Status	Status of the data input.
Transport	Protocol used to send the log data. Rsyslog and Splunk send data using the TCP protocol.
Sources count	The number of log sources this data input has created.
Disabled since	The time when the data input stopped or failed.
Last log time	The time when the last log streamed in the data input.
Error message	The streaming error. This field is populated automatically. It displays only when a streaming error has occurred.

Advanced configuration

Advanced configuration form

Field	Description	Default value
Use SSL/TLS	Option to use SSL/TLS.	
Look up hostnames	Option to perform DNS lookup to resolve IPs to hostnames.	false
Boss thread count	The number of threads that manage connections.	1
Worker thread count	The number of threads that handle incoming data.	4
Read timeout seconds	The timeout in seconds since the last read. When the timeout expires, the system closes the channel.	30
Default timezone	The default time zone of events. The system uses this default when the log does not specify a time zone.	GMT
Sub sample drop ratio	The ratio of events to drop.	-1
Sub sample receive ratio	The ratio of events to receive.	-1
Max length in bytes	The maximum length of log messages in bytes.	32766
Character encoding	The character encoding for this data input.	UTF-8
Drop if queue is full	Option to discard logs if there is a load on the MID Server.	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced configuration form (continued)

Field	Description	Default value
Line breaker delimiters	The line break character separating the raw log lines. Splitting values must be separated by a comma followed by a space: ", ". For example: "\r, \n, , splitHere, #".	

UDP data input configuration fields

Description of the fields on the UDP data input configuration form.

Basic configuration

Field	Description
Name	Name of the new data input. This field is required.
Port	The port for the MID Server. Select a unique port from the array. The placeholder shows the range of ports from which to choose. Make sure that your organization's security team opens the selected port. This field is required.
MID	The MID Server to which the logs are streamed. **Note:** • You can select only MID Servers with log ingestion capability that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. This field is required.
Service instance	The service instance to which to bind the log data. This field is required. **Note:** If no relevant service instance exists, Create an service instance and add CIs to it. Set the status of the new service instance to Operational.

The fields in the following table show read-only information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Status	Status of the data input.
Transport	Protocol used to send the log data: UDP.
Sources count	The number of log sources this data input has created.
Disabled since	The time when the data input stopped or failed.
Last log time	The time when the last log streamed in the data input.
Error message	The streaming error. This field is populated automatically. It displays only when a streaming error has occurred.

Advanced configuration

Field	Description	Default value
Default timezone	The default time zone of events. The system uses this default when the log does not specify a time zone.	GMT
Sub sample drop ratio	The ratio of events to drop.	-1
Sub sample receive ratio	The ratio of events to receive.	-1
Rate limit	Limitation on the number of events per second that the data input processes.	-1
Max length in bytes	The maximum length of log messages, in bytes.	32,766
Character encoding	The character encoding for this data input.	UTF-8
Drop if queue is full	Option to discard logs if many processes are waiting in the queue to access the MID Server.	false

Vector Agent data input configuration fields

Description of the fields on the Vector Agent data input configuration form.

Getting Started tab

Field	Description
Data input name	Name of the new data input. This field is required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Getting Started tab (continued)

Field	Description
Description	Description of the data input.
MID Server	The MID Server to which the Vector Agent logs are streamed. This field is required. **Note:** If the MID Server is down or the connection is lost, the Vector pipeline may get blocked.
Port	The port on the MID Server used for listening to logs. This field is required. Choose a port within the range of 6000-6200.
Transport	The protocol used for streaming log messages to your ServiceNow instance. Currently, only TCP is available.
Status	Status of the data input.

Surrounding logs tab fields

This section describes the information displayed on the **Surrounding logs** tab.

Surrounding logs tab

Column	Description
Time	Timestamp of the log line in the format that the source uses. If no value appears, then check the source type structure of the raw data.
Application service	Service instance in which the metric was found.
Component	Logical component of the service instance that generated the event. Multiple CIs can sometimes perform the same function.
Message	Inner message of the raw log line that contains the text of the system-generated log message regarding the nature of the occurrence.
Level	Type of event. The available values, in order of importance, are: • **Emergency** • **Alert** • **Critical** • **Error** • **Warning** • **Notice**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Surrounding logs tab (continued)

Column	Description
	• **Informational** • **Debug**
Host	Host identifier from the log line that consists of the hostname or IP address of the endpoint.
Log message	The raw log message without the header.

Log Viewer table fields

This section describes the information displayed in the **Log Viewer** table.

Log Viewer table fields

Column	Description
Time	Timestamp of the log line in the format that the source uses. If no value appears, then check the source type structure of the raw data.
Service instance	Service instance in which the metric was found.
Component	Logical component of the service instance that generated the event. Multiple CIs can sometimes perform the same function.
Message	Inner message of the raw log line that contains the text of the system-generated log message regarding the nature of the occurrence.
Level	Type of event. The available values, in order of importance, are: • **Emergency** • **Alert** • **Critical** • **Error** • **Warning** • **Notice** • **Informational** • **Debug**
Host	Host identifier from the log line that consists of the hostname or IP address of the endpoint.
Log message	The raw log message without the header.

Note: The Raw message column does not appear in the Log Viewer table by default. You can display this column by selecting it from the **Filters** pane. For more information, see Customize the Log Viewer table in Health Log Analytics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Log correlators form fields

This section describes the fields on the Log correlators form.

Log correlators form

Field	Description
Type	Type of log correlator. Choices are as follows. • **Free text correlator**: The log correlator analyzes text in the log message. • **Log-key correlator**: The log correlator analyzes log metadata. For example, the name of a service instance in your infrastructure. Log property correlators are specific to the business context of your environment. For more information, see Log correlators for identifying related alerts.
Free text term or Identifier	Text that the log correlator isolates when parsing log lines. The label for this field is **Free text term** for free text log correlators and **Identifier** for log property correlators. **Note:** The value of this field can be the text for either type of log correlator. As a result, the label for this column in the resulting list of log correlators is **Correlation indicator**.
Active	Option to apply the log correlator. When you select this field, the system applies the log correlator to the log stream.
Range of analysis	Set of sources whose log data are analyzed by this log correlator. Choices are as follows: • **All sources**: The log correlator is applied to log lines from all sources in the data stream. • **Only new sources**: The log correlator is applied to log lines from all sources created after this log correlator is activated. • **Specified source**: The log correlator is applied only to the log lines from the source that you specify on this form.
Excluded sources	Sources that are excluded from the log correlator. The system does not analyze log lines from sources that are listed in this field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Log correlators form (continued)

Field	Description
	Note: This field applies only when the **Range of analysis** field is set **All sources** or **Only new sources**. For information about excluding a source from a log correlator, see Exclude a source from a log correlator in Health Log Analytics.
Source	Source of the log correlator. The log correlator analyzes the data of this log source. This field appears only when you're adding the log correlator from the Log Sources form. The field is automatically set to the log source that you're working on.

Log-based CI candidates fields in Health Log Analytics

Field descriptions for the Log-based CI candidates table, the Log-based CI candidate form, and the Add CI candidate to CMDB form.

Log-based CI candidates table

Field	Description
Host name	The host name that Health Log Analytics discovered in the log data.
CI class type	The CI class type discovered in the log data. The CI class type is determined by the data input type: • Rsyslogs – CI class type: Linux Server • Linux Filebeat - CI class type: Linux Server • Windows Filebeat - CI class type: Windows Server • Winlogbeat - CI class type: Windows Server
Last log time	(Read only) The last time this host was found in the log data.
Operation	(Read only) The suggested action to take: Add - Add the CI to the CMDB.
Status	(Read only) The status of the suggested action. • Pending - No action has been taken. • If the taken action failed, this field contains an error message.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Log-based CI candidate form

Field	Description
CI class type	The CI class type discovered in the log data. The CI class type is determined by the data input type: • Rsyslogs – CI class type: Linux Server • Linux Filebeat - CI class type: Linux Server • Windows Filebeat - CI class type: Windows Server • Winlogbeat - CI class type: Windows Server
CI name	The host name that Health Log Analytics discovered in the log data.
Operation	(Read only) The suggested action to take: Add - Add the CI to the CMDB.
Last log time	(Read only) The last time this host was found in the log data.
Status	(Read only) The status of the suggested action: • Pending - No action has been taken. • If the taken action failed, this field contains an error message.

Add CI candidate to CMDB form (Linux Server)

Field	Description
Name	The name of the CI.
Asset tag	Alphanumeric information to help track the asset associated with the CI.
Manufacturer	The device manufacturer.
Asset	(Read-only) The asset associated with the CI.
Class	The asset group. For example, Linux Server.
Comments	Information about the asset.
Company	The company associated with the CI. This field is required.
Serial number	The serial number associated with the CI.
Model ID	The device model ID.
Assigned to	The person using or primarily responsible for this item.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add CI candidate to CMDB form (Linux Server) (continued)

Field	Description
Host name	The host name of the CI.
OS Domain	The OS domain of the CI.
Operating System	The OS running on the CI.
OS Version	The version of the OS running on the CI.
OS Service Pack	The service pack installed on the OS.
DNS Domain	The DNS domain of the CI.
IP Address	The IP address of the CI.
Disk space (GB)	The amount of disk space, in GB.
Description	Textual description of the CI.
RAM (MB)	The amount of RAM on the computer, in MB.
CPU manufacturer	The CPU manufacturer.
CPU type	The CPU type.
CPU speed (MHz)	The speed of the CPU, in MHz.
CPU count	The number of CPUs.
CPU core count	The number of cores per CPU.
IsVirtual	Option to indicate if the device is running on a virtual machine instance.

Metric Data table columns in Health Log Analytics

The Metric Data table lists all metrics that Health Log Analytics collects. Use the table to query metrics by log source, integration, source type, and metric type, review anomaly detection statistics, and view metric baselines.

For more information about using the Metric Data table, see View log anomaly metrics in Health Log Analytics.

Column descriptions

Each row in the Metric Data table represents one metric that HLA collects.

Metric Data columns

Column	Description
Metric Name	Unique identifier of the metric being tracked.
Service	Service instance associated with the metric.
Source	Log source from which the metric originates.
Component	Component within the log source that generates the metric.
Metric Type	Type of measurement, such as meter or gauge.
Dimension	AI Engine metric identifier associated with this record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Metric Data columns (continued)

Column	Description
Subject	Subject identifier that groups related metrics.
Class	Metric classification, such as Keyword Metric, Pattern ID Metric, Raw Metric, or All Events Metric.

Sustained alert table schema

Reference documentation for the sn_occ_sustained_alerts table that stores sustained alert feedback configurations per metric.

Table overview

The `sn_occ_sustained_alerts` table stores per-metric sustained alert feedback configurations. Each record represents a sustained alert setting applied to a specific metric. The table supports multi-tenant deployments through domain separation and provides audit trail support through standard system fields.

Table access and permissions

Access to the sustained alert table is controlled by role-based access control (RBAC) lists. Standard read, write, create, and delete operations are supported. Users with alert feedback permissions can create and modify sustained alert entries for metrics they have access to.

Field definitions

Field name	Type	Description
`metric_id`	String (indexed)	Full metric identifier and foreign key reference to the metric being configured. Required field. Indexed for fast lookup during detection evaluation.
`required_duration_minutes`	Integer	Minimum sustained duration threshold in minutes. Valid range: 1–120 minutes. The system requires anomalies to persist continuously for this duration before emitting a detection. Updates without creating a new record when feedback is reapplied.
`duration_mode`	Choice (enum)	Feedback mode indicator. Values: `adaptive` (system-calculated duration based on signal characteristics) or `manual` (operator-selected duration). Default: `adaptive`.
`sustain_count`	Integer	Counter tracking how many times sustained alert feedback has been applied to this metric. Auto-increments on each reapplication. Allows the system to learn from repeated operator feedback patterns.
`applied_by`	User reference	User who initially applied the sustained alert feedback. Captured for audit trail purposes.
`applied_at`	Timestamp	Date and time when the sustained alert feedback was first applied. Captured for audit trail purposes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field definitions (continued)

Field name	Type	Description
`expires_at`	Datetime (nullable)	Optional expiration timestamp. When set, the feedback automatically becomes inactive after this date. Default: null (feedback does not expire).
`active`	Boolean	Active status flag. Values: `true` (feedback is evaluated) or `false` (feedback is deactivated). Default: `true`. The system skips inactive entries during detection evaluation.
`sys_domain`	Domain reference	Multi-tenancy support field. Indicates which domain (partition) the record belongs to. Enforces domain isolation for all operations and queries.
`sys_created_by`	User reference	System-generated field capturing the user who created the record. Set automatically on record creation.
`sys_updated_by`	User reference	System-generated field capturing the user who last modified the record. Updated automatically on any change.
`sys_created_on`	Timestamp	System-generated field capturing the creation timestamp. Set automatically on record creation.
`sys_updated_on`	Timestamp	System-generated field capturing the last modification timestamp. Updated automatically on any change.

Constraints and validation

The sustained alert table enforces these constraints:

- Metric uniqueness per domain: Each metric can have only one active sustained alert entry per domain. Reapplying feedback updates the existing record rather than creating a duplicate.
- Duration range validation: `required_duration_minutes` must be between 1 and 120 minutes. Invalid values are rejected.
- Domain isolation: All queries and operations are scoped to the active domain. Cross-domain access is blocked by ACL enforcement.
- Expiration enforcement: Records with `expires_at` dates in the past are treated as inactive during detection evaluation, even if `active` is `true`.

Performance characteristics

The sustained alert table is optimized for detection-time lookups:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Lookup performance: P95 query latency ≤ 50 milliseconds per metric lookup, enabled by indexing on `metric_id`.
- Caching: The system caches sustained alert entries in memory with automatic invalidation when table records change, reducing database query load.
- Feedback application: Single-alert feedback application responds in P95 ≤ 500 milliseconds; bulk feedback (up to 50 alerts) in P95 ≤ 2 seconds.

Audit trail and history

All changes to sustained alert records are logged in the audit table. The following changes are tracked:

- Record creation (user, timestamp, initial configuration)
- Duration threshold modifications (`required_duration_minutes` changes)
- Mode changes (switches between adaptive and manual)
- Deactivation or removal (record deletion or `active` flag changes)
- Expiration date updates

The `sys_created_by`, `sys_updated_by`, `sys_created_on`, and `sys_updated_on` fields provide basic audit information. For detailed change history, query the audit table using the sustained alert record's `sys_id`.

Integrations Launchpad in Service Operations Workspace for ITOM

The Integrations Launchpad showcases all Event Management connector integrations, allowing users to pull or push events from external or internal devices. This centralized hub simplifies Event Management by consolidating integration options in one place.

The Integrations Launchpad streamlines the process of managing and utilizing event connectors, enhancing operational efficiency and ensuring seamless integration of event data from various external sources. This centralization helps users maintain better control and visibility over their Event Management ecosystem.

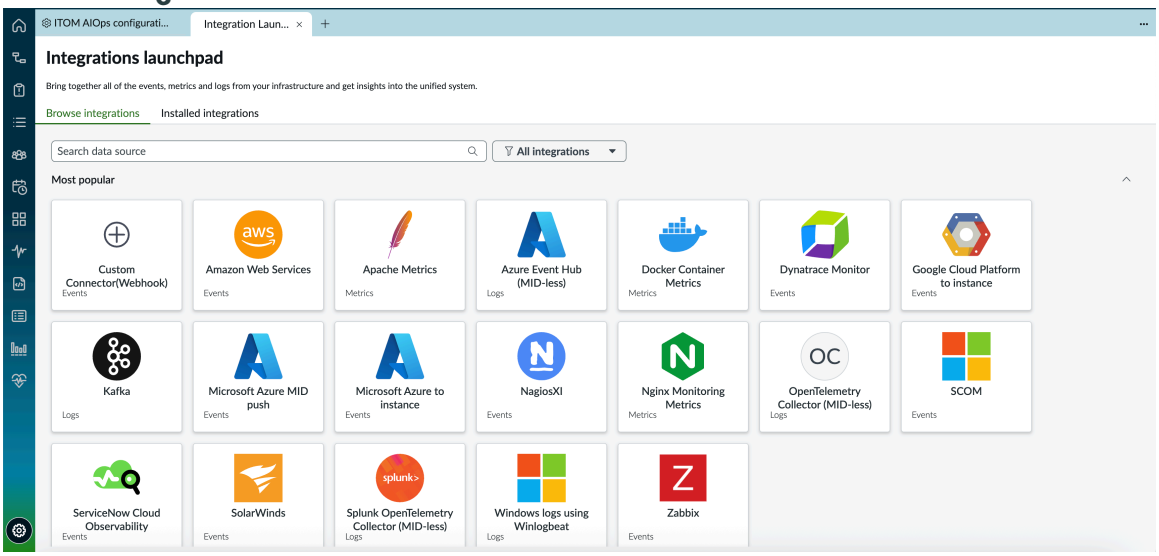
Browse Integrations tab

Displays all pull, push, and custom connector integrations, including connectors available from the ServiceNow store and third parties. This tab features:

- Search Box: Helps you quickly find a specific data source by entering keywords, improving efficiency and saving time.
- All Integrations list: Organizes integrations into categories such as All Integrations, Events (Push, Pull, Custom), Metrics (ACC-M), and Logs (HLA). This categorization makes it easier for users to browse the list and select the relevant type of integration they need.

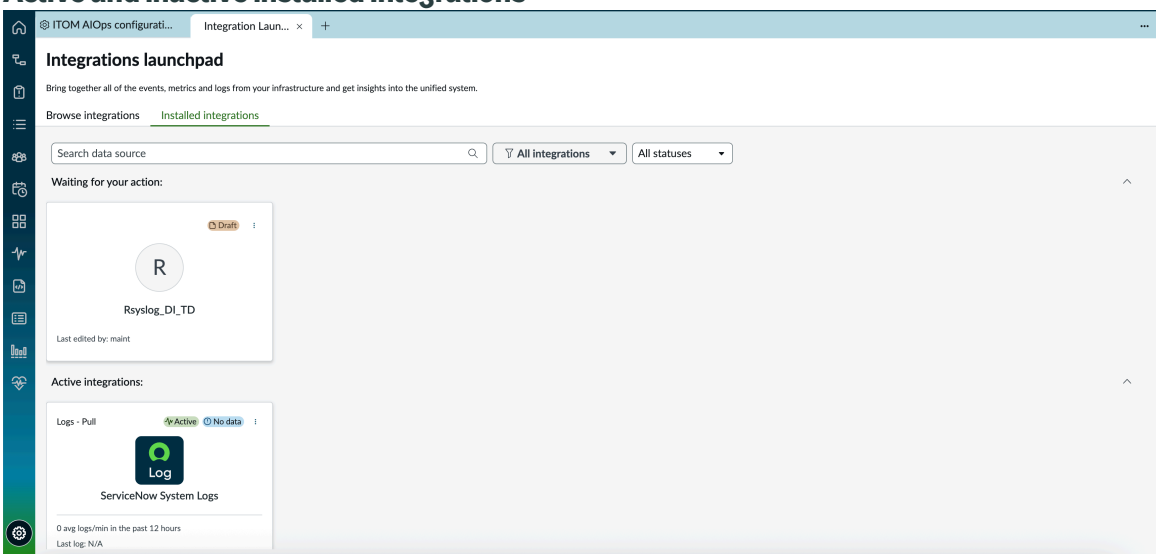
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Browse integrations tab



Installed Integrations tab

Active and inactive installed integrations



Lists all user-configured integrations, both active and inactive. This tab features:

- Search Box: Helps users quickly find a specific data source by entering keywords, improving efficiency and saving time.
- All Integrations list: Organizes integrations into categories such as All Integrations, Events (Push, Pull, Custom), Metrics (ACC-M), and Logs (HLA). This categorization makes it easier for users to browse the list and select the relevant type of integration they need.
- All statuses list: Allows you to filter integrations by their status—All Statuses, Active, Inactive, Draft, or No Data. This helps users quickly identify and manage integrations based on their current state.

Integration status and description

Status	Description
All statuses	All integration statuses
Active	Active integrations that were successfully installed

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status	Description
Inactive	Inactive integrations that were successfully installed
Draft	In-progress integrations with a configuration that was started but not completed
No data	Integrations that were successfully installed with no data

Configure an event pull connector

Configure event pull connectors that require a script, connector definition, and connector instance to pull events from external devices. These connectors automate the data retrieval process, ensuring the seamless integration of external events into your system for efficient monitoring and management.

Before you begin

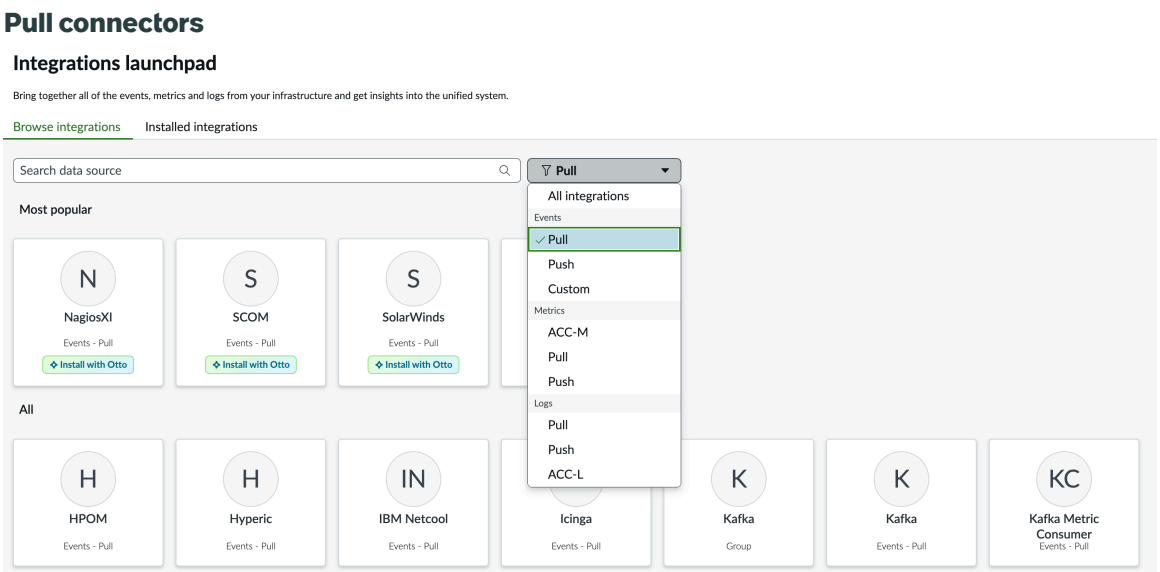
Role required: evt_mgmt_admin

About this task

Starting with the Brazil release, you can use ServiceNow Otto® to configure the following connectors: vCenter, NagiosXI, SolarWinds, SCOM, and Zabbix. Each connector tile displays the **Install with Otto** option. When you select it for any connector, the Otto panel opens on the right side of the screen. In the Otto panel, you can chat with Otto to configure the connector, and later deactivate or delete it if required. You need the ServiceNow Otto for ITOM plugin for the **Install with Otto** option to appear.

Procedure

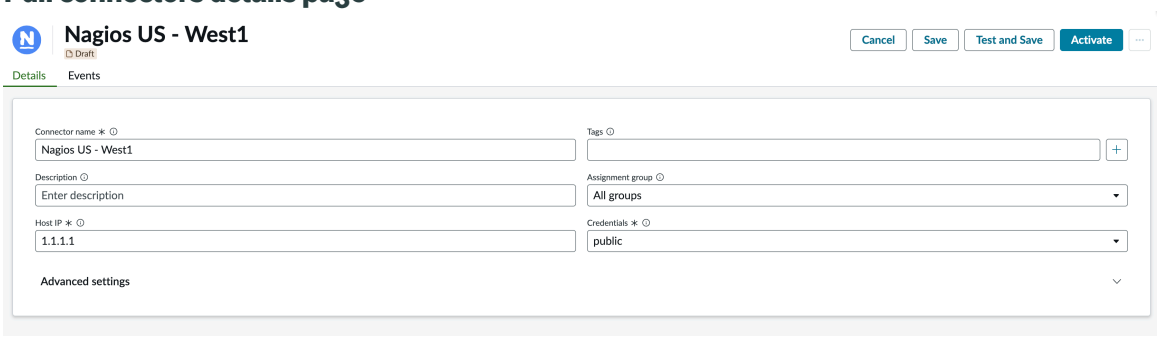
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. On the ITOM AIOps configuration center page, under the **Setup** > **Integrations** section, select **Manage Installed integrations**.
4. In the **Browse Integrations** tab, select the **All integrations** drop-down list and select **Pull**.
   Only pull connector tiles are displayed.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select a pull connector tile.
   If a pop-up menu opens, select the data to track from that connector and select **Continue**.

Pull connectors details page



6. In the **Details** tab, in the **Connector name** field, enter a unique name for the connector type.
7. **Optional:** In the **Tags** field, enter tags to help locate and identify connectors of this type on the Express List.

   To add additional tags, select the plus icon ( ) next to the **Tags** field. The Add tags window opens.

   a. In the **Key** field, enter a tag key.

   b. In the **Value** field, enter a tag value.

   c. Select **Add**.
8. **Optional:** In the **Description** field, enter brief information about this connector.
9. **Optional:** From the **Assignment group** drop-down list, select the group or team that is responsible for managing and maintaining the connector.
10. In the **Host IP** field, enter the IP address that is used to select the appropriate MID Server for communicating with the event source host.
    You can use the host name instead of the host IP.
11. From the **Credentials** drop-down list, select the valid credentials to access the event source host.
    To create a new credential, select **Create new credentials** and continue with the process.
12. **Optional:** If you want to customize configurations to meet specific requirements, select **Advanced settings** and fill in the form.

Field	Description
Connected MID Server	Determine whether you want to have the system choose the optimal MID Server or choose a specific MID Server yourself. Perform only if you must make modifications to the MID Server otherwise leave it empty and let the system choose the optimal MID Server.
Event collection schedule (seconds)	Enter the frequency in seconds that indicates how often the system should check for new events from the external event source. The value can't be lower than the minimum schedule property, which by default is 120 seconds.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Protocol	Defines the communication protocol used for retrieving events from external devices.
severity_by_state_type	Determines the severity level assigned to events based on their state type.
time_zone	Specifies the time zone used for recording and displaying event timestamps.
offset_min	Sets the time offset for event retrieval to ensure accurate synchronization.
Port	Verify the default values for your connector type such as port details or time formats and modify them as necessary. Default values from your connector are filled-in. Specifies the port number used for communication with external devices.
max_fetch_interval_min	Limits the maximum interval between event fetch operations.
initial_sync_in_days	Sets the duration for the initial synchronization process when retrieving historical data.

13. **Optional:** Test the connector before activating it by selecting **Test and Save**.
    When the test succeeds, a pop-up appears where you can activate the pull connector by selecting **Activate integration**.
14. To save the connector, select **Save**.
15. To activate the pull connector, select **Activate**.
    The pull connector is activated and its tile is displayed in the **Installed Integrations** tab.

What to do next

To confirm the successful configuration of the pull connector and the flow of events into the system, select the **Related events** tab. If the setup is successful, proceed to **Add automation** to establish an alert automation. For details on **Related events** tab, see Review integration and configuration health and for information on alert automation, see Alert automation in Service Operations Workspace for ITOM.

Configure an event push connector

Integrate with an event push connector to connect to an external event source and push event information to your ServiceNow instance.

Before you begin

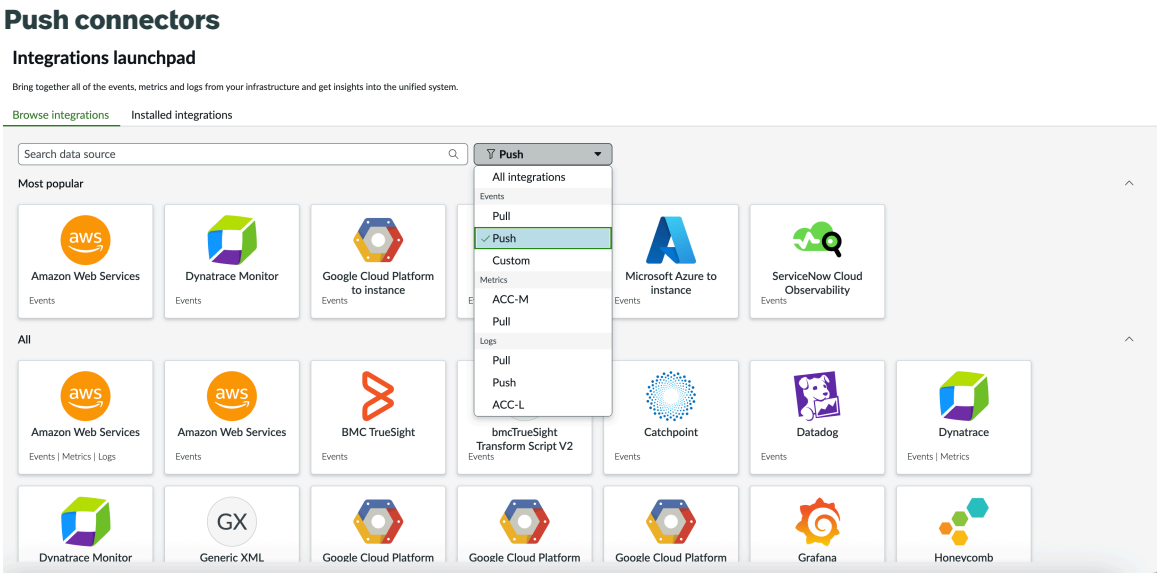
Role required: evt_mgmt_admin

Procedure

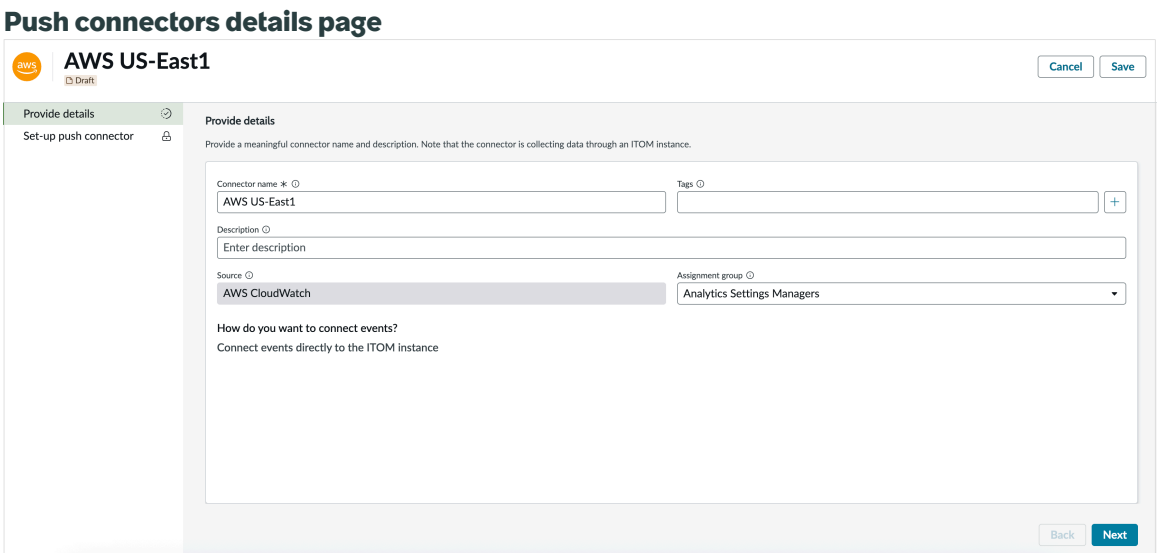
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. On the ITOM AIOps configuration center page, under the **Setup** > **Integrations** section, select **Manage Installed integrations**.
4. In the **Browse Integrations** tab, select the **All integrations** drop-down list and select **Push**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Only push connector tiles are displayed.



5. Select a push connector type tile.
6. Provide details about the connector type on the **Provide details** screen.



a. In the **Connector name** field, enter a unique name for the connector type.

b. **Optional:** In the **Tags** field, enter tags to help locate and identify connectors of this type on the Express List.
To add additional tags, select the plus sign next to the **Tags** field. The Add tags window opens.

   i. In the **Key** field, enter a tag key.

   ii. In the **Value** field, enter a tag value.

   iii. Select **Add**.

c. **Optional:** In the **Description** field, enter information to help identify this connector type.

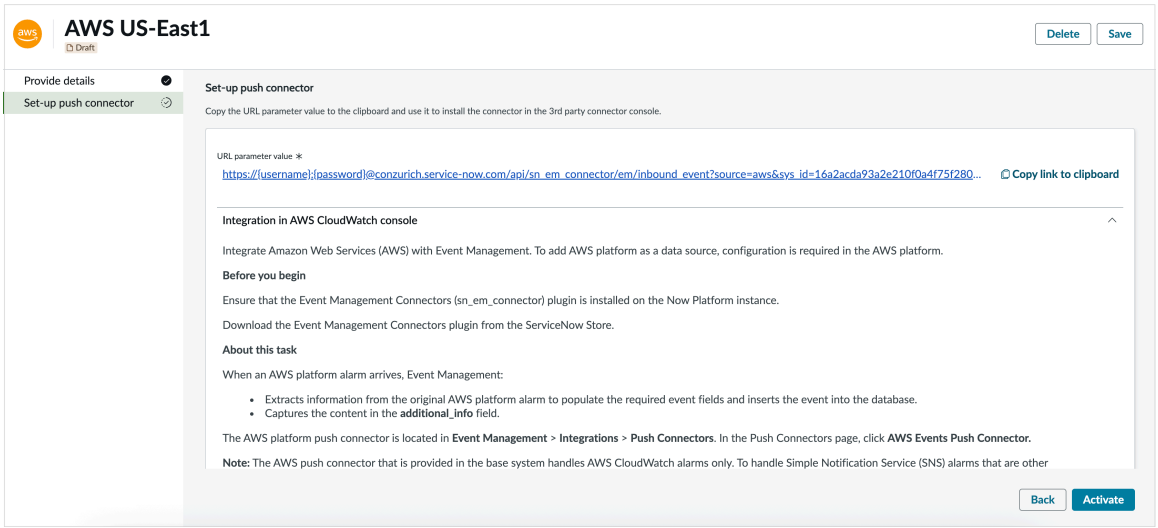
d. Verify that the vendor name in the **Source** field is correct.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

e. **Optional:** From the **Assignment group** drop-down list, select the group or team that is responsible for managing and maintaining the Push connector.

f. Select **Next**.

The connector is saved in draft mode, and the process advances to the Set-up push connector section.



7. In the **URL parameter value** field, select **Copy to clipboard** to copy the auto-generated URL parameter value to the clipboard.

   This URL is generated by the code that depends on the ServiceNow instance and connector type to receive events from the third-party connector. Pasting the URL in your third-party connector configuration creates a webhook that enables it to send events to the ServiceNow instance.

8. In the Select authentication method, select the authentication type.

   Integration Launchpad shows authentication options based on the supported authentication types. You can either create new credentials, if you have the required roles, or select from existing credentials.

   - **Basic**: Sends a username and password (Base64-encoded) with each request. The user_admin role is required to create new Basic Auth credentials. The drop-down list displays users who have the evt_mgmt_integration role. Users with the evt_mgmt_admin role are excluded from the drop-down.
   - **OAuth**: Grants apps limited, token-based access to resources without sharing credentials, using scoped, expiring access tokens. The oauth_admin role is required to create new OAuth client credentials.
   - **API Keys**: Uses a unique secret key to identify and authorize an application or user when calling an API. Creates a new API key credential. Associates the API key with the sn_em_connector.integration user, which is exported as part of the plugin.

9. Select **Activate** and then select **OK**.
10. In the **Details** tab, view the connector details and the URL link.

    Integration Launchpad uses these fields to render the latest error details for the push connector instance:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Last error time**: Stores the timestamp of the latest error. This uses the glide_date_time field type, allowing the Details page to show when the last failure occurred.
- **Last error message**: Stores the latest error message returned for the push connector instance. This read-only string field has a maximum length of 4,000 characters.
- **Last error payload**: Stores the detailed error payload associated with the latest failure. This read-only string field has a maximum length of 10,000 characters.

11. Follow the step-by-step instructions to integrate your third-party connector with Event Management.
    The connector is saved and a notification is sent after the connector is active.

What to do next

To confirm the successful configuration of the pull connector and the flow of events into the system, go to the **Related events** tab. If the setup is successful, proceed to **Add automation** to establish an alert automation. For details on **Related events** tab, see Review integration and configuration health and for information on alert automation, see Alert automation in Service Operations Workspace for ITOM.

Configure an event custom connector

Authenticate your event custom connector as a data source to enable the pushing of event information to your ServiceNow instance. Define the custom connector by providing its details and mapping fields. This allows the extracted information from your custom connector's event messages to populate the required event fields. Finally, create and supply a URL for the custom connector webhook.

Before you begin

- Ensure the Event Management connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance. For more information, see Configure Event Management connectors.
- Ensure that the configuration items for the hosts managed by your custom connector exist in the ServiceNow AI Platform instance. These CIs can be physical or virtual and can be either manually created or discovered via IP discovery or Cloud Discovery. For more information, see Access to cloud environments for ITOM products.

Role required: evt_mgmt_admin

About this task

To start pushing event information to your ServiceNow instance, you must set your ServiceNow AI Platform instance as the REST endpoint using a standard webhook on your custom connector.

By providing connector details and mapping fields, you define the custom connector. The extracted information from the custom connector's event messages then populates the required event fields and inserts the event into the database.

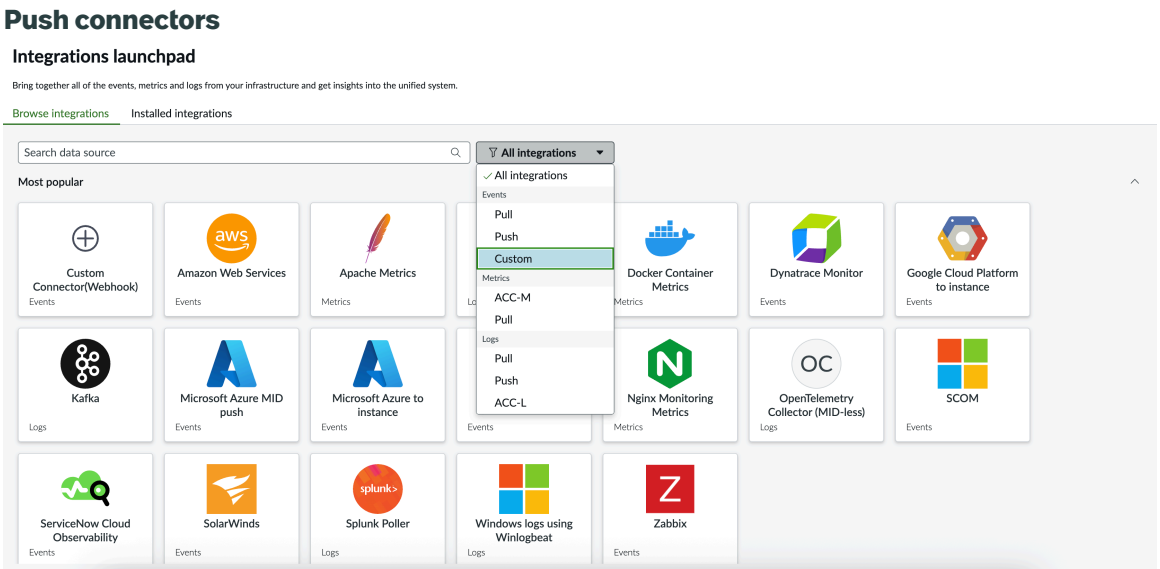
The URL is generated by the code based on the ServiceNow instance and the custom connector. Use this URL to create a webhook that enables your custom connector to send events to the ServiceNow instance.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the ITOM AIOps configuration center page, under the **Setup** > **Integrations** section, select **Manage Installed integrations**.
4. In the **Browse Integrations** tab, select the **All integrations** drop-down list and select **Custom**. Only custom connector tiles are displayed.



5. Select a custom connector type tile.
6. On the **Provide details** page, provide the details for the connector.

   a. In the **Connector name** field, enter a unique integration name for the connector.

   b. **Optional:** In the **Tags** field, enter tags to help locate and identify connectors of this type on the Express List.

      To add additional tags, select the plus icon ( ) next to the **Tags** field. The Add tags window opens.

      i. In the **Key** field, enter a tag key.

      ii. In the **Value** field, enter a tag value.

      iii. Select **Add**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. **Optional:** In the **Description** field, enter brief information about this connector.

d. In the **Source** field, enter the vendor used to gather events from the external event source.

The **Source** field identifies the connector and serves as an identifier to recognize the source of events and alerts once the connector is active.

e. **Optional:** From the **Assignment group** drop-down list, select the group or team that is responsible for managing and maintaining the connector.

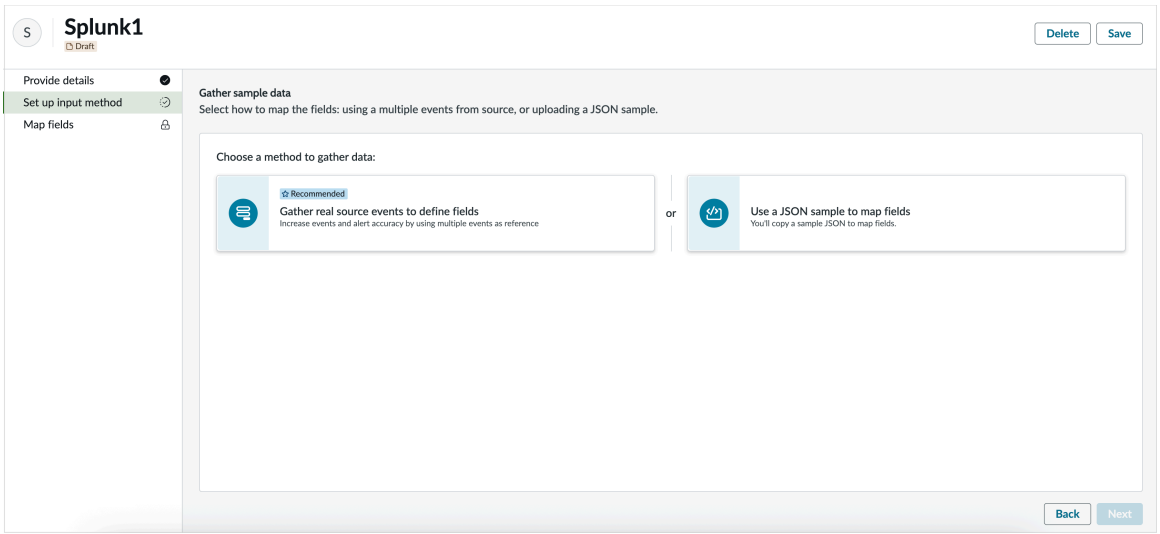
7. **Optional:** Drag or upload an image to display in your connector tile.
   - Drag an image into the box.
   - Browse to the image file by selecting **Upload image** and then choose the file.

   The maximum upload file size is 1 MB.
8. Determine whether you want to connect events directly to the ITOM instance or through a MID Server.
   - To send events directly to the ITOM instance, select **Directly to the ITOM instance**.
   - To send events through a MID Server, which processes and then passes the event to the instance, select **Via the MID server**.

     If a MID Server exists, from the **Select MID server** field, select an available MID Server connected to an events listener.

     If you must create a MID Server, then select one of the following.
     - **Configure MID web server extension**
     - **Configure MID web service event collector context**

     For more information, see Configure the MID Web Server extension and Configure the MID WebService Event Collector Context.
9. Select **Next**.



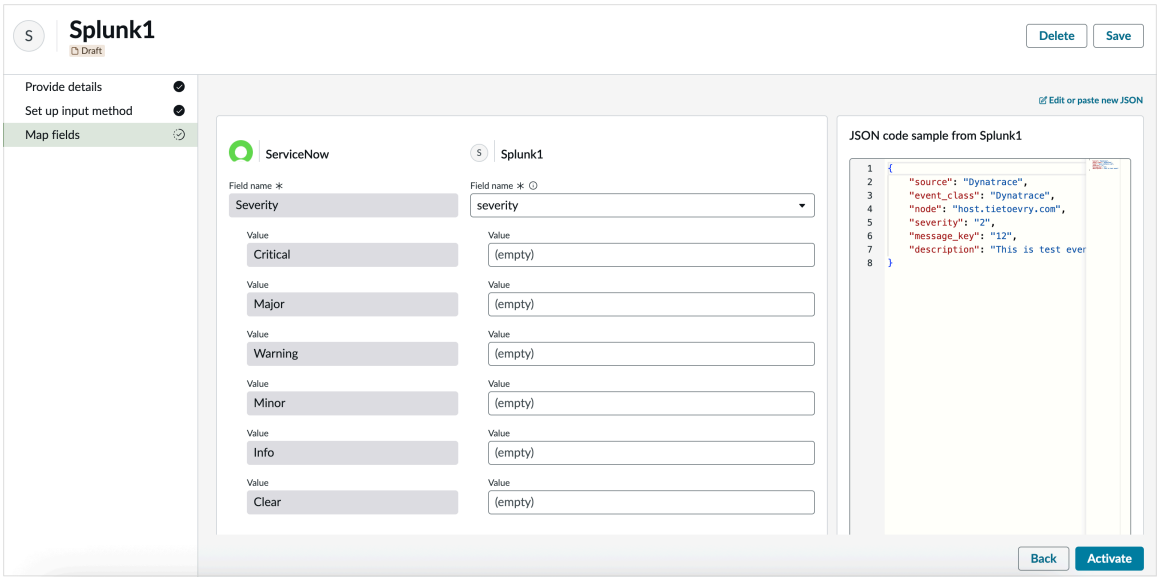
10. On the **Set up input method** page, select a method to gather event data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Method	Description
Gather real source events to define fields	**a.** Select **Gather real source events to define fields**. **Note:** By gathering real-source events from your custom connector, you increase events and alert accuracy by using multiple events as a reference to define the fields. **b.** Select **Copy to clipboard** and copy the URL. **c.** Paste the URL into your custom connector's web hook setup to create a webhook that enables your custom connector to send events to the Service Now instance. Enter your basic authentication cre dentials into the monitoring system's webhook con figuration (such as the username and password). The webhook enables your custom connector to send events to the instance. **d.** Select **Check for events**. The number of events are displayed. The event creates JSON files that you can browse after selecting **Next**.
Use a JSON sample to map fields	**a.** Select **Use a JSON sample to map fields**. **Note:** Only if you have a sample JSON se lect this option. **b.** In the **Enter payload** dialog box, copy and paste your JSON sample payload to create and view the mapping to map the fields.  **c.** Select **Upload JSON**. **d.** Select **Edit or paste new JSON** to edit the JSON that you uploaded or paste a new one. **e.** Select **Copy to clipboard** and copy the URL. **f.** Paste the URL into your custom connector's web hook setup to create a webhook that enables your custom connector to send events to the Service Now instance. Enter your basic authentication cre dentials into the monitoring system's webhook con figuration (such as the username and password). The webhook enables your custom connector to send events to the instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

11. Select **Next**.
    The page opens where you can map fields.



12. On the **Map fields** page, in the connector field names column, enter at least one value that maps to the severity values listed in the ServiceNow **Severity** field column.
13. On the **Map fields** page, in the connector field names column, enter at least one value that maps to the severity values listed in the ServiceNow **Severity** field column.

    You can enter the severity value from the JSON code sample. To set a severity value, you must be familiar with your custom connector's payload and the types of severity it supports. The severity values of the received events must match the generated events in your system.

    Enable the system to create events correctly from incoming data by mapping the fields in your JSON code sample to the ServiceNow fields. The **Severity** and **Message key** information are automatically filled in to save you time and effort. The **Message key** provides the correct identifier for the events, ensuring de-duplication works correctly and redundant alerts are not generated.
14. **Optional:** To view multiple JSON files, select the arrow above the JSON sample.
15. **Optional:** In the Other fields section, in your connector column, specify custom event parameters that are optional but provide additional information about the event.
    If you choose not to provide the optional information, leave the field empty.

    a. In the **Description** field, enter a meaningful alert description.

    b. In the **Metric name** field, enter a metric name that allows you to associate events with the performance metrics or KPIs that triggered the alert.

    c. In the **Node** field, enter a node value to be used for CI binding.

    d. In the **Event time** field, enter the creation time of the custom connector event.
    If the event time isn't mapped, the system will use the default event time.

    e. In the **Event time settings** field, select the time format and the event time zone.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Time format**: A GlideDateTime field in UTC or GMT format, with a maximum length of 40 characters.
- **Time zone**: Times are stored in Coordinated Universal Time (UTC) and are displayed globally based on the system time zone.

16. Activate and save the connector by selecting **Activate** and then select **OK** on the confirmation pop-up window.
    You can view the connector details on the **Details** tab and your field mappings on the **Fields mapping** tab.

Result

After the connector is activated, events start flowing from your custom connector console into the ServiceNow instance. The plug-in extracts information from the original custom connector event message to populate the required event fields and inserts the event into the database. To see the events in your ServiceNow AI Platform instance, navigate to All Events. For more information, see View events.

What to do next

To verify that the process was successfully completed and events are flowing into the system, view the related events on the **Related events** tab. If the setup is successful, proceed to **Add automation** to establish an alert automation. For information on alert automation, see Alert automation in Service Operations Workspace for ITOM.

Configure Solarwinds metric pull connector

Configure a metric pull connectors that require a script, connector definition, and connector instance to pull metrics from external sources. These connectors automate the data retrieval process, ensuring the seamless integration of external metrics into your system for efficient monitoring and performance analysis.

Before you begin

Role required: evt_mgmt_admin

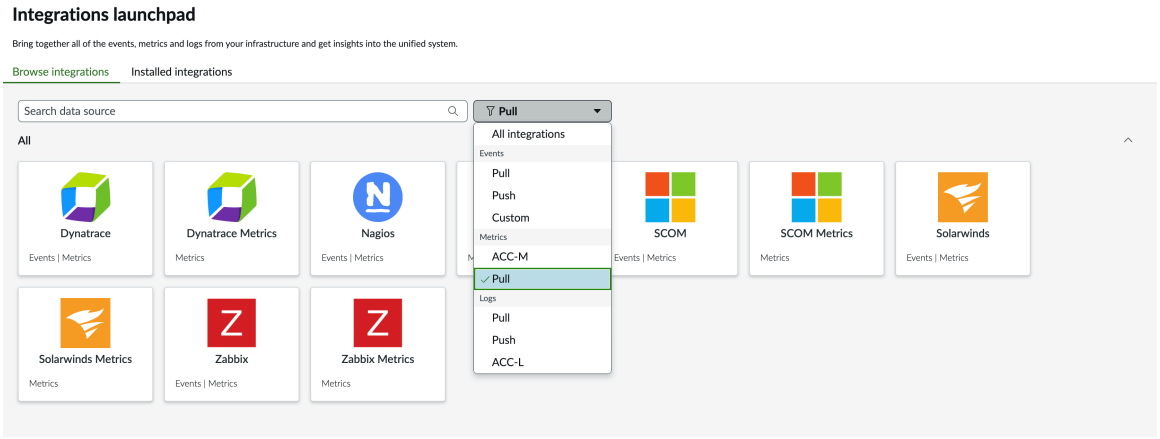
About this task

Note: The new UI for configuring metric pull connector is currently available only for the SolarWinds Metric Connector. For all other metric connectors, the configuration continues to use the Platform Table UI.

Procedure

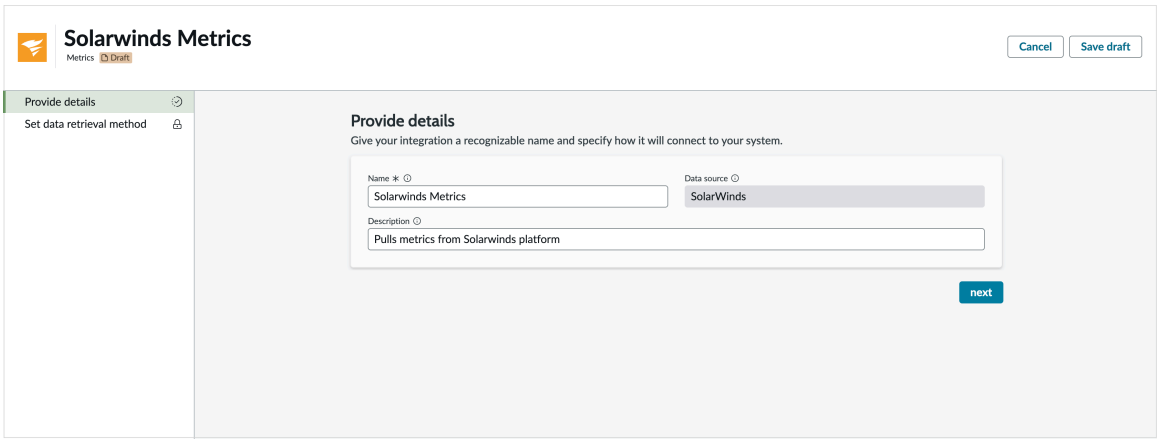
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. On the ITOM AIOps configuration center page, under the **Setup** > **Integrations** section, select **Manage Installed integrations**.
4. In the **Browse Integrations** tab, select the **All integrations** drop-down list and select **Metrics** > **Pull**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Only metric pull connector tiles are displayed.

5. Select a pull connector tile.
   If a pop-up menu opens, select the data to track from that connector and select **Continue**.



6. In the **Provide details** section, enter the following information and select **Next**.
   - In the **Name** field, enter a unique name for the connector type.
   - In the **Data source** field, the external source for retrieving metrics is auto-populated based on the tile type you select.
   - In the **Description** field, enter brief information about this connector.
7. In the **Set data retrieval method** section, enter the following information:
   - In the **Hostname/Host IP** field, enter the IP address that is related to the Solarwinds server.
   - From the **Credentials** drop-down list, select the valid credentials to access the event source host.
   - In the **Metrics collection schedule (seconds)** field, enter the time interval (in seconds) at which the connector retrieves metrics from the source host.
   - In the **MID Server** field, select a MID Server that collects metric data from external tools and securely sends it to ServiceNow.

     If none are available, ensure one is installed, running, and has the required capabilities.

     Note: You can select multiple MID Servers. The system randomly assigns one as the primary and uses the others as backups.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. **Optional:** If you want to customize configurations to meet specific requirements, select **Advanced settings** and fill in the form.

Field	Description
Max rows per query	Frequency in seconds that indicates how often the system should check for new metrics from the external event source. The value can't be lower than the minimum schedule property, which by default is 120 seconds.
Max fetch interval (in minutes)	Limits the maximum interval between event fetch operations.
Offset (in minutes)	Sets the time offset for event retrieval to ensure accurate synchronization.
Port	Specifies the port number used for communication with external devices. (Optional) Verify the default values for your connector type such as port details or time formats and modify them as necessary. Default values from your connector are filled-in.
Protocol	Defines the communication protocol used for retrieving events from external devices.
Debugging	○ Debug: Provides detailed logs for troubleshooting. ○ Log payload: Displays raw log data. Use only for debugging, as it can quickly fill the MID Server logs.

9. **Optional:** Test the connector before activating it by selecting **Test and Save**.
10. To save the connector, select **Save**.
11. To activate the pull connector, select **Activate**.
    The metric pull connector is activated and its tile is displayed in the **Installed Integrations** tab. When you open the tile, you can find the **Overview**, **Details**, and **Data retrieval method** tabs.

    The **Overview** tab allows you to verify that the connector is running and collecting data. It also offers options to improve system settings, such as refining alert definitions or enhancing binding configurations.

Configure the Dynatrace API Key credential from **All** > **Connections and Credentials** > **Credentials**. For more information on how to configure Dynatrace API Key credential, see API key credentials.

About this task

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation pane, select the AIOps configuration center icon.
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. On the ITOM AIOps configuration center page, under the **Setup** > **Integrations** section, select **Manage Installed integrations**.
4. In the **Browse Integrations** tab, select the **All integrations** drop-down list and select **Metrics** > **Pull**.

   Only metric pull connector tiles are displayed.
5. Select the **Dynatrace Metrics** connector tile.
6. In the **Provide details** section, enter the following information and select **Next**.
   - In the **Name** field, enter a unique name for the connector type.
   - In the **Data source** field, the external source for retrieving metrics is auto-populated based on the tile type you select.

     In this case, select **Dynatrace**.
   - In the **Description** field, enter brief information about this connector.
7. In the **Set data retrieval method** section, enter the following information:
   - In the **Hostname/Host IP** field, enter the IP address that is related to the Dynatrace server.
   - From the **Credentials** drop-down list, select the valid credentials to access the metrics source host.

     Select the credential.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- In the **Metric collection schedule (in seconds)** field, enter the time interval (in seconds) at which the connector retrieves metrics from the source host.

  The default value is 60 seconds.

- In the **MID Server** field, select a MID Server that collects metric data from external tools and securely sends it to ServiceNow.

  If none are available, ensure one is installed, running, and has the required capabilities. If none are available, ensure one is installed, running, and has the required capabilities. For example, the **Metric Intelligence Context** must be running on the same MID Server that you are configuring.

  Note: You can select multiple MID Server. The system randomly assigns one as the primary and uses the others as backups.

8. **Optional:** If you want to customize configurations to meet specific requirements, select **Advanced settings** and fill in the form.
   For more information on fields, see Dynatrace advanced settings fields.
9. **Optional:** Test the connector before activating it by selecting **Test and Save**.
10. To save the connector, select **Save**.
11. To activate the pull connector, select **Activate**.
    The metric pull connector is activated and its tile is displayed in the **Installed Integrations** tab. When you open the tile, you can find the **Overview**, **Details**, and **Data retrieval method** tabs.

    The **Overview** tab allows you to verify that the connector is running and collecting data. It also offers options to improve system settings, such as refining alert definitions or enhancing binding configurations.

    The **Details** tab allows you to update the connector's general information (such as name or description) and displays any errors encountered during its operation.

    The **Data Retrieval Method** tab contains the connector settings (such as host, port, and credentials) and may provide additional details for issues like MID Server errors.

Configure Datadog metric pull connector

Configure OAuth-based integration between your Datadog instance and ServiceNow Event Management to securely ingest metric from the Datadog Instance. This setup enables authenticated metric delivery using client credentials, maps discovered server CIs, and allows anomaly alerts to create actionable events in ServiceNow through standard webhooks.

Before you begin

Configure the Datadog API Key credential from **All** > **Connections and Credentials** > **Credentials**. For more information on how to configure Datadog API Key credential, see API key credentials.

Ensure you have the application key configured in the Datadog. For more information, see https://docs.datadoghq.com/account_management/api-app-keys/.

To use container metrics: First, discover your Docker Container CIs (through Discovery, Cloud Discovery, or Agent Client Collector) so that the container_id field on each cmdb_ci_docker_container record is populated. The shipped Datadog Metrics Container Binding event rule matches container metric events to these CIs based on container_id. Datadog reports the container_id as the container's short ID (the first 12 characters of the Docker container

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ID), which is what Discovery stores on the CI. Once the CIs are discovered, enable the Enable container metrics advanced setting (set it to true).

Role required: evt_mgmt_admin

About this task

The Datadog connector can collect Docker container metrics and bind them to Docker Container CIs (cmdb_ci_docker_container). This capability is off by default and is enabled through the **Enable container metrics** advanced setting.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. On the ITOM AIOps configuration center page, under the **Setup** > **Integrations** section, select **Manage Installed integrations**.
4. In the **Browse Integrations** tab, select the **All integrations** drop-down list and select **Metrics** > **Pull**.

   Only metric pull connector tiles are displayed.
5. Select the **Datadog Metrics** connector tile.
6. In the **Provide details** section, enter the following information and select **Next**.
   - In the **Name** field, enter a unique name for the connector type.
   - In the **Data source** field, the external source for retrieving metrics is auto-populated based on the tile type you select.

     In this case, select **Datadog**.
   - In the **Description** field, enter brief information about this connector.
7. In the **Set data retrieval method** section, enter the following information:
   - In the **Hostname/Host IP** field, enter the IP address that is related to the Datadog server.
   - From the **Credentials** drop-down list, select the valid credentials to access the metrics source host.

     Select the credential.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- In the **Metric collection schedule (in seconds)** field, enter the time interval (in seconds) at which the connector retrieves metrics from the source host.

  The default value is 60 seconds.

- In the **MID Server** field, select a MID Server that collects metric data from external tools and securely sends it to ServiceNow.

  If none are available, ensure one is installed, running, and has the required capabilities. If none are available, ensure one is installed, running, and has the required capabilities. For example, the **Metric Intelligence Context** must be running on the same MID Server that you are configuring.

  Note: You can select multiple MID Server. The system randomly assigns one as the primary and uses the others as backups.

- in the **Application key** field, enter the application key that is associated with the user account.

8. **Optional:** If you want to customize configurations to meet specific requirements, select **Advanced settings** and fill in the form.
   For more information on fields, see Datadog advanced settings fields.
9. **Optional:** Test the connector before activating it by selecting **Test and Save**.
10. To save the connector, select **Save**.
11. To activate the pull connector, select **Activate**.
    The metric pull connector is activated and its tile is displayed in the **Installed Integrations** tab. When you open the tile, you can find the **Overview**, **Details**, and **Data retrieval method** tabs.

    The **Overview** tab allows you to verify that the connector is running and collecting data. It also offers options to improve system settings, such as refining alert definitions or enhancing binding configurations.

    The **Details** tab allows you to update the connector's general information (such as name or description) and displays any errors encountered during its operation.

    The **Data Retrieval Method** tab contains the connector settings (such as host, port, and credentials) and may provide additional details for issues like MID Server errors.

Configure Azure Monitor Issue in Integrations Launchpad

An Azure Issue is a unified case that aggregates related alerts and signals from Azure Monitor into a single, trackable operational problem. It preserves investigation context and serves as a durable record for incident management, so you can resolve problems faster instead of tracking scattered alerts.

Before you begin

Verify you already have an Azure Monitor Workspace.

Role required: evt_mgmt_admin

About this task

ServiceNow represents an Azure Issue as a single alert. View the alerts that Azure grouped into the Issue in the **Related Records** tab from the Express List side panel or the alert record in Service Operations Workspace. ServiceNow retains each related alert as an individual alert. This approach lets ServiceNow group and correlate alerts across multiple resources and monitoring systems. ServiceNow is not limited to the alerts that Azure grouped into the Issue. As

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a result, ServiceNow identifies broader incidents, reduces duplicate alerts, and provides a more comprehensive operational view. For this reason, ServiceNow represents an Azure Issue as a single alert instead of an alert group.

Note the following before you start:

- If you already use the Azure push connector to send Microsoft Azure alerts to ServiceNow, use the same push connector URL to send Azure Issues.
- If you have different tenants with different Azure Service Principal credentials (per tenant or per subscription), create separate Azure push connector instances. Use them to push Azure alerts or issues into your ServiceNow instances.

Procedure

1. If you don't already have a Azure monitor alert integration then create a push connector instance by perform the following steps:
   a. Navigate to **Workspaces** > **Service Operations Workspace**.
   b. From the bottom of the navigation pane, select the AIOps Configuration Center icon .

      The ITOM AIOps Configuration Center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
   c. On the ITOM AIOps Configuration Center page, under the Setup Integrations section, select **Add integrations**.

      The Integrations Launchpad page opens.
   d. Search for **Microsoft Azure to instance** and create a push connector instance by providing the following details:
      i. In the Provide details page, provide the connector name and description for the connector in the **Connector name** and **Description** field.
      ii. Select **Next**.

         The Set-up push connector page opens.
      iii. From the **URL parameter value** field, copy the URL by selecting the **Copy link to clipboard**.

         The URL can be used in the Microsoft Azure Action group Securewebhook URL to send Azure alerts and Azure Issues into ServiceNow instance. The URL must be in the following format:

         ```
         https://<instance_name>.service-now.com/api/sn_em_connector/em/inbound_event?source=azuremonitor&sys_id=<sys_id_push_connector_instance>
         ```
      iv. Select **Activate** to activate the push connector instance.
2. In the Azure Monitor portal, perform the following steps:
   a. Navigate to your Azure Monitor Workspace.
   b. Navigate to **Settings** > **Action groups** and select the existing action group that you use to send Azure alerts to ServiceNow.

      This creates an alert, and in turn, the Alert Management rule creates an incident. If you're configuring Azure issues or alerts for the first time, first create an action group by using the above URL you have copied. Then follow the steps in Integrate Azure Monitor with OAuth authentication.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you're configuring Azure issues or alerts for the first time, first create an action group by using the above URL you have copied. Then follow the steps in Integrate Azure Monitor with OAuth authentication.

c. The pull connector shows related alerts and resource information for an issue in the Azure portal under the **Alerts** and **Resources** tab, and enables bi-directional synchronization. To configure it, perform the steps below.

3. Verify that the pull connector instance is active by performing the following step:

> **Note:** If you used the push connector to bring Azure alerts or issues into ServiceNow, the pull connector instance may already be active.

In Integration Launchpad, on the **Installed Integrations** tab, search for `Azure Monitor` and confirm that it is already active.

> **Note:** If you have already configured a pull connector instance for Azure Alerts bi-directional sync, it also works for Azure Issues bi-directional sync and for fetching Azure Issue-related alerts.

4. If you used the push connector to bring Azure alerts or issues into ServiceNow but the Azure Monitor pull connector is not yet active, perform the following steps:
   a. On the **Installed Integrations** tab, search for `Microsoft Azure` and select the **Microsoft Azure (Events – pull)** tile to open the pull connector instance.
   b. In the **Credentials** field, enter your Azure Service Principal credential.
   c. Leave the **Host** field as `1.1.1.1`, because it is not used.
   d. To use a specific MID Server, go to **Advanced Settings** and select the mid server in the **Connected mid server** field.
   e. Select **Test and Save**.

      If the test connection succeeds, activate the connector.

      If Azure bi-directional connector is enabled, when an Azure issue is closed in ServiceNow, it automatically closes in the Azure portal as well.

5. If you used the push connector to bring Azure alerts or issues into ServiceNow, configure a pull connector instance by performing the following steps:
   a. On the **Browse Integrations** tab, search for `Microsoft Azure` and select the **Microsoft Azure (Events – pull)** tile to create a new pull connector instance.
   b. On the **Details** tab, provide the following information:

      i. In the **Connector name** field, enter a name for the pull connector instance.

      > **Note:** The pull connector instance name must match with the push connector instance name.

      ii. In the **Credentials** field, enter your Azure Service Principal credential.
      iii. Leave the **Host** field as `1.1.1.1`, because it is not used.
      iv. To use a specific MID Server, go to **Advanced Settings** and enter the mid server name in the **Connected mid server** field.
      v. Configure the following parameters to control how the system fetches related alerts for an issue:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Set *fetchIssueRelatedAlerts* to control whether the system fetches related alerts for the issue.

  The default is true. Set it to false if you want to disable this behavior.

- Set *fetchIssueRelatedAlertsLimit* to the maximum number of related alerts the system fetches for the issue. The default is 10.

vi. Select **Test and Save**.

If the test connection succeeds, activate the connector.

Review integration and configuration health

Review your events to ensure alerts are created as intended. Start this process by checking the health status of your integration. This provides useful statistics to highlight where you can make improvements. You can enrich alerts with relevant business context, group them for better noise reduction, escalate critical alerts promptly, and notify your team for swift response and resolution.

Before you begin

Role required: evt_mgmt_operator or evt_mgmt_admin

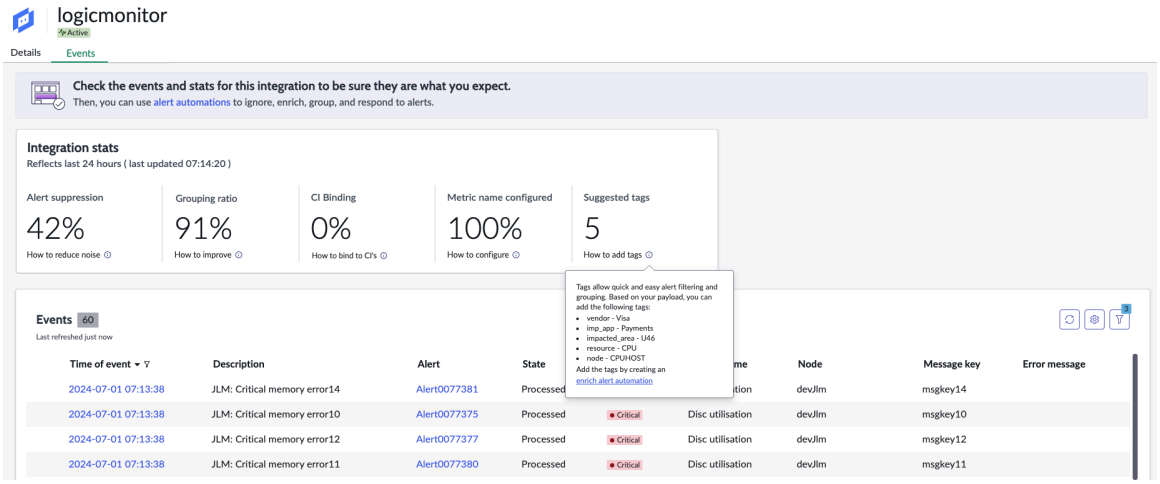
About this task

Health state metrics indicate how effectively alert automations add context and reduce noise, helping operators lower the Mean Time to Repair (MTTR). When adding a new integration, review these metrics, assess the rates, and develop new rules to further enhance noise reduction and improve overall system performance.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. On the ITOM AIOps configuration center page, under the **Setup** > **Integrations** section, select **Manage Installed integrations**.
4. In the **Browse Integrations** tab, select the **All integrations** drop-down list and select **Pull** or **Push** as required.
5. Select a pull, push, or a custom connector type tile.
   If a pop-up menu opens, select the data to track from that connector and select **Continue**.
6. Select the **Events** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



7. In the Health state section, view the data for alerts and their associated attributes.

Alert attributes

Alert attribute	Description
Alert Suppression	The suppression ratio indicates the proportion of alerts created to events received. Reducing unwanted alerts can be achieved by de-duplicating or ignoring them. ○ De-duplication: The **message_key** field is a unique identifier for an alert in the source monitoring system. It is used for de-duplication and alert flapping detection purposes. If the source event does not provide reliable unique values, you can use the default value or create your own. If the message key is not defined, the default message key will be <Source + Node + Type + Resource + Metric Name>. The guideline is for the event source to automatically populate the <Source + Node + Type + Resource + Metric Name> fields and generate the message key. This practice facilitates better distribution of event processing across instance workers and nodes. If the source event does not provide values for these fields, ensure they are populated using transform rules. This action, which does not impact event processing, is essential for de-duplication. Populate as many of these fields as possible before sending the event to the instance. Doing so enhances the distribution of events across processor workers, resulting in improved throughput and scalability. To learn more about de-duplication, see Event Management configuration preferences. To set the message key in your custom connector integration, see Configure an event custom connector. ○ Ignore alert event rules: Filter out low-quality alerts by creating an ignore automation.
Alert compression rate	When you group alerts, a high compression rate is desirable because it means fewer alerts remain for your operations team to review and

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert attribute	Description
	act on. This can lead to improved team efficiency. The compression rate is calculated as 1 – (the number of alert groups + the number of ungrouped alerts) / total alerts. To learn about alert aggregation, see Alert grouping. One way to improve your alert compression rate is by defining a new grouping automation.
CI Binding	The percentage of alerts successfully bound to a Configuration Item (CI) in your CMDB is crucial. Aim for this number to be at or near 100% to enhance alert grouping, root cause analysis, assignment, and more. To bind a host, machine, or any device with an IP, populate the **Node** field with a unique hostname, FQDN, IP, or MAC address. This can be done within the integration itself or by creating an enrich automation. For more complex scenarios, you can override node-based binding using event rules. For more information on CI binding, see Binding alerts to CIs.
Metric name configured	Shows the percentage of alerts that have a metric name defined. It's crucial to aim for near 100% because it's used by default in our automated correlation algorithm. This can be achieved within the integration itself or by creating an enrich automation.
Suggested tags	Provides suggested alert tags based on the integration payload. Alert tags are structured fields that you can define to facilitate easier filtering and grouping of alerts. The tags are stored in *sn_itom_integ_app_recommendation_tags_suggestion*, and only the top 5 most popular tags are displayed. To refine the results of the suggestion mechanism, you can use the *sn_itom_integ_app.evt_mgmt_tag_suggestion_ignore_keys* property. This property displays a list of lowercase field names or keywords, separated by commas, to be ignored when scanning additional alert info for tag suggestions. The default value is time.

8. In the Events section, ensure that your events are generating alerts as expected.

   Verify that alert fields and tags are populated correctly to make the alerts easier to read and filter in Express List. Confirm that severity values align with your operations team's expectations and that fields and tags follow a standardized format across sources for easier grouping.

   By verifying alert generation, you can be confident that your system is properly configured to detect and notify you of noteworthy occurrences. For information on the fields in the Events section, see Integration and configuration health event fields.

What to do next

Now that you've confirmed alerts from the events, you can initiate the alert automation process by selecting **Add automation**. This takes you to the ignore automation step, where you can disregard irrelevant or false-positive alerts. Following that, proceed to enrich, group, and automate responses. This process involves transforming raw alerts into a format understandable

by ServiceNow, grouping the alerts, and escalating an alert. This ensures an immediate response from the appropriate team or individual. For more information on alert automation, see Alert automation in Service Operations Workspace for ITOM.

Activate integration

Activate integration allows you to enable a previously deactivated connector integration, restoring its functionality. This feature helps you seamlessly resume data flow and integration activities, ensuring continuity and efficient event management without the need to reconfigure the integration.

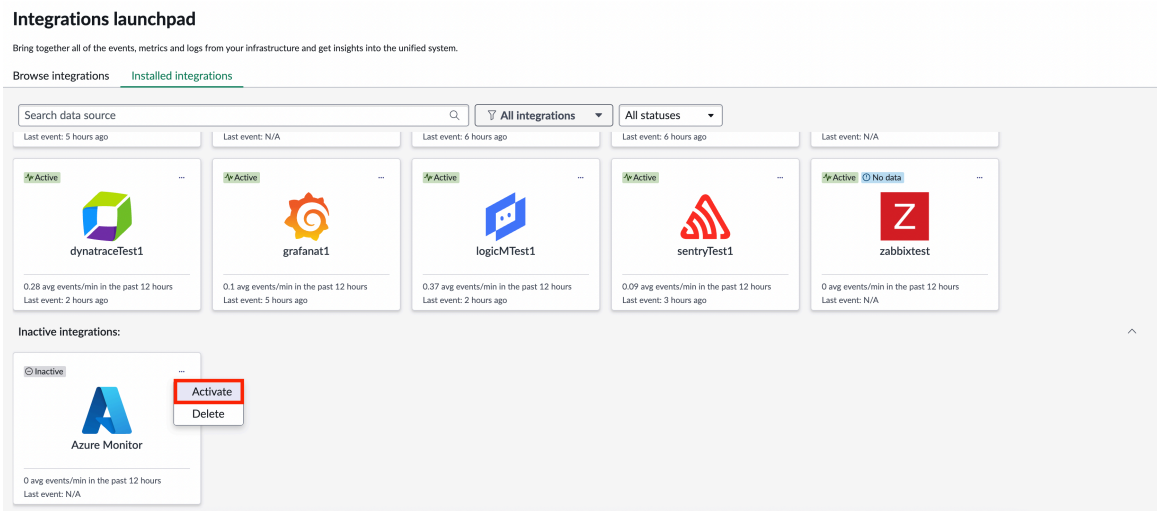
Before you begin

Ensure the integration is deactivated.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. On the ITOM AIOps configuration center page, under the **Setup** > **Integrations** section, select **Manage Installed integrations**.
4. Select the **Installed integrations** tab.
5. For the integration that you want to activate, select the Ellipses icon (•••) and then select **Activate**.



The selected integration is activated, and its status is shown as **Active** on the installation tile.

Deactivate integration

Deactivate integration allows you to temporarily disable an active connector integration without deleting it. This feature helps you manage integrations more effectively by pausing data flow when needed, reducing unnecessary event processing and improving system performance.

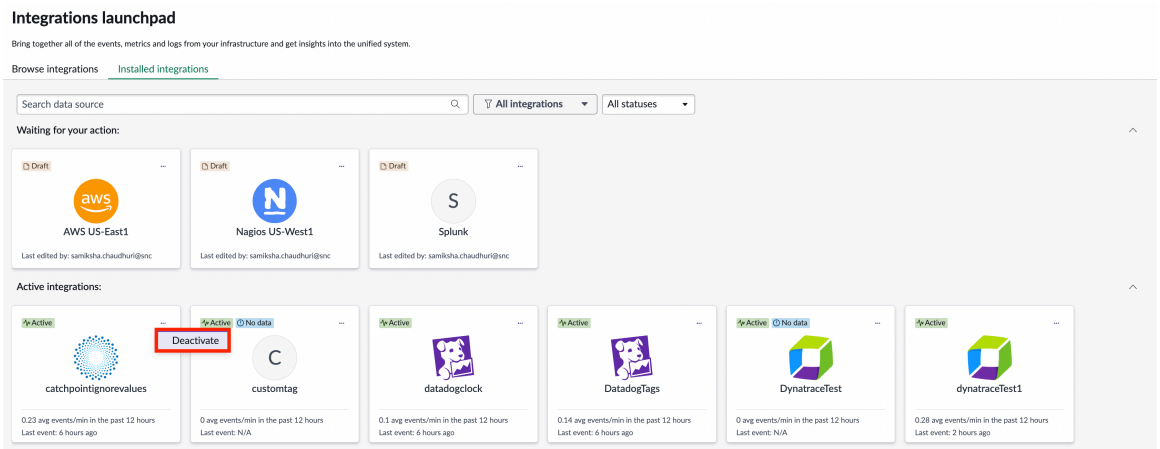
Before you begin

Role required: evt_mgmt_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. On the ITOM AIOps configuration center page, under the **Setup** > **Integrations** section, select **Manage Installed integrations**.
4. Select the **Installed integrations** tab.
5. For the integration that you want to deactivate, select the Ellipses icon (•••) and then select **Deactivate**.



The selected integration is deactivated, and its status is shown as **Inactive** on the installation tile.

Delete integration

Delete integration allows you to permanently remove a connector integration from your system. This feature helps you maintain a clean and organized system by eliminating unused or obsolete integrations, freeing up resources and reducing potential clutter.

Before you begin

Ensure the integration is deactivated.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. On the ITOM AIOps configuration center page, under the **Setup** > **Integrations** section, select **Manage Installed integrations**.
4. Select the **Installed integrations** tab.
5. For the integration that you want to delete, select the Ellipses icon (•••) and then select **Delete**.

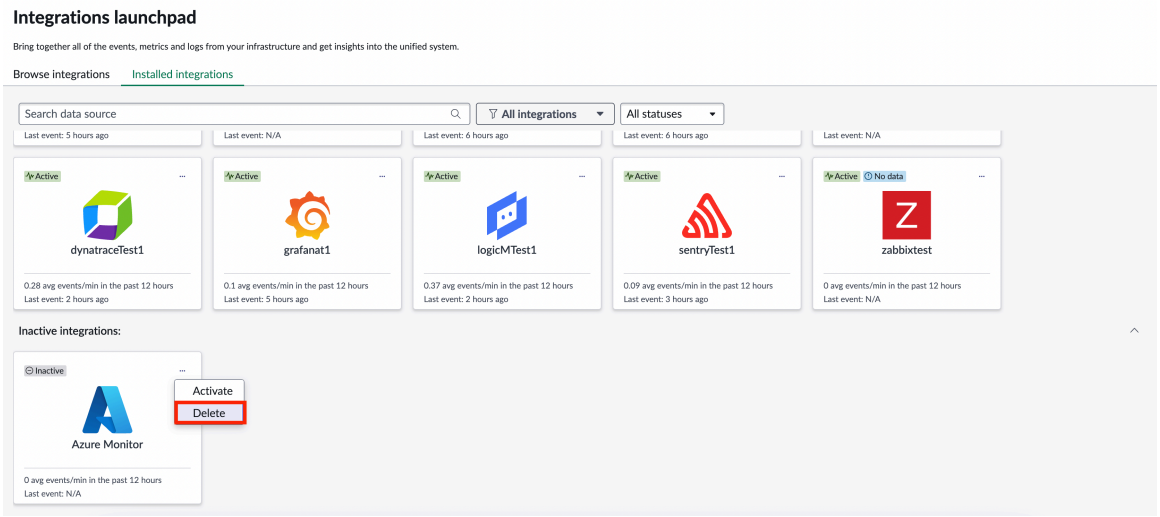
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. On the confirmation window, select **Delete**.
   The integration is deleted.

Service Level Objective Management

Service Level Objective Management (SLO Management) helps your organization define, track, and meet agreed-upon service quality standards. It works alongside Service Level Agreements (SLAs) to help make sure that services meet customer expectations.

Overview of how SLO Management works

- SLAs set the expectations

  SLAs are formal agreements that outline the level of service a customer can expect. SLAs can include response times, resolution times, and uptime targets.

- SLOs defines how to meet expectations

  SLOs are specific, measurable objectives that an organization sets to achieve the SLAs. They translate the broad goals of the SLA into actionable metrics.

- ServiceNow SLO Management helps manage SLOs. It offers functionalities to:
  - Define SLOs based on various metrics.
  - Monitor SLO performance in real-time.
  - Generate alerts when SLOs are at risk of being breached.
  - Track historical data to identify trends and improve processes.

Exploring SLO Management

Service Level Objective Management (SLO Management) helps IT services meet customer expectations.

SLO Management overview

SLO Management is a framework for setting clear expectations and measuring the performance of IT services. It helps organizations deliver consistent services and identify areas for improvement. SLOs define the target service level for a specific service, such as incident resolution or service request fulfillment. Effective SLO management involves setting realistic objectives, monitoring performance, and continuously improving services to meet customer needs.

SLO Management users

Users

Users	Description	Contains Roles
admin	A ServiceNow administrator is responsible for the administration,	All

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Users (continued)

Users	Description	Contains Roles
	development, operation, education, and maintenance of the ServiceNow platform. Responsible for installation and can perform Service Operations Workspace Admin Center configuration of SRM.	
Administrator [srm_admin] **Note:** Not the ServiceNow *admin* role	SRM administrators can manage account settings, configurations, and users. Administrators can perform the following actions: • Access, create, edit, or delete all SRM configurations. • Add or manage integrations. • Create Integrations with Application Performance Monitoring (APM) tools • Set up and maintain Reliability Indicators. • Set up and maintain Error Budget Policies.	• Manager • Responder
Manager [srm_manager]	Managers oversee a team of service reliability engineers (SREs). Managers assign SREs to the team on-call schedule, monitor their performance, create procedures to deal with incidents, and develop solutions. Managers help ensure resilience across all the systems and the DevOps workflows. Managers can perform the following actions within the context of their teams: • Define and set up and teams, on-call schedules, and services. • Add and delete users such as responders, and managers for the teams the are a part of. • Add or manage integrations. • Create Integrations with Application Performance Monitoring (APM) tools	Responder

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Users (continued)

Users	Description	Contains Roles
	• Set up and maintain Reliability Indicators. • Set up and maintain Error Budget Policies.	
Responder [srm_responder]	An SRE that uses SRM to perform everyday tasks. Responders are the individuals who are on call and diagnose and remediate incidents. Responders can only access configurations that they're a part of. They can only access the alerts or incidents for which they have permissions. SREs can perform the following actions, within the context of their teams: • Set up services, teams, and integrations • Confirm their on-call schedules • Manage incident and alert records • Update teams that they've created • Add other responders • Create Integrations with Application Performance Monitoring (APM) tools • Set up and maintain reliability metrics • Set up and maintain error budget actions	Inherits 17 roles including the following: • cmdb_read • sn_sow.sow_user • sn_sow_srm.srm_responder • workspace_user • slo_operator

Note: If you're using the SLO plugin without SRM, make sure that the required alert and cmdb_ci read access is granted to team members.

SLO Management workflow

1. Define SLOs - Identify critical services and define SLOs based on customer expectations and business requirements.

   Note: SLOs can also be generated automatically using the SLO creator agent. For details, see Generating service level objectives.

2. Establish SLIs - Develop Service Level Indicators (SLIs) to measure SLO performance.
3. Monitor and analyze - Track SLI data and analyze performance against SLO targets.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Identify gaps and improve - Determine areas where SLOs aren't being met and implement changes to improve service performance.
5. Review and refine - Regularly review SLO performance and refine SLOs as needed.

SLO Management benefits

- Improved service quality - SLOs help IT services meet customer expectations, leading to increased satisfaction and loyalty.
- Increased transparency - Clear SLOs provide a shared understanding of service expectations between IT and customers.
- Better resource allocation - SLOs help prioritize resources and focus on areas that need improvement.
- Enhanced collaboration - SLO management encourages collaboration between IT teams and customers to achieve common goals.
- Data-driven decision making - SLO performance data informs decisions and drives continuous service improvement.
- Automated SLO generation - The SLO creator agent analyzes operational data to generate SLOs, helping teams get started with SLO-based monitoring. For details, see Generating service level objectives.

Reliability metrics in SLO Management

Learn about the reliability metrics and features that can help you track service health, respond to issues, and support business goals.

Service reliability dashboard

The Service reliability dashboard displays a customizable, high-level view of service performance. It helps you monitor and manage reliability using visualizations that track service states, error budgets, and service level objectives (SLOs) over time.

The dashboard displays information about all services in Service Reliability Management (SRM). You can access the dashboard in Service Operations Workspace in the following ways:

- Navigate to **Services (** **)** > **Service reliability**.
- Navigate to **Home (** **)** > **Service reliability**

For more details, see Visualizations in the Service reliability dashboard.

Note: You can also view SLO information for all services on the Services Overview tab. See Working with SRM services for more information.

Notification destinations

Notification destinations help keep teams informed about service reliability. Attach them to error budget policies to send notifications when a policy is breached.

To view and manage notification destinations in Service Operations Workspace, navigate to **Teams** > **[Your team]** > **SLO Notification destinations**.

Visit the following links to learn more about creating and working with notification destinations:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Create a notification destination in SRM
- Create SLOs, SLIs, and error budget policies
- Notifications for breached error budgets

Reliability metrics tab

The Reliability metrics tab shows how well a specific service is meeting its reliability goals. Use it to track SLOs, service level indicators (SLIs), and error budgets for a service.

To view the Reliability metrics tab in Service Operations Workspace, navigate to **Services ( )** > **[Your service]** > **Reliability Metrics**.

See these links to learn more about what you can do in the Reliability metrics tab:

- Create SLOs, SLIs, and error budget policies
- Edit a reliability metric
- View SRM reliability metrics

Service level objectives table

On the Reliability metrics tab, the Service level objectives table includes the following details about the service SLOs:

- **Name** - Name of the SLO. You can select the name to view the SLO record.
- **Reliability** - Current state of the SLO. For example, stable, at risk, or critical.
- **% Error budget remaining** - Percentage of the error budget still available in the current compliance period.
- **Compliance period** - Time window used to calculate performance:
  - Month - Current month, for example, if the current date is January 26, the month is January 1 through January 31.
  - Rolling 7, 30, or 90 days - Number of days from the current date. For example, for rolling 7 days, the duration is 7 days back from the current date.
- **SLI type** - Performance category being measured:
  - Availability - Percentage of time your service or configuration item is available, also known as uptime.
  - Errors - Frequency of your service errors.
  - Latency - Time that it takes to service a request.
  - Saturation - Fullness of your system, focusing on resource usage.
- **Source type** - Origin of the data used to calculate the SLIs for this SLO:
  - Alert - Uses alerts from integrated monitoring tools.
  - Outage - Uses outages detected by monitoring tools and reported by users. An outage indicates when the service was unavailable. This source type excludes planned outages, such as scheduled maintenance.
- **Updated** - The date and time the SLO was last edited.
- **Updated by** - The user name of the person who last edited the SLO.
- **State** - Status of the SLO. For example, running or retired.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: For performance purposes, SLO and SLI records ([sn_sow_srm_slo_history] and [sn_sow_srm_sli_metric]) are archived after one year and deleted five years later. Archived data is omitted from tables and visualizations.

AI in SLO Management

AI capabilities in SLO Management help teams adopt service level objectives (SLOs) faster and monitor service performance.

Note: Depending on your license, you will have access to certain application features, generative AI skills, agentic workflows, and AI agents. For more information, see ServiceNow product tiers.

AI features in SLO Management

AI feature	Description	Use case	Resources
SLO generation with the SLO creator agent	Analyzes CI data and automatically generates baseline SLOs for eligible configuration items (CIs). You can review, update, and manage the generated SLOs and adjust the agent settings.	An operator needs baseline SLOs for new or existing CIs without manually defining thresholds.	• Generating service level objectives • Manage SLO creator agent settings • View generated SLOs • SLO creator agent system properties
Conversational analysis and SLO creation with the ITOM MCP Server	Connects an MCP client application, such as Claude or Moveworks, to your ServiceNow ITOM environment. You can have natural language conversations about CI reliability, topology, and incident impact, and create SLOs through the MCP client.	An operator wants to investigate CI reliability and topology, assess incident impact, or create SLOs through an MCP client.	• Using the ITOM MCP Server Console to perform ITOM tasks • Activate the ITOM MCP Server Console • Review CI reliability with an MCP Client

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Generating service level objectives

Use the service level objective (SLO) creator agent to auto-generate SLOs for services and configuration items (CIs). The agent can help teams adopt SLOs faster and monitor service performance.

How the SLO creator agent works

The SLO creator agent requires ServiceNow Otto for ITOM and Service Reliability Management (SRM). It automatically generates SLOs by analyzing operational data for services and CIs.

1. Every 14 days, the agent processes up to 25 service or CIs that don't already have an auto-generated SLO.
2. For each service or CI, the agent analyzes critical alerts, incidents, and outages, including data from related CIs.
3. The agent uses existing availability commitments, when available, or business criticality to determine the SLO target.
4. For every service or CI that it analyzes, the agent generates one SLO with up to 10 SLIs.
5. The relevant team manager receives an email when the SLO is generated.
6. The generated SLO is active by default and the assigned team receives an email when the error budget falls to 25% or below.

   SRM managers and responders can review, edit, or turn off generated SLOs.

You can manage the SLO creator agent, including turning the agent on or off and customizing system properties. For more information, see Manage SLO creator agent settings and SLO creator agent system properties. To view SLOs generated by the agent and review details about their creation, see View generated SLOs.

Important: This AI agent is turned on by default. For more information, see AI agents, skills, and agentic workflows on by default.

Access the SLO creator agent in AI Agent Studio

Access the SLO creator agent in AI Agent Studio to manage security controls or duplicate it for further customization.

1. Navigate to **All** > **AI Agent Studio** > **Create and manage**.
2. Select the **AI agents** tab.
3. Select **SLO Creator Agent**.

The SLO Creator Agent page lets you manage the agent, including defining security controls. To modify the agent, duplicate it and adjust the settings.

Important: When you modify an agentic workflow, AI agent, or tool, make sure that you update all instructions accordingly.

Configuring SLO Management

Configure SLO Management to help teams monitor and improve service reliability.

Manage SLO creator agent settings

Activate or deactivate the service level objective (SLO) creator agent and configure the notification settings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

You must have ServiceNow Otto for ITOM and Service Reliability Management (SRM) installed on your instance. For more information, see Install plugins for ServiceNow Otto and Install Service Reliability Management.

Agentic workflows and their AI agents use role masking to determine which users can access them. Ones installed with your applications have specific roles that come included with the application. If you select *Users with specific roles* for user access, you must configure the security controls to include these roles. For the instructions to change the security controls, see Define security controls for an agentic workflow.

For an overview of how and when the SLO creator agent generates SLOs, see Generating service level objectives.

Role required: srm_admin

Procedure

1. Navigate to **All** > *Service Operations Workspace* > **Configurations**.
2. Select **Service Reliability Management** > **Activate** > **AI-generated SLOs**.
3. Configure the SLO creator agent settings.

Setting	Description
Allow the agent to automatically generate SLOs from service alerts and outages.	Turns on or off the SLO creator agent. When the agent is active, it generates SLOs based on alerts, incidents, and outages for eligible services and configuration items (CIs).
Include a policy to email the assigned team if the error budget is less than or equal to 25%.	Sends an email notification to the team assigned to the service or CI when the SLO error budget reaches 25% or lower.
Email team managers when an SLO is generated, or the team if no manager is assigned.	Sends an email notification when the agent generates a new SLO. If a team manager is assigned to the service or CI, the manager receives the notification. Otherwise, the notification is sent to the group email. If no group email exists, all group members with an email address receive the notification.

4. Select **Save** to implement your changes.
   The UI displays `Settings saved`.

What to do next

To view generated SLOs and learn how to modify them, see View generated SLOs and Edit a reliability metric. To configure advanced agent behavior, see SLO creator agent system properties.

Using SLO Management

Using SLO Management ensures IT services meet customer expectations, improves service quality and transparency, and enables data-driven decision making.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

View generated SLOs

View service level objectives (SLOs) generated by the SLO creator agent and review information about how they were created.

Before you begin

You must have ServiceNow Otto for ITOM and Service Reliability Management (SRM) installed on your instance. For more information, see Install plugins for ServiceNow Otto and Install Service Reliability Management.

For an overview of how and when the SLO creator agent generates SLOs, see Generating service level objectives.

Role required: srm_manager, srm_responder, or srm_admin

Procedure

1. Navigate to **Workspaces** > *`Service Operations Workspace`* > **Services**.
2. Select a service and then select the **Reliability Metrics** tab.
3. Select an SLO generated by the SLO creator agent.
   SLOs generated by the agent display `AI` in the Created by column.
4. Select the **Details** tab.
5. In the Activity panel, review the work notes.
   Generated SLOs have work notes that summarize the data and configuration used to create them.

What to do next

To learn more about SLOs, including SLO types and compliance periods, see Reliability metrics in SLO Management. To edit or deactivate an SLO in SRM, see Edit a reliability metric.

Activate SLO-based change approval decisions

Activate Service Level Objective (SLO) change approval decisions to evaluate change requests based on SLO performance.

Before you begin

Review change approval policies and their terminology, including policy inputs, decisions, and approval definitions. For more information, see Change approval policies.

Role required: admin

About this task

Activate the Service Level Objective Change policy's decisions to include SLO performance in your change management process. The policy is active by default, however, its decisions are inactive.

When you activate the policy's decisions, the policy evaluates SLOs as inputs and implements the following:

- Require group manager approval if these conditions are true:
  - The lowest SLO error budget is less than 25%.
  - The highest SLO burn rate is greater than 1%.
- Auto-approve change requests if these conditions are true:
  - The lowest SLO error budget is greater than 25%.
  - The highest SLO burn rate is less than 1%.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Change** > **Change Policy** > **Change Approval Policies**.
2. Select the **Service Level Objective Change policy**.
3. In the **Decisions** tab, set **Active** to true for these decisions:
   - **Budget < 25% and Burn Rate > 1**
   - **Budget > 25% and Burn rate < 1**
4. Select **Update** to save your changes.
   The decisions are active and part of your change management process.

What to do next

Use a test change request to verify that change requests are either auto-approved or routed to a manager as expected.

You can also customize the Service Level Objective Change policy, including its name and conditions, as needed.

For more advanced setups, use Flow Designer to customize the SLOs and services included as policy inputs:

Important: Customizing the flow prevents it from receiving future release updates. That behavior is intentional to avoid overwriting your customizations.

1. Navigate to **Process Automation** > **Flow Designer**.
2. In the list of flows, select **Change - SLO – Authorize** and then select **SLO - Get worst performing SLOs**.
3. Customize the **Action Inputs** section.
4. Select **Done** to implement your changes.

Create SLOs, SLIs, and error budget policies

Define service level objectives (SLOs), service level indicators (SLIs), and error budget policies to monitor service health. These tools help you and your teams track performance and respond when needed.

Before you begin

To send notifications when an error budget policy is breached, your team must have a notification destination configured. You can check by navigating to **Teams** > **[Your team]** > **SLO Notification destinations** in Service Operations Workspace. For more information, see Create a notification destination in SRM.

Note: By default, the outage data source for SLIs includes unplanned and degradation outages. Administrators can include planned outages by adding `planned` to the `sn_sow_slo.outage_supported_types` system property value.

Role required: srm_admin, srm_manager, or srm_responder

About this task

Create SLOs, SLIs, and error budget policies to monitor service health and help make sure that your services support business goals.

In Service Reliability Management (SRM), an SLO must have at least one SLI. SLIs can be filtered to a service or configuration item (CI) within the parent service hierarchy. Filtering an SLI to a CI can help you more accurately track service health and identify root causes faster.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Each SLI can be associated with only one SLO, helping prevent conflicting performance expectations.

Note: SLOs can also be generated automatically using the SLO creator agent. For details, see Generating service level objectives.

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace* > **Services ( )**.
2. On the **Services** page, select the service you want to monitor, then select the **Reliability metrics** tab and select **Add SLO & SLI**.
3. In the Service Level Objective (SLO) form, fill in the fields for your SLO and select **Next**.
   For information about the SLO fields, see Create SLO form.
4. In the Service Level Indicators (SLI) form, select the data source for your SLI.

Data source	Description
Alerts	Base the SLI on alerts from integrated monitoring tools. Use alerts when you want your SLI to include early warning signs and a broader view of reliability.
Outages	Base the SLI on outages detected by monitoring tools and reported by users. Use outages when you want to measure actual downtime and customer impact.

Note: If you create multiple SLIs for an SLO, they must use the same data source.

5. In the same form, select **Add indicators for <data source>**, fill in the fields for your SLI, and then select **Next**.
   For more information about the SLI fields, see Create SLI form.
6. **Optional:** In the Error budget policies form, select **Add policy**, and fill in the fields for your error budget policy.
   For more information, see Add an error budget policy form.

   Note: If you don't add an error budget policy, the SLO objective percentage is only informational. Adding a policy helps you take corrective actions based on the performance data. If you're not ready to add a policy, you can add one later.

7. Review your SLO, SLI, and error budget policy, and then select **Activate**.

   Your SLO, SLI, and error budget policy are now active. The SLO record opens, displaying its reliability state and error budget information.

What to do next

See the following to learn how to monitor and manage your SLOs:

- Reliability metrics in SLO Management - Learn where and how to view SLO performance.
- Edit a reliability metric - Update your SLOs to keep them aligned with your reliability goals.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a notification destination in SRM

Set up notification destinations to help keep teams informed about service reliability.

Before you begin

Before creating notification destinations, set up the Microsoft Teams Graph spoke. When registering an application in the Microsoft Azure portal, grant the following Microsoft Teams Graph API permissions:

- `ChannelMessage.Send`
- `Group.ReadWrite.All**`

For setup instructions, see Set up the Microsoft Teams Graph spoke.

Role required: srm_manager, srm_admin, or admin

About this task

Create a notification destination to deliver messages to a specific Microsoft Teams channel. After you set up a notification destination, team members can attach it to error budget policies to receive messages about policy breaches.

Procedure

1. Navigate to **Workspaces** > *`Service Operations Workspace`*.
2. From the primary navigation, select **Teams** ( ).
3. On the Teams page, select the team you want to use the notification destination.
4. Select the **SLO Notification destinations** tab, select **Create a destination**, and then fill out the form.

Field	Description
Channel URL	Deep link to the relevant Microsoft Teams channel. You can find deep links to channels in Microsoft Teams. They follow this general format: `https://teams.microsoft.com/l/channel/19%abcdef`.
Destination name	Display name of the notification destination. Teams see this name when adding notification destinations to error budget policies.

5. **Optional:** Select **Send test notification** to verify your setup.
   When successful, a message appears in the relevant Microsoft Teams channel. The message is titled `Test Notification` and includes the following text:

```
This is a test notification from the Service Reliability
 Management (SRM) Team '<team-name>'.
```

6. Select **Save**.
   The notification destination appears in the SLO Notification destinations tab. The table includes details about the Microsoft Teams channel and when the notification destination was last updated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

To use and learn more about notification destinations, visit the following pages:

- Create SLOs, SLIs, and error budget policies
- Notifications for breached error budgets

You can also edit and delete notification destinations from the SLO Notification destinations tab. Deleting a notification destination removes it from all error budget policies where it was previously used.

Edit a reliability metric

Update a reliability metric to keep it relevant and aligned with your team's goals.

Before you begin

Updating reliability metrics, such as Service Level Objectives (SLOs) or Service Level Indicators (SLIs), during active measurement periods can result in graph inconsistencies.

Role required: srm_admin, srm_manager, or srm_responder

About this task

To help you manage reliability-metric history, Service Reliability Management (SRM) follows specific naming conventions. When you edit a reliability metric, SRM does the following:

- Retires the existing SLO.
- Creates a copy of the SLO with your edits in a draft state, which you can either save as a draft or activate.
- Appends a number to the copy name, for example, Uptime (2) or Uptime (3).

Procedure

1. Navigate to **Workspaces** > *`Service Operations Workspace`*.
2. Follow these steps to access the **Reliability metrics** tab:
   a. Select the **Services** page icon ( ).
   b. Select the service that uses the reliability metric you want to edit.
   c. Select the **Reliability metrics** tab.
3. To edit a reliability metric, select the relevant reliability metric, and then select **Edit** and **Continue to edit**.
4. Make your changes in the Details, Service level indicators, or Error budget policies tabs.

   Note: If you change the SLI data source, all existing SLIs for the SLO are removed and you must create new ones. An SLO can use only one data source type, and each data source has unique settings that can't be preserved or automatically converted.

   While you can't recover the removed SLIs while editing the SLO, you can view the earlier versions in the Reliability metrics tab.

5. To save and implement your changes, select **Activate**.

   Your edited reliability metric appears in the Reliability metrics tab. SRM sets the state to running and includes a version number in its name, for example, Uptime (3).

   The Activity panel on the Details tab records changes, providing a history of updates to the reliability metric.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

Managing SLOs requires ongoing updates to make sure that they reflect your reliability goals. You can edit or retire existing SLOs and, if needed, reactivate retired SLOs.

Note: If you reactivate a retired SLO, SRM creates and activates a new copy of it. For example: If there are two versions of an SLO, Uptime (1) and Uptime (2), and you reactivate Uptime (1), SRM creates an active version called Uptime (3).

View SRM reliability metrics

Learn about an existing service level objective (SLO) and service level indicator (SLI).

Before you begin

Role required: srm_manager, srm_responder, or srm_admin

Note: Administrators can view any Service Reliability Management (SRM) SLO.

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
2. From the primary navigation, select the **Services** icon ( ).
3. Select a service, select the **Reliability metrics** tab, and then open an SLO.
4. View the SLO header to get key information about the SLO, SLI, and state.

Header element	Description
SLI type	○ **Availability**: Percentage of time the service is available. ○ **Errors**: Frequency of service errors. ○ **Latency**: Time taken to service a request. ○ **Saturation**: Fullness of the system, focusing on resource use.
SLO type	○ **Duration**: Measures the time that the service spends without breaching. The associated metrics are: ▪ **Objective (percentage)**: The target percentage of the SLI that the service is expected to meet. ▪ **Error budget**: The remaining error budget, shown in days and time, before the objective is breached. ○ **Count**: Measures the number of occurrences during a compliance period. The associated metrics are: ▪ **Limit (occurrences)**: The number of occurrences that triggers a breach. ▪ **Remaining breach occurrences**: The number of occurrences left before a breach occurs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Header element	Description
State	○ **Draft**: The SLO isn't active yet. You can add new SLIs, update existing ones, or delete the SLO. ○ **Running**: The SLO is active. You can edit, retire, or delete the SLO. Editing a running SLO automatically retires it and creates a new copy. See Edit a reliability metric for more information. ○ **Retired**: The SLO is no longer active. You can reactivate it if needed.
Service	The service associated with the SLO.
Reliability	○ **Stable**: All SLOs have more than 25% of their error budget remaining. ○ **At risk**: All SLOs have some error budget remaining, but at least one SLO has less than 25% left. ○ **Critical**: At least one SLO has fully used its error budget.

Note: From the header, you can delete, retire, or edit the SLO. Deleting an SLO also deletes the associated SLIs. Retiring an SLO changes its state, but you can reactivate it later from the SLO page or the Reliability metrics tab.

5. Select the **Overview** tab to view summary metrics and performance charts for the SLO.
   - Historic periods: Select a time range. The available periods span from the SLO creation date to the present in defined increments.
   - Summary metrics: View details about SLO performance depending on the configured SLIs and error budget policy thresholds.
   - Service level indicators: View the SLIs associated with the SLO.
   - Service level objective (SLO) history:
     - For duration SLOs, view charts for error budget used, error budget remaining, and burn rate.
     - For count SLOs, view charts for cumulative breach occurrences, burn rate, and alerts, incidents & changes impacting this service.

   You can point to the charts to view daily values.

6. Select the **Details**, **Service level indicators**, and **Error budget policy** tabs to view key configuration details.

   For information about the details shown, see Create SLO form, Create SLI form, and Add an error budget policy form. On the Error budget policies tab, you can select **Add policy** to define actions based on performance data.

   The Details tab also includes a Work notes field and Activity panel to record and track changes to the reliability metric.

What to do next

To learn how to create or edit SLOs, see Create SLOs, SLIs, and error budget policies and Edit a reliability metric.

SLO Management reference

Reference topics provide additional information about Service Level Objective Management.

Add an error budget policy form

Learn about the available fields for setting up error budget policies.

Fields in the Add an error budget policy form

The following table describes the available options in the Add an error budget policy form. For step-by-step instructions, see Create SLOs, SLIs, and error budget policies.

Field	Description
Policy name	Display name of the error budget policy.
Threshold type	Select how you want to track your error budget. • **Burn rate (count)**: Tracks how quickly the error budget is being consumed. A higher burn rate means faster consumption. • **Error budget remaining (%)**: Tracks the percentage of the error budget that's still available during the specified period. **Note:** You can add multiple thresholds to a policy, but each must be unique. If you try to add a duplicate threshold, an error message appears.
Threshold value	The point at which you get notified based on the selected SLO indicator. • Burn rate: Set a value that indicates the burn rate is too high. For example, to be notified when your service or configuration item is burning through its error budget twice as fast as expected, set the threshold to 2. • Error budget remaining: Set a value that indicates the remaining error budget is too low. For example, to be notified when only 25% or less of the error budget remains, set the threshold to 25%. **Note:** The threshold values support up to 4 decimal places and then round up.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Policy action	[Optional] If a breach occurs, select the action that you want to take: • Create incident. • Send an email. • Notify Microsoft Teams. If you select this option, you must also select a relevant notification destination. To set up a notification destination for your team, see Create a notification destination in SRM. **Note:** To learn about the notifications that teams receive for breached error budget policies, see Notifications for breached error budgets.

Create SLO form

Learn about the available fields for adding a service level objective (SLO) to Service Reliability Management.

Service level objective form

The following table describes the available options in the Service level objective form. For step-by-step instructions, see Create SLOs, SLIs, and error budget policies.

Fields in the Service Level Objective form

Field	Description
Name	Name of the SLO.
SLI type	• **Availability**: Percentage of time the service is available. • **Errors**: Frequency of service errors. • **Latency**: Time taken to service a request. • **Saturation**: Fullness of the system, focusing on resource use.
How do you want to measure this objective?	You can measure this objective by: • **Duration**: The amount of time the service spends without breaching. It's the only value available. • **Count**: The number of periods or occurrences in a given compliance period.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Measuring by Duration

Field	Description
Objective (%)	The percentage of how available (uptime) you want the service to be over a length of time. If measuring by duration, an objective percentage of Five Nines (99.999%) means that the service wasn't available for 26 seconds per month, or about 5 minutes and 35 seconds per year. This is used to calculate your error budget.
Compliance period	Period for which the metrics are calculated. The available options are: • **Month**: The duration is considered to be the current month. For example, if the current date is 26th January, the duration will be considered from 1st January until 31st January. • **Rolling 7 days**: The duration is considered to be 7 days from the current date. • **Rolling 30 days**: The duration is considered to be 30 days from the current date. For example, if the current date is 26th January, the duration will be considered from 25th December. • **Rolling 90 days**: The duration is considered to be 90 days from the current date. For example, if the current date is 26th January, the duration will be considered from 25th October.
Error budget	Auto-populated. The maximum level of errors (downtime) allowed over a certain period. A percentage of total service availability. Once you set your objective (%), your error budget is automatically calculated using this formula: 1 – (Desired) Availability. The error budget of a service will be calculated in days, hours, minutes, and seconds for a desired availability of 99.99% (Four Nines) of the year by: **1.** Calculating the total time in seconds in a year: 31536000 seconds. **2.** Determining the error budget as 1 – (Desired) Availability: 1 - 0.9999 = 0.0001. **3.** Converting the error budget to time units. For example, if the error budget is 0.0001:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Measuring by Duration (continued)

Field	Description
	• Error Budget in Seconds = 0.0001 * 31,536,000 seconds = 3,153.6 seconds. • Error Budget in Minutes = 3,153.6 seconds / 60 = 52.56 minutes. • Error Budget in Hours = 52.56/60 = 0.875 hours. • Error Budget in Days = 52.56 minutes / (24 * 60) ≈ 0.0364 days. **Note:** Your error budget appears in units of days, hours, minutes, and seconds only when you measure your SLO by duration.

Measuring by Count

SLO type	Count by periods or Count by occurrences
Limit occurrences	The number of occurrences after which a breach occurs. Limit occurrences act as an error budget.
Compliance period	Period for which the metrics are calculated. The available options are: • **Month**: The duration is considered to be the current month. For example, if the current date is 26th January, the duration will be considered from 1st January until 31st January. • **Rolling 7 days**: The duration is considered to be 7 days from the current date. • **Rolling 30 days**: The duration is considered to be 30 days from the current date. For example, if the current date is 26th January, the duration will be considered from 25th December. • **Rolling 90 days**: The duration is considered to be 90 days from the current date. For example, if the current date is 26th January, the duration will be considered from 25th October.

Note: The **Assignment group** is auto-populated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create SLI form

Learn about the available fields for adding a service level indicator (SLI) to a service level objective (SLO).

Add SLI form

The following table describes the available options in the Add SLI form. For step-by-step instructions, see Create SLOs, SLIs, and error budget policies.

Fields in the Add SLI form

Field	Description
SLI name	Enter a name for your SLI. For example, Critical router issue.
Data source	This field is auto-populated. The alerts or outages are used to calculate the error budget.
Service or configuration item	• <Service-name> - Select this option to filter your SLI to the entire service. This option helps you measure overall service health. • Related configuration item - If your service includes one or more configuration items (CIs) in its hierarchy, select this option to filter your SLI to specific CIs. This option provides a more granular view of service health. **Note:** By default, only level-one CIs appear in the CI list. Administrators can change the number of levels displayed by updating the `sn_sow_slo.slo_rollup_depth` system property value.
Set conditions (optional) Customize your SLI by filtering it to specific alerts or outages. The fields in this section are optional.	
Add condition set	Select this option to specify the alerts or outages included in the error budget. For example, for alerts, if you set the condition to **Status is Critical**, only alerts with a critical status count toward the error budget.

Notifications for breached error budgets

Details about the notifications that teams receive for breached error budget policies.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When notifications are sent

When a service or configuration item breaches its error budget policy and a notification destination is set, Service Reliability Management (SRM) sends a notification to the configured Microsoft Teams channel.

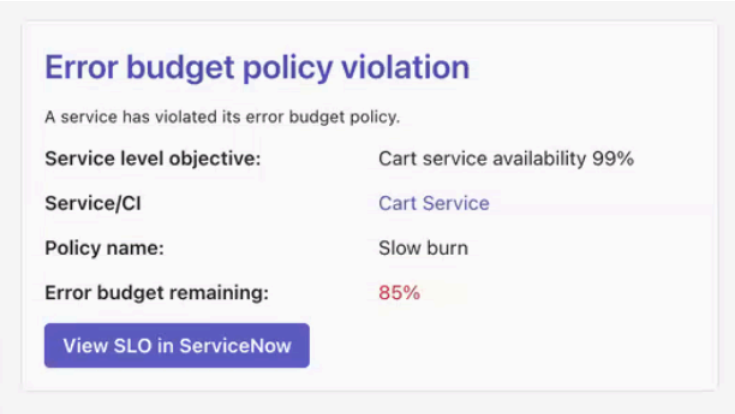
Notification content

The message contains details about the breach to help team members learn about the issue and act. In Microsoft Teams, the message is titled `Error budget policy violation` and lists the following information:

- Service level objective - Name of the service level objective (SLO), for example, `Navigation service availability 99.95`.
- Service/CI - Name of the associated service or configuration time. Select the name to open the relevant service in SRM.
- Policy name - Name of the error budget policy that was breached.
- Error budget remaining - Percentage of error budget left at the time of the breach.
- View SLO in ServiceNow - Link to view the SLO details in SRM.

Sample notification

The following image is a sample notification in Microsoft Teams. It shows an error budget policy violation for the Cart service and details about the SLO and error budget remaining.



Related documentation

See Create a notification destination in SRM and Create SLOs, SLIs, and error budget policies.

SLO creator agent system properties

Configure how the SLO creator agent generates and activates SLOs.

To turn automatic SLO generation on or off and manage email notifications for generated SLOs, see Manage SLO creator agent settings.

Note: Property changes apply only to newly generated SLOs. Existing SLOs aren't recalculated.

sn_ai_agents_slo.commitment_buffer

Description

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Adds a buffer to an availability commitment when the agent calculates the SLO target. Applies only when the agent finds an availability commitment.

Values

Default: `0.09`

When to adjust

Increase the buffer to set stricter SLO targets and provide earlier warning before the service falls below its availability commitment. Decrease it if the generated targets are too strict.

sn_ai_agents_slo.create_slo_mode

Description

Controls if the agent activates generated SLOs automatically or saves them as drafts.

Values

Default: `auto_activate`

Other value: `draft`

When to adjust

Use `draft` to review and edit generated SLOs before activation. Use `auto_activate` when generated SLOs can take effect without review. Error budget notifications begin after activation.

sn_ai_agents_slo.linked_alerts_cap

Description

Limits the number of critical alerts associated with an incident that the agent considers when generating SLOs.

Values

Default: `5`

Maximum: `10`

When to adjust

Increase the value when incidents commonly produce more relevant critical alerts than the default includes. Decrease it when numerous alerts represent the same underlying issue.

sn_ai_agents_slo.linked_outages_cap

Description

Limits the number of outages associated with an incident that the agent considers when generating SLOs.

Values

Default: `5`

Maximum: `10`

When to adjust

Increase the value when a single incident commonly spans more outage records than the default includes. Decrease it when multiple outage records represent the same underlying issue.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

sn_ai_agents_slo.orphan_alert_window_days

Description

Specifies how far back the agent looks for critical alerts that aren't associated with an incident when generating SLOs.

Values

Default: `30`

Range: `7 - 90`

When to adjust

Use a shorter window when older alerts no longer reflect current service reliability. Use a longer window to account for less frequent or recurring alert patterns.

sn_ai_agents_slo.other_incident_window_days

Description

Specifies how far back the agent looks for other P1 and P2 incidents associated with the service or CI when generating SLOs.

Values

Default: `90`

Range: `30 - 180`

When to adjust

Use a shorter window to focus on recent conditions. Use a longer window to account for severe incidents that occur less frequently.

Visualizations in the Service reliability dashboard

List of visualizations and options on the Service reliability dashboard in Service Reliability Management (SRM).

Service state charts

Top-level charts show the number of services in critical, at-risk, and stable states. Their states are based on the error budget remaining on their service level objectives (SLOs). You can select the charts to view service names, adjust the time range, and access additional chart options.

Note: An error budget is the amount of failure a service can experience before breaching its SLO.

Each visualization also includes a trend line showing changes in service count over the past 12 months. Smaller figures indicate how the count has changed compared to a week ago, for example, ↓25 (22%) since Jun 11.

Chart	What it is	How to use it
Critical	Displays the number of services in a critical state. Critical services have 0% error budget remaining on their SLOs.	View how many services have consumed their error budgets and identify the services needing immediate attention.
At risk	Displays the number of services at risk. At-risk services have <= 25% error	Monitor how many services are approaching critical

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Chart	What it is	How to use it
	budget remaining on their SLOs.	thresholds and find issues early.
Stable	Displays the number of stable services. Stable services have more than 25% error budget remaining on their SLOs.	Get insights into overall service health and identify if services are staying reliable over time.

Risk trends over time

Line charts track the number of SLOs with high burn rates and low error budget remaining over the past 12 months. You can use them to find recurring patterns and potential reliability risks.

Chart	What it is	How to use it
High burn rate (>=1)	Shows the number of SLOs with a burn rate >= 1 over time. A high burn rate indicates that the service linked to the SLO is likely to breach its error budget before the compliance period ends. For example, if a service has 30 days to meet its SLO but is using up its error budget in 15 days, the burn rate is 2.	• Find risks early by seeing when services begin consuming error budgets too quickly. • Identify emerging or recurring reliability issues by tracking burn rates over time. • Point to the chart to see the number and percentage of SLOs with a high burn rate at that time. • Select the chart to view SLO details, adjust the time range, and access additional chart options.
Low budget remaining (<=25%)	Shows the number of SLOs with low or no error budget remaining over time.	• Monitor how many services are nearing or have breached their SLOs. • Track rising trends, which might indicate declining reliability or recurring issues that need investigation. • Point to the chart to see the number and percentage of SLOs with little or no error budget remaining at that time. • Select the chart to view SLO details, adjust the time range, and access additional chart options.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service level objectives (SLOs) table

The SLOs table lists the SLOs defined in Service Reliability Management (SRM), and it's sorted by SLO name by default. Use the table to monitor overall reliability, identify services at risk, and find the assigned teams.

The SLO table includes the following columns by default. To customize the columns shown, select the gear icon.

- Name - Name of the SLO. You can select the arrow to sort the table by SLO name, and you can select the name to view the SLO record.
- Reliability - Current state of the SLO. For example, stable, at risk, or critical.
- Measured reliability - Percentage showing the actual performance of the service. For example, if your SLO is 99.9% success, and the actual performance for the month is 99.7%, the measured reliability is 99.7%.
- Objective (percentage) - Target SLO value.
- Burn rate - Numeric value showing how quickly the service is consuming its error budget.
- % Error budget remaining - Percentage of the error budget still available in the current compliance period.
- Service - Name of the service associated with the SLO. You can select the service name to view the service record.
- Assigned - Team responsible for the service.

Dashboard filters and actions

The Service reliability dashboard is built with Platform Analytics and includes standard dashboard features. For details on customizing, duplicating, or sharing dashboards, see the Dashboards in Platform Analytics documentation.

Note: Changes to the Service reliability dashboard affect all SRM users on your instance. To create a personalized version, either build a new dashboard or duplicate the existing dashboard and edit it. Learn more in Create a dashboard with the in-line editor and Duplicate a Platform Analytics dashboard.

Service Observability

The ServiceNow® Service Observability application enables operators to triage and manage incidents in a complex and distributed system. Application and platform telemetry insights from multiple observability tools are combined into a centralized workflow.

Exploring Service Observability

Service Observability helps operations teams triage and manage incidents in a complex and distributed production system. It combines external observability monitoring systems' telemetry with related data from the Configuration Management Database (CMDB) and displays both in a single workflow in the Service Operations Workspace (SOW).

Service Observability overview

Service Observability displays application, infrastructure, and network health metrics in the SOW related to a given service. Metrics can be ingested from an external observability vendor

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

(application, network, and cloud monitors) and displayed alongside information for related configuration items in the CMDB.

Service Observability supports the following observability vendors:

- Amazon CloudWatch
- AppDynamics
- Cisco ThousandEyes synthetic tests
- Datadog
- DynatraceSaaS and on-premise (both Classic and Grail environments)
- LogicMonitor
- Microsoft Azure Monitor
- New Relic
- Prometheus on-premise
- SolarWinds on-premise
- Splunk Observability and logs from Splunk Enterprise
- Zabbix on-premise

Service Observability also supports MetricBase as a data source. For setup instructions, see Create and manage MetricBase data mappings.

Service Observability supports the following databases:

- MySQL
- PostgreSQL (not supported with Splunk)
- RDS (Relational Database Service) for Amazon CloudWatch

After connecting an observability vendor to Service Observability, you map services in the CMDB to observability metrics using existing tags.

With this data mapping, Service Observability displays metrics for entities such as host, database, or network components, along with details about related CI information. Operators use these metrics and contextual information, including current incidents and alerts, to assess service health.

Note: Operators can also use the Analyze a dashboard in Service Observability and the Analyze service health in Service Observability AI skills to generate an analysis for them.

For example, you use Dynatrace to monitor your `checkout` service, databases, and hosts. Metrics from all these entities use the tag `checkout-service` to denote requests coming from that service. By mapping the `checkout` service CI to the Dynatrace data tagged with `checkout-service`, Service Observability retrieves metrics for those databases, hosts, and related CIs. It then displays them together. Operators can pinpoint issues on entities related to the service and narrow down the mitigation process without having to leave the SOW.

Service Observability users

Users

User	Description
System admin	System admins configure users and teams, register services to be monitored, connect Service Observability to observability vendors, and then map those services to that data. They can also view the data in the SOW
Service Observability admin	Service Observability admins can configure users and teams, connect Service Observability to observability vendors, and then map services to that data. They can also view the data in the SOW. Admins can also customize dashboard templates used to display metrics and related information.
Operator/ operations manager **Note:** These users must belong to an `srm` group type to see all data.	Operators use Service Observability when triaging incidents in the SOW. They can view basic health metrics for a service, along with related incidents, alerts, and changes. They can get more detailed information by navigating to the **Observability** tab to view additional service metrics, along with metrics from related entities, such hosts, networks, or databases.

Service Observability workflow

Admins configure Service Observability by creating a connection to an observability vendor and then mapping CI services to that data. Operators use Service Observability to determine if another related entity is causing issues surfaced by the service's performance.

As an admin, you:

1. Determine the services to be monitored by Service Observability based on business criticality.
2. Connect existing observability vendor instances to Service Observability.
3. Map services to observability metric data using vendor-based tags attached to that data.
4. Customize the templates used to display metric charts.

As an operator or manager, you:

1. Spot an issue with a service while working in the SOW, for example, from an alert, the Service dashboard, or Express List, then navigate to the Service Details page.
2. View overall health metrics for the service, along with related incidents, alerts, and changes. If one of the metrics seems unhealthy, navigate to the Observability tab.
3. View more detailed service metrics, as well as information from related entities, to start root cause investigation. When finding that the issue is further down the system's stack, identify the ownership for that entity to start remediation.

Service Observability benefits

Benefit	Feature	Users
Consolidate data from existing monitoring tools, network health tools, cloud providers, ServiceNow agents, and third-party tools for a full-stack view of service health: • Connect data from external Observability vendors. • Map that data to CMDB services • View combined data in the SOW	• Connect a Service Observability data source • Create and manage data mappings .	Admins
Increase efficiency and reduce mean time to resolution (MTTR). View combined metrics from entities associated with a service to begin to determine blast radius and ownership of an incident.	View service health metrics	Operators
See related changes to the system and alerts associated with a service in one place.	View overall service health.	Operators
Use generative AI to analyze metric data and find insights to help determine service health.	• Analyze a dashboard in Service Observability • Analyze service health in Service Observability	Operators
See Service Observability data as part of Incident Management workflows	Digital End-User Experience and Service Observability UI experience on investigate tab	Operators
Customize dashboard templates.	Customize Service Observability dashboard templates	Admins

What to explore next

To learn more about configuring and using Service Observability, see:

- Configuring Service Observability
- View overall service health
- View service health metrics
- Service Observability reference

AI in Service Observability

Generative AI skills in Service Observability help operators analyze metric data and assess service health faster.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Depending on your license, you will have access to certain application features, generative AI skills, agentic workflows, and AI agents. For more information, see ServiceNow product tiers.

AI features in Service Observability

AI feature	Description	Use case	Resources
Analyze dashboard skill	Uses generative AI to summarize a single Service Observability dashboard and call out insights found in the charts within the selected time period.	An operator wants a quick orientation to an unfamiliar dashboard or needs to identify anomalies in chart data without manually reviewing each chart.	• Activate the analyze Service Observability dashboard skill • Analyze a dashboard in Service Observability
Analyze service health skill	Uses generative AI to analyze all available Service Observability dashboards for a selected service, detect insights, and report on overall service health. When activated, the skill also runs automatically during incident investigation from the **Investigate** tab.	An operator is triaging an incident and needs to quickly assess service impact, identify root causes, and determine next steps across all dashboards for the affected service.	• Activate the analyze service health skill • Analyze service health in Service Observability

Configuring Service Observability

After you install Service Observability, you must connect external observability systems and map that data to services. You can also customize the out-of-the-box dashboards to show different information, including data from other ServiceNow products.

Configuration overview

Install Service Observability

If you have the system admin role, you can install the Service Observability application (`sn_sow_svcobs`). The application installs related ServiceNow® Store applications and plug-ins if they aren't already installed.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Review the Service Observability application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.

Role required: system admin [admin]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The following items are installed with Service Observability:

- Plugins
- Store applications
- Roles
- Tables

For more information, see Components installed with Service Observability.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Service Observability application (`sn_sow_svcobs`) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you can't find the application, you might have to request it from the ServiceNow Store.

   In the list next to the **Install** button, the versions that are available to you are displayed.
3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box, any dependencies installed with your application are listed.
4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. Select **Install**.

Activate the analyze service health skill

The analyze service health skill uses generative AI to provide an analysis of all Service Observability dashboards for the selected service. You need to activate this skill before using it.

Before you begin

Before activating the AI skills, you must install the following:

- ServiceNow Otto for ITOM plugin. For more information, see Install the ServiceNow Otto for IT Operations Management (ITOM) application.
- Service Observability. For more information, see Install Service Observability.

Role required: admin

Procedure

1. Navigate to **All** > *AI Admin Hub* > **Skills**
2. On the navigation panel, select **ITOM**.
3. On the **Analyze service health** tile, select **Activate**.

Activate the analyze Service Observability dashboard skill

The analyze Service Observability dashboard skill uses generative AI to provide an analysis of a Service Observability dashboard. You need to activate this skill before using it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Before activating the AI, you must install the following:

- ServiceNow Otto for ITOM plugin. For more information, see Install the ServiceNow Otto for IT Operations Management (ITOM) application.
- Service Observability. For more information, see Install Service Observability.

Role required: admin

Procedure

1. Navigate to **All** > **AI Admin** > **Skills**
2. On the navigation panel, select **ITOM**.
3. On the **Analyze Service Observability dashboard** tile, select **Activate**.

Connect a Service Observability data source

Connect Service Observability to an external observability system. Service Observability displays metrics in the Service Operations Workspace (SOW) from that observability instance.

Before you begin

You must enter a connection URL and credentials for your observability vendor. You can either use an existing connection or create one. Note the following for specific vendors:

Vendor-specific connection information

Observability Vendor	Connection information
AWS	The connection URL must be specific to the region to be monitored, for example, `https://monitoring.us-east-2.amazonaws.com`.
Azure	The connection URL should be `https://management.azure.com`.
Splunk Observability	The connection URL must include the Realm, for example, https://stream.[REALM].signalfx.com
Zabbix	The connection URL must be the IP on which the Zabbix server is hosted

If you're using existing credentials, you need the credential name. If you're creating credentials, collect the following information.

Vendor-specific credential requirements

Observability vendor	Credential type	Information needed
AppDynamics	OAuth 2.0	• OAuth Client ID • OAuth Client secret

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Vendor-specific credential requirements (continued)

Observability vendor	Credential type	Information needed
		• OAuth token URL • AppDynamics account name
Azure	OAuth 2.0	• OAuth Client ID • OAuth Client secret • OAuth token URL • Subscription ID
AWS	AWS credentials	• Access key • Secret key If the user associated with this key is restricted to specific permissions, they must include the following, scoped to all resources: • `cloudwatch:Describe` scoped to all resources • `cloudwatch:Get` scoped to all resources • `cloudwatch:List` scoped to all resources • `cloudtrail:LookupEvents` • `tag:GetResources` • `tag:GetTagKeys` • `tag:GetTagValues` • `apigateway:Get`
Datadog	API	• API key • Application key

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Vendor-specific credential requirements (continued)

Observability vendor	Credential type	Information needed
		If an application key is restricted to a specific scope, those scopes are required for the following endpoints: • https://api.datadoghq.com/api/v2/catalog/entity • https://api.datadoghq.com/api/v1/hosts • https://api.datadoghq.com/api/v1/query • https://api.datadoghq.com/api/v2/query/timeseries
Dynatrace SaaS Classic	API	API Tenant Access Token The token must have `entities.read` and `metrics.read` scope permissions.
Dynatrace SaaS Grail	API	API Platform Token The token must have `storage:metrics.read` and `storage:bucket.read` scope permissions.
Dynatrace on-premise	API	• API key. The key must be an environment scoped token. • The name of the MID Server your Dynatrace instance is hosted on
LogicMonitor	API	Access token
New Relic	API	• Account ID • API key
Prometheus on-premise	Basic Auth	• Basic Auth credential user name • Basic Auth credential password • The name of the MID Server your Prometheus instance is hosted on

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Vendor-specific credential requirements (continued)

Observability vendor	Credential type	Information needed
SolarWinds	Basic Auth	• Basic Auth credential user name • Basic Auth credential password • The name of the MID Server your SolarWinds instance is hosted on
Splunk Enterprise	API	Bearer Token
Splunk Observability	API	Access token
ThousandEyes	API	API key
Zabbix	Basic Auth	• Basic Auth credential user name • Basic Auth credential password • The name of the MID Server your Zabbix instance is hosted on. The MID Server must be in an active state.

Role required: sn_sow_svcobs.admin

About this task

The first step to ingesting observability data is to create a connection to the observability instance.

Service Observability supports the following observability vendors:

- Amazon CloudWatch
- AppDynamics
- Cisco ThousandEyes synthetic tests
- Datadog
- DynatraceSaaS and on-premise (both Classic and Grail environments)
- LogicMonitor
- Microsoft Azure Monitor
- New Relic
- Prometheus on-premise
- SolarWinds on-premise
- Splunk Observability and logs from Splunk Enterprise
- Zabbix on-premise

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Service Operations Workspace** > **Configurations**, then navigate to **Service Observability** > **Data sources**.
2. Select your observability vendor.
3. On the **Add connection** form, fill in the fields.
   You can use an existing HTTP or HTTPs connection and an existing credential or create one.
4. Select **Save**.

Result

A new connection appears in the list of observability data sources. You use this connection when you create a data mapping.

What to do next

Map your connection to the services that you want to monitor in Service Observability. See Create and manage data mappings.

Create and manage data mappings

Map your services to the data from a connected external observability vendor instance, and view it in charts for the service.

Before you begin

- You can map any of the following service types:
  - Service instance
  - Mapped application service
  - Calculated application service
  - Dynamic CI group
  - Technology management service
  - Tag-based service
  - Offerings
  - Business service
- Connect a Service Observability data source

Role required: sn_sow_svcobs.admin

About this task

Tip:

If you want to use MetricBase as your data source, follow the procedure described in Create and manage MetricBase data mappings instead.

When a service CI is mapped to specific observability vendor metric tag key/value pairs, Service Observability displays metrics containing those tags for that service. These metrics are grouped by the following entity types:

- Application: Metrics associated with the selected service
- Compute: Metrics associated with the hosts the service is run on
- Databases: Metrics associated with databases used by the service
- Networking: Metrics associated with network devices used by the service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, say you have metrics from New Relic that are used to monitor services, databases, and hosts. On those metrics, you have used the tag `service_name`. Say you have also mapped the `checkout` service CI to the observability metadata key/value pair `service_name = checkout`. Service Observability shows you all the database and host metrics tagged with `service_name = checkout` in the context of the `checkout` service CI.

If some of your metrics on different entities use a different key name or a different key value, you can create exceptions. For example, if your host metrics use `service` instead of `service_name`, you can create an exception to include those metrics.

Each entity type has its own dashboard and each metric or related CI has its own default chart. You can customize the templates used for the dashboards and charts. See Customize Service Observability dashboard templates for more information.

Note: To understand how Service Observability creates these mappings, see Observability vendor entity mappings for Service Observability.

For a description of the field values, see Service Observability data mapping form.

Procedure

1. Navigate to **All** > **Service Observability** > **Configure Data mappings**.
2. Select **Create your first mapping** or **Create mapping**.
3. On the Observability data mapping page, enter a name for the mapping.
4. Choose the services that should use this mapping.
   a. Choose **Select services**.

      The top 30 recommended services display in dialog. These are services that would most benefit from using Service Observability based on business criticality and frequency of alerts, incidents, and SLOs over the past 90 days.

      You can instead manually choose services by choosing **All Services** from the left navigation.

      Note: Use the filter to narrow down the service list.

   b. Select the services to add to the mapping. You can add services from any combination of service type.

   c. Select **Add services** to add them to the mapping.
   The Mapping preview pane updates to show the selected service, or the first service in a list of services.
5. Create a rule to determine how Service Observability should map internal services to the observability entities using tag keys and values.

   a. Select the data source for this map.

   b. Enter the tag key that you want to use to map the observability data to the service.
   The key can be any tag you use on your observability metadata, for example `service`. The entered key must match the tag you use in the observability metadata and is case-sensitive.

      Note: If you use more than one tag to represent a service, you can create an exception. For example, if most tags use `service` except for database metrics, which use `service_name`, you can create an exception for the database metrics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Manually enter a tag value or choose one from the drop-down menu.

Note: Values are case-sensitive.

Values can be strings that are from your observability metadata, like a service name, or they can be a variable used to represent multiple instances, for example `$(service)`. When your key represents a service, a drop-down menu shows fields from the corresponding CI that can be used as a variable. If you choose to use a variable, be sure that the values resolve to values sent in the observability data.

Note: If you selected more than one service to map, the drop-down displays only the fields that are common to all selected services.

You can now test your mapping or add exceptions.

6. **Optional:** If some of your entities use different key names or values, create exceptions to the default policy by configuring them in the Exceptions card.
7. Test the mapping.
   The **Mapping preview** panel shows the test results for the first service mapped. Service Observability sends a request through the connection and returns the entities found using the provided mapping. If you created an exception using a different source, the panel shows the results from each source separately. If the results don't seem correct, try reconfiguring the mapping by changing the tag key or value.

   If you have more than one service mapped, use the **Service** drop-down menu to select and test a different service.
8. Select **Save mapping**.

Result

On the **Observability** tab of the Service details page, dashboards and charts show metrics for the entities found from the mapping.

Create and manage MetricBase data mappings

Map your services to metrics from MetricBase, and view them in charts for the service.

Before you begin

- You can map any of the following service types:
  - Service instance
  - Mapped application service
  - Calculated application service
  - Dynamic CI group
  - Technology management service
  - Tag-based service
  - Offerings
  - Business service
- Your instance has metrics in MetricBase.

Role required: sn_sow_svcobs.admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

When a service CI is mapped to MetricBase, Service Observability can display metrics from MetricBase for that service and its related entities (such as hosts, databases, and network devices). The system automatically identifies the entities through CMDB relationships.

When you select MetricBase as your data source, generic dashboards appear that display ServiceNow-native charts. You can customize these dashboards by adding MetricBase charts for the specific metrics you want to view. See Add MetricBase charts to Service Observability dashboard templates for more information.

Procedure

1. Navigate to **All** > **Service Observability** > **Configure Data mappings**.
2. Select **Create your first mapping** or **Create mapping**.
3. On the Observability data mapping page, enter a name for the mapping.
4. Choose the services that should use this mapping.
   a. Choose **Select services**.

      The top 30 recommended services display in dialog. These are services that would most benefit from using Service Observability based on business criticality and frequency of alerts, incidents, and SLOs over the past 90 days.

      You can instead manually choose services by choosing **All Services** from the left navigation.

      Note: Use the filter to narrow down the service list.

   b. Select the services to add to the mapping. You can add services from any combination of service type.
   c. Select **Add services** to add them to the mapping.
   The Mapping preview pane updates to show the selected service, or the first service in a list of services.
5. Select **MetricBase** as the data source for this mapping.
   Service Observability automatically detects and displays the entities related to your services. No additional configuration is required.
6. **Optional:** If some of your entities require different configurations, create exceptions to the default policy by configuring them in the Exceptions card.
7. Test the mapping.
   The **Mapping preview** panel shows the test results for the first service mapped. Service Observability sends a request and returns the entities found using the provided mapping. If the results don't seem correct, try reconfiguring the mapping or adjusting your exception rules.

   If you have more than one service mapped, use the **Service** drop-down menu to select and test a different service.
8. Select **Save mapping**.

Result

On the **Observability** tab of the Service details page, dashboards for the selected service(s) show ServiceNow-native charts. You can customize these dashboards by adding MetricBase charts for the specific metrics you want to view. See Add MetricBase charts to Service Observability dashboard templates for more information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Customize Service Observability dashboard templates

You can customize the Service Observability dashboards on both the Overview and Observability tabs of the Service Details page. You can change or add metrics and related data to fit your business needs.

Service Observability dashboards are built using templates specific for each observability vendor and entity tab. They're built using Platform Analytics, letting you customize templates to meet your business needs. For example, you might want to display metrics from your observability vendor that aren't available by default.

The Service Observability dashboards use vendor-specific templates. You can see what each template displays by default from its respective reference topic.

- Amazon CloudWatch templates for Service Observability
- AppDynamics templates for Service Observability
- Azure Monitor templates for Service Observability
- Cisco ThousandEyes templates for Service Observability
- Datadog templates for Service Observability
- Dynatrace templates for Service Observability
- LogicMonitor templates for Service Observability
- New Relic templates for Service Observability
- Prometheus templates for Service Observability
- SolarWinds templates for Service Observability
- Splunk Observability templates for Service Observability
- Zabbix templates

Note: When you make a customization, you're changing the template and not the individual service's dashboard. This means that dashboards for any services that also use the same data source are also changed.

Along with observability data, you can also add charts for data from ServiceNow tables and also from data stored in the MetricBase and Health Log Analytics applications.

When you customize a template, a copy of the original is saved so that you can reimplement it if needed. Default dashboards display a `Certified` tag.

Edit data charts on Service Observability dashboard templates

Edit Service Observability dashboard templates to view different observability metrics on the Overview or Observability tabs' charts. Metrics are scoped to the selected service.

About this task

When you edit or add an observability chart on a dashboard, you use the Edit data source page of Platform Analytics to create a query. Use the built-in query editor for simple metric queries. Use Advanced mode for more complex queries or to paste a query copied from a chart in your observability vendor instance.

Use simple queries to return metrics associated with services, hosts, and databases. The returned metrics are aggregated across the time window set by the user.

Use advanced query mode to cut and paste queries from existing observability charts into Service Observability. For most observability vendors, you can simply copy a query from an existing chart in your observability instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Both query types support template variables that let you use the same query to return metrics for multiple entity instances.

Before you begin

Role required: sn_sow_svcobs.admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace** and then navigate to a service record.
   You can access a service record from these pages in the SOW:
   - **Services** list: Choose a service from the list.
   - **Service dashboard**: Choose a service in the dashboard and select **Service Details**.
   - **List**: Navigate to **Application Services** > **Services** and select a service.
   - **Express list** alert: Select a service from the **Impacted services** column.

   The Service Details page opens and the Overview tab is displayed.

   Trouble?
   If charts are displaying error messages, see Chart error states.
2. Open the template in editing mode.
   - If you're editing a certified template, select **Duplicate**.
   - If you're editing a custom template, select **Edit**.

   Note: Duplicating a certified template keeps you from overwriting it and also lets you reinstall it.

   The new dashboard is titled with the words `- Copy` appended. Use the pencil icon to change the dashboard name.
3. To do basic editing, such as rearranging, resizing, or deleting charts, follow the instructions for Edit in-line Platform Analytics dashboard elements.
4. To add a vendor query for a new chart, follow these steps:

   a. In Edit mode, select **Add new element** and choose **Data visualization** > **New visualization**.

   b. In the **Configuration panel**, select `Line` for **Visualization type** and choose **Add data source**.

   c. In the **Add data source** page, open **Service Observability** in the navigation panel and select your observability vendor.
   Be sure to select the same vendor used on the template you're editing.

   d. Enter a query in the **Metric** card.

   Use the query builder to edit a simple vendor-specific query.

   To copy a full query from your vendor chart, activate the **Advanced** switch and paste in a query from your vendor chart.

   For AWS and Azure, instead of entering a query in advanced mode, you can import selected charts from an existing dashboard. Select **Import from AWS/Azure Dashboard**. Select a data source name, then select a dashboard and from the list of charts, select the one to import, then select **Import query**. The query for the chart is pasted into the Query box.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use template variables to replace hard-coded entities or time periods. This makes the query return results that match the service and time period selected in the UI.

Note: Use the **Docs** link to refer to the vendor-specific documentation for help with creating the query.

e. To preview your query, select **Run** and then choose a service and entity.

f. When satisfied with your query, select **Add this source** to add the chart to the template.

5. To edit an existing query, follow these steps.

a. In Edit mode, select the chart to edit.

b. In the **Data sources** section of the Configuration panel, use the **More actions** menu to select **Edit**.

c. In the **Edit data source** page, edit the query in the **Metric** card.

Use the query builder to create a simple vendor-specific query.

To copy a full query from your vendor chart, activate the **Advanced** switch and paste in a query from your vendor chart.

For AWS and Azure, instead of entering a query in advanced mode, you can import selected charts from an existing dashboard. Select **Import from AWS/Azure Dashboard**. Select a data source name, then select a dashboard and from the list of charts, select the one to import, then select **Import query**. The query for the chart is pasted into the Query box.

Use template variables to replace any hard-coded entities or time periods.

Note: Use the **Docs** link to refer to the vendor-specific documentation for help with creating the query.

d. To preview your query, select a service and an entity and select **Run**.

e. When satisfied with your query, select **Apply** to add the chart to the template.

6. When done customizing, select **Save** and then **Exit editing mode.**
7. To return the template to the default (Certified) version, use the **More actions** menu to select **Return to certified**.

Edit ServiceNow data on Service Observability dashboard templates

Edit Service Observability dashboard templates to view data from problem and business app records on the Overview or Observability dashboards.

Before you begin

Role required: sn_sow_svcobs.admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace** and then navigate to a service record.
You can access a service record from these pages in the SOW:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Services** list: Choose a service from the list.
- **Service dashboard**: Choose a service in the dashboard and select **Service Details**.
- **List**: Navigate to **Application Services** > **Services** and select a service.
- **Express list** alert: Select a service from the **Impacted services** column.

The Service Details page opens and the Overview tab is displayed.

Trouble?
If charts are displaying error messages, see Chart error states.

2. Open the template in editing mode.
   - If you're editing a certified template, select **Duplicate**.
   - If you're editing a custom template, select **Edit**.

   Note: Duplicating a certified template keeps you from overwriting it and also lets you reinstall it.

   The new dashboard is titled with the words `- Copy` appended. Use the pencil icon to change the dashboard name.
3. To do basic editing, such as rearranging, resizing, or deleting charts, follow the instructions for Edit in-line Platform Analytics dashboard elements.
4. To add a new ServiceNow table, follow these steps:
   a. In Edit mode, select **Add new element** and choose **List**.
   b. In the **Configuration panel** in the **Data sources** section, choose **Add data source**.
   c. In the **Add data source** page, find the **Table** whose data you want to display and choose **Add this source**.
   d. In the **Columns and rows** section, add and arrange the columns to display.
5. To edit an existing chart, follow these steps.
   a. In Edit mode, select the chart to edit.
   b. In the **Data** section of the Configuration panel, verify that the correct table is selected in **Table** field.
   c. In the **Columns and rows** section, add and arrange the columns to display.
6. When done customizing, select **Save** and then **Exit editing mode.**
7. To return the template to the default (Certified) version, use the **More actions** menu to select **Return to certified**.

Add MetricBase charts to Service Observability dashboard templates

Add MetricBase data to charts on Service Observability dashboard templates when you want to view those metrics in context of Service Observability.

About this task

You can add metrics that are stored in the MetricBase application to your Service Observability dashboards. These charts display with data scoped to the selected service.

Before you begin

Role required: sn_sow_svcobs.admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace** and then navigate to a service record.
   You can access a service record from these pages in the SOW:
   - **Services** list: Choose a service from the list.
   - **Service dashboard**: Choose a service in the dashboard and select **Service Details**.
   - **List**: Navigate to **Application Services** > **Services** and select a service.
   - **Express list** alert: Select a service from the **Impacted services** column.

   The Service Details page opens and the Overview tab is displayed.

   Trouble?
   If charts are displaying error messages, see Chart error states.
2. Open the template in editing mode.
   - If you're editing a certified template, select **Duplicate**.
   - If you're editing a custom template, select **Edit**.

   Note: Duplicating a certified template keeps you from overwriting it and also lets you reinstall it.

   The new dashboard is titled with the words `- Copy` appended. Use the pencil icon to change the dashboard name.
3. To do basic editing, such as rearranging, resizing, or deleting charts, follow the instructions for Edit in-line Platform Analytics dashboard elements.
4. To add a new chart with MetricBase data, follow these steps:

   a. In Edit mode, select **Add new element** and choose **Data visualization**, select **New Visualization**, and then select **Line**.

   b. In the **Data sources** section of the Configuration panel, select **Add data source**.

   c. In the **Add data source** page, navigate to **MetricBase** > **Monitorable Item** and select the data to display, and then choose **Add this source**.
   The data is added to the dashboard.

   d. Use the controls in the **Data** section of the Configuration panel to select the metric and configure the query.
5. When done customizing, select **Save** and then **Exit editing mode.**
6. To return the template to the default (Certified) version, use the **More actions** menu to select **Return to certified**.

Add Health Log Analytics data

Add a graph showing logs from Health Log Analytics (HLA) in a Service Observability dashboard.

About this task

You can add logs from HLA to your Service Observability dashboards. These charts display with data scoped to the selected service.

Before you begin

Role required: sn_sow_svcobs.admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace** and then navigate to a service record.
   You can access a service record from these pages in the SOW:
   - **Services** list: Choose a service from the list.
   - **Service dashboard**: Choose a service in the dashboard and select **Service Details**.
   - **List**: Navigate to **Application Services** > **Services** and select a service.
   - **Express list** alert: Select a service from the **Impacted services** column.

   The Service Details page opens and the Overview tab is displayed.

   Trouble?
   If charts are displaying error messages, see Chart error states.
2. Open the template in editing mode.
   - If you're editing a certified template, select **Duplicate**.
   - If you're editing a custom template, select **Edit**.

   Note: Duplicating a certified template keeps you from overwriting it and also lets you reinstall it.

   The new dashboard is titled with the words `- Copy` appended. Use the pencil icon to change the dashboard name.
3. To do basic editing, such as rearranging, resizing, or deleting charts, follow the instructions for Edit in-line Platform Analytics dashboard elements.
4. To add a new chart with HLA data, follow these steps:

   a. In Edit mode, select **Add new element** and choose **Data visualization**, select **New Visualization**, and then select **Line**.

   b. In the **Data sources** section of the Configuration panel, select **Add data source**.

   c. In the **Add data source** page, navigate to **Health Log Analytics** > **Log components**.

   d. Enter a saved search or select a component and then optionally add conditions or a Lucene query, as described in Step 5 of Create log data dashboards and visualizations in Health Log Analytics.

   e. Once the filter is correct, choose **Add this source**.
   The data is added to the dashboard.

   f. Use the controls in the **Data** section of the Configuration panel to further configure the chart.
5. When done customizing, select **Save** and then **Exit editing mode.**
6. To return the template to the default (Certified) version, use the **More actions** menu to select **Return to certified**.

Add Splunk Enterprise data to Service Observability dashboard templates

Add Splunk Enterprise data to charts on Service Observability dashboard templates when you want to view those metrics in context of Service Observability.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

You can add metrics that are stored in Splunk Enterprise to your Service Observability dashboards. These charts display with data from the query you add to the chart.

Note: The results from these queries are not automatically scoped to the selected service.

Before you begin

You need a connection to your Splunk Enterpise instance. See Connect a Service Observability data source for more information.

Role required: sn_sow_svcobs.admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace** and then navigate to a service record.
   You can access a service record from these pages in the SOW:
   - **Services** list: Choose a service from the list.
   - **Service dashboard**: Choose a service in the dashboard and select **Service Details**.
   - **List**: Navigate to **Application Services** > **Services** and select a service.
   - **Express list** alert: Select a service from the **Impacted services** column.

   The Service Details page opens and the Overview tab is displayed.

   Trouble?
   If charts are displaying error messages, see Chart error states.
2. Open the template in editing mode.
   - If you're editing a certified template, select **Duplicate**.
   - If you're editing a custom template, select **Edit**.

   Note: Duplicating a certified template keeps you from overwriting it and also lets you reinstall it.

   The new dashboard is titled with the words `- Copy` appended. Use the pencil icon to change the dashboard name.
3. To do basic editing, such as rearranging, resizing, or deleting charts, follow the instructions for Edit in-line Platform Analytics dashboard elements.
4. To add a new chart with MetricBase data, follow these steps:

   a. In Edit mode, select **Add new element** and choose **Data visualization**, select **New Visualization**, and then select **Line**.

   b. In the **Data sources** section of the Configuration panel, select **Add data source**.

   c. In the **Add data source** page, navigate to **Service Observability** > **Splunk Enterprise Metrics**, paste in a query from an existing Splunk chart, and then choose **Add this source**. The data is added to the dashboard.

   d. Use the controls in the **Data** section of the Configuration panel to select the metric and configure the query.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. When done customizing, select **Save** and then **Exit editing mode.**
6. To return the template to the default (Certified) version, use the **More actions** menu to select **Return to certified**.

Use synthetic monitoring with Service Observability

Create a synthetic monitor to test your service's endpoints. Then display the results by customizing a Service Observability dashboard.

Overview of using synthetic monitoring with Service Observability

Synthetic monitoring simulates user transactions on a service's HTTP endpoints, enabling you to identify performance bottlenecks, help confirm up-time, and optimize user experiences. It continually calls a service's endpoint to test availability, response times, or the presence of a defined string in the response body. When a test fails the configured criteria, it can send an alert. For more information about synthetic monitoring, see Exploring synthetic monitoring.

The results of the monitor's test can be added to the Service Observability Overview dashboard and to the Observability Service dashboard. To view synthetic data related to a service on a dashboard, you first create a monitor that tests the endpoints of your service. Then you customize a dashboard template to add the monitor's test results.

Note: When you customize the template to add synthetic monitoring, you're adding it to all dashboards that use that template. Services that don't have a configured monitor display an empty chart.

1. Create a synthetic monitor to test a service.

   Install and configure synthetic monitoring and then create a monitor to continually test your service's endpoints using status code, response time, or response body as criteria.

2. Add synthetic monitor results to a Service Observability dashboard

   Customize a Service Observability dashboard template to add synthetic monitoring test results.

Create a synthetic monitor to test a service

Install and configure synthetic monitoring and then create a monitor for your service.

Before you begin

Your service must have an HTTP-reachable endpoint, configured as a CI in the HTTP(S) Endpoints [cmdb_ci_endpoint_http] table of the Configuration Management Database (CMDB).

Role required: n_sow_svcobs.admin, sn_sow_synthetics.synthetics_admin

Procedure

1. Install synthetic monitoring.
   See Install synthetic monitoring for more information.
2. If needed, create a location to run the monitor from.
   Monitors can be run locally from a ServiceNow Glide instance or from your environment using either a cluster of Agent Client Collector (ACC) agents or from a MID Server. If you choose to run them from your environment, you must create a location. See Create synthetic monitoring locations for more information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Create the monitor.
   Follow the steps in Create and edit a synthetic monitor. Be sure to select the service you want to monitor as the **Related service CI**.

What to do next

Once you create the monitor, it begins running tests. View the results of those tests to verify the results before embedding synthetic monitoring into a Service Observability dashboard. For more information about viewing monitor test results, see Identifying system issues with synthetic monitoring.

Once you have expected results, move on to Add synthetic monitor results to a Service Observability dashboard.

Add synthetic monitor results to a Service Observability dashboard

Add a synthetic monitor to a dashboard in Service Observability by customizing an existing dashboard template.

About this task

Once you have created monitors for your services, you can display those results on your Service Observability dashboards by customizing the template to include a chart that queries synthetic monitoring. You can add synthetic monitoring to either the Overview dashboard or the Observability > Service dashboard.

Note: When you customize the template to add synthetic monitoring, you're adding it to all dashboards that use that template. Services that don't have a configured monitor display an empty chart.

Before you begin

Role required: sn_sow_svcobs.admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace** and then navigate to a service record.
   You can access a service record from these pages in the SOW:
   - **Services** list: Choose a service from the list.
   - **Service dashboard**: Choose a service in the dashboard and select **Service Details**.
   - **List**: Navigate to **Application Services** > **Services** and select a service.
   - **Express list** alert: Select a service from the **Impacted services** column.

   The Service Details page opens and the Overview tab is displayed.

   Trouble?
   If charts are displaying error messages, see Chart error states.
2. Open the template in editing mode.
   - If you're editing a certified template, select **Duplicate**.
   - If you're editing a custom template, select **Edit**.

   Note: Duplicating a certified template keeps you from overwriting it and also lets you reinstall it.

   The new dashboard is titled with the words `- Copy` appended. Use the pencil icon to change the dashboard name.
3. To add a new ServiceNow table, follow these steps:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In Edit mode, select **Add new element** and choose **List**.

b. In the **Configuration panel** in the **Data sources** section, choose **Add data source**.

c. In the **Add data source** page, search for and select the synthetic monitoring data source, depending on the data you want to display.

- If you want to display the status of all tests associated with a service, select the `Single API` [sn_synthetics_check_single_api] table.
- If you want to display the results of a single synthetic test for a service, select the `Single API Result` [sn_synthetics_check_single_api_result] table.

Note: Leave the **Follow filters** check box selected. This control enables the chart to display information for the selected service.

4. In the **Default display** section, choose **Add** to begin adding columns from the table to the new list.
5. Choose **Save** and then **Exit editing mode** to return to the dashboard.
The synthetic monitoring data now appears on the dashboard.

What to do next

For detailed instructions about editing dashboards, see Edit in-line Platform Analytics dashboard elements.

Monitoring services and investigating issues

Operators use Service Observability to monitor the health of their services and to triage and manage incidents. They can view performance metrics from external observability monitoring systems in the context of an application service and its related CIs (Configuration Item).

Overview of using Service Observability

Service Observability can display metrics from an observability monitoring instance in context of a service. Along with metrics for the service and information about related CIs, Service Observability can infer entities related to the service, like a host or database, and display their metrics. This functionality gives an operator a more holistic view of what might be affecting performance.

The **Overview** tab on the Service Details page shows high-level performance metrics for the service and other contextual information such as open alerts or incidents affecting the service. The **Observability** tab displays more detailed metrics from the observability system for the service, along with metrics for inferred entities that are found through data mappings configured during setup. It also shows information about CIs related to those inferred entities. Instead of having to switch to an external tool, an operator can view those external metrics in the context of the Service Operations Workspace (SOW).

Note: Operators can also use the Analyze a dashboard in Service Observability and the Analyze service health in Service Observability AI skills to generate an analysis for them.

- View overall service health

  In the **Overview** tab of the Service Details page in the SOW, view overall service health and related information, like alerts and changes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- View service health metrics

  In the **Observability** tab, view more detailed service metrics, as well as metrics from related entities such as databases, hosts, and network components.

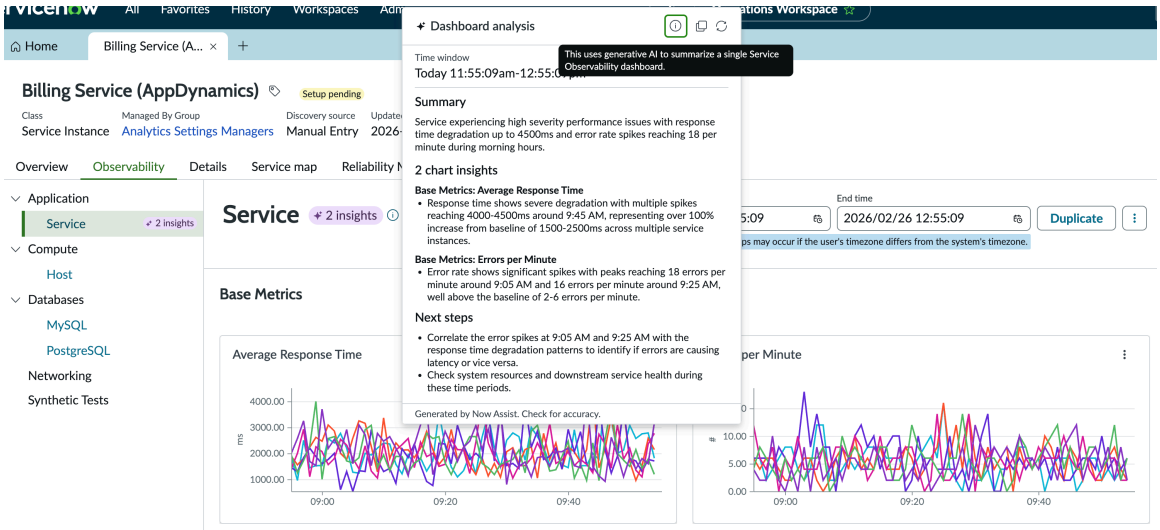
Analyze a dashboard in Service Observability

Use the analyze Service Observability dashboard skill to view an analysis of a single Service Observability dashboard.

About this task

The analyze Service Observability dashboard skill uses generative AI to summarize a single Service Observability dashboard, including calling out insights found in the charts. This summary helps operators quickly orient to and understand a particular dashboard.

When you ask the skill to analyze a dashboard, it generates an optimized version of the Service Observability charts on the dashboard and then analyzes the data, taking the time period shown into account. It then reports any insights it finds.



The skill's results remain available for an hour and don't automatically refresh. You need to rerun the skill to view a new analysis.

Note the following:

- The analysis captures the time range as reflected by the user's set time zone. When sharing analysis data across time zones, be aware that the analysis time period always reflects the time zone originally captured and may not be in sync with your time zone settings.
- The analysis doesn't weigh insights with regards to possible impact to an alert, incident, or overall dashboard health.
- The skill has a maximum number of 50 images that can be analyzed.

Before you begin

You need to manually activate this skill before it can be used. See Activate the analyze Service Observability dashboard skill for more information.

Role required: admin, operator

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace** and then navigate to a service record.
   You can access a service record from these pages in the SOW:
   - **Services** list: Choose a service from the list.
   - **Service dashboard**: Choose a service in the dashboard and select **Service Details**.
   - **List**: Navigate to **Application Services** > **Services** and select a service.
   - **Express list** alert: Select a service from the **Impacted services** column.

   The Service Details page opens and the Overview tab is displayed.

   Trouble?
   If charts are displaying error messages, see Chart error states.
2. To the right of the dashboard name, select **Analyze dashboard**.
   The skill analyzes the data in Service Observability charts, looking for insights in the data that happened within the currently selected time period. Once complete, a badge displays one of the following:
   - **Analysis**: The skill didn't find any insights, but will display a summary of the dashboard.
   - **Insights**: A count of insights found is shown.
   - **Analysis unavailable**: The skill wasn't able to run an analysis.

   Note: Because the skill only analyzes the data in the time period captured by the screen shot, it may produce more accurate results if you lengthen the time period before analyzing. Note that longer time periods result in longer response time. For best results, use time periods less than 48 hours.
3. Select the info icon next to the badge to review the analysis and possible insights.
   The analysis tells you where it found the insights and the next steps you can take to determine the source of the insights.

   The analysis badge remains on the page for 60 minutes, after which the button resets so you can run a new analysis. After five minutes of running or if you change the time period, the analysis shows you a warning that it's out of date. Select the refresh icon to rerun it.

   Note: Select the **Copy** icon to copy the analysis, for example to paste it into work notes for an incident or alert.

Analyze service health in Service Observability

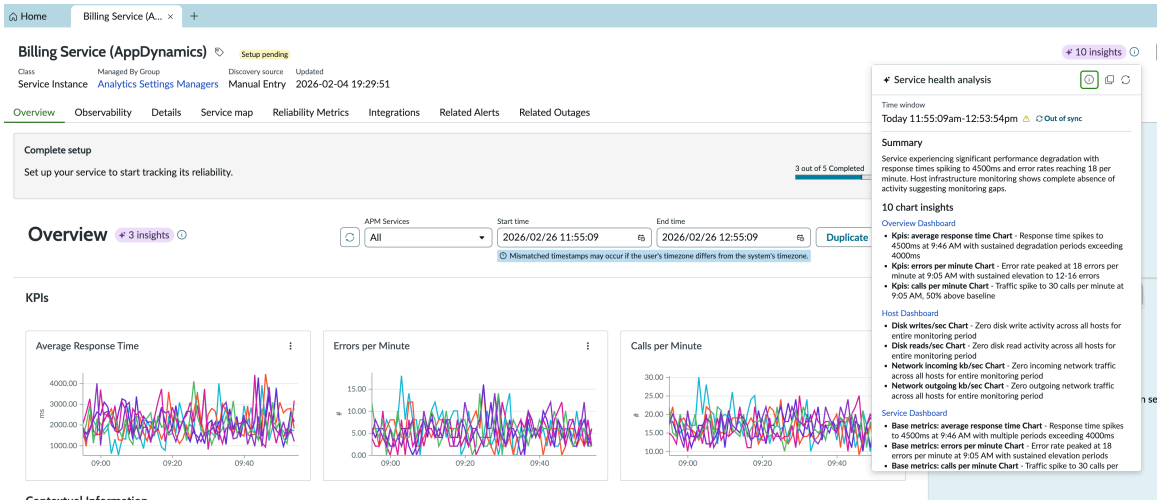
Use the Analyze Service Health skill to view an analysis of all Service Observability dashboards for the selected service.

About this task

The analyze service health skill uses generative AI to analyze all available Service Observability dashboards for the selected service.

When you ask the skill to analyze a service's health, it generates an optimized version of the Service Observability charts for a service, whether or not they are currently displayed. It then analyzes the data, and taking the time period shown into account, detects reports any insights it finds, and analyzes general service health. With these insights on service health, operators can assess service impact, identify root causes, and streamline incident response.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The skill's results remain available for an hour and don't automatically refresh. You need to rerun the skill to view a new analysis.

Once the skill is activated, it automatically runs for you in incident investigation from the **Investigate** tab in Incident Management. See Digital End-User Experience and Service Observability UI experience on investigate tab for more information.

Note the following:

- The analysis captures the time range as reflected by the user's set time zone. When sharing analysis data across time zones, be aware that the analysis time period always reflects the time zone originally captured and may not be in sync with your time zone settings.
- The analysis doesn't weigh insights with regards to possible impact to an alert, incident, or overall dashboard health.
- The skill has a maximum number of 50 images that can be analyzed.

Before you begin

You need to manually activate this skill before it can be used. See Activate the analyze service health skill for more information.

Role required: admin, operator

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace** and then navigate to a service record.
   You can access a service record from these pages in the SOW:
   - **Services** list: Choose a service from the list.
   - **Service dashboard**: Choose a service in the dashboard and select **Service Details**.
   - **List**: Navigate to **Application Services** > **Services** and select a service.
   - **Express list** alert: Select a service from the **Impacted services** column.

   The Service Details page opens and the Overview tab is displayed.

   Trouble?
   If charts are displaying error messages, see Chart error states.
2. At the top-right of the record page, select **Analyze service**.
   The skill optimizes the data on all existing Service Observability charts in dashboards and analyzes the data, looking for insights in the data that happened within the currently selected time period. Once complete, a badge displays one of the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Analysis**: The skill didn't find any insights, but will display a summary of the dashboard.
- **Insights**: A count of insights found is shown.
- **Analysis unavailable**: The skill wasn't able to run an analysis.

Note: Because the skill only analyzes the data in the time period captured by the screen shot, it may produce more accurate results if you lengthen the time period before analyzing. Note that longer time periods result in longer response time. Additionally, dashboards with more than 10,000 points can't be included as part of the analysis. Reducing very large time windows can help keep this from occurring. For best results, use time periods less than 48 hours.

3. Select the info icon next to the badge to review the analysis.
   The analysis tells you where it found the insights and the next steps you can take to determine the source of the insights.

   The analysis badge remains on the page for 60 minutes, after which the button resets so you can run a new analysis. After five minutes of running or if you change the time period, the analysis shows you a warning that it's out of date. Select the refresh icon to rerun it.

   Note: Select the **Copy** icon to copy the analysis, for example to paste it into work notes for an incident or alert.

View overall service health

View overall service health and related events, like alerts and changes, with the **Overview** tab on the Service Details page in the SOW.

Before you begin

A data mapping must be configured. For more information, see Create and manage data mappings.

Role required: operator [snc_sow_svcobs.manager]

About this task

When you have been notified that a service is experiencing performance issues, you can begin your investigation with the **Overview** tab on the Service Details page.

Note: Operators can also use the Analyze a dashboard in Service Observability and the Analyze service health in Service Observability AI skills to generate an analysis for them.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace** and then navigate to a service record.
   You can access a service record from these pages in the SOW:
   - **Services** list: Choose a service from the list.
   - **Service dashboard**: Choose a service in the dashboard and select **Service Details**.
   - **List**: Navigate to **Application Services** > **Services** and select a service.
   - **Express list** alert: Select a service from the **Impacted services** column.

   The Service Details page opens and the Overview tab is displayed.

   Trouble?
   If charts are displaying error messages, see Chart error states.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Use the charts in the Overview section to help determine where there might be performance issues.
   The Overview section shows the basic rate, error, and duration (RED) metrics along with metrics for key transactions found on the service. Hover over a metric to view more details.

   Note: If more than one service is found with the same name, select an individual service using the **All services** drop-down menu.

3. Change the time period using the time picker.
4. Use the other charts on the page to view related information about the service, such as recent changes, open incidents, and trends for incidents and alerts.
   These charts help explain whether recurring incidents or alerts might be caused by performance issues on the service. For detailed information about using this page, refer to the corresponding Overview templates for your observability vendor described in Service Observability templates.

What to do next

To view more detailed metrics and metrics for related entities, select the **Observability** tab. For more information, see View service health metrics.

View service health metrics

View detailed metrics for a service, as well as metrics from related entities, such as databases and hosts, on the **Observability** tab in SOW.

About this task

The **Observability** tab on the Service details page displays metrics for related entities inferred from external observability instances. You can view related metrics without leaving the ServiceNow platform.

The metrics are grouped by the following entity types:

- Application metrics: Metrics associated with the application services
- Computer metrics: Metrics associated with the hosts of the service
- Databases: Metrics associated with databases used by the service

For example, say you have metrics from New Relic used to monitor services, databases, and hosts. Say that you also have an issue with the `checkout` service and want to view performance information and metrics related to that service. Service Observability can show you the service, database, and host metrics related to that service that are coming from New Relic, along with related CI information from the ServiceNow platform. Each entity type has its own dashboard and each metric and related CI information has its own chart.

Note: Operators can also use the Analyze a dashboard in Service Observability and the Analyze service health in Service Observability AI skills to generate an analysis for them.

Before you begin

A data mapping must be configured. For more information, see Create and manage data mappings.

Role required: operator [snc_sow_svcobs.manager]

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace** and then navigate to a service record.
   You can access a service record from these pages in the SOW:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Services** list: Choose a service from the list.
- **Service dashboard**: Choose a service in the dashboard and select **Service Details**.
- **List**: Navigate to **Application Services** > **Services** and select a service.
- **Express list** alert: Select a service from the **Impacted services** column.

The Service Details page opens and the Overview tab is displayed.

Trouble?
If charts are displaying error messages, see Chart error states.

2. Select the **Observability** tab.
   The **Observability** tab shows the related metrics and CI information available for the service. Use the navigation pane to view the entity dashboards.

   Note: If you don't see navigation options for an entity, then the metrics for that entity haven't been discovered or mapped.

3. Select an entity to view its dashboard.
   You can do the following with the charts:
   - Display metrics for a single entity by electing the **All [entity type]** drop-down list and choosing an entity.

     Note: If more than one entity returned metrics, charts display multiple lines with one line for each entity.

   - Display metrics from a different time period using the time picker. The default time period is the last hour.
   - Refresh the charts to the current time period of the last hour by selecting the **Refresh** button.
   - Hover over a point to view detailed information.

   For detailed information about using this page, refer to the corresponding Observability templates for your observability vendor described in Service Observability templates.

Service Observability reference

Reference topics provide additional information about administering and using Service Observability.

Components installed with Service Observability

Several types of components are installed with activation of the Service Observability plugin, including tables and user roles.

Roles installed

Role title [name]	Description	Contains roles
Operator/ Operations manager [snc_sow_svcobs.manager]	Triages incidents in the SOW. Views basic health metrics for a service and more detailed service metrics from related entities.	• sn_sow_srm.srm_responder • connection_admin • evt_mgmt_connector_instance_write

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role title [name]	Description	Contains roles
Service Observability admin [sn_sow_svcobs.admin]	Configures data sources and adds data mappings. Customizes dashboard templates.	• sn_sow_srm.srm_admin • connection_admin • evt_mgmt_connector_instance_write • sn_sow_itsm_admin.sow_admin_user

Store applications installed

The following are installed when you install Service Observability.

Store application [plugin]	Description
Service Observability UI [sn_service_obs_ui]	The Overview and Observability tabs in the Service Details page of the SOW.
Service Reliability Management	Service Reliability Management and Service Observability display service performance metrics together to give a holistic view into service health.
Platform Analytics	Enables customizing the dashboards.

Tables installed

Table	Description
Dashboard fragments [sn_sow_svcobs_dashboard_fragments]	Contains the definitions of dashboards in JSON format.
Service to data mapping configuration map [sn_sow_svcobs_svc_to_config_map]	Associates data mapping configurations with a registered service using the CMDB Group Contains Configuration Item [cmdb_group_contains_ci] table.
Data mapping configurations [sn_sow_svcobs_mapping_config]	Defines a data mapping configuration for a service.
Data mapping configuration rules [sn_sow_svcobs_mapping_config_rules]	Defines a single tag-based mapping rule.
Observability data source [sn_sow_svcobs_data_source]	Defines a third-party observability vendor data source (an `http_connections`) that can be used to get telemetry for services.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
Service Observability entity records [sn_sow_svcobs_entity_records]	Records configuration items and unknown monitored objects for entities that appear in dashboards.
Service Observability PA Dashboards sn_sow_svcobs_pa_dashboards	Contains reference information for customized dashboards.

Domain separation and Service Observability

Domain separation is supported for Service Observability. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

Domain separation and Service Observability overview

Domain separation is present in all aspects of the synthetic monitoring application. Users belonging to a specific domain see only the data existing in their own domain.

How domain separation works in Service Observability

When data is separated by domains in Service Observability, users can only configure and see the observability data in their own domain. By default, all users and records are set to the parent domain unless the admin assigns them to a specific domain.

You define the domain-separated environment when you configure your data inputs. All relevant records and data processing in the Service Observability program flow reside in the same domain as the data input. The domain name of a data input appears in the Domain column that is displayed in the tables in your instance.

Service Observability manages all aspects of the data, such as the data mappings and the data displayed on dashboards. When a property is changed, the new value affects new sources only in the specific domain.

Observability vendor entity mappings for Service Observability

Understand how Service Observability maps service, host, and database entities to your observability vendor resources.

Service Observability displays metrics from your observability vendor for services, hosts, databases, and network components on the Observability dashboards based on the key:value pairs in the mapping rules you create during configuration. Service Observability sends a request to the observability vendor using that mapping as a filter to find related entities. Any additional filtering needed to find the entities is noted in the following sections.

Amazon CloudWatch entity mapping

Resources are returned using the AWS `GetResources` API.

Service Observability entity category	Service Observability entity dashboard	AWS resource
Application	API Gateway - HTTP	API Gateway HTTP APIs
	API Gateway - REST	API Gateway REST APIs
	ELB	ELB application load balancers
	Lambda	Lambda functions
Compute	Host	EC2 instances
Databases	RDS	RDS database instances

AppDynamics entity mapping

Resources are returned using the value of the `entityName` property.

Service Observability entity category	Service Observability entity dashboard	AppDynamics resource
Application	Service	AppDynamics applications returned by the `/controller/rest/applications/` API
Compute	Host	Server nodes for applications returned by the `/controller/sim/v2/user/machines/keys/` API
Databases	MySQL	MySQL database instances returned by the `/controller/rest/databases/collectors/`
	PostgreSQL	MySQL database instances returned by the `/controller/`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Observability entity category	Service Observability entity dashboard	AppDynamics resource
		`rest/databases/collectors/`

Azure entity mapping

Resources are returned using the Azure `ResourceGraph` API.

Service Observability entity category	Service Observability entity dashboard	Azure resource
Application	Service	• `Microsoft.Compute/cloudServices` • `Microsoft.Web/sites`
Compute	Host	`Microsoft.Compute/virtualMachines`
Databases	MySQL	• `Microsoft.DBforMySQL/servers` • `Microsoft.DBforMySQL/flexibleServers`
	PostgreSQL	• Microsoft.DBforPostgreSQL/servers • `Microsoft.DBforPostgreSQL/flexibleServers`

Datadog entity mapping

Service Observability entity category	Service Observability entity dashboard	Datadog resource
Application	Service	Entities returned from the Software Catalog: List Entities API
Compute	Host	Hosts returned from the Hosts: List Hosts API
Databases	MySQL	Databases returned by filtering the `mysql.net.max_connections`

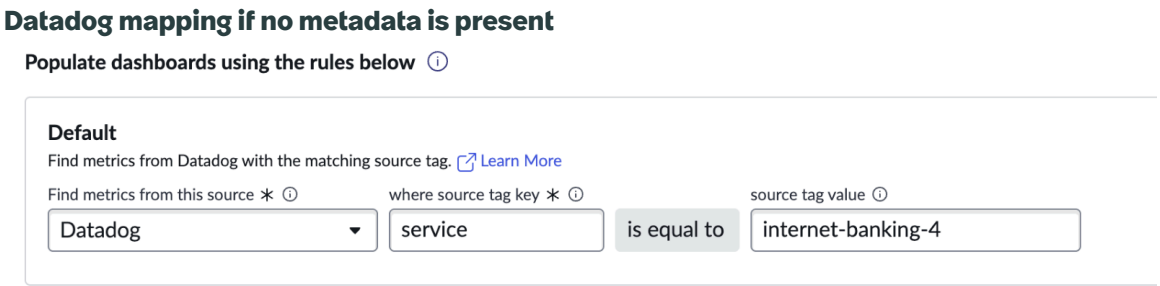
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Observability entity category	Service Observability entity dashboard	Datadog resource
		metric, filtered by the provided key:value pair in the data mapping. **Note:** If your databases don't emit this metric, they aren't mapped.
	PostgreSQL	Databases returned by filtering the `postgresql.connections` metric, filtered by the provided key:value pair in the data mapping. **Note:** If your databases don't emit this metric, they aren't mapped.

Items of note:

- Service entities: The `Software Catalog list entities` API only returns data for services that include metadata. If you want to map services that don't include metadata, you must create a mapping using `service` as the tag and the name of the service as the value.

  For example, say you have a service named `internet-banking-4` that you want to use in a mapping and it doesn't contain metadata. You set up the mapping as shown in this screenshot.

- Default dashboard templates: The Requests, Errors, and Latency charts on the Overview and Observability dashboard templates are created using the Datadog `trace.http.request` trace metric. If a service isn't emitting that metric, no data is found. You can customize the template to use a different trace metric query. See Customize Service Observability dashboard templates for more information.

Dynatrace entity mapping

You can use either the Dynatrace Classic query or Grail (DQL) query, however both require separate data connections. For Grail queries, Service Observability first queries the Grail data source and if not found, will fall back to a Classic query.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Observability entity category	Service Observability entity dashboard	Dynatrace resource
Application	Service	Services
Compute	Host	Hosts
Databases	MySQL	MySQL database instances
	PostgreSQL	PostgreSQL database instances

LogicMonitor entity mapping

Resources are returned using the Get Devices API, using specific property values on the entities as a filter.

Service Observability entity category	Service Observability entity dashboard	LogicMonitor resource
Application	Service	Entities with the `predef.externalResourceType` auto property set to `Service`
Compute	Host	Entities with the `predef.externalResourceType` auto property set to `PhysicalServer`, `Container`, or `VirtualMachine`
Databases	MySQL	Entities with the `system.categories` custom property set to `MySQL`
	PostgreSQL	Entities with the `system.categories` custom property set to `PostgreSQL`

New Relic entity mapping

Service Observability entity category	Service Observability entity dashboard	New Relic resource
Application	Service	Application services
Compute	Host	Hosts
Databases	MySQL	MySQL database instances
	PostgreSQL	PostgreSQL database instances

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Prometheus entity mapping

Service Observability entity category	Service Observability entity dashboard	Prometheus resource
Application	Service	Applications
Compute	Host	Server nodes for applications
Databases	MySQL	MySQL database instances
	PostgreSQL	PostgreSQL database instances

SolarWinds entity mapping

Service Observability entity category	Service Observability entity dashboard	SolarWinds resource
Application	Service	Application services
Compute	Host	Hosts
Networking	Firewall	By default, data mappings find and display metrics using Palo Alto Firewall keys. If you want metrics from a different firewall, follow the instructions for customizing dashboard templates.
	Load Balancer	By default, data mappings find and display metrics using F5 Big-IP Load Balancer keys. If you want metrics from a different load balancer, follow the instructions for customizing dashboard templates.
	Interface	Network interfaces
	Other Network Devices	Other network devices, such as switches and routers

Items to note:

- You can use custom properties for key/value pairs in a data mapping.
- If you are using SolarWinds as an exception in your mapping to ingest networking metrics, using custom properties is optional. If you do use them, only entities with those properties in their metadata are returned. If you leave the tag and key values blank, all supported entities are returned.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Splunk entity mapping

Resources are returned using the Splunk Metric time series Metadata API. Service Observability searches for matching key:value pairs in custom properties and then falls back to searching dimensions.

