        # HTTP Check Metrics
        - httpcheck.duration
        - httpcheck.status
        - httpcheck.error
        # Prometheus node_exporter Metrics
        - node_cpu_seconds_total
        - node_memory_MemTotal_bytes
        - node_memory_MemAvailable_bytes
        - node_disk_read_bytes_total
        - node_disk_written_bytes_total
        - node_disk_io_time_seconds_total
        - node_network_receive_bytes_total
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        - node_network_transmit_bytes_total
        # K8s Cluster Metrics
        - k8s.node.condition_ready
        - k8s.node.allocatable_cpu
        - k8s.node.allocatable_memory
        - k8s.deployment.available
        - k8s.deployment.desired
        # Kubelet Stats Metrics
        - k8s.node.cpu.usage
        - k8s.node.memory.working_set
        - k8s.pod.cpu.usage
        - k8s.pod.phase
        - k8s.pod.memory.working_set
        - k8s.container.cpu.usage
        - k8s.container.memory.working_set
        - k8s.container.restarts
```

Note: Histogram metrics are not supported by ServiceNow MID Server.

Even if histogram metrics are sent to the MID Server, the ServiceNow transform script will automatically ignore them. However, as a best practice, it is recommended to filter out histogram metrics at the collector level to optimize network bandwidth and reduce unnecessary data transmission.

To exclude histogram metrics, add the following filter:

```
filter/drop_histograms:
    metrics:
      metric:
        - 'type == METRIC_DATA_TYPE_HISTOGRAM'
```

3. CONFIGURE EXPORTERS

Choose one of the following authentication methods based on your requirements:

a. OPTION A: API KEY AUTHENTICATION

Add the following exporter under the "exporters:" section:

```
otlphttp/opentelemetry:
  metrics_endpoint:
 "http://{mid_server_ip}:{port}/api/mid/sa/inbound_metrics?tr
ansform=TransformMetrics_MidOpenTelemetry"
  headers:
    Authorization: "Key {api_key}"
  timeout: 30s
  compression: gzip
  tls:
    insecure: true
  sending_queue:
    enabled: true
    num_consumers: 4
    queue_size: 100
  retry_on_failure:
    enabled: true
    initial_interval: 5s
    max_interval: 30s
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Replace {mid_server_ip}, {port}, and {api_key} with your actual values.

b. OPTION B: BASIC AUTHENTICATION

For Basic Authentication, you need to configure both an extension and an exporter.

i. Configure Basic Auth Extension

Add the following under the "extensions:" section:

```
extensions:
  basicauth/mid:
    client_auth:
      username: "otel"
      password: "Otel@123"
```

Note: Replace username and password with your actual credentials.

ii. Configure Basic Auth Exporter

Add the following under the "exporters:" section:

```
otlphttp/opentelemetryBasic:
  metrics_endpoint:
 "http://{mid_server_ip}:{port}/api/mid/sa/inbound_metrics?t
ransform=TransformMetrics_MidOpenTelemetry"
  auth:
    authenticator: basicauth/mid
  timeout: 30s
  compression: gzip
  tls:
    insecure: true
  sending_queue:
    enabled: true
    num_consumers: 4
    queue_size: 100
  retry_on_failure:
    enabled: true
    initial_interval: 5s
    max_interval: 30s
```

Note: Replace {mid_server_ip} and {port} with your actual values.

4. CONFIGURE SERVICE PIPELINE

Add the configured processors and exporters to the metrics pipeline under the "service:" section:

```
service:
  pipelines:
    metrics:
      receivers: [<your_configured_receivers>]
      processors: [memory_limiter, transform, filter/minimal]
      exporters: [otlphttp/opentelemetry,
 otlphttp/opentelemetryBasic]
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- Replace <your_configured_receivers> with your actual receiver names (e.g., hostmetrics).
- Include only the exporters you have configured (API Key or Basic Auth, or both).
- Processor order matters: memory_limiter should be first, followed by transform and filter.
- Ensure the processor names match those defined in Step 2.
- If using histogram filtering, add filter/drop_histograms after filter/minimal.

5. ADDITIONAL CONFIGURATION OPTIONS
By default, OpenTelemetry sends data in Protocol Buffers (protobuf) format.

To send data in JSON format instead, add the following header to your exporter configuration:

```
headers:
  Content-Type: "application/json"
```

COMPLETE CONFIGURATION EXAMPLE.

Below is a complete example configuration file combining all components:

```
receivers:
  hostmetrics:
    collection_interval: 10s
    scrapers:
      cpu:
      memory:
      disk:
      filesystem:
      network:
      processes:
      paging:

processors:
  memory_limiter:
    limit_mib: 5
    spike_limit_mib: 1

  transform:
    metric_statements:
      - context: scope
        statements:
          - set(name, "")
          - set(version, "")

  filter/minimal:
    metrics:
      include:
        match_type: strict
        metric_names:
          - system.cpu.time
          - system.cpu.load_average.1m
          - system.memory.usage
          - system.network.io
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  filter/drop_histograms:
    metrics:
      include:
        metric:
          - 'type != METRIC_DATA_TYPE_HISTOGRAM'

extensions:
  basicauth/mid:
    client_auth:
      username: "otel"
      password: "Otel@123"

exporters:
  otlphttp/opentelemetry:
    metrics_endpoint:
 "https://10.0.0.100:8443/api/mid/sa/inbound_metrics?transform=
TransformMetrics_MidOpenTelemetry"
    headers:
      Authorization: "Key your_api_key_here"
    timeout: 30s
    compression: gzip
    tls:
      insecure: false
    sending_queue:
      enabled: true
      num_consumers: 4
      queue_size: 100
    retry_on_failure:
      enabled: true
      initial_interval: 5s
      max_interval: 30s

service:
  extensions: [basicauth/mid]
  pipelines:
    metrics:
      receivers: [hostmetrics]
      processors: [memory_limiter, transform, filter/minimal,
 filter/drop_histograms]
      exporters: [otlphttp/opentelemetry]
```

Integrate Dynatrace platform events

Integrate Dynatrace with Event Management by adding Dynatrace as an authenticated data source.

What authentication is used

There are two methods of authentication:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- OAuth authentication: Provides enterprise-grade authentication to keep your enterprise environment safe. Authentication is performed using Dynatrace access tokens. For more information, see Integrate Dynatrace with OAuth authentication.
- Basic webhook authentication: Provides a basic standard of authentication, without the need for Dynatrace Active Directory. This authentication can be especially useful for distributed small teams, such as SRE or DevOps teams. For more information, see Integrate Dynatrace with basic authentication.

Note: When a problem is reopened in Dynatrace, the original start time is retained and not updated to the time of reopening. This behavior is intentional and reflects how Dynatrace manages the problem lifecycle. Problems reopened within the defined reopening period (typically 30 minutes) are treated as a continuation of the original issue. The start time continues to reflect the timestamp of the earliest triggering event, even after reopening.

Do not use the evidence details timestamp as a substitute for the problem start time. The evidence timestamp refers to individual contributing events within the problem. It is part of the Root Cause Analysis (RCA) and does not indicate the start or duration of the overall problem.

Starting from the Xanadu release, the base system rules provided with the connector, which you have not previously used (i.e., neither activated, deactivated, nor modified), will now have the **Apply additional matching rules** check box set to true. Previously, this check box was disabled. This change allows you to execute more event rules or automation using the same filter conditions for the connector.

Note: This feature applies only to active event rules.

Integrate Dynatrace with basic authentication

Integrate Dynatrace with Event Management by adding a standard webhook in the Dynatrace console.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Ensure that configuration items for the hosts managed by Dynatrace exist in the ServiceNow AI Platform instance. These CIs can be physical or virtual and can be either manually created or discovered via IP discovery or Cloud Discovery.

Confirm you have created a user with an **Identify Type** of **Machine** and the evt_mgmt_integration role.

Roles required: evt_mgmt_integration and web_service_admin

About this task

Configure the Event Management environment for the collection of events from Dynatrace by authenticating Dynatrace as a data source. In your Dynatrace console, set your ServiceNow AI Platform instance as the rest endpoint using a standard webhook.

Procedure

1. In your Dynatrace console, define Host Naming rules:
   a. Navigate to **Settings** > **Process and contextualize** > **Naming** > **Host Naming**.
   b. Define the Host Naming rules for each cloud provider (Azure/AWS/GCP) to uniquely identify a CI from ServiceNow.
   This ensures the ServiceNow CIs can be uniquely identified from the payload received from Dynatrace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: You do not need to create a Host Naming rule for VMware machines because Dynatrace manages them as physical servers.

2. Define anomaly detection rules:
   a. Navigate to **Settings** > **Analyze and alert** > **Alerts** > **Hosts**.
   b. In the **Hosts** tab, define rules on when to create alerts on the managed hosts.
3. Define the integration settings:
   a. Navigate to **Settings** > **Analyze and alert** > **Notifications** > **Problem notifications**.
   b. In the Set up custom integration form, add the Webhook URL: `https://<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=dynatrace`

      Note:

      For basic authentication, select **Create basic authorization header**. You can see the username and password fields for the user.

   c. Enter the user name and password of the relevant user.

      Note: Ensure the evt_mgmt_integration role is assigned to the selected user. To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.

   d. In the Custom payload section, add the following payload structure for the events that will be generated.

      Ensure that ImpactedEntities and ProblemDetailsJSONv2 are passed as JSON objects, not strings.

```
{
  "ImpactedEntities": {ImpactedEntities},
  "ImpactedEntity": "{ImpactedEntity}",
  "PID": "{PID}",
  "ProblemDetailsHTML": "{ProblemDetailsHTML}",
  "ProblemDetailsJSONv2": {ProblemDetailsJSONv2},
  "ProblemDetailsMarkdown": "{ProblemDetailsMarkdown}",
  "ProblemDetailsText": "{ProblemDetailsText}",
  "ProblemID": "{ProblemID}",
  "ProblemImpact": "{ProblemImpact}",
  "ProblemSeverity": "{ProblemSeverity}",
  "ProblemTitle": "{ProblemTitle}",
  "ProblemURL": "{ProblemURL}",
  "State": "{State}",
  "Tags": "{Tags}"
}
```

4. Define the integration settings for the Grail problem event, which ServiceNow® now supports through its new payload.
   a. Log in to the Dynatrace instance and, from the left-hand panel, select **Workflow**.
   b. On the Workflow page, select **+ Workflow** to create a new workflow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Create a blank workflow.

d. In the Select a trigger section, select **Problem trigger**.

e. In the middle workflow section, on the problem trigger tile, add the **Send ITOM event** task.

f. Select **+ Create a new connection**.

g. In the **Connection name** field, enter a name.

h. In the **ServiceNow ITOM Event API URL** field, paste the URL in this format:`https://<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=dynatrace`.

i. In the **Type** field, select **Basic Authentication**, and then select **Create basic authorization header**. The username and password fields appear.

j. Enter the user name and password of the relevant user.

> **Note:** Ensure the `evt_mgmt_integration` role is assigned to the selected user. For proper authentication, use the least-privileged user with the `evt_mgmt_integration` role rather than a highly privileged user.

k. Save the workflow and select **Run** to execute the workflow.

Result

Alerts start flowing from the Dynatrace console into the Event Management plugin. The plugin extracts information from the original Dynatrace alert message to populate the required event fields and inserts the event into the database. In your ServiceNow AI Platform instance, navigate to **All Events** to see the events.

> **Note:** By default, host binding is enabled for Dynatrace events for all providers (Azure/AWS/Google). If all hosts in the environment are discovered using Cloud Discovery by providing credentials and discovered resources are in the cmdb_ci_vm_object list, then the VM binding may not occur. To resolve this, you must enable the **Dynatrace - General** event rule. For further information about Event rules, see Event rules.

Integrate Dynatrace with OAuth authentication

Integrate Dynatrace with Event Management by authenticating Dynatrace V1 or V2 tokens in the Dynatrace Monitor.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

The Event Management plugin must be installed on the ServiceNow AI Platform instance.

Verify Configuration Items for the hosts managed by Dynatrace exist in ServiceNow. These CIs can be physical or virtual, and can be either manually created or discovered using IP discovery or Cloud discovery.

Role required: evt_mgmt_integration

About this task

Dynatrace integration with OAuth authentication is available starting from the Washington DC platform release or later.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Configuration on the ServiceNow instance.

   a. Create *glide.oauth.inbound.client.credential.grant_type.enabled* system property to use Client Credentials grant type for OAuth inbound integrations.

      - Type: true|false
      - Value: true

      Note: An administrator must create this system property because the evt_mgmt_admin role lacks permission to do so.

   b. Create an OAuth Entity endpoint for clients to access the instance.

      i. Navigate to **All** > **System OAuth** > **Application Registry** and then select **New**.

      ii. On the interceptor page, select **Create an OAuth API endpoint for external clients** and then fill in the form.

      iii. To create an OAuth client record, select **Submit**.

   c. Add the OAuth Application User and the Default Grant Type to the created OAuth client record.

      i. On the OAuth Entity form, add the **OAuth Application User** and the **Default Grant Type** fields to use the Client Credentials grant type for OAuth inbound integrations.

      ii. Open the created OAuth client record.

      iii. From the page header, select the **More** options icon.

      iv. Select **Configure** > **Form Layout**

      v. On the Form Layout page, add **OAuth Application User and Default Grant Type** from the list of fields.

      vi. **Save** or **Update** the form.

      vii. For the **OAuth Application User** field, select the user.

      The user must have the evt_mgmt_integration role that will be used to create the events sent by Dynatrace.

      Note: To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.

      viii. Set **Default Grant Type** field value to **Client Credentials**.

2. In the Dynatrace console, define the integration settings.

   a. Navigate to **Settings** > **Integration** > **Problem notifications** > **Set up notifications**.

   b. In the Set up custom integration form, webhook URL.

   ```
   https://<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=dynatrace
   ```

   c. Enable **Use OAuth 2.0 for authentication**.

   d. In the OAuth 2.0 credentials section, perform the following steps.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

i. Provide Access token URL as `https://<instance_name>.service-now.com/oauth_token.do`.

ii. Provide the value for **Client ID** with the client id of the OAuth Entity Client created in ServiceNow instance.

iii. Provide “Client secret” with the client secret of the OAuth Entity Client created in ServiceNow instance.

iv. Select **Save**.

e. In the Custom payload section, add in the following payload structure for the events that will be generated. Ensure that `ImpactedEntities` and `ProblemDetailsJSONv2` are passed as JSON objects, not strings.

```
{
  "ImpactedEntities": {ImpactedEntities},
  "ImpactedEntity": "{ImpactedEntity}",
  "PID": "{PID}",
  "ProblemDetailsHTML": "{ProblemDetailsHTML}",
  "ProblemDetailsJSONv2": {ProblemDetailsJSONv2},
  "ProblemDetailsMarkdown": "{ProblemDetailsMarkdown}",
  "ProblemDetailsText": "{ProblemDetailsText}",
  "ProblemID": "{ProblemID}",
  "ProblemImpact": "{ProblemImpact}",
  "ProblemSeverity": "{ProblemSeverity}",
  "ProblemTitle": "{ProblemTitle}",
  "ProblemURL": "{ProblemURL}",
  "State": "{State}",
  "Tags": "{Tags}"
}
```

Result

Alerts start flowing from Dynatrace agents into the Event Management plugin. The plugin extracts information from the original Dynatrace alert message to populate the required event fields and inserts the event into the database. In your ServiceNow AI Platform instance, navigate to All Events to see the events.

Note: By default, host binding is enabled for Dynatrace events for (AWS/Azure/GCP) providers. If all hosts in the environment are discovered using Cloud Discovery by providing credentials and discovered resources are in the cmdb_ci_vm_object list, then the VM binding may not occur. To resolve this, you must enable the Dynatrace - General event rule. For further information about Event rules, see Event rules.

Integrate New Relic platform events

Integrate New Relic with Event Management by adding a standard webhook in the New Relic old and new consoles.

Before you begin

Verify that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Role required: evt_mgmt_integration

About this task

Configure the Event Management environment for the collection of events from New Relic by authenticating New Relic as a data source. Set your ServiceNow AI Platform instance as the rest

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

endpoint using a standard webhook. Use procedure step 1 for the new console. Use procedure step 2 for the old console.

Starting from the Xanadu release, the OOTB (Out-Of-The-Box) event rules provided with the connector, which you have not previously used (i.e., neither activated, deactivated, nor modified), will now have the **Apply additional matching rules** check box set to true. Previously, this check box was disabled. This change allows you to execute more event rules or automation using the same filter conditions for the events.

Note: This feature applies only to active event rules.

Procedure

1. For the new console:

   a. Create a destination.

      i. Navigate to **Alerts & AI** > **Destinations**.

      ii. In the **Add destinations** section, select the **Webhook** channel type.

      iii. In the **Webhook name** field, enter the webhook name.

      iv. In the **Endpoint URL** field enter: `https://<InstanceName>.service-now.com/api/sn_em_connector/em/inbound_event?source=newrelic`

      v. In the **Basic Auth** section, enter your user name and password.

      Note: Verify the evt_mgmt_integration role is assigned to the selected user. To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.

      vi. Select **Save destination**.

   b. Create a policy.

      i. Navigate to **Alerts & AI** > **Alert Conditions & Policies**.

      ii. Select **New Alert policy** and define a policy.

      iii. Select **Set up Notifications**.

      iv. In the **Add Channel** section select **Webhook**, and then select the destination that you created in the previous substep.

      v. In the **Payload template** section, paste the following JSON payload.

```
{ "account_id": {{nrAccountId}}, "account_name": {{json
 accumulations.tag.account.[0]}}, "closed_violations_count":
 {{closedIncidentsCount}}, "open_violations_count":
 {{openIncidentsCount}}, "condition_description":
 "{{escape accumulations.conditionDescription.[0]}}",
 "condition_family_id":
 {{accumulations.conditionFamilyId.[0]}}, "condition_name":
 "{{escape accumulations.conditionName.[0]}}",
 "current_state": {{json state}}, "details":
 {{json issueTitle}}, "duration": {{#if
 issueDurationMs}}{{issueDurationMs}}{{else}}0{{/if}},
 "event_type": "INCIDENT", "incident_acknowledge_url":
 {{json issueAckUrl}}, "incident_id": {{json issueId}},
 "incident_url": {{json issuePageUrl}}, "metadata":
 { {{#if locationStatusesObject}}"location_statuses":
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
{{json locationStatusesObject}},{{/if}} {{#if
accumulations.metadata_entity_type}}"entity.type":
{{json accumulations.metadata_entity_type.[0]}},{{/if}}
{{#if accumulations.metadata_entity_name}}"entity.name":
{{json accumulations.metadata_entity_name.[0]}},{{/if}}
"section": "metadata" }, "owner": {{json owner}},
"policy_name": {{json accumulations.policyName.[0]}},
"policy_url": {{json policyUrl}}, "runbook_url": {{json
accumulations.runbookUrl.[0]}}, "severity": {{json
priority}}, "targets": [ { "id": "{{labels.targetId.[0]}}",
"name": "{{#if accumulations.targetName}}{{escape
accumulations.targetName.[0]}}{{else
if entitiesData.entities}}{{escape
entitiesData.entities.[0].name}}{{else}}N/A{{/if}}",
"link": "{{issuePageUrl}}", "product":
"{{accumulations.conditionProduct.[0]}}", "type": "{{#if
entitiesData.types.[0]}}{{entitiesData.types.[0]}}{{else}
}N/A{{/if}}", "labels": { {{#each
accumulations.rawTag}}"{{escape @key}}": {{#if
this.[0]}}{{json this.[0]}}{{else}}"empty"{{/if}}{{#unless
@last}},{{/unless}}{{/each}} } } ], "timestamp":
{{updatedAt}}, "violation_callback_url": {{json
issuePageUrl}}, "violation_chart_url": {{json
violationChartUrl}} }
```

vi. Select **Send test notification** to get the test event in your ServiceNow instance.

vii. Select **Save message**.

viii. Select **Activate workflow** to activate the workflow.

c. Create alert conditions to apply to the policy:

i. Navigate to **Alerts & AI** > **Alert Conditions & Policies**.

ii. Select **Create alert condition**, define the required alert details, and add it to the policy you created in the previous step.

iii. Select **Save Condition**.

2. For the old console.

a. Create a notification channel.

i. Navigate to **Alerts & AI** > **Notification channels**.

ii. In the **Channel details** tab, select the **Webhook** channel type.

iii. In the **Base Url** text box, enter: `https://<InstanceName>.service-now.com/api/sn_em_connector/em/inbound_event?source=newrelic`

iv. In the Basic Auth section, enter the user name and password of the relevant user.

> **Note:** Verify the evt_mgmt_integration role is assigned to the selected user. To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.

v. In the **Custom Payload** section, select **Add Custom Payload**, and select the **JSON** payload type.

vi. Paste the following JSON payload into the **Custom Payload**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
{ "account_id": "$ACCOUNT_ID", "account_name":
 "$ACCOUNT_NAME", "closed_violations_count_critical":
 "$CLOSED_VIOLATIONS_COUNT_CRITICAL",
 "closed_violations_count_warning":
 "$CLOSED_VIOLATIONS_COUNT_WARNING",
 "condition_description": "$DESCRIPTION",
 "condition_family_id": "$CONDITION_FAMILY_ID",
 "condition_name": "$CONDITION_NAME", "current_state":
 "$EVENT_STATE", "details": "$EVENT_DETAILS",
 "duration": "$DURATION", "event_type":
 "$EVENT_TYPE", "incident_acknowledge_url":
 "$INCIDENT_ACKNOWLEDGE_URL", "incident_id": "$INCIDENT_ID",

```

b. Create a policy.

i. Navigate to**Alerts & AI** > **Policies**.

ii. Select**New Alert policy**and define a policy.

iii. In the**Notification Channels**section, select**Add**, select**Webhook**, and then select the channel you created in the previous step.

c. Create alert conditions to apply to the policy:

i. Navigate to**Infrastructure** > **Settings** > **Alerts**.

ii. Select**Create alert condition**, define the required alert details, add it to the policy you created in the previous step.

iii. Select**Create**.

Result

Alerts start flowing from the New Relic console into the Event Management plugin. The plugin extracts information from the original New Relic alert message to populate the required event fields and inserts the event into the database. In your ServiceNow AI Platform instance, navigate to**All Events**to see the events.

Note: By default, host binding is enabled for New Relic events for all providers (Azure/AWS/GCP). If all hosts in the environment are discovered using Cloud Discovery by providing credentials and discovered resources are in the cmdb_ci_vm_object list, then the VM binding may not occur. To resolve this, you must enable the**New Relic - General**event rule. For further information about Event rules, see Event rules.

Integrate New Relic with REST API key token

Integrate using an API key to establish secure communication and automate data exchange via REST API. This simplifies integration, enabling seamless access to services and enhancing operational efficiency.

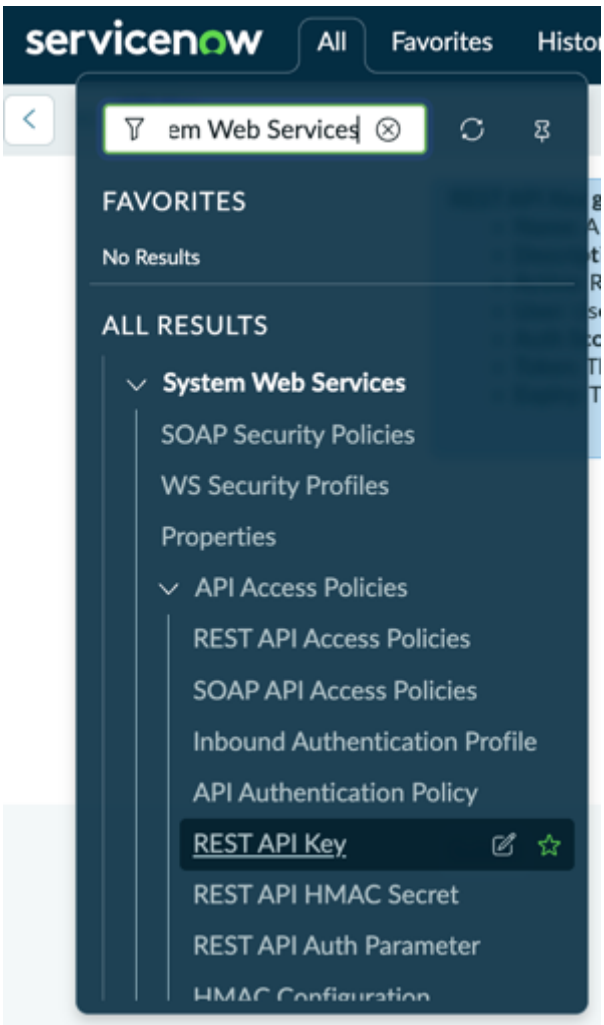
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: evt_mgmt_integration

Procedure

1. Navigate to **All** > **System Web Services** > **API Access Policies** > **REST API Key**.



2. Select **New**.
3. On the form, fill the fields.

> **Note:** The user needs to be created with the evt_mgmt_integration role. Create a new one on the sys_user table to use here to facilitate the right access.

API Key

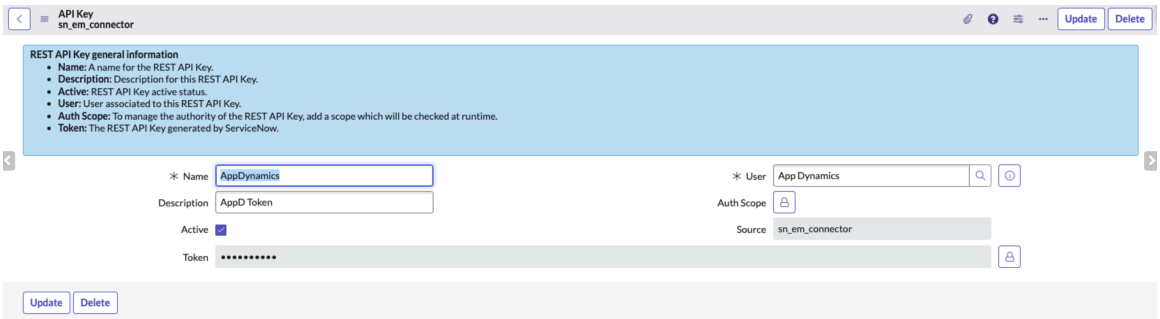
Field	Description
Name	Name to identify the REST API Key
Description	Description for the REST API Key.
Active	Status of the REST API Key.
User	User associated to the REST API Key. Use the look-up icon to select the user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Auth Scope	Option to add auth scope to manage the authority of the REST API Key.
Token	The REST API key generated by the ServiceNow AI Platform. Copy the key to use as part of the REST API call within the Header or Query parameter.
Expiry	Time after which the credential is no longer valid. Empty value means no expiration.

4. Unlock Auth Scope and add: UserAccount.
5. Use the form menu and select **Save**.

   The system generates a token and saves it in the **Token** field. To see the token, use the lock icon and copy the contents display below the field. This is your query parameter (or header) value when your other system sends a REST API request to ServiceNow.



Integrate Catchpoint events

Integrate Catchpoint with Event Management by adding an alert webhook in the Catchpoint platform.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Role required: evt_mgmt_admin

About this task

Configure the Event Management environment for the collection of events from Catchpoint by authenticating Catchpoint as a data source. In the Catchpoint platform, set your ServiceNow AI Platform as the rest endpoint using a webhook.

Procedure

1. In the Catchpoint platform, create an alert webhook destination.

   a. Login to the Catchpoint platform.

   b. Navigate to **Catchpoint** > **Setting** > **API** > **Alert Data Webhook** to set the webhook endpoint.

   c. In the API Alert Webhook, provide the following details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

API Alert Webhook form

Field	Value
Name	Any name based on your requirement.
URL	The default format of the URL to push events from Catch Point to the ServiceNow AI Platform instance, `https://<username>:<password>@<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=catchpoint`.
On Failure Alert	The email address for the API Alert webhook.
Notification Trigger	Select based on your requirement. The default value is 3.
Add the following headers	▪ Authorization: **Basic {Base 64 | username:password}** ▪ Content-Type: **application/json**
Format	Select **Template** and add the following template: `{ "Source": "CatchPoint", "severity": "${notificationLevelId}", "alertType": "${AlertType}", "time_of_event": "${alertCreateDateUtc(YYYY-MM-DD HH:MI:SS)}", "monitorType": "${Switch(${MonitorTypeId},'0', 'IE','2', 'Object','3','Emulated','8', 'Ping','9', 'Tracert','10', 'DNS-Traversal','11', 'Ping-TCP','12', 'DNS-Exp', '13','DNS-Direct', '14','Tracert-UDP', '15', 'Port-TCP','16', 'FTP','17', 'Data-Push-API','18', 'Chrome','19', 'Playback', '20', 'Playback-Mobile', '21', 'SMTP', '22', 'Port-UDP', '23', 'Ping-UDP', '24', 'Streaming', '25', 'API', '26', 'Mobile', '27', 'SFTP', '28', 'SSH', '29', 'Tracert-TCP')}", "testName": "${TestName}", "testId": "${TestId}",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value

	"testUrl": "${TestUrl}",
	"testPath": "${testPath}",
	"testLink": "${testLink}",
	"productName":
	"${ProductName}",
	"clientId": "${ClientId}",
	"productId": "${productId}",
	"nodeName":"${nodeDetails("${
	nodeName}")}",
	"nodeClientServerAddress":"${
	nodeDetails(\"${NodeClientAdd
	ress},\"),}",
	"nodeServerAddress":
	"${nodeDetails(\"${nodeServe
	rAddress},\"),}",
	"Labels" : "${testLabels}",
	"addtionalInformation":
	"Test initial URL:
	${testUrl}\n\nAlert type:
	${AlertType}\n\nScatter
	Chart:
	${scatterplotChartURL}\n\nWa
	terfall Chart:
	${waterfallChartURL}\n\nTest
	properties:
	${testLink}\n\nTest time
	of run / Test time of
	alert (Central Time):
	${reportDateLocal(YYYY-MM-DD
	HH:MI:SS)} /
	${alertCreateDateLocal(YY
	YY-MM-DD HH:MI:SS)}"}

2. For the HTTP Endpoint monitoring tests, in the ServiceNow instance, create a CI.

> **Note:** The Catchpoint connector supports multiple types of monitoring tests such as Endpoint, Networking, and others. The following steps apply only to the HTTP Endpoint monitoring tests.

   a. Navigate to **Configuration** > **CI Class Manager**.

   b. Click **Hierarchy** and search for **HTTP(S) Endpoint**.

   c. In the CI Type field, select **cmdb_ci_endpoint_http**.
   If the services are not modeled, then you should manually add the CIs under the [cmdb_ci_endpoint_http] table. Also, the manual endpoint should be removed before the automatic discovery of services. For other type tests CI bindings, you can create Event rules based on their requirements.

Result

Alerts start flowing from the Catchpoint connector into the Event Management plugin. The following table shows how the Catchpoint severity mapping translates into the ServiceNow mapping.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Severity levels between Catchpoint and ServiceNow

Catchpoint severity	ServiceNow severity
0	Warning
1	Critical
2/3	Clear

Integrate Datadog platform events

Integrate Datadog with Event Management by adding a standard webhook in the Datadog console.

What authentication is used

There are two methods of authentication:

- OAuth authentication: Provides enterprise-grade authentication to keep your enterprise environment safe. Authentication is performed using Datadog Monitor V1 or V2 access tokens. For more information, see Integrate Datadog with OAuth authentication.
- Basic webhook authentication: Provides a basic standard of authentication, without the need for Datadog Active Directory. This authentication can be especially useful for distributed small teams, such as SRE or DevOps teams. For more information, see Integrate Datadog with basic authentication.

Starting from the Xanadu release, the OOTB (Out-Of-The-Box) event rules provided with the connector, which you have not previously used (i.e., neither activated, deactivated, nor modified), will now have the **Apply additional matching rules** check box set to true. Previously, this check box was disabled. This change allows you to execute more event rules or automation using the same filter conditions for the events.

Note: This feature applies only to active event rules.

Integrate Datadog with basic authentication

Integrate Datadog with Event Management by adding a standard webhook in the Datadog console.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

- Role required: evt_mgmt_integration
- Confirm you have created a user with an **Identify Type** of **Machine** and the evt_mgmt_integration role.
- The Event Management plugin must be installed on the ServiceNow AI Platform instance.
- Verify Configuration Items for the hosts managed by Datadog exist in ServiceNow. These CIs can be physical or virtual, and can be either manually created or discovered using IP discovery or Cloud discovery.

About this task

Configure the Event Management environment for the collection of events from Datadog. In your Datadog console, set your ServiceNow AI Platform instance as the rest endpoint using a standard webhook.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the Datadog console, add cloud provider tags:

   a. Navigate to **Menu** > **Infrastructure** > **Hosts**.

   b. Click **Inspect** for the VM on which the Datadog agent is installed.

   c. Click **Edit Tags** and add the *cloud_provider* tag.
   The tag should be suffixed with the value of **aws**, **azure**, or **gcp** to identify the AWS, Microsoft Azure, or Google Cloud Platform (GCP) provider options. For example: cloud_provider:aws

   d. Click **Save Tags** to save the new tag.

   Note: Datadog adds the *cloud_provider* tag by default when the Azure and Google integration is installed on the Datadog agent. Tags can also be added at the cloud provider level. Datadog collects all the tags defined at the VM level on the cloud.

2. In the Datadog console, add a webhook:

   a. Navigate to **Menu** > **Integration** > **Integrations**, and search for webhooks.

   b. Create a webhook that includes the user ID and password of the ServiceNow user in the endpoint.
   For example, use `https://<username>:<password>@<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=datadog`.

   Note: Verify that the selected user is assigned the evt_mgmt_integration role. To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.

   c. Add the required payload structure.

   - Add in the following payload structure for monitoring alerts.

```
{
    "body": "$EVENT_MSG",
    "last_updated": "$LAST_UPDATED",
    "event_type": "$EVENT_TYPE",
    "title": "$EVENT_TITLE",
    "date": "$DATE",
    "org": {
        "id": "$ORG_ID",
        "name": "$ORG_NAME"
    },
    "id": "$ID",
    "alert_id": "$ALERT_ID",
    "alert_metric": "$ALERT_METRIC",
    "metric_namespace": "$METRIC_NAMESPACE",
    "alert_priority": "$ALERT_PRIORITY",
    "alert_transition": "$ALERT_TRANSITION",
    "alert_status": "$ALERT_STATUS",
    "alert_title": "$ALERT_TITLE",
    "alert_type": "$ALERT_TYPE",
    "host_name": "$HOSTNAME",
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    "priority": "$PRIORITY",
    "tags": "$TAGS",
    "alert_scope": "$ALERT_SCOPE"
}
```

- Add in the following payload structure for monitoring work items.

```
{
  "id": "$CASE_ID",
  "type": "$CASE_TYPE",
  "status": "$CASE_STATUS",
  "priority": "$CASE_PRIORITY",
  "title": "$EVENT_TITLE",
  "body": "$EVENT_MSG",
  "assignee": {
    "id": "$CASE_ASSIGNEE_ID",
    "name": "$CASE_ASSIGNEE_NAME",
    "email": "$CASE_ASSIGNEE_EMAIL"
  },
  "attributes": $CASE_ATTRIBUTES,
  "correlated_alerts": $CASE_CORRELATED_ALERTS,
  "date_created": "$DATE",
  "date_updated": "$LAST_UPDATED",
  "tags": "$TAGS"
}
```

ServiceNow auto-detects the case payload and represents it as a work Item alert (message key `Datadog_Case_<case_id>`).

3. In the Datadog console, define rules:
   a. Navigate to **Menu** > **Monitors** > **Manage Monitors**, and configure rules on when to create a problem from Datadog on the managed hosts.
   b. In the **Notify your team** section, select the webhook on which the problem should be notified.

   Similarly, create a rule for case or work items that triggers on events such as created, priority changed, status changed, closed and so on. It then notifies your ServiceNow webhook.

Result

Alerts start flowing from Datadog agents into the Event Management plugin. The plugin extracts information from the original Datadog alert message to populate the required event fields and inserts the event into the database. In your ServiceNow AI Platform instance, navigate to **All Events** to see the events.

For case or work items, while creating push connectors select the **Configure Work Item Alerts** button. You are redirected to the Datadog work Items pull connector instance form, where you configure related-alert fetch and bi-directional synchronization. For more information, see Configure a Datadog work item connector instance.

Note: By default, host binding is enabled for Datadog events for (AWS/Azure/GCP) providers. If all hosts in the environment are discovered using Cloud Discovery by providing credentials and discovered resources are in the cmdb_ci_vm_object list, then the VM binding may not occur. To resolve this, you must enable the **Datadog - General** event rule. For further information about Event rules, see Event rules.

Integrate Datadog with OAuth authentication

Integrate Datadog with Event Management by authenticating Datadog V1 or V2 tokens in the Datadog Monitor.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

The Event Management plugin must be installed on the ServiceNow AI Platform instance.

Verify Configuration Items for the hosts managed by Datadog exist in ServiceNow. These CIs can be physical or virtual, and can be either manually created or discovered using IP discovery or Cloud discovery.

Role required: evt_mgmt_integration

About this task

Datadog integration with OAuth authentication is available starting from the Washington DC platform release or later.

Procedure

1. Configuration on the ServiceNow instance.

   a. Create *`glide.oauth.inbound.client.credential.grant_type.enabled`* system property to use Client Credentials grant type for OAuth inbound integrations.

      - Type: true|false
      - Value: true

      Note: An administrator must create this system property because the evt_mgmt_admin role lacks permission to do so.

   b. Create an OAuth Entity endpoint for clients to access the instance.

      i. Navigate to **All** > **System OAuth** > **Application Registry** and then select **New**.

      ii. On the interceptor page, select **Create an OAuth API endpoint for external clients** and then fill in the form.

      iii. To create an OAuth client record, select **Submit**.

   c. Add the OAuth Application User and the Default Grant Type to the created OAuth client record.

      i. On the OAuth Entity form, add the **OAuth Application User** and the **Default Grant Type** fields to use the Client Credentials grant type for OAuth inbound integrations.

      ii. Open the created OAuth client record.

      iii. From the page header, select the **More** options icon.

      iv. Select **Configure** > **Form Layout**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

v. On the Form Layout page, add **OAuth Application User and Default Grant Type** from the list of fields.

vi. **Save** or **Update** the form.

vii. For the **OAuth Application User** field, select the user.

The user must have the evt_mgmt_integration role that will be used to create the events sent by Datadog.

Note: To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.

viii. Set **Default Grant Type** field value to **Client Credentials**.

2. In the Datadog console, add cloud provider tags.
   a. Navigate to **Menu** > **Infrastructure** > **Hosts**.
   b. Select **Inspect** for the VM on which the Datadog agent is installed.
   c. Select **Edit Tags** and add the cloud_provider tag.

   The tag must be suffixed with the value of aws, azure, or gcp to identify the AWS, Microsoft Azure, or Google Cloud Platform (GCP) provider options. For example: cloud_provider:aws.

   d. Select **Save Tags**.

   Note: Datadog adds the cloud_provider tag by default when the Azure and Google integration is installed on the Datadog agent. Tags can also be added at the cloud provider level. Datadog collects all the tags defined at the VM level on the cloud.

3. In the Datadog console, add a webhook.
   a. Navigate to **Menu** > **Integration** > **Integrations** and search for webhooks.
   b. On the webhook tile, select **Configure**.
   c. Select the **Auth Methods** tab and then select **New Auth Method**.
   d. Enter the name and select the protocol as **OAuth 2.0 Client Credentials**.
   e. Provide Access token URL as `https://<instance_name>.service-now.com/oauth_token.do`.
   f. Provide the value for **Client ID** with the client id of the OAuth Entity Client created in ServiceNow instance.
   g. Provide “Client secret” with the client secret of the OAuth Entity Client created in ServiceNow instance.
   h. Select **Save**.
   i. Create webhook URL as

   `https://<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=datadog`

   j. Select the OAuth Method created in the previous steps in AuthMethod dropdown.
   k. ▪ Add in the following payload structure for monitoring alerts.

```
{
    "body": "$EVENT_MSG",
    "last_updated": "$LAST_UPDATED",
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    "event_type": "$EVENT_TYPE",
    "title": "$EVENT_TITLE",
    "date": "$DATE",
    "org": {
        "id": "$ORG_ID",
        "name": "$ORG_NAME"
    },
    "id": "$ID",
    "alert_id": "$ALERT_ID",
    "alert_metric": "$ALERT_METRIC",
    "metric_namespace": "$METRIC_NAMESPACE",
    "alert_priority": "$ALERT_PRIORITY",
    "alert_transition": "$ALERT_TRANSITION",
    "alert_status": "$ALERT_STATUS",
    "alert_title": "$ALERT_TITLE",
    "alert_type": "$ALERT_TYPE",
    "host_name": "$HOSTNAME",
    "priority": "$PRIORITY",
    "tags": "$TAGS",
    "alert_scope": "$ALERT_SCOPE"
}
```

- Add in the following payload structure for monitoring work items.

```
{
  "id": "$CASE_ID",
  "type": "$CASE_TYPE",
  "status": "$CASE_STATUS",
  "priority": "$CASE_PRIORITY",
  "title": "$EVENT_TITLE",
  "body": "$EVENT_MSG",
  "assignee": {
    "id": "$CASE_ASSIGNEE_ID",
    "name": "$CASE_ASSIGNEE_NAME",
    "email": "$CASE_ASSIGNEE_EMAIL"
  },
  "attributes": $CASE_ATTRIBUTES,
  "correlated_alerts": $CASE_CORRELATED_ALERTS,
  "date_created": "$DATE",
  "date_updated": "$LAST_UPDATED",
  "tags": "$TAGS"
}
```

ServiceNow auto-detects the case payload and represents it as a work Item alert (message key `Datadog_Case_<case_id>`).

Result

Alerts start flowing from Datadog agents into the Event Management plugin. The plugin extracts information from the original Datadog alert message to populate the required event fields and inserts the event into the database. In your ServiceNow AI Platform instance, navigate to All Events to see the events.

For case or work items, while creating push connectors select the **Configure Work Item Alerts** button. You are redirected to the Datadog work Items pull connector instance form, where you configure related-alert fetch and bi-directional synchronization. For more information, see Configure a Datadog work item connector instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: By default, host binding is enabled for Datadog events for (AWS/Azure/GCP) providers. If all hosts in the environment are discovered using Cloud Discovery by providing credentials and discovered resources are in the cmdb_ci_vm_object list, then the VM binding may not occur. To resolve this, you must enable the Datadog - General event rule. For further information about Event rules, see Event rules.

Create a rule for case or work items that triggers on events such as created, priority changed, status changed, and closed. The rule then notifies your ServiceNow webhook.

Configure a Datadog work item connector instance

Integrate Google Cloud Platform (GCP) events

Integrate Google Cloud Platform (GCP) with Event Management by adding a standard webhook in the GCP console.

Before you begin

- Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.
- The Event Management plugin must be installed on the ServiceNow AI Platform instance.
- Verify Configuration Items for the hosts managed by GCP exist in ServiceNow. These CIs can be physical or virtual, and can be either manually created or discovered using IP discovery or Cloud discovery.
- The Event Management Connector plugin supports GCP alert data in JSON 1.2 format only.
- Role required: evt_mgmt_integration

About this task

Configure the Event Management environment for the collection of events from GCP. In your GCP console, set your ServiceNow AI Platform instance as the rest endpoint using a standard webhook.

Starting from the Xanadu release, the OOTB (Out-Of-The-Box) event rules provided with the connector, which you have not previously used (i.e., neither activated, deactivated, nor modified), will now have the **Apply additional matching rules** check box set to true. Previously, this check box was disabled. This change allows you to execute more event rules or automation using the same filter conditions for the events.

Note: This feature applies only to active event rules.

Procedure

1. In the GCP console, add a webhook.

   a. Navigate to **Monitoring** > **Alerting**, and click **Edit Notification Channels**.

   b. In the Webhooks section, click **Add New**.

   c. Select the **Use HTTP Basic Auth** check box, and enter the user name and password of the relevant ServiceNow user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

> **Note:** Ensure that the selected user is assigned the evt_mgmt_integration role. To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.

d. Enter the endpoint URL.
For example, use`https://<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=googlemonitor`.

2. In the GCP console, create an alerting policy.
   a. Navigate to **Monitoring** > **Alerting**, and select **Create Policy**.
   b. Configure policy conditions that initiate alerts when the conditions are violated.
   c. Select the webhook on which the problem should be notified.

> **Note:** If you need to directly open an incident in the GCP console from the alert, navigate to **Quick Response (in Alert)** > **Show Incident in GCP Console**.

Result
Alerts start flowing from GCP into the Event Management plugin. The plugin extracts information from the original GCP alert message to populate the required event fields and inserts the event into the database. In your ServiceNow AI Platform instance, navigate to**All Events** to see the events.

GCP does not send values such as the severity level in the payload. The default severity is Minor, which can be changed in the*`Push Connector Configuration`* section of **Push Connectors** > **Google Monitor Push Connector**. The valid values of severity are**1- Critical**,**2- Major**,**3- Minor**,**4- Warning**, and**5- Info**.

> **Note:**
>
> To map the GCP hosts to the**cmdb_ci_server**record instead of**cmdb_ci_vm_object**, disable the**Google Monitor - General**event rule created for GCP. For further information about event rules, see Event rules.

Event collection from Google Cloud Platform (GCP)

The MID WebService Event Collector enables you to collect JSON formatted event messages sent from Google Cloud Platform (GCP).

Before you begin
Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Ensure that you:

- Deploy and start the MID Server. See MID Server configuration .
- Configure and start the MID Web Server. See Configure the MID Web Server extension.
- Configure and start the MID WebService Event Collector. See Configure the MID WebService Event Collector Context.

Role required: evt_mgmt_admin

About this task
JSON formatted event messages are sent from Google Cloud Platform. The MID Server transforms the collected event messages by parsing them using the TransformEvents_MidGoogleMonitor script include, located here: **Event Management** >

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integrations > **PushConnectors**. In the Push Connectors page, click **Google Monitor Mid Push Connector**.

The default format of the URL to push event messages from the GCP to the MID Server is `http://<MID_Server_IP>:<MID_Web_Server_Port>/api/mid/em/inbound_event?Transform=TransformEvents_MidGoogleMonitor`.

Variables in the default URL

Variable	Description
MID_Server_IP	IP address of the MID Web Server Extension.
MID_Web_Server_Port	Listening port of the MID Web Server Extension.
MID_Web_Server_User	Username for the MID Web Server Extension.
MID_Web_Server_Password	Password of the user of the MID Web Server.

The following procedure describes the collection of JSON formatted event messages using basic authentication.

Procedure

1. Verify that the MID Server IP is accessible from the Google Cloud Platform (GCP) console and that the MID rest point is accessible from GCP.
   Alternatively, install the MID Server on a GCP VM and provide the VM external IP address in the URL. In the GCP console, create a firewall rule.
   a. Navigate to **VPC Network** > **Firewall** > **Create Firewall**.
   b. Set the direction to **ingress** to allow the mid_web_server_port to connect.
   c. Add the GCP VM that the MID Server is installed on to the **Applicable to instances** list.
2. In the GCP console, add a webhook.
   a. Navigate to **Monitoring** > **Alerting** and click **Edit Notification Channels**.
   b. In the Webhooks section, click **Add New**.
   c. Select the **Use HTTP Basic Auth** check box, and enter the username and password of the MID Webserver User.

      Note: Ensure that the selected user is assigned the evt_mgmt_integration role. To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.

   d. Enter the endpoint URL.
      For example, use `http://<MID_Server_IP>:<MID_Web_Server_Port>/api/mid/em/inbound_event?Transform=TransformEvents_MidGoogleMonitor`
3. In the GCP console, create an alerting policy.
   a. Navigate to **Monitoring** > **Alerting** and click **Create Policy**.
   b. Configure the policy conditions that initiate alerts when the conditions are violated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Select the webhook notification channel on which the problem should be notified.

d. Select the **Notify on incident closure** check box to send the closure events to the MID Server and save the alert policy.

Note: If you need to directly open an incident in the GCP Console from the alert, navigate to **Quick Response (in Alert)** > **Show Incident in GCP Console**. For more information about creating an alert policy, see Managing alerting policies on the Google Cloud documentation site.

Result

GCP does not send values such as the severity level into the payload. The default severity is Minor, which can be changed in the *Push Connector Configuration* section of **Push Connectors** > **Google Monitor MID Push Connector**. The valid values of severity are **1- Critical**, **2- Major**, **3- Minor**, **4- Warning**, and **5- Info**.

Integrate Grafana events

Integrate Grafana with Event Management by adding Grafana as an authenticated data source.

What authentication is used

The methods of authentication are as follows:

- Basic webhook authentication: Provides a basic standard of authentication, using username and password. For more information, see Integrate Grafana events with basic authentication.
- OAuth authentication: Provides enterprise-grade authentication to keep your enterprise environment safe. Authentication is performed using access tokens. For more information, see Integrate Grafana with OAuth authentication.
- API key authentication: Integrate using API key to secure communication between Grafana and ServiceNow. For more information, see Integrate Grafana with REST API key token.

Integrate Grafana events with basic authentication

Integrate Grafana with Event Management by adding a standard webhook in the Grafana console.

Before you begin

- Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.
- The Event Management plugin must be installed on the ServiceNow AI Platform instance.
- Confirm you have created a user with an **Identify Type** of **Machine** and the evt_mgmt_integration role.
- The CI binding happens through the IP, instances should be discovered as servers to initiate the binding. CIs discovered through cloud or CIs in **cmdb_ci_vm_object** don't get bounded as Grafana doesn't provide any information for object IDs.
- Role required: evt_mgmt_integration

About this task

Configure the Event Management environment for the collection of events from Grafana. In your Grafana console, set your ServiceNow AI Platform instance as the rest endpoint using a standard webhook.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can also configure Grafana as an event push connector from the Integrations Launchpad. For more information, see Configure an event push connector.

Note: Perform steps 1 and 2 for Grafana v7.4.3. For Grafana v9.3.2. skip to step 3.

Procedure

Grafana v7.4.3

1. In the Grafana console, create a notification channel.
   a. Navigate to **Alerting** > **Notification Channels**.
   b. Click **New Channel** and select the type as **Webhook**.
   c. Enter a URL.
   For example, use `https://<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=grafana`.
   d. Under the **Optional WebHook** settings, select the HTTP Method, **POST**, and enter the user name and password of the relevant ServiceNow user.
      Note: Ensure that the selected user is assigned the evt_mgmt_integration role. To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.
   e. Click **Test** to verify the connection.
2. In the Grafana console, create alerting rules.
   a. Click **Edit** on the required panel and then **Create Alert**.
   b. In the **Alert** tab, add the following tags:

Tags	Description
Severity	(This tag is optional and has to be lower cased.) Severity with which the alert has to be created.
Count	(This tag is required, otherwise the alerts don't close automatically in ServiceNow.) The number of devices, hosts, or servers monitored by this alert rule.

   c. Add the notification channel under **Notifications** in the alert rule.
   d. Click **Save**.
   e. Navigate to **Alerting** > **Alert Rules** to access the created rule.

Grafana v9.3.2.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the Grafana console, create a contact point.

   a. Navigate to **Alerting** > **Contact Points**.

   b. Select **New Contact Point**, enter a name, and select the type as **Webhook**.

   c. Enter a URL.
   For example, use `https://<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=grafana`.

   d. In the **Optional WebHook** settings, set the HTTP Method as **POST**, and enter the user name and password of the relevant ServiceNow user.

      Note: Ensure that the selected user is assigned the evt_mgmt_integration role. To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.

   e. Click **Save** and **Test** to verify the connection.

4. In the Grafana console, create a notification policy.

   a. Navigate to **Alerting** > **Notification Policies**.

   b. Select **New Policy**, add matchers.
   Matchers are labels that direct alert rules to the contact point.

   c. Select your contact point.

   d. Select **Save Policy**.

5. In the Grafana console, create alert rules.

   a. Navigate to **Alerting** > **Alert Rule**.

   b. Select **New Rule**.

   c. Set the Query and Alert Condition.

   d. Set the data source, metrics, and the necessary filters.

   e. Set the alert evaluation behavior.

   f. Enter the rule name.

   g. In the summary and annotations section, add a summary or a description.

   h. From the scroll down, select **+Add New**.

   i. Enter the node, resource, and metric information.
   This information is required for the node, resource, and metric_name fields for the event.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Use the value string to pass these values. For example, a node can be {{ $values.C0.Labels.instance }}.

j. Under custom labels, provide the required labels to direct your notifications to the appropriate contact point.

Note: You can also pass the severity under custom labels. The same is used for events. The available severity options are: critical, major, minor, warning.

k. Click **Save**.

Result

Alerts start flowing from Grafana into the Event Management plugin. The plugin extracts information from the original Grafana alert message to populate the required event fields and inserts the event into the database. In your ServiceNow AI Platform instance, navigate to **All Events** to see the events.

Note:

- For Grafana v7.4.3, you may see extra clear events coming into ServiceNow which aren't bound to an alert. Ignore them as they're created to overcome the issue of Grafana not sending information in the clear notification.
- A severity parameter is added which is used only for Grafana 8 and above. The provided value is used as a severity for an event if the severity isn't passed in custom labels.

Integrate Grafana with OAuth authentication

Integrate Grafana with Event Management with ServiceNow using OAuth authentication.

Before you begin

- Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.
- The Event Management plugin must be installed on the ServiceNow AI Platform instance.
- The CI binding happens through the IP, instances should be discovered as servers to initiate the binding. CIs discovered through cloud or CIs in **cmdb_ci_vm_object** don't get bounded as Grafana doesn't provide any information for object IDs.
- Role required: evt_mgmt_integration

About this task

Configure the Event Management environment for the collection of events from Grafana. In your Grafana console, set your ServiceNow AI Platform instance as the rest endpoint using a standard webhook.

Perform the following steps for Grafana v9.3.2 to send event to ServiceNow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Configuration on the ServiceNow instance.

   a. Create *glide.oauth.inbound.client.credential.grant_type.enabled* system property to use Client Credentials grant type for OAuth inbound integrations.

      - Type: true|false
      - Value: true

      Note: An administrator must create this system property because the evt_mgmt_admin role lacks permission to do so.

   b. Create an OAuth Entity endpoint for clients to access the instance.

      i. Navigate to **All** > **System OAuth** > **Application Registry** and then select **New**.

      ii. On the interceptor page, select **Create an OAuth API endpoint for external clients** and then fill in the form.

      iii. To create an OAuth client record, select **Submit**.

   c. Add the OAuth Application User and the Default Grant Type to the created OAuth client record.

      i. On the OAuth Entity form, add the **OAuth Application User** and the **Default Grant Type** fields to use the Client Credentials grant type for OAuth inbound integrations.

      ii. Open the created OAuth client record.

      iii. From the page header, select the **More** options icon.

      iv. Select **Configure** > **Form Layout**

      v. On the Form Layout page, add **OAuth Application User and Default Grant Type** from the list of fields.

      vi. **Save** or **Update** the form.

      vii. For the **OAuth Application User** field, select the user.

      The user must have the evt_mgmt_integration role that will be used to create the events sent by Grafana.

      Note: To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.

      viii. Set **Default Grant Type** field value to **Client Credentials**.

2. In the Grafana console, create a contact point.

   a. Navigate to **Alerts &IRM** > **Alerting** > **Contact Points**.

   b. Select **New Contact Point**, enter a name, and select the type as **Webhook**.

   c. Enter a URL.
   For example, use `https://<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=grafana`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. In the **Optional WebHook** settings, set the HTTP Method as **POST**.

e. In **HTTP Config**, select **+Add**.

f. In **OAuth2**, select **+Add**.

g. Provide token URL as: `https://<instance_name>.servicenow.com/oauth_token.do`.

h. Provide the value for **Client ID** with the client id of the OAuth Entity Client created in ServiceNow instance.

i. Provide **Client secret** with the client secret of the OAuth Entity Client created in ServiceNow instance.

j. Select **Save Contact point**.

3. In the Grafana console, create a notification policy.

a. Navigate to **Alerting** > **Notification Policies**.

b. Select **New Policy**, add matchers.
Matchers are labels that direct alert rules to the contact point.

c. Select your contact point.

d. Select **Save Policy**.

4. In the Grafana console, create alert rules.

a. Navigate to **Alerting** > **Alert Rule**.

b. Select **New Rule**.

c. Set the Query and Alert Condition.

d. Set the data source, metrics, and the necessary filters.

e. Set the alert evaluation behavior.

f. Enter the rule name.

g. In the summary and annotations section, add a summary or a description.

h. From the scroll down, select **+Add New**.

i. Enter the node, resource, and metric information.
This information is required for the node, resource, and metric_name fields for the event.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Use the value string to pass these values. For example, a node can be {{ $values.C0.Labels.instance }}.

j. Under custom labels, provide the required labels to direct your notifications to the appropriate contact point.

Note: You can also pass the severity under custom labels. The same is used for events. The available severity options are: critical, major, minor, warning.

k. Click **Save**.

Result

Alerts start flowing from Grafana into the Event Management plugin. The plugin extracts information from the original Grafana alert message to populate the required event fields and inserts the event into the database. In your ServiceNow AI Platform instance, navigate to **All Events** to see the events.

A severity parameter is added which is used only for Grafana 8 and above. The provided value is used as a severity for an event if the severity isn't passed in custom labels.

Integrate Grafana with REST API key token

Integrate using an API key to establish secure communication and automate data exchange via REST API. This simplifies integration, enabling seamless access to services and enhancing operational efficiency.

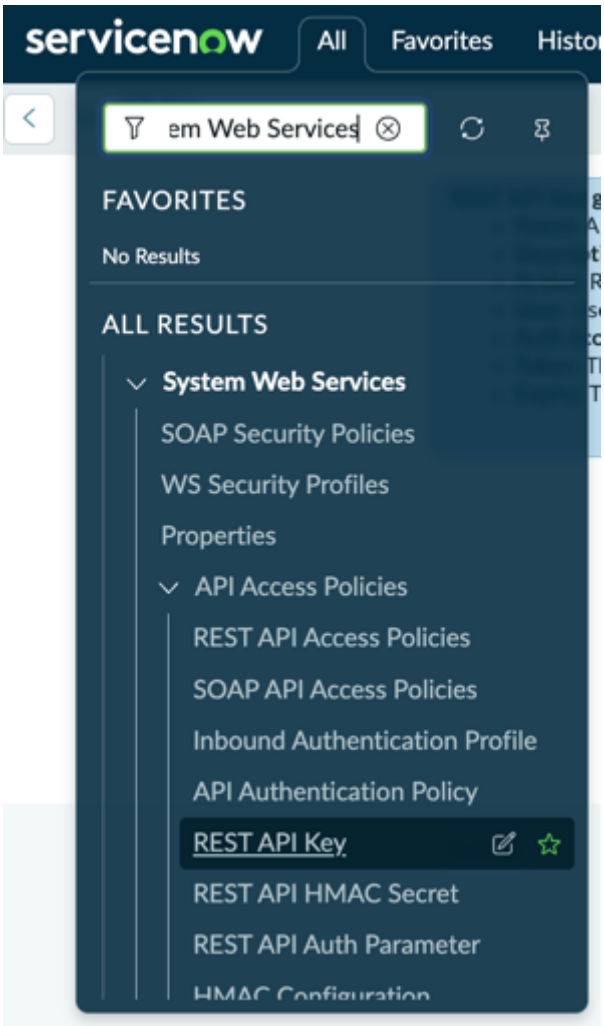
Before you begin

Role required: evt_mgmt_integration

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Web Services** > **API Access Policies** > **REST API Key**.



2. Select **New**.
3. On the form, fill the fields.

> **Note:** The user needs to be created with the evt_mgmt_integration role. Create a new one on the sys_user table to use here to facilitate the right access.

API Key

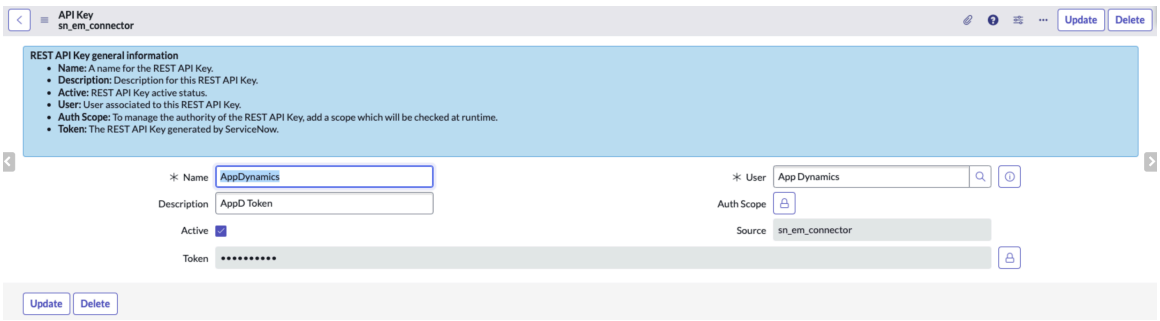
Field	Description
Name	Name to identify the REST API Key
Description	Description for the REST API Key.
Active	Status of the REST API Key.
User	User associated to the REST API Key. Use the look-up icon to select the user.
Auth Scope	Option to add auth scope to manage the authority of the REST API Key.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Token	The REST API key generated by the ServiceNow AI Platform. Copy the key to use as part of the REST API call within the Header or Query parameter.
Expiry	Time after which the credential is no longer valid. Empty value means no expiration.

4. Unlock Auth Scope and add: UserAccount.
5. Use the form menu and select **Save**.

   The system generates a token and saves it in the **Token** field. To see the token, use the lock icon and copy the contents display below the field. This is your query parameter (or header) value when your other system sends a REST API request to ServiceNow.



Integrate Honeycomb events

Integrate Honeycomb with Event Management by creating a webhook and configuring it as a trigger in the Honeycomb platform.

Before you begin

Discovery for Honeycomb services and datasets is not supported. For event/CI binding to work, manually create a CI in the ServiceNow instance.

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance. For more information, see Install Event Management

Role required: evt_mgmt_admin

About this task

Configure the Event Management environment for the collection of events from Honeycomb by authenticating Honeycomb as a data source. In the Honeycomb platform, set your ServiceNow AI Platform as the rest endpoint using a webhook.

Procedure

1. In the Honeycomb platform, create an integration of *`type=webhook`*.

   a. Navigate to **Usage** > **Integrations**.

   b. Select the **Add Integration** button.

   c. Enter values in the **Name** and **Webhook URL** fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When enting the Webhook URL, use the following format: `https://<USERNAME>:<PASSWORD>@<INSTANCE_NAME>.service-now.com/api/sn_em_connector/em/inbound_event?source=honeycomb`

d. In the **Provider** field, select **Webhook**.

e. Select **Add** to complete webhook creation.

2. Add the webhook to a trigger.

a. Navigate to **Triggers** > **Create New Trigger**.

b. Add a name and description for the trigger in the relevant fields.

c. In the **Alerts** section, configure the threshold and frequency in the relevant fields.

d. In the **Recipients** section, select **Add Recipient** and select the webhook created in step 1.

e. Select **Save Trigger**.

Note: To view the trigger in the Honeycomb platform, navigate to **Quick Response (in Alert)** and select **Show Trigger in Honeycomb**.

Result

Alerts flow from the Honeycomb connector into the Event Management plugin. The plugin extracts information from the original Honeycomb trigger message to populate the required event fields, and inserts the event into the database. You can view the events in your ServiceNow AI Platform instance by navigating **All Events**.

Honeycomb does not send severity information in the trigger message. The default severity for the Honeycomb alert is *3 - Minor*, which can be changed in the Push Connector Configuration section of **Push Connectors** > **Honeycomb Push Connector** . The valid severities are: *1 - Critical*, *2 - Major*, *3 - Minor*, *4 - Warning*, and *5 - Info*.

Integrate Instana events

Integrate Instana with Event Management by adding Instana as an authenticated data source.

What authentication is used

The methods of authentication are as follows:

- Basic webhook authentication: Provides a basic standard of authentication, using username and password. For more information, see Integrate Instana events.
- OAuth authentication: Provides enterprise-grade authentication to keep your enterprise environment safe. Authentication is performed using access tokens. For more information, see Integrate Instana with OAuth authentication.

Integrate Instana events

Integrate Instana with Event Management by adding a standard webhook in the Instana console.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Confirm you have created a user with an **Identify Type** of **Machine** and the evt_mgmt_integration role.

Role required: evt_mgmt_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the Instana console, navigate to **Settings** > **Events & Alerts** > **Alert Channels**.
2. Open the **Add Alert Channel** dropdown and select the **Generic Webhook** option.
3. In the **Webhook URLs** field, create an alert channel by entering the following URL:
   `https://<instance>.service-now.com/api/sn_em_connector/em/inbound_event?source=instana`
4. To authenticate the ServiceNow URL, enter the following in the **Custom HTTP Request Headers**:

Field	Value
Key	Authorization
Value	Basic <base64_encoded username:password>

5. Configure Instana to create alerts for event types or events.

   a. Navigate to **Settings** > **Events & Alerts** > **Alerts**.

   b. Select **New Alert**.

   c. In the **Events** section, select one of the following:
      - Alert on Event Type(s)
      - Alert on Event(s)

   d. When creating alerts for event types:
      i. Select the type of events for which you want alerts to be created, such as **Critical Issues**, **All Incidents**, **Warning issues**, and so forth.
      ii. In the **Alerting** section, select the **servicenow** alert channel.

   e. When creating alerts for events:
      i. Select the events for which you want alerts to be created.
      ii. In the **Alerting** section, select the **servicenow** alert channel.

   When Instana creates an alert, the alert is sent to the ServiceNow instance. Alerts created for the host entity are bound to the Server (cmdb_ci_server) table, and alerts created for the website entity are bound to the HTTP(S) (cmdb_ci_endpoint_http) table.

   Add other entity types in the Instana - ci_type Event Field Mapping table to ensure that the entity binds with the correct CI in the ServiceNow instance.

6. To view the event in the Instana source system, you can access it from a ServiceNow instance:
   a. Navigate to **All** > **Event Management** > **Service Operations Workspace**.
   b. Select **All Alerts**.
   c. Select the relevant alert.
   d. On the **Details** tab, locate the **Actions** section on the right side of the page and in the **Show Event on Instana UI** cell, select **Launch app**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integrate Instana with OAuth authentication

Integrate Instana with Event Management with ServiceNow using OAuth authentication.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Role required: evt_mgmt_admin

Procedure

1. Configuration on the ServiceNow instance.

   a. Create *glide.oauth.inbound.client.credential.grant_type.enabled* system property to use Client Credentials grant type for OAuth inbound integrations.

      - Type: true|false
      - Value: true

      Note: An administrator must create this system property because the evt_mgmt_admin role lacks permission to do so.

   b. Create an OAuth Entity endpoint for clients to access the instance.

      i. Navigate to **All** > **System OAuth** > **Application Registry** and then select **New**.

      ii. On the interceptor page, select **Create an OAuth API endpoint for external clients** and then fill in the form.

      iii. To create an OAuth client record, select **Submit**.

   c. Add the OAuth Application User and the Default Grant Type to the created OAuth client record.

      i. On the OAuth Entity form, add the **OAuth Application User** and the **Default Grant Type** fields to use the Client Credentials grant type for OAuth inbound integrations.

      ii. Open the created OAuth client record.

      iii. From the page header, select the **More** options icon.

      iv. Select **Configure** > **Form Layout**

      v. On the Form Layout page, add **OAuth Application User and Default Grant Type** from the list of fields.

      vi. **Save** or **Update** the form.

      vii. For the **OAuth Application User** field, select the user.

      The user must have the evt_mgmt_integration role that will be used to create the events sent by Grafana.

      Note: To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.

      viii. Set **Default Grant Type** field value to **Client Credentials**.

2. In the Instana console, navigate to **Settings** > **Events & Alerts** > **Alert Channels**.

3. Open the **Add Alert Channel** drop-down list and select the **Generic Webhook** option.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. In the **Webhook URLs** field, create an alert channel by entering the following URL: `https://<instance>.service-now.com/api/sn_em_connector/em/inbound_event?source=instana`.
5. Enable the **Enable OAuth** toggle switch to authenticate the ServiceNow URL.
   a. In the **Client ID** field, provide the client id value of the OAuth Entity Client created in ServiceNow instance.
   b. In the **Client Secret** field, provide the client secret value of the OAuth Entity Client created in ServiceNow instance.
   c. In the **Token URL** field, enter `https://<instance_name>.servicenow.com/oauth_token.do`
   d. To test the integration, select **Test channel**
   e. Select **Save**.
6. Configure Instana to create alerts for event types or events.
   a. Navigate to **Settings** > **Events & Alerts** > **Alerts**.
   b. Select **New Alert**.
   c. In the **Events** section, select one of the following:
      - Alert on Event Type(s)
      - Alert on Event(s)
   d. When creating alerts for event types:
      i. Select the type of events for which you want alerts to be created, such as **Critical Issues**, **All Incidents**, **Warning issues**, and so forth.
      ii. In the **Alerting** section, select the **servicenow** alert channel.
   e. When creating alerts for events:
      i. Select the events for which you want alerts to be created.
      ii. In the **Alerting** section, select the **servicenow** alert channel.

   When Instana creates an alert, the alert is sent to the ServiceNow instance. Alerts created for the host entity are bound to the Server (cmdb_ci_server) table, and alerts created for the website entity are bound to the HTTP(S) (cmdb_ci_endpoint_http) table.

   Add other entity types in the Instana - ci_type Event Field Mapping table to ensure that the entity binds with the correct CI in the ServiceNow instance.
7. To view the event in the Instana source system, you can access it from a ServiceNow instance:
   a. Navigate to **All** > **Event Management** > **Service Operations Workspace**.
   b. Select **All Alerts**.
   c. Select the relevant alert.
   d. On the **Details** tab, locate the **Actions** section on the right side of the page and in the **Show Event on Instana UI** cell, select **Launch app**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integrate ServiceNow Cloud Observability Events

Integrate ServiceNow Cloud Observability with Event Management by adding a standard webhook in the ServiceNow Cloud Observability platform. Download the Event Management Connector plugin from the ServiceNow Store so you can integrate with ServiceNow Cloud Observability.

Before you begin

- Role required: evt_mgmt_integration

About this task

Authenticate ServiceNow Cloud Observability as a data source to enable Event Management to collect events from ServiceNow Cloud Observability. In your ServiceNow Cloud Observability platform, use a standard webhook to set your ServiceNow AI Platform instance as the rest endpoint.

Note: Ensure the evt_mgmt_integration role is assigned to the selected user. To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.

Starting from the Xanadu release, the OOTB (Out-Of-The-Box) event rules provided with the connector, which you have not previously used (i.e., neither activated, deactivated, nor modified), will now have the **Apply additional matching rules** check box set to true. Previously, this check box was disabled. This change allows you to execute more event rules or automation using the same filter conditions for the events.

Note: This feature applies only to active event rules.

Procedure

1. Create a CI.

   Note: Discovery for ServiceNow Cloud Observability services isn't supported. Create a CI manually in a Service Instance (cmdb_ci_service_auto) table to enable binding.

   a. Navigate to **All** > **Configuration** > **Application Service**.

   b. Select **New**.

   c. In the form, enter the name.
   The name must be the service name provided in the ServiceNow Cloud Observability platform.

   d. From the Operational Status list, set the operational status to **Operational**.

   e. Select **Next**.

   f. Select **Done**.

2. In your ServiceNow Cloud Observability platform, create a notification destination.

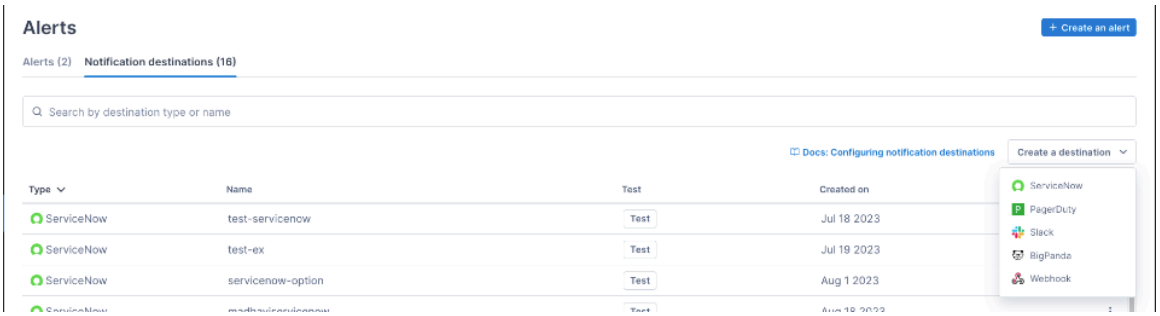
   a. From the navigation bar, select **Alerts**.

   b. Select the **Notification destinations** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Select **Create a destination**.

d. Select **ServiceNow** or **webhook**.
Use the ServiceNow destination to connect only with the ServiceNow platform. If you have any issues with the ServiceNow destination, then use the **webhook** destination option.



3. In your ServiceNow Cloud Observability platform, create a ServiceNow notification destination.

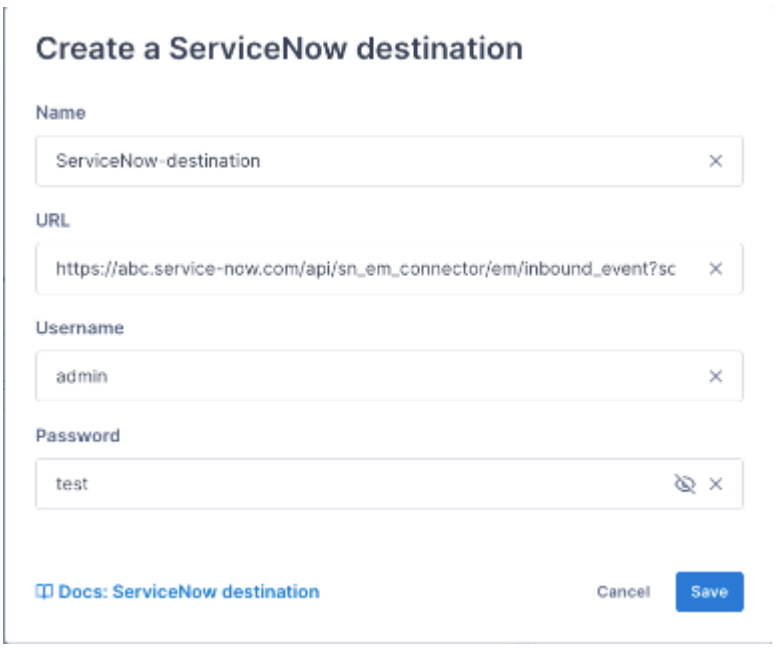
a. In the **Name** field, enter a name for the ServiceNow destination.

b. In the **URL** field, provide the ServiceNow instance URL.
This is the default format of the URL to push events from ServiceNow Cloud Observability to the ServiceNow AI Platform instance. Use this format: `https//<instance-name>.servicenow.com/api/sn_em_connector/em/inbound_event?source=lightstep`

c. In the **Username** field, enter your ServiceNow user name.

d. In the **Password** field, enter your ServiceNow user password.

Create a ServiceNow destination



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: In a ServiceNow instance, CI binding occurs only if the name of the service in the ServiceNow Cloud Observability platform value matches the name fields of the CI you created in the *cmdb_ci_service_auto* table.

e. Select **Save**.

4. **Note:** If you have any issues with the ServiceNow destination in the previous step, then use the **webhook** destination option.

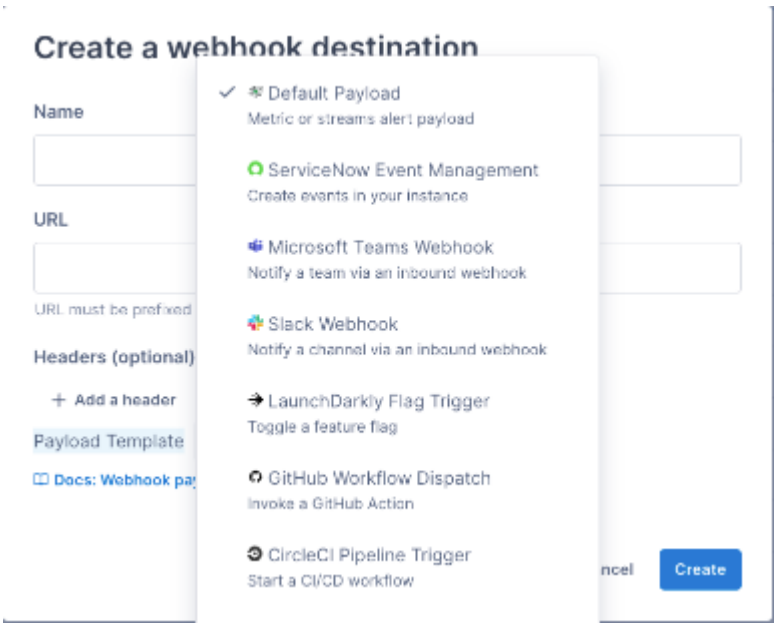
In your ServiceNow Cloud Observability platform, create a **webhook** notification destination.

a. In the **Name** field, enter a name for the webhook destination.

b. In the **URL** field, provide the webhook URL.
This is the default format of the URL to push events from ServiceNow Cloud Observability to the ServiceNow AI Platform instance. Use this format: `https//<username>:<password>@<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=lightstep`

c. Select **Payload Template**.

d. Select the **ServiceNow Event Management** option.

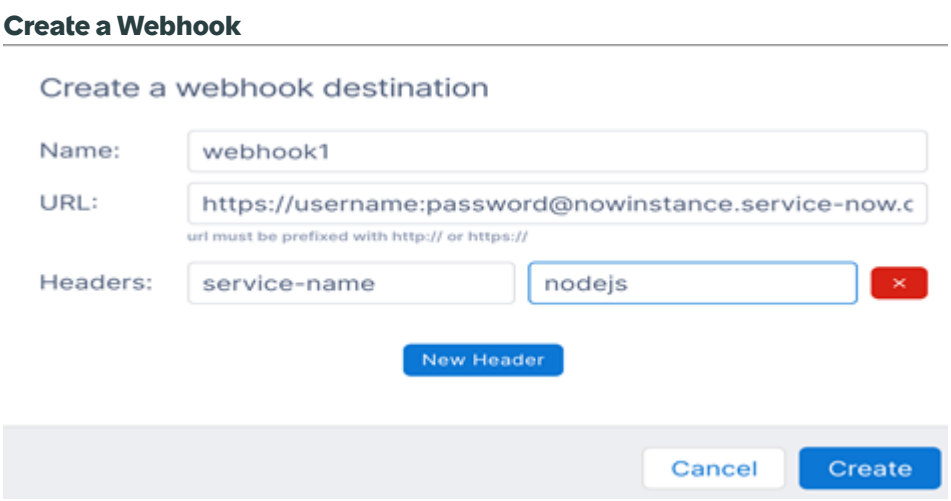


Note: In a ServiceNow instance, CI binding occurs only if the name of the service in the ServiceNow Cloud Observability platform value matches the name fields of the CI you created in the *cmdb_ci_service_auto* table.

e. If you selected the **Default Template** option in the previous substep, then select **New Header** and in the **Headers** field, enter the **service-name** and define its **value**.

Note: In a ServiceNow instance, CI binding occurs only if the **service-name** header value matches the name fields of the CI you created in the **cmdb_ci_service_auto table**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



f. Select **Create**.

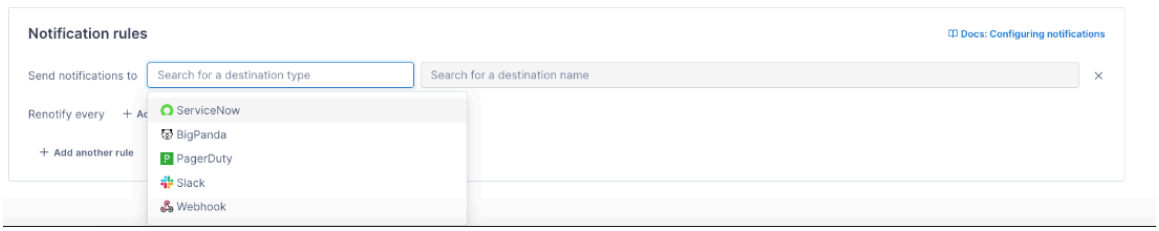
5. In the ServiceNow Cloud Observability platform, configure an alert.

a. From the navigation bar, select **Alerts**.

b. Select **Create an Alert** and enter an alert name.

c. In the Alert Configuration area, define the threshold.

d. According to the destination that you created, in the **Notification Rules** area, in the **Send Notifications to** field, select your notification destination type and search for the destination name.



e. Select **Save**.
The default severity for stream-based alerts is **Critical**. You can change the default in the Push Connector Configuration area of an ServiceNow AI Platform instance. The valid severity values are:

- 1- Critical
- 2- Major
- 3- Minor
- 4- Warning
- 5- Info

Integrate Logicmonitor events

Integrate Logicmonitor with Event Management to send events into ServiceNow by adding a webhook using Basic Authentication, it will also be available with bi-directional functionality.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.
- The Event Management plugin must be installed on the ServiceNow AI Platform instance.
- Role required: evt_mgmt_integration

About this task

Configure the Event Management environment for the collection of events from Logicmonitor. In your Logicmonitor console, set your ServiceNow AI Platform instance as the rest endpoint using a standard webhook.

Starting from the Xanadu release, the OOTB (Out-Of-The-Box) event rules provided with the connector, which you have not previously used (i.e., neither activated, deactivated, nor modified), will now have the **Apply additional matching rules** check box set to true. Previously, this check box was disabled. This change allows you to execute more event rules or automation using the same filter conditions for the events.

Note: This feature applies only to active event rules.

Procedure

1. In the Logicmonitor console, create a custom HTTP Delivery integration.
   a. Navigate to **Settings** > **Integrations** and click **Add** > **Custom HTTP Delivery Integration**.
   b. In the Manage Custom HTTP Delivery Integration form, fill in the **Name** and **Description** field and select the **Use the same URL and data to notify on various alert activity** check box.
   c. Specify when to send a notification on alert activities by selecting the **Acknowledged**, **Cleared**, and **Escalated/De-escalated** check boxes as needed.

      Note: If you are using the bi-directional Connector update, do not select the **Acknowledged** check box. Doing so can trigger a loop back to the Alert and close the Alert record unintentionally.

   d. In the HTTP method menu, select **HTTP POST**.
   e. Fill in the **Username** and **Password** field, and enter a URL with the format as, `https://{Instance-name}.service-now.com/api/sn_em_connector/em/inbound_event?source=logicmonitor`.
   f. Under the Alert Data section, select **Raw** and select the format as **JSON**.
   g. Add the custom payload provided in the description of the connector.
   h. Click **Test Alert Delivery** to verify the connection or **Save**.
2. When you're finished creating the integration, create an escalation chain for the alert settings.
   a. Navigate to **Settings** > **Alert Settings** > **Escalation Chains** and click **Add**.
   b. In the Manage Testing chain form, fill in the **Name** and **Description** field and select the rate at which the alerts should be notified.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Under the Stages section, select the Add icon to add a stage and click **Save**.

d. In the new stage, select the Add icon to search for the user.

e. Add the integration as the Contact Method and click **Save**.

3. After creating the escalation chain, configure alert rules for the chain you created.

a. Navigate to **Settings** > **Alert Settings** > **Alert Rules**, and click **Add**.

b. On the Add Alert window, configure the conditions that initiates the alerts when conditions are violated.

c. Under the Escalation chain menu, select the escalation chain you created.

d. Click **Save**.

Note: To map the CI to the **cmdb_ci_vm_object** record instead of the **cmdb_ci_server**, enable the event rule created for Logicmonitor. The Logicmonitor's collector name, which comes in as a hostname in the payload, should be the same as the object_id of the virtual machine discovered in the **cmdb_ci_vm_object** record.

Event collection from Logicmonitor

The MID WebService Event Collector enables you to collect JSON formatted event messages from the Logicmonitor.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Ensure that you:

- Deploy and start the MID Server. See MID Server configuration .
- Configure and start the MID Web Server. See Configure the MID Web Server extension.
- Configure and start the MID WebService Event Collector. See Configure the MID WebService Event Collector Context.

Role required: evt_mgmt_admin

About this task

JSON formatted event messages are sent from Logicmonitor. The MID Server transforms the collected event messages by parsing them using the TransformEvents_MidLogicmonitor script include, located here: **Event Management** > **Integrations** > **PushConnectors**. In the Push Connectors page, click **Logicmonitor Mid Push Connector**.

The default format of the URL to push event messages from Logicmonitor to the MID Server is `http://<MID_Server_IP>:<MID_Web_Server_Port>/api/mid/em/inbound_event?Transform=TransformEvents_MidLogicmonitor`.

Variables in the default URL

Variable	Description
MID_Server_IP	IP address of the MID Web Server Extension.
MID_Web_Server_Port	Listening port of the MID Web Server Extension.
MID_Web_Server_User	Username for the MID Web Server Extension.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Variables in the default URL (continued)

Variable	Description
MID_Web_Server_Password	Password of the user of the MID Web Server.

Procedure

1. In the Logicmonitor console, create a custom HTTP Delivery integration.
   a. Navigate to **Settings** > **Integrations** and click **Add** > **Custom HTTP Delivery Integration**.
   b. In the Manage Custom HTTP Delivery Integration form, fill in the **Name** and **Description** field and select the **Use the same URL and data to notify on various alert activity** check box.
   c. Specify when to send a notification on alert activities by selecting the **Acknowledged**, **Cleared**, and **Escalated/De-escalated** check boxes as needed.
   d. In the HTTP method menu, select **HTTP POST**.
   e. Fill in the **Username** and **Password** field, and enter a URL with the format as, `http://<MID_Server_IP>:<MID_Web_Server_Port>/api/mid/em/inbound_event?Transform=TransformEvents_MidLogicmonitor`.
   f. Under the Alert Data section, select **Raw** and select the format as **JSON**.
   g. Add the custom payload provided in the description of the connector.
   h. Click **Test Alert Delivery** to verify the connection or **Save**.
2. When you're finished creating the integration, create an escalation chain for the alert settings.
   a. Navigate to **Settings** > **Alert Settings** > **Escalation Chains** and click **Add**.
   b. In the Manage Testing chain form, fill in the **Name** and **Description** field and select the rate at which the alerts should be notified.
   c. Under the Stages section, select the Add icon to add a stage and click **Save**.
   d. When you create the new stage, select the Add icon again to search for the user. Add the integration as the Contact Method and click **Save**.
3. After creating the escalation chain, configure alert rules for the chain you created.
   a. Navigate to **Settings** > **Alert Settings** > **Alert Rules**, and click **Add**.
   b. On the Add Alert window, configure the conditions that initiates the alerts when conditions are violated.
   c. Under the Escalation chain menu, select the escalation chain you created.
   d. Click **Save**.

> **Note:** To map the CI to the **cmdb_ci_vm_object** record instead of the **cmdb_ci_server**, enable the event rule created for Logicmonitor. The Logicmonitor's collector name, which comes in as a hostname in the payload, should be the same as the object_id of the virtual machine discovered in the **cmdb_ci_vm_object** record.

Integrate Oracle Cloud Infrastructure alarms

Integrate Oracle Cloud Infrastructure (OCI) alarms with Event Management to send events into ServiceNow by adding a https subscription using Basic Authentication.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.
- Oracle Cloud Discovery must be performed to ensure that the created alerts are bound to the configuration items in the ServiceNow AI Platform. For more information, see Oracle Cloud Infrastructure Discovery.
- Role required: evt_mgmt_integration

About this task

The Oracle Cloud Notifications service enables you to set up communication channels for publishing messages using topics and subscriptions. When a message is published to a topic, the Notifications service sends the message to all of the topic's subscriptions.

When an Oracle Management Cloud alert is raised, becomes severe, or clears, you may want to be actively notified through an https custom URL to the ServiceNow instance.

The Oracle Cloud connector creates events in ServiceNow®.

You can configure the Event Management environment for the collection of alarms from Oracle Cloud by setting your ServiceNow AI Platform instance as the https subscription.

Procedure

1. In the Oracle Cloud console, set up a https subscription.

   a. On the Create Subscription form, under the Configure Subscription section in the Protocol list, select **HTTPS (Custom URL)**.

   Note: When the subscription is created, the password will not be shown in clear text.

   b. In the URL field, enter a URL with the format: `https://<username>:<password>@<instancename>.service-now.com/api/sn_em_connector/em/inbound_event/oraclecloud`.
   For example, `https://oracleevents:oracleevents@instance1.service-now.com/api/sn_em_connector/em/inbound_event/oraclecloud`.
   When the subscription is created with the ServiceNow instance URL, the Oracle Cloud Push connector will receive a payload that will confirm the subscription and is moved to an **Active** state in the Oracle Cloud console.

2. In the Oracle Cloud console, you can create an alarm definition and set the notification destination with the topic containing the https ServiceNow subscription.

   a. Navigate to **Observability & Management** > **Alarm Definitions**.

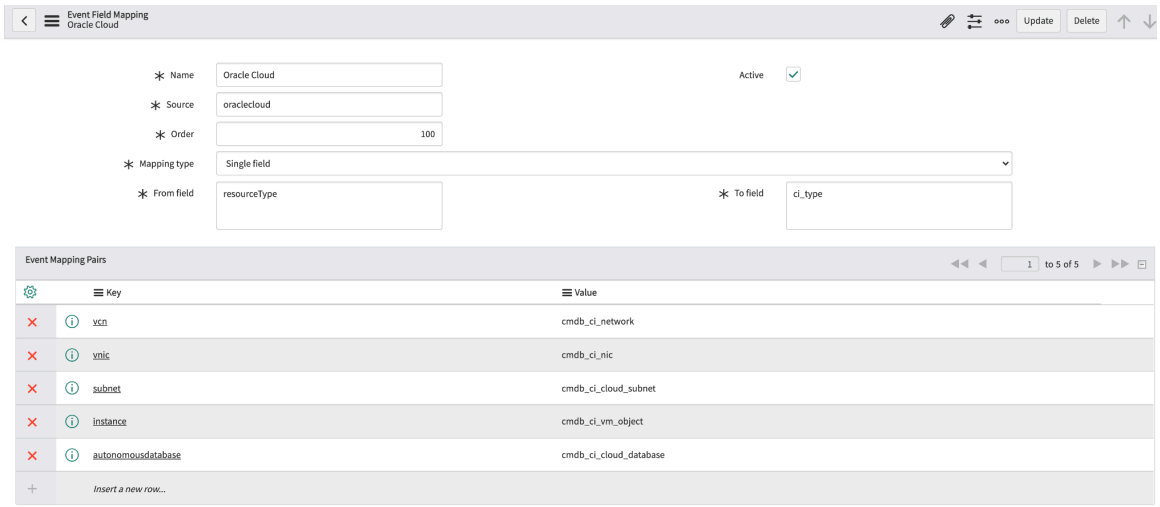
   b. Click **Create Alarm** or select an existing alarm that you want to set the topic containing the https ServiceNow subscription.

   c. In the Destinations section in the Topic list, select the topic with the https ServiceNow subscription.
   When an alarm is triggered in the Oracle Cloud console, the same alarm will be received in the Oracle Cloud Push connector in the ServiceNow instance and an event will be created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result

Depending on the Oracle Cloud alarm resource, the alert will bind to the CI using the following Event Field Mapping:



You can create other event rules or modify the Event Field Mapping to map to other resource types.

Once the https subscription is configured and an Oracle Cloud alarm triggers a message in Event Management the message:

- Authenticates the Oracle Cloud alarm message with the relevant ServiceNow user given in the https subscription.
- Extracts information from the original Oracle Cloud alarm message to populate the required event fields and inserts the event into the ServiceNow AI Platform database.
- Captures specified content in the **Additional Information** field of the event form.

Integrate Prometheus events

Integrate Prometheus with Event Management by adding a standard webhook in Prometheus's Alert Manager.

Before you begin

- Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.
- Verify Configuration Items for the hosts managed by Prometheus exist in ServiceNow. These CIs can be physical or virtual, and can be either manually created or discovered using IP discovery or Cloud discovery.
- Role required: evt_mgmt_integration

About this task

Configure the Event Management environment for the collection of events from Prometheus.

Starting from the Xanadu release, the OOTB (Out-Of-The-Box) event rules provided with the connector, which you have not previously used (i.e., neither activated, deactivated, nor modified), will now have the **Apply additional matching rules** check box set to true. Previously, this check box was disabled. This change allows you to execute more event rules or automation using the same filter conditions for the events.

Note: This feature applies only to active event rules.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the Prometheus instance, add a webhook.
   a. Navigate to Alertmanager.yml and add a webhook entry under the recievers.
   b. Enter the endpoint uRL. For example, use `https://<instance-name>/service-now.com/api/sn_em_connector/em/inbound_event?source=prometheus`.
   c. Type `basic_auth` underneath *`http_config`*.
   d. Add a username and password under *`basic_auth`*, then add the created webhook name in the receiver under *`route`*.
2. In the Prometheus instance, create an alert rule.
   a. Create a file for the alert rule and add its' path inside prometheus.yml under *`rules_files`*.
   b. Create the alert rule as per the prometheus format using PromQL.
   c. Restart AlertManager and Prometheus to reflect the changes.

Result

Alerts start flowing from Prometheus into the Event Management plugin. The plugin extracts information from the original Prometheus alert message to populate the required event fields and inserts the event into the database. In your ServiceNow AI Platform instance, navigate to **All Events** to see the events.

If severity isn't received in the payload, the default severity is Major, which can be changed in the *`Push Connector Configuration`* section of **Push Connectors** > **Prometheus Push Connector**. The valid values of severity are **1- Critical**, **2- Major**, **3- Minor**, **4- Warning**, and **5- Info**.

Note:

To map hosts to the *`cmdb_ci_vm_object`* record instead of *`cmdb_ci_hardware`*, enable the **Prometheus VM Binding** event rule created for Prometheus. For further information about event rules, see Event rules.

Integrate Sentry events

Integrate Sentry with Event Management by adding a standard webhook in the Sentry platform.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Discovery for Sentry services are not supported. You must create a CI manually in the [cmdb_ci_service_auto] table to enable binding by completing the following steps:

1. From the navigation bar, go to **Configuration/Application Service**.
2. Provide the project name you are monitoring on the Sentry application.
3. Set the operational status to **Operational**.
4. Click **Next** then **Done**.

Role required: evt_mgmt_admin

About this task

Configure Event Management for the collection of events from Sentry by authenticating Sentry as a data source. In your Sentry platform, use a standard webhook to set your ServiceNow AI Platform as the rest endpoint.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the Sentry console, create an internal integration.

   a. Navigate to **Settings** > **Developer Settings**.

   b. Click **New Internal Integration**.

   c. In the Internal Integration Details section, on the Sentry Integration Details page, fill in the fields.

   Sentry Integration Details

Fields	Description
Name	Name of your integration.
Webhook URL	The default format of the URL to push events from Sentry to the ServiceNow AI Platform instance. For example, `https://<username>:<password>@<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=sentry`.
Alert Rule Action	Option to enable the integration. **Note:** When enabled, the integration becomes available in the Issue Alert and Metric Alert rules in Sentry. The alerts will be sent to the ServiceNow instance.
Schema	Schema for your UI components. This field should be left empty.
Overview	Description for the integration.
Authorized JavaScript Origins	Auth Tokens from the browser to enable the origins of the pages making the requests. This field should be left empty.

   d. In the Permissions section, under Issue & Event, specify the level of access you want. You can select **Read**, **Read & Write**, or **Admin**.

   e. In the Webhooks section, select the **Issue** check box.

   f. Click **Save Changes**.

2. In the Sentry console, create alert rules and configure them to receive alerts for issues from Sentry to the ServiceNow instance.

   a. Navigate to **Alerts** > **Create Alert Rule**.

   b. Select the alert type and click **Set Conditions**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The Issues alert type creates issue alerts. The other alert options create metric alerts.

c. On the Alert Rule page, create either an issue alert or a metric alert.

Alert Rule

Option	Description
Issue alert	**i.** Enter the environment, team, and alert name for your alert. **ii.** Under Set conditions, enter the **When** and **If** conditions that will trigger the alert. **iii.** For the **Then** condition, select **Send a notification via an integration** and select your internal integration from the list. **iv.** Set the action interval for the alert.
Metric alert	**i.** Add a filter to your transactions. **ii.** Select the function and time interval. **iii.** Set the thresholds that will trigger the alert. **iv.** Add the actions to be performed when the thresholds defined are met. **v.** Add your internal integration from the list to the list of actions to receive the alerts. **vi.** Add a rule name and team for the alert.

d. Click **Save Rule**.

Integrate Scout APM events

Enable the collection of events from Scout APM by authenticating Scout APM as a data source to integrate it with Event Management.

Before you begin

The Event Management plugin (com.glideapp.itom.snac) must be installed.

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Discovery for Scout APM applications is not supported. To enable binding, you must manually create a CI in a ServiceNow instance in the Service Instance [cmdb_ci_service_auto] table.

Role required: evt_mgmt_admin

Procedure

1. Enable Scout APM monitoring as an application service on your ServiceNow instance.

a. Navigate to **Configuration** > **Application Service**.

b. Provide the application name that you are monitoring.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Set the operational status to Operational.

d. Select **Next**

e. Select **Done**.

2. Log in to the Scout APM console.

3. Create a notification channel.

a. Navigate to **Organization** > **Alerts & Notifications**.

b. Select **New Webhook**.

c. Provide the name of the webhook and the webhook URL.
Use the following URL format: `https://<USERNAME>:<PASSWORD>@<INSTANCE_NAME>.service-now.com/api/sn_em_connector/em/inbound_event?source=scout`

d. Validate whether the webhook is operational by selecting **Send Test Alert**.
A new event appears on your ServiceNow instance in the Events [em_event] table with the data source as Scout APM.

4. In the Organization section, create a new notification group.

a. On the **Alerts & Notifications** page, navigate to **Organization** > **Notification Groups**.

b. Add a name for the group and select the webhook channel you created.

c. Select the **Create Notification Group** button.

5. In the application section, create alert conditions and configure them to receive alerts for notifications from Scout APM to the ServiceNow instance.

a. Navigate to **Applications** > **Alert Conditions**.

b. Select the type of alert condition.
For more information, see the Scout APM documentation.

c. Select **Create Alert condition**.

d. In the Alert Conditions table, select the notification group you created.
The alert condition is displayed on the Scout console.

6. Configure error notifications to receive alerts for errors from the Scout APM to the ServiceNow instance.

a. Navigate to **Application** > **Error Notifications**.

b. Add a name and description for the notification.

c. Select the notification group that you created.
The Scout APM notification channel is configured with the error notifications.

d. Select the **Add Notification Group** button.
For any new error notifications in the Scout APM application, a new event will be generated in the Events [em_event] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
You can view all notifications on your ServiceNow instance in the Events [em_event] table with the data source as Scout APM.

Integrate Sumo Logic events

Use the Sumo Logic push connector to integrate Sumo Logic with Event Management by adding a standard webhook in the Sumo Logic platform.

Before you begin
Ensure that the Event Management connector's plugin is installed on the ServiceNow AI Platform instance.

Role required: evt_mgmt_integration

About this task
Configure the Event Management environment for the collection of events from Sumo Logic by authenticating Sumo Logic as a data source. In the Sumo logic site, set your ServiceNow AI Platform instance as the rest endpoint using a webhook.

Procedure
1. In the Sumo Logic site, create a notification destination.
2. Go to Monitoring and select **Custom Webhook**.
3. Fill in the form with the Name, Description, and the URL.

   Use this URL format to push events from Sumo logic to the ServiceNow Instance `.https://<username>:<password>@<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=sumologic`

   Note: Use a credential having the evt_mgmt_integration role as the username and password.

   In the Payload section, use the following template:

```
{
    "type": "{{MonitorType}}",
    "node": "{{ResultsJSON._sourceHost}}",
    "metric_name": "{{Name}}",
    "description": "monitor Query: {{Query}}\n
 Trigger Condition:{{TriggerCondition}}\n
 Trigger Value:{{TriggerValue}}\n Trigger Time
 Range:{{TriggerTimeRange}}\n View Trigger
 Query:{{TriggerQueryURL}}\n View Monitor:{{QueryURL}} \n
 Results:{{ResultsJSON}}",
    "name": "{{Name}}",
    "short_description": "{{Description}}",
    "MonitorType": "{{MonitorType}}",
    "Query": "{{Query}}",
    "QueryURL": "{{QueryURL}}",
    "ResultsJson": "{{ResultsJson}}",
    "NumQueryResults": "{{NumQueryResults}}",
    "Id": "{{Id}}",
    "DetectionMethod": "{{DetectionMethod}}",
    "TriggerType": "{{TriggerType}}",
    "TriggerTimeRange": "{{TriggerTimeRange}}",
    "time_of_event": "{{TriggerTime}}",
    "TriggerCondition": "{{TriggerCondition}}",
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    "TriggerValue": "{{TriggerValue}}",
    "TriggerTimeStart": "{{TriggerTimeStart}}",
    "TriggerTimeEnd": "{{TriggerTimeEnd}}",
    "SourceURL": "{{SourceURL}}",
    "alertResponseUrl": "{{alertResponseUrl}}"
  }
```

Log Monitors Type events can be created without CI binding since you're receiving the node value as "node": "{{ResultsJSON._sourceHost}}" in the event payload from Sumo Logic. You can create events but you can't bind them since you don't get them as host names for the log monitor type. A push connector parameter was created - "create_log_monitorType_events" with a value of False. If the param value is False, the payload is ignored, and "log" events aren't created. If you change the param to True, events are created, and then you must define event rules for CI binding.

Refer to the following ServiceNow Severity Mapping with Sumo logic TriggerType table:

Severity Mapping

Sumo Logic Trigger Type	Severity
Critical	Critical
Warning	Minor
MissingData	Warning
ResolvedCritical/ResolvedWarning/ ResolvedMissingData	Clear

Integrate Sumo Logic with REST API key token

Integrate using an API key to establish secure communication and automate data exchange via REST API. This simplifies integration, enabling seamless access to services and enhancing operational efficiency.

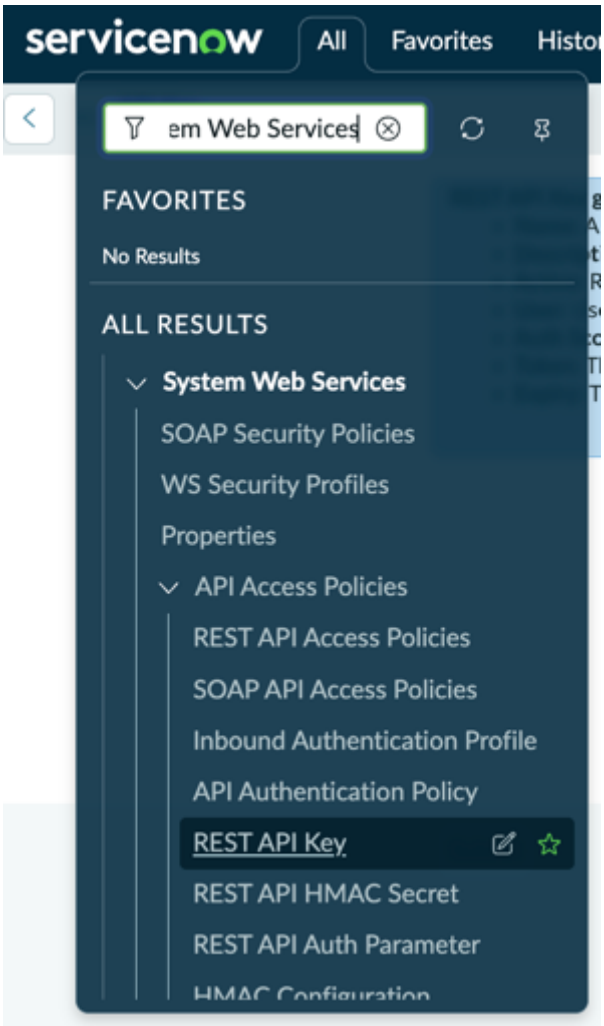
Before you begin

Role required: evt_mgmt_integration

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Web Services** > **API Access Policies** > **REST API Key**.



2. Select **New**.
3. On the form, fill the fields.

> **Note:** The user needs to be created with the evt_mgmt_integration role. Create a new one on the sys_user table to use here to facilitate the right access.

API Key

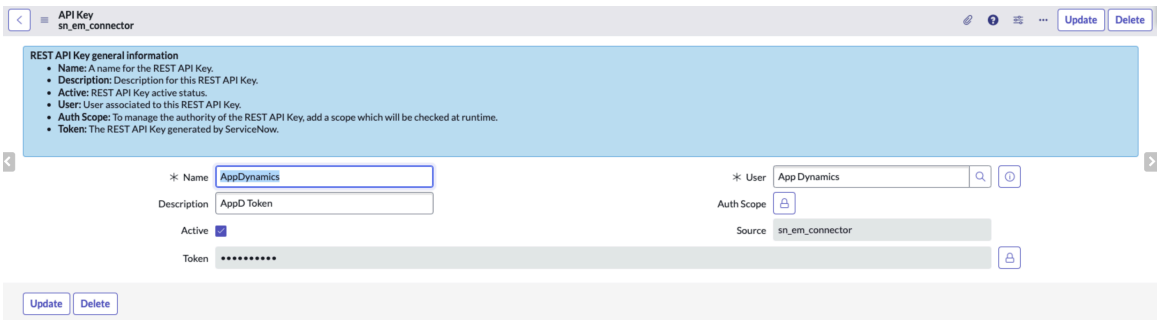
Field	Description
Name	Name to identify the REST API Key
Description	Description for the REST API Key.
Active	Status of the REST API Key.
User	User associated to the REST API Key. Use the look-up icon to select the user.
Auth Scope	Option to add auth scope to manage the authority of the REST API Key.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Token	The REST API key generated by the ServiceNow AI Platform. Copy the key to use as part of the REST API call within the Header or Query parameter.
Expiry	Time after which the credential is no longer valid. Empty value means no expiration.

4. Unlock Auth Scope and add: UserAccount.
5. Use the form menu and select **Save**.

   The system generates a token and saves it in the **Token** field. To see the token, use the lock icon and copy the contents display below the field. This is your query parameter (or header) value when your other system sends a REST API request to ServiceNow.



Integrate ThousandEyes platform events

Integrate ThousandEyes with Event Management by adding a standard webhook in the ThousandEyes console.

What authentication is used

There are two methods of authentication:

- OAuth authentication: Provides enterprise-grade authentication to keep your enterprise environment safe. Authentication is performed using ThousandEyes Monitor V1 or V2 access tokens. For more information, see Integrate ThousandEyes with OAuth authentication.
- Basic webhook authentication: Provides a basic standard of authentication, without the need for ThousandEyes Active Directory. This authentication can be especially useful for distributed small teams, such as SRE or DevOps teams. For more information, see Integrate ThousandEyes with basic authentication.

Integrate ThousandEyes with basic authentication

Integrate ThousandEyes with Event Management by adding a webhook in the ThousandEyes platform.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Discovery for ThousandEyes services is not supported, so you must create a CI manually in the ServiceNow instance for event binding to work.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Confirm you have created a user with an **Identify Type** of **Machine** and the evt_mgmt_integration role.

Role required: evt_mgmt_admin

About this task

Configure the Event Management environment for the collection of events from ThousandEyes by authenticating ThousandEyes as a data source. In your ThousandEyes platform, set your ServiceNow AI Platform instance as a rest endpoint using a webhook.

Procedure

In the ThousandEyes platform, create a notification destination.

a. From the navigation bar, navigate to **Alerts** > **Alert Rules**.

b. Click on any existing alert rule and select the **Notification** tab.

c. Select **Edit Webhook** and enter the following information.

Edit Webhooks

Field	Description
Name	Enter a name for the webhook.
URL	Provide the webhook URL. **Note:** The default format of the URL to push events from ThousandEyes to the ServiceNow instance is `https://<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=thousandeyes`.
Auth Type	Select **Basic**.

d. Click **Add New Webhook**.

Result

The default severity for the ThousandEyes alert is **Major -2**, which can be changed in the *Push Connector Configuration* section of **Push Connectors** > **ThousandEyes Push Connector**. The valid values of severity are **1- Critical**, **2- Major**, **3- Minor**, **4- Warning**, and **5- Info**.

The default timezone of the ThousandEyes alert is GMT, if you want to send the alert in a different timezone, it can be changed in the *Push Connector Configuration* section of **Push Connectors** > **ThousandEyes Push Connector**. The valid value format is **GMT+01:00**, **GMT +02:00**, **GMT-05:30**, **GMT-02:00**, etc.

Integrate ThousandEyes with REST API key token

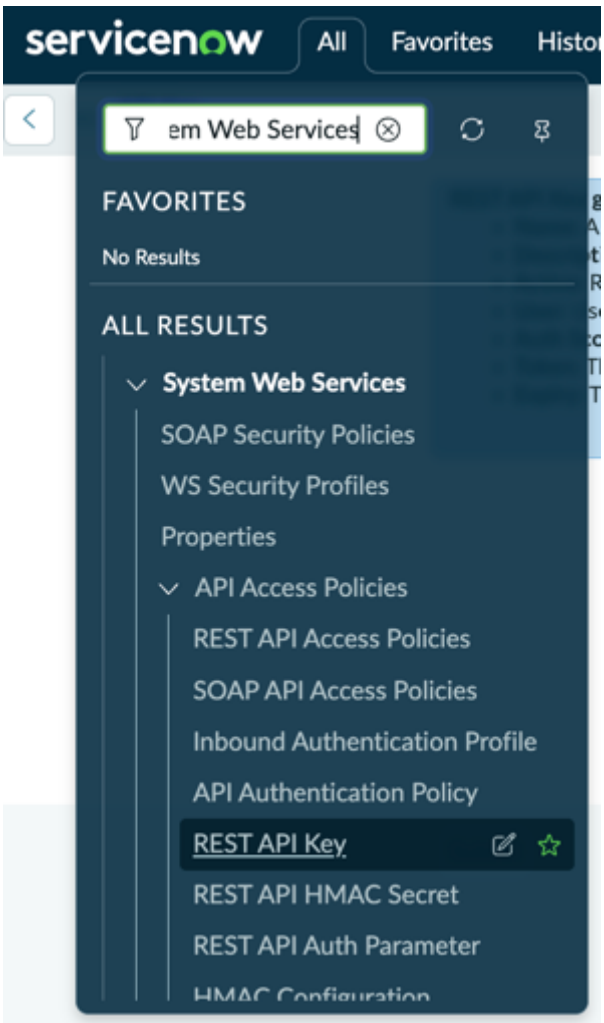
Integrate using an API key to establish secure communication and automate data exchange via REST API. This simplifies integration, enabling seamless access to services and enhancing operational efficiency.

Before you begin

Role required: evt_mgmt_integration

Procedure

1. Navigate to **All** > **System Web Services** > **API Access Policies** > **REST API Key**.



2. Select **New**.
3. On the form, fill the fields.

> **Note:** The user needs to be created with the evt_mgmt_integration role. Create a new one on the sys_user table to use here to facilitate the right access.

API Key

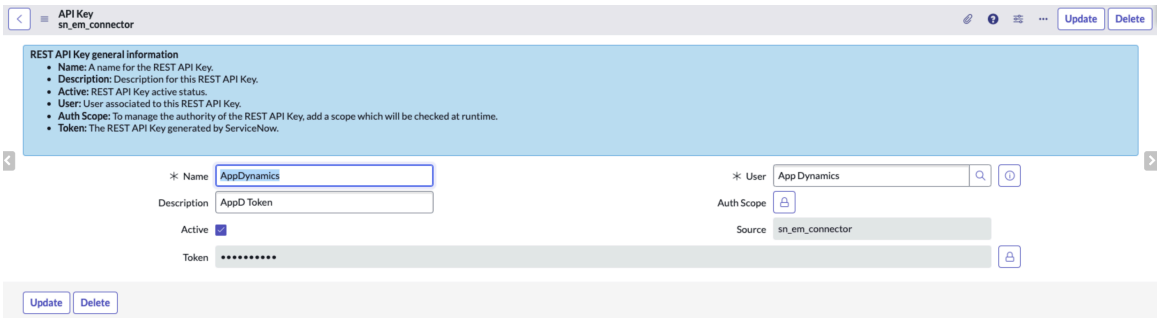
Field	Description
Name	Name to identify the REST API Key
Description	Description for the REST API Key.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Active	Status of the REST API Key.
User	User associated to the REST API Key. Use the look-up icon to select the user.
Auth Scope	Option to add auth scope to manage the authority of the REST API Key.
Token	The REST API key generated. Copy the key to use as part of the REST API call within the Header or Query parameter.
Expiry	Time after which the credential is no longer valid. Empty value means no expiration.

4. Unlock Auth Scope and add: UserAccount.
5. Use the form menu and select **Save**.

   The system generates a token and saves it in the **Token** field. To see the token, use the lock icon and copy the contents display below the field. This is your query parameter (or header) value when your other system sends a REST API request to ServiceNow.



Result

Now you are ready to start sending events. In your monitoring tool you can send events either with the header or the query `param: x-sn-apikey`. For example:

```
https://[INSTANCENAME].service-now.com/api/sn_em_connector/em/inbound_event?source=[SOURCENAME]&sys_id=[SYSID OF PUSH CONNECTOR INSTANCE]&x-sn-apikey=[AUTH TOKEN]
```

Integrate ThousandEyes with OAuth authentication

Create credentials in the instance and configure the ThousandEyes webhook.

Before you begin

Role required: web_service_admin

Procedure

1. Navigate to **All** > **System OAuth** > **Application Registry** and then select **New**.
2. Select **Create an OAuth API endpoint for external clients**.
3. Copy the automatically generated field **Client ID**.
   The **Client ID** is used when configuring the ThousandEyes SeviceNow integration.
4. Unlock the **Redirect URL** field and assign the value: **https://app.thousandeyes.com/webhooks-oauth-callback/**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Configure the Access and Refresh token lifespans by providing a value in seconds.
6. In ThousandEyes, navigate to **Manage** > **Alert Rules**.
7. Open an alert rule and select the **Notifications** tab.
8. Under **Webhooks**, select **Configure Webhooks** or **Edit webhooks**, and then select **Add New Webhook**.
9. Complete the following fields:

   Name

   Enter a name for the webhook.

   URL

   ```
   https://<instance-name>.service-now.com/api/
   sn_em_connector/em/inbound_event?source=thousandeyes
   ```

   Auth Type

   Select **OAuth**.

   Auth URL

   ```
   https://<instance-name>.service-now.com/oauth_auth.do
   ```

   Client ID

   Paste the Client ID generated in the ServiceNow instance.

10. Select **Get Token**.
11. When the ServiceNow authorization page opens, sign in and select **Allow**.
12. Test and save the webhook.

Integrate Panopta as a data source

Integrate the Panopta cloud-based monitoring solution with Event Management. To add Panopta as a data source, configuration is required in Panopta.

Configure Panopta

To prepare Panopta as a datasource, follow the procedure described in this link: How do I integrate with ServiceNow.

When the Event Management integration is configured in Panopta, add the integration to any of your Panopta Alert Timelines so that the ServiceNow instance receives incident events accordingly.

Optional Event Management configuration

Configure an alert action rule for launch in context of Panopta. For more information, see Launch web application from alert and Create or edit an alert action rule.

Related topics

Configure Event Management connectors

Integrate Event Integration (EIF) format event connector

Use the push connector that allows events to be forwarded from products, generally from IBM, that support the Event Integration (EIF) format to a MID Server.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Ensure the MID Server is assigned with `EventManagement` or `ALL applications`.

Role required: evt_mgmt_integration

About this task

Configure the Event Management environment for the collection of events from products that support the EIF format to a MID Server.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **EIF listener context**.
2. Click **New**.
3. Create a new EIF listener context by completing the EIF listener context form:

   a. On the form, fill in the fields.

EIF listener context form

Field	Description
Name	Unique name for the EIF listener context.
Short Description	Short description of the MID Server extension execution context.
Port	Port for the EIF listener to receive EIF events. The default value is **9998**. However, if the port is already in use, you can use any other free port instead.
Status	The status of the EIF listener. This field is blank until the listener is run. After the listener has run, the value is automatically populated to one of the following statuses: ▪ Started: The listener is running. ▪ Stopped: The listener is not running. ▪ Offline: The MID Server is down. ▪ Error: The listener failed with an error.
Execute on	The MID Server location for running the listener.
MID Server	The name of the designated MID Server when you select **Specific MID Server** in the **Execute on** field.
Executing on	The name of the MID Server on which the extension is running. This field is automatically populated with the name of the MID Server even if it's down. If you stop the extension, this field is empty.

   b. On the form, you can select the related links on the EIF listener context form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Commands available on the EIF listener context form

Related Link	Description
Start	Select this option if the listener is not running. The listener is started on the configured MID Server and port number.
Stop	Select this option to stop the running listener on the configured MID Server.
Restart	Select this option to stop then start the listener on the configured MID Server and port number.
Update Parameters	Select this option if you want to make changes to the listener configuration of the current running listener. If the parameters are valid, the listener disconnects and reconnects with new parameters.
Test Parameters	Select this option to test if the port is a valid number.

4. When you're finished, right-click the form header and select **Save**.
5. Click **Update**.
6. If you want to check the incoming EIF traffic, complete the following steps:
   a. Navigate to **MID Server** > **Servers**.
   b. Select the MID Server the EIF extension is running.
   c. Under the **Configuration Parameters** tab, add the **mid.log.level** properties.

What to do next

If the MID Server fails to start, you can review the MID Server log errors.

EIF events warning severity

If the EIF event payload has a warning severity, it will be mapped differently in the ServiceNow instance.

EIF events severity	ServiceNow events severity mapping
UNKNOWN	Warning
Warning	Minor
Minor	Major
Critical	Critical
Fatal	Critical

Create a push connector configuration parameter

Some connectors have no parameters that are shipped out of the box. Therefore, it’s necessary to create and add the parameter to the push connector configurations list in the form layout before adding the new parameter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: evt_mgmt_admin, personalize_form

Procedure
1. Navigate to **All** > **Event Management** > **Integrations** > **Push Connectors**.
2. Open a push connector.
3. On the **Push Connector** form, right-click on the form header and select **Configure** > **Form Layout**.
4. In the **Available** list, search for **Push Connector Configurations** > **Push Connector**, and move it to the **Selected** list.
5. Select **Save**.
6. In the Push Connector Configurations [sn_em_connector_push_config] table, double-click on **Insert a new row** to add a new push connector configuration parameter.
7. Select **Update**.

Result
Push Connector Configurations list added to push connector form layout. You can now create push connector parameters.

Configure a push connector instance

Configure a push connector instance to receive the events from an external system.

Before you begin
Ensure that you've defined a push connector definition.

Role required: evt_mgmt_admin

About this task
You can use a connector instance to receive the events coming from external sources. You can create the following type of push connector instances:

- Instance type
- MID type

Procedure
1. Navigate to **All** > **Event Management** > **Integrations** > **Push Connector Instances**.
2. Select the connector instance that you want to configure, or select **New** to create a push connector instance.
3. On the **Push Connector Instance** form, fill in the fields.

   For more details, see Push connector instance form.
4. Select **Submit** or **Update**.

Result
The push connector instance form is saved and now you can receive the events from an external system.

Configure event collection for SNMP traps

The SNMP listener runs on the MID Server, which acts as a collection endpoint for SNMP traps. The MID Server sends the traps to the ServiceNow instance for further processing as an event by Event Management.

Before you begin

Role required: agent_admin

Note:

- To view the MID SNMP Trap Listener in the UI: agent_admin
- To perform other operations, any one of the following roles is required: agent_admin, evt_mgmt_integration, or evt_team_operator

Ensure that the MID Server is assigned with either `EventManagement` or `ALL applications`.

About this task

Use the **MID SNMP Trap Listeners** to listen for SNMP traps. In this configuration, the specified MID Server acts as a collection endpoint for SNMP traps.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **MID SNMP Trap Listeners**.
2. Select **New**.
3. Complete the SNMP Trap Collector Context form.

Option	Description
Name	Unique name for the SNMP Trap Collector.
Short description	Short description of the MID Server extension execution context.
SNMP version	Specify the SNMP version: ○ v1 and v2c ○ v3
Minimum Security Level	The valid security level values are: ○ None - No security level value set. ○ noAuthnoPriv - Communication without au thentication and privacy ○ authNoPriv - Communication with authenti cation and without privacy. ○ authPriv - Communication with authentica tion and privacy. **Note:** This field appears only when `v3` is selected in the **SNMP version** field.
UDP Port	UDP port for SNMP Trap Collector to receive SNMP Traps. The default value is *1,162*. However, if the port is already in use, you can use any other free port instead.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
Status	The status of the trap listener. This field is blank until the listener is run. After the listener has run, the value is automatically populated to one of these statuses: ○ **Started:** The listener is running. ○ **Stopped:** The listener is not running. ○ **Offline:** The MID Server is down. ○ **Error:** The listener failed with an error.
Execute on	The MID Server location for running this listener. Select from specific MID Server. The recommended setting is **Specific MID Server**. Network hardware typically has to be configured to send to a specific IP address.
MID Server	Specify the name of the designated MID Server when you select **Specific MID Server** in the **Execute on** field.
EngineID	Displays only when **SNMP version=v3**. ○ When sending an SNMP Inform message, include the default value of this field in the message. ○ When sending an SNMP Trap message, include a value other than the default value of this field in the message.
Executing on	The name of the MID Server on which the extension is running. This field shows the name of the MID Server even if the MID Server is down. If you stop the extension, this field is empty. This field is automatically populated.

4. Right-click the form header and select **Save**.
5. In the **Credentials for SNMPs** section, specify the required SNMP v3 credentials that the SNMP listener uses for authentication.

   Note: The **Credentials for SNMPs** section appears only when `v3` is selected in the **SNMP version** field.

6. In the **Related Links** section, click **Test parameters**.
7. Click **Update**.
8. **Optional:** If the MID Server fails to start, review the MID Server log errors.

   (Optional) When working with object identifiers (OIDs), a trailing OID counter can affect event rule matching. To remove the trailing counter value from translated OIDs, navigate to **MID Server** > **Properties** and set the **mid.em.snmp_oid_key_counter_cut.enabled** property to

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

true. The property removes the trailing numeric value only when it can be identified as the OID counter. If additional numeric segments remain in the translated OID (for example, because MIB translation is incomplete), the counter is not removed. The system cannot determine which numeric values are significant and which represent the counter.

What to do next

In **Related Links**, these actions may be run against the SNMP traps listener:

Commands available in the SNMP trap listener form

Related Link	Description
Start	If it is currently not running, starts the listener. The listener is started on the configured MID Server and port number.
Stop	Stops the running listener on the configured MID Server. If the listener is not running, no action is taken.
Restart	Stops, then starts the listener on the configured MID Server and port number.
Test parameters	Tests that the port is a valid number.
Update parameters	If you make changes to the listener configuration, use this option to update the parameters of the currently running listener. First, the parameters are tested for validity. If the parameters are valid, the listener disconnects and reconnects with the new parameters.

Note: Updates to the SNMP trap listener take effect only after clicking **Restart** or **Update parameters**.

Related topics

SNMP probe MIB modules

Configure the SNMP traps listener to receive OEM traps

Configure the SNMP traps listener to receive OEM traps

Configure the SNMP trap listener to receive traps from Oracle Enterprise Manager (OEM).

Before you begin

Role required: evt_mgmt_admin

About this task

Event Management can process Oracle Enterprise Manager Cloud Control SNMP traps as events. For the SNMP trap listener to receive traps from OEM, you must designate the MID Server that runs the SNMP trap listener as a recipient of the trap. Upon receiving an OEM trap, the MID Server sends the trap to the ServiceNow instance for further processing as an event by Event Management.

The OEM 12c Trap event rule, Oracle EM MIB, and associated alert action rules are provided out-of-the-box, as well as these alert action rules:

- `Oracle EM Launch Target Status`
- `Oracle EM Launch View Event`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **MID SNMP Traps Listener**.
2. Click **New**.
3. Fill in the fields, as described in Configure event collection for SNMP traps.
   For the **SNMP version** field, select: `v1 and v2c`.

   The SNMP version field on the trap listener form has two options: v1 and v2c (default) and v3.The OEM 12c Trap event rule specifically processes SNMPv1-style traps (it relies on v1 fields like enterprise, generic_trap, and specific_trap). So selecting v1 and v2c is correct for OEM.

4. Verify the setup.
   - Check the listener is running: After submitting the trap listener record, look at the MID Server log for a message like "TrapListenerExtension: started. Listening on port <port>". This confirms the MID Server is listening.
   - Verify events are being created: Navigate to Event Management > All Events (or the em_event table) and filter by source = Oracle EM. If OEM is sending traps and the listener is working, events should appear here.
   - Check the event rule matched: Open an event and verify the event_class field shows "Trap From Enterprise 111" and the OEM-specific fields (like oraEMNGEvent_Severity, oraEMNGEventHost_Name, etc.) are populated in additional info.
   - Check alert creation: Navigate to Alerts and verify alerts are created from the OEM events, with the "View Target Status" and "View Event" launch-in-context actions available.

   Some basic troubleshooting:
   - Port binding error: If the MID Server log shows "IOException starting the SNMP listener", the port is likely already in use. Choose a different port or check for conflicts.
   - No events appearing: Enable MID Server debug logging — the listener logs full trap details (PDU, variable bindings, OIDs) when debug is on. This helps confirm whether traps are reaching the MID Server at all.
   - Authentication failures (v3 only): The log will show "Authentication failure" messages with the sender address and SNMP USM error code. Common causes: wrong credentials, mismatched engine ID, or security level mismatch.
5. Click **Submit**.

> **Note:**
>
> Ensure all required SNMP MIB files are uploaded on the instance. For more information, see Load a MIB module.
>
> .

What to do next

In Oracle Enterprise Manager Cloud Control, configure the MID Server as a trap listener target.

Configure SNMP Trap collection for high availability

For SNMP traps, the MID Server requires failover configuration for the trap listener.

You can configure two MID Servers for failover. Because the SNMP Trap listener on the MID Server receives inbound traffic on the IP address and port of the MID Server, you configure each MID Server to receive the same SNMP traps. Only one MID Server is active at any point in time, therefore Event Management does not receive duplicate traps.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure message keys to spread SNMP object identifiers

By default, most SNMP trap events are processed by a single Event Management processing job. This can negatively effect event processing. Configure message keys on the MID Server to ensure that more than one processing job is invoked, ensuring optimal SNMP trap performance.

Before you begin
Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **MID Server** > **Servers**.
   The **MID Servers** page opens.
2. Select the relevant MID Server and on the MID Server page, select the **Configuration Parameters** tab.
3. Click **New**.
4. In the **Parameter name** field, select *`mid.snmp.event.oid.keys`*.
5. In the **Value** field, enter a comma separated list of OIDs to be used for the message key.
6. Click **Submit**.

   Note: The OID trap counter may cause problems activating event rules. To remove the trap counter from the OID, navigate to **MID Server** > **Properties** and set the **mid.em.snmp_oid_key_counter_cut.enabled** property to **true**.

7. To set conditions in a script that determine the message key to be used based on the SNMP traps received:
   a. Navigate to **MID Server** > **Script Includes**.
   b. Locate and select **SNMPTrapKeyFilter**.
   c. In the **Script** field, set conditions for which OIDs are to be used based on the SNMP trap event received.
   d. Select the **Active** check box to activate the script.
   e. Click **Update**.

Configure event collection from email

Configure an inbound email action to send email notifications when events and alerts are triggered.

Before you begin
Role required: evt_mgmt_admin

About this task
When you add an inbound email action to send email, Event Management uses inbound email actions to process inbound email in the same manner as any external event. The email content is used to generate and update events, use rules to generate alerts, or change event severity. The severity is updated after the impact calculation and stored in the em_impact_status table.

Procedure

1. Navigate to **All** > **System Properties** > **Email Properties**.
2. In the **Inbound Email Configuration** section, in the **Email receiving enabled** option, select **Yes** to enable the collection of events from email.
3. Navigate to **System Policy** > **Email** > **Inbound Actions**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In the list of Inbound Email Actions records, search for and open the default **create event** form.

a. On the **Inbound Email Actions** form, specify these values.

Field	Value
Active	Select the check box to enable the email notification.
Target table	Select **Event [em_event]**.
Action type	Select **Record Action**.

b. Select the **Description** tab and enter a description for the email message.

c. Select the **Actions** tab and select these **Field Actions**.

- **[Severity] [To] [<the event severity>]**
- **[Type] [From email] [<portion of the email>]**

  For example, you can select **Subject** as the portion of the email to use.

4. To customize the inbound parameters and map the text to event variables, add a **Script**.

Example
For example:

```
current.source = 'email';
current.event_class = 'email';
current.description = email.body_text;
current.time_of_event = new GlideDateTime();
current.insert();
```

5. From the instance, send an email that contains matching data, and then confirm that the event or alert information appears in Event Management.
For more information sending email messages to create an instance, see Inbound email actions.

Note: Ensure that the user who sends the email has the role **evt_mgmt_integration**.

6. Select **Submit**.

Result

The inbound email is sent to the em_event table and regular Event Management processes continue, for example, event rules and alert management rules run.

Event forwarding

Accelerate the event processing testing life cycle by forwarding a stream of events from your ServiceNow production environment to your non-production environment.

Use event forwarding to forward events from one instance to another, for example, from a production to a non-production instance. Event forwarding enables you to test and evaluate event rules, event field mappings, alert management rules, and alert correlation. This approach has no impact on your production environment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Not all monitoring sources can send events to multiple target instances. In such cases, you can configure a scheduled job to periodically forward the event stream. The scheduled job forwards events from your ServiceNow instance that is connected to the monitored source to other instances.

Set up event forwarding

Create an event forwarding configuration record to enable events to flow from one ServiceNow instance to another instance. Forwarding events to multiple target instances requires creating separate configuration records for each target instance.

Before you begin

You must have a credential with the evt_mgmt_integration role, which enables you to create events in the target instance. If you don't have this credential, see Create basic auth server credentials for information on how to create it.

Role required: evt_mgmt_admin

About this task

The source instance forwards events to a target instance. The source instance must have a user with the evt_mgmt_integration role, a password for the credential, and a new event forwarding record. The target instance receives events from the source. The target instance must have a credential with the same user name and password as the source instance.

The event forwarding record contains details about the target ServiceNow instance URL to which events are to be forwarded along with the credentials to connect it.

You must create a separate configuration record for each target instance to forward events to multiple target instances. Events are then sent to each target instance with an active event forwarding configuration.

Procedure

1. On your source instance, navigate to **All** and enter `sn_em_connector_event_sync_configuration.list` in the filter navigator.
2. On the **Event Sync Configurations** page, select **New**.
3. On the **Event Sync Configuration** page, in the **Instance url** field, enter the target ServiceNow URL to receive events in the format `https://<your_instance>.service-now.com`.
4. In the **Credentials** field, provide the credentials for the target instance by either entering them or searching for them.
   - To enter your credentials, start typing and then select the credential from the drop-down list.
   - To search for your credentials, select the Lookup using list icon ( ) to select your credential from the credentials lookup table.
5. Select **Save**.
6. Select **Test Connection** to validate the connection to the target ServiceNow instance.
   - If the connection succeeded, a confirmation message displays.
   - If the connection didn't succeed, check your credentials and the instance URL.
7. When validated, select the **Active** check box to activate the event forwarding to the target instance and select **Submit**.
   To forward events, you must also activate the **Event Management - Event Forwarding Job** scheduled job.
   The configuration is created and is listed on the **Event Sync Configurations** page.
8. For multiple targets, repeat the steps for a separate configuration record for each instance.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related topics

Periodically run an event forwarding job

Periodically run an event forwarding job

Activate the event forwarding job to periodically send events to all target instances with active event forwarding configurations.

Before you begin
Role required: evt_mgmt_admin

About this task
Event forwarding requires both an active event forwarding configuration record and an active **Event Management - Event Forwarding Job** scheduled job.

You can customize the *event - forwarding* job behavior through related system properties. For more information, see Event forwarding properties.

Note: To minimize the performance impact, the scheduled job sends events not older than the latest hour when it ran for the first time after setting up event forwarding.

Procedure

1. Navigate to **All** > **Scheduled jobs** > **Event Management - Event Forwarding Job**.
2. On the **Scheduled Script Execution** page, select the **Active** check box.
3. In the **Repeat Interval** field, set the appropriate time interval for the job to run periodically.

   The default value is for the job to run every minute.
4. Select **Update**.

Result
The event forwarding job runs periodically based on the repeat interval that you set. Events are sent to all target ServiceNow instances that have active event forwarding configuration records.

If the admin account is disabled, configure the user of the scheduled job. By default, it's admin, but in this case, it must be changed.

Note:

If the event forwarding to the instance failed due to any reason, the **Last Event Forwarding status** field displays `Failed` with a corresponding error message displayed in the **Last Event Forwarding error** field. The target instance generates a self-health monitoring event during the next successful event forwarding indicating the failure of event forwarding for the specified time range.

Create basic auth server credentials

Create credentials to access a ServiceNow instance.

Before you begin
Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Select **New**.
3. Select **Basic Auth Credential**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. On the form, fill in the fields.

Basic Auth Credentials form

Field	Description
Name	Enter a unique and descriptive name for this credential.
User name	Name to identify the user.
Password	Password to use this credential.
Active	Option to enable the use of this credential.
Order	The order (sequence) in which the platform tries this credential while it attempts to log in to devices. The smaller the number, the higher in the list this credential appears. Establish credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number (or none), the instance tries the credentials in a random order. Default value: `100`

5. Select **Submit**.

Result
The Basic Auth credential for use with the server instance is created.

Processing Events

Event processing is the process of taking events or streams of events, analyzing them and taking automatic action. The process includes viewing events, event binding, event rules and event field mapping.

An event is a notification from one or more monitoring tools that indicate something of interest has occurred, such as a log message, warning, or error. Events are processed and alerts are generated based on the following factors:

Event collection configuration via a MID Server, script, SNMP trap collector, or email message.

An Event rule, alert binding, or event field mapping configuration for processing events from various sources. When a package of events that contains events with a custom (non-supported) state is processed, the events with the custom state are not processed.

For more information, see Exploring Event Management.

View events

Event Management tracks individual events to manage external systems. These events are notifications from monitoring tools indicating occurrences of interest, like log messages, warnings, or errors. Event Management gathers events from external sources and stores them in the Event [em_event] table, offering a list of raw incoming events.

Before you begin
Role required: evt_mgmt_admin, evt_mgmt_operator, evt_mgmt_user, or evt_mgmt_integration

Note: Ensure that you do not change the **Classification** field value in event [em_event] tables, either manually, by script, or by event rule.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The event monitoring tool generates the values of the source and resource fields. Event Management implementers can define event types and register nodes to help uniquely identify incoming events and create alerts for the specific needs of the enterprise. Event Management uses this information to determine whether to create an alert or update an existing one.

An event source may generate duplicate events with the same identifying information. For events with the same identifying information, Event Management uses the time interval between events to determine whether the events represent an existing issue or new issue.

Additional fields should be included in the **Additional information** field of the event. Do not add additional fields to an event by adding a custom field to the event [em_event] table. For more information about how to include additional fields in events, see Custom alert fields.

Note: Avoid writing business rules for event [em_event] tables, as they can result in performance degradation.

Procedure

1. Navigate to **All** > **Event Management** > **All Events**.

   The All Events list displays the following columns.

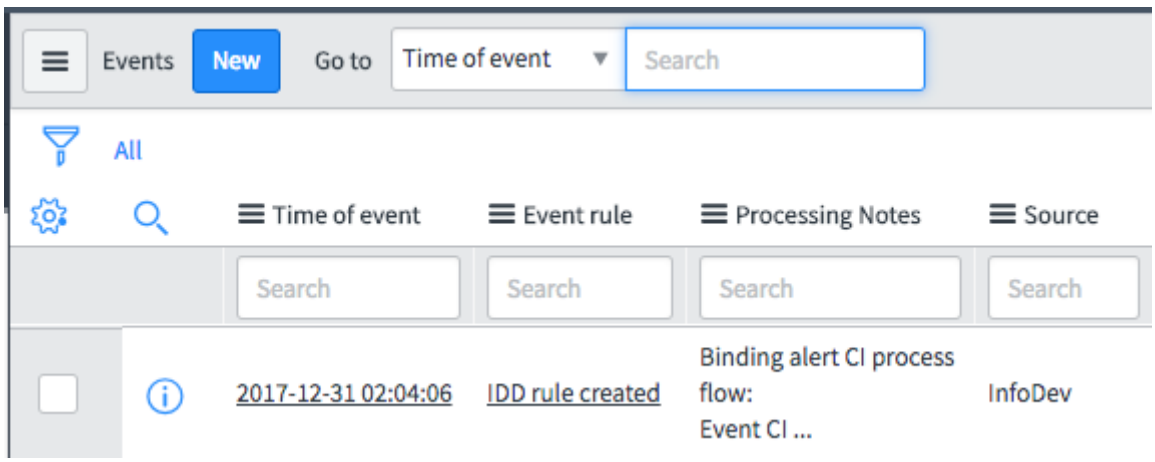
All Events list

Column	Description	Populated by
Time of event	The time that the event occurred, in the network node time zone. The system supports time resolution in seconds.	External event monitoring tool
Source	Event monitoring software that generated the event, such as SolarWinds or SCOM. Maximum length: 100 characters.	External event monitoring tool
Description	Reason for event generation. Shows extra details about an issue. For example, a server stack trace or details from a monitoring tool. Maximum length: 4000 characters.	External event monitoring tool
Node	Node name, fully qualified domain name (FQDN), IP address, or MAC address that is associated with the event, such as IBM-ASSET. Maximum length: 100 characters.	External event monitoring tool
Type	The metric type to which the event is related, such as Disk or CPU, which is used to identify an event record from which alerts are created. Maximum length: 100 characters.	External event monitoring tool
Resource	Node resource that is relevant to the event. For example, Disk C, CPU-1, the name of a process, or service. Maximum length: 100 characters.	External event monitoring tool
Metric Name	Unique name that describes which metrics are collected and for which this alert has been created.	External event monitoring tool
Message Key	Unique event identifier to identify multiple events that relate to the same alert. If this value is empty, it is generated from the **Source**, **Node**, **Type**, **Resource**, and **Metric Name** field values. Maximum length: 1024 characters.	External event monitoring tool
State	The status of the event:	Event

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column	Description	Populated by
	○ **Ready**: Event has been received and is waiting to be processed. ○ **Queued**: Event is queued by the event processor job. ○ **Processed**: Event was successfully processed. ○ **Error**: Failure occurred while processing the event. For example, the event collection method or event **Severity** is blank. ○ **Ignored**: Value is not in use.	
Severity	Mandatory. The options are typically interpreted as follows: ○ **Critical**: Immediate action is required. The resource is either not functional or critical problems are imminent. ○ **Major**: Major functionality is severely impaired or performance has degraded. ○ **Minor**: Partial, non-critical loss of functionality or performance degradation occurred. ○ **Warning**: Attention is required, even though the resource is still functional. ○ **OK**: An alert is created. The resource is still functional. ○ **Clear**: No action is required. An alert is not created from this event. Existing alerts are closed.	Event
Alert	If an alert was created as a result of the event, this field contains the unique ID that Event Management generates to identify the alert.	A matching event rule or event field mapping

2. To review a single event, click the required row in the **Time of event** column.
3. To review the event rules that processed the event, in the **Related Links** section click **Check process of event**.
   For further ways to see which event rules were applied to the event, you can display the `Event rule` and `Processing Notes` fields in the Events list.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Optional event fields to display the applied event rule

Column	Description
Matching Event rule	The event rule that matches the current event rule definitions. This information is primarily used to create event rule recommendations for events that currently are not covered by rules. If event rules have been modified, this information can be retrieved from the Processing Notes field, described below. **Note:** This field does not show the history of event rules that were applied to the event.
Processing Notes	Information related to the binding to CI type and the event rules that were applied to the event.

4. To create an event rule for an event that is not associated with an event rule:

   a. Click the event.

   The event opens in the Event form.

   b. Click **Create Event Rule**.
   The fields of the new Event rule are populated with data from the event. You can use the event information, for example, when composing fields for alerts.

Team-based integrations in Event Management

Team-based integrations empower teams to optimize event processing within Event Management to enhance efficiency and operational effectiveness.

Team-based integrations provides the following capabilities:

- Assign teams to particular connectors, providing a structured approach to integration efforts.
- Enable each team to define and apply custom rules, enabling a more targeted and straightforward handling of event processing.
- Route alerts automatically to the appropriate team members responsible for the integrated systems based on integration ownership and configuration item (CI) ownership.
- Enable seamless integration and automation through the automatic assignment of alerts to appropriate team members based on integration ownership and configuration item (CI) ownership.

Customize event rules, event mapping, and the precedence of team rules for team-based integrations. For more information, see Team-based integration properties.

Related topics

Event rules

Event field mapping configuration

Alert assignment groups for teams

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

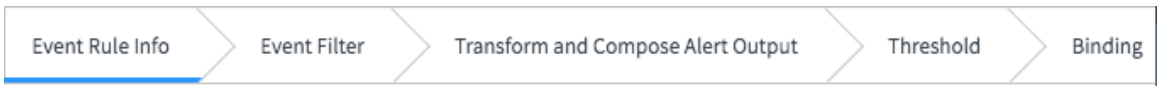
Event rules

Use event rules to generate alerts for tracking and remediation. Event rules are stored in the Event Rule [em_match_rule] table. Configure and customize event rules to manage events and alert generation.

Note: Use Ignore automation and Enrich automation in Service Operations Workspace, the updated way to automatically filter out irrelevant alerts, or to transform and standardize alert data for better response.

Event rules do not change the event records in the Event table. Changes to event data are stored in the ServiceNow instance memory.

For a workspace-based interface for Event Management automation, see Alert automation in Service Operations Workspace for ITOM.



Use the Event rule designer to create and configure event rules. You can use the default event rules or event rules that you have created to:

- Apply an event rule filter to determine whether the rule applies to an event.
- Apply a transform with **Event Match Fields** and optional **Event Compose Fields** to format the alert text.
- Apply a threshold to create custom alerts for rapidly recurring events.
- Automatically create or close alerts.
- Bind alerts to CI information from the CMDB.
- Run multiple sequential rules defined for the same event by selecting the **Apply additional matching rules** check box. The event rules run in ascending order as defined in the **Order** field. Event rules applied to assignment groups only run after the global rules have run.

Create or edit an event rule

You can create event rules to generate alerts for tracking and remediation. Use team-based integrations in event rules to make sure that connector ownership and execution of rules give precedence to general rules. Teams can maintain consistency and hierarchy while offering flexibility and customization options.

Before you begin

Role required: evt_mgmt_admin

About this task

Note: Use Ignore automation and Enrich automation in Service Operations Workspace, the updated way to automatically filter out irrelevant alerts, or to transform and standardize alert data for better response.

View the list of available event rules on the **Event Rules** page to determine whether you want to create or edit an event rule.

You can create rules that:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Transform information in events to populate specified alert field values and compose alert fields from various values.
- Configure threshold rules that create or close alerts only when the incoming matching events exceed the specified threshold.
- Bind alerts to CIs using CI identifiers.

Options to create the rule are:

- Create an event rule and assign event fields for alert generation.
- Create a rule from an existing event or group of events that don't have a rule. In this case, the event fields are copied to the Event Match Fields section of the rule.
- Edit an existing event rule.
- For Team-based integrations, select an assignment group.

- Run multiple sequential rules defined for the same event by selecting the **Apply additional matching rules** check box. The event rules run in ascending order as defined in the **Order** field. Event rules applied to assignment groups only run after the global rules have run.

You can refresh an existing event rule with new event data. For more information see, Refresh event rules.

Note:

- Event rules that aren't configured to perform any action are skipped. Therefore, if the rule isn't configured as ignore, threshold, or binding, it's important to specify either the match or the composed fields.
- Make sure that you don't change the **Classification** field value in event [em_event] tables, either manually, by script, or by event rule.

Note: To automatically filter out irrelevant alerts or transform and standardize alert data for better response, you can also use Ignore automation and Enrich automation.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Rules** and take one of the following actions.

Option	Description
Create an event rule from an existing event	**a.** Select the link for unassociated events or grouped events that aren't mapped to the rules.  **b.** Select the event that you want to use for cre ating the rule. The event fields are copied to the Event Field Rules section of the rule.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
Edit an existing event rule	In the event rule list, select the required event rule to be modified. The event rule opens in the event rule designer where you can modify the values of the fields. Select **Save and Upgrade**  to modify the rule when the following banner message appears and you want to convert the event rule. `Rule cannot be viewed in the event rule designer. To modify the rule click 'Save and Upgrade'.`
Create an event rule	Select **New**.

2. Ensure that **Active**  is selected.
   When the rule is deactivated, Event Management finds and applies another event rule. An alert is still created for the event unless *`Ignore`* is selected in another applicable rule or when configuring the filter for this event rule.
3. Enter a unique and meaningful name and fill in the form.

Event Rule Info form

Field	Description
Source	Category to which this matching rule applies. The mapping rule only applies to events with the same event class value. If this value is empty, apply the rule to all events.
Order	Order in which an event rule is evaluated when multiple rules are defined for the same type of event. Event rules are evaluated in ascending order.
Description	Type additional information that describes the event rule.
Apply additional matching rules	Select to apply additional event matching rules according to the Order field. The last rule with binding settings sets the CI binding. When selected, the Thresholds tab is inactive.
Assignment group	For team-based integrations, select an assignment group. If no assignment group is defined in the event rule, then this event rule is considered as a global rule. When the rules are running – first the global rules run and then the rules that belong to the assignment group that the event's source instance belongs to.

4. **Optional:** Define the event rule using these Event Rule Designer features.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
Event Filter	Define a filter to restrict to which events the event rule must apply. See Filter the events that an event rule applies to.
Transform and compose alert output	Configure the customization of alert content. See Configure an event rule to customize alert content.
Threshold	Create or close alerts according to the specified threshold. See Set a threshold to suppress alert generation.
Binding	Configure event rules to automatically bind alerts to CI information from the CMDB. See Binding alerts to CIs.

5. Select **Save**, **Submit**, or **Update**.

Related topics

- Pattern matching

- Configure an event rule to customize alert content
- Refresh event rules
- Simulate event processing
- Filter the events that an event rule applies to

Use event input information

The **Event Input** pane that is included in the steps to create an event rule provides a reference to the information that you can use when configuring an event rule.

Note: Use Ignore automation and Enrich automation in Service Operations Workspace, the updated way to automatically filter out irrelevant alerts, or to transform and standardize alert data for better response.

In the **Transform and compose alert output** pane, you can also drag the information into the required fields to customize alert content. The fields in the right-hand pane appear as a reference to which fields, expressions, and their values are available when working in the Event Rule designer. The fields that display in the Transform and compose alert output left-hand workarea become the fields in the generated alert form. In addition, you can define alert tags that are specific for customization.

Note: Use Ignore automation and Enrich automation in Service Operations Workspace, the updated way to automatically filter out irrelevant alerts, or to transform and standardize alert data for better response.

General components and navigation

The Event Input pane consists of these sections:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Event Additional Info
- Expressions
- Event Raw Info

The Event Input pane displays in all Event Rule designer sections, except for the Event Rule Info section. The fields in the right-pane can be modified only in the Transform and compose alert output section. In all the other sections, the Event Input pane is read-only and available for reference purposes.

Note: If **Accessibility enabled** 
is selected in System Settings, standard edit mode is not available .

Edit modes

Mode	Description
Standard edit mode	Text selected in the left-hand workarea cannot be edited. Undo is not available. In this mode, you can only mark the text or values and transform it by selecting a field name.
Regex edit mode	Edit text in the left-hand workarea by selecting it, as required. After you have edited the text, you cannot go back to the standard mode. **Undo** is not available. However, **Reset** is available, returning the field to its original value. You can compose text using regular expression (regex) format conventions, for example, type (.*) to create a field name. You cannot use field values like: type "$" to include the value of a field and specify the name of the field in parentheses {}. You can include special characters in a field by "escaping" them, that is, by prefixing the character with a "\". For example, to include a "\" in your text, enter "\\".

Event additional info

The Event additional info section displays default event form fields. It also displays fields that were created to display in alerts and added to the **Additional information** section of the alert.

When configuring text in the fields in the left-hand workarea, you can drag field names and/or their value from this section into the fields.

Expressions

The Expressions section is available only if an additional information field was created. You can create expressions from event raw data or from additional information data.

1. Click in a field in the **Event Input** pane to perform transformation actions.
2. Create an expression by transforming information and associating it with a field name. Either select a field name from the suggested list, or create a field name, as required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Click in a field in the **Event Input** pane. In the left-hand workarea, select the required information.

Create expressions by transforming information and associating it with a field name. Select a field name from the suggested list, or you can create a field name, as required.

Event raw info

The Event raw info section is always available. Its contents are the fields from the Event form.

To transform text, click a field in the right-panel to open it in the work area on the left-panel, in the Mark Expressions section. You can select text in the **Mark Expressions** section where the selected text becomes the value of a newly created field. Name the new field. This new field is added to the Expressions section.

Note: When creating regex expression for input, ensure that you create input with the variables in sequential order. While variables can be skipped for inclusion, the selected order must be maintained.

Controlling how fields appear:

- Use the exclusion list [em_event_rule_black_list] table to hide fields from the right-pane.
- Use the em_event_rule_order form to order the position of each field.
- Fields that are not in the exclusion list and also not part of the em_event_rule_order table still appear in the event rule designer. They appear in the right-panel and in the **Transform and Compose Alert Output** tab.

Related topics

Create or edit an event rule

Configure an event rule to customize alert content

Filter the events that an event rule applies to

Set a threshold to suppress alert generation

Filter the events that an event rule applies to

Define a filter to restrict to which events the event rule must apply. Configure the filter by providing a set of conditions that each event must match to be either excluded or included from applying to the event rule.

Before you begin

Ensure that a name is specified for the event rule.
Role required: evt_mgmt_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Note: Use Ignore automation and Enrich automation in Service Operations Workspace, the updated way to automatically filter out irrelevant alerts, or to transform and standardize alert data for better response.

To construct the required condition statement, you can use event fields as well as additional fields that are defined in the **Additional Information** field of the event. Use these fields to configure conditions that can exclude events. Alternatively, you can filter incoming events to ensure that only those events that meet the required conditions are included.

Note: Event rules filter is case-sensitive.

While working in the Event Filter tab:

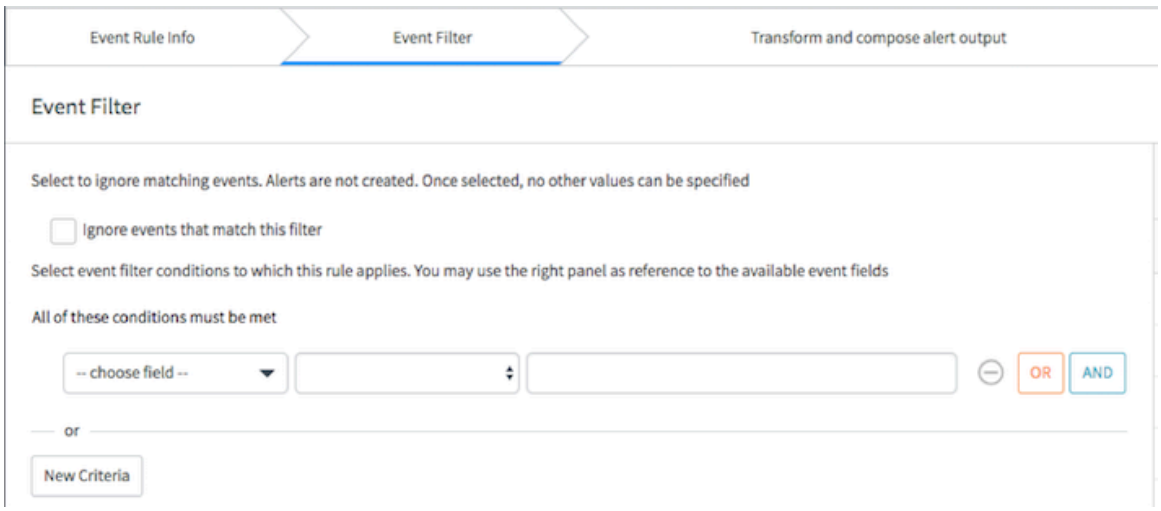
- In the Event rule list, if you selected a recommended rule or an existing rule, the filter fields are populated with values from these events. You can use these filter fields to compose filter conditions.
- You can click another tab (for example, **Threshold**), work in that area and then return to work in the Event Filter area without losing information.
- Use the right-panel as a source of reference for which fields are available to be used when composing filter conditions.

Note: Event filters created on additional_info fields only perform a string comparison and not a numeric comparison, even if the information entered into the value field appears as if it is numeric, as depicted in the following graphic:

Note: To automatically filter out irrelevant alerts or transform and standardize alert data for better response, you can also use Ignore automation and Enrich automation.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Rules**.
2. Click **New** or open an event rule.
3. Click **Event Filter**.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. To ignore events, select **Ignore events that match this filter**.
   All events that match this event rule are ignored. You can add more conditions to the filter by clicking either **OR** or **AND**.

   Note: Even if an event is ignored by an event rule, the event is still recorded in the Event [em_event] table. Select this option to inhibit an alert from being created and be associated with the event.

5. To configure conditions to which the event rule must apply, click **New Criteria**.
   You can add further conditions by clicking either **OR** or **AND**.

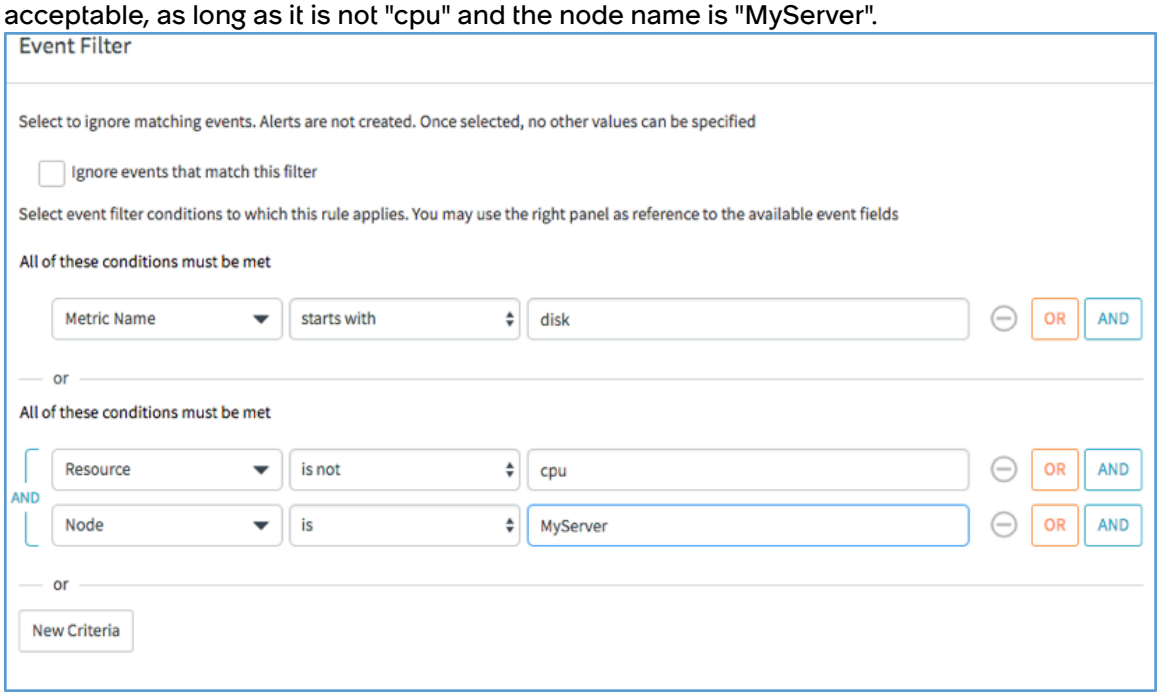
   Note: The **%** character is not supported in filter conditions.

6. You can add field names to the Event Rule Simple Field Black Lists [em_event_rule_black_list] table to either show or hide fields from the filter.

   - To remove fields from the filter and the right panel, add a new black list field with **Show in rule** not selected.
   - To remove fields only from the filter and still enable it to appear in the right panel, add an exclusion list field with **Show in rule** selected.

7. Click either **Save** or **Submit**.

Example:
Example showing filter conditions that are specified to run a rule when the metric name starts with the word "disk". For this example, any resource is acceptable, as long as it is not "cpu" and the node name is "MyServer".



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example to filter events using time conditions. In the **Select Field or add New** field, select `Time of event`.

Specify the required time conditions, for example, anytime after yesterday.

Find events that are not matched to rules

Find events that are not matched to any rules, and determine if it is necessary to create event rules to manage them.

Before you begin

Role required: evt_mgmt_admin

About this task

Note: Use Ignore automation and Enrich automation in Service Operations Workspace, the updated way to automatically filter out irrelevant alerts, or to transform and standardize alert data for better response.

This task describes how to find events that are not matched to rules.

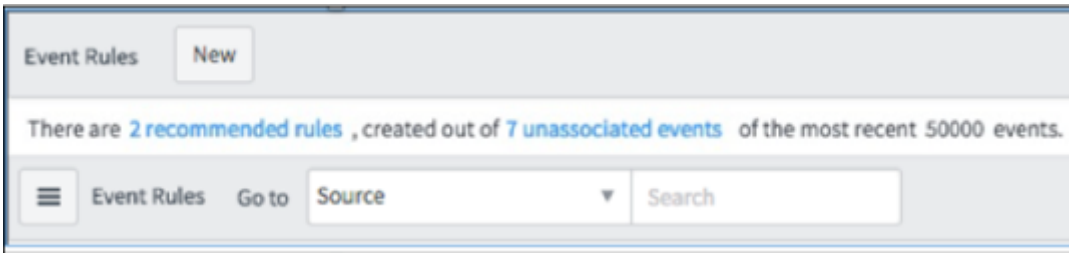
Note: Use Ignore automation and Enrich automation, the updated way to automatically filter out irrelevant alerts, or to transform and standardize alert data for better response.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Rules**.
2. Near the top of the form, click the link for events or grouped events that are not mapped to rules.

Example



What to do next

Create an event rule. For example, event rules are useful for managing events that occur regularly.

View event rules

You can view all event rules on the Event Rules list.

Before you begin

Role required: evt_mgmt_admin

About this task

Note: Use Ignore automation and Enrich automation in Service Operations Workspace, the updated way to automatically filter out irrelevant alerts, or to transform and standardize alert data for better response.

Note: Use Ignore automation and Enrich automation, the updated way to automatically filter out irrelevant alerts, or to transform and standardize alert data for better response.

Procedure

Navigate to **All** > **Event Management** > **Rules** > **Event Rules**.

Event Rules list

Field	Description
Name	The event rule name.
Override default binding	Legacy binding criteria. If, in the **Bind** section criteria have not been specified or if the specified bind criteria are not matched, then the legacy binding criteria are considered.
Order	Order in which an event rule is evaluated when multiple rules are defined for the same type of event. Event rules are evaluated in ascending order.
Source	Event monitoring software that generated the event, such as SolarWinds or SCOM. Maximum length: 100 characters.
Updated	Update date and time for the rule.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: You can filter the Event Rule list to display the required subset of the information. However, if you create a favorite link after filtering, when the link is clicked the Event Rule list does not display the correct filter.

Related topics

View events

Configure an event rule to customize alert content

You can configure an event rule to customize alert content. You can customize the order of the fields and select which fields display. The fields in the left-hand work area of the **Transform and Compose Alert Output** section of an event rule are the fields that appear in the generated alert.

Before you begin

Role required: evt_mgmt_admin

About this task

Note: Use Ignore automation and Enrich automation in Service Operations Workspace, the updated way to automatically filter out irrelevant alerts, or to transform and standardize alert data for better response.

You can customize alert content by adding the required event fields and modifying the text in the fields.

Note: When creating regex expression for input, ensure that you create input with the variables in sequential order. While variables can be skipped for inclusion, the selected order must be maintained. Use unique names within the Additional Info data to prevent conflicts with the predefined field variable names. Identical names cause issues in event rule regex. As a result, you may find that a saved regex is missing or unavailable when you later access it from the Expressions section.

Format alert text by using one or both of these methods:

Format alert text

Format method	Description
Transform	Create a field to display in an alert. The field and its value appear in the **Additional Information** section or in the **Alert Tags** section. In the **Event Input** pane, the new field is listed in the **Expressions** section.
Compose	Determine which text to display in the selected field.

Note:

- Configure which fields display in the **Event Input** pane by configuring the exclusion list [em_event_rule_black_list].

  A field entered into the exclusion list that already appears in an existing event rule is not removed from the rule. Instead, it is moved to the **Manual Attributes** section in the rule.

- Control the order of event form fields by configuring em_event_rule_order.

To automatically filter out irrelevant alerts or transform and standardize alert data for better response, you can also use Ignore automation and Enrich automation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Rules**.
2. Click **New** or open an event rule.
3. Click **Transform and compose alert output**.
   In this section, you can use the **Transform** mode and the **Compose** mode.
4. To transform information in fields—standard mode:

   Note: In this step, the selection of text is made in standard edit mode. In this mode, undo is available.

   a. Click the required field in the Event Input pane. The value and contents of the selected field appear in the workarea on the left.

   b. Select standard edit mode .

   c. Using the pencil cursor, highlight the required text. You can double-click text in the field to select a word or select the required text and symbols.

   Note: If **Accessibility enabled** Accessibility enabled is selected in System Settings, standard edit mode is not available .

   d. Select a field name from the list or enter the required expression name. Fields that appear in the list are existing event fields, additional info fields or previously defined alert tags (fields prefixed with "t_"). The field name appears in the **Expressions** pane and the selected text is highlighted. Both the text and the expression name are highlighted in the same color. Each additional expression that you create, plus its value, is highlighted in a different color.

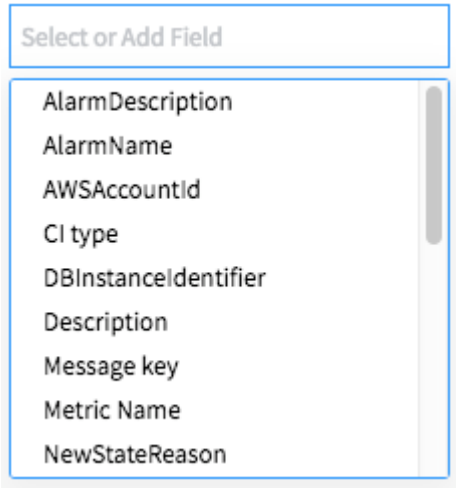
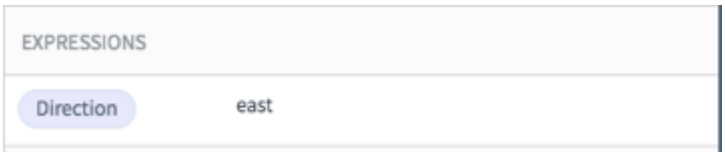
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note: Transform field names cannot contain a ‘ (single quote) character.

e. Click **Done**. The expression name appears in the **Expressions** section of the **Event Input** pane.



f. If you click an expression or its value in the **Event Input** pane, the details display in the workarea on the left.

5. To transform information in fields—regex mode:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- In regex mode, undo is not available.
- When building a regex expression from variables that are highlighted in the event, place the selected variables in the same order that they appear in the event field.
- When composing the event rule regex, specify the terms using an exact match of the input from the event fields. For example, for the text `vhxy2stlgwc_8888_hec03v012979`, the regex

  ```
  ^([^_]+)_
  ```

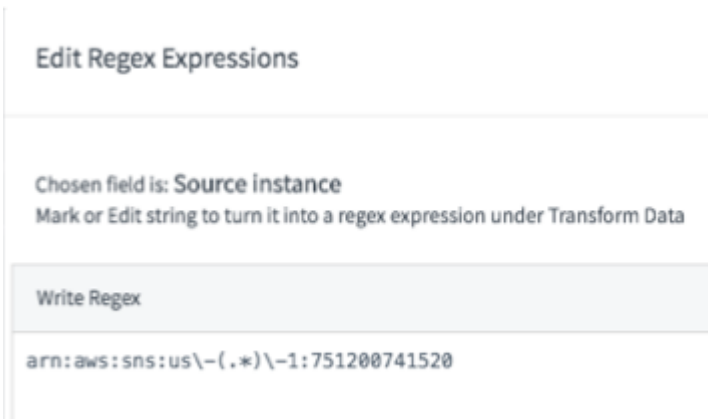
  looks as if it should catch the text `"vhxy2stlgwc"` that appears before the underscore. However, it does not work as this text is not an exact match. Use the full regex, as follows:

  ```
  ^([^_]+)_.*
  ```

- The Java Matcher parser is used for the regex engine. Ensure that you use a Java parser to test the regex.
- If the regex does not match the entire string when parsing data, the event rule will not capture the event, and no parsing takes place.
- The Java regex engine "matches" method is used. With this implementation, the regex engine attempts to match the entire input sequence against the specified pattern. Other matching methods, for example, the find method, are not supported.
- No regex flags are set by default, except the `Pattern.DOTALL` flag. With this implementation of Java regex, the DOT character "." matches any character, including a line terminator.
- Aside from `Pattern.DOTALL`, other regex flags cannot be changed.
- `Lookahead` is supported. However, `Lookbehind` is not supported.

a. Click the required field in the Event Input pane. The value and contents of the selected field appears in the workarea on the left.

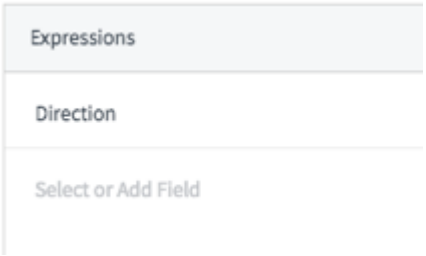
b. Select regex edit mode .



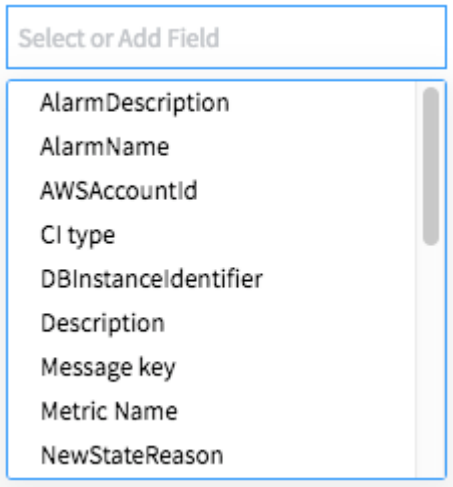
c. Select the required text and symbols 
. Replace the highlighted text with (.*) to create a regex expression.

d. In the **Expressions** pane, click the **Select or Add Field** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



e. Select a field name from the list or enter the required expression name. Fields that appear in the list are existing event fields, additional info fields or previously defined alert tags (fields prefixed with "t_"). The field name appears in the **Expressions** pane.



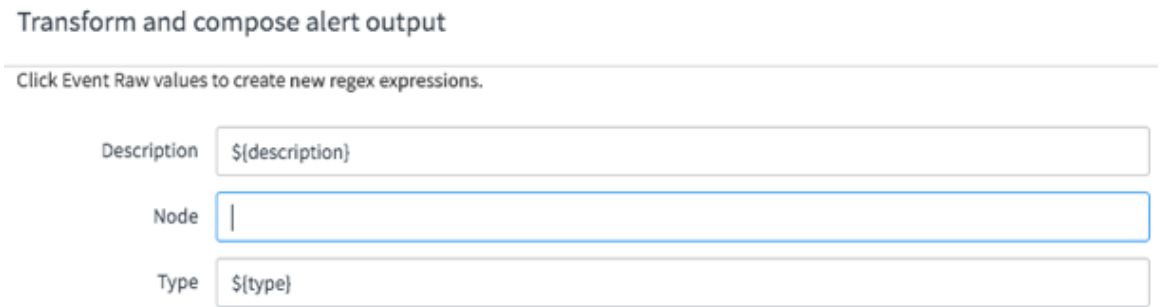
Note: Transform field names cannot contain a ‘ (single quote) character.

f. Click **Done**.

Note:

- When building a regex expression from variables that are highlighted in the event, place the selected variables in the same order that they appear in the event field.
- When composing the event rule regex, specify the terms using an exact match of the input from the event fields. For example, for the text vhxy2stlgwc_8888_hec03v012979, the regex ^([^_]+)_ looks as if it should catch the text “vhxy2stlgwc” that appears before the underscore. However, it does not work as this text is not an exact match. Use the full regex, as follows: ^([^_]+)_.*

6. To compose text, in the Transform and compose alert output section, click in the required field.



Compose text in the alert fields by performing any of these actions:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Drag a field from the Event Info pane into the required field.
- Use the Event Info pane as a reference of which fields are available. Write the field name details, using the format ${<fieldname>}, where "$" means "use the value". Between the brackets, the name of the event field replaces the <fieldname> variable.
- Freely enter text, spaces, or characters. For example, use spaces or underscore symbols (_) to make the text in the alert field readable.

7. To specify fields that must display in the generated alert, select the **Manual attributes** check box.

   Note: These fields, and their values, display in the **Additional Information** section or in the **Alert Tags** section for attributes prefixed with "t_".

   a. In the left-hand column, enter a value.

   b. In the right-hand column, either drag a value from the Add or Expression fields or type in a value.
   When entering a value with attributes prefixed with "t_", a drop-down list appears with all the previously defined "t_" attributes.

8. Click **Save** or **Update**.

What to do next
You can filter event rules. See Filter the events that an event rule applies to.

Related topics
Create or edit an event rule

Alert tags

Filter the events that an event rule applies to

Set a threshold to suppress alert generation

The event threshold is the rate upon which Event Management generates an alert. Receiving multiple events for a device over a short interval may warrant creating an alert, as the condition may be serious. However, receiving events over a longer interval may indicate a less serious situation which would not warrant creating an alert.

Before you begin
Role required: evt_mgmt_admin

About this task

Note: Use Ignore automation and Enrich automation in Service Operations Workspace, the updated way to automatically filter out irrelevant alerts, or to transform and standardize alert data for better response.

You can configure the properties in an event rule to create alerts, suppress alert generation, or close existing alerts according to a specified threshold. The threshold is based on the value of event fields or number of occurrences over a specified period.

Note: **Field Name** can be the name of any numeric field in the **Additional information** field of the event. Therefore, if CPU is an additional information field for a specific event, then CPU can be used as a **Field Name**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Assume that you want to generate an alert when CPU utilization reaches or exceeds 80% three times with no more than 20 seconds between any two consecutive events. Create an event rule with these settings (an explanation for each value is given in parentheses):

- **Create Alert Operator**: *>=* (operator to determine whether utilization of **Field Name** reaches or exceeds the specified value)
- **Field Name**: *CPU* (events regarding high CPU usage)
- **Threshold Value**: *80* (percent)
- **Occurs**: *3* (three events occur where the CPU usage is at or above ">=" 80%)
- **Over(seconds)**: *20* (20 seconds or less between events)

To demonstrate how the preceding settings are evaluated, assume that the following events are received:

Scenario	Outcome
Reported elapsed time and the CPU usage for each event: • First event elapse time 20, CPU=85 • Second event elapse time 40, CPU=80 • Third event elapse time 60, CPU=70	In this scenario, no alert is generated since one event has a CPU utilization that is under 80%.
Reported elapsed time and the CPU usage for each event: • First event elapse time 20, CPU=85 • Second event elapse time 40, CPU=90 • Third event elapse time 70, CPU=95	In this scenario, an alert is not generated since the elapsed time in one event is over the specified 20 seconds.
Reported elapsed time and the CPU usage for each event: • First event elapse time 20, CPU=85 • Second event elapse time 40, CPU=95 • Third event elapse time 60, CPU=90	In this scenario, an alert is generated since in all events the elapsed time is within the specified time and the CPU usage is over 80%.

Note:

- When configuring an event rule to create or close alerts according to a threshold, events that arrive at the same second, as determined by the `time_of_event` field, are skipped. This occurs because these events are considered to be duplicates.
- When threshold conditions are configured, alerts close when the **Close Alert Operator** condition is met, and not when an event is received with **Severity = Clear** or **Resolution state = Closing**.

To automatically filter out irrelevant alerts or transform and standardize alert data for better response, you can also use Ignore automation and Enrich automation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Rules**.
2. Create or open an event rule.
3. Click **Threshold**.
4. Select **Active**.
   If **Active** is not selected, the fields on this page do not appear.
5. In the **Create Alert Operator** field, select an operator.
   - If you select **Count**, specify the corresponding **Occurs** and **Over(seconds)** fields.
   - If you select any operator other than **Count**, the **Field name** and **Threshold value** fields appear. Specify the required values in these fields.

     Note: The value of the **Threshold value** property can be the name of any field in the **Additional information** of the event. For example, if `CPU` is a field in **Additional information** for a specific event, then `CPU` can be used as the **Threshold value**.

   - In the **Occurs** field, specify the required value.
   - In the **Over(seconds)** field, specify the required period.
6. To automatically close alerts, in the **Close Alert Operator** field, select an operator.
   Extra fields appear according to your selection.
   - If **Count** is specified as the operator for the **Create Alert Operator** field, then the selection in the **Close Alert Operator** field is either `None` or `Idle`. Specify the required value.
   - If you select **Idle**, configure the **Over(seconds)** field.
   - In the **Close Alert Operator** field, if you select an operator other than **Idle**, then configure the **Threshold value**, **Occurs**, and **Over(seconds)** fields.
7. Click **Save** or **Submit**.

Example:

To create an alert when a specific event occurs 5 times in 10 minutes, in **Threshold**:

1. In the **Field name** field, specify the name of any field that exists in the **Additional information** field in the event. The value of the field is irrelevant.
2. In the **Create Alert Operator** field, select `Count`.
3. In the **Occurs** field, specify `5`.
4. In the **Over** field, `600` (10 * 60 seconds).
5. Click **Save** or **Submit**.

To create an alert when a specific event occurs 5 times in 10 minutes with a metric value greater than 55. Assume that “metric_value” is a field in the **Additional information** of the event. Specify:

1. Select the *`Active`* check box.
2. In the **Create Alert Operator** field, select `>=`.
3. In the **Field name** field, specify **metric_value**.
4. In the **Threshold value** field, specify `55`.
5. In the **Occurs** field, specify `5`.
6. In the **Over** field, specify `600` (10 * 60 seconds).
7. Click **Save** or **Submit**.

Binding alerts to CIs

CI binding or linking is the process of finding and connecting a Configuration Item (CI) from the Configuration Management Database (CMDB) to an alert, using the logic defined in event rules. This helps ensure alerts are tied to the right IT components for better visibility and faster issue resolution.

Understanding CI binding

Binding alerts to CIs links incoming alerts to the correct Configuration Item (CI) representing a specific host, such as a computer, server, router, or virtual machine in your IT infrastructure. This ensures accurate alert tracking, simplifies troubleshooting by identifying the source of issues, and maintains a historical record of alerts tied to specific systems.

In IT Operations Management, the relationship between alerts and CIs plays a critical role in effectively managing services and infrastructure. A CI represents a component within your IT environment, such as a server, application, or database. Linking alerts to CIs ensures that alerts and incidents are directly associated with the affected component, enabling accurate impact analysis and faster resolution.

In dynamic and large-scale environments, it's often challenging to pinpoint which CI is responsible for triggering an alert. Alerts are generated from raw event data captured across multiple sources, but this data may not explicitly reference a CI. Without a reliable method to bind alerts to CIs, IT teams face the risk of:

- Poor visibility into service impact.
- Longer mean time to resolution (MTTR).
- Inefficient alert management processes.

Event rules provide a structured way to analyze incoming event data, enrich it with additional context, and map it to the correct CI. These rules act as a bridge, transforming raw event data into actionable alerts linked to CIs. For example, event rules can:

- Parse incoming event data: The process involves breaking down raw event data to extract important details, such as hostnames, IP addresses, or service tags. These details are then used to analyze the event—identifying its source, type, and impact—and to enrich the alert by adding relevant context, like affected services, priorities, or resolution steps, ensuring it's actionable for IT teams.
- Match patterns: Here, the extracted event details—such as hostnames, IP addresses, or service tags—are compared against entries in the CMDB to identify the corresponding Configuration Item (CI) based on predefined rules or logic. Once matched, the alert is linked to the CI, providing context about the affected IT component for better visibility and faster resolution.
- Bind the CI to the alert: At this point, the alert is automatically associated with the identified CI. It ensures that the alert is connected to the right IT component in the system, making it easier to track and manage, and helping teams quickly address the issue.

Types of CI binding

Binding type	Description
Implicit Node binding (Default binding)	Binds alerts to host CIs by matching the **Node** field in the event with attributes like Name, FQDN, IP, or MAC address.
CI field matching binding	Binds alerts using the **CI Identifier** field, a JSON structure containing column names and values (e.g., Name, FQDN, IP, or MAC Address).
CI identification binding	Binds alerts to specific applications on hosts using event rules.
Process-level binding	Binds alerts to application CIs by matching process-related attributes.
Device-level binding	Binds alerts to device CIs by matching event data with attributes like hostname, IP address, or MAC address.

Key benefits

- Improved service visibility: Alerts linked to CIs provide a clear picture of which IT components are affected.
- Enhanced automation: Automated CI binding reduces manual effort, ensuring consistency.
- Faster resolution: Teams can quickly diagnose and resolve issues by focusing on the impacted CI.

Example use case

Scenario: A company's email server named MailServer-01 goes down.

Process:

1. Alert generation: An alert is triggered when MailServer-01 becomes unresponsive.
2. CI binding: Event Management automatically looks for MailServer-01 in the CMDB (Configuration Management Database).
   - If found, the alert is linked to this specific server (CI).
   - If not found, the alert remains unlinked until more information is provided.

