you can resolve alerts or notify teams. For more information, see Create a custom subflow for alerts.
- A scheduled job applies alert management rules to new or updated alerts every 11 seconds. If an alert management rule does not start immediately, allow 10–15 seconds before you start troubleshooting. For more information, see Alert management rules for resolving alerts.

Business rules

- Business rules created on alert tables should not take more than a few milliseconds. In place of using a business rule, consider if the same functionality can be achieved using a job.
- Do not use business rules to associate an alert with a CI. Use event rules to do binding instead of using business rules.

Planning

- Organize event source configuration of filters, modules, and so on, into multiple parallel efforts, rather than in serial.
- Validate processed event formats to ensure that data that is parsed is aligned with desired results.
- Test production events in a non-production environment. Integrate with non-production element managers and ServiceNow instances. If non-production element managers are not available, send events from element managers to both production and non-production environments.

Services and dashboard

- Use Service Groups to group services into logical groups to reduce the number of services displayed on the Service Health dashboard.
- Import manually built service maps.

Metric Intelligence collector logs and files

Metric Intelligence collector logs and files are located under the path `$(MID_SERVER_DIR)/agent`. Use these logs and files for troubleshooting and monitoring purposes.

Location of Metric Intelligence collector logs and files

Log or file	Path
PowerShell metric collector log file	Logs/retrieve_metrics{connector instance ID}.log
PowerShell output file	work/metrics/metrics_output_{connector instance ID}.txt
PowerShell input file	work/metrics/parameters_{connector instance ID}.txt

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Metric Intelligence performance can be checked in the MID Server log file when the *mid.log.level* MID Server parameter is in debug mode.

Metric Intelligence performance numbers are available in the Performance Statistics [sa_performance_statistics] table. To view the performance numbers, filter the Performance Statistics list for **Metric Collector**.

Rotate event and alert table for cleanup

Domain separation and Event Management

Domain separation is supported in Event Management. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

How domain separation works in Event Management

When domains are separated in Event Management, users can only see and manage alerts and events in their own (tenant) domain.

A domain column is present for Event Management tables that are provided in the base system. The column displays the name of the domain to which the event or alert belongs.

Note:

If the domain column does not display in the list, click (Update Personalized List) and add the required column. In addition, you can add a column that displays the domain path.

For information about domain separation limitations in Event Management, see Configure Event Management domain separation.

Related topics

Domain separation for service providers

Configure Event Management domain separation

You can configure Event Management for **domain separation** to create logically defined domains that limit unauthorized access to data. When domains are separated in Event Management, users can only see and manage alerts and events in their own (tenant) domain.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: evt_mgmt_admin and evt_mgmt_integration

About this task
Activate the **Domain Support – Domain Extension Installer** plugin and configure the MID Server for Event Management.

The following Event Management features have limited domain separation support.

Features with limited domain separation support

Feature	Support
Event – alert flow	Supported. Separation is based on the domain user that sent events. User access is required for the credentials of the sending API events or in the configuration of the MID Server reporting events. In a multi-domain environment, each MID Server can serve only one domain according to the integration user that it uses. In the configuration of the connector instance, make sure that the MID Server have same domain as Connector instance. To configure pull connectors to support custom domain separation, see Configure domain separation for pull connector events.
Impact calculation	Supported. Segregation is based on the manner in which CIs are segregated.
Application services	Partially supported. Segregation is based on the manner in which CIs are segregated.
Dynamic CI groups	Partially supported. Segregation is based on the manner in which CIs are segregated. **Note:** The discovery process does not segregate CIs by domain.
Remediation	Supported. While editing alert management rules, users can only apply relevant workflows. For more information on domain separation in the Flow Designer, see Domain separation and Flow Designer.
Alert Aggregation	Supported. In domain-separated environments, alert groups are created only for alerts in the same domain.

Procedure
1. If it is not already active, activate the Domain Support – Domain Extension Installer plugin.
2. Configure the connector instance to be in the same domain as the MID Server.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Event Management Integrations

An event is a notification from one or more monitoring tools that indicate something of interest has occurred, such as a log message, warning, or error.

Events are processed and alerts are generated based on the following factors:

- Event collection configuration via a MID Server, script, SNMP trap collector, or email message.
- An Event rule, alert binding, or event field mapping configuration for processing events from various sources.

When a package of events that contains events with a custom (non-supported) state is processed, the events with the custom state are not processed.

Integration with external events

Event Management receives external events via an integration or scripts. If you are using a script to collect events, no configuration is required. All other integrations require configuration.

When an integration is configured, Event Management can collect events that are sent directly to the ServiceNow AI Platform instance or via the MID Server, SNMP trap or email.

The integration with external systems can be initiated from a ServiceNow AI Platform instance using a pull connector, or from an external system using a push mechanism.

Integration via a ServiceNow AI Platform instance

The ServiceNow AI Platform instance includes push connectors that help external monitoring systems to integrate with Event Management directly.

You can configure the authentication in the ServiceNow AI Platform instance and update the external monitoring systems to use endpoints to send the events for the push connectors that are available. For more information, see Push Connectors.

Integration via MID Server

The MID Server facilitates communication and movement of data between external applications, data sources, services, and the ServiceNow AI Platform instance.

Connector operation	Description
Pull	You can configure connector instances to use connector definitions (script instructions). This enables the MID Server to connect to external servers to obtain event information using a pull operation.
Push	You can configure external systems to push event information to the ServiceNow AI Platform instance via MID Server. For example, you can configure the MID WebService Event Collector to push event messages to the MID Server. For more information, see Pushing events to the MID Server using web service API.

Standard event form

A standard event form must be used by all events, regardless of how they arrive at the ServiceNow AI Platform instance. For more information, see Event field format for event collection.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Event Management Connectors domain personalization

Create events in different domains for all Event Management connectors using just a single connector instance by personalizing domain separation of Event Management connectors.

How the domain is identified

In a ServiceNow instance, events are created within the logged-in or MID Server user domains. However, you can create events in a different domain by providing metadata values in the event HTTP request, including the URL, headers, request body (payload), and connector parameters.

The logged-in user or the MID Server user must have access to the provided domain. The connector resolves the domain based on the provided identifier and creates events in that domain.

System properties provide the default metadata that sets the domain-separated table to identify the domain. For more information, see Domain properties installed with Event Management.

Connector Exceptions

You cannot personalize domain separation for the following pull connectors:

- SCOM
- IBM Netcool (supports only IBM Netcool_v2)
- HPOM
- Hyperic

You cannot personalize domain separation for the following push connectors:

- SAP SolMan Transform Script
- bmcTrueSight Transform Script
- Transform Generic Events MID
- TransformEvents_xmlSample

Related topics

Domain separation and Event Management

Configure domain separation for pull connector events

Configure pull connectors to personalize domain separation of events so you can use them to create events in domains other than the user's currently logged-in or MID Server domain.

Before you begin

Make sure that you have the following setup:

- You have read access to the domain information table for the evt_mgmt_integration role (default table: core_company). For more information, see Configure an ACL.
- You enabled the *evt_mgmt.connector_enable_custom_domain_separation* system property .
- You installed the following plug-ins on your ServiceNow instance:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Event Management *com.glideapp.itom.snac* plug-in
- Event Management connectors *sn_em_connector* plug-in
- Domain Support - Domain Extensions Installer *com.glide.domain.msp_extensions.installer* plug-in

You can download the plug-ins from the ServiceNow Store.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances** > **.**
2. On the **Connector Instances** list, deactivate the connector instance of the connector for which you want to configure domain separation by selecting it and clearing the **Active** check box.
3. Select **Update**.
4. Navigate to **All** > **Event Management** > **Integrations** > **Connector Definitions**.
5. From the **Connector Definitions** list, select your connector definition.
6. Determine whether all events should be created in a provided domain or determined by a domain provided in the payload of each event.

   a. In the **Connector Parameters** table, double-click **Insert a new row**

   b. Choose the event creation domain definition location.
   - To have all events be created in the provided domain, enter `payloadDomainInfoFieldValue` in the **Name** column.
   - To have events be created in the domain provided in the payload of the event, enter `payloadDomainInfoFieldName` in the **Name** column.

   Note: If both the *payloadDomainInfoFieldValue* and the *payloadDomainInfoFieldName* are provided, the domain provided in the payload of the event takes precedence.

   c. Select **Update**.
7. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
8. On the **Connector Instances** page, select your connector instance from the list.
9. In the Connector Instance Values list, provide a value in the **Value** field of the parameters.

Parameter	Value
payloadDomainInfoFieldValue	The value that will be used to match the do main record. For example, ServiceNow.
payloadDomainInfoFieldName	The key in the payload that has the domain identifier. For example, if the payload key **com pany** holds the domain identifier, then the value in the **Value** column would provide the company information. For example: **company** {

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter	Value
	"source": "Solarwinds", "host": "127.0.0.1", "company": "ServiceNow" } **Note:** Dot-walking isn't supported.

10. Select **Save**.
11. Select **Test Connector** to verify the connection between the MID Server and the connector.
    - If the test is successful, a confirmation message appears.
    - If the test fails, a message provides instructions to correct the problem.

    On a successful test, an onscreen message appears. If the test fails, follow the onscreen message instructions to correct the problem and then run another test.

    Note: Use a network tool such as *ping* to verify whether the credentials are correct and network connection from the MID Server to the connector server.

12. After the connector is verified, select the **Return to Connector Instance** link.
13. Activate the connector instance by selecting **Active** and **Update**.
14. **Optional:** Configure the domain for events by providing domain metadata through the connector parameters.

    For example, to use the User [sys_user] table for a single connector instance in the **Connector Definitions** form, create parameters with the following names, and add their values in the **Connector Instance** form.

    - *connectorDomainInfoTableName* - sys_user

      Note: The table must be domain separated.

    - *connectorDomainInfoColumnName* - user_name
    - *connectorDomainIdColumnName* - sys_domain
    - *connectorDomainPathColumnName* - sys_domain_path

    For more information, see Connector domain metadata.

Result

The Event Management connector is set up for domain separation.

Configure domain separation for push connector events

Configure push connectors to create events in domains other than the user's currently logged-in or MID Server domain.

Before you begin

Make sure that you have the following setup:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- You have read access to the domain information table for the evt_mgmt_integration role (default table: core_company). For more information, see Configure an ACL.
- You enabled the *evt_mgmt.connector_enable_custom_domain_separation* system property.
- You installed the following plug-ins in the ServiceNow AI Platform® instance:
  - Event Management (*com.glideapp.itom.snac*)
  - Event Management connectors (*sn_em_connector*)
  - Domain Support - Domain Extensions Installer (*com.glide.domain.msp_extensions.installer*)

    You can download the plug-ins from the ServiceNow Store.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Push Connectors**.
2. Open a push connector.
3. On the **Push Connector** screen, scroll down to the **Push Connector Configurations** list and select **New**.

   Note: If this list is not displayed, you must create a push connector configuration parameter. For more information, see Create a push connector configuration parameter.

4. In the **Push Connector Configurations** screen, determine whether events should be created in the provided domain or the domain provided in the payload of each event.

Domain creation location	Parameter and values
The provided domain	○ **Field name**: payloadDomainInfoFieldValue ○ **Value**: domain-identifier

The domain provided in the payload of each event	○ **Field name**: payloadDomainInfoFieldName
	○ **Value**: field-name-in-payload
	Example: If the payload key “company” holds the domain identifier, then “company” is the value.
	“company”
	{
	“source”: “Solarwinds”,
	“host”: “127.0.0.1”,
	“company”: “ServiceNow”
	}

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If both the *payloadDomainInfoFieldValue* and the *payloadDomainInfoFieldName* parameters are provided, then the *payloadDomainInfoFieldName* takes precedence.

5. Select **Submit**.

Result

Events are created in the domain referred to by the domain identifier.

Note: The table that stores domain information records (for example, core_company) must be domain separated. For more information, see Domain-separate a custom table.

Configure Event Management connectors

Event Management provides many connectors to pull or push events from external devices. Connectors are available from the ServiceNow store as well as from third parties. You can also create custom connectors.

Provided connectors (pull)

This table lists the connectors that are provided with Event Management.

Note:

- The Azure Metrics and AWS CloudWatch Metrics connectors display in the base system only when the Operational Intelligence plugin (com.snc.sa.metric) is activated.
- All connectors support external credential storage solutions. For details on configuring external credential storage, see External credential storage configuration.

Connectors	Supported version	Description
Azure Monitor		Send alert state changes to the Azure Portal.
HPOM	08.60.005	Receive events from the HP Operations Manager (HPOM).
Hyperic	5.8.4.0	Receive events from the VMware vRealize Hyperic server.
Logicmonitor	156	Receive events from the Logicmonitor server.
IBM Netcool	8.1.0	Receive events from IBM Netcool/OMNIbus Object Servers and Impact Servers.
Icinga2	2.4.1	Receive events from the Icinga2 server.

© 2026 ServiceNow, Inc. All rights reserved.

Connectors	Supported version	Description
Apache Kafka Consumer Connector	• 3.0.0 • 3.2.0	Receive events from the Apache Kafka server.
ServiceNow Cloud Observability	2.1.1 or higher	Receive events from the ServiceNow Cloud Observability platform.
NagiosXI	5.5.2	Receive events from the Nagios XI server.
NNMi	10.30.653	Receive events from the NNMi server.
OBM, also known as OMi v2	10.01, 10.10, 10.11, 10.12, 10.60, 10.61, and 11.01	Receive alerts from the OBM server.
OMi	10.01, 10.10, 10.11, 10.12, 10.60, and 10.61	Receive alerts from OMi server.
Op5	7.3.15	Receive alerts from an OP5 Monitor.
Opsview	5.4.0	Receive alerts from an Opsview Monitor
PRTG	21.3.71	Receive alerts from a Paessler PRTG Network Monitor source.
SAP Solution Manager	7.2 740 SP16	Receive alerts from an SAP Solution Manager Monitor source.
SCOM	• 2007 – version 6.1.7221.0 • 2012 - version 7.1.10226.0 • 2016 - version 7.2.117190	Alert and metric collection from the Microsoft System Center Operations Manager (SCOM).
SolarWinds	• NPM 12.0 • SAM 6.2.4	Receive events from the SolarWinds monitor.
vCenter	6.5	Receive events from your VMware vSphere environment.
vRealize	VMware vRealize Operations Manager Supported version: 8.10.0	Receive events from the vRealize Operations Log and Event Management servers.
Zabbix	5.0.9	Receive alerts from the Zabbix server.

Provided connectors (push)

This table lists the connectors that are provided with Event Management. Generic push connectors are also provided, one for event collection through the MID Server and the other through the instance.

Before you begin, ensure the Event Management Connectors plugin is installed in the ServiceNow AI Platform instance. You can download the plugin from the ServiceNow Store website.

Connectors	Description	Supported authentication
AWS	Use the connector to process Amazon Web Services (AWS) alarms as events. The event collection is through the instance.	N/A
Azure	Use OAuth authentication to process Azure platform event messages. The event collection is through the instance.	• Integrate Azure Monitor with OAuth authentication • Integrate Azure Monitor with basic authentication
Configure Azure Monitor Bi-directional connector	Use the Azure Monitor Pull connector to send information from ServiceNow Event Management to the Azure Portal.	Basic authentication
Microsoft Azure MID Push Connector	Collect JSON formatted event messages sent from Microsoft Azure. The collection is through the MID Server.	Basic authentication
BMC TrueSight	Collect JSON formatted event messages sent from BMC TrueSight Operations Management (TrueSight). The event collection is through the MID Server.	Basic authentication
New Relic	Collect JSON formatted event messages sent from New Relic. The event collection is through the instance.	Basic authentication
Dynatrace	Collect JSON formatted event messages sent from Dynatrace. The event collection is through the instance.	• Integrate Dynatrace with OAuth authentication • Integrate Dynatrace with basic authentication
Datadog	Collect JSON formatted event messages sent from Datadog. The event collection is through the instance.	• Integrate Datadog with OAuth authentication • Integrate Datadog with basic authentication

Connectors	Description	Supported authentication
Catchpoint	Configure the Catchpoint connector to receive Catchpoint events. Event Management can process the Catchpoint events as ServiceNow events.	Basic authentication
Google Cloud Platform (GCP)	Collect JSON formatted event messages sent from GCP. The event collection is through the instance.	Basic authentication
Google Cloud Platform (GCP) MID Push Connector	Collect JSON formatted event messages sent from GCP. The event collection is through the MID Server.	Basic authentication
Logicmonitor	Collect JSON formatted event messages sent from Logicmonitor. The event collection is through the instance.	Basic authentication
Logicmonitor MID Push Connector	Collect JSON formatted event messages sent from Logicmonitor. The event collection is through the MID Server.	Basic authentication
Oracle Cloud Push Connector	Use basic authentication to process Oracle Cloud alarms. The event collection is through the instance.	Basic authentication
Prometheus	Collect JSON formatted event messages sent from Prometheus. The event collection is through the instance.	Basic authentication
Sentry	Configure the Sentry connector to receive Sentry events. Event Management can process the Sentry events as ServiceNow events.	Basic authentication
SNMP traps	Process SNMP traps as events.	Basic authentication
ThousandEyes	Collect JSON formatted event messages sent from ThousandEyes. The event collection is through the instance.	• Integrate ThousandEyes with OAuth authentication • Integrate ThousandEyes with basic authentication
Email	Configure an inbound email action to send email	Basic authentication

Site24X7 Integrate with this application for one-directional transfer of events from Site24x7 to Event Management	Site24x7 Integration

Create a custom pull connector

You can create a customized pull connector that requires a script, connector definition, and connector instance, to retrieve events on behalf of an event source.

Before you begin

Role required: evt_mgmt_admin

About this task

A custom connector script can make remote API calls for a new event source to send events to the ServiceNow instance. You can create a script, and then add it as part of a new Event Management connector definition and connector instance. This procedure automatically creates a JavaScript code file using the name that you enter in the **Name** field as the filename. The JavaScript custom code that accomplishes these actions must:

- Connect to an event monitoring tool.
- Retrieve events from an event monitoring tool.
- Send events to the Event [em_event] table using a web service API. See REST API.

Each connector definition is specific to an event source vendor. The connector definition specifies the MID Server script include that pulls events from the external event source. In addition, the connector definition specifies what connector instance value parameters are needed to connect to the external event source host.

Procedure

1. Create a custom MID Server script include.
   This example uses Groovy (deprecated). In place of a script include in Groovy, it is recommended to use JavaScript.

   a. Implement these methods:

   - `@Override OperationStatus testConnection()`
   - `@Override OperationStatus execute()`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. Design the class to extend the *ThirdPartyConnector*.

Example

```
public class HypericConnector extends ThirdPartyConnector
```

c. Import platform classes for event creation, sending, logging, and third-party connector base classes.

Example

```
package com.service_now.mid.probe.tpcon.test

import com.glide.util.Log
import com.service_now.mid.MIDServer
import com.service_now.mid.probe.event.IEventSender
import com.service_now.mid.probe.event.SNEventSender
import com.service_now.mid.probe.tpcon.OperationStatus
import com.service_now.mid.probe.tpcon.OperationStatusType
import com.service_now.mid.probe.tpcon.ThirdPartyConnector
import com.snc.commons.eventmgmt.Event
```

d. Connect to the data collector, such as SCOM or VMware vRealize Hyperic (Hyperic), with the API provided by the collector.

e. Use the *context* parameters to set the event field values that came from a connector instance.

Example

```
def authString = (context.username +
 ':'+ context.password).getBytes().encodeBase64().toString()
def urlStr = 'http://'+context.host + ':'
 + context.parameters.port + '/' + apiFunction
```

f. Implement the *execute* function in the script.
It reads events from the connector using its API to create Event objects and send them to the ServiceNow instance. For example:

Example

```
GPathResult alertsResponse1 =
 readAlerts('hqu/hqapi1/alert/find.hqu?begin=' + lastSignatureStr +
'&end='+ tillStr +'&count=1000000&severity=1&inEscalation=false&notFixed=false');
Event event = new Event()
event.emsSystem = context.name
event.source = "Hyperic"
event.description = it.@reason
event.type = it.@name
...
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
IEventSender eventSender =
 MIDServer.getSingleton(SNEventSender.class)
    for (Event event  : list) {
        eventSender.sendEvent(event)
     }
```

2. Navigate to **MID Server** > **MID Server Script Files** and create a script.
3. Specify the **Parent** field as *Groovy*, complete the form as appropriate, and then click **Submit**.
4. Navigate to **Event Management** > **Integrations** > **Connector Definitions** and create a connector definition.
5. In the **Groovy script to run** field, select the MID Server script file, complete the form as appropriate.
   In addition to **username** or **host**, you can add any other parameter, for example, **port**, and then click **Submit**.
6. Navigate to **Event Management** > **Integrations** > **Connector Instances** and create a connector instance.
7. In the **Connector definition** field, select the connector definition, complete the form as appropriate, and then click **Submit**.
8. To confirm or debug the script, use debug printouts from Groovy to the MID Server log.
9. To monitor incoming events using the custom connector instance, navigate to **ECC** > **Queue** and filter on **ConnectorProbe**.
10. Create a custom connector definition.
    a. Navigate to **All** > **Event Management** > **Integrations** > **Connector Definitions**.
    b. Click **New**.
    c. In the **Name** field, type a descriptive name for the connector definition.
    d. In the **Script type** field, select **Javascript**.
    e. Right-click the form header and select **Save**.
    The **Javascript to run** field is automatically populated with the name of the JavaScript template file.
11. To edit the default JavaScript file, click the information icon ( ) to the right of the JavaScript file name and follow these steps:
    a. Specify the information required for the **testConnection** function.
    This function tests the connector definition to verify if the connection to the target is valid.
    b. Specify the information required for the **execute** function.
    This function retrieves the information from the external source.
    c. Specify the information required for the **retrieveKpi** function.
    This function retrieves the metric data from the external source.
12. **Optional:** You can replace the default JavaScript with your JavaScript code.
13. Fill in the fields, as appropriate.

Connector Definition form

Field	Description
Default schedule	The number of seconds between attempts to receive events.
Bi-directional	Specify to enable the external monitoring system to be updated if the alert is changed. There is default implementation for SCOM.
Alert field identifier	Specify the alert field that, if changed manually, causes the external monitoring system to be updated. **Note:** This field appears only if **Bi-directional** is selected.
Collect metrics	Select to enable the collection of metrics. **Note:** Metrics are collected only for SCOM external event sources.
Metrics collection default schedule (seconds)	Specify the number of seconds of information that must be collected. The default is 10 seconds. **Note:** This field appears only if **Collect metrics** is selected.
Connector Parameters	Specify the parameters to enable communication with an event server.
Connector Definition to MID Server Capabilities	The MID Server name to process events from the event server. If not specified, an available MID Server is used.

14. Click **Submit**.

Configure a pull connector

Configure a pull connector to schedule the frequency of event collection.

Before you begin

Before starting this procedure:

- Locate or define a connector definition.
- Create the credentials to connect to the event source.
- If the connector instance is to be used for the collection of Metric Intelligence metric data, the Metric Intelligence plugin must be activated.

Role required: evt_mgmt_admin

About this task

You can use a connector instance to control the location and manner in which events arrive from external sources. You can optionally select to collect Metric Intelligence information from the external sources that you are connecting to. The Metric Intelligence feature is for the analysis of trends, threshold definitions, and anomaly detection. You can run a test to confirm that connector instance parameters let the MID Server receive events from a supported external event source to the Event [em_event] table. The test also confirms:

- The MID Server is running.
- The host is running on the IP address that is in the **Host IP** field.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Both the MID Server and the host are running in the same domain.
- The connector instance value fields are valid.
- A connection can be made to the event source, using API, to retrieve events.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New**.
3. Fill in the fields, as appropriate.

Connector Instance Form

Field	Description
Name	A unique name for the connector instance record, such as the name of event source host.
Description	Any optional information that the administrator wants to use to identify this record.
Assignment Group	Designates which team is responsible for managing, maintaining, and responding to issues related to this connector instance.
Connector definition **Note:** Metric Intelligence connectors (such as the AWS CloudWatch and AzureConnector), appear in the base system only if the Metric Intelligence plugin (com.snc.sa.metric) is activated.	The vendor and protocol used to gather events from the external event source. Select the connector definition that matches the source of external events. The options available in the base system are, for example: ○ AWS CloudWatch ○ AzureConnector ○ Datadog ○ HPOM ○ IBM Netcool ○ NagiosXI ○ NNMi ○ OMi ○ SCOM ○ SolarWinds ○ Op5 ○ PRTG ○ vCenter ○ Zabbix For a list of the connector definitions available in the base system, see Configure Event Management connectors.
Host IP	The IP address of the event source host. The system uses this IP address to select the appropriate MID Server for communicating with the event source host.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Credential	The record from the Credentials [discovery_credentials] table containing valid credentials to the event source host.
Event collection last run time	The date and time of the most recent event import. The value of this field is automatically populated.
Last event collection status	The status of the last import. The value of this field is automatically populated. ○ **None** - A valid connection has not yet been established. ○ **Success** - A successful connection was established. ○ **Error** - A connection was established. However the external event source was not updated.
Event collection schedule (seconds)	The frequency in seconds that the system checks for new events from the external event source. This value cannot be lower than the minimum schedule property, which by default is 120 seconds.
Last error message	Last error message received by the connector. If the test connector fails, an error message appears in this field.
Active	This option appears only after the form has been saved. Do not select this check box until after you test the connection between the MID Server and the connector. Select this check box to enable pulling events from this external event source.
Bi-directional	Select to invoke the bi-directional option. This option is available only when the specified connector definition has been configured with bi-directional values. When selected, this option enables the bi-directional exchange of values to-and-from the external event source. The **Last bi-directional status** option appears only when this option is selected. This option appears only if the connector definition that is selected is SCOM.
Last bi-directional status	The value of this field is automatically populated. The status values are: ○ **None** - A valid connection has not yet been established. ○ **Success** - A successful connection was established. ○ **Error** - A connection was established. However the external event source was not updated. This option appears only if the connector definition that is selected is SCOM.
Metrics collection	Designates collection of Metric Intelligence metric data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: The metrics connector supports working against the SCOM database (MSSQL) that is configured to work with SSL. This option appears only if the connector definition supports metric collection, such as SCOM.
Metrics collection last run time	The date and time of the most recent metric data collection. The value of this field is automatically populated.
Last metrics collection status	Status of the metric data collection activity. The value of this field is automatically populated. This option appears only if the connector definition that is selected supports metric collection (such as SCOM) and if the **Metrics collection** option is selected.
Metrics collection schedule (seconds)	The time, in seconds, to repeat the metric data collection scheduled job. This option appears only if the connector definition that is selected supports metric collection (such as SCOM) and when the **Metrics collection** option is selected.
Metrics database host	Enter either the IP address or the host name of the metrics database host. This option appears only if the connector definition that is selected supports metric collection (such as SCOM).
Connect using a named instance	Select to specify the MSSQL named instance to connect to. This option appears only if the connector definition that is selected is SCOM.
Metrics database named instance	The name of the metrics database instance. This option appears only if the connector definition that is selected supports metric collection (such as SCOM).
Metrics database port	The port used by the metric database. The connection is made using JDBC. The base system value is 1,433. This option appears only if the connector definition that is selected supports metric collection (such as SCOM).
Database login with Windows authentication	Perform database login with the credentials of the log-on user that is defined on the MID Server service. This option appears only if the connector definition that is selected is SCOM.
Metrics collection running	When selected, indicates that the Metric Intelligence collection is running.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	This option appears only if the connector definition that is selected supports metric collection (such as SCOM).
Metrics database credential	Credentials for the metric database. This option appears only if the connector definition that is selected supports metric collection (such as SCOM).
Connector Instance Values	The related list containing connection parameters for the event source host. The list of parameters depends on the selected connector definition.
MID Servers for Connectors	The name of theMID Server to process events from the event server.

4. Right-click the form header and select **Save**.
5. Click **Test connector** to verify that the MID Server can communicate with the external server host.
6. If the test fails, follow the instructions on the page to correct the problem and then run another test. The description of the reason for failure is shown in the MID Server log, according to the type of error, such as Events, Metrics, or Bi-Directional.
7. After a successful test, select the **Active** check box and then click **Update**.
8. Confirm that Event Management processes events using this connector instance by manually creating an event.

Related topics

Configure Event Management connectors

Configure a default MID Server for connectors

You can set a default MID Server for connectors to ensure that there is always a MID Server available to receive external events.

Before you begin

Role required: evt_mgmt_operator

About this task

The default MID Server must have connectivity to all external event sources.

Procedure

1. Enter `sys_properties.list` in the navigation filter to open the System Property [sys_properties] table.
2. Select the `mid.server.connector_default` system property.
3. On the form, fill in the fields.

Task Template form

Field	Description
mid.server.connector_default	Default MID Server for connectors

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Determines the MID Server connectors to use when no MID Server is specified. Must match a MID Server name. ○ **Type**: select `string` from the list ○ **Value**: enter the name of an existing MID Server, for example, SNC MID Server ○ **Location**: System Property [sys_properties] table

Note: You can reset the default MID Server by clearing the *`mid.server.connector_default`* property or by updating the value of this property to a different MID Server. This property is not automatically reset in all scenarios.

4. Click **Update**.

Configure the Dynatrace metrics connector instance

Configure the Dynatrace connector instance to receive Metric Intelligence raw data from the Dynatrace server.

Before you begin

To activate metric collection, ensure that the MID Server that retrieves metrics is configured with the Metric Intelligence extension and that the extension is in **Started** mode. See Manually configure the Metric Intelligence extension.