The returned payload is then filtered by the presence of a specific metric in the metadata that corresponds with an entity type.

Service Observability entity category	Service Observability entity dashboard	Splunk Property or dimension	Splunk metric used for filtering
Application	Service	• Property: `sf_service` • Dimension fallback: `service.name`	`sf_metric:service.request`
Compute	Host	• Property: `host.name` • Dimension fallback: `host.id`	`sf_metric:disk.summary_util`
Databases	MySQL	• Property: `mysql.instance.name` • Dimension fallback: `mysql.instance.endpoint`	`sf_metric:mysql.threads`
	PostgreSQL	Not supported	

Zabbix entity mapping

In Zabbix, every monitored entity is categorized as a host. To enable differentiation between entities, Service Observability searches for keywords in attributes on metadata tags, including host tags, inherited tags, templates, and host groups. Any Zabbix host that does not match a keyword are classified and displayed as Host entities.

The following table shows the keywords used to find distinct entities. Keywords are case insensitive.

Service Observability entity category	Service Observability entity dashboard	Metadata keyword
Application	Service	• Apache • nginx

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Observability entity category	Service Observability entity dashboard	Metadata keyword
		• Kubernetes • cluster • application
Compute	Host	Any non-matching keyword
Databases	MySQL	• Mysql • Msql • mariadb
	PostgreSQL	• Postgres • Psql • Pgsql • Postgresql
Networking	Firewall	• Firewall • palo-alto • palo alto • pan • fortigate • fortinet • fgt • sophos • sonicwall • watchguard • zscaler By default, data mappings find and display metrics using Palo Alto Firewall keys. If you want metrics from a different firewall, follow the instructions for customizing dashboard templates.
	Load Balancer	• Loadbalancer • load_balancer • alb • nlb • f5

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Observability entity category	Service Observability entity dashboard	Metadata keyword
		• netscaler • big-ip • bigip By default, data mappings find and display metrics using F5 Big-IP Load Balancer keys. If you want metrics from a different load balancer, follow the instructions for customizing dashboard templates.
	Other Network devices	• Network • router • rt • gateway • gw • juniper • junos • switch • catalyst • nexus • arista

Item to note:

The default dashboards for each entity type display metrics using Zabbix standard keys. If your implementation uses custom item keys, you need to customize your dashboard templates accordingly.

Advanced query support for AWS and Azure

Understand how to create advanced queries for Service Observability dashboard charts.

Advanced queries in Service Observability support most vendor-specific query languages. Simply copy a query from the observability chart and paste it into the Advanced query field in Service Observability. However, queries to AWS and Azure must be JSON-formatted and follow the guidelines outlined in this topic.

Note: As of version 1.10, you can import charts directly from AWS and Azure. See Edit data charts on Service Observability dashboard templates for more information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AWS advanced queries

Data from AWS is accessed using the `GetMetricData` API. Queries can be either a direct request in JSON format to that API or they can be in the form of a `DashboardBody` metric widget. For example, you can use the widget representation for a chart that exists on an AWS CloudWatch dashboard.

Example: Direct GetMetricData request

The following example shows a `GetMetricData` JSON query for a chart that displays the average CPU Utilization for an ELB instance.

```
{

    "StartTime": 1637061900, // can be replaced with “${START}”
    "EndTime": 1637074500, // can be replaced with “${END}”
    "MetricDataQueries": [
        {
            "Expression": "SELECT AVG(CPUUtilization) FROM
 SCHEMA(\"AWS/EC2\", InstanceId)",
            "Id": "q1",
            "Period": 300,
            "Label": "Cluster CpuUtilization"
        },
        {
            "Id": "m1",
            "Label": "Unhealthy Behind Load Balancer",
            "MetricStat": {
                "Metric": {
                    "Namespace": "AWS/ApplicationELB",
                    "MetricName": "UnHealthyHostCount",
                    "Dimensions": [
                        {
                            "Name": "LoadBalancer",
                            "Value":
 "app/EC2Co-EcsEl-EXAMPLE69Q/fdd2210e799e4376" // can be
 replaced with “${ENTITIES}” or “${ENTITIES_ELB}”
                        }
                    ]
                },
                "Period": 300,
                "Stat": "Average"
            }
        }
    ]
}
```

Example: Copied source for a single object in an AWS CloudWatch dashboard

This example shows the JSON copied directly from a single object in the widgets list of the Source view for a CloudWatch dashboard.

```
{
  "type": "metric",
  "x": 9,
  "y": 0,
  "width": 15,
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  "height": 5,
  "properties": {
    "view": "timeseries",
    "metrics": [
      [ "AWS/ApplicationELB", "RequestCountPerTarget",
 "TargetGroup", "targetgroup/api-tg/1e3dc9z72fe21ca2",
 "AvailabilityZone", "us-west-1a" ],
      ["...", "targetgroup/api-tg-cs/82a1db5f950073e1", ".",
 "." ]
    ],
    "region": "us-west-1"
  }
}
```

Both types of queries can use template variables to represent a set of entities or the start and end time selected in the UI. For example, instead of querying for a single ELB instance, you can replace the `Value` field for the `LoadBalancer` dimension with `${ENTITY_ELB}`. The query is run against each ELB instance associated with the selected service in the Service Observability UI. The chart displays a time series for each one.

Note: JSON objects copied from the source of a CloudWatch dashboard don't include explicit time fields. The values from the time picker in the Service Observability UI are used automatically.

Template variables

AWS field	Template variable
`Dimensions[n].Value`	• `ENTITIES` • `ENTITIES_HOST` • `ENTITIES_LAMBDA` • `ENTITIES_API_GATEWAY_HTTP` • `ENTITIES_API_GATEWAY_REST` • `ENTITIES_ELB` • `ENTITIES_RDS` The `Dimensions[n].Value` field must be a resource identifier key.
`StartTime`	`START`
`EndTime`	`END`

Azure advanced queries

You run an advanced query for an Azure-based chart by copying the source from the Azure UI and pasting it in the **Advanced query** field.

To copy the source:

1. In the Azure UI, export and download the dashboard.
2. Copy the JSON for a single chart. Charts are located at `properties.lenses[i].parts[j].metadata.settings.content.options.chart`.
3. Paste the JSON into the query field. The JSON must include at least the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
```
{
“metrics”: [
  “name”: string,
  “resourceMetadata”: {
    “id”: string
    }
  ]
}
```
```

The `id` field must be either an Azure resource ID or a template variable.

Service Observability template variables

Understand the template variables that you can use in your queries when editing Service Observability dashboards and charts.

You can use the following template variables in your query. Variables enable the query to be used for multiple services, hosts, and database instances, as well as for the time period currently selected for the dashboard.

Note: Amazon CloudWatch uses slightly different template variables. See Advanced query support for AWS and Azure for more information.

Aside from the variables listed below, you can also use any tag key used in the chart's data mapping as a template variable.

Template variables

Variable	Description
`{$ENTITIES_HOST}`	Returns metrics for the selected host
`{$ENTITIES_MYSQL}`	Returns metrics for the selected MySQL instance
`{$ENTITIES_POSTGRESQL}`	Returns metrics for the selected PostgreSQL instance
`{$ENTITIES_SERVICE}`	Returns metrics for the selected service.
`{$ENTITIES}`	Returns metrics for the selected entity; either service, host or database.
`{$START_TIME}`	Returns metric time series using the selected start time.
`{$END_TIME}`	Returns metric time series using the selected end time.

Example query

Let's say you're using NewRelic and you create a data mapping that maps the key `service` to the value `checkout-service`.

A simple query built using the query builder might look like this:

```
rate(count(apm.service.transaction.duration), 1 minute
```

It would return the rate of transactions for the `checkout-service` service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Instead you might use a full vendor query like this:

```
SELECT rate(count(apm.service.transaction.duration), 1
 minute) as 'Web throughput' FROM Metric WHERE (entity.guid
 = 'NDc2NDMyNXxBUE18QVBQTE1DQVRJT058MTA3NjIyODQwMw') AND
 (transactionType = 'Web') LIMIT MAX SINCE 30 minutes ago
 TIMESERIES UNTIL now
```

It would return the duration for the hard-coded `NDc2NDMyNXxBUE18QVBQTE1DQVRJT058MTA3NjIyODQwMw` entity from the last 30 minutes.

To create a query that would return the time series for any selected service at any time period, you can replace the entity and times with template variables:

```
SELECT average(convert(apm.service.transaction.duration, unit,
 'ms')) as metricValue,
 average(convert(apm.service.transaction.duration, unit, 'ms'))
 - 100 as loop FROM Metric WHERE entity.guid IN (${ENTITIES})
 FACET entity.guid, entity.name SINCE ${START} UNTIL ${END}
 TIMESERIES LIMIT 25
```

Service Observability templates

View the templates for your observability vendor to understand the default dashboards provided by Service Observability.

See Customize Service Observability dashboard templates for information about customizing these templates.

Amazon CloudWatch templates for Service Observability

Templates used to create Amazon CloudWatch dashboards in Service Observability. You can edit these templates as needed.

See Customize Service Observability dashboard templates for more information.

Amazon CloudWatch Overview tab for Service Observability

Information that is displayed on the Amazon CloudWatch **Overview** tab of the Service Details page in the SOW.

Note: If the dashboards have been customized, they might not reflect the information shown on this page.

Chart name	Description	Data source
Invocations	Aggregate rate of transactions through the service.	AWS
Errors	Number of transactions that have an error.	AWS
Duration	Aggregate duration of transactions through the service, in milliseconds.	AWS

Contextual information section

The Recent changes table shows changes made to the system that might have an impact on the service. This data comes from the related configuration items in the CMDB.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status indicators section

The Status indicators section displays charts for related Configuration Items (CIs) that might be affecting the service.

Chart name	Description	Data source
SLO Error Budget	Information about your current error budget for this service, as configured in Service Reliability Management (SRM). For more information on error budgets, see Create SLOs, SLIs, and error budget policies.	CMDB
Systems impacted	Services or service offerings that have a relationship to the selected service.	CMDB
Open incidents last 30 days	Day-by-day occurrence of open incidents affecting this service over the last month.	CMDB
Open alerts last 30 days	Day-by-day occurrence of alerts affecting this service over the last month.	CMDB
Current open incidents	Listing of active incidents that affect this service.	CMDB
All active alerts	Listing of active alerts that affect this service.	CMDB

Amazon CloudWatch Observability tab for Service Observability

Dashboard and charts on the Amazon CloudWatch tab of the Service Details page in the SOW.

Application dashboards

This dashboard displays performance metrics for the selected service.

Note: If the dashboards have been customized, they might not reflect the information shown on this page.

API Gateway - HTTP

Chart	Description	Data source
Request Count	Aggregate rate of transactions through the service, per minute.	AWS
Latency	Aggregate duration of transactions through the service, in milliseconds.	AWS
4xx Errors	Number of errors returned with a status of 4xx.	AWS
5xx Errors	Number of errors returned with a status of 5xx.	AWS

API Gateway - REST

Chart	Description	Data source
Request Count	Aggregate rate of transactions through the service, per minute.	AWS
Latency	Aggregate duration of transactions through the service, in milliseconds.	AWS
4xx Errors	Number of errors returned with a status of 4xx.	AWS
5xx Errors	Number of errors returned with a status of 5xx.	AWS

ELB

Chart	Description	Data source
Request Count	Aggregate rate of transactions through the service, per minute.	AWS
Latency	Aggregate duration of transactions through the service, in milliseconds.	AWS
4xx Errors	Number of errors returned with a status of 4xx.	AWS
5xx Errors	Number of errors returned with a status of 5xx.	AWS

Lambda

Chart	Description	Data source
Errors	Number of errors reported by the Lambda function.	AWS
Duration	Aggregate duration of transactions through the service, in milliseconds.	AWS
Invocations	Number of Lambda invocations executed by this service.	AWS

Compute dashboards

This dashboard displays metrics for hosts related to the service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Host

Chart	Description	Data source
CPU utilization	Percent of the host processing power being consumed by this service.	AWS
Disk Write Bytes	Number of bytes written to the database by this service.	AWS
Disk Read Bytes	Number of bytes read from the database by this service.	AWS
Network In Bytes	Amount of incoming network traffic in bytes for this service.	AWS
Network Out Bytes	Amount of outgoing network traffic in bytes for this service.	AWS
All EC2 VM Instances	Information for all EC2 VM instances the service is actively using. Select a link to view more detailed information.	CMDB
All Active Servers	Information for all servers the service is actively using. Select a Server link to view more detailed information.	CMDB

Database dashboards

This dashboard displays metrics for RDS databases related to the service.

RDS

Chart	Description	Data source
CPU utilization	Percent of the database's processing power being consumed by this service.	AWS
Free Memory	Amount of memory in bytes available on this database.	AWS
Free Storage	Amount of storage in bytes available on this database.	AWS
Current Connections	Number of connections from this service to the database.	AWS
Read Latency	Time taken in milliseconds for read operation from the database to complete.	AWS
Write Latency	Time taken in milliseconds for write operation from the database to complete.	AWS
All RDS Instances	Information for all databases the service is actively using. Select a database link to view more detailed information.	CMDB

AppDynamics templates for Service Observability

Templates used to create AppDynamics dashboards in Service Observability. You can edit these templates as needed.

See Customize Service Observability dashboard templates for more information.

AppDynamics Overview tab for Service Observability

Information that is displayed on the AppDynamics **Overview** tab of the Service Details page in the SOW.

KPIs section

The KPIs section displays basic performance metrics for the service.

Note: If the dashboards have been customized, they might not reflect the information shown on this page.

Chart name	Description	Data source
Average Response Time	Average rate of transactions through the service.	AppDynamics
Errors per Minute	Rate of errors per minute on transactions for the service.	AppDynamics

Contextual information section

The Recent changes table shows changes made to the system that might have an impact on the service. This data comes from the related configuration items in the CMDB.

Status indicators section

The Status indicators section displays charts for related CIs that might be affecting the service.

Chart name	Description	Data source
SLO Error Budget	Information about your current error budget for this service, as configured in Service Reliability Management (SRM). For more information on error budgets, see Create SLOs, SLIs, and error budget policies.	CMDB
Systems impacted	Services or service offerings that have a relationship to the selected service.	CMDB
Open incidents last 30 days	Day-by-day occurrence of open incidents affecting this service over the last month.	CMDB
Open alerts last 30 days	Day-by-day occurrence of alerts affecting this service over the last month.	CMDB
Current open incidents	Listing of active incidents that affect this service.	CMDB
Current open alerts	Listing of active alerts that affect this service.	CMDB

AppDynamics Observability tab for Service Observability

Dashboard and charts on the AppDynamics Observability tab of the Service Details page in the SOW.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Application dashboard

This dashboard displays performance metrics for the selected service.

Note: If the dashboards have been customized, they might not reflect the information shown on this page.

Service

Chart name	Description	Data source
Average Response Time	Average rate of transactions through the service.	AppDynamics
Errors per Minute	Rate of errors per minute on transactions for the service.	AppDynamics
Calls per Minute	Number of calls to the server, per minute.	AppDynamics
Number of slow calls	Number of calls to the server that have a response time slower than the set slow threshold.	AppDynamics
Number of Very Slow Calls	Number of calls to the server that have a response time slower than the set very slow threshold.	AppDynamics

Compute dashboard

This dashboard displays metrics for hosts related to the service.

Host

Chart	Description	Data source
CPU %Busy	Percent of the host processing power being consumed.	AppDynamics
Memory Used %	Percent of memory the host is using.	AppDynamics
Disk Reads/sec	Percent of disk space being used, per second.	AppDynamics
Disk Writes/sec	Percent of disk space being written to, per second.	AppDynamics
Network Incoming KB/sec	Number of kilobytes coming into the service, per second.	AppDynamics
Network Outgoing KB/sec	Number of kilobytes being sent by the service, per second.	AppDynamics
All Active Servers	Information for all servers the service is actively using. Select a host link to view more detailed information.	CMDB

Database dashboards

These dashboards display metrics for databases related to the service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MySQL

Chart	Description	Data source
Calls Per Minute	Number of database calls made by the service, per minute	AppDynamics
Time Spent in Executions	Number of seconds spent executing database calls by the service.	AppDynamics
DB Inserts	Number of database inserts by the service.	AppDynamics
DB Reads	Number of database reads by the service.	AppDynamics
All MySQL Instances	Information for all databases the service is actively using. Select a database link to view more detailed information.	CMDB

PostgreSQL

Chart	Description	Data source
Calls Per Minute	Number of database calls made by the service, per minute	AppDynamics
Time Spent in Execution(s)	Time in seconds the database in execution mode for this service.	AppDynamics
All PostgreSQL Instances	Information of all databases the service is actively using. Select a database link to view more detailed information.	CMDB

Azure Monitor templates for Service Observability

Templates used to create Azure Monitor dashboards in Service Observability. You can edit these templates as needed.

See Customize Service Observability dashboard templates for more information.

Azure Monitor Overview tab for Service Observability

Information that is displayed on the Azure Monitor **Overview** tab of the Service Details page in the SOW.

Note: If the dashboards have been customized, they might not reflect the information shown on this page.

Chart name	Description	Data source
Requests	Aggregate rate of transactions through the service.	Azure
Response Time	Aggregate duration of transactions through the service, in milliseconds.	Azure
Http 5xx	Number of errors returned with a status of 5xx.	Azure

Contextual information section

The Recent changes table shows changes made to the system that might have an impact on the service. This data comes from the related configuration items in the CMDB.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status indicators section

The Status indicators section displays charts for related Configuration Items (CIs) that might be affecting the service.

Chart name	Description	Data source
SLO Error Budget	Information about your current error budget for this service, as configured in Service Reliability Management (SRM). For more information on error budgets, see Create SLOs, SLIs, and error budget policies.	CMDB
Systems impacted	Services or service offerings that have a relationship to the selected service.	CMDB
Open incidents last 30 days	Day-by-day occurrence of open incidents affecting this service over the last month.	CMDB
Open alerts last 30 days	Day-by-day occurrence of alerts affecting this service over the last month.	CMDB
Current open incidents	Listing of active incidents that affect this service.	CMDB
All Active alerts	Listing of active alerts that affect this service.	CMDB

Azure Monitor Observability tab for Service Observability

Dashboard and charts on the Azure Monitor Observability tab of the Service Details page in the SOW.

Application dashboard

This dashboard displays performance metrics for the selected service.

Note: If the dashboards have been customized, they might not reflect the information shown on this page.

Service

Chart	Description	Data source
Requests	Aggregate rate of requests through the service.	Azure
Http 4xx	Number of transactions that have an HTTP 4xx response.	Azure
Response time	Aggregate duration of transactions through the service, in milliseconds.	Azure
Data Out	Volume in bytes of outgoing network traffic from this service.	Azure

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service (continued)

Chart	Description	Data source
Http 2xx	Number of transactions that have an HTTP 2xx response.	Azure
Data In	Volume in bytes of incoming network traffic to this service.	Azure

Compute dashboard

This dashboard displays metrics for hosts related to the service.

Host

Chart	Description	Data source
Available Memory Percentage	Percent of the memory available to the service.	Azure
CPU %	Percent of the host processing power being consumed.	Azure
VM Cached Bandwidth Consumed Percentage	Percent of the virtual machine's cached bandwidth that the service is consuming.	Azure
All Active VM Instances	Information for all virtual machines (VM) the service is actively using. Select a VM link to view more information.	CMDB
All Active Servers	Information for all hosts the service is actively using. Select a host link to view more detailed information.	CMDB

Database dashboards

These dashboards display metrics for databases related to the service.

MySQL

Chart	Description	Data source
Storage %	Percentage of storage currently being consumed by the service.	Azure
CPU %	Percentage of CPU currently being consumed by the service.	Azure
Memory %	Percentage of memory currently being consumed by the service.	Azure
Active Connections	Number of connections currently used by the service.	Azure
Aborted Connections	Number of connections from the service terminated by the database	Azure
MySQL Uptime	Total time in seconds that this MySQL instance has been running since its last restart.	Azure
Slow Queries	Number of queries that take longer than the specified threshold to execute. This threshold is typically defined by the `long_query_time` parameter in MySQL.	Azure

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

PostgreSQL

Chart	Description	Data source
Storage %	Percentage of storage currently being consumed by the service.	Azure
CPU %	Percentage of CPU currently being consumed by the service.	Azure
Memory %	Percentage of memory currently being consumed by the service.	Azure
Active Connections	Number of connections currently used by the service.	Azure
Aborted Connections	Number of connections from the service terminated by the database	Azure
Succeeded Connections	Number of successful connections from the service to the database.	Azure
Deadlocks	Number of deadlocks encountered by the service.	Azure
Is Database Alive	1 if database is up, 0 if it is down.	Azure
All PostgreSQL Instances	Information of all databases the service is actively using. Select a database link to view more detailed information.	CMDB

Cisco ThousandEyes templates for Service Observability

Templates used to create Cisco ThousandEyes synthetics dashboard in Service Observability. You can edit this template as needed.

See Customize Service Observability dashboard templates for more information.

Cisco ThousandEyes Observability tab for Service Observability

Dashboard and charts on the Cisco ThousandEyes Observability tab of the Service Details page in the SOW.

Synthetic Tests dashboard

This dashboard displays synthetic monitoring metrics for the selected service.

Note: If the dashboards have been customized, they might not reflect the information shown on this page.

Network Test

Chart	Description	Data source
Latency	Network latency measurements over time.	Cisco ThousandEyes
Jitter	Variation in latency measurements over time.	Cisco ThousandEyes
Packet loss %	Percentage of network packets lost during transmission.	Cisco ThousandEyes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

HTTP Test

Chart	Description	Data source
Throughput	HTTP throughput measurements showing data transfer rates.	Cisco ThousandEyes
Response Time	HTTP response time measurements for the monitored service.	Cisco ThousandEyes

Page Load Test

Chart	Description	Data source
Time to complete	Time required to fully load the monitored page.	Cisco ThousandEyes
Error Count	Number of errors encountered during page load tests.	Cisco ThousandEyes

Datadog templates for Service Observability

Templates used to create Datadog dashboards in Service Observability. You can edit these templates as needed.

See Customize Service Observability dashboard templates for more information.

Datadog Overview tab for Service Observability

Information that is displayed on the Datadog**Overview** tab of the Service Details page in the SOW.

KPIs section

The KPIs section displays basic performance metrics for the service.

Note: If the dashboards have been customized, they might not reflect the information shown on this page.

Chart name	Description	Data source
Request	Aggregate rate of transactions through the service.	Datadog
Errors	Percent of transactions that have an error.	Datadog
Latency	Aggregate duration of transactions through the service, in milliseconds.	Datadog

Transactions charts

The Transactions charts show metrics for specific key transactions on the service. The key transactions are determined by your observability system configuration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Chart name	Description	Data source
Requests	Each line represents the throughput of a key transaction through the service. Hover over a point to view the different transaction names.	Datadog
Errors	Each line represents the percentage of errors on a key transaction in the service. Hover over a point to view the different transaction names.	Datadog
Latency	Each line represents the response time for a key transaction on the service. Hover over a point to view the different transaction names.	Datadog

Contextual information section

The Recent changes table shows changes made to the system that might have an impact on the service. This data comes from the related configuration items in the CMDB.

Status indicators section

The Status indicators section displays charts for related CIs that might be affecting the service.

Chart name	Description	Data source
SLO Error Budget	Information about your current error budget for this service, as configured in Service Reliability Management (SRM). For more information on error budgets, see Create SLOs, SLIs, and error budget policies.	CMDB
Systems impacted	Services or service offerings that have a relationship to the selected service.	CMDB
Open incidents last 30 days	Day-by-day occurrence of open incidents affecting this service over the last month.	CMDB
Open alerts last 30 days	Day-by-day occurrence of alerts affecting this service over the last month.	CMDB
Current open incidents	Listing of active incidents that affect this service.	CMDB
Current open alerts	Listing of active alerts that affect this service.	CMDB

Datadog Observability tab for Service Observability

Dashboard and charts on the Datadog Observability tab of the Service Details page in the SOW.

Application dashboard

This dashboard displays performance metrics for the selected service.

Note: If the dashboards have been customized, they might not reflect the information shown on this page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service KPIs

Chart	Description	Data source
Requests	Aggregate rate of requests through the service.	Datadog
Errors	Number of transactions that have an error.	Datadog
Latency	Aggregate duration of transactions through the service, in milliseconds.	Datadog

Top Transactions

Chart	Description	Data source
Requests	Each line represents the throughput of a key transaction through the service. Hover over a point to view the different transaction names.	Datadog
Errors	Each line represents the number of errors on a key transaction in the service. Hover over a point to view the different transaction names.	Datadog
Latency	Each line represents the response time for a key transaction on the service. Hover over a point to view the different transaction names.	Datadog

Compute dashboard

This dashboard displays metrics for hosts related to the service.

Host

Chart	Description	Data source
CPU Utilization	Percent of the host processing power being consumed.	Datadog
Memory Utilization	Percent of memory the host is using.	Datadog
Disk Utilization	Percent of disk space being used.	Datadog
All Active Servers	Information for all hosts the service is actively using. Select a host link to view more detailed information.	CMDB

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Host (continued)

Chart	Description	Data source
All Active VM Instances	Information for all virtual machines (VM) the service is actively using. Select a VM link to view more information.	CMDB

Database dashboards

These dashboards display metrics for databases related to the service.

MySQL

Chart	Description	Data source
Max Connections	Maximum number of concurrent connections that can be established with the MySQL database server.	Datadog
Failed Connections	Number of failed attempts to connect to the MySQL server.	Datadog
Slow Queries Rate	Number of database queries that have been categorized as slow by Datadog.	Datadog
Data Reads	Number of read operations performed on the MySQL database.	Datadog
Data Writes	Number of write operations performed on the MySQL database.	Datadog
Cache Utilization	Percentage of the cache memory being used by the MySQL database.	Datadog
All MySQL Instances	Information for all databases the service is actively using. Select a database link to view more detailed information.	CMDB

PostgreSQL

Chart	Description	Data source
Connections	Total number of connections to the database server, including all connection states such as active, idle, and others.	Datadog
Connections Used	Number of connections to the database used by this service.	Datadog
Active Waiting Queries	Number of queries in the queue waiting to be executed.	Datadog
Deadlocks	Number of deadlocks encountered by the service.	Datadog
Rollbacks	Number of transactions rolled back by the service.	Datadog
Buffer Hits	Number of times disk blocks were found in the buffer cache, so that a read wasn't necessary.	Datadog
All PostgreSQL Instances	Information of all databases the service is actively using. Select a database link to view more detailed information.	CMDB

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Dynatrace templates for Service Observability

Templates used to create Dynatrace dashboards in Service Observability. You can edit these templates as needed.

See Customize Service Observability dashboard templates for more information.

Dynatrace Overview tab for Service Observability

Information that is displayed on the Dynatrace **Overview** tab of the Service Details page in the SOW.

KPIs section

The KPIs section displays basic performance metrics for the service.

Note: If the dashboards have been customized, they might not reflect the information shown on this page.

Chart name	Description	Data source
Rate	Aggregate rate of transactions through the service.	Dynatrace
Error %	Percent of transactions that have an error.	Dynatrace
Latency	Aggregate duration of transactions through the service, in milliseconds.	Dynatrace

Key Transactions charts

The Transactions charts show metrics for specific key transactions on the service. The key transactions are determined by your observability system configuration.

Chart name	Description	Data source
Rate	Each line represents the throughput of a key transaction through the service. Hover over a point to view the different transaction names.	Dynatrace
Error %	Each line represents the percentage of errors on a key transaction in the service. Hover over a point to view the different transaction names.	Dynatrace
Latency	Each line represents the response time for a key transaction on the service. Hover over a point to view the different transaction names.	Dynatrace

Contextual information section

The Recent changes table shows changes made to the system that might have an impact on the service. This data comes from the related configuration items in the CMDB.

Status indicators section

The Status indicators section displays charts for related CIs that might be affecting the service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Chart name	Description	Data source
SLO Error Budget	Information about your current error budget for this service, as configured in Service Reliability Management (SRM). For more information on error budgets, see Create SLOs, SLIs, and error budget policies.	CMDB
Systems impacted	Services or service offerings that have a relationship to the selected service.	CMDB
Open incidents last 30 days	Day-by-day occurrence of open incidents affecting this service over the last month.	CMDB
Open alerts last 30 days	Day-by-day occurrence of alerts affecting this service over the last month.	CMDB
Current open incidents	Listing of active incidents that affect this service.	CMDB
Current open alerts	Listing of active alerts that affect this service.	CMDB

Dynatrace Observability tab for Service Observability

Dashboard and charts on the Dynatrace Observability tab of the Service Details page in the SOW.

Dynatrace dashboards are the same for both managed and SaaS environments.

Application dashboard

This dashboard displays performance metrics for the selected service.

Note: If the dashboards have been customized, they might not reflect the information shown on this page.

Service Basic metrics

Chart	Description	Data source
Rate	Aggregate rate of transactions through the service.	Dynatrace
Error %	Percent of transactions that have an error.	Dynatrace
Latency	Aggregate duration of transactions through the service, in milliseconds.	Dynatrace
Client error rate	Rate of errors the service clients experienced.	Dynatrace
Client throughput	Rate of client requests for this service.	Dynatrace

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Basic metrics (continued)

Chart	Description	Data source
Client response time	Response time for client requests on this service, in milliseconds.	Dynatrace
Total DB connections	Number of databases that this client has connections to. **Note:** Not available with Grail (DQL) queries.	Dynatrace
DB connection errors	Number of errors received by the client when trying to access databases. **Note:** Not available with Grail (DQL) queries.	Dynatrace
Time spent in database calls	Duration of requests to databases, in milliseconds. **Note:** Not available with Grail (DQL) queries.	Dynatrace

Service Transactions

Chart	Description	Data source
Key Request Count	Each line represents the throughput of a key transaction through the service. Hover over a point to view the different transaction names.	Dynatrace
Key Request Error %	Each line represents the percentage of errors on a key transaction in the service. Hover over a point to view the different transaction names.	Dynatrace
Key Request Response Time	Each line represents the response time for a key transaction on the service. Hover over a point to view the different transaction names.	Dynatrace

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Compute dashboard

This dashboard displays metrics for hosts related to the service.

Host

Chart	Description	Data source
CPU utilization	Percent of the host processing power being consumed.	Dynatrace
Memory utilization	Percent of memory the host is using.	Dynatrace
Disk utilization	Percent of disk space being used.	Dynatrace
Network RX - bytes received	Count of bytes received.	Dynatrace
Network TX - bytes transferred	Count of bytes sent.	Dynatrace
All Active Servers	Information for all hosts the service is actively using. Select a host link to view more detailed information.	CMDB
All Active VM Instances	Information for all virtual machines (VM) the service is actively using. Select a VM link to view more information.	CMDB

Process

Chart	Description	Data source
CPU Usage	Percent of the host processing power being consumed.	Dynatrace
Memory Usage	Percent of memory the host is using.	Dynatrace
Requests	Rate of requests per second	Dynatrace
Throughput	Size of requests, in megabytes per second.	Dynatrace
Latency	Aggregate duration of transactions, in milliseconds.	Dynatrace

Process Group

Chart	Description	Data source
CPU Usage	Percent of the host processing power being consumed.	Dynatrace
Memory Usage	Percent of memory the host is using.	Dynatrace
Requests	Rate of requests per second	Dynatrace
Throughput	Size of requests, in megabytes per second	Dynatrace
Latency	Aggregate duration of transactions, in milliseconds.	Dynatrace
All Active Servers	Information for all hosts the service is actively using. Select a host link to view more detailed information.	CMDB

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Database dashboards

These dashboards display metrics for databases related to the service.

MySQL

Chart	Description	Data source
CPU utilization	Percent of the database's processing power being consumed.	Dynatrace
Memory utilization	Percent of memory the database is using.	Dynatrace
Availability	Percent of time the database is available.	Dynatrace
Connections	Number of connections to the database.	Dynatrace
Slow queries	Number of database queries that have been categorized as slow by Dynatrace.	Dynatrace
All MySQL Instances	Information for all databases the service is actively using. Select a database link to view more detailed information.	CMDB

PostgreSQL

Chart	Description	Data source
Deadlocks	Number of deadlocks detected in this database.	Dynatrace
Committed Transactions	Number of transactions in this database that have been committed.	Dynatrace
Active Backend Connections	Number of backends currently connected to this database.	Dynatrace
Query Conflicts	Number of queries cancelled due to conflicts with recovery in this database.	Dynatrace
Active Time	Time spent executing SQL statements in this database.	Dynatrace
Fatal Sessions	Number of database sessions to this database that were terminated by fatal errors	Dynatrace
All PostgreSQL Instances	Information of all databases the service is actively using. Select a database link to view more detailed information.	CMDB

LogicMonitor templates for Service Observability

Templates used to create LogicMonitor dashboards in Service Observability. You can edit these templates as needed.

See Customize Service Observability dashboard templates for more information.

LogicMonitor Overview tab for Service Observability

Information that is displayed on the LogicMonitor **Overview** tab of the Service Details page in the SOW.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

KPIs section

The KPIs section displays basic performance metrics for the service.

Note: If the dashboards have been customized, they might not reflect the information shown on this page.

Chart name	Description	Data source
Response Time	Response time metrics for the service, displayed in milliseconds over time.	LogicMonitor
Status	Status metrics for the service. A value of `1` means the service is up. A value of 2 means it's down.	LogicMonitor

Contextual information section

The Recent changes table shows changes made to the system that might have an impact on the service. This data comes from the related configuration items in the CMDB.

Status indicators section

The Status indicators section displays charts for related CIs that might be affecting the service.

Chart name	Description	Data source
SLO Error Budget	Information about your current error budget for this service, as configured in Service Reliability Management (SRM). For more information on error budgets, see Create SLOs, SLIs, and error budget policies.	CMDB
Systems impacted	Services or service offerings that have a relationship to the selected service.	CMDB
Open incidents last 30 days	Day-by-day occurrence of open incidents affecting this service over the last month.	CMDB
Open alerts last 30 days	Day-by-day occurrence of alerts affecting this service over the last month.	CMDB
Current open incidents	Listing of active incidents that affect this service.	CMDB
Current open alerts	Listing of active alerts that affect this service.	CMDB

LogicMonitor Observability tab for Service Observability

Dashboard and charts on the LogicMonitor Observability tab of the Service Details page in the SOW.

Application dashboard

This dashboard displays performance metrics for the selected service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If the dashboards have been customized, they might not reflect the information shown on this page.

Service basic metrics

Chart	Description	Data source
Response Time	Response time metrics for the service, displayed in milliseconds over time.	LogicMonitor
Status	Status metrics for the service. A value of `1` means the service is up. A value of `2` means it's down.	LogicMonitor

Compute dashboard

This dashboard displays metrics for hosts related to the service.

Host

Chart	Description	Data source
CPU Busy %	Percentage of time the CPU is actively busy processing tasks, showing periods of high activity versus idle time.	LogicMonitor
Memory Usage	Percent of memory the host is using.	LogicMonitor
CPU Utilization	Overall CPU load and usage patterns across the host, showing continuous utilization levels over time.	LogicMonitor
Network RX - bytes transferred	Amount of data received by the host over the network, measured in bytes.	LogicMonitor
Network TX - bytes transferred	Amount of data transmitted by the host over the network, measured in bytes.	LogicMonitor
All Active Servers	Information for all servers the service is actively using. Select a host link to view more detailed information.	CMDB

Database dashboards

These dashboards display metrics for databases related to the service.

MySQL

Chart	Description	Data source
Response Time	Response time metrics for the database, displayed in milliseconds over time.	LogicMonitor
CPU Busy %	Percent of the database's processing power being consumed.	LogicMonitor
Memory Used %	Percent of memory the database is using.	LogicMonitor

© 2026 ServiceNow, Inc. All rights reserved.

MySQL (continued)

Chart	Description	Data source
Status	Status metrics for the service. A value of `1` means the database is up. A value of 2 means it's down.	LogicMonitor
All MySQL Instances	Information for all databases the service is actively using. Select a database link to view more detailed information.	CMDB

PostgreSQL

Chart	Description	Data source
Response time	Response time metrics for the database, displayed in milliseconds over time.	LogicMonitor
CPU Busy %	Percent of the database's processing power being consumed.	LogicMonitor
Memory Used %	Percent of memory the database is using.	LogicMonitor
Status	Status metrics for the service. A value of `1` means the database is up. A value of 2 means it's down.	LogicMonitor
Busy servers	Number of busy servers for the database over time.	LogicMonitor
Maximum servers	Maximum number of servers available for the database.	LogicMonitor
All PostgreSQL Instances	Information of all databases the service is actively using. Select a database link to view more detailed information.	CMDB

MetricBase templates for Service Observability

Templates used to create MetricBase dashboards in Service Observability. You can edit these templates as needed.

See Customize Service Observability dashboard templates for more information.

MetricBase Overview tab

Information that is displayed on the MetricBase **Overview** tab of the Service Details page in the SOW.

Contextual information section

The Recent changes table shows changes made to the system that might have an impact on the service. This data comes from the related configuration items in the CMDB.

Status indicators section

The Status indicators section displays charts for related CIs that might be affecting the service.

Chart name	Description	Data source
SLO Error Budget	Information about your current error budget for this service, as configured in Service Reliability Management (SRM).	CMDB

Chart name	Description	Data source
	For more information on error budgets, see Create SLOs, SLIs, and error budget policies.	
Systems impacted	Services or service offerings that have a relationship to the selected service.	CMDB
Open incidents last 30 days	Day-by-day occurrence of open incidents affecting this service over the last month.	CMDB
Open alerts last 30 days	Day-by-day occurrence of alerts affecting this service over the last month.	CMDB
Current open incidents	Listing of active incidents that affect this service.	CMDB
Current open alerts	Listing of active alerts that affect this service.	CMDB

MetricBase Observability tab for Service Observability

Dashboard and charts on the MetricBase Observability tab of the Service Details page in the SOW.

Compute dashboard

This dashboard displays metrics for hosts related to the service.

Host

Chart	Description	Data source
All Active VM Instances	Information for all virtual servers the service is actively using. Select a host link to view more detailed information.	CMDB

Database dashboards

These dashboards display metrics for databases related to the service.

MySQL

Chart	Description	Data source
All MySQL Instances	Information for all databases the service is actively using. Select a database link to view more detailed information.	CMDB

PostgreSQL

Chart	Description	Data source
All PostgreSQL Instances	Information of all databases the service is actively using. Select a database link to view more detailed information.	CMDB

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Networking dashboards

These dashboards display metrics for network devices related to the service.

Other Networking Devices

Chart	Description	Data source
All Router Instances	Information of all routers the service is actively using. Select a router link to view more detailed information.	CMDB
All Switch Instances	Information of all switches the service is actively using. Select a switch link to view more detailed information.	CMDB

New Relic templates for Service Observability

Templates used to create New Relic dashboards in Service Observability. You can edit these templates as needed.

See Customize Service Observability dashboard templates for more information.

New Relic Overview tab for Service Observability

Information that is displayed on the New Relic **Overview** tab of the Service Details page in the SOW.

KPIs section

The KPIs section displays basic performance metrics for the service.

Note: If the dashboards have been customized, they might not reflect the information shown on this page.

Chart name	Description	Data source
Rate	Aggregate rate of transactions through the service.	New Relic
Error %	Percent of transactions that have an error.	New Relic
Latency	Aggregate duration of transactions through the service, in milliseconds.	New Relic

Transactions charts

The Transactions charts show metrics for specific key transactions on the service. The key transactions are determined by your observability system configuration.

Chart name	Description	Data source
Rate	Each line represents the throughput of a key transaction through the service. Hover over a point to view the different transaction names.	New Relic
Error %	Each line represents the percentage of errors on a key transaction in the service. Hover over a point to view the different transaction names.	New Relic

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Chart name	Description	Data source
Latency	Each line represents the response time for a key transaction on the service. Hover over a point to view the different transaction names.	New Relic

Contextual information section

The Recent changes table shows changes made to the system that might have an impact on the service. This data comes from the related configuration items in the CMDB.

Status indicators section

The Status indicators section displays charts for related CIs that might be affecting the service.

Chart name	Description	Data source
SLO Error Budget	Information about your current error budget for this service, as configured in Service Reliability Management (SRM). For more information on error budgets, see Create SLOs, SLIs, and error budget policies.	CMDB
Systems impacted	Services or service offerings that have a relationship to the selected service.	CMDB
Open incidents last 30 days	Day-by-day occurrence of open incidents affecting this service over the last month.	CMDB
Open alerts last 30 days	Day-by-day occurrence of alerts affecting this service over the last month.	CMDB
Current open incidents	Listing of active incidents that affect this service.	CMDB
Current open alerts	Listing of active alerts that affect this service.	CMDB

New Relic Observability tab for Service Observability

Dashboard and charts on the New Relic Observability tab of the Service Details page in the SOW.

Application dashboard

This dashboard displays performance metrics for the selected service.

Note: If the dashboards have been customized, they might not reflect the information shown on this page.

Service basic metrics

Chart	Description	Data source
Rate	Aggregate rate of transactions through the service, per minute.	New Relic

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service basic metrics (continued)

Chart	Description	Data source
Error %	Percent of transactions that have an error.	New Relic
Latency	Aggregate duration of transactions through the service, in milliseconds.	New Relic
Time spent in database calls	Duration of requests to databases, in milliseconds.	New Relic
Database throughput	Rate of database requests for this service, per minute.	New Relic
Time spent in database queries	Time spent querying the database, in milliseconds.	New Relic

Service transactions

Chart	Description	Data source
Rate	Each line represents the throughput of a key transaction through the service. Hover over a point to view the different transaction names.	New Relic
Error %	Each line represents the percentage of errors on a key transaction in the service. Hover over a point to view the different transaction names.	New Relic
Latency	Each line represents the response time for a key transaction on the service. Hover over a point to view the different transaction names.	New Relic

Compute dashboard

This dashboard displays metrics for hosts related to the service.

Host

Chart	Description	Data source
CPU utilization	Percent of the host processing power being consumed.	New Relic
Memory utilization	Percent of memory the host is using.	New Relic

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Host (continued)

Chart	Description	Data source
Disk utilization	Percent of disk space being used.	New Relic
All Active Servers	Information for all servers the service is actively using. Select a host link to view more detailed information.	CMDB

Database dashboards

These dashboards display metrics for databases related to the service.

MySQL

Chart	Description	Data source
CPU utilization	Percent of the database's processing power being consumed.	New Relic
Memory utilization	Percent of memory the database is using.	New Relic
Availability	Percent of time the database is available.	New Relic
Connections	Number of connections to the database.	New Relic
Slow queries	Number of database queries that have been categorized as slow by New Relic.	New Relic
All MySQL Instances	Information for all databases the service is actively using. Select a database link to view more detailed information.	CMDB

PostgreSQL

Chart	Description	Data source
Scheduled Checkpoints	Average number of scheduled checkpoints that were performed.	New Relic
Buffers Written for Checkpoint	Average number of buffers written during checkpoints.	New Relic
Buffers Written by Background Writer	Average number of buffers written by the background writer.	New Relic
Buffers Allocated	Average number of buffers allocated.	New Relic
Checkpoint Write Time	Time in milliseconds spent writing files to disk.	New Relic
All PostgreSQL Instances	Information of all databases the service is actively using. Select a database link to view more detailed information.	CMDB

Prometheus templates for Service Observability

Templates used to create Prometheus dashboards in Service Observability. You can edit these templates as needed.

See Customize Service Observability dashboard templates for more information.

Prometheus Overview tab for Service Observability

Information that is displayed on the Prometheus **Overview** tab of the Service Details page in the SOW.

KPIs section

The KPIs section displays basic performance metrics for the service.

Note: If the dashboards have been customized, they might not reflect the information shown on this page.

Chart name	Description	Data source
Request Rate	Aggregate rate of transactions through the service, per second.	Prometheus
Error %	Percent of transactions that have an error.	Prometheus
Average Response Time	Average duration of transactions through the service, in seconds.	Prometheus

Contextual information section

The Recent changes table shows changes made to the system that might have an impact on the service. This data comes from the related configuration items in the CMDB.

Status indicators section

The Status indicators section displays charts for related CIs that might be affecting the service.

Chart name	Description	Data source
SLO Error Budget	Information about your current error budget for this service, as configured in Service Reliability Management (SRM). For more information on error budgets, see Create SLOs, SLIs, and error budget policies.	CMDB
Systems impacted	Services or service offerings that have a relationship to the selected service.	CMDB
Open incidents last 30 days	Day-by-day occurrence of open incidents affecting this service over the last month.	CMDB
Open alerts last 30 days	Day-by-day occurrence of alerts affecting this service over the last month.	CMDB
Current open incidents	Listing of active incidents that affect this service.	CMDB
All Active alerts	Listing of active alerts that affect this service.	CMDB

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Prometheus Observability tab for Service Observability

Dashboard and charts on the Prometheus Observability tab of the Service Details page in the SOW.

Application dashboard

This dashboard displays performance metrics for the selected service.

Note: If the dashboards have been customized, they might not reflect the information shown on this page.

Service KPIs

Chart	Description	Data source
Request Rate	Aggregate rate of transactions through the service, per second.	Prometheus
Error %	Percent of transactions that have an error.	Prometheus
Average Response Time	Aggregate duration of transactions through the service, in seconds.	Prometheus
Throughput	Count of successful transactions, per second.	Prometheus
Active Requests	Count of current in-flight requests to the service.	Prometheus
Response Time (95th Percentile)	95th percentile response time for HTTP requests, in seconds.	Prometheus
Average Request Size	Average size of requests to the service, in bytes.	Prometheus
Average Response Size	Average size of responses from the service, in bytes.	Prometheus

Compute dashboard

This dashboard displays metrics for hosts related to the service.

Host

Chart	Description	Data source
CPU utilization	Percent of the host processing power being consumed.	Prometheus
Memory utilization	Percent of memory the host is using.	Prometheus
Disk utilization	Percent of the host disk being used.	Prometheus

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Host (continued)

Chart	Description	Data source
All Active Servers	Information for all servers the service is actively using. Select a host link to view more detailed information.	CMDB
All Active VM Instances	Information for all virtual machines the service is actively using. Select a host link to view more detailed information.	CMDB

Database dashboards

These dashboards display metrics for databases related to the service.

MySQL

Chart	Description	Data source
Thread Utilization %	Percent of the database's threads being consumed.	Prometheus
Queries Per Second	Number of queries made to the database by the service, per second.	Prometheus
InnoDB Memory %	Percent of InnoDB buffer pool being consumed.	Prometheus
Active Connections	Number of connections to the database.	Prometheus
Aborted Connections	Rate of aborted connections.	Prometheus
Uptime	Average number of hours the database has been available.	Prometheus
Inbound Network Traffic	Number of bytes per second of inbound traffic to the database.	Prometheus
Outbound Network Traffic	Number of bytes per second of outbound traffic to the database.	Prometheus
Slow Queries	Rate of slow queries detected by MySQL, per second.	Prometheus
All MySQL Instances	Information for all databases the service is actively using. Select a database link to view more detailed information.	CMDB

PostgreSQL

Chart	Description	Data source
Active Sessions	Count of sessions currently active.	Prometheus
Idle Sessions	Count of idle sessions.	Prometheus
Committed Transactions	Total committed transactions since server start.	Prometheus
Failed Transactions	Total rolled back transactions since server start.	Prometheus

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

PostgreSQL (continued)

Chart	Description	Data source
Deadlocks	Total deadlocks detected since server start.	Prometheus
Locks Count	Current count of locks given out by the database.	Prometheus
Cache Hit Ratio	Percentage of database requests that can be served by the cache.	Prometheus
All PostgreSQL Instances	Information of all databases the service is actively using. Select a database link to view more detailed information.	CMDB

SolarWinds templates for Service Observability

Templates used to create SolarWinds dashboards in Service Observability. You can edit these templates as needed.

See Customize Service Observability dashboard templates for more information.

SolarWinds Overview tab for Service Observability

Information that is displayed on the SolarWinds **Overview** tab of the Service Details page in the SOW.

KPIs section

The KPIs section displays basic performance metrics for the service.

Note: If the dashboards have been customized, they might not reflect the information shown on this page.

Chart name	Description	Data source
Rate	Aggregate rate of transactions through the service.	SolarWinds
Error %	Percent of transactions that have an error.	SolarWinds
Latency	Aggregate duration of transactions through the service, in milliseconds.	SolarWinds

Transactions charts

The Transactions charts show metrics for specific key transactions on the service. The key transactions are determined by your observability system configuration.

Chart name	Description	Data source
Rate	Each line represents the throughput of a key transaction through the service. Hover over a point to view the different transaction names.	SolarWinds
Error %	Each line represents the percentage of errors on a key transaction in the service. Hover over a point to view the different transaction names.	SolarWinds
Latency	Each line represents the response time for a key transaction on the service. Hover over a point to view the different transaction names.	SolarWinds

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Contextual information section

The Recent changes table shows changes made to the system that might have an impact on the service. This data comes from the related configuration items in the CMDB.

Status indicators section

The Status indicators section displays charts for related CIs that might be affecting the service.

Chart name	Description	Data source
SLO Error Budget	Information about your current error budget for this service, as configured in Service Reliability Management (SRM). For more information on error budgets, see Create SLOs, SLIs, and error budget policies.	CMDB
Systems impacted	Services or service offerings that have a relationship to the selected service.	CMDB
Open incidents last 30 days	Day-by-day occurrence of open incidents affecting this service over the last month.	CMDB
Open alerts last 30 days	Day-by-day occurrence of alerts affecting this service over the last month.	CMDB
Current open incidents	Listing of active incidents that affect this service.	CMDB
Current open alerts	Listing of active alerts that affect this service.	CMDB

SolarWinds Observability tab for Service Observability

Dashboard and charts on the SolarWinds Observability tab of the Service Details page in the SOW.

Note: The X axis on SolarWinds charts use Universal Time Code (UTC) instead of the user's timezone.

Application dashboard

This dashboard displays performance metrics for the selected service.

Note: If the dashboards have been customized, they might not reflect the information shown on this page.

Service basic metrics

Chart	Description	Data source
Rate	Aggregate rate of transactions through the service, per minute.	SolarWinds
Latency	Aggregate duration of transactions through the service, in milliseconds.	SolarWinds

© 2026 ServiceNow, Inc. All rights reserved.

Service basic metrics (continued)

Chart	Description	Data source
Time spent in database calls	Duration of requests to databases, in milliseconds.	SolarWinds
Time spent in database queries	Time spent querying the database, in milliseconds.	SolarWinds
Database throughput	Rate of database requests for this service per minute.	SolarWinds

Compute dashboard

This dashboard displays metrics for hosts related to the service.

Host

Chart	Description	Data source
CPU utilization	Percent of the host processing power being consumed.	SolarWinds
Memory utilization	Percent of memory the host is using.	SolarWinds
Disk utilization	Percent of disk space being used.	SolarWinds
All Active Servers	Information for all hosts the service is actively using. Select a host link to view more detailed information.	CMDB
All Active VM Instances	Information for all virtual machine instances the service is actively using. Select a VM link to view more detailed information.	CMDB

Database dashboards

Database metrics are currently not supported for SolarWinds.

Networking dashboards

These dashboards display metrics for network devices related to the service.

By default, the Firewall dashboard displays Palo Alto metrics and the Load Balancer dashboard displays F5 Big-IP metrics.

Firewall

Chart	Description	Data source
CPU Utilization	Percentage of CPU utilization on the firewall device.	SolarWinds
Session Utilization	Percentage of session capacity currently in use.	SolarWinds
Drop Rate	Percentage of network packets/connections that the device has intentionally blocked or failed to process.	SolarWinds

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Firewall (continued)

Chart	Description	Data source
Availability	Percentage of time the firewall is available.	SolarWinds
Recent Changes	Table displaying recent configuration changes made to the firewall device.	CMDB
Current Open Incidents	Table listing active incidents affecting the firewall device.	CMDB
All Active Alerts	Table listing all active alerts related to the firewall device.	CMDB

Load Balancer

Chart	Description	Data source
Connection Utilization	Percentage of available connections currently in use.	SolarWinds
Inbound Rate	Rate of bytes per second received from the configured nodes.	SolarWinds
Outbound Rate	Rate of bytes per second sent to the configured nodes.	SolarWinds
Pool Member Status	Pool Availability Status: • 0: None (no status available) • 1: Available, all members healthy • 2: Degraded, some members down • 3: Unavailable, all members down • 4: Unknown, status cannot be determined	SolarWinds
Error	Percentage of inbound errors on the load balancer.	SolarWinds
Latency	Aggregate duration of transactions through the load balancer, in milliseconds.	SolarWinds

Interface

Chart	Description	Data source
Error	Percentage of inbound errors on the interface.	SolarWinds
Traffic	Rate in bytes per second of traffic through the interface.	SolarWinds
Bandwidth Utilization	Percentage of available bandwidth.	SolarWinds

Other Networking Devices

Chart	Description	Data source
CPU Utilization	Percentage of CPU utilization on the networking device.	SolarWinds
Packet Loss	Percentage of packets dropped.	SolarWinds
Error	Percentage of errors on the networking device.	SolarWinds

Splunk Observability templates for Service Observability

Templates used to create Splunk Observability dashboards in Service Observability. You can edit these templates as needed.

See Customize Service Observability dashboard templates for more information.

Splunk Observability Overview tab for Service Observability

Information that is displayed on the Splunk **Overview** tab of the Service Details page in the SOW.

KPIs section

The KPIs section displays basic performance metrics for the service.

Note: If the dashboards have been customized, they might not reflect the information shown on this page.

Chart name	Description	Data source
Rate	Aggregate rate of transactions through the service.	Splunk
Error %	Percent of transactions that have an error.	Splunk
Latency	Aggregate duration of transactions through the service, in milliseconds.	Splunk

Key Transactions charts

The Key Transactions charts show metrics for specific key transactions on the service. The key transactions are determined by your observability system configuration.

Chart name	Description	Data source
Rate	Each line represents the throughput of a key transaction through the service. Hover over a point to view the different transaction names.	Splunk
Error %	Each line represents the percentage of errors on a key transaction in the service. Hover over a point to view the different transaction names.	Splunk
Latency	Each line represents the response time for a key transaction on the service. Hover over a point to view the different transaction names.	Splunk

Contextual information section

The Recent changes table shows changes made to the system that might have an impact on the service. This data comes from the related configuration items in the CMDB.

Status indicators section

The Status indicators section displays charts for related CIs that might be affecting the service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Chart name	Description	Data source
SLO Error Budget	Information about your current error budget for this service, as configured in Service Reliability Management (SRM). For more information on error budgets, see Create SLOs, SLIs, and error budget policies.	CMDB
Systems impacted	Services or service offerings that have a relationship to the selected service.	CMDB
Open incidents last 30 days	Day-by-day occurrence of open incidents affecting this service over the last month.	CMDB
Open alerts last 30 days	Day-by-day occurrence of alerts affecting this service over the last month.	CMDB
Current open incidents	Listing of active incidents that affect this service.	CMDB
All Active alerts	Listing of active alerts that affect this service.	CMDB

Splunk Observability tab for Service Observability

Dashboard and charts on the Splunk Observability tab of the Service Details page in the SOW.

Application dashboard

This dashboard displays performance metrics for the selected service.

Note: If the dashboards have been customized, they might not reflect the information shown on this page.

Service KPIs

Chart	Description	Data source
Rate	Aggregate rate of transactions through the service, per minute.	Splunk
Error %	Percent of transactions that have an error.	Splunk
Latency	Aggregate duration of transactions through the service, in milliseconds.	Splunk

Service top transactions

Chart	Description	Data source
Rate	Each line represents the throughput of a key transaction through the service. Hover over a point to view the different transaction names.	Splunk

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service top transactions (continued)

Chart	Description	Data source
Error %	Each line represents the percentage of errors on a key transaction in the service. Hover over a point to view the different transaction names.	Splunk
Latency	Each line represents the response time for a key transaction on the service. Hover over a point to view the different transaction names.	Splunk

Compute dashboard

This dashboard displays metrics for hosts related to the service.

Host

Chart	Description	Data source
CPU utilization	Percentage of CPU currently being consumed by the service.	Splunk
Memory utilization	Percentage of memory currently being consumed by the service.	Splunk
Disk utilization	Percentage of disk space currently being consumed by the service.	Splunk
All Active Servers	Information for all hosts the service is actively using. Select a host link to view more detailed information.	CMDB
All Active VM Instances	Information for all VM instances the service is actively using. Select a host link to view more detailed information.	CMDB

Database Dashboards

These dashboards display metrics for databases related to the service.

MySQL

Chart	Description	Data source
Queries Per Second	Number of queries per second the service is sending to the database.	Splunk
Row Locks Rate	Frequency at which row locks are encountered by transactions from this service.	Splunk
Buffer Pool Usage	Usage of the buffer pool to access cached data by this service.	Splunk
Table I/O Wait Time	Time in milliseconds that the database is waiting on Input/Output operations on tables sent by this service to complete.	Splunk

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MySQL (continued)

Chart	Description	Data source
Threads	Number of threads used by this service	Splunk
Uptime	Amount of time in (?) that the database has been running since its last restart.	CMDB

Zabbix templates

Templates used to create Zabbix dashboards in Service Observability. You can edit these templates as needed.

See Customize Service Observability dashboard templates for more information.

Zabbix Overview tab for Service Observability

Information that is displayed on the Zabbix **Overview** tab of the Service Details page in the SOW.

KPIs section

The KPIs section displays basic performance metrics for the service.

Note: If the dashboards have been customized, they might not reflect the information shown on this page.

Chart name	Description	Data source
CPU Usage (System)	Displays the system CPU usage percentage over time.	Zabbix
CPU Load	Shows the CPU load average for the system.	Zabbix
Running Processes	Number of processes currently running on the system.	Zabbix
Available Memory (%)	Percentage of memory currently available on the system.	Zabbix

Contextual information section

The Recent changes table shows changes made to the system that might have an impact on the service. This data comes from the related configuration items in the CMDB.

Status indicators section

The Status indicators section displays charts for related CIs that might be affecting the service.

Chart name	Description	Data source
SLO Error Budget	Information about your current error budget for this service, as configured in Service Reliability Management (SRM). For more information on error budgets, see Create SLOs, SLIs, and error budget policies.	CMDB
Systems impacted	Services or service offerings that have a relationship to the selected service.	CMDB

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Chart name	Description	Data source
Open incidents last 30 days	Day-by-day occurrence of open incidents affecting this service over the last month.	CMDB
Open alerts last 30 days	Day-by-day occurrence of alerts affecting this service over the last month.	CMDB
Current open incidents	Listing of active incidents that affect this service.	CMDB
Current open alerts	Listing of active alerts that affect this service.	CMDB

Zabbix Observability template for Service Observability

Dashboard and charts on the Zabbix Observability tab of the Service Details page in the SOW.

Application dashboard

This dashboard displays performance metrics for the selected service.

Note: If the dashboards have been customized, they might not reflect the information shown on this page.

Service

Chart	Description	Data source
CPU Usage (System)	CPU usage percentage over time.	Zabbix
CPU Load	CPU load for the system: rolling one minute average.	Zabbix
Running Processes	Number of processes currently running on the system.	Zabbix
Available Memory (%)	Percentage of memory currently available on the system.	Zabbix

Compute dashboard

This dashboard displays metrics for hosts related to the service.

Host

Chart	Description	Data source
CPU Load	CPU load average for the host on a rolling one minute average.	Zabbix
CPU Idle Time	Percentage of time the CPU is idle.	Zabbix
Memory Available	Percentage of available memory on the host.	Zabbix

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Host (continued)

Chart	Description	Data source
Running Processes	Number of processes currently running on the host.	Zabbix
Network RX	Network data received in bytes per second.	Zabbix
Network TX	Network data transmitted in bytes per second.	Zabbix
All Active Servers	Information for all active server instances with their operating system, CPU count, RAM, disk space, and support group information.	CMDB
All Active VM Instances	Information for all virtual machine instances the service is actively using. Select a VM link to view more detailed information.	CMDB

Database dashboards

These dashboards display metrics for databases related to the service.

MySQL

Chart	Description	Data source
Active Connections	Number of active database connections.	Zabbix
Queries Per Second	Rate of database queries executed per second.	Zabbix
Rows Deleted By Queries Per Second	Number of rows deleted by queries per second.	Zabbix
Rows Returned By Queries Per Second	Number of rows returned by queries per second.	Zabbix
Rows Inserted By Queries Per Second	Number of rows inserted by queries per second.	Zabbix
Rows Updated By Queries Per Second	Number of rows updated by queries per second.	Zabbix
All MySQL Instances	Table listing all MySQL database instances with their operational status, class, and support group information.	CMDB

PostgreSQL

Chart	Description	Data source
Number of Connections	Total number of active database connections.	Zabbix
Number of Waiting Connections	Number of database connections currently waiting.	Zabbix
Connected Backends	Number of connected backend processes.	Zabbix

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

PostgreSQL (continued)

Chart	Description	Data source
Rows Returned By Queries Per Second	Number of rows returned by queries per second.	Zabbix
Rows Inserted By Queries Per Second	Number of rows inserted by queries per second.	Zabbix
Rows Deleted By Queries Per Second	Number of rows deleted by queries per second.	Zabbix
All Postgresql Instances	Table listing all PostgreSQL database instances with their operational status, discovery source, category, subcategory, and support group information.	CMDB

Networking dashboards

These dashboards display metrics for network devices related to the service.

By default, the Firewall dashboard displays Palo Alto metrics and the Load Balancer dashboard displays F5 Big-IP metrics.

Firewall

Chart	Description	Data source
CPU Utilization	Percentage of CPU utilization on the firewall device.	Zabbix
Session Utilization	Percentage of session capacity currently in use.	Zabbix
Memory Utilization	Percentage of memory utilization on the firewall device.	Zabbix
Availability	Uptime and availability status of the firewall device: • 0: Unavailable • 1: Available	Zabbix
Recent Changes	Table displaying recent configuration changes made to the firewall device.	CMDB
Current Open Incidents	Table listing active incidents affecting the firewall device.	CMDB
All Active Alerts	Table listing all active alerts related to the firewall device.	CMDB

Load Balancer

Chart	Description	Data source
Current Connections (To Node)	Number of current connections from server-side to the configured nodes.	Zabbix

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Load Balancer (continued)

Chart	Description	Data source
Requests TX	Rate of bytes per second sent to server-side from the configured nodes.	Zabbix
Requests RX	Rate of bytes per second received server-side from the configured nodes.	Zabbix
Pool Availability State	Pool Availability Status: • 0: None (no status available) • 1: Available, all members healthy • 2: Degraded, some members down • 3: Unavailable, all members down • 4: Unknown, status cannot be determined	Zabbix
Packets TX	Number of packets transmitted per second from the server-side to the configured nodes.	Zabbix
Packets RX	Number of packets received per second by the server-side from the configured nodes.	Zabbix
Inbound Error %	Percentage of inbound errors on the load balancer.	Zabbix
Outbound Error %	Percentage of outbound errors on the load balancer.	Zabbix

Other Networking Devices

Chart	Description	Data source
CPU Utilization	Percentage of CPU utilization on the networking device.	Zabbix
Availability	Uptime and availability status of the networking device: • 0: Unavailable • 1: Available	Zabbix
Inbound Error %	Percentage of inbound errors on the networking device.	Zabbix
Outbound Error %	Percentage of outbound errors on the networking device.	Zabbix
Inbound Traffic	Amount of inbound network traffic in bytes per second.	Zabbix
Outbound Traffic	Amount of outbound network traffic in bytes per second.	Zabbix

Service Observability data mapping form

Field descriptions for the Observability data mapping form. Use this form to map activated services in Service Observability to metrics from your observability instance. Each service can be mapped only once, but can contain exceptions to include all related entities.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Mapping name	Name for the mapping. The name should be descriptive so that users understand where the data is coming from.
Services	Service to use for this mapping. Each service can be mapped only once.
Default	
Find metrics from this source	Existing data connection to use for metrics. To add a connection, see Connect a Service Observability data source.
where source tag key	Tag key that you want to map to the activated service. If you use more than one tag to represent a service, you can create an exception. For example, most tags use `service_name` except for database metrics, which use `service`.
source tag value	Value that represents the service name. Values can be strings or a variable that represents fields on the CI for the service. You can use variables on your observability data as the value to map multiple entities at once. For example, if your observability data uses the `$service_name` variable and you enter that as the **source tag value**, all services using that value are mapped.
Exceptions	
For entity type	Entity that uses a different key or value than the default.
Find metrics from this source	Existing data connection to use for metrics. To add a connection, see Connect a Service Observability data source.
where source tag key	Tag key that you want to map to the activated service for this entity.
source tag value	Value that represents the service name. Values can be strings or a variable that represents fields on the CI for the service.

Chart error states

Understand the different error states that the charts in Service Observability might display and how to fix them.

Error message	Fix
Set up this service's observability data mapping	Observability mapping hasn't been configured for the service by an admin. See Create and manage data mappings.
Data mapping is not configured	Observability mapping hasn't been configured for the service by an admin. See Create and manage data mappings.
Authentication failed	Service Observability can't connect to the data source. See Connect a Service Observability data source.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Error message	Fix
No results found	No metrics were found for the chart.
Something went wrong	Connection to the data source was successful, but the observability instance didn't respond. This error might be due to a connection timeout on the observability vendor side.
No impacted systems found (Impacted systems chart on the Overview page)	Only services found on your service map can be displayed. Update your service map to include all services that should be included in the chart. See Service Mapping.
Set up objectives (SLO Error Budget chart on the Overview page)	SLOs haven't been configured for Service Reliability Management. See Create SLOs, SLIs, and error budget policies.

Service Reliability Management

Service Reliability Management (SRM) helps your organization respond, collaborate, track, and self-remediate when working on alerts and incidents. SRM is available when you have both ITSM Standard and ITOM Operator Professional subscriptions.

Overview of Service Reliability Management

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Get started

Explore Learn about SRM concepts and features.	Configure Install and configure SRM.
Use Work with services, teams, and reliability tasks in SRM.	Reference Get details about SRM components, such as fields, tables, and properties.

Install from the Store

Install SRM from the ServiceNow Store. Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Note: When installing from the store, first confirm that you have all the dependencies needed by selecting the Dependencies tab. For more information, see Install Service Reliability Management.

Troubleshoot and get help

- Visit our community
- Search the Known Error Portal for known error articles
- Contact Customer Service and Support

Exploring Service Reliability Management

Service Reliability Management (SRM) provides a self-serve, guided experience for teams to manage service health. The experience is built using the Service Operations Workspace application and combines ITOM and ITSM capabilities into a single workflow.

SRM overview

Optimize service health with site reliability engineering (SRE) practices. SRM is a single operations workspace that empowers teams to improve the reliability of digital services with SRE.

- Use on-call escalations to respond to issues in a timely manner.
- Reduce setup friction with guided self-service to onboard distributed teams with separated data, empowered access, and minimal governance from central IT.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When SRM is installed, several plugins and applications are also activated. For more information, see Plugins or applications installed with ITOM AIOps.

SRM users

Users

Users	Description	Contains Roles
admin	ServiceNow administrators manage, configure, and maintain the ServiceNow platform. In SRM, they can access and work in the Service Operations Workspace Admin Center. Only administrators can do the following: • Install SRM. • Add and manage SRM administrators. • Create and manage integration users.	All
SRM administrator [srm_admin] **Note:** This role differs from the ServiceNow admin role.	SRM administrators can manage account settings, configurations, and users. Administrators can perform the following actions: • Access, create, edit, or delete all SRM configurations. • Add or manage integrations. • Create integrations with Application Performance Monitoring (APM) tools. • Set up and maintain reliability metrics. • Set up and maintain error budget policies.	• Manager • Responder
SRM manager [srm_manager]	Managers oversee a team of SREs. Managers assign SREs to the team on-call schedule, monitor their performance, and create procedures to handle incidents and develop solutions. Managers promote resilience across all the systems and the DevOps workflows. Managers can perform the following actions within the context of their teams:	Responder

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

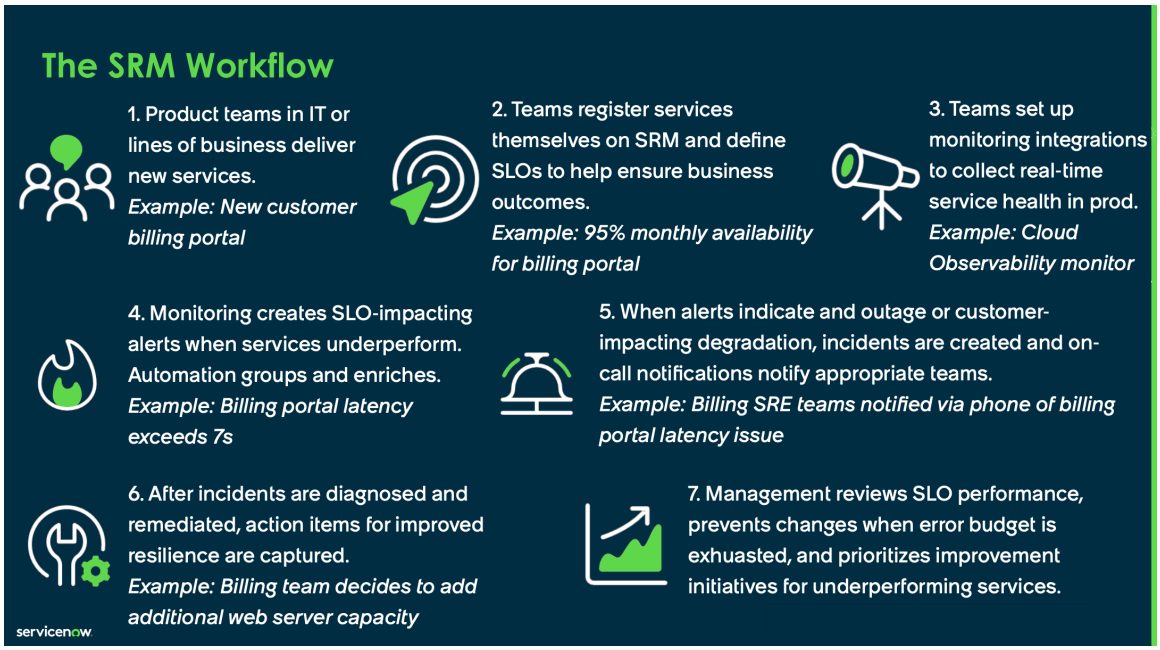
Users (continued)

Users	Description	Contains Roles
	• Define and set up teams, on-call schedules, and services. • Add and delete users such as responders and managers for the teams they're a part of. • Add or manage integrations. • Create Integrations with Application Performance Monitoring (APM) tools. • Set up and maintain reliability metrics. • Set up and maintain error budget policies.	
SRM responder [srm_responder]	A Service Reliability Engineer (SRE) that uses SRM to perform everyday tasks. Responders are the individuals who are on call and diagnose and remediate incidents. Responders can only access configurations that they're a part of. They can only access the alerts or incidents for which they have permissions. SREs can perform the following actions, within the context of their teams: • Set up services, teams, and integrations. • Confirm their on-call schedules. • Manage incident and alert records. • Update teams that they've created. • Add other responders. • Create integrations with Application Performance Monitoring (APM) tools. • Set up and maintain reliability metrics. • Set up and maintain error budget actions.	Inherits 17 roles including the following: • cmdb_read • sn_sow.sow_user • sn_sow_srm.srm_responder • workspace_user • slo_operator

For more information, see SRM roles and responsibilities.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SRM workflow



1. Product teams in IT or Lines of Business continuously deliver new service instances and technology management services. Example: New customer billing portal.
2. Along with SLO Management, teams can register services and define service level objectives (SLOs), helping them reach business outcomes. Example: 95% monthly availability for the billing portal.
3. Monitoring integrations are set up by the teams to collect the real-time health of these services. Example: Cloud Observability.
4. Monitoring creates service level indicators (SLIs) impacting alerts when services are underperforming. Automation groups and enriches. Example: Billing portal latency is exceeding 7 s.
5. When the alerts indicate an outage or customer-impacting degradation, incidents are created and on-call notifications notify appropriate team resources. Example: A Billing SRE team is notified via phone of a latency issue on the billing portal.
6. After teams collaboratively diagnose and remediate incidents, they identify action items for improving the system's resilience. Example: The Billing team decides to add additional web server capacity.
7. Management continually reviews SLO performance, helps to prevent changes when the error budget is exhausted, and prioritizes improvement initiatives for underperforming services.

SRM benefits

Benefit	Feature	Users
Team-based experience	Working with SRM teams	SRM administrators, managers, and responders
Service registration	Working with SRM services	SRM administrators, managers, and responders

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Benefit	Feature	Users
Prebuilt integrations	Working with integrations in SRM	SRM administrators, managers, and responders
Measure service health	Reliability metrics in SLO Management	SRM administrators, managers, and responders
On-call coverage	Create an SRM on-call schedule	SRM administrators, managers, and responders
Remediate high severity alerts and incidents	Working with SRM reliability tasks	SRM administrators, managers, and responders

What to explore next

To learn more about configuring and using SRM, see:

- Configuring Service Reliability Management
- Using Service Reliability Management
- Service Reliability Management reference

Get started with Service Reliability Management

Service Reliability Management (SRM) accelerates your path to viewing service health in the context of service level objectives and incident resolution. Helps IT Operations and DevOps teams deliver on the promise of agility, performance, and uptime.

Get started with SRM to understand the different sections in the SRM interface.

For more information on roles, see SRM roles and responsibilities.

Basic SRM tasks

Step	Description	Reference
Set up teams and services	Setup guides for the Home, Services, and Teams pages show how to add a team or service to SRM.	Add an SRM team
Visit and learn about your Home page	The Home page is where you find the things most important to you. For example, the services with critical alerts and incidents and work assigned to you and your team.	SRM Home page
Learn how to navigate SRM	Get familiar with the different sections and elements of the SRM interface. The sections and elements are used throughout the documentation.	SRM interface

SRM helps you when you must create and administer teams, services, and integrations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SRM tasks

Step	Description	See this
Manage a service instance or technology management service in SRM	Define the basic tasks and parameters that make up your service and how it should behave.	Add a service to SRM
Set up an SRM team	Set up a team. Teams are responsible for the issues that occur in their associated services.	Add an SRM team
Set up on-call schedules and escalation policies	Create an on-call schedule for your team to make sure they're available to resolve issues. You can set up an escalation policy to make sure at least one team member is engaged in incident response.	Create an SRM on-call schedule
Configure service relationships	Use a map canvas to add, configure, and arrange services. You can add child services that depend on parent services.	View impact of child service on parent service
Integrate services with third-party monitoring tools	Set up a third-party integration, such as Datadog or ServiceNow Cloud Observability, with SRM so that alerts are available to your teams within SRM.	Working with integrations in SRM
Establish SLOs, SLIs & error budgets for services	Establish goals for how well your service should operate. Also, specify the maximum amount of time that a technical system can fail without contractual consequences.	Service Level Objective Management
Set up alert automations **Note:** This functionality is only available if you have installed the Alert automations application.	Alert automations enable you to define alert conditions. Set up alert rules for each APM tool to define the conditions when the APM tool should send notifications to SRM.	The Alert automation application is available from the ServiceNow Store.

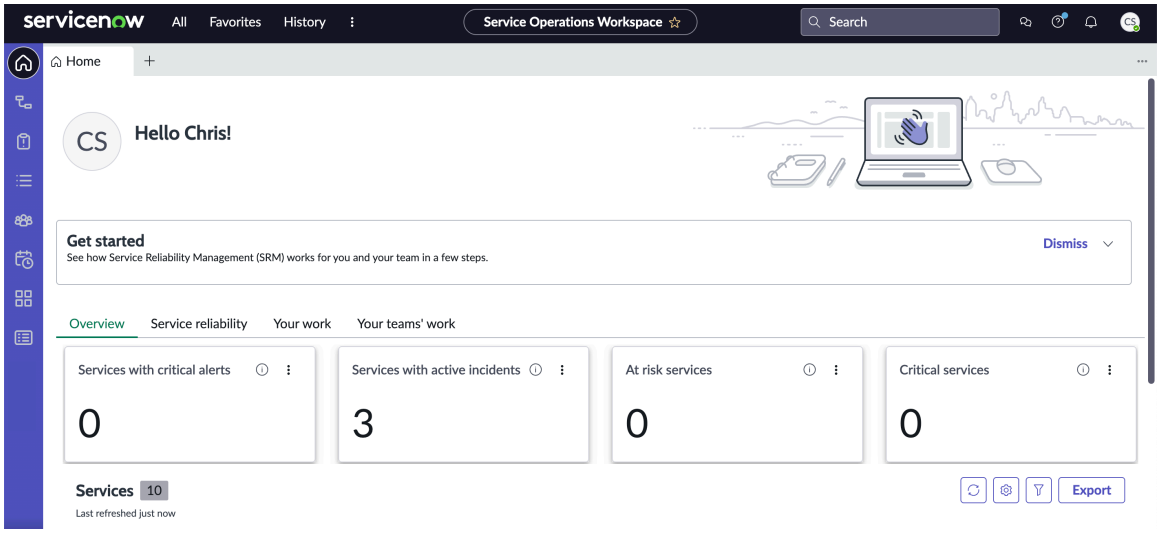
SRM Home page

The Service Reliability Management (SRM) Home page provides relevant information about your work, services, schedules, maintenance reminders, and teams. View the Home page by navigating to **Service Reliability Management**.

Service Reliability Management Home page sections

In the workspace, select **Home** ( ) to view the Home page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



When you're on-call, your schedule is listed.

Home page sections

Get started	Contains setup tasks and their progress for teams and services. For more information on completing setup, see Add a service to SRM and Edit service details in SRM. **Note:** You can skip any section and come back to it later. Progress is marked in percentages by the actions that you take. As long as a step remains incomplete, the tiles are available. You can minimize them, at any point, by selecting the Up icon . Use **Dismiss** to remove it from your page. The checklist states are as follows: • **None**: No action has been taken. • **Done**: All required fields have been added. • **Pending**: Some fields or approvals still must be added or granted.
Overview	Contains an overview of all service alerts, incidents, and at-risk and critical services. **Services with critical alerts** are the default list view. Select a card to see the list view for that area.
Service reliability	Displays a dashboard for monitoring and managing service performance. The dashboard offers multiple visualizations to help you track error budgets, monitor service level objectives, and identify issues across services.
Your work	Contains incidents and alerts assigned to you. Select a card to see the list view for that area.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Home page sections (continued)

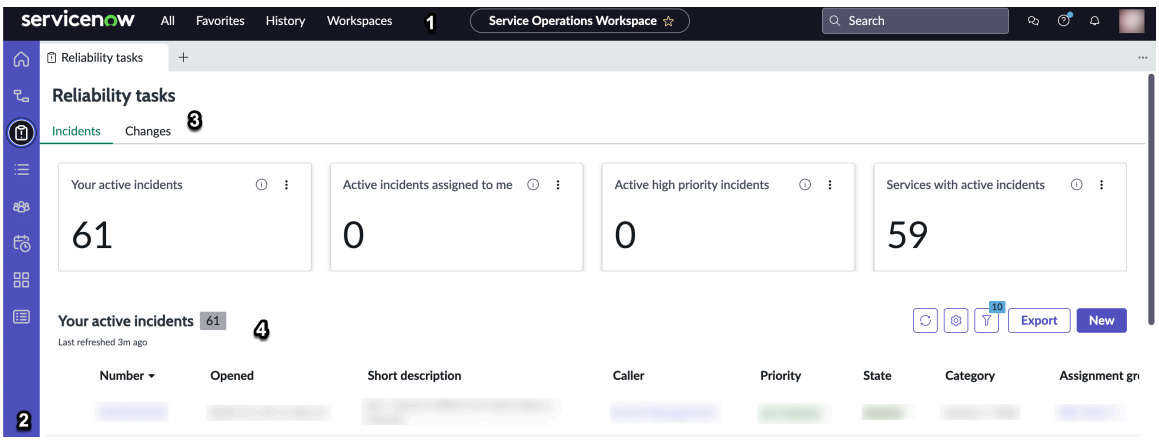
Your teams' work	Contains incidents and alerts assigned to your team. Select a card to see the list view for that area.

SRM interface

The different components on the Service Reliability Management (SRM) interface provide easy access to different functions. The features and functions that appear depend on your role and permissions.

The SRM interface has the following different sections:

Interface sections



Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics. Depending on your role, you may see other icons in the primary navigation.

If you see the SOW Home page, select an SRM icon to view SRM-specific information.

Sections	Description
1 - Header	A home for your organization logo and system-level utilities present everywhere in the interface. • All • Favorites • History • Workspaces • Current workspace • Search • Sidebar discussions • Help

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sections	Description
	• Notifications • Profile icon: Represents your profile
2 - Primary navigation	Easy access to specific pages in SRM. The primary navigation uses icons, including icons for Services, Reliability tasks, Teams, and Schedules. Use tooltips to identify them.
3 - Content headers	Tabs, cards, or buttons that provide the means to accomplish product-level tasks. The elements in the content header differ from one page to another.
4 - Content area	Canvas or the main area where you can gather information, read metrics, and perform tasks. **Note:** If you want to minimize the side panel on forms, by default, navigate to **Preferences** > **Workspace** and disable the **Show sidebar** option. That action disables it across the Service Operations Workspace, not just SRM.

Search, filters, lists, forms, and guides

An overview of the additional elements in the Service Reliability Management (SRM) interface that help you find items, view available forms and lists, and follow setup processes.

Table List view

View services and incidents as a list.

- Search using the header text box.
- Order items using the list columns.
- Filter list results using the list columns.

Note: View the active filters using the filter icon in the list view header.

Each view contains its own unique items. See those pages for details.

Form view

When you open any of the table records from the list view, you see the details of the record as a form.

Each view contains its own unique items. See those pages for details.

Note: Grayed out fields can't be changed.

The Attachments panel is often visible by default, to hide it select the Attachment icon .

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Setup checklists

Use the setup checklists to visualize the process that you go through to reach your goals. Each step is highlighted as you complete it.

Export list information to a file

You can export live information to a file in Service Reliability Management (SRM).

Before you begin

Note: Bulk selection doesn't impact exports. The export includes all records that match the current filter criteria. It doesn't consider the selections you make in the list view.

Role required: srm_admin, srm_manager, or srm_responder

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. Select the list view in any landing page section in SRM with an **Export button**.

3. Determine which filters you want to use and select them from the Filters or More actions menu in the list columns.

   Note:

   The Export button only becomes available if there are records in the list view.

   The export contains all list data that matches your filtered/grouped lists.

4. Select **Export**.
   In the pop-up window select:
   - File Type:
     - Excel
     - CSV
     - JSON
     - PDF
   - Delivery type:
     - Download
     - Email: Provide an email address

   For **Email**: Once the export is complete, a success message appears with your email address at the top of the screen. It's useful for larger files because, depending on the size of the file, exporting might take some time. Email runs in the background, so you're free to do something else while waiting.

   For **Download**: The pop-up begins exporting and the file appears in your Download directory. Depending on the size of the file, it might take some time. You can open it in any application that supports the file format.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Manually create SRM tags

Add tags to classify, categorize, and add context to data. Service Reliability Management (SRM) imports tags and attaches them to services, alerts, and incidents. You can also manually create tags.

Before you begin

Role required: srm_admin, srm_manager, or srm_responder

About this task

There are two ways that tags can enter the system and attach to an alert or incident. The first is automated but the last one is manual.

- Imported from a third-party integration such as Datadog.
- Using the tag icon in the header of a service, alert, or incident.
- Added using the **Modify field values** action in an automation rule.

This task describes how to add tags to services and incidents in SRM. For information about managing alerts, see Alerts in Service Operations Workspace.

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Services** or **Reliability tasks**.
3. Open a service or incident.
4. In the header, select the **Tag** icon to add tags.
5. Enter your tag in the pop-up window.
   Your tag is saved and appears below the Add Tag box alongside any existing tags.
6. Select anywhere in the form to close the pop-up.

Note:

Tags are also shown under the description in the incident list view.

SRM incidents

Track and collaborate on incidents in the Incidents tab, helping you and your teams resolve issues efficiently.

The Incidents tab appears in the Service Reliability Management (SRM) Reliability tasks page. Its top header shows description information, tags, priority information, state, service, and assignment group.

Note: Tags are imported from third-party integrations and attached to incidents. However, you can also create tags to categorize data and drive system logic using the Tag icon . For more information on creating and viewing tags, see Manually create SRM tags.

When selecting an incident, you're taken to an overview. This section contains three content panels: Summary, Activity, and Recommended actions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: When an editable field is updated, notifications are sent based on user notification preferences.

In the Impact Summary, you find the following information:

Affected CIs

Field	Description
Configuration item	Name of and link to the configuration item associated with this incident.

Impacted Services

Field	Description
Configuration item	Name of and link to the configuration item associated with this incident.
Managed by	Team responsible for the incident.
Owned by	Incident owner.
Approval group	Team responsible for approvals.
Location	Geographical location of the incident if defined.
Operational status	Status of the incident.
Manually added.	Whether this incident was manually added or the result of an error budget policy.

Details

Contains incident details and related alerts

Field	Description
Short description	Brief description of the incident.
Description	Detailed description of the incident.
Number	Incident identifier.
Impact	Impact is a measure of the effect of an incident on business processes. Choices are: • 1 - High • 2 - Medium • 3 - Low
Assignment group	Team assigned to the incident.
Priority	Priority is based on **Impact** and **Urgency**, and it identifies how quickly the incident should be addressed. Choices are: • High Impact = Critical Priority • Medium Impact = High Priority • Low Impact = Moderate

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Details

Contains incident details and related alerts

(continued)

Field	Description
	Note: See Priority Data Lookup rules below.
Category	Category of the incident. Choices are: • Inquiry/Help • Software • Hardware • Network • Database
Urgency	Urgency is a measure of how long the resolution can be delayed until an incident has a significant business impact.
Service	Affected service associated with the incident. You can edit this field from a list menu. **Note:** When you set a service, and that service has an assigned team, the assigned team of that service is automatically assigned to the incident.
Severity	Imported severity on the incident. Values P1–P5.
Configuration item	Asset associated with the incident.
Assigned to	Individual responsible for resolving the incident.
State	State of the incident. The state moves and tracks incidents through several stages of resolution. Choices are: • New • In Progress • Ob Hold • Resolved • Canceled
Watch list	Individuals interested in the incident. Subscribes them to notifications according to their preferences.
Resolution code	Code associated with the resolution. Choices are: • None (default) • Duplicate • Known error • No resolution provided

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Details

Contains incident details and related alerts

(continued)

Field	Description
	• Resolved by caller • Resolved by change • Resolved by problem • Resolved by request • Solution provided
Resolution notes	Detailed information on the resolution. Resolution notes are posted to the **Activity** timeline.

Note: Priority is calculated according to the following sample data lookup rules:

Priority Data lookup rules

Impact	Urgency	Priority
1 - High	1 - High	1 - Critical
1 - High	2 - Medium	2 - High
1 - High	3 - Low	3 - Moderate
2 - Medium	1 - High	2 - High
2 - Medium	2 - Medium	3 - Moderate
2 - Medium	3 - Low	4 - Low
3 - Low	1 - High	3 - Moderate
3 - Low	2 - Medium	4 - Low
3 - Low	3 - Low	5 - Planning

When a service is deleted, its integrations, alerts, incidents, and automations are removed. Deleting a service isn't a recoverable action so consider deactivating the service instead.

The Related Records tab contains any alerts associated with this incident.

Note: All field values are imported from the related records and aren't editable from SRM.

Child Incidents

Field	Description
Number	Identifier for the related incident.
Short description	Brief description of the related incident.
Priority	Priority of the related incident.
State	State of the related incident.
Assigned to	Team member assigned to the related incident.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Child Incidents (continued)

Field	Description
Assignment group	Team assigned to the related incident.
Service	Service associated with the related incident.

Alerts

Field	Description
Number	Identifier for the related alert.
Severity	Severity of the related alert.
Short description	Brief description of the related alert.
Acknowledged	Whether the related alert has been acknowledged or not.
Assigned to	Team member assigned to the related alert.
Configuration item	Asset associated with the related alert.
Parent	Primary alert associated with the related alert.

Recent Impactful Changes

Field	Description
Number	Identifier for the related changes associated with this incident.
Short description	Brief description of the related changes associated with this incident.
Type	Type of the recent changes associated with this incident.
State	State of the recent changes associated with this incident.
Planned start date	Date and time to begin changes associated with this incident.
Planned end date	Date and time to begin changes associated with this incident.
Assigned to	Team member responsible for the change request associated with this incident.

Change Requests

Field	Description
Short description	Brief description of the change request associated with this incident.
Type	Type of the change request associated with this incident.
State	State of the change request associated with this incident.
Planned start date	Date and time to begin change request work associated with this incident.
Planned end date	Date and time change request work associated with this incident ended.
Assigned to	Team member responsible for the change request associated with this incident.

Postmortem tab

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About Postmortem owner:

- If a Scribe has already been chosen in the Collaboration panel Responders list, they're automatically made the owner.
- If there's more than one scribe, the first one assigned is chosen. Otherwise, you can select an owner from the list menu.
- If a new scribe is added or an existing user persona is changed to Scribe, that user is made the owner.
- If you manually remove an owner, no new owner is automatically selected.

Use the drag-and-drop feature to edit postmortem sections. You can exclude sections from PDFs, delete sections, or reorder sections.

To add new sections, select the **Add** icon .
Compose panel

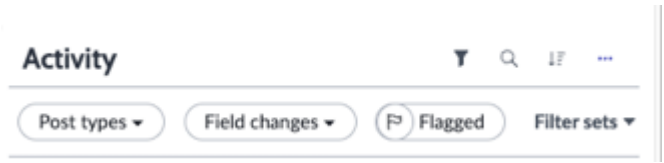
Work notes are added to the Activity timeline automatically. Visible to responders and above. Add comments using the **Compose** text box.

Comments are added to the Activity timeline automatically. Visible to everyone in SRM.

Activity section

Stream that contains all the system activity, and resolution notes. You can filter, sort, expand or collapse all posts using the header icons.

Note: The filter option includes **Post types**, **Field changes**, and **Filter sets**. All choices are selected by default. Flagged entries are either all or none.



Actions panel

Note:

The **Notifications**, **Agent assist**, **Expert on-call**, and **Email templates** panels aren't currently supported in SRM.

Attachments section

Open the **Attachments** section using the Attachment icon .

On the **Attachments** section, you can initially **Browse** your local hard drive for files.

Once you have added attachments, you can:

- Search for an attachment based on its name or extension

  Note: You must have two or more attachments to search.

- Upload a new attachment using the ( ) icon.
- Download, remove, or rename existing attachments using the More actions icon ( ).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Template section

Open the **Template** panel using the Template icon .

Note: Existing templates are displayed, but creating templates isn't available in SRM.

Collaboration panel

Displays the available Zoom meetings, Microsoft Teams, or Slack channels to start or join.

To start or join a Zoom meeting:

Note: The Zoom integration and recognized IDs must be active in your instance. If Start Channel is unavailable, contact your administrator.

1. Select **Start Zoom**.
   - A meeting pop-up appears.
   - Add participants.
   - Select **Create Meeting**.
   - The meeting is created, invitations are sent, and you join the meeting.

     Note: Any issues found when starting a meeting are shown in a banner message.
2. Select **Join Meeting**
   - **Sign in** to your Zoom account.
   - You join the Zoom meeting.

1. Select **Start Channel**.
   - Sign in to your Microsoft Teams account.
   - Select **Create**. You are redirected to the Microsoft Teams application.
   - Back in the Collaboration column, the **Join Channel** button is activated.

     Note: Any issues found when joining a channel are shown in a banner message.
2. Select **Join Channel** in the Collaboration panel in SRM.
3. Sign into your Microsoft Teams account.

   You are taken to the channel in Microsoft Teams.

Start or join a Slack channel:

Note: The Slack integration and recognized IDs must be active in your instance. If Start Channel is unavailable, contact your administrator.

1. Select **Start Slack**.
   - Add participants in the Create a Slack channel pop-up.
   - Select **Create**. You are redirected to the Slack application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Back in the Collaboration column, the **Join Slack** button is activated.

  Note: Any issues found when starting a channel are shown in a banner message.

2. Select **Join Channel** in the Slack application window.
3. Sign into you Slack account.

   You are taken to the Slack channel.

Service Operations Workspace setup for SRM

Install and configure Service Reliability Management (SRM) within the Service Operations Workspace Admin Center so that SRM admins, managers and responders can provide service reliability efficiently.

You can Install Service Reliability Management from the Service Operations Workspace Admin Center.

Note: The Data visualizations app v24.1.8 is also required. See Data visualizations in the ServiceNow Store to install the app.

Once installed, configuring SRM within the Service Operations Workspace Admin Center sets up the SRM workspace with options and actions.

Using the Service Reliability Management menus in the Service Operations Workspace Admin Center, you can:

- Assign an administrator to Service Reliability Management.
- Activate teams and services in SRM
- Customize service approval settings.
- Customize team approval settings
- Access and publish the request catalog item for users.
- Configure error budget actions for breached SRM SLOs.

Alert automations are conditional triggers that execute response actions automatically, based on the contents of the alert. This functionality is available to SRM upon request, from the Alert automations application in the ServiceNow Store.

Configuring Service Reliability Management

Configuring Service Reliability Management (SRM) involves installing it from the ServiceNow Store or Service Operations Workspace Admin Center. You can also assign administrators and import services and teams.

Using guided setup for SRM

The guided setup provides a sequence of tasks to help you configure SRM on your instance. To open the guided setup, navigate to **All** > *Service Operations Workspace* **Admin Center** > **Overview**. Next, find the Service Reliability Management tile and select **Configure**.

SRM configuration documentation

Visit the following pages to set up and configure SRM. The content is primarily for srm_admin or admin users.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Install Service Reliability Management

Install the Service Reliability Management (SRM) application from the Admin Center or ServiceNow Store.

Before you begin

Subscriptions required: ITSM Standard and ITOM Operator Professional subscriptions.

Note: The data visualizations store app v24.1.8 is also required. See Data visualizations in the ServiceNow Store to install the app.

To create and manage alert automations, install the Alert automation application available on request in the ServiceNow Store.

Role required: admin

About this task

Roles and demo data are installed with SRM. The demo data includes templates that help accelerate implementation and SRM use.

Procedure

1. Navigate to **All** > *Service Operations Workspace* **Admin Center** > **Overview**.
2. Locate the *Service Reliability Management* card and select **Install**.
3. In the pop-up window, select **Start Install**.
   You're taken to the ServiceNow Store portal.
4. Complete the necessary steps.

   Note: If any dependencies are red on the app store listing, select the row to open the dependent app and install it. If the dependent app is already installed but still appears in red, you can get or reopt it as needed.

   Demo data comprises the sample records that describe application features for the common use cases. Demo data is loaded when you first install the application on a development or test instance.

   Following installation, the *Service Reliability Management* card can be used to configure SRM.

Assign an administrator to Service Reliability Management

Add people from your ServiceNow instance to administer Service Reliability Management (SRM) and your service operations.

Before you begin

Role required: admin

About this task

The SRM admin can add and create teams. They can also manage data across all SRM teams.

Procedure

1. Navigate to **All** > *Service Operations Workspace* **Admin Center** > **Overview**.
2. In the *Service Reliability Management* tile, select **Configure**.
3. Navigate to **Assign admins** > **Service reliability management admins**.
4. Enter user names in the field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Users must have an email address associated with their user record to appear in the search results.

5. Select **Save**.

Activate teams and services in SRM

Activate teams and services to be managed in the Service Reliability Management (SRM) application.

Before you begin

Role required: srm_admin or admin

Procedure

1. Navigate to **All** > *Service Operations Workspace* **Admin Center** > **Configurations**.
2. Select *Service Reliability Management* > **Activate** > **Teams and services**.
3. Select **Activate teams and services** to begin importing or adding teams.
4. Use the condition builder to filter the teams shown in the Assignment groups list.

   Note:

   Filters on the same field use AND logic, and filters on different fields use OR logic. For example, filtering for multiple `Business Criticality` levels and `State = Open`, evaluates as `(Criticality = 1 OR 2 OR 3 OR 4) AND (State = Open)`.

   List view filters are saved automatically and persist when you navigate away and return.

5. In the Assignment groups list, select the teams you want to add and then select **Activate**.
   You reach the **Activate services** option to add services.
6. From the **Select a service class** list, select a service.
   The following service types are available:
   - Application Services
   - Mapped Application Services
   - Calculated Application Services
   - Dynamic CI Group
   - Technical Services
   - Tag-based Services
7. Use the condition builder to add new services to the list view.
8. Select the services that you want to add and then select **Activate**.
   The **Activate Services** pop-up opens.
9. From the **Support Group** drop-down, select the relevant support group and select **Confirm**.

Result

On the **Activate teams and services** page, the following options appear:

- Existing teams
- Existing services

You can select the options to view the teams or services.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Customize service approval settings

Add an approval process to your services for governance.

Before you begin
Role required: srm_admin or admin

About this task
Require approval when Service Reliability Management (SRM) admins, managers, or responders request to create or add a service in SRM.

Procedure

1. Navigate to **All** > *Service Operations Workspace* **Admin Center** > **Configurations**.
2. Select *Service Reliability Management* > **Governance and autonomy** > **Service governance**.
3. Choose one or both processes by selecting the relevant check box.

   Approval requirement types:

   - Approval required when creating a new service:

     Requires approval when creating a service in SRM, and assigns it to the team responsible for new services.

   - Approval required when associating an existing Configuration Management Database (CMDB) service:

     Requires approval to add an existing service to SRM, and assigns it to the team responsible for existing services.

4. Enter or select the team responsible for approvals.
5. Select **Save**.
   This action initiates the approval process and assigns approval to the team responsible for approving the new service.

   Note: Approvals take two steps. First, the request is approved, which appears in the **Stage** field of the request record. Next, the request remains **Pending** until the request item is approved in the **Request** record.

Customize team approval settings

Customize how team approvals work when non-admin users create or add a team in Service Reliability Management (SRM). This feature, also known as team governance, helps you control access and align with internal policies.

Before you begin
Role required: srm_admin or admin

About this task
By default, team governance is active in SRM. When non-admin users request a team, SRM creates two records: a parent request and a requested item. The approval team is notified, and any member can approve the request from My approvals. Once approved, the team is created or added, the parent request is set to `Approved`, and the requested item is set to `Closed Complete`.

You can customize team governance by turning off approvals or changing the approval team.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Non-admin users are SRM managers and SRM responders. When team governance is active, admins and SRM admins can still create and add teams without approval.

Procedure

1. Navigate to **All** > *Service Operations Workspace* **Admin Center** > **Configurations**.
2. Under **Service Reliability Management**, select **Governance and autonomy** and then select **Team governance**.
3. Review or update the approval options.

Option	Description
Approval required when creating a new team	Clear this option to let non-admin users cre ate teams in SRM without approval.
Approval required when associating an ex isting team	Clear this option to let non-admin users add existing teams to SRM without approval.

4. Review or update the approval team for one or both options.
   By default, the approval team is set to `SRM Team approvers`. You can view its members in `sys_user_group.list`.

   Note: Any member of the approval team can approve requests, but they need the `sn_request_read` role to view request details. Without that role, they only see the approval task.

5. Select **Save** to update your team governance settings.

Configure error budget actions for breached SRM SLOs

Configure the actions that the team can select when the error budget of a service level objective (SLO) is breached.

Before you begin

Role required: srm_admin or admin

Procedure

1. Navigate to **All** > *Service Operations Workspace* **Admin Center** > **Configurations**.
2. Select *Service Reliability Management* > **Governance and autonomy** > **Error budgets**.
3. Select **Configure error budget actions** to edit the Process Error Budget Policy Threshold subflow in Workflow Studio.

   Note: Working in Workflow Studio requires advanced ServiceNow expertise. For more detailed information on editing workflows or creating custom workflows, see Flow Designer.

Approve a change request for SRM

Approve a service change request in Service Reliability Management (SRM) to allow the requested action to proceed.

Before you begin

Only open change requests are available on the **Reliability tasks** page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: SRM approval team or admin

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Reliability tasks** ( ).
3. Select the **Changes** tab.
4. Select a change request and then select the **Details** tab.
5. On the **State** field, select the list and select **Approved**.
6. Select **Save**.
   The change request state updates from `Assess` to `Approved`.

   On approval, the new service is created and added to the SRM team. The owner is set to the person shown in the Assigned to field. And the Managed by group is set to the SRM team associated with the assignee.

Configure fields for escalation triggers

Configure additional fields for on-call escalation triggers in Service Reliability Management (SRM).

Before you begin
Role required: admin

About this task
Configure additional fields that teams can use when setting up escalation triggers. By default, escalation triggers run only when the Assignment group field changes. Completing the following procedure makes other fields available, giving teams more flexibility and helping them respond to issues quickly.

Procedure

1. Navigate to **All** > **On-Call Scheduling** > **Administration** > **Trigger Rule Table Config**.
2. Select **em_alert** or **incident** to configure additional trigger fields for alerts or incidents.
3. In **Trigger condition fields**, add fields from the following table.

   Note: Selecting fields not listed in the table might cause performance issues.

Table	Supported fields
em_alert	○ Assigned to ○ Flap count ○ Flap last state ○ Initial event generation time ○ Last event generation time

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Supported fields
	○ Number of Work Notes ○ Overall Event Count
incident	○ Assigned to ○ Category ○ Escalation ○ Impact ○ Reopen count ○ State ○ Urgency

4. Select **Update** to save your changes.
   The selected fields now appear as options for teams configuring escalation triggers.

What to do next
To set up an escalation trigger, see Create an escalation trigger.

Configure Twilio to send notifications in SRM

Connect your Service Reliability Management (SRM) instance and Twilio account to send notifications to teams.

Before you begin
Before you begin, you must have a String Identifier (SID) and an authentication token for an active Twilio account.

Note: Performing this action requires ServiceNow expertise.

Role required: srm_admin or admin

About this task
You can adjust what gets sent from Twilio by editing the on-call workflow in the system.

Procedure
1. Navigate to **All** > *Service Operations Workspace* **Admin Center** > **Configurations**.
2. Select *Service Reliability Management* > **Integrations** > **Twilio API Key**.
3. Select **Twilio Config**.
4. In the new window, select **here** to edit the record.
5. Enter the **Account SID** value.
6. **Optional:** Enter a **Validity Period** value.
7. Select **Connect** to activate the key or **Save** to save your changes without activating.

Install the Alert Automation application

Install the **Alert Automation** application and any supporting applications.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Subscriptions required: ITSM Professional or ITOM Operator Professional subscriptions.

About this task

Before creating management rules, you must install and configure the Service Reliability Management (SRM) application, available in the ServiceNow Store.

Procedure

1. To access the ServiceNow Store and download the application onto your SRM instance, select the link in the email you received.
2. In your ServiceNow AI Platform instance, navigate to **All** > **System Applications** > **All Available Applications** > **All**.
3. Locate the *Service Operations Workspace* **Alert Automation** application and select **Install**.
   Alert automation rules are ready to use in SRM.

Using Service Reliability Management

Service Reliability Management (SRM) enables you to register services, monitor service health, and respond to service degradations with on-call shifts and escalation policies.

Basic Tasks in SRM

Working with SRM services

A service represents a functional outcome like networking, payments, or HR services, that is owned by a team. To deliver that outcome, a service can contain one or more technical components like a user authentication service, or a piece of shared infrastructure like a database.

Service Reliability Management (SRM) works with integrations to prioritize and route alerts to the relevant responders. It follows up with escalations until the alert is acknowledged and someone responds. When you create or add a service in SRM, it must reflect a service in your SRM infrastructure.

Note: You might want multiple tool integrations to monitor each technology management service and receive events from those tools. See Working with integrations in SRM for more information.

In addition, you can create reliability metrics for the service. See Reliability metrics in SLO Management.

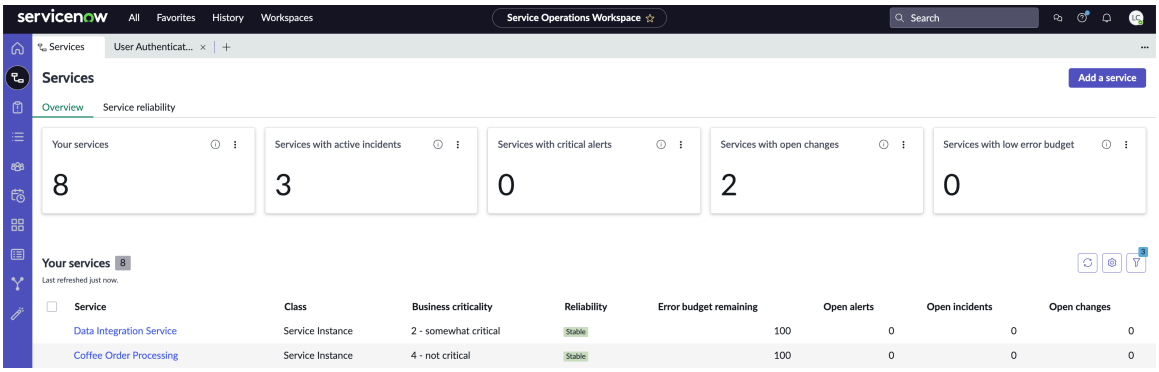
Tying a team and policies to that service makes it easier to divide responsibilities and track technical outcomes. It also makes it easier to automate response routines and focus on who you notify and when.

The state of an exiting service is inherited. The state of a created service in SRM is **None**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Services Overview

Information on the Overview tab



The cards on the Overview tab display the following metrics. By default, the list view shows information related to the Your services card. Select a different card to view different information in the list view.

- **Your services**: Count of all the services you or your team manages and monitors for reliability.
- **Services with active incidents**: Services with open incidents sorted in the following order:
  - Business criticality - most critical first.
  - Number of active incidents - highest first.
  - Percentage of error budget remaining - lowest first.
- **Services with critical alerts**: Services with open alerts sorted in the following order:
  - Business criticality - most critical first.
  - Number of alerts - highest first.
  - Percentage of error budget remaining - lowest first.
- **Services with open changes**: All the services your team manages and monitors.
- **Services with low error budget**: Services with less than 25% error budget remaining.

  The error budget metric is represented as the amount of service level objective (SLO) that you can spend over a specified time. It can be used to manage release velocity.

Note: To refresh the card and list values, select Refresh .

You can interact with the list in the following ways:

- Group or filter columns to customize the view.
- Edit, sort, or export the list as needed. See Export list information to a file.

For more information about individual service details, see Edit service details form.

Services list view definitions

The columns include the following details:

- **Service**: Name of the service.
- **Class**: Service instance or technology management service.
- **Business criticality**: Importance of the service to the business.
- **Open alerts**: Number of open alerts assigned to the service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: For technology management services, the counts for **Open alerts** and **Open critical alerts** include alerts for related configuration items (CIs). To view the individual alerts and their associated CIs, open the service and select the **Related alerts** tab. The alert counts include related CIs up to 3 levels deep, with a maximum of 2,000 CIs.

- **Open incidents**: Number of open incidents assigned to the service.
- **Error budget remaining**: Percentage of error budget remaining for the service.

Service reliability

The Service reliability tab is a customizable dashboard showing high-level service performance. For more information about the dashboard, see Visualizations in the Service reliability dashboard.

Add a service to SRM

Add services to Service Reliability Management (SRM) to help your teams manage service health.

Before you begin

If you're adding a technology management service to SRM, make sure it doesn't have a support group. You assign the support group when you add the service to SRM.

Role required: srm_manager, srm_responder, or srm_admin

About this task

Add a service to SRM to assign it to your teams and let them access its incidents and alerts. You can either create a service or import an existing one. SRM supports both service instances and technology management services:

- Service instances - Business-facing services, such as an HR portal. Service instances often have multiple infrastructure components.
- Technology management services - IT-focused services that support a business service or service instance. For example, an authentication service or database service.

When you add a technology management service to SRM, you also add its offerings. Offerings are specific components within a parent technology management service. For example, Spam filtering is an offering within the Email technology management service. In SRM, you can assign a parent technology management service and its offerings to different teams.

Note: When you import an existing technology management service, its offerings don't inherit its support group. Offerings either keep their existing support group or, if they don't have one, you must assign it before setting up Service Level Objectives (SLOs).

Procedure

1. Navigate to **Workspaces** > *`Service Operations Workspace`*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. Select the Services icon and then select **Add**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the Add services for your teams modal, you can either create a service or add existing services.

Option	Steps
Create a new service	**a.** Select **Create a new service**. **b.** Fill in the fields. For field descriptions, see Add service form. **c.** Select **Next**.
Select existing services	**a.** Select **Select existing services**. **b.** Search for and select your service. You can add more than one. **c.** Select **Next**. **Tip:** Select the search box to view up to 25 services not yet in SRM, ordered by creation time. After you enter three characters, it shows up to 25 matching results. Both lists can include services with or without a support group. If a ser vice has one, the support group can be an SRM team or a group outside SRM.

4. In the Assign a team step, assign your service to an existing or new support group. In SRM, support groups are also known as teams.

Option	Steps
Select an existing team	Enter your team's name in the search box.
Create a team	Select **Create a team**. For more information about creating teams, see Add an SRM team.

5. Select **Add service**.
If approvals aren't enabled, your service appears in the service list. If approvals are enabled, your request is sent for approval. After it's approved, the service appears in the services list.

Note: If you added a technology management service, its offerings appear in the Offerings tab on the parent technology management service's page. Offerings also appear in the services list. To view an offering without an assigned support group, remove all filters from the services list.

What to do next

If an offering doesn't have a support group, assign it to a support group before setting up SLOs. For how to assign support groups, see Edit service details in SRM.

You can also add integrations to your service to start monitoring its health.

Edit service details in SRM

Edit an existing service owned by your team. For each service that you support in SRM provide general information about the service and the SRM team that supports it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: srm_admin, srm_manager, or srm_responder

Procedure
1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select the **Services** icon ( ).
3. From your services list, select the service that you want to edit or update.
   To view and select a technology management service offering without an assigned support group, remove all filters from the services list.
4. On the Overview page, select the **Details** tab.
5. Fill in or edit the fields.
   For more information on the field descriptions, see Edit service details form.
6. To save the updated service details after editing, select **Save**.

Remove a service from SRM

Remove a service from Service Reliability Management (SRM) when you no longer need to track or monitor its reliability.

Before you begin
SRM administrators can remove any service from SRM. SRM managers can remove only the services assigned to their teams.

Note: Administrators and SRM administrators have a delete option on service pages. That option deletes the service from both SRM and the Configuration Management Database (CMDB). The remove option, described below, only removes the service from SRM.

Role required: srm_manager or srm_admin

About this task
Remove one or more services from SRM when you no longer need to track their reliability. Removing a service from SRM does the following:

- Removes the service from SRM views, including the Service page and Service reliability dashboard.
- Deletes all draft service level objectives (SLOs) associated with the service. Those SLOs aren't recoverable.
- Retires all active SLOs associated with the service. Those SLOs are no longer active but remain visible in SRM.

Removing a service from SRM doesn't affect the service reliability tasks, such as alerts, change tasks, or incidents. The service also remains in the CMDB, and you can add it back to SRM at any time.

Note: The following procedure shows how to remove services from SRM using the Services page. You can also remove services using the Teams page by selecting a team and then the **Services managed** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
2. In the primary navigation, select **Services**.
3. Point to a service you want to remove, and then select its check box.
   You can select one or more services.
4. Select **Remove**.
5. In the dialog, review the details about the affected SLOs and then select **Remove service**.
   The page displays `<service-name> removed from SRM`. The service no longer appears in the SRM application, but it remains in the CMDB. You can add it back to SRM at any time.

Note: If you receive an error when removing a service, see Troubleshoot SRM.

What to do next

To learn how to monitor and manage services that remain in SRM, see Working with SRM services. To add a service that you want to monitor or that was removed by mistake, see Add a service to SRM.

Working with integrations in SRM

Connect your services to monitoring tools using the Integrations Launchpad . Integrations send information to Service Reliability Management (SRM), helping you track alerts, manage incidents, and maintain service health.

Access the Integrations Launchpad

As an SRM admin, manager, or responder, you can access the Integrations Launchpad in the following ways:

- From the primary navigation, select the ITOM Admin Experience icon, and then select either **Add integration** or **Manage installed integrations**.
- From the Services page ( ), select a service, select the **Integrations** tab, and then select **Add an integration**.
- From the Services page ( ), select a service, expand **Complete setup**, and then select **Add integrations**.

Integration details specific to SRM

Be aware of the following when using the Integrations Launchpad for SRM:

Connector type support

SRM supports custom, pull, and push connectors. Pull connectors retrieve data from external sources, and push connectors send data from external sources to your instance.

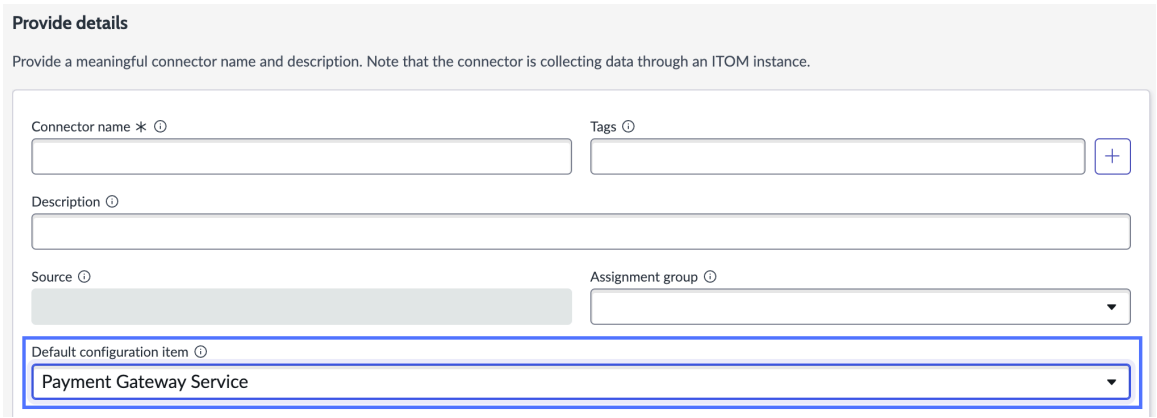
Note: For information about setting up connectors, see Integrations Launchpad in Service Operations Workspace for ITOM.

Configuration item field

When you set up an integration for SRM, the Provide details step has an additional field called Default configuration item.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set this field to the service your integration monitors. If an incoming alert doesn't include service details, SRM uses this field to connect the alert to the relevant service. This field helps make sure that your teams receive alerts for the services they support.



Learn more

Visit the following links to set up and manage integrations with the Integrations Launchpad. The pages are in a different section because the Integrations Launchpad is part of the broader Service Operations Workspace.

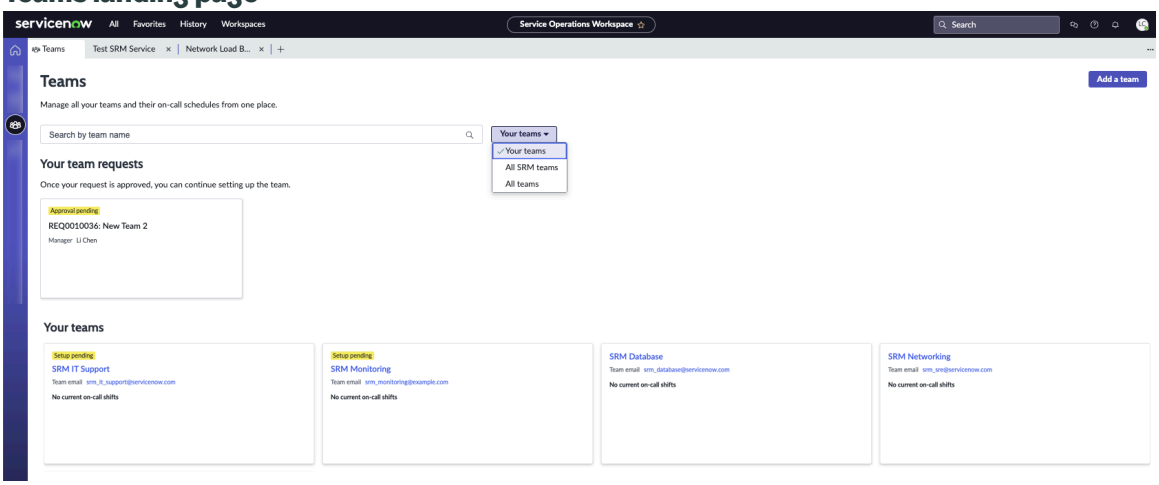
- Activate integration
- Configure an event custom connector
- Configure an event pull connector
- Configure an event push connector
- Deactivate integration
- Delete integration

Working with SRM teams

Manage schedules and define escalation policies for your team. That way, your team sees who is on call and accountable and can have the confidence that critical alerts or incidents are acknowledged in a timely manner.

On the Teams landing page, view and manage your teams and team requests.

Teams landing page



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Search by team name among teams you belong to, all SRM teams, or all teams in your organization.

Your selection determines the cards that you're shown on the Teams landing page.

Choices are:

- **Your teams** (default)
- **All SRM teams**: All the SRM teams.

  Note: Your ability to take actions in each team depends on permissions for that team.

- **All teams**: All teams you have access to in your organization.

  Note: Your ability to take actions in each team depends on permissions for that team.

The Your team requests section contains team cards for any pending requests, if there are any.

The Your teams section contains cards that provide information about a specific team, such as team status, name, manager, email, current shift name and duration, and primary responder. See Manage your SRM team details for more information.

Add an SRM team

Request to create a team to start monitoring your services. Teams are responsible for the issues that occur in the associated services.

Before you begin

Role required: srm_manager, srm_responder, or srm_admin

About this task

If you have the srm_admin or admin role, you can set up teams using a different process. See Activate teams and services in SRM for more information.

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. Select **Teams** ( ), select **Add a team**.
3. Create a new team or add an existing one.

Option	Steps
Add a new team	**a.** In the **New or existing** field, select **I am creating a new team**. **b.** On the form, fill in the fields. For more information on the field descriptions, see Create team form. **c.** Select **Add team**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Steps
Register an existing team	**a.** In the **New or existing** field, select **I want to give a group access to SRM app**. **b.** Select an existing team from the **Select team** list. **c.** Select **Add team**.

Result
When the request is approved, the team is created. Your team appears in the Teams landing page under **Your teams**.

What to do next
- Manage your SRM team details
- Set up escalation policies for your team in SRM
- Create an SRM on-call schedule
- Add team members to SRM
- Manage or add a service to your SRM team

Manage your SRM team details

Add or edit team members, description, contact information of you team.

Before you begin
Role required: srm_manager, srm_responder, or srm_admin

Procedure
1. Navigate to **Workspaces** > *`Service Operations Workspace`*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Teams** ( ).
3. Select the team card whose details you want to update.
4. On the form in the **Details** tab, update the details as required.

Field	Description
Name	Unique name of the team.
Manager	Person who manages the team.
Group email	Email contact for the team that includes all team members.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Description	Description of the team that helps others to understand its responsibilities, purpose, or location.

5. Select **Save**.

Add team members to SRM

Add new team members to your team as required to plan, manage, resolve issues, and increase the efficiency of your business operations.

Before you begin

Role required: srm_manager or srm_admin

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Teams** ( ).
3. Select the team card to open.
4. Select **Teams members** tab.
5. Select **Add**.
6. In the pop-up window select members to add from the list menu.

   Note: Member details are imported from user records and not editable.

7. Select **Add**.

Manage or add a service to your SRM team

Add a service to an incident to increase the amount of data for the incident.

Before you begin

Role required: srm_manager, srm_responder, or srm_admin

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Teams** ( ).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select a team card to open any team you want to view or add a service to.
4. From the team page, select the **Services managed** tab.
   You can export the list of services. See Export list information to a file for more information.
5. **Optional:** Add a service to your team by selecting **Add**.
6. Add a new service or register an existing one.

Option	Steps
Add a new service	**a.** In the **New or existing** field, select **Create a new service in Service Reliability Management**. **b.** On the form, fill in the fields. For more information on the field descriptions, see Add service form. **c.** Select **Next**.
Register an existing service	**a.** In the **New or existing** field, select **Associate existing CMDB services to Service Reliability Management**. **b.** Select one or more services. **c.** Select **Next**.

7. In the Assign a team step, fill in the fields.
   - In the **Service owner** field, select the user who will own the services.
   - In the **Support Group** field, select a team that will monitor services.

   The service record has been added.
8. Finish setting up your service or do it later.

Option	Steps
Finish setting up your service	**a.** Select **Continue to setup**. **b.** Select **Add integrations** and connect your service to a data source to monitor events. **c.** Select **Add SLO & SLI** and create a service level objective and measure your service health with a service level indicator.
Do it later	Select **Do it later**.

See Edit service details in SRM and Edit service details formfor information on the service and completion steps for setup.

Create an SRM on-call schedule

Set up an on-call schedule to make sure that someone is available to respond to incidents and critical alerts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Before creating an on-call schedule, a team must exist in Service Reliability Management (SRM). The Alert table [em_alert] must also be added to the Trigger Rule Table Config list. See Add an SRM team and Add alert table to enable on-call scheduling for Service Operations Workspace for ITOM for more information.

Role required: srm_manager, srm_responder, or srm_admin

About this task

Shifts in SRM let you define variable time periods for your shift-based workforce. Create shifts for particular dates and times when you need coverage, and assign them to team members.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace** > **Teams (** **)**.
2. On the Teams page, select your team.
3. Select the **Schedule** tab and then select **Create shift**.
4. In the Create new dialog, select either **Create new** or **Use template**.
   Your system admin can create predefined templates for you to use to create shifts.
5. Fill in the fields.
   For more information on the field descriptions, see Create a shift form in Service Reliability Management.
6. Select **Create shift**.

Set on-call team preferences in SRM

Set on-call preferences for team members to increase the efficiency of your business operations.

Before you begin

Role required: srm_manager or srm_admin

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Teams** ( ).
3. Select the team card to open.
4. Select the **On-call team preferences** button.
5. On the form, fill in the fields.

Field	Description
On-call shift managers	Team managers for the on-call shift.
PTO requests	Requests for Paid Time Off (PTO) made by team members. Choices are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ System default (Not allowed) ○ With approval ○ Without approval ○ Not allowed
First day of the week	First day of your work week. **Note:** This option is available for Washington DC and later releases only.
Allow shift schedule overlap	Option to allow schedules to overlap
Escalation rule on shift overlap	Choices are: ○ System default (Escalate to all shifts) ○ Escalate to outgoing shift ○ Escalate to incoming shift ○ Escalate to all shifts

6. Select **Save**.

Set up escalation policies for your team in SRM

Set up an escalation policy for your team to ensure that alerts or incidents are resolved in a timely manner by the appropriate team member.

Before you begin

Before creating an escalation policy, you must create an on-call shift for your team.

Note: Only the responder who created the team or the manager of the team can set up an escalation policy for that team.

Role required: srm_manager, srm_responder, or srm_admin

About this task

An escalation policy is a set of guidelines that outlines how and when incidents should be elevated to higher levels of authority. It delineates clear procedures and responsibilities for escalation to help responders promptly address problems. It defines the order in which notifications should be escalated if an alert or incident isn't acknowledged or resolved within a defined amount of time. If no one responds, the escalation is based on your defined policies until someone responds. After a team member responds, the escalation policy stops escalating and no further notifications are sent.

Note: Escalation workflow is triggered only if there's an active shift.

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. From the primary navigation, select **Teams** ( ).
3. Select the **Escalation triggers and policies** tab.
4. Under **Escalation policies** in the left panel, select **Create policy**.
5. On the Escalation policy form, fill in the fields.
   For more information, see Set up escalation policies form in SRM
6. **Optional:** Select **Add escalation step** to define the additional steps for escalation and escalation path.
   For more information on the Add escalation step form, see Set up escalation policies form in SRM.
7. Select **Save changes**.
8. **Optional:** Add another escalation policy to the team for another category of alert or incident by selecting **Add a policy**.

Create an escalation trigger

To address issues promptly, define the conditions that trigger a team's escalation policy in Service Reliability Management (SRM).

Before you begin

If your team needs trigger fields other than Assignment group, confirm that an admin has already configured them. For more information, see Configure fields for escalation triggers.

Role required: srm_manager or srm_admin

About this task

This procedure shows how to create escalation triggers in SRM. If your organization manages on-call scheduling using IT Service Management (ITSM), you can also use ITSM On-Call Scheduling to define escalation triggers. See Create an escalation trigger rule for more information. While that procedure lists ITSM roles, SRM users only need the srm_manager or srm_admin role.

For a broader overview of escalation processes in ITSM, see Designing an escalation process.

Procedure

1. Navigate to **Workspaces** > *`Service Operations Workspace`*.
2. From the primary navigation, select **Teams** ( ).
3. Select your team, and then select the **Escalation triggers and policies** tab.
4. In the **Escalation triggers** panel, select **Create trigger**, and fill in the Escalation trigger form.

Field	Description
Escalation trigger name	Name of the trigger. Example: `P1 incidents`.
Order	Order of execution for the trigger. When a team has multiple escalation triggers, the triggers with lower values are evaluated first.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Active	Option to activate or deactivate the trigger.
Conditions	Choose the table (**Alert** or **Incident**) and set the conditions for the trigger. When conditions are met, the system triggers an escalation for the relevant team. Example: `Priority is 1 - Critical`.
Advanced options	Define what happens when the trigger conditions are met and when the trigger runs. For **Trigger action**, select **Workflow**, **Subflow** or **Script**, then choose the specific item. Example: Select **Workflow**, and **On-Call: Assign by Acknowledgment** to auto-assign the incident to the person who acknowledges it. Select **Run trigger rule every time the selected field changes** to run the trigger when one of the chosen fields updates. If not selected, the trigger runs only when the Assignment group changes.

5. Select **Save**.
   The UI displays `The Escalation trigger has been added successfully`. The trigger is now active and runs when the defined conditions are met.

Working with SRM reliability tasks

Alerts, incidents, and change requests are reliability tasks. From creation to resolution, SRM helps you manage your alerts throughout the response life cycle.

The Reliability Tasks pane ( ) has several tabs:

- **Incidents** are created manually or based on Service Level Objectives (SLOs) and Service Level Indicators (SLIs). For more information on incidents, see Working with incidents in SRM. For more information on SLO, SLI, and error budget actions, see Create SLOs, SLIs, and error budget policies.
- **Changes** can be created within SRM. See Manually create an SRM change task.

The Express List pane ( ) provides a focused view of alerts to help you monitor, evaluate, and resolve health issues efficiently. You can create alerts from SRM service pages or by using integrations. For more information on alerts, see Express List in the Service Operations Workspace for ITOM and Manually create an SRM alert.

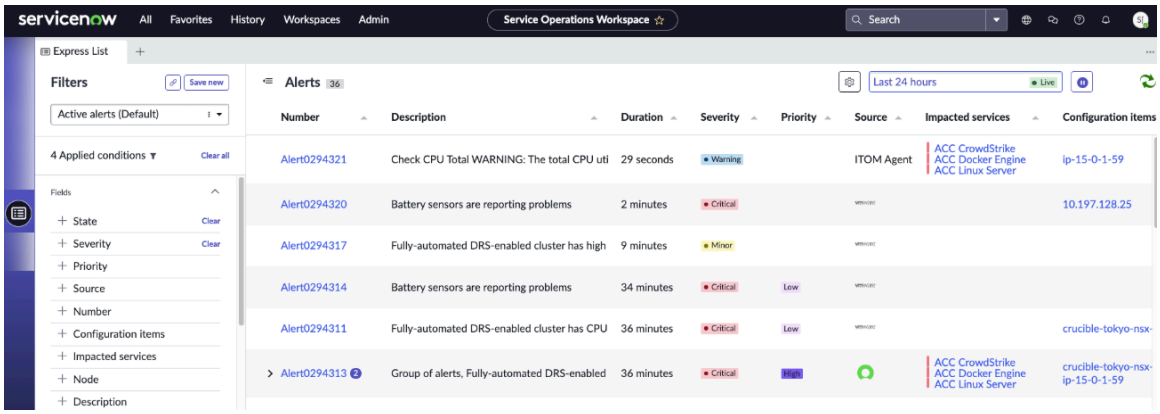
Responders and above are notified for updates to reliability tasks based on their notification preferences.

Working with alerts in SRM

Monitor, evaluate, and resolve health issues in the Express List.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Event Management Express List feature provides a customizable, sortable view for accessing and managing alerts. Use the Express List feature to prioritize alerts, understand their impact, and resolve issues faster.



As a Service Reliability Management (SRM) user, you automatically have the evt_team_operator role, which lets you access the Express List feature ( ). To learn more about that role, see Roles used by Express List.

Visit the following to work with alerts in the Express List feature:

- Acknowledge viewed alerts in Express List
- Assign alerts in Express List
- Close an alert in Express List
- Create an incident from an alert in Express List
- Monitor incoming alerts
- Place an alert in the Acknowledged state
- Place an alert in the Maintenance state

In SRM, integrations create alerts or you create alerts manually. Visit the following link to learn how to create an alert from the **Services** page:

Manually create an SRM alert

Create an alert for testing purposes or if you think an issue poses a risk.

Before you begin

Role required: srm_admin, srm_manager, or srm_responder

Procedure

1. Navigate to **Workspaces** > *`Service Operations Workspace`*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. In the navigation pane, select **Services**.
3. Select the service that you want to trigger an alert for.
4. Select the **Related alerts** tab.
5. Select **Trigger alert** and fill out the **Trigger an alert** form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To trigger an alert, you must first create an event to get processed. Only **Service** is required.

Trigger an alert

Field	Description
Service	Select a service for the event.
Source	Manual.
Node	Enter the name of the node (for example, FQDN, IP address, or MAC address) associated with the event.
Type	Enter a type of event.
Resource	Enter a node resource (process or service) associated with the event.
Metric Name	Enter the name of the metric associated with the event.
Source instance	Enter a data source for the event.
Message key	Enter an identifier for multiple events related to the same event.
Severity	Select the expected impact of this event. Choices are: ○ Critical: Immediate action is required. The resource is either not functional or critical problems are imminent. ○ Major: Major functionality is severely impaired or performance has degraded. ○ Minor (default): Partial, non-critical loss of functionality or performance degradation occurred. ○ Warning: Attention is required, even though the resource is still functional. ○ OK: The resource is still functional.
Time of the event	Select the date and time that the event occurred in the source system.
Description	Enter information describing the event.
Additional information	Add more information relevant to the event.
Processing notes	Enter relevant processing information.

6. Select **Trigger**.
   Service Reliability Management (SRM) creates an event to generate the alert. Refresh the screen to see the event processing results.

   Express List automatically displays your alert. If enabled, SRM triggers the applicable automations and on-call escalation workflows.

What to do next

Consider making the following optional adjustments to your alert for testing purposes or team collaboration:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Acknowledge the alert or assign it to someone on your team.
- Add comments or work notes in the **Compose** panel.
- Add an attachment related to the alert using the attachment icon .

Working with incidents in SRM

Plan ahead of service disruptions and have SRM send notifications and create status when incidents occur. Distractions are minimized and teams stay focused on remediation.

You can manually create incidents within SRM or create an error budget action to do so. See Manually create an SRM incident or Create SLOs, SLIs, and error budget policies for more information.

- Manual creation from an alert.
- Manual creation from the incident view.
- Automatically from Alert automations, if Alert automations are installed.

The **Assigned to** field on an incident specify who should be notified. When a team is selected as a responder, team automations are checked to determine which schedule to use for the notifications.

Note:

The **Assigned to** field is cleared when the **Assigned-team** or **Service** field is updated on an incident. Escalation policies for the newly assigned teams run. The field remains cleared until a user on the new team acknowledges an escalation notification.

If the Service is changed and the new Service does not have an assigned team, no changes occur.

When a service is deleted, its integrations, alerts, incidents, and automations are removed. Deleting a service isn't a recoverable action so consider deactivating the service instead.

Responders and above are notified for updates to incidents based on their notification preferences. If you made the update, you won't be notified.

You can resolve incidents by selecting specific incidents or in bulk. See Resolve an SRM incident, or Close an SRM incident or Cancel an SRM incident.

Note:

Incidents in the **Resolved** state are automatically closed after 3 days.

For more information on the areas and fields available in an incident, see SRM incidents.

Export list information to a file from the list view.

Respond to an incident in the following ways:

- Tag an incident.
- Update the priority of an SRM incident.
- Set the state of the incident.
- Copy an SRM incident.
- Add a service to an SRM incident.
- SRM incidents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Resolve an SRM incident.
- Cancel an SRM incident.
- Close an SRM incident.
- Reopen an SRM incident.

Manually create an SRM incident

Create an incident if you think an issue poses a serious risk and should be taken care of as soon as possible.

Before you begin

Role required: srm_manager, srm_responder, or srm_admin

About this task

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Reliability tasks** ( ).
3. Select the Incidents tab.
4. Select **New**.
5. Fill in the fields on the Create New Incident form, as appropriate.

   Only the **Short Description** field is required.

Incident Field mapping

Field	Description
Short Description	Add brief description of the incident.
Description	Add detailed description of the incident.
Number	Identifier assigned to the incident.
Impact	Select is a measure of the effect of the incident. Impact affects **Priority**. Choices are: ○ 1 - High ○ 2 - Medium ○ 3 - Low
Assignment group	Select a team to work on the incident by typing or searching.
Priority	Automatically set based on **Impact** and **Urgency**. It identifies how quickly the incident should be addressed. See **Priority Data lookup rules** table below.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Values are: ○ 3 - Moderate ○ 4 - Low ○ 5 - Planning
Category	Select a category for the incident. Choices are: ○ --None-- ○ Inquiry/Help (default) ○ Software ○ Hardware ○ Network ○ Database
Urgency	Select a measure of how long the resolution can be delayed until an incident has a significant business impact. Urgency affects **Priority**.
Service	Select a service associated with the incident.
Severity	Select a severity to associate with the incident by typing or searching. Choices are: ○ 1 - High ○ 2 - Medium ○ 3 - Low
Configuration item	Select a asset to associate with the incident by typing or searching.
Assigned to	Assign team member to work on the incident by typing or searching.
State	Choose a state for the incident. Choices are: ○ New (default) ○ In Progress ○ On Hold ○ Resolved ○ Canceled See SRM incident states for more information.
Watchlist	Select individuals to watch the incident by typing or searching.
Resolution code	Select a resolution code when you have one. Choices are: ○ None (default) ○ Duplicate ○ Known error ○ No resolution provided ○ Resolved by caller ○ Resolved by change

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ Resolved by problem ○ Resolved by request ○ Solution provided
Resolution notes	Enter any relevant resolution information.

Note: Priority is calculated according to the following sample data lookup rules:

Priority Data lookup rules

Impact	Urgency	Priority
1 - High	1 - High	1 - Critical
1 - High	2 - Medium	2 - High
1 - High	3 - Low	3 - Moderate
2 - Medium	1 - High	2 - High
2 - Medium	2 - Medium	3 - Moderate
2 - Medium	3 - Low	4 - Low
3 - Low	1 - High	3 - Moderate
3 - Low	2 - Medium	4 - Low
3 - Low	3 - Low	5 - Planning

6. Select **Save**.
   The incident is created and the new incident form displayed.
7. Add an attachment related to the incident in the **Actions** panel using the **Attachments** icon .
8. Create an incident template using the Template icon .
9. Start or join a Zoom meeting, Microsoft Teams, or Slack channel in the **Collaboration** panel..
10. Select **Save**.
    The incident appears with comments, work notes, and incident activity captured in the **Activity** stream. For more information on incident fields, see SRM incidents.

Reassign an SRM incident

Reassign an incident to a responder when the incident tasks should be addressed by a particular team member.

Before you begin

This action is available when the **Assigned to** field in the incident is populated.

Role required: srm_manager, srm_responder, or srm_admin

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Reliability tasks** ( ).
3. Select the **Incidents** tab.
4. You have two options.

Option	Description
Option	Description
In the incident list view	Double-click the **Assigned to** field for the inci dent and replace the team member from the list menu.
In the Details tab of incident form	Delete the name in the **Assigned to** field and reassign. Select **Save**.

The incident is now assigned to the new responder and an email notification sent. The assignee is displayed in the list view and on the form.

Update the priority of an SRM incident

If the priority of an incident should be changed, you can manually update it to reflect its new criticality.

Before you begin

Role required: srm_manager, srm_responder, or srm_admin

Procedure

1. Navigate to **Workspaces** > *`Service Operations Workspace`*.
   You're taken to your SRM Home page.

Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Reliability tasks** ( ).
3. Select the **Incidents** tab.
4. In the Incident list view, select a **Priority** value from the list menu.
   - 1 - Critical
   - 2 - High
   - 3 - Moderate
   - 4 - Low
   - 5 - Planning (default)
5. Select **OK**.
   The new priority is reflected in the incident list view and incident header and form field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add a service to an SRM incident

Add a service to an incident to increase the amount of data for the incident.

Before you begin
Role required: srm_manager, srm_responder, or srm_admin

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Reliability tasks** ( ).
3. You have two options.

Option	Description
In the incident list view	Double-click the **Service** field for the incident and replace the team member using search. Select **OK**.
In the incident form	Select a new **Service** value from the list menu. Select **Save**.

   For value choices see SRM incidents.
   The new service is displayed in the incident list view and incident form.

Add resolution code and notes to an SRM incident

Add a resolution code and notes to an incident when you have resolved the incident.

Before you begin
Role required: srm_manager, srm_responder, or srm_admin

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Reliability tasks** ( ).
3. Open the incident.
4. In the Incident **Details** panel, select a **Resolution code** from the list menu.
5. Enter text in the **Resolution notes** text box.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The resolution notes are displayed in the **Activity** timeline panel.

6. Select **Save**.

Copy an SRM incident

Copy an incident, if you have a similar issue.

Before you begin

Role required: srm_manager, srm_responder, or srm_admin

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Reliability tasks** ( ).
3. Open the incident you want to copy.
4. Using the list menu under the More option button, select **Copy incident**.
5. Select a team member from the list menu for the **Caller** field.
   After the incident is copied, the **Activity** timeline of the new incident is updated with the original incident as a work note.

Resolve an SRM incident

Resolve an incident, if you need it reviewed, or you think it has already been handled, but aren't ready to close it.

Before you begin

Role required: srm_manager, srm_responder, or srm_admin

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Reliability tasks** ( ).
3. Select the **Incidents** tab.
4. You have two options.

Option	Steps
In the incident list view	**a.** Double-click the **State** field (or use the key board shortcut) for the incident and select from the list menu. **b.** Select **OK**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Steps
	Tip: If you have the srm_admin role, you can update multiple incidents at once. First, select the relevant incidents and select **Edit**. Then use the **State** drop-down to choose the appropriate value and select **Update**.
In the incident form	**a.** Select a new **State** field value from the list menu. **b.** Select **Save**.

For value choices, see SRM incidents.
The new state is displayed in the incident list view, incident form, and form header.

Result
Resolved incidents remain in the Incidents list view. Check your filters if you don't see them.

Note:

When you resolve an incident, the related alerts remain open until you close the incident.

Cancel an SRM incident

Close an incident, if you think it is not an issue, or if it has already been handled.

Before you begin
Role required: srm_manager, srm_responder, or srm_admin

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Reliability tasks** ( ).
3. Open the incident you want to cancel.
4. You have two options.

Option	Steps
In the incident list view	**a.** Double-click the **State** field (or use the key board shortcut) for the incident and select from the list menu. **b.** Select **OK**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Steps
	Tip: If you have the srm_admin role, you can update multiple incidents at once. First, select the relevant incidents and select **Edit**. Then use the **State** drop-down to choose the appropriate value and select **Update**.
In the incident form	**a.** Select a new **State** field value from the list menu. **b.** Select **Save**.

For value choices, see SRM incidents.
The new state is displayed in the incident list view, incident form, and form header.

Result
Canceled incidents remain in the Incidents list view. Check your filters if you don't see them.

Note:

When you cancel an incident, the related alerts are closed.

Close an SRM incident

Close an incident when it's not an issue or has already been handled.

Before you begin
Role required: srm_responder, srm_manager, or srm_admin

Procedure

1. Navigate to **Workspaces** > *`Service Operations Workspace`*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Reliability tasks** ( ).
3. You have two options.

Option	Steps
In the incident list view	**a.** Double-click the **State** field (or use the key board shortcut) for the incident and select from the list menu. **b.** Select **OK**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Steps
	Tip: If you have the srm_admin role, you can update multiple incidents at once. First, select the relevant incidents and select **Edit**. Then use the **State** drop-down to choose the appropriate value and select **Update**.
In the incident form	**a.** Select a new **State** field value from the list menu. **b.** Select **Save**.

For value choices, see SRM incidents.
The new state is displayed in the incident list view, incident form, and form header.

Result
Closed incidents remain in the incidents list view. If they don't appear, try adjusting your filters.

Note:

When you close an incident, any related alerts are closed.

Reopen an SRM incident

Reopen a closed incident if you think the issue is not yet resolved.

Before you begin
Role required: srm_manager, srm_responder, or srm_admin

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Reliability tasks** ( ).
3. Find and open the incident you want to reopen.
   Check your filters if you don't see them.
4. You have two options.

Option	Steps
In the incident list view	**a.** Double-click the **State** field (or use the key board shortcut) for the incident and select from the list menu. **b.** Select **OK**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Steps
	Tip: If you have the srm_admin role, you can update multiple incidents at once. First, select the relevant incidents and select **Edit**. Then use the **State** drop-down to choose the appropriate value and select **Update**.
In the incident form	**a.** Select a new **State** field value from the list menu. **b.** Select **Save**.

For value choices, see SRM incidents.
The new state is displayed in the incident list view, incident form, and form header.

Manually create an SRM change task

Create a change task to implement a controlled process for modifying approved and supported actions for SRM.

Before you begin

For general information on Change requests, see Using Change Management.

Role required: srm_manager, srm_responder, or srm_admin

Procedure

1. Navigate to **Workspaces** > *`Service Operations Workspace`*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. Select **Reliability tasks** ( ).
3. Select the **Changes** tab.
4. Select **New** from the **Changes** list header.
5. In the **Select a change** window, search for a change record or select an SOW change creation page card to select the type of change request.
6. Select **Next**.
7. In the form Details tab, fill in the fields on the **Change request**, **Impact**, **Assignment**, **Planning**, **Schedule**, **Notes**, and **Closure information** forms.
   For more information, see Create change request forms.
8. **Optional:** Select **Assign to me**.
9. Select **Save**.

   The change request is created and a **Related Records** tab appears for the request.

10. **Optional:** You can take the following steps in **State** workflow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

(Optional) If the change request requires approval, you'll see the **Request approval** button. Select **Request approval** and **State** moves to **Assess**. See Approve a change request for SRM for instructions on approving a change request.

If the change request is pre-approved or doesn't require approval, you can move the **State** to **Scheduled**.

Once approved and scheduled, you can select **Implement** to put the change request into action.

Once implemented, you only after reviewing the details on the change request, select Review. The change request is moved to the **Review** state.

Note: All open change tasks are set to **Canceled**.

For more information on **State** in Change requests, see, SRM change request states

Service Reliability Management reference

Reference topics provide additional information about administering Service Reliability Management.

SRM roles and responsibilities

Roles grant users access to different parts of the SRM console. Roles determine the actions that users can or can't perform in Service Reliability Management.

SRM has the following predefined roles:

Note: The SRM experience was optimized for you to having just the SRM roles. Additional roles could change the UI and have unintended consequences.

Roles List

Role	Tasks
SRM Administrator [srm_admin]	• Update a service managed by any SRM team • Assign new incidents • Create and edit incidents • Create and edit changes • Create teams • Update any SRM team • Create and edit on-call shifts • Delete on-call shifts • Create and edit escalation policies and triggers • Delete escalation policies and triggers • Schedule coverage request • Submit time off • Create event

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles List (continued)

Role	Tasks
SRM Manager [srm_manager]	• Update a service managed by your SRM team • Assign new incidents • Create and edit incidents • Create and edit changes • Create teams • Update SRM teams that you manage • Create and edit on-call shifts • Delete on-call shifts • Create and edit escalation policy and trigger • Delete escalation policies and triggers • Schedule coverage request • Submit time off • Create event
SRM Responder [srm_responder]	• Update a service if you are in the support group tied to the service • Assign new incidents • Create and edit incidents • Create and edit changes • Create teams • View on-call shifts • View escalation policies and triggers • Edit contact preferences • Schedule coverage request • Submit time off • Create event
Administrator [admin]	• Update a service managed by your SRM team • Delete services • Assign new incidents • Create and edit incidents • Create and edit changes • Delete incidents • Create teams

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles List (continued)

Role	Tasks
	• Update SRM teams that you manage • Delete on-call shifts • Override contact preferences • Manually create an alert • Delete alerts • Submit time off

Create team form

Request to create a team to start monitoring your services.

Create a team form

For more information, see Add an SRM team.

Field	Description
Team name	Name the team.
Team manager	Manager for the team.
Team email	Email contact for the team.
Team members	Members for your team.
Tags	Words that describe or relate to your team.
Briefly describe the team responsibilities	Description of your team. For example, team responsibilities or geographic location.

Create a shift form in Service Reliability Management

Set up an on-call schedule for your team to ensure that the right person is always available to quickly respond to incidents and critical alerts.

Create a shift form

For more information, see Create an SRM on-call schedule.

Create shift

Field	Description
Shift name	Name for the shift.
All day shift	If selected, the shift is an all-day commitment.
Shift starts	Date and time the shift begins.
Shift ends	Date and time the shift ends.
Repeats	Shift repetition. Choices are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create shift (continued)

Field	Description
	• Never • Daily • Weekly
Every	How often to repeat. Display depends on the time frame chosen.
More options	More options to customize your schedule.
Timezone	User time zone.
Holiday schedule	Schedule to use for the holiday.
Repeats until	Date and time to end repetition.

Create shift using shift template

Field	Description
Shift name	Name for the shift.
Template/Schedule	Existing templates for shifts. Choices are: • 24 x 7 • Off hours (workday 8:00 - 5:00) • Off hours (workday 9:00 - 5:00) • Workday 8:00 - 5:00 • Workday 9:00 - 5:00

Add service form

Create or add an existing service to your instance so that alerts and incidents on that service are available to your teams within SRM.

Add a service form

For more information, see Add a service to SRM.

Add services for your teams

Field	Description
Service name	Enter a name for your service. For example, Cloud storage service. Your teams see this name in SRM.
Service class	Select either service instance or technology management service .
Business criticality	Specify how important the service is to the business:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add services for your teams (continued)

Field	Description
	• 1 - most critical • 2 - somewhat critical • 3 - less critical • 4 - not critical
Operational status	Select the status of your service: • Operational • Non-operational • Repair in Progress • DR Standby • Ready • Retired • Pipeline • Catalog
Short description	Describe your service to help your teams understand its purpose and other relevant information.

Edit service details form

Edit an existing service owned by your team.

Service Details form

For more information, see Edit service details in SRM.

Field	Description
Name	Name of the service.
Support group	SRM team managing the service.
Business criticality	How important this service is the business.
Owned by	Service owner. May not be part of an SRM team.
Operational Status	Status for the service's ability to perform operational functions.
Stakeholders	Product owners or service consumers who determine the target availability of a service.
Environment	Choices are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	• None • Development • Production • Test
Managed by group	Team manager responsible for the service. Add by search or edit using the text editor.
Change group	Team responsible for changes. Add by search or edit using the text editor.
Status	Status of the service.
Life Cycle Stage	Choices are: • Deploy • Design • End of Life • Ideation • Operational
Phase	Phase of the service. Choices are: • None • Pipeline • Catalog • Retired
Location	Address where the service resides. Add by search or edit using the text editor.
Used for	Purpose for the service. Choices are: • Production (default) • Staging • QA • Test • Development • Demonstration • Training • Disaster recovery
Short description	Additional information about the service.
Support by	SRM team managing the service. Add by search or edit using the text editor.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set up escalation policies form in SRM

Escalation policies define the order and conditions in which members or devices receive notifications.

Escalation policy form

Field	Description
Name	Name of the escalation policy.
Active on shift	Team that receives the notifications on their shift..
Create from scratch	Option to create your own policy.
Create from template	Option to create a policy by using a template created by your admin.
Description	Text describing the policy.
Active	Option to activate or deactivate the policy.
Use as default	Option to use this team as the default
Order	Order of execution. This is the hierarchy or chain of command. When there are multiple escalation policies with the same conditions for a team, the escalation policy with the smaller order number is executed first.
Conditions	Conditions for the policy. The table and conditions that define the escalation policy These conditions are checked after the escalation is started by an escalation trigger. If the conditions are met, the policy is run.
Escalation steps	Escalation steps to add. See the Escalation steps form for more information about the fields.
Escalation notifications	Notification conditions for the policy. **Note:** When user preference override is on, your escalation policy overrides any policy that the on-call agents set for their own notification preferences. When user preference override is off, the on-call agents' notification preferences take priority over this escalation policy.
Add notification step	Additional notification steps to add. You can select email, call, or SMS. You can add as many attempts as you like.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Escalation steps form

Add escalation step

Field	Description
Escalation step name	Name of the escalation step.
Order	Order of execution. This is the hierarchy or chain of command.
Responder level	Level of authority or expertise needed to respond to the incident.
Rotate through members	Option to notify all members, one by one, until one of them acknowledges the incident or until all of them are notified.
Additional audience	Specific users, teams, groups, or devices that you want to notify.
Time to next step after last notification	The maximum amount of time that will pass before the issue is escalated to the next step. For example, if a responder can't resolve the issue within 30 minutes of the notification, the issue is escalated to the manager.

Domain separation and SRM

Domain separation is supported for Service Reliability Management (SRM).

Support level: Basic*

The support level is Basic but has some exceptions or special conditions.

- Business logic: Ensure that data goes into the proper domain for the application’s service provider (SP) use cases.
- The user interface, cache keys, reporting, rollups, and aggregations all use the domain at production run time.
- The owner of the instance must be able to set up the application to function across multiple tenants.

Sample use case: When an SP uses chat to respond to a tenant-customer’s message, the client must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Overview of domain separation

- Domain separation is present in all metadata tables in the application. Instance level tables also have domain separation explicitly. Other internal tables, such as the internal Team Request table, are domain-separated implicitly by referencing domain-separated records.
- System properties are not domain-separated, which has implications for Team Management features. The properties are shared by multiple domains and are set at the instance level. Domain-specific setup for these is not supported.
- Where another application is being leveraged (for example the Event Management Connectors) domain separation is determined by the domain-separation capabilities of that application.

How domain separation works in the Service Reliability Management application

The specific conditions indicated by the Basic* support level rating above relate to team management:

- New teams created through a catalog item backed by an Integration Hub flow are setup by the Service Operations Workspace administrator. They can initiate it from the Service Portal. An SRM admin, manager or responder can do it through the SRM workspace. Instructions appear in the SRM documentation.
- Integration Hub subflows and actions control management of SRM teams.
- Only one catalog item and flow can be set up for each instance. The customer is responsible for setting up team properties to support domain separation as a customization of the existing flows.
- The requestor of a team catalog item is associated with the domain and is available as part of the request item. As a result, if needed, the requester can create the team in a specific domain or the catalog Item and extend it to capture the domain another way. In either case, the Service Operations Workspace must make changes to the Integration Hub flows and actions to support this.

For more information, see Domain separation and On-Call Scheduling.

Domain separation for service providers

Create change request forms

Fill out the fields in the forms to create a change task to implement a controlled process for modifying approved and supported actions for SRM.

Change request form

Create a new change request. For more information, see Manually create an SRM change task.

Field	Description
Short description	Brief description of the change request.
Description	Description based on Short description.
Number	Identifier for the change request.
Category	Category for the change request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Choices are: • Hardware • Software • Service • System Software • Application Software • Network • Telecom • Documentation • Other (default)
Model	Model to use for the change request. Standard (default)
Risk	Risk the issue poses. Choice are: • High • Moderate (default) • Low
Type	Type of change request. Standard (default). Read-only.
Impact	Impact the issue poses. Choices are: • 1 - High • 2 - Medium • 3 - Low (default)
State	State of the change request. Choices are: • New (default) • Assess If approval is required further states are unavailable. • Scheduled • Implement • Canceled
Work notes list	Team members to receive notifications when work notes are added.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: An administrator must have already created an email notification for the work notes list for this to be available.
Work notes	Any additional information related to the request.

Impact, Assignment, Planning, Schedule, Notes, and Closure information

Field	Description
Configuration item	Asset affected by the issue.
Service	Service affected by the issue.
Service offering	Service offering affected by the issue.
Assignment group	Team assigned to the change request
Assigned to	User assigned to the change request.
Justification	Reasoning for the change request.
Implementation plan	Imported text.
Risk and impact analysis	Analysis of risk and impact of the issue.
Backout plan	Imported text.
Test plan	Imported text.
Planned start date	Expected date to begin change.
Planned end date	Expected date to finish change.
Actual start date	Date change implementation began.
Actual end date	Date change implementation ended.
Conflict status	Not run. Read-only.
Conflict last run	Based on Conflict status. Read-only
Watch list	Interested users.
Work notes list	Team members to receive notifications when work notes are added. **Note:** An administrator must have already created an email notification for the work notes list for this to be available.
Additional comments	Additional notes for the request.
Work notes	Additional notes on the work done for the request
Close code	Code for the change request. Choices are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	• None (default) • Successful • Successful with issues • Unsuccessful
Close notes	Notes on the change request closure.

SRM incident states

Incidents can be in a few different states depending on how they are acted on.

An incident is created in SRM when a third-party monitoring tool has an event. Incidents can be manually created or assigned. Edit actions from the incident form using the state button in the form. Use the **Save** button in the form to keep any changes you've made. Changes to incidents in the list view are automatically saved.

Incident states

State	Description
New	State on incident creation. The incident is logged but not yet worked on.
In Progress	The incident is assigned being worked on.
On Hold	The responsibility for the incident shifts temporarily to another entity to provide further information, evidence, or a resolution.
Resolved	A satisfactory fix is provided for the incident to ensure that it does not occur again.
Closed	The incident is closed when it is confirmed that the incident is satisfactorily resolved.
Canceled	Incident was triaged but found to be a duplicate incident, an unnecessary incident, or not an incident at all. To reopen an incident. Select **New**.

SRM alert states

Alert can be in a few different states depending on how they are acted on.

An alert is created in SRM when a third-party monitoring tool has an event. Alerts are manually assigned. An alert is one of four states. You can edit actions from either the Alerts list or the Alert form. Use the **Save** button in the form to keep any changes you've made. Changes to Alerts in the list view are automatically saved.

Note: You can acknowledge and assign an alert in any state.

Alert actions

State	Description
Open	State on alert creation. From this state you can acknowledge and set to: **Flapping**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert actions (continued)

State	Description
	Flapping occurs when the event source continues to generate events even after its associated alert has been closed. See Configure alert flapping for more information on event flapping. **Closed** Closes the alert.
Reopen	From this state you can acknowledge and set to: **Open** Sets the alert to the **Open** state. **Flapping** Flapping occurs when the event source continues to generate events even after its associated alert has been closed. **Closed** Closes the alert.
Flapping	Flapping occurs when the event source continues to generate events even after its associated alert has been closed. From this state you can set to: **Open** Sets the alert to the **Open** state. **Reopen** Reopens the alert. **Closed** Closes the alert.
Closed	From this state you can set to: **Open** Sets the alert to the **Open** state. **Reopen** Reopens the alert. **Flapping** Flapping occurs when the event source continues to generate events even after its associated alert has been closed.

SRM change request states

Incidents can be in a few different states depending on how they are acted on.

Change requests can be manually created in SRM. Edit actions from the change request form using the state field in the form or using buttons in the change request record. Use the **Save** button in the form to keep any changes you've made. Changes to change requests in the list view are automatically saved.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Change request states

State	Description
New	State on change request creation. The request is logged but not yet worked on.
Assess	The change request approval is being worked on.
Scheduled	The change request is scheduled for work.
Implement	The change request is taking action.
Review	The change request is moved to the **Review** state. **Note:** All open change tasks are set to **Canceled**.
Closed	The change request is closed.
Canceled	Change request was triaged but found to be a duplicate, or unnecessary. **Note:** You cannot reopen a canceled changed request.

CMDB service classes

Service Reliability Management (SRM) typically supports several Configuration Management Database (CMDB) service classes.

Types of CMDB service classes that SRM supports:

- Service instances (cmdb_ci_service_auto)
- Technology management services (cmdb_ci_service_technical)
- Query-based services (cmdb_ci_query_based_service)
- Mapped application services (cmdb_ci_service_discovered)
- Calculated application services (cmdb_ci_calculated)
- Tag-based application services (cmdb_ci_service_by_tags)

Troubleshoot SRM

Find answers to issues that you may encounter when using Service Reliability Management (SRM).

Condition

When trying to remove a service from SRM, you see one of the following messages:

- `<service-name> couldn't be removed from SRM. Check your permissions. Only SRM team managers can remove their team's services.`
- `<x> services couldn't be removed from SRM. Check your permissions. Only SRM team managers can remove their team's services.`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cause

You're not assigned the required role to remove the selected services. As an SRM manager, you can only remove services that belong to your teams. You can still view and filter services across teams, but you can't remove services owned by another team.

Remedy

To remove the service from SRM, follow these steps to identify the manager to contact:

1. Navigate to **Workspaces** > *`Service Operations Workspace`* > **Services**.
2. Select the filter icon ( ) and remove the existing filters, letting you view services not assigned to your teams.
3. Find and select the service you want to remove.
4. Select the **Details** tab and then select the information icon ( ) in the Support group field.

The manager's name appears below the team name. Contact the manager to request the removal of the service from SRM.

ITOM Mobile Agent

Stay connected and keep services reliable with ITOM Mobile Agent, which lets you access Service Reliability Management (SRM) features on iOS and Android devices. Use it to track alerts, manage incidents, work on change and catalog tasks, and manage on-call shifts on the go.

Explore ITOM Mobile Agent

Learn how you can use ITOM Mobile Agent to manage service reliability on the go, including its capabilities, benefits, and a sample workflow.

ITOM Mobile Agent overview

Use ITOM Mobile Agent to access Service Reliability Management (SRM) features on iOS and Android devices. With ITOM Mobile Agent, you can track alerts, manage incidents, and work on change and catalog tasks on the go. You can also manage on-call schedules by checking shifts, requesting time off, and filling scheduling gaps.

To help you manage service reliability in one place, ITOM Mobile Agent auto-integrates with existing ServiceNow mobile apps. It runs in the ServiceNow Agent app and automatically includes ITSM Mobile Agent features. With that setup, you can manage alerts, incidents, on-call schedules, and tasks in one mobile app.

Note: If you already use ITSM Mobile Agent for incidents, on-call schedules, and tasks, install ITOM Mobile Agent to add alerts to your mobile experience. With ITOM Mobile Agent, you get and configure alert notifications and view alerts in the My work, My team, and Notifications tabs. See Install ITOM Mobile Agent for installation instructions.

ITOM Mobile Agent users

The following table lists user roles and what each user can do in ITOM Mobile Agent:

User	Description
Admin	Admins install ITOM Mobile Agent so teams can access service reliability features on the go.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

User	Description
SRM admin	SRM admins customize alert and incident notifications for ITOM Mobile Agent. They make sure that the relevant people are aware of critical issues.
SRM manager	SRM managers track team progress, monitor unassigned issues, and review performance metrics. They also handle on-call schedules, including shift rescheduling, time-off requests, and scheduling gaps.
SRM responder	SRM responders manage alerts, incidents, and tasks on the go. They accept, assign, and close alerts; create and collaborate on incidents; and process critical issues. They can also view upcoming shifts and request time off.

ITOM Mobile Agent workflow

This sample workflow shows how ITOM Mobile Agent helps you manage services and the teams assigned to them:

1. Monitoring tools generate critical alerts when they detect issues, and the ITOM Mobile Agent system sends mobile alert notifications to on-call responders.
2. As an on-call SRM responder, you acknowledge, reassign, or close the alerts. If needed, you create incidents from the alerts, and then the ITOM Mobile Agent system assigns them to the appropriate team.
3. You troubleshoot and collaborate on incidents, escalating them to major incidents when necessary, and then resolve and close the incidents, providing relevant details as needed.
4. As an SRM manager, you adjust shifts, approve time-off requests, and resolve scheduling gaps for the on-call responders. Use dashboards to view alert trends, incident resolution times, and team performance.

ITOM Mobile Agent benefits

Working with ITOM Mobile Agent has the following benefits:

Improve service reliability

Minimize downtime by managing alerts and incidents on the go.

Respond to issues faster

Keep on-call engineers connected, letting them accept, assign, and close alerts from anywhere.

Notify the right people

Customize push notifications to make sure that the relevant people are aware of critical issues.

Boost collaboration

Help teams work efficiently by managing on-call schedules and filling coverage gaps on mobile.

- Configure ITOM Mobile Agent
- Use ITOM Mobile
- ITOM Mobile Agent reference

Configure ITOM Mobile Agent

Set up and configure ITOM Mobile Agent.

Configuration overview

Use the pages in this section to set up and configure ITOM Mobile Agent. The information covers required and optional setup steps, including installing the app, managing alerts, and customizing alert recipients.

ITOM Mobile Agent auto-integrates with ITSM Mobile Agent, so you can manage alerts, incidents, and on-call schedules from the same mobile app. Where relevant, this section links to ITSM Mobile Agent content, providing additional configuration options for your mobile experience.

Required configuration steps

If you're an admin, start by installing ITOM Mobile Agent. If you're a Service Reliability Management admin, manager, or responder, you can start by downloading the ServiceNow Agent app and then logging in.

- Install ITOM Mobile Agent
- Download the ServiceNow Agent app
- Log in to ITOM Mobile Agent

Optional configuration steps

After you log in to ITOM Mobile Agent, you can work with the core features. Visit the following links to configure and customize ITOM Mobile Agent further to meet your team's needs:

- Configure when to send alert notifications for ITOM Mobile
- Customize ITOM Mobile Agent email recipients
- Customizing other mobile settings for ITOM Mobile Agent

Install ITOM Mobile Agent

Install and give your teams access to ITOM Mobile Agent.

Before you begin

Service Reliability Management (SRM) services, service integrations, teams, and on-call schedules must be set up. ITOM Mobile Agent connects to your existing SRM setup, helping your teams manage alerts, incidents, tasks, and on-call schedules.

Role required: admin

About this task

ITOM Mobile Agent runs in the ServiceNow Agent app. When you install ITOM Mobile Agent, your teams can access it in the ServiceNow Agent app on their devices.

This procedure is for admins managing mobile access for their teams. If you aren't an admin and want to use ITOM Mobile Agent on your mobile device, see Download the ServiceNow Agent app.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Search for and select ITOM Mobile Agent.
   If you can't find ITOM Mobile Agent, request it from the ServiceNow Store.
3. Review the listed dependencies and, if needed, install the required plugins and applications.
4. Select **Install**.

   After the application is installed, your teams can access ITOM Mobile Agent by downloading the ServiceNow Agent app and logging in to the relevant instance.

What to do next

To start using ITOM Mobile Agent, see Download the ServiceNow Agent app and Log in to ITOM Mobile Agent.

You can also customize ITOM Mobile Agent to meet your team's needs:

- Configure when to send alert notifications for ITOM Mobile
- Customize ITOM Mobile Agent email recipients
- Customizing other mobile settings for ITOM Mobile Agent

Download the ServiceNow Agent app

Download the ServiceNow Agent app to use ITOM Mobile Agent on your device.

Before you begin

ITOM Mobile Agent must be installed. See Install ITOM Mobile Agent for more information.

Role required: srm_manager, srm_responder, or srm_admin

About this task

The ITOM Mobile Agent application runs in the ServiceNow Agent app. To access ITOM Mobile Agent, download the ServiceNow Agent app on your device.

Procedure

1. Download the ServiceNow Agent app for your device:
   - For iOS, use the App Store.
   - For Android, use Google Play.
2. Confirm that the app is on your device.

   Look for the ServiceNow Agent app icon ( ). The app appears on your device with the name Agent.

What to do next

To start using ITOM Mobile Agent, see Log in to ITOM Mobile Agent. You must log in to receive push notifications about alerts and incidents.

Log in to ITOM Mobile Agent

Log in to your ITOM Mobile Agent instance on the ServiceNow Agent app to manage alerts, incidents, and on-call schedules on the go.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

ITOM Mobile Agent must be installed, and the ServiceNow Agent app must be downloaded on your device. See Install ITOM Mobile Agent and Download the ServiceNow Agent app for more information.

You must also have your instance address, for example `nebula-dev.service-now.com`, or a QR code for the instance. If you don't have one, contact your admin.

Role required: srm_manager, srm_responder, or srm_admin

Procedure

1. Tap the ServiceNow Agent icon ( ) on your device.
2. Enter the address of your instance manually or with a QR code.

Option	Description
Manual entry	Replace `example.service-now.com` with the address of your instance. You don't need to include `service-now.com`. For example, enter `nebula-dev` for `nebula-dev.service-now.com`.
QR code	Tap the QR code icon and scan the QR code.

3. **Optional:** In the **Nickname** field, enter an alternative name for your instance.
   Alternative names can help you quickly navigate between different instances on your device.
4. Tap **Save and log in**, enter your credentials, and then tap **Log in**.
   The app displays `Logged into <instance-name> as <username>` and the ITOM Mobile Agent **My work** tab.

> **Note:** You must be logged in to get push notifications about alerts and incidents. If you aren't, you only get email notifications.

What to do next

Visit these links to start using ITOM Mobile Agent:

- Work with alerts in ITOM mobile
- Managing incidents and major incidents on mobile
- Working with On-Call Scheduling on mobile
- Working with tasks on mobile

Configure when to send alert notifications for ITOM Mobile

Keep your teams informed by configuring when ITOM Mobile Agent sends a notification about an alert.

Before you begin

Role required: admin

About this task

By default, ITOM Mobile Agent sends a push notification and email when an alert meets these conditions:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Assigned to is empty** - The alert isn't assigned to anyone.
- **State is not Closed** - The alert state isn't closed. It's either empty, flapping, open, or reopen.
- **Severity is Critical** - The alert severity is critical. It isn't clear, empty, OK, major, minor, or warning.

You can update those conditions as needed. For example, the ITOM Mobile Agent app can send notifications for both critical and major alerts. However, if you customize the conditions, the conditions don't receive future release updates. That behavior is intentional to avoid overwriting your work.

Note: To get push notifications, you must log in to ITOM Mobile Agent. If you log out, you only get email notifications.

This procedure is for admins configuring alert push notifications and emails. To manage other notification features, see Customizing other mobile settings for ITOM Mobile Agent.

Procedure

1. Navigate to **All** > *Mobile App Builder*.
2. Search for and select **ITOM Mobile Agent**.
3. Select **Mobile notifications**.
4. In the **When to send** section, update or add to the assigned to, state, and severity conditions. For example, adding the condition **OR [Severity][is][Major]** under the condition **[Severity][is][Critical]** sends a push notification and email when the **Severity** field of an alert is Critical or Major.
5. Implement your changes by selecting **Save**.
   The page displays `Your changes have been saved.`

What to do next

To customize who receives emails about alerts, see Customize ITOM Mobile Agent email recipients. You can also customize other notification features, such as setting custom notification tones and overriding the Do Not Disturb setting for critical issues. See Customizing other mobile settings for ITOM Mobile Agent for more information.

Customize ITOM Mobile Agent email recipients

Customize who receives emails about alerts to help reduce notification overload and efficiently delegate responsibilities.

Before you begin

Role required: srm_admin or admin

About this task

By default, ITOM Mobile Agent sends emails about alerts to everyone in a team's group email. You can customize the email recipients as follows:

- Exclude managers from alert emails, reducing notification overload.
- Include individual team members on alert emails, making sure that the right people stay informed.

Procedure

1. Navigate to **All** > **Service Reliability Management** > **Teams**.
2. In the list, find the team that you want to customize.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Choose one or more options to include or exclude certain recipients from email alerts.

Option	Instruction
Exclude managers from alert emails	In the **Exclude manager** column, set **false** to **true**.
Include individual team members on alert emails	In the **Include members** column, set **false** to **true**.

4. Save your changes by selecting the check mark.
   Your updates appear in the **Teams** list, and ITOM Mobile Agent sends emails accordingly.

Customizing other mobile settings for ITOM Mobile Agent

Learn how to customize your mobile experience further. Configure actionable notifications, set custom notification tones, and override the Do Not Disturb setting for critical issues to help your teams stay informed.

Explore other settings

ITOM Mobile Agent auto-integrates with ITSM Mobile Agent, letting you manage alerts, incidents, and on-call schedules from the same mobile app. Visit the following ITSM Mobile Agent documentation to learn about customizing mobile notifications.

- Configurable actionable notifications for ITSM Mobile Agent
- Enable Push notification categories for ITSM Mobile Agent
- ITSM Mobile email notification redirection via web
- Set custom alert tones in ITSM Mobile Agent for different incident priority
- Enable Override do not disturb to receive critical alerts

Use ITOM Mobile

Work with alerts, incidents, on-call schedules, and tasks on the go.

ITOM Mobile Agent tasks

Work with alerts in ITOM mobile

Manage alerts on the go. Learn how to assign, reassign, and close alerts in ITOM Mobile Agent. You can also add work notes to alerts and create incidents from alerts.

Add work notes to an alert

Add work notes to an alert to update your team, share important information, and document your actions.

Role required: srm_manager, srm_responder, or srm_admin

1. On your device, tap the ServiceNow Agent icon ( ).
2. Tap the **Notifications** tab and select the relevant alert.
3. Tap the More options icon ( ).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select **Add work notes** and enter your notes.
5. Save and add your notes to the alert by tapping **Submit**.

ITOM Mobile Agent displays `Success! Comments added`. The assigned team member also receives a push notification that the alert has had comments added.

To view an alert's work notes on mobile, navigate to the alert and select the **Activity** tab.

Assign an alert

Assign an alert to make sure the correct team member acts on it. You can assign an alert to yourself.

Role required: srm_manager, srm_responder, or srm_admin

1. On your device, tap the ServiceNow Agent icon ( ).
2. Tap the **Notifications** tab and select the relevant alert.
3. Tap the More options icon ( ) and select **Assign alert**.
4. Tap **Assigned to** and select a team member to assign the alert to.
5. Implement your changes by tapping **Submit**.

The assigned team member receives a push notification that the alert has been assigned to them. The alert also appears in their **My work** tab.

Close an alert

Close an alert to show that the issue is resolved or that no further action is needed.

Role required: srm_manager, srm_responder, or srm_admin

1. On your device, tap the ServiceNow Agent icon ( ).
2. Tap the **Notifications** tab and select the relevant alert.
3. Tap the **More options** icon ( ) and select **Close alert**.

ITOM Mobile Agent displays Alert closed successfully. The alert no longer appears in the assigned team member's **My work** tab.

To view closed alerts that were assigned to you, tap **My work** and then tap **See all** in the My Alerts section. The **Closed** tab shows your closed alerts.

Create an incident from an alert

Create an incident when an alert signifies a critical issue that disrupts or could disrupt your system.

When you create an incident from an alert, ITOM Mobile Agent assigns the incident to the same team but not the same responder. For example, if the alert is assigned to the Network Ops team and responder Alex, the incident is assigned to the Network Ops team.

Role required: srm_manager, srm_responder, or srm_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. On your device, tap the ServiceNow Agent icon ( ).
2. Tap the **Notifications** tab and select the relevant alert.
3. Tap the **More options** icon ( ) and select **Create incident**.

ITOM Mobile Agent displays a notification similar to `INC0013579 was created from Alert0002468`. You can view the incident in the **My team** tab. For more information about managing incidents in ITOM Mobile Agent, see Managing incidents and major incidents on mobile.

Note: If you don't see the option to create an incident from an alert, make sure that the alert is assigned to a team. To assign the alert to a team, see Assign alerts in Express List. In the Express List, teams are also known as assignment groups.

Reassign an alert

Reassign an alert to make sure the correct team member or an available team member acts on it. You can reassign an alert to yourself.

Role required: srm_manager, srm_responder, or srm_admin

1. On your device, tap the ServiceNow Agent icon ( ).
2. Tap the **Notifications** tab and select the relevant alert.
3. Tap the **More options** icon ( ) and select **Reassign alert**.
4. Tap **Assigned to** and select a team member to reassign the alert to.
5. Implement your changes by tapping **Submit**.

ITOM Mobile Agent displays Alert reassigned successfully. The assigned team member receives a push notification and the alert appears in their **My work** tab.

Managing incidents and major incidents on mobile

Manage and resolve incidents on the go using ITOM Mobile Agent. Learn how to create, process, and collaborate on incidents on your mobile device. You can also track and collaborate on major incidents.

ITOM Mobile Agent auto-integrates with ITSM Mobile Agent, letting you manage alerts, incidents, and on-call schedules from the same mobile app. Refer to the following ITSM Mobile Agent documentation to learn about managing incidents on your mobile device.

Manage an incident

Settings

Synthetic monitoring

The ServiceNow® synthetic monitoring application empowers organizations to proactively manage and enhance the performance and availability of critical services. By simulating user transactions on API endpoints, this solution identifies performance bottlenecks, helps ensure up-time, and optimizes user experiences.

Get started

Explore Learn about synthetic monitoring	Configure Add users and create and manage a synthetic monitor
Identify Use synthetic monitoring to identify performance issues	Reference Find reference information about synthetic monitoring

Exploring synthetic monitoring

Learn how synthetic monitoring provides proactive, automated testing of service endpoints. By simulating user interactions, it can identify bugs, performance issues, and outages before they impact real users.

Synthetic monitoring overview

Synthetic monitors continually call HTTP endpoints in the Configuration Management Database (CMDB) to test availability, response times, or the presence of a defined string in the response body. When a test fails the configured criteria, it can alert you to endpoint issues before your customers do.

For example, you might create a monitor that tests the *GET* HTTP endpoint of a service. You could configure that monitor to check for a status code of 200 and a response time of under 500

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ms. If any code other than 200 is returned or the request takes longer than 500 ms, the test fails. An alert can then be generated and sent through Event Management.

The synthetic monitoring tests can be run by an Agent Client Collector (ACC) deployed in your network, on a MID Server, or on the ServiceNow platform.

Note: The HTTP endpoints must exist in the HTTP Endpoints [cmdb_ci_endpoint_http] table. Endpoints tested from the ServiceNow platform must be publicly accessible.

Monitor creation options

You can create synthetic monitors in the following ways:

Manual monitor creation

Create monitors for any HTTP endpoint by manually configuring the endpoint details. See Create and edit a synthetic monitor.

Monitors for discovered APIs

Create monitors for APIs discovered through API Insights. Each discovered API is represented in the Configuration Management Database (CMDB) as an API component CI, and you create the monitor directly against that existing CI. See Create a synthetic monitor for a discovered API.

Monitors from incidents

Create monitors directly from incident records to prevent future occurrences. See Create synthetic monitors from incidents.

Synthetic monitoring users

Synthetic monitoring users

User	Description
Synthetic monitoring administrator (Admin role)	Assigns roles, creates and edits monitors, and views monitor tests and their results.
Service owner (Editor role)	Creates and edits monitors and can also view monitor tests and their results.
Network operation center (NOC) operator (Viewer role)	Monitors tests and their results.

Synthetic monitoring customer-hosted workflow

Synthetic monitoring workflow

Admins, service owners, and NOC operators use synthetic monitoring in the following way:

1. As a service owner, you determine which endpoints to monitor based on business criticality.
2. As an admin or service owner, you configure locations to run the monitor from.

Note: The ServiceNow hosted location is available by default and doesn't need to be configured. However, endpoints tested by that location must be publicly available. You can also run the monitor from an ACC Proxy cluster or a MID Server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. As an admin or service owner, you configure the monitor and then after it runs once, review the results of the tests. If the results aren't successful, you troubleshoot the configuration. You can also create an alert that fires when a test fails.
4. Synthetic monitoring runs tests based on the monitor's configuration and reports the results of each test.
5. As a service owner or operator, you monitor the test results and also respond to any generated alerts.

Synthetic monitoring benefits

Synthetic monitoring benefits

API discovery and synthetic monitoring integration

Synthetic Monitoring integrates with API Insights to enable proactive monitoring of discovered APIs.

How the integration works

API Insights discovers APIs across your estate and represents each one in the Configuration Management Database (CMDB) as an API component CI. You create a synthetic monitor directly against that existing API component CI — Synthetic Monitoring does not create a new CI.

The integration eliminates manually configuring endpoint details, as the API component CI already captures the endpoint URL and HTTP method. If the API is related to an application service in the CMDB, that relationship is used to populate the monitor's service automatically. Service relationships are optional and may not be present for every discovered API.

Benefits

- The API component CI already carries the endpoint URL and HTTP method, so you don't configure them manually
- Proactive monitoring identifies issues before users are impacted
- Continuous validation of API availability and performance
- Integration with existing CMDB relationships and service mapping
- Consistent monitoring across all discovered APIs

Workflow

The following workflow describes how API discovery integrates with synthetic monitoring:

1. API Insights discovers an API endpoint in your environment and represents it in the CMDB as an API component CI.
2. You create a synthetic monitor directly against that existing API component CI. See Create a synthetic monitor for a discovered API.
3. The monitor continuously tests the API at the specified frequency.
4. Test results are displayed on the monitor details page.
5. Alerts are generated when tests fail based on your configured criteria.

Discovery sources

Synthetic monitors can be created for APIs discovered through the following sources:

API Insights

APIs discovered and cataloged through the API Insights application. The application provides visibility into API usage, performance, and dependencies.

Multi-service monitoring for shared endpoints

A single HTTP endpoint or discovered API is tagged to more than one application service so every team that depends on it is notified when it fails.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Why tag more than one service

In earlier releases, an HTTP endpoint check or a discovered API check could relate to only one application service. If a shared endpoint served several teams, each team had to create its own check against the same endpoint. This was necessary to see that endpoint's health reflected against their own service.

You can now tag a single HTTP endpoint or discovered API to multiple application services. One check now represents every team that depends on that shared endpoint. The underlying CMDB relationships between the endpoint and each application service are preserved rather than replaced when a new service is added.

How it works

When you select more than one application service for an HTTP endpoint or discovered API, synthetic monitoring creates a Connects to::Connected by relationship between the endpoint and each service you select. Adding a new service to an endpoint does not remove the relationships to services that were already tagged.

The endpoint's related services list shows every application service tagged to it, with duplicate entries removed, so each team can see which other services share the same endpoint.

When a shared endpoint fails a test, the resulting event is evaluated against every application service tagged to that endpoint, and each of those services can show the impact on the Service Health dashboard.

Note: Alert routing to each team individually is not part of this release. All teams tagged to a shared endpoint currently see the same alert configuration for the check.

otherprops="store-2026-09">How the Service Health dashboard resolves impacted services depends on how the endpoint was added to the CMDB:

Endpoints created directly in synthetic monitoring

Impacted services display on the Service Health dashboard through an automatic fallback mechanism.

Important: When you upgrade to a higher platform version, manually created entries must be repopulated using upgrade scripts. Contact ServiceNow support to request these scripts.

Endpoints discovered and mapped through Discovery or Service Mapping

Impacted services display on the Service Health dashboard because they're resolved through the platform's Discovery/Service Mapping model.

Where multi-service tagging applies

- HTTP endpoint checks. See Create and edit a synthetic monitor.
- API Insights discovered API checks. See Create a synthetic monitor for a discovered API.

Configuring synthetic monitoring

Plan and configure your implementation of synthetic monitoring.

Configuration overview

- Install synthetic monitoring
- Create synthetic monitoring locations

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Create and edit a synthetic monitor
- Create synthetic monitors from incidents
- Create a synthetic monitor for a discovered API
- Manage synthetic monitors

Install synthetic monitoring

You can install the synthetic monitoring application (`com.snc.uib.sow_synthetics`) with the admin role.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Review the synthetic monitoring application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.
- Confirm that the Configuration items (CI) that you want to monitor exist in the CMDB HTTP Endpoints [cmdb_ci_endpoint_http] table.
- Confirm that configured credentials exist in the Credentials [discovery_credentials] table if your endpoint requires authentication.

> **Note:** Synthetic monitoring supports API key credentials, basic authentication credentials, and OAuth.

Role required: sn_sow_synthetics.synthetics_admin

About this task

The following items are installed with synthetic monitoring:

- Plugins
- Roles
- Tables

For more information, see Components installed with synthetic monitoring.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the synthetic monitoring application (com.snc.uib.sow_synthetics) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you can't find the application, you might have to request it from the ServiceNow Store.

   In the list next to the **Install** button, the versions that are available to you are displayed.
3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box, any dependencies installed with your application are listed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. Select **Install**.

What to do next

Create synthetic monitoring locations

Create synthetic monitoring locations

Create a synthetic monitoring location to run a synthetic monitor. If you plan to run monitors from a ServiceNow hosted location, you can skip this procedure.

Before you begin

You need at least one of the following:

- A MID Server
- One or more Agent Client Collector (ACC) agent that monitors the health and performance of the HTTP endpoints to be monitored using synthetic monitoring. If you plan to run tests only from the ServiceNow hosted location, you don't need to set up a location.

Note:

- If your synthetic monitor is testing a private HTTP endpoint, your location must only include ACC agents that are within the same network boundaries as the HTTP endpoint.
- If your monitor is testing an HTTP endpoint from different datacenters, cloud providers, or geographic regions, a different location must be used for each.

Role required: sn_sow_synthetics.synthetics_admin

About this task

Synthetic monitors can be hosted from:

- A MID Server
- A cluster of Agent Client Collector agents
- A ServiceNow hosted location, as long as all monitored endpoints are publicly available. You don't need to configure a local instance as a location. It's available by default.

You can create as many locations as needed, but you must have at least one location to create a synthetic monitor.

Procedure

1. Navigate to **All** > *Service Operations Workspace* > **Configurations**.
2. Navigate to **Synthetic monitoring setup** > **Manage Locations**.
3. Select **Create a new location**.
4. Expand the Location details card and enter a unique name and an optional description for this location.
   The description should clearly state where the servers or agents in this location are running. For example, `US-1-east-cluster`.
5. In the **Location type** field, select either **MID Server** or **Agent Client Collector**, depending on where you want the monitor to be hosted.
6. Expand the **Select** card and select one or more MID Servers or ACC agents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Select **Save**.

> **Note:** You can delete locations from the Synthetic Locations menu, which you can navigate to by selecting **All** > **Synthetic Monitoring** > **Synthetic Locations**. However, you must first remove any monitors running on that location, either by editing the monitors to use a different location or deleting the monitors. See Create and edit a synthetic monitor for more information.

What to do next

Create and edit a synthetic monitor

Create and edit a synthetic monitor

Create or edit a synthetic monitor to test the availability and performance of your HTTP endpoints before your users discover issues.

Before you begin

- A configuration item (CI) for the endpoint you want to test.
- If you're testing private endpoints or want to run the monitors from your environment, one or more locations must be created to host the monitor. To create a location, see Create synthetic monitoring locations.

> **Note:** If you're monitoring an API discovered through API Insights or discovery patterns, see Create a synthetic monitor for a discovered API.

> **Note:** For information about how to bulk create synthetic monitors, see the Synthetic Monitoring Developer Guide.

Role required: sn_sow_synthetics.synthetics_editor or sn_sow_synthetics.synthetics_admin

1.

Procedure

1. Navigate to **All** > *Service Operations Workspace* and select the synthetic monitoring icon ( ).
2. On the Overview page, either create a synthetic monitor or edit an existing one.
   - To create a synthetic monitor, select **New**.
   - To edit an existing one, select the link for the monitor you want to edit and then select the **Details** tab.
3. On the form, fill in the fields.

   a. In the Monitor details section, enter a unique name for the monitor and a description.

   b. In the HTTP settings section, fill in the fields.

HTTP settings section

Field	Description
HTTP method	HTTP method that you want to monitor for the endpoint.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: HEAD and OPTIONS methods aren't supported from a MID Server.
HTTP endpoint CI	CI for the endpoint that you want the monitor to test. If the endpoint doesn't exist, choose **Manage HTTP endpoints in CMDB** to create a CI.
Related service CI	Application service CI or CIs related to the HTTP endpoint. You can select one or more application services. Saving the monitor replaces the endpoint's application-service relationships with exactly what's selected here — deselecting a service removes its CI relationship..
Support group	Group who is notified and assigned alerts when this monitor fails. **Note:** To view this field in the HTTP Endpoints table, use the Synthetic Monitoring view.
Query parameters	String of query parameters to include in the request URL. **Note:** The string shouldn't include the leading question mark. For example, use `id=xyz&customer=myco` instead of `?id=xyz&customer=myco`.
Credentials	Credential needed if the endpoint requires authentication. OAuth, Basic Auth, and API keys are supported.
Headers	Key-value pairs for the HTTP request headers. You can add multiple pairs.
Body	Text that is used if the API expects a message body, such as a JSON snippet.

c. In the Locations section, select one or more locations.

Choose a MID Server or Agent Client Collector location, or to run this monitor's test from your ServiceNow instance, choose ServiceNow hosted location.

Note: When running tests from your instance, only six tests can be run every minute for performance reasons.

Choose **Create new location** to create a location.

For more information on how to create a location, see Create synthetic monitoring locations.

d. In the Assertion section, define a successful test by selecting one or more criteria, an operator, and a value.

Note: Multiple criteria are joined with an `AND` phrase, so the test must pass all criteria to be successful.

Criteria type	Description of success
Status code	Endpoint returns the given status code.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Criteria type	Description of success
Response time (in ms)	Endpoint response time is less than the given value.
Response body	Endpoint sends a string value in the response body that matches the selected operator and given value.

e. In the Frequency section, enter the number of minutes between each test run.

f. **Optional:** To have an alert sent through Event Management when a test fails:

- In the Alert settings section, activate the toggle switch.
- Select an alert severity for a test failure.
- Add tags to the alert. For more information about using tags in alerts, see Tag cluster alert grouping.

4. Select **Save**.

Result

The Overview page for the synthetic monitor displays the results of the tests that the monitor runs. See Identifying system issues with synthetic monitoring for more information.

Create synthetic monitors from incidents

Create synthetic monitors from incidents to proactively track endpoint failures and reduce repeat occurrences.

Before you begin

Role required: sn_sow_synthetics.synthetics_admin

- Recommended Action for ITSM and Synthetic Monitoring application is installed on your ServiceNow instance
- Incident should have a valid configuration item (CI) and a service associated with it
- At least one execution location (self hosted MID Server) is available and configured

About this task

This feature helps operations teams quickly assess and respond to incidents by automatically correlating incidents with the impacted business service and related Configuration Items (CIs). It provides instant visibility into all affected endpoints and clearly highlights monitoring coverage, enabling teams to understand impact, identify gaps, and take action. Administrators currently need to use the Synthetic monitoring application to configure monitors. The application now recommends and enables synthetic monitor creation directly from the Incidents page, helping improve incident actionability and strengthening service resilience.

When incident analysis shows failing endpoints were not monitored, synthetic admin users access the incident and set up synthetic monitors to prevent the occurrence in the future.

While creating these synthetic monitors from a post-incident recommended action, the system automatically discovers HTTP endpoints associated with the incident's affected services. Users can select from the discovered endpoints to create monitors without manually entering URLs. The system automatically selects the mid server location based on the endpoints as part of the recommendations from incidents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > *Service Operations Workspace*, and to the incidents page.
2. Select the incident that has a valid configuration item (CI) and a service associated with the incident.
3. On the incident details page, locate the Recommendations panel.
   If Synthetic monitoring is available and there are no monitors for the affected endpoints, the **Add monitors** action card is displayed.

   Note:

   You must have either the administrator role or admin privileges to install the applications. If you don't, contact your system administrator to install the application.

4. Select **Add monitors** to open the monitor creation form.
5. Select the endpoints for which you want to create synthetic monitors.

   Synthetic Monitoring automatically selects an available MID server as the execution location when creating monitors. To configure a default MID server for auto-selection, set the following system property:

   `sn_sow_synthetics.default_mid_location`

   Note: Default values are configured for response code, frequency, and trigger status for an alert on the incident.

6. Select **Create monitor**.
   The following template is used to create synthetic monitors from Recommendations.
   ```
   name: autogenerated type: "single_api", interval: 5,
   should_create_alert: true, alert_severity: 1, method: "GET",
   valid_http_code: "200", valid_http_code_type: "equals",
   locations: Randomly selected from available Synthetics locations
   of type Self hosted MID
   ```

   Note: If you select the same endpoints and click **Create monitor** again, the application prevents duplicate monitors from being created.

7. Select the link on the success message to view the monitors created in Synthetic monitoring landing page.

Create a synthetic monitor for a discovered API

Create a synthetic monitor to test the availability of APIs discovered through API Insights.

Before you begin

- API Insights
- CMDB CI Class Models. For more information, see API extension classes.
- An existing API component (cmdb_ci_api_component) record in the CMDB for the API Insights to discover APIs.
- One or more locations must be created to host the monitor to test private endpoints or run the monitors from your environment. To create a location, see Create synthetic monitoring locations.

Role required: sn_sow_synthetics.synthetics_editor or sn_sow_synthetics.synthetics_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

When API Insights discovers APIs through Service Graph Connectors, you can proactively monitor their availability and performance by creating synthetic monitors. Synthetic monitors identify issues before they impact users and verify continuous monitoring of critical API endpoints.

For more information about how API discovery integrates with synthetic monitoring, see API discovery and synthetic monitoring integration.

Procedure

1. Navigate to **All** > *Service Operations Workspace* and select the synthetic monitoring icon ( ).
2. On the Overview page, create a synthetic monitor by selecting **New**.
3. In the Monitor details section, enter a name and description for the monitor.

   Use a descriptive name that identifies the discovered API being monitored, such as the API name or endpoint path.
4. In the **Endpoint settings** section, configure how the monitor interacts with the discovered API.

   a. For **Endpoint type**, select **Discovered API**.

   b. In the **API** field, select the discovered API that you want to monitor.

   Each option in the list identifies a discovered API by its HTTP method, path, and URL. The method is part of the selected API component and does not require separate configuration.

   Note: The **API** field lists only API components that meet the following criteria:
   - The endpoint's operational status is **Operational**.
   - The URL starts with `http`.
   - The URL does not contain placeholder or template characters (for example, `/users/{id}`).

   If a known API does not appear in the list, verify that it meets these criteria.

   To browse the available API component records, select the info icon beside API, and then select **View API components**.

   c. Verify the service association.

   If the discovered API is related to one or more application services in the CMDB, those services and their support groups are populated automatically and shown as read-only. If no service relationship exists, these fields are hidden and the monitor is created without a service association.

   d. **Optional:** To configure optional request details, expand **Advanced settings**.

   (Optional) Under **Advanced settings**, you can configure the following optional details:

   - **Query parameters**: Query parameters to append to the request URL.

     Note: Do not include the leading question mark. For example, use `id=xyz&customer=myco` instead of `?id=xyz&customer=myco`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Credentials**: The credential to use if the discovered API requires authentication. OAuth, Basic Auth, and API keys are supported.
- Select **Add headers and body** to add custom request headers and, if the API expects a message body, the request body.

  Note: For example, enter a JSON snippet for REST APIs that require a request body.

5. In the Locations section, select one or more locations where the monitor tests run.

   Select a MID Server or Agent Client Collector location, or to run this monitor's test from your ServiceNow instance, select ServiceNow hosted location.

   Note: When running tests from your instance, only six tests can be run every minute for performance reasons.

   To create a location, select **Create new location**. For more information, see Create synthetic monitoring locations.

6. In the Assertion section, define success criteria for the API tests.

   Select one or more criteria, a condition for the criteria, and a value to determine when a test passes.

   Note: Multiple criteria use an AND phrase, so the test must pass all criteria to be successful.

   Common assertions for discovered APIs include:

   - **Status code**: Verify the API returns the expected HTTP status code (for example, 200 for successful requests).
   - **Response time**: Verify the API responds within an acceptable time threshold.
   - **Response body**: Validate that the API returns expected data in the response body.

7. In the Frequency section, enter the number of minutes between each test run.

   Consider the criticality of the discovered API when setting the frequency. Critical APIs may require more frequent monitoring.

8. **Optional:** To receive alerts when the discovered API monitor fails, configure alert settings.
   - In the Alert settings section, activate the toggle switch.
   - Select an alert severity for test failures.
   - Add tags to the alert to help with alert management and routing. For more information about using tags in alerts, see Tag cluster alert grouping.
9. Select **Save**.

Result

The synthetic monitor begins testing the discovered API endpoint at the specified frequency. The Overview page displays test results, including availability, response time, and assertion status. See Identifying system issues with synthetic monitoring for more information about viewing and analyzing test results.

What to do next

After creating the monitor, verify that tests run successfully and adjust assertions or frequency as needed based on the API's performance characteristics and business requirements.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Manage synthetic monitors

Edit or delete synthetic monitors after creating them.

Before you begin
Role required: sn_sow_synthetics.synthetics_editor

Procedure
1. Navigate to **All** > *Service Operations Workspace* and select the synthetic monitoring icon ( ).
2. Follow these instructions to edit a monitor.

Option	Description
Edit multiple monitor configurations	From the synthetic monitoring landing page, select one or more monitors and select **Edit**. See Create and edit a synthetic monitor. **Note:** Current values aren't shown in the fields. If you don't edit a field, the original values remain. If you want to edit properties other than cre dentials, location, or alert settings, you must edit a single monitor at a time from the **De tails** tab.
Edit a single monitor configuration	From the synthetic monitoring landing page, select a monitor to open it and then select the **Details** tab to edit. See Create and edit a syn thetic monitor for more information.
Delete monitors	From the Synthetic monitoring landing page, choose one or more monitors to delete and select **Delete**.

Enable ECC queue cleanup for synthetic monitoring

Grant the ECC Queue auto-purge job permission to remove old synthetic monitoring messages from the ECC queue.

Before you begin
Role required: admin

About this task
The ECC Queue auto-purge job requires **Can Delete** application access on the ECC Queue [ecc_queue] table. This access is not enabled by default, so the job can evaluate messages against its purge categories but can't remove any of them until an admin grants this access.

Consider enabling this access as a performance-tuning step if you observe contention or delays in responses from synthetic monitoring checks, since an unpruned queue can contribute to that behavior.

Procedure
1. Navigate to **System Definition** > **Tables**.
2. Open the ECC Queue [ecc_queue] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the **Application Access** related list, select **Can Delete**.
4. Save the table record.

Result
On its next scheduled run, the ECC Queue auto-purge job removes and flags messages according to its purge categories.

What to do next
Note: Enabling this access is a manual step in this release. Automating it is planned for a future release, so this procedure may be removed once that work ships.

Identifying system issues with synthetic monitoring

Tests run by synthetic monitors enable service owners and operators to view service endpoint performance at scale.

Overview of using synthetic monitoring

As a service owner, you can use synthetic monitoring to monitor your service's endpoints, verifying that they're available and performing as expected. You can be notified when synthetic tests fail, enabling you to mitigate issues quickly. You can see trends in HTTP API success rates and response times.

As an operator, you can use synthetic monitoring as part of triaging issues. When you learn a service is reported to have issues, you can view test results for that service's endpoints. If tests are failing or response times are slow, that might be something to investigate.

View aggregate information about the monitors

The synthetic monitoring landing page shows an overview of all created monitors, including inactive monitors.

From here, you can see the status for all your monitors. Selecting a card at the top filters the list of monitors. For example, you can view only the monitors that have failed or that are in an unknown state.

By default, the list of monitors is sorted by the timestamp in the **Updated** column. You can select a different column header to sort by that category.

Selecting a monitor lets you view details about the monitor's tests, including details, configuration, and associated alerts.

View a monitor and its tests

To view a monitor's details and the results of its tests, select a monitor from the synthetic monitoring landing page. The Monitor details page provides key information needed to understand how the monitor is performing.

Use the information in the header to understand the basic health of the monitor, including its status and when it last ran a test.

View individual tests

The Metrics card displays two charts to help you understand the health of each test the monitor has run. The **Failed tests** chart displays each test with a value of 0 when it was successful and a value of `1` when it failed. Hover over a point on the chart to view further details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The **Response time** chart shows the amount of time in milliseconds that it took to receive a response from the endpoint. Hover over a point on the chart to view details.

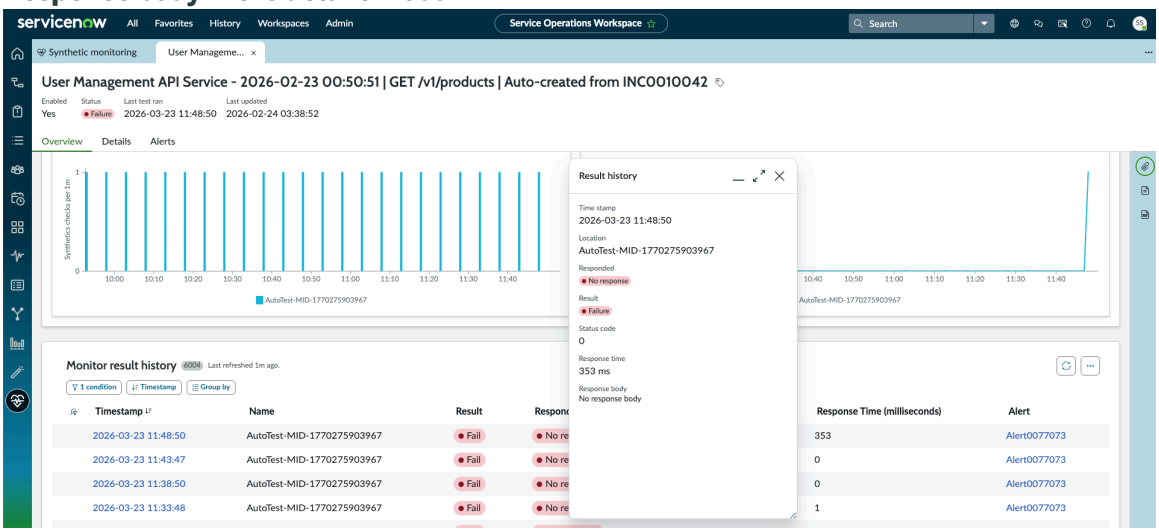
Note: Test results are retained for 21 days.

The **Monitor result history** table lists each test. By default, the table is sorted from newest to oldest by the timestamp. You can sort by any column to help find issues. For example, you can sort by **Result** to see all failures together or you can sort by **Response time** to view the tests with the highest latency.

If a monitor was configured to generate an alert when it fails, a link to the alert displays in the **Alert** column. Select an alert link to view its details.

When you see a failure or high latency, select a test to view details, including the response body, which might help explain any issues.

Response body in the details modal



View aggregate monitor information

View information about all your synthetic monitors.

Before you begin

Role required: sn_sow_synthetics.synthetics_viewer, sn_sow_synthetics.synthetics_editor, sn_sow_synthetics.synthetics_admin

Procedure

1. Navigate to **All** > *Service Operations Workspace* and select the synthetic monitoring icon ( ).
2. To filter the list of monitors, select a card at the top of the page.
   For example, to view only monitors that have failed tests, select the **Failed** card.
3. To view details about each test run by the monitor, select a monitor name.
   The monitor's Overview tab opens. For more information about this page, see View a monitor's test results.
4. To export the list of monitors, select **Export**.
   You can export to the following file formats:
   - XLSX
   - CSV

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- JSON
- PDF

View a monitor's test results

View the results of tests run by a monitor, along with configuration details, and related configuration items (CIs).

Before you begin

Role required: sn_sow_synthetics.synthetics_viewer, sn_sow_synthetics.synthetics_editor, sn_sow_synthetics.synthetics_admin

Procedure

1. Navigate to **All** > *Service Operations Workspace* and select the synthetic monitoring icon ( ).
2. Select a monitor from the list of all monitors.
3. View the overall health of the monitor in the header, which shows its status, and when it was last run and updated.
4. View health metrics for the monitor from the **Metrics** card.
   The **Failed tests** chart displays each test with a value of `0` when successful and a value of `1` when it failed. The **Response time** chart shows the amount of time in milliseconds that it took to receive a response from the endpoint. Hover over a point on the charts to view details.
   - To change the time period, use the drop-down menu.
   - To refresh the chars, use the context menu.
5. View the status of each test in the **Monitor result history** card.
   To view the details for a test, select its timestamp. For more information about the test details, see View test details.

   Note: If your monitor uses OAuth and a test fails with a 4xx error, it may be because your refresh token expired. Re-authenticate by visiting the OAuth credential page and clicking the credential link.

   To view active alerts created by the monitor, select the Alert link to open its details.

   Note: Filtering the list affects the data displayed in the metric charts.

View test details

View the results of an individual synthetic test run by a monitor.

Before you begin

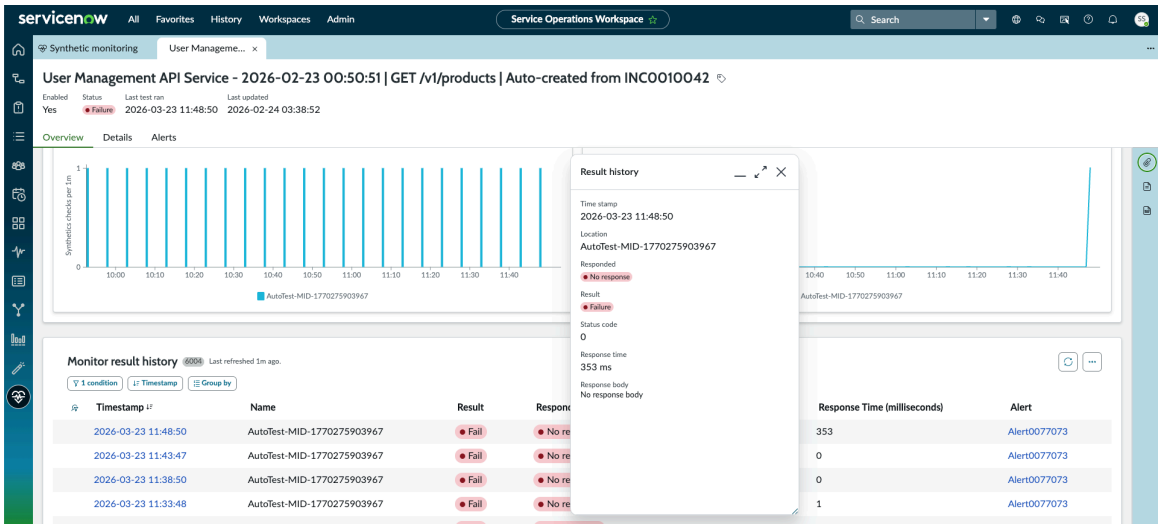
Role required: sn_sow_synthetics.synthetics_viewer, sn_sow_synthetics.synthetics_editor, sn_sow_synthetics.synthetics_admin

Procedure

1. Navigate to **All** > *Service Operations Workspace* and select the synthetic monitoring icon ( ).
2. Select a monitor from the list of all monitors.
3. Select a test from the list of tests.
   The modal displays information about the test including a response body. In this example, it shows that the request was sent to a bad gateway.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If your monitor uses OAuth and a test fails with a 4xx error, it may be because your refresh token expired. Re-authenticate by visiting the OAuth credential page and clicking the credential link.



View alerts for a synthetic monitor

View all the current active alerts for your monitors.

Before you begin

Role required: sn_sow_synthetics.synthetics_viewer, sn_sow_synthetics.synthetics_editor, sn_sow_synthetics.synthetics_admin

About this task

You can view open alerts from all your monitors by selecting the **Open Alerts** card on the synthetic monitoring home page. To view a single alert, select the alert link from the resulting list.

To view alerts for a specific monitor, follow this procedure.

Procedure

1. Navigate to **All** > *`Service Operations Workspace`* and select the synthetic monitoring icon ( ).
2. Select a monitor from the list of all monitors and then select the **Alerts** tab.
   The **Alerts** tab shows the alerts for the monitor. Select an alert to view details.

Note: The alert shows the impacted service associated with the monitor. If for some reason this field isn't populated, see Impacted Service not appearing in alerts.

Synthetic monitoring reference

Reference topics provide additional information about the synthetic monitoring application, such as components installed and page details.

Components installed with synthetic monitoring

Several types of components are installed with activation of the synthetic monitoring plugin, including tables and user roles.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles installed

Role	Description	Contains roles
Synthetic monitor viewer [sn_sow_synthetics.synthetics_viewer]	Views test configurations and their results.	• cmdb_read • sn_sow.sow_user • agent_client_collector_user • sn_sow_synthetics.credential_reader
Synthetic monitor editor [sn_sow_synthetics.synthetics_editor]	Creates and edits tests. Views test configurations and their results.	• credential_admin • sn_cmdb_editor • sn_sow_synthetics.synthetics_viewer
Synthetic monitor admin [sn_sow_synthetics.synthetics_admin]	Assigns roles. Creates and edits tests. Views test configurations and their results.	• agent_client_collector_admin • sn_sow_synthetics.synthetics_editor • sn_sow_itsm_admin.sow_admin_user
Synthetic monitor credential reader [sn_sow_synthetics.credential_reader]	Used internally to read from the Credentials [discovery_credentials] table.	None
Synthetic monitor event writer [sn_sow_synthetics.synthetics_event_writer]	Used internally to communicate with the MID Server.	None

Tables installed

Table	Description
Check [sn_sow_synthetics_check]	Configuration information for synthetic checks.
Check Execution Location [sn__sow_synthetics_check_execution_location]	Execution location configuration for synthetic checks.
Single API [sn_sow_synthetics_check_single_api]	Additional configuration information and last run results for single API synthetic checks.
Single API Header [sn_sow_synthetics_check_single_api_header]	Key value pairs of requests headers for single API synthetic checks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
Single API to Policy [sn_sow_synthetics_check_single_api_policy]	Single API synthetic test data and its corresponding Agent Client Collector (ACC) policies.
Single API Result [sn_sow_synthetics_check_single_api_result]	Results from each synthetic check run.
sn_sow_synthetics_recommendation_state	Per-endpoint creation state, idempotency_key, error tracking
sn_sow_synthetics_recommendation_telemetry	Aggregate workflow metrics: card_shown, endpoints_discovered, monitors_created, workflow_status
Synthetic Private Locations [sn_sow_synthetics_private_location]	Definitions of the ACC Agent Proxy Clusters available for synthetic monitoring. Extends the Proxy Agent Cluster [sn_agent_cluster] table.
sn_sow_synthetics_bulk_job	Provides async bulk job tracking.
sn_sow_synthetics_bulk_job_governance	Defines governance metadata for rate limiting and auditing for bulk jobs.

Synthetic monitoring properties

Synthetic monitoring includes the following properties.

These properties are available for synthetic monitoring.

Note: To open the System Properties [sys_properties] table, enter `sys_properties.list` in the navigation filter.

Properties for synthetic monitoring

Property	Description
sn_sow_synthetics.logger	Controls logging output. Valid values are: • debug • info • notice (default) • warning • err • crit
sn_sow_synthetics.auto_mid_selection.skip_phases	Determines the number of comma-separated phases to skip in selection cascade. Default value is empty.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties for synthetic monitoring (continued)

Property	Description
sow.recommendation.enabled	Feature flag to enable recommendation tile on incidents and by default it is set to 'false'.
sow.recommendation.max_endpoints	Determines the max endpoints to be shown in recommendation panel. The default value is 50.
sn_sow_synthetics.default_mid_location	Displays default location sys_id for auto MID selection phase 5. The default value is 'null'.
sn_sow_synthetics.auto_mid_selection.enabled	Flag to enable/disable auto MID selection and be default it is set to 'true'.
sn_sow_synthetics.auto_mid_selection.dns_cache_ttl	Determines the DNS cache time for IP affinity phase. The default value is 300 seconds.

Domain separation and synthetic monitoring

Domain separation is supported for synthetic monitoring. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

Domain separation and synthetic monitoring overview

Domain separation is present in all aspects of the synthetic monitoring application. Users belonging to a specific domain see only the data existing in their own domain.

How domain separation works in synthetic monitoring

When data is separated by domains in synthetic monitoring, users can only configure and see the monitoring data in their own domain. By default, all users and records are set to the parent domain unless the admin assigns them to a specific domain.

You define the domain-separated environment when you configure your data inputs. All relevant records and data processing in the synthetic monitoring program flow reside in the same domain

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

as the data input. The domain name of a data input appears in the Domain column that is displayed in the tables in your instance.

Using domain separation in your instance is transparent to synthetic monitoring. The application manages all aspects of the data, such as the monitor configurations and results. When a property is changed, the new value affects new sources only in the specific domain.

When setting up Agent Client Collector (ACC) for non-hosted synthetic checks, each domain that supports non-hosted synthetics requires its own ACC cluster and MID Server. The ACC cluster and MID Server must be created in a leaf domain.

Domain separation for service providers

Synthetic monitor status definitions

Learn what each synthetic monitor test status means, so you can distinguish a genuine endpoint failure from a test that never ran.

Overview of Synthetic monitor status

Each test run by a synthetic monitor reports one of the following statuses. Use these definitions to distinguish a monitor that detected a genuine problem with the monitored endpoint from a monitor whose test could not run at all.

Status definitions

Synthetic monitor test statuses

Status	Definition
Passed	The test executed and the response met all configured assertion criteria.
Failed	The test executed but the response did not meet one or more configured assertion criteria. The monitor successfully reached the endpoint and received a response, but that response failed evaluation. Examples include an unexpected status code, a response time over the configured threshold, or missing expected content.
Unknown	The test could not run, so no result is available for evaluation. An Unknown status means the monitor could not attempt the check at all, rather than reaching the endpoint and receiving an unsuccessful response. Unknown is expected in this case, and does not by itself indicate a problem with the monitored endpoint.

Important: A Failed status indicates the monitored endpoint returned an unexpected result. An Unknown status indicates the monitor was unable to run the test at all. Treat these differently when triaging alerts: an Unknown status should prompt you to investigate the monitor's execution environment, such as its location or MID Server, rather than the health of the monitored endpoint itself.

Common causes of an Unknown status

An Unknown status can occur whenever the test cannot run to completion. Common causes include the following.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Causes of an Unknown status

Cause	Description
MID Server removed from the synthetic monitoring location	If the MID Server assigned to a monitor's location is removed from that location, the test cannot run and the status becomes Unknown. This is expected behavior.
MID Server is down or not validated	If the MID Server assigned to a monitor's location exists but is down or has not been validated, the test cannot run and the status should become Unknown, since the check never actually executed. **Note:** In earlier releases, this scenario could incorrectly report a Failed status and generate an alert, making it appear that the monitored endpoint was down. If you see a Failed status for a monitor and suspect its MID Server is down or unvalidated, check the MID Server's status before troubleshooting the monitored endpoint.

Identifying system issues with synthetic monitoring

ECC queue auto-purge for synthetic monitoring

A scheduled job removes old Synthetic monitoring messages from the ECC queue. The job also flags stuck or orphaned messages with status as error, so that the queue doesn't grow indefinitely and stale entries aren't mistaken for pending work.

Enable the cleanup job

The ECC Queue auto-purge job requires **Can Delete** application access on the ECC Queue [ecc_queue] table. This access is not enabled by default, so the job can't remove any records until an admin grants it.

For information about enabling this access, see Enable ECC queue cleanup for synthetic monitoring.

How the job runs

The ECC Queue auto-purge job runs once daily, overnight. On each run, the job evaluates synthetic monitoring messages in the ECC Queue [ecc_queue] table against the categories in the following table. The job then either removes each matching message or flags it as error.

Important: Only messages that belong to synthetic monitoring are evaluated. Messages that other applications place in the same queue table are never removed or modified, regardless of their state or age.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Purge categories

ECC queue auto-purge categories

Category	Applies to	Condition	Result
Completed requests	Output-queue messages	State is **Processed** and the message was created more than 30 days ago.	Removed from the queue
Completed responses	Input-queue messages	State is **Processed** and the message was created more than 30 days ago.	Removed from the queue
Failed executions	Messages in either queue	State is **Error** and the message was created more than 30 days ago.	Removed from the queue
Orphaned ready	Messages in either queue	State is **Ready** and the message was created more than 1 day ago, meaning it was never picked up.	Flagged as error
Orphaned processing	Messages in either queue	State is **Processing** and the message was last updated more than 7 days ago, meaning it is stuck in progress.	Flagged as error
Disabled monitor	Messages in either queue	State is **Ready** or **Processing** and the monitor that the message belongs to has been disabled. Age isn't considered.	Flagged as error

Messages that are flagged as errored remain in the queue with a state of **Error**. They are then eligible for removal under the failed executions category once they are more than 30 days old.

When cleanup can't be completed

If the job can't remove records for reasons such as a table permission restriction, then the job writes a warning to its log instead of reporting success. Review the job's log output to confirm that each run completed the cleanup it reported.

For more information, see Troubleshoot ECC queue growth.

Troubleshoot synthetic monitors

Read these topics to understand how to fix common issues in synthetic monitoring.

Upgrade issues

What to do when monitors don't work after upgrading synthetic monitoring.

Condition

After upgrading synthetic monitoring, monitors remain in unknown state.

Cause

After upgrading synthetic monitoring, if the monitor is hosted on a MID Server, the server must be restarted to re-recognize the hosted monitors.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Remedy

Restart the MID Server. See Manually start, stop, and restart a MID Server.

Related topics

Synthetic monitor status definitions

OAuth issues

Learn how to fix OAuth token refresh issues.

Condition

OAuth token doesn't refresh as expected.

Cause

Your OAuth provider and server have different refresh time periods. Refresh time periods are based on the OAuth provider. When creating an OAuth connection, you configure it to have an x-amount of time before needing reauthentication. If that configured amount of time isn't the same as your provider's, your token might require a refresh sooner or later than expected.

Remedy

Refer to your OAuth provider's documentation when configuring OAuth. See OAuth Inbound and Outbound authentication for more information.

Impacted Service not appearing in alerts

When a test fails for a monitor and you have configured an alert to trigger, the alert record should show the impacted service. There are a few reasons why this field might not be populated.

Condition

The Impacted Services field isn't populated on an alert record from a failed synthetic monitor. Following are the causes and remedies for the different reasons the field isn't populated.

Cause: Service isn't a mapped service

The service isn't a mapped service.

Remedy

This field only populates when the associated service is configured as a mapped application service in the Configuration Management Database (CMDB).

Cause: The field didn't have time to populate

Impacted Services are populated at alert creation.

Remedy

Close and reopen the alert so new mappings are applied.

Cause: Race condition encountered

If an alert triggers immediately, the platform might not have time to establish the necessary CMDB relationships before the alert attempts to populate impacted services.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Remedy

Try reloading the page or consider running tests from the MID Server.

Cause: Delayed population

The relationship might take up to a minute to appear, which means the field might not populate until after the initial alert creation event.

Remedy

Check back after a few minutes.

Bulk monitor import issues

Learn to fix issues that might occur when you create monitors in bulk.

Common bulk monitor import issues

Issue	Cause	Solution
cmdb_ci is required	Missing HTTP endpoint	Create endpoint in CMDB first
Location not found	Invalid location sys_id	Verify location exists
Authentication failed	Invalid credentials	Check username/password
Job stuck in "pending"	Event queue backed up	Wait or contact admin
Timeout errors	Large payload, slow processing	Increase timeout, reduce batch size

Troubleshoot ECC queue growth

If the ECC queue keeps growing or contains large numbers of stale synthetic monitoring messages, use this information to identify why the auto-purge job isn't clearing them.

The job reports success but the queue doesn't shrink

The most common cause of this condition is that the ECC Queue [ecc_queue] table doesn't have **Can Delete** application access enabled. This access isn't enabled by default, so until an admin grants it, the job can evaluate messages against the purge categories but can't actually remove any of them.

Review the job's log output for warnings from the most recent run. If a warning indicates that records couldn't be removed, confirm that the job has delete access to the ECC Queue [ecc_queue] table. To grant that access, see Enable ECC queue cleanup.

Messages remain for monitors that are disabled

When a monitor is disabled, messages that it already placed in the queue can remain there. On its next run, the auto-purge job flags queued messages in the **Ready** or **Processing** state as errored when the monitor they belong to is disabled. Because the job runs once daily, these messages can persist until the next run.

Stale entries appear to be pending work

Messages left in the **Ready** state that were never picked up, and messages stuck in the **Processing** state, can look like pending work when they are reviewed in the queue. The auto-purge job flags both as errored so that they are distinguishable from messages that are

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

genuinely waiting to be processed. For the age thresholds that apply to each state, see ECC queue auto-purge for synthetic monitoring.

Synthetic monitoring Landing Page

Read the following to understand what is displayed on the Synthetic monitoring landing page where you can view aggregate information about your synthetic monitors.

Aggregate information

The cards show aggregate information for all monitors, whether they're active or not. Select a card to filter the Monitors list.

Aggregate cards

Card title	Description
Total monitors	Total number of monitors created.
Passed	Number of total monitors that have returned the value that was set as the monitor's assertion, for example a status code of 200.
Failed	Number of total monitors that returned a value other than what was configured as the assertion.
Pending	Number of total monitors that are in the Pending state. Monitors are set to **Pending** before the first test runs.
Paused	Number of total monitors that are in the Paused state. Paused monitors are monitors that have been set to **Monitor disabled** on the Configuration page.
Unknown	Number of total monitors that aren't running due to an issue with the related Agent Client Collector (ACC) proxy.

Monitor list

By default, this list displays all monitors that have been created. You can select a card at the top of the page to filter to a list of monitors with that state. Select a monitor to view its details page.

Details page of a synthetic monitor

Read the following to understand how to use the Details page of a synthetic monitor to view the results of its tests.

Header

The header provides an overview of the monitor.

Item	Description
Monitor name	Name given to the monitor when it was created.
Enabled	Indication of whether the monitor is active.
Status	Status of the latest test run. Values can be one of the following: • Pending: The monitor is waiting for the first test to run, based on the configured frequency. • Success: The test ran and passed the assertion criteria that you set.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Item	Description
	• Unknown: The test failed to run, likely due to an issue with the related Agent Client Collector (ACC) proxy. • Failure: The test ran but didn't pass the assertion criteria. Select a timestamp link to view the response body for more information about the test.
Last test ran	Timestamp for when the latest test finished running.
Last updated	Timestamp for when the monitor was most recently edited and saved.

Overview tab

The **Overview** tab provides an aggregated view of all the tests that the monitor has run. This tab shows the following:

- Metrics card: Charts that provide performance of each test for the time period selected in the time picker.
- Monitor result history: All tests run by the monitor and its results.

Details tab

You can use the **Details** tab to create a monitor or edit an existing one. See Create and edit a synthetic monitor for more information.

Alerts tab

You can use the Alerts tab to view alerts generated by a monitor.

ITOM AIOps reference

Reference topics provide additional information about about using ITOM AIOps

Components installed with AIOps Experience

Several types of components are installed with activation of the AIOps Experience [sn_sow_aiops] application, including user role and plugins.

Note: The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Demo data is available for this feature.

Roles installed

Role title [name]	Description	Contains roles
evt_mgmt_user	Manages the alert lifecycle and performs basic operations, such as viewing alerts.	itil

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role title [name]	Description	Contains roles
evt_mgmt_operator	Manages alerts, including tasks such as closing and acknowledging them.	evt_mgmt_user
evt_team_operator	Manages Event Management operations within a specific team as defined in the **Assignment Group** field. This role allows the operator to read and write alerts exclusively for their assigned team. Additionally, the operator can make configuration changes specific to their team, including updates to Alert Automation and the Integrations Launchpad. **Note:** The evt_team_operator role must be assigned to an assignment group to view and manage alerts for that group. If the role is created but not associated with any groups that have alerts assigned, the operator cannot see any alerts.	sn_sow_alert_rules.automation_create_nonglobal sn_sow_alert_rules.automation_delete_nonglobal
evt_mgmt_admin	Configures and sets up Event Management properties and rules.	evt_mgmt_user and evt_mgmt_operator

Plugins installed

Plugin	Description
Event Management [com.glideapp.itom.snac]	Provides service-oriented availability and monitor events through an intuitive console.
Performance Analytics - Premium [com.snc.pa.em]	Provides core out-of-the-box Key Performance Indicators (KPIs) to help monitor and enhance event management processes. Please note that activating this plugin on production instances may require a separate Performance Analytics license.
Performance Analytics - Content Pack - Event Management [com.snc.pa.premium]	Includes core out-of-the-box Key Performance Indicators (KPIs). Activating this plugin on production instances may require a separate Performance Analytics license.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To return to the procedure, see Install Service Operations Workspace for ITOM application.

Application service details page

Provides comprehensive information about an application service, including its name, business criticality, ownership, process and operational status, traffic-based discovery details, discovery status, and relevant comments. This enables thorough analysis of the application service's current state and usage, provides clarity on ownership and criticality, and aids in prioritizing resources and actions effectively.

Application service details page fields

Field	Description
Name	Name of the application service.
Business criticality	Importance level of the service to business operations.
Owned by	Person or team responsible for managing and overseeing the service.
Process Status	Current stage or status of the service's operational processes.
Operational status	Current stage or condition of the service's operational processes, showing whether it is functioning smoothly or encountering issues.
Traffic based discovery	Option to identify service instances based on network traffic patterns.
Discovery status	System's ability to locate and recognize the service within its network.
Comments	Additional notes or pertinent information regarding the service that may be helpful for understanding its management or usage.

To return to the procedure, see View application service details in Service Operations Workspace.

Create list fields

Create customized lists with fields tailored to your needs.

The form you complete varies depending on whether you choose to base your list on an existing one (**Start from existing**) or create a new list (**Create your own**).

Start From Existing form

Field	Description
List	Existing list that you want to modify.
List Name	Name for your list. The default name in this field is the name of the existing list in the **List** field with `- Copy` appended.
Select columns	Record fields to include in list view. The columns from the list you selected appear. You can add or remove columns to modify the list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Start From Existing form (continued)

Field	Description
Add Filters	Condition used to filter the list. By default the conditions applied to the list selected appear. You can modify this condition.

Create Your Own form

Field	Description
List Name	Name for your list.
Select Source	Source table for the records.
Select columns	The columns to display in the list. This field is populated with columns from a Workspace list view if one exists. If a Workspace list doesn't exist, the columns are populated with the Default list view of the table selected.
Add filters	Condition used to filter the list.

To return to the procedure, see Create a list in Service Operations Workspace for ITOM

Metrics View Configuration form fields

Define how metrics are displayed within Service Operations Workspace.

Metrics View Configuration form

Field	Description
Title	Name of the metric.
Active	Option to activate the metric.
Order	Numerical value indicating the order of the metric on the page.
Configuration Item Type	Configuration item type. Available options are: • cmdb_ci_app_server_tomcat • cmdb_ci_metric_extension • cmdb_ci_app_win_server
Source Metrics Types	Metric types you want the metric to monitor. Select the Lock icon ( ) to unlock the list of source metric types and select metric types to be monitored.
Chart Type	Type of chart in which the metric is presented in Service Operations Workspace, either **Line** or **Stacked Bar**.

To return to the procedure, see Configure alert metrics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integration and configuration health event fields

Populate the event fields to capture details such as event time, description, alert number, state, severity, metric name, node, message key, and error message.

Event fields

Field	Description
Time of Event	Indicates when the event occurred.
Description	Provides details about the event or incident.
Alert	Specifies the alert number that is triggered based on the event.
State	Describes the current state of the event (e.g., open, closed).
Severity	Indicates the severity level of the event (e.g., critical, warning).
Metric Name	Identifies the specific metric associated with the event.
Node	Specifies the node or device related to the event.
Message Key	Unique identifier for the event message.
Error Message	Provides additional information about any errors associated with the event.

To return to the procedure, see Review integration and configuration health.

Datadog advanced settings fields

Populate the Datadog advanced settings fields to define API paths, batching limits, host filters, sync duration, connection details, and debugging options. These values control how the pull connector retrieves and processes metrics and host data from Datadog, ensuring the connector runs with the desired scope and behavior.

Datadog advanced settings fields

Field	Description
Base API path	The specific API path for querying metrics. The default is `/api/v2/query/timeseries`.
Enable container	Enables collection of Docker container metrics (CPU, memory, network) and binds them to Docker Container CIs (cmdb_ci_docker_container). Set this to true only after your Docker Container CIs have been discovered — if enabled before the CIs exist, container metrics are still collected but remain unbound. Default: false.
Host API Path	The specific API path for retrieving the list of hosts. The default is `/api/v1/hosts`.
Host batch size	The number of hosts to retrieve in a single API call.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Datadog advanced settings fields (continued)

Field	Description
	The default is 500, and any value above 1000 is automatically capped at 1000.
Host filter	(Optional) A comma-separated list of regular expressions (regex) to filter for specific hosts to monitor. or example, ^prod-db-.* is a regex pattern that means "match any host whose name starts with prod-db-". Example Use Case: To monitor only hosts starting with app-server- and the specific host critical-db-01, you would set the hostFilter to: ^app-server-.*, ^critical-db-01$.
Initial sync in mins	Time, in minutes, that the system takes to complete the first synchronization of data with the Datadog Metrics API. For example, if the value is 15, the connector fetches metrics from the past 15 minutes. If the value is above 120, it is capped to 120. Default: 15
Metric batch size	The number of metrics to query in a single API call. The default is 50, and any value above 50 is automatically capped at 50.
Port	Port number for the Datadog server to connect to. This is typically not needed when using https.
Protocol	The protocol for the connection. Default: https
Debugging	• Debug: Provides detailed logs for troubleshooting. • Log payload: Displays raw log data. Use only for debugging, as it can quickly fill the MID Server logs.

To return to the procedure, see Configure Datadog metric pull connector.

Dynatrace advanced settings fields

Populate the pull connector advanced settings fields to optimize event retrieval and synchronization based on specific requirements such as connection preferences, event frequency, and time zone settings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dynatrace advanced settings fields

Field	Description
Base API path	Root URL or endpoint used to connect to the Dynatrace Metrics API. All API requests are made relative to this base path.
connectionAliasSysID	Sys ID of the connection alias record associated with the Dynatrace connection.
debug	• Debug: Provides detailed logs for troubleshooting. • Log payload: Displays raw log data. Use only for debugging, as it can quickly fill the MID Server logs.
Initial sync in mins	Time, in minutes, that the system takes to complete the first synchronization of data with the Dynatrace Metrics API. For example, if the value is 15, the connector fetches metrics from the past 15 minutes. Default: 15
isGrailApiEnabled	Enables Grail-based metric collection for the Dynatrace connection. When enabled, this allows Grail API calls to fetch metrics data and populates the Connector Instance Metrics [sn_em_connector_instance_metrics] table with Grail-related metric IDs. When disabled, the table is populated with classic metric IDs. Default: false.
logPayload	Enables logging of the request and response payloads for the Dynatrace connection, useful for debugging.
Max metrics per query	Maximum number of metrics that can be requested in a single query to the Dynatrace Metrics API. The value cannot exceed 32, the maximum limit allowed by Dynatrace. Requests exceeding this limit must be split into multiple queries. Default: 32
Page Size	Number of records returned in a single response when querying the Dynatrace Metrics API. If the total results exceed this number, multiple pages are returned. Default: 500
Port	Port number used for connecting to the Dynatrace server.
Request per minute	Maximum number of API requests that can be sent to the Dynatrace Metrics API within one minute.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dynatrace advanced settings fields (continued)

Field	Description
	Exceeding this limit may result in throttling or temporary blocking of requests. **Note:** Relevant only when you enable **Throttle API calls**. Default: 1000
Throttle API calls	Limits the rate of API requests to the Dynatrace Metrics API, preventing overload, request failures, or temporary blocking. Enable this option to automatically limit the rate of API requests, preventing overloading the Dynatrace Metrics API and avoiding request failures. Default: false
Protocol	Communication protocol used for retrieving events from Dynatrace server. Default: https

To return to the procedure, see Configure Dynatrace metric pull connector.

Pull connector fields

Populate the pull connector advanced settings fields to optimize event retrieval and synchronization based on specific requirements such as connection preferences, event frequency, and time zone settings.

Advanced settings fields

Field	Description
Connected MID Server	Determine whether you want to have the system choose the optimal MID Server or choose a specific MID Server yourself. Perform only if you must make modifications to the MID Server otherwise leave it empty and let the system choose the optimal MID Server.
Event collection schedule (seconds)	Enter the frequency in seconds that indicates how often the system should check for new events from the external event source. The value can't be lower than the minimum schedule property, which by default is 120 seconds.
Protocol	Defines the communication protocol used for retrieving events from external devices.
severity_by_state_type	Determines the severity level assigned to events based on their state type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced settings fields (continued)

Field	Description
time_zone	Specifies the time zone used for recording and displaying event timestamps.
offset_min	Sets the time offset for event retrieval to ensure accurate synchronization.
Port	Verify the default values for your connector type such as port details or time formats and modify them as necessary. Default values from your connector are filled-in. Specifies the port number used for communication with external devices.
max_fetch_interval_min	Limits the maximum interval between event fetch operations.
initial_sync_in_days	Sets the duration for the initial synchronization process when retrieving historical data.

To return to the procedure, see Configure an event pull connector.

Outbound webhook parameters

The parameters to be configured when sending data to other systems using an outbound webhook.

Outbound webhook parameters

Parameter	Definition
Destination URL field	The webhook endpoint (URL) where the alert is to be sent.
JSON payload data tab	The alert data, composed in JSON format, being sent to the indicated URL. Enter the details you want to be notified about in the JSON object when the automation is triggered. You can insert alert fields by selecting **Insert Field Values** or add custom fields by typing {custom_field.JSON_path}. To add additional alert fields, select **Insert alert fields**.
Payload headers	Add predefined or custom metadata headers in the **Key** and **Value** fields. A key is the name of a header field, and a value is the corresponding data assigned to that header field.
Test payload	Select to verify that the webhook is functioning correctly and that the receiving system can process the data as expected.

To return to the procedure, see Create Respond automation.

Agent Client Collector

The Agent Client Collector is an agent that is installed on infrastructure components. The Agent Client Collector is built on a Sensu framework which enables you to adopt and extend monitoring checks from the community. It executes commands on the machines it is installed on and sends

Preparing for Agent Client Collector implementation Follow the steps described in the planning and deployment checklists to ensure successful Agent Client Collector deployment.	Exploring Agent Client Collector Analyze CI data sent to the instance, and provide data to other Agent Client Collector applications.	Agent Client Collector server deployment Connect agents directly to the ServiceNow® cloud using a MID Server or ITOM Cloud Services (ICS).	Agent Client Collector endpoint deployment Connect agents directly to the ServiceNow® cloud using ITOM Cloud Services (ICS).
Agent Client Collector shared deployment Deploy selected Agent Client Collector components on both servers and endpoints.	Agent Client Collector Log Analytics Stream log data from Linux and Windows hosts to a ServiceNow instance.		Live CI View View live data for incident related CIs to help resolve incidents.

Exploring Agent Client Collector

The Agent Client Collector Framework (ACC-F) is a powerful solution for monitoring the performance and health of infrastructure components by using agents installed on servers and devices. It collects and sends critical system data to ServiceNow for analysis, enabling proactive management and troubleshooting of Configuration Items (CIs).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

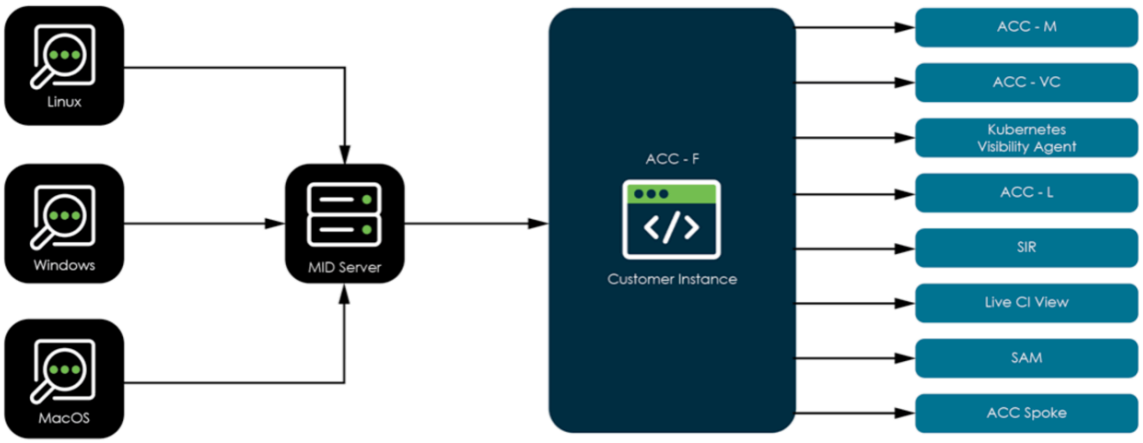
Agent Client Collector Framework overview

The Agent Client Collector Framework enables organizations to monitor and manage the health of their infrastructure through agents installed on key systems. These agents execute predefined commands on the machines they are installed on, sending the resulting data back to the ServiceNow® instance via a dedicated MID Server. The framework enables seamless management of both the Agent Client Collector and MID Server, storing event data and performance metrics in the appropriate database. By providing insights into CI performance, ACC-F helps organizations identify and resolve issues quickly, improving operational efficiency and system reliability.

Agent Client Collector Framework workflow

The following illustration describes the layout and data flow within the Agent Client Collector Framework application.

Collecting and distributing data with ACC-F



1. Agent Installation: The agent is installed on infrastructure components, such as servers, devices, and network equipment. These agents are responsible for executing system commands and gathering performance data from the host machine. ACC-F is deployed on the customer's ServiceNow® instance.
2. Data collection: The agent runs predefined scripts or queries (checks) on the infrastructure components to collect various system metrics and events. This includes performance data such as CPU usage, memory utilization, disk space, and network activity. The agent also collects error logs and system alerts.
3. MID Server communication: The agent sends the collected data to the ServiceNow instance through a dedicated MID Server. The MID Server acts as a secure communication bridge between the infrastructure and the ServiceNow platform, ensuring data is transmitted reliably and securely.
4. Data Storage: Upon receiving the data, the ServiceNow instance stores the events and performance metrics in the relevant database. This data is then associated with the respective Configuration Items (CIs) within the ServiceNow CMDB Configuration Management Database (CMDB), enabling efficient tracking and reporting.
5. Data Analysis and Reporting: The collected data is analyzed within the ServiceNow instance, where it is used for monitoring, troubleshooting, and reporting purposes. This analysis helps identify potential issues or areas of improvement, triggering alerts or actions to resolve problems proactively.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Feedback Loop: Based on the analysis, the system can trigger remediation actions, such as running corrective scripts, reconfiguring settings, or notifying responsible teams for further investigation. The feedback is looped back into the system, allowing for continuous monitoring and optimization.

Agent Client Collector Framework benefits

Agent Client Collector Framework provides data to other Agent Client Collector components.

Benefit	Feature	Users
Monitor your system's health, performance, and availability through automated collection of events and metrics, leveraging automated configurations.	Agent Client Collector Monitoring	NOC User, Event Management administrator
Track server inventory, software installations and usage continuously with non-admin access and minimal network communication.	How Agent Client Collector for Visibility Content works	CMDB/Discovery administrator
Gather detailed inventory data of devices not connected to your network or running in isolated environments (air-gapped).	Agent Client Collector Framework Air Gapped Configuration Item Management Solution	CMDB/Discovery administrator
Minimize triage time of incidents by direct access of live device details and interactions to remediate.	View live CI data with Agent Client Collector	ITSM user
Stream log data into your instance to predict problems and solve them before they happen, to minimize user impact.	Agent Client Collector Log Analytics	Agent Client Collector administrator

Agent Client Collector Framework use case

The Agent Client Collector Framework (ACC-F) use case demonstrates how a financial organization can use Agent Client Collector Framework to assist in IT asset discovery.

Use case overview

A leading financial organization needed a robust IT discovery solution to maintain compliance, secure critical systems, and manage a growing remote workforce. While the organization initially relied on agentless discovery methods — where MID Servers interrogate systems and populate the CMDB—it faced significant challenges. These limitations affected their ability to monitor secure environments and remote endpoints effectively, leading to potential security and compliance risks.

Challenges

- Restricted server access: The financial organization's security policies restricted MID Servers from initiating connections to core banking servers and sensitive financial databases. This made agentless discovery insufficient for these high-security assets.
- Remote workforce visibility: The company's growing remote workforce meant many employee laptops and mobile devices operated outside the corporate network. Agentless discovery

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

couldn't capture data from these endpoints, creating blind spots in asset tracking and compliance monitoring.

- Regulatory compliance: Financial institutions face stringent regulations (such as PCI, DSS and SOX) requiring detailed and auditable asset data. Agentless discovery struggled to meet these requirements, especially for in-depth monitoring and policy enforcement.

Solutions

To address these challenges, the financial organization implemented an agent-based discovery approach.

- Agent deployment on critical servers: Agents were installed on core banking servers and sensitive financial databases. This allowed continuous, secure monitoring without violating access restrictions.
- Remote endpoint management: Agents deployed on remote employee laptops provided real-time data collection and monitoring, regardless of location. This ensured that all devices, even those outside the corporate network, were included in asset discovery.
- Enhanced data collection: The agents collected detailed system information and enforced security policies directly on each asset, ensuring compliance with regulatory standards and improving audit readiness.

Outcomes

- Comprehensive asset visibility: The organization achieved full visibility across its IT environment, including secure data centers and remote endpoints. This reduced blind spots and improved decision-making for IT operations and security teams.
- Improved compliance and audit readiness: Agent-based discovery provided granular, auditable data that met stringent regulatory requirements. This streamlined compliance reporting and reduced the risk of regulatory penalties.
- Enhanced security posture: By enforcing policies at the endpoint level, the organization strengthened its cybersecurity defenses, protecting sensitive financial data from potential threats.

This approach enabled the financial institution to maintain control over its IT environment, support its remote workforce effectively, and ensure compliance with industry regulations - critical factors in safeguarding sensitive financial operations and maintaining customer trust.

Agent Client Collector architecture

The Agent Client Collector is a ServiceNow agent installed on your Windows, Linux, and macOS devices to monitor your company's infrastructure and installed applications.

Agent Client Collector architecture - overview

The Agent Client Collector is built on a Sensu framework and comes installed with monitoring capabilities for servers, databases, application servers, and middleware. It also supports extending monitoring through additional checks from the Sensu community or Nagios-compatible plugins, allowing you to customize monitoring to your needs.

Monitoring with checks and policies

The agent runs checks on the host to gather relevant data, transforming it into events or metrics. These checks are defined within ServiceNow and are associated with monitoring policies. A policy is a combination of the Configuration Items (CIs) being monitored and the checks that run on those CIs. The checks are associated with policies to monitor different aspects of the system.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can customize check instances - such as adjusting the frequency or specifying parameters like login credentials for databases - without affecting the original check definition. Customization of a check instance takes effect only on the check instance associated with the policy and does not change the global check definition. This customization ensures flexibility in monitoring various CIs under different scenarios.

Data collection and transmission

After installation, the agent collects information on its host and processes. The agent pushes the collected data to the ServiceNow instance through the MID Server. The MID Server serves as a bridge between the agent and the ServiceNow instance, ensuring the data is transformed and securely sent for processing.

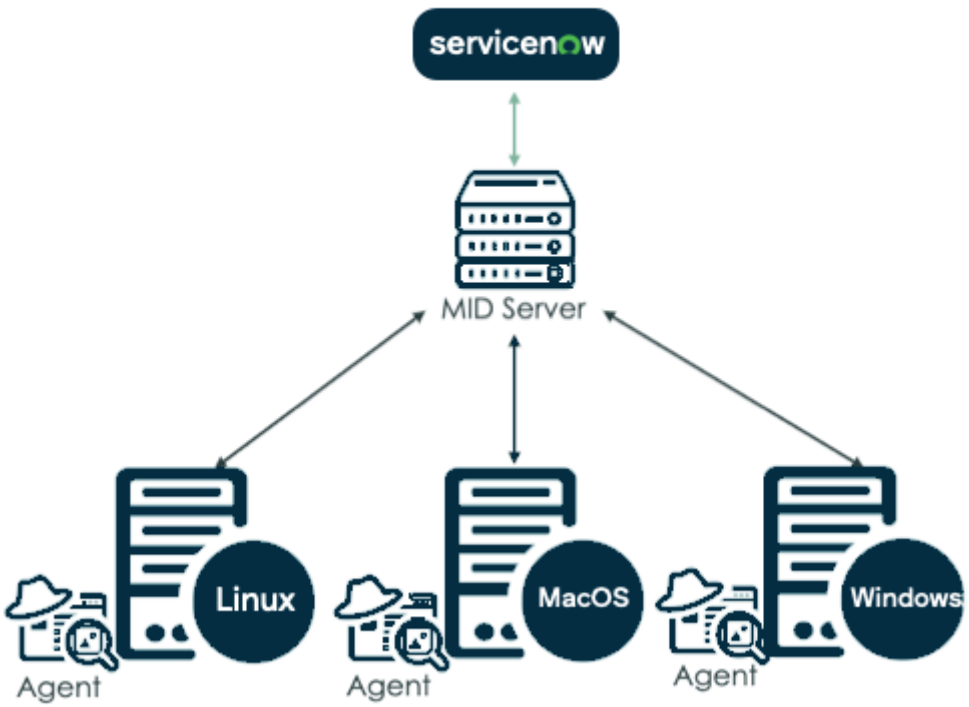
On the instance, CIs are created for the host and applications classified from the running processes (such as Microsoft SQL Server). Once these CIs are created, the active monitoring policies associated with the CIs are downloaded to the agent's MID Server, which then pushes the policies to the agent for execution.

Data storage and use

The results from the checks are stored in the ServiceNow instance:

- CI data: CMDB for Configuration Items.
- Event data: Events table (for example, alerts triggered by threshold breaches).

This data can be leveraged for monitoring, alerting, and reporting. Integration ensures real-time visibility into the health of your infrastructure and applications, while also enabling proactive issue detection and remediation.



1. Define a monitoring policy in the ServiceNow instance.
2. The MID Server fetches the check instances from the instance and passes them to the agent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. The agent runs the checks, collects data, and sends the results back to the MID Server.
4. The MID Server sends the collected data to the ServiceNow instance, where it is stored in the CMDB or events tables.

The commands and their configurations that run on the Agent are called **checks**. The Agent comes by default with **check definitions**, which determine a specific command and the default frequency with which it runs. Checks are defined on the instance and are passed to the Agent via the MID Server.

A **policy** is a combination of the CIs being monitored by the Agent Client Collector and the checks that run on those CIs. You associate check definitions with policies. Those check definitions are then referred to as **check instances**. You can customize check instances to meet your needs. For example, customize the running interval or the parameters specific to the policy, such as the login credentials to access a MySQL database. Customization of a check instance takes effect only on the check instance associated with the policy, which does not affect the original check definition or already created check instances in other policies.

Domain separation and Agent Client Collector

Domain separation is supported for Agent Client Collector (ACC). Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

How domain separation works in Agent Client Collector

Domain separation in ACC allows the isolation of data collected by the Agent Client Collector to a particular domain. As a result, only users within that domain can access and view this data. Similarly, agents and their associated configurations are tied to specific domains, ensuring that operations within one domain do not affect or leak into others. This creates a more organized and secure environment for managing multiple groups, business units, or regions.

- Data Security and Privacy: Restricting data access based on domains reduces the risk of unauthorized access and cross-domain data leakage, ensuring that sensitive information stays within its designated domain.
- Access Control: By isolating domains, organizations can enforce strict access controls, allowing only designated users or teams to view or interact with the data relevant to their domain.

Use cases for domain separation in Agent Client Collector

- Multi-department collaboration with data isolation: IT and Finance departments can independently monitor their respective systems without data overlap. For example, if there's an issue with a server in the payment processing system, Finance can run specific checks in their domain without interference from IT.
- Regulatory compliance: Domain separation helps comply with regulations like GDPR or SOX by ensuring that only authorized personnel can access sensitive data. For instance, the Compliance department can monitor regulatory checks while being restricted from accessing IT infrastructure data.
- Incident management and troubleshooting: IT can troubleshoot network issues, while Finance monitors transaction systems. Domain separation allows both departments to work independently, ensuring faster resolution and preventing data exposure.

Related topics

Domain separation for service providers

Use case: Data isolation and monitoring with domain separation

Optimizing data isolation and monitoring with domain separation ensures financial institutions protect sensitive information, improve operational efficiency, and maintain compliance by securely segregating departmental data.

Use case overview

In a large financial institution, departments like IT, Finance, Compliance, and HR need to manage their systems independently while keeping sensitive data protected. The Agent Client Collector (ACC) collects data from various agents on servers and devices, and domain separation ensures that each department's data is securely isolated. This allows departments to manage their own monitoring, troubleshooting, and reporting, greatly reducing the risk of cross-domain interference or unauthorized access.

Challenges without domain separation

- Data privacy and security risks: Sensitive data could be exposed to unauthorized users. For example, IT staff could inadvertently access financial or payroll data, violating privacy policies.
- Operational inefficiency: Departments would have to share configurations, making it harder to manage and troubleshoot issues, leading to confusion and inefficiencies.
- Compliance issues: Meeting regulatory requirements for data isolation would be difficult, risking compliance violations.
- Increased risk of data corruption: Shared environments can lead to accidental data corruption, as changes in one department could affect others.

Solution

- Data isolation: Each department has a dedicated domain, ensuring that data collected by agents is accessible only within that domain.
- Independent configuration and monitoring: Departments set their own checks, policies, and tasks without affecting others.
- Access control: Role-based access control (RBAC) restricts user access to data within their domain. For example, IT can access only infrastructure data, while Finance can access only financial transaction data.
- Enhanced security: Domain separation ensures that users in one department cannot access data from other departments, reducing the risk of unauthorized access.

Outcome

- Improved data security: Sensitive data is protected, reducing unauthorized access risks.
- Operational efficiency: Departments operate independently, managing configurations and monitoring without conflicts.
- Regulatory compliance: Easier adherence to data privacy regulations (GDPR, SOX) due to secure data segregation.
- Reduced data corruption: Isolated environments prevent unintended cross-departmental impacts, enhancing system stability.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use case: Regulatory compliance in financial services

A financial institution needs to ensure that its data is accessible only to the departments that have authorization for the indicated data.

Challenge

The financial institution must comply with regulations that require strict data separation between departments (such as HR, IT, or Finance).

Solution

1. Create separate domains for each department (IT, Finance, HR, Compliance, and so forth) in the Agent Client Collector (ACC) configuration.
2. Apply access controls so that sensitive data (such as employee records and financial transactions) is accessible only to authorized departments.
3. Use ACC health instance scans to ensure that data separation is maintained, especially when updating or troubleshooting systems.
4. Periodically audit domain separation settings to ensure compliance with data privacy regulations such as GDPR, SOX, or PCI-DSS.

Outcome

Compliance with legal and regulatory requirements is ensured, and sensitive data is protected from unauthorized access.

Agent Client Collector plugins

An Agent Client Collector (ACC) plugin is a script or group of scripts that extend the Agent Client Collector's capabilities. Plugins enhance monitoring by collecting metrics, performing specialized checks, and triggering events based on conditions, like monitoring an application's queue size when it reaches 60% or 80%. Plugins ensure scalable, customizable monitoring to adapt to evolving infrastructure or application needs.

Plugin-check dependency

Plugins are tightly integrated with checks in the Agent Client Collector Framework. A dependency is created between the plugin and the check to ensure that the plugin is executed alongside the associated check.

- Plugin Dependency: A plugin can be associated with one or more checks, and vice versa, where checks can depend on multiple plugins.
- Execution: Plugins and checks run on the same agent, working in unison to gather data, perform specialized tasks, or trigger necessary events

Plugin-agent compatibility

Agents must be the same version as their corresponding plugins or can be one version lower. For example, an ACC agent version 4.1.0 can work with an ACC-F store version 5.1.0.

Creating and managing plugins

You can create Agent Client Collector plugins as needed to customize the monitoring to your specific environment. These plugins are typically formatted as tar.gz files, which contain the scripts that define the plugin's functionality.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Plugin creation: Custom plugins are developed and packaged into tar.gz files.
- Integration with checks: Once created, the plugin is integrated with checks by establishing the appropriate dependencies, ensuring that the plugin and check run together.
- Customization: Plugins can be customized to meet the specific requirements of your monitoring needs, whether it's adding more detailed metrics, checking system thresholds, or generating custom events.

Pre-installed plugins

Agent Client Collector Framework includes a set of pre-installed plugins that provide basic functionalities for common monitoring tasks, such as gathering standard metrics or monitoring key system parameters. For more detailed information on the plugins that come with the Agent Client Collector as part of ITOM AIOps, see Plugins or applications installed with ITOM AIOps.

Secure parameters in Agent Client Collector

Secure parameters in Agent Client Collector (ACC) refers to securely passing sensitive data, such as user names, passwords, and API keys, during check execution, without exposing the sensitive data in the command line. Parameters are passed to the script through standard input (STDIN), hiding them from logs or any process that might capture command-line arguments.

Depending on the coding language in use, implementation of secure parameters may vary. For example, in Linux's Bash, the *read* command (*read <variable_name>*) is used, populating *<variable_name>* with the value entered in STDIN.

Secure parameters data flow

1. Create secure parameters: Define secure parameters in the instance, referencing credentials that need protection (such as usernames and passwords). For details, see Create secure parameters for a check.
2. Configure secure parameters: Set an **Order** value to determine the sequence in which credentials are passed to the standard input.
3. Pass credentials: Transfer credentials from the MID Server to the agent, based on the check to which they are assigned. When the check executes, the agent passes the secured parameters to the script using STDIN, in the order specified by the **Order** value configured in the instance.
4. Execute the check: Upon execution, the agents send the secure parameters to the script via STDIN, following the specified order.
5. Run the script: The script retrieves and uses the secure parameters from STDIN to execute with the secured credentials.

Secure parameters benefits

- Enhanced security: Passing sensitive data like usernames and passwords directly in the command line is a security threat, as they could be exposed to unauthorized access or malicious users. Secure parameters ensure that such data is securely handled and hidden from view.
- Prevent data exposure: When using secure parameters, the credentials are not written in plain text in the command line, avoiding the risk of them being captured in logs or process listings.
- Data flow control: Secure parameters enable controlled and customizable passing of credentials to the script, ensuring the correct handling and timing of sensitive information.

Agent Client Collector logs

Agent Client Collector (ACC) logs play a critical role in monitoring the activity and performance of the agent. Logs offer valuable feedback that helps identify potential issues, especially when the agent's performance is suboptimal. By providing insights into areas of concern, these logs are essential for troubleshooting and resolving issues, ultimately improving the overall effectiveness of the agent.

Agent Client Collector (ACC) logs offer key benefits for monitoring and maintaining agent performance.

- Configurable severity levels: Agent Client Collector logs enables you to configure the severity levels for monitoring, including *Error*, *Debug*, and *Info*. This flexibility helps focus on specific areas, such as tracking errors or diagnosing issues.
- Log retention management: You can set up log retention policies, determining how often to delete logs to preserve system resources. This ensures that the logs remain manageable and do not negatively impact system performance.
- Performance issue identification: Logs provide valuable insights to identify areas where the agent may be experiencing issues, helping to improve agent performance.

For details on locating and managing Agent Client Collector logs, see View the Agent Client Collector logs.

Operating system and application monitoring using Agent Client Collector

IT Operations Management (ITOM) monitoring for the Agent Client Collector is installed on the ServiceNow® instance. It monitors the specific operating system and applications that are installed on the host machine.

The Agent Client Collector monitors the following applications.

ACC Applications

Operating System/Application	Configuration description
Windows	No special configuration required.
Linux	No special configuration required.
Apache HTTP Server	See Configure Agent Client Collector Apache HTTP server monitoring.
Apache Tomcat	See Configure Agent Client Collector Apache Tomcat monitoring.
IBM WebSphere	No special configuration required. Accessed through JMX. Default management port is **9100**.
IIS	No special configuration required.
JBoss/WildFly	No special configuration required. Default port is **9990**. For troubleshooting information, see Monitoring performance in the Red Hat customer portal.
Microsoft SQL Server	No special configuration required. Ensure that the instance name is populated in the CI record, either by running Discovery or by manually populating the record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ACC Applications (continued)

Operating System/Application	Configuration description
My SQL	No special configuration required. Default port is **3306**.
Oracle Database	No special configuration required. Ensure that the SID and Oracle Home path are populated in the CI record, either by running Discovery or by manually populating the record. Default port is **1521**.
Oracle WebLogic	No special configuration required. Accessed via a JMX port. Default port is **7001**. Ensure that the WebLogic home (wls_home) parameter is populated in the CI record, either by running Discovery or by manually populating the record. Ensure that the user running the agent has sufficient permissions to access the JAR files in the **Weblogic** installation directories.

When using the **Microsoft SQL Server**, **Oracle Database**, and **Oracle WebLogic** applications, you must run Discovery to configure CI fields on the instance. Ensure that the Discovery plugin (com.snc.discovery) is installed to enable running Discovery.

When the application is running on a port other than the default, ensure that you update the port number in the check instance's parameters.

Configure Agent Client Collector Apache HTTP server monitoring

To configure the Agent Client Collector to perform Apache HTTP server monitoring, set the following configurations in the Apache HTTP server application.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. On the Apache HTTP Server host, navigate to one of the following locations:
   - In a Linux environment:
     - `/etc/httpd`
     - `/etc/httpd/conf`
     - `/etc/apache2`
     - `/etc/apache2/conf`
   - In a Windows environment: The `conf` directory in the Apache installation location.
2. Locate either the `httpd.conf` or `apache2.conf` file.
3. Ensure that the following line is uncommented:
   `LoadModule status_module modules/mod_status.so`
4. Configure the check instance port to be identical to the port on which Apache is listening (default for both is **80**).
5. To ensure a secure connection, configure SSL, as follows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Ensure that the following line is uncommented:
`LoadModule ssl_module modules/mod_ssl.so`

b. Activate the *ssl_secure_connection* parameter in the check instance.

c. Configure the check instance port to be identical to the port on which Apache is listening to secure connections (default is **443**).

Apache Module

Apache SLL/TLS Strong Encryption: How-to

Configure Agent Client Collector Apache Tomcat monitoring

To configure the Agent Client Collector to perform Apache Tomcat monitoring, set the following configurations in the Apache Tomcat application.

Before you begin
Role required: agent_client_collector_admin

Procedure

1. Open a management JMX port when starting the server:

a. In a Linux environment:

i. In `bin` directory in the Tomcat home directory, create a `setenv.sh` file.

ii. Ensure that the file contains the following:

```
export CATALINA_OPTS=$CATALINA_OPTS"
-Dcom.sun.management.jmxremote=true
-Dcom.sun.management.jmxremote.port={PORT NUMBER}
-Dcom.sun.management.jmxremote.rmi.port={PORT NUMBER}
-Dcom.sun.management.jmxremote.ssl=false
-Dcom.sun.management.jmxremote.authenticate=false
-Djava.rmi.server.hostname=127.0.0.1"
```

iii. Run `chmod 755 setenv.sh` to give the `setenv.sh` file executable permissions.

b. In a Windows environment:

i. In `bin` directory in the Tomcat home directory, create a `setenv.bat` file.

ii. Ensure that the file contains the following:

```
@echo=off
if defined CATALINA_OPTS (
set CATALINA_OPTS=%CATALINA_OPTS% -
Dcom.sun.management.jmxremote=true
) else (
set CATALINA_OPTS=-
Dcom.sun.management.jmxremote=true
)
set CATALINA_OPTS=%CATALINA_OPTS% -
Dcom.sun.management.jmxremote.port={PORT NUMBER}
set CATALINA_OPTS=%CATALINA_OPTS% -
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
Dcom.sun.management.jmxremote.rmi.port={PORT NUMBER}
set CATALINA_OPTS=%CATALINA_OPTS% -
Dcom.sun.management.jmxremote.authenticate=false
set CATALINA_OPTS=%CATALINA_OPTS% -
Dcom.sun.management.jmxremote.ssl=false
set CATALINA_OPTS=%CATALINA_OPTS% -
Djava.rmi.server.hostname=127.0.0.1
```

{PORT NUMBER} represents the number of the port you open for JMX RMI monitoring. The default value created by the check definition is **9000**.

2. Restart Tomcat.
   a. In a Linux environment: Run the `shutdown.sh` script, followed by the `startup.sh` script.
   b. In a Windows environment: Run the `shutdown.bat` script, followed by the `startup.bat` script.

Monitor HTTP points

Use the **Monitoring HTTP Entry Points** and **Monitoring HTTP Entry Points Metrics** policies that come with the ITOM Monitoring scoped app to monitor `http` and `https` entry points and entry points metrics. You can customize these policies as needed, or you can configure a new policy to monitor service entry points.

Before you begin

Role required: agent_client_collector_admin

About this task

An entry point is the access point for a service. In an Agent Client Collector policy, you specify the service you want to monitor, and the policy monitors the service's entry points.

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Policies**.
2. Select either the **Monitoring HTTP Entry Points** or **Monitoring HTTP Entry Points Metrics** policy.
   The relevant **Policy - Monitoring HTTP Entry Points** page opens.
3. On the **Monitored CIs** tab:
   a. In the **Table** field, ensure that the **sn_itmon_http_entrypoint** database view table is selected for the Agent Client Collector to retrieve http and https entry points for monitoring.
   b. In the **Filter** section, configure a filter for the services and entry points to be taken from the **sn_itmon_http_entrypoint** database view table.
4. Click the **Proxy Settings** tab and select the type of proxy you want to enable for the entry point monitoring.
   - **Single proxy agent**: Select to enable monitoring a single agent, which you select in the **Proxy agent** field that appears after selecting this option.
   - **Multi-proxy agents by filter**: Select to enable monitoring multiple agents. Configure a filter in the **Proxy filter** section that appears after selecting this option to monitor only the agents that match the filter's conditions.
   - **Script based proxy**: Select to enable monitoring an agent based on a script.

   You must configure a proxy to run an HTTP policy.
5. Click the **Checks** tab and in the **Filter checks by groups** field, select **HTTP** to display all of the http checks in the **Available** cell.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

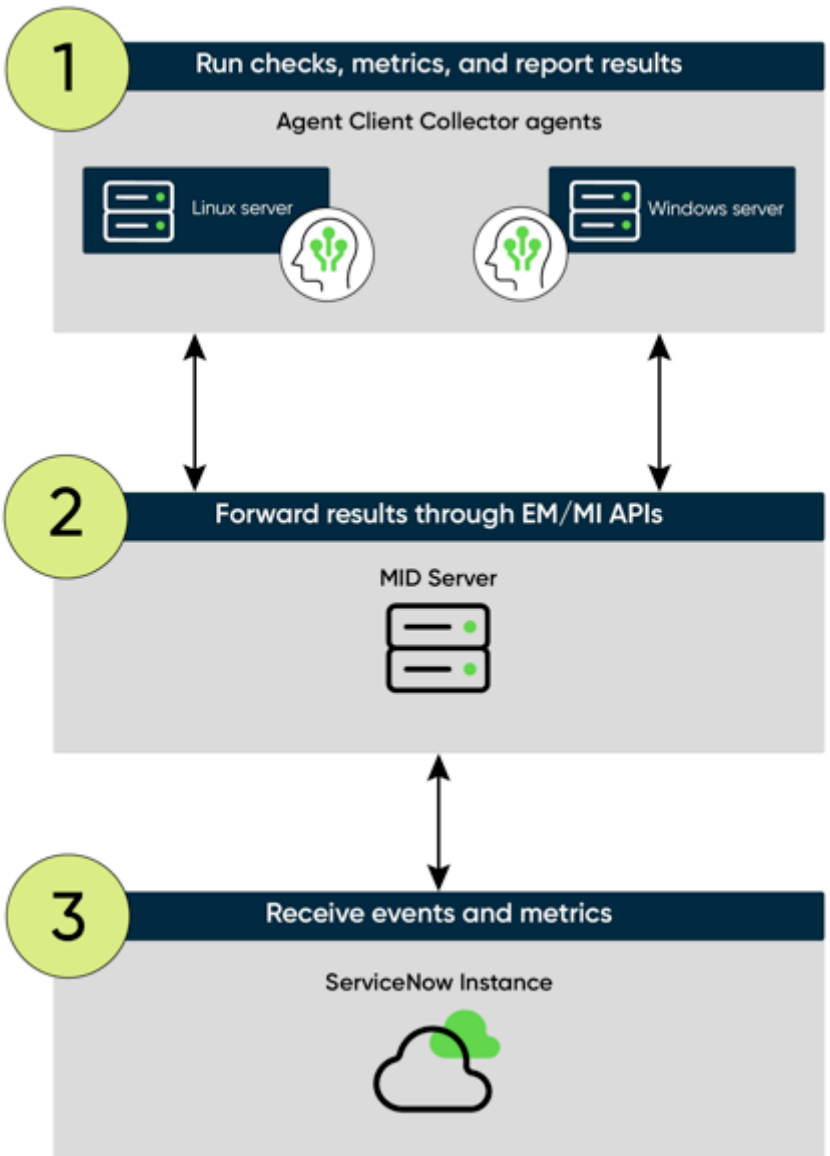
6. Select the relevant checks and click the right arrow button to move them to the **Selected** cell.
7. Select the **Active** check box at the top of the page to activate the policy.
8. Click **Update**.
   The policy monitors the entry points specified by the policy's configurations.

Agent-based data flow

The Agent Client Collector gathers information on the health of the CI that the Agent is installed on, and the applications that run on the hosts. The Agent runs several checks and pushes the checks' results to the MID Server, where they are converted into events or metrics.

Events are stored in the instance's Events database, while metrics are stored in the Metrics database.

The following image displays the data flow from the Agent Client Collector to the instance.



The numbered entries in the flow indicate the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Specified checks run on the agent. Data, including metrics, is pushed to the MID Server.
2. The MID Server analyzes the data and classifies the results as events or metrics. MID Server uses REST API to send the results to the instance.
3. The instance receives the data and stores it in the relevant database.

Agent Client Collector Monitoring use case

The Agent Client Collector Monitoring (ACC-M) use case demonstrates how organizations can achieve unified monitoring across hybrid IT environments.

Use case overview

Many enterprises today operate in a hybrid IT environment, where some resources are hosted on-premises, while others reside in the cloud. This complexity often leads to fragmented monitoring, making it difficult to obtain a unified view of IT service health. Agent Client Collector Monitoring (ACC-M) bridges this gap by providing a comprehensive and converged picture of the organization's services, regardless of where they're hosted. ACC-M is a lightweight monitoring solution that integrates seamlessly into its existing ServiceNow platform.

Challenge

An IT operations team struggled to cohesively monitor service health, due to the disparate nature of its infrastructure. On-premises resources, such as databases and ERP systems, were monitored using traditional methods, while cloud services had separate monitoring tools. This fragmentation resulted in:

- A lack of real-time visibility into overall service health.
- Delayed issue identification and troubleshooting.
- Multiple monitoring dashboards, increasing complexity for the IT team.
- Difficulty in correlating on-premises and cloud alerts, leading to inefficiencies.

Solution

ACC-M enables real-time, unified visibility across a hybrid IT environment. It improves operational efficiency, reduces downtime, and creates a more resilient IT infrastructure capable of supporting both on-premises and cloud-based services.

ACC-M streamlines the monitoring of on-premises and cloud resources into a single, unified display by offering the following solutions:

Solutions implemented by ACC-M

Solution	Description	Outcome
Unified monitoring across environments	ACC-M collects health metrics, performance data, and alert statuses from both on-premises and cloud infrastructure components. ACC-M uses lightweight agents installed on servers, VMs, and cloud resources to gather relevant data, providing:	Improved response: With a unified view of all resources, the IT operations team can quickly identify where issues are occurring and prioritize them based on overall service impact, reducing their mean-time-to-resolution (MTTR).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Solutions implemented by ACC-M (continued)

Solution	Description	Outcome
	• CPU and memory utilization for on-premises servers. • Network performance metrics. • Availability and performance metrics for cloud services, such as databases and storage.	
Converged health view	ACC-M provides the company's IT team with a converged health dashboard within the ServiceNow platform, providing: • A unified view of both on-premises and cloud resources. • Real-time updates on service health, ensuring that hybrid services are monitored together and not in isolation. • Integrated insights into service dependencies, correlating incidents that impact both on-premises and cloud systems.	Proactive monitoring and maintenance: ACC-M's real-time health metrics enable proactive monitoring of services, avoiding outages by identifying and resolving issues before they escalate.
Hybrid Alerting and Automation	ACC-M enables setting up automated alerts for both on-premises and cloud environments, streamlining their incident response processes. When a service in the hybrid environment experiences an issue, ACC-M does the following: • Automatically generates alerts with enriched context, identifying whether the issue originated from the on-premises infrastructure or cloud services. • Triggers automated workflows for remediation	Operational efficiency: The convergence of on-premises and cloud monitoring into a single platform eliminates the need for multiple monitoring tools. This reduces complexity and frees IT resources to focus on more strategic tasks.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Solutions implemented by ACC-M (continued)

Solution	Description	Outcome
	based on the alert type, reducing manual intervention.	
Service Health Visualization	Using the ServiceNow Service Map enables visualizing how services are performing across the entire hybrid infrastructure. ACC-M feeds this with continuous, real-time data, helping the IT team do the following: • Track dependencies between on-premises and cloud services. • Identify potential points of failure before they impact the business. • See at a glance which services are healthy, degraded, or at risk, wherever they're hosted.	Enhanced Business Continuity: With a full view of the hybrid infrastructure health, IT can ensure that critical business services are up and running, improving overall business continuity.

Windows event log monitoring

Windows event log monitoring tracks, analyzes, and manages event logs generated by various Windows OS components.

The Windows OS Events policy includes the os.windows.check-event-log check, which measures the Windows event log against thresholds specified in the check's parameters. For details on the configurable check parameters, see Windows event log filter parameters.

How Agent Client Collector for Visibility Content works

Agent Client Collector for Visibility Content (ACC-VC) requires installation of ServiceNow Agent Client Collector (ACC) on the target host. ACC is a derivative of Sensu-Go, an open-source software.

ACC-VC use cases

ACC-VC applies Checks and Policies to schedule and collect host data. ACC-VC is triggered in the following cases:

- Periodic scheduling: A policy-based approach where Discovery is triggered on a periodic basis.
- On CI delete: When the computer or server CI record is deleted.
- MID Server cycle: When the MID Server goes down and comes back up.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Target host cycle: When the target host goes down and comes back up.
- Network break: When there is a break in the network link to the target.

Note:

- Discovery is triggered for those agents whose hosts are already present. Agents whose hosts are not present are discovered through ACC-F.
- Agent Client Connector for AI Control Tower is available on the ServiceNow Store. This app is an ACC connector and adds an AI proxy capability that collects AI-based traffic from managed devices, supporting AI Control Tower shadow AI use cases.

ACC-VC checks and policies

The ACC-VC assets are stored as Agent plugins with the main entry point [acc_visibility_main] and other modules for OS families. There is one main system Discovery Check definition, called *`Enhanced Discovery`*, which is used by the *`Enhanced Discovery Policy`*. This ACC-VC policy runs off a schedule, which is defaulted to 24 hours (86,400 seconds). This policy configuration is synced to all agents as defined in the ACC-VC policy.

When the payload is returned from the MID Server to the instance, the ACC-VC Check Type, *`EnhancedDiscovery`*, delegates tasks to the EnhancedDiscoveryHandler script include provided by ACC-VC. The script contains logic to process the data from the check and handles tasks such as:

- Data transformation into an identification and reconciliation engine (IRE) compatible payload
- Non-CI data reconciliation (cmdb_running_processes, cmdb_tcp_connections, and so on)

The ACC-VC Check Definition, *`Enhanced Discovery`*, is initiated by the ServiceNow Instance. Then, an ECC Queue record with topic, MonitoringProbe, is created on the output queue with relevant Check information. The MID Server then processes the check by sending a message to the ACC via WebSocket over TLS.

During this time, the MID Server also serves any relevant Assets or Plugins that the ACC requests. The MID Server ensures the Assets and Plugins are relevant to the particular Operating System, platform, OS version, and architecture on which the ACC is running.

You can edit and modify all parts of the ACC-VC application including check type, policy, and check definition. See Checks and policies for more information.

Virtual machines and cloud instances

ACC-VC associates a target, discovered via Discovery, with a pre-existing virtual machine (VM) Instance CIs. ACC-VC associates the discovered CI record with any pre-existing VM Instance record or Cloud Server Instance record with appropriate CMDB relationships.

The following variants of virtualization and cloud server vendors are supported for ACC-VC:

- vCenter
- Amazon AWS Cloud
- Google (GCP)
- Microsoft Azure

Agent Client Collector for Visibility Content use case

The Agent Client Collector for Visibility Content (ACC-VC) use case demonstrates how a financial organization can perform effective discovery across on-premise and remote environments.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use case overview

A leading financial organization needed to overcome the limitations of traditional agentless discovery to ensure comprehensive visibility, compliance, and security across both on-premise and remote environments.

Challenges

- Limited visibility into restricted environments: The organization's security policies prevented MID Servers from initiating connections to highly sensitive systems, such as core banking infrastructure and financial databases. This created visibility gaps in critical environments.
- Incomplete coverage of remote endpoints: With a rapidly expanding remote workforce, many devices operated outside the corporate network boundary, making them inaccessible to agentless discovery. This resulted in gaps in asset tracking and monitoring.
- Compliance and audit challenges: Strict regulatory requirements required granular, auditable, and continuously updated asset data. Agentless methods lacked the depth and consistency needed to meet these standards.

Solutions

To address these challenges, the financial organization implemented Agent Client Collector for Visibility Content (ACC-VC) as part of its ITOM strategy.

- Agent-based data collection for secure environments: Agents were deployed on restricted and high-security systems, enabling:
  - Secure, outbound communication without violating firewall policies.
  - Continuous monitoring without requiring inbound access.
- Remote endpoint visibility: Agents installed on employee devices provided continuous visibility, regardless of network location, and real-time data collection from off-network systems.
- Deep and continuous discovery: ACC-VC enabled:
  - Rich system telemetry and configuration data collection.
  - Continuous updates to the CMDB, improving data freshness and accuracy.
- Compliance and policy enforcement: Agents enforced and monitored endpoint level compliance by:
  - Capturing detailed, auditable system data.
  - Supporting compliance frameworks and audit requirements.

Outcomes

- End-to-end asset visibility: The organization achieved complete visibility across secure data center assets, cloud and hybrid environments, and remote workforce devices. This eliminated blind spots and improved operational decision making.
- Improved CMDB accuracy and reliability: Continuous data collection ensured up-to-date and trustworthy CI data, and improved service mapping and dependency insights.

> **Note:** Shadow AI detection is another key ACC-VC use case. The Agent Client Connector for AI Control Tower app, available on the ServiceNow Store, is an ACC connector that adds an AI proxy capability to collect AI-based traffic from managed devices, supporting AI Control Tower shadow AI use cases.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Enhanced compliance and audit readiness: The organization benefited from granular, auditable asset data, faster and more efficient compliance reporting, and reduced risk of regulatory violations.
- Increased operational efficiency: Reduced reliance of manual discovery and troubleshooting led to faster issue detection and lower operational overhead.

ACC-VC enabled the organization to transform its discovery strategy from periodic with limited visibility to continuous and intelligent, with comprehensive observability. This enabled the financial institution to:

- Secure critical systems
- Support a distributed workforce
- Maintain regulatory compliance
- Build a resilient and scalable IT operations framework

Configuring Agent Client Collector

Plan and configure your Agent Client Collector implementation.

Agent Client Collector configuration typically follows these steps:

1. Preparing for Agent Client Collector implementation
2. Deploying Agent Client Collector on servers
3. Deploying Agent Client Collector on endpoints
4. Deploying Agent Client Collector on both servers and endpoints

Preparing for Agent Client Collector implementation

Successful Agent Client Collector (ACC) implementations, especially involving large numbers of endpoints or servers, require careful deployment. When proceeding with a large-scale ACC deployment, follow the steps described in the planning and deployment checklists.

Agent Client Collector planning checklist

Successful Agent Client Collector (ACC) implementations, especially involving large numbers of endpoints or servers, require careful planning. Before proceeding with a large-scale ACC deployment, follow the steps described in the planning checklist.

Agent Client Collector planning

Step number	Action	Description
1	Define use cases, targeted devices, and success metrics	Typical ACC use cases include ITOM Visibility, ITAM (SAM/HAM), ITSM (DEX), ITOM Health (HLA/ Metric Intelligence). Many customers have success metrics targeting a percentage of devices with successful data collection for a use case over a 7 to 14-day window (for example, “95% of endpoints report software usage over a 14-day period”).
2	Identify Key Stakeholders	Involve network, security, and device/ software management teams (such

© 2026 ServiceNow, Inc. All rights reserved.

Agent Client Collector planning (continued)

Step number	Action	Description
		as jamf/Intune experts) as early as possible during planning.
3	Assess ServiceNow License, Store App and Instance Requirements	Ensure that you have all license entitlements for your use cases. Determine which software updates or configuration changes to your production and sub-production instances are needed to support your targeted number of devices.
4	Assess Software Requirements	1. Ensure that all CPU architectures and operating systems for your use cases are supported. If not, determine whether non-ACC solutions such as Service Graph Connector or Discovery Patterns can be used. 2. Determine whether your use cases require elevated system privileges on endpoints or servers (for example, root access on Linux for device serial number tracking).
5	Assess Network Requirements	Verify whether there are VPN, firewall, or proxy restrictions that prevent ACC from sending data to your ServiceNow instance.
6	Assess Device Management Requirements	Verify which internal solutions are available for deploying software within your organization on all targeted devices. For example, Intune and Jamf for endpoints; Chef, Puppet, or Ansible for servers.
7	Draft ACC Solution Architecture	Work with your ServiceNow account team to define how ACC agents send data to the ServiceNow instance, based on your use cases and differences in server and endpoint deployment techniques. Verify whether direct connections are made using ITOM Cloud Services or MID Servers.
8	Define and Segment your ACC Deployment Plan	Define evaluation, pilot, and broad rollout stages and the number of devices targeted in each phase. Align each segment with risk tolerance and business goals. ACC must be rolled out gradually, with no more than 5,000 agents per hour.

Agent Client Collector planning (continued)

Step number	Action	Description
9	Internal Compliance and Security Review	Work with internal teams and your stakeholders to review your deployment plan, solution architecture, and to obtain approvals.

Agent Client Collector deployment checklist

Successful Agent Client Collector (ACC) implementations, especially involving large numbers of endpoints or servers, require careful deployment. When proceeding with a large-scale ACC deployment, follow the steps described in the deployment checklist.

Agent Client Collector deployment

Step number	Action	Description
1	Update production and sub-production instances	Ensure that all instances are updated to the most recent store applications, family releases, or both.
2	Assess instance capacity	Open support tickets if additional instance capacity is needed for the projected number of ACC agents.
3	Deploy and configure MID Servers when required	If connecting over 1,000 ACC agents to a single MID Server, assess performance and whether a load balancer in front of a MID Server is needed.
4	Verify whether ITOM Cloud Services (ICS) is required and, if so, whether it is configured	Some use cases (such as DEX) always require ICS.
5	Download appropriate installer files from the instance	Installer files may be in one of the following formats: • .rpm • .msi • .pkg
6	Define a deployment calendar	Share deployment groups and group size, assignments, start/stop, success gates, go/no-go signers, and rollback criteria with stakeholders.
7	Package ACC in appropriate software management tools	Software management tools include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agent Client Collector deployment (continued)

Step number	Action	Description
		• Intune • jamf
8	Deploy pilot and test environments on sub-production instances using your preferred software management tool	In test and pilot environments, you can test multiple operating systems and hardware combinations (such as server vs. laptop).
9	Monitor the ServiceNow instance and the software management solution	• On the instance, monitor the performance and rate limit violations. • On the software management solution, monitor the deployment success rate.
10	Assess data collection, install success rate, and instance performance over the next 2-3 business days	Workloads and data collection can vary significantly, depending on the time of day; therefore, monitor deployment success over several days.
11	Update deployment calendar and continue with next install cohorts	After successful deployment, continue with data collection.

Deploying Agent Client Collector on servers

When deploying the Agent Client Collector, perform deployment and management tasks on your environment's servers.

Server deployment uses MID Servers to connect your agents to a ServiceNow instance. Agents deployed on data center servers open WebSocket connections to your MID Servers, which relay data to your instance. You manage the sizing, certificates, and load balancing of the MID Server.

Use server deployment when your agents are in controlled environments such as data centers, where you are already running MID Servers and want to keep traffic on your network. Agent Client Collector Monitoring (ACC-M) and Agent Client Collector Log Analytics (ACC-L) require server deployment, and you can deploy Agent Client Collector for Visibility Content (ACC-VC) with servers as well.

Configuring Agent Client Collector with a MID Server

Configure the Agent Client Collector with a MID Server to enable communication between network servers and the ServiceNow instance.

Configure an Agent Client Collector with a MID Server using a single-line command

Use a single-line command to set up an Agent Client Collector with a MID Server. You can also use the single-line command to migrate agents with MID-less configuration to be used with a MID Server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required:

- In a Linux or macOS environment: root
- In a Windows environment: agent_client_collector_admin

About this task

Running the single-line command includes flags, which indicate the options to be added to the `acc.yml` configuration file. These options dictate the configuration of the Agent Client Collector with the MID Server. If you don't specify an option in the command, the existing option in the `acc.yml` file is used. If there's no existing option, an error message indicates that the parameter is required to enable connecting to an endpoint.

Running a command validates that a connection can be made with the specified parameter (for example, the specified api-key value). However, the command doesn't verify if the value of the parameter is valid.

Procedure

1. In a terminal window, navigate to the Agent Client Collector installation location:
   - Linux: `/usr/share/servicenow/agent-client-collector/bin/`
   - macOS: `/opt/servicenow/agent-client-collector/bin`
   - Windows: `C:\Program Files\ServiceNow\agent-client-collector\bin`
2. Run the following command: `acc gateway mid <flags>`.

   For example (replace with your actual values): `acc gateway mid -a fbhsbnxdbshs635oo -b wss://1.2.3.4:8800`.

   The available flags appear in the following table:

MID Server configuration flags

Flag	Type	Description
-y, <--acc-yml>	String	Location of the `acc.yml` being configured. Can also be used to modify and validate parameters if the file is in a different location that the default. Optional. If no value is entered, the default location of the `acc.yml` file is used.
-a, <--api-key>	String	The API key to be used by the MID Server.
-b, <--backend-url>	String	One or more backend connection URLs specifying a websocket endpoint to a MID Server. Multiple values are specified using commas between entries

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Flag	Type	Description
		with no spaces separating the values; for example, `<url1>,<url2>`.
-h, help	N/A	Explains what the specified command does.

3. Restart the agent for the configuration settings to be entered into the `acc.yml` file.

Configure the websocket server on the MID Server

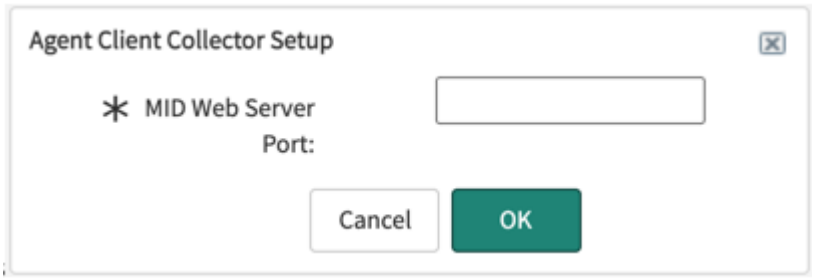
Configure the websocket server on MID Servers to enable connections from agents to the MID Server. You can configure only one websocket server per MID Server.

Before you begin

- Ensure that you download and install curl (or similar software) on your MID Server Windows machine.
- Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **MID Server** > **Servers**.
2. Select the relevant MID Server name.
3. In the **Related Links** section, click **Setup ACC Listener**.
   The **Agent Client Collector Setup** dialog box appears.



4. Enter the MID web server port (**8800**) in the displayed field.

   Note: You can change the default port, **8800**, as needed.

   - To invoke secure TLS configuration, configure the following in the `acc.yml` file: `wss://<mid_ip>:<websocket_port>/ws/events`
   - To invoke TLS 1.3 support on the MID Web Server, set the following parameter in the `wrapper-override.conf` file on the MID Server: `-Djdk.tls.server.protocols="TLSv1.3"`
   - In a Linux environment, port numbers under 1024 can be used only with superuser privileges.

5. Click **OK**.
   A confirmation message with the URL for the agent configuration file appears.

   The web server and websocket extension are configured for the MID Server. To verify the configuration, navigate to the following menu options:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Agent Client Collector** > **MID Web Server**. When editing the fields on the resulting form, you must restart the MID web server extension to save your changes.
- **Agent Client Collector** > **Websocket Endpoint**

6. Verify the validity of the websocket, using curl:

   a. Enter the following command into a cmd or terminal window: *curl -Lk -H "Authorization: Key <API_KEY>" https://<mid_server_address>:<port>/api/mid/mon*

   b. Verify that you receive a valid JSON response (and not an error message), such as the following:
   Successful installation JSON message:

```
{
                "connectedAgentsNum" : 1
}
```

Configure a websocket endpoint

Configure a websocket to enable the endpoint to provide web access from the MID Server to the Agent Client Collector (ACC).

Before you begin

Role required: agent_client_collector_admin

About this task

For added security, ensure that MID Servers deployed for the Agent Client Collector aren't deployed for other components.

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Deployment** > **MID Servers**.
2. Select a MID Server.
3. Select the **ACC Websocket Endpoints** tab on the bottom of the page.
4. Select **New**.
5. Configure the fields on the page.

ACC Websocket Endpoint page

Field	Description
Name	Enter a descriptive name for the websocket endpoint.
MID Server	The name of the selected MID Server.
Short description	Optionally, enter a short description for the websocket endpoint.
Accessible IP address	Apply an external/public IP when the MID Server has an internal IP that is not accessible from an agent. Used for cloud solutions with an agent that has access only to the MID Server's public IP. If the MID Server and all agents are in the same Virtual

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	private cloud (VPC), this field can be left empty.

6. In the **Related Links** section, select **Start** to activate the websocket endpoint.

Configure the frequency of updating the agent MID Server list

By default, the list of MID servers connected to agents is updated once daily. If you have a dynamic environment that adds MID servers frequently, you may want to schedule updates more often, or execute the job on demand.

Before you begin
Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **System Definition** > **Scheduled Jobs**.
2. Locate the **Update Mid List for All Agents** job.
3. To run the job immediately, click **Execute Now**.
4. To edit the frequency by which the job runs:

   a. In the **Run** field, select **Periodically**.
   The **Repeat Interval** field appears.

   Repeat interval field

   
   b. Configure the frequency by which you want the job to run.
   The cells next to the **Hours** cell represent minutes and seconds, respectively.

   c. Click **Update** to update the job frequency.

Enable Agent Client Collector monitoring on the MID Server

Enable Agent Client Collector monitoring on the MID Server by configuring the Agent Client Collector framework (ACC-F) and Metric Intelligence extensions in a single action. Enabling Agent Client Collector monitoring also enables monitoring on agents connected to the MID Server.

Before you begin
Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **MID Servers**.
2. On the MID Server page, select a MID Server to view the MID Server's details.
3. In the **Related Links** section, select **Setup ACC Monitoring** and enter the relevant port number in the **MID Web Server Port** field of the dialog box.

Result
The MID Server is configured to support both the Agent Client Collector and Metric Intelligence.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: You are prompted to enter a port number only on initial ACC Monitoring setup.

Automatic MID Server selection

Automatic selection of MID Servers ensures that each agent uses the most efficient available MID Server.

The Agent Client Collector automatic MID Server selection feature set is disabled by default. There are several factors to consider before determining if automatic MID Server selection is right for your use cases.

Use case considerations

Automatic MID Server selection provides several benefits. MID Server capabilities can narrow the list of MID Servers an agent can potential connect to. Automatic MID Server selection keeps the back-end URL configuration list up to date on the agent host without additional work flows.

When automatic MID Server selection is enabled, the agent performs a connectivity test against the list of available MID Servers and determines the best connection based on latency and number of currently connected agents.

However, there are several additional considerations that may make automatic MID Server selection wrong for your use case.

The ACC automatic MID Server selection is not a true load balancer and should be considered a fail-over mechanism. There is higher complexity for choosing a back-end URL as it is derived from multiple input sources. If, instead, an application load balancer is used only one back-end URL needs to be specified. See Enable the Agent Client Collector load balancer for more information.

By default, each agent is sent the list of all MID Servers listening for ACC connections. Since that list includes MID Servers running in restricted areas, the agents can try to connect to them which can generate security alerts.

Your DNS configuration should be considered before using automatic MID Server selection because the resolution can lead to unexpected results. The DNS resolution is done periodically. End User Compute systems that alternate between internal corporate, Wi-Fi, VPN, or external networks may not be able to reconnect if the network context has changed.

Automatic selection process

When automatic selection is enabled, the ServiceNow instance sends periodic MID Server updates to existing agents. The agent selects a MID Server based on information it receives from the ServiceNow instance.

During automatic MID Server selection, the agent selects a primary MID and a secondary MID list, and writes them to the agent's config file. The agent uses this list for fail-over protection when the primary MID/secondary MID in the list loses connection.

When an agent detects that its IP address has changed, it automatically connects with the most efficient MID Server available from the agent's list of MID Servers.

To secure communication between the MID Server and the agent, use the MID Server's unified key store. For details on using the MID Server unified key store, see MID Server unified key store.

Enable automatic MID Server selection

Enabling automatic MID Server selection lets the agent perform a connectivity test against the list of available MID Servers and determine the best connection based on latency and number of currently connected agents. Automatic MID Server selection is disabled by default.

Before you begin
Role required: agent_client_collector_admin

Procedure

- To enable sending periodic MID Server updates from the ServiceNow instance to existing agents, set the *sn_agent.enable_auto_mid_selection* system property to **true**.
- To enable automatic MID Server selection for individual agents:
  1. Set the *enable-auto-mid-selection* property in the agent's `acc.yml` file to **true**.
  2. Enable and execute the Update MID List for All Agents and Update MID List for All New Agents scheduled jobs.

What to do next
To disable automatic MID Server selection again, set each of the properties back to **false**.

Configure the Agent Client Collector capabilities for MID Servers

Configure the MID Servers with Agent Client Collector capabilities to enable the MID Servers to work with agents. Agents that have identical MID Server capabilities are eligible for automatic MID Server selection.

Before you begin
Role required: agent_client_collector_admin

About this task
A capability defines MID Server functions. Any MID Server that is assigned with a capability that has **Is ACC Capability=true** is enabled to work with an agent. For details on the MID Server capabilities, see MID Server capabilities.

Procedure

1. Navigate to **All** > **MID Server** > **Capabilities**.
2. Select a capability to enable the MID Server to work with the agent.
   a. Select the ACC Capability column next to the AgentClientCollector entry.
   b. Set the value to **true**.
3. Enable other capabilities for Agent Client Collector MID Servers by selecting the Is ACC Capability column next to the AgentClientCollector entry and setting the value to **true**.

Result
MID Servers with the same capabilities are eligible to be used during automatic MID Server selection.

Configure the automatic MID Server selection based on the Agent Client Collector capabilities

Configure the MID Servers that are ineligible for automatic MID Server selection with the agent. For example, you may want to block a MID Server from connecting to your agent due to firewall constraints.

Before you begin
Role required: agent_client_collector_admin

About this task

Agents with different levels of Agent Client Collector (ACC) capability can't be considered for automatic MID Server selection. To block a MID Server from automatic selection, assign it different ACC capabilities from all other MID Servers in your environment. Do not assign different capabilities from the primary MID Server.

Procedure

1. Configure the Agent Client Collector capabilities for MID Servers, as described in Configure the Agent Client Collector capabilities for MID Servers.
2. Navigate to **All** > **Agent Client Collector** > **MID Servers**.
3. Select the MID Server that you want to be ineligible for automatic MID Server selection.
4. Select the additional actions icon and select **View** > **Default View**.
5. Select the **Capabilities** tab.
6. Ensure that the MID Server isn't assigned with the capabilities that have **Is ACC Capability=true** on the **Capabilities** tab.

Example: Configuring MID Servers to be ineligible for automatic MID Server selection

1. Assign the **AgentClientCollector** capability to MID Server A and MID Server C, but not to MID Server B.
2. On the MID Server Capabilities page:
   a. Assign a capability to MID Server A and MID Server C.
   b. Assign a different capability to MID Server B.
3. Install Agent Client Collector Framework and specify MID Server A as the MID Server during installation.

   After installation, the agent has **Status=Up** and its MID Server is MID Server A.
4. Execute the MID Server Selection scheduled job to determine which MID Servers are eligible for automatic MID Server selection.

   MID Server B is ineligible for automatic selection, because it doesn't have the same ACC capability as MID Server A. MID Server C is eligible, because it has the same ACC capability as MID Server A.

Agent Client Collector Installation

You can install the Agent Client Collector on any supported host machine. The Agent Client Collector connects to a MID Server using the HTTP/S protocol, and the connection remains active after being established. One MID Server may handle several agents simultaneously, while a single agent works with one MID Server at a time and switches to a different MID Server when necessary to provide failover protection.

When an agent's IP address changes, it selects a MID Server to connect to based on the agent's MID Server list.

Verify that your server's OS and version is supported. For a list of supported OS's and versions, see ServiceNow Store Page

The maximum number of agents that can be connected to a single MID Server is configurable in the *sn_agent.mid.max_allowed_agents* MID Server property. The default value is 4,000.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For the list of required OS versions, see For a list of supported OS's and versions ServiceNow Store Page

For ACC-VC, a default 1 GiB MID Server can support 700 agents concurrently. An 8 GiB configuration for a MID Server can support 8,000 agents concurrently. You can also scale out. For example, 5 MID Servers with 8 GiB of heap size can handle up to 40k agents.

Agent Client Collector is installed with ruby version 3.3.2.

The default user account is a local user called **servicenow**. This user has basic level permissions.

The following table describes the permissions required to work with various features associated with the agent, per OS. An asterisk (*) indicates that no special permissions are required.

Agent on Endpoints Deployment

Feature	Windows	Linux	macOS
Basic inventory	*	*	*
Serial number(s)	*	sudo dmidecode	*
Running processes	Debug programs	*	*
Mapping TCP connections to running processes	*	sudo ss	*
Storage devices	LOCAL SYSTEM	*	*
Logged-in users	LOCAL SYSTEM	*	*
Package self-upgrade	LOCAL SYSTEM	sudo rpm/dpkg	Not supported

If you completely reinstall the agent on a single host server, and you're using ITOM Cloud Services, you must delete the agent record to allow for re-registration. Delete the original agent on the **Agent Client Collectors** page (**All** > **Agent Client Collector** > **Agents**).

Agents whose **Status = Down** or **Disconnected** which haven't been deleted are deleted automatically after 30 days. You can modify this setting on the Autoflush form page (see Autoflush form).

Use the Manual Transport Layer Security protocol (mTLS) for secure authentication between your MID Web Server and the agent (the client). For details, see Connect the agent to the MID Server using mTLS.

For details on using Agent Client Collector in an air-gapped environment, see the Agent Client Collector Framework Air Gapped Configuration Item Management Solution [KB1585753] article in the Now Support Knowledge Base.

Golden image mode enables cloning of additional instances. Setting golden image mode is described in the installation procedure prerequisites for each OS. For information on the structure and modularity of the golden image plugin by operating system, see Golden image structure and modularity.

Agent Client Collector supports domain separation. The domain of the agent and the CIs it creates is determined by the domain of the MID Server that the agent is connected to. The

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

user's domain must be the lowest domain level (known as a leaf domain) to enable creating a Websocket endpoint extension for the MID Server.

Related topics

Agent Client Collector installation on a Linux OS system

Install the Agent Client Collector on a Windows machine manually

Agent Client Collector installation on a macOS system

Agent Client Collector system requirements

System requirements are the fundamental specifications and configuration needed to install and run Agent Client Collector (ACC) effectively.

Verify that your server's OS and version is supported. For a list of supported OS's and versions ServiceNow Store Page

Before installing the Agent Client Collector, you must do the following:

- When working with a MID Server:
  - Ensure that one or more MID Servers are properly registered and validated with your instance, to be available for an agent connection request. For details, see Configuring MID Servers. In a staging environment, you need only one MID Server. However, in a production environment, configure at least two MID Servers to support zero-touch configuration and ensure that a MID Server is always available if one fails.
  - Ensure that there's a validated connection from the designated server where you're installing the agent to the MID Server.
  - Ensure that the MID Server port on which the Agent Client Collector listener runs is accessible.
- When working with MID-less deployment, follow the instructions described in Configuring MID-less Agent Client Collector.
- Ensure that the following plugins are installed on your instance:

Application	Plugin
ACC-F	○ MID Server ○ CMDB for scoped applications ○ Agent Client Collector global utilities ○ MID Web Server ○ Service Error Management
ACC-VC	○ Agent Client Collector for Visibility Content ○ Agent Client Collector Framework ○ Discovery [com.snc.discovery] plugin
ACC-M	○ Agent Client Collector Framework ○ Agent Client Collector Monitoring

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Application	Plugin
	○ Event Management and Service Mapping Core ○ Metric Intelligence - [com.snc.sa.metric] plugin
ACC-L	○ Agent Client Collector Framework ○ Agent Client Collector Log Analytics ○ Health Log Analytics
DEX	○ Agent Client Collector Framework ○ ITOM Cloud Services Core [sn_itom_cloud_svc]

You can verify that these plugins are installed on the **System Definitions** > **Plugins** page.

All plugins that come with the base system are signed with the ServiceNow certificate. Optionally, you can use custom plugins and sign them using your own certificate, as described in Enable OpenSSL secure signing for plugins.

- Ensure that your system has the minimum requirements for agent installation.

Minimum installation requirements

Agent Client Collector component	Requirements
Agent Client Collector Framework	○ 1 GB RAM ○ 300 MB free disk space ○ 1 CPU core
Agent Client Collector Monitoring	○ 1 GB RAM ○ 1 GB free disk space ○ 1 CPU core
Agent Client Collector for Visibility Content	○ 1 GB RAM ○ 1 GB free disk space ○ 1 CPU core

- Ensure that you're installing Agent Client Collector on one of the supported operating system distributions. For details on the supported operating systems, see Agent Client Collector Framework in the ServiceNow® Store.

Important: All supported operating systems work only with the x86-64 CPU architecture type. ACC-F v3.1.1 also adds native support for ARM64 on Apple Silicon architectures. For the latest information, see the Agent Client Collection on non- x86-64 computers and embedded boards [KB1172387] article in the Now Support Knowledge Base.

When using ACC-L: The Agent Client Collector comes with the default *`servicenow`* user. Ensure that this user has read access to enable Agent Client Collector to view all the configured log paths. For example, the Agent Client Collector *`servicenow`* user that comes installed with the base system does not have permissions to view the paths to `/var/log/` in Linux and C :

`\Windows\System32` in Windows. For information about configuring permissions for the *`servicenow`* user, see the ACC-L Permission Denied issues [KB1117271] article in the Now Support Knowledge Base.

When determining the number of machines and servers needed to support your agents (such as the number of machines requiring proxy agents), consider the agents' performance KPIs. For details on agent performance KPIs, see Agent Client Collector performance and footprint for URL monitoring.

Deploy the Agent Client Collector using a custom base image

Deploy the Agent Client Collector on a virtual machine during mass deployment using the machine's base image. Mass deployment uses silent installation, which hides installation status.

Before you begin

Use Microsoft SCCM to manage the deployment and security of your devices, as described in the Create a Windows service account with Log on as a Service KB article.

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agent Downloads**.
2. Download the installation file of the relevant OS.
3. Install the agent according to the relevant OS instructions.
4. Run the following command to stop the agent service:
   - In a Windows environment: Run the command `sc stop AgentClientCollector`
   - In a Linux environment: Run the command `sudo systemctl stop acc`
5. Ensure that the `acc.yml` file doesn't include an encrypted API key.
   For example: `api-key: "<insert plain text API key here>"`
6. Delete the contents of the agent's cache directory, keeping the directory structure intact:
   - In a Windows environment: `C:\ProgramData\ServiceNow\agent-client-collector\cache`
   - In a Linux environment: `/var/cache/servicenow/agent-client-collector`
7. When installing on a Windows machine, ensure that the installation was successful by doing one of the following:
   - Enable logging in silent installation and verify that the log file ends with the string, `Windows Installer installed the product.`
   - Ensure that the **AgentClientCollector** service has the status `Running`.
8. When installing on a Linux machine, access the machine where the agent is installed and modify the `/usr/share/servicenow/agent-client-collector/serial_number.txt` file in one of the following ways:
   - Change its content with the host's serial number, by running the following command: `sudo -n dmidecode -s system-serial-number`
   - Assign sudo permissions to the ServiceNow user to enable running the following `osqueryi` command: `sudo -E env "PATH=$PATH" osqueryi --logger_min_status=3 --line "select hardware_serial from system_info"`

> **Note:** You must change the virtual machine's host name after deployment to a unique value, to avoid damaging the host's CI.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. As a post-deployment step, restart the agent service.
   - In a Windows environment: Run the command `sc start AgentClientCollector`
   - In a Linux environment: Run the command `sudo systemctl start acc`

Enable the Agent Client Collector load balancer

Enable a load balancer to ensure that you have functional MID Servers. A load balancer distributes resources over multiple MID Servers to ensure that no single MID Server is overloaded.

Before you begin

1. Install the Agent Client Collector Framework.
2. Configure the Agent Client Collector web server.
3. Ensure that you have access to the internal application's load balancer configuration.
4. Verify that the file `<mid_server_install_path>/static/hello.txt` was created during MID Server setup.

   `hello.txt` is an empty file that is created manually, to retrieve an HTTP response 200.

Role required: agent_client_collector_admin

About this task

Load balancers are not configured by default. Follow this procedure to configure a load balancer in your environment.

Procedure

1. Configure the load balancer so that it can be used in the *`backend-url`* parameter in the `acc.yml` configuration file.
2. Perform the following setup actions on the load balancer:

   a. Increase the idle timeout to 300 seconds.

   b. Configure the load balancer target group with *`https`* and port 443.
   Configure all MID Servers behind the load balancer as targets.

   c. Configure the load balancer health check to monitor the `<mid_server_install_path>/static/hello.txt` file created during MID Server setup.
   The health check ensures that there are no communication interruptions between the load balancer and the MID Server.

3. Add the `<mid_server_install_path>/static/hello.txt` file to the static folder for each MID Server.
   You can place the file in another location that doesn't require credentials, to simplify the setup.
4. Update the acc.yml configuration file with the appropriate FQDN (*`backend-url`* value) and port number, and turn off automatic MID Server selection.

```
backend-url:
 - wss://<fqdn>:<port>/ws/events
enable-auto-mid-selection: false
```

5. Restart the Agent Client Collector.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result

The Agent Client Collector data flow proceeds as described in Agent Client Collector architecture.

Note:

When working with SSL, all certificates or certificate chains used by the configured MID Servers must be signed by root certificate authorities whose certificates are bundled inside a single `.pem` file. To transfer the signed certificates to the agent, specify the `.pem` file in the *`trusted-ca-file`* property of the agent's `.yml` configuration file. For information on enhancing security with SSL/TLS configuration, see the ITOM Agent Client Collector documentation material article in the Now Support Knowledge Base.

Restart an agent manually

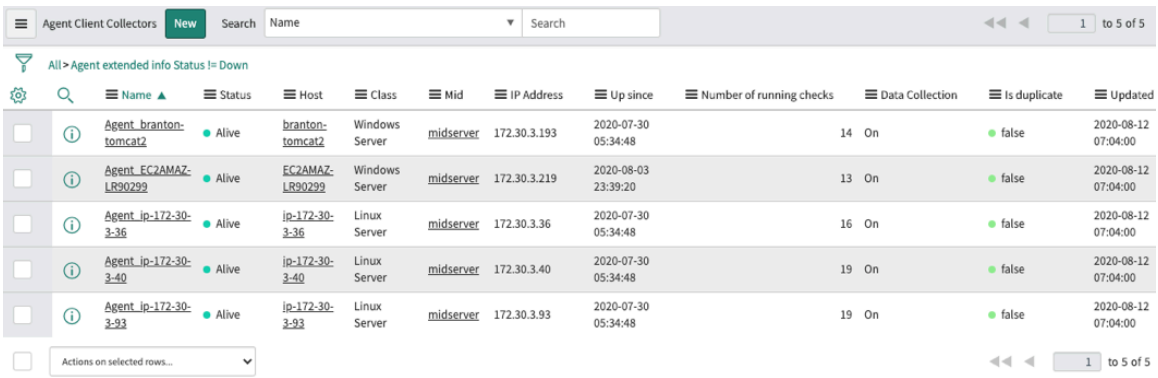
Perform manual restart of an agent when the agent configuration file has been refreshed, or if the agent is unstable. You can perform manual restart only on agents installed in a Windows environment and for Linux-based agents that use `systemd`.

Before you begin

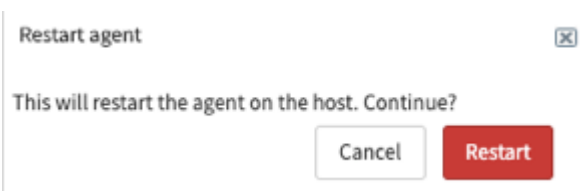
Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agents**.
   The **Agent Client Collectors** page appears with the list of agents.



2. Select the check box of the agent you want to restart.
   You can select multiple agents.
3. In the **Actions on selected rows...** list underneath the list of agents, select **Restart agent**.
   A confirmation dialog box appears.



4. Select **Restart**.
   Alternatively, you can restart the agent from within the agent record by selecting the agent name and, in the **Related Links** section, select **Restart agent**.

Agent Client Collector installation on a Linux OS system

Install Agent Client Collector on a system that uses a Linux OS, either using a single-line command script, or following the installation procedure to embed in your own package distribution mechanism. The installation procedure provides consistency when using package distribution solutions.

Install Agent Client Collector on a Linux system

Install Agent Client Collector using a package distribution tool.

Before you begin

- You can manually install the Agent Client Collector on a few machines to verify that your agents contain the correct policies and checks.
- Ensure that the Agent Client Collector Listener is configured on your MID Servers, and the service is available from your target hosts, see Configure the websocket server on the MID Server.
- Verify that your server's Operation Systems and version is supported. For a list of supported Operation Systems and their versions, see ServiceNow Store Page.
- Verify whether there are restrictions or requirements to be aware of during deployment, such as specifying an account other than the default servicenow account. For more information about embedding the agent into your own automated system, see ITOM Agent Client Collector documentation material [KB1122613].
- Ensure that the MID Server and its MID Web Server and ACC Websocket Endpoint extensions are up and running.
- Enable golden image mode for cloning additional agents by setting the golden image marker located at `/tmp/acc-goldenimage`. The golden image marker takes no action during new Linux installations, as there is nothing which requires cleaning.
- Retrieve the MID Server ACC Listener information to be specified in the agent's *`backend-url`* parameter.
  1. Navigate to **All** > **Agent Client Collector** > **Deployment** > **MID Servers**.
  2. Select a MID Server.
  3. Select the **ACC Websocket Endpoints** tab.
  4. Select a websocket endpoint.
  5. Copy the value in the **Endpoint URL** field.
- Retrieve the MID Server API key specified in the agent's *`api-key`* parameter.
  1. Navigate to **All** > **Agent Client Collector** > **Deployment** > **MID Web Server API Key**.
  2. Select the API key to use.
  3. In the **Related Links** section, select **View API key**.
  4. Copy the API key value and close the pop-up window.

Role required: agent_client_collector_admin

About this task

During Linux installation (and upgrade), the agent executable file is enabled with Linux capabilities (CAP_SETFCAP, CAP_SETPCAP) by default. Store apps such as Agent Client Collector Log Analytics (ACC-L) can use this to grant capabilities to read the entire file system (CAP_DAC_READ_SEARCH). The system undergoes various security measures to verify that granting capabilities does not pose a security risk. These measures include double verification

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

of content origination and the plugin verification process. This procedure assumes that you are familiar with commands for Linux capabilities.

To opt out of these enhanced capabilities, run the following commands, based on your Linux OS/packaging system:

Linux enhanced capability opt-out commands

OS/Packaging System	Commands

RPM	`ACC_SKIP_CAPS=true yum / dnf localinstall`
	
	`ACC_SKIP_CAPS=true rpm -vi agent-client-collector-<version number>-x86_64.rpm`

Debian	`ACC_SKIP_CAPS=true apt-get install`
	
	`ACC_SKIP_CAPS=true dpkg -i agent-client-collector-<version number>-<distro>_amd64.deb`

SLES	`ACC_SKIP_CAPS=true zypper install`

Procedure

1. Download the relevant installation packages.
   - For manual installation:
     a. Navigate to > **Agent Client Collector** > **Deployment** > **Agent Downloads**.
     b. Download the relevant .rpm or .deb installation file.
     c. Download the relevant signature files to validate the installation files.
   - For command-line installation, run the following commands to download both the signature and installation files to your local machine:

```
curl -LO
 https://install.service-now.com/glide/distribution/builds/package/app-signed/agent-client-collector-<version_number>-x86_64.rpm
curl -LO
 https://install.service-now.com/glide/distribution/builds/package/app-signed/agent-client-collector-<version_number>-x86_64-rpm-rpm.zip
```

   Note: Each curl command must appear on a single line.

2. **Optional:** Verify the package signature.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Extract the installation file (if it is compressed) by running the following command: `unzip agent_client-collector-<version_number>-x86_64-rpm-rpm.zip`

b. Validate the installation file signature by running the indicated commands.

- On an RPM-based system:

```
openssl dgst -sha256 -verify {<ServiceNow
 DGST pem key>} -signature {<signature file>}
 agent-client-collector-<version number>-x86_64.rpm
```

Where `<ServiceNow DGST pem key>` is the `.pem` file extracted from the `.zip` file, and `<signature file>` is the `.bin` file extracted from the `.zip` file.

For example:

```
$ curl -sLO
 https://install.service-now.com/glide/distribution/builds/package/app-signed/agent-client-collector-3.0.0-x86_64.rpm
$ curl -sLO
 https://install.service-now.com/glide/distribution/builds/package/app-signed/agent-client-collector-3.0.0-x86_64-rpm-rpm.zip
$ unzip agent-client-collector-3.0.0-x86_64-rpm-rpm.zip
Archive: agent-client-collector-3.0.0-x86_64-rpm-rpm.zip
inflating: ServiceNow_Digicert_DGST.pem
extracting: agent-client-collector-3.0.0-x86_64.bin
$ openssl dgst -sha256 -verify ServiceNow_Digicert_DGST.pem
 -signature agent-client-collector-3.0.0-x86_64.bin
 agent-client-collector-3.0.0-x86_64.rpm
Verified OK
```

Note: Each command must appear on a single line.

- On a Debian-based system:

(Optional) `gpg --import ServiceNow_Digicert_Public.gpg`

`sudo gpg --verify agent-client-collector-<version number>-<distro>_amd64.deb`

For example:

```
$ curl -sLO
 https://install.service-now.com/glide/distribution/builds/package/app-signed/agent-client-collector-3.0.0-debian-9_amd64.deb
$ curl -sLO
 https://install.service-now.com/glide/distribution/builds/package/app-signed/agent-client-collector-3.0.0-debian-9_amd64-deb-deb.zip
$ unzip
 agent-client-collector-3.0.0-debian-9_amd64-deb-deb.zip
Archive:
 agent-client-collector-3.0.0-debian-9_amd64-deb-deb.zip
extracting: ServiceNow_Digicert_Public.gpg
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
$ gpg --import ServiceNow_Digicert_Public.gpg
gpg: /home/admin/.gnupg/trustdb.gpg: trustdb created
gpg: key 985DD52C6A0ABB45: public key "ServiceNow, Inc.
 (Signing) <seceng@servicenow.com>"
imported
gpg: Total number processed: 1
gpg: imported: 1
$ dpkg-sig --verify
 agent-client-collector-3.0.0-debian-9_amd64.deb
Processing
 agent-client-collector-3.0.0-debian-9_amd64.deb...
GOODSIG _gpgbuilder 9B928FB49771DF6C047430DD985DD52C6A0ABB45
 1665054068
```

Note: Each command must appear on a single line.

3. Install the Agent Client Collector package using the package manager associated with Linux distribution.

OS	Command
RHEL-based	`yum / dnf localinstall`
SLES	`zypper install`
Debian-based	`apt-get install`

Alternatively, if these commands aren't configured correctly, you can use the core commands that are configured to run with the package manager commands.

- RPM-based system: `# rpm -vi agent-client-collector-<version number>-x86_64.rpm`
- Debian-based system: `# dpkg -i agent-client-collector-<version number>-<distro>_amd64.deb`

Verify that the package commands are configured correctly with your system administrator.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Some file systems may have restrictions enabled; for example, `/var/` may be mounted with a *`noexec`* flag. Because the agent must execute Agent Client Collector plugins that are normally stored in the `/var/cache` directory, you must deploy the application into specific folders by customizing the installation paths using the `--relocate` option as an `.rpm` parameter.

For example: `rpm -i --relocate /var/cache=/opt/cache agent-client-collector-<version_number>-x86_64.rpm`

The following paths can be relocated:

Path	Notes
`/etc`	When updating, you must also update the *`allow-list`* parameter in the `acc.yml` file with the new path.
`<usr share location>/usr/share`	N/A
`<cache dir location>/var/cache`	Updating the `/var` directory retains all `/var` subdirectories, nested under the new directory.
`/var/log`	
`/var/run`	
`/var`	

After relocating an installation path, update the relevant `ACC_UPGRADE_CMD` string described in step 7.

Review the paths in `/usr/lib/systemd/system/acc.service` to ensure that they appear as expected.

4. When installing a .deb package, configure the agent's `acc.yml` configuration file.

   a. Copy the sample configuration file:

   ```
   # cp -p /etc/servicenow/agent-client-collector/acc.yml.example /etc/servicenow/agent-client-collector/acc.yml
   ```

   b. Rename the allow list file.

   ```
   # cp -p /etc/servicenow/agent-client-collector/check-allow-list.json.default /etc/servicenow/agent-client-collector/check-allow-list.json
   ```

   Note: This step is not relevant for .rpm packages, which come with `acc.yml` and `check-allow-list.json` files included in the base system.

5. Update the configuration file, adding *`check-allow-list.json`* to `/etc/servicenow/agent-client-collector` and copying the *`backend-url`* and *`api-key`* from the instance.
   For example:

   ```
   ---
   # Agent Client Collector configuration
   ```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
backend-url:
 - "wss://YOUR_MID_ENDPOINT_HERE:YOUR_MID_PORT_HERE/ws/events"
api-key: "YOUR_API_KEY_HERE"
log-level: "info"
insecure-skip-tls-verify: false
allow-list: /
etc/servicenow/agent-client-collector/check-allow-list.json
verify-plugin-signature: true
max-running-checks: 10
disable-sockets: true
disable-api: true
statsd-disable: true
enable-auto-mid-selection: false
agent_cpu_threshold:
 cpu_percentage_limit: 25
 repeated_high_cpu_num: 3
 monitor_interval_sec: 60
 agent_cpu_threshold_disabled: false
```

The *allow-list* feature, indicating the commands permitted to be executed by the agent, is enabled.

6. Configure sudoers.

   Configuration is typically automated by your Linux sysadmin. To verify configuration correctness, configure sudoers manually before full configuration. To do so, create a new sudoers file for the agent service user by running the following command:

   `visudo -f /etc/sudoers.d/01_servicenow`

7. Add the sudoers configuration according to your Linux distribution.

   When sudo commands are executed as part of Agent Client Collector checks, the system adds the `-E` flag to preserve the environment variables. Commands are executed as `- sudo -E <command_placeholder>` in the sudoers file. Add the *SETENV* command for the Agent Client Collector service user as shown in the code snippet below. If the *Application Patterns* for Agent Client Collector is enabled, ensure sudoers is updated with privileged commands, see Discovery commands for probes and patterns and SSH credentials.

   - When installing agents on a deb/ubuntu system, run the following:

     ```
     User_Alias ACC_USERS = servicenow
     Cmnd_Alias ACC_CMD = /usr/sbin/dmidecode -s
      baseboard-serial-number,/usr/sbin/dmidecode
      -s chassis-serial-number,/usr/sbin/dmidecode
      -s system-serial-number,/usr/sbin/dmidecode -s
      system-uuid,/usr/sbin/ss -tanp,/usr/bin/systemctl start
     acc,/usr/bin/systemctl stop acc,/usr/bin/dpkg --install
      --refuse-downgrade
      --skip-same-version /
     var/cache/servicenow/agent-client-collector/upgrade/agent-cli
     ent-collector-upgrade*
     Cmnd_Alias ACC_CMD_SETENV = /usr/bin/netstat
      -ltnup,/usr/bin/ls -l /proc/*,/usr/bin/cat /proc/*
     ACC_USERS ALL = (root) NOPASSWD:ACC_CMD
     ACC_USERS ALL = (root) NOPASSWD:SETENV:ACC_CMD_SETENV
     Defaults:ACC_USERS !requiretty
     ```

by /var/cache/servicenow/agent-client-collector/acc-f-
commons/bin/linux_run_upgrade.rb /usr/bin/rpm\
 -Uv /
var/cache/servicenow/agent-client-collector/upgrade/agent-cli
ent-collector-upgrade.rpm /usr/bin/systemctl\ start\
 acc /usr/bin/systemctl\ stop\ acc /usr/bin/systemctl\
 daemon-reload /
var/log/servicenow/agent-client-collector/upgrade.log *
ACC_USERS ALL = (root) NOPASSWD:ACC_UPGRADE_CMD
```

8. Configure the agent to run as a service.

a. Safeguard resource consumption by adding the indicated values to the `/usr/lib/systemd/system/acc.service` file.

- CPUShares=128
- CPUQuota=10%
- MemoryLimit=192M

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- BlockIOWeight=10
- LimitNICE=15

For example:

```
# vi /usr/lib/systemd/system/acc.service
[Unit]
Description=Agent-Now acc
After=network-online.target
[Service]
Environment=AGENT_ROOT=/usr/share
Environment=AGENT_CACHE_ROOT=/var/cache
Environment=AGENT_CONFIG_ROOT=/etc
Environment=AGENT_LOG_ROOT=/var/log
Environment=AGENT_RUN_ROOT=/var/run
Environment=RUBYOPT=-Eutf-8
User=servicenow
Group=servicenow
ExecStart=/usr/share/servicenow/agent-client-collector/bin/a
cc-service start acc
KillMode=process
Restart=on-failure
RestartSec=1min
CPUShares=128
CPUQuota=10%
MemoryLimit=192M
BlockIOWeight=10
LimitNICE=+15
[Install]
WantedBy=network-online.target
```

b. Run the reload daemon command If you modified the service file after enabling the acc service.

```
# systemctl daemon-reload
```

c. Enable and start the service by running the following commands.

```
# systemctl enable acc
```

```
# systemctl start acc
```

Validate Linux installation

After installing the Agent Client Collector on a Linux system, validate the installation by ensuring it was completed properly.

Before you begin

Install the Agent Client Collector on a Linux system (see Install Agent Client Collector on a Linux system).

Role required: agent_client_collector_admin

Procedure

1. Run the `# systemctl status acc` command.
   The *`active (running)`* indicator appears when the service is running properly.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
# systemctl status acc
● acc.service - Agent-Now ACC
Loaded: loaded (/usr/lib/systemd/system/acc.service; enabled;
 vendor preset: disabled)
Active: active (running) since Mon 2022-04-25 14:10:24 UTC; 6
 months 23 days ago
Main PID: 2693 (acc)
Tasks: 10 (limit: 512)
Memory: 143.4M (limit: 192.0M)
CPU: 12h 57min 50.442s
CGroup: /system.slice/acc.service
 └─2693 /usr/share/servicenow/agent-client-collector/bin/acc
 start --config-file
/etc/servicenow/agent-client-collect...
```

2. View the encrypted *api-key* and *agent-key-id* in use by running the `grep -E '^api-key|agent-key-id' /etc/servicenow/agent-client-collector/acc.yml` command.

```
# grep -E
 '^api-key|agent-key-id' /
etc/servicenow/agent-client-collector/acc.yml
api-key:
 "encrypted:adskfjldfjlasd+ajflksadjmoreunreadablestringasdfdfk
djksdjaasdfas"
agent-key-id:
 b4ac2ab4ac2b4ac2b4ac2b4ac2b4ac2b4ac2b4ac2b4ac2b4ac2b4ac2b4ac2
b4a
```

Note: The *grep* command must appear on a single line.

3. View the agent's connection with its backend URL by running the `grep 'successfully connected' /var/log/servicenow/agent-client-collector/acc.log` command.

```
# grep 'successfully
 connected' /var/log/servicenow/agent-client-collector/acc.log
2022-11-17T19:03:17.94 [INFO] [agent] successfully connected to
 the url:
wss://MY_BACKEND_FQDN:MY_BACKEND_PORT/ws/events
```

Note: The *grep* command must appear on a single line.

4. Verify the unique agent ID by running the `# echo $(hexdump -e '/1 "%02x"' /var/cache/servicenow/agent-client-collector/agent_now_id)` command.

```
# echo $(hexdump -e '/1
 "%02x"' /
var/cache/servicenow/agent-client-collector/agent_now_id)
14b4443df6d2394d
```

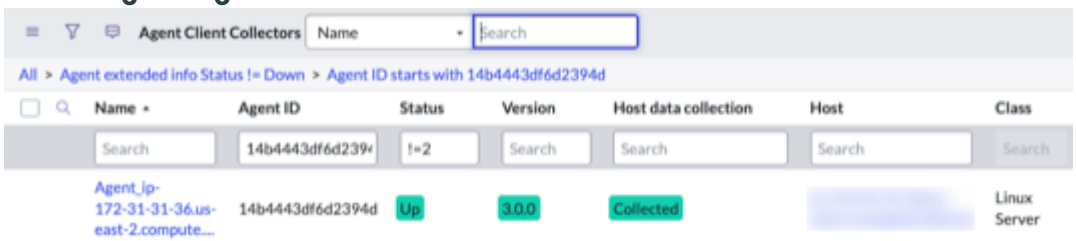
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The indicated agent ID appears on the Agents page in an instance (**All** > **Agent Client Collector** > **Agents**) with **Status = Up** and **Host data collection = Collected** (both appearing in green).

Linux agents - green status



Upgrade Agent Client Collector on a Linux system

Upgrade your existing Agent Client Collector version on a system running a Linux OS if the single-line command script is not connected to the instance or you want to use enhanced customization options.

Before you begin

- The upgrade procedure is the same for both MID Server and MID-less deployments.
- Enable golden image mode for cloning additional instances by setting the golden image marker located at `/tmp/acc-goldenimage`. The golden image marker is applied only during a Linux upgrade and not during new installations.
- Role required: agent_client_collector_admin

Procedure

1. **Optional:** Back up sensitive files by running the following command.

```
tar
 -Pcvzf /root/acc_backup.tar.gz /
etc/servicenow/agent-client-collector \
/var/cache/servicenow/agent-client-collector/agent_now_id \
/usr/lib/systemd/system/acc.service
```

2. Download the .rpm/.deb agent package and signature files, as described in Install Agent Client Collector on a Linux system.
3. Upgrade the package.
   - In an RPM-based system:

     ```
     rpm -Uv agent-client-collector-<version number>-x86_64.rpm
     ```

   - In a DEB-based system:

     ```
     dpkg -i agent-client-collector-<version number>-
     <distro>_amd64.deb
     ```

4. Restore the systemd service file (if you customized the file), using either an automation tool or by reloading systemd configuration.

```
tar -C / -Pxvzf /root/acc_backup.tar.gz
 usr/lib/systemd/system/acc.service
```

```
systemctl daemon-reload
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Change the *owner:group* setting to the correct one by running the following command.

```
chown -R
 servicenow:servicenow /
{etc,var/cache,var/log,usr/share}/servicenow/agent-client-colle
ctor
```

6. Restart the service and verify that it connects to its backend-url.

```
systemctl restart acc
tail -f /var/log/servicenow/agent-client-collector/acc.log
```

Uninstall Agent Client Collector from a Linux system manually

Uninstall the Agent Client Collector from a Linux machine manually if the command script is unavailable due to the specific agent not being connected to the instance.

Before you begin

- The uninstall procedure is the same for both MID Server and MID-less deployments.
- Role required: agent_client_collector_admin

About this task

By default, an uninstalled agent is removed from the system after 30 days. To modify this amount of time, update the *sn_agent_ci_extended_info* table, accessible from the Auto Flushes page (enter *sys_auto_flush.LIST* into the instance's search filter field).

Procedure

1. Stop the service.
   `sudo systemctl stop acc`
2. Use the relevant package management tool to remove the service.
   - yum remove agent-client-collector
   - apt-get remove agent-client-collector
   - zypper remove agent-client-collector

   Alternatively, you can run one of the following commands, based on the OS in use.

   - `rpm -e agent-client-collector`
   - `dpkg -r agent-client-collector`
3. If you ran either the `rpm` or `dpkg` command, remove any remaining files from your system.

```
# userdel -r servicenow
# groupdel servicenow
# rm
 -R /
{etc,var/cache,var/log,usr/share}/servicenow/agent-client-colle
ctor
```

Warning: Do not use the command rm -Rf, as this can cause data loss.

Perform a single-line Agent Client Collector installation on Linux

Use an efficient single-line command script to install Agent Client Collector on a machine that uses a Linux operating system. If a script is not connected to the instance or you want to use enhanced customization options, you might have to install Agent Client Collector manually.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Ensure that you have configured the Agent Client Collector web server.
- Verify that your server's OS and version matches the list of supported OS versions as described in Agent Client Collector Installation.
- Ensure that the unzip program is installed on your Linux machine.
- Determine the resource limits for the agent to be configured in the `/usr/lib/systemd/system/acc.service` file after installation.
- Ensure that you have the `openssl` and `dgst` (for RHEL/Centos/SUSE installation) packages available, to be used by the install script.
- Ensure that you have the `gpg` package available for validation (for Ubuntu/Debian installation).
- Enable golden image mode for cloning additional instances by setting the golden image marker located at `/tmp/acc-goldenimage`. The golden image marker takes no action during new Linux installations, as there is nothing which requires cleaning.
- When performing single-line installation on more than one agent, download the agent package to your local machine. Place the package on your *ftp* server, using an Ansible script. For details on mass deployment of agents, see Deploy the Agent Client Collector using a custom base image.
- In order for the Agent to retrieve the OS serial numbers and TCP connections along with associated running processes, sudo access for “dmidecode” and “ss” is required on Linux systems.

Role required: agent_client_collector_admin

Procedure

1. Retrieve MID Server websocket URL parameters.
   a. Navigate to **Agent Client Collector** > **Websocket Endpoint** and select the relevant websocket endpoint.
   b. Copy the value of the **Endpoint URL** field to be used in the installation command.
2. Copy and edit the following command line, substituting your own information for the command parameters.

```
ACC_API_KEY=<api_key> ACC_MID=wss://<mid_ip>:<websocket_port>/ws/events bash -c "$(curl -L https://<instance URL>/api/sn_agent/agents/install_agent)"
```

Command parameters

Parameter	Value
ACC_API_KEY	The API key used to access the MID Server websocket. If no ACC_API_KEY value is specified, you will be asked to enter the API key value during execution of the script.
ACC_MID	The URL of the MID Server websocket. If you are specifying multiple MID Servers, enter a string separated by commas for each MID Server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. **Optional:** If you need to create new check definitions to be included in the allow list that indicates the checks enabled to run on the agent, disable the allow list by adding *ACC_ALLOW_LIST=0* to the single-line command string.

   Note: This action compromises your system's security and is recommended only as a temporary measure until you finish updating the allow list. After completing the update, re-activate the allow list by removing *ACC_ALLOW_LIST=0* from the single-line command string.

4. **Optional:** If the certificate validation process is too time consuming or if you are using the agent for development purposes, you can bypass certificate validation by adding *ACC_VALIDATE_SIG=0* to the single-line command string.
5. Run the single-line command (specified in step 2, above) on the server where the Agent Client Collector is installed.
6. **Optional:** Configure resource limits for the agent in the `/usr/lib/systemd/system/acc.service` file, according to your business needs.

   (Optional) The default values in the file are:

   - *CPUShares*: 128
   - *CPUQuota*: 10%
   - *MemoryLimit*: 192M
   - *BlockIOWeight*: 10
   - *LimitNICE*: +15

Upgrade the Agent Client Collector manually on a Linux system

Perform a manual upgrade of your existing Agent Client Collector version on a system running a Linux OS if the single-line command script is not connected to the instance or you want to use enhanced customization options.

Before you begin

- Ensure that you have configured the Agent Client Collector web server. For more information, see Configure the websocket server on the MID Server.
- Restart the MID Web Server.
- Collect host data, to ensure that all files are up to date. For details, see Collect data from your system devices.
- Ensure that you have installed a Linux version of the Agent Client Collector. For more information, see Agent Client Collector installation on a Linux OS system.
- The upgrade procedure is the same for both MID Server and MID-less deployments.
- Role required: agent_client_collector_admin

Procedure

1. Back up the `agent-id` and configuration files.

```
mkdir -p /tmp/acc-upgrade-backup
sudo cp
 -rp /etc/servicenow/agent-client-collector/acc.yml /
tmp/acc-upgrade-backup
sudo cp
 -rp /
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
etc/servicenow/agent-client-collector/check-allow-list.json /
tmp/acc-upgrade-backup
sudo cp
 -rp /
var/cache/servicenow/agent-client-collector/agent_now_id /
tmp/acc-upgrade-backup
```

2. Uninstall the package.

   a. Stop the service.
   `sudo systemctl stop acc`

   b. Disable the service.
   `sudo systemctl disable acc`

   c. Uninstall the package:
   - For RHEL/CentOS/SUSE: `sudo rpm -e agent-client-collector`
   - For Ubuntu/Debian: `sudo dpkg -r agent-client-collector`

3. Download the installation file.
   For example, when working with an Ubuntu/Debian OS, use both of the following:

   ```
   curl -L -O https://<MID-WEBSERVER-URI:PORT>/static/
   acc_installers/agent-client-collector/glide/distribution/builds/
   package/app-signed/agent-client-collector-<version number>-
   <Ubuntu/Debian version>_amd64-deb-deb.zip -O
   ```

   ```
   https://<MID-WEBSERVER-URI:PORT>/static/acc_installers/agent-
   client-collector/glide/distribution/builds/package/app-signed/
   agent-client-collector/agent-client-collector-<version number>-
   <Ubuntu/Debian version>_amd64.deb
   ```

4. Verify and install the package.

   a. Unzip the compressed file.

   ```
   unzip agent-client-collector-2.3.0-debian-9_amd64-deb-deb.zip
   ```

   b. Validate the installer file signature.
   - RHEL/Centos/SUSE OS:

     ```
     openssl dgst -sha256 -verify {<ServiceNow DGST pem key>}
     -signature {<signature file>} agent-client-collector-<version
     number>-x86_64.rpm
     ```

   - Ubuntu/Debian OS:

     ```
     gpg --import ServiceNow_Digicert_Public.gpg
     dpkg-sig --verify agent-client_collector-<version
      number>-<Ubuntu/Debian version>_amd64.deb
     ```

   c. Install the package.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- RHEL/CentOS/SUSE: `sudo rpm -vi --force agent-client-collector-<version number>-x86_64.rpm`
- Ubuntu/Debian: `sudo dpkg -1 agent-client-collector-<version number>-<Ubuntu/Debian version>_amd64.deb`

5. Restore the `agent-id` and configuration files.

```
sudo -u servicenow cp
 -rp /tmp/acc-upgrade-backup/acc.yml /
etc/servicenow/agent-client-collector/acc.yml
sudo -u servicenow cp
 -rp /tmp/acc-upgrade-backup/check-allow-list.json /
etc/servicenow/agent-client-collector/check-allow-list.json
sudo -u servicenow cp
 -rp /tmp/acc-upgrade-backup/agent_now_id /
var/cache/servicenow/agent-client-collector/agent_now_id
```

6. Configure the agent to run as a service.
   `sudo systemctl enable acc`
7. Start the service.
   `sudo systemctl start acc`
8. View the logs to verify that the startup was successful.
   `sudo tail -f /var/log/servicenow/agent-client-collector/acc.log`

Uninstall Agent Client Collector from a Linux system using a single-line command

Uninstall the Agent Client Collector from a Linux machine by running an efficient single-line command. If the script is not connected to the instance, you might have to uninstall Agent Client Collector manually.

Before you begin

- The uninstall procedure is the same for both MID Server and MID-less deployments.
- Role required: agent_client_collector_admin

Procedure

Uninstall Agent Client Collector by running the following command in a command window where `<instance url>` is the URL of the ServiceNow instance.
`bash -c "$(curl -L https://<instance url>/api/sn_agent/agents/install_agent)" -s "--remove"`.

Note: Uninstalling the Agent Client Collector removes the `acc.yml` file and its directory from your machine.

Agent Client Collector installation on a Windows machine

When installing the Agent Client Collector on a Windows machine, either download an installation file and use a wizard to install the agent manually, or use silent installation to automate agent installation and configuration. Manual installation enables you to test the agent on a single system, while silent installation enables you to deploy the agent at scale.

Install the Agent Client Collector on a Windows machine manually

Install the Agent Client Collector on a Windows machine manually when you want to test the agent on a single system.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

1. Ensure that you've configured the Agent Client Collector web server. For details, see Configure the websocket server on the MID Server.
2. Verify your server's OS and version.
3. When using Microsoft Internet Explorer, do the following to prepare the Agent Client Collector installation file:
   a. Navigate to **Server Manager** > **Local Server**.
   b. Turn off **IE Enhanced Security Configuration**.
   c. Download the installation file.
   d. Change the extension of the installation file from `.man` to `.msi`
4. Ensure that .NET Framework 4.6.2 or later is installed on the target machine.

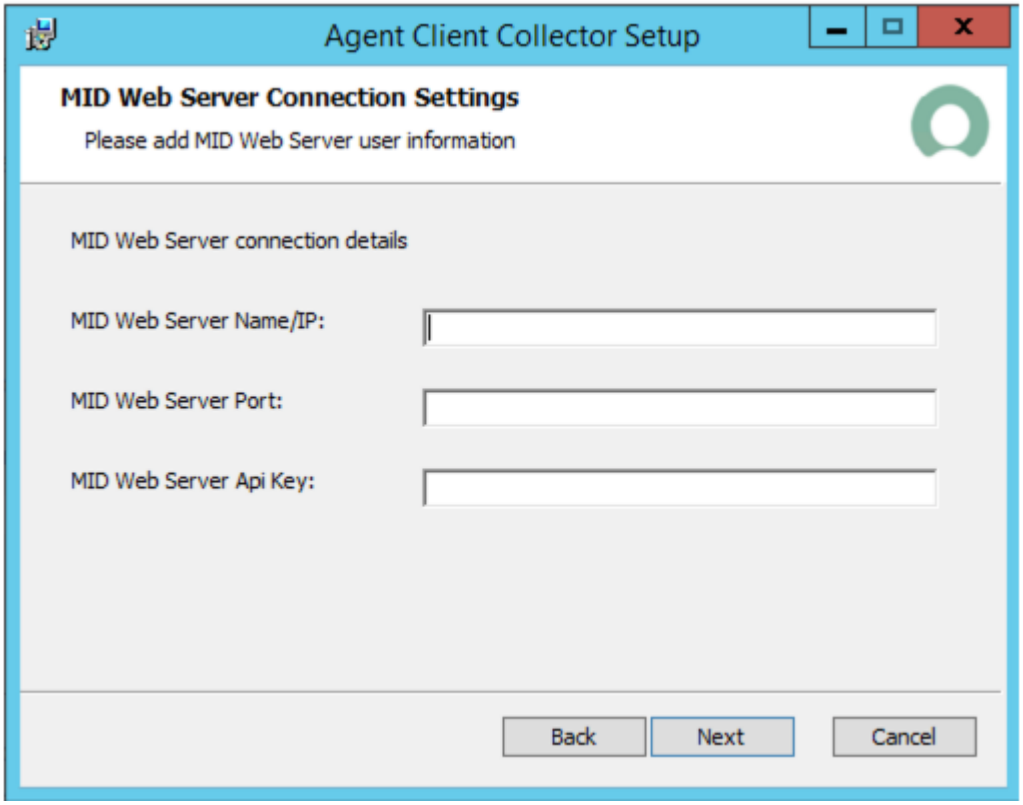
   Note: If the .NET Framework is not running effectively, use the legacy VBSript installer by running the following command on the target machine:
   ```
   msiexec /i <msi_file_path> /quiet /qn /norestart
   USE_VBS_CA=1 ACC_API_KEY=<key_value> ACC_MID=wss://
   <mid_ip>:<websocket_port>/ws/events ACC_ALLOW_LIST=False
   ```
5. Enable golden image mode for cloning additional agents by setting the msi property *`GOLDEN_IMAGE=true`*.

Role required: agent_client_collector_admin

Procedure

1. Navigate to **Agent Client Collector** > **Agent Downloads**.
2. To perform installation using the wizard:
   a. Download the .msi file that is accessible from the link on the UI.
   The Installation Wizard opens.
   b. Select **Next** until you reach the **MID Web Server Connection Settings** page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



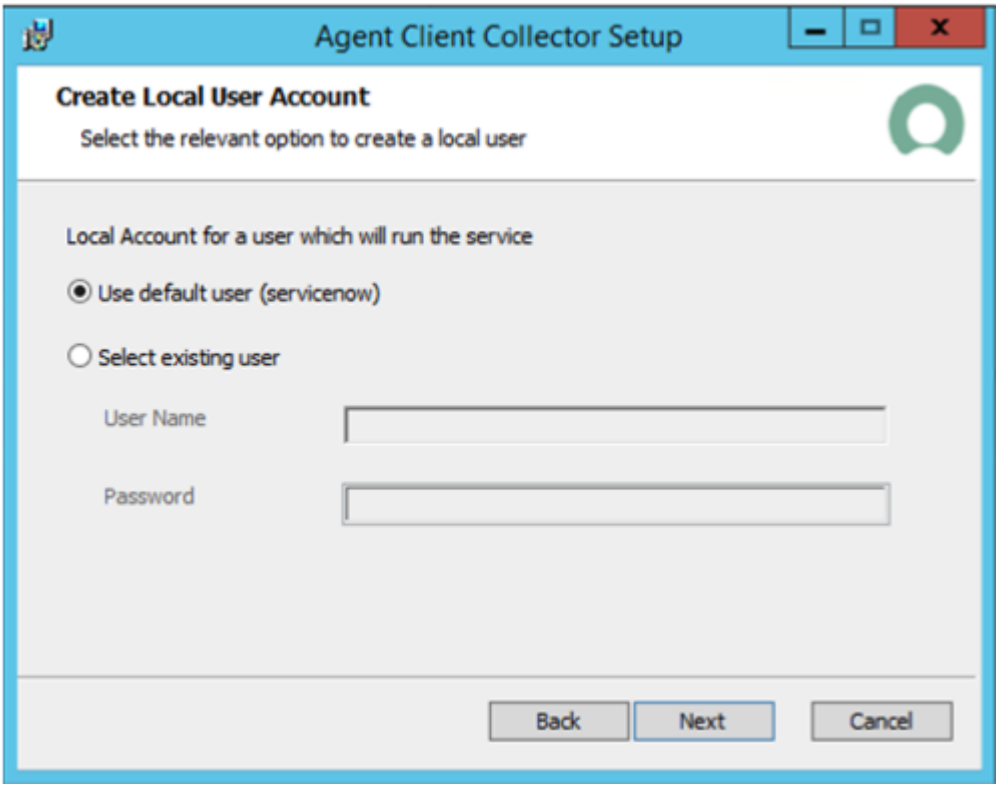
c. Enter the relevant parameters in the dialog box fields:

MID Web Server Connection Settings fields

Field name	Description
MID Web Server Name/IP	IP address of the MID Web server.
MID Web Server Port	Port number of the MID Web server. Use a number between 1024-49151.
MID Web Server API Key	API key to access the MID Web server.

d. Select **Next**.
The **Create Local User Account** page appears.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



e. Select the relevant option in the dialog box.

Create Local User Account dialog box

Option	Description
Use default user (servicenow)	Default user with which to run the Agent Client Collector on a Windows machine. Selecting this option creates a local user called **servicenow** as part of the installation. The servicenow user password is randomly generated and is not stored in the system. A security event is created on the host machine which, if repeated, requires opening a support case. For details, see KB1649116 article in the HI Knowledge Base.
Select existing user	When selecting this option, configure the following subfields: ▪ **User Name**: User name to log in to the Windows environment. ▪ **Password**: Password of the selected user. The user can be one of the following: ▪ Local user (created by the virtual machine owner; provides added resiliency). ▪ Domain user (created by IT personnel).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	▪ Group Managed Service Account (gMSA): Enter the name of the group managed service account in the **User Name** field and leave the **Password** field empty. ▪ Local Service Account: Enter *LOCALSERVICE* in the **User Name** field and leave the **Password** field empty. ▪ Local System Account: Enter *SYSTEM* in the **User Name** field and leave the **Password** field empty. Due to Windows UAC restrictions, running the agent as a local SYSTEM account is necessary to perform an upgrade via *msiexec*.

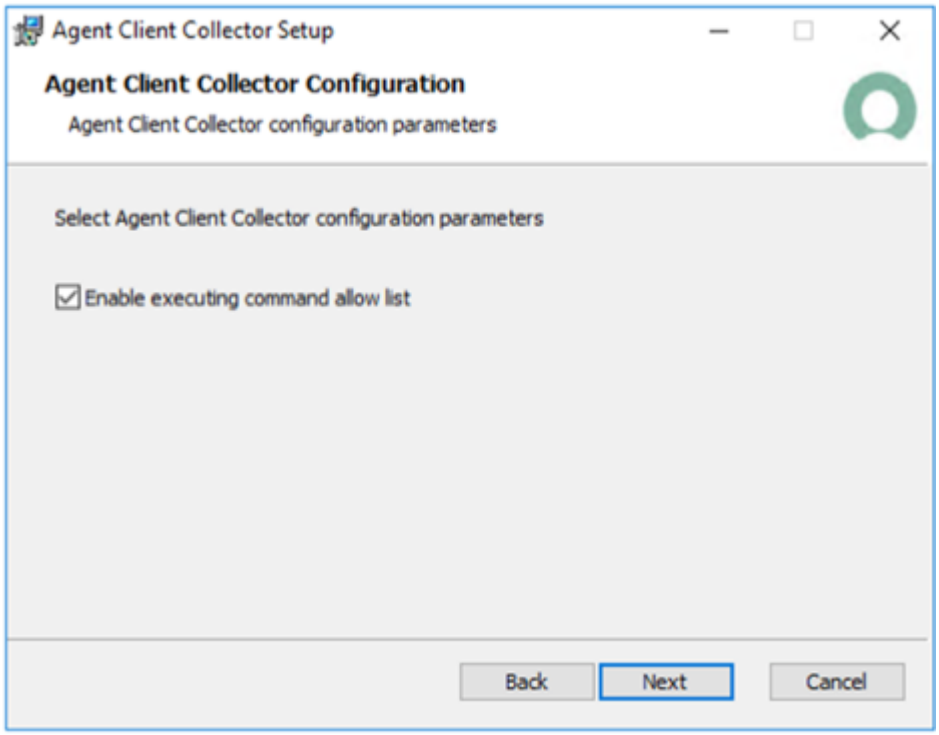
Note: Using a Local System account creates the local group *ServiceNow Users*, and adds the created user to the group. The ServiceNow Users group has access to Agent Client Collector directories and has the following privileges:

- **Performance Monitor**: Comes with the base system; enables viewing all performance counters in the system.
- **Log on as a service**: Enables starting network services and services that run continuously, even when no one is logged onto the console.
- **Debug programs**: Enables debugging processes and reading process details for users outside the ServiceNow user group.

f. Select **Create User**.
The system creates a Windows user with the specified credentials, and the Agent Client Collector Configuration page appears.

g. To enable the **Allow-List** containing the checks enabled to run after setup, select the **Enable executing command allow list** check box on the resulting page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



h. Select **Next** to open the installation page.

When installation completes, click **Next** to complete and exit the wizard.

After a successful installation, the service starts automatically and generates the following:

- User: Default = servicenow (an existing user can also be configured to manage the service). The servicenow user belongs to the local user group **ServiceNow Users**.
- Service: AgentClientCollector
- File location:
  - Default for installation = C:\Program Files\ServiceNow\agent-client-collector
  - Default for service files = C:\ProgramData\ServiceNow\agent-client-collector, which holds the cache, config, and log folders.

3. To run Silent installation to disable installation reports, run the command line appearing in the **Silent installation** section of the procedure, as follows:

```
msiexec /i <msi_file_path> /quiet /qn /norestart
ACC_API_KEY=<key_value> ACC_MID=wss://<mid_ip>:<websocket_port>/
ws/events ACC_ALLOW_LIST=False
```

To enable the allow list of specified checks when running Silent installation, set the *ACC_ALLOW_LIST* parameter to **True**.

4. To configure multiple MID Servers with Silent installation, run the command line appearing in the **Silent installation** section of the procedure with comma-separated values, as follows:

```
msiexec /i <msi_file_path> /quiet /qn /
norestart ACC_API_KEY=<key_value> ACC_MID="wss:/
/<mid1_ip>:<websocket1_port>/ws/events,wss://
<mid2_ip>:<websocket2_port>/ws/events"
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Insert the following parameter values in the command:

Command parameters

Parameter	Value
ACC_API_KEY	The API key used to access the MID Server websocket.
ACC_MID	The URL of the MID Server websocket.
DENY_LOCAL_LOGON	When set to *True*, prevents any user other than the default servicenow user from logging onto the service. Default value: False
HTTPS_PROXY	A fully qualified URL to a proxy server. For example: `https://proxy.url.net`
PAC_FILE	A readable filepath on the system. For example: `/path/to/servicenow/readable/file`
PASSWORD_NEVER_EXPIRES	When set to *True*, the password for the default servicenow user never expires. Default value: False
START_SERVICE	When set to *True*, the Agent Client Collector service automatically starts after installation. Default value: True
LOCALUSERNAME	Account running the Agent Client Collector as a Windows service. Possible values: ○ SYSTEM ○ LOCALSERVICE ○ DOMAIN\gMSA$ ○ string (local username) Default = `servicenow` When using the SYSTEM, LOCALSERVICE, or DOMAIN\gMSA$ accounts, you do not have to configure a password.
LOCALPASSWORD	Password for the user specified in the LOCALUSERNAME parameter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The configured MID Server values are automatically added to the `acc.yml` file. The agent connects to the first available MID Server in the list.

To configure a secondary MID server, enter the following syntax in the `backend-url` section of the `acc.yml` file, per the `.yml` standard: `- "wss://<MID IP>:<Web socket port>/ws/events"` (with the quotation marks).

Upgrade the Agent Client Collector manually on a Windows system

Perform a manual upgrade of your existing Agent Client Collector version on a system running a Windows OS.

Before you begin

Enable golden image mode for cloning additional agents by setting the msi property *GOLDEN_IMAGE=true*.

Role required: agent_client_collector_admin

Procedure

Upgrade to the new agent version, as described in Upgrade an agent in an instance.
You can use either the manual or single-line procedure. When restoring backup files, the system replaces the configuration file values.

Uninstall the Agent Client Collector manually from a Windows machine

Uninstall the Agent Client Collector from a Windows machine manually instead of using the single-line procedure. Use the manual procedure if the command script is unavailable due to the specific agent not being connected to the instance.

Before you begin

Role required: agent_client_collector_admin

Procedure

Uninstall the Agent Client Collector in the Windows Control Panel.

Install the Agent Client Collector on a Windows machine using silent installation

Install the Agent Client Collector on a Windows machine using silent installation when you want to deploy the agent at scale.

About this task

Silent installation automatically creates a local user called **servicenow** (unless another existing user is invoked with the *LOCALUSERNAME* parameter, as described in the command parameters table in the following procedure). The servicenow user password is randomly generated and is not stored in the system. A security event is created on the host machine which, if repeated, requires opening a support case. For details, see KB1649116 article in the Now Support Knowledge Base.

Before you begin

ACC installs need to access this URL: `https://install.service-now.com/`.

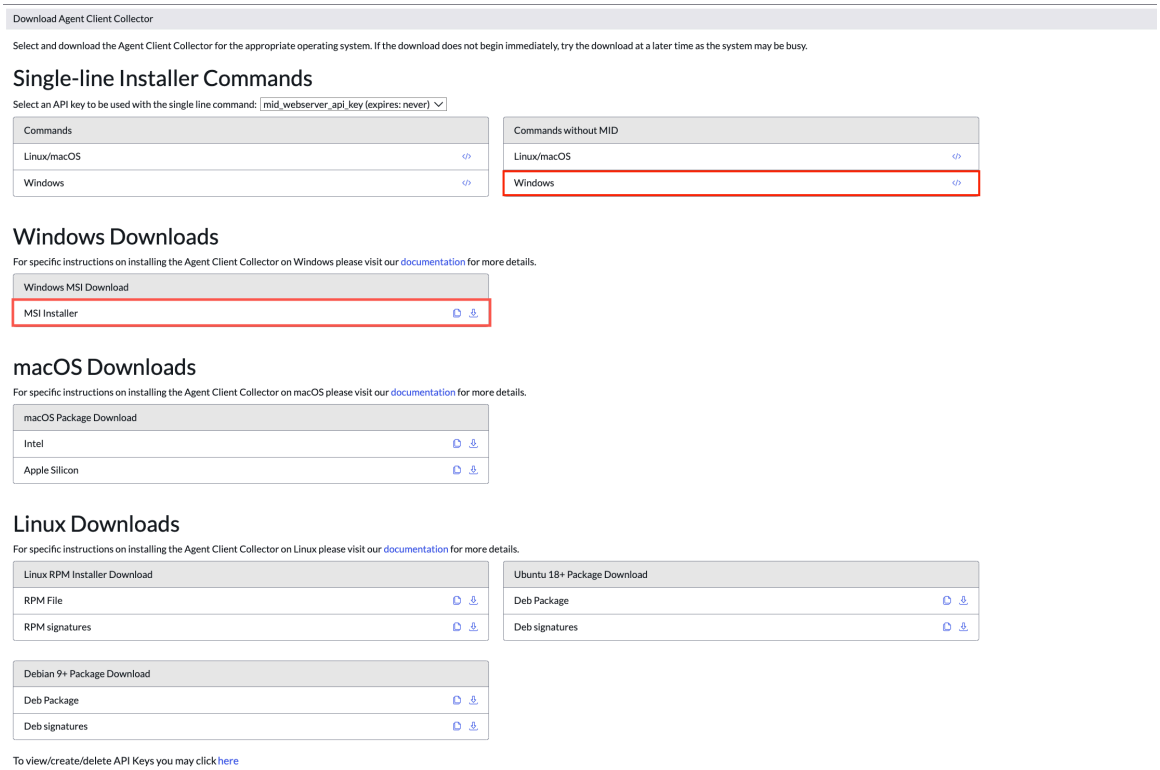
Enable golden image mode for cloning additional agents by setting the msi property *GOLDEN_IMAGE=true*.

Role required: agent_client_collector_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Deployment** > **Agent Downloads**.
2. From the Windows Download section, download the MSI installer by selecting the Download icon ( ).



3. To run Silent installation to disable installation reports, run the command line appearing in the **Silent installation** section of the procedure, as follows:
   ```
   msiexec /i <msi_file_path> /quiet /qn /norestart
   ACC_API_KEY=<key_value> ACC_MID=wss://<mid_ip>:<websocket_port>/
   ws/events ACC_ALLOW_LIST=False
   ```

   To enable the allow list of specified checks when running silent installation, set the *ACC_ALLOW_LIST* parameter to **True**.

4. To configure multiple MID Servers with Silent installation, run the command line appearing in the **Silent installation** section of the procedure with comma separated values, as follows:
   ```
   msiexec /i <msi_file_path> /quiet /qn /
   norestart ACC_API_KEY=<key_value> ACC_MID="wss:/
   /<mid1_ip>:<websocket1_port>/ws/events,wss://
   <mid2_ip>:<websocket2_port>/ws/events"
   ```

   Insert the following parameter values in the command:

Command parameters

Parameter	Type	Value
ACC_API_KEY	String	The API key used to access the MID Server websocket.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter	Type	Value
ACC_MID	String	The URL of the MID Server websocket.
ACC_ALLOW_LIST	Boolean	Indicates whether the allow-list is enabled (True) or disabled (False). Default = True
START_SERVICE	Boolean	Indicates whether the agent starts automatically upon installation (true) or must be started manually (false). Default = True
LOCALUSERNAME	String	Account running the Agent Client Collector as a Windows service. Possible values: ○ SYSTEM ○ LOCALSERVICE ○ DOMAIN\gMSA$ ○ string (local username) Default = `servicenow` When using the SYSTEM, LOCALSERVICE, or DOMAIN \gMSA$ accounts: ○ You do not have to configure a password. ○ You must run the relevant .msi command, as described in Account commands for LocalService, LocalSystem, and gMSA during Windows installation.
LOCALUSERPASSWORD	String	Password used to access the agent. Default = <randomly generated password>
ISDOMAIN	Boolean	Assigns a domain user account to the Windows service. Possible values: ○ 0 - DOMAIN is ignored ○ 1 - DOMAIN is used

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter	Type	Value
DOMAIN	String	Indicates the user domain. Applies only to domain user accounts (not gMSA)
PASSWORD_NEVER_EXPIRES	Boolean	Indicates whether the user password expires (false) or never expires (true). Default = false
SN_PROG_ROOT	String	Indicates the installation path for the agent's application files. Enclose the path in quotes. For example: SN_PROG_ROOT="D:\ServiceNow\agent-client-collector"

The configured MID Server values are automatically added to the `acc.yml` file. The agent connects to the first available MID Server in the list.

To configure a secondary MID server, enter the following syntax in the `backend-url` section of the `acc.yml` file, per the `.yml` standard: `- "wss://<MID IP>:<Web socket port>/ws/events"` (with the quotation marks).

For the `<MID IP>` value, you can assign either the MID FQDN or CNAME. To enable high availability, use either the Auto MID Selection algorithm, or manage a virtual IP with a load balancer. For more information, see the ITOM Agent Client Collector documentation material [KB1122613] article in the HI Knowledge Base.

Uninstall Agent Client Collector from a Windows system using a single-line command

Uninstall the Agent Client Collector from a Windows machine by running an efficient single-line command. If the script is not connected to the instance, you might have to uninstall Agent Client Collector manually.

Before you begin

Role required: agent_client_collector_admin

Procedure

Uninstall Agent Client Collector by running the following command in a command window. `msiexec /quiet /x <path_to_acc_msi_file>`.

Note: Uninstalling the Agent Client Collector removes the `acc.yml` file and its directory from your machine.

Run Agent Client Collector self-diagnostic tests

Run built-in self-diagnostic tests to validate agents' configuration, connectivity, and system requirements.

Before you begin

Ensure that you have installed the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Agent Client Collector agent: Version 6.0.1 or higher
- Agent Client Collector Framework Store Application Plugin: Version 6.0.1 or higher

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agents**.
2. Select an agent record.
3. Select **Run Self Test** from the **Related Links** section.
4. Verify that tests execute automatically.
   Test results appear in the Agent Self Test Run (`sn_agent_self_test_run`) table.

   For details on the diagnostic self-tests that the agent runs, see Agent Client Collector diagnostic self tests.

Require a maintenance token for Windows uninstalls

Require using a maintenance token when uninstalling an agent from a Windows device. A maintenance token provides a layer of administrative control so that unauthorized personnel can't perform the uninstall.

Before you begin
Role required: sn_agent.token_admin

Procedure

1. Navigate to the Agent Client Collector Setup wizard, as described in Install the Agent Client Collector on a Windows machine manually.
2. Select the **Require maintenance token for uninstall** check box on the Agent Client Collector Configuration page.
3. Complete the installation and exit the setup wizard.

Note: Alternatively, you can enable requiring a maintenance token by using the following single line command:

```
msiexec /i <msi_file_path> /quiet /qn /norestart
 ACC_API_KEY=<key_value>
 ACC_MID=wss://<mid_ip>:<websocket_port>/ws/events
 ACC_ALLOW_LIST=False UNINSTALLVALIDATION=1
```

Enable uninstall validation during agent upgrade

Configure requiring a maintenance token to uninstall agents during agent upgrade. A maintenance token provides a layer of administrative control so that unauthorized personnel can't perform the uninstall.

Before you begin
Role required: sn_agent.token_admin

Procedure

1. Navigate to **All** > **System Properties** > **All Properties**.
2. Locate the *sn_agent.upgrade_enable_uninstall_validation* property and set its value to **true**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If the property does not exist, select **New** to create it.

Note: If uninstall validation is enabled, setting the system property back to **false** disables the feature on the next version upgrade.

Result
The property is invoked for both selective upgrade and high volume upgrade, and the uninstall feature is enabled on Windows agents.

Create a maintenance token

Create a maintenance token to use when uninstalling an agent from a Windows device. Administrators require maintenance tokens to ensure that unauthorized employees can't perform an uninstall.

Before you begin
Role required: sn_agent.token_admin

About this task
Maintenance tokens are short-lived by design. The default expiration is after 30 minutes. To modify the expiration time:

1. Navigate to **All** > **System Properties** > **All Properties**.
2. Select **New**.
3. Configure the following values for the token's expiration time:

Maintenance token fields

Field	Value
Name	*sn_agent.maintenance_token.expiry_minutes*
Type	integer
Value	<the amount of time, in minutes, before the token expires>

4. Select **Submit**.

Procedure
1. Navigate to **All** > **Agent Client Collector** > **Deployment** > **Agent Maintenance Token**.
2. Select **New**.
3. Configure the following values for the token:

Maintenance token fields

Field	Description
Alias	Enter a descriptive name for the maintenance token.
Purpose	Select **uninstall**.
Scope	Select the token's scope:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **global**: Token applies to all agents. ○ **targeted**: Token applies only to selected agents. When selecting this option, the **Agents** field appears.
Agents	Select the **Unlock agents** ( ) icon and select the agents for the token to apply to. This field appears only when selecting **targeted** as the token scope.

4. Select the **Activate** check box to activate the token.
5. Select **Submit**.

What to do next
Uninstall the agent using the maintenance token, as described in Uninstall an agent using a maintenance token.

Note: Ensure that you use the maintenance token before it expires.

Uninstall an agent using a maintenance token

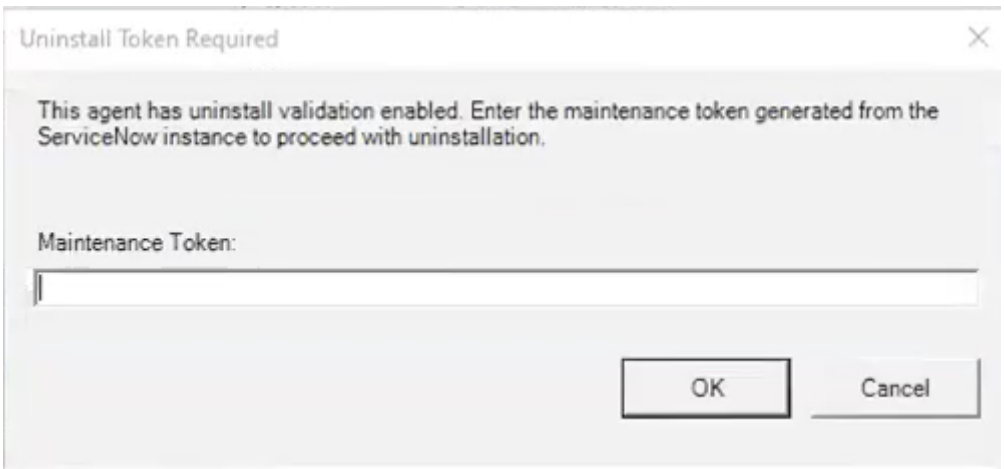
Uninstall an agent from a Windows device using a maintenance token. Administrators require maintenance tokens to ensure that unauthorized employees can't perform an uninstall.