Result: The alert now shows that MailServer-01 is the affected system.

- Impact: IT teams immediately know which server to investigate.
- Efficiency: They don't need to check other infrastructure components or systems, saving time and effort.

This direct link helps streamline troubleshooting by pointing to the exact problem source.

To enrich alerts by identifying the CI or extracting, composing, or tagging alert fields, you can also create an enrich automation in Service Operations Workspace. For more information, see Enrich automation.

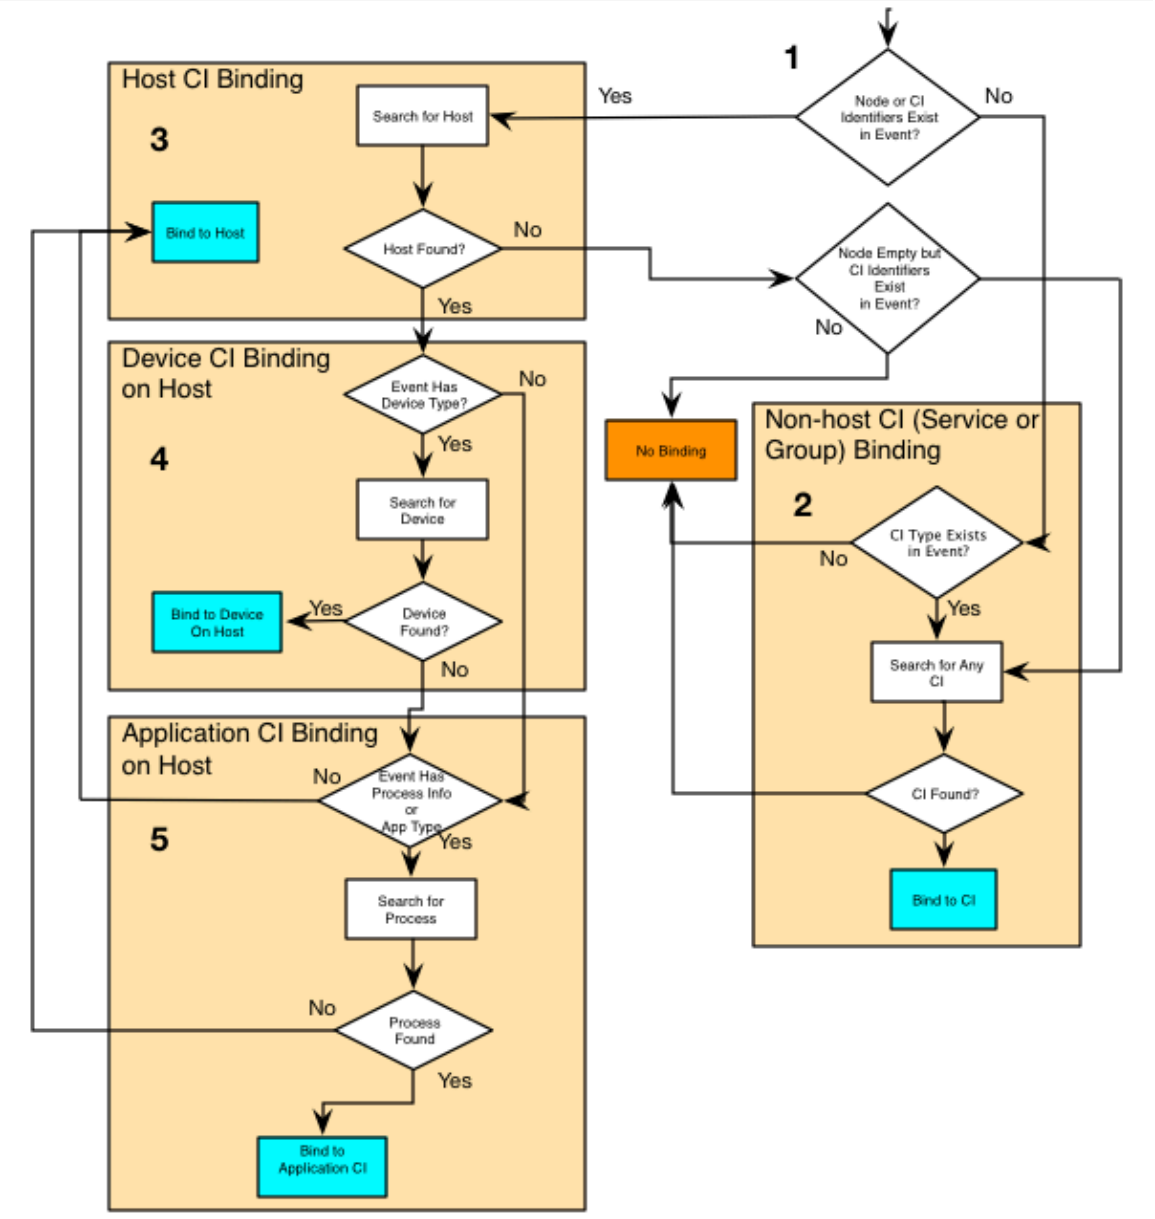
Binding process flow

Learn the process of binding Configuration Items (CIs) to alerts. This includes handling event arrival, binding alerts using available fields when no node is present, and searching the CMDB for matching hosts. It also explains linking alerts to CIs based on host and CI type detection.

CI binding to alerts: Flow diagram



Process of linking CIs to alerts

1. Event Arrival: When an event is received, Event Management checks for node or CI identifiers.
2. Is Node Value Present?
   - Yes: If a node value is provided, Event Management searches the CMDB for a matching host.
   - No: If no node is found, the system attempts to bind the alert using other available details, such as:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Alert Type
- Additional Information
- CI Identifier

Note: For Kubernetes CIs and other non-host CIs, use an event rule with CI field matching instead of relying only on the Node value. Kubernetes CIs follow the same binding approach as other non-host CIs.

3. Host and CI Type Detection:
   - Both Found: If both a host and CI type are identified, the alert is linked to the corresponding device CI.
   - Host Only Found: If only a host is identified, the system links the alert to an application CI.

Additional Considerations

- Event Processing Notes: The event can include the binding process flow in its **Processing Notes** field, providing insights into the binding actions.
- Binding to Retired CIs: By default, events do not bind to CIs with a Retired status. To enable binding to these CIs, set the *evt_mgmt.ignore_retired_cis_in_binding* property to false.
- Specifying CI Statuses for Binding: You can configure the *evt_mgmt.install_status_list_to_ignore_in_binding* property by specifying CI status numbers to control which CIs are considered for binding. For example:

CI Statuses

Status Number	Status
1	Installed
2	OnOrder
3	InMaintenance
4	PendingInstall
5	PendingRepair
6	InStock
7	Retired
8	Stolen
100	Absent

Note: To specify multiple statuses, separate each status number with a comma.

Binding alerts to a specific host CI (default binding)

Binding alerts to Configuration Items (CIs) using the **Node** field or the **CI Identifier** field ensures accurate event association. By comparing an event record's **Node** or **CI Identifier** value, alerts are linked to the right system. This improves response, root cause analysis, and impact assessment by providing clear visibility into affected assets.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

How default binding works

The system can perform default binding using the **Node** field or the **CI Identifier** field from the event record.

When an event enters the system, a key field like **Node** is available in the event record. However, there is no **Node** field in the CI. Instead, the node value from the event is compared with various attributes in the host CI, such as Name, Fully Qualified Domain Name (FQDN), IP, or MAC address. If a match is found, the alert is linked to the corresponding CI. This is the default method for binding alerts to CIs.

The property *sa.active_operation_status* is used by the default binding mechanism, specifically when binding via IP/MAC using the node field in the event. When an event attempts to bind to a host through the node field (using IP/MAC), the system ignores hosts whose operational status is not included in this property and the operational status of the host must also not be null. By default, the property value is "1", which corresponds to Operational. You can extend the list to include additional statuses, and any status in the list is not ignored during binding.

Example: If *sa.active_operational_status* = "1,2", then both Operational and Non-operational hosts are considered valid for binding. The status attribute is defined by the following values:

- 1 – Operational
- 2 – Non-operational
- 3 – Repair in Progress
- 4 – DR Standby
- 6 – Retired

Note: In this binding process, the CI must be a host. Host CIs include Computers, Operating Systems (OS), Switches, Routers, or any CI type/class that extends the [cmdb_ci_hardware] table, meaning the CI type or class must be a hardware component.

If no match is found using node, the system looks at the **CI Identifier** field on the event record. The **CI Identifier** is a JSON structure containing column names and values for comparison (e.g., Name, Fully qualified domain name, IP, or MAC Address). The JSON is: {"column_name":"<column_value>"}. For example, if we want to bind to a CI identified by **serial_number** whose value is **Dell Latitude 7420 Laptop**, the JSON is: `{"serial_number":"Dell Latitude 7420 Laptop"}`. If a match is found, the alert is linked to the corresponding CI.

Difference between binding with Node vs. CI Identifier

In default binding, the system considers all fields in the **Additional Information** field and attempts to match their values with the CI table. The **CI Identifier** field allows specifying particular fields for matching, even if they are not present in **Additional Information**. This process uses a predefined JSON structure and applies only when the CI is a host.

Note: Even if the **Node** or the **CI Identifier** successfully binds the alert with the CI, event rules further determine how the binding occurs using the **Override default binding** check box available in Event rules. This ensures that alerts are bound correctly based on business logic, not just direct matches. This ensures that alerts are bound correctly based on business logic, not just direct matches.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example: Resolving a CI Using Node and Event Rules

Imagine a server (Server-123) in your network generates an event. The event record contains a **Node** field with the value "Server-123.example.com".

1. Matching with CI Attributes:
   a. The system checks the Node value against the CMDB.
   b. It compares "Server-123.example.com" with the FQDN, IP, MAC address, or Name of existing host CIs.
   c. If a match is found (e.g., FQDN in the CMDB is also "Server-123.example.com"), the alert is linked to that CI.
2. Applying Event Rules: Even if the Node resolves to Server-123, additional event rules might determine if the alert should be linked differently. For example, an event rule may specify that alerts from Server-123 should be linked to a parent CI (like a cluster) instead of the individual server.

Fallback CI binding fields

Use these **Additional Info** fields to help the system bind alerts to the correct Configuration Item (CI) when standard CI binding methods don't find a match.

- sn_fallback_binding_ci_id: Specifies the exact CI to bind to by providing the CI's `sys_id`
- sn_fallback_binding_ci_name: Specifies the name of the CI to search for and bind to. If multiple CIs have the same name, the system uses the first matching CI.
- sn_fallback_binding_ci_type: Used in conjunction with `sn_fallback_binding_ci_name`: Use this field together with sn_fallback_binding_ci_name to narrow the search when multiple CIs share the same name. This field specifies the CI class or type that the system should match.

The system evaluates these fallback fields only after it attempts all standard CI binding strategies and finds no matching CI. Store these fields (keys) in the Additional Info field of an event and populate them with relevant CI information. When standard binding methods fail, the system uses the values of these fields as fallback criteria for CI binding. For example, the Additional Info field might contain:

```
{"sn_fallback_binding_ci_name": "linux01"}
```

In this example, the system uses the value of `sn_fallback_binding_ci_name` (`linux01`) to find and bind the appropriate CI when standard CI binding strategies don't identify a match.

Overriding default binding

Overriding default binding allows flexibility in linking alerts to CIs beyond the default Node-based matching. This helps customize alert binding based on business needs, ensuring accurate associations and preventing mislinked alerts, improving incident management and root cause analysis.

By default, alerts are bound to CIs by matching the node value in the alert with attributes like Name, FQDN, IP, or MAC Address in the CI. However, if you want to change this behavior—either by using additional criteria or ignoring the node altogether—you can use the **Override Default Binding** check box.

This allows for two scenarios:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. When Binding Type = CI Field Matching
   - If the CI is a host, the Node is required for binding. For more information, see Bind host CIs using CI field matching.
   - If the CI is not a host, the Node must be empty. For more information, see Bind non-host CIs using CI field matching.
2. When Binding Type = CI Identification. For more information, see Bind alerts to CIs using CI identification.

This flexibility ensures alerts are linked correctly based on specific business needs.

Note: You can also use the Service Operations Workspace to define binding rules. For more information, see Create Enrich automation.

Bind host CIs using CI field matching

When CI Field Matching is used and the CI is a host, the Node value from the alert is used for binding. The system compares the Node with attributes like Name, FQDN, IP, or MAC Address in the CMDB to find a match. This ensures that alerts are correctly linked to the corresponding host CI.

Before you begin
Role required: evt_mgmt_admin

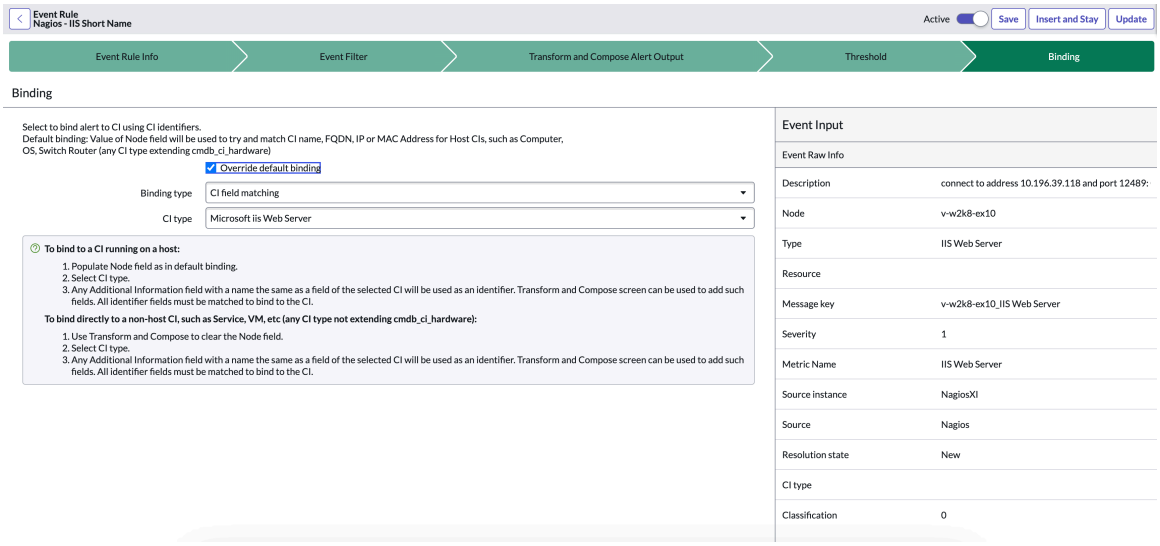
About this task
When an event enters the system, key field like **Node** is available on the event record. The **Node** field generally represents the name of the server. In CI there is no field like **Node**. However, the value of **Node** from the event is compared with different values in the host CI such as Name, Fully qualified domain name (FQDN), IP, or MAC Address. If a match is found, the alert is linked to the corresponding CI. This is the default binding of alerts to CIs. In this binding, the CI must be a host. Host CIs include Computers, OS, Switches, Routers—essentially any CI type or class that extends the [cmdb_ci_hardware] table.

There may be cases where no match is found because the column names in the event record and the table differ for the same item. In such cases, you can manually create an additional key-value pair with a name matching the table column, ensuring the matching process continues successfully. For information on how to create a manual field, see Bind CIs using CI field and column matching.

Note: Even if the node successfully binds the alert with the CI, event rules further determine how the binding occurs.

Procedure
1. Navigate to **All** > **Event Management** > **Rules** > **Event Rules**.
2. Select **New** and complete the required fields of the event rule.
3. Select the **Binding** tab.
4. Select the **Override default binding** check box.
5. In the **Binding type** field, select **CI field matching**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. In the **CI type** field, select the appropriate type of hardware component (such as a server, router, or storage device) that the CI type represents.
   The **CI type** determines the specific CMDB table where the system searches for the matching CI. For example, if the **CI type** is **Network Adapter**, the system searches in the [cmdb_ci_network_adapter] table.
7. Select **Submit**.

> **Note:** You can also use the Service Operations Workspace to define binding rules. For more information, see Create Enrich automation.

Bind non-host CIs using CI field matching

Bind alerts to a specific device

Bind each alert directly to the originating device to establish a clear source of impact. This ensures accurate troubleshooting, reduces noise from unrelated alerts, and helps teams focus on resolving the right issue faster.

Before you begin

Role required: evt_mgmt_admin

About this task

In IT environments, multiple devices like switches have many smaller components, such as ports. When something goes wrong, it's not enough to just say the switch has an issue—the system needs to pinpoint exactly which port is causing it. Binding alerts to the specific port that triggered the issue allows teams to act faster and fix the real issue without wasting time checking the entire switch or unrelated components.

The following example procedure shows the alert binding configuration for a switch named IP-Switch-1, ensuring alerts target the correct port. The event rule setup starts by enabling the **Override default binding** option and selecting **CI field matching** as the **Binding type**. Choosing **Switchport** as the **CI type** instructs the system to bind alerts to individual ports. The Binding Device Map defines how the system links the switch (cmdb_ci_ip_switch) to its ports (dscy_switchport) using the cmdb_ci reference field. This map guides the binding logic. Under **Configuration** > **Network** > **Switches**, selecting **IP-Switch-1** reveals its switchports and interface names. When an incoming event includes a matching interface name in the **Additional**

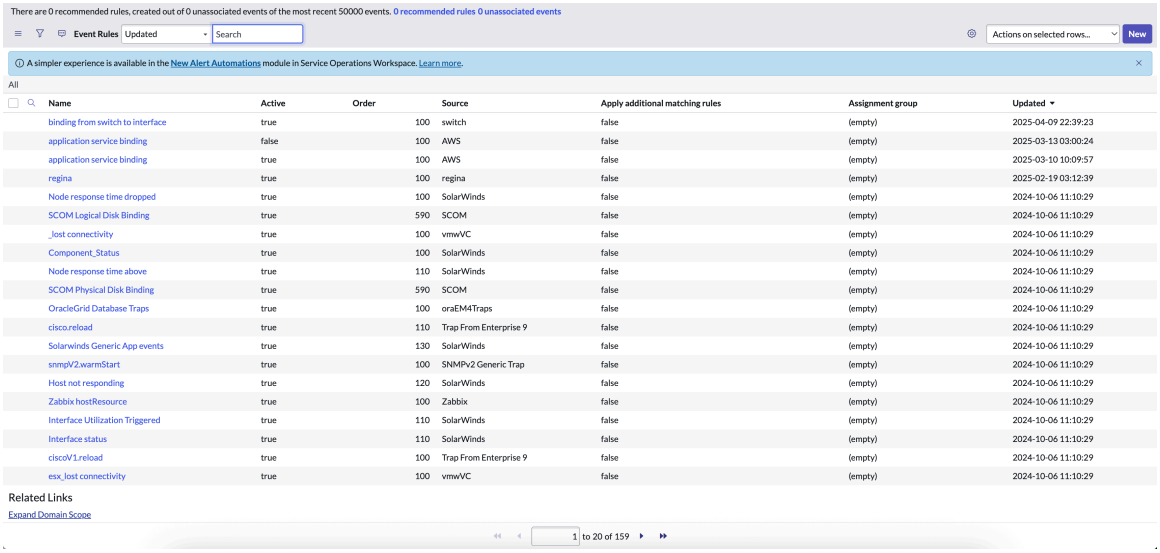
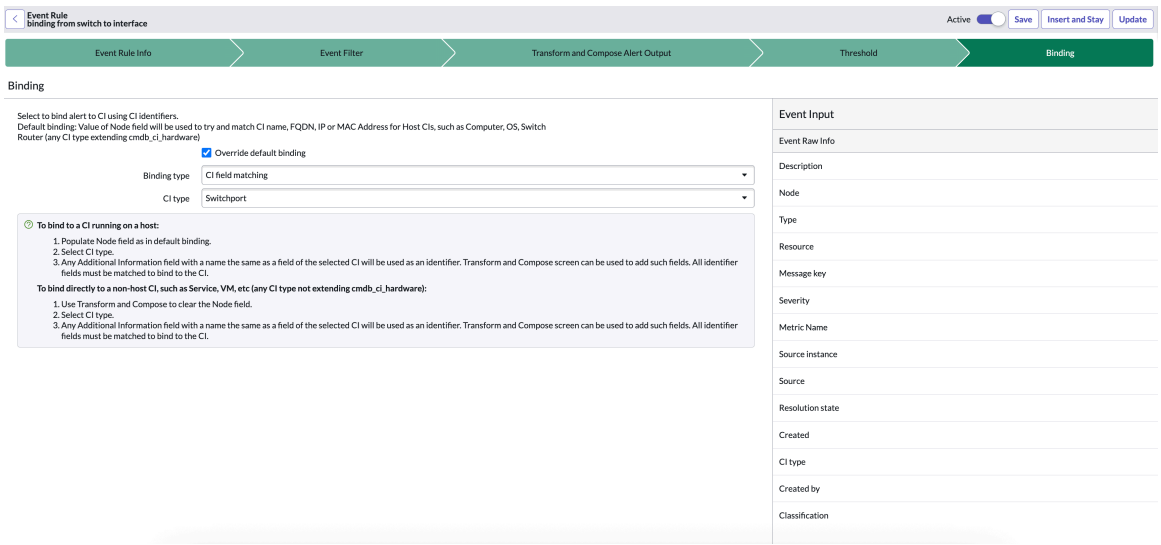
information field, the system binds the alert directly to the correct port—ensuring precise and meaningful alert context.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Rules**.
2. Select **New**.



3. Select the **Binding** tab.
4. Select the **Override default binding** check box.
5. In the **Binding type** field, select **CI field matching**.
6. In the **CI type** field, select **Switchport**.
   The **CI type** determines the specific CMDB table where the system searches for the matching CI.



7. Navigate to **All** and search `em_binding_device_map.list`.
   The Binding Device Maps page opens. Here the column values **From ci type** is mapped to **To ci type** using the **Mapped column**. For example, **cmdb_ci_ip_switch** is mapped to the Switchport [dscy_switchport] table using the reference field **cmdb_ci**.

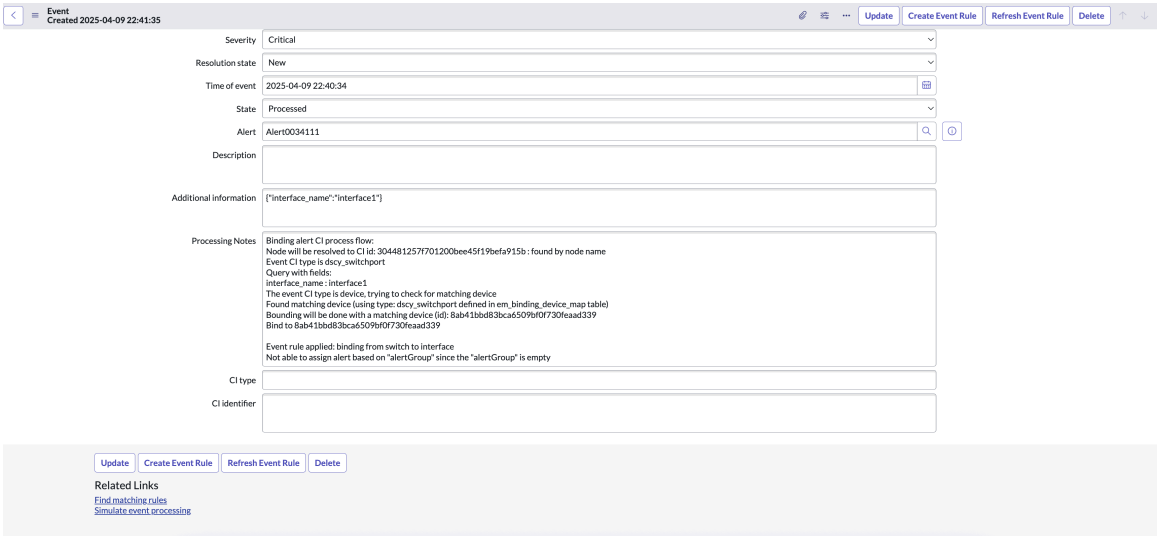
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In the following image, you can see the processing notes indicating that the binding has occurred between the alert and the matching device.



Bind alerts to a specific process

Bind specific server processes to their corresponding Configuration Items (CIs) in the CMDB to ensure accurate mapping and visibility. This binding is crucial for identifying service dependencies, reducing ambiguity from generic process names, and enabling effective monitoring. It supports faster alert resolution, impact analysis, and better alignment between infrastructure and application components in dynamic environments.

Before you begin

Role required: evt_mgmt_admin

About this task

Sometimes, when an alert (or event) comes into the system, it needs to be connected — or "bound" — to a Configuration Item (CI) in the CMDB. By default, the system binds alerts to host specified in the **Node** field of the event. Imagine a situation where you have a Windows server running multiple processes, like MSFT SQL Instances and SQL Server Analysis Services. The challenge is to bind an event to the specific process instance rather than just the host server. Multiple processes could have the same generic name, such as MSSQLSERVER, leading to ambiguity.

The following example procedure uses a Windows server as the host, MSFT SQL Instances as the CI class of the process, and MSSQLSERVER as the process name. The following steps assume that the event **Node** field provides the host name. The **Additional Information** field contains specific process details required for binding.

Alert-to-CI Binding via Process Mapping

Action	Steps
Set event rule: Add process name	Add the process name `sa_process_name` in the event rule.
Set event rule: Define CI type	Select the target CI type in the event rule. For example, MSFT SQL Instances.
Define process mapping	Navigate to the Process to CI Type Mapping table [em_binding_process_map] and add an entry mapping a CI type (e.g., MSFT

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert-to-CI Binding via Process Mapping (continued)

Action	Steps
	SQL Instances) to a process name (e.g., MSSQLSERVER).
Bind CI to alert	When an event is triggered, the system: **1.** Applies default binding to identify the host. **2.** Checks the CI type specified in the event rule. **3.** Looks up the Process to CI Type Mappings table [em_binding_process_map] for a matching process name and CI type. **4.** Searches the CI Relationships table [cmdb_rel_ci.list] for a Runs on::Runs relationship between the process and the host CI. **5.** Binds to a process when values from the **CI Type** column match the corresponding entries in the **Process** column in the Process to CI Type Mappings table [em_binding_process_map].

Procedure

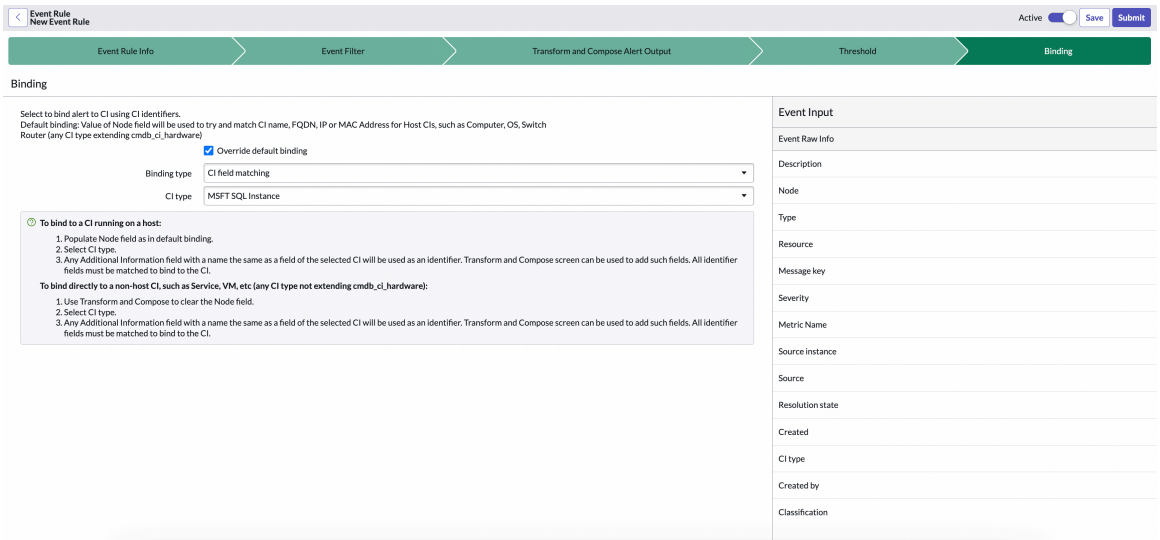
1. Navigate to **All** > **Event Management** > **Rules** > **Event Rules**.
2. Select **New**.
3. Select the **Transform and Compose Alert Output** tab and perform the following steps:

   a. Select the **Manual attributes** check box.
   b. Enter `sa_process_name` is `${process}`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

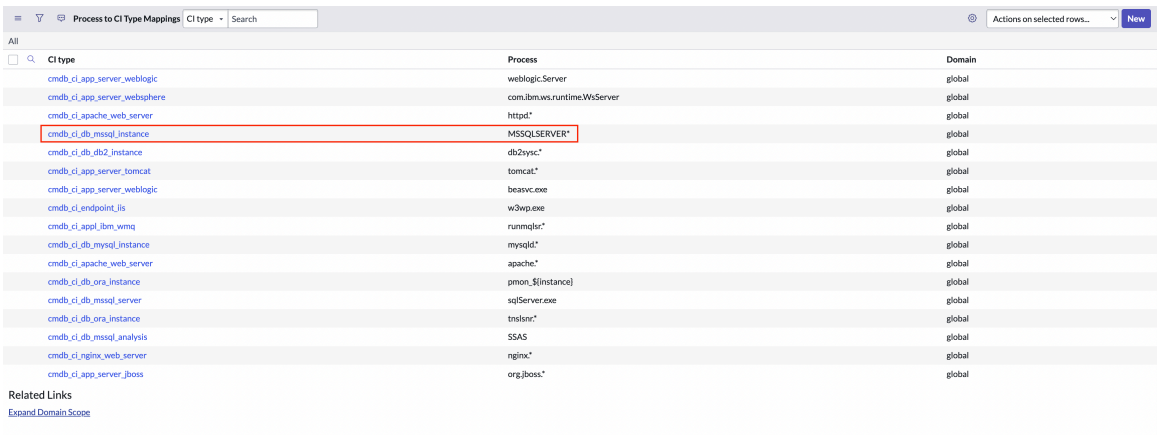
sa_process_name is a special variable name used to specify the name of the process to search for. ${sa_process_name} will appear in the **Additional information** field of the event. Instead of `${process}`, you can enter any other field name from which the variable `sa_process_name` derives its value.

4. Select the **Binding** tab.
5. Select the **Override default binding** check box.
6. In the **Binding type** field, select **CI field matching**.
7. In the **CI type** field, select **MSFT SQL Instances**.
   The **CI type** determines the specific CMDB table where the system searches for the matching CI.



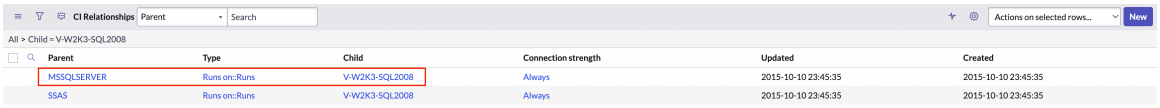
8. Navigate to **All** and search `em_binding_process_map.list`.

   The Process to CI Type Mappings page opens. Here the values from the **CI type** column are mapped to entries in the **Process** column. For example, **cmdb_ci_db_mssql_instance** is mapped to the **MSSQLSERVER** process.



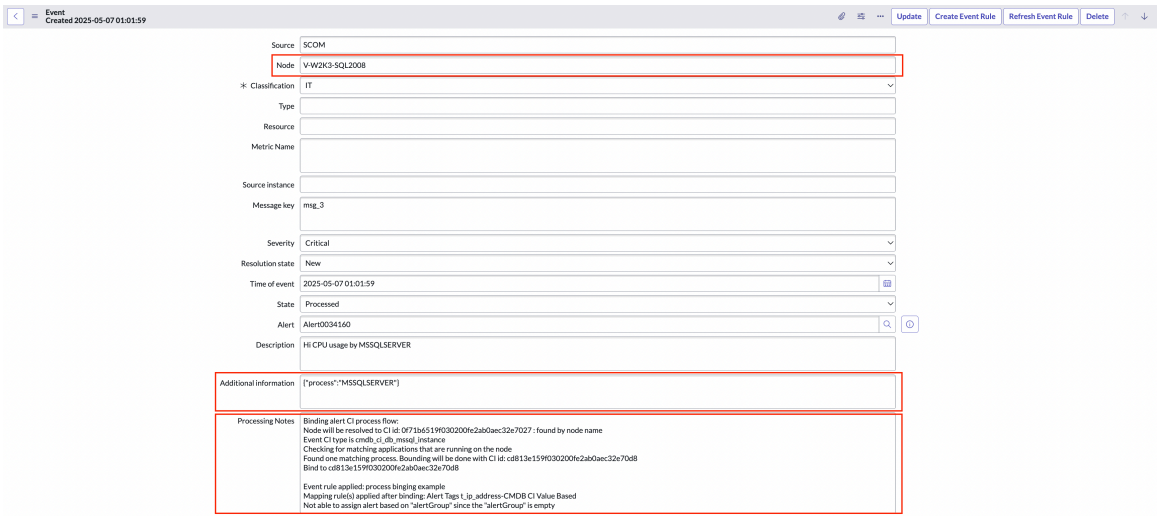
9. **Optional:** Navigate to **All** and search `cmdb_rel_ci.list`.
   The CI Relationships page opens.
10. **Optional:** Verify that the node is in a Runs on::Runs relationship with the appropriate process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



11. Navigate to **All** > **Event Management** > **All Events**.
12. Create an event with **Node** value as the name of the host such as Windows Server (V-W2K3-SQL2008).
    The **Additional information** field in the event has a key called **process** whose value is **MSSQLSERVER**.

    In the following image, you can see the processing notes indicating that the binding has occurred between the alert and the matching process.



Bind non-host CIs using CI field matching

If no match is found using the **Node** field, the system uses the **CI identifier** field to match alerts with non-host CIs based on attributes like Name, FQDN, IP, or MAC. This ensures accurate alert association, improving visibility, troubleshooting, and root cause analysis for diverse infrastructure components.

Before you begin

Role required: evt_mgmt_admin

About this task

Note: Use Enrich automation in Service Operations Workspace, the updated way to transform and standardize alert data for better response.

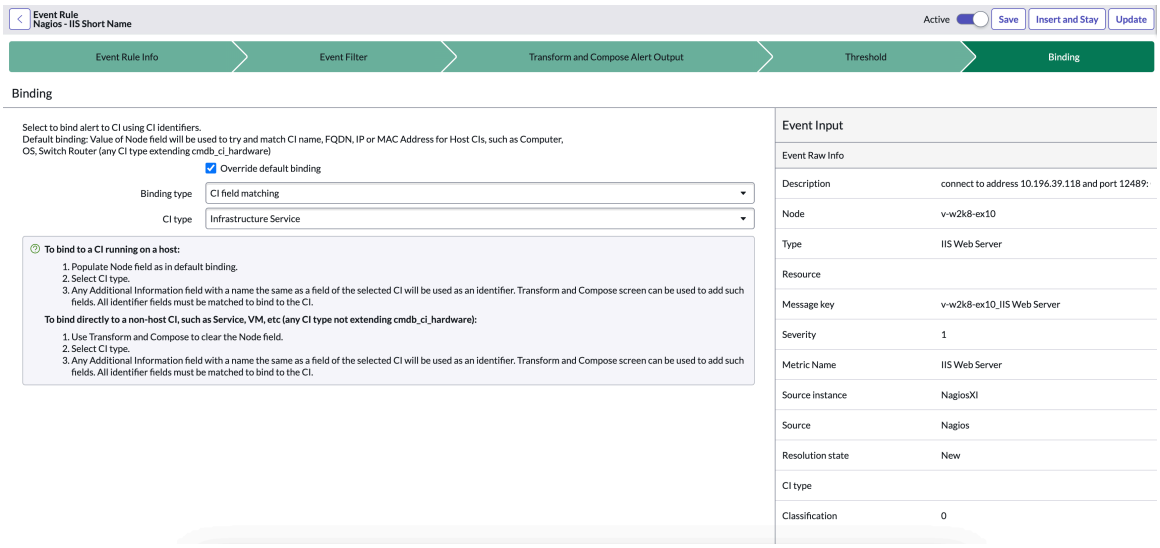
If no match is found using the **Node** field, the system looks at the **Additional information** field of the alert. When you select a CI type, such as File System, the system automatically searches for a matching record in the [cmdb_ci_file_system] table. It uses the details provided in event rule record, specifically in the **Additional information** field, to refine the search. For example, if the **Additional information** field contains values like `{"mount_point": "/snap/amazon-ssm-agent/9565", "name": "/dev/loop0"}`, the system looks for a record in the [cmdb_ci_file_system] table that matches these values. If a match is found, the system binds the CI to the alert, ensuring accurate identification and association. Similarly, if the **CI type** is **Network Adapter**, the system searches in the [cmdb_ci_network_adapter] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

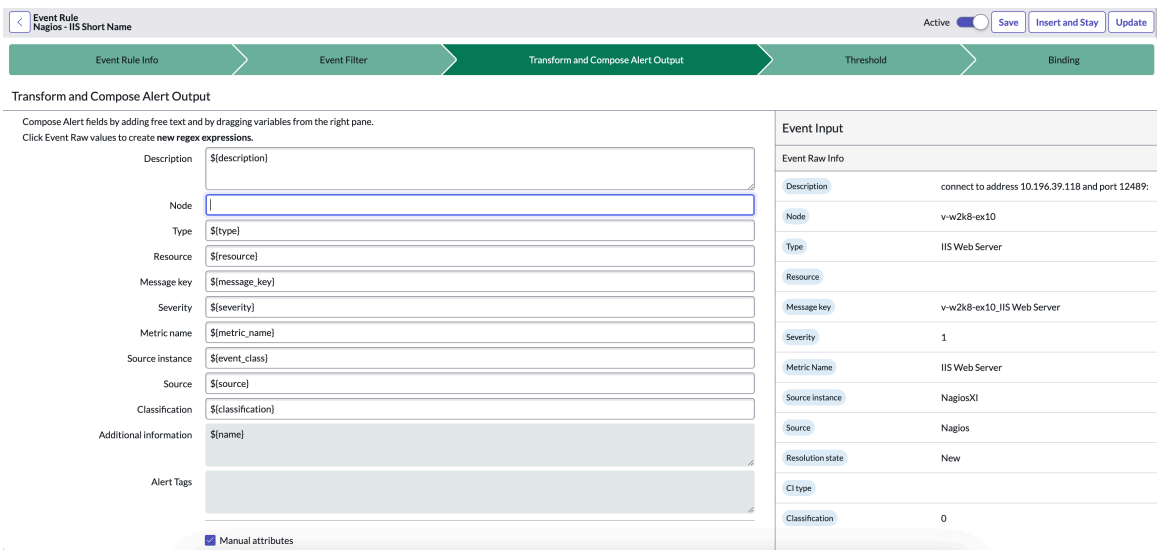
There may be cases where no match is found because the column names in the event record and the table differ for the same item. In such cases, you can manually create an additional key-value pair with a name matching the table column, ensuring the matching process continues successfully. For information on how to create a manual field, see Bind CIs using CI field and column matching.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Rules**.
2. Select **New** and complete the required fields of the event rule.
3. Select the **Binding** tab.
4. Select the **Override default binding** check box.
5. In the **Binding type** field, select **CI field matching**.



6. Select the **Transform and Compose Alert Output** tab.
7. Clear the **Node** field value.



8. In the **CI type** field, select the non-host CI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A non-host CI type is any CI type that does not extend the [cmdb_ci_hardware] table, such as a Service or VM. The **CI type** determines the specific CMDB table where the system searches for the matching CI.

9. Select **Save**.

Bind CIs using CI field and column matching

Bind CIs by matching event **Additional information** fields with CI attributes. If column names differ, manually create an additional key-value pair to align with the CI table, ensuring accurate CI association.

Before you begin

Role required: evt_mgmt_admin

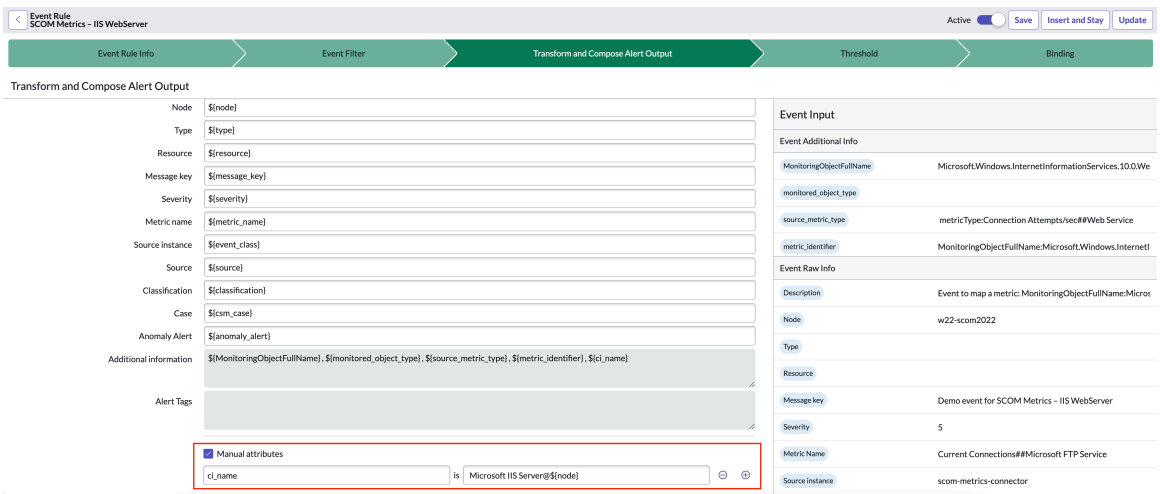
About this task

Note: Use Enrich automation in Service Operations Workspace, the updated way to transform and standardize alert data for better response.

If no match is found using the **Node** field, the system looks at the **Additional information** field in the event record. There may be cases where no match is found because the column names in the event record and the table differ for the same item. In such cases, you can manually create an additional key-value pair with a name matching the table column and add it to the **Additional information** field, ensuring the matching process continues successfully.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Rules**.
2. Select **New** and complete the required fields, or open an existing event rule record to modify it.
3. Select the **Transform and Compose Alert Output** tab.
4. Select the **Manual attributes** check box.
5. In the **Field Name** and **Field Value** fields, enter the corresponding field name and specify the source field from which the value should be populated.



Use the add icon (⊕) icon to add multiple fields as needed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Select **Save**.
   The fields are created in the event rules record. However, when any alert is generated from an event using the event rule, the manually added fields appear in the **Additional information** field of the alert.

Bind alerts to CIs using CI identification

Bind alerts to specific applications on hosts using event rules to ensure accurate tracking and to improve issue resolution speed—leading to efficient remediation and better alignment of alerts with the right resources.

Before you begin

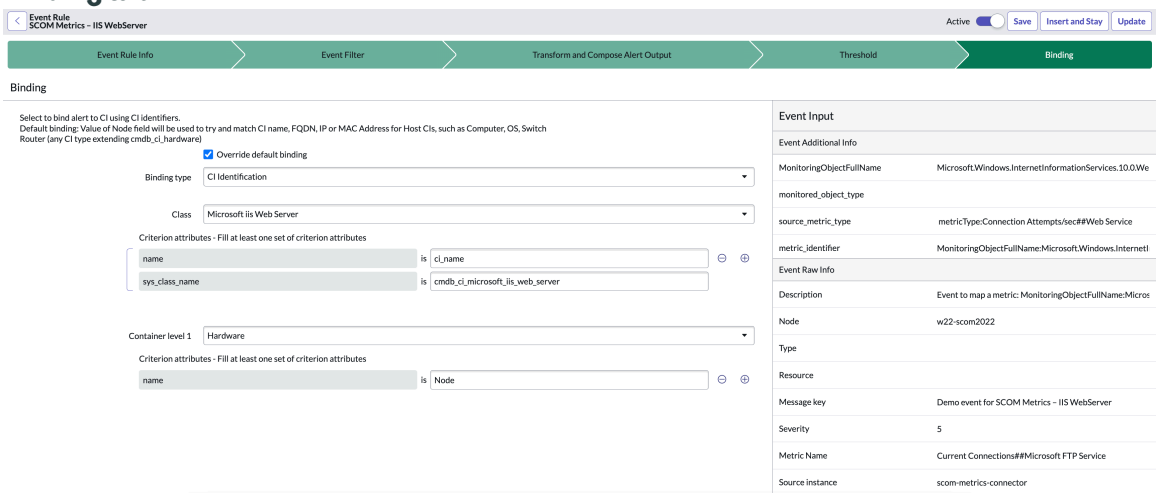
Role required: evt_mgmt_admin

About this task

Before going through the procedure, let's first understand how this binding works with an example. Suppose an out-of-the-box event rule, SCOM Metrics – IIS WebServer, generates an alert for a Microsoft IIS Web Server running on a host. Instead of binding the alert to just the host machine, you want it to be associated with the specific application (IIS Web Server) where the issue occurred. Here's how the system ensures accurate binding.

Let's say in the **Binding** tab, the **Class** and **Container Level 1** are defined along with their respective attributes, as shown in the image.

Binding tab



The binding procedure follows these steps:

1. Identifying the Host (Container Level 1)

   Since the Microsoft IIS Web Server runs on a host (in this case Hardware), the system first locates the host, which is defined as **Container Level 1**. The name field is used to identify the host, and its value is taken from the **Node** field of the event. Using this name, the system searches the CMDB to find a matching host CI.

2. Identifying the Microsoft IIS Web Server CI on the Host

   Once the host is identified, the system looks for a Microsoft IIS Web Server CI under that host with the following attributes:

   - name = ci_name
   - sys_class_name = cmdb_ci_microsoft_iis_web_server

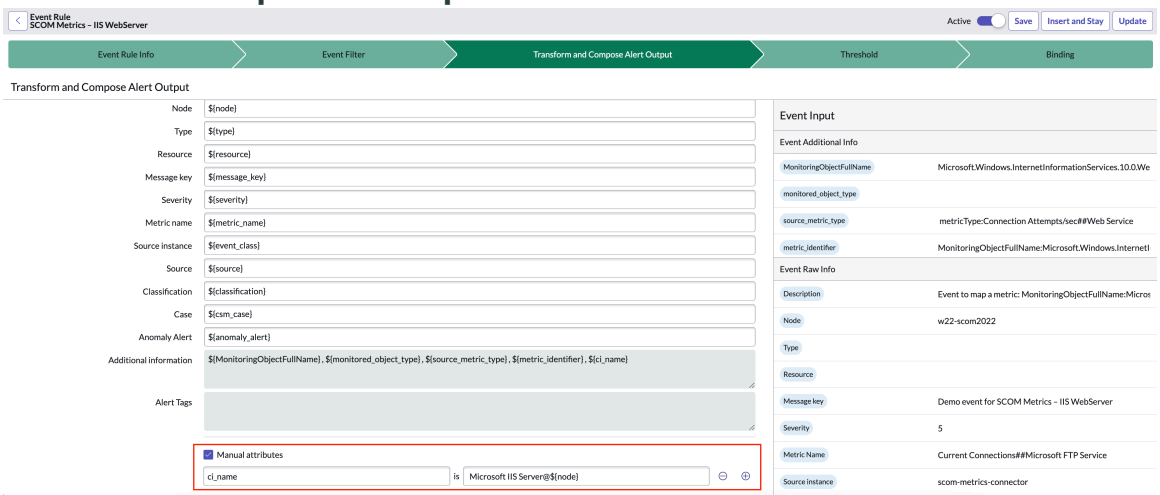
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Here, ci_name is derived from the key-value pair defined in the **Transform and Compose Alert Output** tab of the event rule. Assume that in the **Transform and Compose Alert Output** tab of the event rule, the **Manual attributes** check box is selected and the following key-value pair is already added:

- **Field Name**: `ci_name`
- **Field Value**: `Microsoft IIS Server@${node}`

This ensures that `ci_name` appears in the **Additional information** field of the alert and is used when configuring the attribute field of the CI class.

Transform and Compose Alert Output tab



If a matching Microsoft IIS Web Server CI is found on the identified host, the alert is bound to the correct application CI rather than just the host. This ensures more precise incident tracking and resolution, linking the alert to the actual service affected instead of only the machine it runs on.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Rules**.
2. Select **New** and complete the required fields of the event rule.
3. Select the **Binding** tab.
4. Select the **Override default binding** check box.
5. In the **Binding type** field, select **CI Identification**.
6. In the **Class** field, select a CI class.
7. In the **Select an identifier** field, select an identifier for the class.

   An identifier for a class is a set of rules that helps the system recognize and match CIs correctly. Think of it like a fingerprint for each type of CI (such as a server, router, or application). The identifier uses key attributes—like a serial number, hostname, or IP address—to make sure that when new data comes in, it gets linked to the right CI instead of creating duplicates. For more information on CI identification rule, see Create a CI identification rule.

8. In the **Add value** field, add the exact value or specify the source field from which the value for the field must be populated.

   Add or remove fields using the add (⊕) and the delete (⊖) icons.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: While filling in the CI Class attributes, if you do not find the attribute you need, you can use the **Transform and Compose Alert Output** tab of the event rule to add the necessary key-value pair. For more information, see Configure an event rule to customize alert content.

The event rule transformation and composition is useful when relevant information exists in a different field but needs to be extracted or reassigned for proper alert processing. This is especially important when the required attribute is not directly available and must be manually defined.

For example, suppose the **Additional information** field of an alert contains the alert name under the **Node** field. However, for correct processing, we need this value to appear under the **Name** field instead. Since there is no existing name attribute in the event, we can manually create one using the **Transform and Compose Alert Output** tab in the event rule. Here's how:

a. Select the **Transform and Compose Alert Output** tab.

b. Select the **Manual attributes** check box.

c. Add the following key-value pair:

- **Field**: Name
- **Field Value**: Node

This configuration ensures that the system extracts the **Node** value and maps it to the name field, making it available for CI binding and alert correlation.

9. In the *Container level 1* area, specify the host.
10. In the **Select an identifier** field, select an identifier for the container.
11. In the **Add value** field, add the exact value or the field that is the source for the **Select an identifier** field of the container.

    Add or remove fields using the add (⊕) and the delete (⊖) icons.
12. Select **Save**.

Example: Binding alerts to non-host CIs

Bind alerts to an application service (a non-host CI) using event rules and event field mapping. This example demonstrates how to achieve this by leveraging the IP address associated with the service.

Before you begin

Role required: evt_mgmt_admin

About this task

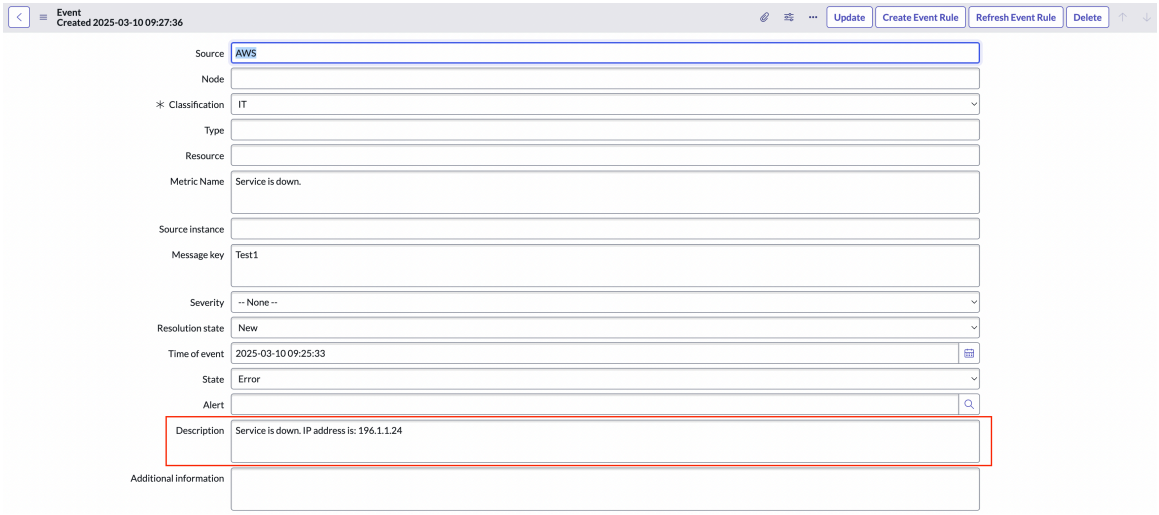
When an event is generated, it may not always include the exact name of the Application Service it affects. Instead, it might provide details such as an IP address. In this example, suppose application services are identified by IP addresses. Since the goal is to bind the alert to an Application Service, you need to determine which service name corresponds to the given IP address.

To achieve this, follow these steps:

1. Match the correct Application Service: Override the default binding and select **Binding Type** as **CI field matching**. The binding process needs to associate the alert with an Application Service, not a host. In the event rule, set the **CI Type** to **Application Service** so that the system searches for the service in the Application Service table (cmdb_ci_service_auto).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Extract the IP address from the event description: The event might contain a message like `Service is down. IP address is: 196.1.1.24`. You need to extract the IP address from this description for further processing.

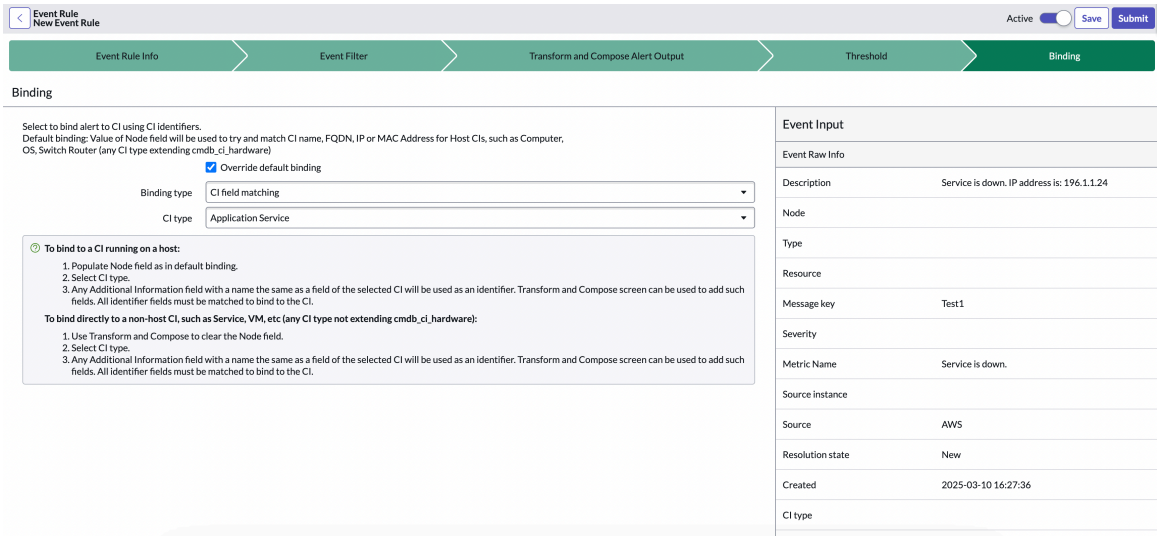


3. Translate the IP address into a service name using Event Field Mapping: Use Event Field Mapping to look up the extracted IP address in the CMDB and find the associated application service. Once a matching service is found, its name is stored in the **Name** field of the event.
4. Bind the alert to the correct Application Service: If the service name is identified, the alert's CI is populated with that service.

Procedure

1. Navigate to **All** > **Event Management** > **All Events**.
2. Open the specific event for which you want to create an event rule.
3. Select **Create Event Rule**.
   The new event rule page opens. Some fields in the event rule are populated based on the event record data, such as the Source field value.
4. In the **Event Rule Info** tab, in the **Name** field, enter `application service binding`.
5. Select the **Binding** tab.
   In this tab, select the CI type as a service (non-host) instead of a host. The goal is to bind alerts to an Application Service, not to a physical or virtual machine.
6. Perform the following steps:
   a. Select the **Override default binding** check box.
   b. In the **Binding type** field, select **CI field matching**.
   c. From the **CI type** list, select **Application Service**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



7. Select the **Transform and Compose Alert Output** tab.

   In this tab, you extract the IP address of the application service into a manually created field. Extracting the IP allows the system to look up the corresponding service in the Application Service table (cmdb_ci_service_auto). Without extracting the IP, the system wouldn't be able to determine which Application Service the event belongs to, making it difficult to bind the alert correctly.

8. Perform the following steps:

   a. Clear the **Node** field.

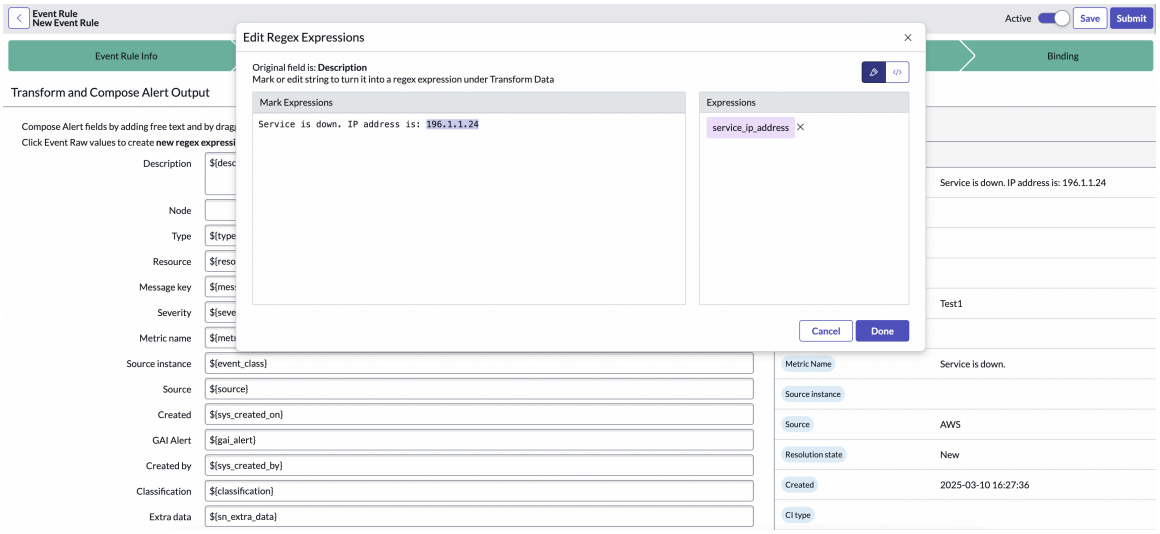
      When an event is processed, it often comes with multiple fields of information. The **Node** field typically contains the host or device name. However, the goal is to bind the alert to an Application Service rather than a host. Clearing the **Node** field ensures that the system focuses on identifying the correct service instead of mistakenly associating the alert with a host CI.

   b. Under **Event Input** > **Event Raw Info**, select **Description**.

      The Edit Regex Expressions window opens.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. In the Mark Expressions section, select the IP address, manually enter a field name (e.g., service_ip_address), and press Enter to save it.



d. Select **Done**.

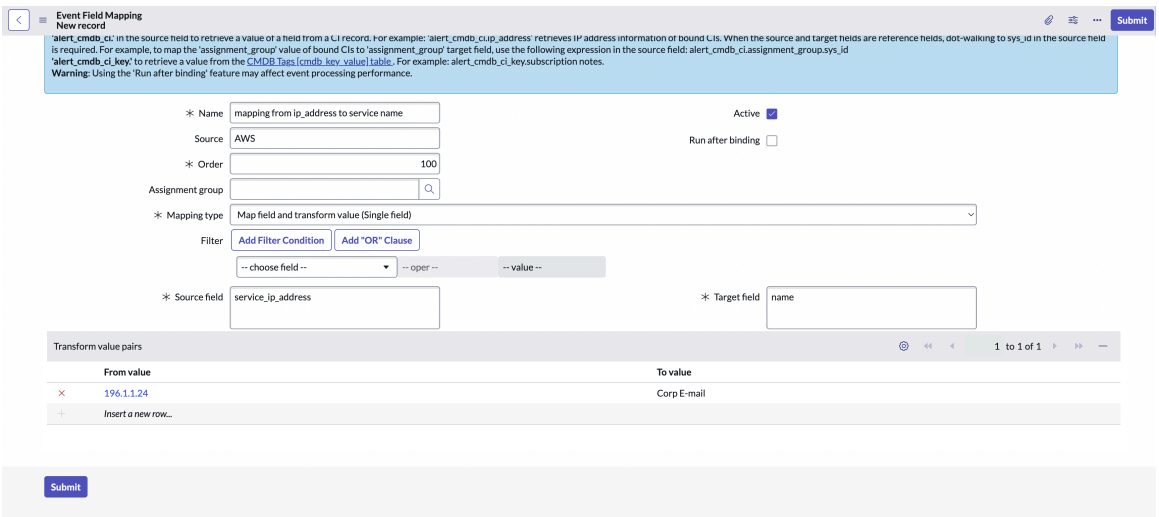
The IP address is extracted into the newly created **service_ip_address** field, which is added to the **Additional info** field of the alert. This allows it to be used later to identify the corresponding Application Service.

9. Select **Submit** in the event rule to save your changes.

10. Navigate to **All** > **Event Management** > **Rules** > **Event Field Mapping**.
In Event Field Mapping, configure the extracted IP address to map it to the corresponding service name. The event provides only an IP address, but alerts need to be associated with a service name (not just an IP). The system needs to map this IP to its corresponding Application Service so that teams can easily identify the impacted service.

11. Select **New**.
The Event Field Mapping window opens.

12. Perform the following:



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

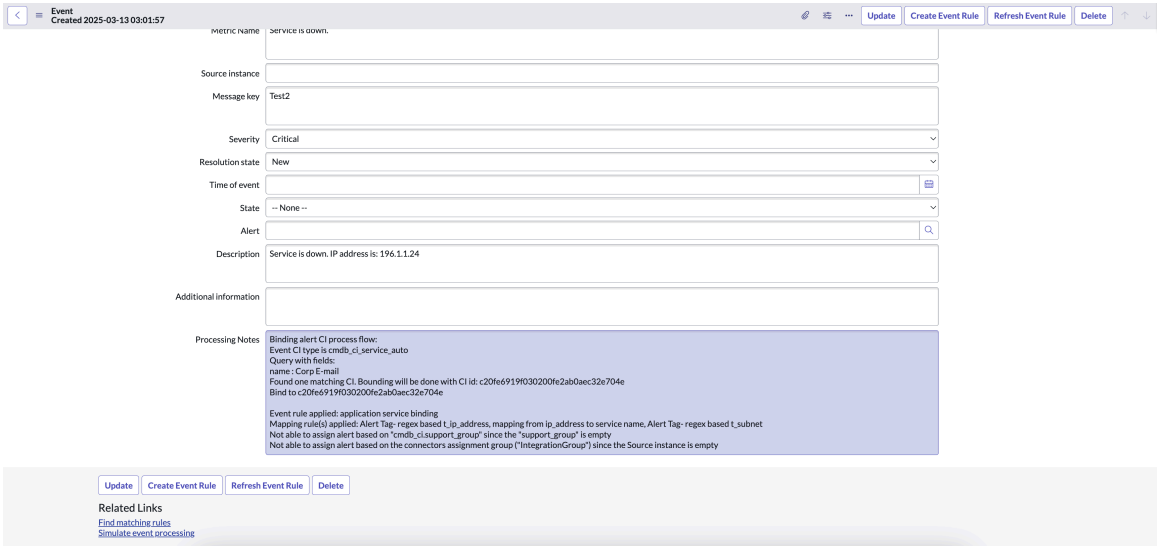
Field	Action
Name	Enter the name of the mapping. Example: mapping from ip_address to service name.
Source	Enter `AWS`. **Note:** The source is the same as the one in the Events record.
Mapping type	Select **Map field and transform value (Single field)**
Source field	Enter `service_ip_address`.
Target field	Enter `name`. The target field value is the column name in the Application Service table (cmdb_ci_service_auto) where the source field value is searched.
Transform value pairs	
From value	196.1.1.24
To value	Corp E-mail

13. Select **Submit**.

The system extracts the IP address of the service from the event and stores it in the **service_ip_address** field. The Application Service table (cmdb_ci_service_auto) does not have a column for searching by IP address. The Transform value pairs feature maps the IP address to a name—in this case, Corp E-mail—and saves it in the **name** field within the **Additional info** field of the alert. The **Target field** specifies where to search for the Corp E-mail in the Application Service table. The system looks for Corp E-mail in the **name** column of the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Application Service table (cmdb_ci_service_auto). If a match is found, the alert is bound to the corresponding Application Service.



Example: Bind alerts to CIs using dynamic CI types

Use event field mapping to dynamically bind alerts to the appropriate CIs based on event attributes, eliminating the need for separate event rules for each CI type (also known as CI class). This approach simplifies configuration, improves accuracy, and enhances alert to CI binding.

Before you begin

Role required: evt_mgmt_admin

About this task

In general, for an event generated from a specific source mentioned in the **Source** field, the system applies the corresponding event rule. The override default binding option in an event rule specifies a specific CI class for binding. However, in a more dynamic use case, the CI class is not predefined and can change based on event attributes. For example, suppose a customer has multiple CIs with the same name, but each CI belongs to a different CI class. In the traditional event rule method, as the CI class (or the CMDB table) is defined for a CI, the mapping is incorrect because the system searches in the same CI class for all CIs with the same name and attributes, instead of looking in the specific CMDB table defined for each CI class.

To resolve this—in other words, to determine the correct CI class to search—the system uses the **CI type** field from the event to identify the CI class. By using an event field mapping that maps from event attributes to CI type, it becomes possible to know which CMDB table to search, ensuring that the CI is correctly mapped to the event.

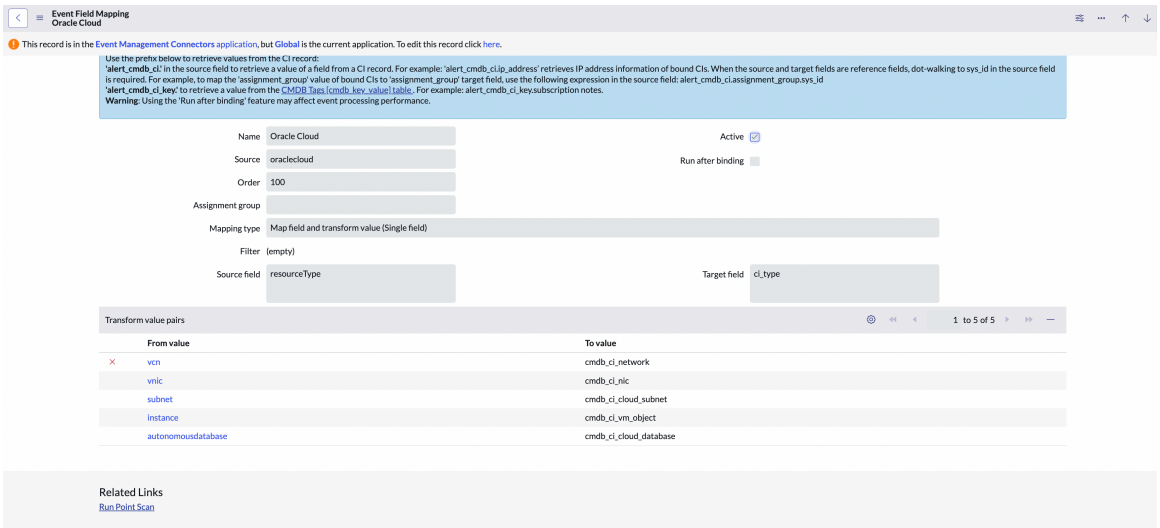
2. Select **Oracle Cloud**.

   This is an existing event field map used as an example. The event field map details page opens.



3. Review the event field mapping details page and understand the relevant fields and their corresponding values.

Event Field Mapping fields

Field	Description
Name	Event field map name.
Source	Event monitoring software that generated the event. In this case, oraclecloud.
Order	Number to define the order in which this action should be processed. Actions with lower numbers are processed first.
Mapping type	Select **Map field and transform value (Single field)**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Source field	**resourceType** is a field that is defined in the **Additional Information** field of the event defined by the Oracle Cloud system. The possible values of **resourceType** are listed in the **From value** column, while the corresponding CMDB tables for those values are specified in the **To value** column in the Transform value pairs section. If **resourceType** is **instance**, the system searches in the [cmdb_ci_vm_object] table for CI binding.
Target field	The **CI type** field (**ci_type**) in an event is a special field that provides the CI class name, indicating which CMDB table to search. The **CI type** field values are listed in the **To value** column in the Transform value pairs section.
Transform value pairs	
From value	Lists the possible values of the event field (e.g., `resourceType`) that are derived from the event data.
To value	Specifies the corresponding CMDB table associated with each value listed in the **From value** column. Indicates the CI type to bind the alert to.

View patterns for event group creation

Event groups are sets of events that do not have a matching event rule. You can view the patterns in a group of events to learn the impact of creating a rule based on the event source and description patterns.

Before you begin

Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

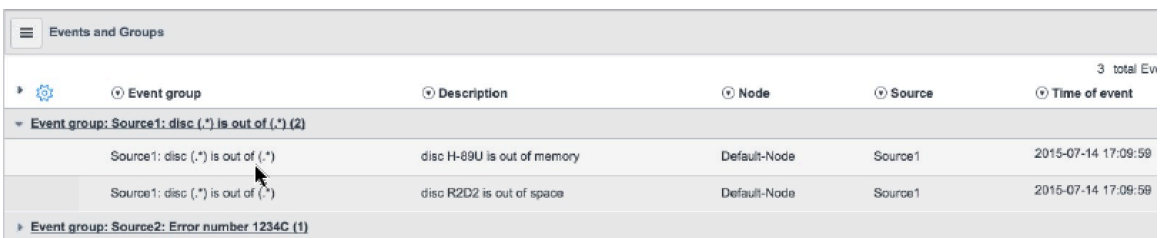
About this task

Events are grouped according to their source and description.

Note: Use Ignore automation and Enrich automation in Service Operations Workspace, the updated way to automatically filter out irrelevant alerts, or to transform and standardize alert data for better response.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Rules**.
2. Wait for the group calculation to complete and then click the created link.
   If there are not enough events, the calculation will not create groups.
3. In the list of events, select an event.
4. To change the pattern of an event, double-click the pattern, make your changes, and then click **Update**.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Refresh event rules

Manually update event rules to reflect current event information because once an event rule is created, the **Event Additional info** and **Event Raw info** fields are not automatically updated.

Before you begin

Role required: evt_mgmt_admin

About this task

Note: Use Ignore automation and Enrich automation in Service Operations Workspace, the updated way to automatically filter out irrelevant alerts, or to transform and standardize alert data for better response.

Procedure

1. Navigate to **All** > **Event Management** > **All Events**.
2. Select the event.
3. Select **Refresh Event Rule**.
4. Select the event rules to refresh.
5. Select **Refresh Selected**.

   If you selected multiple event rules, then the last selected item in the list opens in the Event Rule Designer.

   Note: If the current event rule regex expressions do not match the selected event after the refresh, the update fails and an error message appears specifying the problematic fields. This safeguard ensures that your previously defined event rule regex expressions are not broken due to the refresh.

Find rules that will be applied to an event

View the rules that will be applied on an event to determine how this event will be processed.

Before you begin

Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task

Note: Use Ignore automation and Enrich automation in Service Operations Workspace, the updated way to automatically filter out irrelevant alerts, or to transform and standardize alert data for better response.

Procedure

1. Navigate to **Event Management** > **All Events**, and then click an event number.
2. Under **Related Links**, click **Find matching rules**.
3. Review the information that appears in the blue box at the top of the page, and review all **Processing Notes** to find rules that apply to an event.

Simulate event processing

Simulate event processing logic to understand which rules execute on an event and how event fields change.

Before you begin

Role required: evt_mgmt_admin

About this task

Note: Use Ignore automation and Enrich automation in Service Operations Workspace, the updated way to automatically filter out irrelevant alerts, or to transform and standardize alert data for better response.

Procedure

1. Navigate to **All** > **Event Management** > **All Events**.
2. Open the event you want to simulate.
3. In the **Related Links** section, select **Simulate event processing.**
4. In the info message that appears at the top of the screen, select the link to the created simulated alert.
5. **Optional:** View which event rules and event field mapping rules were applied and the event field values by selecting the **Activities** tab.

Event field mapping configuration

Use Event field mappings rules to map values from specific fields to values in other fields.

Event Management stores event field mappings in the Event Field Mapping [em_mapping_rule] table. The mappings apply after event rule processing and prior to alert generation. The mapping values from the Event Mapping Pair [em_mapping_pair] table apply to the alert. The original event severity remains unchanged.

For example, if events come with the field "**org_severity**" with the values "*Low*, *Medium*, *High*" and you want the alert **Severity** to hold this value, create an event field mapping rule that maps the field **org_severity** to **Severity**, with these values:

Example showing org_severity mapped to Severity

Original org_severity value	Map to alert Severity value
Low	Warning
Medium	Major
High	Critical

Default event field mappings

Event Management provides default event field mappings for commonly used system monitoring tools. The Transform Value Pairs from event field mappings format the incoming event data for Event Management.

You can view the default event field mappings and mapping pairs by navigating to **Event Management** > **Rules** > **Event Field Mappings** and double-clicking **Name**.

Create event field mappings

Use event field mappings to map values from specific event fields to values in other fields to provide more comprehensive information in an alert. Use team-based integrations in event rules to make sure that connector ownership and execution of rules give precedence to global rules. Teams can maintain consistency and hierarchy while offering flexibility and customization options.

Before you begin

Role required: evt_mgmt_admin

About this task

Create the rule to match the event by its class and original values. Also, specify the new values to replace the original values in the event.

For users familiar with the classic Event Management experience, enrich automations create event rules but with an easier interface and with better team support. For more information, see Create Enrich automation.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Field Mapping**.
2. Select **New** or open an existing rule to edit and fill in the fields.

Event Field Mapping form

Field	Description
Name	Event field mapping name.
Source	Event monitoring software that generated the event, such as SolarWinds or SCOM. Maximum length: 100 characters.
Order	Number to define the order in which this action should be processed. Actions with lower numbers are processed first.
Assignment group	For Team-based integrations, select an assignment group. If no assignment group is defined in the event field-mapping rule, then this rule is considered global. When the rules are running – first the global rules run and then the rules that belong to the assignment group that the event's source instance belongs to.
Mapping type	Mapping mechanism that is used to change an event field value. ○ **Map field and transform value (Single field)**: Maps the **Source field** value to the matching value in the Transform value pairs [em_mapping_pair] table and populates the **Target field**. Source and Target fields may be event fields, additional info fields, or alert tags.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **Create or update field and set constant value (Constant)**: Sets a constant value to a **Target field**. The **Target field** may be an event field, additional info field, or alert tag. ○ **Map field (Copy field)**: Copies the exact value of a Source field to the specified Target field. The Source and Target fields may be Event field, Additional info field, or alert tags. ○ **Map field and transform value using regex**: Generically maps the value from the Source field to the matching value in the Transform value pairs table and populate the **Target field**. Source and Target fields may be event, additional info, or alert tags fields. ○ **Map field using regex**: Copies the value from a generically defined **Source field** to the **Target field**. The Source field must be a field from the event additional info field. The Target field may be the field of event, additional info, or alert tag. With this type, you can generically find the name of the Source field by using a regular expression (regex). ○ **Map field and copy value from regex group**: Copies part of the Source field value to the Target field. Source and Target fields may be event fields, additional info fields, or alert tags. Define a regex to specify what part of the **Source field** should be copied. ○ **Advanced mapping using script**: Implements your own logic for event values transformation by using a script. When the 'Run after binding' check box is selected, the rule is executed after the CI binding phase. The dedicated script also has the sys_id of the CI in the input parameters. **Warning:** Complex scripts may affect event processing performance. ○ **Map field from reference table** Use this rule type to extract a **Source field** value from the selected **Reference table** by matching the **Field to match**value to the **Matching alert field** value and then mapping the **Source field** value to the **Target field**. The **Matching alert field** and the **Target field** may be event fields, additional info fields, or alert tags.
Filter	A condition for event field mapping. Select **Add Filter Condition** or **Add "OR" Clause** to configure multiple conditions. **Note:** The filter is case-sensitive.
Active	Activates or deactivates the event field mapping. If possible, find and apply another event field mapping rule.

Field	Description
Run after binding	○ When selected, the rule is executed after the CI binding phase. ○ Use the relevant prefix to retrieve values from the CI record: ▪ **alert_cmdb_ci.** to retrieve a field from the CI record. For example: Use 'alert_cmdb_ci.assignment_group' to populate (and transform) an alert 'assignment_group' field with the value of the CI's assignment group. Dot-walk to a related record is also possible. For example, use alert_cmdb_ci.asset.model ▪ **alert_cmdb_ci_key.** to retrieve a value from the CMDB Tags table. For example, alert_cmdb_ci_key.subscription notes. **Warning**: Using the 'Run after binding' feature may affect event processing performance. **Note:** This check box is displayed only for the following Mapping types: **Map field and transform value (Single field)**, **Map field (Copy field)**, **Map field and transform value using regex**, **Map field and copy value from regex group**, and **Map field from reference table**.

○ If you selected **Map field and transform value (Single field)**, fill in the fields as appropriate.

Map field and transform value (Single field) fields

Field	Description
Source field	Event field to map - includes all event and additional info fields. Note: For Additional info fields use: "additional_info.<field name>". When the 'Run after binding' check box is selected, you can use the **alert_cmdb_ci** and the **alert_cmdb_ci_key** prefixes to receive CI related data.
Target field	Event field where the mapping rule inserts or updates the value. When this field is identical to the **Source field**, the mapping rule updates the value in memory of the event field. Alert tags can also be defined by using the *<t_>* prefix.
Run after binding	▪ When checked, activates Event field mapping after CI binding. ▪ Use the following prefix to retrieve values from the CI record: ▪ **alert_cmdb_ci.** to retrieve a field from the CI record. For example, use 'alert_cmdb_ci.assignment_group' to populate (and transform) an

Field	Description
	alert 'assignment_group' field with the value of the CI's assignment group. Dot-walk to a related record is also possible. For example, use alert_cmdb_ci.asset.model ▪ **alert_cmdb_ci_key.** to retrieve a value from the CMDB Tags table. For example, alert_cmdb_ci_key.subscription notes. **Warning**: Using the 'Run after binding' feature may affect event processing performance.

Key fields (Transform Value Pairs section)

Field	Description
Key	Value that the mapping rule searches for. Whenever the event field has this value, the mapping rule adds the value listed in the **Source field** field to the field listed in the **Target field**. This field is displayed when the **Mapping type** is **Map field and transform value (Single field)**. Select **+** to add more **Key** fields, as required.

Typical use case: To map the 'event_severity' field in the additional info field with possible values [such as WARNING, MINOR, CRITICAL, CLEAR, MAJOR] to the severity field, configure the following:

- Source field: 'event_severity'
- Target field: 'severity'
- Transform value pairs:
  - From value: 'WARNING', to value: '4'
  - From value: 'MINOR', to value: '3'
  - and so forth...

- If you selected **Create or update field and set constant value (Constant)**, fill in the fields as appropriate.

Create or update field and set constant value (Constant) fields

Field	Description
Target field	The **Target field** may be an an event field, additional info field, or alert tag. Typical use case: Set alert severity to 1 for all events that match the filter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Value	Value you want to use for the **To field**. This field is displayed when the **Mapping type** is **Constant**.

Typical use case: Set alert severity to 1 for all events that match the filter.

- If you selected **Map field (Copy field)**, fill in the fields as appropriate.

Map field (Copy field) fields

Field	Description
Source field	**Source field** value to be copied to the **Target field** field. The **Source field** may be an event field, additional info field, or alert tag.
Target field	Event field where the mapping rule inserts or updates the value. The **Target field** may be an event field, additional info field, or alert tag.
Run after binding	▪ When checked, activates Event field mapping after CI binding. ▪ Use the relevant prefix to retrieve values from the CI record: ▪ **alert_cmdb_ci.** to retrieve a field from the CI record. For example, use 'alert_cmdb_ci.assignment_group' to populate (and transform) an alert 'assignment_group' field with the value of the CI's assignment group. Dot-walk to a related record is also possible. For example, use alert_cmdb_ci.asset.model ▪ **alert_cmdb_ci_key.** to retrieve a value from the CMDB Tags table. For example, alert_cmdb_ci_key.subscription notes. **Warning**: Using the 'Run after binding' feature may affect event processing performance.

Typical use case: To copy the IP field from the event additional info field to the alert field node, use the following:

- 'Source field': ip
- 'Target field': node

- If you selected **Map field and transform value using regex**, fill in the fields as appropriate.

Map field and transform value using regex

Field	Description
Source field	Source field value to be copied to the **Target field** field. The **Source field** may be an event field, additional info field, or alert tag.
Target field	Event field where the mapping rule inserts or updates the value. The **Target field** may be an event field, additional info field, or alert tag.
Run after binding	▪ When checked, activates Event field mapping after CI binding. ▪ Use the relevant prefix to retrieve values from the CI record: ▪ **alert_cmdb_ci.** to retrieve a field from the CI record. For example, use 'alert_cmdb_ci.assignment_group' to populate (and transform) an alert 'assignment_group' field with the value of the CI's assignment group. Dot-walk to a related record is also possible. For example, use alert_cmdb_ci.asset.model ▪ **alert_cmdb_ci_key.** to retrieve a value from the CMDB Tags table. For example, alert_cmdb_ci_key.subscription notes. **Warning**: Using the 'Run after binding' feature may affect event processing performance.

Typical use case: To map severity from the field color in the Additional info field to the Severity field, use:

- Source field: 'color'
- Target field: 'severity'
- Transform value pairs:
  - From value: '.*red', To value: '1'. This covers both 'dark red', 'light red', and other values containing 'red' and maps them all to '1'.
  - and so forth...

Key fields (Transform Value Pairs section)

Field	Description
Key	Value that the mapping rule searches for. Whenever the event field has this value, the

Field	Description
	mapping rule adds the value listed in the **Source field** field to the field listed in the **Target field**. This field is displayed when the **Mapping type** is **Map field and transform value (Single field)**. Select **+** to add more **Key** fields, as required.

- If you selected **Map field using regex**, fill in the fields as appropriate.

Map field using regex fields

Field	Description
Source field	Generically defined Source field value to be copied to the **Target field** field. The **Source field** must be a field from the event additional info field. With this type, you can generically find the name of the Source field by using a regular expression (regex).
Target field	Event field where the mapping rule inserts or updates the value. The **Target field** may be an event field, additional info field, or alert tag.

Typical use case: To map the 'region' field from the additional_info field that appears as 'tags.region' or 'tags|region' or 'cloud.region' to an alert tag *t_region*, use:

- 'Source field': *region
- 'Target field': t_region

- If you selected **Map field and copy value from regex group**, fill in the fields, as appropriate.

Map field and copy value from regex group fields

Field	Description
Source field	Generically defined Source field value to be copied to the **Target field** field. The Source field must be a field from the event additional info field. With this type, you can generically find the name of the Source field by using a regular expression (regex).
Target field	Event field where the mapping rule inserts or updates the value. The **Target field** may be an event field, additional info field, or alert tag.

Field	Description
Run after binding	▪ When checked, activates Event field mapping after CI binding. ▪ Use the relevant prefix to retrieve values from the CI record: ▪ **alert_cmdb_ci.** to retrieve a field from the CI record. For example, use 'alert_cmdb_ci.assignment_group' to populate (and transform) an alert 'assignment_group' field with the value of the CI's assignment group. Dot-walk to a related record is also possible. For example, use alert_cmdb_ci.asset.model ▪ **alert_cmdb_ci_key.** to retrieve a value from the CMDB Tags table. For example, alert_cmdb_ci_key.subscription notes. **Warning**: Using the 'Run after binding' feature may affect event processing performance.
Regex group expression	.*_.*_(.*)_.*

Typical use case: To extract the third octet from the IP and save it in the additional info *third_octet* field, use:

- 'Source field': ip
- 'Target field': third_octet
- 'Regex group expression': .*_.*_(.*)_.*

○ If you selected **Advanced mapping using script**, fill in the fields as appropriate.

Advanced mapping using script fields

Field	Description
Script	The code editor gives text editor support for inline scripts. The code editor has these features for the supported language services and Inline scripts: Syntax coloring, indentation, line numbers, and automatic creation of closing braces and quotes, Auto-suggestions, and auto-completions. Editing tips: ▪ To insert a fixed space anywhere in your code, press the Tab key. ▪ To indent a single line of code, select in the leading white space of the line and then press Tab. ▪ To indent one or more lines of code, select the code and then press Tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	▪ To decrease the indentation, press Shift +Tab. ▪ To remove one tab from the start of a line of code, select in the line and press Shift +Tab. ▪ To declare variables, use the var keyword so that they remain within the proper JavaScript scope.
Run after binding	When the 'Run after binding' check box is selected, the rule is executed after the CI binding phase. The dedicated script also has the sys_id of the CI in the input parameters. **Warning:** Complex scripts may affect event processing performance.

- If you selected **Map field from reference table**, fill in the fields as appropriate.

Map field from reference table fields

Field	Description
Reference table	The reference table. Select the table from where the field is to be mapped to the Target field in the event.
Field to match	The field from the Reference table to be matched with the Matching alert field from the event. It's used to filter out the Reference table records.
Source field	**Source field** value to be copied to the **Target field** field. The **Source field** is the field of the table that was selected as the Reference table.
Matching alert field	Event field to find matching Reference table records. The **Matching alert field** is matched with the **Field to match** field. The Matching alert field may be the Event field, Additional info field, or the Alert tag.
Target field	Event field where the mapping rule inserts or updates the value. The **Target field** may be an event field, additional info field, or alert tag.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Run after binding	▪ When checked, activates Event field mapping after CI binding. ▪ Use the relevant prefix to retrieve values from the CI record: ▪ **alert_cmdb_ci.** In the **Matching alert field**, to retrieve a value of a field from a CI record. For example: 'alert_cmdb_ci.ip_address' retrieves IP address information of bound CIs. When the **Matching alert field** and the **Field to match** fields are reference fields, dot-walking to sys_id in the **Matching alert field** is required. For example, to use the 'assignment_group' value of bound CIs to match with the **Field to match** field, use the following expression in the **Matching alert field**: alert_cmdb_ci.assignment_group.sys_id ▪ **alert_cmdb_ci_key.** to retrieve a value from the CMDB Tags table. For example, alert_cmdb_ci_key.subscription notes. **Warning**: Using the 'Run after binding' feature may affect event processing performance.

Typical use case: Extract 'short_description' from the 'pc_vendor_cat_item' records matching its 'name' field with the 'cat_item_name' field in the Additional info field of the event and map it to the 'description' field on the event in the following fields:

- 'Reference table': pc_vendor_cat_item
- 'Field to match': name
- 'Source field': short_description
- 'Matching alert field': cat_item_name
- 'Target field': description

3. Right-click the form header and select **Save**.
4. Select **Submit**.

Example:
The following values comprise a predefined rule that is applied to events in the *Trap From Enterprise 9* class. If the events contain the `snmpTrapOID` element with a value of `iso.org.dod.internet.private.enterprises.cisco.0.0`, the mapping rule changes the value to `reload` in the alerts. If the events contain the `snmpTrapOID` element, a value of `iso.org.dod.internet.private.enterprises.cisco.0.1`, the mapping rule changes the value to `tcpConnectionClose` in the alerts.

Field	Values
Name	cisco.snmpTrapOID

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Values
Source	Trap From Enterprise 9
Mapping type	Map field and transform value (Single field).
Source field	snmpTrapOID
Target field	snmpTrapOID

Transform Value Pairs	• Pair 1
	  ○ **Key**: iso.org.dod.internet.private.enterprises.cisco.0
	  ○ **Value**: reload
	• Pair 2
	  ○ **Key**: iso.org.dod.internet.private.enterprises.cisco.0
	  ○ **Value**: tcpConnectionClose

What to do next

Test an event field mapping by sending an event that includes a field that is present in the event field mapping.

Event identifiers

Event identifiers uniquely distinguish one event from another. Event Management uses these identifiers to determine whether to create a new alert or update an existing one.

By default, an event is uniquely identified by the following fields:

- **Message Key**
- **Domain**
- **Category**

Changing the **Category** field (for example, through a Background Script or Business Rule) may lead to unexpected system behavior.

If the **Message Key** is not provided, the system automatically generates one by concatenating the following fields:

- **Source**
- **Type**
- **Node**
- **Resource**
- **Metric Name**

If the above fields are not defined in the incoming event, you can define them using event rules.

Alert tags

Alert tags allow consolidation for all normalized fields and improve the admin experience to transform and normalize alert fields (key/value) enabling reuse of normalized fields across

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

different sources. This improves alert quality for correlation and provides more out-of-the-box TBAC (Tag Based Automatic Correlation) definitions.

Example: Field normalization in alert management

In some cases, the same information may exist under different field names across data sources. For instance, an incoming event from one source has the location stored under the field **region**, but in other source, the same information is captured under **impacted_region**. To avoid confusion and enable consistent grouping, filtering, or automation, we normalize these fields by creating a unified field — for example,**t_region**. This field pulls the value from **region** or from **impacted_region** depending what field is present in the event. This way, the normalized field **t_region** always holds the location value in a consistent manner, regardless of the original source field.

Alert tags field appears in the Alerts form. These tags are created by Event Rules and in Event mapping and are saved in the alert tags' table [em_alert_tags]. The naming convention used to create key/value pairs is t_<tag name>. This enables reusing tags in the event rules by allowing users to select tags that were previously defined. When new alert tags are defined, TBAC (Tag Based Alert Clustering) tags are automatically created. Using these TBAC tags, you can create new TBAC alert clustering definitions from the new source of tags.

Event field format for event collection

Event Management requires all events to use a standard form, regardless of how they arrive at the instance.

In the application navigation filter, enter `em_event.list`.

Event form

Name	Description
em_event.source [Source]	Event monitoring software that generated the event, such as SolarWinds or SCOM. Maximum length: 100 characters.
em_event.node [Node]	Node name, fully qualified domain name (FQDN), IP address, or MAC address that is associated with the event, such as IBM-ASSET. Maximum length: 100 characters.
em_event.type [Type]	Optional. The metric type to which the event is related, such as Disk or CPU, which is used to identify an event record from which alerts are created. Maximum length: 100 characters.
em_event.resource [Resource]	Node resource that is relevant to the event. For example, Disk C, CPU-1, the name of a process, or service. Maximum length: 100 characters.
metric_name [Metric Name]	The name of the metric that has been measured, such as `DB Disk Free Space (MB)`, `Disk Writes/sec`, or `Disk Write Bytes/sec`.
em_event.event_class [Source instance]	If the em_event.node field is not specified, it is mandatory for alerts to be created automatically. Values for the em_event.event_class field originate from either the source generating the events or by event rule. Name of the machine or software that generated the event. For example, SolarWinds on 10.22.33.44. Corresponding field display name is **Source Instance**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Event form (continued)

Name	Description
em_event.message_key [Message key]	Unique event identifier to identify multiple events that relate to the same alert. If this value is empty, it is generated from the **Source**, **Node**, **Type**, **Resource**, and **Metric Name** field values. Maximum length: 1024 characters.
em_event.ci_type [CI type]	String containing information about CI type. Maximum length: 100 characters.
em_event.severity [Severity]	Event severity options are: • **Critical**: Immediate action is required. The resource is either not functional or critical problems are imminent. • **Major**: Major functionality is severely impaired or performance has degraded. • **Minor**: Partial, non-critical loss of functionality or performance degradation occurred. • **Warning**: Attention is required, even though the resource is still functional. • **OK**: An alert is created. The resource is still functional. • **Clear**: No action is required. An alert is not created from this event. Existing alerts are closed.
em_event.resolution_state [Resolution state]	Optional. If the field is empty, the resolution on corresponding alerts is still pending. Event state from the event source is either **New** or **Closing**. • **New**, the resolution on corresponding alerts is open. • **Closing** event state closes corresponding alerts.
em_event.time_of_event [Time of event]	Time that the event occurred in the source system. This field is a GlideDateTime field in UTC or GMT format. Maximum length: 40 characters.
em_event.state [State]	Current processing state of the event: • **Ready**: Event has been received and is waiting to be processed. • **Processed**: Event was successfully processed. • **Ignored**: Value is not in use. • **Error**: Failure occurred while processing the event. For example, the event collection method or event **Severity** is blank.
em_event.alert [Alert]	If an alert was created as a result of the event, this field contains the unique ID that Event Management generates to identify the alert.
em_event.description [Description]	Reason for event generation. Shows extra details about an issue. For example, a server stack trace or details from a monitoring tool. Maximum length: 4000 characters.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Event form (continued)

Name	Description
em_event.additional_info [Additional information]	Optional. A JSON string that gives more information about the event. The JSON data is supported for String values only, other value types are not supported. You must convert numbers to String values by enclosing them in double quotes. For example, this value is not supported: {"CPU":100 } while this value is supported: {"CPU":"100"}. Another example of a valid JSON string is: {"evtComponent":"Microsoft-Windows-WindowsUpdateClient","evtMessage":"Installation Failure: Windows failed. Error 0x80070490"}. This information can be used for third-party integration or other post-alert processing. Values in the **Additional information** field of an Event that are not in JSON key/value format are normalized to JSON key/value format when the event is processed. For example, assume that the following plain text is in the **Additional information** field "Connection instance is successful". When the event is processed, all this plain text becomes one JSON string and might not be useful within an alert. In the resultant alert, this string is in the **Additional information** field in JSON key/value format, containing the data: {"additional_content": "Connection instance is successful"}.
processing_notes [Processing Notes]	Display of the events processing log.

Custom alert fields

You can populate custom alert fields with data contained in **Additional information** field of the event.

Valuable data contained in **Additional information** fields of events can be useful, for example, for reporting. Alert fields are automatically populated from fields that have the same name in the event. This behavior holds true for **Additional information** event fields and for **Additional information** fields that Event Rule adds. Therefore, to populate a custom alert field with the value in **Additional information** fields, use the custom field name in the **Additional information** field. You can also use Event Rules for this purpose. Values in the **Additional information** field of an Event that are not in JSON key/value format are normalized to JSON format when the event is processed. For more information, see Configure an event rule to customize alert content.

The short description field of an alert is automatically written using the type, node, and description of the alert. To prevent the short description field from being over-written, open the *sys_properties* table, locate the *evt_mgmt.override_alert_short_description* property, change the value to `false`, and then click **Update**.

Depending on permissions, you may only be able to create fields with the **user_** prefix. If so, use Event Rules to create an **Additional information** field with the same name. To prevent some fields to be copied to the alert field, use the *evt_mgmt.alert_black_list_fields* property and add the field names that must be excluded. By default, the fields that are not copied are:

- message_key
- category
- additional_info

- sys_created_on
- sys_mod_count
- sys_id

Testing and sending events

You can manually test and send events to confirm that Event Management properly manages events and generates alerts.

Before you begin

Role required: evt_mgmt_admin

About this task

For example, you can manually send events to:

- Confirm that the MID Server is using an event connector definition and instance to send events.
- Confirm that event rules, event field mapping, and other configurations do generate alerts.
- Track an operation or action that did not generate an event.

Procedure

1. Navigate to **All** > **Event Management** > **All Events**.
2. Click **New** and then fill in the fields.

Event form

Name	Description
Source	Event monitoring software that generated the event, such as SolarWinds or SCOM. Maximum length: 100 characters.
Node	Node name, fully qualified domain name (FQDN), IP address, or MAC address that is associated with the event, such as IBM-ASSET. Maximum length: 100 characters.
Type	The metric type to which the event is related, such as Disk or CPU, which is used to identify an event record from which alerts are created. Maximum length: 100 characters.
Resource	Unique event identifier to identify multiple events that relate to the same alert. If this value is empty, it is generated from the **Source**, **Node**, **Type**, **Resource**, and **Metric Name** field values. Maximum length: 1024 characters.
Metric Name	The name of the metric that has been measured, such as `DB Disk Free Space (MB)`, `Disk Writes/sec`, or `Disk Write Bytes/sec`.
Source instance	Name of the machine or software that generated the event. For example, SolarWinds on 10.22.33.44. Corresponding field display name is **Source Instance**.
Message key	Unique event identifier to identify multiple events that relate to the same alert. If this value is empty, it is generated from the **Source**, **Node**, **Type**, **Resource**, and **Metric Name** field values. Maximum length: 1024 characters.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
Severity	The severity of the event. The options are typically interpreted as follows: ○ **Critical**: Immediate action is required. The resource is either not functional or critical problems are imminent. ○ **Major**: Major functionality is severely impaired or performance has degraded. ○ **Minor**: Partial, non-critical loss of functionality or performance degradation occurred. ○ **Warning**: Attention is required, even though the resource is still functional. ○ **Clear**: No action is required. An alert is not created from this event. Existing alerts are closed. ○ **OK**: An alert is created. The resource is still functional.
Resolution state	Optional. If the field is empty, the resolution on corresponding alerts is still pending. Event state from the event source is either **New** or **Closing**. ○ **New**, the resolution on corresponding alerts is open. ○ **Closing** event state closes corresponding alerts.
Time of event	Time that the event occurred in the source system. This field is a GlideDateTime field in UTC or GMT format. Maximum length: 40 characters.
State	The current processing state of the event: ○ **Ready**: Event has been received and is waiting to be processed. ○ **Processed**: Event was successfully processed. ○ **Ignored**: Value is not in use. ○ **Error**: Failure occurred while processing the event. For example, the event collection method or event **Severity** is blank.
Alert	If an alert was created as a result of the event, this field contains the unique ID that Event Management generates to identify the alert.
Description	Reason for event generation. Shows extra details about an issue. For example, a server stack trace or details from a monitoring tool. Maximum length: 4000 characters.
Additional information	A JSON string that gives more information about the event. The JSON data is supported for String values only, other value types are not supported. You must convert numbers to String values by enclosing them in double quotes. For example, this value is not supported: {"CPU":100 } while this value is supported: {"CPU":"100"}. Another example of a valid JSON string is: {"evtComponent":"Microsoft-Windows-WindowsUpdateClient","evtMessage":"Installation Failure: Windows failed. Error 0x80070490"}. This information can be used for third-party integration or other post-alert processing. Values in the **Additional information** field of an Event that are not in JSON key/value format are normalized to JSON key/value format when the event is processed. For example, assume that the following plain text is in the **Additional information** field “Connection instance is successful”. When the event is processed, all this plain text becomes one JSON string and might not be useful within an alert. In the resultant alert, this string is in the **Additional information** field in JSON key/value format, containing the data: {“additional_content”: “Connection instance is successful"}.

3. Click **Submit**.

View event processing statistics

Extract statistics from your instance to ensure that performance is not affected and extract metrics related to event processes to monitor event processing status.

Before you begin

Ensure that the *Event Management - Collect xmlstats* job is active. Configure this scheduled job by navigating to **System Definition** > **Scheduled Jobs**.

You can control the processing of event statistics using the *evt_mgmt.event_processing_stats_period* property. For information about configuring this property, see Configure statistics processing period.

Role required: evt_mgmt_operator

About this task

You can view key metrics from the instance to ensure that performance is not affected and monitor the status of the processing of events. For more information about viewing self-health monitoring statistics, see View Metric Intelligence self-health statistics.

Procedure

1. In a browser where the instance is running, run the XML Stats script by appending the following text to the instance URL: `xmlstats.do?include=XMLStatsEm`
2. Press **Enter**.
3. Monitor the event processing metrics that are reported to ensure that events are processed according to accepted benchmark values.

Result

Example: Sample output after running the XML Stats script

```
<xmlstats created="Tue Oct 23 04:01:25 PDT 2018"
 includes="XMLStatsEm" version="2">
<itom_event_management>
<event_processing>
<processed count="47" max_process_time="10"
 mean_process_time="5" record_time="2018-10-23 11:00:41"/>
<ready count="7" oldest_ready_event="37" record_time="2018-10-23
 11:00:41"/>
<error count="5" record_time="2018-10-23 11:00:41"/>
<total_created count="5" record_time="2018-10-23 11:00:41"/>
</event_processing>
</itom_event_management>
</xmlstats>
```

The event processing metrics in the report are described in the following table.

Note: The default processing cycle is events created in the last hour and updated in the last minute.

Event processing statistics

Metric	Description
Event processing statistics	
processed count=n	Number of events processed by the instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Event processing statistics (continued)

Metric	Description
max_process_time=n	Longest time taken by the instance to process an event.
mean_process_time=n	Average time taken by the instance to process the events in this cycle.
Event ready statistics	
ready count=n	Number of events that are in Ready state and are available to be processed. Default processing cycle: events created in the last hour and updated in the last minute.
oldest_ready_event=n	Longest time taken by an event to remain in Ready state. If this metric has a value that is bigger than your benchmark figure, investigate the event further to determine what is impeding the processing. Default processing cycle: events created in the last hour.
Other processing statistics	
error count=n	Number of events for which errors were reported. Default processing cycle: events created in the last hour and updated in the last minute.
total_created count=n	Overall number of events that were processed during this event processing cycle. Default processing cycle: events created in the last hour.

Enable processing of event process statistics

Enable the system property that switches on statistics processing for events to let the platform collect and analyze metrics such as event volume, processing flow, and handling time. This helps you monitor system performance, identify bottlenecks, and optimize event handling for faster and more efficient operations.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **System Properties** > **All Properties**.
2. Select **New** and fill in the form.

System property fields

Field	Description
Name	Name of the property you are creating.
Description	Narrative that describes the property and its function.
Choices	Comma-separated values for a choice list. If you need a different choice list label and value, use an equal sign (=) to separate the label from the value. For example, Blue=0000FF, Red=FF0000,Green=00FF00 displays Blue, Red, and

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Green in the list, and saves the corresponding hex value in the property value field.
Type	Data type, that is selected from a list (for example, integer, string, or true|false).
Value	Desired value for the property. When retrieving properties using the *gs.getProperty()* method, treat the results as strings. For example, a true|false property returns 'true' or 'false' (strings), not the Boolean equivalent.
Read roles	Roles that have read access to this property.
Write roles	Roles that have write access to this property.

3. Select **Submit**.

Add a system property

Configure statistics processing period

Set the time period, in seconds, for collecting event processing statistics. For example, you can set a time period twice as long as the default 60 seconds to collect more statistics.

Before you begin

Role required: evt_mgmt_admin

About this task

Use the *evt_mgmt.event_processing_stats_period* property to configure the XMLStatsEm script time to collect event processing statistics. The default value of this property is 60 and the unit is second. Set the property values to run the script over a longer or shorter period. For example, set a shorter period of statistics collection so fewer CPU resources are used.

Procedure

1. Navigate to **All** > **System Properties** > **All Properties**.
2. Search for the *evt_mgmt.event_processing_stats_period* property.
   Either configure the value of an existing *evt_mgmt.event_processing_stats_period* property to run the XMLStatsEm script over a shorter or longer time period or create a new property if it does not exist already.
   - If the property exists, set the property to the required time period to enable the XMLStatsEm script time to collect event processing statistics and click **Update**.
   - If the property does not exist, click **New**, fill in the form, and click **Submit**.

Add a system property

Manage and monitor alerts

An alert is a notification for selected events that are considered to be important and require attention. Event Management generates alerts based on event rules.

You can monitor and resolve alerts in ways that are based on alert impact calculations and alert configuration and property settings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert management rules for resolving alerts

You can configure Event Management to respond to alerts automatically. An alert management rule determines the required alert response, such as to open an incident, knowledge base article, open a task, launch remediation action.

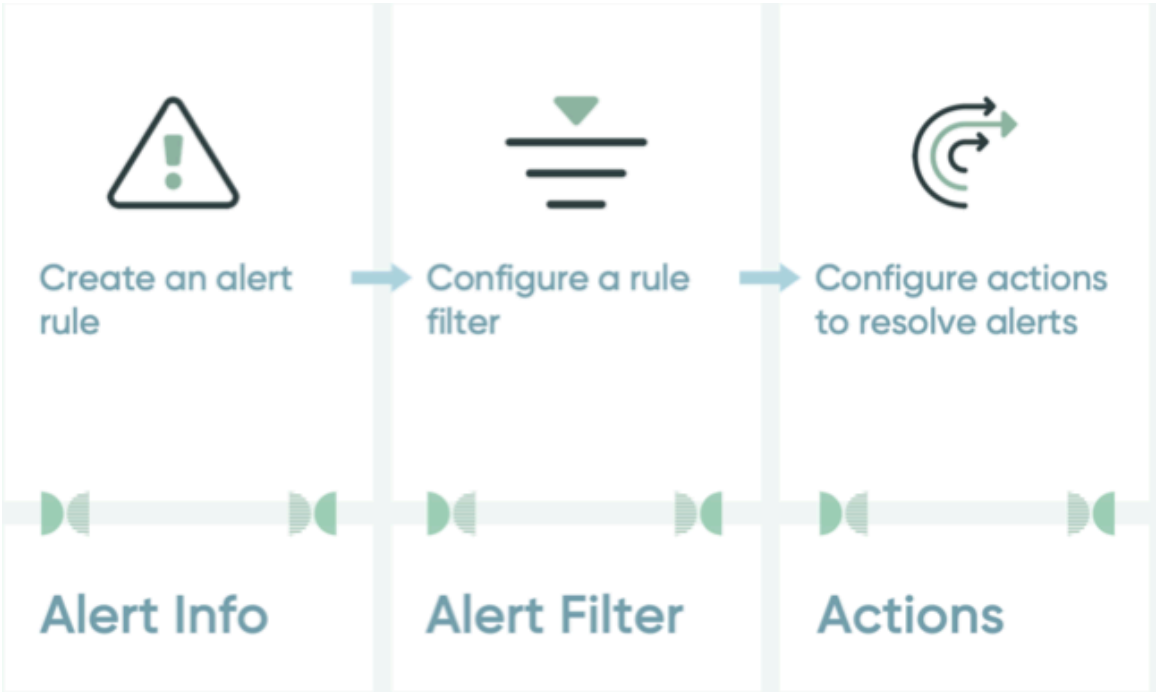
Alert management rules provided with the base system as a store application (Alert Rules Management [sn_em_arm]) to help you respond to alerts. You can create filters to specify conditions for the rule so that the remedial action specified in the rule takes effect only when the conditions are met. For example, launch the required subflow or open an incident based on an alert. The alert's execution history is automatically updated to indicate the actions that were invoked.

Users with the evt_mgmt_admin role can use the alert management rule designer to create and customize alert management rules to act on specified alerts. Define rules with filters to determine which alerts the rule applies to. You can create rules to launch applications, URLs, subflows, remediation actions, or take other actions, such as to open an incident. For more information, see Create an alert management rule.

Users with the evt_mgmt_operator role can manually run alert management rules.

Alert management rule flow

The flow to create and run an alert management rule is:



Alert management rule components

Component	Description
Alert Info	Configure a name and general information for the rule.
Alert Filter	Specify a filter to determine to which alerts the rule applies. You can specify the related list conditions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert management rule components (continued)

Component	Description
	Note: The fields that are not supported for alert filtering are: Overall Event Count, Priority, Priority Group, Priority Breakdown, Tags, and Impacted Services.
Actions	Specify the response to the alert, such as to run a subflow, perform remediation action, launch an application, or launch a URL in a browser.

How rules are applied to updated alerts

Alert management rules run on all updated open alerts. Rules don't run on closed alerts, even if they've been updated. The filters determine whether the rule's actions apply to the alert. For example, if a rule's condition indicates that an email message is sent when the alert severity changes to Major, the rule applies to an alert updated by a severity change from Warning to Major.

Use of filters and other actions

Filters ensure that the rule is invoked only when the configured condition occurs, and not for every update of the alert. For example, you can configure a rule so that updates that aren't relevant (such as a **Work notes** field update) don't cause the rule to run. As another example, a filter condition can specify that the alert management rule runs only when the alert severity is critical.

You can perform the following actions:

- Specify a filter that determines which alerts the rule applies to.
- In the Related List Conditions section of the form, configure additional conditions, for example, with an *Alert > Parent* relationship, to filter for any alerts that were received today.
- Respond to alerts. For example, by using subflows and workflows, create incidents for primary alerts with critical severity, or open a search engine in a browser to search for data according to the description field of the alert.
- Apply remediation. Remediation is based on Orchestration workflows that can be scripted to perform remediation tasks such as gathering system information or rebooting a server.

Note: For enhanced performance of *Event Management - Evaluate Scoped Alert Rules Management* scheduled jobs, use subflows instead of workflows.

Scheduled jobs that check alert management rules

Alert management rules are checked every 11 seconds by the default *Event Management - Evaluate Scoped Alert Rules Management0* scheduled job. The job then executes the required actions. For large-scale environments, you can add more than one job. Please contact Customer Service and Support.

Note: Only new users from Vancouver and up get two scheduled jobs: *Event Management - Evaluate Scoped Alert Rules Management0* and *Event Management - Evaluate Scoped Alert Rules Management1*. Users upgrading from previous family releases remain with a single scheduled job *Event Management - Evaluate Scoped Alert Rules Management0*.

Don't modify the *sn_em_arm.alert_management.num_of_jobs* property.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

By default, the alert grouping job (**Service Analytics group alerts using RCA/Alert Aggregation**) and the alert management (**Event Management - Evaluate Scoped Alert Rules Management0**) jobs run independently of each other. For more information about coordinating the alert response and the automated alert grouping, see Synchronizing alert response with automated alert grouping.

Migrate existing alert action rules

Existing alert action rules from an earlier release can be migrated to become alert management rules. You can modify an alert action rule only after migrating it to an alert management rule. For more information, see Migrate an alert action rule to an alert management rule.

Create an alert management rule

Create an alert management rule to track alerts and resolve them by determining the required response, for example, to open an incident or launch remediation action.

Before you begin

To enable remediation with a subflow, you can use a subflow that is available with the base system, or you can create your own subflow. For details, see Create a custom subflow for alerts.

Role required: evt_mgmt_admin, flow_designer

About this task

Note: Use Respond automation in Service Operations Workspace, the updated way to automate alert responses with an easier interface.

Use alert management rules to track and resolve alerts.

While working in the alert management rule designer, you can work in multiple sections without losing information in any section.

Note:

- Alert management rules that are not configured to perform any action are skipped and the rule is automatically set to inactive.
- Mark the alert with the **In Maintenance** status when:
  - an alert is bound to a CI by a user action, such as an alert management rule
  - and the CI is in the Maintenance state

Create alert management rules that:

- Locate other alert management rules that have relevance to the selected alert.
- Determine when the execution of the rule takes place.

Alert management rules do not necessarily complete in the order in which they are invoked.

You can configure alert management rules to:

- Automatically generate and link incidents, tasks, or knowledge articles to alerts.
- Automatically apply a remediation workflow or enable users to manually run remediation.
- Automatically construct a URL according to the value of specified fields in the alert.

To assist you, several alert management rules are provided with the base system. You can use them as presented or you can use them as examples to build custom alert management rules.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert management rules provided with the base system

Rule	Description	Active
Open sensor dashboard in PRTG	The sensor dashboard in the Paessler PRTG Network Monitor (PRTG) application opens.	Yes
Oracle EM Launch Target Status and View Events	Launch Oracle Enterprise Manager to view: • Target Status • Event for alerts from source Oracle EM	Yes
Drilldown to OMI	Drill down to the HP Operations Manager i (OMi) application.	Yes
Create Incident on Primary Critical Alert	Create an incident for primary critical alerts. The incident can be created automatically or manually.	No
Search Google for "description"	Open Google Search in a browser to search for data according to the description that appears in the alert.	Yes
Create Incident	Create an incident for all alerts that are not in maintenance state. The rule runs automatically on selective update.	No
Create Incident Manually	Manually create an incident for alerts that are not in maintenance state.	Yes
Create Major Incident Candidate	Create a major incident candidate for all alerts that are not in maintenance state and are not secondary alerts. A major incident candidate can be promoted to become a major incident.	No
Create Major Incident	Create a major incident for all alerts that are not in maintenance state and are not secondary alerts.	No

If your instance was upgraded from Kingston, the alert action rules that were provided with the Kingston base system are available to you. However, if you modified any of the rules, the changes made are not carried over.

Alert management rules run 5 seconds after an alert is updated, resetting the timer if updates occur within that window. This delay ensures remediation actions, such as incident creation, are triggered only when the issue is clear and stable, reducing duplicates and unnecessary noise. To change the default 5-second delay, create the `evt_mgmt.alert_rule_delay` property on the **All** > **System Properties** > **All Properties** and change the value. To know how to create a property, see Add a system property.

Procedure

1. Navigate to **Event Management** > **Rules** > **Alert Management Rules**.
2. Click **New** and then fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert Management Rule form

Field	Description
Name	Unique name for the rule.
Active	Check box for enabling the rule. If this check box is selected, you must specify: ○ in the **Alert Filter** section, an alert filter ○ in the **Actions** section, at least one of any of these actions: ▪ active subflow ▪ workflow ▪ quick response
Order	Order in which rules are evaluated when multiple rules are defined for the same alert. Alert management rules are evaluated in ascending order. The default value is `100`.
Multiple alert rules	Instruction about whether to search for additional rules: ○ **Search for additional rules**: Execute the current rule then continue and execute other matching rules in the order of rule priority, where the lower number has the higher priority. ○ **Stop search for additional rules**: Execute only the current rule for the alert that matches the filter. When selecting this option, a rule configured second in a rule hierarchy may run before the results of the first rule take effect.
Description	Descriptive text for the rule.
Assignment group	Assignment group that works on the alert. If no assignment group is defined in the alert rule, then this alert rule is considered as a global rule. When the rules are running – first the global rules run and then the rules that belong to the assignment group of the alert.

3. Click **Alert Filter** and specify conditions for alerts that this rule is applied to.

Alert Filter stage

Field	Description
Rule is activated when	Rule execution takes place when: ○ **Alert changes to filter**–content changes to the alert cause the alert to match the filter. If the filter is matched on following update of the alert, the rule is not applied. If the alert was closed and then reopens, at the next update of the alert and the filter is matched, the rule is applied. Thereafter, when there is an update of the alert, the rule is no longer applied.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **Alert matches filter**–the content of the alert matches the filter. On following update of the alert and if the filter is matched, the rule runs and is applied to the alert. The rule remains applied for every matching update.
Alert filter	
Preview	Function to preview alerts that match the specified condition. A hyperlink shows how many alerts match the filter.  If you click the hyperlink, the browser opens another tab that lists alerts in the Alerts [em_alert_list] table. The list shows which alerts match the rule, including closed alerts. Alerts that have already been run by the rule are not marked in any way. You can click any alert to view further details.
Conditions	Conditions that, if fulfilled, cause the filter to be applied. For more information about building conditions, see Using the condition builder. To add another condition, click **New Criteria**. **Note:** The **Created on** condition is not invoked when running the **Event Management - Evaluate Alert Management Rules** job. Instead, use the **Updated on** condition, as the job detects alerts based on the time they were updated and not on the time they were created.
Related List Conditions	Conditions to include a relationship with another table in the filter. **a.** Click **Table** and select the required table. **b.** Specify the conditions for this filter. For more information about creating related lists, see Add related list conditions.

4. Click **Actions**.
   In this section, you can configure the following action types as a response to alerts or to remediate alerts:
   - Remediation Subflows: Execute a subflow provided with the base system.
   - Launch Applications: Open applications and browsers that you configure.

   Note: The Remediation Workflows option is deprecated. To enable flows to be triggered by alerts, use the Flow Designer.

5. **Optional:** In the Remediation Subflows section, follow these instructions to add subflows:

   a. Under **Subflow**, double-click the cell.

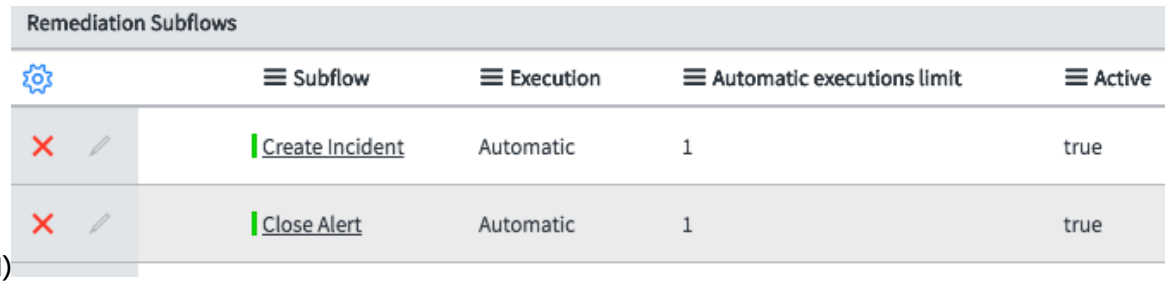
   b. Click the search icon.
   The list of subflows provided with the base system appears. For more information, see Event Management subflows in the base system.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. From the subflow list, select a subflow.

d. Repeat, adding as many subflows as required.

(Optional)



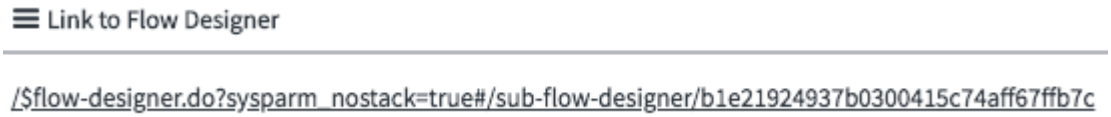
e. To specify when the subflow must be executed, double-click the cell under **Execution**.

Subflow execution options

Name	Description
Automatic	The subflow is executed automatically when the rule is matched.
Manual	Execute the subflow if required when the rule is matched.
Both	When the rule is matched, the subflow is executed automatically and you can optionally execute the subflow again manually.

f. Under **Automatic executions limit**, double-click the cell and enter the integer number of times to execute the subflow.
After the subflow has been executed the indicated number of times, it does not run anymore.

g. To enable the subflow to be executed, double-click the cell under **Active** and select `true`.
A link in the cell under **Link to Flow Designer** appears only after a subflow has been selected and the rule has been saved.



6. To add instructions to launch applications or to open browser windows, in the Launch Applications area:

a. Under **Display Name**, double-click the cell.
Specify a name for the link.

b. In the **URL** field, compose the URL using data from the alert in the format:`http://${source}.com:${port}/${cmdb_ci.name}`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The **Active** field is automatically updated.

Any URL-based action can utilize the alert parameters and the URLs can refer to wikis, messaging services, REST APIs, and so on.

7. Click **Submit**.

Result

The alert management rule is added to the list of available rules that can be used to resolve alerts.

Related topics

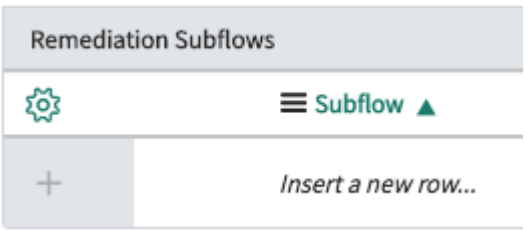
Apply a quick response in an alert

Event Management subflows in the base system

The subflows provided with the base system appear in the Remediation Subflows area of alert management rules.

Accessing the subflows

Navigate to **Event Management** > **Rules** > **Alert Management Rules** and click **New**. Click the **Actions** tab. In the Remediation Subflows area, double-click the **Insert a new row** field.



Click the search icon to add subflows. The list of subflows that are provided with the base system appears.

Subflows in the base system

Name	Description
Acknowledge Alert	Subflow to mark the alert as being Acknowledged. Acknowledge an alert to show that further attention is required.
Attach Knowledge Article (legacy)	Subflow to attach a knowledge article to the alert. This subflow is provided for instances that are migrated from legacy releases (prior to the London release). **Note:** Add the **Knowledge article** column to the Alert Management Rules [em_alert_management_rule] table, and select an article to attach to an alert when the rule executes.
Change Alert to Maintenance Mode	Subflow to mark the alert as being in Maintenance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Subflows in the base system (continued)

Name	Description
Close Alert	Subflow to mark the alert as being Closed.
Create Incident	Subflow to create an incident. Fields from the alert are used to populate the matching fields in the incident that is created. **Note:** • If there is an existing incident that is attached to the alert, this subflow is not activated. • If the alert is in Maintenance, an incident is not created. • The alert management job runs even if the alert grouping job is not complete, if a specified time frame has passed. When this occurs, you can enable the *Avoid INTs on secondary alerts* rule to prevent incidents from being created for secondary alerts. This prevents duplicate incidents because an incident already exists for the primary alert when the *evt_mgmt.avoid_int_enabled* property is enabled.
Create Major Incident Candidate	Subflow to create a major incident candidate. Fields from the alert populate the matching fields in the major incident candidate that is created. A major incident candidate can be upgraded to become a major incident. **Note:** • If there is an existing incident that is attached to the alert, this subflow is not activated. • If the alert is in Maintenance, a major incident candidate is not created. • If the **Role in group** is **Secondary**, the major incident candidate is not created.
Create Major Incident from Alert	Subflow to create a major incident from alert. Fields from the alert are used to populate the matching fields in the major incident that is created.

Subflows in the base system (continued)

Name	Description
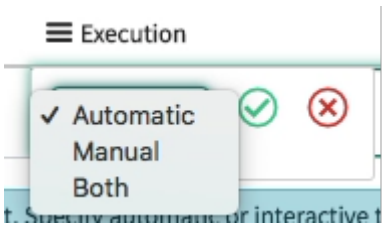
	script for instances migrated from legacy releases (prior to the London release). If configured, apply the task template. **Note:** Add the **Task template** column to the Alert Management Rules [em_alert_management_rule] table, and select a task template and task to apply when the rule executes.
Overwrite Alert Template (legacy)	This subflow applies the alert template. This subflow is provided for instances that are migrated from legacy releases (prior to the London release). **Note:** Add the **Task type** column to the Alert Management Rules [em_alert_management_rule] table, and select an alert template to apply when the rule executes.

1. Select the subflow that you need.
2. To customize a subflow, see Create a custom subflow for alerts. This topic also describes the input parameters in a subflow.
3. To specify when the workflow must be executed, double-click the cell under **Execution**.



.

Create a custom subflow for alerts

You can create a subflow according to your requirements. For example, you can resolve alerts, notify teams, or run remediation actions.

Before you begin

Role required: evt_mgmt_admin, flow_designer

About this task

Copy an existing subflow, and then customize it. Publish the custom subflow so that it is available to be used to resolve any alert. For more information, see Create a subflow.

Note: If your ServiceNow instance uses domain separation, you must ensure that the new custom subflow that you created operates only on the data of the designated domain.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

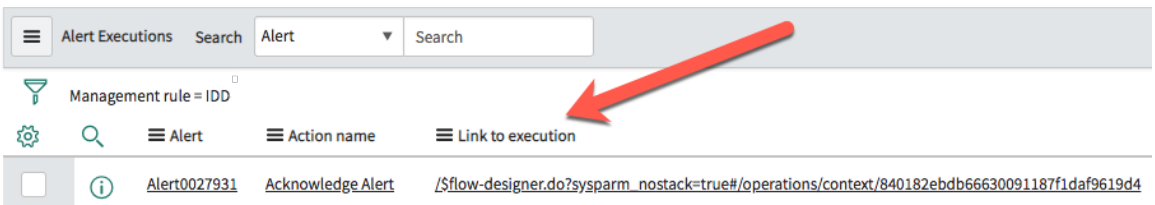
Procedure

1. Navigate to **All** > **Process Automation** > **Flow Designer**.
2. In the Flow Designer window, click **Subflows**.
3. Click **Create Incident**.
   The Create Incident subflow opens in Flow Designer in read-only format. The inputs in the Create Incident subflow are described in the following table.

Create Incident input parameters

Value	Description
alertRuleName	The name of the alert management rule that specifies this subflow, for example `IDD`.
alertRuleId	The sys_id of the alert management rule, for example, `1ae122e84f5f1300b28392918110c71e`.
alertGR	The alert record that matches the filter that is defined in the alert management rule, for example, `Alert0027931`
executionId	The ID of the execution to be retrieved, for example, `000182ebdb66630091187f1daf9619d4`
userName	The current user's name, for example, `admin`.
userDisplayName	The name that the current user specified to be displayed, for example, `System Administrator`.

For example, in an alert management rule that has processed alerts, in the Alert Executions area, click the **Link to execution** of the required alert.



The Flow Designer opens. Click **Subflow Inputs and Outputs**. The input variable names of the subflow are displayed with their respective values.

4. In the subflow header, click more actions and select **Copy subflow**.
5. In the **New Subflow Name** field, enter the name of the new subflow.
6. To limit the application scope of the subflow, in the **Application** field, select the required application, otherwise select `Global`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Click **Copy**.
   The new subflow is created and is opened as a tab in the subflow designer editor. The inputs provided by the template appear.

   Inputs are fixed and cannot be added to.

   In the editor, you can delete subflow inputs or outputs, as required.

8. To delete an input, click .
   Inputs are fixed and cannot be added to.
9. Create subflow outputs by defining the names and data types.
   a. Click to add output.
   b. Define the name and the data type.
10. To save the subflow in draft status, click **Save**.
11. To save and publish the subflow so that it can be used in the alert management rule designer, click **Publish**.

Result

Include the modified subflow in an alert management rule to resolve alerts according to your customized requirements.

Subflows

Alert executions information

Alert executions information provides a reference to the alert management rule actions that are performed. This information appears in the Alert Management Rule record only if an alert matches the filter in the rule and an action was performed. You can click any link in the Alert Executions list to open the referenced item.

Alert Executions

In the Alert Management Rule record, the Alert Executions list shows key related records for the rule.

Note: The Alert Executions list in the Alert Management Rules record shows alert execution information and lists the alert management rules that the selected alert matched.

Alert Executions list

Information in the Alert Executions list

The columns in the Alert Executions list are populated with details of the alerts that matched the alert management rule and the actions that ran. The listed alerts match the filter in the rule.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

View alert execution information

You can click any link in the Alert Executions list to view the alert execution information of the referenced item. This information appears in the Alert Management Rule record only after an alert matched the filter in the rule and an action was performed.

Before you begin

Role required: evt_mgmt_admin

About this task

Among the information shown in the Alert Executions list is:

- The list of alerts that matched the filter of the rule.
- The tasks, including incidents, that were opened.
- Which remediation workflows ran and which subflows ran.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Alert Management Rules**.
2. In the Alert Management Rules list, click the rule.
   If an alert matched the filter in the rule and an action was performed, the Alert Executions list appears in the Alert Management Rules record. The list appears irrespective of the stage of the selected alert management rule.

Alert Executions list

Column	Description
Alert	Alert number of the alerts that matched the alert management rule.
Action name	Name of the action that was taken to resolve the alert (subflow or workflow).
Link to execution	Link to the action execution log that was created when the action was performed.
Related task	Link to the task that was created when the alert was resolved. For example, if the action for a rule is to create an incident, this field provides the incident number with a link to open the incident. A link is provided to the workflow remediation task that is created to monitor the remediation.
Log	Notice or information showing the result of the execution action, for example, how executions took place, "`1 out of 2 executions`". When the alert closes, the execution count number (the first number) resets to 0. This information does not indicate that the subflow was executed successfully, rather that the call to that subflow was successful and that the subflow is correctly configured.
Automatic run	Indication of how the action ran: automatically (true) or manually (false).
Created	Date and time that the entry was created.

© 2026 ServiceNow, Inc. All rights reserved.

Migrate an alert action rule to an alert management rule

Existing alert action rules from an earlier release can be executed, but cannot be modified. Alert action rules that have been migrated become alert management rules and all the definitions of the alert action rules are migrated to the alert management rule format. Migrated rules can be modified.

Before you begin

Role required: evt_mgmt_admin

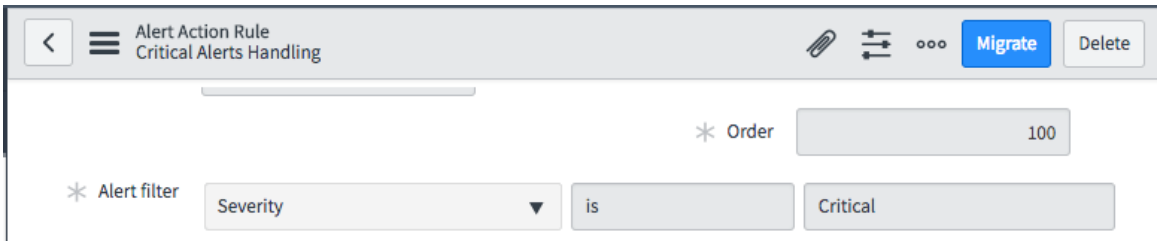
About this task

Existing alert action rules are active, read-only rules. An alert action rule can be modified only after it is migrated to an alert management rule.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Alert Action Rules**.
2. Select an alert action rule to migrate or delete.

Alert Action Rule record



3. Click **Migrate**.
   If you clicked **Migrate**, the list of migrated rules can be found, together with new alert management rules, by navigating to **Event Management** > **Rules** > **Alert Management**.

   After a successful migration, all the definitions of the alert action rules are migrated to the alert management rule format.

Result

When an alert action rule has been migrated successfully, the alert action rule can no longer be modified. However, the new alert management rule can be modified.

What to do next

If the alert action rule that was migrated had a task template, you can customize the alert management rule designer to display the task template name.

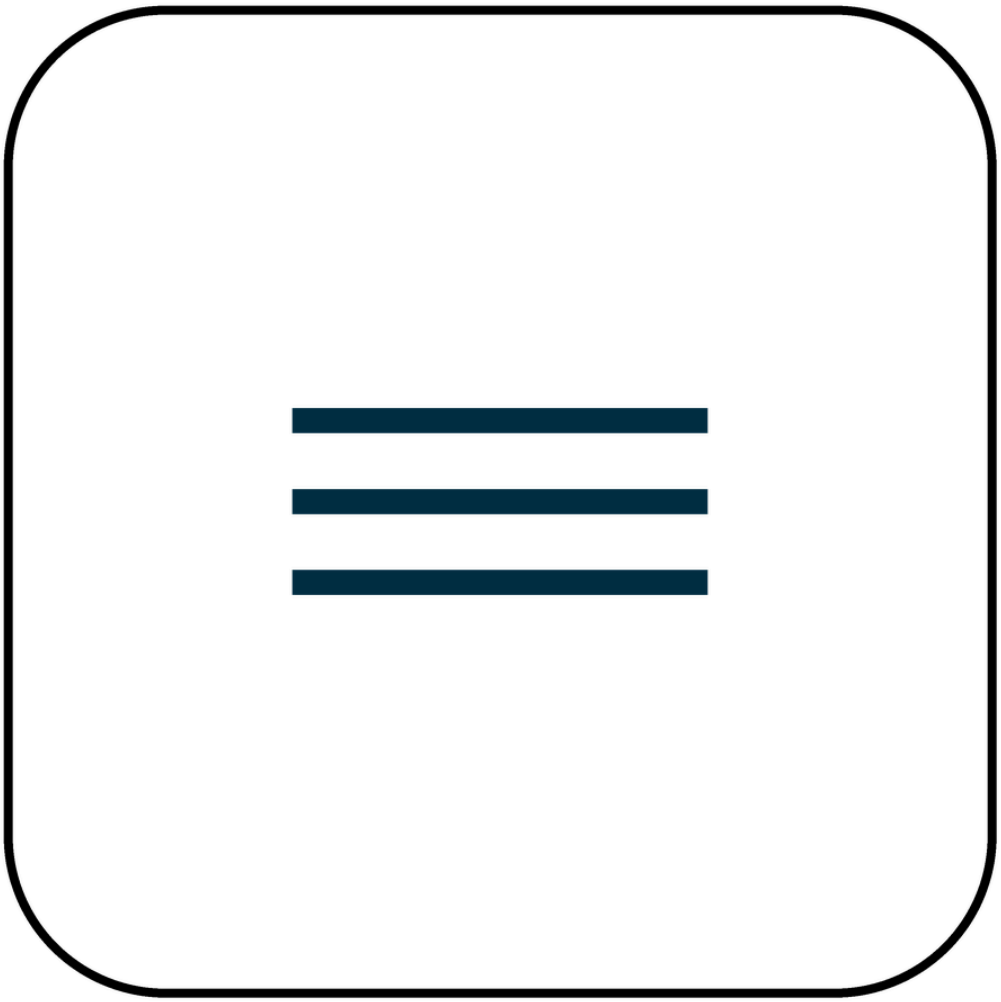
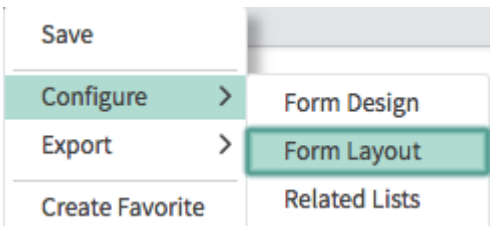
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. In the header of the alert management rule, click **Additional actions**



2. Select **Configure** > **Form Layout**.

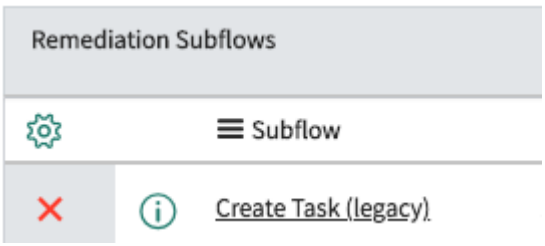


3. In the **Available** pane, select **Task template** and move it to the **Selected** pane. Position it as required.

4. In the **Task template** field, select the required template.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. In the Actions tab, in the Remediation Subflows area, select the Create Task (legacy) subflow to run the task template.



Related topics

Apply a quick response in an alert

Synchronizing alert response with automated alert grouping

Synchronize alert response with grouping by ensuring alert management jobs runs after alert grouping jobs—this prevents duplicate actions like incident creation on secondary alerts.

Before you begin

Role required: admin

About this task

By default, the alert grouping job (**Service Analytics group alerts using RCA/Alert Aggregation**) and the alert management job (**Event Management - Evaluate Scoped Alert Rules Management0**) run independently of each other. To synchronize the alert response with automated alert grouping (for example, to avoid creating an incident on a secondary alert), you must enable the property *evt_mgmt.avoid_int_enabled* to ensure that the Alert Management job is executed after the Alert Grouping job is completed. This property is accessible from the Event Management Properties page (**All** > **Event Management** > **Administration** > **Event Management Properties**). In addition, you must configure the relevant alert management rule (for example, for incident creation), to filter out all secondary alerts.

Note: If only one alert exists when the Alert Management job runs, an incident is created. When a second alert arrives later, the next Alert Grouping job forms a group, makes the new alert as secondary, and creates a new incident.

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Event Management Properties**.
2. If you want to avoid incidents on secondary alerts, select the **Enable Avoid Incidents on Secondary alerts and wait for Grouping job to be executed** check box.
3. Select **Save**.
4. To filter out secondary alerts, navigate to **All** > **Event Management** > **Rules** > **Alert Management Rules**.
5. Select the relevant rule.
6. In the Alert Management Rule form, select the **Alert Filter** tab.
7. In the Condition area, select **And**.
8. Add a condition:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Role in Group**
- **is not**
- **Secondary**

9. Select **Update**.

Configure alert remediation actions

Run commands to perform alert remediation on remote Linux and Windows CIs.

Before you begin

Install the following plugins:

- IntegrationHub Enterprise spokes plugin
- ServiceNow IntegrationHub Action Step - PowerShell
- ServiceNow IntegrationHub Action Step - SSH

For Linux: Ensure that the remote Linux host is reachable using the MID Server IP address that runs action scripts.

For Windows:

- Ensure that Powershell v3.0 - 5.0 are supported and installed on the Windows target server.
- Enable Powershell remoting on the remote Windows target server.
- Ensure that the remote Windows target server is reachable using the FQDN from the MID Server that runs action scripts.

Add credentials to the credential aliases that come with the base system:

- linuxAdmin
- windowsAdmin

Role required: evt_mgmt_admin or flow_designer

Procedure

1. Access remediation actions in one of the following ways:
   - Quick actions in an alert, as described in Apply a quick response in an alert.
   - The Playbook tab in Service Operations Workspace, as described in Run actions to resolve alert issues .
2. Configure additional input in the alert's **Additional Information** field, using this format:

   ```
   {"remediation_action_resource":"<mandatory input>"}
   ```

   The mandatory input per action is described in the following table.

Action name	Mandatory input in Additional information field
Stop Windows Process	Process ID
Restart Linux Service	Service Name
Kill Linux Process	Process ID
Get Windows Processes	N/A

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Action name	Mandatory input in Additional information field
Stop Windows Service	Service Display Name
Restart Windows Service	Service Display Name
Get Windows Services	N/A
Stop Linux Service	Service Name
Start Windows Service	Service Display Name
Suspend Windows Service	Service Display Name
Get Linux Services	N/A
Run Linux Top for Memory	N/A
Show Disk Space Used	N/A
Run Linux Top	N/A
Start Linux Service	Service Name
Show Disk Space Used	N/A

Result

After executing an alert action, the results are noted in the *Work Notes* field of the alert.

CI Remediation

Alert and configuration item (CI) remediations help troubleshoot and resolve underlying problems that generate alerts. Remediation is based on Orchestration workflows that can be scripted to perform remediation tasks such as gathering system information or rebooting a server.

Event Management provides a framework for configuring and implementing a system-wide remediation plan to resolve, minimize, or prevent problems that generate events and alerts. Configure alert management rules to remediate alerts and CI remediation rules to remediate a set of CIs.

Alert remediation

Use alert management rules to associate specific alerts with a remediation workflow. You can apply a workflow to alerts manually. Alternatively, you can configure the alert management rule that executes a workflow automatically for alerts that match the rule criteria. The workflow can also be scripted to request user approval before executing subsequent workflow tasks. The workflow is paused for user approval, even if it was automatically triggered.

CI remediation

Configure remediation more comprehensively by creating CI remediation rules to manually apply remediation to specific CIs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Remediation tasks

When a remediation workflow is executed, a remediation task is created to capture details such as the time that the workflow started to run, the alert that triggered the remediation workflow (if relevant), and the CI that was remediated. View these tasks to track remediation activities in the organization.

Related topics

Migrate an alert action rule to an alert management rule

Create or edit CI remediation

Create a CI remediation rule that lets users manually apply an Orchestration workflow for resolving issues with specific CIs associated with alerts. Define these CIs in the CI filter conditions of the rule.

Before you begin

Create the workflow to remediate CIs. In the workflow settings, select **Remediation Task [em_remediation_task]** in the **Table** field.

Then submit the workflow definition, and add the following conditions to the workflow properties:

- **[Run Remediation][is][true]**
- **[Workflow][is][<name of the new workflow that you just created>]**

  For example, if the name of the workflow is `CI remediation`, add this condition:

  [Workflow][is][CI remediation]

After you finish configuring the workflow, make sure that you publish it. For more details, see Create a workflow.

Role required: evt_mgmt_admin

About this task

A CI remediation rule associates a set of CIs that might experience problems with a remediation workflow. The remediation workflow can either resolve the underlying problem or help troubleshoot the problem that generated the alert. For example, you can proactively configure a workflow with the appropriate response actions for predictable alerts. For more details, see the Event Management Remediation short video.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **CI Remediations**.
2. Click **New**, or select a CI remediation to edit.
3. Fill in the fields, and click **Submit** or **Update**.

CI remediation form

Control	Description
CI filter	Conditions to match the CIs that you want to apply this remediation to.
Orchestration workflow	The remediation workflow to apply to CIs that match the filter conditions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
In service maps that are opened from the Event Management dashboard, this remediation can be applied to any CIs that match the filter conditions.

View remediation tasks

Event Management automatically creates a remediation task to capture every remediation that was applied to a CI or to an alert. It gives you an overall view of remediation activities in the organization.

Before you begin
Role required: evt_mgmt_user

Procedure

Navigate to **All** > **Event Management** > **Remediation Tasks**.

Column	Description
Number	Number assigned to this task.
Configuration item	Item or service affected by this task.
Priority	Priority that was assigned to this task, based on impact and urgency.
State	State of the task, which can be open or closed.
Assigned to	Person that this task was assigned to.
Short description	Description for the task.
Task type	This task type is a remediation task.

How alerts work with CIs in maintenance

When a CI is in maintenance, the impact tree, the service map, and Alerts tab are updated based on various factors.

Watch this brief video to learn about how alerts work with CIs.

A CI is in maintenance when:

- A change request is scheduled for the CI.
- The **Install Status** field on the CI record is set to **In Maintenance**.

Note: To customize how alerts work with CIs in maintenance, see Create maintenance rules.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

How CIs in Maintenance appear in Event Management	Description and the optimal time to resolve the alert
CI with an active change request  If an active change request is scheduled for the CI or if the **Install Status** of the CI is **In Maintenance**, all alerts on the affected CI are excluded from impact calculation. The Alerts tab also temporarily hides all corresponding alerts. The impact tree shows the CI in green with a note of **(In Maintenance)**. The impact tree and the service map temporarily show CIs in green. For a service, all alerts on CIs in the service are also hidden from the Alerts tab. The entire service is shown in green on the impact tree. For a host with an active change request, the host applications are considered as one unit. All child applications are treated in the same manner as the host until the change request is no longer active.	An active change request has the following values: • The **State** is **Scheduled** or **Implement**. • The current time is between the Planned start date and Planned end date on the change request. OR • The current time is between the Actual start date and Actual end date on the change request. You can monitor the progress of the change request. Wait until the change request moves to the **Review** or **Closed** state. Then you can address all alerts for the affected CI and any alerts that generated between start and end dates. Use the impact tree, topology, and Alerts tab to show the calculated impact severity. **Note:** The **Maintenance** check box for an alert is selected when the **Install Status** field on the CI record is **In Maintenance**. This **Maintenance** check box indicates that the alert must be hidden from the **Alerts** tab. When the maintenance job updates this field, the Updated field (sys_updated_on) changes for open alerts, but not for closed alerts.
CI with no active change request and not in maintenance When there is no active change request for a CI and when the CI is not in maintenance, impact calculation resumes. The impact tree, the service map, and Alerts tab show the calculated impact severity for alerts.	An inactive change request has the following values: • The **State** is **New**, **Assess**, **Authorize**, **Review**, **Close**, or has no changes at all. • The **State** is **Scheduled** or **Implement**. However, the current time is before or after the planned or actual date ranges on the change request. You can monitor the progress of the change request. When a CI has an inactive change request, you can address the corresponding alerts as appropriate.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

How CIs in Maintenance appear in Event Management	Description and the optimal time to resolve the alert
CI with no active change request and in maintenance If no active change request is scheduled for the CI and if the **Install Status** of the CI is **In Maintenance**, all alerts on this CI are excluded from impact calculation. The impact tree shows the CI in green with a note of **(In Maintenance)**. The impact tree and the service map temporarily show CIs in green.	All alerts on a CI with an inactive change request and **In Maintenance** has no impact calculation.

Create maintenance rules

SLAs for application services and CIs

Event Management supports the creation of SLAs for application services and for CIs.

You can monitor and manage the quality of the application services offered by your organization. For example, you might want to set up an SLA that is triggered when the max alert severity of an application service or CI is **Critical**, and measure the time it takes to bring the application service or CI back to the **OK** state, when the conditions that caused the alert have been resolved.

SLAs and the Task table

You can create SLA definitions only for tables that extend the Task table. The Event Management application provides a table named Event Management SLA [em_ci_severity_task], which extends the Task table. Use this table in your SLA definitions to specify the severity level that should trigger and stop the SLA. During alert impact calculation, changes in the severity level of application services and CIs are automatically updated in the Event Management SLA table. Scheduled jobs keep the information in this table up to date.

How the Event Management SLA table is populated

The Event Management SLA table is populated differently for application services and CIs:

- For application services, the system automatically populates the Event Management SLA table when an application service is created or when its max severity is changed.
- For CIs, you must first identify which CIs can be made available for SLAs by creating an SLA configuration record. The system then automatically populates the Event Management SLA table with the CI max severity is changed.

Note: Duplicate CIs are not added to the Event Management SLA table even if the same CI matches more than one SLA configuration filter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create an SLA configuration for CIs

Create an SLA configuration from the Event Management application to determine which CIs are available for SLAs.

Before you begin
Role required: evt_mgmt_admin

About this task
The SLA configuration record is a filter on a table in the system. Select a table that has the CIs for which you want to create an SLA.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **SLA Configuration**.
2. Click **New**.
3. Fill in the form fields (see table).

SLA Configuration form fields

Field	Description
Name	Provide a descriptive name.
Table	Select a table with the CIs for which you want to create the SLA. You can also use the Configuration Item to Host View [query_based_service_basic_view] table, which is used by Dynamic CI Groups.
Filter	Configure the filter for the records.

4. Right-click the header and select **Save**.

Example:
The following is an example.

If you want to run an SLA on all Linux servers for major and critical alerts, first create an SLA configuration on the Linux Server [cmdb_ci_linux_server] table. Then create the SLA definition with this filter:

- `CI.class` is `Linux Server`
- `Severity` is `Major` or `Critical`

What to do next
Create an SLA definition on the CIs that match this SLA configuration.

Limit the records for the SLA configuration filter

If too many records are returned by the SLA configuration filter, you can add a property to set the maximum number of records.

Before you begin
Role required: evt_mgmt_admin

About this task
By default, the size of dynamic CI group records is limited to 10,000 elements. Exceeding this limit can affect system stability. If the filter configuration for a specified dynamic CI group returns too many records, you can limit the number of records. Set the value of the sa.qbs.max_num_of_cis property to limit the returned records. For more information, see Create a Dynamic CI Group.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Enter `sys_properties.list` in the application navigator.
2. Add the following property:
   sa.qbs.max_num_of_cis
3. Set the value to an integer that represents the maximum number of records to return.

Create an SLA definition for a CI or application service

You can create SLA definitions for CIs and application services just as you can for other task records in the instance.

Before you begin
Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Service Level Management** > **SLA** > **SLA Definitions**.
2. Click **New**.
3. Fill out the fields on the SLA Definition form.
   For a description of each field, see Create an SLA definition for a CI or application service.
4. For the **Table** field, select **Event Management SLA [em_ci_severity_task]**.
5. Configure the **Start condition** filter by adding conditions, such as:

SLA filter conditions

For all CIs where the **Severity** is **Critical**		
Type	**is**	**CI** **Note:** Event Management SLAs work only on CI classes from Service Instance [cmdb_ci_service_auto].
Severity	**is**	**Critical**
For a specific service, such as Email, when the **Severity** is **Critical**		
Application Service	**is**	**Email**
Severity	**is**	**Critical**

6. Configure pause, stop and reset conditions.
7. Click **Submit**.

Alert lifecycle configuration

Event Management provides various modules, templates, and properties for configuring alerts and the actions that execute for these alerts.

Configure the alert active interval

The active interval property (**evt_mgmt.active_interval**) determines how Event Management handles a new event that is similar to events that appear on an existing closed alert. The system uses the active interval, event, and existing closed alert information to either reopen the alert and add the event information, or create a new alert.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: evt_mgmt_admin

About this task
When the new event is received and the alert is already closed, Event Management compares the time since the last alert update (**sys_updated_on**) and the active interval property value. Then, the system either updates the existing alert or creates a new alert (if the original alert is closed), as explained in the following table. If the alert is open, Event Management automatically updates it without checking the active interval property value.

Scenario	Result
The new event occurs before the active interval elapses for the existing closed alert.	The event is identified as a recurrence of an existing issue. The alert is updated with the event information and the alert is reopened.
The new event occurs after the active interval elapses for the existing closed alert.	A new alert is created because the event is identified as a new issue. The event information is added to the new alert.

Change the active interval by editing the **Active interval (in seconds), within which a new event reopens a closed alert** property value.

Procedure
1. Navigate to **All** > **Event Management** > **Administration** > **Event Management Properties**.
2. Change the number of seconds for the **Active interval (in seconds), within which a new event reopens a closed alert** property.
3. Click **Save**.

Configure alert flapping

Set flapping properties to determine when an alert enters and exits the flapping state. Flapping can indicate configuration problems (that is, thresholds set too low), troublesome services, or real network problems.

Before you begin
Role required: evt_mgmt_admin

About this task
Flapping occurs when the event source continues to generate events even after its associated alert has been closed. Flapping causes the resource's status to repeatedly fluctuate between the *OK* severity and a severity requiring attention, for example, *Critical*.

Procedure
1. Navigate to **All** > **Event Management** > **Administration** > **Event Management Properties**.
2. Edit the following properties, as appropriate.

Property	Description
evt_mgmt.update_alert_restricted_fields_elapsed_time	When the system receives events that do not update alerts, system fields are not updated by default. This occurs when the event data is identical to the existing alert. This helps re duce noise. For example, a "keep alive" event

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	might be sent every few minutes from a serv er. This confirms that a device is still connect ed, even if no new data is being exchanged. This property defines the minimum time inter val (in seconds) that must pass before an alert can be updated based on identical events. If an identical event is received within this in terval, the update is suppressed to avoid gen erating frequent, redundant notifications. By default, the interval is set to 86,400 seconds (24 hours).
evt_mgmt.flap_interval	Flap interval, in seconds, which is the time pe riod within which an alert enters the flapping state. An alert enters the flapping state when its cur rent **Flap Count** value reaches or exceeds the given *evt_mgmt.flap_frequency* prop erty value within the time period specified by the *evt_mgmt.flap_interval* property.
evt_mgmt.flap_frequency	Flap frequency, frequency an alert must reoc cur to enter the flapping state.
evt_mgmt.flap_quiet_interval	Flap quiet interval (in seconds), quiet time that must pass for an alert to exit the flapping state. An alert exits the flapping state when the time interval between the latest occur rence of the event and the **Flap last update time** of the alert reaches or exceeds the *evt_mgmt.flap_quiet_interval* prop erty value. An alert can also exit flapping in these conditions: ○ When an incoming event arrives after the *flap_quiet_interval* time has elapsed. The new alert generates and its state value depends on the incoming event severity. ○ After a background job, which runs every five minutes, verifies that no alert updates occurred and the *flap_quiet_interval* time has elapsed. If there are no updates, the alert shows the previous state value that it had before the background job ran.

3. Click **Save**.

View alerts in the flapping state

Alert priority

Determine the order in which to handle alerts according to the alert priority score. Multiple factors determine the alert priority score and this value changes with changes to the underlying factors.

Multi-factor decisions

The value of the alert priority score is a composite of the value of the category and its relative weight. You can configure the factors that make up the score, as described in the following sections, according to *`Category order`*, *`Category value mapping`*, and *`CI type weight factor mapping`*. The categories are:

- *`Accumulated categories`* - These categories accumulate items with different sub-types that may have a different status or weighing factor. For example, services that are factored according to different criticality or services that are factored according to cost.
- *`Choice-list categories`* - A list of items. You can map any of the items to a different value, thereby changing the priority for that item. For example, critical severity, which has the value of 1 by default, can be mapped to 4 to give it a higher weight in the calculated alert priority score.

List of categories

Category	Description
Accumulated categories	
Number of impacted business-services	This category is factored by the business-criticality of the service. An alert that has an impact on one service has a lower priority score than an alert that has an impact on many services. For example, if a router is down, then it might affect many services and a higher priority ensures that this alert is handled before handling another alert that has an impact on fewer services. An alert that has an impact on many non-critical services must be handled with priority. However, if an alert has an impact on only a few services, but they are critical services, then this alert has a higher priority.
CI type	This category distinguishes between various CI types. For example, an alert on a CI type that is a router or switch may have a higher priority than an alert on another CI type, like a server or application.
Number of Secondary alerts	Alerts that have characteristics similar to other alerts are usually grouped together, such as alerts with the same message key. A parent alert which has many secondary alerts has a higher priority than a parent alert that has only a few secondary alerts. All secondary alerts of a parent alert are counted. If a secondary alert is closed, it is no longer correlated to the parent alert. If a

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

List of categories (continued)

Category	Description
	parent alert is closed, all secondary alerts are no longer correlated and their priority value is calculated accordingly.
Choice-list categories	
Alert state	Priority score is not calculated for an alert that is in *Closed* state. The available states with their default values are: • Open = mapping value 1 • Reopen = mapping value 2 • Flapping = mapping value 3
Alert severity	The priority score reflects the level of seriousness of the underlying alert, for example, an alert that has severity of *Critical* has a higher weighted value than an alert with a severity of *Minor*. Priority is not calculated for an alert that has a severity of *OK*. The available levels are: • Critical • Major • Minor • Warning
Role	The priority score reflects the role of the alert. The priority score is higher for an alert that has a role of *Parent*, next is the role of *None*, and the least weight is given to an alert with a role of *Secondary*. A parent alert that has many secondary alerts has a higher value than a parent alert that has less secondary alerts. The available roles are: • Parent • None • Secondary

Structure of the alert priority score

Weighted value for each category

Each category has its own placement in the alert priority score, according to its order and limit. You can configure the order and limit, as described in Modify the alert priority score, below. There are only positive numbers.

All category values are mapped from the *em_alert_priority_category_mapping* table, except for the following:

- CI Type: Mapped from the *em_alert_priority_ci_type* table.
- Secondary: Value is the number of secondary alerts and is not mapped from any table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: To ensure optimal memory protection, alert groups with more than 1000 alerts may not have an accurate priority score.

Example constituents of alert priority score of 7302020.003

Category	Score
Services	(7.0, 1000000.0) For example, if there are 2 impacted services whose business criticality priority score is as follows: • Service1: Business criticality priority score = **3** • Service2: Business criticality priority score = **4** The sum of the business criticality priority scores is **7**, so the computed priority value is 7,000,000 (7 * 1,000,000) **Note:** The business criticality priority score is the mapped value (**Value after mapping**) in the application services entries of the Alert Priority Category Mappings table (em_alert_priority_category_mapping).
Severity	(3.0, 100000.0)
CI type	(20.0, 100.0)
Role	(2.0, 10.0)
Secondary	(0, 0.01)
State	(3.0, 0.001)

Using the scores from the preceding table, the alert priority score is computed as follows:

```
(Services value * 1,000,000) + (Severity value * 100,000) +
(CI type value * 100) + (Role value * 10) + (Secondary value) +
(State value * 0.001)
```

Replacing the values of the categories from the preceding table into the formula:

```
(7 * 1,000,000) + (3 * 100,000) + (20 * 100) + (2 * 10) + (0 *
0.001) + (3 * 0.001) = 7,302,020.003
```

In the **Priority Breakdown** area of the **More Information** tab, the alert priority value is displayed as 7302020.003. In the Alerts list, this value is displayed as 7302 (number of thousands).

Note: If you have customized business criticality values that differ from the out-of-box values, add an entry to the Alert Priority Category Mappings table [em_alert_priority_category_mapping].

Effect of category limits

Limits placed on categories enable overflow values to affect the next category that is ranked higher in priority order. Each accumulated category has a predefined limit. If the count goes above that limit, 1 is added to the next higher-order category. For example, if the number of CI types goes over the limit, then 1 is added to the next category (Severity) which is higher in priority: `yyy-zzz becomes yy(y+1) -000`

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Display in All Alerts list

In the **All Alerts** list, the alert priority score value is displayed in the **Priority** column. For display purposes only, the actual calculated alert priority score is divided by 1000, while in the database, for calculation and sorting purposes, the full computed value is used.

The detailed computation of the alert priority of the selected alert is displayed in the **Priority Breakdown** area **More Information** tab.

Calculating the alert priority score

Calculating alert priority is based on all of a group's alerts, and not only the group's primary alert. Priority is calculated for alerts that match these conditions:

- State not-equal to **Closed**
- Severity not-equal to **OK**

Alerts that are queued for priority calculation are listed in the `em_alert_trigger_queue` table. In the Scheduled Jobs table, there are two `Event Management - Alert Priority Queue` jobs. These two jobs can run in parallel. You can use *`Insert and Stay`* to create another job. The `Event Management - Alert Priority Queue` job runs once every minute and calculates priorities in batches of 1000 open alerts. There are multiple factors that determine the value of the priority of an alert. A change in severity triggers an immediate update of the alert priority score. In this case, only the severity-part of the priority is changed, together with severity information in the **Priority Breakdown** area of the **More Information** tab.

Triggers that cause recalculation

Triggers that can cause the alert priority score to be recalculated are:

List of recalculation triggers

Trigger	Effect on the alert priority score
New alert	The generation of a new alert is a trigger to calculate the alert priority score.
Existing alert that changes from closed to any other state	Priority is not calculated for a closed alert, so if the alert state is changed from its current state of closed to open, reopen, or flapping, that change is a trigger to recalculate the alert priority score.
Role change, between primary, secondary, or none	Changes in role are a trigger for the alert priority score to be recalculated. For example: • An alert whose type has changed to `Primary`, triggers the alert priority score to be recalculated. • An alert whose type has changed to `None`, triggers the alert priority score to be recalculated. • An alert whose type has changed to `Secondary`, triggers the alert priority score to be recalculated.
CI type	When a CI becomes bound to alert, that change is a trigger to recalculate the alert priority score. This trigger to recalculate the priority occurs once only, when the CI is bound to the alert.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

List of recalculation triggers (continued)

Trigger	Effect on the alert priority score
Change of number of secondary alerts	A change in the number of secondary alerts triggers the alert priority score to be recalculated.
Severity	A change in severity is a trigger to recalculate the alert priority score. For example, changing from OK to `Major` triggers the score to be recalculated. Unlike the other triggers listed above, a change in severity triggers an immediate update of the severity part of the alert priority score calculation.

Modify the alert priority score

You can change the importance of some categories of the alert priority, by modifying their order and/or their weight, as described below. For example, if the CI type is higher in importance than the number of impacted services, you can change their respective order. As a result, the number of services is now multiplied by 100, while CI type is now multiplied by 1000000.

Note: The changes that you make, using this advanced procedure, change the default method of calculating the alert priority score. Alerts that might otherwise not have a high score, by changing these configurable values, change the way you determine the order in which to handle alerts.

Changing category order

Navigate to the *em_alert_priority_category_order* table. In the **Order** column, you can change the order of the required category.

Category value mapping

The *em_alert_priority_category_mapping* table shows the configuration value for each category choice. Each value in a drop-down list of categories can be remapped to a different value by configuring this table.

CI type weight factor mapping

Navigate to the *em_alert_priority_ci_type* table. You can add a new CI, for example, `DualCoreCPU` and in the **Priority** column, you can change the priority of the required category. In addition, you can edit existing Type and also change its priority value. This table is used to map the value of each CI type, for example, a mainframe that is CI_type: cmdb_ci_mainframe might have a priority of 80, while a server with CI type: cmdb_ci_server might have a priority of 60. The mapping enables you to customize the priority of the various Ci types.

Alert assignment groups for teams

Alert assignment groups assign alerts to the right teams promptly and automatically, improving overall incident management capabilities.

Admins determine the alert assignment group priority, making sure that alerts are routed to the appropriate team members.

The Alert assignment group is determined by the *evt_mgmt.alert_auto_assignment_field* property value. As an admin, you can choose to set the assignment group based on the alert fields using the property value and the order of the comma-separated fields by editing the property value.

Assigning alert assignment group precedence

Assign alert assignment group precedence to make sure that alerts are routed to the appropriate team members.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** and search for `sys_properties.list`.
2. In the **Search** field, enter `evt_mgmt.alert_auto_assignment_field` and select the property record.
   For more information on the property, see Team-based integration properties.
3. In the **Value** field, enter the assignment group precedence.
   Set the assignment group precedence according to the order of the comma-separated fields such as cmdb_ci.support_group, IntegrationGroup.
4. Select **Update**.

Configuring Express List views for users and user groups

Centrally control what users monitor by predefining views in Express List and assigning them to users and user groups.

As an Event Management admin, you can create Express List views to ensure that users focus on specific services, priorities, or alerts. Event Management enables you to define the filters, column order, and filter attributes for an Express List view and then assign the view to individual users and user groups.

Users belonging to a group can only see the predefined views you assigned to that group and their own saved views. If a user belongs to multiple groups, they can see the views you assigned to all of these groups. Users can switch between views and modify and save all views except their assigned default view. However, they can't override settings in any of their assigned views and modify or share their default view.

The filter conditions builder enables you to configure AND and OR conditions between attributes.

© 2026 ServiceNow, Inc. All rights reserved.

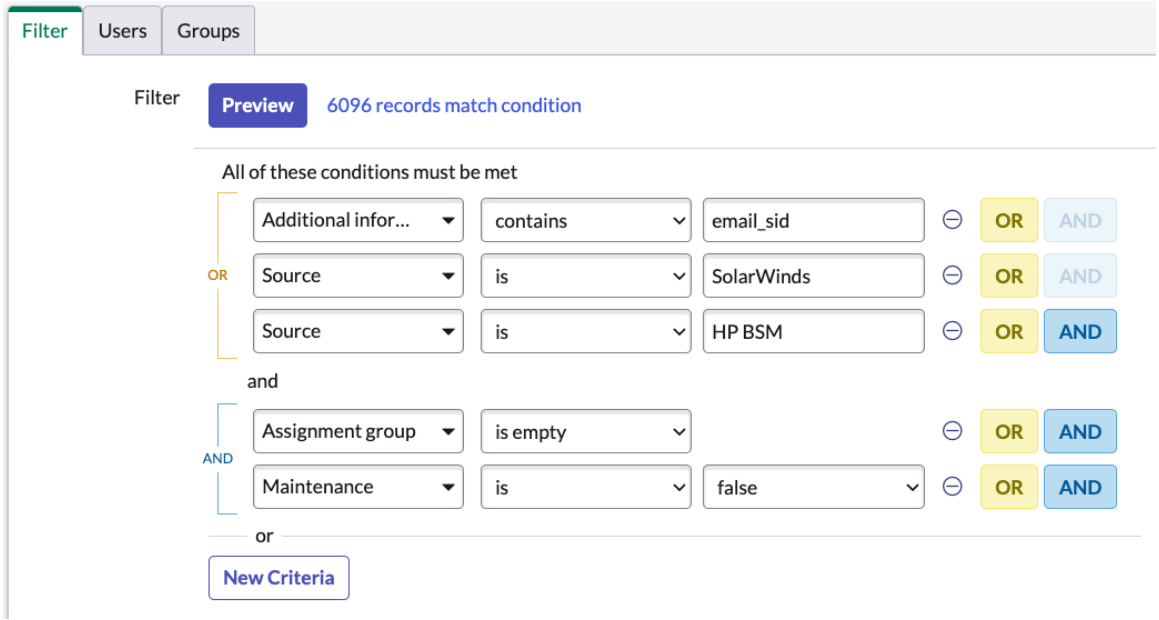
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Express List view filter conditions



For example, the admin can configure conditions that allow the user to see only alerts that are not assigned to an assignment group or in maintenance. In the example, the alerts must also contain a value of email_sid and must be from one of the specified sources.

Related topics

Create a predefined Express List view for users

Identify an assigned Express List view

Create a predefined Express List view for users

Configure an Express List view for users to make sure that they focus on specific services, priorities, or alerts. You can set the filters, column order, and filter attributes for this view and assign it to individual users or user groups.

Before you begin

For more information about predefined Express List views, see Configuring Express List views for users and user groups.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Express List Views**.
2. Select **New**.
3. On the **Express List View** form, fill in the fields.

Express List View table

Field	Description
Name	Unique name of the Express List view.
Primary Sort By Field	The field by which to sort the Express List. Default: Initial event generation time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Secondary Sort By Field	Optional field by which to sort the results of the primary sort-by field.
Order	The order of this Express List view, if multiple views exist.
Order of Primary Sort By Field	The sorting order of the Primary Sort By Field: Ascending or Descending.
Order of Secondary Sort By Field	The sorting order of the Secondary Sort By Field, if set: Ascending or Descending.
Default Time Range	Time range selected by default when assigned users or groups open this Express List view. Default: **Last 24 hours**.
Default	Option to make this Express List view the default view for the assigned users or groups. If multiple default views exist, the value in the **Order** field determines their order.

4. Set filter conditions for the Express List view.

   a. In the **Filter** tab, select a field, an operator, and one or more values for a condition.

   > **Note:** The default field is State. When selecting fields for filter conditions, use only direct reference fields or single-level references and not nested references. Nested references in filter conditions aren't supported. For example, **Configuration#item.Class** #uses a reference field, **Configuration item**, that#contains #another reference field, **Class**.

   b. **Optional:** Add a filter condition or alert tag filter condition.

Task	Actions
Add a filter condition	i. Select either the AND or the OR operator. ii. Select a field, an operator, and one or more values for the condition.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Task	Actions
Add an alert tag filter condition	i. In the Alert Tags Filter section, select **Insert a new row**. ii. Select the required tag, operator, and value for each tag filter. iii. Optionally add additional filter conditions by selecting **New criteria** and adding the tag filter condition.

c. View the number of results a query with the configured conditions would return by selecting **Preview**.

5. Assign users and groups to the Express List view.

Task	Procedure
Assign a user to the selected Express List view	a. In the **Users** tab, select **Insert a new row**. b. Select the search icon and search for the relevant user in the **Users** table. c. Select the user. d. Select the save icon.
Assign a user group to the selected Express List view	a. In the **Groups** tab, select **Insert a new row**. b. Select the search icon and search for the relevant group in the **Groups** table. c. Select the group. d. Select the save icon. **Note:** Users who belong to a group can only see the views that you assigned to that group. If a user belongs to multiple groups, they can see the views you con figured for all of these groups.

6. From the form menu, select **Save**.
   The following tabs display:
   - The **Express List Table Fields** tab shows the fields to be displayed as table columns in Express List.
   - The **Express List View Field Attributes** tab shows the filter attributes for the open alerts in Express List.
7. **Optional:** Add columns to the Express List.

   a. In the **Express List Table Fields** tab, select **New**.

   b. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Field	The column to add.
Express List View	Name of the view to which to add the column.
Minimum width	Minimum width of the column in pixels.
Order	Position of the column in the table.
Active	Option to display the column.

c. Select **Submit**.

8. **Optional:** Add filter attributes to customize this view for assigned users.
These filters are automatically applied to the Filters pane in Express List when users select this view.

a. In the **Express List View Field Attributes** tab, select **New**.

b. On the form, fill in the fields.

Field	Description
Field	Attribute to add to the Filter pane.
Express List View	Name of the view to which to add the attribute.
Order	Position of the attribute in the pane.
Active	Option to activate the attribute.

9. **Optional:** Exclude fields from the Express List view by deactivating them.

a. In the **Express List Table Fields** tab, select the information icon for the relevant field record.

b. Select **Open Record**.

c. On the field form, clear the **Active** check box.

d. Select **Update**

10. **Optional:** Exclude field attributes from the Express List view by deactivating them.

a. In the **Express List View Field Attributes** tab, select the information icon for the relevant field attribute record.

b. Select **Open Record**.

c. On the field form, clear the **Active** check box.

d. Select **Update**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: You can view the updated state of a field or a field attribute in the table by selecting the list controls icon and then selecting **Refresh List**.

11. When you're satisfied with the Express List view, select **Update**.

Assign users and groups to predefined Express List views

Assign individual users and user groups to preconfigured Express List views to make sure that they focus on specific services, priorities, or alerts.

Before you begin

For more information about predefined Express List views, see Configuring Express List views for users and user groups.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Express List Views**.
2. Select the predefined Express List view that you want to assign to a user or group.
3. Assign users or groups to the selected Express List view.

Task	Procedure
Assign a user to the selected Express List view	**a.** In the **Users** tab, select **Insert a new row...**. **b.** Select the search icon ( ) and search for the relevant user in the **Users** table. **c.** Select the user and then select the save icon ( ).
Assign a user group to the selected Express List view	**a.** In the **Groups** tab, select **Insert a new row...**. **b.** Select the search icon ( ) and search for the relevant group in the **Groups** table. **c.** Select the group and then select the save icon ( ). **Note:** Users belonging to a group can only see the predefined views you assigned to that group and their own saved views. If users belong to multiple groups, they can see the views you as signed to all of these groups.

4. Select **Update**.

Alert impact calculation

Impact calculation shows the magnitude of an outage on CIs, services, alerts, and alert groups. The system uses factors such as impact rules and CI relationships to calculate the severity

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

of a generated alert. The severity appears on the impact tree, application services maps, and dashboards.

Impact calculations are available for application services alert groups. The following factors are used to calculate the overall impact of an outage.

Note: Impact calculation is supported only for services of type Service Instance [cmdb_ci_service_auto] and services that extend this class. Impact is not calculated for Technology Management Service [cmdb_ci_service_technical] or Business Service [cmdb_ci_service_business] classes.

- Impact rules.
- Number of related active alerts.
- Past history of the affected CI.
- Relationships between CIs for a particular application service or application services.
- If the CI element includes a network or storage devices.
- Alerts on CIs in the maintenance state are excluded from impact calculation.

  Note:

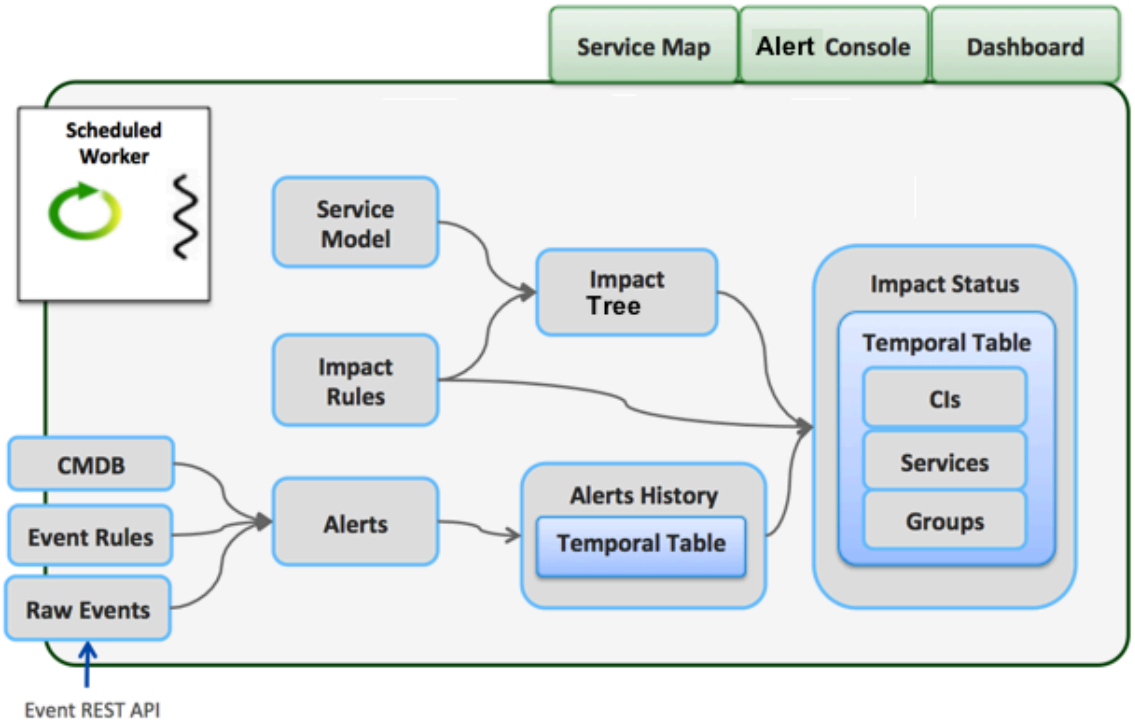
  - CIs are considered to be in maintenance not only when an active change request is scheduled, but also when the **Status** field of the CI is set to **In Maintenance**.
  - When a child CI is put in maintenance, it also places the parent CI in maintenance.

- By default, impact is calculated for all operational application services. However, the system allows you to filter impact calculation by service class or by individual application service. For more information, see Add CMDB tables or classes for impact calculation and Add application services for impact calculation.

If there is a connection between services, the impact of one service on the other is also calculated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Impact calculations use information from various sources to set the alert severity



How impact is calculated

Impact calculation varies depending on the CI relationships for a application service or application services. Additional factors, such as change requests, network paths, storage paths, and related CIs all affect impact calculation.

Services

The following impact calculation flow operates for alerts where the outage does not affect a network or network storage. Event Management performs the following steps:

1. Create a service map. Use the Service Configuration Item Associations [svc_ci_assoc] and CI Relationships [cmdb_rel_ci] tables to create child-parent relationships in the application service or application services.
2. If there is no CMDB path from the service to the CI but an association appears in the svc_ci_assoc table, show a Depends-on relationship between the application service and the CI. Otherwise, show no connection.
3. For an application services, if the CIs assigned to the service are also connected to the service in the CMDB, the map keeps the hierarchy between CIs as they appear in CMDB. The CI service assignments appear in the Service Configuration Item Associations section of the Application service form. If there is no connection to the service in the CMDB, the CIs appear directly under the application services in the map.
4. Create the impact tree. Mark the magnitude of an outage by 100% down, 60% affected, 40% impaired, or 20% impaired. If the items in two or more clusters are affected, the impact is 100% down.

Change requests and the In Maintenance status

If an active change request is scheduled for the CI or if the **Install Status** of the CI is **In Maintenance**, all alerts on the affected CI are excluded from impact calculation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Alerts tab also temporarily hides all corresponding alerts. The impact tree shows the CI in green with a note of **(In Maintenance)**. The impact tree and the service map temporarily show CIs in green.

Note:

- CIs are considered to be in maintenance not only when an active change request is scheduled, but also when the **Status** field of the CI is set to **In Maintenance**.
- When a child CI is put in maintenance, it also places the parent CI in maintenance.

For a service, all alerts on CIs in the service are also hidden from the Alerts tab. The entire service is shown in green on the impact tree. For a host with an active change request, the host applications are considered as one unit. All child applications are treated in the same manner as the host until the change request is no longer active. For additional information, see How alerts work with CIs in maintenance.

Network paths

To account for network redundancy, Event Management uses a separate impact calculation. You can see network topology or path changes in the application service. The following impact calculation flow operates for alerts where a network path is affected. Event Management performs the following steps:

1. Create a application service map for the affected network.
   - Use the host ID and target IP information from the alert and the network path from the Network Paths [sa_network_paths] table.
   - Use the elements in the network path that derive from the Configuration Item [cmdb_ci] table. Also, use the elements that are associated to the path, from the Infra Path To Elements [sa_infra_path_assoc] table.
   - Set the relationships. The application CI has a Depends on::Used by relationship on an element in the path that is defined in the CI Relationship [cmdb_rel_ci] table. In the relationship, the application CI is the parent and the element in the network path is the child.
2. Calculate a separate severity for each regular element in the path. Each regular element in the path contributes its own severity to its ancestors up to the application CI where the path originated from.
3. Calculate all redundant elements in the path with the redundancy rule by reducing the severity on the impacted CIs by one level. For example, if the severity is *`Critical`*, the redundancy rule decreases severity by one level to *`Major`*.
4. Create the impact tree. Mark the magnitude of an outage by 100% down, 60% affected, 40% impaired, or 20% impaired. If the items in two or more clusters are affected, the impact is 100% down.

Storage paths

To account for storage device redundancy, Event Management uses a separate impact calculation. You can see impact tree updates when the network storage topology changes from the application service. Event Management performs the following steps for alerts that contain storage CIs:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Create a application service map for the affected storage device:
   - Use the storage device in the sa_fs_to_storage_path table. The storage device definition uses the file system information in the path.
   - Use the elements in the storage path that derive from the Configuration Item [cmdb_ci] table. Also, use the elements that are associated to the path from the Infra Path To Elements [sa_infra_path_assoc] table.
   - Set the relationships. The application CI has a Depends on::Used by relationship on an element in the path that is defined in the CI Relationship [cmdb_rel_ci] table. In the relationship, the application CI is the parent and the element in the storage path is the child.
2. Calculate a separate severity for each regular element in the path. Each regular element in the path contributes its own severity to its ancestors up to the original application CI the path.
3. Use the redundancy rule to calculate redundant elements in the path by reducing the severity on the impacted CIs by one level. For example, if the severity is *`Critical`*, the redundancy rule decreases by one level to *`Major`*.
4. Create the impact tree. Mark the magnitude of an outage by 100% down, 60% affected, 40% impaired, or 20% impaired. If the items in two or more clusters are affected, the impact is 100% down.

Related CIs

As alerts generate for a CI, additional impact calculations run for related CIs. For example additional impact calculations run for a application service dependency to a CI that is not actually part of the application service. These related CIs are not discovered as part of the service. Instead, the related CIs are specified by an infrastructure relationship definition.

The following impact calculation flow operates for alerts with CIs that have a dependency to related CIs which are considered outside the application service. Event Management performs the following steps:

1. Derive relationships between the application service CIs and related CIs. Use the relationships, impact rules, and other data from the Infrastructure Relations [em_impact_infra_rel_def] table.
2. Add related CIs to the impact tree and alert list on the Event Management dashboard.
   - Use data from the Infrastructure Relationship [em_impact_infra_rel_def] table to show containment links to the host.
   - Use the Impact Status [em_impact_status] and Alert History [em_alert_history] tables to determine the status.

Impact rules

Impact rules, which are used for impact calculation, estimate the magnitude or severity of an outage based on affected CIs.

The Impact Rule [em_impact_rule] table contains impact rules that show the applicable CIs, application services, and settings for impact. The following default impact rules are available.