- Create an access token in Dynatrace with Read Metrics (metrics.read) scope permissions, to enable fetching metric data. This token is used in the connector to call the Dynatrace REST API.
- Configure the Service graph connector for Dynatrace. This is configured in the instance and discovers Dynatrace CIs. For details on this Service graph connector, see Configure Service Graph Connector for Observability - Dynatrace using guided setup.

Role required: evt_mgmt_admin

About this task

By default, the Dynatrace service graph connector discovers CIs and supports metric collection for the following entity types:

- HOST
- APPLICATION
- SERVICE
- PROCESS_GROUP_INSTANCE

Configure other entity metrics for collection when creating event rules for CI binding.

Procedure

1. Navigate to **Event Management** > **Integrations** > **Connector Instances**.
2. Select **New** and create a connector instance.
   For details on the connector instance fields displayed on the page, see Dynatrace connector instance form.
3. Select and hold (or right-click) the form header and select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The connector instance values are added to the form and the parameters that are relevant to the connector appear.

4. **Optional:** In the Connector Instance Values section, you can edit the values of the mandatory Dynatrace parameters.
   For details on the connector instance value parameters, see Dynatrace connector instance value parameters.
5. In the MID Servers for Connectors section, add a MID Server for the Dynatrace connector to use.
6. In the Related Links section, select **Configure metrics to collect**.
   Only metrics with the value **Active=true** are collected by the instance.
7. Configure the metrics you want the instance to collect with the value **Active=true**.
   Metrics with the value **Active=false** are not collected by the instance.
8. **Optional:** Select **New** to create new metrics.
   Configure the fields on the Connector instance metrics - New record (sn_em_connector_instance_metric) page.

Connector instance metrics page

Field	Description
Metric name	Display name for the metric to be configured in the ServiceNow instance.
Metric connector instance	Set by default to **Dynatrace connector instance**. All metrics are collected for the Dynatrace connector instance.
Metric type	The name of the Dynatrace entity type which the metric belongs to.
Metric ID	The Dynatrace metric ID of the metric being collected.
Active	Select for the metrics to collect.

   - Ensure that the CIs related to the metrics exist in the instance.
   - Create an event rule to perform CI binding, as needed. For details, see Create or edit an event rule.
9. Select **Test Connector** to verify the connection between the MID Server and the connector.
10. After a successful test, select the **Active** check box and then select **Update**.

Configure the Nagios metrics connector instance

Configure the Nagios metric connector instance to receive Metric Intelligence raw data from the Nagios server.

Before you begin

To activate metric collection, ensure that the MID Server that retrieves metrics is configured with the Metric Intelligence extension and that the extension is in **Started** mode. See Manually configure the Metric Intelligence extension.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Create basic authentication credentials on ServiceNow instance with Nagios SQL database username and password.
- ServiceNow does not support discovery for Nagios. Therefore, create the CI entry manually in the respective table using the hostname configured on the Nagios platform.

Role required: evt_mgmt_admin

About this task

By default, CI binding will occur for the following entities:

- HOST HTTP Endpoint: The event rule applies to the Nagios metric HTTP if you are running a check that includes command_name as service_http.
- MySQL Instance: The event rule applies to the Nagios metric MySQL if you are running a check that includes command_name as mysql.

If you are running any other checks on HTTP endpoints or MySQL, you can edit the existing event rule to add the command_name. For other entities, configure event rules based on CI binding requirements.

Procedure

1. Navigate to **Event Management** > **Integrations** > **Connector Instances**.
2. Select **New** and create a connector instance.
   For details on the connector instance fields displayed on the page, see Nagios connector instance form.
3. Select and hold (or right-click) the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.
4. **Optional:** In the Connector Instance Values section, you can edit the values of the mandatory Nagios parameters.
   For details on the connector instance value parameters, see Nagios connector instance value parameters.
5. In the MID Servers for Connectors section, add a MID Server for the Nagios connector to use.
6. Ensure that the CIs related to the metrics exist in the instance.
7. Create an event rule to perform CI binding, as needed.
   For details, see Create or edit an event rule.
8. Select **Test Connector** to verify the connection between the MID Server and the connector.
9. After a successful test, select the **Active** check box and then select **Update**.

Configure the Zabbix metrics connector instance

Configure the Zabbix Metric connector instance to receive Metric Intelligence raw data from the Zabbix server.

Before you begin

To activate metric collection, ensure that the MID Server that retrieves metrics is configured with the Metric Intelligence extension and that the extension is in **Started** mode. See Manually configure the Metric Intelligence extension.

Create basic authentication credentials on ServiceNow instance with Zabbix server username and password.

Role required: evt_mgmt_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

ServiceNow does not support discovery for Zabbix, so CI entries must be manually created in the appropriate table using the hostname configured in the Zabbix platform.

- Create an Event Rule to bind specific CIs.
- Users can add tag information to Zabbix items, and the relevant tags will be included in the metric-to-CI records. These tags can also be used as filter conditions in the Event Rule for CI binding.

Procedure

1. Navigate to **Event Management** > **Integrations** > **Connector Instances**.
2. Select **New** and create a connector instance.
   For details on the connector instance fields displayed on the page, see Zabbix connector instance form.
3. Select and hold (or right-click) the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.
4. **Optional:** In the Connector Instance Values section, you can edit the values of the mandatory Zabbix parameters.
   For details on the connector instance value parameters, see Zabbix connector instance value parameters.
5. In the MID Servers for Connectors section, add a MID Server for the Zabbix connector to use.
6. Select **Test Connector** to verify the connection between the MID Server and the connector.
7. After a successful test, select the **Active** check box and then select **Update**.

Note: ServiceNow supports only unsigned float and unsigned integer metric types for Zabbix.

Configure the SolarWinds metrics connector instance

Configure the SolarWinds connector instance to receive Metric Intelligence raw data from the SolarWinds server.

Before you begin

To activate metric collection, ensure that the MID Server that retrieves metrics is configured with the Metric Intelligence extension and that the extension is in **Started** mode. See Manually configure the Metric Intelligence extension.

Configure the Service graph connector for SolarWinds. This is configured in the instance and discovers SolarWinds CIs. For details on configuring this connector, see Service Graph Connector for SolarWinds.

Role required: evt_mgmt_admin

About this task

By default, the Solarwinds Metric Connector Collects metrics from the following tables:

- Orion.CPULoad
- Orion.NPM.InterfaceTraffic
- Orion.VolumePerformanceHistory
- Orion.VolumeUsageHistory
- Orion.ResponseTime

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Event Management** > **Integrations** > **Connector Instances**.
2. Select **New** and create a connector instance.
   For details on the connector instance fields displayed on the page, see Solarwinds connector instance form.
3. Select and hold (or right-click) the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.
4. **Optional:** In the Connector Instance Values section, you can edit the values of the mandatory SolarWinds parameters.
   For details on the connector instance value parameters, see Solarwinds connector instance value parameters.
5. In the MID Servers for Connectors section, add a MID Server for the SolarWinds connector to use.
6. In the Related Links section, select **Configure metrics to collect**.
   Only metrics with the value **Active=true** are collected by the instance.
7. Configure the metrics you want the instance to collect with the value **Active=true**.
   Metrics with the value **Active=false** are not collected by the instance.
8. **Optional:** Select **New** to create new metrics.
   Configure the fields on the Connector instance metrics - New record (sn_em_connector_instance_metrics_solarwinds) page.

Connector instance metrics page

Field	Description
Metric name	Name for the metric to be configured in the ServiceNow instance.
Metric connector instance	Set by default to **SolarWinds connector instance**. All metrics are collected for the SolarWinds connector instance.
Additional columns	(Optional) List of additional columns to fetch for CI-related information. For example: DateTime, Node, Resource. If **DateTime** is not provided, the current time is used as the metric timestamp. If **Node** and **Resource** are provided, they are populated accordingly. To reference fields from a parent table, use dot-walking format, such as `Interface.InterfaceName`. If a field should populate a specific standard field (like **Resource**), use an alias with the same name. For example, to use `InterfaceName` as the resource, specify it as `Interface.InterfaceName AS Resource`.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Table Name	Name of the table from which metrics are collected.

- Ensure that the CIs related to the metrics exist in the instance.
- Create an event rule to perform CI binding, as needed. For details, see Create or edit an event rule.

9. Select **Test Connector** to verify the connection between the MID Server and the connector.
10. After a successful test, select the **Active** check box and then select **Update**.

> **Note:** Ensure that **Registration Mode** is enabled for the SolarWinds source in the Metric Sources table.

Configure event collection from HP OMi

Configure the HP Operations Manager (OMi) connector instance to receive alerts from the HP OMi server.

Before you begin

Supported versions: 10.01, 10.10, 10.11, 10.12, 10.60, and 10.61.
The OMi connector is not supported on versions below version 10.

Create Basic Auth type of credential to connect to OMI.

Role required: evt_mgmt_admin

Procedure

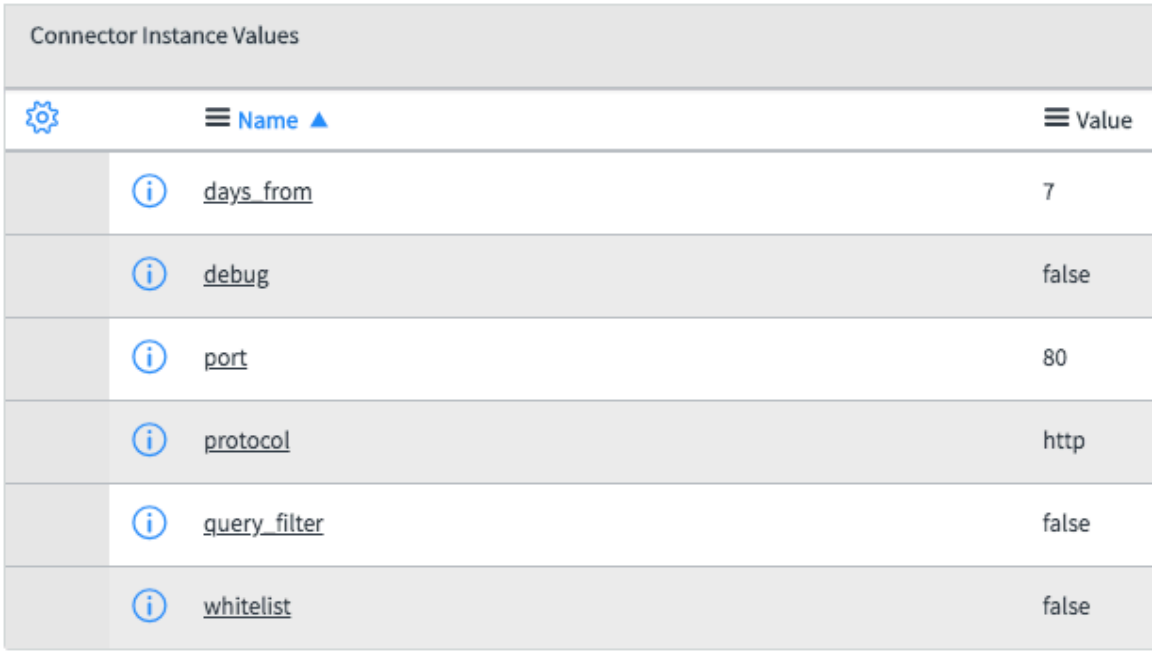
1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New** and create a connector instance with the following details:

Field	Value
Name	Descriptive name for the OMi connector.
Description	Description for the use of the OMi event collection instance.
Host IP	Specify the OMi IP address.
Credential	Click in the **Credential** field. Select a Basic Auth credential from the list or click the search icon. Either select the required credentials from the list or click **New** and create the required credentials using Basic Auth type. If you create the credentials, save them using a unique and recognizable name, for example OMiOPS.
Event collection last run time	Last run time value. Automatically updated.
Last event collection status	Last run time status. Automatically updated.
Event collection schedule (seconds)	Frequency in seconds that the system checks for new events from OMi. The default value is 120 seconds.
Last error message	Last error message. Automatically updated.
Connector Definition	Select **OMi**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
MID Servers (MID Server for Connectors section)	Optional. Name of a MID Server. If no MID Server is specified, an available MID Server that has a matching IP range is used. In the MID Servers for Connectors section, specify a MID Server that is up and valid. You can configure several MID Servers. If the first is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section.

3. Right-click the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.



4. In the Connector Instance Values section, specify the OMi values.

   a. **days_from**.
   Specify the number of days for which events must be collected on the first collection cycle. Default 7.

   b. **debug**.
   Default `false`. To enter debug mode, specify `true`.

   c. **port**.
   Default 80.

   d. **protocol**.
   Default `http`.

   e. **query_filter**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Default value is false. If you do want to use this extra filter to query events, specify the event attributes. For example, `assigned_user = "admin" AND title = "My Title"`. The query filter criteria are:

- A filter property that specifies an event attribute, such as, `related_ci`
- A supported operator, for example, `OR` or `AND`
- A value for the filter property, for example, `admin` or `integrator`

Everything from the query_filter field undergoes URL encoding and is then passed as a parameter to the OMi API call. For detailed information on how to build the filter query, see "Filtering by Event Attributes: query" in the HP OMi Extensibility Guide. For example, to query the events for a list of events that are assigned to the admin user, specify:

```
event_list?query=assigned_ user%20EQ%20"admin"
```

To nest query_filter event attributes, specify the hierarchy using square brackets "[ ]".

f. inclusion list.
Default value:`false`. Specify a comma-separated list to include this feature to add attributes that should be collected and added to the Event Management **Additional information** field.

5. Right-click the form header and select **Save**.
6. Click **Test Connector** to verify the connection between the MID Server and the connector.
7. If the test fails, follow the instructions that the error issues to correct the problem and then run another test.

   Note: Use a network tool, such as ping, to verify credential correctness and network connectivity from the MID Server to the HP OMi server.

8. After a successful test, select the **Active** check box and then click **Update**.

Configure event collection from HPOM

Configure the HPOM connector instance to receive events from HP Operations Manager (HPOM).

Before you begin

Role required: evt_mgmt_admin
Supported version: 08.60.005.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New** and create an HPOM connector instance with the following details:

Field	Value
Name	Specify a unique name for the HPOM connector instance.
Host IP	Specify the HPOM IP address.
Credential	Click in the **Credential** field. Select a credential from the list or click the search icon. Either select the required credentials from the list or click **New** and create the required credentials.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
	If you create the credentials, save them using a unique and recognizable name, for example, HPOMOPS.
Schedule (seconds)	The frequency in seconds that the system checks for new events from HPOM.
Description	Type a description for the use of the HPOM event collection instance.
Connector definition	The vendor and protocol used to gather events from the external event source. Select the **HPOM** connector definition.
Last error message	The last error message is automatically updated.
Last run time	The last run time value is automatically updated.
Last run status	The last run time status is automatically updated.
MID Servers (MID Server for Connectors section)	Optional. Name of a MID Server. If no MID Server is specified, an available MID Server that has a matching IP range is used. In the MID Servers for Connectors section, specify a MID Server that is up and valid. You can configure several MID Servers. If the first is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section.

3. Right-click the form header and click **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.
4. In the Connector Parameters section, specify the values of the mandatory HPOM parameters.
   - **driver**. Specify the driver to be used to make the call. This driver is specific to the type of database you are calling into.
     - For an IBM DB2 Universal driver, specify: com.ibm.db2.jcc.DB2Driver
     - For an Oracle driver, specify: oracle.jdbc.OracleDriver
     - For a Microsoft SQL driver, specify: com.microsoft.sqlserver.jdbc.SQLServerDriver
     - For a MySQL driver, specify: com.mysql.jdbc.Driver
     - For a Sybase driver, specify: com.sybase.jdbc3.jdbc.SybDriver
   - **url**. Specify a URL. The JDBC protocol uses a connection string to establish the authentication and other parameters to establish a connection between the client and the database. Each database has its own connection string format. In the following URLs, replace the variables, for example, <username> and <password>, with your values.
     - For an IBM DB2 Universal URL, specify: [jdbc:db2://sysmvs1.stl.ibm.com:<port number>/<database name>:user=<username>;password=<password>]

       For example: jdbc:db2://sysmvs1.stl.ibm.com:5021/regionsdb:user=example;password=wlrs21.
     - For an Oracle URL, specify: [jdbc:oracle:thin:@<IP address>:<port number>:<database name>]

       For example: jdbc:oracle:thin:@172.31.255.255:4028:OracleMain.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- For a Microsoft SQL URL, specify: [jdbc:sqlserver://<IP address>;user=<username>;password=<password>]

  For example: jdbc:sqlserver://localhost;user=example;password=w3lrs2.

- For a MySQL URL, specify: [jdbc:mysql://<IP address>/database?user=<username>;password=<password>]

  For example: jdbc:mysql://localhost/database?user=example;password=65wlrs.

- For a Sybase URL, specify: [jdbc:sybase:Tds:<IP address>:<port number>/<database name>?user=<username>;password=<password>]

  For example: jdbc:sybase:Tds:172.31.255.255:4100/SYBMAIN?user=example;password=wlrs1m.

5. Use a network tool, such as ping, to verify that the HPOM server is running and the IP address matches the value in the *Host IP* field.
6. Click **Test connector** to verify the connection between the MID Server and the HPOM connector.
7. If the test fails, follow the instructions that the error issues to correct the problem and then run another test.

   Note: Use a network tool, such as ping, to verify credential correctness and network connectivity from the MID Server to the HPOM server.

8. After a successful test, select **Active** and then click **Update**.

Configure a pull connector

Configure event collection from Hyperic

Configure the Hyperic connector instance to receive events from the VMware vRealize Hyperic server.

Before you begin

Role required: evt_mgmt_admin
Supported version: 5.8.4.0.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New** and create a Hyperic connector instance with the following details:

Field	Value
Name	Specify a unique name for the Hyperic connector instance.
Host IP	Specify the Hyperic IP address.
Credential	In the Credentials form, click **New** and create the required credentials. Save the credentials using a unique and recognizable name, for example, HypericOPS.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
Schedule (seconds)	The frequency in seconds that the system checks for new events from Hyperic.
Description	Type a description for the use of the Hyperic event collection instance.
Connector definition	The vendor and protocol used to gather events from the external event source. Select the **Hyperic** connector definition.
Last error message	The last error message is automatically updated.
Last run time	The last run time value is automatically updated.
Last run status	The last run time status is automatically updated.
MID Servers (MID Server for Connectors section)	Optional. Name of a MID Server. If no MID Server is specified, an available MID Server that has a matching IP range is used. In the MID Servers for Connectors section, specify a MID Server that is up and valid. You can configure several MID Servers. If the first is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section.

3. Right-click the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.
4. In the Connector Parameters section, specify the values of the mandatory Hyperic parameters.
   a. **port** Default value 7080.
   b. **protocol** Default value http.
5. Click **Test connector** to verify the connection between the MID Server and the Hyperic connector.
6. If the test fails, follow the instructions that are issued by the error to correct the problem and then run another test.

   Note: Use a network tool, such as ping, to verify credential correctness and network connectivity from the MID Server to the Hyperic server.

7. After a successful test, select the **Active** check box and then click **Update**.

Configure a pull connector

Configure event collection from IBM Netcool

Configure the IBM Netcool_V2 connector to receive events from IBM Netcool/OMNIbus Object Servers and Impact Servers. The IBM Netcool_V2 connector uses REST API calls and is bidirectional.

Before you begin

For the IBM Netcool_V2 connector:

- Role required: evt_mgmt_admin
- Perform connector validation on IBM NetCool/OMNIbus version 8.1.0.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

To use IBM Netcool_V2 connector, configure a connector instance for the MID Server.

Note: The IBM Netcool connector is deprecated and only IBM Netcool_V2 connector is supported.

Procedure

1. Navigate to **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New** and create a connector instance with the following details:

Field	Value
Name	Specify a unique name for the Netcool connector instance.
Description	Type a description for the use of the Netcool event collection instance.
Host IP	Specify the Netcool IP address.
Credential	In the Credentials form, click **New**, and create the required credentials. Save the credentials using a unique and recognizable name, for example, NetcoolOPS.
Event collection last run time	The last run time value is automatically updated.
Last event collection status	The last run time status is automatically updated.
Event collection schedule (seconds)	The frequency in seconds that the system checks for new events from Netcool. The default value is 120 seconds.
Last error message	The last error message is automatically updated.
Connector definition	Select IBM Netcool_V2 to gather events from the external event source.
MID Servers (MID Server for Connectors section)	Specify a MID Server that is up and is valid. You can configure several MID Servers. If the first is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section. If no MID Server is specified, an available MID Server that has a matching IP range is used.

3. Right-click the form header and click **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.
4. In the Connector Parameters section, specify the value of the required Netcool parameters.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connector	Required parameters
IBM Netcool_V2	○ *additional_alert_columns*: com ma separated list of columns to include in event additional information from net cool alert. Specify here if the desired columns are not already part of event. ○ *debug*: Boolean flag to enable debug logs. Default: false. ○ *initial_sync_in_days*: The number of days of data fetched on first pull. The de fault value is 3, but can be changed accord ing to your requirements. ○ *message_key_delimiter*: Separate hi erarchical parts of a message key, enabling structured namespacing. ○ *port*: The port number on which IBM Net cool is running. For example: 8080. ○ *Protocol*: Protocol to use when connect ing to the Netcool server. Default: https.

5. Verify that Netcool servers are up and running:
   For the IBM Netcool_V2 connector, use this REST API call to verify that the Netcool API is up and running: `http://hostname:port/objectserver/restapi/alerts/status`
6. Right-click the form header and click **Save**.
7. Click **Test connector** to verify the connection between the MID Server and the Netcool connector.
8. If the test fails, follow the instructions that are issued by the error to correct the problem and then run another test.
9. After a successful test, select the **Active** check box and then click **Update**.

Related topics

Configure a pull connector

Configure event collection from an Icinga2 connector

Configure the Icinga 2 (Icinga) connector instance to receive events while monitoring your network resources.

Before you begin

Role required: evt_mgmt_admin

Supported version: 2.4.1.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New**.
3. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connector Instance form

Field	Description
Name	Descriptive and unique name for the Icinga connector.
Description	Description for the use of the Icinga event collection instance.
Connector definition	Name of the required connector definition. Select **Icinga2**.
Host IP	IP address where Icinga is installed.
Credential	Permission to connect to Icinga. Click the search icon in the **Credential** field. Use Basic Authentication credentials. Either select the required credentials from the list or click **New** and create the required credentials on the Credentials form. If you create the credentials, save them using a unique and recognizable name, for example, ICINGA2CHCK.
Event collection last run time	Last run time value. Automatically updated.
Last event collection status	Last run status. Automatically updated.
Event collection schedule (seconds)	Frequency, in seconds, that the system checks for new events from Icinga. The default value is 120 seconds.
Last error message	Last error message. Automatically updated.

4. Right-click the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.

   a. debug: Display debug messages. Default value: false. Specify true to see debug messages.

   b. logPayloadForDebug: Display payload related debug messages. Default value: false. Specify true to see payload related debug messages.

5. In the Connector Instance Values section, verify and where required, modify the default connector instance values.

Field	Description
debug	Display debug messages. Default value: `false`. Specify `true` to see debug messages.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
port	Number of the connector port. Default value: `5665`.
protocol	Type of protocol. Default protocol type: `https`.
alert_type	Provide the Icinga alert type details. There are 2 types of an alert in Icinga2: SOFT and HARD SOFT: Connector instance will pull a soft alert. HARD: Connector instance will pull a hard alert.

6. **Optional:** In the MID Servers for Connectors section, specify a MID Server that is up and is valid.
   If no MID Server is specified, an available MID Server that has a matching IP range is used.

   You can configure several MID Servers. If the first is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section.
7. Right-click the form header and select **Save**.
8. Test the connection between the MID Server and the Icinga connector.
   a. Click **Test Connector**.
      If the test fails, follow the instructions that the error issues to correct the problem and then run another test.

      Note: Use a network tool, such as ping, to verify credential correctness and network connectivity from the MID Server to the external monitoring tool.

   b. After a successful test, select the **Active** check box.
9. Click **Update**.

Configure event collection from Logicmonitor

The Logicmonitor pull connector sends information from Event Management to Logicmonitor. It sends responses received from a Push connector in a bi-directional environment to Logicmonitor.

Before you begin
Role required: evt_mgmt_admin

About this task
Starting from the Xanadu release, the OOTB (Out-Of-The-Box) rules provided with the connector, which you have not previously used (i.e., neither activated, deactivated, nor modified), will now have the**Apply additional matching rules**check box set to true. Previously, this check box was disabled. This change allows you to execute more event rules or automation using the same filter conditions for the connector.

Note: This feature applies only to active event rules.

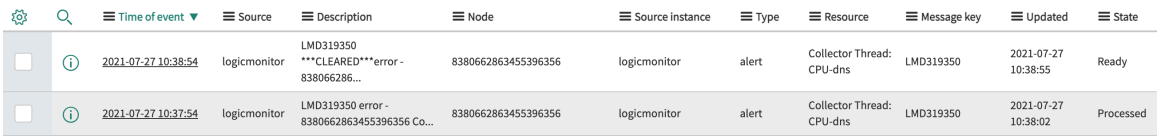
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to**All** > **Event Management** > **Event Connectors (Pull)** > **Connector Instances**.
2. Click**New**.
   The**Connector Instance New Record**page appears.
3. Enter values in the required fields, which are indicated by a red asterisk.

Field	Description
Name	Descriptive name for the connector.
Connector definition	Search for and select**Logic Monitor**.
Credential	Select**Basic Auth**for basic authentication. Pro vide access_id and access_key from Logic monitor's token based API authentication in the credentials as the basic authentication username and password.
Host IP	The Logicmonitor IP address.

When adding bi-directional functionality for a Push connector, the Connector Instance name must match the Source Instance field of the event generated by that source.



Time of event	Source	Description	Node	Source instance	Type	Resource	Message key	Updated	State
2021-07-27 10:38:54	logicmonitor	LMD319350 ***CLEARED***error - 838066286...	8380662863455396356	logicmonitor	alert	Collector Thread: CPU-dns	LMD319350	2021-07-27 10:38:55	Ready
2021-07-27 10:37:54	logicmonitor	LMD319350 error - 8380662863455396356 Co...	8380662863455396356	logicmonitor	alert	Collector Thread: CPU-dns	LMD319350	2021-07-27 10:38:02	Processed

The source of events is**logicmonitor**so you should create an instance with the name`logicmonitor`.

All > Active = true

Name	Active	Event collection last run time	Connector definition	Last event collection signature	Last event collectio
logicmonitor	true	2021-07-27 11:21:41	Logic Monitor		Success

Note: The Update queue business rule in the Alert table identifies each manual update of the alert and updates the connector queue accordingly. By default, changes to all alert fields are tracked.

4. Select the **Bi-directional** and **Active** check boxes, and then click **Save**.
   The LogicMonitor pull connector does not retrieve events or populate the Events [em_event] table.

Configure event collection from NNMi

Configure the HP Network Node Manager i (NNMi) connector instance to receive events while monitoring your network resources.

Before you begin

Supported version: NNMi 10.30 and later, including NNMi 25.5.

Note: The connector supports NNMi versions 10.30.653 and 25.5. If you use another version and encounter issues, contact ServiceNow Support.

Role required: evt_mgmt_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

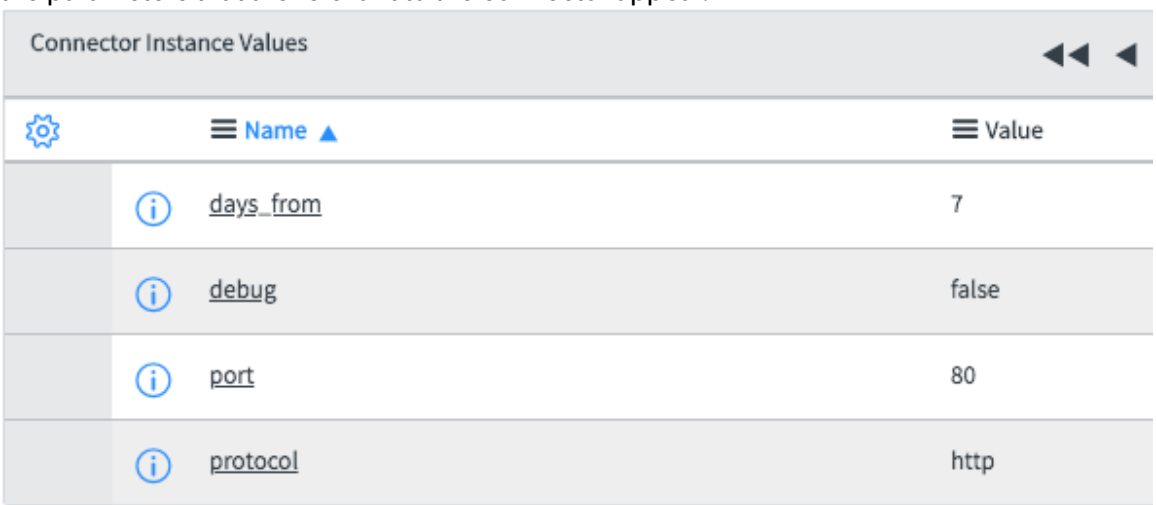
Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New**.
3. On the form, fill in the fields.

Connector Instance form

Field	Description
Name	Descriptive and unique name for the NNMi connector.
Description	Description for the use of the NNMi event collection instance.
Connector definition	Name of the required connector definition. Select **NNMi**.
Host IP	IP address where NNMi is installed.
Credential	Permission to connect to NNMi. Click the search icon in the **Credential** field. Either select the required credentials from the list or click **New** and create the required credentials on the Credentials form. If you create the credentials, save them using a unique and recognizable name, for example, NNMiCHCK. The selected credentials use basic authentication.
Event collection last run time	Last run time value. Automatically updated.
Last event collection status	Last run status. Automatically updated.
Event collection schedule (seconds)	Frequency, in seconds, that the system checks for new events from NNMi. The default value is 120 seconds.
Last error message	Last error message. Automatically updated.