Before you begin
Enable requiring a maintenance token for uninstalls, as described in Require a maintenance token for Windows uninstalls.

Create a maintenance token to be used when uninstalling an agent, as described in Create a maintenance token.

Role required: sn_agent.token_admin

Procedure
1. Navigate to the Control Panel on your Windows machine and select the Agent Client Collector application to uninstall.
   After the uninstall process begins, the **Uninstall Token Required** dialog box opens.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Retrieve the maintenance token that you created.
   a. Navigate to **All** > **Agent Client Collector** > **Deployment** > **Agent Maintenance Token**.
   b. Select the relevant maintenance token.
   c. Select **View Maintenance Token** in the Related Links section.
   d. Select the **Copy Token** ( ) icon to copy the maintenance token value.
3. Paste the maintenance token in the **Maintenance Token** field.
4. Select **OK**.

Note: Alternatively, you can enable requiring a maintenance token by using the following single line command:

```
msiexec /quiet /x <path_to_acc_msi_file>
 UNINSTALL_TOKEN=<valid_token_value>
```

The agent is uninstalled from your Windows machine.

If you provide an invalid maintenance token, uninstall is blocked. For more information, check the uninstall logs at `<user folder>\AppData\Local\Temp\ACC_Logs`.

Prepare agent deployment on a non-persistent virtual desktop infrastructure machine

Configure the preliminary settings on an instance to enable using the agent with a non-persistent virtual desktop infrastructure machine (NPVDI) machine. NPVDI agents gather data more quickly than traditional agents not enabled for an NPVDI.

Before you begin

Role required: agent_client_collector_admin

About this task

Configurations are set on a ServiceNow instance.

Note: These configurations need to be set only once per VDI setup. You can deploy multiple VDI agents on a single setup.

Procedure

1. Create a registration key marked for light registration.
   a. Navigate to **All** > **System definition** > **Tables**.
   b. Access the *sn_agent_registration_key* table.
   c. Select **New** to create a new registration key.
   d. Set *light_registration* to **true**.
2. Add the static policies you want the VDI agent to run.
   a. Navigate to **All** > **Agent Client Collector** > **Configuration** > **VDI policies**.
   b. Select **New**.
   c. Select the policies to be added as a VDI policy in the **VDI policy** field.
   The available policies are published, non-proxy policies.
   d. Select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. **Optional:** Add configuration files to the agent.

   a. Navigate to **All** > **Agent Client Collector** > **Configuration** > **VDI configuration files**.

   b. Select **New**.

   c. Select the configuration files to be added to the agent in the **Configuration file** field. Configuration files that aren't mapped to a check or policy are added to the agent.

   d. Select **Submit**.

4. Grant the user the role of *agent_client_collector_user_rest*. These credentials are used when enabling an NPVDI agent.

What to do next

Enable an agent to run as an NPVDI agent, as described in Enable a non-persistent virtual desktop infrastructure agent.

Enable a non-persistent virtual desktop infrastructure agent

Configure an agent to enable it to work in a non-persistent virtual desktop infrastructure (NPVDI) environment. NPVDI agents are self-sufficient and start running checks immediately.

Before you begin

Ensure that you have set preliminary configurations in your ServiceNow instance, as described in Prepare agent deployment on a non-persistent virtual desktop infrastructure machine.

Role required: agent_client_collector_user

About this task

A non-persistent VDI (NPVDI) machine is deployed agent installed on its golden image. When working with an NPVDI agent, data collection begins within two minutes.

NPVDI machines have their file system and storage cleaned after each use. There is no record of previous activity on an NPVDI machine; the only indicator it retains throughout its existence is its FQDN.

Procedure

Install the agent MSI on the NPVDI gold image host using the following parameters:

```
msiexec /i agent.msi NP_VDI_GOLD_IMAGE=true `
  INSTANCE_URL=<instance-url> `
  INSTANCE_REST_API_USER=<basic-auth-user> `
  INSTANCE_REST_API_PASS=<basic-auth-password> `
  REGISTRATION_KEY=<light-registration-key> `
  [PAC_FILE=<pac-url-or-path>] `
  [HTTPS_PROXY=<proxy-url>]
```

For details on the MSI installation parameters, see MSI installation parameters.

The following occurs during installation.

a. The installer validates the parameters.

b. The agent downloads the NPVDI configurations (policies, checks, assets and config files) from the instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. The installer registers the agent binary as a Windows group policy (GPO) shutdown script.

d. The installer marks the agent as non-persistent, making it eligible for a golden image.

Agent Client Collector upgrade overview

The Agent Client Collector Framework manages agent upgrades directly from the instance, with no manual action required on individual agent hosts.

You can upgrade Agent Client Collector agents one at a time through the UI, or upgrade all eligible agents at once using the auto-upgrade feature. After an upgrade starts, each agent downloads the new version, installs it, restarts, and reports the result back to the instance.

Before you upgrade

Configure the Agent Client Collector web server. For details, see Configure the websocket server on the MID Server.

Ensure that the MID Server, MID Web Server, and the MID Server websocket server are running.

Roles required: agent_client_collector_admin

- In a Windows environment: Local SYSTEM account
- In a Linux environment: sudo rpm/dpkg
- In a macOS environment: sudo pkg

Upgrade methods

Two upgrade methods are available:

Single agent upgrade

Upgrade one agent at a time from the agent record in the UI. Use this method to validate the upgrade process before a broader rollout. You can also select multiple agents from the list view to upgrade up to 50 agents at a time.

Mass upgrade

Upgrade all eligible agents automatically using the built-in scheduled job or a background script. The scheduled job applies rate limiting to control the rollout pace. The background script also uses rate limiting, and triggers an immediate upgrade without waiting for the next scheduled run.

Upgrade stages

Both single and mass upgrade attempts, progress through the following stages. Each stage creates a record in the Agent Upgrade Histories table.

InstanceVerification

The instance confirms the agent is eligible for upgrade. Checks include operating system support, agent version, agent status, and MID Server connectivity.

AgentVerification

The agent confirms it can perform the upgrade. Checks include permissions, available disk space, and dependencies.

Upgrade

The agent downloads the package, installs it, and restarts with the new version.

For details on the required properties for agent overview, see Agent Client Collector upgrade properties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

High-volume upgrade does not support Agent Client Collector to MID Server communication via mTLS.

When performing high-volume upgrade, all agents that aren't using the most up-to-date version are upgraded. No upgrade is performed on agents already using the upgraded version.

No upgrade is performed on agents that are outside the application scope. For more information, see Application scope.

An agent is excluded from high-volume upgrade when you reach the failed upgrade limit for an agent. The failed upgrade limit is specified in the *sn_agent.auto_upgrade.retry_limit* system property. The default value for this property is 3.

- This property applies to both high-volume and selective upgrades that have failed.
- When an agent reaches the failed upgrade limit, an Agent Client Collector administrator can still run selective upgrade on the agent.
- You can manually reset the failed upgrade limit by selecting the **Reset failed upgrade attempts** option on the agent page (select **All** > **Agent Client Collector** > **Agents** and select an agent).
- After a successful upgrade, the upgraded agent is considered to have zero failed upgrades (for future upgrades).

Agent eligibility

An agent is eligible for auto-upgrade when it meets all of the following conditions:

- Status is **Up**.
- Version is 2.7.0 or higher and lower than the target upgrade version.
- Agent is not flagged as a duplicate.
- Has a valid MID Server or Pod reference.
- Has not exceeded the retry limit for failed upgrades.
- Runs on a supported operating system.

Package download sources

During upgrade, each agent downloads the new package from one of the following sources, depending on its connection type:

- Agents connected via Cloud Services (ICS) download from the ServiceNow CDN at `https://cdn-install.sncapps.service-now.com`.
- Agents connected via MID Server download from the MID Server directly over the local network.
- If the MID Server is unavailable, agents fall back to the Install Server at `https://install.service-now.com`. To enable agent fallback, ensure that the install server is specified on the ServiceNow instance.

If your agents use a custom download server, configure the *agent-upgrade-url-path* key in the agent's `acc.yml` file. This setting takes priority over the default sources.

Rollout strategy

Use a phased approach to reduce risk when upgrading a large agent fleet:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Upgrade one agent from the UI to confirm the process works end-to-end.
2. Upgrade 5–10 agents from the list view, selecting agents across different operating systems.
3. Perform a full rollout by enabling the scheduled job or running the background script.

Upgrade an agent in an instance

Perform selective self-upgrade instead of bulk upgrade for enhanced efficiency when working with agents that are difficult to access, such as agents deployed in the cloud. You can perform selective upgrade on up to 50 agents at a time.

Before you begin

Note: Selective upgrade is available for the agents version 2.7.0 and above.

Supported Operating Systems: Windows, Linux and macOS.

Ensure that data files are up to date by restarting the MID Server and collecting host data. For details on collecting host data, see Run host data collection on demand.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

Ensure that you have sudo permissions and that the following configurations are set:

Linux Operating Systems

OS	Commands	Agent version
CentOS,Red Hat	• `/usr/bin/systemctl start acc` • `/usr/bin/systemctl stop acc` • `<systemctl location> daemon-reload` (default location is `/usr/bin`) • `/usr/bin/rpm/ systemd-run -Uv <cache dir location>/ upgrade/agent-client-collector-upgrade.rpm` Default cache directory location: `/var/cache/ servicenow/agent-client-collector` • `unzip -o`: Unzips the signature file to validate the installation. • `openssl dgst -sha256 -verify`: Verifies use of a signature from a servicenow installation file. **Note:** If you installed the Linux agent using the `--relocate` flag (for example, `rpm -i --relocate /var/cache=/opt/cache agent-client-collector-<version_number>-x86_64.rpm`), you must have permission to execute the following commands: • `sudo /usr/`	2.7

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When connecting via a MID Server, ACC installs need to access one of the following URLs:

- `https://<MID-WEBSERVER-URI:PORT>/static/acc_installers`
- `https://install.service-now.com/`

When upgrading MID-less agents, upgrade is performed at the URL set in the *agent-upgrade-url-path* property of the acc.yml file. If no URL is set at this property, upgrade is performed by downloading the installer script from the following Content Delivery Network (CDN) URL: `https://cdn-install.sncapps.service-now.com/glide/distribution/builds/package`

Note: When using a CDN, send your download request through a proxy server, for added security. For details, see Configure a download proxy for Agent Client Collector upgrades.

Select the version to which you want to upgrade your agent.

1. Navigate to **All** > **System Properties** > **All Properties**.
2. Select **New**.
3. Assign the following values:
   - Name = **sn_agent.agent_upgrade_version**
   - Type = **string**
   - Value = The version number to be upgraded to, in the format <major_version.minor_version.patch_version>. For example: **4.3.2**
4. Select **Submit**.

If you do not select a version, the agent automatically upgrades to the current Agent Client Collector Framework scoped app version.

Role required:

- Windows: Local SYSTEM account (Agent Client Collector service running as *Local System*)
- Linux: sudo rpm/dpkg/systemd-run
- macOS: sudo pkg

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agents**.
2. Select the agent that you want to upgrade.
   Verify that the agent has both a version number and **Status=Up**.
3. In the **Related Links** section, select **Upgrade agent**.
4. In the confirmation dialog box, select **Upgrade**.
   The **Agent Upgrade Histories** page appears, where you can monitor the upgrade progress in the **State** column, which displays either **Success** or **Failed**. The full upgrade process takes between 3-10 minutes.
5. View the log for the agent upgrade in the **Message** column.
   - For a failed upgrade on a Linux machine, navigate to the `<cache directory location>/upgrade/agent-client-collector-upgrade.rpm` file. Ensure that the configurations are set for the relevant OS, according to the Linux Operating Systems table, above.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- For a failed upgrade on a Windows machine, check the relevant log file, located at `<user folder>\AppData\Local\Temp\ACC_Logs`:
  - ACC logs: `ACC_Upgrade.log`
  - MSI logs: `MSI_ACC_Upgrade.log`
- For a failed upgrade on a macOS machine, check the log file, located at `/Library/Application Support/servicenow/agent-client-collector/log/upgrade.log`.

Related topics

Upgrade multiple agents in an instance

Upgrade multiple agents in an instance

When performing selective upgrade of an agent in an instance, you can select multiple instances to upgrade at once.

Before you begin

Supported Operating Systems: Windows, Linux and macOS.

Agent Client Collector installs need to access this URL: `https://install.service-now.com/`. MID connected agents can download the installer from the MID Server (`https://<MID-WEBSERVER-URI:PORT>/static/acc_installers`).

Select the version to which you want to upgrade your agent.

1. Navigate to **All** > **System Properties** > **All Properties**.
2. Select **New**.
3. Assign the following values:
   - Name = **sn_agent.agent_upgrade_version**
   - Type = **string**
   - Value = The version number to be upgraded to, in the format <major_version.minor_version.patch_version>. For example: **4.3.2**
4. Select **Submit**.

If you do not select a version, the agent automatically upgrades to the current Agent Client Collector Framework scoped app version.

When working with MID-less agents, ensure that the agents can communicate with the ServiceNow Content Delivery Network (CDN). For details, see Configure a download proxy for Agent Client Collector upgrades.

Role required: agent_client_collector_admin

About this task

You can select up to 50 agents at a time for upgrade. To upgrade large numbers of agents, incorporate the Agent Client Collector into your software deployment tools.

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agents**.
2. Select the check box next to the agents that you want to upgrade.
   You can select up to 20 agents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the **Actions on selected rows...** box, select **Upgrade agent**.
4. In the confirmation dialog box, select **Upgrade**.

Related topics

Upgrade an agent in an instance

Run a mass upgrade via the scheduled Agent Client Collector upgrade job

Activate the built-in scheduled job to upgrade all eligible Agent Client Collector agents automatically in rate-limited batches.

Before you begin

Configure the required upgrade properties before enabling the scheduled job. For details, see Agent Client Collector upgrade properties.

Role required: agent_client_collector_admin

About this task

The **Upgrade agents incrementally** scheduled job upgrades all eligible agents on a recurring schedule. The job respects the rate limits set in the upgrade properties, upgrading agents in batches to avoid overloading MID Servers. Agents that have never failed an upgrade are prioritized over agents with prior failures.

Procedure

1. Navigate to **All** > **System Definition** > **Scheduled Jobs**.
2. Search for **Upgrade agents incrementally** and select record.
3. Set **Active** to **true**.
4. **Optional:** Adjust the **Run** schedule to match your maintenance window.
   The default schedule runs every hour.
5. Select **Update**.
   The job runs on the configured schedule, upgrading agents in batches that adhere to the configured rate limits.

Run a mass Agent Client Collector upgrade using a background script

Trigger an immediate upgrade of all eligible Agent Client Collector agents without waiting for the next scheduled job run.

Before you begin

Configure the required upgrade properties before running the script. For details, see Configure Agent Client Collector upgrade properties.

Role required: agent_client_collector_admin

About this task

The background script upgrades agents connected via MID Server and agents connected via Cloud Services (ICS) in a single run. Both function calls in the script are required — omitting either skips the corresponding agent group.

The system queries all agents that are **Up**, not duplicated, have a valid MID Server or Pod connection, and have not exceeded the retry limit. Agents with no prior failures are upgraded before agents with prior failures.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Definition** > **Scripts - Background**.
2. Change the application scope to `sn_agent` (Agent Client Collector).
3. Paste the following script into the editor.

```
var duration = 60; // Duration in minutes for rate limiting
 calculations

var a = new AgentUpgradeUtil();
a.upgradeAgentsLimitedByMid(duration);  // Upgrades agents
 connected via MID Servers
a.upgradeAgentsMidless(duration);       // Upgrades agents
 connected via Cloud Services
```

   Set `duration` to the number of minutes used for rate limiting calculations. The default value of `60` applies the per-hour limits configured in the upgrade properties.

4. Select **Run script**.
   The system begins upgrading eligible agents immediately, adhering to the rate limits set in the upgrade properties.

Repeat high-volume upgrade for failed agents

If high-volume upgrade fails for specific agents, you must clear the problematic agents' history to re-enable upgrade. If the target upgrade version changes, you don't need to clear the agents' history, as the agents upgrade with the next scheduled high-volume upgrade.

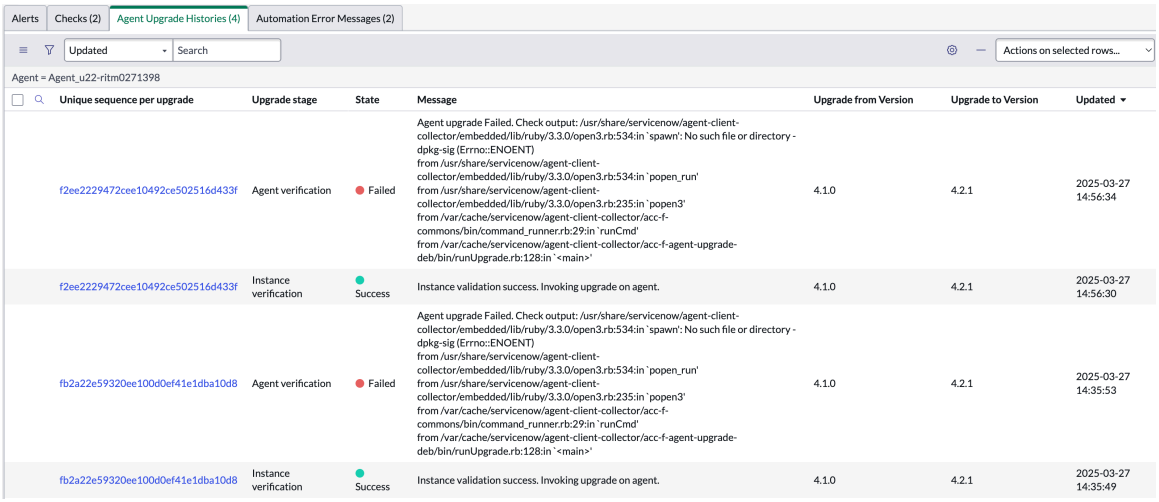
Before you begin

Roles required: agent_client_collector_admin

- In a Windows environment: Local SYSTEM account
- In a Linux environment: sudo rpm/dpkg/systemd-run
- In a macOS environment: sudo pkg

Procedure

1. Navigate to the Agent Client Collectors page **All** > **Agent Client Collector** > **Agents**.
2. Select an entry for which the *`Version`* number is not the highest available version.
3. Locate the *`Agent Upgrade Histories`* tab.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Underneath the check box ☐, hover next to a failed upgrade entry and select the check box that appears.
5. Select the arrow next to the **Actions on selected rows...** drop-down and select **Delete**.

Result
The specified agents will be upgraded with the next scheduled high volume upgrade.

Configure proxies during MID-less upgrade using a CDN

Create proxies for added security when upgrading MID-less agents via a Content Delivery Network (CDN). You add proxy servers to the sn_agent_proxy table on the ServiceNow instance.

Before you begin
Role required: agent_client_collector_admin

Procedure
1. Navigate to **All** > **Agent Client Collector** > **Package Download Proxies**.
2. Select **New** to create a proxy server.
3. Fill in the fields on the page.

Proxy - New record page fields

Field	Description
Name	A descriptive name to identify the proxy server.
URL	The URL of the proxy server that is accessed when the agent downloads the installer. Enter the URL in the following format: `some.example.com:8800`.
Domain	Select one of the following: ○ **leaf**: Select if domain separation is active, and select the leaf domain for the proxy to be used in. ○ **global**: Select if domain separation is not active.
Order	A number indicating which proxy is used first when the agent downloads the installer from the CDN. Lower numbers are used first.
Active	Select for the URL to be invoked. Clear for the URL to be ignored.

If no proxy server is specified, the default of *`direct`* is invoked, instructing the agent to download the installer directly from the CDN.

Configure a download proxy for Agent Client Collector upgrades

Add a proxy server entry so that agents behind a corporate proxy can download upgrade packages from the ServiceNow Content Delivery Network (CDN).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

This configuration applies only to agents connected via Cloud Services (ICS) that can't reach the CDN directly. Agents connected via MID Server download packages from the MID Server or the Install Server and don't use this proxy configuration.

Role required: agent_client_collector_admin

About this task

Proxy configuration is managed through the Package Download Proxies table. When you add, update, or remove a proxy record, the system reads all active entries sorted by the **Order** field and generates a proxy list. The updated configuration is automatically pushed to all agents via MID Server configuration sync. No manual file editing or agent restart is required.

The agent tries each proxy in order, from the lowest **Order** value to the highest. If a proxy fails, the agent moves to the next entry. To configure a direct connection as a fallback, add an entry with the URL set to `direct`.

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Package Download Proxies**.
2. Select **New**.
3. Fill in the proxy record fields.

Package Download Proxies form

Field	Description
Name	Descriptive label for this proxy entry, for example US - `East Corporate Proxy`.
URL	Proxy address in `host` : `port` format, for example `proxy` . `example` . `com` : 8080. Enter `direct` to configure a direct connection with no proxy.
Order	Numeric priority. Lower numbers are tried first. Default is 100.
Active	Selected by default. Clear to disable this entry without deleting it.
Domain	The domain this proxy applies to. Use for domain-separated instances.

4. Select **Submit**.
   The system generates an updated proxy list and pushes it to all agents via MID Server configuration sync. Changes take effect without an agent restart.
5. **Optional:** Add additional proxy entries to configure failover.
   Repeat the preceding steps for each proxy, assigning a higher **Order** value to each successive entry. The agent tries each proxy in order and falls back to the next if the current one fails.

Example: Proxy with direct connection fallback

The following configuration tries a corporate proxy first. If the proxy is unavailable, the agent connects directly to the CDN.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Proxy failover example

Name	URL	Order	Active
Corporate Proxy	`proxy.example.com:8080`	100	Yes
Direct Fallback	`direct`	200	Yes

What to do next

To temporarily block all CDN downloads, clear the **Active** check box on all proxy records. With no active entries, the system blocks CDN downloads. This is useful during maintenance windows.

Configure Agent Client Collector upgrade properties

Set the system properties that control Agent Client Collector upgrade behavior, including the target version and rate limits for mass upgrades.

Before you begin

Role required: agent_client_collector_admin

About this task

Two properties are required before any upgrade can run. Additional optional properties let you control rate limits, retry behavior, and timeout thresholds.

Procedure

1. Navigate to **All** > **System Properties** > **All Properties**.
2. Set the required upgrade properties.

Required upgrade properties

Property	Value	Description
sn_agent.auto_upgrade.en`true`*d*		Enables the upgrade feature. Set to **true** before running any upgrade, manual or scheduled.
sn_agent.agent_upgrade_v	Target version number, for example `5.0.1`	The version agents upgrade to. If left empty, the system uses the current Agent Client Collector Framework application version.

3. **Optional:** Set optional properties to adjust rate limits and timeout behavior.

Optional upgrade properties

Property	Default	Description
sn_agent.auto_upgrade.max_upgrades_per_hour	1000	Maximum agents upgraded per job run. Lower this value for a more gradual rollout.
sn_agent.auto_upgrades_per_mid	50	Maximum agent upgrades routed through a single MID Server per job run. Prevents overloading individual MID Servers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Default	Description
sn_agent.auto_upgrade.retry_limit	3	Number of times the system retries a failed upgrade before permanently skipping the agent.
sn_agent.agent_upgrade_wait_time	30	Minutes the system waits for an agent to complete its upgrade before marking it as failed.
sn_agent.upgrade.timeout_minutes	10	Minutes allowed for the initial upgrade validation check on the agent.
sn_agent.min_upgrade_history_per_agent	2	Number of upgrade history records kept per agent. Older records are automatically removed.

Create and edit Agent Client Collector plugins

Custom plugins extend Agent Client Collector monitoring capabilities beyond the default plugins. You can create plugins for specific monitoring requirements or modify existing plugins.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. Put every script or executable the plugin needs inside `bin/`.
   - For Linux and macOS assets, ensure that the agent can execute these files.
   - Make each script/executable executable before building the archive: `chmod +x bin/my_script.rb bin/helper.sh`
   - For Windows plugins that run scripts other than batch files, include a batch file in `bin/` that calls the actual script. For example, a batch file can call a PowerShell script using `powershell %~dp0\test.ps1`.
2. If the plugin requires ACC command allowlist validation, create `allow_list/allow_list.json` at the top level of the plugin folder.
   The file is a JSON array. Each entry defines an allowed executable and the arguments it may receive.

```
[
  {
    "args": [
      "-d",
      "--parent_cache_dir",
      "/var/cache/servicenow/agent-client-collector/"
    ],
    "exec": "my_script.rb",
    "skip_arguments": false
  },
  {
    "args": [
      "--log-level=(FATAL|ERROR|WARN|INFO|DEBUG)",
      "-l",
      "(FATAL|ERROR|WARN|INFO|DEBUG)"
    ],
    "exec": "helper.sh",
    "skip_arguments": false,
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    "use_regex": true
  }
```

Field meanings:

- *exec*: the file name inside `bin/` that is allowed to run.
- *args*: list of allowed arguments. Set *use_regex* to `true` when an argument is a regular expression.
- *skip_arguments* : when `true`, the agent allows the command to run but does not validate the argument list.

You can generate a starting allowlist from the instance using the **Agent Client Collector Command Allow-list Generator** page.

3. Build the `.tar.gz`.
   - On Linux or macOS:

     Open a terminal, change to the plugin folder (the folder that contains `bin/` and optionally `allow_list/`), then run:

     ```
     tar -C . -zcvf my_custom_plugin.tar.gz *
     ```

     Command options:

     - `-C .` — uses the current folder as the base, so the archive contents sit at the root level (`bin/`, `allow_list/`) instead of being wrapped in an extra parent folder.
     - `-z` — gzip compression.
     - `-c` — create the archive.
     - `-v` — verbose output.
     - `-f my_custom_plugin.tar.gz` — output file name.
     - `*` — include all files and folders in the current directory.
   - On Windows:

     Use any archiving utility that supports the `.tar.gz` format. Ensure the archive contains `bin/` at the root and optionally `allow_list/` at the root. Do not wrap the contents in an extra parent folder.
4. Before you upload, verify that the archive has the correct top-level structure:
   Run the following command:

   ```
   tar -tzf my_custom_plugin.tar.gz
   ```

   Expected output:

   ```
   bin/
   allow_list/
   bin/my_script.rb
   bin/helper.sh
   allow_list/allow_list.json
   ```

   There must be no extra parent directory such as `my_custom_plugin/bin/`.
5. Attach the `tar.gz` file to the plugin record, according to the instructions that appear on the UI page.
6. Navigate to **All** > **Agent Client Collector** > **Configuration** > **ACC Plugins**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Click **New**.
   The **Agent Client Collector Plugin - New record** page appears.
8. Enter values in the fields on the page, as described in the following table.

Agent Client Collector Plugin fields

Field	Description
Name	Plugin name. This field is populated automatically with the name of the tar.gz file attached to the plugin, and is visible only when selecting an existing record.
Description	Description of the plugin.
Operating System	Selects the operating system to be monitored by the plugin.
Platform	Selects the platform to be monitored by the plugin.
Active	Selected to activate the plugin and download it to the MID server.
Advanced	Selected to enable selecting the operating system version to be monitored by the plugin.
OS Version	Selects the operating system version to be monitored by the plugin. This field appears only when selecting the **Advanced** check box.

Secure a custom plugin with a certificate

When you customize or create an Agent Client Collector plugin, you can secure the plugin with either a third-party certificate or an internal secure certificate in the plugin's script. Official plugins are signed by an external certificate authority.

Using a signed certificate is enabled by default. To disable this feature, set the *`verify-plugin-signature`* property to **False** in the acc.yml on the host. When you disable a signed certificate, your configured plugins use no certificate.

For details on how to configure a self-signed certificate by using OpenSSL, see Enable OpenSSL secure signing for plugins. For details on how to configure a third-party certificate, consult the third-party vendor's documentation.

When the agent's current certificates can't validate a plugin, Agent Client Collector requests the updated certificates from its synchronized MID Server. You can manually refresh the agent to receive these certificates before the scheduled synchronization. For details, see Manually refresh Agent Client Collector certificates.

You can manually save the certificates in a directory on the MID Server that is connected to the installed agents. Any agent that's installed in your environment can then access the certificates from that MID Server.

For details on how to configure the certificate synchronization properties, see Synchronization properties for validating Agent Client Collector plugins.

Optimize distribution of agents to MID Servers

Optimize the distribution of agents by allowing redistribution from one MID Server to another. Agents will always be connected to the MID Server with the fastest response time.

Before you begin

Ensure that the following settings are configured:

- The *sn_agent.enable_auto_mid_selection* system property is set to true. When using the `acc.yml` file, the property is *enable_auto_mid_selection*.
- On the MID Server page (**Agent Client Collector** > **MID Server**):
  - Status: Up
  - Validated: Yes

Role required: agent_client_collector_admin

About this task

Only validated MID Servers can accept connections from agents.

Procedure

1. Navigate to **Agent Client Collector** > **Deployment** > **MID Servers**.
2. On the **MID Servers [Agent Client Collector view]** page, select the check box next to the MID Server from which you want to redistribute agents.
3. In the **Actions on selected rows** list, select **Try redistributing connected agents**.
   Note the number of agents assigned to your MID Servers.
4. Refresh the page to view the results of the redistribution attempt.
   The values in the **Number of agents** column for any affected MID Server will show a change if any agents were redistributed.

View the Agent Client Collector configuration file for an agent

View the `acc.yml` Agent Client Collector configuration file without having to access the host server by retrieving the file from an agent.

Before you begin

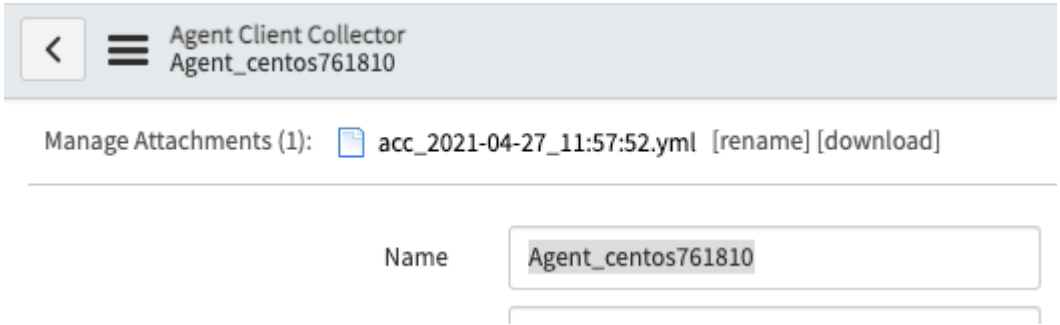
Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agents**.
2. On the Agent Client Collectors page, select an agent.
3. In the **Related Links** section, select **Grab agent config (acc.yml)**.
   A message appears on the page that indicates that the file is attaching.
4. Wait several seconds and refresh the page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The `acc.yml` configuration file appears as an attachment on the agent.



Related topics

Configuration file options

Create an Agent Client Collector configuration data file

Create an Agent Client Collector configuration data file and associate it with check definitions so that you can view the information about your instance. You can also add or delete an attachment to the configuration data files, which are used by check definitions during check executions.

Before you begin

Role required: agent_client_collector_admin

About this task

A check definition is an individual check entry in the system. For details, see Agent Client Collector configuration data files.

Configuration data file attachments contain instance data, such as configuration item (CI) information, which is used when executing a check.

Domain separation is supported in the Agent Client Collector configuration data files.

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Configuration** > **Configuration Files**.
2. Select **New**.
3. Add or remove an attachment.

Action	Description
Add a file	Synchronize the record and the relevant MID Servers. **a.** Select the paper clip icon . The Attachments dialog box opens. **b.** Select **Choose file** and select a file to at tach. **c.** Close the Attachments dialog box.
Delete a file	Optionally, delete an attachment you don't want to be associated with the record. **a.** Select **Manage Attachments**. The Attachments dialog box opens.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Action	Description
	b. Select the check box next to the attach ment that you want to remove. **c.** Select **Remove**.

The attachment name must be unique for each domain and can consist only of alphanumeric characters.

If the attachment contains invalid characters or is a duplicate of another attachment, the following situations occur:

- The configuration file is automatically set to **Active = False**.
- A message appears in the Error column indicating a problem with the attachment.

Each record can contain only one attachment.

4. **Optional:** In the **Description** field, enter a description for the configuration data file.
5. Select **Submit**.

Result

- The configuration data file is listed on the Agent Client Collector Configuration File page.
- The **Name** value is automatically set to the name of the attachment.

Checks use the configuration data file with instance data during check execution.

Validate plugins on the MID Server

Validate plugins on your MID Server to ensure that they match the plugins on your ServiceNow instance. Validating plugins ensures that the instance provides accurate data on all of your MID Server plugins.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Deployment** > **MID Servers**.
2. Select a MID Server entry on the MID Servers page.
3. Select the **Validate ACC Plugins** link.
   The **Queues** page appears, displaying the ECC queue.
4. Refresh the queue to view the new input record.
5. Select the record to view its results.

   Validation status is visible in the **Payload** section of the form.

   If plugins aren't validated, restart the MID Server. Plugins sync automatically when the MID Server restarts.

Validate plugins on agents

Validate plugins on your agents to ensure that they match the plugins on your ServiceNow instance. Validating plugins ensures that the instance provides accurate data on all of your agents' plugins.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: agent_client_collector_admin

About this task
Only plugins that are able to be executed are validated. For example, if you're running an agent on a macOS, only macOS plugins on your instance are validated.

Procedure
1. Navigate to **All** > **Agent Client Collector** > **Agents**.
2. Select an agent on the **Agent Client Collectors** page.
3. Select the **Validate ACC Plugins** link.
   The **Queues** page appears, displaying the ECC queue.
4. Refresh the queue to view the new input record.
5. Select the record to view its results.

   Validation status is visible in the **Payload** section of the form.

   If plugins aren't validated, navigate back to the **Agent Client Collectors** page and select the **Clear ACC Plugins** link.

   The plugins automatically re-sync the next time a command runs which requires the plugin.

Using proxy agents in Agent Client Collector
You can use a proxy agent to monitor the health and performance of your configuration items (CIs). This works even if the agent is in the cloud or external to your host server.

Proxy agents are used to monitor:

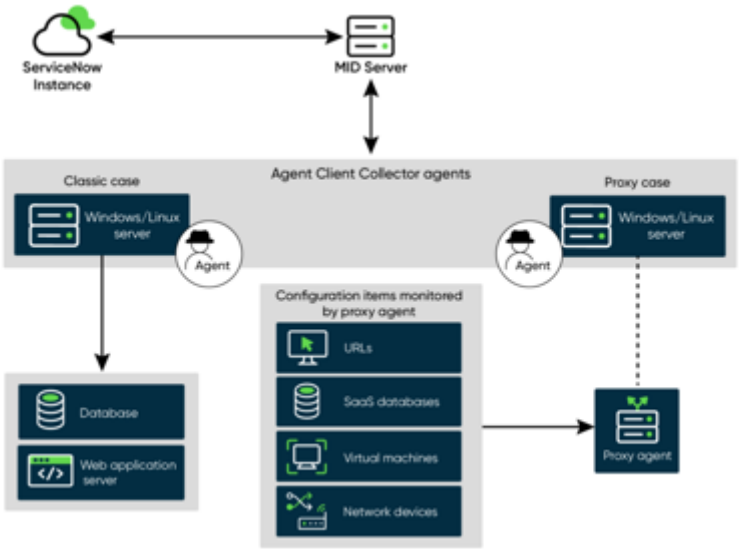
- URLs (to ensure that the URLs are available and accessible)
- Services that don't have a host server
- Closed services on which you can't configure an agent
- External databases in the cloud

One agent can monitor multiple entities and their CIs.

The following diagram shows the connection between a ServiceNow instance, the MID Server, and Agent Client Collector agents, as well as proxy agents that monitor CIs that are external to the agent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Proxy agent configuration



You can configure the proxy agent to do a custom check when it is monitoring external entities. To learn how to create custom checks, see Create and edit checks.

You can create a cluster of proxy agents on multiple proxy servers to monitor the services that are external to the host server. To learn how to create a proxy agent cluster, see Create a proxy agent cluster.

Use a Proxy Auto-Configuration (PAC) file to dynamically determine the appropriate proxy server to use. PAC files provide flexible and automated proxy configuration. They enable the agent to use different proxies for different destinations, connect directly to internal resources, and implement complex proxy routing logic. They also automatically handle proxy failover. For details on the parameters used for PAC file configuration, see Configuration file options.

Following is a sample PAC file:

```
function FindProxyForURL (url, host) {

   // Connect directly to internal hosts
   if (isPlainHostName(host) ||
      shExpMatch(host, "*.internal.company.com")) {
      return "DIRECT";
   }

   // use proxy for all other hosts
   return "PROXY proxy.company.com:8080:
}
```

Related topics

- Agent Client Collector Monitoring default checks and policies

Configure an agent on a proxy server

Configure an Agent Client Collector on a proxy server when monitoring services external to the host server, such as URLs or external databases in the cloud.

Before you begin

Role required: agent_client_collector_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Proxy agents should be dedicated agents, as running other apps on a proxy agent is likely to cause performance degradation.

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agents** > **Policies**.
2. Select the policy containing the checks that you want to run on a proxy server.
   You must configure a proxy server for checks and policies that monitor external services. For details on these checks and policies, see Agent Client Collector Monitoring default checks and policies.
3. Select the **Proxy Settings** tab.
4. Select from the following fields.

Field	Description
Single proxy agent	Select to display the **Proxy agent** field, where you select a single proxy agent.
Multi-proxy agents by cluster	Select to enable a group of proxy agents to monitor the policy CIs. When selecting this check box, the **Agent cluster name** field appears.
Agent cluster name	Select an agent cluster to monitor the policy CIs.
Multi-proxy agents by filter	Select to filter multiple proxy agents from the agent list. When selecting this option, all proxy agents monitor the same services. For example, you may want to use this option for multiple proxy servers in different geographic locations. **Note:** ○ This field appears only when the **Hide Multi Proxy Agent by filter, if its not selected** property (*sys_ui_policy*) is set to **active=false**. ○ This field appears only for existing policies where this option was previously selected. If you remove the filter in an existing policy, the option disappears.
Multi-proxy agents by script	Select to configure a JavaScript for selecting proxy agents. When selecting this option, you can assign services to different proxy agents, which can serve as a form of load balancing.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Run checks on all proxy agents (No load balancing)	Clear this option to load balance the selected multi proxy agents that monitor the matching CIs in the policy's **Monitored CIs** tab. Select this option for each agent to monitor all matching CIs in the policy's **Monitored CIs** tab. For example, if you have five agents in a cluster or five agents using the filter/script option and 10 matching CIs in the policy, when you clear this option, each agent monitors two CIs. When selecting this option, each agent monitors all 10 of the matching CIs in the policy. For existing or active policies, this option is enabled by default. For new and inactive policies, this option is turned off by default. Select this option only in a case where you have an external endpoint for which you want to measure how quickly it is accessed from different locations.

5. Select **Activate**.

Create a proxy agent cluster

Create a cluster of agents on multiple proxy servers to monitor services external to the host server. Creating a cluster of agents enables you to assign that cluster to multiple policies instead of having to assign the agents individually to every policy.

Before you begin

Role required: agent_client_collector_admin

About this task

A proxy agent cluster monitors the CIs that match the filter specified on the policy's **Monitored CIs** tab.

A proxy agent cluster must contain at least one agent. All of the cluster's agents monitor the CIs specified in its assigned policy. No special configuration is necessary on the policy level to enable proxy cluster monitoring.

The default CPU threshold value when working with proxy agent clusters is 80%. You can modify this value in the *proxy_cpu_percentage_limit* property.

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Configuration** > **Proxy Agent Cluster**.
2. Select **New**.
3. In the **Name** field, enter a descriptive name for the cluster.
4. Add an agent to the cluster.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the **Agents in cluster** section, locate the **Agent** column and select **Insert a new row**.

b. Select the search icon ( ) and select an agent to add to the cluster.

c. Select the check icon ( ) to add the agent to the cluster.
Repeat this step for each agent that you want to add to the cluster.

5. Select **Submit**.

Result
The **Proxy Agent Clusters** page appears and displays the agent added to the cluster.

What to do next
Select this proxy cluster to monitor CIs specified in an agent policy. For details, see Configure an agent on a proxy server.

Assign a proxy agent cluster to a policy

Assign a proxy agent cluster to a policy when monitoring services external to the host server, such as URLs or external databases in the cloud. The agents in the cluster monitor all of the policy's CIs.

Before you begin
Ensure that you have a policy containing the checks that monitor external services. For details on these checks and policies, see Agent Client Collector Monitoring default checks and policies.

Role required: agent_client_collector_admin

About this task
Only one app should be run on a given proxy agent because running multiple apps is likely to cause performance degradation.

Procedure
1. Navigate to **All** > **Agent Client Collector** > **Agents** > **Policies**.
2. Select the policy containing the checks that you want to run on a proxy server.
3. Select the **Proxy Settings** tab.
4. Select **Edit in Sandbox** to enable modifying fields on the form.
5. Indicate whether you are assigning a single proxy agent or a proxy agent cluster to monitor the policy CIs.
   - Assign a single proxy agent by selecting **Single proxy agent** and selecting an agent.
   - Enable a proxy agent cluster by selecting **Multi-proxy agents by cluster**. Provide the name of the cluster in the field that appears.
6. Determine whether to select multiple proxy agents from the agents list through a filter or a script.
   - To select agents through a filter, configure a filter or retain or modify an existing filter when the **Multi-proxy agents by filter** option is selected.

     Note:
     - This field appears only when the **Hide Multi Proxy Agent by filter, if its not selected** property (*sys_ui_policy*) has been set to **active=false**.
     - If you remove the filter in an existing policy, the option disappears.

   - To select agents through a script:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select **Edit in Sandbox**.

b. Clear any selected proxy options in the **Proxy Settings** tab.

c. Select **Multi-proxy agents by script**.

d. In the **Proxy script** field that appears, enter a script to assign services to different proxy agents as a form of load balancing.

7. Determine whether to load-balance the selected multi-proxy agents that monitor the matching CIs in the policy's **Monitored CIs** tab or have each agent monitor the matching CIs.
   - To load balance the selected multi-proxy agents that monitor the matching CIs, clear the **Run checks on all proxy agents (No load balancing)** option.

     For example, if you have five agents in a cluster or five agents using the filter/script option and 10 matching CIs in the policy, each agent would monitor two CIs.

     You can also enable load balancing at a later time, as described in Enable load balancing between proxy agents in a cluster.

   - To have each agent monitor all matching CIs, select the **Run checks on all proxy agents (No load balancing)** option.

     If there are 10 matching CIs in the policy, each agent would monitor all 10. For example, you might want to use this option for multiple proxy servers in different geographic locations.

     If an agent is not functioning properly, the monitored CIs are redistributed to another agent.

   Note: For existing or active policies, the **Run checks on all proxy agents (No load balancing)** option is enabled by default. For new and inactive policies, this option is turned off by default.

8. Select **Activate**.

Related topics

Enable load balancing between proxy agents in a cluster

Enable load balancing between proxy agents in a cluster

Enable load balancing between proxy agents in a cluster so that if an agent is not functioning properly, monitored CIs are redistributed to another agent. After enabling load balancing, you can view the CIs monitored by each proxy agent in a policy.

Before you begin

Ensure that you have upgraded to Tokyo patch 1 or San Diego patch 7.

Role required: agent_client_collector_user

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Configuration** > **Policies**.
2. Select the policy containing the CIs you want the proxy agents to monitor.
3. Select the **Proxy Settings** tab.
4. Enable load balancing for the proxy agents by clearing the **Run checks on all proxy agents (No load balancing)** check box.
   Load balancing is enabled for the proxy agents monitoring the CIs. For example, if you have five agents and 10 matching CIs in the policy, each agent monitors two CIs.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. In the **Related Links** section, select **Show distribution of proxy agent's CIs**.
   A pop-up window displays the distribution of monitored CIs among agents within the policy.

Configure a MID Server to work with Agent Client Collector Monitoring

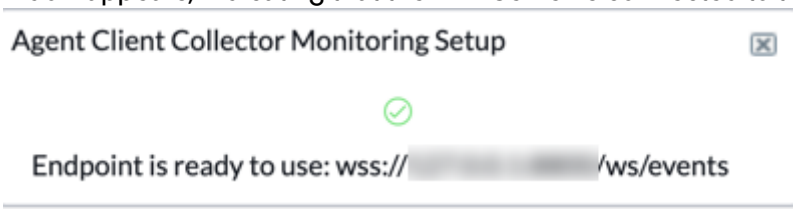
Connect agents to a MID Server to enable Agent Client Collector Monitoring (ACC-M) functionality.

Before you begin
Role required: agent_client_collector_admin

About this task
For details on configuring Agent Client Collector for log monitoring, see Agent Client Collector Log Analytics.

Procedure
1. Navigate to **All** > **Agent Client Collector** > **Deployment** > **MID Servers**.
2. Select the MID Server that you want to connect to the agent.
3. In the **Related Links** section, select **Setup ACC Monitoring**.

Result
A confirmation window appears, indicating that the MID Server is connected to the agent.



Related topics
Configure multiple MID Servers to work with Agent Client Collector Monitoring

Configure multiple MID Servers to work with Agent Client Collector Monitoring

Connect agents to multiple MID Servers to enable Agent Client Collector Monitoring functionality. Multiple MID Servers can support each other with load balancing and domain separation.

Before you begin
Role required: agent_client_collector_admin

About this task
When configuring multiple MID Servers, use the same port for all MID Servers. Using different ports requires you to add each MID Server individually, as described in Configure a MID Server to work with Agent Client Collector Monitoring.

Procedure
1. Navigate to **All** > **Agent Client Collector** > **MID Servers**.
2. Select the check boxes corresponding to the MID Servers you want to connect to your agent.
3. In the **Actions on selected rows...** window, select **Setup ACC Monitoring**.
   The option includes the number of MID Servers selected out of the number of available MID Servers. For example: **Setup ACC Monitoring (7 of 8)** indicates that 7 MID Servers were selected out of 8 available MID Servers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
A confirmation window appears, indicating that the selected MID Servers are connected to the agent.

Enable log monitoring in a Linux environment

To enable monitoring logs in a Linux environment, select the relevant policy and assign specific check parameters to the policy. When log monitoring is enabled and a specified string is discovered in the log being monitored, the system creates an event.

Before you begin
Ensure that the servicenow user has access to the log file being monitored, or that the specified user can run the `sudo` command.

Role required: agent_client_collector_admin

Procedure
1. Navigate to **All** > **Agent Client Collector** > **Policies**.
2. Select the **Linux log monitoring** policy.
3. On the **Check Instances** tab, select **util.check-logs** to enable monitoring log files not owned by the *`root`* user.
   Ensure that the Agent Client Collector *`servicenow`* user has read permissions for the log file being monitored.
4. Specify the log file to be searched by the check:
   a. In the **Check Parameter Definitions** tab at the bottom of the page, select the **file** entry in the **Name** column.
   b. In the **Default value** field, enter the path of the log file you want to search.
5. Specify the string you want to locate in the log:
   a. In the **Check Parameter Definitions** tab at the bottom of the page, select the **pattern** entry in the **Name** column.
   b. In the **Default value** field, enter the search pattern strings that you want to search for in the log file, such as `404`, `Error`, and so forth. The default values are SEVERE and `Exception`.

      Ensure that you separate multiple patterns with a pipe (|) and pass it as a parameter inside quotes. For example: `"SEVERE|404"`.
6. Click **Update** to save your check instance and return to the **Policy - Linux Log Monitoring** page.
7. Select the **util.check-logs-sudo** check to monitor logs owned by the root user.
8. Repeat steps 4 and 5 to monitor logs owned by the root user.
9. For the **util.check-logs-sudo** check, modify the `/etc/sudoers` file on the host or Linux virtual machine, as follows:
   When the agent is installed on the host's default location (`/usr/share/servicenow/agent-client-collector`) or on a Linux virtual machine, add the following string to the `/etc/sudoers` file:

```
servicenow ALL=
 SETENV: /
var/cache/servicenow/agent-client-collector/monitoring-plugin-l
inux/bin/check-log.rb *
Defaults:servicenow !requiretty
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
Defaults exempt_group += servicenow
```

10. On the **Policy** page, click **Save** and then click **Publish** to activate the policy to monitor the log file.

Enable log monitoring in a Windows environment

To enable monitoring logs in a Windows environment, select the relevant policy and assign specific check parameters to the policy. When log monitoring is enabled and a specified string is discovered in the log being monitored, the system creates an event.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Policies**.
2. Select the **Windows log monitoring** policy.
3. On the **Check Instances** tab, select **os.windows.check-log** to enable monitoring Windows log files.
4. On the **Check Parameters** tab, specify the log parameters to be monitored by the check, as described in the following table:

Check parameters

Name	Value
warning	Number of times the specified pattern strings are found in the log which generates a *`warning`* event. Default = 1. For example, if the *`pattern`* value is **Exception** and one Exception event is located in the log, a *`warning`* event is generated.
critical	Number of times the specified pattern strings are found in the log which generates a *`critical`* event. Default = 2. For example, if the *`pattern`* value is **Exception** and two Exception events are located in the log, a *`critical`* event is generated.
file	Location of the log file.
pattern	Strings which are being searched for in the log. Default values are **Severe** and **Exception**. Other possible values include **404** and **Error**. Ensure that you separate multiple patterns with a pipe (|) and pass it as a parameter inside quotes. For example: `"SEVERE|404"`.

Select the Azure policies to activate for metric collection

Activate the Azure policies that come with the Agent Client Collector base system so that Azure virtual machines can collect metrics. These metrics help you monitor the configuration items (CIs) in the CMDB.

Before you begin

- Prepare an instance with an active MID Server and metric base.
- Install Agent Client Collector Framework and Agent Client Collector Monitoring.
- Run Discovery on the Azure cloud account to populate the CMDB with CIs to be monitored.

Role required: agent_client_collector_admin

Procedure

1. Prepare and configure the proxy agent to be used by the policy.
   For details on configuring a proxy agent, see Using proxy agents in Agent Client Collector.
2. Assign the credentials to the Azure policy.
   a. Navigate to **All** > **Agent Client Collector** > **Policies**.
   b. Select the relevant policy.
      For details on the policies that are available with the base system, see Azure cloud metrics.
   c. Select the **Credentials** tab.
   d. In the **Credential name** field, select the credentials to be invoked for the policy.
      To see the available credentials, go to the Credentials page by navigating to **All** > **Discovery** > **Credentials**.

      Ensure that you select the **Type=Azure** credentials. If you need to create credentials, select **New** and select **Azure Service Principal** credentials.
   e. In the **Credential alias** field, assign an alias to the credentials.
3. Navigate to **All** > **Agent Client Collector** > **Configuration** > **Policies** and select the relevant policy to activate.
4. Select the application scope icon and verify that you are in the Agent Client Collector Monitoring scope to edit the policy.
5. Enable the policy in Edit mode by selecting **Edit in Sandbox**.
6. Enable the proxy agent to be used to execute the check.
   a. Select the **Proxy Settings** tab.
   b. Select **Single proxy agent** and select the proxy agent to be used to execute the check from the **Proxy agent** field.
7. Select **Save**.
8. Republish the policy by selecting **Republish**.

Use the Agent Client Collector Health Dashboard

The Agent Client Collector Health Dashboard enables you to monitor the status of the agents in your system.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agent Health Dashboard**.
   The **Agent Health Dashboard** page appears and displays information about the configured agents in the dashboard widgets.

   In the **Agents by Data Collection Status** widget, **Off (manual)** indicates agents manually turned off (for maintenance or troubleshooting), and **Off (auto)** indicates agents automatically turned off (after crossing the CPU usage threshold).

2. Click the refresh arrow icon on the top right corner of a widget to refresh its data, as needed.

   You can refresh all widgets on the dashboard by selecting the form header icon and then selecting **Refresh**.

Agent Client Collector Discovery

Discover CIs in your environment by using Agent Client Collector for Visibility Content (ACC-VC) Discovery. ACC-VC works with both horizontal IP-based Discovery, and you can also use push-based Discovery.

Using push-based and horizontal IP-based Discovery together

Discovery performed by Agent Client Collector for Visibility Content (ACC-VC) is compatible and can coexist with horizontal IP-based Discovery. You may have ACC installed on a given target host and still have that host as part of a horizontal IP-based Discovery schedule as well.

To avoid conflicts, ACC-VC does not perform Discovery when the target host's IP already has a CI that has been discovered by horizontal IP-based Discovery (discovery_source is ServiceNow). To override this behavior, set the system property [*sn_agent.disco_disable_ci_clobber_of_agentless_disco*] to false. This setting is ignored if horizontal IP-based Discovery was not performed over a specific time. Update the system property [*sn_agent.disco_ci_clobber_of_agentless_disco_threshold_days*] if necessary. The default is 14 days. See System properties for more details.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To enable Discovery using Agent Client Collector, enable the following Discovery properties on the Discovery properties page (**All** > **Discovery Definition** > **Properties**):

Agent Client Collector Discovery properties

Field	Description
glide.discovery.domain.name.nbt	Set OS domain name by NBT or WMI. If set to **true**, Windows domain name is set by NBT. Otherwise it's set by WMI. • **Type**: true | false • **Default value**: true
glide.discovery.enable.software_simplify	Enables cleanup for software's name and version. If set to **true**, it removes any appended version or commonly found phrases from the name and removes leading 0s in the version. If set to **false**, raw data is persisted in the table. Use with the **glide.discovery.enable.software_simplify_sccm** property to avoid software data discrepancy between Discovery and SCCM. • **Type**: true | false • **Default value**: true **Note:** Once the property is set to **false**, to disable the cleanup, duplicate records are generated for a given software. Name and Version are the primary identifiers.

Using push-based Discovery and Intel EMA together

Agent Client Collector for Visibility Content (ACC-VC) can collect data for uses cases with the Intel vPro® platform when the Intel ® Endpoint Management Assistant (EMA) application is installed on Windows endpoints. You can install the Intel EMA application from the ServiceNow store. Attributes are stored in the CMDB when enabled. Currently, data for Intel EMA can only be fetched for Windows endpoints.

The Intel EMA application enables customers to configure access to the Intel Instance from their ServiceNow instance. For example, IT Support groups can open a remote console and perform some actions like power cycle from a ServiceNow incident.

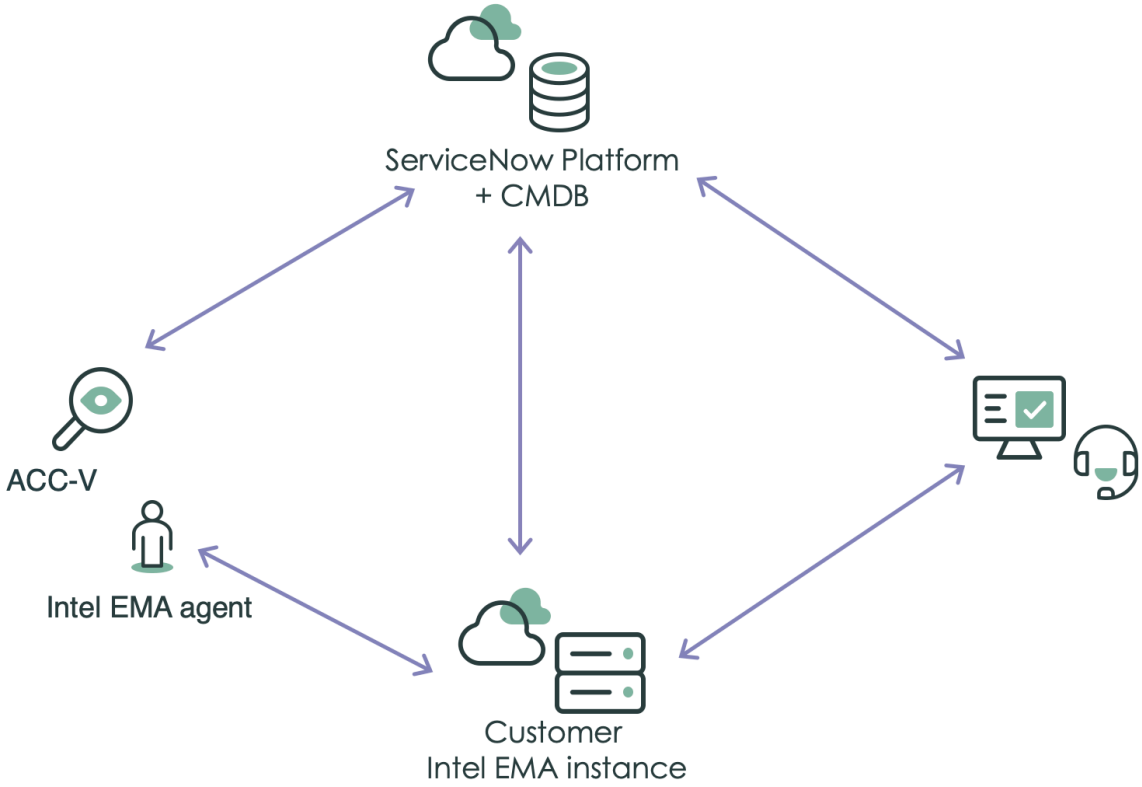
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Intel + ServiceNow platform



Using push-based Discovery and SAM together

Agent Client Collector for Visibility Content (ACC-VC) collects installed software data for use cases for Software Asset Management (SAM), when the SAM plugin is installed. Using push-based Discovery and SAM together can help optimize software data collection with SAM basic metering and SAM total usage metrics.

ACC-VC can capture the last accessed time for the software or applications that are installed on the target via push-based Discovery. This information along with the target CI reference, is added to the Software Update [samp_sw_usage] table.

SAM Basic metering and SAM total usage metrics are supported for both Windows and macOS.

The software usage records are domain separated. The records are populated with the domain of the MID Server that is used for the agent-based Discovery for the target.

Note: For software installations (cmdb_sam_sw_install), to avoid insertion of duplicate records, the same discovery source "ServiceNow" is being used for both push-based Discovery and horizontal IP-based Discovery.

Requirements

SAM basic metering and SAM total usage metrics

To apply SAM basic metering or SAM total usage metrics, you need the following:

- SAM plugin (com.snc.samp) enabled
- System property [*sn_acc_vis_content.persist_sam_usage_metrics*] set to true. See System properties for more details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Write permissions enabled for the log folder in the ACC install directory.
- In a Windows environment: For maximum efficiency, run ACC with the Local System account (on the agent, set **Log On As = Local System**).

For details on SAM metering setup with the Agent Client Collector, see the Knowledge Base article KB1642676.

Software edition information

To retrieve software edition information, you need the SAM plugin (com.snc.samp) enabled.

SAM basic metering

SAM basic metering tracks when installed software was last used on an endpoint. In a Windows environment, this is determined by observing which applications are running on the machine.

How SAM basic metering works (on a Windows machine)

- Every 8 minutes, the agent checks the running process table on the endpoint and records each observed application.
- Running applications are considered used, and their last accessed time updates to the current time.
- Once every 24 hours, the agent also reads the Windows Registry Run keys (`HKLM...\Run`, `HKLM\Wow6432Node...\Run`, and `per-user HKU<SID>...\Run`) to acknowledge auto-start applications that may have started and exited before being checked. These observations are sent to the instance as part of the existing 24-hour metering payload.
- On an instance, each observed executable is matched to a product using an exact lookup in the Software Product Process (*samp_sw_product_process*) table.
- If a matching product is found, the last accessed time on the corresponding Software Installation (*cmdb_sam_sw_install*) record is updated.
- If no mapping exists in the Software Product Process (*samp_sw_product_process*) table for an executable, no last accessed time is written for the software installation record. The unmapped executable is logged for the for review.

How SAM basic metering works (on a macOS machine)

The last accessed time (*last_used* value) is collected using the native macOS metadata attribute.

If reclamation rules are enabled for the product, the last accessed time is also stored in the Software Usage (*samp_sw_usage*) table.

Use the *sn_acc_vis_content.disable_sam_reclamation_rules_for_licensable_softwares* property to define reclamation rules for licensable software, as follows:

- **True**: SAM usage is stored for all licensable software (with or without defined reclamation rules), and for any non-licensable software that has a reclamation rule defined.
- **False**: Store SAM usage according to defined reclamation rules.

Common applications supported include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- WinZip
- Google Chrome
- Sublime Text
- Notepad++
- Autodesk
- Microsoft Office 365
- Tableau

SAM total usage metrics

SAM total usage metrics allows you to measure total usage time and total usage count on any application that has a software reclamation rule enabled.

Osquery provides a daemon executable which can run as a service, called Osqueryd. Osqueryd needs to be manually deployed for SAM total usage metrics to work properly. Each Osqueryd deployment requires the osquery.conf file, optional external packs, and initialization flags (configured in osquery.flags file) provided when starting the service. In return, the daemon service runs scheduled queries on the host and logs it into a local file system.

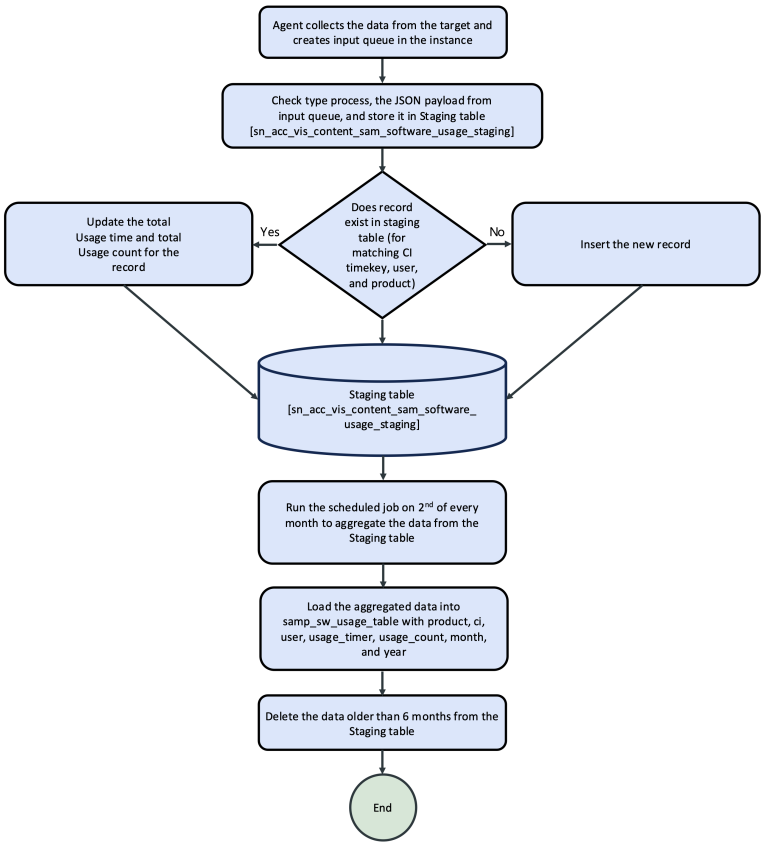
Note: Osquery supports filesystem-based logging by default. This configuration is provided in the osquery.conf file on any fresh Osquery installation. Osquery is not needed from an implementation or configuration viewpoint for basic metering. Total Usage metrics requires osqueryd to be installed separately.

Domain information can be collected during the data collection. This can help large organizations with multiple employee directories map software to the correct user. Currently, this is supported for Windows only. To map the software usage/assigned_to with the correct user in a domain separated environment, use the system property [sn_acc_vis_content.column_name_for_user_mapping] with a valid field name. By default, the value of this system property is empty which means it only validates the username and not the domain. You can use either of the following formats to validate username and domain: username@domain or domain\username.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SAM total usage metrics flowchart

Using the list of processes, you can perform SAM normalization to map the processes for the relevant installed software records. This provides flexibility since installed software names and processes are not usually the same. For the list of processes in the payload, query the Software Discovery Model [cmdb_sam_sw_discovery_model] table and Software Product [samp_sw_product] table to fetch the corresponding product and publisher. Once the product is fetched, check if the reclamation rule is enabled for that product to persist the total usage time in the Software Usage [samp_sw_usage] table. See the flowchart for details.



install and configure Osqueryd for Windows using the following script.

```
# Install latest osquery

$msi = "osquery-5.7.0.msi"
$url = "https://pkg.osquery.io/windows/$msi"
$dst = "$PSScriptRoot\$msi"
Invoke-WebRequest -Uri $url -OutFile $dst
# msiexec /i "$dst" /quiet /qn /norestart
Start-Process msiexec.exe -Wait "/i $dst /quiet /qn /norestart"

# Configure osqueryd service

$flags = "--logger_rotate=true
--logger_rotate_size=26214400
--logger_rotate_max_files=1
--watchdog_level=-1
--config_path=C:\Program Files\osquery\osquery-sam.conf"
```

.\manage-osqueryd.ps1 -install
Restart-Service osqueryd
```

For details on Windows and macOS see Configure Osqueryd schedule for SAM total usage metrics and Configure Osqueryd logs for SAM total usage metrics.

Collecting SAM metrics without osqueryd

Optionally, you can enhance efficiency by using non-osqueryd data collection when using push-based Discovery and Software Asset Management (SAM) together. When non-osqueryd data collection is invoked, data collection is automatically performed on all available agents, instead of invoking osqueryd on each agent individually.

To perform non-osqueryd data collection:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Ensure that the following permissions are configured for the relevant OS:
   - Windows: The ACC service must run as the Local System account. Set the ACC service's Log On As value to **Local System**.
   - macOS: The `servicenow` user must be able to run osqueryi without a password. For information about `servicenow` user permissions for osqueryi, see Configure ServiceNow sudoers file.
2. On the System Properties page (**All** > **System properties** > **All properties**), set the *sn_acc_vis_content.enable_sam_collection_without_osqueryd* property to **true**.

Note:

- Enable this property only when all agents are version 4.1.0 or later.
- SAM basic metering (last accessed time) works with both osqueryd and non-osqueryd configurations. The 8-minute process poll and 24-hour payload run regardless of the osqueryd deployment mode.

Software edition information

Edition information is supported for Adobe Acrobat and MS SQL server. With this feature, SAM admins can get clear visibility into the editions of their installed software. Osquery commands are used to fetch the edition information which then shows in the Software Installation [cmdb_sam_sw_install] table in the Edition Override column. For more details, see the support KB: https://support.servicenow.com/kb?id=kb_article_view&sysparm_article=KB0721360

Related topics

Configure Osqueryd schedule for SAM total usage metrics

Configure Osqueryd logs for SAM total usage metrics

Configure Osqueryd schedule for SAM total usage metrics

SAM total usage metrics works by relying on the Osqueryd service running on the target host. Configure the Osqueryd service to run the required schedule Osquery on the host.

Before you begin

Role required: admin

Procedure

1. Navigate to **Osqueryd installation folder**.
2. Find and edit the osquery.conf file.
3. Add the below Osquery pack under the packs keyword.

   For Windows:

```
"packs": {
      "sam-metering":
 "C:\\ProgramData\\ServiceNow\\agent-client-collector\\cache\
\acc-visibility-modules\\bin\\sam-metering.conf"
  }
```

   For macOS:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
"packs": {
    "sam-metering": "/Library/Application\
 Support/servicenow/agent-client-collector/cache/acc-visibili
ty-modules/bin/sam-metering.conf"
  }
```

Result
You can now Configure Osquery logs for SAM total usage metrics.

Configure Osqueryd logs for SAM total usage metrics

By default, Osquery supports log rotation based on size. To enable it for SAM total usage metrics and to configure the log size and rotation, you need to add specific flags for Osqueryd service.

Before you begin
Role required: admin

Note: SAM with Osqueryd consumes memory and CPU cycles. For example, with the Agent installed on a Windows Machine having 2 CPU core, 8 GB RAM, 1000 software installations, and 500 running processes, the following was observed:

- Average CPU usage for the Agent and Osqueryd was less than 10 % CPU and maximum of 30% CPU. This will only occur when the SAM background policy is triggered. By default, the trigger happens every 480 seconds.
- Average Memory usage for Agent and Osqueryd was less than 10 MB and maximum of 26 MB was consumed.

To store the data for a single running process for two days, the log file size on an average should be 52429 bytes. The log file size must be increased if the number of running processes on the machine is higher. For example, with 500 running processes the log size would be on average 25 MB which is 26214400 bytes.

Procedure

1. Navigate to **Osqueryd installation folder**.
2. Find and edit the osquery.flags file.
3. Add the below flags with these sizing guidelines:

   Note: Modification of the log file size should be done as per the Osqueryd Log file sizing guidelines.

   For Windows:

   - --logger_rotate=true
   - --logger_rotate_size=26214400
   - --logger_rotate_max_files=1
   - --watchdog_level=1

   For macOS:

   - --logger_rotate=true
   - --logger_rotate_size=26214400
   - --logger_rotate_max_files=1

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- --watchdog_level=1
- --logger_mode=0644

4. Save the file.

Result
Once the Osqueryd schedule and Osqueryd logs are configured the Osqueryd service can start.

The schedule runs the Osquery `Select name, pid, elapsed_time, start_time, user_time, system_time, username from processes p JOIN users u ON u.uid = p.uid where p.elapsed_time != -1 AND u.type !='special';` every 5 minutes (300 seconds) on the target machine. The results are logged into the log file. The log file contains snapshot entries of all the queries configured to run by the Osqueryd. This query contains all the processes attributes.

Note:

A temporary file *`marker.json`* is created in a temporary local folder on your machine in the directory:

For Windows `: <userprofile>\\AppData\\Local\\AgentClientCollector\\SAM`.

For macOS: `/Library/Application\ Support/servicenow/agent-client-collector`.

This file has read/write permissions and contains the marker data: *`Data and Last Read Unix Time stamp`*.

The Osqueryd can also be configured to write its logs to a custom directory path instead of the default directory. If you choose a custom directory, modify the check definition [samadvanced-background-log-check].

Application patterns for the Agent Client Collector

Application patterns gather details on the applications that run on the Agent Client Collector (ACC) host. Application patterns are supported only for servers, and are triggered after the Agent Client Collector host Discovery is complete.

Prerequisites for using application patterns

To enable application patterns on the Agent Client Collector, install the following:

- Agent Client Collector Framework
- Agent Client Collector for Visibility Content
- Discovery

Ensure that the agent is connected to a MID Server to enable pattern execution. Pattern execution on an agent is supported only using a MID Server. Each pattern step is executed on the agent as an ad-hoc check; ad-hoc checks are logged on the agent side as *`PatternOnTheFlyCheck`*.

Set the *`sn_agent.appl_classification_behavior`* property to **full**, and restart any MID Servers connected to the agent.

When working in a Windows environment, ensure that you're working with Powershell 3.0 or higher.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required (on the host device):

- In a Linux or macOS environment: ServiceNow user with sudoers; nopasswd enabled with regular Discovery commands.
- In a Windows environment: Local System user, SYSTEM, or a local user account where the local user account uses one of the following:
  - Logon as a service
  - Backup (SeBackupPrivilege)
  - Debug Programs privileges

Viewing supported application patterns

To view the list of patterns supported for Agent Client Collector, navigate to **All** > **Pattern Designer** > **Supported Patterns for ACC**. Application patterns are the only pattern types supported for use with Agent Client Collector.

Viewing Application Patterns executed on Agent Client Collector

You can view the application patterns that were executed on a given agent.

1. Navigate to **All** > **Agent Client Collector** > **Agents**.
2. Select an agent.
3. Select **View** > **Discovery** from the context menu (hamburger icon).
4. Open the agent.
5. Select the **Application Pattern logs** tab on the bottom of the page.

   The list of patterns executed on the agent appears. Executed patterns are indicated with the value **true** in the Executed On Agent column.

Unsupported application pattern operations

Application patterns aren't supported in the following pattern operations:

- WMI method invocation
- Change/unchange user
- All custom operations
- SNMP query
- Put file

Agent Client Collector pattern execution properties

Configure the following properties (**All** > **System Properties** > **All Properties**) to maximize the use of application patterns with Agent Client Collector:

Application pattern properties

Property	Description
sn_agent.appl_classification_behavior	Set value to **full** to enable working with applications patterns and to access pattern commands in the allow-list. Default: simple

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Application pattern properties (continued)

Property	Description
	Note: To enable application pattern execution with the allow-list, use the allow-list template for application patterns. For details, see Generate a Pattern allowlist.
sn_agent.trigger_patterns_on_endpoints	Controls whether Discovery patterns are triggered during application classification for endpoint CIs (cmdb_ci_computer). Set to true to enable pattern triggering on endpoints, which follows the same classification path as non-endpoint CI types. When set to false, endpoints skip pattern-based classification and fall back to simple classification behavior. Default: false

MID Server configuration parameter properties

mid.discovery.agent.command.mid.timeout	The maximum duration, in seconds, that the MID Server waits for a response from the agent before timing out. Default: 60 seconds
mid.discovery.agent.command.timeout	The maximum amount of time, in seconds, that the command is given to execute on the agent host. Default: 60 seconds

Using pattern designer debugging in ACC mode

You can debug application patterns that are configured in ACC mode.

1. Set the *sn_agent.appl_classification_behavior* property to **full**.
2. In the Pattern Designer, enable the debug option and select **Use ACC connection** in the Debug identification section.

The pattern log indicates whether the pattern was successfully executed on the agent.

You can also receive pattern details in the following logs:

- MID Server logs: Set *mid.log.level* to DEBUG for the mid agent log to display details on the pattern step, ACC check, and the pattern response.
- ACC logs: Search for the string *PatternOnTheFlyCheck* for details on pattern checks.

© 2026 ServiceNow, Inc. All rights reserved.

Oracle Global License Advisory Services (GLAS) data collection

Oracle Java process discovery works either with patterns (when using either a MID Server or Agent Client Collector), or with file-based discovery (using Agent Client Collector with file-based discovery). If both the pattern and file-based discovery run the same Java installation, the pattern-collected data takes precedence.

When performing Discovery with Agent Client Collector, ensure that you have the following settings:

- All users must have the Oracle GLAS store app, starting with version 1.8.4.
- Agent Client Collector users:
  - Must have the Agent Client Collector Framework store plugin.
  - Can have the Agent Client Collector for Visibility Content store plugin, for extra data.

  For information about privileged user access, see KB1705845.

> **Note:** Oracle Java discovery with ACC is applicable in all server environments. However, currently, it's partially supported for different Desktop environments. For a Windows Desktop update set, see the KB article KB1705845.

For information on java installation Discovery using Agent Client Collector for Visibility Content, see Discover java installation data using Agent Client Collector for Visibility Content file-based discovery.

For information on the collected data, see Data collected during Agent Client Collector for Visibility Content File-Based Discovery.

Application patterns support Oracle GLAS data collection in a Linux environment. For details on using patterns, see Oracle GLAS data collection using patterns.

Although Oracle GLAS supports Put file operations, the related files are deployed using Agent Client Collector plugins instead of SSH or WMI.

Related topics

Discovery patterns used by ITOM Visibility

Discover java installation data using Agent Client Collector for Visibility Content file-based discovery

Discovering java installation data using Agent Client Collector for Visibility Content file-based discovery enables you to discover file information in your system.

Before you begin

- Install the latest version of Agent Client Collector for Visibility Content.
- Install file-based discovery.
- Enable the Oracle Global License Advisory Services (GLAS) hardware data collection policy.

Role required: discovery_admin

Procedure

1. Enable file-based discovery.
   a. Navigate to **All** > **Discovery Definition** > **Configuration Console**.
   b. Enable the **File Discovery** entry.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Enable the Java Discovery property.
   a. Locate the *sn_acc_vis_content.file_discovery.enable_java_discovery* property on the System Properties page (**All** > **System Properties** > **All Properties**).
   b. Set the property value to **true**.
3. Grant elevated permissions to the `acc` user, enabling access to your java installation directories, for example:

   - `/usr/lib/jvm/*/bin/java`
   - `/usr/lib/jvm/*/*/bin/java`

   You can add additional java directories during java installation, as needed.

   - In a Linux environment, grant elevated permissions in the `/etc/sudoers` file to enable access to the java installation directories.
   - In a Windows environment, grant elevated permissions (read and execute) via the system administrator to enable access to the java installation directories.

Result

When running Discovery for java installation, data is discovered through file-based discovery and is stored in the `ora_java_audit` table. For details on the data stored in this table, see Data collected during Agent Client Collector for Visibility Content File-Based Discovery.

Discover java installation data using Agent Client Collector for Visibility Content process-based discovery

Discovering java installation data using Agent Client Collector for Visibility Content process-based discovery enables you to discover java installation information in your system.

Before you begin

- Install the latest version of Agent Client Collector for Visibility Content.
- Enable the Oracle Global License Advisory Services (GLAS) hardware data collection policy.

Role required: discovery_admin

Procedure

1. Enable the process-based discovery check definitions.
   a. Navigate to **All** > **Agent Client Collector** > **Check Definitions**.
   b. Locate the **Oracle GLAS Java Process Discovery** and **Oracle GLAS HW data collection** entries.
   c. Locate the **Active** column for each entry, select the value and choose **true**.
2. Grant elevated permissions to the `acc` user, enabling access to your java installation directories, for example:

   - `/usr/lib/jvm/*/bin/java`
   - `/usr/lib/jvm/*/*/bin/java`
   - `/usr/lib/jvm/*/bin/jcmd`
   - `/usr/lib/jvm/*/*/bin/jcmd`
   - `/var/cache/servicenow/agent-client-collector/osquery/bin/osqueryi`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can add additional java directories during java installation, as needed.

- In a Linux environment, grant elevated permissions in the `/etc/sudoers` file to access the java installation directories.
- In a Windows environment, grant elevated permissions (read and execute) via the system administrator to access the java installation directories.

Discovering DNS names using push-based discovery

CMDB owners need CIs to contain all domain system names (DNS) associated with their system. Starting in Agent Client Collector for Visibility Content (ACC-VC) version 2.3.0, ACC-VC can discover DNS name lists for Windows and Linux CIs.

When discovering DNS names associated with systems, the following occurs.

- network_adapters.rb is used to populate the DNS name for all the IP addresses using OSquery. (There is no limit.)
- Nslookupcommand is used to get the DNS name for all IP addresses.

Note: Nslookup must be configured on the target.

This creates a relationship of *`Owns::Owned by`* between the CI and the DNS names.

This information is then populated into the [cmdb_ci_dns_name] table.

Populating Assigned To attribute in Computer CI for Agent Client Collector for Visibility Content

To update the Assigned To attribute of the Computer CI, you need to collect information from the logged in user.

Before you begin

Role required: admin

You can automatically populate Assigned to for Windows endpoint devices and macOS devices, like workstations or employee laptops, as part of agent-based Discovery using ACC-VC with the following system properties. See Available system properties for more information.

- **sn_acc_vis_content.set_assigned_to**
- **sn_acc_vis_content.assigned_to_user_order**
- **sn_acc_vis_content.column_name_for_user_mapping**

Procedure

1. Create higher user privileges to fetch the logged in user details.
   Use Log on As Local System User instead of the default ServiceNow user for running the Agent Client Collector. When working in a macOS environment, use the default ServiceNow user.

   Ensure that you have Powershell to run the internal commands on your machines that fetch the logged in user details.

2. User names match is performed on the user records in the sys_user table.
   The Assigned To attribute is populated and then it creates a reference to the user. Systems logs shows a warning if no user can be found in sys_user. The user names sourced for Assigned To attribute is based on the system property: **sn_acc_vis_content.assigned_to_user_order**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Assigned_to attribute is set based on priorities.
   If assigned_to is already there, keep it as is by default. However, you can update the **sn_acc_vis_content.set_assigned_to** system property to override it. If there are any Reconciliation Rules defined, then the IRE populates the field accordingly.

Result

No new user account is created in the sys_user table. Instead, the existing user is queryied and the same is referenced as Assigned To user for a CI.

Populating users based on type for Agent Client Collector for Visibility Content

You can persist the type of users that populate the CMDB depending on your particular interests. Currently, local and system are supported for Windows, Linux, and macOS.

You can filter the types of users by using the system property: **sn_acc_visibility.persist_os_user_type**. See Available system properties for more information.

For Windows

You need to identify if a server is domain controller or not. Since domain controller machines don't have local accounts, local user information does not persist for such machines and is not populated.

For non-domain controller Windows machines, use OSquery commands to get user information through ACC-VC: select *uid*, *username*, *directory*, *type* from users where **type=local** or **type=special**.

For Linux

The userID defines if a user is a local account or system account. This is defined by *UID_MIN* and *UID_MAX*.

Use this command to get user information through ACC-VC to get *UID_MIN* and *UID_MAX* value: `grep -E '^UID_MIN|^UID_MAX' /etc/login.defs`.

Use this command to get user names: `cat /etc/passwd | awk -F':' '{print $1,$3,$6`.

For macOS

Use OSquery commands to get user information through ACC-VC: select *uid*, *username*, *directory* from users. User names that are preceded by '_' are treated as system accounts. Others are local accounts.

License key discovery

License key discovery in Agent Client Collector for Visibility Content automatically collects software license keys from the Windows registry on managed endpoints.

License key discovery enables the Agent Client Collector for Visibility Content (ACC-VC) Windows agent to read software license keys stored in the Windows registry on managed endpoints. When a device is discovered, the agent reads registry values defined by an admin-configured list of registry paths and value names, and reports the results in your instance.

The feature is off by default and must be explicitly enabled using a system property.

Why use license key discovery

License key discovery helps administrators track software license keys across managed Windows devices. By linking discovered keys to device CIs and SAM products, it supports software asset management and license tracking efforts. Administrators can detect duplicate licenses, track compliance, and manage license costs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Who can use license key discovery

Specific roles are required to configure and view license key discovery data. For details, see the Access control table on the License key discovery and access control tables page.

No role can delete license key records. If a key that was previously detected is no longer found on a device, it is marked as **Absent** rather than deleted, preserving the audit trail.

Configure license key discovery

Enable license key discovery and define the registry paths and values you want the Agent Client Collector for Visibility Content Windows agent to collect from managed endpoints.

Before you begin

The SAM Professional plugin (com.snc.samp) must be active.

The Agent Client Collector for Visibility Content Windows agent must be deployed on the endpoints.

Role required: agent_client_collector_admin or discovery_admin

Procedure

1. Navigate to **All** > **System Properties** > **All Properties**.
2. Search for the *sn_acc_vis_content.enable_license_key_discovery* property.
3. Set the **Value** field to `true`.
   The default value is `false`. Setting this property to `true` enables license key collection.
4. Select **Save**.
5. Navigate to the **License Registry Configuration** [sn_acc_vis_content_license_registry_config] table and create a record for each registry entry you want to collect.
   Enter the appropriate values in the fields for each record. For details about the fields, see the License Registry Configuration form table.
6. Select **Submit** to save the configuration record.
7. **Optional:** To apply configuration changes immediately, navigate to **All** > **System Definition** > **Scheduled Jobs**, search for the `Refresh License Key Config File` scheduled job, and select **Execute Now**.
   By default, this job runs daily at 8:30 a.m. UTC.

Result

The *`Refresh License Key Config File`* scheduled job reads all active configuration records and publishes them to the agent as `LicenseKeyConfig.json`. On the next agent run, the Windows agent queries the defined registry paths on each managed endpoint and sends the collected key values to your instance. Discovered keys are stored in the **License Keys** [sn_acc_vis_content_license_keys] table, linked to the device CI, the associated SAM product, and the user assigned to the CI. If a key that was previously detected is no longer found, it is marked as **Absent**.

Agent Client Collector Log Analytics setup

Configure Agent Client Collector Log Analytics on your ServiceNow instance either with or without using guided setup.

Agent Client Collector Log Analytics setup using guided setup

Agent Client Collector Log Analytics guided setup provides a sequence of tasks that help you configure Agent Client Collector Log Analytics on your instance. Using guided setup ensures that

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

you have the minimum required setup to use the application. For more information, see Set up Agent Client Collector Log Analytics using guided setup.

For more information about using the guided setup interface, see Using guided setup.

Agent Client Collector Log Analytics setup without using guided setup

If you are not using guided setup, you must perform several configuration steps manually. For more information, see Set up Agent Client Collector Log Analytics without using guided setup.

Set up Agent Client Collector Log Analytics using guided setup

Configure Agent Client Collector Log Analytics on your ServiceNow instance using guided setup.

Before you begin

- Agent Client Collector Log Analytics has a dependency on the ServiceNow® Event Management application. Set up Event Management before you configure Agent Client Collector Log Analytics. For more information, see Event Management setup.
- ServiceNow Service Operations Workspace ITOM Apps must be installed. If it is not installed already, install it manually. For more information, see Install Service Operations Workspace for ITOM application.

Role required: agent_client_collector_admin

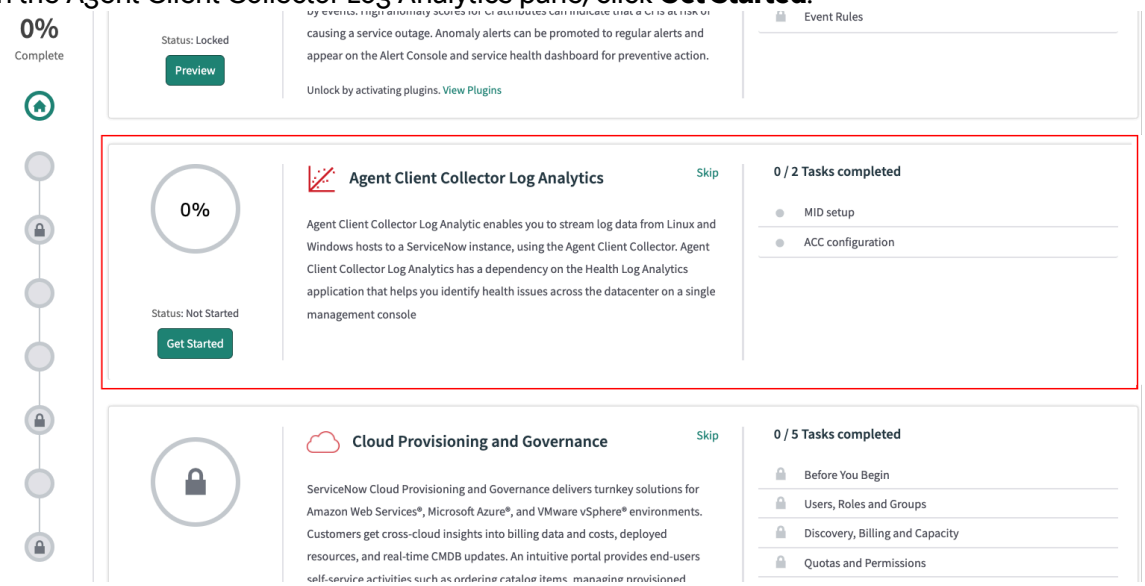
About this task

Agent Client Collector Log Analytics guided setup provides a sequence of tasks that help you configure Agent Client Collector Log Analytics. Using guided setup ensures that you have the minimum required setup to use the application.

Note: If you are not using guided setup, you must perform several configuration steps manually. For more information, see Set up Agent Client Collector Log Analytics without using guided setup.

Procedure

1. Navigate to **All** > **Guided Setup** > **ITOM Guided Setup**.
   The IT Operations Management Guided Setup welcome screen appears.
2. Select **Get Started**.
3. In the Agent Client Collector Log Analytics pane, click **Get Started**.

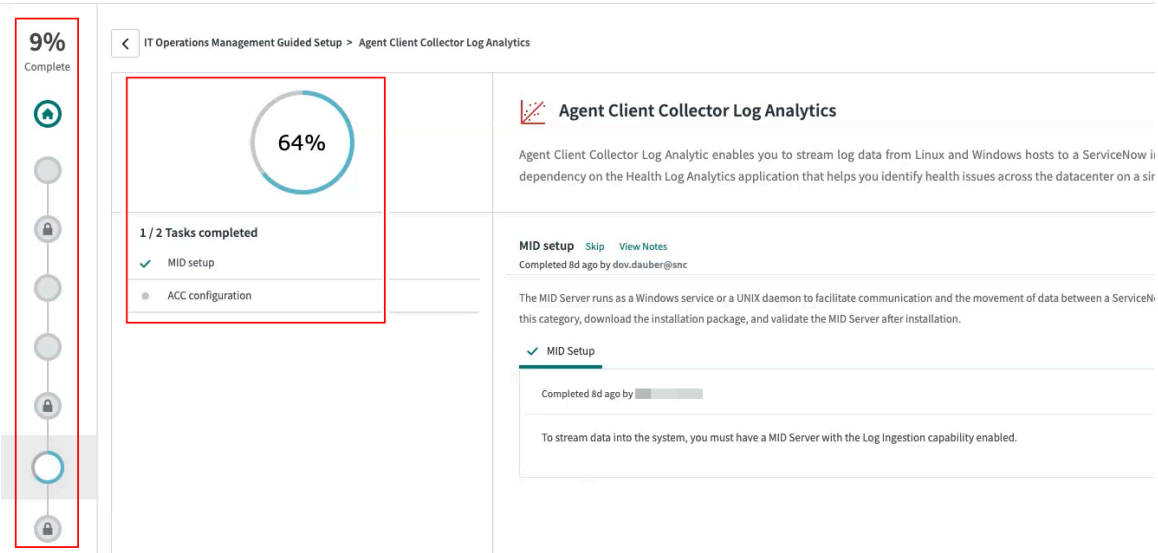


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. In the **MID setup** section, take the appropriate action:
   - If you have already configured a MID Server, select **Mark as Complete**.
   - If you have not configured a MID Server, select **Configure** and set up a MID Server, then select **Mark as Complete**. For more information, see Use MID Server guided setup.

   Note: To stream data into the system, you must have a MID Server with the Log Ingestion capability enabled.

   When the MID Server is configured, the status indicator for Agent Client Collector Log Analytics guided setup shows that 64% of the configuration is complete. The progress indicator shows the completion percentage for all the IT Operations Management tasks.



5. Configure Agent Client Collector Log Analytics.

   a. In the **ACC Configuration** section, select a setup task and read the instructions in the help pane.

   b. Select **Configure** and complete the task.
   For detailed information about each setup task, consult the Agent Client Collector Log Analytics product documentation.

   c. Complete all required setup tasks in the task list.

   d. Select **Mark as Complete** to complete the Agent Client Collector Log Analytics configuration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set up Agent Client Collector Log Analytics without using guided setup

Configure the Agent Client Collector to stream log data from Linux and Windows hosts to a ServiceNow instance without using guided setup.

Before you begin

Note: You can configure Agent Client Collector Log Analytics using guided setup. The guided setup ensures that you have the minimum required setup for using the application. For more information, see Set up Agent Client Collector Log Analytics using guided setup.

- The Agent Client Collector Log Analytics (ACC-L) plugin must be installed. The plugin comes with the Agent Client Collector Framework (ACC-F) and Agent Client Collector Monitoring (ACC-M) plugins. For more information, see Agent Client Collector installation.
- ServiceNow Service Operations Workspace ITOM Apps must be installed. If it is not installed already, install it manually. For more information, see Install Service Operations Workspace for ITOM application.
- Agent Client Collector Log Analytics has a dependency on the Health Log Analytics application, Version 22.0.12 - December 2021 and later, available from the ServiceNow Store. Streaming log data from Windows hosts is supported in Agent Client Collector Log Analytics Version 3.1.0 and later.

  Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- The Agent Client Collector comes with the default *`servicenow`* user. Ensure that this user has read access to enable Agent Client Collector to view all the configured log paths. For example, the Agent Client Collector *`servicenow`* user that comes installed with the base system does not have permissions to view the paths to `/var/log/` in Linux and `C:\Windows\System32` in Windows. For information about configuring permissions for the *`servicenow`* user, see the ACC-L Permission Denied issues [KB1117271] article in the Now Support Knowledge Base.

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Deployment** > **MID Servers**.
2. On the MID Server page, select a MID Server that is validated and has a Status value of **Up**.
3. On the MID Server page for the selected server, select **Setup ACC Log Analytics** in the related links section.
   Agent Client Collector Log Analytics setup starts.

   In addition, the system automatically creates an ACC data input. When it has been created, the data input record is added to the ACC data inputs table and the data input is ready to stream logs.

   Note: It is important to configure an ACC data input for every MID Server to which Agent Client Collectors can connect. For more information, see Set up additional ACC data inputs.

   The system also prompts you to set up the MID Web Server. For more information, see MID Web Server.
4. In the ACC Log Analytics Setup dialog box, configure the ports.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the **MID Web Server Port** and **ACC data input Port** fields, enter the appropriate port numbers.

b. Select **OK**.
The URL with the configured endpoint appears in the dialog box.

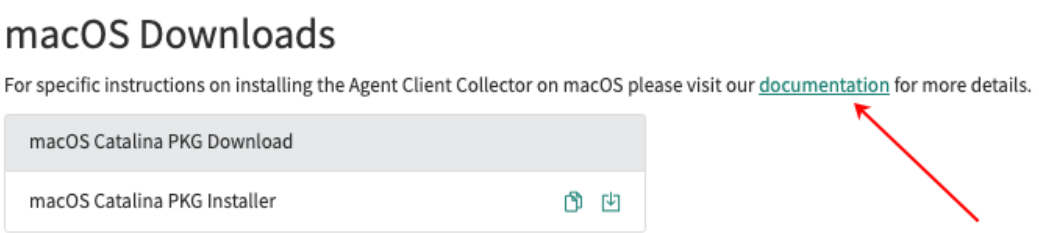
c. Copy and save the endpoint URL for use when installing the ACC agent on the endpoint machine.

5. Navigate to **All** > **Agent Client Collector** > **MID Web Server API Key** and copy and save the MID Web Server API key for use when installing the ACC agent on the endpoint machine.
6. Install the ACC agent on the endpoint machine.

Note: If you have already installed the ACC agent, proceed to Agent Client Collector log policies.

a. Navigate to **All** > **Agent Client Collector** > **Deployment** > **Agent Downloads**.

b. Download the ACC agent for the appropriate operating system.
For detailed instructions, select the documentation link for the operating system. For example:



Result
Agent Client Collector Log Analytics and the ACC agent are installed. You can start using the application.

What to do next
Review the Agent Client Collector log policies.

Identify and resolve log streaming issues

Make sure that your ACC data inputs are streaming data properly by identifying and resolving log streaming issues.

Before you begin
Role required: agent_client_collector_admin

About this task
In the ACC data input record, the Streaming Sources related list shows the streaming data of that data input's sources. This data enables you to identify streaming issues and their possible cause.

For example, if the last event time for a data input's endpoint server is yesterday, the server might be down or configured incorrectly. A streaming issue might also be caused by the data input configuration file not being installed on the endpoint.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: You can view the streaming data of all data inputs and the MID Servers that receive logs from them in the Streaming Sources page. For more information, see Identify and resolve a log streaming issue in Health Log Analytics in the ServiceNow Health Log Analytics application documentation.

Procedure

1. Navigate to **All** > **ACC Data Inputs** and select a data input record.
2. On the data input form, select the Streaming Sources related list.
3. Review the streaming data of that data input's sources.
   For a description of the filters, see ACC data input streaming sources.
4. Resolve any data streaming issues.
   a. Navigate to **All** > **ACC Log Analytics** > **ACC Log Alerts**.
   b. Open alerts and address the specified issues.

What to do next

Proceed to the next step in the Health Log Analytics data input setup flow. For more information, see Set up additional ACC data inputs.

ACC data input streaming sources

In the ACC data input record, the Streaming Sources related list shows the streaming data of that data input's sources.

Streaming Sources related list

Filter	Description
Status	The status of the source. A red bullet indicates that this source has not streamed data in the last hour.
Last event time	The last recorded time an event arrived at the MID Server in the last one-minute interval. Health Log Analytics continuously updates the last event time. If the last event time is not up to date, data is not streaming.
Raw log lines/sec	The average number of raw log lines that streamed to the MID Server per second in the last one-minute interval. **Note:** This value represents the number of raw log lines before preprocessing.
Preprocessed log lines/sec	The average number of preprocessed log lines that streamed to the MID Server per second in the last one-minute interval.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Streaming Sources related list (continued)

Filter	Description
	Note: This value can differ from the number of raw log lines per second. For example, the difference can be a result of logs having been dropped during preprocessing.

View log shipper alerts

View all log shipper check alerts for Agent Client Collector Log Analytics (ACC-L) agents.

Before you begin

Role required: agent_client_collector_admin

About this task

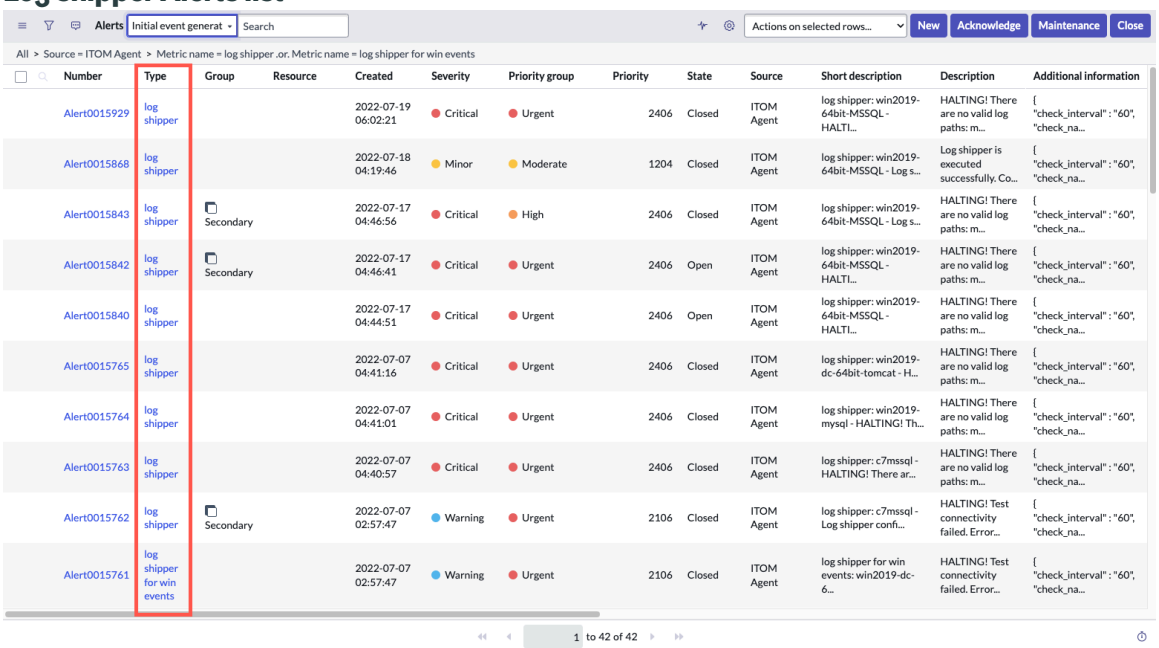
In the ACC Alerts list, you can see at a glance if any issues are preventing the log shipper from collecting data. The list shows all log shipper-related alerts in one place and provides information to help you resolve the issues.

The ACC Alerts list only includes alerts about the success or failure of log shipper execution on a CI on a specific agent. These alerts are a subset of the alerts shown in the Event Management Alerts list, which includes alerts of all types. For more information about the Event Management Alerts list, see View alert information.

Log shipper alerts are generated from log shipper events with a severity of Major or Critical. These alerts are typically related to log path issues or a lack of permissions.

Note: If an **OK** event on the log shipper is received on a CI where an open log shipper alert exists, the open log shipper alert on that CI is closed.

Log shipper Alerts list



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **ACC Log Analytics** > **ACC Log Alerts**.
2. Review the information provided in the Alerts list.
   For details and a description of the columns, see Monitor incoming alerts.

Related topics

View log shipper events

View log shipper events

View all log shipper events with all severity levels for Agent Client Collector Log Analytics (ACC-L) agents.

Before you begin
Role required: agent_client_collector_admin

About this task
The ACC Events list shows all log shipper-related events in one place. The list only includes events about the success or failure of log shipper execution on a CI on a specific agent. These events are a subset of the events shown in the Event Management Events list, which includes events of all types.

Procedure

1. Navigate to **All** > **ACC Log Analytics** > **ACC Log Events**.
2. Review the information provided in the Events list.
   For details and a description of the columns, see View events.

Collect web usage data using Agent Client Collector for Visibility Content

Track website visits across your organization and gain visibility into web applications your users access using Agent Client Collector for Visibility Content (ACC-VC).

Before you begin
Verify that the following components are installed in your environment:

- Agent Client Collector Framework (ACC-F)
- Agent Client Collector for Visibility Content
- URL Discovery and Monitoring (sn_itom_url_disc)
- The DEX Browser Extension 4.1.0 is enabled on the host

Role required: sn_acc_vis_content.application_admin and discovery_admin

About this task
Web data collection is enabled on Windows and macOS platforms.

Web data collection is supported on Google Chrome and Microsoft Edge browsers.

ACC-VC can collect web usage data in the following modes:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Configured monitoring (tracks only pre-configured websites)
- Full monitoring (captures domain-level website access activity from supported Chromium-based browsers on managed corporate devices). Automatically captures domain-level usage data from managed Windows and macOS devices and stores it in the User Web Usage (sn_acc_vis_content_user_web_usage) table.

For details on URL Discovery, see URL Discovery insights dashboard and Discovery Admin Workspace Settings.

Procedure

1. Navigate to **System Definition** > **System Properties**.
2. Search for the property *sn_acc_vis_content.enable_full_monitoring*.
3. Set the **Value** field to `true`.
   Setting this property to true automatically activates the VISC Get URL Metrics monitoring policy and enables full monitoring of web usage data for all websites visited on Chromium-based browsers. Setting it to false deactivates the policy.
4. Select **Update**.
   The system activates the VISC Get URL Metrics monitoring policy and begins collecting web usage data from managed devices.
5. **Optional:** Configure the data retention period by searching for the property *sn_acc_vis_content.web_usage_retention_days* and setting the desired number of days.
   The default retention period is 7 days. Records older than this value are automatically deleted. Modifying this value updates the auto-flush retention period for the User Web Usage (sn_acc_vis_content_user_web_usage) and Application Domain (sn_acc_vis_content_application_domain) tables.

Result

The ACC agent on each managed device monitors URL activity from Chromium-based browsers and stores the data locally. At scheduled intervals (default: once every 24 hours), the agent runs the VISC Get URL Metrics check and sends the data to your instance. The data is processed and stored in the User Web Usage table, with daily aggregation jobs updating domain-level totals. For details on the VISC Get URL Metrics policy and check, see Agent Client Collector for Visibility Content default checks and policies.

What to do next

After enabling web usage collection, you can view the collected data in the User Web Usage (sn_acc_vis_content_user_web_usage) table and monitor aggregated domain-level statistics in the Application Domain (sn_acc_vis_content_application_domain) table. Data aggregates from the User Web Usage table to the Application Domain table, including total page views, total unique users, last accessed time, and daily page view trends. By default, this job runs daily.

For details on these tables, see Web usage data collection tables and fields.

Deploying Agent Client Collector on endpoints

When deploying the Agent Client Collector, perform deployment and management tasks on your endpoints.

Endpoint deployment connects agents directly to the ServiceNow® cloud through ITOM Cloud Services (ICS). Agents on laptops, remote offices, and distributed sites reach ICS over the internet using a secure connection, without a MID Server. ServiceNow® manages the infrastructure and issues certificates automatically.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Choose endpoint deployment when your agents operate beyond the data center, where maintaining MID Servers isn't practical. Digital End-User Experience (DEX) requires this architecture, and Agent Client Collector for Visibility Content (ACC-VC) supports it in specific use cases.

Configuring MID-less Agent Client Collector

Configure MID-less Agent Client Collector to enable sending information through the cloud. Sending information through the cloud allows the MID Server to be used for more persistent resources.

Configure MID-less Agent Client Collector using a single-line command

Use a single-line command to set up a MID-less Agent Client Collector. You can also use the single-line command to migrate agents configured with a MID Server to have a MID-less configuration.

Before you begin

Role required:

- In a Linux or macOS environment: root
- In a Windows environment: agent_client_collector_admin

About this task

Running the single-line command includes flags, which indicate the options to be added to the `acc.yml` configuration file. These options dictate the configuration of the MID-less Agent Client Collector. If you don't specify an option in the command, the existing option in the `acc.yml` file is used. If there's no existing option, an error message indicates that the parameter is required to enable connecting to an endpoint.

Running a command validates that a connection can be made with the specified parameter (for example, the specified registration-key value). However, the command doesn't verify if the value of the parameter is valid.

Procedure

1. Run the following command in a terminal window: `acc gateway ics <flags>`.
   The available flags appear in the following table:

MID-less configuration flags

Flag	Type	Description
-y, <--acc-yml>	String	Location of the `acc.yml` being configured. Can also be used to modify and validate parameters if the file is in a different location that the default.Can also be used to modify a different file location to check if the parameters specified are valid. Optional. If no value is entered, the default location of the `acc.yml` file is used.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Flag	Type	Description
-b, <--backend-url>	String	The gRPC URL for the ITOM cloud services (ICS) gateway.
-i, <--instance-url>	String	The instance URL.
-r, <registration-key>	String	The registration key for the ITOM cloud services (ICS) gateway.
-h, help	N/A	Explains what the specified command does.

2. Restart the agent for the configuration settings to be entered into the `acc.yml` file.

Installing MID-less Agent Client Collector

Installing MID-less Agent Client Collector (ACC) enables you to send data from the agent to the instance through the cloud. Sending information through the cloud allows the MID Server to be used for more persistent resources.

Note: MID-less ACC requires ServiceNow cloud infrastructure and is not supported for customer-hosted, on-premises ServiceNow instances. For on-premises instances, install Agent Client Collector with a MID Server, as described in Configuring Agent Client Collector with a MID Server.

Before using MID-less Agent Client Collector, do the following:

1. Ensure that your ServiceNow instance has migrated from an F5 load balancer to Application Delivery Controller, version 2 (ADCv2) and has mTLS support.
   a. Enter the following command in your terminal: `curl -v https://<instance>.service-now.com/stats.do 2>&1 | grep "< Server"`.
      - If the system returns **snow_adc**, the instance is on ADCv2/ADCv3.
      - If the system doesn't return **snow_adc**, the instance isn't on ADCv2/ADCv3. To migrate the instance to ADCv2/ADCv3, contact Customer Support.
   b. Navigate to `<instance_url>/adcv2/supports_tls`

      If the URL returns a value of **true**, mTLS is supported.
2. Install the ITOM Cloud Services Core (sn_itom_cloud_svc) scoped app plugin.

   If you're using Agent Client Collector for Visibility Content, install the Agent Client Collector for Visibility Content (sn_acc_vis_content) plugin.
3. Configure an agent registration key on the instance. For details, see Configure an agent registration key.

   If registration fails between the agent and the instance, the registration key is cleared from the `acc.yml` configuration file.

Install MID-less Agent Client Collector using a single-line command in a Windows environment

Install MID-less Agent Client Collector on a Windows machine to enable sending data from the agent to the instance through the cloud. Sending information through the cloud allows the MID Server to be used for more persistent resources.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Install the ITOM Cloud Services Core (sn_itom_cloud_svc) plugin.
- Onboard your instance to use ITOM Cloud Services. For details, contact Customer Support.
- Configure an agent registration key. For details, see Configure an agent registration key.
- Role required: agent_client_collector_admin

About this task

For details on sending data through the cloud in a MID-less deployment, see DEX Architecture.

Procedure

1. Retrieve the publicly accessible gateway URL, based on your location.
   - AMER (Americas): `itomcnc-prod-gateway-amer.sncapps.service-now.com:443`
   - EMEA (Europe): `itomcnc-prod-gateway-emea.sncapps.service-now.com:443`
   - APAC (Asia Pacific): `itomcnc-prod-gateway-apac.sncapps.service-now.com:443`
2. On the Windows server where the agent is installed, enter the following command:

```
msiexec /i <msi_file_path> /quiet /qn /norestart
 CONNECT_WITHOUT_MID="true" ACC_CNC="<gateway_endpoint>"
 REGISTRATION_KEY="<registration_key>"
 INSTANCE_URL="https://<instance_url>"
```

   For details on the parameter values in the command, see Agent Client Collector MID-less installation command parameters.

Install MID-less Agent Client Collector manually in a Linux environment

Install MID-less Agent Client Collector manually on a Linux machine to enable sending data from the agent to the instance through the cloud. Sending information through the cloud allows the MID Server to be used for more persistent resources.

Before you begin

- Install the ITOM Cloud Services Core (sn_itom_cloud_svc) plugin.
- Onboard your instance to use ITOM Cloud Services. For details, contact Customer Support.
- Configure an agent registration key. For details, see Configure an agent registration key.
- Role required: agent_client_collector_admin

About this task

For details on sending data through the cloud in a MID-less deployment, see DEX Architecture.

Procedure

1. Download the relevant installation package.
   a. Navigate to > **Agent Client Collector** > **Deployment** > **Agent Downloads**.
   b. Download the relevant .rpm or .deb installation file.
   c. Download the relevant signature files to validate the installation files.
2. **Optional:** Verify the package signature.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Extract the installation file (if it is compressed) by running the following command: `unzip agent_client-collector-<version_number>-x86_64-rpm-rpm.zip`

b. Validate the installation file signature by running the indicated commands.

- On an RPM-based system:

```
openssl dgst -sha256 -verify {<ServiceNow
 DGST pem key>} -signature {<signature file>}
 agent-client-collector-<version number>-x86_64.rpm
```

Where `<ServiceNow DGST pem key>` is the `.pem` file extracted from the `.zip` file, and `<signature file>` is the `.bin` file extracted from the `.zip` file.

For example:

```
$ curl -sLO
 https://install.service-now.com/glide/distribution/builds/package/app-signed/agent-client-collector-3.0.0-x86_64.rpm
$ curl -sLO
 https://install.service-now.com/glide/distribution/builds/package/app-signed/agent-client-collector-3.0.0-x86_64-rpm-rpm.zip
$ unzip agent-client-collector-3.0.0-x86_64-rpm-rpm.zip
Archive: agent-client-collector-3.0.0-x86_64-rpm-rpm.zip
inflating: ServiceNow_Digicert_DGST.pem
extracting: agent-client-collector-3.0.0-x86_64.bin
$ openssl dgst -sha256 -verify ServiceNow_Digicert_DGST.pem
 -signature agent-client-collector-3.0.0-x86_64.bin
 agent-client-collector-3.0.0-x86_64.rpm
Verified OK
```

Note: Each command must appear on a single line.

- On a Debian-based system:

(Optional) `gpg --import ServiceNow_Digicert_Public.gpg`

`sudo gpg --verify agent-client-collector-<version number>-<distro>_amd64.deb`

For example:

```
$ curl -sLO
 https://install.service-now.com/glide/distribution/builds/package/app-signed/agent-client-collector-3.0.0-debian-9_amd64.deb
$ curl -sLO
 https://install.service-now.com/glide/distribution/builds/package/app-signed/agent-client-collector-3.0.0-debian-9_amd64-deb-deb.zip
$ unzip
 agent-client-collector-3.0.0-debian-9_amd64-deb-deb.zip
Archive:
 agent-client-collector-3.0.0-debian-9_amd64-deb-deb.zip
extracting: ServiceNow_Digicert_Public.gpg
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
$ gpg --import ServiceNow_Digicert_Public.gpg
gpg: /home/admin/.gnupg/trustdb.gpg: trustdb created
gpg: key 985DD52C6A0ABB45: public key "ServiceNow, Inc.
 (Signing) <seceng@servicenow.com>"
imported
gpg: Total number processed: 1
gpg: imported: 1
$ dpkg-sig --verify
 agent-client-collector-3.0.0-debian-9_amd64.deb
Processing
 agent-client-collector-3.0.0-debian-9_amd64.deb...
GOODSIG _gpgbuilder 9B928FB49771DF6C047430DD985DD52C6A0ABB45
 1665054068
```

Note: Each command must appear on a single line.

3. Install the Agent Client Collector package using the package manager associated with Linux distribution.

OS	Command
RHEL-based	`yum / dnf localinstall`
SLES	`zypper install`
Debian-based	`apt-get install`

Alternatively, if these commands are not configured correctly, you can use the core commands that are configured to run with the package manager commands.

- RPM-based system: `# rpm -vi agent-client-collector-<version number>-x86_64.rpm`
- Debian-based system: `# dpkg -i agent-client-collector-<version number>-<distro>_amd64.deb`

Verify that the package commands are configured correctly with your system administrator.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Some file systems may have restrictions enabled; for example, `/var/` may be mounted with a *noexec* flag. Because the agent must execute Agent Client Collector plugins that are normally store in the `/var/cache` directory, you must deploy the application into specific folders by customizing the installation paths using the `--relocate` option as an `.rpm` parameter.

For example: `rpm -i --relocate /var/cache=/opt/cache agent-client-collector-<version_number>-x86_64.rpm`

The following paths can be relocated:

Path	Notes
`/etc`	When updating, you must also update the *allow-list* parameter in the `acc.yml` file with the new path.
`/usr/share`	N/A
`/var/cache`	Updating the `/var` directory retains all `/var` subdirectories, nested under the new directory.
`/var/log`	
`/var/run`	
`/var`	

Review the paths in `/usr/lib/systemd/system/acc.service` to ensure that they appear as expected.

4. Run the relevant package upgrade command, based on the cpu your machine runs with:
   - Intel cpu:

     ```
     sudo installer -pkg agent-client-collector-<version
      number>-macos_x64.pkg -target /
     ```

   - Apple silicon cpu:

     ```
     sudo installer -pkg agent-client-collector-<version
      number>-macos_arm64.pkg -target /
     ```

   This command also backs up and restores the agent-id and configuration files before upgrading.

5. In the `acc.yml` configuration file:

   a. Set the following parameters:

Parameter	Value
backend-url	"<gateway URL>"
connect-without-mid	true
instance-url	"<instance URL>"
registration-key	"<regsitration-key>"

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter	Value
insecure-skip-tls-verify	false

b. Comment out the *api-key* parameter.

6. Save the configuration file.

7. Configure sudoers.

Configuration is typically automated by your Linux sysadmin. To configure manually if you want to ensure correctness before full configuration, run the following.

```
# visudo -f /etc/sudoers.d/01_servicenow
User_Alias ACC_USERS = servicenow
Cmnd_Alias ACC_CMD = /usr/sbin/dmidecode -s
 baseboard-serial-number,/usr/sbin/dmidecode
 -s chassis-serial-number,/usr/sbin/dmidecode
 -s system-serial-number,/usr/sbin/dmidecode -s
 system-uuid,/usr/sbin/ss -tanp
ACC_USERS ALL = (root) NOPASSWD:ACC_CMD
Defaults:ACC_USERS !requiretty
```

8. Configure the agent to run as a service.

a. Safeguard resource consumption by adding the indicated values to the `/usr/lib/systemd/system/acc.service` file.

- CPUShares=128
- CPUQuota=10%
- MemoryLimit=192M
- BlockIOWeight=10
- LimitNICE=15

For example:

```
# vi /usr/lib/systemd/system/acc.service
[Unit]
Description=Agent-Now acc
After=network-online.target
[Service]
Environment=AGENT_ROOT=/usr/share
Environment=AGENT_CACHE_ROOT=/var/cache
Environment=AGENT_CONFIG_ROOT=/etc
Environment=AGENT_LOG_ROOT=/var/log
Environment=AGENT_RUN_ROOT=/var/run
Environment=RUBYOPT=-Eutf-8
User=servicenow
Group=servicenow
ExecStart=/usr/share/servicenow/agent-client-collector/bin/a
cc-service start acc
KillMode=process
Restart=on-failure
RestartSec=1min
CPUShares=128
CPUQuota=10%
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
MemoryLimit=192M
BlockIOWeight=10
LimitNICE=+15
[Install]
WantedBy=network-online.target
```

b. Run the reload daemon command If you modified the service file after enabling the acc service.

```
# systemctl daemon-reload
```

c. Enable and start the service by running the following commands.

```
# systemctl enable acc
```

```
# systemctl start acc
```

Install MID-less Agent Client Collector using a single-line command in a Linux environment

Install MID-less Agent Client Collector on a Linux machine to enable sending data from the agent to the instance through the cloud. Sending information through the cloud allows the MID Server to be used for more persistent resources.

Before you begin

- Install the ITOM Cloud Services Core (sn_itom_cloud_svc) plugin.
- Onboard your instance to use ITOM Cloud Services. For details, contact Customer Support.
- Configure an agent registration key. For details, see Configure an agent registration key.
- Role required: agent_client_collector_admin

About this task

For details on sending data through the cloud in a MID-less deployment, see DEX Architecture.

Procedure

1. Retrieve the agent registration key:
   a. Navigate to **All** > **Agent Client Collector** > **Deployment** > **Agent Registration Key**.
   b. Select the relevant agent registration key.
   c. Copy the registration key value and store it in a place where you can easily retrieve it, when needed.
2. Retrieve the publicly accessible gateway URL, based on your location.
   - AMER (Americas): `itomcnc-prod-gateway-amer.sncapps.service-now.com:443`
   - EMEA (Europe): `itomcnc-prod-gateway-emea.sncapps.service-now.com:443`
   - APAC (Asia Pacific): `itomcnc-prod-gateway-apac.sncapps.service-now.com:443`
3. On the Linux server where the agent is installed, enter the following command:

```
CONNECT_WITHOUT_MID="true" ACC_CNC="<gateway_endpoint>"
 REGISTRATION_KEY="<registration_key>"
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
INSTANCE_URL="https://<instance_url>" bash -c "$(curl -L
https://<instance_url>/api/sn_agent/agents/install_agent)"
```

For details on the parameter values in the command, see Agent Client Collector MID-less installation command parameters.

Install MID-less Agent Client Collector manually in a macOS environment

Install MID-less Agent Client Collector manually on a macOS machine to enable sending data from the agent to the instance through the cloud. Sending information through the cloud allows the MID Server to be used for more persistent resources.

Before you begin

- Install the ITOM Cloud Services Core (sn_itom_cloud_svc) plugin.
- Onboard your instance to use ITOM Cloud Services. For details, contact Customer Support.
- Configure an agent registration key. For details, see Configure an agent registration key.
- Role required: agent_client_collector_admin

About this task

For details on sending data through the cloud in a MID-less deployment, see DEX Architecture.

Procedure

1. Download the installation files to your local machine.

```
curl -L <download link from the Agent Downloads page on the
instance>
```

2. Validate the installation file signature.

```
pkgutil --check-signature agent-client-collector-<version
number>-macos-catalina_x64.pkg
```

Note: Ensure that the `pkg` certificate chain has the ServiceNow developer ID installer certificate.

3. Install the Agent Client Collector package.

```
sudo installer -pkg agent-client-collector-<version
number>-macos-catalina_x64.pkg -target /
```

4. Copy the installation files.

   a. Sample configuration file:
   ```
   sudo cp -p /Library/Application\ Support/servicenow/agent-
   client-collector/acc.yml.example /Library/Application\ Support/
   servicenow/agent-client-collector/acc.yml
   ```

   b. Sample allow list file:
   ```
   sudo cp -p /Library/Application\ Support/servicenow/agent-
   client-collector/check-allow-list.json.default /Library/
   Application\ Support/servicenow/agent-client-collector/check-
   allow-list.json
   ```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. **Optional:** To create new check definitions to be included in the allow list, first disable the allow list by commenting out the *allow-list* parameter in the `acc.yml` file.

   (Optional) `sudo -H -u _servicenow vi /Library/Application\ Support/servicenow/agent-client-collector/acc.yml`

   Note: This action compromises your system's security and is recommended only as a temporary measure until you finish updating the allow list. After completing the update, uncomment the allow list parameter in the configuration file to re-activate the allow list.

   For details on adding custom checks to an allow list, see Generate an Agent Client Collector allowlist.

6. In the `acc.yml` configuration file:

   a. Set the following parameters:

Parameter	Value
backend-url	"<gateway URL>"
connect-without-mid	true
instance-url	"<instance URL>"
registration-key	"<regsitration-key>"
insecure-skip-tls-verify	false

   b. Comment out the *api-key* parameter.

7. Save the configuration file.
8. To ensure that the configuration file points to a valid endpoint, run the following commands to restart the Agent Client Collector:

```
sudo launchctl unload
 -w /Library/LaunchDaemons/com.sn.acc.plist
sudo launchctl load -w /Library/LaunchDaemons/com.sn.acc.plist
```

   Note: By default, exiting the installation program causes the program to restart immediately. To ensure that the program remains stopped after exiting, set the KeepAlive property in the `/Library/LaunchDaemons/com.sn.acc.plist` file to **false**.

Install MID-less Agent Client Collector using a single-line command in a macOS environment

Install MID-less Agent Client Collector on a macOS machine to enable sending data from the agent to the instance through the cloud. Sending information through the cloud allows the MID Server to be used for more persistent resources.

Before you begin

- Install the ITOM Cloud Services Core (sn_itom_cloud_svc) plugin.
- Onboard your instance to use ITOM Cloud Services. For details, contact Customer Support.
- Configure an agent registration key. For details, see Configure an agent registration key.
- Role required: agent_client_collector_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

For details on sending data through the cloud in a MID-less deployment, see DEX Architecture.

Procedure

1. Retrieve the agent registration key:
   a. Navigate to **All** > **Agent Client Collector** > **Deployment** > **Agent Registration Key**.
   b. Select the relevant agent registration key.
   c. Copy the registration key value and store it in a place where you can easily retrieve it, when needed.
2. Retrieve the publicly accessible gateway URL, based on your location.
   - AMER (Americas): `itomcnc-prod-gateway-amer.sncapps.service-now.com:443`
   - EMEA (Europe): `itomcnc-prod-gateway-emea.sncapps.service-now.com:443`
   - APAC (Asia Pacific): `itomcnc-prod-gateway-apac.sncapps.service-now.com:443`
3. On the macOS server where the agent is installed, enter the following command:

```
CONNECT_WITHOUT_MID="true" ACC_CNC="<gateway_endpoint>"
 REGISTRATION_KEY="<registration_key>"
 INSTANCE_URL="https://<instance_url>" bash -c "$(curl -L
 https://<instance_url>/api/sn_agent/agents/install_agent)"
```

For details on the parameter values in the command, see Agent Client Collector MID-less installation command parameters.

Configure an agent registration key

Configure an agent registration key so that you can deploy MID-less Agent Client Collector. Deploying MID-less Agent Client Collector enables you to use the MID Server for more persistent resources.

Before you begin

Install the plugins necessary for deploying MID-less Agent Client Collector.

Role required: agent_client_collector_admin

About this task

The Cleanup Agent Registration Keys scheduled job runs daily and deletes expired registration keys. The length of time for which a registration key is valid is controlled by the *sn_agent.registration_key_validity.days* property, based on when the key was created. The amount of time that the customer is notified prior to upcoming key expiration is controlled by the *sn_agent.registration_key_notification.days* property.

If a key's expiration date is approaching, create a new registration key and enter it into any existing automation jobs to prevent registration outage.

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Deployment** > **Agent Registration Key**.
2. Select **New**.
3. In the **Name** field, enter a descriptive name for the registration key.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. **Optional:** To receive notifications when a registration key is soon to expire, select a group with a valid email address in the **Ownership Group** field.
   When keys are deleted via the Cleanup Agent Registration Keys scheduled job, the indicated group receives an email notification.
5. Select **Submit**.

Result

The new agent registration key is ready to use for installation.

Installing MID-less Agent Client Collector

Agent Client Collector Framework configuration properties

Agent Client Collector installation on a macOS system

Install Agent Client Collector on a system that uses macOS. You can either use a single-line command script or follow a manual installation procedure if the agent is not connected to the instance or you want enhanced customization options.

To enable privileged access to information on the macOS system, add the *_servcienow* user account to the admin group (or equivalent).

Incorporating the Agent Client Collector into a custom base image for mass deployment is not supported on macOS.

Perform a single-line Agent Client Collector installation on macOS when using a MID Server

Use an efficient single-line command script to install Agent Client Collector on a machine that uses macOS operating system. Use the manual installation procedure if the agent is not connected to the instance or you want enhanced customization options.

Before you begin

- Ensure that you have configured the Agent Client Collector web server.
- Verify that your server's OS and version matches the list of supported OS versions as described in Agent Client Collector Installation.
- Ensure that you have the *pkgutil* packages available, to be used by the install script.
- Enable golden image mode for cloning additional agents by setting the golden image marker located at `/Library/Preferences/acc.rc.plist`.
- Ensure that the target agents have connectivity to the following:
  - ServiceNow install server [install.service-now.com]
  - ServiceNow instance
  - The MID Server to which the agent will connect

Role required: agent_client_collector_admin

Procedure

1. Retrieve the MID Server websocket URL parameters.
   a. Navigate to **Agent Client Collector** > **Websocket Endpoint**.
   b. Select the relevant websocket endpoint.
   c. Copy the **Endpoint URL** field value to be used in the installation command.
2. Retrieve the API Key.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Navigate to **Agent Client Collector** > **Deployment** > **MID Web Server API Key**.

b. Copy the **API Key** value, to be used in the installation command.

3. Run the following command on the server where the Agent Client Collector is being installed.

```
ACC_API_KEY=<api_key>
 ACC_MID=wss://<mid_ip>:<websocket_port>/ws/events
 bash -c "$(curl -L https://<instance
 URL>/api/sn_agent/agents/install_agent)"
```

Enter the following values in the command line:

Command line parameters

Parameter	Value
ACC_API_KEY	Replace the *<api_key>* string with the API key used to access the MID Server websocket. If no value is specified, you will be prompted to enter the API key value during the script's execution.
ACC_MID	Replace the *<mid_ip>* string with the URL of the MID Server websocket. When specifying multiple MID Servers, enter a string separated by commas for each MID Server.
ACC_ALLOW_LIST	(Optional) Add the string *ACC_ALLOW_LIST=0* to disable the allow list. By default, the allow list is enabled. **Note:** Disabling the allow list compromises your system's security and is recommended only as a temporary measure until you finish updating the allow list. After completing the update, re-activate the allow list by removing *ACC_ALLOW_LIST=0* from the single-line command string.
ACC_VALIDATE_SIG	(Optional) Add the string *ACC_VALIDATE_SIG=0* to disable verifying the installer certificate validation. By default, validation is enabled. Default: Validation is enabled. **Note:** Disable certification validation only when using non-standard signature validation tools.

Manually install Agent Client Collector on macOS

Install Agent Client Collector manually on a machine that uses macOS when the agent is not connected to the instance or you want enhanced customization options.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Ensure that you have configured the Agent Client Collector web server.
- Verify that your server's OS and version matches the list of supported OS versions as described in Agent Client Collector Installation.
- Enable golden image mode for cloning additional agents by setting the golden image marker located at `/Library/Preferences/acc.rc.plist`.
- Navigate to **Agent Client Collector** > **Deployment** > **Agent Downloads** and download the signed `.pkg` relevant for your OS.
- Store the `.pkg` installation package on one of your installed agents.

Role required: agent_client_collector_admin

Procedure

1. Download the installation files to your local machine.

```
curl -L <download link from the Agent Downloads page on the
 instance>
```

2. Validate the installation file signature.

```
pkgutil --check-signature agent-client-collector-<version
 number>-macos-catalina_x64.pkg
```

Note: Ensure that the `pkg` certificate chain has the ServiceNow developer ID installer certificate.

3. Install the Agent Client Collector package.

```
sudo installer -pkg agent-client-collector-<version
 number>-macos-catalina_x64.pkg -target /
```

4. Copy the installation files.

   a. Sample configuration file:
   `sudo cp -p /Library/Application\ Support/servicenow/agent-client-collector/acc.yml.example /Library/Application\ Support/servicenow/agent-client-collector/acc.yml`

   b. Sample allow list file:
   `sudo cp -p /Library/Application\ Support/servicenow/agent-client-collector/check-allow-list.json.default /Library/Application\ Support/servicenow/agent-client-collector/check-allow-list.json`

5. **Optional:** To create new check definitions to be included in the allow list, first disable the allow list by commenting out the *`allow-list`* parameter in the `acc.yml` file.

   (Optional) `sudo -H -u _servicenow vi /Library/Application\ Support/servicenow/agent-client-collector/acc.yml`

Note: This action compromises your system's security and is recommended only as a temporary measure until you finish updating the allow list. After completing the update, uncomment the allow list parameter in the configuration file to re-activate the allow list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For details on adding custom checks to an allow list, see Generate an Agent Client Collector allowlist.

6. Save the configuration file.
7. In the configuration file, connect the agent with the MID Server.

   a. Set the MID Server connection.

   ```
   "wss://<MID Server IP>:<Web Socket Port>/ws/events"
   ```

   The web socket port was configured on the MID Server when it was set as an Agent Client Collector listener.

   b. Locate the *api-key* parameter and specify the API key value inside double quotation marks, as follows:
   api-key:"111111111"
   The specified API key is encrypted the first time the agent runs.

8. To ensure that the configuration file points to a valid endpoint, run the following commands to restart the Agent Client Collector:

```
sudo launchctl unload
 -w /Library/LaunchDaemons/com.sn.acc.plist
sudo launchctl load -w /Library/LaunchDaemons/com.sn.acc.plist
```

Note: By default, exiting the installation program causes the program to restart immediately. To ensure that the program remains stopped after exiting, set the KeepAlive property in the `/Library/LaunchDaemons/com.sn.acc.plist` file to **false**.

Upgrade Agent Client Collector manually on a macOS system

Perform a manual upgrade of your existing Agent Client Collector version on a system running a macOS. Manual upgrade is useful if the single-line command script isn't connected to the instance or you want to use enhanced customization options.

Before you begin

- The upgrade procedure is the same for both MID Server and MID-less deployments.
- Enable golden image mode for cloning additional agents by setting the golden image marker located at `/Library/Preferences/acc.rc.plist`.
- Role required: agent_client_collector_admin

Procedure

1. **Optional:** Manually back up the `agent-id` and `acc.yml` configuration files by running the following commands.

```
mkdir -p /tmp/acc-upgrade-backup

cp -rp /Library/Application\
 Support/servicenow/agent-client-collector/acc.yml /
tmp/acc-upgrade-backup

cp -rp /Library/Application\
 Support/servicenow/agent-client-collector/check-allow-list.js
on /tmp/acc-upgrade-backup
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
cp -rp /Library/Application\
 Support/servicenow/agent-client-collector/agent_now_id /
tmp/acc-upgrade-backup
```

Manually backing up the configuration files provides an added layer of security by ensuring that your files are backed up before beginning the upgrade process.

2. Navigate to **All** > **Agent Client Collector** > **Deployment** > **Agent Downloads**.
3. In the **macOS Downloads** section, download the relevant agent package and signature `.pkg` files.
4. Perform package upgrade, based on the cpu your macOS runs with.
   - Intel cpu:

     ```
     sudo installer -pkg agent-client-collector-<version
      number>-macos_x64.pkg
     ```

   - Apple silicon cpu:

     ```
     sudo installer -pkg agent-client-collector-<version
      number>-macos_arm64.pkg
     ```

   This command also backs up and restores the agent-id and configuration files before upgrading.
5. Verify that the upgrade was successful.
   a. Navigate to **All** > **Agent Client Collector** > **Agents**.
   b. Verify the following values for your agent:
      - **Host data collection** = Collected
      - **Version** = <Relevant version number>

Uninstall the Agent Client Collector from macOS using a single-line command

Uninstall the Agent Client Collector from macOS machine by running an efficient single-line command. If the agent is connected to the instance, uninstall Agent Client Collector manually.

Before you begin

- The uninstall procedure is the same for both MID Server and MID-less deployments.
- Role required: agent_client_collector_admin

Procedure

Run the following command.

```
bash -c "$(curl -L https://<Instance
 URL>/api/sn_agent/agents/install_agent)" -s "--remove"
```

Note: Uninstalling the Agent Client Collector removes the `acc.yml` file and its directory from your machine. The user and group **_servicenow**, created as part of the installation process, is also removed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Uninstall the Agent Client Collector from a macOS machine manually

Uninstall the Agent Client Collector from a macOS machine manually instead of using the single-line procedure when the specific agent is not connected to the instance.

Before you begin

- The upgrade procedure is the same for both MID Server and MID-less deployments.
- Role required: agent_client_collector_admin

Procedure

1. In a command window, disable and stop the service:
   sudo launchctl unload -w /Library/LaunchDaemons/com.sn.acc.plist
2. Delete the following files/directories:

```
sudo rm /Library/LaunchDaemons/com.sn.acc.plist
sudo rm -rf /opt/servicenow/agent-client-collector
sudo rm -rf /var/run/servicenow/agent-client-collector
sudo rm -rf /Library/Application\
 Support/servicenow/agent-client-collector
```

3. Remove the **_servicenow** user and group.

```
sudo /usr/bin/dscl . -delete /Users/_servicenow
sudo /usr/bin/dscl . -delete /Groups/_servicenow
```

4. Remove the **pkg** from the list of installed packages.

```
sudo pkgutil --forget com.servicenow.agent-client-collector
```

Agent Client Collector File-Based Discovery

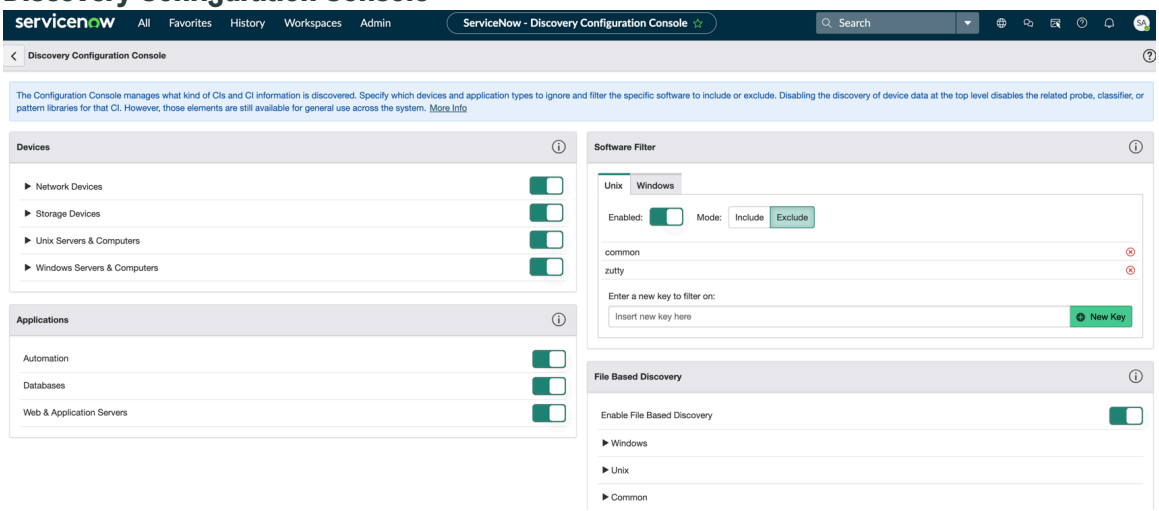
Agent Client Collector File-Based Discovery (FBD) scans file systems on managed endpoints to discover installed software and track file inventories.

FBD runs as a lightweight background process within the existing Agent Client Collector agent. It is configured and controlled entirely from the ServiceNow instance. Administrators define which directories to scan, which files to look for, and how often to scan. The agent discovers matching files, collects metadata such as name, path, size, and version, and sends the results back to the instance where they are stored in the appropriate CMDB and application tables.

To activate FBD, navigate to the Discovery Configuration Console (**All** > **Discovery Definition** > **Configuration Console**) and in the **File Based Discovery** section, activate the **Enable File Based Discovery** toggle switch.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Discovery Configuration Console



For details on the FBD configuration and system properties, see Agent Client Collector File-Based Discovery properties.

Supported platforms

FBD supports the following operating systems:

- Windows
- Linux
- macOS

Required plugins

The following plugins are required for File-Based Discovery on Agent Client Collector:

- *File-based Discovery* (com.snc.discovery.file_based_discovery)
- *Software Asset Management - File Signature Normalization* (com.snc.file_signature_normalization) — Activated automatically once the File-based Discovery plugin is active
- *Agent Client Collector - Visibility Content* (sn_acc_vis_content)
- *Software Asset Management Professional* (com.snc.samp)

Delta scanning

Delta scanning is a performance optimization that applies only to the File Management policy. It reduces the volume of data sent from the endpoint to the instance on repeat scans.

The delta scanning process works as follows:

1. **First scan** — A full scan runs. All matching files are sent to the instance. A fingerprint, which is a snapshot of all discovered file paths and sizes, is saved locally on the endpoint.
2. **Subsequent scans** — The scanner compares the current file list against the saved fingerprint and reports only the differences:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Added** — files that exist now but were not in the previous fingerprint
- **Modified** — files that exist in both but with a different size
- **Deleted** — files that were in the previous fingerprint but no longer exist on disk

3. **Periodic full scan** — After a configured number of delta scans (default: 5), a full scan is automatically forced to verify accuracy and correct any drift.

Note: Delta scanning does not apply to the SAM or SWID policies. These policies always perform a full scan on each run.

Archive file scanning

Archive file scanning extends file-based discovery to inspect ZIP and JAR archive files and report the files contained within them. This enables discovery of software artifacts such as executables and libraries that are packaged in the ZIP or JAR files on the endpoint.

Archive file scanning is disabled by default. To enable it, set the *sn_acc_vis_content.file_discovery.archive_scan_enabled* property to **true**. This property requires the **discovery_admin** role to modify.

When archive file scanning is enabled, the agent inspects each ZIP or JAR file encountered during a directory scan. The agent reads the archive's internal index to enumerate the files inside. No file content is extracted or decompressed. Only metadata is collected.

For each file found inside an archive, the agent applies the same filtering rules used for regular files on disk, including SAM allowlist and File Management extension rules. Files that pass the filters are reported alongside other discovered files.

For filtering rules and performance safeguards, see Archive file scanning filtering rules and limits.

Running process-based discovery

Running process-based discovery extends File-Based Discovery (FBD) with process-based path detection, enabling the Agent Client Collector for Visibility Content agent to detect software running outside of standard configured scan directories.

Why use running process-based discovery

Some software is never installed into the standard program directories that FBD scans. Common examples include:

- Portable applications run from a removable drive or a user folder
- User-installed tools placed in a personal directory, such as a Python interpreter under a user profile
- Command-line utilities installed into a user's local binary directory

A directory-only scan cannot detect applications installed outside standard scan directories, but they are visible as running processes. Running process-based discovery closes that gap, giving SAM teams a more complete and accurate view of the software in use across your organization. This reduces risk and improves audit readiness.

Platform coverage

Running process-based discovery supports Windows, Linux, and macOS. Coverage scope varies by operating system and depends on the privileges granted to the agent service account. For

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

platform-specific coverage details and privilege requirements, see Running process-based discovery platform coverage and properties.

Enable running process-based discovery

Enable running process-based discovery so that the Agent Client Collector for Visibility Content agent detects software running from directories outside your configured File-Based Discovery scan paths.

Before you begin

File-Based Discovery must be active on the configuration console.

The Agent Client Collector for Visibility Content Windows agent must be deployed on the endpoints.

Role required: disco_admin

Procedure

1. Navigate to **All** > **System Properties** > **All Properties**.
2. Search for the *sn_acc_vis_content.file_discovery.fbd_process_scan_enabled* property.
3. Set the **Value** field to `true`.
   The default value is `false`. Setting this property to `true` activates the agent policy that collects process directories.
4. Save the record.

Result

The associated agent policy activates during the next agent synchronization. From that point, the host runs the FBD SAM Process Scan Policy and begins collecting process directories every five minutes. The next daily FBD scan includes the process-discovered directories in its SAM output.

Note: A directory is removed from discovery when its software is no longer present on disk. If the software runs again, it is rediscovered within 24 hours.

What to do next

For Linux and macOS hosts, complete the privilege configuration to obtain full coverage across all users. For details, see Platform coverage.

To exclude specific directories from running process-based discovery, see Exclude directories from running process-based discovery.

Exclude directories from running process-based discovery

Exclude specific directories from running process-based discovery so that processes running from those locations aren't recorded or included in File-Based Discovery scans.

Before you begin

Running process-based discovery must be enabled. For details, see Enable running process-based discovery.

Role required: disco_admin

About this task

Some running processes have no Software Asset Management (SAM) value and only add noise to discovery output, such as security tooling or the agent's own processes. Use the FBD Process Path Exclusions [sn_acc_vis_content_fbd_proc_path_exclude] table to prevent those directories from being recorded. A set of common exclusions is included in the base system.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to the FBD Process Path Exclusions [sn_acc_vis_content_fbd_proc_path_exclude] table.
2. Select **New**.
3. Complete the fields for the exclusion record.

FBD Process Path Exclusions form

Field	Description
Path	Absolute directory prefix to exclude. Any process running from this directory or a subdirectory of it is ignored.
Platform	Operating system the exclusion applies to: **Windows** or **Unix**. Unix covers Linux and macOS. There is no combined option; specify the platform explicitly.
Active	When selected (the default), the exclusion is enforced. Clear this check box to disable the exclusion temporarily without deleting the record.
Description	Optional notes describing the purpose of the exclusion.

4. Select **Submit**.

Result

The exclusion is pushed to the relevant agents automatically. New collection cycles skip the excluded directories. Any previously collected paths that match the exclusion are removed during the next daily maintenance cycle.

Discovering a license key in a file-based discovery framework

License key discovery across Windows, Linux, and macOS enables ACC to automatically identify and create an inventory of license keys stored in files on managed computers. A license key proves that software installation is legitimate and is being used within the boundaries the vendor agreed to at the time of purchase.

What is a license key

A license key is a unique string associated with a piece of software. License keys typically encode constraints such as the number of permitted users or devices, the expiration date, or the product edition or tier purchased.

Organizations track license keys for compliance audits, renewal discussions, and licensing cost management. Without visibility into license keys, organizations can't reliably determine whether they are compliant, or whether they have purchased the right number of licenses.

Why file-based discovery is necessary

License keys are stored in different locations depending on the vendor and product architecture. The following broad storage categories exist:

Storage location	Example vendors/products	Discoverable on-machine?
Windows Registry (Windows only)	Microsoft Office, Windows operating system	Yes — via registry-based discovery (previously released)
Files on disk (cross-platform)	AutoCAD, MATLAB, Quest	Yes — via file-based discovery (current release)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Storage location	Example vendors/products	Discoverable on-machine?
Cloud or user-based authentication	Modern subscription-licensed applications	No — nothing is stored on the machine

Beginning in version 2.0.0, file-based discovery identifies license keys stored in files on any operating system, including Linux and macOS.

How file-based discovery operates

File-based license key discovery acts as a framework rather than a single reader because every vendor's license file format differs. The framework provides the underlying mechanism to find a candidate file and pass its content for processing, while administrators supply configuration that specifies what to look for and how to read it.

This architecture enables support for new vendors and file formats through configuration alone — no platform code changes are required.

Configure a license key discovery rule and write a parser script

Enable license key discovery to verify the legitimacy of your software installation. Set up support for a new vendor's license file format by creating a parser script and defining a matching rule.

Before you begin

Role required: agent_client_collector_admin or discovery_admin

About this task

To discover license keys from a vendor's license file format, you must create the following complementary configuration records:

- A parser script that knows how to extract license information from the specified file format.
- A file-matching rule that tells the framework when to invoke that parser.

The parser is created first because the file-matching rule references it.

Procedure

1. Write the parser script on the **License Parsers** page.
   a. Enter *sn_acc_vis_content_license_parser.list* into the navigation menu.
   b. Select **New**.
   c. Enter a name into the **Parser Name** field.

   The parser is a small piece of server-side JavaScript that receives the raw text content of a matched file and extracts license information from it.

   The script must extract the following information where available:

   - Product name
   - Vendor name
   - License key
   - Expiry date (if present in the file)

   The script must set a variable called `answer` to an array of result objects. Create one object per license entry found in the file — a single file can contain multiple products' licenses. If the script fails to set `answer` as an array, the parser is treated as invalid.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example structure of a result object:

```
{
  product_name: "Product Name",
  vendor: "Vendor Name",
  license_key: "ABC123DEF456",
  expiry_date: "2026-12-31"
}
```

2. Validate the parser script before using it on real data.

   Every License Parser record includes a **Test Parser** link in the **Related Links** section. To validate your script, do the following on the License Parser record page:

   a. Fill in the **sample_input** field with representative file content.

   b. Fill in the **sample_output** field with the exact result you expect the parser to produce.

   c. Select **Test Parser**.

   The Test Parser executes your script against the sample input using the exact same code path used during a real scan. It reports whether the actual result matches the expected sample output, catching mistakes before the parser processes real license files.

3. Create a License File Configuration record to define the matching rule.

   With the validated parser in place, create a License File Configuration record that describes which file to look for. Enter *sn_acc_vis_content_license_file_config.list* in the navigation menu and specify the following:

   - **display_name** — A unique name identifying the rule
   - **file_name** — The file name or partial name to match (for example, "ProductLicense")
   - **file_name_condition** — How to match the file name: `exact_match` (default), `starts_with`, `ends_with`, or `contains`
   - **file_extension** — Optional file extension to narrow the match further (do not include a leading dot before the extension)
   - **platform** — The operating system(s) the rule applies to: `all` (default), `windows`, `linux`, or `mac`
   - **parser** — Reference to the parser created in the previous steps
   - **order** — Priority when multiple rules could match the same file (default 100; lower values win)
   - **active** — Indicates whether the rule is currently in use (default = true)

4. Enable license key discovery in the system.

   Ensure that the following components are active:

   - System property `sn_acc_vis_content.enable_license_key_discovery` — Set to **true**
   - Policy `File Based Discovery Policy - License Key` — **Active**
   - Check definition `File Based Discovery - License Key` — **Active**

   After enabling these components, the agent will begin scanning for files matching your License File Configuration rule during its regular file-scanning activity.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result

Your new rule is active and the agent will automatically discover license keys from files matching your configuration. The discovered licenses appear in the appropriate tables when they are successfully matched in the software catalog.

Perform Zscaler remediation

If the Zscaler application installed on your Windows or macOS agent is not running efficiently, you can stop and start the app. This process is called *remediation*. Running remediation automatically creates an incident on the agent. You can also view Zscaler statuses on the Zscaler dashboard as a graph.

By default, the **Zscaler Monitoring Policy** monitoring check runs every 30 minutes to check the status of the Zscaler app running on your agent. The Zscaler monitoring policy contains the following checks:

- *zscaler-monitoring-check*: Checks the status of the Zscaler app running on your agent.
- *zscaler-remediation-check*: Invoked only when the Zscaler app is not running efficiently. This check shuts down and restarts the app, and automatically creates an incident.

  Only one incident is created every 24 hours for a Zscaler app that does not remediate properly. For example, if the remediation check runs multiple times on an agent, new remediation records are created and associated with the same incident. After 24 hours have passed, a second incident is created. When the Zscaler app restarts successfully, the incident closes.

  Zscaler remediation produces the following output:

  - Amount of data produced per remediation: 2KB
  - Maximum number of remediations that can run in a day: 48 (one every 30 minutes)
  - Maximum amount of data produced by a single agent, per day: 96KB
  - Maximum amount of data produced by a 20K agents, per day: 1.92GB

Check Zscaler monitoring

Check the monitoring status of your Zscaler app, to verify that it is running properly.

Before you begin

Role required: agent_client_collector_admin

About this task

If the monitoring app is down, the Zscaler tunnel status is either *51 (SERVICE-DOWN-ERROR)* or *56 (SYSTEM_SOCKETS_EXHAUSTED_ERROR)*. When that happens, a remediation check runs, which shuts down and then starts the Zscaler app.

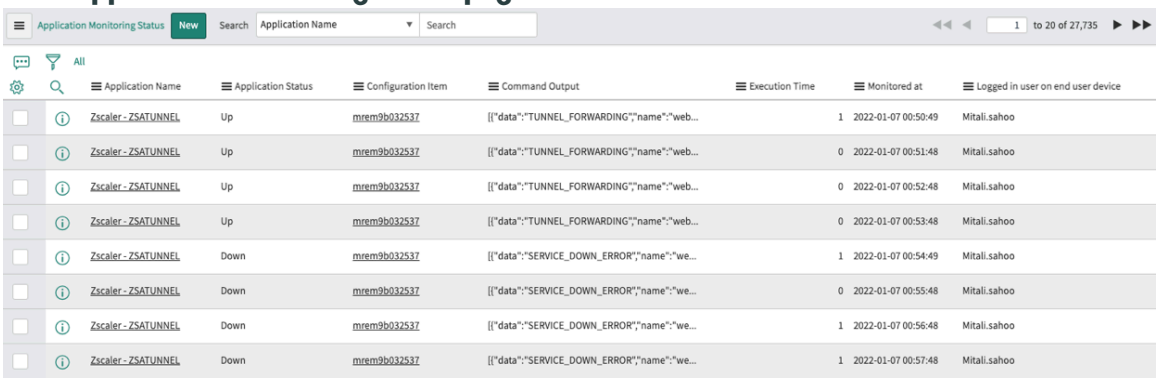
By default, the Zscaler monitoring check (*zscaler-monitoring-check*) runs automatically every 30 minutes. If you are experiencing problems with your Zscaler app, you may want to run the check more often or immediately. For details, see Customize the Zscaler monitoring check.

Procedure

1. Navigate to **All** > **Remediate Zscaler VPN** > **Monitoring Status**.
   The **Application Monitoring Status** page appears.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Application Monitoring Status page



- If the Zscaler app is running properly, the **Application Status** column displays the **Up** value.
- If the Zscaler app is not running properly, the **Application Status** column displays the **Down** value.

2. If the **Application Status** column displays the **Down** value, the remediation check (*`zscaler-remediation-check`*) runs.
   - For details on customizing the amount of time after which the system verifes the Zscaler status, see Customize the Zscaler remediation wait time.
   - For details on monitoring Zscaler remediation checks, see Check Zscaler remediation.

Customize the Zscaler remediation wait time

Configure the amount of time (in seconds) by which the Zscaler remediation check verifies the Zscaler status. This amount of time indicates how often the system checks the Zscaler status after the remediation check runs.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. Navigate to **Agent Client Collector** > **Agents** > **Configuration** > **Check Definition**.
2. Select *`zscaler-remediation-check`*.
3. In the **Command** field, modify the value to: `zscaler_app_remediator.rb --wait_time=<time_in_sec>`, where `<time_in_sec>` is the number of seconds the system waits before checking the Zscaler status.
   By default, the system waits 30 seconds.
4. Select **Save**.
   - If the Zscaler app is running within the configured `wait_time`, the remediation result is **Success**.
   - If the Zscaler app is not running within the configured `wait_time`, the remediation result is **Failed**.

Customize the Zscaler monitoring check

Customize the frequency by which the Zscaler monitoring check runs. By default, the Zscaler monitoring check runs every 30 minutes. If your Zscaler app is not working efficiently, you can set the check to run more frequently.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: agent_client_collector_admin

About this task
For details on customizing the Zscaler monitoring check, see Perform Zscaler remediation.

Procedure
1. Navigate to **All** > **Agent Client Collector** > **Configuration** > **Policies**.
2. Select the **Zscaler Monitoring Policy** entry.
3. Select the **Scheduling** tab.
4. In the **Interval (sec)** field, modify the value to the number of seconds for the monitoring check to wait in between executions.
   The default value is 1800.

   To run the monitoring check immediately, enter a value of **1**.

Result
Zscaler monitoring checks run according to the frequency specified in the **Interval (sec)** field.

Check Zscaler remediation

Verify that Zscaler remediation stops and starts the Zscaler app after the remediation monitoring check fails.

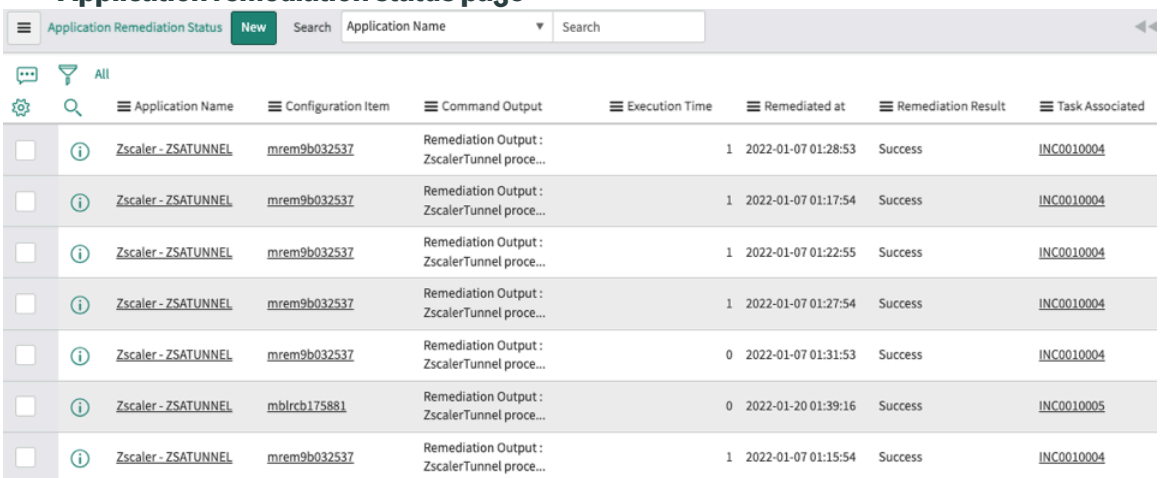
Before you begin
Verify that the Zscaler monitoring check returns an **Application Status** value of **Down**, indicating that the Zscaler app isn't working properly.

Role required: agent_client_collector_admin

Procedure
Navigate to **All** > **Remediate Zscaler VPN** > **Remediation Result**.

The **Application Remediation Status** page appears.

Application remediation status page



When remediation successfully shuts down and restarts Zscaler, the **Remediation Result** column has a value of **Success**. The **Task Associated** column displays a link to the incident created on remediation. When remediation is successful, the incident closes automatically.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use the Zscaler dashboard

Use the Zscaler dashboard to view Zscaler monitoring and remediation statuses in graph format.

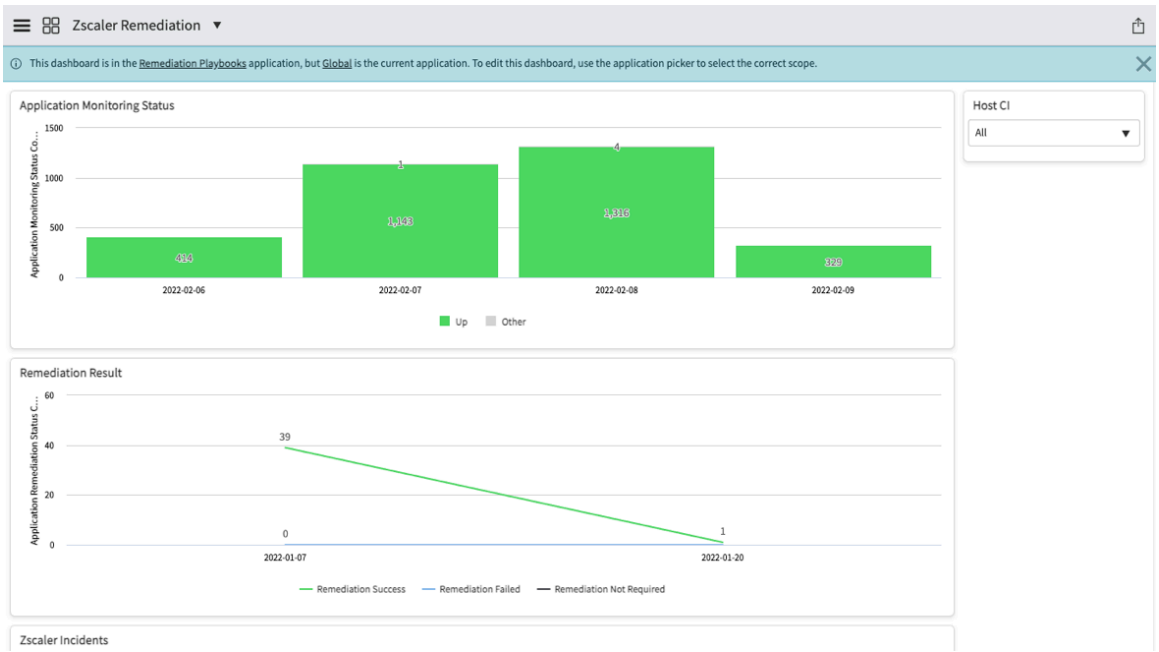
Before you begin

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Remediate Zscaler VPN** > **Dashboard**.
   The Zscaler Remediation Dasbhoard appears.

Zscaler Dashboard



The dashboard displays graphs divided according to the following sections:

Zscaler Remediation Dashboard sections

Section	Description
Application Monitoring Status	Displays a bar graph of the number of Zscaler apps by date, and their statuses (Up, Down, Unknown, Other).
Remediation Result	Displays a line graph of the number of Zscaler remediations, and their statuses (Success, Failed, Not Required).
Zscaler Incidents	Displays a line graph of the number of Zscaler incidents created, and their statuses (Opened, Closed).

2. **Optional:** In the **Host CI** window on the upper right side of the page, select the CI whose data you want to view.
   The default value is All, indicating that the dashboard displays data from all of the CIs on the host.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Choose and configure metrics to monitor

Metric Intelligence uses data sources that can monitor hundreds of metrics for all CIs. Choose which details are important for each data source type and CI, then activate or deactivate the respective monitor type to control data processing.

Before you begin

See Get started with Metric Intelligence for the high level steps of setting up Metric Intelligence.

Role required: evt_mgmt_admin

About this task

The SCOM data source, available by default, collects about 400 metric types from discovered devices such as '% Available Memory' and '% of Free Space'. Processing data from all metric types can overload the system and impact performance. It might be necessary to deactivate selected metric types for selected CIs to reduce that load.

The overall number of metrics that can be processed, depends on the number of MID Servers and their hardware configuration. For details about hardware requirements and metrics scalability, see MID Server distributed cluster for Metric Intelligence.

Note: The *Active* setting (true or false) for a metric in the Monitoring System Metric Types [sa_source_metric_type] table takes precedence over the setting for the corresponding metric in the Metric To CI Mappings [sa_metric_map] table. If a metric type in the Monitoring System Metric Types [sa_source_metric_type] table is disabled, all records related to the corresponding metrics are removed from the Metric To CI Mappings [sa_metric_map] table.

Procedure

1. Navigate to **All** > **Event Management** > **Metrics** > **Metric Types**.
   The **Monitoring System Metric Types** displays the metric types that are being collected per data source, per CI type.
2. Review the **Monitoring System Metric Types** list, and set the value in the **Active** column to **false** or **true**, as necessary.

Column	Description
Source	Data source monitoring the metric type.
Source Metric Type	Metric such as '% Free Space' that is being monitored for the CI type.
Anomaly Detection Action Level	The level of anomaly detection processing and analysis applied to CIs and metrics. The available options are: ○ **Metrics Only**: Only gather metrics from the data source without any further processing. ○ **Bounds**: Includes the Metrics Only processing level, and also creates a statistical model and shows bounds in Insights Explorer. ○ **Anomaly Scores**: Includes the Bounds processing level, and also calculates and displays anomaly scores.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column	Description
	○ **Anomaly Alerts**: Includes the Anomaly Scores processing level, and also creates anomaly alerts, as applicable. ○ **IT Alerts**: Includes the Anomaly Alerts processing level, and also creates IT alerts which are based on anomaly alerts, as applicable.
Monitored Object Type	CI type that is being monitored.
Active	Determines whether the metric data is processed by Event Management alert aggregation and RCA metrics.
Unit	Unit type that is associated with the source metric type, displayed in the Metric Intelligence reports.

Create a configuration settings rule

Configuration settings affect how metric data is processed. Configuration settings rules override the default metric processing behavior to determine the system actions when an anomaly is detected.

Before you begin

Role required: evt_mgmt_admin

About this task

A number of configuration settings determine the behavior of Metric Intelligence MID Servers. In the base system, these configuration settings are configured with default values, data types, and range of valid values. You cannot directly modify these configuration settings or add new ones. However, you can create a metric configuration rule with new configuration settings that override the default values on the MID Servers.

Then, manually apply these rules to all Metric Intelligence MID Servers in a single synchronization operation, or rely on an hourly system job to perform the synchronization.

To take effect, Metric Intelligence MID Servers must be synchronized with the updates to the configuration settings rules.

It is valid to have multiple rules for a setting that affect the same CIs, in which case:

- Rules in which a filter is defined take precedence over a global rule in which no filter has been defined.
- If multiple rules that affect the same set of CIs have the same priority, then only the latest rule to be defined is applied.
- If multiple rules with different priorities affect the same set of CIs, then rules with the highest priority are applied.

Procedure

1. Navigate to **All** > **Event Management** > **Anomaly Detection** > **Metric Config Rules**.
2. On the Metric Configuration Rules pane, click **New**, and fill out the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Metric Configuration Rules form

Field	Description
Name	Rule name.
Order	Rule priority within all other rules. Higher numbers represent higher priorities.
Filter by	Check box for displaying the **Rule** field, where you can specify conditions that CIs must meet for the rule to apply. For example, in the **choose field** list, select **Add Related Fields** and then add the filter **[class][is][Linux Server]**. If clear, the rule applies globally to all CIs in the Metric To CI Mapping [sa_metric_map] table.

3. Right-click the form title, and click **Save**.
4. In the Metric overridden configurations form section click **New**, fill out the form, and then click **Submit**.

Metric overridden configurations form

Field	Description
Name	Configuration setting for which to override its value. Click the icon to display the list of all configuration settings. Click the icon to display the **Metric Settings** dialog with details such as range of possible values. See the following tables (Configuration Settings and Internal Configuration Settings) for details about configuration settings.
Rule	Rule to which the created configuration setting applies.
Value	New value that overrides the default value for the specified configuration setting.

You can modify the following configuration settings in the **Name** field.

Note: The filter specified in the metric configuration rule does not apply to settings with a global scope.

Configuration Settings

Name and Description	Values	Default	Data Type	Scope
anomaly_detection_enabled Enable/disable anomaly detection.	N/A	true	boolean	CI/Metric

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name and Description	Values	Default	Data Type	Scope
Note: If anomaly_detection_action_level is set, then anomaly_detection_enabled is ignored.				
anomaly_detection_action_level Action level of anomaly analysis and processing. For more information, see Configure the action level for anomaly detection.	choices: ○ Metrics Only ○ Bounds ○ Anomaly Scores ○ Anomaly Alerts ○ IT Alerts	○ New records: Bounds ○ Upgraded records: Anomaly Alerts	choice	CI/Metric
buffer_anomaly_eviction_size Maximum number of anomalies at individual metric level that can be stored in internal buffer before sending them to instance for every CI/Metric pair.	60–1440	60	integer	Global
buffer_ci_score_eviction_size Maximum number of anomalies at CI level that can be stored in internal buffer before sending them to instance (Currently not being used)	60–1440	60	integer	Global
buffer_metric_eviction_size Maximum number of metrics that can be stored in internal buffer before sending them to instance for every CI/Metric pair.	60–1440	60	integer	Global
connection_login_timeout_secs Maximum time in seconds to log in to the local database on MID Server.	30–60	30	integer	Global
corrupt_data_count_threshold Minimum number of training points (15-minute averages)	10–100	30	integer	Global

Configure multiple MID Servers to work with Agent Client Collector Monitoring

Synchronize configuration settings rules

Metric Intelligence configuration settings rules contain user specified values that override default values that currently exist on Metric Intelligence MID Servers. To take effect, the Metric Intelligence MID Servers must be synchronized with the updated set of configuration settings rules.

Before you begin

Role required: evt_mgmt_admin

About this task

You can manually initiate a synchronization to immediately apply the updates on all Metric Intelligence MID Servers. Or, you can rely on a system job, that runs on an hourly recurring schedule, checking for updates to the metric configuration rules. If it is determined that there are updates, the system job sends these updates to the Metric Intelligence MID Servers.

Procedure

1. Navigate to **All** > **Event Management Rules** > **Anomaly Detection** > **Metric Config Rules**.
2. On the Metric Configuration Rules pane, click **Sync to MID**.

What to do next

Verify that all Metric Intelligence MID Servers have been synchronized with the updated set of configuration settings rules:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Navigate to **Output and Artifacts** > **ECC Queue**.
2. In the **Queues** pane, search the **Topics** column for `MetricConfigProbe`.
3. Check the **Agent** column and verify that all MID Servers are updated.

Understanding the Monitoring Technology Dashboard

The Monitoring Technology Dashboard enables you to monitor server resources for the platform you select. The dashboard enables you to identify the CIs and servers in your system with the highest resource consumption, and the most recent active alerts.

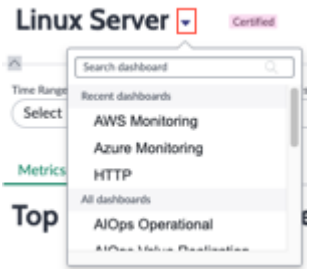
You can customize the appearance of individual widgets on the Monitoring Technology Dashboard. For example, you could change the data parameters displayed for the CPU Utilization (Linux) metric, like the date range. You can include the customized widgets when creating a custom dashboard. For more information, see Customize the Monitoring Technology Dashboard.

The Monitoring Technology Dashboard shows the five CIs and servers with the highest metric readouts during the past six hours. It also shows the 50 most recent active alerts on your OS's servers.

To enable viewing the Monitoring Technology Dashboard, ensure that you have installed clotho version 23.1.0.

To view the dashboard, navigate to **All** > **AIOps Dashboards** > **Monitoring Technology Dashboards** and select the OS whose metrics you want to view.

Select the arrow next to the dashboard name to enabled choosing a different dashboard to view:



Monitoring Technology Dashboard for Linux

With the Linux Monitoring Technology Dashboard, you can monitor the health and performance of your Linux infrastructure. The dashboard enables you to identify the CIs and servers in your system with the highest resource consumption, and also the most recent active alerts.

Overview of the dashboard

The Monitoring Technology Dashboard shows the five CIs and servers with the highest metric readouts during the past six hours. The dashboard also shows the 50 most recent active alerts on your OS's servers.

To view the dashboard, navigate to **All** > **AIOps Dashboards** > **Monitoring Technology Dashboards** and select **Linux Server**.

Using the Monitoring Technology Dashboard for Linux

Before using the Monitoring Technology Dashboard for Linux:

- Ensure that you're working in the Agent Client Collector Monitoring scope in your ServiceNow instance.
- Ensure that the agent_client_collector_admin and dashboard_admin roles are enabled.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Enable Metric Intelligence on the MID Server.
- Ensure that the **Linux OS Events** and **Linux OS Metrics** policies are enabled.

  Enabling these policies activates metric to CI mapping.
- Ensure that the clotho plugin version 1.19.0.10 or above is enabled.
- After upgrading from a previous version, follow the procedure described in the ACC-M Dashboard Filters are not working when upgraded from Tokyo/Utah to Vancouver [KB1438042] article in the NOW Support Knowledge Base.

Point to the relevant widget to view a specific point of data and all of its details in a pop-up window. Select the Alerts tab to view the 50 most recent active alerts for CIs.

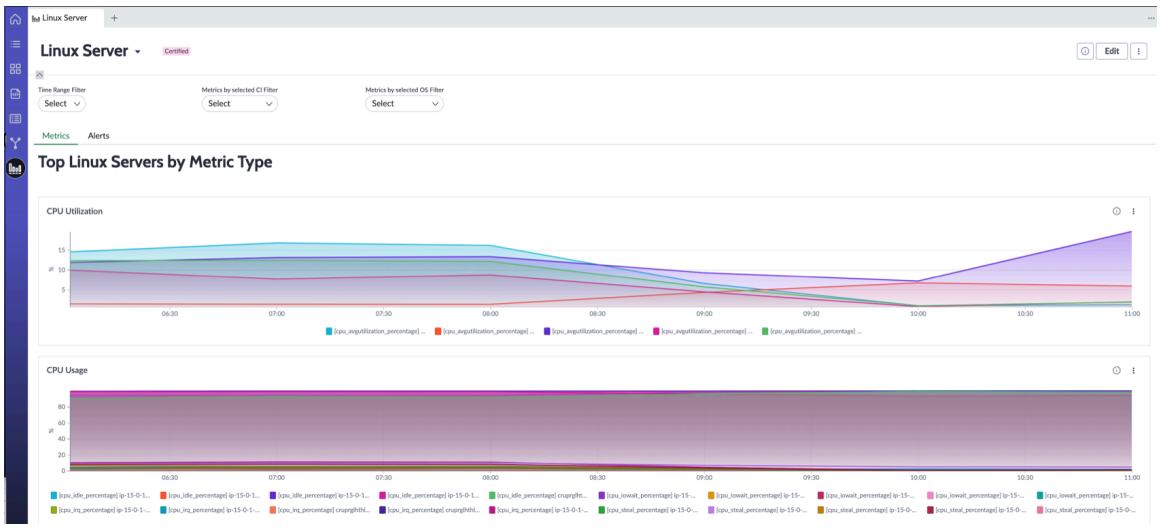
You can filter the dashboard data according to the following filters:

Dashboard filters

Filter name	Description
Time range filter	The time range for which you want metric data to display on the dashboard.
Metrics by selected CI filter	The CIs for which you want metric data to display on the dashboard.
Metrics by selected OS filter	The OS for which you want metric data to display on the dashboard.

On the right side of widgets displaying a single metric, you can select the More options icon (⋮) and select **Change group by**. Select the category you want to view the metric by: Host name, Class, Operating System, or OS Version.

Linux server dashboard



The Metrics subtab displays the top five performing CIs and servers over the past six hours, according to the following metrics.

- CPU Utilization
- System Uptime
- CPU Usage

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Load Average
- Memory
- Memory Distribution
- Processes
- Network Utilization
- Swap
- Disk Usage

You can customize the appearance of the individual widgets on the Linux Monitoring Technology Dashboard. For example, you could change the timeframe for which the alerts appear. You can also include customized widgets when you are creating a custom dashboard. For more information, see Customize the Monitoring Technology Dashboard.

Monitoring Technology Dashboard for Windows

With the Windows Monitoring Technology Dashboard, you can monitor the health and performance of your Windows infrastructure. The dashboard enables you to identify the CIs and servers in your system with the highest resource consumption, and also the most recent active alerts.

Overview of the dashboard

The Monitoring Technology Dashboard for Windows shows the five CIs and servers with the highest metric readouts during the past six hours. The dashboard also shows the 50 most recent active alerts on your OS's servers.

To view the dashboard, navigate to **All** > **AIOps Dashboards** > **Monitoring Technology Dashboards** and select **Windows Server**.

Using the Monitoring Technology Dashboard for Windows

Before using the Monitoring Technology Dashboard for Windows:

- Ensure that you're working in the Agent Client Collector Monitoring scope in your ServiceNow instance.
- Ensure that the agent_client_collector_admin and dashboard_admin roles are enabled.
- Enable Metric Intelligence on the MID Server.
- Ensure that the **Windows OS Events** and **Windows OS Metrics** policies are enabled:

  Enabling these policies activates metric to CI mapping.
- Ensure that the clotho plugin version 1.19.0.10 or above is enabled.
- After upgrading from a previous version, follow the procedure described in the ACC-M Dashboard Filters are not working when upgraded from Tokyo/Utah to Vancouver [KB1438042] article in the NOW Support Knowledge Base.

To view the dashboard, navigate to **All** > **AIOps Dashboards** > **Monitoring Technology Dashboards** and select **Windows Server**.

Point to the relevant widget to view a specific point of data and all of its details in a pop-up window. Select the Alerts tab to view the 50 most recent active alerts for CIs.

You can filter the dashboard data according to the following filters:

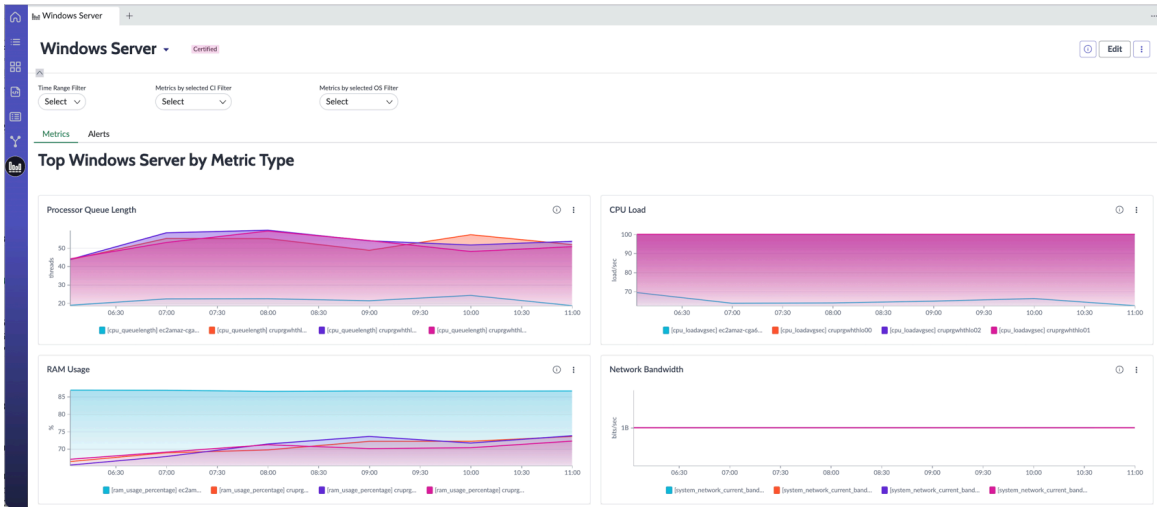
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dashboard filters

Filter name	Description
Time range filter	The time range for which you want metric data to display on the dashboard.
Metrics by selected CI filter	The CIs for which you want metric data to display on the dashboard.
Metrics by selected OS filter	The OS for which you want metric data to display on the dashboard.

On the right side of widgets displaying a single metric, you can select the More options icon (⋮) and select **Change group by**. Select the category that you want to view the metric by: Host name, Class, Operating System, or OS Version.

Windows server dashboard



The Metrics subtab displays the top five performing CIs and servers over the past six hours, according to the following metrics.

- Processor Queue Length
- CPU Load
- System Uptime
- CPU Core
- RAM Usage
- Network Bandwidth
- Memory Distribution
- Network Flow
- Disk Usage
- Disk Read/Write
- Disk Distribution

You can customize the appearance of the individual widgets on the Windows Monitoring Technology Dashboard. For example, you could change the timeframe for which the alerts

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

appear. You can also include customized widgets when you are creating a custom dashboard. For more information, see Customize the Monitoring Technology Dashboard.

Monitoring Technology Dashboard for HTTP

With the HTTP Monitoring Technology Dashboard you can monitor the response time of your `http` and `https` URLs. By using the dashboard, you can identify the URLs with the highest metric readouts in your system's infrastructure, and view the most recent active alerts on those URLs.

Overview of the dashboard

The HTTP Monitoring Technology Dashboard shows the five URLs with the highest metric readouts during the past six hours. The dashboard also shows the 50 most recent active alerts on those URLs.

To view the dashboard, navigate to **All** > **AIOps Dashboards** > **Monitoring Technology Dashboards** and select **HTTP**.

Using the Monitoring Technology Dashboard for HTTP

Before using the Monitoring Technology Dashboard for HTTP:

- Ensure that you're working in the Agent Client Collector Monitoring scope in your ServiceNow instance.
- Ensure that the agent_client_collector_admin and dashboard_admin roles are enabled.
- Enable Metric Intelligence on the MID Server.
- Ensure that the **HTTP Entry Points Events** and **HTTP Entry Points Metrics** policies are enabled.

  Enabling these policies activates metric to CI mapping.
- Ensure that the clotho plugin version 1.19.0.10 or above is enabled.
- After upgrading from a previous version, follow the procedure described in the ACC-M Dashboard Filters are not working when upgraded from Tokyo/Utah to Vancouver [KB1438042] article in the NOW Support Knowledge Base.

The Azure Monitoring Technology Dashboard contains the tabs that are listed in the following table.

HTTP Monitoring Technology Dashboard tabs

Tab	Description
Metrics	Displays the top 5 performing metrics that are associated with the URLs in your system.
Alerts	Displays the 50 most recent alerts that are associated with the URLs in your system. Alerts help you to remediate your system by providing information on problematic behavior.

On the right side of widgets displaying a single metric, you can select the More options icon (⋮) and select **Change group by**. Select the category you want to view the metric by: Host name, Class, Operating System, or OS Version.

Point to the relevant widget to view a specific datapoint and all of its details in a pop-up window.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use the **Time range filter** to filter the time range for which you want metric data to display on the dashboard.

You can customize the appearance of the individual widgets on the HTTP Monitoring Technology Dashboard. For example, you could change the data parameters that display for the Response Time metric, like the time range that the response time is displayed. You can also include the customized widgets when you're creating a custom dashboard. For more information, see Customize the Monitoring Technology Dashboard.

Monitoring Technology Dashboard for Azure

With the Azure Monitoring Technology Dashboard, you can monitor the health and performance of your Azure infrastructure. By using the dashboard, you can identify the configuration items (CIs) and servers with the highest metric readouts, and view the most recent active alerts on those CIs.

Overview of the dashboard

The Azure Monitoring Technology Dashboard shows the five CIs and servers with the highest metric readouts during the past six hours. The dashboard also shows the 50 most recent active alerts in your Azure environment. Based on the dashboard metrics, you might want to resize your CIs and servers to improve your system performance and efficiency.

To view the dashboard, navigate to **All** > **AIOps Dashboards** > **Monitoring Technology Dashboards** and select **Azure Monitoring**.