Application Cluster Member

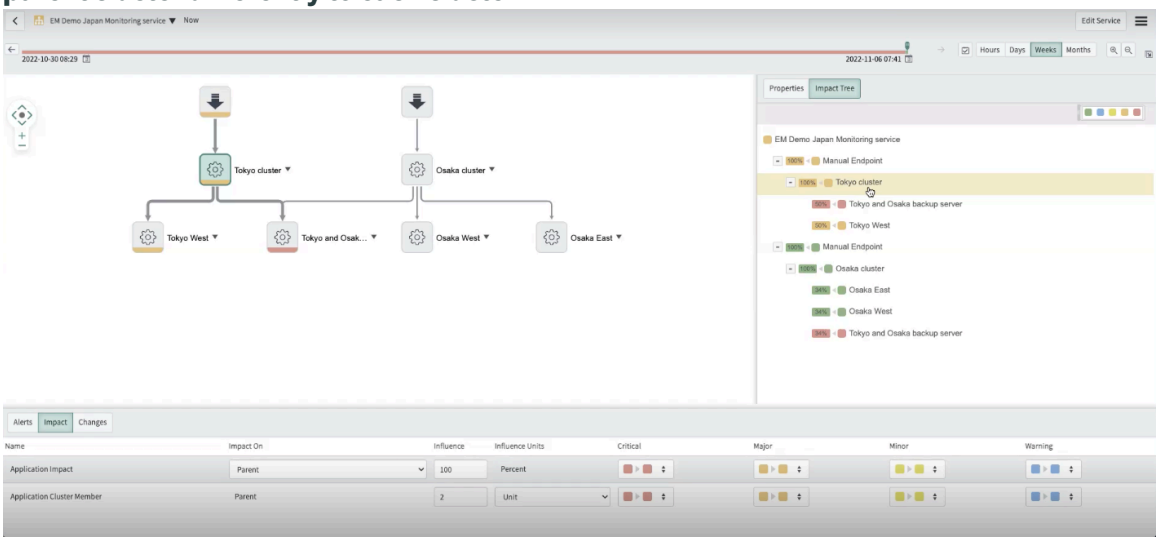
Determines how application cluster members affect the overall impact of the cluster. For example, if a three-member cluster requires **90% Influence** to set the severity for the entire cluster to **Major**, each member has **30% Influence** (90% divided by 3).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The severity of the entire cluster can only change to **Major** when all three members have a severity of **Major**.

You can configure different impact rules per cluster and thus the child CI impact propagation to the parent (for the same child CI) will be different. Therefore, you can manually create groups of Cis (aka manual clusters) and configure the impact rule at the cluster level for downstream towards the cluster children.

Example where the same child CI will propagate its impact to its parent cluster differently to each cluster



In the above example, there are two entry points. The Osaka cluster on the right-hand side has three CIs. The Tokyo cluster on the left-hand side has two CIs. The Tokyo and Osaka backup server has shared parents - Tokyo cluster and Osaka cluster. On the right-hand panel you can see the Impact Tree where the Tokyo cluster has two Application Cluster Members with 50% influence each and the Osaka cluster has three with 34% influence each.

For manual cluster configuration there are two rows: Application Impact and Application Cluster Member. The children are displayed since the Impact On field was selected as Parent and not Application Service. In the Application Cluster Member row the Influence field is configured to two. This implies that the minimum amount of children who fail (and that they propagate the failure upwards to their parents) are two. The Osaka cluster is configured to three. The percentage is different for the Tokyo and Osaka backup server for each cluster (50% and 34%). As you can see, even though the Tokyo and Osaka backup server failure is Red Critical, it influences the parents differently. The Osaka cluster remains green even though the Tokyo cluster failure is Orange Major.

Click a service or CI to see the alerts that are associated with it. For example, if you click the high-level application service, the alerts that are associated with it are displayed in the alert area under the Map View when you select **Alerts**. The alerts listed are those of the selected service. Alerts of child-services are listed when those services are selected.

The following impact fields are displayed when you select **Impact**.

Inclusion

Determines the impact on entities with a Contains relationship. This rule is read-only.

Infrastructure Dependencies

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Determines the definition of impact propagation for CIs in infrastructure relationships.

CI application service

Determines how impact applies to parent or child entities that are part of an application service.

CI Impact

Applies to application services. Determines the relationship between service members. The impact from child to parent CIs is always 100%. For example, the parent impact severity is derived from the child CI with the highest severity.

CI Parent in Application

Sets impact only on the parent entity.

Network Path

Determines how impact applies to parent or child entities that are part of a traditional network.

OS Cluster Member

Determines how host cluster members affect the overall cluster status based on a percentage or number of cluster members. For example, if a three-host cluster requires **60% Influence** to set the severity of **Major**, each member has **20% Influence** (60% divided by 3). The severity of the entire cluster can only change to **Major** when two or more cluster members have a severity of **Major**. The entire cluster is also considered to be down.

Storage Path

Determines how impact applies to parent or child entities that are part of a storage network.

Properties

In addition to configuring impact rules, you can configure properties for impact calculation.

Configure these properties, as appropriate:

Impact Calculation Properties

Property Name	Description
`evt_mgmt.impact_calculation.alert_grouping_support`	Enable alert grouping support.
`evt_mgmt.impact_maintenance.sleep_time_sec`	Minimum time in seconds for checking CI maintenance: checks both the Status field on the CI and any change request schedule for the CI.
`evt_mgmt.impact_calculation.alert_delay_msec`	The delay after creating or updating an alert, before it is used for impact calculation and grouping. Used to compensate for the late arrivals or slow business rules defined on the em_alert table. Default = 2000 msec. Used when alerts and events are processed one at a time (when the `evt_mgmt.max_objs_in_alert_query` property is not defined or is set to **1**).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Impact Calculation Properties (continued)

Property Name	Description
`evt_mgmt.impact_calculation.alert_holdback_delay`	The delay after creating or updating an alert, before it is used for impact calculation and grouping. Used to compensate the late arrivals or slow business rules defined on em_alert table. Default = 30000 msec. Used in large customer environments with high traffic, when alerts and events are processed in batches (when the `evt_mgmt.max_objs_in_alert_query` property is set to a value greater than **1**).

For more information, see Event Management - Impact calculation [KB1157218].

Understand Service Maps

Service maps show active alerts for CIs and the relationships between CIs. By viewing this information, you can better understand the source of alerts and take remediation steps. The service map is available for all application services.

About Service Maps

A service map shows alerts with impacted CIs and CI interdependencies. For example, changes to a connection between a host and hypervisor appear on the service map. As service map definitions change, the service map, alert, and impact information updates accordingly. From the Quebec release, there is enhanced visibility. When the alert is bound to the entry point, the service map identifies an entry point problem.

Note: Alerts will not be displayed for the entry points on the service map.

You can open a service map from these places:

- From the Application services list, you can view service maps for application services.
- From the Monitored services list, you can view service maps for monitored services.

The following icons are used in service maps. The icon shapes are slightly different for application services.

Service map icons

Icon	Description
	Represents applications such as Microsoft IIS or SQL servers.
	Represents physical and VM computers and servers.
	Represents the network starting point. For example, Layer 3 devices appear toward the top of the map, and connected software and services appear near the end of the map.
	Shows the number of redundant CIs.
	Shows the workload between machines.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service map icons (continued)

Icon	Description
	The gray connector shows a relationship between CIs.
	Each CI with no active alerts box represents a network CI. A gray box represents a CI with no active alerts. Information about the CI is hidden.
	Hides multiple CIs that are designated as redundant.
	An impacted CI displays the color that represents the severity of the alert associated with the CI. • **Critical (red)**: Immediate action is required. The resource is either not functional or critical problems are imminent. • **Major (orange)**: Major functionality is severely impaired or performance has degraded. • **Minor (yellow)**: Partial, non-critical loss of functionality or performance degradation occurred. • **Warning (blue)**: Attention is required, even though the resource is still functional. • **OK (green)**: An alert is created. The resource is still functional. • **No color**: No active alerts.
	Represents a fiber channel, hard drives, or other data storage devices.
	Represents related web services for the network such as NGINX or JBoss web server.

Note: Session timeout settings don't apply to this screen. The session remains connected, even when there is no human interaction. If this setting is a concern, either log out or close the active tab in the browser.

Alert impact calculation

View an alert impact on CIs in a service map

View the impact tree

The impact tree shows the relationships between CIs and the relative percentage impact for each child CI. This information is available for both discovered services and application services.

Before you begin

Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

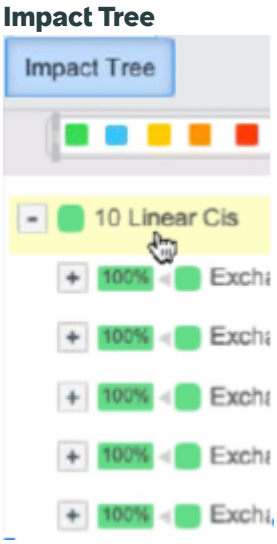
About this task

The impact tree shows the result of impact rules on CI parent and child relationships. The tree represents a service map with CIs from the Service Configuration Item Associations [svc_ci_assoc] table. When related CIs are connected but not part of the service map, the impact for the related CIs can also appear in the impact tree.

The numbers or percentages on a parent CI summarize overall severity based on alerts from child CIs. The parent severity is based on impact rule computations.

You can also learn about the impact tree from the following video tutorial.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Procedure

1. Open the service map for the service from the Application service list.
   a. Navigate to **Event Management** > **Services** > **Application Services**.
   b. Click **View service** next to the service.
2. On the service map, click a CI that has a severity color.
3. Click the **Impact** tab.
4. From the **Impact Tree** tab in the side pane, expand the parent CI and click the CI that generated alerts.
5. Use the severity color to locate CIs that contain alerts:
   - **Critical (red)**: Immediate action is required. The resource is either not functional or critical problems are imminent.
   - **Major (orange)**: Major functionality is severely impaired or performance has degraded.
   - **Minor (yellow)**: Partial, non-critical loss of functionality or performance degradation occurred.
   - **Warning (blue)**: Attention is required, even though the resource is still functional.
   - **OK (green)**: An alert is created. The resource is still functional.
6. Do one or more of the following.

Option	Description
Adjust impact rules	**a.** Click the **Impact** tab. **b.** Review and adjust the impact rules as nec essary.
Remediate an alert	**a.** Click the **Alerts**. **b.** Right-click the alert and select **Run remedia tion**.

Network paths appearing in the impact tree can use a large amount of resources, which degrades system performance. To disable network paths from appearing

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

in the impact tree, navigate to **System Properties** > **All Properties** and set the *evt_mgmt.network_path_excluded* property to **true**.

To view impact tree using Service Operations Workspace, see View impact tree using Service Operations Workspace.

Adjust impact rules for a CI

Configure impact rules to customize the impact calculation for discovery services and manual services. The impact rules update the overall alert and show the impact on related CIs. When you change impact rules, the updates apply to alert severity in places such as the Event Management dashboard and Operator Workspace.

Before you begin

Role required: evt_mgmt_admin

About this task

You can view and adjust the impact rules of CIs from the application service map of a service.

Note: Event Management Dashboard is not supported for new instances in the Paris release. However, instances upgraded from a release prior to Orlando that use Event Management Dashboard can continue to do so.

Procedure

1. Open the application service map from either the Event Management dashboard or the Application service list.

Option	Description
From the Event Management dashboard	**a.** Navigate to **Event Management** > **Dash board**. **b.** Double-click the tile of the application ser vices.
From the Application Service list	**a.** Navigate to **Event Management** > **Services** > **Application Services**. **b.** Click **View Map** next to the application ser vices.

2. On the application service map, click a CI.
3. Below the map, click the **Impact** tab and then adjust the impact rules accordingly.

Impact Rules

Field	Description
Name	The name of the impact rule. ○ **Application Cluster Member**: Determines how application cluster members affect the overall impact of the cluster. For example, if a three-member cluster requires **90% Influence** to set the severity for the entire cluster to **Major**, each member has **30% Influence** (90% divided by 3). The severity of the entire cluster can only change to **Major** when all three members have a severity of **Major**. **Note:** To configure a manual cluster, see Configure a manual cluster

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **Application Impact**: Determines how impact is applied to a specific CI, the overall application service, or parent/child entities within an application service. For the Application Impact rule, you can choose from the following Impact options: **Application Service** or **Parent**. ▪ If no CI is selected, the alert rule applies to the entire application service. ▪ If you select a specific CI, you can define whether the rule applies to the service or its parent. ○ **CI Parent in Application**: Sets impact only on the parent entity. ○ **Inclusion**: Determines the impact on entities with a Contains relationship. This rule is read-only. ○ **Infrastructure Dependencies**: Determines the definition of impact propagation for CIs in infrastructure relationships. ○ **Network Path**: Determines how impact applies to parent or child entities that are part of a traditional network. ○ **OS Cluster Member**: Determines how host cluster members affect the overall cluster status based on a percentage or number of cluster members. For example, if a three-host cluster requires **60% Influence** to set the severity of **Major**, each member has **20% Influence** (60% divided by 3). The severity of the entire cluster can only change to **Major** when two or more cluster members have a severity of **Major**. The entire cluster is also considered to be down. ○ **Storage Path**: Determines how impact applies to parent or child entities that are part of a storage network.
Impact On	The valid type of service for this impact rule. ○ **Application Service**: The impact rule applies to a application service. ○ **Parent**: The impact rule applies to the parent CI.
Influence	The value to allow the impact rule to set on the parent. Set a value on the parent. This field works with the **Influence Units** field.
Influence Units	The unit of measurement to show impact on the parent. Set the highest value on the parent CI. Set lower values on each child CI. When alerts occur for several child CIs, Event Management calculates the sum of the **Influence Units** of each affected child. If the sum exceeds the parent **Influence Units** value, the parent receives the highest severity in the set. This field works with the **Influence** field. ○ **Percent**: When the percentage exceeds the **Influence** value, apply the impact on the parent. ○ **Number**: When the number exceeds the **Influence** value, apply the impact on the parent. For example, you can set the parent **Influence Units** to **100%** and the child CIs to these values: ▪ Child 1: 34% ▪ Child 2: 34%

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	▪ Child 3: 34% ▪ Child 4: 70% When alerts for Child 3 and Child 5 have the Critical severity, the severity of the parent is set to Critical because the sum is greater than 100% (34% + 70% = 104%).
Impact when Critical	The alternative impact to use when the calculated severity is Critical. If the column to the right of **Impact when Critical** has a higher severity, update all right-most columns with the same or a lower severity as **Impact when Critical**. To make sure the topology and impact tree accurately show impact, always update each column accordingly. ○ **Critical**: Red (highest severity). ○ **Major**: Orange. ○ **Minor**: Yellow. ○ **Warning**: Blue (lowest severity).
Impact when Major	The alternative impact to use when the calculated severity is **Major**. If the column to the right of **Impact when Major** has a higher severity, update all right-most columns the same or a lower severity as **Impact when Major**. To make sure the topology and impact tree accurately show impact, always update each column accordingly. ○ **Critical**: Red (highest severity). ○ **Major**: Orange. ○ **Minor**: Yellow. ○ **Warning**: Blue (lowest severity).
Impact when Minor	The alternative impact to use when the calculated severity is **Minor**. Controls the field values to the right of this field. If the **Impact when Warning** column has a higher severity, use the **Impact when Minor** value for both fields. To make sure the topology and impact tree accurately show impact, always update each column accordingly. ○ **Critical**: Red (highest severity). ○ **Major**: Orange. ○ **Minor**: Yellow. ○ **Warning**: Blue (lowest severity).
Impact when Warning	The alternative impact to use when the calculated severity is **Warning**. To make sure the topology and impact tree accurately show impact, make sure that the columns to the left have higher severities. ○ **Critical**: Red (highest severity). ○ **Major**: Orange. ○ **Minor**: Yellow. ○ **Warning**: Blue (lowest severity).

What to do next

Review the changes on the impact tree. For example, if you changed a number or percentage influence for child CIs, review the impact tree updates accordingly.

© 2026 ServiceNow, Inc. All rights reserved.

View an alert impact on CIs in a service map

You can view service maps to see active alerts for CIs and the relationship between CIs. By viewing this information, you can better understand the source of alerts and take remediation steps. The service map is available for all application services.

Before you begin

Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task

You can open a service map from these places:

- From the Application services list, you can view service maps for application services.
- From the Monitored services list, you can view service maps for monitored services.

Procedure

1. Open an application service map:
   a. Navigate to **Event Management** > **Services** > **Application Services**.
   b. Next to the service, click **View Map**.
2. Do one or more of the following.

Option	action
View alerts for a CI by type and severity	In the service map: **a.** Click a CI tile. **b.** Below the map, click the **Alerts** tab and re view the listed alerts.
View changes to a CI in a discovered ser vice	In the service map: **a.** Click a CI tile. **b.** Below the map, click the **Changes** tab.
Show alert bindings to CIs	In the service map: **a.** Click a CI tile. **b.** Click the additional actions menu icon to view the **Affected CIs** indicator. **c.** Below the map, click the **Affected CIs** tab.
View CI properties	In the service map: **a.** Click a CI tile. **b.** In the side pane, click the **Properties** tab and review information about the CI. **c.** If you want to view more detailed informa tion, scroll to the end of the pane and click **Detailed Properties**.
Show the impact rules for a CI	In the service map: **a.** Click a CI that has a severity. **b.** Below the service map, click the **Impact** tab and review the listed impact rules.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	action
Show alert details for networks or storage for a service	In the service map: **a.** Right-click a path between CIs. **b.** Select **Show network path**or **Show storage path**.
Display additional information for CIs	In the service map header: **a.** Click the additional actions menu icon **b.** You can select the **Map Indicators** for additional information that you want to view.
Remediate a CI	In the topology, right-click the CI, and then select **Remediation options**.

Alert impact calculation

Understand Service Maps

Create an infrastructure relationship for related CIs

Infrastructure relationships show CIs that are connected to a application service but are not necessary parts of the service. Infrastructure relationships are only available for application services.

Before you begin

Role required: evt_mgmt_admin

About this task

When you create a CI infrastructure relationship, the information is stored in the Infrastructure Relations [em_impact_infra_rel_def] table. When alerts generate, the related CI accompanies the application service information on the Event Management dashboard and in the impact tree. Additional information for the related CIs only appears on a related dependency view map for the application service. The following default infrastructure relationships are available.

Default infrastructure relationships

Infrastructure relationship	Impact rule	Description
cmdb_ci_appl	OS Cluster Member	Shows alert impact between hardware and software applications.
cmdb_ci_esx_server	Infrastructure Dependencies	Shows alert impact between VCenter and ESX clusters.
cmdb_ci_kvm	Infrastructure Dependencies	Shows that alert impact on Linux Kernel-based Virtual Machine (KVM) connectivity.
cmdb_ci_vm_zones	Infrastructure Dependencies	Shows alert impact on the Solaris VM zones.

For example, based on of the cmdb_ci_vm_zones Infrastructure relationship definition, Event Management adds ZoneServer@mmp1 to the application service. The Containment rule manages impact severity on alerts.

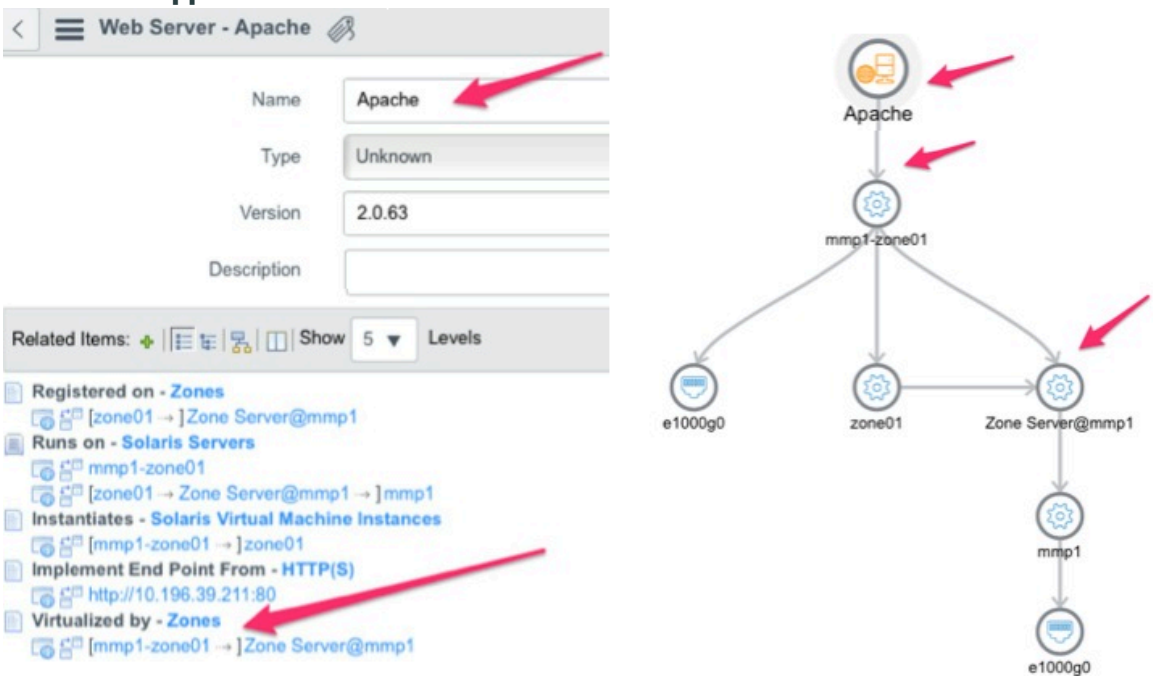
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related CIs appear on the BSM



Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Infrastructure Relations**.
2. Click **New**.
3. Fill in the fields, as appropriate.

Infrastructure Relations form

Field	Description
Child Type	The table that contains data about the child entity.
Parent Type	The table that contains data about the parent entity.
Relation Type	The relationship between the child and parent entities.
Impact Direction	The impacts direction to show on the application service map. ○ **From Child to Parent**: When an alert is regarding a child, show the impact on the parent. ○ **From Parent to Child**: When an alert is regarding a parent, show the impact on the child entity.
Impact Rule	The impact rule to calculate infrastructure relationships: ○ **OS Cluster Member** : Determines how host cluster members affect the overall cluster status based on a percentage or number of cluster members. For example, if a three-host cluster requires **60% Influence** to set the severity of **Major**, each member has **20% Influence** (60% divided by 3). The severity of the entire cluster can only change to **Major** when two or more cluster members have a severity of **Major**. The entire cluster is also considered to be down. ○ **Application Cluster Member** : Determines how application cluster members affect the overall impact of the cluster. For example, if a three-member cluster

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	requires **90% Influence** to set the severity for the entire cluster to **Major**, each member has **30% Influence** (90% divided by 3). The severity of the entire cluster can only change to **Major** when all three members have a severity of **Major**. ○ **Infrastructure Dependencies** : Determines the definition of impact propagation for CIs in infrastructure relationships. ○ **CI Application Service**: Determines how impact applies to parent or child entities that are part of an application service. ○ **CI Parent in Application**: Sets impact only on the parent entity. ○ **Inclusion**: Determines the impact on entities with a Contains relationship. This rule is read-only. ○ **Network Path**: Determines how impact applies to parent or child entities that are part of a traditional network. ○ **Storage Path**: Determines how impact applies to parent or child entities that are part of a storage network. ○ **CI Impact** : Applies to application services. Determines the relationship between service members. The impact from child to parent CIs is always 100%. For example, the parent impact severity is derived from the child CI with the highest severity.

4. Click **Submit**.

View impact of child service on parent service

In the map view of an application service, the severity of a child service is propagated to its parent service.

Before you begin

Role required:

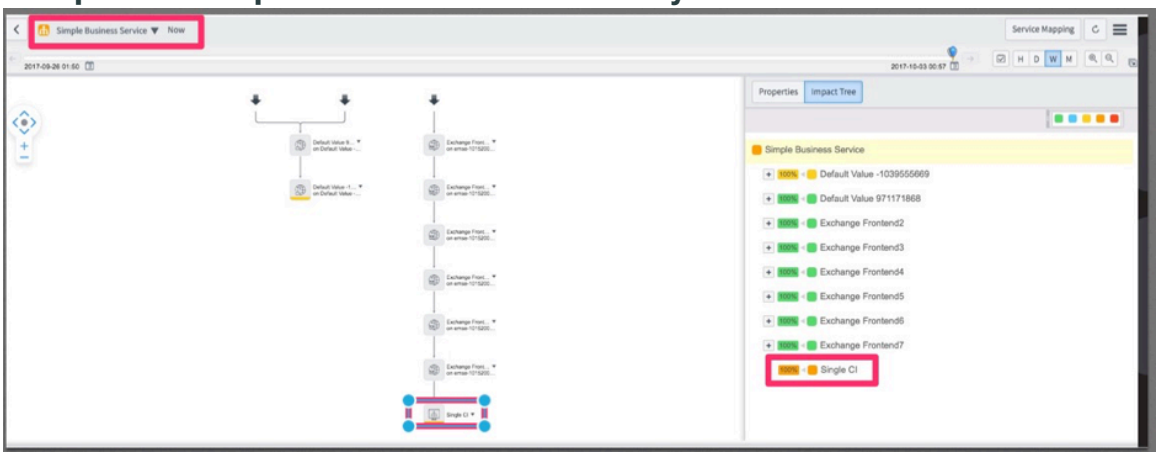
- for application services, evt_mgmt_admin
- for discovered services, service_mapping_admin

About this task

In the map view of a discovered application service, you can see that the severity of a child service is propagated to the parent service.
An application service is affected by the severity of alerts that are directly associated with it and alerts on the CIs that are in the service. If the severity of a child service is higher than that of its parent service, the parent service shows the child service severity on the map view. In the map view, the **Impact Tree** list shows the CIs. The color of the CIs indicates the alert severity. The child service is also affected by application services that are under it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example where the parent service shows the severity of the child service



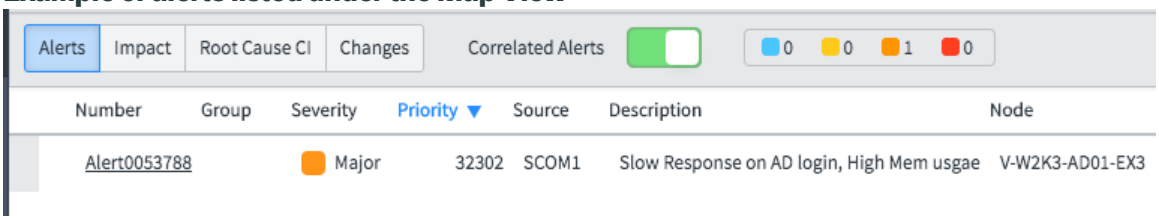
If a loop is created, for example, by connecting a parent service to a sub-service, this relationship can be viewed in the map view. The impact of this loop is not calculated and the Impact Tree does not display this relationship. For example, assume that there are three CIs, A, B, and C, where C is a sub-service to B and B is a sub-service to A. The relationship of the A connected service to C is displayed in the map view. However, this relationship is not shown in the Impact Tree.

Note: A message appears in the system error log in the following format, where the sys_id of the service and the node changes accordingly: `Found loop in ServiceId: [sysId], and node:[sysId]. Removing this relation to avoid impact loops`

For example, `Found loop in ServiceId:409d4fd59f030200fe2ab0aec32e705c, and node:df5cf6159f030200fe2ab0aec32e70a2. Removing this relation to avoid impact loops`

Click a service or CI to see the alerts that are associated with it. For example, if you click the high-level application service, the alerts that are associated with it are displayed in the alert area under the Map View. The alerts listed are those of the selected service. Alerts of child-services are listed when those services are selected.

Example of alerts listed under the Map View



Procedure

Open an application service map:

a. Navigate to **Event Management** > **Services** > **Application Services**.

b. Select **View Service** next to the service.

c. On the right-hand panel, select **Impact tree**.

d. On the lower panel, select **Impact**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result

In the service map, you can visually verify that the service health of the sub-service is rolled-up to the parent service. At the bottom of each icon of an impacted CI is a colored bar that represents the severity of the alert. This color bar also displays in the bottom bar of its parent service. For manual cluster configuration, you can modify the Application Impact and Application Cluster Member.

Related topics

- Transfer a map segment into another application service
- Configure a manual cluster
- Adjust alert impact while triaging an alert
- View an alert impact on CIs in a service map

Add CMDB tables or classes for impact calculation

Add the CMDB tables that contain application services to be considered during impact calculation, helping ensure accurate and relevant impact results.

Before you begin

Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task

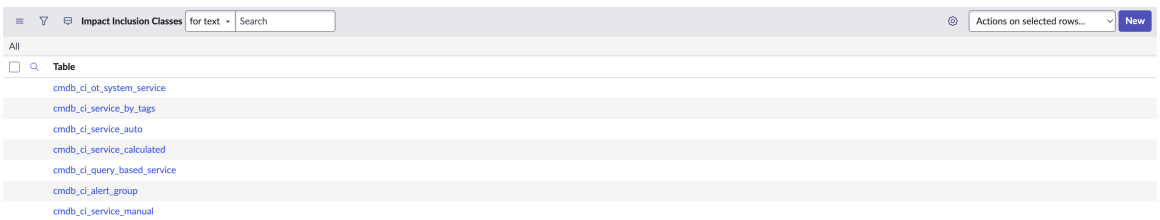
Organizations may have a vast number of CMDB tables—or classes—such as cmdb_ci_service_by_tags, cmdb_ci_service_auto and many others. However, not all of these are required for impact calculation. To streamline analysis and avoid processing irrelevant data, you can selectively add or remove only those CMDB classes that represent critical infrastructure or components. The procedure below shows how to add a CMDB class. If you want to remove any CMDB table from the list, see Remove CMDB tables or classes from impact calculation.

When you add a CMDB class, all application services related to that class are considered for impact calculation. However, if you do not want to include all services of a specific class and only want to select specific ones, you can do so on the Impact Filter Services page. For more information on how to include or exclude a service, see Add application services for impact calculation.

Procedure

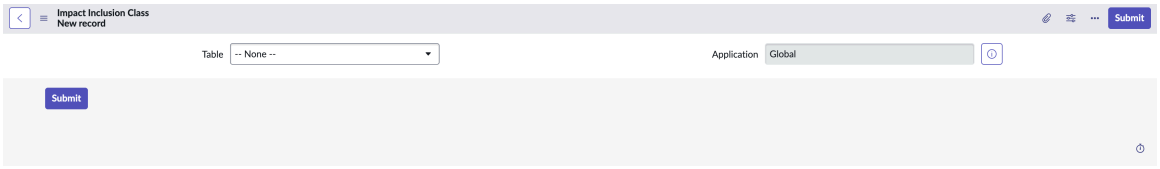
1. Navigate to **All** and search for `em_impact_inclusion_class.list`.

   The Impact Inclusion Classes page opens, displaying a list of CMDB classes that are included in impact calculation.



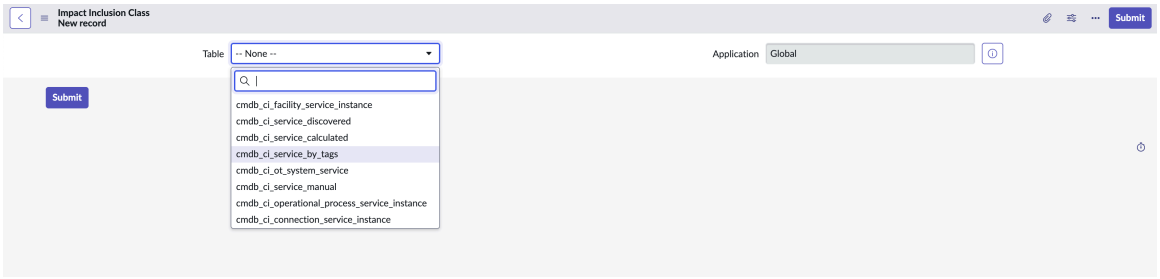
2. Select **New**.

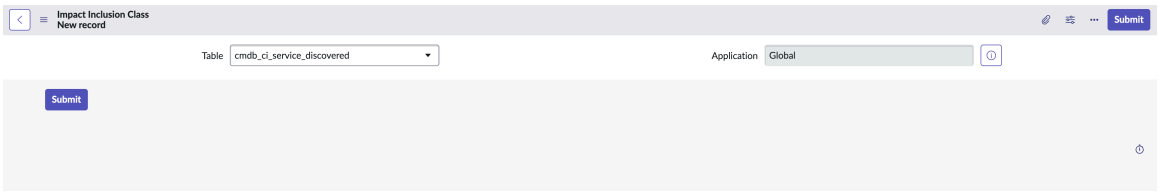
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



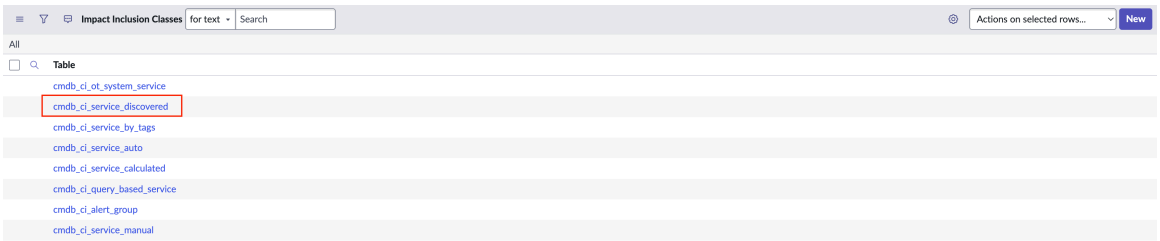
3. From the **Table** field, select a CMDB table.

> **Note:** The list contains only the CMDB tables supported for impact calculation, not all CMDB tables.





4. Select **Submit**.
   The CMDB table adds to the list of impact inclusion classes.



Remove CMDB tables or classes from impact calculation

Exclude unnecessary CMDB tables or classes from impact calculation to improve performance and focus on relevant data.

Before you begin

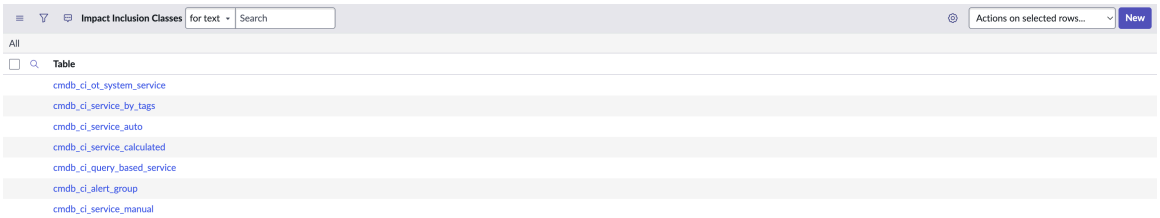
Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

Procedure

1. Navigate to **All** and search for `em_impact_inclusion_class.list`.

   The Impact Inclusion Classes page opens, displaying a list of CMDB classes that are included in impact calculation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



2. Select the CMDB table that you want to remove.
3. Select the Actions on selected rows menu and then select **Delete**.
4. In the confirmation window, select **Delete**.
   The CMDB table is removed from the list.

Add application services for impact calculation

Specify the application services that must be considered during impact calculation to ensure accurate service impact assessment.

Before you begin

Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task

Organizations may have thousands—or even hundreds of thousands—of application services. If a CMDB class is added to the em_impact_inclusion_class.list table, then all application services related to that class are included in impact calculation. However, there are two possible scenarios:

- Scenario 1: CMDB class is added to em_impact_inclusion_class.list but you want only specific services to be considered for impact calculation. You can either:
  - Remove the unwanted services from the em_impact_filter_service.list, or
  - Set their status to false in the em_impact_filter_service.list.

  For information on how to remove the application service from the list, see Remove application services from impact calculation.
- Scenario 2: CMDB class is not added to em_impact_inclusion_class.list. So, none of the application services related to this class are considered for impact calculation. However, you want only specific application services from this class to be included, you can directly add those services to the em_impact_filter_service.list table and set their status to true without adding the CMDB class to the em_impact_inclusion_class.list table.

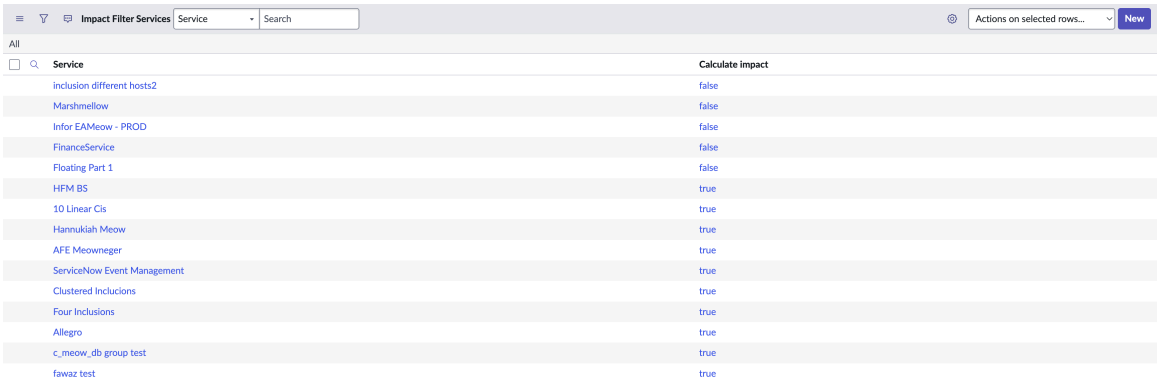
The following procedure shows how to add an application service directly to the em_impact_filter_service.list table so that it is considered for impact calculation.

Procedure

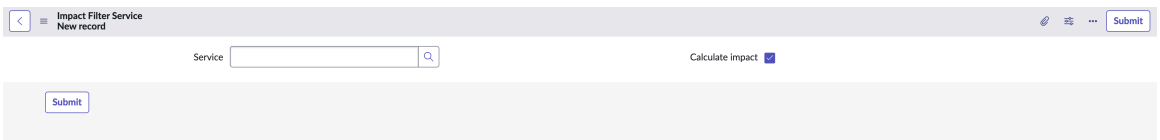
1. Navigate to **All** and search for `em_impact_filter_service.list`.

   The Impact Filter Services page opens.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



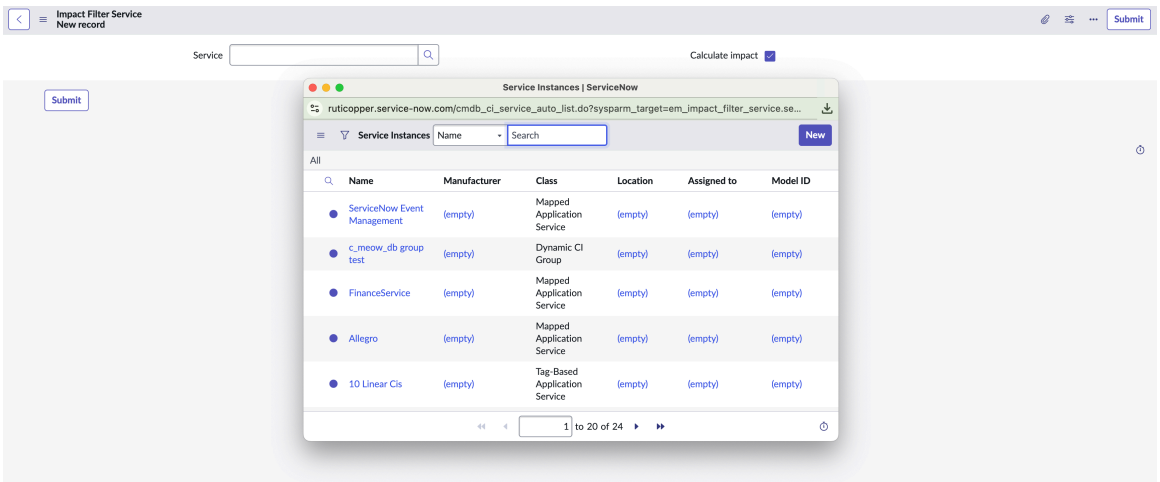
2. Select **New**.



3. In the **Service** field, select the search icon ( ).

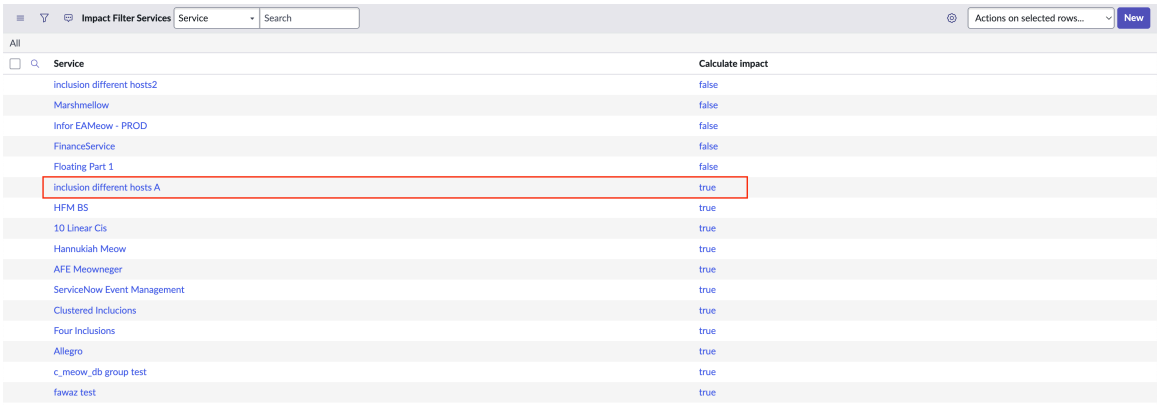
Note: By default, the **Calculate impact** check box is selected.

4. In the Service Instances page, select the service that you want to add for the impact calculation.



5. Select **Submit**.
The application service adds to the list of impact filter services.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note: Only the application services added to the Impact Filter Services list appear in the Service Dashboard.

Remove application services from impact calculation

Exclude specific application services from impact calculation to reduce noise and focus on critical components.

Before you begin

Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task

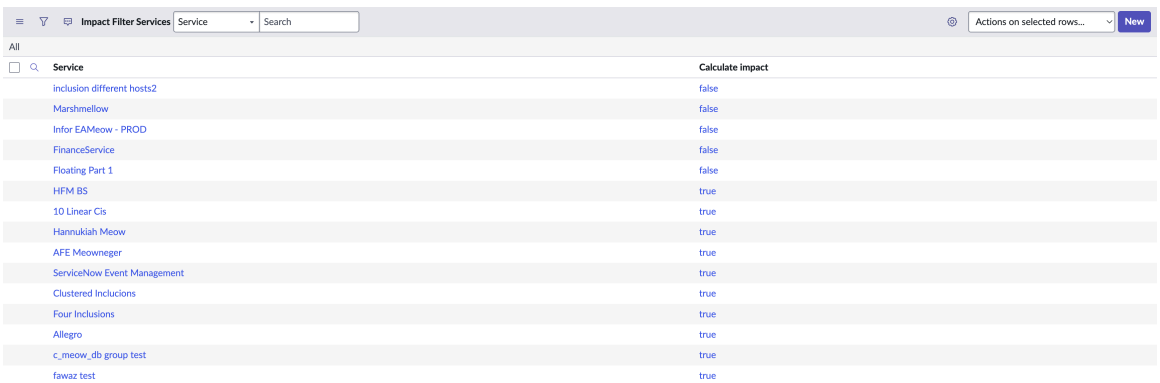
Removing or deleting a record from the list won't necessarily exclude the application service from impact calculation if the CMDB class still exists in em_impact_inclusion_class.list. However, even if the class exists in em_impact_inclusion_class.list, the application service will not be considered for impact calculation if its status is set to **Calculate Impact** = **false** in em_impact_filter_service.list.

For the application service that you want to exclude from the impact calculation, add the application service with **Calculate Impact** = **false**, or change the **Calculate Impact** = **false**, if this record already exist. The procedure shows how to configure this setting.

Procedure

1. Navigate to **All** and search for `em_impact_filter_service.list`.

   The Impact Filter Services page opens.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. For the application service that you want to exclude from the impact calculation, change the **Calculate impact** status of the application service to **false**.
   This keeps the application service record in the list but excludes it from impact calculation.

Probable Root Cause Analysis (RCA)

Shorten the mean time to repair (MTTR) by discovering the root cause of an alert.

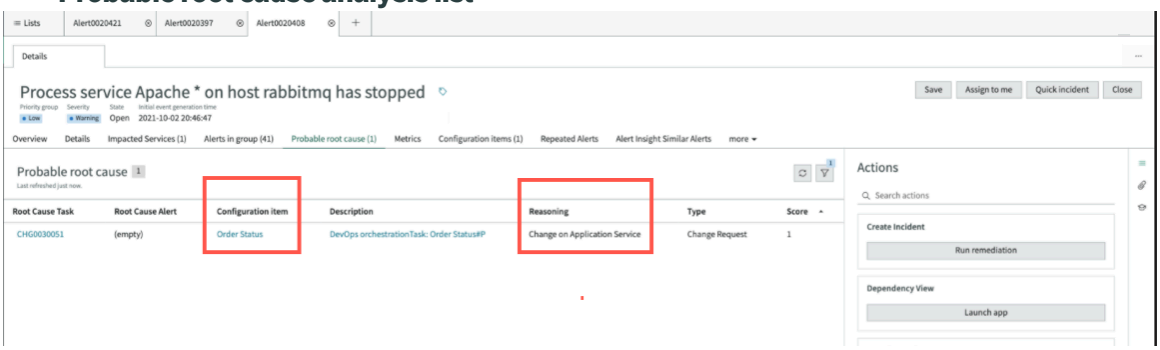
Probable root cause analysis (RCA) provides a list of probable root causes for alerts. This capability uses existing data in IT Service Management to help you determine the root cause of an issue.

RCA takes three factors into consideration: Alerts, configuration item (CI) topology, and change requests on the CIs. It extracts CIs from alerts or alert groups and analyzes the CI relationships in the CMDB. It then uses a set of configurable filters to consider relevant change requests on the CIs as possible root causes.

Change requests can be related to a time frame or to a CI, the application service it belongs to, or the software installed on it. For example, a CI must be upgraded or a security patch installed on it. A change request on one CI can affect other CIs.

RCA maps the alerts and change requests to the CIs. It proceeds to calculate the root cause score, a logical score used for sorting probable root causes. The calculation of this score is based on change requests on CIs, and on alerts on a crucial CI called the Topology Origin CI. The root cause score determines how RCA populates the probable root causes list.

Probable root cause analysis list



By default, the list shows the five probable root causes with the highest score. It lists the CIs related to each alert, and the reason RCA identified them as probable root causes.

Each probable root cause includes an explanation how RCA correlated the alert with the change request. The reason can indicate that the change request was applied directly to the CI that generated the alert. It can also indicate changes to a CI in the affected CIs list or to a related CI. Additionally, it can indicate changes to an application service or to software installed on the CI or related infrastructure. RCA identifies installed software by using the `cmdb_software_instance` table.

For alert groups, RCA uses topology analysis to identify upstream CIs that might explain cascading failures in the group. Changes on these topology origin CIs receive higher priority in the probable root cause score.

Scoring for probable root causes is determined by the following criteria, in the indicated order (lower number = higher priority):

1. Change on a CI that originates from topology.
2. Change on a related CI originates from topology.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Change on a CI.
4. Change on a related CI/change on an application service/change on software.
5. Alert on the CI that originates from topology.

To disable the Probable Root Cause Analysis feature, you must create the property *sa_analytics.disable_prc* and set the value to `true`. For more information on how to create a property, see Add a system property.

Customize RCA settings

Modify default settings that determine RCA behavior.

Before you begin

Role required: evt_mgmt_admin

About this task

Default filter settings control which change requests RCA considers as possible root causes. You may want to change certain default settings, for example to make RCA ignore standard change requests.

You can also change the number of probable root causes shown in the list. By default, the list shows the five probable root causes with the highest root cause score.

By default the RCA calculation is enabled. You can disable it by changing the default *sa_analytics.disable_prc* value to True.

Procedure

1. Navigate to **All** > **System Properties** > **All Properties**.
2. Do one or both of the following, as needed.
   - Change default filter settings:
     a. Select **New**.
     b. In the **Name** field, specify the name of the property for which you want to change the default setting.

        The new property must have the same name as the related property in the table.

Property	Description	Type	Default value
sa_analytics.rca.filter_category	The categories of change requests that RCA considers as possible root cause.	string	" "
sa_analytics.rca.filter_type	The types of change requests that RCA considers as possible root cause.	string	"standard,normal,emergency"
sa_analytics.rca.filter_state	The state of change requests that	string	"-1,0,3,7,8,157"

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description	Type	Default value
	RCA considers as possible root cause.		▪ Implement: -1 ▪ Review: 0 ▪ Closed: 3,7,8,157
sa_analytics.rca.filter_interval_hour	The value, in hours, during which change requests occurred that RCA considers as possible root cause.	int	168
sa_analytics.rca_use_legacy_query	Use legacy queries for RCA calculation.	Boolean	True
sa_analytics.rca.get_tasks_for_impacted_cis	Include change requests for impacted services in the RCA list.	Boolean	True
sa_analytics.rca_scoring_by_time_proximity	Enable scoring of RCAs by time proximity to the alert.	Boolean	True
sa_analytics.rca_cmdb_relation_levels	Number of levels to search related configuration items.	int	1
sa_analytics.rca_time_filtering_by_planned_time	Enables filtering of change requests by planned time.	Boolean	True
sa_analytics.rca_time_filtering_by_actual_time	Enables filtering of change requests by implementation time.	Boolean	True
sa_analytics.rca.upper_filter_interval_hour	Determines the time in hours as the upper bound for change requests filtering.	int	1
sa_analytics.rca.order_by_scoring_for_virtual_alerts	When scoring for virtual alerts – order the RCAs for virtual alert – order the records by scoring of PRCs of the corresponding secondaries.	Boolean	True
sa_analytics.rca_same_reason_prc_use_newer	When 2 PRCs have the same reasoning, prioritize the one with the most recent change request during scoring calculations.	Boolean	True

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description	Type	Default value
sa_analytics.rca.prefer_cr_ase_appr_	In case there service is the same change request on application service and on CI, prefer the one from application service.	Boolean	False

c. Enter a valid value for the property.

Note: The value you set for the new property overrides the default value for the related property.

- Change the maximum number of probable root causes shown in the list:

a. Find the property *sa_analytics.rca_task_table_max_records*.

Property name	Description	Type	Default value
sa_analytics.rca_task_table_max_records	The maximum number of probable root causes shown in the Probable root causes list.	integer	5

b. Replace the default value with a new valid value.

- Disable RCA by creating the *sa_analytics.disable_prc* property.

a. Select **New**.

b. Fill in the form with the following values.

Property name	Description	Type	Value
sa_analytics.disable_prc	Disabling the Probable root cause.	Boolean	True

3. Click **Submit**.

Alert similarity

Finding alerts that are similar to the alert that you are currently investigating can help save troubleshooting time by seeing how similar alerts were resolved.

Finding similar alerts

Alert similarity applies natural language processing (NLP) based on ServiceNow AI Platform machine learning (ML) as implemented in Predictive Intelligence.

ML logic filters out irrelevant information and provides further information to help you understand the cause of alerts. You can view solutions used to resolve similar alerts and the probable root cause.

ML helps find similar alerts based on text found in these alert record fields:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Configuration item.Class
- Metric name
- Description

Additional alert information

In the Alert Workspace, select the required alert and click **Insight** to view additional information about the alert.

In the Alerts list, select the required alert and use the Alert Insight tabs on the right side of the alert record to view additional information about the alert. For example, you can view the top recent alerts for the current CI and similar CIs to find the most suitable solution towards resolving the alert.

The alert insight tabs are:

- Impacted Services
- Flapping
- History
- Activities
- More Information
- Repeated Alerts
- Similar Alerts
- CI Incidents
- CI Change Requests
- CI Problems
- Related Incidents
- Related Change Requests
- Related Problems

For more information about the alert insight tabs, see Alert insight information.

Find similar alerts

You can find alerts similar to the alert currently being investigated. Save troubleshooting time by reviewing similar alerts to see how they were resolved.

Before you begin

Ensure that the Predictive Intelligence plugin is activated. To activate this plugin, see Activate a plugin.

Ensure that the `evt_mgmt.similarity_use_ml` property is set to `true`.

Role required: evt_mgmt_admin

About this task

Save time in resolving the current alert by reviewing how similar alerts were resolved. Provide resolution consistency by resolving similar alerts in the same way.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Event Management** > **All Alerts**.
2. In the list of alerts, click the alert record that you want to investigate.
3. In the alert record, click the **Similar Alerts** tab.
   Alerts that are similar to the alert that is being investigated are listed.

   By default, up to 10 similar alerts are listed. You can modify this value by setting the `evt_mgmt.similarity_max_similar_alerts_shown` property.

4. If you configured a threshold, in the Related links area, click **Show Similarities Details**.
   The Sys ID and confidence level of each similar alert is displayed. The Confidence level is an indication of how the similar alert matches the parameters that you set. As an example, a high confidence percentage value indicates a higher likelihood of similarity of the alerts to the values that you set.

   You can modify the value of the threshold by setting the `evt_mgmt.similarity_use_threshold` property.

Similarity solutions

Similarity solutions enable you to use Machine Learning (ML) to compare the text in a resolved alert record to an open alert record to reuse its resolution approach.

Training a similarity solution

To train a similarity solution, you collect words to compile a collection that Machine Learning (ML) can use to compare text in alert fields. ML compares text in the **Short Description**, **Description**, **Source**, **Type**, **Resource**, and **Metric Name** fields in a resolved alert to see whether the words match words in an open alert. The resolved alert provides an example to show how the open alert can be resolved.

To train a solution, the filter must return at least one record. If your filter returns no records, update it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The preferred number of records for training a solution is between 30,000 records and 300,000. If you submit more than 300,000 records, the most recent 300,000 records are used to train the solution. Use only authentic records from the database.

- Ensure that the records you train are not too old and that they are relevant to your business needs. Keep the words in the collection current.
- Do not use hard-coded dates as filters because these filters are not updated when you retrain solutions unless you update them manually before every retraining. Instead, use relative date filters, for example, the last 3 months, last 6 months, or last 12 months.
- Perform training as needed until it provides an acceptable similarity solution. This practice provides you time to review and update your solution definition.

For more information on similarity solution concept, see Create and train a similarity solution.

Fields to include in the solution

Record the fields that are likely to contain words and phrases that help the system identify similar records for your solution.

The similarity fields that you select should be a subset of your input field selections. For example, if you select fields from incident records that are in Open state, do not select **Close note** as a similarity field. Because open records do not include **Close note** fields, the text cannot be similar.

The similarity fields are available to users when they create records.

About the similarity score

The similarity score is a measure from 0-100 of the degree of similarity between two alert records. Alert records that have a similarity score higher than the threshold that you specify is returned by the solution.

Review similarity examples and their scores using the **Show training progress** feature to determine whether to either increase or decrease the solution threshold. You can change the threshold value in the **Threshold for Similarity Score** field.

View training solution progress

Training times vary based on the number of records and classes within the training set. The more records and classes you use, the longer the training can take. For example, a data set containing 100,000 records and several hundred classes can take around five hours to complete.

To show the training solution progress, the ML solution automatically performs the following activities when you select **Show training progress** on the Solutions page. For more information, see View solution training progress.

Solution training activities

Activity	Description
Fetching files for training.	The system downloads the training records and sends them to the nearest training service.
Preparing the data.	The system removes duplicate records from the training set.
Training the solution.	The training service trains the solution.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Solution training activities (continued)

Activity	Description
Uploading the trained solution.	The training service uploads the solution as attachment records.

Create an Event Management similarity solution

Create and train a solution that applies machine learning to a collection of words to target and suggest similar alerts in your instance dataset. For example, you can compare the text in a resolved alert record to an open alert record to reuse its resolution approach.

Before you begin

Role required: evt_mgmt_admin

About this task

The encryption scheme that you use can affect whether you can train solutions.

- If your data is encrypted by Full Disc Encryption (FDE), you can train solutions.
- If the field you are using for training is encrypted using Field Encryption, ensure that the shared service worker user has the correct encryption module role.
- If you are using Edge Encryption, training is not supported.

Note: This feature supports only English language processing.

Procedure

1. Navigate to **All** > **Predictive Intelligence** > **Similarity** > **Solution Definitions**.
2. Click **New**.
3. On the form, fill in the fields.

ML Solution Definition form

Field	Description
Solution Template	Use to define a word collection.
Label	Unique name for the similarity solution.
Name	Field that is auto-populated with a system-assigned name that is similar to the label name when the solution is created.
Table	Table that contains the records to use for the word collection, for example, the Incident table or the Asset table. When you assign a table value, a link appears that shows the number of records that match your current conditions.
Filter	Conditions that you want to apply to the training records. To train a solution, the filter must return at least one record. If your filter returns no records, update it.
Input Fields	Record the fields that contain the text and context that you want to include in your word collection. The field data type can be a string, reference, choice, or HTML, such as **Short description** and **Description**. **Note:** **Journal type** is not a supported data type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Good candidates for your input fields have text that is relevant to the solution. For example, if you are configuring a solution to find similar incident records, you can select the **Short Description**, **Description**, **Resolution notes**, and **Close notes** fields.
Training Frequency	Training is performed once by the system, by default. Because your data can age over time and degrade the accuracy of recommendations, consider invoking scheduled trainings once your solution definition is fairly stable.
Domain	On instances where domain separation is active, select the domain whose target records you want to use for your word collection. Create a separate similarity solution definition record for each domain whose field values you want to use for your word collection.
Similarity Fields	Record fields that are likely to contain words and phrases that help the system identify similar records for your solution. To change your **Similarity Field** choices, click the Lock icon ( ) to open the field and make your updates. Click the icon again to close the field and save your updates.
Similarity Window	The period in which you want to look for similar records. If you have a smaller number of total incoming records, a larger window might be best. However, if the window is too large, you may retrieve records that are not as useful. If the window is too small, you might not retrieve enough similar records. For example, if you are looking for similar incident records that are open, you can select **Last 1 day**. This selection targets the most recent records, many of which could still be open.
Similarity Window Filters	Filter conditions for your similarity window. These filters define the dataset conditions under which your similarity results are determined. For example, if you are looking for similar incident records that are open, you can filter your search by creating conditions such as: **[Incident state] [is] [In progress]** These filters are applied in addition to the **Input Field** filters.
Window Refresh Frequency	Frequency to refresh the similarity window. For example, if your window contains incident records that are open, you can select a refresh frequency value of **Every 15 minutes**. New incidents typically occur frequently throughout the day so this frequency increases the likelihood that newly opened records are included in the refresh. **Note:** If your similarity window is composed of records such as Knowledge article records, which are typically not created often, you can choose a larger refresh frequency such as **Every 1 day**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Click **Save** to save the solution definition record so you can return to it later, or click **Submit & Train** to create the solution definition record and train it.
5. If you submitted the solution for training, click **OK** on the **Training Activation** window to confirm.

Result

The system schedules the solution for training with the nearest training service. You and other users subscribed to the Predictive Intelligence Notifications category receive a notification when the training completes, including any errors that might have occurred in the training. When training is complete, the system uploads the solution as an Attachment record.

What to do next

Review the trained similarity solution examples in the **Similarity Examples** related link on your ML Solution Definition form.

View Event Management solution training progress

View solution training progress or statistics to determine whether a solution is available or how long the next training cycle might take to complete.

Before you begin

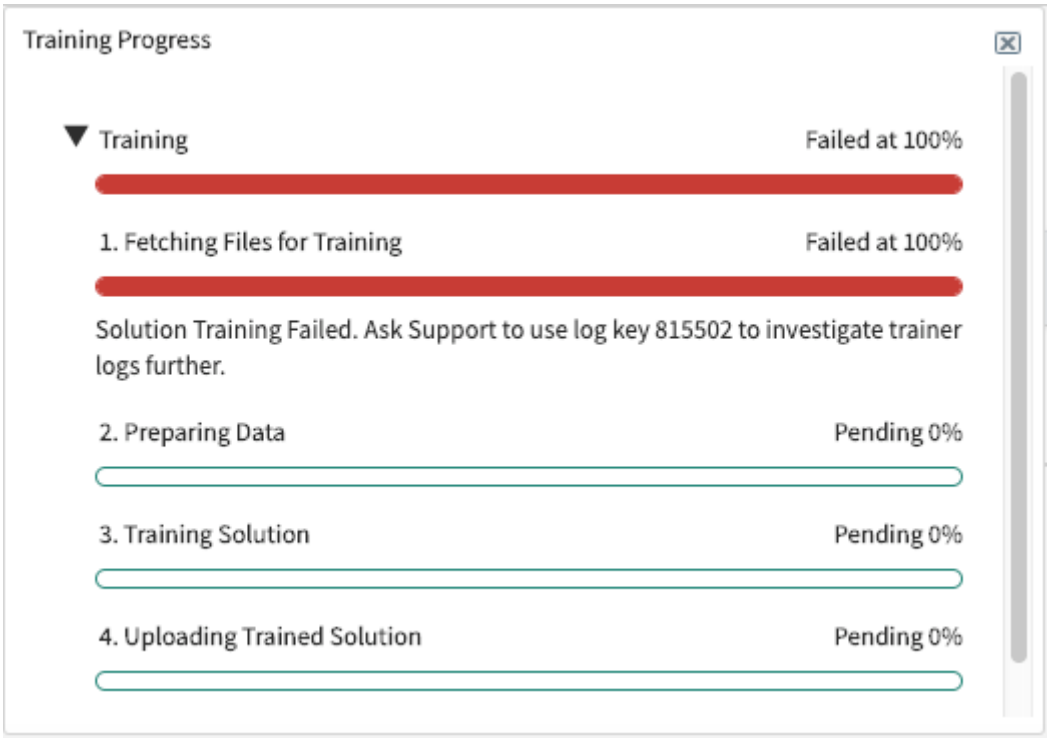
Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Predictive Intelligence** > **Similarity** > **Solutions**.
2. In the ML Solutions list, select the solution whose progress or statistics you want to view.
3. Click the **Show training progress** related link.
   The ML solution automatically performs activities that appear in the Training Progress pop-up window.

   The system shows a Training Progress pop-up window. In the following example, the progress failed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



If the training is a success, all bars would be fully blue and the progress for each step would show 100%.

What to do next
See Review Event Management similarity examples.

Review Event Management similarity examples

Review the similarity examples and scores that the system provides during solution training to see how the selected alert record compares to existing alert records. For example, you can modify the similarity score threshold to increase the accuracy of your similarity recommendations.

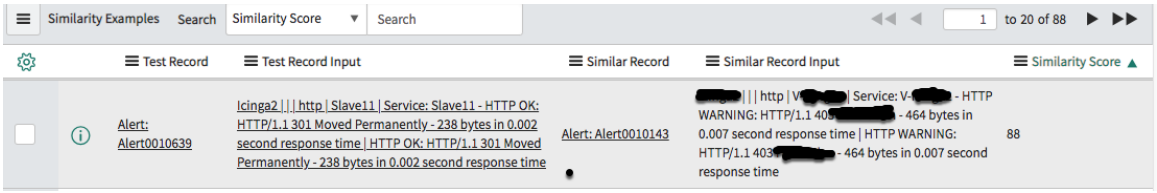
Before you begin
Train a similarity solution in a ServiceNow datacenter. For more information, see Create an Event Management similarity solution.

Role required: evt_mgmt_admin

About this task
Adjust the current threshold to provide useful results. For example, a low similarity score has more coverage but less precision.

Procedure
1. Navigate to **All** > **Predictive Intelligence** > **Similarity** > **Solutions**.
2. In the ML Solutions list, locate your solution and click the Information icon (ⓘ).
3. Click **Open Record**.
4. Click the **Similarity Examples** related link.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. Review the similarity examples and their threshold scores to determine the accuracy and coverage levels you want applied to your solution similarity results.
   The higher the similarity score, the more precise it is and the less coverage it offers. The lower the similarity score, the more coverage it has and the less precision it offers.
6. Based on your review, determine whether to increase or decrease the similarity score threshold value for your similarity solution

   The solution returns only similarity results that have a score that is higher than the threshold. If the current threshold is not providing useful results, adjust the threshold value.
7. Navigate to **Predictive Intelligence** > **Similarity** > **Solutions**.
8. In the ML Solutions list, locate your solution and click the Reference icon (ⓘ).
9. Click **Open Record**.
10. In the Solution Statistics tab, enter a new value in the **Similarity Score Threshold** field.
    For example, suppose that the current score is 80. Based on your similarity example review, you might want to enter a higher score of 90. This returns fewer results but ones that are more similar to the alert record under review. A lower similarity score has more coverage but less precision.
11. Right-click in the form header and click **Save**.
    Your solution uses the new similarity threshold value. In the example, the solution returns similar results that have a score higher than 90.

Activate Event Management solution version

The system activates the most recent version of the solution, but you can activate any previously trained Event Management solution version if it is more appropriate.

Before you begin

Because you might have created more than one solution, you can choose to activate the solution that is most appropriate.
Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Predictive Intelligence** > **Similarity** > **Solutions**.
2. In the ML Solutions list, click the Reference icon (ⓘ) for the trained solution that you want to activate.
3. Click **Open Record**.
   You can assign a title to the solution using the `evt_mgmt_similarity_solution_title` property. The default value is `ml_x_global_alert_similarity`. This property changes the value in the **Solution Name** field.
4. In the solution record, click **Activate**.
   The system activates this solution version and deactivates any other solution version.

Self-health monitors for Event Management

Use the Event Management self-health monitors to track Event Management features and resolve issues.

Monitor Event Management to detect and resolve issues

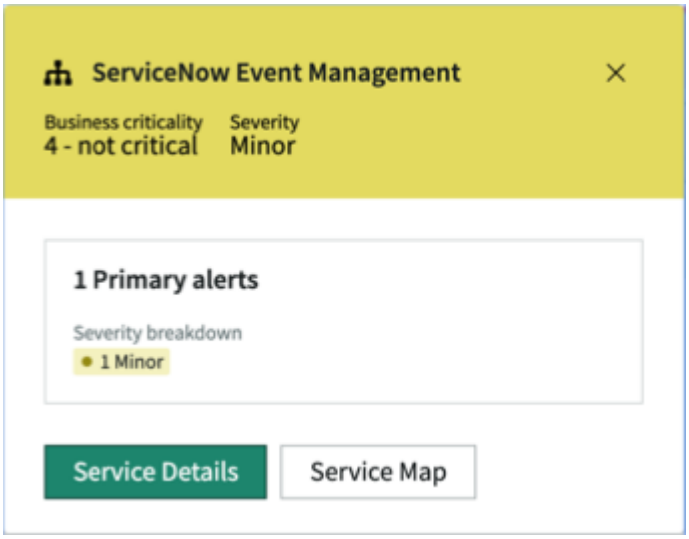
Enable the self-health feature to help detect and troubleshoot Event Management health issues. Some configuration is required before the self-health feature can display meaningful data. Once configured and the related scheduled jobs are enabled, the Service Operations Workspace displays data that is automatically collected and calculated on a recurring schedule.

Note: Event Management Dashboard is not supported for new instances in the Paris release. However, instances upgraded from a release prior to Orlando that use Event Management Dashboard can continue to do so.

The self-health feature creates CIs in the CMDB to represent the components of the self-health service. Use the provided monitors to monitor and track the health of services and Event Management features.

Event Management self-health can:

- Trigger alerts when there is an issue with Event Management.
- Display the **ServiceNow Event Management** application services in Service Operations Workspace. Use Service Operations Workspace to view alerts by application service, technical service, and alert groups. You can double-click a tile to view general information about the service.



- Click **Service Details** to view details of the service.
- Click **Service Map** to view a map representation of the **ServiceNow Event Management** application services to see the relationships between CIs in the **ServiceNow Event Management** application services.

Self-health monitoring process workflow

After the *`Event Management – self-health monitoring`* property is enabled:

1. The **ServiceNow Event Management** application services is automatically created.
2. Jobs are automatically scheduled to run scripts that configure what must be monitored.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. The Monitoring States [em_monitor_state] table is updated after each event run that the configuration scripts trigger.
4. The alerts that are generated are monitored.

   The service displays the status of the monitored entity. For example, alerts are displayed in the Event Management dashboard, Service Operations Workspace or All Alerts list.

You can resolve the alerts according to the underlying issue by using **Quick Response** on the standard platform interface. For details, see Apply a quick response in an alert.

Jobs scheduled to process scripts

The jobs scheduled to run by default after the *Event Management — self-health monitoring* property is enabled are:

- The `Event Management - Insert Health Monitor` scheduled job which runs the scripts.
- The `Event Management - Update Health Monitor` scheduled job which runs the update scripts. This job runs once every minute.

Start or stop self-health monitoring

You can control the starting or stopping of the self-health monitor feature by configuring the self-health monitoring property. The first time that the self-health monitoring property is enabled, it automatically creates the ServiceNow Event Management application services.

Before you begin

Role required: evt_mgmt_admin

About this task

Configure the self-health monitoring property to monitor and track application services and Event Management.

Procedure

1. Navigate to **All** > **Event Management** > **Event Management Properties**.
2. Locate the *Enable Event Management self-health monitoring* (*evt_mgmt.self_health_active*) property.
   Select one of these values:

Enable Event Management self-health monitoring property

Field	Description
Enabled	The ServiceNow Event Management application services is created and set to monitor self-health. Events are received and alerts are generated.
Alerts Only	The ServiceNow Event Management application services and the CIs related to it are not created. Alerts are created but are not bound to a CI.
Disabled	The ServiceNow Event Management application services is not operational. Events are not received, and alerts are not generated.

3. Click **Save**.

Result

The ServiceNow Event Management application services is set according to the value selected for the *evt_mgmt.self_health_active* property.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure the Event Management - Insert Health Monitor scheduled job

Determine what the Event Management - Insert Health Monitor scheduled job is to monitor. After the job runs, you can view the **ServiceNow Event Management** application services.

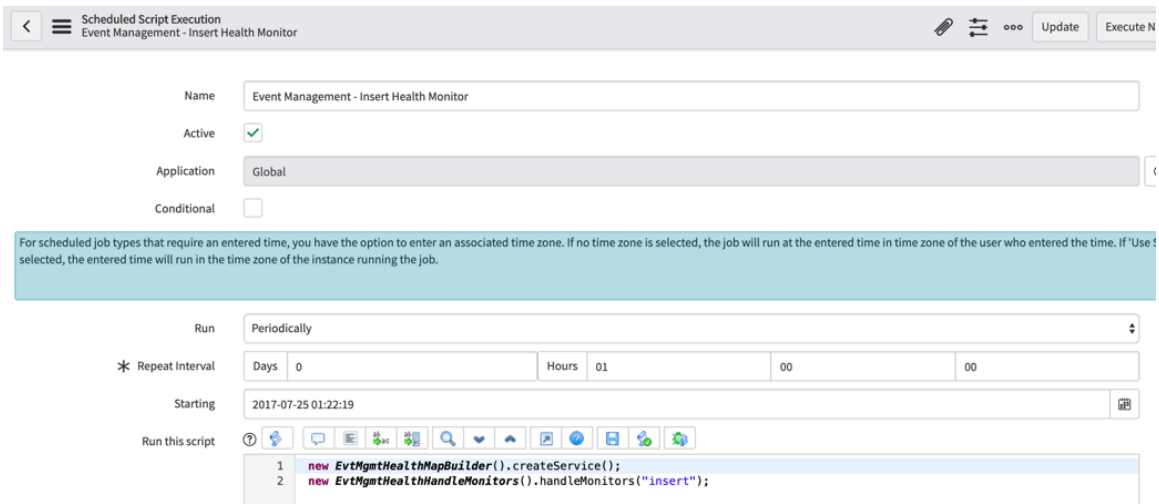
Before you begin

Ensure that the *Enable Event Management — self-health monitoring* property is enabled on the Event Management Properties page (**Event Management** > **Event Management Properties**).

Role required: evt_mgmt_admin

Procedure

1. Navigate to **System Definition** > **Scheduled Jobs**.
2. Locate and select the **Event Management - Insert Health Monitor** job.



3. Modify the scripts indicated in the **Run this script** field to determine what the scripts are to monitor.

Monitor self-health with domain separation

Use domain separation to enable self-health to display Event Management health issues that are based on data, rules, and settings from the logged in user domain. The selected domain must not contain any child domains.

Before you begin

Ensure that the Domain Support — Domain Extension Installer (com.glide.domain.msp_extensions.installer) plugin is activated and that the MID Server you're connecting to is configured for Event Management.

Role required: evt_mgmt_admin

About this task

Self-health monitoring is domain aware. If the Domain Support — Domain Extension Installer (com.glide.domain.msp_extensions.installer) plugin has been activated, then self-health displays health issues based on data, rules, and settings from the logged in user domain. If rules and settings aren't defined for a child domain, then the settings of the parent are applied, recursively.

Note: To generate self-health monitoring events in the domain-separated instance, you must specify the domain of these generated events. This is done by specifying the `sys_id` of the required domain in the *evt_mgmt.domain_self_monitoring* property.

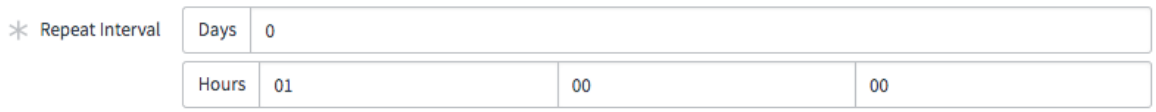
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When the Domain Support — Domain Extension Installer (com.glide.domain.msp_extensions.installer) plugin isn't activated, adding, or removing a connector or MID Server is immediately reflected in the map.

When the Domain Support — Domain Extension Installer (com.glide.domain.msp_extensions.installer) plugin is activated, updates are done periodically according to the interval specifications of the Event Management — Insert Health Monitor scheduled job.

Procedure

1. Navigate to **All** > **System Scheduler** > **Scheduled Jobs**.
2. In the **Schedule** list, locate and select the Event Management — Insert Health Monitor job.
3. In the Event Management — Insert Health Monitor job, under Related Links, select **Configure Job Definition**.
4. Set the required periodic update time in the **Repeat Interval** field by specifying the required values.
   The default interval is one hour.

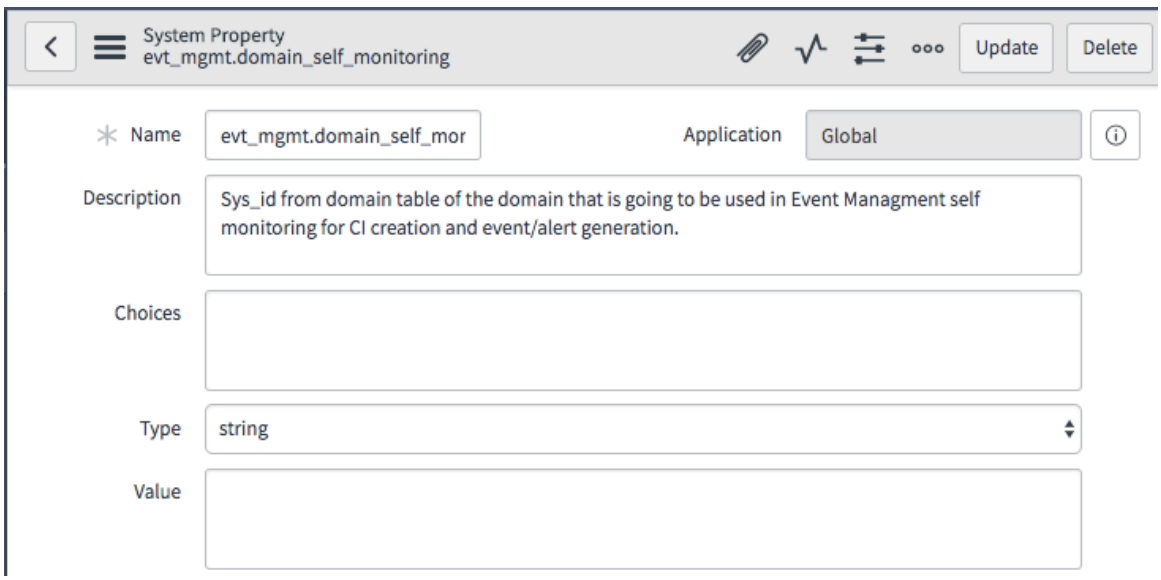


5. Select **Update**.

Result

Further configuration is required for CI creation, receipt of events, and alert generation. The `sys_id` of the domain must be specified in the **Value** field of the *`evt_mgmt.domain_self_monitoring`* property.

1. Navigate to **System Properties All Properties**.
2. Locate and select the *`evt_mgmt.domain_self_monitoring`* property.



3. In the **Value** field, specify the `sys_id` of the domain.
4. Select **Update**.

Domain separation setup and basic administration

Configure a self-health monitor

You can configure a self-health monitor to track Event Management components and see that they do not exceed the specified threshold.

Before you begin

Role required: evt_mgmt_admin

About this task

The Monitoring Configurations [em_monitor_conf] table lists the records that determine which Event Management components are being monitored. Each record contains the health monitor script that is relevant to what you are monitoring. If you intend to create a new health monitor script, you must configure a monitor to match the purpose of the custom script. You can configure the monitoring configuration records to track the items that are important to you. For example, you can modify the threshold aspect in the *`Connector's Idle state monitoring`* record, by specifying that the monitoring job frequency is 90 seconds instead of 120 seconds.

Note: Each of the monitoring configuration records can be disabled.

If a monitoring configuration specifies a threshold, the configuration value determines what alert severity to display. Threshold values specify the delay time values in units of minutes.

After the *`Event Management - self-health monitoring`* property is enabled, these jobs are automatically scheduled to run scripts that configure what must be monitored:

- The `Event Management - Insert Health Monitor` scheduled job runs the scripts. Determine what must be monitored by adding or modifying the script in this job, which runs once every hour.
- The `Event Management - Update Health Monitor` scheduled job runs the update scripts. This job runs once every minute.

Use the following procedure to configure whether a monitoring configuration can run and set the frequency of the monitoring job. You can specify the threshold values that, if exceeded, trigger an alert.

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Self-Health Monitoring**.
2. From the Monitoring Configurations list, select a monitoring configuration record and modify the required field.
   On the form, fill in the fields.

Monitoring Configuration form

Field	Description
Active	Check box for enabling the monitoring configuration to be active.
Monitoring job frequency [seconds]	Frequency that the monitoring job is run.
Critical Threshold	Any point above the value is considered a critical consequence.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Major Threshold	Any point above the value, but below the value of the **Critical Threshold**, is considered a major consequence.
Minor Threshold	If exceeded, the value is considered a minor consequence.
Warning Threshold	If the value is exceeded, a warning is issued.

3. Click **Update**.

Result
The values in the modified monitoring configuration record are compared to the actual values as they occur in events that are received. Alerts are created according to the configuration settings.

Example:
Example 1: Use the following procedure to modify the **Critical Threshold** field of the **Connector's Idle state monitoring** monitor from 30 seconds to 35 seconds. This field determines the number of seconds that pass before an alert is generated when the **Critical Threshold** idle state value of a connector is exceeded. In this example, the **Critical Threshold** field is modified from 30 seconds to 35 seconds.

1. Navigate to **Event Management** > **Settings** > **Self-Health configuration**.
2. From the Monitoring Configurations list, select **Connector's Idle state monitoring**.
3. In the **Critical Threshold** field, modify the value to `35`.
4. Click **Update**.

Result The threshold value of the **Critical Threshold** field is increased from 30 to `35`, thereby increasing the number of seconds that pass before an alert is generated for this threshold.

Example 2: This example describes the configuration of the severity threshold when using the **Connectors Status** monitor. The **Connector Status** monitor has a true (= value 1) or false (= value 0) configuration for the severity threshold. For this monitor, where a threshold has the value `1`, then that severity is displayed. Only one severity threshold can have the value`1`. This example assumes that the required severity displayed is `Minor`.

1. Navigate to **Event Management** > **Settings** > **Self-Health configuration**.
2. From the Monitoring Configurations list, select **Connectors Status**.
3. In the **Minor Threshold** field, specify the value `1`.
4. Click **Update**.

Result The monitor issues an alert if the threshold value of the **Minor Threshold** field is exceeded.

What to do next
Create a customized monitor. A template is provided to assist you to create script that can monitor the specified components. For more information, see Create a self-health monitor with a custom script.

Create a self-health monitor with a custom script

You can create a self-health monitor to use custom health monitor script to monitor specified Event Management components.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: evt_mgmt_admin

About this task
To augment the self-health monitors that are provided with the base system, you can create a self-health monitor to monitor the components that you specify. The health monitor scripts that are provided with the base system are listed in the following table.

Health monitor scripts provided with the base system

Health monitor script	Used by a monitor to:
Check delay in event processing	Monitor the duration of events [in minutes] that remain in Ready state and are not processed.
Connectors Monitor	Monitor: • Whether the time that a connector in idle state surpassed the threshold [in minutes] configured. • The active status of connectors.
Get Event Processing state	Monitor the time that events are in Ready state. Alerts are sent when this time exceeds the threshold.
MID Server Threshold Alerts	Monitor MID Server health. Events are sent when changes in MID Server state are detected.

You can create alert management rules to respond to and remediate the issues detected by self-health. Alerts are generated based on the specified severity and threshold. Navigate to **Event Management** > **Administration** > **Self-Health Monitoring** for the monitors that are provided with the base instance to monitor the issues detected by self-health, which are:

Monitor	Description
Connector's idle state monitoring	Monitor to verify whether any of the connectors were in idle state that surpassed the threshold [in minutes] that was configured. Health Monitor script selected: `Connectors Monitor`.
Connectors Status	Monitor to track the active status of the connectors. Select only one threshold to configure which severity to invoke using 1 to select the threshold field or 0 to ignore the threshold field. For more information, see Connector status example. Health Monitor script selected: `Connectors Monitor`.
Delay in event processing	Monitor to track the duration of events [in minutes] that remain in Ready state and were not processed. This duration period initiates an alert for the event processing CI with severity according to the configured thresholds [minutes].

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Monitor	Description
	Health Monitor script selected: `Check delay in event processing`.
Event Processing job	Monitor the state of the event processing jobs. An alert is generated when the idle time of a job exceeds the configured threshold. Health Monitor script selected: `Get Event Processing state`.
MID Server MID Server Threshold Alerts	Monitor MID Server MID Server health. Events are sent when issues with MID Server availability and resource thresholds are detected. Health Monitor script selected: `MID Server Threshold Alerts`.

Note: To prevent a self-health monitor from detecting the connector status, at any time you can clear the **Active** check box of the monitor and then click **Update**.

Procedure

1. Navigate to **Event Management** > **Administration** > **Self-Health Monitoring**, and click **New**.
2. On the form, fill in the fields.

Monitoring Configuration form

Field	Description
Name	Descriptive and meaningful name for the monitor.
Description	Text narrative that describes the monitor.
Active	Check box to enable the monitor.
Monitoring job frequency [seconds]	Frequency that the monitoring job should run. Default: `120` seconds.
Last Run	Last run date and time. These values are automatically updated.
Script	Monitoring script. Click the search icon. The existing scripts are listed in the Health Monitor Scripts screen, or click **New** to create a custom health monitor script. For more information about creating a custom health monitor script, see step 3.
Note: Regarding all the following threshold configuration fields: All monitored values are compared against the thresholds. If a monitored value exceeds a threshold, an alert with the appropriate severity is issued.	
Critical Threshold	Any point above the value is considered a critical consequence.
Major Threshold	Any point above the value, but below the value of the Critical Threshold, is considered a major consequence.
Minor Threshold	If exceeded, the value is considered a minor consequence.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Warning Threshold	If the value is exceeded, a warning is issued.
Additional information	Further information about the monitor.

3. On the Monitoring Configuration form, next to the **Script** field, click the search icon to open the Health Monitor Scripts form.
   To create a custom health monitor script, click **New**.
4. On the form, fill in the fields.

Health Monitor Script form

Field	Description
Active	Check box to enable the monitor.
Description	Text narrative that describes the custom script.
Name	Descriptive and meaningful name for the custom script.
Script	Custom script to run when called from a monitor. A script template is provided as a guide. You can use the Health monitor scripts provided with the base system as examples of how to author the script, and use the script editor tools. Ensure that the custom script includes: Run the monitor function, which is called according to the "monitoring job frequency" setting *`runUpdateHealthMonitorScripts(scriptId)`*. Add this function to run the monitoring logic. Specify the configuration function that is called every hour *`runInsertHealthMonitorScripts(scriptId)`*. Add the configuration logic and add a CI if needed. In the navigation pane search field, enter `em_monitor_state.list`. In the Monitoring States [em_monitor_state] table, specify the initialization of the monitor record in the required record. Use the helper functions defined in *`EvtMgmtHealthMonitorCommon`* and *`EvtMgmtEventAlertGenerator`* script includes: ○ EvtMgmtHealthMonitorCommon ○ healthMonitorCommon.shouldRun ○ healthMonitorCommon.calculateSeverity ○ EvtMgmtEventAlertGenerato ○ openAlert ○ closeAlert

You can use the Monitoring Configurations [em_monitor_conf] table for self-health monitoring configuration, the Health Monitor Scripts [em_monitor_scripts] table for scripts. Use the Monitoring States [em_monitor_state] table for displaying the results of the monitor.

These tables are initialized inside *`runInsertHealthMonitorScripts`*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information about script includes and APIs, see:Script includes that are installed with Event Management

5. Click **Submit**.

Result

To monitor the Event Management components that you specify, you can configure a self-health monitor that uses the custom health monitor script that you created.

View the Event Management self-health application services map

You can view Event Management application services maps to visualize configuration items (CIs) that comprise this service. The maps show the relations and connections between these CIs.

Before you begin

Role required: evt_mgmt_admin

The Event Management application services topology map only displays MID Servers that have passed validation and connectors that are active.

About this task

The Event Management components that are monitored by the self-health application services are listed in the following table:

Components monitored by the self-health application service

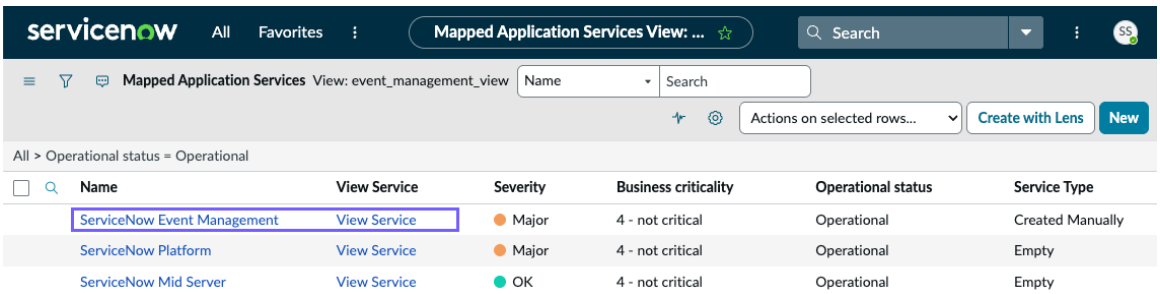
Component	What is monitored
Event connectors	For each connector: • Status: Success or Error • Delay: Elapsed time from 'last run time' (above threshold)
Event processing jobs	For each event processing job: • Number of actual jobs executed compared to the number of jobs configured to run. • Delay of any of the event processing jobs above the time set as threshold. • Duration of events in Ready state compared to the specified threshold. • Delay of event rule processing above the set threshold. If there is a delay, an alert is generated and the event rule is disabled.
MID Servers	MID Servers that have been validated are displayed. The MID Server status and the `Ecc_agent_issue` table are monitored. An event is triggered whenever this table is updated. The MID Server status is displayed, either **Up** or **Down**. For information about MID Server health, see MID Server heartbeat

Procedure

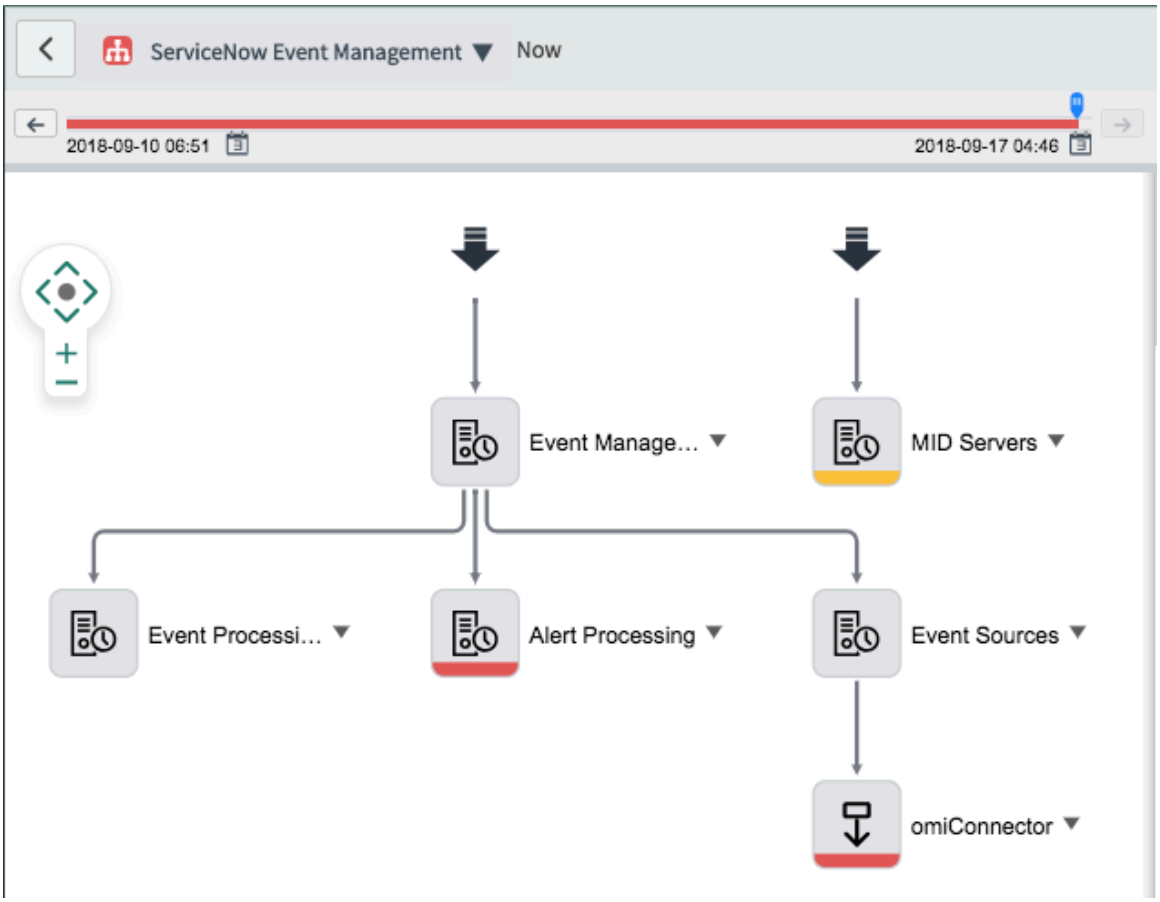
1. Navigate to **All** > **Event Management** > **Services** > **Application Services**.
2. Click the **ServiceNow Event Management** application services.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the **Application Services** page, locate **ServiceNow Event Management** and click **View Service**.



Displayed on the map are the related MID Servers and the Event Management object, as depicted in the following image; these MID Servers have an **UP** status. MID Servers are updated when they are created or deactivated.



Under the Event Management object is Event Processing, Alert Processing, and Event Sources (for example, connectors). Only **Active** connectors are shown; when a connector is created, the connector is displayed only after it has been activated. The status of active connectors is updated and the status of non-active connectors is not displayed.

In the preceding image, the health of Event Management components is displayed. The omniConnector component has a red bar, indicating that a critical alert has occurred that affects this connector. In addition, this critical alert impacts the parent Alert Processing object, which as a result, has a red bar.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
You can select the configuration item that has a critical alert and change the impact from parent to application service.

Create maintenance rules

Use maintenance rules to mark CIs in maintenance status. When in maintenance status, these CIs are excluded from impact calculation.

Before you begin
Role required: evt_mgmt_admin

About this task
You can define rules to mark CIs that match the specified criteria as being in maintenance status. The marked CIs populate the Impact Maintenance CIs [em_impact_maint_ci] table.

Note: When running maintenance rules, the cmdb_ci status of matching CIs is not changed. However, matching CIs are flagged in the em_impact_maint_ci table by these rules and this status is considered for impact and alert calculations.

The field flagged by this rule as being in maintenance status is the CMDB status field.

Note: To activate a maintenance rule, select the **Active** field in the maintenance rule. To deactivate a maintenance rule, clear the **Active** field.

The maintenance rules provided with the base instance are:

Default maintenance rule	Description
CI in Change Window	Where the CI has an active change window, the matching CIs are marked as being in maintenance status. The rule runs a query against the change request [change_request] table to determine whether the rule is applied. All these conditions in the change_request table must be met: • **State** is one of these options: Scheduled, Implement, Work in Progress, or Open/New (state in (-2, -1, 1, 2)). • **Approval** is Approved (approval = 'approved'). • The change request window is active, that is, the current time is between **Planned start date** and **Planned end date**, or the current time is between **Actual start date** and **Actual end date**. • The change request record is not an on-hold record (on_hold='false'). **Note:** All these conditions must be present for the CI to be placed in maintenance status by this rule. For example, if the **State** of the change request approval status is `Change is waiting for`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Default maintenance rule	Description
	`approval`, then the change is not added to the em_impact_maint_ci table.
Maintenance status of CI	CIs whose CMDB status field is **In Maintenance** are flagged by this rule as being in maintenance status. By default, retired CIs are not included in CIs that are **In Maintenance**. To include retired CIs: **1.** Navigate to **All Properties**. **2.** Select **New**. **3.** Configure the *evt_mgmt.maintenance_rule_include_retired* property with **Value = true**. **Note:** Including thousands of retired CIs may decrease system performance.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Maintenance Rules**.

2. Click **New**.

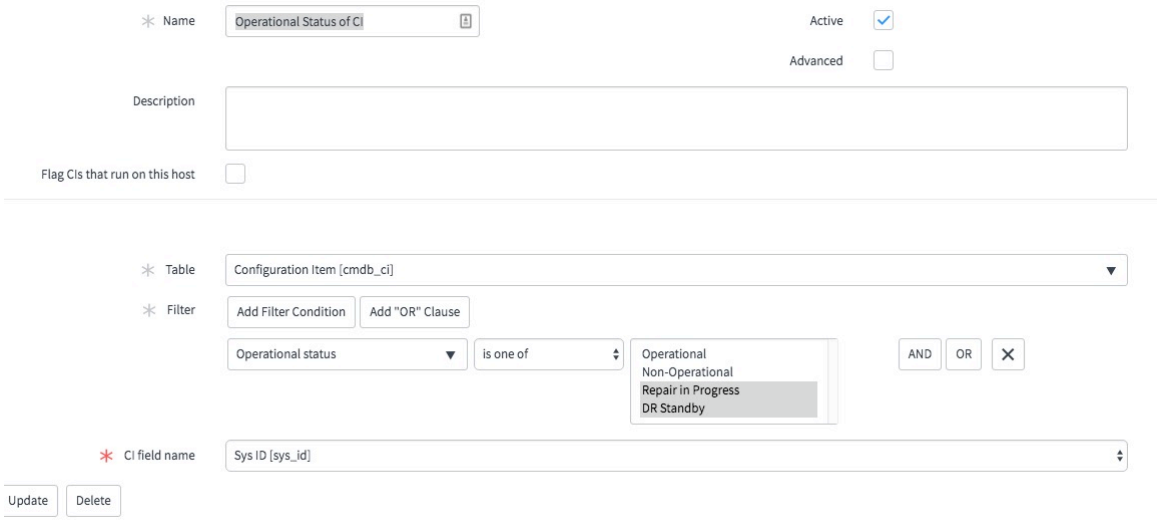
3. Fill in the fields, as appropriate.

Column heading	Description
Name	The maintenance rule name.
Active	Select to activate the maintenance rule.
Advanced	Select to enable the optional script section to display.
Description	Information that describes this maintenance rule.
Flag CIs that run on this host	Select to flag all applications running on the recognized host as being in maintenance.
Table	Select the table that contains the CI that you require.
Filter	Specify how to select the data.
CI field name	Select the CI from the list. The list is populated according to your selection in the **Table** field. If a CMDB table, or a table derived from CMDB, was selected, specify `sys_id` for the **CI field name**. Otherwise, specify the required CI field that you want to use. See the examples.

4. Click **Submit**.

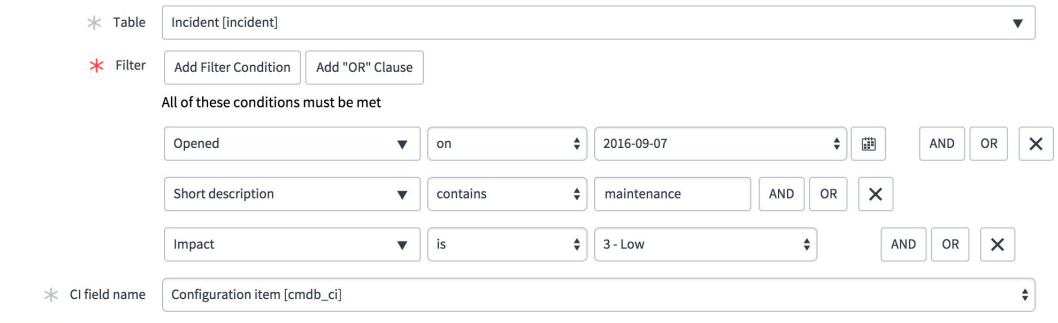
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example:
Example of a maintenance rule using a CMDB table.
Assume that a company defines a CI as being in maintenance when the Operational Status of the CI is either **Repair in Progress** or **DR Standby**.



Example of a maintenance rule using a table other than CMDB.

Assume that a company uses Incident records to track maintenance. Any maintenance request is translated to an incident when it has a description that starts with “Performing maintenance on CI”. As long as the status of such an incident is open, this status indicates that the maintenance is in progress. For the **CI field name** field, specify a CI name from the table that was chosen, in this case **Incident**.



Example of a maintenance rule that uses the advanced script feature.

In the Maintenance Rule page, select the **Advanced** option. Customize the provided example script:

```
var gr = new GlideRecord('cmdb_ci');
gr.addQuery('name', 'your_name_here');
gr.query();
while (gr.next()){
 result.push(gr.sys_id +'');}
```

The advanced script must always return a text string that represents an array of CI IDs, for example, ['sys_id1','sys_id2','sys_id3']. Ensure that every possible execution path returns a value. If the script does not return a value, the maintenance calculator job fails with an exception.

You can use this script as an example to prepare your own customized script.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
(function findCisInMaint(){
var result = [];

//Your code goes here, this is an example of setting CIs in maintenance
var gr = new GlideRecord('cmdb_ci');
gr.addQuery('name', 'your_name_here');
gr.query();
while (gr.next()){
 result.push(gr.sys_id +''); //The array should be a string array, make sure to add strings
}

//Make sure to create a string representation of the array
return JSON.stringify(result);

})();
```

- How alerts work with CIs in maintenance
- Place an alert into maintenance

Resolve an incident related to an alert

When you resolve an incident that is associated with an alert, the alert can also close according to the *evt_mgmt.incident_closes_alert* property.

Before you begin

Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

Procedure

1. Open an incident.
2. Click **Resolve Incident**.

   The corresponding alert is closed, resolved, or left alone as specified by the *evt_mgmt.incident_closes_alert* system property.

   The alert may not close immediately when the incident is closed. Depending on the value of the *evt_mgmt.alert_rule_close_delay* parameter, the alert may close 5 seconds after the last alert update. This value (in seconds) is defined in the parameter. To use the property, you need to create the property with the same name and assign the required value to it. For more information on how to create a property, see Add a system property.

Close an alert

Close an alert by an event or a user action. Closing an alert also closes any related incident that is not already resolved or closed.

Before you begin

Role required: evt_mgmt_admin or evt_mgmt_operator

About this task

An alert can be closed manually, automatically by a close or clear event, or when a related incident is resolved. Whether the alert is closed when the incident is closed is determined by the *evt_mgmt.incident_closes_alert* property. The default value is Yes (True).

When a Clear event is triggered for an open alert, the corresponding alert is set to the "Closed" state. Closing an alert also closes any related incident that is not already resolved or closed. This default behavior can be configured using the *evt_mgmt.alert_closes_incident* property.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Event Management** > **All Alerts**.
2. Select the alert you want to close.
3. In the Alert Form, select **Close**.
   The alert closes without confirmation. If the alert has any resolved or closed incidents, a work note is added to the incident indicating that the related alert was closed.

   If an alert has an open incident that is not related to any other open alerts, the incident is either closed, resolved, or left unchanged. This behavior is based on the *evt_mgmt.alert_closes_incident* property. The available values are: Resolve Incident, Close Incident, and Do Nothing.

Reopen an alert

Additional events can cause reopening of alerts, or you can reopen an alert by changing its state. When an alert reopens, any associated incidents can also be updated or reopened according to the incident state and the *evt_mgmt.alert_reopens_incident* property.

Before you begin
Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task
When an alert is reopened, the related incident is processed as follows:

- If the incident is not *Resolved* or *Closed*, a work note is added to indicate that the related alert was reopened.
- If the incident is *Resolved* or *Closed*, the incident is reopened, a new incident is created, or nothing is done, depending on the *evt_mgmt.alert_reopens_incident* property value.
  - If the incident is reopened, work notes are added to the incident.
  - If a new incident is created, any matching alert management rule, alert action rule, and task template applies to the incident. If there is no matching alert action rule or template, fields from the existing incident are copied to a new incident.

Procedure

1. Navigate to **All** > **Event Management** > **All Alerts**.
2. Search by alert number.
3. In the **State** field, click **Reopen**.
4. Click **Update**.

Alert insight properties

Use these properties to configure alert insight.

The role required: evt_mgmt_admin

The following alert_insight properties are under sys_properties.

Property	Usage
Time Frame	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Usage
evt_mgmt.alert_insight_alert_history_min	Set the time frame (in minutes) to retrieve repeated and similar alert data. Default `43200` (30 days) **Note:** Alerts are retrieved regardless of their state (open / reopen / flapping / closed).
evt_mgmt.alert_insight_closed_alert_window	Set the time frame (in minutes) to retrieve alerts that were already closed. It is the time after the alert last updated date. Default: `4320` (3 days)
Similarity	
evt_mgmt.alert_insight_alert_same_as_filter	This property is a comma-separated string that defines which of the alert fields is used to consider alerts to be similar. Default: `source,type,resource,metric_name`
Related CIs	
evt_mgmt.alert_insight_related_cis_topology_levels The relationship types are: • CMDB based (metadata rules and suggested relations) • Within application services • Within Alert groups	For 'Within application service' relationship type, this property sets the depth or the maximum level of relationship of retrieved CIs. Default: 3
Score	
evt_mgmt.alert_insight_group_mapping	This property sets the score for within alert group relations. Default: 2
evt_mgmt.alert_insight_level_1_mapping	This property sets the score for level 1 relationship. Default: 3
evt_mgmt.alert_insight_level_2_mapping	This property sets the score for level 2 relationship. Default: 2
evt_mgmt.alert_insight_level_3_mapping	This property sets the score for level 3 relationship. Default: 1
Maximum related tasks	
evt_mgmt.alert_insight_max_tasks	Maximum related tasks to retrieve for alert insight. Default: 10

Metadata rules consideration

The parent-child relationship of CIs is considered. Dependent relationship rules consist of hosting and containment rules, each type modeling the data from a different perspective of the CI.

To manage dependent relationship rules:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To access rules at the class level, use the CI Class Manager. Navigate to **All** > **Configuration** > **CI Class Manager**.
- To access grouped rules, use the Metadata Editor. Navigate to **All** > **Configuration** > **Identification/Reconciliation** > **Metadata Editor**.

Containment rules represent configuration hierarchy of CIs, describing which CI contains which other CIs.

Hosting rules represent placement of CIs in a business definition, describing what CIs run on.

Modify the alert insight properties to configure the way alert information and analysis appears in the Alert Insight pane.

Related CIs configuration

The following properties control which CMDB relationships to consider for related CIs. The CMDB relationships include regular CMDB relation rules, metadata rules (containment rules and hosting rules), and suggested relations.

Property	Usage
evt_mgmt.related_cis_get_all_relation_types	Get all relation types, not including metadata rules. Default: `false`
evt_mgmt.related_cis_use_containment_rules	Use metadata containment rules. Default: `true`
evt_mgmt.related_cis_use_hosting_rules	Use metadata hosting rules. Default: `true`
evt_mgmt.related_cis_use_suggested_relations_rules	Use suggested relations rules. Default: `false`
evt_mgmt.related_cis_validate_relation_rules	This property controls whether to validate relation of CI according to metadata rules. Default: `true`

Score

Scores are configured per relation type or depth. Scores are accumulated. The higher the score, the more relevant is the related CI to the current CI.

Example: For a CI that was found at level `2` in the same application service of the current CI, the score is 2. The same CI is in the same alert group, so there is an extra score of `3`. The accumulated score is therefore `2+3 = 5`.

Affiliation type

The Affiliation Type column in the **Related Incidents**, **Related Change Requests**, and **Related Problems** tabs shows the type of relationship that the CI of the selected alert and the related CI have.

To see affiliation type relationships, navigate to **All** > **Configuration** > **Identification/ Reconciliation** > **Metadata Editor**.

The parent-child relationship between configuration items is considered.

© 2026 ServiceNow, Inc. All rights reserved.

Rotate event and alert table for cleanup

The growth of data tables impedes performance. Preserve instance performance by event table rotation and alert table cleanup for status and alert history retention.

Containing the growth of event tables

By default, the Event Management event [em_event] table uses table rotation. The table rotation schedule ensures that new data is written to one of the tables in the rotation group. According to the value of **Clean base rotation** setting, the base table is deleted and then a new round of writing the tables in a daily rotation commences. By default, this table deletion occurs after seven rotations.

To back up events to a custom table, see Event Management configuration preferences.

Containing the growth of alert tables

By default, a scheduled job cleans out the alert [em_alert] table. Table cleanup is done also for impact status and alert history table.

Related topics

- Purge impact status and alert history
- Alert table clean up
- Table rotation

Modify event table rotation

Table rotation is used by Event Management, by default, to contain the growth of event [em_event] tables within the rotation table group.

Before you begin

Role required: evt_mgmt_admin

About this task

Table rotation ensures that event tables grow to a reasonable size.
Each table rotation has a schedule, according to which new data is written to one of the tables in the rotation group. A table rotation group includes the original table plus several additional tables. After the rotation procedure has written the last table in a rotation, the rotation overwrites the first table in the rotation. By default, the table rotation for Event Management is to rotate the em_table to an offload table and the base table cleanup takes place after seven table rotations.
For information about backing up events to a custom table, see Event Management configuration preferences.

Procedure

1. Navigate to **All** > **System Definition** > **Table Rotations**.
2. Select the [em_event] table rotation group to modify.
3. Edit the required fields.
4. Select **Update**.

Related topics

- Table rotation
- Apply table rotation

Purge impact status and alert history

Automatically cleans up outdated impact statuses and alert history from the database to free up space, improve system performance, and ensure only relevant data is retained.

Before you begin

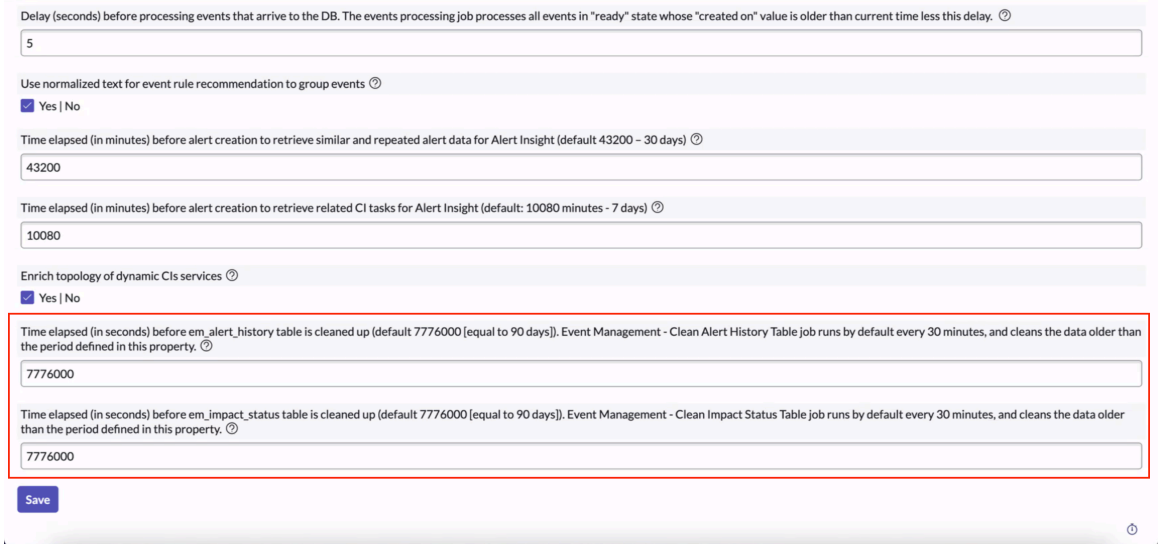
Role required: evt_mgmt_admin

About this task

If records are older than 90 days, by default they are purged. If records are retained for a longer period, larger volumes of data are stored, and performance may be impacted. The data cleanup is done by two jobs: Event Management - Clean Alert History Table and Event Management - Clean Impact Status Table.

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Event Management Properties**.
2. To shorten the retention period, use the highlighted properties.



Related topics

- Rotate event and alert table for cleanup

- Alert table clean up

Clean alert history and impact status tables

Schedule jobs to mark and remove old alert records in the Alert History [em_alert_history] and Impact Status [em_impact_status] tables, to prevent the tables from becoming overloaded with data.

Before you begin

Role required: evt_mgmt_admin

About this task

Schedule the following jobs to remove old alert records:

- **Backfill**: Determines when alerts are to be marked for deletion.
- **Clean**: Deletes the alerts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The records in the [em_alert_history] and [em_impact_status] tables are deleted by default after three months. This is controlled by the properties *evt_mgmt.impact_calculation.cleanup_age_seconds.em_alert_history* and *evt_mgmt.impact_calculation.cleanup_age_seconds.em_impact_status*. The default value is 7,776,000 seconds (equivalent to 90 days).

Procedure

1. Navigate to **All** > **System Definition** > **Scheduled Jobs**.
   The **Scheduled Jobs** page appears.
2. To determine how often to mark alerts for deletion on the **Impact Status** table:

   a. Locate and select the **Event Management - Backfill Impact Status Table** job.
   The **Scheduled Script Execution** page appears.

Scheduled Script Execution page

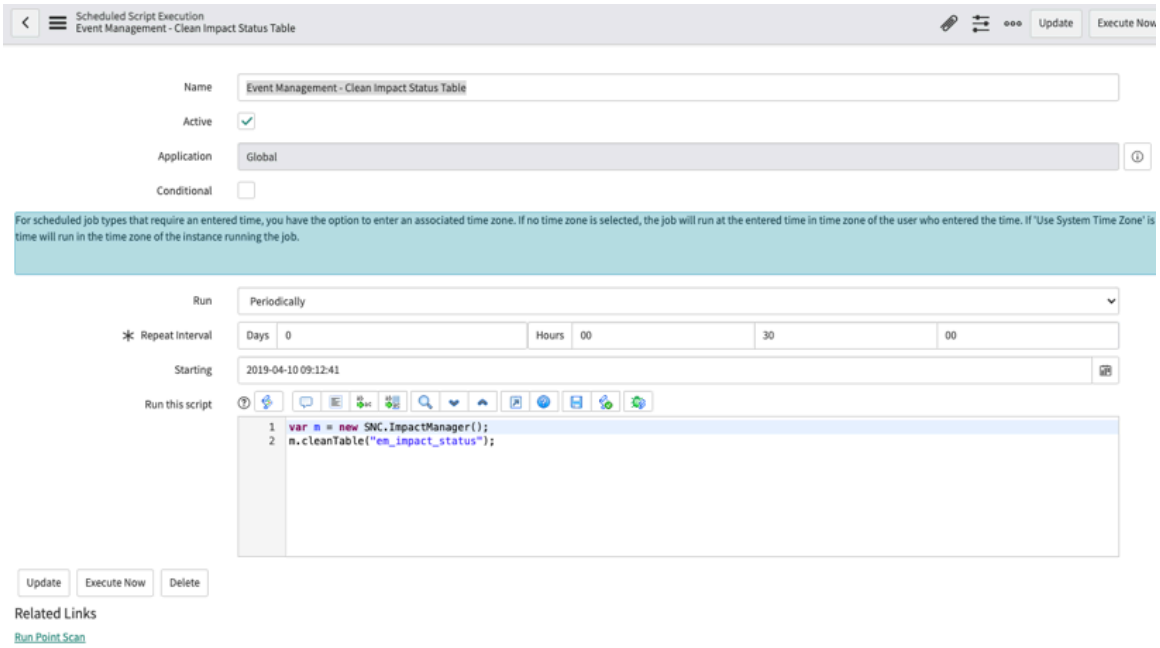
   b. In the **Repeat Interval** field, configure how often you want the job to run.
   To run the job immediately, select **Execute Now**.

   c. Select **Update**.

3. To remove old alerts from the **Impact Status** table:

   a. Locate and select the **Event Management - Clean Impact Status Table** job.
   The **Scheduled Script Execution** page appears.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



b. In the **Repeat Interval** field, configure how often you want the job to run.
To run the job immediately, select **Execute Now**.

c. Select **Update**.

4. Repeat steps 2 and 3 to perform the Backfill and Clean jobs on the **Alert History Table**.

Alert table clean up

The Scheduled Jobs feature runs a script to automatically close alerts in the Alerts [em_alert] table that meet specific conditions, helping reduce alert noise and keep the system clean and efficient.

Before you begin

Role required: evt_mgmt_admin

About this task

When the Event Management plugin is activated, by default a job is scheduled to run the `Event Management - auto close alerts` script to automatically close alerts in the alerts table that meet the specified conditions. The default retention policy for closed alerts is that the system deletes closed alerts if it is not updated for 90 days. For more information on the scheduled job, see Table cleaner.

Due to the high level of traffic to the table, you cannot audit the Alert table [em_alert] as a whole. Instead, audit selected fields of interest on the table.

Procedure

1. Set the table to `audit = true`.

2. Set `audit = true` on the relevant fields.
To avoid an excess of audit records, audit only the fields that are necessary for auditing.

Result

The `Event Management - auto close alerts` script runs automatically and repeatedly at the scheduled time and closes alerts that meet the specified conditions.

Alert grouping

Alert grouping is the process of organizing and consolidating related alerts into sets based on common characteristics or criteria. This helps in simplifying alert management by reducing noise, making it easier to prioritize, track, and address issues efficiently. Grouped alerts provide a clearer overview of related incidents, facilitating quicker root cause analysis and remediation.

How alert grouping works

Alert grouping enhances operational efficiency and optimizes alert management by categorizing alerts. Here's how it works:

1. Event consolidation: Event Management collects alerts from multiple sources, providing a centralized view of notifications and alerts. This consolidation enables teams to manage alerts more efficiently and recognize critical issues more easily.
2. Contextual Enrichment: Alerts are enriched with data from the Configuration Management Database (CMDB), which contains detailed information about applications and infrastructure components. This context allows teams to better understand the significance of alerts and prioritize responses based on their impact.
3. Intelligent Correlation: Event Management utilizes different types of machine learning algorithms to automatically group related alerts. This intelligent grouping reduces alert noise by combining similar alerts, allowing teams to concentrate on significant issues rather than being inundated with multiple notifications.

Benefits of alert grouping

- Creating automated alert groups by aggregating alerts based on predefined patterns.
- Correlating alerts using timestamps and CI identification to form automated alert groups.
- Forming CMDB based alert grouping by correlating alerts based on CI relationships in the CMDB.
- Correlating alerts based on text similarity of alerts using NLP (Natural Language Processing).

Alert grouping and use cases

Alert grouping methods range from user-defined approaches, like Manual and Rule-based to advanced, fine-tunable algorithms, including Automatic, Mixed, Text-based, Log Analytics, and Network Traffic-based grouping.

Alert grouping types and use cases

Type	Description	Use case
Log Analytics Grouping	Alerts are grouped based on the analysis of log data. This involves correlating log entries to identify related alerts and	An online gaming company enhances server stability by implementing proactive log

	issues. By leveraging log patterns and sequences, this method can detect complex, multi-step problems across the IT environment.	analytics. They monitor logs from game servers in real-time and use analysis tools to detect patterns of errors that occur before crashes. For instance, the analysis reveals that certain error patterns appear about 30 minutes prior to server crashes. By setting up automated alerts for these patterns, the company can initiate remediation actions, such as restarting services or reallocating resources, before a crash occurs. This proactive approach prevents disruptions, minimizes downtime, and improves the gaming experience by addressing issues before they impact players.
Rule-based Grouping	Alerts are grouped according to predefined rules and criteria set by users. These rules might include specific conditions, such as thresholds or event types. This method is effective for consistent and repeatable patterns but requires maintenance of the rules.	In a data center managing an e-commerce website, rule-based alert grouping helps handle high traffic during events like flash sales. Alerts about server issues, such as high CPU usage, are designated as parent alerts. These parent alerts are linked to child alerts that report related problems, like slow database queries. The rules ensure that server-related alerts are grouped with their symptoms, allowing the IT team to quickly identify and address server overload issues. This approach improves issue resolution efficiency and minimizes downtime.
Automated Grouping	Advanced algorithms automatically identify and group related alerts based on patterns and similarities in the alert data. This method	A large financial institution uses machine learning to manage alerts from numerous servers and applications. The system analyzes historical

Type	Description	Use case
	leverages machine learning and AI to adapt to new and unknown issues, providing proactive alert management. Event Management groups alerts that are similar, but not necessarily identical, based on the proximity in time of the last event generation. Alerts with the same CI and the same pattern identifier are grouped together. Automatic alert grouping consists of the following components. • Alert Aggregation Learner (**Service Analytics Alert Aggregation Learner - Daily**): This offline job runs daily to process past alerts and perform statistical analysis to build alert patterns. For details, see Configure pattern based alert grouping. • Real-time Alert Aggregation job (**Service Analytics group alerts using RCA/ Alert Aggregation**): This job runs every minute to generate alert aggregation groups based on alert patterns, CMDB relationships, text similarity, user-defined alert clustering tags, and network traffic connection between processes.	alert data to recognize patterns, such as database server failures frequently being accompanied by client connection errors. It then automatically groups related alerts together. For instance, when a new database server failure alert is detected, it is grouped with previous connection error alerts. This automated grouping helps the IT and security teams quickly identify and address issues, improving response times and reducing downtime.
Mixed Grouping	Mixed Grouping method combines alerts using multiple grouping strategies, such as CMDB-based grouping and tag-based grouping, into a single, cohesive group. It leverages the strengths of each strategy to reduce alert noise, improve alert correlation, and highlight the true root cause of incidents.	Use case for CMDB-based grouping: A telecommunications company uses CMDB data to manage alerts related to their network infrastructure. Alerts related to a specific network router and its connected devices are grouped together based on their CMDB

Alert grouping types and use cases (continued)

Type	Description	Use case
	• CMDB-based Grouping: Alerts are grouped based on Configuration Item (CI) relationships and dependencies from the Configuration Management Database (CMDB). This approach ensures that alerts related to specific infrastructure components or services are grouped together, providing context-aware alert management. • Tag Cluster Grouping: Alerts are categorized and grouped using tags or labels that represent common attributes, such as application, server type, or geographic location. This method allows for flexible and dynamic grouping based on evolving tagging strategies.	relationships, enabling the network team to see all related issues and address the root cause efficiently. Use case for tag cluster grouping: An organization without a CMDB manages a Linux server running various services. The IT team uses a **Node** field in each alert to identify the server, and they group all events related to services on the same server based on this node value. For example, they cluster alerts like Service A down and Service B high CPU usage together if they share the same node value. This approach helps the IT team address server-related issues more efficiently. By clustering alerts for the same node, application, or IP address, the team streamlines their response efforts and resolves issues more effectively, even without a CMDB.
Network-traffic based Grouping	Network-traffic-based alert grouping analyzes network connections between processes across hosts to identify related alerts. This method leverages service candidates detected through ML Service Mapping, ensuring that alerts related to network traffic issues are grouped together for better context and faster alert resolution.	A cloud-based e-commerce platform experiences transaction slowdowns, causing delays in payment processing. Traditional alerting generates separate alerts for API timeouts, database lags, and network issues, making it difficult to pinpoint the root cause. With Network-Traffic Based Grouping, alerts are automatically grouped based on process-to-process connections identified through ML Service Mapping. The system detects that payment gateway services,

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert grouping types and use cases (continued)

Type	Description	Use case
		fraud detection, and order processing are part of the same service candidate. This reveals that an overloaded fraud detection process is causing transaction bottlenecks. By scaling up the service, the team quickly resolves the issue, minimizing downtime and improving customer experience.
Text-based Grouping	Alerts are grouped by analyzing the text content of alerts to identify similarities and related issues. Natural language processing (NLP) techniques are used to find commonalities in alert description, metric name, and ci class, making this method effective for unstructured data.	In an organization that uses Zoom rooms for virtual meetings, the IT team receives numerous alerts when the Zoom room server experiences an outage. Each alert might indicate a different Zoom room being down, such as Zoom room no 10 is down, Zoom room no 11 is down, and so on, with the only difference being the room number. For organizations with a CMDB, these alerts can be grouped using CMDB relations, as the system can correlate the alerts based on the server's impact on all associated Zoom rooms. However, for organizations without a CMDB, text-based grouping can be used. The system applies natural language processing to group alerts with similar descriptions, helping the IT team quickly identify that multiple Zoom rooms are affected by the same underlying server issue. This approach allows the IT team to efficiently address the root cause of the problem, reducing downtime and improving response times.
Manual Grouping	Users manually select and group related alerts based on their expertise and	A system administrator receives multiple alerts about different services failing on

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert grouping types and use cases (continued)

Type	Description	Use case
	understanding of the system. This approach allows for precise control but can be time-consuming and may miss automated correlations.	a single server. The admin manually groups these alerts, recognizing that they are all related to a single hardware failure on that server, and prioritizes fixing the hardware issue to restore all services.

Manual and rule-based alert grouping differs from algorithm-based grouping mainly in how the parent alert is chosen. In manual, rule-based, or log analytics grouping, one of the real alerts is designated as the parent alert. In Automatic, CMDB, Text-based, Tag Cluster modes, and Network Traffic, a virtual alert, representing the oldest and most severe alert in the group, is created as the parent alert.

By default, the main alert of the group is the oldest and the alert with the highest severity. There is a script include, GroupingProduceGroupMainAlertHook, using which we can change the main alert selection logic. The method that you should customize is getMainAlert.

Note: In domain-separated environments, alert groups are created only for alerts within the same domain.

For information on scheduled jobs and parameters, refer to Scheduled jobs and parameters for alert grouping. For detailed information on different grouping types, see Alert grouping types and creation methods.

Scheduled jobs and parameters for alert grouping

Automate alert organization by configuring jobs to group alerts based on predefined criteria and parameters.

To group alerts in Automated, CMDB, Text-based, Tag Cluster, and Network Traffic Correlation groups, the scheduled job named **Service Analytics group alerts using RCA/Alert Aggregation** is typically run once per minute. This job handles the grouping of alerts based on the specified method. Additionally, you can run multiple scheduled jobs in parallel to manage alert grouping more efficiently. For further details, see Run multiple scheduled jobs for alert grouping.

To define which alerts are grouped, the following parameters are used:

- *sa_analytics.aggregation_enabled*: This parameter enables alert grouping created by the schedule job. Set the property *Enable alert aggregation for Automated, CMDB, and Text-Based groups* to `true` to activate this feature.

  Note: This property also applies to Tag Cluster and Network Traffic Correlation grouping.

- *sa_analytics.agg.query_dynamic_window*: By default, this is set to 10 minutes (600 seconds). It defines the maximum time difference allowed between the last event generation times of two alerts that can be grouped together.
- *sa_analytics.agg.query_max_group_lifetime*: This parameter specifies the maximum time period from the generation of the first alert to the last alert in a group, with a default of 30 minutes (1800 seconds). If events arrive with a delay exceeding this period, the *sa_analytics.agg.group_expiration_time* parameter can be used to extend the grouping time beyond 30 minutes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Some parameters, such as **sa_analytics.agg.query_dynamic_window**, **sa_analytics.agg.query_max_group_lifetime**, and **sa_analytics.agg.group_expiration_time**, are not provided out of the box. To use these properties, you need to create properties with the same names and assign the required values to them. For more information on how to create a property, see Add a system property.

Example: How alerts are grouped

For tag-cluster grouping, alerts are added to a group based on the timeframe parameter defined in the alert tag clustering settings. For automated, CMDB, and text-based, network traffic grouping, alerts are aggregated as follows.

Consider the following alerts with the same CI. (All of them may be added to the same CMDB group).

- Alert1: Initial event generation at 01:00:00 AM
- Alert2: Initial event generation at 01:11:00 AM
- Alert3: Initial event generation at 01:13:00 AM
- Alert4: Initial event generation at 01:16:00 AM
- Alert5: Initial event generation at 01:25:00 AM
- Alert6: Initial event generation at 01:34:00 AM
- Alert7: Initial event generation at 01:43:00 AM

Alert1 and Alert2 are not grouped due to the time gap exceeding 10 minutes. Alert2 and Alert3 create a group at 01:13:00 AM. The 10-minute dynamic window starts at 01:13:00 AM, with the following:

- Alert4 is added to the group at 01:16:00 AM, restarting the 10-minute window.
- Alert5 and Alert6 are added to the group as their event times are within the 10-minute window.
- Alert7 is not added to the group because it arrives 9 minutes after Alert6, exceeding the *sa_analytics.agg.query_max_group_lifetime* limit of 30-minute maximum group lifetime from the initial group creation (01:13:00 AM + 30 minutes = 01:43:00 AM).

Note: After an alert is created, correlation logic is applied only once. Changes to the alert after its creation are not re-evaluated for correlation. If correlation is not established initially, the alert may still be added to a group later—but only if a new incoming alert matches and triggers grouping logic.

Configure scheduled job-based alert grouping

Set up rules and parameters to group related alerts automatically, streamlining alert management and reducing alert noise.

Before you begin
Role required: evt_mgmt_admin

About this task
The scheduled job Service Analytics: Group Alerts Using RCA/Alert Aggregation helps in grouping alerts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Alert Correlation Properties**.
2. On the Alert Correlation Properties page, enable the relevant properties.
   - Enable CMDB correlation (*sa_analytics.agg.query_cmdb_correlation_enabled*).
   - Enable Network Traffic correlation (*sa_analytics.agg.query_network_traffic_correlation_enabled*).
   - Enable ML based Automation correlation (*sa_analytics.specific_patterns_enabled*).
   - Enable Text based correlation (*sa_analytics.text_based_group_enabled*).
   - Group by property, with comma-separated list of field names. Alerts can be grouped together when the specified field values match each other. The property can contain alert field names (such as assignment_group), CI field names (such as alert_cmdb_ci.location), or alert additional info field names (such as additional_info.state). It can also contain alert tags (such as t_data_center). Property: *sa_analytics.agg.group_alert_with_same_group_by_fields*.
   - Max number of relations between CIs in a topology which form a CMDB group (*sa_analytics.agg.query_cmdb_graph_walk_nodes*).
   - Use all CMDB relations for CMDB group correlation (*evt_mgmt.related_cis_get_all_relation_types*).
3. Select **Save**.

   To group alerts without a CI as Text-based or ML based groups, set *sa_analytics.enable_no_ci_grouping* to `true`. Ensure the Feature Identifier includes both the node and metric name. For details on configuring the feature identifier, see Manage pattern identifier attributes for alert grouping.

4. **Optional:** Set *evt_mgmt.alert_groups_reasoning.enable_worknotes* to `none` to prevent group reasoning work note display.

   (Optional) By default, a work note appears in the **Activities** tab when a group is created or updated, showing the grouping reason.

Automated alert grouping

CMDB based alert grouping

Text-based alert grouping

Tag cluster alert grouping

Run multiple scheduled jobs for alert grouping

Run multiple scheduled jobs in parallel to group alerts. This helps prevent overwhelming the system during surges (alert storms).

Before you begin

Role required: admin

About this task

The current scheduled job operates with a single thread. During alert surges (alert storms), processing takes significantly longer. To address this impact, now multiple jobs can process

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

alerts within the scheduled job. This enhances scalability and improves overall performance during high-volume periods.

The number of jobs to be running in the alerts processing is defined in a new property *sa_analytics.agg.alert_grouping.num_of_jobs*. The job number is sent as a parameter to the relevant method.

Note: In this scenario, the procedure for increasing the scale-out from no scale-out (single job) to 2 jobs is shown.

You can efficiently manage and run multiple scheduled jobs in parallel to group alerts using specific properties. These properties allow you to tailor the grouping criteria to meet your needs, ensuring that alerts are processed based on assignment groups, domain separation, or group-by fields. The available properties are:

- *sa_analytics.agg.group_alert_with_same_assignment_group_only*: Groups alerts that share the same assignment group. By default, the value is set to false. If you want to set this property to true, create a property with the same name and set the value to true.
- *sa_analytics.agg.group_alert_with_same_domain_only*: Groups alerts that belong to the same domain. By default, the value is set to true.
- *sa_analytics.agg.group_alert_with_same_group_by_fields*: "Group by" property, with comma-separated list of field names that need to have matching values across alerts to allow alerts to be grouped together. The property can contain alert field names (such as assignment_group), CI field names (such as alert_cmdb_ci.location), or alert additional info field names (such as additional_info.state). It can also contain alert tags (such as t_data_center).

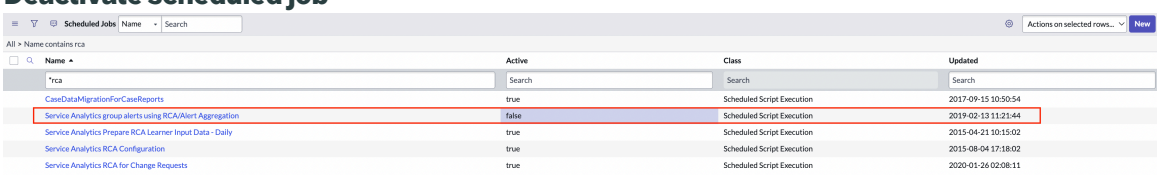
Note: To ensure efficient scale-out, at least one of these properties must be defined to establish some form of separation or grouping logic. This is necessary to ensure that all alerts belonging to the same group are processed correctly by specific jobs, creating a logical division of alerts.

Without setting at least one of these properties to true, the alerts will not be properly segregated. If you do not define any grouping logic, the scale-out will not work. This occurs when both the assignment group and domain separation are set to false. All alerts will be processed by a single scheduled job.

Procedure

1. Navigate to **All** > **System definition** > **Scheduled jobs**.
2. Locate the scheduled job: Service Analytics group alerts using RCA/Alert Aggregation.
3. For all existing scheduled jobs Service Analytics group alerts using RCA/Alert Aggregation, set the value in the **Active** column to **false**.

Deactivate scheduled job



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Create a new property *sa_analytics.agg.alert_grouping.num_of_jobs*, or if it already exists, update the property to the desired number of multiple scheduled jobs for alert grouping such as 2 or 4.
5. Clone the scheduled job definition from the Scheduled jobs [sys_auto] table to the desired number of multiple scheduled jobs for alert grouping.
6. In the new jobs, call the queryS0 function and pass the job number as input.

   In the Run this script section, call queryS0 instead of the old query() function.

   Note: Job numbers must start at 0 and follow consecutively: 0, 1, 2, 3, 4...

7. Fix hashes in the [sa_analytics_status] and [sa_hash] table by selecting the earliest hash with the same prefix and cloning it.

   Add the hash name suffix "_groupingX", where X is the job number.

   In the case of scaling out from no scale-out (single job) to 2 jobs, and for the hash name `last_alert_process_time`, clone it to maintain the same value as in `last_alert_process_time`:

   - `last_alert_process_time_grouping0`
   - `last_alert_process_time_grouping1`

   In the case of scaling out from no scale-out (single job) to 4 jobs, and for the hash name `last_alert_process_time`, clone it to maintain the same value as in `last_alert_process_time`:

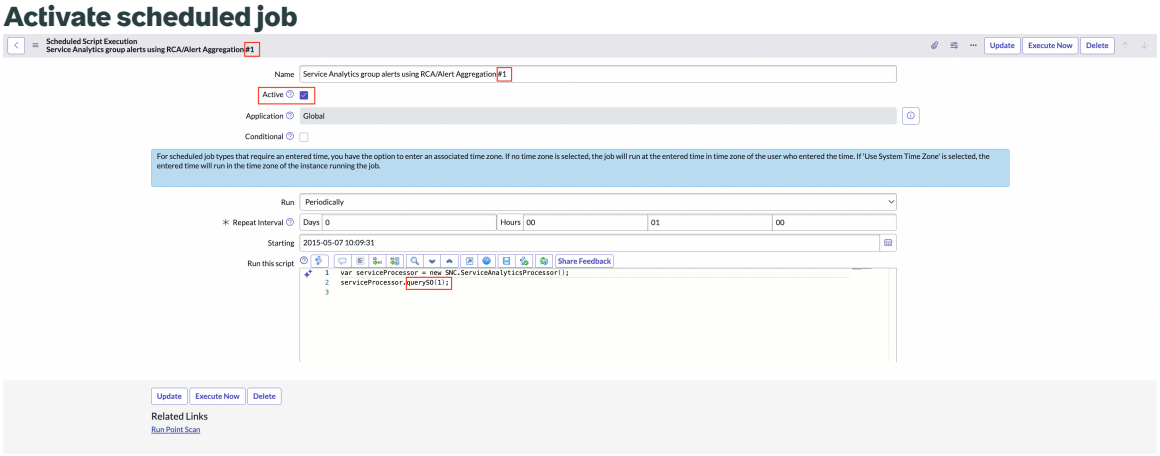
   - `last_alert_process_time_grouping0`
   - `last_alert_process_time_grouping1`
   - `last_alert_process_time_grouping2`
   - `last_alert_process_time_grouping3`

Hashes to be cloned

Hash name	Table
query_job_last_run	sa_hash
last_alert_process_time	sa_analytics_status
last_staging_table_update_time	sa_analytics_status
last_staging_table_truncate_time	sa_analytics_status
analytics_trigger_g1	sa_hash

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Activate the new jobs by selecting the **Active** check box for each job.



Result

The scheduled job Service Analytics group alerts using RCA/Alert Aggregation is set up to run multiple jobs simultaneously for alert grouping.

Configure alert correlation logic order

Improve alert management by enabling users to customize correlation logic order. This feature empowers you to fine-tune correlation methods to their specific needs, enhancing alert prioritization and response efficiency.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Properties** > **All Properties**.
2. Search for the property *sa_analytics.agg.query.group_logic_order*.

   Default value is “MIXED,NETWORK_TRAFFIC,PATTERN,GENERALIZED_PATTERNS,TEXTBASE". This is a comma separated list of the grouping types in the order of their execution.

   Note: If one of the grouping types is not specified in the property, it needs to be added manually. Alert correlation rules are trigger-based and applied immediately when an alert is created or updated, before other grouping algorithms.

   - MIXED: Combination of 2 or more grouping criteria
   - NETWORK_TRAFFIC: Network traffic grouping
   - PATTERN: Automated CI-based patterns grouping
   - TEXTBASE: Text-based grouping
3. Use the property *sa_analytics.agg.query.group_logic_order* to define or modify the order of correlation methods based on your preferences.

Configure filters for automatic alert groups

Filter alerts and alert groups to reduce alert noise. Only alerts that match the filter are included in the group of the selected group type (Automated, CMDB, or Text).

Before you begin

Role required: evt_mgmt_admin

About this task

If your filter specifies alerts whose configuration item class is not Linux, then only alerts with non-Linux configuration items are included in the group of the selected group type.

Note: After the filter is created, it will only apply to new alerts.

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Automatic Group Filter**.
2. On the Automatic Group Filters page, either select an existing group filter or create a new filter.
3. If you are creating a new filter:

   a. Select **New**.

   b. Enter a name for the filter in the **Name** field.

   c. Select the alert group type:

   - Automated
   - Text
   - CMDB

   You can assign more than one group type with a single filter condition.

   Each group type can have only one active filter.

4. In the **Alert Filter** section, create conditions for the alert to meet to be included in the group.
5. Save the alert group filter.
   - For an existing alert group filter, select **Submit**.
   - For a new alert group filter, select **Update**.

Result

The filter condition appears on the SA Grouped Alert Filters page in the **Alert filter** column.

Apply alert group filters to aggregated groups

Reduce noise by locating only aggregated alert groups that match a configured filter. Aggregated groups are groups created for alerts with identical CIs and pattern identifiers.

Before you begin

Note: This procedure is relevant for advanced configuration only.

Role required: evt_mgmt_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Automatic Group Filters**.
2. On the Automatic Group Filters page, add the **Aggregated** column.
   a. Select the Personalize List icon ( ) in the upper right corner.
   b. Move the **Aggregated** entry from the **Available** list to the **Selected** list.
   c. Select the up/down arrows to determine where the **Aggregated** entry is to appear on the form.
   d. Select **OK**.
3. On the Automatic Group Filters page, double-click the value in the **Aggregated** column.

   Aggregated groups apply only to automated alert groups. When the Aggregated option appears, it is automatically activated for an automated alert group.

   Note: If the value of the **Automated** field changes, the value of the **Aggregated** field also changes. You can change the value of the **Aggregated** field only if the value of the **Automated** field is true.

4. Select **true** for the specified filter to apply to groups with identical CIs and pattern identifiers or select **false** to ignore the filter and create aggregated groups for all alerts in the system.

Related topics

Manage pattern identifier attributes for alert grouping

Alert grouping types and creation methods

Explore different alert grouping types, understand their descriptions, and learn about their creation methods to enhance problem identification and streamline alert management.

Viewing and managing alert groups

Navigate to **Event Management** > **All Alerts** to view all alert groups. The icon in the **Group** column denotes the alert group type, while alerts not associated with any group have no entry in the **Group** column. Double-click the **Group** column to open the Grouped Alerts dialog, where you can view all alerts in the group and manually add or remove alerts.

Note: An alert can belong to only one alert group at a time.

Types of alert grouping

Alert grouping types

Type	Icon	Description	Creation method	Additional information
Log Analytics	L	Log Analytics groups are formed when the system identifies multiple related Log Analytics alerts, grouping them based on their significant connections.	Created as part of log analytics event processing.	Kinds of Health Log Analytics alerts

For information on scheduled jobs and parameters, refer to Scheduled jobs and parameters for alert grouping. For detailed information on configuring alert correlation logic order, see Configure alert correlation logic order.

Log analytics alert grouping

ServiceNow Health Log Analytics identifies patterns in log data and learns pattern behavior. When its artificial intelligence engine detects anomalous behavior, it sends an event to the ServiceNow Event Management application.

Log analytics alert groups are created by the Health Log Analytics application. For more information, see Types of Health Log Analytics alerts.

Rule-based alert grouping

Rule-based alert grouping is created by alert correlation rules. These rules allow you to manually classify alerts as primary or secondary and establish a relationship between them. Use alert correlation rules to group related alerts. The rule runs only for new alerts or alerts whose status changed from close/flapping to open/reopen.

Example: If rule-based alert grouping is applied, secondary alerts indicating that virtual machines or applications on the offline server are also down and are grouped under the primary alert, which is the root alert for the server that is offline. You can view rule-based alert grouping in Express List of Service Operations Workspace (ITOM). For more information, see Viewing links between alerts in rules-based alert groups.

Primary and secondary alerts

- Primary alert: Identifies the root cause of an alert group and represents its secondary alerts.
- Secondary alert: Related to the same issue, they are grouped under the primary alert. The purpose of secondary alerts is to determine which alerts to suppress, reducing alert noise and allowing you to focus on the primary alert.

How primary and secondary alerts interact

In rule-based alert grouping, one of the real alerts is designated as the primary alert. Primary and secondary alert filter conditions specify which alerts are classified as primary and which as secondary. The filter criteria are applied to the Alert [em_alert] table.

In this alert grouping, both primary and secondary alerts are visible but secondary alerts are grouped under the primary alert. The property **Keep the secondary alert open even when primary closed. for manual or rule based** (*evt_mgmt.rule_based_manual_closure*) controls whether secondary alerts remain open or are closed when the primary alert is closed.

If the property is not selected (i.e., set to No), after the primary alert is closed, the parent reference is removed from the secondary alerts (the grouping is dissolved), and the secondary alerts are closed and become stand-alone. If you select the checkbox for the property (i.e., set it to Yes) and the primary alert is closed, the parent reference is removed from the secondary alerts (the grouping is dissolved), causing them to become stand-alone open alerts.

Alert hierarchy

Only one level of secondary alerts is permitted. In situations where a secondary alert has its own secondary alert, the Event Management application flattens the hierarchy to preserve only two levels.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, assume alert A is the primary alert and alert B is the secondary alert. If alert C becomes a secondary alert for alert B, the application flattens the hierarchy so that A remains the primary and B and C become sibling secondary alerts, one level below A.

As another example, assume that there are three correlation rules that produce the following results:

- Rule 1 (with an Order value of 1): B becomes a primary alert for A.
- Rule 2 (with an Order value of 2): A becomes a primary alert for C and D.
- Rule 3 (with an Order value of 3): E becomes a primary alert for A.

When alerts B, C, D, and E are triggered, they all appear in the alert list separately because there are no correlations between them.

When alert A is triggered:

1. Rule 1 makes A a secondary alert under alert B.
2. Rule 2 makes both C and D secondary alerts under alert A, and the hierarchy is flattened so that A, C, and D become secondary alerts to the primary alert B.
3. Rule 3 is not applied because multiple parents are not allowed—A already has B as its primary.

Therefore, if all alerts are triggered, only B appears as the primary alert for A, D, and C, while E remains a standalone alert.

Create an alert correlation rule

Create an alert correlation rule to designate primary and secondary alerts. The primary alert is identified as the root cause of the alert group and the secondary alerts are grouped under the primary alert.

Before you begin

Role required: evt_mgmt_admin

About this task

Grouping automation helps you manage alerts more effectively by collecting similar alerts together. This makes it easier to see patterns, quickly identify issues, and respond efficiently. For more information on how to group alerts easily, see Create Group automation.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Alert Correlation Rules**.
2. Select **New**.
3. On the form, fill in the fields.
   For information on the fields, see Alert correlation rule form.
4. Select **Submit**.

Result

A rule-based alert group is created when a new alert is generated. An alert group is also created when the status of an existing alert changes from Closed or Flapping to Open or Reopened, provided the filter criteria are matched.

Automated alert grouping

Automated alert grouping is a process that uses historical data to automatically organize similar alerts into groups. These alerts could be system issues, like server errors or network outages. By grouping related alerts together, it helps teams quickly identify patterns, manage recurring problems, and reduce the noise from too many individual alerts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Imagine you're monitoring a city's traffic system. You get a lot of alerts—like reports of accidents, traffic jams, and road closures. Automated alert grouping works like a smart assistant that organizes these alerts based on patterns, so you can see related issues together and respond more efficiently. These automated alert groups are displayed in the Express List within the Service Operations Workspace.

How do you enable this grouping

To enable machine learning-based automation for alert correlation, set the property **Enable ML based Automation correlation** (sa_analytics.specific_patterns_enabled) to true.

If the Domain Support - Domain Extensions Installer is activated, alert aggregation patterns are created based on the domain level defined in the sa_analytics.agg.learner_domain_level property. By default, this domain level is set to two, which corresponds to the second level in the domain hierarchy. For example, in a company, Level 1 might represent the company itself, while Level 2 could represent departments or teams within the company. Alerts are grouped based on this second level, like sorting them by department or team. For more details, Domain separation and Event Management.

How does it work

Automated alert grouping uses machine learning (ML) and historical data to identify patterns among alerts. It looks at specific characteristics, called pattern identifiers—such as the type of issue, the affected system, CI or metric that happened multiple times within a similar time period —to determine if alerts are related. The Alert Aggregation Learner uses algorithms to group alerts based on patterns. Specifically, it uses pattern-based algorithms and probabilistic methods to analyze incoming alerts and identify related ones.

Think of it like noticing that accidents often happen at a particular intersection at rush hour. The system groups similar alerts (like recurring traffic jams at the same spot) together based on certain identifiers (like location or type of problem). The system follows these key steps to group alerts effectively:

- Analyze Historical Data: The system studies past alerts to learn patterns and relationships.
- Apply Machine Learning: ML algorithms analyze historical alert data to identify patterns and relationships among alerts. It enables the system to learn from past incidents and improve its ability to group similar alerts together over time.
- Group Similar Alerts: Alerts with matching patterns are automatically grouped together.

Imagine you're managing a city's traffic system, and you receive multiple alerts:

- 8:00 AM: Accident on Main Street
- 8:05 AM: Traffic jam near Main Street
- 8:10 AM: Road closure on Main Street

Automated alert grouping works like a smart assistant by analyzing these alerts and recognizing a pattern. It groups them together because they all relate to Main Street, likely stemming from the same accident. This helps you see the bigger picture quickly and focus on resolving the root cause (the accident), rather than addressing each alert separately.

Benefits

- Find Recurring Issues: Quickly spot patterns (like a server consistently overheating).
- Save Time: Handle groups of related alerts instead of individual ones.
- Improve Response: Focus on fixing the root cause rather than dealing with scattered issues.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Understanding pattern identifiers

A pattern identifier is a set of criteria or attributes (such as alert type, affected system, etc.) used to group similar alerts. It helps to identify recurring issues, making it easier for teams to respond and address ongoing problems.

How pattern identifiers group alerts

Consider a network monitoring system that generates alerts for various issues, such as high CPU usage, memory leaks, or connection timeouts.

Pattern Identifier: Metric Name and CI

- Alert 1: High CPU usage on Server A at 10:00 AM
- Alert 2: High CPU usage on Server A at 10:05 AM
- Alert 3: Memory leak on Server B at 10:10 AM
- Alert 4: High CPU usage on Server A at 10:15 AM

In this case, the pattern identifier could be set to the Metric Name (e.g., high CPU usage) combined with the Configuration Item (CI) (e.g., Server A). Alerts 1, 2, and 4 would be grouped together because they share the same metric (high CPU usage) and the same CI (Server A), indicating a recurring issue that may need further investigation. Alert 3, however, would not be included in this group because it has a different metric (memory leak) and CI (Server B).

Note: The set of alert fields used for the pattern identifier is also referred to as Feature Identifier Attributes or simply attributes.

How to configure effective pattern identifiers

To configure effective pattern identifiers for alert grouping, follow these three key steps to ensure accurate and meaningful analysis of alerts.

Step	Action	Description
Create an event rule	Define an event rule. To know how to create an event rule, see Create or edit an event rule.	Set up an event rule to populate the relevant alert fields for the pattern identifier.
Manage pattern identifier	Add relevant alert field to the pattern identifier. To know how to add fields to the pattern identifier, see Manage pattern identifier attributes for alert grouping.	After adding the relevant alert fields, select **Deploy** to activate the pattern identifier.
Choose relevant identifiers	Select alert fields that clearly identify the problem. For example, if the issue is that a service is offline or there's no connection to the database, look for specific	• Avoid overly unique fields (e.g., date) that make pattern identification difficult. • Avoid overly common fields that result in too

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Step	Action	Description
	values in the alert that indicate this. Add these types of fields to the pattern identifier. By default, we provide the **Metric Name** field as a pattern identifier.	many alerts being grouped together, making patterns indistinguishable.

Alert grouping and Learned Patterns

Learn how alert patterns are discovered, grouped, and displayed in the system.

Concept	Description
Pattern discovery	When a set of alert fields matches, the alerts are grouped into a "Learned Pattern." For example, alerts with the same Priority Group and Resource are grouped into a pattern.
Pattern reporting	These patterns are displayed on the Learned Patterns report found under **Event Management** > **Administration** > **Learned Patterns**.

Managing Pattern Attributes and Time Frame

Learn the process of managing pattern identifier attributes, deployment of new sets, and how the system identifies issues.

Concept	Description
Active pattern identifier attributes	Only one set of attributes can be active at a time. **Note:** The new set replaces the current one after deployment.
Purpose and time frame	Pattern grouping identifies issues within the last 30 days, controlled by the **sa_analytics.agg.learner_period_days** property.
Issue identification	To identify an issue, the system utilizes a combination of Configuration Items (CIs) and Pattern Identifiers (sometimes referred to as Feature Identifiers). By default, a Pattern Identifier is defined as the Metric Name, but this can be modified. Two alerts are considered similar if they share the same CI and Pattern Identifier, although fields such as Source, Severity, Description, and others may differ.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Concept	Description
	For more information, see Manage pattern identifier attributes for alert grouping. **Note:** The Alert Aggregation Learner also identifies patterns of alerts within manual alert groups. In some cases, you can create patterns from alerts where the CIs share the same value in a specified field. For example, to build patterns from alerts with the same CI **Location** field, enter `location` in the *`sa_analytics.agg.learner_group_by_property`* property. For more information, Configure scheduled job-based alert grouping. When working with CI-based groups, ensure that the pattern identifier includes both the node and the metric name. For details on configuring the Feature Identifier, see Learned patterns report. **Note:** Alerts that lack a CI can still be grouped together as Text-based or CI-based alert groups, treating a node as a CI. To enable this functionality, set the sa_analytics.enable_no_ci_grouping property to true.

Configure pattern based alert grouping

Configure the Alert Aggregation Learner (Service Analytics Alert Aggregation Learner - Daily), an offline job that runs daily to process past alerts. It identifies patterns of related alerts using a combination of pattern-based and probabilistic techniques, enabling quicker detection and resolution of recurring issues.

Before you begin

Role required: evt_mgmt_admin

About this task

The Alert Aggregation Learner tracks manual additions and removals of alerts from automated alert groups. If you undo any previous alert additions or removals, the automatic process adjusts accordingly.

You can review user additions and removals from automated alert groups and undo any action to prevent it from being automatically repeated. The Alert Aggregation Learner also identifies patterns in manual alert groups, enabling automatic formation of new alert groups based on these patterns when new streams of alerts arrive.

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Alert Corrlelation Properties**.
2. Enable the following properties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Enable alert aggregation for Automated, CMDB, and Text-based groups (*sa_analytics.aggregation_enabled*).

  Note: When disabled, disables all other groups.

- Enable ML based Automation correlation (*sa_analytics.specific_patterns_enabled*).

3. **Optional:** To configure the time period for the Alert Aggregation Learner to process alerts, perform the following steps:

   a. Navigate to **All** > **System Properties** > **All Properties**.

   b. On the System Properties page, select the *sa_analytics.agg.learner_period_days* property.

      If the property doesn't exist, you need to define it.

   c. Set the property's **Value** to the number of days by which you want alert aggregation learner job to process.

      Note: Values larger than 30 days increase job processing time. For optimal performance, use values of 30 days or less.

Manage pattern identifier attributes for alert grouping

The Alert Aggregation Learner analyzes alerts and identifies patterns using a defined set of alert and configuration item (CI) attributes. By configuring these attributes as pattern identifiers, you can control which characteristics are used to group alerts. This customization creates meaningful alert groups, improving alert management and response times by reducing noise and enabling focus on critical issues.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **Event Management** > **Administration** > **Manage Pattern Identifier**.
2. On the SA Alert Aggregation Pattern Attributes page, select **New** to create a new pattern identifier, or open an existing pattern identifier.
   The SA Alert Aggregation Pattern Attribute page opens.
3. Select the Unlock Feature Identifier Attributes icon ( ) and move attributes from the **Available** list to the **Selected** list.

   Note: Properties from CMDB CI via dot-walking are not populated.

   The **Configuration Item** attribute is automatically considered as an identifier and should not be added explicitly to the Feature Identifier Attributes section. The pattern is defined as a combination of the configuration item and your selected feature identifier attributes.

4. Selecting the Lock Feature Identifier Attributes icon ( ).
5. Select **Submit** for a new pattern identifier or **Update** for an existing pattern identifier.
6. Navigate back to the SA Alert Aggregation Pattern Attribute page by opening the pattern identifier.
7. Activate the pattern identifier attributes by selecting **Deploy**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

- Ensure a corresponding event rule exists: Verify that there is an event rule set up to assign or populate the newly defined pattern identifier attributes to the incoming alerts. Event rules define how attributes are assigned to alerts based on certain conditions.
- Run the Service Analytics Attribute Populator for Historical Alerts job: After the new event rule is in place, this job retroactively populates the pattern identifier attributes for existing alerts that were created before the new attributes were defined. This ensures that past alerts have the necessary attributes for proper grouping.

Learned patterns report

The Learned Patterns report helps assess the efficiency of alert aggregation and identify recurring alert patterns. It enables proactive issue resolution, enhancing overall system performance by providing insights into frequent alerts.

Navigating and sorting the report

To access the Learned Patterns report, navigate to **Event Management** > **Reporting** > **Learned Patterns**.

Sorting Options: You can sort patterns by Pattern Score, Frequency, and Size to prioritize which alerts to address first.

Metrics and data in the report

The report displays key metrics associated with learned patterns, including:

- Frequency: The occurrence count of pattern identifier attributes (CI/MetricName).
- Pattern Identifier Attributes: Describes how alert grouping combines relevant pattern attributes to create a learned pattern. These patterns can reappear across multiple alerts, often indicating the same underlying issue.
- Presentation Format: Metrics are shown in a table format, organized by learned patterns.

This report allows you to:

- Focus on Higher Frequency Alerts: Allocate resources to higher-frequency alerts to expedite the resolution of numerous alerts.
- Target Larger Patterns with Lower Frequency: Allocate resources to larger learned patterns with lower frequency for targeted analysis.

Pattern group details and identifier attributes

- Expand a pattern group to display details about all the identifier attributes that are associated with the pattern.
- Sort the entries within each pattern by Configuration Item and Feature Identifier.

Column	Description
Configuration Item	CI associated with the combined pattern identifier attributes.
Feature Identifier	Feature identifier used for the combined pattern identifier attributes.
Frequency	Number of times the combined pattern identifier attributes appear in the data set.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column	Description
Size	Number of occurrences of the combined pattern identifier attributes (like Configuration Item and Feature Identifier) within a learned pattern.
Score	Calculated score that combines the frequency and size of the learned pattern. The formula for this score is: `Score = Frequency × (Size + 1)`. This score helps prioritize patterns based on their recurrence and size, making it easier to focus on high-priority patterns.
CI Link	Link in the **Configuration Item** column to view details of the CI information.

Exclude patterns from learned patterns

Exclude CI-based or CI class-based alerts and patterns when you encounter alerts incorrectly added to a learned pattern by the Learned Patterns job. For example, a pattern might include an alert that occurred at the same time as other alerts but is not actually related to them. This maintains accuracy, ensuring better alert groupings and improved management efficiency.

Before you begin

Role required: evt_mgmt_admin

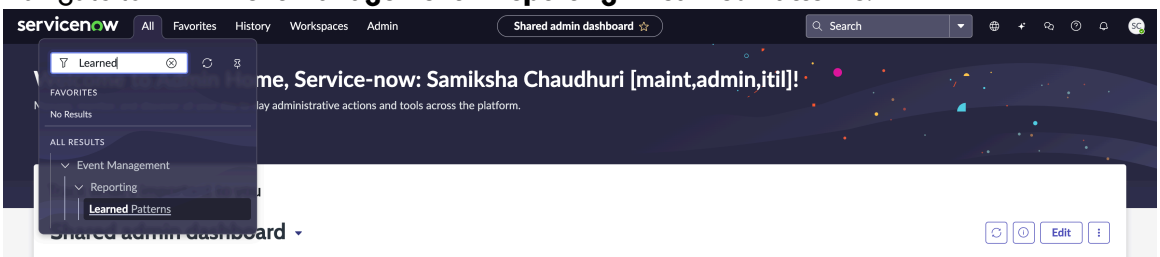
About this task

You select the incorrect alert in a pattern to exclude the entire pattern to which it belongs.

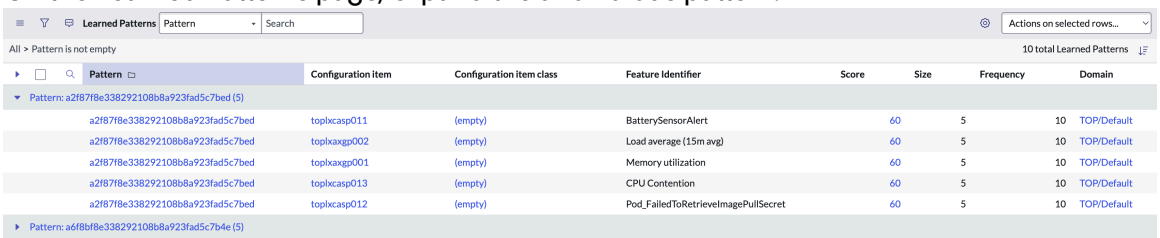
Note: When you exclude an incorrect alert, any other patterns containing that alert are also excluded.

Procedure

1. Navigate to **All** > **Event Management** > **Reporting** > **Learned Patterns**.



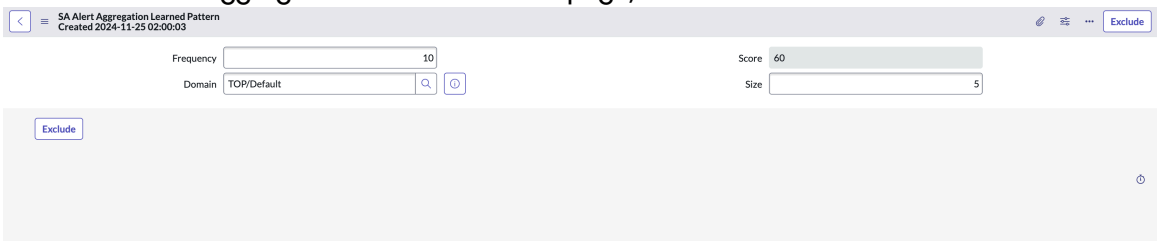
2. On the Learned Patterns page, expand the anomalous pattern.



3. Select the pattern name to open it for exclusion.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. On the SA Alert Aggregation Learned Pattern page, select **Exclude**.



Result

The entire pattern is removed from the Learned Patterns report and listed on the Excluded Patterns page, located at **Event Management** > **Administration** > **Excluded patterns**.

If the pattern includes other alerts, you can restore it by reclaiming those alerts as a learned pattern. For further details, see Restore excluded patterns.

Restore excluded patterns

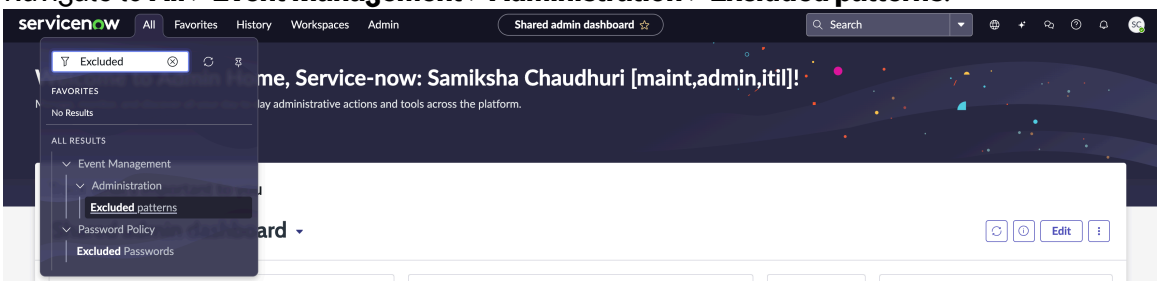
Restoring excluded patterns to the learned patterns report lets you reintegrate valuable insights lost due to incorrect alerts. This flexibility maintains accurate alert aggregation and enhances monitoring. For example, if you excluded a pattern due to an incorrect alert, you can restore it without that alert, ensuring relevant data remains accessible for analysis and decision-making.

Before you begin

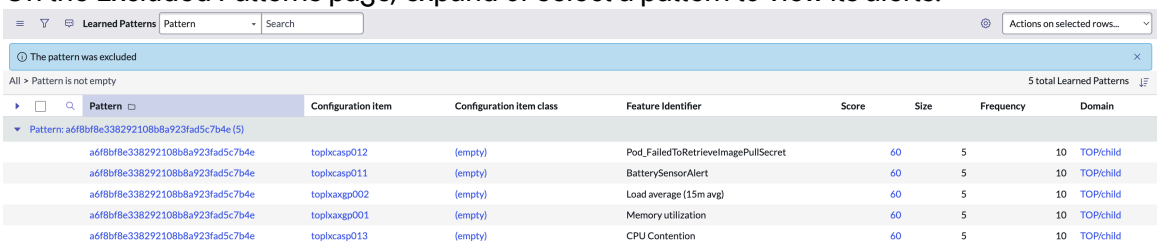
Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Excluded patterns**.

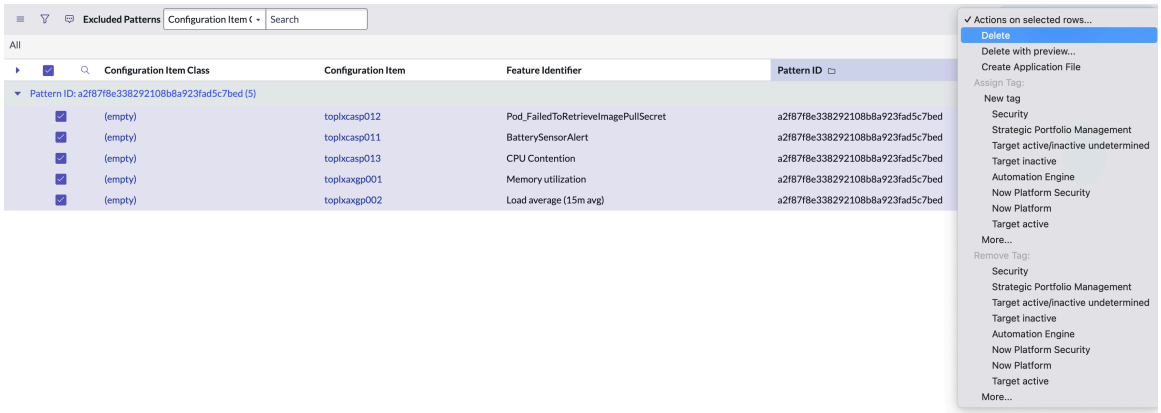


2. On the Excluded Patterns page, expand or select a pattern to view its alerts.



3. Select the patterns you want to restore.
4. In the **Actions on selected rows** drop-down menu, select **Delete**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. In the confirmation window, select **Delete**.
6. Run the Learned Patterns scheduled job.
   a. Select **System Definition** > **Scheduled Job**.
   b. On the Scheduled Jobs page, search for the Service Analytics Alert Aggregation Learner - Daily job.
   c. Open the Service Analytics Alert Aggregation Learner - Daily job.

   d. Select **Execute Now**.

Result

The pattern appears with its restored alerts on the Learned Patterns report page. To access this page, navigate to **Event Management** > **Reporting** > **Learned Patterns**.

Network traffic based alert grouping

The Network traffic based alert grouping method groups alerts by analyzing network traffic connections between processes across hosts. It leverages service candidates identified by ML Service Mapping to group alerts related to network traffic issues. This ensures alerts from directly connected processes within the same service candidate are grouped together, offering a more contextual view of network incidents.

Service candidates are potential collections of processes within your IT environment that are identified based on their network connections and interactions. They represent different services or functions that your IT systems provide, even if they are not fully detailed in your

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

system's configuration database. For example, service candidates might group together all the processes involved in email delivery, even if the configuration details are incomplete.

ML Service Mapping uses machine learning to automatically discover and map out these service candidates. It identifies how different processes and components are connected and grouped together based on their network traffic and interactions. This helps in understanding and organizing the IT services and their components, making it easier to manage and troubleshoot issues. For example, ML Service Mapping might automatically identify and map the connections between email servers and mail clients based on their network interactions.

Note: Network traffic based alert grouping is enabled for new customers starting with the Brazil release. Existing customers need to enable the property Enable Network Traffic correlation (*sa_analytics.agg.query_network_traffic_correlation_enabled*) manually.

How it works

- Host identification: Alerts related to network issues are generated from various sources.
- Network context identification: The correlation process uses horizontal discovery results and ML Service Mapping to identify the most relevant service candidates and network connections.

  This process uses the results of the scheduled job **Event Management - Populate Service candidate process to process mapping - Daily**, which runs once a day. The job stores process-to-process connections for Host CIs in the format required by the alert grouping algorithm.

- Alert grouping: Alerts are grouped based on direct process-to-process connections within the context of the same service candidate. Grouping is updated in real-time as new alerts are received.

Benefits

- Improved accuracy: By leveraging network traffic connections and service candidates, this method provides high accuracy in grouping alerts, minimizing false positives.
- Enhanced coverage: It effectively groups alerts even in environments with low CMDB maturity, covering a broader range of alerts and issues.
- Streamlined resolution: IT teams can quickly identify and resolve related issues in bulk, reducing the volume of alerts to manage and improving operational efficiency.

Enable network traffic-based alert grouping

Activate network traffic-based alert grouping to automatically correlate and reduce alert noise by grouping related events based on network traffic patterns. This helps improve efficiency in alert response and streamlines alert management.

Before you begin
Ensure the Service Mapping Plus application (sn_sm_scoped_app) is installed.

Role required: evt_mgmt_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Alert Correlation Properties**.
2. Ensure that the property Enable Network Traffic correlation (*sa_analytics.agg.query_network_traffic_correlation_enabled*) is selected.

Disable network traffic-based alert grouping

Disable network traffic-based alert grouping to prevent alerts from being grouped solely by network activity. This reduces noise during traffic spikes and helps critical issues stand out for quicker resolution.

Before you begin
Role required: evt_mgmt_admin

About this task

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Alert Correlation Properties**.
2. Clear that check box for the property Enable Network Traffic correlation (*sa_analytics.agg.query_network_traffic_correlation_enabled*).
3. Set the property *sa_analytics.enable_process_mapping_calculation* to false.

Follow up on work notes and review service candidate

Track and follow up on work notes while reviewing the service candidate to ensure all actions and updates are captured. This helps maintain clarity and continuity in the review process, reducing the chances of missed details.

Before you begin
Role required: evt_mgmt_admin and sm_admin

Procedure

1. Navigate to **All** > **Event Management** > **All Alerts**.

   Note: Scroll down to an alert with **Network Traffic** as the group, and in the **Group** column, right-click and select **Show Matching**. This displays all alerts related to **Network Traffic**.

2. For the alert whose work notes you want to see, select the alert number.
3. On the Alert page, scroll down and select the **Activities** tab.
   You can view the work notes for the selected alert.
4. In the work notes, select the service candidate to view details.
   The Application Service Candidate page opens.
5. Select **Preview Map Graph** to view the service candidates mapping in the form of a graph.
   Service candidates mapping provides a visual representation of how different service candidates are connected, making it easier to understand relationships, identify potential issues, and analyze dependencies more effectively.

Mixed alert grouping

Mixed alert grouping combines multiple strategies—currently CMDB-based and tag-based grouping—to form a single, cohesive alert group. It reduces noise, bridges gaps when one method isn't enough, and delivers a clearer, end-to-end view of incidents. This approach helps operators identify root causes faster and take informed action, even in complex or incomplete data environments.

To understand how Mixed grouping works in practice, it's important to look at the individual strategies it currently supports. At this stage, Mixed Grouping comprises two core methods: CMDB based alert grouping, which leverages service relationships defined in the CMDB, and Tag cluster alert grouping, which uses shared metadata across alerts. Each plays a distinct role in correlating related alerts effectively.

If you're looking to group alerts, see Create Group automation.

CMDB based alert grouping

CMDB based alert grouping helps organizations manage alerts by organizing them according to their related configuration items (CIs) within the Configuration Management Database (CMDB). This method groups alerts based on CI relations in applications or infrastructure components. Teams can better understand the impact of issues, respond more effectively to alerts, and maintain service availability.

CMDB alert groups are created based on the current relationships between CIs in an organization. This means that when several alerts are triggered on different CIs—for example, if a server is experiencing issues — alerts are grouped based on CI relationships.

By default, all the existing connections between CIs are used to group alerts. However, given the complexity of IT systems, there are many types of relationships, and organizations can filter which ones to consider when aggregating alerts. For instance, you can filter relationship types by suggested relationships that appears in the CMDB Group CI Relations [em_suggested_relation_type] table. You can also filter using the hosting and containment rules (dependent relationship rules).

For example, if a server is hosting multiple applications, and there's a problem, all related alerts can be grouped together. This includes alerts for both the server and the applications it hosts. This helps the IT team quickly identify and address the root cause of the issue rather than dealing with each alert in isolation. Similarly, if different processes are running on a server, grouping alerts based on those processes allows teams to see how problems in one area might affect others. This leads to a more comprehensive understanding of the situation.

The CMDB alert groups are effectively displayed in the Express List within the Service Operations Workspace, which allows teams to easily monitor and manage related alerts. This feature enhances operational efficiency by providing a clear view of alerts that are interconnected based on the current relationships among configuration items (CIs).

Use cases for CMDB based alert grouping

Use cases for CMDB grouping enhance alert management by correlating alerts based on Configuration Item relationships, improving visibility, and facilitating more efficient troubleshooting.

Common CMDB grouping use cases

In the context of CMDB grouping, organizations face several challenges when managing alerts related to Configuration Items (CIs).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Common use cases

Use Case	Challenges	Solutions
Shared Configuration Item (CI) Scenario: An organization monitors a database server experiencing multiple issues, resulting in numerous alerts related to different applications using that database.	• Delayed response: Teams may respond to alerts in isolation, potentially overlooking related alerts, leading to delayed resolutions. • Inefficient resource allocation: Time and resources may be wasted on investigating separate alerts that are actually related. • Lack of context: Alerts related to the same CI can be scattered across different alert groups, making it difficult to see the full picture.	• Aggregate alerts related to the same CI into a single group for a unified view. • Facilitate faster alert resolution by addressing all related alerts together.
Hosting/Containment Relations Scenario: A physical server hosts several virtual machines (VMs), and an alert is generated for a hardware failure on the server. Multiple alerts also arise for the VMs due to their reliance on the server.	• Visibility into dependencies: Teams may lack visibility into how CIs are interconnected, leading to inefficient troubleshooting processes. • Complex alert resolution: Understanding which CIs are affected and how they relate can be complicated, resulting in longer resolution times. • Resource drain: Mismanagement of alerts can lead to duplicated efforts across teams, wasting time and resources.	• Group alerts using CMDB hosting/containment rules to aggregate alerts related to the physical server and its hosted VMs into a single alert group. • Provide a comprehensive view of all alerts tied to the physical server's failure. • Focus remediation efforts on the physical server while monitoring the VMs to ensure all aspects are addressed efficiently.
Applicative Relations Scenario: An enterprise application relies on multiple micro-services, and an issue arises with one of these services, generating alerts across several components, complicating diagnosis.	• Understanding application dependencies: Teams may find it challenging to trace how application components interact, making it difficult to pinpoint issues in complex systems. • Slow incident resolution: Without a clear understanding of applicative flow, alert	• Implement grouping based on applicative flow relations to aggregate alerts related to the affected microservice and its dependent components. • Utilize dependency maps to visualize how different services interact.

Common use cases (continued)

Use Case	Challenges	Solutions
	resolution can be slow and labor-intensive. • Inconsistent monitoring: Alerts related to applications may not be consistently monitored or prioritized, leading to potential oversights.	• Streamline the resolution process by addressing grouped alerts related to the application, improving response times.

CMDB alert grouping — properties and functionality

Learn about the key properties and functionality of CMDB alert grouping, which facilitate efficient alert organization based on relationships and enhance the overall effectiveness of alert management.

Properties for managing CMDB alert group creation

Use the properties listed in the following tables to control CMDB alert group creation. For more information, see Configure scheduled job-based alert grouping.

Property	Setting
Enable CMDB correlation *sa_analytics.agg.query_cmdb_correlation_enabled*	Enable this property to automatically use CI relationships for alert aggregation, correlating alerts and creating CMDB alert groups.
Max number of relations between CIs in a topology that form a CMDB group *sa_analytics.agg.query_cmdb_graph_walk_nodes*	Set the maximum number of enabled relations between CIs in a topology that form a CMDB group. For example, if you set this property to 3, a CI associated with an alert will automatically be grouped with similar CIs within three hops or less. **Note:** This property setting impacts all types of relations used for alert aggregation. Using a value greater than 4 may negatively affect the performance of the alert aggregation job.
Use all CMDB relations for CMDB group correlation *evt_mgmt.related_cis_get_all_relation_types*	Set to true if you want to use all relationship types for CMDB grouping. The default setting for new users is that the option is set to true, meaning all relationship types are used for grouping. Set the property to false to filter the relations.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties for managing automatic creation of CMDB alert groups for advanced use cases

In some use cases, you may need to ignore or exclude certain CI relationships from automatic alert group creation. In this case, the *evt_mgmt.related_cis_get_all_relation_types* property must be set to false, and the properties in the below table must also be configured.

Note: If the *evt_mgmt.related_cis_get_all_relation_types* property is set to false, and the relationship isn't specified in the [em_suggested_relation_type] table, the relationship is not considered for alert aggregation.

Properties for managing automatic creation of CMDB alert groups for advanced use cases

Property	Setting
Enable Suggested Relations for CMDB Correlation *sa_analytics.agg.query_cmdb_suggested_relationship_enabled*	Keep this property enabled to use any suggested relationships defined in the CMDB Group CI Relations [em_suggested_relation_type] table when forming CMDB alert groups. To include a new relationship, add it to this table. This property is enabled by default.
Use CMDB relationship based on host-containment Metadata rules *evt_mgmt.related_cis_use_containment_rules*	Containment rules specify which configuration item classes can be contained within another item through a specific relationship when creating a service template. Keep this property enabled when forming CMDB alert groups to use any host-containment rules defined in the Metadata Editor. For more details, see CMDB dependent relationship rules. This property is enabled by default.
Enable filtering by dependent relationship rules *evt_mgmt.related_cis_use_hosting_rules*	Hosting rules define what classes of configuration items are hosted on other classes of configuration items. Keep this property enabled when forming CMDB alert groups to apply any hosting rules, which define which classes of configuration items are hosted on other classes. This property is hidden and enabled by default. **Note:** If you need to change the default value, add the property, as it does not exist in the instance by default. For more information on how to create a property, see Add a system property.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties for managing automatic creation of CMDB alert groups for advanced use cases (continued)

Property	Setting
Ignore CMDB alert groups from forming due to CI applicative flow relations *sa_analytics.agg.ignore_cmdb_applicative_flow*	Set this property to true to prevent CMDB groups from forming based on applicative flow relations for CI relations in application services. This property is hidden and enabled by default. **Note:** If you need to change the default value, add the property, as it does not exist in the instance by default. For more information on how to create a property, see Add a system property.
sa_analytics.applicative_flow_relation	This property is hidden and enabled by default.

Event Management stores a map of related CIs in the Event Management CI Graph Reuse [em_ci_graph_reuse] table for each processed CI. You can adjust the storage period by modifying the *sa_analytics.agg.query_cmdb_graph_reuse_period* property, with the default set to one day (86,400 seconds). This process enhances the search performance of relations in the CMDB. To disable the storage process during advanced use-case configurations, set the property value to zero.

Note: If you need to change the default value, add the *sa_analytics.agg.query_cmdb_graph_reuse_period* property, as it does not exist in the instance by default. For more information on how to create a property, see Add a system property.

View the Dependency map for CMDB alerts

The Dependency map illustrates how and why alerts are grouped, simplifying troubleshooting and issue management. It reveals connections between CIs within a CMDB alert group, enhancing visibility into their relationships. Additionally, if a CI is not part of the group but connects to other alert CIs, it remains visible on the map, aiding alert resolution and proactive management.

Before you begin

Role required: evt_mgmt_user, evt_mgmt_operator

Procedure

1. Navigate to **All** > **Event Management** > **All Alerts**.
2. Search for the CMDB group.
3. Open a CMDB group alert.
4. Scroll down and select the **Activities** tab.

   You may see a message similar to the following:

   ```
   Alert2405199 and Alert2405219 were grouped together because of
   CI relationships. Open Dependency Map for CMDB Group Alerts.
   Open Dependency Map for CMDB Group Alerts.
   ```

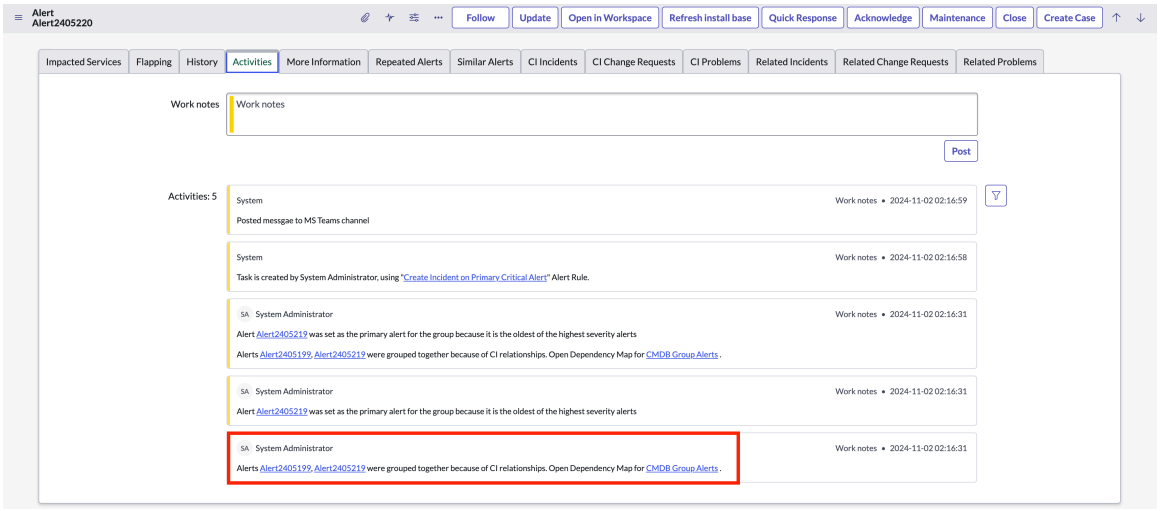
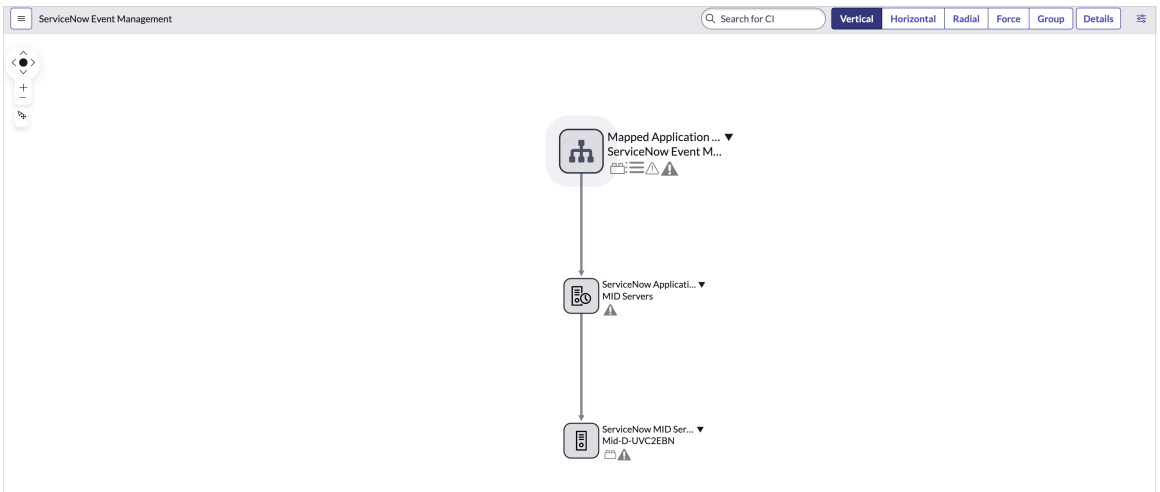
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. Select the link to see the dependency view of the CMDB alerts.



Add a CI relationship to CMDB Group CI Relations

Add a CMDB group CI relationship for a CI class to enable accurate alert group generation.

Before you begin

Role required: evt_mgmt_admin

About this task

Configure the *sa_analytics.agg.query_cmdb_suggested_relationship_enabled* property to further enhance alert grouping by using suggested relationships. For more information on properties, see CMDB alert grouping — properties and functionality.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **CMDB Group CI Relations**.

   a. Click **New**.

   b. Complete the form.

Suggested Relationship fields

Field	Description
Base class	The base class in the relationship serves as either the parent or the child, depending on the type of relationship established.
Relationship	The type of relationship that defines how two or more entities are connected.
Dependent class	The class that relies on another class in the relationship, serving as either the parent or the child depending on the relationship type.

2. Click **Submit**.

Example: CMDB Group CI relation

Base Class	Relationship	Dependent/Target Class
Oracle	Is Hosted On	Linux Server
Oracle	Is Hosted On	Solaris Server

Note: The same parent class and relationship can appear more than once.

Delete a CI relationship from CMDB Group CI Relations

Delete a CMDB group CI relationship to limit available relationships for CMDB alert grouping, helping to reduce noise and improve alert relevance.

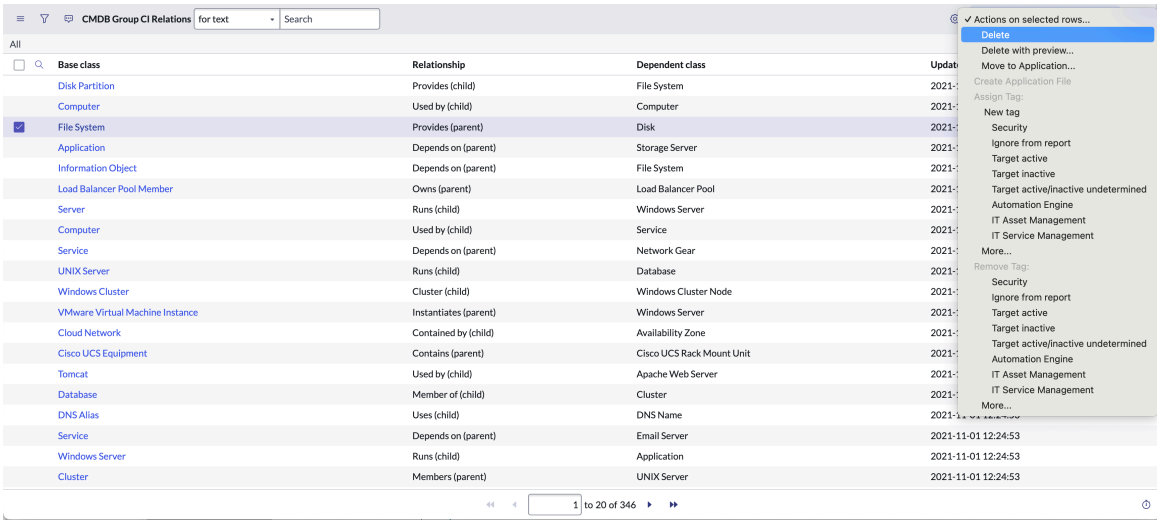
Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **CMDB Group CI Relations**.
2. Select the checkbox next to the CI relationship you want to delete.
3. Select the Actions menu and then select **Delete**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. On the confirmation window, select **Delete**.
   The CI relationship is deleted.

Tag cluster alert grouping

Tag cluster alert grouping enables you to easily create groups of alerts. It is a non-code method of alert grouping that correlates alerts without having to use CMDB or model training. This simpler way of grouping similar alerts reduces the overall noise of a large quantity of alerts.

Note: To group alerts using tag-based grouping, create a grouping automation in Service Operations Workspace. For more information, see Create Group automation.

Tag cluster alert grouping is enabled immediately after the activation of the Tag-Based Alert Clustering Engine application, available in the ServiceNow Store. This grouping is applied according to the correlation logic order specified in the Configure alert correlation logic order. Alert grouping tags are attached to definitions on a many-to-many (M2M) basis. Multiple tags can be linked to a single definition, and a tag can be part of multiple definitions. Groups formed from tag cluster alert grouping definitions are classified as the Tag Cluster group type.

Tag cluster alert grouping supports domain separation, allowing different domains to have their own distinct alert grouping configurations and logic.

First, create alert grouping tags to define the criteria for grouping alerts. You can set the tags to require an exact match, an approximate ('fuzzy') match, or a character pattern match.

You can also use preconfigured tags to speed up alert clustering. These predefined tags are mapped from alerts and are based on information from sources such as the Alert field, Alert tags, or Alert additional info. If the required data is missing and the selected tag source is Alert CI or Alert CI key, the tag is populated using the Configuration Item (CI) value from the Configuration Management Database (CMDB). Predefined tags are easily identified by their description, which includes out of the box.

You can attach one or more tags to an alert clustering definition, which specifies the conditions for alert correlation. You can either create your own alert clustering definition or use a predefined one provided by the application. Predefined definitions come with associated tags.

Important: Make sure to activate predefined definitions before use. In new systems, several definitions are active by default. The remaining ones must be activated. For more information, see Activate a predefined alert clustering definition.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Once one or more alert clustering tags are attached to a definition, the system collects alerts and checks if their tags match all the tag values specified in the definition. Alerts with matching or similar tag values are grouped together. New incoming alerts join an existing group if their tags match the tags in the definition used to create the group.

For tag-cluster grouping, alerts are added to a group based on the timeframe defined in the alert clustering settings. The time between the initial alert (virtual alert) and subsequent alerts is evaluated. If two new alerts are received, and their time difference falls within the defined timeframe, they are added to the group. The initial event's generation time is used to determine the relevance of the timeframe.

Create alert clustering tags

Create streamlined alert correlations with alert clustering tags by grouping alerts that share identical or similar tags based on your configured match method. This reduces noise, enhances incident prioritization, and improves operational efficiency, enabling faster issue resolution and response times.

Before you begin

Role required: evt_mgmt_admin

About this task

Note: To group alerts using tag-based grouping, create a grouping automation in Service Operations Workspace. For more information, see Create Group automation.

Procedure

1. Navigate to **All** > **Event Management** > **Tag Based Alert Clustering Engine** > **Alert Clustering Tags**.
2. Click **New**.
3. Fill in the values on the Event Management tag based alert clustering tag form.
4. Select **Submit**.

Result

The tag appears in the Tag Based Alert Clustering Tags table.

Create an alert clustering definition

Define alert clustering conditions to trigger one or more alert clustering tags, which help create alert groups from fewer alerts. Creating alert groups from fewer alerts reduces noise, making it easier to identify critical incidents, prioritize responses, and manage issues effectively.

Before you begin

Role required: evt_mgmt_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

To create a tag definition, users need to use a filter to define which alerts the definition will apply to. They then define a grouping criteria by specifying which field values should be compared to create a group.

Note: To group alerts using tag-based grouping, create a grouping automation in Service Operations Workspace. For more information, see Create Group automation.

Procedure

1. Navigate to **All** > **Event Management** > **Tag Based Alert Clustering Engine** > **Alert Clustering Definitions**.
2. Select **New**.
3. Configure the fields on the Event Management tag based alert grouping definition form.
4. Select **Save**.
   The definition appears in the Tag Based Alert Clustering Definitions table.

Activate a predefined alert clustering definition

Activate the predefined alert clustering definitions provided with the Tag-Based Alert Clustering Engine application before use. Utilizing these preconfigured definitions minimizes setup time and ensures a more efficient configuration process, allowing for quicker implementation and streamlined alert management.

Before you begin

Important: If you are already using the Tag-Based Alert Clustering Engine application, all the predefined definitions are inactive and must be activated. In contrast, new customers will find several definitions active by default, allowing for immediate utilization of the alert clustering capabilities without additional setup.

Role required: evt_mgmt_admin

About this task

Note: To group alerts using tag-based grouping, create a grouping automation in Service Operations Workspace. For more information, see Create Group automation.

Procedure

1. Navigate to **All** > **#Event Management** > **Tag Based Alert Clustering Engine** > **Clustering Definitions**.
2. Select a predefined definition.

   Note: For a complete list of the available predefined definitions, see List of predefined tag-based alert grouping definitions.

3. On the Tag Based Alert Clustering Definition form, select the **Active** check box.
4. Select **Save**.

Result

In the Tag Based Alert Clustering Definitions table, the **Active** field for the activated definition displays the value **true**. You can now associate an alert clustering tag with this definition, enabling effective grouping of alerts based on the defined criteria.

© 2026 ServiceNow, Inc. All rights reserved.

Attach a predefined tag to an alert grouping definition

Get started faster with alert clustering by attaching a predefined alert clustering tag to a tag-based alert clustering definition in Event Management. By associating a predefined tag, you ensure that alerts meeting the specified criteria are grouped effectively, facilitating quicker identification and response to related incidents.

Before you begin

Role required: evt_mgmt_admin

About this task

The Tag Based Alert Clustering Engine application comes with a set of predefined alert clustering tags. Attach a tag to a tag-based alert clustering definition to specify the conditions that must be met for alert correlation. This enables effective grouping of alerts based on shared characteristics, improving the accuracy and efficiency of incident response and management.

Note: To group alerts using tag-based grouping, create a grouping automation in Service Operations Workspace. For more information, see Create Group automation.

Procedure

1. Navigate to **All** > **#Event Management** > **Tag Based Alert Clustering Engine** > **Alert Clustering Definitions**.
2. Select a definition.
3. Under the Tag Based Alert Clustering Definitions Tags M2M section, select **Insert a new row**.
4. Use the search field to locate a predefined alert clustering tag, and then select the green check mark to confirm your selection.

   Note: Predefined tags are recognizable by their description, which includes "out of the box." For a complete list of the available predefined tags, see List of predefined alert grouping tags.

5. Select **Save**.

Result

The predefined alert clustering tag is now attached to the tag-based alert clustering definition. This association enables the effective grouping of alerts based on the specified criteria, facilitating improved alert management and response efficiency.

Text-based alert grouping

In text-based alert grouping, alerts are organized and correlated based on specific text patterns or keywords within the alert content. This approach dynamically groups alerts that share similar textual characteristics, such as error messages or event descriptions, allowing for more flexible and adaptive management of alerts.

The EM Alert Clustering Solution is a method used to correlate alerts based on similarities in specific fields and form clusters or groups. In ServiceNow Event Management, it creates clusters based on the Description, Metric name, and Configuration item.Class fields. This solution organizes alerts into text-based groups, and when a new alert arrives, the ML Predictor identifies the appropriate cluster, grouping alerts within the same cluster.

Note: The ML Predictor job is asynchronous and assigns real-time alerts to clusters, which may result in slight delays. This delay can cause text-based groups to be created several minutes later, as the alert grouping job runs once per minute. If prediction results are not available during a run, they are rechecked in the next grouping job.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For text-based logic to execute, you must have the Predictive Intelligence plugin (com.glide.platform_ml) installed and the EM Alert Clustering Solution definition activated.

There are specific settings or limits used to control the behavior of text-based alert grouping. These thresholds define the criteria for how alerts are grouped based on text patterns or attributes. The text-based thresholds are:

- Cluster quality threshold: The Cluster quality threshold (*sa_analytics.alert_grouping_tb_cluster_quality_threshold*) determines the minimum quality required for an alert cluster to be considered valid. This threshold ensures that only clusters with a minimum level of similarity and reliability are used. Clusters that meet this threshold are considered valid, improving the precision of the groupings and reducing noise from irrelevant or low-quality clusters. The range of the threshold is from 1 to 100 and the default value is 70.
- Alert rank threshold: The Alert rank threshold (*sa_analytics.alert_grouping_tb_alert_rank_threshold*) defines the minimum rank required for an alert to be included in a group. This threshold ensures that only alerts with a certain level of similarity are grouped together, filtering out lower-ranked alerts to maintain the quality of the alert group. The default value is 0.3, where smaller values indicate better similarity.

Note: To use these properties, you need to create properties with the same names and assign the required values to them. For more information on how to create a property, see Add a system property.

The EM Alert Clustering Solution definition is located in the [ml_capability_definition_clustering] table. To access it, navigate to **Predictive Intelligence** > **Clustering** > **Solution Definitions**.

To verify if the solution definition is active, see Verify text-based clustering solution. To disable the EM Alert Clustering Solution definition, set the property *sa_analytics.text_based_group_enabled* to `false`. Then clear the **Active** check box in the EM Alert Clustering Solution definition.

Example of text-based alert grouping

Scenario	Example
Network Connectivity Problems: There are widespread network connectivity issues affecting multiple departments.	Alerts from various network monitoring tools might report issues like Network segment down, High packet loss, or Connectivity issues in subnet. Text-based alert grouping uses the EM Alert Clustering Solution and ML Predictor to streamline alert management. The EM Alert Clustering Solution employs Natural Language Processing (NLP) algorithms to analyze and identify common text patterns in alerts. These patterns include issues such as Network segment down or High packet loss. It then clusters these alerts based on their text similarity, grouping related issues together. The ML Predictor further enhances this process by evaluating new alerts in real time and assigning them to the appropriate existing clusters based on their text patterns.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scenario	Example
	This dynamic grouping provides a consolidated view of the connectivity problems, allowing network engineers to quickly diagnose and address the root cause of the issues more efficiently.

Verify text-based clustering solution

Event Management uses Natural Language Processing (NLP) algorithms to identify common text patterns in alerts and create alert groups through clustering. This approach not only organizes similar alerts efficiently but also reduces noise and helps focus on significant issues, enhancing overall alert management.

Before you begin

Ensure that the Predictive Intelligence plugin (com.glide.platform_ml) is installed.

Ensure the parameter *sa_analytics.text_based_group_enabled* is set to `true`.

Note: If the Predictive Intelligence plugin is not installed, the text-based logic will not execute, even if *sa_analytics.text_based_group_enabled* is set to true. This is because text-based grouping relies on clustering alerts based on the description, metric name, and CI class. Without the plugin, clustering cannot be performed, and as a result, text-based groups will not be created, regardless of the active status.

Ensure that there are at least 100 alerts in the Alerts table [em_alerts].

Role required: evt_mgmt_admin

Procedure

1. Navigate to **Predictive Intelligence** > **Clustering** > **Solution Definitions**.
   The Clustering Definitions page opens.
2. Select EM ALert Clustering Solution.
3. Verify that the **Active** check box is selected.
4. Select **Update & Retrain**.
   For more information on ML solutions, see Reviewing your ML solution training jobs.

Manual alert grouping

Manual alert grouping involves organizing and categorizing alerts based on user-defined criteria and direct intervention.

You can manually select and group alerts to better manage and resolve incidents by tailoring the grouping based on specific needs, relevance, or context. This approach ensures that alerts are categorized effectively, enhancing overall incident management and response efficiency.

Create alert group manually

Manually create an alert group to organize and manage related alerts when not using scheduled jobs. This provides flexibility to group alerts on-demand for effective resolution.

Before you begin

Role required: evt_mgmt_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

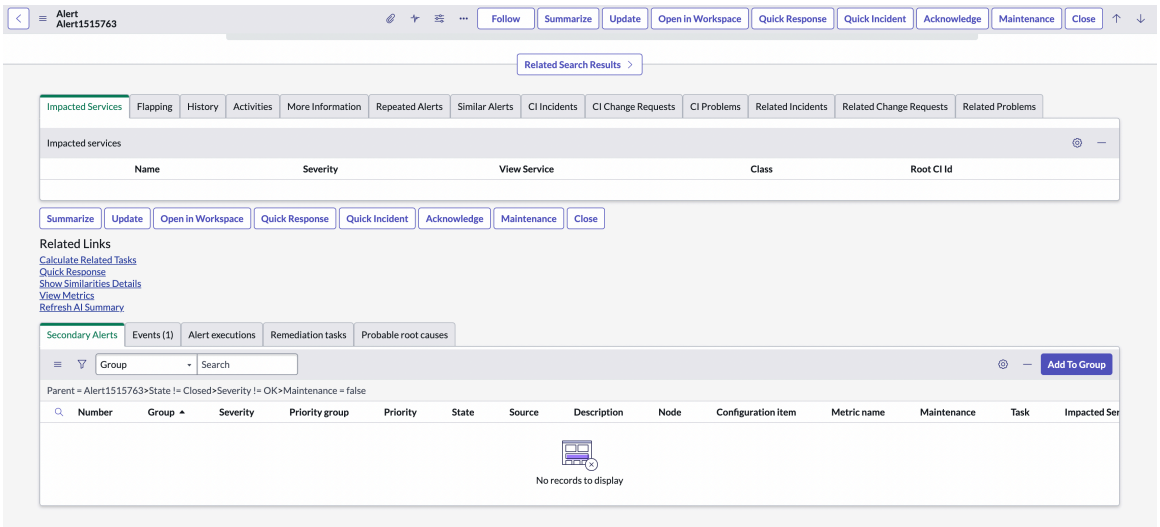
Procedure

1. Navigate to **All** > **Event Management** > **All Alerts**.
2. Select the alert number to open the alert.

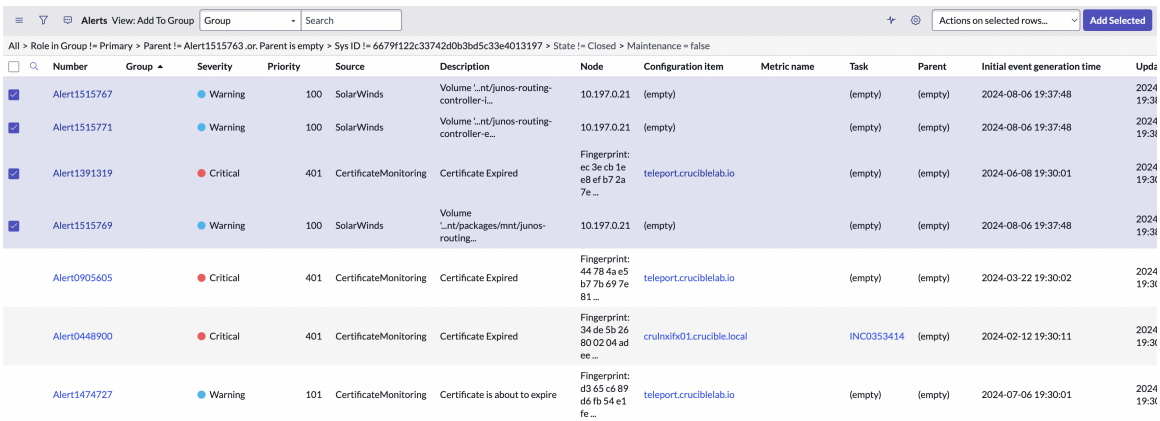
   The alert will be used to create an alert group, designated as the primary alert, to which you can add secondary alerts.

   Note: A closed alert cannot be assigned as a parent alert.

3. Scroll down and in the **Secondary Alerts** tab, select **Add To Group**.

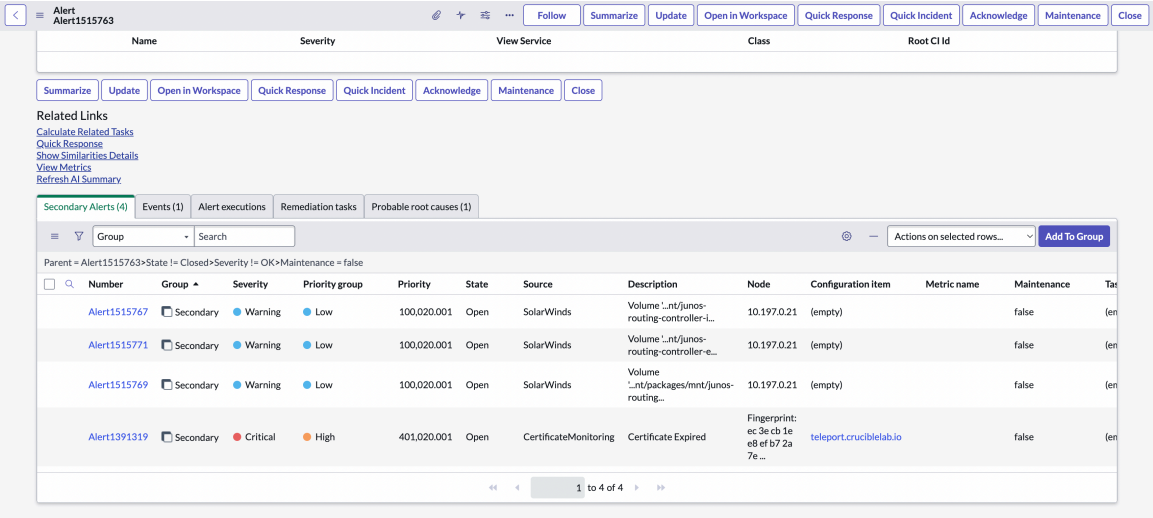


4. Select the check boxes for all alerts you want to add to the group as secondary alerts and select **Add Selected**.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. In the **Secondary Alerts** tab, view the alerts that have been added as secondary.



Add secondary alert manually to an existing alert group

Add any relevant alert discovered during the review of an automated alert group as a secondary alert to improve the group's completeness and utility for incident troubleshooting.

Before you begin

Role required: evt_mgmt_admin

About this task

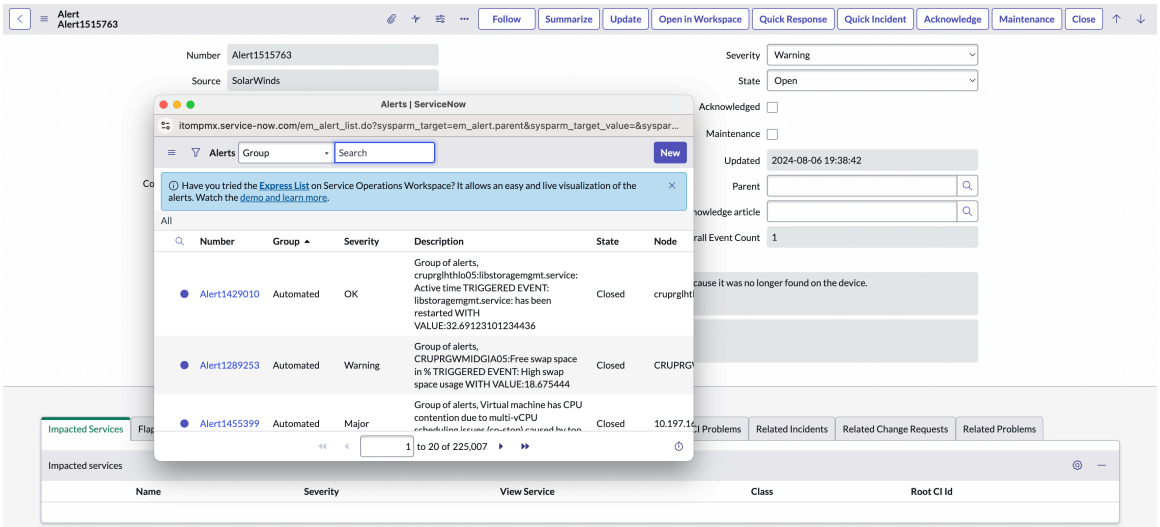
The alert you select to add to a new group may already be part of another group. Adding it to the new group will automatically remove it from its current group, changing its group association. Alternatively, you can update the alert's parent to move it to a different group. By specifying a new parent, the alert is transferred to the new parent's group and removed from the previous one. This can be accomplished by updating the **Parent** field on the alert form or by modifying the **Parent** column in the Alerts list.

Note: When you add an alert to a group, this action is logged as feedback for alert grouping as part of the process. Currently, the feedback option is available but does not trigger further actions after being logged. Future enhancements to this feature are being considered.

Procedure

1. Navigate to **All** > **Event Management** > **All Alerts**.
2. Select the alert number to open the alert.
3. In the **Parent** field, search for the alert you want to assign as the parent for the selected alert.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Select the parent alert number.
5. Select **Update**.

Result

The alert is added as a secondary alert to the selected parent alert.

Remove an alert from an alert group

Remove an alert if you want to improve the group's accuracy and usefulness in troubleshooting an incident. If this action leaves the group with one or no alerts, the group is deleted and no longer displays as an alert group.

Before you begin

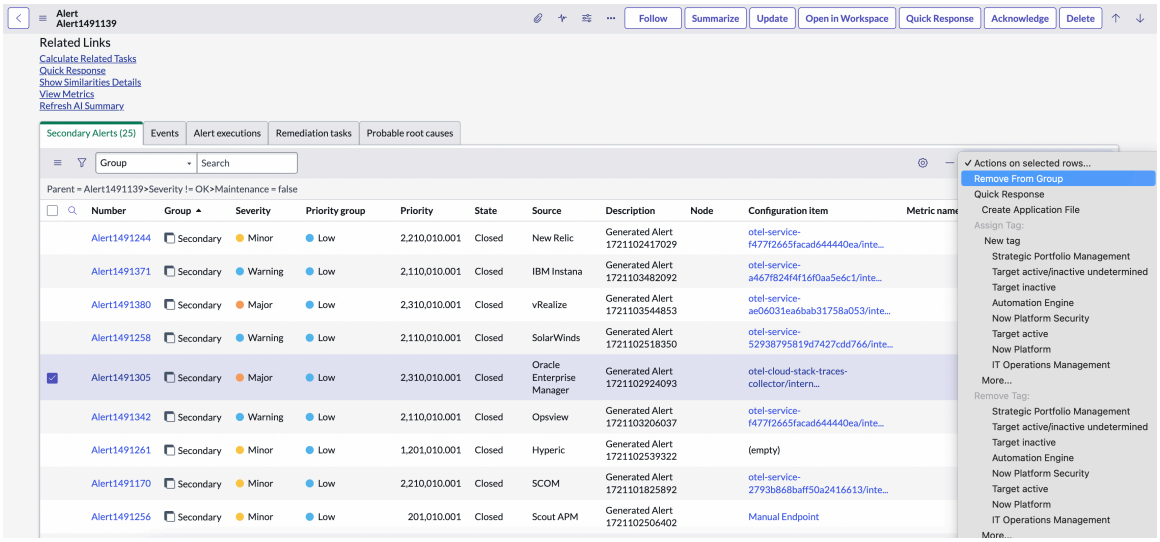
Role required: evt_mgmt_operator

Procedure

1. Navigate to **All** > **Event Management** > **All Alerts**.
2. Select the alert number to open the alert group.
3. Scroll down to view the **Secondary Alerts** tab.
4. Select the check box next to the alert you want to remove from the group.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. From the Actions on selected row menu, select **Remove From Group**.



Result

The alert is removed from the group.

Configure work notes for alert grouping justifications

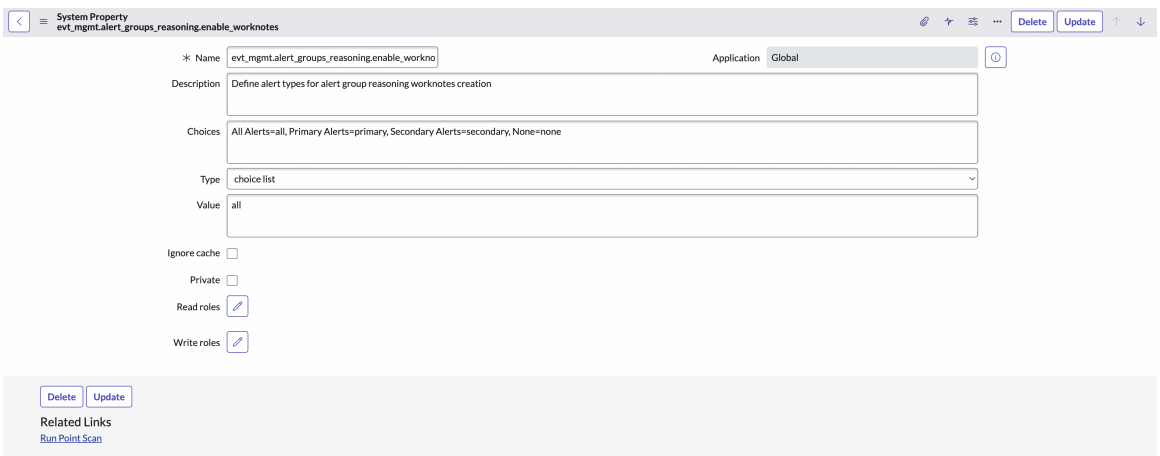
As alerts are added to a group, a message is recorded in the alert's Work notes field to explain why the alert was included in the group. Define alert types for creating these worknotes related to alert group reasoning.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **System Properties** > **All Properties**.
2. Search for the property *`evt_mgmt.alert_groups_reasoning.enable_worknotes`*.
3. Open the property.



4. In the **Choices** field, define alert types for creating worknotes related to alert group reasoning.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property values

Value	Description
All Alerts	Work note information is generated for every alert.
Primary Alerts	Work note information is generated only for primary alerts.
Secondary Alerts	Work note information is generated only for secondary alerts.
None	No work note information is generated.

5. Select **Update**.

Alert grouping types and creation methods

Application services in Event Management

An application service is a set of interconnected applications and hosts which are configured to offer a service to the organization.

For general information on application services, see Application services.

Manually create an application service in Event Management

You can manually create an application services. Event Management can use application services to monitor service performance and identify health issues.

Before you begin

Role required: evt_mgmt_admin

About this task

An application services is a set of interconnected applications and hosts which are configured to offer a service to the organization. Application services can be internal, like an organization email system or customer-facing, like an organization website. Use application services to organize, maintain, and monitor services in your organization.

Application services do not support these CI types:

- cmdb_ci_endpoint
- cmdb_ci_translation_rule
- cmdb_ci_config_file
- cmdb_ci_qualifier
- cmdb_ci_application_cluster

Procedure

1. Navigate to **All** > **Event Management** > **Services** > **Application Services**.
2. Click **New**.
3. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a Service form

Field	Description
Name	Enter a unique application service name.
Owned by	Specify an owner who is responsible for this application service in the organization
Add entry points:	
CI Type	Select the CI type (CI class) for the CI you are adding. Every CI belongs to a CI type which contains a set of attributes configured for this kind of CI, for example, cmdb_ci_appl for applications.
CI Name	Select the CI from the list of CIs of the selected CI type.

The CI type list includes only allowed CI types. For example, you cannot add an application cluster.

4. Click **Submit**.

What to do next

For details on grouping application services, see Group application services.

For details on controlling user access to application services, see Control user access to application services.

Convert manual services to application services

You can convert existing manual services to application services. Event Management can use application services to monitor service performance and identify health issues.

Before you begin

Role required: evt_mgmt_admin

About this task

Manual services are no longer supported and this service type, as well as discovered services, have been replaced by application services. Any existing manual services must be converted to application services.
During the conversion process:

- The manual service record is moved from the Manual Services [cmdb_ci_service_manual] table to the Mapped Application Service [cmdb_ci_service_discovered] table by changing the record class.
- All the original manual service attributes, such as, name, owner, and operational status, are retained in the application services.
- The configuration items (CIs) of the manual service are retained in the application services after the conversion.
- The system queries the CMDB for the latest CI changes and applies CI impact rules.

Application service does not support these CI types:

- cmdb_ci_endpoint
- cmdb_ci_translation_rule

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

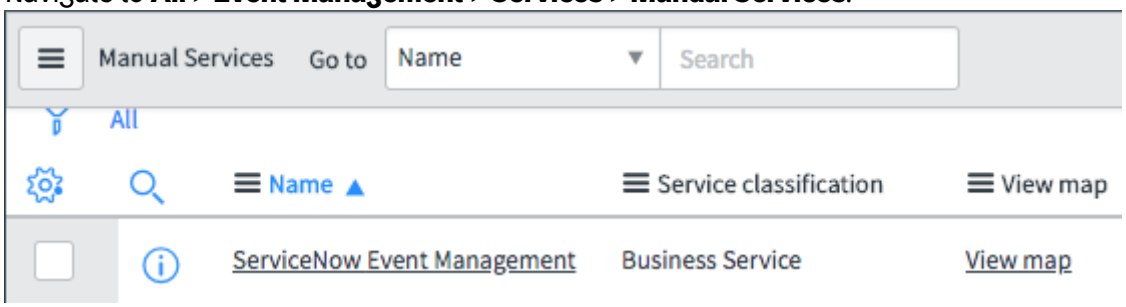
- cmdb_ci_config_file
- cmdb_ci_qualifier
- cmdb_ci_application_cluster

If the preceding CI types are used in the manual service that you want to convert, the conversion fails. CIs of this type should be removed before conversion. They can be replaced by adding new CIs to the application services after conversion.

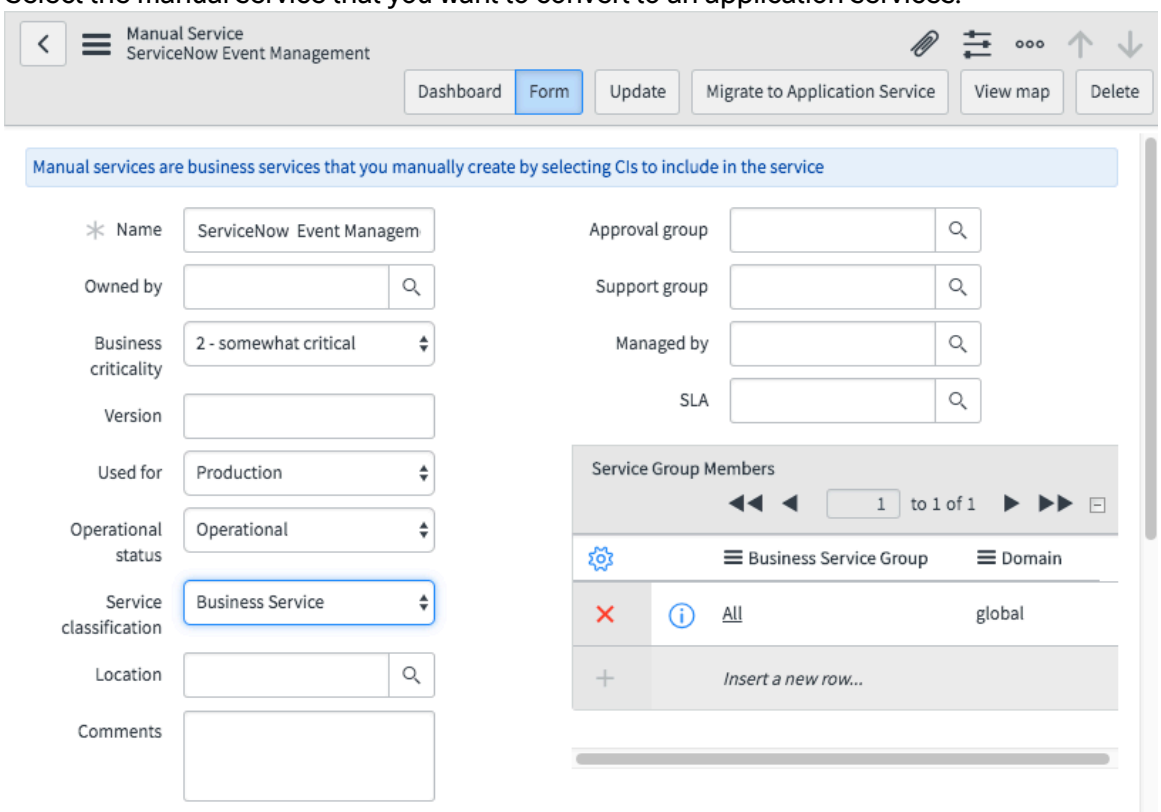
If your ServiceNow instance uses domain separation, the conversion fails if CIs from multiple domains are in the same service. Replace or remove relevant CIs before conversion. The converted application services contains only CIs assigned to the same domain as the application services.

Procedure

1. Navigate to **All** > **Event Management** > **Services** > **Manual Services**.



2. Select the manual service that you want to convert to an application services.



3. Click **Migrate to Application Service**.
4. Click **OK**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result

- The CIs from the manual service are added to the converted application services.
- After the conversion process is complete, the application services form opens.

Convert manual services to application services using API

You can use a JavaScript API to convert existing manual services to application services. Event Management can use application services to monitor service performance and identify health issues.

Manual services are no longer supported and this service type, as well as discovered services, have been replaced by application services. Any existing manual services must be converted to application services. Ensure that any automation of manual services (such as business rules or scheduled jobs) have been built and tested before converting to application services.

Note: Manual services are static and retain their original structure after conversion to application services. To update imported manual services with the existing CMDB state, either populate the original manual services to ensure that all CIs are assigned to the correct service, or run the **update with CMDB changes** option after the conversion.

During the conversion process:

- The manual service record is moved from the Manual Services [cmdb_ci_service_manual] table to the Mapped Application Service [cmdb_ci_service_discovered] table by changing the record class.
- All the original manual service attributes, such as, name, owner, and operational status, are retained in the application services.
- The configuration items (CIs) of the manual service are retained in the application services after the conversion.
- The system queries the CMDB for the latest CI changes and applies CI impact rules.

The maximum number of CI connections added to application services during this operation is controlled by the sa.service.max_ci_service_population property. By default, the value is 1,000 (one thousand connections). Increasing the number of CI connections may cause performance issues. To adjust the maximum number of added CI connections, add the sa.service.max_ci_service_population property, as described in Add a system property.

Attempting to process more CIs than the value specified in the sa.service.max_ci_service_population property causes the operation to fail.

Run the conversion process in small chunks of approximately 10 at a time. This makes it easier to pinpoint the problematic service if a conversion problem occurs.

Application services do not support these CI types:

- cmdb_ci_endpoint
- cmdb_ci_translation_rule
- cmdb_ci_config_file
- cmdb_ci_qualifier
- cmdb_ci_application_cluster

If the preceding CI types are used in the manual service that you want to convert, the conversion fails. CIs of this type should be removed before conversion. They can be replaced by adding new CIs to the application services after conversion.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If your ServiceNow instance uses domain separation, the conversion fails if CIs from multiple domains are in the same service. Replace or remove relevant CIs before conversion. The converted application services contains only CIs assigned to the same domain as the application services.

The JavaScript API is:

```
BusinessServiceManager.migrateManualToApplicationService(String
 service_id)
```

Parameters

Name	Type	Description
service_id	String	sys_id of the manual service to be converted

Returns

Type	Description
Boolean	`true` for a successful conversion, `false` for a conversion that failed

Where the `sys_id` of an existing manual service is `451047c6c0a8016400de0ae6df9b9d76`, run the following API to convert it to an application services:

```
var bsManager = new SNC.BusinessServiceManager();
var res =
 bsManager.migrateManualToApplicationService("451047c6c0a8016400
de0ae6df9b9d76");
```

Configuring CIs in a manual service as a manual cluster

Configure or modify a CI as a specific CI or a generic CI class in a manual service (that was not discovered automatically) as a manually defined cluster. A manual cluster delivers redundancy capabilities and provides continued operations if one or more CIs fail.

Manual cluster allows you to group CIs under a logical cluster in a service. In the impact tree you can set the relative impact of a cluster member on the cluster.

Note: Creation of nested manual clusters (cluster inside cluster) is currently not supported.

Once the CI is defined as a manual cluster its impact calculation shows the magnitude of an outage on its children CIs. Impact calculation uses factors such as impact rules and CI relationships to calculate the severity of a generated alert. Impact rules estimate the magnitude or severity of an outage based on affected CIs. They determine how the impact applies to parent or child entities that are part of an application service.

The magnitude of an outage can be 100% down, 60% affected, 40% impaired, or 20% impaired.

Redundancy is defined in impact rules. For example, you can define that the parent CI is critical if at least two child CIs are critical. The impact from child to parent CIs is not always 100%. If the CIs of all three children are affected, the impact is 100% down.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In a service map, you can configure or modify a specific CI or a generic CI class in a manual service as a manually defined cluster. When configuring as a generic CI class, all the CIs of the selected class in that service are configured the same.

Note: Visual representation of a manual cluster may differ from the visual representation of a cluster that is discovered automatically.

Related topics

Alert impact calculation

Configure a manual cluster

Provide redundancy capabilities of an entire cluster in case of failure of one or more CIs in that cluster. By viewing the relative impact of a cluster member on the cluster information, you can better understand the source of alerts and take remediation steps.

Before you begin

Role required: evt_mgmt_admin

About this task

In a manual service that was not discovered automatically, you can manually group a specific CI or a generic CI class under a logical cluster. The relative impact of a cluster member on the cluster can be configured in the impact tree.

For more information, see Alert impact calculation.

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Manual Clusters**.
2. Select **New**.
3. In the **Select a Service containing this manual cluster** section, select an application service to contain the new manual cluster based on a specific CI or general CI class.
   The cluster number is automatically generated and appears in the **Number** field.

   a. Select the Lookup using list icon ( ) in the **Service** field.

   b. In the CMDB CI Service [cmdb_ci_service_discovered] table, select a manually created service.
   To define a new application service, see Manually create an application service in Event Management.

   c. **Optional:** Preview the record by selecting the Preview this record icon ( ).

4. In the **Select a Specific CI or generic CI class** section, in the **Defined As** field, select how to define the manual cluster.
   Select a specific CI or a generic CI class that applies to all CIs of this class.
   - Specific CI - In the **Configuration item** field, select the Lookup using list icon ( ) and select the configuration item.
   - Generic CI class – In the **Configuration item class** field, select the configuration item class.
5. In the **Provide a Description** section, either provide a description in the **Description** field or leave it blank to contain an automatically generated description when you select **Save** or **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The **Description** field is automatically updated when you select **Save** or **Submit**. The automatically generated description consists of the configuration item name and the service name. For example: `CI <Alert Processing> in service <linuxApplService> (*** auto generated ***)`.

To prevent an automatic update of the Description field and retain your changes, delete the (*** auto generated ***) suffix that appears as part of the description.

6. Activate the cluster by selecting the **Activate** check box.
7. Select **Submit**.

Result

The manual cluster is saved in the EM Impact Manual Cluster [em_impact_manual_cluster] table. The impact calculation is recalculated automatically.

Related topics

Configuring CIs in a manual service as a manual cluster

Modify a manual cluster

Modify an existing manual cluster by changing the service, CI, CI class, or description.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Manual Clusters**.
2. From the list, select a manual cluster.
3. Change the service containing the manual cluster by selecting a different one in the **Select a Service containing this manual cluster** section.
   The cluster number appears in the **Number** field.
   a. Select the Lookup using list icon ( ) in the **Service** field.
   b. In the CMDB CI Service [cmdb_ci_service_discovered] table, select a manually created service.
   c. **Optional:** Preview the record by selecting the Preview this record icon ( ).
4. In the **Select a Specific CI or generic CI class** section, use the **Defined As** field to modify the manual cluster.
   - Specific CI - In the **Configuration item** field, select the Lookup using list icon ( ) and select the configuration item.
   - Generic CI class – In the **Configuration item class** field, select the configuration item class.
5. **Optional:** In the **Provide a Description** section, modify the description in the **Description** field.

   (Optional) The **Description** field is automatically updated when you select **Save** or **Submit**. The automatically generated description consists of the configuration item name and the service name. For example: `CI <Alert Processing> in service <linuxApplService> (*** auto generated ***)`.

   To prevent an automatic update of the Description field and retain your changes, delete the (*** auto generated ***) suffix that appears as part of the description.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Activate or deactivate the cluster by selecting or clearing the **Activate** check box.
7. Select **Update** to save your changes.

Result

The manual cluster is saved in the EM Impact Manual Cluster [em_impact_manual_cluster] table. The impact calculation is recalculated automatically.

Related topics

Configuring CIs in a manual service as a manual cluster

Create an alert query

An alert query is a set of alerts that meet specific criteria for a particular service.

Before you begin

Navigate to **Event Management** > **Administration** > **Event Management Properties** and ensure that the **Enable alert query support** (*evt_mgmt.impact_calulation.alert_group_support*) property is set to **Yes**.

Role required: evt_mgmt_admin or evt_mgmt_operator

About this task

The main motivation to use alert queries is a modeling solution based on data contained in the alert itself, as an alternative to using either discovered, application, or technical services. Create an alert query to combine similar alerts that meet the specific criteria.

You can learn about Event Management basics, including alert queries, from this video:

Procedure

1. Navigate to **Event Management** > **Services** > **Alert Queries**.
2. Select **New**.
3. On the **Alert Query** form, fill in the fields.

   For a description of the field values, see Alert Query form

   Note: In the **Filter** field:

   - When defining an alert query filter, include only fields that appear in the Alert Histories [em_alert_history] table. Impact calculation is based on Alert History data and fields such as Overall Event Count, Priority, and Priority group are not copied to the Alert Histories [em_alert_history] table.
   - Do not specify a dynamic time condition. For example, in the filter, do not specify `Created` condition of `Last 45 minutes` because impact calculation is triggered by a change of alert or alert query. However, for the dynamic time condition, none of these conditions have changed.

     
   - Some filters may slow down impact calculation. To solve this problem, adjust your alert query by adding an appropriate index, as described in Index suggestions for slow queries.

4. Select **Update**.

Related topics

Create alert group manually

Create an application service group

Create service groups to combine similar services. Organize services by groups to perform actions simultaneously on multiple services and to control user access to services.

Before you begin

Role required: evt_mgmt_admin

About this task

Service groups are a way to organize and group services based on the application services or technical services they impact. Instead of looking at individual service from different infrastructure components (like servers, databases, or applications), Service groups help consolidate them under the umbrella of a service group. Application service groups enable faster identification of alert impact. Service groups appear in the **Group by** option on the Service Operations Workspace dashboard.

Procedure

1. Navigate to **All** > **Event Management** > **Services** > **Service Groups**.
   The Application Service Group page opens.
2. Select **New**.
3. In the **Name** field, enter the name of the new service group.
4. **Optional:** In the **Parent Group** field, enter the name of another group in which to embed the new group.
   Users with access to a parent service group automatically have access to all its child groups.
5. Select **Submit**.

Related topics

Assign a role to a service group

Group application services

Assign a role to a service group

Assign an Event Management role to the application service group to ensure that group members can manage and act on alerts.

Before you begin

Configure a service group to enable users to manage application services or alert groups.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Services** > **Service Group Responsibilities**.
2. Click **New**.
3. In the **Application Service Group** field, select the name of the service group.
4. In the **Role** field, select an Event Management role:
   - evt_mgmt_admin
   - evt_mgmt_integration

Activate and configure Service Mapping for top-down discovery

A top-down discovery provides a list of CIs and their interrelationships. This information is useful for managing software services and hardware issues that are associated with alerts.

Before you begin
Role required: evt_mgmt_admin

About this task
In Event Management, Service Mapping relationships appear on alerts. You can view the related CI and other information in the Event Management dashboard. The mapping relationships appear in a service map with the generated alert, any CIs that are bound to the alert, and all related CIs.

Procedure

Use Service Mapping to get top-down discovery information.
Service Mapping, which is closely related to Event Management, provides tools to discover the relationships between network, hardware, software, storage, and other devices.

Request Service Mapping

Configure email notifications for service severity changes

Configure an email notification to notify users when there is an application service severity change.

Before you begin
Role required: evt_mgmt_admin

About this task
Configure an email notification to notify users when there is an application service severity change. The notification involves specifying when to send it, who receives it, and what it contains.

Procedure

1. Navigate to **All** > **System Properties** > **Email Properties**.
2. In the **Outbound Email Configuration** section, in the **Email sending enabled** option, select **Yes** to enable sending severity information by email.
3. Click **Save**.
4. Navigate to **System Notification** > **Email** > **Notifications**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Click **New**.

   a. In the **Email Notification Actions** form, specify these values.

Field	Value
Name	Type a descriptive name, for example, *Application Service severity change*.
Table	Select the required service type and its corresponding table: Alert Group, Discovered Service, Technical Service, or Application service.
Active	Select the check box to enable email notification.

   b. Click the **Who will receive** tab.
   In the **Users** area, search for and select the required user (the user does not require System Administrator credentials). Repeat this step for as many users that are required to receive this notification.

   c. Click the **When to send** tab and in the **choose field** box, search for and select *Severity*.

   d. Click the **What will it contain** tab and in the **Subject** field, type meaningful text that makes it clear to the receiver of the email notification what the content of the email is.

   e. In the **Message HTML** message area, using the **Select variables** functions, compose the conditions under which the email notification is to be sent.
   For example, configure these variables to change severity:

```
severity changed
```

```
Severity: ${severity}
```

```
on application service
```

```
Name: ${name}
```

6. Click **Submit**.

Configure contextual colors and icons

Use the **Contextual colors and icons** form to configure color, text, and icons to have different default or custom contexts, identified by a context ID.

Before you begin
Role required: evt_mgmt_admin

About this task
You can customize the colors or icons of elements in the **Contextual colors and icons** form to affect the displayed colors or icons of severities in related Event Management screens, either when accessibility mode is off or on. For more information about accessibility, see Accessibility features .

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In each color selection field, you have the option of entering the value of the color as any of the following Cascading Style Sheet (CSS) formats that determine how HTML elements should be displayed:

- Name: predefined color names, for example, red, green, olive, blue, darkblue, or lightblue
- RGB decimal: RGB(102, 153, 204)
- RGB hex: #223344

See the following websites for information about CSS color declarations (including hex or RGB notation):

- HTML Colors (W3CSchools) for more information on hex and RGB notation.
- HTML Color Names (W3CSchools) for valid color names.

The context IDs that are provided with the base instance are:

- information_severity
- warning_severity
- minor_severity
- major_severity
- critical_severity
- topology_connection

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Contextual colors and icons**.
2. Click **New** or modify an existing configuration.
3. Configure the following fields.

Item	Description
Context details	
Context ID	Enter a unique ID for the context, for example, clear_severity.
Context Name	Readable name for the context. This text is available to be read out by screen readers.
Batch	The batch that this context is a member of.
Description	Description of uses for the context.
Colors **Note:** For each entry in the color fields, after you enter a color code, a block appears to the right of the field showing the specified color. Use of invalid color codes triggers an appropriate error notification.	
CSS Color	The corresponding CSS color code for the context color name.
CSS Color on Interaction	CSS color code that appears on hover or focus.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Item	Description
Accessible CSS Color	Accessible CSS color code that appears when accessibility mode is enabled.
Accessible CSS Color on Interaction	Accessible CSS color code that appears on hover or focus.
Icons	
Icon	Icon that is displayed when the context includes an icon.
Accessible Icon	Icon that is displayed when the context includes an icon and when accessibility mode is enabled. To add your own icon, or to see a list of available icons, see Upload one or more images.

4. Click **Submit**.

View Event Management license usage

Event Management is licensed based on the number of CIs bound to alerts during the last year. For alerts not bound to CIs, the system calculates the number of nodes that can send events to the instance during the last year.

Before you begin

Role required: evt_mgmt_admin or evt_mgmt_operator

About this task

The **Event Management - Node Count Store** job calculates the number of unique nodes that send event information, either directly or through third-parties, to Event Management and are eligible for licensing in the last year. The information from this job is stored in the License Usage [em_unique_nodes] table for visibility by all users. CIs bound to alerts are counted towards licensing; if there are no CIs that are bound to alerts, the event node field is used. Node is a reference to a server, not the instances of the software on it. Your node count is based on the amount of infrastructure (servers for example) that will be sending events.

Procedure

Navigate to **All** > **Event Management** > **Reporting** > **License Usage**.

The table is filled automatically based on the alerts in the system. The user has no permission to edit the table. It is used to calculate the usage of the Event Management licensing.

Column	Description
CMDB CI	The CI that is bound to the alert that is gener ated from the event. If there is a value for this field, the **Node** field is empty.
Node	The string value of the **Node** field of the event. If there is a value for this field, the **CMDB CI** field is empty.
Type	One of these values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column	Description
	• Unknown - A CI has not bound to the generated alert. • Server - The source of the event was a server. • PaaS - The source of the event was Platform as a Service.
Is licensable	One of these values: • True - The event listed is counted towards the license usage. • False - The event listed is not counted towards the license usage.

Alert automation in Service Operations Workspace for ITOM

Alert automation is crucial as organizations deal with increasing number of alerts and complex IT infrastructures. Manual alert handling is slow, error-prone and inefficient, underscoring the need for automated systems. Automation can improve the mean time to resolve alerts, improve service reliability and better scale staff resources.

Alert automations also support both centralized administrator and distributed team roles. This enables qualified teams to self-serve and create their own alert automations. For example, you may consider granting access to site reliability engineers (SREs). Members of teams can manage automations for their own team and their own alerts without impacting other teams.

For users familiar with our classic experience, alert automation offers an easier user interface and better team support for event rules, tag-based clustering definitions and alert management rules. Some advanced features are currently only available to admins in the classic experience. These two experiences use the same backend tables. You can use whichever experience is most convenient, and changes in one will also update the other.

https://player.vimeo.com/video/1068873181?h=b03003c9bf&badge=0&autopause=0&player_id=0&app_id=58479

Alert automation types

Currently, Service Operations Workspace ITOM provides the following types of automation.

1. Ignore automation: Reduce irrelevant or false-positive alerts, efficiently manage alert fatigue by filtering out noisy notifications, and allow teams to focus on critical issues.
2. Enrich automation: Enhance raw alerts with contextual information to make them more informative and actionable. In simple terms, this involves taking the raw events generated by monitoring tools and transforming them into a common and standard format to aid automated grouping and response.
3. Group automation: Group multiple related alerts into a single primary alert to reduce alert noise and identify the root cause.
4. Create Respond automation: Respond to alerts automatically by notifying appropriate stakeholders, escalate them as needed or run remediation actions. Determine how and when alerts are escalated based on severity or type. Integrate with third-party systems to create cases, notifications or run remediation actions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert automation process flow

You may start by sending alerts or events from monitoring systems to ServiceNow using the Integrations Launchpad. This is where administrators establish connections between ServiceNow and monitoring tools. These integrations enable the collection of monitored data, generating events from third-party sources.

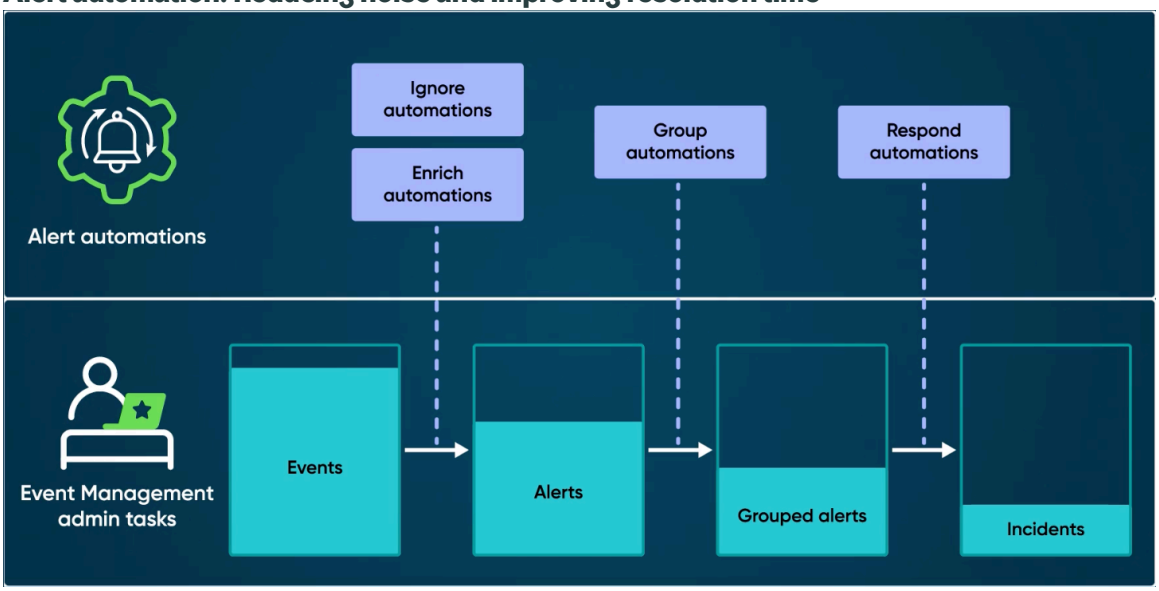
When alerts are received by ServiceNow, alert automations run in the order shown on the page. First, we ignore alerts to reduce noise. Next, we enrich alerts with extra context, then group the alerts using the added context. Finally, we respond to alerts by escalating or running remediations. There can be several automations for each type. Each automation runs based on specific trigger conditions and executes specific actions. Alerts are only automated when they are received; we do not apply automations to past alerts.

In the alert enrichment phase, administrators add or extract necessary fields from alerts to provide essential information for swift resolution. This ensures that alerts contain all relevant details required for effective incident response. Administrators add context to alerts by modifying and normalizing them. This enhances the correlation of alerts, making it easier to identify patterns and potential threats.

The enriched and composed alerts are then grouped based on predefined criteria, consolidating related alerts. This reduces alert fatigue and facilitates efficient remediation. Finally, escalated alerts trigger notifications to stakeholders through various channels, ensuring timely communication and response to critical alerts.

The following diagram illustrates this process flow.

Alert automation: Reducing noise and improving resolution time



This comprehensive alert automation process can reduce alert noise, improve mean time to resolution (MTTR), enhance service reliability, and boost staff productivity.

Create Ignore automation

Ignore automation streamlines the process of disregarding irrelevant or false-positive alerts from monitoring systems, efficiently managing alert fatigue by filtering out unnecessary notifications. As a result, teams can prioritize and resolve critical issues more effectively.

Before you begin

Role required: evt_mgmt_admin, evt_team_operator, or srm_responder

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Ignore automations filter out alerts from source monitoring systems that match specific conditions. Separately, Event Management ignores alerts that have a duplicated message key field or where the severity is **Clear**.

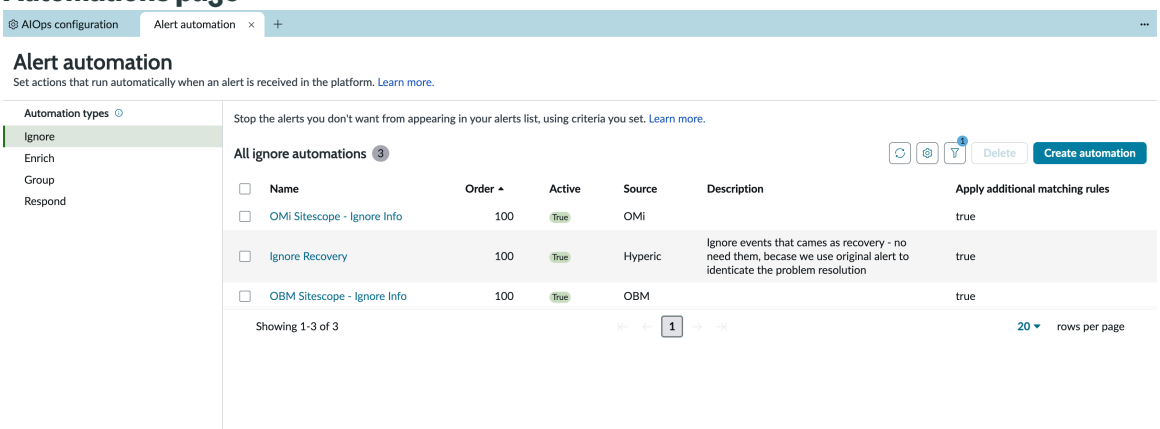
For users familiar with the classic Event Management experience, ignore automations provide a simpler interface with enhanced team support for the event filter section of event rules.

Note: Ignoring alerts before enriching them improves performance and simplifies the processing flow. The condition filter in ignore automations applies only to the original event, not the enriched one. Enrich automations do not run if **Don't run other enrich alert automations** is set to false, and another enrich automation with a lower order, the same source, and matching filter conditions already applies. To avoid conflicts, consider the enrich automation order, source, and filter conditions when creating enrichments or event rules.

Procedure

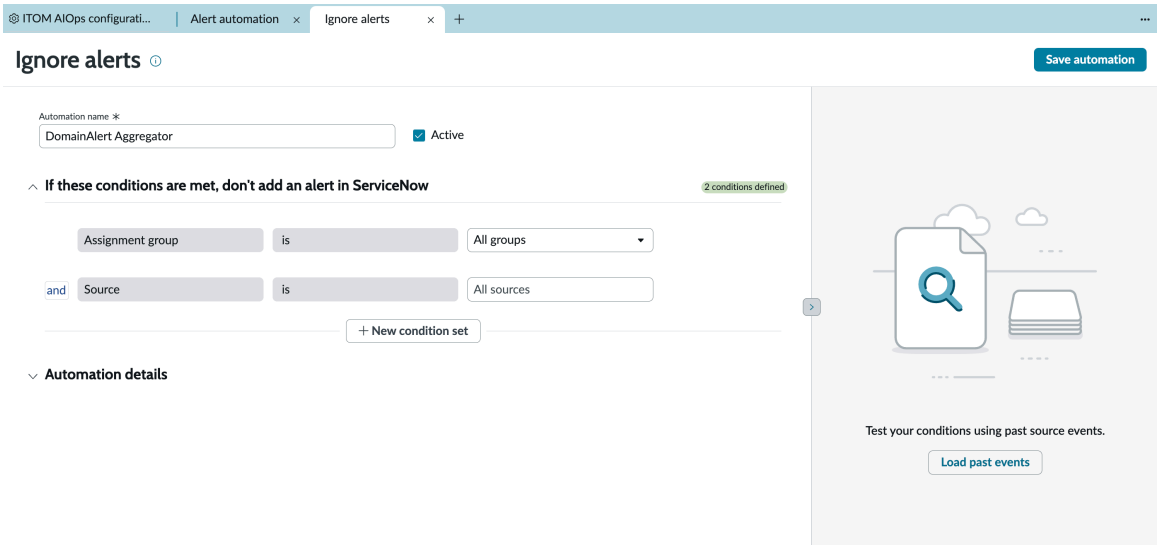
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. On the ITOM AIOps configuration center page, under the Optimize section, select **Ignore alerts**.
   The Ignore alerts page is displayed.

Automations page



4. Select **Create automation**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. In the **Automation name** field, enter the name of the automation for ignoring alerts.
6. Activate the automation by enabling the **Active** toggle switch.
7. In the **If these conditions are met, don't add an alert in ServiceNow** section, set up filter criteria to identify the events you want to capture.
   a. From the **Assignment group** field menu, select the assignment group to determine which team's alerts trigger the automation.

      The **Assignment group** represents a specific team responsible for handling certain alerts. By selecting an assignment group, you ensure that only the alerts assigned to that a particular team trigger the automation. This way, the automation is targeted and only activates for relevant alerts associated with the selected team.

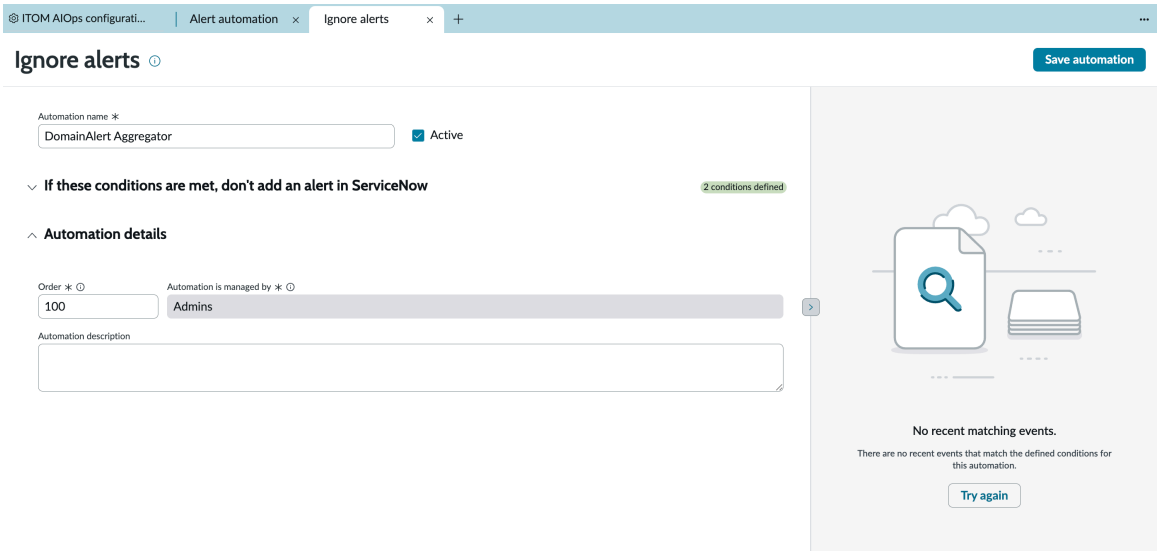
      Note:

      - If you're logged in to the instance with the administrator role (evt_mgmt_admin), all assignment groups are available. Additionally, you can also select **All groups** to generate alerts for any available group.
      - If you're an operator, only the group you're a part of is available.
      - Only members of the selected group or administrators can update or delete the automation.

   b. From the **Source** field menu, select the monitoring tool from where the alert is generated.
   c. Set up the conditions by selecting the field, operator, and field value. Then, add more conditions using OR or AND operators.

      To add another set of conditions, select **+ New condition set**. If you don't see an additional info field, you can manually it in the drop-down list.
8. To verify that you're ignoring the correct events or to see examples of fields that can be used to set the conditions, select **Load past events**.
   You can preview the details of some past events.
9. In the **Automation details** section, provide an order and automation description.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



a. In the **Order** field, enter the automation order.

> **Note:** Automations run in order from the lowest to the highest.

The **Automation is managed by** field displays the team or assignment group who owns, edits, and can delete this automation. The assignment group is the same as the one defined in the **If these conditions are met** section.

b. In the **Automation description** field, enter a brief description of the automation.

10. Select **Save automation**.
A notification appears when the automation is successfully saved. Otherwise, an error message is displayed. The ignore automation that you created appears on the **Ignore alerts** page where you can view, edit, or delete the existing automation.

What to do next
You can transform raw events into an understandable format by creating Create Enrich automation.

Create Enrich automation

Alert enrichment involves transforming raw events from monitoring tools into a standard format, aiding automated grouping and response. This includes extracting fields from lengthy alert payloads or composing them into a standardized format. Additionally, you can create tags, which are metadata added to alerts for easier filtering and grouping.

Before you begin
Role required: evt_mgmt_admin, evt_team_operator, or srm_responder

About this task
Extracting takes values from event payload fields and places them in alert output fields, while composing combines multiple alert fields into one. For more information, see Extracting and composing alert fields.

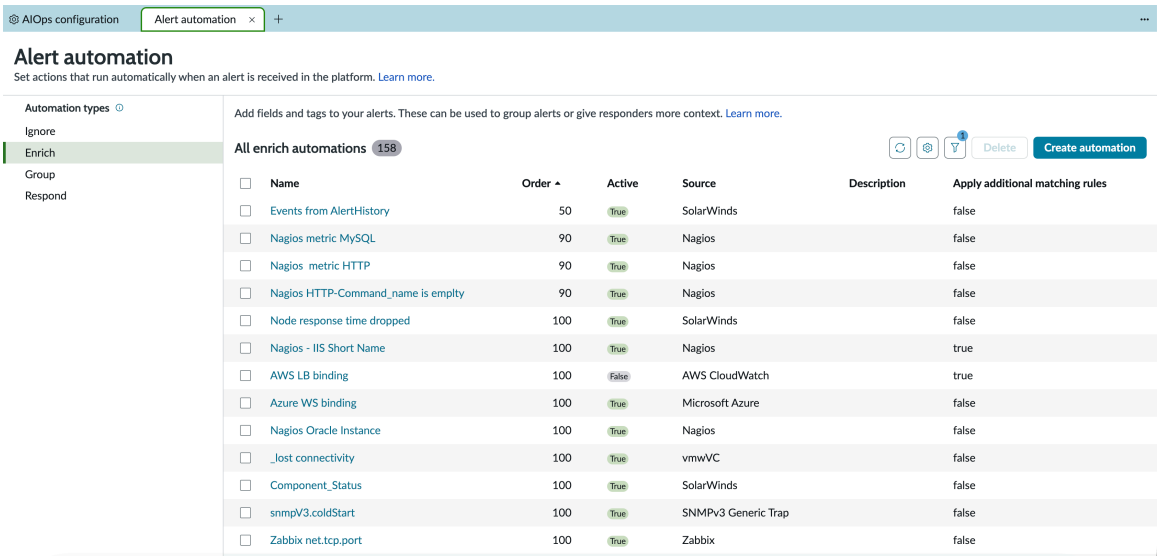
For users familiar with the classic Event Management experience, enrich automations create event rules but with an easier interface and with better teams support. Event rules offer a few advanced features like thresholds and CI identification using IRE that are not yet available in enrich automations. Admins may also enrich alerts with event field mapping rules. Changing alert values creates an event field mapping rule with the mapping type **Map field and transform**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

value (Single field). This rule is linked to the event rule and runs simultaneously, allowing for streamlined mapping and transformation of event data to enrich alerts.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. On the ITOM AIOps configuration center page, under the Optimize section, select **Enrich alerts**.
   The Enrich alerts page is displayed.



4. Select **Create automation**.
   By default, the **Active** check box is selected.
5. In the **Automation name** field, enter the name of the automation for enriching alerts.
6. In the **If these conditions are met** section, set up filter criteria to identify the alerts you want to enrich.

   The condition is evaluated against the raw event received from the source monitoring system and does not account for enriched fields.

   a. From the **Assignment group** field menu, select the assignment group to determine which team's alerts will trigger the automation.

      The **Assignment group** represents a specific team responsible for handling certain alerts. By selecting an assignment group, you ensure that only the alerts assigned to that particular team will trigger the automation. This way, the automation is targeted and only activates for relevant alerts associated with the selected team.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

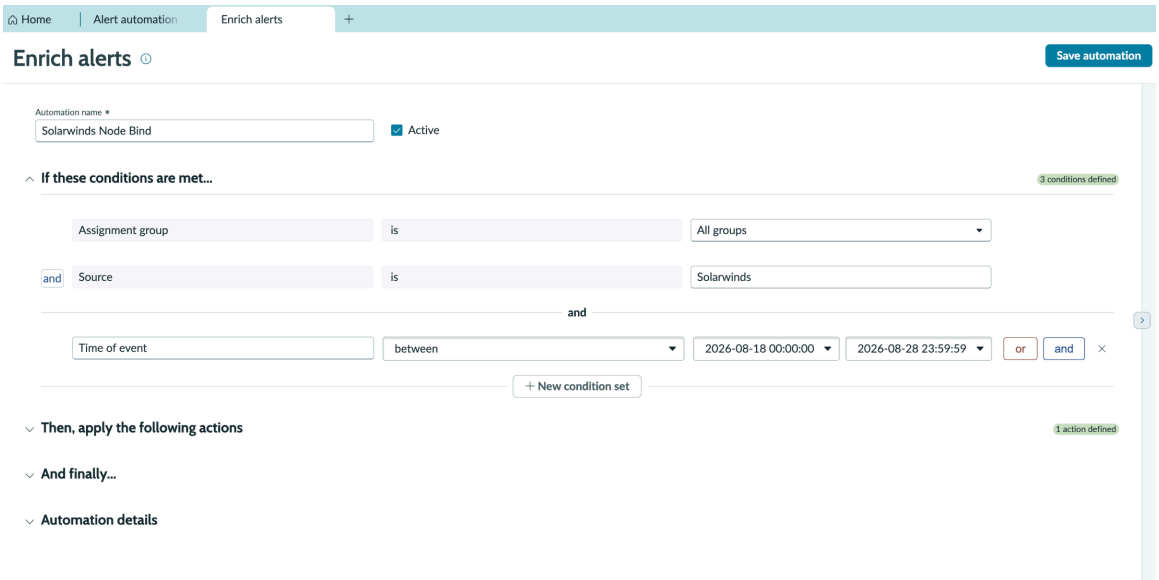
Note:

- If you're logged in to the instance with an administrator role (evt_mgmt_admin), all of the assignment groups are available. Additionally, you can select **All groups** to enable generating alerts for any of the available groups.
- If you're an team operator, only the groups you're a member of are available.
- Only members of the selected group or administrators can update or delete the automation.

b. From the **Source** field menu, select the monitoring tool from where the alert is generated.

c. Set up the conditions by selecting the field, operator, and field value. Then, add more conditions using OR or AND operators.

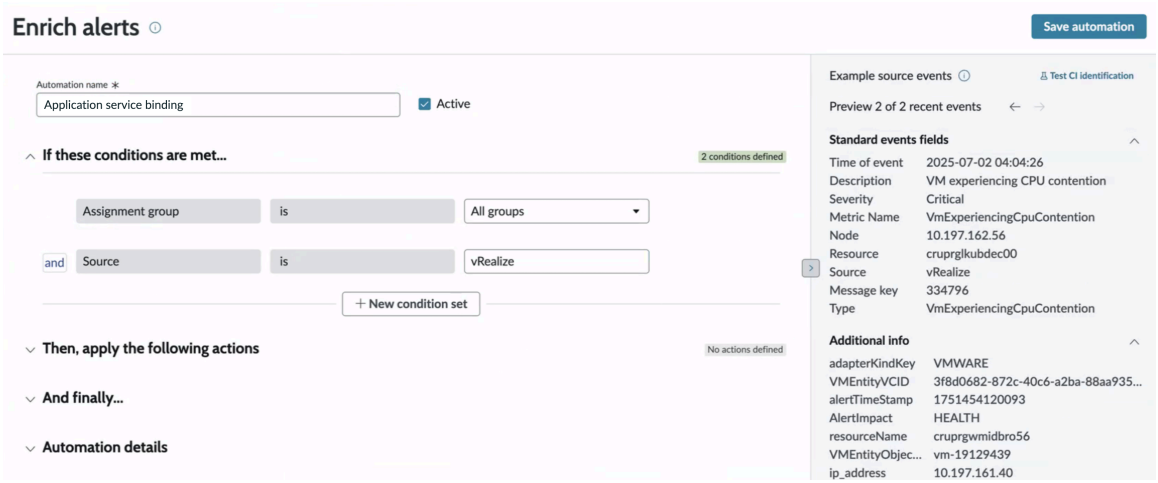
When using time-based condition filters in Enrich/Event rules (a filter that contains a time-based condition), the value is saved as a static value. The time is evaluated in the system time zone of the instance, defined by the *`glide.sys.default.tz`* system property, which defaults to America/Los_Angeles if left empty.



To add another set of conditions, select **+ New condition set**. You can also manually add an additional info field if you don't see it in the drop-down list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Select **Load past events** to view previous events when creating the automation.



7. In the **Then, apply the following actions** section, select the automation actions that will be triggered by this automation.
   You must select at least one action.
   - **Extract alert fields**: Retrieves alert field values from the event payload and places them in an alert output field.
   - **Copy or compose fields**: Merges various alert fields, tags and text to generate a composed alert output.
   - **Change alert values**: Maps the current value of alert fields to specified new values.
   - **Improve configuration item (CI) identification**: Identifies CIs other than a host for better alert grouping, team assignment, and service health.

Option	Action
Extract alert fields	**a.** Enable the **Extract fields** toggle switch. **b.** From the **Extract from field** menu, select a value. The menu displays the standard event fields, additional info, and tags. The field value is then displayed. You can also manually enter a field name that is not displayed and add your own value. The example source events pane displays a sample of recent events in your system. If no events are displayed, you may cre ate an event, see Create or edit an event rule. **c.** In the **Regular expression** field, create a regular expression to extract the value that you want to extract.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Action
	Note: You can compose text using regular expression (regex) format conventions. Use one or more capture groups with parentheses to extract parts of the input. Capture groups in the regular expression are assigned to alert outputs based on the order in which they appear. The regex must match the entire input, so consider sur rounding your regex with `.*` on each end. For example, `(\w+).acme.com.*` captures the host name in a fully qualified domain name. The parser for the regex engine is Perl Compatible Regular Expressions (PCRE) compat ible. Nested JSON data is preprocessed to strip quotes and replace colons with equal signs. **d.** In the **Alert output** field, select an alert field or an alert tag. You can also manually enter a new field name. If you want to add an alert tag, select the **Set as a tag** check box. **Tip:** Create alert tags that can be shared across sources for easier filtering and grouping, such as the out-of-the-box tags.  **e.** Select **Preview multiple events** to verify that the regular ex pression (regex) is general-purpose enough to correctly ex tract values across many examples. **Note:** This option is available only when example source events are available and matched with the regex filter.  To include additional fields for extraction, select **+ Add fields**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Action
Copy or compose fields	**a.** Enable the **Copy or compose fields** toggle switch. **b.** From the **Composition** field, select alert fields and/or alert tags, manually enter a field name or even add free text. Alert fields are displayed in the `${field}` syntax format. **c.** In **Output to field**, select an existing alert field or alert tag, or manually enter an alert field. **Output to field** is an enriched alert containing the composed alert data. For easier grouping, you can select a tag from the menu. If you want to use the new field name as a tag for grouping, select the **Set as a tag** check box. **Tip:** Create alert tags that can be shared across sources for easier filtering and grouping, such as the out-of-the-box tags.  To create additional alert data compositions, select **+ Add fields**.
Change alert values	**a.** Enable the **Change alert values** toggle switch. **b.** In **Alert field to change values for** field, enter the field in the alert that you want to map values for. **c.** In the **When value is** field, enter original value in the alert field that you want to change. **d.** In the **Change it to** field, enter the new value that will replace the original value in the alert field. To add more field values, select **+ Add value** and to add more fields to map, select **+ Add field to map**. Improve configuration item (CI) identification	This option allows you to change how alerts are bound or linked to a Configuration Item (CI). This ensures alerts are associated with the correct IT components for better visibility and faster is sue resolution.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

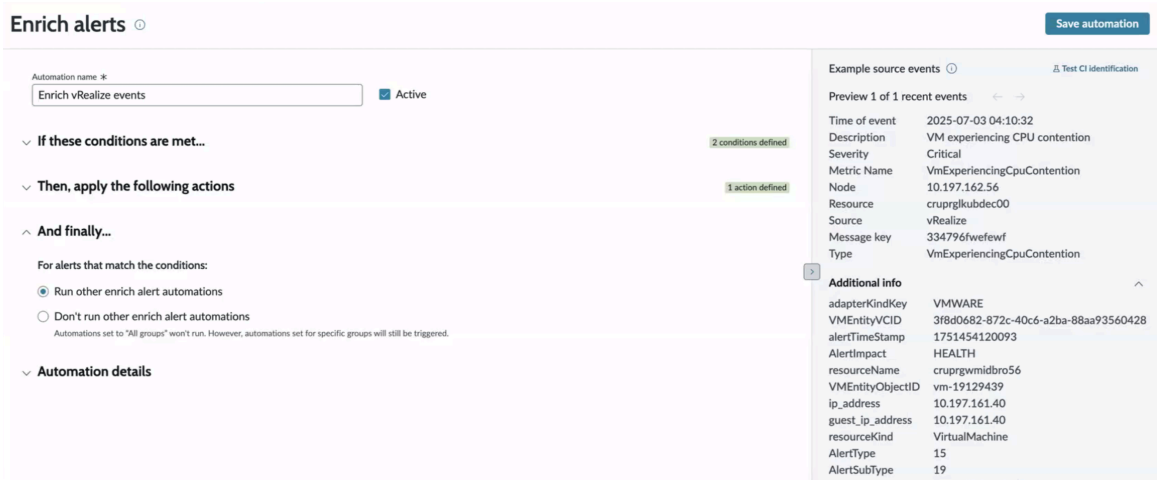
Option	Action
	The default and most common way to bind alerts to CIs is based on the **Node** field. This works out of the box with no configura tion needed. Use it by populating the **Node** field in your alert with a CI's Name, Fully Qualified Domain Name (FQDN), IP, or MAC ad dress. This supports host CIs including Computers, Operating Systems (OS), Switches, Routers, or any CI type or any class that extends the [cmdb_ci_hardware] table. You may enable this action to improve the CI identification for other types of CIs such as processes or service instances. The system searches for a matching CI in the appropriate CMDB table based on the selected CI type. For example, if you se lect VMware Virtual Machine Instance as the CI class, the sys tem searches for a matching record in the [cmdb_ci_vmware_ instance] table. The search uses details from the event rule record, specifically the **Additional info** fields.  **a.** Enable the **Improve configuration item (CI) identification** tog gle switch. **b. Select which CI class you'd like to identify**: In the **CI class** field, specify the CI class for which the event's node field is evaluated during CI identification. This determines the type of CI the system attempts to identify first. Select **View items** to see the list of CIs of this type and their at tribute values. **c. Identify the CI when the following alert fields match the CI at tributes**: In this section, map alert fields to CI attributes to help the system find the correct CI: ▪ **Alert field**: Select the alert field that contains identifying in formation. ▪ **CI attribute**: Select the CI attribute that the alert field must map to. **d.** Use Advanced options to control how the system treats the alert node field during CI identification. ▪ Node field behavior: Choose one of the following: ▪ Consider node field: Uses the alert's node value during CI identification. ▪ Ignore node field: Ignores the alert's node value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Action
	Based on the selected CI class, the system recommends whether you should consider or ignore the node field, but you can override this recommendation if needed. ▪ Use all matching additional info fields: Select this check box to use all matching fields from the event's Additional Info for CI identification instead of mapping individual fields. **e. + Add fallback**: Add fallback CI class and field mappings to de fine alternate identification logic. If the primary configuration does not identify a CI, the system evaluates each fallback in or der until it finds a match. Ensure that the **Node** field in the alert is populated correctly to identify a host CI. The CI you are identifying must have a runs on relationship to the host CI or be mapped to the host. **f.** Ensure that at least one CI attribute is present in the **Addition al info** field of the alert. For instructions on how to populate these fields, see Set ad ditional info fields to match CI attribute format. The system at tempts to match values from the **Additional info** field of the alert with the CI table. If a match is found, the alert is bound to the corresponding CI. **g.** Select **Test CI identification** to test the CI identification on sample events. After successful CI identification, the sys tem displays a message with the relevant de tails.  If CI identification fails, the system shows a message explain ing the details.  For more information on CI binding, see Binding alerts to CIs.

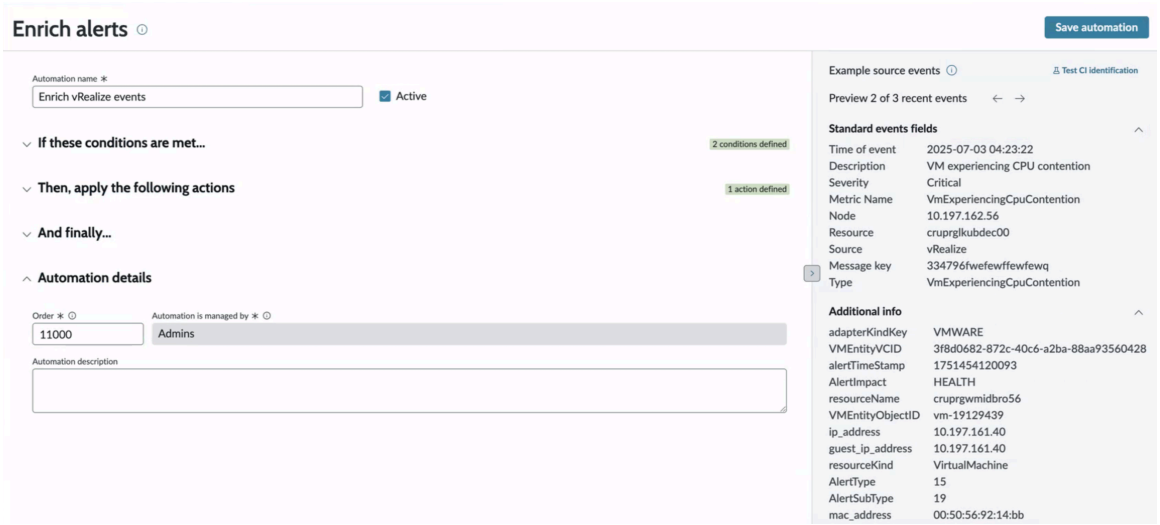
8. In the **And finally** section, to continue running other enrichment automations with same filter conditions after this automation is executed, select **Run other enrich alert automations**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



If you select **Don't run other enrich alert automations**, additional automations of this type will stop running after this automation is executed once. If the automation is managed by an administrator, it will stop running administrator-owned automations but will continue to run automations owned by other assignment groups.

9. In the **Automation details** section, provide an order and automation description.



a. In the **Order** field, enter the automation order.

Note: Automations run in order from the lowest to the highest. Ensure there are no enrichment automations with a lower order number that have matching conditions and have **Apply additional automations of this type** set to false. Otherwise, this may prevent subsequent automations from running.

During alert processing, enrichment automations assigned to specific teams are applied first, based on the **Order** field. After these are evaluated, enrichment automations assigned to **Global / All groups** are applied. If multiple automations match, the automation with the highest order value is selected to improve CI identification.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The **Automation is managed by** field displays the team or assignment group who owns, edits, and can delete this automation. The assignment group is the same as the one defined in the **If these conditions are met** section.

b. In the **Automation description** field, enter a brief description of the automation.

10. Select **Save automation**.
A notification appears when the automation is successfully saved. Otherwise, an error message is displayed. The enrich automation that you created appears on the Enrich alerts page where you can view, edit, or delete the existing automation.

What to do next

You can manage alerts more effectively by grouping similar alerts together with the help of Create Group automation.

Related topics

Extracting and composing alert fields

Extracting and composing alert fields

Extracting and composing are ways to manage what you see in the alert output, making it simpler to filter, group, and read. Alert automation enables you to extract values from event payload's alert field and place it in an alert output field. Composing allows you to merge multiple alert fields into a single output field.

Extracting alert fields

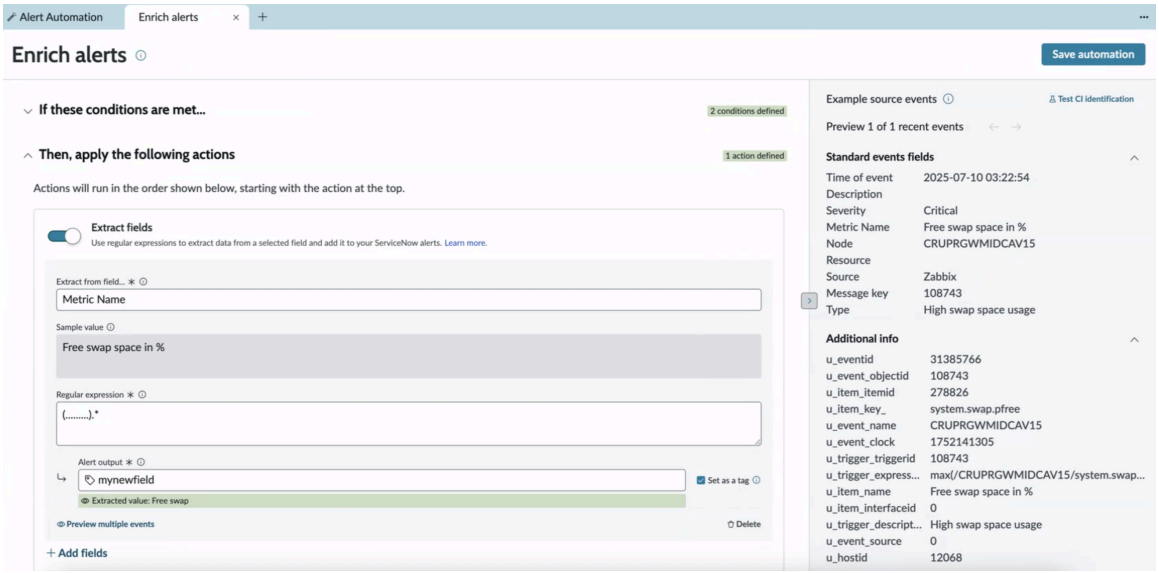
Alert notifications often contain relevant context buried within event payloads. By enriching alert outputs with values from the existing payload, you can better understand the significance of alerts and determine the appropriate steps for resolution. For example, a host name typically includes crucial information such as service, node, cluster, datacenter, and domain. To automatically add the value for a cluster tag based on incoming host data, you can extract just the cluster data.

When extracting alert fields, use regular expressions (regex) to build value formulas. Regex allows you to precisely identify and capture the relevant portions of the payload, enabling the creation of meaningful and actionable alert notifications.

Note: You can compose text using regular expression (regex) format conventions. Use one or more capture groups with parentheses to extract parts of the input. Capture groups in the regular expression are assigned to alert outputs based on the order in which they appear. The regex must match the entire input, so consider surrounding your regex with `.*` on each end. For example, `(\w+).acme.com.*` captures the host name in a fully qualified domain name. The parser for the regex engine is Perl Compatible Regular Expressions (PCRE) compatible.

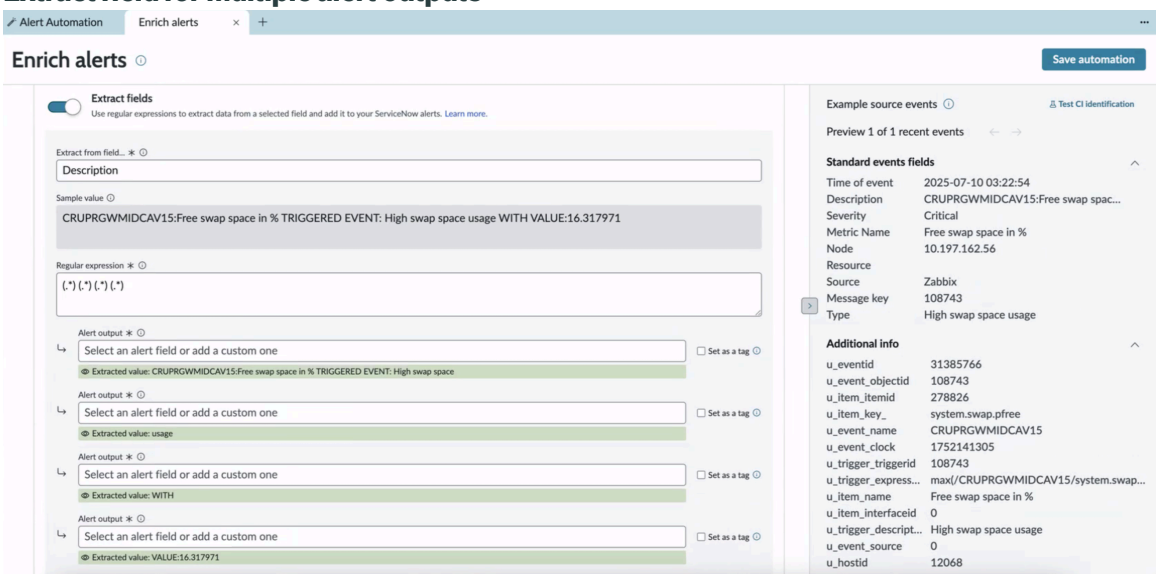
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Extract alert fields



If you use multiple capture groups with parentheses, each extracted value appears in a separate output field.

Extract field for multiple alert outputs



Preview the alert output across example events to verify that the values are extracted as expected by selecting **Preview multiple events**.

Note: This option is available only when example source events are available and matched with the regex filter.

Example: Extracting alert fields

Suppose you need to extract only six letters from a specific field of an event and display them in a new alert field named `mynewfield`. You also want to tag this new alert field for later use in alert grouping. Here's how you can achieve this:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

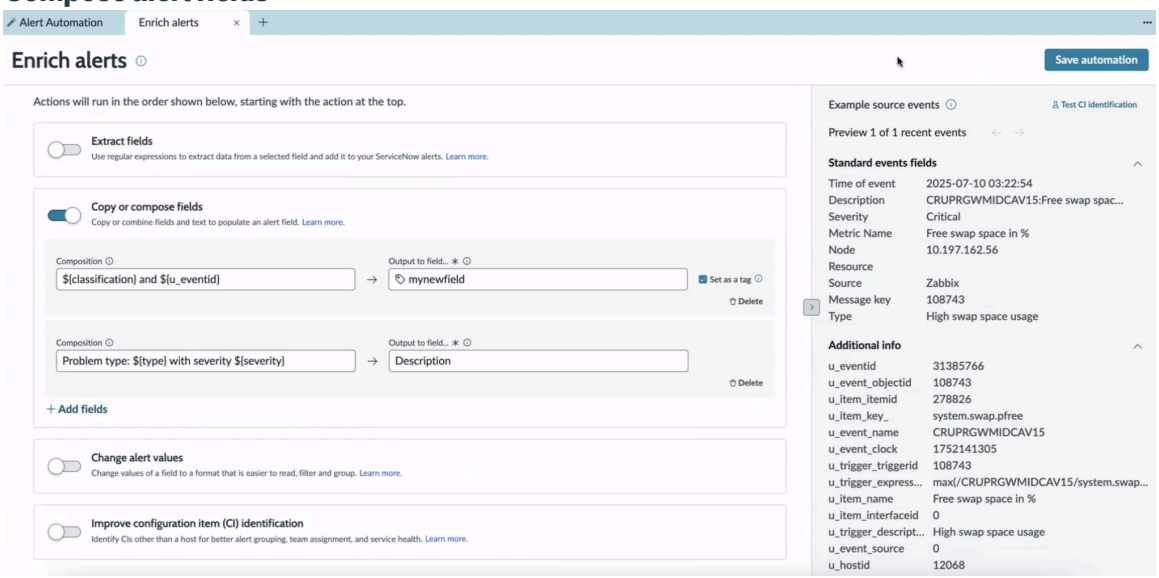
- **Source input field**: Select the event field from which you want to extract data. In this case, the field is **Metric Name**.
- **Regular expression**: Use a regular expression to extract the specific part you need from the selected field's value. For example, if the **Metric Name** field value contains "Free swap space in %" and you want to extract "Free swap", your regular expression must be (.....).*.
- **Alert output**:
  - Choose an existing alert field, an existing alert tag, or manually enter a new field name. In this case, let's enter a new field name `mynewfield`.
  - Set `mynewfield` as a tag for later use in tag-based grouping. Notice the tag displayed before the field name.

  After applying the regular expression to the selected field's value (in this case the **Metric Name** field value), verify the extracted word displayed below the **Alert output** field. For instance, it should show "Free swap" if the regular expression matches correctly.
- **Preview multiple events**: Previewing multiple events allows you to verify if the regular expression accurately extracts data from a range of example events. This helps determine if any adjustments to the regular expression are needed.

Composing alert fields

When creating an alert output, you can select or manually enter fields, tags, or free text to include. This data can be easily read, filtered, and grouped for better management and understanding of the alerts.

Compose alert fields



Example: Composing alert fields

Suppose you want to have two input fields that compose data and display it in two different alert output field. In one scenario, you want the source value to come from an existing alert field along with a new field, showing the composed value in a new alert output field. You also plan to tag the new alert output field for later use in tag-based grouping. In the other scenario, you combine existing fields with free text and select the alert output to display in an existing alert field. Here's how you can achieve this:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Scenario 1:
  1. **Source input field**: Select an existing alert field and add the text "and", followed by entering another field **u_eventid**. For example: ${classification} and ${u_eventid}.

     Note that alert fields are displayed in the `${field}` syntax format. You can also select the field name from the drop-down list, and the syntax will be added automatically.

  2. **Alert output**: Enter the name of the new alert field where you want to display the values from the input fields. For example, let's name it `mynewfield`.

     Set `mynewfield` as a tag for later use in tag-based grouping. Notice the tag displayed before the field name.

- Scenario 2:
  1. **Source input field**: Select existing alert fields and include any desired free text for how you want them to appear in the alert output field. For example: Problem type: ${type} with severity ${severity}.

     Alert fields are displayed in the `${field}` syntax format. You can also select the field name from the drop-down box, and the syntax will be added automatically.

  2. **Alert output**: Select an existing alert field where you want to display the values from the input fields. For instance, select **Description**.

Regex preprocessing behavior in Enrich alert automation

Explains how Event Management alert automation preprocesses values before applying regex patterns. Describes why matching behavior differs between pre-populated **Additional Info JSON** fields and free-text sample values.

Preprocessing alert fields

Event Management alert automation preprocesses alert field values before evaluating regex patterns. This preprocessing ensures consistent matching in the backend but can lead to different behavior in the UI depending on how you provide the sample value.

Understanding this behavior helps you build regex patterns that validate correctly and behave as expected at runtime.

How preprocessing works

During regex evaluation, preprocessing occurs only if the value is a JSON value (JSON inside the **Additional Info**) regardless of how you enter the Sample Value. The system automatically preprocesses the Sample Value when you select a pre-populated **Additional Info** field from the **Extract from field** drop-down list.

Before applying regex matching, the backend preprocesses values as follows:

- Removes quote characters (`"`)
- Replaces ": " with "=" (or ":" with "=", if no space is present)
- Converts JSON into `{key=value}`

Free-text Sample Value limitation

When you manually enter a free-text sample value (for example, when the selected field has no data or when testing without matching events):

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The UI does not preprocess the sample value.
- The backend does preprocess the value during regex matching.
- Regex patterns that work in external tools may not appear as matching in the UI.

Example

Current	Preferred
`{"type": "linux_server"}`	`{type=linux_server}`
`{"CI_Type": "server"}`	`{CI_Type=server}`

Impact

A mismatch can occur between the value entered in the **Sample Value** field, and the value the backend evaluates during regex matching.

Workaround

Instead of matching JSON structure, match the preprocessed `{key=value}` format:

- Use `{key=value}` instead of `{"key": "value"}`.
- Avoid matching JSON structure (quotes, colons, whitespace).

Set additional info fields to match CI attribute format

Set additional info fields in alerts to match the field and value format of CI attributes in CI records. This ensures accurate alert-to-CI binding, improving alert tracking and reducing manual effort.

Before you begin

Ensure that you are on the Enrich Alerts page and the **Improve configuration item (CI) identification** toggle switch is enabled.

Role required: evt_mgmt_admin, evt_team_operator, or srm_responder

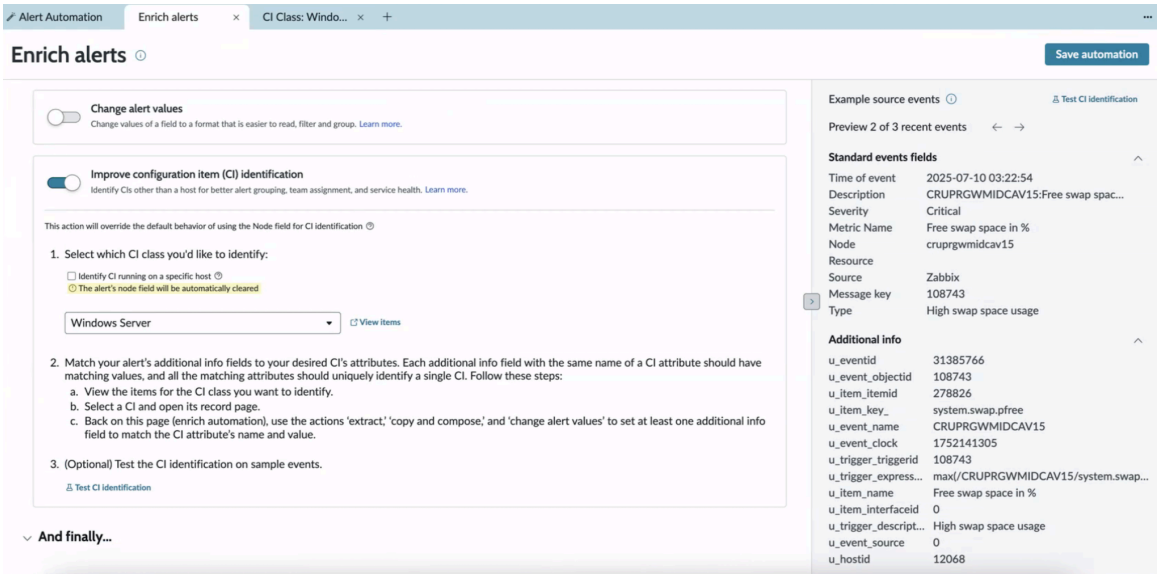
About this task

The system attempts to match the **Additional Info** fields of the alert with attributes in the CI table. If exactly one matching CI is found, the alert is linked to that CI. For CI identification to be successful, add new fields or ensure that your alert has additional info fields corresponding to column name for CI attributes. For example, use column name **ip_address** instead of the column label **IP Address**. Each matching key name must have matching values. If there are matching fields in your alert that you don't wish to use for binding, copy them to another field then clear the original field.

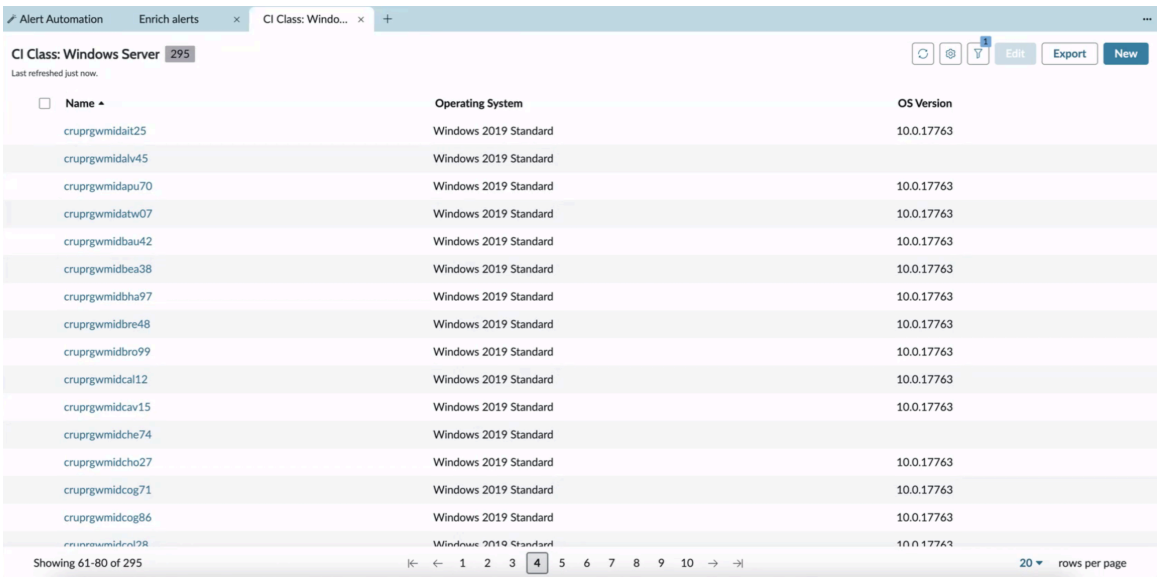
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Under **Improve configuration item (CI) identification**, in the **Select which CI class you'd like to identify** field, select the CI class.



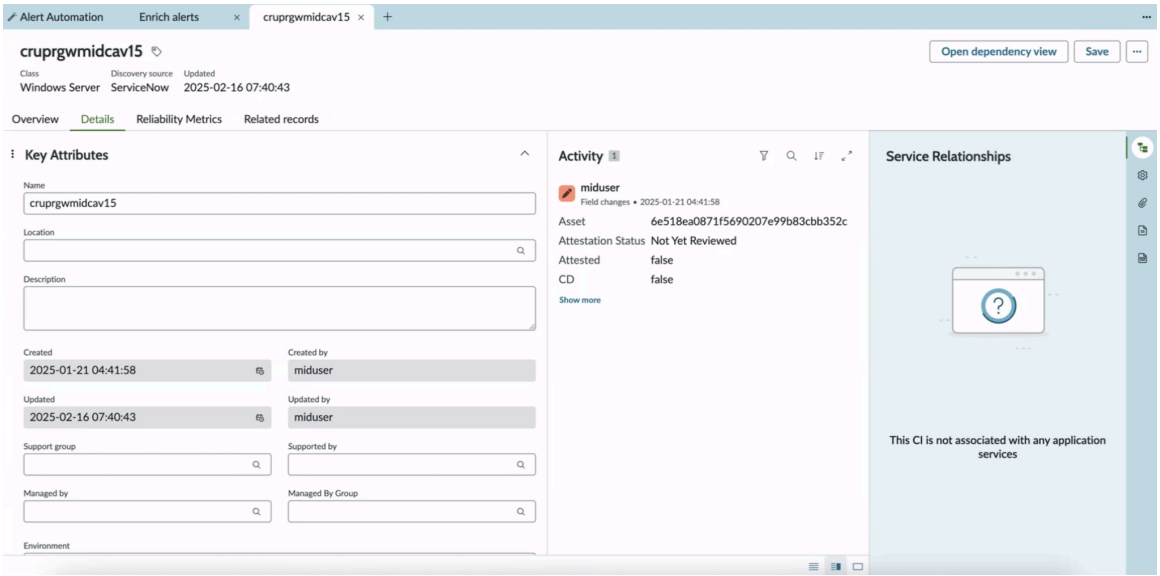
2. Select **View items** next to the **Select which CI class you'd like to identify** field to open the list of CIs of the selected CI class.



3. Select a CI name to open its details or record page.

   At least one field and its corresponding value from the CI details page must appear in the **Additional info** field of the alert.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

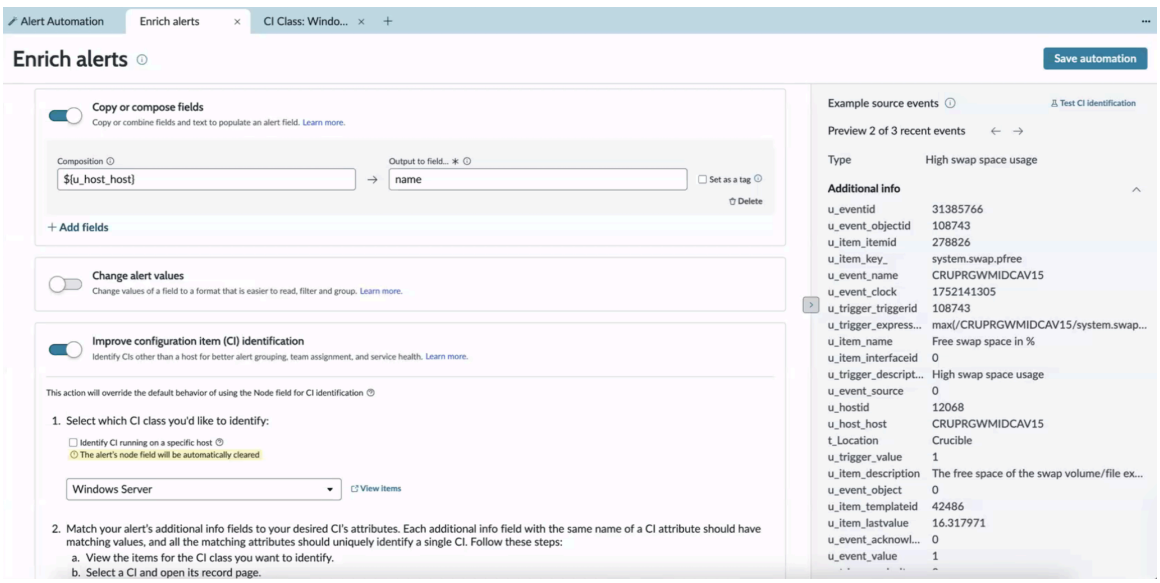


4. Set at least one **Additional info** field in your alert to match the CI attributes in the CI record.

   Use **Extract fields**, **Copy or Compose fields**, and **Change alert values** to precisely match the field and value format.

   Example: Suppose the CI record page has the **name** field with the value **CRUPRGWMIDCAV15**. To include these fields and their values in the **Additional info** field of the alert, set the fields as shown in the image.

   Map the `${u_host_host}` field to a new field called **name**. This field is added to the **Additional info** and is used for CI identification during the binding stage.



Create Group automation

Grouping automation helps you manage alerts more effectively by collecting similar alerts together. This makes it easier to see patterns, quickly identify issues, and respond efficiently. By organizing alerts in this way, you can reduce alert noise, identify root causes, and assign them to the appropriate teams.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: evt_mgmt_admin, evt_team_operator, or srm_responder

About this task

Grouping of this method is most useful when alerts share common data or tags, such as a node or location. You can use fields or tags populated via an enrich automation. Use of alert tags is the best way to group alerts when your CMDB or service maps are immature. This complements our other grouping algorithms, including alert correlation rules, ML, and text-based grouping. Even if a new alert is matched with multiple groups, it is grouped only with the first match. You can control the priority order of these algorithms via system property. For information on correlation logic order, see Configure alert correlation logic order.

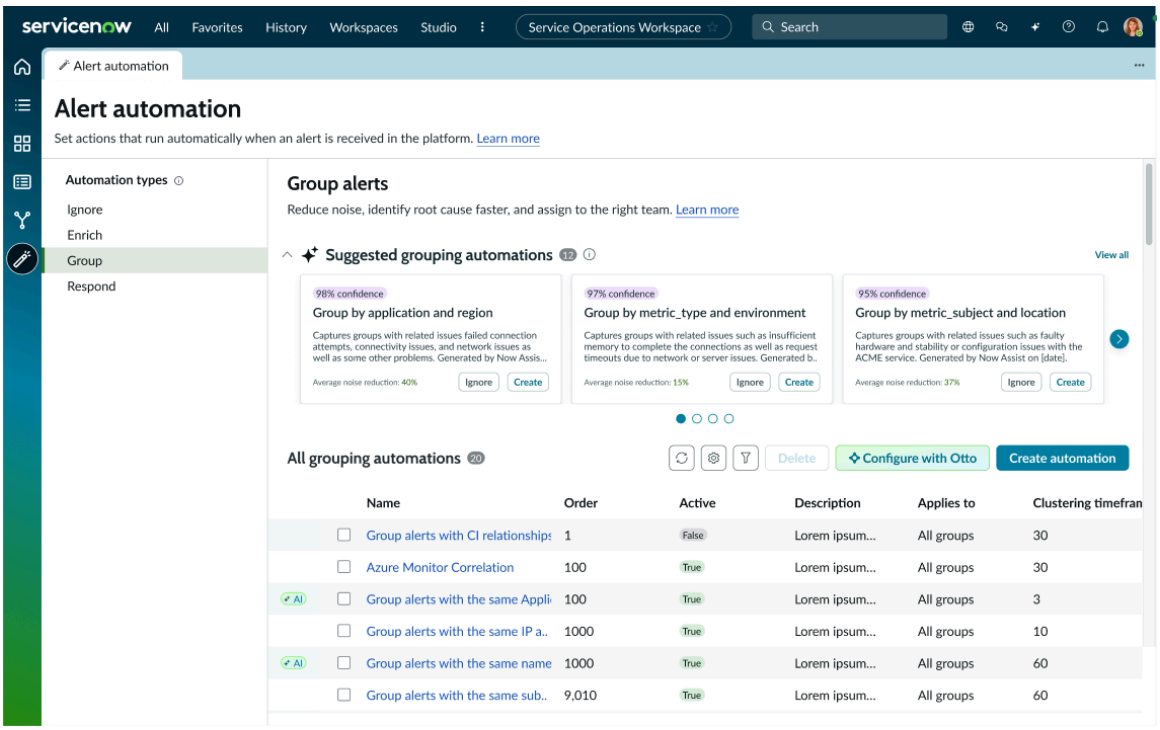
Alert automation also provides a simulation feature allowing you to test how many alert groups would be formed, how many are left ungrouped, and the compression rate. A higher compression rate means your team is more productive and may be able to identify root causes faster. However, consider whether the groups are accurate, operationally correct, and assigned to the right teams. You may adjust the group criteria until you are satisfied with the resulting groups.

For users familiar with the classic Event Management experience, this feature offers an easier interface with improved team support for creating tag-based alert clustering definitions.

Procedure

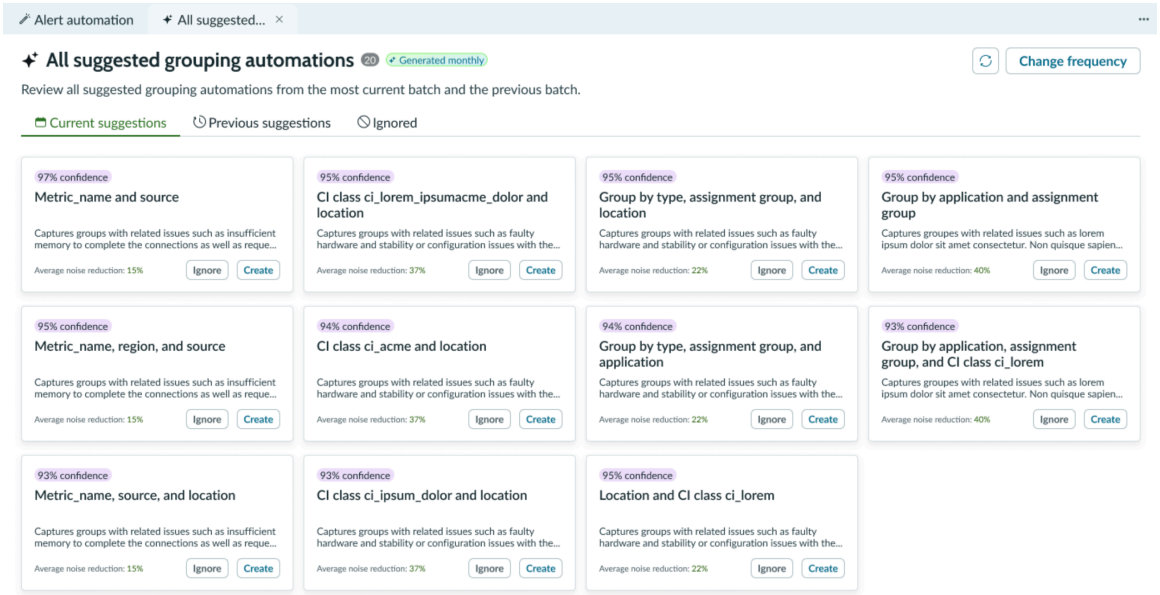
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. On the ITOM AIOps configuration center page, under the Optimize section, select **Group alerts**

   The Group Alerts page appears. In the Suggested Grouping Automations section, review the suggested automations. If you want to proceed with one, select **Create** on the corresponding automation tile.

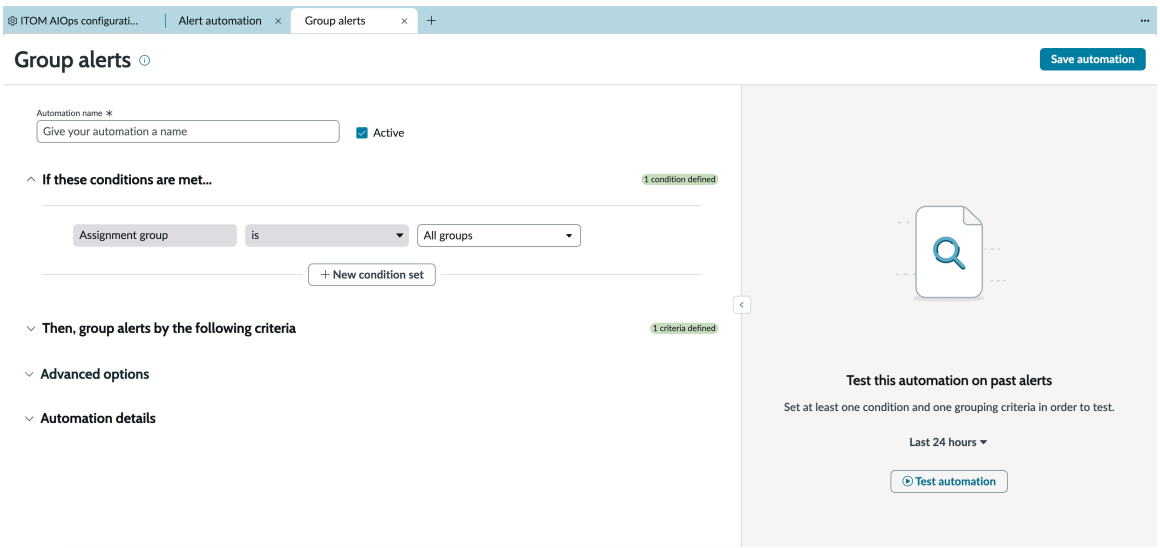


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you want to see all suggested automations—including previously suggested and ignored ones—select **View all** in the Suggested Grouping Automations section.

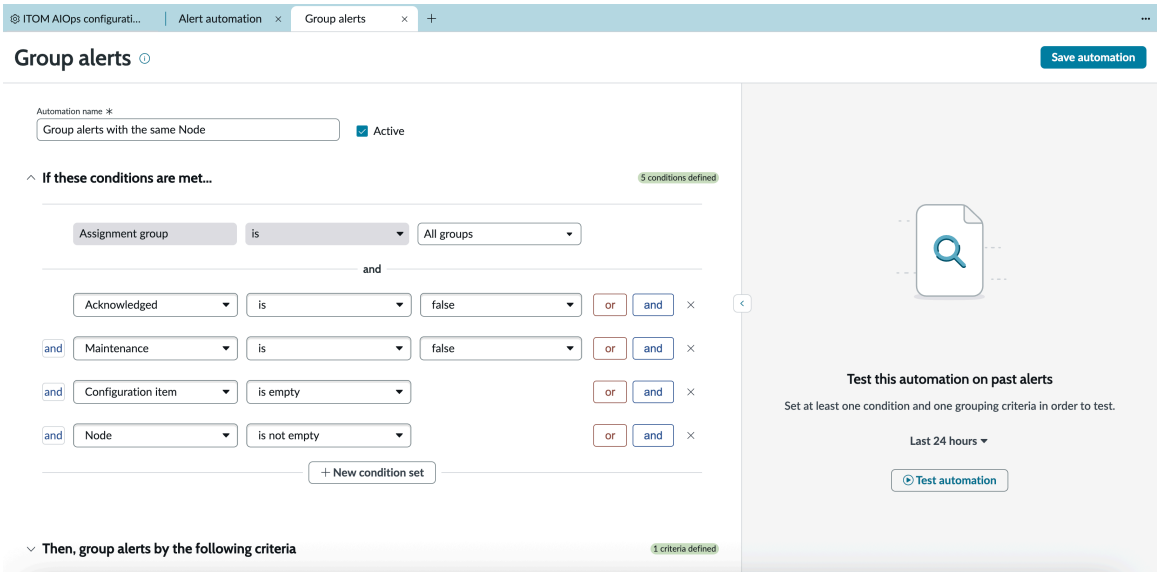


4. Choose how to create the grouping automation.
   - To create the automation using natural language, select **Configure with Otto**. The ServiceNow Otto panel opens with guidance for describing the grouping automation that you want to create. Continue creating the automation in the panel.
   - To create the automation manually, continue to the next step.
5. Select **Create automation**.



6. In the **Automation name** field, enter the name of the automation for grouping alerts. By default, the **Active** check box is selected.
7. In the **If these conditions are met** section, set up filter criteria to identify the alerts that you want to group.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



a. From the **Assignment group** field menu, select the assignment group to determine which team's alerts will trigger the automation.

The **Assignment group** represents a specific team responsible for handling certain alerts. By selecting an assignment group, you ensure that only the alerts assigned to that particular team will trigger the automation. This way, the automation is targeted and only activates for relevant alerts associated with the selected team.

Note:

- If you're logged in to the instance with an administrator role (evt_mgmt_admin), all of the assignment groups are available. Additionally, you can select **All groups** to enable generating alerts for any of the available groups.
- If you're an operator, only the group you're a part of is available.
- Only members of the selected group or administrators can update or delete the automation.

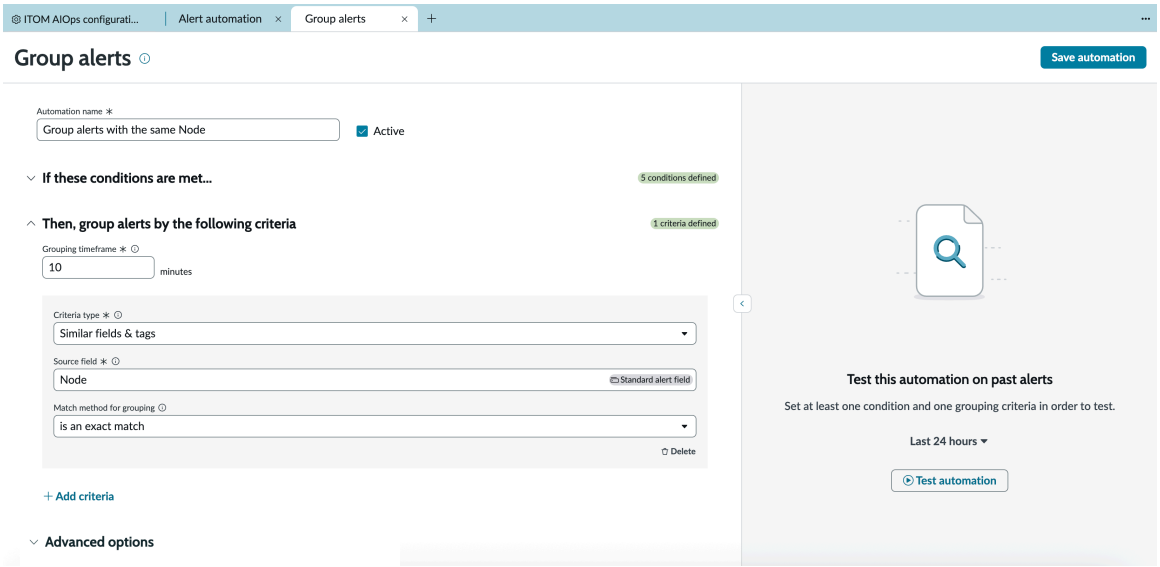
b. Set up the conditions by selecting the field, operator, and field value. Then, add more conditions using OR or AND operators. You must add at least one more filter besides the assignment group.

Tip: Select a more specific filter to enhance performance.

To add another set of conditions, select **+ New condition set**. You can also manually add an additional info field if you don't see it in the drop-down list.

8. In the **Then, group alerts by the following criteria** section, perform the following steps.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



a. In the **Grouping timeframe** field, specify the duration (in minutes) during which alerts are collected and grouped together. This is a fixed window that starts when the first alert arrives.

b. In the **Criteria type** menu, select how you want to group the alerts.

Available options are:

- **Similar fields & tags**: Groups alerts that share common fields or tags.
  - In the **Source field** menu, select the source from which you want the alerts to be grouped.

    Note: You can manually add a field name and select the type of the field. The available options include additional info field, alert tag, and CI tag. This flexibility allows you to customize the information being captured according to your specific needs.

  - In the **Match method for grouping** field, select one of the following options: group alerts based on an exact match, fuzzy match, or pattern match.

    When you select a value for the fuzzy match method in the grouping field, the **Similarity threshold (percentage)** field becomes visible. Alerts are grouped when their similarity is greater than or equal to the specified percentage based on edit distance.

    For example, if you have alerts from USA, CA, and USA, NY, you can group the alerts by country. Set the **Source** field to the location. If the **Match Method for Grouping** is a fuzzy match and the **Similarity threshold (percentage)** is 50%, alerts are grouped when they are at least 50% similar. They share the country "USA" as a common attribute.

  - When you select a value for the pattern match method in the grouping field, the **Pattern matching** field becomes visible. Alerts are grouped when the specified pattern matches. For more information, see Pattern matching.

    Use asterisks (*) in the search string to match any number of characters or a question mark (?) to match any single character. Everything else in the search string matches itself. For example, use "HTTP Error 5??" to match all HTTP 500 errors.

- **Related CIs**: Group alerts according to CI (Configuration Item) relationships. These include parent/child (**VM** > **host**), sibling relationships (for example, multiple VMs on the same

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

host), containment (**process** > **application** > **server**), and applicative flows that describe how components interact within an application. These alerts are connected because the underlying infrastructure components are connected.

- **Related log properties**: Health Log Analytics (HLA) alerts are grouped together because their underlying logs look related based on patterns detected by the HLA algorithms.

  You can create an alert group based on related log properties on HLA alerts combined with alert tags or CMDB logic. When you choose to use related log properties, only log analytics alerts will be considered for grouping. Run the related log properties rule later in the rule order so that other rules—such as CMDB- or service-based grouping—can evaluate and group log analytics alerts first.

- **Impacted service instances**: Alerts are grouped because they affect the same service instance, regardless of topological distance (hops) between the alert CIs.

  You can control which service instance must be considered by specifying relevant impacted service instance. When you select **Impacted service instances**, two options are available: **Any service instance** and **Specific service instance**. If you choose **Specific service instance**, you can select one or more service instances from the list. Alternatively, select the search icon ( ) to open the **Select impacted service instances** pop-up and choose the required service instances.

  By default, the Impacted service instances grouping criterion is based on the impacted service. It can also be configured to use service associations from the [svc_ci_assoc] table. You can control whether to use impacted services or service associations using the *`sa_analytics.use_impacted_services_for_mixed_grouping`* system property. If the property value is `true`, alerts are grouped by impacted services and if the property value is `false`, the alerts are grouped by service associations.

c. To include additional fields for grouping, select **+ Add criteria**.

9. In the **Advanced options** section, you can do the following:

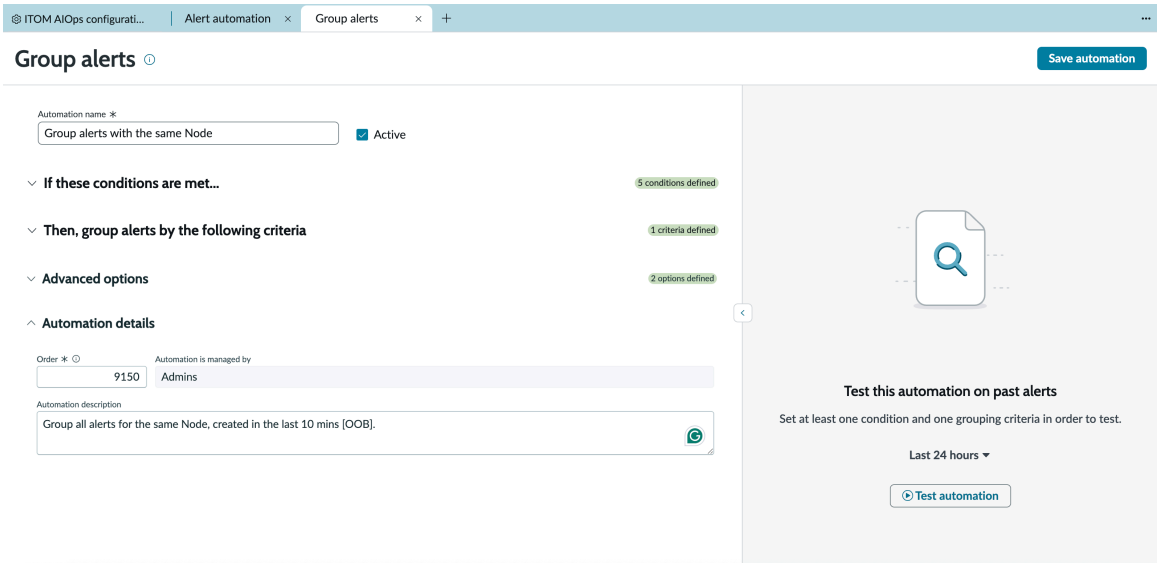
- Enable the toggle switch to set the minimum number of alerts required to form a group. When you enable it, the **Minimum number of alerts in the group** field appears, allowing you to enter the number. The default value is 2, which means grouping occurs only when there are two or more alerts.
- Enable the toggle switch to form group only if at least one alert meets specific conditions you define.

  Note: The threshold and required alert act as prerequisites for forming an alert group. The threshold defines the minimum number of alerts required to create a group. The required alert condition ensures that at least one specific, meaningful alert is present before grouping starts. If that alert is not present, the group is not created — even if there are multiple other alerts. In other words, a group is created only when both conditions are satisfied.

  Example: Imagine a network switch with multiple ports, where alerts can occur either on individual ports or on the switch itself. You want a group to be created only when the switch is affected, not when there is just a port-level issue. In this setup, if alerts occur only on one or more ports, no group is created. A group is created only when an alert occurs on the switch along with one or more alerts on its ports. This ensures that grouping happens only for larger, meaningful issues involving the switch, and not for minor or isolated port problems. This prevents unnecessary alert groups from being created. It helps you focus on more important and meaningful issues and reduces noise caused by minor or isolated alerts.

10. In the **Automation details** section, provide an order and automation description.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



a. In the **Order** field, enter the automation order.

> **Note:** Alerts are grouped based on the first match, executed in order from the lowest to the highest number. The **Automation is managed by** field displays the team or assignment group who owns, edits, and can delete this automation. The assignment group is the same as the one defined in the **If these conditions are met** section.

b. In the **Automation description** field, enter a brief description of the automation.

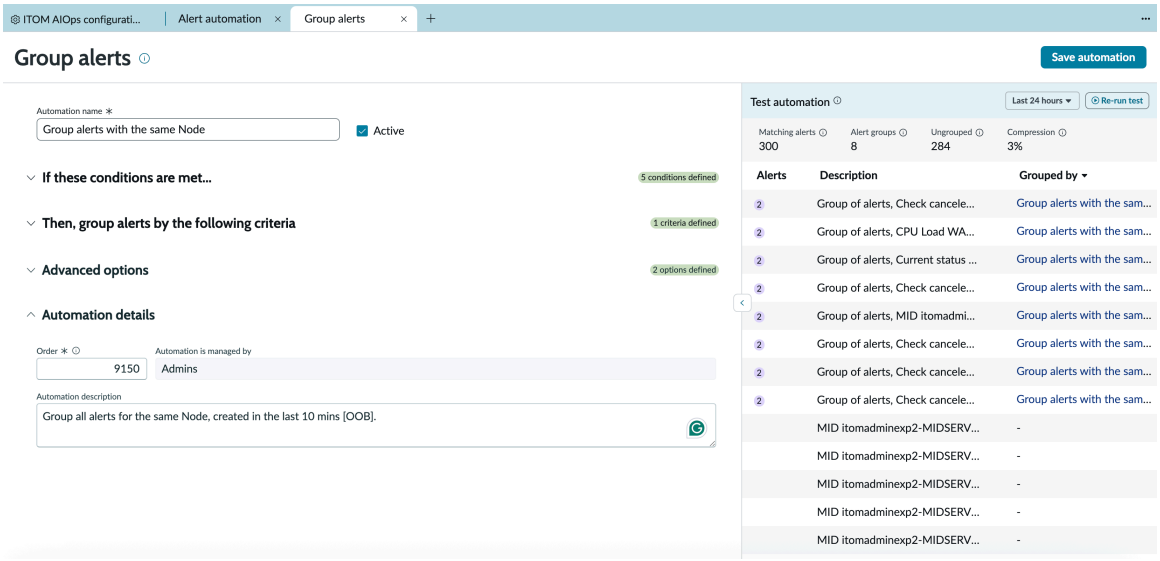
11. Test the alert grouping by navigating to **Test this automation on past alerts**.

Select the timeframe for the simulation from the drop-down list, select whether you want to consider other grouping types, and then select **Test automation**.

> **Note:** From the **Consider other group types** menu, you can select either **This automation only** or **Consider other group types**. Selecting **This automation only** ignores other alert group types while choosing **Consider other group types** includes all alert grouping automations, such as mixed, automated, and text-based alert grouping.

During the simulation, it shows both the grouped alerts and the ungrouped alerts for the specified timeframe. If any alerts are grouped, you are shown the number of alerts that are grouped. You can select this number to view the grouped alerts. Additionally, selecting an individual alert displays the details of that specific alert. You can also modify any alert grouping conditions or field values and initiate the process again by selecting **Re-run test**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The header of the Test Automation section also displays the following: matching alerts, alert groups, ungrouped alerts, and compression.

- **Matching alerts**: The total number of matching alerts before grouping that match the conditions defined for this automation.
- **Alert groups**: The number of groups containing more than one alerts matching the automation conditions. The smaller number in parentheses represents the number of groups created by this automation.
- **Ungrouped**: The number of alerts matching the automation conditions that remain ungrouped.
- **Compression**: The percentage reduction in the number of total alerts achieved by grouping, calculated as 1 - (Alert groups + Ungrouped) / Total alerts. You can improve the compression rate by grouping your alerts into related problems. The smaller number in parentheses indicates the percentage of matching alerts compressed by this automation.
- When the criteria type is **Related CIs**:
  - The **Open CIs dependency map** link appears in the Test Automation section.
  - The **Configuration Item** field is displayed.

The Test Automation section displays three key columns: **Description**, **Type**, and **Time**. The **Description** column outlines the alert group details. Preceding the **Description** column, a number indicates the total alerts contained within that group. **Type** specifies the category of grouping, such as This grouping automation, Other grouping automation, CMDB group, or Single alert, among others. Selecting **Other grouping automation** directs you to the corresponding automation page that generated the group. Additionally, the **Time** column shows when the test was conducted.

> **Important:** You can run the simulation of alerts on your test as well as production instance. The test automation simulates the automation using up to 200 recent alerts that match the specified conditions. It only considers groups where all alerts meet the conditions for this automation, although additional grouping algorithms may be applied during actual runtime.

12. Select **Save automation**.
    A notification appears when the automation is successfully saved. Otherwise, an error message is displayed. The group automation that you created appears on the Group alerts page where you can view, edit, or delete the existing automation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

You can escalate alerts needing quicker responses from teams or individuals by implementing Create Respond automation.

Create Respond automation

Respond to alerts automatically by notifying appropriate stakeholders, escalating them as needed based on severity and type, or other executing response actions. This process ensures that alerts are managed promptly and effectively.

Before you begin

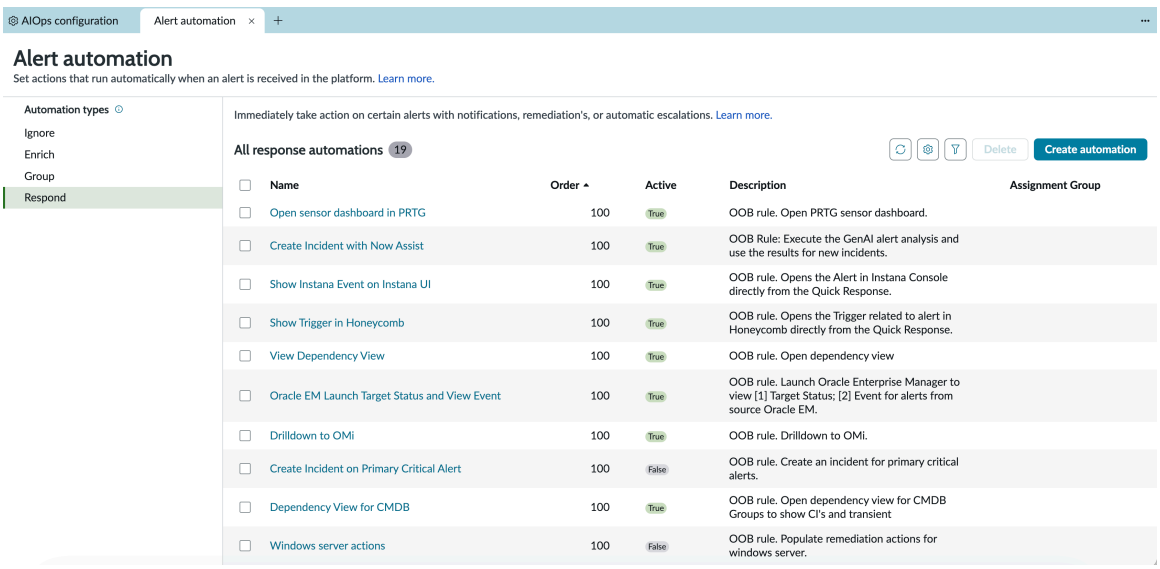
Role required: evt_mgmt_admin, evt_team_operator, or srm_responder

About this task

For users familiar with the classic Event Management experience, this provides an easy interface with enhanced team support for creating response automations or alert management rules. Alert management rules and response automations are configurable automated actions triggered by alerts matching specific conditions. These actions help IT teams resolve issues faster with minimal manual effort. These advanced features are currently only available to administrators and other personas mentioned in the role required section.

Procedure

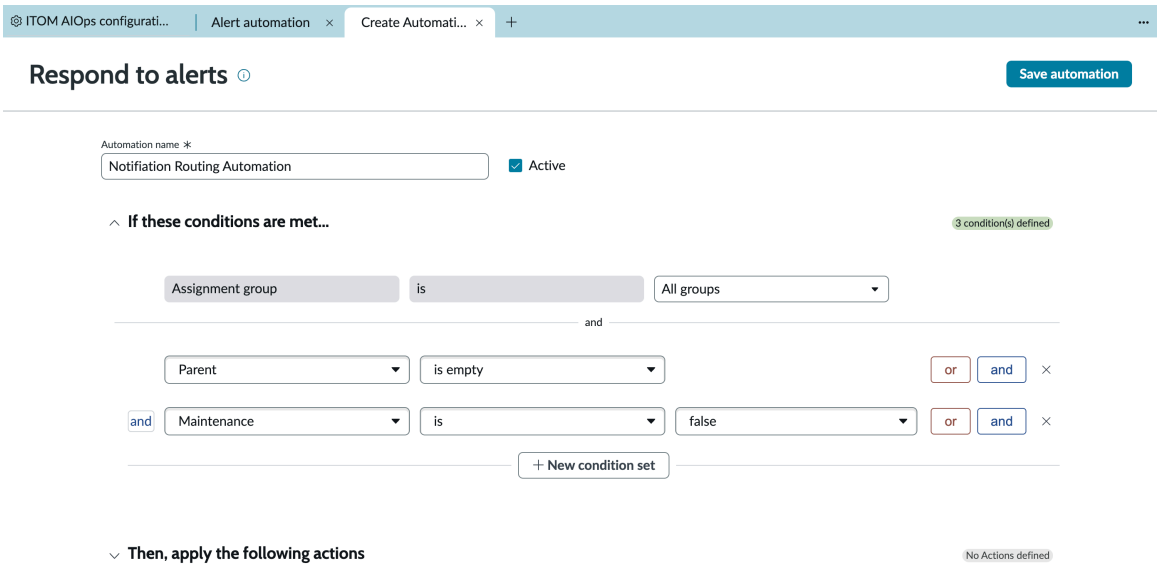
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. On the ITOM AIOps configuration center page, under the Optimize section, select **Respond alerts**.
4. Select **Create automation**.
   The Respond page appears.



5. In the **Automation name** field, enter the name of the automation.
   By default, the **Active** check box is selected.
6. In the **If these conditions are met** section, create filter criteria to identify the alerts you want to capture.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important: You can limit respond automations to primary alerts to prevent secondary alerts from being overwhelmed by unnecessary noise. Ensure these automations are applied only to alerts associated with CIs that aren't currently undergoing maintenance.



a. From the **Assignment group** field menu, select the assignment group to determine which team's alerts will trigger the automation.

The **Assignment group** represents a specific team responsible for handling certain alerts. By selecting an assignment group, you ensure that only the alerts assigned to that particular team will trigger the automation. This way, the automation is targeted and only activates for relevant alerts associated with the selected team.

Note:

- If you're logged in to the instance with an administrator role (evt_mgmt_admin), all of the assignment groups are available. Additionally, you can select **All groups** to enable generating alerts for any of the available groups.
- If you're an operator, only the group you're a part of is available.
- Only members of the selected group or administrators can update or delete the automation.

b. For the **Parent** field value, select whether the alert for which you want a response is grouped under a parent alert.

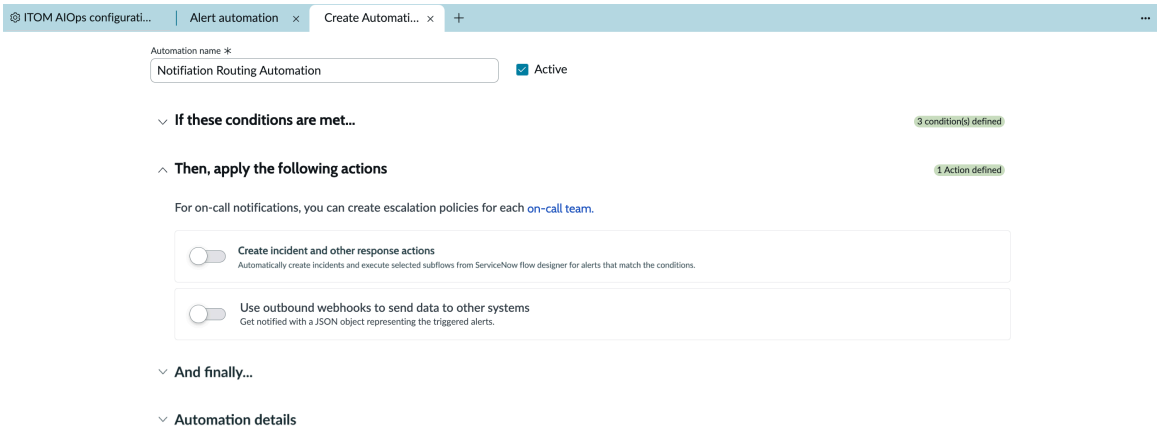
c. For the **Maintenance** field value, select whether the alert for which you want a response is under maintenance.

d. To add another set of conditions, select **+ New condition set**. You can also manually add an additional info field if you don't see it in the drop-down list.

Set up the conditions by selecting the field, operator, and field value. Then, add more conditions using OR or AND operators.

7. In the **Then, apply the following actions** section, select one or more of the two automation actions that can be triggered by the automation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Action	Description
Create incident and other response actions	Creates an incident for the alerts that match the specified filter. For details on mapping the alert fields to the incident fields, see Alert field mapping on the Respond page. **Note:** If you want incident fields to be automatically populated with default values, consider using **Create Incident (advanced)** in the **Response subflows** field. **Create Incident (advanced)** pre-populates incident fields even when you don't explicitly customize them, which helps ensure consistent incident data and reduces configuration effort. The **Create incident and other response actions** option also executes selected subflows from Workflow Studio for alerts that match the specified condition. For example, you may select out-of-the-box subflows to restart services. You can also create your own custom subflows, leveraging hundreds of integrations available in Integration Hub. 
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Action	Description
	a. In the **Response subflow** field, select the subflow. Selecting the Information icon ( ) takes you to the workflow of the subflow. For example, if you select the Information icon ( ) next to Close Alert, the Close Alert workflow opens. **Close Alerts workflow**  **b.** In the **How should the subflow execute?** field, select **Automatically**, **Manually** or **Automatically and Manually**. **Note:** If you select a subflow with an execution type of **Manually** or **Automatically and Manually**, and then save the automation, it appears in the Express List.  **c.** In the **Execution limit** field, specify the maximum number of times the subflow can run. After reaching the limit, the subflow will not execute again. **d.** In the **Response subflow** field, when you select **Create Incident (advanced)**, two check boxes appear. ▪ **Customize incident fields** ▪ **Add wait time**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Action	Description
	When you select the **Customize incident fields** check box, a mapping section ap pears with the following fields: ▪ **Alert input value**: Generates the value us ing AI or takes it from the alert. ▪ **Incident field name**: Maps the selected alert value to the specified incident field. **Note:** At least one field mapping is required when you select the **Cus tomize incident fields** check box. **Cre ate Incident (advanced)** automatical ly fills incident fields with default val ues, even if you don't customize them. **e.** Select the **Add wait time** check box to de lay incident creation and allow alerts time to auto-resolve or downgrade. You can define conditions that are eval uated after the wait period to determine whether an incident still needs to be cre ated. This helps prevent unnecessary inci dents for alerts that resolve on their own or reduce in severity. To add another response action, select **+ Add response action**.
Use outbound webhooks to send data to oth er systems	Sends notifications to other systems using outbound webhooks. For example, this capa bility can be used to send a chat notification, create a case, or trigger an external runbook to remediate the issue. For details on configuring an outbound web hook, see Outbound webhook parameters. To create an additional property, select **+ Add property**. The property can be any custom key-value pair that you want to include in the webhook payload, such as "Content-Type: ap plication/json" or "Authorization: Bearer <to ken>".

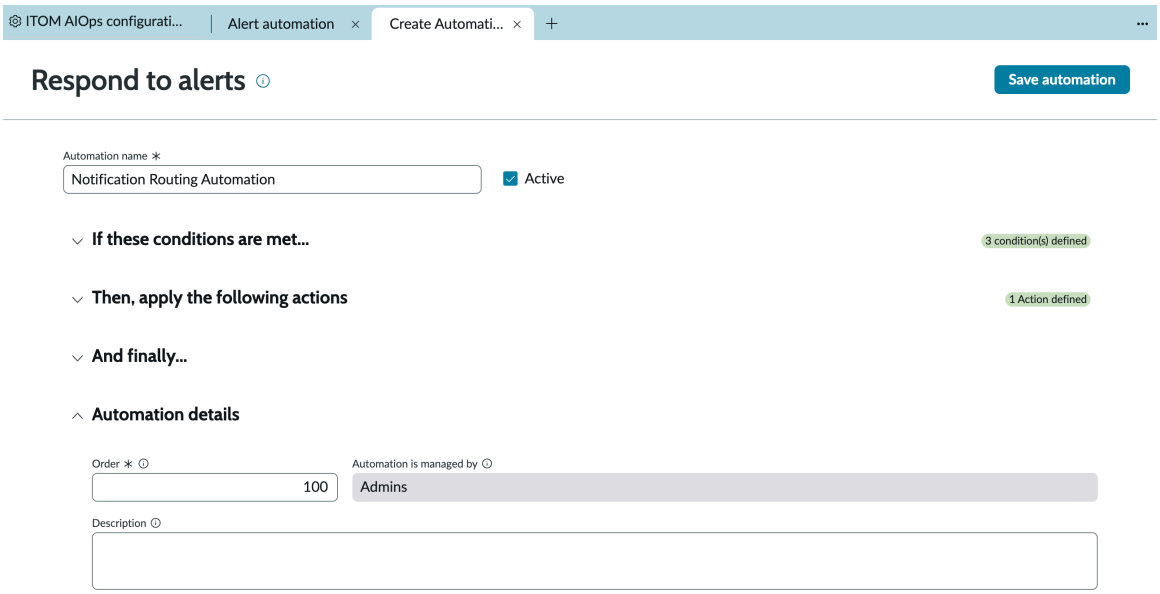
Note: If you don't select at least one action, the automation is deactivated.

8. In the **And finally** section, to continue running other response automations with same filter conditions after this automation is executed, select **Run other response automations**. If you select **Don't run response automations**, additional automations of this type will stop running after this automation is executed once. If the automation is managed by an

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

administrator, it will stop running administrator-owned automations but will continue to run automations owned by other assignment groups.

9. In the **Automation details** section, provide an order and automation description.



For information on the Automation details fields, see #unique_2282.

10. Select **Save automation**.

A notification appears when the automation is successfully saved. Otherwise, an error message is displayed.

The response automation that you created appears on the All response automations page where you can view, edit, or delete the existing automations.

Delete an automation

Delete an automation to permanently remove an automated alert handling rule from your system.

Before you begin

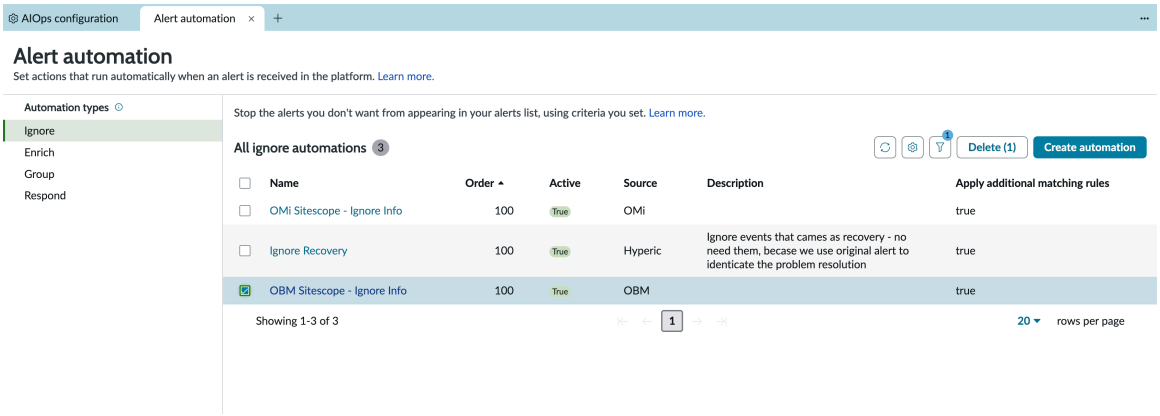
Role required: evt_mgmt_admin, evt_team_operator, or srm_responder

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. On the ITOM AIOps configuration center page, under the Optimize section, select the automation type that you want to delete, such as Ignore, Enrich, Group, or Respond.

   The page for that automation type opens, displaying all the existing automations.
4. To delete an automation, select the check box next to its name and then select **Delete**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. In the confirmation window, select **Delete**.
   The alert is permanently deleted.

Express List in the Service Operations Workspace for ITOM

Express List helps you identify health issues across the datacenter on the Service Operations Workspace. It provides quick information on alerts so you can monitor systems and services, resolve alerts, evaluate the alert impact, track issues, and report incidents more efficiently.

https://player.vimeo.com/video/1199445396?h=c7b7151862&badge=0&autopause=0&player_id=0&app_id=58479

The Express List pane sortable alert list reduces the number of clicks necessary to access alert information. Selecting the check box of an alert opens a preview panel where you can view data that helps for prioritization, impact realization, and root cause analysis. You can easily modify the Express List pane to narrow down the display. Use the provided fields list to display additional alert information and to filter out or show matching alerts. You can also modify the displayed time range.

Note:

Exporting alerts is not supported from the Express List. To export alerts, open the list view in Service Operations Workspace.

The following image shows a sample Express List pane.

Express List benefits

The Express List pane enables operators to more efficiently perform the following actions:

- **Monitoring systems or application services**. Monitoring the performance and capability of computer systems to see any discrepancies.
- **Resolving alerts**. Working on discrepancies to troubleshoot issues and promote the efficient functioning of IT infrastructure.
- **Tracking issues**. Tracking and documenting defects and resolutions in detail and reporting incidents.
- **Reporting incidents**. Escalating complex issues to management, other IT resources, third parties or vendors.

Alert information displayed in the Express List preview panel

The Express List preview panel displays additional alert information on the Express List pane. This information enables you to conduct an assessment that helps in resolving incidents without having to open multiple alert forms.

The **Info** tab on the preview panel displays the following information for a selected alert:

- Alert number (link)
- Status
- Duration
- Configuration items (with links)
- Metric name
- Node
- Resource
- Source
- Assigned to
- Assignment group
- Last Updated
- Impacted services

  For more information, see View data on impacted services on the preview panel in Express List.

- Additional info
- Custom field

You can view additional alert information by selecting any of the linked items.

The **Alerts in group** tab on the preview panel displays alert information for a selected alert group. Information for each alert is displayed in a tile with additional options for each alert in the group.

Each tile displays the following alert information:

- Alert number (link)
- Status
- Severity
- Configuration items

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Duration
- Metric name

Viewing alerts: Essential and Extended modes

You can view alerts in two modes:

- **Essential** mode displays primary and single alerts only. Expand an alert group to view its secondary alerts.
- **Extended** mode displays all alert types, including secondary alerts.

Note: You can switch between **Essential** and **Extended** modes without entering search text.

Customizing the alert display time range

You can determine the time range of the displayed alerts. The default time range is the last 24 hours. The list continues to update with new alerts until you select the pause icon ( ). Selecting the current range setting in the upper right displays a dialog box with date and time range options:

- All time - The last 90 days
- Last 24 hours
- Last 2 days
- Last week
- Last 12 hours
- Last hour
- Last 15 minutes
- Custom - Enables you to select a date and time range from the pop-up calendar.

The **Default Time Range** field is introduced on the Express List view in the following versions:

- Service Operations Workspace Express List 26.6.1
- Service Operations Workspace Express List App 26.4.0
- Service Operations Workspace ITOM Apps 26.9.0

Administrators can configure the default time range for a predefined Express List view by using the **Default Time Range** field. The default value is **Last 24 hours**.

The *evt_mgmt.express_list.all_time_days* system property controls the number of days included in the **All time** range. It does not affect the default time range.

Roles used by Express List

AI in Express List

ServiceNow Otto for ITOM provides generative AI skills and agentic workflows in Express List that help operators triage alerts, investigate incidents, and respond faster.

Express List includes several generative AI skills and agentic workflows. All features require ServiceNow Otto for IT Operations Management (ITOM) to be installed. For a summary of all AI features across ITOM AIOps, see Install ITOM using ServiceNow Otto for Setup.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Depending on your license, you will have access to certain application features, generative AI skills, agentic workflows, and AI agents. For more information, see ServiceNow product tiers.

AI features in Express List

AI feature	Description	Use case	Resources
Alert analysis skill	Uses generative AI to generate a human-readable brief of an alert and additional technical information to support investigation. Analyses are provided in English regardless of the language used in the alert description.	An operator opens an alert in Express List and wants a quick summary of what the alert means and what to investigate next.	View an alert analysis by ServiceNow Otto in Express List
Alert group analysis skill	Uses generative AI to generate a simplified, human-readable description of an alert group and technical information to support investigation.	An operator selects an alert group in Express List and wants to understand the group's overall significance before deciding how to respond.	View an alert group analysis by ServiceNow Otto in Express List
Alert group description generation skill	Uses generative AI to generate a comprehensive description of an alert group that encompasses all alerts within the group. The generated description replaces the original alert group description.	An operator wants to replace a system-generated alert group description with a meaningful, AI-generated summary that reflects the full scope of the group.	Generate an alert group description in Express List using ServiceNow Otto
Past incident analysis skill	Queries historical records to find related past incidents and analyzes their frequency, criticality, work notes, and resolution. Presents a summary of the most relevant incidents in the ServiceNow Otto panel, including resolution strategies and contact details for teams who resolved similar incidents.	An operator is investigating an alert and wants to know whether similar issues have occurred before and how they were resolved.	• Accelerate alert resolution with past incident analysis • Generate a ServiceNow Otto summary of past related incidents
AI-generated incident creation skill	Creates an incident with a human-readable, AI-generated description directly from an alert in Express List.	An operator determines that an alert requires an incident and wants the incident description to be generated automatically	Create an incident from an alert with ServiceNow Otto in Express List

AI features in Express List (continued)

AI feature	Description	Use case	Resources
		rather than written manually.	
Analyze alert impact agentic workflow	Uses observability AI agents to investigate an alert and surface information about its severity, impact, ownership, and potential root causes. Integrates with observability tools such as Dynatrace, Kentik, and New Relic.	An operator selects an alert from an observability-connected source and wants to understand its blast radius, identify responsible teams, and find potential root causes before escalating.	• Analyze alert impact agentic workflow • Analyze alert impact in the ServiceNow Otto panel
Analyze potential impact agentic workflow	Analyzes how a change request might affect relevant servers and services. The agent verifies prerequisites, retrieves the change request, selects up to 10 affected servers, identifies matches with suggested services, and displays an impact analysis in the ServiceNow Otto panel. The analysis is also saved to the change request work notes.	An operator or change manager wants to assess the risk of a change request before approving it, without manually reviewing all affected CIs.	• Analyze potential impact agentic workflow • Assess a change request with the Analyze potential impact workflow
Manage alerts autonomously agentic workflow	Provides a unified AI-driven process that automates alert triage, impact analysis, and root cause investigation. Generates reports, summarizes key insights and possible next steps, and stores structured findings in the alert record. Also analyzes Health Log Analytics alerts in an alert group and can classify alerts as proactive or reactive. **Note:** Autonomous workflow is a simplified AI process elaborated in the AI Specialist. You can now activate and manage AI Specialist, controlling the groups it targets and the specific alert type it handles. Activating the AI Specialist automatically disables the Autonomous workflow.	An operations team wants alerts to be triaged, analyzed, and summarized automatically as they arrive, with AI insights available in Express List without manual intervention.	• Manage alerts autonomously agentic workflow • Configure the manage alerts autonomously agentic workflow • Review AI-generated alert insights in Express List

Configure ServiceNow Otto for ITOM

Enable Event Management users to view alert analyses that ServiceNow Otto for ITOM creates using generative AI.

Note: Depending on your license, you will have access to certain application features, generative AI skills, agentic workflows, and AI agents. For more information, see ServiceNow product tiers.

Configure the manage alerts autonomously agentic workflow

Configure an alert management rule to operate the manage alerts autonomously agentic workflow manually or automatically.

Before you begin

- Install ServiceNow Otto for IT Operations Management (ITOM). For more information about installing ServiceNow Otto plugins, see Install plugins for ServiceNow Otto.
- [Optional] Additional configuration is required for some skills used in the agentic workflow:
  - **Observability skills**: Configure the relevant observability skills to surface data from observability tools integrated with Event Management. See Configure observability agents for ServiceNow Otto.
  - **Log analytics skills**: Install and configure Health Log Analytics to enable analysis of log analytics alerts. See Configuring Health Log Analytics.

Agentic workflows and their AI agents use role masking to determine which users can access them. Ones installed with your applications have specific roles that come included with the application. If you select *`Users with specific roles`* for user access, you must configure the security controls to include these roles. For the instructions to change the security controls, see Define security controls for an agentic workflow.

Role required: evt_mgmt_admin, evt_mgmt_operator

About this task

Configure the autonomous workflow alert management rule to operate the manage alerts autonomously agentic workflow manually or automatically. For more information about alert management rules, see Alert management rules for resolving alerts.

When the workflow operates automatically, alerts are addressed as they're created and AI insight information is displayed in Express List.

When the workflow operates manually, users must manually generate AI insights. For more information, see Review AI-generated alert insights in Express List.

For more information about the manage alerts autonomously agentic workflow, see Manage alerts autonomously agentic workflow.

Note:

If you change the alert management rule for the manage alert autonomously workflow, you must update the **sn_aiops_ai_agents.autonomous_alert_rule_sys_id** property, which points to the alert management rule.

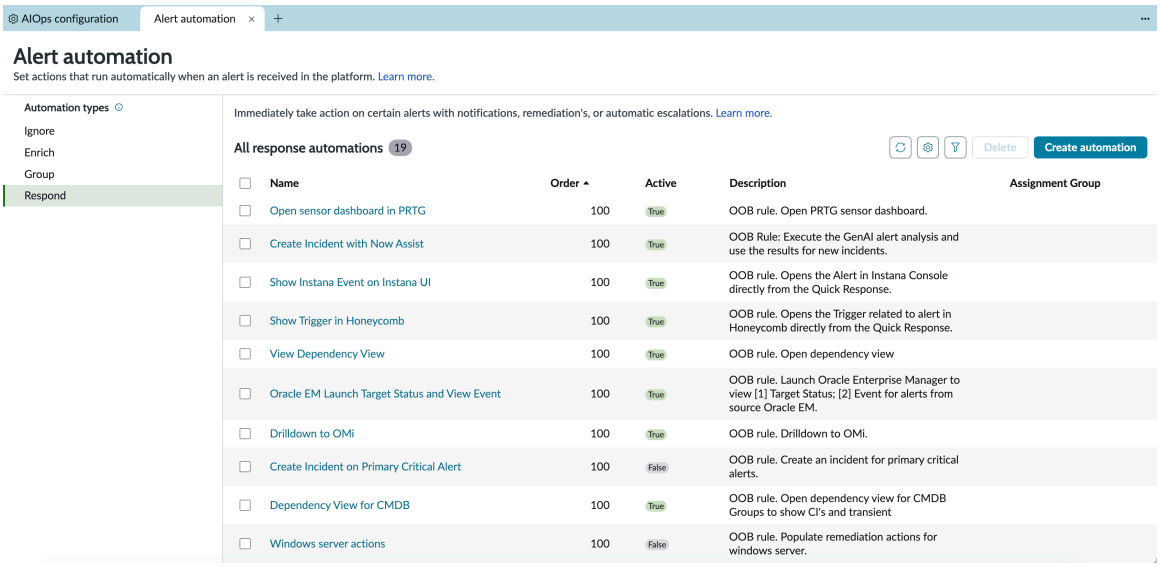
Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation pane, select the AIOps configuration center icon.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.

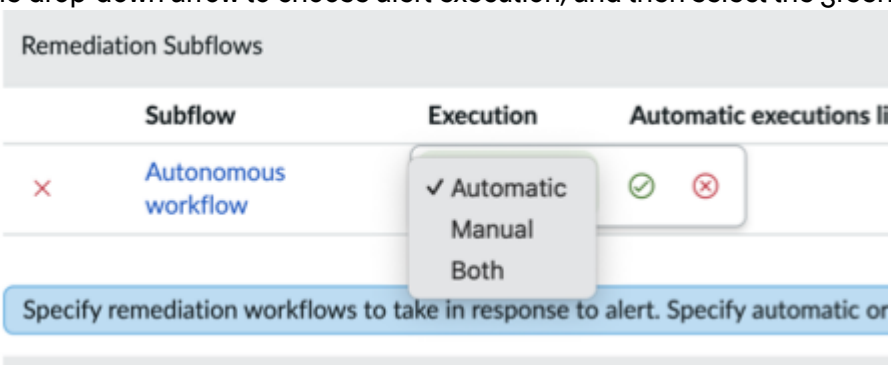
3. On the ITOM AIOps configuration center page, under the Optimize section, select **Respond to alerts**.
   The Respond page appears.



4. In the Name column, select **Autonomous workflow**.
   If the Edit automation pop-up is displayed, select **Open**. The Alert Management Rule form opens to the Alert info tab.

   Note: The **Active** check box is selected when the rule is enabled. To disable the rule and the manage alerts autonomously agentic workflow, select the check box.

5. Configure the execution information for the alert by selecting the **Actions** tab.
6. In the Execution column, double-click the cell for the **Autonomous workflow**.
7. Select the drop-down arrow to choose alert execution, and then select the green check mark to save.



What to do next

To learn more about generating AI insights with the manage alerts autonomously agentic workflow, see Review AI-generated alert insights in Express List.

Set up your workspace

Learn how to set up your individual Express List workspace to suit your needs.

Identify an assigned Express List view

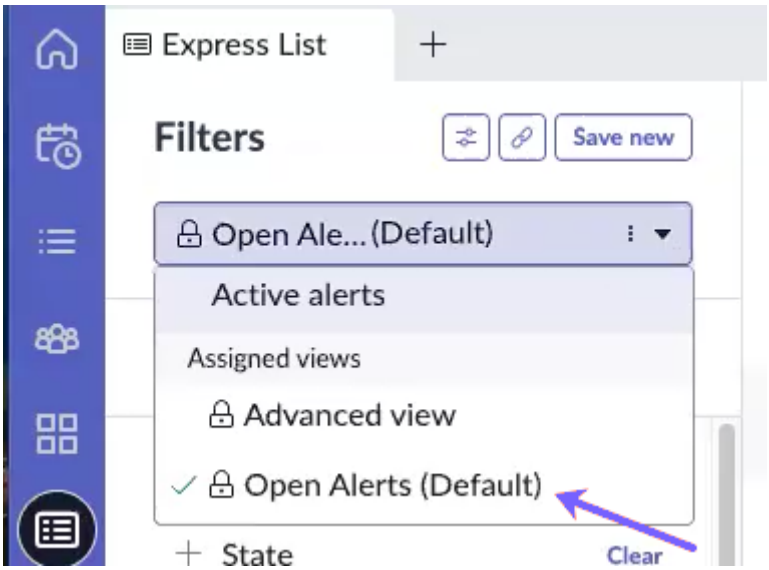
Identify Express List views assigned to you by your Event Management admin to make sure that you focus on specific services, priorities, or alerts.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon .
3. **Optional:** In the Filters pane, turn on the **Use advanced filters** option to access advanced filters assigned to you.
4. From the drop-down list in the Filters pane, select an Express List view assigned to you. The default view is marked as Default.



Note: You can't override the filters in views assigned to you. However, you can modify, save, and share these views locally.

The Filters pane lists the predefined filters. The Express List table displays the columns configured for the selected view.

Related topics

Configuring Express List views for users and user groups

Add or modify Express List columns

Add columns to the Event Management Express List display to focus the list of alerts that is displayed or modify the existing columns that are displayed.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon .

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Edit the default columns in the pane.
   a. Select the gear icon ( ).
   b. In the **Available columns** list, select the desired columns.
   c. In the **Selected columns** list, drag selected columns up or down to reorder the fields.

   d. **Optional:** Select **Restore to column default** to return the columns to the default state.
   e. Select **OK**.
4. **Optional:** Modify the column width, order, and sort direction directly in the Express List pane.

Option	Action
Column width	Point to the right side of the column until the bi-directional arrow appears and drag the col umn to the desired width.
Column order	Select the column header and drag it to the desired location.
Column sort	Select the column header and then select the arrow. The arrow direction indicates the sort order. Each selection of the arrow changes the sort direction.

What to do next

- Filter the Express List display by adding or removing fields
- Save a custom filter in Express List

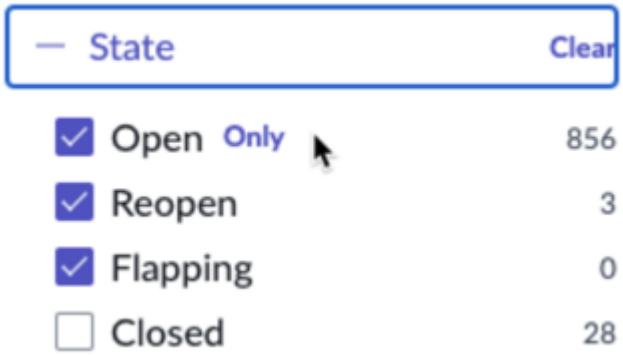
Filtering the alert display in the Express List pane

Filters help you create different views of categorized alerts, creating a targeted list of alerts to prioritize and focus on, saving time and minimizing distractions.

The fields in the interactive Filters pane in Express List help you create different views of alerts. The default filters are determined by the selected Express List view.

You can interactively view the result of adding or removing any of the fields. The numbers next to each attribute indicate the number of alerts that are returned.



Alternatively, you can turn on the **Use advanced filters** option to set complex filters using a condition builder. The and/or logic provides more flexibility in filtering the alerts.

In the Filters pane, you can perform the following actions:

- Filter by string, number, or date attributes. For more information, see Filter the Express List display using attributes.
- Add filters to or remove filters from the default filter list to focus on the applied filters. The most common filters are State, Priority, CI, and Impacted services. For more information, see Filter the Express List display by adding or removing fields
- Add or remove alert tags. Tags enable you to identify and group alerts easily without the need for discovery or accessing the CMDB. For more information, see Categorize alerts displayed in Express List
- Display or hide alerts that match a selected alert. For more information, see Filter out or show matching alerts.
- Save, delete, assign as the default, or share the filter layout. For more information, see Save a custom filter in Express List.

Filter the Express List display using attributes

Filter the Express List display by text, number, and date attributes using the interactive Express List filter panel. Create a targeted list of alerts to prioritize and focus on.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the primary navigation, select the Express List icon ( ).
3. From the Filters panel on the left side, select whether to filter to text, number, or date attributes depending on your filter type.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Filter attribute type	Action
Text	Find elements by name by typing the first few characters to display the elements that start with those characters. Then select the values that you want to view in the Express List pan  el.
Number of impacted services	Enter a condition to view alerts according to the number of alerts on the selected fil ter. For example, to display alerts that have fewer than 10 impacted services, you would select the **less than** condition and enter  10.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Filter attribute type	Action
Date	View alerts according to the selected date and time range in the pop-up calendar in the Express List panel. 
Filter the Express List display by adding or removing fields

Add fields to or remove fields from the Express List pane filter using the interactive filter panel. Use filtering to create different views of categorized alerts.

Before you begin

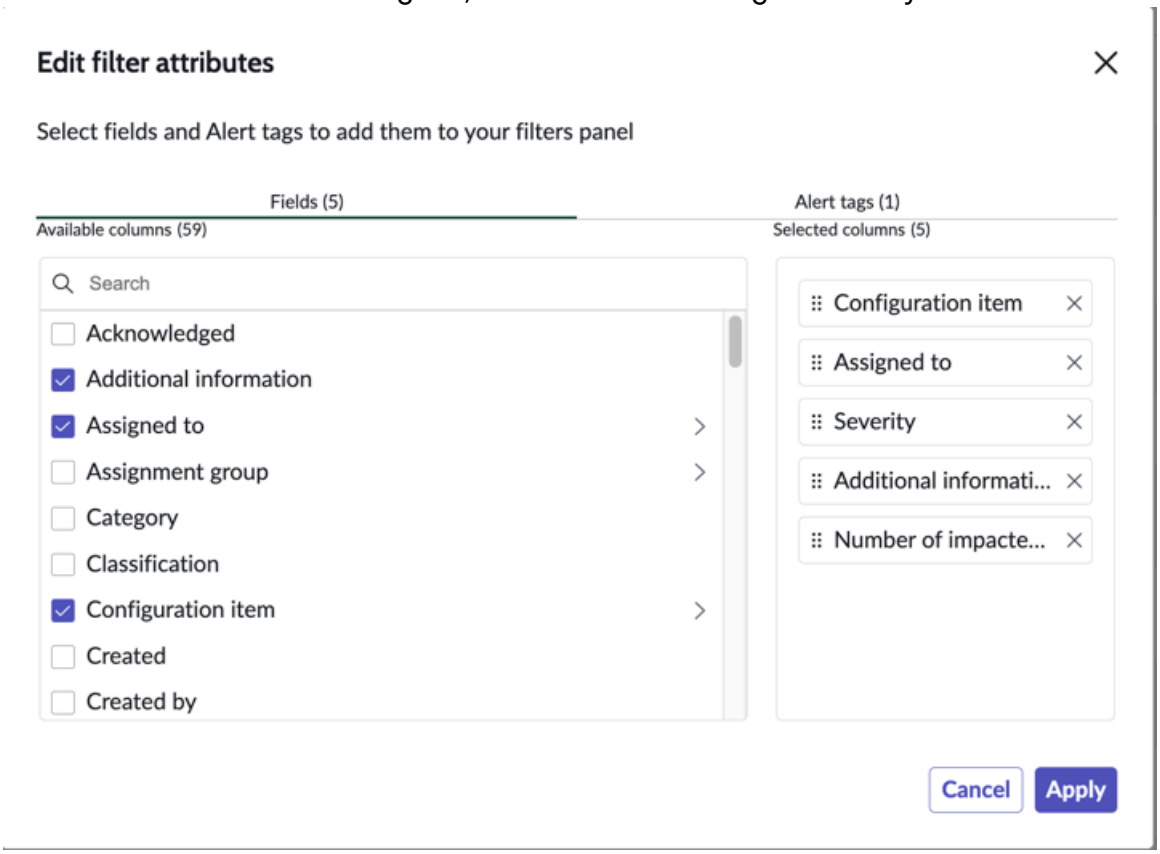
Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the primary navigation, select the Express List icon ( ).
3. In the left filter pane, select the Edit filter attributes icon ( ).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. In the **Edit filter attributes** dialog box, select fields or alert tags to add to your filter.

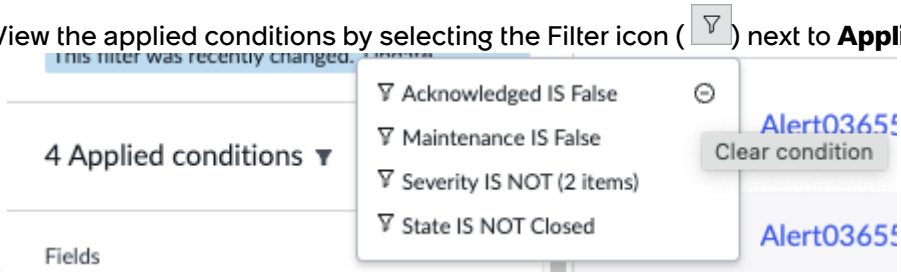


The **Fields** tab is displayed by default and displays the number of selected fields.

The number of available fields is displayed at the top of the column next to **Available columns**.

The selected fields are displayed in the right column. The number of selected columns are displayed at the top of the column next to **Selected columns**.

5. **Optional:** Find a specific field by entering its name in the **Search** field.
6. **Optional:** Rearrange the order of the selected columns by dragging them up or down in the right column.
7. **Optional:** Remove a column by selecting the **X** next to its name.
8. Select **Apply**.
9. **Optional:** Clear a filter by selecting **Clear** next to that filter name.
   Clear appears only if you selected or cleared any of the attribute check boxes of the selected filter.
10. **Optional:** View the applied conditions by selecting the Filter icon ( ) next to **Applied conditions**.



11. **Optional:** Remove a condition by selecting the **Clear condition**( ) icon.

Result

All the selected fields are displayed in the **Filters** panel in the **Fields** column.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Categorize alerts displayed in Express List

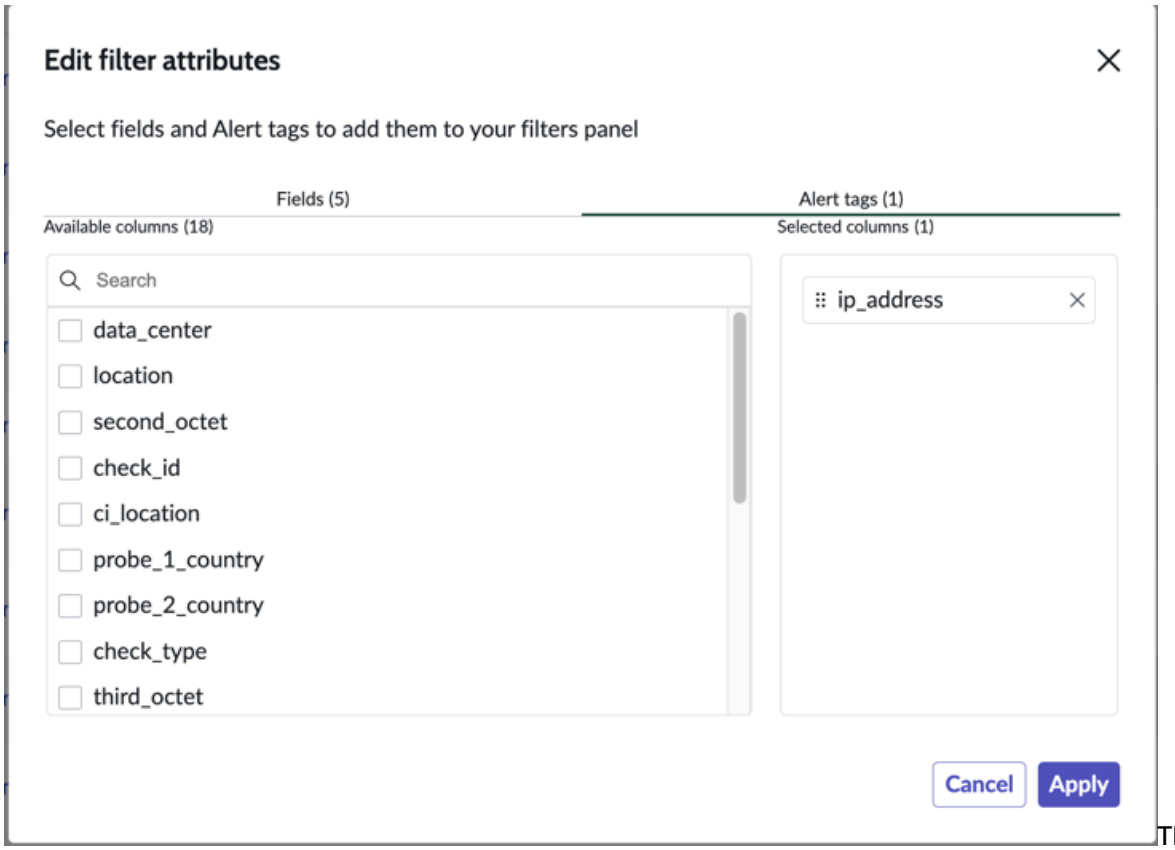
Create different views of alerts by adding tags in Express List to enable you to easily identify and group alerts without the need for discovery or accessing the CMDB.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the primary navigation, select the Express List icon ( ).
3. In the left filter pane, select the **Edit filter attributes** icon ( ).
4. In the **Edit filter attributes** dialog box, select the **Alert tags** tab.



The **Alert tags** tab title displays the number of selected alert tags.

The left column displays the number of available tags in the **Available columns** column title.

The selected tags are displayed in the right column. The number of selected tags is displayed in the **Selected columns** column title.

5. **Optional:** Find a specific tag by entering its name in the **Search** field.
6. **Optional:** Rearrange the selected tags by dragging them up or down in the right column.
7. **Optional:** Deselect a tag by selecting the (**X**) next to it.
8. Select **Apply**.

Result

All the selected tags are displayed in the **Filters** pane under the **Alert tags** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Filter out or show matching alerts

Create different views of categorized alerts in Express List by either displaying or filtering out alerts that match a selected alert.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the primary navigation, select the Express List icon ( ).
3. Right-click an alert row.
4. Match or filter out matching alerts.
   - Display matching alerts by selecting **Show Matching** from the context menu.
   - Filter out matching alerts by selecting **Filter Out** from the context menu.

Save a custom filter in Express List

Save your custom view of categorized alerts in Express List to use again, share, or set as your default view. Saving your custom view saves all filters, tags, and conditions.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the primary navigation, select the Express List icon ( ).
3. Once you have set up a filter that you want to reuse, set as your default view, or share with others, save the filter.
   For more information about filtering the Express List alert display, see the following topics:
   - Filter the Express List display using attributes
   - Filter the Express List display by adding or removing fields
   - Filter out or show matching alerts

   a. In the Express List select **Save new**.

   b. In the **Save new filter** dialog box in the **Filter name** field, enter a name for the filter.

   c. **Optional:** Make this filter your default filter by selecting **Set as default**.

   d. Select **Save** to save the filter.
4. **Optional:** Share a saved filter by copying its link to send to others.

   a. In the **Filters** panel, select the filter from the drop-down list.

   b. Select the Copy link to clipboard icon ( ).
5. **Optional:** Set a saved filter as your default filter.

   a. In the **Filters** panel, select the filter from the drop-down list.

   b. Select the More Actions icon ( ) and select **Set as default**.
6. **Optional:** Delete a saved filter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the **Filters** panel, select the filter from the drop-down list.

b. Select the More Actions icon ( ) and select **Delete filter**.

Add custom fields to the Express List preview panel

Add custom fields from the Alert [em_alert] table to the Express List Info preview panel to track alert information.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **System Properties** > **All Properties**.
2. In the **System Properties** list, select **evt_mgmt.express_list.custom_fields**.

   If a message appears about the application scope, select **here** to be able to edit the record.
3. In the **Value** field, enter the custom name from the Alert [em_alert] table.
   If you want to provide more than one field, use commas to separate the field names.
4. Select **Update**.
5. **Optional:** View the custom fields on the preview panel:

   a. In the primary navigation, select the Express List icon ( ).

   b. Select a row or the information icon at the beginning of a row.

Result

The Info tab on the preview panel displays the custom fields at the bottom of the fields list.

Assigning and managing alerts

Learn how to assign and manage alerts in Express List.

Monitor incoming alerts

You can monitor incoming alerts in Service Operations Workspace. You can also monitor and manage alerts in the Event Management interface.

Before you begin

Role required: evt_mgmt_admin, evt_mgmt_operator

Note: The evt_mgmt_user role is view-only and does not have permission to perform this action.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon .
3. View the alert information.

Alerts column headings

Column heading	Description
Number	Unique ID generated by Event Management to identify the alert.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column heading	Description
Group	An entry in this column indicates that the associated alert is a member of an alert group. Alerts that do not have an entry in this column are ungrouped alerts. ○ **Automated**: Aggregated automatically by alert aggregation. A virtual alert is added to the group as the primary alert of the group. ○ **Rules-based**: Alert group created as a result of a user-configured correlation rule. ○ **Manual**: This alert is a member of an alert group that is formed when right-clicking an alert and setting it as secondary to the selected primary alert. ○ **CMDB**: CIs without historical data that were aggregated by alert aggregation based on CI relationships in the CMDB. ○ **Secondary**: This alert is a component of an alert group. The alert at the head of the group is known as the primary alert. When **Correlated Alerts** is selected, the secondary alerts that are under the primary alert do not display, making the Alerts list less cluttered and easier to review. ○ **None**: This alert is an ungrouped alert. To make an ungrouped alert become a member of a group, right-click it and select in the topic **Add to Groups**. Select the alert and click **Add Selected**. ○ **Text**: This alert is a member of an alert group that was created based on the similarity of their text or description. ○ **Log Analytics**: This alert is a member of a Log Analytics alert group. ○ **Component-based**: This alert is a member of a Log Analytics group that was created based on the affected IT components or services. ○ **Tag Cluster**: This alert is a member of an alert group that was created based on common tags or labels assigned to them. ○ **Network Traffic**: This alert is a member of an alert group that was created based on network traffic connections between processes of host CIs. ○ **Mixed**: This alert is a member of a grouping method that combines alerts using multiple grouping strategies, such as CMBD-based grouping and tag-based grouping, into a single, cohesive group.
Severity	The severity of the event. The value for this field is copied from the event unless the event closes the alert, in which case the previous severity is retained for reporting. ○ **Critical**: Immediate action is required. The resource is either not functional or critical problems are imminent. ○ **Major**: Major functionality is severely impaired or performance has degraded. ○ **Minor**: Partial, non-critical loss of functionality or performance degradation occurred. ○ **Warning**: Attention is required, even though the resource is still functional. ○ **OK**: An alert is created. The resource is still functional. ○ **Clear**: No action is required. An alert is not created from this event. Existing alerts are closed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column heading	Description
Priority group	Indicates which alerts should be attended to first. Priority is calculated for each open alert and then mapped into one of four priority categories.
Priority	Value providing a guide as to the priority of the alert, based on a number of accumulated categories. For example, alert state and business criticality.
Source	Event monitoring software that generated the event, for example, SolarWinds or SCOM. Optionally, you can enter a description, for example, `Group Alert`. This field has a maximum length of 100.
Description	The alert description.
Node	Node name, fully qualified domain name (FQDN), IP address, or MAC address that is associated with the event, such as IBM-ASSET. This field has a maximum length of 100.
Configuration item	JSON string that represents a configuration item. For example, {"name":"SAP ORA01","type":"Oracle"}. The CI identifier that generated the event appears in the **Additional information** field. This field has a maximum length of 1000. Click to open the alert in dependency view.
Impacted Services	Lists the services affected by this alert group. Select an impacted service to view its record. **Note:** You can access the Service Map in Service Operations Workspace directly from the impacted service form by selecting **Service Map**. The service map shows the impacted path of alerts, enabling you to quickly assess their effect on the service. For more information, see View unified service map and the impact paths in Service Operations Workspace.  el-imp-service-open-map.png
Metric Name	Unique name that describes which metrics are collected and for which this alert has been created.
Maintenance	Shows whether the resource affected by the alert is in maintenance, Valid values are `true` or `false`.
Task	The corresponding task for the alert, such as an incident, change, or problem.
Parent	Reference to a parent alert.
Initial event generation time	Time that the initial event occurred in the remote system.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

If Operational Intelligence is activated, you can right-click an alert and click **View Metrics**. This opens the integrated Insights Explorer and Dependency Views map for the associated CI.

Related topics

- Metric Intelligence
- View alert information
- Alert grouping types and creation methods

Assign alerts in Express List

Assign alerts in Express List to yourself, to someone else, or to an assignment group to balance your organization's work load.

Before you begin

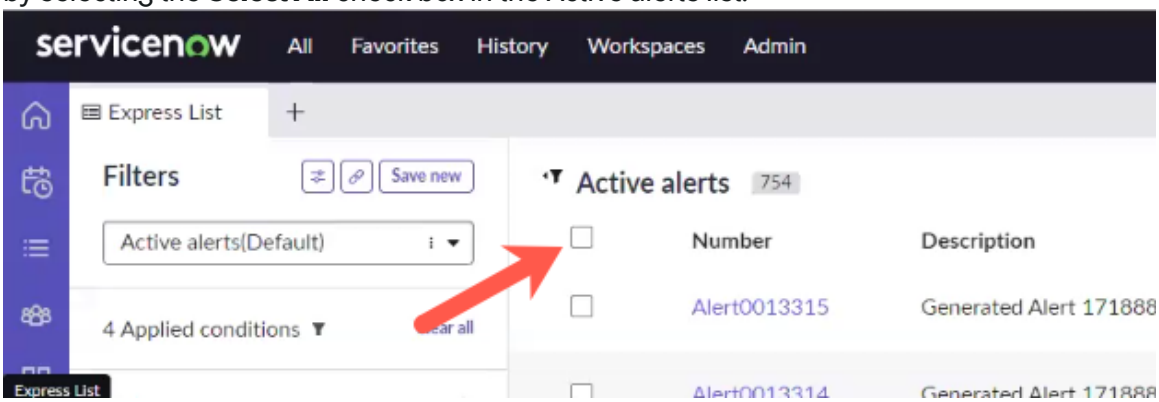
Role required: evt_mgmt_operator, evt_mgmt_admin

Note: The evt_mgmt_user role is view-only and does not have permission to perform this action.

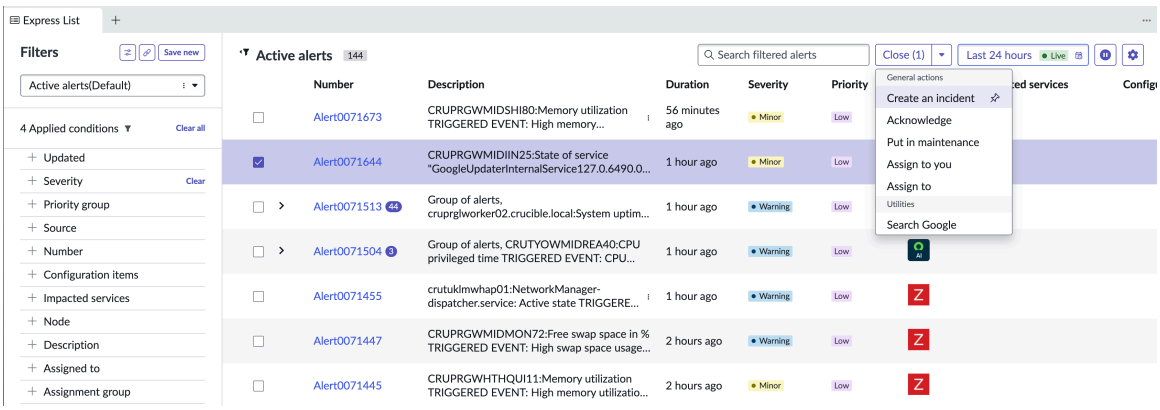
Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon .
3. Select the check box next to the alert number that you want to assign.

Note: You can perform the action on up to 1,000 alerts simultaneously by selecting the **Select All** check box in the Active alerts list.



4. Select the **Close** drop-down list.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Perform one of the following actions.

Assignment	Actions
Yourself	Select **Assign to you** and then select **OK**.
Someone else	**a.** Select **Assign to**. **b.** Select the name of the person to whom you want to assign the alert from the **Assigned to** field. **c.** (Optional) Enter information about the as signment or alert in the **Work notes** field. **d.** Select the **Assign <number> alerts** button.
Assignment group	**a.** Select **Assign to**. **b.** Select the name of the group from the **As signment group** field. **c.** Select the name of the person to whom you want to assign the alert from the **Assigned to** field. **d.** (Optional) Enter information about the as signment or alert in the **Work notes** field. **e.** Select the **Assign <number> alerts** button.

Result
The assigned person appears in the **Assigned to** column and the assignment group appears in the **Assignment group** column in the Express List pane.

Find alert records in Express List using text search

Perform a text search for alert records in a filtered list of alerts.

Before you begin
Role required: evt_mgmt_operator, evt_mgmt_admin

About this task
Event Management searches through the alerts that you're currently seeing in the Express List based on the filters and time range you have set. It searches in the following predefined fields even if they aren't visible: **Metric name**, **Node**, **Alert number**, **Alert Tags**, and **Description**. It treats the text that you enter as a single string rather than individual words. The selected alert list mode determines which alert types are displayed and included in the search. **Essential** mode displays primary and single alerts only. **Extended** mode displays all alert types, including secondary alerts.

Procedure
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon .
3. **Optional:** Select **Essential** or **Extended** from the **Switch search scope** menu.
   Essential includes primary and single alerts. **Extended** includes all alert types, including secondary alerts.
4. In the **Search filtered alerts** field, enter the search text.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Ensure that the text string meets or exceeds the minimum character requirement specified in the notification message.
- The maximum character limit is 50.
- The search isn't case-sensitive.

Note: The minimum character requirement is determined by the *evt_mgmt.express_list.min_search_chars* system property setting.

5. Perform the search by selecting the check icon or pressing **Enter**.

Result

The results match both the filters that you have applied and the string you entered in the Search filtered alerts field. In the resulting alert records, the string is highlighted and the filters show the number of records that match the string. Recent searches are saved and accessible from the Search filtered alerts field.

Highlight alerts by condition in Express List

Learn how to apply color-coded highlights to alerts in the Express List based on conditions such as severity, state, and priority, so you can quickly spot critical signals.

Before you begin

Role required: evt_mgmt_admin

About this task

To turn on this feature, enable the system property [sn_sow_exp_app.express_list_conditional_highlighting]. This property is disabled by default.

Procedure

1. Navigate to **All** and search for `sys_highlighted_value_list.do`.
   The Highlighted Values page opens.
2. In the Highlighted Values filter, set **for text** = `em_alert`.
3. Select **New** to create a record where you add the highlight conditions.
4. In the **Table** field, select **Alert[em_alert]**.
5. In the **Field** field, select the field from the drop-down list.
6. Right-click the form header and select **Save**.
7. In the **Highlighted Value Condition** tab, select **New**.
8. In the Highlighted Value Condition form, fill in only these fields.

Field	Description
Conditions	Define the criteria that trigger the highlight. Select **Add Filter Condition** to add a condition, or Add OR Clause to add an alternative set of conditions. Use **AND** or **OR** to combine multiple conditions, and the red **X** to remove one.
Color	Select the highlight color applied to rows that match the condition (for example, yellow).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Application	The application scope in which the condition applies (for example, Global).
Order	The sequence in which the condition is evaluated when multiple conditions exist. Lower numbers are evaluated first.
Show Icon	Select this check box to display an icon with the highlight.
Icon	Icon to display (for example, check-circle-fill).
Variant	Controls the visual style and emphasis of the highlighted text, including the icon (for example, primary, secondary, or tertiary), determining how prominently it appears.
Value Override	Enter a string value to display in place of the field's actual value.
Size	Select the size of the highlight or icon (for example, Small or Medium). Medium is the default. **Note:** This is available only from the Australia release.

9. Select **Submit**.
   You return to the Highlighted Values page.
10. In the **UX Highlighted Values Configurations** tab, select **Edit**.
11. In the Collection list, select **SOW Highlighted Value Config** and use the arrow button to move it to the **UX Highlighted Values Configurations** List.
12. Select **Save**.
    The highlight conditions appear on the alerts in the Express List.

Manage alert states in Express List

Learn how to change alert states.

Acknowledge viewed alerts in Express List

Acknowledge alerts that you've viewed to remove clutter in the Express List pane.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Note: The evt_mgmt_user role is view-only and does not have permission to perform this action.

About this task

Use Acknowledge to denote that the alert is known, and can temporarily be ignored. Do not use Acknowledge to mark an alert as needing attention.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon .
3. Acknowledge selected alerts.
   You can acknowledge alerts regardless of whether you are working in the main pane or in the preview panel. The preview panel opens only when a single alert or alert group is selected.

Location	Action
The Express List pane	**a.** In the Express List pane, select the alert to acknowledge. You can select more than one alert row. **Note:** You can perform the action on up to 1,000 alerts simultaneously by selecting the **Select All** check box in the Active alerts list.  To display the individual alerts inside a group, select the chevron icon ( ) at the beginning of the alert group row. **b.** From the **Close** drop-down list at the top right of the alert list, select **Acknowledge**.
The Express List preview panel for group alerts	**a.** Select an alert group row check box. **b.** In the **Alerts in group** tab, select an alert tile. **c.** Select the more actions icon ( ). **d.** Select **Acknowledge**.

Result

The alert is acknowledged and its status is displayed at the top of the preview panel.

Place an alert in the Acknowledged state

Placing an alert into the Acknowledged state indicates that the alert has issues that need to be addressed.

Before you begin

Role required: evt_mgmt_admin

Note: The evt_mgmt_user role is view-only and does not have permission to perform this action.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon .
3. Filter with **Active alerts**.
4. Select an alert.

5. On the **Details** subtab, select the **Acknowledged** check box to place the alert into the Acknowledged state.
6. Click **Save**.

Place an alert in the Maintenance state

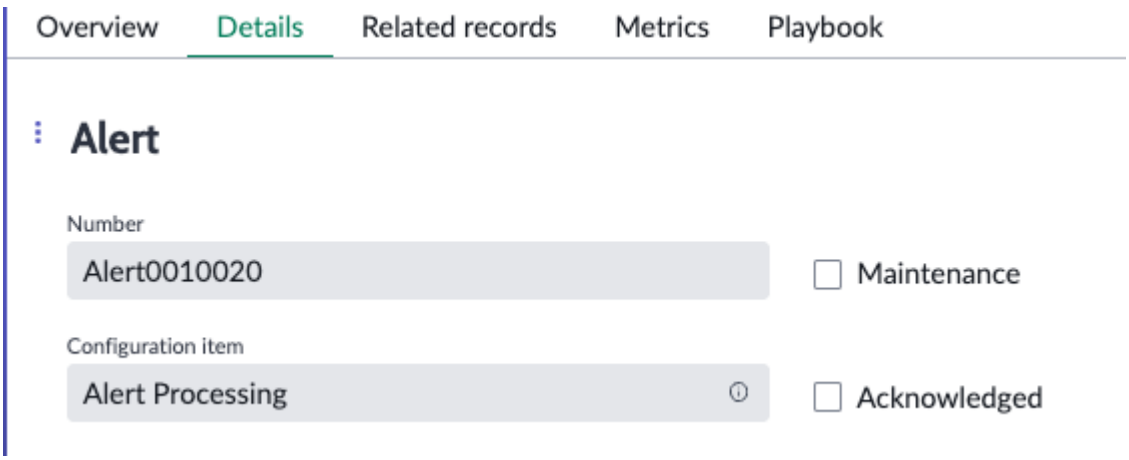
Placing an alert into the Maintenance state indicates that there are issues with the alert's CIs that are being addressed.

Before you begin

Role required: evt_mgmt_admin or evt_mgmt_operator

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon .
3. Filter with **Active alerts**.
4. Select an alert.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. On the **Details** subtab, select the **Maintenance** check box to place the alert into the Maintenance state.
6. Click **Save**.

Mute a CI's alerts in Express List

Mute a CI's alerts in Express List to avoid alerts being issued when replacing or upgrading the CI.

Before you begin

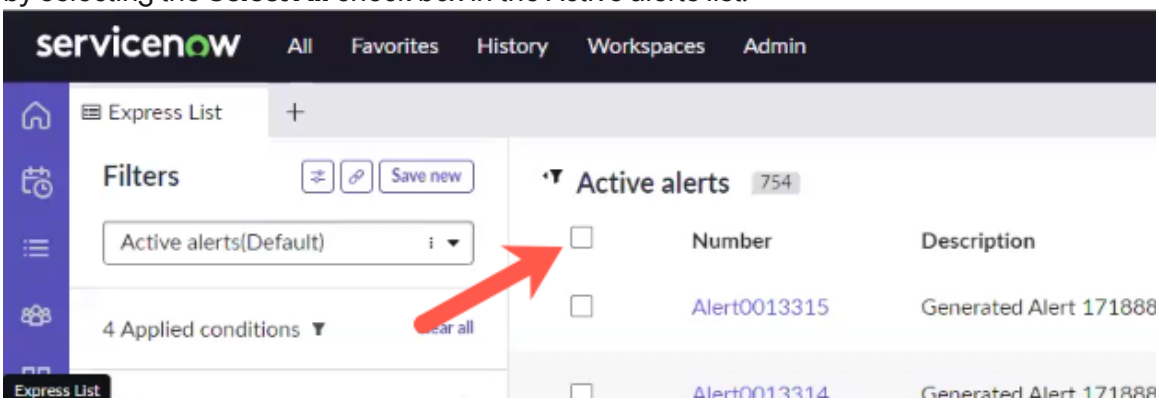
Role required: evt_mgmt_operator, evt_mgmt_admin

Note: The evt_mgmt_user role is view-only and does not have permission to perform this action.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon .
3. Select the alert row check box.

Note: You can perform the action on up to 1,000 alerts simultaneously by selecting the **Select All** check box in the Active alerts list.



4. From the **Close** drop-down list, select **Put in Maintenance**.

Result

Alerts are muted for the configuration items of that alert.

Note: The maintenance timeframe isn't provided in the **Put in Maintenance** action. Alert maintenance status is calculated based on whether the related CI is currently in maintenance, such as during an active change request or through a maintenance rule. The **Maintenance Calculation** scheduled job updates associated alerts when the CI enters or exits maintenance.

Close an alert in Express List

Manually close alerts from the Express List pane or preview panel if you know the root cause or have fixed the problem.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Note: The evt_mgmt_user role is view-only and does not have permission to perform this action.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon .
3. Close selected alerts.
   You can close alerts regardless of whether you are working in the main pane or in the preview panel. The preview panel opens only when a single alert or alert group is selected.

Location	Action
The Express List pane	**a.** In the Express List pane, select the alert. You can select more than one alert row. **Note:** You can perform the ac tion on up to 1,000 alerts simulta neously by selecting the **Select All** check box in the Active alerts list.  To display the individual alerts inside a group, select the chevron icon ( ) at the beginning of the alert group row. **b.** From the **Close** drop-down list at the top right of the alert list, select **Close alert**.
The Express List preview panel for group alerts	**a.** Select an alert group row. **b.** In the **Alerts in group** tab, select an alert tile. **c.** Select the more actions icon ( ). **d.** Select **Close alert**.

Result
The alert is closed and its status is displayed at the top of the preview panel.

Reopen alert closed by AI Specialist

Reopen an alert that the AIOps AI Specialist auto-closed as noise so it bypasses the noise classifier and runs the full investigation pipeline. Your override is honored for the alert's entire lifecycle, preserved in the audit trail, and fed back to improve future classification accuracy.

Before you begin
Role required: evt_mgmt_operator, evt_mgmt_admin

About this task
When the AI Specialist classifies an alert as noise, it closes the alert automatically. If you determine the alert is significant, reopen it. Reopening tells the system the classification was wrong, so the alert is not classified as noise again. Instead, it runs through the full investigation as if it were new and significant, and your decision helps improve future classification.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon .
3. Open an alert that was closed by AI and you want to reopen.
   When an alert is auto-closed by the AIOps AI Specialist, its reasoning appears under the **Overview** tab in the Summary section. If you determine the alert is significant, reopen it. The alert can be reopened by selecting the **Reopen** link provided following the reasoning or you can reopen the alert from the **Details** tab as shown in the procedure.
4. Select the **Details** tab.

   In the Activity section, the work note states the alert is closed by an AI Specialist. The **State** field shows **Closed**.
5. Change the **State** field value to **Reopen**.

   Note: Select **Reopen**, not **Open**. Reopen is the state transition the system watches for to trigger the classifier bypass and full investigation pipeline. Setting the state to **Open** does not register as an operator override of the AI close, so the alert would not be guaranteed the bypass-and-reinvestigate treatment.

Hide closed alerts in Express List

Choose whether to display the closed alerts in an alert group as well as the open alerts on the preview panel and in Link View.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon .
3. In the Active alerts list, select an alert group.

   The preview panel shows the default display:

   - The Alerts tab and Timeline view show only the open alerts. The closed alerts are hidden.
   - Link View shows the attributes of both open and closed alerts.
4. On the relevant tab, change the display.

   On the preview panel, Alerts tab:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Show both the open and the closed alerts by switching the **Hide closed alerts** toggle to the closed position.

b. (Optional) Sort the displayed alerts by time or by severity by selecting the sort icon ( ) and then choosing the relevant menu item.

Note: If you switch the toggle or sort the alerts in the Timeline view, the Alerts tab adjusts to reflect your selection.

In Link View: Show only the attributes of open alerts while hiding those of closed alerts by switching the **Hide attributes of closed alerts** toggle to the open position.

Responding to and working with alerts in Express List

Learn how to respond to an alert and manage its workflow.

Manage alerts autonomously agentic workflow

Enhance IT operations with AI-driven, autonomous alert management using the manage alerts autonomously agentic workflow.

Manage alerts autonomously agentic workflow overview

The manage alerts autonomously workflow introduces a unified AI-driven process that significantly streamlines alert management and reduces resolution times. This workflow supports alert management in the following ways:

- Automates the triage
- Impact analysis
- Root cause investigation of IT alerts
- Generates reports, summarizes key insights and possible next steps

For information on how to review key insights and data derived from the workflow in Express List, see Review AI-generated alert insights in Express List.

For information about configuring this workflow, see Configure the manage alerts autonomously agentic workflow.

Use the information on this page to learn about the actions related to the manage alerts autonomously agentic workflow. To modify the workflow, you must duplicate it and adjust the settings according to your requirements. For more information, see Duplicate an agentic workflow .

Important: When you modify an agentic workflow, AI agent, or tool, make sure that you update all instructions accordingly.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Manage alerts autonomously agentic workflow

The manage alerts autonomously agentic workflow uses the manage alerts AI agent to perform alert management and resolution tasks.

AI agent used in the manage alerts autonomously agentic workflow

AI agent	AI agent role
Manage alerts AI agent	Investigates alerts, summarizes alert-related reports, and stores structured insights with key findings.

The manage alerts autonomously agentic workflow performs several actions in the course of the workflow. These actions may include the following:

- Triages alerts
  - Evaluates and categorizes alert
  - Analyzes alert history to identify noise patterns
  - Updates alert group description based on analysis
  - Performs related incidents analysis to detect focal points and common closure patterns
- Determines alert impact
  - Evaluates impact on services
  - Determines user impact by finding recent incidents or cases
  - Uses observability skills for deeper service state validation
- Investigates relevant information
  - Retrieves and summarizes similar closed alerts
  - Analyzes recent changes for causal relationships
  - Summarizes related KB articles for relevant information
  - Identifies trends or anomalies in related metrics
  - Uncovers errors, exceptions, or warnings in related logs
  - Analyzes non-primary log analytics alerts in an alert group to support investigation, including the following:
    - Classifies alerts as proactive or reactive, indicating emerging risk or an active issue
    - Assess if triage is required
    - Provides contextual insights, including potential failure scenarios and what may occur if the alert isn't addressed
- Summarizes and stores information
  - Consolidates findings
  - Generates a final summary
  - Saves the summaries in the alert record, such as

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- reasoning, evidence, and confidence level behind AI-driven investigation of alert significance and automatic closure of insignificant alerts, and
- summaries of Service Observability dashboards to provide health analysis of each service associated with an alert. For more information see, Analyze service health in Service Observability.

- Provides clear, actionable insights

Important: This agentic workflow is turned on by default. For more information, see AI agents, skills, and agentic workflows on by default.

Review AI-generated alert insights in Express List

Access alert information in Express List that is consolidated autonomously by AI skills and agents. Use the AI insights badge, column, and filter to monitor alert statuses and review of AI-generated insights.

Before you begin

For this feature, you must have ServiceNow Otto for IT Operations Management (ITOM) installed on your instance. For more information about installing ServiceNow Otto plugins, see Install plugins for ServiceNow Otto.

Agentic workflows and their AI agents use role masking to determine which users can access them. Ones installed with your applications have specific roles that come included with the application. If you select *Users with specific roles* for user access, you must configure the security controls to include these roles. For the instructions to change the security controls, see Define security controls for an agentic workflow.

Role required: None

About this task

The manage alerts autonomously workflow investigates alerts, summarizes alert-related reports, and stores structured insights with key findings for use in Express List. For more information about the manage alerts autonomously agentic workflow, see Manage alerts autonomously agentic workflow.

Autonomous workflow is a simplified AI process elaborated in the AI Specialist. You can now activate and manage AI Specialist, controlling the groups it targets and the specific alert type it handles. Activating the AI Specialist automatically disables the Autonomous workflow.

Note: Currently, ServiceNow Otto for ITOM only supports tag-based, CMDB, Log Analytics, Mixed, Automated, and Network Traffic-based alert groups. For all other alert group types, it only analyzes the parent alert.

There are several ways to explore AI insights in Express List.

- Quickly review if alerts have been processed by checking for the AI insights badge AI.
- Search for specific information and key words in the Insights column. To add the column, see Add or modify Express List columns for more information.
- Filter for information by using the **Insights** filter attribute in the filter panel.
- Review **AI insights** in the preview panel or the alert record.

These options present differently, depending on whether the workflow is configured for automatic or manual execution.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- When the workflow operates automatically, alerts are addressed as they're created and AI insight information is displayed in Express List.
- When the workflow operates manually, you must manually generate AI insights. For more information, see details in the following procedure.

For information about configuring this workflow, see Configure the manage alerts autonomously agentic workflow.

Procedure

1. Navigate to **Workspace Experience** > **Workspaces** > **Service Operations Workspace**.
2. Select the Express List icon .
3. Review the AI insights through the following options.

Review AI insights	Procedure
Check for the AI Insights badge for alert status	○ If the AI insights icon AI is visible next to the check box, insights are available for that alert. ○ If insights aren't available for an alert, you can initiate the process manually. Details for generating insights are in the following options.
Search for alerts with AI Insights information and key words	Search for content with the free text search. For more information, see Find alert records in Express List using text search.
Filter using AI Insights filter attribute	Filter using the **Insights** attribute with a minimum string of two characters. For more information, see Filtering the alert display in the Express List pane.
Review AI insights in the preview panel	**a.** In the alerts list, select an alert by selecting the check box or the information icon ⓘ next to the alert. **b.** ▪ If data isn't available for this alert, you can initiate the process by selecting **Generate**. ▪ In the **Insights** tab, review **AI insights**. ▪ If the AI Specialist is in the active state, you can see the processing steps of the agentic workflow. After processing completes, the **View AI activity** link appears. Select the link to go to the **AI activity** tab on the alert details page. In the **AI activity** tab, view the detailed report of the alert along with the workflow steps.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Review AI insights	Procedure
Review AI Insights in the alert record overview	**a.** In the alerts list, select an alert number to open the alert record. The **Overview** tab is selected by default. **b.** ▪ If data isn't available for this alert, you can initiate the process by selecting **Gen erate**. ▪ If data is available, you can review the **AI insights** summary in the Summary sec tion. ▪ If the AI Specialist is in the active state, you can see the processing steps of the agentic workflow. After processing com pletes, the **View AI activity** link appears. Select the link to go to the **AI activity** tab on the alert details page. **c.** Select the **AI activity** tab to view the de tailed report of the alert along with the work flow steps.

Analyze alert impact agentic workflow

Use the analyze alert impact agentic workflow to investigate an alert and get the context that you need to respond efficiently.

Analyze alert impact agentic workflow overview

The analyze alert impact agentic workflow uses AI agents to interact with observability tools, such as Dynatrace, Kentik, and New Relic. The agents surface information to help you do the following:

- Understand the severity and impact of alerts.
- Find potential root causes using insights, such as recent deployments.
- Identify ownership by surfacing relevant services and responsible teams.
- Support stakeholder communication with clear, actionable information.

Use the information on this page to learn about the agents related to the analyze alert impact agentic workflow. To modify the analyze alert impact agentic workflow, duplicate it and adjust the settings.

Important: When you modify an agentic workflow, AI agent, or tool, make sure that you update all instructions accordingly.

Analyze alert impact agentic workflow

Investigate an alert and get insights into its severity, impact, ownership, and root causes.

To access the agentic workflow in AI Agent Studio:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Navigate to **All** > **AI Agent Studio** > **Create and manage**.
2. Select **Analyze alert impact**.

The Analyze alert impact page lets you manage the agentic workflow, including defining key requirements, defining security controls, and adding triggers.

Important: This agentic workflow is turned on by default. For more information, see AI agents, skills, and agentic workflows on by default.

AI agents used in the analyze alert impact agentic workflow

The analyze alert impact agentic workflow uses observability AI agents to gather information from alerts and request insights. The observability AI agents require additional configuration. For configuration procedures and detailed information about the data returned by these agents, see Configure observability agents for ServiceNow Otto.

AI agents and their roles

AI agent	What it does
SRE Investigate AI Agent	Coordinates observability and network agents to collect and correlate investigation findings.
Observability agents	Retrieves data from the observability vendor associated with the alert. For details, see Configure observability agents for ServiceNow Otto

Generating the alert analysis

In the agentic workflow record:

1. Review the information in the Define key requirements, Define security controls, and Add triggers screens, make the necessary updates, and then select **Continue**.
2. In the Select channels and status screen:
   a. Turn on the ServiceNow Otto panel display.
   b. Select **Save and test**.
3. Test the agentic workflow by asking a question, for example, `What is the impact of Alert0010056NR?`
4. Select **Continue to Test Chat Response**.

   The page shows the chat responses, visualizes the AI agents involved, and lists the AI agent decision logs.

In *AI Agent Studio*, you get notified when the analysis is generated. You can then act on the information or ask more questions about the alert. For more information about using the agentic workflow in the ServiceNow Otto panel, see Analyze alert impact in the ServiceNow Otto panel.

Analyze alert impact in the ServiceNow Otto panel

Learn how to use the analyze alert impact agentic workflow in the ServiceNow Otto panel. The agentic workflow helps you investigate an alert and get the context that you need to respond efficiently.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Make sure ServiceNow Otto for ITOM is installed and observability agents are configured for third-party vendors. For more information, see Install plugins for ServiceNow Otto and Configure observability agents for ServiceNow Otto.

Agentic workflows and their AI agents use role masking to determine which users can access them. Ones installed with your applications have specific roles that come included with the application. If you select *Users with specific roles* for user access, you must configure the security controls to include these roles. For the instructions to change the security controls, see Define security controls for an agentic workflow.

Role required: evt_mgmt_operator

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon ( ).
3. Select an alert from a source associated with an observability agent.
4. Open the panel by selecting the ServiceNow Otto icon.
5. Ask a tool-specific question about the alert.
   For example, for New Relic alerts, you can ask `Have there been recent deployments for this alert?`. To better understand the type of data you can query, see the **Overview of data returned** row in the corresponding vendor's table in Configure observability agents for ServiceNow Otto.

   AI agents analyze your question and respond with a summary or insight. The first response for an alert might take several seconds to appear.

What to do next

Use the information that you received to understand the alert impact and respond accordingly. You can also ask more questions about the alert.

Note: Your conversation in the ServiceNow Otto panel is specific to the alert that you selected in Step 3. To ask about a different alert, open that alert and select the ServiceNow Otto icon to start a new conversation.

Triage and analyze alerts agentic workflow

Use the Triage and analyze alerts agentic workflow to complete preliminary alert tasks and analysis for alerts.

Triage and analyze alerts agentic workflow overview

The Triage and analyze alerts agentic workflow uses AI agents to support alert triage, investigation, and analysis. AI agents can perform the following functions:

- Acknowledge alerts.
- Assign alerts to individual users and assignment groups.
- Summarize alert and alert group data to create a human-readable description and add technical analysis.
- Investigate relevant past incidents to analyze the significance of the alert and present options for resolution.

Note: These functions can also be used for the origin alert of an incident when the workflow is accessed from the incident form or Express List using the ServiceNow Otto panel.

Use the information on this page to learn about the agents related to the Triage and analyze alerts agentic workflow. To modify the Triage and analyze alerts agentic workflow, you must duplicate it and adjust the settings according to your requirements. For more information, see Duplicate an agentic workflow.

Important: When you modify an agentic workflow, AI agent, or tool, make sure that you update all instructions accordingly.

Triage and analyze alerts agentic workflow

Acknowledge, assign, and investigate current and past alerts to determine significance and possible resolutions.

To access the agentic workflow, use the ServiceNow Otto panel. For more information about using the agentic workflow in the Now Assist panel, see ServiceNow Otto panel.

AI agents used in the Triage and analyze alerts agentic workflow

The Triage and analyze alerts agentic workflow uses a team of AI agents to perform preliminary tasks and support alert resolution.

AI agents used in the Triage and analyze alerts agentic workflow

AI agent	AI agent role
Alert handling AI agent	Assign, acknowledge, and maintain an up-to-date alert record.
Alert analysis AI agent	Perform alert analysis, and update alert description, when applicable.
Alert history analysis AI agent	Analyze past occurrences, assess its significance, and close the alert when applicable.
Related incidents analysis AI agent	Analyze past incidents and provide insights on common assignments and summarized resolution notes.
Alert verification AI agent	Assess data completeness and determine whether the alert is suitable for analysis.

View an alert analysis by ServiceNow Otto in Express List

View an alert analysis created using generative AI. Alert analysis include a human-readable brief of the alert and technical information to help you investigate the alert more effectively.

Before you begin

Install the ServiceNow Otto for ITOM. For more information, see Install the ServiceNow Otto for IT Operations Management (ITOM) application.

Note: Currently, ServiceNow Otto for ITOM only supports tag-based, CMDB, Log Analytics, Mixed, Automated, and Network Traffic-based alert groups. For all other alert group types, it only analyzes the parent alert.

Role required: evt_mgmt_operator

View an alert analysis by ServiceNow Otto in Service Operations Workspace

View an alert analysis by ServiceNow Otto for an alert on the alert's Overview tab in the Service Operations Workspace. Alert analyses include a human-readable brief of the alert and technical information to help you investigate the alert more effectively.

Before you begin

Install the ServiceNow Otto for ITOM plugin. For more information, see Install the ServiceNow Otto for IT Operations Management (ITOM) application.

Note: Currently, ServiceNow Otto for ITOM only supports tag-based, CMDB, Log Analytics, Mixed, Automated, and Network Traffic-based alert groups. For all other alert group types, it only analyzes the parent alert.

Important: This generative AI skill is turned on by default. The skill will be automatically available to appropriate role users for the application. For more information, see AI agents, skills, and agentic workflows on by default.

Role required: evt_mgmt_user, evt_mgmt_operator

Procedure

1. Navigate to **Workspace Experience** > **Workspaces** > **Service Operations Workspace**.
2. Select the List icon ( ).
3. In the Alerts list, select **All Alerts**.
4. Select an alert.
   The alert opens in a separate tab, displaying the **Overview** subtab.
5. In the **Analysis** section, select **Analyze alert**.
6. Review the information provided in the alert analysis.

Launch an alert analysis from the ServiceNow Otto panel

Initiate an alert analysis from the ServiceNow Otto panel. The alert analysis displays directly in the panel for convenient review.

Before you begin

Install the ServiceNow Otto for ITOM plugin. For more information, see Install the ServiceNow Otto for IT Operations Management (ITOM) application.

For comprehensive information about the ServiceNow Otto panel, see ServiceNow Otto panel.

Role required: evt_mgmt_operator

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. Select the List icon ( ) in the navigation bar.
3. Select **Lists** > **Alerts** > **All Alerts**.
4. Initiate an alert analysis from the ServiceNow Otto panel using one of the available methods.

Launch an alert analysis	Procedure
From the list	**a.** Select the ServiceNow Otto panel icon ( ). The panel displays. **b.** Enter an alert analysis request, including the alert number, in the field at the bottom of the panel. **Note:** If you provide incomplete information, ServiceNow Otto prompts you for the missing details. The alert analysis displays in the panel.
From an alert form	**a.** Open an alert. **b.** Select the ServiceNow Otto panel icon ( ). The panel displays. **c.** Select **Perform alert analysis**. The alert analysis displays in the panel.

5. **Optional:** Enter follow-up questions or requests.
   For example: `Summarize the analysis` or `Show alert severity`.

Accelerate alert resolution with past incident analysis

Use ServiceNow Otto to investigate relevant past incidents and present effective strategies used to resolve them.

ServiceNow Otto queries historical records to find past incidents and analyzes their frequency, criticality, work notes, and resolution. It presents a summary of the most relevant related incidents in the ServiceNow Otto panel. The summary includes resolution strategies used, as well as contact details for individuals or teams who resolved the incidents and could assist with the current alert. The information provided helps you better understand the context and significance of the current alert and work more efficiently toward resolving it.

Generate a ServiceNow Otto summary of past related incidents

View an AI summary of past incidents related to the current alert, including strategies used to resolve them.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Install ServiceNow Otto for ITOM. For more information, see Install the ServiceNow Otto for IT Operations Management (ITOM) application.
- Ensure that the Alert investigation skill is active. For more information, see Install the ServiceNow Otto for IT Operations Management (ITOM) application.

For comprehensive information about the ServiceNow Otto panel, see ServiceNow Otto panel.

Role required: evt_mgmt_operator

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. Select the List icon ( ) in the navigation bar.
3. Select **Lists** > **Alerts** > **All Alerts**.
4. Open an alert.
5. Select the ServiceNow Otto panel icon ( ).
   The panel displays.
6. Request a past incidents investigation by selecting **Analyze related incidents**.
   A summary of the most relevant related incidents displays in the panel.
7. **Optional:** Inspect the details of a related incident by selecting the relevant link under Related Incidents.
   The incident page opens, showing the Overview tab.

Respond to an alert in Express List

Run a response action to remediate an alert issue manually from the Express List pane.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Note: The evt_mgmt_user role is view-only and doesn't have permission to perform this action.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon .
3. Select the alert number to open it.
4. Select the response action for the alert from the **Close** drop-down list.

Note: If the list is empty, no response actions are available.

Run response actions on multiple alerts in Express List

Run response actions to efficiently remediate and respond to issues on multiple alerts directly from the Express List pane.

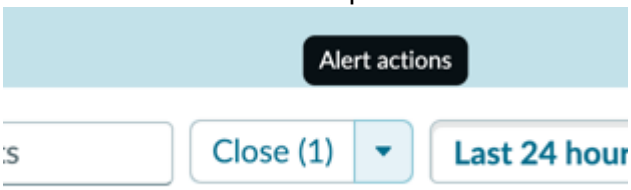
Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

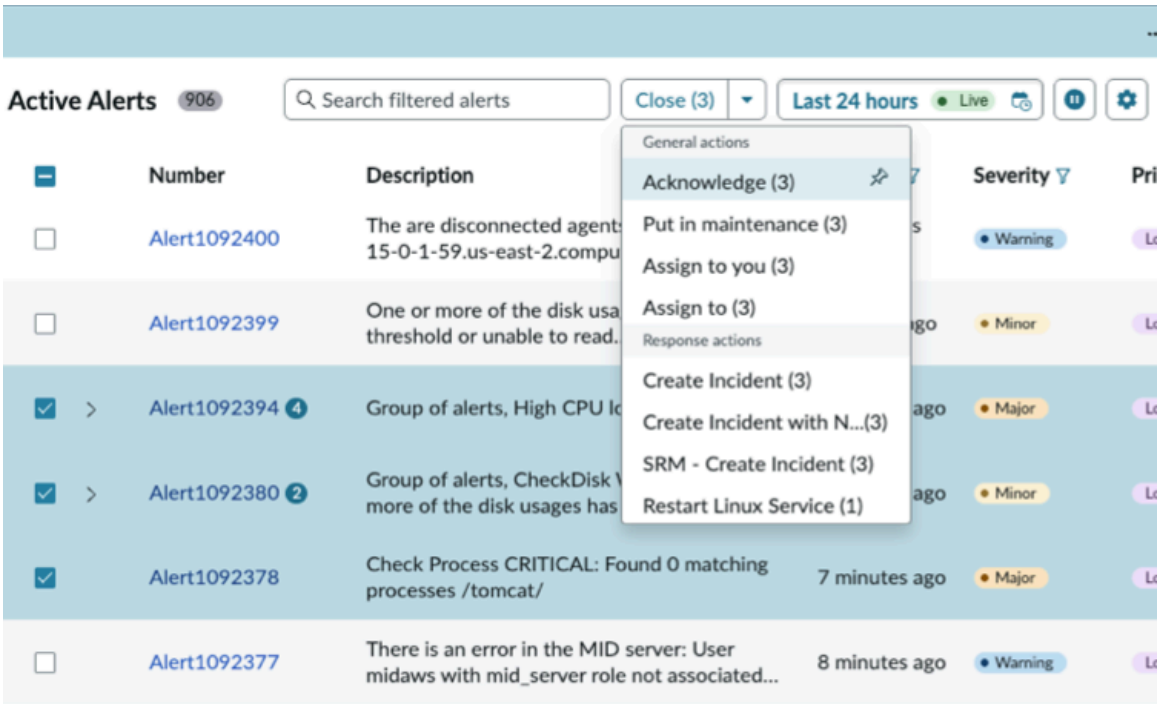
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon .
3. In the **Active Alerts** list, select the check boxes for desired alerts.
4. Select the **Alert actions** drop-down arrow to view **Response actions**.



5. Select a response action.



Note: Numbers next to actions represent the number of alerts that can be addressed with that action. If the list is empty, no response actions are available.

The **Run response action** modal appears. The modal describes the number of alerts addressed with the selected action, and lists the selected alerts that aren't addressed.

View details about an alert in Express List

View information about the impact and cause of an alert on the alert's Overview tab in the Express List.

Before you begin

Role required: evt_mgmt_operator

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon .

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select the alert number to open it.
   The alert opens in a separate tab, displaying the **Overview** tab.
4. View alert information on the **Overview** tab.

Overview tab

Section	Description
Summary	Contains a description of the selected alert, describing why it is considered an issue.
Impact	Lists the Configuration item and any services impacted by the alert. The **Impacted Services** tile includes the following subtabs: ○ **Application services:** The application services affected by the alert. For details on application services, see Application services. ○ **Related service offerings:** The service offerings connected to the application services affected by the alert. Application services and their related service offerings display on a many-to-many basis. That is, several service offerings can relate to one or more application services, and several application services can relate to one or more service offerings.
Cause	Lists the log properties with information contributing the alert issue, as well as probable root causes for the alert.

View data on impacted services on the preview panel in Express List

View extra information on the preview panel about impacted services that are bound to alerts.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon.
3. In the Active alerts list, select an alert check-box.
4. On the preview panel, open the Info tab.
5. Hover over the Impacted services section to display information icons.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Select the relevant icon to display extra information on an impacted service.

Impacted service information icons

Icon	Name	Description
ⓘ	Info	Displays the severity, the business criticality, and a short description of the impacted service. From this pop-up, you can open the service map in Service Operations Workspace by selecting **View service map**.  The service map shows the impacted path of alerts, enabling you to quickly assess their effect on the service. For more information, see View unified service map and the impact paths in Service Operations Workspace. If metrics data exists for this service, you can open the Metric Explorer from the pop-up by selecting **View related metrics**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Icon	Name	Description
	Contact person/group	Displays the name of the owner of the impacted service and the support group assigned to it.

View metrics for an alert

Viewing metrics enables you to understand historical data related to an alert's CI.

Before you begin

- Ensure that you install the Operational Intelligence (com.snc.sa.metric) plugin.
- Configure the metrics to be displayed for the alert, as described in Configure alert metrics.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon .
3. Select an alert to open it.
4. Click the **Metrics** subtab.
   The configured metrics appear on the page.

   To customize the metrics display, configure the following properties on the **System Properties** > **All Properties** page:

   - *ws_metric.widgets_number_limit*: Specify the number of widgets/records that can be displayed on the metrics tab.
   - *ws_metric.datasets_per_widget_limit*: Specify the number of charts/datasets that can be displayed on a chart.

5. In the **Time range relative to alert** list, select the time range for which you want the metrics to be displayed for the alert:
   - 1 hour before and after (default setting)
   - 3 hours before and after

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- 5 hours before and after
- Custom range (to configure a customized time range for the metrics to measure)

6. Click a parameter below a chart to hide the specified parameter's data on the chart.
7. **Optional:** Click the **Insights Explorer** button to view metrics by dragging and dropping them onto a timeline.

Related topics

View metric values in the Insights Explorer

View anomaly alert metric data on the preview panel in Express List

View visualizations for anomaly alerts to investigate anomalies using metric data. You can view visualizations from the Express List preview panel or the alert record.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon .
3. In the Active alerts list, locate an anomaly alert.
   Information in the **Description** column can help you determine which alerts are anomaly alerts. For example, an alert description might warn about values nearing or exceeding configured thresholds, or metrics above or below a defined boundary.
4. Choose where to view the anomaly chart.

Option	Procedure
To view the chart in the preview panel	**a.** Select the check box for the anomaly alert. **b.** In the preview panel, select the **Info** tab. A chart with a visual representation of the anomaly appears.
To view the chart in the alert record	Select the number of the anomaly alert to open the alert record. The **Overview** tab opens by default. The anomaly chart is displayed.

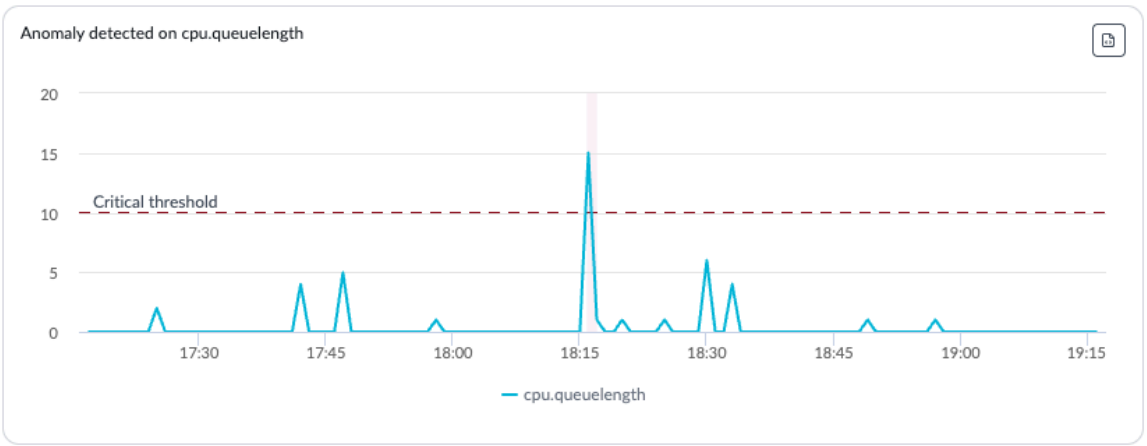
Depending on how the metric anomaly is configured, one of two charts is displayed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- When the Metric Intelligence statistical model is used to detect anomalies, the anomaly alert chart is displayed with upper and lower bounds based on machine learning models.

  For more information, see Understanding Metric Intelligence.

- When thresholds are configured by administrators, the static threshold metric anomaly alert chart shows anomalies defined using the configured thresholds.



Note:

The raw data used for the metric chart in the preview panel is available only for seven days. If older alerts are selected and the raw data is no longer available, a chart isn't shown.

For more information, see Create metric rules.

5. **Optional:** Review surrounding metric data by selecting the **Open in Metric explorer** icon ( ) in the information panel.

   (Optional) The **Metric Explorer** tab displays the time frame of the anomaly. For an open alert, the chart shows one hour before and after the last time of event generation. For a closed alert, the chart shows one hour before and after the first event that created an alert. If there's no data, the chart isn't displayed.

   For more information, see Metric Explorer.

View Log Analytics anomaly alert charts on the preview panel in Express List

View visualizations for Health Log Analytics anomaly alerts to identify periods of behavior that deviate from expected ranges. You can view visualizations from the Express List preview panel or the alert record.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon .
3. In the Active Alerts list, locate a Log Analytics based alert.
   This option is available only for individual alerts or the underlying individual alerts within a group.
4. Choose where to view the anomaly chart.

Option	Procedure
View the chart in the preview panel	**a.** Select the check box for a Log Analytics based alert. **b.** In the preview panel, select the **Info** tab. A chart with a visual representation of the anomaly appears.
View the chart in the alert record	Select the number of the anomaly alert to open the alert record. The **Overview** tab opens by default. The anomaly chart is displayed.

5. **Optional:** Select the parameter to visualize anomaly data within that time period:
   - **Events per minute** - The default setting, which shows the detected anomaly.
   - **Day ago**
   - **Week ago**
6. **Optional:** Review relevant logs in context by selecting the Open in Surrounding logs icon: .
   The **Surrounding logs** tab displays the list of log lines that were generated one minute before and one second after the Log Analytics alert. For more information, see How Health Log Analytics generates alerts.

Run actions to resolve alert issues in Service Operations Workspace for ITOM

Resolve the underlying issue of an alert by running predefined remediation tasks, ensuring faster issue resolution and ensuring consistent resolution.

Before you begin

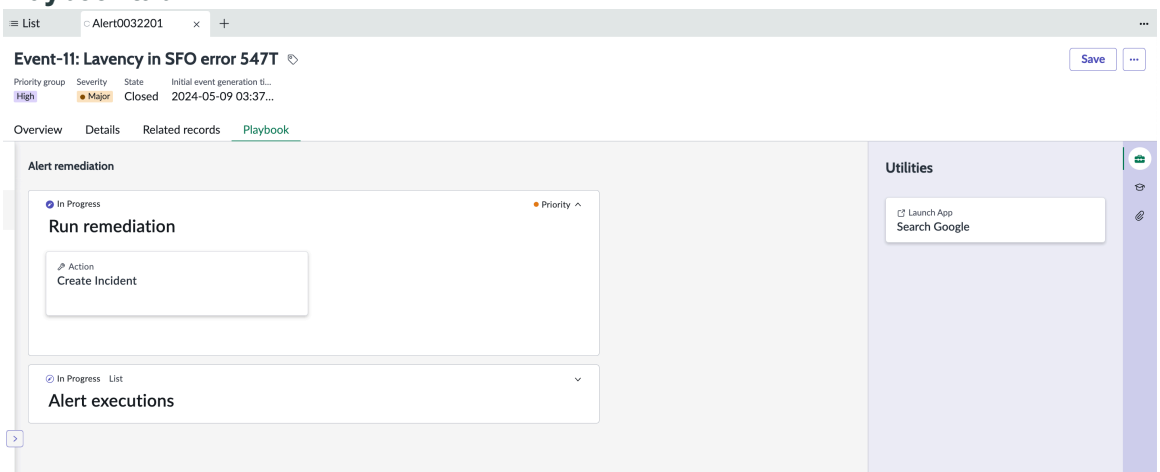
Role required: evt_mgmt_operator

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon .
3. Select the alert number to open it.
   The alert opens in a separate tab, displaying the **Overview** tab.
4. Select **Launch playbook**.
5. Select the **Playbook** tab.
   The **Run remediation** card displays the available remediation actions.

Playbook tab



6. Select the tile corresponding to the action you want to run.
   The selected action appears on the **Alert executions** card.

Result

When the action is complete, it appears in the **Completed** card underneath the Alert remediation section.

Launch a web application for an alert in Service Operations Workspace for ITOM

Launch a web application that was configured in an alert management rule to quickly access necessary tools, improving response times and efficiency.

Before you begin

Role required: evt_mgmt_operator or evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon .
3. Select the alert number to open it.

   The alert opens in a separate tab, displaying the **Overview** subtab. In the right panel, the **Utilities** tab is selected by default.

4. In the Utilities section, select the web application to launch the app.

> **Note:** For information on how to add a web application that can be launched, see Create an alert management rule.

Working with alert groups in Express List

Learn how to manage alert groups.

Viewing an alert group analysis by ServiceNow Otto in Express List

View an analysis of alert groups in Express List, generated using AI. The analysis helps you better understand the nature of the alert group, why the alerts in the group were correlated, and how to proceed in the remediation process.

The AI-driven alert group analysis offers a simplified, human-readable description of the group and technical information to help you investigate it more efficiently. The information provided is based on descriptions and Configuration Item (CI) details relating to the individual alerts in the group. Alert group analysis is supported for the following alert group types:

Tag-based alert groups

Tags help categorize alerts based on common attributes, such as impacted systems or services. Alerts in tag-based alert groups share certain tags, indicating similarities in the issues. The alert analysis for these groups presents the shared tags that were used to correlate the alerts in the group. It also provides insights into why these alerts were grouped. In addition, the analysis offers suggestions for a course of action based on the similarities between the tags.

CMDB alert groups

When an alert is created on a CI in the Configuration Management Database (CMDB), Event Management looks for alerts on other CIs that are closely related to it in the CMDB topology. A close topological relationship between CIs suggests an interdependence between components in the IT infrastructure and contributes to alert correlation. When a relationship between CIs is found, a CMDB alert group is formed. The alert analysis for CMDB alert groups explains the nature of the group and why it was formed, and the relationships between the CIs. It also provides technical information to help you decide on which alerts to concentrate your investigation.

Log Analytics alert groups

When Event Management identifies multiple Log Analytics alerts that are related in important ways, it groups them into a Log Analytics group. The system generates a Log Analytics group when the Log Analytics alerts share one or more relationships related to time, metadata, message text, and trend. The alert analysis for Log Analytics alert groups is based on anomaly information provided by Health Log Analytics. It also considers the descriptions, CIs, and tags of the alerts in the group.

Network Traffic-based alert groups

The Network Traffic-based alert grouping method groups alerts by analyzing network traffic connections between processes across hosts. It leverages service candidates identified by ML Service Mapping to group the alerts. Alert analysis for network traffic-based alert groups gives a description for all the alerts in the group and the connections between them.

Mixed alert groups

The Mixed grouping method combines alerts using multiple grouping strategies, such as those used in CMDB alert groups and tag-based groups, in a single, cohesive group. This method leverages the strengths of each strategy to reduce alert noise, improve alert correlation, and highlight the true root cause of incidents.

Automated alert groups

Automated alert grouping uses aggregation algorithms to identify and group related alerts. The algorithms group alerts that share the same alert identifier, such as the CI and metric identifier, and that occurred multiple times within a similar time frame.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The algorithms rely on historical data to detect recurring patterns and organize similar alerts. Alert analysis for automated alert groups provides details about the CI or time-based patterns that contributed to the grouping. The analysis also includes a summary of historical incidents related to the group, including frequency, criticality, and resolution strategies.

View an alert group analysis by ServiceNow Otto in Express List

View an alert group analysis created using generative AI. The analysis offers a simplified, human-readable description of the alert group and technical information to help you investigate it more efficiently.

Before you begin

- Install ServiceNow Otto for ITOM. For more information, see Install the ServiceNow Otto for IT Operations Management (ITOM) application.
- View important information about the ServiceNow Otto for IT Operations Management (ITOM) application in AI in IT Operations Management.

Note: Currently, ServiceNow Otto for ITOM only supports tag-based, CMDB, Log Analytics, Mixed, Automated, and Network Traffic-based alert groups. For all other alert group types, it only analyzes the parent alert.

Role required: evt_mgmt_operator

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the navigation bar, select the Express List icon ( ).
3. In the Active alerts list, select the information icon ( ) next to an alert group to display the preview panel.
4. On the preview panel **Info** tab, select **Analyze** in Alert analysis by ServiceNow Otto.
5. View the information provided in the Alert analysis.
6. **Optional:** Use the Alert analysis icons to perform related tasks.

Alert analysis icons

Icon	Description
	Copy the content of the alert analysis to the clipboard.
	Refresh the alert analysis. **Note:** Refreshing regenerates the results. Past results are deleted.

Related topics

Viewing an alert group analysis by ServiceNow Otto in Express List

Update an alert description in Express List based on a ServiceNow Otto for ITOM analysis summary

Update alert descriptions in alert groups or single alerts in Express List, to a human-readable summary generated by AI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Updating the alert description is available for the alert types:

- Tag-based alert group.
- CMDB correlation alert group.
- Network Traffic correlation alert group.
- Log Analytics single alerts and alert group.
- Mixed alert group.
- Automated alert group.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the navigation bar, select the Express List icon ( ).
3. In the Active alerts list, select the information icon ( ) of an alert.
4. On the preview panel **Info** tab, select **Analyze** in Alert analysis by ServiceNow Otto.
5. Review the human-readable, AI-generated summary in the Alert analysis.
6. On the preview panel **Info** tab, select **Update description** to update the description based on the summary content of the alert group.
   The AI-generated summary content replaces the original description of the alert group.

View an alert group analysis by ServiceNow Otto in Express List

View an alert group analysis created using generative AI. The analysis offers a simplified, human-readable description of the alert group and technical information to help you investigate it more efficiently.

Before you begin

Install the ServiceNow Otto for ITOM plugin. For more information, see Install the ServiceNow Otto for IT Operations Management (ITOM) application.

Role required: evt_mgmt_operator

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. Select the Express List icon ( ) in the left navigation bar.
3. In the Active alerts list, select the information icon ( ) to the left of an alert group to display the preview panel.
4. On the preview panel Info tab, select **Analyze** in Alert analysis by ServiceNow Otto.
5. View the information provided in the Alert analysis.
6. **Optional:** Use the Alert analysis icons to perform related tasks.

Viewing an alert group analysis by ServiceNow Otto in Express List

Generate an alert group description in Express List using ServiceNow Otto

Use AI to generate a meaningful description of an alert group in Express List that encompasses all the alerts within the group. The generated description replaces the original description of the group.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. Select the Express List icon ( ) in the navigation bar.
3. In the Active alerts list, select the information icon ( ) for an alert.
4. Below the displayed alert group description, select **Update description**.
   ServiceNow Otto generates a comprehensive new description of the alert group, which encompasses all the alerts within the group. If you select **Update**, the generated description replaces the original description of the alert group taken from the earliest, most severe secondary alert in the group.
5. **Optional:** Restore the original alert group description by selecting the revert icon ( ) next to **Update description** and then choosing **Restore**.

Save the ServiceNow Otto alert analysis as an alert group description

Save the human-readable summary generated by ServiceNow Otto in the Alert analysis as the description of an alert group.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. Select the Express List icon ( ) in the left navigation bar.
3. In the Active alerts list, select the information icon ( ) to the left of an alert.
4. On the preview panel Info tab, select **Analyze** in Alert analysis by ServiceNow Otto.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Review the human-readable, AI-generated Alert analysis summary.
6. Select **Save description** to save the summary content as the description of the alert group. The AI-generated summary content replaces the original description of the alert group.

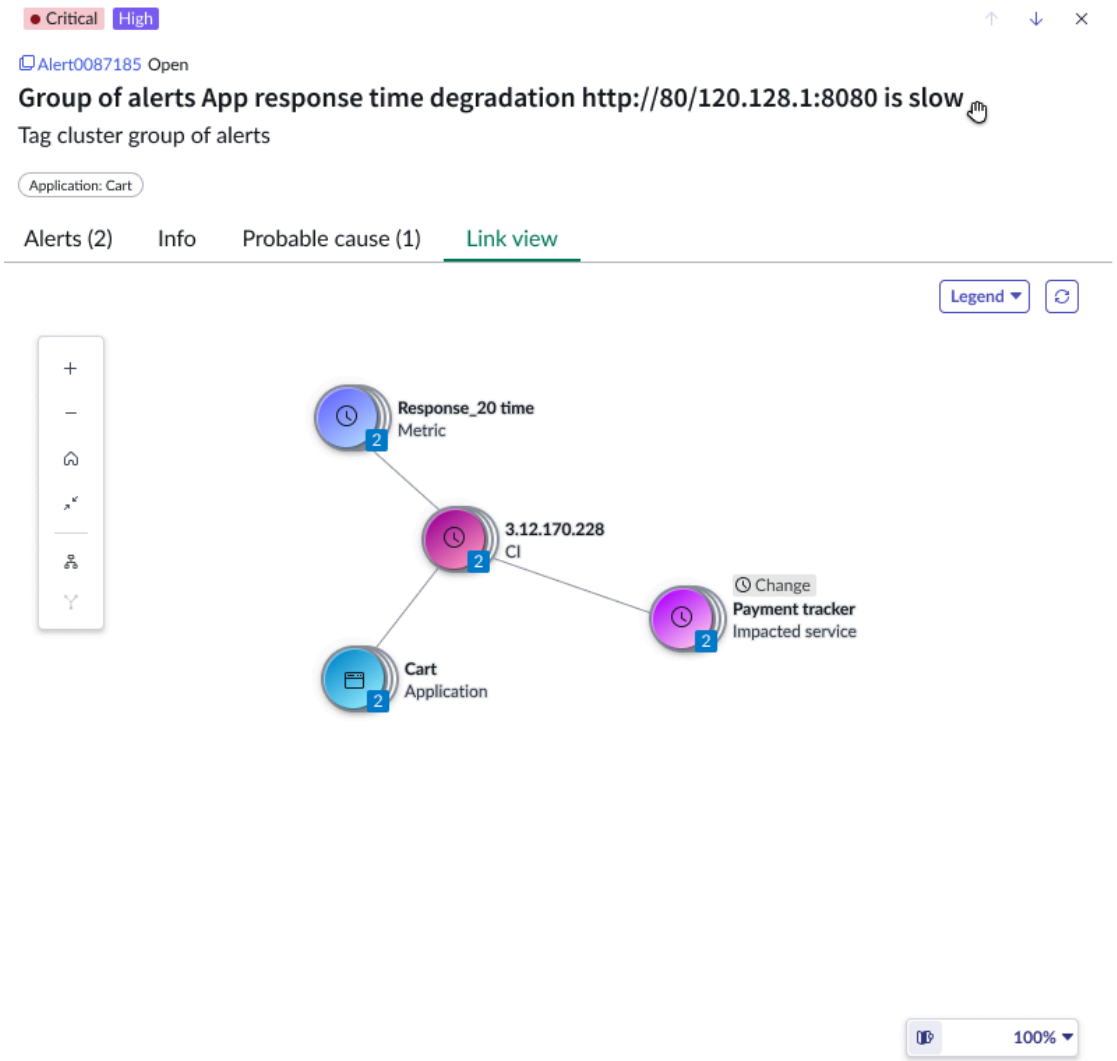
Viewing links between alerts in alert groups in Express List

Gain a better understanding of the relationships between alerts in alert groups in the Express List by using Link View. Link View offers a visual representation of the relationships between the alerts in a group.

When Event Management generates an alert group, Link View shows how the attributes of the alerts in the group are linked. The colored tags represent configuration items (CIs) and other environment items in relation to the alerts.

The information shown in Link View is available without the need for a populated Configuration Management Database (CMDB). However, when the CMDB is populated, Link View offers additional value by providing the probable cause of the alerts and the service that the alert group impacts.

Sample alert group in Link View



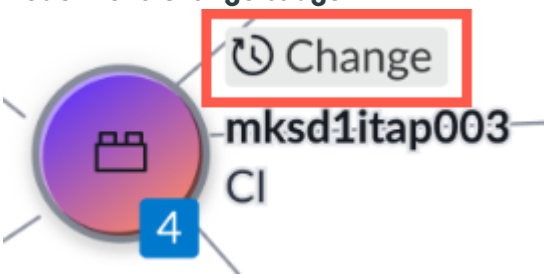
You can focus on your areas of interest by dragging the nodes in Link View to different positions. When you refresh an alert group, rearranged nodes appear in their original position again. Therefore, Link View is not refreshed automatically, but waits for you to do so manually.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If an alert on a CI impacts a service in the Configuration Management Database (CMDB), Link View shows the impacted service. You can view it at a glance for quick triage.

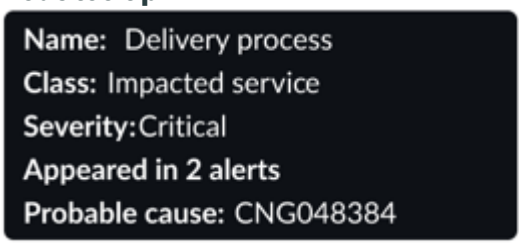
A stacked node indicates that multiple nodes were mapped for the same tag. When the same key-value pair appears in more than one alert, the corresponding node is shown with a badge. For example, when the same key-value pair appears in two alerts, the badge on the node shows the number 2. See the Payment tracker node in the sample alert group figure. When a node has no badge, the key-value pair appears in only one alert. An active change request, a probable cause of the alert, is marked by a Change badge.

Node with a change badge



The Link View legend lists the meaning of the symbols and colors used and enables you to toggle between hiding and showing types of tags to reduce noise. In addition, the legend describes the meaning of the various lines linking the alert attributes. Attributes linked by a solid line share one or more alerts, whereas attributes linked by a dotted line are correlated by grouping criteria. For a description of each tag, see Attributes in Express List Link View. Hovering over a node displays a tooltip that includes the tag name, class, and severity. It also shows the number of alerts in which the tag appeared. If applicable, the tooltip indicates whether the alert is primary or secondary or the probable cause.

Node tooltip



Currently, Link View is supported for several alert groups. For more information, see the following topics:

- Viewing links between alerts in tag-based alert groups
- Viewing links between alerts in rules-based alert groups
- Viewing links between alerts in CMDB-based alert groups
- Alert links in network traffic-based alert groups
- Alert links in log analytics-based alert groups
- Viewing links between alerts in mixed alert groups

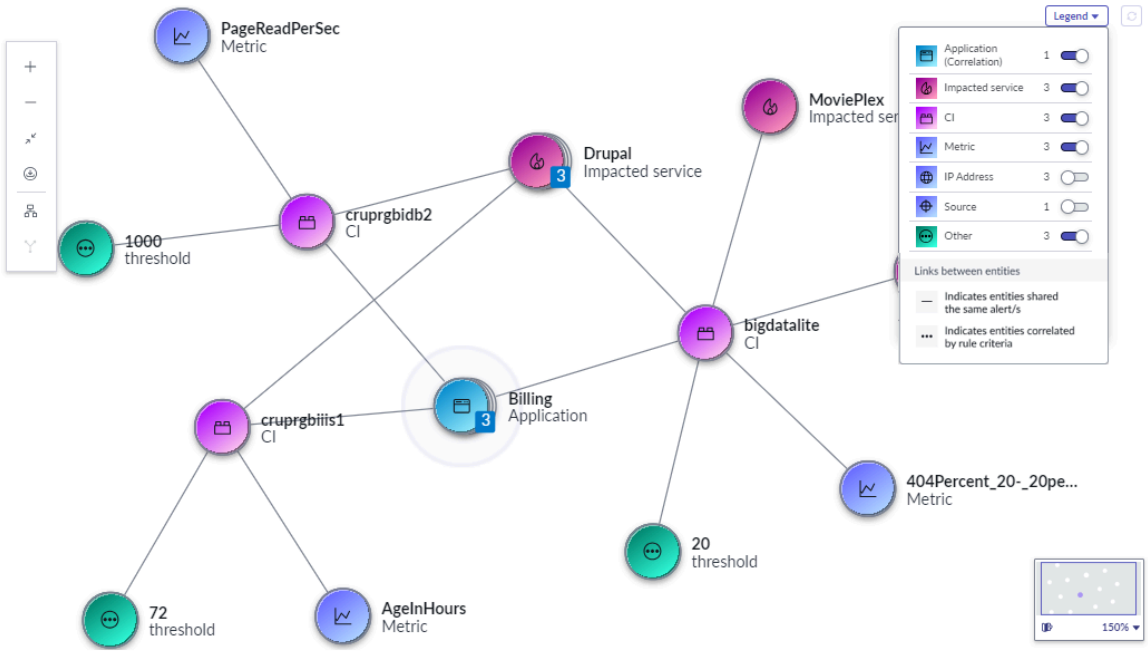
Viewing links between alerts in tag-based alert groups

View the connections between alerts in a tag-based alert group in Express List by using Link View. Link View shows how the attributes of the alerts in the group are linked with each other.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When you've set alert tags and Event Management has generated an alert group based on tag-based rules, Link View offers a visual representation of the relationships between the alerts. The colored tags represent Configuration Items (CIs) and other environment items in relation to the alerts.

Sample tag-based alert group in Link View



In this example, the defining tag for the correlation, Application, is linked to the tags of the relevant CIs. However, a correlation can be defined by any tag or combination of two tags, such as Resource and Metric name. When the defining tag is missing from Link View, the correlation was based on information that is not represented in the view, such as the description. Each CI node is further linked to the tags that appeared on the same alert as that CI.

In an alert group that was generated from tag rules, nodes connected by a dashed line signify an approximate, "fuzzy" match. This means that the nodes were correlated when the match on the tag rule was not exact, but close enough to be significant. For example, this could happen when a location, email address, or IP pattern was similar enough to qualify as a match.

The Link View legend lists the meaning of the symbols and colors used to represent the tags and their number of unique nodes. In the legend, defining tags are marked as Correlation. You can toggle between hiding and showing tag types to reduce noise. For a description of each tag, see Attributes in Express List Link View.

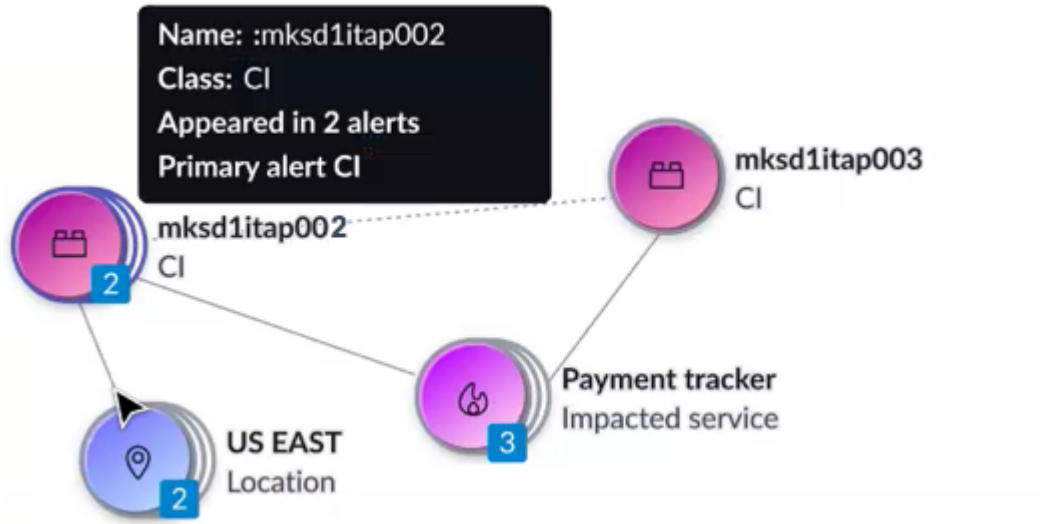
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sample rules-based alert group in Link View



Rules-based alert groups are comprised of a primary alert and one or more secondary alerts. The primary alert is generated directly and is represented in Link View as the Home node. Secondary alert nodes are connected to the Home node by a dashed line, indicating that they don't share the same alert, but are correlated using rule criteria. A solid line between nodes indicates that the connected nodes share the same alert or multiple alerts.

If an alert on a CI impacts a service in the Configuration Management Database (CMDB), Link View shows the impacted service. You can view it at a glance for quick triage. Hovering over a node displays a tooltip. The tooltip includes the tag name, type, number of alerts in which it appeared, and whether it is a primary or secondary alert.

Viewing links between alerts in CMDB-based alert groups

View the connections between alerts in alert groups in Express List that were created based on the proximity of Configuration Items (CIs) in the Configuration Management Database (CMDB). Link View shows how the attributes of the alerts in the group are linked with each other.

When alerts on CIs that are located near each other in the CMDB topology occur within a certain time-frame, Event Management generates a CMDB-based alert group. Event Management correlates CIs in a service map when they are separated by a maximum of three other CIs. The colored tags in Link View offer a visual representation of the CIs and other environment items in relation to the alerts in the group.

Alert links in log analytics-based alert groups

Use Link View in Express List to see why alerts in a log analytics-based alert group are correlated together through the visualization of shared attributes.

Link View for log analytics-based alert groups shows the connections between component-based alerts. Each component-based alert may involve multiple host configuration items (CIs). A component represents a logical part of a service instance where the alert was detected. Components can consist of multiple CIs that perform the same function, such as multiple redundant hosts. For more information, see Types of Health Log Analytics alerts.

The colored tags in the link view represent attributes of the alerts such as hosts, users, or correlation indicators extracted from the logs. The lines connect attributes that share the same alert. This visualization helps you understand the relationships between different alerts in the group using their shared attributes.

Log analytics-based groups often contain multiple correlation attributes within a single group. Link View enables you to explore why anomalies detected on different components were correlated into one group. By manipulating the attribute display, you can better understand the relationships between alerts that share common attributes.

Viewing links between alerts in mixed alert groups

Link View displays the connections between alerts in mixed alert groups in Express List, including how alert attributes relate to each other within the group.

Link View for mixed alert groups shows the connections between alerts in groups that combine different alert group strategies to form a single cohesive group.

To view how different alert groups are visualized in Link View, see the description of Link view for the relevant alert group types. Currently, mixed groups are composed of Tag cluster alert groups, CMDB-based alert groups, related log entities and shared impacted services.

For more information about alerts in the mixed alert group, see Mixed alert grouping.

For more information about Link View for related groups, see Viewing links between alerts in tag-based alert groups, and Viewing links between alerts in CMDB-based alert groups.

Viewing links between alerts in alert groups in Express List

View links between alerts in a group in Express List

View links between alerts in a group in Express List

Use Link View in Express List to view a visual representation of the relationships between alerts in a group.

Before you begin

Role required: evt_mgmt_operator or evt_mgmt_admin

About this task

For an overview of Link View in Express List, see Viewing links between alerts in alert groups in Express List.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the primary navigation, select the Express List icon ( ).
3. In the fields in the interactive filter panel, select **Group** and then the check box for the alert groups to display.

   Note: Link View is supported for the following alert group types:
   - Network traffic-based
   - Rules-based
   - Mixed alert groups, which include:
     - CMDB-based alert groups
     - Tag cluster-based alert groups
     - Related log entities
     - Shared impacted services

4. In the **Active alerts** list, select the description of an alert group.
   The preview panel opens to the **Alerts in group** tab, which lists all the correlated alerts in the selected group.
5. Navigate to **Link View**.
   Link View opens, displaying the relationships between the alerts in the selected group.
6. **Optional:** Customize the Link View display.

Task	Action
Focus on an area of interest	Select one or more nodes and rearrange them in Link View by dragging them to a new location.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

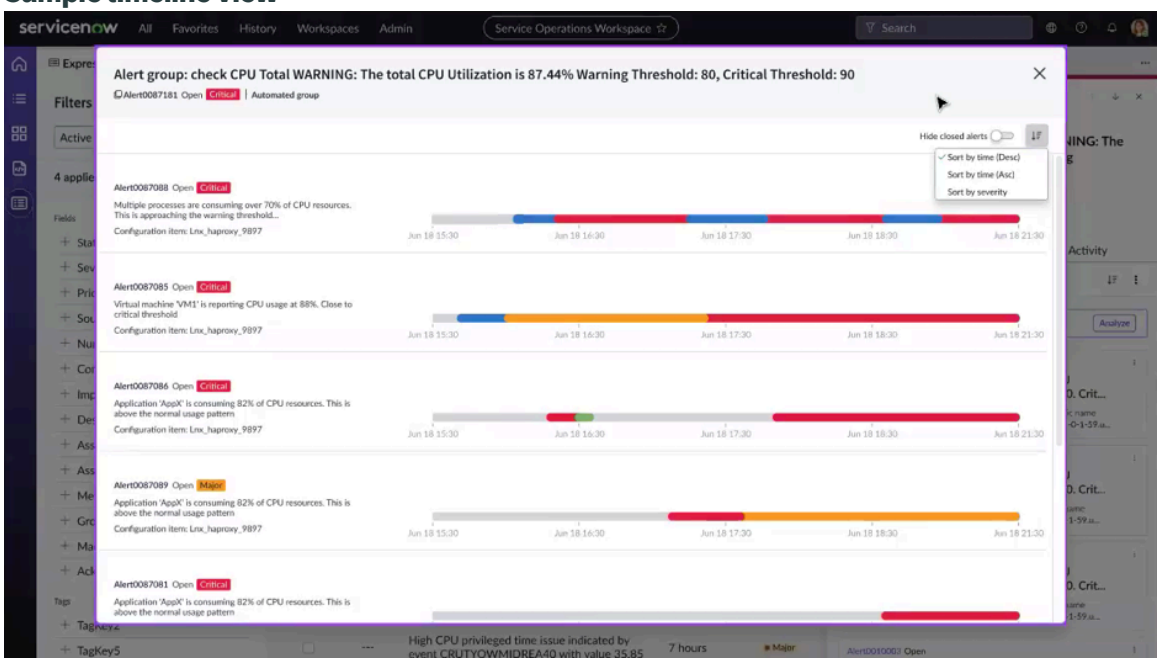
Task	Action
Refresh the alert group	Select **Refresh**. After refreshing the alert group, rearranged nodes appear in their original position again. Newly added nodes are marked as New. **Note:** The **Refresh** button is enabled when new data for the alert group is available. Link View doesn't refresh auto matically.
View the meaning of icons and colors	Select the Link View legend. (Optional) The legend also indicates the num ber of unique nodes displayed per tag. For a description of each tag, see Attributes in Ex press List Link View.
Reduce noise	In the Link View legend, toggle between hid ing and showing a tag type.
View information about an alert	Hover over a node to display text with informa tion about the alert.

Chronological alert data in an alert group

Visualize the chronological sequence of events within an alert group in Express List using the Timeline view. This feature provides a comprehensive overview of when the alerts occurred, their severity changes, and other pertinent data for efficient triage and Mean Time to Resolution (MTTR).

In Timeline view, each alert is represented by a bar, enabling you to quickly discern the order of occurrence, severity transitions, and closure status. The timeline begins with the creation of the first alert and extends to the present moment.

Sample timeline view



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Standard severity colors are used in the bars, with gray segments indicating periods before alert creation or after its closure. Hovering over a severity bar reveals a tooltip with key alert details.

Severity range by color in Timeline view

Color	Severity
	Critical
	Major
	Minor
	Warning
	OK

The title of the Timeline view for an alert group summarizes the group's description, number, state, severity, and grouping type, derived from the primary alert. Detailed information including alert number, state, severity, a brief description, and associated Configuration Item (CI) or node, when available, is displayed for each alert within the group.

Remove alerts from an alert group in Express List

Remove secondary alerts from an alert group directly from the Express List pane or from the preview panel.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Note: The evt_mgmt_user role is view-only and does not have permission to perform this action.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon .
3. Remove a secondary alert from an alert group.
   You can remove alerts from a group regardless of whether you are working in the main pane or in the preview panel. The preview panel opens only when a single alert or alert group is selected.

Location	Action
The Express List pane	**a.** In the Active alerts list, select the chevron icon ( ) at the beginning of one or more alert group rows to display the alerts con tained in the group. **b.** Select one or more secondary alerts. **c.** From the **Close** drop-down list at the top right of the list, select **Remove from group**. **Note:** When you are trying to remove the only secondary alert from an alert group, thereby ungrouping the group, a message displays that enables you to undo the action.
The Express List preview panel for a group of alerts	**a.** In the **Alerts in group** tab, select an alert tile. **b.** Select the more actions icon ( ). **c.** Select **Remove from group**.

Promoting alerts in Express List

Learn how to promote an alert to an incident or generate a case.

Create an incident with ServiceNow Otto in Express List

Create an incident with a human-readable, AI-generated description.

Before you begin

Currently, this feature is available for CMDB, Log Analytics, tag-based, and component-based alerts.

Role required: evt_mgmt_operator, evt_mgmt_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Note: The evt_mgmt_user role is view-only and doesn't have permission to perform this action.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon .
3. Create an incident from a selected alert.
   a. In the Express List pane, select the check box for the desired alert.

      Note: To display the individual alerts inside a group, select the chevron icon (›) at the beginning of the alert group row.

   b. Select the **Alert actions** drop-down list.

   c. Under **Response actions**, select **Create Incident with Otto**.

   An incident with a human-readable, AI-generated description is created from the selected alert and a confirmation message is displayed.

Create an incident from an alert with ServiceNow Otto in Express List

Create an incident with a human-readable, AI-generated description from the Express List pane by using AI.

Before you begin

Note: Currently, ServiceNow Otto for ITOM only supports tag-based, CMDB, Log Analytics, Mixed, Automated, and Network Traffic-based alert groups. For all other alert group types, it only analyzes the parent alert.

Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon .
3. Create an incident from a selected alert.
   a. In the Express List pane, select the alert.

      Note: To display the individual alerts inside a group, select the chevron icon (›) at the beginning of the alert group row.

   b. Select the **Alert actions** drop-down list.

operations teams. By monitoring issues and creating cases proactively, you can better correlate customer issues and provide faster responses.

If you are using the integration between the Customer Service Management and Event Management applications, you can create a case for the customer install base affected by an alert. For more details, see Manually create a proactive case from an alert. You can also activate an alert rule to automatically create a proactive case from an alert when an incident is created. For more details, see Activate an alert rule to automatically create a proactive case from an alert.

Express List reference

Reference topics provide additional information for configuring and using Express List.

Roles used by Express List

Detailed information on all roles that can access the Express List feature on the Service Operations Workspace.

Role title	Description	Contains roles
Event Management Administrator [evt_mgmt_admin]	Has read and write access to all Event Management features to configure Event Management. **Note:** Be careful with the evt_mgmt_admin role because it can be elevated to the admin role.	• evt_mgmt_user • template_editor_global
Event Management Operator [evt_mgmt_operator]	In combination with the evt_mgmt_user permissions, can also activate operations on alerts such as acknowledge, close, open incident, and run remediations.	evt_mgmt_user
Event Team Operator [evt_team_operator]	Manages Event Management operations within a specific team as defined in the **Assignment Group** field. This role allows the operator to read and write alerts exclusively for their assigned team. Additionally, the operator can make configuration changes specific to their team, including updates to Alert Automation and Integrations Launchpad.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role title	Description	Contains roles
	Note: The evt_team_operator role must be assigned to an assignment group to view and manage alerts for that group. If the role is created but not associated with any groups that have alerts assigned, the operator cannot see any alerts.	
Event Management User [evt_mgmt_user]	Has read-only access to all Event Management features. The contained itil role grants access to manage incidents that are created from alerts. Can only view Express List.	itil
Event Management Integrator [evt_mgmt_integration]	Has create access to the Event [em_event] and Registered Nodes [em_registered_nodes] tables to integrate with external event sources.	

Alerts in Service Operations Workspace

The Service Operations Workspace interface displays an alerts list and details on specific alerts.

When you click an alert in the alerts list, the **Details** tab of the selected alert appears. The issue that caused the alert appears in the alert title. Only the sub tabs relevant to the alert appear on the resulting page. For example, the **Alerts in Group** option appears in the **Related Records** tab only for alert groups.

View the alerts that Azure grouped into the issue in the alert list. The **Source** column displays A for these alerts.

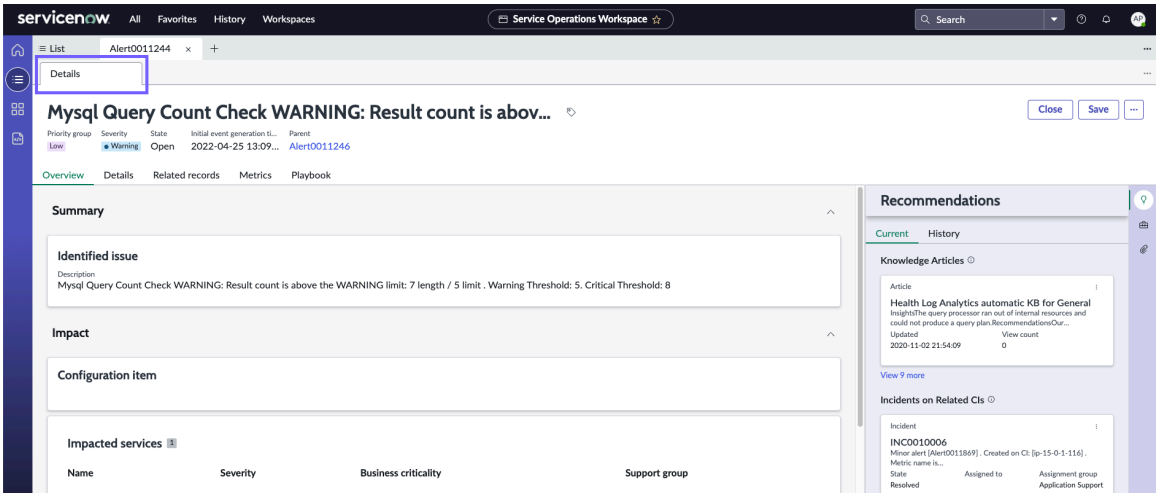
Details tab



The following table describes areas on the alert form.

Alert form areas

Feature	Description
Header	The header includes these details: • Description: The text from the **Description** field of the alert is displayed. • Priority group: Priority group to which the alert belongs. • Severity: Severity of the alert. • State: The state of the alert. • Initial event generation time: Date and time when the initial event was generated. • Parent: The primary alert in the group (relevant only for child alerts in a group). • Group: Group type to which the alert belongs (relevant only for alerts in a group). • Task: Number of the incident with which the alert is associated. The displayed information varies according to the alert type.
Overview tab	When viewing an alert with an assigned CI, this tab opens when selecting the alert. The information displayed varies depending on the type of alert (grouped, secondary, or primary). If you have installed the Health Log Analytics app, alert types include Health Log Analytics alerts and component-based alerts.
Details tab	Shows the alert's core attributes, including its number, configuration item, class, resource, type, severity, state, and full description of the identified issue. Alongside are assignment fields (assigned to, assignment group, task, parent) plus the work notes and a chronological Activity log tracking state changes and system events.
Related Records tab	Displays lists of records linked to the alert, grouped into categories: events, impacted services, service offerings, changes, configuration items, remediation tasks, incidents, and similar alerts.

Attributes in Express List Link View

The table lists the node attributes available in Link View with their icon and description.

Note: "Attribute" is a generic term that represents fields and tags found on the alerts or configuration items (CI).

Attributes in Link View

Attribute name	Icon	Description
Impacted service		Service in the Configuration Management Database (CMDB) impacted by an alert on a CI.
Resource		Node resource that is relevant to the event. For example, Disk C, CPU-1, the name of a process, or service. Maximum length: 100 characters.
Source		Event monitoring software that generated the event, such as SolarWinds or SCOM. Maximum length: 100 characters.
Region		Predefined attribute extracted from connector payload.
Location		Predefined attribute extracted from connector payload.

Attributes in Link View (continued)

Attribute name	Icon	Description
Assignment group		Alert assignment group.
Environment		Predefined attribute extracted from connector payload.
Metric		Unique name that describes which metric data is collected.
IP address		Predefined attribute extracted from connector payload.
CI		JSON string that represents a configuration item. For example, `{"name":"SAP ORA01","type":"Oracle"}`. The CI identifier that generated the event appears in the Additional information field. Maximum length: 1000 characters.
Node		Node name, fully qualified domain name (FQDN), IP address, or MAC address that is associated with the event, such as IBM-ASSET. Maximum length: 100 characters.
Application		Predefined attribute extracted from connector payload.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Attributes in Link View (continued)

Attribute name	Icon	Description
Process		A process or a cluster of processes running on the host that are identified by the horizontal discovery.
Component		A logical part of a service instance where the alert was detected, with one component shown for each child alert.
Service		Attribute extracted from the log file. The impact of this alert on the service might not be clear or defined.
Host		Attribute extracted from the log file. It might not be identified in the CMBD.
User		Attribute extracted from the log file.
Account		Attribute extracted from the log file.
Path		Path or route extracted from the log file.
Request id		The request ID extracted from the log file.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Attributes in Link View (continued)

Attribute name	Icon	Description
URL		Web address or URL extracted from the log file.
Detection		An identified anomaly on a metric measured by Health Log Analytics.
Other **Note:** This attribute is user-defined. All the other attributes are predefined in the system.		User-defined attribute. **Note:** All the other attributes are predefined in the system.

Lines linking attributes

Link	Visual representation	Description
Solid line		Solid line linking attributes in Link View, indicating that the attributes share one or more alerts.
Dotted line		Dotted line linking attributes in Link View, indicating that the attributes are correlated by grouping criteria.

Alert field mapping on the Respond page

The fields to be configured on the Respond page, when selecting an action to be triggered by an alert automation.

Select automation actions fields

Field	Description
Incident field name	Name of the field that will appear in the incident.
Map field	Option that indicates how the incident field is to be mapped:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Select automation actions fields (continued)

Field	Description
	• **Same as**: The selected incident field will have the same value as the indicated alert field. • **To**: The selected incident field will be set to a specified value.
Alert field value	Value that will be set in the alert field: • If you select **Same as** in the Map field column, the alert field value that you want to appear in the incident field also appears in the Incident field name column. • If you select **To** in the Map field column, enter the alert field value that you want to appear in the specified incident field.

To return to the procedure, see Create Respond automation.

Using Event Management

As an Event Management operator, your role is to find alerts, analyze them, and take action to help resolve the underlying issue.

This guide can assist you on a regular basis.

View alert information

View a list of all alerts for application services s, and then manage individual alerts as necessary.

Before you begin

Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task

Multiple related events may correlate into a single alert. Event Management only creates alerts when one or more events meet the conditions defined in event rules, alert action rules, and alert configuration settings.

When updating an alert, empty field values do not override values inherited from the alert's event.

Procedure

1. Navigate to **All** > **Event Management** > **All Alerts**.

Note: To stop the message from appearing, set the *show_sow_enhanced_experience_message* property in the [sys_properties] table to false.

2. To view or manage an alert, click the alert number.
3. Review the information on the Alert form.
   You can click tabs on the form for further information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To view flapping information, click the **Flapping** tab.
- To view alert history, click the **History** tab.

Alert form

Field	Description
Number	If an alert was created as a result of the event, this field contains the unique ID that Event Management generates to identify the alert.
Source	Event monitoring software that generated the event, such as SolarWinds or SCOM. Maximum length: 100 characters.
Node	Node name, fully qualified domain name (FQDN), IP address, or MAC address that is associated with the event, such as IBM-ASSET. Maximum length: 100 characters.
Type	The metric type to which the event is related, such as Disk or CPU, which is used to identify an event record from which alerts are created. Maximum length: 100 characters.
Resource	Node resource that is relevant to the event. For example, Disk C, CPU-1, the name of a process, or service. Maximum length: 100 characters.
Configuration item	JSON string that represents a configuration item. For example, `{"name":"SAP ORA01","type":"Oracle"}`. The CI identifier that generated the event appears in the **Additional information** field. Maximum length: 1000 characters. Note: Reference pop-ups and click-throughs are hidden by default for read-only fields. For **Configuration item** and other read only fields, you can optionally change the read-only setting. For more information, see Configure pop-ups on read-only fields . Click to open the alert in dependency view.
Task	The corresponding task for the alert, such as an incident, change, or problem.
Metric Name	Unique name that describes which metric data is collected.
Description	A description of the alert.
Message key	Unique event identifier to identify multiple events that relate to the same alert. If this value is empty, it is generated from the **Source**, **Node**, **Type**, **Resource**, and **Metric Name** field values. Maximum length: 1024 characters.
Severity	The severity of the event. The value for this field is copied from the event unless the event closes the alert, in which case the previous severity is retained for reporting. ○ **Critical**: Immediate action is required. The resource is either not functional or critical problems are imminent. ○ **Major**: Major functionality is severely impaired or performance has degraded. ○ **Minor**: Partial, non-critical loss of functionality or performance degradation occurred. ○ **Warning**: Attention is required, even though the resource is still functional.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **OK**: An alert is created. The resource is still functional. ○ **Clear**: No action is required. An alert is not created from this event. Existing alerts are closed.
State	The state of the alert. ○ **Open**: The alert requires user action. ○ **Reopen**: The previously closed alert requires additional user action. ○ **Flapping**: After the alert has been closed, it receives a high frequency of identical events from the same source that causes many alert reopenings. User action is required. ○ **Closed**: The alert is closed and no further user action is required.
Acknowledged	Select **Acknowledged** to indicate that a user has acknowledged the alert.
Maintenance	A check box that shows whether the resource that is affected by the alert is in maintenance.
Updated	The most recent time that the alert information was updated.
Parent	○ If this field is blank, you can specify an alert number. The current alert becomes a secondary alert to this parent alert. ○ If an alert number is displayed, then the current alert is already a secondary alert to this current alert, which is the parent alert.
Feedback	This field appears in alert forms only if the alert being modified is a parent alert. Your response provides feedback about the accuracy and usefulness of the group. Possible values are: ○ None - No value was selected. ○ No Feedback - There is no feedback for this alert. ○ Yes - The alert group is accurate and useful. ○ No - The alert group is not accurate and not useful. **Note:** Currently, the feedback option is available but does not trigger further actions after being logged.
Knowledge article	The knowledge article associated with the alert, if any.
Overall Event Count	The counter is increased every time an event is bound to the alert. The count value is kept even after the actual event has been purged. Primary alerts (virtual alerts) are updated based on their secondary alerts. The actual number of events that affected the alert is displayed. **Note:** Do not create an Alert Group based on Event Count. Where an Alert Group is based on Event Count, the impact of the group does not calculate properly because the Event Count field is not copied to the em_alert_history table for impact calculation.
Source instance	The name of the machine or software that generated the event. For example, SolarWinds on 10.22.33.44.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
User name and role	The user and role of the person who made the most recent alert updates.
Acknowledged	The **Acknowledged** check box value after the most alert recent update. ○ *True*: The **Acknowledged** is selected. ○ *False*: The **Acknowledged** check box is cleared.
Correlated Alerts section	The secondary alerts that are correlated with this alert, where this alert is the primary alert. For more information, see Rule-based alert grouping.
Primary Alerts section	The primary alert that is correlated with this alert, where this alert is a secondary alert. For more information, see Rule-based alert grouping.

Additional tabs.

Field	Description
Impacted Services tab	
Impacted Services	The impacted services that are related to this alert are listed. For more information, see View the impact tree.
Flapping tab	
Flap count	The number of times the alert has flapped—that is, has fluctuated between a closed and a non-closed state—within the flap interval since the start time in the **Flap start window**.
Flap start window	The initial start time to measure the flapping occurrences.
Flap last update time	The last time flapping occurred. This time is the platform processing time, not the source system time.
Flap last state	The state before the alert entered the flapping state.
History tab	
Initial event generation time	The time when the event that generated the alert first occurred. This time is the platform processing time, not the source system time.
Last event generation time	The last time the event that is linked to the alert occurred. This time is the platform processing time, not the source system time.
Created	The time that the alert was created.
Work notes	The additional notes about the alert.
Activities tab	
Activity	A record of the work that was performed. The text has a date and time stamp.
More Information tab	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Priority Breakdown	Displays the computation of the alert priority score.
Additional information	A JSON string that gives more information about the event. The JSON data is supported for String values only, other value types are not supported. You must convert numbers to String values by enclosing them in double quotes. For example, this value is not supported: {"CPU":100 } while this value is supported: {"CPU":"100"}. Another example of a valid JSON string is: {"evtComponent":"Microsoft-Windows-WindowsUpdateClient","evtMessage":"Installation Failure: Windows failed. Error 0x80070490"}. This information can be used for third-party integration or other post-alert processing. Values in the **Additional information** field of an Event that are not in JSON key/value format are normalized to JSON key/value format when the event is processed. For example, assume that the following plain text is in the **Additional information** field "Connection instance is successful". When the event is processed, all this plain text becomes one JSON string and might not be useful within an alert. In the resultant alert, this string is in the **Additional information** field in JSON key/value format, containing the data: {"additional_content": "Connection instance is successful"}.

What to do next

You can respond to the alert in the following ways:

Alert response options

Option	Description
Submit	Save the modifications that were made to the form and return to the **Alerts** list.
Acknowledge the alert.	Click **Acknowledge**. If the alert is reopened, this button reappears so you can reacknowledge the alert.
Create an incident.	Click **Create incident**.
If Security Incident Response is activated, create a security incident response.	Click **Create Security Incident**.
Designate that the alert is in maintenance.	Select the **Maintenance** check box. For more information, see View all alerts by the maintenance status.
Close the alert.	Click **Close**. For more information, see Close an alert.

Security incidents created from events and alerts

Priority group

For better triage and focus, alerts that have a higher priority are brought to the top of the alert list. This placement brings to your attention those alerts that require you to handle them at a higher priority than other alerts.

The priority group indicates which alerts should be attended to first. Priority is calculated for each open alert and then mapped into one of four priority categories.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Thresholds

Thresholds on the calculated priority are used to determine to which category the alert is mapped to. Alerts with a priority above the value of the *evt_mgmt.top_priority_group_threshold* property are categorized as **Urgent**, which is the highest priority. The default value of this threshold is 1M.

Priority group categories

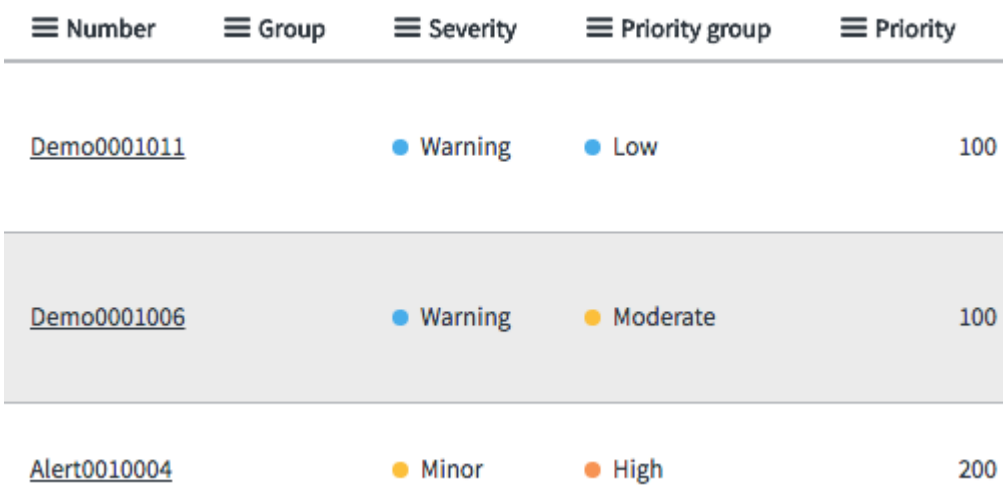
The priority groups into which alerts fall are listed in the following table.

Alert priority groups

Priority group	Icon
Urgent	
High	
Moderate	
Low	

The value of the alert priority group is more meaningful than the alert severity on its own. For example, an alert with a severity of Major, may not be in need of resolution ahead of an alert whose priority is Critical. The combined group priority value takes the weight of each factor into account, giving you a better indication of which alert to attend to first.

The alert priority group is available in alert lists in the Dashboard, Alert Intelligence, and All Alerts page. For example, in the **All Alerts** list, the alert priority group is displayed as depicted in the following image.



Triggers that cause recalculation

Changes to open alerts trigger the recalculation of the priority and then the alert is again categorized into the relevant priority group. Closed alerts are not considered for alert priority group calculation.

Alert execution information

Alert execution information provides a reference to the actions that have been performed concerning the alert. Among the information presented is which alert management rules ran on the alert, incidents that were opened, and which remediation workflows ran.

Alert Executions

In an alert form, the Alert Execution tab shows key related records for the alert. For example, it shows which actions were performed and which alert management rules were run. If an incident was opened, the related tasks are shown.

Alert Executions

Fields in the Alert Executions section

Field	Description
Alert	Reference to the alert that ran under this rule.
Action name	Indicates how the alert was resolved.
Link to execution	Link action that was taken to resolve the alert.
Related task	Link to the incident that was created when the alert was resolved.
Log	Link to the log that details the actions taken to resolve the alert
Automatic run	Indicates if the rule was automatic (true) or manual (false).

Action name

This indicates what occurred, for example, if an incident was created.

Log

The log reveals which alert management rule initiated the action. It shows, for example, automatic execution 1 out 3, or manual execution, 2 out of 4.

View alerts in the flapping state

You can view alerts that are specifically in the flapping state.

Before you begin

Before starting this procedure, ask your administrator to configure alert flapping properties.
Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task

Flapping occurs when the event source continues to generate events even after its associated alert has been closed. Flapping causes the resource's status to repeatedly fluctuate between the *OK* severity and a severity requiring attention, for example, *Critical*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The frequency of events from an identical source within a given time interval determines whether an alert is in a flapping state or a new issue has occurred. Based on the *evt_mgmt.flap_frequency* and *evt_mgmt.flap_interval* property values:

- If the same issue is recurring, Event Management associates the new event with the existing alert and the state of the alert is set to **Flapping**.
- If the issue occurs after the time interval expires, Event Management creates an alert.

For example, you can respond to an alert by rebooting a problematic server. After no events are generated for several minutes, it is assumed that the issue is fixed and the alert is closed. If the reboot did not actually fix the issue, this server can generate more events later. Then additional alerts are generated for the same issue.

Procedure

1. Navigate to **All** > **Event Management** > **All Alerts**.
2. Click the number of an alert that is in the **Flapping** state.
3. On the alert, click the **Flapping** tab.

Flapping tab on Alert form

Field	Description
Flapping tab	
Flap count	The number of times the alert has flapped—that is, has fluctuated between a closed and a non-closed state—within the flap interval since the start time in the **Flap start window**.
Flap start window	The initial start time to measure the flapping occurrences.
Flap last update time	The last time flapping occurred. This time is the platform processing time, not the source system time.
Flap last state	The state before the alert entered the flapping state.

4. If the **Parent** field is empty, address this alert as a new issue.

Related topics

Configure alert flapping

View all alerts by the maintenance status

The **Maintenance** status indicates that the CI is under maintenance. For example, there is a software upgrade, and the issues can result from that activity, therefore all maintenance alerts are discarded.

Before you begin

Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task

The alert maintenance status can change due to any of these reasons:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- A user selected the **Maintenance** check box on the alert, or selected the alert from the list view, and then clicked the **Maintenance** UI action.
- A new alert that had been bound to a CI whose status is in maintenance status on the CMDB table.
- If all previous events associated with the alert are in maintenance, the alert **Maintenance** field can automatically be set to *true* showing maintenance is in progress. However, if an alert **Maintenance** field is *false* but the related CI status is changed to *In Maintenance* after the alert was created, any subsequent events do not put the alert into maintenance. For example, if an alert is generated for a router and later the router is taken down for maintenance, it is still assumed that there was a problem before maintenance started and the issue must not be ignored.

Note:

- If a maintenance flag was set on an alert in Geneva, after upgrading to Helsinki it affects the impact as a regular alert.
- If an alert is bound to a CI by a user action (such as an alert management rule) and the CI is in the Maintenance state, you must manually bind the CI to the alert and mark it with the **In Maintenance** status.

Procedure

1. Navigate to **All** > **Event Management** > **All alerts**.
2. Review the **Maintenance** column for each alert.
   A value of *true* indicates that the CI is under maintenance.

Note: If the **Maintenance** field is not visible on the Alert form, personalize the list to add the field. For more information, see Personal lists.

Collaborate from within an alert

You can collaborate with colleagues and write work notes while working in an alert.

Before you begin
Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task
You can select to work either in a compact view of Connect that overlays the standard user interface or in a full-screen workspace. The conversations are not copied into the alert.

Procedure

1. Navigate to **All** > **Event Management** > **All Alerts**.
2. Click the required alert.
3. In the alert screen, click **Follow**.
   The label of the button changes to **Following**, showing the current connection to collaboration status.
4. To view the Connect sidebar in a full window, click the down arrow in the **Follow** button and select **Open Connect Full**.
   You can write text in the **Worknote** field. This text is not copied into the alert.
5. To collaborate with colleagues or with support, click the **Add User** icon.
6. To conclude the Connect collaboration session, click **Following**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Place an alert into maintenance

You can manually place any alert into maintenance to hide it from the Alerts list and Agent Workspace.

Before you begin

Role required: evt_mgmt_admin, evt_mgmt_operator

About this task

Placing the alert in maintenance does not place the CI into maintenance. The **Status** field on the CI record remains the same.

Procedure

1. Navigate to **All** > **Event Management** > **All Alerts**.
2. Perform one of the following actions.

Option	Description
To put multiple alerts into maintenance	Select the check boxes next to each alert, and then click the **Maintenance** UI action at the top of the list.
To put one alert into maintenance	Open the alert, and either select the **Maintenance** check box and click **Update**, or click the **Maintenance** UI action at the top of the list.

Alert insight information

Alert insight aids faster alert triage, enabling a quicker way to find a solution and expose the probable root cause of the selected alert.

Use alert insight to find a solution and help find the root cause of the alert

Results from data analysis provide further information about the alert, beyond that of the alert form. This aids faster alert triage, enabling a quicker way to find a solution and expose the probable root cause of the alert.

Information shown is from repeated alerts, similar alerts, incidents, problems, and change requests on the same CI, similar CIs, and other CIs that are related by CMDB relations or grouping.

Apply a quick response in an alert

In an alert, use the *Quick Response* feature to apply remediation to the alert or to launch a web application.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

About this task

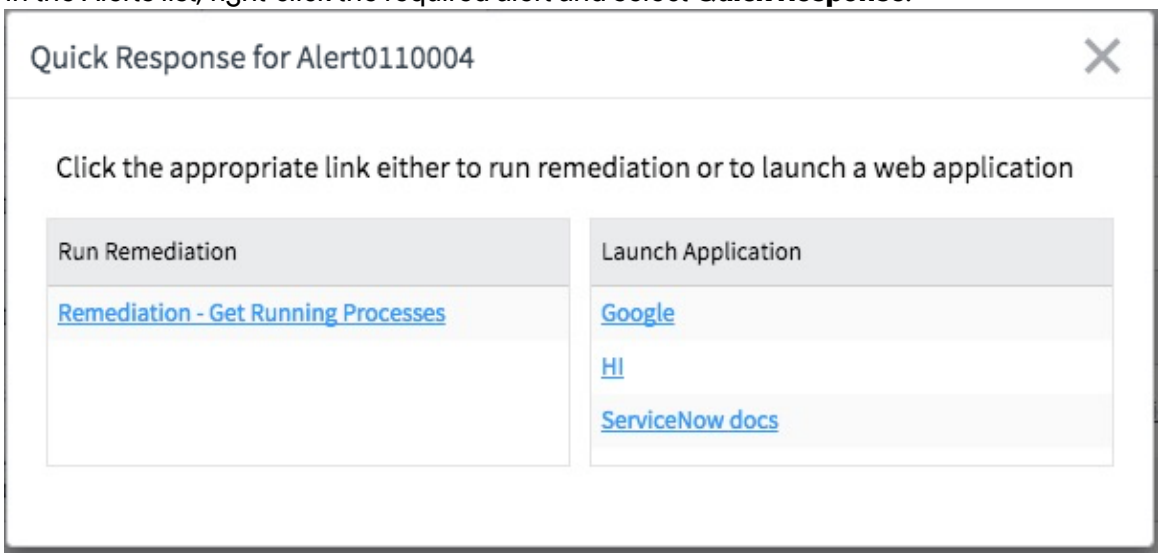
Quick Response is a feature that enables you to perform a quick action on the selected alert. The action is to apply remediation or to launch an application. If you have upgraded from Istanbul or earlier, this feature is a combination of the **Remediation** and **Launch an application** features.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you select a remediation link when invoking a Quick Response, a workflow is executed according to the criteria specified in the alert management rule. Click a launch application link to launch the web application that was configured in the alert management rule. For further information, see Migrate an alert action rule to an alert management rule.

Procedure

1. Navigate to **All** > **Event Management** > **All Alerts**.
2. In the Alerts list, right-click the required alert and select **Quick Response**.



3. In the Quick Response page, click the required link to perform the required action.
   If the link that you require is not available, perform one of these actions.

Option	Description
For Remediation, define a remediation task using an Alert rule based on the selected alert	**a.** Navigate to **Alert Rules**. **b.** Select the required alert management rule to edit. **c.** Click **Remediation**. **d.** Click **Enable Remediation**. **e.** In the **Execution** field, select either Auto matic or Manual. **f.** In the **Orchestration** workflow field, specify the remediation workflow. ▪ For **Orchestration**, in the workflow set tings, select **Remediation Task [em_re mediation_task]** in the **Table** field. ▪ After you finish configuring the orchestra tion workflow, publish it. **g.** Click **Update**. For further information, see Migrate an alert action rule to an alert management rule.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
For Launch Application, create a web application link using an Alert rule based on the selected alert	**a.** Navigate to **Alert Rules**. **b.** Select the required alert management rule to edit. **c.** Click **Launcher**. **d.** Click **Enable**. **e.** In the **Display Name** field, specify a name for the link. **f.** In the **URL** field, compose the URL using data from the alert in the format: `${source}.com:${port}/${cmdb_ci.name}` **g.** Click **Update**. For further information, see Migrate an alert action rule to an alert management rule.

What to do next

To create a remediation task or web application link, see Migrate an alert action rule to an alert management rule.

Related topics

Launch web application from alert

Monitor service health

On the Operator Workspace, you can view alerts by application services, technical service, and alert group. For services, you can also open a service map to view relationships between CIs in the service.

Before you begin

Ask an administrator to create at least one application services, technical service, or alert group if none of these items exist.

Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task

The Operator Workspace tiles represent a service, alert group, or CI. The tile color represents the overall alert severity.

Note: Event Management Dashboard is not supported for new instances in the Paris release. However, instances upgraded from a release prior to Orlando that use Event Management Dashboard can continue to do so.

These tile icons are available:

Dashboard tile icons

Icon	Meaning
	Represents the status of a mapped application services.
	Represents the status of an Alert group with a set of corresponding open alerts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dashboard tile icons (continued)

Icon	Meaning
	Represents the status of a dynamic CI group.

Each tile represents the highest severity of an alert for the service, alert group, or CI. For example, a tile appears in red if an alert is critical. A green tile indicates either information alerts or no currently active alerts. As the alert severities change, the tile colors update accordingly. The following severities are available:

- **Red**: critical severity (highest severity). Immediate action is required. The resource is either not functional or critical problems are imminent.
- **Orange**: major severity. Major functionality is severely impaired or performance has degraded.
- **Yellow**: minor severity. Partial, non-critical loss of functionality or performance degradation occurred.
- **Blue**: warning severity (lowest severity). Attention is required, even though the resource is still functional.
- **Green**: informational. No severity. An alert is created. The resource is still functional.

Procedure

To integrate with Operational Intelligence, activate the Operational Intelligence (com.snc.sa.metric) plugin.
Follow the steps in the Get started with Metric Intelligence topic. Metrics information appears on the **Metrics** tab in the Service Operations Workspace.

Related topics

View metric values in the Insights Explorer

View discovered service history

The discovered service history shows the frequency of discovered services for a particular time period.

Before you begin

Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task

The discovered services history appears only when there are multiple discovered services that occur over a period. A discovered service is a service that is discovered by Service Mapping. The discovered services history is not available for application services. If no discovered services are generated for a particular service, the discovered services history is hidden.

Procedure

1. Navigate to **All** > **Event Management** > **Service Operations Workspace**.
2. Click a service tile and click **Service Map**.
3. Click the **History map** button.

   The history timeline appears, with changes to the service indicated by a clock icon ( ).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. To view a map showing changes in the service's severity, click the More icon ( ) and select **Advanced map**.

The displayed color corresponds to the discovered services severity. The length of the bar in each color corresponds to how long the discovered services stayed at that severity.

The following table explains the severity colors:

Service severity colors

Severity	Icon color
Critical	Red
Major	Orange
Minor	Yellow
Warning	Blue

5. To change the information that appears on the discovered services history Advanced map, click a history icon.

- **Calendar icon**: Show information for currently active discovered services.
- **Hours**: Show information for discovered services that occurred in the past hour.
- **Days**: Show information for discovered services that occurred in the past 24 hours.
- **Weeks**: Show information for discovered services that occurred in the past week.
- **Months**: Show information for discovered services that occurred in the past month.

Monitor alerts for an application services

To view information for application services only, navigate to the application services list. From this list, you can open service maps to view and manage alerts for the CIs in each service.

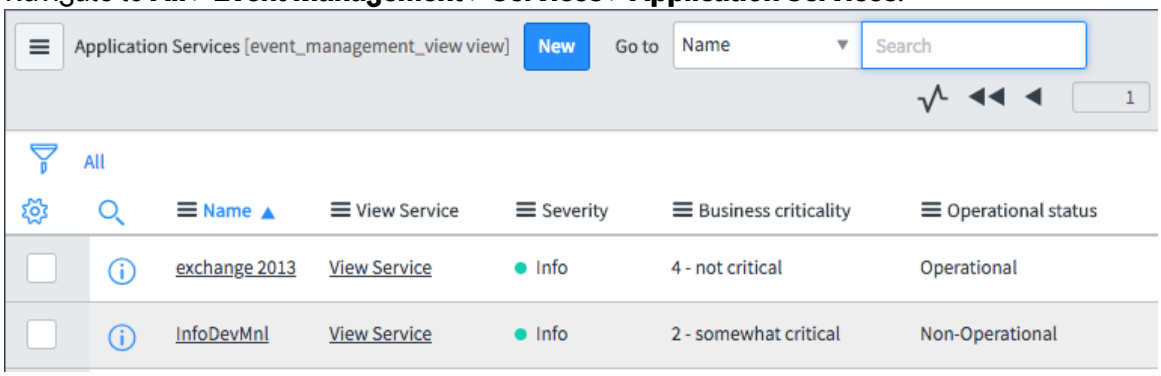
Before you begin

Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Event Management** > **Services** > **Application Services**.



2. In the row of the required application services, click **View Map**.
3. Do one or more of the following.

Option	Action
View alert details for a CI	In the service map: **a.** Click a CI tile. **b.** Below the map, click the **Alerts** tab and re view the listed alerts.
View impact on the CI parent	In the service map: **a.** Click a CI tile. **b.** Below the service map, click the **Impact** tab and review the listed impact rules. **c.** Adjust the impact rules as necessary.
Change the map display, map layout, or map indicators	In the service map header: **a.** Click the menu icon. **b.** Configure the appropriate settings.
Navigate to another application services	In the service map header: **a.** Click the down arrow next to the service name or the folder icon for all services. **b.** Search for and select another application services ( ). The icon color represents the highest impact or severity for active alerts on the application services. ○ **Critical**: Red (highest severity). ○ **Major**: Orange. ○ **Minor**: Yellow. ○ **Warning**: Blue (lowest severity).
View properties for a CI	In the service map:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Action
	a. Click a CI tile. **b.** In the side pane, click the **Properties** tab and review information about the CI. **c.** If you want to view more detailed informa tion, scroll to the end of the pane and click **Detailed Properties**.

View monitored services

View all services that Event Management supports, such as, alert groups, discovered services, application services, and technical services. According to the type of service, you can view service definition details or drill down into the service.

Before you begin

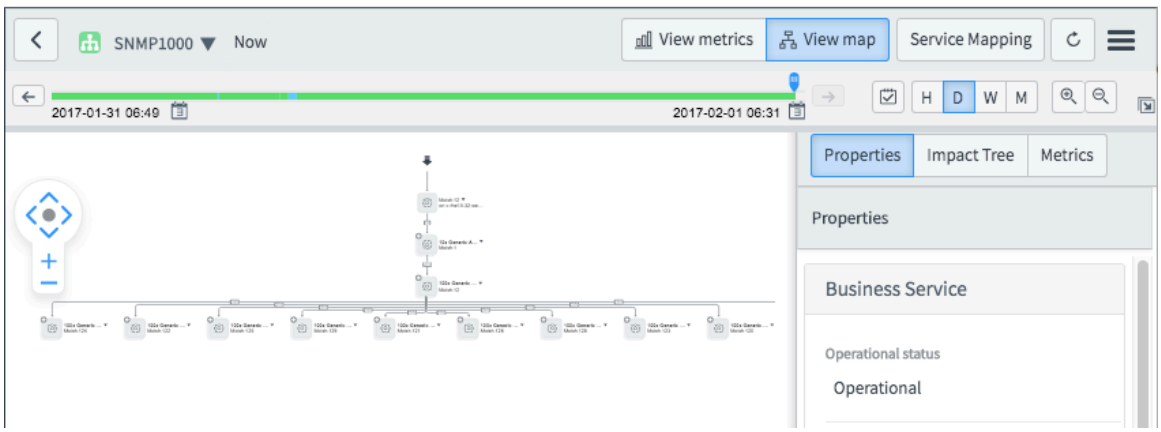
Role required: evt_mgmt_user

Note: Application services that were created before activating the Event Management plugin are not listed in the in the **View Service** column of the Monitored Services list.

Procedure

1. Navigate to **All** > **Event Management** > **Monitored services**.
2. Click **View Service** to open the view that is relevant to that service.
   When you drill down to the contents of the service, either a map, alert list, or CI list appears according to the type of service.

   For example, if you click **View Service** for SNMP1000, you can drill down to the contents of the service and the related topology map appears.



3. To view service definition details of a service, click the name of the service on the **Monitored services** page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, in the **Name** column, click SNMP1000 (SNMP1000).

Monitor service health

Use the Event Management overview dashboard

The Event Management overview module uses Performance Analytics to present data from your instance for you to better visualize and understand your processes and drive continual improvement.

About this task

From the Xanadu release onward, the Event Management overview module has been deprecated and replaced with the AIOps dashboards. The dashboards deprecated include the following:

- Event Management insights
- Event Management scorecards
- Event Management overview

The AIOps dashboards offer comprehensive visualizations of critical operational data. You can monitor key performance indicators (KPIs), track service health, and gain valuable context on the overall IT environment. For more information, see AIOps Dashboards in Service Operations Workspace for ITOM.

Performance Analytics and Reporting

Launch web application from alert

You can launch a web application from an alert that matches the conditions set in an alert action rule.

Before you begin

Create an alert action rule that is configured to prepare a URL when the conditions that you stipulate are met. For example, based on the results when the alert parameters are resolved, this feature can open a Knowledge Base article or construct a URL.

Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Right-click an alert in All Alerts or the Alert list in the Event Management Dashboard (for instances upgraded from a release before Orlando), and choose **Quick Response**. Click the required link to launch the web application that was configured in the alert action rule. For further information, see Migrate an alert action rule to an alert management rule.

Procedure

1. Navigate to **All** > **Event Management** > **All Alerts**.
2. Right-click the required alert and select **Quick Response**.
   A window appears with a list of available web applications that were configured in the alert action rule and the filter that matches the alert. To see the target URL, point to the cursor over the application name.

   Note: If one or more of the alert action rule parameters cannot be resolved, the related application name appears in black. When the alert parameters are resolved, then the application name becomes a link.

3. Click the name of an application to open the URL in another tab or window in your browser.

Example:

A common use case is launch in context to the source management system.
Other examples include to search in knowledge bases, not only within ServiceNow, but externally as well. Any URL-based action can utilize the alert parameters and the URLs can refer to wikis, messaging services, REST APIs, and so on.

Event Management Operator Tutorial

As an Event Management operator, your role is to find alerts, analyze them, and take action to help resolve the underlying issue.

Note: The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

Take the tutorial

Before you can work as an operator, take a tutorial to become familiar with several Event Management concepts. The tutorial helps you understand what operators typically do on a regular basis.

Start the tutorial by clicking the first lesson:

Lesson 1	An overview of events and alerts
Lesson 2	An overview of application services

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Lesson 3	Event Management operator workspaces
Lesson 4	What operators do

An overview of alerts for Event Management operators

As an Event Management operator, understand how alerts are generated from events, what to look for in alerts, and how alerts are grouped.

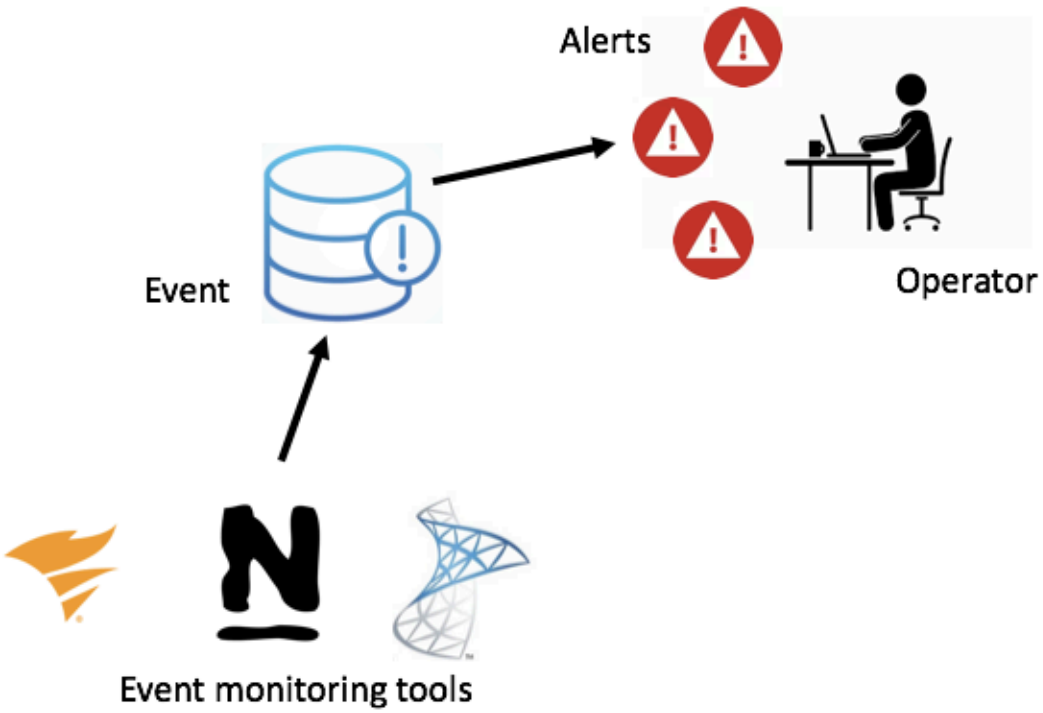
This is the first lesson in the Event Management tutorial.

Lesson 1		**An overview of events and alerts**
Lesson 2		An overview of application services
Lesson 3		Event Management operator workspaces
Lesson 4		What operators do

Your organization already has an event monitoring tool in place, such as Microsoft System Center Operations Manager (SCOM), Nagios, SolarWinds, and so on. When an issue occurs on your network, such as a computer going down or a database failure, the event monitoring tools send events to your ServiceNow instance. The Event Management application processes the events according to the settings that your administrator configured, and then generates alerts. An alert is an indicator that the issue requires some type of action.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert generation



As an Event Management operator, your role is to view alerts. Depending on how Event Management is implemented in your organization, take an action to help resolve the underlying issue or notify someone who can. Later in this tutorial, you will see the phases of a typical alert management process.

Alert priority and severity

The two most common characteristics of an alert are the priority and the severity.

- The priority of an alert is a score that helps you determine how important the impact is to application services. Multiple factors determine the alert priority score. Your Event Management administrator can configure the algorithm that the Event Management application uses to calculate priority.
- The severity of an alert is an indicator of how serious the underlying issue is. The event monitoring tool in your organization usually sends severity values with the event, which then gets carried over in the alert. These are the default severity types that you will see in this tutorial:

Severity	Description
Critical	The resource is either not functional or critical problems are imminent.
Major	Major functionality is severely impaired or performance has degraded.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

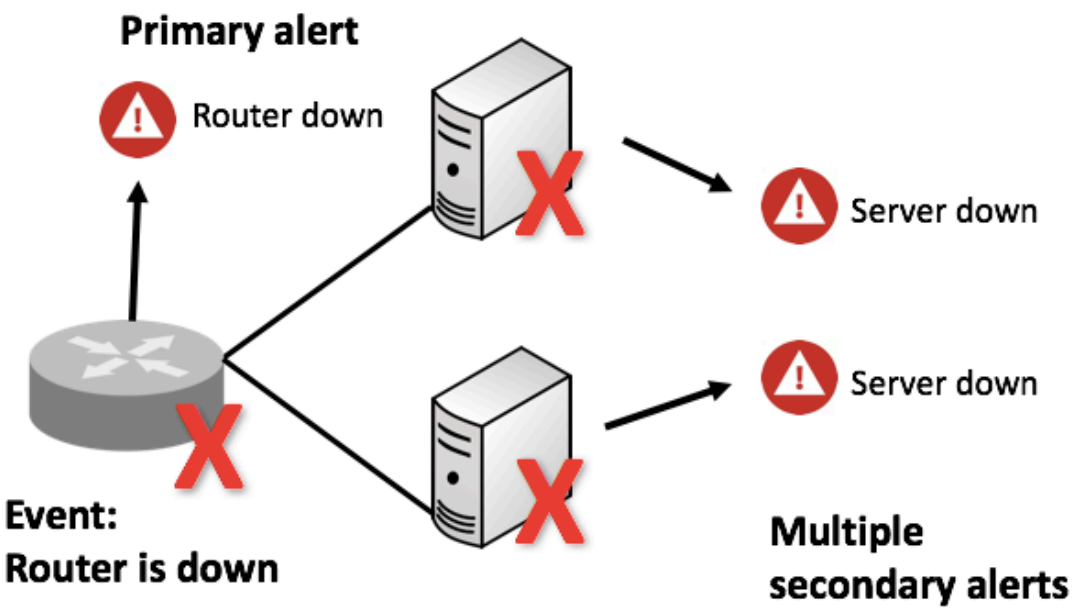
Severity	Description
Minor	Partial, non-critical loss of functionality or performance degradation occurred.
Warning	Attention is required, even though the resource is still functional.
OK	No severity. An alert is created. The resource is still functional.
Clear	The alert no longer needs action.

Correlated alerts

Some alerts are related to each other. For example, if a router goes down, several separate alerts could be generated, one for each server connected to the router. All of these alerts are related, or correlated. To help you manage correlated alerts, Event Management can automatically group them and establish a two-level hierarchy. One root alert, called the primary alert, appears at the top, and other related alerts, called secondary alerts, appear under the primary alert. When you view alerts, primary alerts stand out by default so you know which alert to focus on without being distracted by the secondary alerts.

In our example, if a router goes down on your network, network communication is also affected for connected servers, assuming they cannot reach any other routers. The router outage becomes the primary alert and the alerts generated on the server are secondary alerts that are correlated under the router alert.

Secondary alert generation



Depending on your organization's Event Management implementation, alerts might be grouped automatically based on correlation rules that your administrator sets up. Your instance can also learn how to improve the way it correlates alerts based on these rules. As an operator, you should still verify the accuracy of the correlation and, if necessary, manually correlate additional alerts with the primary alert. Later in the tutorial, you will learn how to do this.

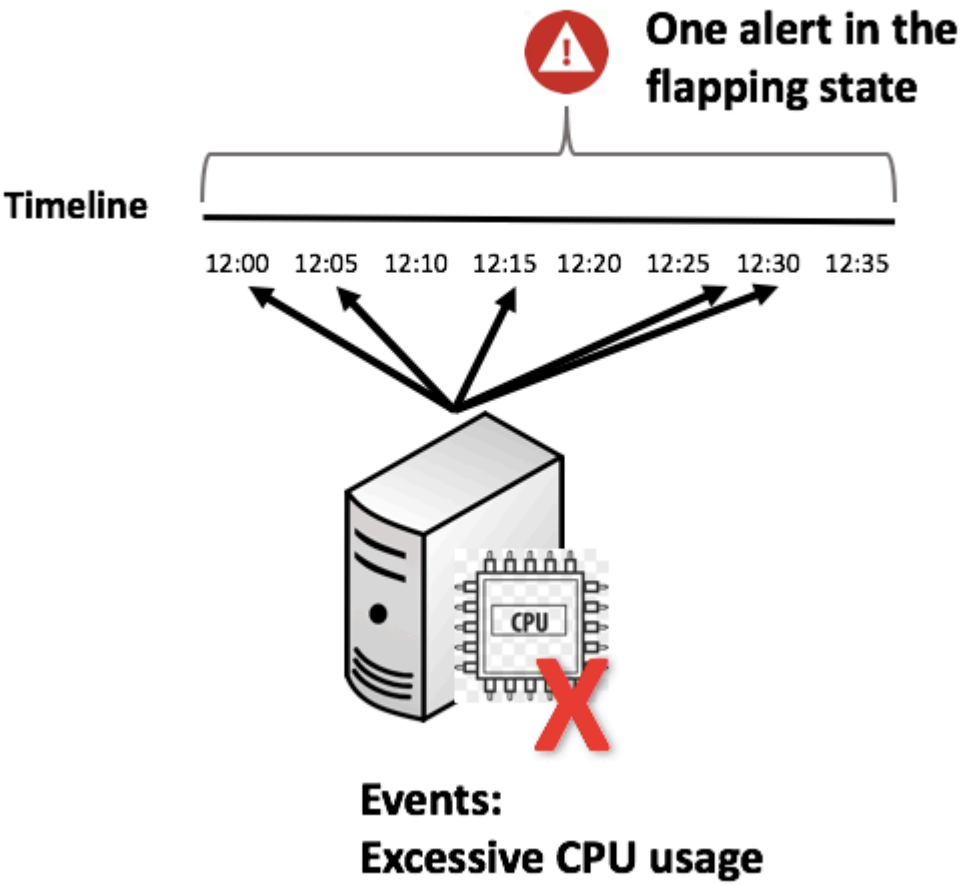
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In this tutorial, you will learn how to manually correlate alerts.

Alert flapping

An alert can flap, meaning that it gets multiple open-close events in rapid succession. Flapping indicates that Event Management does not know whether the underlying events are genuine or not. The events could indicate small issues with the way CIs are configured, or larger issues, like network outages.

Alert flapping



For example, if a server that hosts a web service has too many active processes, it might trigger an event about excessive CPU usage. Since CPU usage can fluctuate rapidly depending on web service requests, several events might be triggered, leading to the alert being put in the flapping state. As an operator, you might need to create an incident to have the server restarted. Someone might have to reconfigure the CPU or make a hardware change on the device.

As another example, consider a loose network cable that causes momentary, repeated network outages. The thresholds that your administrator configures might not be optimal for this kind of alert and Event Management considers it a flapping alert.

Continue the tutorial

Proceed to the next lesson: Application services for Event Management operators.

Application services for Event Management operators

As an Event Management operator, you need to understand what application services are.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

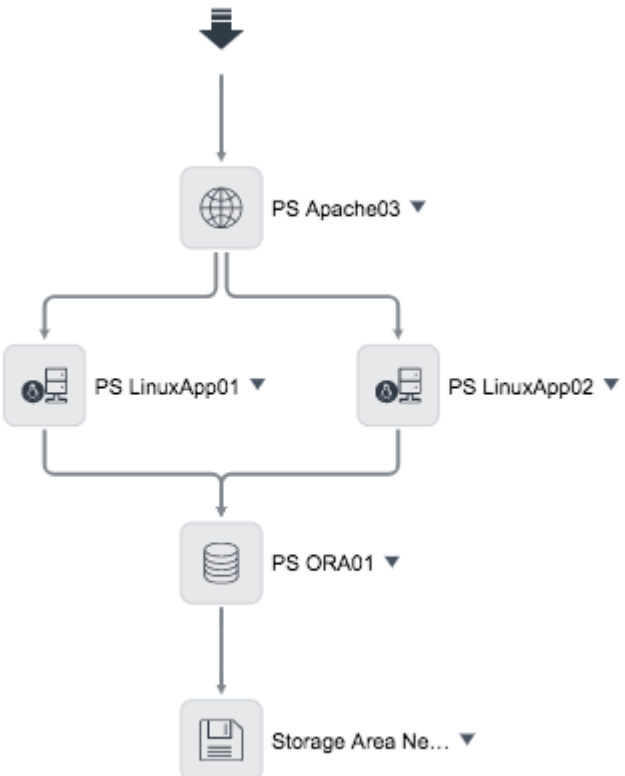
This is the second lesson in the Event Management tutorial.

Lesson 1	✓	An overview of events and alerts
Lesson 2	○	**An overview of application services**
Lesson 3	○	Event Management operator workspaces
Lesson 4	○	What operators do

An application service is a collection of components, such as network devices, computers, and applications that offer a service to your organization. The services can be something like an email system or a website that tracks orders or requests in a database. Your administrator should have already specified the application services in your ServiceNow instance.

Each component that makes up an application service is referred to as a configuration item or CI. This service map provides a visual representation of an application service:

Service map



In this example, you can see a Web Portal application service with these CIs:

- **PS Apache03**: An Apache web server that hosts a company website.
- **PS LinuxApp01** and **PS LinuxApp02**: Two Linux servers that share the workload from the web server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **PS ORA01**: A database server that both Linux servers need to access.
- **Storage Area Network 001**: A mass storage device on which the other CIs depend.

You can see service maps like this on the Service Operations Workspace dashboard. Later in this tutorial, you will learn about the dashboard and what an application service looks like when an alert is associated with a CI.

Types of application services

Event Management classifies application services into the following types:

Technical services

A technical service is a dynamic grouping of CIs based on some common criteria. For example, a technical service could be comprised of all web servers or all Oracle databases for a specific location, like North America.

Application services

An application service can consist of discovered services, manual services, or both. A discovered service is an application service that the Service Mapping application finds (if your organization uses Service Mapping). A manual service is an application service that your administrator configures by selecting and adding each CI and specifying the relationships between CIs.

Alert groups

Alerts that are grouped together, either manually or automatically.

Alert impact

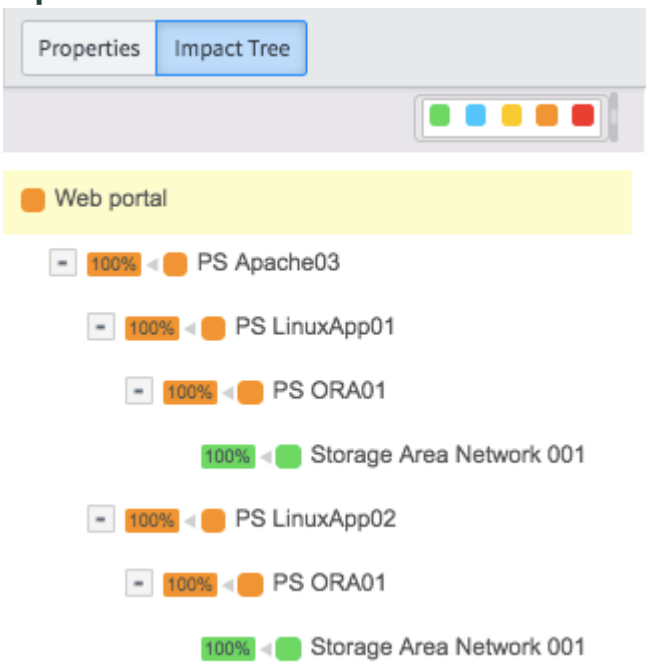
Application services are critical to the operations of your organization. If an issue occurs on one CI, the entire application service can be affected. Part of your role as an operator is to analyze alerts on CIs and see how they impact the application service as a whole. You can then take an action to help remediate or solve the underlying issue. Your administrator can configure impact rules that go into calculations for the severity of an alert.

Later, when you learn how to use the Service Operations Workspace dashboard, you will learn how to view an impact tree for an application service. This helps you understand the relationship between the severity of an alert and the overall application service.

In this example, you can see how a **Major** alert on an Oracle database (**PS ORA01**) also causes a major alert on its parent CIs and on the Web portal application service itself.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Impact tree



Continue the tutorial

Proceed to the next lesson: Event Management operator environment.

Event Management operator environment

As an Event Management operator, your primary work environment is the Service Operations Workspace dashboard.

In this, the third lesson in the Event Management tutorial, you get an overview of your workspaces so you know how to find the information you need.

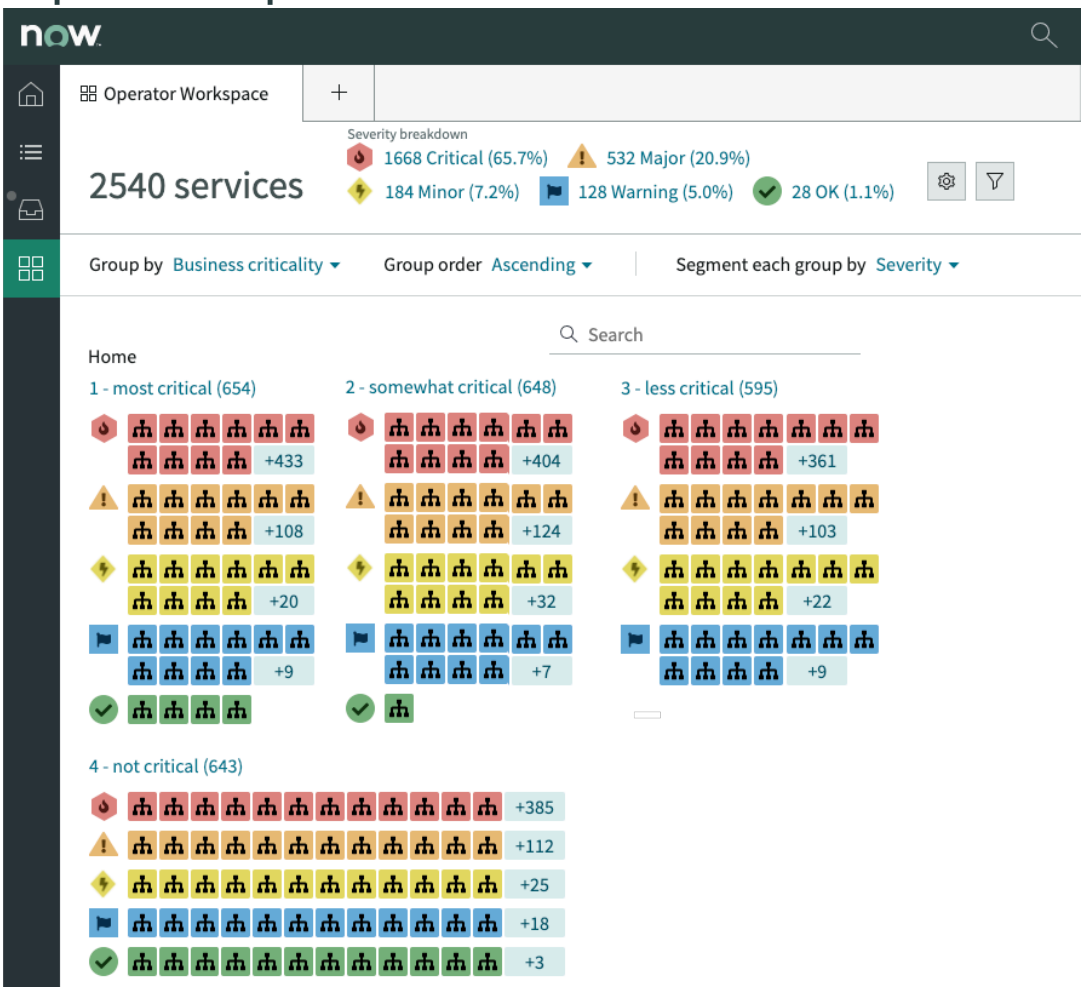
Tutorial lessons		
Lesson 1	✓	An overview of events and alerts
Lesson 2	✓	An overview of application services
Lesson 3	○	Event Management operator environment
Lesson 4	○	What operators do

The Service Operations Workspace dashboard

Your main area of work is the Service Operations Workspace dashboard, which provides a view that focuses on how alerts relate to application services. From here, you can drill into each application services to see the affected CIs and get an understanding of the overall impact of whatever caused the alert. To open the dashboard, navigate to **Event Management** > **Service Operations Workspace**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Operations Workspace



The main sections of the dashboard are:

Banner

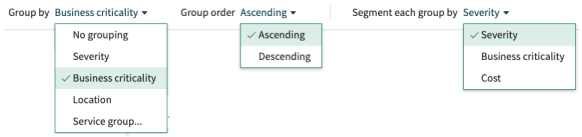
The banner contains controls that show or hide application services based on the criteria you select:

Click a severity level to show or hide application services based on the alerts associated with them.

Use the **Group** and **Segment** controls to organize the view.

Note: Your administrator assigns an application the criticality and cost value to your application services.

Group and Segment filters

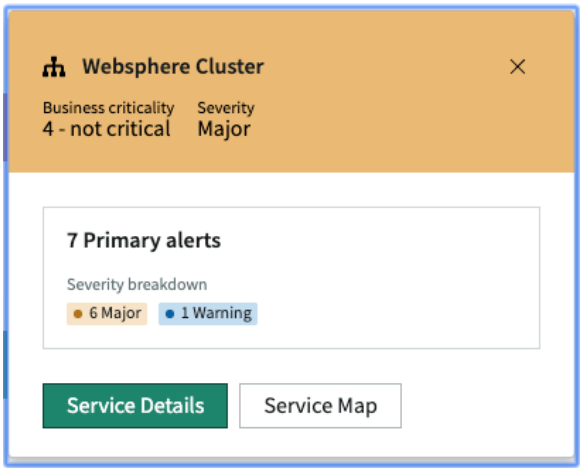


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Application services

The Service Operations Workspace dashboard displays tiles that represent application services. The color of a tile represents the severity of the alerts that are associated with the application service.

Click a tile to show a summary of alerts associated with the application service. Click to view details or the service map.



Alerts

Click the List icon ( ). On the Lists tab, click the kind of alert to view.

You can filter or sort the list to find an alert. Sort by any alert details, such as the **Priority**, which considers multiple factors for how serious the alert is. You can also sort by the **Severity**, which is a value provided by the event monitoring tool.

Open any alert by clicking the number.

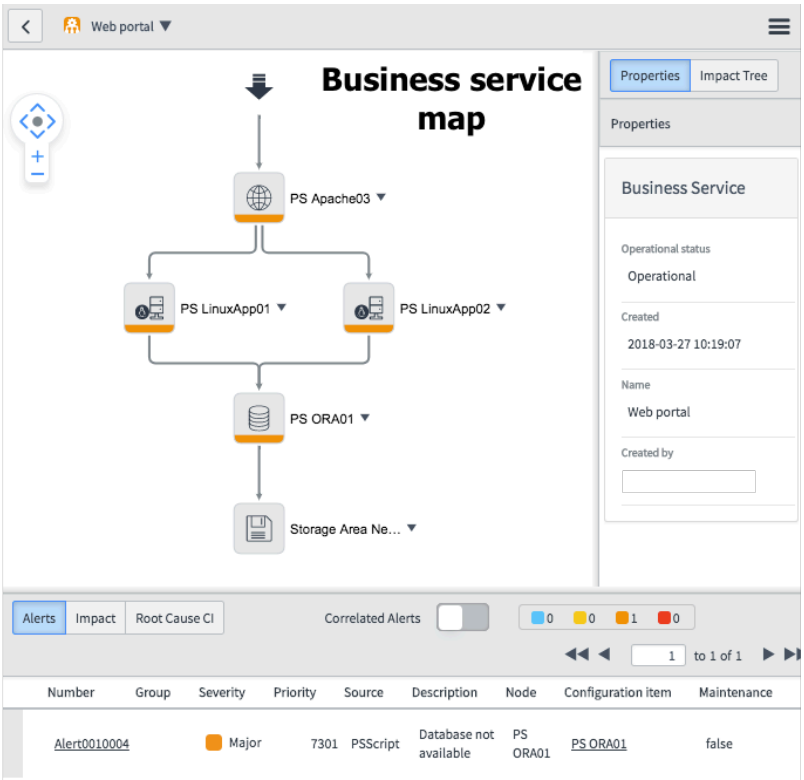
You will learn about what each of the columns means for an alert later on when you analyze an alert.

Application service map views on the Service Operations Workspace dashboard

Double-click the name of an application service tile to open one of the application service map views. The view that you see depends on the type of application service.

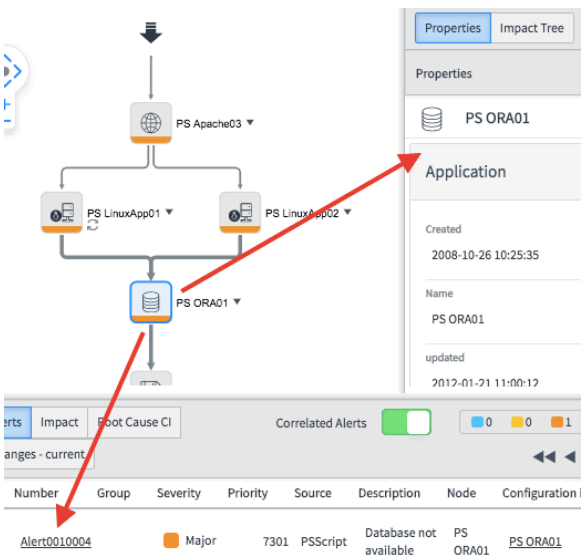
For a manual or standard application service, this view appears:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



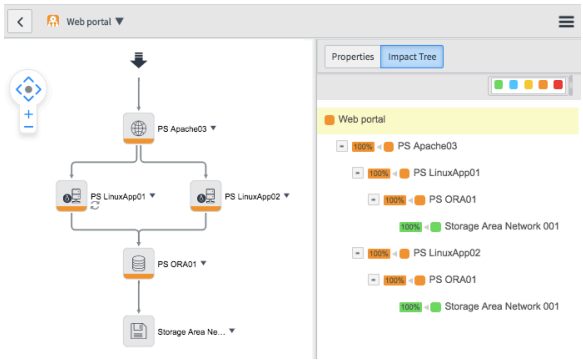
The application service map that you were introduced to in a previous lesson appears in the main panel. This is what you can do from this view:

Click any of the CIs to see the alerts only for that CI and to display the details about that CI in the **Properties** pane.



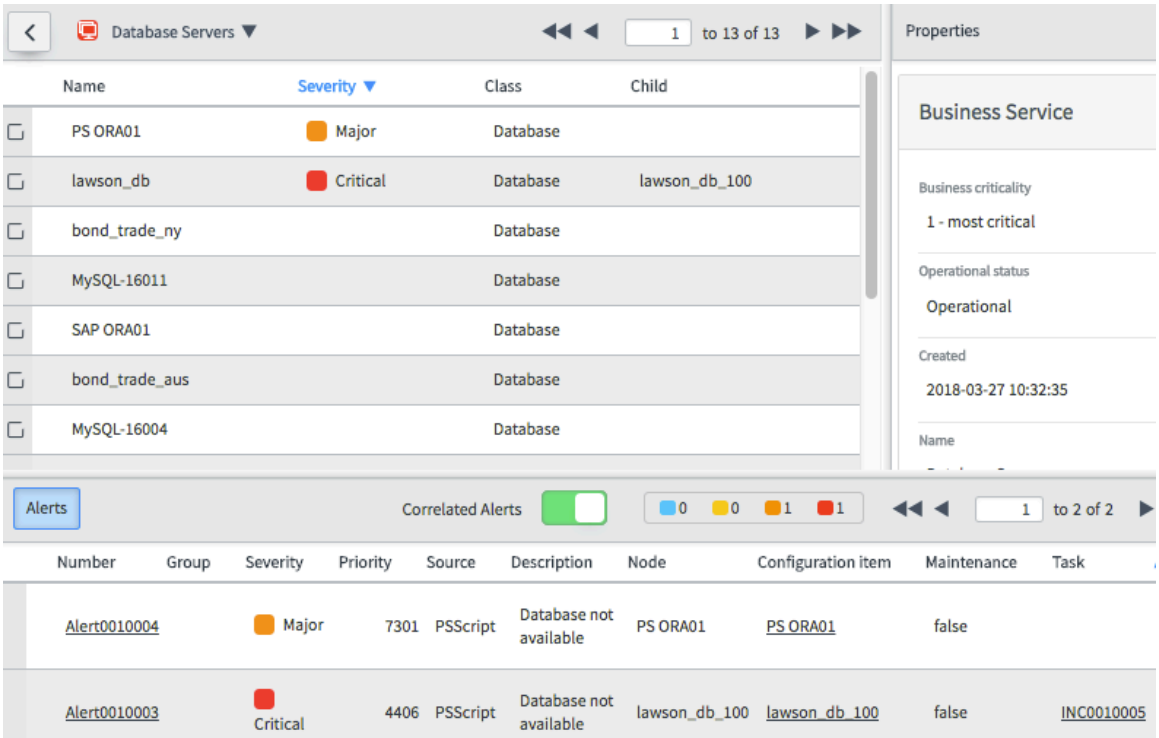
Click **Impact Tree** to see the state of all the CIs and how they affect each other when receiving an alert. You will learn more about the impact tree later on in the tutorial.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



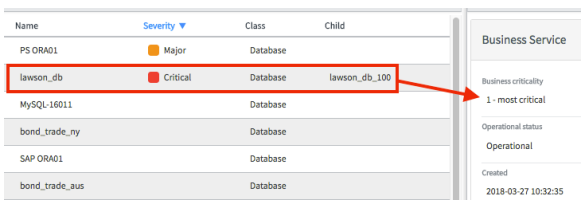
Open any alert from the **Alerts** list at the bottom by clicking the number.

For a technical application service, this view appears:



This is what you can do from this view:

Click any CI to view details about it.



Open any alert from the **Alerts** list at the bottom by clicking the number.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Continue the tutorial

Proceed to the next lesson: What Event Management operators do.

What Event Management operators do

As an Event Management operator, your typical workflow involves three phases: analyzing an alert and its effect on application services, taking some type of action, and making sure the alert is finally closed.

This is the last lesson in the Event Management tutorial. In this lesson, you will run through the three phases of a typical operator day-to-day workflow.

Lesson 1	✓	An overview of events and alerts
Lesson 2	✓	An overview of application services
Lesson 3	✓	Event Management Service Operations Workspace
Lesson 4	○	**What operators do**

Your organization will have specific policies and procedures that may differ from the phases outlined in this topic. In addition, your administrator might have customized the Event Management application so that some of these phases are automated and do not actually require any action on your part.

For the purposes of this tutorial, we will walk you through each phase and allow you to perform the tasks manually.

Phase 1	Analyze and acknowledge an alert	In this phase, you will find an alert to work on, analyze the details, and acknowledge it so that other operators know it is a legitimate alert.
Phase 2	Triage an alert	In this phase, you take an action to help remediate the issue that caused the alert. The most common action to take is to create an incident and assign it to someone who can solve the underlying issue.
Phase 3	Close an alert	In this phase, you will verify that the alert is resolved, and then close the alert.

Start here

Start out by learning how to Analyze and acknowledge an alert.

Operator phase 1: Analyze and acknowledge an alert

As an Event Management operator, the first thing you should do is access alerts and then find the ones you want to focus on. Open the Alert form to analyze the details. Acknowledge the alert to let other operators know that the issue should be addressed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Phase 1	○	**Analyze and acknowledge an alert**
Phase 2	○	Triage alerts
Phase 3	○	Close an alert

You must understand both of your operator environments: the Service Operations Workspace dashboard and Service Operations Workspace. Review Event Management operator environment if you have not already done so. This tutorial uses the Service Operations Workspace dashboard.

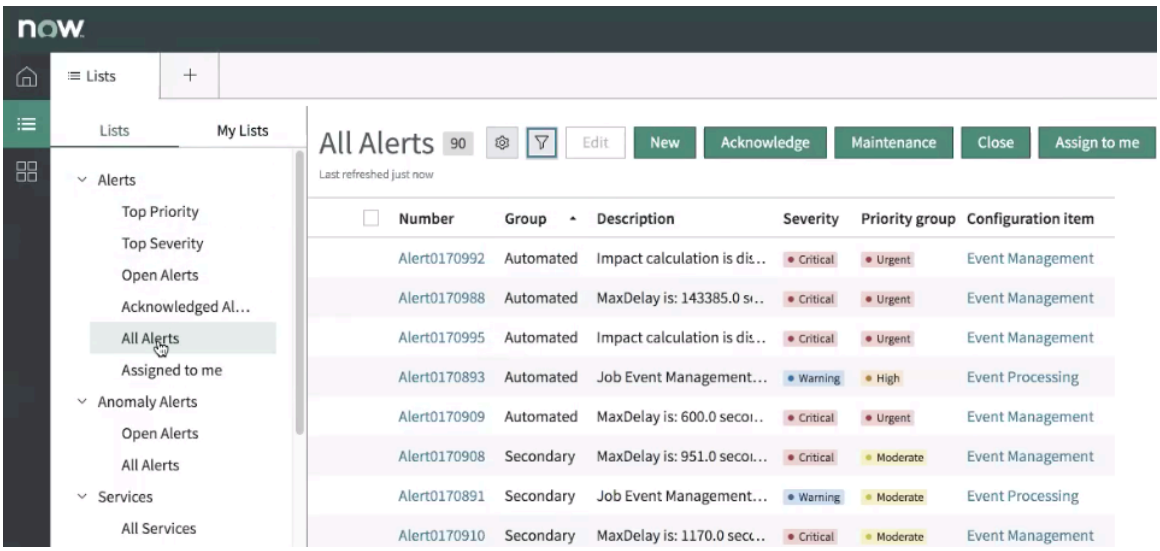
Role required: evt_mgmt_operator

Procedure

1. Navigate to **Event Management** > **Workspaces** > **Service Operations Workspace**.

   In the list, click **Alerts** > **All Alerts**. By default, all alerts appear in the list sorted by **Group**. Click any heading to sort by that value. To view current filter settings, click the filter icon

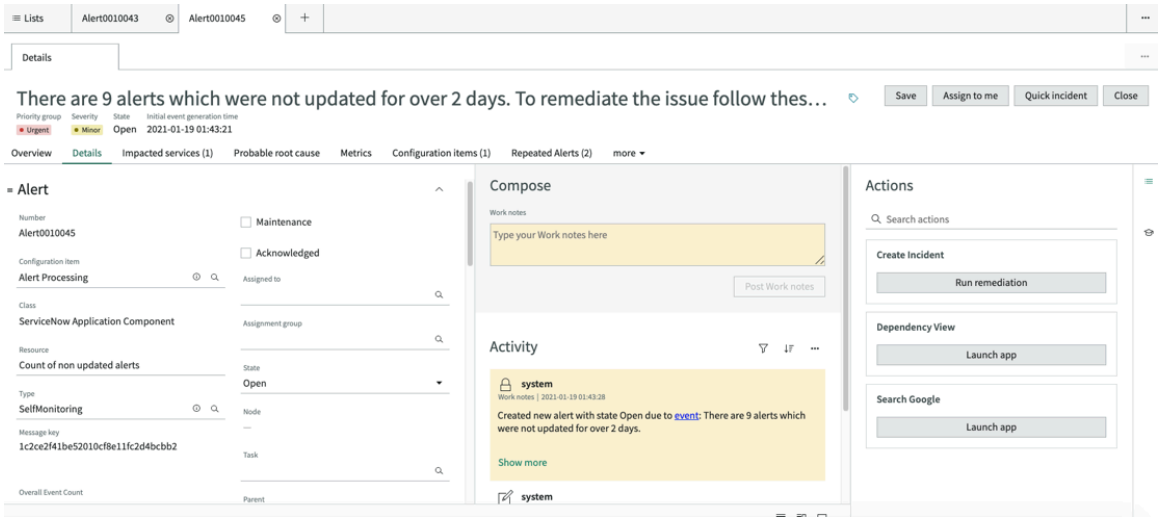
   . To modify filter settings, click **Advanced view**.



2. Find the alerts to focus on by clicking **Application Services** > **Services**, or by using any of the filtering and sorting options.
3. Click an alert name to open the **Details** tab for the alert.

   Example
   The important fields on the form and related items are described after the screenshot.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Fields on the Alert Details tab for an alert that is associated with a single CI

Field	Description
Number	The automatically generated alert number that you saw in the list of alerts on the Service Operations Workspace dashboard.
Node	The name of the CI with which the alert is associated. The event that generated the alert occurred on this CI. You might see a computer name, or an IP address or MAC address of a device.
Resource	The object on the node that caused the event. You might see values like the name of a hard disk, a CPU, or the name of a process or a service. You can add information to this field if necessary.
Configuration item	The CI in the CMDB to which this alert applies. If the **Node** field is filled in but this field is empty, and if you know which CI the node represents, you can enter the CI in this field to manually associate the alert with it. **Note:** Your administrator can configure rules that automatically bind CIs to an alert, usually based on what is in the **Node** field. However, it is possible that the system is unable to find the correct CI to bind the alert to. In this case, you might need to manually select a CI. For the purposes of this tutorial, we assume that the correct CI is bound to the alert. When an alert contains a CI, the **Overview** tab opens when selecting the alert.
Task	Any existing task that is associated with the alert, such as an incident, change request, or problem, is shown in this field. When you first look at an alert, this field is blank. You can associate a task when you triage the alert. You associate an incident to an alert and assign the incident to someone at a later stage in this tutorial.
Description	A description of the alert that came from the alert monitoring software in your organization. You can add information if necessary.
Severity	Severity value for the alert:

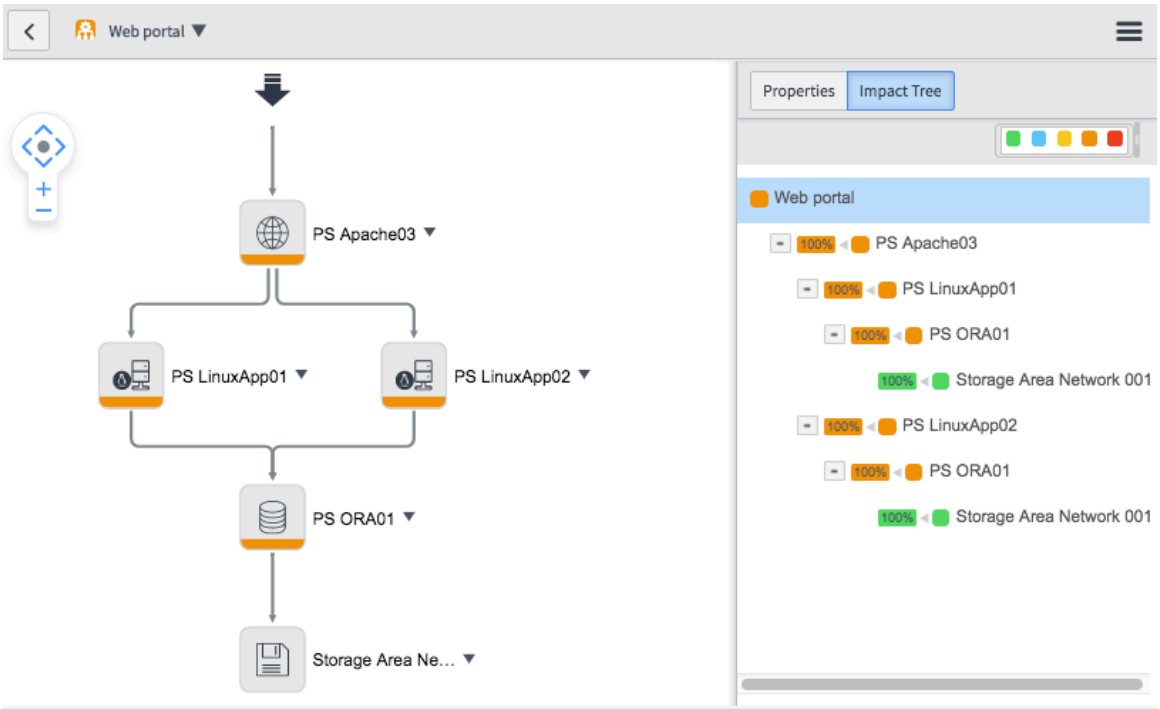
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ Critical: Immediate action is required. Either the resource is not functional or critical problems are imminent. ○ Major: Major functionality is severely impaired or performance has degraded. ○ Minor: There is a partial, non-critical loss of functionality, or performance has degraded. ○ Warning: Attention is required even though the resource is still functional. ○ Info: An informational message. An alert is created, but the resource is still functional. ○ Clear or Resolved: No action is required. An alert is not created from this event. Existing alerts are closed.
State	The processing state that the alert is in. A newly generated alert is in the **Open** state. Other states are: ○ **Reopen** indicates that a previously closed alert is open again, and it requires your attention. ○ **Flapping** indicates that the alert is receiving a high frequency of identical events from the same source, which can cause many alerts to re-open even after it is closed. ○ **Closed** indicates that the alert is closed and does not require any further action. You will close an alert as part of the last stage in this tutorial.
Maintenance	Indicates that the alert does not need to be worked on and is hidden from the list of alerts in the Service Operations Workspace dashboard. In this example, we do not want to put the alert in maintenance.
Acknowledged	Indicates that an operator verified that the alert is genuine and is triaging it. You acknowledge the alert at a later stage in this topic. Your Event Management administrator can also have alerts automatically acknowledged immediately after they are generated. If this is the case, the **Acknowledge** check box on the Alert form might already be selected.
Parent	Displays a value only for secondary alerts. The value indicates the alert number of the parent alert. The field is empty for primary alerts (alerts with no parent alert).
Knowledge article	Any existing knowledge base (KB) article that is associated with the alert. When you first open an alert, this field is blank. You can associate a KB article when you triage the alert.

4. Click the **Impacted Services** tab and then click the service name.
   Before you acknowledge the alert, you might want to learn more about the services that are affected due to the service that is the source of the alert.

   The service opens and displays the **Details** tab. Click **Service Map** to view the map of related application services.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



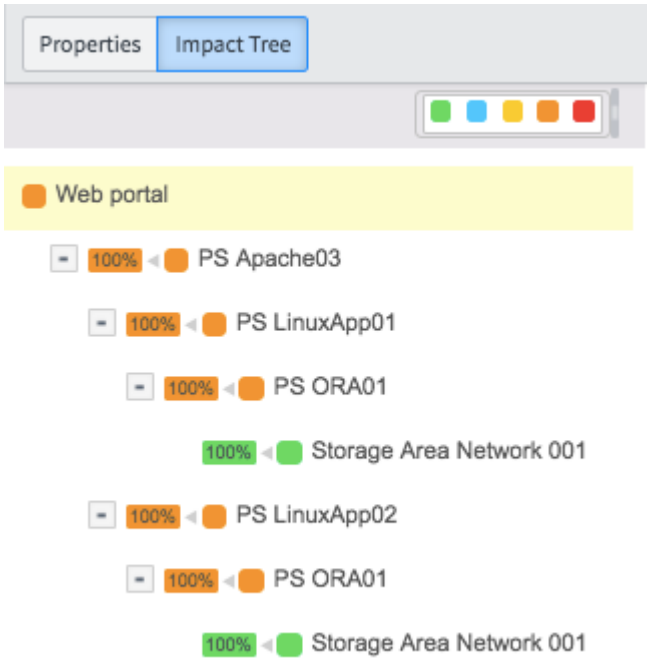
Notice that the major severity indicator in orange is displayed on several CIs. It starts with the Oracle database (**PS ORA01**) and propagates up to all CIs that depend on the database. From this, you can surmise that the alert with the highest level of severity on the Oracle database indicates the root cause of the issue.

This does not necessarily mean that the system generated separate alerts for each CI, but it is possible. When you triage an alert, you can determine whether alerts on other CIs should be correlated under a primary alert.

5. Click the **Impact Tree** tab and review the impacts on each CI.

   The percentages next to each CI in the impact tree show you the effect on each CI. In this example, each CI is impacted 100% by the alert. This means the underlying issue is serious enough to impact the functionality of the application service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

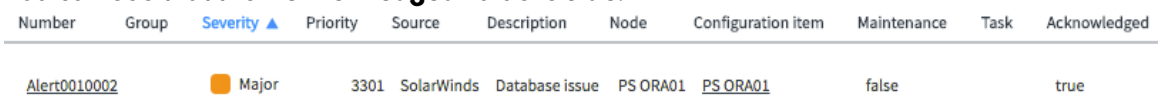


6. Acknowledge the alert.

   Acknowledging an alert does not assign it to you, nor does it create a task like an incident or change request. It simply lets other operators know that you are aware of the issue. After you acknowledge an alert, you will take further action during the triage stage.

Option	Description
Acknowledge a single alert	With this process, you can acknowledge only the alert that you are viewing. **a.** Open the Alert Details form as described earlier. **b.** Select the **Acknowledged** check box.
Acknowledge one or more alerts	With this process, you can acknowledge one alert or multiple related alerts. **a.** Open the list of alerts as described earlier. **b.** Select each alert to acknowledge. **c.** Click **Acknowledge**.

7. Navigate back and look for the alert that you acknowledged.
   You can see that the **Acknowledged** value is **true**.



Number	Group	Severity ▲	Priority	Source	Description	Node	Configuration item	Maintenance	Task	Acknowledged
Alert0010002		Major	3301	SolarWinds	Database issue	PS ORA01	PS ORA01	false		true

What to do next

Go to Operator phase 2: Triage an alert.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Operator phase 2: Triage an alert

After you analyze and acknowledge an alert, you must triage it. The triage phase involves verifying alert correlation and taking an action to help resolve the issue that caused the alert. This topic covers the most common triage task: creating an incident from an alert.

Before you begin

Note: The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

Phase 1		Analyze and acknowledge an alert
Phase 2		**Triage alerts**
Phase 3		Close an alert

Role required: evt_mgmt_operator

Procedure

1. Before you start to work on the alert, check whether other alerts should be correlated with the one you just reviewed:

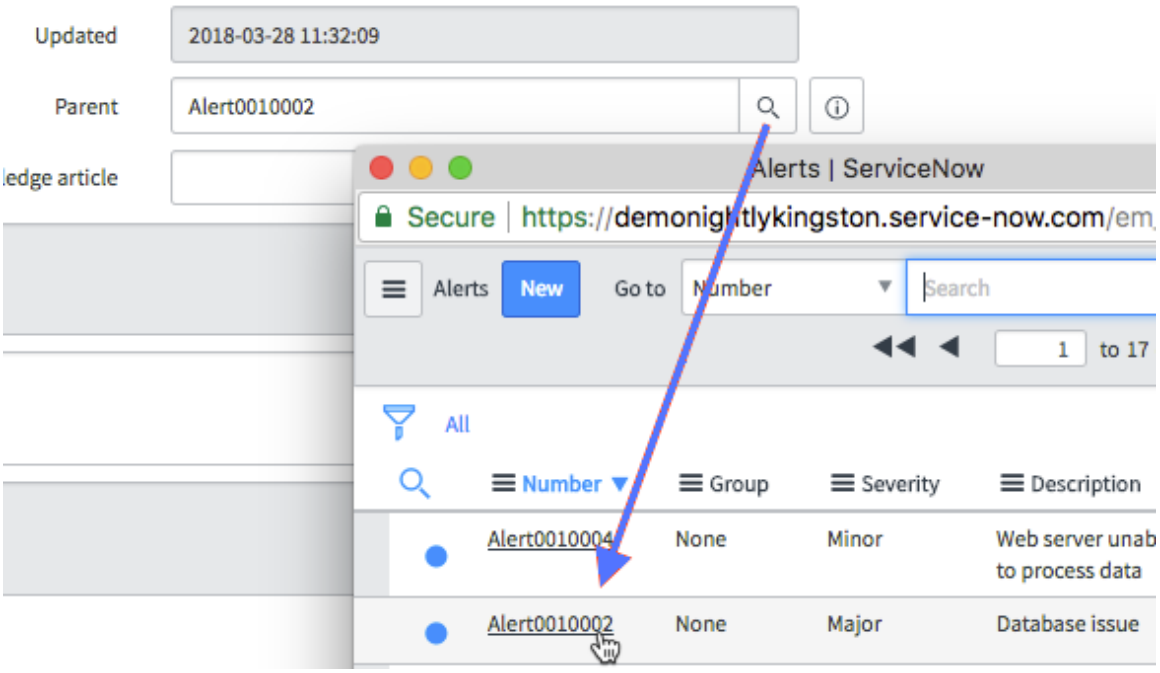
   a. Navigate to **Event Management** > **Service Operations Workspace**.

   b. Click the same application service tile and review the alerts in the **Alerts** list.

   c. If multiple alerts are present, open one to determine if it is related to the other alert, or if the underlying issue is the same in both alerts.
   For example, an alert might be associated with a web server while another alert exists for a database issue. Correlate the web server alert as a secondary alert with the database alert as the primary alert.

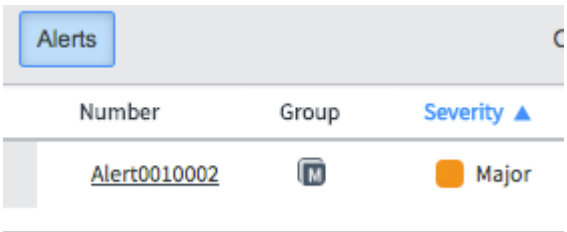
   d. Open the secondary alert, click the lookup icon ( ) in the **Parent** field, and then select the primary alert.
   This creates a primary (parent) / secondary (child) relationship between the two alerts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



e. Repeat this process to correlate as many secondary alerts as necessary.

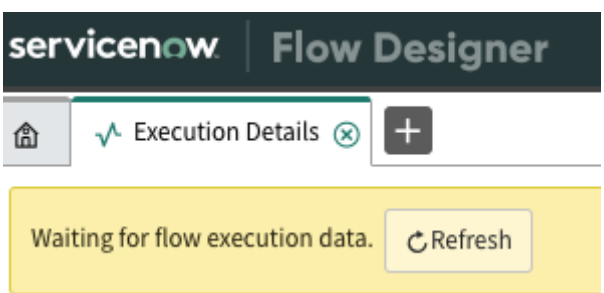
f. Navigate back to the Service Operations Workspace dashboard and verify that the primary alert displays an icon in the **Group** column.



Note: Your administrator can set up rules that let the system automatically correlate alerts so that you do not need to do so manually. In that case, a **Feedback** field appears on the Alert form. Select **Yes** if the system correlated the alert correlated correctly, or **No** if not. Currently, the feedback option is available but does not trigger further actions after being logged.

2. Open the primary alert.
3. On the Alert form, click **Actions** > **Create Incident**.
   If your organization uses Security Incident Response, the button is **Create Security incident**.

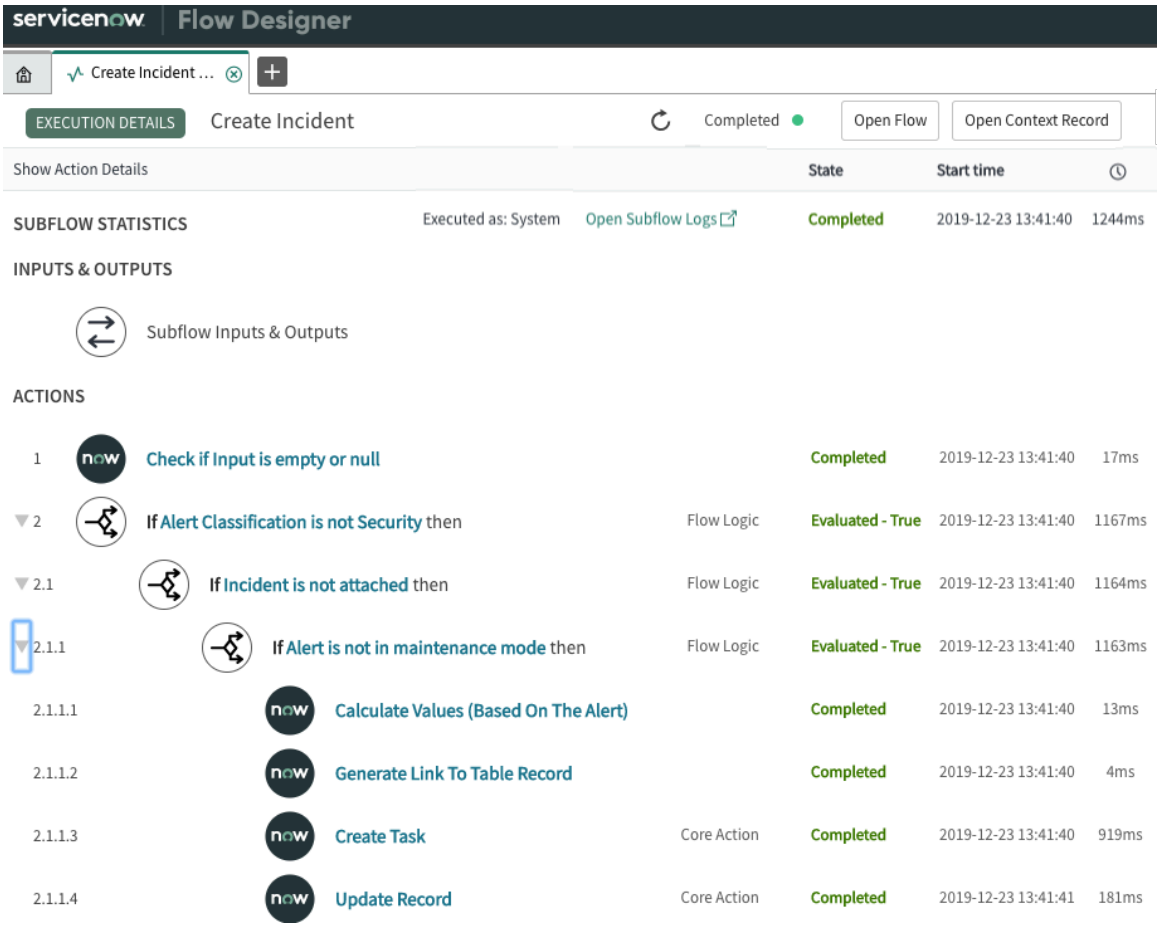
   The Flow Designer opens.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

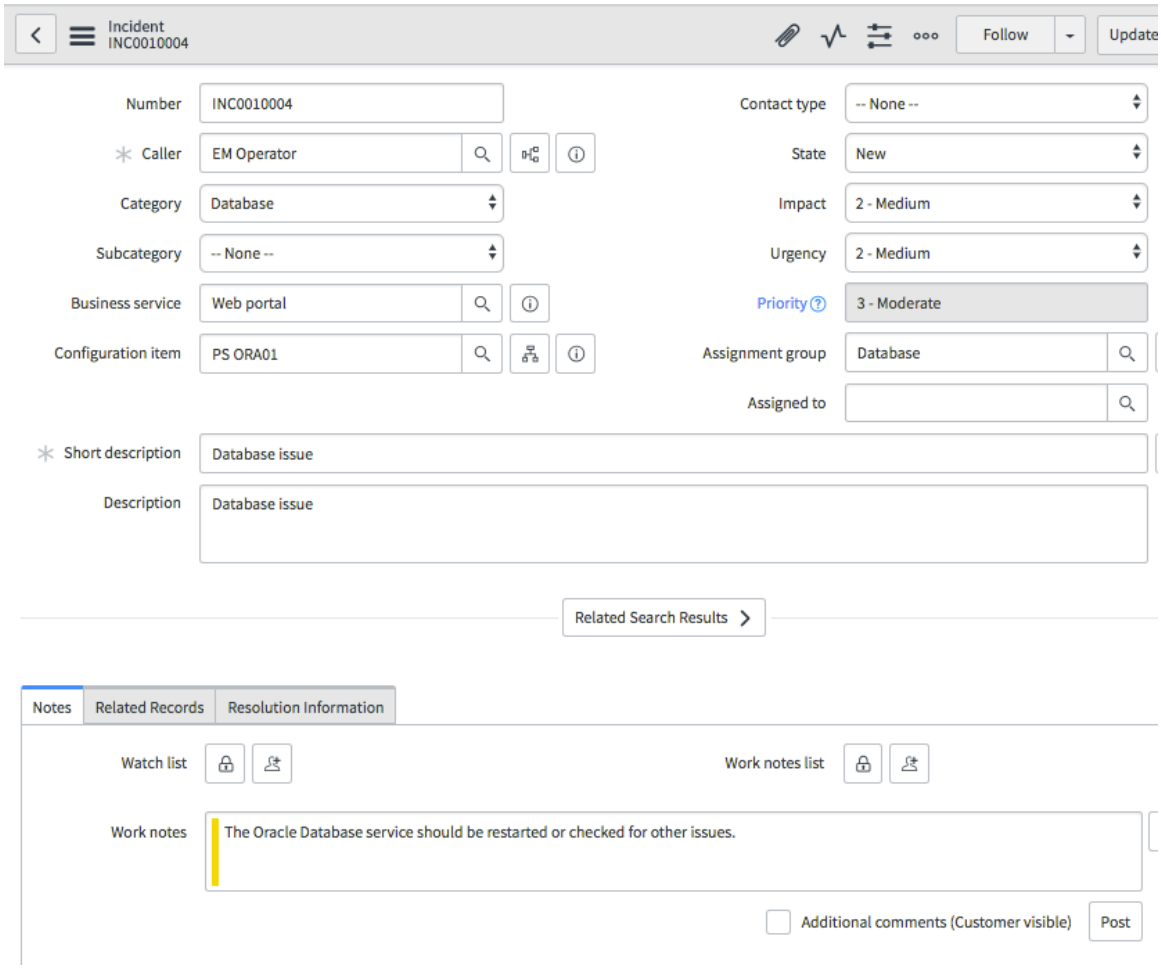
4. Click **Refresh**.

   The **Execution Details** page opens.



5. Click **Open Context Record** and then fill in the Incident form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

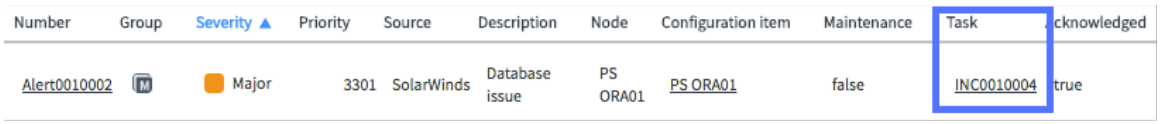


Field	Description
Caller	Click the lookup icon ( ) and then select your name. The caller is the person who discovered the issue that led to the incident.
Category and Subcategory	Select a category that best describes this alert. In this example, **Database** is the best choice.
Application service	Select the application service to which the CI belongs. In this example, the application service is **Web portal**.
Configuration item	If it is not already populated, select the CI. In this example, the Oracle database (**PS ORA01**) is automatically populated into the field.
Impact and Urgency	Select the impact and urgency levels that you think appropriate.
Assignment group Assigned to	Click the lookup icons ( ) for both or either of these fields, and then select the group or the individual that can handle the issue.

6. Click **Submit** to create the incident.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Alert you are working on reappears. On the Alert form, the incident is populated in the **Task** field. You can also see the incident number in the Task column on the Service Operations Workspace dashboard.



Number	Group	Severity ▲	Priority	Source	Description	Node	Configuration item	Maintenance	Task	cknowledged
Alert0010002		Major	3301	SolarWinds	Database issue	PS ORA01	PS ORA01	false	INC0010004	true

What to do next

There are other tasks you perform as part of the triage stage:

- Run a remediation workflow on an alert if your Event Management administrator already set up a workflow in your ServiceNow instance and your policies allow you to trigger it from the alert.
- Launch a web application from an alert to open a website or an event monitoring tool that provides more information about the alert.
- Associate a knowledge base article with an alert if there is existing information about the alert that might help resolve the underlying issue.
- Put an alert into maintenance to temporarily hide it from the Service Operations Workspace dashboard if the alert does not require action at this time.

If you do not need to perform any other triage actions, proceed to Phase 3: Close an alert.

Run a remediation workflow on an alert

As an Event Management operator, you can also run a workflow on your ServiceNow instance that helps remediate the alert. For example, you might run a workflow that automatically restarts a server on your network, which might resolve an alert about CPU usage.

Before you begin

Note: The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

Phase 1	✓	Analyze and acknowledge an alert
Phase 2	○	**Triage alerts**
Phase 3	○	Close an alert

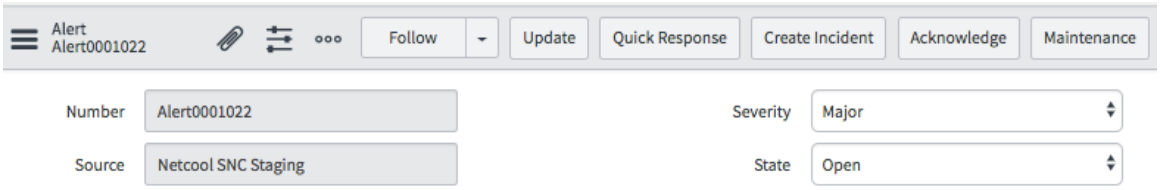
Note: You can run a remediation workflow if your administrator already set up workflows for you to choose from. You should be familiar with your organization's policies regarding triaging of alerts.

Role required: evt_mgmt_operator

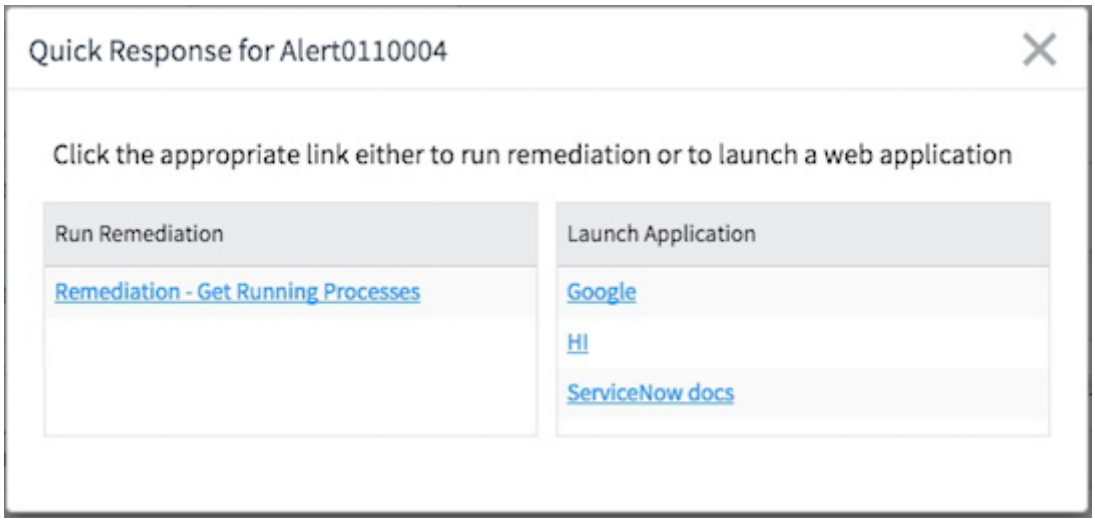
Procedure

1. From the Service Operations Workspace dashboard, open the alert that you acknowledged in Phase 1: Analyze and acknowledge an alert.
2. On the Alert form, click **Quick Response**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. In the Quick Response window, click the name of the remediation under **Run Remediation**.



What to do next

There are also other tasks you can take as part of the triage stage:

- Launch a web application from an alert to open a website or an event monitoring tool that provides more information about the alert.
- Put an alert into maintenance to temporarily hide it from the Service Operations Workspace dashboard if the alert does not require action at this time.
- Associate a knowledge base article with an alert if there is existing information about the alert that might help resolve the underlying issue.

If you do not need to perform any other triage actions, proceed to Phase 3: Close an alert.

Launch a web application from an alert

As an Event Management operator, you can also launch a web application from an alert. The web application might be a console for your event monitoring tool or any external website with additional alert information.

Before you begin

Note: The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

Phase 1	✓	Analyze and acknowledge an alert
Phase 2	○	**Triage alerts**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Phase 3	Close an alert

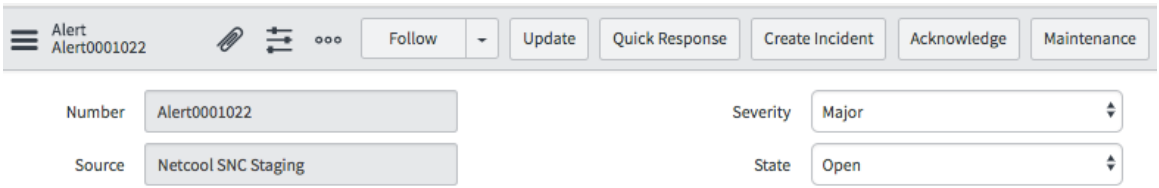
Role required: evt_mgmt_operator

You can launch a web application if your administrator has set up a link to the application. You should be familiar with your organization's policies on triaging alerts.

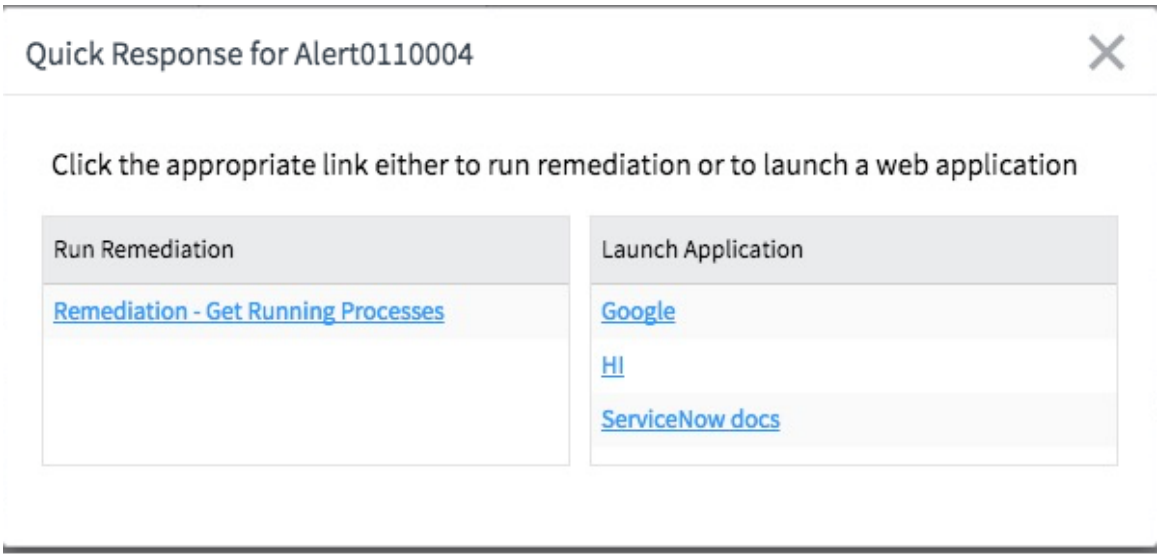
About this task

Procedure

1. From the Service Operations Workspace dashboard, open the alert that you acknowledged in Phase 1: Analyze and acknowledge an alert.
2. On the Alert form, click **Quick Response**.



3. In the Quick Response window, click the name of the application under **Launch Application**. Your administrator has specified which applications should appear in the list.



What to do next

There are also other tasks you can take as part of the triage stage:

- Run a remediation workflow on an alert if your Event Management administrator already set up a workflow in your ServiceNow instance and your policies allow you to trigger it from the alert.
- Put an alert into maintenance to temporarily hide it from the Service Operations Workspace dashboard if the alert does not require action at this time.
- Associate a knowledge base article with an alert if there is existing information about the alert that might help resolve the underlying issue.

If you do not need to perform any other triage actions, proceed to Phase 3: Close an alert.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Associate a knowledge base article with an alert

As an Event Management operator, you can associate a knowledge base (KB) article with the alert to capture additional information about the alert. This might include a procedure that someone has to follow to resolve the underlying issue on your network, or a best practice to prevent the issue from reoccurring.

Before you begin

Note: The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

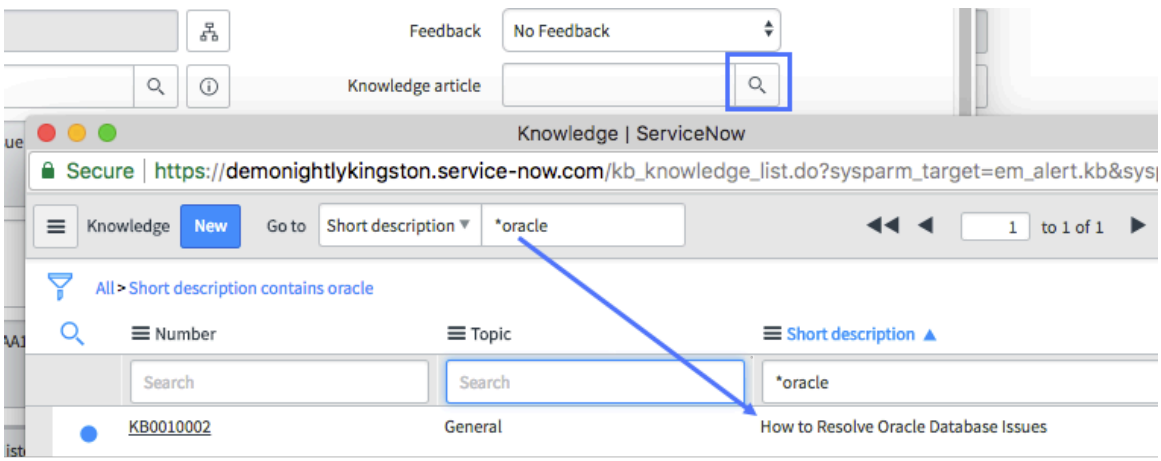
Phase 1	✓	Analyze and acknowledge an alert
Phase 2	○	**Triage alerts**
Phase 3	○	Close an alert

This task assumes that your organization uses the Knowledge Base application in your ServiceNow instance.

Role required: evt_mgmt_operator

Procedure

1. From the Service Operations Workspace dashboard, open the alert that you acknowledged in Phase 1: Analyze and acknowledge an alert.
2. On the Alert form, click the lookup icon (🔍) next to the **Knowledge article** field.
3. Filter the list of existing KB articles by first selecting a field, such as **Short Description**, and then entering related text into the search text field.
   You can use the `contains` (*) operator to search for articles that contain keywords. For example, entering `*oracle` in the short description filters the KB articles that contain the word `oracle` somewhere in the short description.



4. If you cannot find any related KB articles, you can click **New**, create a new one, and then click **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The KB article number appears in the **Knowledge article** field on the Alert form.

5. Click **Update** on the Alert form to save the information.

What to do next

There are also other tasks you can take as part of the triage stage:

- Run a remediation workflow on an alert if your Event Management administrator already set up a workflow in your ServiceNow instance and your policies allow you to trigger it from the alert.
- Launch a web application from an alert to open a website or an event monitoring tool that provides more information about the alert.
- Put an alert into maintenance to temporarily hide it from the Service Operations Workspace dashboard if the alert does not require action at this time.

If you do not need to perform any other triage actions, proceed to Phase 3: Close an alert.

Put an alert into maintenance

As an Event Management operator, you can put an alert into maintenance if the alert does not require further action but you still want to keep it active. Putting the alert into maintenance hides it from the Service Operations Workspace dashboard so that other operators do not need to access it, but it does not close the alert.

Before you begin

Note: The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

Phase 1	✓	Analyze and acknowledge an alert
Phase 2	○	**Triage alerts**
Phase 3	○	Close an alert

Role required: evt_mgmt_operator

Procedure

1. From the Service Operations Workspace dashboard, open the alert that you acknowledged in Phase 1: Analyze and acknowledge an alert.
2. Select the **Maintenance** check box and click **Update**, or click the **Maintenance** button at the top of the list.
3. Click **Update**.
4. Navigate to **Event Management** > **Operators Workspace**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Notice that alerts in maintenance are not visible in the list by default. The filter excludes alerts where `Maintenance | = | true`.

What to do next

If the issue that led to the alert still needs further attention later, navigate to **Event Management** > **All Alerts**, open the alert, and then clear the **Maintenance** check box and click **Update**. From there you can perform other triage actions.

There are other tasks you can take as part of the triage stage:

- Run a remediation workflow on an alert if your Event Management administrator already set up a workflow in your ServiceNow instance and your policies allow you to trigger it from the alert.
- Launch a web application from an alert to open a website or an event monitoring tool that provides more information about the alert.
- Associate a knowledge base article with an alert if there is existing information about the alert that might help resolve the underlying issue.

If you do not need to perform any other triage actions, proceed to Phase 3: Close an alert.

Operator phase 3: Close an alert

After you take action on an alert, you can verify several items on the alert and then close it.

Before you begin

Note: The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

Phase 1	✓	Analyze and acknowledge an alert
Phase 2	✓	Triage alerts
Phase 3	○	**Close an alert**

Role required: evt_mgmt_operator

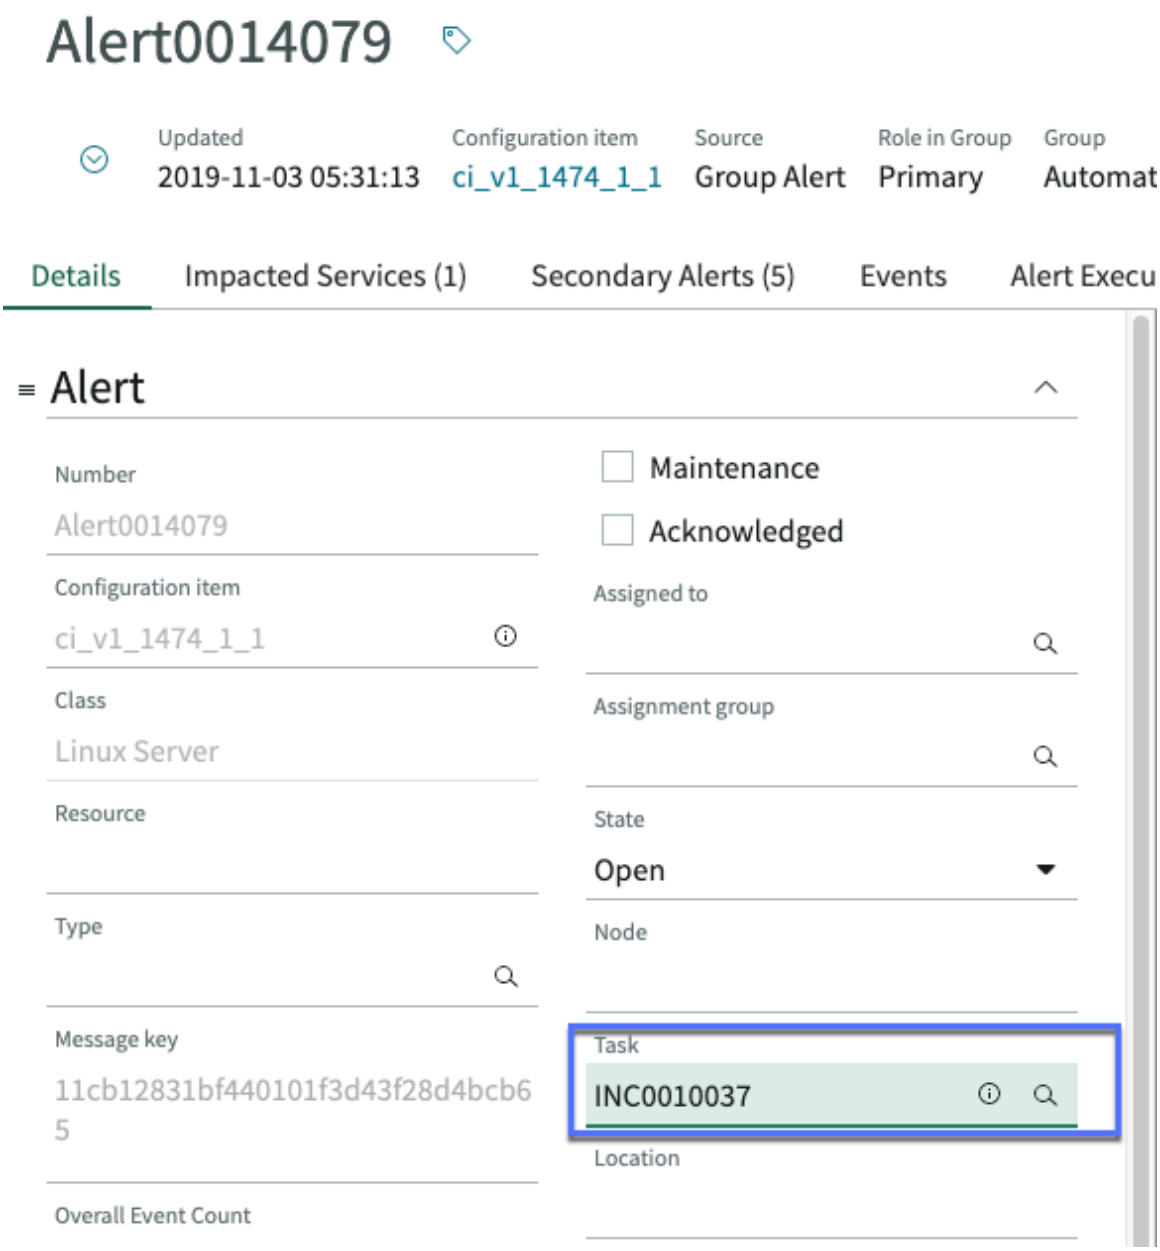
About this task

Procedure

1. Navigate to **Workspace Experience** > **Workspaces** > **Service Operations Workspace**.
2. Find the alert you want to close.
   If the alert does not appear in the list, for example because it is in maintenance, change the filter options as needed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

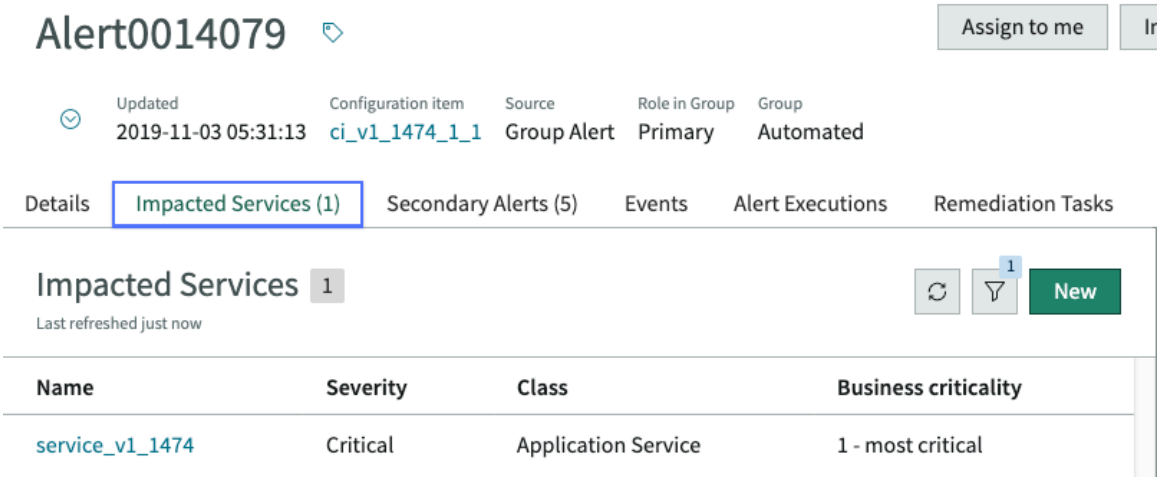
3. Click the alert number to open the Alert Details tab and review key information about the alert.



4. Review information about application services on the **Impacted Services** tab.

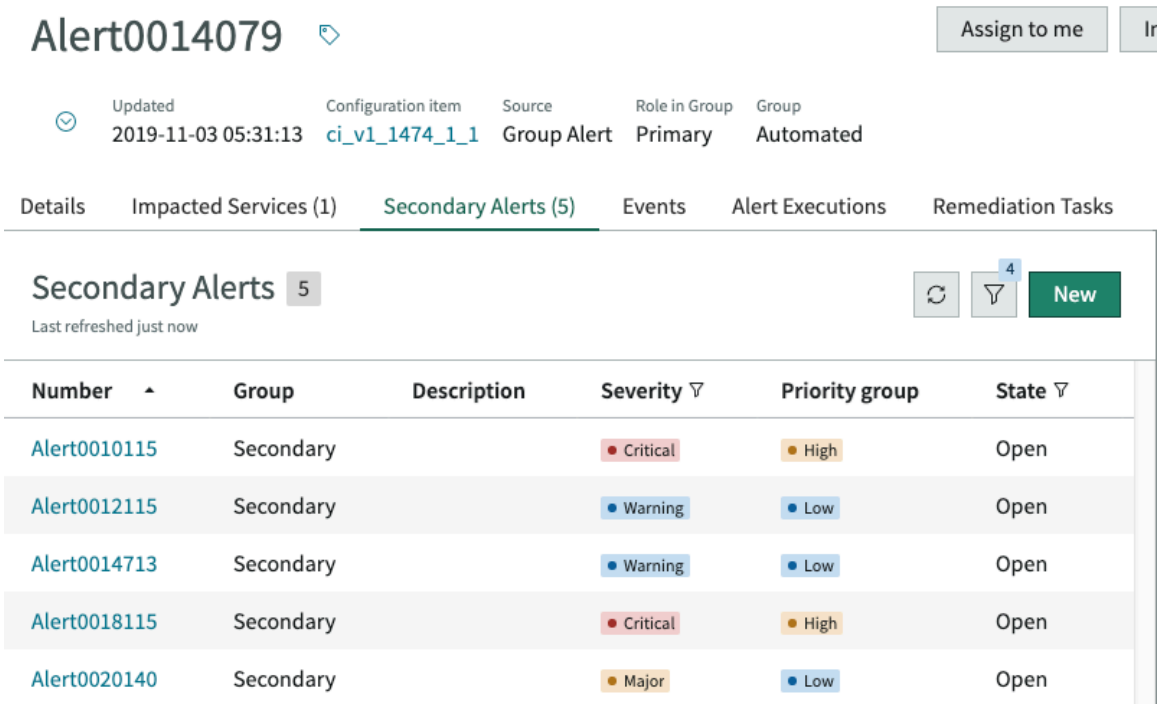
In this example, the service_1474 application service appears in the list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



If you need more information about an application service and want to see the service map, click the service name and then click **Service Map**.

5. Look at the alerts related to this application service, and modify the correlation if necessary. The process for a primary alert differs from the process for a secondary alert.
   - On a primary alert, the secondary alerts that are correlated with the primary appear on the **Secondary Alerts** tab.



Typically, you do not have to do anything with the secondary alerts unless you want to add more secondary alerts or remove the correlation altogether.

Note: When you close a primary alert, the secondary alerts are also closed by default.

   - On a secondary alert:

     The alert number of the primary alert appears in the **Parent** field. You do not have to do anything with the parent alert, unless you want to re-correlate this secondary alert with another primary alert, or remove the correlation altogether by clearing the field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: When you close a secondary alert, the primary alert is not closed. You must close the primary alert separately.

6. When you are sure the underlying issue causing the event and corresponding alert has been rectified, click **Close**.
   If you think that the alert needs attention, do not close it. Instead, put it into maintenance by selecting the **Maintenance** checkbox.

What to do next

You are finished with the Event Management Operator tutorial, which covers a basic workflow of analyzing alerts, triaging them, and closing them out.

After you close an alert, you might need to follow up on these items:

Reopen an alert

If you think an alert requires further action, you can manually change its state to **Reopen**. When an alert reopens, any associated incidents can also be updated or reopened according to the incident state and the rules that your administrator configured.

Note: Any time you reopen an alert, always go through the triage and close phases again.

Work with alerts in the flapping state

In some cases, the same event that created the alert you just closed could be triggered again, even repeatedly, in a short amount of time. If this occurs, the **State** of the alert that you just closed changes to **Reopen**, and eventually to **Flapping** depending on settings that your administrator configures.

See Handle alerts in the flapping state for more information on what to look for.

For a summary of other tasks that you might need to perform at some time, see Advanced tasks for the Event Management operator.

Advanced tasks for the Event Management operator

As an Event Management operator, you might need to perform additional tasks that are outside of your typical workflow, or tasks that you need to perform only once.

Advanced task	Description
Customize your alert list view	Get to the alerts you need to analyze as soon as possible.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced task	Description
Work with flapping alerts	If an alert is in the flapping state, it means that the underlying issue keep reoccurring. You should triage the alert again and look for another solution.
Handle alerts while CIs are in maintenance	Learn how to handle alerts on a CI that is in the maintenance state, which means it is undergoing some type of change.
Adjust alert impact while triaging an alert	You can change impact rules, which affects how alert impact is calculated and alert severity.

Customize your alert list view

You can create one or more customized alert list views that show only the information pertinent to you. For example, you might want to focus only on the alerts for application services in a specific location, or only the alerts for application services of high criticality.

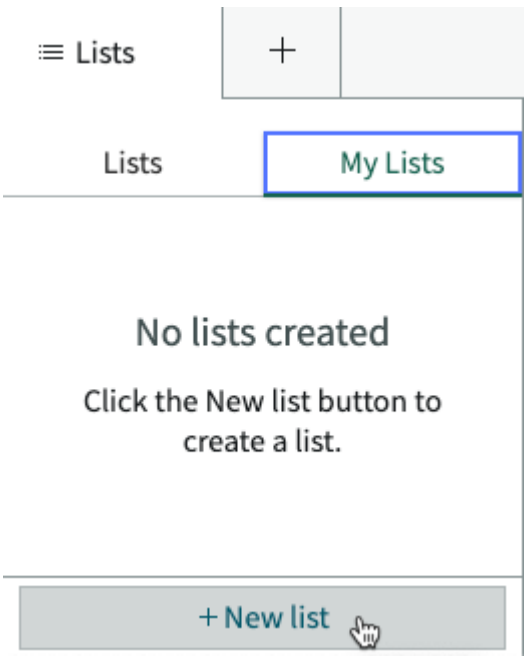
Before you begin

Note: The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

Role required: evt_mgmt_operator

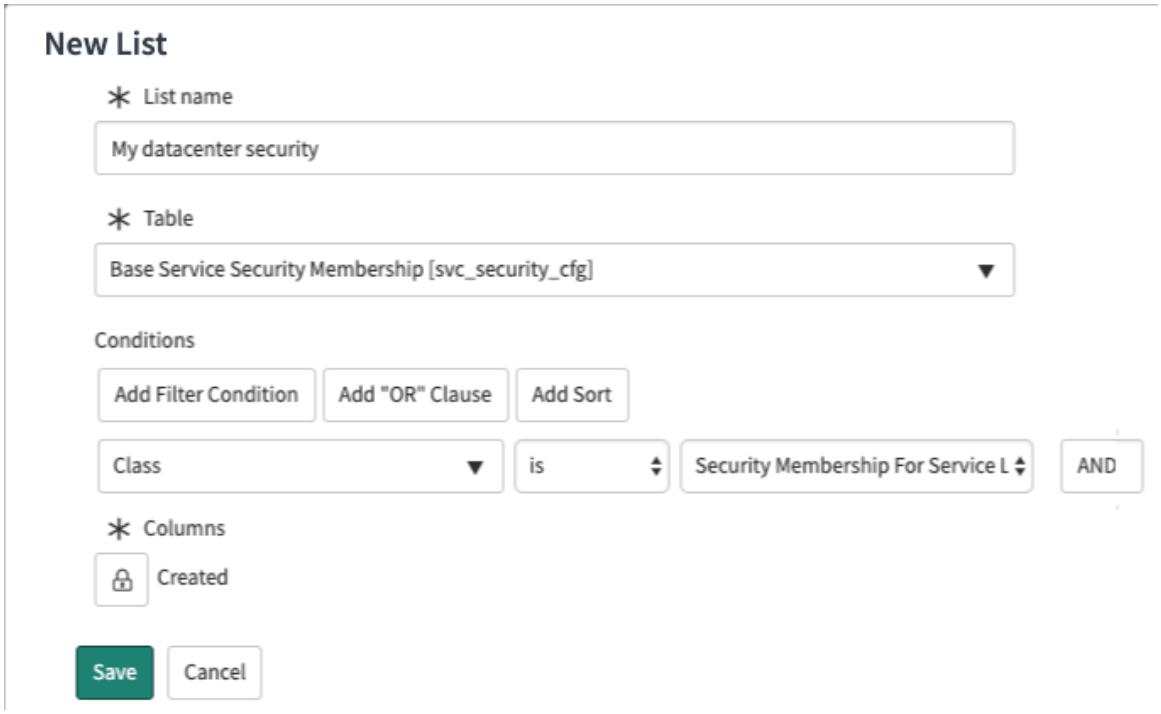
Procedure

1. Navigate to **Event Management** > **Operators Workspace**.
2. On the **Lists** tab, click **My Lists**.



3. Click **+ New list**, fill in the form with name and filter conditions, and then click **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The list appears on the **My Lists** tab.

Note: The list applies only to application services, and not to application service groups. The groups appear whether or not they match the filter, and whether or not they contain any services that match the filter.

Work with flapping alerts

If an alert is in the flapping state, you might need to triage the alert again.

Before you begin

Note: The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

Role required: evt_mgmt_operator

About this task

If an event repeatedly triggers the same alert in a short amount of time, the alert is put into the flapping state, even if an operator closed it previously. The event can also be fluctuating between severity levels, such as Info and Critical. You should triage the alert again, and take action to try to prevent the event from reoccurring.

Note: Your Event Management administrator can configure several settings that determine when to mark an alert as flapping, and other settings that determine what action you can take. This topic covers a generic example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Find alerts in the flapping state:
   a. Navigate to **Event Management** > **Operators Workspace**.
   b. Modify the list of alerts by clicking the filter icon ( ) and specifying criteria to find flapping alerts.
   Click **Advanced view** to modify filter settings. For example, you can specify:
   `State | is | Flapping`.
2. Click the alert number to open it.
3. On the alert, click the **Flapping** tab and review the information:

Field	Description
Flap count	The number of times the alert started flapping since the time in the **Flap start window** field.
Flap start window	The time that flapping started.
Flap last update time	The last time flapping occurred. This time is the instance processing time, not the source system time.
Flap last state	The state of the alert before it entered the flapping state.

4. Decide which action to take based on how often flapping has occurred.
   You can do any of the following, depending on what your organization's standard operating procedures are and what your Event Management administrator configured:
   - Run a remediation workflow that might do something like reboot a server or reset a router.
   - Access a web application, like the application for your event monitoring software on your network.
   - Modify an associated incident or a KB article to include additional information or steps.
5. After you are certain that the underlying issue is addressed, close the alert.

Handle alerts while CIs are in maintenance

When an alert occurs on a CI that is in the maintenance state, the alert state is also changed to maintenance. You should find and monitor the states of these alerts. Later, when changes on the CI are complete, finish triaging the alert and close it.

Before you begin

Note: The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before completing this task, familiarize yourself with basic form configuration in an instance. You might need to add fields and related lists to forms.

The example in this topic assumes that a network administrator opened a change request to reconfigure a problematic web server.

Role required: evt_mgmt_operator

Procedure

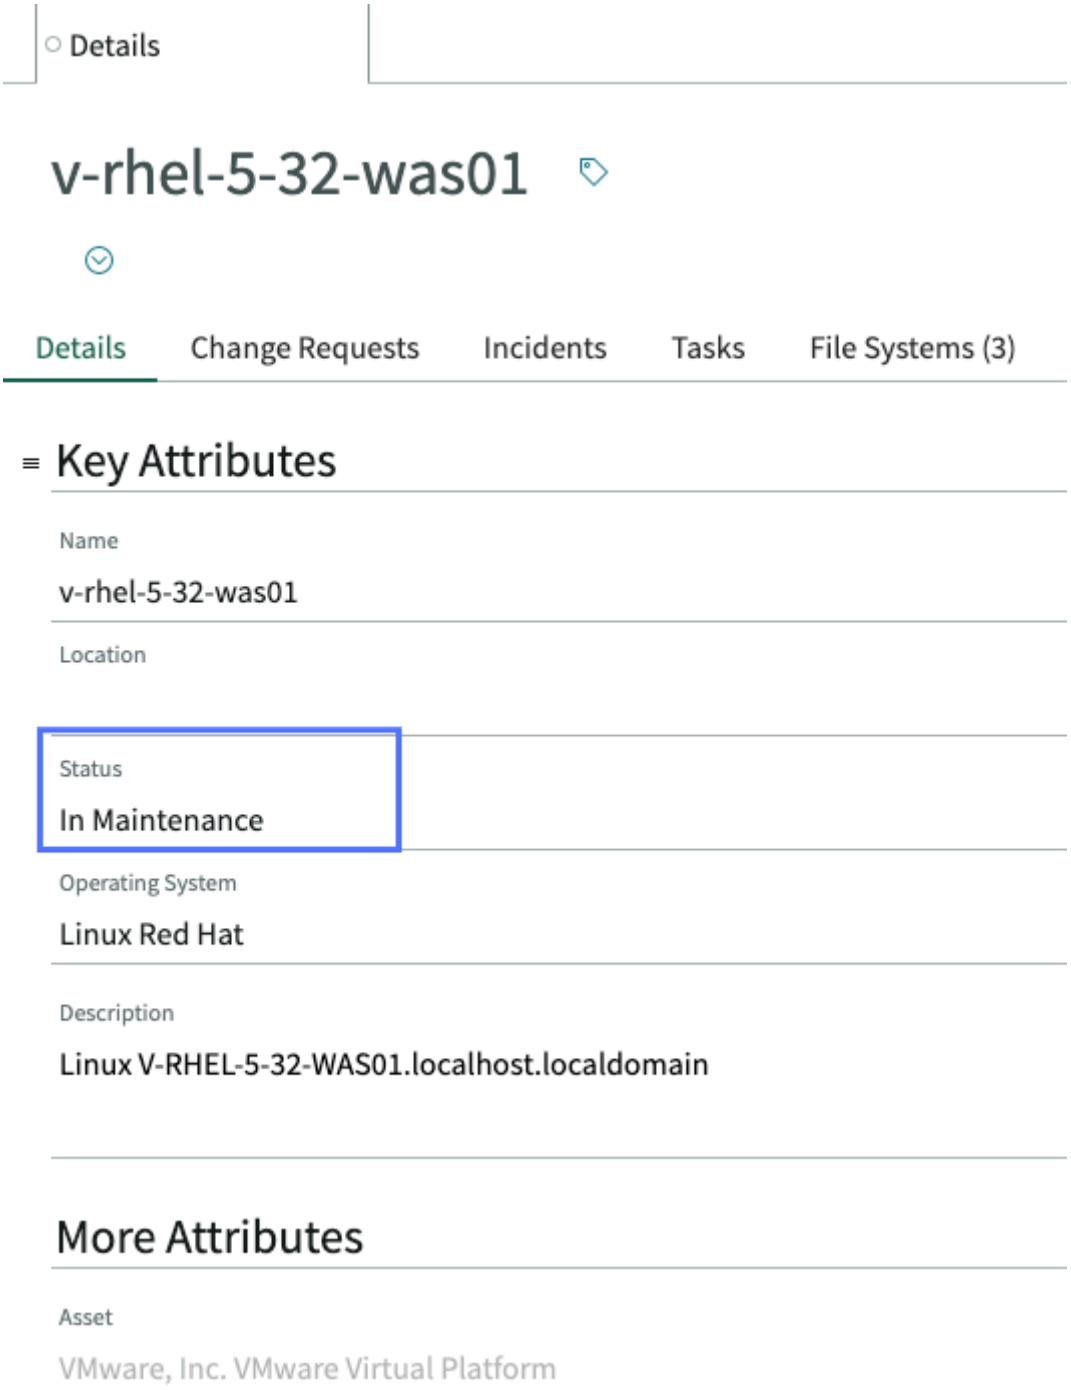
1. Find alerts in maintenance:
   a. Navigate to **Event Management** > **Operators Workspace**.
   b. Click the filter icon ( ) and in the Filter box, click **Advanced view** and specify:

      `State|is|Maintenance`.
2. In the list of alerts, find an alert with a value in the **Configuration Item** column. This is the CI on which the alert occurred.
3. Click the CI name to open the form that displays information about the CI.

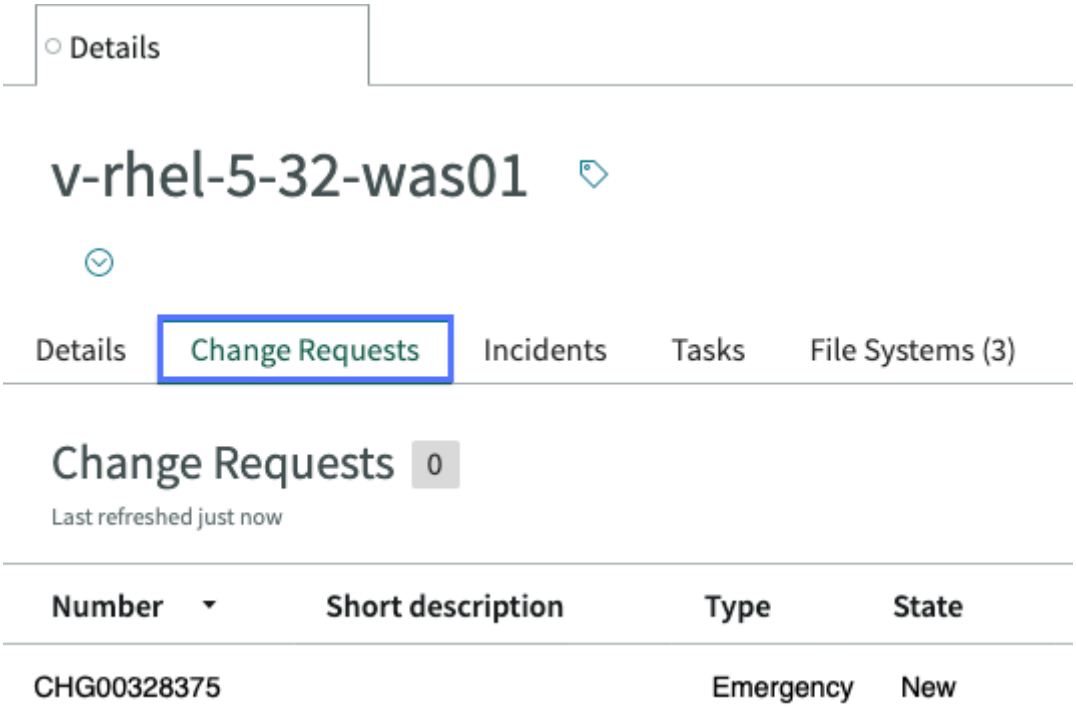
   In this example, the status of the web server is **In Maintenance** and there is a change request scheduled so that someone can reconfigure it.
4. Click the CI name to open the form that displays information about the CI.

   In this example, the status of the server (on the **Details** tab) is **In Maintenance**. You can view the scheduled change request on the **Change Requests** tab (someone will reconfigure the CI).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. At this point, you should not modify the alert associated with this CI.
   You can open the change request to see if a schedule is attached. Coordinate with your team to find out when the CI will no longer be in maintenance.
6. After you verify that the **Status** field on the CI is not **In Maintenance**, open the alert again and clear the **Maintenance** check box.
7. Continue to triage the alert.

Adjust alert impact while triaging an alert

As an Event Management operator, you might need to modify the impact that an alert has on an application service and on the CIs in a service. Adjust the impact when it does not accurately represent your network environment.

Before you begin

Note: The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

Role required: evt_mgmt_operator

About this task

Before you make any modifications to impact calculations, make sure that you understand how the application services and the CIs actually function. You might need to perform tests on network infrastructure or contact someone who can.

Procedure

1. Navigate to **Event Management** > **Operators Workspace**.
2. Double click the name of the application service that has the alerts you want to modify.
3. On the Details tab, click **Service Map**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. On the **Service Map** tab, click **Full Map** Tree.
5. On the map, click **Impact Tree**.
6. Analyze the application service to see whether the impact tree accurately reflects the impact of the alerts based on what you know about the CIs involved.

   In this example, a critical alert indicates a serious issue with a Linux server that is part of a Web portal application service.

   Notice that the impact on the Web portal itself is red, meaning critical. This is true even though only one of the Linux servers that it relies upon actually has a critical alert. The other Linux Server is not impacted by the alert. Assume for this example that the Linux servers perform different roles for the web service. Even though **PS LinuxApp02** has a critical alert, the **PS LinuxApp01** server can adequately provide all the necessary services to keep the application service operational.

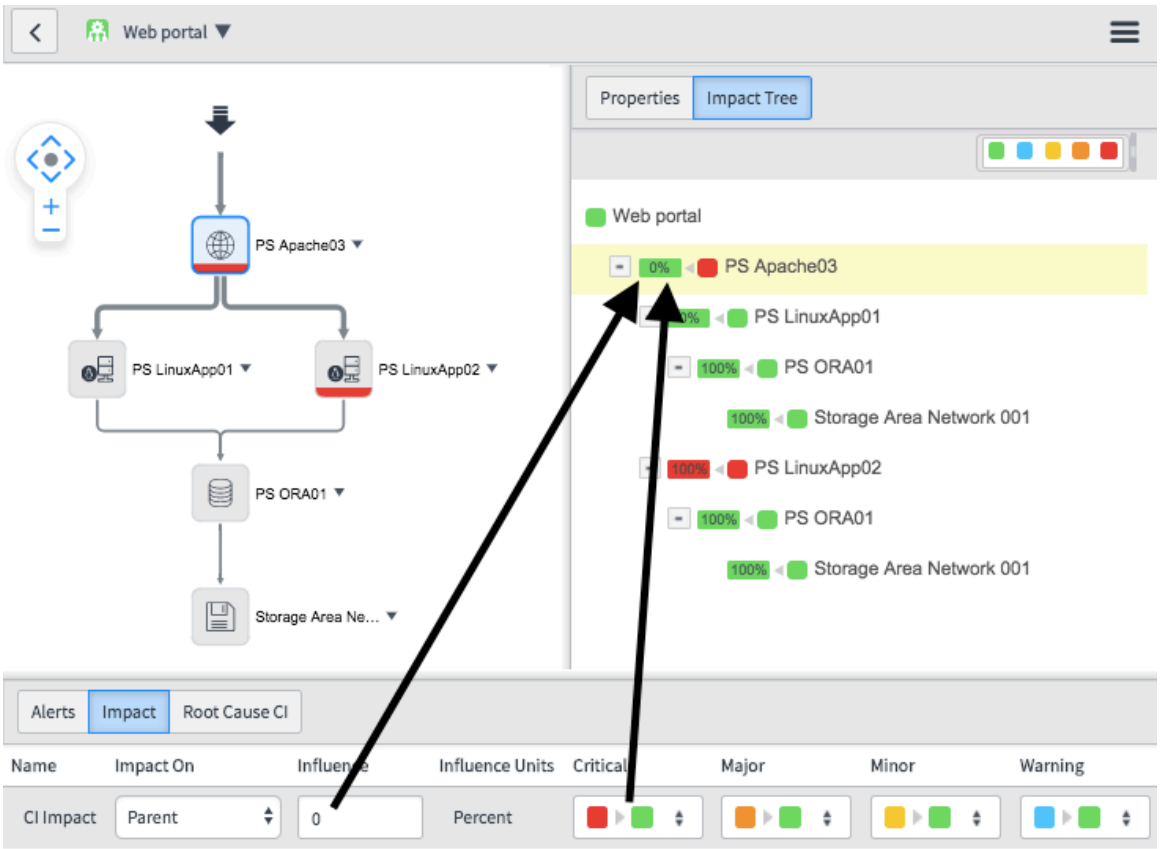
7. Click the **PS Apache03** CI, and then click **Impact** to display the impact rules for the CI. By default, the CI impact rule appears, showing you this information:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The **Impact On** and **Influence** columns show you that the CI (**PS Apache03**) should inherit 100% of the impact of all child CI impacts. In this case, the child CI impacts include the critical impact on the **PS LinuxApp02** server. This setting is why the **PS Apache03** web server, and the application service as a whole, inherits the impact 100%.
- The **Critical** column shows you that a critical alert (red) is inherited as critical alert (red).

8. Change the **Influence** value to 0 since the web server is still operational.
9. Change the **Critical** column to indicate that a critical impact status (red) should be inherited as a non-impact (green).
10. Wait for the dashboard to update automatically, or click **Event Management** > **Service Operations Workspace** and double-click the same application service to get an updated application service map.

    Notice that the influence on the Apache web server is 0% and the impact status is green. Also notice that the critical alert status (red) remains unchanged, even though the impact changed to green.



11. Navigate back to the Service Operations Workspace dashboard.
    Notice that the application service is now green, indicating that the overall application service is operational. The critical alert still displays at the bottom in the Alerts list, indicating that there is still an issue that you or other operators can address.

What to do next

Your administrator might configure additional impact rules that display when you click a CI in the application service map. You can make adjustments to the **Influence** fields on any impact rule to get the most accurate impact tree.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Event Management reference

Reference topics provide additional information about mapping and fine-tuning application services using Event Management lists and forms.

Components installed with Event Management

Activating the Event Management (com.glideapp.itom.snac) plugin adds several roles, scheduled jobs, and tables.

Note: The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Roles installed with Event Management

Roles used by the Event Management application.

Event Management adds these roles.

Role title [name]	Description	Contains roles
Event Management Administrator [evt_mgmt_admin]	Has read and write access to all Event Management features to configure Event Management. **Note:** Exercise caution with the evt_mgmt_admin role, as it can be elevated to the admin role. A user with the evt_mgmt_admin role has the ability to add and modify scripts that run on a global scope. Ensure proper access control. With this role, the user can create and/or update the following scripts: • Alert correlation rules • Alert management rules • Maintenance rules • Advanced scripts • Event field mapping • Pre- and post-binding scripts	• evt_mgmt_user • template_editor_global
Event Management Operator [evt_mgmt_operator]	In addition to the evt_mgmt_user permissions, can also activate operations on alerts such as acknowledge, close, open incident, and run remediations.	evt_mgmt_user
Event Management User [evt_mgmt_user]	Has read access to all Event Management features. Has the itil role to be able to manage incidents that are created from alerts.	itil
Event Management Integrator	Has create access to the Event [em_event] and Registered Nodes	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role title [name]	Description	Contains roles
[evt_mgmt_integration]	[em_registered_nodes] tables to integrate with external event sources.	
Event Management AIOps Manager [evt_aiops_manager]	Responsible for overseeing NOC teams performance and can onboard AI Specialists as part of the agentic workforce features in AIOps.	evt_team_operator
Event Management Team Operator [evt_team_operator]	Can create and manage their own integrations, set up their own alert automations, and enhance control over alert management for their teams.	

Scheduled jobs installed with Event Management

List of scheduled jobs that are provided with Event Management.

To review the list of scheduled jobs, navigate to **System Scheduler** > **Scheduled Jobs**. Event Management adds the following scheduled jobs.

Scheduled job	Description
Event Management — Connector execution job	Compares current time with time when active connector instances were last run and sets relevant connectors to execute. Runs every 10 seconds.
Event Management — Handle Impact Stuck Service	Releases stuck services and marks them as requiring rebuilding in the Impact Changes table to rebuild the impact tree. Runs every 2 minutes, 31 seconds.
Event Management — Impact Calculator Trigger	Trigger the impact calculation. The Event Management dashboard and impact tree are refreshed using the calculated figures. Runs every 6 seconds.
Event Management — Impact Topology Consumer	Consumes topology changes and marks the related services as 'require rebuilding' in the Impact Changes table to rebuild their impact trees. Runs every 19 seconds.
Event Management — Update stuck connectors	Release connector instances that are stuck. Runs every 2 minutes.
Event Management — Alert Priority Queue	Calculate alert priority. Two Alert Priority Queue jobs are active and available and can be run multi-thread. Runs every minute.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scheduled job	Description
Event Management — Auto Close Alerts	Alerts that are idle longer than 7 days (default time period) are closed. Modify the default using the `evt_mgmt.alert_auto_close_interval` property. Runs every 10 minutes.
Event Management — Calculate Alert Priority Grouping	Runs and calculates the priority groups: urgent, high, moderate and low for the alerts according to the highest and lowest priority score in the system. Runs every 30 minutes.
Event Management — Close Flapping Alerts	Close flapping alerts. Runs every 5 minutes.
Event Management — Close Threshold Alerts	Close threshold alerts. Runs every 2 minutes.
Event Management — Evaluate Scoped Alert Rules Management0	Execute alert management rules. Two separate jobs run to ease the load on the system. Runs every 11 seconds.
Event Management — Evaluate Scoped Alert Rules Management1	
Event Management — Filter Services for Impact - Queue Handler	Process changes from em_impact_inclusion_class and em_impact_filter_service. Runs every minute.
Event Management — Impact Tree Builder	Handles all services with changes from the em_impact_changes table and rebuilds their impact trees. Runs every 11 seconds.
Event Management — Insert Health Monitor	Job to produce the **ServiceNow Event Management** application services. Runs once every hour.
Event Management — Maintenance Calculator	Calculate the maintenance for CIs. Runs every minute.
Event Management — Node Count	Calculate license usage. Runs once every hour.
Event Management — Populate Impacted Services Table	Scan cmdb_ci_service_auto and copy all services to em_impacted_service, along with all related classes to em_impact_inclusion_class.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scheduled job	Description
	Runs once after upgrade.
Event Management — Process Events	Job that runs and processes each Ready event (apply event rule, mapping rule, and create or update alert) Runs every 5 seconds.
Event Management — Process Metric Binding	Process metric binding. Runs every 5 seconds.
Event Management — Process Records in em_extra_data_json	Creates events for log analytics anomalies. Runs every 13 seconds.
Event Management — Queue Connector Processor	Bi-directional functionality. Processes all pending alerts in the Update Queue and sends them to the MID Server. By default, this dequeue process is performed in batches of 1,000 alerts. Runs every 30 seconds.
Event Management — Recalculate Impact for Groups	By default, this job is not active. Can be run on demand to correct the impact on service groups. Runs on demand.
Event Management — Recover Stuck Events	Handle all events that are in queued state and switch back to Ready to handle events from the beginning. Runs at system startup.
Event Management — Update Health Monitor	Update the **ServiceNow Event Management** application services. Runs once every hour.
Event Management — Update SLA Configuration Result	Synchronizes the CIs that match the SLA configuration filter with the Event Management SLA [em_ci_severity_task] table. Runs every 10 minutes.
Event Management — Update SLA Severity	Updates Event Management SLA [em_ci_severity_task] table with the new severity. Runs once every minute.
Event Management — Convert IT Service	Run this property on demand to convert manual services to application services.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scheduled job	Description
	Runs every 30 minutes.
Event Management — Collect xmlstats	Collect event processing statistics. Runs once every minute.
Event Management — Impact Calculator for Alert Groups and SLA	Calculates the effect of alerts on alert group services.
Event Management — Manual Impact Calculator Trigger	Manually trigger of Impact Calculation on all operational Services.
4x Event Management — Impact Calculator for BS_0	Calculates the impact of alerts on application services, and builds the impact tree on the Event Management dashboard. Four separate jobs run to ease the load on the system.
4x Event Management — Impact Calculator for BS_1	
4x Event Management — Impact Calculator for BS_2	
4x Event Management — Impact Calculator for BS_3	
Event Management — Backfill Alert History table	Locates redundant records in the em_alert_history table and cancels them.
Event Management — Backfill Impact Status table	Locates redundant records in the em_impact_status table and cancels them.
Event Management — Impact for Groups	Calculates the impact of alerts on service groups.
Event Management — Clean Alert History Table	Cleans the Alert History (em_alert_history) table by removing records more than 90 days old. You can customize the amount of time after which alerts are removed by configuring *evt_mgmt.impact_calculation.cleanup_age_sec* in the sys_properties.list table.
Event Management — Clean Impact Status Table	Cleans the Impact Status (em_impact_status) table by removing records more than 90 days old. You can customize the amount of time after which alerts are removed by configuring *evt_mgmt.impact_calculation.cleanup_age_sec* in the sys_properties.list table.

Event Management adds the following scheduled jobs to support alert aggregation and RCA.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
Service Analytics Purge Old Observation Data — Daily	Cleans the staging data.
Service Analytics Prepare RCA Learner Input Data — Daily	Prepares RCA input data. Stores and probes MID Server to learn statistical information about alerts.
Service Analytics group alerts using RCA/Alert Aggregation	Applies RCA and alert aggregation to open alerts and prepares automated alert groups.
Service Analytics Alert Aggregation Learner — Daily	Learns information about existing alerts and groups new open alerts.
Service Analytics RCA Configuration	Configures root cause analysis.
Service Analytics Check File System Space on Analytics MID — Daily	Checks disk usage on the dedicated MID Server, and generates an event if it exceeds the threshold set in the *sa_analytics.rca.mid_max_allowed_space* property.
Service Analytics Gather Value Report Data — Daily	Gathers data for the Value Report.
Service Analytics — Update virtual alerts for aggregation groups	Update the virtual alerts that were created to represent alert aggregation groups, with any changes to alerts belonging to that group. Runs every minute.
Service Analytics Attribute Populator for Historical Alerts	Populate attributes used in feature identifier for historical alert data using event rules. Runs on demand.
Event Management - Analytics Alert Syncer	Gathers alert data that is used by grouping job.

Domain separation properties for Event Management connectors

Properties provide the metadata to identify the domain.

You can change the values if you want to use any other table or fields for domain identification but make sure that the table is domain separated.

Note: When personalizing domain separation for event management connectors, all the properties can be overridden at the connector level as well.

There are three caches maintained for personalizing domain separation (main, user_access, missing_domain). You can create a few system properties to control them.

Default System Properties

Property	Description
evt_mgmt. connector_domain_info_table_name	The table where you store domain information for personalizing domain separation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Default System Properties (continued)

Property	Description
	• **Type**: string • **Default value**: core_company
evt_mgmt. connector_domain_info_column_name	The field name in the table to identify the provided domain for personalizing domain separation. • **Type**: string • **Default value**: name
evt_mgmt. connector_domain_id_column_name	The field to get domain ID from for personalizing domain separation. • **Type**: string • **Default value**: sys_domain
evt_mgmt. connector_domain_path_column_name	The field to get the domain path from for personalizing domain separation. • **Type**: string • **Default value**: sys_domain_path

Property	Description
evt_mgmt.connector_custom_domain_sep_cache_expire_in_seconds	For personalizing domain separation, if you don't want your main cache to expire every week.
evt_mgmt.connector_custom_domain_sep_user_access_on_domain_cache_size	For personalizing domain separation, if you want to increase the size of the user access cache.
evt_mgmt.connector_custom_domain_sep_missing_domain_cache_expire_in_seconds	For personalizing domain separation, if you want to increase the

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	expire time for cache storing information regarding the missing domain.
evt_mgmt.connector_custom_domain_sep_cache_size	For personalizing domain separation, if you need more main cache size for storing domain information.

Tables installed with Event Management

Tables that are provided when Event Management is activated.

Event Management adds these tables.

Table	Description
Alert [em_alert]	Alerts that Event Management manage.
Alert Correlation Rule [em_alert_correlation_rule]	Rules specifying primary and secondary correlated alerts.
Alert Aggregation Group Alerts [em_agg_group_alert]	Stores alerts associated with aggregated alert groups.
Alert Aggregation Group [em_agg_group]	Relationships between aggregated groups and primary alerts.
Alerts History [em_alert_history]	History of alerts. Used for impact calculation.
Alert Rule [em_alert_rule]	Mappings of alert fields to the Incident [incident] table.
Alert Template [em_alert_template]	Alert templates. This table extends the Template [sys_template] table.
Event Management SLA [em_ci_severity_task]	Event Management SLA tasks for CIs and services.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
Connector Definition [em_connector_definition]	Settings for gathering events from external event sources.
Connector Instance [em_connector_instance]	Connection details for external event sources.
MID Server to Connector Instance [em_connector_instance_to_mid]	Mappings of MID Servers to connector instances.
Event Management License Usage [em_unique_nodes]	When events are received by ITOM AIOps, an entry is added or updated in this table based on the monitored target specified in the received message. The entry links to its corresponding CMDB CI. If none is found, the entry is assigned *Type = Unknown*.
Event [em_event]	Events received by Event Management.
Event Filter [em_event_filter]	Storage for defined event filters.
Event Match Rule [em_match_rule]	Updated events for alert processing. Used by event rules.
Event Match Field [em_match_field]	Mappings of event fields to alert fields. Simple mapping. Used by Event Rules.
Event Compose Field [em_compose_field]	Mappings of event fields to alert fields. Composite mapping. Used by Event Rules.
Event Mapping Rule [em_mapping_rule]	Updated event fields for alert processing.
Event Processing Statistics [em_event_stats]	Statistics on Event Management performance.
Event Type [em_event_type]	Event types.
Task Template [em_incident_template]	Templates that define how to populate new tasks. For example, how fields of an incident that is being created from an alert, must be populated. This table extends the Template [sys_template] table.
Registered Nodes	Registered nodes data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
[em_registered_nodes]	
Threshold Rule [em_threshold_rule]	Alert threshold rules.
Binding Device Map [Em_binding_device_map]	Event binding to network paths and storage paths.
Process to CI Type Mappings [Em_binding_process_map]	Event binding to specific processes.
CI Remediation [em_ci_remediation]	Remediation rule definitions.
Impact Graph [em_impact_graph]	Impact tree of CIs containing CI hierarchy and impact rules to be used for impact calculation.
Impact Graph History [em_impact_graph_history]	History of changes in impact tree.
Impact Rule Definitions [em_impact_rule_definition]	Definition of rules used for impact calculation.
Impact Rule instance [em_impact_rule]	Rules based on impact rule definitions.
Impact Inclusion Classes [em_impact_inclusion_class]	Specifies the classes to be used for impact calculation.
Impact Filter Services [em_impact_filter_service]	Specifies services to be included or excluded from impact calculation.
Infrastructure Relations [em_impact_infra_rel_def]	Child-parent pairs or CI types. CIs matching these definitions are added to impact trees.
Impact Maintenance CIs [em_impact_maint_ci]	CIs that are in maintenance and therefore are excluded from impact calculation.
Impact Status [em_impact_status]	Calculated status of CIs and services to be displayed in the dashboard and service maps for dynamic CI groups.
SLA Configuration [em_sla_configuration]	SLA configuration records that identify the CIs that SLAs can run on.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
Service Analytics Metric Type Registration [sa_metric_registration]	Source registration details for processing raw data.
Health monitor scripts [em_monitor_scripts]	These scripts determine how to monitor or check, for example, when using the Connectors Monitor script. You can create customized script to monitor a device or an entity. The scripts provided with the base instance are: • Check delay in event processing • Connectors Monitor • Get Event Processing state • MID Server Threshold Alerts
Monitoring configuration [em_monitor_conf]	Use this table to configure what to monitor according to the scripts that are listed. Configure how often to run each script. If a script has a threshold, it determines what alert severity to display. Threshold values are in units of minutes and specify the delay time. Navigate to **Event Management** > **Settings** > **Self-Health configuration** to see the list of Monitoring Configurations or to create a new one. Use this script to test Data Center Monitoring. The scripts provided with the base instance are: • Connector's idle state monitoring-monitor to verify whether any of the connectors was in idle state that surpassed the threshold [in minutes] that was configured. • Connectors Status- monitor to track the active status of the connectors. • Delay in event processing-monitor to track the duration [in minutes] of events that remained in 'ready' state and were not processed. • Event Processing job-monitors the state of the event processing jobs. • MID Server Threshold Alert-monitors MID Server health.
Monitoring Event Management Jobs [em_monitor_jobs_state]	Monitor Event Management jobs by adding the relevant jobs to the table. **Note:** The following jobs are not monitored by this table: • Event Management - Process Events • Event Management - Impact Tree Builder • Event Management - Recover Stuck Events • Event Processing

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
Monitoring state [em_monitor_state]	Use this table to set the threshold for each connector. When there is a value above the threshold, an alert is generated.
EM XMLStats Data [em_xmlstats_data]	Self-health statistics and diagnostic details for Metric Intelligence and Event Management, which are used to produce the XMLStats page.

Event Management adds the following tables to support alert aggregation and RCA.

Table	Description
SA RCA Status [sa_rca_status]	Information (such as IDs) for the latest messages that were sent to the ECC Queue for a service during RCA.
SA RCA Output [sa_rca_output]	RCA learner output data.
SA RCA Group [sa_rca_group]	Automated alert groups for the RCA query.
SA Analytics Alert Staging [sa_analytics_alert]	Staging table for alerts used for analytics.
SA RCA Input [sa_rca_input]	Input data for the RCA learner.
SA Analytics Status [sa_analytics_status]	Last run information to be used for alert aggregation and RCA.
SA RCA Group Alert [sa_rca_group_alert]	Alerts associated with automated alert groups.
SA RCA Service Configuration Item Association [sa_rca_svc_ci_assoc]	Associations between CIs and services.
SA Alert Aggregation Learned Pattern [sa_agg_pattern]	Learned patterns from alert aggregation.
SA Alert Aggregation Learned Pattern Elements [sa_agg_pattern_element]	CI/Metric Name pairs associated with learned patterns.
SA Alert Aggregation Query Group Patterns	Relationships between groups discovered in alert aggregation queries and patterns found in learning.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
[sa_agg_group_pattern]	
SA Alert Aggregation Query -- Staged (Recent) Alerts [sa_agg_group_alert_staging]	A staging table for alerts that have not yet been associated with any aggregated alert group.
SA Agg Pattern Attribute [sa_agg_pattern_attribute table]	CI/alert attributes to be used for finding patterns for alert aggregation.
SA Alert Attribute Populator Status [sa_alert_attribute_populator_status table]	State and statistics for attribute populator job.
SA Alert Aggregation Learned Pattern Elements Pair wise Mutual Information and Joint Probability [sa_agg_pattern_element_pair]	Pairwise probabilities for pattern elements.
EM Agg Group Prediction [em_agg_group_prediction]	Alert predictions for alert groups.

Event Management Platform Analytics Solutions

Platform Analytics Solutions contain preconfigured dashboards. These dashboards contain actionable data visualizations that help you improve your business processes and practices.

Platform Analytics Solutions

Platform Analytics data visualizations use Performance Analytics indicator data to show you data over time, helping you analyze your business processes and identify areas of improvement. With Platform Analytics Solutions, you can get value from Performance Analytics for your application with minimal setup. You can always create your own objects as well.

To enable the solution for Event Management, an admin can navigate to **Performance Analytics** > **Guided Setup**. Click **Get Started** then scroll to the section for Event Management. The guided setup takes you through the entire setup and configuration process.

Data visualization in ITOM now includes a funnel component to help you track metric progression across stages, making it easier to identify drop-offs or bottlenecks in processes. For more details, see Data visualization in ITOM.

Before you begin

Role required: user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Performance Analytics** > **Dashboards**.
2. On the **Dashboards** page, select a dashboard to view.
3. Select the **Edit** button.
4. Select the relevant element to open the Configuration panel.
5. In the Configuration panel, edit the element's options.
6. Select **Save**.

What to do next

Users with the admin role can customize colors and fonts. To customize fonts, navigate to **sys_ux_theme_property.list** and edit the applicable fonts.

Machine learning solutions for Event Management

Build solutions for Event Management with Predictive Intelligence.

Solution definition

Solution Definition for Event Management

Solution Definition	Description
Closed alert similarity	Closed alert similarity is a similarity solution definition that is used to recommend similar Alert records based on these fields: Description, Node, Resource, CI Type,Source, and Metric Name from the Alert [em_alert] table. Results are visible to users on the Alert form and on the Similar Alerts tab in Workspace.
EM Alert Clustering Solution	EM Alert Clustering Solution is a clustering solution definition used in Event Management. Allows building clustering models enabling identification of common text patterns in alerts to create alert groups. Text clusters are based on these fields: Description, Metric Name, Configuration Item Class from the Alert [em_alert] table.

Performance Analytics Edit Widget dialog box

Fields in the dialog box for editing a Performance Analytics dashboard widget.

Section	Description
Show real-time updates	Select for updates to appear in the widget in real-time.
Show	Select or clear the boxes to show or hide the following on the widget: • Border • Header • Title
Title alignment	Select the alignment of the widget title:

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Section	Description
	• Left • Center • Right
Title color	Select to configure the color of the widget title.
Header color	Select to configure the color of the widget header.
Interactivity	Select from the displayed options. • Follow interactive filter • Show when following filter

Event Management MID Web Server extension form

Fields in the form for creating or modifying a MID Web Server extension.

MID Web Server Context form

Field	Description
Name	Unique name for the extension for easy identification.
Short description	Brief, meaningful description of the extension.
Status	This field is auto-populated with the status of the extension. The field is blank until the extension is started. After issuing a command to the extension, one of the following values is displayed: • Started: The extension is running. • Stopped: The extension is not running. • Offline: The MID Server is down. • Error: The extension failed with an error. The error message is displayed in the **Error Message** field. • Warning: A run-time exception has occurred. The extension continues to work.
HTTP/HTTPS Port	Port number the extension listens on for incoming requests.
Authentication Type	The available authentication types are: • **API Key** (default): Any client connecting to the extension must enter an API key into the request's authorization header. For details on viewing existing API keys, see Configure MID Web Server API key authentication.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MID Web Server Context form (continued)

Field	Description
	• **Keybased** (deprecated and kept only for compatibility with releases prior to the Brazil release): The value in the **Secret Key** field is used to generate an authentication token sent in the **Authorization** header of incoming client requests. For details, see Configure key-based MID Web Server authentication. • **Basic**: Define a username and password in the **Basic Auth User** and **Basic Auth User Password** fields, which appear when selecting this option. • **mTLS**: A certificate-based authentication that uses the TLS protocol. For details, see MID Web Server and agent mTLS Authentication.
Secret Key	The value generated when Keybased authentication is selected for the value in the Authentication Type field.
Basic Auth User	Username to be used when selecting Basic authentication.
Basic Auth User Password	Password to be used when selecting Basic authentication.
Secure Connection	Option to indicate that the extension is to use the TLS protocol to encrypt incoming connections. A certificate and private key combination must also be provided to the extension. When selecting this option, the **MID Server Unified Keystore** check box appears.
Use MID Unified Keystore	Option for using the MID Server Unified Keystore option for a secure connection. Clear this option to use **Web Server Keystore**. For details, see Configure a secure MID Web Server extension.
Keystore Certificate Alias	The alias name of the keypair inside the selected keystore that the extension uses to establish a secure connection. Leave this field empty to use the default alias when using the MID Unified Keystore or when using the Web Server Keystore with a single alias.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MID Web Server Context form (continued)

Field	Description
Keystore Password	The password for the Web Server Keystore when it is used to establish a secure connection.
Keystore Key Password	The password of the private key entry mapped to the specified alias of the Web Server Keystore. This field can be left empty if the password matches the entry in the Keystore Password field.
Truststore Password	The password to the truststore that holds the Certificate Authority (CA) certificates used to validate the signatures of the client certificates. Appears when the **mTLS** authentication type is selected. Leave this field empty if the extension is configured to use the cacerts truststore of the JRE running the MID Server.
Error Message	Message describing any error that causes a command, such as Start or Stop, to fail. This field appears only when the value in the Status field is Error.
Execute on	Location for running this extension. The available options are **Specific MID Server** or **Specific MID Server Cluster**.
MID Server	Depending on your selection in the **Execute on** field, the name of the designated MID Server or MID Server cluster. • If you selected **Specific MID Server**, the name of the designated MID Server. • If you selected **Specific MID Server Cluster**, the name of the designated MID Server cluster.
Executing on	Displays the name of the MID Server on which the extension is running even if the MID Server is down. If the user stops the extension, this field is empty.

Event Management tag based alert clustering tag form

The form for creating or modifying a tag based alert clustering tag displays detailed information about the tag.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tag based alert clustering tag form

Field	Description
Name	Name of the clustering tag. Defaults to a description of the configured tag (such as, **Exact match on Alert Field "metric name"**). The default name is visible only after saving the tag. Tag names must be unique.
Customized name	Select the check box to customize the value in the **Name** field.
Domain	The domain in which the current record was created. Read-only.
Description	Enter an optional description of the tag.
Source	Select the source from which to choose the field to be matched. • **Alert field** • **Alert additional info** • **Alert CI** • **Alert CI key** • **Alert tags** If you select **Alert additional info**, choose an **Additional Info Key** instead of a field. **Alert additional info** is a field on alert containing the key value pair in Jason format and we can use a specific key. **Alert CI key**: Create CMDB key values to cluster alerts based on CMDB Key Values [cmdb_key_value] table. Key values provide an additional method for determining commonalities between alert CIs.
Selected field	Indicate the field that has to match between alerts for the alerts to be included in a group. Appears when you select **Alert Field** or **Alert CI** in the **Source** field. If you select **Alert CI** in the **Source** field, you need to select a CMDB key. A CMDB key is assigned to the CI of the alert.
Key	Indicate the Key that has to match between alerts for the alerts to be included in a group.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tag based alert clustering tag form (continued)

Field	Description
	Appears when you select **Alert additional info** in the **Source** field, or appears when you select **Alert tags** in the **Source** field. When **Alert additional info** is selected, enter the name of one of the fields in the additional info field. When **Alert tags** is selected, enter the name of the relevant alert tag.
CMDB key	Indicate the CMDB key to match for the alerts to be included in a group. Appears when you select **Alert CI Key** in the **Source** field.
Match method	Select the type of match required for the alerts to be included in a group. • **Exact**: Indicates that the field value must be an exact match for the alert to be included in a group. For example, you can configure an alert clustering tag indicating that the alert's **Metric name** field must be an exact match to form a group. When invoking that tag, all alerts with identical values in the **Metric name** field are included in the same group. • **Fuzzy**: Indicates that the field value needs to be an approximate match (depending on the value configured in the **Similarity** field) for the alert to be included in a group. • **Pattern**: Indicates that the field value needs to follow the pattern in the **Pattern** field. For correct syntax and usage examples, see Pattern matching.
Similarity	Specify the similarity percentage that must be met by the alerts to be included in a group. For example, entering 50 indicates that at least 50 percent of the indicated value must appear in the alert for the alert to be included in the group. Appears only when **Fuzzy** is selected as the **Match Method** value. Default value = 90

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

List of predefined alert grouping tags

A list of the predefined alert clustering tags provided with the Tag Based Alert Clustering Engine # application.

Predefined alert clustering tags

Name	Source	Match method
CI	em_alert.cmdb_ci	Exact match
Description	em_alert.description	Exact match
Metric Name	em_alert.metric_name	Exact match
Node	em_alert.node	Exact match
Resource	em_alert.resource	Exact match
Source	em_alert.source	Exact match
Source instance	em_alert.event_class	Exact match
Type	em_alert.type	Exact match
Assignment group	em_alert.assignment_group	Exact match
CI Class	cmdb_ci.sys_class_name	Exact match
Dns domain	cmdb_ci.dns_domain	Exact match
ip address	cmdb_ci.ip_address	Exact match
Location	cmdb_ci.location	Exact match
Environment	cmdb_ci.environment	Exact match
CI name	cmdb_ci.name	Exact match
Namespace	cmdb_ci.namespace	Exact match

Predefined tags extracted from connector payload

Name	Description	Default mapping from CMDB
t_ip_address	IP address	cmdb_ci.ip_address
t_application	Application	-
t_region	Region	-
t_location	Location	cmdb_ci.location
t_environment	Environment	cmdb_ci.environment
t_namespace	Namespace	cmdb_ci.namespace

Event Management tag based alert grouping definition form

The form for creating or modifying a tag based alert clustering definition displays detailed information about the definition.

Tag based alert clustering definition form

Field	Description
Name	Name of the alert clustering definition. Definition names must be unique.
Active	Select to activate the definition. This option is selected by default.
Order	The order by which definitions are tested for incoming alerts. Those with lower Order values are tested first. When an alert matches one of the definitions' filters, it continues searching for more definitions. Default value = 1000
Domain	The domain in which the current record was created. Read-only.
Assignment group	Assignment group that works on the alert. If no assignment group is defined in the alert rule, then this alert rule is considered as a global rule. When the rules are running – first the global rules run and then the rules that belong to the assignment group of the alert.
Description	Enter an optional description of the alert clustering definition.
Filter	Set conditions that incoming alerts must meet to be measured by the alert clustering definition's tags. If the tags correspond to alerts that exist in the system and are within the **Clustering timeframe (minutes)** value, the incoming alerts join with the existing alerts to form an alert group. After configuring the filter, you can click the **Preview** button to view how many existing alerts match the filter's condition.

Tag based alert clustering definition form (continued)

Field	Description

	Note:
	• Matching alerts are not automatically included together in an alert group. Alerts are grouped only if they have corresponding alert clustering tags.
	• Filter parameters are case sensitive by default. To disable case sensitivity, set the *sa_analytics.correlation_case_sensitive* parameter to **false**.
	• You can also configure alert fields to be excluded from the search, using the *sn_em_tbac.tag_excluded_alert_fields* property. By default, the following are excluded by this property:
	  ○ type
	  ○ event_class

Override group description	Default group descriptions begin with a "Group of alerts" prefix, followed by the description of the primary alert in the group. You may override this group description by selecting the **Override group description** check box. Then, in the **Custom description** field, type a description. This description is used as the description of the groups that are created by this alert clustering definition. **Note:** You cannot save the form if you left the Custom description field blank or with the default 'Group of alerts' text.
Clustering timeframe	The maximum time, in minutes, allowed between the first alert and subsequent alerts for them to be grouped together. For example, a value of 60 indicates that any alert generated within 60 minutes of the first alert in the group (the oldest alert) is included in the alert group. Any alert generated after this 60-minute window from the initial alert is not included in the group. Permitted values = 0-1440
Tag Based Alert Clustering Definitions Tags M2M	Select the alert clustering tags to be assigned to the alert clustering definition. Alerts that meet the criteria specified in the selected tags are included in the alert group.

Tag based alert clustering definition form (continued)

Field	Description
	The available options are the tags created on the **Tag Based Alert Clustering Tags** page.

List of predefined tag-based alert grouping definitions

A list of the predefined alert clustering definitions provided with the Tag Based Alert Clustering Engine#application.

Predefined alert clustering definitions

Name	Description	Order
Group alerts from the same Application	Group all alerts from the same application, created in the last 10 minutes. In new systems, this definition is activated by default.	9010
Group all alerts from the same IP address	Group all alerts from the same IP address, created in the last 10 minutes.	9020
Group all alerts from the same Namespace	Group all alerts from the same namespace, created in the last 10 minutes. In new systems, this definition is activated by default.	9030
Group all alerts from the same Subnet	Group all alerts from the same subnet, created in the last 10 minutes. In new systems, this definition is activated by default.	9040
Group alerts from the same CI class and Location	Group all alerts from the same CI class and location, created in the last 10 minutes.	9050
Group alerts from the same Application and Environment	Group all alerts from the same application and environment, created in the last 10 minutes.	9060
Group all alerts from a similar Node	Group all alerts from a similar node name, created in the last 10 minutes.	9070
Group alerts from the same Location and Assignment group	Group all alerts from the same location and assignment group, created in the last 10 minutes.	9080
Group alerts from the same Region and Metric	Group all alerts from the same region and metric, created in the last 10 minutes.	9090
Group alerts from the same CI class and Metric	Group all alerts from the same CI class and metric, created in the last 10 minutes.	9100
Group alerts from the same Node and Metric	Group all alerts from the same node and metric, created in the last 10 minutes.	9110
Group alerts from the same Assignment group and Class	Group all alerts from the same assignment group and class, created in the last 10 minutes.	9120
Group alerts from the same Type, Metric and Source	Group all alerts from the same type, metric, and source instance, created in the last 10 minutes.	9130
Group alerts from the same CI	Group all alerts from the same CI, created in the last 10 minutes.	9140

Predefined alert clustering definitions (continued)

Name	Description	Order
	Important: When this rule is active, CMDB grouping must be disabled.	
Group alerts from the same Node	Group all alerts from the same node, created in the last 10 minutes. In new systems, this rule is activated by default.	9150

Domain properties installed with Event Management

Use the domain properties installed with Event Management to provide metadata that identifies the appropriate domain table for event creation.

Default domain metadata properties

Property
evt_mgmt. connector_domain_info_table_name
evt_mgmt. connector_domain_info_column_name
evt_mgmt. connector_domain_id_column_name
evt_mgmt. connector_domain_path_column_name

Connector domain metadata

Override push connector default domain metadata values installed with Event Management with the values in the event HTTP request, including the URL, headers, request body (payload), and connector parameters. Override pull connector domain metadata values with connector parameters only.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Domain metadata parameters

Name	Description	Overrides System Property
connectorDomainInfoTableName	Name of the table containing the records with the domain information.	evt_mgmt.connector_domain_info_table_name • **Type**: string • **Default value**: core_company
connectorDomainInfoColumnName	Name of the column that has a value that should be matched with the domain identifier. For example, you might want to identify a record in the Domain Info table that has a matching value in the **company_name** field.	evt_mgmt.connector_domain_info_column_nam • **Type**: string • **Default value**: name
connectorDomainIdColumnName	Name of the table column that stores the domain ID.	evt_mgmt.connector_domain_id_column_name • **Type**: string • **Default value**: sys_domain
connectorDomainPathColumnName	Name of the table column that stores the domain path.	evt_mgmt.connector_domain_path_column_na • **Type**: string • **Default value**: sys_domain_path

Order of preference for accessing domain metadata

You must provide domain metadata to configure personalized push connector domains. The metadata in preferred accessing order are:

1. Push connector parameters
2. URL query parameters
3. HTTP headers
4. Request body (payload)
5. Default system properties

URL query parameters

Push connectors have the following URL syntax:

- Instance Type: `https://<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=<connector-source>`
- MID Server type: `http://<MID_Server_IP>:<MID_Web_Server_Port>/api/mid/em/inbound_event?Transform=<connector-transform-script-name>`

You can include domain metadata as additional query parameters in the ServiceNow push connector webhook URL. For example, if the domain information source is the sys_user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

table, the URL could be `https://<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=<connector-source>&connectorDomainInfoTableName=sys_user`

Request headers

Any of the domain metadata properties can be passed as part of HTTP request headers. Check the documentation from your third-party monitoring tool for information about how request headers are set.

Request body (payload)

You can reference domain metadata from the request body (JSON payload) by setting the metadata parameters as root-level keys in the payload. The following example shows how the *connectorDomainInfoTableName* and *connectorDomainInfoColumnName* parameters might be passed as part of the request body:

```
{
    “source”: “Azure Monitor”,
    “host”: “127.0.0.1”,
    “company”: “ServiceNow”,
    “connectorDomainInfoTableName”: “sys_user”,
    “connectorDomainInfoColumnName”: “first_name”
    }
```

Note: For information on connector parameters, see Configure domain separation for push connector events.

Dynatrace connector instance form

The Dynatrace connector instance form displays the fields you must fill in when creating a Dynatrace connector instance.

Connector instance page

Field	Description
Name	Unique name for the Dynatrace metric connector instance.
Description	Description for the use of connector instance.
Connector Definition	The connector definition to be used by the connector. Select **Dynatrace Metrics**.
Host IP	Hostname/IP address of the Dynatrace server.
Credential	Select the search icon and select the existing API key credential. If this credential does not exist, create a new credential, as follows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connector instance page (continued)

Field	Description
	1. Ensure that you have an access token with Read Metric (metrics.read) permissions, created on the Dynatrace UI. 2. Select **New** after selecting the search icon. 3. Select **API Key Credentials**. 4. In the **API Key** field, enter the access token from the Dynatrace UI. 5. In the **Name** field, enter a descriptive name to uniquely identify the credential. 6. Fill in any other relevant fields, and select **Submit**.
Metric collection	Selected by default. Read-only.
Metric collection schedule (seconds)	Time interval (in seconds) at which the metric connector pulls metrics from the Dynatrace server. Default: 60.
Active	Select to activate the connector instance.

Dynatrace connector instance value parameters

The following table displays the Dynatrace connector instance value parameters that you can fill in, as needed, when creating a Dynatrace connector instance.

Connector instance value parameters

Parameter	Description
BaseApiPath	Custom base path for Dynatrace API calls. If your Dynatrace instance uses a different path than the default `/api/v2/metrics`, enter the custom path to ensure successful collection of metrics.
connectionAliasSysID	Connection credential alias sys ID of the Service graph connector you have configured. By default, the classic sys ID is populated. You can provide the sys ID of the Grail connection, if configured.
debug	Set to **true** to enable debug logs. Default: false
initialSyncInMins	Number of minutes before the current time that the initial metric collection runs. For example, if the value is 15, the connector fetches metrics from the past 15 minutes. Default: 15

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connector instance value parameters (continued)

Parameter	Description
isGrailApiEnabled	Set to **true** to enable Grail connection. Grail API related metrics are displayed in the **Configure metrics to collect** list. If this value is set **false**, the classic connection is enabled and classic API related metrics are displayed. Default: false
logPayload	Determines whether to print the raw log payload. Set to **true** only for debugging purposes, as printing the raw payload quickly fills up the MID Server logs. Default: false
maxMetricsPerQuery	Maximum number of metric ids to query per API call to Dynatrace. The value cannot exceed 32, the maximum limit allowed by Dynatrace. Default: 32
pageSize	Maximum number of records to return in an API response from Dynatrace. Default: 500
port	Port number for the Dynatrace server to connect to. empty
protocol	Protocol to use when connecting to the Dynatrace server. Default: https
throttleApiCalls	Determines whether throttling is enabled. When enabled (**true**), a limit is set on the number of API calls to Dynatrace per minute. Default: false
requestPerMinute	The limit on number of API calls to Dynatrace per minute. Relevant only when *`throttleApiCalls`* = **true**. Default: 1000

Push connector instance form

Push Connector Instance form displays the fields that you must fill when you create or modify a connector.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Name	A unique name for the connector instance record, such as the name of an event source host.
Description	Any optional information that the administrator wants to use to identify this record.
Push Connector definition	Select the definition for the external system from which you want to receive events. You can select any existing definition, for example: • Thousandeyes • Dynatrace • Catchpoints For a list of the connector definitions available in the base system, see Configure Event Management connectors. **Note:** If there are available configuration parameters for the push connector type you select, they appear under Push Connector Instance Configuration Parameters.
MID Server	It shows the list of MID Servers that has at least one MID Server Event Listener context up and running. The MID Server section appears only when the MID type of definition is selected.
URL	This field is auto-populated only after saving the details of the connector instance. Instance: The URL has to be configured in an external system with the ServiceNow credential having a evt_mgmt_integration role to receive the events. MID push connector instance: The URL has to be configured from an external system with Configure the MID Web Server extension credential to receive the events. This field appears only after the form has been saved.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Active	Select this check box to enable receiving the events from this external event source. This field appears only after the form has been saved.

Here are some options that depend on the type of **Push Connector Definition** you selected:

- Datadog: For case or work items, while creating push connectors select the **Configure Work Item Alerts** button. You are redirected to the Datadog work Items pull connector instance form, where you configure related-alert fetch and bi-directional synchronization. For more information, see Configure a Datadog work item connector instance.
- Dynatrace: Specify the connection credential alias sys ID of the Service graph connector as the parameter value of the **connection_sys_id** parameter. For details on configuring this the Service graph connector, see Configure Service Graph Connector for Observability - Dynatrace using guided setup.

Configure a push connector

Nagios connector instance value parameters

The following table displays the Nagios connector instance value parameters that you can fill in, as needed, when creating a Nagios connector instance.

Connector instance value parameters

Parameter	Description
debug	Set to **true** to enable debug logs. Default: false
max_fetch_interval_min	Limits metric history retrieval to prevent system overload. Default: 180 minutes
offset_min	Adds a small time buffer to ensure no metrics are missed. Default: 5 minutes

Nagios connector instance form

The Nagios connector instance form displays the fields you must fill in when creating a Nagios connector instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connector instance page

Field	Description
Name	Unique name for the Nagios metric connector instance.
Description	Brief explanation of the purpose or use of the connector instance.
Connector Definition	Connector definition to be used by the connector. Select **Nagios Metrics**.
Metrics database host	Host IP address of the host where the Nagios server collects metrics.
Metrics database credentials	Credentials required to access the Nagios database.
Metric collection	Option is pre-selected and read-only.
Metric collection schedule (seconds)	Time interval (in seconds) at which the connector retrieves metrics from the Nagios server. Default: 60 seconds.
Active	Option to activate the connector instance.

Zabbix connector instance form

The Zabbix connector instance form displays the fields you must fill in when creating a Zabbix connector instance.

Connector instance page

Field	Description
Name	Unique name for the Zabbix metric connector instance.
Description	Brief explanation of the purpose or use of the connector instance.
Connector Definition	Connector definition to be used by the connector. Select **Zabbix Metrics**.
Host IP	Host IP address of the host where the Zabbix server collects metrics.
Credential	Credentials required to access the Zabbix database. Select the search icon and select the Basic Auth credential.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connector instance page (continued)

Field	Description
	• Name: Provide the unique name for Zabbix cred. • UserName: Provide Zabbix server username • Password: Provide Zabbix server password • Select **Submit**.
Metric collection	Option is pre-selected and read-only.
Metric collection schedule (seconds)	Time interval (in seconds) at which the connector retrieves metrics from the Zabbix server. Default: 60 seconds.
Active	Option to activate the connector instance.

Zabbix connector instance value parameters

The following table displays the Zabbix connector instance value parameters that you can fill in, as needed, when creating a Zabbix connector instance.

Connector instance value parameters

Parameter	Description
api_endpoint_suffix	Set this value based on your Zabbix server web interface installation: https://www.zabbix.com/documentation/current/en/manual/installation/frontend#welcome-screen Default value: /zabbix/api_jsonrpc.php [For Apache Server]
debug	Set to **true** to enable debug logs. Default value: false
enable_batch_processing	If batch processing is enabled, metrics details are fetched in batch with 1000 (can be altered by setting appropriate value to - 'max_hosts_per_batch' parameter) hosts per batch. Default value: false
groupids	Provide the host group IDs. These IDs will be used to fetch metrics from the hosts attached to the specified groups. This applies only if `enable_batch_processing` is set to true.
logPayloadForDebug	Determines whether to print the raw log payload. Set to **true** only for debugging purposes, as printing the raw payload quickly fills up the MID Server logs. Default value: false

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connector instance value parameters (continued)

Parameter	Description
max_fetch_interval_min	Configured from the 'max_fetch_interval_min' parameter: If the time exceeds 'max_fetch_interval_min', fetching starts from 'max_fetch_interval_min' before the current time; for an INITIAL run without 'lastMetricSignature', the time is set to 'max_fetch_interval_min' before the current time. Default value: 180 minutes
max_hosts_per_batch	If batch processing is enabled, metrics details are fetched in batch with 1000 (can be altered by setting appropriate value to - 'max_hosts_per_batch' parameter) hosts per batch. Default value: 1000
offset_min	Specifies the time offset in minutes for adjusting the fetch start time relative to the current time. Default: 5 minutes
port	Port number for the Zabbix server to connect to. Default value: empty
protocol	Protocol to use when connecting to the Zabbix server. Default value: http
with_triggers	It will fetch the trigger information. Default value: false

Note: When monitoring a large number of hosts in Zabbix, fetching massive metric data can impact performance and cause API timeouts; enabling batch processing (enable_batch_processing = true) mitigates this by fetching metrics in batches (default: 1000 hosts, configurable via *max_hosts_per_batch*), though it increases network calls and must be used when monitoring 10,000+ hosts or facing performance issues.

SCOM connector instance form

The SCOM connector instance form displays the fields you must fill in when creating a SCOM connector instance.

Connector instance page

Field	Description
Name	Unique name for the SCOM connector instance.
Description	Description for the use of the SCOM event collection instance.
Active	Select to activate the connector instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connector instance page (continued)

Field	Description
	Appears only when selecting a connector instance that has already been created.
Connector definition	The vendor and protocol used to gather events from the external event source. For a regular SCOM connector, select **SCOM**. For a connector instance that you want to monitor metrics, select **SCOM Metrics**. When selecting this option, the fields in the **Connector instance - metrics fields** table appear.
Assignment group	Select the group to whom the connector instance is assigned. For example, this may be a group of administrators or a support group.
Host IP	Specify the SCOM IP address. This field does not appear when **SCOM metrics** is selected as the Connector definition.
Credential	Select Windows credentials. **Note:** When configuring Windows credentials, if the credential applies to specific MID servers, ensure that the MID Servers you specify on the credential record match the MID Servers specified in the **MID Servers for Connectors** section on the Connector Instance form. This field does not appear when **SCOM metrics** is selected as the Connector definition.
Event collection last run time	The last event collection run time value updates automatically. This field does not appear when **SCOM metrics** is selected as the Connector definition.
Last event collection status	The last event collection run time status updates automatically. This field does not appear when **SCOM metrics** is selected as the Connector definition.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connector instance page (continued)

Field	Description
Event collection schedule (seconds)	The frequency in seconds that the system checks for new events from SCOM Operations. This field does not appear when **SCOM metrics** is selected as the Connector definition.
Bi-directional	Select to invoke the bi-directional option. This option enables the bi-directional exchange of values to-and-from the external event source. There is default implementation for SCOM. The **Last bi-directional status** option displays only when this option is selected. This field does not appear when **SCOM metrics** is selected as the Connector definition.
Last bi-directional status	The value of this field populates automatically. This field does not appear when **SCOM metrics** is selected as the Connector definition.
Last error message	The last error message field is automatically updated. This message is the last error message received by the connector. If the test connector fails, an error message is displayed in this field. This field does not appear when **SCOM metrics** is selected as the Connector definition.
MID Servers (MID Server for Connectors section)	Specify one or more MID Servers that are up and valid. MID Servers sort according to the order that their details were entered into the MID Server for Connectors section. The port requirement from the MID Server to the SCOM server is `1433`. If the specified MID Server is in a cluster, it may not be selected and another available MID Server is selected in its place. Ensure that the specified MID Servers match the MID Servers specified on the Windows Credentials page, as the connector uses Windows credentials to access MID Servers. If no MID Server is specified, an available MID Server that has a matching IP range is used.

Connector instance - metrics fields (displayed when Connector definition = SCOM Metrics)

Field	Description
Metrics collection	Selected by default. Read-only.
Metrics collection last run time	The last run time of the Metrics Collection scheduled job. This field is read-only.
Last metrics collection status	Status of the Metric Intelligence collection activity. The value of this field populates automatically. This field is read-only.
Metrics collection schedule (seconds)	The time, in seconds, to repeat the Metric Intelligence Collection scheduled job.
Metrics database host	The IP address or the host name of the metrics database host.
Connect using a named instance	When selected, the connection is made using the specified named instance. Otherwise, the connection is made using the specified port.
Metrics database port	The port used by the metrics database. The connection is made using JDBC. Default port number is 1433. If **Connect using a named instance** is selected, this option does not appear.
Metrics database named instance	The metrics database instance name.
Database login with Windows authentication	Perform database login with the credentials of the logged-in user defined on the MID Server service.
Metrics database credential	Credentials for the metric database. Use JDBC credentials for the local database user. If **Database login with Windows authentication** is selected, this option does not appear.

Solarwinds connector instance form

The Solarwinds connector instance form displays the fields you must fill in when creating a Solarwinds connector instance.

Connector instance page

Field	Description
Name	Unique name for the Solarwinds metric connector instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connector instance page (continued)

Field	Description
Description	Brief explanation of the purpose or use of the connector instance.
Connector Definition	Connector definition to be used by the connector. Select **Solarwinds Metrics**.
Host IP	Hostname/IP address of the Solarwinds server.
Credential	Credentials for a SolarWinds user with Basic Authentication and read access to the SWIS REST API.
Metric collection	Option is pre-selected and read-only.
Metric collection schedule (seconds)	Time interval (in seconds) at which the connector retrieves metrics from the Solarwinds server. Default: 60 seconds.
Active	Option to activate the connector instance.

Solarwinds connector instance value parameters

The following table displays the Solarwinds connector instance value parameters that you can fill in, as needed, when creating a Solarwinds connector instance.

Connector instance value parameters

Parameter	Description
debug	Set to **true** to enable debug logs. Default value: false
max_fetch_interval_in_min	Number of minutes before the current time when the initial metric collection runs. For example, if the value is 180, the connector fetches metrics from the past 180 minutes. Default value: 180 minutes
logPayloadForDebug	Determines whether to print the raw log payload. Set to **true** only for debugging purposes, as printing the raw payload quickly fills up the MID Server logs. Default value: false
offset	Specifies the time offset in minutes for adjusting the fetch start time relative to the current time. Default: 0 minutes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connector instance value parameters (continued)

Parameter	Description
Port	Port number for the Solarwinds server to connect to. Default value: 17774
protocol	Protocol to use when connecting to the Solarwinds server. Default value: https

Event forwarding properties

Several system properties enable you to customize an event forwarding job.

Note: To access the System Properties [sys_properties] table, enter `sys_properties.list` in the navigation filter.

Property	Description
evt_mgmt.event_forwarding.sources_to_exclude	List of event sources from which events should not be forwarded. By default, all events are forwarded. Separate multiple sources by commas. • **Type**: string • **Default value**: Empty
evt_mgmt.event_forwarding.event_fields_to_include	List of event fields to include when sending events to the target instance besides the required default fields: resolution_state, event_class, additional_info, node, resource, cmdb_ci,severity, time_of_event, message_key, sys_domain, metric_name, ci_type, ci_identifier, type, source, description, and sys_domain_path. Separate multiple fields by commas. • **Type**: string • **Default value**: Empty
evt_mgmt.event_forwarding.event_batch_size	Maximum number of events to batch while sending to the target instance. • **Type**: integer • **Default value**: 500
evt_mgmt.event_forwarding.max_payload_size_in_mb	Maximum size of the event payload, in MB, sent to the target instance at a single time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	• **Type**: integer • **Default value**: 5
evt_mgmt.event_forwarding.max_events_to_forward_per_day	Maximum number of events that can be forwarded from the instance per day to minimize the performance impact on the source instance. • **Type**: integer • **Default value**: 100000
evt_mgmt.event_forwarding.log_debug	Enables or disables debug logging for event forwarding. Set this property to true to log debugging information. • **Type**: Boolean • **Default value**: False

Team-based integration properties

Team-based integration system properties enable you to customize the assignment group functionality for existing and new customers for event rules and event field mapping.

Team-based integration system properties

Property	Description
evt_mgmt.alert_auto_assignment_field	The property determines automatic alert assignm list of comma-separated fields. The default value of this property is cmdb_ci.sup IntegrationGroup. The assignment group value is **group** field (cmdb_ci.support_group) of the alert the value is taken from the IntegrationGroup valu **group** field in the Connector instances table [em For upgraded instances from previous family rel to avoid any impact on production instances. • **Type**: String • **Default value**: ○ Empty - for upgraded customers ○ cmdb_ci.support_group, IntegrationGroup - **Note:** When you use an alert field in this p alert field in the **Additional Info** field, an aler the value of the **Assignment group** field mu For example, `{"Alert field name":"` `desired sys_user_group record>`

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Team-based integration system properties (continued)

Property	Description
evt_mgmt.enable_group_level_event_rules	Activates team-based functionality for executing field-mapping rules. Global rules take precedence based rules. • **Type**: Boolean • **Default value**: ○ False - for upgraded customers ○ True - for new customers

Alert Query form

You can combine similar alerts that meet specific criteria for a particular service by creating an alert query.

Alert Query form

Field	Description
Name	The alert query name.
Business criticality	The importance of this alert query to the business. This field can determine disaster recovery strategies for this alert query. • 1: most critical • 2: somewhat critical • 3: less critical • 4: not critical
Used for	The purpose of the alert query. Select from: • Production (Default) • Staging • QA • Test • Development • Demonstration • Training • Disaster recovery
Owned by	The party that is responsible for the alert query.
Email	The email alias for the alert query.
Business phone	The phone number for the business.
Operational status	The status of the alert query.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert Query form (continued)

Field	Description
	• **Operational**: The alert query is running. Impact calculation runs only on alert queries in the Operational status. Select this option to use this service. If you customized preconfigured options for this category, select the option whose value is set to 1. Event Management calculates impact only on services in use. If you do not want to use this service now, select one of these options: • **Non-Operational**: The alert query is unavailable, disabled, or down. • **Repair in progress**: The alert query is receiving maintenance. • **DR Standby**: The alert query is available as a disaster recovery (DR) standby. • **Ready**: The alert query is prepared for use. • **Retired**: The alert query is withdrawn from active use.
Comments	Any additional notes and information.
Service Group Members	The service group which contains this service.
Filter	The conditions for sending a notification to the alert query. The conditions must meet the alert values. **Note:** • When defining an alert query filter, include only fields that appear in the Alert Histories [em_alert_history] table. Impact calculation is based on Alert History data and fields such as Overall Event Count, Priority, and Priority group are not copied to the Alert Histories [em_alert_history] table. • Do not specify a dynamic time condition. For example, in the filter, do not specify `Created` condition of `Last 45 minutes` because impact calculation is triggered by a change of alert or alert query. However, for the dynamic time condition, none of these conditions have changed. • Some filters may slow down impact calculation. To solve this problem, adjust your alert query by adding an appropriate index, as described in Index suggestions for slow queries.

Alert correlation rule form

Manage the fields that define how alerts are correlated and grouped.

Alert correlation rule form

Field	Description
Name	Name of the correlation rule.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert correlation rule form (continued)

Field	Description
Order	The evaluation priority for the rule. Rules with lower numerical values are given higher priority. An alert is evaluated against each alert action rule until a match is found. For example, if you have two alert correlation rules with priorities 10 and 20, respectively, the rule with priority 10 will be evaluated first. If an alert matches the criteria of the rule with priority 10, no further rules will be checked. If it doesn't match, the alert will then be evaluated against the rule with priority 20.
Active	Option to activate or deactivate the rule.
Advanced	Option to switch to advanced mode, which lets you use custom scripts to define your own logic. The sample correlation rule, **Alert correlation rule SAMPLE**, is provided out-of-the-box for reference. You can use the available script as a guide. **Note:** The **Filter** condition specifies which alerts the rule will apply to. Ensure that the same condition is used in the advanced script to identify alerts to be included in the group.
Description	Description of the rule.
Primary Alert	The filter condition to identify the alert that is the primary alert, or most important alert, in a set of related alerts. This field does not appear when **Advanced** is selected.
Secondary Alert	The filter condition to identify the alert that is related to the primary alert, however it is of lesser importance. This field does not appear when **Advanced** is selected.
Filter	The filter condition to identify the alert on which the script is run. **Filter** is available only when **Advanced** is selected. Filter parameters are case sensitive by default. To disable case sensitivity, set the *sa_analytics.correlation_case_sensitive* parameter to **false**.
Relationship Type	Specify the type of relationship between the primary and secondary alert: • **No Relationship**: Ignore the relationship when looking for a match. • **Same CI or Node**: Relate both alerts with the same CI. If the CI field is blank, the alerts must have the same Node value. • **Primary is Parent**: Relate the alerts where the primary alert is the parent in a parent-child relationship, as described in the CI Relationship Types table [cmdb_rel_ci]. • **Primary is Child**: Relate the alerts where the primary alert is the child in a child-parent relationship, as described in the CI Relationships table [cmdb_rel_ci].

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert correlation rule form (continued)

Field	Description
	This field does not appear when the **Advanced** check box is selected.
Time Difference in Minutes	The minutes between which the primary and secondary event must occur to match this rule. The default value is 60 minutes. **Note:** The value for this entry cannot exceed 1440 minutes (one day). This field does not appear when **Advanced** is selected.
Script	Custom script that you can modify to return a JSON string that specifies the primary and secondary alerts. Select **Advanced** to display the script field. `(/* The function needs to return a JSON-{correlationType:[correlatedAlerts]} for example: if your filter matches the alert, set the alert as the primary alert and set alerts 1, 2 and 3 each as secondary alerts.` `You can use both multiple primary alerts and multiple secondary alerts. The correlationType can be PRIMARY or SECONDARY, and the alerts ID must be in an array. CurrentAlert is the GlideRecord of the currentAlert on which that rule runs. The system supports only one primary per alert, so: Do not correlate more than one alert under the PRIMARY array. Do not correlate alerts that already have a primary under the SECONDARY array. The system supports open alerts only, so do not correlate alerts that have been closed under either one of the arrays. */`  `(function findCorrelatedAlerts(currentAlert){`  `var result = {}; //Insert your code here result = {'SECONDARY':['alertID1','alertID2','alertID3']};` `return JSON.stringify(result);`  `})(currentAlert);`
Relationship	Description of the CI relationship between primary and secondary, for example, *Allocated from::Allocated to* or *Allocated to::Allocated from*.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert correlation rule form (continued)

Field	Description
	This field displays only if either **Primary is Parent** or **Primary is Child** is selected for the **Relationship Type**.  This field does not appear when **Advanced** is selected.

Health Log Analytics

The ServiceNow® Health Log Analytics application helps prevent IT issues before your users are affected. It helps you identify the root cause of an issue by enabling you to triage related logs and analyze the raw data.

Health Log Analytics collects raw log data streaming into your instance and structures textual data into key-value pairs. It detects meaningful patterns in the data, and when it discovers an anomaly, it sends an event to the Event Management application.

Health Log Analytics is available in the ServiceNow Store.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Exploring Health Log Analytics

ServiceNow Health Log Analytics (HLA) predicts IT issues before they affect your users by collecting, analyzing, and correlating machine-generated log data in real time. It discovers anomalies and alerts you to potential issues.

Health Log Analytics overview

Health Log Analytics typically receives and processes log data and sends events to ServiceNow Event Management. The application discovers anomalies as they happen. It helps you identify the root cause of an issue by enabling you to triage related logs and analyze the raw data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Health Log Analytics can handle any kind of machine-generated textual log data. It can process application, infrastructure, and network logs, as well as other types of textual log data. Although a Configuration Management Database (CMDB) can be helpful to generate high-quality events and alerts, it is not necessary.

Note:

- Health Log Analytics supports only UTF-8 logs. It does not support binary logs.
- If you are sending logs in a language other than English, additional configuration may be required.

For a brief explanation of key terms and concepts used in HLA, see the Health Log Analytics terminology.

Health Log Analytics users

Health Log Analytics Users

User	Description	Role
Administrator	Configures the Health Log Analytics application to make it ready for use by Operators. Performs administration tasks to keep the system running efficiently.	evt_mgmt_admin, admin
Operator	Analyzes Log Analytics alerts and takes action to help resolve the underlying issue.	evt_mgmt_operator

Health Log Analytics workflow

Health Log Analytics collects and processes log data automatically. It structures the data logically for operators to analyze, and generates meaningful alerts and suggestions that display in Event Management.

The diagram shows the Health Log Analytics workflow from collecting the data through sending an event or alert to Event Management.

Health Log Analytics workflow

Ingestion

This layer connects your environment to Health Log Analytics. You can stream your logs directly from servers and endpoints or from log repositories. The optional guided setup helps you create data input connectors for common data sources, such as:

- Rsyslog
- Beats
- Splunk

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Elasticsearch
- MID Server
- TCP

Structuring

This layer deals with structuring log data and auto-mapping it to logical silos, called Components. Data structuring can be done automatically or manually.

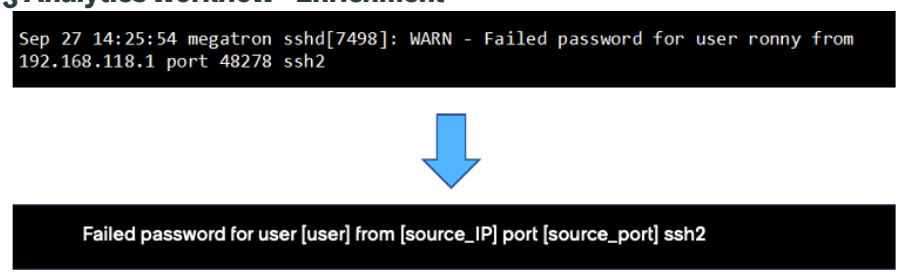
The system auto-structures log data by extracting the following properties from incoming log messages: Message, Timestamp, Host, Severity, and External-IDs. It extracts explicit values, like "property-name" and "value is IP." and semantic ones such as length, number of English words, and variance.

Auto-mapping assigns log samples and metadata to the appropriate tags automatically. The system tries to map log lines by analyzing the source that streams the data. The mapping is based on agent hints and common transport header fields.

Enrichment

This layer handles identifying the variable parts of a log message.

Health Log Analytics workflow - Enrichment



It also identifies keywords and contextual properties. In the image, "WARN" and "Failed" are the keywords to track. "User," "source IP," and "port" are the contextual properties.

Analysis

In this layer, each log line is indexed. Health Log Analytics extracts properties from the inner log message that contribute to models of behavior that the system learns to expect. Anomalous behavior departs from this expected behavior. You can search for an event and its most significant properties for manual triaging.

Machine Learning (ML) and Artificial Intelligence (AI)

Health Log Analytics uses advanced unsupervised machine-learning algorithms to discover patterns within logs and learn their unique data behavior. It then sets dynamic thresholds based on the data signature in real time to detect issues when they first occur. When the system detects a deviation from the typical pattern, it sends an event to Event Management.

Alert in Event Management

Health Log Analytics sends events to Event Management. In Event Management, Health Log Analytics alerts appear in the **All alerts** list. This list enables operators to see alerts from the event and the Health Log Analytics alert type in a single location.

What to explore next

- Health Log Analytics architecture
- How Health Log Analytics generates alerts
- Types of anomalous behavior in Health Log Analytics
- Types of Health Log Analytics alerts

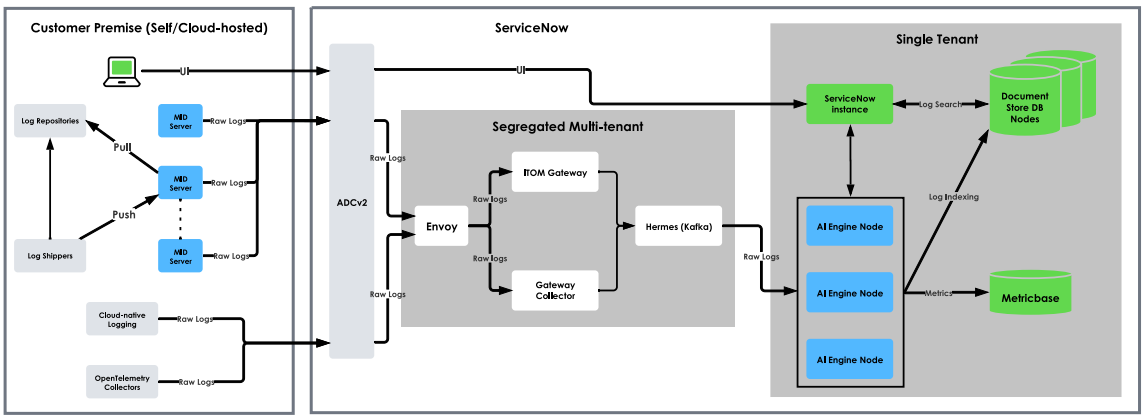
Health Log Analytics architecture

Health Log Analytics collects logs streaming into your ServiceNow instance from endpoints or data lakes, such as Splunk and Elasticsearch.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The ServiceNow instance receives the logs either via a MID Server connector instance or via MID-less Ingest, which supports integration with services such as Amazon Data Firehose. Health Log Analytics identifies and triages anomalies in your log data using unsupervised machine-learning (ML) models. It then groups the anomalies together and applies further algorithms to help identify the root cause of the issue.

Health Log Analytics scaled architecture



Health Log Analytics terminology

Before getting started with Health Log Analytics, it's important to familiarize yourself with some key concepts used in the application.

Health Log Analytics (HLA) terminology

Term	Description
Alert	A notification that HLA generates when it finds a statistically significant anomaly in metrics based on your system's log data, indicating a potential IT issue. HLA sends these alerts to Event Management, where you can see them in the **All Alerts** list.
Anomaly	Unusual or unexpected behavior in log data that differs from the baseline of normal behavior that HLA has learned from historical patterns.
Baseline	The statistical model of normal behavior of your system that HLA has learned from historical log data patterns. This baseline helps HLA identify anomalies.
Classification	A data type that determines how the HLA engine analyzes and processes a parsed log field. Available classifications are: Meter, Gauge, Histogram, Automatic Root Cause (ARC Only), Timeless Gauge, and Invalid.
Component	Representation of the smallest part of a service instance, typically a single micro service, module, or daemon. For example, a "checkout flow" service instance may include components such as cart-service, payment-service, and inventory-service. Every log or metric is assigned to a single component. This ensures that anomalies or incidents are attributed to that specific component.
Configuration Item (CI)	An individual item in your IT environment, such as a server, database, or application, that is tracked and managed in the Configuration Management Database (CMDB).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Health Log Analytics (HLA) terminology (continued)

Term	Description
Configuration Management Database (CMDB)	The central database in ServiceNow that stores and manages information about all CIs and their relationships. This database provides HLA with the necessary context to correlate logs, anomalies, and alerts to specific services.
Correlation	The process of connecting related log events, anomalies, and alerts. By using factors like patterns and relationships defined in the CMDB service relationships, HLA identifies a shared root cause and reduces "noise."
Data input	A configurable connector that enables HLA to collect, transform, and ingest log data from external sources. **Note:** The term data input is used in HLA's classic interface (UI16) and back-end records. See also: Integration.
Data input mapping	The process of mapping raw log data to its specific log source, enabling HLA to connect logs to the corresponding service instance and component for analysis with full context. It also involves mapping your raw log data to source types so HLA can understand the format and structure of your logs. **Note:** The term data input is used in HLA's classic interface (UI16) and back-end records. See also: Integration. For a description of the simplified mapping interface in the new HLA UI, see: Log context mapping.
Detection algorithm	The statistical or machine-learning logic that HLA uses to analyze metrics and patterns to identify anomalous behavior. Examples include sigma-based detection, trend analysis, and comparing against a baseline.
Enrichment	The process of adding extra, contextual information to raw log data to make it more meaningful and actionable for analysis. Enrichment helps HLA connect technical events to their potential impact on your business.
Grouped alerts	A collection of related alerts that are combined into a single group to reduce noise and simplify triage.
Incident	A record created in ServiceNow when correlated alerts point to a significant disruption in a service, requiring investigation and resolution.
Integration	A configurable connector that establishes data pipelines so HLA can collect, transform, and ingest log data from external sources. Setup of integrations is done through the Integrations Launchpad, which significantly reduces implementation time compared to manual data input setup. **Note:** The term integration is used in HLA's new UI experience and front-end records. See also: Data input.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Health Log Analytics (HLA) terminology (continued)

Term	Description
Integrations Launchpad	A framework that provides integration setup workflows for connecting external log data sources to HLA. Setting up integrations through the Integrations Launchpad significantly reduces implementation time compared to manual data input setup.
Label	A semantic identifier assigned to common log properties, such as MESSAGE, HOST, TIMESTAMP, SEVERITY, and EVENT-ID. Labels tell HLA what role a parsed log field plays in the log structure.
Lexical keywords	Specific words found in log data, such as "crashed" or "failed," that can point to important issues. HLA tracks lexical keywords to detect widespread issues and long-forming trends. For more information, see: Add, edit, or delete lexical keywords in Health Log Analytics.
Log context mapping	The process of mapping your raw log data to the appropriate log source, enabling HLA to connect logs to their corresponding service instance and component for contextualized analysis. The user-friendly Log context mapping interface in the new HLA UI focuses only on the service context. It's simpler to use than Data input mapping in HLA's classic interface (UI16), which also includes source type configuration. See also: Data input mapping.
Log ingestion	The process of streaming of logs from servers and endpoints or log repositories to HLA, using data input connectors or integrations.
Log property	A structured data element, such as timestamp, severity, or error code, that is extracted from a log entry.
Log source	A logical representation of the source of the log data that HLA ingests. Each log source is defined by a service instance-component pair. HLA performs anomaly detection and generates alerts on issues within the scope of each individual log source.
Log Viewer	An interface within HLA that allows you to search, filter, and examine raw or parsed log data from multiple sources. The Log Viewer helps you investigate events and better understand your system's behavior.
Metric	A quantifiable measurement extracted from log data in HLA. HLA supports various generic metric types, such as METER (event count), GAUGE (numeric value), and HISTOGRAM (distribution bucket). It uses the extracted log data to automatically create message-pattern-based metrics (METER), severity metrics (METER), keyword metrics (METER), and raw log metrics (METER, GAUGE, and HISTOGRAM). Each metric is associated with a specific log source and monitored for anomalous behavior.
MID Server	An intermediary agent that facilitates secure communication between on-premise or private cloud log sources and the ServiceNow instance. It enables HLA to collect log data securely from environments that the instance can't access directly.
Parsing	The process of extracting meaningful, structured data fields from raw log entries. HLA uses its AutoParser and AutoExtraction capabilities to

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Health Log Analytics (HLA) terminology (continued)

Term	Description
	parse the logs, which then enables effective analysis, correlation, and visualization of the data.
Pattern	A recurring format found in log messages (free text fields within log records). HLA groups similar log messages that share this format into a pattern. It then monitors how often that pattern occurs to establish normal system behavior and detect anomalies. **Note:** HLA only performs pattern monitoring and anomaly detection on log properties labeled as MESSAGE.
Raw log data	The original, unprocessed log entries collected from external sources, which HLA ingests before parsing and analysis.
Root Cause Analysis (RCA)	An automated analysis that identifies meaningful factors, entities, and highlights that contributed to an alert or incident, helping to identify the underlying cause.
Service instance (formerly application service)	A logical grouping of Configuration Items (CIs), such as servers, databases, and applications, that collectively deliver a complete business service. In HLA, log data is correlated to service instances to provide a comprehensive, real-time view of their operational health and performance. **Note:** A single service instance can consist of multiple CIs, whereas the same CIs might be part of multiple service instances.
Severity	A classification in HLA that indicates the level of impact or urgency of an alert. This helps operators prioritize which issues to investigate and resolve first.
Source type	A configuration profile for a log data type that determines how HLA interprets, parses, and extracts fields from logs of that format and prepares the data for processing. Think of it as telling HLA: "Here's a specific type of log, and here's how you should process it."
Source type structure	A template within a Source Type that defines the fields and their arrangement in logs of that specific type. The Source type structure ensures that HLA can consistently extract and understand the incoming data. Think of it as telling HLA: "This part of this log is the timestamp." "This part is the severity." "This part is the error code," and so on.
Tag	Metadata applied to logs, metrics, or alerts. Tags are used for categorization, filtering, and correlation.
Time series	A sequence of metric values recorded in chronological order over a period of time. This data is used to identify trends, seasonality, and anomalies.
Variable extraction	The process of identifying and extracting dynamic, user-defined fields from log messages to enable custom metrics and analytics in HLA.

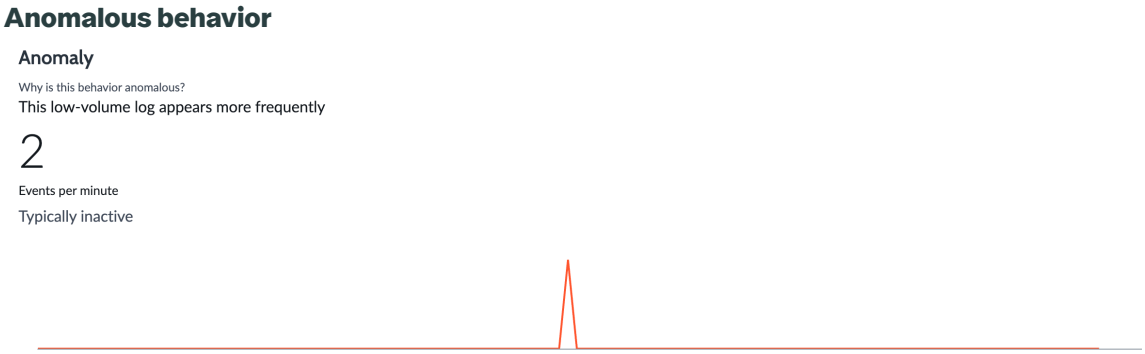
How Health Log Analytics generates alerts

Health Log Analytics identifies patterns in your log data and learns pattern behavior. When HLA's AI engine detects anomalous behavior, it sends an event to the ServiceNow Event Management application. As an operator, you can use these predictive alerts to handle emerging IT issues before they impact users.

Log anomaly detection

Anomalies are abnormal or unexpected behavior that occur when activities deviate from established baselines. There are many kinds of anomalies. In this example, the system tracks the baseline rate (the average number of events per minute) for a specific log pattern. When this typically inactive log generates a spike in events, the system detects the deviation from the baseline and generates an alert.



Health Log Analytics uses various methods to detect anomalies and generate alerts.

Alert metrics

Health Log Analytics monitors multiple metrics in the log stream to detect anomalous behavior. Each metric is associated with a unique source: the combination of service instance and component. When the system identifies an anomalous pattern for a metric, it generates an alert.

As an operator, you can provide feedback about the generated alerts. Your feedback "teaches" Health Log Analytics that a specific alert is significant or irrelevant to you. The application then either raises the priority of the alert metric or mutes it to reduce noise.

- A significant alert is more likely to be included in a Log Analytics group when the associated metric behaves anomalously. For more information, see Mark an alert as significant in Health Log Analytics
- Mute an alert for a specified source to eliminate distracting new alerts for unimportant issues. When a metric is muted, Health Log Analytics removes the current alert and any other alerts based on that metric from the feed. It also stops generating new alerts from that metric. For more information, see Mute an unimportant alert in Health Log Analytics.
- When the situation changes, you can return a significant metric to its default significance. You can also reactivate a muted metric to cause the system to start generating alerts again. For more information, see Restore normal importance to an alert metric in Health Log Analytics.

Lexical keywords

Health Log Analytics scans your logs for words that can indicate important issues. Lexical keywords such as "crashed" or "failed" signal a condition that can merit attention.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The system sets a threshold for each lexical keyword that is based on what it considers the normal occurrence pattern and frequency of that keyword in your logs. When it scans your logs, it finds all occurrences of the keyword. If the number exceeds the threshold, it generates an alert. For more information, see View the lexical keywords that generate alerts in Health Log Analytics.

For information about managing global keywords, see Add, edit, or delete lexical keywords in Health Log Analytics. To create or delete keywords for a specific source type, see Configure source type capabilities in Health Log Analytics.

Correlations

Log correlators are keys or values in log data that detect correlations between alerts. For example, a log correlator could detect when the ID of a particular network device occurs simultaneously in multiple warnings across different service instances. For more information, see Log correlators for identifying related alerts.

Advanced alert filtering

Add advanced log alert filters to scan alerts for conditions that you specify. The filters reduce noise by dropping alerts that do not indicate a significant issue. While developing a filter, you can test, update, publish, or activate the filter at any time. For more information, see Create advanced log alert filters.

Custom alert rules

Define a Log Analytics alert rule when you encounter log data that should generate an alert. The alert rule generates an alert for a specified metric with a threshold that you specify and sets the properties of the generated alert. For more information, see Alert rules in Health Log Analytics.

Types of anomalous behavior in Health Log Analytics

Anomalous behavior in a CI or a service can indicate an important issue. For example, a spike in the frequency or number of messages of a particular type can indicate a problem.

To build models of expected behavior, Health Log Analytics monitors the log stream to learn baselines for patterns, metrics, and gauges over various time periods. Time periods can be hourly, daily, weekly, or unlimited. Behavior that departs from the learned models is considered anomalous behavior.

Types of log property

Pattern

A pattern is a value or rate that repeats, whether in text, time, or relationships.

Meter

A meter property is a numeric or text value. For example, a status code, a response code, an action, or a pattern.

Gauge

A gauge property has a numerical value that is reported continuously. Gauge properties represent operations that consume resources. For example, CPU usage, memory usage, or response time.

How anomalies appear in Health Log Analytics

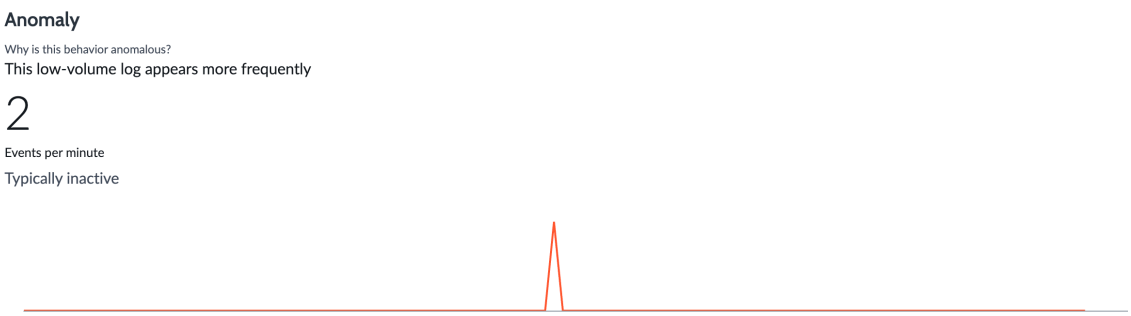
The Anomaly card illustrates the anomalous activity that led to the alert. The chart shows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Recent anomalous activity
- Expected behavior (the learned baseline)
- Baseline values from one day earlier
- Baseline values from the previous week

In this example, the system tracks the baseline rate (the average number of events per minute) for a specific log pattern. When this typically inactive log generates a spike in events, the system detects the deviation from the baseline and generates an alert.

Anomaly card



Kinds of anomalies

Some of the kinds of anomalies

Behavior	Description
New behavior	A pattern that has not ever been seen. The New Behavior alert type does not display a chart.
Signal dead/Stopped appearing	All pattern or log data from a source has stopped. There has been no signal for at least five minutes.
Signal alive/Appearing again	A pattern or log data from a "dead" source is appearing again. For a baseline of one hour, a pattern is "dead" if it appears less than once per minute.
Anomaly above average or below average	Activity that deviates from expected baseline behavior for pattern or meter or gauge metrics, such as keywords metrics or severity metrics.
Baseline reference increase or decrease	An increase or decrease in the value or volume of a log property as compared to the one-hour or one-week baseline.
Correlation of severity and keyword alerts	An increase in the volume of a severity level or keyword.

Types of Health Log Analytics alerts

Health Log Analytics generates several types of alerts.

In the list of alerts, all alerts that are generated by Health Log Analytics have the value **Log Analytics** in the **Source** column.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The value in the **Group** column identifies the type of alert as one of the following:

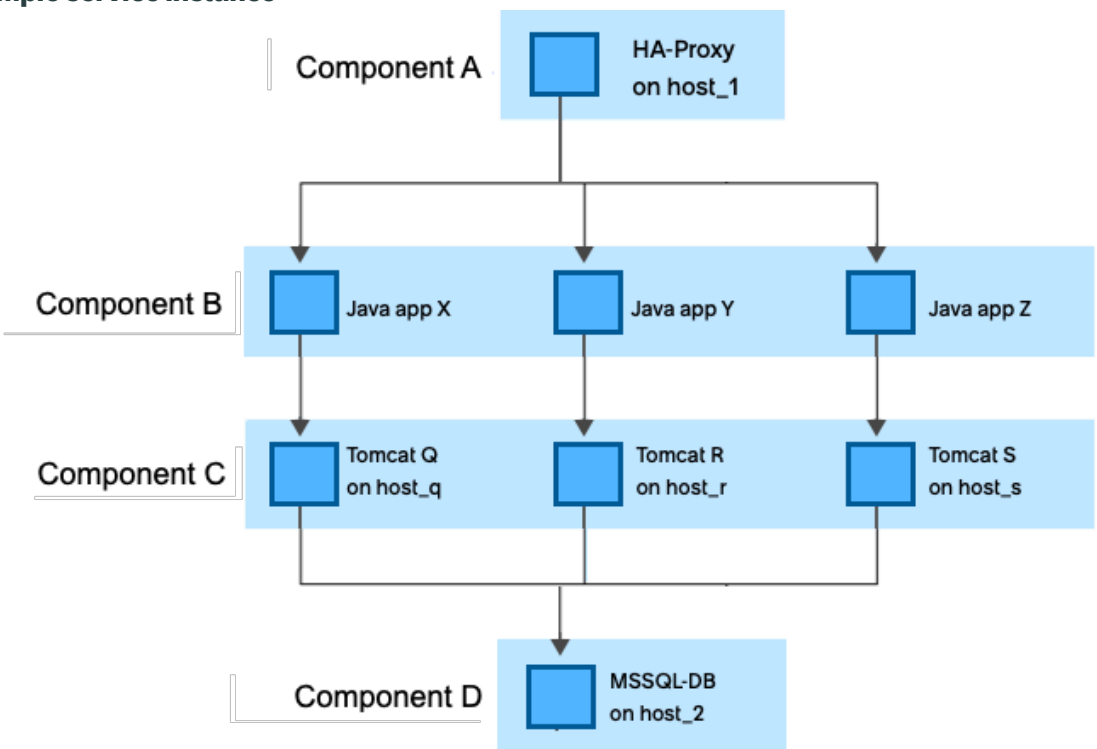
Component-based alert

Component-based alerts involve more than one configuration item (CI). A component is a logical component of a service instance that caused the alert. A component can be multiple CIs that perform the same function, such as multiple redundant hosts.

Important: Each Component-based alert is the parent of a number of read-only alerts. You do not work directly on read-only alerts. You work only on the parent Component-based alert.

In this example service instance, the identical Java apps X, Y, and Z make up a single component: Component B. Tomcat servers Q, R, and S and their hosts make up a different single component: Component C.

Example service instance



Log Analytics alert

A Log Analytics alert identifies an anomaly that involves a single CI. A Log Analytics alert has the value **None** in the **Group** column. The anomaly that leads to the alert can be an unexpected number of log entries or an unexpected value of a metric.

Log Analytics group

When the system identifies multiple Log Analytics alerts that are related in important ways, it groups them into a Log Analytics group. A Log Analytics group can group up to four alerts. The system generates a Log Analytics group when the Log Analytics alerts share one or more of the following relationships:

- Time: The events all occurred within a configured time interval.
- Metadata: The alerts have matching values in log-line metadata. For example, all alerts involve the same host.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Message text: The message text in the log data is similar or identical between alerts.
- Trend: The alerts show a similar tendency in values or rates. For example, a particular metric value is increasing in all alerts.

Note: You can mark an alert as significant. A significant alert is more likely to be included in a Log Analytics group when the associated metric behaves anomalously. For more information, see Mark an alert as significant in Health Log Analytics.

Configuring Health Log Analytics

As an Administrator, set up and configure Health Log Analytics for Operators to use, and carry out administration tasks to ensure that the system runs efficiently.

Configuration overview

Complete the following tasks for a successful setup and configuration of Health Log Analytics.

Important: Regardless of how you implement Health Log Analytics, for log data ingestion via a MID Server you must first configure MID Server system requirements and ensure that the MID Server log ingestion capability is enabled.

For MID Server proxy requirements, see MID Server proxy preconditions for streaming logs to Health Log Analytics.

Setup and configuration tasks:

1. Install Health Log Analytics (HLA).

   Install the Health Log Analytics application.

2. Set up log data inputs for streaming raw log messages to your ServiceNow instance.

   Use any of the following methods:

   - Set up integrations for Health Log Analytics from the Integrations Launchpad.

     You're encouraged to set up data input integrations from the Integrations Launchpad, which provides a unified interface for convenient integration.

   - Set up data inputs in Health Log Analytics using guided setup.
   - Set up data inputs in Health Log Analytics manually.

3. Identify and resolve a log streaming issue in Health Log Analytics.

   Identify and address log streaming issues to ensure that the data inputs you have configured are streaming data properly to your instance.

4. Edit raw log data before processing in Health Log Analytics.

   Modify raw log messages before they are processed in the MID Server, and therefore before Health Log Analytics maps and structures it.

5. Map your logs to service instances and components for log context.

   Map your logs to service instances and components so that Health Log Analytics can generate alerts in context.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you turn off automatic mapping, you must define a mapping script manually in the **Data Input Mapping** page. For more information, see Map raw log data manually.

6. Refine the source type structure in Health Log Analytics.

   Fine-tune how Health Log Analytics reads your inner log messages and detects anomalies by customizing the extracted properties in the source type structure.

   Health Log Analytics enables you to reclassify auto-classified properties and change auto-mapped labels. These adjustments help the system's machine learning better understand your priorities.

7. Perform additional data input setup tasks.

   After performing the mandatory data input setup and configuration, you can continue with optional setup tasks.

8. Perform advanced data input configuration tasks.

For a brief explanation of key terms and concepts used in HLA, see the Health Log Analytics terminology.

Install Health Log Analytics (HLA)

Install Health Log Analytics by requesting ServiceNow HLA installation from ServiceNow Customer Support.

Before you begin

Verify that the Health Log Analytics application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. To obtain the entitlements, contact your ServiceNow Solution Consultant.

The minimum version of the ServiceNow AI Platform required for Health Log Analytics installation is Brazil.

Important: Health Log Analytics uses the default user sn_occ_occultus for internal communication. Make sure that this user is active and do not deactivate it.

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. On the ServiceNow Store website, opt into the ITOM AIOps product.

   a. Go to the ServiceNow Store website and search for the Health Log Analytics app.

Health Log Analytics app in the ServiceNow Store

   b. Select the Health Log Analytics tile.
   The Health Log Analytics product page displays.

Health Log Analytics product page in the ServiceNow Store

   c. Under **Included in Products**, select ITOM AIOps.

   d. Select **Opt-in** to opt-in to ITOM AIOps.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Install the Health Log Analytics application on your ServiceNow instance.

   a. On your instance, navigate to **System Applications** > **All Available Applications** > **All**.

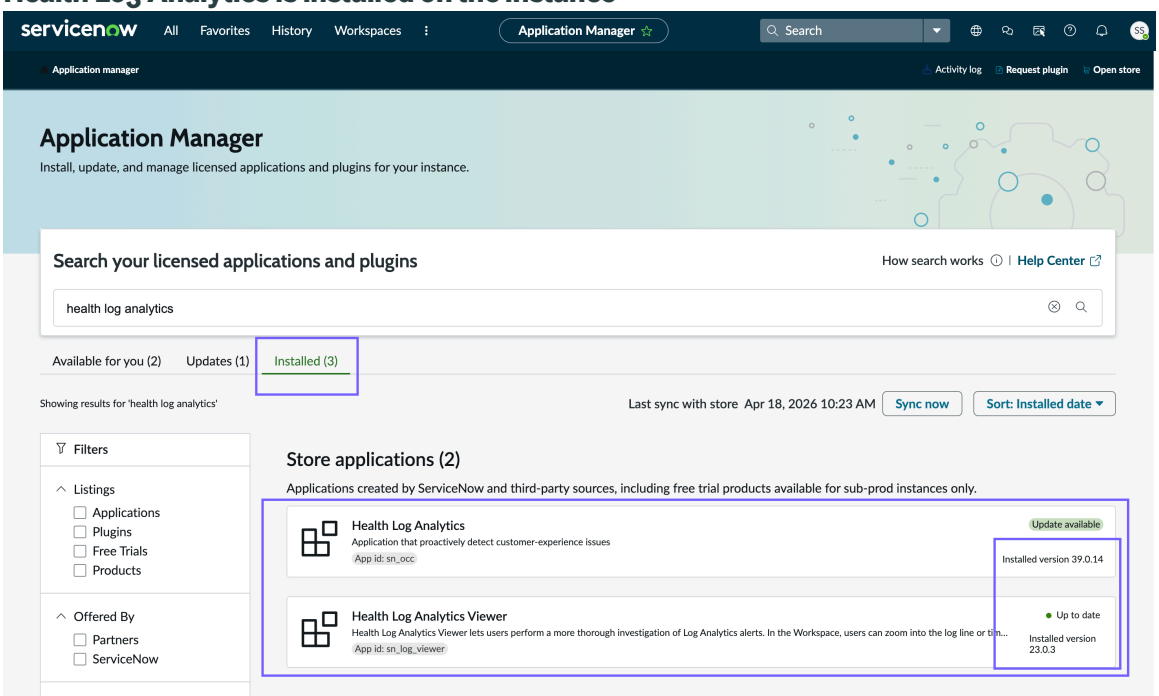
   b. Find the Health Log Analytics application using the search bar.

   c. On the Health Log Analytics tile, select **Install**.
   When the application is successfully installed on the instance, an automatic change request (CHG) is triggered to request provisioning for the necessary endpoints. The instance admin receives the request and any relevant notifications.

   > **Note:** Even when the Health Log Analytics application is installed successfully, it will not work until the endpoints have been provisioned. Provisioning endpoints configures your source systems to collect and send their log data to your ServiceNow instance. Health Log Analytics depends on this ingested data to detect anomalies, correlate events, and generate alerts.

   d. On the **Installed** tab, verify that the application and its dependencies were installed successfully.

Health Log Analytics is installed on the instance



3. **Optional:** Observe the status of the provisioning process by reviewing the CHG.

   > **Note:** Some steps in the provisioning process might require your explicit approval. In such cases, ServiceNow Customer Support will reach out.

4. When provisioning is completed, verify that the Health Log Analytics application is up and running on your ServiceNow instance.

   a. On the instance, enter `sn_occ_stats.do` in the navigator and press the **Enter** keyboard key.
   The Health Log Analytics Package Dependencies and Versions table displays.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Health Log Analytics Package Dependencies and Versions table

Health Log Analytics Package Dependencies and Versions

Dependency	Version
Health Log Analytics	39.0.14
Service Operations Workspace Log Analytics	26.5.0
Alert Intelligence	23.13.0
---	---
Occultus Version	1.36.0.27
MetricBase Version	25.2.0.6
ElasticSearch Version	8.17.3
---	---

Occultus

Node: svc241172.aus101.service-now.com ,Status: Active ,Version: 1.36.0.27

The provisioned endpoints are listed along with their version number:

- Occultus
- MetricBase
- ElasticSearch

The Health Log Analytics application is up and running on your instance.

Result
The Health Log Analytics application is installed and provisioned on your instance.

What to do next

- Set up the data input process for Health Log Analytics
- (Optional) Install the ServiceNow® Agent Client Collector Log Analytics (ACC-L) plugin.

  Agent Client Collector Log Analytics enables you to stream log data from Linux and Windows hosts to a ServiceNow instance using the Agent Client Collector. For more information, see the Agent Client Collector Log Analytics documentation.

Set up Health Log Analytics on your ServiceNow instance

Implement Health Log Analytics on your ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:

- Install Health Log Analytics on your instance before implementation. For more information, see Install Health Log Analytics (HLA).
- Regardless of how you implement Health Log Analytics, you must configure MID Server system requirements and ensure that the MID Server log ingestion capability is enabled.

  For MID Server proxy requirements, see MID Server proxy preconditions for streaming logs to Health Log Analytics.

Setting up data inputs

You're encouraged to integrate data inputs with Health Log Analytics from the Integrations Launchpad. This tool provides a unified interface for convenient integration with connectors that feed raw log messages from external sources into your instance for processing and analysis. For more information, see Set up integrations for Health Log Analytics from the Integrations Launchpad.

Alternatively, you can set up data inputs in one of the following ways:

- Using guided setup. The guided setup provides a sequence of tasks to help you configure data inputs on your ServiceNow instance. Using the guided setup ensures that you have the minimum required setup for the data input process. For more information, see Set up data inputs in Health Log Analytics using guided setup.
- Manually. For more information, see Set up data inputs in Health Log Analytics manually.

For supported data inputs, see Supported data inputs for Health Log Analytics.

Set up integrations for Health Log Analytics from the Integrations Launchpad

Set up integrations from the Event Management Integrations Launchpad in Service Operations Workspace for ITOM.

Integrations Launchpad

The Integrations Launchpad tool provides a unified interface for convenient integration with connectors that feed raw log messages from external sources into your ServiceNow instance for processing and analysis. For more information, see Integrations Launchpad in Service Operations Workspace for ITOM.

Integrations for Health Log Analytics

The Integrations Launchpad enables the following integrations for Health Log Analytics:

Pull integrations

These integrations pull log data from external data sources and stream the data to your instance, typically via a MID Server. Select an integration in the table to open a page with the setup procedure.

Pull integrations

Integration	Description
Amazon CloudWatch	Streams log data from Amazon CloudWatch to your instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Pull integrations (continued)

Integration	Description
Amazon S3	Streams log data from Amazon S3 (Simple Storage Service) buckets to your instance.
Apache Kafka	Streams log data from Apache Kafka to your instance.
Elasticsearch	Streams log data from Elasticsearch indices to your instance.
Microsoft Azure Event Hubs	Streams events from Microsoft Azure Event Hubs to your instance.
Microsoft Azure Log Analytics	Streams log data from Microsoft Azure Log Analytics to your instance. The connector points the Health Log Analytics AI engine to a data source in your Microsoft Azure Log Analytics account.
MID Server	Collects log messages from the MID Server and streams them to your instance.
ServiceNow System Logs Retriever	Sends log data from the ServiceNow System Log table to the Health Log Analytics AI engine. This integration doesn't run on a MID Server. **Note:** Only a single ServiceNow System Logs Retriever data input can exist in the system, and only users with the admin role can create and configure it.
Splunk Poller	Pulls log data from Splunk to your ServiceNow instance periodically by query.

Push integrations

These integrations connect to external data sources that push log data to your instance, typically via a MID Server. Select an integration in the table to open a page with the setup procedure.

Push integrations

Integration	Description
ACC Log Analytics	The ACC-L agent is installed on the monitored host and sends raw log data to your instance via the MID Server.
Cribl	Enables Health Log Analytics to process Cribl log messages streaming into the ServiceNow instance.
Edge Delta REST	Enables Health Log Analytics to process logs it receives from Edge Delta in a distinct format. These logs stream into the ServiceNow instance via REST.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Push integrations (continued)

Integration	Description
Edge Delta TCP	Enables Health Log Analytics to process logs it receives from Edge Delta in a distinct format. These logs stream into the ServiceNow instance over the TCP transport protocol.
GCP PubSub	Receives log messages that were published to a Google Cloud Pub/Sub topic and streams them to your instance.
REST API	Streams log data to your instance in JSON format.
Splunk TCP	Streams log messages to your ServiceNow instance over the TCP transport protocol using a Splunk heavy forwarder.
Splunk UDP	Streams log messages to your ServiceNow instance over the UDP transport protocol using a Splunk heavy forwarder.
TCP	Sends raw log messages to your instance directly over a TCP/SSL socket.
UDP	Sends raw log messages to your instance directly over a UDP socket.
Vector Agent	Enables Health Log Analytics to process log messages that are streaming into the ServiceNow instance via a Vector Agent.

MID-less integrations

These integrations stream log data directly to your ServiceNow instance, without a MID Server.

MID-less integrations

Integration	Description
AWS Firehose	Streams log messages from Amazon Data Firehose directly to the collector service in ITOM Gateway, where it's queued for Health Log Analytics processing.
Cribl Stream	Streams Cribl log data directly to your ServiceNow instance.
Microsoft Azure Event Hubs (MID-less)	Streams events from Microsoft Azure Event Hubs to your instance.
OpenTelemetry Collector	Streams log data directly to your ServiceNow instance using the OpenTelemetry (OTLP) protocol.
Splunk OpenTelemetry Collector	Streams Splunk log data directly to your ServiceNow instance using the OpenTelemetry (OTLP) protocol.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MID-less integrations for Health Log Analytics

Health Log Analytics (HLA) supports integrations that stream log data directly to your ServiceNow instance without a MID Server. Use these integrations to simplify your deployment and reduce infrastructure overhead.

Role of the MID Server in Health Log Analytics

A Management, Instrumentation, and Discovery (MID) Server is a Java application that runs on a server in your network. In a standard HLA deployment, the MID Server acts as a relay between your log data sources and your ServiceNow instance. It collects, filters, and forwards log data on behalf of the instance.

While MID Servers provide flexibility and support a wide range of integrations, they introduce additional infrastructure to deploy, maintain, and monitor. Organizations with high log volumes may also have to scale MID Server capacity over time.

How MID-less integrations work

MID-less integrations bypass the MID Server entirely. Log data streams from your third-party source directly to ServiceNow over HTTPS, where it is queued and processed by HLA.

This architecture relies on two components:

ITOM Gateway

A lightweight, cloud-native component that receives incoming log data and routes it to your ServiceNow instance. You deploy ITOM Gateway based on your expected log volume. For more information, including deployment options and prerequisites, see MID-less log streaming via ITOM Gateway in Health Log Analytics.

JSON Web Token (JWT)

A secure, time-limited token used to authenticate the data stream between your log source and the ServiceNow datacenter. JWT authentication removes the requirement to store credentials such as AWS keys directly on your ServiceNow instance. For more information, see Configure a JWT provider and token.

Supported MID-less integrations

The following integrations support MID-less log streaming to Health Log Analytics.

- AWS Firehose
- Microsoft Azure Event Hubs (MID-less)

MID-less integrations using the OpenTelemetry (OTLP) protocol:

- Cribl Stream
- OpenTelemetry Collector
- Splunk OpenTelemetry Collector

Note:

- OTLP uses a standardized, vendor-neutral protocol to send application and system logs to HLA. It enables logs to be easily collected, processed, and correlated regardless of their origin or destination.
- The MID-less OpenTelemetry integrations all use the same transport model and share a common setup procedure in the Integrations Launchpad.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When to use MID-less integrations

Consider MID-less integrations when your organization wants to:

- Reduce infrastructure by eliminating the requirement to deploy and maintain a MID Server
- Simplify onboarding with a guided setup in the Integrations Launchpad
- Stream log data from cloud-native sources, such as Amazon Data Firehose or Microsoft Azure Event Hubs, where a MID Server intermediary adds unnecessary complexity
- Avoid storing third-party credentials on the ServiceNow instance

Before choosing a MID-less integration, review the following:

- MID-less integrations require ITOM Gateway. You must set up and configure ITOM Gateway before activating any MID-less integration. For more information, see MID-less log streaming via ITOM Gateway in Health Log Analytics.
- If your deployment requires on-premises data collection, bidirectional communication, or integration types not yet supported in MID-less mode, a MID Server based integration may be more appropriate.

MID-less integration setup from an MCP Client

Set up MID-less integrations for HLA from an AI-enabled MCP Client without opening the ServiceNow UI. This capability requires the ITOM MCP Server Console to be active on your instance. In addition, your MCP Client must be connected to the ITOM MCP Server Console with valid OAuth credentials. For more information, see MID-less log ingestion for HLA from an MCP Client.

MID-less log streaming via ITOM Gateway in Health Log Analytics

Health Log Analytics (HLA) can receive log data from external sources directly through the ITOM Gateway, without routing data through a MID Server. This architecture supports cloud-native log sources such as Amazon Data Firehose, Cribl, and OpenTelemetry, and is required for high-volume HLA deployments.

How log streaming via ITOM Gateway works

External log sources send data to the ITOM Gateway over gRPC. The ITOM Gateway forwards the data to the#Hermes#Messaging Service, which delivers it to the AI Engine, the HLA processing back-end. This design separates log streaming from ingestion, enabling higher throughput than direct MID Server streaming.

Deployment scenarios

The setup path depends on your expected log volume.

Log streaming via ITOM Gateway deployment scenarios

Deployment type	Setup
Standard	For typical log volumes, enable ITOM Gateway and the#Hermes#Messaging Service on your instance, configure a JSON Web Token (JWT) provider and token, and set up your log source from Integrations Launchpad.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Log streaming via ITOM Gateway deployment scenarios (continued)

Deployment type	Setup
	For more information, see Configure a JWT provider and token and Set up log streaming via ITOM Gateway for Health Log Analytics.
High-volume	For deployments requiring 30,000 or more log events per second, you must scale the HLA infrastructure before enabling ITOM Gateway. This process involves resizing the AI Engine and Elasticsearch nodes and coordinating a cross-team migration. Contact ServiceNow Support to request infrastructure scaling. For details and the required information to provide, see Set up log streaming via ITOM Gateway for Health Log Analytics **Note:** Infrastructure scaling requires a 6-hour change window and involves expected downtime of 2–6 hours for HLA functions only.

Supported log sources

Currently, the following log sources can stream data to HLA via ITOM Gateway:

- AWS Firehose
- Cribl Stream
- OpenTelemetry Collector

Each source has a dedicated tile in Integrations Launchpad for configuration.

Authentication

Log sources authenticate to HLA using a JWT token. You must configure a JWT provider and generate a token on the ServiceNow instance before activating an ITOM Gateway integration.

Key components

Key components

Component	Description
ITOM Gateway	Receives incoming log data from external sources over gRPC and forwards it to the #Hermes#Messaging Service.
Hermes#Messaging Service	Message broker that routes data from ITOM Gateway to the HLA back-end.
AI Engine	HLA back-end component that processes and analyzes ingested log data.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Key components (continued)

Component	Description
Integrations Launchpad	ServiceNow interface for configuring log source integrations. Each supported log source has a dedicated tile.

Related topics

Configure a JWT provider and token

Set up log streaming via ITOM Gateway for Health Log Analytics

Configure a JWT provider and token

Configure a JSON Web Token (JWT) provider and token to authenticate log streaming integrations sending data to Health Log Analytics (HLA) via ITOM Gateway. This configuration is required before you can activate any ITOM Gateway integration in Integrations Launchpad.

Before you begin

- Review the MID-less log streaming via ITOM Gateway in Health Log Analytics documentation.
- Verify that Health Log Analytics version 36.0.19 or higher is installed on your instance.
- Verify that the user creating the KeyStore has appropriate access permissions for the `sys_certificate`, `jwt_key_store`, `jwt_provider`, and `sn_ics_jwt_config` tables and for the relevant cryptographic modules. For ACL recommendations, see the How to resolve Key Management Framework access denied errors for Password2 decryption [KB1112530] article in the Now Support Knowledge Base.

Role required: sys_admin

About this task

This procedure creates a JWT token for ITOM Cloud Services, which enables HLA to authenticate incoming log data from external sources via ITOM Gateway. For more information, see MID-less log streaming via ITOM Gateway in Health Log Analytics.

Procedure

1. In a terminal or PowerShell session, generate a private key, certificate, and keystore. Use the following commands:

```
# Generate the private key
openssl genrsa -out private.key 2048

# Create the certificate (metadata prompts are optional)
openssl req -new -x509 -key private.key -out public_key.cer
 -days 9125 -sha256

# Create the keystore
openssl pkcs12 -export -in public_key.cer -inkey private.key
 -out my_keystore.p12 -name my_keystore
```

   These commands produce two output files used in later steps: `my_keystore.p12` and `public_key.cer`.

2. On the ServiceNow instance, create a certificate record that stores the keystore.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Navigate to **All** > **System Definition** > **Certificates**.

b. Select **New** to create a record.

c. Fill in the required fields.

d. Set **Type** to Java Key Store.

e. In the **Key store password** field, enter the keystore password generated in step 1.

f. Attach the `my_keystore.p12` file created in step 1.

g. Select **Submit**.

Note:

- If you encounter keystore password errors, re-enter the password carefully and use the Validate Keystore option on the certificate record to confirm it is correct.
- If files are not attaching, confirm that both `my_keystore.p12` and `public_key.cer` are attached to their respective records.

3. Create a JWT Key that links the signing credentials to the certificate.

a. Navigate to **All** > **System OAuth** > **JWT Keys**.

b. Select **New** to create a record.

c. Fill in the **Name** field.

d. Set **Signing Keystore** to the certificate record created in step 2.

e. In the **Signing Key** field, enter the keystore password generated in step 1.

f. Select **Submit**.

4. Create a JWT Provider that defines how tokens are generated.

a. Navigate to **All** > **System OAuth** > **JWT Providers**.

b. Select **New** to create a record.

c. Fill in the **Name** field.

d. Set **Signing Configuration** to the JWT Key created in step 3.

e. Set **Expiry Interval (sec)** to `3600`.

f. Select **Submit**.

5. Create an ICS JWT Config record that completes the connection between the JWT Provider and HLA.

a. Navigate to **All** > **ITOM Cloud Services** > **ICS JWT Config**.

b. Select **New** to create a record.

c. Fill in the **Name** field.

d. Set **JWT Provider** to the JWT Provider created in step 4.

e. Attach the `my_keystore.p12` file created in step 1.

Note: This record requires its own copy of the `my_keystore.p12` file.

f. Select **Submit**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The JWT provider and token are configured, enabling Health Log Analytics to authenticate incoming log data from external sources via ITOM Gateway.

What to do next
Set up log streaming via ITOM Gateway for Health Log Analytics.

Set up log streaming via ITOM Gateway for Health Log Analytics

Set up log streaming via ITOM Gateway to enable Health Log Analytics (HLA) to receive log data directly from external sources without a MID Server.

Before you begin
- Review the MID-less log streaming via ITOM Gateway in Health Log Analytics documentation.
- Verify that Health Log Analytics version 36.0.19 or higher is installed on your instance.
- Verify that HLA provisioning is complete. Confirm that the AI Engine and Elasticsearch show green status at: `https://<instance>.service-now.com/xmlstats.do?include=services_status`.
- Verify that ITOM Cloud Services Core is installed on your instance.
- Verify that a JWT provider and token are configured on your instance. For more information, see Configure a JWT provider and token.
- (High-volume deployments only) If you expect 30,000 or more log events per second, contact ServiceNow Support to request infrastructure scaling. Proceed to the log streaming via ITOM Gateway setup procedure only after ServiceNow confirms that scaling is complete.

  Provide the following information:

Required information for infrastructure scaling

Information	Example
Expected maximum log events per second	100,000 log events per second from all sources
Environment URL or URLs	<customer>prod.service-now.com
Preferred migration date and time	Sundays, overnight US time preferred

Note: Scaling requires a 6-hour change window and expected HLA downtime of 2–6 hours.

Role required: evt_mgmt_admin

About this task
Log streaming via ITOM Gateway removes the MID Server from the log ingestion path. External log sources send data directly to the ITOM Gateway, which routes it through the#Hermes #Messaging Service to the HLA AI Engine. For more information, see MID-less log streaming via ITOM Gateway in Health Log Analytics.

Setup involves two stages: enabling ITOM Gateway and Hermes on your instance, and creating an integration from Integrations Launchpad.

Supported log sources include AWS Firehose, Cribl Stream, and OpenTelemetry Collector.

For more information about connecting a Cribl Stream instance to the ServiceNow ITOM Gateway, see the Set up Cribl to send data to HLA without a MID server [KB2271238] article in the Now Support knowledge base.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Enable ITOM Gateway and the#Hermes#Messaging Service.
   a. Navigate to **All**.
   b. In the navigation filter, enter **sys_service.list** and press Enter.
   c. In the **Services** table, verify that an entry for `itom-hla-gw` exists with a corresponding `sys_service_endpoint` entry.
   d. Navigate to **All** > **MID Server** > **Properties**.
   e. Search for the property `mid.hla.itom_gateway_streaming.enabled` and set it to true.
   All MID Servers automatically switch to ITOM Gateway streaming mode.

   Note: MID Servers re-establish gRPC connections. Data inputs are not restarted.

2. Set up the integration from Integrations Launchpad.
   For more information, see Set up integrations for Health Log Analytics from the Integrations Launchpad.
3. On the **Overview** tab of the integration, confirm that the ITOM Gateway URL, Integration ID, and Token values are populated.
   If these values appear, log streaming via ITOM Gateway setup is complete.

Set up an Amazon Data Firehose integration for Health Log Analytics

Set up an integration to stream log data from Amazon Data Firehose directly to the ServiceNow datacenter, where it's queued for Health Log Analytics processing. There's no need to store AWS keys on your ServiceNow instance.

Before you begin

Set up MID-less log streaming via ITOM Gateway. Choose the deployment method based on your expected log volume. For more information, see MID-less log streaming via ITOM Gateway in Health Log Analytics.

As an alternative to the provided procedure, set up a MID-less integration for HLA from an AI-enabled MCP Client. For more information, see MID-less log ingestion for HLA from an MCP Client.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations Launchpad appears.
4. In the **Browse integrations** tab, enter `Firehose` in the search field.
5. Select the Amazon Data Firehose (MID-less) integration tile.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If you start an integration setup before meeting all prerequisites, a message appears. You can cancel the setup and complete the prior requirements first. Alternatively, you can continue in draft mode and complete the requirements later. Note that you can't activate the integration until you have completed all the prerequisites.

6. On the **Provide details** form, fill in the fields.
   For a description of the fields, see Amazon Data Firehose integration configuration fields.
7. Select **Next**.
8. Follow one of the procedures provided on the **Set-up instruction** screen to install the integration in AWS.
   You can perform the installation procedure using either AWS CloudFormation or the AWS Management Console. Both methods require the same input. The appropriate choice depends on your requirements and the size of your deployment:
   - Use AWS CloudFormation when you need automation, repeatability, and infrastructure-as-code benefits. It's best for deploying standardized configurations across multiple environments. AWS CloudFormation prompts for input automatically.
   - Use the AWS Management Console when you need manual setups or quick configurations without automation.

   Before you perform either of these procedures, copy the access token, the ServiceNow endpoint URL, and the integration ID to the clipboard. You need these values during the installation process.
9. Do one of the following.
   - If you completed all the prerequisites before starting the configuration, activate the integration either with or without AI-powered capabilities. Select the appropriate option.
     - **Activate with AI** enables AI-powered automatic parsing and mapping of log data to service instances and components for contextual alerts.

       When the integration is activated successfully, the **Overview** tab is displayed. ServiceNow Otto for ITOM collects and analyzes log data. An AI icon indicates that AI is active.
     - **Activate** activates the integration without AI-powered mapping. The integration is activated and the **Overview** tab is displayed.

     On the Integrations Launchpad, the integration tile is available in the **Installed integrations** tab.
   - If you didn't complete all the prior requirements, select **Save draft**.

     The system saves the integration as a draft in the Integrations Launchpad **Installed integrations** tab, under **Waiting for your action**. At a later time, complete the prerequisites and activate the installation. For more information, see Activate a draft integration in Health Log Analytics.

What to do next

On the **Overview** tab, do the following:

- Use the displayed information to refine how Health Log Analytics reads the log data. For more information, see Review log streaming data and adjust integration settings in Health Log Analytics.
- Use the More options menu (⋮) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct

© 2026 ServiceNow, Inc. All rights reserved.

access to the **Log Viewer**. Use the **Log Viewer** to review raw log messages ingested by the integration. For more information, see:

- Log data auto-mapping and mapping
- Source type structure adjustment
- Review alert-related logs on the Log Viewer

If you activated the integration with AI, verify that AI correctly auto-mapped log data to service instances and components. To do this, select **View mapping** under **Log context mapping**. You can override the AI mapping by selecting a different log field from each list. For more information, see Map logs to service instances, components, source types.

Set up a Cribl Stream (MID-less) integration for Health Log Analytics

Set up a Cribl Stream integration to stream Cribl log data directly to your ServiceNow instance, without a MID Server.

Before you begin

Set up MID-less log streaming via ITOM Gateway. Choose the deployment method based on your expected log volume. For more information, see MID-less log streaming via ITOM Gateway in Health Log Analytics.

As an alternative to the provided procedure, set up a MID-less integration for HLA from an AI-enabled MCP Client. For more information, see MID-less log ingestion for HLA from an MCP Client.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations Launchpad appears.
4. In the **Browse integrations** tab, search for the Cribl Stream integration and select its tile.

   Note: If you start an integration setup before meeting all prerequisites, a message appears. You can cancel the setup and complete the prior requirements first. Alternatively, you can continue in draft mode and complete the requirements later. Note that you can't activate the integration until you have completed all the prerequisites.

5. On the **Provide details** form, fill in the fields and then select **Next**.
6. On the **Set-up instruction** screen, follow the instructions to enable sending Cribl log data to ServiceNow using OpenTelemetry.

   a. Copy the provided access token, endpoint, and integration ID to the clipboard.
   These credentials enable Cribl to securely send logs to the ServiceNow ITOM Gateway.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Credentials

Credential	Description
Access Token	The JWT credential passed with every request (servicenow-access-token).
Endpoint	The Gateway gRPC endpoint, the address to which Cribl Stream will send the log data.
Integration ID	The ID by which the integration identifies to ServiceNow (servicenow-integration-id).

b. In the Cribl UI or configuration files, depending on your deployment, set up a Cribl destination that uses the OpenTelemetry Protocol (OTLP) to forward data to ServiceNow.

Note: Cribl integrates directly with ServiceNow via API. No collector or agent is needed.

c. In Cribl, paste the copied credentials into the destination configuration.

For more detailed instructions, see the Set up Cribl to send data to HLA without a MID Server [KB2271238] article in the Now Support knowledge base.

7. Do one of the following.

- If you completed all the prerequisites before starting the configuration, activate the integration either with or without AI-powered capabilities. Select the appropriate option.
  - **Activate with AI** enables AI-powered automatic parsing and mapping of log data to service instances and components for contextual alerts.

    When the integration is activated successfully, the **Overview** tab is displayed. ServiceNow Otto for ITOM collects and analyzes log data. An AI icon indicates that AI is active.
  - **Activate** activates the integration without AI-powered mapping. The integration is activated and the **Overview** tab is displayed.

  On the Integrations Launchpad, the integration tile is available in the **Installed integrations** tab.
- If you didn't complete all the prior requirements, select **Save draft**.

  The system saves the integration as a draft in the Integrations Launchpad **Installed integrations** tab, under **Waiting for your action**. At a later time, complete the prerequisites and activate the installation. For more information, see Activate a draft integration in Health Log Analytics.

What to do next

On the **Overview** tab, do the following:

- Use the displayed information to refine how Health Log Analytics reads the log data. For more information, see Review log streaming data and adjust integration settings in Health Log Analytics.
- Use the More options menu ( ) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct

access to the **Log Viewer**. Use the **Log Viewer** to review raw log messages ingested by the integration. For more information, see:

- Log data auto-mapping and mapping
- Source type structure adjustment
- Review alert-related logs on the Log Viewer

If you activated the integration with AI, verify that AI correctly auto-mapped log data to service instances and components. To do this, select **View mapping** under **Log context mapping**. You can override the AI mapping by selecting a different log field from each list. For more information, see Map logs to service instances, components, source types.

Set up a Microsoft Azure Event Hubs (MID-less) integration for Health Log Analytics

Set up an integration for streaming events from Microsoft Azure Event Hubs to your ServiceNow instance without a MID Server.

Before you begin

Set up MID-less log streaming via ITOM Gateway. Choose the deployment method based on your expected log volume. For more information, see MID-less log streaming via ITOM Gateway in Health Log Analytics.

As an alternative to the provided procedure, set up a MID-less integration for HLA from an AI-enabled MCP Client. For more information, see MID-less log ingestion for HLA from an MCP Client.

Role required: evt_mgmt_admin

About this task

This Microsoft Azure Event Hubs integration eliminates the need for a MID Server, which simplifies setup and enables more efficient log data ingestion into your instance. By removing the MID Server requirement, log data collection and processing are streamlined to promote faster analysis and root cause identification.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations Launchpad appears.
4. In the **Browse integrations** tab, enter `Azure Event Hubs (MID-less)` in the search field.
5. Select the Azure Event Hubs (MID-less) integration tile.

   Note: If you start an integration setup before meeting all prerequisites, a message appears. You can cancel the setup and complete the prior requirements first. Alternatively, you can continue in draft mode and complete the requirements later. Note that you can't activate the integration until you have completed all the prerequisites.

6. On the **Provide details** form, fill in the fields and then select **Next**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details

Field	Description
Integration Name	Unique name of this integration. For example: My Event Hubs MID-less integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
Description	Option to add a brief description of the integration to help identify it.
Transport	Protocol used to stream the log data. This field is read-only. This integration uses Microsoft Azure Event Hubs to stream log data to your instance.

7. On the **Set-up instruction** screen, perform the appropriate procedure to install the integration in your third-party console.
   - Install the integration with Bicep, a domain-specific language (DSL) that uses declarative syntax to deploy Azure resources.

     Using Bicep enables automation and consistency across environments through Infrastructure as Code (IaC), allowing you to manage your Azure environment more efficiently. It also supports version control and integration with CI/CD pipelines.

   - Install the integration in the Azure portal.

     If you're doing a one-time setup or prefer a graphical interface, installing in the Azure portal is a good choice. It provides a convenient way to configure resources, making it suitable for straightforward deployments.

   The screen provides a link to detailed configuration instructions for each of these two installation options.
8. Do one of the following.
   - If you completed all the prerequisites before starting the configuration, activate the integration either with or without AI-powered capabilities. Select the appropriate option.
     - **Activate with AI** enables AI-powered automatic parsing and mapping of log data to service instances and components for contextual alerts.

       When the integration is activated successfully, the **Overview** tab is displayed. ServiceNow Otto for ITOM collects and analyzes log data. An AI icon indicates that AI is active.

     - **Activate** activates the integration without AI-powered mapping. The integration is activated and the **Overview** tab is displayed.

     On the Integrations Launchpad, the integration tile is available in the **Installed integrations** tab.

   - If you didn't complete all the prior requirements, select **Save draft**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The system saves the integration as a draft in the Integrations Launchpad **Installed integrations** tab, under **Waiting for your action**. At a later time, complete the prerequisites and activate the installation. For more information, see Activate a draft integration in Health Log Analytics.

What to do next

On the **Overview** tab, do the following:

- Use the displayed information to refine how Health Log Analytics reads the log data. For more information, see Review log streaming data and adjust integration settings in Health Log Analytics.
- Use the More options menu ( ) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct access to the **Log Viewer**. Use the **Log Viewer** to review raw log messages ingested by the integration. For more information, see:
  - Log data auto-mapping and mapping
  - Source type structure adjustment
  - Review alert-related logs on the Log Viewer

If you activated the integration with AI, verify that AI correctly auto-mapped log data to service instances and components. To do this, select **View mapping** under **Log context mapping**. You can override the AI mapping by selecting a different log field from each list. For more information, see Map logs to service instances, components, source types.

Set up an OpenTelemetry Collector integration for Health Log Analytics

Set up an OpenTelemetry Collector integration to stream log data directly to your ServiceNow instance using the OpenTelemetry (OTLP) protocol, without a MID Server.

Before you begin

Set up MID-less log streaming via ITOM Gateway. Choose the deployment method based on your expected log volume. For more information, see MID-less log streaming via ITOM Gateway in Health Log Analytics.

As an alternative to the provided procedure, set up a MID-less integration for HLA from an AI-enabled MCP Client. For more information, see MID-less log ingestion for HLA from an MCP Client.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations Launchpad appears.
4. In the **Browse integrations** tab, search for the OpenTelemetry (MID-less) integration and select its tile.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If you start an integration setup before meeting all prerequisites, a message appears. You can cancel the setup and complete the prior requirements first. Alternatively, you can continue in draft mode and complete the requirements later. Note that you can't activate the integration until you have completed all the prerequisites.

5. On the **Provide details** form, fill in the fields and then select **Next**.
6. On the **Set-up instruction** screen, follow the provided procedure to enable sending log data to ServiceNow using OpenTelemetry.

   a. Copy the provided access token, endpoint, and integration ID to the clipboard.
   These credentials enable the collector to receive telemetry data and forwarding it to the ServiceNow ITOM Gateway.

   Credentials

Credential	Description
Access Token	The JWT credential passed with every request.
Endpoint	The address to which the data is sent: the ITOM Gateway.
Integration ID	The ID with which the integration identifies to ServiceNow.

   b. In your OpenTelemetry Collector configuration file, exporters section, add an OTLP exporter to forward telemetry data to ServiceNow.
   Typically, the configuration file is `otel-collector-config.yaml`.

```
exporters:
  otlp/servicenow:
    endpoint:
itomgw-prod-gateway-phxbwi.sncapps.service-now.com:443
    headers:
      # Reads the access token from the
SERVICENOW_ACCESS_TOKEN env variable
      servicenow-access-token: ${SERVICENOW_ACCESS_TOKEN}
      servicenow-integration-id:
f7452b23877c4b10ebdd4335dabb3553
```

   This step tells the collector where to send the data and how to authenticate with your instance.

   For more detailed instructions, see the Configure an OpenTelemetry Collector or 3rd Party agent to send data to HLA [KB2117238] article in the Now Support knowledge base. For further assistance, contact your OpenTelemetry Collector administrator.

7. Do one of the following.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If you completed all the prerequisites before starting the configuration, activate the integration either with or without AI-powered capabilities. Select the appropriate option.
  - **Activate with AI** enables AI-powered automatic parsing and mapping of log data to service instances and components for contextual alerts.

    When the integration is activated successfully, the **Overview** tab is displayed. ServiceNow Otto for ITOM collects and analyzes log data. An AI icon indicates that AI is active.
  - **Activate** activates the integration without AI-powered mapping. The integration is activated and the **Overview** tab is displayed.

  On the Integrations Launchpad, the integration tile is available in the **Installed integrations** tab.
- If you didn't complete all the prior requirements, select **Save draft**.

  The system saves the integration as a draft in the Integrations Launchpad **Installed integrations** tab, under **Waiting for your action**. At a later time, complete the prerequisites and activate the installation. For more information, see Activate a draft integration in Health Log Analytics.

What to do next

On the **Overview** tab, do the following:

- Use the displayed information to refine how Health Log Analytics reads the log data. For more information, see Review log streaming data and adjust integration settings in Health Log Analytics.
- Use the More options menu (⋮) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct access to the **Log Viewer**. Use the **Log Viewer** to review raw log messages ingested by the integration. For more information, see:
  - Log data auto-mapping and mapping
  - Source type structure adjustment
  - Review alert-related logs on the Log Viewer

If you activated the integration with AI, verify that AI correctly auto-mapped log data to service instances and components. To do this, select **View mapping** under **Log context mapping**. You can override the AI mapping by selecting a different log field from each list. For more information, see Map logs to service instances, components, source types.

Set up a Splunk OpenTelemetry Collector (MID-less) integration for Health Log Analytics

Set up a Splunk OpenTelemetry Collector integration to stream Splunk log data directly to your ServiceNow instance using the OpenTelemetry (OTLP) protocol, without a MID Server.

Before you begin

Set up MID-less log streaming via ITOM Gateway. Choose the deployment method based on your expected log volume. For more information, see MID-less log streaming via ITOM Gateway in Health Log Analytics.

As an alternative to the provided procedure, set up a MID-less integration for HLA from an AI-enabled MCP Client. For more information, see MID-less log ingestion for HLA from an MCP Client.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations Launchpad appears.
4. In the **Browse integrations** tab, search for the Splunk OpenTelemetry (MID-less) integration and select its tile.

   Note: If you start an integration setup before meeting all prerequisites, a message appears. You can cancel the setup and complete the prior requirements first. Alternatively, you can continue in draft mode and complete the requirements later. Note that you can't activate the integration until you have completed all the prerequisites.

5. On the **Provide details** form, fill in the fields and then select **Next**.
6. On the **Set-up instruction** screen, follow the provided procedure to enable sending Splunk log data to ServiceNow using OpenTelemetry.

   a. Copy the provided access token, endpoint, and integration ID to the clipboard.
   These credentials enable Cribl to securely send logs to the ServiceNow ITOM Gateway.

   Credentials

Credential	Description
Access Token	The JWT credential passed with every request.
Endpoint	The address to which the data is sent: the ITOM Gateway.
Integration ID	The ID with which the integration identifies to ServiceNow.

   b. In your OpenTelemetry Collector configuration file, exporters section, add an OTLP exporter to forward telemetry data to ServiceNow.
   Typically, the configuration file is `otel-collector-config.yaml`.