4. Right-click the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.



5. In the Connector Instance Values section, verify and where required, modify the default connector instance values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
days_from	Number of days for which events must be collected at the first collection cycle. Default value: `7` days. **Note:** The maximum number of past events that can be collected is 3,000. The first time that the connector runs, it collects all events (up to the 3,000 limit) that were created from the `days_from` date until the current date.
debug	Display debug messages. Default value: `false`. Specify `true` to see debug messages.
port	Number of the connector port. Default value: `80`.
protocol	Type of protocol. Default protocol type: `http`.

6. **Optional:** In the MID Servers for Connectors section, specify a MID Server that is up and is valid.
   If no MID Server is specified, an available MID Server that has a matching IP range is used.

   You can configure several MID Servers. If the first is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section.
7. Right-click the form header and select **Save**.
8. Test the connection between the MID Server and the NNMi connector.

   a. Click **Test Connector**.
   If the test fails, follow the instructions that the error issues to correct the problem and then run another test.

   Note: Use a network tool, such as ping, to verify credential correctness and network connectivity from the MID Server to the external monitoring tool.

   If you encounter the error `"TypeError: Cannot read property 'inc:getIncidentsResponse' from undefined`, refer to the Known Error article KB0262185 for the updated script and instructions.

   b. After a successful test, select the **Active** check box.
9. Click **Update**.

Configure event collection from NagiosXI

Configure the NagiosXI connector instance to receive events from the Nagios Core monitor.

Before you begin

Supported version: 5.5.2.
The NagiosXI connector instance requires a credential that lets the instance access NagiosXI accounts. You can use an existing credential or create a new one. For more information, see Create Nagios XI server credentials.

Role required: evt_mgmt_admin

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New**.
3. On the form, fill in the fields.

Field	Description
Name	Descriptive name for the Nagios connector.
Description	Description for the use of the NagiosXI event collection instance.
Host IP	Specify the Nagios XI IP address.
Credential	Select the credential with basic authentication that you created for this connector. For more information, see Create Nagios XI server credentials. Ensure that the user password contains the NagiosXI user API key, for example 04lquEPqf4JimWCm8RWbJokOpW8LYBUfEvJp9OSHSRYe4QDrHPFndYbV
Event collection last run time	The last run time value is automatically updated.
Last event collection status	The last run time status is automatically updated.
Event collection schedule (seconds)	The frequency, in seconds, that the system checks for new events from Nagios. The default value is 120 seconds.
Last error message	The last error message is automatically updated.
Connector Definition	Select **NagiosXI**.
MID Servers (MID Server for Connectors section)	Optional. Name of a MID Server. If no MID Server is specified, an available MID Server that has a matching IP range is used. In the MID Servers for Connectors section, specify a MID Server that is up and valid. You can configure several MID Servers. If the first is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section.

4. Right-click the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.
5. In the Connector Instance Values section, specify the Nagios values.
   - **initial_sync_in_days**. Specify the number of days for which events must be collected at the first collection cycle. Default value `7` days.
   - **port**. Default value `80`.
   - **protocol**. The default protocol type is `http`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **time_zone**. The default time zone is `GMT`; update this value to the Nagios timezone. For example, if Nagios is sending the events according to the EDT time zone, update this value to `GMT - 04 : 00` (abbreviations such as **EDT** are not supported).
- **severity_by_state_type**. The default value is `false`. When set to `true`, the state_type is used along with the state to determine the severity which creates less critical events as shown in the following mapping table.

Mapping Table

_state_type(Connect definition parameter)	State (Nagios JSON payload attribute)	State_type (Nagios JSON payload attribute)	ServiceNow Severity
false	2	0/1	1 (Critical)
false	1	1	1(Critical)
false	1	0	2(Major)
false	0	0/1	5(OK)
true	0	0/1	5(OK)
true	1	0	4 (Warning-soft -> Warning)
true	2	0	2(Critical-soft -> Major)
true	3	0	4(Unknown-soft-> Warning)
true	1	1	3(Warning-hard -> Minor)
true	2	1	1(Critical-hard -> Critical)
true	3	1	3(Unknown-hard -> Minor)

6. Right-click the form header and select **Save**.
7. Click **Test Connector** to verify the connection between the MID Server and the connector.
8. If the test fails, follow the instructions that the error issues to correct the problem and then run another test.
   If this message appears: `Connection test failed: Failed to connect to Nagios on test connector. Invalid API Key`, then enter the API Key for the specific user to be able to read the Nagios events.

   Note: Use a network tool, such as ping, to verify credential correctness and network connectivity from the MID Server to the Nagios Core monitor.

9. After a successful test, select the **Active** check box and then click **Update**.

Create Nagios XI server credentials

Create credentials to access Nagios XI server.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select **Basic Auth Credential**.
4. On the form, fill in the fields.

Basic Auth Credentials form

Field	Description
Name	Enter a unique and descriptive name for this credential. For example, you might call it `Nagios authentication`.
User name	Name to identify the user.
Password	Nagios XI user API key. For example:`04lquEPqf4JimWCm8RWbJokOpW8LYBUfEvJp`
Active	Option to enable the use of this credential.
Order	The order (sequence) in which the platform tries this credential as it attempts to log on to devices. The smaller the number, the higher in the list this credential appears. Establish credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number (or none), the instance tries the credentials in a random order. Default value: `100`

5. Click **Submit**.

Result
The credential for use with the Nagios XI server connector is created.

Credentials and connection information

Configure event collection from OBM

Configure the Operation Bridge Manager (OBM), also known as OMi v2, connector instance to receive alerts from the OBM server. The OBM connector script OBM v2 will be available after installing the Event Management Connectors app.

Before you begin
Role required: evt_mgmt_admin

Supported versions: 10.01, 10.10, 10.11, 10.12, 10.60, 10.61, and 11.01.

About this task
Starting from the Xanadu release, the OOTB (Out-Of-The-Box) event rules provided with the connector, which you have not previously used (i.e., neither activated, deactivated, nor modified), will now have the **Apply additional matching rules** check box set to true. Previously, this check box was disabled. This change allows you to execute more event rules or automation using the same filter conditions for the events.

Note: This feature applies only to active event rules.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Event Management** > **Event Connectors (Pull)** > **Connector Instances**.
2. Click **New** and create a connector instance with the following details:

Field	Value
Name	Descriptive name for the OBM connector.
Description	Description for the use of the OBM event collection instance.
Host IP	Specify the OBM IP address.
Credential	Select the required credentials from the list or click **New** and create the required credentials. If you create the credentials, save them using a unique and recognizable name, for example OBMOPS.
Event collection last run time	The last run time value is automatically updated.
Last event collection status	The last run time value is automatically updated.
Event collection schedule (seconds)	Frequency in seconds that the system checks for new events from OBM. The default value is 120 seconds.
Last error message	The last error message is automatically updated
Connector Definition	Select **OBM V2**. **Note:** This script will be available after installing the Event Management connector scoped app.
MID Servers (MID Server for Connectors section)	Specify the MID Server to run the OBM connector instance. You can configure several MID Servers. If the first server is down, the next MID Server If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section. If no MID Server is specified, an available MID Server that has a matching IP range is used.

3. Right-click the form header and select **Save**.
   The parameters that are relevant to the OBM connector appear.
4. In the Connector Instance Values section, specify the OBM values.

   a. **days_from**.
   Specify the number of days for which events must be collected on the first collection cycle. The default value is `7` days and data can only be pulled a maximum of 7 days from the OBM system.

   b. **debug**.
   The default value is `false`. To enter debug mode, change the value to `true`.

   c. **port**.
   The default value is `80`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. **protocol**.
The default value is `http`.

e. **query_filter**.
The default value is false. If you do want to use this extra filter to query events, specify the event attributes. For example, `assigned_user = "admin" AND title = "My Title"`. The query filter criteria are:

- A filter property that specifies an event attribute, such as, `related_ci`
- A supported operator, for example, OR or AND
- A value for the filter property, for example, `admin` or `integrator`

Everything from the query_filter field undergoes URL encoding and is then passed as a parameter to the OBM API call. For detailed information on how to build the filter query, see "Filtering by Event Attributes: query" in the OBM Extensibility Guide. For example, to query the events for a list of events that are assigned to the admin user, specify:

`event_list?query=assigned_ user%20EQ%20"admin"`

To nest query_filter event attributes, specify the hierarchy using square brackets "[ ]".

f. **inclusion list**.
The default value is `false`. Specify a comma-separated list to include this feature to add attributes that should be collected and added to the Event Management **Additional information** field.

5. Right-click the form header and select **Save**.
6. Click **Test Connector** to verify the connection between the MID Server and the connector.
7. If the test fails, follow the instructions that the error issues to correct the problem and then run another test.

   Note: Use a network tool, such as ping, to verify that the OBM server is running and the IP address matches the value in the **Host IP** field.

8. After a successful test, select the **Active** check box and then click **Update**.

Configure OP5 or OP5_v2 connector

Configure the OP5 or OP5_v2 Monitor connector instance to receive alerts from an OP5 Monitor source.

Before you begin

The OP5_v2 connector is supported in Event Management connectors version 2.3.0 - August 2022, available from the ServiceNow Store.

Supported version:

- OP5: 7.3.15
- OP5_v2: 8.3.8

Role required: evt_mgmt_admin

About this task

Starting from the Xanadu release, the OOTB (Out-Of-The-Box) event rules provided with the connector, which you have not previously used (i.e., neither activated, deactivated, nor modified),

© 2026 ServiceNow, Inc. All rights reserved.

will now have the **Apply additional matching rules** check box set to true. Previously, this check box was disabled. This change allows you to execute more event rules or automation using the same filter conditions for the events.

Note: This feature applies only to active event rules.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New** and create a connector instance with the following details:

Field	Value
Name	Descriptive name for the OP5 or OP5_v2 connector.
Description	Description for the use of the OP5 or OP5_v2 event collection instance.
Host IP	Specify the OP5 or OP5_v2 IP address.
Credential	Either select the required credentials from the list or click **New** and create the required credentials. If you create the credentials, save them using a unique and recognizable name, for example, OP5OPS.
Event collection last run time	The last run time value is automatically updated.
Last event collection status	The last run time status is automatically updated.
Event collection schedule (seconds)	The frequency in seconds that the system checks for new events from OP5 or OP5_v2.
Last error message	The last error message is automatically updated.
Connector definition	Select **OP5** or **OP5_v2**.
Connector Instance Values section	The parameters that are specific to **OP5** or **OP5_v2** display here when the form is saved.
MID Servers (MID Server for Connectors section)	Optional. Name of a MID Server. If no MID Server is specified, an available MID Server that has a matching IP range is used. In the MID Servers for Connectors section, specify a MID Server that is up and valid. You can configure several MID Servers. If the first is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section.

3. Right-click the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.
4. In the Connector Instance Values section, specify the OP5 or OP5_v2 values.

   a. **days_from**.
   Specify the number of days for which events must be collected at the first collection cycle. Default value 7 days.

   b. **debug**.

Displays debug messages. Default value: false. Specify true to see debug messages

c. **logPayloadForDebug**.
Displays payload related debug messages. Default value: false. Specify true to see payload related debug messages.

d. **port**.
Default value `443`.

e. **state_types**.
Specify filters for event collection based on the **state_types** attribute. You can filter events based on state type. Specify the type, for example, `soft` or `hard`.

5. Right-click the form header and select **Save**.
6. Click **Test Connector** to verify the connection between the MID Server and the connector.
7. If the test fails, follow the instructions that the error issues to correct the problem and then run another test.
8. After a successful test, select the **Active** check box and then click **Update**.

Configure Opsview_v2 connector

Configure the Opsview_V2 connector instance to receive alerts from an Opsview Monitor source.

Before you begin

Ensure you have the supported version of the Opsview_V2 connector: 6.7.0.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New** and create a connector instance with the following details:

Field	Value
Name	Descriptive name for the Opsview connector.
Description	Description for the use of the Opsview event collection instance.
Host IP	Specify the Opsview IP address.
Credential	Either select the required credentials from the list or click **New** and create the required credentials. If you create the credentials, save them using a unique and recognizable name, for example, OpsviewOPS. **Note:** User should have the CONFIGUREVIEW role with access to 'VIEW ALL, CHANGE NONE'.
Event collection last run time	The last run time value is automatically updated.
Last event collection status	The last run time status is automatically updated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
Event collection schedule (seconds)	The frequency in seconds that the system checks for new events from Opsview.
Last error message	The last error message is automatically updated.
Connector definition	Select **Opsview_v2**.
Connector Instance Values section	The parameters that are specific to Opsview_V2 display here when the form is saved.
MID Servers (MID Server for Connectors section)	Optional. Name of a MID Server. If no MID Server is specified, an available MID Server that has a matching IP range is used. In the MID Servers for Connectors section, specify a MID Server that is up and valid. You can configure several MID Servers. If the first is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section.

3. Right-click the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.
4. In the Connector Instance Values section, specify the Opsview_v2 values.

   a. **days_from**.

   Specify the number of days for which events must be collected at the first collection cycle. Default value 7 days.

   b. **debug**.
   Display debug messages. Default value: false. Specify true to see debug messages.

   c. **logPayloadForDebug**.
   Display payload related debug messages. Default value: false. Specify true to see payload related debug messages.

   d. **eventtype_filter**.
   Specify filters for event collection based on the eventtype attribute. Specify one of these values 0,1,2,3.

   e. **port**.

   Default value is 80.

   .

   f. **protocol**.
   The default protocol type is HTTPS.

5. Right-click the form header and select **Save**.
6. To verify the connection between the MID Server and the connector, select **Test Connector**.
7. If the test fails, follow the instructions that the error issues to correct the problem and then run another test.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If this message appears: `Connection test failed: Failed to connect to Opsview on test connector. Invalid API Key`, then enter the API Key for the specific user to be able to read the Opsview events.

Note: Use a network tool, such as ping, to verify credential correctness and network connectivity from the MID Server to the Opsview Monitor source.

8. After a successful test, select the **Active** check box and then select **Update**.

Configure PRTG connector

Configure the PRTG connector instance to receive alerts from a Paessler PRTG Network Monitor source.

Before you begin

Role required: evt_mgmt_admin
Supported version: 21.3.71.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New** and create a connector instance with the following details:

Field	Value
Name	Descriptive name for the PRTG connector.
Description	Description for the use of the PRTG event collection instance.
Host IP	Specify the PRTG IP address.
Credential	Either select the required credentials from the list or click **New** and create the required credentials. If you create the credentials, save them using a unique and recognizable name, for example, PRTGOPS.
Event collection last run time	The last run time value is automatically updated.
Last event collection status	The last run time status is automatically updated.
Event collection schedule (seconds)	The frequency in seconds that the system checks for new events from PRTG.
Last error message	The last error message is automatically updated.
Connector definition	Select **PRTG**.
Connector Instance Values section	The parameters that are specific to **PRTG** display here when the form is saved.
MID Servers (MID Server for Connectors section)	Optional. Name of a MID Server. If no MID Server is specified, an available MID Server that has a matching IP range is used. In the MID Servers for Connectors section, specify a MID Server that is up and valid. You can configure several MID Servers. If the first is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Right-click the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.
4. In the Connector Instance Values section, specify the PRTG values.

   a. **add_columns**.
   Specify which columns to be returned by the connector. Separate the names with a comma and without a space between the names. The output is stored in the **Additional information** field of the event. Default value `false`. If `false` is specified, only the default list of columns is retrieved: parent, name, type, objid, tags, message, status, priority, datetime, actions, baselink, basetype, modifiedby.

   Note: Only columns names that are applicable to the **Message** content type can be specified.

   b. **date_format**.
   The format date and time. Default format M/d/yyyy/ h:mm:ss a. If you receive an event whose date is in a different format, modify this value to match the format of the incoming event. If you do not, the event will not be processed correctly.

   For example, an event might arrive on June 27, 2019 at 11:25 AM with a listed date of *`2019/06/27/ 11:25:00 a`*. Modify the **date_format** value to *`yyyy/M/d/ h:mm:ss a`* to match the format of the received event.

   In the **date_format**, `a` represents AM, and `p` represents PM.

   c. In the **days_from** field, specify the number of days for which events must be collected at the first collection cycle.
   Default value `7` days.

   d. **debug**.
   Default value `false`.

   e. **port**.
   Default value `80`.

   f. **protocol**.
   The default protocol type is `http`.

   g. **prtg_api_fetched_events_num**.
   Maximum number of events, per query, that can be fetched from the PRTG client into the MID Server. Default number: `50,000`.

   h. **time_zone**.
   The default time zone is the `GMT` time zone; update this value to the PRTG time zone. For example, if PRTG is sending events according to the EDT time zone, update this value to `GMT - 4` (abbreviations such as EDT are not supported).

5. Right-click the form header and select **Save**.
6. Click **Test Connector** to verify the connection between the MID Server and the connector.
7. If the test fails, follow the instructions that the error issues to correct the problem and then run another test.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If this message appears: `Connection test failed: Failed to connect to PRTG on test connector. Invalid API Key`, then enter the API Key for the specific user to be able to read the PRTG events.

Note: Use a network tool, such as ping, to verify credential correctness and network connectivity from the MID Server to PRTG.

8. After a successful test, select the **Active** check box and then click **Update**.

Apache Kafka Consumer Connector

The Apache Kafka Consumer connector instance enables you to create events from messages collected from the Apache Kafka topic as a JSON payload that contains essential information in a data block.

Apache Kafka is a distributed publish-subscribe messaging system that receives data from disparate source systems and makes the data available to target systems in real time.

You can use this connector to create ServiceNow events from Kafka messages. Messages in the Kafka topic must be in JSON format.

Like other message broker systems, Kafka facilitates the asynchronous data exchange between processes, applications, and servers.

Kafka software runs on one or more servers. Each node, called a broker, in a Kafka cluster helps producer applications write data to topics, which are where records are stored and published. Consumer applications read from topics. Topics are divided into partitions to make them more manageable and Kafka guarantees strong ordering for each partition.

Configure the Apache Kafka Consumer connector

Configure the Apache Kafka Consumer connector instance to create events from streaming messages collected by the Apache Kafka connector.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Select **New**.
3. On the form, fill in the fields.

Connector instance form

Field	Value
Name	Descriptive and unique name for the Kafka Consumer connector.
Description	Description to be used by the Kafka Consumer event collection instance.
Connector definition	Name of the required connector definition, which in this case should be Kafka Consumer.
Host IP	The host IP.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
	Note: This field must contain a value to complete the creation process so the placeholder 1.1.1.1 should be entered as a temporary value.
Event collection last run time	This field is automatically set to the last runtime value.
Last event collection status	This field is automatically set to the last runtime status.
Event collection schedule (seconds)	The frequency in seconds that the system checks for new events from the Kafka Consumer. The default value is 60 seconds.
Last error message	This field is automatically set to the last error message.

4. For PLAINTEXT or SASL_PLAINTEXT, in the **Credential** field, create a Basic authentication credential.
   Use the **Kafka SSL credential** type for a new Kafka pull connector instance with **SASL_PLAINTEXT** authentication. Go to step 5.

   Use the **Kafka SSL credential** type when the Kafka server's **sasl.enabled.mechanisms** or **sasl.mechanism** parameter's value don't equal **PLAIN**. Go to step 5.

   a. Select the Search icon next to the **Credential** field.

   b. On the Credentials screen, select **New**.

   c. From the list of available credentials, select **Basic Auth Credentials**.

   d. On the Basic Authentication screen, give information for either PLAINTEXT authentication, which doesn't require credentials, or SASL_PLAINTEXT authentication, which requires credentials.
      - For PLAINTEXT authentication, in the **Name** field, type any value and leave the **User Name** and **Password** fields empty.
      - For SASL_PLAINTEXT authentication, give a name for the credential in the **Name** field, preferably prefaced by SASL. Provide the user name and password In the **User Name** and **Password** fields.

   e. Select **Submit**.

5. For a SASL_PLAINTEXT, SSL, or SASL_SSL authentication credential, in the **Credential** field, create a Kafka SSL credential.

   a. Select the Search icon next to the **Credential** field.

   b. On the Credentials screen, select **New**.

   c. From the list of available credentials, select **Kafka SSL Credentials**.

   d. On the Kafka SSL Authentication screen, fill in the Kafka SSL credentials fields.
      For the Kafka SSL credentials fields descriptions, see Kafka SSL credentials fields.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If you clear the **Disable hostname verification** field, then in the **Additional Kafka consumer properties** field, enter the value of the *ssl.endpoint.identification.algorithm* parameter the same as of the Kafka server parameter value. For example:

```
ssl.enabled.protocols=TLSv1.2,TLSv1.1,TLSv1;
sasl.jaas.config=org.apache.kafka.common.security.plain.Pl
ainLoginModule required username=<username>
 password=<password>;
sasl.enabled.mechanisms=PLAIN;ssl.endpoint.identification.
algorithm=;
```

e. Select **Submit**.

6. Right-click the form header and select **Save**.
7. Verify the connector instance values based on your Kafka setup and the JSON payload from the Kafka topic.

   Change the connector instance values if necessary.

Connector instance Values table

Field	Description
authentication_type	The Kafka Consumer authentication type. The currently supported values are: ○ PLAINTEXT (no authentication) (Default) ○ SASL_PLAINTEXT (basic authentication – user name and password)
bootstrap_servers	The servers that establish the connection with the Kafka cluster. Values in this field should be in the form host1:port1, host2:port2, and so on (comma-separated). This field is required.
consumer_group_name	The Consumer group name. If the same Kafka topic is being consumed from two different instances, use different consumer group names so all events are captured for both instances. This field is required.
time_of_event_field	The name of the field in the JSON payload/ message that includes the time of the event.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	If a field in the JSON payload/message includes the time of the event, that value should be the value for this parameter. If no time field value is given, then the received time of the event in the ServiceNow instance is set as time_of_event. The time_of_event field should be a first-level field in the JSON payload/message. Nested field names aren't allowed.
timezone	The time zone of the time_of_event field in the JSON payload/message. The timezone value isn't used when the time_of_event field is empty. For example, if the time_of_event in the payload/message is in the IST time zone, the value would be GMT+0530. Default: GMT.
date_format	The date_time format of the time_of_event field in the JSON payload/message. If no time field value is given, then the time when the event was received in the instance in GMT time is used. The date_time value isn't used when the time_of_event field is empty. Default: yyyy-MM-dd HH:mm:sss.
debug	Displays debug messages. Default value: false. Specify true to see debug messages.
logPayloadForDebug	Displays payload related debug messages. Default value: false. Specify true to see payload related debug messages.
topic	The Kafka topic from which the messages are fetched.

8. In the **MID Servers for Connectors** section, specify a MID Server that is up and is valid.

   Note: You can configure several MID Servers. If the first server is down, the next MID Server is used. If that MID Server isn't available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the **MID Servers for Connectors** section.

   If you do not specify a MID Server, an available MID Server that has a matching IP range is used.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. Right-click the form header and select **Save**.
10. Test the connection between the MID Server and the Kafka Consumer connector.
    a. Select **Test Connector**.
    b. If the test connection fails, verify whether the credential is valid, and that the network is connected from the MID Server to the Kafka broker.

    Note: Kafka topic name validation occurs only in **Test Connector** validation.

11. After a successful test, make the connector instance active by selecting the **Active** check box.
12. Select the **Update** button.

What to do next
After the connector is created, you must map the fields. For more information, see Map Kafka message payload attributes to alert fields.

Map Kafka message payload attributes to alert fields

Map Kafka message attributes to alert fields to make alerts based on the messages more meaningful. Use event field mapping to map Kafka severity values to appropriate ServiceNow values.

Before you begin
Role required: evt_mgmt_admin

About this task
Use event field mappings to provide more comprehensive information in an event alert. Substitute values from the event field mapping rule into the event. Transform information in events to populate specified alert field values and compose alert fields from various values to generate alerts for tracking and remediation. If needed, use both event field mappings and alert rules.

The following table compares a message received from a topic and a flattened payload in the event **Additional info** field. The message received from a topic is flattened as a single field and appears in the event **Additional info** field. Use these flattened messages to create event rules and mappings.

Actual versus flattened payload

Actual Payload inserted into a topic	Flattened payload in the Additional Info field

<pre>{
"version": "v0.1.0",
"name": "fibsrc",
"id": "mnop6789",
"trigger_description": "Triggers on duration_ms goes above 5K",
"status": "TRIGGERED",</pre>
	<pre>{
	"flattened.alert_type": "on_true",
	"flattened.description": "Current value (12.296815 k) greater than threshold value (5 k)",
	"flattened.id": " mnop6789",</pre>

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Actual versus flattened payload (continued)

Actual Payload inserted into a topic	Flattened payload in the Additional Info field

<pre>{
"alert_type": "on_true",
"summary": "Triggered: fibsrc",
"description": "Current value (12.296815 k) greater than threshold value (5 k)",
"operator": "greater than",
"threshold": 5000,
"groups": [
{
"Group": "GroupA",
"Result": 12296.815478000368
}
],
"trigger": {
"Result": 12296.815478000368
}
}</pre>
	<pre>"flattened.kafkaKey": "null",
	"flattened.kafkaOffset": "28",
	"flattened.kafkaPartition": "0",
	"flattened.kafkaTopicName": "topic123",

	}</pre>

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. To map the Kafka message attributes to the predefined alert fields to generate alerts by creating event field mappings.
   a. Navigate to **All** > **Event Management** > **Rules** > **Event Field Mapping**.
   b. In the Event Field Mapping window, select **New**.
   c. In the Name field, enter a name for the field mapping.
   d. In the Source field, enter **Kafka Consumer**.
   e. In the Mapping type field, select the appropriate mapping type
   f. For a list of the available mapping types, see Event Field Mappings.
2. To map the Kafka message attributes to the predefined alert fields to generate alerts by creating event rules.
   a. Navigate to **All** > **Event Management** > **Rules** > **Event Rules**.
   b. Select **New** .
   c. In the Name field, enter a name for the event rule.
   d. In the Source field, enter **Kafka Consumer**.
   e. Select **Event Filter**.
   f. Enter the appropriate filter according to your requirement.
   g. Select **Transform and compose alert output**.

      When creating event rules, the event fields are displayed in the Event Rules Transform and Compose Alert Output tab. Because the Kafka message varies from user to user, you must transform the event fields to the alert fields to see the details in the alert.

      Note: Because the severity value is required to create an alert, you must map the **Severity** field using event rules or event field mappings. If the Severity field is empty, the event isn't processed and enters into an error state.

   h. Map the fields of the event and **Additional Info** field to the fields of the alert.
   i. Select **Binding**.
   j. Enter the appropriate binding according to your requirement.
   k. Select **Submit**.
      For more information, see Create or edit an event rule.
3. In the All Events screen, check whether any of the events from Kafka are in an error state due to a missing event rule and provide missing rules.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Navigate to **All** > **Event Management** > **All Events**.

b. In the All Events table, open any Kafka consumer event that shows Error as the state in the **Severity** column.

   The message received from the Kafka consumer can vary. The connector cannot know the attributes that will be received. You must map the **Severity** field or other event fields to the fields in the message to ensure that alert fields are correctly populated.

c. On the All Events screen, create a new event rule by selecting **Create Event Rule**.
   For more information on creating event rules, see Event Rules.

   If no event field mappings exist to handle the new type of event, create event field mappings.
   For more information, see Create event field mappings.

Result

Your Apache Kafka consumer connector is configured. When new messages arrive into the Kafka topic, they are received into the ServiceNow instance as events, and alerts are then created from those events.

Configure the Kafka metrics connector instance

Configure the Kafka metric consumer connector instance to read message send to Kafka server over topic.

Before you begin

To activate metric collection, ensure that the MID Server that retrieves metrics is configured with the Metric Intelligence extension and that the extension is in **Started** mode. See Manually configure the Metric Intelligence extension.

- For PLAINTEXT in the Credential field, create a Basic authentication credential.

  Select the Search icon ( ) next to the Credential field.

- ServiceNow does not support discovery for Kafka. Therefore, create the CI entry manually in the respective table.

Role required: evt_mgmt_admin

Procedure

1. On the Credentials screen, select **New**.
2. From the list of available credentials, select **Basic Auth Credentials**.
3. On the Basic Authentication screen, give information for PLAINTEXT authentication, which doesn't require credentials.
   For PLAINTEXT authentication, in the **Name** field, type any value and leave the **User Name** and **Password** fields empty.
4. Select **Submit**.
5. For a SASL_PLAINTEXT, SSL, or SASL_SSL authentication credential, in the Credential field, create a Kafka SSL credential.

   a. Select the Search icon ( ) next to the Credential field.

   b. On the Credentials screen, select **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. From the list of available credentials, select **Kafka SSL Credentials**.

For the Kafka SSL credentials fields descriptions, see Kafka SSL credentials fields.

Note: If you clear the **Disable hostname verification** field, then in the **Additional Kafka consumer properties** field, enter the value of the *ssl.endpoint.identification.algorithm* parameter the same as of the Kafka server parameter value. For example:

```
ssl.enabled.protocols=TLSv1.2,TLSv1.1,TLSv1;
sasl.jaas.config=org.apache.kafka.common.security.plain.Pl
ainLoginModule required username=<username>
 password=<password>;
sasl.enabled.mechanisms=PLAIN;ssl.endpoint.identification.
algorithm=;
```

Configure SAP Solution Manager connector

Configure the SAP Solution Manager (Solman) connector instance to enable communication between the SAP Solution Manager and Event Management.