Using the Monitoring Technology Dashboard for Azure

Before using the Monitoring Technology Dashboard for Azure:

- Create an Azure credential. For details on creating Azure credentials, see Create Azure cloud credentials.
- Create a Discovery schedule, using the credential created in the previous step. For details on creating a Discovery schedule, see Discovery for Microsoft Azure.
- Ensure that you're working in the Agent Client Collector Monitoring scope in your ServiceNow instance.
- Ensure that the agent_client_collector_admin and dashboard_admin roles are enabled.
- Enable Metric Intelligence on the MID Server.
- Ensure that the **Azure VM Metrics**, **Azure Storage Account Metrics**, **Azure Load Balancer Metrics**, **Azure Gateway Metrics**, and **Azure Redis Cache Metrics** policies are enabled
- Ensure that the clotho plugin version 1.19.0.10 or above is enabled.

The Azure Monitoring Technology Dashboard contains the tabs that are listed in the following table.

Azure Monitoring Technology Dashboard tabs

Tab	Description
Virtual Machines	Displays the metric data from the virtual machines in the Azure environment.
Storage Accounts	Displays the metric data from the storage accounts in the Azure environment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure Monitoring Technology Dashboard tabs (continued)

Tab	Description
Load Balancer	Displays the metric data from the load balancers in the Azure environment.
Application Gateway	Displays the metric data from the application gateway in the Azure environment.
Redis	Displays the metric data from the Redis cache in the Azure environment.

Point to the relevant widget to view a specific datapoint and all of its details in a pop-up window.

You can filter the dashboard data according to the following filters:

Dashboard filters

Filter name	Description
Time range filter	The time range for which you want metric data to display on the dashboard.
Metrics by selected CI filter	The CIs for which you want metric data to display on the dashboard.

You can customize the appearance of the individual widgets on the Azure Monitoring Technology Dashboard. For example, you could change the time that the CPU usage on virtual machines is displayed. You can also include the customized widgets when you're creating a custom dashboard. For more information, see Customize the Monitoring Technology Dashboard.

Monitoring Technology Dashboard for AWS

With the AWS Monitoring Technology Dashboard, you can monitor the health and performance of your AWS infrastructure. Identify the configuration items (CIs) and servers with the highest metric readouts. View the most recent active alerts on those CIs and servers.

Overview of the dashboard

The AWS Monitoring Technology Dashboard shows the five CIs and servers with the highest metric readouts during the past six hours. The dashboard also shows the 50 most recent active alerts in your AWS environment.

To view the dashboard, navigate to **All** > **AIOps Dashboards** > **Monitoring Technology Dashboards** and select **AWS Monitoring**.

Using the Monitoring Technology Dashboard for AWS

Before using the Monitoring Technology Dashboard for AWS:

- Create an AWS credential. For details on creating AWS credentials, see Setup AWS service accounts.
- Create a Discovery schedule, using the credential created in the previous step. For details on creating a Discovery schedule, see Access setup for AWS service accounts.
- Ensure that you're working in the Agent Client Collector Monitoring scope in your ServiceNow instance.
- Ensure that the agent_client_collector_admin and dashboard_admin roles are enabled.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Enable Metric Intelligence on the MID Server.
- Ensure that the **AWS Metrics**, **AWS EC2 Metrics**, and **AWS DynamoDB Metrics** policies are enabled.

  Enabling these policies activates metric to CI mapping.
- Ensure that the clotho plugin version 1.19.0.10 or above is enabled.
- After upgrading from a previous version, follow the procedure described in the ACC-M Dashboard Filters are not working when upgraded from Tokyo/Utah to Vancouver [KB1438042] article in the NOW Support Knowledge Base.

The AWS Monitoring Technology Dashboard contains the tabs that are listed in the following table.

AWS Monitoring Technology Dashboard tabs

Tab	Description
EC2	Displays the metric data from the EC2 (virtual machines) in the AWS environment.
EC2 Alerts	Displays the active EC2 (virtual machine) alerts in the AWS environment.
EBS	Displays the metric data from the EBS (storage volume) in the AWS environment.
S3	Displays the metric data from the S3 (cloud object storage) in the AWS environment.
RDS	Displays the metric data from the RDS (cloud database) in the AWS environment.
ELB	Displays the metric data from the ELB (cloud load balancing) in the AWS environment.
Dynamo DB	Displays the metric data from the Dynamo DB (cloud database) in the AWS environment.
ECS Cluster	Displays the metric data from the ECS cluster in the AWS environment.
ECS Service	Displays the metric data from the ECS service in the AWS environment.

On the right side of widgets displaying a single metric, you can select the More options icon (⋮) and select **Change group by**. Select the category you want to view the metric by: Host name, Class, Operating System, or OS Version.

Point to the relevant widget to view a specific datapoint and all of its details in a pop-up window. Select the **Alerts** tab to view the 50 most recent active alerts in your environment. Alerts help you to remediate your system by providing the information on problematic behavior.

Use the **Time range filter** to filter the time range for which you want metric data to display on the dashboard.

Use the **Metrics by selected CI filter** to select the CIs for which you want to view metrics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can customize the appearance of the individual widgets on the AWS Monitoring Technology Dashboard. For example, you could change the time that the EC2 metrics appear. You can also include the customized widgets when you are creating a custom dashboard. For more information, see Customize the Monitoring Technology Dashboard.

Monitoring Technology Dashboard for GCP

With the GCP Monitoring Technology Dashboard, you can monitor the health and performance of your GCP infrastructure. Identify the configuration items (CIs) and servers with the highest metric readouts. View the most recent active alerts on those CIs and servers.

Overview of the dashboard

The GCP Monitoring Technology Dashboard shows the five CIs and servers with the highest metric readouts during the past six hours. The dashboard also shows the 50 most recent active alerts in your GCP environment.

To view the dashboard, navigate to **All** > **AIOps Dashboards** > **Monitoring Technology Dashboards** and select **GCP Monitoring**.

Using the Monitoring Technology Dashboard for GCP

Before using the Monitoring Technology Dashboard for GCP:

- Create a GCP credential and use it to create a Discovery schedule. For details on creating GCP credentials, see Discovery for Google Cloud Platform.
- Create a Discovery schedule, using the credential created in the previous step. For details on creating a Discovery schedule, see Discovery for Google Cloud Platform.
- Ensure that you're working in the Agent Client Collector Monitoring scope in your ServiceNow instance.
- Ensure that the agent_client_collector_admin and dashboard_admin roles are enabled.
- Enable Metric Intelligence on the MID Server.
- Ensure that the **GCP GCE Metrics** policy is enabled.

  Enabling this policy activates metric to CI mapping.
- Ensure that the clotho plugin version 1.19.0.10 or above is enabled.
- After upgrading from a previous version, follow the procedure described in the ACC-M Dashboard Filters are not working when upgraded from Tokyo/Utah to Vancouver [KB1438042] article in the NOW Support Knowledge Base.

The GCP Monitoring Technology Dashboard contains the tabs listed in the following table.

GCP Monitoring Dashboard tabs

Tab	Description
GCP	Displays graphs of the top 14 performing OS resources, such as CPU, Memory, Disk Operations and Network.
Alerts	Displays the 50 most recent alerts that are associated with the URLs in your system. Alerts help you to remediate your system by providing information on problematic behavior.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

On the right side of widgets displaying a single metric, you can select the More options icon (⋮) and select **Change group by**. Select the category you want to view the metric by: Host name, Class, Operating System, or OS Version.

Point to the relevant widget to view a specific datapoint and all of its details in a pop-up window.

Use the **Time range filter** to filter the time range for which you want metric data to display on the dashboard.

Use the **Metrics by selected CI filter** to select the CIs for which you want to view metrics.

You can customize the appearance of the individual widgets on the GCP Monitoring Technology Dashboard. For example, you could change the timeframe for which the alerts appear. You can also include customized widgets when you are creating a custom dashboard. For more information, see Customize the Monitoring Technology Dashboard.

Monitoring Technology Dashboard for VMware vSphere

With the VMware vSphere Monitoring Technology Dashboard, you can monitor the health and performance of your VMware vSphere infrastructure. You can identify the CIs and servers with the highest metric readouts. You can also view the most recent active alerts on those CIs and servers.

Overview of the dashboard

The VMware vSphere Monitoring Technology Dashboard shows the five CIs and servers with the highest metric readouts during the past six hours. The dashboard also shows the 50 most recent active alerts in your VMware vSphere environment.

To view the dashboard, navigate to **All** > **AIOps Dashboards** > **Monitoring Technology Dashboards** and select **VMWare vSphere Monitoring**.

Using the Monitoring Technology Dashboard for VMware vSphere

Before using the Monitoring Technology Dashboard for VMware vSphere:

- Create a VMware vSphere credential and use it to create a Discovery schedule. For details on creating VMware vSphere credentials, see Discovery for VMware.
- Create a Discovery schedule, using the credential created in the previous step. For details on creating a Discovery schedule, see Discovery for VMware virtualization.
- Ensure that you're working in the Agent Client Collector Monitoring scope in your ServiceNow instance.
- Ensure that the agent_client_collector_admin and dashboard_admin roles are enabled.
- Enable Metric Intelligence on the MID Server.
- Ensure that the **VSphere Datacenter Metrics**, **VSphere Datastore Metrics**, **VSphere ESX Server Metrics** and **VSphere VirtualMachine Metrics** policies are enabled.

  Enabling these policies activates metric to CI mapping.
- Ensure that the clotho plugin version 1.1.0 or above is enabled.
- After upgrading from a previous version, follow the procedure described in the ACC-M Dashboard Filters are not working when upgraded from Tokyo/Utah to Vancouver [KB1438042] article in the NOW Support Knowledge Base.

The VMware vSphere Monitoring Technology Dashboard contains the tabs listed in the following table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

VMware vSphere Monitoring Dashboard tabs

Tab	Description
VirtualMachine	Displays graphs of the top VMware vSphere VMs by metric type.
ESX Server	Displays graphs of the top VMware vSphere ESX servers by metric type.
Datacenter	Displays graphs of the top VMware vSphere datacenters by metric type.
Datastore	Displays graphs of the top VMware vSphere datastores by metric type.
Alerts	Displays the 50 most recent alerts that are associated with the URLs in your system. Alerts help you to remediate your system by providing information on problematic behavior.

On the right side of widgets displaying a single metric, you can select the More options icon (⋮) and select **Change group by**. Select the category you want to view the metric by: Host name, Class, Operating System, or OS Version.

Point to the relevant widget to view a specific datapoint and all of its details in a pop-up window.

You can filter the dashboard data according to the following filters:

Dashboard filters

Time range filter	The time range for which you want metric data to display on the dashboard.
Metrics by selected CI filter	The CIs for which you want metric data to display on the dashboard.

You can customize the appearance of the individual widgets on the VMware vSphere Monitoring Technology Dashboard. For example, you could change the timeframe for which the alerts appear. You can also include customized widgets when you are creating a custom dashboard. For more information, see Customize the Monitoring Technology Dashboard.

Customize the Monitoring Technology Dashboard

Customize the Monitoring Technology Dashboard widgets in the Data Visualizations library so your dashboard displays information exactly as you want to see it.

Before you begin

Role required: agent_client_collector_admin

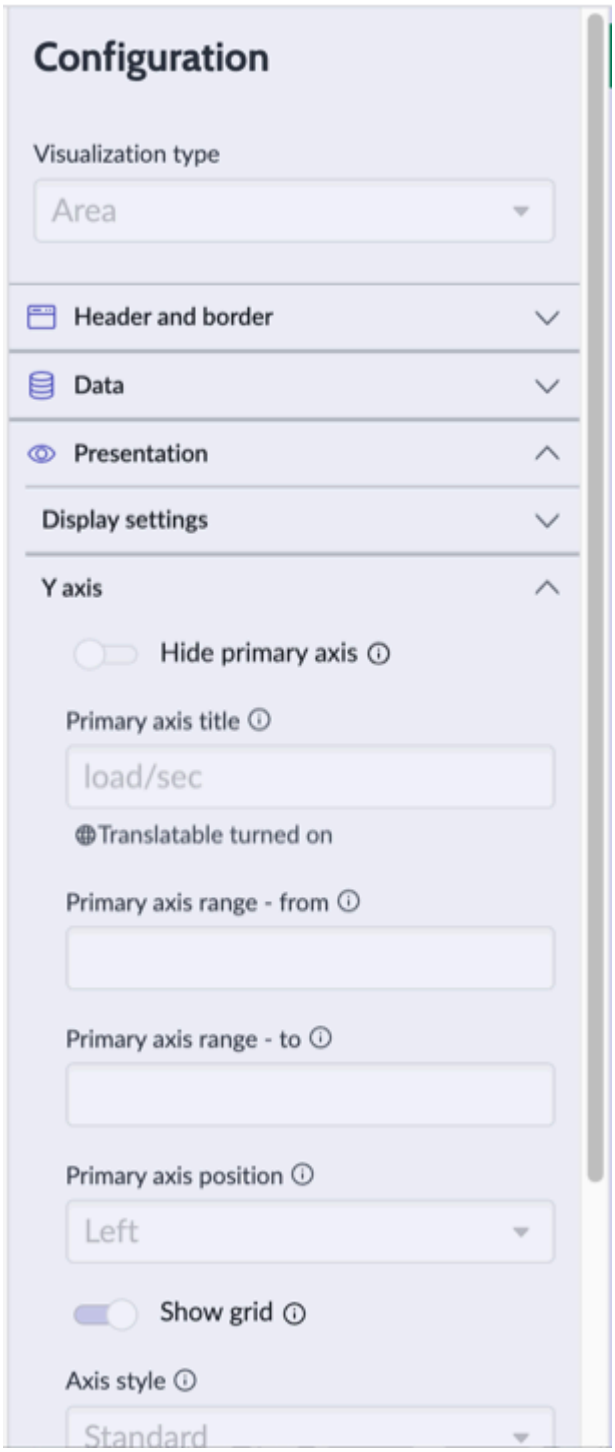
Procedure

1. Navigate to the OS dashboard whose widgets you want to customize.
   - To access the Windows Server Dashboard, navigate to **All** > **AIOps** > **Monitoring Technology Dashboard** > **Windows Server**.
   - To access the Linux Server Dashboard, navigate to **All** > **AIOps** > **Monitoring Technology Dashboard** > **Linux Server**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Select **Analytics Center** > **Data Visualizations**.
3. View all available widgets by selecting the **All** tab.
4. Select the widget that you want to change.
5. Select the ( ) icon, and select **Duplicate**.
6. In the **New name** field in the dialog box, enter a name for your duplicated widget, and select **Duplicate**.
7. In the widget's **Configuration** tab on the right, expand the relevant options and customize the information for the widget to display.

Configuration tab



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For details on working with data visualizations, see Data visualizations in the Analytics Center Data visualizations in the Analytics Center.

8. Select **Save and close**.

Result

Your customized widgets are saved in the Data Visualizations library, and can be used to configure a customized dashboard (see Create a dashboard with the In-line editor).

Setting exclusion lists for IPs and NICs

Agent Client Collector for Visibility Content (ACC-VC) version 1.3.0 supports exclusion list for IPs and Network Interface Controllers (NICs) with a flexible mechanism for filtering out values for IPs and or NICs when creating or updating the host CI and related items.

The property [*sn_acc_vis_content.network_adapter_exclusion_list*] contains the list of regular expressions for the names and IP addresses that are excluded in the Network Adapter and IP Address tables. The value of this property is comma-separated regular expressions. Make sure that there is no comma in the regex and nic and ip_addr should be in different lines.

Sample format of the value should be:

- nic = nameRegex1, nameRegex2, nameRegex3
- ip_addr = IPRegex1, IPRegex2

Identify software editions on Windows devices

Determine which edition of software is in use on Windows devices in your environment, to maintain an accurate software inventory. Software products commonly support multiple editions, making it difficult to identify which edition is in use.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. In the navigation pane, enter `sn_acc_vis_content_software_registry_edition_config.list`.
   The **Software Edition Configurations** page appears.
2. Select **New** to set edition configuration for a Windows device.
   The **Software Edition Configuration - New record** page appears. For details on the fields displayed on the page, see Software edition configuration fields.
3. Select **Submit**.
   The configured product appears on the **Software Edition Configurations** page, and is automatically added to the `EditionRegistryConfig.json` file after the daily scheduled job runs.
4. In the navigation pane, enter `cmdb_sam_sw_install.list`.
   The **Software Installations** page opens.
5. Find the relevant software entry, and confirm the edition in the **Edition override** column.
   The edition appears only after the **Software Installed** or **SAM Discovery** policy runs. By default, these policies runs once daily.

© 2026 ServiceNow, Inc. All rights reserved.

Generate a Pattern allowlist

Generate an allowlist for a selection of patterns, to configure the patterns permitted to run on an agent.

Before you begin

Ensure that the following plugins are installed on your instance:

- Discovery (com.snc.discovery)
- Pattern Designer Enhancements (com.sn_itom_pde)
- **Pattern Allowlist Generator** available as part of Agent Client Collector for Visibility Content 1.5.0 (202512)

Role required: discovery_admin or agent_client_collector_admin

Procedure

1. Navigate to **All** > **Pattern Designer** > **Patterns allowlist for ACC**.
   The **Pattern Allowlist Generator** page appears.
2. Select the type of pattern selection in the **Pattern Selection** section.
   - **All patterns**: The allowlist generates for all patterns on the agent.
   - **Specific patterns**: The allowlist generates on the agent only for the patterns you select.

     After selecting this option, choose the patterns from which you want the allowlist to be generated.
3. Select **Generate Allowlist**.
4. Select **Copy** to copy the generated allowlist.
5. Append the copied allowlist into the existing `check-allow-list.json` allowlist on the agent.

   The patterns specified in the allowlist are permitted to run on the agent.

   The allowlist's default location is:
   - Windows: `C:\ProgramData\ServiceNow\Agent Client Collector\check-allow-list.json`
   - Linux: `/etc/servicenow/agent-client-collector/check-allow-list.json`

   Note: To generate allowlist for commands nested within EVAL() in a pattern step, ensure the Pattern Designer Enhancements plugin is v3.9.1 or above.

Define temporary variables for a pattern allowlist

Define temporary variables by assigning values such as executable paths, config file paths, and so forth. Defining temporary variables ensures that runtime commands are successful.

About this task

If a Linux command executable relies on an undefined temporary variable, the command fails at runtime.

For example, for the command `$pathToCmd "/log/acc.log"`, if a value is not defined for `$pathToCmd`, the command will fail.

Before you begin

Role required: agent_client_collector_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Pattern Designer** > **Pattern Allowlist Temporary Variables**.
2. Select **New** to create a new variable.
3. Create a record and define the temporary variable.

   For example:

Pattern Allowlist Temporary Variables

Field	Value
Value	bin/sh/testexec
Pattern	.NET Application
Operating system	Linux
Temporary variable	exePath

4. Select **Submit**.

Domain usage discovery and categorization

Agent Client Collector for Visibility (ACC-VC) domain usage discovery classifies the domains that users visit against a set of admin-defined domain signatures. It enables you to see which websites and services, such as AI tools, are being used across the endpoints in your environment.

Domain usage discovery overview

Domain usage discovery matches the domains that users visit against a set of domain-type signatures, and records a match for each combination of endpoint, domain, and user. You can create categories of any type, such as AI Tools, Productivity, or Security, and map them to the domain URLs in your signatures. Use the resulting data to see which categories of website and services are accessed from your browsers and devices.

Note: This capability reuses the existing web usage collection pipeline. No new agent-side data collection module is required.

Prerequisites

Domain usage discovery depends on the Agent Client Collector for Visibility (ACC-VC) VISC Get URL metrics policy. This policy ships turned off, so you must activate it before AI domain usage discovery can classify any domains. For more information, see Agent Client Collector for Visibility Content default checks and policies.

Domain signatures

Domain usage discovery relies on how you categorize domains. The system doesn't categorize domains automatically. To identify usage of a website or application, create a domain signature for it and assign the category that you want. Visited domains that match the signature are then reported under that category. For example, to identify usage of an AI application, create a domain signature for it and set its category to AI Tools.

How domain usage discovery works

Domain usage discovery runs inline as part of existing web usage processing:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- After the system resolves a visited domain, it checks the domain against the active domain-type signatures.
- Domain matching is case-insensitive.
- If the domain matches a signature, the system records the endpoint, domain, user, matching signature, and category.
- Existing web usage data collection and storage are unaffected. This classification happens in addition to, not instead of, standard web usage tracking.
- The system records each endpoint, domain, and user combination only one time. It doesn't update or duplicate existing records.
- The system loads the active domain signatures fresh each time it processes web usage data, so newly activated signatures are detected without requiring a restart.

Categorize domain usage

Group the domains that users visit in your environment by business relevance, such as AI tools, productivity applications, or security services.

Before you begin

Verify the Agent Client Collector for Visibility (ACC-VC) VISC Get URL metrics policy is active to enable domain usage discovery to classify any domains. For more information, see Agent Client Collector for Visibility Content default checks and policies.

Role required: discovery_admin

About this task

Domain usage discovery relies on how you categorize domains. To identify usage of a website or an application, create a domain signature and assign it to a category.

Procedure

1. Create a category.

   a. Navigate to **All** > **System Definition** > **Tables**.

   b. Open the **Entity Categories** (`sn_acc_vis_content_entity_category`) list and select **New**.

   c. On the form, fill in the fields.

Entity categories

Field	Description
Name	The display name of the category. This field is required. For example: AI Tools, Productivity, or Microsoft.
Description	Option to add a brief description of the category to help identify it.
Active	Option to activate the category.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: You can also activate a saved category later from the **Entity Categories** list.

d. Select **Save**.

e. **Optional:** View the saved categories in the **Entity Categories** list.
You can activate saved categories from this list by setting Active=true for the relevant categories.

2. Create a signature.

a. Navigate to **All** > **System Definition** > **Tables**.

b. Open the **URL Domain Signature** (`sn_acc_vis_content_url_domain_signature`) table.

c. Under related links, select **Show List**.

d. Select **New**.

e. On the form, fill in the fields.

Domain Signature form

Field	Description
Domain type	The display name of the signature. The options are: External or Internal.
Category	The category to which the system assigns matching domains. For example, AI Tools. This field is required.
URL domain	The pattern to match against the URL domain. This field is required
Description	Option to add a brief description of the signature to help identify it.
Active	Option to activate the signature.

f. Select **Submit**.

Saving the signature starts a job that evaluates the visited domains against the signature and categorizes any matches.

Browser extension discovery and categorization

Agent Client Collector for Visibility (ACC-VC) browser extension discovery inventories browser extensions installed on the endpoints in your environment. When an admin-defined signature matches, ACC-VC classifies each extension into a category, such as AI Tools, Productivity, or Security.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

How browser extension discovery works

Users can install browser extensions without administrator involvement. Therefore, traditional software discovery often misses them. Browser extension discovery gives you an inventory of the extensions on your endpoints, their assigned category, and the devices where each extension is installed.

Browser extension discovery supports these browsers:

- Chrome
- Edge
- Brave
- Opera
- Firefox
- Safari

Note: On Mac machines, populating the browser extension status and extended metadata columns requires FDA.

For an extension to appear in the inventory, create a signature and specify the extension ID or name to match. Assign a category, such as AI Tools, to classify the matching extensions in the inventory. ACC-VC matches each discovered extension against the active signatures, and writes the result to the Browser Extension Catalogs table.

A signature takes effect on a device the next time that the 24-hour discovery check runs on that device. The daily configuration refresh picks up signatures that are new or newly activated. If an extension matches more than one signature, ACC-VC applies only the first match, in this fixed order:

1. Extension ID signatures
2. Exact-name signatures
3. Other name-condition signatures, such as contains, starts with, and ends with.

Browser extensions are categorized or re-categorized automatically, without creating a new signature, in the following cases:

- An inactive signature is reactivated.
- New browser extensions are discovered that match an existing active signature.

Browser extension metadata fetching

Assess shadow IT and shadow AI risk in your organization by using browser extension metadata fetching in Agent Client Collector for Visibility (ACC-VC). This capability is an optional layer on top of browser extension discovery that collects each extension's metadata.

Browser extension metadata fetching overview

ACC-VC browser extension discovery identifies extensions installed across the endpoints in your environment. Browser extension metadata fetching goes a step further: it reads each extension's manifest and preference data to collect declared and runtime-granted permissions, host access, install source, and install and update timestamps. The system collects this metadata for extensions on Windows, Mac, and Linux endpoints. This feature provides security and IT teams the detail needed to assess shadow IT and shadow AI risk, rather than just the extension name and version.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: On Mac machines, populating the extended metadata column requires FDA.

Data collected

The type of data browser extension metadata fetching collects depends on the browser family, as shown in the table.

Browser extension metadata by browser family

Field group	Chrome, Edge, Brave, and Opera	Firefox
Permissions	Runtime-granted permissions, falling back to permissions declared in the extension manifest	Permissions declared by the extension
Host access	Granted explicit hosts, falling back to manifest host permissions	Declared origins
Install source	Web store or side-loaded, classified from browser-reported signals	Web store or side-loaded, classified from browser-reported signals
Install and update time	Extension install and update timestamps reported by the browser	Extension install and update timestamps reported by the browser

Performance impact

Turning on browser extension metadata fetching increases the amount of data the agent reads and sends for each extension. Turn it on deliberately instead of leaving it on by default.

Note: If you turn off browser extension metadata fetching after previously turning it on, existing metadata records aren't deleted, but they stop being refreshed.

Categorize discovered browser extensions

Group discovered browser extensions in your environment by business relevance.

Before you begin

Role required: discovery_admin

About this task

Browser extension discovery finds the extensions on your endpoints and maps the category to which each extension belongs, along with the devices where it is installed. For an extension to appear in the inventory, create a signature and assign it a category to classify the matching extensions.

Important: If the system property sn_acc_vis_content.full_browser_extension_discovery is set to True, all browser extensions will be discovered, but those that don't have a matching user-defined signature will not have a category assigned to them. If this system property is set to False, only browser extensions that are matched with signatures will be discovered.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Create a category.

   a. Navigate to **All** > **System Definition** > **Tables**.

   b. Open the **Entity Categories** (sn_acc_vis_content_entity_category) table.

   c. Under related links, select **Show List**.

   d. Select **New**.

   e. On the form, fill in the fields.

   Entity Categories form

Field	Description
Name	The display name of the category. This field is required. For example: Adobe Acrobat, AI Tools, or Microsoft.
Description	Brief description of the category.
Active	When selected, activates the category. **Note:** You can also activate a saved category later from the **Entity Categories** table.

   f. Select **Submit**.

   g. **Optional:** View the saved categories in the **Entity Categories** table.

   Note: You can activate saved categories from this table by setting Active=true for the relevant categories.

2. Create a signature.
   The signature is a rule that matches extensions to a category based on the extension ID or name.

   a. Navigate to **All** > **System Definition** > **Tables**.

   b. Open the **Browser Extension Signature** (sn_acc_vis_content_browser_extension_signature) table.

   c. Under related links, select **Show List**.

   d. Select **New**.

   e. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Browser Extension Signature form

Field	Description
Name	The display name of the signature. This field is required. For example: ChatGPT.
Extension ID	The extension ID that matches the extension ID that is unique across vendors.
Extension name condition	Matching condition for the extension name. Options are: Exact match, Contains, Starts with, and Ends with.
Extension name	The pattern to match against the extension name. For example: ChatGPT.
Version condition	Matching condition for the version. Options are: Any version, Exact match, Starts with, Ends with, Contains, Less than, Greater than, Not empty, and Empty.
Version	Pattern to match against the version. **Note:** If you don't specify a version, the signature matches any version.
Category	Category assigned to matching browser extensions.
Description	Brief description of the signature. For example: Extensions related to ChatGPT.
Active	When selected, activates the signature.

f. Select **Submit**.

Submitting the signature triggers evaluation of browser extensions against it and categorization of any matches.

3. **Optional:** Fetch metadata of the discovered browser extensions.

   a. Navigate to **All** > **System Properties** > **All Properties**.

   b. Set the system property `sn_acc_vis_content.collect_extended_browser_extension_metadata` to True to collect the metadata.

   c. Optional: Review the fetched metadata.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

i. Navigate to **All** > **System Definition** > **Tables**.

ii. Open the **Browser Extension Metadata** (sn_acc_vis_content_browser_extension_metadata) table.

iii. Review the metadata.

Result

The categorized browser extensions in your environment appear in the **Browser Extension Catalogs** (sn_acc_vis_content_browser_extension_catalog) table. Each entry in the table shows the browser extension, its assigned category, extension ID, version, and the signature that matched. Filter by category to see all the browser extensions in the group.

The **Device Browser Extensions** (sn_acc_vis_content_device_browser_extension) table shows the mapping of the discovered browser extensions for each browser and device, and their profile and status.

Software packages categorization

Agent Client Collector for Visibility (ACC-VC) classifies discovered software packages in your environment into categories. This categorization removes the need to tag software records manually and provides an accurate software inventory.

Software categorization overview

Software packages the system has discovered in your environment are stored in two different tables:

- If Software Asset Management (SAM) is installed on your instance, they are stored in the **Software Discovery Models** (cmdb_sam_sw_discovery_model) table.
- If SAM is not installed, they are stored in the **CMDB CI Package** (cmdb_ci_spkg) table and the **Software package** column is populated.

ACC-VC software categorization compares each discovered software package with active, admin-defined categorization signatures. A signature is a rule that matches software to a category based on the software name or publisher. When you activate the signature, ACC-VC scans discovered software and finds matches. The system then creates entries in the Software Categorization Catalog table. Each catalog entry identifies the software package, the category assigned to it, and the signature it matched. You can filter the catalog by category to review all software in a group, such as AI tools, security-related software, or communication tools.

Software is categorized or re-categorized automatically, without creating a new signature, in the following cases:

- An inactive signature is reactivated.
- New software is discovered that matches an existing active signature.

Categorize discovered software

Group discovered installed software packages in your environment by business relevance.

Before you begin

In the System Properties, verify that the software categorization system property is set to true: `sn_acc_vis_content.sw_categorization.enabled=true`.

Role required: discovery_admin

About this task

Software categorization classifies discovered software packages into categories, such as AI tools, security software, communication software, or a publisher-based category. Use this procedure to define a category and a signature that matches discovered software to that category.

Procedure

1. Create a category.

   a. Navigate to **All** > **System Definition** > **Tables**.

   b. Open the **Entity Categories** (sn_acc_vis_content_entity_category) table.

   c. Under related links, select **Show List**.

   d. Select **New**.

   e. On the form, fill in the fields.

   Entity Categories form

Field	Description
Name	The display name of the category. This field is required. For example: Adobe Acrobat, AI Tools, or Microsoft.
Description	Brief description of the category.
Active	When selected, activates the category. **Note:** You can also activate a saved category later from the **Entity Categories** table.

   f. Select **Submit**.

   g. **Optional:** View the saved categories in the **Entity Categories** table.

   Note: You can activate saved categories from this table by setting Active=true for the relevant categories.

2. Create a signature.
   The signature is a rule that matches software to a category based on the software name or publisher.

   a. Navigate to **All** > **System Definition** > **Tables**.

   b. Open the **Installed Software Signature** (sn_acc_vis_content_sw_install_signature) table.

   c. Under related links, select **Show List**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Select **New**.

e. On the form, fill in the fields.

Define the match condition using the software name, publisher, or both. Either the software name or the publisher is required.

Software install signature form

Field	Description
Name	The display name of the signature. This field is required. For example: ChatGPT.
Category	Category assigned to matching software. For example: AI Tools.
Software name condition	Matching condition for the software name. Options are: Exact match, Contains, Starts with, and Ends with.
Software name	Pattern to match against the software name. Defining either Software name or Publisher is required. For example: ChatGPT.
Publisher condition	Matching condition for the publisher. Options are: Exact match, Contains, Starts with, and Ends with.
Publisher	Pattern to match against the publisher. Defining either Publisher or Software name is required.
Version condition	Matching condition for the version. Options are: Any version, Exact match, Starts with, Ends with, Contains, Less than, Greater than, Not empty, and Empty.
Version	Pattern to match against the version. **Note:** If you don't specify a version, the signature matches any version.
Description	Brief description of the signature.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Active	When selected, activates the signature.

f. Select **Submit**.

Submitting the signature triggers evaluation of the installed software against it and categorization of any matches.

Result
The categorized software appears in the **Installed Software Catalogs** (sn_acc_vis_content_sw_install_catalog) table. Each entry in the table shows the software package, its assigned category, and the signature that matched. For each record, either the **Software package** or the **SAM discovery model** column is populated, depending on whether SAM is installed on the instance. Filter by category to see all the software in the group.

Discover portable software installed by package managers

Agent Client Collector for Visibility Content (ACC-VC) can discover software on Windows, Linux, and macOS endpoints that is not discoverable by traditional ACC-VC checks and policies. ACC-VC uses third-party package managers to track essential tools and development packages for software asset management (SAM) and IT asset management (ITAM).

Portable software discovery - overview

The Agent Client Collector software discovery policies discover software that has a dedicated executable file. The Software Discovery via Running Processes check detects software installed by package managers (containing .js files or .py modules) that is not detected by other ACC-VC checks, For details on ACC-VC policies and checks, see Agent Client Collector for Visibility Content default checks and policies.

With portable software package discovery, the ACC-VC agent identifies and reports portable software installed through a package manager. This includes globally-installed npm packages, which enrich your software asset inventory with Node.js-based tools and utilities.

What gets discovered

For each package found on a host, the agent captures the following information:

- Package name: The display name configured in the Portable Software Package Discovery (*sn_acc_vis_content_process_based_sw_config*) table, or the actual npm package name if no display name is specified.
- Version: The installed version of the package. Populated only if the number is available; otherwise, this field is blank.
- Vendor/Publisher: The vendor name from the configuration. Populated only if the vendor/publisher is available; otherwise, this field is blank.
- Installation directory: The file system path where the package is installed.

Configuring npm package discovery

To begin discovering packages, you must configure package discovery. See Configure portable software discovery in Agent Client Collector for Visibility Content for step-by-step instructions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure portable software discovery in Agent Client Collector for Visibility Content

Configure portable software the Agent Client Collector for Visibility Content (ACC-VC) agent discovers by updating the config table. This ensures that only portable software that was configured is searched for and discovered.

Before you begin

Ensure that you have access to the ACC-VC scoped app in your ServiceNow instance.

Role required: discovery_admin

About this task

Software discovery is governed by the Portable Software Package Discovery (*sn_acc_vis_content_process_based_sw_config*) table. When you add or remove entries from this table, the changes are delivered to ACC agents on their next check cycle, and an agent rebuild is not needed.

Procedure

1. Enter *sn_acc_vis_content_process_based_sw_config.list* into the navigation panel.
   The **Process Based Software Discovery Configurations** page opens.
2. Configure the following fields for each software name you want the system to discover.

Field	Description
Software name	The name to match. This is either the process's own name, or the script/package name that shows up in the interpreter's command line (for example, openclaw). Not case-sensitive.
Description	Enter descriptive text indicating why you're searching for the software.
Active	Select the check box for the software to be pushed to the agent.

3. Select **Update**.
4. Activate the **Software DIscovery via Running Process** policy.
   The discovered software displays in the Software installation (*cmdb_sam_sw_install*) table with the following fields discovered:

Field	Description
Name	The name of the software you configured in the Process Based Software Config (*sn_acc_vis_content_process_based_sw_config* table.
Version	The software version. If not discoverable during initial detection, the agent tries again every 5 minutes.
Vendor/Publisher	The vendor/publisher of the software. If not discoverable during initial detection, the agent tries again every 5 minutes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Install location	The directory that the discovered software resides in.
Status	When software is successfully discovered, value is *install ok installed*.

Discover portable software installed by package managers

ACC-VC NPVDI endpoints

Agent Client Collector for Visibility Content (ACC-VC) adjusts how its discovery and software checks run on Windows non-persistent virtual desktop infrastructure (NPVDI) endpoints, so that data collected during a short-lived session reaches your instance before the session ends.

How ACC-VC identifies an NPVDI endpoint

An NPVDI endpoint is a virtual desktop that is provisioned from a golden image for each user session and is reset or removed when the user logs off. Because the endpoint might not exist at the next scheduled discovery interval, ACC-VC changes when and how certain checks run on these endpoints so that session data isn't lost.

NPVDI support applies only to non-persistent Windows agents. Discovery of persistent Windows, macOS, and Linux devices remains unchanged. ACC-VC doesn't detect NPVDI endpoints automatically. An endpoint that isn't explicitly configured as non-persistent, including an endpoint with missing or unclear configuration, is treated as a persistent endpoint. The agent is marked as non-persistent when you install it on the golden image. For more information, see Enable a non-persistent virtual desktop infrastructure agent.

ACC-VC policies that support NPVDI

The following VDI policies list determines which policies run on NPVDI agents. ACC-VC has already added the following policies to this list, so you don't have to add them yourself. The list has no effect on persistent endpoints.

- *Enhanced Discovery*
- *SAM Discovery*
- *SAM background*
- *SAM background (Non OsqueryD)*

For more information about each policy, see Agent Client Collector for Visibility Content default checks and policies.

The *Software installed* policy isn't registered as a VDI policy because it applies only to servers. To add other published policies to an NPVDI agent, see Prepare agent deployment on a non-persistent virtual desktop infrastructure machine.

Data collection when an NPVDI session ends

The SAM Discovery policy runs on its regular schedule and also when the endpoint shuts down. Each run sends the software installation data it collects to your instance. The shutdown run makes sure that data collected since the previous run reaches your instance before the session and its data are removed.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Enhanced Discovery, SAM background, and SAM background (Non OsqueryD) policies run on their regular schedule only.

Reduced Enhanced Discovery on NPVDI endpoints

Some *Enhanced Discovery* inventory modules don't have to be collected again in every short-lived session. On NPVDI endpoints, ACC-VC can skip the following modules:

- File systems
- Network adapters
- Storage devices
- Local users
- Intel EMA
- Memory modules

By default, all six modules are skipped. You control the skipped modules and whether the installed software scan results are cached within the same session with a system property. For details, see Configure ACC-VC data collection for NPVDI endpoints.

The following inventory areas run on every check and can't be skipped:

- *Basic Inventory*
- *Enhanced Inventory*
- *TCP Connections*
- *Running Processes*

Installed software caching on NPVDI endpoints

The software installations and usage metrics check discovers the software installed on an endpoint and collects usage metrics for that software, such as last used date and total usage duration.

On NPVDI endpoints, you can enable caching of the installed software inventory. When caching is enabled, the full installed software scan runs one time for each golden image. Later check runs reuse the cached results instead of rescanning. Caching is turned off by default.

Caching applies only to the installed software inventory. Software usage metrics are collected on every check run, because usage is specific to each session and can't be reused.

Behavior when NPVDI configuration is unavailable

If an NPVDI endpoint can't read its NPVDI configuration, for example, because the acc.yml file is missing or malformed, ACC-VC doesn't skip any Enhanced Discovery modules and treats caching as turned off. Discovery then runs the same way it does on a persistent endpoint.

Configure ACC-VC data collection for NPVDI endpoints

Choose which *Enhanced Discovery* modules Agent Client Collector for Visibility Content (ACC-VC) skips on Windows non-persistent virtual desktop infrastructure (NPVDI) endpoints. Optionally, choose whether installed software scan results are cached within the same session.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Verify that your instance is prepared for NPVDI agents and that the agent is installed on the golden image as a non-persistent agent. For details, see Prepare agent deployment on a non-persistent virtual desktop infrastructure machine and Enable a non-persistent virtual desktop infrastructure agent.
- ACC-VC version 2.1.1 or later must be installed.
- Role required: admin

About this task

Two system properties control how ACC-VC collects data on NPVDI endpoints. These settings apply only to Windows endpoints that are configured as non-persistent. On all other endpoints, the full *Enhanced Discovery* and installed software scan run every time, regardless of these settings. For details on each property, see ACC-VC NPVDI system properties.

Procedure

1. Navigate to **All** and enter `sys_properties.list` in the filter.
2. Open the *sn_acc_vis_content.np_vdi.enhanced_discovery_skip_modules* property.
3. Set the **Value** field to a comma-separated list of the *Enhanced Discovery* modules to skip.

   Valid values are:

   - `file_systems`
   - `network_adapters`
   - `storage_devices`
   - `local_users`
   - `intel_ema`
   - `memory_modules`

   By default, all six modules are listed. To collect a module on NPVDI endpoints, remove it from the list. Any other value is ignored.

4. Select **Update**.
5. **Optional:** Cache the installed software inventory on NPVDI endpoints.

   a. Open the *sn_acc_vis_content.np_vdi.cache_installed_software_enabled* property.

   b. Set the **Value** field to `true`.

   c. Select **Update**.

   (Optional) When caching is enabled, the full installed software scan runs one time for each golden image, and later check runs reuse the cached results. Software usage metrics are still collected on every check run.

Result

When you update either property, the instance regenerates the NPVDI configuration file (`NPVDIConfig.json`) that ACC-VC uses on NPVDI agents. A daily scheduled job also refreshes this file.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Deploying Agent Client Collector on both servers and endpoints

When deploying the Agent Client Collector, there are components which are shared between servers and endpoints.

Checks and policies

A check is a combination of a command and its configuration. The check is executed on the Agent Client Collector's devices to gather data from those devices.

Checks

Checks are provided with the base system, and their commands execute scripts which provide monitoring data for your operating systems and applications. A check's default name indicates what is being monitored and measured, the entity, and the monitoring data. For example, a check named *os.linux.check-system-cpu* checks the CPU data on a Linux system. The identified command in the check runs on the monitored device, providing an output and status. Each individual check is referred to as a **check definition**. After being associated with policies, check definitions are then referred to as **check instances**.

You can customize check instances to meet your needs. For example, customize the running interval or the parameters specific to the policy, such as the login credentials to access a MySQL database. Customization of a check instance takes effect only on the check instance associated with the policy, which does not affect the original check definition or already created check instances in other policies.

The following check types are provided with the Event Management base system:

- **Event**: The check's result is transformed into an Event Management event.
- **Metric**: The values from the check result are transformed to metrics.

For details on the Agent Client Collector Framework default checks, see Agent Client Collector Framework default checks.

For details on the Agent Client Collector Monitoring default checks and policies, see Agent Client Collector Monitoring default checks and policies.

For details on the Agent Client Collector for Visibility Content default checks and policies, see Agent Client Collector for Visibility Content default checks and policies.

If checks are not running on the agent's devices, your agent may be in CPU protection mode. CPU protection mode is activated when a device's CPU consumption is too high. To view a list of all disabled checks related to the agent, navigate to the agent record on the Agent Client Collectors page (**All** > **Agent Client Collector** > **Agents**), select an agent and select the **Disabled Checks** tab at the bottom of the page.

In the `acc.yml` configuration file, you can modify the CPU protection mode thresholds which determine when a check is disabled. To re-enable a check, select the check and select **Re-enable disabled check** in the **Actions on selected rows...** drop-down. For details on the CPU protection mode thresholds, see Agent Client Collector CPU protection thresholds. For details on manually turning off data collection, see Pause Agent Client Collector data collection.

Configure the cpu_protection_behavior property to determine whether all checks enter CPU protection mode, or only the check that crosses the configured cpu_percentage_limit value with the highest CPU usage within the monitoring interval. For details, see Agent Client Collector CPU protection thresholds.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A check is marked as **Stale** if it is no longer associated with a policy. To remove a stale check, renable it by selecting the box next to the check and selecting **Re-enable disabled checks** from the **Actions on selected rows...** cell.

In the base system, the event's exit status indicates its severity, as follows:

- 0 = OK
- 1 = WARNING
- 2 = CRITICAL

You can add additional severities (such as MAJOR and MINOR) by running a customized script. The following exit statues indicate these severities:

- 13 = MAJOR
- 14 = MINOR

Privileges for running check commands

If the servicenow base system user does not have privileges to run specific check commands, do the following for the relevant operating systems:

- In a Linux system: Enable the servicenow user to run the command with `sudo` permissions. Ensure that the following sudo configuration requirements are met:
  - Disable tty and password requirements
  - Preserve all environment variables
  - Support dynamic PATH for executing commands

  Example configuration in the `/etc/sudoers` file:

```
Cmnd_Alias ACC_F = /usr/sbin/dmidecode -s
 baseboard-serial-number, /usr/sbin/dmidecode -s
 chassis-serial-number, /usr/sbin/dmidecode -s
 system-serial-number, /usr/sbin/dmidecode -s
 system-uuid, /usr/sbin/ss -tanp
servicenow ALL=(root)
 SETENV: /
var/cache/servicenow/agent-client-collector/osquery/bin/osque
ryi *, ACC_F
Defaults:servicenow !requiretty
Defaults exempt_group += servicenow
```

  Note: Command paths may vary. Consult the sudoers manual for special considerations.
  - The `SETENV:` string enables the servicenow user to preserve environment variables.
  - The `!requiretty` string disables tty.
  - Adding the servicenow user to the `exempt_group` bypasses password requirements and enables dynamic PATH for executing sudo commands.

  Ensure that you configure the *must_sudo* check parameter with a value of **true** in the check command parameters section of the check definition.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- In a macOS system: Ensure that the user running the agent service belongs to a user group with privileges to query all tcp connections on the host.
- In a Windows system: Using Windows User Management, add the servicenow user to the groups with the relevant privileges, enabling the user to execute the required commands.

Executing checks that missed their execution time

A check doesn't execute if the laptop or agent is down during its scheduled execution time. When this happens, the system behavior depends on whether the check has executed previously.

- Check that never executed: The check runs at the agent reconnect time + X (where X = 0-60 minutes), and this is the permanent run time of the check.

  For example: Policy X was synced to an agent. Check A in the policy never ran previously and was scheduled to run at 2am. However, the laptop was asleep at that time. The laptop wakes up at 9:09am. After the agent is restored, it notices that check A never ran. Check A is scheduled to run between 9:09am-10:09am and ends up running at 9:54am. The check A interval is every 24 hours, so check A now is scheduled to run daily at 9:54am.

- Check that missed an existing execution time: The previously run check runs at the agent reconnect time + X (where X = 0-60 minutes), but in the future, the check reverts to its originally scheduled run time.

  For example: Check A runs once a day and is scheduled to run daily at 9:54am. The laptop was asleep or the agent was not connected from 9am until 1pm. At 1:17pm, the laptop is awake and the agent starts and connects. The agent noticed that check A did not run at 9:54am and schedules it to run between 1:17pm-2:17pm. The check ends up running at 1:37pm. However, the next time check A runs is at 9:54am, its originally scheduled time.

  This scenario takes effect only for checks running at an interval of every 60 minutes or less frequently. Checks that run more often than every 60 minutes at their scheduled interval starting from whenever the agent is up.

Policies

A **policy** is a combination of the CIs being monitored by the Agent Client Collector and the check definitions that run on those CIs.

To enable a single policy to support multiple credentials, assign a credential alias to the policy. For example, if you have MySQL servers for both Linux and Windows with different credentials, you must create separate policies for each credential type. However, if you use a credential alias, you can assign a single policy to the alias. The agent then matches the relevant credential to the application being monitored. For details on credential aliases, see Create a Connection and Credential alias.

Alerts generated by policies with an event-type check are automatically closed when the CI monitoring stops due to any of the following:

- De-activating the policy
- De-activating the check that caused the alert
- Deleting the check from the policy
- Deleting the policy
- Modifying the policy filter that determines the monitored CIs

Agent Client Collector configuration data files

Configuration data files store dynamic instance data, such as virtual machine details, that check definitions use during execution. This ensures that checks are executed with up-to-date and accurate information about the instance being monitored.

Configuration data files structure

- Attachment based: A configuration data file contains a single attachment with instance data, such as Azure VM details.
- Synchronization: When an attachment is added or deleted, the data file is synchronized across all MID Servers configured with the Agent Client Collector. If a file or its attachment is deleted, it is also removed from the MID Server.
- Access point: The configuration data files can be accessed on the MID Server at `static/cache/config-files`.
- Size: Configuration data files cannot be larger than 10MB.

Check definitions used by configuration data files

- Check definition: Individual check entries are referred to as check definitions. For instance, *`os.linux.check-system-cpu`* checks the CPU on Linux systems.
- Accessing check definitions: Check definitions can be accessed from **All** > **Agent Client Collector** > **Configuration** > **Check Definitions**.

File association

- Download process: When a check executes, the agent downloads the configuration data file associated with that check.
- Domain-Specific Synchronization: Files are synchronized only with agents within the same domain, ensuring secure and localized data handling.

Working with configuration data files

Configuration data files serve as a repository for dynamic instance data that is used by check definitions when they are executed. These files ensure that checks are run with accurate, real-time information about the systems or instances being monitored. Configuration data files work as follows:

- Store instance-specific data: Configuration data files store dynamic instance data, such as virtual machine details, server configurations, and other system-specific information. This data is used by check definitions during execution to ensure the latest information is available.
- Create check definitions: A check definition is created with an associated configuration data file. For example, a check definition monitoring system CPU data may include configuration data detailing the system's environment, ensuring checks use accurate and relevant instance data.
- Synchronize with MID Servers: When a configuration data file is added or updated, it synchronizes across all MID Servers communicating with the Agent Client Collector. If the file or attachment is deleted, it is also removed from the MID Servers, ensuring consistency and up-to-date data availability.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Execute with updated data: During execution, the Agent Client Collector agent downloads the relevant configuration data file from the MID Server. The agent uses this data to execute the check, ensuring access to the most current and accurate instance information.
- Store and access data: Configuration data files are stored on the MID Server in the `static/cache/config-files` directory. This storage location facilitates easy access and management, ensuring the necessary data for checks is always available when needed.

Agent Client Collector API

Use the Agent Client Collector (ACC) API to create a flow that executes an `osquery` command on agents and processes the results. By leveraging the ACC API, you can automate the querying of agent data and streamline the processing of results, making it easier to monitor and manage system performance.

The system supports osquery 5.7.0, providing compatibility with a range of queries for efficient data collection.

The ACC API enables seamless integration and automation for executing queries and managing agents. Here's how it works:

1. Execute osquery commands: You can use the ACC API to send osquery commands to agents. These commands collect a wide range of system and performance data from the target machines.
2. Process results: After the osquery command is executed on the agents, the ACC API processes the results and returns the necessary data. This data can be used for monitoring, troubleshooting, or reporting purposes.
3. Support for osquery 5.7.0: The ACC API is compatible with osquery 5.7.0, which ensures it supports the latest features and improvements, enabling you to leverage advanced query capabilities for enhanced data collection.
4. Enable API features: To use the ACC API, enable the agent and policy APIs. This allows you to configure and manage various aspects of your agents, including their communication, data collection, and query execution.

For details on agent APIs, see Enable agent APIs.

For details on enabling policy APIs, see Enable policy APIs.

Agent Client Collector health instance scan suite

The Agent Client Collector (ACC) health instance scan suite consists of checks that detect anomalies and other issues that might occur on your instance. These checks ensure the overall health and performance of the ACC, proactively identifying potential problems before they impact system operations.

For details on running the ACC health instance scan, see Schedule the Agent Client Collector (ACC) health instance scan.

For details on the ACC health instance scan suite checks, see Agent Client Collector health instance scan checks.

For details on importing the `global.ACCInstanceScanUtil` script include, see the Script Include ACCInstanceScanUtil [KB1630132] article in the Now Support Knowledge Base.

Schedule the Agent Client Collector (ACC) health instance scan

Run the **Run (ACC) health instance scan** as a scheduled job to monitor the overall health of the instance receiving data from the Agent Client Collector.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: agent_client_collector_admin

About this task
This procedure describes how to schedule an ACC health instance scan. Alternatively, you can run the ACC health instance scan on demand, as follows:

1. Navigate to **All** > **Instance Scan** > **Suites**.
2. Select **ACC Health Instance Scan**.
3. Select **Execute Suite Scan**.

Procedure
1. Navigate to **All** > **System Definition** > **Scheduled Jobs**.
2. Select the **Run ACC Health Instance Scan** entry.
3. Select the **Active** check box.
4. Set the frequency by which the job is to repeat in the **Repeat Interval** field.
   The default is 7 days.
5. Select **Execute Now** to run the **Run ACC Health Instance Scan** job.

Result
The results of the job are compiled in the Scan Results (scan_result) table. Errors are compiled in the Agents issue (sn_agent_acc_error_msg) table.

For details on the ACC health instance scan suite checks, see Agent Client Collector health instance scan checks.

Agent Client Collector certificates

Agent Client Collector certificates verify the authenticity of your agents, servers, and users. Using Agent Client Collector certificates ensures the safety of your environment.

Discovering certificates

To discover certificates on all of your host's applications with open ports, navigate to **All** > **System Properties** > **All Properties** and set the *sn_acc_vis_content.tls_ssl_scan_all_open_ports* property to **true**.

If you want to maintain certificates only for applications running on specific ports, set this property to **false**. The property's default value is **true**.

Manually refresh Agent Client Collector certificates

Refresh Agent Client Collector self-signed certificates manually to validate Agent Client Collector plugins, instead of waiting for the scheduled synchronization. For example, you can use this feature when the agent can't validate a plugin and you don't want to wait for the scheduled synchronization.

Before you begin
- Ensure that the self-signed certificate is placed in a `.zip` file on the MID Server in the following location: `agent\static\cert`
- Ensure that the certificate authority is part of a truststore, as the certificate chain validates before the customer plugin signature.
- Role required: agent_client_collector_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Agent Client Collector** > **MID Servers**.
2. Select a MID Server.
3. In the Related Links section, select **Trigger ACC certificate sync**.
4. Restart the MID Server.

Result

When an agent fails to perform a certificate check, the agent synchronizes certificates available on the MID Server by pulling self-signed certificates from the install server. Certificates are downloaded by the Agent Client Collector if the agent does not validate its plugins.

Enable OpenSSL secure signing for plugins

Create a self-signed certificate for an Agent Client Collector plugin. The following procedure gives an example of how to create an x509 certificate using OpenSSL. For other certificate types, consult OpenSSL documentation.

Before you begin

- Ensure that the *verify-plugin-signature* property is set to **True** in the agent's `acc.yml` file to verify plugin signing.
- Ensure **OpenSSL** is installed on your system.

Role required: agent_client_collector_admin

About this task

Enabling an OpenSSL secure signing mechanism for plugins works with an Agent Client Collector installed on a Linux system.

Procedure

1. Create a plugin file with a `tar.gz` extension.
   For more information, see Create and edit Agent Client Collector plugins.
2. Generate your own secure self-certificate for the plugin file.

   a. Create an x509 certificate.

   ```
   openssl req -nodes -x509 -sha256 -newkey rsa:2048 -keyout
    "sign.key" -out "sign.crt" -days 365 -subj

    "/C=<CountryName>/ST=<StateOrProvinceName>/L=<Locality>/O=<O
   rganization>/OU=<OrganizationalUnit>/CN=sign"
   ```

   b. Sign the plugin file.

   ```
   openssl dgst -sha256 -sign "sign.key" -out sign.txt.sha256
    <plugin-name>.tar.gz
   ```

   Alternatively, you can sign plugins using a certificate authority. When doing so, assign the certificate .pem format and place it in the agent's `cert` directory.

   c. Verify that the signature is configured correctly.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
openssl dgst -sha256 -verify  <(openssl x509 -in
 "sign.crt" -pubkey -noout) -signature sign.txt.sha256
 <plugin-name>.tar.gz
```

If the file is valid, the output is `Verified OK`.

d. Encode the signature's certificate with base64 coding.

```
base64 sign.txt.sha256 > sign.txt.sha256_encode64.sig
```

A `sign.txt.sha256_encode64.sig` file is created.

3. Run the following commands to create a new directory and insert the `tar.gz` and `sign.txt.sha256_encode64.sig` files.
   a. `mkdir signed-plugin`
   b. `mv <plugin-name>.tar.gz signed-plugin`
   c. `mv sign.txt.sha256_encode64.sig signed-plugin`
   d. `cd signed-plugin`
4. Create another `tar.gz` file by running the same commands as you ran for the first `tar.gz` file.
   a. `tar -C . -zcvf ../<plugin-name>.tar.gz *`
   b. `cd..`

   Note: Save the new file as `../<plugin-name>.tar.gz` to avoid naming collisions with the original `<plugin-name>.tar.gz` file that exists in the current directory.
5. Upload the new `tar.gz` plugin file to the instance.
6. Set the plugin file as *`active=true`*.
7. Place the `sign.crt` file into one of the following locations:
   - The Agent Client Collector's `cert` directory, located in the `config` folder.
   - On the MID Server, compress the file into a `.zip` file and place it in the `agent/static/cert/customer` folder.
8. In the `acc.yml` file, set `verify-plugin-signature` to **true**.

What to do next

Add the self-signed `sign.crt` file to the agent host trust store, as described in Add a self-signed certificate to the OS truststore.

Add a self-signed certificate to the OS truststore

Add a self-signed certificate to the truststore of your operating system (OS). By adding a certificate to the truststore, you can verify that the certificate is authentic and that your connections are secure.

About this task

The procedure for adding a certificate to a truststore depends on the host's OS.

Adding a self-signed certificate to the truststore instructs the operating system to trust the certificate when it's establishing secure connections. This way, the applications can

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

communicate securely with services that use the self-signed certificate. If you add a certificate that isn't trustworthy, you might compromise your system's security.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. On a Windows OS:

   a. Press the Windows button + R on your keyboard.
   The **Run** field opens.

   b. Enter the string `certmgr.msc` and press **Enter**.
   The Certificate Manager opens.

   c. Expand the Trusted Root Certification Authorities directory.

   d. Select and hold (or right-click) **Certificates**.

   e. Select **All tasks** > **Import**.
   The Certificate Import Wizard opens.

   f. Follow the steps in the Certificate Import Wizard.
   For details, see Import a self-signed certificate.

   Alternatively, you can add a Windows certificate using PowerShell by running the following command as an administrator:

```
Import-Certificate -FilePath <path to your certificate file>
 -CertStoreLocation Cert:\LocalMachine\Root
```

2. On a macOS:

   a. Import the certificate into a keychain by running the following command in a terminal window:

```
bash

code:
sudo security add-trusted-cert -d -r trustRoot -k
 "/Library/Keychains/System.keychain" <path to your
 certificate file>
```

   b. Enter the administrator password when prompted.

   c. Open the Keychain Access application to verify that the certificate has been added.
   A successfully added certificate is labeled as, **This certificate is marked as trusted for...plugin verification.**

3. On a Linux OS:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Prepare the self-signed certificate file as a Privacy Enhanced Mail (PEM) file.

b. Copy the certificate to the Certificate Authority (CA) directory, which is the directory where the certificates are stored.

- On a Debian/Ubuntu-based system, run the following command:

```
sudo cp <path to certificate
 file> /usr/local/share/ca-certificates/
```

- On a Red Hat/Fedora-based system, run the following command:

```
sudo cp <path to certificate
 file> /etc/pki/ca-trust/source/anchors
```

c. Update the CA certificates:

- On a Debian/Ubuntu-based system, run the following command:

```
update-ca-certificates
```

The command reads the certificate bundle in the `/usr/local/share/ca-certificates` directory, updates the certificate bundle, and stores it in `/ext/ssl/certs/ca-certificates.crt`.

- On a Red Hat/Fedora-based system, run the following command:

```
sudo update-ca-trust extract
```

Result

Your self-signed certificate is on the OS that you are working with.

Import a self-signed certificate

Import a self-signed certificate in a Windows system by using the Certificate Import Wizard. The Certificate Import Wizard is required to complete the self-signed certificate import process on a Windows Operating System (OS).

Before you begin

Ensure that you have followed the procedure for importing a self-signed certificate in a Windows system, as described in Add a self-signed certificate to the OS truststore.

Role required: agent_client_collector_admin

Procedure

1. On the first page of the wizard, select **Next**.
   The truststore is typically located in the Trusted Root Certification Authorities directory of the certificate manager.
2. Browse to the location where you have the self-signed certificate file.
   The file is typically located in the agent's `config/cert` directory.
3. Select and hold (or right-click) the certificate file and select **Install certificate**.
4. Select **Next**.
5. Select the option to place the certificate in the Trusted Root Certification Authorities truststore.
6. Select **Next** and **Finish** to complete the wizard.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The certificate is imported into the truststore.

What to do next
If a security warning appears, select **Confirm** to confirm the import.

Revoke Agent Client Collector certificates

Stop communication between the agent and ITOM cloud services by removing an Agent Client Collector certificate. For example, there might be a security breach due to which you want to stop communication by revoking the agent's certificate.

Before you begin
Role required: agent_client_collector_admin

Procedure
1. Navigate to **All** > **Agent Client Collector** > **Agents**.
2. Select the agent for which you want to revoke the certificate.
3. Select the **Revoke Agent Certificate** button.
4. Select the reason for certificate revocation.
   For a list and explanation of the available revocation reasons, see Agent Client Collector certificate revocation reasons.
5. Select **OK**.
   The agent's certificate is revoked and the ITOM cloud services layer has its certificate revocation list (CRL) updated.

Result
Communication between the agent and ITOM cloud services is stopped.

Related topics
Add a self-signed certificate to the OS truststore

Agent certificate rotation

The Agent Client Collector certificate is valid for two years and must be rotated before it expires to avoid issues with agent connectivity. When expiration is approaching, the agent initiates a certificate rotation request.

When an Agent Client Collector's certificate expiration is approaching, system properties verify that a valid certificate is in place when the existing certificate expires.

- *certificate-rotation-days-out*: Indicates the number of days before certificate expiration that an agent attempts to rotate its certificate. Configured in the `acc.yml` configuration file. Default = 28.
- *sn_agent.certificate_rotation_days_out*: Indicates the number of days before certificate expiration that the system accepts a certificate rotation request for a specific agent. Configured on the System Properties page (**All** > **System Properties** > **All Properties**). Default = 28.

Run Certificate Discovery via Agent Client Collector for Visibility Content

Discover TLS/SSL certificates used by ports running on the agent's server. The Certificate Inventory and Management application uses this information to manage TLS/SSL certificates.

Before you begin

Verify that the latest version of Agent Client Collector for Visibility Content (ACC-VC) is installed.

Verify that the latest version of Certificate Inventory and Management is installed.

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Policies**.
2. Enable the *TLS SSL Certificate Capture* policy.
3. Navigate to **All** > **System properties** > **All properties**.
4. To discover certificates on specific ports:
   a. Locate and select the *sn_acc_vis_content.tls_ssl_scanner_ports* property.
   b. Enter a comma-separated list of port numbers on which to scan for certificates in the **Choices** field.
   By default, the values are identical to those values configured for the *tls_ssl_certs* property.
5. To discover certificates on all available open ports:
   a. Locate and select the *sn_acc_vis_content.tls_ssl_scan_all_open_ports* property.
   b. Assign the value **true**.
6. **Optional:** To store the original certificate in the instance, set the *sn_acc_vis_content.tls_ssl_keep_original* property to **true**.

Result

The Agent Client Collector collects the data and discovers the TLS/SSL certificates. This data is the same as what is gathered by the IP-based *tls_ssl_probe* property.

The TLS/SSL certificates are populated in the following tables:

- Discovered Certificates [sn_disco_certmgmt_certificate_history]
- Unique Certificates [cmdb_ci_certificate]
- Installed Certificates [sn_disco_certmgmt_cmdb_installed_certificate]

A CI relationship is created between the discovered certificates and the corresponding Host CI (in this case, the agent's server).

Collect data from your system devices

Run a check command on your server or database to gather data from those devices. Depending on the check that is invoked, collected data may be monitoring data, visibility data, log data, or user metrics.

Policies

A policy consists of the Configuration Items (CIs) monitored by the Agent Client Collector, and the checks that run on those CIs. Policies define which checks to run, as well as when and on which CIs to run them.

Checks

A policy runs a set of checks. Each check is defined with the following attributes:

- Command to run
- Check type
- Command timeout
- Plugins to be used (`tar.gz` files that are securely and automatically downloaded to the agent)

Determining when checks run

Policy checks run based on one of the following scheduling models:

- Interval-based scheduling: The minimum number of seconds between each check run. For example:
  - An interval value is at least once per hour (at least once every 3,600 seconds).
  - The agent was down during the scheduled interval when the check was to run. When the agent is back up, it runs the check within one hour.

  If a check interval is less than one hour, the check is executed based on the indicated amount of time since the check's most recent run. For example, for a check scheduled to run once every eight hours:

  - The check runs at 00:00 (midnight)
  - The check runs again at 08:00 (8 AM)

  However, if the agent is down at 8:00 and is back up at 09:03, the check runs within an hour; that is, between 09:03 and 10:03. If the check runs at 09:57, the next run is at 17:57 (5:57 PM). In these cases, the check picks the running time at random to ensure running of once every eight hours.

  A check completes its run when the results are sent to the MID Server (in a MID deployment) or ITOM Cloud Services (ICS) Pod (in a MID-less deployment).

- Cron-based scheduling: Runs at fixed times or intervals (for example, every day at 6:00 PM or every two hours).

Determining where checks run

Policies monitor the configuration items (CIs) that are mapped to the agent hosts. To determine the specific CI types to be monitored, you can create filters. For details on configuring policy filters, see Create a service filter for a policy.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Updating policy mappings

When activating a policy, Agent Client Collector Framework maps monitored CIs to a policy. This policy mapping repeats every seven days after the initial mapping. Every 15 minutes (by default), the Agent Client Collector monitors the CMDB for any changes matching the filter conditions, and updates the mapping accordingly. To modify the frequency by which mapping between the CMDB and CI is updated, modify the sn_agent_sync_filters_interval_min property on the System Properties page (**All** > **System Properties** > **All Properties**).

Verify data collection in Agent Client Collector

Collect data by gathering essential information from an agent's host system before executing any checks or policies. This process ensures that the Agent Client Collector has accurate and up-to-date data on the infrastructure, processes, and applications running on the host.

Before you begin
Role required: agent_client_collector_admin

About this task
Collected data is stored as Configuration Item (CI) data, which serves as a foundation for monitoring, alerts, and Metric Intelligence in the ServiceNow® instance.

Before checks and polices can be executed, Agent Client Collector collects data on:

- Host system details (such as hardware and the system's OS version)
- Installed applications and services
- Running processes
- Resource usage metrics (such as CPU, memory, and disk utilization)

Collected data is stored in the ServiceNow instance in either the CMDB (Configuration Management Database) or events table.

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agents**.
2. On the Agent Client Collectors page, locate the **Host Data Collection** column for an agent. A green Collected icon Collected indicates successful data collection for the specific agent.

Create an Agent Client Collector policy

Policies consist of the CIs monitored by the Agent Client Collector and the checks that run on those CIs. When creating a policy, you configure a filter which determines the CIs on which the checks are to run. For example, a policy to run checks on all Apache web servers. You can create new policies or edit the default policies.

Before you begin
Role required: agent_client_collector_admin

About this task
When associating a check definition with a policy, a copy of the definition is created as a check instance. These values appear on the **Check Instances** tab on the bottom of the **Policy** form. Any changes you make to a check instance affect only the instance in the policy; the original check definition remains unchanged. When changing the original check definition, the changes do not apply to already created check instances. It is recommended you make a copy of a check definition if you are changing its default parameters after having initiated one or more check definitions in a policy.

Some policy checks require credentials, while others don't. For example:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The Agent Client Collector does not require credentials for checks that run on its own server. However, when accessing software requiring root or administrator access (such as MySQL), credentials are required.
- When the Agent Client Collector is used as a proxy:
  - Credentials must be invoked to allow the agent to connect to the remote device over SNMP or other protocols.
  - Increase the agent's *cpu_percentage_limit* value in the `acc.yml` file, as indicated in the blue box on the **Proxy Settings** tab.
- When the Agent Client Collector uses the HTTP endpoint:
  - If the URL does not require logging in (such as with a public website), no credentials are required.
  - If the URL does require logging in (such as with an API endpoint), credentials are required.

You assign a credential alias in the policy's **Credentials** tab, as described in the following procedure.

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Policies**.
2. Click **New**.
   The **Policy** page appears.
3. Enter values in the fields on the page, as described in the following table:

Policy Definition Form

Field	Description
Name	A descriptive name for the policy.
Description	Description of the policy.
Publish status	Hard coded as **Draft**, which means that the policy has not yet been published. You cannot edit this field.
Hierarchy	Hard coded as **None**. When a child policy is added to the policy, the value changes to **Parent**. Child policies have a value of **Child**.

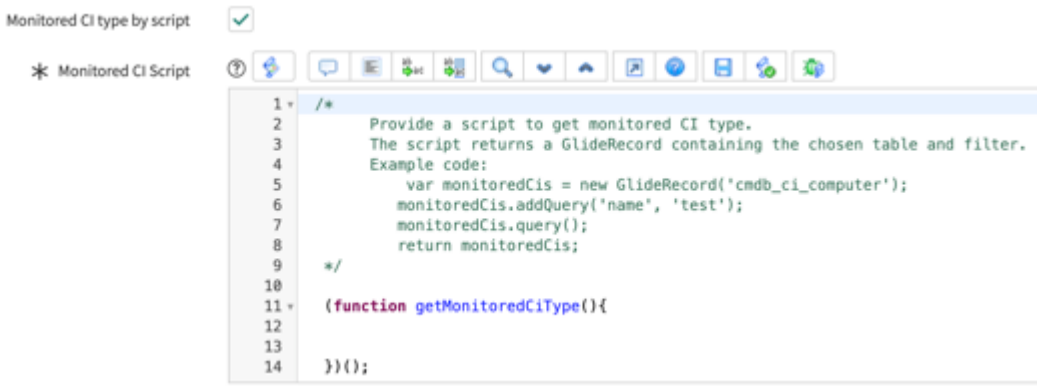
4. On the **Monitored CIs** tab, select one of the following options:
   - **Manual calculation**: Select to exclude the policy from scheduled policy calculation, ignoring any changes to the policy's impacted CIs.

     Select this option when the policy monitors a single CI. Otherwise, the Refresh and Publish Monitoring Policies scheduled job takes an abnormally long time to complete.
   - **Monitored CI type by filter**: Configure the following sub-fields:
     - **Monitored CI type**: Select the CI type which you want the policy's checks to monitor.
     - **Filter**: Configure a filter so that the policy's checks monitor only CI types meeting the specified criteria.
   - **Monitored CI type by script**: Enables you to specify the monitored CIs using a script. Using a script allows you to create a CI filter for tables related to each other, and not just for a single

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

table. For example, you can set a filter in both a Linux servers table and an Oracle table when searching for a CI. You return an object containing the table and filter at the end of the script.

An example of a script appearing in the **Monitored CI Script** field is:



- **Monitored CI type by CMDB Group**: Enables you to specify the monitored CIs by using CMDB group queries. When selecting this option, the **Monitored CMDB group** field appears, where you select a CMDB group to associate with the policy.
  - For details on CMDB groups, see CMDB groups.
  - For details on building a CMDB query using the CMDB query builder, see Build a CMDB query using the CMDB query builder.

5. Select checks in the **Available** cell on the **Checks** tab, and move them to the **Selected** cell for them to be included in the policy.
   Checks can be selected multiple times, when you are monitoring more than one process. You can also select a group of checks in the **Filter checks by groups** field, which presents checks of the selected group in the **Available** cell.
6. **Optional:** Configure a proxy server on the **Proxy Settings** tab.

   (Optional) Configure a proxy server only when using the agent as a proxy to report data on remote machines. For details, see Configure an agent on a proxy server.
7. On the **Scheduling** tab, select one of the following:
   - **Interval-based scheduling**: Configure the time interval (in seconds) to indicate the frequency with which the policy's checks will run.
   - **Cron-based scheduling**: Enables configuring the policy to be active only during a specific time or time frames.

     a. Select the unlock icon (

) to enable selecting cron expressions.

     b. Select the search icon ( ) to select a cron expression. Select **New** to create a new cron expression, or select one of the cron expressions that come with the base system, which are:
     - Every hour nightly 5:00pm-7:00am
     - Every minute daily 8:00am-4:59pm
     - Every minute Mon-Fri 8:00am-4:59pm

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When creating a new cron expression, you must enter it in valid cron format.

The specified cron expression operates in the time zone of the machine hosting the agent.

Note: If an **Interval** or **Cron** value was specified for the check definition, that value overrides the value configured in either of these fields.

8. On the **Credentials** tab, select one of the following:
   - **Credential name**: Select credentials to be assigned to the policy. The available credentials are those displayed on the associated check definition's **Check Secure Parameter Definitions** tab.
   - **Credential alias**: Select the search icon to select a credential alias to be used by the policy's checks to connect to the monitored CI. The available options are those created on the **Connection & Credential Aliases** page. For details on credential aliases, see Credential aliases for Discovery.
9. Click **Save**.
   The following buttons appear:
   - **Publish**: Publishes the Draft policy, moving its **Publish status** to **Queued**. A queued policy is processed by the policy publishing job. The job calculates which agents run the policy and then sends the policy to the relevant MID Servers. The job then moves the policy's **Publish status** to **Published**. A published policy is active on the agent.
   - **Delete**: Deletes the policy.

Related topics

Create a policy hierarchy

Create a policy hierarchy

Policies are attached to groups of related CIs. If you have a subgroup of related CIs, you can attach a new policy to the subgroup using a policy hierarchy, without creating the new policy from scratch.

Before you begin

Role required: agent_client_collector_admin

About this task

Policy hierarchy enables you to use a policy as a template to create a new policy, which is then attached to a subgroup of the original policy's CIs. The original policy is the **parent** policy, and the new policy is the **child** policy.

Note: You cannot create a child policy when a proxy agent is in place for the parent policy.

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Policies**.
2. On the **Policies** page, select a published policy with a Hierarchy value of either **None** or **Parent**.
3. Select the **Create Child** button at the top of the page or underneath the **Monitored CIs** tab.
   A new (child) policy opens with the same parameters as the original policy. The name of the policy is *<Policy name><date and time created>*.

Note: The child policy inherits the parent policy's parameters only when it is first created; there is no continuous inheritance from the parent to the child.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following fields appear hard-coded with the indicated values:

Child policy fields

Field	Value
Publish status	Draft
Hierarchy	Child
Parent	<Name of the parent policy>

The **Order** field value indicates the priority by which the agent attaches itself to the policy. A lower number indicates higher priority, and each created child policy takes on a higher value than the policy preceding it. You can modify this value, as needed.

4. Modify the policy's parameters, as needed.
The following buttons appear on the child policy page:

Button	Description
Compare to Parent	Select to display the differences between the child policy and its parent policy.
Return to Parent	Select to leave the child policy page (without saving) and return to the parent policy.

The following buttons appear on the parent policy page:

Button	Description
Deactivate	Appears for an active policy. Enables you to select from the following: ○ Deactivate the parent policy and all of its child policies ○ Deactivate only the parent policy
Activate	Appears for an inactive policy. Enables you to select from the following: ○ Activate the parent policy and all of its child policies ○ Activate only the parent policy
Delete	Enables you to select from the following: ○ Delete the parent policy and all of its child policies ○ Delete only the parent policy

5. Select **Save**.
Child policies appear on the **Child Policies** tab of the parent policy.

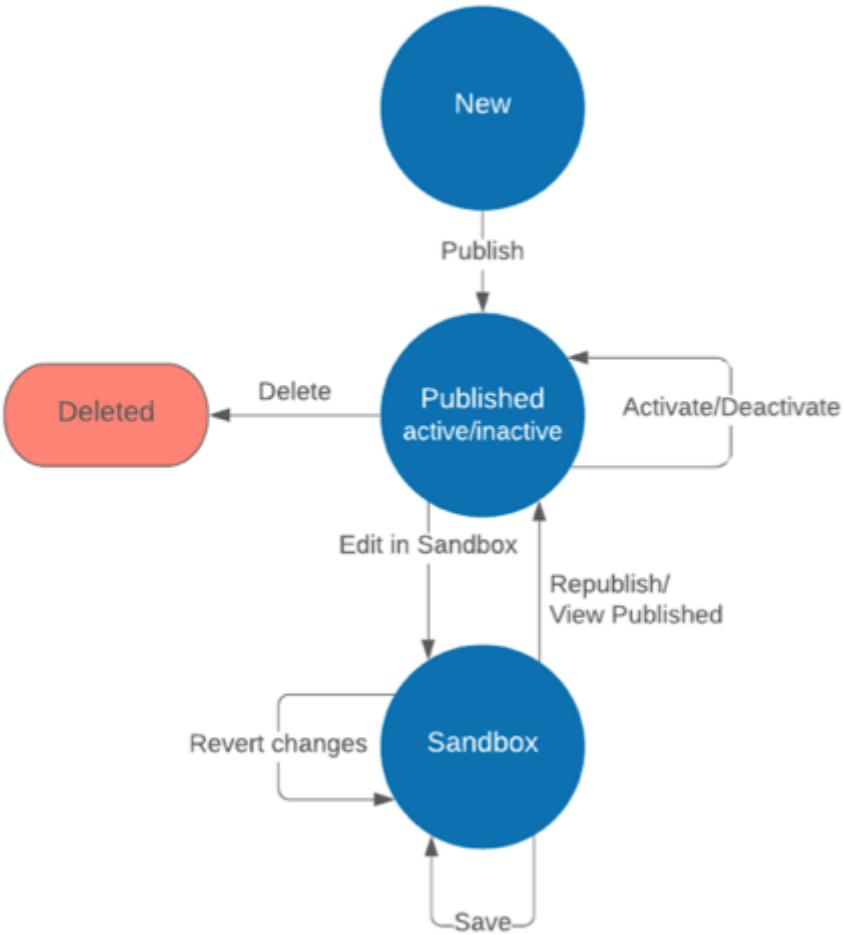
Edit a published policy

A policy with a status of **published** has been passed through the MID Server and sent to the agent. To edit a published policy, you must enable editing.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: agent_client_collector_admin

About this task
You select a Published policy and then select the **Edit in Sandbox** option to enable editing of the policy. You edit the policy in the sandbox and then save, republish, or delete the policy, as needed. The following diagram illustrates the flow of editing a published policy:

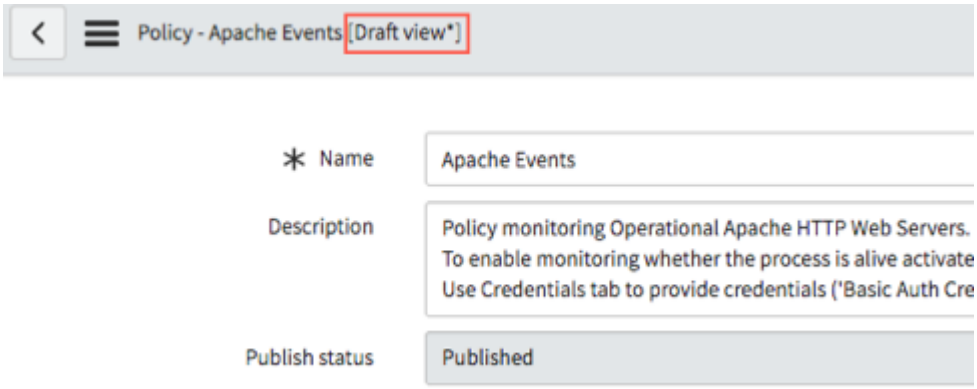


Procedure
1. Navigate to **All** > **Agent Client Collector** > **Policies**.
2. Click a policy for which the **Publish status** is **Published**.
3. Activate or deactivate the policy, as needed, by clicking the **Activate** or **Deactivate** button.
4. Select the **Edit in Sandbox** button.
   The policy is now in **Draft view**, and its fields are editable.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- When you select this option, the policy's check instances are also editable.
- Although the policy is in **Draft view**, its **Publish status** remains **Published**.



While editing the policy's fields, you can select the following options, as needed:

Edit policy buttons

Button	Description
Revert All Changes	Reverts the changes you entered into the Sandbox policy fields to the most recently published values. The policy's **Publish status** returns to **Published**, and remains in **Draft view** for editing. This button appears only after entering updates into the Sandbox policy fields.
View Published	Returns to the most recently published policy. The policy returns to **Published** view.
Save	Saves the changes you entered into the Sandbox policy fields. The policy remains in **Draft view**, and the **Publish status** is **Published***. The asterisk indicates that the current published version is not the most up to date, since there are changes that have not yet been published.
Republish	Publishes the updates you entered into the Sandbox policy fields. The policy is saved with your updates and opens as the published policy. ○ The published policy's **Publish status** is set to **Queued** if the policy changes result in either: ▪ A change in which agents are running the policy (that is, a change to the monitored CI filter). ▪ A change in the policy's check instances.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Button	Description
	The policy's publishing job recalculates Queued policies and sends them to the relevant MID Servers. ○ The published policy's **Publish status** is set to **Ready to publish** if the changes to the policy do not require any agent recalculation (that is, a change to the policy interval). The policy's publishing job sends Ready to publish policies to the relevant MID Servers, without recalculating those policies. After the policy publishing job processes a policy, the policy **Publish status** moves to **Published**. This button appears only after entering updates into the policy fields, for a policy whose **Publish status** is **Published***.
Delete	Deletes the policy. This button appears only when viewing the published policy, and deletes both the Published and Sandbox policies.

5. Select checks in the **Available** cell of the Checks tab, and move them to the **Selected** cell for them to be included in the policy.
   Checks can be selected multiple times, when you are monitoring more than one process. You can also select a group of checks in the **Filter checks by groups** field, which presents checks of the selected group in the **Available** cell.
6. In the **Check Instances** table, view the check instances that are configured for the policy, or select a check instance to edit it.
7. On the **Agents** tab, view the agents that are executing the policy.

   The list of agents is calculated based on the monitored CIs.

   This tab appears only when viewing a published policy.

Create a service filter for a policy

Configure a service filter so that the policy monitors only those services that match the filter.

Before you begin

Role required: agent_client_collector_admin

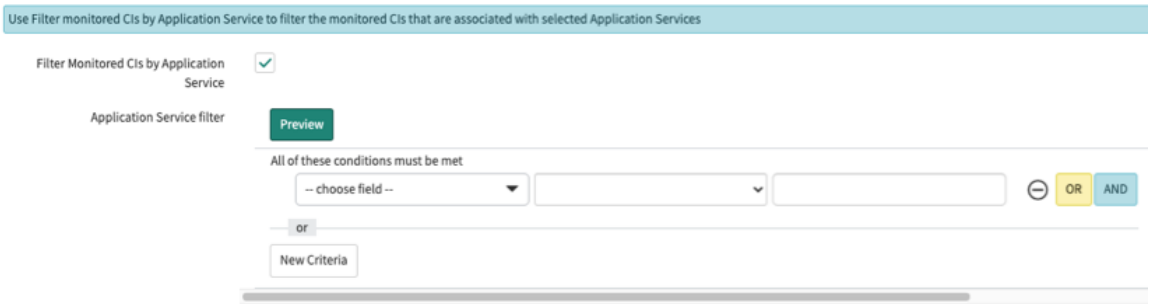
Procedure

1. Navigate to **All** > **Agent Client Collector** > **Policies**.
   The **Policies** page appears.
2. Select a policy.
   The details page of the policy appears.
3. Select the **Edit in Sandbox** button to enable editing the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. On the Monitored CIs tab, select the **Filter Monitored CIs by service** check box.
   The **Application Service filter** section appears.

Application Service filter section



5. Configure conditions in the fields and select **Save** at the bottom of the page.
   The policy is configured with the indicated service filter. Only CIs matching the service filter are included in the policy's logs.

Export and import an Agent Client Collector policy

You can move a single or multiple Agent Client Collector policies from one ServiceNow instance to another by exporting the policy and then importing it into the target instance. Only published policies can be exported.

Before you begin

Ensure that you published the policies you want to export on the source instance.

Note: When working in a domain separated environment, imported policies are moved from the source instance domain to the identical domain on the target instance. Therefore, you must ensure that you have defined the same domains on the target instance as you have on the source instance, either by cloning the source instance or by exporting and importing domains from the source to the target instance.

Role required: agent_client_collector_admin

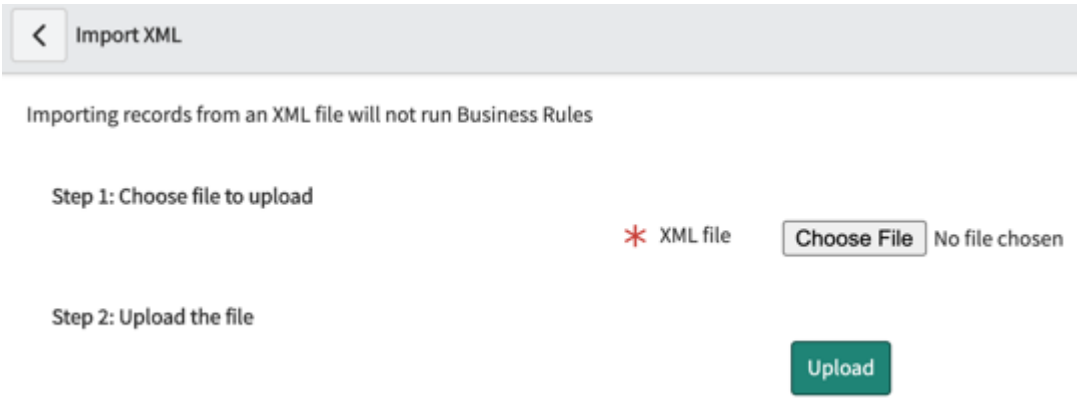
Procedure

1. Navigate to **All** > **Agent Client Collector** > **Policies**.
2. Select the check box of the published policies you want to export.
3. In the **Actions on selected rows...** list underneath the list of policies, select **Export policies**.
   A confirmation dialog box appears.
4. Click **Yes**.
   The selected policies are exported as an update set file in XML format, which is downloaded to your browser. The generated update set has the following name convention: `AccPolicyExport <Current Date and Time>`. For example, `AccPolicyExport 2020-08-11 15:35:05`.
5. Import the policy to the target instance.

   a. Navigate to **System Update Sets** > **Retrieved Update Sets**.
      The **Retrieved Update Sets** page appears.

   b. Right-click on one of the table headers and select **Import XML**.
      The **Import XML** page appears.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



c. Click the **Choose File** button and select the previously downloaded update set to import.

d. Click **Upload**.

> **Note:** When the exported content is in a scope, the imported update set appears on the **Retrieved Update Sets** page as multiple records. The **Global** scope record is the parent, and the other records appear with the Global record as their parent update set. Only the Global update set record can initiate the import process.

e. Select the **Global** update set.

f. On the **Retrieved Update Sets** page, click **Preview Update Set Batch** to verify whether there are any conflicts with existing policies on the target instance.
Resolve any conflicts, as needed.

g. If no conflicts exist, click **Commit Update Set Batch** to validate and commit the update set.

h. Navigate to **Agent Client Collector** > **Policies** and verify that the imported policies appear on the Policies list.
The imported policies are synchronized with the relevant MID Servers on the target instance and are ready for immediate use.

> **Note:** The import process overrides any existing policies on the target instance and sets the imported policies to **Published**. However, draft copies of policies created on the target instance are not modified. Therefore, delete draft records of the imported policies after completing the import process, as these records are not synchronized with the published policies on the target instance.

Create and edit checks

You can select a check based on the type of entity (such as a server or an application) you want to monitor. You can view and edit the default checks or create new checks, as needed.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Check Definitions**.
2. Click **New**.
   The **Check Definition** page appears.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Using Ruby scripts in a Windows environment causes high CPU consumption.

3. Enter values in the fields on the page, as described in Agent Client Collector check definition page.
4. On the **Parameters** tab, enter parameter definitions, as needed.
   Parameters are used for the **Command** field when the Simple template is used, as described in Agent Client Collector check definition page.

   The information you can add for parameters is described in Check definition form parameters tab.

Test a check definition or check instance

When working with a check definition or check instance, you can test the check against its assigned agent to ensure that the check is configured properly.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Check Definitions**.
2. Select a check definition from the list.

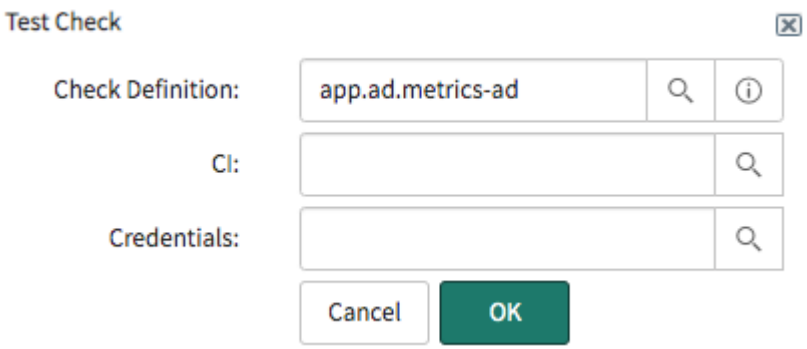
   Note: When running a Test Check in a check instance:

   a. Navigate to **Agent Client Collector** > **Policies**.

   b. Select a policy.

   c. Select a check instance in the policy.
   Continue with the following steps in this procedure.

3. In the **Related Links** section, click **Test Check**.
   The **Test Check** dialog box appears.



4. Configure the fields in the dialog box.

Test Check dialog box fields

Field	Description
Check Definition	Displays the name of the selected check definition.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
CI	Select the CI on which to run the check. The available options are those CIs which meet both of the following criteria: ○ Belong to the group specified in the **Check group** field. ○ Belong to an agent with **Up** status. If the **Check group** field is empty, the value defaults to **cmdb_ci_computer**.
Credentials	Select the credentials of the user whom you want the agent to connect with. This field appears only if you have configured secure check parameters on the **Check Secure Parameter Definitions** tab in the Check Definition.
Proxy agent	Select a proxy agent to be associated with the check. This field appears only when working with a check instance and when one of the options has been selected on the **Proxy Settings** tab in the instance's policy.

Create check parameters for a check

Create a check parameter to add a configurable input that customizes how a check runs, without changing the underlying script or command.

Before you begin
Role required: agent_client_collector_admin

About this task
A check parameter contains:

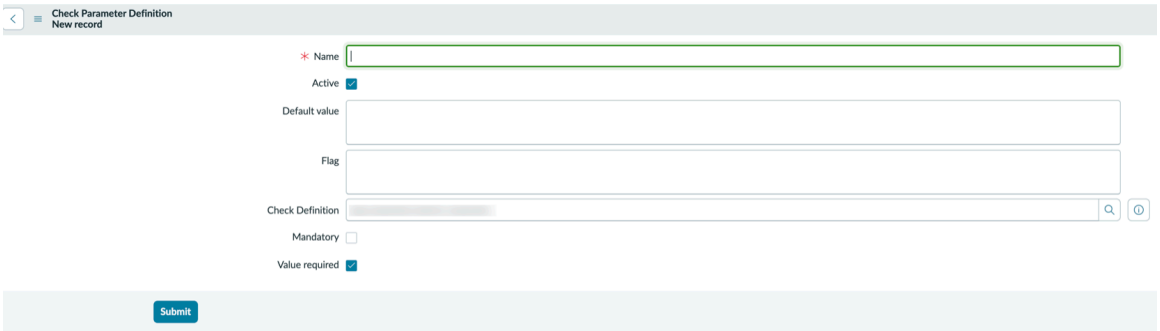
- Check Parameter Definition: defines each check type. It declares the parameter's name, meaning, default value, and the command-line flag it maps to.
- Check Parameter Value: specify the value of the defined parameter which is specific to a check instance.

Note: The meaning and valid values of any parameter depend on the related check definition.

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Check Definitions**.
2. Select a check definition from the displayed list.
   The **Check Definition** page for the selected check appears.
3. Scroll to the bottom of the page and select the **Check Parameter Definitions** tab.
4. Select **New**.
   The **Check Parameter Definition New Record** page appears.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. Configure the fields on the page.

Field	Description
Name	Name of the parameter, formatted as a refer ence prefix.
Active	Activates the check parameter on selection.
Default Value	Indicates that the parameter must contain a default value.
Flag	A prefix that must be added before the para meter value in the command. For example `-p`.
Check Definition	The name of the check definition connected to the parameter.
Mandatory	Indicates that the parameter is mandatory.
Value required	Indicates that a value must be provided for the parameter.

Note: The **Active**, **Flag**, and **Value required** options are displayed only when the **Command Auto Generation** option is selected.

6. Select **Submit**.
The configured parameter appears in the table on the **Check Parameter Definitions** tab.

   Repeat this procedure to enter multiple check parameters.

7. Enter the check parameters in the **Command** field of the check definition.
Each check definition has a **Command** field containing a template. Parameter values are substituted into this template at execution time:

```
check-kernel-parameter.rb {{if .labels.params_parameter_value}}
 -v {{.labels.params_parameter_value}} {{end}}
 {{if .labels.params_parameter_name}} -p
 {{.labels.params_parameter_name}} {{end}}
```

   - `.labels.params_<parameter_name>` refers to the value configured for that parameter.
   - `{{if ...}} ... {{end}}` adds the flag and value only when the parameter has a value. If the parameter is empty, its flag is omitted.
   - The flag prefix such as `-v`, `-p`, and so on is picked from the **Flag** field on the check parameter definition.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This command is assembled automatically from the configured parameter values.

Example:

The `os.linux.check-kernel-parameter` check defines two parameters:

Example parameter values

Parameter name	Flag	Purpose
`parameter_name`	-p	The Linux kernel parameter to check. For example, `kernel.shmmni`
`parameter_value`	-v	The expected value for that kernel parameter.

When you configure `parameter_name` with the following settings:

```
Name:           parameter_name
Active:         true
Mandatory:      true
Flag:           -p
Value required: true
Value:          kernel.shmmni
```

You also specify the `parameter_value` as 4096. The check runs as follows:

```
check-kernel-parameter.rb -v 4096 -p kernel.shmmni
```

Related topics

Create a check definition

Agent Client Collector check definition page

Create secure parameters for a check

When creating a check definition or check instance, you can configure the parameters you want to be secured when the agent executes the check. During check execution, the secured parameters are obfuscated, securing their information. Only credential information is obfuscated.

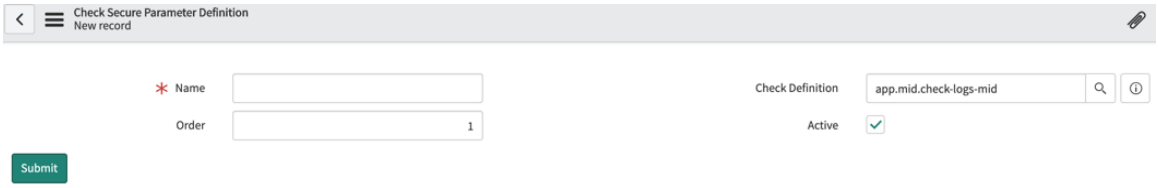
Before you begin

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Check Definitions**.
2. Select a check definition from the displayed list.
   The **Check Definition** page for the selected check appears.
3. Scroll to the bottom of the page and select the **Check Secure Parameter Definitions** tab.
4. Click **New**.
   The **Check Secure Parameter Definition New Record** page appears.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. Configure the fields on the page.

Field Name	Description
Name	The name of the parameter, formatted as a reference prefix. For example, `cred_` is a reference prefix for the credentials table.
Check Definition	The name of the check definition connected to the parameter.
Order	A number indicating the order in which the parameter is sent to the check command/script. For example, if you configure the following parameters: ○ Name=**cred_user_name**, Order=**1** ○ Name=**cred_password**, Order=**2** The *`username`* parameter is sent first to the standard input, and the *`password`* parameter is sent second to the standard input. The *READ* command is performed first on the *`username`* parameter and then on the *`password`* parameter. You can then use *`$username`* and *`$password`* in your *Bash* script.
Active	Select the check box to activate the secure parameter.

6. Click **Submit**.
   The configured parameter appears in the table on the **Check Secure Parameter Definitions** tab.

   Repeat this procedure to enter multiple secure parameters.

7. Enter the secure parameters into the **Command prefix** field of the check definition.

Create a check type

Create a check type to execute the `osquery` command on the Agent.

Before you begin

Role required: agent_client_collector_integration or agent_client_collector_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In an Event Management instance, enter `sn_agent_check_type.list` into the navigation bar.
   The **Check Types** page appears.
2. Click **New**.
   The `Check Type - New Record` page appears.
3. In the **Name** field, enter `osquery`.
4. In the **Instance Script** field, enter the following script:

```
for (var index = 0; index < checkResults.length; index++) {
var check = checkResults[index].check;
gs.info('result ' +
index + ': requestId: ' +
check.requestId + ' agent_name: ' +
checkResults[index].agent_id +
' ci_id: ' + check.ci_id +
' status: ' + check.status +
' output: ' + check.output);

}
```

   You can modify this script, as needed, but this initial script helps you to verify that your setup was successful.
5. Click **Submit**.

Create a check definition

Create a check definition to execute the `osquery` command on the Agent.

Before you begin

Role required: agent_client_collector_integration or agent_client_collector_admin

Procedure

1. In an Event Management instance, navigate to **Agent Client Collector** > **Check Definitions**.
2. Click **New**.
3. In the **Name** field, enter `util.osquery`.
4. In the **Check type** field, enter `osquery`.
5. In the **Command** field, enter the following script:

```
osqueryi  --logger_min_status 1 --json
 "{{.labels.params_query}} "
```

6. In the **Plugins** field, enter the `osquery` plugin.
7. In the **Parameters** section, enter the following values for a check parameter definition.

Column	Value
Name	query
Default value	select * from logged_in_users
Mandatory	true

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Click **Test check** and select one of the available agents.
   The test result appears, indicating its success or failure.

Enable checks from the community for Agent Client Collector

You can take checks from the github community and customize them for use in the Agent Client Collector (ACC), or you can compose your own scripts. Create a plugin with the customized Sensu check and install it on a ServiceNow instance.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. Copy a check from the github community to your local machine.
2. Create a `tar.gz` file to be appended to your plugin:
   a. Create a folder on your local machine.
   b. Create a sub-folder called `bin`.
   c. Place the checks you want to run (scripts and executables) in the `bin` folder.
   d. In a Linux environment, give executable permissions to the checks by running *`chmod +x filename`* on each of the checks.
   e. Navigate to the parent folder (above the bin folder).
   f. In a Linux environment, run the *`tar -C <parent_folder_name> --zcvf <my_plugin_name>.tar.gz *`* command.
   In a Windows environment, use an archiving utility that supports the `tar.gz` format.
   g. In a Windows environment, ensure that you include the following scripts in the `bin` folder:
      - A batch script configured to run on the check command and initiate the run. For example, *`powershell <%~dp0>\test.ps1`*

        The *<%~dp0>* variable directs to the drive (*d*) and path (*p*) of the batch file.
      - The relevant script (for example, `test.ps1`) to be executed in the batch script.
3. Create a new ACC plugin, as described in Create and edit Agent Client Collector plugins.
4. Test the new plugin.
   a. Create a new check definition for the customized Sensu check.
   For details, see Create and edit checks.
   b. On the **Check Definition** page, navigate to the **Related Links** section and select **Generate allow list content**.
   c. Copy the entries you want to include in the allow list and add them to the agent's `check-allow-list.json` file, either manually or using an automation tool.
   The location of this file is indicated in the `allow-list` parameter of the agent's `acc.yml` file.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Create a new policy and add the newly created check definition.
For details on creating a policy, see Create an Agent Client Collector policy.

e. Select the check definition and in the **Related Links** section, select **Test check**.

5. Enable credentials when testing a check:

a. Navigate to **Connections & Credentials** > **Credentials**.

b. Click **New**.

c. Select the type of credentials you want to create.
For details on creating credentials, see Create a Connection and Credential alias.

d. Enter values in the fields on the page to assign credentials to your selected credential type.

e. Click **Submit**.

6. Create secure parameters for your check, as described in Create secure parameters for a check.

Verify agent functionality

Verify that an agent is running properly by performing a self-test on the agent. If one or more of the tests fail, you can diagnose the agent problem and view a potential resolution.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agents**.
2. Select an agent that is running (**Status = Up**).
3. In the **Related Links** section, select **Run self-test**.
4. The **Agent Self Test Runs** page appears, displaying the previous self-tests run on the agent.
If the current test doesn't appear, refresh the page.
5. Hover next to the entry for the current test and select the info icon .
The **Agent Self Test Run** pop-up window appears.
6. Select **Open Record**.
The Agent Self Test Run page appears, displaying information on the self test.
7. In the **Agent Self Test Results** table at the bottom of the page, locate a test with **Status = Fail**.
8. Hover next to the entry for the failed test and select the info icon .
The **Agent Self Test Results** pop-up window appears.
9. Select **Open Record**.
The Agent Self Test Results page appears, displaying information on the failed test.

Result

In the **Agent Self Test Logs** table on the bottom of the page, you can view the level of the failed test (ERROR or WARNING), and a resolution for the failed test.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

View the Agent feature matrix

The Agent Client Collector Agent feature matrix displays the availability of Agent Client Collector features. The matrix displays data in a graph and a table.

Before you begin

Role required: agent_client_collector_admin

About this task

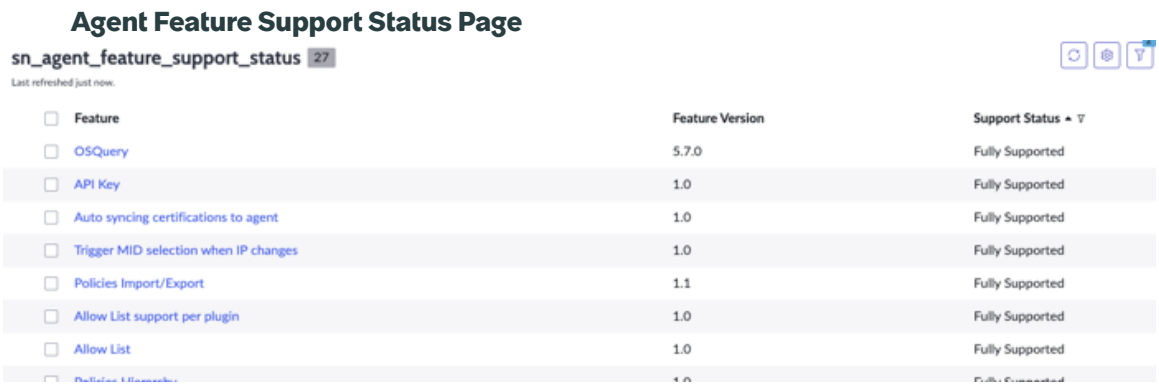
The Agent feature matrix displays the granularity of Agent Client Collector features that are fully supported, partially supported, and not supported. A partially supported feature may have instance and framework requirements met, but runs on at least one agent version which does not meet the feature requirements.

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agent Feature Matrix**.
   The **Agent feature matrix** appears.

   The matrix shows the support status of Agent Client Collector features that are fully supported, partially supported, and not supported (Unsupported).

2. Select one of the categories on the graph.
   A list of all features in the category appears on the **Agent Feature Support Status** page.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select one of the features.
   The **Agent Feature Support Status** page for the specific feature appears:

   The page displays the following:

   - Sections indicating the support status of the feature, and the various instance requirements of the feature. The **Action Items** field displays the actions you need to take to fully support a feature that is either partially supported or unsupported.
   - Instance requirements and agent framework version requirements that have been met by the agent feature.

View agent errors

Agent Client Collector (ACC) errors are visible in logs related to the agent and the ServiceNow instance. This feature provides improved visibility of agent errors, enabling faster error resolution.

Before you begin

- Ensure that the Error Framework (*com.glide.error_framework*) plugin is active.
- Ensure that the system property *sn_agent.use_glide_error_framework* is set to **true** (**All** > **System properties** > **All Properties**).
- Ensure that ACC Admin Workspace (*sn_acc_wrksp*) store application is active.

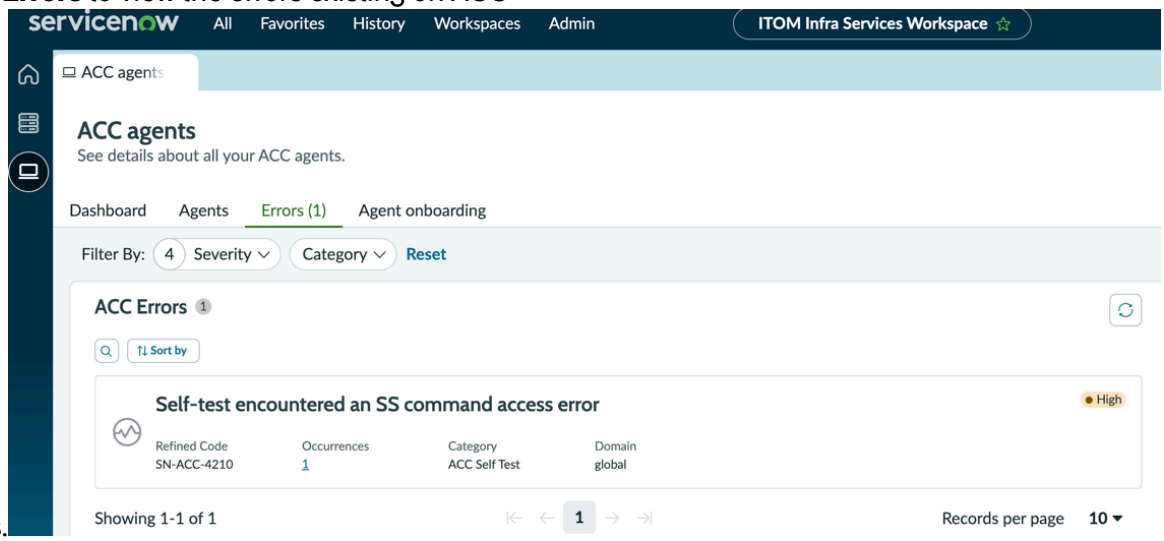
Role required: agent_client_collector_admin

Procedure

1. Navigate to **Workspaces** > **ITOM Infra Services Workspace**.
2. Select the ACC agents icon.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select **Errors** to view the errors existing on ACC agents.

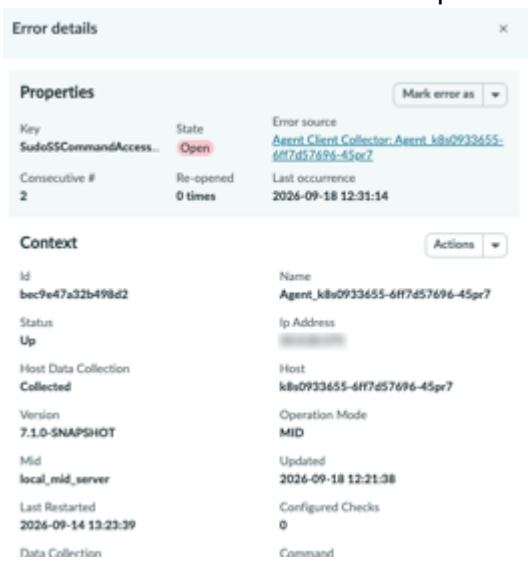


4. Filter the displayed errors by selecting severity and category values in the **Filter By** options. If you don't configure a filter, all agent errors appear.

5. Select an error to view additional information, including the error's root cause and remediation instructions.

   a. Select the **Errors** subtab to view detailed information about the error.

   b. Select the information ⓘ icon to open the **Error details** panel.



6. **Optional:** To view errors for a specific agent:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select **All** > **Agent Client Collector** > **Agents**.
The **Agent Client Collectors** table appears.

b. Select an agent.

c. Select the **Automation Error Messages** tab at the bottom of the page to view errors relating to the agent.

Using Agent Client Collector logs

Use Agent Client Collector logs to track events in your system. Log levels indicate the severity of each event.

Configure Agent Client Collector log levels

You configure the log levels that you want the Agent Client Collector logs to contain. All events that match or exceed the specified log level display in the Agent Client Collector logs.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. Specify the desired log level in the `acc.yml` configuration file.
   Alternatively, you can specify the log level as an argument in the `--loglevel` command-line flag, as follows:

```
acc start --log level debug
```

2. Restart the agent using the service manager:
   - **Linux**:

```
sudo service acc restart
```

   - **Windows**:

```
sc.exe stop AgentClientCollector
sc.exe start AgentClientCollector
```

   - **macOS**:

```
sudo launchctl load
 -w /Library/LaunchDaemons/com.sn.acc.plist
```

Note: You must restart the service after changing the log level.

View the Agent Client Collector logs

You can view the activity logs for an Agent Client Collector.

About this task

Agent Client Collector logs are accessible from:

- **Linux**: `/var/log/servicenow/agent-client-collector/acc.log`
- **Windows**: The location specified by the `log-file` configuration flag. The default location is: `C:/ProgramData/ServiceNow/agent-client-collector/log/acc.log`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If the C : /ProgramData directory is hidden (such as on older Windows versions), change the Explorer filter to show hidden elements.

- **macOS**: The default location is: /Library/Application\ Support/servicenow/agent-client-collector

Before you begin
Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agents**.
   The **Agent Client Collectors** page opens.

Agent Client Collectors page

   The displayed columns are those selected when clicking the Settings icon .

   The **Host** column indicates the host name of the agent.

   The **Class** column indicates the agent's CI type.

2. Select an agent.
   The **Agent Client Collector** page opens.
3. In the **Related Links** section, click **Grab Agent Log**.
   The **Queues** page opens for the selected Agent.
4. Refresh the page and click the relevant entry with the value **Queue = input**.
   The **Payload** section on the **Queue** form displays the log for the Agent Client Collector.

Enable log monitoring in a Linux environment

Enable log monitoring in a Windows environment

Set the agent log level

Configure the agent log level directly from your ServiceNow® instance, without needing to access the acc.yml configuration file.

About this task
Configuring the agent log level from the instance changes the log level temporarily, and doesn't update the log level in the acc.yml configuration file. When restarting the agent, the log level reverts to its status as set in the acc.yml configuration file.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: agent_client_collector_admin

Procedure
1. Navigate to **All** > **Agent Client Collector** > **Agents**.
2. Select an agent.
3. In the related links, select **Set Log Level**.
4. In the Set Log Level dialog box, select the log level to invoke for the agent, and select **OK**.
5. Reset the log level to its originally configured level by doing one of the following actions:
   - In the related links, select **Reset Log Level**.
   - Restart the agent.

Enable metrics collection and evaluation

To enable a ServiceNow instance to collect and evaluate metrics, you must create a distributed MID Server cluster, associate MID Servers with the cluster, and enable Metric Intelligence for your MID Server.

Before you begin
Ensure that the following plugins are installed on your instance:

- Event Management (com.glideapp.itom.snac)
- Metric Intelligence - com.snc.sa.metric plugin
- MetricBase

To verify that the MetricBase plugin has been installed correctly:

1. Enter `stats.do` in the instance navigation pane.
2. Search for the **MetricBase Statistics** section and verify that the following appears:
   - Status: ONLINE
   - Name: clotho

Role required: agent_client_collector_admin

Procedure
1. Create a distributed MID Server cluster in your instance:

   a. Navigate to **MID Server** > **Clusters**.
   The MID Server Clusters page opens, displaying the list of configured MID Server clusters.

   b. Click **New**.
   The **MID Server Cluster - New record** page opens.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

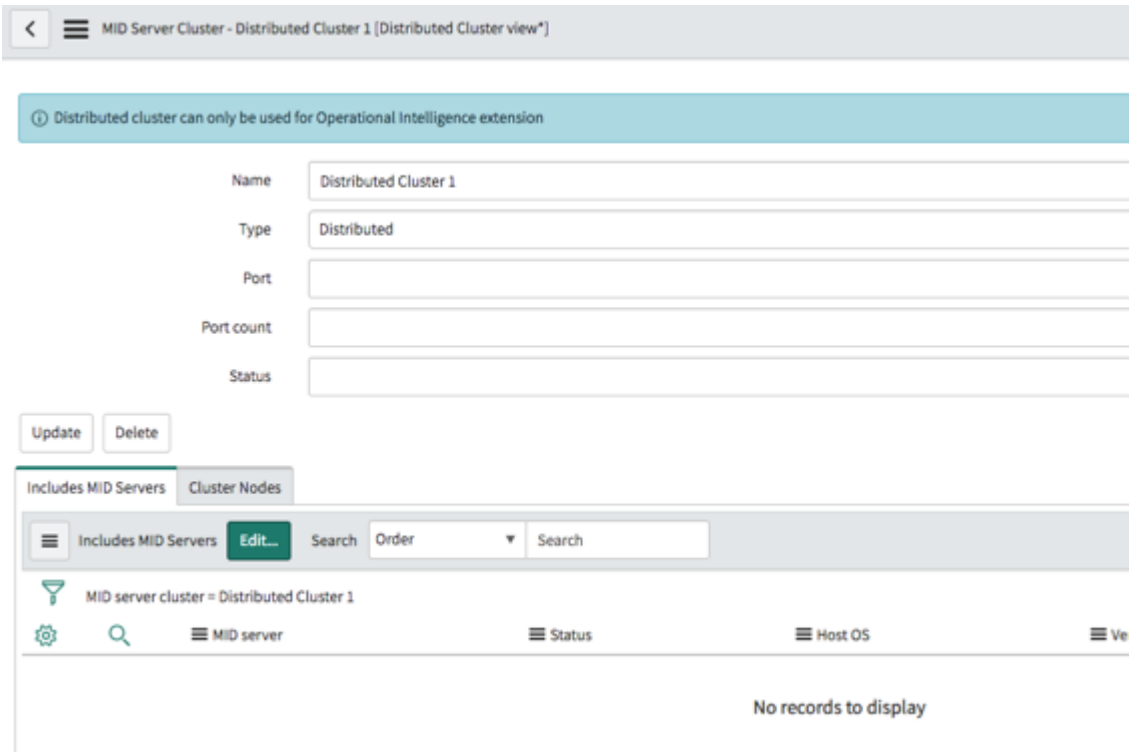
c. In the **Name** field, assign a descriptive name for the cluster.

d. In the **Type** field, select **Distributed**.

e. Click **Submit**.
The distributed MID Server appears on the MID Server Clusters page.

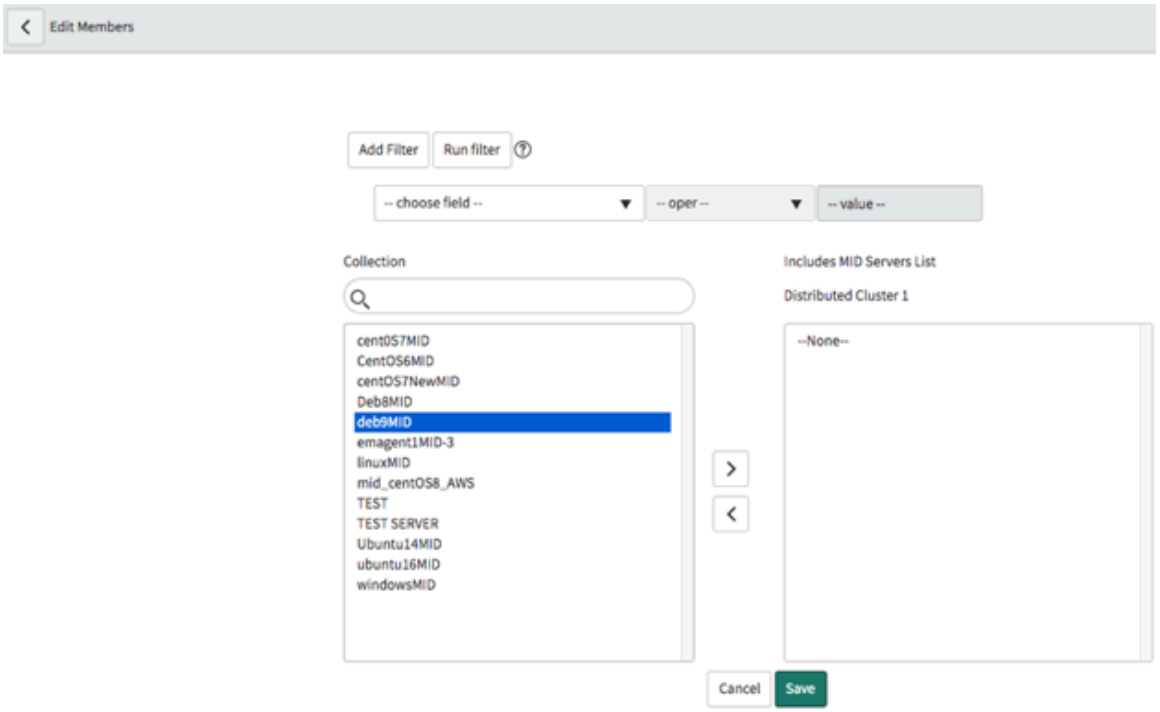
2. Assign MID Servers to the distributed MID Server cluster:

a. On the MID Server Clusters page, select the distributed MID Server cluster.
The following page appears:



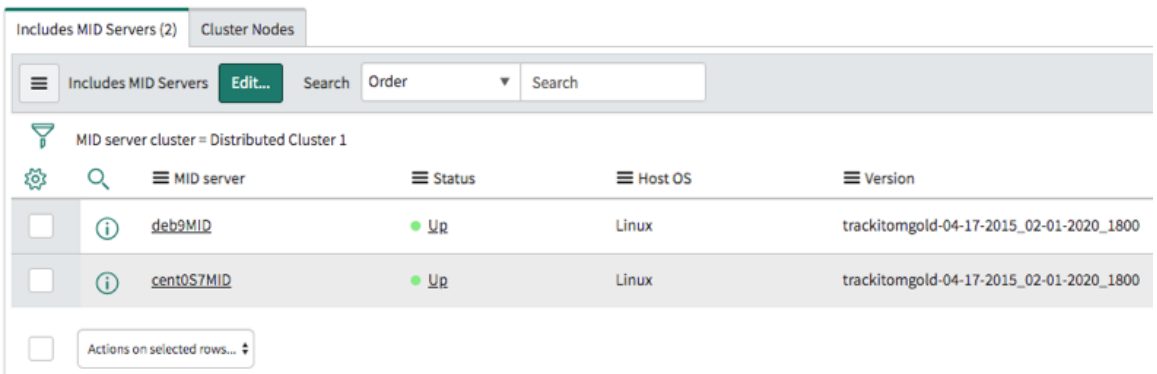
b. On the **Includes MID Servers** tab, click **Edit**.
The **Edit Members** page appears.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



c. Select the relevant MID Servers from the left cell and click the right arrow button to move them to the right cell.
In a staging environment, it is acceptable to have only one MID Server in the cluster.

d. Click **Save**.
The **Includes MID Servers** tab displays the MID Servers that are part of the cluster.

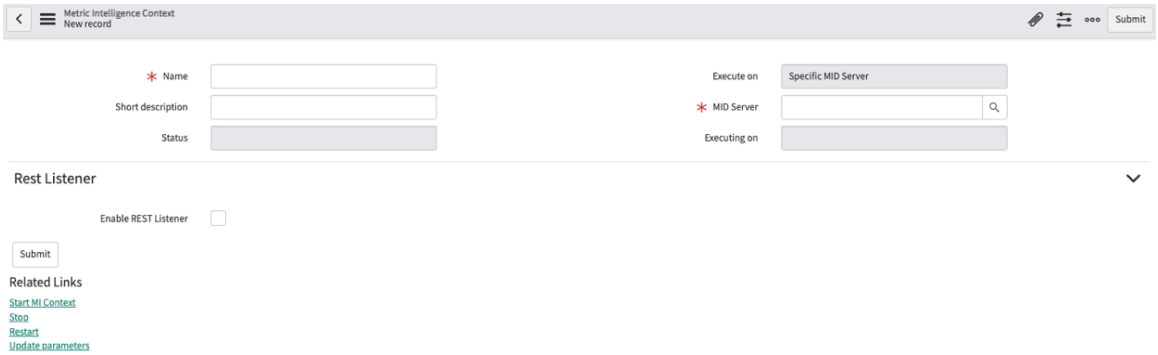


3. Enable Metric Intelligence for your MID Server:

a. Navigate to **MID Server** > **Extensions** > **Metric Intelligence**.
The **Metric Intelligence Metrics Contexts** page appears.

b. Click **New**.
The **Metric Intelligence Contexts - New record** page appears.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



c. In the **Name** field, enter a descriptive name for the Metric Intelligence metrics extension.

d. In the **MID Server** field, select the MID Server to which you want to associate the Metric Intelligence metrics extension.

e. Select the **ACC Dedicated MID** check box to assign the specified MID Server as the only MID Server in the distributed cluster.
Selecting this option helps conserve system resources and memory.

f. In the **Related Links** section at the bottom of the page, click **Start**.
A message appears, indicating the status of the extension.

g. Click **Submit**.

h. Click **Start**.

Related topics

Limit metrics collection and evaluation

Limit metrics collection and evaluation

You can limit the metrics you send from the MID Server to the instance, either by de-activating a specific CI or an entire CI type.

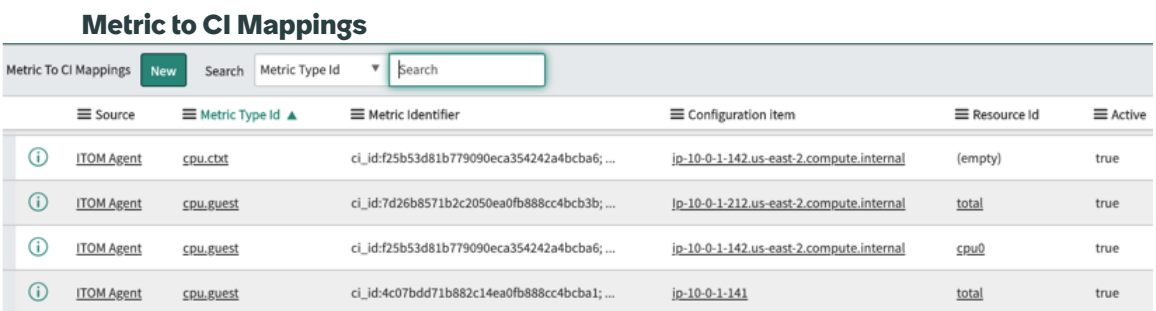
Before you begin

Role required: agent_client_collector_admin

Procedure

1. To limit metrics collection and evaluation for specific CIs:

a. Navigate to **Event Management** > **Anomaly Detection** > **Metric to CI**.
The **Metric to CI Mappings** page appears.



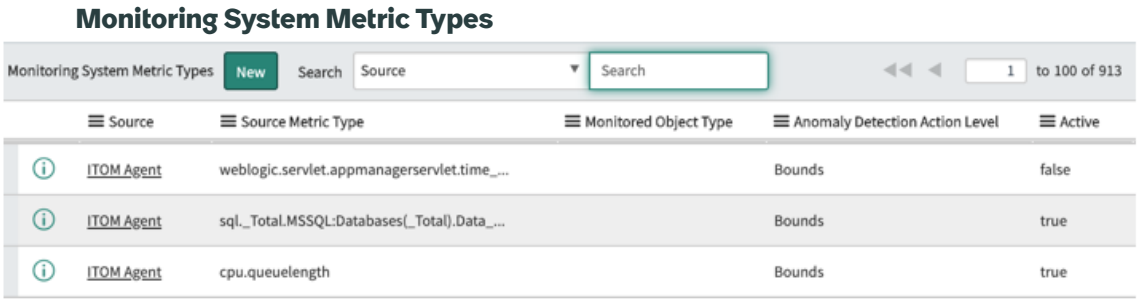
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The Metric to CI Mapping is identified by both its metric identifier and its configuration item.

b. To prevent sending metrics for a specific metric and CI, set the value of the **Active** column to **false**.

2. To limit metrics collection and evaluation for an entire CI type:

a. Navigate to **Event Management** > **Anomaly Detection** > **Metric Types**.
The **Monitoring System Metric Types** page appears.



b. To prevent sending metrics for a metric type, set the value of the **Active** column to **false**.

Software filter

The Software filter lets you define rules to automatically exclude irrelevant entries from your Software Asset Management (SAM) inventory. At the same time, it keeps a complete, auditable record of everything filtered so that nothing disappears silently.

Discovery and the Agent Client Collector regularly report every application installed on a device. However, not everything found is meaningful licensing or asset-management software. For example, Operating-system shortcuts, Progressive Web App (PWA) stubs, Citrix Receiver placeholder entries, browser-extension shortcuts, and similar artifacts are frequently reported as installed software. However, they aren't applications your organization is licensing, tracking, or reconciling.

Software filter - Benefits

- Cleaner license reconciliation. Irrelevant entries no longer inflate install counts or trigger false compliance findings.
- Less manual clean-up. You no longer must search for and deactivate the same irrelevant software records after every discovery cycle.
- Full transparency. Every exclusion is logged, so you can see what was filtered, when, and by which rule.

How filtering works

Agent scans and background discovery runs produce software installs on devices in your network. Each item is checked against the set of currently active filter rules before it is written to your SAM software inventory.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If an item matches an active rule, it is excluded from the SAM inventory and a record of the exclusion is written to the review table instead.
- If an item matches no active rule, it flows through to your SAM inventory as normal. Nothing changes for software that is relevant to you.
- If the same software is reported again on a later scan, its existing review record is refreshed, not duplicated. The review table reflects the latest confirmation date rather than growing indefinitely.

A single malformed rule (for example, an invalid pattern) is skipped and logged rather than blocking the rest of the check. One bad rule doesn't accidentally exclude everything.

For details on the tables that determine which entries are labeled as irrelevant, see Software filter tables.

Modifying rules

If you deactivate or edit a custom rule, the behavior of excluded software changes on the next discovery scan:

- Software that no longer matches any active rule stops being excluded and flows into your SAM inventory as normal.
- Entries for filtered software remain in the Software Install Filter Staging table as a historical record, but are no longer refreshed with new confirmation dates.
- If you reactivate the rule or change it to match the software again, exclusion resumes on the next scan and the staging table entry is refreshed.

Create a custom filter rule

Create a custom filter rule in the Software Install Custom Filter table (samp_sw_install_custom_filter). Rules determine the criteria by which software is excluded from your Software Asset Management (SAM) workspace.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. Navigate to the Software Install Custom Filter table **All** > **Software Install Custom Filter**.
2. Select **New** to create a custom filter rule.
3. Complete the fields based on the software you want to exclude.
   For details on the available fields, see Software filter fields.
4. Select **Submit**.

Result

The custom filter rule is created and takes effect on the next discovery or agent scan that reports matching software.

Example: Exclude a custom internal shortcut

Your organization has an internal tool that installs a desktop shortcut called *`Company Portal Shortcut`* on every managed Windows device. To ensure that it doesn't clutter your SAM inventory, configure the rule as follows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Name**: Exclude Company Portal Shortcut
- **Software Name**: Company Portal Shortcut, Condition: Exact match
- **OS Filter**: Windows
- **Discovery Source**: (leave blank)
- **Active**: On

From the next scan onward, any Windows device reporting *Company Portal Shortcut* will have that entry excluded from the SAM inventory and logged in the review table instead.

Review filtered software

Review the entries in the Software Install Filter Staging table (samp_sw_install_filter_staging) to confirm your rules are filtering only the software you expect.

Before you begin
Role required: agent_client_collector_admin

About this task
The Software Install Filter Staging table automatically records every software item that has been excluded by an active filter rule.

When the same software is reported on a later scan, its staging table entry is automatically refreshed with the new confirmation date. Entries that have not been updated indicate software that has not been reported recently by your devices.

Procedure

1. Navigate to the Software Install Filter Staging table (**All** > **Software Install Filter Staging**).
2. Review the records to verify the software that has been excluded and by which rule.
   Each entry contains the following information:
   - The software's display name, publisher, version, and discovery source.
   - The custom rule that excluded it (appears blank if it was excluded by a rule from the base-system).
   - The date it was last reconfirmed as excluded.
3. Confirm that your rules are excluding only the software you intended.
   If you find unexpected exclusions, check your active rules and adjust them as needed.

Configure the Google Cloud Platform (GCP) configuration data file

Configure the Google Cloud Platform (GCP) configuration data file to monitor metrics in your GCP environment.

Before you begin
Role required: agent_client_collector_admin

About this task
The GCP configuration data file is a .json file which contains all of the metrics collected from your GCP environment. Metrics that you add to the *acc_gcp_metrics_list.json* file are monitored by the check to which the file is attached.

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Configuration** > **Configuration Files**.
2. Locate the *acc_gcp_metrics_list.json* configuration file.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Download and add the GCP metrics to the configuration file that you want to be monitored. For details on the available GCP metrics, see Google Cloud Platform (GCP) metrics.
4. Select the Manage Attachments icon ( ) to attach the updated configuration file.

Configure the action level for anomaly detection

Create a configuration setting rule that refines the level of anomaly detection processing and analysis that is applied to specific CIs and metrics. Set a processing level that reflects the importance of metrics at different stages of implementation, to reduce data load if needed.

Anomaly detection consists of multiple levels of processing. At the lowest level, metric data is gathered from data sources. At the highest level, statistical models are created, anomaly scores are calculated, and anomaly alerts and IT alerts are created. You can apply the full anomaly detection process or a reduced level of processing, for specific data series.

Use the *anomaly_detection_action_level* configuration setting in a configuration setting rule to set the level of processing for specific CIs and metrics. For example, you can initially set only a small percentage of CIs and metrics to generate anomaly alerts, and later increase that percentage.

Action levels

The *anomaly_detection_action_level* configuration setting provides action levels starting at 'Metrics only' for basic anomaly processing, and ending at 'IT Alerts' for full processing and analysis.

Action levels from lowest to highest:

Metrics Only

Only gather metrics from the data source without any further processing.

Bounds

'Metrics Only' processing level and in addition creates statistical model and show bounds in Insights Explorer.

Anomaly Scores

'Bounds' processing level and in addition calculates and display anomaly scores.

Anomaly Alerts

'Anomaly Scores' processing level and in addition creates anomaly alerts as applicable.

IT Alerts

'Anomaly Alerts' processing level and in addition creates IT alerts which are based on anomaly alerts, as applicable.

Create a configuration settings rule

Create Azure policies for metric collection

Create your own policies to enable Azure to collect the metrics for the resources that have policies that don't come with the base system. The Azure Metrics Collector check brings the metrics to the agent through the Azure Metrics Batch API.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Ensure that the configuration Items (CIs) that you want to collect the metrics for are included in the CMDB. CIs are typically populated during Discovery.
- Ensure that the *sn_agent.multi_ci_dev_mode* property is set to **true** on the **System Properties** page (**All** > **System Properties** > **All Properties**).

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Policies**.
2. Select **New**.
3. Select the application scope icon and verify that you are in the Agent Client Collector Monitoring scope.
4. In the **Name** field, enter a name for the policy.
5. Configure a filter that determines which CIs are to be monitored by the policy by selecting the **Monitored CIs** tab and the **Monitored CI type by filter** check box, as described in the following table.

Monitored CIs filter

Option	Action
Monitored CI type	Select the CI type to be monitored. The CI type must match the resource that you entered in the .json script file that contains the metrics to be monitored.
<Filter fields>	Configure the conditions that must be met for the resources in the specified Monitored CI type to be monitored. Ensure that you set the following conditions: ○ **Object ID** = <name of the resource entered in the .json script file that contains the metrics to be monitored> ○ **State** = Available The Available state indicates that resources must be available to be monitored.
Preview	Select to view the number of resources that match the specified condition. The number of matching results appears next to the **Preview** button. Select the result to view all CI records that match the condition.

6. Add the Azure Metrics Collector check to the policy.
   a. On the **Checks** tab, locate the **Azure Metrics Collector** check in the **Available** cell.
   b. Select the right arrow button to move the check to the **Selected** cell.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Configure a proxy server to access the Azure metrics.
   a. On the **Proxy Settings** tab, select **Single proxy agent**.
   b. In the **Proxy agent** field, select the proxy agent to execute the policy and retrieve the Azure metrics.
8. Configure the credentials for the policy.
   a. Select the **Credentials** tab.
   b. In the **Credential name** field, select the **azure_metrics_collector**.
9. Select **Save**.
10. Add secure parameters to the check instance.
    a. In the policy's **Check Instances** section, select the **Azure Metrics Collector** check instance.
    b. On the **Check Secure Parameters** tab, select **New**.
    c. Add the secure check parameters that are described in the following table.

Secure check parameters

Name	Order value
cred_tenant_id	1
cred_client_id	2
cred_secret_key	3

Ensure that the **Active** check box is selected for each parameter.

    d. Select **Update**.

11. Add the `.json` configuration file to the check instance.
The file sends the list of Azure resources to the agent.
    a. Select the Azure Metrics Collector check instance.
    b. Select the **Check Parameters** subtab.
    c. Select **New**.
    d. On the form, fill in the fields.

Check Parameter form

Field	Description
Name	Descriptive name for the `.json` file to be added to the instance's configuration files (**Agent Client Collector** > **Configuration Files**).
Value	String that indicates the name of the `.json` file.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	For example: `acc_azure_vm_metrics_config.json`
Flag	Value that you enter (**-c**) to indicate that the check retrieves the name of the configuration file. The configuration file contains a namespace and a list of metrics. The value must indicate the name of the file that was uploaded to the list of configuration files (**Agent Client Collector** > **Configuration Files**), in `.json` format. For example: `acc_azure_vm_metrics_config.json`.

Ensure that the **Active**, **Mandatory**, and **Value required** check boxes are selected.

e. Select **Submit**.

12. Create a `.json` file that indicates the metrics that you want your policy to monitor.

The following example displays a `.json` file for retrieving load-balancer metrics.

acc_azure_static_ms_lb_config.json

```
{
  "namespace": "Microsoft.Network/loadBalancers",
  "metrics": [
        "AllocatedSnatPorts",
        "ByteCount",
        "DipAvailability",
        "PacketCount",
        "SnatConnectionCount",
        "SYNCount",
        "UsedSnatPorts",
        "VipAvailability"
  ],
  "time_grain": "PT1M"
}
```

Add the `.json` file to the list of configuration files at **Agent Client Collector** > **Configuration Files**.

13. Create a .json file to indicate the resources that you want your policy to monitor.

a. On the **Proxy Settings** tab, select **Multi-CI Mode**.

b. Copy a script from one of the Azure cloud policies that comes with the base system.

- Cloud policies that come with the base system are described in Create Azure policies for metric collection.
- The script is located in the **Config file creation script** field of the policy's **Proxy Settings** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Paste the script into the **Config file creation script** field of your policy.

d. At the end of the script, configure the *resource_id*, *region*, and *sys_id* parameters with the values of the CI that you want the policy to monitor.

14. Select **Save** and then publish the policy by selecting **Publish**.

Result
The configured policy retrieves the resources and their metrics from the specified Azure CI and sends them to the agent.

Block event creation for non-existent entities

Invoke the *skip_events_for_nonexistent* parameter to block event creation when specific process, service, or log does not exist. Invoke this parameter if you do not want to be notified about these non-existent entities.

Before you begin
Role required: agent_client_collector_admin

About this task
A process, service, or log does not exist when the following checks do not contain valid values for the indicated parameters:

Check parameters

Check	Parameter
os.linux.check-process	*file_pid*, *daemon_name*
util.check-windows-service	*service*
os.windows-check-log	*file*
util.checks-logs	*file*
util.checks-logs-sudo	*file*

Procedure
1. Navigate to **All** > **Agent Client Collector** > **Configuration** > **Check Definitions**.
2. Locate the check definition for which you want to block events.
3. On the **Check Parameter Definitions** tab, select *skip_events_for_nonexistent*.
4. Select the **Active** check box to enable the parameter and prevent alert creation when the process, service, or log isn't located for the specified check.
   If you want to receive notification about the missing process or service, leave the *skip_events_for_nonexistent* parameter with its default value of **false**.

Enable viewing HAProxy metrics

Configure the HAProxy metrics stats page to enable monitoring your system devices by viewing HAProxy metrics.

Before you begin
Role required: agent_client_collector_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

HAProxy provides load balancing and reverse proxy capabilities for both HTTP and TCP requests. The HAProxy checks remove backend servers that fail several health checks in a row, and transfer incoming traffic to backend servers as part of load balancing.

Procedure

1. Access the HAProxy configuration file, located at: `/etc/haproxy/haproxy.cfg`.
2. Add the following to the bottom of the file:

```
listen frontend *:8080       #Haproxy
Monitoring run on port 8080
mode http
option forwardfor
option httpclose
stats enable
stats show-legends
stats refresh 5s
stats uri /stats        #URL for HAProxy monitoring
stats realm Haproxy\Statistics.   #Title for pop up window
stats auth admin:admin     #User and Password for login to the
 monitoring dashboard
stats admin if TRUE
default_backend backend       #This is optional for monitoring
 backend
```

3. Run the following command to restart the HAProxy:
   `sudo service haproxy restart`
4. View the HAProxy metrics on your system by viewing the HAProxy metrics stats page, accessible from the following URL:
   `http://<HAProxyServer>:8080/stats`

Related topics

HAProxy default checks and policies

Enable Apache Kafka health monitoring

Set configurations in the Apache HTTP server application to enable the Agent Client Collector to perform Apache Kafka HTTP server monitoring.

Before you begin

- Enable Java Management Extensions (JMX) for Kafka metric collection by running the following command:

```
Environment="JMX_PORT=9999"
```

- Role required: agent_client_collector_admin

Procedure

1. Enable collecting Apache Kafka performance metrics using Java Management Extensions (JMX) by running the following command:

```
JMX_PORT=9999 bin/kafka-server-start.sh config/server.properties
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Configure the admin server port by modifying the port number of the admin.serverPort property in the zookeeper.properties file.
   The default port is 8080.

Enable running of Varnish checks

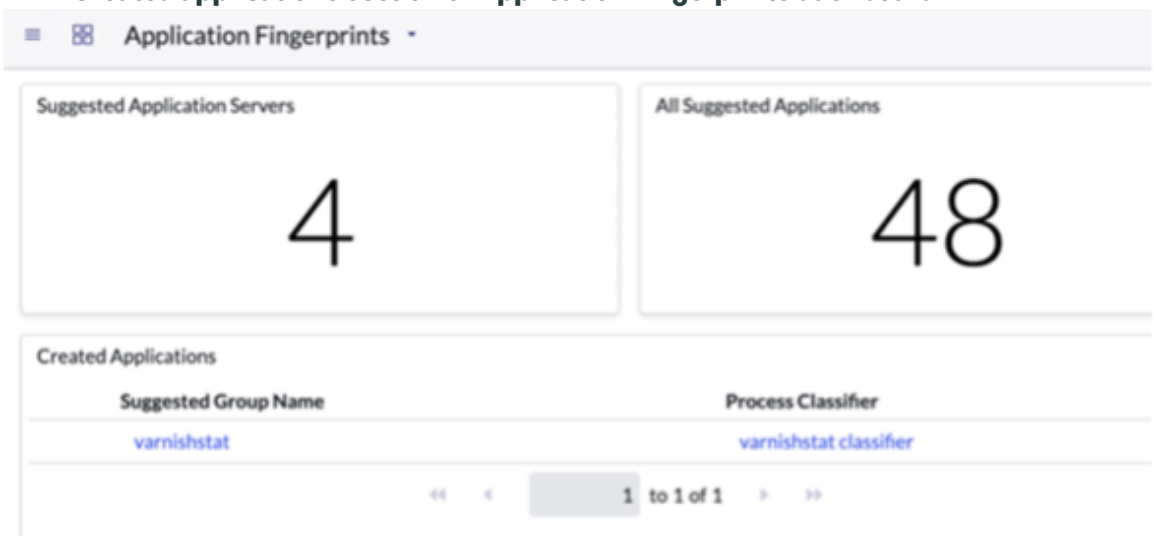
Use application fingerprints to discover the Varnish CI, to enable running Varnish checks.

Before you begin
Role required: discovery_admin

Procedure

1. Navigate to **All** > **Discovery** > **Home**.
2. Select the **Application Fingerprints** tile.
   The **Application Fingerprints** dashboard appears.
3. Select the **All Suggested Applications** tile.
4. On the Application Suggestions page, select the **varnishstat** entry in the **Suggested Group Name** column.
   The varnishstat details appear on the Application Suggestion page.
5. Select Discover Application.
   Discovery locates an application CI for the varnishstat entry. The CI appears on the Application Fingerprints dashboard in the **Created Applications** section.

Created applications section of Application Fingerprints dashboard



6. Run basic Discovery on the host machine.

Result
The varnishstat CI is discovered and a record is created in the u_cmdb_ci_varnishtat table.

The Varnish policies and checks are available to run.

Detecting portable applications using push-based discovery

Portable applications are those applications that don't need to be installed on the target system. Starting in ACC-VC version 2.3.0, push-based Discovery can detect portable applications, such as Firefox, VLC, Notepad++ etc, for Windows only.

Note: Only portable applications listed in https://portableapps.com/ are supported.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When the portable application is executed, it creates a running process. The application creates a path similar to the following for the configuration file 'appinfo.ini':

```
-\ <--- Directory with FirefoxPortable.exe
 +\App
 +\firefox
 +\Data
 +\profile
 +\settings
 +\plugins\ (optional)
```

Note: ServiceNow users must have Local account access to get the data in order to read appinfo.ini file.

Name, Version, and Vendor attributes are fetched from the Portable software and are found in the appinfo.ini files. appinfo.ini is the mandatory file to execute any portable application. If SAM is installed, the information is displayed in Software installation [cmdb_sam_sw_install] table. If SAM is not installed, the information shows in the Software instance [cmdb_software_instance] table.

Cloud Native Operations for Visibility

Cloud Native Operations for Visibility (CNO for Visibility) has been renamed Agent Client Collector for Kubernetes – Visibility. The term Cloud Native Operations for Visibility has been deprecated.

For the Kubernetes Visibility Agent documentation, see Kubernetes Visibility Agent.

Enabling Agent Client Collector data collection

You can perform actions which enhance data collection from the hosts on which Agent Client Collector is running.

Create a call API to send an osquery request

Create a background script to send an `osquery` request. The `osquery` request enables data collection from your host's operating system.

Before you begin

Role required: administrator

Procedure

1. Create the following background script:
   - `"MTLV9DE22016"` is the name of the server running an agent
   - `"c8bf9072539333003e76ddeeff7b12c5"` is the sys_id of the previously created check definition

```
cis = new GlideRecord("cmdb_ci_server");
    cis.addQuery("name", "MTLV9DE22016");
    cis.query();
    check = {
        "checkDefId": "c8bf9072539333003e76ddeeff7b12c5",
        "params": {
            "query": "select pid,cmdLine from processes limit
 4"
        }
    };
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    var agentNow = new sn_agent.AgentNowHandler();
    gs.info('request_id: ' +
agentNow.runCheckForCis(cis,check,'1',60000));
```

2. Run the script to print the request ID:
request_id: `eefbff7ab75733003e766068de11a981`
3. Check the system logs for messages coming from the instance script.

```

View host data collection for an agent

Run data collection on an agent's host to discover the components that are running on the host.

Before you begin

Role required: agent_client_collector_admin

About this task

The Refresh Host Data for Agents scheduled job collects host data and runs every hour on the following:

- Hosts which have not been discovered in the past 12 hours.
- Host for which Discovery failed.

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agents**.
In the **Host data collection** column, view the status of data collection on the agent's host. The possible statuses are:

Host data collection statuses

Status	Description
<empty>	Indicates that the agent has been added within the past minute and the Refresh and Publish Monitoring Policies scheduled job has not yet run to initiate data collection. The job runs every minute.
Collected (green)	Host data collection is complete.
Collecting (yellow)	Host data collection is in progress.
Collection failed (red)	Host data collection failed.

2. **Optional:** Locate the **Host data last collected** column to view when data collection was last performed on the host.

Generate an Agent Client Collector allowlist

Specify the checks to be included in the list of checks that are enabled to run on the agent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: agent_client_collector_admin

About this task
The default allowlist includes all validated checks, and is included in the base system policies. If the allowlist cannot be read correctly, no checks run on the agent.

Procedure
1. Navigate to **All** > **Agent Client Collector** > **Check Definitions**.
   The **Check Definitions** page appears.
2. In the **Related Links** section at the bottom of the page, click **Generate allow-list content**.

   Note: Alternatively, you can click a check definition or check instance record and click **Generate allow-list content** to generate a complete allowlist.

   The **Agent Client Collector Command Allow-list Generator** page appears, with the list of checks scanned from the **Command** field of the check instance records.

   The values appear with the following attributes:

Command attributes

Attribute	Description
exec	The executing command.
args	Possible argument strings.
skip_arguments	Boolean. Determines whether to verify that the argument was added to the allowlist. ○ **true**: Skips argument validation and checks only for illegal characters, specifically |; \<>&'$() ○ **false**: Executes argument validation to ensure that the argument is included in the allowlist. If it is not, the command cannot execute.
use_regex	Boolean. Determines whether to evaluate the *arg* strings as a regular expression. ○ **true**: Evaluates each entry in the args array as a regular expression ○ **false**: Evaluates each entry in the args array as it is. **Note:** Ensure that the regex is useable in valid JSON format and is golang compatible.
allow_shell	Boolean. Allow for the given entry to be executed in shell mode and for check definitions to default to *execv*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Attribute	Description
	○ **true**: This allowlist entry permits execution in shell mode. ○ **false**: This allowlist entry doesn't permit execution in shell mode.

3. Copy the entries you want to include in the allowlist and add them to the agent's `check-allow-list.json` file, either manually or using an automation tool.
   The location of this file is indicated in the *`allow-list`* parameter of the agent's `acc.yml` file. The default location is:

   ○ Windows: `C:\ProgramData\ServiceNow\Agent Client Collector\check-allow-list.json`
   ○ Linux: `/etc/servicenow/agent-client-collector/check-allow-list.json`

Run host data collection for an agent

Collect data on the host being monitored by an agent. Manually collecting host data ensures that the host's files are up to date.

Before you begin
Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agents**.
2. Underneath the check box icon ☐, hover next to an agent and select the check box that appears.
   Repeat this step for all agents for which you want to collect data.
3. Select the arrow next to the **Actions on selected rows...** drop-down and select **Collect host data**.

Result
Data is collected for the specified agents. The collection status is indicated in the page's **Host data collection** column.

Run host data collection on demand

You can perform host data collection on demand, if you need to perform data collection before the job is scheduled to run.

Before you begin
Ensure that you have sufficient permissions to create CIs.

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agents**.
   The **Agent Client Collectors** page appears.
2. Select an agent with **Status = Alive**.
3. On the agent form, click the **Collect Host Data** button.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Pause Agent Client Collector data collection

If CPU consumption on your server is getting too high, you can manually turn off the Agent Client Collector data collection to pause all checks performed by the agent, except for the agent's keep alive messages.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agents**.
   The **Agent Client Collectors** page appears, displaying the list of configured agents.
2. Select the checkbox next to the relevant agents.
3. In the **Actions on selected rows...** dropdown, select **Pause data collection** to pause data collection on the agents (**Data Collection = Off (manual)**).

   Select **Resume data collection** to resume data collection on the agents.

   Alternatively, you can set the status of an agent by selecting the agent and in the **Related Links** section, select the **Pause data collection** link to pause data collection on the agent. To resume data collection on the agent, select the **Resume data collection** link.

Clear Agent Client Collector plugins

Clear the plugin and configuration file cache folder and control plugin downloads. Clearing the cache folder removes unwanted plugins that have synced to the agent.

Before you begin

Ensure that the following are installed on your system:

- Agent Client Collector Framework (ACC-F), starting with version 3.5.5
- MID Server
- CMDB
- Agent Client Collector agent, starting with version 3.5.5
- ACC Global Utilities

Ensure that the **disable_assets** system property in the `acc.yml` configuration file is set to **false**.

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agents**.
2. Select an agent.
3. In the **Related Links** section, select **Clear ACC Plugins**.
4. In the confirmation dialog box, select **Clear ACC Plugins**.
5. **Optional:** Select **Collect host data** to re-download your plugins from the instance.
   Plugins download automatically when used by their respective checks/policies.

Create a golden image for a virtual machine

Create a golden image to run on a VIrtual Desktop Infrastructure (VDI) machine. The golden image enables installing a virtual agent on VDI virtual machine, which generates data quicker than standard agents.

Before you begin
Role required: agent_client_collector_admin

Procedure

Navigate to **All** > > .

Agent Client Collector Monitoring

Agent Client Collector Monitoring enables you to monitor your service availability, examine the health and performance of your environment, and ensure that your infrastructure and its applications are running properly.

Get started

Note:

If checks are not running on the agent's devices, your agent may be in CPU protection mode. CPU protection mode is activated automatically when a device's CPU consumption is too high for one of two reasons: either the user is running too many checks, or the machine is under-resourced. When it happens, the agent's Data Collection status turns to Off. ACC-F generates an event and records it in a log. To manually resume data collection by the ACC agent, see Pause Agent Client Collector data collection.

The user needs to monitor the activity of the ACC to resolve the issue through manual intervention and then re-enable ACC collection. To setup the ACC monitoring, see Enable Agent Client Collector monitoring on the MID Server.

Exploring Agent Client Collector Monitoring

Agent Client Collector Monitoring is built on a Sensu framework which enables you to adopt and extend monitoring checks from the community. Agent Client Collector Monitoring collects data on your company's infrastructure and installed applications.

Agent Client Collector Monitoring overview

Checks and policies run on the agent's client to retrieve the relevant data, which is transformed into events or metrics, as appropriate. Events and metrics are sent from the agent to your ServiceNow instance through a Metric Intelligence MID Server and are stored in the relevant database. A single MID Server can support multiple agents (such as ACC-M and ACC-L). For details on configuring the MID Server for Metric Intelligence, see MID Server distributed cluster for Metric Intelligence.

Agent Client Collector Monitoring comes with the Event Management plugin and also requires installing the request Metricbase (Clotho DB), as described in How to request Metricbase (Clotho DB) configuration (KB0816088).

For details on the plugins installed with Agent Client Collector Monitoring, see Plugins or applications installed with ITOM AIOps.

Agent Client Collector Monitoring workflow

The following illustration describes the layout and data flow within the Agent Client Collector Monitoring application.

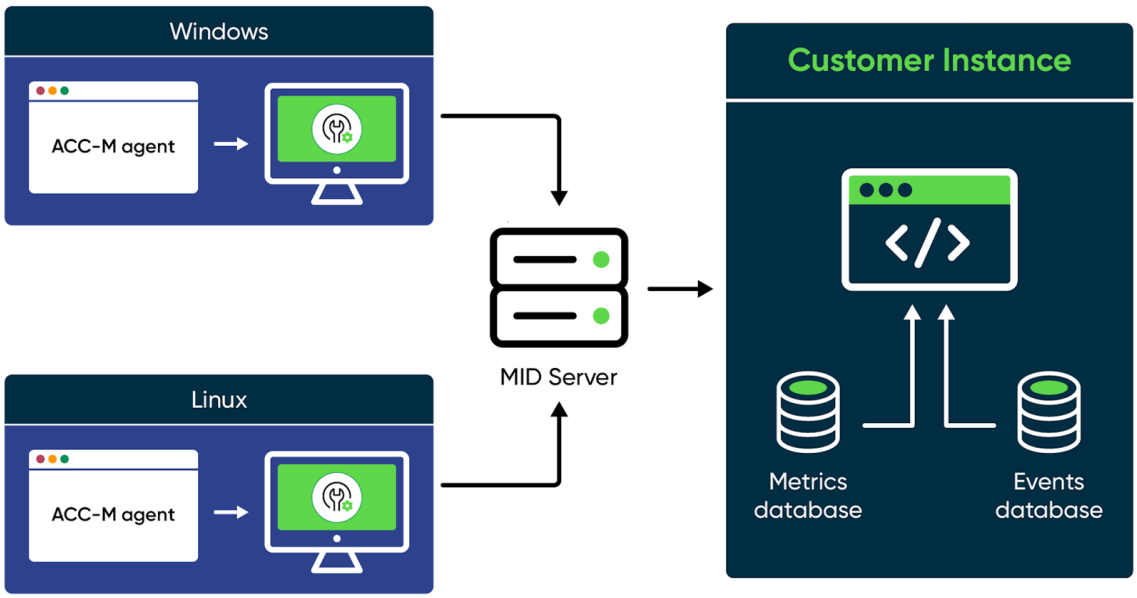
Monitoring service health and availability with ACC-M



Agent Client Collector Monitoring benefits

Benefit	Feature	Users
Monitor logs which track events occurring in a Windows environment	Windows event log monitoring	Agent Client Collector administrator
Monitor operating systems and applications	Operating system and application monitoring using Agent Client Collector	Agent Client Collector administrator
Gather metrics on host data	Metric Intelligence	Agent Client Collector administrator

AI in Agent Client Collector Monitoring

AI provides generative AI features in Agent Client Collector Monitoring that help administrators diagnose agent errors and investigate agent behavior faster.

ServiceNow Otto for ITOM includes two AI features for Agent Client Collector Monitoring. Both features are accessed through the ServiceNow Otto panel and require ServiceNow Otto for IT Operations Management (ITOM) to be installed. For a summary of all AI features across ITOM AIOps, see AI in ITOM AIOps.

Note: Depending on your license, you will have access to certain application features, generative AI skills, agentic workflows, and AI agents. For more information, see ServiceNow product tiers.

AI features in Agent Client Collector Monitoring

Configuring Agent Client Collector Monitoring

Plan and configure your Agent Client Collector Monitoring implementation.

To configure Agent Client Collector Monitoring, follow these steps:

1. Configure a MID Server to work with Agent Client Collector Monitoring.
2. Choose and configure metrics to monitor.
3. Configure the action level for anomaly detection.
4. Create a configuration settings rule.
5. Enable metrics collection and evaluation.

Depending on the checks and metrics you want to monitor, perform the following actions to enable full check activation and metrics collection:

1. Enable viewing HAProxy metrics.
2. Enable running of Varnish checks.
3. Select the Azure policies to activate for metric collection.
4. Create Azure policies for metric collection.

View an error analysis by ServiceNow Otto® in Agent Client Collector

View an error analysis created by generative AI. Error analyses enable asking questions on a specific agent's error or error code.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **AI Agent Studio** > **Create and manage**.
2. Select the **Agentic workflows** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select the **Agent Client Collector (ACC) Diagnostic** entry.
4. Locate the **Add AI agents that can perform these steps** widget and select the **Agent Client Collector (ACC) Diagnostic** entry.
5. Enable ServiceNow Otto® by sliding the **Allow AI specialists to access this AI agent** toggle switch to the right.

   ServiceNow Otto® retrieves information on errors within agents.

Agent Client Collector (ACC) diagnostic workflow

Enable and use AI agents to examine agent behavior through the Agent Client Collector (ACC) diagnostic workflow.

Before you begin

- Ensure that the ServiceNow Otto panel is enabled on your instance. For details, see Activate the ServiceNow Otto panel standard chat.
- Ensure that ServiceNow Otto for IT Operations Management (ITOM) is installed on your instance. For more information, see Install the ServiceNow Otto for IT Operations Management (ITOM) application.
- Enable the Agent Client Collector diagnostic workflow in AI Agent Studio.
  1. Select **All** > **AI Agent Studio** > **Create and manage**.
  2. On the **Agentic workflows** tab, select **Agent Client Collector (ACC) Diagnostic**.
  3. Select the **Select channels and status** option.
  4. In the **Engage via the** *`ServiceNow Otto`* panel, slide the **Display** toggle bar to the right (active).
- Role required: agent_client_collector_admin, agent_client_collector_user, or now_assist_panel_user

About this task

Invoke the Agent Client Collector (ACC) diagnostic workflow to:

- Question issues of an ACC agent while on an ACC form.
- Request suggestions to remediate a specific ACC error code.

Procedure

1. In a ServiceNow instance, select the ServiceNow Otto icon ( ).
2. In the ServiceNow Otto panel, enter prompts to invoke the ACC diagnostic workflow and perform remediation actions on the agent.
   Possible prompts include:
   - Diagnose issues with ACC agent <agent name>
   - Multiple errors on <agent name>, diagnose them
   - Provide suggestions to remediate ACC error code <error code number>

Result

An error report is generated, based on the activity logged by the Agent Client Collector Framework.

Agent Client Collector Log Analytics

Agent Client Collector Log Analytics (ACC-L) enables you to stream log data from Linux and Windows hosts to a ServiceNow instance, using the Agent Client Collector.

As with Agent Client Collector Framework (ACC-F), the Agent Client Collector connects to a MID Server. A single MID Server may support multiple agents, while a single agent works with one MID Server at a time and switches to a different MID Server when necessary to provide failover protection.

Use the Agent Client Collector to stream log data to your ServiceNow® instance by means of a log shipper. The log data is mapped and structured in the ServiceNow® Health Log Analytics application. For more information, see the Health Log Analytics product documentation.

Agent Client Collector Log Analytics has a dependency on the Health Log Analytics application, Version 22.0.12 - December 2021 and later, available from the ServiceNow Store. Streaming log data from Windows hosts is supported in Agent Client Collector Log Analytics Version 3.1.0 and later.

The Agent Client Collector Log Analytics (ACC-L) application, Version 3.2.0, August 2022, has a dependency on the Agent Client Collector Framework (ACC-F) application, Version 2.10.1, August 2022.

To enable Agent Client Collector Log Analytics, you enable log analytics on the Agent Client Collector, as described in Set up Agent Client Collector Log Analytics without using guided setup.

Dependencies

For a list of Agent Client Collector Log Analytics plugin dependencies, see Plugins or applications installed with ITOM AIOps.

Set up additional ACC data inputs

Data inputs for streaming log messages to your ServiceNow instance using the Agent Client Collector are created automatically as part of the Agent Client Collector setup. Set up additional ACC data inputs manually as needed using the Health Log Analytics data input setup flow.

Before you begin

- The Agent Client Collector Log Analytics application has a dependency on the following ServiceNow applications, available from the ServiceNow Store:
  - Health Log Analytics, Version 22.0.12 - December 2021 and later releases.
  - Agent Client Collector -Framework, Version 2.7.0 - December 2021 and later releases.
- Verify that a MID Server is installed and configured. For more information, see MID Server system requirements.
- The MID Server must be configured to work with the Agent Client Collector. For more information, see Enable Agent Client Collector monitoring on the MID Server.

Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

Role required: evt_mgmt_admin

About this task

It is important to configure an ACC data input for every MID Server to which Agent Client Collectors can connect, even if no agent is currently connected to it. An agent works with one

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MID Server at a time, but is connected to a different MID Server when necessary to provide failover protection.

Important: As part of the standard Health Log Analytics data input setup, you can define JavaScript functions for mapping and preprocessing raw log data. The JavaScript function must be identical for all ACC data inputs, because agents will switch to a different ACC data input when the system connects them to a different MID Server to provide failover protection. The latest published JavaScript function is provided to all existing and future ACC data inputs and replaces the previous one. This feature is supported in the Health Log Analytics application, Version 22.0.12 - December 2021 and later, available from the ServiceNow Store.

Procedure

1. Set up additional ACC data inputs manually using the Health Log Analytics data input setup flow.
   For more information, see Configure ACC data inputs manually.
2. Identify and address log streaming issues to ensure that your data inputs are streaming data properly.
   For more information, see Ensure that the data input is streaming data.
3. Determine how Health Log Analytics handles raw log data that is streaming into your instance. By default, every incoming log line is auto-mapped to the correct tag. If properties aren't discovered automatically, map the data input sources manually by defining a JavaScript function. For more information, see Map the raw data.
4. **Optional:** Modify raw log data and drop or break up log messages before they are processed. Define a JavaScript function that modifies your raw log data before Health Log Analytics maps and structures it. For more information, see Edit your raw log data before processing.
5. **Optional:** Refine the source type structure to make sure that Health Log Analytics extracts and classifies all properties correctly.
   For more information, see Refine the source type structure in Health Log Analytics.

Configure ACC data inputs manually

Agent Client Collector setup automatically creates an ACC data input for streaming log messages to your ServiceNow instance. You can set up additional ACC data inputs manually as needed.

Before you begin

- The Agent Client Collector Log Analytics application has a dependency on the following ServiceNow applications, available from the ServiceNow Store:
  - Health Log Analytics, Version 22.0.12 - December 2021 and later releases.
  - Agent Client Collector -Framework, Version 2.7.0 - December 2021 and later releases.
- Verify that a MID Server is installed and configured. For more information, see MID Server system requirements.
- The MID Server must be configured to work with the Agent Client Collector. For more information, see Enable Agent Client Collector monitoring on the MID Server.

Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

Role required: evt_mgmt_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **ACC Log Analytics** > **ACC Data Inputs**.
2. Select **New**.
3. On the form, fill in the fields.
   For a description of the fields, see ACC data input configuration fields.
4. **Optional:** Select **Advanced** to set additional configuration fields.
5. Select **Save**.
   Health Log Analytics adds the data input record to the Data Inputs table.
6. Ensure that the data input is configured correctly by selecting **Test connection**.

   Health Log Analytics tries to connect the MID Server to the data repository.

   - If the connection was established, the **Test connection** button is turned off and the **Publish** button is enabled.
   - If the connection failed, the reason for the failure displays in the **Error message** field. This field displays only when a streaming error has occurred.

     Resolve the issue, select **Save** if you modified the configuration, and then select **Test connection** to test the connection again.

     Note: You can only publish the data input configuration when the connection is created successfully.

   Note: You can revert to the last published configuration by selecting **Revert Changes**. This option is available only when you're modifying a configuration that has been published previously.

7. Select **Publish** to publish the data input to the MID Server.

Result

The new data input is ready to stream logs.

Note: The data input record includes these related lists:

- Agents – Lists all active agents connected to the MID Server for this data input.
- Streaming Sources – Lists all sources for this data input and the MID Server that receives logs from it.

What to do next

Ensure that the data input is streaming data.

ACC data input configuration fields

Description of the fields on the ACC data input configuration form.

Basic configuration

Field	Description
MID	The MID Server to which the logs stream.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Basic configuration (continued)

Field	Description
	Note: • Only one ACC data input can be defined per MID Server. You can select only MID Servers with AgentClientCollector capability that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. However, when 10 non-ACC data inputs are defined for a MID Server, you can still define one ACC data input for it. This addition makes a total of 11 data inputs for that MID Server. • When you submit the form, this field becomes read-only. This field is required.
Port	The port on the MID Server. The port must be configured and active. It must not be occupied by another process. Make sure that your organization's security team opens the port before you assign it. **Note:** When you update the port, the system updates the Agent Client Collector with the new port configuration. Log streaming continues seamlessly without log loss after 1-3 minutes. This field is required.
Description	Description of the data input.

The fields in the following table show read-only information.

Field	Description
Name	The name of the data input: Agent Log Analytics. **Note:** All ACC data inputs have the same name. You can identify an ACC data input by the name of the MID Server that is defined for it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Status	The status of the data input.
Transport	The protocol used to send the log data. The ACC data input sends data using a ServiceNow Agent.
Sources count	The total number of log sources originating from all ACC data inputs together. This feature is supported in the Health Log Analytics application, Version 22.0.12 - December 2021 and later, available from the ServiceNow Store.
Disabled since	The time when the data input stopped or failed.
Last log time	The time when the last log streamed in the data input.
Error message	The streaming error. This field is populated automatically. It displays only when a streaming error has occurred.

Advanced configuration

Field	Description	Default value
Look up hostnames	Option for selecting to perform DNS lookup to resolve IPs to hostnames.	false
Use SSL	Option for selecting to use SSL.	true
Client inactivity timeout (sec)	The timeout, in seconds, to close an inactive channel.	15
Worker thread count	The number of threads that handle incoming data.	4
Default time zone	The default time zone of events. The system uses this default when the log does not specify a time zone.	GMT
Sub sample drop ratio	The ratio of events to drop.	-1
Sub sample receive ratio	The ratio of events to receive.	-1
Max length in bytes	The maximum length of log messages, in bytes.	32,766
Character encoding	The character encoding for this data input.	UTF-8

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced configuration (continued)

Field	Description	Default value
Drop if queue is full	Option for selecting to discard logs if many processes are waiting in the queue to access the MID Server.	false

Agent Client Collector log policies

Agent Client Collector data inputs stream log messages to your ServiceNow instance using the ServiceNow Agent Client Collector. The Agent Client Collector Log Analytics (ACC-L) application provides predefined log policies for collecting log data from the CIs monitored by the ACC.

You can work with Agent Client Collector log policies in the following ways:

- Use the system's predefined log policies.

  The default ACC-L log policies consist of the monitored CIs and the check that runs on those CIs. For a complete list of the predefined log policies and monitored CI types, see Agent Client Collector Log Analytics default policies and checks.

- Edit a predefined log policy.

  For example, you can modify a default policy if your organization always uses a specific non-default log path. For more information, see Edit a log policy.

- Customize a published log policy by creating a child policy from it.

  You can use an existing log policy (the parent policy) as a template to create a new log policy (the child policy). You then customize the parameters that the child policy inherits from the parent to focus on a subgroup of its CIs or services. For example, create a child policy if your organization saves a subset of IIS Server logs to a different location. For more information, see Create a child log policy.

  Note: The child policy is inherently more specific than its parent policy. When Agent Client Collector matches a condition defined in the child policy, it will not try to match the parent policy.

- Define a new log policy when no policy exists for the CI that you want Agent Client Collector to monitor.

  For more information, see Create an Agent Client Collector log policy. For a general explanation of Agent Client Collector policies, see Checks and policies.

Agent Client Collector Log Analytics default policies and checks

Agent Client Collector Log Analytics provides various default policies and checks.

Streaming log data from Windows hosts is supported in Agent Client Collector Log Analytics Version 3.1.0 and later.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	OS	Description	Check
		Note: • The log path that WebLogic uses has two environment variables, as described in the WebLogic documentation. For more information, see Environment variables. • On both Windows and Linux, Agent Client Collector Log Analytics adds a default environment variable from the WebLogic documentation to the log path. You can either use this default environment variable to get the full directory, or change it manually if you prefer to use a known direct directory. For information about customizing the environment variable, see Edit log path configurations.	
WebSphere Application Server on Linux Logs	Linux	Collects logs from WebSphere application servers running on a Linux OS and sends them to the MID Server for further analysis.	log shipper

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	OS	Description	Check
Windows OS Event Logs	Windows	Collects Windows event logs from Windows servers and sends them to the MID Server for further analysis.	log shipper for win events

Environment variables

The log path used for collecting logs from certain servers may contain environment variables. It's important to note that on Linux systems, the ACC Agent can only access environment variables that reside in the `/etc/environment` file. Add the environment variables that the agent must access to the `/etc/environment` file using the format *<NAME>='<VALUE>'*. On Windows systems, you can create environment variables in the usual manner.

Default ACC-L checks

Agent Client Collector Log Analytics (ACC-L) provides the following default **Type=Log** checks.

- The *log shipper* check launches a background process that sends logs from servers to an agent data input, according to the check's configured log path. When access permissions are lacking or the log path is configured incorrectly, the system sends an alert to the instance. For proper log configuration, ensure that the *servicenow* user has permissions to access the configured log path on the machine that is hosting the agent, and that the log path is configured correctly.
- The *log shipper for win events* check is similar to the *log shipper* check, but sends event logs from Windows OS servers to the agent data input.

> **Note:** To collect Security Windows event logs, *servicenow* users on an agent hosting machine must have admin privileges.

Create an Agent Client Collector log policy

Create an ACC log policy when no default policy exists for the CI you want Agent Client Collector to monitor.

Before you begin

- The Agent Client Collector Log Analytics (ACC-L) application, available from the ServiceNow Store, must be installed. For more information, see Agent Client Collector Installation.
- The Agent Client Collector comes with the default *servicenow* user. Ensure that this user has read access to enable Agent Client Collector to view all the configured log paths. For example, the Agent Client Collector *servicenow* user that comes installed with the base system does not have permissions to view the paths to `/var/log/` in Linux and `C:\Windows\System32` in Windows. For information about configuring permissions for the *servicenow* user, see the ACC-L Permission Denied issues [KB1117271] article in the Now Support Knowledge Base.

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **ACC Log Analytics** > **ACC Log Policies**.
   The **Policies** page displays all Log Analytics policies. For a list of the policies that come with the base system, see Agent Client Collector Log Analytics default policies and checks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Select **New**.

   Note: For general information about creating an ACC policy, see Create an Agent Client Collector policy.

3. On the form, fill in the fields.

   Policy Definition Form

Field	Description
Name	A descriptive name for the policy.
Description	Description of the policy.
Publish status	Hard-coded as **Draft**, which means that the policy has not yet been published. You cannot edit this field.
Hierarchy	Hard-coded as **None**. When a child policy is added to the policy, the value changes to **Parent**. Child policies have a value of **Child**.

4. On the **Checks** tab, associate the log policy with the relevant log shipper check.
   - For Linux and Windows, except for Windows event logs, select the *`log shipper`* check definition.
   - For Windows event logs only, select the *`log shipper for win events`* check definition.
5. On the **Monitored CIs** tab, specify the CIs to which the policy applies.

   a. Choose the CI type to be monitored.
   - **Monitored CI type by filter**: Select the monitored CI type. You can narrow down the CIs that will be monitored by using filter conditions.
   - **Monitored CI type by script**: Specify the monitored CIs by using a script.
   - **Monitored CI type by CMDB Group**: Specify the monitored CIs by using CMDB group queries.

   For more information about choosing monitored CI types, see Create an Agent Client Collector policy.

   b. **Optional:** Monitor only CIs that are associated with an Application Service by selecting **Filter Monitored CIs by Application Service**.
   You can specify the Application Services to be monitored by using filter conditions. Agent Client Collector will only retrieve the logs of CIs that are associated with these Application Services.

6. Save the log policy.
   In the Check instances related list, a check instance record is created.
7. Open the relevant check instance record and then select **Edit in Sandbox**.
8. Select the Log path configurations related list.
9. Add a log path for the check instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: A check must have at least one log path configured for it to enable streaming logs. For more information about checks, see Checks and policies.

a. Select **New**.

b. On the form, fill in the fields.

Configuration form

Field	Description
Path	The full path from where the logs are streamed. You can use a wildcard. This field is required.
Component	The device type or stack layer that provides a context for the logs, used for anomaly detection and correlation. For example: Tomcat.
Source Type	Defines how Health Log Analytics handles a specific log type and parses the log data. For example: Tomcat Catalina.

c. Optional: For shipping multiline logs using Filebeat, configure the following properties.

(Optional) These parameters control how Agent Client Collector Log Analytics (ACC-L) handles messages that span multiple lines of text.

For more information, see Manage multiline messages in the Elastic documentation.

Field	Description
multiline.pattern (regex)	The regular expression to match. **Note:** You must define this property before you can configure the multiline.match and multiline.negate properties.
multiline.match	How ACC-L combines matching lines into a single log line. (Optional) The available options are None, Before, and After. Default is None.
multiline.negate	Option for determining whether the pattern identified in the log lines is negated. (Optional) The available options are None, True, and False. Default is None.

d. Optional: Define the following properties that control the Filebeat YML configuration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Fields	Field that enables you to include and exclude information in the output. For example, you can add a field for filtering the log data. (Optional) Add more Field rows by selecting the plus icon next to the Value field: ⊕. Remove a Field row by selecting the minus icon: ⊖. For more information, see the Log input Fields description in the Elastic documentation.
Configuration Options	Field that enables you to add configuration options to the log lines. For example, you can add the encoding to use. **Note:** Define only configuration options that are supported by Filebeat. For more information, see the Log input Configuration options description in the Elastic documentation.

e. Select **OK**.
The log path is created.

10. Select **Return to Policy**.
11. On the policy form, select **Publish**.
The policy's Publish status changes to **Published**.
12. **Optional:** Activate the policy by selecting **Activate**.

What to do next
Verify that the data input is streaming data.

Create a child log policy

Refine an existing log policy to focus on a subset of CIs or services by creating a child policy.

Before you begin
Role required: agent_client_collector_admin

About this task
A published log policy (the parent policy) can be used as a template for creating a new log policy (the child policy). You can customize the parameters that the child policy inherits from the parent to focus on a subgroup of its CIs or services.

The child policy inherits parameters from its parent policy that are modified after the child policy's creation, unless you disable this option in the child policy. You can choose to review these modified parameters in draft mode in each child policy before accepting them.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The child policy is inherently more specific than its parent policy. When Agent Client Collector matches a condition defined in the child policy, it will not try to match the parent policy.

Procedure

1. Navigate to **All** > **ACC Log Analytics** > **ACC Log Policies**.
2. On the **Policies** page, select a published policy with a Hierarchy value of either **None** or **Parent**.
3. Select **Create Child**.
   A new policy opens with the same parameters as the published policy. The name of the new policy is *<Policy name><date and time created>*.

   For example, MySQL DB on Linux Logs 2022-02-13 04:44:12.

   The following fields are read-only:

   Child policy fields

Field	Value
Publish status	Draft
Hierarchy	Child
Parent	<Name of the parent policy>

   The **Order** field value indicates the priority by which the agent attaches itself to the child policy in relation to its sibling policies. A lower number indicates a relatively higher priority for this child policy. By default, each new child policy takes on a higher value (and hence, a lower priority) than the one preceding it. You can modify the order value as needed.
4. Customize the child policy's parameters.
   For a description of the parameters, see Create an Agent Client Collector log policy.
5. Select **Save** to create the child policy.
6. **Optional:** Select **Disable inherit option** to disable automatically inheriting modified parameters from the parent policy.
7. Select **Publish** to publish the child policy.

Result
The child policy is published and appears on the **Child Policies** tab of the parent policy.

Edit a log policy

You can edit published Agent Client Collector log policies. For example, modify a default log policy if your organization always uses a specific non-default log path.

Before you begin
Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **ACC Log Analytics** > **ACC Log Policies**.
2. Select a policy for which the **Publish status** is **Published**.
3. Select **Edit in Sandbox**.
   The policy is now in **Draft view**, and its fields and check instances are editable.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Although the policy is in **Draft view**, its publish status remains **Published**.

4. On the **Monitored CIs** tab, edit the CIs to which the policy applies as needed.

   a. Choose the CI type to be monitored.

   - **Monitored CI type by filter**: Select the monitored CI type. You can narrow down the CIs that will be monitored by using filter conditions.
   - **Monitored CI type by script**: Specify the monitored CIs by using a script.
   - **Monitored CI type by CMDB Group**: Specify the monitored CIs by using CMDB group queries.

   For more information about choosing monitored CI types, see Create an Agent Client Collector policy.

   b. **Optional:** Monitor only CIs that are associated with an Application Service by selecting **Filter Monitored CIs by Application Service**.
   You can specify the Application Services to be monitored by using filter conditions. Agent Client Collector will only retrieve the logs of CIs that are associated with these Application Services.

5. **Optional:** In the **Check Instances** table, select the log shipper check instance record and edit it.
   For more information, see Edit log path configurations.
6. Select **Save** to save the changes you entered into the Sandbox policy fields.
   The policy remains in **Draft view**, and the **Publish status** is **Published***. The asterisk (*) indicates that the current published version is not the most up to date one, because it contains saved changes that have not yet been published.
7. Select **Republish** to publish the updates.
   The policy returns to **Published** state and opens as the published policy.

   Note: This option appears only after entering updates into the policy fields, for a policy whose **Publish status** is **Published***.

8. Determine the active status of the policy by selecting either **Activate** or **Deactivate**.
9. **Optional:** Select **Delete** to delete both the Published and the draft policies.

Edit log path configurations

Modify a log path configuration in the log shipper check instance.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **ACC Log Analytics** > **ACC Log Policies**.
2. Select a policy record.
3. In the Check instances related list, select the log shipper check instance record.
4. Select **Edit in Sandbox** to enable editing the record.
5. On the Log path configuration related list, edit a log path configuration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select the log path configuration that you want to edit.

b. Edit the configuration.

- You can add custom fields, allowing you to include additional information in the output.
- You can add extra configuration options, such as `encoding`, `include_lines`, and `exclude_lines`, to filter your log data. For information about discovering file encoding, see the How to Detect File Encoding on Windows, Linux and Mac [KB1702770] article in the Now Support Knowledge Base.

  These configuration options impact all the files that the data input streams to your instance.

  Note: Define only configuration options that are supported by Filebeat. For more information, see the Log input Configuration options description in the Elastic documentation.

c. Select **Update** to save your edits.

6. **Optional:** Add an environment variable or edit an existing one in the **Path** field.
   Use the relevant format for its name:
   - On Linux, capitalize the name and precede it with a dollar sign: $. For example: `$HOME`. The name is case sensitive.
   - On Windows, surround the name with percentage signs: %. For example: `%HOMEPATH%`. The name is not case sensitive.

   Important: The servicenow user and ACC agent must have access to the environment variable. On Linux systems, only environment variables that reside in the `/etc/environment` file are accessible. Add the environment variable to this file using the format *<NAME>='<VALUE>'*.

7. **Optional:** Delete a log path.

   a. Check the box next to the log path configuration that you want to delete.

   Note: You can select multiple log path configurations, but a check must have at least one log path configured for it to enable streaming logs. For more information about checks, see Checks and policies.

   b. Select **Delete**.

8. Select **Return to policy** to go back to the log policy record.
9. Select **Republish** and then confirm to publish the policy again with the updated log path configurations.
   The changes take effect in a few minutes.

CI association to a dynamic CI Group in Agent Client Collector Log Analytics

When the Agent Client Collector Log Analytics (ACC-L) application discovers a CI that is not associated to an application service, it creates a dynamic CI Group. The application then associates the CI to the group.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A dynamic CI Group is a group of CIs that are organized by attribute, such as the CI type. By default, Agent Client Collector log policy checks monitor only CIs that are associated to an application service. The Agent Client Collector Log Analytics application inspects the CIs that the Agent Client Collector discovers. When it discovers a CI that is not associated to an application service, the application creates a dynamic CI Group and associates the CI to it.

If the CI is later associated to an actual application service, its association to the dynamic CI Group is automatically deleted. The baseline for the CI is lost in this process. While the system is establishing the new baseline, it doesn't issue alerts for the application service to which the CI is now associated.

You can choose to disable the association of unassociated CIs to a dynamic CI group by changing the default setting of the relevant system property, *sn_accl.dynamic_service.creation.enabled*, to false. The Agent Client Collector Log Analytics application will then not associate unassociated CIs to dynamic CI Groups. In this case, logs are not streamed for CIs that are not associated to an application service.

View live CI data with Agent Client Collector

View live data for incident-related CIs through Agent Client Collector for information that can help resolve the incidents.

Before you begin

- Collecting running processes for a macOS system requires `sudo` privileges. If `sudo` privileges aren't granted, only processes run by the Agent Client Collector are collected.

  To enable `sudo` privileges for osqueryi, add the following strings to either the `/etc/sudoers` file or to an individual file in the `/etc/sudoers.d` directory:

  - `Cmnd_Alias LIVE_CI_VIEW = /Library/Application\ Support/servicenow/agent-client-collector/osquery/bin/osqueryi`
  - `_servicenow ALL=(ALL) NOPASSWD:LIVE_CI_VIEW`
- To enable the OSQuery executable to retrieve information on logged-in users in a Windows environment, the agent must run as a local SYSTEM account.

Verify that you have installed Agent Client Collector Framework and Service Operations Workspace on your instance.

Role required: itil

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. Select the Lists icon ( ).
3. Select **Incidents** > **All**.
4. Select an incident from the list.
5. On the <name of incident> form, select the **Live CI Data** tab.
   The CI data is displayed in the cards described in the following table.

Live CI Data tab cards

Card	Description
Device details	General details about the CI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Card	Description
Memory Usage	Amount of memory being used by the CI.
Top 5 running processes by CPU usage	The five CI processes using the most CPU.
Top 5 running processes by memory usage	The five CI processes using the most memory.
Disk Usage %	Percentage of disk space in use on the CI.
Logged-in users	Users logged in to the CI. Whether this data is visible depends on your OS privileges. ○ MacOS: Requires sudo privileges ○ Windows system: Requires administrator privileges ○ Linux: No special privileges are required

Related topics

View live CI data logs

Assign a CI to an incident to view live CI data

View live CI data logs

View CI logs to receive additional details on an incident when viewing live CI data. For example, viewing log information for a process with high CPU usage can help you pinpoint when the usage went up, helping you determine the root cause of the issue.

Before you begin

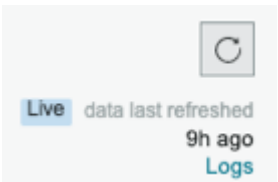
Ensure that you have installed Agent Client Collector Framework and Service Operations Workspace on your instance.

Role required: itil

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. Select the Lists icon ( ).
3. Select **Incidents** > **All**.
4. Select an incident from the list.
5. Select the **Live CI Data** tab.
6. Select the **Logs** link on the right side of the pane.

Logs link



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The **data last refreshed** value follows the instance time zone and not your local system time zone. Therefore, ensure that your local system time zone matches the instance time zone.

The logs appear on the **Log** page.

Assign a CI to an incident to view live CI data

Retrieve live CI data to help troubleshoot the issues that caused an incident by assigning the problematic CI to its incident. An incident typically is associated with the CI that caused the incident, but if this was omitted during the incident creation, you can assign the CI manually.

Before you begin
Role required: itil

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. Select the Lists icon ( ) icon.
3. Select **Incidents** > **All**.
4. Select an incident with a value of **Configuration item = (empty)**.
5. Select the **Live CI Data** tab.
6. Enter the first several characters of the CI that caused the incident in the **Primary configuration item** field.
   A list of CIs matching the string appears.
7. Select the relevant CI from the list.
   The name of the CI appears in the **Primary configuration item** field, and the CI's live data appears on the **Live CI Data** tab.

AI Control Tower

AI Control Tower (AICT) is an enterprise-grade governance control plane which provides centralized visibility, monitoring, and policy enforcement across all AI systems and platforms within an organization. AICT addresses the challenge of uncontrolled AI adoption by intercepting AI-related traffic at the network, device, or application layer and applying organization-wide security and data governance policies.

Business Challenge

As organizations adopt AI systems, multiple AI platforms are available for use. These platforms include including cloud-based large language models (LLMs), browser-based AI tools, autonomous AI agents, local offline models, and embedded AI services. Organizations currently lack the visibility and control mechanisms necessary to govern these interactions effectively.

Key challenges include:

- Limited visibility into which AI models and services are in use across the organization.
- Lack of awareness about which data is being shared with external AI systems.
- Insufficient oversight of agent-to-agent communication and data exchange.
- Risk of confidential or sensitive data being exposed to unauthorized external systems.
- Unclear permissions and access controls granted to AI tools.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Compliance gaps in AI-related interactions and data handling.
- User awareness gaps regarding the sensitivity of information shared with external AI systems.

These factors create organizational risk through potential data leakage, compliance violations, and uncontrolled shadow AI adoption.

AICT Solution

AI Control Tower functions as a comprehensive governance platform that intercepts, monitors, and controls AI-related traffic and interactions. The platform applies enterprise security and data governance policies to provide centralized oversight of all AI systems and agent activities within an organization.

AICT enables you to maintain granular visibility into AI usage patterns, classify and protect sensitive data, enforce compliance policies, and reduce the risk of unauthorized data exposure.

Key Capabilities

AI Control Tower provides the following primary functional capabilities:

Capability	Description
Visibility	Identifies LLMs and AI systems that you can interact with. Tracks agent-to-agent communication, monitors browser-based AI usage, and detects local AI model usage where applicable.
Data Awareness	Inspects outbound prompts and file uploads in accordance with policy and consent requirements. Classifies data sensitivity including personally identifiable information (PII), financial data, and confidential intellectual property. Detects when regulated or confidential data is being shared externally.
Central Policy Enforcement	Enforces organization-wide AI usage policies. Blocks access to unauthorized AI services, restricts specified data categories from external sharing, and applies conditional access controls based on risk assessment.
Risk and Compliance Monitoring	Detects potential data leakage and unauthorized autonomous agent activity. Generates audit logs and compliance reports to support regulatory requirements and organizational governance.

Business Benefits

AI Control Tower provides:

- Prevention of confidential data leakage to external AI systems.
- Improved AI governance and organizational compliance posture.
- Centralized control over AI tool adoption and shadow AI reduction.
- Increased user awareness regarding AI data sharing risks.
- Safe and monitored deployment of autonomous agents.
- Comprehensive audit trails for compliance and regulatory reporting.

AI Proxy

AI Proxy gives customers visibility and control over AI traffic leaving managed endpoints. It intercepts outbound calls to AI providers, attributes each call to the originating process, and streams structured events to the AI Control Tower (AICT) on your ServiceNow instance.

AI Proxy - Overview

AI Proxy operates as a lightweight HTTPS proxy embedded inside your existing Agent Client Collector (ACC). You activate AI Proxy through a configuration flag during installation. AI Proxy intercepts outbound calls to AI providers and attributes each call to the originating process. The proxy streams structured events to AICT on your ServiceNow instance. Non-AI traffic flows through without inspection.

AI provider classification

After detecting AI traffic, the AI Proxy enforces policies based on your organization's classification of AI providers.

Authorized LLM providers

These providers your organization approves for use under organizational policies. AI Proxy forwards traffic to these providers after policy inspection and enforcement.

Unauthorized LLM providers

These providers your organization does not approve. AI Proxy blocks traffic to unauthorized providers when it detects their use.

Policy enforcement and monitoring

AI Proxy tracks AI activities by intercepting and monitoring AI-related traffic. The system detects policy violations in real time. Your ServiceNow instance syncs governance policies for applicable devices and users. AI Proxy then sends this data to ServiceNow, where the system maps the data to users, devices, and departments to provide comprehensive insights into AI usage across your organization.

Set up an AI proxy

Configure an AI proxy server to monitor AI commands traveling from your Agent Client Collector (ACC) agent to the AI Control Tower (AICT).

Before you begin

- Install the ITOM Cloud Services Core (sn_itom_cloud_svc) plugin.
- Onboard your instance to use ITOM Cloud Services. For details, contact Customer Support.
- Configure an agent registration key. For details, see Configure an agent registration key.

You must configure ACC with an ICS (mid-less) architecture to enable using an AI proxy. For details on configuring ACC without a MID Server, see Configuring MID-less Agent Client Collector.

Role required: agent_client_collector_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Retrieve the publicly accessible gateway URL, based on your location.
   - AMER (Americas): `itomcnc-prod-gateway-amer.sncapps.service-now.com:443`
   - EMEA (Europe): `itomcnc-prod-gateway-emea.sncapps.service-now.com:443`
   - APAC (Asia Pacific): `itomcnc-prod-gateway-apac.sncapps.service-now.com:443`
2. Run the relevant command, depending on the OS you're using.
   - On a Windows server:

```
msiexec /i <msi_file_path> /quiet /qn /norestart
 CONNECT_WITHOUT_MID="true" ACC_CNC="<itom_gateway_url>"
 REGISTRATION_KEY="<agent_registration_key>"
 INSTANCE_URL="https://<instance_url> AI_PROXY_ENABLED="true"
 LOCALUSERNAME="LocalSystem"
```

   - On a Linux or macOS server:

```
sudo CONNECT_WITHOUT_MID="true" ACC_CNC=<itom
 gateway url> REGISTRATION_KEY=<agent
 registration key> INSTANCE_URL=<instance url>
 AI_PROXY_ENABLED="true" LOCALUSERNAME="LocalSystem"
 bash -c "$(curl -L https://<instance
 url>/api/sn_acc_shadow_ai/agents/install_agent)"
```

   For details on the parameter values in the command, see Agent Client Collector MID-less installation command parameters.

Result
The AI proxy monitors AI traffic coming from your AI tools. Traffic is either allowed to pass through to the AI Control Tower, or is blocked, depending on your configured AICT policies.

What to do next
Configure AICT policies to determine which AI resources are blocked, and for whom. For details, see .

Create AI Control Tower (AICT) policies

Create AICT policies to block personnel from using unauthorized AI tools. AICT polices are synchronized with the Agent Client Collector, which invokes the policies that run.

Before you begin
You must configure ACC with an ICS (mid-less) architecture to enable using an AICT policies. For details on configuring ACC without a MID Server, see Configuring MID-less Agent Client Collector.

Ensure that ITOM Shadow AI governance is installed in your enviornment.

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **AI Control Tower** > **AI Assets**.
2. In the filter on the left side of the page, expand **Govern** and select **Policies**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select **Create policy**.
4. Select a policy type in the **Choose a policy type** field.
   - A threat response: Takes an agent offline when a security threat is detected.
   - An explicit block: Blocks a user or department from using an AI agent, model, or domain.
5. Configure the relevant parameters, based on the selected policy type.
   - A threat response:
     a. Select what will happen when a threat is detected.
     b. In the **Which agents** cell, select the conditions by which the detected threat takes the agent offline.
     c. In the **sensitivity** field, select whether the agent is to be taken offline on every detection, or only above a specified threshold.
     d. Select a follow-up action in the **Do this** cell, after the agent is taken offline:
        - Create a ticket: Opens a ticket in the indicated group's queue.
        - Notify: Sends a notification to the user.
     e. Select the **Publish** button to publish the policy.
   - An explicit block:
     a. Select whether the block is to apply to a user or a department in the **Who** field.
     b. Select what is being blocked in the **What** field, either an AI agent, a model, or a domain.

        When selecting an AI agent, configure a filter for the field values that create the block, as needed.

     c. Select a follow-up action of **Notify** to send a notification to the user, in the **Add follow-up** drop down.
     d. Select the **Publish** button to publish the policy.

Result

- The action to be taken appears in the **Policy summary** cell.
- The policy is synchronized with the Agent Client Collector policies, and appears in the list of Agent Client Collector policies. Agent Client Collector invokes the policy and takes the indicated action.

Agent Client Collector reference

Reference topics provide additional information about Agent Client Collector.

Agent Client Collector Framework reference

Reference topics provide additional information about mapping and fine-tuning application services using Agent Client Collector Framework lists and forms.

Agent Client Collector user roles

Administrators can assign user roles to grant access to the Agent Client Collector. The following standard roles for the Agent Client Collector Framework (ACC-F) are included in the ServiceNow system with the Agent Client Collector installed on it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agent Client Collector user roles

Role	Description
agent_client_collector_admin	All permissions on Agent Client Collector, including: • Access to REST API • Add, edit, and delete policies, checks, agents, web sockets • MID Server management
agent_client_collector_integration	Access to REST API
agent_client_collector_user	• View checks and policies • Access to some REST APIs
evt_mgmt_admin	Starts the ACC listener.

Agent Client Collector Framework default checks

Agent Client Collector Framework provides default checks with the base system.

Checks

The following table lists the default checks that come with the Agent Client Collector Framework base system.

Type	Name	Description	Command
Restart	restart	Restarts the agent. Check is active by default	Restart agent
Discovery	check-discovery-basic	Performs basic discovery of the agent's host to discover: • Host CI, including IP address, serial number, and hostname. • Running processes (cmdb_running_process) of the host • TCP ports (cmdb_tcp) The check is performed by default every 12 hours (43200 seconds), and times	endpoint_discovery.rb

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Type	Name	Description	Command
		out after 600 seconds of inactivity. Plugins: osquery, acc-f-commons, acc-f-modules	

Note: The *check-read-log* and *config-file-reader* checks are for internal use only.

Agent Client Collector diagnostic self tests

The following table describes each diagnostic self-test that runs in the Agent Self Test Run (`sn_agent_self_test_run`) table.

Agent Client Collector (ACC) diagnostic self-tests

Self-test name	Description
Allow List Validation	Checks if the allowlist is enabled and whether the allowlist file is a valid JSON file.
Cache Subdirectory Creation	Verifies that a user can create subdirectories in the cache directory. Required by ACC as it creates a directory per plugin.
MID Authentication Configuration	Checks if the MID Server authentication is configured. At least 1 authentication method is required.
MID Connection	Tests the connection to the MID Server over both HTTP(S) and WebSockets.
MID Connection Configuration	Checks if the MID connection is configured. At least 1 MID Server connection is required.
OSQuery Test	Verifies OSquery executable availability and executes a basic system query.
PAC File	Validates the configured PAC file is accessible and valid.
Powershell Version	Validates Powershell installation and version.
Ruby Script Execution	Verifies that the current user is able to execute a basic Ruby script.
Sudo SS Command Access	Validates sudo access via `ss` command.
WMI Permissions	Checks WMI permissions for process queries.

Agent Client Collector performance and footprint for URL monitoring

The following tables display the agent performance KPIs and its footprint on the host during URL monitoring data collection execution on different operation systems.

URL monitoring checks on a Linux system

Linux Cent OS 8, 2 CPUs, 4GB RAM					
Checks per minute	100	250	500	1000	1500

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL monitoring checks on a Linux system (continued)

Linux Cent OS 8, 2 CPUs, 4GB RAM					
Metrics (expected/ actual)	700/700	1750/1750	3500/3500	7000/7000	10500/10500
Network utilization - Tx (MID > Agent)	35 KB/s	78 KB/s	146 KB/s	286 KB/s	430 KB/s
Network utilization - Rx (MID < Agent)	15 KB/s	27 KB/s	51 KB/s	107 KB/s	116 KB/s
Network utilization - Tx (Agent > MID)	8 KB/s	23 KB/s	37 KB/s	89 KB/s	113 KB/s
Network utilization - Rx (Agent < MID)	28 KB/s	72 KB/s	142 KB/s	285 KB/s	426 KB/s
Memory consumption	22 MB	25 MB	26 MB	34 MB	39 MB
CPU of all checks	~3%	~7%	~11%	~21%	~24%
Process CPU utilization	1% - 1.5%	1.5% - 2.5%	5% - 6%	6% - 7%	12% - 13%
Host CPU utilization	~10%	~19%	~23%	~45%	~53%

Agent Client Collector certificate revocation reasons

The following table lists and describes the possible reasons for revoking an Agent Client Collector certificate to stop communication between the agent and ITOM cloud services.

Certificate revocation reasons

Reason	Description
Unspecified	Revoke a certificate without providing a specific revocation code. **Note:** This reason code doesn't provide an audit trail identifying why a certificate was revoked.
Key Compromise	You suspect that the private key associated with a certificate is compromised. For example, if a laptop belonging to a user in your organization is stolen, any private keys stored on the laptop may be compromised.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Certificate revocation reasons (continued)

Reason	Description
CA Compromise	You suspect that a Certificate Authority's (CA) private key has been compromised and is in the hands of an unauthorized individual. If a CA's private key is revoked, the CA hierarchy considers all certificates below that CA revoked as well.
Affiliation Changed	An individual is no longer working in the organization, or the computer account to which the certificate was issued is no longer in use. Can also be used if a person changes roles within an organization and no longer requires using the certificate associated with their previous role. For example, an employee could move from the purchasing department and no longer require a certificate to authorize purchase requests.
Superseded	Indicates that a new certificate must be issued in place of a previously issued certificate. For example, if you update a certificate template and reissue certificates, you could revoke the previous certificate with this reason code.
Cessation of Operation	A server or workstation is decommissioned, and all certificates issued to the server are no longer required. You can use this revocation reason when decommissioning a CA.
Certificate Hold	A temporary revocation indicating that a CA won't validate a certificate at that specific time. **Note:** Using this reason code makes it difficult to determine whether a certificate was valid at a specific time.
Remove from CRL	Enables future unrevoking of the certificate, removing the certificate from the certificate revocation list (CRL).
Privilege Withdrawn	The certificate holder no longer has the privileges required to continue using the certificate.
AA Compromise	Indicates suspected or actual compromise of the authentication authority (AA) validated in the certificate.

Agent Client Collector check definition page

The fields to be configured on the Check Definition page, when creating a check definition.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Check definition form

Field	Description
Name	A descriptive name for the check.
Check Type	Select the type of check. The available monitoring options are: • Events • Metrics
Active	Select to activate the check.
Is Proxy Valid	Select to indicate that the check's policy is set to work as a proxy. When viewing this option in the check instance, it is read-only.
Command Auto Generation	Select to automatically generate the command with the **Command Prefix** value and the **Parameters** tab values.
Command Prefix	The command that is used for automatic generation when the **Command Auto Generation** check box is selected. The prefix consists of any portion of the command which is static (does not change), such as the script name.
Command	• Enter the command that the Agent Client Collector executes. **Note:** When the **Command Auto Generation** check box is selected, this field is automatically populated with the prefix and flags of the active parameters specified in the **Parameters** tab. • The field contains parameters taken from one or more of the following: ○ Simple template: `{{.labels.params_field_name}}`: Takes values from entries in the **Parameters** tab. For example, a string of `{{.labels.params_warning}}` means that the value of the *warning* parameter is used (provided it has been configured on the **Parameters** tab). ○ Monitored CI: `{{.labels.params_ci_field_name}}`: Takes values automatically from the monitored CI, where `field_name` is replaced with the exact name of the required field in the CI table.
Configuration Data Files	Select the configuration data files to be downloaded when the check runs.
Description	Description of the check.
Exec Mode	The execution mode of the check. Available options are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Check definition form (continued)

Field	Description
	• *shell*: To be used for checks which do not support *execv*. • *execv*: Provides enhanced security during check execution. The default execution modes are: • Existing check definitions: *shell* • New check definitions: *execv* • If no value is entered in the field: *shell* When upgrading to version 2.9.0, if this field is read-only, ensure that you disable the read-only status, as described in the (KB1122498) article in the Now Support Knowledge Base.
Interval-based scheduling	When selected, enables configuring a time interval (in seconds) to wait between check executions.
Interval	The amount of time, in seconds, to wait between check executions. For example, a value of 60 means that the check runs every 60 seconds. Specified value must be an integer. Appears only when selecting **Interval-based scheduling**.
Cron-based scheduling	When selected, enables selecting the frequency with which check results are to be sent, in the **When to send the check results** field.
When to send the check results	The time or frequency to send check results. • When event severity changes (default for event checks) • Always send check results (default for non-event checks) • Do not send check results • When the check results change • (Advanced) Based on exit codes of the check: Send results only if the exit code is 240 (OK), 241 (Warning), or 242 (Critical). However, if the command output is empty, then even if one of these codes are part of the exit code, check results aren't sent.
Timeout	The amount of time, in seconds, after which the check execution stops when no output is returned. For example, a value of 60 means that when the check execution doesn't return a value for 60 seconds, the execution stops.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Check definition form (continued)

Field	Description
Check group	A record in the *sn_agent_check_group* table consisting of the group name and CMDB CI class type. Assign a check group to enable filtering only checks in the group for selection when defining a policy.
Event status change threshold	The number of consecutive times that a check's response status must happen before a new event is sent. For example, if this value is set to 5, a check whose response status changes from **OK** to **Error** generates a new event with an **Error** status only after the fifth consecutive occurrence of the status change. After an agent restart, an initial event is always sent. Default value: 5 (except for AWS event policies)
Event status repair threshold	The number of consecutive times that a check's response status must improve to close the previous event. For example, if this value is set to 3, a check whose response status changes from **Error** to **OK** closes the previous event and generates a new event with an **OK** status only after the third consecutive occurrence of the status change. Default value: 1 (except for AWS event policies)
Credential failure regex	The string from the check's output indicating that the check failed due to a credentials error. The agent then continues searching credentials that are part of the credential alias until it finds the correct one. This field is relevant (and mandatory) when the check's policy uses a credential alias. When creating a new check, enter the string manually.
Plugins	Select the plugins to be associated with the check. Once this is done, the plugins download before the check executes.

Check definition form parameters tab

The Parameters tab definitions for the **Command** field on the check definition form.

Parameters Tab

Field	Description
Name	A descriptive name for the parameter.
Default value / value	Default value / value of the parameter.
Active	Boolean. When set to **true**, the parameter is taken to the **Command** field when the **Command Auto Generation** check box is selected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters Tab (continued)

Field	Description
Mandatory	Boolean. When set to **true**, a parameter value must be specified for the command to run.
Flag	String. Prefix that is added before the parameter value in the **Command** field when the **Command Auto Generation** check box is selected.
Value required	Boolean. When set to **true** and when the **Command Auto Generation** check box is selected, the value of this parameter is added to the **Command** field after the **Flag** value.

Test check dialog box fields

The dialog box fields when testing a check definition.

Test Check dialog box fields

Field	Description
Check Definition	Displays the name of the selected check definition.
CI	Select the CI on which to run the check. The available options are those CIs which meet both of the following criteria: • Belong to the group specified in the **Check group** field. • Belong to an agent with **Up** status. If the **Check group** field is empty, the value defaults to **cmdb_ci_computer**.
Credentials	Select the credentials of the user whom you want the agent to connect with. This field appears only if you have configured secure check parameters on the **Check Secure Parameter Definitions** tab in the Check Definition.
Proxy Agent	Select a proxy agent to be associated with the check. This field appears only when working with a check instance and when one of the options has been selected on the **Proxy Settings** tab in the instance's policy.

Agent Client Collector data collection properties

Description of the properties that determine the behavior of Agent Client Collector data collection.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data collection properties

Property	Description
sn_agent.host-data_collection_refresh_duration	The amount of time (in seconds) between agent data collections on the host. Applicable only when no host CI is assigned to the agent. Default: 43200 (12 hours)
sn_agent.disco_minimum_threshold	The minimum number of minutes since the last endpoint Discovery on a given IP before Discovery can be triggered again. This property prevents running endpoint Discovery too often, such as in cases where a network intermittently has a break or a laptop is repeatedly rebooted. Default: 60
sn_agent.disco_disable_ci_clobber	When set to *true*, indicates that data collected by the ServiceWatch or ServiceNow Discovery sources takes precedence over Agent Client Collector when the threshold in the *sn_agent.disco_ci_clobber_of_agentless_disc* property hasn't been exceeded. Default: true
sn_agent.disco_ci_clobber_of_agentless_threshold	Maximum number of days since an existing CI has been discovered using agentless Discovery where the existing CI is linked instead of being rediscovered by the agent. Takes effect when *endpoint_disco_disable_ci_clobber_of_agentl* = **true** and over 14 days (by default) have passed since a non-ACC Discovery source (such as ServiceWatch or ServiceNow) has discovered the CI. After this threshold has been exceeded, agent Discovery can execute and overwrite an existing CI regardless of whether the CI has been previously discovered by a non-ACC Discovery source. This process presents the most recently discovered data in the CMDB. Default: 14
sn_agent.ci_prefers_ip_version	Indicates whether IPv4 or IPv6 is the preferred version when saving an IP Address value in the IP Address field of the CI record. Default: 4
sn_agent.ci_serial_number.pref_order	Specify the order of the fields to locate a serial number value to be saved to the host CI's *serial_number* field during agent data

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data collection properties (continued)

Property	Description
	collection. Values must be comma-separated, without spaces, and in lowercase. Default: bios,system,uuid,baseboard,chassis
sn_agent.mac_ci_name_pref_order	Specify the order of the values by which the CI record's *Name* field is populated during macOS data collection. Values must be comma-separated, without spaces, and in lowercase. Default: name,hostname,computer_name,local_hostname
sn_agent.host_data_collection.disable_container	When set to *true*, indicates that data collection is disabled for containerized agents. Default: true

Agent Client Collector policy collection properties

Description of the properties that determine the behavior of Agent Client Collector policy collection.

Policy collection properties

Property	Description
sn_agent.full_policy_calculation_cycle_days	The number of days for a policy to reach a full calculation cycle. If the policy's last full calculation cycle was more than 7 days ago, the policy is queried to fully calculate its calculation cycle. Default: 7
sn_agent.max_number_of_monitored_cis_per_policy	The maximum number of monitored CIs that can be processed per policy. Default: 400000
sn_agent.max_num_of_monitored_cis_unassociation	The maximum number of monitored CIs unassociated with agents that can be processed per policy. Default: 1000
sn_agent.policy_force_recalc_interval	The time limit, in minutes, used to determine whether forced recalculation is required for any policies. Forced recalculation redistributes both a policy's monitored CIs and the corresponding agent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Policy collection properties (continued)

Property	Description
	Default: 10
sn_agent.policy_force_recalc_required	When set to *true*, checks whether forced recalculation is required for policies. Forced recalculation redistributes a policy's monitored CIs and the corresponding agent. Default: true
sn_agent.populate_proxy_agent_monitored_cis	When set to *true*, repopulates the monitored CIs for given policies to show the distribution of CIs among proxy agents. Default: false

Agent Client Collector Framework configuration properties

Description of the properties that determine the behavior of Agent Client Collector Framework configuration.

Framework configuration properties

Property	Description
sn_agent.agent_static_import_chartreader_limit	The character limit for a given payload item. Relates only to the configuration item being processed and not the total attachment size. Default: 1000000
sn_agent.agent_upgrade_wait_time	Maximum number of minutes for an agent to successfully upgrade before entering *Warning* status. Default: 30
sn_agent.agent_version	The current ACC-F release version installed on the instance. Type: String
sn_agent.appl_classification_behavior	The characteristics and behaviors for applications during Agent Discovery. When set to *simple*, creates a shell CI. Default: simple
sn_agent.auto_upgrade.enabled	When set to true, the instance automatically upgrades existing Agent Client Collector installations to the version set in the sn_agent.agent_version property, if the agent version is lower than the property's version.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Framework configuration properties (continued)

Property	Description
	Type: Boolean Default: false
sn_agent.auto_upgrade.max_upgrades_per_hour	The maximum number of Agent Client Collector upgrades possible per MID Server every hour. Type: Integer Default: 50 **Note:** Modifying this value may negatively affect system performance.
sn_agent.auto_upgrade.max_upgrades_per_hour	The maximum number of Agent Client Collector upgrades possible for all agents on all MID Servers. Type: Integer Default: 1000 **Note:** Modifying this value may negatively affect system performance.
sn_agent.config_publish.max_payload_size	The size, in bytes, that the config_publish_payload can reach on the MonitoringProbe ECC queue topic before an error is logged and the payload is skipped. Default: 15000000
sn_agent.ecc_queue.max_payload_size	The maximum allowable payload size for an ECC queue record to be processed by the agent. Default: 5000000
sn_agent.enable_auto_mid_selection	When set to **true**, the instance sends a list of MID Servers to the agents. To enable automatic selection of a MID Server from the list, set the *auto-mid-selection* property to true in the agents' acc.yml file. Automatic selection of MID Servers ensures that each agent uses the most efficient available MID Server. Default: false

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Framework configuration properties (continued)

Property	Description
	Note: This property determines only whether a list of MID Servers is sent to the agent. • If this property was previously set to **true** and is then set to **false**, automatic MID selection is performed on the previously sent MID Server list if the *auto-mid-selection* property is set to **true** in the acc.yml file. • If this property is set to **true** and the *auto-mid-selection* property in the acc.yml file is set to **false**, no automatic MID Server selection is performed.
sn_agent.installer_max_endpoints	Maximum number of MID Web Server endpoint URLs to be selected during agent single line installation. Default: 3
sn_agent.keep_alive.alive_duration	The amount of time, in seconds, within which the agent's last_refreshed timestamp must be updated. After this time period, the agent status moves from *Up* to *Warning*. If the indicated time period passes again, the status moves from *Warning* to *Down*. Default: 120
sn_agent.keep_alive.disconnected_duration	The amount of time, in seconds, within which the last_keepalive timestamp must be updated. After this time period, the agent status changes from *Up* to *Disconnected*. Default: 600
sn_agent.logging.verbosity	The minimum level of messages that are logged for Agent Client Collector Framework. Messages with the indicated status and anything more severe are logged. Options: • error • warn • info • debug Default: info

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Framework configuration properties (continued)

Property	Description
sn_agent.max_sys_ids_in_query	The maximum number of sys IDs to return during GlideRecord queries. Default: 400000
sn_agent.maximum_mids_to_select	The maximum number of MID Servers that can be selected for agent setup. Default: 20
sn_agent.min_upgrade_history_per_agent	The minimum number of upgrades saved per agent. Default: 2
sn_agent.registration_key_validity_days	The number of days after creation of a registration key that the key is valid before it is deleted. Default: 90
sn_agent.registration_key_notification_days	The number of days before registration key deletion that an email notification is sent to the key's ownership group, informing of pending deletion. Default: 14
sn_agent.sync_filters_interval_min	The number of minutes after which CMDB changes are detected and then synched to the MID Server. Default: 10
sn_agent.time_ago_in_seconds_to_query_sysevent_sync_queues	When processing sysevent_sync_queues, only query those created within the indicated time (in seconds). Default: 43200 (12 hours)

Agent Client Collector data collection tables

Agent Client Collector performs data collection based on the scoped apps that you've installed. Agent Client Collector Framework performs basic data collection, and Agent Client Collector for Visibility Content performs enhanced data collection.

The Refresh Host Data for Agents scheduled job collects host data every hour on hosts that haven't had data collection run in the past 12 hours. The job collects the data described in the following tables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agent Client Collector Framework data collection

Data	CMDB field
hostname	ci.name
physical memory	ci.ram
hardware vendor	ci.manufacturer
hardware model	ci.model_id
CPU name	ci.cpu_type
OS domain	ci.os_domain
OS name	ci.os
OS version	ci.os_version
IPv4 address	ci.ip_address
Default gateway	ci.default_gateway
Serial number	ci.serial_number
DNS Name	ci.name
FQDN	ci.fqdn
TCP Connections	cmdb_tcp
Running Processes	cmdb_running_process
Serial numbers **Note:** When collecting data from Linux hosts, `dmidecode` must be configured with `sudo` permissions to collect all serial numbers.	cmdb_serial_number

Agent Client Collector for Visibility Content data collection

Data	CMDB field
CPU manufacturer	ci.cpu_manufacturer
CPU speed	ci.cpu_speed
OS arch	ci.os_address_width
CPU count	ci.cpu_count
CPU core count	ci.cpu_core_count
CPU core thread	ci.cpu_core_thread
Is virtual	ci.virtual
Start date (uptime)	ci.start_date
Object ID	ci.object_id
TCP Connections	cmdb_tcp
Running Processes	cmdb_running_process

Account commands for LocalService, LocalSystem, and gMSA during Windows installation

When installing an agent on a Windows host using a LocalService, LocalSystem, or gMSA account, you must run msi commands to enable the accounts.

Account type commands

Account type	Command
LocalSystem	`msiexec /i C:\acc-installer.msi /qn /norestart ACC_API_KEY=<API key code> ACC_MID=<MID Server URL>/ws/events ACC_ALLOW_LIST=False LOCALUSERNAME="SYSTEM"`
LocalService	`msiexec /i C:\acc-installer.msi /qn /norestart ACC_API_KEY=<API key code> ACC_MID=<MID Server URL>/ws/events ACC_ALLOW_LIST=False LOCALUSERNAME="LOCALSERVICE"`
gMSA	`msiexec /i C:\acc-installer.msi /qn /norestart ACC_API_KEY=<API key code> ACC_MID=<MID Server URL>/ws/events ACC_ALLOW_LIST=False LOCALUSERNAME="DOMAIN\gMSA$"`

Verify API is associated with a live agent

Call the *AgentNowHandler.hasAgent* API to determine if the CI is associated with a live agent. The API gets a sys_id of the CI and returns a true/false result.

The *hasAgent()* method takes a sys_id of the CI as a string parameter and returns **true** when the CI fulfills one of the following conditions:

- The CI is `sn_agent_cmdb_ci_agent` and this agent is alive.
- The CI is a host (extends `cmdb_ci_hardware`) and is associated with a live agent.
- The CI is an application (extends `cmdb_ci_appl`) and has a runs-on relation to a host associated with a live agent.

For example:

```
var agentNow = new sn_agent.AgentNowHandler();
gs.info('Agent assocation with CI? ' +
agentNow.hasAgent('158279505372b30034b8ddeeff7b1270'); // sys_id
 of agent
```

Configuration file options

Options available in the `acc.yml` configuration file.

Basic configuration options for acc.yml configuration file

Option	Type	Default	Description	Example
name	String	Agent_<value of the *hostname* command>	Agent name registered on the SN instance can be specified by the user. The result of the 'hostname' command is used as the default.	`name: <name of agent>`
backend-url	List	`wss://127.0.0.1:8800/ws/events`	List of MID Webserver endpoint URLs to communicate with. If communication cannot be configured with the first URL, the system moves to the ensuing URLs until it establishes a connection. Works when `enable-auto-mid-selection=true`	`backend-url: <mid server ip>:<websocket port>`
api-key	String	<None>	API key used by the MID Server to authenticate incoming agent connections. Value is encrypted on initial agent startup.	`api-key: <mid web server api key>`
user	String	admin	Username used for basic authentication. If this parameter is empty, the agent does not start.	`user: "agent-01"`
password	String	admin	Password used for basic authentication.	`password: <secure-password>`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Basic configuration options for acc.yml configuration file (continued)

Option	Type	Default	Description	Example
			Value is encrypted on initial agent startup. If this parameter is empty, the agent does not start.	
log-level	String	Info	Amount of logging to appear in the acc.log file. Values: • Panic • Fatal • Error • Warn • Info • Debug	`log-level: debug`
allow-list	String	/etc/servicenow/agent-client-collector/check-allow-list.json	Path to the JSON file that contains the list of check commands the agent can execute. Comment out this parameter to disable the allow-list. If this parameter is empty, the allow-list is disabled.	`allow-list: /etc/agent/check-allow-list.json`
appl_classification_behavior	list	simple	Indicates whether to enable shell CI creation on the agent. Possible values are: • simple: Indicates that shell CI creation is enabled.	`appl_classification_beha off`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Basic configuration options for acc.yml configuration file (continued)

Option	Type	Default	Description	Example
			• off: Indicates that no shell CIs are created for the application. • full: Indicates that complete Discovery of the application CIs is performed using patterns.	

Advanced configuration options for acc.yml configuration file

Option	Type	Default	Description	Example
verify-plugin-signature	Boolean	true	Verifies the plugin signature before execution. Disable when using self-signed or developmental plugins.	`verify-plugin-signature: true`
insecure-skip-tls-verify	Boolean	true	Determines whether to verify the certificate when connecting to the MID Server. Set as **false** to enforce full TLS verification.	`insecure-skip-tls-verify: true`
enable-auto-mid-selection	Boolean	true	Controls the Auto MID Selection feature to connect to the optimal MID Web Server provided by the instance.	`enable-auto-mid-selection: true`
check-command-prefer-installed	Boolean	false	Indicates the preference of executables provided within ACC plugins or executables available in the host system's PATH variable.	`check-command-prefer-installed: false`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced configuration options for acc.yml configuration file (continued)

Option	Type	Default	Description	Example
			• false = ACC plugins • true = Executables in the host system's PATH variable	
command-log-redaction-regex	String	`'-password[=\s]([^"\s]+)|-[pP]\s([^"\s]+)|--user\s[^":\s]+:([^\s"]+)|-pw\s([^"\s]+)|-u\s[^":\s]+:([^\s"]+)|[^"\s]+/([^\s"]+)@'`	The regex to search for and to remove potentially sensitive user information from ACC logs and payloads.	`'-password[=\s]([^"\s]+)|-[pP]\s([^"\s]+)|--user\s[^":\s]+:([^\s"]+)|-pw\s([^"\s]+)|-u\s[^":\s]+:([^\s"]+)|[^"\s]+/([^\s"]+)@'`
powershell_installed	Boolean	false	Disables powershell command execution on agents.	`powershell_installed: true`
allow-list-global-only	Boolean	false	Set to **true** to enhance security by relying only on the allow list defined in the *`allow-list`* parameter you specify during configuration, ignoring allow lists bundled with ACC plugins.	`allow-list-global-only: false`
disable-assets	Boolean	false	Indicates whether a check running with an asset (plugin) dependency fetches ACC plugins from the ServiceNow® instance, or uses a copy of the plugins in its cache folder.	`disable-assets: false`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced configuration options for acc.yml configuration file (continued)

Option	Type	Default	Description	Example
			When set to **false**, additional assets can be downloaded during check execution. Set to **true** to enhance security and ensure that no new plugins are downloaded during check execution.	
agent-upgrade-url-path	String	`https://install.servicenow.com/glide/distribution/builds/package/app-signed/`	Indicates an alternate web server URL endpoint for downloading ACC installer packages when performing selective upgrade.	`agent-upgrade-url-path: https://<ip address>:<port>/acc_installers`
certificate-rotation-days-out	Integer	28	Indicates the number of days before certificate expiration that an agent attempts to rotate its certificate.	`certificate-rotation-days-out=28`
enable-patterns-on-agent	Boolean	false	Enables gathering details on the applications which run on the Agent Client Collector. This parameter is required only when using the Agent Client Collector for pattern execution.	`enable-patterns-on-agent: true`
keepalive-filter-nics	Boolean	true	Indicates whether Network Interface Controllers	`keepalive-filter-nics: true`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced configuration options for acc.yml configuration file (continued)

Option	Type	Default	Description	Example
			(NICs) are filtered on the agent (**true**) or the MID Server (**false**) during keepalive action.	
keepalive-number_nics_per_ip_type	Integer	1	Indicates the maximum number of Network Interface Controllers (NICs) per IP type (IP4, IP6) sent with a keepalive action. The indicated number is sent for each IP type. For example, if the value is 1, a maximum of 2 NICs are sent (0-1 each for IP4 and IP6). If the value is 4, a maximum of 8 NICs are sent (0-4 each for IP4 and IP6).	`keepalive-number_nics_per_ip_type 4`

Proxy Auto-Configuration (PAC) file parameters

Option	Type	Default	Description	Example
pac-file	String (Required)	"" (empty)	Specifies the location of the PAC file to use for proxy configuration. Can be either: • A local file path (such as: `file:///etc/proxy/proxy.pac`) • A remote URL (such as: `https://proxy.company.com/proxy.pac`)	`pac-file: "https://proxy.company.com/proxy.pac"`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Proxy Auto-Configuration (PAC) file parameters (continued)

Option	Type	Default	Description	Example
pac-cache-ttl	Duration (Optional)	30m (30 minutes)	Determines how long proxy rules from the PAC file are cached in memory. Setting this to 0 disables caching.	`pac-cache-ttl: "1h" # Cache for 1 hour`
pac-refresh-interval	Duration (Optional)	30m (30 minutes)	Specifies how often the agent is to check for updates to the PAC file. Useful when the PAC file is hosted remotely and may be updated periodically.	`pac-refresh-interval: "15m" # Check for updates every 15 minutes`
pac-dial-timeout	Duration (Optional)	30s (30 seconds)	Indicates the amount of time to wait when establishing a connection through a proxy server before timing out.	`pac-dial-timeout: "10s" # 10 second timeout`
pac-reset-on-connect-failure	Boolean (Optional)	true	When set to true, the agent clears the PAC cache and attempts to refresh the PAC file if a proxy connection proxy fails. This helps recover from proxy configuration changes or temporary proxy issues.	`pac-reset-on-connect-failure: true`

Synchronization properties for validating Agent Client Collector plugins

Use the following properties when synchronizing public certificates from the MID Server to the Agent Client Collector.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Certificate synchronization - MID properties

Property	Description
mid.acc.cert_monitor_disable	Ability to disable the monitor from synchronizing the public certificates. Default value: False
mid.acc.cert_monitor_interval	Interval (in seconds) at which the monitor synchronizes public certificates from a configured endpoint URL. Default value: 86400
mid.acc.cert_monitor_target_url	Endpoint URL prefix (minus the filename) from which the monitor synchronizes public certificates. Default value: ServiceNow Install server
mid.acc.cert_monitor_target_filename	Endpoint URL target filename from which the monitor synchronizes public certificates. Default value: SNCertificates.zip

Certificate synchronization - Agent properties

Property	Description
fetch-certificates-from-mid	Status of whether the public certificates are retrieved from the MID Server for plugin asset validation. Default value: True

Agent Client Collector statuses

The following table lists and describes the Agent Client Collector statuses.

Agent Client Collector statuses

Status	Description
Up	Agent is connected and working properly.
Warning	Agent has not been refreshed in over 2 minutes (based on the value of the sn_agent.keep_alive.alive_duration property).
Down	Agent is shut down.
Restarting	Agent restart is in progress.
Upgrading	Agent upgrade is in progress.
Disconnected	Agent's MID Server is down.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agent Client Collector statuses (continued)

Status	Description
Registered	The agent has registered successfully with the instance, a certificate was issued, and the instance has not yet received a keepalive.
Registration Failed	The agent failed to register with the instance and was not issued a certificate. See Agent Issues for more info.
Unknown	Agent's MID Server has not sent a keepalive communication for over 10 minutes (based on the value of the sn_agent.keep_alive.disconnected_duration system property).

Agent Client Collector log levels

The following table displays the available log levels which indicate the severity of Agent Client Collector events.

Log level	Description
Panic	Severe errors that cause the service to shut down unexpectedly.
Fatal	Fatal errors that cause the service to shut down (status 0).
Error	Non-fatal service error messages.
Warn	Warning messages indicating potential issues.
Info	Information messages representing service actions.
Debug	Detailed service operation messages which help troubleshoot issues.

Agent Client Collector log rotation parameters

If Agent Client Collector logs get too large, they can drain system resources. To ensure system efficiency, configure parameters in the `acc.yml` file by which to rotate logs out of the system's storage (Windows default location = `C:\ProgramData\ServiceNow\agent-client-collector\config\acc.yml`. Linux default location = `/etc/servicenow/agent-client-collector/acc.yml`).

Log rotation parameters

Parameter	Definition
log-file-and-stdout	Write logs to the `stdout` file. Default: **false**
log-retention-duration	Maximum age, in days, of the log file before it is rotated out of the system's storage.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Log rotation parameters (continued)

Parameter	Definition
	Default: **72h**
log-retention-files	Maximum number of log files that can be stored before being rotated out of the system. Default: **3**
log-max-size	Maximum size, in MB, of the log file before it is rotated out of the system's storage. Default: **10**
log-level	The log level to be measured by the logs. Available options are: **Panic, Fatal, Error, Warn, Info, Debug**. Default: **Info** The specified log level represents the lowest level of events displayed in the log. For example, a user who specifies **Error** sees all Error events, as well as Fatal and Panic events.

Agent Client Collector CPU protection thresholds

When an agent meets the configured thresholds specified in the agent's `acc.yml` file, it enters CPU protection mode, either for an individual check or for all checks. Agents in CPU protection mode appear in the agent logs with the syntax `Agent Protection`.

Parameter	Description
agent_cpu_threshold_disabled	To prevent the agent from shutting itself off when CPU memory reaches a certain threshold, set value to **True**. Default=False
cpu_percentage_limit	The percentage of the agent's CPU usage that sends the agent into CPU protection mode. Default=5 **Note:** When working with Windows event and metric checks, set this value to 10.
cpu_protection_behavior	Assign **individual** for the system to disable only the individual check that passed the *cpu_percentage_limit* value. If multiple checks crossed the threshold, the check with the highest CPU is disabled.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter	Description
	Assign **all** to disable all checks and pause data collection. Possible values: all, individual Default: all
repeated_high_cpu_num	The number of consecutive times CPU consumption exceeds the *cpu_percentage_limit* for the agent to enter CPU protection mode. Default=3
monitor_interval_sec	Indicates the frequency, in seconds, that the agent monitor runs to check if the *cpu_percentage_limit* is exceeded. Default=60
proxy_cpu_percentage_limit	The percentage of the agent's CPU usage when the agent is running proxy checks too frequently, that sends the agent into CPU protection mode. Default=80

Golden image structure and modularity

The following table outlines the structure and modularity of the golden image mode for cloning agents, based on the operating system (OS) in use.

Golden image structure by OS

	Linux	macOS	Windows
Trigger type	marker file	plist key	msi property
Fresh install handling	none	supported	supported
Service control	stop and disable	skip load	stop and disable
Identity handling	cache wipe	skip restore	skip restore
Certificate handling	cert wip	skip restore	cert wipe
Runtime state	Cache and database wipe	skip restore	Cache and database wipe

Agent Client Collector health instance scan checks

The Agent Client Collector (ACC) health instance scan suite includes checks that detect anomalies and issues on your instance. Use this reference to identify what each check does and when it applies.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ACC Health Instance Scan Suite checks

Check name	Description
ACC duplicate agent for host CI	Identifies configuration items (CIs) associated with multiple active agents, indicating potential issues with CI identification.
ACC Error Framework	Verifies whether the ACCErrorManager has been created, which enables associating errors to the relevant ACC scoped app. Detects whether an automation source application, automation error category, and automation error code exist for the Agent Client Collector Framework application.
ACC find modified script includes	Detects modified Agent Client Collector Framework script includes that might have been altered post-upgrade.
ACC skipped upgrades	Reports upgrades that were skipped since the last upgrade. **Note:** Skipped upgrades don't generate an error message.
ACC verify plugin folder hierarchy	Validates the correct creation of ACC Plugin folders and flags duplicate folders that may cause synchronization issues.
ACC active policies count	Counts the number of active published policies. If the number exceeds 300, consolidate the policy to improve performance.
ACC agent to MID Connection	Verifies the connection of 1000 agents per 1-GB Java Virtual Machine (JVM) to confirm the MID Server isn't overloaded. If overloaded, configure additional JVMs or redistribute agents to other MID Servers.
ACC verify sn_agent CI counts match	Confirms that the records in the sn_agent_ci_extended_info and sn_agent_cmdb_ci_agent tables match, verifying data consistency for agents.
ACC ICS Diagnostics Tool	Analyzes the ServiceNow instance and its setup with ITOM Cloud Services.
ACC automation_error_msg cleaner	Verifies that the Agent Issues table cleaner exists and is enabled, ensuring ACC-specific error records are regularly cleaned up and the table remains manageable.
ACC Verify global.ACCInstanceScanUtil exists	Detects that the `global.ACCInstanceScanUtil` file is installed for instances starting with the Xanadu release or later. Without this file,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ACC Health Instance Scan Suite checks (continued)

Check name	Description
	several ACC Health Instance Scan checks don't run.

Additional information

For details on importing the `global.ACCInstanceScanUtil` script include, see the Script Include ACCInstanceScanUtil [KB1630132] article in the HI Knowledge Base.

For details on running the ACC health instance scan, see Schedule the Agent Client Collector (ACC) health instance scan.

Agent onboarding configuration settings

The settings you can customize when generating an Agent Onboarding installation plan. Toggle settings to activate and enable customization.

Agent onboarding configuration fields

Field	Description	Options
Connection type	Method the agent uses to connect to the instance.	• **Use ICS (MID-less)** • **Use MID Server**
MID Server	MID Servers the agent sends data to. Up to three MID Servers can be selected. Appears only when the Connection type is set as **Use MID Server**.	Drop-down list of available MID Server instances.
Registration key	Authorization key for registering with the ServiceNow instance for ICS (MID-less) connection. Appears only when the Connection type is set as **Use ICS (MID-less)**.	Drop-down list of available registration keys.
API key	Authentication key for connecting to the MID Server. Enabled by default and can't be turned off.	Drop-down list of available API keys. Select **Add new** to create a new key.
Log level/debug mode	Controls the level of details that the agent logs. Keep at **Info** unless you're troubleshooting.	• **Error** • **Warn** • **Info** (default) • **Debug** • **Trace**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agent onboarding configuration fields (continued)

Field	Description	Options
CPU thresholds	Caps agent CPU usage to protect endpoint performance. Default: 20% for Digital End-User Experience (DEX), 5% for all others.	Enter an integer
Enable PAC file configuration	URL to be used when connecting the agent through a proxy server.	Enter the Proxy Auto-Configuration (PAC) file URL.
API port	REST API port on the agent.	Enter the port number Default port number: 3031

Agent installation plan steps

After you complete agent onboarding, the system generates an installation plan. The following table describes each step in the plan and the commands or actions required.

Installation plan steps

Step	Description
Instance configured	Confirms the instance is configured and ready. Marked as Completed when the criteria monitored by the check are complete.
MID Server configured	Confirms the MID Server is configured and ready. Marked as Completed when the criteria monitored by the check are complete.
ICS configured	Confirms the ITOM Cloud Service (ICS) is configured and ready. Marked as Completed when the criteria monitored by the check are complete.
Network connectivity verified from endpoint to MID	Runs the indicated command in a terminal on the endpoint to verify network connectivity before installation.
Service Account Configuration	Runs the indicated commands in an elevated Command Prompt on the endpoint. For the "Deny log on locally" setting, use Local Security Policy (`secpol.msc`). Required for Linux and macOS, optional for Windows
Installation packages downloaded for Windows	Runs the indicated command in an elevated Command Prompt or PowerShell, from the directory where you downloaded the .msi file.
Review and update configuration file	After installation, find the agent `acc.yml` configuration file and update it with your registration (for ICS) or API key (for MID Server) and verify that the default field values match your configuration. The default field values are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Installation plan steps (continued)

Step	Description

	`verify-plugin-signature: true`
	`max-running-checks: 10`
	`disable-secrets: true`
	`disable-api: true`
	`stated-disable: true`
	
	Note: Only the configuration options handled by the onboarding process are used.

Agent Client Collector upgrade properties

System properties that control Agent Client Collector upgrade behavior, including the target version, rate limits, retry logic, and timeouts.

Selective upgrade properties

Set these properties before running any selective upgrade. Navigate to **All** > **System Properties** > **All Properties** and search for each property name.

Selective upgrade properties

Property	Value	Description
sn_agent.auto_upgrade.enab	`true`	Enables the upgrade feature. Set to **true** before running any upgrade, manual or scheduled.
sn_agent.agent_upgrade_versio	Target version, for example `5.0.1`	The version agents upgrade to. If empty, the system uses the current Agent Client Collector Framework application version. Must be a valid version number.

Optional properties

These properties have default values suitable for most environments. Adjust them only when your environment requires different rate limits or timeout thresholds.

Optional upgrade properties

Property	Default	Description
*sn_agent.auto_upgrade.max_upgrades_per_*	1000	Maximum agents upgraded per job run across all MID Servers. Lower this value for a more gradual rollout pace.
*sn_agent.auto_upgrade.max_upgrades_per_*	50	Maximum agents upgraded through a single MID Server per job run. Prevents overloading individual MID Servers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Optional upgrade properties (continued)

Property	Default	Description
sn_agent.auto_upgrade.retry_limit	3	Number of times the system retries a failed upgrade before permanently skipping the agent. After an agent reaches this limit, reset the `failed_upgrade_attempts` field on the Agent Extended Info record to allow retries.
sn_agent.agent_upgrade_wait_time	30	Minutes the system waits for an agent to complete its upgrade before marking it as failed and transitioning the agent to **Warning** status.
sn_agent.upgrade.timeout_minutes	10	Minutes allowed for the initial upgrade validation check on the agent (AgentVerification stage).
sn_agent.min_upgrade_history_per_agent	2	Number of upgrade history records retained per agent. Older records are automatically removed.

Property usage note

The *sn_agent.agent_upgrade_version* property is specifically for overriding the upgrade target version. The *sn_agent.agent_version* property controls package download URLs, version display, and other system behaviors. Use *sn_agent.agent_upgrade_version* when you want to target a specific version for upgrades without affecting other system behavior.

Agent Client Collector upgrade error codes

Error codes generated during Agent Client Collector upgrades, with descriptions and resolution steps.

Upgrade errors appear in **All** > **Agent Client Collector** > **ACC Errors**. Filter by error codes starting with ACC - 50 to see upgrade-specific issues. Additional detail is available in the **Message** column of the Agent Upgrade Histories table. For supported platforms, see Supported platforms for Agent Client Collector auto-upgrade.

Upgrade error codes

Error code	Description	Resolution
ACC-5005	Agent operating system is not supported for auto-upgrade.	The agent can't be auto-upgraded. Manually install the new version on the agent host. For supported platforms, see Supported platforms for Agent Client Collector auto-upgrade.
ACC-5006	Agent version is earlier than the minimum required for auto-upgrade (2.7.0).	Manually upgrade the agent to version 2.7.0 or higher, then retry.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Upgrade error codes (continued)

Error code	Description	Resolution
ACC-5007	Agent is not in **Up** status.	Wait for the agent to reconnect. If the agent remains down, investigate connectivity issues on the agent host.
ACC-5013	Agent-side validation failed (AgentVerification stage).	Check the `acc.log` file on the agent host. Common causes include insufficient permissions, low disk space, and missing dependencies.
ACC-5015	MID Server is not in **Up** status.	Restore the MID Server that this agent connects through, then retry the upgrade.
ACC-5016	Upgrade timed out. The agent did not complete the upgrade within the allowed time.	Connect to the agent host and check whether the agent service is running. Review the upgrade log: • Linux and macOS: `{AGENT_LOG_DIR}/servicenow/agent-client-collector/upgrade.log` • Windows: `%TEMP%\ACC_Logs\ACC_Upgrade.log` If the service is running but the status did not update, restart the agent service.
ACC-5017	Agent has exceeded the maximum retry limit for failed upgrades.	1. Investigate the root cause in the agent logs. 2. After resolving the issue, open the agent record and navigate to the related Agent Extended Info record. 3. Set `failed_upgrade_attempts` to 0 and save. 4. Navigate to ACC Errors and resolve the ACC-5017 error for this agent. 5. The agent is picked up in the next scheduled upgrade run.
ACC-5018	Target upgrade version is invalid.	Check the *`sn_agent.agent_upgrade_version`* property. The value must be a valid version number, for example `5.0.1`.

Supported platforms for Agent Client Collector auto-upgrade

Operating systems and package types supported for Agent Client Collector auto-upgrade, and the minimum agent version required.

The minimum agent version for upgrade eligibility is 2.7.0 on all platforms. Agents on unsupported platforms are skipped with error code ACC-5005.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported platforms for auto-upgrade

Operating system	Package type	Requirements
Windows	MSI	Agent must run as the SYSTEM account.
Linux — Red Hat, CentOS, Oracle, Rocky, Alma, CentOS Stream	RPM	Agent must run as root or have full sudo access. For information on configuring sudo access, see Install Agent Client Collector on a Linux system.
Linux — Ubuntu, Debian, GNU/Linux	DEB	Agent must run as root or have full sudo access. For information on configuring sudo access, see Install Agent Client Collector on a Linux system.
macOS — Intel (x64)	PKG	Agent must run as root or have full sudo access. For information on configuring sudo access, see Manually install Agent Client Collector on macOS.
macOS — Apple Silicon (ARM64)	PKG	Architecture is detected automatically. Agent must run as root or have full sudo access. For information on configuring sudo access, see Manually install Agent Client Collector on macOS.

Non-supported platforms

Auto-upgrade is not supported on Linux SuSE, Solaris, or AIX. Agents on these platforms are skipped during upgrade runs and generate error code ACC-5005. To upgrade agents on unsupported platforms, manually install the new version on the agent host.

Required agent permissions

Agents must run with elevated privileges on the host to perform a self-upgrade:

- Windows: SYSTEM account
- Linux: root user or sudoers file configuration with full sudo access
- macOS: root user or sudoers file configuration with full sudo access

MSI installation parameters

The following table describes the MSI parameters used when preparing an agent for installation on a gold image and used with a non-persistent virtual desktop infrastructure (NPVDI) machine.

Parameter	Type	Description
NP_VDI_GOLD_IMAGE	boolean	Indicates a gold image host is enabled for the NPVDI agent. Set to **true**.
INSTANCE_URL	string	ServiceNow instance base URL for REST downloads.
INSTANCE_REST_API_USER	string	Basic-auth username for `fetch_vdi_config` REST API. This is the user created in the Prepare agent deployment on a non-persistent virtual desktop infrastructure machine procedure.
INSTANCE_REST_API_PASS	string	Basic-auth password; passed to the agent as the `ACC_REG_KEY` environment variable.
REGISTRATION_KEY	string	VDI light-registration key (must have `light_registration=true` on the instance). Passed to `acc` as the `ACC_REG_KEY` environment variable.
PAC_FILE	string	PAC file for proxy auto-configuration during downloads. Takes precedence over `HTTPS_PROXY`. Optional.
HTTPS_PROXY	string	Static HTTPS proxy URL for downloads (ignored if `PAC_FILE` is set). Applied to REST API calls only. Optional.
GOLD_IMAGE_SKIP_PROXY	boolean	Set to **true** to bypass PAC/proxy during configuration downloads and connect directly. Optional.
CUSTOM_PLUGIN_CERT_FOLDER	string	Directory containing custom plugin-signing certificates; copied into the agent config directory before download.

Parameter	Type	Description
		Optional.

Agent Client Collector Monitoring reference

Reference topics provide additional information about Agent Client Collector Monitoring checks and policies.

Agent Client Collector Monitoring Footprint

The following table describes Agent Client Collector resource consumption. We supply performance testing values to specific customers upon request.

Parameters	Linux	Windows
Machine spec	Cent OS 8, 4 CPU Core, 8GB Memory	Windows Server 2019, 2 CPU, 4GB Memory
Network - (Agent > MID)	10.64 KB/s	350-400 byte/s
Network - (MID > Agent)	48 byte/s	5-15 byte/s
Average CPU Utilization	~1%	~3.89%
Max CPU per check	10 to 15%	15 to 20%
Memory overhead (avg)	~13.88 MB	~31.15 MB

Agent Client Collector Monitoring default checks and policies

Agent Client Collector Monitoring provides various default checks and policies.

Provided checks

The following tables list the default checks. You can edit these checks as needed. For more information about a specific check, see its Check Definitions page, as described in Checks and policies.

Linux

Type	Name	Description
Event	os.linux.check-process	Counts the number of running processes. You can block event creation for this check when no process is detected. For details, see Block event creation for non-existent entities.
Event	os.linux.check-system-cpu	Checks the CPU usage percentage.
Event	os.linux.check-system-cpu-load	Checks the CPU data load percentage against the configured thresholds.
Event	os.linux.check-system-disk-usage	Checks the file system's mount points and metrics.
Event	os.linux.check-system-memory-percentage	Checks the memory usage percentage.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Linux (continued)

Type	Name	Description
Event	os.linux.check-system-memory-swap	Checks the memory swap usage.
Event	os.linux.check-threads-count	Counts the number of threads running on the system. Sends an alert if that number is greater than the Warning or Critical threshold values.
Metric	os.linux.metrics-memory-vmstat	Collects vmstat memory metrics.
Metric	os.linux.metrics-process-status	Collects process status metrics provided to the metrics parameter.
Metric	os.linux.metrics-system-cpu	Collects CPU metrics, including cores.
Metric	os.linux.metrics-system-cpu-load	Uses uptime to collect CPU load metrics.
Metric	os.linux.metrics-system-cpu-percentage	Collects CPU usage percentage metrics, including average CPU utilization percentage.
Metric	os.linux.metrics-system-disk	Collects disk metrics.
Metric	os.linux.metrics-system-disk-capacity	Collects disk capacity metrics.
Metric	os.linux.metrics-system-disk-usage	Collects disk usage metrics, providing total, used, and available disk memory, as well as the disk's percentage of memory used.
Metric	os.linux.metrics-system-memory	Collects memory metrics, providing data in KB.
Metric	os.linux.metrics-system-memory-percent	Collects memory percentage metrics.
Metric	os.linux.metrics-system-uptime	Collects system uptime in seconds.
Metric	os.linux.metrics-reboot-count-today	Collects the number of reboots performed today.

Linux Log Monitoring

Type	Name	Description
Event	util.check-logs	Enables monitoring log files owned by a regular user. You can block event creation for this check when no process is detected. For details, see Block event creation for non-existent entities.
Event	util.check-logs-sudo	Enables monitoring log files owned by a root user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Linux Log Monitoring (continued)

Type	Name	Description
		You can block event creation for this check when no process is detected. For details, see Block event creation for non-existent entities.

Linux Network Monitoring

Type	Name	Description
Metric	os.linux.metrics-network-interface	Retrieves all network interface related metrics for Linux servers.
Metric	os.linux.metrics-netstat.tcp	Retrieves metrics on TCP socket states from netstat. Useful on high-traffic web or proxy servers with large numbers of short-lived TCP connections coming and going.

Windows Log Monitoring

Type	Name	Description
Event	os.windows.check-log	Enables monitoring log files on a Windows server.

Windows

Type	Name	Description
Event	os.windows.check-disk-name	Takes the storage drive name as input and verifies if the drive is present. Returns a CRITICAL\WARNING\OK value based on the parameter provided.
Event	os.windows.check-event-log	Measures the Windows event log against parameter thresholds and returns a CRITICAL\WARNING\OK event.
Event	os.windows.check-event-log-count	Measures the Windows event log against parameter thresholds and returns a CRITICAL\WARNING\OK event. Provides information on the number of events that have occurred within a specified duration for a single log file and a single ID. Also indicates the filters to be applied to retrieve events for a specific single-valued windows event level and provider name. Retrieving events from multiple log files is not supported. The number of events is provided, without details of each and every event.
Event	os.windows.check-event-log-details	Collects and filters Windows event logs based on the `duration_hour`, `event_log_level` and `log_file` values. Retrieves and filters Windows event logs according to the provided parameters. It returns details about the events

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Windows (continued)

Type	Name	Description
		with CRITICAL, WARNING, or OK status, based on the specified severity level. Supported on Windows version 7 and higher.
Event	os.windows.check-env-variables	Checks the environmental variables using a regular expression and returns either a *WARNING* or *OK* value. If a new system variable is created after agent installation, you must restart the agent. This check can access only those user variables that are associated with the current user (used during agent installation).
Event	os.windows.check-file-hashcode-update	Takes the file's path and MD5 hashcode as an input and verifies whether file content has been modified. Returns a *CRITICAL*, *WARNING*, or *OK* value. Read permissions are required on the monitored file.
Event	os.windows.check-file-update	Takes the file's path and interval as an input and verifies whether file content has been modified. Returns a *CRITICAL*, *WARNING*, or *OK* value. Read permissions are required on the monitored file.
Event	os.windows.check-modules	Verifies whether the list of modules is present.
Event	os.windows.check-processor-queue-length	Checks Processor Queue Length.
Event	os.windows.check-system-cpu-load	Checks the CPU load by using the *typeperf* command.
Event	os.windows.check-system-disk	Checks disk usage under specific parameters.
Event	os.windows.check-system-memory	Collects RAM usage.
Event	os.windows.check-system-patch	Verifies system patch installation. Returns either a *WARNING* or *OK* value.
Event	os.windows.check-system-process	Checks the user's task list to find running processes.
Event	os.windows.check-user-account	Takes the list of user names as an input and verifies whether the user account is active. Returns a *CRITICAL*, *WARNING*, or *OK* value.
Event	os.windows.check-windows-directory	Checks if a directory exists.
Event	os.windows.check-windows-pagefile	Collects page file usage and compares it to the Warning and Critical thresholds.
Event	os.windows.check-windows-process	Checks if a user input process is running.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Windows (continued)

Type	Name	Description
Event	util.check-windows-service	Checks if a user-supplied service is running on Windows. Only the RUNNING status is treated as OK. Any other status generates either a WARNING or CRITICAL event, depending on your configuration. You can block event creation for this check when no process is detected. For details, see Block event creation for non-existent entities.
Metric	os.windows.metrics-process-status	Retrieves the number of running instances, the percentage of CPU utilization, and the memory usage (in kilobytes) of the specified Windows process.
Metric	os.windows.metrics-processor-queue	Collects Processor Queue Length.
Metric	os.windows.metrics-system-cpu-load	Collects the average CPU load per second.
Metric	os.windows.metrics-system-disk-usage	Collects disk usage metrics.
Metric	os.windows.metrics-system-memory-percent	Collects RAM usage per second, providing free physical, free virtual, total physical and total virtual memory percentage.
Metric	os.windows.metrics-system-network	Collects network metrics.
Metric	os.windows.metrics-system-uptime	Collects system uptime.
Metric	util.metrics-windows-perf-counters	(No description)

MID Server

Type	Name	Description
Event	app.mid.check-active	Checks if the MID Server is active, based on the occurrence of LogStatusMonitor in the MID log.
Events	app.mid.check-logs-mid	Checks the MID logs for errors.
Metric	app.mid.metrics-stats	Collects MID Server information from the log and returns metrics.

HAProxy monitoring

Type	Name	Description
Event	check-haproxy	Retrieves the HAProxy load balancer details to determine whether it is running.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

HAProxy monitoring (continued)

Type	Name	Description
Metric	metrics-check-haproxy	Retrieves the HAProxy load balancer metrics to determine whether it is running.

HTTP (to be run in proxy mode)

Type	Name	Description
Event	util.check-http-response	Takes a URL or a combination of host/path/port/ssl, and checks for a 200 response that matches a pattern, if provided. Can use client certificates.
Event	util.check-http-follow-redirect	Checks that the URL doesn't exceed the maximum number of redirects.
Metric	util.metrics-http-curl	Retrieves HTTP endpoint metrics using curl.

Additional HTTP checks (no policy)

Type	Name	Description
Event	util.check-http-response-code	Raises a critical event if the URL response code does not match the regex.

Active Directory Metrics

Type	Check	Description	Command
Metric	metrics.windows.active-directory	Collects Active Directory metrics on the Windows host. Usage: winchecks metric-windows-active-dir -s hostname	`winchecks metric-windows-active-dir {{if .labels.params_scheme}} -S {{.labels.params_scheme}} {{end}}`

Apache

Type	Event/Metric	Description	Minimum version
Metric	app.apache.metrics-apache	Retrieves Apache HTTP server metrics.	2.4.x

Apache Kafka

Type	Event/Metric	Description	Minimum version
Event	kafka.check-zookeeper-status	Raises a critical event if the hosted Kafka Zookeeper is down.	ZooKeeper 3.1.2

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Apache Kafka (continued)

Type	Event/Metric	Description	Minimum version
Event	kafka.check-topic-replicas	Raises a critical event if any topic has partitions with unknown replicas.	ZooKeeper 3.1.2
Event	kafka.check-topic-replication-factor	Raises a critical event if replication factor of at least one topic is above or below provided replication factor parameter.	ZooKeeper 3.1.2
Event	kafka.check-topic-leader	Raises a critical event if any topic has partitions with unknown leaders or unpreferred replica as leader.	ZooKeeper 3.1.2
Event	kafka.check-topic-partitions	Raises a critical event if the number of partitions for a topic is less the min_partitions param.	ZooKeeper 3.1.2
Event	kafka.check-broker-status	Raises a critical event if Kafka Broker on the host is down.	Kafka 0.10.1.0
Metric	kafka.metrics.broker	Collects Kafka Broker Metrics from the host.	Kafka 0.10.1.0
Metric	kafka.metrics.zookeeper	Collects Zookeeper Metrics from the host.	ZooKeeper 3.5.0-alpha

Azure k8s Metrics

Type	Event/Metric	Description	Command
Metric	azure.metrics-k8s-service	Provides pod, nodes, and cluster level metrics from all Azure Kubernetes services in metric form. Usage: metrics-azure-k8s-service.rb Command example: `metrics-azure-k8s-service.rb -S {{.labels.params_subscription_id}} -r westus2`	`metrics-azure-k8s-service.rb -r {{.labels.params_ci_region}} {{-s {{if.labels.params_subscrip -S {{.labels.params_subscripti {{end}}`

Azure VM Metrics

Type	Event/Metric	Description	Command
Metric	azure.metrics-vm-cpu	Provides CPU-related metrics of each VM instance in the Azure region. Command example: `./metrics-`	`metrics-azure-vm.rb -r {{.labels.params_ci_region} {{if .labels.params_subscri -S {{.labels.params_subscripti`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure VM Metrics (continued)

Type	Event/Metric	Description	Command
		`azure-vm.rb -S {{.labels.params -T cpu`	`{{end}} -T {{.labels.params_type}}`
Metric	azure.metrics-vm-disk	Provides disk-related metrics of each VM instance in the Azure region. Command example: `./metrics-azure-vm.rb -S {{.labels.params_subscription_id}} -T disk`	`metrics-azure-vm.rb -r {{.labels.params_ci_region} {{if .labels.params_subscri -S {{.labels.params_subscripti {{end}} -T {{.labels.params_type}}`
Metric	azure.metrics-vm-memory	Provides memory-related metrics of each VM instance in the Azure region. Command example: `./metrics-azure-vm.rb -S {{.labels.params_subscription_id}} -T memory`	`metrics-azure-vm.rb -r {{.labels.params_ci_region} {{if .labels.params_subscri -S {{.labels.params_subscripti {{end}} -T {{.labels.params_type}}`
Metric	azure.metrics-vm-network	Provides network-related metrics of each VM instance in the Azure region. Command example: `./metrics-azure-vm.rb -S {{.labels.params_subscription_id}} -T network`	`metrics-azure-vm.rb -r {{.labels.params_ci_region} {{if .labels.params_subscri -S {{.labels.params_subscripti {{end}} -T {{.labels.params_type}}`
Metric	azure.metrics-vm-flows	Provides flows-related metrics of each VM instance in the Azure region. Command example: `./metrics-azure-vm.rb -S {{.labels.params_subscription_id}} -T flows`	`metrics-azure-vm.rb -r {{.labels.params_ci_region} {{if .labels.params_subscri -S {{.labels.params_subscripti {{end}} -T {{.labels.params_type}}`

GCP GCE metrics

Type	Event/Metric	Description
Metric	gcp.metrics.GCE	Retrieves metrics from GCP for Google Compute Engine.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GCP GCE metrics (continued)

Type	Event/Metric	Description
Metric	glassfish.metric-server-requests	Provides http-request metrics for all applications deployed on the Glassfish server.
Metric	glassfish.metric-server-resources	Provides metrics of the resources deployed on the Glassfish server.
Metric	glassfish.metric-transaction-service	Provides metrics for all transactions on applications deployed on the Glassfish server.
Metric	glassfish.metric-deployed-apps	Provides metric output of the applications deployed on the Glassfish server.
Metric	glassfish.metric-deployment-lifecycle	Provides lifecycle metrics applications deployed on the Glassfish server.

Glassfish

Type	Name	Description
Metric	glassfish.metric-jvm-level	Retrieves JVM metrics on the Glassfish server.
Metric	glassfish.metric-server-requests	Provides http-request metrics for all applications deployed on the Glassfish server.
Metric	glassfish.metric-server-resources	Provides metrics of the resources deployed on the Glassfish server.
Metric	glassfish.metric-transaction-service	Provides metrics for all transactions on applications deployed on the Glassfish server.
Metric	glassfish.metric-deployed-apps	Provides metric output of the applications deployed on the Glassfish server.
Metric	glassfish.metric-deployment-lifecycle	Provides lifecycle metrics applications deployed on the Glassfish server.

IBM WebSphere AS

Type	Event/Metric	Description	Minimum version
Metric	app.websphere.metrics-websphere	Returns IBM WebSphere application server metrics.	9

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

IBM WebSphere AS (continued)

Type	Event/Metric	Description	Minimum version
		Ensure that the user running the agent has sufficient permissions to access the required files in the `IBM Websphere` AS installation directories.	

IIS

Type	Event/Metric	Description	Minimum version
Event	app.iis.check-iis-alive	Checks if IIS is running.	-
Event	app.iis.check-iis-current-connections	Checks the number of current connections to the IIS server and their status, depending on the input. By default, all sites are connected to the IIS server.	-
Metric	app.iis.metrics-iis	Returns IIS metrics.	-

JBoss/WildFly

Type	Event/Metric	Description	Minimum version
Metric	app.jboss.metrics-jboss	Retrieves JBoss/WildFly server metrics. Ensure that the user running the agent has sufficient permissions to access the required files in the`JBoss/WildFly` installation directories.	16, 17

Kubernetes

Type	Event/Metric	Description	Command
Event	k8s.check-kube-apiserver-available	Checks if Kubernetes API server is up.	`check-kube-apiserver-available.rb {{if .labels.params_api_server}} -s {{.labels.params_api_server}} {{end}}`
Event	k8s.check-kube-nodes-ready	Checks whether Kubernetes nodes are in ready-to-use state.	`check-kube-nodes-ready.rb {{if .labels.params_api_server}} -s {{.labels.params_api_server}} {{end}}`
Event	k8s.check-kube-pods-pending	Measures the threshold by which pods are in the Pending state. Determine the threshold by setting the	`check-kube-pods-pending.rb {{if .labels.params_api_server}} -s {{.labels.params_api_server}} {{end}}`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Kubernetes (continued)

Type	Event/Metric	Description	Command
		pending_timeout check parameter value (default = 300 seconds).	
Event	k8s.check-kube-pods-restarting	Checks the pods that are restarting. Determine the threshold by setting the check parameter value (default = 10).	`check-kube-pods-restarting.rb {{if .labels.params_api_server}} -s {{.labels.params_api_server}} {{end}} {{if .labels.params_restart}} -r {{.labels.params_restart}} {{end}}`
Event	k8s.check-kube-pods-running	Checks the pods that are in the running state. Configure the threshold in the *not_ready_time* check parameter, in seconds (default = 0).	`check-kube-pods-running.rb {{if .labels.params_api_server}} -s {{.labels.params_api_server}} {{end}} {{if .labels.params_not_ready_time}} -time {{.labels.params_not_ready_time}} {{end}}`
Event	k8s.check-kube-pods-runtime	Checks whether pods are running longer than expected. Configure threshold in the check parameter (in seconds). You can configure both WARNING and CRITICAL thresholds.	check-kube-pods-runtime.rb {{if .labels.params_critical}} -c {{.labels.params_critical}} {{end}} {{if .labels.params_warning}} -w {{.labels.params_warning}} {{end}} {{if .labels.params_api_server}} -s {{.labels.params_api_server}} {{end}}
Event	k8s.check-kube-service-available	Checks whether Kubernetes services are up and running. Add the list of services to be monitored in the services' *check_param* field as comma-separated values (without spaces). If you enter services that are not valid, the check fails.	`check-kube-pods-runtime.rb {{if .labels.params_critical}} -c {{.labels.params_critical}} {{end}} {{if .labels.params_warning}} -w {{.labels.params_warning}} {{end}} {{if .labels.params_api_server}} -s {{.labels.params_api_server}} {{end}}`
Metric	k8s.metrics-pods	Provides a pod count from all of the exposed services.	`metrics-pods.rb {{if .labels.params_api_server}} -s {{.labels.params__api_server }} {{end}}`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MsSQL

Type	Event/Metric	Description	Minimum version
Metric	app.msssql.metrics-mssql	Retrieves MSSQL database metrics.	2016
Metric	app.metrics-mssql-query	Generic MSSQL query class which accepts a query and dumps metrics.	2016

MySQL

Type	Event/Metric	Description	Minimum version
Event	app.mysql.check-mysql-alive	Checks if the MySQL database is running.	5.7, 8
Event	app.mysql.check-mysql-threads	Checks the number of running threads on the MySQL database. Depending on the input, it determines the status: OK, Warning, or Critical.	5.7, 8
Event	util.check-mysql-query	Checks the length of a MySQL query result set. Ensure that you use the native_password authentication method on the MySQL server when utilizing this check.	5.7, 8
Metric	app.mysql.metrics-mysql	Returns MySQL database metrics.	5.7, 8
Metric	app.mysql.metrics-mysql-processes	Returns MySQL database process metrics.	5.7, 8
Metric	util.metrics-mysql-query	Creates a formatted metric for the length of a MySQL query result set.	5.7, 8

MongoDB

Type	Event/Metric	Description	Minimum version
Event	app.mongodb.check-mongodb-alive	Monitors whether the MongoDB server is alive and creating alerts for the MongoDB server health status.	
Event	app.mongodb.check-mongodb-metrics	Creates alerts for any of the MongoDB metrics, based on the threshold limit.	
Metric	app.mongodb.metrics-mongodb	Returns metrics of the MongoDB server and all databases.	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Oracle

Type	Event/Metric	Description	Minimum version
Event	app.oracle.check-oracle-alive	Checks if the Oracle database is running. When using this check, add the OS user (servicenow) to the **oinstall** group to ensure that the user has execute permissions for the sqlplus tool. Ensure that the CREATE SESSION database privilege is activated.	12c, 18c
Metric	app.oracle.metrics-oracle	Returns Oracle database metrics. When using this check, add the OS user (servicenow) to the **oinstall** group to ensure that the user has execute permissions for the sqlplus tool. Ensure that the CREATE SESSION and SELECT database privileges are activated.	12c, 18c
Metric	util.metrics-oracle-query	Generic Oracle query class that accepts a query and dumps metrics. When using this check, add the OS user (servicenow) to the **oinstall** group to ensure that the user has execute permissions for the sqlplus tool. Ensure that the CREATE SESSION and SELECT database privileges are activated.	12c, 18c

Oracle WebLogic AS

Type	Event/Metric	Description	Minimum version
Metric	app.weblogic.metrics-weblogic	Returns Oracle WebLogic application server metrics. Ensure that the user running the agent has sufficient permissions to access the required files in the `WebLogic` installation directories.	12cR2

Tomcat

Type	Event/Metric	Description	Minimum version
Metric	app.tomcat.metrics-tomcat	Returns Apache Tomcat server metrics.	8.5.27, 9.x

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

App

Type	Name	Description
Event	util.check-snmp	SNMP check that compares the metric value to the default. Requires input such as server, port, SNMP community, and limits.
Metric	util.metrics-snmp	Collects metrics from an SNMP OID value.
Metric	util.metrics-snmp-bulk-sn	Collects metrics from an SNMP Table OID and returns the result as a table.

Service enhancements (can be associated with any policy)

Type	Event/Metric	Description	Command
Metric (Windows)	os.windows.metrics-service-status	Collects Windows service status, providing metric of number of services running. Only the RUNNING status is treated as OK. Any other status generates either a WARNING or CRITICAL event, depending on your configuration.	`winchecks metric-windows-service-status -S Wcmsvc --scheme hostname.proc`

Varnish

Type	Name	Description
Metric	app.varnish.metrics-varnish	Collects Varnish metrics from the host.

vSphere

Type	Name	Description
Metric	vsphere.metric-VirtualMachine	Retrieves metrics for the vSphere Virtual Machine.
Metric	vsphere.metric-Datastore	Retrieves metrics for the vSphere Datastore.
Metric	vsphere.metric-Datacenter	Retrieves metrics for the vSphere Datacenter.
Metric	vsphere.metric-ESX_Server	Retrieves metrics for the vSphere ESX Server or HostSystem

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Zscaler

Type	Name	Description
Metric	zscaler-monitoring-check	Verifies whether the Zscaler app is running properly.
Metric	zscaler-remediation-check	Shuts down and restarts the Zscaler app, and creates an incident. Runs only when the zscaler-monitoring-check fails.

CPU enhancements

Type	Event/Metric	Description	Command
Metric	os.windows.metrics-system-cpu	Collects CPU core metrics.	`winchecks metric-windows-cpu --scheme hostname.proc`

Disk enhancements - Linux events (can be associated with any policy)

Event/Metric	Description	Command
os.linux.check-disk-ioTimeWeighted	Measures the `disk ioTimeWeighted` value, returning a **CRITICAL \WARNING\OK** message, according to the thresholds specified in the parameters.	`check-disk-ioTimeWeighted.rb`
os.linux.check-disk-sectorsWritten	Measures the total number of sectors written successfully, returning a **CRITICAL \WARNING\OK** message, according to the thresholds specified in the parameters.	`check-disk-sectorsWritten.rb`
os.linux.check-disk-sectorsRead	Measures the disk's total number of sectors read successfully, returning a **CRITICAL\WARNING\OK** message, according to the thresholds specified in the parameters.	`check-disk-sectorsRead.rb`
os.linux.check-disk-readTime	Measures the total number of milliseconds spent by all read- against thresholds, returning a **CRITICAL\WARNING\OK** message, according to the thresholds specified in the parameters.	`check-disk-readTime.rb`
os.linux.check-disk-writes	Measures the total number of writes completed successfully, returning a **CRITICAL \WARNING\OK** message,	`check-disk-writes.rb`

Disk enhancements - Linux events (can be associated with any policy) (continued)

Event/Metric	Description	Command
	according to the thresholds specified in the parameters.	
os.linux.check-disk-reads	Measures the total number of reads completed successfully, returning a **CRITICAL\WARNING\OK** message, according to the thresholds specified in the parameters.	`check-disk-reads.rb`
os.linux.check-disk-writesMerged	Measures the `disk writesMerged` value, returning a **CRITICAL\WARNING\OK** message, according to the thresholds specified in the parameters.	`check-disk-writesMerged.rb`
os.linux.check-disk-readsMerged	Measures the `disk readsMerged` value, returning a **CRITICAL\WARNING\OK** message, according to the thresholds specified in the parameters.	`check-disk-readsMerged.rb`
os.linux.check-disk-writeTime	Measures the total number of milliseconds spent by all write operations, returning a **CRITICAL\WARNING\OK** message, according to the thresholds specified in the parameters.	`check-disk-writeTime.rb`
os.linux.check-disk-ioInProgress	Measures the `disk ioInProgress` value, returning a **CRITICAL\WARNING\OK** message, according to the thresholds specified in the parameters.	`check-disk-ioInProgress.rb`
os.linux.check-disk-iotime	Measures the `disk ioTime` value, returning a **CRITICAL\WARNING\OK** message, according to the thresholds specified in the parameters.	`check-disk-ioTime.rb`

Disk enhancements - Windows events (can be associated with any policy)

Event/Metric	Description	Command
os.windows.check-disk-AvgSecWrite	Measures average disk writes per second, returning a **CRITICAL\WARNING\OK** message, according to the specified in the parameters.	`winchecks check-windows-AvgDisksec-write -w 1 -c 0`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Disk enhancements - Windows events (can be associated with any policy) (continued)

Event/Metric	Description	Command
os.windows.check-disk-ReadBytes-sec	Measures the `disk ReadBytes` value per second, returning a **CRITICAL\WARNING\OK** message, according to the thresholds specified in the parameters.	`winchecks check-windows-DiskReadBytes-sec -w 1 -c 0`
os.windows.check-disk-WriteBytes-sec	Measures the `disk WriteBytes` value per second, returning a **CRITICAL\WARNING\OK** message, according to the thresholds specified in the parameters.	`winchecks check-windows-DiskWriteBytes-sec -w 1 -c 0`
os.windows.check-disk-AvgSecRead	Measures the average disk reads per second, returning a **CRITICAL\WARNING\OK** message, according to the thresholds specified in the parameters.	`winchecks check-windows-AvgDisksec-read -w 1 -c 0`

Disk enhancements - Windows metrics (can be associated with any policy)

Event/Metric	Description	Command
os.windows.metrics-system-disk	Collects the following disk metrics: • AvgDiskSecPerRead • AvgDiskSecPerWrite • DiskReadBytesPerSec • DiskWriteBytesPerSec	`winchecks metric-windows-disk`

Memory enhancements (can be associated with any policy)

Type	Event/Metric	Description	Command
Event (Linux)	os.linux.check-free-physical-memory	Measures the free physical memory percentage of the Linux system, returning a **CRITICAL\WARNING\OK** event message, according to the thresholds specified in the parameters.	`check-free-physical-memory -w 10 -c 5`
Event (Linux)	os.linux.check-free-virtual-memory	Measures the free virtual memory percentage of	`check-free-virtual-memory -w 10 -c 5`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Memory enhancements (can be associated with any policy) (continued)

Type	Event/Metric	Description	Command
		the Linux system, returning a **CRITICAL\WARNING\OK** event message, according to the thresholds specified in the parameters.	
Event (Windows)	os.windows.check-free-physical-memory	Measures the free physical memory percentage of the Windows system, returning a **CRITICAL\WARNING\OK** event message, according to the thresholds specified in the parameters.	`winchecks check-windows-free-physfical-memory -w 10 -c 5`
Event (Windows)	os.windows.check-free-virtual-memory	Measures the free virtual memory percentage of the Windows system, returning a **CRITICAL\WARNING\OK** event message, according to the thresholds specified in the parameters.	`winchecks check-windows-free-physical-memory -w 10 -c 5`
Metric (Windows)	os.windows.metrics-system-memory	Collects the following memory metrics: • FreePhysicalMemory • TotalPhysicalMemory • FreeVirtualMemory • TotalVirtualMemorySize • AvailableMemory • TotalVisibleMemorySize	`winchecks metric-windows-memory --scheme hostname.proc`

Process enhancements (can be associated with any policy)

Type	Event/Metric	Description	Command
Event (Linux)	os.linux.check-process-cpu	Measures the Linux process CPU usage, returning a **CRITICAL\WARNING\OK** message, according to the thresholds	`check-process-cpu.rb -p acc -c 95 -w 85`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Process enhancements (can be associated with any policy) (continued)

Type	Event/Metric	Description	Command
		specified in the parameters.	
Event (Linux)	os.linux.check-process-memory	Measures the Linux process memory usage, returning a **CRITICAL\WARNING\OK** message, according to the thresholds specified in the parameters.	`check-process-memory.rb -p acc -c 95 -w 85`
Metric (Linux)	os.linux.metrics-process-usage	Collects the Linux process status, including the CPU and memory data used by the process.	`metrics-process-usage.rb -p acc -s hostname.proc`
Event (Windows)	os.windows.check-process-cpu	Measures the Windows process CPU usage, returning a **CRITICAL\WARNING\OK** message according to the thresholds specified in the parameters.	`winchecks check-windows-process-cpu-p acc -c 95 -w 85`
Event (Windows)	os.windows.check-process-memory	Measures the Windows process memory usage, returning a **CRITICAL\WARNING\OK** message according to the thresholds specified in the parameters.	`winchecks check-windows-process-memory-p acc -c 95 -w 85`
Metric (Windows)	os.windows.metrics-process-usage	Collects the Windows process status, including the CPU and memory data used by the process.	`winchecks metric-windows-process-status -n Svchost -s hostname.proc`

Supported Agent policies

This table lists the supported Agent Client Collector for Monitoring policies that the check definitions are associated with. The policies consist of the monitored CIs and the checks that run on them.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description	Checks
Apache Events	Monitors operational Apache HTTP web servers. To enable monitoring if the process is alive, activate the relevant check: • For Linux: os.linux.check-process • For Windows: os.windows.check-windows-process On the **Credentials** tab, specify Basic Auth Credentials.	• os.linux.check-process • os.windows.check-windows-process
Apache Metrics	Monitors operational Apache HTTP web servers. On the **Credentials** tab, specify Basic Auth Credentials.	app.apache.metrics-apache
Apache Kafka Events	Monitors the status of Kafka Broker, Kafka topics, partictions, replicas and Zookeeper.	
Apache Kafka Metrics	Monitors and collects metrics from Kafka Broker and Kafka Zookeeper.	

Azure DB Metrics	Monitors Azure databases on an Azure datacenter.
	
	To enable the policy's checks:
	• Configure a proxy agent.
	• Add the following Azure service principal credentials:
	  ○ Tenant ID
	  ○ Client ID
	  ○ Secret Key
	• Configure the Authentication Method as **Client secret**.
	• Add Azure credentials in the policy.
	• Provide the *subscription_id* value in each check instance.
	
	The default monitored CI Type is cmdb_ci_azure_datacenter, but the binding occurs on the Cloud Database (cmdb_ci_cloud_database).
	For details on configuring a policy, see Create an Agent Client Collector policy.	

Azure k8s Service Metrics	Monitors the Azure CI, *cmdb_ci_azure_datacenter*.	azure.metrics-k8s-service

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description	Checks
	Binds with the Kubernetes data cluster, *cmdb_ci_kubernetes_cluster*.	For details, see Azure Health Monitoring default checks and policies.
Azure VM Metrics	Monitors the Azure CI, *cmdb_ci_azure_datacenter*. Binds with the virtual machine instance, *cmdb_ci_vm_instance*.	• azure.metrics-vm-cpu • azure.metrics-vm-disk • azure.metrics-vm-memory • azure.metrics-vm-network • azure.metrics-vm-flows For details, see Azure Health Monitoring default checks and policies.
Basic Discovery	Runs basic ServiceNow Discovery on all agents, every 12 hours. This check extracts basic information about the host and its running processes. The host information is used to create the corresponding host in the CMDB, while the running processes create the classified application CIs. You need advanced OS privileges to use the Net stat command to discover ports. The command that you run depends on your OS, as follows: • Linux: `sudo -n netstat -antp` • Windows: `netstat -anop TCP`	check-discovery-basic
Docker Container Metrics	Collects performance metrics for Docker containers. Provide the credentials of users who are Docker user group members or have sudo rights. Provide these credentials on the **Credentials** tab of the policy form.	container.docker.metrics-docker
Docker Engine Metrics	Collects general metrics for the Docker engine. Provides the credentials of a user which is either a member of the Docker user group or has been assigned sudo rights on the **Credentials** tab. To enable running checks through this policy, add the servicenow user to the Docker user	container.docker.metrics-docker-info

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description	Checks
	group on the machine where the agent is running.	
F5 SNMP Events	Example for using SNMP checks. Because the Agent doesn't run on SNMP devices, provide the following to complete this policy: • A Proxy Agent and credentials. • The host of the Proxy Agent. On the **Credentials** tab, specify the SNMP Community Credentials for connecting to the server.	util.check-snmp
F5 SNMP Metrics	Example for using SNMP metrics. Because the Agent doesn't run on SNMP devices, provide the following to complete this policy: • Proxy Agent and credentials. • The host of the Proxy Agent. On the**Credentials** tab, specify the SNMP Community Credentials for connecting to the server.	• util.metrics-snmp • util.metrics-snmp-bulk-sn
Glassfish Metrics	Runs metric checks on the Glassfish server. Glassfish metrics are supported in ITOM Agent Client Collector version 2.3.0 - August 2022, available from the ServiceNow Store.	
HAProxy Events	Retrieves the HAProxy load balancer details to determine whether it is running. HAProxy events are supported in ITOM Agent Client Collector version 2.3.0 - August 2022, available from the ServiceNow Store.	
HAProxy Metrics	Retrieves the HAProxy load balancer metrics to determine whether it is running. HAProxy metrics are supported in ITOM Agent Client Collector version 2.3.0 - August 2022, available from the ServiceNow Store.	
HTTP Entry Points Events	Runs the util.check-http-follow-redirect check on all HTTP entry points that belong to application business services. The policy filter chooses the services. The services define the entry points. • To enable this check, there is a new database view which combines the application services table with the entry points table.	util.check-http-follow-redirect

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description	Checks
	• You can filter the services and receive the entry points. • When you receive an alert, it is automatically bound to the entry points. This alert affects the impact calculation, because entry points are considered. • This policy requires a Proxy Agent.	
HTTP Entry Points Metrics	For example, when the alert is bound to the entry point, the service map identifies an entry point problem. • The metric binds to the entry point CI. In previous releases, the metric was bound to the service and the entry point was the resource. • This policy requires a Proxy Agent.	util.metrics-http-curl
IIS Events	Monitors operational IIS servers.	• app.iis.check-iis-alive • app.iis.check-iis-current-connections
IIS Metrics	Monitors operational IIS servers.	app.iis.metrics-iis
JBoss/WildFly Application Server Events	Monitoring operational JBoss/WildFly application servers. To enable monitoring if the JBoss process is alive, activate os.linux.check-process. The *jboss_home* parameter in the check instance is specified as the location where JBoss is installed.	os.linux.check-process
JBoss/WildFly Application Server Metrics	Monitors operational JBoss/WildFly application servers.	app.jboss.metrics-jboss
Kubernetes	Monitors health of Kubernetes infrastructure, such as clusters, nodes, pod status, API, and service availability. When running Kubernetes checks: • Proxy agent must be enabled. • Enter Kubernetes credentials, either a username/password combination or a bearer token (but not both). • To activate and publish the policy, configure the *api_server* value in the	• k8s.check-kube-apiserver-available • k8s.check-kube-nodes-ready • k8s.check-kube-pods-pending • k8s.check-kube-pods-restarting • k8s.check-kube-pods-running

Name	Description	Checks
	check parameter definitions of each check, as one of the following: ◦ `https://127.0.0.1:<portnumber>/api` (If the API server and agent are running on the same server) ◦ `https://<api_server_url>/api` (Whether the API server and agent are running on the same or different servers). To use the localhost as your api_server, run the following command: `"kubectl proxy -port=8081 &"` • Run Discovery to discover all Kubernetes CIs. For details, see Kubernetes discovery.	• k8s.check-kube-pods-runtime • k8s.check-kube-service-available • k8s.metrics-pods
Linux log monitoring	Monitors logs on operational Linux servers.	• util.check-logs • util.check-logs-sudo
Linux OS Events	Runs Linux checks on operational Linux servers.	• os.linux.check-process • os.linux.check-system-cpu • os.linux.check-system-cpu-load • os.linux.check-system-disk-usage • os.linux.check-system-memory-percentage • os.linux.check-system-memory-swap • os.linux.check-threads-count
Linux OS Metrics	Collects Linux metrics on operational Linux servers.	• os.linux.metrics-memory-vmstat • os.linux.metrics-process-status • os.linux.metrics-system-cpu • os.linux.metrics-system-cpu-load • os.linux.metrics-system-disk • os.linux.metrics-system-disk-capacity • os.linux.metrics-system-disk-usage

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description	Checks
		• os.linux.metrics-system-memory • os.linux.metrics-system-memory-percentage • os.linux.metrics.reboot_count_today
MSSQL Events	Monitors the operational MSSQL server process. Runs os.windows.check-windows-process to monitor when the server process is alive.	os.windows.check-windows-process
MSSQL Metrics	Monitors operational MSSQL server process. Runs app.mssql.metrics-mssql to gather metrics.	app.mssql.metrics-mssql
MySQL DB Events	Monitors operational MySQL instances. On the **Credentials** tab, specify Basic Auth Credentials for connecting to the database server. **Note:** Utility checks, prefixed with util, have required parameters for which you must specify a value. These parameters have no default values.	• app.mysql.check-mysql-alive • app.mysql.check-mysql-threads • util.check-mysql-query
MySQL DB Metrics	Monitors operational MySQL instances. On the **Credentials** tab, specify Basic Auth Credentials for connecting to the database server. **Note:** Utility checks, prefixed with util, have required parameters for which you must specify a value. These parameters have no default values.	• app.mysql.metrics-mysql • app.mysql.metrics-mysql-processes • util.metrics-mysql-query
Network ping metrics	Monitors the ip address discovered in the ServiceNow instance. The cmdb_ci_hardware monitored CI type is bound to the relevant server: This policy requires a proxy agent.	util.metrics-ping
Oracle DB Events	Monitors operational Oracle Database instances. On the **Credentials** tab, specify Basic Auth Credentials for connecting to the database server. **Note:** Utility checks, prefixed with util, have required parameters for which you must specify a value. These parameters have no default values.	app.oracle.check-oracle-alive

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description	Checks
Oracle DB Metrics	Monitors operational Oracle Database instances. On the **Credentials** tab, specify Basic Auth Credentials for connecting to the database server. **Note:** Utility checks, prefixed with util, have required parameters for which you must specify a value. These parameters have no default values.	• app.oracle.metrics-oracle • util.metrics-oracle-query
Self-Healing Events	Runs a ping command to another host. Ensure that you run this check in proxy mode.	util.check-ping
Tomcat Events	Monitors operational Apache Tomcat servers. To enable monitoring if the Tomcat process is alive, activate the relevant check: • For Linux: os.linux.check-process • For Windows: util.check-windows-service If the Tomcat service is running under a different name, update the value of the check instance's *service* parameter to the correct value.	• os.linux.check-process • util.check-windows-service
Tomcat Metrics	Monitors operational Apache Tomcat servers. If Tomcat Metrics are running on a port other than the default port (9000), update the value of the check instance's *port* parameter to the correct port value.	app.tomcat.metrics-tomcat
Varnish Metrics	Monitors and collects metrics from Varnish. Varnish metrics are supported in ITOM Agent Client Collector version 2.3.0 - August 2022, available from the ServiceNow Store. You must perform discovery using application fingerprints before running Varnish checks. For details, see Enable running of Varnish checks.	
vSphere Metrics	Monitors and collects metrics from vSphere. vSphere metrics are supported in ITOM Agent Client Collector version 2.3.0 - August 2022, available from the ServiceNow Store. This policy requires a proxy agent.	
WebLogic Application Server Events	Monitors operational Oracle WebLogic application servers. This policy monitors if the WebLogic process running on Linux is alive.	os.linux.check-process

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description	Checks
	On the **Credentials** tab, specify Basic Auth Credentials for connecting to the application server.	
WebLogic Application Server Metrics	Monitors operational Oracle WebLogic application servers. On the **Credentials** tab, specify Basic Auth Credentials for connecting to the application server. Ensure that the user running the agent has sufficient permissions to access the required files in the `WebLogic` installation directories.	app.weblogic.metrics-weblogic
WebSphere Application Server Events	Monitors operational IBM WebSphere servers. This policy monitors if the WebSphere process running on Linux is alive. On the **Credentials** tab, specify Basic Auth Credentials for connecting to the application server.	os.linux.check-process
WebSphere Application Server Metrics	Monitors operational IBM WebSphere servers. On the **Credentials** tab, specify Basic Auth Credentials for connecting to the application server.	app.websphere.metrics-websphere
Windows Log Monitoring	Monitors logs on operational Windows servers.	os.windows.check-log You can block event creation for this check when no process is detected. For details, see Block event creation for non-existent entities.
Windows OS Events	Runs Windows checks on operational Windows servers.	• os.windows.check-processor-queue-length • os.windows.check-system-cpu-load • os.windows.check-system-disk • os.windows.check-system-memory • os.windows.check-system-process • os.windows.check-windows-directory

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Description	Checks
		• os.windows.check-windows-directory • os.windows.check-windows-directory • os.windows.check-windows-pagefile • os.windows.check-windows-process
Windows OS Events - Extended	Runs Windows checks to monitor directories and files on Windows servers.	• check-directory-file-count • check-directory-integrity • check-file-age • check-file-response-time • check-file-size • check-file-space • os.windows.check-directory-space
Windows OS Metrics	Collects Windows metrics on operational Windows servers.	• os.windows.metrics-processor-queue-len • os.windows.metrics-system-cpu-load • os.windows.metrics-system-disk-usage • os.windows.metrics-system-memory-percent • os.windows.metrics-system-network • os.windows.metrics-system-uptime
Zscaler Monitoring Policy	Executes Zscaler monitoring on all of a machine's CIs.	• zscaler-monitoring-check • zscaler-remediation-check

Active Directory metrics

The following table lists the metrics that are gathered as output from Active Directory checks. Entries indicated as **Featured metrics** are high-visibility metrics that are displayed in the Operator Workspace Metric tab after an alert is generated. These metrics provide the operator with additional information to help them further explore the specified issue.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Active Directory metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
active_dir.DRA_Inbound_Bytes_after_compressed/sec			Shows the compressed size of inbound compressed replication data (size after compression, from DSAs in other sites).
active_dir.DRA_Inbound_Bytes_before_compressed/sec			Shows the original size of inbound compressed replication data (size before compression, from DSAs in other sites).
active_dir.DRA_Inbound_Bytes_not_compressed/sec			Shows the number of incoming bytes replicated that were not compressed at the source (that is, from DSAs in the same site).
active_dir.DRA_Inbound_Bytes_Total/sec (featured metric)			Shows the total number of bytes replicated in. This counter is the sum of the number of uncompressed bytes (never compressed) and the number of compressed bytes (after compression).
active_dir.DRA_Inbound_Full_Sync_Objects_Remaining (featured metric)			Shows the number of objects remaining until the full synchronization is completed (when set).
active_dir.DRA_Inbound_Object_Updates_Remaining_in_Packet			Shows the number of object updates received in the current directory replication update packet that have not yet been applied to the local server.
active_dir.DRA_Inbound_Objects/sec			Shows the rate at which replication updates received from

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Active Directory metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			replication partners are applied by the local directory service. This counter excludes changes that are received but not applied (because, for example, the change has already been made). This indicates how much replication update activity is occurring on the server as a result of changes generated on other servers.
active_dir.DRA_Inbound_Objects_Applied/sec			Shows the number of objects received from inbound replication partners that contained no updates that needed to be applied.
active_dir.DRA_Inbound_Objects_Filtered/sec			Shows the number of objects received from neighbors through inbound replication. A neighbor is a domain controller from which the local domain controller replicates locally.
active_dir.DRA_Inbound_Properties_Applied/sec			Shows the number of properties that are updated due to the incoming property's winning the reconciliation logic that determines the final value to be replicated.
active_dir.DRA_Inbound_Properties_Filtered/sec			Shows the number of property changes that are received during the replication that we have already seen.
active_dir.DRA_Inbound_Properties_Total/sec			Shows the total number of object

Active Directory metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			properties received from inbound replication partners.
active_dir.DRA_Inbound_Values_DNs/sec			Shows the number of object property values received from inbound replication partners that are distinguished names (DNs) that reference other objects. DN values, such as group or distribution list memberships, are generally more expensive to apply than other kinds of values.
active_dir.DRA_Inbound_Values_Total/sec			Shows the total number of object property values received from inbound replication partners. Each inbound object has one or more properties, and each property has zero or more values. Zero values indicate property removal.
active_dir.DRA_Outbound_Bytes_after_compressed/sec			Shows the compressed size of outbound compressed replication data (size after compression, from DSAs in other sites).
active_dir.DRA_Outbound_Bytes_before_compressed/sec			Shows the original size of outbound compressed replication data (size before compression, from DSAs in other sites).
active_dir.DRA_Outbound_Bytes_not_compressed/sec			Shows the number of bytes replicated

			out that were not compressed (that is, from DSAs in the same site).
active_dir.DRA_Outbound_Bytes_Total/sec (featured metric)			Shows the total number of bytes replicated out. This counter is the sum of the number of uncompressed bytes (never compressed) and the number of compressed bytes (after compression).
active_dir.DRA_Outbound_Objects/sec			Shows the number of objects that were determined by outbound replication to have no updates that the outbound partner did not already have.
active_dir.DRA_Outbound_Objects_Filtered/sec			Shows the number of objects replicated out.
active_dir.DRA_Outbound_Properties/sec			Shows the number of properties replicated out.
active_dir.DRA_Outbound_Values_DNs/sec			Shows the number of object property values containing DNs sent to outbound replication partners. DN values, such as group or distribution list memberships, are generally more expensive to read than other kinds of values.
active_dir.DRA_Outbound_Values_Total/sec			Shows the number of object property values sent to outbound replication partners.
active_dir.DRA_Pending_Replication_Synchronizations			Shows the number of directory synchronizations that are queued for this

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			server but not yet processed.
active_dir.DRA_Sync_Requests_Made			Shows the number of synchronization requests made to neighbors.
active_dir.DS_Threads_in_Use (featured metric)			Shows the current number of threads in use by the directory service (which is different from the number of threads in the directory service process). This is the number of threads currently servicing client API calls; it can be used to indicate whether additional processors should be used.
active_dir.LDAP_Bind_Time (featured metric)			Shows the time, in milliseconds, taken for the last successful LDAP bind.
active_dir.LDAP_Client_Sessions (featured metric)			Shows the number of currently connected LDAP client sessions.
active_dir.LDAP_Searches/sec (featured metric)			Shows the rate at which LDAP clients perform search operations.
active_dir.LDAP_Successful_Binds/sec (featured metric)			Shows the number of LDAP binds per second.

Apache Kafka default checks and policies

Agent Client Collector provides the following policies for Apache Kafka health monitoring. Policies come with the checks specified in the indicated table. Policies and checks are available for both Windows and Linux.

Apache Kafka Topic Events

Check	Description	Usage	Output
kafka.check-zookeeper-status	Raises a critical event if the hosted Kafka Zookeeper is down.	`commonchecks check-kafka-zk-status` [flags] Where the flags are: `-p, --port =` Zookeeper Port (default "2181"). Usage example: `commonchecks check-kafka-zk-status -p 2181`	Kafka Zookeeper Status OK: Kafka Zookeeper is Up!
kafka.check-topic-replicas	Raises critical event if any topic has partitions with unknown replicas.	`commonchecks check-kafka-replicas` [flags] Where the flags are: • `-p, --port =` Zookeeper Port (default "2181"). • `-d, --detailed` = Lists unknown replicas in each partition of a topic. • `-i, --include_list` = Comma seperated list to include topics (allows * wild character) • `-e, --exclude_list` = Comma seperated list to exclude topics (allows * wild character) Usage example: commonchecks check-kafka-replicas -H localhost -p 2181 -i "test*" -e "accTopic,*offsets" -d	<topic> has partitions with unknown replicas. Unknown replicas are: {"0":["0"],"1":["0"],"2":["0"]}. <topic> has partitions with unknown replicas. Unknown replicas are: {"0":["0"]}.
kafka.check-topic-replication-factor	Raises critical event if replication factor of at least one topic is above or below	`commonchecks check-kafka-rf` [flags]	TestTopic has replication factor 1,

Check	Description	Usage	Output
	provided replication factor param.	Where the flags are: • `-p, --port =` Zookeeper Port (default "2181"). • `-d, --detailed` = Lists unknown replicas in each partition of a topic. • `-i, --include_list` = Comma separated list to include topics (allows * wild character) • `-e, --exclude_list` = Comma separated list to exclude topics (allows * wild character) • `-r, --replication factor` = Expected replication factor for a topic (default 1) Examples: `commonchecks check-kafka-partitions -H localhost -p 2181 -r 2 -i "accMetrics,*Topic" -e "testTopic"`	which is less than expected: 2. accMetrics has replication factor 1, which is less than expected: 2.
kafka.check-topic-leader	Raises critical event if any topic has partitions with unknown leaders or unpreferred replica as leader.	`commonchecks check-kafka-leader` [flags] Where the flags are • `-p, --port` = Zookeeper Port (default "2181"). • `-d, --detailed` = A list of partitions in each topic with	<topic> contains, partitions with unpreferred replica as leader.(partitions with unpreferred replicas are [0]). <topic> contains, partitions with unpreferred replica as leader.(partitions with

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Apache Kafka Topic Events (continued)

Check	Description	Usage	Output
		list to exclude topics (allows * wild character)	
		Usage example 1: `commonchecks check-kafka-partitions -H localhost -p 2181 -P 3`	<topic> has 1 partitions, expected at least 3. <topic> has 1 partitions, expected at least 3. <topic> has 1 partitions, expected at least 3.
		Usage example 2: commonchecks check-kafka-partitions -H localhost -p 2181 -P 3 -i "accMetrics,*Topic" -e "testTopic"	<topic> has 1 partitions, expected at least 3. <topic> has 1 partitions, expected at least 3.

Note: Values for include_list and exclude_list parameters have to be wrapped between double quotes. For example: "test1,*topic".

Apache Kafka Broker Events

Check	Description	Usage	Output
kafka.check-broker-status	Raises critical event if Kafka Broker on the host is down.	`commonchecks check-kafka-broker-status` [flags] Where the flags are: `-p, --port` = Kafka Broker port (default "9092"). Usage example: `commonchecks check-kafka-broker-status -p 9092`	Kafka Broker Status OK: Kafka Broker ubuntu20:9092 is Up!

Apache Kafka Broker Metrics

Check	Description	Usage	Output
kafka.metrics.broker	Collects Kafka Broker Metrics from the host.	`commonchecks metric-kafka-broker` [flags] Where the flags are: • `-J, --javapath` = Java executable path (default "java"). • `-j, --jmxport` = JMX Port (default "9999") Usage example: `commonchecks metric-kafka-broker -J "/usr/bin/java" -j 9999`	hostname.Kafka.Broker.ReplicaManage 0.000 hostname.Kafka.Broker.DelayedOperati 627.000 hostname.Kafka.Broker.ControllerStats. 0.000 hostname.Kafka.Broker.RequestMetrics 0.000

Apache Kafka Zookeeper Metrics

Check	Description	Usage	Output
kafka.metrics.zookeeper	Collects Zookeeper Metrics from the host.	`commonchecks metric-kafka-zookeeper` [flags] Where the flag is: `-p, --adminserverport` = Admin Server Port (default "8085") Usage example: `commonchecks metric-kafka-zookeeper -p 8085`	hostname.Kafka.Zookeeper.outstanding 2.000 1648183249 hostname.Kafka.Zookeeper.avg_latency 1.05 1648183249 hostname.Kafka.Zookeeper.num_alive_ 1.000 1648183249 hostname.Kafka.Zookeeper.open_file_d 124.000 1648183249

Apache Kafka metrics

The following table lists the metrics that are gathered as output from Kafka checks. Entries indicated as **Featured metrics** are high-visibility metrics that are displayed in the Operator Workspace Metric tab after an alert is generated. These metrics provide the operator with additional information to help them further explore the specified issue.

Broker metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
Kafka.Broker.RequestMetrics.TotalTimeMs.FetchConsumer.Mean (featured metric)			Total time (in ms) to serve the Consumer request.
Kafka.Broker.RequestMetrics.TotalTimeMs.FetchFollower.Mean (featured metric)			Total time (in ms) to serve the Follower request.
Kafka.Broker.RequestMetrics.TotalTimeMs.Produce.Mean (featured metric)			Total time (in ms) to serve the Producer request.
Kafka.Broker.BrokerTopicMetrics.BytesOutPerSec.OneMinuteRate (featured metric)			Aggregate outgoing byte rate.
Kafka.Broker.BrokerTopicMetrics.BytesInPerSec.OneMinuteRate (featured metric)			Aggregate incoming byte rate.
Kafka.Broker.ReplicaManager.UnderReplicatedPartitions.Value			Number of unreplicated partitions.
Kafka.Broker.ReplicaManager.IsrExpandsPerSec.OneMinuteRate			Rate at which the pool of in-sync replicas (ISRs) shrinks.
Kafka.Broker.ReplicaManager.IsrShrinksPerSec.OneMinuteRate			Rate at which the pool of in-sync replicas (ISRs) shrinks.
Kafka.Broker.KafkaController.ActiveControllerCount.Value (featured metric)			Number of active controllers in cluster.
Kafka.Broker.KafkaController.OfflinePartitionsCount.Value			Number of offline partitions.
Kafka.Broker.ControllerStats.LeaderElectionRateAndTimeMs.OneMinuteRate (featured metric)			Leader election rate and latency.
Kafka.Broker.ControllerStats.UncleanLeaderElectionsPerSec.OneMinuteRate			Number of unclean elections per second.
Kafka.Broker.DelayedOperationPurgatory.PurgatorySize.Fetch.Value			Number of requests waiting in fetch purgatory.
Kafka.Broker.DelayedOperationPurgatory.PurgatorySize.Produce.Value			Number of requests waiting in producer purgatory.
Kafka.Broker.RequestMetrics.RequestsPerSec.Produce.OneMinuteRate (featured metric)			Number of producer requests per second.
Kafka.Broker.RequestMetrics.RequestsPerSec.FetchConsumer.OneMinuteRate (featured metric)			Number of consumer requests per second.

Broker metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
Kafka.Broker.RequestMetrics.RequestsPerSec.FetchFollower.OneMinuteRate (featured metric)			Number of follower requests per second.

Zookeeper metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
Kafka.Zookeeper.outstanding_requests (featured metric)			Number of requests queued.
Kafka.Zookeeper.avg_latency (featured metric)			Average amount of time it takes to respond to a client request (in ms).
Kafka.Zookeeper.num_alive_connections (featured metric)			Number of clients connected to ZooKeeper.
Kafka.Zookeeper.open_file_descriptor_count			Number of file descriptors in use.
Kafka.Zookeeper.pending_syncs			Number of pending syncs from followers.
Kafka.Zookeeper.followers			Number of active followers.

AWS Health Monitoring default checks and policies

Agent Client Collector provides the following default checks and policies for AWS monitoring.

AWS Metrics policy

Type	Check	Description	Usage	Usage example
Metric	aws.metrics-ec2	Returns metrics of all EC2 instances in a AWS Datacenter.	metrics-ec2.rb (options) -F, --filter FILTER String representation of the filter to filter EC2 instances by tags. -b, --batch_size BATCH_SIZE Batch size. Number of instances to	`./metrics-ec2.rb -F "{name:tag:environment,v [ENV1,ENV2]} {name:tag:Name,values: [Instance1,Instance2]}"` Provide the filter string along with double quotes ("") around the filter parameter. Set the *batch_size*

AWS Metrics policy (continued)

Type	Check	Description	Usage	Usage example
			fetch metrics in parallel. (Default value: 10)	parameter according to the agent environment.
Metric	aws.metrics-ebs	Returns metrics of all EBS volumes in an AWS datacenter.	metrics-ebs.rb (options) -F, --filter FILTER String representation of the filter to filter EBS Volumes by Tags. -b, --batch_size BATCH_SIZE Batch size. Number of volumes to fetch metrics parallelly. (Default value: 10)	`./metrics-ebs.rb -F "{name:tag:environment,values:[ENV1,ENV2]} {name:tag:Name,values:[Volume1,Volume2]}"` Provide filter string along with double quotes ("") for the filter parameter. Set the *batch_size* parameter according to the agent environment.
Metric	aws.metrics-s3	Returns metrics of all S3 buckets in an AWS datacenter.	metrics-s3.rb (options) -b, --batch_size BATCH_SIZE Batch size. Number of S3 buckets to fetch metrics in parallel. (Default value: 10)	`./metrics-s3.rb -b 5` Set the *batch_size* parameter according to the agent environment.
Metric	aws.metrics-rds	Returns metrics of all RDS buckets in an AWS datacenter.	metrics-rds.rb (options) -F, --filter FILTER String representation of the filter to filter RDS Instances by tags. -b, --batch_size BATCH_SIZE Batch size. Number of	`./metrics-rds.rb -F "{name:tag:environment,values:[ENV1,ENV2]} {name:tag:engine,values:[MariaDB]}"` Provide the filter string with double quotes ("") around the filter parameter. Set the *batch_size*

AWS Metrics policy (continued)

Type	Check	Description	Usage	Usage example
			databases to fetch metrics in parallel. (Default value: 10)	parameter according to the agent environment.
Metric	aws.metrics-classic-elb	Returns metrics of all classic elastic load balancers in an AWS datacenter.	metrics-elb.rb (options) -e, --exclude_lb EXCLUDE_LB Exclude metrics from load balancers whose name contains one of the comma separated strings. -b, --batch_size BATCH_SIZE Batch size. Number of databases to fetch metrics in parallel. (Default value: 10)	`./metrics-elb.rb -t classic -e "classic,itom,ip" -b 10` Provide comma separated strings in double quotes ("") for the *`exclude_lb`* parameter. Set the *`batch_size`* parameter according to the agent environment.
Metric	aws.metrics-network-elb	Returns metrics of all network elastic load balancers in an AWS datacenter.	metrics-elb.rb (options) -e, --exclude_lb EXCLUDE_LB Exclude metrics from load balancers whose name contains any of the comma separated strings. -b, --batch_size BATCH_SIZE Batch size. Number of databases to fetch metrics in parallel. (Default value: 10)	`./metrics-elb.rb -t network -e "vpc,itom,ip" -b 10` Provide comma separated strings in double quotes ("") for the *`exclude_lb`* parameter. Set the *`batch_size`* parameter according to the agent environment. Do not change the command prefix.

AWS Metrics policy (continued)

Type	Check	Description	Usage	Usage example
Metric	aws.metrics-application-elb	Returns metrics of all application elastic load balancers in an AWS datacenter.	metrics-elb.rb (options) -e, --exclude_lb EXCLUDE_LB Exclude metrics from load balancers whose name contains any one of the string from comma separated strings. -b, --batch_size BATCH_SIZE Batch size. Number of databases to fetch metrics in parallel. (Default value: 10)	`./metrics-elb.rb -t application -e "classic,app,ip" -b 10` Provide comma separated strings in double quotes ("") for the *`exclude_lb`* parameter. Set the *`batch_size`* parameter according to the agent environment. Do not change the command prefix.

Metric	aws.metrics-ec2-count	Returns count of EC2 instances by instance_type or status in an AWS datacenter.	metrics-ec2-count.rb (options)
			
			-s, --scheme SCHEME Metric naming scheme, text to prepend to metric. Default: aws.ec2
			
			-t, --type METRIC type Count by type: status, instance. Default: instance
				`./metrics-ec2-count.rb -t status`
				
				`./metrics-ec2-count.rb -t status -s metric.aws.ec2`

AWS DynamoDB metrics

Type	Check	Description	Usage	Command
Metric	aws.metrics-dynamodb	Monitors the health of DynamoDB tables in an AWS datacenter.	e, --exclude_tb EXCLUDE_TB Exclude metrics from tables whose name	`metrics-dynamodb.rb -r {{.labels.params_ci_reg` `{{.labels.params_exclud` `-f`

AWS DynamoDB metrics (continued)

Type	Check	Description	Usage	Command
		Binds to the DynamoDB table (cmdb_ci_dynamodb_table)	contains a string from comma separated strings. b, --batch_size BATCH_SIZE Batch size. Number of tables to fetch metrics in parallel. (Default value: 10)	{{.labels.params_exclud {{end}} {{.labels.params_batch_ -b {{.labels.params_filter {{end}}

AWS EC2 metrics

Type	Check	Description	Usage	Command
Metric	aws.metrics-ecs-cluster	Monitors ECS clusters in an AWS datacenter. Binds to the AWS ECS Cluster CI type (cmdb_ci_cloud_ecs_cluster)	-F, --filter FILTER String representation of the filter to filter ECS clusters by tags. b, --batch_size BATCH_SIZE Batch size. Number of clusters to fetch metrics in parallel. (Default value: 10)	metrics-ecs-cluster.rb -r {{.labels.params_ci_reg {{.labels.params_filter -f {{.labels.params_filter {{end}} {{.labels.params_batch_ -b {{.labels.params_filter {{end}}
Metric	aws.metrics-ecs-service	Monitors ECS services in an AWS datacenter. Binds to the AWS ECS Service CI type (cmdb_ci_cloud_ecs_service)	-F, --filter FILTER String representation of the filter to filter ECS clusters by tags. b, --batch_size BATCH_SIZE Batch size. Number of clusters to fetch metrics in parallel. (Default value: 10)	metrics-ecs-service.rb -r {{.labels.params_ci_reg {{.labels.params_filter -f {{.labels.params_filter {{end}} {{.labels.params_batch_ -b {{.labels.params_filter {{end}}

AWS metrics

AWS metrics

The following tables list and describe the metrics that are gathered as output from the specified AWS checks. Entries indicated as **Featured metrics** are high-visibility metrics that are displayed in the Operator Workspace Metric tab after an alert is generated. These metrics provide the operator with additional information to help them further explore the specified issue.

aws.metrics-ec2 metrics

Metric Name	Description
aws.ec2.CPUCreditBalance.Average	Number of earned CPU credits that an instance has accrued since it was launched or started.
aws.ec2.CPUUtilization.Average	Average percentage of allocated EC2 compute units that are currently in use on the instance.
aws.ec2.DiskReadOps.Average (Featured metric)	Average of completed read operations from all instance store volumes available to the instance in a specified time period.
aws.ec2.DiskWriteOps.Average (Featured metric)	Completed write operations to all instance store volumes available to the instance in a specified time period.
aws.ec2.DiskReadBytes.Average (Featured metric)	Average number of bytes read from all instance store volumes available to the instance.
aws.ec2.DiskWriteBytes.Average (Featured metric)	Average number of bytes written to all instance store volumes available to the instance.
aws.ec2.NetworkIn.Average (Featured metric)	Average number of bytes received by the instance on all network interfaces. This metric identifies the volume of incoming network traffic to a single instance.
aws.ec2.NetworkOut.Average (Featured metric)	Average number of bytes sent out by the instance on all network interfaces. This metric identifies the volume of outgoing network traffic from a single instance.
aws.ec2.NetworkPacketsIn.Average	Average number of packets received by the instance on all network interfaces. This metric identifies the volume of incoming traffic in terms of the number of packets on a single instance.
aws.ec2.NetworkPacketsOut.Average	Average number of packets sent out by the instance on all network interfaces. This metric identifies the volume of outgoing traffic in terms of the number of packets on a single instance.

aws.metrics-ec2 metrics (continued)

Metric Name	Description
aws.ec2.MetadataNoToken.Average	Average number of times the instance metadata service was successfully accessed using a method that does not use a token.
aws.ec2.CPUCreditUsage.Average	Average number of CPU credits spent by the instance for CPU utilization.
aws.ec2.CPUSurplusCreditBalance.Average	Average number of surplus credits that have been spent by an unlimited instance when its *CPUCreditBalance* value is zero.
aws.ec2.CPUSurplusCreditsCharged.Average	Average number of spent surplus credits that are not paid down by earned CPU credits, and which thus incur an additional charge.
aws.ec2.StatusCheckFailed_Instance.Average	Reports whether the instance has passed the instance status check in the last minute.
aws.ec2.StatusCheckFailed_System.Average	Reports whether the instance has passed the system status check in the last minute.
aws.ec2.StatusCheckFailed.Average	Reports whether the instance has passed both the instance status check and the system status check in the last minute.

aws.metrics-ebs metrics

Metric Name	Description
aws.ebs.VolumeReadBytes.Average (Featured metric)	Average total number of bytes transferred during the period while reading.
aws.ebs.VolumeWriteBytes.Average (Featured metric)	Average total number of bytes transferred during the period while writing.
aws.ebs.VolumeReadOps.Average (Featured metric)	Average total number of read operations in a specified time period.
aws.ebs.VolumeWriteOps.Average (Featured metric)	Average total number of write operations in a specified time period.
aws.ebs.VolumeTotalReadTime.Average (Featured metric)	Average total number of seconds spent by all read operations completed in a specified time period.
aws.ebs.VolumeTotalWriteTime.Average (Featured metric)	Average of total number of seconds spent by all write operations completed in a specified time period.
aws.ebs.VolumeIdleTime.Average	Average of total number of seconds in a specified time period when no read or write operations were submitted.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

aws.metrics-ebs metrics (continued)

Metric Name	Description
aws.ebs.VolumeQueueLength.Average	Average number of read and write operation requests waiting to be completed in a specified time period.
aws.ebs.VolumeThroughputPercentage.Average	Average percentage of I/O operations per second (IOPS) delivered of the total IOPS provisioned for an Amazon EBS volume.
aws.ebs.VolumeConsumedReadWriteOps.Average	Average total amount of read and write operations (normalized to 256K capacity units) consumed in a specified time period.
aws.ebs.BurstBalance.Average	Average percentage of I/O credits (for gp2) or throughput credits (for st1 and sc1) remaining in the burst bucket.

aws.metrics-s3 metrics

Metric Name	Description
aws.s3.NumberOfObjects.Average (Featured metric)	Average total number of objects stored in a bucket for all storage classes. Collected every 12 hours.
aws.s3.BucketSizeBytes.Average (Featured metric)	Average amount of data in bytes stored in a bucket in the STANDARD storage class. Collected every 12 hours.

aws.metrics-rds metrics

Metric Name	Description
aws.rds.BinLogDiskUsage.Average	Average amount of disk space occupied by binary logs on the primary. Applies to MySQL read replicas.
aws.rds.BurstBalance.Average	Average percent of General Purpose SSD (gp2) burst-bucket I/O credits available.
aws.rds.CPUUtilization.Average (Featured metric)	Average percentage of CPU utilization.
aws.rds.CPUCreditUsage.Average	Average number of CPU credits spent by the instance for CPU utilization.
aws.rds.CPUCreditBalance.Average	Average number of surplus credits that have been spent by an unlimited instance when its *`CPUCreditBalance`* value is zero.
aws.rds.DatabaseConnections.Average (Featured metric)	Average number of database connections in use.

aws.metrics-rds metrics (continued)

Metric Name	Description
aws.rds.DiskQueueDepth.Average (Featured metric)	Average number of outstanding I/Os (read/write requests) waiting to access the disk.
aws.rds.EBSByteBalance%.Average	Average percentage of throughput credits remaining in the burst bucket of your RDS database.
aws.rds.EBSIOBalance%.Average	Average percentage of I/O credits remaining in the burst bucket of your RDS database.
aws.rds.FailedSQLServerAgentJobsCount.Average (Featured metric)	Average number of failed Microsoft SQL Server Agent jobs during the last minute.
aws.rds.FreeableMemory.Average (Featured metric)	Average amount of available random access memory.
aws.rds.FreeStorageSpace.Average	Average amount of available storage space.
aws.rds.MaximumUsedTransactionIDs.Average	Average amount of maximum transaction IDs that have been used. Applies to PostgreSQL.
aws.rds.NetworkReceiveThroughput.Average (Featured metric)	Average incoming (receive) network traffic on the DB instance, including both customer database traffic and Amazon RDS traffic used for monitoring and replication.
aws.rds.NetworkTransmitThroughput.Average (Featured metric)	Average outgoing (transmit) network traffic on the DB instance, including both customer database traffic and Amazon RDS traffic used for monitoring and replication.
aws.rds.OldestReplicationSlotLag.Average	Average lagging size of the replica lagging the most in terms of write-ahead log (WAL) data received. Applies to PostgreSQL.
aws.rds.ReadIOPS.Average	Average number of disk read I/O operations per second.
aws.rds.ReadLatency.Average (Featured metric)	Average amount of time taken per disk I/O operation.
aws.rds.ReadThroughput.Average	Average number of bytes read from disk per second.
aws.rds.ReplicaLag.Average	Average amount of time a read replica DB instance lags behind the source DB instance. Applies to MySQL, MariaDB, Oracle, PostgreSQL, and SQL Server read replicas.
aws.rds.ReplicationSlotDiskUsage.Average	Average amount of disk space used by replication slot files. Applies to PostgreSQL.

aws.metrics-rds metrics (continued)

Metric Name	Description
aws.rds.SwapUsage.Average	Average amount of swap space used on the DB instance. This metric is not available for SQL Server.
aws.rds.TransactionLogsDiskUsage.Average	Average disk space used by transaction logs. Applies to PostgreSQL.
aws.rds.TransactionLogsGeneration.Average	Average size of transaction logs generated per second. Applies to PostgreSQL.
aws.rds.WriteIOPS.Average	Average number of disk write I/O operations per second.
aws.rds.WriteLatency.Average (Featured metric)	Average amount of time taken per disk I/O operation.
aws.rds.WriteThroughput.Average	Average number of bytes written to disk per second.
aws.rds.CPUSurplusCreditBalance.Average	Average number of surplus credits that have been spent by an unlimited instance when its *`CPUCreditBalance`* value is zero.
aws.rds.CPUSurplusCreditsCharged.Average	Average number of spent surplus credits that are not paid down by earned CPU credits, and which therefore incur an additional charge.

aws.metrics-classic-elb metrics

Metric Name	Description
aws.classicElb.EstimatedALBActiveConnectionCount.Average (Featured metric)	Average estimated number of concurrent TCP connections active from clients to the load balancer and from the load balancer to targets.
aws.classicElb.EstimatedALBConsumedLCUs.Average	Average estimated number of load balancer capacity units (LCU) used by an Application Load Balancer. You pay for the number of LCUs that you use per hour.
aws.classicElb.EstimatedALBNewConnectionCount.Average (Featured metric)	Average estimated number of new TCP connections established from clients to the load balancer and from the load balancer to targets.
aws.classicElb.EstimatedProcessedBytes.Average	Estimated number of bytes processed by an Application Load Balancer.
aws.classicElb.DesyncMitigationMode_NonCompliant_Request_Count.Sum	Number of requests that do not comply with RFC 7230.
aws.classicElb.HTTPCode_ELB_5XX.Sum (Featured metric)	Number of HTTP 4XX client error codes generated by the load balancer.

aws.metrics-classic-elb metrics (continued)

Metric Name	Description
aws.classicElb.HTTPCode_ELB_4XX.Sum (Featured metric)	Number of HTTP 5XX server error codes generated by the load balancer.
aws.classicElb.SurgeQueueLength.Maximum	Maximum total number of requests (HTTP listener) or connections (TCP listener) that are pending routing to a healthy instance. The maximum size of the queue is 1,024. Additional requests or connections are rejected when the queue is full.
aws.classicElb.SpilloverCount.Sum (Featured metric)	Total number of requests rejected because the surge queue is full.
aws.classicElb.RequestCount.Sum	Total number of requests completed or connections made during the specified interval.
aws.classicElb.Latency.Average (Featured metric)	Average total time elapsed, in seconds, from the time the load balancer sent the request to a registered instance until the instance started to send the response headers.
aws.classicElb.BackendConnectionErrors.Sum (Featured metric)	Total number of connections that were not successfully established between the load balancer and the registered instances.
aws.classicElb.HealthyHostCount.Average	Average number of healthy instances registered with your load balancer. A newly registered instance is considered healthy after it passes the first health check.
aws.classicElb.UnHealthyHostCount.Average	Average of number of unhealthy instances registered with your load balancer. An instance is considered unhealthy after it exceeds the unhealthy threshold configured for health checks.

aws.metrics-network-elb

Metric Name	Description
aws.networkElb.ActiveFlowCount.Average (Featured metric)	Average total number of concurrent flows (or connections) from clients to targets. This metric includes connections in the SYN_SENT and ESTABLISHED states.
aws.networkElb.ActiveFlowCount_TCP.Average (Featured metric)	Average total number of concurrent TCP flows (or connections) from clients to targets. This metric includes only connections in the ESTABLISHED state.
aws.networkElb.ActiveFlowCount_TLS.Average	Average total number of concurrent TLS flows (or connections) from clients to targets.

aws.metrics-network-elb (continued)

Metric Name	Description
(Featured metric)	This metric includes only connections in the ESTABLISHED state.
aws.networkElb.ActiveFlowCount_UDP.Average (Featured metric)	Average total number of concurrent UDP flows (or connections) from clients to targets.
aws.networkElb.ClientTLSNegotiationErrorCount.Sum (Featured metric)	Average total number of TLS handshakes that failed during negotiation between a client and a TLS listener.
aws.networkElb.ConsumedLCUs.Average	Average number of load balancer capacity units (LCU) used by your load balancer.
aws.networkElb.ConsumedLCUs_TCP.Average	Average number of load balancer capacity units (LCU) used by your load balancer for TCP.
aws.networkElb.ConsumedLCUs_TLS.Average	Average number of load balancer capacity units (LCU) used by your load balancer for TLS.
aws.networkElb.ConsumedLCUs_UDP.Average	Average number of load balancer capacity units (LCU) used by your load balancer for UDP.
aws.networkElb.HealthyHostCount.Maximum (Featured metric)	The maximum number of targets that are considered healthy.
aws.networkElb.NewFlowCount.Sum (Featured metric)	Total number of new flows (or connections) established from clients to targets in the time period.
aws.networkElb.NewFlowCount_TCP.Sum (Featured metric)	Total number of new TCP flows (or connections) established from clients to targets in the time period.
aws.networkElb.NewFlowCount_TLS.Sum (Featured metric)	Total number of new TLS flows (or connections) established from clients to targets in the time period.
aws.networkElb.NewFlowCount_UDP.Sum (Featured metric)	Total number of new UDP flows (or connections) established from clients to targets in the time period.
aws.networkElb.PeakBytesPerSecond.Maximum (Featured metric)	Maximum average throughput (bytes per second), calculated every 10 seconds during the sampling window. This metric includes health check traffic.
aws.networkElb.PeakPacketsPerSecond.Maximum (Featured metric)	Maximum average packet rate (packets processed per second), calculated every 10 seconds during the sampling window. This metric includes health check traffic.
aws.networkElb.ProcessedBytes.Sum	Total number of bytes processed by the load balancer, including TCP/IP headers. This count

aws.metrics-network-elb (continued)

Metric Name	Description
	includes traffic to and from targets, minus health check traffic.
aws.networkElb.ProcessedBytes_TCP.Sum	Total number of bytes processed by TCP listeners.
aws.networkElb.ProcessedBytes_TLS.Sum	Total number of bytes processed by TLS listeners.
aws.networkElb.ProcessedBytes_UDP.Sum	Total number of bytes processed by UDP listeners.
aws.networkElb.ProcessedPackets.Sum	Total number of packets processed by the load balancer. This count includes traffic to and from targets, including health check traffic.
aws.networkElb.TargetTLSNegotiationErrorCount.Sum (Featured metric)	Total number of TLS handshakes that failed during negotiation between a TLS listener and a target.
aws.networkElb.TCP_Client_Reset_Count.Sum	Total number of reset (RST) packets sent from a client to a target. These resets are generated by the client and forwarded by the load balancer.
aws.networkElb.TCP_ELB_Reset_Count.Sum	Total number of reset (RST) packets generated by the load balancer.
aws.networkElb.TCP_Target_Reset_Count.Sum	Total number of reset (RST) packets sent from a target to a client. These resets are generated by the target and forwarded by the load balancer.
aws.networkElb.UnHealthyHostCount.Maximum (Featured metric)	Maximum number of targets that can be considered unhealthy.

aws.metrics-application-elb metrics

Metric Name	Description
aws.applicationElb.ActiveConnectionCount.Sum (Featured metric)	Total number of concurrent TCP connections active from clients to the load balancer and from the load balancer to targets.
aws.applicationElb.ClientTLSNegotiationErrorCount.Sum (Featured metric)	Total number of TLS connections initiated by the client that did not establish a session with the load balancer due to a TLS error.
aws.applicationElb.ConsumedLCUs.Average	The average number of load balancer capacity units (LCU) used by your load balancer. You pay for the number of LCUs that you use per hour. For more information, see Elastic Load Balancing pricing.

aws.metrics-application-elb metrics (continued)

Metric Name	Description
aws.applicationElb.DesyncMitigationMode_NonCompliant_Request_Count.Sum (Featured metric)	Total number of requests that do not comply with RFC 7230.
aws.applicationElb.DroppedInvalidHeaderRequestCount.Average (Featured metric)	Average of requests where the load balancer removed HTTP headers with header fields that are not valid before routing the request. The load balancer removes these headers only if the routing.http.drop_invalid_header_fields.enabled attribute is set to true.
aws.applicationElb.ForwardedInvalidHeaderRequestCount.Average (Featured metric)	Average of requests routed by the load balancer that had HTTP headers with header fields that are not valid. The load balancer forwards requests with these headers only if the routing.http.drop_invalid_header_fields.enabled attribute is set to false.
aws.applicationElb.GrpcRequestCount.Sum	Total number of gRPC requests processed over IPv4 and IPv6.
aws.applicationElb.HTTP_Fixed_Response_Count.Sum	Total number of fixed-response actions that were successful.
aws.applicationElb.HTTP_Redirect_Count.Sum	Total number of redirect actions that were successful.
aws.applicationElb.HTTP_Redirect_Url_Limit_Exceeded_Count.Sum (Featured metric)	Total number of redirect actions that couldn't be completed because the URL in the response location header is larger than 8K.
aws.applicationElb.HTTPCode_ELB_3XX_Count.Sum (Featured metric)	Total number of HTTP 3XX redirection codes that originate from the load balancer. This count does not include response codes generated by targets.
aws.applicationElb.HTTPCode_ELB_4XX_Count.Sum (Featured metric)	Total number of HTTP 4XX client error codes that originate from the load balancer. This count does not include response codes generated by targets.
aws.applicationElb.HTTPCode_ELB_5XX_Count.Sum (Featured metric)	Total number of HTTP 5XX server error codes that originate from the load balancer. This count does not include any response codes generated by the targets.
aws.applicationElb.HTTPCode_ELB_500_Count.Sum (Featured metric)	Total number of HTTP 500 error codes that originate from the load balancer.
aws.applicationElb.HTTPCode_ELB_502_Count.Sum (Featured metric)	Total number of HTTP 502 error codes that originate from the load balancer.

aws.metrics-application-elb metrics (continued)

Metric Name	Description
aws.applicationElb.HTTPCode_ELB_503_Count.Sum (Featured metric)	Total number of HTTP 503 error codes that originate from the load balancer.
aws.applicationElb.HTTPCode_ELB_504_Count.Sum (Featured metric)	Total number of HTTP 504 error codes that originate from the load balancer.
aws.applicationElb.IPv6ProcessedBytes.Sum	Total number of bytes processed by the load balancer over IPv6.
aws.applicationElb.IPv6RequestCount.Sum	Total number of IPv6 requests received by the load balancer.
aws.applicationElb.NewConnectionCount.Sum	Total number of new TCP connections established from clients to the load balancer and from the load balancer to targets.
aws.applicationElb.NonStickyRequestCount.Sum	Total number of requests where the load balancer chose a new target because it couldn't use an existing sticky session.
aws.applicationElb.ProcessedBytes.Sum (Featured metric)	Total number of bytes processed by the load balancer over IPv4 and IPv6.
aws.applicationElb.RejectedConnectionCount.Sum (Featured metric)	Total number of connections that were rejected because the load balancer had reached its maximum number of connections.
aws.applicationElb.RequestCount.Sum	Total number of requests processed over IPv4 and IPv6.
aws.applicationElb.RuleEvaluations.Sum	Total number of rules processed by the load balancer given a request rate averaged over an hour.

aws.metrics-ec2-count metrics

Metric Name	Description
aws.ec2.types.<type_name>	Count of EC2 instances for the specified type in AWS Datacenter.
aws.ec2.status.running	Count of EC2 instances in Active state in an AWS Datacenter.
aws.ec2.status.stopped	Count of EC2 instances in Stopped state in an AWS Datacenter.
aws.ec2.status.total	Count of all EC2 instances in an AWS Datacenter.

aws.metrics-dynamodb metrics

Metric Name	Description
aws.dynamodb.ConsumedWriteCapacityUnits.Average (Featured metric)	Number of write capacity units consumed over the specified time period, for tracking how much provisioned throughput is used.
aws.dynamodb.ConsumedReadCapacityUnits.Average (Featured metric)	Number of read capacity units consumed over the specified time period, for tracking how much provisioned throughput is used.
aws.dynamodb.ProvisionedWriteCapacityUnits.Average (Featured metric)	Number of provisioned write capacity units for a table.
aws.dynamodb.ProvisionedReadCapacityUnits.Average (Featured metric)	Number of provisioned read capacity units for a table.
aws.dynamodb.SuccessfulRequestLatency.GetItem.Average (Featured metric)	Successful requests to DynamoDB or Amazon DynamoDB streams during the specified time period. Run by a GetItem operation.
aws.dynamodb.SuccessfulRequestLatency.BatchGetItem.Average	Successful requests to DynamoDB or Amazon DynamoDB streams during the specified time period. Run by a BatchGetItem operation.
aws.dynamodb.SuccessfulRequestLatency.PutItem.Average (Featured metric)	Successful requests to DynamoDB or Amazon DynamoDB streams during the specified time period. Run by a PutItem operation.
aws.dynamodb.SuccessfulRequestLatency.BatchPutItem.Average	Successful requests to DynamoDB or Amazon DynamoDB streams during the specified time period. Run by a BatchPutItem operation.
aws.dynamodb.SuccessfulRequestLatency.Query.Average	Successful requests to DynamoDB or Amazon DynamoDB streams during the specified time period. Run by a Query operation.
aws.dynamodb.SuccessfulRequestLatency.Scan.Average	Successful requests to DynamoDB or Amazon DynamoDB Streams during the specified time period. Run by a Scan operation.
aws.dynamodb.ReturnedItemCount.Scan.Average	Number of items returned by Scan operations during the specified time period.
aws.dynamodb.ReturnedItemCount.Query.Average	Number of items returned by Query operations during the specified time period.
aws.dynamodb.UserErrors.Average (Featured metric)	Requests to DynamoDB or Amazon DynamoDB streams that generate an HTTP 400 status code during the specified time period. An HTTP 400 usually indicates a client-side error, such as an invalid combination of parameters, an attempt to update a nonexistent table, or an incorrect request signature.
aws.dynamodb.SystemErrors.GetItem.Average	Requests to DynamoDB or Amazon DynamoDB streams that generate an HTTP

aws.metrics-dynamodb metrics (continued)

Metric Name	Description
(Featured metric)	500 status code during the specified time period. An HTTP 500 usually indicates an internal service error. Run by a GetItem operation.
aws.dynamodb.SystemErrors.Scan.Average	The requests to DynamoDB or Amazon DynamoDB streams that generate an HTTP 500 status code during the specified time period. An HTTP 500 usually indicates an internal service error. Run by a Scan operation.
aws.dynamodb.SystemErrors.Query.Average	Requests to DynamoDB or Amazon DynamoDB streams that generate an HTTP 500 status code during the specified time period. An HTTP 500 usually indicates an internal service error. Run by a Query operation.
aws.dynamodb.SystemErrors.BatchGetItem.Average	Requests to DynamoDB or Amazon DynamoDB streams that generate an HTTP 500 status code during the specified time period. An HTTP 500 usually indicates an internal service error. Run by a BatchGet operation.
aws.dynamodb.SystemErrors.PutItem.Average (Featured metric)	Requests to DynamoDB or Amazon DynamoDB streams that generate an HTTP 500 status code during the specified time period. An HTTP 500 usually indicates an internal service error. Run by a PutItem operation.
aws.dynamodb.SystemErrors.UpdateItem.Average	The requests to DynamoDB or Amazon DynamoDB streams that generate an HTTP 500 status code during the specified time period. An HTTP 500 usually indicates an internal service error. Run by an UpdateItem operation.
aws.dynamodb.SystemErrors.DeleteItem.Average	Requests to DynamoDB or Amazon DynamoDB streams that generate an HTTP 500 status code during the specified time period. An HTTP 500 usually indicates an internal service error. Run by a DeleteItem operation.
aws.dynamodb.SystemErrors.BatchWriteItem.Average	Requests to DynamoDB or Amazon DynamoDB streams that generate an HTTP 500 status code during the specified time period. An HTTP 500 usually indicates an internal service error. Run by a BatchWrite operation.
aws.dynamodb.ConditionalCheckFailedRequests.Average (Featured metric)	Number of failed attempts to perform conditional writes.

aws.metrics-dynamodb metrics (continued)

Metric Name	Description
aws.dynamodb.TimeToLiveDeletedItemCount.Average	Number of items deleted by Time to Live (TTL) during the specified time period. This metric helps you monitor the rate of TTL deletions on your table.
aws.dynamodb.TransactionConflict.Average	Rejected item-level requests due to transactional conflicts between concurrent requests on the same items.
aws.dynamodb.ReadThrottleEvents.Average (Featured metric)	Requests to DynamoDB that exceed the provisioned read capacity units for a table.
aws.dynamodb.WriteThrottleEvents.Average (Featured metric)	Requests to DynamoDB that exceed the provisioned write capacity units for a table.
aws.dynamodb.ThrottledRequests.GetItem.Average	Requests to DynamoDB that exceed the provisioned throughput limits on a resource for a GetItem operation.
aws.dynamodb.ThrottledRequests.PutItem.Average	Requests to DynamoDB that exceed the provisioned throughput limits on a resource for a PutItem operation.
aws.dynamodb.ThrottledRequests.DeleteItem.Average	Requests to DynamoDB that exceed the provisioned throughput limits on a resource for a DeleteItem operation.
aws.dynamodb.ThrottledRequests.UpdateItem.Average	Requests to DynamoDB that exceed the provisioned throughput limits on a resource for an UpdateItem operation.
aws.dynamodb.ThrottledRequests.BatchGetItem.Average	Requests to DynamoDB that exceed the provisioned throughput limits on a resource for a BatchGetItem operation.
aws.dynamodb.ThrottledRequests.Scan.Average	Requests to DynamoDB that exceed the provisioned throughput limits on a resource for a Scan operation.
aws.dynamodb.ThrottledRequests.Query.Average	Requests to DynamoDB that exceed the provisioned throughput limits on a resource for a Query operation.
aws.dynamodb.ThrottledRequests.BatchWriteItem.Average	Requests to DynamoDB that exceed the provisioned throughput limits on a resource for a BatchWriteItem operation.
aws.dynamodb.SuccessfulRequestLatency.GetRecords.Average	The successful requests to DynamoDB or Amazon DynamoDB Streams during the specified time period. Run by a GetRecords operation.
aws.dynamodb.ReturnedBytes.GetRecords.Average	The number of bytes returned by GetRecords operations (Amazon DynamoDB streams) during the specified time period.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

aws.metrics-dynamodb metrics (continued)

Metric Name	Description
aws.dynamodb.ReturnedRecordsCount.GetRecords.Average	The average of stream records returned by GetRecords operations (Amazon DynamoDB streams) during the specified time period.

aws.metrics-ecs-cluster metrics

Metric	Description
aws.ecs.cluster.CPUReservation.Average (Featured metric)	Percentage of CPU units reserved by running tasks in the cluster.
aws.ecs.cluster.CPUUtilization.Average (Featured metric)	Percentage of CPU units used in the cluster.
aws.ecs.cluster.MemoryReservation.Average (Featured metric)	Percentage of memory reserved by running tasks in the cluster.
aws.ecs.cluster.MemoryUtilization.Average (Featured metric)	Percentage of memory used in the cluster.
aws.ecs.cluster.CpuReserved.Average	CPU units reserved by tasks in the cluster.
aws.ecs.cluster.CpuUtilized.Average	CPU units used by tasks in the cluster.
aws.ecs.cluster.NetworkRxBytes.Average (Featured metric)	Number of bytes received by the cluster.
aws.ecs.cluster.NetworkTxBytes.Average (Featured metric)	Number of bytes transmitted by the cluster.
aws.ecs.cluster.EphemeralStorageReserved.Average	Ephemeral storage is the volatile temporary storage attached to your instances, present only during the running lifetime of the instance.
aws.ecs.cluster.MemoryUtilized.Average (Featured metric)	Memory being used by tasks in the cluster.
aws.ecs.cluster.MemoryReserved.Average (Featured metric)	Memory reserved by tasks in the cluster.
aws.ecs.cluster.StorageReadBytes.Average (Featured metric)	Number of bytes read from storage in the cluster.
aws.ecs.cluster.StorageWriteBytes.Average	Number of bytes written to storage in the cluster.

aws.metrics-ecs-cluster metrics (continued)

Metric	Description
(Featured metric)	
aws.ecs.cluster.ContainerInstanceCount.Average (Featured metric)	Number of EC2 instances running the Amazon ECS agent that are registered with a cluster.
aws.ecs.cluster.ServiceCount.Average (Featured metric)	Number of services in the cluster.
aws.ecs.cluster.TaskCount.Average	Number of tasks running in the cluster.

aws.metrics-ecs-service metrics

Metric	Description
aws.ecs.service.CPUUtilization.Average (Featured metric)	Percentage of CPU units used in the service.
aws.ecs.service.MemoryUtilization.Average (Featured metric)	Percentage of memory used in the service.
aws.ecs.service.CpuReserved.Average	CPU units reserved by tasks in the service.
aws.ecs.service.CpuUtilized.Average	CPU units used by tasks in the service.
aws.ecs.service.NetworkRxBytes.Average (Featured metric)	Number of bytes received by the service.
aws.ecs.service.NetworkTxBytes.Average (Featured metric)	Number of bytes transmitted by the service.
aws.ecs.service.EphemeralStorageReserved.Average	Ephemeral storage is the volatile temporary storage attached to your instances which is present only during the running lifetime of the instance.
aws.ecs.service.MemoryUtilized.Average	Memory being used by tasks in the service.
aws.ecs.service.MemoryReserved.Average	Memory reserved by tasks in the service.
aws.ecs.service.StorageReadBytes.Average (Featured metric)	Number of bytes read from storage in the service.
aws.ecs.service.StorageWriteBytes.Average (Featured metric)	Number of bytes written to storage in the service.
aws.ecs.service.RunningTaskCount.Average	Number of tasks currently in the RUNNING state.

aws.metrics-ecs-service metrics (continued)

Metric	Description
(Featured metric)	
aws.ecs.service.DeploymentCount.Average	Number of deployments in an Amazon ECS service.
aws.ecs.service.DesiredTaskCount.Average (Featured metric)	Desired number of tasks for an Amazon ECS service.
aws.ecs.service.TaskSetCount.Average (Featured metric)	Number of task sets in the service.
aws.ecs.service.PendingTaskCount.Average (Featured metric)	Number of tasks currently in the PENDING state.

Azure Health Monitoring default checks and policies

Agent Client Collector provides the following default checks and policies for Azure health monitoring.

Azure k8s Metrics

Type	Check	Description	Command

Metric	azure.metrics-k8s-service	Provides pod, nodes, and cluster level metrics from all Azure Kubernetes services in metric form.
		
		Usage: metrics-azure-k8s-service.rb
		
		`-S, --subscription ID ARM Subscription ID`
		`-r, Region`
		
		Example: `metrics-azure-k8s-service.rb -S {{.labels.params_subscription_id}} -r westus2`
			`metrics-azure-k8s-service.rb -r {{.labels.params_ci_region}} {{-s {{if.labels.params_subscrip -S {{.labels.params_subscripti {{end}}`

Azure metrics

The following tables list and describe the metrics that are gathered as output from Azure checks. Entries indicated as **Featured metrics** are high-visibility metrics that are displayed in the

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Operator Workspace Metric tab after an alert is generated. These metrics provide the operator with additional information to help them further explore the specified issue.

Azure Kubernetes Service check metrics

Metric Name	Description
apiserver_current_inflight_requests (Featured metric)	Maximum number of currently used inflight requests on the API server per request kind in the past second.
cluster_autoscaler_cluster_safe_to_autoscale	Determines whether cluster autoscaler takes action on the cluster.
cluster_autoscaler_scale_down_in_cooldown	Determines if the scale down is in cooldown; no nodes are removed during this timeframe.
cluster_autoscaler_unneeded_nodes_count	Number of nodes that are currently not needed and can be removed by the autoscaler.
cluster_autoscaler_unschedulable_pods_count	Number of pods that are currently not able to be scheduled in the cluster.
kube_node_status_allocatable_cpu_cores (Featured metric)	Total number of available CPU cores in a managed cluster.
kube_node_status_allocatable_memory_bytes (Featured metric)	Total amount of available memory in a managed cluster.
kube_node_status_condition (Featured metric)	Statuses for various node conditions.
kube_pod_status_phase (Featured metric)	Number of pods by phase.
kube_pod_status_ready (Featured metric)	Number of pods in Ready state.
node_cpu_usage_millicores (Featured metric)	Aggregated measurement of CPU utilization in millicores across the cluster.
node_cpu_usage_percentage (Featured metric)	Aggregated average CPU utilization measured in percentage across the cluster.
node_disk_usage_bytes	Number of disk space bytes in use by device.
node_disk_usage_percentage (Featured metric)	Percentage of disk space used by device.
node_memory_rss_bytes	Number of container RSS memory bytes in use.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure Kubernetes Service check metrics (continued)

Metric Name	Description
node_memory_rss_percentage (Featured metric)	Percentage of container RSS memory in use.
node_memory_working_set_bytes	Number of container working set memory bytes in use.
node_memory_working_set_percentage (Featured metric)	Percentage of container working set memory in use.
node_network_in_bytes (Featured metric)	Network received bytes.
node_network_out_bytes (Featured metric)	Network transmitted bytes.

Azure VM CPU metrics

Metric Name	Description
Percentage CPU (Featured metric)	The percentage of allocated compute units that are currently in use by the Virtual Machine(s).
CPU Credits Remaining	Total number of credits available to burst. Only available on B-series burstable VMs.
CPU Credits Consumed	Total number of credits consumed by the Virtual Machine. Only available on B-series burstable VM.

Azure VM Network metrics

Metric Name	Description
Network In (Featured metric)	The number of billable bytes received on all network interfaces by the Virtual Machines (Incoming Traffic) (Deprecated).
Network Out (Featured metric)	The number of billable bytes out on all network interfaces by the Virtual Machines (Outgoing Traffic) (Deprecated).
Network In Total (Featured metric)	The number of bytes received on all network interfaces by the Virtual Machines (Incoming Traffic).
Network Out Total (Featured metric)	The number of bytes out on all network interfaces by the Virtual Machines (Outgoing Traffic).

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure VM Disk metrics

Metric Name	Description
Disk Read Bytes (Featured metric)	Bytes read from disk during monitoring period.
Disk Write Bytes (Featured metric)	Bytes written to disk during monitoring period.
Disk Read Operations/Sec (Featured metric)	Disk Read IOPS.
Disk Write Operations/Sec (Featured metric)	Disk Write IOPS.
Data Disk Read Bytes/sec (Featured metric)	Bytes per second read from a single disk during monitoring period.
Data Disk Write Bytes/sec (Featured metric)	Bytes per second written to a single disk during monitoring period.
Data Disk Read Operations/Sec (Featured metric)	Read IOPS from a single disk during monitoring period.
Data Disk Write Operations/Sec (Featured metric)	Write IOPS from a single disk during monitoring period.
Data Disk Bandwidth Consumed Percentage (Featured metric)	Percentage of data disk bandwidth consumed per minute.
Data Disk IOPS Consumed Percentage (Featured metric)	Percentage of data disk I/Os consumed per minute.
Data Disk Target Bandwidth (Featured metric)	Baseline bytes per second throughput Data Disk can achieve without bursting.
Data Disk Target IOPS (Featured metric)	Baseline IOPS Data Disk can achieve without bursting.
Data Disk Max Burst Bandwidth (Featured metric)	Maximum bytes per second throughput Data Disk can achieve with bursting.
Data Disk Max Burst IOPS (Featured metric)	Maximum IOPS Data Disk can achieve with bursting.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure VM Disk metrics (continued)

Metric Name	Description
Data Disk Used Burst BPS Credits Percentage	Percentage of Data Disk burst bandwidth credits used so far.
Data Disk Used Burst IO Credits Percentage	Percentage of Data Disk burst I/O credits used so far.
Premium Data Disk Cache Read Hit (Featured metric)	Premium Data Disk Cache Read Hit.
Premium Data Disk Cache Read Miss (Featured metric)	Premium Data Disk Cache Read Miss.
Premium OS Disk Cache Read Hit (Featured metric)	Premium OS Disk Cache Read Hit.
Premium OS Disk Cache Read Miss (Featured metric)	Premium OS Disk Cache Read Miss.

Azure VM Flow metrics

Metric Name	Description
Inbound Flows (Featured metric)	Inbound Flows are number of current flows in the inbound direction (traffic going into the VM).
Outbound Flows (Featured metric)	Maximum creation rate of outbound flows (traffic going out of the VM).
Inbound Flows Maximum Creation Rate (Featured metric)	Maximum creation rate of inbound flows (traffic going into the VM).
Outbound Flows Maximum Creation Rate (Featured metric)	Maximum creation rate of outbound flows (traffic going out of the VM).

Azure VM Memory metrics

Metric Name	Description
VM Cached Bandwidth Consumed Percentage (Featured metric)	Percentage of cached disk bandwidth consumed by the VM.
VM Cached IOPS Consumed Percentage	Percentage of cached disk IOPS consumed by the VM.
VM Uncached Bandwidth Consumed Percentage	Percentage of uncached disk bandwidth consumed by the VM.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure VM Memory metrics (continued)

Metric Name	Description
(Featured metric)	
VM Uncached Bandwidth Consumed Percentage	Percentage of uncached disk IOPS consumed by the VM.
Available Memory Byte (Featured metric)	Amount of physical memory, in bytes, immediately available for allocation to a process or for system use in the Virtual Machine.

Azure VM Metrics policy - Azure Metrics Collector check metrics

Metric name	Units	Description
Percentage CPU (featured metric)	%	The percentage of allocated compute units that are currently in use by the Virtual Machine.
CPU Credits Remaining		Number of earned CPU credits that have not been consumed by the Virtual Machine.
CPU Credits Consumed		Total number of CPU credits that have been consumed by the Virtual Machine.
Network In		Number of bytes received on all network interfaces by the instance.
Network Out		Number of bytes sent out on all network interfaces by the instance.
Network In Total (featured metric)	Bytes	The number of bytes received on all network interfaces by the Virtual Machine(s) (Incoming Traffic).
Network Out Total (featured metric)	Bytes	The number of bytes out on all network interfaces by the Virtual Machine(s) (Outgoing Traffic).
Available Memory Bytes (featured metric)	Bytes	Amount of physical memory in bytes immediately available for allocation to a process or for system use in the Virtual Machine.
VM Cached Bandwidth Consumed Percentage		Percentage of cached disk bandwidth consumed by the VM.

Azure VM Metrics policy - Azure Metrics Collector check metrics (continued)

Metric name	Units	Description
VM Cached IOPS Consumed Percentage		Percentage of cached disk IOPS consumed by the VM.
VM Uncached Bandwidth Consumed Percentage		Percentage of uncached disk bandwidth consumed by the VM.
VM Uncached IOPS Consumed Percentage		Percentage of uncached disk IOPS consumed by the VM.
Disk Read Bytes (featured metric)	Bytes	Bytes read from disk during monitoring period.
Disk Write Bytes (featured metric)	Bytes	Bytes written to disk during monitoring period.
Disk Read Operations/Sec (featured metric)	CountPerSecond	Disk Read IOPS.
Disk Write Operations/Sec (featured metric)	CountPerSecond	Disk Write IOPS.
OS Disk Read Bytes/sec		Bytes/Sec read from disk during monitoring period.
OS Disk Write Bytes/sec		Bytes/Sec written to disk during monitoring period.
OS Disk Read Operations/Sec		Read IOPS from disk during monitoring period.
OS Disk Write Operations/Sec		Write IOPS from disk during monitoring period.
OS Disk Queue Depth		Average number of read and write requests that were queued for the selected disk during the sample period.
OS Disk Bandwidth Consumed Percentage		Percentage of data disk bandwidth consumed per minute.
OS Disk IOPS Consumed Percentage		Percentage of data disk I/Os consumed per minute.
OS Disk Target Bandwidth		Baseline bytes per second throughput data disk can achieve without bursting.
OS Disk Target IOPS		Baseline IOPS data disk can achieve without bursting.
OS Disk Max Burst Bandwidth		Maximum bytes per second throughput data disk can achieve with bursting.
OS Disk Max Burst IOPS		Maximum IOPS data disk can achieve with bursting.

Azure VM Metrics policy - Azure Metrics Collector check metrics (continued)

Metric name	Units	Description
OS Disk Used Burst BPS Credits Percentage		Percentage of data disk burst bandwidth credits used so far.
OS Disk Used Burst IO Credits Percentage		Percentage of data disk burst I/O credits used so far.
Premium OS Disk Cache Read Hit		Premium OS disk cache read hit.
Premium OS Disk Cache Read Miss		Premium OS disk cache read miss.
Inbound Flows		Number of current flows in the inbound direction (traffic going into the VM).
Outbound Flows		Number of current flows in the inbound direction (traffic going out of the VM).
Inbound Flows Maximum Creation Rate		Maximum creation rate of inbound flows (traffic going into the VM).
Outbound Flows Maximum Creation Rate		Maximum creation rate of outbound flows (traffic going out of the VM).

Azure Load Balancer metrics policy - Azure Metrics collector check metrics

Metric name	Units	Description
AllocatedSnatPorts (featured metric)		Total number of SNAT ports allocated within the time period specified by the metric definition's *PT* (Period of Time) value.
ByteCount (featured metric)	bytes	Total number of bytes transmitted within the time period specified by the metric definition's *PT* (Period of Time) value.
DipAvailability (featured metric)	count	Average load balancer health probe status per time duration.
BlockedCount (featured metric)		Total number of packets transmitted within the time period specified by the metric definition's *PT* (Period of Time) value.
SnatConnectionCount (featured metric)	count	Total number of new SNAT connections created within the time period specified by

Azure Load Balancer metrics policy - Azure Metrics collector check metrics (continued)

Metric name	Units	Description
		the metric definition's *PT* (Period of Time) value.
SYNCount (featured metric)		Total number of SYN packets transmitted within the time period specified by the metric definition's *PT* (Period of Time) value.
UsedSnatPorts (featured metric)		Total number of SNAT ports used within the time period specified by the metric definition's *PT* (Period of Time) value.
VipAvailability (featured metric)	count	Average load balancer data path availability per time duration.

Azure Redis Cache policy - Azure Metrics Collector check metrics

Metric name	Units	Description
connectedclients		Number of client connections to the cache.
totalcommandsprocessed		Total number of commands processed by the cache server.
cachehits (featured metric)	count	Number of successful key lookups.
cachemisses (featured metric)	count	Number of failed key lookups.
cachemissrate		Rate of failed key lookups.
getcommands		Number of get operations from the cache.
setcommands (featured metric)	count	Number of set operations to the cache.
operationsPerSecond		Number of instantaneous operations per second executed on the cache.
evictedkeys		Number of items evicted from the cache.
totalkeys		Number of keys in the cache.
expiredkeys		Number of items expired from the cache.
usedmemory	bytes	Amount of cache memory used for key/value pairs in the cache.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure Redis Cache policy - Azure Metrics Collector check metrics (continued)

Metric name	Units	Description
usedmemoryRss	bytes	Amount of cache memory used during the specified reporting interval, including fragmentation and metadata
serverLoad (featured metric)	Percent	Percentage of cycles in which the Redis server is busy processing and not waiting idle for messages
cacheWrite (featured metric)	BytesPersSecond	Amount of data written to the cache.
cacheRead (featured metric)	BytesPerSecond	Amount of data read from the cache.
allConnectionsCreatedPerSecond		Number of instantaneous connections created per second on the cache via port 6379 or 6380 (SSL).
allConnectionsClosedPerSecond		Number of instantaneous connections closed per second on the cache via port 6379 or 6380 (SSL).
allconnectedclients (featured metric)	count	Number of currently connected clients to the system.
alltotalcommandsprocessed		The cumulative count of all commands processed by the system.
alloperationsPerSecond		Total number of operations (such as read or write commands) performed per second across all instances.
allusedmemory (featured metric)	bytes	Total amount of memory being used across the system.
allusedmemoryRss (featured metric)	bytes	The total Resident Set Size (RSS), which reflects the amount of memory physically present in RAM across all instances, including swap.

Azure Gateway Metrics policy - Azure Metrics collector check metrics

Metric name	Units	Description
ApplicationGatewayTotalTime (featured metric)	MilliSeconds	Time that it takes for a request to be processed and its response to be sent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure Gateway Metrics policy - Azure Metrics collector check metrics (continued)

Metric name	Units	Description
AvgRequestCountPerHealthyHost		Average request count per minute per healthy backend host in a pool.
AzwafBotProtectionMatches		Matched Bot Rules.
AzwafCustomRuleMatches		Matched Custom Rules.
AzwafSecRuleMatches		Matched Managed Rules.
AzwafTotalRequests		Total number of requests evaluated by WAF.
BackendConnectTime		Time spent establishing a connection with a backend server.
BackendFirstByteResponseTime		Time interval between start of establishing a connection to backend server and receiving the first byte of the response header, approximating processing time of backend server.
BackendLastByteResponseTime		Time interval between start of establishing a connection to backend server and receiving the last byte of the response body.
BackendResponseStatus		Number of HTTP response codes generated by the backend members. This does not include any response codes generated by the Application Gateway.
BlockedCount		Total number of blocked operations or requests
BytesReceived (featured metric)	bytes	Total number of bytes received by the Application Gateway from the clients.
BytesSent (featured metric)	bytes	Total number of bytes sent by the Application Gateway to the clients.
CapacityUnits		Capacity units consumed.
ClientRtt		Round trip time between clients and Application Gateway. Indicates how long it takes to establish connections and return acknowledgments.
ComputeUnits		Compute units consumed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure Gateway Metrics policy - Azure Metrics collector check metrics (continued)

Metric name	Units	Description
CpuUtilization		Current CPU utilization of the Application Gateway.
CurrentConnections (featured metric)	count	Count of current connections established with Application Gateway.
EstimatedBilledCapacityUnits		Estimated capacity units that will be charged.
FailedRequests (featured metric)	count	Count of failed requests that Application Gateway has served.
FixedBillableCapacityUnits		Fixed Billable Capacity Units.
HealthyHostCount (featured metric)	count	Number of healthy backend hosts.
NewConnectionsPerSecond		New connections per second established with Application Gateway.
ResponseStatus		HTTP response status returned by Application Gateway.
Throughput (featured metric)	bytesPerSecond	Number of bytes per second the Application Gateway has served.
TotalRequests (featured metric)	count	Count of successful requests that Application Gateway has served.
UnhealthyHostCount (featured metric)	count	Number of unhealthy backend hosts.

Azure Storage Account policy - Azure Metrics Collector check metrics

Metric name	Units	Description
Transactions (featured metric)	count	Total number of requests made to the storage account.
Ingress (featured metric)	bytes	Amount of ingress data. This number includes ingress from an external client into Azure Storage as well as ingress within Azure.
Egress (featured metric)	bytes	Amount of egress data. This number includes egress from an external client into Azure Storage as well as egress within Azure. As a result,

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure Storage Account policy - Azure Metrics Collector check metrics (continued)

Metric name	Units	Description
		this number does not reflect billable egress.
SuccessServerLatency (featured metric)	milliseconds	Average latency used by Azure Storage to process a successful request.
SuccessE2ELatency (featured metric)	milliseconds	The average end-to-end latency of successful requests made to a storage service or the specified API operation.
Availability (featured metric)	percent	The percentage of availability for the storage service or the specified API operation.

Azure Blob Services metrics

Metric Name	Description
Availability	Percentage of availability for the storage service or the specified API operation. Availability is calculated by taking the TotalBillableRequests value and dividing it by the number of applicable requests, including those that produced unexpected errors. All unexpected errors result in reduced availability for the storage service or the specified API operation.
BlobCapacity (Featured metric)	Amount of storage used by the storage account's Blob service, in bytes.
BlobCount	Number of Blobs in the storage account's Blob service
Container Count	Number of containers in the storage account's Blob service.
Egress (Featured metric)	Amount of Egress data, in bytes. Includes egress from an external client into Azure Storage as well as Egress within Azure. As a result, this number does not reflect billable Egress.
Index Capacity (Featured metric)	Amount of storage used by ADLS Gen2 (Hierarchical) Index, in bytes.
Ingress (Featured metric)	The amount of Ingress data, in bytes. Includes Ingress from an external client into Azure storage, as well as ingress within Azure.
SuccessE2ELatency	End-to-end latency of successful requests made to a storage service or the specified

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure Blob Services metrics (continued)

Metric Name	Description
(Featured metric)	API operation, in milliseconds. Includes the required processing time within Azure storage to read the request, send the response, and receive acknowledgment of the response.
SuccessServerLatency (Featured metric)	Latency used by Azure storage to process a successful request, in milliseconds. This value does not include the network latency specified in **SuccessE2ELatency**.
Transactions	Number of requests made to a storage service or the specified API operation. Includes successful and failed requests, as well as requests which produced errors. Use the *ResponseType* dimension for the number of different types of responses.

Azure cloud metrics

Azure cloud metrics are gathered from Azure virtual machines (VMs) and Azure storage account policies. Collecting the cloud metrics enables you to monitor the performance of your Azure resources.

Azure cloud metrics collection - Overview

To begin collecting Azure cloud metrics, you must select the metrics that you want to add to the CMDB and set the relevant system configurations. For example, you can monitor the number of bytes sent and received from Azure resources. For details, see Agent Client Collector for Visibility Content reference.

Using Azure policies

You can use preconfigured Azure policies for metric collection, or you can create your own Azure policies.

When using a preconfigured policy, you do the following tasks:

- Prepare an instance with an active MID Server and metric base.
- Install Agent Client Collector Framework and Agent Client Collector Monitoring.
- Run Discovery on the Azure cloud account to populate the CMDB with the configuration items (CIs) to be monitored.
- Configure a proxy agent and assign credentials to the policy. Proxy agents monitor CIs for agents that are in the cloud. Credentials enable the agent to access the Azure policy.

The policies available with the base system for you to activate and configure are described in the following table.

Azure policies available with base system

Policy name	Description	Link to supported metrics
Azure Load Balancer metrics	Collects the metrics for the Azure load balancers.	Supported metrics for Microsoft Load Balancers

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure policies available with base system (continued)

Policy name	Description	Link to supported metrics
Azure Gateway metrics	Collects the metrics for the Azure network gateway.	Supported metrics for Microsoft Network Gateways
Azure Redis Cache metrics	Collects the metrics for the Azure Redis cache.	Supported metrics for Microsoft Redis cache
Azure Storage Account metrics	Collects the metrics for the Azure storage accounts.	Supported metrics for Microsoft storage accounts
Azure Virtual Machine (VM) metrics	Collects the metrics for the VMs, which help you monitor Azure VMs.	Supported metrics for Microsoft virtual machines

Specifying the CIs for metric collection

When creating policies, you must include the CIs that you want to collect the metrics for in the CMDB. The CIs are typically populated during Discovery, which finds applications and devices on your network and updates the CMDB accordingly.

When creating a policy, you must decide which CIs you want the policy to monitor. To enable monitoring CIs, you do the following tasks:

1. Configure the Azure Metrics Collector check in the policy.
2. Set the credentials for the Azure Metrics Collector check to enable retrieving metrics from Azure to the Agent Client Collector agent.
3. Generate a .json file that specifies the list of resources to be monitored.
4. Generate a .json file that specifies the list of metrics to be retrieved from monitored resources.

For details on the Azure policies, see Create Azure policies for metric collection.

For details on the Azure Metrics Batch API, see the Metrics Batch API page.

Cassandra default checks and policies

Agent Client Collector provides the following policies for Cassandra health monitoring. Policies come with the checks specified in the indicated table. Policies and checks are available for Linux only.

Cassandra Metrics

Check	Description	Usage	Command	Output
app.cassandra.metrics-cassandra	Returns metrics of a Cassandra database.	`metrics-cassandra-graphite.rb` Options: **-h host** Hostname where the Cassandra	`metrics-cassandra-graphite.rb --cfstats -P {{.labels.params_port}} -h {{.labels.params_host}}`	`<host>.cassandra.load 132270.08 1645107221`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cassandra Metrics (continued)

Check	Description	Usage	Command	Output
		database is running **-P port** Cassandra JMX port		

Cassandra metrics

The following table lists the metrics that are gathered as output from Cassandra checks. Entries indicated as **Featured metrics** are high-visibility metrics that are displayed in the Operator Workspace Metric tab after an alert is generated. These metrics provide the operator with additional information to help them further explore the specified issue.

metrics-cassandra metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
cassandra.load (featured metric)		byte	The disk space used by live data on a node.
cassandra.uptime (featured metric)		seconds	
cassandra.heap.used (featured metric)		byte	
cassandra.heap.total (featured metric)		byte	
cassandra.exceptions		count	Number of internal exceptions caught. Under normal exceptions this should be zero.
cassandra.key_cache.size		byte	Total size of occupied cache, in bytes.
cassandra.key_cache.capacity		byte	Cache capacity in bytes.
cassandra.key_cache.hits		count	Total number of cache hits.
cassandra.key_cache.requests (featured metric)		count	Total number of cache requests.
cassandra.key_cache.hit_rate (featured metric)		count	All time cache hit rate.
cassandra.compactionstats.pending_tasks		count	The number of pending compactions.

metrics-cassandra metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
cassandra.threadpool.ReadStage.active		count	Number of tasks being actively worked on by this pool. Local reads run on this thread pool on this ReadStage.
cassandra.threadpool.ReadStage.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.ReadStage.completed		count	Number of tasks completed.
cassandra.threadpool.ReadStage.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.MiscStage.active		count	Number of tasks being actively worked on by this pool. Miscellaneous tasks run on this stage.
cassandra.threadpool.MiscStage.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.MiscStage.completed		count	Number of tasks completed.
cassandra.threadpool.MiscStage.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.CompactionExecutor.active		count	Number of tasks being actively worked on by this pool. Compactions are run on these threads.
cassandra.threadpool.CompactionExecutor.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.CompactionExecutor.completed		count	Number of tasks completed.
cassandra.threadpool.CompactionExecutor.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.MutationStage.active		count	Number of tasks being actively worked on by this pool. Responsible for all other writes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

metrics-cassandra metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
cassandra.threadpool.MutationStage.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.MutationStage.completed		count	Number of tasks completed.
cassandra.threadpool.MutationStage.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.MemtableReclaimMemory.active		count	Number of tasks being actively worked on by this pool. Memtable recycling.
cassandra.threadpool.MemtableReclaimMemory.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.MemtableReclaimMemory.completed		count	Number of tasks completed.
cassandra.threadpool.MemtableReclaimMemory.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.PendingRangeCalculator.active		count	Number of tasks being actively worked on by this pool. Calculates token range.
cassandra.threadpool.PendingRangeCalculator.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.PendingRangeCalculator.completed		count	Number of tasks completed.
cassandra.threadpool.PendingRangeCalculator.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.GossipStage.active		count	Number of tasks being actively worked on by this pool. Handles gossip requests.
cassandra.threadpool.GossipStage.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.GossipStage.completed		count	Number of tasks completed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

metrics-cassandra metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
cassandra.threadpool.GossipStage.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.SecondaryIndexManagement.active		count	Number of tasks being actively worked on by this pool. Performs updates to secondary indexes.
cassandra.threadpool.SecondaryIndexManagement.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.SecondaryIndexManagement.completed		count	Number of tasks completed.
cassandra.threadpool.SecondaryIndexManagement.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.HintsDispatcher.active		count	Number of tasks being actively worked on by this pool. Performs hinted hand off.
cassandra.threadpool.HintsDispatcher.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.HintsDispatcher.completed		count	Number of tasks completed.
cassandra.threadpool.HintsDispatcher.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.RequestResponseStage.active		count	Number of tasks being actively worked on by this pool. Coordinator requests to the cluster run on this thread pool.
cassandra.threadpool.RequestResponseStage.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.RequestResponseStage.completed		count	Number of tasks completed.
cassandra.threadpool.RequestResponseStage.blocked		count	Number of tasks that were blocked due to queue saturation.

metrics-cassandra metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
cassandra.threadpool.ReadRepairStage.active		count	Number of tasks being actively worked on by this pool. Read repair happens on this thread pool.
cassandra.threadpool.ReadRepairStage.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.ReadRepairStage.completed		count	Number of tasks completed.
cassandra.threadpool.ReadRepairStage.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.CounterMutationStage.active		count	Number of tasks being actively worked on by this pool. Responsible for counter writes.
cassandra.threadpool.CounterMutationStage.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.CounterMutationStage.completed		count	Number of tasks completed.
cassandra.threadpool.CounterMutationStage.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.MigrationStage.active		count	Number of tasks being actively worked on by this pool. Runs schema migrations.
cassandra.threadpool.MigrationStage.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.MigrationStage.completed		count	Number of tasks completed.
cassandra.threadpool.MigrationStage.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.MemtablePostFlush.active		count	Number of tasks being actively worked on by this pool. Cleans up commit log after memtable is written to disk.

metrics-cassandra metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
cassandra.threadpool.MemtablePostFlush.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.MemtablePostFlush.completed		count	Number of tasks completed.
cassandra.threadpool.MemtablePostFlush.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.PerDiskMemtableFlushWriter_0.active		count	Number of tasks being actively worked on by this pool. Responsible for writing a spec (there is one of these per disk 0-N).
cassandra.threadpool.PerDiskMemtableFlushWriter_0.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.PerDiskMemtableFlushWriter_0.completed		count	Number of tasks completed.
cassandra.threadpool.PerDiskMemtableFlushWriter_0.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.ValidationExecutor.active		count	Number of tasks being actively worked on by this pool. Performs validation compaction or scrubbing.
cassandra.threadpool.ValidationExecutor.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.ValidationExecutor.completed		count	Number of tasks completed.
cassandra.threadpool.ValidationExecutor.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.Sampler.active		count	Number of tasks being actively worked on by this pool. Responsible for re-sampling the index summaries of *`SStables`*.

metrics-cassandra metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
cassandra.threadpool.Sampler.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.Sampler.completed		count	Number of tasks completed.
cassandra.threadpool.Sampler.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.MemtableFlushWriter.active		count	Number of tasks being actively worked on by this pool. Writes memtables to disk.
cassandra.threadpool.MemtableFlushWriter.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.MemtableFlushWriter.completed		count	Number of tasks completed.
cassandra.threadpool.MemtableFlushWriter.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.InternalResponseStage.active		count	Number of tasks being actively worked on by this pool. Responsible for intra-cluster callbacks.
cassandra.threadpool.InternalResponseStage.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.InternalResponseStage.completed		count	Number of tasks completed.
cassandra.threadpool.InternalResponseStage.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.ViewMutationStage.active		count	Number of tasks being actively worked on by this pool. Responsible for materialized view writes.
cassandra.threadpool.ViewMutationStage.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.ViewMutationStage.completed		count	Number of tasks completed.

metrics-cassandra metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
cassandra.threadpool.ViewMutationStage.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.AntiEntropyStage.active		count	Number of tasks being actively worked on by this pool. Builds merkle tree for repairs.
cassandra.threadpool.AntiEntropyStage.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.AntiEntropyStage.completed		count	Number of tasks completed.
cassandra.threadpool.AntiEntropyStage.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.CacheCleanupExecutor.active		count	Number of tasks being actively worked on by this pool. Cache maintenance performed on this thread pool.
cassandra.threadpool.CacheCleanupExecutor.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.CacheCleanupExecutor.completed		count	Number of tasks completed.
cassandra.threadpool.CacheCleanupExecutor.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.message_type.READ.dropped		count	Number of dropped messages. Regular reads.
cassandra.message_type.RANGE_SLICE.dropped		count	Number of dropped messages. Token range read.
cassandra.message_type._TRACE.dropped		count	Number of dropped messages. Tracing writes.
cassandra.message_type.HINT.dropped		count	Number of dropped messages. Hint replay.
cassandra.message_type.MUTATION.dropped		count	Number of dropped messages. Regular writes.

Directory Scan monitoring default checks and policies

The Agent Client Collector provides the following default checks and policies for Directory Scan monitoring.

Windows OS Events - Extended policy

Type	Check	Description	Usage and Usage Example	Output
Event	check-directory-file-count	Checks the number of files present in a given directory and compares it to the provided warning and critical thresholds. Returns a CRITICAL, WARNING, or OK event based on the critical and warning thresholds.	check-directory-file-count.rb (options) -d, --dir Absolute path to the directory to count the files (required) -w, --warning Warning threshold (required) -c, --critical Critical threshold (required)	DirectoryFileCount CRITICAL: <path to dir> has 165 files.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Windows OS Events - Extended policy (continued)

Type	Check	Description	Usage and Usage Example	Output
		Note: • Counts the number of files inside the directory, not including files in subdirectories. • The agent requires read and execute permissions on the directory being monitored.	-H, include_hidden_files Set active to **true** to include hidden files while counting (default is **false**) **Usage Example:** `check-directory-file-count.rb -d /path/to/directory -w 50 -c 100`	
Event	check-directory-integrity	Compares the last modified time of the directory with the current time to determine if any updates have occurred within a defined time interval. Based on this comparison, the check returns a CRITICAL or OK event. **Note:** The agent requires read and execute permissions on the directory being monitored.	commonchecks check-directory-integrity (options) -d, --dirpath DIRPATH: Absolute path to the directory to check (required). -i, --interval INTERVAL: Time interval in seconds to check for recent updates (required). Default value can be set to 180 seconds. **Usage example:** `commonchecks check-directory-update -d /path/`	Common Checks CRITICAL: Directory Integrity: CHANGES DETECTED for <path to file> within the last 180 seconds (Last Modified: Wed, 04 Dec 2024 12:18:55 EST).

Windows OS Events - Extended policy (continued)

Type	Check	Description	Usage and Usage Example	Output
			`to/directory -i 180`	
Event	check-file-age	Evaluates the age of a specified file by comparing its last modification time with the current time. Raises an alert if the file exceeds the defined critical or warning age thresholds. **Note:** The agent requires read and execute permissions on the file being monitored.	commonchecks check-file-age (options) -f, --filepath FILEPATH: Absolute path to the file to check (required). -c, --critical CRITICAL: Critical age threshold in minutes for the file (required). -w, --warning WARNING: Warning age threshold in minutes for the file (required). **Usage example:** `commonchecks check-file-age -f /path/to/file.txt -c 120 -w 60`	Common Checks OK: File <path to file> age: 30 minutes.
Event	check-file-response-time	Compares the time needed to read a specified file and compares it with the critical and warning thresholds. Based on this comparison, the check returns a CRITICAL or OK event.	commonchecks check-file-response-time (options) -f, --filepath FILEPATH: Absolute path to the file to check (required). -c, --critical CRITICAL: Critical threshold in seconds for file response time (required).	Common Checks OK: File read response time: 0.0020 seconds for the file_name: /var/log/servicenow/agent-client-collector/acc.log.

Windows OS Events - Extended policy (continued)

Type	Check	Description	Usage and Usage Example	Output
		Note: The agent requires read and execute permissions on the file being monitored.	-w, --warning WARNING: Warning threshold in seconds for file response time (required). -t, --timeout TIMEOUT: Maximum time allowed for reading the file content, specified in seconds. Time out value must be greater than the critical threshold value. **Usage example:** `commonchecks check-file-response-time -f /var/log/servicenow/agent-client-collector/acc.log -c 10 -w 5 -t 20`	
Event	check-file-size	Measures the size of a file (the actual amount of data it contains) and compares it against specified thresholds. Returns a CRITICAL, WARNING, or OK event based on the comparison of the file size and the thresholds.	commonchecks check-file-size (options) -f, --filepath FILEPATH Absolute path to the required file (required). -c, --critical CRITICAL. Critical threshold in kilobytes. Provide as a number without units (for example, 1000	Common Checks OK: For File <path to file> size: 4.72 KB is within thresholds

Google Cloud Platform (GCP) metrics

The following table lists and describes the metrics that are gathered by the *acc_grp_metrics_list.json* configuration data file. The file is uploaded to a check definition or check instance, and the metrics in the file are monitored by the check for its agent.

GCP metrics

Metric name	Metric type	Service	Description
CPU utilization	appengine.googleapis.com/flex/cpu/utilization	app engine	Fractional utilization of allocated CPU across an App Engine flexible environment version.
Response count	appengine.googleapis.com/http/server/response_count		Delta HTTP response count
Free disk space percent	file.googleapis.com/nfs/server/free_bytes_percent	file	Free disk space as a percentage of the total space.
Circuit Operational Status	interconnect.googleapis.com/network/interconnect/link/operational	interconnect	Whether the operational status of the circuit is 'up'. This metric is specific to individual physical circuits
Operational Status	interconnect.googleapis.com/network/interconnect/operational		Whether the operational status of the interconnect is 'up'. This metric is specific to the aggregate LACP bundle.
Instance group size	compute.googleapis.com/instance_group/size	compute	The number of VMs in the instance group.
CPU utilization	compute.googleapis.com/instance/cpu/utilization		Fractional utilization of allocated CPU on this instance. Values are typically numbers between 0.0 and 1.0 (but can

GCP metrics (continued)

Metric name	Metric type	Service	Description
			exceed 1.0). Charts display the values as a percentage between 0% and 100% (or more).
CPU usage time	compute.googleapis.com/instance/cpu/usage_time		Delta CPU usage time in seconds. Cumulative CPU usage time since instance start.
CPU scheduler wait time	compute.googleapis.com/instance/cpu/scheduler_wait_time		Wait time is the time a vCPU is runnable but not scheduled to run by the hypervisor.
CPU reserved cores	compute.googleapis.com/instance/cpu/reserved_cores		Number of cores reserved for the instance.
Disk queue length	compute.googleapis.com/guest/disk/queue_length		Number of requests waiting to be handled by the disk.
Uptime	compute.googleapis.com/instance/uptime		Delta of how long the VM has been running, measured in seconds. For availability monitoring, use uptime checks instead.
Disk read bytes	compute.googleapis.com/instance/disk/read_bytes_count		Delta count of bytes read from disk.
Disk max read operations	compute.googleapis.com/instance/disk/max_read_ops_count		Maximum number of read operations that can be performed per second.
Disk write bytes	compute.googleapis.com/instance/disk/write_bytes_count		Delta count of bytes written to disk.
Disk max write operations	compute.googleapis.com/instance/disk/max_write_ops_count		Maximum number of write operations that can be performed per second.
Disk read operations	compute.googleapis.com/instance/disk/read_ops_count		Delta count of disk read IO operations.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GCP metrics (continued)

Metric name	Metric type	Service	Description
Disk write operations	compute.googleapis.com/instance/disk/write_ops_count		Delta count of disk write IO operations.
Memory balloon RAM size	compute.googleapis.com/instance/memory/balloon/ram_size		The total amount of memory allocated to the guest's balloon driver in bytes. Memory ballooning enables the hypervisor to reclaim memory from the guest VM.
Memory balloon RAM used	compute.googleapis.com/instance/memory/balloon/ram_used		Memory currently used by the guest RAM, excluding memory used by the balloon itself, measured in bytes.
Memory swap in	compute.googleapis.com/instance/memory/balloon/swap_in_bytes_count		The amount of memory (in bytes) swapped in from disk to memory.
Memory swap out	compute.googleapis.com/instance/memory/balloon/swap_out_bytes_count		The amount of memory (in bytes) swapped out from memory to disk.
Network received bytes	compute.googleapis.com/instance/network/received_bytes_count		Delta count of bytes received from the network.
Network sent bytes	compute.googleapis.com/instance/network/sent_bytes_count		Delta count of bytes sent over the network.
Network received packets	compute.googleapis.com/instance/network/received_packets_count		Delta count of packets received from the network.
Network sent packets	compute.googleapis.com/instance/network/sent_packets_count		Delta count of packets sent over the network.
Anonymous memory used	compute.googleapis.com/guest/memory/anonymous_used		Anonymous memory usage in bytes. Anonymous memory represents memory that is not backed by a file.
Memory bytes used	compute.googleapis.com/guest/memory/bytes_used		Total memory usage in bytes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GCP metrics (continued)

Metric name	Metric type	Service	Description
Dirty memory used	compute.googleapis.com/guest/memory/dirty_used		Dirty memory usage in bytes. Dirty pages are pages in memory that have been modified but not yet written to disk.
Page cache used	compute.googleapis.com/guest/memory/page_cache_used		Page cache memory usage in bytes. Page cache is used to cache file data.
Unevictable memory used	compute.googleapis.com/guest/memory/unevictable_used		Unevictable memory usage in bytes. Unevictable memory is memory that cannot be swapped out.
Disk operation bytes	compute.googleapis.com/guest/disk/operation_bytes_count		Delta count of bytes transferred in disk operations.
System problem state	compute.googleapis.com/guest/system/problem_state		Indicates whether the system is experiencing problems. 1 means there is a problem, 0 means no problem.
System uptime	compute.googleapis.com/guest/system/uptime		Delta of system uptime in seconds.
System problem count	compute.googleapis.com/guest/system/problem_count		Delta count of system problems detected.
CPU limit utilization	kubernetes.io/anthos/container/cpu/limit_utilization	anthos	The fraction of the CPU limit that is currently in use on the instance.
Memory limit utilization	kubernetes.io/anthos/container/memory/limit_utilization		The fraction of the memory limit that is currently in use on the instance.
Executions	cloudfunctions.googleapis.com/function/execution_count	cloudfunctions	Count of function executions broken down by status.
Tunnel established	n.googleapis.com/tunnel_established	vpn	Indicates successful tunnel establishment if > 0.
RTT latencies per internal TCP/UDP load balancer	loadbalancing.googleapis.com/l3/internal/rtt_latencies	loadbalancing	A distribution of RTT measured over TCP connections for

GCP metrics (continued)

Metric name	Metric type	Service	Description
			internal TCP/UDP load balancer flows.
Unacked messages by region	pubsub.googleapis.com/subscription/num_unacked_messages_by_region	pubsub	Number of unacknowledged messages in a subscription, broken down by Cloud region.
Disabled for network	firebasedatabase.googleapis.com/network/disabled_for_overages	firebasedatabase	Indicates if the Firebase database has been disabled for network overages.
Disabled for storage	firebasedatabase.googleapis.com/storage/disabled_for_overages		Indicates if the Firebase database has been disabled for storage overages.
Database load	firebasedatabase.googleapis.com/io/database_load		Fraction of database load, grouped by type.
CPU utilization	cloudsql.googleapis.com/database/cpu/utilization	cloudsql	Current CPU utilization represented as a percentage of the reserved CPU that is currently in use.
Disk utilization	cloudsql.googleapis.com/database/disk/utilization		The fraction of the disk quota that is currently in use.
Instance state	cloudsql.googleapis.com/database/instance_state		The current serving state of the Cloud SQL instance.
Memory utilization	cloudsql.googleapis.com/database/memory/utilization		The fraction of the memory quota that is currently in use.
Server up	cloudsql.googleapis.com/database/up		Indicates if the server is up.
CPU utilization by priority	spanner.googleapis.com/instance/cpu/utilization_by_priority	spanner	Percent utilization of provisioned CPU, by priority.
Smoothed CPU utilization	spanner.googleapis.com/instance/cpu/smoothed_utilization		24-hour smoothed utilization of provisioned CPU.
Storage used	spanner.googleapis.com/instance/storage/used_bytes		Storage used in bytes. Sampled every 60 seconds.
CPU usage percent	memcache.googleapis.com/node/cpu/utilization	memcache	CPU usage percent by Memcached node.

GCP metrics (continued)

Metric name	Metric type	Service	Description
Cache memory usage	memcache.googleapis.com/node/cachememory		Bytes allotted for the Memcached cache in this node, grouped by whether that memory is used.
Used memory	redis.googleapis.com/redis.googleapis.com/stats/memory/usage_ratio	redis	Total number of bytes allocated by Redis.
Memory usage ratio	redis.googleapis.com/stats/memory/usage_ratio		Memory usage as a ratio of maximum memory.
CPU load	bigtable.googleapis.com/cluster_cpu_load	bigtable	CPU load of a cluster.
Disk load	bigtable.googleapis.com/cluster_disk_load		Utilization of HDD disks in a cluster.
Storage utilization	bigtable.googleapis.com/cluster_storage_utilization		Storage used as a fraction of total storage capacity.
HDFS storage utilization	dataproc.googleapis.com/cluster/hdfs/storage_utilization	dataproc	The percentage of HDFS storage currently used.
Unhealthy HDFS blocks by status	dataproc.googleapis.com/hdfs/unhealthy_blocks		Indicates the number of unhealthy blocks inside the cluster.
Processes	agent.googleapis.com/processes/count_by_state	processes	Count of processes in the given state. Relevant for Linux only.
Process CPU	agent.googleapis.com/processes/cpu_time		Time taken by CPU to complete a given process.
TCP connections	agent.googleapis.com/processes/network	network	Current count of TCP connections.

Glassfish default checks and policies

Agent Client Collector provides the following default checks and policies for Glassfish monitoring.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Glassfish metrics policy

Type	Check	Description	Usage and usage example	Output

Metric	glassfish.metric-jvm-level	Retrieves the Glassfish server's JVM metrics.
		
		Requires basic authentication credentials.
			`-i, --instance Glassfish Monitoring Instance Name (required)`
			`-p, --password Glassfish password`
			`-P, --port Glassfish API port`
			`--ssl Enable secure connnection to Glassfish`
			`-u –username Glassfish username`
			
			Usage example:
			`metric-glassfish-jvm-level.rb {{if .labels.params_port}} -P {{.labels.params_port}} {{end}} -i {{.labels.params_glassfish_server_ins`
				`glassfish.jvm.garbage-collectors.Scavenge.Col 200 0 1652959788`

Metric	glassfish.metric-server-requests	Provides http-request metrics for all applications deployed on the Glassfish server.	`-i, --instance Glassfish Monitoring Instance Name`	`glassfish.http-service.server.request.C 200 0 1652959788`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Glassfish metrics policy (continued)

Type	Check	Description	Usage and usage example	Output

		Requires basic authentication credentials.	`(requir ed) -p, --password Glassfish password -P, --port Glassfish API port --ssl Enable secure connnect ion to Glassfish -u –username Glassfish username`
			
			Usage example:
			`metric-glassfish-server-requests.rb -i {{.labels.params_glassfish_server_ins {{if .labels.params_port}} -P {{.labels.params_port}} {{end}}`	

Metric	glassfish.metric-server-resources	Provides metrics of the resources deployed on the Glassfish server. Requires basic authentication credentials.	`-i, --instance Glassfish Monitor ing Instance Name (requir ed) -P, --port Glassfish API port -r --`	`glassfish.resources. {{PoolName}}.AverageCon 0 1652959936`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Glassfish metrics policy (continued)

Type	Check	Description	Usage and usage example	Output

			`resource_pool Resource Pool Name --ssl Enable secure connnection to Glassfish -u –username Glassfish username -p --password Glassfish password`
			
			Usage example:
			`metric-glassfish-server-resources.rb {{if .labels.params_port}} -P {{.labels.params_port}} {{end}} {{if .labels.params_resource_pool}} -r {{.labels.params_resource_pool}} {{end}} -i {{.labels.params_glassfish_server_ins`	

Metric	glassfish.metric-transaction-service	Provides metrics for all transactions on applications deployed on the Glassfish server. Requires basic authentication credentials.	`-i, --instance Glassfish Monitoring Instance Name (required) -P, --port Glassfish API port`	`glassfish.transaction-service.ActiveCount 0 1652959977`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Glassfish metrics policy (continued)

Type	Check	Description	Usage and usage example	Output
			`--ssl Enable secure connnection to Glassfish -u –username Glassfish username -p --password Glassfish password` Usage example: `metric-glassfish-transaction-service.rb {{if .labels.params_port}} -P {{.labels.params_port}} {{end}} -i {{.labels.params_glassfish_server_ins`	
Metric	glassfish.metrics-deployed-apps	Provides metric output of applications deployed on the Glassfish server. Requires basic authentication credentials.	`-a, --apps Application deployed on Glassfish server (required) -i, --instance Glassfish Monitoring Instance Name (required) -P, --port`	`glassfish.applications.{{Deployed Application}}.Activated 0 1652959665`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Glassfish metrics policy (continued)

Type	Check	Description	Usage and usage example	Output
			`Glassfish API port --ssl Enable secure connnection to Glassfish -u –username Glassfish username -p --password Glassfish password` Usage example: `metric-glassfish-deployed-applications.rb {{if .labels.params_port}} -P {{.labels.params_port}} {{end}} -a {{.labels.params_deployed_apps}} -i {{.labels.params_glassfish_server_ins`	
Metric	glassfish.metrics-deployment-lifecycle	Provides lifecycle metrics of the Glassfish server applications. Requires basic authentication credentials.	`metric-glassfish-deployment-lifecycle.rb (options) -i, --instance Glassfish Monitoring Instance Name (required) -p --password`	`glassfish.deployment.li 2 1653022649`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Glassfish metrics policy (continued)

Type	Check	Description	Usage and usage example	Output
			Glassfish password -P, --port Glassfish API port --ssl Enable secure connnection to Glassfish -u –username Glassfish username Usage example: `metric-glassfish-deployment-lifecycle.rb {{if .labels.params_port}} -P {{.labels.params_port}} {{end}} -i {{.labels.params_glassfish_server_ins`	

GlassFish metrics

The following table lists the metrics that are gathered as output from GlassFish checks. Entries indicated as **Featured metrics** are high-visibility metrics that are displayed in the Operator Workspace Metric tab after an alert is generated. These metrics provide the operator with additional information to help them further explore the specified issue.

glassfish.metrics-deployed-apps metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
glassfish.applications.{Deployed Application}.TotalServletsLoaded	Deployed Application	count	Total number of Servlets loaded so far.
glassfish.applications.{Deployed Application}.ServletProcessingTimes	Deployed Application	ms	Cumulative Servlet processing times.
glassfish.applications.{Deployed Application}.ActiveServletsLoaded	Deployed Application	count	Number of Servlets loaded.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

glassfish.metrics-deployed-apps metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
glassfish.applications.{Deployed Application}.ExpiredSessionsTotal (featured metric)	Deployed Application	count	Total number of sessions expired so far.
glassfish.applications.{Deployed Application}.PassivatedSessionsTotal	Deployed Application	count	Total number of sessions passivated so far.
glassfish.applications.{Deployed Application}.ActivatedSessionsTotal	Deployed Application	count	Total number of sessions activatedso far.
glassfish.applications.{Deployed Application}.SessionsTotal	Deployed Application	count	Total number of sessions created so far.
glassfish.applications.{Deployed Application}.RejectedSessionsTotal (featured metric)	Deployed Application	count	Total number of sessions rejected so far.
glassfish.applications.{Deployed Application}.PersistedSessionsTotal	Deployed Application	count	Total number of sessions persisted so far.
glassfish.applications.{Deployed Application}.ActiveSessions (featured metric)	Deployed Application	count	Number of active sessions.
glassfish.applications.{Deployed Application}.RequestCount	Deployed Application	count	Cumulative number of requests processed so far
glassfish.applications.{Deployed Application}.MaxTime (featured metric)	Deployed Application	ms	Longest response time for a request; not a cumulative value, but the largest response time from among the response times.
glassfish.applications.{Deployed Application}.ErrorCount (featured metric)	Deployed Application	count	Cumulative value of the error count, with error count representing the number of cases where the response code was greater than or equal to 400.
glassfish.applications.{Deployed Application}.ProcessingTime	Deployed Application	ms	Average request processing time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

glassfish.metrics-deployed-apps metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
glassfish.applications.{Deployed Application}.TotalJspCount	Deployed Application	count	Total number of JSP pages loaded so far.
glassfish.applications.{Deployed Application}.JspCount	Deployed Application	count	Number of active JSP pages.
glassfish.applications.{Deployed Application}.JspErrorCount (featured metric)	Deployed Application	count	Total number of errors triggered by JSP page invocations.
glassfish.applications.{Deployed Application}.JspReloadedCount	Deployed Application	count	Total number of reloaded JSP pages.

glassfish.metrics-deployment-lifecycle metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
glassfish.deployment.lifecycle.ActiveApplicationsDeployed (featured metric)		count	Total number of applications deployed so far.
glassfish.deployment.lifecycle.TotalApplicationsDeployed (featured metric)		count	Number of applications deployed.

glassfish.metric-server-requests metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
glassfish.http-service.server.request.Count200		count	Number of responses with a status code equal to 200.
glassfish.http-service.server.request.Count2xx		count	Number of responses with a status code in the 2xx range.
glassfish.http-service.server.request.Count302		count	Number of responses with a status code equal to 302.
glassfish.http-service.server.request.Count304		count	Number of responses with a status code equal to 304.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

glassfish.metric-server-requests metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
glassfish.http-service.server.request.Count3xx		count	Number of responses with a status code equal in the 3xx range.
glassfish.http-service.server.request.Count400		count	Number of responses with a status code equal to 400.
glassfish.http-service.server.request.Count401		count	Number of responses with a status code equal to 401.
glassfish.http-service.server.request.Count403		count	Number of responses with a status code equal to 403.
glassfish.http-service.server.request.Count404		count	Number of responses with a status code equal to 404.
glassfish.http-service.server.request.Count4xx		count	Number of responses with a status code equal in the 4xx range.
glassfish.http-service.server.request.Count503		count	Number of responses with a status code equal to 503.
glassfish.http-service.server.request.Count5xx		count	Number of responses with a status code equal in the 5xx range.
glassfish.http-service.server.request.MaxTime		ms	Longest response time for a request; not a cumulative value, but the largest response time from among the response times.
glassfish.http-service.server.request.CountBytesReceived (featured metric)		count	Number of bytes received.
glassfish.http-service.server.request.CountBytesTransmitted (featured metric)		count	Number of bytes transmitted.
glassfish.http-service.server.request.RequestCount (featured metric)		count	Cumulative number of requests processed so far.
glassfish.http-service.server.request.CountOpenConnections		count	Number of open connections.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

glassfish.metric-server-requests metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
glassfish.http-service.server.request.ProcessingTime (featured metric)		ms	Average request processing time.

glassfish.metric-jvm-level metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
glassfish.jvm.garbage-collectors.Scavenge.CollectionCount		count	Total number of collections that have occurred.
glassfish.jvm.garbage-collectors.Scavenge.CollectionTime		ms	Approximate accumulated collection elapsed time in milliseconds.
glassfish.jvm.garbage-collectors.MarkSweepCompact.CollectionCount		count	Total number of collections that have occurred.
glassfish.jvm.garbage-collectors.MarkSweepCompact.CollectionTime		ms	Approximate accumulated collection elapsed time in milliseconds.
glassfish.jvm.memory.CommittedHeapSize		bytes	Amount of memory in bytes that is committed for the Java virtual machine to use.
glassfish.jvm.memory.CommittedNonHeapSize		bytes	Amount of memory in bytes that is committed for the Java virtual machine to use.
glassfish.jvm.memory.InitHeapSize		bytes	Amount of memory in bytes that the Java virtual machine initially requests from the operating system for memory management.
glassfish.jvm.memory.InitNonHeapSize		bytes	Amount of memory in bytes that the Java virtual machine initially requests from the operating

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

glassfish.metric-jvm-level metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			system for memory management.
glassfish.jvm.memory.MaxHeapSize (featured metric)		bytes	Maximum amount of memory in bytes that can be used for memory management.
glassfish.jvm.memory.MaxNonHeapSize		bytes	Maximum amount of memory in bytes that can be used for memory management.
glassfish.jvm.memory.ObjectPendingFinalizationCount		Count	Approximate number of objects for which finalization is pending.
glassfish.jvm.memory.UsedHeapSize		bytes	Amount of used memory in bytes.
glassfish.jvm.memory.UsedNonHeapSize		bytes	Amount of used memory in bytes.

glassfish.metric-transaction-service metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
glassfish.transaction-service.ActiveCount (featured metric)		count	Provides the number of transactions that are currently active.
glassfish.transaction-service.CommittedCount (featured metric)		count	Provides the number of transactions that have been committed.
glassfish.transaction-service.RolledBackCount (featured metric)		count	Provides the number of transactions that have been rolled back.

glassfish.metric-server-resources metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
glassfis.resources.{PoolName}.AverageConnWaitTime	PoolName	ms	Average wait-time-duration per successful connection request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

glassfish.metric-server-resources metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
glassfis.resources.{PoolName}.ConnRequestWaitTime	PoolName	ms	The longest and shortest wait times of connection requests. The current value indicates the wait time of the last request that was serviced by the pool.
glassfis.resources.{PoolName}.NumConnAcquired	PoolName	count	Number of logical connections acquired from the pool.
glassfis.resources.{PoolName}.NumConnCreated	PoolName	count	The number of physical connections that were created since the last reset.
glassfis.resources.{PoolName}.NumConnDestroyed	PoolName	count	Number of physical connections that were destroyed since the last reset.
glassfis.resources.{PoolName}.NumConnfailedValidation	PoolName	count	The total number of connections in the connection pool that failed validation from the start time until the last sample time.
glassfis.resources.{PoolName}.NumConnFree	PoolName	count	The total number of free connections in the pool as of the last sampling.
glassfis.resources.{PoolName}.NumConnnotSuccessfullyMatched	PoolName	count	Number of connections rejected during matching.
glassfis.resources.{PoolName}.NumConnReleased	PoolName	count	Number of logical connections released to the pool.
glassfis.resources.{PoolName}.NumConnSuccessfullyMatched	PoolName	count	Number of connections successfully matched.
glassfis.resources.{PoolName}.NumConnTimedOut	PoolName	count	The total number of connections in the pool that timed out between the start time and the last sample time.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

glassfish.metric-server-resources metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
glassfis.resources.{PoolName}.NumConnUsed	PoolName	count	Provides connection usage statistics. The total number of connections that are currently being used, as well as information about the maximum number of connections that were used (the high water mark).
glassfis.resources.{PoolName}.NumPotentialConnLeak (featured metric)	PoolName	count	Number of potential connection leaks.
glassfis.resources.{PoolName}.WaitQueueLength (featured metric)	PoolName	count	Number of connection requests in the queue waiting to be serviced.

HAProxy default checks and policies

Agent Client Collector provides the following default checks and policies for HAProxy monitoring.

HAProxy events policy

Type	Check	Description	Usage	Output
Event	check-haproxy	Retrieves the details of the HAProxy load balancer to determine whether it is running.	`commonchecks check-haproxy (options) -h host host -P port Port on which the HAProxy server is running -A all services all services -q Path on which HAProxy Stats URI is`	`CheckHAProxy OK: UP: 50% of 4 // services, DOWN: backend/nginx1[L4CON], backend/BACKEND`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

HAProxy events policy (continued)

Type	Check	Description	Usage	Output
			configu red -use ssl ssl Usage example: check- haproxy.rb -h localhost -P 8080 -A true -q stats -use_ssl false	

HAProxy metrics policy

Type	Check	Description	Usage	Output
Metric	metrics-check-haproxy	Retrieves the HAProxy load balancer metrics to determine whether it is running.	commonche cks metrics-c heck-hapr oxy (options) -q host Path on which HAProxy Stats URI is configu red -P port Port on which the HAProxy server is running -c host host name Usage example: metrics- check- haproxy.rb -q stats	<hostname> .haproxy.f rontend.se ssion_curr ent 0 1652265 603 <hostname> .haproxy.f rontend.se ssion_to tal 0 1652265 603 <hostname> .haproxy.b ackend.ses sion_curr ent 0 1652265 603 <hostname> .haproxy.b ackend.ses sion_total 1 1652265 603

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

HAProxy metrics policy (continued)

Type	Check	Description	Usage	Output
			`-P 8080 -c localhost`	

HAProxy metrics

The following table lists the metrics that are gathered as output from HAProxy checks. Entries indicated as **Featured metrics** are high-visibility metrics that are displayed in the Operator Workspace Metric tab after an alert is generated. These metrics provide the operator with additional information to help them further explore the specified issue.

Front-end metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
haproxy.frontend.session_current (featured metric)		count	The current number of sessions being used to issue requests.
haproxy.frontend.session_total (featured metric)		count	Total number of sessions
haproxy.frontend.bytes_in (featured metric)		count	The total number of bytes recieved by the server in the last second from the client.
haproxy.frontend.bytes_out (featured metric)		count	The total number of bytes sent by the server in the last second.
haproxy.frontend.connection_errors (featured metric)		count	The number of requests that encountered an error trying to connect to a server.
haproxy.frontend.warning_retries		count	The number of times a connection to a server was retried.
haproxy.frontend.warning_redispatched		count	The number of times a request was redispatched to another server.
haproxy.frontend.response_1xx		count	HAProxy exposes the number of responses by HTTP status code - 1xx
haproxy.frontend.response_2xx		count	HAProxy exposes the number of responses

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Front-end metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			by HTTP status code - 2xx
haproxy.frontend.response_3xx		count	HAProxy exposes the number of responses by HTTP status code - 3xx
haproxy.frontend.response_4xx		count	HAProxy exposes the number of responses by HTTP status code - 4xx
haproxy.frontend.response_5xx		count	HAProxy exposes the number of responses by HTTP status code - 5xx
haproxy.frontend.response_other		count	HAProxy exposes the number of responses by non-HTTP application
haproxy.frontend.queue_time		count	The average queue time over the last 1024 requests.
haproxy.frontend.connect_time		count	The average connect time over the last 1024 requests.
haproxy.frontend.response_time (featured metric)		count	The response time to the client
haproxy.frontend.average_time (featured metric)		count	The average time taken for the sessions.

Back-end metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
haproxy.backend.session_current (featured metric)		count	The current number of sessions being used to issue requests.
haproxy.backend.session_total (featured metric)		count	Total number of sessions
haproxy.backend.bytes_in (featured metric)		count	The total number of bytes recieved by the server in the last second from the client.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Back-end metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
haproxy.backend.bytes_out (featured metric)		count	The total number of bytes sent by the server in the last second.
haproxy.backend.connection_errors (featured metric)		count	The number of requests that encountered an error trying to connect to a server.
haproxy.backend.warning_retries		count	The number of times a connection to a server was retried.
haproxy.backend.warning_redispatched		count	The number of times a request was redispatched to another server.
haproxy.backend.response_1xx		count	HAProxy exposes the number of responses by HTTP status code - 1xx
haproxy.backend.response_2xx		count	HAProxy exposes the number of responses by HTTP status code - 2xx
haproxy.backend.response_3xx		count	HAProxy exposes the number of responses by HTTP status code - 3xx
haproxy.backend.response_4xx		count	HAProxy exposes the number of responses by HTTP status code - 4xx
haproxy.backend.response_5xx		count	HAProxy exposes the number of responses by HTTP status code - 5xx
haproxy.backend.response_other		count	HAProxy exposes the number of responses by non-HTTP application
haproxy.backend.queue_time		count	The average queue time over the last 1024 requests.

Back-end metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
haproxy.backend.connect_time		count	The average connect time over the last 1024 requests.
haproxy.backend.response_time (featured metric)		count	The response time to the client
haproxy.backend.average_time (featured metric)		count	The average time taken for the sessions.
haproxy.backend.num_up		count	

HTTP default checks and policies

Agent Client Collector provides the following policies for HTTP health monitoring. Policies come with the checks specified in the tables below.

HTTP entry point events policy

Type	Check	Description	Usage and Usage Example	Output
Event	util.check-http-follow-redirect	Verifies that redirection links can be followed in a set number of requests.	Usage check-head-redirect.rb (options): • -A, --auth-first-only: Use basic auth on first request only. • -aws-access-key-id: AWS Access Key. Either set ENV["AWS_ACCESS_KEY_ID"] or provide it as an option on agent. • -r -aws-region: AWS Region (defaults to us-east-1). • --aws-secret-access-key: AWS Secret Access Key. Either set ENV["AWS_SECRET_ACCESS_KEY"] or provide it as an option on agent.	Check Head Redirect OK

HTTP entry point events policy (continued)

Type	Check	Description	Usage and Usage Example	Output
			• -R --redirect: Follow first <N> redirects • -g --get-redirects: Follow first <N> redirects with GET requests. • -s, --s3-config-bucket: S3 config bucket to get configuration. • -k, --s3-config-key: S3 config key to get configuration. • -u, --url: URL needs to be updated in `Monitoring HTTP Entrypoint/cmdb_ci_endpoint_http_list.do` for the CI. The Aws-region, aws-secret-key, aws-access-key ,s3-config, s3-config-key parameters are useful if you do not want to configure connection information in other check parameters. If a bucket and key have access to the environment in which the Sensu check executes in, provide an AWS key and token and the checks pull the specified

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

HTTP entry point events policy (continued)

Type	Check	Description	Usage and Usage Example	Output
			JSON file from S3 and merge the JSON config into the current check configuration. Usage example: `command: check-head-redirect.rb -R 10 -u 'https://servicenow.com'`	
Event	util.check-http-response	Verifies URL response time and raises a CRITICAL/WARNING event if elapsed time exceeds provided CRITICAL/WARNING thresholds. Otherwise, it raises an OK event.	Usage: check-head-redirect.rb (options) • -R, --redirect: Follow first <N> redirects. • -w --timeout_warning: Set the timeout threshold for warning in milliseconds. • -c --timeout_critical: Set the timeout threshold for critical in milliseconds. • -u, --url URL needs to be updated in `Monitoring HTTP Entrypoint/cmdb_ci_endpoint_http_list.do` for the CI. Usage example: `command: check-head-redirect.rb -R 10 -u 'https://servicenow.com'`	Check Head Redirect OK

HTTP entry point events policy (continued)

Type	Check	Description	Usage and Usage Example	Output
			`-w 3000 -c 5000`	

HTTP entry point metrics policy

Type	Check	Description	Usage and Usage Example	Output
Metric	util.metrics-http-curl	Retrieves metrics on HTTP endpoints using curl. This check requires a proxy agent.	Usage: • -a, --curl_args "CURL ARGS": Additional arguments to pass to curl. • s, --scheme SCHEME: Metric naming scheme, text to append to metric (Default: hostname). • -u, --url: URL needs to be updated in `Monitoring HTTP Entrypoint/cmdb_ci_endpoint_http_list.do` for the CI. Usage example: `metrics-curl.rb -u myURL.com -a -Lk`	Check run successfully. Output: ws10.curl_timings.time_total 0.219622 1642749209 ws10.curl_timings.time_namelooku 0.145494 1642749209 ws10.curl_timings.time_connect 0.151103 1642749209 ws10.curl_timings.time_pretransfe 0.168569 1642749209 ws10.curl_timings.time_redirect 0.095899 1642749209 ws10.curl_timings.time_starttransfe 0.219351 1642749209 ws10.curl_timings.http_code 200 1642749209

HTTP entry point metrics

The following table lists the metrics that are gathered as output from HTTP entry point checks. Entries indicated as **Featured metrics** are high-visibility metrics that are displayed in the Operator Workspace Metric tab after an alert is generated. These metrics provide the operator with additional information to help them further explore the specified issue.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

HTTP entry point metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
http_code (featured metric)			Status code of the request.
time_total (featured metric)		milliseconds	The total time the operation lasted.
time_namelookup (featured metric)		seconds	Time to resolve the name in the URL.
time_connect (featured metric)		seconds	Time to complete the connection to the remote host or proxy.
time_pretransfer (featured metric)		seconds	Time between start and beginning of file transfer. Includes all pre-transfer commands and negotiations.
time_starttransfer (featured metric)		seconds	Time between the start and the transfer of the first byte. Includes *time_pretransfer* and the time the server used to calculate the result.
time_redirect (featured metric)		seconds	Time for all redirection steps including: • name lookup • connect • pretransfer • transfer Shows the complete execution time for multiple redirections.

HTTP response code check

Agent Client Collector provides the following additional check for HTTP response code. This check is not associated with any policy.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

HTTP response code check

Type	Name	Description	Usage and usage example	Output

Event	util.check-http-response-code	Raises a critical event if the URL response code doesn't match the regex.
		
		Pass credentials (username and password) using secure parameters.
			`-u, --url URL needs to be updated in the Monitoring HTTP Entrypoint/cmdb_ci_endpoint_http_list.do for the CI`
			`-r, --response-code Regex string to match the response code. Otherwise, a critical event is raised. Default: 200`
			`-f, --follow_redirects Follows redirect URLs`
			
			Usage example:
			`command: check-response-code.rb -u 'https://servicenow.com' -r 2.. -f`
				`CheckResponseCode OK : URL is in OK state. HTTP Response code is 200, matches regex`

Internet Information Services (IIS) metrics

The following table lists the metrics that are gathered as output from IIS checks. Entries indicated as **Featured metrics** are high-visibility metrics that are displayed in the Operator Workspace Metric tab after an alert is generated. These metrics provide the operator with additional information to help them further explore the specified issue.

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
iis._Total.Web_Service(_Total).Current_Connections (featured metric)		count	Total number of current connections to IIS.
iis._Total.Web_Service(_Total).Total_Get_Requests (featured metric)		count	Total of HTTP GET requests received by the IIS server.
iis._Total.Web_Service(_Total).Total_Post_Requests (featured metric)		count	Total of HTTP POST requests received by the IIS server.
iis._Total.Web_Service(_Total).Get_Requests/sec (featured metric)		count per second	Rate of all HTTP GET requests received by the IIS server.
iis._Total.Web_Service(_Total).Post_Requests/sec (featured metric)		count per second	Rate of all HTTP POST requests received by the IIS server.

Linux default checks and policies

Agent Client Collector provides the following default checks and policies for Linux Metrics monitoring.

Linux monitoring metrics checks

Linux metrics policy

Check	Metric Name	Resource	Description	Units	Featured Metric	Anomaly Detection
os.linux.metrics.process-usage	proc.acc.running	process-name	Number of processes running with this name(acc)	count		
	proc.acc.cpuPercent	process-name	Percentage of cpu taken by the process.	percent		
	proc.acc.memPercent	process-name	Percentage of memory taken by the process.	percent		
os.linux.metrics.reboot-count-today	reboot.count.today	empty	Number of reboot done on today	count		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Linux metrics policy (continued)

Check	Metric Name	Resource	Description	Units	Featured Metric	Anomaly Detection
os.linux.metrics-system-cpu	cpu.total.user	total	Normal processes executing in user mode; cpu.total.user is the total of the cpuN.user metrics.	count		
	cpu.total.nice	total	Niced processes executing in user mode; cpu.total.nice is the total of the cpuN.nice metrics.	count		
	cpu.total.system	total	Time the CPU spent running the kernel; cpu.total.system is the total of the cpuN.system metrics.	sec		
	cpu.total.idle	total	Total time the CPU spent in an idle state.; cpu.total.idle is the total of the cpuN.idle metrics.	sec		
	cpu.total.iowait	total	Total time the CPU spent waiting for IO operations to complete.;	sec		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Linux metrics policy (continued)

Check	Metric Name	Resource	Description	Units	Featured Metric	Anomaly Detection
			cpu.total.iowait is the total of the cpuN.iowait metrics.			
	cpu.total.irq	total	Total time that the processor is spending on handling Interrupts.; cpu.total.irq is the total of the cpuN.irq metrics.	sec		
	cpu.total.softirq	total	Time spent on servicing soft interrupt requests; cpu.total.softirq is the total of the cpuN.softirq metrics.	sec		
	cpu.total.steal	total	Total time the virtual CPU spent waiting for the hypervisor to service another virtual CPU. Only applies to virtual machines.	sec		
	cpu.total.guest	total	Total time the CPU spent running the virtual processor. Only	sec

	vmstat.balloon_inflate	empty				
	vmstat.balloon_ deflate	empty				
	vmstat.balloon_ migrate	empty				
os.linux.metrics-process-status	proc.<process>.VmSize	process-name	The total amount of virtual memory used by the process	KB		
	proc.<process>.VmRSS	process-name	The non-swapped physical memory a process has used	KB		
	proc.<process>.VmSwap	process-name	The total amount of swap space used.	KB		

Linux network monitoring checks

Note: When upgrading from an earlier version, manually add the checks in this table to the Linux metrics policy.

Linux metrics policy

Type	Check	Description	Usage and usage example	Metrics collected	Featured Metric
Metric	os.linux.metrics-network-interface	Retrieves all network interface related metrics for Linux servers.	Usage: • -x, excludeinterface: List of interfaces to exclude	• rxBytes (featured metric) • rxPackets (featured metric) • rxErrors	yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Linux metrics policy (continued)

Type	Check	Description	Usage and usage example	Metrics collected	Featured Metric
			(comma separated) • -i, includeinterface: List of interfaces to include (comma separated) • -I, includeinterfaceregex: Regex matching interfaces to include • -X, excludeinterfaceregex: Regex matching interfaces to exclude Usage example: `command: metrics-network-interface.rb`	• rxDrops (featured metric) • rxFifo • rxFrame • rxCompressed • rxMulticast • rxBytes (featured metric) • rxPackets (featured metric) • rxErrors • rxDrops (featured metric) • rxFifo • rxColls • rxCarrier • rxCompressed	
Metric	os.linux.metrics-netstat-tcp	Retrieves metrics on TCP socket states from netstat. Useful on high-traffic web or proxy servers with large numbers of short-lived TCP connections coming and going.	Usage: • -p, port: The port from which you want to receive metrics. Value range = 1-65535. • -t, type: The port type from which to receive metrics. Values=local or remote. Default = local	• tcp.UNKNOWN • tcp.ESTABLISHED • tcp.SYN_SENT • tcp.SYN_RECV • tcp.FIN_WAIT1 • tcp.FIN_WAIT2 • tcp.TIME_WAIT • tcp.CLOSE • tcp.CLOSE_WAIT • tcp.LAST_ACK • tcp.LISTEN • tcp.CLOSING	no

Linux metrics policy (continued)

Type	Check	Description	Usage and usage example	Metrics collected	Featured Metric
			• -d, disabletcp6: Disables the tcp6 check. Enter a value to set disabletcp6 = true. Usage example: `metrics-netstat-tcp.rb`		

Linux metrics

The following table lists the metrics that are gathered as output from Linux checks. Entries indicated as **Featured metrics** are high-visibility metrics that are displayed in the Operator Workspace Metric tab after an alert is generated. These metrics provide the operator with additional information to help them further explore the specified issue.

os.linux.metrics-process-usage metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
proc.acc.running			Number of processes running with this name (acc).
proc.acc.cpuPercent			Percentage of CPU taken by the process.
proc.acc.memPercent			Percentage of memory taken by the process.

os.linux.metrics-reboot-count-today metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
reboot.count.today			Number of reboots today.

© 2026 ServiceNow, Inc. All rights reserved.

os.linux.metrics-system-cpu metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
cpu.total.user			Normal processes executing in user mode; *cpu.total.user* is the total of the *cpuN.user* metrics.
cpu.total.nice			Niced processes executing in user mode; *cpu.total.nice* is the total of the *cpuN.nice* metrics.
cpu.total.system			Time the CPU spent running the kernel; *cpu.total.system* is the total of the *cpuN.system* metrics.
cpu.total.idle			Total time the CPU spent in an idle state; *cpu.total.idle* is the total of the *cpuN.idle* metrics.
cpu.total.iowait			Total time the CPU spent waiting for IO operations to complete; *cpu.total.iowait* is the total of the *cpuN.iowait* metrics.
cpu.total.irq			Total time that the processor is spending on Interrupts; *cpu.total.irq* is the total of the *cpuN.irq* metrics.
cpu.total.softirq			Time spent servicing soft interrupt requests; *cpu.total.softirq* is the total of the *cpuN.softirq* metrics.
cpu.total.steal			Total time the virtual CPU spent waiting for the Hypervisor to

os.linux.metrics-system-cpu metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			service another virtual CPU. Applies only to virtual machines.
cpu.total.guest			Total time the CPU spent running the virtual processor. Applies only to Hypervisors.
cpu.total.guest_nice			Total time the CPU spent running as nice guest OS; *cpu.total.guset_nice* is the total of the *cpuN.guest_nice* metrics
cpu.<cpu-core>.user			Time spent with normal processing in user mode.
cpu.<cpu-core>.nice			Time spent with niced processing in user mode.
cpu.<cpu-core>.system			Time spent running in kernel mode.
cpu.<cpu-core>.idle			Time spent idle.
cpu.<cpu-core>.iowait			Time spent waiting for I/O to complete. Also considered idle time.
cpu.<cpu-core>.irq			Time spent serving hardware interrupts.
cpu.<cpu-core>.softirq			Time spent serving software interrupts.
cpu.<cpu-core>.steal			Time stolen by other operating systems running in a virtual environment.
cpu.<cpu-core>.guest			Time spent running a virtual CPU or guest OS under the control of the kernel.
cpu.<cpu-core>.guest_nice			Total time the CPU spent running as nice guest OS.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

os.linux.metrics-system-cpu metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
cpu.intr			Interrupts serviced since boot time.
cpu.ctxt			Total number of context switches across all CPUs.
cpu.btime			Boot time.
cpu.processes			The number of processes and threads created, which includes (but is not limited to) those created by calls to the fork() and clone() system calls.
cpu.procs_running			The total number of processes running on all CPUs.
cpu.procs_blocked			The number of processes currently blocked and waiting for I/O to complete.
cpu.cpu_count			The number of CPUs on the system.
cpu.<cpu-core>.cores			The number of CPU cores.

os.linux.metrics-system-cpu-load metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
load_avg.one (featured metric)			The average system load over one minute.
load_avg.five (featured metric)			The average system load over five minutes.
load_avg.fifteen (featured metric)			The average system load over fifteen minutes.
load_avg.norm.one			The average system load over one minute normalized by the number of CPUs.

os.linux.metrics-system-cpu-load metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
load_avg.norm.five			The average system load over five minutes normalized by the number of CPUs.
load_avg.norm.fifteen			The average system load over fifteen minutes normalized by the number of CPUs.

os.linux.metrics-system-cpu-percentage metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
cpu.avgutilization_percentage			The average percentage of CPU used.
cpu.user_percentage (featured metric)			Percentage of time total CPU was used by normal processes in user mode.
cpu.nice_percentage (featured metric)			Percentage of time all CPUs used by niced processes in user mode.
cpu.system_percentage (featured metric)			Percentage of time the CPU spent running the kernel.
cpu.idle_percentage (featured metric)			Percentage of time all CPIUs were idle.
cpu.iowait_percentage (featured metric)			Percentage of time all CPUs waited for I/O to complete.
cpu.irq_percentage (featured metric)			Percentage of time all CPUs serviced interrupts.
cpu.softirq_percentage (featured metric)			Percentage of time all CPIs serviced software interrupts.
cpu.steal_percentage (featured metric)			Percentage of time all CPUs serviced virtual-host operating systems.

os.linux.metrics-system-cpu-percentage metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
cpu.guest_percentage (featured metric)			Percentage of time all CPUs serviced guest operating systems.

os.linux.metrics-system-disk metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
disk.<disk-name>.reads (featured metric)			Total number of reads completed successfully.
disk.<disk-name>.readsMerged			Total number of reads merged.
disk.<disk-name>.sectorsRead			Total number of sectors read successfully.
disk.<disk-name>.readTime		milliseconds	Total number of milliseconds spent by all reads.
disk.<disk-name>.writes (featured metric)			Total number of writes completed successfully.
disk.<disk-name>.writesMerged			Total number of writes merged.
disk.<disk-name>.sectorsWritten			Total number of sectors written successfully.
disk.<disk-name>.writeTime		milliseconds	Total number of milliseconds spent by all writes.
disk.<disk-name>.ioInProgress			Total number of I/Os currently in progress.
disk.<disk-name>.ioTime (featured metric)			Total time spent on I/Os.
disk.<disk-name>.ioTimeWeighted			Total time spent on I/Os. This can provide a measure of both I/O completion time and the backlog that might be accumulating.

os.linux.metrics-system-disk-capacity metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
disk.<file-system-name>.total			The total size of the file system.
disk.<file-system-name>.used			The total amount of space allocated to existing files in the file system.
disk.<file-system-name>.avail			The total amount of space available within the file system.
disk.<file-system-name>.used_percentage			The percentage of the available space that is currently allocated to all files on the file system.
disk.<file-system-name>.itotal			The total number of *inodes* on the file system.
disk.<file-system-name>.iused			The number of used *inodes*.
disk.<file-system-name>.iavail			The number of free (unused) *inodes*.
disk.<file-system-name>.iused_percentage			The percentage of used *inodes*.

os.linux.metrics-system-disk-usage metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
disk_usage.<disk>.total			Total amount of space available on the disk.
disk_usage.<disk>.used			Total amount of space used in the disk.
disk_usage.<disk>.avail			Total amount of space available on the disk.
disk_usage.<disk>.used_percentage (featured metric)			The percentage of space used on the disk.

os.linux.metrics-system-memory metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
memory.total			Total usable RAM.
memory.free			Total free RAM.
memory.available			An estimate of how much memory is available for starting new applications without swapping.
memory.buffers			Temporary storage used for raw disk blocks.
memory.cached			In-memory cache for files read from disk (the page cache). Does not include *mem_swapcached*.
memory.swapTotal (featured metric)			Total amount of swap space available.
memory.swapFree (featured metric)			Amount of swap space that is currently unused.
memory.dirty			Memory which is waiting to be written back to the disk.
memory.swapUsed (featured metric)			The amount of swap space in use.
memory.used			The amount of RAM in use.
memory.usedWOBuffersCaches			The amount of memory in use.
memory.freeWOBuffersCaches			Value of *MemAvailable* from */proc/meminfo* if present, but falls back to free + buffered + cached memory if not.
memory.swapUsedPercentage			Percent of swap space used.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

os.linux.metrics-system-memory-percent metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
memory_percent.free (featured metric)			Percentage of free RAM.
memory_percent.available (featured metric)			Percentage of memory available
memory_percent.buffers (featured metric)			Percentage of memory used for raw disk blocks.
memory_percent.cached (featured metric)			Percentage of memory used with in-memory cache for files read from disk.
memory_percent.dirty (featured metric)			Percentage of memory waiting to be written back to the disk.
memory_percent.swapUsed (featured metric)			Percentage of swap space used.
memory_percent.usedWOBuffersCaches (featured metric)			Percentage of memory used.
memory_percent.freeWOBuffersCaches (featured metric)			Percentage of memory available.

os.linux.metrics-system-uptime metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
system.uptime(sec)			The amount of time the system has been working and available.

os.linux.metrics-memory-vmstat metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
vmstat.nr_free_pages			Pages that are currently unused by the system.
vmstat.nr_alloc_batch			Pages allocated to other domains due to insufficient memory in each domain of each

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

os.linux.metrics-memory-vmstat metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			non-uniform memory access (NUMA) node.
vmstat.nr_inactive_anon			Memory pages in each domain of each NUMA node that have not been accessed.
vmstat.nr_active_anon			Anonymous virtual memory pages that have been recently used.
vmstat.nr_inactive_file			The memory page corresponding to the file that has not been accessed in each domain of each NUMA.
vmstat.nr_active_file			The memory page corresponding to the file that has been recently accessed.
vmstat.nr_unevictable			The number of pages in the unevictable (non-)LRU list.
vmstat.nr_mlock			Pages mapped into a VM_LOCKED VMA that are a class of unevictable pages.
vmstat.nr_anon_pages			Memory mapped pages that are not part of a file.
vmstat.nr_mapped			The number of memory mapped pages.
vmstat.nr_file_pages			
vmstat.nr_dirty			Pages waiting to be written to disk.
vmstat.nr_writeback			Pages currently being written to disk.
vmstat.nr_slab_reclaimable			Pages from the kernel slab memory usage that can be reclaimed.
vmstat.nr_slab_unreclaimable			Pages from the kernel slab memory

os.linux.metrics-memory-vmstat metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			usage that cannot be reclaimed.
vmstat.nr_page_table_pages			Pages allocated to page tables.
vmstat.nr_kernel_stack			Amount of memory allocated to kernel stacks.
vmstat.nr_unstable			The number of unstable pages in each domain of each NUMA node.
vmstat.nr_bounce			
vmstat.nr_vmscan_write			The number of dirty pages written back during a scan of LRUs.
vmstat.nr_vmscan_immediate_reclaim			
vmstat.nr_writeback_temp			
vmstat.nr_isolated_anon			The number of anonymous memory pages isolated in each domain of each NUMA node.
vmstat.nr_isolated_file			The number of file storage pages isolated in each domain of each NUMA node.
vmstat.nr_shmem			The number of shared memory pages.
vmstat.nr_dirtied			The number of dirty pages in each domain of each NUMA node.
vmstat.nr_written			
vmstat.numa_hit			The number of pages that were successfully allocated to this node.
vmstat.numa_miss			The number of pages that were allocated to this node because of low memory on the intended node.

os.linux.metrics-memory-vmstat metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
vmstat.numa_foreign			The number of pages initially intended for this node that were allocated to another node.
vmstat.numa_interleave			The number of interleave policy pages successfully allocated to this node.
vmstat.numa_local			The number of pages successfully allocated on this node by a process on this node.
vmstat.numa_other			The number of pages allocated on this node by a process on another node.
vmstat.workingset_refault			
vmstat.workingset_activate			
vmstat.workingset_nodereclaim			
vmstat.nr_anon_transparent_hugepages			
vmstat.nr_free_cma			Free continuous memory allocator pages in each domain of each NUMA.
vmstat.nr_dirty_threshold			
vmstat.nr_dirty_background_threshold			
vmstat.pgpgin			The number of pages brought in from disk.
vmstat.pgpgout			The number of pages written out to disk.
vmstat.pswpin			The number of pages brought in from swap space.
vmstat.pswpout			The number of pages swapped out into swap space.
vmstat.pgalloc_dma			
vmstat.pgalloc_dma32			
vmstat.pgalloc_normal			

© 2026 ServiceNow, Inc. All rights reserved.

os.linux.metrics-memory-vmstat metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
vmstat.pgalloc_movable			
vmstat.pgfree			The number of pages free since the last boot.
vmstat.pgactivate			Number of page activations since the last boot.
vmstat.pgdeactivate			Number of page deactivations since the last boot.
vmstat.pgfault			Minor faults since the last boot.
vmstat.pgmajfault			Major faults since the last boot.
vmstat.pglazyfreed			
vmstat.pgrefill_dma			
vmstat.pgrefill_dma32			
vmstat.pgrefill_normal			Number of page refills since the last boot.
vmstat.pgrefill_movable			
vmstat.pgsteal_kswapd_dma			
vmstat.pgsteal_kswapd_dma32			
vmstat.pgsteal_kswapd_normal			
vmstat.pgsteal_kswapd_movable			
vmstat.pgsteal_direct_dma			
vmstat.pgsteal_direct_dma32			
vmstat.pgsteal_direct_normal			
vmstat.pgsteal_direct_movable			
vmstat.pgscan_kswapd_dma			
vmstat.pgscan_kswapd_dma32			
vmstat.pgscan_kswapd_normal			Number of pages scanned by *kswapd* since boot.
vmstat.pgscan_kswapd_movable			
vmstat.pgscan_direct_dma			
vmstat.pgscan_direct_dma32			

© 2026 ServiceNow, Inc. All rights reserved.

os.linux.metrics-memory-vmstat metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
vmstat.pgscan_direct_normal			Number of pages reclaimed since boot.
vmstat.pgscan_direct_movable			
vmstat.pgscan_direct_throttle			
vmstat.zone_reclaim_failed			
vmstat.pginodesteal			
vmstat.slabs_scanned			
vmstat.kswapd_inodesteal			
vmstat.kswapd_low_wmark_hit_quickly			
vmstat.kswapd_high_wmark_hit_quickly			
vmstat.pageoutrun			Number of times *kswapd* called page reclaim.
vmstat.allocstall			Number of times page reclaim was called directly (low memory).
vmstat.pgrotated			
vmstat.drop_pagecache			
vmstat.drop_slab			
vmstat.numa_pte_updates			
vmstat.numa_huge_pte_updates			
vmstat.numa_hint_faults			
vmstat.numa_hint_faults_local			
vmstat.numa_pages_migrated			
vmstat.pgmigrate_success			
vmstat.pgmigrate_fail			
vmstat.compact_migrate_scanned			
vmstat.compact_free_scanned			
vmstat.compact_isolated			
vmstat.compact_stall			The number of times a process stalls when running memory compaction so that a huge page is free for use.

os.linux.metrics-memory-vmstat metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
vmstat.compact_fail			The number of times the system attempted to compact memory but failed.
vmstat.compact_success			The number of times the system compacted memory and freed a huge page for use.
vmstat.htlb_buddy_alloc_success			
vmstat.htlb_buddy_alloc_fail			
vmstat.unevictable_pgs_culled			
vmstat.unevictable_pgs_scanned			
vmstat.unevictable_pgs_rescued			
vmstat.unevictable_pgs_mlocked			
vmstat.unevictable_pgs_munlocked			
vmstat.unevictable_pgs_cleared			
vmstat.unevictable_pgs_stranded			
vmstat.thp_fault_alloc			The number of huge pages successfully allocated to handle a page fault.
vmstat.thp_fault_fallback			The number of page fault fails to allocate a huge page before falling back to using small pages.
vmstat.thp_collapse_alloc			The number of pages collapsed into one huge page with the successful allocation of a new huge page to store the data.
vmstat.thp_collapse_alloc_failed			The number of pages collapsed into one huge page but failed allocation.
vmstat.thp_split			The number of base pages to split from a huge page.

os.linux.metrics-memory-vmstat metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
vmstat.thp_zero_page_alloc			The number of successful allocations of huge zero pages.
vmstat.thp_zero_page_alloc_failed			The number of times the kernel failed to allocate a huge zero page and falls back to using small pages.
vmstat.balloon_inflate			
vmstat.balloon_deflate			
vmstat.balloon_migrate			

os.linux.metrics-process-status metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
proc.<process>.VmSize			The total amount of virtual memory used by the process.
proc.<process>.VmRSS			The non-swapped physical memory used by a process.
proc.<process>.VmSwap			The total amount of swap space used.

MongoDB default checks and policies

Agent Client Collector provides the following policies for MongoDB health monitoring. Policies come with the checks specified in the indicated table. Policies and checks are available for both Windows and Linux.

MongoDB Events

Type	Check	Description	Usage	Command	Output
Event	app.mongodb.check-mongodb-alive	Monitors whether the MongoDB server is alive and creating alerts for the MongoDB server health status.	`commoncheck check-mongodb-alive -H db_host -p db_port` Where:	`commoncheck check-mongodb -p {{.labels.port}} -H {{.labels.host}}`	`Check mongodb Alive OK: Indicates that the server is in good health`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MongoDB Events (continued)

Type	Check	Description	Usage	Command	Output
			• `db_host` = Host where server is running. • `db_port` = Port to connect to the MongoDB server. Usage example: `command: commonchecks check-mongodb-alive -H 10.***.***.*** -p 27017`		
Event	app.mongodb.check-mongodb-metrics	Creates alerts for any of the MongoDB metrics, based on the threshold limit. To trigger the alerts for any MongoDB server metric, pass the whole metric name in the parameter.	`commonchecks check-mongodb-metrics -H Hostname -p port -w warning -c critical -d database -m MetricName` Where: • `Hostname` = Host where server is running. • `port` = Port to connect to the MongoDB server. • `warning` = Warning	`commonchecks check-mongodb-metrics -c {{.labels.p -d {{.labels.params_database}} -w {{.labels.params_warning}} -H {{.labels.params_host}} -p {{.labels.params_port}} -m {{.labels.params_metric}}`	`Check mongodb Metrics OK: Indicates that the mongodb.connection.cu value is within the acceptable threshold`

MongoDB Events (continued)

Type	Check	Description	Usage	Command	Output
			threshold value. • `critical` = Critical threshold value. • `database` = Database name. • `MetricName` = Specific metric to monitor. Usage example: `command: commonchecks check-mongodb-alive -H 10.***.***.*** -p 27017`		

MongoDB Metrics

Type	Check	Description	Usage	Command	Output

Metric	app.mongodb.metrics-mongodb	Retrieves metrics of the MongoDB server and all databases.
		
		Sample metrics:
		• `mongodb.connections` : Incoming connections
		• `mongodb.locks.Database` : Intent Exclusive lock mode
		• `mongodb.locks.Database.acquireCount_X` : Exclusive lock mode
			`commoncheck check-mongodb`
			
			Where:
			• `host` = Hostname where the MongoDB server is running.
			• `port` = Port to connect to the MongoDB server.
			• `database` = Database name.
				`commoncheck metrics-mongodb -p {{.labels.params_port}} -H {{.labels.params_host}} -d {{.labels.params_database}}`	`commoncheck<hostname>.mongodb.co`
					`20632`
					`1639498004`
					
					`mongodb.metrics.totalCreated:`
					
					`mongodb.locks.Database.acquireCount_IX`
					
					`mongodb.locks.Database.acquireCount_X`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MongoDB Metrics (continued)

Type	Check	Description	Usage	Command	Output
		• `mongodb.locks.Database.acquireCount_IS` : Intent shared lock mode			

MongoDB metrics

The following table lists the metrics that are gathered as output from MongoDB checks. Entries indicated as **Featured metrics** are high-visibility metrics that are displayed in the Operator Workspace Metric tab after an alert is generated. These metrics provide the operator with additional information to help them further explore the specified issue.

metrics-mongodb metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
mongodb.asserts.msg (featured metric)		count	Number of message assertions raised since the MongoDB process started. Examine the log file for more information about these messages.
mongodb.asserts.regular (featured metric)		count	Number of regular assertions raised since the MongoDB process started. Examine the log file for more information about these messages.
mongodb.asserts.rollovers		count	Number of times that the rollover counters have rolled over since the last time the MongoDB process started.
mongodb.asserts.tripwire			Number of tripwire assertions raised since the MongoDB process started.
mongodb.asserts.user		count	Number of "user asserts" that occurred since the last time the MongoDB process started.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

metrics-mongodb metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
mongodb.asserts.warning (featured metric)		count	Number of warnings raised since the MongoDB process started.
mongodb.connections.available		count	Number of unused incoming connections available.
mongodb.connections.current		count	Number of incoming connections from clients to the database server.
mongodb.connections.totalCreated		count	Count of all incoming connections created to the server.
mongodb.cursor.open.noTimeout		count	Number of open cursors with the option *DBQuery.Option.noTimeout* set to prevent timeout after a period of inactivity.
mongodb.cursor.open.pinned		count	Number of "pinned" open cursors.
mongodb.cursor.open.total (featured metric)		count	Number of cursors that MongoDB is maintaining for clients. Because MongoDB exhausts unused cursors, typically this value is small or zero. However, if there is a queue, stale tailable cursors, or a large number of operations, this value may increase.
mongodb.cursor.timedOut		count	Total number of cursors that have timed out since the server process started.
mongodb.databaseSizes.avgObjSize	admin	bytes	Average size of each document in bytes.
mongodb.databaseSizes.avgObjSize	config	bytes	Average size of each document in bytes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

metrics-mongodb metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
mongodb.databaseSizes.avgObjSize	local	bytes	Average size of each document in bytes.
mongodb.databaseSizes.collections	admin	count	Number of collections in the database.
mongodb.databaseSizes.collections	config	count	Number of collections in the database.
mongodb.databaseSizes.collections	local	count	Number of collections in the database.
mongodb.databaseSizes.dataSize	admin	bytes	Total size of the uncompressed data held in the database. The *dataSize* decreases when you remove documents. For databases using the *WiredTiger* storage engine, *dataSize* may be larger than *storageSize* if compression is enabled. The *dataSize* decreases when documents shrink.
mongodb.databaseSizes.dataSize	config	bytes	Total size of the uncompressed data held in the database.
mongodb.databaseSizes.dataSize	local	bytes	Total size of the uncompressed data held in the database.
mongodb.databaseSizes.indexes	admin	count	Total number of indexes across all collections in the database.
mongodb.databaseSizes.indexes	config	count	Total number of indexes across all collections in the database.
mongodb.databaseSizes.indexes	local	count	Total number of indexes across all collections in the database.
mongodb.databaseSizes.indexSize	admin	bytes	Sum of the space allocated to all

metrics-mongodb metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			indexes in the database, including free index space.
mongodb.databaseSizes.indexSize	config	bytes	Sum of the space allocated to all indexes in the database, including free index space.
mongodb.databaseSizes.indexSize	local	bytes	Sum of the space allocated to all indexes in the database, including free index space.
mongodb.databaseSizes.objects	admin	count	Number of objects (specifically, documents) in the database across all collections.
mongodb.databaseSizes.objects	config	count	Number of objects (specifically, documents) in the database across all collections.
mongodb.databaseSizes.objects	local	count	Number of objects (specifically, documents) in the database across all collections.
mongodb.databaseSizes.storageSize	admin	bytes	This value does not decrease as you remove or shrink documents. This value may be smaller than *`dataSize`* for databases using the *`WiredTiger`* storage engine with compression enabled. *`storageSize`* does not include space allocated to indexes. See *`indexSize`* for the total index size.
mongodb.databaseSizes.storageSize	config	bytes	Sum of the space allocated to all collections in the database for

metrics-mongodb metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			document storage, including free space.
mongodb.databaseSizes.total	totalStorageSize	bytes	Sum of the space allocated to all collections in the database for document storage, including free space.
mongodb.globalLock.activeClients.readers (featured metric)		count	Number of active client connections performing read operations.
mongodb.globalLock.activeClients.total		count	Total number of internal client connections to the database, including system threads as well as queued readers and writers. This metric will be higher than the total of *activeClients.readers* and *activeClients.writers* due to the inclusion of system threads.
mongodb.globalLock.activeClients.writers (featured metric)		count	Number of active client connections performing write operations.
mongodb.globalLock.currentQueue.readers (featured metric)		count	Number of operations that are currently queued and waiting for the read lock. A consistently small read queue, particularly of shorter operations, is not a cause for concern.
mongodb.globalLock.currentQueue.total		count	Total number of operations queued waiting for the lock (i.e., the sum of *globalLock.currentQueue.rea* and *globalLock.currentQueue.wri* A consistently small

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

metrics-mongodb metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			queue, particularly of shorter operations, is not a cause for concern. The *globalLock.activeClients* readers and writers information provides context for this data.
mongodb.globalLock.currentQueue.writers (featured metric)		count	Number of operations that are currently queued and waiting for the write lock. A consistently small write queue, particularly of shorter operations, is not a cause for concern.
mongodb.globalLock.totalTime		microseconds	Time, in microseconds, since the database last started and created the *globalLock*. This is approximately equivalent to the total server uptime.
mongodb.locks.Collection.acquireCount_r		count	Number of times the collection lock was acquired in the Intent Shared (IS) lock mode.
mongodb.locks.Collection.acquireCount_w		count	Number of times the collection lock was acquired in the Intent Exclusive (IX) lock mode.
mongodb.locks.Collection.acquireCount_W		count	Number of times the collection lock was acquired in the Exclusive (X) lock mode.
mongodb.locks.Database.acquireCount_r		count	Number of times the database lock was acquired in the Intent Shared (IS) lock mode.
mongodb.locks.Database.acquireCount_w		count	Number of times the database lock was acquired in the Intent

metrics-mongodb metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			Exclusive (IX) lock mode.
mongodb.locks.Database.acquireCount_W		count	Number of times the database lock was acquired in the Exclusive (X) lock mode.
mongodb.locks.Global.acquireCount_r		count	Number of times the global lock was acquired in the Intent Shared (IS) lock mode.
mongodb.locks.Global.acquireCount_w		count	Number of times the global lock was acquired in the Intent Exclusive (IX) lock mode.
mongodb.locks.Global.acquireCount_W		count	Number of times the global lock was acquired in the Exclusive (X) lock mode.
mongodb.mem.pageFaults		count	Total number of page faults. The `extra_info.page_faults` counter may increase dramatically during moments of poor performance and may correlate with limited memory environments and larger data sets. Limited and sporadic page faults do not necessarily indicate an issue.
mongodb.mem.resident (featured metric)		mebibyte	This value is roughly equivalent to the amount of RAM, in mebibyte (MiB), currently used by the database process. During normal use, this value tends to grow. In dedicated database servers, the number tends to approach the total

metrics-mongodb metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			amount of system memory.
mongodb.mem.virtual		mebibyte	The quantity, in mebibyte (MiB), of virtual memory used by the mongod process.
mongodb.metrics.document.deleted		count	Total number of documents deleted.
mongodb.metrics.document.inserted		count	Total number of documents inserted.
mongodb.metrics.document.returned		count	Total number of documents returned by queries.
mongodb.metrics.document.updated		count	Total number of documents updated.
mongodb.metrics.getLastError.wtime_num (featured metric)		count	Total number of *`getLastError`* operations with a specified write concern (w) that wait for replica set members to acknowledge the write operation (w value greater than 1).
mongodb.metrics.getLastError.wtime_totalMillis (featured metric)		miliseconds	Total amount of time in milliseconds that the mongod has spent performing *`getLastError`* operations with write concern (w). These operations wait for one or more members of a replica set to acknowledge the write operation (a w value greater than 1).
mongodb.metrics.getLastError.wtimeouts (featured metric)		count	Number of times that write concern operations have timed out as a result of the *`wtimeout`* threshold to *`getLastError`*. This number

metrics-mongodb metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			increments for both default and non-default write concern specifications.
mongodb.metrics.operation.scanAndOrder		count	Total number of queries that return sorted numbers that cannot perform the sort operation using an index.
mongodb.metrics.queryExecutor.scanned		count	Total number of index items scanned during queries and query-plan evaluation. This counter is the same as *`totalKeysExamined`* in the output of explain().
mongodb.metrics.queryExecutor.scannedObjects		count	Total number of documents scanned during queries and query-plan evaluation. This counter is the same as *`totalDocsExamined`* in the output of explain().
mongodb.metrics.record.moves			A document that reports on data related to record allocation in the on-disk memory files.
mongodb.metrics.repl.apply.batches_num		count	Total number of batches applied across all databases.
mongodb.metrics.repl.apply.batches_totalMillis		count	Total amount of time in milliseconds the mongod has spent applying operations from the oplog.
mongodb.metrics.repl.apply.ops		count	Total number of oplog operations applied. *`metrics.repl.apply.ops`* is incremented after each operation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

metrics-mongodb metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
mongodb.metrics.repl.buffer.count		count	Current number of operations in the oplog buffer.
mongodb.metrics.repl.buffer.maxSizeBytes		bytes	Maximum size of the buffer. This value is a constant setting in the mongod, and is not configurable.
mongodb.metrics.repl.buffer.sizeBytes		bytes	Current size of the contents of the oplog buffer.
mongodb.metrics.repl.network.bytes		count	Total amount of data read from the replication sync source.
mongodb.metrics.repl.network.getmores_num		count	Reports the total number of *`getmore`* operations, which are operations that request an additional set of operations from the replication sync source.
mongodb.metrics.repl.network.getmores_totalMillis		count	Total amount of time required to collect data from *`getmore`* operations.
mongodb.metrics.repl.network.ops		count	Total number of operations read from the replication source.
mongodb.metrics.repl.network.readersCreated		count	Total number of oplog query processes created. MongoDB creates a new oplog query any time an error occurs in the connection, including a timeout, or a network operation. Furthermore, *`metrics.repl.network.reade`* increments every time MongoDB selects a new source for replication.

metrics-mongodb metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
mongodb.metrics.ttl.deletedDocuments		count	Total number of documents deleted from collections with a `ttl` index.
mongodb.metrics.ttl.passes		count	Total number of documents deleted from collections with a `ttl` index.
mongodb.network.bytesIn		count	Total number of bytes that the server has received over network connections initiated by clients.
mongodb.network.bytesOut		count	Total number of bytes that the server has sent over network connections initiated by clients.
mongodb.network.numRequests		count	Total number of distinct requests that the server has received. Use this value to provide context for the `network.bytesIn` and `network.bytesOut` values to ensure that MongoDB's network utilization is consistent with expectations and application use.
mongodb.opcounters.command		count	Total number of commands issued to the database since the mongod instance last started. `opcounters.command` counts all commands except the write commands: insert, update, and delete.
mongodb.opcounters.delete		count	Total number of delete operations since the mongod instance last started.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

metrics-mongodb metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
mongodb.opcounters.getmore		count	Total number of *getMore* operations since the mongod instance last started. This counter can be high even if the query count is low. Secondary nodes send *getMore* operations as part of the replication process.
mongodb.opcounters.insert		count	Total number of insert operations received since the mongod instance last started.
mongodb.opcounters.query		count	Total number of queries received since the mongod instance last started.
mongodb.opcounters.update		count	Total number of update operations received since the mongod instance last started.
mongodb.opcountersRepl.command		count	Total number of replicated commands issued to the database since the mongod instance last started.
mongodb.opcountersRepl.delete		count	Total number of replicated delete operations since the mongod instance last started.
mongodb.opcountersRepl.getmore		count	Total number of getMore operations since the mongod instance last started.
mongodb.opcountersRepl.insert (featured metric)		count	Total number of replicated insert operations since the mongod instance last started.

metrics-mongodb metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
mongodb.opcountersRepl.query (featured metric)		count	Total number of replicated queries since the mongod instance last started.
mongodb.opcountersRepl.update		count	Total number of replicated update operations since the mongod instance last started.

MS Exchange default checks and policies

Agent Client Collector provides the following default checks and policies for MS Exchange monitoring.

Type	Check	Description	Usage and usage example	Output
Metric	app.msexchange.metrics - msexchange	Retrieves Microsoft Exchange metrics.	`winchecks metric-msexchange (options) -s scheme Replaces the host name with this parameter` Usage example: `winchecks metric-msexchange {{if .labels.params_scheme}} -s {{if .labels.params_scheme}} {{end}}`	Metrics from MS Exchange server

MSSQL default checks and policies

The Agent Client Collector provides the following default checks and policies for MSSQL Metrics monitoring.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MSSQL Metrics

Type	Check	Description	Usage and Usage Example	Output
Metric	app.metrics-mssql-query	Generic MSSQL query class which accepts a query and dumps metrics.	winchecks metrics-mssql-query (options) -d, --database DATABASE Database schema to connect to (required) -q ,--query The query to execute, should return a list metric name and value, for example SELECT METRIC_NAME, VALUE FROM GV $SYSMETRIC -h, --host HOST Host name to connect to, defaults to localhost -r, --port PORT Port to connect to, defaults to 1433 -s, --scheme SCHEME Metric naming scheme, text to prepend to .$parent. $child, **Usage Example** `.winchecks metrics-mssql-query -d master -H localhost -p 1437 -q "select name,size from sys.database_files"`	Custom metrics defined in the parameters, which also contain value and timestamp.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MySQL default checks and policies

The Agent Client Collector provides the following default checks and policies for MySQL Metrics monitoring.

MySQL Events

Type	Check	Description	Usage and Usage example	Output
Event	app.mysql.check-mysql-alive	Verifies the length of a result set from a MySQL query.	check-mysql-query-result-count.rb (options) -c, --critical COUNT COUNT critical threshold for number of items returned by the query (required) -d, --database DATABASE MySQL database (required) -h, --host HOST MySQL Host to connect to (required) -i, --ini VALUE My.cnf ini file --ini-section VALUE Section in my.cnf ini file. To enable connection to MySQL thru the .ini file, provide the values against the properties 'user' and 'password' in the **client** section in the .ini file. -P, --port PORT MySQL Port to connect to -q, --query QUERY Query to execute (required)	MysqlQueryCountCheck OK/CRITICAL/WARNING: message regarding ratio between query length and threshold values

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MySQL Events (continued)

Type	Check	Description	Usage and Usage example	Output
			-w, --warning COUNT Count warning threshold for number of items returned by the query (required) -S, --socket UNIX socket to connect to (required if host specified is 'localhost' on UNIX - like systems) **Usage Example** `check-mysql-query-result-count.rb -h 127.0.0.1 -P 3306 -d mysql -q "select * from user" -w 5 -c 8`	
Event	app.mysql.check-mysql-threads	Verifies the MySQL DB number of running threads and assigns a status of OK/WARNING/ CRITICAL depending on input values.	check-mysql-threads.rb (options) -h, --hostname HOST Hostname to login to -i, --ini VALUE My.cnf ini file --ini-section VALUE Section in my.cnf ini file (Needed if .ini path provided). To enable connection to MySQL thru the .ini file, provide the values against the properties	CheckMySQLHealth OK/Critical/ Warning and number of running threads

Network ping default checks and policies

Agent Client Collector provides the following default checks and policies for Network ping monitoring. Policies and checks are available for both Windows and Linux.

Network-ping metrics policy

Check	Description	Usage	Command	Output

util.metrics-ping	Runs on the ip address discovered in the ServiceNow instance. Pings the host and collects metrics.
	
	The monitored CI type is *cmdb_ci_hardware* and is bound to the relevant server.
	
	A proxy agent is required.
		metrics-ping.rb (options)
		
		`c --count COUNT Ping count`
		
		`-h Host to ping`
		
		`-t --timeout TIMEOUT Timeout`
		
		Example: ./ metrics-ping.rb -h 10.196.121.11
				`c7inc000473 83.ping.packets_transmitted 5 1675923 886`
				
				`c7inc0047 383.ping.packets_received 5 1675923 886`
				
				`c7inc0047 383.ping.packet_loss 0 1675923 886`
				
				`c7inc0047 383.ping.time 3999 1675923 886`
				
				`c7inc0047 383.ping.min 0.253`

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Network-ping metrics policy (continued)

Check	Description	Usage	Command	Output
				1675923886 c7inc0047383.ping.avg 0.292 1675923886 c7inc0047383.ping.max 0.318 1675923886 c7inc0047383.ping.mdev 0.032 1675923886 **Note:** Windows does not support the *ping.time* and *ping.mdev* metrics.

Network ping metrics

The following table lists the metrics that are gathered as output from Network ping checks. Entries indicated as **Featured metrics** are high-visibility metrics that are displayed in the Operator Workspace Metric tab after an alert is generated. These metrics provide the operator with additional information to help them further explore the specified issue.

network-ping metrics

Metric type	Units	Metric type description
ping.packets_transmitted	count	Number of data packets sent to the target host during the ping test.
ping.packets_received	count	Number of data packets successfully received by the target host.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

network-ping metrics (continued)

Metric type	Units	Metric type description
ping.packet_loss	percentage	Percentage of data packets that failed to reach the target host.
ping.time	ms	Amount of time for the data packets to travel to the destination and back.
ping.min	ms	Shortest amount of time for a series of ping requests on the data packets.
ping.avg	ms	Average amount of time for a series of ping requests on the data packets.
ping.max	ms	Longest amount of time for a series of ping requests on the data packets.
ping.mdev	ms	Mean deviation (measure of the variability or dispersion) of the round-trip time (RTT) of the packets sent during the ping test.

Network host availability check

Agent Client Collector provides the following default check for network ping monitoring. The check is available for both Windows and Linux.

util.check-ping check

Check	Description	Usage	Command	Output
util.check-ping	Checks the network host availability via ICMP (ping) requests. Generates an OK event if the ping success ratio exceeds the Warning threshold (-W, default 50%). Generates a Warning event if the ping success ratio is between the warning threshold (-W,	`check-ping.rb -h <ip-address>` (options) `-h host`: Host to ping (Required). Default=<localhost> `-c count`: Number of ping requests sent to the host. Default=1 `-T timeout`: The timeout (in seconds) for each ping request. If the		`ICMP ping unsuccessful for host: 192.168.1.1 (successful: 0/5)`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

util.check-ping check (continued)

Check	Description	Usage	Command	Output
	default 50%) and the critical threshold (-C, default 20%). Generates a Critical event if the ping success ratio falls below the critical threshold (-C, default 20%). A proxy agent is required.	timeout expires before a reply is received, the ping is considered failed. Default=5 `-6 ipv6`: Enables IPv6 pinging. Ping uses IPv4 when this flag is not used. Default=False `-i interval`: Interval (in seconds) between each ping request. Default=1 `-W ratio`: The success ratio threshold for a Warning state. If the successful ping responses are below this ratio and above the -C ratio, the script returns a Warning. Default=0.5 `-C ratio`: The success ratio threshold for a Critical state. If the successful ping responses are below this ratio, the script returns a Critical failure. Default=0.2 `-r report`: Flag to append to the failure message of an MTR (My Trace Route) report if the ping fails.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

util.check-ping check (continued)

Check	Description	Usage	Command	Output
		When MTR runs, a network diagnostic report generates. Default=false		

Nginx default checks and policies

Agent Client Collector provides the following policies for Nginx health monitoring. Policies come with the checks specified in the indicated table. Policies and checks are available for both Windows and Linux.

Nginx Events policy

Check	Description	Usage	Command	Output

nginx.check-nginx-alive	Verifies whether Nginx server is alive.
	Note: Use basic authentication for events.
		`check-nginx-status.rb`
		-h, --host
		Nginx hostname
		-p, --port
		Nginx port
		Note: Use basic authentication for events.
				Successful
				`CheckNginxStatus OK: Nginx is Alive and healthy`
				Failure
				`CheckNginxStatus CRITICAL: Nginx is Down`

Nginx Metrics policy

Check	Description	Usage	Command	Output

nginx.metrics-nginx-server	Retrieves the following information:
	nginx.active_connections
	Total number of active connections on server.
	nginx.accepts
		`metrics-nginx.rb`
		Options:
		`-u --url` Full URL to the server status page. For example: `https://yoursite.com/nginx_status`
				`ws19-INC0047517.nginx.active_connections 1 1640135552`
				`ws19-INC0047517.nginx.accepts 5746 1640135552`
				`ws19-INC0047517.nginx.handled`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Nginx Metrics policy (continued)

Check	Description	Usage	Command	Output
	Note: Use basic authentication for metrics.			

Nginx metrics

The following table lists the metrics that are gathered as output from Nginx checks. Entries indicated as **Featured metrics** are high-visibility metrics that are displayed in the Operator Workspace Metric tab after an alert is generated. These metrics provide the operator with additional information to help them further explore the specified issue.

metrics-nginx metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
nginx.active_connections (featured metric)	admin	count	Total number of connections opened on the server, including waiting connections (*`nginx.waiting`* value). It reflects the number of current users on the website. There can be multiple connections opened for a single user.
nginx.accepts (featured metric)	admin	count	Represents the total established connections when `https://yoursite.com/nginx_status` is triggered.
nginx.handled (featured metric)	admin	count	Total number of connections handled by the Nginx server.
nginx.requests (featured metric)	admin	count	Total number of requests handled by the Nginx server.
nginx.reading (featured metric)	admin	count	Current number of connections where Nginx server is reading the request header.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

metrics-nginx metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
nginx.writing (featured metric)	admin	count	Represents the current number of connections where the Nginx server is writing the response back to the client.
nginx.waiting (featured metric)	admin	count	Number of idle client connections waiting for a request.

PostgreSQL default checks and policies

Agent Client Collector provides the following default checks and policies for PostgreSQL health monitoring.

PostgreSQL checks

Type	Check	Description	Command
Event	postgresql.check-alive	Triggers an alert on the status of the PostgreSQL database.	`commonchecks check-postgres-alive -d {{.labels.params_database}} -p {{.labels.params_port}} -H {{.labels.params_host}}`
Event	postgresql.check-connections	Triggers an alert on the total connection load on the PostgreSQL database, based on the configured threshold.	`commonchecks check-postgres-connections -d {{.labels.params_database}} -c {{.labels.params_critical}} -p {{.labels.params_port}} -H {{.labels.params_host}} -w {{.labels.params_warning}} -a {{.labels.params_use_percer`
Metric	postgresql.metric-active-connections	Provides metrics on the total active connection on the PostgreSQL database.	`commonchecks metric-postgres-connections -p {{.labels.params_port}} -d {{.labels.params_database}}`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

PostgreSQL checks (continued)

Type	Check	Description	Command
			`-H {{.labels.params_host}}`
Metric	postgresql.metric-dbsize	Provides metrics on the total size for each of the server's PostgreSQL databases.	`commonchecks metric-postgres-dbsize -d {{.labels.params_database}} -H {{.labels.params_host}} -p {{.labels.params_port}}`
Metric	postgresql.metric-locks	Provides metrics on the locks in the PostgreSQL database/tables.	`commonchecks metric-postgres-locks -p {{.labels.params_port}} -d {{.labels.params_database}} -H {{.labels.params_host}}`
Metric	postgresql.metric-relation-size	Provides metrics on the database table size on the server.	`commonchecks metric-postgres-relation-size -p {{.labels.params_port}} -l {{.labels.params_limit}} -H {{.labels.params_host}} -d {{.labels.params_database}}`
Metric	postgresql.metric-statsbgwriter	Provides metrics related to buffer allocations.	`commonchecks metric-postgres-statsbgwriter -p {{.labels.params_port}} -d {{.labels.params_database}} -H {{.labels.params_host}}`
Metric	postgresql.metric-statsdb	Provides metrics related to commits/ rollbacks/tuples transactions / deadlocks/query conflicts count.	`commonchecks metric-postgres-statsdb -d {{.labels.params_database}} -H {{.labels.params_host}}`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

PostgreSQL checks (continued)

Type	Check	Description	Command
			`-p {{.labels.params_port}}`
Metric	postgresql.metric-statsio	Provides table based metrics related index reads/total hits to a table index.	`commonchecks metric-postgres-statsio -s {{.labels.params_scope}} -H {{.labels.params_host}} -p {{.labels.params_port}} -d {{.labels.params_database}}`
Metric	postgresql.metric-statstable	Provides metrics related to CRUD operations.	`commonchecks metric-postgres-statstable -d {{.labels.params_database}} -H {{.labels.params_host}} -s {{.labels.params_scope}} -p {{.labels.params_port}}`

PostgreSQL metrics

The following tables list and describe the metrics that are gathered as output from the specified PostgreSQL checks. Entries indicated as **Featured metrics** are high-visibility metrics that are displayed in the Operator Workspace Metric tab after an alert is generated. These metrics provide the operator with additional information to help them further explore the specified issue.

postgresql.check-connections metrics

Metric	Description
pgsql.connections.active (Featured metric)	Provides metrics on the total active connections in the PostgreSQL database.
pgsql.connections.idle (Featured metric)	Provides metrics on the total idle connections on the PostgreSQL database.

postgresql.metric-dbsize metrics

Metric	Description
pgsql.db.size (Featured metric)	Provides metrics on the total disk size utilization for each of the PostgreSQL databases on the server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

postgresql.metric-locks metrics

Metric	Description
pgsql.locks.AccessShareLock	Provides metrics on read-lock mode acquired automatically from queried tables.
pgsql.locks.ExclusiveLock	Provides metrics on read-lock mode acquired by LOCK TABLE table for IN EXCLUSIVE MODE statements.

postgresql.metric-relation-size metrics

Metric	Description
pgsql.tables_size (Featured metric)	Provides metrics on the database table size on the server.

postgresql.metric-statsbgwriter metrics

Metric	Description
pgsql.statsbgwriter.buffers_alloc	Provides metrics related to the number of allocated buffers.
pgsql.statsbgwriter.buffers_backend	Provides metrics related to the number of buffers written directly by a backend.
pgsql.statsbgwriter.buffers_backend_fsync	Provides metrics related to the number of times a backend had to execute its own fsync call. Normally the background writer handles these calls, even when the backend performs its own write.
pgsql.statsbgwriter.buffers_checkpoint	Provides metrics related to the number of buffers written during checkpoints.
pgsql.statsbgwriter.buffers_clean	Provides metrics related to the number of buffers written by the background writer.
pgsql.statsbgwriter.checkpoint_sync_time	Provides metrics related to the total amount of time spent in the portion of checkpoint processing where files are synchronized to disk, in milliseconds.
pgsql.statsbgwriter.checkpoint_write_time	Provides metrics related to the total amount of time spent in the portion of checkpoint processing where files are written to disk, in milliseconds.
pgsql.statsbgwriter.checkpoints_req (Featured metric)	Provides metrics related to the number of requested checkpoints that have been performed.
pgsql.statsbgwriter.checkpoints_timed (Featured metric)	Provides metrics related to the number of scheduled checkpoints that have been performed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

postgresql.metric-statsbgwriter metrics (continued)

Metric	Description
pgsql.statsbgwriter.maxwritten_clean	Provides metrics related to the number of times the background writer stopped a cleaning scan because it had written too many buffers.

postgresql.metric-statsdb metrics

Metric	Description
pgsql.statsdb.blk_read_time (Featured metric)	Provides metrics related to the time spent reading data file blocks by backends in this database, in milliseconds.
pgsql.statsdb.blk_write_time (Featured metric)	Provides metrics related to the time spent writing data file blocks by backends in this database, in milliseconds.
pgsql.statsdb.blks_hit (Featured metric)	Provides metrics related to the number of times disk blocks were found in the buffer cache, so that a read was not necessary. This only includes hits in the PostgreSQL buffer cache, not the operating system's file system cache.
pgsql.statsdb.blks_read	Provides metrics related to the number of disk blocks read in this database.
pgsql.statsdb.checksum_failures	Provides metrics related to the number of data page checksum failures detected in this database (or on a shared object), or 0 if data checksums are not enabled.
pgsql.statsdb.conflicts	Provides metrics related to the number of queries canceled due to conflicts with recovery in this database. Conflicts occur only on standby servers.
pgsql.statsdb.deadlocks (Featured metric)	Provides metrics related to the number of deadlocks detected in this database.
pgsql.statsdb.numbackends	Provides metrics related to the number of backends currently connected to this database. This is the only column in this view that returns a value reflecting the current state; all other columns return the accumulated values since the last reset.
pgsql.statsdb.temp_bytes	Provides metrics related to the total amount of data written to temporary files by queries in this database. All temporary files are counted, regardless of why the temporary file was created, and regardless of the *`log_temp_files`* setting.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

postgresql.metric-statsdb metrics (continued)

Metric	Description
pgsql.statsdb.temp_files	Provides metrics related to the number of temporary files created by queries in this database. All temporary files are counted, regardless of why the temporary file was created (such as sorting or hashing), and regardless of the *log_temp_files* setting.
pgsql.statsdb.tup_deleted	Provides metrics related to the number of rows deleted by queries in this database.
pgsql.statsdb.tup_fetched	Provides metrics related to the number of rows fetched by queries in this database.
pgsql.statsdb.tup_inserted	Provides metrics related to the number of rows inserted by queries in this database.
pgsql.statsdb.tup_returned	Provides metrics related to the number of rows returned by queries in this database.
pgsql.statsdb.tup_updated	Provides metrics related to the number of rows updated by queries in this database.
pgsql.statsdb.xact_commit	Provides metrics related to the number of transactions in this database that have been committed.
pgsql.statsdb.xact_rollback	Provides metrics related to the number of transactions in this database that have been rolled back.

postgresql.metric-statsio metrics

Metric	Description
pgsql.statsio.heap_blks_hit (Featured metric)	Provides metrics related to the number of buffer hits in this table.
pgsql.statsio.heap_blks_read	Provides metrics related to the number of disk blocks read from this table.
pgsql.statsio.idx_blks_hit	Provides metrics related to the number of buffer hits in all indexes in this table.
pgsql.statsio.idx_blks_read	Provides metrics related to the number of disk blocks read from all indexes in this table.
pgsql.statsio.tidx_blks_hit	Provides metrics related to the number of buffer hits in this table's TOAST table index (if any).
pgsql.statsio.tidx_blks_read	Provides metrics related to the number of disk blocks read from this table's TOAST table index.
pgsql.statsio.toast_blks_hit	Provides metrics related to the number of buffer hits in this table's TOAST table (if any).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

postgresql.metric-statsio metrics (continued)

Metric	Description
pgsql.statsio.toast_blks_read	Provides metrics related to the number of disk blocks read from this table's TOAST table (if any).

postgresql.metric-statsio metrics

Metric	Description
pgsql.statstable.idx_scan	Provides metrics related to the number of index scans initiated on this table.
pgsql.statstable.idx_tup_fetch	Provides metrics related to the number of live rows fetched by index scans.
pgsql.statstable.n_dead_tup	Provides metrics related to the estimated number of dead rows.
pgsql.statstable.n_live_tup	Provides metrics related to the estimated number of live rows.
pgsql.statstable.n_tup_del	Provides metrics related to the number of deleted rows.
pgsql.statstable.n_tup_hot_upd	Provides metrics related to the number of rows HOT updated (that is, with no separate index update required).
pgsql.statstable.n_tup_ins	Provides metrics related to the number of inserted rows.
pgsql.statstable.n_tup_upd	Provides metrics related to the number of updated rows.
pgsql.statstable.seq_scan	Provides metrics related to the number of sequential scans initiated on this table.
pgsql.statstable.seq_tup_read	Provides metrics related to the number of live rows fetched by sequential scans.

RabbitMQ default checks and policies

Agent Client Collector provides the following default checks and policies for RabbitMQ health monitoring. You must perform RabbitMQ discovery before executing the checks. RabbitMQ checks are available only in a Windows environment.

RabbitMQ Events policy

Type	Check	Description	Command
Event	check-rabbitmq-alive	Verifies whether the RabbitMQ server is alive, using the REST API. If the server is down, an alert triggers.	`check-rabbitmq-alive.rb --host {{.labels.params_host}} --port {{.labels.params_port}} -v {{.labels.params_vhost}}`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

RabbitMQ Events policy (continued)

Type	Check	Description	Command
Event	check-rabbitmq-cluster-health	Verifies whether the RabbitMQ server's cluster nodes are running. If the nodes are down, an alert triggers.	`check-rabbitmq-cluster-health.rb --host {{.labels.params_host}} --port {{.labels.params_port}}`
Event	check-rabbitmq-consumers	Verifies the number of consumers on the RabbitMQ server and triggers an alert based on the configured threshold.	`check-rabbitmq-consumers.rb {{if .labels.params_warn}} --warn {{.labels.params_warn}} {{end}} {{if .labels.params_critica --critical {{.labels.params_critical}} {{end}} --host {{.labels.params_host}} --port {{.labels.params_port}}`
Event	check-rabbitmq-messages	Verifies the total number of messages queued on the RabbitMQ server and triggers an alert based on the threshold.	`check-rabbitmq-messages.rb --critical {{.labels.params_critical}} --port {{.labels.params_port}} --warn {{.labels.params_warn}} --host {{.labels.params_host}}`
Event	check-rabbitmq-network-partitions	Verifies whether the RabbitMQ network partition has occurred and triggers an alert based on the threshold.	check-rabbitmq-network-partitions.rb --host {{.labels.params_host}} --port {{.labels.params_port}}
Event	check-rabbitmq-node-health	Verifies whether the RabbitMQ server node is in a running state.	`check-rabbitmq-node-health.rb --host {{.labels.params_host}} {{if .labels.params_watchalarms}} --alarms {{.labels.params_watchalarms}} {{end}} {{if .labels.params_socketw`

RabbitMQ Events policy (continued)

Type	Check	Description	Command
			`params_memwarn}} mwarn {{.labels.params_memwarn}} {{end}}`
Event	check-rabbitmq-queue-drain-time	Verifies the time it will take for each queue on the RabbitMQ server to drain, based on the current message exit rate. For example, if a queue has 1,000 messages in it but only 1 message exits per second, an alert generates. The default critical level of 360 seconds has been exceeded.	`check-rabbitmq-queue-drain-time.rb --host {{.labels.params_host}} --port {{.labels.params_port}} --warn {{.labels.params_warn}} --critical {{.labels.params_critical}}`
Event	check-rabbitmq-queues-synchronised	Verifies that all mirrored queues with secondary queues are synchronised.	`check-rabbitmq-queues-synchronised.rb --host {{.labels.params_host}} --port {{.labels.params_port}}`
Event	check-rabbitmq-stomp-alive	Verifies whether the RabbitMQ server is alive and responding to STOMP.	`check-rabbitmq-stomp-alive.rb --host {{.labels.params_host}} --queue {{.labels.params_queue}} --port {{.labels.params_port}}`

RabbitMQ Metrics policy

Type	Check	Description	Command
Metric	metrics-rabbitmq-overview	Provides RabbitMQ overview statistics.	`metrics-rabbitmq-overview.rb --port {{.labels.params_port}} --host {{.labels.params_host}}`

RabbitMQ Metrics policy (continued)

Type	Check	Description	Command
Metric	metrics-rabbitmq-queue	Provides RabbitMQ metrics per queue.	`metrics-rabbitmq-queue.rb --port {{.labels.params_port}} --host {{.labels.params_host}} {{if .labels.params_vhost}} --vhost {{.labels.params_vhost}} {{end}}`

RabbitMQ metrics

The following table lists the metrics that are gathered as output from RabbitMQ checks. Entries indicated as **Featured metrics** are high-visibility metrics that are displayed in the Operator Workspace Metric tab after an alert is generated. These metrics provide the operator with additional information to help them further explore the specified issue.

metrics-rabbitmq-overview metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
rabbitmq.queue_totals.messages.count		count	Provides metrics on the total number of messages (ready plus unacknowledged).
rabbitmq.queue_totals.messages.rate (featured metric)		rate / sec	Provides metrics on the total number of messages (ready plus unacknowledged)
rabbitmq.queue_totals.messages_ready.count		count	Provides metrics on the number of messages ready for delivery.
rabbitmq.queue_totals.messages_ready.rate		rate / sec	Provides metrics on the number of messages ready for delivery.
rabbitmq.queue_totals.messages_unacknowledged.count		count	Provides metrics on the number of unacknowledged messages.
rabbitmq.queue_totals.messages_unacknowledged.rate		rate / sec	Provides metrics on the number of unacknowledged messages.
rabbitmq.message_stats.deliver_get.count		count	Provides metrics on messages

© 2026 ServiceNow, Inc. All rights reserved.

metrics-rabbitmq-overview metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			recently delivered to consumers.
rabbitmq.message_stats.deliver_get.rate (featured metric)		rate / sec	Provides metrics on messages recently delivered to consumers.
rabbitmq.message_stats.deliver_no_ack.count		count	Provides metrics on unacknowledged messages recently delivered to consumers.
rabbitmq.message_stats.deliver_no_ack.rate		rate / sec	Provides metrics on unacknowledged messages recently delivered to consumers.
rabbitmq.message_stats.publish.count		count	Provides metrics on recently published messages.
rabbitmq.message_stats.publish.rate		rate / sec	Provides metrics on the recently published messages.
rabbitmq.object_totals.channels.count		count	Provides metrics on the total number of channels.
rabbitmq.object_totals.connections.count (featured metric)		count	Provides metrics on the total number of connections.
rabbitmq.object_totals.consumers.count (featured metric)		count	Provides metrics on the total number of consumers.
rabbitmq.object_totals.exchanges.count		count	Provides metrics on the total number of exchanges.
rabbitmq.object_totals.queues.count (featured metric)		count	Provides metrics on the total number of queues.

metrics-rabbitmq-queue metrics

rabbitmq.queue.{{QueueName}}.avg_egress_rate (featured metric)	Queue Name	count	Provides queue specific metrics on the rate at which unacknowledged

© 2026 ServiceNow, Inc. All rights reserved.

metrics-rabbitmq-queue metrics (continued)

			message records enter RAM for the given queue.
rabbitmq.queue.{{QueueName}}.consumers	Queue Name	count	Provides queue specific metrics on the total consumers for the given queue.
rabbitmq.queue.{{QueueName}}.messages	Queue Name	count	Provides queue specific metrics on the total messages in the given queue.
rabbitmq.queue.{{QueueName}}.drain_time	Queue Name	count	Provides queue specific metrics on the message drain time for the given queue.

URL Monitoring default checks and policies

Agent Client Collector provides policies for URL Monitoring. Polices come with embedded checks.

URL Monitoring uses the HTTP Entry Point default policies. For details, see HTTP default checks and policies.

Varnish default checks and policies

Agent Client Collector provides the following default checks and policies for Varnish monitoring.

Varnish metrics policy

Type	Check	Description	Usage	Output

Metric	app.varnish.metrics-varnish	Collects Varnish metrics from the host.	`linuxchecks metrics-varnish (options)`
			where:
			• -t = fields List of required metrics, comma separated within ""
			• -v = varnishname The Varnish instance to retrieve data from.
				`hostname.MAIN_sess_conn 175 1649420020`
				`hostname.MAIN_sess_drop 0 1649420020`
				`hostname.MAIN_client_req 173 1649420020`
				`hostname.MAIN_cache_hit 0 1649420020`

Varnish metrics policy (continued)

Type	Check	Description	Usage	Output
				hostname.MAIN_threads_created 200 1649420020 hostname.MAIN_threads_failed 0 1649420020 hostname.MAIN_thread_queue_len 0 1649420020 hostname.MAIN_sess_queued 0 1649420020 hostname.MAIN_n_expired 167 1649420020 hostname.MAIN_n_lru_nuked 0 1649420020 hostname.MAIN_backend_req 0 1649420020

Varnish metrics

The following table lists the metrics that are gathered as output from Varnish checks. Entries indicated as **Featured metrics** are high-visibility metrics that are displayed in the Operator Workspace Metric tab after an alert is generated. These metrics provide the operator with additional information to help them further explore the specified issue.

Varnish metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
MAIN_sess_conn (featured metric)		count	Cumulative number of accepted client

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Varnish metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			connections by Varnish Cache.
MAIN_sess_drop (featured metric)		count	Number of connections dropped due to a full queue.
MAIN_client_req (featured metric)		count	Cumulative number of received client requests. Increments after a request is received, but before Varnish responds.
MAIN_cache_hit		count	Cumulative number of times a file was served from Varnish's cache.
MAIN_cache_hitpass		count	Cumulative number of hits for a "pass" file.
MAIN_cache_miss		count	Cumulative number of times a file was requested but was not in the cache, and was therefore requested from the backend.
MAIN_backend_conn		count	Cumulative number of successful TCP connections to the backend.
MAIN_backend_unhealthy (featured metric)		count	Cumulative number of backend connections which were not attempted because the backend has been marked as unhealthy.
MAIN_backend_busy		count	Cumulative number of times the maximum amount of connections to the backend has been reached.
MAIN_backend_fail (featured metric)		count	Cumulative number of failed connections to the backend.
MAIN_backend_reuse (featured metric)		count	Cumulative number of connections that were reused from the keep-alive pool.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Varnish metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
MAIN_backend_recycle		count	Cumulative number of current backend connections which were put back to a pool of keep-alive connections and have not yet been used.
MAIN_threads (featured metric)		count	Number of threads in all pools.
MAIN_threads_limited		count	Number of times a thread needed to be created but couldn't because varnishd maxed out its configured capacity for new threads.
MAIN_threads_created		count	Number of times a thread has been created.
MAIN_threads_failed (featured metric)		count	Number of times that Varnish unsuccessfully tried to create a thread.
MAIN_thread_queue_len		count	Current queue length: number of requests waiting on worker thread to become available.
MAIN_sess_queued		count	Number of times Varnish has been out of threads and had to queue up a request.
MAIN_n_expired (featured metric)		count	Cumulative number of expired objects for example due to TTL.
MAIN_n_lru_nuked (featured metric)		count	Least Recently Used Nuked Objects: Cumulative number of cached objects that Varnish has evicted from the cache because of a lack of space.
MAIN_backend_req (featured metric)		count	Number of requests to the backend.

vSphere default checks and policies

Agent Client Collector provides the following default checks and policies for vSphere monitoring.

vSphere virtualMachine metrics policy

Type	Check	Description	Usage	Output
Metric	vsphere.metric-VirtualMachine	Retrieves metrics for a vSphere virtual machine. Must use a proxy agent.	`commonchecks metric-vsphere -H hostname -R VirtualMachine -v vm_id -r true -i 20` where: • -H = hostname Instance Hostname • -i = intervalId 20 for real time metrics; 300 for 5 minutes older aggregate metrics (default 300) • -r = resourceLevelMetric To enable resource level metrics (default=false)	`vsphere.VirtualMachine.c 8 1654755994`

vSphere Datastore Metrics policy

Type	Check	Description	Usage	Output
Metric	vSphere.metric-Datastore	Retrieves Metrics for vSphere Datastore. Must use a proxy agent.	`commonchecks metric-vsphere -H hostname -R Datastore -v vm_id -r` where: • -H = hostname Instance Hostname • -r = resourceLevelMetric To enable	`vsphere.Datastore.disk.c 21474836480 1655182836`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

vSphere Datastore Metrics policy (continued)

Type	Check	Description	Usage	Output
			resource level metrics (default=false)	

vSphere Datacenter Metrics policy

Type	Check	Description	Usage	Output

Metric	vsphere.metric-Datacenter	Retrieves metrics for the vSphere datacenter.	`commonchecks metric-vsphere -H hostname -R Datacenter -v vm_id -r`
			where:
			• -H = hostname Instance Hostname
			• -r = resourceLevelMet To enable resource level metrics (default=false)
				`vsphere.Datacenter.vmop.numChangeDS.latest.total 217 1655194924`
				`vsphere.Datacenter.vmop.numChangeHost.latest.total 1373 1655194924`
				`vsphere.Datacenter.vmop.numChangeHostDS.latest.total 9 1655194924`
				`vsphere.Datacenter.vmop.numClone.latest.total 192 1655194924`

vSphere ESX Server Metrics policy

Type	Check	Description	Usage	Output
Metric	vsphere.metric-ESX_Server	Retrieves metrics for vSphere ESX server or HostSystem. Must use a proxy agent.	`commonchecks metric-vsphere -H hostname -R HostSystem -v vm_id -r`	`vsphere.HostSystem.net.broadcastRx.summation.total 63885`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

vSphere ESX Server Metrics policy (continued)

Type	Check	Description	Usage	Output
			where: • -H = hostname Instance Hostname • -r = resourceLevelMet To enable resource level metrics (default=false)	1655198 166 vsphere.HostSystem.net.broadcastTx.summation.total 196 1655198 166 vsphere.HostSystem.net.bytesRx.average.total 5924 1655198 166

vSphere metrics

The following table lists the metrics that are gathered as output from vSphere checks. Entries indicated as **Featured metrics** are high-visibility metrics that are displayed in the Operator Workspace Metric tab after an alert is generated. These metrics provide the operator with additional information to help them further explore the specified issue.

vsphere.metric-VirtualMachine metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
net.broadcastRx.summation	network adapter	packets	Number of broadcast packets received.
net.broadcastTx.summation	network adapter	packets	Number of broadcast packets transmitted.
net.bytesRx.average	network adapter	KiB	Average amount of data received per second.
net.bytesTx.average	network adapter	KiB	Average amount of data transmitted per second.
net.droppedRx.summation	network adapter	packets	Number of received packets dropped.
net.droppedTx.summation	network adapter	packets	Number of transmitted packets dropped.
net.multicastRx.summation	network adapter	packets	Number of multicast packets received.
net.multicastTx.summation	network adapter	packets	Number of multicast packets transmitted.

vsphere.metric-VirtualMachine metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
net.packetsRx.summation	network adapter	packets	Number of packets received.
net.packetsTx.summation	network adapter	packets	Number of packets transmitted.
net.received.average	network adapter	KiB	Average rate at which data was received during the interval. This represents the bandwidth of the network.
net.transmitted.average	network adapter	KiB	Average rate at which data was transmitted during the interval. This represents the bandwidth of the network.
net.usage.average (featured metric)	network adapter	KiB	Network utilization (combined transmit- and receive-rates).
disk.maxTotalLatency.latest (featured metric)	drive	millisecond	Highest latency value across all disks used by the host.
disk.read.average	drive	KiB	Average number of kilobytes read from the disk each second.
disk.usage.average (featured metric)	drive	KiB	Aggregated disk I/O rate.
disk.usage.maximum	drive	KiB	Maximum disk I/O rate.
disk.usage.minimum	drive	KiB	Minimum disk I/O rate.
disk.write.average	drive	KiB	Average number of kilobytes written to the disk each second.
cpu.costop.summation	cpu-core	millisecond	Time the virtual machine is ready to run, but is unable to run due to co-scheduling constraints.
cpu.demand.average	cpu-core	megahertz	The amount of CPU resources a virtual machine would use if there were no CPU

vsphere.metric-VirtualMachine metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			contention or CPU limit.
cpu.demandEntitlementRatio.latest	cpu-core	percent	CPU resource entitlement to CPU demand ratio.
cpu.entitlement.latest	cpu-core	megahertz	CPU resources devoted by the ESXi scheduler.
cpu.idle.summation	cpu-core	millisecond	Total time that the CPU spent in an idle state.
cpu.latency.average	cpu-core	percent	Percent of time the virtual machine is unable to run because it is contending for access to the physical CPU(s).
cpu.maxlimited.summation	cpu-core	millisecond	Time the virtual machine is ready to run, but is not running because it has reached its maximum CPU limit setting.
cpu.overlap.summation	cpu-core	millisecond	Time the virtual machine was interrupted to perform system services on behalf of itself or other virtual machines.
cpu.readiness.average	cpu-core	percent	Percentage of time that the virtual machine was ready, but could not get scheduled to run on the physical CPU.
cpu.ready.summation	cpu-core	millisecond	Milliseconds of CPU time spent in ready state.
cpu.run.summation	cpu-core	millisecond	Time the virtual machine is scheduled to run.
cpu.swapwait.summation	cpu-core	millisecond	CPU time spent waiting for swap-in.

vsphere.metric-VirtualMachine metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
cpu.system.summation	cpu-core	millisecond	Amount of time spent on system processes on each virtual CPU in the virtual machine.
cpu.usage.average (featured metric)	cpu-core	percent	Percentage of CPU capacity being used.
cpu.usagemhz.average	cpu-core	megahertz	CPU usage, as measured in megahertz.
cpu.used.summation	cpu-core	millisecond	Time accounted to the virtual machine. If a system service runs on behalf of this virtual machine, the time spent by that service (represented by cpu.system) should be charged to this virtual machine. If not, the time spent (represented by cpu.overlap) should not be charged against this virtual machine.
cpu.wait.summation (featured metric)	cpu-core	millisecond	Total CPU time spent in wait state.The wait total includes time spent the CPU Idle, CPU Swap Wait, and CPU I/O Wait states.
cpu.usage.vcpus.average	cpu-core	percent	Percentage of vcpus capacity being used.
cpu.utilization.average	cpu-core	percent	Percentage of CPU capacity being used.
mem.active.average	memory	KiB	Amount of memory that is actively used, as estimated by VMkernel based on recently touched memory pages.
mem.activewrite.average	memory	KiB	Estimate for the amount of memory actively being written to by the virtual machine.

vsphere.metric-VirtualMachine metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
mem.compressed.average	memory	KiB	Kilobytes of memory that have been compressed.
mem.compressionRate.average	memory	KiB	Rate of memory compression for the virtual machine.
mem.consumed.average	memory	KiB	Amount of host physical memory consumed by a virtual machine, host, or cluster.
mem.decompressionRate.average	memory	KiB	Rate of memory decompression for the virtual machine.
mem.entitlement.average	memory	KiB	Amount of host physical memory the virtual machine is entitled to, as determined by the ESX scheduler.
mem.granted.average	memory	KiB	Amount of host physical memory or physical memory that is mapped for a virtual machine or a host.
mem.latency.average	memory	KiB	Percentage of time the virtual machine is waiting to access swapped or compressed memory.
mem.llSwapInRate.average	memory	KiB	Rate at which memory is being swapped from host cache into active memory.
mem.llSwapOutRate.average	memory	KiB	Rate at which memory is being swapped from active memory to host cache.
mem.llSwapUsed.average	memory	KiB	Space used for caching swapped pages in the host cache.
mem.overhead.average	memory	KiB	Host physical memory consumed by the virtualization

vsphere.metric-VirtualMachine metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			infrastructure for running the virtual machine.
mem.overheadMax.average	memory	KiB	Host physical memory reserved for use as the virtualization overhead for the virtual machine.
mem.overheadTouched.average	memory	KiB	Actively touched overhead host physical memory (KB) reserved for use as the virtualization overhead for the virtual machine.
mem.shared.average	memory	KiB	Amount of guest physical memory that is shared with other virtual machines, relative to a single virtual machine or to all powered-on virtual machines on a host.
mem.usage.average (featured metric)	memory	percent	Memory usage as percent of total configured or available memory.
mem.vmmemctl.average	memory	KiB	Amount of memory allocated by the virtual machine memory control driver.
mem.vmmemctltarget.average	memory	KiB	Target value set by VMkernal for the virtual machine's memory balloon size. In conjunction with vmmemctl metric, this metric is used by VMkernel to inflate and deflate the balloon for a virtual machine.
mem.zero.average	memory	KiB	Memory that contains 0s only. Included in shared amount. Through transparent page sharing, zero

vsphere.metric-VirtualMachine metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			memory pages can be shared among virtual machines that run the same operating system.
power.energy.summation	power	joule	Total energy (in joule) used since last stats reset.
power.power.average	power	watt	Current power usage.
sys.heartbeat.latest	system	number	Number of heartbeats issued per virtual machine.
sys.osUptime.latest	system	seconds	Total time elapsed, in seconds, since last operating system boot-up.
sys.uptime.latest	system	seconds	Total time elapsed since last system startup.
virtualDisk.read.average	virtual disk	KiB	Average number of kilobytes read from the virtual disk each second.
virtualDisk.write.average	virtual disk	KiB	Average number of kilobytes written to the virtual disk each second.
rescpu.actav1.latest	rescpu	percent	CPU active average over 1 minute.
rescpu.actav15.latest	rescpu	percent	CPU active average over 15 minutes.

			issued per second to the datastore.
disk.provisioned.latest	disk	KiB	Amount of storage set aside for use by a datastore or a virtual machine. Files on the datastore and the virtual machine can expand to this size but not beyond it.
disk.queueLatency.average	disk	millisecond	Average amount of time spent in VMkernel queue (per SCSI command).
disk.queueReadLatency.average (featured metric)	disk	millisecond	Average amount of time spent in the VMkernel queue per SCSI read command.
disk.queueWriteLatency.average	disk	millisecond	Average amount of time spent in the VMkernel queue per SCSI write command.
disk.read.average	disk	KiB	Average number of kilobytes read from the disk each second.
disk.scsiReservationCnflctPct.average	disk	Number	Number of SCSI reservation conflicts for the LUN as a percent of total commands during the collection interval.
disk.scsiReservationConflicts.summation	disk	Number	Number of SCSI reservation conflicts for the LUN during the collection interval.
disk.throughput.contention.average	disk	millisecond	Average amount of time for an I/O operation to the datastore or LUN across all ESX hosts accessing it.
disk.throughput.usage.average	disk	KiB	The current bandwidth usage for the datastore or LUN.

vsphere.metric-Datastore metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
disk.totalLatency.average (featured metric)	disk	millisecond	Average amount of time taken during the collection interval to process a SCSI command issued by the guest OS to the virtual machine.
disk.totalReadLatency.average	disk	millisecond	Average amount of time taken to process a SCSI read command issued from the guest OS to the virtual machine.
disk.totalWriteLatency.average	disk	millisecond	Average amount of time taken to process a SCSI write command issued by the guest OS to the virtual machine.
disk.unshared.latest	disk	KiB	Amount of space associated exclusively with a virtual machine.
disk.usage.average (featured metric)	disk	KiB	Aggregated disk I/O rate.
disk.used.latest	disk	KiB	Amount of space actually used by the virtual machine or the datastore. May be less than the amount provisioned at any given time. This depends on whether the virtual machine is powered off, whether snapshots have been created, and other factors.
disk.write.average	disk	KiB	Average number of kilobytes written to the disk each second.

vsphere.metric-ESX_Server metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
cpu.coreUtilization.average (featured metric)	cpu-core	percent	CPU utilization of the corresponding core (if hyper-threading is enabled) as a percentage.
cpu.reservedCapacity.average	cpu-core	megahertz	Total CPU capacity reserved by virtual machines.
cpu.totalCapacity.average	cpu-core	megahertz	Total CPU capacity reserved by and available for virtual machines.
datastore.maxTotalLatency.latest	datastore	millisecond	Highest latency value across all datastores used by the host.
hbr.hbrDiskReadLatency.average	host-based replication	millisecond	Average Disk read latency.
hbr.hbrDiskStallLatency.average	host-based replication	millisecond	Average Disk stall latency.
hbr.hbrNetRx.average	host-based replication	KiB	Average amount of data received per second.
hbr.hbrNetTx.average	host-based replication	KiB	Average amount of data transmitted per second.
hbr.hbrNumVms.average	host-based replication	Number	Number of powered-on virtual machines running on this host that currently have host-based replication protection enabled.
mem.heap.average	memory	KiB	VMkernel virtual address space dedicated to VMkernel main heap and related data.
mem.heapfree.average	memory	KiB	Free address space in the VMkernel main heap.Varies based on number of physical devices and configuration options.

vsphere.metric-ESX_Server metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
mem.llSwapIn.average	memory	KiB	Amount of memory swapped-in from host cache.
mem.llSwapOut.average	memory	KiB	Amount of memory swapped-out to host cache.
mem.lowfreethreshold.average	memory	KiB	Threshold of free host physical memory below which ESX/ESXi will begin reclaiming memory from virtual machines through ballooning and swapping.
mem.reservedCapacity.average	memory	MiB	Total amount of memory reservation used by powered-on virtual machines and vSphere services on the host.
mem.sharedcommon.average	memory	KiB	Amount of machine memory that is shared by all powered-on virtual machines and vSphere services on the host.
mem.state.latest	memory	KiB	One of four threshold levels representing the percentage of free memory on the host.
mem.swapin.average	memory	KiB	Amount of memory swapped-in from disk.
mem.swapinRate.average	memory	KiB	Rate at which memory is swapped from disk into active memory.
mem.swapout.average	memory	KiB	Amount of memory swapped-out to disk.
mem.swapoutRate.average	memory	KiB	Rate at which memory is being swapped from active memory to disk.
mem.swapused.average	memory	KiB	Amount of memory that is used by swap. Sum of memory swapped of all

vsphere.metric-ESX_Server metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			powered on VMs and vSphere services on the host.
mem.sysUsage.average	memory	KiB	Amount of host physical memory used by VMkernel for core functionality, such as device drivers and other internal uses. Does not include memory used by virtual machines or vSphere services.
mem.totalCapacity.average	memory	KiB	Total amount of memory reservation used by and available for powered-on virtual machines and vSphere services on the host.
mem.unreserved.average	memory	KiB	Amount of memory that is unreserved. Memory reservation not used by the Service Console, VMkernel, vSphere services and other powered on VMs user-specified memory reservations and overhead memory.
mem.vmfs.pbc.capMissRatio.latest (featured metric)	memory	percent	Trailing average of the ratio of capacity misses to compulsory misses for the VMFS PB Cache.
mem.vmfs.pbc.overhead.latest	memory	KiB	Amount of VMFS heap used by the VMFS PB Cache.
mem.vmfs.pbc.size.latest	memory	MiB	Space used for holding VMFS Pointer Blocks in memory.
mem.vmfs.pbc.sizeMax.latest	memory	MiB	Maximum size the VMFS Pointer Block Cache can grow to.

vsphere.metric-ESX_Server metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
mem.vmfs.pbc.workingSetLatest	memory	TiB	Amount of file blocks whose addresses are cached in the VMFS PB Cache.
mem.vmfs.pbc.workingSetMax.latest	memory	TiB	Maximum amount of file blocks whose addresses are cached in the VMFS PB Cache.
net.errorsRx.summation (featured metric)	network adapter	Number	Number of packets with errors received.
net.errorsTx.summation (featured metric)	network adapter	Number	Number of packets with errors transmitted.
net.unknownProtos.summation	network adapter	KiB	Number of frames with unknown protocol received.
power.powerCap.average	power	watt	Maximum allowed power usage.
rescpu.maxLimited1.latest	rescpu	percent	Amount of CPU resources over the limit that were refused, average over 1 minute.
rescpu.maxLimited15.latest	rescpu	percent	Amount of CPU resources over the limit that were refused, average over 15 minutes.
rescpu.maxLimited5.latest	rescpu	percent	Amount of CPU resources over the limit that were refused, average over 5 minutes.
storageAdapter.maxTotalLatency.latest (featured metric)	storage adapter	millisecond	Highest latency value across all storage adapters used by the host.
storagePath.maxTotalLatency.latest (featured metric)	storage adapter	millisecond	Highest latency value across all storage paths used by the host.

Windows default checks and policies

Agent Client Collector provides the following default checks and policies for Windows health monitoring.

Windows event monitoring checks

Windows OS Events policy

Check	Description	Usage and Example	Output
os.windows.check-event-log	Measures the Windows event log against parameter thresholds and returns a *CRITICAL* | *WARNING* | *OK* event.	Usage: • -w warning - Triggers a WARNING event if the event log count matching the pattern is above the WARNING parameter value specified in the check parameter. • -c critical - Triggers a CRITICAL event if the event log count matching the pattern is above the CRITICAL parameter value specified in the check parameter. • -e event level - Specifies the severity level of the event. Possible values: Information, Verbose, Critical, Warning, Error. • -i - Unique event ID • -d - The duration of time, in hours, in which you want to retrieve events from the Windows event log. Usage example: `winchecks check-windows-event-log -w 5 -c 10 -e "Information" -l`	Check Event Log OK: The Event Log that matches the pattern is <matched count>

Windows OS Events policy (continued)

Check	Description	Usage and Example	Output
		`"Application" -d 24`	
os.windows.check-event-log-count	Measures the Windows event log against parameter thresholds and returns a CRITICAL \WARNING\OK event. Provides information on the number of events that have occurred within a specified duration for a single log file and a single ID. Also indicates the filters to be applied to retrieve events for a specific single-valued windows event level and provider name. Retrieving events from multiple log files is not supported. The number of events is provided, without details of each and every event.	Usage: • -w warning - Triggers a WARNING event if the event log count matching the pattern is above the WARNING parameter value specified in the check parameter. • -c critical - Triggers a CRITICAL event if the event log count matching the pattern is above the CRITICAL parameter value specified in the check parameter. • -l log_file - The log file to be monitored. Name of the file is written in double quotation marks. • -r regex_pattern - The regex pattern which filters out the description in the event log. Written in double quotation marks. • -e event level - Specifies the severity level of the event. Possible values: Information, Verbose, Critical, Warning, Error. • -i id - Unique event ID • -d duration_hour - The duration of time, in hours, in which you want to retrieve events	Check Event Log OK: The Event Log that matches the pattern is <matched count>

Windows OS Events policy (continued)

Check	Description	Usage and Example	Output
		from the Windows event log. Decimal points can be used; for example, 30 minutes - 0.5. • -p provider_name - Source of the event, written in double quotation marks. Usage example: `winchecks check-windows-event-log -w 5 -c 10 -e "Information" -l "Application" -d 24`	
os.windows.check-event-log-details	Collects and filters Windows Event logs based on the `duration_hour`, `event_log_level` and `log_file` values. Retrieves and filters Windows event logs according to the provided parameters. It returns details about the events with CRITICAL, WARNING, or OK status, based on the specified severity level.	Usage: • -d duration_hour - Duration (in hours) from the current time to filter events (Default: 24). • -e event_log_level - Filter the events based on the event level. Possible values are: Information, Verbose, Critical, Warning, Error. Multiple values are comma-separated (Default: Information). For example: Information, Warning • -i id - Filters events based on the specified event IDs. For multiple IDs, values are comma-separated and enclosed in double quotation marks.	Check Event Log Details WARNING: Type: Information, Category: Application, Machine: ws19-inc0061393.LOCAL.LAB, Event_ID: 1704, Message: Security policy in the Group policy objects has been applied successfully., TimeCreated: 10/14/2024 12:09:35 AM. Type: Information, Category: Application, Machine: ws19-inc0061393.LOCAL.LAB, Event_ID: 16384, Message: Successfully scheduled Software Protection service for restart at 2124-09-20T06:25:44Z. Reason: Rules Engine, TimeCreated: 10/13/2024 11:25:44 PM.

Windows OS Events policy (continued)

Check	Description	Usage and Example	Output
		For example: "1257, 1001" • -l log_file - Specifies the log file name to filter events. The name of the file is written in double quotation marks. Supports creating custom files and multiple values are comma-separated. (Default: Application). For example: "Application, System" • -p provider_name - The name of the event provider, enclosed in double quotation marks. • -r regex_pattern - Filters events by matching the event message with the specified pattern. Value must be enclosed in double quotation marks. • -s servicenow_event_severity - Creates a servicenow event with the value given in this parameter. Possible values are: Critical, Warning and OK. Usage example: `winchecks check-windows-event-log-details -d 24 -l Application -e Warning -r "*" -s Warning`	Type: Information, Category: Application, Machine: ws19-inc0061393.LOCAL.LAB, Event_ID: 16394, Message: Offline downlevel migration succeeded., TimeCreated: 10/13/2024 11:24:19 PM. Type: Information, Category: Application, Machine: ws19-inc0061393.LOCAL.LAB, Event_ID: 8224, Message: The VSS service is shutting down due to idle timeout., TimeCreated: 10/13/2024 11:51:36 AM.

Windows OS Events policy (continued)

Check	Description	Usage and Example	Output
os.windows.check-disk-name	Takes the storage drive name as input and verifies if the drive is present. Returns a *CRITICAL | WARNING | OK* value based on the parameter provided.	winchecks check-windows-disk-name <options> -d : Disk name (Default = C) Usage example:`winchecks check-windows-disk-name -d C`	Windows Checks OK: Disk storage C is present.
os.windows.check-processor-queue-length	Measures the process queue length against thresholds and returns a CRITICAL \WARNING\OK event according to the thresholds given in the accompanying parameters.	Usage: • -w warning - Triggers a WARNING event if the processor queue length count matching the pattern is above the WARNING parameter value specified in the check parameter. • -c critical - Triggers a CRITICAL event if the processor queue length count matching the pattern is above the CRITICAL parameter value specified in the check parameter. Usage example: `winchecks check-windows-processor-queue-length -w 5 -c 10`	Processor Queue Length OK: The Processor Queue length is 0.00
os.windows.check-system-cpu-load	Checks CPU Load by using typeperf. Measures the CPU load against configured thresholds and returns a CRITICAL \WARNING\OK event	Usage: • -w warning - Triggers a WARNING event if the CPU load count matching the pattern is above	CPU Load OK: The total CPU utilization is 26.92%

Windows OS Events policy (continued)

Check	Description	Usage and Example	Output
		• -x ignore_type - Skip volumes with the specified filesystem types. • -i ignore_mnt - Skip the specified mount points when collecting disk usage. Returns an error if a specified mount point does not exist in the system. • -r ignore_mnt_regex - Skip volumes whose names match the given regular expression. • -l ignore_label - Skip volumes whose labels match the given regular expression. Usage example: `winchecks check-windows-disk -w 85 -c 95`	
os.windows.check-system-memory-percent	Collects the RAM usage. Measures the memory usage against configured thresholds and returns a CRITICAL \WARNING\OK event according to the thresholds given in the accompanying parameters.	Usage: • -w warning - Triggers a WARNING event if the memory use percentage matching the pattern is above the WARNING parameter value specified in the check parameter. • -c critical - Triggers a CRITICAL event if the memory use percentage matching the pattern is above the CRITICAL	RAM Usage OK: The total memory utilization is 84%

Windows OS Events policy (continued)

Check	Description	Usage and Example	Output
		parameter value specified in the check parameter. Usage example: `winchecks check-windows-ram -w 85 -c 95`	
os.windows.check-system-process	Query running processes to find running processes that match the given arguments (pattern, name, both pattern and name. At least one must be given). Measures the running processes against configured thresholds and filters, returns a CRITICAL \WARNING\OK event according to the thresholds given in the accompanying parameters.	Usage: • -n name - Process executable name to check the process execution. • -p pattern - Pattern (sub string) to search for in the command that invoked the process. Produces valid results only if the user running the Agent owns the queried process has view permissions for the queried process. • -w warnover - Triggers a WARNING status if the query returns more processes than those specified by the argument. • -W warnunder - Triggers a WARNING status if the query returns fewer processes than those specified by the argument. • -c critover - Triggers a CRITICAL event if the query returns more processes than those specified by the argument.	Check Process OK: OK Found 1 matching running processes named explorer

Windows OS Events policy (continued)

Check	Description	Usage and Example	Output
		• -C critunder - Triggers a CRITICAL event if the query returns fewer processes than those specified by the argument. Usage example: `winchecks check-windows-processes -n explorer`	
os.windows.check-directory	Verifies whether a Windows directory exists.	Usage: -d --directory Path to the relevant directory; use '\' for separation. Usage example: `winchecks check-windows-directory -d dir_path`	Check Directory OK: The directory 'C:/Users/Public' exists
os.windows.check-pagefile	Collects the *`Pagefile`* usage and compares it against the WARNING and CRITICAL thresholds.	Usage: • -w warning - Triggers a WARNING event if the *`Pagefile`* usage is above the WARNING parameter value specified in the check parameter. • -c critical - Triggers a CRITICAL event if the *`Pagefile`* usage is above the CRITICAL parameter value specified in the check parameter. Usage example: `winchecks check-windows-pagefile -w 75 -c 85`	Check Windows Page File OK: Page file usage at 31.63%

Windows OS Events policy (continued)

Check	Description	Usage and Example	Output
os.windows.check-free-physical-memory	Measures the free physical memory against configured thresholds and returns a CRITICAL \WARNING\OK event according to the thresholds given in the accompanying parameters.	Usage: • -w warning - Triggers a WARNING event if the free physical memory is under the WARNING parameter value specified in the check parameter. • -c critical - Triggers a CRITICAL event if the free physical memory is under the CRITICAL parameter value specified in the check parameter. Usage example: `winchecks check-windows-free-physical-memory -w 10 -c 5`	Free Physical Memory OK: The Free Physical Memory is 20.25%
os.windows.check-free-virtual-memory	Measures the free virtual memory against configured thresholds and returns a CRITICAL \WARNING\OK event according to the thresholds given in the accompanying parameters.	Usage: • -w warning - Triggers a WARNING event if the free virtual memory is above the WARNING parameter value specified in the check parameter. • -c critical - Triggers a CRITICAL event if the free virtual memory is above the CRITICAL parameter value specified in the check parameter. Usage example: `winchecks check-windows-free-virtual-`	Free Virtual Memory OK: The Free Virtual Memory is 25.66%

Windows OS Events policy (continued)

Check	Description	Usage and Example	Output
		`memory -w 10 -c 5`	
os.windows.check-process-cpu	Processes CPU usage against configured thresholds and returns a CRITICAL \WARNING\OK event according to the thresholds given in the accompanying parameters.	Usage: • -p processname - Process name to collect CPU usage. • -w warning - Triggers a WARNING event if the CPU usage is above the WARNING parameter value specified in the check parameter. • -c critical - Triggers a CRITICAL event if the CPU usage is above the CRITICAL parameter value specified in the check parameter. Usage example: `winchecks check-windows-process-cpu-p acc -c 95 -w 85`	Check Process CPU OK: Process CPU usage is 0.0000%
os.windows.check-process-memory	Processes memory usage against thresholds and returns a CRITICAL \WARNING\OK event according to the thresholds given in the accompanying parameters.	Usage: • -p processname - Process name to collect memory usage. • -w warning - Triggers a WARNING event if the process memory usage is above the WARNING parameter value specified in the check parameter. • -c critical - Triggers a CRITICAL event if the process	Check Process Memory OK: Process Memory usage is 0.0149%

Windows OS Events policy (continued)

Check	Description	Usage and Example	Output
		memory usage is above the CRITICAL parameter value specified in the check parameter. Usage example: `winchecks check-windows-process-memory-p acc -c 95 -w 85`	
os.windows.check-user-account	Takes the list of user names as an input and verifies whether the user account is active. Returns a CRITICAL\WARNING \OK value.	winchecks check-windows-user-disabled (options) -u : Comma separated List of User Name Usage example: `winchecks check-windows-user-disabled- u Administrator,Guest`	User Name and Status
util.windows.check-windows-service	Verifes whether a Windows Service is present and returns the actual service state and service type reported by the Windows Service Control Manager (`sc query`), for example: `Service: 'X', Status: 'RUNNING', Startup Type: 'WIN32_OWN_PROCESS'` Possible values: • RUNNING • STOPPED • START_PENDING • STOP_PENDING • CONTINUE_PENDING	Usage: • -s, service - The service to check if running (triggers an event with default severity of WARNING if the service is not running). • -e, non_running_services_event_severity - Sets the severity level for reporting events when the service is not running. The values can be either CRITICAL or WARNING (Default: WARNING). • -G, skip_events_for_nonexistent - Skips the event	`Service: '[ ]', Status: '[RUNNING/STOPPED/etc.]', Startup Type: '[WIN32_OWN_PROCESS/etc.]'`

			win2019-dc-64bit.mem.total_visible(KB) 8387596.00 1645372274
os.windows.check-process-status	Collects windows process status with CPU and memory data used by the process.	Usage: • -n, process - Process name to collect status metric. • —scheme, scheme - Replaces output's hostname+process with the given value (example: hostname.process).	win2019-dc-64bit.Process.Status 67 1645372421 win2019-dc-64bit.Process.CpuPercent 0 1645372421 win2019-dc-64bit.Process.Memory(KB) 1226444 1645372421

Windows metrics

The following table lists the metrics that are gathered as output from Windows checks. Entries indicated as **Featured metrics** are high-visibility metrics that are displayed in the Operator Workspace Metric tab after an alert is generated. These metrics provide the operator with additional information to help them further explore the specified issue.

Windows metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
Process.Status			Windows process status including CPU and memory data.
Process.CpuPercent			Percentage of CPU used by the process.
Process.Memory(KB)		KB	Memory used by the given process.
cpu.queuelength (featured metric)			Processor queue length.
cpu.loadavgsec (featured metric)			Average CPU load per second.
disk.AvgDisksec/Read		seconds	Average time of a read from the disk.
disk.AvgDisksec/Write		seconds	Average time of a write to the disk.

Windows metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
disk.DiskReadBytes/sec		byte/sec	Rate at which bytes are transferred from the disk during read operations.
disk.DiskWriteBytes/sec		byte/sec	Rate at which bytes are transferred to the disk during write operations.
disk_usage.avail(GB)		GB	Disk available.
disk_usage.used(GB)		GB	Disk used.
disk_usage.total(GB)		GB	Disk total.
disk_usage.used_percentage (featured metric)			Disk used in percentage.
mem.free_physical_percentage			Percent of free physical memory.
mem.free_virtual_percentage			Percent of free virtual memory.
ram.usage_percentage (featured metric)			Percent of RAM used.
mem.free_physical(KB)		KB	Amount of free physical memory.
mem.total_physical(KB)		KB	Total physical memory.
mem.free_virtual(KB)		KB	Amount of free virtual memory.
mem.total_virtual(KB)		KB	Total virtual memory.
mem.available(KB)		KB	Total amount of virtual memory available.
mem.total_visible(KB)		KB	Total amount of physical memory accessible to the operating system.
system.uptime(Sec)		seconds	Duration that the system has been operational.
system.network.Bytes_Received/sec (featured metric)		byte/sec	Bytes received per second for active network adapters.
system.network.Bytes_Sent/sec (featured metric)		byte/sec	Bytes sent per second for active network adapters.

Windows metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
system.network.Bytes_Total/sec (featured metric)		byte/sec	Sum of the bytes received and sent per second.
system.network.Current_Bandwidth		bit/sec	Estimate of the network interface bandwidth.
system.network.Offloaded_Connections			Number of IPv4 and IPv6 TCP connections currently handled by the TCP chimney offload capable network adapter.
system.network.Output_Queue_Length			Length of the output packet queue.
system.network.Packets/sec			Rate that packets are sent and received on the network.
system.network.Packets_Outbound_Discarded			Number of outbound packets that were discarded.
system.network.Packets_Outbound_Errors			Number of outbound packets that could not be sent becuase of errors.
system.network.Packets_Received/sec			Rate that packets are received.
system.network.Packets_Received_Discarded			Number of inbound packets that were discarded.
system.network.Packets_Received_Errors			Number of inbound packets that could not be sent because of errors.
system.network.Packets_Received_Non-Unicast/sec			Rate that non-unicast (subnet broadcast or subnet multicast packets) are delivered to a higher-layer protocol.
system.network.Packets_Received_Unicast/sec			Rate that unicast (subnet) packets are delivered to a higher-layer protocol.

Windows metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
system.network.Packets_Received_Unknown			Number of packets that were received, but discarded, because of an unknown or unsupported protocol.
system.network.Packets_Sent/sec			Rate that packets are sent.
system.network.Packets_Sent_Non-Unicast/sec			Rate that packets are requested for transmission to non-unicast (subnet broadcast or subnet multicast) addresses by higher-layer protocols. Includes packets that were discarded or not sent.
system.network.Packets_Sent_Unicast/sec			Rate that packets are requested to for transmission to subnet-unicast addresses by higher-layer protocols. Includes packets that were discarded or not sent.
system.network.TCP_Active_RSC_Connections			Number of IPv4 and IPv6 TCP connections currently receiving large packets from the RSC-capable network adapter.
system.network.TCP_RSC_Average_Packet_Size		byte	Average size of received packets across all TCP connections.
system.network.TCP_RSC_Coalesced_Packets/sec			The large-packet receive rate across all TCP connections.
system.network.TCP_RSC_Exceptions/sec			The RSC exception rate for received packets across all TCP connections.

Windows log monitoring default checks and policies

Agent Client Collector provides the following policy for Windows log monitoring.

Windows log monitoring policy

Type	Check	Description	Usage and Usage Example	Output
Event	os.windows.check-log	Enables monitoring log files on a Windows server.	Usage: • -c crit N: Critical level if pattern has a group. • -f -log-file FILE: Path to log file. • -o --warn-only: Warn instead of critical on match. • -q pattern PAT: Pattern to search for. To search for multiple patterns, separate each pattern with a pipe (|) and put inside quotes. For example: "SEVERE|404" • -w warn N: Warning level if pattern has a group.	Windows Log CRITICAL: Found 4 criticals, 0 warnings for pattern SEVERE|Exception|404|Errorin file C:\ProgramData\ServiceNow\agent-client-collector\log\acc.log

Linux log monitoring default checks and policies

Agent Client Collector provides the following policy for Linux log monitoring.

Type	Check	Description	Usage and Usage Example	Output
Event	util.check-logs	Enables monitoring log files owned by a regular user.	Usage: • -i --icase: Run a case insensitive match. • -c, --crit N: Critical level (if pattern has a group).	CheckLog CRITICAL: 0 warnings, 8 criticals for pattern SEVERE|Exception in log file /var/log/servicenow/agent-client-collector/acc.log

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Type	Check	Description	Usage and Usage Example	Output
			• --encode-utf16u: Encode line with utf16 before matching. • -e, --encoding ENCODING-PAGE: Specific encoding page to read log file with. • -E, --exclude PAT: Pattern to exclude from matching. • -F, --filepattern FILE: Check a pattern of files, instead of one file. For REGEX, first test it on `https://rubular.com/` to get the expected outcomes and then pass it inside quotes as a parameter. For example, to get all *`.log`* extension files, pass `"(.)*\.log$"` as REGEX. • -f, --log-file FILE: Path to log file. • -l, --log-pattern PAT: Log format of each log entry: • -o, --warn-only Warn instead of critical on match. • -q, --pattern PAT Pattern to search

			groupWarning level if pattern has a group. Usage example: `command: check-log.rb -c 2 -w 1 -q "SEVERE|Exception" -s /tmp/cache/check-log -f /var/log/servicenow/agent-client-collector/acc.log`	

Agent Client Collector checks – credential and permission requirements

Agent Client Collector checks require specific credentials and permissions to execute successfully. The following sections outline the application-level (DB grants, API roles) and OS-level access required for each check.

Oracle check

Learn about the credential and permission requirements for the Oracle checks `app.oracle.check-oracle-alive`, `app.oracle.metrics-oracle`, and `util.metrics-oracle-query`.

Oracle checks require two separate accounts with different permissions.

Oracle database account

The database user configured in ServiceNow® must have the following permissions:

- CREATE SESSION or CONNECT
- SELECT access to the Oracle views or tables queried by the specific check that is running

Checks and queries

Check	Queries
`check-oracle-alive`	`SELECT BANNER FROM v$version WHERE banner LIKE 'Oracle%'`
`metrics-oracle`	`SELECT TABLESPACE_NAME, sum(BYTES), sum(MAXBYTES) FROM sys.dba_data_files GROUP BY TABLESPACE_NAME`
`util.metrics-oracle-query`	Any custom query. The database account needs SELECT on the object targeted by that query.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agent Client Collector agent OS account

All three checks run *sqlplus* locally on the target host where the OS account runs the Agent Client Collector agent. This is a separate identity from the Oracle database account.

Agent Client Collector agent OS account needs the following access:

- Execute access to `$ORACLE_HOME/bin/sqlplus`
- Access to Oracle client libraries under `$ORACLE_HOME/lib`
- Access to Oracle configuration files if applicable, such as `tnsnames.ora` and `sqlnet.ora`

Depending on the Oracle installation, this means the Agent Client Collector agent OS account must be a member of `oinstall` or a database administrator.

Configuration Prerequisites:

- *sqlplus* installed and reachable at `$ORACLE_HOME/bin/sqlplus`
- Oracle listener reachable from the agent host through `--host`, `default localhost`, and `--port`, default 1521
- Valid Oracle database credentials

Troubleshooting

Error	Cause
Permission denied or command not found on *sqlplus*	The Agent Client Collector agent OS account lacks access to `$ORACLE_HOME` or *sqlplus*. This is not a database credential problem.
`ORA-xxxxx` errors	Oracle-side error that points to the database account or grants and not the OS account.
Custom query fails only on `util.metrics-oracle-query`	Re-check SELECT grants whenever `--query` is changed to target a new object.

MySQL check

Learn about the credential and permission requirements for the MySQL checks `app.mysql.check-mysql-alive`, `util.metrics-mysql-query`, `app.mysql.check-mysql-threads`, `app.mysql.metrics-mysql`, `app.mysql.metrics-mysql-processes`, and `util.check-mysql-query`

MySQL checks require two separate accounts with different permissions:

MySQL database account

The database user configured in the ServiceNow® credential must have the following permissions:

- Basic login privilege on the target host and port, or socket
- SELECT access to whatever schema or table is targeted by a custom query
- PROCESS privilege for checks that read server-wide thread or connection state

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Checks and additional requirements

Check	Additional requirement
`check-mysql-alive`	Login privilege only
`check-mysql-query-result-count`, `metrics-mysql-query-result-count`	SELECT access on the object targeted by the configured `--query`
`check-mysql-threads`, `metrics-mysql-processes`	PROCESS privilege. Without it, the account only sees its own connection or thread, not the server-wide count, and the check silently under-reports instead of erroring.
`metrics-mysql-graphite`	Login privilege only

Agent Client Collector Agent OS account

There is no special OS permission required. The Agent Client Collector agent OS account only needs additional access if:

- A UNIX socket is used instead of TCP through `--socket`. The agent needs read and execute access to the socket file and its parent directory.
- An `ini` file is used to source connection settings through `--ini` or `--ini_section`, `my.cnf-style`. The agent needs read access to this `ini` file.

Depending on the deployment, this typically means group membership on the socket's owning group, or read ACLs on the `my.cnf` file. It doesn't usually require root or DBA-level access.

Configuration Prerequisites:

- MySQL or MariaDB TCP endpoint that is reachable from the agent host through `--hostname` and `--port`, or through `--socket`
- Database credentials are valid and not blocked by host-based grant restrictions, such as `user@'agent-host'` compared to `user@'%'`
- For thread or process metrics, confirm PROCESS is granted by running `SHOW GRANTS FOR 'user'@'host';`

PostgreSQL check

Credential and permission requirements for the PostgreSQL checks that monitor database size, statistics, connections, and locks.

PostgreSQL database account

The database user configured in the ServiceNow credential must meet the following requirements.

- Required for every check in this group: the account must be allowed to authenticate and connect to the specific database named in `--database`. It needs CONNECT privilege on that database, and `pg_hba.conf` on the server must permit login from the agent host for that user and database combination.
- Required only for `postgresql.check-connections` and `postgresql.metric-active-connections`: the `pg_monitor` role on `Postgres 10+`, or superuser. Both checks query `pg_stat_activity` across all databases and sessions.

Configuration Prerequisites:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Postgres TCP endpoint must be reachable from the agent host.

- `pg_hba.conf` must let the agent host's source IP to authenticate for this user and database.
- The connection `sslmode=disable` is hard-coded. If the server enforces SSL/TLS only through `hostssl` entries, the check fails with an SSL-negotiation error that can look like an authentication failure.
- Confirm `pg_monitor` is granted if you're using connection or stats metrics.

HAProxy check

Credential and permission requirements for the HAProxy checks `check-haproxy` and `metrics-check-haproxy`.

HAProxy stats credential

The HAProxy stats credential are required only when the HAProxy stats page has authentication enabled.

Agent Client Collector Agent OS account

When using an HTTP or HTTPS stats page an Agent Client Collector account is not required. OS-level access is only required if using the UNIX stats socket, with `--stats` pointed at a socket path instead of an HTTP hostname.

In that case, the ACC agent OS account needs read/write access to the socket, which is often owned by `haproxy:haproxy` with restrictive permissions.

Configuration prerequisites:

- The HAProxy stats page or socket must be enabled in the HAProxy configuration through `stats socket` or `stats enable`.
- If a `stats-page` credential is configured, it must match `stats auth user:pass` in the HAProxy configuration.

Troubleshooting:

A permission denied error when connecting to the stats socket is an OS-level group or ACL issue on the ACC agent account. It is not a credential problem.

File or directory check

OS-level permission requirements for the file or directory check.

Agent Client Collector Agent OS account

The Agent Client Collector agent OS account is only required if the target file or directory is owned by another service account. The Agent Client Collector agent OS account needs the following permissions:

- Read permission, and for directories, execute or traverse permission, on the target `--directory`, `--dirpath`, or `--filepath`.
- For `check-file-response-time`, read access to the contents of the file, not just metadata, because it measures read latency.

A file or directory owned by another application, such as its own log or data directory, is frequently not world-readable. In that case, the Agent Client Collector agent account needs group membership or an ACL grant to read it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuration Prerequisites:

- Confirm the target path exists and is spelled or cased correctly. Paths are case-sensitive on Linux.
- Confirm read and execute permission on the full path, including every parent directory, not just the final file or directory. A missing execute bit on a parent directory blocks traversal even if the file itself is readable.

Troubleshooting:

- A file not found result for a file that exists means a missing execute bit on a parent directory rather than a problem with the file itself.
- For files owned by another service account, add the Agent Client Collector agent OS account to the owning group, or grant an ACL, rather than loosening the file's world permissions.

Azure metrics script

When creating a new policy for Azure cloud metrics, create a .json script to determine the metrics to be monitored. The format for the script appears below, followed by a table explaining the script contents.