```
exporters:
  otlp/servicenow:
    endpoint:
 itomgw-prod-gateway-phxbwi.sncapps.service-now.com:443
    headers:
      # Reads the access token from the
 SERVICENOW_ACCESS_TOKEN env variable
      servicenow-access-token: ${SERVICENOW_ACCESS_TOKEN}
      servicenow-integration-id:
 7b36df1387f00f10d696c845dabb351f
```

This step tells the collector where to send the data and how to authenticate with your instance.

For more detailed instructions, see the Configure an OpenTelemetry Collector or 3rd Party agent to send data to HLA [KB2117238] article in the Now Support knowledge base. For further assistance, contact your OpenTelemetry Collector administrator.

7. Do one of the following.
   - If you completed all the prerequisites before starting the configuration, activate the integration either with or without AI-powered capabilities. Select the appropriate option.
     - **Activate with AI** enables AI-powered automatic parsing and mapping of log data to service instances and components for contextual alerts.

       When the integration is activated successfully, the **Overview** tab is displayed. ServiceNow Otto for ITOM collects and analyzes log data. An AI icon indicates that AI is active.

     - **Activate** activates the integration without AI-powered mapping. The integration is activated and the **Overview** tab is displayed.

     On the Integrations Launchpad, the integration tile is available in the **Installed integrations** tab.

   - If you didn't complete all the prior requirements, select **Save draft**.

     The system saves the integration as a draft in the Integrations Launchpad **Installed integrations** tab, under **Waiting for your action**. At a later time, complete the prerequisites and activate the installation. For more information, see Activate a draft integration in Health Log Analytics.

What to do next

On the **Overview** tab, do the following:

- Use the displayed information to refine how Health Log Analytics reads the log data. For more information, see Review log streaming data and adjust integration settings in Health Log Analytics.
- Use the More options menu (⋮) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct access to the **Log Viewer**. Use the **Log Viewer** to review raw log messages ingested by the integration. For more information, see:
  - Log data auto-mapping and mapping
  - Source type structure adjustment
  - Review alert-related logs on the Log Viewer

If you activated the integration with AI, verify that AI correctly auto-mapped log data to service instances and components. To do this, select **View mapping** under **Log context mapping**. You can override the AI mapping by selecting a different log field from each list. For more information, see Map logs to service instances, components, source types.

Set up an ACC Log Analytics integration for Health Log Analytics

Set up an ACC Log Analytics (ACC-L) integration for streaming log messages to your ServiceNow instance. This integration can be used when agent-less log collection is impractical, for example because of security requirements or host accessibility.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Verify you're using the latest release version of the Health Log Analytics plugin to enable ACC Log Analytics integration setupfrom the Integrations Launchpad.
- Verify that a MID Server is installed and configured. For more information, see MID Server system requirements.
- The MID Server must support the Agent Client Collector Listener. The ACC Listener can be enabled during ACC Log Analytics integration setup from the Integrations Launchpad.
- The Agent Client Collector Log Analytics application has a dependency on the following ServiceNow applications, available from the ServiceNow Store:
  - Health Log Analytics, Version 22.0.12 - December 2021 and later releases.
  - Agent Client Collector - Framework, Version 2.7.0 - December 2021 and later releases.

Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

Role required: evt_mgmt_admin

About this task

Set up an integration from the Integrations Launchpad in Service Operations Workspace, which you access from the ITOM AIOps configuration center. The AIOps configuration center is a centralized workspace for configuring and managing AIOps features from a single place. The integrations setup process reduces implementation time compared to manual data input setup in the classic interface in Health Log Analytics. For more information, see Integrations Launchpad in Service Operations Workspace for ITOM.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation pane, select the AIOps configuration center icon.
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations Launchpad appears.
4. In the **Browse integrations** tab, search for `Agent Log Analytics`.
5. Select the Agent Log Analytics integration tile.

   Note: If you start an integration setup before meeting all prerequisites, a message appears. You can cancel the setup and complete the prior requirements first. Alternatively, you can continue in draft mode and complete the requirements later. Note that you can't activate the integration until you have completed all the prerequisites.

6. On the **Provide details** form, complete the fields.
   For a description of the fields, see the **Provide details** table in ACC Log Analytics (ACC-L) integration configuration fields.
7. **Optional:** Select **Advanced settings** and complete the advanced configuration fields.
   For a description of the fields, see the **Advanced settings** table in ACC Log Analytics (ACC-L) integration configuration fields.
8. Select **Next** to save your settings and proceed to the **Setup instructions** tab.
9. Enable Agent Client Collector Log Analytics to stream logs from your IT infrastructure to Health Log Analytics by creating log collection policies for your configuration items (CIs).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information, see Create an Agent Client Collector log policy.

10. Do one of the following.
    - If you completed all the prerequisites before starting the configuration, activate the integration either with or without AI-powered capabilities. Select the appropriate option.
      - **Activate with AI** enables AI-powered automatic parsing and mapping of log data to service instances and components for contextual alerts.

        When the integration is activated successfully, the **Overview** tab is displayed. ServiceNow Otto for ITOM collects and analyzes log data. An AI icon indicates that AI is active.

      - **Activate** activates the integration without AI-powered mapping. The integration is activated and the **Overview** tab is displayed.

      On the Integrations Launchpad, the integration tile is available in the **Installed integrations** tab.

    - If you didn't complete all the prior requirements, select **Save draft**.

      The system saves the integration as a draft in the Integrations Launchpad **Installed integrations** tab, under **Waiting for your action**. At a later time, complete the prerequisites and activate the installation. For more information, see Activate a draft integration in Health Log Analytics.

What to do next

On the **Overview** tab, do the following:

- Use the displayed information to refine how Health Log Analytics reads the log data. For more information, see Review log streaming data and adjust integration settings in Health Log Analytics.
- Use the More options menu (⋮) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct access to the **Log Viewer**. Use the **Log Viewer** to review raw log messages ingested by the integration. For more information, see:
  - Log data auto-mapping and mapping
  - Source type structure adjustment
  - Review alert-related logs on the Log Viewer

If you activated the integration with AI, verify that AI correctly auto-mapped log data to service instances and components. To do this, select **View mapping** under **Log context mapping**. You can override the AI mapping by selecting a different log field from each list. For more information, see Map logs to service instances, components, source types.

Set up an Amazon CloudWatch integration for Health Log Analytics

Set up an integration for streaming log data from Amazon CloudWatch to your ServiceNow instance.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.

> **Important:** Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses aren't routable over the internet. Without a public IP, external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *`mid.public_ip`* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

Role required: evt_mgmt_admin

About this task

Set up an integration from the Integrations Launchpad in Service Operations Workspace, which you access from the ITOM AIOps configuration center. The AIOps configuration center is a centralized workspace for configuring and managing AIOps features from a single place. The integrations setup process reduces implementation time compared to manual data input setup in the classic interface in Health Log Analytics. For more information, see Integrations Launchpad in Service Operations Workspace for ITOM.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation pane, select the AIOps configuration center icon.
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations Launchpad appears.
4. In the **Browse integrations** tab, search for `CloudWatch`.
5. Select the Amazon CloudWatch integration tile.

   Note: If you start an integration setup before meeting all prerequisites, a message appears. You can cancel the setup and complete the prior requirements first. Alternatively, you can continue in draft mode and complete the requirements later. Note that you can't activate the integration until you have completed all the prerequisites.

6. On the **Provide details** form, fill in the fields.
   For a description of the fields, see the **Provide details** table in Amazon CloudWatch integration configuration fields.
7. Select **Next** to save your settings and proceed to the next configuration form.
8. On the **Set data retrieval method** form, fill in the fields.
   For a description of the fields, see the **Set data retrieval method** table in Amazon CloudWatch integration configuration fields.
9. **Optional:** Select **Advanced settings** and fill in the advanced configuration fields.
   For a description of the fields, see the **Advanced settings** table in Amazon CloudWatch integration configuration fields.
10. Do one of the following.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If you completed all the prerequisites before starting the configuration, activate the integration either with or without AI-powered capabilities. Select the appropriate option.
  - **Activate with AI** enables AI-powered automatic parsing and mapping of log data to service instances and components for contextual alerts.

    When the integration is activated successfully, the **Overview** tab is displayed. ServiceNow Otto for ITOM collects and analyzes log data. An AI icon indicates that AI is active.
  - **Activate** activates the integration without AI-powered mapping. The integration is activated and the **Overview** tab is displayed.

  On the Integrations Launchpad, the integration tile is available in the **Installed integrations** tab.
- If you didn't complete all the prior requirements, select **Save draft**.

  The system saves the integration as a draft in the Integrations Launchpad **Installed integrations** tab, under **Waiting for your action**. At a later time, complete the prerequisites and activate the installation. For more information, see Activate a draft integration in Health Log Analytics.

What to do next

On the **Overview** tab, do the following:

- Use the displayed information to refine how Health Log Analytics reads the log data. For more information, see Review log streaming data and adjust integration settings in Health Log Analytics.
- Use the More options menu (⋮) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct access to the **Log Viewer**. Use the **Log Viewer** to review raw log messages ingested by the integration. For more information, see:
  - Log data auto-mapping and mapping
  - Source type structure adjustment
  - Review alert-related logs on the Log Viewer

If you activated the integration with AI, verify that AI correctly auto-mapped log data to service instances and components. To do this, select **View mapping** under **Log context mapping**. You can override the AI mapping by selecting a different log field from each list. For more information, see Map logs to service instances, components, source types.

Set up an Amazon S3 integration for Health Log Analytics

Set up an integration for streaming log data from Amazon S3 (Simple Storage Service) buckets to your ServiceNow instance.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.

> **Important:** Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses aren't routable over the internet. Without a public IP, external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *mid.public_ip* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

About this task

Set up an integration from the Integrations Launchpad in Service Operations Workspace, which you access from the ITOM AIOps configuration center. The AIOps configuration center is a centralized workspace for configuring and managing AIOps features from a single place. The integrations setup process reduces implementation time compared to manual data input setup in the classic interface in Health Log Analytics. For more information, see Integrations Launchpad in Service Operations Workspace for ITOM.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation pane, select the AIOps configuration center icon.
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations Launchpad appears.
4. In the **Browse integrations** tab, search for S3.
5. Select the Amazon S3 integration tile.

   Note: If you start an integration setup before meeting all prerequisites, a message appears. You can cancel the setup and complete the prior requirements first. Alternatively, you can continue in draft mode and complete the requirements later. Note that you can't activate the integration until you have completed all the prerequisites.

6. On the **Provide details** form, fill in the fields.
   For a description of the fields, see the **Provide details** table in Amazon S3 integration configuration fields.
7. Select **Next** to save your settings and proceed to the next configuration form.
8. On the **Set data retrieval method** form, fill in the fields.
   For a description of the fields, see the **Set data retrieval method** table in Amazon S3 integration configuration fields.
9. **Optional:** Select **Advanced settings** and fill in the advanced configuration fields.
   For a description of the fields, see the **Advanced settings** table in Amazon S3 integration configuration fields.
10. Do one of the following.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If you completed all the prerequisites before starting the configuration, activate the integration either with or without AI-powered capabilities. Select the appropriate option.
  - **Activate with AI** enables AI-powered automatic parsing and mapping of log data to service instances and components for contextual alerts.

    When the integration is activated successfully, the **Overview** tab is displayed. ServiceNow Otto for ITOM collects and analyzes log data. An AI icon indicates that AI is active.
  - **Activate** activates the integration without AI-powered mapping. The integration is activated and the **Overview** tab is displayed.

  On the Integrations Launchpad, the integration tile is available in the **Installed integrations** tab.
- If you didn't complete all the prior requirements, select **Save draft**.

  The system saves the integration as a draft in the Integrations Launchpad **Installed integrations** tab, under **Waiting for your action**. At a later time, complete the prerequisites and activate the installation. For more information, see Activate a draft integration in Health Log Analytics.

What to do next

On the **Overview** tab, do the following:

- Use the displayed information to refine how Health Log Analytics reads the log data. For more information, see Review log streaming data and adjust integration settings in Health Log Analytics.
- Use the More options menu (⋮) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct access to the **Log Viewer**. Use the **Log Viewer** to review raw log messages ingested by the integration. For more information, see:
  - Log data auto-mapping and mapping
  - Source type structure adjustment
  - Review alert-related logs on the Log Viewer

If you activated the integration with AI, verify that AI correctly auto-mapped log data to service instances and components. To do this, select **View mapping** under **Log context mapping**. You can override the AI mapping by selecting a different log field from each list. For more information, see Map logs to service instances, components, source types.

Set up an Apache Kafka integration for Health Log Analytics

Set up an integration for streaming log data from Apache Kafka to your ServiceNow instance for processing by Health Log Analytics.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.

> **Important:** Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses aren't routable over the internet. Without a public IP, external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *mid.public_ip* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

- Consider whether to pull the log data to a single MID Server or to a MID Server cluster.

  In MID Server clusters, multiple MID Servers are grouped together for failover protection. The active integration runs on a single MID Server in the cluster. If that MID Server fails, the system moves its tasks to the next available MID Server in the cluster in a configured order.

  If you decide to use a MID Server cluster, verify the following:

  - The MID Server cluster includes only MID Servers that support basic authentication.

    Note: mTLS is not supported for log ingestion.

  - Log ingestion is enabled for each MID Server in the cluster.

    Note: If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically.

  - No more than the default maximum of 10 integrations will pull logs to a single MID Server.

    A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 integrations running on it, even when that MID Server is down.

Role required: evt_mgmt_admin

About this task

Set up an integration from the Integrations Launchpad in Service Operations Workspace, which you access from the ITOM AIOps configuration center. The AIOps configuration center is a centralized workspace for configuring and managing AIOps features from a single place. The integrations setup process reduces implementation time compared to manual data input setup in the classic interface in Health Log Analytics. For more information, see Integrations Launchpad in Service Operations Workspace for ITOM.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation pane, select the AIOps configuration center icon.
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations Launchpad appears.
4. In the **Browse integrations** tab, search for `Kafka`.
5. Select the Kafka integration tile.

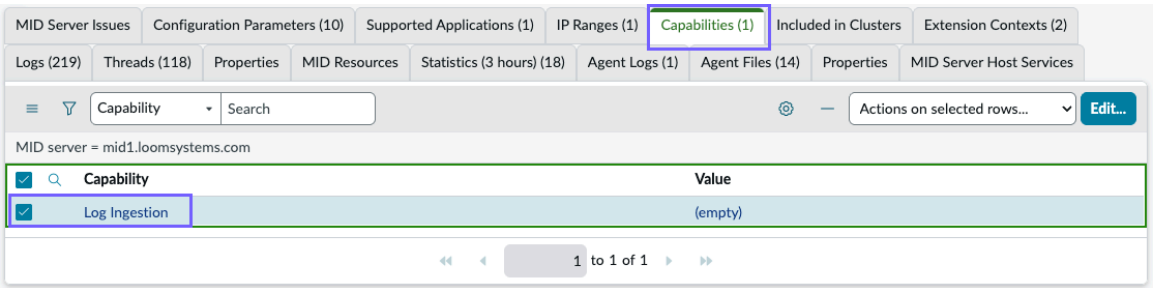
If you activated the integration with AI, verify that AI correctly auto-mapped log data to service instances and components. To do this, select **View mapping** under **Log context mapping**. You can override the AI mapping by selecting a different log field from each list. For more information, see Map logs to service instances, components, source types.

Set up a Cribl integration for Health Log Analytics

Set up an integration to enable Health Log Analytics to process Cribl log messages streaming into your ServiceNow instance.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses aren't routable over the internet. Without a public IP, external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *mid.public_ip* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

Role required: evt_mgmt_admin

About this task

If your organization uses Cribl for filtering and routing large volumes of log data from various sources, the log format received by Health Log Analytics is distinct from other types. The Cribl integration enables HLA to detect and separate transport headers from inner log messages in this format. It then forwards only the inner message to the source type structure for processing.

You set up integrations through the Integrations Launchpad in Service Operations Workspace, which you access from the ITOM AIOps configuration center. The AIOps configuration center is a centralized workspace for configuring and managing AIOps features from a single place. The integrations setup process reduces implementation time compared to manual data input setup in the classic interface in Health Log Analytics. For more information, see Integrations Launchpad in Service Operations Workspace for ITOM.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation pane, select the AIOps configuration center icon.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.

3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations Launchpad appears.
4. In the **Browse integrations** tab, enter `Cribl` in the search field.
5. Select the Cribl integration tile.

   Note: If you start an integration setup before meeting all prerequisites, a message appears. You can cancel the setup and complete the prior requirements first. Alternatively, you can continue in draft mode and complete the requirements later. Note that you can't activate the integration until you have completed all the prerequisites.

6. On the **Provide details** form, fill in the fields.
   For a description of the fields, see Cribl integration configuration fields.
7. Select **Next**.
8. On the **Set up connection** form, fill in the fields.
   For a description of the fields, see Cribl integration configuration fields.
9. Do one of the following.
   - If you completed all the prerequisites before starting the configuration, activate the integration either with or without AI-powered capabilities. Select the appropriate option.
     - **Activate with AI** enables AI-powered automatic parsing and mapping of log data to service instances and components for contextual alerts.

       When the integration is activated successfully, the **Overview** tab is displayed. ServiceNow Otto for ITOM collects and analyzes log data. An AI icon indicates that AI is active.

     - **Activate** activates the integration without AI-powered mapping. The integration is activated and the **Overview** tab is displayed.

     On the Integrations Launchpad, the integration tile is available in the **Installed integrations** tab.

   - If you didn't complete all the prior requirements, select **Save draft**.

     The system saves the integration as a draft in the Integrations Launchpad **Installed integrations** tab, under **Waiting for your action**. At a later time, complete the prerequisites and activate the installation. For more information, see Activate a draft integration in Health Log Analytics.

What to do next

On the **Overview** tab, do the following:

- Use the displayed information to refine how Health Log Analytics reads the log data. For more information, see Review log streaming data and adjust integration settings in Health Log Analytics.
- Use the More options menu (⋮) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct access to the **Log Viewer**. Use the **Log Viewer** to review raw log messages ingested by the integration. For more information, see:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Log data auto-mapping and mapping
- Source type structure adjustment
- Review alert-related logs on the Log Viewer

If you activated the integration with AI, verify that AI correctly auto-mapped log data to service instances and components. To do this, select **View mapping** under **Log context mapping**. You can override the AI mapping by selecting a different log field from each list. For more information, see Map logs to service instances, components, source types.

Set up Cribl integration authentication credentials

Configure credentials in Health Log Analytics for the authentication method used by the Cribl integration.

Before you begin

Decide on the appropriate authentication method for your instance:

- Basic authentication is preferred for self-hosted (On-Prem) Cribl instances.
- Token-based authentication is required for Cribl Cloud instances.

> **Note:** Token-based authentication is also supported for self-hosted (On-Prem) Cribl instances.

For token-based authentication, create a client ID and a client secret on your Cribl instance and use them to generate a token. For example:

- Client ID: 1234567890abcdef
- Client secret: abcdef1234567890

For detailed information on the Cribl API, refer to the Cribl API documentation.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Select the default Cribl credential alias: Cribl_Credential_Alias.
3. Select **New** to create a credential record.
4. Select the appropriate credentials type for your Cribl instance:
   - For basic authentication, select **Basic Auth Credentials**.
   - For token-based authentication, select **Custom Header API Key Credential**.
5. On the displayed form, fill in the fields.
   - For basic authentication:

Basic Auth credentials fields

Field	Description
Name	A name that describes the credentials.
Username	Your Cribl server username. For example: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Password	Your Cribl server password. For example: admin123.

- For token-based authentication:

Custom Header API Key credential fields

Name	A name that describes the credential.
API Key	The authentication token you generated on the Cribl instance.

6. Select **Save** to save the credentials configuration.

What to do next

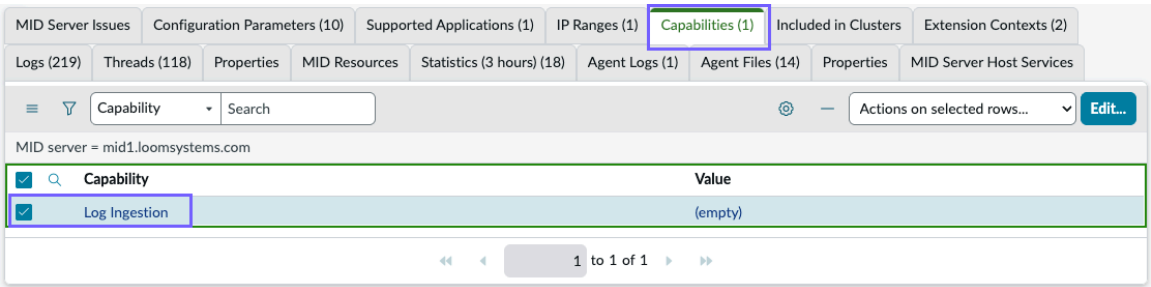
- Verify that the provided credentials have appropriate permissions to access your Cribl instance.
- Verify that only one active credential record of each credentials type exists under the credential alias.

Set up an Edge Delta REST integration for Health Log Analytics

Set up an Edge Delta REST integration to enable Health Log Analytics to process logs it receives from Edge Delta in a distinct format. These logs stream into your ServiceNow instance via REST.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses aren't routable over the internet. Without a public IP, external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *mid.public_ip* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

Role required: evt_mgmt_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

If your organization uses Edge Delta to handle large volumes of log data from multiple sources before sending it to Health Log Analytics, the log format HLA receives from Edge Delta is different from other types. The Edge Delta integration enables HLA to detect and separate transport headers from inner log messages in this format. It forwards only the inner message to the source type structure for processing.

You set up integrations through the Integrations Launchpad in Service Operations Workspace, which you access from the ITOM AIOps configuration center. The AIOps configuration center is a centralized workspace for configuring and managing AIOps features from a single place. The integrations setup process reduces implementation time compared to manual data input setup in the classic interface in Health Log Analytics. For more information, see Integrations Launchpad in Service Operations Workspace for ITOM.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations Launchpad appears.
4. In the **Browse integrations** tab, enter `Edge Delta` in the search field.
5. Select the Edge Delta REST integration tile.

   Note: If you start an integration setup before meeting all prerequisites, a message appears. You can cancel the setup and complete the prior requirements first. Alternatively, you can continue in draft mode and complete the requirements later. Note that you can't activate the integration until you have completed all the prerequisites.

6. On the **Provide details** form, fill in the fields.
   For a description of the fields, see Edge Delta REST integration configuration fields.
7. Select **Next**.
8. Follow the instructions in the **Set-up instruction** page to install the integration in the third-party console.
   a. Copy the displayed URL.
   b. In Edge Delta, create an HTTP destination.
   c. Paste the copied URL into the HTTP destination.
   d. Add the following headers:
      - Authorization

        Use either of the following:
        - Key <API_KEY>

          Find the API_KEY by navigating to **All** > **MID Web Server API Key** > **View API Key**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Basic <Base64 (username:password)>

  Note: Verify that you use a username and password for a MID web server with Basic Auth enabled.

- Content-Type: application/json.

9. Do one of the following.
   - If you completed all the prerequisites before starting the configuration, activate the integration either with or without AI-powered capabilities. Select the appropriate option.
     - **Activate with AI** enables AI-powered automatic parsing and mapping of log data to service instances and components for contextual alerts.

       When the integration is activated successfully, the **Overview** tab is displayed. ServiceNow Otto for ITOM collects and analyzes log data. An AI icon indicates that AI is active.

     - **Activate** activates the integration without AI-powered mapping. The integration is activated and the **Overview** tab is displayed.

     On the Integrations Launchpad, the integration tile is available in the **Installed integrations** tab.

   - If you didn't complete all the prior requirements, select **Save draft**.

     The system saves the integration as a draft in the Integrations Launchpad **Installed integrations** tab, under **Waiting for your action**. At a later time, complete the prerequisites and activate the installation. For more information, see Activate a draft integration in Health Log Analytics.

What to do next

On the **Overview** tab, do the following:

- Use the displayed information to refine how Health Log Analytics reads the log data. For more information, see Review log streaming data and adjust integration settings in Health Log Analytics.
- Use the More options menu ( ) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct access to the **Log Viewer**. Use the **Log Viewer** to review raw log messages ingested by the integration. For more information, see:
  - Log data auto-mapping and mapping
  - Source type structure adjustment
  - Review alert-related logs on the Log Viewer

If you activated the integration with AI, verify that AI correctly auto-mapped log data to service instances and components. To do this, select **View mapping** under **Log context mapping**. You can override the AI mapping by selecting a different log field from each list. For more information, see Map logs to service instances, components, source types.

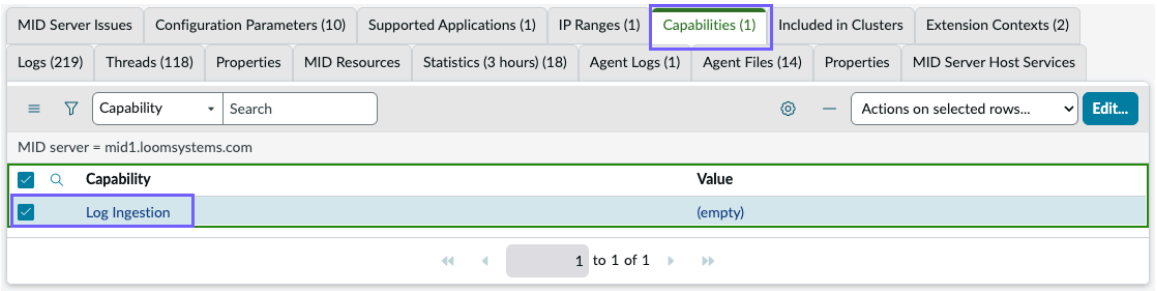
Set up an Edge Delta TCP integration for Health Log Analytics

Set up an Edge Delta TCP integration to enable Health Log Analytics to process logs it receives from Edge Delta in a distinct format. These logs stream into your ServiceNow instance over the TCP transport protocol.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses aren't routable over the internet. Without a public IP, external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *`mid.public_ip`* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

Role required: evt_mgmt_admin

About this task

If your organization uses Edge Delta to handle large volumes of log data from multiple sources before sending it to Health Log Analytics, the log format HLA receives is different from other types. The Edge Delta integration enables HLA to detect and separate transport headers from inner log messages in this format. It forwards only the inner message to the source type structure for processing.

You set up integrations through the Integrations Launchpad in Service Operations Workspace, which you access from the ITOM AIOps configuration center. The AIOps configuration center is a centralized workspace for configuring and managing AIOps features from a single place. The integrations setup process reduces implementation time compared to manual data input setup in the classic interface in Health Log Analytics. For more information, see Integrations Launchpad in Service Operations Workspace for ITOM.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation pane, select the AIOps configuration center icon.
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations Launchpad appears.
4. In the **Browse integrations** tab, enter `Edge Delta` in the search field.
5. Select the Edge Delta TCP integration tile.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

> **Note:** If you start an integration setup before meeting all prerequisites, a message appears. You can cancel the setup and complete the prior requirements first. Alternatively, you can continue in draft mode and complete the requirements later. Note that you can't activate the integration until you have completed all the prerequisites.

6. On the **Provide details** form, fill in the fields.
   For a description of the fields, see the **Provide details** table in Edge Delta TCP integration configuration fields.
7. **Optional:** Select **Advanced settings** and fill in the advanced configuration fields.
   For a description of the fields, see the **Advanced settings** table in Edge Delta TCP integration configuration fields.
8. Select **Next**.
9. In the **Set-up instruction** screen, copy the displayed Host IP and Port values and paste them in your Edge Delta pipeline under TCP destination.

   > **Note:** The Host IP and Port values are based on your configuration on the **Provide details** form.

10. Do one of the following.
    - If you completed all the prerequisites before starting the configuration, activate the integration either with or without AI-powered capabilities. Select the appropriate option.
      - **Activate with AI** enables AI-powered automatic parsing and mapping of log data to service instances and components for contextual alerts.

        When the integration is activated successfully, the **Overview** tab is displayed. ServiceNow Otto for ITOM collects and analyzes log data. An AI icon indicates that AI is active.
      - **Activate** activates the integration without AI-powered mapping. The integration is activated and the **Overview** tab is displayed.

      On the Integrations Launchpad, the integration tile is available in the **Installed integrations** tab.
    - If you didn't complete all the prior requirements, select **Save draft**.

      The system saves the integration as a draft in the Integrations Launchpad **Installed integrations** tab, under **Waiting for your action**. At a later time, complete the prerequisites and activate the installation. For more information, see Activate a draft integration in Health Log Analytics.

What to do next

On the **Overview** tab, do the following:

- Use the displayed information to refine how Health Log Analytics reads the log data. For more information, see Review log streaming data and adjust integration settings in Health Log Analytics.
- Use the More options menu (⋮) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct access to the **Log Viewer**. Use the **Log Viewer** to review raw log messages ingested by the integration. For more information, see:

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Log data auto-mapping and mapping
- Source type structure adjustment
- Review alert-related logs on the Log Viewer

If you activated the integration with AI, verify that AI correctly auto-mapped log data to service instances and components. To do this, select **View mapping** under **Log context mapping**. You can override the AI mapping by selecting a different log field from each list. For more information, see Map logs to service instances, components, source types.

Set up an Elasticsearch integration for Health Log Analytics

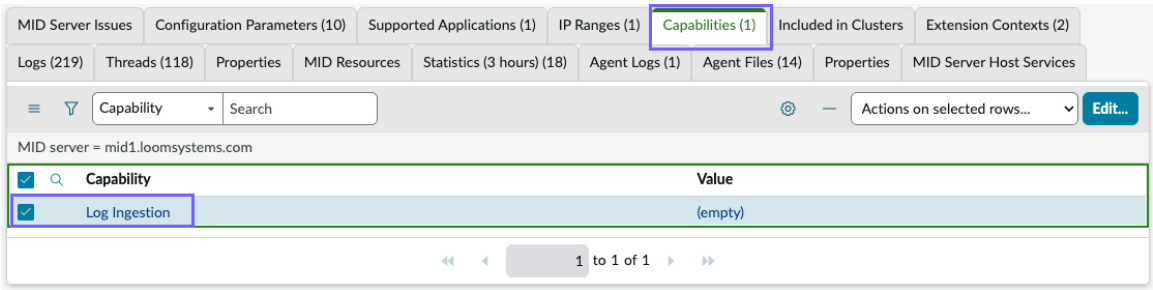
Set up an integration to stream log data seamlessly from Elasticsearch indices to your instance for Health Log Analytics processing.

Before you begin

Note: Health Log Analytics supports Elasticsearch versions above 7.10.2 and below 8.18.2. For advanced Elasticsearch log streaming guidance, see the Stream logs using Elasticsearch data input - Advanced guide [KB1080162] article in the Now Support Knowledge Base.

- Verify that the Health Log Analytics application is installed and provisioned on your instance. For more information, see Install Health Log Analytics (HLA).
- Verify that a service instance is available.
- Verify that the Health Log Analytics AI Engine is up and running.

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses aren't routable over the internet. Without a public IP, external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named `mid.public_ip` with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

About this task

Set up an integration from the Integrations Launchpad in Service Operations Workspace, which you access from the ITOM AIOps configuration center. The AIOps configuration center is a centralized workspace for configuring and managing AIOps features from a single place. The integrations setup process reduces implementation time compared to manual data input setup in the classic interface in Health Log Analytics. For more information, see Integrations Launchpad in Service Operations Workspace for ITOM.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations Launchpad appears.
4. In the **Browse integrations** tab, enter *`Elasticsearch`* in the search field.
5. Select the Elasticsearch integration tile.

   Note: If you start an integration setup before meeting all prerequisites, a message appears. You can cancel the setup and complete the prior requirements first. Alternatively, you can continue in draft mode and complete the requirements later. Note that you can't activate the integration until you have completed all the prerequisites.

6. On the **Provide details** form, fill in the fields.
   For a description of the fields, see the **Provide details** table in Elasticsearch integration configuration fields.
7. Select **Next**.
8. On the **Set data retrieval method** form, fill in the fields.
   For a description of the fields, see Elasticsearch integration configuration fields.
9. **Optional:** Select **Advanced settings** to set advanced configuration fields.
   For a description of the fields, see the **Advanced settings** table in Elasticsearch integration configuration fields.
10. Do one of the following.
    - If you completed all the prerequisites before starting the configuration, activate the integration either with or without AI-powered capabilities. Select the appropriate option.
      - **Activate with AI** enables AI-powered automatic parsing and mapping of log data to service instances and components for contextual alerts.

        When the integration is activated successfully, the **Overview** tab is displayed. ServiceNow Otto for ITOM collects and analyzes log data. An AI icon indicates that AI is active.

      - **Activate** activates the integration without AI-powered mapping. The integration is activated and the **Overview** tab is displayed.

      On the Integrations Launchpad, the integration tile is available in the **Installed integrations** tab.

    - If you didn't complete all the prior requirements, select **Save draft**.

The system saves the integration as a draft in the Integrations Launchpad **Installed integrations** tab, under **Waiting for your action**. At a later time, complete the prerequisites and activate the installation. For more information, see Activate a draft integration in Health Log Analytics.

What to do next

On the **Overview** tab, do the following:

- Use the displayed information to refine how Health Log Analytics reads the log data. For more information, see Review log streaming data and adjust integration settings in Health Log Analytics.
- Use the More options menu (⋮) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct access to the **Log Viewer**. Use the **Log Viewer** to review raw log messages ingested by the integration. For more information, see:
  - Log data auto-mapping and mapping
  - Source type structure adjustment
  - Review alert-related logs on the Log Viewer

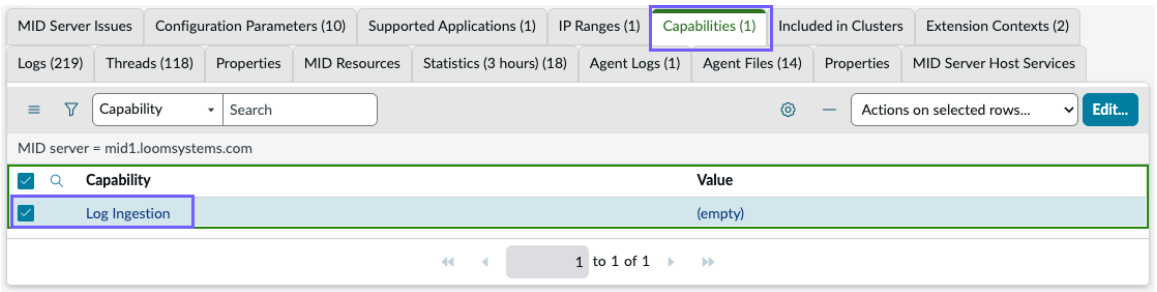
If you activated the integration with AI, verify that AI correctly auto-mapped log data to service instances and components. To do this, select **View mapping** under **Log context mapping**. You can override the AI mapping by selecting a different log field from each list. For more information, see Map logs to service instances, components, source types.

Set up a GCP PubSub integration for Health Log Analytics

Set up an integration for receiving log messages that were published to a Google Cloud Platform (GCP) Pub/Sub topic and streaming them to your ServiceNow instance.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses aren't routable over the internet. Without a public IP, external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties,

  - Source type structure adjustment
  - Review alert-related logs on the Log Viewer

If you activated the integration with AI, verify that AI correctly auto-mapped log data to service instances and components. To do this, select **View mapping** under **Log context mapping**. You can override the AI mapping by selecting a different log field from each list. For more information, see Map logs to service instances, components, source types.

Set up a MID Server integration for Health Log Analytics

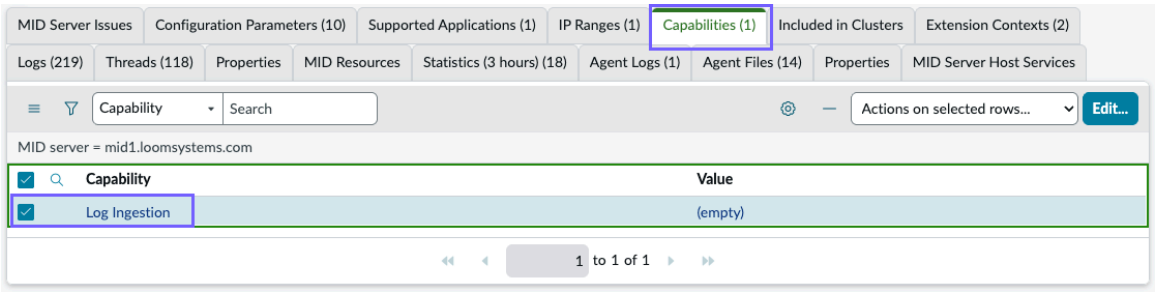
Set up an integration for collecting and streaming MID Server log messages to your ServiceNow instance for processing by Health Log Analytics.

Before you begin

Important: You can create only one MID Server integration per MID Server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses aren't routable over the internet. Without a public IP, external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *mid.public_ip* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

Role required: evt_mgmt_admin

About this task

Set up an integration from the Integrations Launchpad in Service Operations Workspace, which you access from the ITOM AIOps configuration center. The AIOps configuration center is a centralized workspace for configuring and managing AIOps features from a single place. The integrations setup process reduces implementation time compared to manual data input setup in the classic interface in Health Log Analytics. For more information, see Integrations Launchpad in Service Operations Workspace for ITOM.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation pane, select the AIOps configuration center icon.
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations Launchpad appears.
4. In the **Browse integrations** tab, enter `mid` in the search field.
5. Select the MID Server integration tile.

   Note: If you start an integration setup before meeting all prerequisites, a message appears. You can cancel the setup and complete the prior requirements first. Alternatively, you can continue in draft mode and complete the requirements later. Note that you can't activate the integration until you have completed all the prerequisites.

6. On the **Provide details** form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For a description of the fields, see the **Provide details** table in MID Server integration configuration fields.

7. Select **Advanced Settings** and fill in the fields.
   For a description of the fields, see the **Advanced Settings** table in MID Server integration configuration fields.
8. Do one of the following:
   - If you completed all the prerequisites before starting the configuration, select **Activate**.

     The integration is activated and the **Overview** tab is displayed. On the Integrations Launchpad, the integration tile is available in the **Installed integrations** tab.
   - If you didn't complete all the prior requirements, select **Save draft**.

     The system saves the integration as a draft in the Integrations Launchpad **Installed integrations** tab, under **Waiting for your action**. You can complete the prerequisites and activate the installation later. For more information, see Activate a draft integration in Health Log Analytics.

What to do next

On the **Overview** tab, do the following:

- Use the displayed information to refine how Health Log Analytics reads the log data. For more information, see Review log streaming data and adjust integration settings in Health Log Analytics.
- Use the More options menu (⋮) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct access to the **Log Viewer**. Use the **Log Viewer** to review raw log messages ingested by the integration. For more information, see:
  - Log data auto-mapping and mapping
  - Source type structure adjustment
  - Review alert-related logs on the Log Viewer

Set up a REST API integration for Health Log Analytics

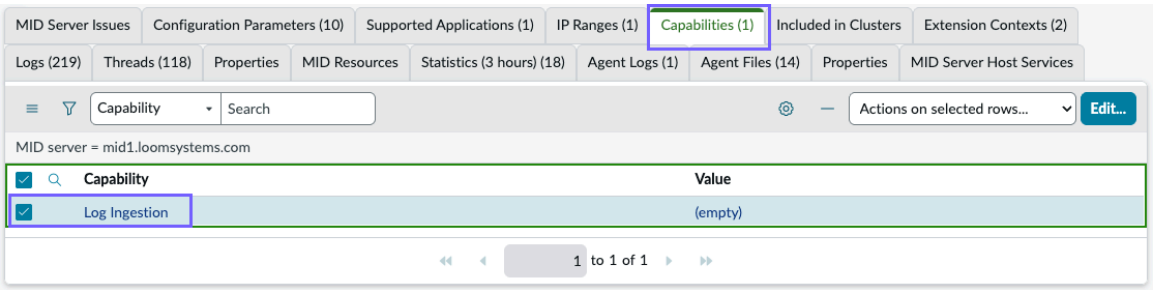
Set up an integration for streaming log data to your ServiceNow instance for processing by Health Log Analytics.

Before you begin

- Verify that the Health Log Analytics application is installed and provisioned on your instance. For more information, see Install Health Log Analytics (HLA).
- Verify that a service instance is available.
- Verify that the Health Log Analytics AI Engine is up and running.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

On the MID Web Server Context form, in the **Execute on** field, select *Specific MID Server* and not the cluster option. In the **MID Server** field, select the specific MID Server to which the log data is pulled.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses aren't routable over the internet. Without a public IP, external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named `mid.public_ip` with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

Note: REST API integrations support only UTF-8 encoding for incoming data.

Role required: evt_mgmt_admin

About this task

Set up an integration from the Integrations Launchpad in Service Operations Workspace, which you access from the ITOM AIOps configuration center. The AIOps configuration center is a centralized workspace for configuring and managing AIOps features from a single place. The integrations setup process reduces implementation time compared to manual data input setup in the classic interface in Health Log Analytics. For more information, see Integrations Launchpad in Service Operations Workspace for ITOM.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation pane, select the AIOps configuration center icon.
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations Launchpad appears.
4. In the **Browse integrations** tab, enter REST in the search field.
5. Select the REST API integration tile.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

> **Note:** If you start an integration setup before meeting all prerequisites, a message appears. You can cancel the setup and complete the prior requirements first. Alternatively, you can continue in draft mode and complete the requirements later. Note that you can't activate the integration until you have completed all the prerequisites.

6. On the **Provide details** form, fill in the fields.
   For a description of the fields, see REST API integration configuration fields.
7. Select **Next**.
8. In the **Set-up instruction** screen, copy the provided URL to the clipboard.

   The format of the URL is: `http://(MID_SERVER_IP):(MID_WEB_SERVER_PORT)/api1/mid/hla/raw`, where `/aps/mid/hla/raw` is the endpoint. HLA has replaced `(MID_SERVER_IP)` and `(MID_WEB_SERVER_PORT)` with the values you configured on the **Provide details** form.

9. Do one of the following.
   - If you completed all the prerequisites before starting the configuration, activate the integration either with or without AI-powered capabilities. Select the appropriate option.
     - **Activate with AI** enables AI-powered automatic parsing and mapping of log data to service instances and components for contextual alerts.

       When the integration is activated successfully, the **Overview** tab is displayed. ServiceNow Otto for ITOM collects and analyzes log data. An AI icon indicates that AI is active.

     - **Activate** activates the integration without AI-powered mapping. The integration is activated and the **Overview** tab is displayed.

     On the Integrations Launchpad, the integration tile is available in the **Installed integrations** tab.

   - If you didn't complete all the prior requirements, select **Save draft**.

     The system saves the integration as a draft in the Integrations Launchpad **Installed integrations** tab, under **Waiting for your action**. At a later time, complete the prerequisites and activate the installation. For more information, see Activate a draft integration in Health Log Analytics.

What to do next

Instruct your API client to send log messages to the MID Server.

1. In the API client, configure a request with the following parameters:
   - HTTP Method: POST.
   - URL: The URL you copied in the **Set-up instruction** screen.
   - Authentication: The required authentication credentials. For example, Basic authentication (username and password).

     > **Note:** The authentication method must be the same as the method configured on the MID Web Server.

   - Headers: Set the `Content-Type` header to match your payload format.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- For JSON: `application/json`.
- For raw text: `text/plain`.

- Body: The logs payload in JSON or raw text.

2. Send the request.

   A successful response indicates that the MID Server has received the payload. When the MID Server has processed the log messages, the data input streams them to your ServiceNow instance using the REST protocol.

If you activated the integration with AI, verify that AI correctly auto-mapped log data to service instances and components. To do this, select **View mapping** under **Log context mapping**. You can override the AI mapping by selecting a different log field from each list. For more information, see Map logs to service instances, components, source types.

Set up a ServiceNow System Logs Retriever integration for Health Log Analytics

Set up an integration for streaming log data from your ServiceNow platform's System Log table to the HLA engine.

Before you begin

- Verify that the Health Log Analytics application is installed and provisioned on your instance. For more information, see Install Health Log Analytics (HLA).
- Verify that a service instance is available.
- Verify that the HLA Engine is up and running.

Note:

- This integration doesn't run on a MID Server.
- Only a single ServiceNow System Logs Retriever integration or data input can exist in the system.
- The HLA store app installation automatically creates the ServiceNow System Logs Retriever integration. Use this procedure if you need to recreate it manually.

Role required: evt_mgmt_admin

About this task

Set up an integration from the Integrations Launchpad in Service Operations Workspace, which you access from the ITOM AIOps configuration center. The AIOps configuration center is a centralized workspace for configuring and managing AIOps features from a single place. The integrations setup process reduces implementation time compared to manual data input setup in the classic interface in Health Log Analytics. For more information, see Integrations Launchpad in Service Operations Workspace for ITOM.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations Launchpad appears.
4. In the **Browse integrations** tab, enter `System Logs` in the search field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select the ServiceNow System logs tile.

   Note: If you start an integration setup before meeting all prerequisites, a message appears. You can cancel the setup and complete the prior requirements first. Alternatively, you can continue in draft mode and complete the requirements later. Note that you can't activate the integration until you have completed all the prerequisites.

6. The **Provide details** form is displayed.
   These fields are auto-populated, because only one ServiceNow System Logs Retriever integration or data input can exist in the system. For a description of the fields, see the **Provide details** table in ServiceNow System Logs Retriever integration configuration fields.
7. Select **Next**.
8. **Optional:** On the **Set data retrieval method** page, build conditions for filtering log data from the System Log table before it is streamed to the HLA engine.

   (Optional) This page helps you focus on the specific logs you want to monitor. For example, you might want to look at Discovery logs or exclude email logs. By default, all logs are included.

9. Do one of the following:
   - If you completed all the prerequisites before starting the configuration, select **Activate**.

     The integration is activated and the **Overview** tab is displayed. On the Integrations Launchpad, the integration tile is available in the **Installed integrations** tab.

   - If you didn't complete all the prior requirements, select **Save draft**.

     The system saves the integration as a draft in the Integrations Launchpad **Installed integrations** tab, under **Waiting for your action**. You can complete the prerequisites and activate the installation later. For more information, see Activate a draft integration in Health Log Analytics.

Result

Log data starts streaming from the ServiceNow System Log table to the Health Log Analytics AI engine, based on the configured filters. The dedicated HLA engine for your instance starts analyzing your system logs in real-time.

Note: Starting with Health Log Analytics version 37.0.15, you can use the ServiceNow System Logs Retriever integration to automatically detect errors and anomalies in your ServiceNow instance's system log. By combining HLA anomaly detection with ServiceNow Otto for ITOM, you can identify and resolve platform issues more effectively for a better user experience. For more information, see Use Case: Proactive monitoring of your ServiceNow instance in Health Log Analytics.

What to do next

Use the information in the **Overview** tab to refine how HLA reads the log data by adjusting your integration configuration. For more information, see Review log streaming data and adjust integration settings in Health Log Analytics.

Note:

- The MID Server streaming status and the **Log streaming sources** table do not appear on the **Overview** tab for this integration, because it doesn't run on a MID Server.
- When the integration is first configured, it may take up to 24 hours for the first alerts to appear. Once the data is populated, you can refresh the screen to see real-time metrics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

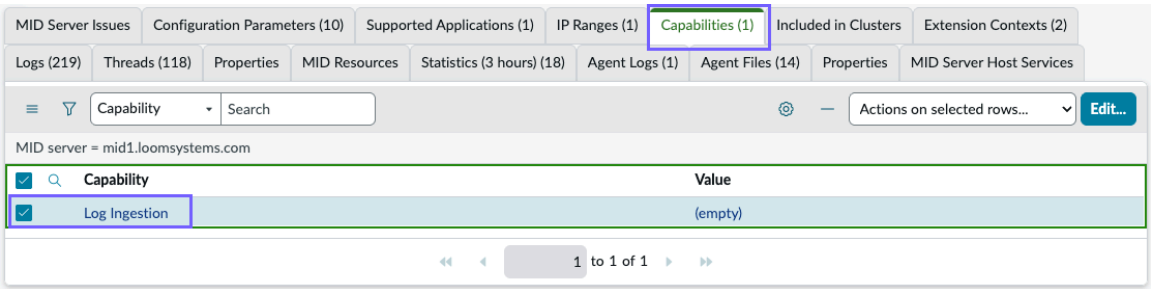
Use the More menu to go directly from the **Overview** tab to the **Data Input Mapping**, **Source Type Structures**, and **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More menu also provides direct access to the **Log Viewer**, where you can see the raw logs that the integration ingests.

Set up a Splunk Poller integration for Health Log Analytics

Set up an integration that periodically pulls log data from Splunk to your ServiceNow instance for processing by Health Log Analytics.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



> **Important:** Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses aren't routable over the internet. Without a public IP, external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *`mid.public_ip`* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.
- For shipping your logs encrypted using SSL TLS, see the Streaming Data With Rsyslog & Filebeat Using SSL [KB0866319] article in the Now Support Knowledge Base.
- The MID Server must support basic authentication.

  > **Note:** mTLS is not supported for log ingestion.

- No more than the default maximum of 10 integrations will stream logs to a single MID Server. You can modify the maximum number by adding the property `sn.occ.log_ingestion.max_datainputs_per_mid` to the MID Server and then changing the default value.

  To find out how many data inputs are streaming logs to the same MID Server, navigate to the **Streaming Sources** table. Then count the data inputs that stream to a specific MID Server.

- Consider whether to pull the log data to a single MID Server or to a MID Server cluster.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In MID Server clusters, multiple MID Servers are grouped together for failover protection. The active integration runs on a single MID Server in the cluster. If that MID Server fails, the system moves its tasks to the next available MID Server in the cluster in a configured order.

If you want to use a MID Server cluster, verify the following:

- The MID Server cluster includes only MID Servers that support basic authentication.
- Log ingestion is enabled for each MID Server in the cluster.

  Note: If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically.

- No more than the default maximum of 10 integrations can stream logs to a single MID Server.

  A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 integrations running on it, even when that MID Server is down.

Role required: evt_mgmt_admin

About this task

Set up an integration from the Integrations Launchpad in Service Operations Workspace, which you access from the ITOM AIOps configuration center. The AIOps configuration center is a centralized workspace for configuring and managing AIOps features from a single place. The integrations setup process reduces implementation time compared to manual data input setup in the classic interface in Health Log Analytics. For more information, see Integrations Launchpad in Service Operations Workspace for ITOM.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations Launchpad appears.
4. In the **Browse integrations** tab, enter `Splunk Poller` in the search field.
5. Select the Splunk Poller integration tile.

   Note: If you start an integration setup before meeting all prerequisites, a message appears. You can cancel the setup and complete the prior requirements first. Alternatively, you can continue in draft mode and complete the requirements later. Note that you can't activate the integration until you have completed all the prerequisites.

6. On the **Provide details** form, fill in the fields.
   For a description of the fields, see the **Provide details** table in Splunk Poller integration configuration fields.
7. Select **Next**.
8. On the **Set data retrieval method** form, fill in the fields.
   For a description of the fields, see the **Set data retrieval method** table in Splunk Poller integration configuration fields.
9. Select **Advanced settings** and fill in the advanced configuration fields.
   For a description of the fields, see Splunk Poller integration configuration fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

10. Do one of the following.
    - If you completed all the prerequisites before starting the configuration, activate the integration either with or without AI-powered capabilities. Select the appropriate option.
      - **Activate with AI** enables AI-powered automatic parsing and mapping of log data to service instances and components for contextual alerts.

        When the integration is activated successfully, the **Overview** tab is displayed. ServiceNow Otto for ITOM collects and analyzes log data. An AI icon indicates that AI is active.

      - **Activate** activates the integration without AI-powered mapping. The integration is activated and the **Overview** tab is displayed.

      On the Integrations Launchpad, the integration tile is available in the **Installed integrations** tab.

    - If you didn't complete all the prior requirements, select **Save draft**.

      The system saves the integration as a draft in the Integrations Launchpad **Installed integrations** tab, under **Waiting for your action**. At a later time, complete the prerequisites and activate the installation. For more information, see Activate a draft integration in Health Log Analytics.

What to do next

On the **Overview** tab, do the following:

- Use the displayed information to refine how Health Log Analytics reads the log data. For more information, see Review log streaming data and adjust integration settings in Health Log Analytics.
- Use the More options menu ( ) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct access to the **Log Viewer**. Use the **Log Viewer** to review raw log messages ingested by the integration. For more information, see:
  - Log data auto-mapping and mapping
  - Source type structure adjustment
  - Review alert-related logs on the Log Viewer

If you activated the integration with AI, verify that AI correctly auto-mapped log data to service instances and components. To do this, select **View mapping** under **Log context mapping**. You can override the AI mapping by selecting a different log field from each list. For more information, see Map logs to service instances, components, source types.

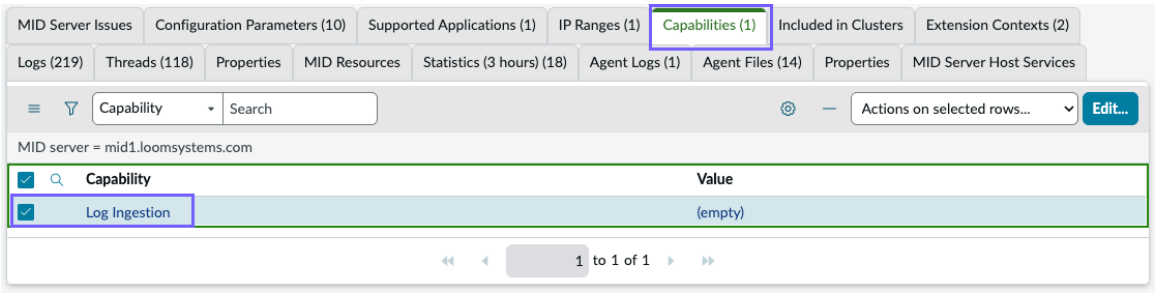
Set up a Splunk TCP integration for Health Log Analytics

Set up an integration to stream log messages to your ServiceNow instance over the TCP transport protocol using a Splunk heavy forwarder. Health Log Analytics processes the ingested log data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses aren't routable over the internet. Without a public IP, external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *`mid.public_ip`* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.
- For shipping your logs encrypted using SSL TLS, see the Streaming Data With Rsyslog & Filebeat Using SSL [KB0866319] article in the Now Support Knowledge Base.
- The MID Server must support basic authentication.

  Note: mTLS is not supported for log ingestion.

- No more than the default maximum of 10 integrations will stream logs to a single MID Server. You can modify the maximum number by adding the property `sn.occ.log_ingestion.max_datainputs_per_mid` to the MID Server and then changing the default value.

  To find out how many data inputs are streaming logs to the same MID Server, navigate to the **Streaming Sources** table. Then count the data inputs that stream to a specific MID Server.

Role required: evt_mgmt_admin

About this task

Set up an integration from the Integrations Launchpad in Service Operations Workspace, which you access from the ITOM AIOps configuration center. The AIOps configuration center is a centralized workspace for configuring and managing AIOps features from a single place. The integrations setup process reduces implementation time compared to manual data input setup in the classic interface in Health Log Analytics. For more information, see Integrations Launchpad in Service Operations Workspace for ITOM.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations Launchpad appears.
4. In the **Browse integrations** tab, enter `Splunk` in the search field.
5. Select the Splunk TCP integration tile.

   Note: If you start an integration setup before meeting all prerequisites, a message appears. You can cancel the setup and complete the prior requirements first. Alternatively, you can continue in draft mode and complete the requirements later. Note that you can't activate the integration until you have completed all the prerequisites.

6. On the **Provide details** form, fill in the fields.
   For a description of the fields, see the **Provide details** table in Splunk TCP integration configuration fields.
7. **Optional:** Select **Advanced settings** and fill in the advanced configuration fields.
   For a description of the fields, see the **Advanced settings** table in Splunk TCP integration configuration fields.
8. Select **Next**.
9. Follow the procedure on the **Set-up instruction** screen to install the integration in the third-party console.

   Note: The procedure varies based on your configurations.

10. Do one of the following.
    - If you completed all the prerequisites before starting the configuration, activate the integration either with or without AI-powered capabilities. Select the appropriate option.
      - **Activate with AI** enables AI-powered automatic parsing and mapping of log data to service instances and components for contextual alerts.

        When the integration is activated successfully, the **Overview** tab is displayed. ServiceNow Otto for ITOM collects and analyzes log data. An AI icon indicates that AI is active.
      - **Activate** activates the integration without AI-powered mapping. The integration is activated and the **Overview** tab is displayed.

      On the Integrations Launchpad, the integration tile is available in the **Installed integrations** tab.
    - If you didn't complete all the prior requirements, select **Save draft**.

      The system saves the integration as a draft in the Integrations Launchpad **Installed integrations** tab, under **Waiting for your action**. At a later time, complete the prerequisites and activate the installation. For more information, see Activate a draft integration in Health Log Analytics.

What to do next

On the **Overview** tab, do the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Use the displayed information to refine how Health Log Analytics reads the log data. For more information, see Review log streaming data and adjust integration settings in Health Log Analytics.
- Use the More options menu (⋮) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct access to the **Log Viewer**. Use the **Log Viewer** to review raw log messages ingested by the integration. For more information, see:
  - Log data auto-mapping and mapping
  - Source type structure adjustment
  - Review alert-related logs on the Log Viewer

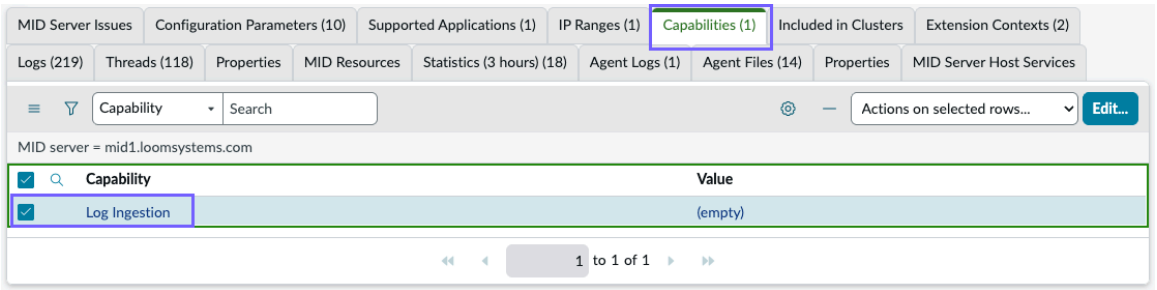
If you activated the integration with AI, verify that AI correctly auto-mapped log data to service instances and components. To do this, select **View mapping** under **Log context mapping**. You can override the AI mapping by selecting a different log field from each list. For more information, see Map logs to service instances, components, source types.

Set up a Splunk UDP integration for Health Log Analytics

Set up an integration to stream log messages to your ServiceNow instance over the UDP transport protocol using a Splunk heavy forwarder. Health Log Analytics processes the ingested log data.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses aren't routable over the internet. Without a public IP, external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *mid.public_ip* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.
- For shipping your logs encrypted using SSL TLS, see the Streaming Data With Rsyslog & Filebeat Using SSL [KB0866319] article in the Now Support Knowledge Base.

Role required: evt_mgmt_admin

About this task

Set up an integration from the Integrations Launchpad in Service Operations Workspace, which you access from the ITOM AIOps configuration center. The AIOps configuration center is a centralized workspace for configuring and managing AIOps features from a single place. The integrations setup process reduces implementation time compared to manual data input setup in the classic interface in Health Log Analytics. For more information, see Integrations Launchpad in Service Operations Workspace for ITOM.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations Launchpad appears.
4. In the **Browse integrations** tab, enter `Splunk` in the search field.
5. Select the Splunk UDP integration tile.

   Note: If you start an integration setup before meeting all prerequisites, a message appears. You can cancel the setup and complete the prior requirements first. Alternatively, you can continue in draft mode and complete the requirements later. Note that you can't activate the integration until you have completed all the prerequisites.

6. On the **Provide details** form, fill in the fields.
   For a description of the fields, see **Provide details** table in Splunk UDP integration configuration fields.
7. **Optional:** Select **Advanced settings** and fill in the advanced configuration fields.
   For a description of the fields, see the **Advanced settings** table in Splunk UDP integration configuration fields.
8. Select **Next**.
9. Follow the procedure on the **Set-up instruction** screen to install the integration in the third-party console.

   Note: The procedure varies based on your configurations.

10. Do one of the following.
    - If you completed all the prerequisites before starting the configuration, activate the integration either with or without AI-powered capabilities. Select the appropriate option.
      - **Activate with AI** enables AI-powered automatic parsing and mapping of log data to service instances and components for contextual alerts.

        When the integration is activated successfully, the **Overview** tab is displayed. ServiceNow Otto for ITOM collects and analyzes log data. An AI icon indicates that AI is active.

      - **Activate** activates the integration without AI-powered mapping. The integration is activated and the **Overview** tab is displayed.

      On the Integrations Launchpad, the integration tile is available in the **Installed integrations** tab.

    - If you didn't complete all the prior requirements, select **Save draft**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The system saves the integration as a draft in the Integrations Launchpad **Installed integrations** tab, under **Waiting for your action**. At a later time, complete the prerequisites and activate the installation. For more information, see Activate a draft integration in Health Log Analytics.

What to do next

On the **Overview** tab, do the following:

- Use the displayed information to refine how Health Log Analytics reads the log data. For more information, see Review log streaming data and adjust integration settings in Health Log Analytics.
- Use the More options menu (⋮) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct access to the **Log Viewer**. Use the **Log Viewer** to review raw log messages ingested by the integration. For more information, see:
  - Log data auto-mapping and mapping
  - Source type structure adjustment
  - Review alert-related logs on the Log Viewer

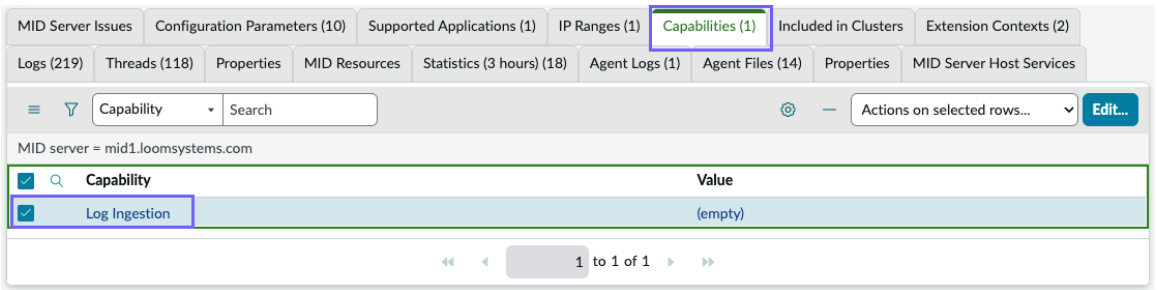
If you activated the integration with AI, verify that AI correctly auto-mapped log data to service instances and components. To do this, select **View mapping** under **Log context mapping**. You can override the AI mapping by selecting a different log field from each list. For more information, see Map logs to service instances, components, source types.

Set up a TCP integration for Health Log Analytics

Set up an integration for sending log data to your ServiceNow instance directly over a TCP/SSL socket.

Before you begin

- Verify that the Health Log Analytics application is installed and provisioned on your instance. For more information, see Install Health Log Analytics (HLA).
- Verify that a service instance is available.
- Verify that the HLA Engine is up and running.
- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses aren't routable over the internet. Without a public IP, external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *mid.public_ip* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.
- For shipping your logs encrypted using SSL TLS, see the Streaming Data With Rsyslog & Filebeat Using SSL [KB0866319] article in the Now Support Knowledge Base.

Note: For information about streaming data from Logstash to your instance, see the Streaming data from Logstash to your HLA instance [KB0994735] article in the Now Support knowledge base.

Role required: evt_mgmt_admin

About this task

Set up an integration from the Integrations Launchpad in Service Operations Workspace, which you access from the ITOM AIOps configuration center. The AIOps configuration center is a centralized workspace for configuring and managing AIOps features from a single place. The integrations setup process reduces implementation time compared to manual data input setup in the classic interface in Health Log Analytics. For more information, see Integrations Launchpad in Service Operations Workspace for ITOM.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations Launchpad appears.
4. In the **Browse integrations** tab, enter TCP in the search field.
5. Select the TCP integration tile.

   Note: If you start an integration setup before meeting all prerequisites, a message appears. You can cancel the setup and complete the prior requirements first. Alternatively, you can continue in draft mode and complete the requirements later. Note that you can't activate the integration until you have completed all the prerequisites.

6. On the **Provide details** form, fill in the fields.
   For a description of the fields, see the **Provide details** table in TCP integration configuration fields.
7. Select **Next**.
8. In the **Set-up instruction** screen, follow the instructions on the screen to install the integration in the third-party console.
9. Do one of the following.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If you completed all the prerequisites before starting the configuration, activate the integration either with or without AI-powered capabilities. Select the appropriate option.
  - **Activate with AI** enables AI-powered automatic parsing and mapping of log data to service instances and components for contextual alerts.

    When the integration is activated successfully, the **Overview** tab is displayed. ServiceNow Otto for ITOM collects and analyzes log data. An AI icon indicates that AI is active.
  - **Activate** activates the integration without AI-powered mapping. The integration is activated and the **Overview** tab is displayed.

  On the Integrations Launchpad, the integration tile is available in the **Installed integrations** tab.
- If you didn't complete all the prior requirements, select **Save draft**.

  The system saves the integration as a draft in the Integrations Launchpad **Installed integrations** tab, under **Waiting for your action**. At a later time, complete the prerequisites and activate the installation. For more information, see Activate a draft integration in Health Log Analytics.

What to do next

On the **Overview** tab, do the following:

- Use the displayed information to refine how Health Log Analytics reads the log data. For more information, see Review log streaming data and adjust integration settings in Health Log Analytics.
- Use the More options menu (⋮) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct access to the **Log Viewer**. Use the **Log Viewer** to review raw log messages ingested by the integration. For more information, see:
  - Log data auto-mapping and mapping
  - Source type structure adjustment
  - Review alert-related logs on the Log Viewer

If you activated the integration with AI, verify that AI correctly auto-mapped log data to service instances and components. To do this, select **View mapping** under **Log context mapping**. You can override the AI mapping by selecting a different log field from each list. For more information, see Map logs to service instances, components, source types.

Set up a UDP integration for Health Log Analytics

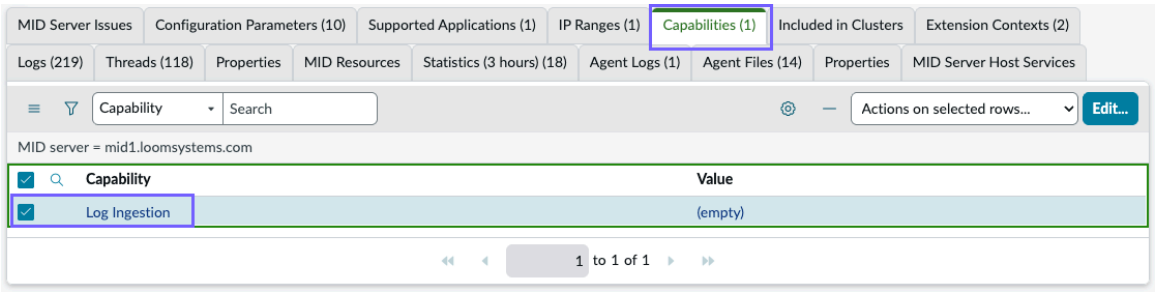
Set up an integration for sending log data to your ServiceNow instance directly over a UDP socket.

Before you begin

- Verify that the Health Log Analytics application is installed and provisioned on your instance. For more information, see Install Health Log Analytics (HLA).
- Verify that a service instance is available.
- Verify that the HLA Engine is up and running.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses aren't routable over the internet. Without a public IP, external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *mid.public_ip* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

Role required: evt_mgmt_admin

About this task

Set up an integration from the Integrations Launchpad in Service Operations Workspace, which you access from the ITOM AIOps configuration center. The AIOps configuration center is a centralized workspace for configuring and managing AIOps features from a single place. The integrations setup process reduces implementation time compared to manual data input setup in the classic interface in Health Log Analytics. For more information, see Integrations Launchpad in Service Operations Workspace for ITOM.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation pane, select the AIOps configuration center icon.
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations Launchpad appears.
4. In the **Browse integrations** tab, enter UDP in the search field.
5. Select the UDP integration tile.

   Note: If you start an integration setup before meeting all prerequisites, a message appears. You can cancel the setup and complete the prior requirements first. Alternatively, you can continue in draft mode and complete the requirements later. Note that you can't activate the integration until you have completed all the prerequisites.

6. On the **Provide details** form, fill in the fields.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For a description of the fields, see the **Provide details** table in UDP integration configuration fields.

7. **Optional:** Select **Advanced Settings** to set advanced configuration fields.
   For a description of the fields, see the **Advanced Settings** table in UDP integration configuration fields.
8. Select **Next**.
9. In the **Setup instruction** screen, follow the instructions on the screen to install the integration in the third-party console.
10. Do one of the following.
    - If you completed all the prerequisites before starting the configuration, activate the integration either with or without AI-powered capabilities. Select the appropriate option.
      - **Activate with AI** enables AI-powered automatic parsing and mapping of log data to service instances and components for contextual alerts.

        When the integration is activated successfully, the **Overview** tab is displayed. ServiceNow Otto for ITOM collects and analyzes log data. An AI icon indicates that AI is active.

      - **Activate** activates the integration without AI-powered mapping. The integration is activated and the **Overview** tab is displayed.

      On the Integrations Launchpad, the integration tile is available in the **Installed integrations** tab.

    - If you didn't complete all the prior requirements, select **Save draft**.

      The system saves the integration as a draft in the Integrations Launchpad **Installed integrations** tab, under **Waiting for your action**. At a later time, complete the prerequisites and activate the installation. For more information, see Activate a draft integration in Health Log Analytics.

What to do next

On the **Overview** tab, do the following:

- Use the displayed information to refine how Health Log Analytics reads the log data. For more information, see Review log streaming data and adjust integration settings in Health Log Analytics.
- Use the More options menu (⋮) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct access to the **Log Viewer**. Use the **Log Viewer** to review raw log messages ingested by the integration. For more information, see:
  - Log data auto-mapping and mapping
  - Source type structure adjustment
  - Review alert-related logs on the Log Viewer

If you activated the integration with AI, verify that AI correctly auto-mapped log data to service instances and components. To do this, select **View mapping** under **Log context mapping**. You can override the AI mapping by selecting a different log field from each list. For more information, see Map logs to service instances, components, source types.

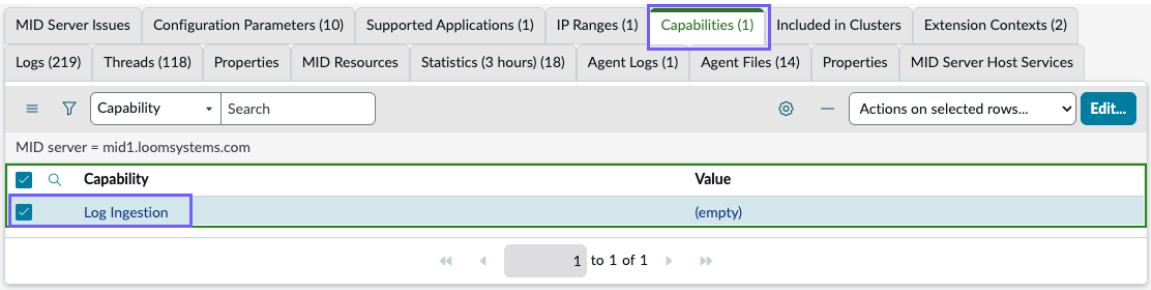
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set up a Vector Agent integration for Health Log Analytics

Set up a Vector Agent integration to enable Health Log Analytics to process log messages that are streaming into your ServiceNow instance via a Vector Agent.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses aren't routable over the internet. Without a public IP, external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *`mid.public_ip`* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

- Verify that you have a `vector.yaml` file on your machine, or create one.

Role required: evt_mgmt_admin

About this task

If your organization uses Vector by Datadog to handle log data from multiple sources before sending it to Health Log Analytics, the log format HLA receives is distinct from other types. The Vector Agent integration enables HLA to detect and separate transport headers from inner log messages in this format. Only the inner messages are forwarded to the source type structure for processing.

You set up integrations through the Integrations Launchpad in Service Operations Workspace, which you access from the ITOM AIOps configuration center. The AIOps configuration center is a centralized workspace for configuring and managing AIOps features from a single place. The integrations setup process reduces implementation time compared to manual data input setup in the classic interface in Health Log Analytics. For more information, see Integrations Launchpad in Service Operations Workspace for ITOM.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation pane, select the AIOps configuration center icon.
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations Launchpad appears.
4. In the **Browse integrations** tab, enter `Vector` in the search field.
5. Select the `Vector` integration tile.

   Note: If you start an integration setup before meeting all prerequisites, a message appears. You can cancel the setup and complete the prior requirements first. Alternatively, you can continue in draft mode and complete the requirements later. Note that you can't activate the integration until you have completed all the prerequisites.

6. On the **Provide details** form, fill in the fields.
   For a description of the fields, see the **Provide details** table in Vector Agent integration configuration fields.
7. Select **Next**.
8. In the **Set-up instruction** screen, follow the instructions on the screen to install the integration in your third-party console.
   Update the `vector.yaml` file as explained in the steps.
9. Do one of the following.
   - If you completed all the prerequisites before starting the configuration, activate the integration either with or without AI-powered capabilities. Select the appropriate option.
     - **Activate with AI** enables AI-powered automatic parsing and mapping of log data to service instances and components for contextual alerts.

       When the integration is activated successfully, the **Overview** tab is displayed. ServiceNow Otto for ITOM collects and analyzes log data. An AI icon indicates that AI is active.
     - **Activate** activates the integration without AI-powered mapping. The integration is activated and the **Overview** tab is displayed.

     On the Integrations Launchpad, the integration tile is available in the **Installed integrations** tab.
   - If you didn't complete all the prior requirements, select **Save draft**.

     The system saves the integration as a draft in the Integrations Launchpad **Installed integrations** tab, under **Waiting for your action**. At a later time, complete the prerequisites and activate the installation. For more information, see Activate a draft integration in Health Log Analytics.

What to do next

On the **Overview** tab, do the following:

- Use the displayed information to refine how Health Log Analytics reads the log data. For more information, see Review log streaming data and adjust integration settings in Health Log Analytics.
- Use the More options menu (⋮) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct access to the **Log Viewer**. Use the **Log Viewer** to review raw log messages ingested by the integration. For more information, see:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Log data auto-mapping and mapping
- Source type structure adjustment
- Review alert-related logs on the Log Viewer

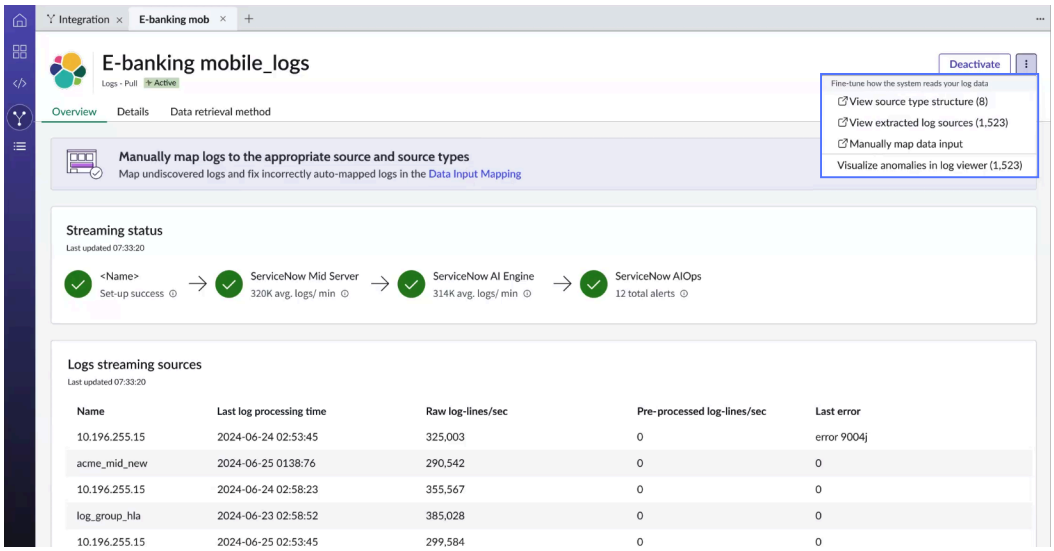
If you activated the integration with AI, verify that AI correctly auto-mapped log data to service instances and components. To do this, select **View mapping** under **Log context mapping**. You can override the AI mapping by selecting a different log field from each list. For more information, see Map logs to service instances, components, source types.

Monitor log data flow and optimize integration settings

The Overview screen in Health Log Analytics provides a comprehensive view of the components in the log-processing pipeline of a specific active integration. From this screen, you can troubleshoot any streaming issues for this integration and adjust its settings if needed.

The **Overview** screen shows the log data streaming status and streaming sources of an active integration. It provides direct access to the **Data Input Mapping**, **Source Type Structures**, and **Log Sources** pages, as well as the **Log Viewer**, all with context from the current integration.

Overview screen and View menu items



Streaming status

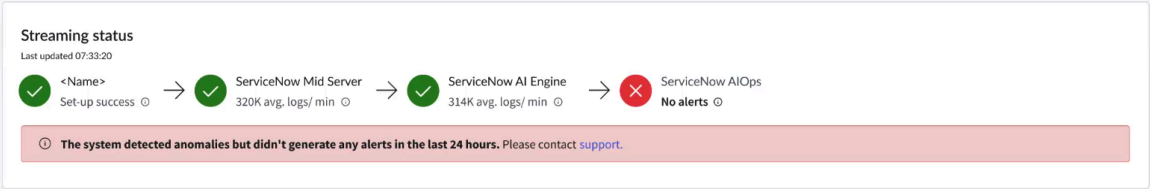
The **Streaming status** section on the **Overview** screen shows the status of data streaming between the log source and the MID Server and between the MID Server and the HLA engine. In addition, it displays the number of logs per minute passing through the MID Server and through the HLA engine.

Note: For the ServiceNow System Logs Retriever integration, the **Overview** screen doesn't display the MID Server streaming status because that integration doesn't run on a MID Server.

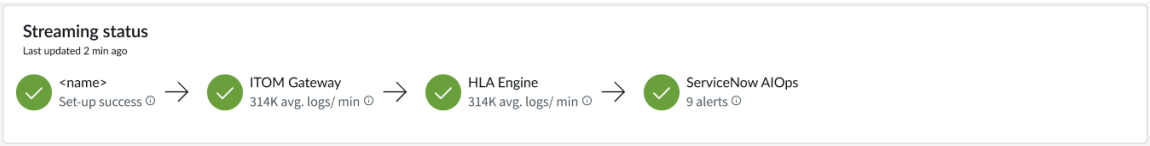
The ServiceNow AIOps component shows the total number of alerts that the HLA engine has created. These statistics are updated when the **Overview** screen loads and are automatically refreshed every minute to show live data. You can change the default auto-refresh time interval through the system property *sn_itom_integ_app.overview_page_data_input_stats_auto_refresh_interval_secon*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If data streaming fails, the integration is automatically deactivated and the **Streaming status** marks the component where the failure occurred. In addition, a banner explains the failure and either proposes steps to take to fix it or refers to ServiceNow support.



For MID-less or OpenTelemetry Protocol (OTLP) integrations, such as Amazon Data Firehose, the **Overview** screen displays the ITOM Gateway as a component in the log-processing pipeline. The MID Server component is not shown in the pipeline, because log data is sent directly from the source to the ITOM Gateway. The logs are then processed by the HLA engine to find anomalies.



For these integrations, the **Overview** screen shows the average rate of logs per minute over the last 15 minutes passing through the ITOM Gateway and the HLA engine, similar to the metrics shown for MID-based ingestion.

Note: The ITOM Gateway component is shown only if the MID Server property *mid.hla.itom_gateway_streaming.enabled* is set to true. For more information, see MID Server properties.

When the integration isn't streaming live data from the source, a warning message is displayed. There is a 4-hour interval between the last log source time and the current time before this message is generated. You can change the default time interval through the system property *sn_itom_integ_app.overview_page_log_source_time_threshold_hours*.

Note: The warning message is displayed only when the HLA engine is up and running.

Log streaming sources

The **Log streaming sources** section displays all sources that are currently streaming log data to HLA through this integration. Depending on your integration, the **Log streaming sources** table displays the following information about the integration's log streaming sources.

Note: This table isn't available for the ServiceNow System Logs Retriever integration.

Log streaming sources

Column	Description
Name	The name of the log data source.
Status	The streaming status: Active or Not active.
Data input	The integration streaming the data to your ServiceNow instance.
MID Server	The MID Server to which the log data is streaming.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Log streaming sources (continued)

Column	Description
Last event time	The time when the integration received the latest event.
Last log processing time	The time when the last log was received or processed.
Raw log lines/sec	The average number of raw log lines that streamed to the MID Server per second in the last one-minute interval. **Note:** This value represents the number of raw log lines before preprocessing.
Pre-processed log lines/sec	The average number of preprocessed log lines that streamed to the MID Server per second in the last one-minute interval. **Note:** This value can differ from the number of raw log lines per second. For example, the difference can be a result of logs having been dropped during preprocessing.

Example

As an admin, you use the integration **Overview** page to verify continuous data flow into the ServiceNow instance. If log streaming fails, HLA doesn't receive the real-time data needed to detect anomalies or generate alerts.

For example, the **Streaming Status** for an active Elasticsearch integration may show a red circle with a white X for the MID Server component in the log-processing pipeline. This indicates that logs are not reaching the MID Server.

The **Log Streaming Sources** table shows a state of Authentication Failed or Connection Error, with an error message indicating invalid credentials. This points to an issue with the Elasticsearch credentials. Fixing the credentials and either restarting the log service or waiting for the next polling cycle, restores the connection.

The **Log Streaming Sources** table now shows a connection state of Connected or Active with successful authentication. The **Streaming Status** displays a green circle with a white check mark for the MID Server component. With log streaming restored, HLA can resume processing data and generating anomaly alerts.

Related topics

Review log streaming data and adjust integration settings in Health Log Analytics

Review log streaming data and adjust integration settings in Health Log Analytics

Review the log data streaming status and streaming sources of an active integration for Health Log Analytics on the integration's Overview screen. From this tab, you can investigate streaming issues and refine the integration settings. Leverage the displayed data to refine how HLA reads the log data by adjusting the integration's configuration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

For an overview of this feature, see Monitor log data flow and optimize integration settings.

Confirm that the integration has been activated on the Integrations Launchpad. For more information, see Set up integrations for Health Log Analytics from the Integrations Launchpad.

For MID-less or OpenTelemetry Protocol (OTLP) integrations, verify that the *mid.hla.itom_gateway_streaming.enabled* property is set to true in the MID Server properties. This enables displaying the ITOM Gateway component on the Overview screen.

To access the Log Viewer from the Overview tab with context from the integration, you must have the ServiceNow Service Operations Workspace Log Analytics application installed.

Role required: evt_mgmt_admin

About this task

For more information about interpreting and using the data shown in the **Overview** screen, see Monitor log data flow and optimize integration settings.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Manage installed integrations**.
   The Integrations Launchpad appears.
4. In the **Installed integrations** tab, search for an active integration and open it.
   The **Overview** screen displays, showing the integration's data streaming status and its log data sources data.

   Note: The ServiceNow System Logs Retriever integration doesn't run on a MID Server. Therefore, for this integration the **Overview** screen doesn't display the MID Server streaming status.

5. Analyze the provided data and investigate any data streaming issues.
6. **Optional:** Adjust the configuration of the integration, if needed.

   Use the options on the View menu ( ) to navigate to the relevant table or the Log Viewer.

   Note: The View menu content changes dynamically depending on whether the referenced tables contain data.

View menu options

Option	Description
Data Input Mapping	Opens the **Data Input Mapping** page. On this page, you can map sources manually if HLA didn't discover properties automatically. For more information, see Map raw log data manually.
Source Type Structure	Opens the **Source Type Structures** page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	In the Source Type Structure, log data is classified and organized based on its origin or type. You can adjust the structure and verify that the HLA AI engine extracts properties properly and classifies them correctly. For more information, see Source type structure adjustment in Health Log Analytics.
Log Sources	Opens the **Log Sources** table. This table enables you to verify that HLA has created all your log sources. If a log source is missing, you can add it manually. For more information, see Verify your log sources in Health Log Analytics.
Log Viewer	Opens the **Log Viewer**, which shows the frequency of anomalies in the log data during a specific time period. For more information, see Review alert-related logs on the Log Viewer. **Note:** The Log Viewer option appears only if the Service Operations Workspace Log Analytics application is installed.

7. When you have resolved any data streaming issues and fixed the configuration, select **Test and save**.
   The system saves the updated configuration to the database and tests the configured port, returning either success or an error. If an error is returned, fix the configuration according to the suggestions on the screen and then select **Test and save** again. Once the test is successful, continue with the next step.
8. Reactivate the integration.

Activate a draft integration in Health Log Analytics

Activate an integration that was configured and saved as a draft in Health Log Analytics (HLA).

Before you begin

Configure an integration in draft mode through the Integrations Launchpad and save it.

Role required: evt_mgmt_admin

Procedure

1. Complete all the prior requirements for the integration.
2. In the Integrations Launchpad **Installed integrations** tab, under **Waiting for your action**, locate and select the integration tile.
3. On the configuration page, select **Activate**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- For Push integrations: The integration is activated and the **Overview** tab is displayed. The integration tile is available in the **Installed integrations** tab on the Integrations Launchpad.
- For all other integrations: Continue with the following steps.

4. In the pop-up window, select **Test & Save** to save the integration to the database and test connectivity.
   If an error is returned, adjust the configuration as suggested in the error message and then try to activate the integration again.
5. When the test is successful, select the appropriate activation option.
   - **Activate**

     The integration is activated and the **Overview** tab is displayed.

     Note: If your integration supports activation with AI capabilities, you can select this option to activate the integration without enabling these capabilities.

   - **Activate with AI**

     Note: This option is only available if your integration supports activation with AI capabilities.

     The integration is activated with AI capabilities enabled and the **Overview** tab is displayed. ServiceNow Otto collects and analyzes log data, and an icon indicates that it auto-maps log data to service instances and components for contextual alert generation.

   The integration tile is available in the **Installed integrations** tab on the Integrations Launchpad

Edit an installed integration in Health Log Analytics

Edit an installed integration for streaming log data to Health Log Analytics on the Integrations Launchpad. For example, you can switch to a different service instance.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Manage installed integrations**.
   The Integrations Launchpad appears.
4. In the **Installed integrations** tab, search for and select the tile for the integration you want to edit.
5. Select a tab that you want to edit.
6. Select **Deactivate** to deactivate the integration.

   Note: You must deactivate the integration before you can edit it.

7. Select **Edit**.
8. Edit the integration per your requirements.
9. Select **Test and save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Health Log Analytics tests the MID Server connectivity, returning either success or an error. If an error is returned, make adjustments to your configuration as suggested on the screen, and then select **Test and save** again. When the test is successful, you can reactivate the integration.

10. Select **Activate**.

Deactivate a log data integration in Health Log Analytics

Deactivate an integration for streaming log data to Health Log Analytics on the Integrations Launchpad. A deactivated integration stops streaming logs to your ServiceNow instance, but is still available.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Manage installed integrations**.
   The Integrations Launchpad appears.
4. In the **Installed integrations** tab, search for and select the integration tile for the integration you want to deactivate.
5. In the **Overview** tab, select **Deactivate**.

Result

The integration is deactivated and stops streaming log data to the instance. The deactivated integration is still available on the Integrations Launchpad in the **Installed integrations** tab, under **Waiting for your action**.

Set up data inputs in Health Log Analytics using guided setup

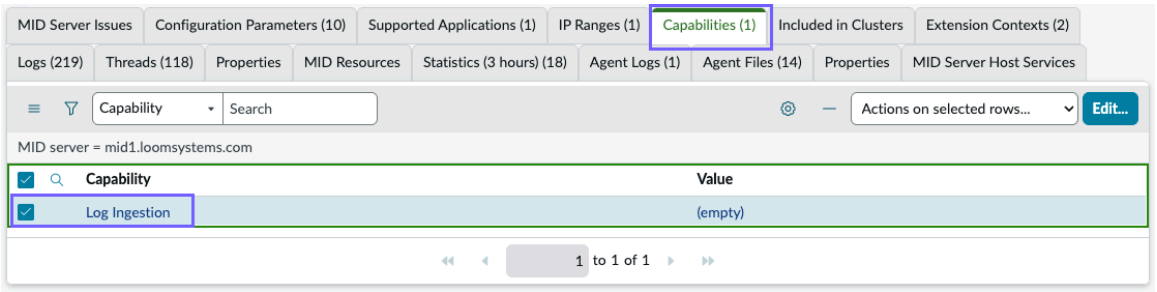
The Health Log Analytics guided setup provides a sequence of tasks to help you create data inputs on your ServiceNow instance. Data input configuration is an essential step in setting up the Health Log Analytics application. Using guided setup ensures that you have the minimum required setup for the data input process.

Before you begin

Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses aren't routable over the internet. Without a public IP, external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *mid.public_ip* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.
- For shipping your logs encrypted using SSL TLS, see the Streaming Data With Rsyslog & Filebeat Using SSL [KB0866319] article in the Now Support Knowledge Base.
- For MID Server proxy requirements, see MID Server proxy preconditions for streaming logs to Health Log Analytics.

Role required: evt_mgmt_admin

About this task

For information about using the guided setup interface, see Using guided setup.

Procedure

1. Navigate to **All** > **Guided Setup** > **ITOM Guided Setup** > **Health Log Analytics**.
2. Follow the instructions to select and set up a data input.

What to do next

Once you've created the data input connector, proceed to map your raw log data.

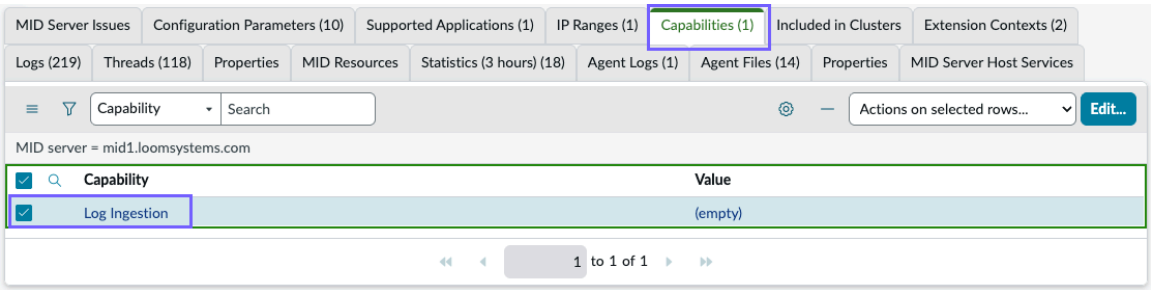
Note: Consider using the Health Log Analytics data input guided setup, which ensures that you have the minimum required setup for the data input process. For more information, see Set up data inputs in Health Log Analytics using guided setup.

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses aren't routable over the internet. Without a public IP, external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *mid.public_ip* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.
- For shipping your logs encrypted using SSL TLS, see the Streaming Data With Rsyslog & Filebeat Using SSL [KB0866319] article in the Now Support Knowledge Base.
- For MID Server proxy requirements, see MID Server proxy preconditions for streaming logs to Health Log Analytics.

Role required: evt_mgmt_admin. For the ServiceNow System Logs data input: admin.

Procedure

1. Setup a data input manually by performing the relevant procedure described in the product documentation.

Data Inputs

Data Input	Description
Agent Client Collector	The data input streams log messages to your ServiceNow instance using the ServiceNow Agent Client Collector. This data input is supported for use with the Agent Client Collector Log Analytics

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data Input	Description
	application, available from the ServiceNow Store.
Amazon CloudWatch	The data input streams log data from Amazon CloudWatch to your ServiceNow instance.
Amazon S3 Bucket	The data input streams log data from Amazon S3 (Simple Storage Service) buckets to your ServiceNow instance.
Apache Kafka	The data input streams log data from Apache Kafka to your ServiceNow instance.
Cribl	The data input to enables Health Log Analytics to process Cribl log messages streaming into your ServiceNow instance.
Edge Delta	The data input enables Health Log Analytics to process Edge Delta log messages streaming into your ServiceNow instance.
Elasticsearch	The data input pulls log data from Elasticsearch indexes into your instance.
GCP PubSub	The data input receives log messages that are published to a Google Cloud Pub/Sub topic and streams them to your ServiceNow instance.
Microsoft Azure Event Hubs	The data input streams events from Microsoft Azure Event Hubs to your ServiceNow instance.
Microsoft Azure Log Analytics	The data input streams log data from Microsoft Azure Log Analytics to your ServiceNow instance.
MID Server	The data input collects MID Server log files and streams them to your instance.
REST API	The data input streams log data to your ServiceNow instance in JSON format.
Rsyslog or Beats	The data input streams log data into your instance using Rsyslog or Beats.
ServiceNow System Logs Retriever	The data input streams log data from the ServiceNow System Log table to the Health Log Analytics AI engine. **Note:** Only a single ServiceNow System Logs Retriever data input can exist in the system, and only users with the admin role can create and configure it. This data input doesn't run on a MID Server.
Splunk	The data input streams log data into your instance using Splunk.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data Input	Description
Splunk Polling	The data input periodically pulls log data from Splunk by using a query.
TCP	The data input sends raw log messages to your instance directly over a TCP/SSL socket.
UDP	The data input streams raw log messages to your ServiceNow instance directly over a UDP socket.
Vector Agent	The data input enables Health Log Analytics to process log messages that are streaming into your ServiceNow instance via a Vector Agent.

Note: Testing the connection to the MID Server at the end of the data input setup procedure ensures that your data input is configured correctly. You can only publish a data input configuration when the connection between the MID Server and the data repository has been established.

2. Identify and address streaming issues to confirm that the data input is streaming log data to the MID Server from all sources.
   For more information, see Identify and resolve a log streaming issue in Health Log Analytics.
3. **Optional:** Edit raw log data before Health Log Analytics maps and structures it.
   For more information, see Edit your raw log data before processing.
4. Determine how Health Log Analytics handles raw log data that is streaming into your instance. By default, every incoming log line is auto-mapped to the correct tag. If properties aren't discovered automatically, map the data input sources manually by defining a JavaScript function. For more information, see Map the raw data.
5. **Optional:** Tweak the source type structure to make sure that Health Log Analytics extracts and classifies all properties correctly.
   For more information, see Refine the source type structure in Health Log Analytics.
6. **Optional:** Perform additional data input setup tasks.
   For more information, see Additional data input setup tasks in Health Log Analytics.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses aren't routable over the internet. Without a public IP, external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *mid.public_ip* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose the Amazon CloudWatch data input.
4. On the form, fill in the fields.
   For a description of the fields, see Amazon CloudWatch data input configuration fields.
5. **Optional:** Select **Advanced** to set additional configuration fields.
   For a description of the fields, see Amazon CloudWatch data input configuration fields. For information about configuring the advanced settings later, see Configure advanced settings for Amazon CloudWatch data inputs in Health Log Analytics manually.
6. On the **Query settings** tab, fill in the fields.
   For a description of the fields, see Amazon CloudWatch data input configuration fields.
7. On the **Transport** tab, fill in the fields.
   For a description of the fields, see Amazon CloudWatch data input configuration fields. These fields are required.
8. Select **Save**.
   Health Log Analytics adds the data input record to the Data Inputs table.
9. Verify that the data input is configured correctly by selecting **Test connection**.

   Health Log Analytics tries to connect the MID Server to the data repository.

   If the data input is configured to run on a MID Server cluster, the system tries to connect all the MID Servers contained in the cluster to the repository. The cluster passes the test if at least one of its MID Servers gets connected. This feature is supported in the Health Log Analytics application, Version 26.0.17 - February 2023 and later, available from the ServiceNow Store.

   - If the connection was established, the **Test connection** button is turned off and the **Publish** button is enabled.
   - If the connection failed, the reason for the failure displays in the **Error message** field. Resolve the issue, select **Save** if you modified the configuration, and then select **Test connection** to test the connection again.

     Note: You can only publish the data input configuration when the connection is created successfully.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: You can revert to the last published configuration by selecting **Revert Changes**. This option is available only when you're modifying a configuration that has been published previously.

10. Select **Publish** to publish the data input to the MID Server.

Result

The data input configuration process is complete. Health Log Analytics adds the data input record to the **Data Inputs** table and attaches the configuration file to the data input record. The data input starts streaming log data from Amazon CloudWatch to your ServiceNow instance.

Note: If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

What to do next

Make sure that the data input is streaming data.

clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses aren't routable over the internet. Without a public IP, external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *mid.public_ip* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

Role required: evt_mgmt_admin

About this task

If your organization uses Cribl for filtering and routing large volumes of log data from various sources, the log format Health Log Analytics receives is distinct from other types. The Cribl data input enables HLA to detect and separate transport headers from inner log messages in this format. It forwards only the inner message to the source type structure for processing.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose the Cribl data input.
4. On the **Getting Started** tab, fill in the form fields and then select **Next**.
   For a description of the fields, see Cribl data input configuration fields.
5. On the **Config** tab, fill in the form fields and then select **Next**.
   For a description of the fields, see Cribl data input configuration fields.
6. On the **Process** tab, select the required route and then select **Next**.

   For more information, see Cribl data input configuration fields.

   Note: For troubleshooting issues related to this step, see the Cribl - Setting up Cribl data input | Troubleshooting setup & data ingestion issues [KB0558611] article in the Now Support Knowledge Base.

   The **Finish** tab opens.
7. On the Cribl instance, verify that the configuration of the data input is correct.
   You can use the Cribl commands displayed on the **Finish** tab as needed.
8. When the configuration is correct, return to the data input configuration **Finish** tab and select **Publish** to publish the data input.

Result

The data input configuration process is complete. The data input starts streaming log data to your ServiceNow instance.

For resolving issues related to the ingestion of log data from Cribl, see the Cribl - Setting up Cribl data input | Troubleshooting setup & data ingestion issues [KB0558611] article in the Now Support Knowledge Base.

Note: If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

What to do next

Make sure that the data input is streaming data.

© 2026 ServiceNow, Inc. All rights reserved.

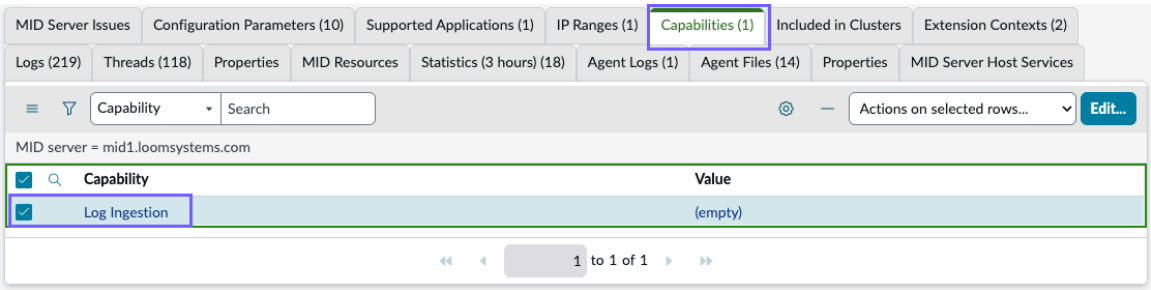
Configure an Edge Delta data input in Health Log Analytics manually

Set up an Edge Delta data input to enable Health Log Analytics to process Edge Delta log messages streaming into your ServiceNow instance.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses aren't routable over the internet. Without a public IP, external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *`mid.public_ip`* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

Role required: evt_mgmt_admin

About this task

If your organization uses Edge Delta to handle large volumes of log data from multiple sources, the log format is distinct from other types. Edge Delta sends data to Health Log Analytics. The Edge Delta data input enables HLA to detect and separate transport headers from inner log messages. It forwards only the inner message to the source type structure for processing.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose the Edge Delta data input.
4. On the form, fill in the fields.
   For a detailed description of the fields, see Edge Delta data input configuration fields.
5. Select **Save** to save your configuration.
6. Select **Publish** to publish the data input.

Result

The data input configuration process is complete. Health Log Analytics adds the data input record to the **Data Inputs** table. The data input starts streaming log data to your ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Note: If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

What to do next

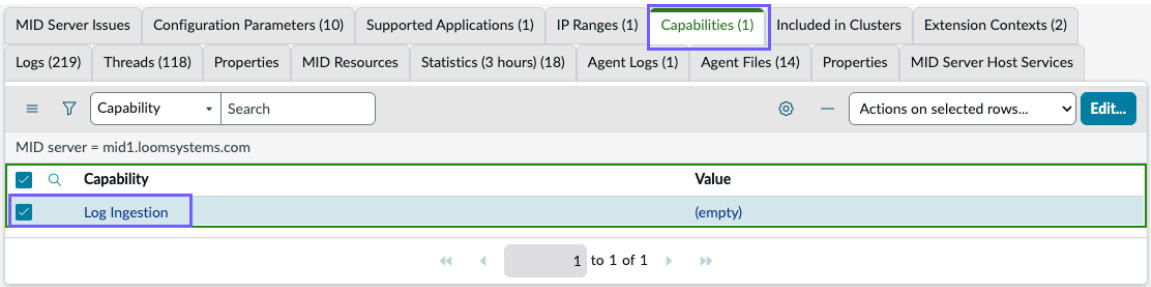
Make sure that the data input is streaming data.

Configure an Elasticsearch data input in Health Log Analytics manually

Set up a data input for streaming log data from Elasticsearch indices to your ServiceNow instance.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses aren't routable over the internet. Without a public IP, external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *`mid.public_ip`* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

Health Log Analytics supports Elasticsearch versions above 7.10.2 and below 8.18.2.

Note: For advanced information about streaming log data from Elasticsearch indices to your instance, see the Stream logs using Elasticsearch data input - Advanced guide [KB1080162] article in the Now Support knowledge base.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose the Elasticsearch data input.
4. On the form, fill in the fields.
   For a description of the fields, see Elasticsearch data input configuration fields.
5. **Optional:** Select **Advanced** to set advanced configuration fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For a description of the fields, see Elasticsearch data input configuration fields. For information about configuring the advanced settings later, see Configure advanced settings for Elasticsearch data inputs in Health Log Analytics manually.

6. On the **Transport** tab, fill in the fields.
   For a description of the fields, see Elasticsearch data input configuration fields.
7. On the **Query Settings** tab, fill in the fields.
   For a description of the fields, see Elasticsearch data input configuration fields.
8. Select **Save**.
   Health Log Analytics adds the data input record to the Data Inputs table.
9. Verify that the data input is configured correctly by selecting **Test connection**.

   Health Log Analytics tries to connect the MID Server to the data repository.

   If the data input is configured to run on a MID Server cluster, the system tries to connect all the MID Servers contained in the cluster to the repository. The cluster passes the test if at least one of its MID Servers gets connected. This feature is supported in the Health Log Analytics application, Version 26.0.17 - February 2023 and later, available from the ServiceNow Store.

   - If the connection was established, the **Test connection** button is turned off and the **Publish** button is enabled.
   - If the connection failed, the reason for the failure displays in the **Error message** field. This field displays only when a streaming error has occurred.

     Resolve the issue, select **Save** if you modified the configuration, and then select **Test connection** to test the connection again.

     Note: You can only publish the data input configuration when the connection is created successfully.

   Note: You can revert to the last published configuration by selecting **Revert Changes**. This option is available only when you're modifying a configuration that has been published previously.

10. Select **Publish** to publish the data input to the MID Server.

Result
The data input configuration process is complete. Health Log Analytics adds the data input record to the **Data Inputs** table and attaches the configuration file to the data input record. The data input starts streaming log data from Elasticsearch indices to your ServiceNow instance.

For more information about streaming logs using the Elasticsearch data input, see the Stream logs using Elasticsearch data input - Advanced guide [KB1080162] article in the Now Support Knowledge Base.

Note: If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

What to do next
Make sure that the data input is streaming data.

Note: If you experience permissions-related issues with streaming log data from Elasticsearch, refer to the Granting privileges for data streams from Elasticsearch [KB0967366] article in the Now Support Knowledge Base.

Related topics

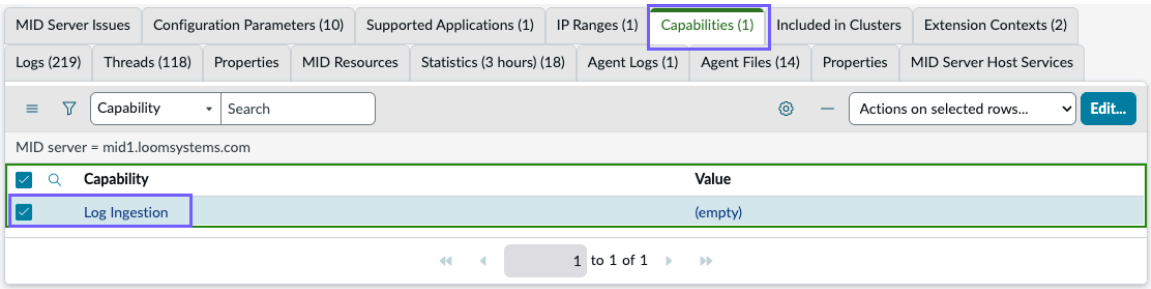
Configure advanced settings for Elasticsearch data inputs in Health Log Analytics manually

Configure a GCP PubSub data input in Health Log Analytics manually

Set up a data input for receiving log messages that were published to a Google Cloud Platform (GCP) Pub/Sub topic and streaming them to your ServiceNow instance.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses aren't routable over the internet. Without a public IP, external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *mid.public_ip* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.
- For shipping your logs encrypted using SSL TLS, see the Streaming Data With Rsyslog & Filebeat Using SSL [KB0866319] article in the Now Support Knowledge Base.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose the GCP PubSub data input type.

   Note: The selected data input type complements the passive data input (listener). For more information, see Supported data inputs for Health Log Analytics.

4. On the form, fill in the fields.
   For a description of the fields, see GCP PubSub data input configuration fields.
5. **Optional:** Select **Advanced** to set additional configuration fields.
   For a description of the fields, see GCP PubSub data input configuration fields.
6. Select **Save**.
   Health Log Analytics adds the data input record to the Data Inputs table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Verify that the data input is configured correctly by selecting **Test connection**.

   Health Log Analytics tries to connect the MID Server to the data repository.

   If the data input is configured to run on a MID Server cluster, the system tries to connect all the MID Servers contained in the cluster to the repository. The cluster passes the test if at least one of its MID Servers gets connected. This feature is supported in the Health Log Analytics application, Version 26.0.17 - February 2023 and later, available from the ServiceNow Store.

   - If the connection was established, the **Test connection** button is turned off and the **Publish** button is enabled.
   - If the connection failed, the reason for the failure displays in the **Error message** field. Resolve the issue, select **Save** if you changed the configuration, and then select **Test connection** to test the connection again.

     Note: You can only publish the data input configuration when the connection is created successfully.

   Note: You can revert to the last published configuration by selecting **Revert Changes**. This option is available only when you're modifying a configuration that has been published previously.

8. Select **Publish** to publish the data input to the MID Server.

Result
The data input configuration process is complete. Health Log Analytics adds the data input record to the **Data Inputs** table and attaches the configuration file to the data input record. The data input starts to receive log messages from the Google Cloud Pub/Sub topic and streams them to your ServiceNow instance via the MID Server.

Note: If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

Configure a Microsoft Azure Event Hubs data input in Health Log Analytics manually

Set up a data input for streaming events from Microsoft Azure Event Hubs to your ServiceNow instance.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.

  Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses aren't routable over the internet. Without a public IP, external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *mid.public_ip* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose the Microsoft Azure Event Hubs data input.
4. On the form, fill in the fields.
   For a description of the fields, see Microsoft Azure Event Hubs data input configuration fields.
5. **Optional:** Select **Advanced** to set additional configuration fields.
   For a description of the fields, see Microsoft Azure Event Hubs data input configuration fields.
   For information about configuring the advanced settings later, see Configure advanced settings for Microsoft Azure Event Hubs data inputs in Health Log Analytics manually.
6. On the **Query settings** tab, fill in the fields.
   For a description of the fields, see Microsoft Azure Event Hubs data input configuration fields.
7. On the **Transport** tab, fill in the fields.
   For a description of the fields, see Microsoft Azure Event Hubs data input configuration fields.
8. Select **Save**.
   Health Log Analytics adds the data input record to the Data Inputs table.
9. Verify that the data input is configured correctly by selecting **Test connection**.

   Health Log Analytics tries to connect the MID Server to the data repository.

   If the data input is configured to run on a MID Server cluster, the system tries to connect all the MID Servers contained in the cluster to the repository. The cluster passes the test if at least one of its MID Servers gets connected. This feature is supported in the Health Log Analytics application, Version 26.0.17 - February 2023 and later, available from the ServiceNow Store.

   - If the connection was established, the **Test connection** button is turned off and the **Publish** button is enabled.
   - If the connection failed, the reason for the failure displays in the **Error message** field. Resolve the issue, select **Save** if you modified the configuration, and then select **Test connection** to test the connection again.

     Note: You can only publish the data input configuration when the connection is created successfully.

   Note: You can revert to the last published configuration by selecting **Revert Changes**. This option is available only when you're modifying a configuration that has been published previously.

10. Select **Publish** to publish the data input to the MID Server.

Result

The data input configuration process is complete. Health Log Analytics adds the data input record to the **Data Inputs** table and attaches the configuration file to the data input record. The data input starts streaming log data from Microsoft Azure Event Hubs to your ServiceNow instance.

Note: If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

Make sure that the data input is streaming data.

Related topics

Configure advanced settings for Microsoft Azure Event Hubs data inputs in Health Log Analytics manually

Configure a Microsoft Azure Log Analytics data input in Health Log Analytics manually

Set up a data input for streaming log data from Microsoft Azure Log Analytics to your ServiceNow instance. The data input points the Health Log Analytics AI engine to a data source in your Microsoft Azure Log Analytics account.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.

> **Important:** Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses aren't routable over the internet. Without a public IP, external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *`mid.public_ip`* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose the Microsoft Azure Log Analytics data input.
4. On the form, fill in the fields.
   For a description of the fields, see Microsoft Azure Log Analytics data input configuration fields.
5. **Optional:** Select **Advanced** to set additional configuration fields.
   For a description of the fields, see Microsoft Azure Log Analytics data input configuration fields. For information about configuring the advanced settings later, see Configure advanced settings for Microsoft Azure Log Analytics data inputs in Health Log Analytics manually.
6. On the **Query settings** tab, fill in the fields.

   Health Log Analytics uses the values set in these fields to generate the query for receiving log data from Microsoft Azure Log Analytics.

   For example:

```
{"query": "ContainerLog | where TimeGenerated > %s | take 500",
 "project": ["TimeGenerated", "LogEntry", "LogEntrySource"]}
```

   where:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- `ContainerLog`: The data source name.
- `TimeGenerated`: The event time property name.
- `500`: The maximum number of rows retrieved in each query.
- `["TimeGenerated", "LogEntry", "LogEntrySource"]`: The event time and the comma-separated list of column names to return.

Alternatively, you can configure a custom query in the **Log query** field. The value you set in this field overrides the values in all other fields on the **Query settings** tab except the **From** field. If the **Log query** field is empty, Health Log Analytics generates the query using the values set in the other fields on the tab.

For a description of the **Query settings** fields, see Microsoft Azure Log Analytics data input configuration fields.

7. On the **Transport** tab, fill in the fields.
   For a description of the fields, see Microsoft Azure Log Analytics data input configuration fields.
8. Select **Save**.
   Health Log Analytics adds the data input record to the Data Inputs table.
9. Verify that the data input is configured correctly by selecting **Test connection**.

   Health Log Analytics tries to connect the MID Server to the data repository.

   If the data input is configured to run on a MID Server cluster, the system tries to connect all the MID Servers contained in the cluster to the repository. The cluster passes the test if at least one of its MID Servers gets connected. This feature is supported in the Health Log Analytics application, Version 26.0.17 - February 2023 and later, available from the ServiceNow Store.

   - If the connection was established, the **Test connection** button is turned off and the **Publish** button is enabled.
   - If the connection failed, the reason for the failure displays in the **Error message** field. Resolve the issue, select **Save** if you modified the configuration, and then select **Test connection** to test the connection again.

     Note: You can only publish the data input configuration when the connection is created successfully.

   Note: You can revert to the last published configuration by selecting **Revert Changes**. This option is available only when you're modifying a configuration that has been published previously.

10. Select **Publish** to publish the data input to the MID Server.

Result
The data input configuration process is complete. Health Log Analytics adds the data input record to the **Data Inputs** table and attaches the configuration file to the data input record. The data input starts streaming log data from Microsoft Azure Log Analytics to your ServiceNow instance.

Note: If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

What to do next

Make sure that the data input is streaming data.

Related topics

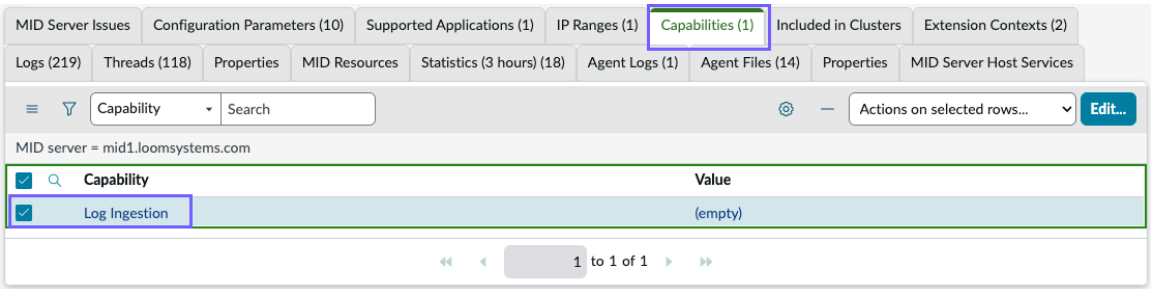
Configure advanced settings for Microsoft Azure Log Analytics data inputs in Health Log Analytics manually

Configure a MID Server data input in Health Log Analytics manually

Set up a data input for collecting and streaming MID Server log messages to your ServiceNow instance.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses aren't routable over the internet. Without a public IP, external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *mid.public_ip* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.
- For shipping your logs encrypted using SSL TLS, see the Streaming Data With Rsyslog & Filebeat Using SSL [KB0866319] article in the Now Support Knowledge Base.

Role required: evt_mgmt_admin

About this task

This procedure describes how to create a MID Server data input from the Data Inputs page. To configure the MID Server data input automatically, click the related link on the MID Server form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:

- When you create a MID Server data input, all logs are automatically mapped to the predefined mid_server_log source type. This source type includes preconfigured mapping settings to maximize the value of monitoring your MID Server logs. To review the mapping script, navigate directly from the data input configuration form to the mapping form by selecting **Go to Mapping** under Related Links. Review the source type by navigating to Source Type Structures and select the mid_server_log source type.
- For optimal performance, debug MID Server log messages are not processed by default. If you want to send debug messages to Health Log Analytics for processing, add the following to your MID Server properties: mid.hla.mid_data_input.ignore_debug_level_logs = false.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose the MID Server data input.
4. On the form, provide a description of the data input and the name of the MID Server from which the logs are streamed.
   For a description of the fields, see MID Server data input configuration fields.
5. **Optional:** Select **Advanced** to set additional configuration fields.
   On the form, fill in the fields. For a description of the fields, see MID Server data input configuration fields. For information about configuring the advanced settings later, see Configure advanced settings for MID Server data inputs in Health Log Analytics manually.
6. Select **Submit**.

Result

The data input configuration process is complete. Health Log Analytics adds the data input record to the **Data Inputs** table and attaches the configuration file to the data input record. The data input starts collecting and streaming MID Server log messages to your ServiceNow instance.

For a description of how this data input can help you detect and resolve emerging issues in your organization's ServiceNow instance, see Use Case: Proactive monitoring of your ServiceNow instance in Health Log Analytics.

Note: If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

What to do next

Make sure that the data input is streaming data.

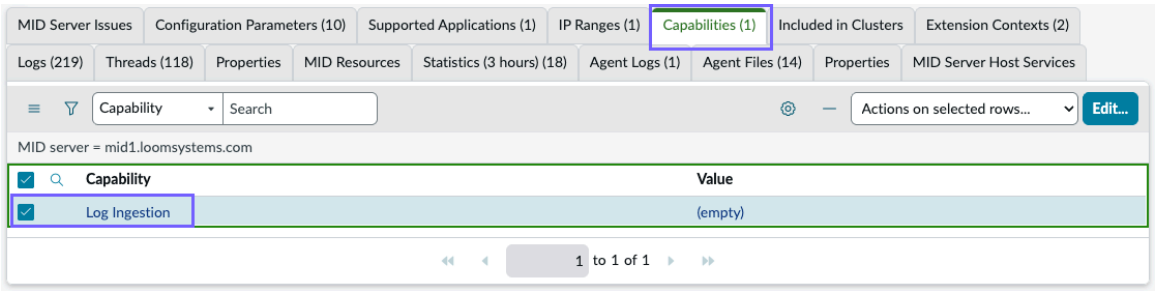
Configure a REST API data input in Health Log Analytics manually

Set up a REST API data input for streaming log data to your ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

On the MID Web Server Context form, in the **Execute on** field, select *Specific MID Server* and not the cluster option. In the **MID Server** field, select the specific MID Server to which the log data is pulled.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses aren't routable over the internet. Without a public IP, external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *`mid.public_ip`* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose the REST API data input.
4. On the form, fill in the fields.
   For a description of the fields, see REST API data input configuration fields.
5. Select **Save**.
   - Health Log Analytics adds the data input record to the **Data Inputs** table.
   - The system automatically generates the REST API data input URL for sending logs to the MID Server. The generated URL will be in this format: `http://(MID_SERVER_IP):(MID_WEB_SERVER_PORT)/ap1/mid/hla/raw`. HLA replaces `(MID_SERVER_IP)` and `(MID_WEB_SERVER_PORT)` with the values you configured.
6. Copy the generated URL.
7. Instruct your API client to send log messages to the MID Server.

   a. In the API client, configure a request with the following parameters:
      - HTTP Method: POST.
      - URL: The URL you copied in the previous step.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Authentication: The required authentication credentials. For example, Basic authentication (username and password).

  Note: The authentication method must be the same as the method configured on the MID Web Server.

- Headers: Set the `Content-Type` header to match your payload format.
  - For JSON: `application/json`.
  - For raw text: `text/plain`.
- Body: The logs payload in JSON or raw text.

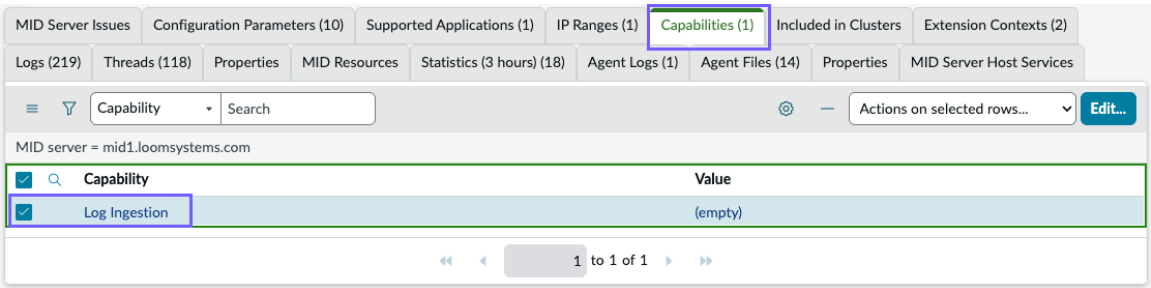
b. Send the request.
A successful response indicates that the MID Server has received the payload. When the MID Server has processed the log messages, the data input streams them to your ServiceNow instance using the REST protocol.

Configure a Rsyslog, Filebeat, or Winlogbeat data input in Health Log Analytics manually

Set up a data input for streaming log messages to your ServiceNow instance using an Rsyslog, Filebeat, or Winlogbeat agent.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses aren't routable over the internet. Without a public IP, external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *`mid.public_ip`* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.
- For shipping your logs encrypted using SSL TLS, see the Streaming Data With Rsyslog & Filebeat Using SSL [KB0866319] article in the Now Support Knowledge Base.

Role required: evt_mgmt_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose the data input type to create from the available data input types described in the table.

   Note: The selected data input type complements the passive data input (listener). For more information, see Supported data inputs.

   Data input types

Type	Description
Rsyslog	Streams log messages from UNIX-based servers to the ServiceNow AI engine using the Rsyslog agent.
Linux using Filebeat	Streams system log messages and local files from Linux servers to the instance using the Filebeat agent.
Windows Application Logs using Filebeat	Streams local files from Microsoft Windows devices to the ServiceNow instance using the Filebeat agent.
Windows OS using Winlogbeat	Streams Windows event logs to the ServiceNow instance using the Winlogbeat agent.

4. On the **Getting Started** tab, fill in the form.

   For a description of the fields, see Rsyslog, Filebeat, or Winlogbeat data input configuration fields.

   Note: When creating a data input for Linux using Filebeat, you can select a content pack from the **Content pack** drop-down. The content pack contains default source types and mapping script templates that save you the time it takes to create them from scratch. For more information, see Health Log Analytics content packs for quicker time to value.

5. If the Rsyslog, Filebeat, or Winlogbeat agent has not already been installed, download and install it from the **Installation** tab.
   For installation instructions, refer to the product documentation of the respective agent.

   Note: Make sure that you're running the latest version of the agent. Earlier versions will work, but with limited functionality.

6. On the **Tagging and Binding** tab, assign logs to an service instance in the Configuration Management Database (CMDB) to enable the service to correlate the log data and enable the system to do root cause analysis.

   a. For each source, configure the path and service instance for the logs to be streamed.

   Note: By default, only the required fields **Path** and **Service instance** appear.

   For a description of the fields, see Rsyslog, Filebeat, or Winlogbeat data input configuration fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. If you want to ship multiline logs using Filebeat, configure the properties that control how Filebeat handles messages that span multiple lines of text.

Field	Description
Match	Specifies how Filebeat combines matching lines into an event.
Negate	Defines whether the pattern identified in the log lines is negated.
Regex	Specifies the regular expression to match.

Note: Health Log Analytics currently doesn't support multiline properties for Rsyslog.

c. Optional: Define additional log paths to enable the data input to stream log types from multiple paths.
Do the following for each additional log path:

i. Insert a new row.

ii. Configure the log path.

iii. Choose a service instance.

iv. (Optional) Choose a component and a source type.

Note: This option is not available or necessary when using Winlogbeat, because Health Log Analytics streams the Windows event logs.

7. On the **Finish** tab, complete the configuration for your data input type.

- Rsyslog:

  a. Download the configuration file and install it on the endpoint device, in the `/etc/rsyslog.d/rsyslog.conf` directory.

  Note: If you are using the Health Log Analytics application, Version 20.0.11 - July 2021, available from the ServiceNow Store , do the following instead:

  i. On the endpoint device, install the configuration file in the `/etc/rsyslog.d/` directory.

  ii. Create a spool directory by running the `sudo mkdir -p/var/spool/rsyslog` command.

  b. Validate the configuration by running the `rsyslogd -N1` command and verify the output.

  c. Restart Rsyslog by running the `sudo systemctl restart rsyslog` command.

  d. Verify the output. If it contains errors, check the `/var/log/messages` system log file for error messages and fix the errors.

- Linux using Filebeat:

  a. Download the configuration file and install it on the endpoint device, in the `/etc/filebeat/` directory.

  b. Start the agent service by running the `sudo service filebeat start` command.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The generated configuration ignores files that were last changed more than six hours ago. If needed, you can change this setting in the configuration.

c. Restart the agent service by running the appropriate command.

- Windows using Beats (Filebeat or Winlogbeat):

a. Download the configuration file and install it on the endpoint device, in the `C:\Program Files\` directory.

b. Start the agent service by running the appropriate command in PowerShell.

- Filebeat: `PS > Start-Service filebeat`
- Winlogbeat: `PS > Start-Service winlogbeat`

Note: The generated configuration ignores files that were last changed more than six hours ago. If needed, you can change this setting in the configuration.

c. Restart the agent service by running the appropriate command.

8. Select **Save**.
   Health Log Analytics adds the data input record to the Data Inputs table.
9. Verify that the data input is configured correctly by selecting **Test connection**.

   Health Log Analytics tries to connect the MID Server to the data repository.

   - If the connection was established, the **Test connection** button is turned off and the **Publish** button is enabled.
   - If the connection failed, the reason for the failure displays in the **Error message** field. This field displays only when a streaming error has occurred.

     Resolve the issue, select **Save** if you modified the configuration, and then select **Test connection** to test the connection again.

     Note: You can only publish the data input configuration when the connection is created successfully.

   Note: You can revert to the last published configuration by selecting **Revert Changes**. This option is available only when you're modifying a configuration that has been published previously.

10. Select **Publish** to publish the data input to the MID Server.

Result
The data input configuration process is complete. Health Log Analytics adds the data input record to the **Data Inputs** table and attaches the configuration file to the data input record. The data input starts streaming log data to your ServiceNow instance.

Note: The configuration file Health Log Analytics generates for new Filebeat data inputs is compatible with Filebeat version 7.14 and above. The minimum Filebeat version that Elasticsearch currently supports is 7.17, which is nearing its end of life (EOL).

Existing Filebeat data input configuration files in HLA are compatible with Filebeat versions up to 8.x. For Filebeat version 9.0 and above, either migrate from log input to filestream input or generate a new configuration file. For more information on the migration process, refer to the Filebeat documentation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

What to do next

Make sure that the data input is streaming data.

Related topics

Configure advanced settings for Rsyslog, Splunk, TCP data inputs

Configure advanced settings for Beats data inputs in Health Log Analytics manually

Configure a ServiceNow Log Export data input in Health Log Analytics manually

Set up a data input for monitoring ServiceNow instance node logs from both Java code and JavaScript in Health Log Analytics (HLA). This data input provides a complete view of your instance status, including server context.

Before you begin

Note: Only a single ServiceNow Log Export data input can exist in the system. This data input doesn't run on a MID Server.

- Verify that the Log Export Service (LES) is installed on your ServiceNow instance. LES is a ServiceNow Platform tool under a different license than Health Log Analytics that enables you to export your system logs seamlessly into HLA. For more information, see Log Export Service (LES).
- Verify that the Hermes Messaging Service is up and running:
  1. Navigate to **All** > **Hermes Messaging Service** > **Diagnostics**.
  2. Ensure that the status icon is green, signifying that the service is active.

     If it isn't, contact ServiceNow support.
- Create an instance-signed PKI Certificate:
  1. Navigate to **All** > **Certificate Generator** > **Instance PKI Certificate Generator**.
  2. In the **Certificate Password** field, set a password to use for your certificate.
  3. Select **Generate**.

     The system generates the certificate.
  4. Download the `keystore` and `truststore` files to your machine.
- Create a Basic Auth credential and attach it to a credential alias.
  1. Navigate to **All** > **IntegrationHub** > **IntegrationHub Usage** > **Connections & Credentials** > **Credentials**
  2. Select **New**.
  3. Select **Basic Auth Credentials**.
  4. In the **Password** field, enter the certificate password.
  5. In the **Credential alias** field, attach the new Basic Auth credential to a new credential alias.

Role required: evt_mgmt_admin

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The ServiceNow Log Export data input streams system node logs from Java code and JavaScript into HLA. This provides a complete view of your ServiceNow instance status with server context. This enhanced visibility facilitates improved monitoring and generates more meaningful alerts to help you identify instance issues, detect security threats, optimize performance, and maintain regulatory compliance.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose **ServiceNow Log Export Hermes Consumer**.
4. Select the **Manage Attachments** icon ( ) and attach the `keystore` and `truststore` files to the form.
5. On the form, fill in the fields.
   For a description of the fields, see ServiceNow Log Export data input configuration fields.
6. Select **Save**.
   Health Log Analytics adds the data input record to the Data Inputs table.

Result

The data input configuration process is complete. Health Log Analytics adds the data input record to the **Data Inputs** table and attaches the configuration file to the data input record.

Alerts generated by this data input have the `glide_node_log alerts` component alert tag in the **Express List Active alerts** page.

Configure a ServiceNow System Logs Retriever data input in Health Log Analytics manually

Set up a data input for streaming log data from the ServiceNow System Log table to the HLA engine (aka Occultus).

Before you begin

Note: Only a single ServiceNow System Logs Retriever data input can exist in the system. This data input doesn't run on a MID Server.

Role required: admin

About this task

The HLA store app installation automatically creates the ServiceNow System Logs Retriever data input. Use this procedure if you need to recreate it manually.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose the ServiceNow System Logs Retriever data input.
4. On the form, fill in the fields.
   For a description of the fields, see ServiceNow System Logs Retriever data input configuration fields.
5. Select **Save**.
   Health Log Analytics adds the data input record to the Data Inputs table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result

The data input configuration process is complete. Health Log Analytics adds the data input record to the **Data Inputs** table and attaches the configuration file to the data input record.

The data input starts streaming ServiceNow log data from the System Log table to the Health Log Analytics AI engine, based on the configured filters. Admin users can set filters to query the System Log table. Operators can monitor the logs and view the alerts that Health Log Analytics generates from them.

For a description of how this data input can help you detect and resolve emerging issues in your organization's ServiceNow instance, see Use Case: Proactive monitoring of your ServiceNow instance in Health Log Analytics.

Note: If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

What to do next

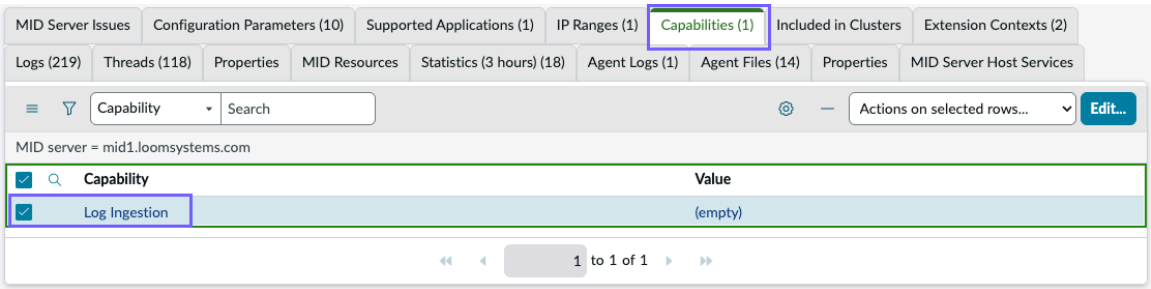
Make sure that the data input is streaming data.

Configure a Splunk data input in Health Log Analytics manually

Set up a data input for streaming log messages to your ServiceNow instance using a Splunk heavy forwarder.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses aren't routable over the internet. Without a public IP, external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *mid.public_ip* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.
- For shipping your logs encrypted using SSL TLS, see the Streaming Data With Rsyslog & Filebeat Using SSL [KB0866319] article in the Now Support Knowledge Base.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Configure Splunk to forward logs to your ServiceNow instance using Syslog.
- The configuration of this data input assumes the existence of an environment variable named $SPLUNK_HOME. In Unix-like environments, this variable typically points to `/opt/splunk`.

> **Note:** The Windows environment uses the same directory structure, but with backslashes (\).

Role required: evt_mgmt_admin

About this task

This setup procedure is for streaming logs to your instance using a Splunk heavy forwarder. If you can't use a heavy forwarder, you can use a Splunk Universal Forwarder instead. For more information, see the Splunk Universal Forwarder as a Shipping method [KB0961378] article in the Now Support Knowledge Base.

Starting in the Yokohama family release, you can use new Splunk data inputs to ingest data in the preprocessed ("cooked") log-forwarding format that Splunk uses by default. In cooked mode, the Splunk forwarder embeds configuration details, such as host, source type, source, and other settings into the log data. Ingesting the data into HLA in this format verifies that each log line retains all the relevant contextual information. If you are using the cooked data option in HLA, there is no need to edit the `props.conf` and `transforms.conf` files during Splunk data input configuration.

> **Note:** All Splunk configuration files are located in the $SPLUNK_HOME/`etc/system/local/` folder. If a configuration file that you need to modify doesn't exist, create it and save it to this folder.

> **Note:** A MID Server that is down can cause a blockage in your Splunk pipeline. A full processing queue does not affect the pipeline.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose the Splunk data input for streaming logs via a Splunk heavy forwarder or universal forwarder.
4. On the **Getting Started** tab, fill in the form fields.
   For a description of the fields, see Splunk data input configuration fields.
5. On the **Outputs.conf** tab, add the following stanzas to the `outputs.conf` file to make the shipper forward log data over the selected transport protocol on the selected port.

   Select **Next**.

   > **Note:** If you have already configured outputs, merge these lines with your existing configuration.

   - Forwarding over TCP:

     > **Note:** Use the first stanza only if you have not already configured a tcpout stanza. The second stanza is required for forwarding to Health Log Analytics over TCP.

     ```
     [tcpout]
     indexAndForward = 1
     ```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
defaultGroup = nothing

[tcpout:health_log_analytics]
server = ip-172-31-17-121.us-east-2.compute.internal:5000
sendCookedData = false
compressed = false
```

- Forwarding over UDP:

  Note: Use the first stanza only if you have not already configured a syslog stanza. The second stanza is required for forwarding to Health Log Analytics over UDP.

```
[syslog]defaultGroup = nothing

[syslog:health_log_analytics]
server = ip-172-31-17-121.us-east-2.compute.internal:5000
```

6. On the **Props.conf** tab, edit the `props.conf` file, and then select **Next**.

   Note: If you selected the **Use Cooked Data** option on the **Getting Started** tab, there is no need to edit the `props.conf` file.

   a. Modify existing stanzas or add stanzas to mark source types, service instances, and hosts for forwarding to Health Log Analytics.

      Note: For best results, mark only source types for forwarding.

      When adding stanzas, use the following name formats:

      - Source types: [<source type>]. For example: [syslog]
      - Sources (not recommended): [source::<source>]. For example, [source::myApp]
      - Hosts (not recommended): [host::<host>]. For example, [host::10.9.8.7]

   b. Add the following line to the end of each stanza that you want to forward to Health Log Analytics over either TCP or UDP.

      - Forwarding over TCP:

```
TRANSFORMS-cloned_data = clone_for_hla_store_sourcetype,
 clone_for_hla
```

      - Forwarding over UDP:

```
TRANSFORMS-cloned_data = clone_for_hla_store_sourcetype,
 clone_for_hla_udp
```

      This line applies the CLONE_SOURCETYPE transform on the data to prevent manipulation needed for Health Log Analytics processing from affecting your existing data pipeline. For example, to send all logs from the source type "syslog" to Health Log Analytics:

```
[syslog]
                                    #existing configuration
 goes here
                                    TRANSFORMS-cloned_data =
 clone_for_hla_store_sourcetype, clone_for_hla_udp
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Add the following stanza to apply all the relevant transforms needed for Health Log Analytics processing.

Note: Splunk enables you to anonymize sensitive data on the cloned source type for the selected protocol. For more information, see the "Anonymize data" section in the Splunk documentation.

- Forwarding over TCP:

```
[send_to_hla_tcp]
TRANSFORMS-health_log_analytics =
 health_log_analytics_add_sourcetype,
 health_log_analytics_add_host,
 health_log_analytics_add_source,
 health_log_analytics_add_syslog5424,
 health_log_analytics_add_index,
 health_log_analytics_add_syslogHost,
 health_log_analytics_add_time
```

- Forwarding over UDP:

```
[send_to_hla_udp]
TRANSFORMS-health_log_analytics =
 health_log_analytics_add_sourcetype,
 health_log_analytics_add_host,
 health_log_analytics_add_source,
 health_log_analytics_add_syslog5424,
 health_log_analytics_add_index,
 health_log_analytics_add_syslogHost,
 health_log_analytics_add_time
```

7. On the **Transforms.conf** tab, add the following stanzas to the `transforms.conf` file, and then select **Next**.

Note: If you selected the **Use Cooked Data** option on the **Getting Started** tab, there is no need to edit the `transforms.conf` file.

The third stanza clones the logs for further manipulation without affecting your existing indexing. The remaining stanzas add the information needed to enable correct Health Log Analytics processing.

Note: You can obfuscate sensitive data by adding a transform here and then modifying the stanza of the cloned source type in the `props.conf` file.

```
[accepted_keys]
#Custom field for preserving sourcetype
hla_sourcetype_preservation=_hla_sourcetype

#Store sourcetype in a custom field, since CLONE_SOURCETYPE
 overwrites it
[clone_for_hla_store_sourcetype]
SOURCE_KEY = MetaData:Sourcetype
REGEX = ^sourcetype::(.+)$
FORMAT = hla_sourcetype::$1
DEST_KEY = _hla_sourcetype
```

8. On the **Finish.conf** tab, restart Splunk by running the `$SPLUNK_HOME/bin/splunk restart splunkd` command.
9. Select **Save**.
   Health Log Analytics adds the data input record to the Data Inputs table.
10. Verify that the data input is configured correctly by selecting **Test connection**.

    Health Log Analytics tries to connect the MID Server to the data repository.

    - If the connection was established, the **Test connection** button is turned off and the **Publish** button is enabled.
    - If the connection failed, the reason for the failure displays in the **Error message** field. This field displays only when a streaming error has occurred.

      Resolve the issue, select **Save** if you modified the configuration, and then select **Test connection** to test the connection again.

      Note: You can only publish the data input configuration when the connection is created successfully.

    Note: You can revert to the last published configuration by selecting **Revert Changes**. This option is available only when you're modifying a configuration that has been published previously.

11. Select **Publish** to publish the data input to the MID Server.

Result

The data input configuration process is complete. Health Log Analytics adds the data input record to the **Data Inputs** table and attaches the configuration file to the data input record. The data input starts streaming log data to your ServiceNow instance using a Splunk shipper.

Note: If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

What to do next

Make sure that the data input is streaming data.

Related topics

Configure advanced settings for Rsyslog, Splunk, TCP data inputs

Configure a Splunk Polling data input in Health Log Analytics manually

Set up a data input that periodically pulls log data from Splunk by using a query.

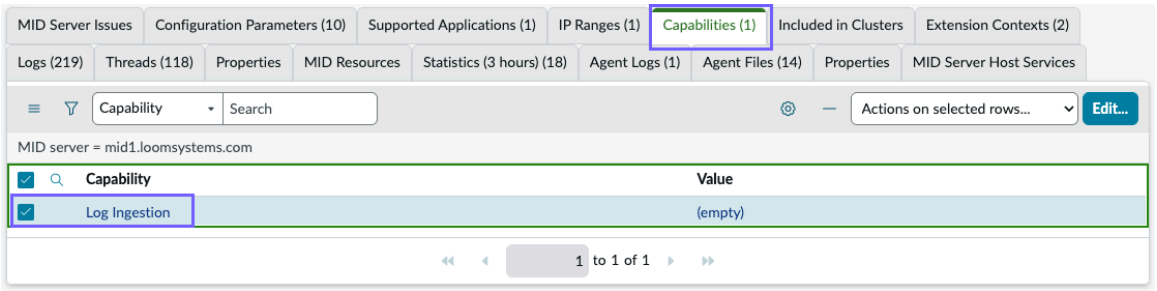
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses aren't routable over the internet. Without a public IP, external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *`mid.public_ip`* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.
- For shipping your logs encrypted using SSL TLS, see the Streaming Data With Rsyslog & Filebeat Using SSL [KB0866319] article in the Now Support Knowledge Base.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose the Splunk Polling data input.
4. On the form, fill in the fields.
   For a description of the fields, see Splunk Polling data input configuration fields.
5. **Optional:** Select **Advanced** to set additional configuration fields.
   On the **Transport tab** and **Advanced tab**, fill in the fields. For a description of the fields, see Splunk Polling data input configuration fields.
6. Select **Save**.
   Health Log Analytics adds the data input record to the Data Inputs table.
7. Verify that the data input is configured correctly by selecting **Test connection**.
   Health Log Analytics tries to connect the MID Server to the data repository. If the data input is configured to run on a MID Server cluster, the system tries to connect all the MID Servers contained in the cluster to the repository. The cluster passes the test if at least one of its MID Servers gets connected.

   Note: You can only publish the data input configuration when the connection is created successfully.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose the TCP data input type.

   Note: The selected data input type complements the passive data input (listener). For more information, see Supported data inputs for Health Log Analytics.

4. On the form, fill in the fields.
   For a description of the fields, see TCP data input configuration fields.
5. **Optional:** Select **Advanced** to set additional configuration fields.
   For a description of the fields, see TCP data input configuration fields. For information about configuring the advanced settings later, see Configure advanced settings for Rsyslog, Splunk, TCP data inputs.
6. Select **Save**.
   Health Log Analytics adds the data input record to the Data Inputs table.
7. Verify that the data input is configured correctly by selecting **Test connection**.

   Health Log Analytics tries to connect the MID Server to the data repository.

   - If the connection was established, the **Test connection** button is turned off and the **Publish** button is enabled.
   - If the connection failed, the reason for the failure displays in the **Error message** field. Resolve the issue, select **Save** if you modified the configuration, and then select **Test connection** to test the connection again.

     Note: You can only publish the data input configuration when the connection is created successfully.

   Note: You can revert to the last published configuration by selecting **Revert Changes**. This option is available only when you're modifying a configuration that has been published previously.

8. Select **Publish** to publish the data input to the MID Server.

Result

The data input configuration process is complete. Health Log Analytics adds the data input record to the **Data Inputs** table and attaches the configuration file to the data input record. The data input starts sending raw log messages to your ServiceNow instance directly over a TCP/SSL socket.

Note: If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

What to do next

Make sure that the data input is streaming data.

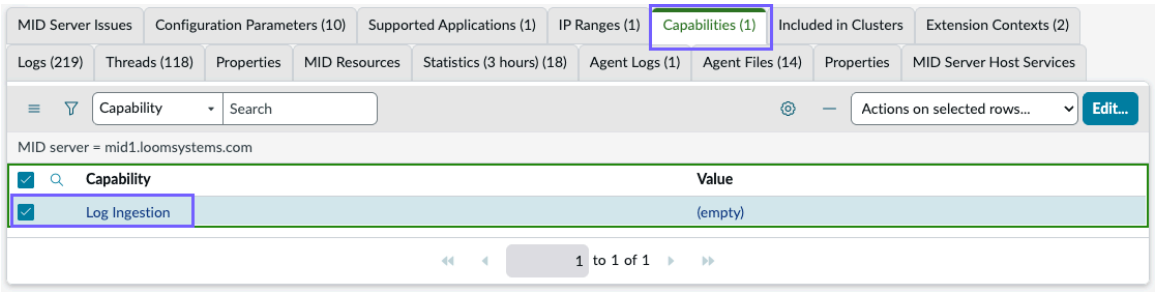
Configure a UDP data input in Health Log Analytics manually

Set up a data input for sending raw log messages to your ServiceNow instance directly over a UDP socket.

Before you begin

This feature is supported in the Health Log Analytics application, Version 25.0.17 - November 2022 and later, available from the ServiceNow Store.

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses aren't routable over the internet. Without a public IP, external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *mid.public_ip* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.
- For shipping your logs encrypted using SSL TLS, see the Streaming Data With Rsyslog & Filebeat Using SSL [KB0866319] article in the Now Support Knowledge Base.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose the UDP data input type.

   Note: The selected data input type complements the passive data input (listener). For more information, see Supported data inputs for Health Log Analytics.

4. On the form, fill in the fields.
   For a description of the fields, see UDP data input configuration fields.
5. **Optional:** Select **Advanced** to set additional configuration fields.
   For a description of the fields, see UDP data input configuration fields.
6. Select **Save**.
   Health Log Analytics adds the data input record to the Data Inputs table.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Verify that the data input is configured correctly by selecting **Test connection**.

   Health Log Analytics tries to connect the MID Server to the data repository.

   - If the connection was established, the **Test connection** button is turned off and the **Publish** button is enabled.
   - If the connection failed, the reason for the failure displays in the **Error message** field. Resolve the issue, select **Save** if you modified the configuration, and then select **Test connection** to test the connection again.

     Note: You can only publish the data input configuration when the connection is created successfully.

   Note: You can revert to the last published configuration by selecting **Revert Changes**. This option is available only when you're modifying a configuration that has been published previously.

8. Select **Publish** to publish the data input to the MID Server.

Result

The data input configuration process is complete. Health Log Analytics adds the data input record to the **Data Inputs** table and attaches the configuration file to the data input record. The data input starts sending raw log messages to your ServiceNow instance directly over a UDP socket.

Note: If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

What to do next

Make sure that the data input is streaming data.

Related topics

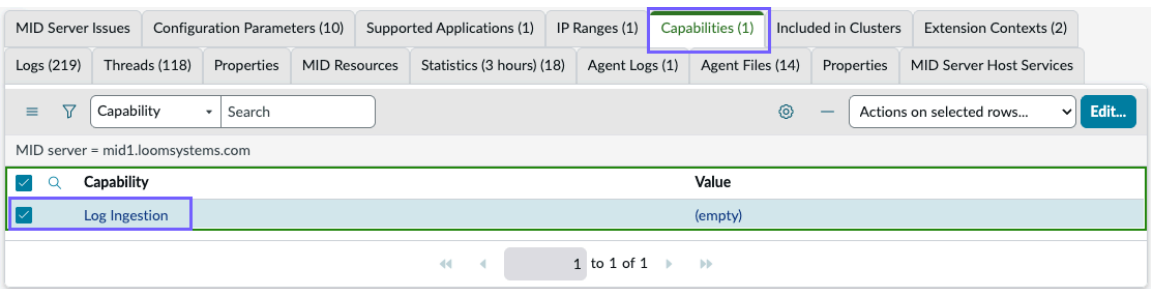
Configure advanced settings for Rsyslog, Splunk, TCP data inputs

Configure a Vector Agent data input in Health Log Analytics manually

Set up a Vector Agent data input to enable Health Log Analytics to process log messages that are streaming into your ServiceNow instance via a Vector Agent.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses aren't routable over the internet. Without a public IP, external clients can't connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *`mid.public_ip`* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

- Verify that you have a `vector.yaml` file on your system, or create one.

Role required: evt_mgmt_admin

About this task

If your organization uses Vector by Datadog to handle log data from multiple sources, the log format is distinct from other types. The Vector Agent data input enables HLA to detect and separate transport headers from inner log messages. It forwards only the inner message to the source type structure for processing.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose **Vector - Stream logs from Vector Agent**.
4. On the **Getting Started** tab, fill in the form and then select **Next**.
   For a detailed description of the fields, see Vector Agent data input configuration fields.
5. On the **vector.yaml** tab, update the code with the relevant values as needed.
   For example, you can specify the sources or source file from which the logs will be streamed.

   Note: Code that you should not modify is preceded by a commented note.

   For more information, consult the Vector documentation.
6. Copy the updated code and paste it into the `vector.yaml` file on your system.
7. Select **Next**.
   The **Finish** tab displays a message confirming that the data input configuration process is complete.
8. Start streaming log data by running Vector with the configuration file.
   Run the following command:`vector --config /path/to/your/vector.yaml`, where `/path/to/your/` is the actual path to your YAML file.
9. **Optional:** Use the other commands displayed on the **Finish** tab as needed.
10. Select **Save** to save the data input.

Result

Health Log Analytics adds the data input record to the **Data Inputs** table. The data input starts streaming log data to your ServiceNow instance.

Note: If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

Make sure that the data input is streaming data.

Identify and resolve a log streaming issue in Health Log Analytics

Find and address log streaming issues to verify that your data inputs are streaming log data to your instance properly.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Streaming Sources**.
   The Streaming Sources page shows all data inputs and the MID Servers that are receiving logs from them.

   Note:

   - When **Look up hostnames** is selected in the advanced data input configuration, the Streaming Sources page shows the hostname of devices that use an Rsyslog or a Filebeat shipper. For Elasticsearch indices, it displays the index name.
   - Streaming Sources is also available as a related list on the data input form. The related list displays only the endpoint devices that are relevant to that data input.
   - If the HLA engine is down and data has stopped streaming, a notification appears at the top of the Streaming Sources page. When this happens, contact ServiceNow support.

2. Select a data input record to view the streaming data of its sources and identify streaming issues and their possible cause.
   For example, if the last recorded event time for a data input's endpoint server is yesterday, that server might be down or configured incorrectly. A streaming issue might also be caused by the data input configuration file not being installed on the endpoint.

Filter	Description
Status	The status of the source. A red bullet indicates that this source has not streamed data in the last hour.
Last event time	The last recorded time an event arrived at the MID Server in the last one-minute interval. Health Log Analytics continuously updates the last event time. If the last event time is not up to date, data is not streaming.
Raw log lines/sec	The average number of raw log lines that streamed to the MID Server per second in the last one-minute interval. **Note:** This value represents the number of raw log lines before preprocessing.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Filter	Description
Preprocessed log lines/sec	The average number of preprocessed log lines that streamed to the MID Server per second in the last one-minute interval. **Note:** This value can differ from the number of raw log lines per second. For example, the difference can be a result of logs having been dropped during preprocessing.

3. Investigate and resolve any data streaming issues.

Note: If you experience permissions-related issues with streaming log data from Elasticsearch, refer to the Granting privileges for data streams from Elasticsearch [KB0967366] article in the Now Support Knowledge Base.

What to do next

When the logs are streaming properly, proceed to map your raw log data.

Note: You can choose to edit incoming raw log data before Health Log Analytics processes it. For example, preprocessing enables you to discard log portions or remove sensitive data from your logs. This task is optional.

Additional data input setup tasks in Health Log Analytics

After performing the initial data input setup and configuration in Health Log Analytics, continue with the remaining data input setup tasks.

Add a timestamp format in Health Log Analytics

Define any timestamp format that does not appear in the list of defined formats. Health Log Analytics must be able to read timestamps of any format contained in your log files.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Timestamp Formats**.
2. To determine whether your timestamp format matches a predefined format in the system, do the following:
   a. Select **Find format**.
   b. Enter a sample of your timestamp.
   c. Select **Find format**.
   If the sample matches an existing format, the system provides its ID.
3. If your timestamp sample doesn't match an existing format, then manually define your custom format and add it to the available timestamp formats.
   a. On the Timestamp Formats page, select **New**.
   b. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Timestamp format form

Field	Description
ID	ID of the timestamp format. This value is selected automatically.
Format	Valid timestamp format. For example, dd-MMM-yyyy, HH:mm. **Note:** Health Log Analytics uses the Java 8 API for timestamp syntax.
Sample	Example of the timestamp format. For example, 03-May-2018, 10:20.
Description	Description of the timestamp format.

4. Select **Submit**.

Result
The system validates the timestamp format and adds it to the list of available timestamps.

Add a source type manually in Health Log Analytics

Create a source type manually before you configure a data input if you want to stream log data to a specific source type. By default, Health Log Analytics automatically extracts the source type during the mapping process.

Before you begin
This feature is supported in the Health Log Analytics application, Version 20.0.11 - July 2021, available from the ServiceNow Store.

Role required: evt_mgmt_admin

Procedure
1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Source Types**.
2. On the Source Types page, select **New**.
3. On the form, fill in the fields.

Source type form

Field	Description
Name	The name of the source type. The name must be between 3-50 characters long. Acceptable characters are letters, numeric values, dashes, and underscores.
Examples	One or more raw input samples for this source type. Enter each sample on a new line. **Note:** This field must contain data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The fields in the following table are read-only.

Field	Description
Created manually	Option for indicating that this source type was created manually. Default: true.
Auto-extraction enabled	Auto-extraction for this source type is disabled by default.
Learning mode	Option for indicating that Learning mode for the source type is ongoing. The AI engine must learn the format of log messages in each new log stream. In Learning mode, it learns the format of messages for this source type and extracts properties based on that knowledge.

4. Right-click the form header and select **Save**.
5. Select **Load examples** to load the raw input samples for this source type that you provided in the **Examples** field.
   When loading the log samples is completed successfully, the **Examples** field and the **Load examples** buttons no longer appear on the form.
6. **Optional:** Check how the AI engine has parsed the raw input samples by selecting the **Go to Source Type Structure** related link and modify the extracted properties if necessary.
7. Click **Submit**.

What to do next

Configure a data input and then map it to the new source type. For more information, see Set up data inputs in Health Log Analytics manually and Map raw log data manually.

Related topics

Refine the source type structure in Health Log Analytics

Configure source type capabilities in Health Log Analytics

Health Log Analytics extracts source types automatically in the mapping process. You can add timestamp formats and specify, delete, or exclude keywords for individual source types.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Source Types**.
   The Source Types table lists all source types that were extracted automatically during raw data mapping.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Source Types

Field	Description
Auto extraction enabled	Auto-extraction for this source type is either enabled or disabled. This value is set on the Source Type Structure form. Default: true.
Learning mode	Learning mode for the source type is either ongoing or completed. The AI engine must learn the format of log messages in each new log stream. In Learning mode, it learns the format of messages for this source type and extracts properties based on that knowledge.
Stack trace detection enabled	Detection of active stack frames for this source type is either enabled or disabled. Typically, a stack trace enables tracking an error to the log in which it originated.

2. Open a record.
3. **Optional:** Add a timestamp format for this source type.
   a. On the **Source Type Timestamps** tab, select **New**.
   b. In the **Timestamp format** field, select a format from the list of available timestamp formats.
   c. Select **Submit**.
4. **Optional:** Specify a keyword for this source type.
   a. On the **Lexical Keywords** tab, select **New**.

      Note: The **Lexical Keywords** tab contains both global and specified keywords. Selecting **New** creates a specified keyword for this source type.

   b. On the form, fill in the fields.

Field	Description
Name	Unique and descriptive name for the keyword.
Regular expression	The regular expression ("regex") that defines matches.
Exact match	Boolean value. If selected, Health Log Analytics matches the exact regex. For example, 'NullPointerException' in a message would not match the regex 'exception'. Default: True
Case-sensitive	Boolean value. If selected, Health Log Analytics looks for a case-sensitive match of the regex.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Default: False

c. Select **Submit**.

5. **Optional:** Delete a keyword specified for this source type.
   a. Select the row of the specified keyword that you want to delete.
   b. From the **Actions on selected rows** list at the bottom of the page, select **Exclude keyword**.
   c. Select **Continue** to delete the keyword.
6. **Optional:** Exclude a global keyword for this source type
   When you exclude a keyword, Health Log Analytics no longer looks for it in the log data of this source type.
   a. Select the row of the global keyword that you want to exclude.
   b. From the **Actions on selected rows** list at the bottom of the page, select **Exclude keyword**.

   Note: You can delete global keywords from the Lexical Keywords page.
7. Select **Update**.

Verify your log sources in Health Log Analytics

Verify that all your log sources are present and active. Health Log Analytics tagging assigns logs to service instances and components, and automatically maps logs to sources.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Log Sources**.
   The Log Sources table provides information about the sources created when you mapped the streaming data. The table lists these sources by service instance.

Column	Description
Service instance	The service instance. Service instances represent large or complete business processes. A single service instance can consist of multiple components, whereas different service instances can include the same components.
Component	The components comprising the service instance. Components represent small technical parts or business processes. Typically, they represent Configuration Items (CIs). Several components are often clustered together in a single service instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column	Description
Status	The status of the log source: Active or Inactive. The Active status indicates that logs streamed into the system from this source in the last hour.
Created	The creation date and time of this log source.
Last event time	The last time logs streamed into the system from this source.

2. Make sure that the system has created all your log sources.
3. Verify the creation, status, and log samples of a specific source in the source record.

   Note: Because auto-mapping can map log data to multiple sources, be sure to verify this information per source.

4. If a log source is missing, add it.

   a. Navigate to **Health Log Analytics** > **Data Input** > **Data Input Mapping**.

   b. Use the JavaScript function to manually map a log sample to the correct service instance, component, and source type.
   For more information, see Map raw log data manually.

   c. Navigate back to the Log Sources page and verify that the status of the new log source is Active.

   The system creates a log source.
5. Make sure that the status of all your log sources is Active.
   If the status of a source is Inactive, double-click it and change it to Active manually.
6. Select **Update**.

Related topics

Delete a log source in Health Log Analytics

Stop extraction of unneeded log data in Health Log Analytics

Extract specific log data in Health Log Analytics

Delete a log source in Health Log Analytics

Delete a log source with or without its associated log data in Health Log Analytics.

Before you begin

Role required: evt_mgmt_admin

About this task

When you delete a log source, Health Log Analytics automatically deletes its related log data. You can also delete a source while keeping the log data. The associated data will then be deleted according to the log retention policy. For more information, see Storage space for log retention in Health Log Analytics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Log Sources**.
2. Open a source record.
3. Delete the log source in one of the following ways:
   - Delete the source and its related data by selecting **Delete**.
   - Delete the source without its related data by selecting the **Delete without logs** related link.

Review properties extracted from a source type in Health Log Analytics

Inspect the properties that were extracted from all the source types in a source type structure in a single table to identify any setup issues.

Before you begin

Role required: evt_mgmt_admin

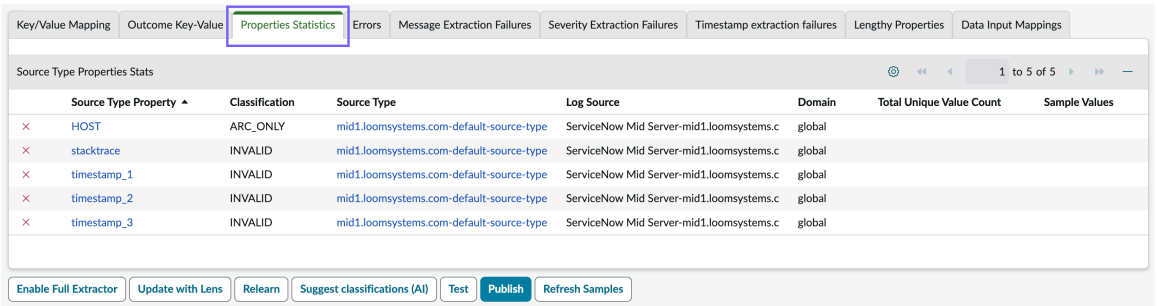
About this task

The Source Type Properties Stats table provides a comprehensive overview of the properties that were extracted from the source types. By reviewing the statistical distribution of their values, you can assess the classification of these properties and adjust your settings if needed.

The procedure in this section explains how to access the Source Type Properties Stats table via the Source Type Structure. From a source type record, you can navigate to the Source Type Structure by selecting the **Go to Source Type Structure** related link.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Source Type Structures**.
2. Open a source type structure record.
3. Open the **Properties Statistics** related links tab.



The **Source Type Properties Stats** table shows the properties of all the source types that are part of this source type structure.

Source Type Properties Stats

Column	Description
Source Type Property	The property extracted from the source type.
Classification	The classification of the property. The available types are: METER, GAUGE, ARC, and INVALID.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column	Description
	Note: A property classified as INVALID (the default classification) isn't tracked for anomaly detection or shown in the Meaningful Properties analysis.
Source Type	The source type from which the property was extracted.
Log Source	The list of Log Sources in which this property appeared.
Domain	The domain to which the log source belongs.
Total Unique Value Count	Only for properties classified as METER: The total number of distinct values contained in it. This field is inactive when the property is classified as ARC or GAUGE. **Note:** The Total Unique Value Count is updated once a day. Records older than 24 hours are deleted automatically.
Sample Values	Only for properties classified as METER: Sample unique values tracked by the system. Default is 30 samples. This field is inactive when the property is classified as ARC or GAUGE.

4. Review the properties and identify possible classification issues.
5. **Optional:** View statistics for individual source type properties classified as ARC_ONLY or GAUGE.
   a. Open a source type property classified as ARC_ONLY or GAUGE from the **Properties Statistics** related links tab.
   b. On the **Source Type Property** form, select **Source Type Properties Stats**.
   The following information displays in a pop-up:
   - For an ARC property: The percentage distribution of terms, based on the processed logs. For example, the percentage of Bad Request vs. Success.
   - For a GAUGE property: The average, minimum, and standard deviation from the expected numerical value.
6. **Optional:** Change classification settings on the **Key/Value Mapping** tab.
   For more information, see Refine the source type structure in Health Log Analytics.

Review patterns extracted from a source type in Health Log Analytics

Inspect all learned patterns extracted from a source type in a source type structure, together with the log sources in which these patterns appeared. Reviewing these patterns can provide valuable insights into the log message patterns that Health Log Analytics tracks for each source type and log source.

Before you begin

Role required: evt_mgmt_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Source Type Structures**.
2. Select a source type in the **Source type name** column.
3. On the Source Type form, select the **Aggregated Log Patterns** related list.
   The tab shows the following data for each pattern that was extracted from this source type. The displayed data is updated every hour.

Aggregated Log Patterns

Column	Description
Pattern text	The content of the aggregated pattern.
Sources	The sources in which the pattern appeared.
Domain	The domain to which the pattern belongs.

Modify a data input configuration in Health Log Analytics

Change the configuration of a data input for Health Log Analytics by adding a new path to an existing data input configuration or modifying the data input's MID Server destination and port.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. Open a record from the Data Inputs table.
3. Modify the data input configuration.

Column	Description
Name	Name of the data input.
Description	Description of the data input.
Port	The port on the MID Server. **Note:** The port must not be occupied by another process. Make sure that your organization's security team opens the selected port.
MID	The MID Server to which the logs stream.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column	Description
	Note: ○ You can select only MID Servers with log ingestion capability that support basic authentication. MID Servers that support mTLS are not listed. ○ The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties.

Settings

Column	Description
Path	The full path from which to stream logs. You can use a wildcard. **Note:** This column is not available on Windows systems using Winlogbeat.
Service instance	The service instance to which to bind the log data. **Note:** If no relevant service instance exists, Create an service instance and add CIs to it. Set the status of the new service instance to Operational.
Component	The device type or stack layer as context for the logs that is used for anomaly detection and correlation. For example, Tomcat. Components typically represent CIs in the CMDB. Several components are often clustered together in a single service instance.
Source Type	The source type that defines how Health Log Analytics handles a specific application and parses the log data. For example: Tomcat Catalina. Each data input can have multiple source types depending on the diversity of its log formats. Service instances and components can have any number of source types.
For handling multiline messages on Linux / Windows systems using Filebeat only:	
Match	Specifies how Filebeat combines matching lines into an event, either **after** or **before**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column	Description
Negate	Boolean that defines whether the pattern identified in the log lines is negated. The default is **false**.
Regex	The regular expression to match.

Note: You can modify the Rsyslog configuration file to make the agent ship system logs in addition to application logs. For more information, see the Shipping system logs using Rsyslog [KB0954507] article in the Now Support Knowledge Base.

4. Select **Update**.
5. For data inputs that use Rsyslog or Beats agents only, rebuild the server-side configuration file and install it on the endpoint device.
   a. Select **Rebuild configuration file**.

      Health Log Analytics rebuilds the file and saves it in the Manage Attachments section. Depending on the agent used, the rebuilt file is saved as either `rsyslog.yml`, `filebeat.yml`, or `winlogbeat.yml`.

      The system automatically renames the previous configuration file by adding a suffix with the date and time the file was rebuilt to the file name.

   b. Install the rebuilt configuration file on the endpoint according to your data input type.

Data input type	Action
Rsyslog	i. Download the file and install it on the endpoint device in the `/etc/rsyslog.d/rsyslog.conf` directory. ii. Validate the configuration by running the `rsyslogd -N1` command. iii. Verify the output. If it contains errors, check the `/var/log/messages` system log file for error messages and fix the errors. iv. Restart Rsyslog by running the `sudo systemctl restart rsyslog` command.
Linux	i. Download the file and install it on the endpoint device in the `/etc/filebeat/` directory. ii. Restart the agent service by running the `sudo service filebeat restart` command. **Note:** The generated configuration ignores files that were last changed more than six hours ago. If needed, you can change this setting in the configuration file.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data input type	Action
Windows using Beats (Filebeat or Winlogbeat):	i. Download the file and install it on the endpoint device in the C : \Program Files\ directory. ii. Restart the agent service by running the appropriate command in PowerShell: ▪ Filebeat: `PS > Restart-Service filebeat` ▪ Winlogbeat: `PS > Restart-Service winlogbeat` **Note:** The generated configuration ignores files that were last changed more than six hours ago. If needed, you can change this setting in the configuration file.

Related topics

Configure advanced settings for Rsyslog, Splunk, TCP data inputs

Configure advanced settings for Beats data inputs in Health Log Analytics manually

Advanced data input configuration in Health Log Analytics

When you have configured a data input successfully, Health Log Analytics adds a record to the Data Inputs table and attaches the configuration file to it. You can configure advanced settings for your data input. Configuring advanced settings is optional.

Configure advanced settings for Amazon CloudWatch data inputs in Health Log Analytics manually

Configure advanced settings for data inputs used for streaming log data from Amazon CloudWatch to your instance.

Before you begin

Role required: evt_mgmt_admin

About this task

You can set system parameters for reading log data that determine the actions that the system performs on log data arriving on the MID Server. For example, you can set the time zone to use if a log lacks a timestamp. If no advanced settings are configured, the system uses the default values.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. Open an Amazon CloudWatch data input record from the Data Inputs table.

   Note: If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

3. Select **Advanced** and then select the **Advanced** tab.
4. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For a description of the fields, see Amazon CloudWatch data input configuration fields.

The **Character encoding** field is read-only. By default, the character encoding used for this data input is UTF-8.

5. **Optional:** In the Streaming Sources related list, verify that this data input is streaming log data from all relevant endpoint devices.
   For more information about streaming sources, see Identify and resolve a log streaming issue in Health Log Analytics.
6. Select **Save**.
   Health Log Analytics adds the data input record to the Data Inputs table.
7. Ensure that the data input is configured correctly by selecting **Test connection**.

   Health Log Analytics tries to connect the MID Server to the data repository.

   If the data input is configured to run on a MID Server cluster, the system tries to connect all the MID Servers contained in the cluster to the repository. The cluster passes the test if at least one of its MID Servers gets connected. This feature is supported in the Health Log Analytics application, Version 26.0.17 - February 2023 and later, available from the ServiceNow Store.

   - If the connection was established, the **Test connection** button is turned off and the **Publish** button is enabled.
   - If the connection failed, the reason for the failure displays in the **Error message** field. Resolve the issue, select **Save** if you modified the configuration, and then select **Test connection** to test the connection again.

     Note: You can only publish the data input configuration when the connection is created successfully.

   Note: You can revert to the last published configuration by selecting **Revert Changes**. This option is available only when you're modifying a configuration that has been published previously.

8. Select **Publish** to publish the data input to the MID Server.

Related topics

Configure an Amazon CloudWatch data input in Health Log Analytics manually

Configure advanced settings for Amazon S3 data inputs in Health Log Analytics manually

Before you begin
Role required: evt_mgmt_admin

About this task
You can set system parameters for reading log data that determine the actions that the system performs on log data arriving on the MID Server. For example, you can set the time zone to use if a log lacks a timestamp. If no advanced settings are configured, the system uses the default values.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. Open an Amazon S3 data input record from the Data Inputs table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

3. Select **Advanced** and then select the **Advanced** tab.
4. On the form, fill in the fields.
   For a description of the fields, see Amazon S3 data input configuration fields.
5. **Optional:** In the Streaming Sources related list, verify that this data input is streaming log data from all relevant endpoint devices.
   For more information about streaming sources, see Identify and resolve a log streaming issue in Health Log Analytics.
6. Select **Save**.
   Health Log Analytics adds the data input record to the Data Inputs table.
7. Ensure that the data input is configured correctly by selecting **Test connection**.

   Health Log Analytics tries to connect the MID Server to the data repository.

   If the data input is configured to run on a MID Server cluster, the system tries to connect all the MID Servers contained in the cluster to the repository. The cluster passes the test if at least one of its MID Servers gets connected. This feature is supported in the Health Log Analytics application, Version 26.0.17 - February 2023 and later, available from the ServiceNow Store.

   - If the connection was established, the **Test connection** button is turned off and the **Publish** button is enabled.
   - If the connection failed, the reason for the failure displays in the **Error message** field. Resolve the issue, select **Save** if you modified the configuration, and then select **Test connection** to test the connection again.

     Note: You can only publish the data input configuration when the connection is created successfully.

   Note: You can revert to the last published configuration by selecting **Revert Changes**. This option is available only when you're modifying a configuration that has been published previously.

8. Select **Publish** to publish the data input to the MID Server.

7. Verify that the data input is configured correctly by selecting **Test connection**.

   Health Log Analytics tries to connect the MID Server to the data repository.

   - If the connection was established, the **Test connection** button is turned off and the **Publish** button is enabled.
   - If the connection failed, the reason for the failure displays in the **Error message** field. This field displays only when a streaming error has occurred.

     Resolve the issue, select **Save** if you modified the configuration, and then select **Test connection** to test the connection again.

     Note: You can only publish the data input configuration when the connection is created successfully.

   Note: You can revert to the last published configuration by selecting **Revert Changes**. This option is available only when you're modifying a configuration that has been published previously.

8. Select **Publish** to publish the data input to the MID Server.

Stop or restart a data input in Health Log Analytics

You can stop using a data input for streaming log messages to your ServiceNow instance. Restart the data input if you want it to resume streaming data.

Before you begin

This functionality is available only when the data input configuration has been published.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Log Data Inputs**.
2. Open a data input record from the Data Inputs table.
3. Select **Stop Data Input**.
   The name of the button changes to **Start Data Input**.
4. To start using the data input again, select **Start Data Input**.

Edit raw log data before processing in Health Log Analytics

Use the Data Input Preprocessor to filter, split, or sanitize raw log data before it is treated in the MID Server and mapped and structured by Health Log Analytics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: evt_mgmt_admin

About this task
Define a JavaScript function to preprocess your raw log data before it reaches Health Log Analytics. For example, you can drop irrelevant or redundant messages to reduce log volume. You can also split multi-event log lines into discrete messages for accurate mapping or sanitize sensitive or personally identifiable information so that it never enters the ServiceNow instance.

Procedure
1. Navigate to **All** > **Health Log Analytics** > **Data Input Preprocessor**.
2. Open a record.

   Note: The first time the preprocessing form is displayed, Health Log Analytics fetches log samples automatically. In subsequent sessions, fetch fresh samples manually by selecting **Refresh Samples**.

3. **Optional:** Prevent showing log samples that are taken from your organization's raw logs by selecting **Disable raw log samples**.
   Select this option if you don't want to expose your logs to Health Log Analytics.
4. **Optional:** View how the current JavaScript function affects the log lines.
   a. Add a sample message in the **Test manual sample** field.
   b. Select **Go**.
   c. Note how the JavaScript function affects the log lines.
5. In the **Raw input samples** field, choose a log sample that will show the effect of the new JavaScript function you're going to define on log lines when you test it.
6. Define a JavaScript function that modifies your raw log data before Health Log Analytics maps and structures it.

   Note:

   (ACC data inputs only) When the Agent Client Collector switches to a different MID Server to provide failover protection, it must switch to a different ACC data input. Therefore, all ACC data inputs must have the same JavaScript function. Health Log Analytics provides the latest published JavaScript function to all existing and future ACC data inputs, replacing the previous script. This feature is supported in the Health Log Analytics application, Version 22.0.12 - December 2021 and later, available from the ServiceNow Store. For information about failover protection in Agent Client Collector Log Analytics (ACC-L), see Agent Client Collector Log Analytics.

   a. In the JavaScript console, either change the provided default JavaScript function, modify an existing custom JavaScript function, or define a new one.

      Note: In addition to the default JavaScript function for data preprocessing, Health Log Analytics provides a JavaScript function template named `Scrubbing`. This JavaScript function removes personally identifiable information such as email addresses, social security numbers, and passwords, from the raw log data. The template can act as a starting point for your custom script code. This feature is supported in the Health Log Analytics application, Version 20.0.11 - July 2021, available from the ServiceNow Store.

      Note: (ACC data inputs only) Make sure that your JavaScript function can be used to handle data streamed by all ACC data inputs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

JavaScript functions for preprocessing raw log data use the following objects:

- Signature: function process(sample, metadata)

Object	Description
sample	The current log sample.
metadata	Object that contains the event stream. To access the event stream, call the *`metadata.eventStream`* function. Because event stream is an object, you can access each of its properties by calling the *`metadata.eventStream.origin`* or *`metadata.eventStream.LocalPort`* functions. The list of available event stream properties is available in the **Event Stream: access via metadata** tab.

- Return type and structure

  Note: The JavaScript function returns a map of two entries. Do not change this return structure.

Object	Description
modifiedInput	The current log message after the JavaScript function has modified the original message. If null, the original log message is used.
splitEvents	Array of log messages after the JavaScript function has divided the original message.

- To discard a log message, call `return drop()`.

b. Test your JavaScript function by selecting **Test** and viewing the outcome on the log sample in related lists.

Tab	Description
Outcome	The result of running the JavaScript function on your log sample.
Event Stream: access via metadata	The key-value pairs that present the event stream metadata.
Failures	The log samples on which the JavaScript function failed to run successfully.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If your new JavaScript function is not behaving as expected, you can revert to the last published one by selecting the **Revert JS Function** related link.

c. **Optional:** Make any necessary adjustments and then test the JavaScript function again.

7. Select the **Save template** option to save the JavaScript function.
   You can either save the JavaScript function as a new template or overwrite the currently selected template.
   - To save the JavaScript function as a new template, enter a new name in the **Template name** field.
   - To overwrite the template currently selected in the **JS function templates** field, leave the **Template name** field empty.
8. Select **Publish** to save the JavaScript function to the database.

Result

When the JavaScript function is published, Health Log Analytics uses it to preprocess your raw log data before mapping and structuring it.

The new script is automatically added to the list of JS function templates from which you can choose. This feature is supported in the Health Log Analytics application, Version 20.0.11 - July 2021, available from the ServiceNow Store.

(ACC data inputs only) Health Log Analytics provides the published JavaScript function to all existing and future ACC data inputs. The new JavaScript function replaces the previous script.

What to do next

Proceed to the **Data Input Mapping** page by selecting the **Go to Mapping** related link. Map raw data that streams into your instance to determine how Health Log Analytics processes it.

Log data auto-mapping and mapping in Health Log Analytics

By default, the HLA Engine tries to auto-map every incoming log line to the correct tags. You can change automatic mapping results manually by defining a JavaScript function.

Auto-mapping incoming log lines

Health Log Analytics auto-mapping assigns log samples and metadata to three tags: service instance, component, and source type. The service instance assignment is based on the service instance specified in the data input setup. The remaining tags are assigned automatically.

For example, in the following example log line, Health Log Analytics uses the "source" field to find the component and source type.

```
{"beat":{"version":"6.8","name":"abc3.prd.acme.com","hostname":"
abc3.prd.acme.com"},"@timestamp":"2020-08-27T10:12:24.792Z","pro

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In the example, Health Log Analytics extracts the string "online_store". It analyzes the following fields if they exist in the log line: source, path, channel, namespace_name, name, pod_name, source_name, and aws_lambda_name. When data is sent over Syslog, it also analyzes the syslog tag.

Stop extraction of unneeded data

If an extracted string is not descriptive enough or contains redundant text or information, you can stop extracting such expendable data. For more information, see Stop extraction of unneeded log data in Health Log Analytics.

Ensuring extraction of specific data

You can make sure that Health Log Analytics extracts specific desired terms. For more information, see Extract specific log data in Health Log Analytics.

AI-assisted log mapping with ServiceNow Otto for ITOM

AI-assisted log mapping using ServiceNow Otto for ITOM recommends optimal mapping configurations based on your log patterns. This approach reduces manual setup effort and improves accuracy without requiring custom JavaScript functions.

For this capability to be enabled, the integration must be activated by selecting the Activate with AI option. This option enables AI-powered automatic parsing and mapping of log data to service instances and components for contextual alerts. When the integration is activated, ServiceNow Otto for ITOM collects and analyzes log data and suggests the best log field for mapping. You can override the suggested mapping by selecting a different log field from each list, if needed. For more information, see Map logs to service instances, components, source types.

Mapping data input sources manually by defining a JavaScript function

You can change automatic mapping results manually by defining a JavaScript function. Data input mapping enables you to organize your log data by service instance and by availability zone. A single service instance can include multiple components, and a component can receive logs from many different source types. An service instance-component pair, however, is unique. Source types are based on a specific log structure and format. Service instances and components are defined more broadly and are therefore used mainly for logical mapping.

Activating **Test mode** avoids blowing up Elasticsearch storage with sample data that is used only for perfecting the log data mapping. When the data input is in Test mode, Health Log Analytics doesn't create the source types, sources, or any other objects it creates in the standard flow. It saves the streamed data in dedicated temporary Elasticsearch indices that appear as components in the Log viewer. When you publish the script and exit Test mode, these temporary indices are deleted to minimize storage space consumption.

When you're defining a JavaScript function, select **Test** to view the outcome of the script as it is currently specified. This functionality enables you to preview the created source types and sources. You can then refine the script until it achieves the desired outcome. For example, it can be useful to compare the test outcome of several versions of the JavaScript function.

Note: By default, the test processes 100 log data samples. You can customize this number in the system properties. For more information, see Configure global Health Log Analytics system properties.

During the data input setup, the system might create an excessive total number of data input sources. For example, this can be due to a faulty mapping script. You can configure limits for the number of sources created per data input in the system properties:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

System property	Description	Default
log_source.sources_warning_limit	The warning limit for the number of sources created per data input.	500
log_source.sources_critical_limit	The critical limit for the number of sources created per data input.	600

The number of log sources that a specific data input has created displays in the **Sources count** field for that data input. When the total number of sources created during the data input setup reaches the warning limit, the system sends a warning notification by email. It also displays a message on the **Data Input mapping**, **Log sources**, and **Data input** pages. The notification and the message include the total number of sources created so far and the three data inputs that contributed the most sources to this total. If no action is taken, the system continues to create sources until the total number reaches the critical limit. When this happens, the data input setup and streaming from all data inputs stops automatically. You can't start data inputs again manually until the issue has been resolved. You can resolve this state by following the instructions in the How to handle too many sources in data inputs [KB0963067] article in the Now Support Knowledge Base.

Binding log data

Binding log data to Configuration Items (CIs) in the Configuration Management Database (CMDB) enables you to search the CMDB for endpoints that match a log. When you configure a data input, you bind log entries to a service instance that is bound to a CI in the CMDB. Binding log entries, service instances, and CIs enables the HLA Engine to correlate them for use in root cause analysis (RCA). For more information, see Configure a Rsyslog, Filebeat, or Winlogbeat data input in Health Log Analytics manually or Configure an Elasticsearch data input in Health Log Analytics manually.

Map raw log data manually

Mapping raw log data that streams into your ServiceNow instance determines how Health Log Analytics processes the data. If HLA doesn't discover properties automatically, you can map data input sources manually.

Before you begin

For an overview of mapping, see Log data auto-mapping and mapping in Health Log Analytics.

Role required: evt_mgmt_admin

About this task

Health Log Analytics structures logs, creates metrics for anomaly detection, and presents alerts based on how your data is tagged. By default, HLA tries to auto-map every incoming log line to the correct tag. To manually map data input sources when the system doesn't automatically discover properties, create a JavaScript function.

In the JavaScript function, you're required to map only the service instance (here called application service). Mapping the component and the source type is optional: Health Log Analytics tries to extract their values from the log data automatically. If the attempt fails, it assigns the default values. If you map the component but not the source type or vice versa, the system tries to extract the missing value from the log data. If it fails, it assigns the component value to the source type or vice versa, depending on which one you have mapped. This feature is supported in the Health Log Analytics application, Version 20.0.11 - July 2021, available from the ServiceNow Store.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

(ACC data inputs only) When the Agent Client Collector switches to a different MID Server to provide failover protection, it must switch to a different ACC data input. Therefore, all ACC data inputs must have the same JavaScript function. Health Log Analytics provides the latest published JavaScript function to all existing and future ACC data inputs, replacing the previous script. This feature is supported in the Health Log Analytics application, Version 22.0.12 - December 2021 and later, available from the ServiceNow Store. For information about failover protection in Agent Client Collector Log Analytics (ACC-L), see Agent Client Collector Log Analytics.

Note: You can manipulate raw log data before Health Log Analytics maps and structures it. For more information, see Edit raw log data before processing.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Mapping** > **Data Input Mapping**.
2. Open a record.

   Note: The first time the Data Input Mapping form is displayed, Health Log Analytics fetches log samples automatically. In subsequent sessions, fetch fresh samples by selecting **Refresh Samples**.

   Note: If the HLA engine is down and data has stopped streaming, a notification appears at the top of the Data Input Mapping page. When this happens, contact ServiceNow support.

3. **Optional:** To forward the complete raw log message, disable automatic header properties detection for this data input by selecting **Disable header detection**.
   For more information, see Header properties detection in Health Log Analytics.
4. **Optional:** Activate Test mode by setting the **Test mode** value to ON.
   In Test mode, Health Log Analytics doesn't create the source types, sources, or any other objects it creates in the standard flow. This is to avoid blowing up Elasticsearch storage with sample data. For more information, see Log data auto-mapping and mapping in Health Log Analytics.
5. **Optional:** View how the current JavaScript function affects log lines.
   a. Add a sample message in the **Test manual sample** field.
   b. Select **Go**.
   c. Note how the JavaScript function affects the log lines.
6. In the **Raw input sample** field, choose a log sample that will show the effect of your new JavaScript function on log lines when you test it.
7. **Optional:** Enable HLA to identify service instances and components from log fields and automatically map log data to them by selecting **Enable auto map from log field**.

   Note:

   - Automatic log context mapping can only be configured in the Service Operations Workspace. For more information about this feature, see Map logs to service instances, components, source types.
   - If a manually-defined mapping script exists, automatic log context mapping overwrites it.
   - To be able to define a JavaScript function manually in the current form, the **Enable auto map from log field** check box must be clear.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Define a JavaScript function that maps your data input sources to the correct service instance (here called application service), component, and source type.

   Note: (ACC data inputs only) Make sure that your JavaScript function can be used to handle data streamed by all ACC data inputs.

   a. In the JavaScript console, either modify the provided default JavaScript function or a custom JavaScript function selected from the **JS functions templates** drop-down list, or define a new JavaScript function.
   The provided templates can act as a starting point for your custom script code. Available templates are:

   - Default Mapping Script
   - Glide Node Log Mapping Script
   - Glide Sys Log Mapping Script
   - Linux OS logs streamed with Syslog

     Note: Logs must have a syslog wrapper for this JavaScript function to work properly.

   - Mid Server Log Mapping Script
   - Windows - Winlogbeat logs streamed with Winlogbeat

   The JavaScript function for mapping raw log data uses the following objects:

   - Signature: function map(sample, metadata)

Object	Description
sample	The current log sample after preprocessing.
metadata	Object that contains: ▪ Event Stream: Access via: <metadata value>. For example: `metadata.eventStream.origin` ▪ Transform header 1: Access via: <metadata value>. For example: `metadata.headers.i1.type` ▪ Transform header 2: Access via: <metadata value>. For example: metadata.headers.i2.type ▪ type Transform header 3: Access via: <metadata value>. For example: `metadata.headers.i3.type` ▪ Fallback Assignment: Access via: <metadata value>. For example: `metadata.fallBacks.host`

   Note: You can create and associate multiple services per source type.

   - Return type and structure

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The JavaScript function returns a map of two entries. Don't change this return structure.

Object	Description
applicationService	The existing application service (that is, the service instance) to which this sample will be assigned. **Note:** The service instance must be bound to anomaly alerts related to the log.
component	The component to which this sample will be assigned.
sourceType	The source type to which this sample will be assigned.

- To discard a log message, call `return drop()`.

b. Test the JavaScript function by selecting **Test**.

Testing the JavaScript function enables you to view the outcome of the script on the log sample. For a description of the displayed fields, see JavaScript function test outcome fields.

Note: If your new JavaScript function is not behaving as expected, you can revert to the last published one by selecting the **Revert JS Function** related link.

c. Optional: Make any necessary adjustments and then test the JavaScript function again.

d. Optional: Compare the outcome of multiple tests.
Comparing the test results of several versions of the JavaScript function can help you refine the script until it achieves the desired outcome.

9. When you have finalized the JavaScript function, select **Save template** to save it.
You can either save the JavaScript function as a new template or overwrite the currently selected template.

- To save the JavaScript function as a new template, enter a new name in the **Template name** field.
- To overwrite the template currently selected in the **JS function templates** field, leave the **Template name** field empty.

10. Select **Publish** to save the JavaScript function to the database.

Result

When the JavaScript function is published, Health Log Analytics uses it to map data input sources.

The new script is automatically added to the list of JS function templates from which you can choose. This feature is supported in the Health Log Analytics application, Version 20.0.11 - July 2021, available from the ServiceNow Store.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

(ACC data inputs only) Health Log Analytics provides the published JavaScript function to all existing and future ACC data inputs. The new JavaScript function replaces the previous script.

What to do next

- (Optional) Edit your raw log data before Health Log Analytics maps and structures it. If you want to perform this task immediately, select the **Go to Preprocessor** related link to proceed to the **Data Input Preprocessor** page.
- (Optional) Fine-tune how the system reads your log data by refining the Source Type structure. This step enables you to reclassify auto-classified properties and change auto-mapped labels.