Before you begin

Role required: admin
Supported versions: Tested on SAP Solution Manager 7.2. Might also work on other versions.

About this task

This configuration enables you to update the SAP Solution Manager with the statuses that have been updated by ServiceNow. For general information about the SAP Solution Manager, see SAP configurations for the SAP Solution Manager connector.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New** and create a connector instance.
3. Fill in the fields on the form.

Connector instance form

Field	Description
Name	Descriptive name for the SAP Solman connector.
Description	Description for the use of the SAP Solman event collection instance.
Active	Option that activates the connector instance. Select this option only after running a successful test.
Connector definition	The vendor and protocol used to gather events from the external event source. Select **SAP Solman**.
Host IP	The IP address where SAP Solman is installed.
Credential	Required credentials entered either by selecting them from the results of a search through the search icon or by clicking **New**. or creating them. If you create credentials, save them using a unique and recognizable name, such as SAPSOLMANOPS.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Event collection last run time	The last run time value. Automatically updated.
Last event collection status	The last run time status. Automatically updated.
Event collection schedule (seconds)	The frequency in seconds that the system checks for new events from SAP Solman.
Bi-directional	Ensure that you select this option to invoke the bi-directional exchange of values to-and-from the external event source. The **Last bi-directional** status option appears only when selecting this option.
Last bi-directional status	This field appears only when **Bi-directional** is selected. This field is automatically populated with the most recent bi-directional status.
Last error message	Last error message. Automatically updated.
Connector Instance Values section	The parameters that are specific to SAP Solman, automatically displayed when saving the form.
MID Servers (MID Server for Connectors section)	MID Server that is up and valid. You can configure several MID Servers so that if the first server is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order in which their details are entered into the MID Server for Connectors section. If no MID Server is specified, an available MID Server that has a matching IP range is used.

4. Right-click the form header and select **Save**.

   The connector instance values are added to the form and the parameters that are relevant to the connector appear.

5. In the Connector Instance Values section, specify the default connector instance values.
   - **Client**: Default value = `001`
   - **Port**: Default value = `8000`
6. Right-click the form header and select **Save**.
7. Click **Test Connector** to verify the connection between the MID Server and the connector. If the test fails, follow the instructions in the error message and then run another test.

   Note: Use a network tool such as *`ping`* to verify the credentials and the network connectivity from the MID Server to the SAP Solman monitor.

8. After a successful test, select the **Active** check box and click **Update**.

Use the SAP Solution Manager Push connector

SAP configurations for the SAP Solution Manager connector

Configure your SAP environment to work with the ServiceNow Event Management platform so you can use the SAP Solution Manager connector.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

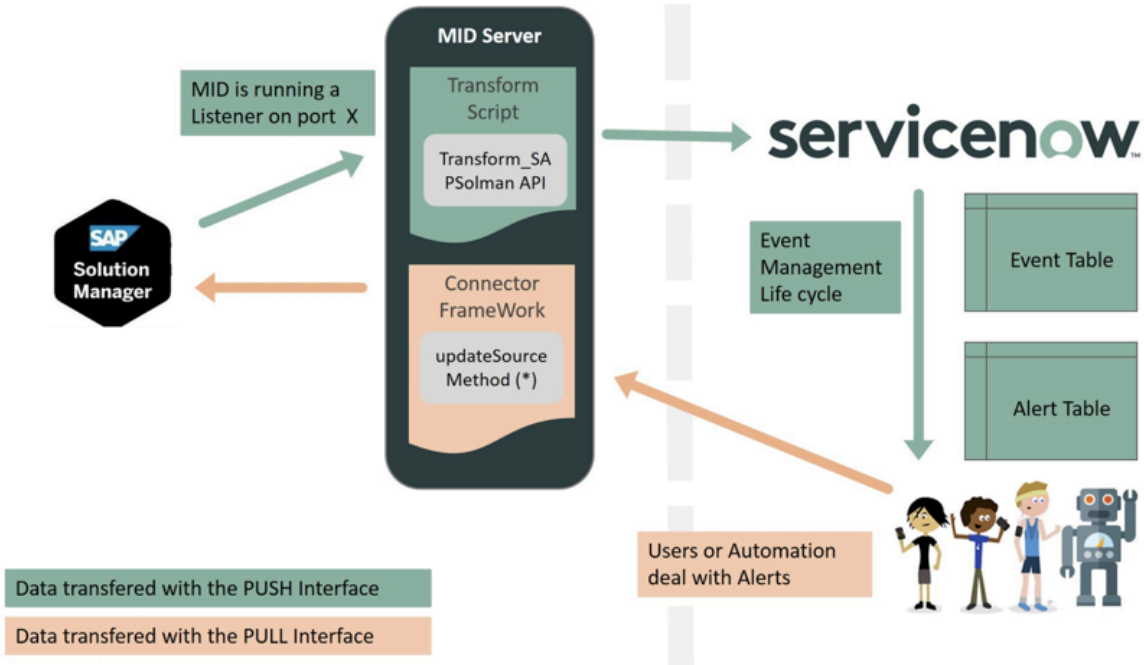
When integrating your SAP environment with Event Management, the SAP Solution Manager sends events through a MID Server to Event Management, which generates an alert from the event.

After the MID Server processes events, you can perform the following actions in the SAP Solution Manager:

- Add comments
- Confirm alerts
- Set status to **Externally Managed**

The following diagram illustrates the flow of data between SAP and Event Management.

SAP Solution Manager connector



Data moves between SAP and Event Management using both Push and Pull interfaces.

- **Pull interface**:

  The Connector Update Queues table [em_connector_update_queue] lists manual updates of alerts and sends them to the SAP Solution Manager.

  The table's business rule identifies each manual update of alerts in Event Management and updates the connector queue with these changes. By default, changes to all alert fields are tracked. For information on adjusting this setting, see the SAP Solution Manager documentation.

  The Event Management - Queue connector processor scheduled job removes alert changes from the queue and sends them to the MID Server. By default, the system performs this process in batches of 1,000 alerts. You can customize this batch size by setting the `evt_mgmt.max_update_source_records` property.

  Note: You must define the Pull interface to enable bi-directional functionality in the SAP Solution Manager connector. For details, see the SAP Solution Manager documentation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Push interface**: Because SAP can only push data to an external source, the integration uses the Push interface to store alerts sent from SAP to Event Management.

  SAP alerts create events in Event Management that use both event rules and CI identification rules to create Event Management alerts.

  After Event Management creates alerts, a business rule listens for a change to the alert. If it detects a change, Event Management updates the SAP Solution Manager alerts.

Event Management Integrations

Use the SAP Solution Manager Pull connector

Use the SAP Solution Manager Pull connector

The SAP Solution Manager Pull connector sends information from Event Management to the SAP Solution Manager. The Pull connector sends responses received from a Push connector in a bi-directional environment.

Before you begin

Role required: evt_mgmt_admin

Procedure

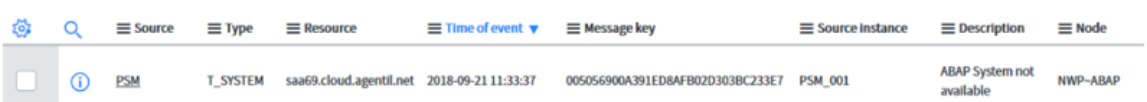
1. Navigate to **All** > **Event Management** > **Event Connectors (Pull)** > **Connector Instances**.
2. Click **New**.
   The **Connector Instance New Record** page appears.
3. Enter values in the required fields, which are indicated by a red asterisk.

Field	Description
Name	Descriptive name for the connector.
Connector definition	Search for and select **SAP Solution Manager**.
Credential	Select **Basic auth** for basic authentication.
Host IP	The SAP Solution Manager IP address.

The Connector Update Queues table [*em_connector_update_queue*] lists manual updates of alerts and sends an event to the SAP Solution Manager, using the Pull interface.

Note: When adding bi-directional functionality for a Push connector, the Connector Instance name must match the Source Instance field of the event generated by that source. The **Connector Instance** field value is a combination of `SID + _ + Mandant`.

For example, the following image displays an event generated by the instance source **PSM_001**. To enable sending information back, you would have to name your connector instance **PSM_001**.



4. Set the following values for the connector instance:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Client**: Represents the client value in SAP, usually 001.
- **Port**: The SAP Solution Manager WebService port. Default value = 8000.

The following table lists the actions you can perform in Event Management, and the resulting updates occurring in SAP Solution Manager.

Event Management actions and SAP Solution Manager updates

Action in Event Management	Result in SAP Solman
Close an alert.	Confirms an alert in the alert inbox. The alert is removed.
Select the **Maintenance** setting in an alert.	Adds a comment indicating that the alert is in Maintenance mode.
Clear the **Maintenance** setting in an alert.	Removes the Maintenance mode comment.
Select the **Acknowledged** setting in an alert.	Adds a comment indicating that the alert is in the Acknowledged mode.
Clear the **Acknowledged** setting in an alert.	Removes Acknowledged mode comment.

Note the following behaviors:

- The Update queue business rule in the Alert table identifies each manual update of the alert and updates the connector queue accordingly. By default, changes to all alert fields are tracked.
- The Event Management — Queue Connector Processor job removes alert changes from the queue and sends them to the MID Server. By default, Event Management performs this dequeue process in batches of 1,000 alerts. You can configure the batch size by setting the `evt_mgmt.max_update_source_records` property.

Use the SAP Solution Manager Push connector

The MID Server web service Event Collector enables you to collect alerts sent from the SAP Solution Manager through event stream notification capabilities. The interface runs both a Push and a Pull interface to interact directly with the SAP Solution Manager.

Before you begin

- Deploy and start the MID Server.
- Configure and start the MID Web Server.
- Configure and start the MID Server web service Event Collector.

Role required: evt_mgmt_admin

About this task

SAP Solution Manager sends JSON formatted event messages to the MID Server. The MID Server parses the collected alert messages and transforms them using the SAP Solman Transform [*TransformEvents_SAPSolman*] script.

JSON formatted messages are collected using basic authentication. For details on other supported authentication methods, see Configure the MID Web Server extension.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Push connectors**.
2. Select the **SAP Solman Transform Script** script.
3. Use the following URL to push alert messages from SAP Solution Manager to the MID Server: `http://<MID_Server_IP>:<MID_Web_Server_Port>/api/mid/em/inbound_event?Transform=TransformEvents_SAPSolman`, where the following are true:
   - **MID_Server_IP** is the IP address of the MID Web Server extension
   - **MID_Web_Server_Port** is the listening port of the MID Web Server extension

What to do next

Create an Remote Function Call (RFC) in the SAP Solution Manager and install a transport, as described in Configure RFC in SAP Solution Manager.

Related topics

Configuring MID Servers

Configure the MID Web Server extension

Configure the MID WebService Event Collector Context

SAP Solution Manager setup configurations

As part of the SAP Solution Manager setup, you must perform several configurations to enable SAP Solution Manager to interact with Event Management.

Configure RFC in SAP Solution Manager

As part of enabling communication with Event Management, you must create a Remote Function Call (RFC) in the SAP Solution Manager and install a transport.

Before you begin

Role required: evt_mgmt_admin

Download the following .psm files and import them into the SAP Solution Manager system.

- https://downloads.docs.servicenow.com/resource/enus/cad/K900249.PSM
- https://downloads.docs.servicenow.com/resource/enus/cad/R900249.PSM

Procedure

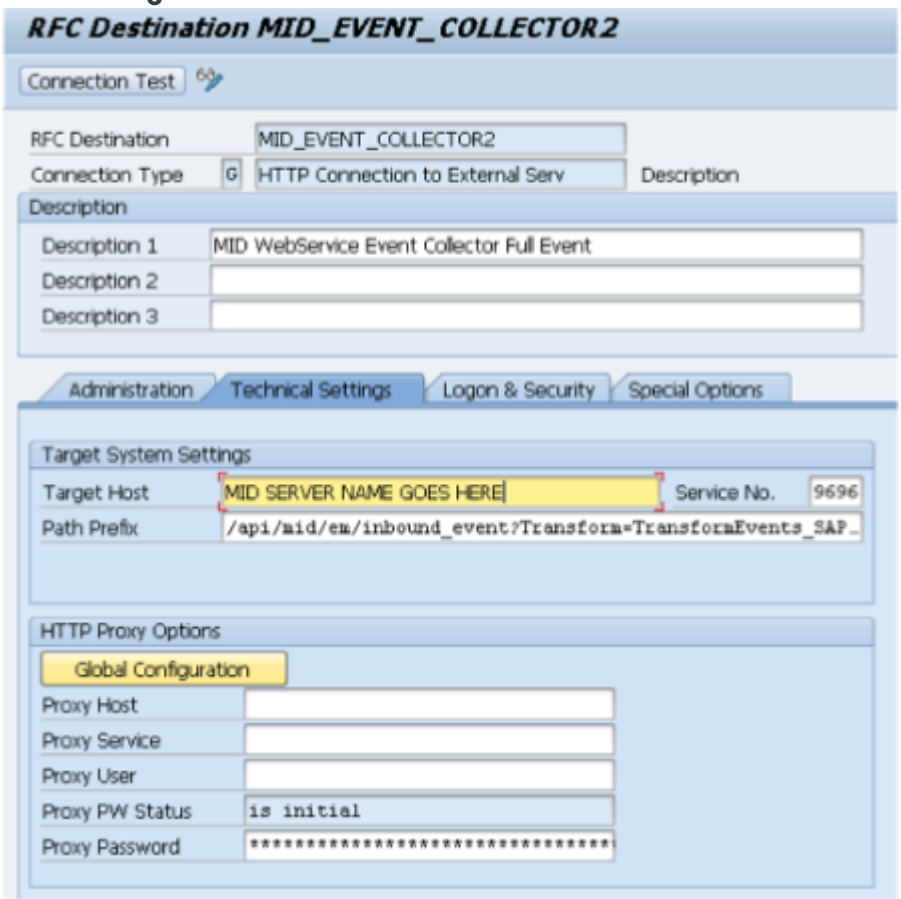
1. On the SAP UI, enter the transaction code `SM59` and create a new RFC with the following parameters on the **Technical Settings** tab:

RFC parameters

SAP Parameter	Value
RFC Destination	`MID_EVENT_COLLECTOR2`. Enter this value exactly because the custom SAP BADI `Z_ALRT_REACTION_IMPL` calls this RFC destination by name.
Target Host	Name of the MID Server.
Service No	Listener port on the MID Server
Path Prefix	The URL of the MID Server transform script: `/api/mid/em/inbound_event?Transform=TransformEvents_SAPSolman`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

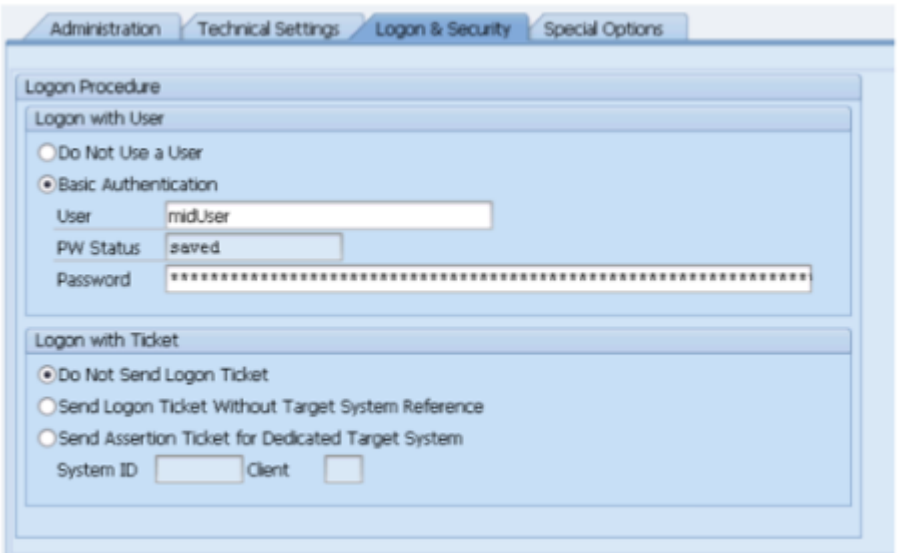
Technical Settings tab



Note: The **RFC Destination** field value must be `MID_EVENT_COLLECTOR2`.

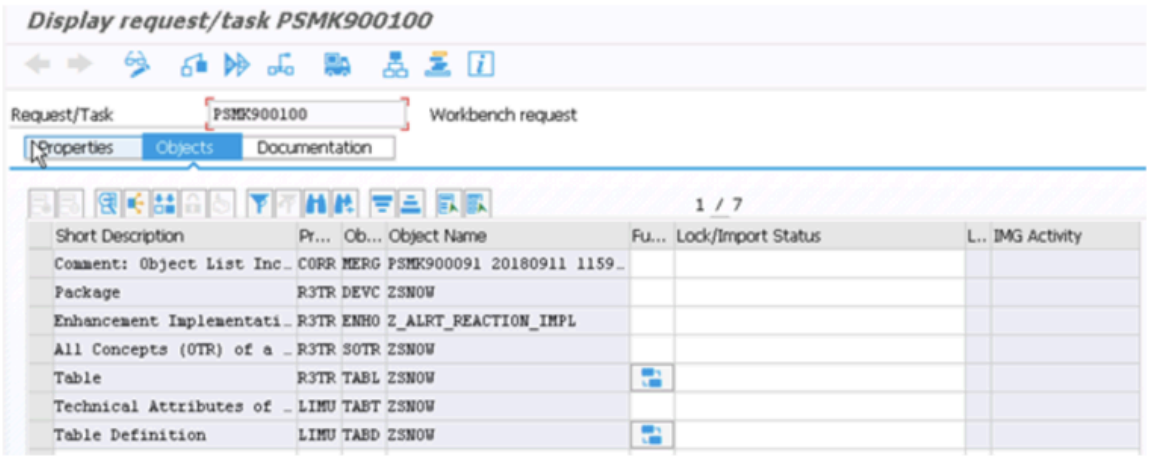
2. On the **Logon & Security** tab, select **Basic Authentication** and enter your Event Management logon credentials in the **User** and **Password** fields.

Logon & Security tab



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A custom SAP BADI (Business Add-in) named Z_ALRT_REACTION_IMPL is created and stored as a workbench transport request. After installation, this BADI calls the RFC to connect to Event Management.



Configure SAP to forward alerts to your BADI

Configure SAP to forward alerts to the BADI (Business Add-in) you create for the integration.

Before you begin

Role required: evt_mgt_admin

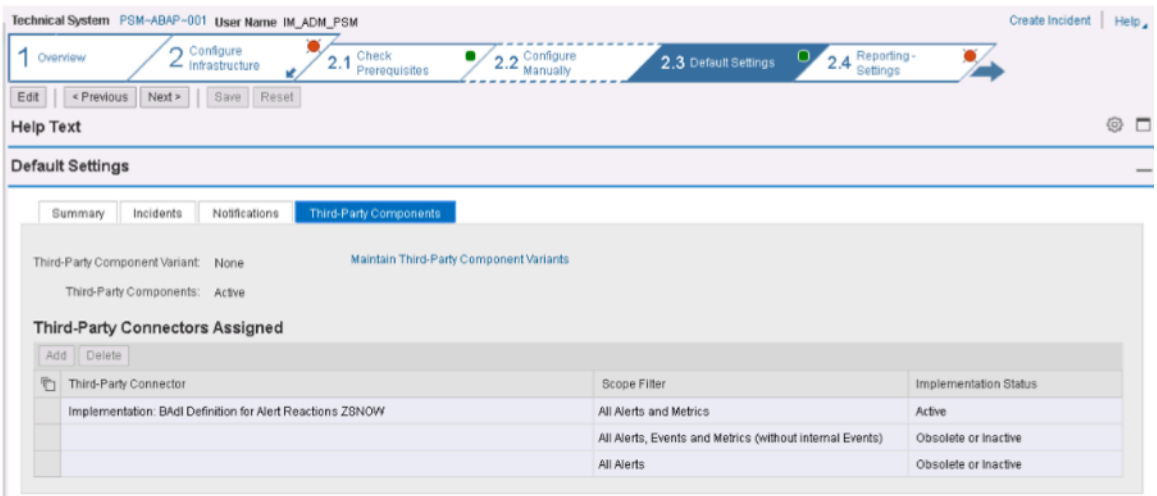
About this task

Third-party alerts get forwarded globally. You can configure the alert reaction only for a specific monitoring template.

Procedure

1. On the SAP UI, navigate to **Application Operations** > **System Monitoring**.
2. In the ribbon at the top of the System Monitoring configuration page, select **2 Configure Infrastructure** > **2.3 Default Settings**.
   The **Default Settings** page appears.

Default Settings page



3. Configure and activate a third-party component.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Enter edit mode by clicking the **Edit** button.

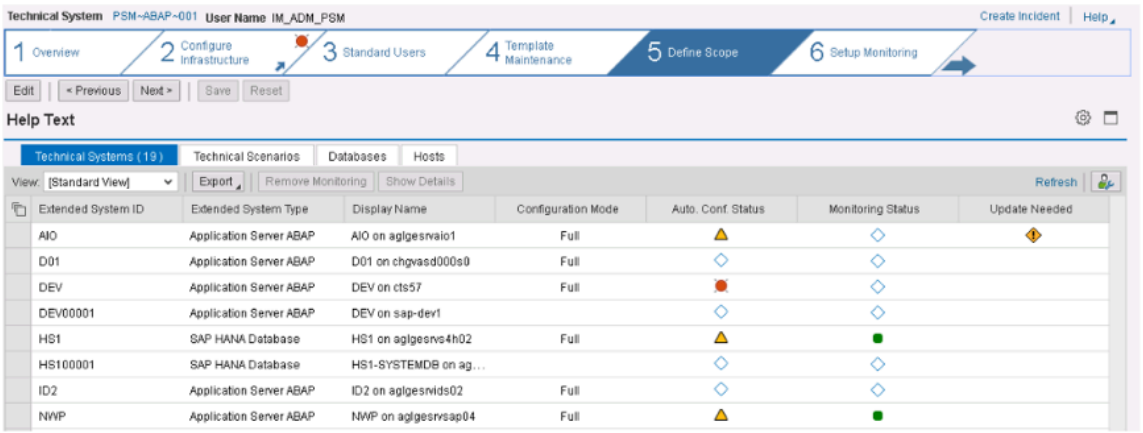
b. Select the **Third-Party Components** tab.

c. Click **Add** and add the following value as the third-party connector: `Implementation: BADI Definition for Alert Reactions ZSNOW with scope = All Alerts and Metrics`.

d. Click **Save** to activate third-party components globally.

4. Define the objects to which the monitoring template will be assigned.

a. In the ribbon at the top of the page, select **5 Define Scope**.
The Define Scope page appears.



b. Select the managed object to which you want to assign the monitoring template.
The monitoring template is assigned to the selected objects.

5. Reactivate the monitoring of templates.

a. Select **6 Setup Monitoring**.

b. Search for and locate entries with **Setup Status = Reconfigure Required** and assign the monitoring template to those entries.

c. Select **Apply** and **Activate**.
When the jobs finish, verify that the **Assignment Status** is green.
All templates and active alerts assigned to the selected objects use the new forwarding method.

What to do next

View alerts generated in SAP Solution Manager to see any pressing issues, as described in View alerts in the SAP Solution Manager inbox.

Configure the alert inbox in SAP Solution Manager

Configure SAP solution manager to retrieve alerts in the system by enabling the alert inbox with the SOA manager.

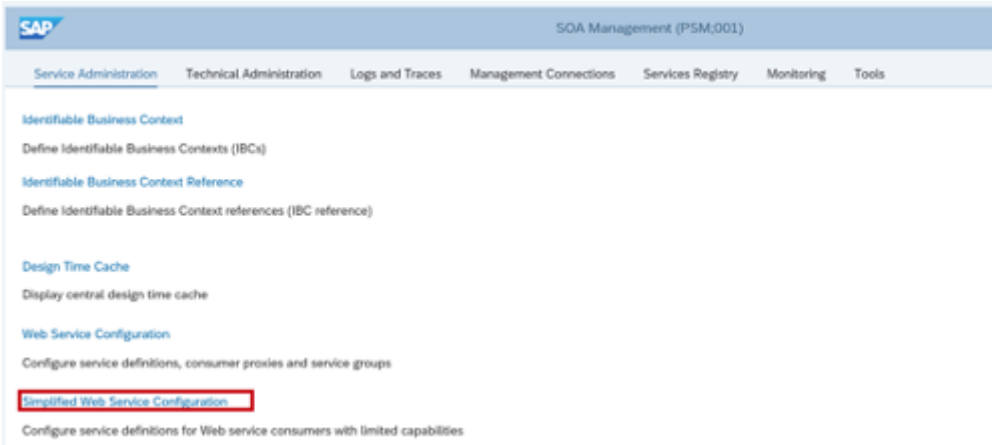
Before you begin

Role required: evt_mgmt_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to SOA MANAGER in your solution manager: `/sap/bc/webdynpro/sap/appl_soap_management?sap-client=XXX&sap-language=EN#`
2. Select **Simplified Web Service Configuration**, then validate the form to activate the service. You must use simplified mode else the resulting web services is different with other modes and not compatible with the connector.



3. Select **Search**.
4. Check the row with the creation type **Simple consumer related**.
   If anything goes wrong, check Configuring a Service Provider (Simplified)

What to do next

View alerts generated in SAP Solution Manager to see any pressing issues, as described in View alerts in the SAP Solution Manager inbox.

View alerts in the SAP Solution Manager inbox

You can view alerts generated in SAP Solution Manager to see any pressing issues. All alerts also forward to Event Management automatically.

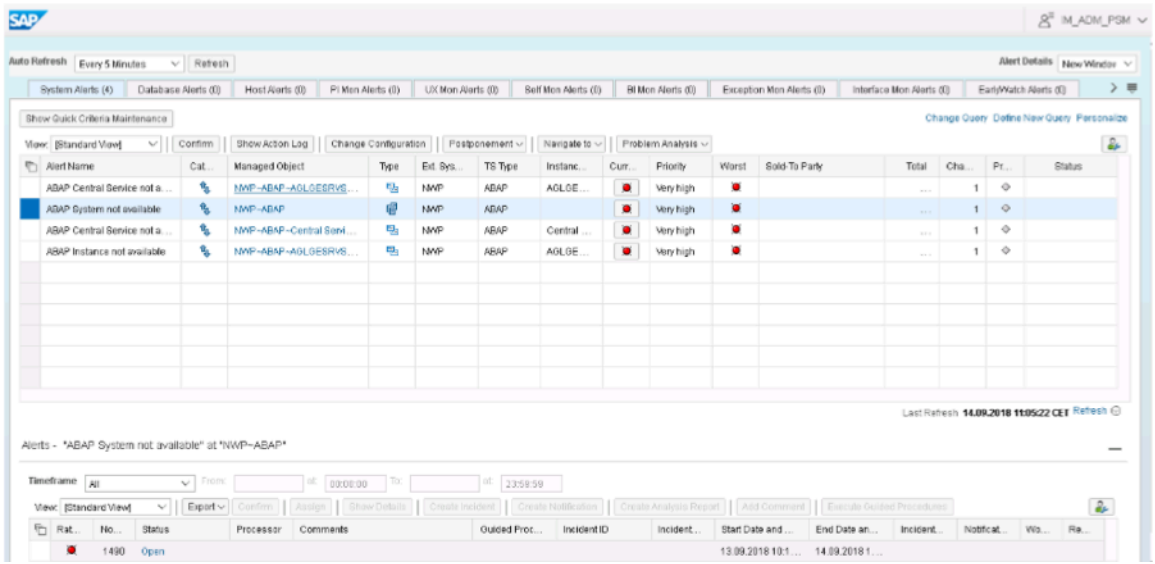
Before you begin

Role required: evt_mgt_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

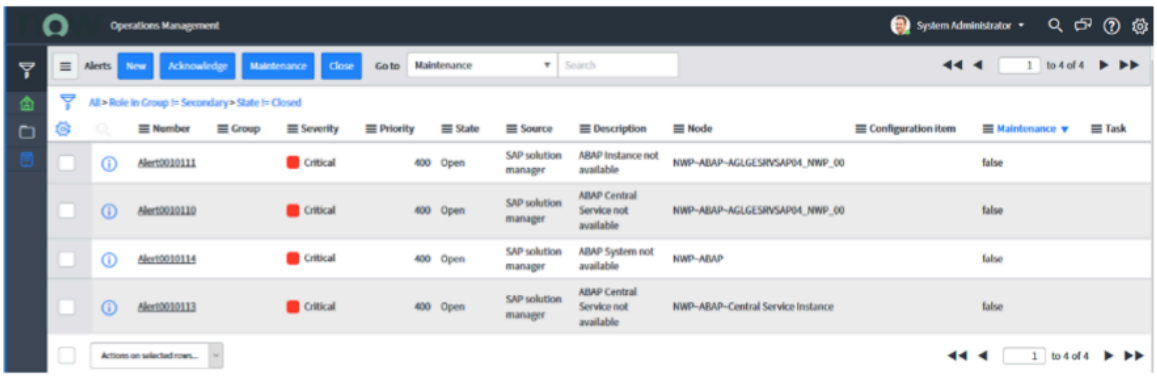
Procedure

1. On the SAP UI, open Solution Manager and select the **System Alerts** tab.



The system alerts are listed on the page.