```
{
  "namespace": "Microsoft.Network/loadBalancers",
  "metrics": [
          "AllocatedSnatPorts",
          "ByteCount",
          "DipAvailability",
          "PacketCount",
          "SnatConnectionCount",
          "SYNCount",
          "UsedSnatPorts",
          "VipAvailability"
  ],
  "time_grain": "PT1M"
}
```

Resources and their metrics are retrievable from the Supported metrics for Azure resources page.

Header	Description
namespace	The name of the resource being monitored.
metrics	The metrics being retrieved from the monitored resource.
time_grain	The granularity of how often metrics are to be collected. Possible values are: • PT1M: Metric values are collected every minute. • PT5M: Metric values are collected every 5 minutes. • PT15M: Metric values are collected every 15 minutes. • PT30M: Metric values are collected every 30 minutes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Header	Description
	• PT1H: Metric values are collected every hour. • PT1D: Metric values are collected daily.

Windows event log filter parameters

The configurable values on the Check Parameters tab of the os.windows.check-event-log check.

Check Parameters tab values

Parameter	Type	Description
provider_name	String	Name of the provider that generated the event. **Note:** If you do not specify a *log_file* value together with the *provider_name*, the system searches all available log files, which increases the time it takes to receive results.
log_file	String	The name of the Windows event log file from which you retrieve events. Possible values are: • Application • System **Note:** If you do not specify a *provider_name* value together with the *log_file*, the system searches all events from the log file, which increases the number of retrieved events.
id	Integer	The numerical id of the event. Possible values are 0-65535.
warning	Integer	Any value above the specified parameter generates a Warning event.
event_level	String	The severity level of the event. Possible values: • Critical • Error

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Check Parameters tab values (continued)

Parameter	Type	Description
		• Warning • Information • Verbose
regex_pattern	String	The regex pattern to be used in searching the event logs. The value must be enclosed in double quotation marks. For example, "error".
duration_hour	Integer	The time period for which you want to retrieve events from the Windows event log. Value is specified in hours; fractions of hours are specified with decimals.
critical	Integer	Any value equal to or above the specified parameter generates a Critical event.

Parameters of MID Server distributed cluster

The following MID Server parameters support the MID Server Distributed cluster type.

You can access these parameters in the **Configuration Parameters** related list of a MID Server. To add and set any of these parameter, see Add a MID Server parameter.

Parameter	Description
mid.distributed.cluster.striped.threadpool.size	Size of striped threadpool in MID Server distributed cluster. • **Type**: integer • **Default value**: Number of cores on the virtual machine or server.
mid.distributed.cluster.log.level	Logging level for MID Server distributed cluster, which can help troubleshooting. However, logging impacts the performance of Metric Intelligence. An empty value designates no logging. • **Type**: integer • **Default value**: none • **Other possible values**: info, debug, trace

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter	Description

mid.distributed.cluster.global.timeout	Global timeout in seconds for MID Server distributed cluster.
	
	• **Type**: integer
	• **Default value**: 180
	• **Other possible values**:
	  ○ **Minimum value**: 60 (not enforced)
	  ○ **Maximum value**: 300 (not enforced)

mid.distributed.cluster.node.max.off.heap.memory	The amount of off heap memory used by Metric Intelligence to process data series per minute. The default 4 GB of space is the amount of off heap memory needed for processing 800,000 data series per minute. Adjust this value proportionally to the amount of actual data series. For example, to process 400,000 data series per minute, you can change the value to 2048. • **Type**: integer • **Default value**: 4096

Scheduled jobs included with MID Server distributed cluster

The following MID Server scheduled job is included with the MID Server Distributed cluster type.

Name	Description
Validate MID distributed cluster	Validates status of the cluster node for each MID Server in the cluster. For a MID Server that is down and its status is not stopped, updates the node status to stopped. Also, validates overall status of the cluster. During this validation, the job stops the cluster if there are multiple sub-clusters in a single cluster.

Components installed with Metric Intelligence

Several types of components are installed with activation of the Metric Intelligence (com.snc.sa.metric) plugin, including tables, scheduled jobs, and properties.

Note: The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scheduled jobs installed

Name	Description
Metric Intelligence — Metric Learner job	Runs daily and builds the statistical models used for anomaly detection.
Metric Intelligence — Purge old metric schemas and anomaly scores	Cleans up the *sa_metric_anomaly_score* and the *sa_metric_schema_definition* tables.
Metric Intelligence — Sync metric schema to mid	Synchronizing data from the instance to the MID Server in the metric schema table *sa_metric_schema_definition*.
Metric Intelligence — Sync tables with mid	Synchronizing data from the instance to the MID Server in tables.
Metric Intelligence — Table cleanup	Cleaning up tables related to various deletion operations.
Metric Intelligence — Observation Interval Learner job	Calculates the observation interval using collected data points for all data series.
Metric Intelligence — Process Stale Anomaly Score – Daily	Daily job that cleans stale anomaly scores, for a specified window of time, in the Metric Anomaly Score [sa_metric_anomaly_score] table. Uses the properties *sa_metric.anomaly_score_stale_interval_in_days* and *sa_metric.anomaly_score_next_stale_interval_in_days* to calculate the window of time for cleaning.
Metric Intelligence — Sync CI Anomaly Scores	Keeps anomaly scores up to date with any deletion of metrics.
Metric Intelligence — Metric configuration job	Synchronizes metric configurations from the instance to all Metric Intelligence MID Servers.
Metric Intelligence — Local level kalman filter model learner job	Builds local level kalman filter models on which to run change detection.
Metric Intelligence — Anomaly Model Test	On-demand scheduled job which runs when user clicks **Run Anomaly Test**.
Metric Intelligence — Validate MID Distributed cluster	**1.** Checks the status of the cluster node. If status is **Started** and the status of the Metric Intelligence extension is not any of **Started**/**Starting**/**Warning** [warning with specific errors], the job takes action. The job changes the status of the cluster node to **Stopped**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	This happens when MID Server stops unexpectedly without notifying the instance that it is stopping. **2.** Checks the status of all cluster nodes on all MID Servers in the cluster. ○ If the status of all nodes is **Stopped** and the status of the cluster itself is **Started**, then the job changes the status of the cluster to **Stopped**. ○ If the cluster status is **Stopped** but MID Servers have a running cluster node, the job changes the cluster status to **Started**. **3.** Checks the number of Cluster Leaders: If two are detected, then the job stops the entire cluster. This happens when MID Servers are not able to connect with other members of the cluster and form multiple sub-clusters.
Event Management - process metric binding events [1000-1020]	Process Metric Intelligence metric binding events separately from Event Management events (bucket range 1000-1020).
Event Management - process metric binding events [1020-1040]	Process Metric Intelligence metric binding events separately from Event Management events (bucket range 1020-1040).
Event Management - process metric binding events [1040-1060]	Process Metric Intelligence metric binding events separately from Event Management events (bucket range 1040-1060).
Event Management - process metric binding events [1060-1080]	Process Metric Intelligence metric binding events separately from Event Management events (bucket range 1060-1080).
Event Management - process metric binding events [1080-1100]	Process Metric Intelligence metric binding events separately from Event Management events (bucket range 1080-1100).
Metric Intelligence - Stationary nonparametric model learner job	Learns the stationary nonparametric model.
Metric Intelligence - Combined Model Learner Job	Constructs information for real time anomaly detection on a subset of collected series. Calculates data frequency and builds statistical models.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tables installed

Table	Description
Metric Time Series Model [sa_time_series]	Statistical models built for metric data.
Alert Anomaly [em_alert_anomaly]	Anomaly alerts that were created from anomaly events that were sent by Metric Intelligence so users can review. Anomaly alerts are kept separately from regular system alerts.
Metric Anomaly Score [sa_metric_anomaly_score]	Stores anomaly scores for the metric.
Metric To CI Mapping Deleted SysIds [sa_metric_map_deleted]	SysIds of deleted metric-to-CI mapping records.
Metric To CI Mapping [sa_metric_map]	Mappings currently in effect of metric types to CIs.
SA Metric Type Registration [sa_metric_registration]	Details about metric type registration.
Metric Type Registration Deleted SysIds [sa_metric_registration_deleted]	SysIds of records that were deleted from the SA Metric Type Registration [sa_metric_registration] table.
Metric Schema Definition [sa_metric_schema_definition]	Map of metrics being received based on CI class. It is used to optimize the metric data payload being sent from the MID Server to the instance.
Metric Type [sa_metric_type]	Metric type source.
Monitoring System Metric Type Deleted SysIds [sa_source_metric_type_deleted]	SysIds of deleted monitoring system metrics.
Monitoring System Metric Type [sa_source_metric_type]	Metric types per CI class, active/inactive status, and metric source.
Metric Settings [sa_metric_config_setting]	Default configuration settings for Metric Intelligence MID Servers.
Metric Configuration Rules [sa_metric_config_rule]	Rules to override configuration settings for MID Servers.
Metric overridden configurations	Maps overridden configurations to custom defined rules.

Table	Description
[sa_metric_config_rule_setting]	
Metric Staged Configurations [sa_metric_config_staging]	Saved encoded configurations for the MID Servers.
Metric learned parameters [sa_metric_learned_param]	Parameters learned for CI/metric combinations, that will be synced to the MID Servers.
Metric To CI Mapping Deleted Details [sa_metric_map_deleted_detail]	Details about deleted entries from metric to CI mapping table. Includes CI, metric, and SysId of the deleted entry in the Metric To CI Mappings [sa_metric_map] table.
Track unique CIs created in metric map [sa_metric_ci_tracker]	All unique CIs for which metric map entry was created.
Metric Class [sa_metric_class]	Metric classes that can be associated with specific metrics to override bounds and widths learned values.
Metric Change Score [sa_metric_change_score]	Change events information.
Anomaly Test Rules [sa_metric_anomaly_test_rule]	Anomaly test rules used for anomaly model testing.
Anomaly test results [sa_metric_anomaly_test_result]	Results from anomaly model testing, such as bounds and anomaly scores.
Metric anomaly test config customized parameters [sa_metric_anomaly_test_config_custom_param]	Customized parameters for selected series in anomaly model testing.
Metric Intelligence Properties [sa_metric_property]	Metric Intelligence properties by domain.
Track host name with metric CI [sa_metric_ci_host]	CIs that are bind with node name from the binding event.
Functions supported by metric expression language [sa_metric_expr_function]	Functions supported by metric expression language.
Argument types for functions supported by metric expression language [sa_metric_expr_func_arg]	Argument types for functions supported by metric expression language.

Table	Description
Track CI Types to metric entries valid for different sources [sa_metric_ci_type_map]	Track CI Types to metric entries that are valid for different sources.
CI Type To Resource Class [sa_ci_type_to_resource_class]	Contains mappings of CI type to resource class. Used for resource binding during resource lookups given a CI and a `resource_path` in the event. The [sa_ci_type_to_resource_class] table contains some default mapping records, and the evt_mgmt_admin role is required to manage this table.
CI Resource [ci_resource]	Parent table used for resource binding.
CI Resource Hardware [ci_resource_hardware]	An extension of the CI Resource [ci_resource] table, used for resource binding.
CI Resource Application [ci_resource_appl]	An extension of the CI Resource [ci_resource] table, used for resource binding.
CI Resource Service [ci_resource_service]	An extension of the CI Resource [ci_resource] table, used for resource binding.
CI Resource VM [ci_resource_vm_object]	An extension of the CI Resource [ci_resource] table, used for resource binding.
CI Resource Database [ci_resource_database]	An extension of the CI Resource [ci_resource] table, used for resource binding.
Series Event History [sa_series_event_history]	Information about CIs start and end maintenance mode. Metric Intelligence stores historical information about the times CIs enter and exit maintenance mode if the system property sa.model_learner.maint_event_record_history_enabled is set to true (default). And if the system property sa_metric.maint_exclusion is also set to true (default), metrics from CIs that are in maintenance mode are excluded from model learning.
Metric Dashboard Metadata [sa_metric_dashboard_metadata]	Chart configurations per CI class, for the metrics that are displayed for a CI associated with an alert, in Agent Workspace.
Metric Config Anomaly Detection Staging [sa_metric_config_anomaly_detection_staging]	Internal table that is used to help calculate the action level for each entry in the Metric to CI Mapping [sa_metric_map] table.

sa_metric.scheduled_jobs_to_monitor_sys_id_list	Contains the sys_ids of the 3 scheduled jobs that self-h monitoring for Metric Intelligence monitors: • Metric Intelligence — Metric configuration job • Metric Intelligence — Sync tables with mid • Metric Intelligence — Validate MID Distributed cluste

Quick start tests for Metric Intelligence

Validate that Metric Intelligence still works after you make any configuration change such as apply an upgrade or develop an application. Copy and configure these quick start tests to pass when using your instance-specific data.

Metric Intelligence quick start tests require activating the Metric Intelligence plugin (com.snc.sa.metric).

Metric Intelligence quick start tests

Test	Description	Release version
OI: Health Metrics Collection	An individual test that verifies the following: • There is at least one Metric Intelligence Metrics extension that is running. • There are entries for the 'Health Metrics' in the Metric to CI table. • For each of the Metric Intelligence Metrics extensions that are currently running, that there is data stored in MetricBase. If the test initially fails, wait until the Metric Intelligence Metrics extension runs for at least 10-15 minutes. Then try again.	Madrid

Event severities

The event severity numbers correspond to actual severities on the Metric Anomaly Score to Event Severity Maps page.

Event severity mapping

Event Severity Number	Event Severity
0	Clear (OK)
1	Critical
2	Major
3	Minor
4	Warning

Agent Client Collector for Visibility Content reference

Review this information for details on OS query scripts, data collected, and definition of terms.

OS module scripts for Agent Client Collector for Visibility Content (ACC-VC)

These platform-specific plugins invoke platform-specific module scripts. Each script outputs to a standard JSON payload regardless of the platform.

Operating System family/plugin	Name of module script
Linux: acc-f-modules	basic_inventory.rb (Starting with ACC-F version 2.10.1, this will not be used.)
	data_collection.rb
	running_processes.rb
	tcp_connections.rb
Windows: acc-f-modules	basic_inventory.rb (Starting with ACC-F version 2.10.1, this will not be used.)
	data_collection.rb
	running_processes.rb
	tcp_connections.rb
macOS Operating Systems: acc-f-modules	basic_inventory.rb (Starting with ACC-F version 2.10.1, this will not be used.)
	running_processes.rb
	tcp_connections.rb
Linux: acc-visibility-modules	installed_software.rb
	file_systems.rb
	storages_devices.rb (support for getting physical disk and corresponding disk partitions only)
	network_adapters.rb

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Operating System family/plugin	Name of module script
	local_users.rb
	enhanced_inventory.rb
	cloud.rb
Windows: acc-visibility-modules	installed_software.rb
	file_systems.rb
	storages_devices.rb (support for getting physical disk and corresponding disk partitions only)
	network_adapters.rb
	local_users.rb
	enhanced_inventory.rb
	cloud.rb
	sam_advanced.rb
	sam_processor.rb
	intel_ema.rb
macOS Operating Systems: acc-visibility-modules	installed_software.rb
	file_systems.rb
	storages_devices.rb (support for getting physical disk and corresponding disk partitions only)
	network_adapters.rb
	local_users.rb
	enhanced_inventory.rb
	cloud.rb

Note:

running_processes.rb and tcp_connections.rb are interdependent. For an efficient Discovery, keep both tcp_connections.rb and running_processes.rb together. Both the files are needed to get the complete data. If one is not there, it will not populate the other data.

To fetch information about all the running_processes on the macOS, you must provide sudo access to osquery. If this configuration is not made, then running_processes.rb will only fetch what is triggered by _servicenow user. For tcp_connections.rb, you must add 'sudo lsof' command in the sudoers file. If this is not done, tcp_connections.rb will only fetch what is triggered by _servicenow user.

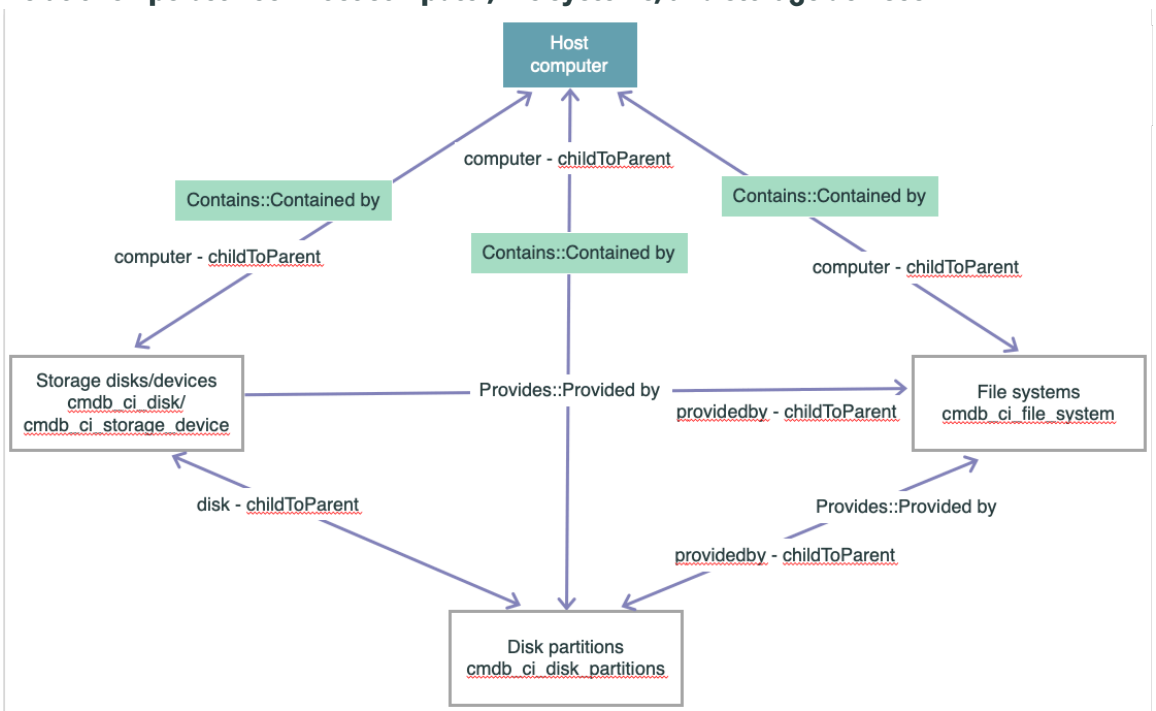
Data collected

ACC-VC uses the same classification criteria as IP-based Discovery for classifying as computer or server. The subset of collected data includes the following categories:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Basic inventory – Starting with ACC-F version 2.10.1, this will not be used.
- Data collection - Collects the necessary data for classification and identification of a host CI. This includes host name, serial numbers, and OS information.
- Installed Software – cmdb_sam_sw_install (if SAM enabled) and cmdb_software_instance (if SAM not enabled)
- File Systems – cmdb_ci_file_system
- Storage Devices – cmdb_ci_disk and cmdb_ci_storage_device
- Serial Numbers – cmdb_serial_number
- Network Adapters – cmdb_ci_network_adapter and cmdb_ci_ip_address
- TCP Connections – cmdb_tcp
- Running Processes – cmdb_running_process (ACC-VC also classifies the running processes and creates application CIs in cmdb_ci_appl, where possible)
- Local User – cmdb_os_user (Populates the local users for all the Operating Systems that ACC-VC supports by adding a new module called local_user)
- Enhanced inventory – Collects enhanced data (such CPU info, start_date, object_id) which is not necessary for identifying a unique host.

Relationships between host computer, file systems, and storage devices



Agent Client Collector terms

Agent Client Collector (ACC)

The software component installed on target hosts that communicates with the MID Server. Sometimes referred to as Agent. This component is a ServiceNow derivative of Sensu-Go.

Agent Client Collector Framework (ACC-F)

A ServiceNow base scoped application that leverages ACC and provides core capabilities (including Check Types, Check Definitions, Policies, and so on) enabling other ACC scoped applications, including ACC-M and ACC-VC.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agent Client Collector Monitoring Monitoring (ACC-M)

A ServiceNow scoped application enabling monitoring use cases.

Agent Client Collector for Visibility Content (ACC-VC)

A ServiceNow scoped application that implements push-based Discovery leveraging ACC and ACC-F.

Horizontal IP-based Discovery

Traditional Discovery available to customers prior to ACC-VC. It discovers data via Probes and Patterns through the MID Server, requiring the Discovery Plugin.

Modules

A subset of discovered data that is populated as part of Discovery. Examples of Modules include: Data Collection, Installed Processes, Serial Numbers, File Systems, Storage Devices, Network Adapters, Running Processes, and TCP Connections.

Push-based Discovery

Discover data via ACC, ACC-F, ACC-VC, and the MID Server with a direct push of data from the target host. Discovery does not require specific IP range configuration on a Discovery Schedule or providing Discovery Credentials for target host.

Sensu-Go agent

The Free and Open Source project which ACC is derived from.

Virtual Machine Instance

A virtual target host running inside of a hypervisor, either on-premise or within a cloud service provider like AWS, GCP, or Microsoft Azure.

Virtual Machine Image

A snapshot of a live virtual machine instance persisted to a file system or cloud storage.

Agent Client Collector for Visibility Content default checks and policies

Agent Client Collector for Visibility Content (ACC-VC) provides various checks and policies as well as a business rule.

Policies

Note: ACC-VC policies execute at a frequency of once per day. The total data ingested would be approximately 572KB. This takes into consideration an average of approximately 1500 installed software applications and approximately 500 running processes other than CI data per machine.

ACC-VC policies

Name	Description	Check definitions
Enhanced Discovery	Runs on a schedule, by default every 24 hours (86400 seconds). The policy interval can be adjusted, for example to run every 4 hours (set the interval to 14400). The ACC-VC policy configuration is synced to all agents based on the policy filter defined by	Enhanced Discovery

ACC-VC policies (continued)

Name	Description	Check definitions
	• FBDFileOutput.json: Stores metadata related to files scanned by a wildcard extension. Runs on the agent when file-based discovery is invoked. For details, see Agent Client Collector File-Based Discovery. Default: false. To activate, navigate to **All** > **Discovery Definition** > **Configuration Console** and in the **File Based Discovery** section, activate the Enable File Based Discovery toggle switch.	
File-based Discovery - SAM	Discovers known software files on the endpoint. Uses an allowlist of recognized software filenames maintained by ServiceNow. When a file on disk matches an allowlist entry, FBD uses the FileBasedDiscovery API to identify the collected software metadata (file name, path, size, and version), identifies the software package it belongs to and records the installation on the instance. Unrecognized files are tracked in the unidentified file records table (cmdb_unidentified_file_set). Runs daily. Default: false. To activate, navigate to **All** > **Discovery Definition** > **Configuration Console** and in the **File Based Discovery** section, activate the Enable File Based Discovery toggle switch.	File-based discovery - SAM
File-based Discovery - SWID tag	Enables SWID tag scanning on a Windows, Linux or macOS platform. When enabled, the scanner looks for `.swid`, `.swidtag`, and `.cmptag` files in the

ACC-VC policies (continued)

Name	Description	Check definitions
	configured scan directories. Stores results in the following tables: • cmdb_swid_tag: Parsed SWID tag records • cmdb_file_information: Individual file records • cmdb_sam_sw_install: Individual software records Default: false. To activate, navigate to **All** > **Discovery Definition** > **Configuration Console** and in the **File Based Discovery** section, activate the Enable File Based Discovery toggle switch.	
File-based Discovery - File management	Discovers files based on customer-defined rules. Administrators configure which file extensions to look for and define filename matching rules such as exact match, starts with, ends with, or contains. This policy builds a device-level file inventory based on the organization's specific needs. Results are stored in the sn_acc_vis_content_device_file_information table. Configure rules in the File Matching rules (sn_acc_vis_contet_file_config) and File extensions (sn_acc_vis_content_file_extension) properties. For details on these properties, see Agent Client Collector File-Based Discovery properties. File Management supports delta scanning; after the initial full scan, only added, modified, and deleted files are sent on subsequent runs. For details on delta scanning, see Agent Client Collector File-Based Discovery.	File-based discovery - File management

Name	Description	Check definitions
VISC Get URL metrics	Controls the collection of web usage data from Windows and macOS managed devices. Runs daily. Default: Inactive. To activate the policy, set the *sn_acc_vis_content.enable_full_monitoring* property to **true**. For details on web usage data system properties, see Web usage data collection tables and fields.	• VISC Get URL metrics • VISC Get targeted URL metric

Note: Windows endpoint devices include devices that have a Windows operating system and belong to CI class: computer.

See System properties for more details. For more details on policies, see Checks and policies.

Check type

ACC-VC has the following check types: *Enhanced Discovery*, *SAM Advanced Discovery*, and *Installed Software*.

Enhanced Discovery

This check type is responsible for invoking the EnhancedDiscoveryHandler script include that processes the payload produced by endpoint_discovery.rb as executed by ACC.

Used by File-base Discovery.

SAM Advanced Discovery

This check type is for the SAM Discovery policy that invokes the EnhancedDiscoveryHandler script include for processing the SAM data produced by the sam_advanced.rb file.

Installed Software

This check type for the *Software installed policy* that invokes the EnhancedDiscoveryHandler script include for processing the installed software data produced by the installed_software.rb file.

Check definitions

ACC-VC check definitions

	agent and the MID Server. For more details on policies, see Checks and policies.
	
	Note:
	
	For the agent to retrieve the OS serial numbers and TCP connections along with associated running processes, sudo access for *dmidecode* and *ss* commands is required on Linux systems. For example, this content could be added to /etc/sudoers or to an individual file in `/etc/sudoers.d/`:
	
	`Cmnd_Alias AGENT_ACC_V = /usr/sbin/dmidecode -s baseboard-serial-number,/usr/sbin/dmidecode -s chassis-serial-number,/usr/sbin/dmidecode -s system-serial-number,/usr/sbin/dmidecode -s system-uuid,/usr/sbin/ss -tanp`
	`servicenow ALL=(root) NOPASSWD:AGENT_ACC_V`
	
	For the sudoers configuration example, the *must_sudo* check parameter, and the equivalent macOS and Windows privilege requirements, see the "Privileges for running check commands" section in Checks and policies.

SAM background log check	Runs every 8 minutes and performs inline aggregation of data generated from Osqueryd logs. After collecting the data, it writes all the intermediate data results into a temporary marker file which is reused in the next run. This reuse limits the number of log files and disk space needed on target systems. **Note:** You may notice a spike in system resource consumption, as the background aggregation check runs every interval.
Software installations and usage metrics	Collects data every 24 hours.
Installed software	Fetches installed software data for all devices other than Windows and macOS endpoint devices.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ACC-VC check definitions (continued)

Name	Description
File-based discovery background	Runs a file scanning background job on the agent.
File-based discovery	Fetches the file data from the agent.
Oracle GLAS Java Process Discovery	Runs `pbd_java_discovery.rb` via osquery to collect Java version, vendor, AMC, and licensing flags. Timeout: 600s. Runs on all platforms.
Oracle GLAS HW data collection	Runs `endpoint_discovery.rb --select=oracle_glas_hw_discovery` to execute Oracle's `ct_cpuq` script. Executes Oracle's hardware validation script on non-Oracle, non-macOS hosts to collect CPU/socket data for GLAS reporting. Runs weekly.
VISC Get targeted URL metric	Gathers per-day usage metrics for the monitored URL from each managed device, and sends the data back to the instance.

Business rule

The *`Enhanced Discovery - On CI Delete`* business rule triggers the Endpoint Discovery Check when the CI associated with a given CI is deleted from sn_agent_cmdb_ci_agent.

Agent Client Collector MID-less installation command parameters

Description of the command line parameters used during MID-less Agent Client Collector installation.

Installation command line parameters

Parameter	Description
CONNECT_WITHOUT_MID	Specify **true** to enable MID-less Agent Client Collector installation. If you don't specify a value, the regular MID Server websocket installation is invoked.
ACC_CNC	Specify a public gateway endpoint for Agent Client Collector.
REGISTRATION_KEY	Active and valid registration key for the agent to communicate with.
INSTANCE_URL	ServiceNow instance that the agent is registered with.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Installation command line parameters (continued)

Parameter	Description
ACC_ALLOW_LIST	Optional string; to disable the allow list, set *ACC_ALLOW_LIST=0*. By default, the allow list is enabled. **Note:** Disabling the allow list compromises your system's security and is intended as a temporary measure while you're updating the allow list. After completing the update, enable the allow list by setting **ACC_ALLOW_LIST=1**.
ACC_VALIDATE_SIG	Optional string; to disable verification of the installer certification validation, set *ACC_VALIDATE_SIG=0* that you can add to disable the verification of the installer certification validation. By default, validation is enabled. **Note:** Disable the certification validation only when using non-standard signature validation tools.

Data collected during Agent Client Collector for Visibility Content File-Based Discovery

The following tables describe the data collected during Agent Client Collector for Visibility Content file-based Discovery.

Java Audit [ora_java_audit]

Field	Description
Name	Name of the record. For example: Java@hostname
Physical Machine Name	Name of the host CI
Machine Type	Either Server(S) or Desktop(D)
Java Publisher/Runtime Vendor	Java Vendor name
Operating System	Operating system in which the java is run
Environment Type	Production or Development or QA environment
Java Release/Version/Build	Java Version
Installation Path	Absolute installation path of the java binary
Installation Date (DateTime)	The date and time of the java binary file created on the file system
Release File (Y / N)	Indicates if a *release.md* file exists in the installation

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Java Audit [ora_java_audit] (continued)

Field	Description
Processor Make/Model	Processor model name
Sockets (Integer)	Number of CPU sockets
Cores (Integer)	Number of CPU cores
V6 and earlier	Indicates if you have a 6 or earlier java version
Open Source	Indicates if you have an open-source java installation
Unlock Commercial features	Indicates if you have the commercial features (like JFR) enabled. Not collected during ACC-VC file-based discovery (FBD).
Mission Control	Indicates if the mission control plugin is enabled
AMC Agent	Indicates if the AMC agent plugin is enabled. Not collected during ACC-VC file-based discovery (FBD).
Usage Tracker	Indicates if the Usage Tracker feature is enabled
Virtual Machine Object ID	Object ID of the Virtual machine instance
PID	Running process PID
IP Address	IP address of the host/VM
First Discovered	The date of the first discovery
Most recent discovery	The date of the most recent discovery
Discovery Source	The discovery method
Application	Reference to the [cmdb_ci_appl] table
Software installation	Reference to the [cmdb_sam_sw_install] table
Java evidence	Reference to the [cmdb_ora_java_evidence] table
Host	Reference to the [cmdb_ci] table

Java Evidence [ora_java_evidence]

Field	Description
Running process	Reference to the [cmdb_running_process] table
Host CI	Reference to the [cmdb_ci_computer] table
File information	Provides a reference to the [cmdb_file_information] table. Relevant only

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Java Evidence [ora_java_evidence] (continued)

Field	Description
	for file-based discovery (FBD); in pattern-based discovery, this field remains empty.

Related topics

Discover java installation data using Agent Client Collector for Visibility Content file-based discovery

Software edition configuration fields

Description of the software edition configuration fields in use when identifying the edition of Windows software.

Software Edition Configuration - New record page

Field	Description
Registry operation	• **Read value**: Reads the values stored in the specified registry key. • **Read subkey**: Reads the key stored in the registry path.
Registry path	Windows registry path indicating where the software is registered.
Product	Software product for which the edition needs to be determined.
Active	Option to activate edition detection for the indicated product.
Priority order	Indicates the hierarchy of values that take precedence when multiple editions are discovered.

Agent Client Collector File-Based Discovery properties

Configure File-Based Discovery behavior using system properties that control scanning paths, performance throttling, and file filtering options.

Discovery settings properties

All File-Based Discovery configuration properties are configurable from the System Properties page (**All** > **System Properties** > **All Properties**).

File-Based Discovery configuration properties

Property	Description	Platf
glide.discovery.file_discovery.path.windows	Directories to scan on Windows endpoints (pipe-separated). Supports environment variables	Win

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

File-Based Discovery configuration properties (continued)

Property	Description	Platf
	(%PROGRAMFILES%) and wildcards.	
glide.discovery.file_discovery.path.linux	Directories to scan on Linux/macOS endpoints (colon-separated). Supports environment variables ($HOME) and wildcards.	Linu mac
glide.discovery.file_discovery.ignore_path.windows	Directories to exclude from scanning on Windows (pipe-separated).	Win
glide.discovery.file_discovery.ignore_path.unix	Directories to exclude from scanning on Linux/macOS (colon-separated).	Linu mac
glide.discovery.file_discovery.throttle_size.windows	Number of files to process before pausing (Windows).	Win
glide.discovery.file_discovery.throttle_size.unix	Number of files to process before pausing (Linux/macOS).	Linu mac
glide.discovery.file_discovery.sleeptime.windows	Pause duration in milliseconds after each throttle batch (Windows).	Win
glide.discovery.file_discovery.sleeptime.unix	Pause duration in milliseconds after each throttle batch (Linux/macOS).	Linu mac
glide.discovery.file_discovery.skip_hidden_folders.windows	When enabled, skips hidden files and folders during scanning (Windows).	Win
glide.discovery.file_discovery.skip_hidden_folders.unix	When enabled, skips dot-prefixed (hidden) files and folders during scanning (Linux/macOS).	Linu mac

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

File-Based Discovery configuration properties (continued)

Property	Description	Platf
glide.discovery.file_discovery.scan_swid.windows	Enables or disables SWID tag scanning on Windows platforms. When enabled, the scanner looks for .swid, .swidtag, and .cmptag files in the configured scan directories.	Win
glide.discovery.file_discovery.scan_swid.unix	Enables or disables SWID tag scanning on Linux and macOS platforms. When enabled, the scanner looks for .swid, .swidtag, and .cmptag files in the configured scan directories.	Linu mac

File based discovery system properties

Property	Description
File matching rules (*sn_acc_vis_content_file_config*)	Defines the filename matching rules. Each rule specifies: • File name: The pattern to match. • Condition: `exact_match`, `starts_with`, `ends_with`, or `contains`. • Extension: Reference to the *sn_acc_vis_content_file_extension* property.
File extensions (*sn_acc_vis_content_file_extension*)	Defines which file extensions to scan for File Management (such as .exe, .dll, .msi, .pkg, and so forth). Each record specifies an extension and the platform it applies to (Windows, Mac, or All).
Full Scan Mode (*sn_acc_vis_content.file_disovery.enable_file_config*)	When false (strict mode), only files that match a rule in the *File Configuration* table are discovered. When true, all files with a matching extension are discovered only if no specific rule exists for them.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

File based discovery system properties (continued)

Property	Description
	Default: false
Delta Scan Frequency (*sn_acc_vis_content.file_discovery.full_scan_frequency*)	The number of delta scans to perform before forcing a full scan. This ensures data accuracy over time. For details on delta scanning, see Agent Client Collector File-Based Discovery. Default: 5
MME Types (Linux only) (*sn_acc_vis_content.file_discovery.linux_mime_types*)	Colon-separated list of MIME types to scan on Linux (for example, `application/x-pie-executable:text/x-shellscript`). On Linux, File Management uses MIME type detection instead of extension-based matching.
Running process-based discovery (*sn_acc_vis_content.file_discovery.rbd_process_scan_enabled*)	Running process-based discovery enables the ACC-VC agent to detect software running outside of standard scan directories, including applications that a directory-only scan can't detect. Default: false
Archive file scanning (*sn_acc_vis_content.file_discovery.archive_scan_enabled*)	Archive file scanning extends file-based discovery to look inside ZIP and JAR archive files and report the files contained within them. This enables discovery of software artifacts that are distributed in compressed packages without requiring the archive to be extracted on the endpoint. Default: false

Performance throttling

The throttling properties control how File-Based Discovery manages system resources during scanning operations. The throttle size determines how many files are processed in each batch, while the sleep time controls the pause duration between batches to prevent excessive system load.

Path configuration

Path properties support environment variables and wildcards for flexible directory specification. Use pipe separators (|) for Windows paths and colon separators (:) for Linux and macOS paths. The ignore path properties allow you to exclude specific directories from scanning to improve performance and avoid unnecessary data collection.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Web usage data collection tables and fields

Description of the tables and their fields used when gathering web usage data from your Windows and macOS machines.

Data collection tables

Name	Description
User Web Usage (sn_acc_vis_content_user_web_usage)	Stores per-user, per-device, per-domain web usage records, including page visit counts and data measured by each day.
Application Domain (sn_acc_vis_content_application_domain)	Stores domain-level information. Updated with aggregated totals (total page views, total users, daily trends) by the daily aggregation job. Domains not previously configured are automatically created here when collected via full monitoring.
Application (sn_acc_vis_content_application)	Stores service application records that group one or more domains. Each application is linked to a CMDB service and a source.

User web usage table fields

Name	Description
Domain (domain)	The application domain of the visited website.
Device (device_id)	The computer (cmdb_ci_computer) from which the website was accessed.
User (user)	User that accessed the website.
Last Accessed (last_accessed)	Date and time that the website was last accessed.
Page Visits (page_visits)	Number of page visits for the current user-domain-device combination.
Page Visits Daywise (page_visits_daywise)	A JSON object storing page visit counts, broken down by day for the retention period (for example, {"2026-03-15": "12", "2026-03-16": "8"})

Application Domain table fields

Name	Description
Application (application)	Application record that the domain belongs to.
Domain (domain)	Domain name that can be monitored (such as `example.com`). The display field. Must be unique.
Category (category)	The URL category (sn_acc_vis_content_url_category) for the domain.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Application Domain table fields (continued)

Name	Description
Domain Type (domain_type)	Indicates whether the domain is internal or external. Default: external
CMDB endpoint http (endpoint_http)	The CMDB HTTP endpoint (cmdb_ci_endpoint_http) for SaaS applications.
Metric monitoring (monitored)	Indicates whether the domain is monitored for metrics. Default: false
Total accessed time (total_accessed_time)	Total accumulated access duration for the domain.
Total users (total_users)	Total number of unique users who accessed the domain. Updated by the daily aggregation job.
Last accessed time (last_accessed_time)	Date and time that the domain was last accessed.
Total page views (total_page_views)	Total number of page views for the domain. Updated by the daily aggregation job.
Total page views daywise (total_page_views_day_wise)	A JSON object storing total page view counts broken down by day (for example, {"2026-03-15": "120", "2026-03-16": "85"}). Updated by the daily aggregation job.

Application table fields

Name	Description
Service (ci_id)	The CMDB service (cmdb_ci_service) associated with the application. The display field.
SAMP product (samp_sw_product)	The Software Asset Management product (samp_sw_product) for the application.
Source (source)	The source (sn_acc_vis_content_source) that discovered or created the application.
Type (type)	Type of application: web or installed Default: web
Metric monitoring (monitored)	Indicates whether the application is monitored for metrics. Read-only. Default: false

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Archive file scanning filtering rules and limits

Reference information for the filtering rules and performance safeguards that apply when Agent Client Collector for Visibility Content scans ZIP and JAR archive files during File-Based Discovery.

Filtering rules

Archive entries are filtered using the same rules as files found on disk, with the following differences.

Archive file scanning filtering rules

Capability	Regular files	Archive entries
SAM allowlist matching	Yes	Yes
File Management extension rules	Yes	Yes
MIME type detection (Linux)	Yes	No. The file does not exist on disk, so the system can't inspect its content type
Version detection	Yes	No. Version can't be queried for a file that hasn't been extracted
SWID tag support	Yes	No. Archive contents aren't decompressed or read, so SWID tags inside ZIP or JAR files aren't processed

Note: On Linux, File Management matching relies on MIME type detection rather than extension rules. As a result, archive entries can only be matched by SAM rules, not by MIME type.

Performance safeguards

The following limits are enforced to prevent archive scanning from affecting agent performance or endpoint stability.

Archive file scanning performance safeguards

Safeguard	Limit	Behavior when exceeded
Maximum archive file size	500 MB	Archive is skipped entirely
Maximum entries per archive	50,000 files	Scanning stops after the limit; entries discovered so far are retained
Per-archive timeout	30 seconds	Scanning of that archive is aborted; entries discovered so far are retained
Corrupt or password-protected archives	Not applicable	Detected automatically, logged, and skipped
Nested archives (archive inside an archive)	Not applicable	Not scanned. Only top-level archives on disk are inspected
Global file limit (*maxFiles*)	Configured per policy	Archive entries count toward the global file limit; scanning stops when the limit is reached

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Software filter tables

The following table lists the software filter tables and the purpose each one serves.

Table	Who edits it	Purpose
Software Install Filter (samp_sw_install_filter)	ServiceNow	Base-system rules maintained by ServiceNow that cover common, well-known filtered software across all customers. Read-only.
Software Install Custom Filter (samp_sw_install_custom_filter)	SAM admin	Where you create, edit, and manage your own organization-specific exclusion rules for internal tools, custom shortcuts, or anything the base-system rules don't cover.
Software Install Filter Staging (samp_sw_install_filter_staging)	System-generated	An audit log of every software install that has been excluded, which rule excluded it, and the last date it was reconfirmed as irrelevant. Use this table to review and validate what is being filtered. Read-only.

Software filter fields

The following table lists the software filter fields from which you can create a filter.

Software filter fields

Field	Description
Name	A descriptive label for the rule. For example, *`Exclude company name shortcut`*.
Software name	(Optional) Enter the display name of the software. In the **Condition** dropdown, select the matching type: • Starts with • Ends with • Contains • Exact match • Regex
Publisher	(Optional) Enter the software vendor or publisher name. In the **Condition** dropdown, select the matching type: • Starts with • Ends with • Contains

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Software filter fields (continued)

Field	Description
	• Exact match • Regex
Version	(Optional) Enter the version string. In the **Condition** dropdown, select the matching type: • Starts with • Ends with • Contains • Exact match • Regex **Note:** Although this field and the **Software name** and **Publisher** fields are optional, at least one of them must have a value.
OS filter	Select the operating system the rule applies to: • All • Windows • Linux • macOS
Discovery source	(Optional) Enter the Discovery source to restrict the rule to installations reported by a specific source. Leave blank to apply the rule to installations from any source.
Active	Toggle to **Active** to enable the rule.

License key discovery and access control tables

Reference information for the tables, fields, access control, and scheduled job used by license key discovery in Agent Client Collector for Visibility Content.

Tables

License key discovery uses the following tables.

License key discovery tables

Table	Label	Purpose
sn_acc_vis_content_license_registry_config	License Registry Configuration	Admin-managed list of registry paths and value names to collect from managed endpoints.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

License key discovery tables (continued)

Table	Label	Purpose
sn_acc_vis_content_license_keys	License Keys	Stores the license key values collected from endpoint devices.

License Keys table fields

The **License Keys** [sn_acc_vis_content_license_keys] table stores the following fields for each discovered key.

License Keys form

Field	Description
Configuration Item	Device the key was collected from. Table: cmdb_ci_computer.
Product	SAM product associated with this key. Table: samp_sw_product.
User	This field is automatically set to the user assigned to the CI. Table: sys_user.
License Key Config	Configuration rule that discovered this key. Table: sn_acc_vis_content_license_registry_config.
Resolved Registry Path	Exact registry path the key was read from on the endpoint.
License Key	Discovered key value.
Last Scanned	Date the key was last detected by the agent.
Absent	Selected when the key is no longer found on the device. Records are never deleted, they are marked **Absent** instead.

License Registry Configuration form fields

The following table describes the fields in the License Registry Configuration [sn_acc_vis_content_license_registry_config] table.

License Registry Configuration form

Field	Description
Product	SAM product this license key belongs to. Links to the SAM Professional product catalog.
Registry Path	Windows registry path where the key is stored. For example, `HKLM\SOFTWARE\Microsoft\Office\16.0\Registration`.
Registry Value Name	Specific registry value to read. For example, `DigitalProductId`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

License Registry Configuration form (continued)

Field	Description
Name	This field is automatically set to a combination of the **Product** and **Registry Value Name** values.
Description	Notes about this configuration record.
Active	Indicator of whether this record is included in future collections. Clearing this check box removes the record from future collections.

Note: The combination of **Product**, **Registry Path**, and **Registry Value Name** must be unique across all configuration records.

Access control

The following table shows which roles can access each license key discovery table.

License key discovery role access

Role	License Registry Configuration table	License Keys table
ACC application admin (agent_client_collector_admin)	Read, write, create	Read only
Discovery admin (discovery_admin)	Read, write, create	Read only
SAM admin (sam_admin)	Read only	Read only
All other roles	No access	No access

Scheduled job

The following scheduled job supports license key discovery.

License key discovery scheduled job

Job	Schedule	Condition
Refresh License Key Config File	Daily at 8:30 a.m. UTC	Runs only when the *sn_acc_vis_content.enable_license_key_discovery* property is set to `true` and the SAM Professional plugin (com.snc.samp) is activated.

License key discovery tables and configuration

License key discovery uses configuration tables to define file-matching rules and extraction parsers, and stores results in dedicated tables for reporting and reconciliation.

Configuration tables

Two configuration tables work together to define and execute the license key discovery framework.

sn_acc_vis_content_license_file_config

Defines which files to treat as license files and which parser to invoke when a file is found.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column name	Type	Description
display_name	String	Unique name identifying the rule.
file_name	String	File name or partial name to match.
file_name_condition	Choice	How to match file_name: `exact_match` (default), `starts_with`, `ends_with`, `contains`.
file_extension	String	Optional file extension to further narrow the match (no leading dot before the extension).
parser	Reference	Reference to `sn_acc_vis_content_license_parser` record that processes matched files.
platform	Choice	Operating system(s) where the rule applies: `all` (default), `windows`, `linux`, `mac`.
order	Integer	Priority when multiple rules could match the same file (default 100; lower values win).
active	Boolean	Indicates whether the rule is currently in use (default = **true**).

sn_acc_vis_content_license_parser

Holds the extraction logic for one license file format. A single parser can be referenced by multiple file-matching rules.

Column name	Type	Description
parser_name	String	Unique name identifying the parser.
parsing_script	Script	Server-side JavaScript that reads file content and sets `answer` to an array of extracted results.
sample_input	String	Representative file content used with Test Parser action.
sample_output	String	Expected extraction result for sample_input, used to validate the parser.
active	Boolean	Whether the parser is currently in use (default = **true**).

Results tables

Once a file has been scanned and parsed, the results flow through three tables, each holding a distinct stage of the outcome.

sn_acc_vis_content_license_file_content

The raw, per-file result of scanning one file on one computer — captured regardless of whether a product match was later found.

Column name	Type	Description
ci	Reference	Reference to `cmdb_ci_computer` — the computer where the file was found.
license_file_config	Reference	Reference to `sn_acc_vis_content_license_file_config` — the rule that matched this file.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column name	Type	Description
file_path	String	Folder path where the file was found.
file_name	String	Name of the file.
file_size	Long Integer	Size of the file in bytes.
file_version	String	File version, if available.
discovered_product_name	String	Product name extracted by the parser.
discovered_vendor	String	Vendor name extracted by the parser.
discovered_license_key	String	License key extracted by the parser.
discovered_expiry_date	Date	Expiry date extracted by the parser, if present in the file.
discovered_file_content	Long Text	Raw file content, stored only when parsing fails (for troubleshooting).
scan_id	String	Identifier of the scan that produced this result.
last_scanned	Date	When this file was last scanned.
parse_status	Choice	`parsed` or `parse_failed`.
absent	Boolean	Set to **true** when the file is no longer found in a later scan (default = **false**).

sn_acc_vis_content_license_keys

The final, resolved license key tied to a computer and a recognized software product — the table which is reported on.

Column name	Type	Description
ci	Reference	Reference to `cmdb_ci` — the computer the license key belongs to.
product	Reference	Reference to `samp_sw_product` — the matched catalog product.
user	Reference	Reference to `sys_user` — user associated with the CI, if resolved.
license_file_config	Reference	Reference to `sn_acc_vis_content_license_file_config` — the rule that led to this result (file-method only).
license_file_path	String	Path of the source license file (file-method only).
license_key	String	The resolved license key.
last_scanned	Date	When this license key was last confirmed.
absent	Boolean	Set to **true** when no longer found in a later scan (default = **false**).

Note: Columns `license_key_config` and `resolved_registry_path` also exist on this table but are populated only by the older registry-based discovery method.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

sn_acc_vis_content_license_file_unresolved

A holding area for discovered product names that could not be automatically matched to the software catalog.

Column name	Type	Description
discovered_product_name	String	Product name as extracted by the parser (unmatched).
discovered_vendor	String	Vendor name as extracted by the parser.
parser	Reference	Reference to `sn_acc_vis_content_license_parser` — the parser that produced this discovery.
normalised_product_name	Reference	Reference to `samp_sw_product` — set by the customer to manually map this discovery to a real catalog product.

Framework constraints

The following constraints are built into the framework:

- **File read permission** — The account under which the ACC agent service runs must have read permission on the folders and files being scanned. This is an operating-system-level requirement. If the agent encounters a file or folder it cannot read, it logs a permission error for that item and continues scanning.
- **File size limit** — License file content is capped at 1 MB. Files larger than this limit are skipped and not read for license key extraction.

These constraints are intentional guardrails and cannot be changed through configuration.

Product reconciliation

Once a parser successfully extracts a product name from a license file, the discovery is reconciled against the software catalog (`samp_sw_product`). If a confident match is found, a final record is created in `sn_acc_vis_content_license_keys`. If no confident match is possible, the discovery is placed in `sn_acc_vis_content_license_file_unresolved` for manual review and mapping.

Manual mappings are performed only once per unique product name. After a customer sets the **normalised_product_name** field, all future scans reporting the same discovered product name resolve automatically with no repeated manual effort.

System properties and policies

Component	Role
System property `sn_acc_vis_content.enable_license_key_discovery`	Master on/off switch (default = **false**). Must be **true** for license key data from either discovery method to be processed and stored.
Policy `File Based Discovery Policy - License Key`	Instructs the agent during its regular file-

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Component	Role
	scanning activity to watch for files matching an active License File Configuration rule. Depends on the File Based Discovery Background Policy also being active.
Check definition `File Based Discovery - License Key`	Defines the concrete agent command executed (files.rb --compact --no-delta, scoped to the license-key scan identifier) and its timeout (10 minutes)

Running process-based discovery platform coverage and properties

Platform coverage identifies which operating systems are supported and what privileges the agent needs for full coverage. The system property controls whether the feature is enabled or disabled.

Platform coverage

Coverage depends on the privileges available to the agent on each operating system.

Platform coverage for running process-based discovery

Platform	Default coverage	Requirement for full coverage
Windows	Full coverage of all running processes.	The ACC service must run as the Local System account. Set the ACC service's **Log On As** to **Local System**.
Linux	Limited to processes owned by the agent service account.	The agent service account must have permission to query process information for processes owned by other users. The `servicenow` user must be able to run `osqueryi` without a password. For more information about `servicenow` user permissions for `osqueryi`, see Configure ServiceNow sudoers file.
macOS	Limited to processes owned by the agent service account.	The agent service account must have permission to query process information for processes owned by other users. The `_servicenow` user must be able to run `osqueryi` without a password. For more information about `_servicenow` user permissions for `osqueryi`, see Configure ServiceNow sudoers file.

Note: On Linux and macOS, if the additional privilege is not granted, the feature still runs but discovers directories only for processes owned by the agent service account. The daily scan continues normally on your configured directories. No errors are raised.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

System property

The following property controls whether running process-based discovery is active. You can configure it from the System Properties page (**All** > **System Properties** > **All Properties**).

Running process-based discovery system property

Property	Default	Description
sn_acc_vis_content.file_discovery.fbd_process_scan_enabled	`false`	Primary on/off control for running process-based discovery. When set to `true`, the agent policy that collects process directories is activated and the daily FBD scan includes process-discovered directories. When set to `false`, collection stops and the daily scan uses only your configured scan directories.

ACC-VC NPVDI system properties

System properties that control how Agent Client Collector for Visibility Content (ACC-VC) runs *Enhanced Discovery* and installed software checks on Windows non-persistent virtual desktop infrastructure (NPVDI) endpoints.

Note: These properties apply only to Windows endpoints that are configured as non-persistent. On all other endpoints, they have no effect. For details on how ACC-VC behaves on NPVDI endpoints, see ACC-VC NPVDI endpoints.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ACC-VC NPVDI system properties

Property	Description
sn_acc_vis_content.np_vdi.enhanced_discovery_skip_modules	• Type: string • Default value: `file_systems,net` Comma-separated list of valid: • `file_systems` • `network_adapters` • `storage_devices` • `local_users` • `intel_ema` • `memory_modules` Any other value is ignore The following inventory a • *Basic Inventory* • *Enhanced Invento* • *TCP Connections* • *Running Process*
sn_acc_vis_content.np_vdi.cache_installed_software_enabled	• Type: true | false • Default value: false Caches the full installed check runs reuse the cac Software usage metrics,

When you update either property, the instance regenerates the NPVDI configuration file (`NPVDIConfig.json`) that ACC-VC uses on NPVDI agents. A daily scheduled job also refreshes this file.

Metric Intelligence

ServiceNow® Metric Intelligence provides the ability to capture, and then explore and analyze operational metrics data, identifying and indicating anomalies. Metric Intelligence generates anomaly alerts that can be promoted to IT alerts and appear on the Service Operations Workspace and service health dashboard. You can leverage this analysis to prevent potential service outages.

Optimize Manage metrics, events, alerts and anomalies to get the most out of your metric data.	Reference Get additional information on Metric Intelligence settings and properties.

Exploring Metric Intelligence

Learn more about using Metric Intelligence to analyze metric data and identify anomalies.

Metric Intelligence overview

Metric Intelligence helps identify and prevent potential service outages. Based on historical metric data, Metric Intelligence indicates anomalous behavior of CIs which events might not capture.

Metric Intelligence users

Users

User	Description
Event Management user [evt_mgmt_user]	Can view alerts and their underlying metrics.
Event Management administrator [evt_mgmt_admin]	Can configure all metric definitions and connector settings.
Operator [evt_mgmt_operator]	Can view all metric definitions and connector settings.

Understanding Metric Intelligence

Use Metric Intelligence to identify and prevent potential service outages. Metric Intelligence, based on historical metric data, indicates anomalous behavior of CIs which events might not capture. Anomaly alerts can be promoted to regular IT alerts and appear on the Service Operations Workspace and service health dashboard for preventive actions.

Anomaly detection

Metric data is collected by various data sources such as SCOM, SolarWinds monitoring system, or Nagios XI server (some partially configured for metric collection by default). These monitoring systems collect metric data from the source environment regularly. Metric Intelligence captures the raw data from these monitoring systems, and uses event rules and the CMDB identification engine to map data to existing CIs and their resources. The data is then analyzed to detect anomalies and to provide other statistical scores.

Metric Intelligence uses historical metric data to build statistical models. These models facilitate projection of expected metric values along with upper and lower bounds. Metric Intelligence then uses these projections to detect statistical outliers and to calculate anomaly scores.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Anomalies are scored on a range of 0-10. High anomaly scores for CI metrics can indicate that a CI is at risk of causing a service outage.

After processing, the Insights Explorer shows metric statistics and charts, and the Anomaly Map shows correlated scores for CIs with the highest anomaly scores, across a timeline.

You may want to disable anomaly detection during system maintenance, as anomalies may be irrelevant when detected while maintenance is in progress. To do so, set the *mid.mi.anomaly_detection.disable* property to **true**.

To customize displaying anomalies for metrics classified as near-constant, contact customer support.

Metric Intelligence is available when you activate the Metric Intelligence (com.snc.sa.metric) plugin.

Terms used with Metric Intelligence

Source metric type

A metric such as '% Free Space' or 'Current Bandwidth' that can be measured by a data source for a CI. For each data source, you can choose which of all possible source metric types are processed. For example, there are about 380 source metric types that are active by default for the SCOM data source.

Anomaly

Data that is outside the control bounds is considered a statistical outlier. These outliers are used to compute an anomaly score, which is a value between 0–10 that indicates the degree to which the metric appears unlikely. When an anomaly score is above a threshold, an anomaly alert is generated. Anomaly alerts are reported separately from regular IT alerts.

Resource

A component of a CI that consists of multiple individual components of similar type, where each subcomponent can be monitored separately. For example, individual Web pages, or specific disks such as 'Disk C:' and 'Disk D:'.

Time series

A series of values (such as metric values) over a time range, associated with a CI and a metric type. Because an anomaly score is evaluated for each metric, the series of anomaly scores over a period of time are also a time series. Time series are computed by the statistical model built for a metric data series. They are used with metric data values, anomaly scores, and upper and lower control bounds.

Statistical models

Metric Intelligence jobs learn from past metric data (up to 32 days old). A model training process analyzes historical data to construct a model that projects future values. Typically, models are in effect until the next time the model learning process runs. These models are used to calculate upper and lower bounds. Incoming values that are beyond those bounds, and that deviate with statistical significance from expected values, generate anomalies. Each model is uniquely patterned and is labeled with a classifier that illustrates the general behavior of the model. This classification determines if anomaly detection can be applied. For most models, it is possible to project which future values deviate from expected values. Such models are associated with control bounds and anomaly detection can be applied (if enabled).

However, for some models, there is insufficient data to determine which values are anomalous. Anomaly detection cannot be applied without additional information (even if anomaly detection is enabled).

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The learned data models are stored in the Metric Time Series Models [sa_time_series] table.

The following statistical models and classifiers are used in anomaly detection:

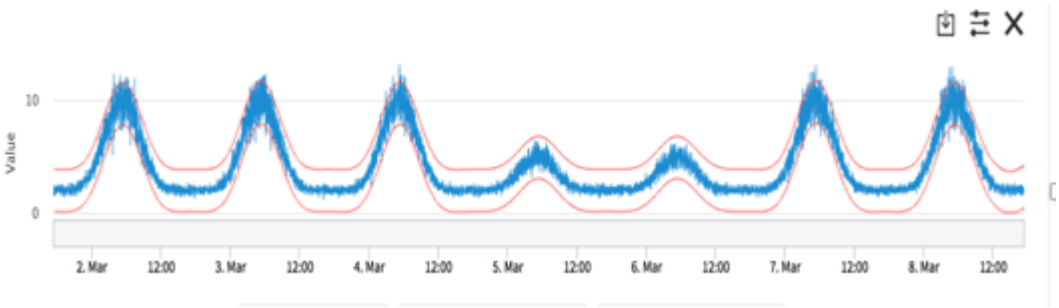
Time Series statistical model

After it is established, a time series model does not adjust to changes in the incoming metric data. Therefore, if the pattern of incoming data changes, those changes are likely to be identified as anomalous. Upper and lower control bounds, after they are learned, persist until the next time the learning process runs (data is learned every day).

Weekly

Data with a pattern that repeats itself over weekly intervals (seasonal model).

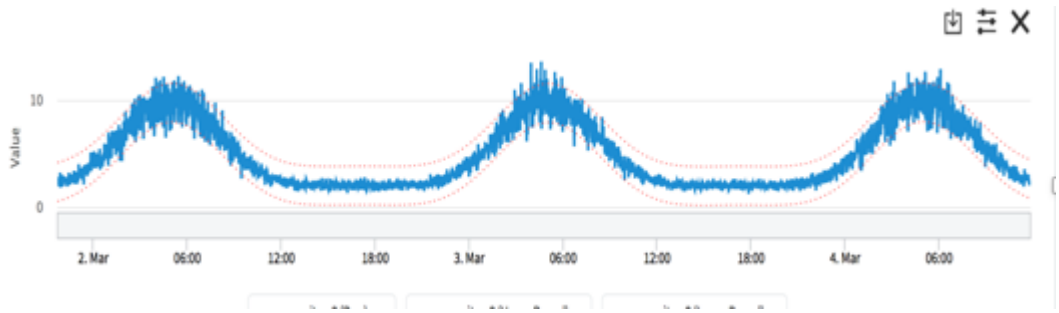
Requires a minimum of 15 days of data in the series, as set by the weekly_model_min_days configuration setting.



Daily

Data with a pattern that repeats itself over a daily interval (seasonal model).

Requires a minimum of 3 days of data in the series, as set by the daily_model_min_days configuration setting.

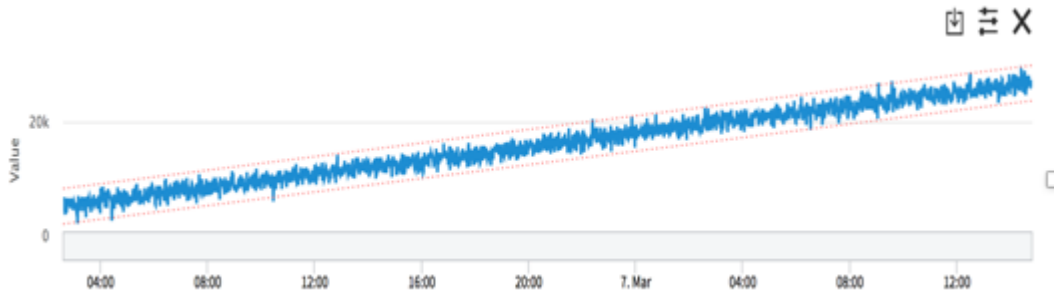


Trendy

Data that has a linear trend with some slope and with some noise.

Requires a minimum of 30 data points in the series, as set by the corrupt_data_count_threshold configuration setting.

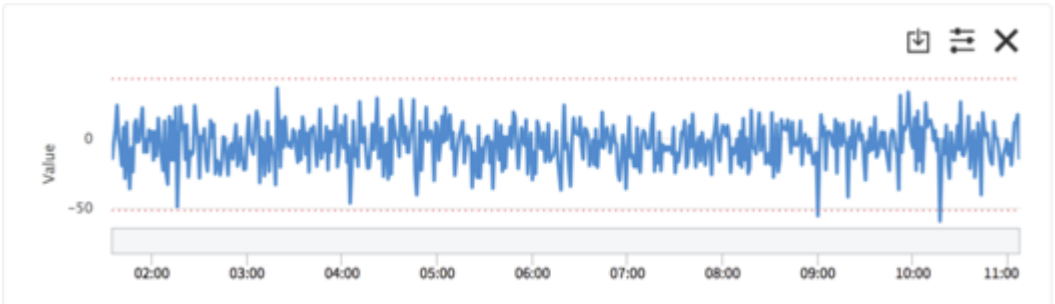
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Noisy

Typical noisy data that is a basic pattern classification in a data model. The pattern cannot be identified with a specific trend or seasonality.

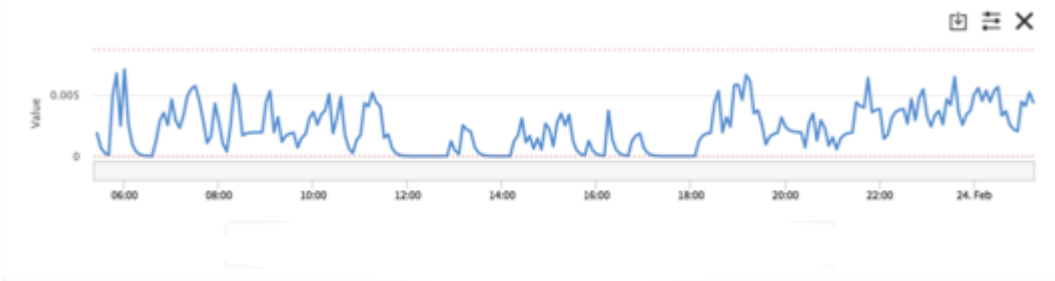
Requires a minimum of 30 data points in the series, as set by the corrupt_data_count_threshold configuration setting.



Positive clipped noisy

Similar to the noisy classifier other than the lower bound that is fixed on 0.

Requires a minimum of 30 data points in the series, as set by the corrupt_data_count_threshold configuration setting.



Centered noisy

Noisy data that typically spreads symmetrically between user-specified upper and lower bounds. The formula that is used to set bounds and width values, ignores the statistical data, and the lower and the upper widths have an identical value.

Requires that the number of data points in the series is zero.

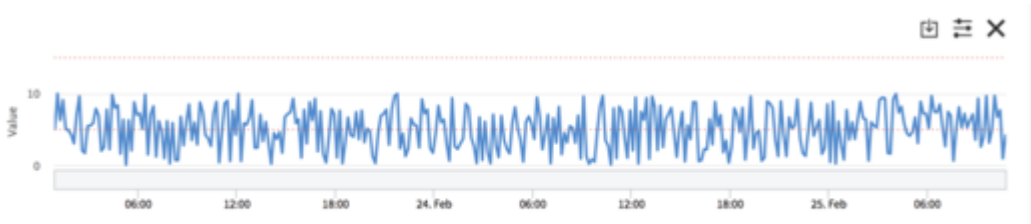
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To retrieve alerts for metrics with this model, create metric rules for static bounds definitions. For details, see Create metric rules.

Skewed noisy

Noisy data that is not evenly spread between user-specified upper and lower bounds, but instead tends to concentrate closer to one of the bounds. The median of the data is used to separately compute an upper width and a lower width.

Requires a minimum of one data point in the series.



To retrieve alerts for metrics with this model, create metric rules for static bounds definitions. For details, see Create metric rules.

Skewed noisy - Generalized Extreme Value (GEV) Distribution

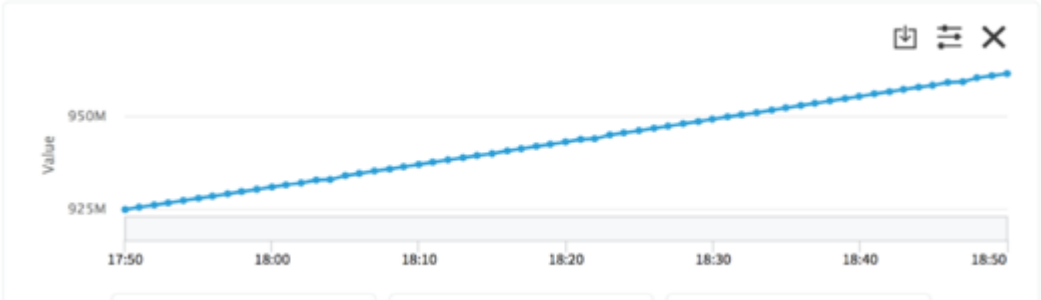
Noisy data that is spread unevenly between user-specified upper and lower bounds, and concentrates closer to one of the bounds. In addition, the data distribution demonstrates a long or heavy tail. The median of data derived from the tail of the distribution is used to separately compute an upper width and a lower width. There must be at least one data point in the series.

Accumulator

Data pattern similar to the trendy classifier but with a monotonous increase and without noise. For this classifier, there is no data model and no anomaly detection.

Requires a minimum of 30 data points in the series, as set by the corrupt_data_count_threshold configuration setting.

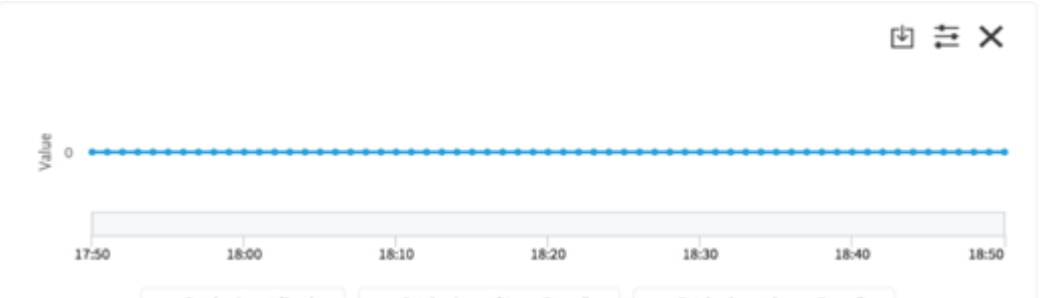
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Near Constant

Nearly constant data, in which most values are a specific constant value. For this classifier, there is no data model and no anomaly detection.

Requires a minimum of 30 data points in the series, as set by the corrupt_data_count_threshold configuration setting.



Detected Constant

Enables checking near-constant metrics for anomalies. To do so, you must move the metrics to the detected-constant model, via a system token. To add tokens to the token list and enable more metrics to be measured for anomalies, contact customer support.

Requires a minimum of 30 data points in the series, as set by the corrupt_data_count_threshold configuration setting.

Enabled when the `metric_name_analysis.add_detected_constant_candidate` system property is set to **true**. To overwrite the value of this property for a specific metric type, update the **Detected Constant Candidate** field in the Metric Types table by doing the following:

1. Enter `sa_metric_type.list` in the instance navigation field.
2. In the **Detected Constant Candidate** column, select the relevant value for the entry you want to update.

Detected Constant Candidate values

Value	Description
<empty>	An algorithm automatically decided whether the metric is to be considered for the detected constant model. This is the default value.

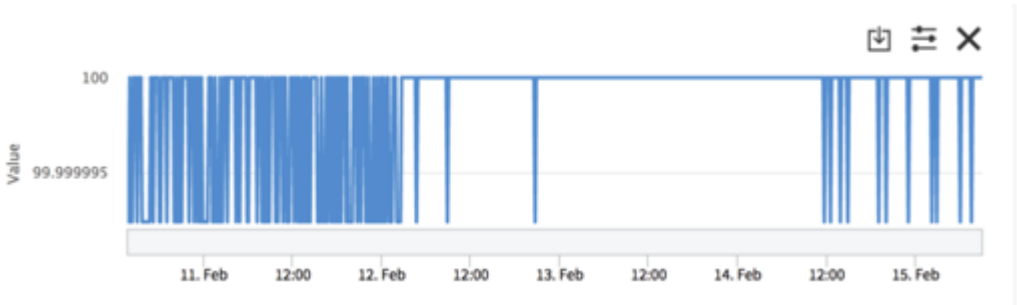
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Value	Description
Yes	The metric is considered for the detected constant model.
No	The metric is not considered for the detected constant model.

Multinomial

Data pattern in which all values are one of a relatively small number of values. For example, values are always 100 or 99.9. For this classifier, there is no data model and no anomaly detection.

Requires a minimum of 400 data points in the series, calculated as 10 times the value of the multinomial_count_threshold configuration setting.



Corrupt

Data has insufficient data points to identify a pattern. For this classifier, there is no data model and no anomaly detection.

Requires that the number of data points in the series is less than the value of the corrupt_data_count_threshold configuration setting (30 by default).

Kalman Filter statistical model

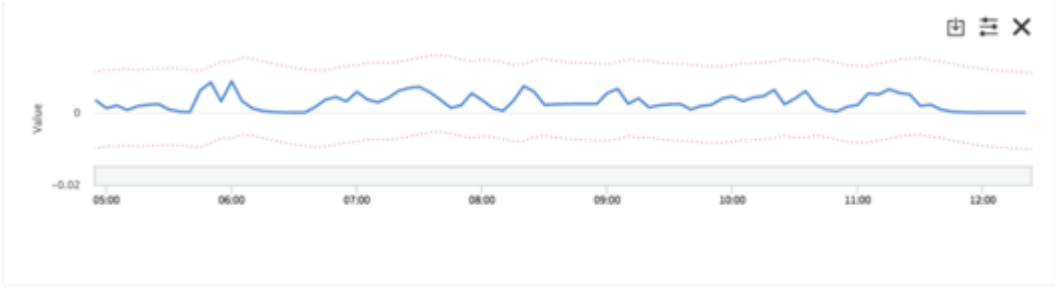
Add on to the time series statistical model and applicable only to the noisy and positive noisy classifiers. This model is a general method of estimating model parameters from a stream of data where level is the only parameter in the model. The Kalman Filter model can adjust to new values in incoming metric data. When there are no clear patterns in the noise or if there is too much noise, the Kalman Filter model is not used.

Local level

When incoming data clusters around a new value according to the current control bounds, the Learner adjusts the data model to accommodate a permanent change. This clustering is detected as a new value in the data model so that most incoming data is again within the control bounds rather than anomalous. Such change detection is useful when for example, cores or memory are added to a server, which impact the baselines.

Requires a minimum of 30 data points in the series, as set by the corrupt_data_count_threshold configuration setting.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Unrecognized

When data does not fit the local level classifier, time series classifiers are used. This happens when it is not possible to adjust the variance ratio in a learned local level model to reasonable values.

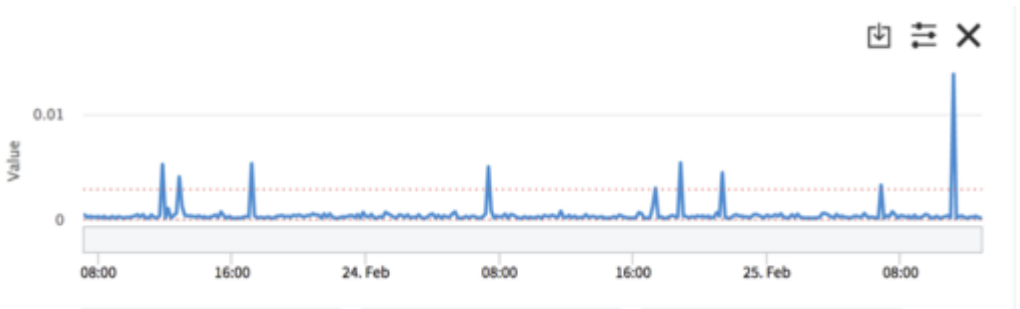
Non-Parametric statistical model

Add on to the positive noisy classifier. In the nonparametric model, noise distribution is not symmetrical and does not fit any seasonal pattern. The nonparametric model creates control bounds that better fit the actual data, and once learned, the control bounds persist until the next learning cycle. This model does not adjust itself to changes in the data, and it takes longer for a deviation to be identified as an anomaly.

Stationary Non-Parametric

Data that is not time-dependent meaning that there is no significant shift in parameters such as mean and variance when shifting data in time.

Requires a minimum of 5000 data points in the series, as set by the snpm_minimum_data_count configuration setting.



Unrecognized

When data does not fit the stationary classifier, time series classifiers are used.

Median Absolute Deviation (MAD) statistical model

An add-on to the skewed noisy classifier. In this type of data, noise distribution is not symmetrical and does not fit any seasonal pattern. In addition, data reflects a heavy or long-tailed distribution. The MAD statistical model creates control bounds that better fit the data, and once learned, the control bounds persist until the next learning cycle. Using this model enhances the deciphering of data collection with approximately 30% greater efficiency.

MID Server distributed cluster for Metric Intelligence

Using Metric Intelligence requires at least one MID Server distributed cluster which contains a single MID Server that is configured for Metric Intelligence.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When using a single Metric Intelligence MID Server, that server must be added to a MID Server distributed cluster.

To support the specified throughput, create a distributed cluster with a single MID Server that meets the Metric Intelligence MID Server requirements. When using a virtual machine (VM), only a single MID Server can run that supports Metric Intelligence. When working with Agent Client Collector, a MID Server can also be connected to multiple agents (ACC-M and ACC-L).

A MID Server supporting Discovery can also be used with other applications.

For details on setting up Metric Intelligence, see Get started with Metric Intelligence.

MID Server distributed clusters

Activating Metric Intelligence (com.snc.sa.metric), automatically activates MID Server distributed cluster (com.snc.agent.distributed.cluster). A MID Server distributed cluster supports the Distributed MID Server cluster type which is used exclusively with Metric Intelligence.

If automatic creation of a MID Server distributed cluster fails, you can configure the cluster manually. For details, contact Customer Support.

Metric Intelligence MID Server

The Metric Intelligence MID Server supports the Metric Intelligence feature by processing data and detecting anomalies. The MID Server transmits batches of processed data to the instance. If an anomaly is detected, then information about the anomaly along with the raw data is sent immediately to the instance.

Each Metric Intelligence MID Server must be configured with the following settings:

- Metric Intelligence as a supported application
- The Metrics capability
- Running the Metric Intelligence Metrics extension

Note: The Metric Intelligence MID Server does not support IPv6.

The Metric Intelligence application that the Metric Intelligence MID Server is configured with enables you to add additional supported applications to the same MID Server. By default, Metric Intelligence is included in the definition of the MID Server ALL option. For information about modifying the behavior of the ALL option when selecting supported applications, see Configure applications included in ALL Applications.

If Domain Support - Domain Extensions Installer is activated, then you can configure a MID Server with the Metrics capability, per domain. In this case, metrics for a business service are processed on the MID Server that is in the same domain as the business service. Otherwise, a MID Server from the global domain is used.

Ensure that the MID Server that you want to configure for Metric Intelligence:

- Is validated. For more information, see Validate a MID Server
- Is in running state
- Meets all software, hardware, and configuration requirements

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Hardware requirements for the virtual machine/host on which the MID Server runs (scaled for 5000 CIs with 100 metrics per CI)

Requirement	
One MID Server with: • Memory: 12 GB • Processor: 4 cores	Supports approximately up to a total of 1.2 million metrics (12,000 CIs with 100 metrics per CI).
One MID Server with: • Memory: 24 GB • Processor: 8 cores	Supports approximately up to a total of 1.7 million metrics (17,000 CIs with 100 metrics per CI).

Software requirements

Software	Supported versions	Additional requirements
Windows	32-bit and 64-bit versions: • Windows 2008 R2 • Windows Server 2012 R2 • Windows Server 2019 • Windows Server 2022 • Windows Server 2025	32-bit or 64-bit version of the MID Server
Linux	• Red Hat Enterprise Edition Linux 6.6 or later • CentOS Linux 6.6 or later	32-bit or 64-bit version of the MID Server

Configuration requirements

Configuration	Requirement
MID Server service logon user (required only for pulling)	Must be set to a user with read access to the SCOM database (OperationsManagerDW). **1.** On the MID Server, open the MID Server **Properties** dialog box. **2.** Click the **Log On** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuration requirements (continued)

Configuration	Requirement
	3. Select **This account**, and enter credentials for a user with the required access. 4. Click **Apply**.

MID Server throttling mechanism

The MID Server throttling mechanism protects against data bursts to the instance. Data burst protection prevents overloading the instance, while ensuring that you do not lose any data.

The MID Server throttling mechanism is enabled by default. You may want to disable this mechanism when troubleshooting, to ensure that the mechanism is not causing system malfunction.

The throttling parameters are MID Server configuration parameters. Configure these parameters on the MID Server record, on the **Configuration Parameters** tab. When you add a configuration parameter, select the matching `mid.oi` parameter from the **Parameter name** list.

- To disable this feature for metrics, set the `mid.oi.metric_token_bucket_enabled` parameter to `false`.
- To disable this feature for anomalies, set the `mid.oi.anomaly_token_bucket_enabled` parameter to `false`.

Configuration Override

Use the `../agent/conf/wrapper-override.conf` file to configure Java override parameters, such as the garbage collector and IPv4.

To configure the garbage collector, override the existing garbage collector parameter. For example, replace `-XX:+UseParallelGC` with `-XX:+UseG1GC`.

To force IPv4, add the following parameter, using the next available `wrapper.java.additional` number:

```
wrapper.java.additional.<number>=-Djava.net.preferIPv4Stack=true
```

Note: Do not renumber existing `wrapper.java.additional` lines. Parameters 101 through 200 are reserved for ServiceNow out-of-the-box parameters. Only override those parameters by uncommenting the existing lines and changing the values.

Use the `../agent/conf/wrapper.conf` file to configure memory for Metric Intelligence. Update the following parameters:

- `wrapper.java.initmemory=1024` or higher
- `wrapper.java.maxmemory=4096` or higher

Optionally, if a server has additional RAM available, for example 16 GB RAM, you can replace `4096` with `8192` in `wrapper.java.maxmemory=4096`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Metric Configuration Rules

Metric configuration rules enable you to determine how incoming metrics from the Agent Client Collector are to be processed.

When a new metric arrives from an Agent Client Collector, a new record is created in the Metric to CI Mappings table, with the value, **Anomaly Detection Action Level = Bounds**.

To trigger execution of a metric configuration rule, navigate to the Metric Configuration Rules table (**Event Management** > **Anomaly Detection** > **Metric Config Rules**) and select the **Sync to MID** button at the top of the page. This also synchronizes all MID Servers connected to the instance.

When executing the rule, the anomaly detection action level defined in the rule is set by the *`anomaly_detection_action_level`* parameter. This retroactively overrides the anomaly detection action level configured for the metric in the Metric to CI Mappings table.

If you do not trigger the rule execution, retroactive overriding of the *`Anomaly detection action level`* parameter is performed during execution of the hourly scheduled **Metric Intelligence - Metric configuration** job.

When configuring a metric configuration rule, rules with a filter run before rules with no filter. When multiple rules have the same priority, the most recently configured rule runs first.

For details on creating configuration settings rules, see Create a configuration settings rule.

For details on the available anomaly detection action levels, see Configure the action level for anomaly detection.

Metric bounds sensitivity

Insights Explorer automatically widens metric bounds when too many anomalies are detected, reducing false alerts so you can focus on genuinely important issues.

Reducing the number of anomalies enables you to focus on important issues while eliminating irrelevant anomalies.

The system uses measurement ranges, called 'bounds', to determine what is considered normal and abnormal metric behavior. These bounds are calculated automatically from your historical metric data.

About variation ranges

A variation range is a measurement of how much your metric values typically vary from their average. The system calculates variation ranges automatically by analyzing your historical data. For example, if your CPU usage averages 50%:

- A small variation range (like 2%) indicates that values stay consistent, typically between 48-52%.
- A large variation range (like 10%) indicates that values fluctuate more widely, typically between 40-60%.

The variation range's measurement (value) is known as standard deviation.

How bounds are set

The system sets bounds by measuring how far away from the average a value can be before it's considered abnormal. The formula is: `Average +/- (multiplier x variation range)`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The multiplier is a number that controls how wide or narrow the acceptable range is.

- Smaller multipliers create narrower bounds and detect more anomalies.
- Larger multipliers create wider bounds and detect fewer anomalies.

Example: CPU averages 50% and the standard deviation is 5%

Sample metric bounds

Multiplier	Bounds
2	40% to 60% (50%+/-10%)
3	35% to 65% (50%+/-15%)
5	25% to 75% (50%+/-25%)

Automatic adjustment process

1. High sensitivity detected: If 95% of a CI's metric values fall within a multiplier of 2, the system recognizes this as overly sensitive. As a result, too many anomalies are created, including some that aren't actually problems.
2. The system widens the bounds: When high sensitivity is detected, the system automatically adjusts from a multiplier of 2 to 5, creating wider bounds and generating fewer, more meaningful anomalies.
3. Normal sensitivity: If high sensitivity isn't detected, the system uses a multiplier of 3 for moderate bounds.

Any metric values falling outside the configured bounds are tagged as anomalies.

The multiplier values (2, 3, and 5) are set by default. For details on customizing these values, see Sensitivity bounds properties for Insights Explorer metrics.

Metric collection sources

When setting up Metric Intelligence, you must configure a source for metric collection. Metric collection can be performed either by the Agent Client Collector, or by metric connectors.

The metric collection source determines where Metric Intelligence gathers metrics from. For details on gathering metrics using Agent Client Collector, see Configuring Agent Client Collector Monitoring.

When gathering metrics with connectors, use either a SCOM or Dynatrace connector. For details on connecting metrics using a SCOM connector, see Configure the SCOM connector instance.

For details on connecting metrics using a Dynatrace connector, see Configure the Dynatrace metrics connector instance.

Metric binding

After metric data is collected, Metric Intelligence identifies the CIs and the resources to bind the data to.

The data that is collected on the MID Server is raw and does not relate to any specific CI or resource in the CMDB. To be useful, the data goes through a **normalization** process that uses CMDB identification rules and event rules to uniquely identify CIs. The process maps and binds the identified CIs to the raw data. Raw data can also be mapped and bound to resources, if binding to a CI is successful and if resource binding is configured.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Records for mapping raw data to CIs are automatically generated and remain in effect for a specified length of time determined by the properties:

- *sa.metric.map.with.ci.expiration.sec*: If the mapping to the CI was found. Set by default to be valid for five days.
- *sa.metric.map.without.ci.expiration.sec*: If mapping to the CI was not found. Set by default to be valid for 24 hours.

When similar metric data arrives within that time period, the existing mapping is used to match the data to CIs. At the end of the time period, metric-to-CI records expire. Also, a change in the event rules triggers an immediate expiration of the respective metric-to-CI records. Next time that raw metric data arrives, it will be normalized again. When Discovery adds or removes CIs, mappings are adjusted to reflect these changes at the next cycle.

All the information about the recent existing mapping is saved under metric-to-CI records in the sa_metric_map table, as shown below. You can access the Metric to CI table by navigating to **All > Event Management > Metrics > Metric to CI**.

Metric to CI table

Metric binding to resources

Bind metrics to resources to simplify metric events binding by enabling binding to resources such as specific disks or web pages, in addition to binding to CIs.

Metric Intelligence models metric series in either of the following methods:

- Binding a metric series to a CI and to the metric being monitored for that CI using a 'CI/Metric' format. For example, 'win_server_001/response_time_mean'.
- Binding a metric series to a CI, a resource within that CI, and the metric being monitored for that resource, using a 'CI/Resource/Metric' format. For example, 'win_server_001/Disk — C/disk_usage'. This method is referred to as *resource binding*.

The first method enables modeling, storing, aggregating, and querying data at the CI level. However, resource binding creates resource records for specific monitored entities, such as an individual web page or a disk. Therefore, resource binding is more efficient when there are multiple resources of similar types within a CI, and metrics applicable to a category of these resources are mapped to these resources.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use cases:

- Common examples are disks, processors, and network interfaces. In cases in which these entities are being monitored but do not exist in the CMDB, using resources for metric binding is useful.
- Some monitoring solutions capture metric data within services such as KPIs for individual web pages in an application. In such cases where the entity being monitored is not a configuration item, metric binding to resources can be helpful.

In those situations, using resource binding results in more meaningful aggregations across similar metrics (such as: avg disk_usage for a host across all disks).

Resource binding process

The MID Server generates metric binding events that are processed by the instance. When processing a metric binding event, there is an attempt to identify the CI to which this metric binding event belongs. If this attempt is successful, then the metric binding event is bound to the identified CI and binding to a resource is attempted. The following steps describe the attempt to bind a metric binding event to a resource:

1. Identify the CI class of the CI that was bound to the metric binding event.
2. Locate the resource class which is mapped to that CI class (using the CI Type To Resource Class [sa_ci_type_to_resource_class] table).
3. Read the *resource_path* attribute value in the **additional_information** field in the metric binding event.
4. Check if a resource record exists in the resource class table. The record must have *name* equal to *resource_path* and *cmdb_ci* equal to the CI that was bound to the metric binding event.
5. If such resource record exists, then the metric binding event is bound to that resource. Otherwise, a new resource record is created with the preceding values and the metric binding event is bound to the newly created resource.

Configure resource binding

- Ensure that the sa.metric.use.resource.binding system property is set to true (default).
- For series intended to be bound to resources, ensure that the *resource_path* attribute is populated by doing either step:
  - Use an event rule to add the *resource_path* attribute to the **Additional information** field in events. For more information, see Creating an event rule to map metrics to specific CIs.
  - Populate the *resource_path* attribute as a part of the respective CI identifier when data is sent to the MID Server for processing.
- Review the default mappings in the CI Type To Resource Class [sa_ci_type_to_resource_class] table and adjust as needed. It is critical that mappings are set as desired prior to data processing.

  Managing the CI Type To Resource Class table requires the evt_mgmt_admin role.

Resource tables

Resource binding uses an underlying hierarchy structure of resources which is a subset of the [cmdb_ci] hierarchy. Metric Intelligence installs the following resource tables:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- CI Resource [ci_resource] (parent table):
- Tables that extend CI Resource [ci_resource]:
  - ci_resource_hardware
  - ci_resource_appl
  - ci_resource_service
  - ci_resource_vm_object
  - ci_resource_database

Mapping CIs to resources

Mappings of CI classes to resource classes are stored in the CI Type To Resource Class [sa_ci_type_to_resource_class] table. This table is installed with Metric Intelligence, and is used during metric binding to resources.

Mappings in the CI Type To Resource Class table (default)

CI class	Resource class
cmdb_ci_hardware	ci_resource_hardware
cmdb_ci_appl	ci_resource_appl
cmdb_ci_service	ci_resource_service
cmdb_ci_database	ci_resource_database
cmdb_ci_vm_object	ci_resource_vm_object

Creating an event rule to map metrics to specific CIs

Create event rules to map incoming raw metric data to specific CIs, to optionally modify metric names, and to populate the *`resource_path`* attribute for resource binding.

The system generates events for every new raw metric data for which there are no CI binding specifications. You can create event rules that filter those events to map the incoming metric data to specific CIs. In such event rules, you can for example define a filter that is based on the monitoring object (such as SCOM).

To use resource binding, the *`resource_path`* attribute of events must be populated. You can configure an event rule to ensure that the *`resource_path`* attribute is included in the **Additional information** field in events. For more information about configuring and using resource binding, see resource binding.

Use the *`resource_path`* attribute to identify the resource within the bound CI. For example, if a metric is collected for the C drive of the `win_server_001` CI, set *`resource_path`* to a value such as `Disk - C`. The metric identifier can then use the `CI/Resource/Metric` format, such as `win_server_001/Disk - C/disk_usage`.

For example, in the Event Rule designer you can update the event rule **SCOM IIS Web Server** as follows:

- On the **Event Filter** tab, define filter to match only IIS Web Servers.
- On the **Binding** tab, set **Class** to `Microsoft IIS Web Server`.

CIs in maintenance mode

Configure anomaly detection to exclude metrics for CIs that are in maintenance mode from model learning.

You can change the settings of system properties to include or exclude metric data for CIs while they are in maintenance mode.

When the system property sa.model_learner.maint_event_record_history_enabled is set to true (default), Metric Intelligence stores historical information about the times CIs enter and exit maintenance mode. When the system property sa_metric.maint_exclusion is set to true (default), metrics from CIs that are in maintenance mode are excluded from model learning.

Anomaly model testing

Use anomaly model testing to apply and evaluate anomaly detection for a small set of CIs and metrics, using actual metric data. Compare test results to expected results, then fine-tune the anomaly detection model before enabling anomaly detection for the tested CIs and metrics in the production environment.

For example, before enabling anomaly detection for Linux Servers, you can use anomaly model testing with actual metric data collected for those Linux Servers. Existing alerts might indicate an anomaly for a specific metric and CI. You can create an anomaly test rule to test anomaly detection for those CIs and metrics, and then check if the expected anomaly is detected. You can also examine the bounds calculated by the anomaly model to see if they match expected bounds. After you fine-tune the test model, you can enable anomaly detection for Linux Servers.

Anomaly model testing supports up to 20 time series, which can include 20 metric types for the same CI, the same metric type for 20 different CIs, or any combination of those options.

View test results in the Insights Explorer

Upon completion of a test run, a URL to an Insights Explorer becomes available. The anomaly model testing results appear in this trimmed-down version of the Insights Explorer. This Insights Explorer is pre-loaded with the charts and scores for the metric series specified in the anomaly test rule. You cannot add any CMDB groups or application services to this Insights Explorer.

Each chart in the Insights Explorer, contains the Anomaly Test Statistics section in its **Chart Settings**. This section is specific to anomaly model testing and provides the following options:

- **Show Bounds**: Displays a computed upper and lower bound for the metric in an anomaly model testing, based on learning of past metric values. The upper and lower bounds always appear together.
- **Show Anomaly Scores**: Displays anomaly scores on a virtual axis of 0-10, for an anomaly model test. Color code is based on the score thresholds that are defined in the Anomaly Score to Event Severity Map [sa_metric_anomaly_score_to_event_severity_map] table.

Advanced Promotion Engine

You can create a definition for the Advanced Promotion Engine so that you can define the conditions for promoting the anomaly alerts to the All Alerts table. By promoting the alerts that meet the conditions, only the most relevant anomaly alerts move to the table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Advanced Promotion Engine moves the most relevant alerts from the list of anomaly alerts to the All Alerts table. When a group of anomaly alerts on a configuration item (CI) meets the conditions that you set in the definition that you created for the Advanced Promotion Engine, the grouping mechanism groups the promoted alerts in the All Alerts table. For example, you can create a condition indicating that only the anomaly alerts that belong to a specific CI class with a minimum severity of Major are to be promoted to the All Alerts table.

The All Alerts table is the table that contains the issues that need your immediate attention. The anomaly alerts on the different metrics within a CI in a specific time period indicate an issue that needs to be promoted to the All Alerts table.

Anomaly alerts indicate a deviation from projected metric values for monitored CIs. For details, see View anomaly alerts.

The Advanced Promotion Engine is activated automatically as part of the Metric Intelligence application.

You can use the Advanced Promotion Engine definitions that come with the base system (for the Linux server and for the Windows server), or you can create definitions on the different CI classes. The base system definitions indicate that the CIs on the Linux and Windows servers are operational, and those CIs that have a minimum severity of Major are to be promoted to the All Alerts table.

All Advanced Promotion Engine tasks require the evt_mgmt_admin role. The evt_mgmt_user role enables you to view definitions and properties only.

Metric Explorer

Metric Explorer provides an easy-to-navigate interface where service agents can view the health of a CI associated with an alert. Health details for a CI include various metric charts with control bounds, and aggregations in a time period.

The set of metric charts that appear for a CI class in Metric Explorer is determined by metric chart configurations in the Metric Dashboard Metadata [sa_metric_dashboard_metadata] table. The Metric Dashboard Metadata table is initially populated with configurations for common classes and important metrics for those classes. A user with the admin or evt_mgmt_admin role can update the default metric chart configurations in the Metric Dashboard Metadata table.

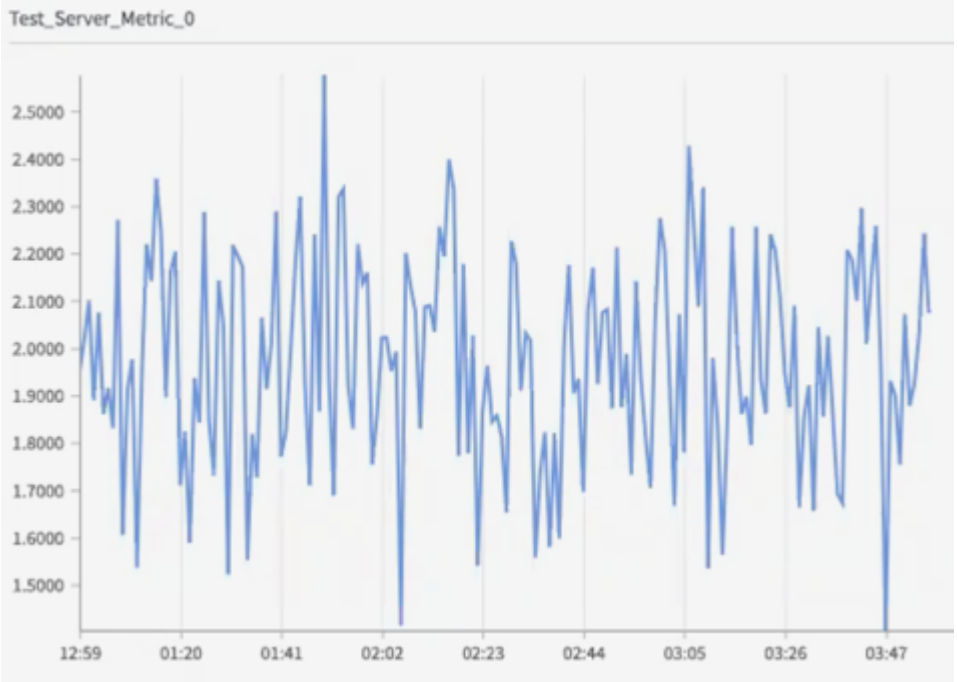
There can be up to 10 active metric charts configured for a class at any point.

Chart types

A metric chart that appears in the metric charts form in Metric Explorer can be a **time-series** chart or a **single-score** chart.

Time-series chart

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The time-series chart type is a graph of all data points in the specified time range, for the metrics of the CI associated with the chart. Time-series charts are similar to charts in Insights Explorer, and depending on settings, show lower and upper bounds.

Single-score chart

The single-score chart type shows a single number which is an aggregation of the data points in the time series for the metric and CI of the chart. The aggregation is an average of the data points, or the maximum, minimum, or last data point in the time series.

Templates

The ITOM Service Operations Workspace Metric Explorer template enables metric chart drill-down from Digital Analytics (DA) dashboards to Metric Explorer. For details, see Express list overview on the ServiceNow® Developer portal.

Self-health monitoring for Metric Intelligence

Use Event Management self-health monitors to monitor the health of Metric Intelligence infrastructure components and processes, and to alert about potential issues. Self-health monitoring allows you to proactively remediate issues and minimize data loss.

Metric Intelligence is pre-configured to use Event Management self-health monitors to ensure that essential components and processes are functioning properly. If a monitor detects a failure, then the Event Management self-health monitoring system creates an event for the issue. These events are then converted into an Event Management alert or get appended to a previous alert. Metric Intelligence self-health monitors run every 60 seconds.

For example, if an Metric Intelligence MID Server distributed cluster experiences an issue, an event is generated with the status of **Major**. Then, this event is converted into an alert. Later, when the issue is resolved, a new event is generated with the status of **Info** and the original alert is closed.

Monitored components and processes

Component/Process Check	Error Condition
Metric Intelligence extension is running properly	Monitor checks the *status* field of the *ecc_agent_ext_context_metric* table to detect a state of **Error** or **Warning**.
Metric Intelligence MID Server distributed cluster is running properly	Monitor checks the *status* field of the *ecc_agent_cluster* table to detect a state of **Error**, **Segmented**, or**Stopped**. **Note:** For a state of **Stopped**, an event is created only if the *error_message* field is not empty.
Metrics are collected by active connectors that are configured for metrics collection	For each connector with the *Metrics collection* flag set to **true**: Monitor checks the status of the *last_kpi_status* field in the *em_connector_instance* table to detect a status of **Error**.
Essential Metric Intelligence scheduled jobs are active	Monitor checks the following essential scheduled jobs, to detect if any is inactive: • Metric Intelligence — Metric configuration job • Metric Intelligence — Sync tables with mid • Metric Intelligence — Validate MID Distributed cluster

For more information about enabling or disabling an Metric Intelligence self-health monitor, see Configure a self-health monitor.

Scheduled jobs installed with Metric Intelligence

Domain separation and Metric Intelligence

Domain separation is supported in Metric Intelligence. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

How domain separation works in Metric Intelligence

When domains are separated in Metric Intelligence, users can view and manage alerts and events only in their own (tenant) domain. After the binding process has finished, the domain of the configuration item (CI) is used so that users within that domain can explore metric data. A domain column is present for Metric Intelligence tables that are provided in the base system. The domain column shows the name of the domain to which the CI belongs.

Note: If the domain column does not appear in the list, click (Personalize List) and add the required column. In addition, you can add a column that displays the domain path.

The following Metric Intelligence features have limited domain separation support.

Feature	Support
Metric types	Supported at global level. The instance owner can control the metric types for all domains.
Metric type registration	Supported at global level. The instance owner can control the metric type registration for all domains.
Metric class	Supported at global level.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Feature	Support
	The instance owner can control the metric classes that are used for all domains.
Configuration settings rules	Supported at global level. The instance owner can control the configuration settings rules for all domains

Domain separation for service providers

Configuring Metric Intelligence

Plan and configure your Metric Intelligence implementation.

Configuration overview

Metric Intelligence configuration typically follows these steps:

1. Install the AIOps Experience plugin [sn_sow_aiops].
2. Manually configure a MID Server for Metric Intelligence.
3. Activate Metric Intelligence.
4. Stream metrics to the instance, via the relevant data source or connector.
5. Choose and configure metrics to monitor.
6. Ensure that metrics are properly bound to CIs.
7. Configure the action level for anomaly detection.
8. Define an advanced promotion rule, to determine the conditions for promoting an anomaly alert to an IT alert.

Get started with Metric Intelligence

Complete the following setup and initial configuration steps to start using Metric Intelligence.

Before you begin

Activate the Metric Intelligence plugin (com.snc.sa.metric).

Role required: evt_mgmt_admin

About this task

Metrics have an expiration date. You can continue receiving data without interruption when a metric's expiration date arrives by pushing ahead the expiration date. For details, contact customer support.

Metric Intelligence guided setup provides a sequence of tasks that help you configure Metric Intelligence on your ServiceNow instance. To open Metric Intelligence guided setup, navigate to **Guided Setup** > **ITOM Guided Setup**, and click **Continue**. Then scroll to **Metric Intelligence**, and click **Continue**. For more information about using the guided setup interface, see Using guided setup.

Alternatively, you can complete the following procedure.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Configure a MID Server for Metric Intelligence.
   For details, see MID Server and MID Server distributed cluster for Metric Intelligence.
2. Use the Automated Metric Intelligence setup.
3. Choose a source for collecting metrics.
4. Choose and configure metrics to monitor.
5. Create event rules to map raw metric data to specific CIs and Create an event rule to bind metric events to host CIs.
6. About 10 minutes after the Metric Intelligence Metrics extension has started, run the quick start tests for Metric Intelligence to verify functionality.

Activating Metric Intelligence

Metric Intelligence enables you to capture, explore and analyze operational metrics data, identifying and indicating anomalies. This analysis can prevent potential service outages.

View and work with Metric Intelligence data in the Insight Explorer, Agent Workspace, and Service Operations Workspace interfaces.

For details on the plugins activated with Metric Intelligence, see Plugins or applications installed with ITOM AIOps.

Automated Metric Intelligence setup

When you initially set up Metric Intelligence, you can automate many of the setup steps. For example, the automated setup configures a MID Server for Metric Intelligence and creates a MID Server distributed cluster which contains that MID Server.

Before you begin

Role required: evt_mgmt_admin

About this task

When the following conditions are met, the related link **Setup Metric Intelligence** appears on the MID Server form, enabling automated setup:

- The MID Server has been validated.
- The MID Server is in a running state.
- The property *sa.metric.display.mid.setup.action* is set to true (default value).

The Metric Intelligence automated setup performs the following setup tasks:

1. Configures the MID Server with the *Operation Intelligence* application
2. Adds the *Metrics* capability to the MID Server
3. Creates a new MID Server cluster of type 'distributed' set with a default port of 47100 for Apache Ignite
4. Adds the MID Server to the new MID Server distributed cluster
5. Creates a Metric Intelligence Metrics Extension and starts it
6. Opens the Metric Intelligence Metrics Context form. On this form, you can click the **Setup REST Listener** UI action to create the MID Web Server extension configured with the 'Enable REST Listener' option and default port 8097

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If automatic setup fails, you can create a MID Server distributed cluster manually, as described in the Use the **Setup Metric Intelligence** link only to create the first MID Server distributed cluster that contains a single MID Server, with default values. After the automated setup completes, you have to manually create any additional MID Server distributed clusters or add Metric Intelligence MID Servers.

Procedure

1. Navigate to **All** > **MID Server** > **Servers**.
2. Select the MID Server that you want to configure as a Metric Intelligence MID Server.
3. On the MID Server form, select **Setup Metric Intelligence** in the Related Links section.
4. In the newly created Metric Intelligence Metrics Extension form:
   a. Wait for the Status value to be **Started**.
   b. If configuring the MID Server for pushing, select the UI action **Setup REST Listener**.
   A notification appears about the MID Server extension being created. The **MID Web Server Extension** field appears and **Enable REST Listener** is checked. You can preview the MID Server Extension record to verify that its Status value is **Started**.

Related topics

MID Server distributed cluster for Metric Intelligence

Manually configure a MID Server for Metric Intelligence

To use Metric Intelligence, configure at least one MID Server with Metric Intelligence as a supported application, with the Metrics capability, and which runs the Metric Intelligence Metrics extension. Then, add that Metric Intelligence MID Server as a member to a MID Server distributed cluster.

Before you begin

Ensure that the MID Server meets all software, hardware, and configuration requirements to be configured for Metric Intelligence.

Role required: To access the MID Server - mid_server. To configure a MID Server in an instance (for example, to add a supported application), refer to the MID Server documentation.

Procedure

1. Navigate to **All** > **MID Server** > **Servers**.
2. Click the MID Server that you want to configure for Metric Intelligence.
3. Add the Metric Intelligence application:
   a. At the center of the MID Server form, click **Supported Applications**.
   b. In the **Supported Applications** section, click **Edit**.
   c. In the slushbucket, select **OperationalIntelligence** and click the **>** add button.
   d. Click **Save**.
4. Add the Metrics capability:
   a. At the center of the MID Server form, click **Capabilities**.
   b. In the **Capabilities** section, click **Edit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. In the slushbucket, select **Metrics** and click the '>' add button.

d. Click **Save**.

5. Click **Update**.

What to do next

Create a MID Server distributed cluster, and add the Metric Intelligence MID Server as a member to that cluster.

Manually configure the Metric Intelligence extension

Configure the MID Server Metric Intelligence extension to enable the MID Server to pull raw metrics from external systems. The extension detects anomalies and reports them to the instance along with raw data. This MID Server Metric Intelligence extension is required and must be running in order for your system to collect Metric Intelligence data.

Before you begin

See Get started with Metric Intelligence for the high level steps of setting up Metric Intelligence.

Role required: evt_mgmt_admin

About this task

The MID Server Metric Intelligence extension normalizes the raw data and then transmits the data to the instance. If the extension detected any anomalies above a specified threshold, they are sent to the instance. The extension runs for as long as it is enabled. This provides a persistent connection to the MID Server to constantly listen for raw Metric Intelligence data from external systems.

The MID Server Metric Intelligence extension:

- Receives raw metric data, batches them and sends them to the instance at specified intervals.
- Detects anomalies and sends a report to the instance.
- The information that is sent to the ServiceNow instance is relevant for Metric Intelligence, so data processing is efficient.

The MID Server Metric Intelligence extension does not provide any API calls. However, when the **Enable REST Listener** option is selected, the extension adds a handler for the supported REST APIs.

Note:

- Only upon configuring the Metric Intelligence extension, the Metric Intelligence MID Servers actually join the distributed cluster for Metric Intelligence.
- After the initial configuration, the first metric is not included in the metrics data.
- There is a delay of one minute in receiving metric information from the synchronization of the instance with the MID Server.

Procedure

1. Navigate to **All** > **MID Server** > **Profiles and Deployments** > **Metric Intelligence**.
2. In the Metric Intelligence Metrics Contexts list, click **New**.
3. Fill in the fields, as appropriate.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Name	A unique name for this extension for easy identification.
Short description	A description of this extension.
Status	This field is auto-populated with the status of the extension. The field is blank until the extension is started. After issuing a command to the extension, one of the following values is displayed: ○ **Started**: The extension is running. ○ **Stopped**: The extension is not running. ○ **Offline**: The MID Server is down. ○ **Error**: The extension failed with an error (the error message is displayed in **Error Message**). ○ **Warning**: A run-time exception has occurred. The extension continues to work.
Error Message	Message describing any error that causes a command, such as **Start** or **Stop**, to fail. This field appears when the value in the **Status** field is **Error** and also when the value in the **Status** field is **Warning**.
Execute on	Location for running this extension. When configuring this option for use with Metric Intelligence, set to **Specific MID Server**. Then specify the MID Server with *`Operationalintelligence`* as a supported application and the *`Metrics`* capability.
MID Server	The name of the designated MID Server, which is configured with *`Operationalintelligence`* as a supported application and the *`Metrics`* capability.
Executing on	[Read-Only] The name of the MID Server on which the extension is running. This field shows the name of the MID Server even if the MID Server is down. If the user stops the extension, this field is empty.

4. When using the Push method for collecting Metric Intelligence data, the MID Server Metric Intelligence extension must be configured with the **Enable REST Listener** enabled. This option enables a listener so that a REST endpoint can receive raw metric data. The raw metric data is then placed in the regular data flow where the data is sent to the instance and the anomaly detector looks for anomalies. When selected, it adds a handler to the web server to listen for any metrics that are pushed to the MID Server. When this option is selected, the Web Server

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

extension, which starts a Web Server on the MID Server, must also be configured. For more information, see Configure the MID Web Server extension.

5. Right-click the form heading and select **Save**.
6. Under **Related Links** click **Start** to save the Metric Intelligence data in this extension and start the extension.

Commands available in the MID Server Metric Intelligence extension

Related Link	Description
Start	Starts the extension on the configured MID Server if it is currently not running.
Stop	Stops the running extension on the configured MID Server. No action is taken if the extension is not running.
Restart	Stops, then starts the extension on the configured MID Server.
Test	The test is not relevant to Metric Intelligence. Parameters are not tested or validated when **Test** is run.
Update parameters	Sends the latest saved parameters to the extension.

Activate the Advanced Promotion Engine

Before you can use the Advanced Promotion Engine feature, you must activate it from the list of plugins.

Before you begin

Role required: evt_mgmt_admin

About this task

To activate the *var.adv-promo-eng*, you also need to install a plugin for ACC-M, which includes Metric Intelligence plugin, as described in Exploring Agent Client Collector Monitoring.

If you don't plan to use ACC-M, install Metrics Intelligence plugin only, as described in Get started with Metric Intelligence.

Procedure

1. Navigate to **System Definition** > **Plugins**.
2. Locate **Advanced Promotion Engine** (id: sn_metric_promote).
3. Select the entry and review the app details on the **Store Application Advanced Promotion Engine** form.
4. Select **Activate/Upgrade** in the Related Links section.
5. Select **Activate**.

Configure domain separation for Metric Intelligence

Configure Metric Intelligence for domain separation to create logically defined domains that limit unauthorized access to data.

Before you begin

Role required: evt_mgmt_admin and evt_mgmt_integration

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Activate the Domain Support – Domain Extension Installer plug-in.
2. Configure the MID Server for Operational Intelligence as a user that belongs to the desired domain with the role 'mid_server' assigned to it.
3. Configure a MID Server distributed cluster in the domain you desire and add Operational Intelligence MID Servers that belong to the same domain.
   For more information about setting up MID Servers for Metric Intelligence , see MID Server distributed cluster for Metric Intelligence.

Note: The Event Management's binding events are configured using the domain of the logged-in MID Server user. Once the process has finished, the record's domain is updated to use the domain from the CI so that any user within that domain can see the metric data.

Optimizing Metric Intelligence

You can perform a variety of tasks to optimize your use of Metric Intelligence.

Create an anomaly test rule

To use the anomaly model testing, create an anomaly test rule in which you specify up to 20 metric series to test anomaly detection for. Run the anomaly test, and after it completes, use the provided URL to open the Insights Explorer which is pre-loaded with the model testing results.

Before you begin

Role required: evt_mgmt_user

Procedure

1. Navigate to **All** > **Event Management** > **Anomaly Detection** > **Anomaly Model Testing**.
2. Select an existing anomaly test rule to edit and run again, or click **New** and fill out the Anomaly Test Rules form.

Field	Description
Name	Name for the model test rule.
Applies to	The table from which to select CI/metric pairs for the model test rule. The table used is Metric To CI Mapping [sa_metric_map].
Rule	Filter conditions to specify pairs of CIs/metrics for the anomaly model testing. If the rule yields more than 20 pairs of CIs/metrics, then the list is truncated to 20.
Start date/End data	The time period for which to apply the anomaly detection testing. The time period must be within the past 7 days.
Status	Status of the test, automatically updated by the system during a test run. Status is initially Scheduled and eventually changes to Complete.

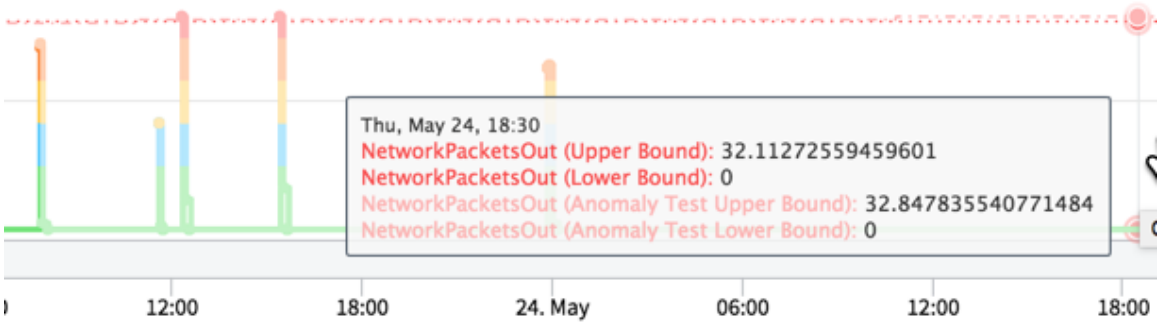
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
URL	URL to the Insights Explorer in which the anomaly model test results are pre-loaded.
Notes	Logging summary, automatically updated by the system with details of each test run of the anomaly test rule.

3. Click **Run Anomaly Test**.
   During the test run, the **Status**, **URL**, and **Notes** fields are automatically updated to reflect the progression of the job.
4. After **Status** changes to Complete, click the **URL** link to open the Insights Explorer to see the results of the test.

Result

The bounds and the chart for the anomaly model test, appear in faint colors in Insights Explorer. Also, the upper and lower bounds that are calculated by the test, use a line pattern that is different than line pattern used for actual anomaly detection results. These differences let you distinguish between actual anomaly detection and anomaly model test results, if both are selected in the chart settings.



What to do next

- Modify the date range for the test or choose different time series, and click **Run Anomaly Test** again to continue and fine-tune the model.
- Click the **Chart Settings** icon for a chart to toggle the display of statistics and aggregations on the chart. Select **Show Bounds** and **Show Anomaly Scores** in the Anomaly Test Statistics and in the Anomaly Statistics sections, to display test results next to actual anomaly detection results.

  Note: Anomaly Model Testing results might be very similar to actual anomaly detection results. If you configure the chart to display both at the same time, as you move the mouse over the chart, it might be difficult to identify points of differences.

- When you are satisfied with the anomaly test results, enable anomaly detection in the production environment, for the metrics and CIs specified in the test. See Choose and configure metrics to monitor for more details.

View metric to CI and resource binding

View the metric to CI and resource binding results, including details for failed bindings which you can use to mitigate the failure. Unmapped metrics are excluded from anomaly detection until properly mapped.

Before you begin

Role required: evt_mgmt_admin

If resource binding is not enabled, then no resource binding results appear.

About this task

Metric Intelligence uses event rules to map metric data with the specific CI or resource that is associated with the metric event. The results of these mappings are stored in the Metric to CI Mappings [sa_metric_map] table. If mapping fails, then the binding status for the metric indicates the general reason for the failure and further details about the failure are provided. Examine the details for a mapping failure and mitigate the problem to improve accurate and effective metric data processing.

- If mapping to a CI is successful, then the mapped CI appears in the **Configuration Item** column. If resource binding was attempted but failed, then the mapped CI does not appear, even if the mapping to a CI was successful. Missing or duplicate CIs can cause CI mapping to fail.
- If mapping to a resource is successful, then the mapped resource appears in the **Resource** column. Resource binding can fail if a resource table mapped to the CI type is missing or if the *resource_path* attribute is missing in the event.

Records in the CI Mappings [sa_metric_map] table remain in effect for 24 hours (by default, if mapping to the CI is not successful), or for 5 days (by default, if mapping to the CI is successful). Later, if within that time period raw data arrives for a metric/CI pair that already has a record, the existing mapping is used to match the data to an existing CI. After Metric to CI Mappings records expire, incoming new raw data requires remapping. These records expire when:

- The 24-hour or 5-day cycle ends.
- An event rule has changed — Triggering an immediate expiration of the respective mapping record.

Adjusting mappings to reflect the addition or removal of CIs by Discovery, takes effect only upon the beginning of the next cycle.

Procedure

1. Navigate to **All** > **Event Management** > **Anomaly Detection** > **Metric to CI**.
   The **Metrics to CI Mappings** page appears.

Column	Description
Source	Data source for the metric.
Metric Type Id	Metric that is measured for the CI, such as disk% and cpu%.
Metric Identifier	A string in the form of CI/resource/metric that uniquely identifies a CI and a metric.
Configuration Item	The CI in the CMDB that is mapped to a metric. A missing value indicates that:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column	Description
	○ The mapping of the metric to a CI was unsuccessful. ○ Resource binding is enabled, but has failed. **Configuration Item** is missing even though binding to a CI was successful.
Resource	The resource that is mapped to a metric. If resource binding is enabled, then a missing value indicates that the mapping of the metric to a resource was unsuccessful.
Expiration Date	Record expiration date.
Anomaly Detection Action Level	The level of anomaly detection processing and analysis applied to CIs and metrics. The available options are: ○ **Metrics Only**: Only gather metrics from the data source without any further processing. ○ **Bounds**: Includes the Metrics Only processing level, and also creates a statistical model and shows bounds in Insights Explorer. ○ **Anomaly Scores**: Includes the Bounds processing level, and also calculates and displays anomaly scores. ○ **Anomaly Alerts**: Includes the Anomaly Scores processing level, and also creates anomaly alerts, as applicable. ○ **IT Alerts**: Includes the Anomaly Alerts processing level, and also creates IT alerts which are based on anomaly alerts, as applicable.
Binding Status	Status of the mapping of the metric to a CI or resource. A **CI Found** status indicates that the mapping was successful, in which case the mapped CI appears in the **Configuration Item** column. Any other status indicates that the mapping failed, and a general reason for the failure is provided. Further details about the failure are provided in the **Binding Failure Reason** column.
Binding Failure Reason	Specific details about the mapping that failed, such as class and host names, and the queries that were used. Click the respective **Event** link to see further details in the **Processing Notes** field.

2. Examine the **Binding Status** and **Binding Failure Reason** as appropriate.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use the details provided to remediate the problem:

Binding Status	Remediation
Host CI Missing	Run Discovery or use any other method to populate the CMDB with the missing host CI.
Non-Host CI Missing	Run Discovery or use any other method to populate the CMDB with the missing non-host CI.
Non-Host CI Duplicate	Use the Duplicate CI Remediator to remediate the duplication.
Dependent CI Duplicate	Use the Duplicate CI Remediator to remediate the duplication.
Dependent CI Missing	Run Discovery or use any other method to populate the CMDB with the missing dependent CI.
Duplicate Metric Map Entry Exists	Check **Binding Failure Reason** and compare the metric identifiers associated with the duplicate metric map entries. If metric identifiers have changed (for example, an identifier was added), set the entry for this series in the CI Mappings [sa_metric_map] table to expire. You can also delete the entry. Also check the associated event rule and ensure that it extracts the attributes correctly and that it does not extract the same CI for two different metric identifiers. This error might appear when 2 different metric identifiers map to the same CI/metric.
Resource ID Not Found	Verify that the CI Type To Resource Class [sa_ci_type_to_resource_class] table contains a mapping record for the respective CI type, or for one of its parents. Then ensure that a table with the name of resource class for this record, exists.

What to do next

Group **Binding Failure Reason** by **Binding Status** to create a summary report with the number of records per failure category. Use this report to efficiently remediate the problems.

Creating an event rule to map metrics to specific CIs

Disable a metric for a CI

Metric Intelligence can be configured to collect significant amounts of data, some of which might not be necessary. To improve performance, you can disable a specific metric for a specific CI to stop processing data related to the specified metric and CI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: evt_mgmt_admin

About this task

Note: The *Active* setting (true or false) for a source metric in the Monitoring System Metric Types [sa_source_metric_type] table takes precedence over the setting for the corresponding metric in the Metric To CI Mappings [sa_metric_map] table. If a source metric type in the Monitoring System Metric Types [sa_source_metric_type] table is disabled, all records related to the corresponding metrics are removed from the Metric To CI Mappings [sa_metric_map] table.

Procedure

1. Navigate to **All** > **Event Management** > **Anomaly Detection** > **Metric to CI**.
2. Locate the record for the metric/CI that you want to disable, and set its **Active** column to **false**.

Disable event collection

For performance reasons, you might want to disable the collection of events from a data source from which metric data is also collected. You can disable event collection for data sources such as Nagios XI server, SolarWinds monitoring system, and Zabbix server.

Before you begin
Role required: evt_mgmt_admin

Note: To restart event collection after it has been disabled, you will need to restore the connector's original script.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Select a connector instance for the data source for which to disable event collection.
   For example, select a connector instance for Nagios, SolarWinds, or Zabbix.
3. Set **Event collection schedule (seconds)** to a large value such as 20,000,000.
   Such setting avoids unnecessary communication with the MID Server, optimizing performance.
4. Click **Update**.
5. Navigate to **MID Server** > **Script Includes** and extend the connector's script (such as *NagiosMetrics_JS*, *SolarWindsJS*, or *ZabbixJS*) by overriding the *execute* method.
   Add a code snippet such as the following, and then click **Update**:

Example: Snippet for Nagios

```
var NagiosJSCustom = Class.create();

// Extending Nagios default script
NagiosJSCustom.prototype = Object.extendsObject(NagiosJS, {

// Override execute method
                    execute: function() {
        var retVal = {};
        retVal['status'] = SUCCESS.toString();
       retVal['error_message'] = "Disabled by custom Class,
 'Last event collection status' will be 'error' and this is
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 normal. To achieve success status, enable event pull in custom
 class(NagiosJSCustom)";

        return retVal;
    });
```

For the SolarWinds connector use:

```
var SolarWindsJSCustom = Class.create();

// Extending solarwinds default script
SolarWindsJSCustom.prototype =
 Object.extendsObject(SolarWindsJS, {
```

For the Zabbix connector use:

```
var ZabbixJSCustom = Class.create();

// Extending zabbix default script
ZabbixJSCustom.prototype = Object.extendsObject(ZabbixJS, {
```

Configure anomaly score thresholds

Metric Intelligence scores anomalies on a range 0-10. This range is broken down to the five levels of event severities, each represented by a different color in the Insights Explorer and in the Anomaly Map. You can configure the anomaly score threshold for each level of severity.

Before you begin

Role required: evt_mgmt_admin

About this task

Anomaly score thresholds are defined in the table Anomaly Score to Event Severity Map [sa_metric_anomaly_score_to_event_severity_map]. For example, by default, anomaly scores from 8 through 9 are severity 2 (Major). These anomalies are displayed in dark orange in the Insights Explorer and in the Anomaly Map.

For information on the event severities that each number corresponds to, see Event severities.

Procedure

1. Navigate to **All** > **Event Management** > **Anomaly Detection** > **Anomaly Score to Severity Mapping**.
2. In the **Metric Anomaly Score to Event Severity Maps** list view, double-click the event severity that you want to modify.
3. Modify the range of anomaly scores that map to the respective event severity.
4. Click **Update**.

View anomaly alerts

Anomaly alerts indicate deviation from projected metric values for monitored CIs. Anomaly alerts are separate from regular IT alerts. They appear in the Service Operations Workspace but not in Express List. You can define an anomaly alert promotion rule to generate an IT alert that is based on anomaly alerts.

Before you begin

Role required: evt_mgmt_user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The statistical model is used to calculate standard deviations, upper and lower bounds, and statistical outliers which are then used to detect anomalies. An anomaly occurs when metric values are out of the projected values according to the statistical model. The system monitors the frequency and persistence of statistical outliers across time to compute a score between 0-10 that indicates how abnormal a deviation is.

Metric Intelligence constantly generates anomaly alerts whenever the anomaly score is above zero. If there is a score that is above four and which has changed from the previous score, then it is sent to the instance. On the instance, the entire sequence of anomaly scores over time can then be displayed in the Insights Explorer.

Metric Intelligence monitors historical data to ensure that metric bounds are accurate and that the alerts close when the anomalous behavior stops. Metric Intelligence also ignores irrelevant anomalies based on the metric's labels. For example, if the available CPU increases from its upper bound of 50% to 60%, the *available* label is identified as an indicator. The behavior does not register as an anomaly. This is because the increase in available CPU represents a favorable outcome, even though the metric of 60% would otherwise represent an anomaly.

Procedure

1. Navigate to **All** > **Event Management** > **Metrics** > **Anomaly Alerts**.
2. In the **Alerts Anomalies** list view, double-click an alert that you want to view.
   Information about an anomaly alert includes the metric value, promotion parameter, and upper and lower bounds (lower bounds cannot be less than 0). Events relevant to the alert appear in the alert's work notes. Description includes details about why the anomaly alert was generated, the metric name, and the anomaly score.

What to do next

Create an Advanced Promotion Engine Definition, to define the conditions which must be met to promote anomaly alerts to IT alerts. For details, see Create a definition for the Advanced Promotion Engine.

View metric values in the Insights Explorer

Metric Intelligence calculates statistics for CI metric data. Insights Explorer displays these metric values as metric charts for the CIs in the CMDB. Insights Explorer lets you overlap any metrics for any CIs in a single chart to create a multi-layered view of metric values across a time range.

Before you begin

Role required: evt_mgmt_user

About this task

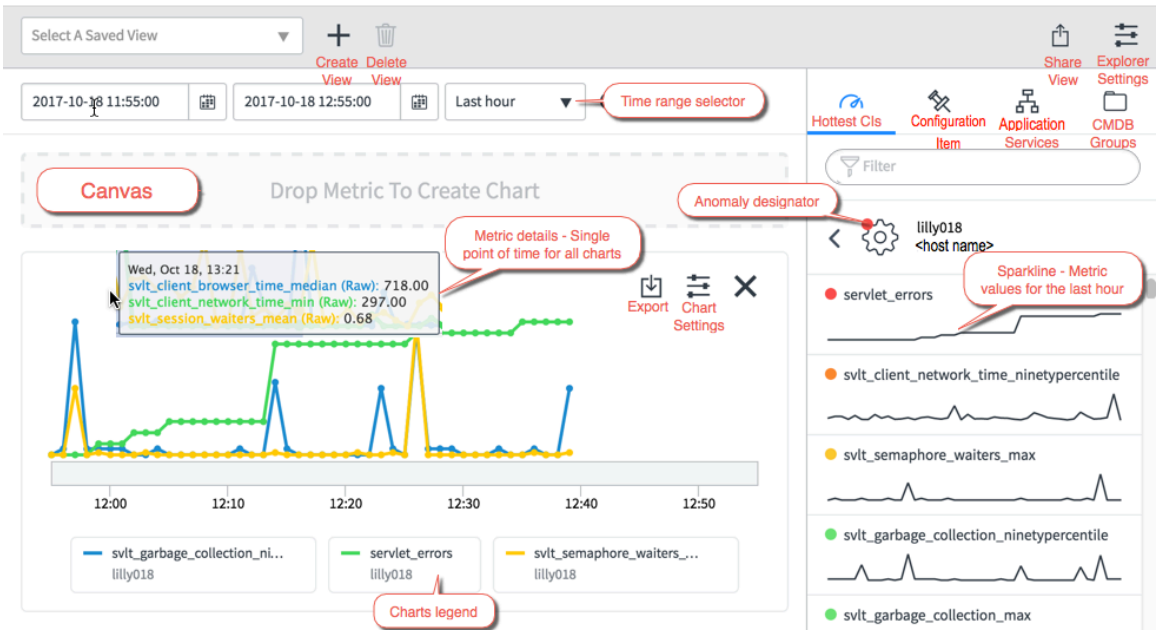
The Insights Explorer provides a canvas to which you can drag various metrics for CIs and create charts. You can place a single metric on the canvas, for an individual metric for a CI. For a more comprehensive chart, you can layer several metrics for a single CI or for different CIs to create a multi-metric chart. In such layered chart, each metric is distinguished by a unique color, which lets you compare metric values across CIs within a specific time range.

Insights Explorer displays metric boundaries according to the most recently configured model. Therefore, legacy anomalies from a previous build may still appear as anomalies, even though according to the current boundaries, the alert does not qualify as an anomaly.

You can also access the Insights Explorer from the business service map. For details, see View metrics from a business service map.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Insights Explorer



If the host name of the CI is available, it appears underneath the CI name. Host name is populated by retrieving the node information from the generated binding event as part of metric binding.

To navigate to a CI for which to display metrics:

- Use Hottest Configuration Items ( ) to quickly access the 10 most anomalous CIs.
- Use Configuration Items ( ) to create a separate custom list of any CIs from the CMDB and then add the metrics for these CIs to the canvas.
- Use Application services ( ) to create a custom list of application services that let you drill into the CIs of these services. You can then add metrics for these CIs to the canvas.
- Use CMDB Groups ( ) to create a custom list of CMDB Groups that let you drill into the CIs of these groups. You can then add metrics for these CIs to the canvas.

The following colors, which are based on color settings for alert severities, indicate anomaly severities:

Red

Critical severity (highest severity).

Orange

Major severity.

Yellow

Minor severity.

Blue

Warning severity (lowest severity).

Green

Informational. No severity.

The dots at the upper left on the CI icons indicate general anomaly tracking status:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Grey: Metrics are being tracked for the CI, but none of those metrics have ever had an anomaly.
- Green: Metric for CI had at least one anomaly in the past, but anomaly score is currently 0.
- Colored: Corresponds to the last recorded severity level according to the configuration of the color band ranges.
- No dot: There are no metrics for the CI and there is no data to drill into.

> **Note:** **Configuration Items** and **Application Services** are likely to include CIs for which there is no metric data.

Metric Intelligence does not track changes to an anomaly score if it is within the green band range.

As you create charts, a legend for each series chart automatically appears underneath the chart. For a single-metric chart, the legend has entries for the aggregations in the chart. For a multi-metric chart, the legend has entries for the metrics in the chart.

Modifications in the Insights Explorer remain during the session, and once the Insights Explorer is refreshed it returns to its initial state.

Procedure

1. Navigate to **All** > **Event Management** > **Metrics** > **Insights Explorer**.
2. Click a CI to drill down to its associated list of metrics, ordered by their most recent anomaly scores.

   For each metric, a sparkline displays metric values for the CI for the last hour. Point to the sparkline to display the metric value at each point of time.

   If resource binding is enabled, then the list of series being monitored for a CI also contains series that belong to a resource and metric. The naming convention for such series is '<resource name>/<metric name>'. For a series that is only bound to a CI, the naming convention is '<metric name>'.

3. Drag a metric to the **Drop Metric To Create Chart** area on the canvas and point to the chart to display the exact metric value at each point of time.
   The metric chart displays data for the specified time period, according to the chart settings. By default, raw data is displayed. If the time period is longer than a week or earlier than the last week, then average data is displayed. Drag subsequent metric to the canvas as follows:
   - In the **Drop Metric To Create Chart** area, so it is displayed individually in a new chart.
   - Onto an existing chart, in the **Replace Chart** highlighted block to overwrite the existing chart.
   - Onto an existing chart, in the **Add Metric** highlighted block to overlap it with the existing metrics in the chart.

     When you display multiple metrics in a single chart, the same aggregation selection applies to all the metrics, and statistics settings are not available. For example, if **Average** is selected in the **Chart Settings**, then averaged values are displayed for all the metrics in the chart.

4. Use the **Search** box to search and filter for specific configuration items, application services, or CMDB groups that are not listed by default.
   In the SEARCH RESULTS section, click the + icon next to an item that you want to add to the ADDED ITEMS section. Or, use advanced search:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Select and then click **Add Configuration Item** to add any specific CIs. In the Add Configuration Items dialog box, select a **CI Class Type** such as Linux Server.
- Select and then click **Add Application Service** to add all CIs included in a specified application services. In the Add Application Services dialog box, select `Discovered Service` or `Manual Service` as the **CI Class Type** and then specify filter conditions to narrow down the search.

  Note: You can add an application services only if its *`Operational Status`* is 'operational'.

- Select and then click **Add CMDB Group** to add all CIs included in a specified CMDB group. In the CMDB Groups dialog box specify filter conditions such as **[GroupName] [starts with] [d]**, to narrow down the search.

After selecting the items that you want to add, click **Add**.

5. Add related CIs:

   a. Click the **Add related CIs** ( ) icon next to a CI.
   The Add Related Configuration Items dialog box appears, displaying all relationships in which the selected CI is a parent or a child.

   b. To further filter the list, you can define specific conditions that must be met.

   c. Select the relationships from which you want to add the parent or the child CI, whichever is not the selected CI.

   d. Click **Add**.

   The CIs from the selected relationships, which are not the selected CI, are added to the list of CIs in the Insights Explorer.

6. Point to a legend item and click its '**X**' icon to remove the corresponding metric from the chart, or to disable the corresponding series from the **Chart Settings**.
7. Click the cog **Settings** icon to open application settings:
   - Enable, disable, or set the frequency for refreshing anomaly data on the Insights Explorer.
   - Activate or deactivate the display of related lists such as All Alerts, Incidents, and Problems. For more information, see Create or modify map indicators.
8. Click the **Chart Settings** icon to toggle the display of statistics and aggregations on the chart. Enabling or disabling an item to add or to remove metrics from a chart, also updates the legend of the chart to reflect the change.

Chart Setting	Description
Show Bounds	Displays a computed upper and lower bound for the metric, based on learning of past values. The upper and lower bounds always display together.
Show Anomaly Scores	Displays anomaly scores on a virtual axis of 0-10. Color code is based on the score thresholds that are defined in the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Chart Setting	Description
	Anomaly Score to Event Severity Map [sa_metric_anomaly_score_to_event_severity_map] table.
Average	Displays aggregated average metric values calculated in one hour intervals. Aggregated averages are displayed as follows: ○ For data that is up to 8 days old: Displays 10-minute aggregation windows. ○ For data that is up to 94 days old: Displays 10-minutes aggregation windows. ○ For older data: Displays 1-hour aggregation windows.
Minimum	Displays aggregated minimum metric values calculated per one hour time periods. For data that is up to 8 days old: Displays 10-minute aggregation windows.
Maximum	Displays aggregated maximum metric values calculated for one hour time periods. For data that is up to 8 days old: Displays 10-minute aggregation windows.
Raw	Displays the raw, unaggregated metric values. These values are kept only for the last 8 days.

What to do next

- Point to the icon of a CI in the right-hand side bar to display the CI type.
- Zoom in or out by changing the default **Last Hour** time range selection. Select one of the preset time periods to display anomaly scores for the last **6 Hours** for example, or specify a custom time period for up to 90 days back.

  To zoom in, highlight a section of a chart. Point to the upper left corner of the section and drag the cursor to the lower right corner. The time range of the chart changes accordingly. If there are other charts on the canvas, they are all automatically synchronized to display data for the same time range. The time range in the title bar automatically updates to reflect the new time range.
- Right-click on a CI in the right-hand side bar and select **View Form** to open its CI form.
- Click the map icon next to an application service listed in the **Application Services** tab, to open its application service map.
- Click Remove ( ) next to a CI to remove it from the Insights Explorer.
- Click the Export icon in a chart to download it as a .png or .svg image, or as a .pdf document.

Related topics

Create an Insights Explorer view

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create an Insights Explorer view

You can create a custom view in the Insights Explorer that saves any metric charts that were added to the canvas, and any added configuration items. After you create a view, you can share a link to the view.

Before you begin

Role required: TSOM Assurance admin

Procedure

1. Navigate to **All** > **Event Management** > **Metrics** > **Insights Explorer**.
2. Click **Create View** ( ), and enter a **Name** in the Create New View dialog box.
   If you are already creating a view, then you can choose **Create With Existing** to load an existing view to work with rather than starting with a blank canvas.
3. Click **Create**.
4. Add items to be included in the view:
   a. Drag metrics and create charts on the canvas.
   b. Add configuration items.
   While modifying a view, it is automatically saved every time you update it. The time settings are not saved in views, and when a saved view is loaded, its time period is always set to **Last hour** displaying current information.

What to do next

- Share a view: Click **Share View** ( ), and then in the Share dialog box, click **Copy Link**. Send or paste the link to make it accessible to whoever you want to share the view with. A shared link captures the time range of the view, the charts that were added to the canvas, and any added configuration items.
- Display a saved view: Open the **Select a Saved View** drop down list, and select a previously saved view that you want to display.

View metric charts in Agent Workspace

Agent Workspace for Metric Intelligence provides easy access to metric charts for a CI. On an alert form, you can drill down to important metric charts for the CI that is associated with the alert.

Before you begin

- The CI that you want to view metric charts for, must be associated with an alert.
- The Metric Dashboard Metadata [sa_metric_dashboard_metadata] table must contain active chart configurations for the CI class for which you want to view metric charts.

Role required: workspace_user and itil

About this task

The set of metric charts, chart types, and other chart characteristics, is determined by the chart configurations in the Metric Dashboard Metadata [sa_metric_dashboard_metadata] table, for the CI class.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Agent Workspace** and click **Agent Workspace Home**.
2. In Agent Workspace, click **List** and in the **Lists** panel, select one of the **Alerts** categorized lists such as **All Alerts** or **Top Priority**.
3. In the alerts list view, open an alert.
   The alert must have a **Configuration item** associated with it.
4. In the **Details** tab of the alert form, click **Metrics**.

Result

All metric charts that are configured for the CI associated with the alert, and that are active, appear on the metric charts form in the **Metrics** tab. The calculation of the default time range for the charts is based on the times that the first and last events that generated the alert, occurred.

What to do next

- Modify the time range for the charts by changing **Start Time** and **End Time**. When you modify the time range, all charts are updated to reflect the new time range.
- Click the cog wheel **Open settings** icon and change the settings for all charts:
  - **Show bounds**: Show the bounds in the chart. Even if enabled, there are no bounds in a chart for aggregated resources.
  - **Show legend**: Show chart legend.
- Click **Insights Explorer** to open the Insights Explorer in a new browser tab. That Insights Explorer opens with the current CI pre-selected and with the current time range settings in Agent Workspace.

Configure metric charts for Agent Workspace

Configure the set of Metric Intelligence metric charts, chart types, and other chart characteristics, that appear in Agent Workspace.

Before you begin

Role required: admin or evt_mgmt_admin

About this task

Up to 10 metric charts for a class can be configured to appear in the Metric Intelligence metric charts form in Agent Workspace. Metric chart configurations are stored in the Metric Dashboard Metadata [sa_metric_dashboard_metadata] table, determining which metric charts appear for a CI that is associated with an alert. By default, the Metric Dashboard Metadata contains pre-configured metric charts for several classes.

If resource binding is enabled and you specify a **Resource Type** in the metric chart configuration, then all the resources for the CI are included in the chart. The class table for the resource class (such as *ci_resource_metric_extension*) that you specify is used for retrieving all the resources for the CI. Then, for each point in time in the data series, the values of resources are aggregated into a single data point. This data point is the average of the metric values of all resources for that point of time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Chart aggregation

Aggregation is applied differently, depending on the setting of **Chart Type***, and on whether resources are included in the chart as indicated by the setting of* **Resource Type***:*

Chart type	Resources	Aggregation
Time_Series	No	No aggregation
Time_Series	Yes	Resources are averaged per data point.
Single_Score	No	Data points are aggregated according to the **Chart Aggregate** setting.
Single_Score	Yes	Resources are averaged per data point and then data points are aggregated according to the **Chart Aggregate** setting.

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Metrics View Configuration**.
2. In the Metric Dashboard Metadatas (Dashboard Metadata) list view, select an existing configuration or click **New**.
3. Fill out the Metric Dashboard Metadata form.

Field	Description
Active	Include the chart on the Metric Intelligence charts form in Agent Workspace.
Resource Type	Resource class associated with the CI and for which to retrieve and aggregate all resources.
Configuration Item Type	CI class that the chart applies to such as *cmdb_ci_metric_extension*.
Chart Aggregate	Type of aggregation that is applied for single-score charts. Aggregation can be the average of the data points in the time series. Or, the minimum, maximum, or the last data point in the time series.
Source Metric Type	Metric such as '% Free Space' that is being monitored for the CI type.
Order	Order in which the metric chart appears within all metric charts specified for the class. For proper appearance and alignment, all single-score charts always appear after any time-series charts, regardless of order settings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Chart Type	○ Time_Series: Charts all the data points in the time series for the metric and CI of the chart. ○ Single_Score: A single number which is the aggregation of all data points in the time series for the metric and CI of the chart. Aggregation is determined by the setting of **Chart Aggregate**.

View Metric Intelligence self-health statistics

Monitor the status of components and processes of Metric Intelligence. Use the XMLStats page to view statistics and diagnostic details that can help with troubleshooting issues with Metric Intelligence.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Open a browser and enter the URL to the instance.
   Type in: `http://<instance name>.service-now.com`
2. Append the following text to the instance URL: `xmlstats.do?include=XMLStatsOI`.
   The complete URL format is: `http://<instance name>.service-now.com/xmlstats.do?include=XMLStatsOI`
3. Hit Enter.

Result

Details are separated between two sections, instance level statistics and node level statistics. Details in the node section are specific to the node in the URL.

Node section

Entry	Description
batches_recieved	Number of batches of metrics that the node received from the MID Server.
batches_processed	Number of batches of metrics processed on the node.

Details in the instance section are for the entire instance, showing the status of the self-health monitors.

Instance section

Entry	Description
scheduled_jobs_monitor	Status of the self-health monitor that checks if the essential Metric Intelligence scheduled jobs are active.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Instance section (continued)

Entry	Description
distributed_cluster_monitor	Status of the self-health monitor that checks if the Metric Intelligence MID Server distributed cluster is running properly.
oi_extension_monitor	Status of the self-health monitor that checks if the Metric Intelligence extension is running properly.
metrics_collection_monitor	Status of the self-health monitor that checks if metrics are being collected by active connectors that are configured for metrics collection.

Verify that the definitions for the Advanced Promotion Engine are active

Verify that the Advanced Promotion Engine definitions that come with the base system are active.

Before you begin

Role required: evt_mgmt_admin

About this task

The active definitions promote a group of anomaly alerts to the All Alerts table when all of the definition's conditions are met.

You can't modify the conditions of the definitions that come with the base system. For information on creating customized definitions, see Create a definition for the Advanced Promotion Engine.

Procedure

1. Navigate to **All** > **Advanced Promotion Engine** > **Advanced Promotion Definitions**.
2. Select the Advanced Promotion Engine definition that you want to be active:
   - Windows Server
   - Linux Server
3. Verify that the **Active** check box is selected.
4. Select **Save**.

Create a definition for the Advanced Promotion Engine

Create a definition for the Advanced Promotion Engine so that you can define the conditions for promoting the anomaly alerts to IT alerts. By promoting the alerts that meet the conditions, only the most relevant alerts move to the table.

About this task

IT Alerts appear in the Express List and are addressed by an operator.

Only metrics that are associated with a metric configuration rule that has **Anomaly score level = Anomaly alerts** are considered for promotion to IT alerts. For details on metric configuration rules, see Metric Configuration Rules.

Before you begin

Ensure that the Metric Intelligence plugin (com.snc.sa.metric) is installed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Advanced Promotion Engine** > **Advanced Promotion Definitions**.
2. Select **New**.
3. In the **Name** field, enter a descriptive name for the definition.
4. In the **Order** field, set the execution order for the definition.
   The definitions with a lower order are executed first.
5. Activate the definition by selecting the **Active** check box.
6. On the **CIs** tab, fill in the fields for the CI alerts that you want to consider for promotion.

CIs tab fields

Field	Description
CI class	CI class alerts to be promoted to the All Alerts table.
Filter	Filter to restrict which CIs that the definition applies to. Select **New Criteria** to configure the conditions that the definition applies to. You can add more conditions by selecting either **OR** or **AND**.
Skip CIs that were created less than this number of days ago	Number of days in the past that any CI created during that time is ignored. For example, a value of 7 indicates that any CIs created less than 7 days ago are not considered for promotion to the All Alerts table.

7. On the **Severity** tab, enter the minimum severity of alerts to be considered for promotion.
   Alerts with the indicated severity level and higher levels are considered for promotion.
8. On the **Number of Alerts** tab, in the **Number of alerts on CI** field, enter the minimum number of a CI's alerts with an identical severity level (or higher) to be considered for promotion.
   For example, a value of 3 means at least three alerts with the indicated severity (or higher) must exist on a CI.
9. On the **Time Window** tab:
   - In the **Consider alerts updated at least this number of minutes ago** field, enter the minimum number of minutes old for an alert to be considered for promotion.

     For example, if the value of the field is 5, only alerts that are updated at least five minutes ago are considered for promotion.
   - In the blue box, select the number of minutes link to modify the amount of minutes during which alerts are to be considered for promotion.

     The **Properties** page opens and you modify the value in the **The width of the time...** field.

     Default = 30.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example:

- The current time is 10:05.
- In the **The width of the time...** field, you entered a value of 30.
- In the **Consider alerts updated at least this number of minutes ago** field, you entered 5.

Alerts that occur between 9:30-10:00 are considered for promotion.

What to do next

Ensure that a metric configuration rule exists which includes metrics you want to be promoted to an IT alert. Verify that the anomaly score level of the rule is **Anomaly alerts**. For details on configuring a metric configuration rule, see Create a configuration settings rule.

View the promoted events

View the anomaly alerts that the Advanced Promotion Engine promoted to IT events. Viewing IT events enables you to track the source of the event.

Before you begin

Role required: evt_mgmt_user

About this task

The system generates an IT event when an anomaly alert is promoted. Those events then become IT alerts. For details, see View the promoted anomaly alerts.

Procedure

1. Navigate to **All** > **Advanced Promotion Events**.
2. On the Events page, view the IT events that are created from the anomaly alerts by the Advanced Promotion Engine.

View the promoted anomaly alerts

View the anomaly alerts that the Advanced Promotion Engine promoted to events, which are then processed as alerts in the All Alerts table. Viewing alerts in the All Alerts table enables you to track the source of the alert.

Before you begin

Role required: evt_mgmt_user

About this task

The Event Management alert grouping feature takes the anomaly alerts that are promoted to the IT events and groups them into new IT alerts.

The Alerts table displays all of the relevant issues in the system.

Procedure

1. Navigate to **All** > **Advanced Promotion Engine** > **Anomaly Alerts**.
2. In the Is Advanced Promoted column header, view the alerts with a value of **true**.
   The IT alert that is created from the anomaly alert appears in the IT Alert column.
3. **Optional:** Select an alert to receive more information about the alert.
   For details on the displayed additional information, see Alerts in Service Operations Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create metric rules

Create a metric rule to determine the metric, the threshold values and ranges, and the severity level of generated events. You can add a filter that determines the Configuration Items (CI) types or resources for which you receive alerts. For example, you can configure a filter to receive alerts only for Windows servers.

Before you begin

Role required: evt_mgmt_admin

About this task

When a metric crosses or falls within the range of a configured threshold, the system creates a single event, which is eventually processed into an IT alert. The severity of the event (and alert) is determined by a defined threshold, and the event is bound to a CI.

Procedure

1. Navigate to **All** > **Event Management** > **Metrics** > **Metric Rules**.
2. Select **New Metric Rule**.
   The **CI selection** page opens.
3. Select the CI class on which to run the rule in the **CI Class** field.
   Only CIs containing metrics are available for selection.
4. **Optional:** Apply a filter within the selected CI class.
   For example, if you selected a CI class of **Linux Server**, you can apply a filter. The filter indicates that the rule applies only to servers with a host name that starts with a specified string.
5. Select **Next**.
   The **Alert criteria** page opens.
6. Select the metric and criteria to create an alert.

   a. Select the alert severity that you want to configure in the **Alert severity** field.
      Choose from the following:
      - Critical
      - Major
      - Minor
      - Warning

   b. Select the metric for the alert severity to apply to in the **Metric** field.

   c. Select the comparison operator (equals, is greater than, is greater than or equals, and so forth) in the **Comparison operator** field.

   d. Enter a value in the **Value** field.

   For example, you can configure criteria to indicate that when the metric **node_rx_packets** is greater than 10, a Critical alert is generated.

   To define additional alert severities, select **Add another alert severity** and repeat this step.

7. Select when to generate the alert in the **Alert when** section.
   Choose from the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **All sampled values must breach the criteria in the following time period**.

  Select the time period, in minutes.

- **Average of sampled values in the following time period must breach the criteria**.

  Select the time period, in minutes.

- **Any time the sampled values breach the criteria**.

8. Select **Next**.
   The **Name and activation** page opens.
9. Verify the name and details of the metric rule.

   To activate the rule, ensure that the **Active** toggle switch

is activated.
10. Select **Finish**.

Create an event rule to bind metric events to host CIs

Create event rules to explicitly allow binding of metric events to host CIs.

Before you begin

Role required: evt_mgmt_admin

About this task

Starting with the London release, Metric Intelligence no longer relies on the default Event Management binding workflow which binds nodes to host CIs. Event Management is configured to apply the default host binding algorithm when an event rule cannot find a CI to bind to, based on event data. In Metric Intelligence, with a given event rule and two different events, one event might bind to the correct CI while another cannot. In this case, the same metric types would be created for the selected CI and for the host level CI, causing confusion.

For example: With an event rule that binds the disk percentage metric to a storage disk, one event can find a disk CI and another event cannot. This results in the disk percentage metric being created for a disk CI and for a host CI.

To avoid this confusion, Event Management default host binding is disabled for metric events in the base system. To allow host binding for metric events, explicitly create the following event rule in the Event Management event rule designer. The underlying binding functionality of the event rule designer is used to map metrics to CIs.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Rules** to open the event rule designer.
2. Click **New** and ensure that the **Active** toggle switch is set to the right (Active).
3. On the **Event Rule Info** tab:
   a. Set **Source** to the data source that this rule applies to.
   b. **Optional:** Enter a **Description** such as `Bind metrics at host level`.
4. On the **Event Filter** tab, set a filter condition to indicate that **Classification** is **Metric**.
5. Click **Save**.

Metric Intelligence reference

Reference topics provide additional information about Metric Intelligence settings and properties.

Insights Explorer settings

You can configure Insights Explorer settings to control for example, the refresh frequency or the display of related records.

Click the cog **Settings** icon to open the Application settings dialog box.

Setting	Description
Refresh interval	Enable and set the frequency for refreshing metrics data on the Insights Explorer.
Indicators	Enable any indicator to display related records such as incidents or problems for CIs. The respective icon displays on the timeline in the metric chart, indicating the number of records for the CI. A toggle is available only if the **Active in Metrics** field is selected on the Map Indicator form for the respective table. For example, the **Incident** toggle is available only if **Active in Metrics** is selected on the Map Indicator form for the incident [Incident] table.

Sensitivity bounds properties for Insights Explorer metrics

The following properties can be configured to customize system behavior when detecting sensitive bounds for Insights Explorer metrics. To invoke changes to the default values, navigate to **System Properties** > **All Properties** and add the indicated properties (they are not visible by default).

Sensitive Bounds Properties

Property Name	Description
sa_metric.sensitive_bounds_calculation_enabled	Enable/disable sensitive bounds calculation. Default: True
sa_metric.sensitive_bounds_percentile	Percentile value of sensitivity bounds calculation. If the configured percentage of metric values falls within the number of standard deviations (STDs) indicated in the *sa_metric.sensitive_bounds_sensitivity_fact* property, sensitive bounds are detected and sensitivity calculation changes to the value specified in the

Access to cloud environments for ITOM products

If your organization deploys IT assets on the cloud, ITOM products must access your cloud environment to collect information about the IT infrastructure.

Related topics

Discovery for cloud environment

Cloud resource discovery references

Install and configure MID Servers to access cloud environments

Install and configure the MID Servers correctly to enable ITOM products to access to the cloud resources.

Before you begin

Role required: discovery_admin or sn_cmp.cloud_admin (for Cloud Provisioning and Governance)

About this task

Procedure

1. For IP-based discovery, Installing the MID Server on a server inside the cloud environment, inside a Virtual Private Cloud (VPC).

   Example

   For example, if you are configuring access to AWS service accounts using IAM roles, install the MID Server at the Amazon EC2 instance.

   Important: If you configure AWS credentials at ServiceNow AI Platform, the location of the MID Server doesn't matter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If your organization has multiple VPC segments, deploy the MID Servers in a manage-mentor transit VPC.

2. Activate IP-based discovery jobs to access the compute layer using agentless credentials.
3. Configure the MID Server with the capabilities necessary for the cloud environment you are planning to discover.

   You can select the `ALL` capability or configure specific capabilities for tighter security.

   Add Cloud Management in **supported application** in MID Server for Cloud Provisioning and Governance requests to be processed.

Cloud environment	MID Server capability required by Cloud Discovery	MID Server capability required by Cloud Provisioning and Governance
Amazon AWS Cloud	`AWS` or `Cloud Management` or `ALL`	`AWS` or `Cloud Management`
Microsoft Azure Cloud	`Azure` or `Cloud Management` or `ALL`	`Azure` or `Cloud Management`
Google Cloud	`Google` or `Cloud Management` or `ALL`	`Google` or `Cloud Management`
IBM Cloud Platform	`IBM` or `Cloud Management` or `ALL`	N/A
Oracle Cloud Infrastructure (OCI)	`OCI` or `Cloud Management` or `ALL`	N/A
OpenStack	`OpenStack` or `Cloud Management` or `ALL`	N/A
Red Hat Virtualization (RHV)	`RHV` or `Cloud Management` or `ALL`	N/A

4. If the MID Servers must go through an unauthenticated proxy server to access cloud resources, modify the `agent\conf\wrapper-override.conf` file, as follows:

```
wrapper.java.additional.1=-Dhttp.proxySet=true
        wrapper.java.additional.2=-Dhttp.proxyHost=<proxyHost>
        wrapper.java.additional.3=-Dhttp.proxyPort=<proxyPort>
        wrapper.java.additional.4=-DuseProxy=true
```

5. If you're using an authenticated proxy server, configure the MID Server parameters in the `config.xml` file.

   For a description of the parameter values, see the **Proxy server parameters** section in MID Server parameters.

Related topics

Proxy server configuration for MID Servers used for Cloud Discovery and Cloud Provisioning and Governance

Proxy server configuration for MID Servers used for Cloud Discovery and Cloud Provisioning and Governance

You can configure the MID Server for Cloud Provisioning and Governance to use a proxy server. Using a proxy server supports all cloud-based activities such as running Discovery, billing downloads, provisioning virtual machines, and running life-cycle operations on virtual machines.

Proxy server limitations

- VMware Cloud is not supported.
- Windows or Linux platforms only are supported.
- The Google Cloud Console integration does not support downloading billing data.
- Remote PowerShell scripts cannot be executed.
- Custom APIs may not work.

Note:

SSH calls should not be routed through a proxy server, when using a private cloud environment that is on the same side of the proxy as the MID Server.

Set *mid.capi.skip_proxy_for_ssh* to true to skip it. See MID Server properties used by Service Mapping for more information.

mid.capi.skip_proxy_for_ssh:

- Determines whether the MID Server skips the proxy server when routing SSH calls.
- Type: true | false
- Default value: false

Supported proxy server authentication for Cloud Provisioning and Governance

Proxy Server type	Authentication type
HTTP/HTTPS	No authentication
SOCKS5	No authentication
HTTP/HTTPS	Basic authentication
SOCKS5	Basic authentication
HTTP/HTTPS	NTLM

Supported proxy server configurations for Cloud Provisioning and Governance

Supported configuration settings

Configuration	Operating system	Proxy server	Authentication mode
Configuration 1	Linux	None	Not Applicable
Configuration 2	Windows	Squid (HTTPS)	None
Configuration 3	Linux	Squid (HTTPS)	Local
Configuration 4	Windows	Squid (HTTPS)	Active Directory

Cloud Request Retry Configuration

If a request is throttled by a cloud provider during Discovery, Cloud Request Retry Configuration provides a customizable method to retry requests. Discovery and Service Mapping Patterns

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

includes a retry configuration for AWS and Azure. You can customize the included configuration or create your own.

Discovery admins and Cloud admins can access the request retry configuration at **All** > **Discovery** > **Cloud Request Retry Configuration**. You can create one configuration for each provider.

When a request is throttled, the retry framework uses retry configuration defined for the provider to handle retries before returning the final response to the ApiCommand classes:

- AwsApiCommand
- AzureApiCommand

The retry configurations are synced with the MID Servers through the MID Server property, *`mid.cloud.discovery.retry.configuration`*.

There are the following retry strategies:

- Exponential backoff
- Response header backoff
- Custom backoff

Exponential backoff

For the following example configuration:

Setting	Value
Max retries	3
Response codes	429
Base delay in ms	1000
Max delay in ms	10000
Additional delay window in ms	1500

The Exponential backoff retry strategy works as follows:

- 1st retry—the backoff multiplier is randomly selected between 0 and 1. The max delay value is 400 ms (400 * 1).
- 2nd retry—the backoff multiplier is randomly selected between 0 and 3. The max delay value is 1200 ms (400 * 3).
- 3rd retry—the backoff multiplier is randomly selected between 0 and 7. The max delay value is 2800 ms (400 * 7).

On subsequent retries, if the delay exceeds 10000 (the max delay), 10000 will be used as initial delay.

Once the initial delay is generated, jitter is added to the delay. The jitter window is defined by the **Additional delay window in ms** field. The system selects a random value between 0 and 1500 and adds it to the initial delay.

If the initial delay is 500, the final delay (with jitter) can be a value between 500 and 2000 ms.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response header backoff

For the following example configuration:

Setting	Value
Max retries	3
Response codes	429
Response header	Retry-After
Response header delay unit	Seconds
Additional delay window in ms	1500

The Response header backoff strategy works as follows:

- Fetch the value of header *`Retry-After`* from the server response.
- Convert the *`Retry-After`* to milliseconds by multiplying by 1000.

Once the initial delay is generated, jitter is added to the delay. The jitter window is defined by the **Additional delay window in ms** field. The system selects a random value between 0 and 1500 and adds it to the initial delay.

If the initial delay is 2000, the final delay (with jitter) can be a value between 2000 and 3500 ms.

Custom backoff

With a custom backoff retry strategy, you define the **Max retries** and **Response codes** and create your own **Mid script include** that defines how requests are retried using the *`getDelay()`* function. For more information, see Script includes.

Set up a cloud service account

Create and configure ServiceNow cloud accounts at ServiceNow AI Platform for the corresponding Cloud vendor service accounts.

Cloud Discovery service account form reference

Set up Oracle Cloud infrastructure (OCI) service accounts

Create and configure cloud service accounts at ServiceNow AI Platform for the corresponding Oracle Cloud Infrastructure (OCI) service accounts.

OCI service account is a type of identity used to authenticate and authorize access to OCI resources and services. It provides a way for applications, services, and users to securely interact with OCI resources. Service accounts are often used for automated processes, applications, or services running within OCI, allowing them to access resources according to the defined permissions and policies.

Verify the REST API permissions

Download the Cloud Discovery patterns spreadsheet so you can grant user permissions required for running the Discovery patterns. In addition to permissions, the spreadsheet also includes useful information such as pattern names, types, CI Classes, and links to vendor

documentation. New patterns are available quarterly, so check periodically to be sure you have the latest version of the spreadsheet.

OCI access and permission using policies

Oracle Cloud Infrastructure (OCI) access and permission using policies provide privileges for secure cloud resource utilization and management in OCI.

For information on OCI permissions, go to the Oracle Help Center and search for the "Managing Access to Resources" article.

Download the Cloud Discovery patterns spreadsheet so you can grant user permissions required for running the Discovery patterns. In addition to permissions, the spreadsheet also includes useful information such as pattern names, types, CI Classes, and links to vendor documentation. New patterns are available quarterly, so check periodically to be sure you have the latest version of the spreadsheet.

Create Oracle API credentials

Create Oracle API credentials on the ServiceNow AI Platform to enable access to your Oracle resources during Oracle discovery.

Before you begin

Verify that your OCI user has at least read-only access to all Oracle services. For information on access permissions, consult your system administrator.

Retrieve the following properties from the Oracle Cloud Console:

- Tenancy Oracle Cloud Identifier (Tenancy OCID)
- User OCID
- Key fingerprint
- Private key

For instructions on retrieving these properties, go to the Oracle Help Center and search for the "Required Keys and OCIDs" article.

Role required: discovery_admin

Procedure

1. Navigate to **All** > **Discovery** > **Credentials**.
2. Select **New**.
3. Select **Oracle API Credentials**.
4. On the form, fill in the fields with the property values you retrieved.

Oracle API Credentials form

Field	Value
Name	Unique and descriptive name for the Oracle credentials.
Active	Option to select to use the credential.
Tenancy Id	Oracle Cloud Identifier (OCID) for your tenancy.
User Id	OCID of the OCI user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
Key Fingerprint	Fingerprint of the public key.
Private Key	RSA private key that is used for API signing authentication.

5. Select **Submit**.

What to do next
Create OCI service accounts. For more information, see Create OCI service accounts.

Create OCI service accounts

Create Oracle Cloud Infrastructure (OCI) service accounts on the ServiceNow AI Platform to access your Oracle account during Oracle discovery.

Before you begin
Verify that Oracle API credentials have been created. For more information, see Create Oracle API credentials.

Retrieve the Compartment ID from **Identity & Security** > **Compartments** in the Oracle Cloud Console.

For GovCloud accounts, confirm that Discovery and Service Mapping Patterns is using at least version 1.29.0.

For UK Sovereign Cloud accounts, confirm that Discovery and Service Mapping Patterns is using at least version 1.35.0.

Role required: discovery_admin

Procedure
1. In the navigation filter, enter `cmdb_ci_cloud_service_account.list`.
2. Select **New**.
3. In the **Discovery Credentials** field, begin to enter the credential name and select it from the list.
4. On the form, fill in the remaining fields.

Cloud Service Account form

Field	Description
Name	A unique name for the OCI service account.
Account ID	The compartment ID, which is the Oracle Cloud Identifier (OCID) of the compartment associated with this service account.
Datacenter URL	The URL of the datacenter. Example URLs:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ For commercial cloud: `https://{service}.ap-mumbai-1.oraclecloud.com` ○ For GovCloud: `https://{service}.us-gov-ashburn-1.oraclegovcloud.com` ○ For UK Sovereign Cloud: `https://{service}.uk-gov-london-1.oci.oraclegovcloud.uk`
Datacenter Type	The type of datacenter where the account is hosted, which should be `OCI Datacenter [cmdb_ci_oci_datacenter]`.

5. Select **Submit**.

What to do next

Schedule an OCI cloud discovery. For more information, see Create an OCI Discovery schedule in Discovery Admin Workspace.

Setup AWS service accounts

Create and configure cloud service accounts at ServiceNow AI Platform for the corresponding Amazon Web Services (AWS) service accounts.

Verify the REST API permissions

Download the Cloud Discovery patterns spreadsheet so you can grant user permissions required for running the Discovery patterns. In addition to permissions, the spreadsheet also includes useful information such as pattern names, types, CI Classes, and links to vendor documentation. New patterns are available quarterly, so check periodically to be sure you have the latest version of the spreadsheet.

Ensure that you are familiar with the hierarchy of AWS service accounts in your environment. For example, if there are AWS Organizations, set up the management and member accounts at ServiceNow AI Platform to reflect that hierarchy. You can set up the AWS service accounts of the following types:

- **Discrete account**: Standalone account, with no management account.
- **Management account**: Management account that may or may not contain member accounts (subaccounts).

  Note: Some ServiceNow UI screens refer to management accounts as **Master** accounts and to the management account field as **Parent account**.

- **Member account**: Subaccount that belongs to the management account.

Access setup for AWS service accounts

Cloud Discovery and Cloud Provisioning and Governance need access to resources in the Amazon Web Services (AWS) service accounts. Learn about different methods of configuring such access.

Cloud Discovery and Cloud Provisioning and Governance access resources in AWS service accounts through MID Servers. You must authorize inbound traffic to Amazon EC2 instances from the MID Server for setting up initial communication. For more information, see Configure security group inbound rules using the AWS Management Console.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Types of AWS credentials

There are permanent and temporary AWS credentials that you can use for configuring access to AWS service accounts.

Permanent

The permanent credentials are the actual AWS credentials for the service account that you add to the Connections and Credentials module of ServiceNow AI Platform. While it might be time consuming to manage credentials on ServiceNow AI Platform, you avoid the complex configurations involved in using temporary credentials.

Temporary

The temporary credentials are generated by the AWS Security Token Service (AWS STS) for IAM roles. After you configure IAM roles for AWS accounts, the MID Server accesses AWS resources with these temporary credentials. You can use the default IAM role, *`OrganizationAccountAccessRole`*, or create custom IAM roles.

Assuming IAM roles in a large AWS organization is more convenient and offers better security than using large numbers of permanent credentials for all AWS accounts. Temporary credentials are only acquired on behalf of a service account when there's no permanent credential specified for that service account in the Service Accounts [cmdb_ci_cloud_service_account] table.

The MID Server uses the AssumeRole action in the AWS Security Token Service API to assume a member account role. Parameters passed to this API determine which additional security restrictions are applied to the role when it accesses the AWS resources.

By default, the MID Server is configured to assume the *`OrganizationAccountAccessRole`*, which grants temporary credentials to all the members of a primary account. This action occurs automatically if no permanent credentials exist for the member accounts. This configuration doesn't apply any additional security or restrict access to any resources in member accounts.

By default, the ServiceNow instance caches temporary credentials for member accounts for 60 minutes. This interval enables the horizontal discovery process to run multiple times without generating new credentials during each discovery. You can avoid credential caching or modify the caching period using MID Server properties.

IAM roles and permissions

To enhance security provided by the default AWS `OrganizationAccountAccessRole` role, you can customize the AWS roles that MID Servers can assume to receive temporary credentials for member accounts. You can configure additional permissions to improve security and customize the way that the member account's role is assumed when discovering cloud resources.

Methods of granting access

For the purposes of configuring access for AWS accounts, the following terms are used:

Trusting accounts

The trusting accounts don't have permanent AWS credentials. You configure the trust relationship for IAM roles in these accounts to rely on other accounts for access.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Trusted accounts

The trusted accounts are used by the trusting accounts for access. The ServiceNow UI refers to the trusted accounts as accessor accounts.

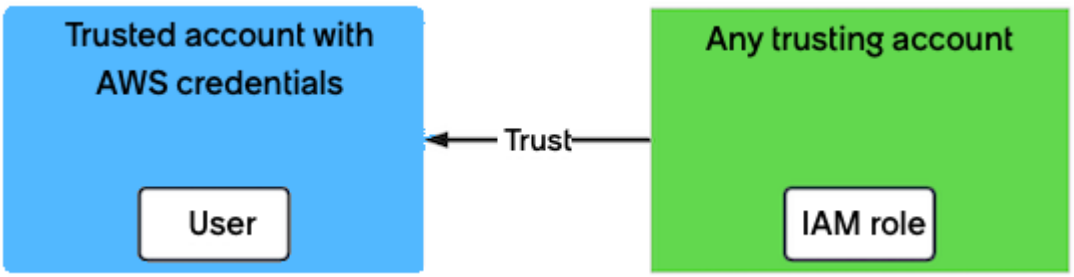
Typically, you set up access to the AWS accounts in your organization using the following methods:

Configuring access for a single account

- Configure AWS credentials on the ServiceNow AI Platform to avoid the complexity of creating and setting up IAM roles. For more information, see Configure access to the AWS accounts using permanent AWS credentials.
- Create an AWS service account on the ServiceNow AI Platform. For more information, see Create AWS service accounts.

Configuring access for an account that trusts an accessor account with AWS credentials

Setting up any AWS account to rely on a trusted account with AWS credentials



- Configure any type of account—discrete (independent), management, or member—to rely on a trusted account with AWS credentials for access.
- Configuring an IAM role belonging to the trusting accounts to trust the user of the trusted account enables using only one set of AWS credentials for providing access to multiple AWS accounts.

For more information, see Configure temporary credential access for trusted AWS accounts.

Configuring access for an account that trusts an accessor account without AWS credentials

Setting up any AWS account to rely on a trusted account without AWS credentials

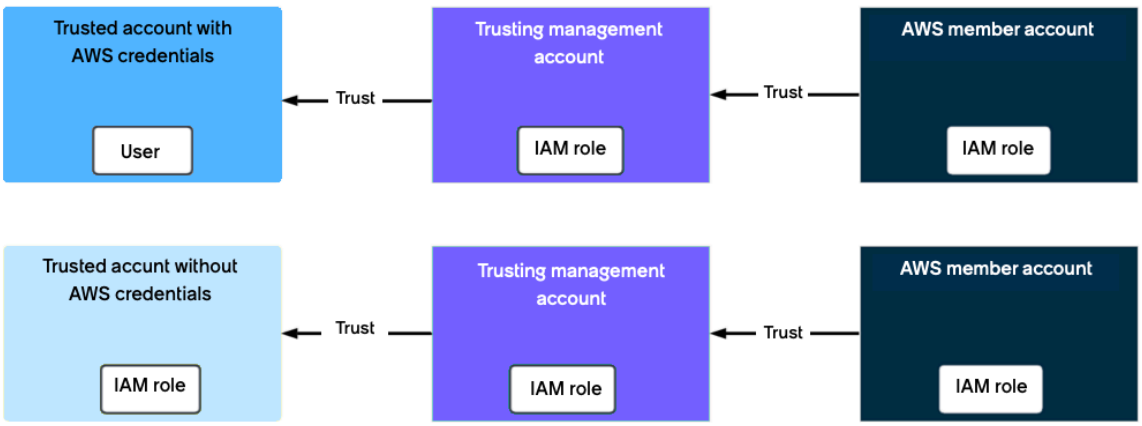
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Configure any type of account—discrete (independent), management, or member—to rely on a trusted account without AWS credentials for access.
- Configure an account without AWS credentials using an IAM role and permissions to access the trusting service account.
- Set up the IAM role of the trusting account to grant access to the IAM role of the trusted account.

For more information, see Configure credential-less access using trusted AWS accounts.

Configuring access for AWS member accounts by using a trust chain from the accessor through the management account.

Configuring member accounts to use their management account for access



- Configure the IAM roles of the member accounts to trust the IAM role of their management account. For more information, see Configure access for trusting AWS member accounts in trust chain.
- Configure the management accounts to trust the accessor accounts with or without AWS credentials. For more information, see:
  - Configure temporary credential access for trusted AWS accounts.
  - Configure credential-less access using trusted AWS accounts.

How Cloud Discovery determines which credentials to use

Member account trusts management account

Cloud Discovery uses the following logic to determine which credentials to use to discover AWS cloud resources in member accounts:

1. If permanent credentials are defined for the member account in the Cloud Service Account [cmdb_ci_cloud_service_account] table, Discovery uses those credentials. The Cloud Service Accounts [cmdb_ci_cloud_service_account] table contains the information on the service account types, like management or member, and their credentials.
2. If no permanent credentials are defined for the member account, Discovery checks the Cloud Service Account AWS Org Assume Role Params [cloud_service_account_aws_org_assume_role_params] table for any special parameters associated with the member account. If parameters exist in that table,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Discovery uses the temporary credentials acquired from specifying a role and its parameters in the AWS Security Token Service API AssumeRole action.

3. If no special parameters are associated with the member account in the [cloud_service_account_aws_org_assume_role_params] table, Discovery checks that table for parameters associated with the management account. If parameters exist that define a role for the management account, Discovery uses the temporary credentials provided by that role.
4. If no special parameters are present in the [cloud_service_account_aws_org_assume_role_params] table for either management or member accounts, Discovery uses the defaults defined for the `OrganizationAccountAccessRole` role.

Member or management account trusts accessor account

1. If permanent credentials are defined for the member or management account in the Cloud Service Account [cmdb_ci_cloud_service_account] table, Discovery uses those credentials. The Cloud Service Accounts [cmdb_ci_cloud_service_account] table contains the information on the service account types, like management or member, and their credentials.
2. If no permanent credentials are defined for the account, Discovery checks the Cloud Service Account AWS Cross Assume Role Params [cloud_service_account_aws_cross_assume_role_params] table for any special parameters associated with the account. If parameters exist in that table, Discovery uses the temporary credentials acquired from specifying a role and its parameters in the AWS Security Token Service API AssumeRole action.

Step-by-Step Guide to Configure AWS Cloud Discovery in ServiceNow Using Patterns [KB2184482]

AWS Cloud Discovery Setup – Use Case Guide with CloudFormation Templates [KB2221157]

Configure access to the AWS accounts using permanent AWS credentials

To securely access data on your provider account, the Discovery process must present appropriate credentials. To make the credentials available to Discovery and Cloud Provisioning and Governance, you first create a user with programmatic access in the AWS Management Console. You then securely store the credentials in a service account at ServiceNow AI Platform.

Before you begin

Roles required:

- AWS Management Console administrator
- For Cloud Discovery: discovery_admin
- For Cloud Provisioning and Governance: admin or sn_cmp.cloud_admin

About this task

Cloud providers often use different names for accounts, regions, and credential settings. Because the ServiceNow application supports several cloud providers, the app uses general-purpose names for the settings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. **Optional:** To create a user for Cloud Provisioning and Governance (for programmatic access to your AWS resource and billing data), perform the following steps.

   a. On the AWS Management Console, navigate to **Identity and Access Managements (IAM)** > **Access Management** > **Users**.

   b. On the IAM Resources portal, select **Users**.

   c. Select **Add user**.

   d. On the Details page, configure the user settings, and then select **Next**.

   Details page

Field	Description
User name	Name for the programmatic user. For example, `servicenowcloud`.
Access type	Select **Programmatic access**.

   e. On the Permissions page, attach the user to a policy.
   Configure the following settings and then select **Next**.

Field	Description
Set permissions for <user name>	Select **Attach existing policies directly**.
Attach one or more policies ...	Select the appropriate policy. **Note:** The **AdministratorAccess** policy has the most powerful permission level, including permission to provision cloud resources. The policy enables the same access that would be granted to the instance if you were not using IAM and used your AWS account Access Key ID and Secret Access Key. You might instead prefer to create a policy or combine multiple policies to grant the appropriate permission level. See Control AWS access and permissions using policies for details.

   f. On the Review page, verify your selections and then select **Create user**.

   g. On the Security Credentials page, copy the secret access key and the access key ID.

   Important: Do not leave the page until you have completed both steps. The **Secret access key** value does not appear again. You need to paste the values that you generate in these steps into a Cloud Provisioning and Governance form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

i. Select **Show** to display the Secret access key. Copy the value.

ii. Select **Download .csv** to save the CSV-format file that contains the user name, Access key ID, and the Secret access key value. You create the file as a backup in the case that you lose the values. Verify that the file was created and then store the file securely.

2. On the ServiceNow AI Platform, configure AWS credentials.

   a. In the ServiceNow instance, navigate to **Discovery** > **Credentials**.

   b. Select **New**, select **AWS Credentials**, enter a unique and meaningful **Name** (for example, `Cloud Provisioning Account`), and then fill in the form.

AWS Credentials form fields

Field	Input value
Name	Unique and descriptive name for the AWS credentials.
Active	Option to use the credential.
Access Key ID	The **Access key ID** that you generated on the AWS Management Console, such as: APIAIOSFODNN7EXAMPLE.
Secret access key	The **Secret access key** that you generated on the AWS Management Console, such as: wPalrXUtnFEMI/K7MDENG/bPxRfiCYEXAMPLEKEY.

   c. Select **Update** or **Submit**.

What to do next

Create an AWS service account on the ServiceNow AI Platform. For more information, see Create AWS service accounts.

Create AWS service accounts

Create AWS service accounts on the ServiceNow AI Platform to access your AWS account during AWS discovery.

Before you begin

- Retrieve the user account number, which can be found in the AWS Management Console by expanding the list under the AWS account name.
- Confirm that Discovery Admin Workspace is using at least version 1.10.0. The **Discovery** > **Cloud Service Accounts** navigation module isn't available with earlier versions. To access **Cloud Service Accounts** with an earlier version, enter in the navigation filter: `cmdb_ci_cloud_service_account.list`.

Role required: discovery_admin

About this task

A service account is a secure record on your instance that stores the credential and access information for your provider account. Discovery uses the information to access your provider account to get data on each resource in each specified datacenter. A cloud account is the logical

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

representation in cloud management of all or part of your managed cloud infrastructure. A cloud account can include multiple service accounts—even service accounts from different providers. For each service account, you specify which datacenter to include in the cloud account.

Procedure

1. Navigate to **All** > **Discovery** > **Cloud Service Accounts**.
2. Select **New**.
3. On the form, fill in the fields.

Cloud Service Account form

Field	Description
Name	The unique and meaningful name for this service account.
Account ID	12-digit user account number. Expand the list under the AWS account name on the AWS Management Console to view the number. **Note:** In the **Account ID** field, remove the hyphen characters (-) from the number. **IAM user account number** Discovery credentials	The credentials needed for ServiceNow applications to access this account. You may configure this field at a later stage, while configuring access to AWS accounts. ○ If you configured AWS credentials at ServiceNow AI Platform , select the magnifying glass icon, and then select the name of the relevant AWS credential. ○ To use other AWS accounts to access this account, leave the field blank. For example, you don't need to specify the AWS credentials for accounts assuming IAM roles or member accounts using their management account for access.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Datacenter URL	URL of the datacenter. This field is required for AWS China region and AWS GovCloud (US) accounts. For example: ○ AWS China region: `https://organizations.cn-northwest-1.amazonaws.com.cn` ○ AWS GovCloud (US): `https://ec2.us-gov-west-1.amazonaws.com`
Datacenter type	Type of the datacenter where the account is hosted. Select **AWS datacenter**.
Datacenter discovery status	Auto-generated value: Status and timestamp of the last execution of Discovery on the datacenter.
Parent account	Name of the management account (also referred to as the master account in some ServiceNow UI screens) that represents the organization in AWS that this member account belongs to. This field appears when you select **AWS datacenter**. Leave the field empty if this account is not part of an AWS organization.
Is master account	Management account flag. This field is also referred to as the master account flag in some ServiceNow UI screens. This field appears when you select **AWS datacenter** from the Datacenter Type list. Select the check box to associate the AWS service account with the management account. Select this check box only for accounts that you previously configured in the AWS Management Console as management accounts with some member accounts belonging to them. See the AWS documentation for information on AWS Organizations. **Note:** You must set up the correct permission in AWS or the Organization role for a standard credential. For more information, see Control AWS access and permissions using policies.
Accessor account	Name of the trusted account. Configure this field only for accounts that don't use permanent AWS credentials and rely on IAM roles for access.

4. Select **Submit**.

Configure temporary credential access for trusted AWS accounts

Configure the trusting account whose resources need to be accessed, to rely on the trusted account using the Identity and Access Management (IAM) role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Familiarize yourself with the Amazon documentation on Creating a role to delegate permissions to an IAM user.
- Decide which AWS account is going to be the trusted account. You use the trusted account to configure temporary credentials for Cloud Discovery using IAM roles. The trusted account that you use to access other accounts using IAM roles is referred to as an accessor account.
- For trust chain setups, confirm that the member account trusts the management account before the management account trusts an accessor account. For more information, see Configure access for trusting AWS member accounts in trust chain.
- Confirm that Discovery Admin Workspace is using at least version 1.10.0. The **Discovery** > **Cloud Service Accounts** navigation module isn't available with earlier versions. To access **Cloud Service Accounts** with an earlier version, enter in the navigation filter: `cmdb_ci_cloud_service_account.list`.

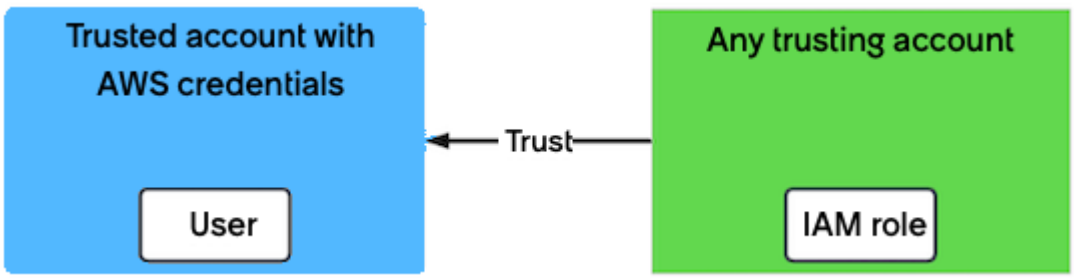
Role required:

- For Cloud Discovery: discovery_admin
- For Cloud Provisioning and Governance: admin or sn_cmp.cloud_admin

About this task

During this configuration, you create an IAM role for the trusting account, and then configure the trusted service account for the trusting account at ServiceNow AI Platform. Finally, you associate the IAM role you created for the trusting account with the trusting account itself.

Setting up any AWS account to rely on a trusted account with AWS credentials



Procedure

1. Create an IAM role for the trusting account and configure the trust relationship between the user assuming this role and the trusted (accessor) account.

   a. Log in to the trusting account on the AWS Management Console.

   b. Create and configure the IAM role specifying the trusted (accessor) account ID in the **Account ID** field.
   For information on creating AWS roles, see the Amazon documentation.

   c. On the Summary page for the IAM role, select the **Trust Relationships** tab.

   d. Select **Edit trust relationship**.
   The Edit Trust Relationship page opens showing the policy document.

   e. Set the *AWS* parameter to the full user ARN of the trusted (accessor) account.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

f. Verify that the *`Action`* value is set to *`sts:AssumeRole`*.

g. Select **Update Trust Policy**.

2. On the ServiceNow AI Platform, configure the trusted service account.

a. Navigate to **All** > **Discovery** > **Cloud Service Accounts**.

b. Selelct **New**.

c. On the form, fill in the fields.
For a description of the field values, see Create AWS service accounts.

d. Select **Submit**.

3. On the ServiceNow AI Platform, configure the trusting service account.

a. Navigate to **All** > **Discovery** > **Cloud Service Accounts**.

b. Select **New**.

c. In the **Accessor account** field, enter the name of the trusted account.

d. On the form, fill in the remaining fields.
For a description of the field values, see Create AWS service accounts.

e. Select **Submit**.

4. On the ServiceNow AI Platform, assign the AWS IAM role to the trusting account, using the relevant form, based on the relationship to the trusted account.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

<table>
<tr><th>Trusted account type</th><th>Steps</th></tr>
<tr><td>Management account</td><td>
a. Navigate to All > Cloud Provisioning and Governance > Organization Access Parameters > AWS Org Assume Role Parameters.
b. Select New.
c. On the form, configure only the following fields for the trusting member account:
Cloud Service Account AWS Org Assume Role Params form
<table>
<tr><th>Field</th><th>Definition</th></tr>
<tr><td>Access role name</td><td>Name of the IAM role created for the trusting account.
▪ If IAM roles are the same across all member accounts: Enter the full ARN using an asterisk (*) as a wildcard for the account ID in the format: <code>arn:aws:iam::*:role/MemberRoleName</code>.
For example: <code>arn:aws:iam::*:role/SN_MEMBER_ACCOUNT_ROLE</code>.
▪ If IAM roles are different across member accounts: Enter the full ARN of the specific IAM role for each member account in a separate entry.</td></tr>
<tr><td>Cloud service account</td><td>Name of the trusting account for which you are providing access using the IAM role.
▪ If IAM roles are the same across all member</td></tr>
</table>
</td></tr>

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

<table>
<tr><th>Trusted account type</th><th>Steps</th></tr>
<tr><td></td><td>
<table>
<tr><th>Field</th><th>Definition</th></tr>
<tr><td></td><td>accounts: Enter the management account name.
▪ If IAM roles are different across member accounts: Enter each member account in a separate entry.</td></tr>
</table>
d. Select Submit.
</td></tr>
<tr><td>Member or discrete account</td><td>
a. Navigate to All > Cloud Provisioning and Governance > Organization Access Parameters > AWS Cross Assume Role Parameters.
b. Select New.
c. On the form, configure only the following fields for the trusting account:
Cloud Service Account AWS Cross Assume Role Params form
<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td>Access role name</td><td>Name of the IAM role created for the trusting account.</td></tr>
<tr><td>Cloud service account</td><td>Name of the trusting account for which you are providing access using the IAM role.</td></tr>
</table>
d. Select Submit.
</td></tr>
</table>

What to do next

Verify that ServiceNow applications can access the trusting service account using the IAM role:

1. Navigate to **All** > **Discovery** > **Cloud Service Accounts**.
2. Select the trusting AWS service account.
3. Under **Related Links**, select **Create Discovery Schedule**.
4. In the Discovery Manager Cloud Discovery page, select **Test Account**.
   - If the connection is successful, a message displays indicating the account validation is successful.
   - If the connection isn't successful, an error message displays indicating the cause of failure.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure credential-less access using trusted AWS accounts

Set up a trusted credential-less account that other AWS accounts can rely on for access.

Before you begin

- Familiarize yourself with the Amazon documentation on Creating a role to delegate permissions to an IAM user.
- Decide which AWS account is going to be the trusted account. You use the trusted account to configure temporary credentials for Cloud Discovery using IAM roles. The trusted account that you use to access other accounts using IAM roles is referred to as an accessor account.
- If you're setting up a trust chain, confirm that the member account trusts the management account. The management account must also trust the accessor account. For more information, see Configure access for trusting AWS member accounts in trust chain.
- Confirm that Discovery Admin Workspace is using at least version 1.10.0. The **Discovery** > **Cloud Service Accounts** navigation module isn't available with earlier versions. To access **Cloud Service Accounts** with an earlier version, enter in the navigation filter: `cmdb_ci_cloud_service_account.list`.

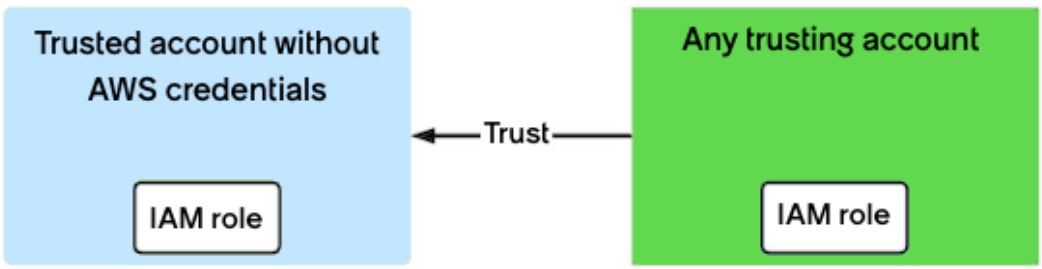
Role required:

- For Cloud Discovery: discovery_admin
- For Cloud Provisioning and Governance: admin or sn_cmp.cloud_admin

About this task

To use an account without AWS credentials, you must first configure that account with an IAM role and permissions to access the trusting service account. Then, you set up the IAM role of the trusting account to grant access to the IAM role of the trusted account.

Setting up any AWS account to rely on a trusted account without AWS credentials



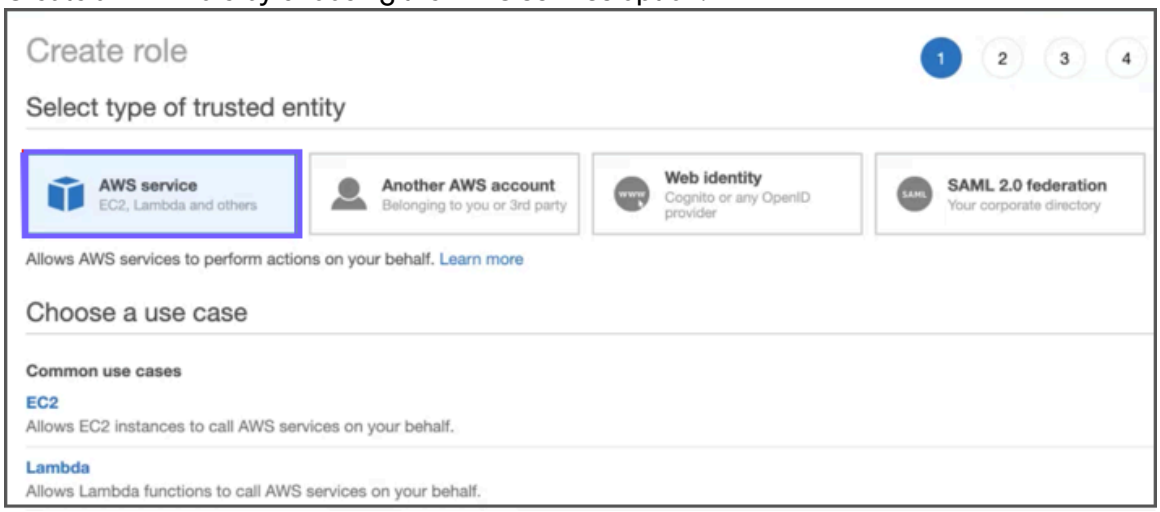
Procedure

1. Configure an IAM role for the trusting account.
   a. Log into the trusting account on the AWS Management Console.
   b. Create an IAM role for this account.
      Use the account ID of the trusted account while creating this IAM role. For operational information about working with AWS roles, refer to the Amazon documentation.
   c. Create a ReadOnlyAccess policy and attach it to the newly created IAM role.
2. Configure the IAM role for the trusted account.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Log into the AWS Management Console using the credentials of the account that you want to set up as a trusted account.

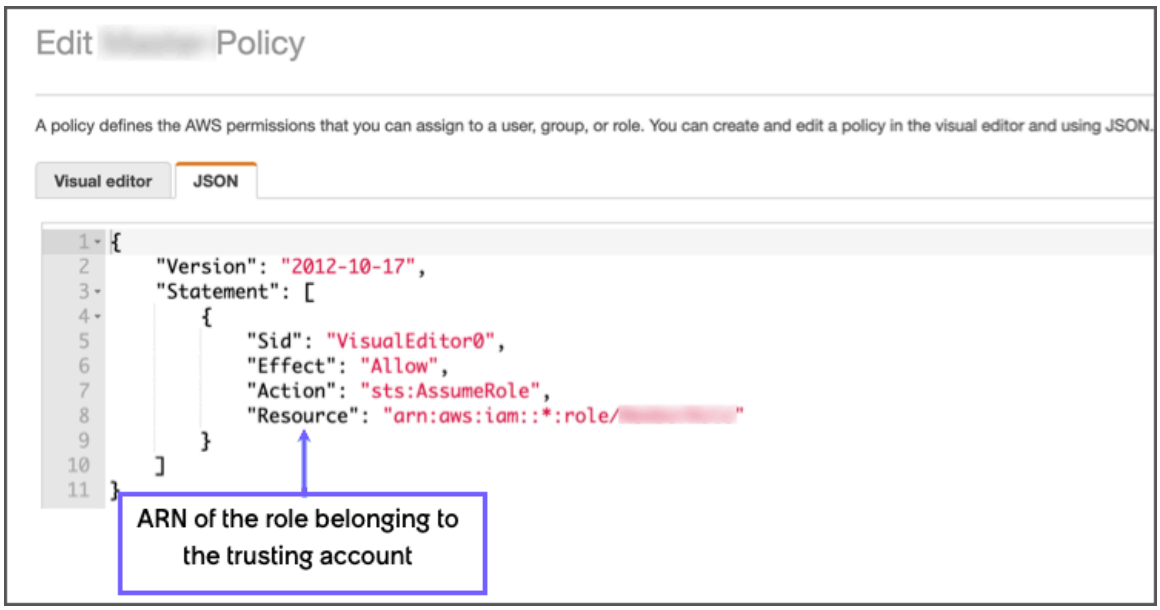
b. Create an IAM role by choosing the **AWS service** option.



c. Create a read-only access policy for the trusted account IAM role.
For more information, see Control AWS access and permissions using policies.

d. Create an additional policy to grant this IAM role access to resources in trusting accounts:

- Set the *`Action`* parameter to `sts:AssumeRole`
- Set the *`Resource`* parameter to the ARN of the trusting account role that you created in 1.b.



e. Attach the newly created role to the relevant Amazon EC2 instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

By default, when you attach an IAM role to an EC2 instance, it creates a trust relationship between this role and the EC2 instance.

3. Configure the trusting service account to grant access to the IAM role belonging to the trusted account.

   a. Log into the trusting account on the AWS Management Console.

   b. Navigate to the IAM role you created for this account as described in 1.b.

   c. Edit the Trust Relationship for this IAM role as follows:

   - Set the *Action* parameter to `sts:AssumeRole`.
   - Set the *AWS* parameter to the ARN of the trusted account role that you created in 2.b.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Configure the MID Server for AWS IAM roles.
   For more information, see Configure the MID Server for AWS IAM roles.
5. On the ServiceNow AI Platform, configure the trusted service account.
   a. Navigate to **All** > **Discovery** > **Cloud Service Accounts**.
   b. Selelct **New**.
   c. On the form, fill in the fields.
      For a description of the field values, see Create AWS service accounts.
   d. Select **Submit**.
6. On the ServiceNow AI Platform, configure the trusting service account.
   a. Navigate to **All** > **Discovery** > **Cloud Service Accounts**.
   b. Select **New**.
   c. In the **Accessor account** field, enter the name of the trusted account.
   d. On the form, fill in the remaining fields.
      For a description of the field values, see Create AWS service accounts.
   e. Select **Submit**.
7. On the ServiceNow AI Platform, assign the AWS IAM role to the trusting account, using the relevant form, based on the relationship to the trusted account.

Trusted account type	Steps
Management account	**a.** Navigate to **All** > **Cloud Provisioning and Governance** > **Organization Access Parameters** > **AWS Org Assume Role Parameters**. **b.** Select **New**. **c.** On the form, configure only the following fields for the trusting member account: **Cloud Service Account AWS Org Assume Role Params form** **Field** / **Definition** Access role name — Name of the IAM role created for the trusting account. ▪ If IAM roles are the same across all member accounts:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

<table>
<tr><th>Trusted account type</th><th>Steps</th></tr>
<tr><td></td><td>
<table>
<tr><th>Field</th><th>Definition</th></tr>
<tr><td></td><td>Enter the full ARN using an asterisk (*) as a wildcard for the account ID in the format: <code>arn:aws:iam::*:role/MemberRoleName</code>.

For example: <code>arn:aws:iam::*:role/SN_MEMBER_ACCOUNT_ROLE</code>.

▪ If IAM roles are different across member accounts: Enter the full ARN of the specific IAM role for each member account in a separate entry.</td></tr>
<tr><td>Cloud service account</td><td>Name of the trusting account for which you are providing access using the IAM role.

▪ If IAM roles are the same across all member accounts: Enter the management account name.

▪ If IAM roles are different across member accounts: Enter each member account in a separate entry.</td></tr>
</table>
d. Select Submit.</td></tr>
<tr><td>Member or discrete account</td><td>a. Navigate to All > Cloud Provisioning and Governance > Organization Access Parameters > AWS Cross Assume Role Parameters.

b. Select New.</td></tr>
</table>

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Trusted account type	Steps
	c. On the form, configure only the following fields for the trusting account: **Cloud Service Account AWS Cross As sume Role Params form** **Field** / **Description** Access role name — Name of the IAM role created for the trusting account. Cloud service account — Name of the trusting account for which you are providing access using the IAM role. **d.** Select **Submit**.

What to do next

Verify that ServiceNow applications can access the trusting service account using the IAM role:

1. Navigate to **All** > **Discovery** > **Cloud Service Accounts**.
2. Select the trusting AWS service account.
3. Under **Related Links**, select **Create Discovery Schedule**.
4. In the Discovery Manager Cloud Discovery page, select **Test Account**.
   - If the connection is successful, a message displays indicating the account validation is successful.
   - If the connection isn't successful, an error message displays indicating the cause of failure.

Configure access for trusting AWS member accounts in trust chain

Configure access for AWS member accounts by using a trust chain from the accessor through the management account.

Before you begin

- Familiarize yourself with the Amazon documentation on Creating a role to delegate permissions to an IAM user.
- Ensure that you know which AWS member accounts are assigned to the same management account. You use the management account for configuring temporary credentials for cloud discovery using IAM roles.
- Confirm that Discovery Admin Workspace is using at least version 1.10.0. The **Discovery** > **Cloud Service Accounts** navigation module isn't available with earlier versions. To access **Cloud Service Accounts** with an earlier version, enter in the navigation filter: `cmdb_ci_cloud_service_account.list`.

Role required:

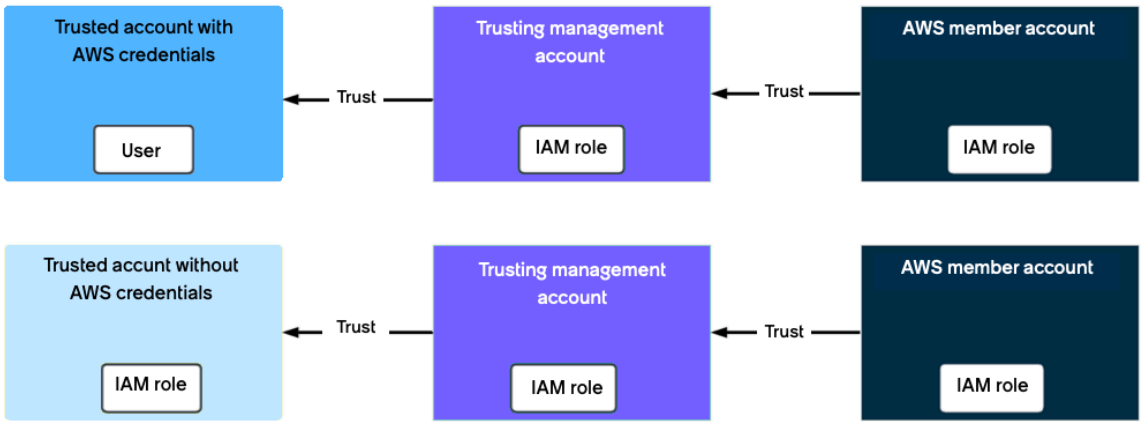
- For Cloud Discovery: discovery_admin
- For Cloud Provisioning and Governance: admin or sn_cmp.cloud_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

You can configure access for AWS member accounts by using a trust chain from the accessor through the management account. The accessor account either has AWS credentials or uses a credential-free method.

Configuring member accounts to use their management account for access



Procedure

1. Create an IAM role for the member account and configure the trust relationship between the user assuming this role and the trusted management account.

   a. Log into the AWS Management Console using the credentials of the member account for which you are configuring access.

   b. Create and configure the IAM role specifying the management account ID in the **Account ID** field.
   For operational information about creating AWS roles, refer to the Amazon documentation.

   c. On the **Summary** page for the IAM role, click the **Trust Relationships** tab.

   d. Click **Edit trust relationship**.
   The Edit Trust Relationship page opens showing the policy document.

   e. Edit the trust relationship as follows:
   - Set the *`Action`* parameter to `sts:AssumeRole`
   - Set the `AWS` parameter to the full role ARN of the management account.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

f. Click **Update Trust Policy**.

2. On the ServiceNow AI Platform, configure the trusting member's service account.

   a. Navigate to **All** > **Discovery** > **Cloud Service Accounts**.

   b. Select **New**.

   c. In the **Parent account** field, enter the name of the management account.

   d. On the form, fill in the remaining fields.
   For a description of the field values, see Create AWS service accounts.

   e. Select **Submit**.

3. On the ServiceNow AI Platform, assign the AWS IAM role to the member account.

   Important: Perform this step only if you created custom IAM roles. By default, the OrganizationAccountAccessRole role is assigned to the member's trusting management account and you don't need to assign the OrganizationAccountAccessRole role to a service account.

   a. Navigate to **All** > **Cloud Provisioning and Governance** > **Organization Access Parameters** > **AWS Org Assume Role Parameters**.

   b. Select **New**.

   c. On the form, configure only the following fields for the trusting member account:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cloud Service Account AWS Org Assume Role Params form

Field	Definition
Access role name	Name of the IAM role created for the trusting account. ▪ If IAM roles are the same across all member accounts: Enter the full ARN using an asterisk (*) as a wildcard for the account ID in the format: `arn:aws:iam::*:role/MemberRoleName`. For example: `arn:aws:iam::*:role/SN_MEMBER_ACCOUNT_ROLE`. ▪ If IAM roles are different across member accounts: Enter the full ARN of the specific IAM role for each member account in a separate entry.
Cloud service account	Name of the trusting account for which you are providing access using the IAM role. ▪ If IAM roles are the same across all member accounts: Enter the management account name. ▪ If IAM roles are different across member accounts: Enter each member account in a separate entry.

d. Select **Submit**.

What to do next

Configure the trusting management account and the trusted accessor account.

- For information on configuring accessor accounts with AWS credentials, see Configure temporary credential access for trusted AWS accounts.
- For information on configuring accessor accounts without AWS credentials, see Configure credential-less access using trusted AWS accounts.

Configure the MID Server for AWS IAM roles

Configure the MID Server to retrieve the temporary security credentials associated with an IAM role.

Before you begin

Role required: discovery_admin or sn_cmp.cloud_admin (for Cloud Provisioning and Governance)

Procedure

1. Navigate to **All** > **Discovery** > **MID Servers**.
2. Select a MID Server installed on an Amazon EC2 instance within the relevant AWS service account.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Open the **Configuration Parameters** related list.
4. Click **New**.
5. In the configuration parameter form, select *mid.aws.instance_profile_name* in the **Parameter name** field.
6. Enter the name of the IAM role attached to the EC2 Instance in the **Value** field.

   Note: AWS Cloud Discovery for "mid.aws.instance_profile_name" accepts both "role name" and "full ARN" as valid parameter values. For example, both of the following values are acceptable:

   - arn:partition:service:region:account-id:resource-type/resource-id
   - resource-id

   The MID Server uses the same IAM role that is set up for the corresponding AWS service account. For more information, see Configure temporary credential access for trusted AWS accounts.

   For operational information about creating AWS roles, refer to the Amazon documentation on Creating a role to delegate permissions to an IAM user.

7. Click **Submit**.
   The new parameter is listed in the MID Server record.

Control AWS access and permissions using policies

Configure policies with the necessary level of permissions to provide access to the AWS resources for Cloud Discovery and Cloud Provisioning and Governance.

Before you begin

Familiarize yourself with creating IAM users and user policies. Refer to the AWS documentation.

Identify the level of permissions required for discovering the resources using Cloud Discovery and managing the resources with Cloud Provisioning and Governance. For example:

- Additional S3 permissions are needed as AWS uses an S3 bucket to store and run the cloud formation templates to deploy stacks using CloudFormation. These permissions are needed even if you run the same CloudFormation template from the AWS console.

  Note: `s3:ListAllMyBuckets` must be scoped account-wide, not to a specific bucket ARN.

- Read-only access is required to do pattern discovery with the custom policy.

AWS CloudFormation provisions and configures resources by making calls to the AWS services that are described in your template. For more information, see How does CloudFormation work?

Download the Cloud Discovery patterns spreadsheet so you can grant user permissions required for running the Discovery patterns. In addition to permissions, the spreadsheet also includes useful information such as pattern names, types, CI Classes, and links to vendor documentation. New patterns are available quarterly, so check periodically to be sure you have the latest version of the spreadsheet.

Roles required:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- AWS Management Console administrator
- For Cloud Discovery: discovery_admin
- For Cloud Provisioning and Governance: admin or sn_cmp.cloud_admin

About this task

The policy you configure defines the AWS permissions that you can assign to a user, group, or a role. Depending on the AWS services you use, specify actions for the service to perform discovery and provisioning and life-cycle actions using Cloud Provisioning and Governance.

Procedure

1. Log in to the AWS Management Console using the credentials of the relevant service account. If you used an IAM user or an IAM role to provide access using temporary credentials, log in using the same IAM user or IAM role.
2. Open the user record in the instance for the relevant user.
3. Define a user policy in AWS Management Console using either of the following methods:
   - Grant administrator access to the instance. This method gives the same level of access as using the Access Key ID and Secret Access Key gives. Attach the `AdministratorAccess` policy to the user profile.

     Note: To create a user policy that supports only Cloud Discovery rather than the provisioning of cloud resources, attach the `ReadOnlyAccess` policy instead.

   - Create a custom policy with a descriptive name. In the Policy Document field, write the code that includes the APIs that this policy allows running.

     Note: The following JSON sample is a partial example showing permissions for Cloud Discovery. It isn't a complete list of all required permissions.

```
{
   "Version":"2012-10-17",
   "Statement":[
      {
         "Sid":"PermissionsNeededForDiscovery",
         "Effect":"Allow",
         "Action":[
            "account:ListRegions",
            "apigateway:GET",

Set up Azure service accounts

Create and configure cloud service accounts at ServiceNow AI Platform for the corresponding Microsoft Azure accounts.

Verify the REST API permissions

Download the Cloud Discovery patterns spreadsheet so you can grant user permissions required for running the Discovery patterns. In addition to permissions, the spreadsheet also includes useful information such as pattern names, types, CI Classes, and links to vendor documentation. New patterns are available quarterly, so check periodically to be sure you have the latest version of the spreadsheet.

Before you begin

Ensure the configuration of Azure credentials

For more information, see Create Azure cloud credentials and Configuration steps for Azure Service Principal User and Credentials (KB2202765)

Ensure that you are familiar with the hierarchy of the Azure service accounts in your environment.

Set up the service accounts at ServiceNow AI Platform to reflect the hierarchy of your environment. You can set up the Azure service accounts for the following Azure account types:

- Management group.
- Subscription.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: discovery_admin

About this task

A service account is a secure record on your instance that stores the credentials and access information for your provider account. Discovery uses the information to access your provider account to get data on each resource in each specified datacenter. A cloud account is the logical representation in cloud management of all or part of your managed cloud infrastructure. A cloud account can include multiple service accounts—even service accounts from different providers. For each service account, you specify which datacenter to include in the cloud account.

Procedure

1. In the navigation filter, enter `cmdb_ci_cloud_service_account.list`.
2. Select **New**.
3. Fill in the fields by the following order:
   a. Select the datacenter.
   b. Select the check box of the **Is management account** if your are creating a service account for a management group.
   c. Select **Should pull events** to preform event-based discovery. For more information, see Microsoft Azure Alert driven discovery

Cloud Service Account form

Field	Description
Name	The unique and meaningful name for this service account.
Account ID	If you are creating a service account for a management group, fill in the Azure management group ID that belongs to the management group. If you are creating a service account for a subscription, fill in the Azure subscription ID.
Discovery credentials	The credentials needed for ServiceNow applications to access this account.
Datacenter URL	URL of the datacenter. Configuring this field is required for Azure Gov Cloud (US) accounts. For example, https://management.usgovcloudapi.net/.
Datacenter type	Type of the datacenter where the account is hosted. Select **Azure datacenter**.
Datacenter discovery status	Auto-generated value: Status and timestamp of the last execution of discovery on the datacenter.
Parent account	When setting up a service account for an Azure subscription, fill in the management group ID. When the **Is management account** check box is selected, the **Parent account** field is not applicable

Discovery for Microsoft Azure

Set up Google Cloud Platform service accounts

Create and configure cloud service accounts at ServiceNow AI Platform for the corresponding Google Cloud Platform (GCP) service accounts.

GCP service account is a unique account typically used by an application or compute workload, such as a Compute Engine instance, rather than a user. A service account is identified by its email address, which is unique to the account. It's used to authenticate and authorize interactions between your application and various GCP services.

Verify the REST API permissions

Download the Cloud Discovery patterns spreadsheet so you can grant user permissions required for running the Discovery patterns. In addition to permissions, the spreadsheet also includes useful information such as pattern names, types, CI Classes, and links to vendor documentation. New patterns are available quarterly, so check periodically to be sure you have the latest version of the spreadsheet.

Configure the Google API credentials for Cloud Discovery

Create Google API credentials to allow Cloud Discovery to access the data on your Google account securely.

Before you begin

Ensure that the latest versions of the following applications are installed:

- Discovery and Service Mapping Patterns
- Visibility Content
- CMDB CI Class Models

Role required: discovery_admin

Procedure

Configure the GCP credentials either by importing a JSON file or by filing in the record manually.

Option	Actions
Import the JSON file	**a.** When receiving the email from GCP, down load the JSON file. **b.** Navigate to **Discovery** > **Credentials**. **c.** Select **New** and then select **Google API Cre dentials**. **d.** Select **Import JSON File**

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Actions
	e. Select **Choose File** and choose the JSON file you downloaded. **f.** Select **Upload Credential Data**.
Configure the credentials manually	**a.** Navigate to **Discovery** > **Credentials**. **b.** Select **New** and then select **Google API Credentials**. **c.** Select **New**. **d.** In the form, fill in the fields according to the form description. For description of the form fields, see Google API Credentials Form. **e.** Select **Submit**.

Google API Credentials Form

Fill in the Google API Credentials form to configure the credentials.

Field	Description
Name	Set a unique name for the Google Cloud API credentials.
Active	Option for enabling this credential for discovery. Select this check box to enable discovery.
Applies to	MID Server to which you apply the credentials. Select **All MID servers**.
Order	Order in which the platform runs this credential as it attempts to log in to devices. A smaller number indicates that the credential appears higher in the list. Establish the credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number, or none, the instance tries the credentials in a random order. The default value is 100.
Email	Your GCP email address.
Secret Key	Secret key that you generated on the Google Cloud Console.
Credential alias	A credential alias that is used by the credentials to authorize actions.

Create GCP service accounts

Create Google Cloud Platform (GCP) service accounts on the ServiceNow AI Platform to access your GCP account during GCP discovery.

Before you begin

Verify that Google API credentials have been created. For more information, see Configure the Google API credentials for Cloud Discovery.

Retrieve the **project_id** value from the JSON key file that is associated with the service account.

Role required: discovery_admin

Procedure

1. In the navigation filter, enter `cmdb_ci_cloud_service_account.list`.
2. Select **New**.
3. In the **Discovery Credentials field**, begin to enter the credential name and select it from the list.
4. On the form, fill in the remaining fields.

Cloud Service Account form

Field	Description
Name	A unique name for the GCP service account.
Account Id	GCP project ID.
Datacenter URL	URL of the datacenter, which should remain empty.
Datacenter Type	Type of the datacenter where the account is hosted, which should be Google Datacenter [cmdb_ci_google_datacenter].

5. Select **Submit**.

What to do next

Schedule a GCP cloud discovery. For more information, see Create a discovery schedule in Cloud Discovery Workspace.

GCP access and permission using policies

Google Cloud Platform (GCP) access and permission using policies provide privileges for secure cloud resource utilization and management in GCP.

Download the Cloud Discovery patterns spreadsheet so you can grant user permissions required for running the Discovery patterns. In addition to permissions, the spreadsheet also includes useful information such as pattern names, types, CI Classes, and links to vendor documentation. New patterns are available quarterly, so check periodically to be sure you have the latest version of the spreadsheet.