2. Navigate to (**Event Management** > **All Alerts)** to view the alerts in Event Management.



The following table describes the field mapping between SAP Solution Manager and Event Management for alerts.

Field mapping for SAP Solution Manager and Event Management

SAP Field	Event Management Field	Description
severity	severity	SAP uses a number from 1 (less critical) to 9 (more critical)
message_key	message_key	SAP message group ID, messageGUID
description	description	Event description
source	source	SAP system ID
managed_object_type	type	The type of the object, such as Host or Instance
node	node	Object name

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SAP Field	Event Management Field	Description
managed_object_name	resource	Solution manager node name
N/A (there is no value provided by SAP. Event Management generates the indicated field.)	source instance	The event class must match the connector pull instance name, with the structure <Source>_<Client>.
source	additional_info.sid	SAP system ID
rating	additional_info.rating	Event color in SAP
resource	additional_info.mandant	SAP mandant
metric_name	metric_name	Metric name for the SAP event
time_of_event	time_of_event	Time of event in SAP

Example: High CPU Usage on SAP Host

Scenario: An alert is generated in SAP Solution Manager when the CPU usage on a critical host exceeds 90% for more than 10 minutes.

SAP Solution Manager Alert

Field	Value
Severity	8 (Critical)
Message Key	CPU_Overload_12345
Description	High CPU usage on SAPHost01
Source	SAP_Prod
Type	Host
Node	SAPNode_01
Time	2024-07-31T14:23:00Z

Here's how the alert is mapped in Event Management:

Mapped Event Management alert

Field	Value
Severity	8
Message Key	CPU_Overload_12345
Source	SAP_Prod
Type	Host
Node/Resource	SAPNode_01
Source Instance	SAP_Prod_100
SID	SAP_Prod
Rating	Red

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Mapped Event Management alert (continued)

Field	Value
Mandant	100

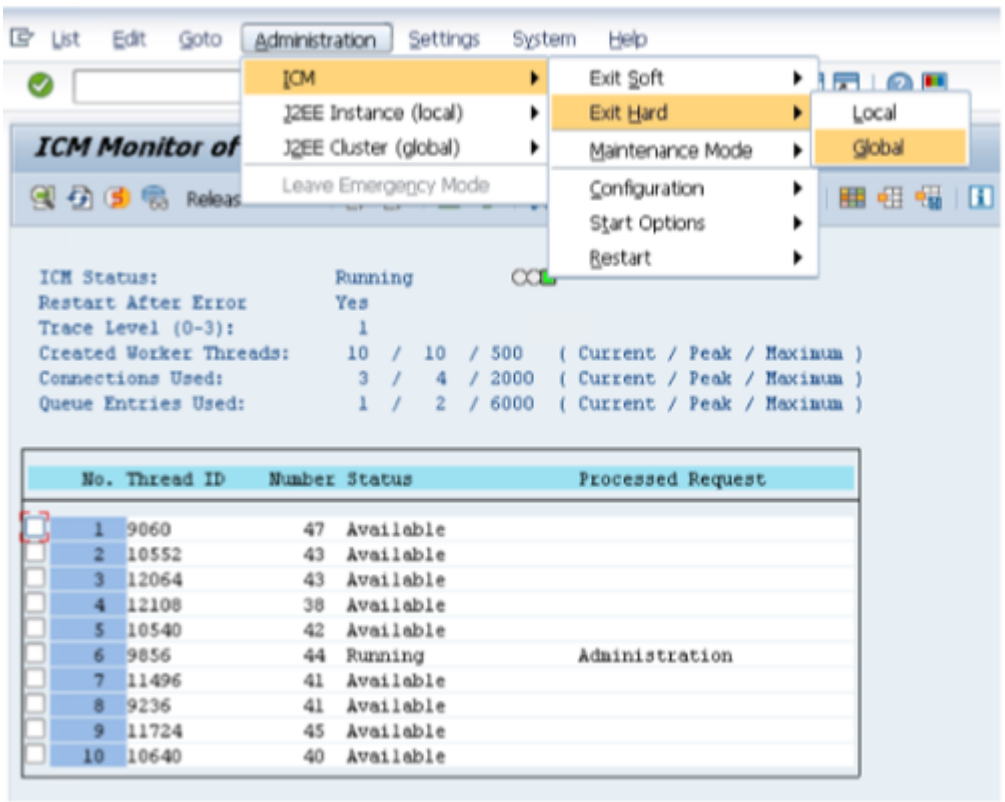
View and update your SAP Solution Manager certificate

View your SAP Solution Manager certificate, and update the certificate if necessary.

Before you begin
Role required: evt_mgmt_admin

Procedure

1. Connect to SAP on client 00.
2. Enter the `strust` transaction.
3. In the Trust Manager UI, open the SSL client.
4. Import the SSL certificate and save it.
5. Use the `smicm` transaction to enable the system to work with both HTTP and HTTPS clients.
6. Navigate to **Administration** > **ICM** > **Exit Hard** > **Global**.



The ICM module restarts.

View the SAP interface log

View the SAP interface log to help you debug issues.

Before you begin
Role required: admin

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

Select a transaction in the SAP UI.
The ZSNOW interface debugging table appears.

SAP Solution Manager transaction codes

The transaction code abbreviations that you can use in the SAP interface when working with the SAP Solution Manager connector.

SAP Solution Manager transaction codes

Transaction Code	Description
ALRTINBOX	Displays the alert inbox.
SOAMANGER	Opens and activates the *Sap_Solman_Alert_Inbox* web service.
SRT_UTIL	View the SOA manager logs.
SOLMAN_WORKCENTER	Opens the SAP Solution Manager interface in a browser.
SM59	Displays the entire output interface.
SE38	Executes the Advanced Business Application Programming (ABAP) code. (The equivalent ServiceNow code is *ZTEST_SNOW_CONNECTOR*.)
MAI_TOOLS	Displays the alarm tool.
SE16	Displays the interface debugging table (ZSNOW).

Configure alert collection from SCOM

Alerts from the Microsoft System Center Operations Manager (SCOM) are collected using the SCOM connector instance.

Before you begin

Role required: evt_mgmt_admin

About this task

The SCOM connector instance requires configuration before receiving alerts and Metric Intelligence raw data from the SCOM server. You can limit the collection of SCOM alerts to only those alerts that belong to the SCOM group that you specify.

Procedure

1. Configure the SCOM connector instance.
2. Configure the Microsoft System Center Operations Manager (SCOM) connector instance to receive alerts and Metric Intelligence raw data from the SCOM server.
3. Limit collected SCOM alerts to specific SCOM groups.

Configure the SCOM connector instance

Configure the Microsoft System Center Operations Manager (SCOM) connector to receive alerts and Metric Intelligence raw data from the SCOM server. SCOM event collection and metric collection are handled by two separate connector definitions: SCOM (for alerts and bi-directional exchange) and SCOM Metrics (for Metric Intelligence raw data).

Before you begin

Common prerequisites (both connectors):

- The MID Server is running on Windows.
- The MID Server resides in the same domain as the SCOM server.
- The MID Server uses the same time zone as the SCOM server.

Additional prerequisites for SCOM event collection:

- The MID Server is running with a user that has local admin permissions to enable the MID Server to run PowerShell.
- The MID Server user has read access to the SCOM API.
- The MID Server has .NET framework version 3.5 (for SCOM 2007/2012) or .NET 4.6 or higher (for SCOM 2016/2019/2022/2025).
- If Bi-directional is selected, ensure that PowerShell version 3.0 is installed on Windows and the MID Server is running with a user that has local admin permissions.

Additional prerequisites for SCOM metric collection:

The MID Server that retrieves metrics is configured with the Metric Intelligence extension and the extension is in Started mode. See Manually configure the Metric Intelligence extension.

If "Database login with Windows authentication" is selected, the MID Server service must run with a user having read access to the SCOM database (OperationsManagerDW).

To configure this:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. In the local services, right-click the MID Server service and select Properties.
2. In the Log On tab, verify that "This account" is selected with the details of the Windows domain user that has read access to the SCOM database.

If "Database login with Windows authentication" is NOT selected, you need a Windows credential in the credential store that has read access to the OperationsManagerDW database.

Upgrading from a previous release: If you are upgrading from a release where a single SCOM connector handled both events and metrics, the upgrade automatically disables metric collection on the old SCOM connector. The upgrade also deprecates the old metric-related parameters and event rules. Your existing SCOM connector continues to handle event collection as before — no action needed for events. To resume metric collection after the upgrade, create a new SCOM Metrics connector instance.

Role required: evt_mgmt_admin

About this task

There are two connector definitions for SCOM. The SCOM (Events) connector collects alerts using PowerShell and native .NET SCOM client executables. It requires DLL files from the SCOM server to be uploaded to the MID Server. It also supports bi-directional alert exchange. The SCOM Metrics connector collects Metric Intelligence raw data using JavaScript running JDBC directly against the OperationsManagerDW database. It does not require any DLL files and does not collect events or support bi-directional exchange.

You can also use this setup for the SCOM managed instance on Azure.

This connector has the *logPayloadForDebug* log parameter enabled, which logs event and metric payloads from the source system. Once debugging is complete, set this parameter to **false** to prevent overloading the system.

Supported versions:

- 2007 – version 6.1.7221.0
- 2012 – version 7.1.10226.0
- 2016 – version 7.2.117190 and 7.3.13261.0
- 2019 – version 10.19.10050.0
- 2022 – version 10.22.10118.0

Procedure

1. Configure the SCOM (Events) connector instance.

   Follow these steps to collect SCOM alerts and optionally enable bi-directional alert exchange. This connector uses PowerShell and native .NET SCOM client executables.

   a. On the SCOM server, download the following files to a local computer.

Version	SCOM path and library names
SCOM 2012R2 or SCOM 2012	`%ProgramFiles%\Microsoft System Center 2012 R2 or 2012\Operations Manager\Server\SDK Binaries`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Version	SCOM path and library names
	▪ Microsoft.EnterpriseManagement.Core.dll ▪ Microsoft.EnterpriseManagement.Operation ▪ Microsoft.EnterpriseManagement.Runtime.d
SCOM 2007	%ProgramFiles%\System Center Operations Manager 2007\SDK Binaries ▪ Microsoft.EnterpriseManagement.Operation ▪ Microsoft.EnterpriseManagement.Operation **Note:** Don't append 2007 to the Microsoft.EnterpriseManagement.Operatic file.
SCOM 2016	%ProgramFiles%\Microsoft System Center 2016\Operations Manager\Server\SDK Binaries ▪ Microsoft.EnterpriseManagement.Core.dll ▪ Microsoft.EnterpriseManagement.Operation ▪ Microsoft.EnterpriseManagement.Runtime.d **Note:** The MID Server must be installed with .NET 4.6 or higher.
SCOM 2019	%ProgramFiles%\Microsoft System Center 2019\Operations Manager\Server\SDK Binaries ▪ Microsoft.EnterpriseManagement.Core.dll ▪ Microsoft.EnterpriseManagement.Operation ▪ Microsoft.EnterpriseManagement.Runtime.d **Note:** The MID Server must be installed with .NET 4.6 or higher.
SCOM 2022	▪ Microsoft.EnterpriseManagement.Core.dll ▪ Microsoft.EnterpriseManagement.Operation ▪ Microsoft.EnterpriseManagement.Runtime.d **Note:** The MID Server must be installed with .NET 4.6 or higher.
SCOM 2025	▪ Microsoft.EnterpriseManagement.Core.dll ▪ Microsoft.EnterpriseManagement.Operation ▪ Microsoft.EnterpriseManagement.Operation ▪ Microsoft.EnterpriseManagement.Runtime.d

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Version	SCOM path and library names
	Note: The MID Server must be installed with .NET 4.6 or higher.

Note: A connection cannot be made to SCOM 2012/SCOM 2016/SCOM 2019/SCOM 2022 and SCOM 2007 from the same MID Server. To work with both SCOM 2012/SCOM 2016/SCOM 2019/SCOM 2022 (any of them) and SCOM 2007 in your instance, do the following before uploading files to your instance:

i. Append .2012 to the end of the `Microsoft.EnterpriseManagement.OperationsManager.dll` file, so it becomes: `Microsoft.EnterpriseManagement.OperationsManager.dll.2012`. Do this for 2012/2016/2019/2022.

ii. Append .2007 to the end of the `Microsoft.EnterpriseManagement.OperationsManager.dll` file found in the 2007 path.

Using these modified file names enables the relevant MID Server to load the applicable DLL when both SCOM versions are deployed. Do not append 2007 to the `Microsoft.EnterpriseManagement.OperationsManager.Common.dll` file (for SCOM 2007).

At any given time, you can define connectors of either SCOM 2007, SCOM 2012/2016, or SCOM2019. Since SCOM 2012 and SCOM 2016 use the same library files, they are able to work at the same time. Although, SCOM 2019 uses the different SCOM DLL files so you cannot configure SCOM 2012, 2016, and 2019 all together. Each SCOM connector can use the database of another connector, for metric support.

b. Navigate to **MID Server** > **JAR Files**.

c. Select **New** and add a separate record for the SCOM version for each of the DLL files that you downloaded from the SCOM server.

i. In the **Name** field, specify the SCOM version and an identifier to make the name unique, for example `2012 1`.

If you are using SCOM 2016, specify 2012 as the version.

ii. Select the paper clip icon in the form header and then attach one of the appropriate DLL files that you downloaded.

iii. Select **Submit**.

d. Repeat step 3, creating a separate record for each of the remaining DLL files.

Ensure that you have a unique identifier after the SCOM version for each file that you attach, for example `2012 2`.

e. Navigate to **Event Management** > **Integrations** > **Connector Instances**.

f. Click **New** and create a new connector instance.

For details on the connector instance fields displayed on the page, see SCOM connector instance form.

g. Select and hold (or right-click) the form header and select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The connector instance values are added to the form and the parameters that are relevant to the connector appear.

h. In the Connector Instance Values section, you can edit the values of the mandatory SCOM parameters.

i. login_with_windows_authentication Default value: **false**.

Set to **true** to enable SCOM event collection and the bi-directional exchange of event values to work with Windows authentication. When invoking this value, ensure that you do the following on the MID Server:

1. Navigate to the list of local services, select and hold (or right-click) the MID Server service, and select **Properties**.
2. In the **Log On** tab, ensure that **This account** is selected with the details of the user in the Windows domain with read access to the SCOM database.

ii. *scom_date_format*: Default format: M/d/yyyy/ h:mm:ss a

If you receive an event whose date is in a different format, modify this value to match the format of the incoming event. If you do not, the event does not process correctly.

For example, an event arrives on June 27, 2019 at 11:25 AM with a listed date of *2019/06/27/ 11:25:00 a*. Modify the *scom_date_format* value to *yyyy/M/d/ h:mm:ss a* to match the format of the received event.

In *scom_date_format*, a represents AM, and p represents PM.

iii. *scom_initial_sync_in_days*: Default value: 7.

iv. *scom_version*: It is mandatory to specify the SCOM version.

Select from 2025, 2022, 2019, 2016, 2012, or 2007.

v. *stop_isMonitorAlert_bidirectional*: Boolean.

Set to **true** to stop only SCOM monitoring alerts bi-directionally. Stopping SCOM monitoring alerts can prevent false alarms on the SCOM console when attempting to update the alerts. When set to **false**, SCOM monitoring alerts continue running bi-directionally for all types of SCOM alerts. Default value = false.

vi. *scom_alert_bulk_size*: Default value: 500. Number of alerts fetched per SCOM collection cycle.

vii. *debug_enabled*: Default value: false. Set to true to enable debug logging on the MID Server.

i. Select and hold (or right-click) the form header and select **Save**.

j. Restart the MID Server service to copy the files.

k. Select **Test connector** to verify the connection between the MID Server and the connector.

If the test fails, correct the problem by following the instructions issued by the error and then run another test.

Note: Use a network tool, such as ping, to verify credential correctness and network connectivity from the MID Server to SCOM.

l. After a successful test, select the **Active** check box and then select **Update**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

The default binding rules that contain SCOM as the external source, that applies to IT alerts and Metric Intelligence raw data, are the following SCOM Management Packs:

- All OS Management Packs
- MS SQL Server
- IIS

m. After a successful test, select the **Active** check box and then select **Update**.

If bi-directional is configured, the bi-directional exchange of values to-and-from the external event source is enabled. These scenarios describe the default bi-directional functionality for SCOM connectors:

- When an alert is resolved in SCOM, it is auto-closed in ServiceNow. However, it is updated irrespective of the bi-directional feature because during each collection cycle, all alert changes are updated.
- When an alert is manually closed in ServiceNow, it is auto-closed in SCOM. If the alert state is changed to **Reopen**, SCOM is also updated.
- When an incident is created and associated to an alert in ServiceNow, SCOM receives the incident number as a ticket ID. However, the state of the incident is not available on SCOM. Therefore when the incident is resolved in ServiceNow, SCOM is not updated as the incident number remains the same. When the alert is associated with a new incident, the new incident number is updated in SCOM.

2. Configure the SCOM Metrics connector instance.

Follow these steps to collect Metric Intelligence raw data from SCOM. This connector connects directly to the SCOM OperationsManagerDW database using JDBC. It does not require SCOM DLL files on the MID Server. Note: This connector collects metrics only. It does not collect events or support bi-directional exchange. To collect SCOM alerts, configure the SCOM (Events) connector.

a. Navigate to **Event Management** > **Integrations** > **Connector Instances**.

b. Click **New** and create a new connector instance.

c. In the **Connector definition** field, select **SCOM Metrics**.

d. Fill in the following fields:

Metrics database host	The IP address or hostname of the server hosting the OperationsManagerDW database.
Connect using a named instance	Select this if the SQL Server uses a named instance instead of a port number.
Metrics database port	The port used by the database. Default is 1433. This field is hidden if "Connect using a named instance" is selected.
Metrics database named instance	The SQL Server named instance name. This field is visible only when "Connect using a named instance" is selected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Database login with Windows authentication	Select this to use the MID Server service account's Windows credentials for database access. When selected, the database credential field is hidden.
Database credential	Visible only when Windows authentication is NOT selected. Select a Windows credential from the credential store that has read access to the OperationsManagerDW database. This field is mandatory when Windows authentication is disabled.
Metrics collection schedule (seconds)	Frequency in seconds to repeat metric collection. Default is 10.

e. Right-click the form header and select **Save**.

f. In the Connector Instance Values section, configure the following parameters:

Field	Description
scom_db_name	The name of the SCOM data warehouse database. Default is OperationsManagerDW. Change this only if your database has been renamed.
metric_chunk_size	Default value is 50000. Maximum number of metric records fetched per batch.
debug_enabled	Default is false. Set to true to enable debug logging on the MID Server.
log_payload	Default is false. Set to true to log raw metric payloads for debugging. Set back to false after debugging is complete to avoid overloading the system.

g. Right-click the form header and select **Save**.

h. Select **Test connector** to verify the database connection.

The test runs a simple query against the OperationsManagerDW database to confirm connectivity.

i. After a successful test, select the **Active** check box and select **Update**.

Limit collected SCOM alerts to specific SCOM groups

Limit the collection of SCOM alerts to only those alerts that belong to the specified SCOM group.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Use the SCOM Authoring workspace and Operations console to define a SCOM group and ensure that the group contains the required computers or instances.
   For further information about SCOM groups, see the SCOM documentation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Create a role that has a scope of the SCOM group.
3. Add the new role to the SCOM user.
4. Assign the role to the user defined in the credentials given to the SCOM connector instance.
5. Remove all other roles from the user.

Result
Only alerts from the specified SCOM group arrive at the instance.

SCOM metric event rules

The base system comes with Microsoft System Center Operations Manager (SCOM) metric event rules. SCOM metric event rules bind event metrics to configuration items (CIs).

When an event's metrics match the event filter conditions, the metrics bind to the indicated CI. The event rules that come with the base system are:

Base system metric event rules

Rule Name	CI type
SCOM Metrics - Windows Server	cmdb_ci_win_server
SCOM Metrics - IIS Web Server	cmdb_ci_microsoft_iis_web_server
SCOM Metrics - SQL Server Reporting Services	cmdb_ci_db_mssql_reporting
SCOM Metrics - MS SQL Database	cmdb_ci_db_mssql_database
SCOM Metrics - MSFT SQL Instance	cmdb_ci_db_mssql_instance

You can create a custom event rule to bind metrics with other CI types. For details, see Create or edit an event rule.

If the event rule filter doesn't match, the default rule, *`SCOM Metrics - Default`* (CI type = *`cmdb_ci_hardware`*) is invoked. The order number of the default event rule must be higher than the order number of any SCOM event rules. This includes both base system rules and custom rules. This ensures that all other rules are checked for matching before invoking the default rule. For details on event rules, see Event rules.

Configure event collection from SolarWinds monitor

Configure the SolarWinds monitor connector instance to receive events from the SolarWinds monitor.

Before you begin
Supported versions:

- SAM 6.2.1
- NPM 2024.1

Note: The SolarWinds monitor connector instance can import events from:

- Network Performance Monitor (NPM)
- SolarWinds Service & Application Monitor (SAM)

The SolarWinds monitor connector instance requires a credential that lets the instance access SolarWinds monitor accounts. You can use an existing credential or create a new one. The

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

provided user must have access to the SolarWinds API to receive events from the SolarWinds connector.

Role required: evt_mgmt_admin and evt_mgmt_integration

About this task

This connector has the *debug* and *logPayloadForDebug* log parameters enabled. The *debug* parameter logs debug messages, such as calls made to the source system to retrieve events. The *logPayloadForDebug* parameter logs event and metric payloads from the source system. Once debugging is complete, set this parameter to **false** to prevent overloading the system. To use the legacy XML format, set the *useXMLResponse* parameter to **true**.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New**.
3. On the form, fill in the fields.

Field	Description
Name	Type a descriptive name for the SolarWinds monitor connector.
Description	Type a description for the use of the SolarWinds monitor event collection instance.
Connector Definition	Select **Solarwinds_v2**.
Host IP	Specify the SolarWinds monitor IP address.
Credential	Select the credential with basic authentication that you created for this connector. For more information, see Create SolarWinds monitor credentials.
Event collection last run time	The last run time value of the scheduled job. This field is updated automatically.
Last event collection status	The last event collection status. This field is updated automatically.
Event collection schedule (seconds)	The frequency in seconds that the system checks for new events from the SolarWinds monitor server.
Last error message	The last error message received by the connector is automatically updated.

4. Right-click the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.
5. In the Connector Instance Values section, specify these fields:

Field	Value
initial_sync_in_days	Specify how many days the initial pull must contain to retrieve events. The default value is 7 days.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
nodes_custom_properties	Specify the SolarWind monitor property names that are associated with the relevant node. This information is added to the **Additional Information** field of the event in JSON format. The SolarWinds monitor custom properties are user-defined fields, for example, country, building, or serial number, that you can associate with monitored network objects. Separate multiple entries with a comma.
port	Specify the value of the port. By default, the value is 17774. **Note:** For version 2023.1 and above, the port is 17774.
queryAlertTable	A boolean toggle that determines the source table for event queries. Setting the value to **false** queries the Orion.Event table, while setting it to **true** queries the Orion.AlertHistory table. Default: false

6. **Optional:** Name of a MID Server.
   If no MID Server is specified, an available MID Server that has a matching IP range is used. In the MID Servers for Connectors section, specify a MID Server that is up and valid. You can configure several MID Servers. If the first is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section. The privileges that are required for the user account that is used for the MID Server to collect events from SolarWinds monitor is that of evt_mgmt_integration.
7. Click **Test connector** to verify the connection between the MID Server and the SolarWinds monitor connector.
   If the test fails, follow the instructions that are issued by the error to correct the problem and then run another test.

   Note: Use a network tool, such as ping, to verify credential correctness and network connectivity from the MID Server to SolarWinds monitor.

8. After a successful test, select the **Active** check box and then click **Update**.

Create SolarWinds monitor credentials

Create a Basic Auth credential in ServiceNow to store the SolarWinds user name and password that the SolarWinds monitor connector uses to access the SolarWinds API.

Before you begin

Confirm you have a local SolarWinds Orion account for Basic authentication (username + password) with rights to query the SolarWinds Information Service (SWIS) REST API. Create this account in the Orion Web Console; it is the account ServiceNow uses to poll alerts.

Role required: evt_mgmt_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.
3. Select **Basic Auth Credential**.
4. On the form, fill in the fields.

Basic Auth Credentials form

Field	Description
Name	Enter a unique and descriptive name for this credential. For example, you might call it `SolarWinds authentication`.
User name	Enter the user name of the SolarWinds account that the connector uses to access the SolarWinds API.
Password	Enter the password for the SolarWinds account.
Active	Option to enable the use of this credential.
Order	The order (sequence) in which the platform tries this credential as it attempts to log on to devices. The smaller the number, the higher in the list this credential appears. Establish credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number (or none), the instance tries the credentials in a random order. Default value: `100`

5. Click **Submit**.

Result
The credential for use with the SolarWinds monitor connector is created.

Credentials and connection information

Configure event collection from vCenter

Configure the VMware vCenter Server (vCenter or vCenter_V2) connector instance to receive events from your VMware vSphere environment.

Before you begin
Events collected by this connector are events that match the vCenter ESX Servers event rule. Supported version: 7.0.2.00500.

Role required: evt_mgmt_admin

About this task
Starting from the Xanadu release, the OOTB (Out-Of-The-Box) event rules provided with the connector, which you have not previously used (i.e., neither activated, deactivated, nor modified), will now have the **Apply additional matching rules** check box set to true. Previously, this check

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

box was disabled. This change allows you to execute more event rules or automation using the same filter conditions for the events.

Note: This feature applies only to active event rules.

This connector has the *debug* and *logPayloadForDebug* log parameters enabled. The *debug* parameter logs debug messages, such as calls made to the source system to retrieve events. The *logPayloadForDebug* parameter logs event and metric payloads from the source system. Once debugging is complete, set this parameter to **false** to prevent overloading the system. To use the legacy XML format, set the *useXMLResponse* parameter to **true**.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New**.
3. On the form, fill in the fields.

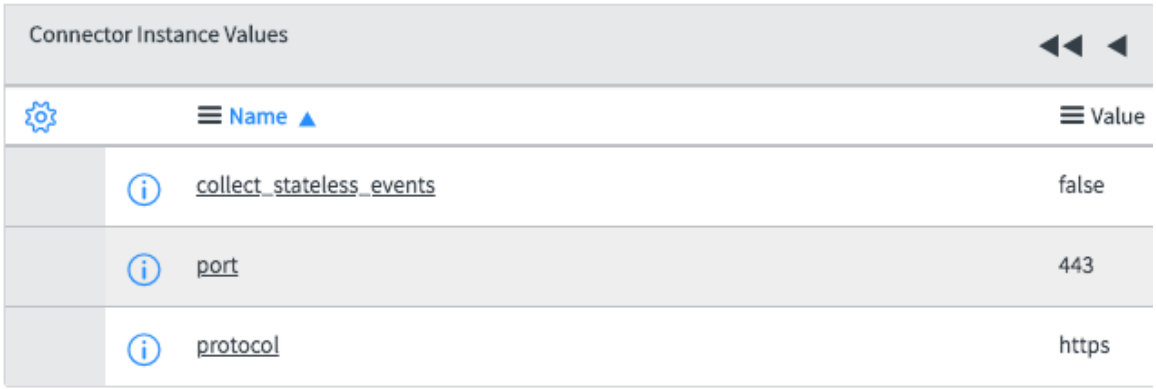
Connector Instance form

Field	Description
Name	Descriptive and unique name for the vCenter connector.
Description	Description for the use of the vCenter event collection instance.
Connector definition	Name of the required connector definition. Select **vCenter** or **vCenter_V2** (vCenter_V2 is located in the Event Management connectors scope).
Host IP	IP address where vCenter is installed.
Credential	Permission to connect to vCenter. Click the search icon in the **Credential** field. Either select the required credentials from the list or click **New** and create the required credentials on the Credentials form. If you create the credentials, save them using a unique and recognizable name, for example, vCenterCHCK.
Event collection last run time	Last run time value. Automatically updated.
Last event collection status	Last run status. Automatically updated.
Event collection schedule (seconds)	Frequency, in seconds, that the system checks for new events from vCenter. The default value is 120 seconds.
Last error message	Last error message. Automatically updated.

4. Right-click the form header and select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The connector instance values are added to the form and the parameters that are relevant to the connector appear.



5. In the Connector Instance Values section, specify the vCenter values.

Field	Value
collect_stateless_events	Events that have a status (stateful) are collected when this field is set to `false` (default). These events are of type AlarmStatusChangedEvent and AlarmClearedEvent. If this field is set to `true`, events of other types are collected as well.
port	Specify the value of the port. Default value: `443`.
protocol	Specify the protocol. Default value: `https`.

6. **Optional:** In the MID Servers for Connectors section, specify a MID Server that is up and is valid.
   If no MID Server is specified, an available MID Server that has a matching IP range is used.

   You can configure several MID Servers. If the first is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section.

7. Right-click the form header and select **Save**.
8. Test the connection between the MID Server and the vCenter connector.

   a. Click **Test Connector**.
   If the test fails, follow the instructions that the error issues to correct the problem and then run another test.

   > **Note:** Use a network tool, such as ping, to verify credential correctness and network connectivity from the MID Server to the external monitoring tool.

   b. After a successful test, select the **Active** check box.

9. Click **Update**.

Configure event collection from vRealize

Configure the VMware vRealize Operations (vRealize or vRealize_V2) connector instance to receive events from the vRealize Operations Log and Event Management servers. vRealize uses basic authentication. vRealize_V2 uses token-based authentication.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: evt_mgmt_admin

Supported version: 8.10.0.

Note: Connect to vRealize using a local account with at least Read-only vRealize Operations permission. You can use an existing credential or create a new one.

About this task

This connector has the *debug* and *logPayloadForDebug* log parameters enabled. The *debug* parameter logs debug messages, such as calls made to the source system to retrieve events. The *logPayloadForDebug* parameter logs event and metric payloads from the source system. Once debugging is complete, set this parameter to **false** to prevent overloading the system. To use the legacy XML format, set the *useXMLResponse* parameter to **true**.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New** and create a vRealize Operations connector instance with the following details:

Field	Value
Name	Specify a unique name for the vRealize Operations connector instance.
Host IP	Specify the vRealize Operations IP address.
Credential	Select the credential with basic authentication that you created for this connector. vRealize_V2 uses token-based authentication providing that the user can generate the token. For more information, see Create vRealize credentials.
Schedule (seconds)	The frequency in seconds that the system checks for new events from vRealize Operations.
Description	Type a description for the use of the vRealize Operations connector.
Connector definition	The vendor and protocol used to gather events from the external event source. Select **vRealize** or **vRealize_V2** (vRealize_V2 is located in the Event Management connectors scope).
Last error message	The last error message is automatically updated.
Last run time	The last run time value is automatically updated.
Last run status	The last run time status is automatically updated.
MID Servers (MID Server for Connectors section)	Optional. Name of a MID Server. If no MID Server is specified, an available MID Server that has a matching IP range is used. In the MID Servers for Connectors section, specify a MID Server that is up and valid. You can configure several MID Servers. If the first is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section.

3. Right-click the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. In the Connector Parameters section, specify the values of the mandatory vRealize Operations parameters.

   a. **port**: Default value = `443`.

   b. **protocol**: Default value = `https`.

   c. **days_from**:
   Number of days worth of data to be pulled on the first event collection run. Default value = `14`. The **days_from** option is available only when using vRealize_V2.

   d. **useXMLResponse**:

   Optional. Controls the content type the connector uses to communicate with the vRealize Operations API. When set to false (default), the connector sends requests and parses responses as JSON. Set to true to use the legacy XML format. Default value = false. The useXMLResponse option is available only when using vRealize_V2.

5. Click **Test connector** to verify the connection between the MID Server and the vRealize Operations connector.
6. If the test fails, follow the instructions that are issued by the error to correct the problem and then run another test.

   Note: Use a network tool, such as ping, to verify credential correctness and network connectivity from the MID Server to vRealize.

7. After a successful test, select **Active** and then click **Update**.

Configure a pull connector

Create vRealize credentials

Create credentials to access vRealize.

Before you begin
Role required: evt_mgmt_admin

About this task
Create Basic Auth type of credential to connect to vRealize.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.
3. Select **Basic Auth Credential**.
4. On the form, fill in the fields.

Basic Auth Credentials form

Field	Description
Name	Enter a unique and descriptive name for this credential. For example, `NewvRealize`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
User name	Name to identify the user. ○ If the username is internal in vRealize, use it as is. ○ If vRealize is integrated with Active Directory (AD), use the format `DOMAIN\username@sourceauth`. For example, `local\administrator@All vCenter Servers`.
Password	Password to use this credential.
Active	Option to enable the use of this credential.
Order	The order (sequence) in which the platform tries this credential as it attempts to log on to devices. The smaller the number, the higher in the list this credential appears. Establish credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number (or none), the instance tries the credentials in a random order. Default value: `100`

5. Click **Submit**.

Result
The credential for use with the vRealize connector is created.

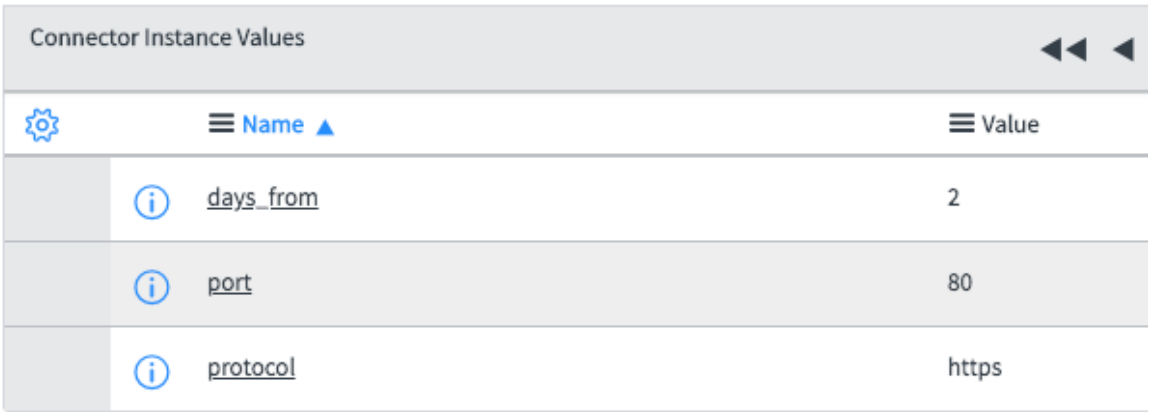
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Name	Descriptive name for the connector.
Host IP	IP address for the Zabbix server.
Credential	Select the credential with basic authentication that you created for this connector. For more information, see Create Zabbix server credentials.
Schedule (seconds)	Frequency, in seconds, that the system checks for new events from the Zabbix server.
Description	Description for the use of the Zabbix server event collection instance.
Connector Definition	Name of the connector definition. Select **Zabbix**.
Last error message	Last error message. Automatically updated.
Last run time	Last run time value. Automatically updated.
Last run status	Last run time status. Automatically updated.
MID Servers (MID Server for Connectors section)	Optional. Name of a MID Server. If no MID Server is specified, an available MID Server that has a matching IP range is used. In the MID Servers for Connectors section, specify a MID Server that is up and valid. You can configure several MID Servers. If the first is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section.

4. Right-click the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.



5. Verify and modify the values, as needed.
   In the Connector Instance Values section, the default connector instance values appear.

Fields in the Connector Instance Values section

Field	Description
days_from	Number of days for which events must be collected at the first collection cycle. Default value: 2

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: The maximum number of past events that can be collected is 3,000. The first time that this connector runs, the number of past events is counted in the past from the current date.
port	Port number. Default: `80`
protocol	Protocol type. Default: `https`

6. Right-click the form header and select **Save**.
7. Click **Test Connector** to verify the connection between the MID Server and the connector.
8. If the test fails, follow the instructions that are issued by the error to correct the problem and then run another test.

   Note: Use a network tool, such as ping, to verify credential correctness and network connectivity from the MID Server to the Zabbix server.

9. After a successful test, select **Active** and then click **Update**.

Credentials and connection information

Configure a Datadog work item connector instance

Configure a Datadog work item to aggregate related alerts and signals from Datadog into a trackable operational problem.

Before you begin

- Verify you already have a Datadog account with API access and Case Management in use.
- Role required: evt_mgmt_operator

About this task
ServiceNow represents a work item as an alert. Each related alert is retained individually, enabling grouping and correlation across multiple resources and monitoring systems. Alerts aren't limited to those Datadog grouped. As a result, ServiceNow identifies broader incidents, reduces duplicate alerts, and provides a more comprehensive operational view.

Note the following before you start:

- If you already use the Datadog push connector, use the same push connector URL to send work items. Configure the Datadog Case Management notification rule and the case payload template described on the push connector page.
- The push connector receives the work item and creates the work item alert and its tracking records. The pull connector then fetches the correct work item title, retrieves related alerts, and drives bi-directional close-back.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Push Connectors**.

   Note: Create this push connector to auto-create the pull connector with the matching name. The connector names must match for bi-directional and fetch related alerts.

2. Select a **Datadog Push Connector** instance used to send work items.
3. Select the **Configure Work Item Alerts** button.

   You're redirected to the pull connector instance form.

4. Fill in the fields.

Field	Description
Name	Name of the connector. The pull connector in stance name must match the push connector instance name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Description	Any optional information that you want to use to identify this record.
Host IP	Use your Datadog site's API host. For example, `api.datadoghq.eu`
Credential	The ServiceNow credential record that stores your Datadog API key or access token. The authentication method is controlled by the `useAccessToken` connector instance value. For more information, see the Connector instance value parameters table.
Active	This option appears only after the form is saved.
Bi-directional	Select to enable bi-directional exchange of values to and from the external event source. This option is available only when the connector definition has bi-directional values configured. After a work item alert is closed in ServiceNow, the corresponding case is automatically closed in Datadog.
Last bi-directional status	The value of this field is automatically populated. This option appears only when the **Bi-directional** option is selected.The status values are: ○ None - A valid connection has not yet been established. ○ Success - A successful connection was established. ○ Error - A connection was established. However the external event source was not updated.

Connector instance value parameters:

Parameter	Description
useAccessToken	Controls the authentication method. By default, this value is false. The **Credential** option must store the Datadog API key and you must set **application_key**. The connector sends the `DD-API-KEY` and `DD-APPLICATION-KEY` headers. When this value is true, the **Credential** option must store the Datadog OAuth access token. The connector sends `Authorization: Bearer <token>` header (`application_key` is not used).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter	Description
application_key	The application key of the Datadog connec tor. By default, this value is empty which indi cates Basic authentication.
fetchCaseRelatedAlerts	Controls whether related alerts are fetched for the work item. The default is true. Set it to false to disable.
caseApiPath	Set as `/api/v2/cases/`.
eventApiPath	Set as `/api/v2/events/`.

5. Right-select the form header and select **Save**.
6. Select **Test connector** to verify the connection.
7. After a successful test, select the **Active** check box and then select **Update**.

Related topics

Configure a push connector

Configure a push connector

You can configure listeners and connectors to push event information to the instance or MID Server.

Event Management receives external events through a push connector or script. If you are using a script to collect events, no configuration is required. All other methods of collecting events require configuration.

After event collection configuration, Event Management can collect events that are sent directly to the instance, or via the MID Server, SNMP trap, or email.

Note: Integrating with push connectors is only available by installing the Event Management Connector plugin from the ServiceNow Store.

Create integration user

Follow the steps in Creating users to create a user and grant the [evt_mgmt_integration] role to the user.

Note: Verify that the **Identify Type** of the user is **Machine**.

Standard event form

All events must use a standard event form, regardless of how they arrive at the instance. For more information, see Event field format for event collection.

Event collection

Event Management facilitates communication and movement of data between external applications, data sources, services, and the ServiceNow AI Platform instance.

Event collection modes	Description
Provided by the base system	Listeners and connectors provided with the Event Management application:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Event collection modes	Description
	• AWS CloudWatch, see Integrate AWS platform as a data source. • Azure event messages, see Integrate Azure Monitor as an authenticated data source. • BMC TrueSight events, see Event collection from BMC TrueSight and BMC TrueSight_v2. • Datadog events, see Integrate Datadog platform events. • Dynatrace events, see Integrate Dynatrace platform events. • Google Cloud Platform (GCP) events, see Integrate Google Cloud Platform (GCP) events • New Relic events, see Integrate New Relic platform events. • Generic event collection through the MID Server. • Generic event collection through the instance. Where event messages are received in XML, you can base your script on the example XML transform script provided with the base system.
Via MID WebService	You can configure the MID WebService Event Collector to push event messages to the MID Server. For more information, see Pushing events to the MID Server using web service API.
Create your own content	You can configure your own listener: • Via MID WebServer API. See Pushing events to the instance using web service API. • Via Custom Transformation. See Event collection from custom payloads.
Via SNMP	SNMP listeners provided with the Event Management application: Generic SNMPv2. See Configure event collection for SNMP traps. In addition, you can create your own custom listener. See Integrate with push connectors.
Via Email	Email listener. See Configure event collection from email.

Push connector instance form

Configure ServiceNow Cloud Observability event collection

Integrate ServiceNow Cloud Observability with Event Management by adding a standard webhook in the ServiceNow Cloud Observability platform. Download the Event Management Connector plugin from the ServiceNow Store so you can integrate with ServiceNow Cloud Observability.

Before you begin

- Role required: evt_mgmt_integration

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Authenticate ServiceNow Cloud Observability as a data source to enable Event Management to collect events from ServiceNow Cloud Observability. In your ServiceNow Cloud Observability platform, use a standard webhook to set your ServiceNow AI Platform instance as the rest endpoint.

Procedure

1. Create a CI.

   Note: Discovery for ServiceNow Cloud Observability services is not supported. Create a CI manually in a ServiceNow instance (cmdb_ci_service_auto table) to enable binding.

   a. Navigate to **All** > **Configuration** > **Application Service**.

   b. Select **New**.

   c. In the form, enter the name.
   The name must be the service name provided in the ServiceNow Cloud Observability platform.

   d. From the Operational Status list, set the operational status to **Operational**.

   e. Select **Next**.

   f. Select **Done**.

2. In your ServiceNow Cloud Observability platform, create a notification destination.

   a. From the navigation bar, click#**Alerts**.

   b. Select the#**Notification destinations** #tab.

   c. Select#**Create a destination**.

   d. Select **webhook**.

   e. In the Name field, enter a name for the webhook.

   f. In the URL field,#provide the webhook URL.
   This is the default #format of the URL to push events from#ServiceNow Cloud Observability to the#ServiceNow AI Platform Instance. Use this format: `https//`

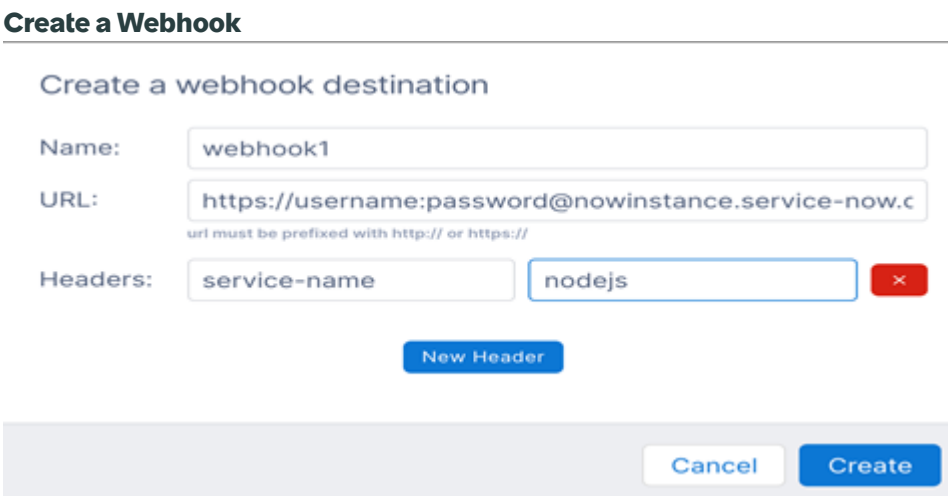
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
&lt;username&gt;:&lt;password&gt;@&lt;instance-name&gt;.service-now.com/
api/sn_em_connector/em/inbound_event?source=lightstep
```

g. Select **New Header**.

h. In the Headers field, enter the **service-name** and define its **value**.

Note: In a ServiceNow instance, CI binding occurs only if the **service-name** header value matches the name fields of the CI you created in the**cmdb_ci_service_auto table**.



i. Click **Create**.

3. In the ServiceNow Cloud Observability platform, configure an alert.

a. From the navigation bar, click#**Alerts**.

b. Select#**Create an Alert** and enter an alert name.

c. In the Alert Configuration area, define the threshold.

d. In the Notification Rules area, in the Send Notifications to fields, select the notification destination as **webhook**.

e. Search for the destination name for the webhook that you created in step 2.

f. Select **Save**.
The default severity for stream based alerts is **Critical**. You can change the default in the #Push Connector Configuration area of an ServiceNow AI Platform instance. The valid severity values are:

- 1- Critical
- 2- Major
- 3- Minor
- 4- Warning
- 5- Info

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure a MID Server push listener for event collection

The MID Server supports the collection of event messages using the MID Web Server to collect data from external sources. The data is transformed (parsed) to the format required for event fields in the event [em_event] table and transmitted to the instance.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Role required: evt_mgmt_admin

About this task

The MID Web Server extension enables external clients to push metric data and events to the MID Server. See Configure the MID Web Server extension. Use the MID WebService Event Collector to enable a URL method to push event messages to the MID Server. See Configure the MID WebService Event Collector Context.

Configure a MID Server with either *`EventManagement`* or *`All`* in the Supported Applications List.

To ensure uninterrupted services, consider also configuring a failover MID Server cluster.

Procedure

1. Navigate to **All** > **MID Server** > **Servers**.
2. Double-click the MID Server that you want to configure, or click **New** to create a new MID Server.
3. In the **Supported Applications** section, click **Edit**.
   a. Click **Edit**.
   b. In the slushbucket, either select **Event Management** or **ALL** and click the **>** add button.
   c. Click **Save**.
4. To ensure that the MID Server is validated, under Related Links, select **Validate**. For more information, see Validate a MID Server.
5. Click **Update**.

What to do next

Configure the MID WebService Event Collector to enable a URL method to push event messages to the MID Server. For more information, see Configure the MID WebService Event Collector Context.

Related topics

- Configure key-based MID Web Server authentication
- Configure the MID Web Server extension
- Configure the MID WebService Event Collector Context

Pushing events to the MID Server using web service API

Configure the MID WebService Event Collector to provide a URL method to push event messages to the MID Server.

The MID WebService Event Collector, by default, enables you to connect to an event generator and send event messages through the MID Server, using a URL in the format: `http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/jsonv2`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The JSON v2 format is the same as the format that clients use to send event messages to the instance. This URL provides good performance.

For more information, see Configure the MID WebService Event Collector Context.

Note: Event Management accepts events in the timezone of the MID Server through which the listener has sent the event message. If you require a different timezone, you can configure the script as required, see Integrate with push connectors.

URL to push custom payloads

The MID Server can also receive a custom payload in JSON, XML, or plain text format. In this case, the MID Server transforms the event messages using the script include that you provide, and then sends the events to the instance. The URL in this case is:

`http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/inbound_event?Transform={Transform_script_name}` For an example of a script include, see the default `TransformEvents_xmlSample` script include.

For an example of how the MID WebService Event Collector transforms JSON formatted event messages, see Event collection from BMC TrueSight and BMC TrueSight_v2.

To send events in generic JSON format, you can use the URL in this format:

```
http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/inbound_event?Transform=TransformEvents_MidJsonGeneric
```

In this case, the `TransformEvents_MidJsonGeneric` MID script include that is provided in the base instance transforms the event messages into the event fields. All fields are added as **Additional Information** fields into the ServiceNow event that is generated.

Note: The URL in the format `http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/{transform_script_name}`is also supported.

The REST API URL for validating connectivity is: `http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/ping`

Script include to transform collected events

Use the required MID Server script include to transform (parse) collected event messages and populate them into the mapped event field. The MID Server script include name is composed of a prefix and suffix. The prefix is the mandatory text `TransformEvents_` and the suffix is the transform name on the URL, for example, `http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/xmlSample` . The composed script name is therefore `TransformEvents_xmlSample`.

You must supply a script include that receives the event messages in a text variable. The script must have a `transform()` function that performs the transformation and prepares the return array of Event objects. When the Event Management plugin is activated, you are provided with the `TransformEvents_xmlSample` sample include script that transforms events from XML format.

Note: Event fields that are not identical to fields in the event table are saved in the **Additional information** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Event message headers

Specify the relevant request header value for the **Content-Type** field according to the format of the event message.

Request header values for the Content-Type

Message format	Content-Type value
JSON	application/json
XML	application/xml
text	text/plain

Authentication and data security options

Options for authentication and data security:

- **Authentication type**, which can be set to either `API Key`, `mTLS`, or `Basic`.
- **Secure Connection**, which lets you choose whether incoming and outgoing data is secured when transmitted. If you choose the advanced secured option, it requires that you obtain a certificate from a well-known certificate authority, and then provide the **Keystore Certificate Alias** and the **Keystore Password**.
- **Use MID Unified Keystore**, which provides encryption protection and enables you to install a custom certificate in the MID Server unified keystore. For details, see Install custom certificates in the MID Server unified key store.
- Users must supply a script that receives the JSON, XML, or text formatted event messages in a text variable. The script must have a transform() function that performs the transformation and prepares the return array of event objects. The `TransformEvents_xmlSample` include script that transforms events from XML format is provided as an example when the Event Management plugin is activated.

For more information about authentication and data security, see Configure the MID Web Server extension.

Related topics

Pushing events to the instance using web service API

Pushing events to the instance using web service API

You can use a web service interface, supported by ServiceNow, that operates on the JSON object as the data input and output format.

Before you begin

Role required: evt_mgmt_integration

About this task

To insert records in the event [em_event] table with a single call, use this web service API:
`https://<instancename>.service-now.com/api/global/em/jsonv2`

Note: Business rules on the event table are not invoked when this URL is used.

Do not add additional fields to an event by adding a custom field to the event table [em_event]. However, additional fields should be included in the **Additional information** [additional_info] field of the event. For more information about how to include additional fields in events, see Custom alert fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For information about troubleshooting performance issues with inbound integrations, see Troubleshooting inbound integrations performance.

The URL in the format: `http://<instancename>.service-now.com/em_event.do?JSONv2&sysparm_action=insertMultiple` is also supported in case you do want to activate Business rules. However, the performance of the first URL is superior.

To work with the URL that ends with `=insertMultiple`, add the following properties, with their respective values, to the MID Server:

- "mid.probe.event.queue.compress" - value: false
- "mid.probe.event.bulk_size" - value: 100
- "mid.probe.event.endpoint.url" - value: em_event.do?JSONv2%26sysparm_action=insertMultiple

Procedure

1. Send the request with these headers:

Parameter	Type	Description
Accept	String	The acceptable type for this message. The default value is `application/json`.
Content-Type	String	The content type for this message. The default value is `application/json`.
POST	String	The request type is POST, with one or more trailing records.

2. One or more events in JSON format can be sent as the payload of the web service call. Event fields that should be populated are:

Variable	Description
source	The name of the event source type. For example, SCOM or SolarWinds.
event_class	Specific instance of the *source*. For example, `SCOM 2012 on 10.20.30.40`
node	The **node** field should contain an identifier for the Host (Server/Switch/Router/etc.) that the event was triggered for. The value of the **node** field can be one of the following identifiers of the Host: ○ Name ○ FQDN ○ IP ○ Mac Address If it exists in the CMDB, this value is also used to bind the event to the corresponding ServiceNow CI.
resource	Populate this field with the device or application name. Use this field if the event refers to a device (such as Disk, CPU, or Network Adapter) or to an application or service running on a Host. Examples: `Disk C:\`, `Nic 001`, or `Trade web application`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Variable	Description
metric_name	Name of the metric that triggered the alert. For example, `Used Memory` or `Total CPU utilization`.
type	The type of event. This type might be similar to the **metric_name** field, but is used for general grouping of event types.
message_key	This value is used for de-duplication of events. For example, there might be two events for the same CI, where one event has CPU of 50% and the next event has CPU of 99%. Where both events must be mapped to the same ServiceNow alert, they should have the same message key. The field can be left empty, in which case the field value defaults to `source+node+type +resource+metric_name`. The **message_key** should be populated only when there is a better identifier than the default.
severity	Severity of the event. ServiceNow values for severity range from 1 – Critical to 5 – OK, with the severity of 0 – Clear. Original severity values should be sent as part of the additional information.
additional_info	This field contains a JSON string (stringified JSON) with key/value pairs representing supplemental information not mapped to standard event fields. Examples include IDs of objects in the event source, event priority (if different from severity), and assignment group information. Values not already in JSON key/value format are normalized to stringified JSON when the event is processed.
time_of_event	Time when the event occurred on the event origin. The format is: yyyy-MM-dd HH:mm:ss The specified time must be according to GMT.
resolution_state	Optional – To indicate that an event has been resolved or no longer occurring, some event monitors use 'clear' severity. Others use a 'close' value for severity. This field is used for monitors that use the 'close' value. Valid values are `New` and `Closing`.

3. To create multiple records with a single call, trigger the event web service using the following URL:

   Replace the <instance name> variable with the name of the required instance.

   `https://<instancename>.service-now.com/api/global/em/jsonv2`

   Example
   Example showing the payload for two events that are sent in a single web service call:

```
{
  "records": [
    {
      "source": "SCOM",
      "event_class": "SCOM 2012 on scom.server.com",
      "resource": "D:",
      "node": "name.of.node.com",
      "metric_name": "Percentage Logical Disk Free Space",
      "type": "Disk space",
      "severity": "4",
      "description": "The disk D: on computer
 V-W2K8-abc.abc.com is running out of disk space. The value
 that exceeded the threshold is 38% free space.",
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
      "additional_info": "{\"scom-severity\":
 \"Medium\", \"metric-value\": \"38\", \"os_type\":
 \"Windows.Server.2008\"}"
    }
},
    {
      "source": "SCOM",
      "event_class": "SCOM 2012 on scom.server.com",
      "resource": "MSSQL-database-name",
      "node": "other.node.com",
      "metric_name": "DB Allocated Size (MB)",
      "type": "Database Storage",
      "severity": "3",
      "description": "High number of active connections for
 MSSQL-database-name running on name.of.node.com. Active
 connections exceed 5000.",
      "additional_info": "{\"scom-severity\":
 \"Medium\", \"metric-value\": \"38\", \"os_type\":
 \"Windows.Server.2008\"}"
      }
    }
  ]
}
```

4. Trigger the event web service using the following URL:
   Replace <instancename> with the name of the required instance. `https://<instancename>.service-now.com/api/global/em/jsonv2`

   Example
   Example showing the payload for one event that is sent in a single web service call:

```
{
  "records": [
    {
      "source": "SCOM",
      "event_class": "SCOM 2007 on scom.server.com",
      "resource": "C:",
      "node": "name.of.node.com",
      "metric_name": "Percentage Logical Disk Free Space",
      "type": "Disk space",
      "severity": "4",
      "description": "The disk C: on computer
 V-W2K8-dfg.dfg.com is running out of disk space. The value
 that exceeded the threshold is 41% free space.",
      "additional_info": "{\"scom-severity\":
 \"Medium\", \"metric-value\": \"38\", \"os_type\":
 \"Windows.Server.2008\"}"
      }
    }
  ]
}
```

Pushing events to the MID Server using web service API

Configure the MID WebService Event Collector Context

Configure the MID WebService Event Collector Context to provide a URL method to push event messages from an external source to the MID Server.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Role required: evt_mgmt_admin

About this task

The default format of the URL to push event messages from an external source to the MID Server is `http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/jsonv2`. This URL provides good performance.

From an external source, to push event messages that are not in jsonv2 format, the format of the URL is: `http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/inbound_event?Transform={Name_of_Transform_Script}`, where the *`{Name_of_Transform_Script}`* variable is the full name of the script and always begins with the text: `TransformEvents_`.

For example, assume the following values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- {MID_Server_IP}: 10.118.69.27
- {MID_Web_Server_Port}: 8097
- Transform script name: EventsToProcess

The URL to be used is therefore: `http://10.118.69.27:8097/api/mid/em/inbound_event/TransformEvents_EventsToProcess`

Note:

- The URL in the format `http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/{transform_script_name}` is also supported.
- The date format for events is yyyy-M-d h:mm:ss.

  If you receive an event whose date is in a different format, you must use a `{transform_script_name}` that is appropriate for the incoming event's date format. If you do not, the event will not be processed correctly.

  For example, an event might arrive on June 27, 2019 at 11:25 AM with a listed date of *`2019/06/27/ 11:25:00 a`*. Use a `{transform_script_name}` with a date format of *`yyyy/MM/dd/ HH:mm:ss a`* to match the format of the received event.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **MID WebService Event Listener**.
2. In the MID WebService Event Collector Contexts list, click **New**.
3. On the form, fill in the fields.

MID WebService Event Collectors Context form

Field	Description
Name	A unique name for this collector for easy identification.
Short description	Enter a brief, meaningful description of this collector.
MID Web Server Extension	Specify and then start the MID Web Server extension. The supported authentication methods are listed in the **Authentication Type** field of the MID Web Server extension. For information about how to configure a MID Web Server extension, see Configure the MID Web Server.
Status	This field is auto-populated with the status of the MID Web Server extension. This field is blank until the MID Web Server extension is started. After issuing a command to the MID Web Server extension, one of the following values is displayed: ○ **Started**: The collector is running. ○ **Stopped**: The collector is not running. ○ **Offline**: The MID Server is down.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **Error**: The collector failed with an error (the error message is displayed in **Error Message**). ○ **Warning**: A run-time exception has occurred.
Execute on	**Specific MID Server** or **Specific MID Server Cluster**, as defined on the specified MID Web Server extension. **Note: Specific MID Server Cluster** is only for internal processing of ECC queue record and is not for external API load balancing.
MID Server	The **Specific MID Server** or **Specific MID Server Cluster**, as defined on the specified MID Web Server extension.
Executing on	The name of the MID Server on which the MID Web Server extension is running.

4. Right-click the form heading and click **Save**.
5. Under **Related Links**, click **Start** to start the collector.

Commands in the Event Management Context form

Related Link	Description
Start	If it is not running, start the collector. This action verifies that a web service API endpoint with the Event Management application is running on the MID Server.
Stop	Stops the running collector on the configured MID Server. If the collector is not running, no action is taken.
Restart	Stops, then starts the collector on the configured MID Server.
Update parameters	Sends updated parameters to the collector. Parameters are also updated when the Event Management MID Server context extension is updated. If you click this control when the collector is not running, no update is made.

Example:
Showing the use of the URL to transform JSON v2 formatted event messages

Assume that JSON v2 formatted event messages are sent to the MID Server. When using the `jsonv2` URL, there is no need to use a script include.

Data for the JSON v2 example

Field	Value
MID_Server_IP	10.218.64.27
MID_Web_Server_Extension_Port	8097
Event message format	jsonv2

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Replace the variables in the default format of the URL `http://<my-instance>.service-now.com/api/global/em/jsonv2`with values from the preceding table:`http://10.218.64.27:8097/api/global/em/jsonv2`

Example showing the URL to push messages not in jsonv2 format

The format of the URL to push event messages from an external source that are not in jsonv2 format is `http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/inbound_event/Transform={Name_of_Transform_Script}`. The {Name_of_Transform_Script} variable is the full name of the script and always begins with the text: TransformEvents_. Specify the script name as the `Transform` header parameter with the prefix `TransformEvents_`.

For this example, assume that the script name is EventsToProcess, the URL is therefore:`http://10.138.64.27:8097/api/mid/em/inbound_event/TransformEvents_EventsToProcess`

Example showing JSON v2 formatted event messages

Note: When copying and pasting the text following, hidden characters might also be copied and can cause unexpected results.

```
curl -v -H "Accept: application/json" -H "Content-Type:
 application/json" -X POST --data "{
    \"records\":
    [ {
         \"source\" : \"Simulated\",
        \"node\" : \"nameofnode\",
        \"type\" : \"High Virtual Memory\",
        \"resource\" : \"C:\",
        \"severity\" : \"5\",
        \"description\" : \"Virtual memory usage exceeds 98%\",
        \"ci_type\":\"cmdb_ci_app_server_tomcat\",
        \"additional_info\":\"{\\\"name\\\":\\\"My
 Airlines\\\"}\"
      },
      {
      \"source\" : \"Simulated\",
      \"node\" : \"01.myairlines.com\",
      \"type\" : \"High CPU Utilization\",
      \"resource\" : \"D:\",
      \"severity\" : \"5\",
      \"description\" : \"CPU on 01.my.com at 60%\"
      }
   ]
}" -u UserName:Password
 http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/jsonv2
```

Example:
Example showing JSON v2 formatted event messages with MID Web Server API key

Note: When copying and pasting the text following, hidden characters might also be copied and can cause unexpected results.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
curl --location -g --request POST
 'http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/json
v2' \
--header 'Accept: application/json' \
--header 'Content-Type: application/json' \
--header 'Authorization: key <mid_webserver_api_key>' \
--data-raw '{
   "records":
    [ {
         \"source\" : \"Simulated\",
        \"node\" : \"nameofnode\",
        \"type\" : \"High Virtual Memory\",
        \"resource\" : \"C:\",
        \"severity\" : \"5\",
        \"description\" : \"Virtual memory usage exceeds 98%\",
        \"ci_type\":\"cmdb_ci_app_server_tomcat\",
        \"additional_info\":\"{\\\"name\\\":\\\"My
 Airlines\\\"}\"
     },
     {
     \"source\" : \"Simulated\",
     \"node\" : \"01.myairlines.com\",
     \"type\" : \"High CPU Utilization\",
     \"resource\" : \"D:\",
     \"severity\" : \"5\",
     \"description\" : \"CPU on 01.my.com at 60%\"
     }
   ]
}'
```

Example: Configuring external API integrations with MID Server failover

To ensure high availability for external API integrations, deploy an external load balancer that distributes traffic across multiple MID servers. Note that the MID cluster web server configuration handles internal processing only (through ecc_queue) and can't manage inbound external API traffic.

Recommended architecture for external API integrations

Field	Value
MID Server 1	mid-1.internal:8080
MID Server 2	mid-2.internal:8080
External Load Balancer	mid-cluster.example.com:443
API endpoint format	jsonv2

Reference the external load balancer hostname in your webhook URL rather than individual MID Server addresses. Replace the variables in the default format: `https://<load-balancer>/api/mid/em/inbound_event?Transform=<format>` with values from the preceding table: `https:///mid-cluster.example.com/api/mid/em/inbound_event?Transform=jsonv2`.

This configuration distributes incoming requests across both MID servers. If one server becomes unavailable, the load balancer automatically routes traffic to the remaining operational server without service interruption.

- Event collection from BMC TrueSight
- Event collection from Microsoft Azure Monitor
- Event collection from Google Cloud Platform

Event collection from custom payloads

The MID WebService Event Collector enables you to collect event information from custom payloads in JSON, XML, or plain text format.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Role required: evt_mgmt_admin

About this task

The MID Server transforms the collected event messages and populates the Event table fields (em_table) in the instance. The collection of formatted event messages is described in this procedure using basic authentication. For information about supported authentication methods, see Configure the MID Web Server extension.

The format of the required MID Server URL is: `http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/inbound_event?Transform={Transform_script_name}`. The name of the MID Server script include is composed by appending a suffix to the default `TransformEvents_` prefix. For information about the collection of JSON v2 event messages, see Configure the MID WebService Event Collector Context.

Note: The URL in the format `http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/{transform_script_name}` is also supported.

Procedure

1. Configure the MID WebService Event Collector, see Configure the MID WebService Event Collector Context.
2. Start the MID WebService Event Collector.

Example:

Transformation of XML formatted event messages using the custom payload URL

Assume that XML formatted event messages are sent to the MID Server. Use this example to return an array of event objects from the collected event messages. The name of the MID Server script include is composed by appending a suffix to the default `TransformEvents_` prefix. For the purposes of this example, the user supplied the xmlSample script include. Using these details, the name of the MID Server script include is `TransformEvents_xmlSample`. The MID Server transforms the collected event messages by parsing the messages using the script include and then transmitting them to the instance.

Data for the XML example

Field	Value
MID_Server_IP	10.218.64.27

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data for the XML example (continued)

Field	Value
MID_Web_Server_Extension_Port	8097
transform_script_suffix _name	xmlSample

Replace the variables in the URL with the values from the above table:
`http://10.218.64.27:8097/api/mid/em/xmlSample`

Note: When copying and pasting the text below, hidden characters might also be copied and can cause unexpected results.

Example showing XML formatted event messages:

```
<records>
    <event>
    <source>My Source</source>
    <node>host1</node>
    <type>type1</type>
    <severity>3</severity>
    <description>Virtual memory usage exceeds 98%</description>
    </event>
    <event>
    <source>My Source</source>
    <node>host2</node>
    <type>type2</type>
    <severity>2</severity>
    <description>Virtual memory usage exceeds 90%</description>
    </event>
    </records>
```

Related topics

Configure the MID Web Server extension

Configure the MID WebService Event Collector Context

Integrate with push connectors

Integrate with a push connector to connect to an external event source. Push connectors process the collected event messages and transform them to the required event format.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed.

Role required: evt_mgmt_admin

Note: If you are upgrading a ServiceNow AI Platform instance from Paris or earlier, you can use legacy listener transform scripts. See Use legacy listener transform scripts for further information.

About this task

The push connectors accept event messages that are generated by external event sources. Configure a connector to listen to an external event source. Using a custom push connector, send the event messages through either the MID Server or the instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: You can use this generic JSON target URL to collect events:`https://<<INSTANCE>>/api/sn_em_connector/em/inbound_event?source=genericJson`. This URL can be used as-is and requires that an event rule be configured.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Push Connectors**.
2. Click **New** or click the push connector that you want to modify, for example, AWS or Azure.
3. On the form, fill in the fields.

Field	Description
Name	Unique name for this push connector for easy identification.
Description	Enter a description for the use of the push connector.
Header name	Specify the name of the header that you want the value for, such as Set-Header.
Header value	The value of the header name that you want the value for, such as Set-Header.
Type	Select to send events either `Instance` or `MID`. In each case, use the URL of the selected type. See the description of the **URL parameter value** field.
Active	Select to enable pulling events from this external event source.
Order	Order in which an event rule is evaluated when multiple rules are defined for the same type of event. Event rules are evaluated in ascending order.
URL parameter value	○ Send events to the instance. Use the URL in this format for all connectors: `https://<<INSTANCE>>/api/sn_em_connector/em/inbound_event?source={URL_parameter_value}` ○ Send events through the MID Server. Use the URL in the format:`http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/inbound_event?Transform={Transform_script}` **Note:** Sending events to the MID Server requires the prior configuration of the MID WebService Event Listener extension.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. In the Script section:
   - If the value selected for the **Type** field is `MID`, the **Transform script** field appears. In this field, specify or search for the name of the MID script include. The script accepts event messages from the required external event source and parses them into the required event format. Use this naming convention for the script: `TransformEvents_<your source>`
   - If the value selected for the **Type** field is **Instance**, the **Script** editor appears. In the **Script** editor, enter the customized script that accepts event messages that the required external event source generates and that the script parses into the required event format.

Example
This example shows the fields that have been transformed, being added to an event form.

```
(function process(/*RESTAPIRequest*/ request, body) {
 /*Function that receives a JSON object, adding all its fields
 to the Additional information object. The field name is a
 concatenation of the field key and the parent field key if it
 exists.*/
 function updateAdditionalInfo(event,
 field,jsonObject,additionalInfo) {
        for (var key in jsonObject) {
            var newKey = key;
            if (field != "") {
                newKey = field + '_' + key;
            }
   // You can do some transformation here and set fields on the
 event
   //if(key == "MySource")
   //   event.source = jsonObject[key];
            additionalInfo[newKey] = jsonObject[key];
        }
    }

    try
 {
        gs.info("TransformEvents_generic received body:" +
 body);
  var jsonObject = JSON.parse(body);
        var event = new GlideRecord('em_event');
  event.source = "GenericJson"; //TODO: Need to define
        event.event_class = "GenericJsonClass"; //TODO: Need to
 define
        event.severity = "5";

        var additionalInfo = {};
        updateAdditionalInfo(event,
 "",jsonObject,additionalInfo);
  /*Iterates over Additional information JSON object and
 adds all nested objects' fields as fields of the Additional
 information object*/
        var notDone = true;
        while (notDone) {
            notDone = false;
            for (var key in additionalInfo) {
                if
 (Object.prototype.toString.call(additionalInfo[key]) ==
 '[object Object]') {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
                    notDone = true;
                    updateAdditionalInfo(event,
 key,additionalInfo[key],additionalInfo);
     additionalInfo[key] = "";
                 }
             }
         }
  gs.info("TransformEvents_generic generated additional
 information:" + JSON.stringify(additionalInfo));
        event.additional_info = JSON.stringify(additionalInfo);
        event.insert();
 }
 catch(er){
  gs.error(er);
  status=500;
  return er;
 }
 return "success";
})(request, body);
```

Use legacy listener transform scripts

Use legacy listener transform scripts when upgrading a ServiceNow AI Platform instance from Paris or earlier. These scripts can be run as part of existing integrated systems, or in unison with Event Management push connectors.

You can use listener transform scripts to ensure that previous integrations are supported. For example, if you are using the `https://<instance-name>.service-now.com/api/global/em/inbound_event` endpoint in various existing integrations, you can continue to use this endpoint in a Quebec or later ServiceNow AI Platform instance.

If you want to use the Event Management push connectors, download the plugin from the ServiceNow Store website. You can then access the push connectors in the ServiceNow AI Platform instance, and the `https://<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event` endpoint is also created.

Use the legacy endpoint with push connectors

You can continue to use the `https://<instance-name>.service-now.com/api/global/em/inbound_event` endpoint with the push connectors, by deactivating the relevant transform scripts. To deactivate a script, navigate to **Event Management** > **Integrations** > **Listener Transform Scripts**. Then click the relevant script in the displayed list, and clear the **Active** check box in the form.

Use the legacy endpoint and deactivate all listener transform scripts

You can also continue to use the `https://<instance-name>.service-now.com/api/global/em/inbound_event` endpoint but deactivate all listener transform scripts to use the push connectors instead. To deactivate all scripts, navigate to **System Properties** > **All Properties**, locate the *sn_em_connector_listener_table_for_InboundEvent* property, and set its value to **True**.

Migrate custom listener transform scripts to the push connectors module

If you have created custom listener transform scripts, they must be migrated to the push connectors module if you want to use the new `https://<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event` endpoint. To migrate the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

custom script, navigate to **Event Management** > **Integrations** > **Listener Transform Scripts**, click the relevant listener transform script, and select the displayed script. Then navigate to **Integrations** > **Push Connectors**, click **New**, and paste in the script you copied from the listener transform script.

Integrate AWS platform as a data source

Integrate Amazon Web Services (AWS) with Event Management. To add AWS platform as a data source, configuration is required in the AWS platform.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Download the Event Management Connectors plugin from the ServiceNow Store.

Role required: evt_mgmt_admin

About this task

When an AWS platform alarm arrives, Event Management:

- Extracts information from the original AWS platform alarm to populate the required event fields and inserts the event into the database.
- Captures the content in the **additional_info** field.

The AWS platform push connector is located in **Event Management** > **Integrations** > **Push Connectors**. In the Push Connectors page, click **AWS Events Push Connector**.

Note: The AWS push connector that is provided in the base system handles AWS CloudWatch alarms only and not CloudWatch events created through event rules. To handle Simple Notification Service (SNS) alarms that are other than AWS CloudWatch, create a new push connector or customize the AWS push connector.

Starting from the Xanadu release, the OOTB (Out-Of-The-Box) event rules provided with the connector, which you have not previously used (i.e., neither activated, deactivated, nor modified), will now have the **Apply additional matching rules** check box set to true. Previously, this check box was disabled. This change allows you to execute more event rules or automation using the same filter conditions for the events.

Note: This feature applies only to active event rules.

Procedure

1. In the AWS platform console, select **Simple Notification Service** .
   If an SNS topic does not exist, create one.
2. Under the SNS topic, create a new subscription.

   a. Take **Topic ARN** from the topic that you created.
   The Amazon Resource Name (ARN) is necessary for binding an Event Management alert to a CI.

   b. Set **Protocol** to: *https*.

   c. In the ServiceNow instance, create a non-interactive user account or identify an existing non-interactive ServiceNow user for this integration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Assign the user only the `evt_mgmt_integration` role. Configure the password according to the password policy for your ServiceNow instance.

d. Set **Endpoint** to: `https://<username>:<password>@<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=aws`

If AWS platform multi-factor authentication (MFA) is enabled, when signing in to the AWS platform website, you're prompted for the user name and password, as well as an authentication code from the AWS platform MFA device of the user.

3. Wait until the subscription changes from `Pending` to `Confirmed` and the subscription ARN is populated.
This can take a few minutes.
4. Create alarms in AWS platform to send to Event Management and link the alarms to the SNS topic that you created.
Raw message delivery must not be enabled in AWS alarm. These following event rules are provided with the base system:

Event rule	Description
AWS host binding	Bind AWS platform alarms, on either the host or virtual machine (VM), to the host Hardware CI.
AWS - General	Bind AWS platform alarms on the Load Balancer (LB) to the Cloud Load Balancer CI, Amazon Relational Database Service (RDS) to the Cloud Database CI, and Host or Virtual Machine (VM) to the Virtual Machine Instance CI. **Note:** To bind events from the Host or Virtual Machine to the Virtual Machine Instance CI, disable the AWS host binding rule.

Note: For the push connector to handle the incoming event, you must sent a request header **x-amz-sns-message-type** with value **Notification**.

This example shows a JSON string for AWS VM binding:

```
{
"Type" : "<type>",
"MessageId" : "<message ID #>",
"TopicArn" : "<topic arn>",
"Subject" : "ALARM: \"<alarm type>\" in <location>",
"Message" : "{\"AlarmName\":\"<alarm
 name>\",\"AlarmDescription\":<alarm
 description>,\"AWSAccountId\":\"<account ID
 #>\",\"NewStateValue\":\"ALARM\",\"NewStateReason\":
\"Threshold Crossed: <threshold and datapoint which
 it crossed>.\",\"StateChangeTime\":\"<date and
 time>\",\"Region\":\"<location>\",\"OldStateValue\":\"OK\",
\"Trigger\":{\"MetricName\":\"CPUUtilization\",\"Namespace\":
\"<namespace>\",\"Statistic\":\"<statistic
 name>\",\"Unit\":null,\"Dimensions\":[{\"name\":
\"InstanceId\",\"value\":\"<dimension
 value>\"}],\"Period\":<period
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 number>,\"EvaluationPeriods\":<number of evaluation
 periods>,\"ComparisonOperator\":
\"GreaterThanOrEqualToThreshold\",\"Threshold\":<threshold
 number>}}",
"Timestamp" : "<date and time>",
"SignatureVersion" : "<version number>",
"Signature" : "<signature>",
"SigningCertURL" : "<URL>",
"UnsubscribeURL" : "<URL>"
}
```

5. To enable multiple member accounts to forward CloudWatch or EventBridge events to a centralized account, where a single SNS topic delivers them to the ServiceNow Event Ingestion endpoint, you need to make configuration on AWS side.
   To configure it, see https://repost.aws/knowledge-center/cloudwatch-cross-account-sns.
   This design simplifies integration, avoids duplicating SNS topics across accounts, and provides a single entry point for all monitoring events flowing into ServiceNow.

Related topics

Event field format for event collection

Integrate with push connectors

Integrate AWS with REST API key token

Integrate using an API key to establish secure communication and automate data exchange via REST API. This simplifies integration, enabling seamless access to services and enhancing operational efficiency.

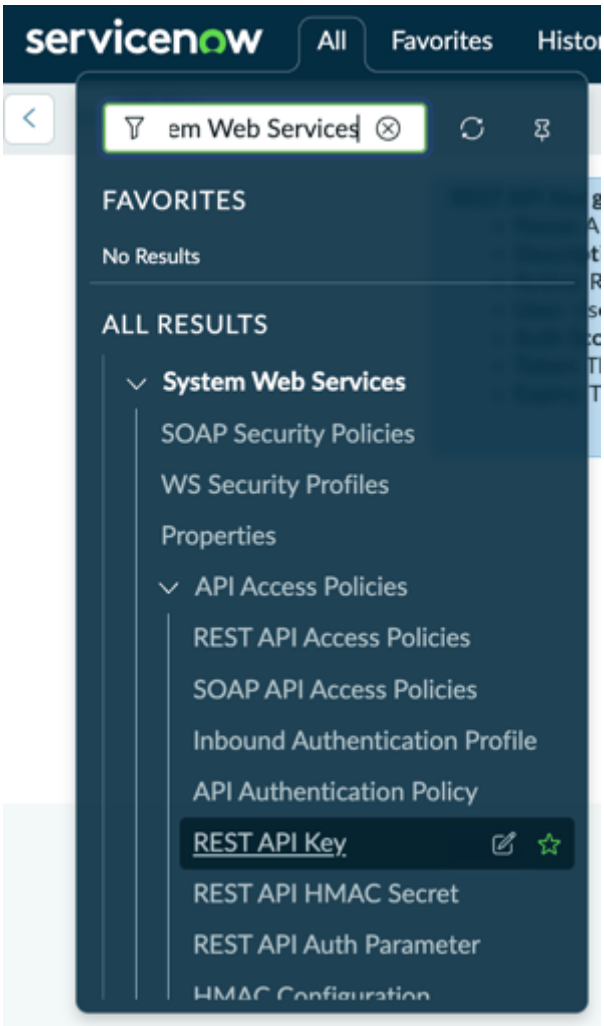
Before you begin

Role required: evt_mgmt_integration

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Web Services** > **API Access Policies** > **REST API Key**.



2. Select **New**.
3. On the form, fill the fields.

> **Note:** The user needs to be created with the evt_mgmt_integration role. Create a new one on the sys_user table to use here to facilitate the right access.

API Key

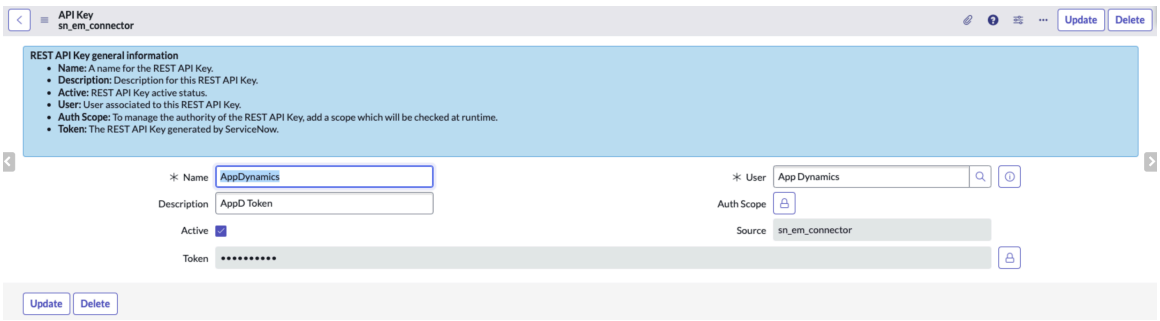
Field	Description
Name	Name to identify the REST API Key
Description	Description for the REST API Key.
Active	Status of the REST API Key.
User	User associated to the REST API Key. Use the look-up icon to select the user.
Auth Scope	Option to add auth scope to manage the authority of the REST API Key.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Token	The REST API key generated by the ServiceNow AI Platform. Copy the key to use as part of the REST API call within the Header or Query parameter.
Expiry	Time after which the credential is no longer valid. Empty value means no expiration.

4. Unlock Auth Scope and add: UserAccount.
5. Use the form menu and select **Save**.

   The system generates a token and saves it in the **Token** field. To see the token, use the lock icon and copy the contents display below the field. This is your query parameter (or header) value when your other system sends a REST API request to ServiceNow.



6. In the AWS environment, under **Simple Notification Service**, create a new topic and then create a new subscription by selecting the topic that you have created.
7. In the Create Subscription window, enter the ServiceNow endpoint value in the **Endpoint** field. Format of the api-key value must be: `https://[INSTANCENAME].service-now.com/api/sn_em_connector/em/inbound_event?source=[SOURCENAME]&sys_id=[SYSID OF PUSH CONNECTOR INSTANCE]&x-sn-apikey=[AUTH TOKEN]`.

   The [AUTH TOKEN] value is the system-generated token displayed in the **Token** field.

Integrate Azure Monitor as an authenticated data source

Integrate Microsoft Azure with Event Management by adding the Azure Monitor as an authenticated data source.

You can configure the Event Management environment for the collection of events from Azure Monitor by setting your ServiceNow AI Platform instance as the rest endpoint.

Once the endpoint is configured, when an Azure Monitor alert message arrives, Event Management:

- Authenticates the Azure Monitor alert message with the relevant ServiceNow user, using OAuth configuration or a standard webhook.
- Extracts information from the original Azure Monitor alert message to populate required event fields and inserts the event into the ServiceNow AI Platform database.
- Captures specified content in the **Additional Information** field of the event form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What authentication is used

There are two methods of authentication:

- OAuth authentication: Provides enterprise-grade authentication to keep your enterprise environment safe. Authentication is performed using Azure Monitor V1 or V2 access tokens. For more information, see Integrate Azure Monitor with OAuth authentication.
- API key authentication: Integrate using API key to secure communication between Azure and ServiceNow. For more information, see Integrate Azure with REST API key token.
- Basic webhook authentication: Provides a basic standard of authentication, without the need for Azure Active Directory. This authentication can be especially useful for distributed small teams, such as SRE or DevOps teams. For more information, see Integrate Azure Monitor with basic authentication.

What to know before you begin

You can use your integrated Azure Monitor as a data source only after you have verified the following:

- For both methods of authentication, the relevant ServiceNow sys_user is assigned the evt_mgmt_integration role.
- The Event Management Connectors plugin is installed in the ServiceNow AI Platform instance. You can download the plugin from the ServiceNow Store website.
- Azure Cloud Discovery must be performed to ensure that the created alerts are bound to the configuration items in the ServiceNow AI Platform. For more information, see Discovery for Microsoft Azure.

Event Rules and Event Field mappings

These event rules and event field mappings are provided with the base system:

Module	Description
Event Rules	**Azure Monitor**: A general event rule to handle all Azure Monitor events.
Event Field Mappings	**Azure Monitor - ci_type**: To map ci_type of events based on resourceType field. A base set of mapping pairs are provided.

These are the mappings provided with the base system in **Azure Monitor - ci_type**:

Transform Value Pairs

Event Mapping Pairs

Key	Value
microsoft.compute/virtualmachines	cmdb_ci_vm_object
microsoft.documentdb/databaseaccounts	cmdb_ci_cloud_database
microsoft.sql/servers	cmdb_ci_cloud_database
microsoft.web/sites	cmdb_ci_cloud_webserver
microsoft.cache/redis	cmdb_ci_cloud_database
microsoft.documentdb	cmdb_ci_cloud_database
microsoft.sql/servers/databases	cmdb_ci_cloud_database

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: You can add new mapping pairs to the Event Field Mapping - **Azure Monitor - ci_type** as per the requirement, to map events to the respective ci_type based on resourceType.

Starting from the Xanadu release, the OOTB (Out-Of-The-Box) rules provided with the connector, which you have not previously used (i.e., neither activated, deactivated, nor modified), will now have the **Apply additional matching rules** check box set to true. Previously, this check box was disabled. This change allows you to execute more event rules or automation using the same filter conditions for the connector.

Note: This feature applies only to active event rules.

If you want to send alert state changes on the ServiceNow instance from the ServiceNow alerts to the Azure Portal, you need to enable the Azure Monitor Bi-directional connector. For more information, see Configure Azure Monitor Bi-directional connector.

Severity mapping from Azure severity to ServiceNow event severity

Azure severity condition	ServiceNow event severity
When an Azure alert monitorCondition is Fired	
Azure Sev0	ServiceNow Critical (severity "1")
Azure Sev1	ServiceNow Major (severity "2")
Azure Sev2 and Sev3	ServiceNow Warning (severity "4")
Azure Sev4	ServiceNow OK (severity "5")
When an Azure alert monitorCondition is resolved	
Any Azure severity	ServiceNow CLEAR (severity "0")

Azure Monitor Issue integration

An Azure Issue is a unified case that aggregates related alerts and signals from Azure Monitor into a single, trackable operational problem. It preserves investigation context and serves as a durable record for incident management Incident Management, so you can resolve problems faster instead of tracking scattered alerts.

Before you begin

Verify you already have an Azure Monitor Workspace.

Role required: evt_mgmt_admin

About this task

ServiceNow represents an Azure Issue as a single alert. View the alerts that Azure grouped into the Issue in the **Related Records** tab from the Express List side panel or the alert record in Service Operations Workspace. ServiceNow retains each related alert as an individual alert. This approach lets ServiceNow group and correlate alerts across multiple resources and monitoring systems. ServiceNow is not limited to the alerts that Azure grouped into the Issue. As a result, ServiceNow identifies broader incidents, reduces duplicate alerts, and provides a more comprehensive operational view. For this reason, ServiceNow represents an Azure Issue as a single alert instead of an alert group.

Note the following before you start:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If you already use the Azure Push Connector to send Microsoft Azure alerts to ServiceNow, use the same push connector URL to send Azure Issues.
- If you're configuring Azure alerts/issues for the first time, use the Azure Push Connector URL to create an action group in the Azure portal. Use the following URL in the Azure action group secure webhook field:

```
https://<instance_name>.service-now.com/api/sn_em_connector/em/inbound_event?source=azuremonitor
```

- If you have different tenants with different Azure Service Principal credentials (per tenant or per subscription), create separate Azure Push Connector instances. Use them to push Azure alerts or issues into your ServiceNow instances.

You can integrate Azure Monitor issues using Integration Launchpad. For more information, see Configure Azure Monitor Issue in Integrations Launchpad.

Procedure

1. In the Azure Monitor portal, perform the following steps:
   a. Navigate to your Azure Monitor Workspace.
   b. Navigate to **Settings** > **Action groups** and select the existing action group that you use to send Azure alerts to ServiceNow.

      This creates an alert, and in turn, the Alert Management rule creates an incident. If you're configuring Azure issues for the first time, first create an action group by following the steps in Integrate Azure Monitor with OAuth authentication.

   c. If you need related alerts and resource information for an issue in the Azure portal under the **Alerts** and **Resources** tab and for bi-directional synchronization, configure the pull connector by performing the steps as mentioned below.
2. In the ServiceNow AI Platform instance, configure a pull connector if you have used a push connector to send Azure issues by perform the following steps:
   a. Navigate to the push connector you're using by going to **All** > **Push connectors**.
   b. Select the Azure Monitor push connector.
   c. Select **Configure Issue Alerts** on the push connector form.

      You're redirected to the pull connector instance form.

   d. If the Azure Monitor pull connector is already activated, verify your credentials and that the instance is active, then select **Test Connection** to validate.
   e. If the Azure Monitor pull connector is not activated yet, configure it as follows:
      i. Leave the pull connector instance name as `Azure Monitor`.
      ii. In the **Credentials** field, enter your Azure Service Principal credential.
      iii. Leave the **Host** field as `1.1.1.1` as it will not be used.
      iv. Select the **Active** check box to activate the connection.
      v. Set *`fetchIssueRelatedAlerts`* to control whether the system fetches related alerts for the issue.

         The default is true. Set it to false if you want to disable this behavior.

      vi. Set *`fetchIssueRelatedAlertsLimit`* to the maximum number of related alerts the system fetches for the issue. The default is 10.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

vii. Select **Test Connection** to validate the connection.

If Azure bi-directional connector is enabled, when an Azure issue is closed in ServiceNow, it automatically closes in the Azure portal as well.

When an Azure issue is closed in ServiceNow, it automatically closes in the Azure portal as well.

3. In the ServiceNow AI Platform instance, configure a pull connector if you have used a push connector instance to send Azure issues by perform the following steps:
   a. Navigate to the push connector instance you're using in ServiceNow by navigating to **All** > **Push connector Instances**.
   b. Select the Azure Monitor push connector instance that was used to send Azure Issues in to ServiceNow instance.
   c. Select **Configure Issue Alerts** UI action present in the push connector form.

      You're redirected to the pull connect instance form.

   d. In the pull connector creation form, perform the following steps:

      i. Leave the pull connector instance name as is.

         The pull connector instance name must match with the push connector instance name.

      ii. In the **Credentials** field, enter your Azure Service Principal credential.
      iii. Leave the **Host** field as `1.1.1.1` as it will not be used.
      iv. Select the **Active** check box to activate the connection.
      v. Set *`fetchIssueRelatedAlerts`* to control whether the system fetches related alerts for the issue.

         The default is true. Set it to false if you want to disable this behavior.

      vi. Set *`fetchIssueRelatedAlertsLimit`* to the maximum number of related alerts the system fetches for the issue. The default is 10.
      vii. Select **Test Connection** to validate the connection.

         If Azure bi-directional connector is enabled, when an Azure issue is closed in ServiceNow, it automatically closes in the Azure portal as well.

Integrate Azure Monitor with basic authentication

Integrate Microsoft Azure with Event Management by adding a standard webhook in Azure Monitor.

Before you begin

Confirm that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Confirm you have created a user with an **Identify Type** of **Machine** and the evt_mgmt_integration role.

Roles required: evt_mgmt_admin and web_service_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Configure the Event Management environment for the collection of events from Azure by authenticating Azure Monitor as a data source. In your Azure Monitor portal, set your ServiceNow AI Platform instance as the rest endpoint using a standard webhook.

On the Azure portal, alert correlation rules are defined through the *Correlate alerts* setting within Alert Processing Rules. When *Correlate alerts* is assigned on the Azure portal, the Azure Monitor alerts received on the ServiceNow® instance within 60 minutes are grouped using tag based alert clustering.

Procedure

1. In the ServiceNow AI Platform, create a user account or identify an existing ServiceNow user for this integration.
   Also ensure the relevant ServiceNow sys_user is assigned the evt_mgmt_integration role. To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.
2. In your Azure Monitor portal, update the Azure Monitor alert rules to use an action group with a standard webhook:

   a. Create an action group with *action type=webhook*, and provide the URL that includes the user ID and password of the ServiceNow user in the endpoint.
   For example:

   ```
   https://<username>:<password>@<instance-name>.service-now.com/
   api/sn_em_connector/em/inbound_event?source=azuremonitor
   ```

   > **Note:** If you have multiple tenants on the Azure portal and you want to use bidirectional functionality to acknowledge, close, or reopen an alert on the Azure Portal, then the URL for the webhook has to be in the following format: `https://<username>:<password>@<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=azuremonitor&event_class=<new_connector_instance_name>`. The <new_connector_instance_name> is the new Azure pull connector instance that you need to create for each tenant with other Azure service principal credentials. To know how to create the pull connector, see Configure Azure Monitor Bi-directional connector.

   b. In the Webhook section, make sure that **Yes** is selected for the **Enable the common alert schema** option.

Result

Alerts start flowing from the Azure Monitor into the Event Management plugin. The plugin extracts information from the original Azure Monitor alert message to populate the required event fields and inserts the event into the database. In your ServiceNow AI Platform instance, navigate to **All Events** to see the events.

What to do next

If you want to send alert state changes on the ServiceNow instance from the ServiceNow alerts to the Azure Portal, you need to enable the Azure Monitor Bi-directional connector. For more information, see Configure Azure Monitor Bi-directional connector.

Integrate Azure with REST API key token

Integrate using an API key to establish secure communication and automate data exchange via REST API. This simplifies integration, enabling seamless access to services and enhancing operational efficiency.

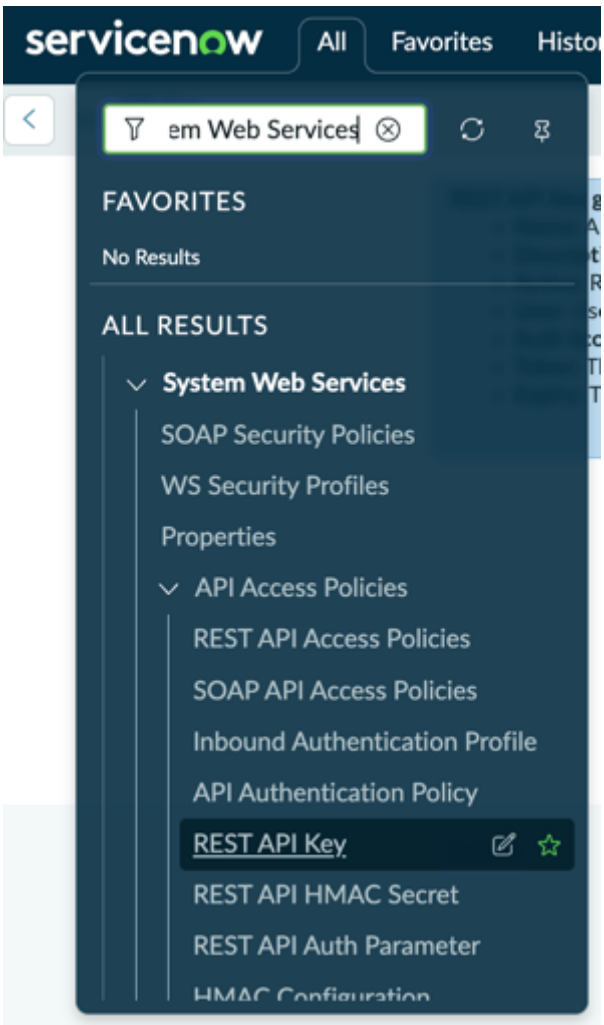
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: evt_mgmt_integration

Procedure

1. Navigate to **All** > **System Web Services** > **API Access Policies** > **REST API Key**.



2. Select **New**.
3. On the form, fill the fields.

> **Note:** The user needs to be created with the evt_mgmt_integration role. Create a new one on the sys_user table to use here to facilitate the right access.

API Key

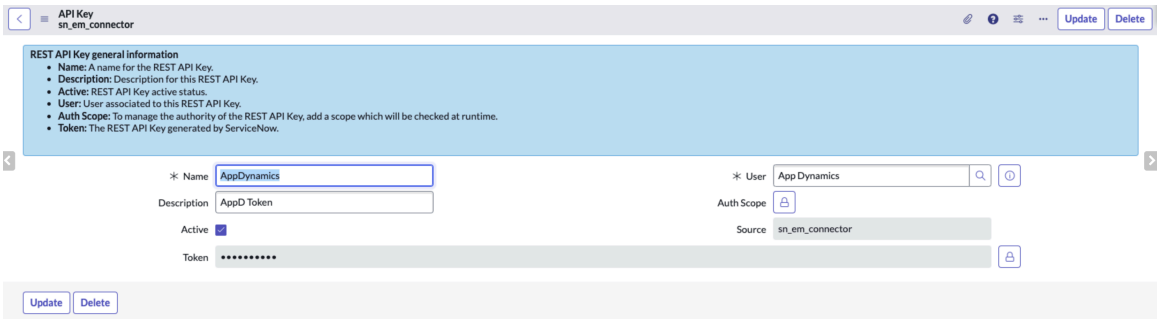
Field	Description
Name	Name to identify the REST API Key
Description	Description for the REST API Key.
Active	Status of the REST API Key.
User	User associated to the REST API Key. Use the look-up icon to select the user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Auth Scope	Option to add auth scope to manage the authority of the REST API Key.
Token	The REST API key generated by the ServiceNow AI Platform. Copy the key to use as part of the REST API call within the Header or Query parameter.
Expiry	Time after which the credential is no longer valid. Empty value means no expiration.

4. Unlock Auth Scope and add: UserAccount.
5. Use the form menu and select **Save**.

   The system generates a token and saves it in the **Token** field. To see the token, use the lock icon and copy the contents display below the field. This is your query parameter (or header) value when your other system sends a REST API request to ServiceNow.



Integrate Azure Monitor with OAuth authentication

Integrate Microsoft Azure with Event Management by authenticating Azure V1 or V2 tokens in the Azure Monitor.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

On the Azure portal, alert correlation rules are defined through the *`Correlate alerts`* setting within Alert Processing Rules. When *`Correlate alerts`* is assigned on the Azure portal, the Azure Monitor alerts received on the ServiceNow® instance within 60 minutes are grouped using tag based alert clustering.

Roles required: evt_mgmt_admin, web_service_admin, and oauth_admin

About this task

Configure the Event Management environment for the collection of events from Azure Monitor. In your Azure Monitor portal, set your ServiceNow AI Platform instance as the rest endpoint using V1 or V2 tokens.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the Azure Monitor portal:

   a. Perform app registration and expose an API.
   For more information about registering an app and exposing an API in Azure, see https://docs.microsoft.com/en-us/azure/active-directory/develop/quickstart-configure-app-expose-web-apis.

   b. Create an action group with a secure webhook, and provide the rest endpoint as `https://<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=azuremonitor`.

   > **Note:** If you have multiple tenants on the Azure portal and you want to use bidirectional functionality to acknowledge, close, or reopen an alert on the Azure Portal, then the URL for the secure webhook has to be in the following format: `https://<username>:<password>@<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=azuremonitor&event_class=<new_connector_instance_name>`. The <new_connector_instance_name> is the new Azure pull connector instance that you need to create for each tenant with other Azure service principal credentials. To know how to create the pull connector, see Configure Azure Monitor Bi-directional connector.

   For servicenowservices.com instances, the rest endpoint has to be `https://<instance-name>.servicenowservices.com/api/sn_em_connector/em/inbound_event?source=azuremonitor&x-sn-apikey=<api-key>`.

   For more information about adding a secure webhook to an action group, see https://docs.microsoft.com/en-us/azure/azure-monitor/platform/action-groups.

   c. Navigate to **Alerts** > **Manage Alert Rules**.

   d. In the Secure Webhook section, make sure that **Yes** is selected for the **Enable the common alert schema** option.

   e. Add the action group with the secure webhook to an alert rule.

2. In the Azure Monitor portal, verify which Azure token is in use by your registered application.

   a. Navigate to **App Registration**, and select the registered application.

   b. In the Manage section, click **Manifest**.

   c. In the editor screen, select the **Microsoft Graph App Manifest** tab and locate the *requestedAccessTokenVersion* parameter or select the **AAD Graph App Manifest** tab and locate the *accessTokenAcceptedVersion* parameter.
   If the value of *requestedAccessTokenVersion* or *accessTokenAcceptedVersion* is **2**, the integration must use V2 tokens.

   If the value of *requestedAccessTokenVersion* or *accessTokenAcceptedVersion* is **1** or **null**, the integration must use V1 tokens.

3. In your ServiceNow AI Platform instance, ensure that the ServiceNow user is assigned with the correct Application (client) ID or Application ID URI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Also ensure the relevant ServiceNow sys_user is assigned the evt_mgmt_integration role.

a. Navigate to **System Security** > **Users and groups** > **Users**.

> **Note:** To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.

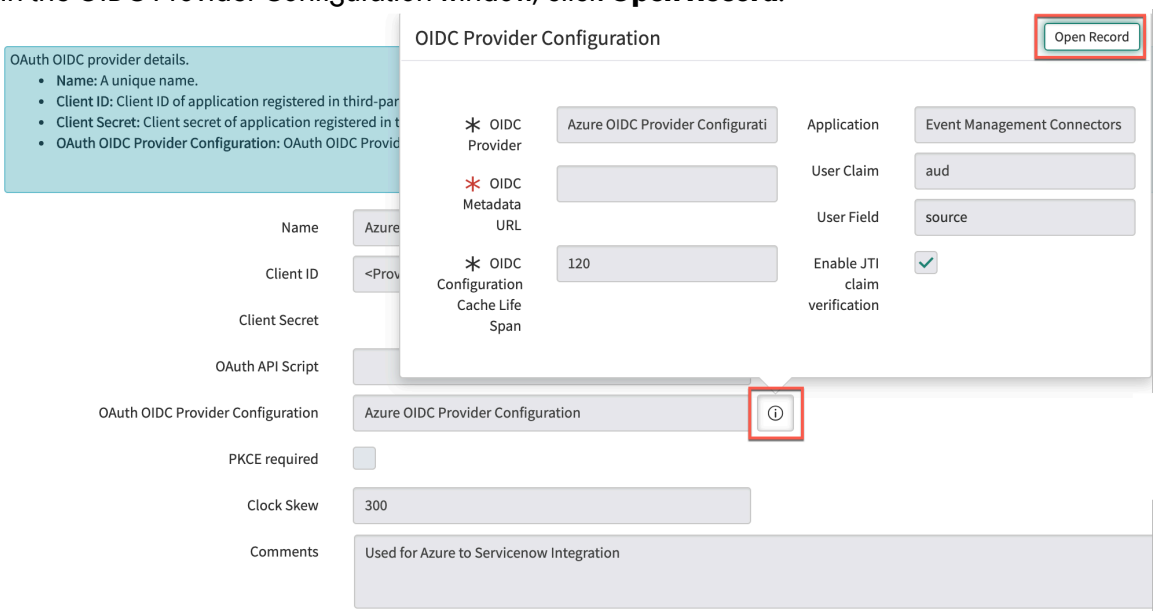
b. Verify that the **Source** field for the ServiceNow sys_user is populated with the correct Application (client) ID or Application ID URI, as defined in the Azure Monitor portal.
If the application is using an Azure V1 token, the **Source** field must be populated with the Application ID URI of the registered application. If the application is using an Azure V2 token, the **Source** field must be populated with the Application (client) ID of the registered application.

If the **Source** field is not displayed, change the form layout to display this field. Click the context menu icon ( ) and select **Configure > Form Layout**. Move **Source** to the Selected list.

> **Note:** If your ServiceNow AI Platform instance version is earlier than Paris Patch 2 or Orlando Patch 9, the **Source** field value must be enclosed in square brackets. For example, `[api://azuretest]`.

4. In your ServiceNow AI Platform instance, navigate to **Event Management** > **Integrations** > **Azure OAuth Config**.
5. Click **Azure OAuth OIDC Entry** and enter the `Client ID`.
   If the registered application is using an Azure V2 token, the `Client ID` should be the same as the `Application (client) ID` of the app registrations defined in your Azure Monitor portal.

   If the registered application is using an Azure V1 token, the `Client ID` should be the same as the `Application ID URI` of the app registrations defined in your Azure Monitor portal (the exposed API).
6. In the **OAuth OIDC Provider Configuration** field, click the info icon ( ).
7. In the OIDC Provider Configuration window, click **Open Record**.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Enter the `OIDC Metadata URL` according to the Azure token used by the registered application, as shown in the following table.

Azure token	OIDC Metadata URL
V2	In the OIDC Provider Configuration form, add the following URL to the **OIDC Metadata URL** field: `https://login.microsoftonline.com/<tenant-id>/v2.0/.well-known/openid-configuration` Ensure that `<tenant-id>` is replaced with the correct Azure Tenant ID. **Note:** If attempting to integrate Azure Gov Cloud with the ServiceNow Azure Monitor Connector, remember to change the claim value to `f1f34126-d4ef-40e1-ad4b-bf5d47b4860d`.
V1	In the OIDC Provider Configuration form: ○ In the Claim Name column, change `azp` to `appid`.  **Note:** If attempting to integrate Azure Gov Cloud with the Service Now Azure Monitor Connector, re member to change the claim value to `f1f34126-d4ef-40e1-ad4b-bf5d47b4860d`. ○ In the **OIDC Metadata URL** field, add the following URL: `https://login.microsoftonline.com/<tenant-id>/.well-known/openid-configuration` Ensure that `<tenant-id>` is replaced with the correct Azure Tenant ID.

Result

When an alert is created in Azure Monitor as part of the alert rule, the notification is sent to the ServiceNow AI Platform using the secure webhook endpoint. In your ServiceNow AI Platform instance, navigate to **All Events** to see the events. If you want to send alert state changes on the ServiceNow instance from the ServiceNow alerts to the Azure Portal, you need to enable the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure Monitor Bi-directional connector. For more information, see Configure Azure Monitor Bi-directional connector .

Configure Azure Monitor Bi-directional connector

The Azure Monitor Pull connector sends information from ServiceNow Event Management to the Azure Portal. The pull connector sends the alert state changes from the ServiceNow environment to the Azure Portal.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

When an alert is triggered in the Azure Portal a Secure Webhook is created to send the alert notifications into ServiceNow. The Azure Monitor Connector will receive the alert notification as an event in the ServiceNow instance.

The Azure Monitor Bi-directional connector is supported in the following ServiceNow AI Platform versions:

- Quebec Patch 9 or later.
- Rome Patch 3 or later.
- San Diego.

Role required: evt_mgmt_admin

About this task

When you configure the Azure Monitor Bi-directional Connector, the bi-directional exchange of values to and from the external event source is enabled. When an alert is **Acknowledged**/**Closed**/**Reopened** on the ServiceNow instance, the state changes in the Azure Portal alert using the bi-directional connector.

These scenarios describe the default bi-directional functionality for the Azure Monitor connector:

- When an alert is closed in the Azure Portal, it is automatically closed in ServiceNow. However, it is updated irrespective of the bi-directional feature because closing the event received from the Azure Portal will close the alert.
- When an alert is manually closed in ServiceNow, all the associated Azure alerts will be closed in the Azure Portal.
- If the alert state is changed to **Reopen** in ServiceNow, all the associated Azure alerts will be opened in the Azure Portal.
- When an alert is **Acknowledged** in ServiceNow, all the associated Azure alerts will be acknowledged in the Azure Portal.

Note: For changing the alert state on the Azure Portal, Mid Server gets access token connecting to https://login.microsoftonline.com/ and to change the alert state on the Azure portal Mid Server calls changestate API on URL https://management.azure.com/ as described in https://learn.microsoft.com/en-us/rest/api/monitor/alertsmanagement/alerts/change-state?view=rest-monitor-alertsmanagement-2023-07-12-preview&tabs=HTTP .

Procedure

1. For a single tenant, perform the following steps:
   - Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
   - Select **Azure Monitor**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- In the **Name** field, verify that the name is same as the name in the Azure push connector from where ServiceNow receives Azure alerts.
- Select the **Active** check box.

  For this configuration, the **Host IP** field has no functional impact and is not used, so a dummy IP address (1.1.1.1) is provided.
- In the **Credential** field, add the Azure Service Principal credentials that has authorization to perform actions.

  To change the alert state, the service principal must have the Microsoft.AlertsManagement permissions and the Monitoring Contributor role.
- Select or add the MID Server to be used for this connector.

  If alerts on the MS Azure portal are not updating as expected, check the MID Server logs for errors.

2. For multiple tenants, perform the following steps:
   - Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
   - Select **New**.
   - In the **Name** field, enter the name of <new_connector_instance_name> that you have mentioned in the URL for secure webhook at Integrate Azure Monitor with OAuth authentication.
   - In the Host IP, enter any dummy IP address such as 1.1.1.1.
   - In the **Credential** field, add the Azure Service Principal credentials of that tenant that has authorization to perform actions.
   - Select the **Bi-directional** check box.
   - Select or add the MID Server to be used for this connector.
   - Select **Submit**.
   - Select the **Active** check box.
   - Select **Update**.

What to do next

Multiple alerts from the Azure Portal may be mapped to a single ServiceNow alert by de duplication. The mapping between the ServiceNow alert and Azure alerts will be maintained in the sn_em_connector_event_data table. The retention of records will depend on the alert's state:

- If the Azure Bi-directional Connector is not active, the records will be deleted in 2 days.
- When the Azure Bi-directional Connector is active:
  - If the alert is in a closed state, then it will retain the data for 7 days. This duration can be customized by the sn_em_connector.eventdata_closedevent_interval system property.
    - If the closed alert is re-opened in 7 days then it will reopen the corresponding closed alerts from the Azure Portal.
    - If the closed alert is re-opened after 7 days then it will not reopen the corresponding closed alerts from the Azure Portal.
  - If the alert is in an open state, then it will retain the data for 30 days. . This duration can be customized by the sn_em_connector.eventdata_openevent_interval.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To close or acknowledge an open ServiceNow alert within 30 days, you can close or acknowledge all corresponding Azure alerts on the Azure Portal.
- If you want to close or acknowledge an open ServiceNow alert after 30 days, you cannot close or acknowledge the corresponding Azure alerts on the Azure Portal.

Event collection from Microsoft Azure Monitor

The MID WebServer Event Collector enables you to collect JSON formatted event messages sent from the Microsoft Azure portal.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Ensure that you:

- Deploy and start the MID Server. See MID Server configuration .
- Configure and start the MID Web Server. See Configure the MID Web Server extension.
- Configure and start the MID WebService Event Collector. See Configure the MID WebService Event Collector Context.

Role required: evt_mgmt_admin

About this task

On the Azure portal, alert correlation rules are defined through the *`Correlate alerts`* setting within Alert Processing Rules. When *`Correlate alerts`* is assigned on the Azure portal, the Azure Monitor alerts received on the ServiceNow® instance within 60 minutes are grouped using tag based alert clustering.

JSON formatted event messages are sent from Microsoft Azure. The MID Server transforms the collected event messages by parsing them using the TransformEvents_MidAzureMonitor script include, located here: **Event Management** > **Integrations** > **PushConnectors**. In the Push Connectors page, click **Azure Monitor Mid Push Connector**.

The default format of the URL to push event messages from Microsoft Azure to the MID Server is `http://<MID_Web_Server_User>:<MID_Web_Server_Password>@<MID_Server_IP>:<MID_Web_Serv api/mid/em/inbound_event?Transform=TransformEvents_MidAzureMonitor`.

Variables in the default URL

Variable	Description
MID_Server_IP	IP address of the MID Web Server Extension.
MID_Web_Server_Port	Listening port of the MID Web Server Extension.
MID_Web_Server_User	Username for the MID Web Server Extension.
MID_Web_Server_Password	Password of the user of the MID Web Server.

The following procedure describes the collection of JSON formatted event messages using basic authentication.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the Azure Monitor Portal, verify that the MID Server IP is accessible from the Azure portal and the MID rest point is accessible from Microsoft Azure.
   Alternatively, install the MID Server on an Azure VM. Provide the Azure VM public address in the URL and allow the mid_web_Server_port in **Azure VM** > **Networking Settings** > **Inbound port rules**.
2. Create an action group with a webhook and provide the rest endpoint as `http://<MID_Web_Server_User>:<MID_Web_Server_Password>@<MID_Server_IP>:<MID_Web_Se api/mid/em/inbound_event?Transform=TransformEvents_MidAzureMonitor`

   Note: For more information about adding a webhook to an action group, see Create and manage action groups in the Azure portal on the Microsoft documentation site.
3. In the Webhook section, make sure **Yes** is selected for the **Enable the common alert schema** option.
4. Navigate to **Alerts** > **Manage Alert Rules**.
5. Add the action group with the webhook to an alert rule.

What to do next

If you want to send alert state changes on the ServiceNow instance from the ServiceNow alerts to the Azure Portal, you need to enable the Azure Monitor Bi-directional connector. For more information, see Configure Azure Monitor Bi-directional connector.

Event collection from BMC TrueSight and BMC TrueSight_v2

The MID WebService Event Collector enables you to collect JSON formatted event messages sent from BMC TrueSight Operations Management (TrueSight), previously known as BMC ProactiveNet Performance Management (BPPM). It uses event stream notification capabilities.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Ensure that you:

- Deploy and start the MID Server. See MID Server configuration .
- Configure and start the MID Web Server. See Configure the MID Web Server extension.
- Configure and start the MID WebService Event Collector. See Configure the MID WebService Event Collector Context.

Role required: evt_mgmt_admin

About this task

JSON formatted event messages are sent from BMC TrueSight. The MID Server transforms the collected event messages by parsing them using the TransformEvents_bmcTrueSight script include, located here: **Event Management** > **Integrations** > **Listener Transform Scripts**. In the Listener Transform Scripts page, click **TransformEvents_bmcTrueSight**.

The default format of the URL to push event messages from BMC TrueSight to the MID Server is `http://<MID_Server_IP>:<MID_Web_Server_Port>/api/mid/em/inbound_event?Transform=TransformEvents_bmcTrueSight`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The default format of the URL to push event messages from BMC TrueSight_v2 to the MID Server is `http://<MID_Server_IP>:<MID_Web_Server_Port>/api/mid/em/inbound_event?Transform=TransformEvents_bmcTrueSight_v2`.

Variables in the default URL

Variable	Description
MID_Server_IP	IP address of the MID Web Server Extension.
MID_Web_Server_Port	Listening port of the MID Web Server Extension.
MID_Web_Server_User	Username for the MID Web Server Extension.
MID_Web_Server_Password	Password of the user of the MID Web Server Extension. However, encode the password in BASE64. For example, if the MID Web Server Extension password is `admin`, in this case use `YWRtaW4=` as the password for MID_Web_Server_Password. To determine the BASE64 value, you can use the utility at this website: https://www.base64encode.org/

The following procedure describes the collection of JSON formatted event messages using basic authentication. For more information about supported authentication methods, see Configure the MID Web Server extension.

Procedure

1. In BMC TrueSight, set the MID WebService Event Collector as the target for BMC TrueSight notification, using these parameters:

   Variables in the generic BMC URL

Variable	Description
serverHost	Name of the BMC TrueSight server.
port	Number of the BMC TrueSight port.

2. In the message body and generic BMC URL, replace the parameters with the values in the preceding table and connect to BMC TrueSight.
   Use the BMC Publish-Subscribe REST approach to create a stream event subscription and send event messages in JSON format. The generic format of the BMC URL to create a stream event subscription is: `http|https://<serverHost>:<port>/bppmws/api/stream/subscribe?dataType=event`. For example: `http://TrueSight1server:40/bppmws/api/stream/subscribe?dataType=event`.

Metric collection from OpenTelemetry (Otel) metrics

The MID WebService metric Collector enables you to collect JSON and protobuf formatted metrics sent from OpenTelemetry (Otel).

Before you begin

Ensure that you have installed the Event Management Connectors (sn_em_connector) plugin on the ServiceNow AI Platform instance and the ServiceNow version is Australia or above.

Ensure that you:

- Deploy and start the MID Server. See MID Server configuration.
- Configure and start the MID Web Server. See Configure the MID Web Server extension.
- To activate metric collection, ensure that the MID Server that retrieves metrics is configured with the Metric Intelligence extension and that the extension is in Started mode. See Manually configure the Metric Intelligence extension.
- Enable the rest listener.
- Install the Discovery and Service Mapping Patterns plugin if you want Kubernetes CI tables.

Role required: evt_mgmt_admin

About this task

Protobuf and JSON formatted metrics are sent from Opentelemetry. The MID Server transforms the collected metrics by parsing them using the *`TransformMetrics_MidOpenTelemetry`* script include, located at **Event Management** > **Integrations** > **PushConnectors**. In the Push Connectors page, select **OpenTelemetry**.

The default format of the URL to push event messages from the Otel to the MID Server is: `http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/sa/inbound_metrics?transform=TransformMetrics_MidOpenTelemetry`

Variables in the default URL

Variable	Description
MID_Server_IP	IP address of the MID Web Server Extension.
MID_Web_Server_Port	Listening port of the MID Web Server Extension.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Variables in the default URL (continued)

Variable	Description
MID_Web_Server_User	Username for the MID Web Server Extension.
MID_Web_Server_Password	Password of the user of the MID Web Server.

Procedure

1. CONFIGURE RECEIVERS: HOSTMETRICS RECEIVER - SYSTEM METRICS COLLECTION

Add the following hostmetrics receiver under the "receivers:" section to collect system metrics:

```
receivers:
  hostmetrics:
    collection_interval: 10s
    scrapers:
      cpu:
      memory:
      disk:
      filesystem:
      network:
      processes:
      paging:
```

Note:

- Collection_interval set to 10 seconds for frequent metric updates.
- Adjust the interval based on your monitoring requirements (higher values reduce overhead).
- Enable only the scrapers you need to minimize resource usage.

2. CONFIGURE PROCESSORS
TRANSFORM PROCESSOR - REMOVE UNNECESSARY FIELDS

a. Add the following transform processor under the "processors:" section to remove unnecessary fields from the payload:

```
transform:
  metric_statements:
    - context: scope
      statements:
        - set(name, "")
        - set(version, "")
```

b. MEMORY LIMITER PROCESSOR - PREVENT MEMORY ISSUES

Add the following memory_limiter processor under the "processors:" section to prevent out-of-memory errors:

```
memory_limiter:
  limit_mib: 5
  spike_limit_mib: 1
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- limit_mib set to 5 MB of memory usage
- spike_limit_mib adjusted to 1 MB to handle temporary spikes
- Adjust these values based on your system's available memory

c. FILTER PROCESSOR - SELECT SPECIFIC METRICS

Add the following filter processor under the "processors:" section to include only selected metrics:

```
filter/minimal:
  metrics:
    include:
      match_type: strict
      metric_names:
        # CPU Metrics
        - system.cpu.time
        - system.cpu.load_average.1m
        - system.cpu.load_average.5m
        - system.cpu.load_average.15m
        # Memory Metrics
        - system.memory.usage
        - system.paging.usage
        # Disk Metrics
        - system.filesystem.usage
        - system.disk.io
        - system.disk.io_time
        # Process Metrics
        - system.processes.count
        - system.processes.created
        # Paging Metrics
        - system.paging.operations
        # Network Metrics
        - system.network.io
        - system.network.packets
        - system.network.errors
        - system.network.dropped
        - system.network.connections
        # MySQL Metrics
        - mysql.operations
        - mysql.locks
        - mysql.uptime
        - mysql.threads