Stop extraction of unneeded log data in Health Log Analytics

Extract specific log data in Health Log Analytics

Header properties detection in Health Log Analytics

Automatic header properties detection in Health Log Analytics separates the transport header from the inner log message and forwards only the inner log message to the source type structure. The inner message contains the actual log data, not the shipping information.

The Health Log Analytics application supports header properties detection for Fluentd, Beats, and Syslog (RFC 3164, RFC 5424).

Starting with Version 33.0.27 - August 2024, the system also supports header properties detection for logs that follow the OpenTelemetry logs data model and semantic conventions. For more information, see the OpenTelemetry Logs Data Model documentation.

You can disable header properties detection for a data input. In this case, the Health Log Analytics AI Engine stops extracting properties from the header. Forwarding the complete raw message to the source type structure can be useful in the following situations:

- The inner log message lacks information for parsing, such as timestamp and severity.
- The header contains information needed for structuring the log data.
- The data input forwards the logs fully parsed.

For the procedure to disable header properties detection, see Map raw log data manually.

Extract specific log data in Health Log Analytics

Set Health Log Analytics to extract specified terms from logs and map them to specific components.

Before you begin

For an overview of mapping, see Log data auto-mapping and mapping in Health Log Analytics.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Mapping** > **Extracted values**.
2. Select **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the **Value to extract** field, enter the term that you want Health Log Analytics to extract from your logs.
4. In the **Map to component** field, enter the component that you want the value mapped to.
5. In the **Property** field, choose a property from the list.
6. **Optional:** Further specify the value to extract by selecting additional options:
   - Exact match
   - Case sensitive
7. **Optional:** In the **Description** field, add a description of the value.
8. Select **Submit**.

Stop extraction of unneeded log data in Health Log Analytics

If an extracted string of data is not descriptive enough or contains redundant text or information, you can set Health Log Analytics to stop extracting such data from your logs.

Before you begin

For an overview of mapping, see Log data auto-mapping and mapping in Health Log Analytics.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Mapping** > **Excluded values**.
2. Select **New**.
3. In the **Value to exclude** field, enter the string that you want Health Log Analytics to stop extracting.
4. **Optional:** Further specify the values to stop extracting by selecting additional options:
   - Starts with
   - Ends with
   - Contains
   - Case sensitive
5. **Optional:** In the **Description** field, add a description of the value.
6. Select **Submit**.

Mapping logs for contextual alerts in Health Log Analytics

Map your incoming log data to service instances, components, and source types so that Health Log Analytics can generate alerts in context.

> **Important:** To enable AI-powered automatic parsing and mapping of log data, the integration must be activated with AI.

Mapping your log data to the correct context is especially important when the integration processes logs from multiple service instances and components. ServiceNow Otto suggests the best log field for mapping to service instances and components. When you use the AI-suggested field, or when that field is the default, an AI sparkle icon (✨) appears. You can select a different field if needed. If the AI agent can't find a suitable match, HLA uses the system default. The system default also applies if the selected field is not present in the sample log.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For a walkthrough of how to set up and review AI-suggested mappings, see AI-assisted log mapping in Health Log Analytics.

Example

A large financial institution might face performance issues with its e-banking application, which relies on various components like web, application, and database servers. Without log context mapping, logs from these components appear isolated, making it difficult to correlate issues. An anomaly in a Tomcat server log might be detected, but without proper context, the operator struggles to assess its impact. Log context mapping enables you to define rules to map logs to the e-banking application service instance and the Tomcat server component. This mapping provides a contextualized view for root cause analysis and resolution.

Map logs to service instances, components, source types

Map your logs to service instances, components, and source types so that Health Log Analytics (HLA) can generate contextual alerts.

Before you begin

For an overview of this feature, see Mapping logs for contextual alerts in Health Log Analytics.

Configure and activate an integration with AI before you perform this procedure. For more information, see Set up integrations for Health Log Analytics from the Integrations Launchpad.

Role required: evt_mgmt_admin

About this task

HLA uses the settings that you define in this procedure to identify service instances, components, and source types in log examples and map log data to them automatically. HLA links logs to the corresponding service instances, components, and source types for contextualized analysis. By default, automatic log context mapping is enabled.

AI suggests the optimal log field for mapping to service instances and components. When you use the AI-suggested field or if it's the default field, an AI sparkle icon (✦) appears. You can select a different field if needed. If AI can't find an optimal match or if your selected field is missing from the sample log, HLA uses the system default.

Important: If a manually defined mapping script exists in the **Data Input Mapping** page, automatic mapping overwrites it.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation pane, select the AIOps configuration center icon.
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. Under Integrations, select **Manage installed integrations**.
   The Integrations Launchpad appears.
4. On the **Installed integrations** tab, search for an integration and open it.
   The **Overview** screen displays.
5. Under **Next steps**, on the **Log context mapping** card, select **View mapping**.
   The **Log context mapping** table displays.
6. Select the relevant integration.
   The integration's **Log context mapping** page displays.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

> **Note:** If the selected integration has features that are unsupported in Service Operations Workspace, you're referred to the **Data Input Mapping** page. For more information, see Map raw log data manually.

7. **Optional:** Turn off automatic service instance and component mapping by using the toggle.
   If you turn off automatic mapping, you must define a mapping script manually in the **Data Input Mapping** page. For more information, see Map raw log data manually.

   The remaining steps in this procedure are only relevant when automatic mapping is enabled.

   > **Note:** When you open the **Log context mapping** form for the first time, the system default values display in all fields.

8. Configure the log field by which HLA identifies a service instance from the **Raw log field** drop-down list.
   A service instance represents a complete business process.
9. Configure the log field by which HLA identifies a component from the **Raw log field** drop-down list.
   A component represents the smallest part of a service instance. A single service instance typically comprises multiple components.
10. **Optional:** Select **Preview** to view the service instances and components the system has identified based on your settings in the previous steps.
    The service instances and components are grouped by service.
11. In **Advanced settings**, review the fallback service and set the log field by which the system identifies a source type.

    a. In the **Selected fallback service** field, review the fallback service the system uses if it can't identify the service instance in the log data.
    The displayed fallback service is the default service instance that you selected when you configured the integration.

    > **Note:** For some integrations, such as Filebeat, this field shows `N/A` instead of a value. In these integrations, if HLA can't identify the service instance, it uses the system default value rather than the fallback service.

    b. Configure the log field by which HLA identifies a source type from the **Raw log field** drop-down list.

    c. **Optional:** Select **Preview** to view the log sources the system has identified based on your source type settings.

12. **Optional:** In the Simulator, review a log processing simulation based on your current mapping.
    The provided simulation helps you understand how the current mapping impacts HLA log processing. Use this information to fine-tune your settings:
    - The **Log fields** tab shows the default service, component, and source type and the raw log.
    - The **Extracted values** tab shows the service instance, component, and source type that the system has extracted from the raw log based on your current settings.
13. Select **Save mapping** to save your settings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

View source type and log source relationships

Explore the many-to-many relationships between source types and log sources to help you optimize data input mapping in Health Log Analytics.

Before you begin

For an overview of mapping, see Log data auto-mapping and mapping in Health Log Analytics.

Role required: evt_mgmt_admin

About this task

Health Log Analytics uses source types to parse logs and utilizes log sources as the framework for detecting anomalies. Each source type provides logs that are analyzed by multiple log sources, and each log source receives logs that are parsed by multiple source types. Reviewing the associations between source types and log sources can help you improve your data input mapping for better performance and outcomes.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Mapping** > **Data Input Mapping**.
2. Verify that log data is streaming into your instance, and then open a data input mapping record.
3. View the associations between the log sources and the source types.
   - View the log sources that are associated with a source type:
     a. Open the **Source Types** tab to view the generated source type structures.
     b. Open a source type structure record.
     c. Select a source type.
     d. Under **Sources**, view all the log sources that receive data from this source type.
   - View the source types that are associated with a log source:
     a. Open the **Sources** tab to view the generated log sources.
     b. Select a log source record.
     c. On the **Source Types** tab, view all the source types that feed data into this log source.

Note: The displayed results are updated once a day. Results that are older than 24 hours are deleted automatically.

Source type structure adjustment in Health Log Analytics

Health Log Analytics (HLA) enables you to reclassify auto-classified log properties and change auto-mapped labels. These adjustments help HLA machine learning analyze your data accurately.

What HLA does automatically

HLA automatically separates the transport header from the inner log message and sends only the inner log message to the source type structure. The system extracts properties from incoming log messages and auto-maps labels to source type fields.

- Classification determines how the HLA engine analyzes and processes each field. Available classifications are: METER, GAUGE, ARC_ONLY, HISTOGRAM, INVALID.
- Labels tell HLA what role a field plays in the log structure. Available labels are: MESSAGE, HOST, TIMESTAMP, SEVERITY, EVENT-ID.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Reviewing and, if necessary, modifying automatically mapped labels and auto-classified properties in the source type structure verifies the HLA engine interprets log fields correctly.

Note: Because a single data input can contain multiple source types, HLA structures log data by source type rather than by data input.

AI-assisted log parsing with ServiceNow Otto

AI-assisted log parsing using ServiceNow Otto provides recommendations for optimal classifications and labels for parsed log properties based on your log patterns. This approach reduces manual effort and improves accuracy without requiring custom JavaScript functions.

To enable this capability, activate the integration with AI-powered capabilities by selecting the **Activate with AI** option. This option enables AI-powered automatic parsing and mapping of log data. When the integration is activated, ServiceNow Otto collects and analyzes log data and displays suggested classifications and labels for your source type properties. An AI icon (✨) indicates that AI is active. Verify that ServiceNow Otto correctly classified and labeled your log properties. You can override the suggestions by selecting a different classification or label from each list, if needed.

While ServiceNow Otto generates a parser automatically for a source type, a notification banner on the **Source Type Structure** page shows the current status of the generation process.

Example

The following example shows how to modify values of extracted properties in the source type structure with JavaScript.

Consider the following log:

```
{
  "TenantId": "abc-01-02-03-04-05050708091011121314",
  "@timestamp": "2020-08-28T08:29:23.967Z",
  "Computer": "john Doe_computer",
  "EventType_s": "LogMessage",
  "Job_s": "johnDoe_cell",
  "IP_s": "1.00.00.00",
  "message": "This is the extracted message. This part of the
 message includes superfluous content and values",
  "MessageType_s": "OUT",
  "Timestamp_d": 1598603359017850000,
  "Type": "my_LogMessage_is",
  "_ResourceId": ""
}
```

The sample code contains `"key":"value"` pairs: The key is the property name. The value is the property value.

The key "message" in the sample has the following value: `"This is the extracted message. This part of the message includes superfluous content and values"`.

If you wanted your logs to contain only the meaningful part of that message, you would add JavaScript code instructing the system to extract only that part:

```
//Added JavaScript to extract only the first sentence in the
 message! if (output['message'] != null){ output['message'] =
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
output['message'].slice(0, output['message'].indexOf("\.")); }
(edited)
```

You could use the same logic to reclassify a value. For example, if the key "Computer" is insignificant, you could set its value to "Invalid."

For more information about the source type structure, see the Source Type Structure – Labels & Classifications [KB0863562] article in the Now Support Knowledge Base.

Note: You can reactivate the learning mode for a source type structure to use the HLA engine's learning functionality again after the initial learning period becomes outdated. On the **Source Type Structure** form, select **Relearn** to reset parsing, extraction, classification, and labeling for the source type structure and restart the learning process.

Refine the source type structure in Health Log Analytics

Fine-tune how Health Log Analytics reads your inner log messages and detects anomalies by customizing the extracted properties in the source type structure.

Before you begin

For an overview, see Source type structure adjustment in Health Log Analytics.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Inputs** > **Source Type Structure**.
2. Open a record.

   Note:

   - Health Log Analytics automatically separates the transport header from the inner log message when **Auto extraction** is selected (default).
   - Health Log Analytics fetches log samples automatically the first time the **Source Type Structure** form displays. In subsequent sessions, fetch the latest samples by selecting **Refresh Samples**.

3. **Optional:** Get AI-powered classification and labeling suggestions.

   AI can classify parsed log properties and suggest appropriate labels.

   a. Select **Suggest classifications (AI)** from the **Source Type Structure** page.

      On the **Key/Value Mapping** tab, AI-suggested classifications and labels appear in the **AI-suggested classification** and **AI-suggested label** columns.

   b. Review the suggestions.

   c. In the **Classification** and **Labels to assign** columns, select your preferred classifications and labels from the lists.

4. **Optional:** View how the current JavaScript function affects the log lines.

   a. Add a sample message in the **Test manual sample** field.

   b. Select **Go**.

   c. In the **Key/Value Mapping** tab, note how the JavaScript function affects the log lines.

5. In the **Raw input sample** field, choose a log message.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When you test your JavaScript function, Health Log Analytics uses this sample message to show the joint effect of automatic extraction and the JavaScript function on the log lines.

The following fields are read only:

Field	Description
Duration (ms)	The processing time of all samples, in milliseconds.
Dropped	The total number of logs dropped in all the samples.
Errors	The total number of errors that occurred in all the samples.
Timestamp extraction failures	The number of timestamp extraction failures that occurred in all the samples.
Severity extraction failures	The total number of severity extraction failures that occurred in all the samples.
Message extraction failures	The total number of message extraction failures that occurred in all the samples.
Lengthy properties	The total number of lengthy properties in all the samples. Lengthy properties are properties with more than 256 characters. **Note:** Because Health Log Analytics doesn't extract such properties, they aren't indexed as keywords in Elasticsearch.

6. Define a JavaScript function that customizes automatically extracted properties or adds properties to the source type structure.

   a. In the JavaScript console, either change the provided default JavaScript function, modify an existing custom JavaScript function, or define a new one.

   Note: In addition to the default JavaScript function, Health Log Analytics provides several JS function templates for refining the source type structure. The templates can act as a starting point for your custom script code. This feature is supported in the Health Log Analytics application, Version 20.0.11 - July 2021, available from the ServiceNow Store.

JS function templates	Description
Extract Key_Values Using Regex	Script used for parsing logs into a series of key:value pairs by using regular expressions to identify specific regex patterns. Depending on the log data being sent to the source type, it parses either the inner message or the full log line. You can view

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

JS function templates	Description
	how the data appears in the samples that are loaded into the source type structure. This process is iterative. It ’s repeated until all key:value pairs are found.
Extract Key_Values Using split-regex	Script used for parsing logs into a series of key:value pairs by using regular expressions to identify specific regex patterns. This process captures the values in a LIST form first, then uses the Java split function to create the key:value pairs. Depending on how the data appears in the raw input, this function might be more efficient than `Extract Key_Values Using Regex`. The raw input is either the inner message that header detection passes on, or the full raw log. If header detection is turned off or doesn't work on that particular log, the full raw log is used.
JSON Parse - flatten	Script used for extracting JSON information that is part of another text string from the raw input. For example, the information could be a JSON request written as part of a longer inner message. Inner JSON sections are difficult to split. In such cases, this script can be used to "flatten" or parse out the key:value pairs.
Extract a new field from raw input	Script that extracts a new field from the raw input, using a regular expression with capture groups to identify the new field's pattern.
Parse XML format	Script used for extracting key:value pairs from the XML by using a regular expression to identify the XML format. This process is iterative. It's repeated until all key:value pairs are found.
Set numerical severity level as textual values	Script used for converting numerical severity values to their corresponding textual severity values. **Note:** To enable the system to identify the severity level of a log correctly, severity must be given in text format. No numerical severity values should remain.
Trim function	Script used for removing the double quotes that surround the string from VALUE.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

JS function templates	Description
	You can adapt this function to remove any other characters that surround the output VALUE of a key:value pair.

The JavaScript function for refining the source type structure uses the following objects:

Signature - function construct (sample, output)

Object	Description
sample	The inner message extracted from the sample message.
output	Object that contains the key-value pair map.

b. Test the JavaScript function by selecting **Test**.

c. View the outcome of the JavaScript function in the related lists and modify if needed.

- The **Key/Value Mapping** tab shows the effect of your JavaScript function combined with the system's automatic extraction on your raw input sample.

  Modify keys where appropriate.

  - The **Classification** field enables you to reset the classification of a property. The available types are:

Classification

Type	Description	Example
Meter	A property with this classification detects anomalies in the number of times the property appears in each log message. It presents changes in the quantity of this value as part of Automatic Root Cause analysis. **Note:** Properties classified as Meter consume resources.	Status codes, response codes, actions, or patterns
Gauge	A property with this classification detects anomalies in a numerical value that is reported continuously.	CPU, memory, or response time

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Type	Description	Example
	Note: Properties with a classification of Gauge consume resources.	
Timeless Gauge	A property with this classification detects anomalies in a numerical value that is not reported continuously. The system notifies about an anomaly in this value regardless when the anomaly occurred. **Note:** This feature is supported in the Health Log Analytics application, Version 20.0.11 - July 2021, available from the ServiceNow Store.	
Automatic Root Cause (ARC Only)	A property with this classification reports the property as part of the Automatic Root Cause analysis of another anomaly and not as an anomaly by itself.	User name, IP addresses, application components, or datacenter
Invalid	A property with this classification isn't calculated or shown in the Automatic Root Cause analysis. **Note:** Properties classified as Invalid save resources.	

- The **Labels to assign** field enables you to set a property on a label.

Labels to assign

Label	Description
Timestamp	The property that holds the timestamp of the event.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Label	Description
	Note: If automatic header properties detection is enabled and the source type lacks a timestamp, the system extracts the timestamp from the transport header. If header detection is turned off or doesn't work for the relevant log lines in the data input, all log lines must have proper timestamps.
Severity	The property that represents the severity level of the log.
Message	The log message. The system uses this property to identify textual patterns in the data.
Host	The property that represents the host from which the event was sent. **Note:** If automatic header properties detection is enabled and the source type lacks a host, the system extracts the host from the transport header. If header detection is turned off or doesn't work for the relevant log lines in the data input, all log lines must have a host.
External ID	The property that serves as a unique identifier for this event type. For example, Event ID in Windows event log.

    - The **Rename key** field enables you to rename the key.
- The **Outcome Key-Value** tab shows how your JavaScript function processed the data.
- The **Data Input Mappings** tab shows the data input mappings for the current source type.

  The **Last event time** column on this tab shows the last date and time that the AI engine processed a log for the data input mapping. The system refreshes this information every five minutes. Knowing when the last log was processed for this data input mapping makes it easier to verify that log data is streaming.

- The remaining tabs show errors, message extraction failures, severity extraction failures, timestamp extraction failures, and lengthy properties.

Note: If your new JavaScript function isn't behaving as expected, you can revert to the last published one by selecting the **Revert JS Function** related link.

d. Optional: Make any necessary adjustments and then test the JavaScript function again.

7. Select the **Save template** option to save the JavaScript function.
   You can either save the JavaScript function as a new template or overwrite the currently selected template.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To save the JavaScript function as a new template, enter a new name in the **Template name** field.
- To overwrite the template currently selected in the **JS function templates** field, leave the **Template name** field empty.

8. Select **Publish** to save the JavaScript function to the database.

Result
When the JavaScript function is published, Health Log Analytics uses it to fine-tune how it reads your inner log messages and detects anomalies.

The new script is automatically added to the list of JS function templates from which you can choose. This feature is supported in the Health Log Analytics application, Version 20.0.11 - July 2021, available from the ServiceNow Store.

What to do next
Continue with the remaining data input setup tasks: Verify that all your log sources are present and active, and add timestamp formats if necessary.

Source type structure adjustment in Health Log Analytics

Health Log Analytics content packs for quicker time to value
Shorten onboarding time for the Health Log Analytics application by installing content packs. The packs contain default source types and mapping script templates that save you the time it takes to create them from scratch.

After installing a content pack, Health Log Analytics begins to stream and parse your log data immediately. The application recognizes and analyzes the data, generates more relevant alerts, and reduces noise from the moment of the integration. You can still customize the mapping configuration later on, if needed.

You can integrate content packs in two different ways:

- Select a content pack when you're configuring a data input. Health Log Analytics activates the selected pack automatically and uses its mapping script for mapping the data input sources.
- Activate a content pack before you configure a data input. When you have configured the data input and you're mapping the raw log data, select the content pack's mapping script from the **Data Input Mapping** form.

Currently, a content pack is available for streaming logs from Linux using Filebeat.

Note: All configurations in content packs exist in the global domain. If you're using domain separation, the content pack content is only available for logs in the global domain.

This feature is supported in the Health Log Analytics application, Version 25.0.17 - November 2022 and later, available from the ServiceNow Store.

Activate a content pack in Health Log Analytics
You can activate a content pack before configuring a data input.

Before you begin
For an overview of this feature, see Health Log Analytics content packs for quicker time to value.

Role required: evt_mgmt_admin

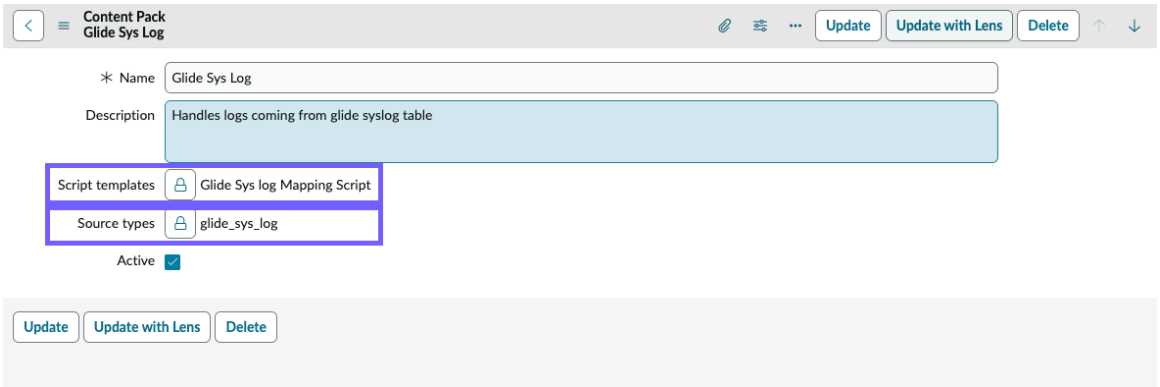
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Content Packs**.
2. Open the appropriate content pack for your data input.

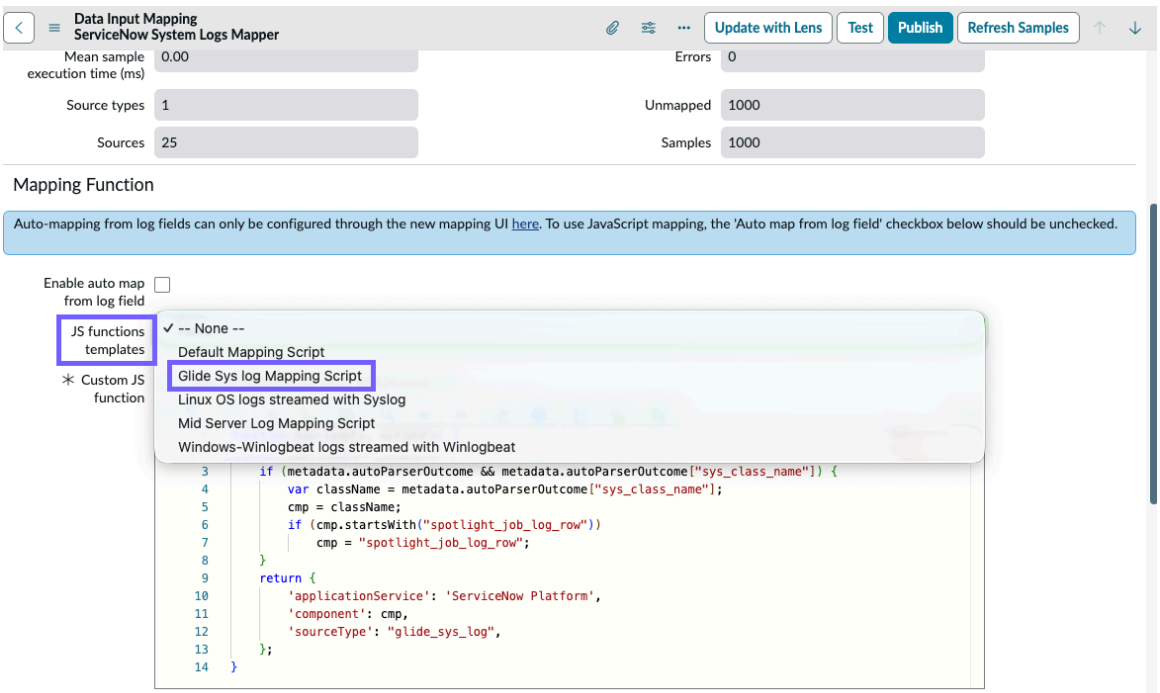
   Note: Currently, a content pack is available for streaming logs from Linux using Filebeat.

3. On the **Content Pack** form, select **Activate**.
   The **Active** check-box appears selected. The activated content pack displays the script templates and source types that are associated with it.



Note: The source types included in the content pack may already exist on your ServiceNow instance. In this case, Health Log Analytics automatically renames the content pack source types by adding a content pack suffix to their name. If you want to use the content pack source types and their mapping, delete or rename the original source types and then remove the suffix from the content pack source types. Otherwise, Health Log Analytics uses the original source types.

On the **Data Input Mapping** form, the mapping script is listed as a JavaScript functions template option.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

When you have configured the data input and you're mapping your raw log data, you can select the content pack's mapping script from the **JS functions templates** drop-down.

Migrating a Health Log Analytics data input configuration between instances

Export a Health Log Analytics data input and source types configuration as an update set and import it to a different ServiceNow instance. In the target environment, you can use the migrated data input for streaming and processing log data. This functionality saves time and reduces possible errors by avoiding the need to configure the settings again on the target instance.

The migrated configuration includes mapping and all other relevant settings, except credentials. Depending on the data input that you're exporting, you may need to configure credentials in the target environment. For example, when exporting Amazon CloudWatch or Amazon S3 data inputs, you must configure Amazon Web Services (AWS) credentials.

This feature is supported in the Health Log Analytics application, Version 25.0.17 - November 2022 and later, available from the ServiceNow Store.

Starting with Health Log Analytics Version 38.0.17 - December 2025, you can also export all source types related to one or more selected log sources to the update set together. For more information, see Export source types by log source.

For general information about update sets in the ServiceNow AI Platform, see System update sets.

Export a Health Log Analytics data input configuration

Export the configuration of a Health Log Analytics data input with or without the related source types to an update set. You can then import the update set to the target environment.

Before you begin

For an overview of this feature, see Migrating a Health Log Analytics data input configuration between instances.

Role required: evt_mgmt_admin

Procedure

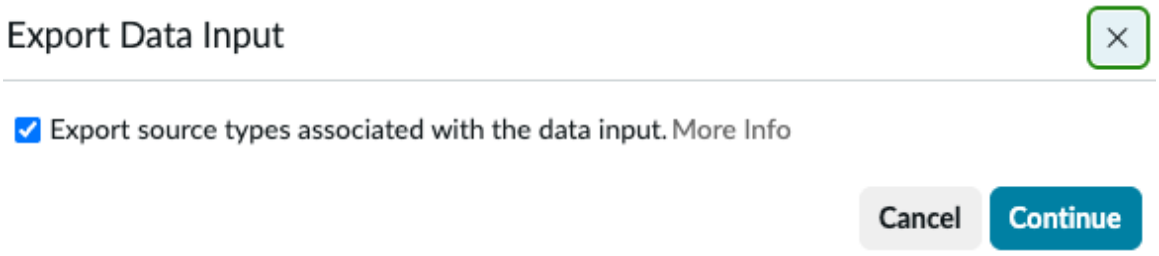
1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. In the Data Inputs list, select the data input that you want to export.
3. Export the data input to an update set.

> **Note:** The exported configuration doesn't include the service instance configured for the data input.

   a. From the **Actions on selected rows** drop-down menu, choose **Export Data Input**.

   b. In the **Export Data Input** dialog, do one of the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



- Leave the check box selected to include the source types that are associated with the data input in the update set.

  When the box is selected, the update set will include the following source type-related tables:

  - sn_occ_source_type
  - sn_occ_source_type_structure
  - sn_occ_sources
  - sn_occ_timestamp_formats
  - sn_occ_lexical_keywords
  - sn_occ_log_correlator
  - sn_occ_log_source_retention
  - sn_occ_quick_replacements
  - sn_occ_reconstructors
  - sn_occ_replacements
- Clear the box to export the data input without the associated source types. For example, if you want to reuse the data input configuration, but configure the source types from scratch.

  When the box is clear, the update set will not include the source type-related tables.

  Note: You can export source types separately. For more information, see Export source types to an update set in Health Log Analytics.

c. Select **Continue**.

The data input, with or without the source types, is exported to an update set.

Note: An update set can act as the parent for multiple child update sets.

4. Select **Download update set** to download the update set to the instance.
The update set is downloaded as an XML file.

What to do next

Import the update set to the required ServiceNow instance. For more information, see Import a Health Log Analytics data input to a target instance.

Import a Health Log Analytics data input to a target instance

Import a data input configuration that you've exported from another instance as an update set.

Before you begin

For an overview of this feature, see Migrating a Health Log Analytics data input configuration between instances.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before performing this procedure, export the data input to an update set. For more information, see Export a Health Log Analytics data input configuration.

Role required: admin

Procedure

1. On the target instance, import the update set that contains the data input configuration.
   a. Navigate to **All** > **System Update Sets** > **Retrieved Update Sets**.
   b. In the Related Links, select **Import Update Set from XML**.
   c. Select **Choose file** and open the update set XML file from the Downloads folder.
   d. Select **Upload**.
   The update set is uploaded to the instance and appears in the **Retrieved Update Sets** list in the Loaded state.
2. Identify and address errors in the update set.
   a. In the **Retrieved Update Sets** list, open the update set record.
   b. Select **Preview Update Set Batch** to detect errors.
   The **Batch Update Set Preview** dialog indicates failure, which is expected behavior.
   c. Close the dialog and resolve the errors in the **Update Set Preview Problems** related list.

      For more information, see Preview a remote update set.

      You can ignore errors that start with 'Could not find a record in [table]' for the following tables:

      - aws_credentials
      - azure_sas_credentials
      - azure_service_principal
      - basic_auth_credentials
      - cmdb_ci_service_auto - Service instance
      - ecc_agent - MID
      - ecc_agent_cluster - MID Server Cluster
      - kafka_ssl_credentials
      - sn_occ_data_input_preprocess_example
      - sn_occ_data_input_preprocess_example_row
      - sn_occ_gcp_credentials
      - sn_occ_mapper_example
      - sn_occ_source_type_examples
      - sn_occ_source_type_structure_data
   d. Select the errors that you ignored and then select the **Select All** check box.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

e. From the **Actions on selected rows...** drop-down menu, choose **Accept remote update**.

f. In the **Preview Problems for Batch** related list, select all remaining errors and accept the remote update as explained in the earlier steps.

3. When all errors in the update set have been resolved, select **Commit Update Set Batch**.
   The imported data input appears on the Data Inputs list. The import includes mapping settings and all other relevant configuration.
4. In the imported data input, configure the following.
   - The MID Server to which the logs stream.
   - Credentials.

     Note: Whether you need to configure credentials depends on the data input that you've imported. For example, you must configure Amazon Web Services (AWS) credentials for Amazon CloudWatch and Amazon S3 data inputs.

   - (Optional) The service instance to which to bind the log data.

   For more information, see the configuration documentation for the relevant data input: Set up data inputs in Health Log Analytics manually.

Result
You can begin using the data input for streaming and processing log data.

Export source types to an update set in Health Log Analytics

Export source types to an update set separate from the Health Log Analytics data input configuration. You can then import the update set to the target environment.

Before you begin
For an overview of this feature, see Migrating a Health Log Analytics data input configuration between instances.

Role required: evt_mgmt_admin

Procedure
1. Navigate to **All** > **Health Log Analytics** > **Source Types**.
2. In the Source Types list, select one or more source types that you want to export.
3. From the **Actions on selected rows** drop-down menu, choose **Export Source Types**.
   The source types are exported to an update set.

   Note: An update set can act as the parent for multiple child update sets.

4. Select **Download update set** to download the update set to the instance.
   The update set is downloaded as an XML file.

What to do next
Import the update set to the required ServiceNow instance. For more information, see Import Health Log Analytics source types to a target instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Export source types by log source

Export all source types related to one or more selected log sources to an update set together in Health Log Analytics. You can then import the update set to the target environment.

Before you begin

For an overview of this feature, see Migrating a Health Log Analytics data input configuration between instances.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Log Sources**.
2. In the Log Sources list, select one or more log sources for which you want to export the related source types.
3. From the **Actions on selected rows** drop-down menu, choose **Export Related Source Types**.
   The source types are exported to an update set.

   Note: An update set can act as the parent for multiple child update sets.

4. In the **Related Source Type Exporter** screen, select **Download update set** to download the update set to the instance.
   The update set is downloaded as an XML file.

What to do next

Import the update set to the required ServiceNow instance. For more information, see Import Health Log Analytics source types to a target instance.

Note: Only the related source types and tables for the selected log sources will be imported, not the data inputs.

Import Health Log Analytics source types to a target instance

Import source types that you've exported separate from the Health Log Analytics data input configuration.

Before you begin

For an overview of this feature, see Migrating a Health Log Analytics data input configuration between instances.

Before performing this procedure, export the source types to an update set. For more information, see Export source types to an update set in Health Log Analytics.

Role required: admin

Procedure

1. On the target instance, import the update set that contains the source types.

   a. Navigate to **All** > **System Update Sets** > **Retrieved Update Sets**.

   b. In the Related Links, select **Import Update Set from XML**.

   c. Select **Choose file** and open the update set XML file from the Downloads folder.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Select **Upload**.
The update set is uploaded to the instance and appears in the **Retrieved Update Sets** list in the Loaded state.

2. Identify and address any errors in the update set.

a. In the **Retrieved Update Sets** list, open the update set record.

b. Select **Preview Update Set Batch** to detect errors in the update set.
The **Batch Update Set Preview** dialog indicates failure, which is expected behavior.

c. Close the dialog and resolve the errors in the **Update Set Preview Problems** related list.
You can ignore errors that start with 'Could not find a record in [table]' for the following tables:

d. Select the errors that you ignored and then select the **Select All** check box.

e. From the **Actions on selected rows...** drop-down menu, choose **Accept remote update**.

f. In the **Preview Problems for Batch** related list, select all remaining errors and accept the remote update as explained in the earlier steps.

3. When all errors in the update set have been resolved, select **Commit Update Set Batch**.

Result
The imported source types appear in the Source Types list.

Check gRPC and network connectivity for Health Log Analytics on the MID Server

Verify that Health Log Analytics can function properly by performing diagnostic tests on the MID Server to check gRPC and network connectivity.

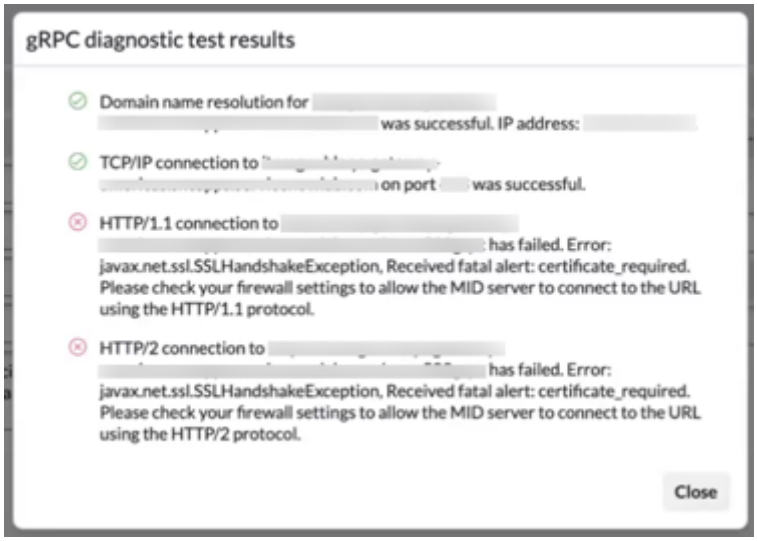
Before you begin
Role required: evt_mgmt_admin

About this task
Your organization's network and security configuration may be keeping Health Log Analytics from functioning properly. For example, complex configurations with proxy and firewall settings might block outbound connections. To avoid operational issues, you can test gRPC and network connectivity on the MID Server.

Procedure

1. Navigate to **All** > **MID Server** > **Servers**.
2. Open the relevant MID Server record.
3. Under Related Links, select **Test gRPC connection**.
The system performs gRPC connectivity tests, such as domain name resolution, TCP/IP, and HTTP connection. When the testing is complete, the test results are displayed. Successful tests are preceded by a green check-mark, while failed tests are preceded by a red x mark.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Fix the issues that caused any tests to fail by following the instructions on the **gRPC diagnostic test results** screen.
5. Select **Test gRPC connection** again and confirm that all the tests are completed successfully.

Administering Health Log Analytics

This section covers tasks involved in Health Log Analytics administration. It provides you with information needed to keep Health Log Analytics running efficiently.

Configure Health Log Analytics system properties for a single log source

Configure system properties for a specific log source if you need to alter the default values, which should not usually be necessary.

Before you begin

Role required: evt_mgmt_admin

About this task

Changing Health Log Analytics system properties affects back-end processes and can produce unexpected results. Therefore, if you must make changes to these properties, keep a record of your adjustments. For example, note the value before and after a modification and the time of the change.

Note: To modify a Health Log Analytics system property whose **Requires restart** value is **true**, contact ServiceNow support to modify it for you.

For a complete description of all the Health Log Analytics system properties, see the HLA System Properties [KB0869842] article in the Now Support Knowledge Base.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Log Sources**.
2. On the **Source properties** tab, right-click a property.
3. Select **Override property value** from the pop-up menu.
4. In the **Value** field, enter the appropriate value.
5. Select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The new value overrides the previous setting for the selected log source.

Related topics
Configure global Health Log Analytics system properties

Configure global Health Log Analytics system properties

Configure global Health Log Analytics system properties if you need to alter the default values, which typically should not be necessary.

Before you begin
Role required: evt_mgmt_admin

About this task
Changing Health Log Analytics system properties affects back-end processes and can produce unexpected results. Therefore, if you must make changes to these properties, keep a record of your adjustments. For example, note the value before and after a modification and the time of the change.

Note: To modify a Health Log Analytics system property whose **Requires restart** value is **true**, contact ServiceNow support to modify it for you.

For a complete description of all the Health Log Analytics system properties, see the HLA System Properties [KB0869842] article in the Now Support Knowledge Base.

Procedure
1. Navigate to **All** > **Health Log Analytics** > **Health Log Analytics Administration** > **System Properties**.
2. Select a property with the scope Source.
3. In the **Value** field, enter the appropriate value.
4. Select **Update**.
   The setting will apply to log sources created from this point forward.
5. Determine the scope of application of the new setting.
   - To apply the setting only to log sources created from this point forward, select **Update**.
   - To override values for this property in all existing log sources and apply the modified setting to all new log sources, select **Override source property**.

Related topics
Configure Health Log Analytics system properties for a single log source

Enable or disable Health Log Analytics system features

Customize the basic configuration of Health Log Analytics by enabling or disabling system features.

Before you begin
Role required: evt_mgmt_admin

Procedure
1. Navigate to **All** > **Health Log Analytics** > **Health Log Analytics Administration** > **Features**.
   By default, the table shows the system features that administrators modify most commonly. To view the complete list of features, use the filtering options.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Select a feature record from the table.
   The record contains the following information:
   - The name of the feature
   - A description of the feature's purpose
   - The default state of the feature
   - The current state of the feature
3. Set the state of a system feature to ON to enable the feature or to OFF to disable it.
4. Select **Update**.

View log anomaly metrics in Health Log Analytics

View and query all metrics that Health Log Analytics tracks from a single location.

Before you begin

Role required: evt_mgmt_admin

About this task

The Metric Data table provides a centralized view of every metric that HLA collects and monitors. It includes pattern metrics, custom metrics, and raw metrics. Use the table for the following tasks:

- Query metrics by log source, integration, source type, and metric type to narrow down which metrics HLA is tracking for a data input or environment.
- Review anomaly detection statistics to see how often HLA detects anomalies for a given metric.
- View metric baselines to understand what HLA records as normal behavior.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Log Anomaly Detection** > **All Metrics**.
   The **Metric Data** table displays a record for each metric that HLA is collecting. For a description of the columns in the table, see Metric Data table columns in Health Log Analytics.
2. **Optional:** Filter the table by log source, integration, source type, or metric type.
   Filtering enables you to narrow the results to the metrics relevant to a specific data input or environment.
3. Select a metric record to view its details.

Health Log Analytics alert notification in Slack or Microsoft Teams channels

Health Log Analytics sends notifications for new anomaly alerts in real time to Slack or Microsoft Teams channels. This built-in functionality frees you from having to continuously monitor logs to prevent incidents.

The notifications include the number of the alert, its description, severity, configuration item, state, and priority group. You can filter the alerts for which notifications are sent to your channel. For example, you may only want to receive alerts of a Major severity or a High priority group. By default, no notifications are sent on secondary alerts.

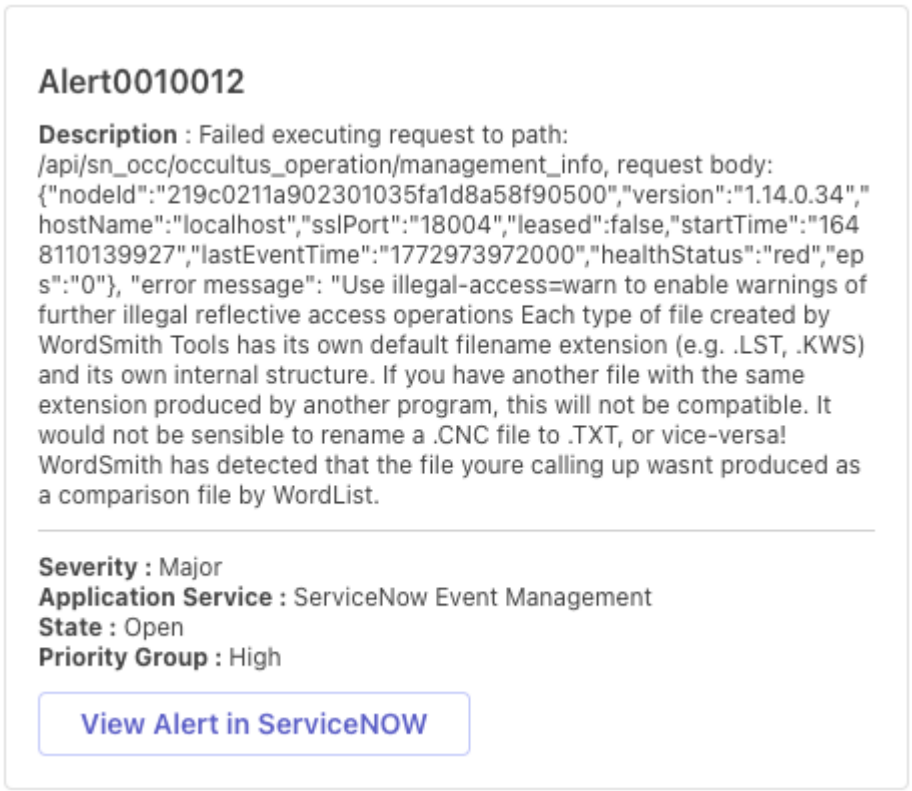
To support channel notification, the channel must be configured to receive Health Log Analytics notifications.

Starting with Version 33.0.27 - August 2024, Health Log Analytics uses the Microsoft Teams Graph spoke application to send notifications on new anomaly alerts. The application replaces the Microsoft Teams spoke plugin, which will be deprecated. If you're using an HLA version earlier than 33.0.27, follow the setup procedure in Set up Health Log Analytics alert notifications

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

in channels. Otherwise, see Set up Health Log Analytics alert notifications in a Microsoft Teams channel.

Sample HLA alert notification in Microsoft Teams



Set up Health Log Analytics alert notifications in channels

Set up notifications for new Health Log Analytics anomaly alerts in either a Slack or Microsoft Teams channel.

Before you begin

Starting with Version 33.0.27 - August 2024, Health Log Analytics uses the Microsoft Teams Graph spoke application to send notifications for new anomaly alerts. The new application replaces the Microsoft Teams spoke plugin, which will be deprecated. If you're using an HLA version earlier than 33.0.27, follow the setup procedure below. Otherwise, refer to Set up Health Log Analytics alert notifications in a Microsoft Teams channel.

Note: If you upgrade from an earlier version to Version 33.0.27 - August 2024 or later, redo the setup using the procedure in Set up Health Log Analytics alert notifications in a Microsoft Teams channel.

For alert notifications in Slack channels, verify that the plugin Slack Webhooks Spoke for ServiceNow Integration Hub (com.sn.slack.ah) is installed:

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel. For more information, see Request a plugin.

Role required: evt_mgmt_operator or evt_mgmt_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Create a Webhook URL for a channel in Slack or Microsoft Teams.

   Health Log Analytics uses the Webhook to notify about the alerts in the channel.

2. Map the Webhook URL for the channel to the service instance associated with the alert.

   a. Navigate to **Health Log Analytics Administration** > **Webhook Notification**.

   b. Select **New**.

   c. On the form, fill in the fields.

   Alert Notification Webhook form

Field	Description
Webhook	The Webhook URL that you created for the channel.
Active	Select to activate the Webhook.
Configuration item	The service instance associated with the alert. If this field is empty, the system uses the default property for the channel: default.slack.webhook.url for Slack or default.teams.webhook.url for Microsoft Teams.

   d. Select **Submit**.

3. Activate the Health Log Analytics Alert Management rule for submitting alerts to the appropriate channel.

   a. Navigate to **Event Management** > **Rules** > **Alert Management Rules**.

   b. Locate the appropriate rule:
      - For Slack: Submit HLA alerts to slack.
      - For Microsoft Teams: Submit HLA alerts to teams.

   c. In the **Active** column for the rule, set the value to `true`.

4. **Optional:** Filter the alerts on which notifications will be sent to the channel.
   a. In the Alert Management Rules table, select the rule for your channel.
   b. Select **Alert Filter**.
   c. On the form, set the conditions that must be met for sending a notification on the alert to the channel.
   d. Select **Update**.

© 2026 ServiceNow, Inc. All rights reserved.

Set up Health Log Analytics alert notifications in a Microsoft Teams channel

Set up notifications for new Health Log Analytics anomaly alerts in a Microsoft Teams channel.

Before you begin

Starting with Version 33.0.27 - August 2024, Health Log Analytics uses the Microsoft Teams Graph spoke application to send notifications on new anomaly alerts. For more information, see Microsoft Teams Graph Spoke. If you're using an HLA version earlier than 33.0.27, refer to the setup procedure in Set up Health Log Analytics alert notifications in channels.

Role required: evt_mgmt_operator or evt_mgmt_admin

Procedure

1. Install the latest version of the Microsoft Teams Graph spoke from the ServiceNow Store.
2. Set up the Microsoft Teams Graph spoke.
   For instructions, see: Set up the Microsoft Teams Graph spoke.
3. Activate the Health Log Analytics Alert Management rule for submitting alerts to the Microsoft Teams channel.
   a. Navigate to **Event Management** > **Rules** > **Alert Management Rules**.
   b. Locate the appropriate rule: Submit HLA alerts to teams.
   c. In the **Active** column for the rule, set the value to `true`.
4. Map the service instance to the Microsoft Teams channel.
   a. In the **All** navigation menu, type `sn_occ_teams_alert_notification_config` and then press Enter.
   b. Select **New**.
   c. On the form, fill in the fields.

      Note:

      - You can obtain the Teams ID and Channel ID from the Microsoft Teams channel.
      - The **Configuration Item** field must correspond to the Service instance. If no CI is needed, leave this field empty. In this case, the record is used for alerts when there's no record that matches their CI.

   d. Select **Submit**.
   e. **Optional:** Repeat steps 1 to 4 to add additional configurations.

Storage space for log retention in Health Log Analytics

The Health Log Analytics base system typically provides 1,000 GB storage space for log source retention, although the storage capacity may vary depending on your license. The default retention time for logs is three days, but you can modify that period.

This feature is supported in the Health Log Analytics application, Version 22.0.12 - December 2021 and later, available from the ServiceNow Store. To activate it, contact your ServiceNow account manager or ServiceNow Support.

When the storage space used by all log sources exceeds 80 percent of the total, you receive an email notification. You can change the default threshold percentage by modifying the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

sn_occ.elastic_storage.utilization_limit.percent system property in the System Properties table.

Automatic reduction of log retention days

By default, logs are retained for three days. You can adjust this period to 3, 7, 14, or 30 days. For more information, see Modify the log source retention period in Health Log Analytics.

If the storage space used by all log sources reaches 100 percent, the number of retention days allocated per source is automatically lowered by one level and you receive an email notification with the specifics. The automatic reduction process starts with the sources that were allocated the highest number of retention days. For example, for a source with 30 retention days, the number is reduced to 14. If the source has 14 retention days, the number is reduced to 7, and so on.

You can change the threshold percentage for the automatic reduction of log retention days by modifying the *sn_occ.log_retention.automatic_reduction_utilization_percent* system property in the System Properties table.

Related topics

Modify the log source retention period in Health Log Analytics

Modify the log source retention period in Health Log Analytics

Modify the period that Health Log Analytics retains logs from a specific source. You can calculate the impact of your intended change on storage to help you make an informed decision.

Before you begin

This feature is supported in the Health Log Analytics application, Version 22.0.12 - December 2021 and later, available from the ServiceNow Store. To activate it, contact your ServiceNow account manager or ServiceNow Support.

To display **Log source retention** in the filter navigator:

1. Navigate to **All** > **System Properties** > **All Properties**.
2. Enter the property name *sn_occ.activate_log_source_retention* in the Search box.
3. Ensure that the property value is set to **true**.

Role required: evt_mgmt_admin

About this task

By default, the log retention duration per source is set to three days. You can change this number to 7, 14, or 30 days. For more information, see Storage space for log retention in Health Log Analytics. Note that longer log retention results in higher storage usage.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Log source retention**.
2. **Optional:** Calculate how changing the retention period for logs from a particular source affects storage.
   a. Open a log source record.
   b. In the Related Links section, select **Calculate how retention impacts storage**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. From the New retention list, select the proposed number of retention days for logs from this source.

d. Select **Calculate**.
The **Projected storage usage (GB)** field displays the amount of storage space in GB that the source would use if the new policy were implemented.

> **Note:** Health Log Analytics bases its calculation of projected storage usage on the volume of log data that was streamed in the past. The estimate could change as the volume of streamed log data varies.

e. Compare the projected usage to the amount of storage needed for the current policy that is shown in the **Current storage usage (GB)** field.

f. Select **Cancel** to close the dialog box.

3. Update the log retention policy per source or for several sources together.
   - To update log retention for a single source:
     a. Open a log source record.
     b. From the Retention days list, select the required number of retention days for logs from this source.
     c. Select **Update**.
   - To update log retention for multiple sources:
     a. Select several log source records.
     b. From the Actions on selected rows choice list, select **Update multiple source retentions**.
     c. From the New retention policy list, select the required number of retention days for logs from the selected sources.
     d. Select **Update**.

   The updated policy takes effect in up to 15 minutes.
4. **Optional:** Restore the default log retention policy per source or for all log sources.
   - To restore the default policy for a single source:
     a. Open a log source record from the table.
     b. In the Related Links section of the record, select **Restore default**.

     The log retention policy for this log source reverts to the default value of three days.
   - To restore the default policy for all sources:
     a. In the Related Links section, select **Restore defaults**.
     b. In the confirmation dialog, select **Continue**.

     The log retention policy for all log sources reverts to the default value of three days.

Scaling Health Log Analytics to stream logs at a higher rate

Stream log data to Health Log Analytics in a scalable, more stable way using the advanced ServiceNow infrastructure.

The new ServiceNow architecture leverages queuing technology in IT Operations Management Cloud Services for authentication and log ingestion. The Health Log Analytics AI engine has

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

been enhanced to scale dynamically in response to increased log ingestion by your organization. Health Log Analytics can be scaled to support more than 50,000 events per second (EPS) or more than 10,000 subscription units (SUs).

You can switch to the advanced ServiceNow infrastructure by submitting a scaling request through your ServiceNow account manager. When your scaling request is approved, ServiceNow provisions the number of Elasticsearch and AI Engine nodes required to support your subscription units.

Enhancing the CMDB with host data Health Log Analytics found in logs

When Health Log Analytics streams logs, it extracts host data from the log events. If host data is discovered that doesn't match the information in the Configuration Management Database (CMDB), the system creates a configuration item (CI) candidate. You can review the candidate based on the data found in the logs.

After reviewing a CI candidate, you can choose to either add it to the CMDB or dismiss it as irrelevant. The **Log-Based CI Candidates** table lists all CI candidates that Health Log Analytics has created, sorted by system update time. The **Operation** column shows the suggested action to take on each CI candidate. You are automatically notified when there are new CI candidates for your consideration. For more information, see Add log-based CIs to the CMDB in Health Log Analytics.

For a description of the related system properties, see the "logsourceinfo (CMDB)" section in the HLA System Properties [KB0869842] article in the Now Support Knowledge Base.

This feature is supported in the Health Log Analytics application, Version 22.0.12 - December 2021 and later, available from the ServiceNow Store. You can use it on the ServiceNow AI Platform using the Rome Patch 6 release (scheduled to be released on January 27, 2022) or later.

Add log-based CIs to the CMDB in Health Log Analytics

Keep the Configuration Management Database (CMDB) updated with host data Health Log Analytics discovered in your logs by adding log-based configuration items (CIs) to the database.

Before you begin

This feature is supported in the Health Log Analytics application, Version 22.0.12 - December 2021 and later, available from the ServiceNow Store. You can use it on the ServiceNow AI Platform using the Rome Patch 6 release (scheduled to be released on January 27, 2022) or later.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Health Log Analytics Administration** > **Log-Based CI Candidates**.
2. Handle a single CI candidate or multiple CI candidates together.

Option	Procedure
Take action on a single CI candidate	**a.** Select a CI candidate record and review the information on the form. For field descriptions, see Log-based CI candidates fields in Health Log Analytics. **b.** Add the CI candidate to the CMDB or delete it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Procedure
	▪ If the CI candidate is appropriate, either add it to the CMDB as is or include more information in it before adding it to the CMDB. ▪ To add the CI candidate to the CMDB as is, select **Add to CMDB** and then se lect **Continue**. ▪ To add more information, select **Edit ad ditional CI fields**. Enter data that was not extracted from the logs, such as the name of the company associated with the CI, and then select **Submit**. The CI is added to the CMDB. In the CMDB table for the relevant class type, the discovery source for the new CI is Health Log Analytics. The CI candidate record is automatically deleted from the Log-based CI candidates table. ▪ If the CI candidate is irrelevant, delete it by selecting **Delete**.
Take action on multiple CI candidates at the same time	**Note:** This option does not enable you to add extra information to the selected CIs. ○ Add multiple CIs to the CMDB. **a.** In the Log-based CI candidates table, se lect the CI candidates you want to add to the CMDB. **b.** From the Actions on selected rows list at the bottom of the page, select **Add to CMDB**. The selected CIs are added to the CMDB. The CI candidate records are automatical ly deleted from the Log-based CI candi dates table. ○ Delete multiple CI candidates. **a.** In the Log-based CI candidates table, se lect the CI candidates you want to delete. **b.** From the Actions on selected rows list at the bottom of the page, select **Delete**.

Analyzing and resolving Log Analytics alerts

Analyze and resolve Log Analytics alerts by investigating log data and taking action to resolve the underlying issue.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Overview of analyzing and resolving a Log Analytics alert

As an Operator, you're responsible for analyzing and resolving the alerts that Health Log Analytics generates. When HLA creates an alert, you review the alert's severity, the affected configuration item (CI), the log data associated with the anomaly, and the impacted services. You try to identify the root cause by investigating the logs that surround the anomaly.

In the Express List, review alert details and use ServiceNow Otto to get an in-depth analysis of the alert and potential resolutions in straightforward, human-readable language. By drilling down into the alert, you can quickly identify the issue and proceed to resolve it before it affects your users.

Using the Log Viewer, you can browse the alert logs by timestamp or range for further investigation. You can visualize the frequency of anomalous log lines in a chart.

More detailed information on tasks and procedures for analyzing and resolving Log Analytics is available via the following links.

- Start remediation of a Log Analytics alert from the Overview tab

  Begin the remediation process of a Log Analytics alert from the alert **Overview** tab. This tab provides information on the alert, log data associated with the anomalous behavior, CIs associated with the alert, and services impacted by it.

- Analyze log lines around an anomalyAnalyze the logs that surround the anomaly

  Review the log lines surrounding the anomaly for clues about the state of faulting systems. This information can help you narrow down the root cause of the alert.

- Use log correlators to identify relationships in log data

  Identify relationships between alerts to help you determine whether an alert is part of a larger issue.

- Navigate to the Express List and select an alert from the Alerts list. Use ServiceNow Otto to get an in-depth analysis of the alert and potential resolutions. By drilling down into the alert, you can quickly identify the issue and proceed to resolve it.
- Review the logs for an alert on the Log viewer

  For further investigation, navigate to the **Log Viewer** to browse the alert logs by timestamp or time range. You can visualize anomaly frequency within a time period for a comprehensive view of log data over a specified time range.

- Add a KB article to a Log Analytics alert

  When you have resolved an alert that Health Log Analytics generated, you can add a knowledge base (KB) article to it. For example, you can provide information that might help others resolve similar issues.

For a brief explanation of key terms and concepts used in HLA, see the Health Log Analytics terminology.

Use cases

Use Case: Proactive monitoring of your ServiceNow instance in Health Log Analytics - Use Health Log Analytics to detect and resolve emerging issues in your organization's ServiceNow instance before they affect platform users.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Start remediation of a Log Analytics alert from the Overview tab

Begin the remediation process of a Log Analytics alert from the alert **Overview** tab. This tab provides information on the alert, the log data associated with the anomalous behavior, CIs associated with the alert, and services impacted by it.

Before you begin

Role required: evt_mgmt_operator, or evt_mgmt_user, or evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the Service Operations Workspace, select the lists icon ( ).
3. Select the appropriate list in the Alerts sub-list and navigate to the relevant alert or group.

   All Health Log Analytics alerts have the value **Log Analytics** in the **Source** column. The value in the **Group** column identifies the type of Log Analytics alert. See Types of Health Log Analytics alerts for a more detailed description of each type of alert or group.

   Tip: To preview an alert in the list, select its info icon ( ).

4. Select the alert number.

   The **Overview** tab displays.

5. View the section of the **Overview** tab that provides the information that you need.

   For a description of the sections and cards, see Sections and cards on the alert Overview tab in Health Log Analytics.

   Note: Because some sections on the **Overview** tab show only a portion of the information, many sections include a link that displays different or more complete information.

6. **Optional:** Run predefined remediation tasks to resolve alert issues.
   a. Select **Launch playbook**.
   b. Select the **Playbook** tab.

      The **Run remediation** card displays the available remediation actions.

   c. Select the tile corresponding to the action you want to run.
   When the action is complete, it appears in the **Completed** card.

Review logs surrounding an anomaly

When Health Log Analytics identifies an anomaly, viewing the logs that surround the anomaly provides clues about the state of faulting systems. This information can help you narrow down the root cause of an alert.

While viewing a Log Analytics alert, the **Surrounding logs** tab lists the log lines that were generated one minute before and one second after the anomaly occurred. The log lines are related to the metric or pattern that triggered the alert. The list is filtered to the relevant component.

Logs generated immediately before the anomaly might indicate warning signs or conditions that led to the issue. By reviewing these logs, you can trace the sequence of events that led to the anomaly, helping you understand what went wrong. Logs created right after the anomaly can

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

help you evaluate the impact of the event by analyzing how the system responded and whether other components were affected. The timeline of the logs around the anomaly can help clarify what might have caused the issue, for example a configuration change or a software update.

You can modify the time range of the displayed log lines. For example, investigate logs from more than one minute before the anomaly or more than a second afterward.

Note: Logs that surround the anomaly are retained and available for 30 days after the creation of the alert. The system does not delete these logs when the global retention period of logs expires. When the retention period expires, the surrounding logs are available only on the **Surrounding logs** tab and not in the Log viewer.

Health Log Analytics enables you to view the anomalous log data graphically on the Log viewer, accessed from the Service Operations Workspace. The Log viewer displays a chart of the frequency of anomalous log lines during one minute before and one minute after the Log Analytics alert. It lists the associated log lines and automatically shows the query that relates to the anomaly, the selected component, and the appropriate time filter. For more information, see Review alert-related logs on the Log Viewer.

Related topics

Analyze log lines around an anomaly

Analyze log lines around an anomaly

Review the log lines around an anomaly to help you identify the root cause of a Log Analytics alert.

Before you begin

For background information, see Review logs surrounding an anomaly.

Role required: evt_mgmt_operator or evt_mgmt_admin

Procedure

1. In the Service Operations Workspace, open a Log Analytics alert.
2. Select the **Surrounding logs** tab and review the information.
   The tab displays the list of log lines that were generated one minute before and one second after the Log Analytics alert. For an explanation of the information on the tab, see Surrounding logs tab fields.
3. **Optional:** View a different time span of the log lines using one of the following methods:
   - Update the time range relative to the alert to a predefined time range in the **Select range** list.
   - Specify a **Start time** or **End time** using the time picker.
4. **Optional:** View the anomalous log data graphically as a function of time by selecting **Log viewer**.

Log correlators for identifying related alerts

In Health Log Analytics, log correlators are keys or values in log data that detect correlations between alerts. These correlations help you determine whether an alert is part of a larger issue.

For example, a log correlator could detect when the interface ID of a particular network device occurs simultaneously in multiple warnings across service instances.

You can identify related alerts in your log data by using log correlators. The base system includes several log correlators. You can define custom correlators for a specific log source, all log sources, or only log sources created after the correlator is activated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Most log lines include a metadata portion plus a message portion. Some log lines, however, include only message text with metadata included in the text. The two types of log correlators, free text correlators and log property correlators, analyze different portions of each log to identify relationships between data from multiple sources.

Free text correlators

Free text correlators analyze the text within the log message portion of log lines that are associated with an anomaly. The system uses free text correlators to identify correlations between alerts. You use free text correlators to add a term that you expect to appear within log messages. A good choice is a term that is not structured and would not otherwise be extracted as a log property. For example, “policy-id” or “ thread-id”.

You also typically add free text correlators for the names of systems, applications, and services that are unique to your environment. Because such a value can be referred to by multiple sources, layers, middleware, or databases, the free text correlator can be an effective detector of correlated alerts. For example, if your organization's service is called TeaTime, then you might add "teatime" as a free text correlator. The correlator would identify alerts that are related because they were generated for resources that support the TeaTime service. For example, a database lock or a connection failure between TeaTime components.

Log property correlators

Log property correlators analyze the metadata portion of log lines. For example, the correlator can analyze the name of a service instance, the interface ID of a network device, or the request ID of a web-facing component. A log property correlator could flag a correlation when the interface ID of a network device simultaneously occurs in multiple warnings in different log sources. Log property correlators are specific to the business context of your environment.

You can specify the set of log sources whose log data are analyzed by a log correlator. Choices are as follows:

- **Only new sources**: The system applies the log correlator only to log lines from log sources that were created after this log correlator is activated.
- **All sources**: The system applies the log correlator to log lines from all log sources.
- **Specified source**: For a log correlator, the system analyzes only log lines from the log source that you specify.

Add a log correlator to identify related alerts

In Health Log Analytics, detect related alerts in log data by adding log correlators. The base system includes several log correlators and you can define custom log correlators.

Before you begin

Role required: evt_mgmt_operator or evt_mgmt_admin

About this task

For information about the types and functions of log correlators, see Log correlators for identifying related alerts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Use one of the following methods to add a log correlator.

Option	Procedure
Add a log correlator for a specific log source	**a.** Navigate to **Health Log Analytics** > **Log Anomaly Detection** > **Log Correlators**. The list of existing log correlators opens. **b.** Select the name of a log correlator. The names appear in the **Correlation indicator** column. **c.** Select **New**.
Add a log correlator that applies either to all log sources or to only those log sources that become active after you define this log correlator	**a.** Navigate to **Health Log Analytics** > **Data Input** > **Log Sources**. **b.** Select the name of the log source. The Log correlators related list displays the list of existing log correlators that analyze log data from the selected log source. **c.** On the **Log correlators** tab, select **New**.

2. Fill in the Log correlator form.
   For a description of the fields, see Log correlators form fields.
3. Select **Active** and then click **Submit**.

Exclude a source from a log correlator in Health Log Analytics

Prevent Health Log Analytics from analyzing log lines from a specific source by excluding that source from the log correlator.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Health Log Analytics** > **Data Input** > **Log Sources**.
2. Open the relevant source on the Log Sources form.
3. On the **Log Correlators** tab, select the option for the log correlator.
4. In the Actions on selected items list, select **Exclude from this source**.

Review alert-related logs on the Log Viewer

The **Log Viewer** tab in Health Log Analytics lets you browse the logs for an alert by timestamp or time range, and visualize anomaly frequency within a specific time period. Customizing the displayed data and adjusting time filters enables you to better understand the framework in which the anomaly occurred, helping you find the root cause faster.

The Log Viewer presents all data connected with the Log Analytics alert. It shows the query that relates to the anomaly, the selected component, and the appropriate time filter. You can personalize the displayed data, and manually adjust the time range without affecting the other settings. The applied filters appear in the **Filters** pane. You can add or remove filters as needed to show only the data you want to view.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The **Log Viewer** displays a chart of the frequency of anomalous log lines during one minute before and one minute after the Log Analytics alert and lists the associated log data. This information helps you identify trends leading up to and following the event, providing context for root cause analysis.

As you analyze the logs for an alert on the **Log Viewer**, you can modify the query to fine-tune the search, save useful searches, and share them with others. For a description of the information displayed in the **Log Viewer** table, see Log Viewer table fields.

You can perform the following tasks on the **Log Viewer**:

- View log data for an alert in Health Log Analytics

  View a chart of the frequency of anomalous log lines and the associated log data.

- Define, save, and share a log data search

  Fine-tune the search query to help determine the causes of the issue, and save and share useful searches.

- Use or modify a saved log data search in Health Log Analytics

  Use a saved search. As the owner of a saved search, you can modify the search values and save your changes.

- Filter search results on the Log Viewer in Health Log Analytics

  Apply filters to show only the data you want to view.

- Customize the Log Viewer table in Health Log Analytics

  Add or remove columns in the table to show only the data you want to view.

If you discover an important metric in the log data, you can use it to define a new Log Analytics alert rule. For more information, see Define a custom Log Analytics alert rule in Health Log Analytics.

Related topics

Review logs surrounding an anomaly

View log data for an alert in Health Log Analytics

View a chart of the frequency of anomalous log lines and the associated log data on the Log Viewer.

Before you begin

Role required: evt_mgmt_operator, or evt_mgmt_admin

Procedure

1. Open the **Log Viewer** tab using one of the following methods:
   - Navigate to **Workspaces** > **Service Operations Workspace** and select the Log Viewer icon ( ).
   - While viewing log entries for an alert on the **Surrounding logs** tab, select **Log Viewer**.
2. **Optional:** Personalize the displayed data and how it is presented on the Log Viewer.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Filter search results on the Log Viewer in Health Log Analytics to show only the data you want to view.
- Customize the Log Viewer table in Health Log Analytics by adding or removing columns.

These features are supported in the Health Log Analytics application, Version 20.0.11 - July 2021, and the Health Log Analytics Viewer application, Version 20.0.4 - July 2021, available from the ServiceNow Store.

3. Analyze log-based anomalies and added context to help you achieve faster mean time to repair (MTTR).
For example, say you find a log line with errors found in a configuration file. On the **Anomaly** card, a sudden spike on the chart indicates where the configuration file is generating the errors. You can view additional key-value pairs extracted from the logs on the **Meaningful log properties** card and find the affected application services and their related service offerings on the **Impacted services** card. For greater context, you may want to investigate the logs that surround the anomaly, locate the configuration file, and find the time frame where the issues occurred.

What to do next

Use additional features on the Log Viewer to refine your search or define alerts.

- Modify the search query to fine-tune the search and save useful searches. See Define, save, and share a log data search.
- If you discover important relationships in the log data, select **Define alert** to define the kind of alert that should be triggered by the data. See Define a custom Log Analytics alert rule in Health Log Analytics for instructions.

Define, save, and share a log data search

Define, save, and share searches of log data to help determine the causes of Log Analytics alerts.

Before you begin

Role required: evt_mgmt_operator or evt_mgmt_admin

Procedure

1. Open the **Log Viewer** using one of the following methods:
   - Navigate to **Workspaces** > **Service Operations Workspace** and select the Log Viewer icon ( ).
   - While viewing log entries for an alert on the **Surrounding logs** tab, select **Log Viewer**.
2. Define a search.
   a. Select the selection icon ( ) and then select **New search**.
   b. Set the values of the search parameters in the search fields.

Search fields

Search field	Description
Query	Search query.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Search field	Description
	Tip: The Log viewer uses the Elasticsearch search engine, so you can use any supported search term structure in the **Query** field.
Component	Logical component of the service instance that generated the event. Multiple CIs can sometimes perform the same function.
Time range	Time range to apply to the X-axis when displaying the returned data. The setting that you specify appears in the **Start time** and **End time** fields. Use one of the following methods: ▪ Select a time period from the list. ▪ Click **Custom range** to use the date and time picker to specify a range. **Note:** You can modify the settings in the **Start time** and **End time** fields manually. The selected time range shown in **Select range** then changes to Custom range. This feature is supported in the Health Log Analytics application, Version 20.0.11 - July 2021, and the Health Log Analytics Viewer application, Version 20.0.4 - July 2021, available from the ServiceNow Store. **Note:** Saved searches do not include time range settings.

c. Select **Search**.

The system returns the full list of log lines that match the search values. The information is displayed in the Results over time chart.

3. **Optional:** Save the search.
The saved search includes any selected filters. For information about filters, see Filter search results on the Log Viewer in Health Log Analytics.

Note: Saved searches do not include time range settings.

a. Select **Save As**.

b. In the **Search name** field, specify a unique and descriptive name for the search and then click **Save**.

Note: If you are using Health Log Analytics application, Version 20.0.11 - July 2021, and the Health Log Analytics Viewer application, Version 20.0.4 - July 2021, available from the ServiceNow Store, you can define an alert rule without saving the search. For more information, see Define a custom Log Analytics alert rule in Health Log Analytics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. **Optional:** Share the saved search with an assignment group.
   a. Select **Share**.
   b. Select an assignment group from the list.
   c. Select **Save**.

Use or modify a saved log data search in Health Log Analytics

Define a custom Log Analytics alert rule in Health Log Analytics

Use or modify a saved log data search in Health Log Analytics

Use a saved search of log data to better understand the causes of an alert. As the owner of a saved search, you can modify the search values and save your changes.

Before you begin

Note: If you're not the owner of the saved search, save the search with a different name. You can then update search values, save your changes, and share the search with others.

Role required: evt_mgmt_operator or evt_mgmt_admin

Procedure

1. Open the **Log Viewer** using one of the following methods:
   - Navigate to **Workspaces** > **Service Operations Workspace** and select the Log Viewer icon ( ).
   - While viewing log entries for an alert on the **Surrounding logs** tab, select **Log Viewer**.
2. Use a saved search.
   a. Select the selection icon ( ) and then select **Load search**.
   b. In the Load search dialog box, select the name of the search to load.
   The system returns the full list of log lines that match the search values and displays the information in the Results over time chart.
3. **Optional:** Update the saved search.
   a. Select the selection icon ( ) and then choose **Manage my searches** from the drop-down list.
   b. Modify the settings.

Manage my searches form

Field	Description
Name	Name of the saved search.
Query	Search query. (Optional) The Log viewer uses the Elasticsearch search engine, so you can use any supported search term structure in the **Query** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Assignment group	Assignment groups that can access the search. The members of the groups can use the search.
Filter	Column filter in standard format (`field1=value1, field2=value2, field3=value3, ...`).
Updated	Date and time the search was updated. (Optional) This feature is supported in the Health Log Analytics application, Version 20.0.11 - July 2021, and the Health Log Analytics Viewer application, Version 20.0.4 - July 2021, available from the ServiceNow Store.

To revert changes you have made to the search values, select the selection icon ( ) and then select **Discard Changes**. The changes that you made to the search values are discarded. You can continue to update the search settings.

c. Save the updated search.

i. Select **Save as**.

ii. In the **Search name** field, specify a unique and descriptive name for the search and then select **Save**.

Filter search results on the Log Viewer in Health Log Analytics

Apply filters on the **Log Viewer** to show only your desired data.

Before you begin

Role required: evt_mgmt_operator, or evt_mgmt_user, or evt_mgmt_admin

About this task

This feature is supported in the Health Log Analytics application, Version 20.0.11 - July 2021, and the Health Log Analytics Viewer application, Version 20.0.4 - July 2021, available from the ServiceNow Store.

Procedure

1. Open the **Log Viewer** using one of the following methods:
   - Navigate to **Workspaces** > **Service Operations Workspace** and select the Log Viewer icon ( ).
   - While viewing log entries for an alert on the **Surrounding logs** tab, select **Log Viewer**.
2. Define and run a search.
   For more information, see Define, save, and share a log data search.
3. Filter the search results in one of the following ways.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

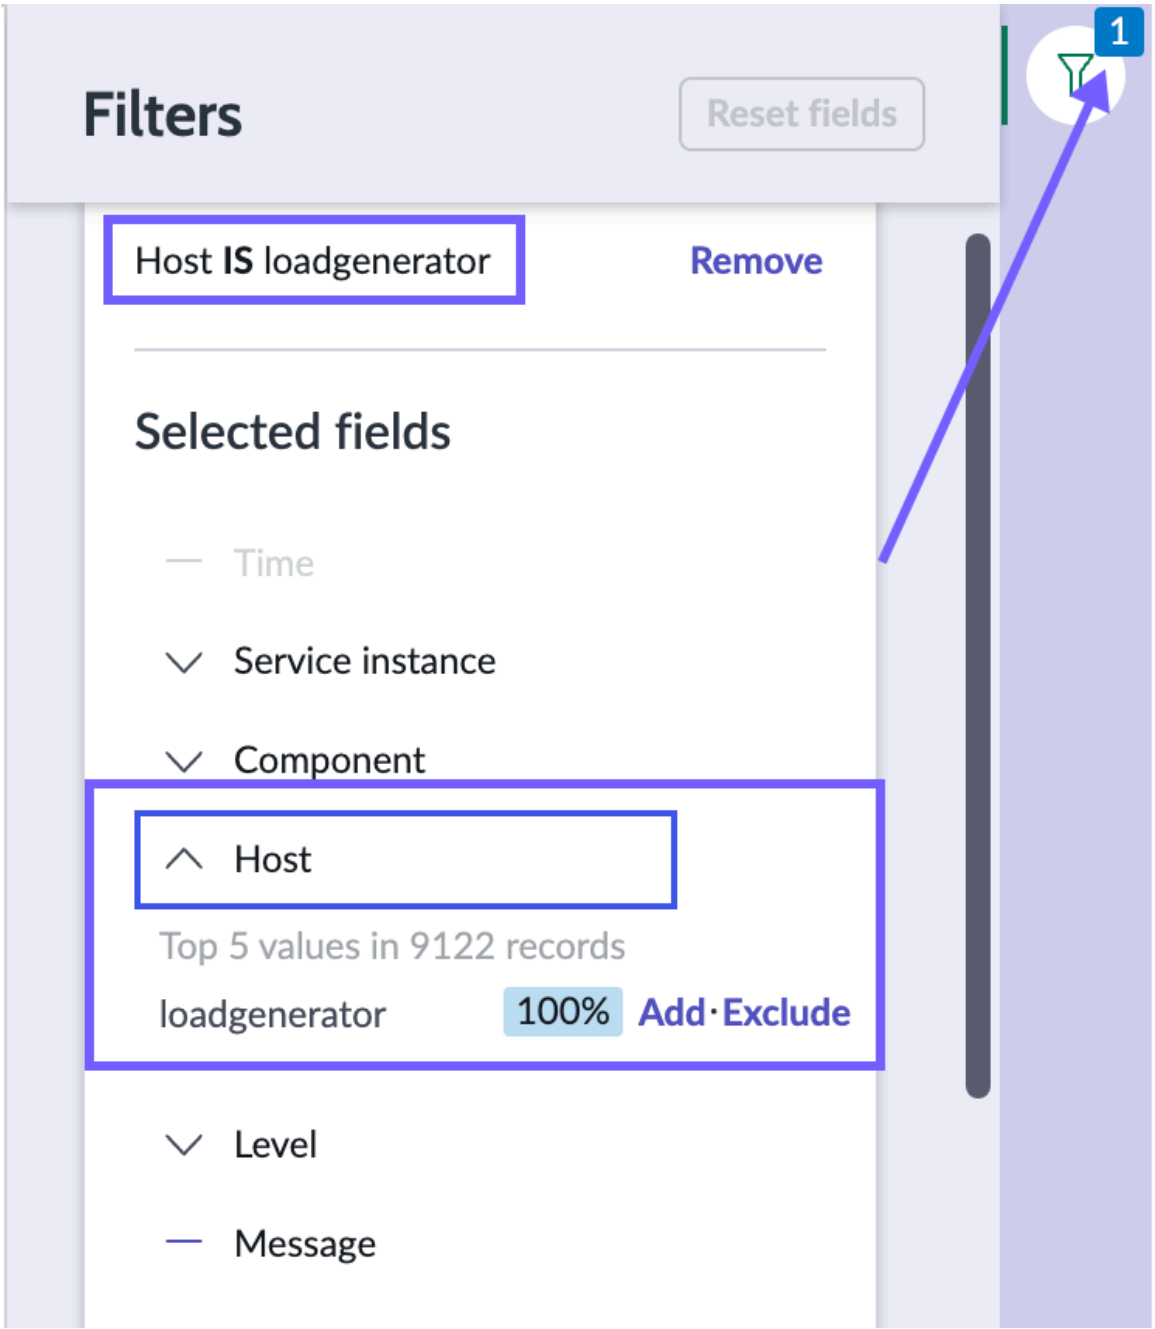
Option	Description
Add filters using the fields list	**a.** Select the filter icon ( ). The Selected fields list includes the fields that currently display as columns in the **Log Viewer** table. By default, the table includes the following columns: Application service, Component, Host, Level, Message, Raw message, and Time. The Available fields list includes all remaining fields that the sys tem has extracted from the log. **b.** Select a field in the list. **Note:** You can search for a specific field using the search option. The top five values the system has found in the records for this field are displayed, along with the percentage of their occur rence.  **c.** Define a filter for a value in the field. ▪ To display only data that contains a val ue, select **Add** for it. For example, to set the filter **[Level][is] [critical]**, select **Add** for the value "criti cal" in the Level field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	▪ To create negative filters that exclude da ta that contains a value, select **Exclude** for it. For example, to set the filter **[Level][is not][critical]**, select **Exclude** for the val ue "critical" in the Level field.
Add filters from the Log Viewer table	**a.** In a column header, select the more actions icon (⋮). **b.** In the dialog box, select the operator and specify the filter terms for the field.  **c.** Select **Apply**. A filter icon in the column header indicates that a filter applies for this field.

The applied filter appears at the top of the **Filters** pane. The total number of applied field value filters in the **Filter** icon adjusts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. **Optional:** Remove a filter in one of the following ways.
   - In the **Filters** pane:
     a. Locate the filter you want to remove.
     b. Select **Remove**.
   - In a column header:
     a. Select the more actions icon (⋮).
     b. Select the filter you want to remove.
     c. Select **Remove filter**.

Customize the Log Viewer table in Health Log Analytics

Add or remove columns in the **Log viewer** table to show only the data you want to view.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: evt_mgmt_operator, or evt_mgmt_admin

About this task
This feature is supported in the Health Log Analytics application, Version 20.0.11 - July 2021, and the Health Log Analytics Viewer application, Version 20.0.4 - July 2021, available from the ServiceNow Store.

Procedure
1. Open the **Log Viewer** using one of the following methods:
   - Navigate to **Workspaces** > **Service Operations Workspace** and select the Log Viewer icon ( ).
   - While viewing log entries for an alert on the **Surrounding logs** tab, select **Log Viewer**.
2. Select the filter icon ( ) to display the **Filters** pane.
   The Selected fields list includes the fields that currently display as columns in the **Log viewer** table. By default, the table includes the following columns: Application service, Component, Host, Level, Message, Raw message, and Time. The Available fields include all remaining fields that the system has extracted from the log.

   In the Service Operations Workspace Log Analytics application, Version 21.2.7 - November 2022 and later, available from the ServiceNow Store, the Log message column is added. The Raw message column no longer displays by default.

   You can add the Raw message column to the table by selecting it from the **Filters** pane.
3. Add or remove columns in the **Log viewer** table.
   - To add a column to the table, select the field of the same name in the Available fields list and then select the add icon ( ).

     The added field displays as a column in the table. It is now listed in the Selected fields list.
   - To remove a column, select the field of the same name in the Selected fields list and then select the remove icon ( ).

     The corresponding column is removed from the table. The removed field is added to the Available fields list.

     If you have filtered the data for specific values in a field, that data still displays even when the field is no longer selected. For more information about filtering data, see Filter search results on the Log Viewer in Health Log Analytics.

     Note: The Time column can't be removed from the table.
4. **Optional:** Adjust the maximum number of characters per field in the table.
   a. Navigate to **Health Log Analytics** > **Health Log Analytics Administration** > **System Properties**.
   b. Open the *sn_occ.log_viewer.max.characters* property record.
   c. In the **Value** field, edit the default value.
   d. Select **Update**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result

The **Log viewer** table shows the customized view from the current session onward until you change your preferences.

Add a KB article to a Log Analytics alert

Add your own knowledge base (KB) article to an alert that was generated by Health Log Analytics. For example, you can provide additional information that might help to resolve the underlying issue.

Before you begin

Role required: evt_mgmt_operator or evt_mgmt_admin

Use Case: Proactive monitoring of your ServiceNow instance in Health Log Analytics

Use Health Log Analytics to detect and resolve emerging issues in your organization's ServiceNow instance before they negatively impact users.

Using the ServiceNow System Logs Retriever integration to detect platform issues automatically

Starting with version 35.0.26 of Health Log Analytics, you can use the ServiceNow System Logs Retriever integration to automatically detect errors and anomalies in your ServiceNow instance's system logs. As an operator you can view, manage, and respond to the generated alerts in the Express List. Filter the list to show only alerts for the impacted service. Then, use ServiceNow Otto to get an in-depth analysis of the alert and potential resolutions in straightforward, human-readable language. This AI-driven tool demonstrates a deep understanding of the Glide system and offers actionable insights.

Combining HLA anomaly detection with ServiceNow Otto AI capabilities provides a comprehensive toolkit for identifying and resolving platform system issues more effectively. This collaboration enables Health Log Analytics to help prevent system issues from impacting your platform users.

Using the MID Server and System Logs Retriever data inputs together to monitor your instance

You can also stay ahead of disruptions to your ServiceNow environment by using the MID Server data input and the ServiceNow System Logs Retriever data input together.

As an admin, you select a MID Server from the MID Servers list. Under Related Links, choose **Create MID Server Data Input using HLA** to create a data input specific to the selected MID Server. Then activate the System Logs Retriever data input and configure it to collect your ServiceNow instance's system logs.

As an operator, you navigate to the Express List and select an alert from the Alerts list. Review the alert details, including duration and impacted services, and analyze the logs that surround the anomaly. Use ServiceNow Otto to get an in-depth analysis of the alert and potential resolutions in straightforward, human-readable language. If needed, for further investigation, you can navigate to the Review alert-related logs on the Log Viewer for a visual presentation of the system logs. Select System Logs Retriever from the components drop-down list to view all the errors that have occurred in the ServiceNow instance. You can customize the visualization by using filters.

By drilling down into the alert and MID Server logs, you can quickly identify the issue and resolve it before it affects your platform users.

Managing alert generation, prioritization, anomaly detection

Influence how Health Log Analytics generates and prioritizes alerts and identifies anomalies. Use alert filters to reduce noise from unimportant issues.

Overview of impacting alert generation, prioritization, and anomaly detection

Explore how to influence alert generation and anomaly detection in Health Log Analytics. You can create and modify rules to generate alerts for specific metrics, ensuring that you're informed of important issues. You can also assign different levels of significance to alerts, helping Health Log Analytics prioritize them based on their relevance. In addition, you can influence anomaly detection by managing the keywords that Health Log Analytics looks for in your log data, and use advanced log alert filters to reduce noise.

- Using alert rules to control when Health Log Analytics generates alerts

  Manage alert rules to generate Log Analytics alerts for specified metrics.

- Assign higher or lower significance to an alert in Health Log Analytics

  Assign higher or lower significance to an alert to help prioritize the alerts that Health Log Analytics generates.

- Influence anomaly detection in Health Log Analytics with lexical keywords

  Influence how Health Log Analytics finds anomalies by managing keywords it looks for in your log data.

- Reduce noise by adding advanced log alert filters

  Use advanced log alert filters to reduce noise by making Health Log Analytics drop alerts that don't indicate a significant issue.

Using alert rules to control when Health Log Analytics generates alerts

Alert rules enable you to set conditions that determine when Health Log Analytics (HLA) triggers an alert.

HLA detects anomalies automatically by learning from your log data. However, some log types need custom alert rules to generate alerts reliably. For more information, see Alert rules in Health Log Analytics.

You can define, change, or delete custom alert rules:

- Define a custom Log Analytics alert rule in Health Log Analytics

  Define a Log Analytics alert rule for log data that is not generating alerts automatically.

- Change a custom Log Analytics alert rule in Health Log Analytics

  Edit a Log Analytics alert rule that you have defined.

- Delete a custom Log Analytics alert rule in Health Log Analytics

  Delete a Log Analytics alert rule that you have defined if it’s no longer needed.

Alert rules in Health Log Analytics

Health Log Analytics (HLA) detects anomalies automatically by learning from your log data. However, some log types require a custom alert rule to generate alerts reliably.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can use custom alert rules to specify the metric, threshold, and alert properties for generating alerts that HLA might not detect automatically.

Anomaly detection logic by log pattern

HLA classifies incoming logs into three patterns before applying anomaly detection. This classification determines which detection logic is used.

Log patterns

Pattern	Description
Lively	Logs arrive frequently and consistently: at least once in 20 seconds. For example, an application writes hundreds of log entries per hour. The ML Engine has enough volume to build a reliable baseline, so it applies standard anomaly scoring to detect deviations.
Sparse	Logs arrive infrequently or irregularly: less than once in 1 minute (60 seconds). For example, a batch job runs every night and writes a small number of log entries. Standard anomaly scoring would produce unreliable results here, so the ML Engine applies probability distribution analysis instead. Sparse logs might not generate alerts if the volume is too low to establish a baseline.
Stopped	Logs have not arrived for more than the configured period. Default is 5 minutes (300 seconds). To modify the default value, update the HLA system property `detective.resolution.signal_dead`. For a log stream to be alerted as stopped or dead it must first be considered alive by running continuously for a minimum period of time. You can set this time in the HLA system property `detective.alive_period_seconds_for_signal_d` For information about setting and changing HLA system properties, see Configure global Health Log Analytics system properties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When to create custom alert rules

- For high-frequency logs with a lively log pattern, there is no need for a custom rule. However, you can add a rule to generate alerts under specific conditions.
- For low-frequency logs with a sparse log pattern, the system might not generate alerts automatically. If these logs should still generate alerts, define a custom alert rule.
- For known critical conditions that HLA might not flag automatically, define a custom rule. For example, if a specific log message indicates that a critical service has failed, define a rule that generates an alert every time that message appears.

Using custom alert rules

Scenario	ML detection	Custom rule
High-frequency logs with a lively log pattern	Likely sufficient	Optional
Low-frequency or periodic logs	Unreliable	Suggested
Known critical conditions	Insufficient	Required

Related topics

Define a custom Log Analytics alert rule in Health Log Analytics

Change a custom Log Analytics alert rule in Health Log Analytics

Delete a custom Log Analytics alert rule in Health Log Analytics

Define a custom Log Analytics alert rule in Health Log Analytics

Define a custom Log Analytics alert rule for log data that might not generate alerts automatically. A custom rule enables you to specify the metric, threshold, and alert properties directly.

Before you begin

For background information, see Alert rules in Health Log Analytics.

Role required: evt_mgmt_operator or evt_mgmt_admin

Procedure

1. Open the **Log Viewer** using one of the following methods:
   - Navigate to **Workspaces** > **Service Operations Workspace** and select the Log Viewer icon ( ).
   - While viewing log entries for an alert on the **Surrounding logs** tab, select **Log Viewer**.
2. Define and run a search.
   For more information, see Define, save, and share a log data search.
3. When a search returns log data that should generate an alert, select **Save** or **Save as** to save the search.

   Note: If you're using Health Log Analytics application, Version 20.0.11 - July 2021, and the Health Log Analytics Viewer application, Version 20.0.4 - July 2021, available from the ServiceNow Store , you don't have to perform this step.

4. Access the form for creating an alert rule by selecting **Define alert** at the top right of the **Log viewer** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. On the form, provide the name and description for the alert rule.
   The name appears on the Anomaly card for generated alerts.
6. Determine whether the rule generates alerts when the threshold conditions are met in the log data by setting the **State** field.
   To activate the rule, select **Enabled**.
7. If you have installed the Health Log Analytics application, Version 20.0.11 - July 2021 , set the Severity value for the alert generated by this alert rule.
   - **Low**: Attention is required even though the resource is still functional.
   - **Medium**: Either performance has degraded or a partial, non-critical loss of functionality has occurred.
   - **High**: Major functionality is severely impaired or performance has degraded.
   - **Critical**: Immediate action is required. Either the resource is not functional or critical problems are imminent.
8. If you have installed the Health Log Analytics application, Version 20.0.11 - July 2021, and the Health Log Analytics Viewer application, Version 20.0.4 - July 2021, fill in the details for the query.

Query details

Field	Description
Your query	The query to search for in the log data. By default, this is the query that was defined on the Log viewer. You can modify the query by adding search requirements to it. To search for all queries, specify an asterisk (*).
Active filters	The filters defined for the query on the Log viewer. You can delete the filters.
Component	The component to which this alert rule applies. By default, this is the component that was defined on the Log viewer. You can choose a different component by selecting the search icon ( ) in the Component row and then selecting the required component from the list.

9. Fill in the fields related to the threshold that will trigger the alert rule.

Threshold

Field	Description
Operator	Mathematical comparison operator that qualifies how the hit count triggers an alert of this kind. This field is automatically set to Bigger Than.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Hit count	Number of matching log entries that serve as the trigger for an alert of this kind.
Time period	Period of time over which the hit count is measured. The period is measured in the units specified by the **Time unit** value.
Time unit	Units of the time period. This field is automatically set to minutes.
Persistence	Time period over which the specified hit count per unit time must persist to trigger an alert of this kind. The field is automatically set to 1 minute.

10. Select **Save**.

This feature is supported in the Health Log Analytics application, Version 20.0.11 - July 2021, and the Health Log Analytics Viewer application, Version 20.0.4 - July 2021, available from the ServiceNow Store.

Role required: evt_mgmt_operator or evt_mgmt_admin

Procedure

1. Open the **Log Viewer** using one of the following methods:
   - Navigate to **Workspaces** > **Service Operations Workspace** and select the Log Viewer icon ( ).
   - While viewing log entries for an alert on the **Surrounding logs** tab, select **Log Viewer**.
2. Open a defined alert.
   a. Select the selection icon ( ) at the top right of the **Log viewer** tab, and then choose **Manage my defined alerts** from the drop-down list.
   b. From the **Defined alerts** table, select the alert that you want to delete.
3. Select **Delete**.

Assign higher or lower significance to an alert in Health Log Analytics

Label an alert in Health Log Analytics as meaningful or insignificant, or restore normal importance to the metric involved in generating it.

Assigning higher or lower significance to an alert helps you prioritize the alerts Health Log Analytics generates. Here are some common use cases for adjusting the importance of an alert:

- Labeling alerts as meaningful: You can make a significant alert more likely to be included in a Log Analytics group when its associated metric behaves anomalously. This ensures that important alerts receive appropriate attention.
- Muting distracting alerts: You can mute alerts for insignificant issues to reduce noise and avoid being overwhelmed by alerts for minor problems. This enables you to focus on more critical alerts. You can view a list of muted metrics to confirm you're aware of metrics that are no longer generating alerts.
- Reducing sensitivity to certain anomalies: You can lower the sensitivity of anomaly detection to a specific anomaly. This can help you focus on more significant anomalies.
- Restoring normal significance: If you previously marked an alert as significant, muted it, or if you lowered sensitivity to certain anomalies, you can return the associated metric to its normal significance. This is useful when you no longer want to treat the alert specially.

You can do the following to adjust the importance of an alert or reduce sensitivity to specific anomalies:

- Mark an alert as significant in Health Log Analytics

  Make an alert more likely to be included in a Log Analytics group when the associated metric behaves anomalously by labeling the alert as meaningful.

- Mute an unimportant alert in Health Log Analytics

  Eliminate distracting new alerts for insignificant issues by muting them. View the list of metrics that were muted and no longer generate alerts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Decrease sensitivity to similar anomalies in Health Log Analytics

  Make Health Log Analytics anomaly detection less sensitive to anomalies like the one that triggered the current Log Analytics alert.

- Restore normal importance to an alert metric in Health Log Analytics

  Return normal significance to the metric involved in generating a Log Analytics alert.

For detailed information about alert metrics, see How Health Log Analytics generates alerts.

Mark an alert as significant in Health Log Analytics

Make an alert more likely to be included in a Log Analytics group when the associated metric behaves anomalously by labeling the alert as meaningful.

Before you begin
Role required: evt_mgmt_operator or evt_mgmt_admin

Procedure

1. In the Service Operations Workspace, open a Log Analytics alert and then select **Apply ML feedback** > **Mark as significant**.
2. Confirm the action in the dialog box.

   Note: Processing this feedback might take a few seconds.

   The alert is marked as significant. The **Restore ML feedback** button appears instead of the **Apply ML feedback** drop-down list.
3. **Optional:** Restore the significant alert.
   If you no longer want the significant alert to be treated specially, you can restore normal significance to the alert metric. For more information, see Restore normal importance to an alert metric in Health Log Analytics.

Mute an unimportant alert in Health Log Analytics

Eliminate distracting new alerts for insignificant issues by muting them.

Before you begin
Role required: evt_mgmt_operator or evt_mgmt_admin

About this task
When you mute an alert that is based on the keyword metric or the pattern severity metric, the system mutes the metric in the dominant pattern. The dominant pattern is the main pattern that contributes to the anomaly. For the specified source only, anomalous behavior for the metric that is associated with the muted alert no longer generates alerts. You can also mute the metric that is associated with an unimportant alert for all components of the Application Service. A component can be multiple CIs that perform the same function.

Procedure

1. In the Service Operations Workspace, open the Log Analytics alert that you don't want to see again.
2. Select **Apply ML feedback**
3. Mute the metric associated with the alert by doing one of the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Select **Mute alert metric** to mute the metric for the specified source only.
- Select **Mute alert metric for all components** to mute the metric for all components of the Application Service.

4. Confirm the action in the dialog box.

   Note: Processing this feedback might take a few seconds.

   The alert is muted. The **Restore ML feedback** button appears instead of the **Apply ML feedback** drop-down list.

5. **Optional:** Restore the muted alert.
   If you no longer want the muted alert to be treated specially, you can restore normal significance to the alert metric. For more information, see Restore normal importance to an alert metric in Health Log Analytics.

Related topics

View the list of muted metrics in Health Log Analytics

View the list of muted metrics in Health Log Analytics

View the list of metrics that were muted so that they no longer generate alerts.

Before you begin

Role required: evt_mgmt_operator or evt_mgmt_admin

Procedure

Navigate to **All** > **Health Log Analytics** > **Log Anomaly Detection** > **Muted Metrics**.

Muted Metrics

Field	Description
Service instance	Service instance where the muted alert with which the metric is associated appears.
Component	Logical component of the service instance that generated the event. Multiple CIs can sometimes perform the same function.
Pattern text	Text for the metric that is associated with the muted alert.
Metric	Log text or key that represents a meter or gauge value in the data. For example, patterns, raw metrics, keyword, severity, all events metrics.
Created	Date and time when the metric was added to the list.

Decrease sensitivity to similar anomalies in Health Log Analytics

Make anomaly detection less sensitive to anomalies like the one that triggered the current Log Analytics alert.

Before you begin

Note: This functionality is not available for customer alerts and new signal alerts.

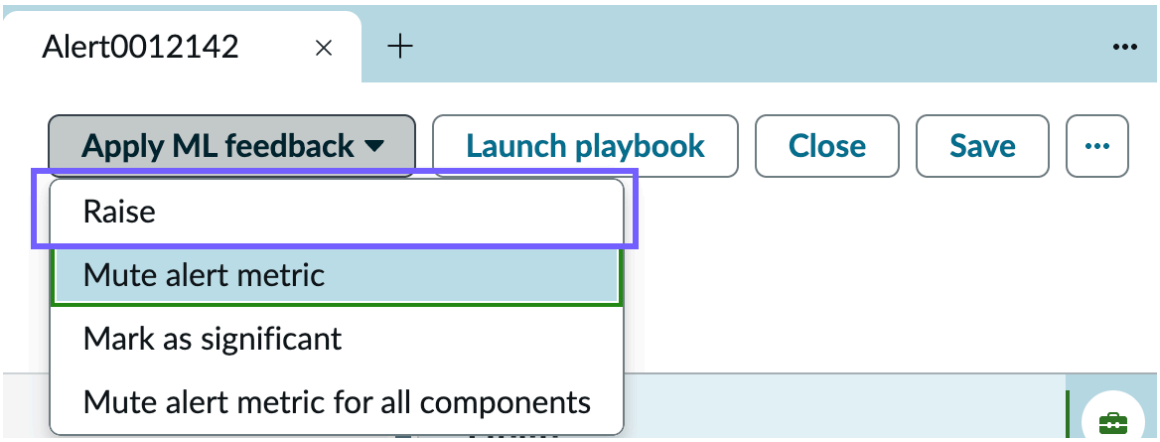
Role required: evt_mgmt_operator or evt_mgmt_admin

About this task

Selecting the Raise feedback option raises the threshold for generating alerts when Health Log Analytics identifies future anomalies similar to the one that led to this alert.

Procedure

1. In the Service Operations Workspace, open a Log Analytics alert and then select **Apply ML feedback** > **Raise**.



2. Confirm the action in the dialog box.

   Note: Processing this feedback might take a few seconds.

   Anomaly detection is now less sensitive to anomalies like the one that triggered the current alert. The **Restore ML feedback** button appears instead of the **Apply ML feedback** drop-down list.

3. **Optional:** Restore normal sensitivity to anomalies like the one that triggered this alert.
   a. While viewing the alert, select **Restore ML feedback**.
   b. Confirm the action in the dialog box.

Suppress alerts from short-lived anomalies

Apply sustained alert feedback to generate alerts only when anomalies persist for a set duration in Health Log Analytics.

Before you begin

Role required: evt_mgmt_operator or evt_mgmt_admin

About this task

Short-lived anomaly spikes that resolve quickly often don't require alerts. If a metric jumps briefly and resolves on its own, the spike is noise and not actionable. The sustained alert feature helps reduce this noise. When you apply sustained alert feedback, the anomaly must persist continuously for 15 minutes before Health Log Analytics generates an alert.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

By default, the system calculates this duration automatically based on the metric's signal amplitude, historical anomaly patterns, and previous sustained alert applications (adaptive mode). You can override it and set a fixed duration yourself, instead (manual mode).

Procedure

1. Open a Log Analytics alert.

   a. In the Service Operations Workspace, select the list icon ( ).

   b. Select the appropriate list in the Alerts sub-list and open the alert you want to configure for sustained alert feedback.
   In the **All Alerts** list, alerts that were generated by Health Log Analytics have the value **Log Analytics** in the **Source** column.

   c. Select the alert number.

2. Select **Apply ML feedback** and then choose **Sustain Alert**.
   A message confirms that the anomaly must persist for 15 minutes before an alert is generated.

   Health Log Analytics applies adaptive mode by default and calculates a recommended duration automatically. A confirmation message states the calculated duration and that it's based on signal amplitude and patterns, for example, "Sustained Alert applied: 12 min (Smart)".

3. **Optional:** To set a fixed duration instead of using the calculated adaptive duration, switch to manual mode.

   a. Select the **[OXY-PLACEHOLDER]** advanced option next to **Sustain Alert**.

   b. Select a preset duration (5, 10, 15, 20, or 30 minutes), or specify a custom duration between 1 and 120 minutes.

   c. Confirm the duration.

   (Optional) Health Log Analytics applies the duration you set instead of the calculated adaptive duration.

4. Confirm sustained alert feedback application.Review the applied sustained alert feedback.

   Sustained alert feedback is applied to the metric. Anomalies that persist for less than the continuous duration threshold are suppressed. The sustained alert configuration applies across user sessions and system restarts.

   The value **Sustained** is displayed underneath the **Applied feedback** label in the header strip at the top of the alert record.A value showing the applied duration and mode—for example, **Sustained: 12 min (Smart)** for adaptive mode or **Sustained: 20 min (Custom)** for manual mode—is displayed underneath the **Applied feedback** label in the header strip at the top of the alert record.

5. **Optional:** Remove the sustained duration threshold for anomalies like the one that triggered this alert.

   a. While viewing the alert, select **Restore ML feedback**.

   b. Confirm the action in the dialog box.

   (Optional) The system removes the sustained alert configuration for the metric associated with this alert.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Restore normal importance to an alert metric in Health Log Analytics

Return normal significance to the metric involved in generating a Log Analytics alert. Use this option if you no longer want an alert to be treated specially that was muted, marked as significant, or made less sensitive to similar anomalies.

Before you begin
Role required: evt_mgmt_operator or evt_mgmt_admin

Procedure

1. While viewing a Log Analytics alert in the Service Operations Workspace, select **Restore ML feedback**.
2. Confirm the action in the dialog box.

Result
The metric that is associated with the alert returns to normal importance.

Influence anomaly detection in Health Log Analytics with lexical keywords

Influence how Health Log Analytics finds anomalies by managing keywords it looks for in your log data. When text in log data for a source matches a lexical keyword that exceeds a specified count threshold, the system identifies an anomaly and generates an alert.

Health Log Analytics scans your logs for words that can indicate important issues. Lexical keywords such as 'crashed' or 'failed' signal conditions that may require attention. The application sets a threshold for each lexical keyword based on its normal occurrence pattern and frequency in your logs.

When Health Log Analytics scans your logs, it identifies all occurrences of the keyword. If the frequency of a lexical keyword in the log data for a source exceeds the specified threshold, the system identifies an anomaly and generates an alert.

Health Log Analytics comes with many default global keywords. You can add, edit, and delete these global keywords or phrases, which apply to all source types.

Note: To add a specified keyword associated with a specific source type, see Configure source type capabilities in Health Log Analytics.

You can manage lexical keywords as follows:

- Add, edit, or delete lexical keywords in Health Log Analytics

  Add, edit, and delete global keywords or phrases.

- View the lexical keywords that generate alerts in Health Log Analytics

  View the list of lexical keywords that can indicate important issues in log entries. By default, the table lists only global keywords.

Add, edit, or delete lexical keywords in Health Log Analytics

Manage the keywords that Health Log Analytics looks for in your log data.

Before you begin
Role required: evt_mgmt_operator or evt_mgmt_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

In log data, terms like "crash" or "failed" are called lexical keywords because they indicate issues that can merit attention. When text in log data for a source matches a lexical keyword that exceeds a specified count threshold, the system identifies an anomaly and generates an alert.

Important: A lexical keyword differs from a key in a `key : value` pair in a log line. For example, *`Hostname`* is a key that takes on a value: the name or IP address of the host. In contrast, a keyword like *`Failed`* is important by itself and does not take on a value.

The application comes with many default global keywords. You can add, edit, and delete global keywords or phrases. These keywords apply to all source types.

Note: To add a specified keyword that is associated with a specific source type, see Configure source type capabilities in Health Log Analytics.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Log Anomaly Detection** > **Lexical Keywords**.
   By default, the Lexical Keywords table lists only global keywords.
2. **Optional:** Add a global keyword.
   a. Select **New**.
   b. On the form, fill in the fields.

Lexical keyword form

Field	Description
Name	Unique and descriptive name for the keyword.
Regular expression	Regular expression (regex) that defines matches.
Exact match	Option to make Health Log Analytics match the exact regex. For example, 'NullPointerException' in a message would not match the regex 'exception'. This field is automatically set to **True**.
Case-sensitive	Option to make Health Log Analytics look for a case-sensitive match of the regex. This field is automatically set to **False**.
Range of analysis	Range of sources types where Health Log Analytics looks for the keyword in the log data. Choices are as follows: ▪ **All source types** ▪ **Specified source type**
Excluded source types	Source types that are not associated with the keyword. Health Log Analytics does not

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	look for the keyword in the log data of these source types.

c. Select **Submit**.

3. **Optional:** Edit a global keyword.
   a. Select the keyword that you want to edit in the list.
   b. On the form, edit the relevant fields.
   c. Select **Update**.
4. **Optional:** Delete one or more global keywords.
   a. Select the rows of the keywords that you want to delete.
   b. From the Actions on selected rows list at the bottom of the page, select **Delete**.
   c. Select **OK**.

Procedure

Navigate to **All** > **Health Log Analytics** > **Log Anomaly Detection** > **Lexical Keywords**.
The Lexical Keywords table appears. By default, the table lists only global keywords.

For information about adding, editing, or deleting global keywords, see Add, edit, or delete lexical keywords in Health Log Analytics.

To add a specified keyword that is associated with a specific source type, see Configure source type capabilities in Health Log Analytics.

Reducing noise by adding advanced log alert filters in Health Log Analytics

Use advanced log alert filters to determine whether to allow an alert or to drop it. These filters reduce noise by dropping alerts that don't indicate a significant issue.

You can add advanced log alert filters to scan alerts for your defined conditions. For example, you can define a filter that drops alerts coming from specific log sources, or alerts for anomalies that do not cross the specified threshold.

Some examples of the actions that advanced filters can enable:

- Alert only on anomalies that are shared across multiple hosts.
- Do not alert on anomalies that happen outside of working hours.
- Do not alert if the anomaly does not cross the specified threshold.
- Alert only on anomalies that are part of a correlation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can manage advanced log alert filters as follows:

- Create advanced log alert filters

  Add advanced log alert filters to scan alerts for conditions that you specify. The filters reduce noise by dropping alerts that do not indicate a significant issue. While developing a filter, you can test, update, publish, or activate the filter at any time.

- Continue modifying the filter by reopening the filter record from the filters list. You can then edit, test, publish, and activate the filter.

For more technical information on log alert filters, see the Advanced Log Alert Filtering [KB0863538] article in the Now Support Knowledge Base.

Log Analytics in Service Operations Workspace for ITOM

View and address the alerts that Health Log Analytics generates in the Service Operations Workspace.

Create advanced log alert filters

Add advanced log alert filters to scan alerts for conditions that you specify. The filters reduce noise by dropping alerts that do not indicate a significant issue. While developing a filter, you can test, update, publish, or activate the filter at any time.

Before you begin

The Disable Alert Rule Engine feature and the Disable Detection Rule Engine feature must be in the OFF state. You set the values by navigating to **Health Log Analytics** > **Health Predictive AI Ops Administration** > **Features**.

Role required: evt_mgmt_operator or evt_mgmt_admin

Procedure

1. Navigate to **Health Log Analytics** > **Log Anomaly Detection** > **Advanced Log Alert Filter**.
2. Select **New**.
3. Enter a unique and descriptive name for the filter.
4. **Optional:** Enter a description of the operation of the filter.
5. In the **Script template** field, select the script that most closely matches your intended logic. The template can act as a starting point for your custom script code.
   After you select a template, the Custom JS function text box is populated with the appropriate JavaScript function. The JavaScript function applies the filter to the alert payload data and either allows or drops the alert. The alert payload is the text and metadata for the kind of alert that the filter will analyze.
6. Save the record by selecting **Submit**.
   To continue modifying the filter, you must reopen the record from the filters list. You can then edit, test, publish, and activate the filter.
7. Edit the default **Alert payload** text in preparation for testing your intended logic.

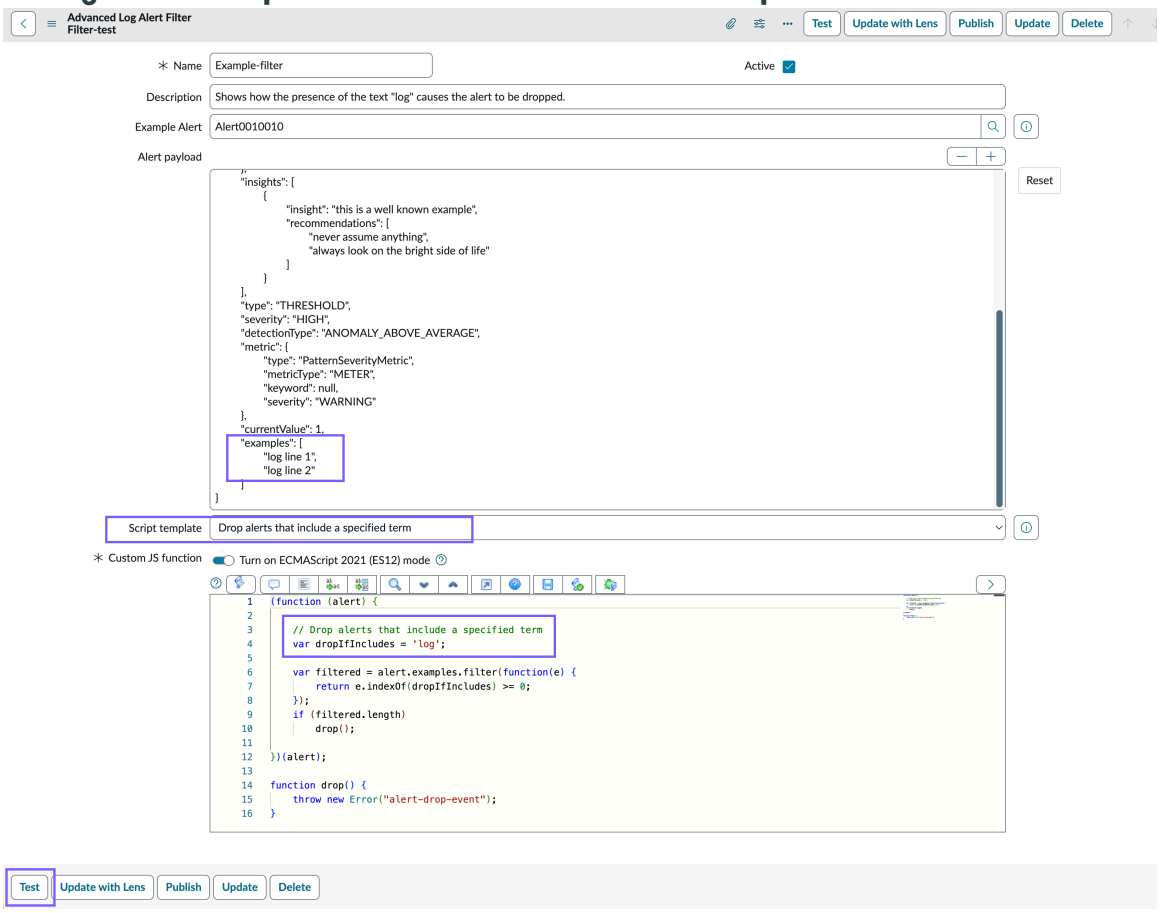
   To remove your changes and revert to the default text for the Alert payload text box, click **Reset**.

   For your convenience, Health Log Analytics provides sample alerts with preconfigured payloads. Select a sample alert in the **Example alert** field to display its payload in the Alert payload text box.
8. **Optional:** Save the current values of the filter without testing by selecting **Update**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. When your content for the alert payload and your JavaScript function are complete, select **Test**.
   To simulate the alert operation, the system saves the filter values, applies the filter to the **Alert payload** text, and then displays one of the following results:
   - `Alert will be dropped.`
   - `Alert will be allowed.`

Testing the JavaScript to determine whether to allow or drop the alert



Note: If your new JavaScript function is not behaving as expected, you can revert to the last published one by selecting the **Revert JS Function** related link.

10. Repeat the process of updating the alert payload and testing the JavaScript function as often as needed.
11. When you're satisfied with the filter, save its values and determine whether to apply it to the log stream.
    - To save the values and apply the filter to the log stream, make sure the **Active** check box is selected and select **Publish**.
    - To save the filter without applying it to the log stream, clear the **Active** check box and select **Publish.**

Note: If you modify a published filter, you must publish the modified filter to apply it to the log stream.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The values of the active filter are saved. If you selected the Active option, the filter is applied to the log stream.

Dashboards for real-time visualization of log data in Health Log Analytics

Health Log Analytics enables you to create log data dashboards and visualizations in real time for enhanced data monitoring and faster identification of deviations.

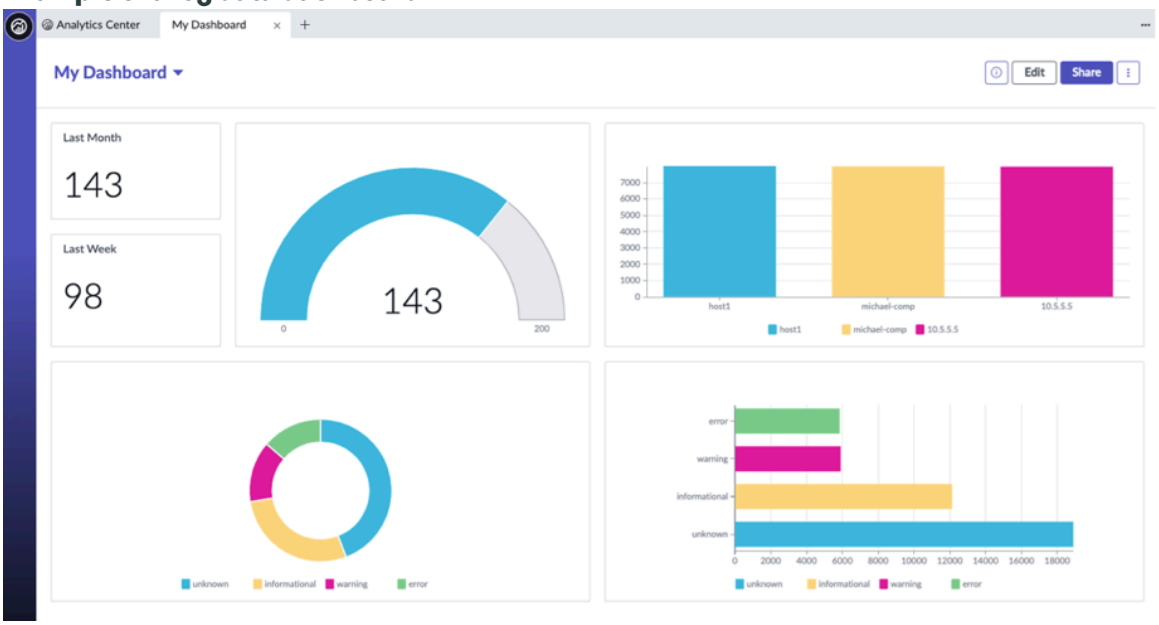
Log data dashboards and visualizations can give you a high-level visual understanding of important issues as they occur in the system. The Health Log Analytics data source of your choice is used to ingest the data that is provided to the visualization. The log data is taken directly from your stored logs, enabling you to create dashboards for any aspect of the data that interests you. For example, by visualizing the components that are generating logs, you can get an indication of the number of components that are fully integrated.

The data can be presented in various types of graphs and charts. You can adjust the time range and the other settings of the visualization as needed.

This functionality is supported in the Service Operations Workspace Log Analytics application, Version 21.2.7 - November 2022 and later, and has a dependency on the Platform Analytics Workspace, available from the ServiceNow Store.

As an alternative to defining your own dashboard, you can use the AIOps dashboards, which offer comprehensive visualizations of critical operational data. For more information, see AIOps Dashboards in Service Operations Workspace for ITOM.

Example of a log data dashboard



Create log data dashboards and visualizations in Health Log Analytics

Build Health Log Analytics log data dashboards and visualizations in real time for easier identification and understanding of issues.

Before you begin
This functionality is supported in the Service Operations Workspace Log Analytics application, Version 21.2.7 - November 2022 and later, and has a dependency on the Platform Analytics Workspace, available from the ServiceNow Store.

For detailed information about creating and working with dashboards, see Dashboards in the Analytics Center.

Note: As an alternative to defining your own dashboard, you can use the AIOps dashboards, which offer comprehensive visualizations of critical operational data. For more information, see AIOps Dashboards in Service Operations Workspace for ITOM.

Role required: evt_mgmt_operator or viz_admin

Procedure

1. Navigate to **Workspaces** > **Platform Analytics Workspace**.
2. On the Analytics Overview page, select the **Dashboards** tab.
   This tab enables you to view all the dashboards you have rights to access on your instance. You can filter the dashboard tiles to limit the number that are visible.

   Note: If you want to use an existing dashboard, select the dashboard here to open it. Otherwise, create a dashboard as explained in the remainder of this procedure.

3. Create a dashboard.
   a. Select **Create new dashboard**.
   b. In the New dashboard dialog, choose **In-line editor** and specify a name and optional description for the dashboard.

      Note: The in-line editor does not automatically save your work. Ensure that you save regularly.

   c. Select **Create new dashboard**.
4. Add an element to the dashboard.
   Various elements are available to help you organize and populate the information on the dashboard. For more information, see Analytics Center dashboard elements.

   a. Select **Add new element**.

   b. Select **Data visualization** from the available elements.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The **Data visualization** element appears on the dashboard, where you can edit it.

Note: You can click and drag the corners of the element to resize it.

5. Edit the element.

   a. On the element, select the Settings icon:

   The Configuration panel opens.

   b. From the **Visualization type** list, choose the type of visual representation you want for the log data.
   You can choose from various types of graphs and charts.

   For detailed information, see Data visualizations in the Analytics Center.

   c. In the Data section, select **+ Add data source**.

   The Health Log Analytics data source that you select is used to ingest the log data that is provided to the visualization.

   d. Select the Health Log Analytics Log components data source.

© 2026 ServiceNow, Inc. All rights reserved.

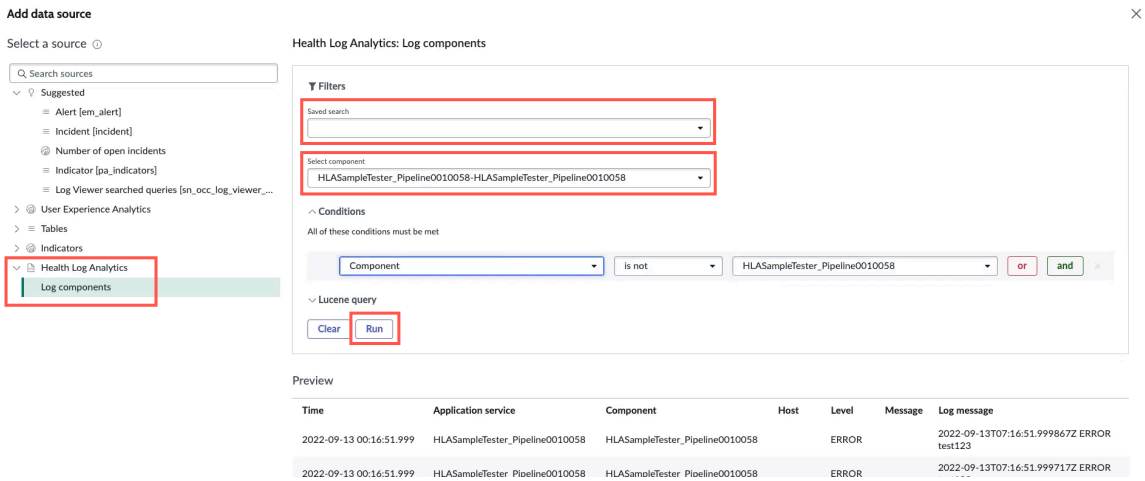
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

e. Choose the required data source from these options:

- Saved searches – a list of all the searches you saved in the Log viewer.
- Select component – a list of all the components that stream data to Health Log Analytics.

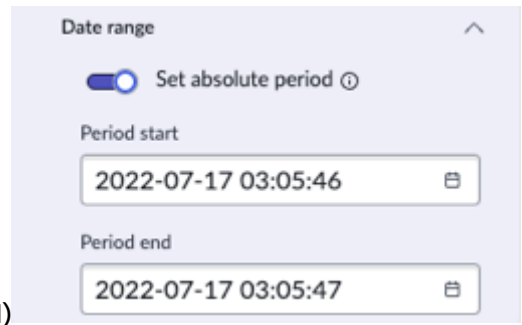
f. Use Conditions, a Lucene query, or both to specify the data segment you're interested in and then select **Run**.



g. Select **Add this source** to add the selected Health Log Analytics data source. The specified visualization displays in the **Data visualization** element.

h. **Optional:** Set fixed start and end dates to customize the time range of the presented data.

(Optional)



i. In the Date range section, select **Set absolute period**.

ii. Specify the start and end date for the absolute period in the appropriate calendars.

i. **Optional:** Adjust the other settings of the visualization as needed.

(Optional) For detailed information on settings for all the visualization types, select the link for the relevant type in Data visualizations in the Analytics Center.

j. **Optional:** Add more elements as needed.

k. Select **Save** to save your changes and continue editing.

l. Select **Exit editing mode** to stop editing and display the dashboard.

Share a Platform Analytics dashboard

Monitor visualized log data on a predefined dashboard in Health Log Analytics

Use visualizations to monitor log data on the built-in Operational Dashboard in Service Operations Workspace Log Analytics and address issues as they occur in the system.

Before you begin

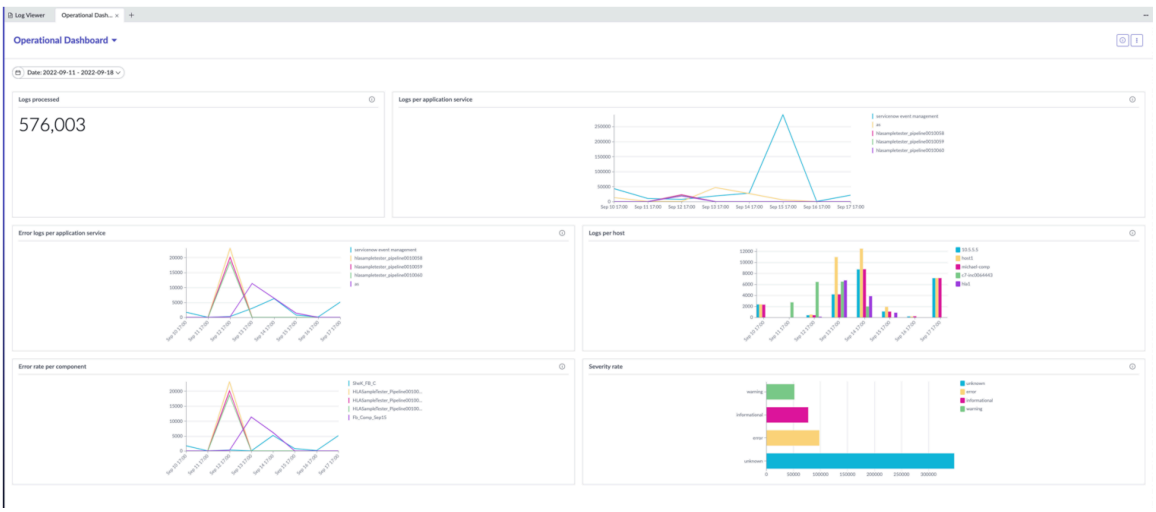
Role required: evt_mgmt_operator or viz_admin

Important: From the Vancouver release onward, this feature is deprecated and replaced with the AIOps HLA Operational dashboard. For more information about AIOps dashboards, see AIOps Dashboards in Service Operations Workspace for ITOM. You can also build a custom dashboard per your needs. For more information, see Create log data dashboards and visualizations in Health Log Analytics.

Procedure

1. Open the **Log Viewer** using one of the following methods:
   - Navigate to **Workspaces** > **Service Operations Workspace** and select the Log Viewer icon ( ).
   - While viewing log entries for an alert on the **Surrounding logs** tab, select **Log Viewer**.
2. Select the selection icon at the top right of the **Log viewer** tab, and then choose **Manage my dashboards** from the drop-down list.
   The **Operational Dashboard** tab displays.

   By default, the dashboard visualizes log data that was ingested in the last 24 hours.



3. **Optional:** Change the time range for which data is shown by selecting the required range from the **Date** drop-down.
   You can specify a custom range by selecting **Custom** and then selecting the required start and end dates.
4. Monitor the visualized log data and use it to identify and address issues.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Event Management service map shows the Health Log Analytics core components and the system health alerts that affect them.

3. On the service map, identify Health Log Analytics system health issues.
4. Drill down into an alert to view details about the issue.

What to do next

Address the alert by performing the action proposed in the notification. For more information, see Health Log Analytics self-health checks, notifications, and proposed actions.

Health Log Analytics system health notifications

Analytics and Reporting in Health Log Analytics

View the number of IT issues predicted before users were affected and the money saved by using Analytics and Reporting in Health Log Analytics.

Platform Analytics Solutions for Health Log Analytics

Platform Analytics Solutions contain prepackaged Performance Analytics and Reporting content for use with other ServiceNow AI Platform products. This Platform Analytics Solution provides valuable insights into the number of IT issues Health Log Analytics predicted before your users were affected. It also shows the money saved by preventing critical outages.

Required roles

The following roles and tasks are associated with this solution:

- ServiceNow AI Platform administrator (admin): Install and activate this solution and make any necessary changes to system properties.
- Performance Analytics administrator (pa_admin): Review the indicators, breakdowns, widgets, and dashboards. Set up and start data collection. Share the dashboards with appropriate stakeholders.

Activate the Platform Analytics Solution for Health Log Analytics

Activate the content pack ServiceNow Store application for the Platform Analytics Solution.

Before you begin

Activate the full, subscription version of Performance Analytics on the instance where you are activating this Platform Analytics Solution. You can activate Performance Analytics on a non-production instance without purchasing a subscription. For more information, see Activate your Performance Analytics subscription.

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Applications** > **All Applications** > **ServiceNow Store**.
2. Browse for Health Log Analytics and verify that you have the necessary valid entitlements.

   You need a HI account and permission to request applications for the instances under consideration. The HI account and the instance need to be part of the same company. For more information, see Install a ServiceNow Product on the ServiceNow Store.
3. Search for `Health Log Analytics (sn.occ)`.
4. Install the application.

   When you install this application, you also activate the Performance Analytics - Premium (com.snc.pa.premium) plugin.

   Note: This plugin requires an additional fee.

Configure the Platform Analytics Solution for Health Log Analytics

Run diagnostics, review and customize components, and start collecting data.

Before you begin

A ServiceNow AI Platform administrator must have installed the content pack plugins or ServiceNow Store application for this Platform Analytics Solution.

Role required: pa_admin

Procedure

1. Run diagnostics on all records.

   These diagnostics can catch many mismatches between the configuration of your Platform Analytics Solutions and your tables.
2. Navigate to **All** > **Performance Analytics** > **Administration Console**.
3. Verify the name of the dashboard that has been installed with this Platform Analytics Solution: Health Log Analytics Overview dashboard.
4. Open the **Indicator Sources** tab.
5. For each dashboard included in this Platform Analytics Solution:

   a. Filter the indicator sources on the dashboard name.

   b. Review the facts table, conditions, and frequency of the indicator sources compared to the data structure on your own instance.

   Important: Pay particular attention to time stamp fields such as Resolved or Created that are referenced in the **Conditions** field. You may need to use different time stamp fields.

   c. If necessary, open an indicator source and make corrections.

   d. If you are editing an indicator source record, go to the Indicators related list and review the Conditions field for each indicator.
   Changing the indicator source can also affect the additional conditions on the individual indicators.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. If you changed the time field stamps in any indicator sources, then change any related Performance Analytics scripts.
7. Open the **Breakdown Sources** tab.
8. For each dashboard included in this Platform Analytics Solution:
   a. Filter the breakdown sources on the dashboard name.
   b. Review the conditions on the breakdown source as described in Review the breakdown sources.
9. Navigate to **All** > **Performance Analytics** > **Jobs**.
10. Set up and run the historical job for this Platform Analytics Solution, *[PA HLA] Historic Data Collection*.
11. Edit and activate the scheduled data collection job for this Platform Analytics Solution, *[PA HLA] Historic Data Collection*.

Health Log Analytics Operational dashboard

The Health Log Analytics Operational dashboard uses Performance Analytics to monitor log data, alerts, and error rates in Service Operations Workspace.

For more information, see HLA Operational dashboard.

Note: The Health Log Analytics Operational dashboard replaces the Health Log Analytics Overview dashboard, which has been deprecated.

Health Log Analytics reference

Reference topics provide additional information about the Health Log Analytics application.

Components installed with Health Log Analytics

Activating the Health Log Analytics, Health Log Analytics Viewer and Health Log Analytics Core plugins adds several components.

Note: The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Plugins

Plugin	Description
Health Log Analytics	Health Log Analytics is an AI-powered log analysis solution capable of preventing IT incidents before users are affected. It automatically identifies your environment and logs, predicts IT incidents, generates alerts, and provides expert suggestions for fixing issues. Health Log Analytics is a ServiceNow Store app. Once installed, the module is available, but you can choose not to interact with it. Dependency:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Plugin	Description
	• Health Log Analytics Core • The ServiceNow® Event Management application
Health Log Analytics Viewer	Event Management operators use the Health Log Analytics Viewer plugin to browse logs by timestamp or time range. Health Log Analytics Viewer enables Event Management operators to search for a specific log text and visualize the frequency of hits in a particular time period. Dependency: The ServiceNow® Event Management application.
Health Log Analytics Core	This plugin contains essential components for Health Log Analytics, such as the AI Engine and Elasticsearch. Health Log Analytics Core is a ServiceNow Store app. Once installed, the module is available, but you can choose not to interact with it. Dependency: The ServiceNow® Event Management application.

Roles

Health Log Analytics uses the following roles.

Role title [name]	Description
Event Management Administrator [evt_mgmt_admin]	Has read and write access to all Event Management features to configure Health Log Analytics.
Event Management Operator [evt_mgmt_operator]	Has read access to all Event Management features. Has write access to alerts to manage the alert life cycle. Has the itil role to manage incidents created from alerts. Can also activate operations on alerts, such as to acknowledge, close, and open an incident and run remediation.

Lists

Health Log Analytics adds the following lists.

Table [name]	Description
Advanced Log Alert Filtering [sn_occ_advanced_alert_filtering]	Controls processing of alert metrics with feedback options. Enables providing more complex feedback to the AI engine.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table [name]	Description
	Beginning with the Health Log Analytics application, Version 20.0.11 - July 2021, available from the ServiceNow Store, this representation no longer displays.
Advanced Log Alert Filter [sn_occ_advanced_alert_filter]	Controls processing of alert metrics with feedback options. Enables providing more complex feedback to the AI engine. **Note:** This feature is supported in the Health Log Analytics application, Version 20.0.11 - July 2021, available from the ServiceNow Store.
Data Inputs [sn_occ_base_data_input_config]	Enables setting up data input connectors to stream log data into the instance.
Data Input Mapping [sn_occ_event_mapper]	Enables mapping raw log data that streams into the instance to determine how Health Log Analytics processes it.
Data Input Preprocessor [sn_occ_data_input_preprocess_screen]	Enables editing raw log data before the system maps and structures it.
Define Alert [sn_occ_custom_alert]	Enables creating custom alerts based on a predefined set of rules.
Excluded Values [sn_occ_auto_service_normalizer]	Enables configuring Health Log Analytics to stop extracting specific log data that is not descriptive enough or contains redundant text or information.
Extracted Values [sn_occ_auto_service_mapper]	Enables configuring Health Log Analytics to extract a specific term found in a field and map it to a specified component.
Features [sn_occ_features]	Lists all Health Log Analytics features. The features can be activated and deactivated.
Lexical Keywords [sn_occ_lexical_keywords]	Shows all default lexical keywords that Health Log Analytics looks for in log data.
Log Correlator [sn_occ_log_correlator]	Shows all correlators that determine whether to correlate different alerts to the same group. Enables adding correlators to Health Log Analytics.
Log Sources [sn_occ_sources]	Provides a view of all data input sources when the log data has been mapped. Enables controlling properties and correlators for these sources.
Muted Metrics [sn_occ_metric_state]	Shows all muted alert metrics together with the muted components. Enables reactivating the muted alert metrics.
Source Type [sn_occ_source_type]	Contains the source types extracted in the mapping process.
Source Type Structure [sn_occ_source_type_structure]	Enables fine-tuning the source type structure. Provides a view of all source types when the log data has been mapped. Source types define how Health Log Analytics treats specific sources and how it parses the logs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table [name]	Description
Streaming Sources [sn_occ_log_streaming_source_stats]	Enables monitoring all entities that stream log data to the instance.
System Health – Notifications [sn_occ_health_check]	Shows all system health notifications together and enables updating their status.
System Properties [sn_occ_system_settings]	Displays system properties and enables customizing their values.
Timestamp Formats [sn_occ_timestamp_formats]	Displays predefined timestamp formats. Enables defining and adding timestamp formats.
Time Zones [sn_occ_time_zones]	Enables deleting records in sn_occ_time_zones for users with the evt_mgmt_admin role.

Forms

Health Log Analytics adds the following forms.

Table [name]	Description
Beats Data Input [sn_occ_data_input_config_filebeat]	Enables configuring advanced settings for Beats data input connectors.
Beats Linux (Filebeat) [sn_occ_data_input_connector_filebeat]	Enables configuring Filebeat data input connectors.
Elasticsearch Data Input [sn_occ_data_input_config_elastic]	Enables configuring an Elasticsearch data input.
MID Server Data Input [sn_occ_data_input_config_midserver]	Enables configuring a MID Server data input.
Rsyslog [sn_occ_data_input_connector_rsyslog]	Enables configuring Rsyslog data input connectors.
Rsyslog Data Input [sn_occ_data_input_config_rsyslog]	Enables configuring advanced settings for Rsyslog data input connectors.
TCP Data Input Configuration [sn_occ_data_input_config_tcp]	Enables configuring advanced settings for TCP data input connectors.
Windows Beats [sn_occ_data_input_connector_winbeat]	Enables configuring Windows Beats data input connectors.
WinLog Beats [sn_occ_data_input_connector_winlogbeat]	Enables configuring WinLog Beats data input connectors.

Supported data inputs for Health Log Analytics

Health Log Analytics (HLA) enables you to connect your ServiceNow instance to several types of data input.

HLA supports the following data input types:

- Passive data inputs (listeners), which wait for log data to be pushed to them. These data inputs require a network port to be open on the MID Server:
  - Rsyslog
  - Beats

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Splunk
- TCP
- UDP
- MID Server
- GCP PubSub
- REST API

The Agent Client Collector data input is supported for use with the Agent Client Collector Log Analytics application, available from the ServiceNow Store.

- Active data inputs (pullers), which pull data from repositories:
  - Elasticsearch
  - Splunk Polling
  - Amazon CloudWatch
  - Amazon S3
  - Microsoft Azure Log Analytics
  - Microsoft Azure Event Hubs
  - Apache Kafka

  For all active data inputs, Health Log Analytics supports MID Server clusters for failover protection. The active data input runs on a single MID Server in the cluster. If that MID Server fails, the system moves its tasks to the next available MID Server in the cluster in a configured order.

  The Elasticsearch data input fetches data from a data repository or database using credentials. If your data is in Elasticsearch, Health Log Analytics must have the following:

  - Permissions to query Elasticsearch

    One of the following types of credentials:
    - Basic authentication (user and password)
    - AWS, for Elasticsearch on Amazon AWS Cloud
  - Network connectivity to the relevant Elasticsearch cluster

  Note: Health Log Analytics must be pointed to the correct index to start pulling the data.

In addition, Health Log Analytics supports Crible, Edge Delta, and Vector Agent data inputs. These data inputs enable HLA to process log messages that are streaming from these tools into your instance.

Native ServiceNow data inputs

Streaming logs from Cloud Observability to Health Log Analytics

Health Log Analytics can process log data it ingests from the ServiceNow® Cloud Observability application, formerly#Lightstep. HLA automatically sets up the configuration needed to enable log streaming from Cloud Observability as part of its native integration. Setting up the connection from Cloud Observability to HLA must be done in the Cloud Observability application. In HLA, you handle log records from Cloud Observability in the same way as any other Data Input Mapping and Source

General guidelines for streaming data to Health Log Analytics

This section helps you identify the appropriate data input for streaming your specific data type to the Health Log Analytics application.

Data inputs for streaming log data to Health Log Analytics

Data type	Data input	Details
Flat files	ACC agent (Agent Client Collector Framework)	Use the ServiceNow ACC agent to stream flat files directly to Health Log Analytics. This method is suitable for log files, CSVs, and other structured file formats.
Cloud applications	Depends on the cloud: Microsoft Azure Event Hubs, Amazon Data Firehose, other methods	• Microsoft Azure Event Hubs: Configure your Microsoft Azure Event Hubs to send data to Health Log Analytics using the Microsoft Azure Event Hubs data input. • Amazon Data Firehose: Set up an Amazon Data Firehose delivery stream to send data to Health Log Analytics using the Amazon Data Firehose data input. • More examples.
Data lakes	Apache Kafka, Cribl	• Apache Kafka: Export data from your data lake to a Kafka topic and use the Apache Kafka data input to stream it to Health Log Analytics. • Cribl: Use Cribl to export data from your data lake and use the Cribl data input to stream it to Health Log Analytics.
Databases	Treat as flat files	Treat database logs, such as Oracle error logs, as flat files and use the ACC agent

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data inputs for streaming log data to Health Log Analytics (continued)

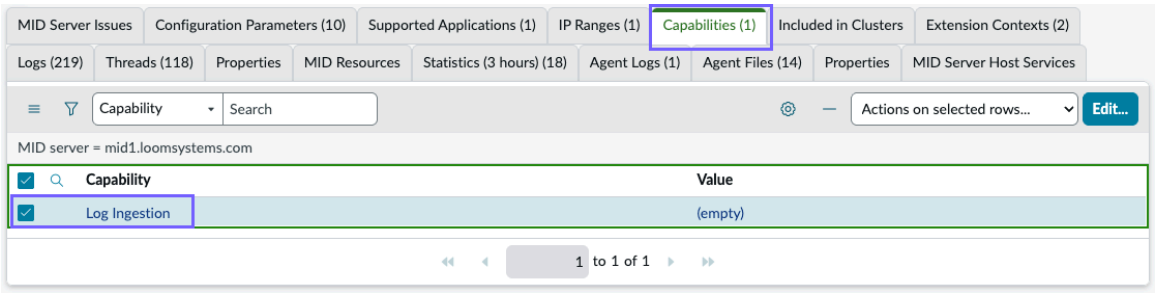
Data type	Data input	Details
		to stream them to Health Log Analytics.
Third-party tools	Varies by tool	• VMware: vCenter can use UDP to stream data to the MID Server and Health Log Analytics using the UDP data input. • More examples.
APM tools	Varies by tool	• New Relic: Use the New Relic plugin to stream events directly to Health Log Analytics. Export raw logs to a flat file and use the ACC agent to stream them to Health Log Analytics. • Dynatrace: Set up the Dynatrace integration to stream data directly from Dynatrace to Health Log Analytics. • Nagios: Use the Nagios plugin to stream events directly to Health Log Analytics. Export logs to a flat file and use the ACC agent to stream them to Health Log Analytics. • Datadog: Use the Vector Agent data input to stream data from Datadog to Health Log Analytics.

MID Server proxy preconditions for streaming logs to Health Log Analytics

Requirements for using a MID Server proxy to stream log data to Health Log Analytics.

- Use a Squid MID Server proxy to enable streaming log data to Health Log Analytics. For more information, see Proxy server configuration for MID Servers used for Cloud Discovery and Cloud Provisioning and Governance.
- Install and configure the MID Server proxy with the log ingestion capability enabled.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



In addition, configure the following properties:

- mid.proxy.use_proxy = true
- mid.proxy.host = <proxy_ip>
- mid.proxy.port = <proxy_port>

Health Log Analytics configuration preferences

Commonly used settings for Health Log Analytics properties and general configuration.

MID Server settings

- The MID Server log ingestion capability must be enabled.

  Note: Enabling **All capabilities** on the MID Server includes enabling the log ingestion capability.

- Use dedicated MID Servers for log ingestion whenever possible.
- To enable MID Servers to run multiple products, Health Log Analytics must have at least the Java Virtual Machine (JVM) memory setting for the standard product for each MID Server thread configuration.

The preferred MID Server settings for Health Log Analytics are:

- - CPUs: 8
  - RAM: 32 GB
  - Network Bandwidth: Up to 10 Gbps
  - EBS Bandwidth: Up to 4,750 Mbps
  - Maximum Java heap size for MID Server: 8,192 MB

  With the above specifications, the expected log ingestion throughput on a Washington DC instance is as follows:

  - For a log message of 300 bytes: 20,000
  - For a log message of 1.1 KB: 12,300
  - For a log message of 2 KB: 7,970

  The minimum requirements for streaming logs to Health Log Analytics are:

  - CPUs: 4
  - RAM: 16 GB
  - Java heap size for MID Server: 8 GB

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For general information, see: MID Server system requirements.

- To increase log ingestion throughput, you can either increase the ulimit or the network bandwidth, or decrease the size of the logs being streamed. The ulimit setting can be configured on an individual MID Server. However, the correlation between the ulimit and the throughput can't be modified.

  The following table lists the ulimit settings for open files relating to network throughput on the MID Server. It shows the size of the logs being streamed from the MID Server to the agent, and the gRPC streaming rate equivalent to the throughput.

  Ulimit settings in relation to throughput

Queue Type	Log line size	gRPC rate
In Memory Queue	300 bytes	18,000
In Memory Queue	1.1 KB	13,000
In Memory Queue	2 KB	10,000
Disk-based Queue	300 bytes	11,000
Disk-based Queue	1.1 KB	5,000
Disk-based Queue	2 KB	3,000

  Starting from the August 2024 release, you can enhance MID Server communication with the ServiceNow instance by using the Lightning gRPC client. This can increase log streaming speeds to Health Log Analytics by up to six times. The Lightning gRPC client requires manual configuration to activate. For more information, see the Lightning gRPC client - Enabling the new MID gRPC streaming architecture [KB1648419] article in the Now Support Knowledge Base.

- By default, the number of data inputs per MID Server is limited to 10. You can configure this limitation for an individual MID Server or for all MID Servers.
- Both in FIPS and non-FIPS mode, MID Servers with Health Log Analytics capability must run on the Java Runtime Environment (JRE) 11 or above.

  Note: To support BC-FIPS version 2.0, Health Log Analytics requires an upgrade to version 34.0.37, December 2024.

Log source retention settings

By default, log retention per source is set to three days. This setting can't be modified.

When using Health Log Analytics application, Version 22.0.12 - December 2021 and later, available from the ServiceNow Store, you can modify the log retention policy per source or for multiple sources together. For more information, see Modify the log source retention period in Health Log Analytics.

Health Log Analytics system health notifications

Health Log Analytics system health notifications help to ensure that you're aware of potentially dangerous conditions. You can manually adjust the status of a notification as the issue is being addressed.

Health Log Analytics uses self-health checks to monitor the health of its components. When it discovers a system health issue, a notification is created and an email sent to all subscribers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Health Log Analytics Administration **System Health - Notifications** list displays all HLA system health notifications, including those about internal errors. You can ask your admin to subscribe you to the system health notifications.

Health Log Analytics System Health - Notifications

Field	Description
Name	Notification header.
Description	Description of the notification.
Created	Date when the notification was created.
State	State of the notification. • **New**: The notification was newly added. • **Acknowledged**: The notification record was read. • **Work in progress**: The issue described in the notification is being addressed. Adjust the value manually. • **Closed**: The issue is no longer active. Adjust the value manually. **Note:** Changing the state of a notification does not affect the state of the issue described in it. A notification in the Closed state will still display in the table. The notification is automatically filtered out of the table only when the issue is detected as fixed (that is, when the Healthy status is **True**).
Healthy	Field that indicates the status of the issue mentioned in the notification. The table shows only notifications with a Healthy value of **False**. When the issue is detected as fixed, the value is automatically changed to **True** and the notification is filtered out of the table.

Health Log Analytics self-health checks, notifications, and proposed actions

Health Log Analytics provides self-health checks, notifications, and proposed problem-solving steps.

Health Log Analytics system health notifications

Self-health check	Notification	Proposed action
Maximum AI engine queue size exceeded	The AI engine is running at overcapacity (size=%s, threshold=%s, duration=%s). As a result, the accuracy of	Contact ServiceNow support.

Health Log Analytics language and character support

Health Log Analytics provides international language support. The default language is US English.

Language support coverage

The current available languages for Health Log Analytics are as follows: US English, UK English, French, German, Italian, Japanese, and Spanish.

Note: To receive keyword-based alerts for languages other than English, keywords in the relevant language must be added to the system before you start streaming. Contact ServiceNow Support for assistance.

Character support

Health Log Analytics currently supports ASCII and Windows-1252 (commonly referred to as ANSI) character encodings, regardless of the text source. It doesn't support encodings for non-Latin scripts, such as Japanese.

Domain separation and Health Log Analytics

Domain separation is supported for Health Log Analytics. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application’s service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

Domain separation and Health Log Analytics overview

Domain separation is present in all aspects of the Health Log Analytics application. Users belonging to a specific domain see only the data existing in their own domain.

How domain separation works in Health Log Analytics

When data is domain separated using a single Health Log Analytics server, each Managed Service Provider (MSP) can see log data only in its own domain. MSPs can also see data in child domains below their domain.

Each MSP can view alerts that Health Log Analytics generates only in their domain. Actions to remediate the alerts apply only for the scope of that domain.

By default, all users and records are set to the parent domain. The admin can assign them to a specific domain.

The Health Log Analytics Domain Separation plugin must be installed before you configure your data inputs in the Health Log Analytics application. There is no setup procedure for the plugin. Install the plugin with the Health Log Analytics application Version 21.0.1 - September 2021, and then activate it. Make sure that you map your data into logical silos and configure rules and entities.

You define the domain-separated environment when you configure your data inputs. Users can use data inputs that are only available in their own domain. Health Log Analytics creates alerts only for logs that arrive in those data inputs. All relevant records and all data processing in the Health Log Analytics program flow reside in the same domain as the data input. A data input's domain name is shown in the **Domain** column displayed in the tables in your instance.

Using domain separation in your instance is transparent to Health Log Analytics. The application manages all aspects of the data, such as system settings and custom operations, separately. When a property is changed, the new value affects new sources only in the specific domain. System properties affecting the server are common to all domains because all domains use the Health Log Analytics server.

Note: Health Log Analytics supports up to 60 kilobytes events per second (EPS) across all domains, without the ability to provide a service level agreement (SLA) to a specific domain and without fairness. If a domain streams a large amount of data, the Health Log Analytics server processes it. Other domains might suffer latency, drops, or other issues as a result, even if they stream a low number of logs. On the MID Server side, 10 kilobytes EPS is expected.

Use cases

- An MSP wants to provide the Health Log Analytics application to multiple customers in a similar environment with a single instance.
- An organization with many tenants wants to isolate its sensitive data, such as security logs.
- An administrator of a tenant organization wants to define a data input only for their own domain.
- An operator in a tenant organization wants to view logs only in their own domain.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- An operator in a tenant organization wants to provide feedback for alerts only in their own domain.
- An MSP Admin wants to view log data from all of their organization's tenant domains.

Domain separation for service providers

JavaScript function test outcome fields

Description of the JavaScript function test outcome fields.

The following fields are read-only:

Field	Description
Duration (ms)	The processing time of all samples, in milliseconds.
Source types	The number of source types predicted or created for this data input.
Sources	The number of sources predicted or created for this data input.
Errors	The number of JavaScript errors that occurred in all the samples.
Unmapped	The number of log lines that could not be mapped. These log lines are mapped to default tags.
Samples	The number of log samples on which the test is run. The default value is 1,000. **Note:** You can increase the number of log samples up to a maximum of 5,000 samples in the system property data_input_mapping.max_examples. For more information, see Configure global Health Log Analytics system properties.

In the related lists, view the predicted or created source types and sources.

List/Tab	Description
Outcome Key Value Mapping	The results of running the JavaScript function on the log samples.
Source Types (from samples)	The predicted or created source types. **Note:** You can open source types that have already been created by selecting the appropriate link.
Sources (from samples)	The predicted or created sources.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

List/Tab	Description
	Note: You can open sources that have already been created by selecting the appropriate link.
Test Outcome	The log samples used for testing your JavaScript function, ordered by sources and source types. The **Test Outcome** list displays the number of log samples for each source-source type combination, and is updated when the log samples are refreshed and you start testing your script. The list links to samples in the **Mapping Samples** table, which shows the outcome of the JavaScript function for each sample. This feature is supported in the Health Log Analytics application, Version 26.0.17 - February 2023 and later, available from the ServiceNow Store.
Source Type Structures	The source type structures for this data input. Reviewing the source type structures can help you gain a better understanding of the data flow. The **Last event time** column on this tab shows the last date and time the AI engine processed a log for the source type structure. The system refreshes this information every 5 minutes. Knowing when the last log was processed for this source type structure makes it easier to verify that log data is streaming.

Health Log Analytics severity mapping

Health Log Analytics (HLA) uses common severity values to identify severity labels in the Source Type Structure.

The **Log severity mapping** table shows how HLA identifies severity words from raw logs (left column) and maps them to its own severity values (middle column). HLA then presents them in Event Management alerts (right column).

Log severity mapping

Raw log severity	HLA log severity	Event Management alert severity
TRACE	TRACE	Keywords-based
VERBOSE	TRACE	Keywords-based
FINE	TRACE	Keywords-based
FINER	TRACE	Keywords-based

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Log severity mapping (continued)

Raw log severity	HLA log severity	Event Management alert severity
FINEST	TRACE	Keywords-based
DEBUG	DEBUG	Keywords-based
DBG	DEBUG	Keywords-based
CONFIG	DEBUG	Keywords-based
INFORMATIONAL	INFORMATIONAL	Keywords-based
INFORMATION	INFORMATIONAL	Keywords-based
INF	INFORMATIONAL	Keywords-based
INFO	INFORMATIONAL	Keywords-based
UNKNOWN	UNKNOWN	Keywords-based
NOTICE	NOTICE	LOW
NOTIFICATION	NOTICE	LOW
WARNING	WARNING	MEDIUM
WARN	WARNING	MEDIUM
ERROR	ERROR	HIGH
ERR	ERROR	HIGH
CRITICAL	CRITICAL	CRITICAL
CRIT	CRITICAL	CRITICAL
FAT	CRITICAL	CRITICAL
FATAL	CRITICAL	CRITICAL
SEVERE	CRITICAL	CRITICAL
ALERT	ALERT	CRITICAL
EMERGENCY	EMERGENCY	CRITICAL
EMER	EMERGENCY	CRITICAL

Note: If your raw log contains numerical severities or unrecognized words, map these values to the HLA Log Severity column by creating a conditional statement using the JS function in the Source Type Structure. For more information, see Source type structure adjustment in Health Log Analytics.

Sections and cards on the alert Overview tab in Health Log Analytics

The **Overview** tab helps you understand Log Analytics alerts, Log Analytics alert groups, and component-based alerts.

Overview tab sections for Log Analytics alerts

The **Overview** tab in Health Log Analytics helps you understand Log Analytics alerts.

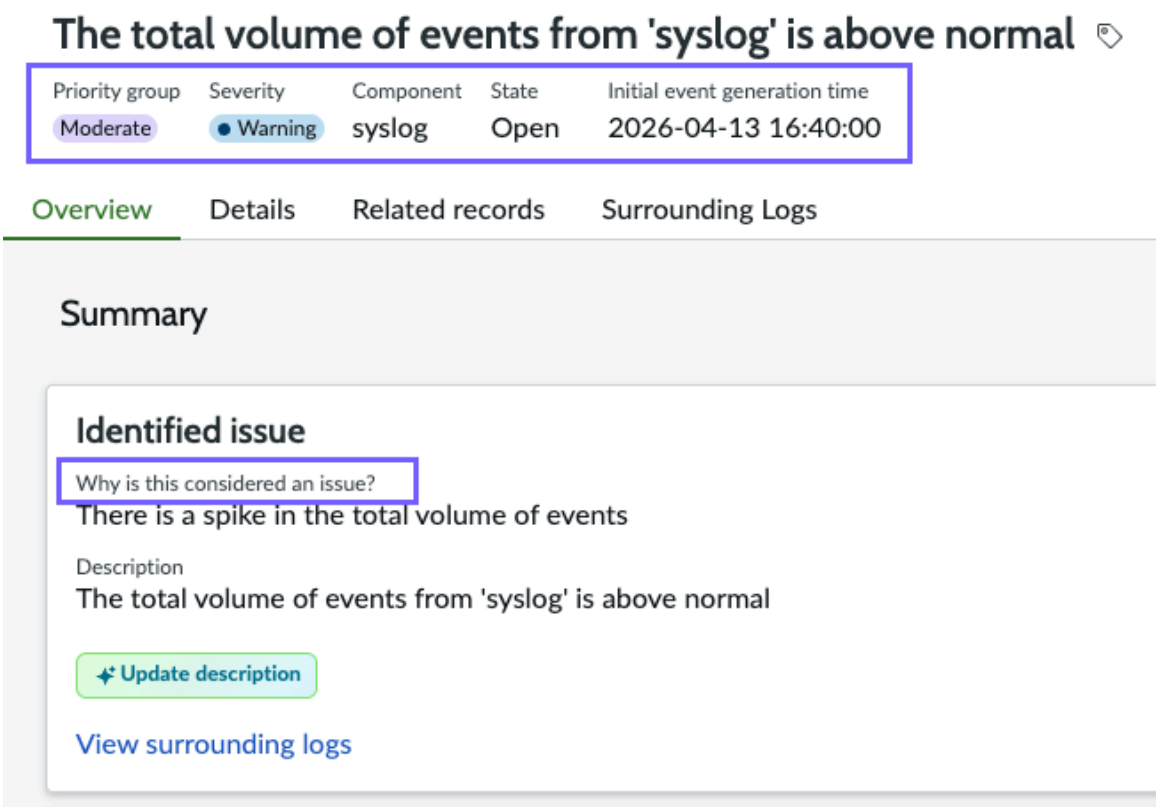
Summary

Identified issue

This card describes the issue that led to the alert. The identified issue appears on the card and in the title for the alert. Information about the alert appears in the banner.

Identified issue



Select **Details** for more information about the alert.

Select **View surrounding logs** to view the log lines that were generated one minute before and one minute after the alert. See Analyze log lines around an anomaly.

Anomaly

This card illustrates the anomalous activity that led to the alert.

The chart shows:

- Recent anomalous activity
- Expected behavior (the learned baseline)
- Baseline values from one day earlier
- Baseline values from the previous week

In this example, the system tracks the baseline rate (the average number of events per minute) for a specific log pattern. When this typically inactive log generates a spike in events, the system detects the deviation from the baseline and generates an alert.

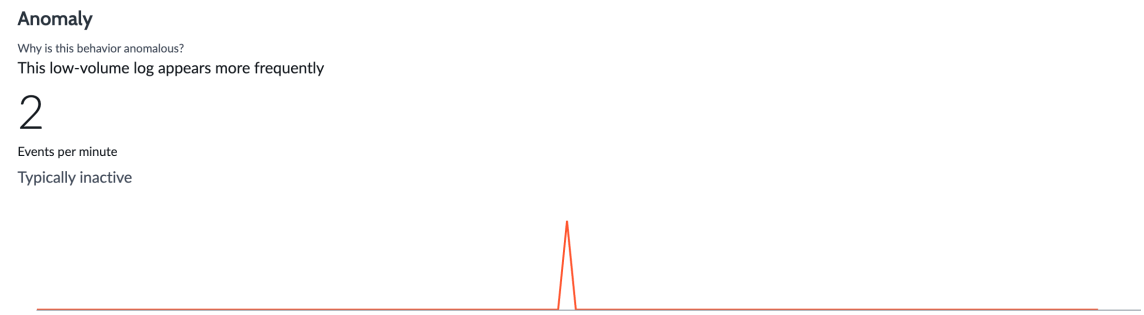
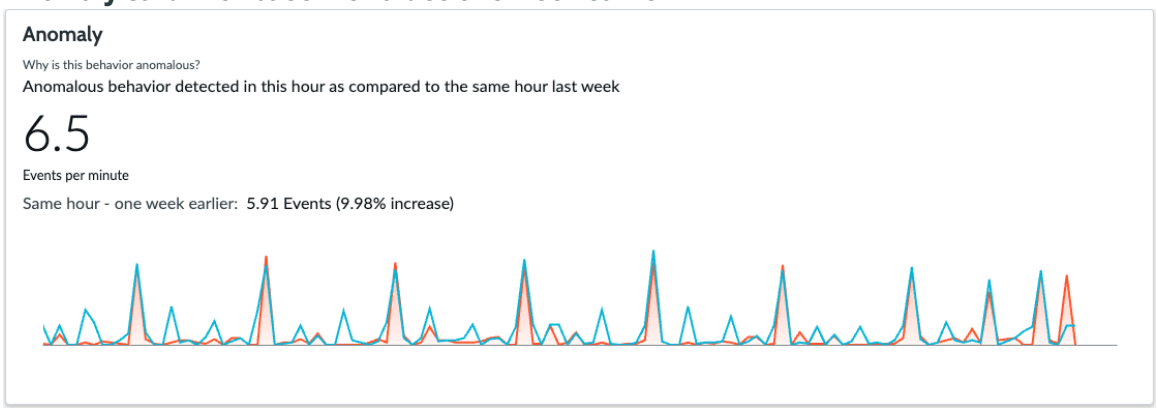
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Anomaly card



In this example, the blue line represents the current average number of events per minute. The orange-shaded area represents the baseline values for the same hour in the previous week.

Anomaly card with baseline values one week earlier



For more information on the kinds of anomalies that you might encounter, see Types of anomalous behavior in Health Log Analytics.

Impact

Configuration Items

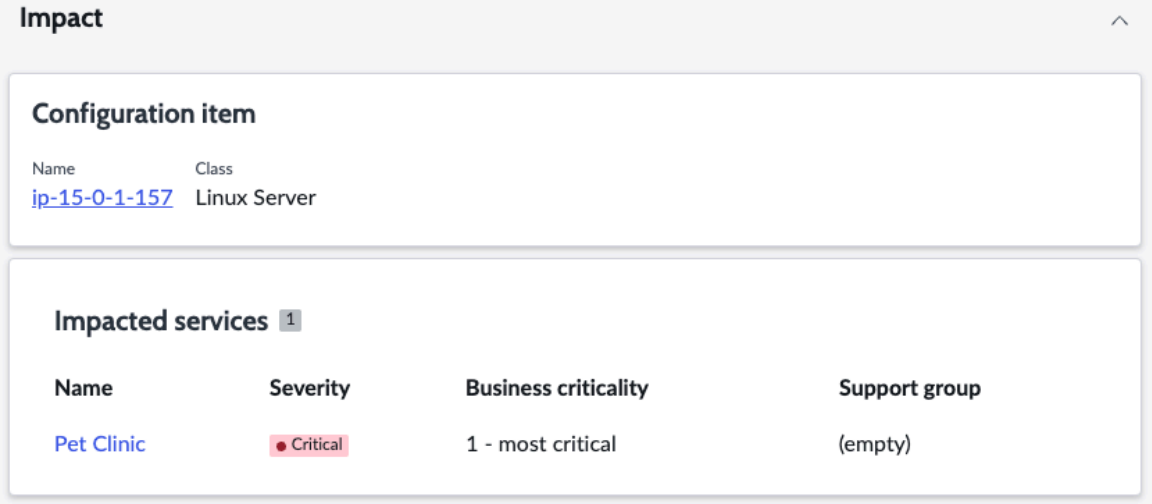
This card provides information about the CIs that are impacted by the alert.

Impacted services

This card provides information about the services that are impacted by the alert.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Impact section

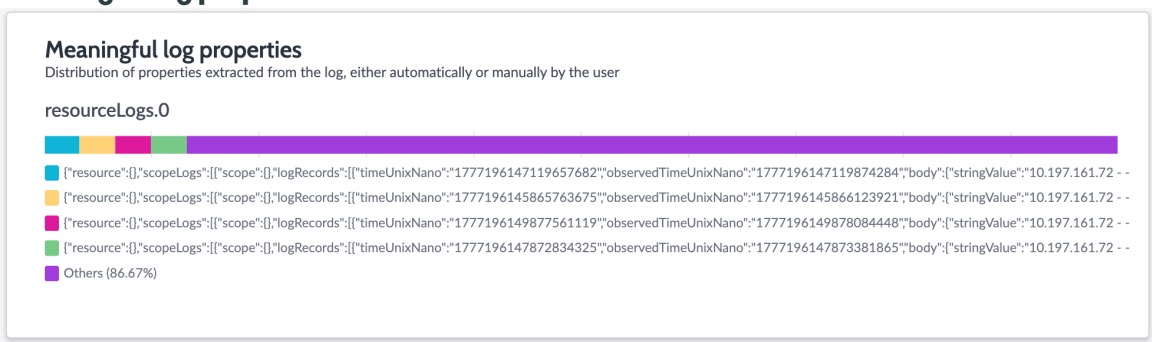


Cause

Meaningful log properties

On this card, each bar chart shows the distribution of values for a single log property that contributed to the anomaly. Each property value is associated with a color. The length of a color bar correlates to the percentage that the property value holds in comparison with all other values for the property.

Meaningful log properties



Overview tab sections for Log Analytics alert groups

The alert **Overview** tab in Health Log Analytics helps you understand Log Analytics groups.

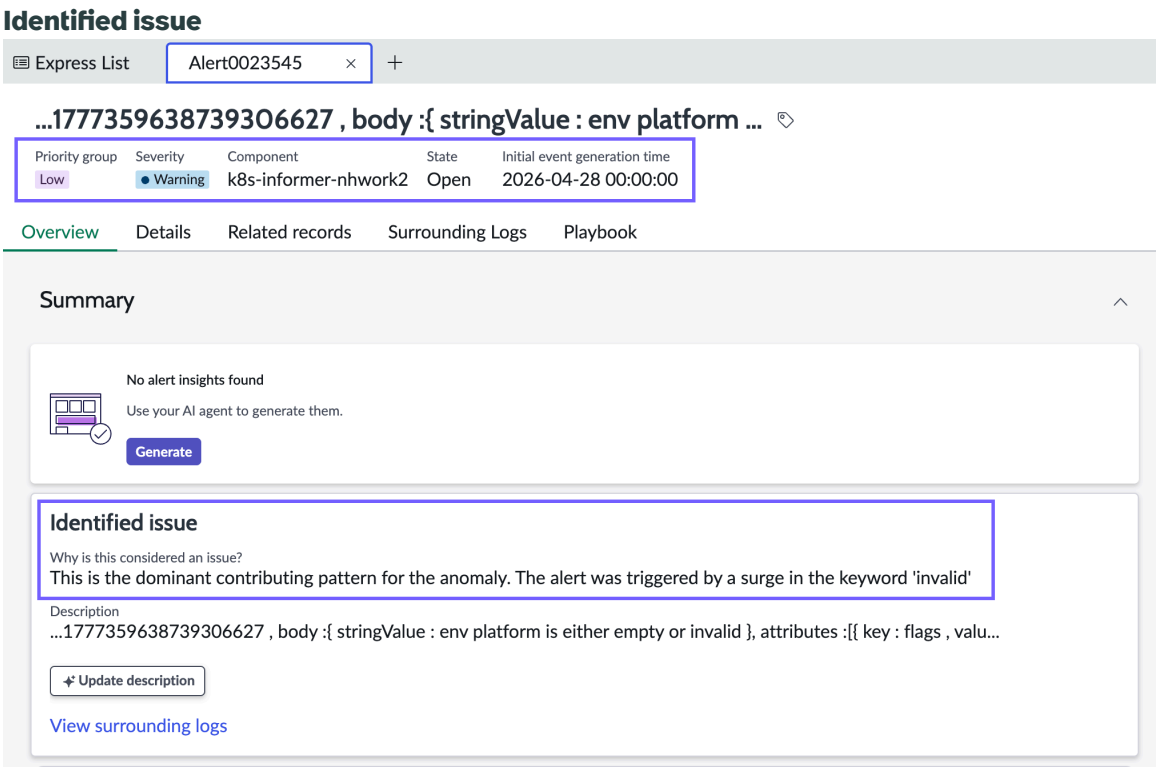
For a detailed description of Log Analytics groups, see Types of Health Log Analytics alerts.

Summary

Identified issue

This card describes the issue that led to the alert. The identified issue appears on the card and in the title for the alert. Information about the alert appears in the banner.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Select **View correlations** to view the list of correlations that relate the Log Analytics alerts.

Correlations list

During initial analysis, alerts are scored. Each correlation in the alert's log data with another alert contributes to the score. The higher the score, the more likely the alert is to be included as a Log Analytics alert in a Log Analytics group.

The following kinds of data are considered when determining whether alerts are correlated:

- Time: The events all occurred within a configured time interval.
- Metadata: The alerts have matching values in log-line metadata. For example, all alerts involve the same host.
- Message text: The message text in the log data is similar or identical between alerts.
- Trend: The alerts show a similar tendency in values or rates. For example, a particular metric value is increasing in all alerts.

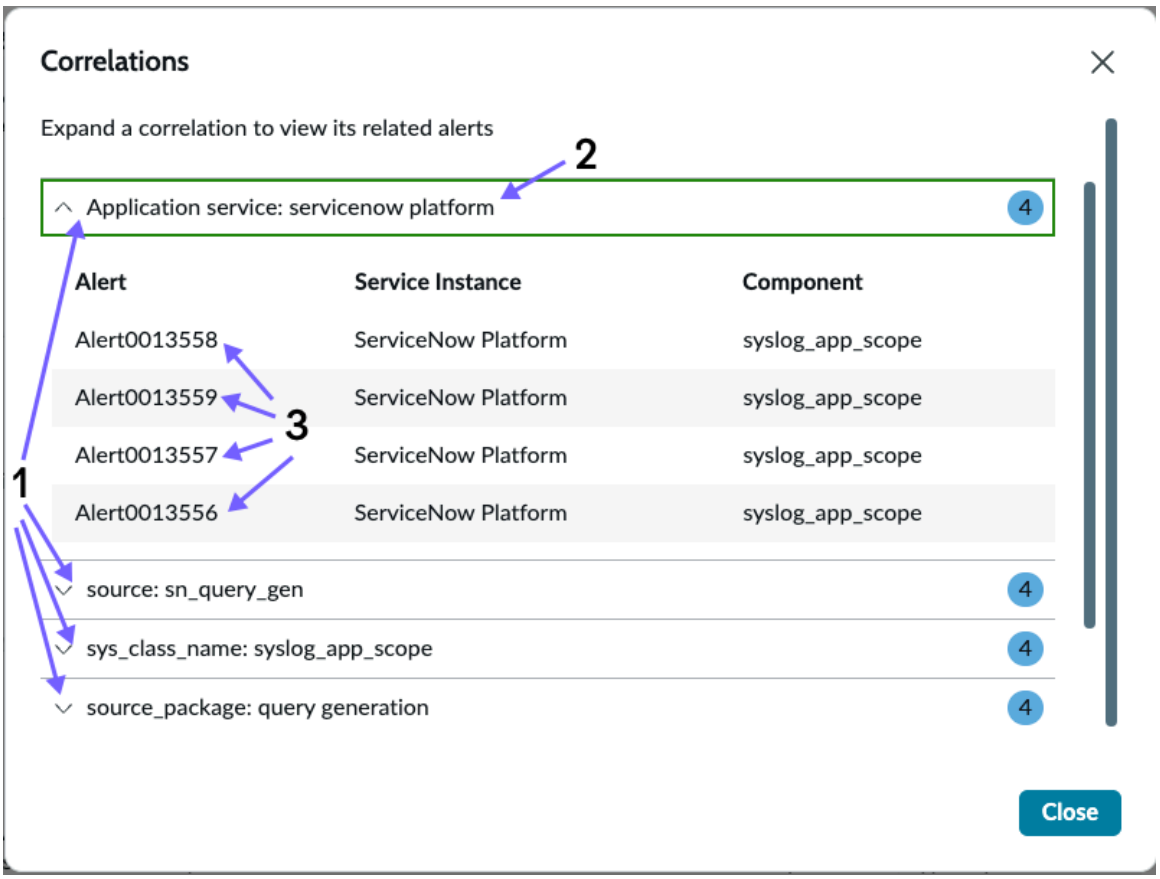
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Correlations



1. List of correlations: The first correlation in the list is expanded to show the individual Log Analytics alerts that are correlated and the log correlator that the alerts share.
2. An individual log correlator: The identifier for a group of correlated Log Analytics alerts. The alerts are grouped by the log-line data or metadata that is common to the alerts (for example, IP address, host name, or user name). The number in the blue square indicates the number of correlated alerts.
3. Log Analytics alerts that are correlated.

Alerts in group

For a Log Analytics alert, the Alerts in group card shows the Log Analytics alerts that are grouped under the Log Analytics alert. Select a Log Analytics alert to view its details.

© 2026 ServiceNow, Inc. All rights reserved.

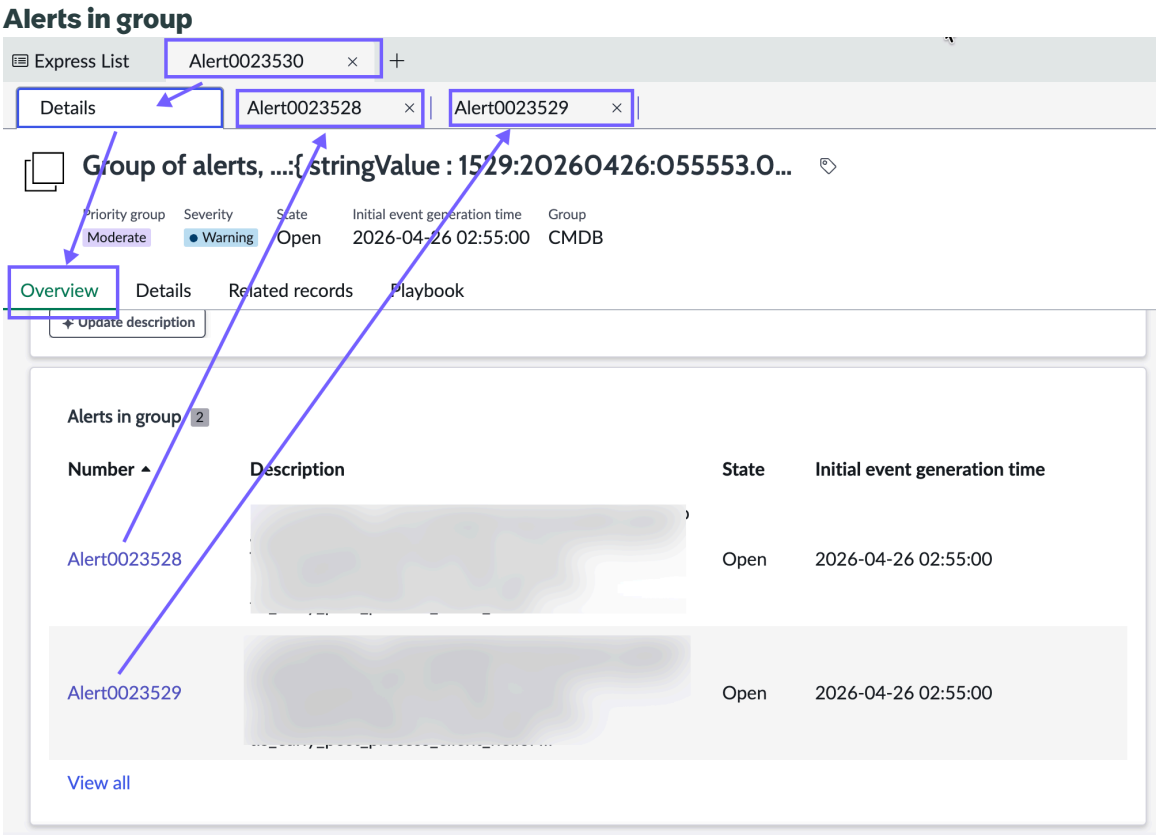
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Select **View all** to the view the list of all Log Analytics alerts in the group and relevant information about them. You can also view the Alerts in group list by selecting the **Related records** tab and then selecting **Alerts in group**.

For each Log Analytics alert in the group, the following information is available.

Alerts in group

Column	Description
Number	The number of the alert. Select the number to view detailed information for an alert. This field is automatically set.
Initial event generation time	The time when the event that generated the alert first occurred. **Note:** Time here is the ServiceNow processing time, not the source system time.
Group	Type of group that the alert belongs to: a standalone Log Analytics alert or a Component-based alert.
Description	Anomalous pattern or metric that caused the alert to be generated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alerts in group (continued)

Column	Description
Severity	Severity value for the alert. The available values are: • **Critical**: Immediate action is required. Either the resource is not functional or critical problems are imminent. • **Major**: Major functionality is severely impaired or performance has degraded. • **Minor**: Either performance has degraded or there is a partial, non-critical loss of functionality. • **Warning**: Attention is required even though the resource is still functional. • **Info**: An informational message. An alert is created, but the resource is still functional. • **Clear or Resolved**: No action is required. An alert is not created from this event. Existing alerts are closed.
Priority group	Priority group that indicates the order in which to resolve alerts. Choices are as follows: • **Urgent** • **High** • **Moderate** • **Low** The priority group value is more important than severity alone. For example, a high priority and low severity alert should be addressed before a low priority and high severity alert. For information on how priority is calculated, see Alert priority.
State	Processing state of the alert. A newly generated alert is in the **Open** state. Other states are as follows: • **Reopen**: A previously closed alert is open again, and it requires your attention. • **Flapping**: The alert is receiving identical events from the same source at high frequency. This state can cause an alert to re-open from the

Alerts in group (continued)

Column	Description
	Closed state, resulting in a high frequency of changes between Open and Closed states. • **Closed**: The alert is closed and does not require any further action. You close an alert when it is remediated.
Configuration item	CI in the CMDB. The CI is applied to by the alert.
Node	Node field that is received in the log message. The event described in the log message occurred on this node. Often, the node is the name of the CI that is associated with the alert. For example, a computer name, IP address, FQDN, or MAC address.
Source	All Health Log Analytics alerts have the value **Log Analytics** in the **Source** column to indicate that the Health Log Analytics app generated the alert.
Metric name	Name of the metric whose anomalous behavior led to the alert. For example, the *`I/O request`* in the case that the I/O request took longer than 15000 ms to complete.
Updated	Most recent time when the alert information or state was updated.

Impact

Configuration Items

This card provides information about the CIs that are impacted by the alert.

Impacted services

Integration configuration fields

This section provides descriptions of the fields on the integration configuration forms for Health Log Analytics.

ACC Log Analytics (ACC-L) integration configuration fields

Description of the fields on the ACC Log Analytics (ACC-L) integration configuration forms for Health Log Analytics.

For the ACC Log Analytics (ACC-L) integration setup procedure, see Set up an ACC Log Analytics integration for Health Log Analytics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details

Field	Description
Transport	The protocol used to send the log data. This field is read-only. The ACC-L integration uses a ServiceNow Agent to send data.
Port	The port on the MID Server to which the ACC-L agent connects. This field is required. **Important:** This port can't be the same as the MID Web Server port.
Description	Option to add a brief description of the integration to help identify it.
ACC Listener	
MID Server	The MID Server to which the logs stream. This field is required. **Note:** • Only one ACC-L integration can be defined per MID Server. You can only select MID Servers with AgentClientCollector capability that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. Exception: if 10 non-ACC-L integrations are already defined for a MID Server, you can still add one ACC-L integration, for a total of 11. • When you submit the form, this field is set to read-only. • **Important:** The configured MID Server can't be changed after the integration is activated.
MID Web Server port	Port used by the MID Server to receive data from ACC agents. This field is auto-populated and read-only when a MID Server has been configured.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details (continued)

Field	Description
	Note: The MID Web Server port must be reachable through your firewall.

Advanced settings

Field	Description
Lookup hostnames	Option to perform DNS lookup to resolve IPs to hostnames.
Use SSL	Option to use SSL.
Client inactivity timeout (seconds)	The timeout, in seconds, to close an inactive channel.
Sub sample drop ratio	The ratio of logs to drop. The default value is -1: no logs are dropped. For example: If you want one out of every five logs to be dropped, change the value to 5.
Max length in bytes	The maximum length of log messages, in bytes.
Character encoding	The character encoding for this integration: UTF-8. This field is read-only.
Worker thread count	The number of threads that handle incoming data.
Sub sample receive ratio	The ratio of logs to receive. The default value is -1: no logs are received. For example: If you want one out of every five logs to be received, change the value to 5.
Default timezone	The default time zone of events. The system uses this default when the log does not specify a time zone.
Drop if queue is full	Option to discard logs if many processes are waiting in the queue to access the MID Server.

Amazon CloudWatch integration configuration fields

Description of the fields on the Amazon CloudWatch integration configuration forms for Health Log Analytics.

For the Amazon CloudWatch integration setup procedure, see Set up an Amazon CloudWatch integration for Health Log Analytics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details

Field	Description
Integration Name	Unique name of this integration. For example: My CloudWatch integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
Service instance	The service instance (formerly the application service) to which to bind the log data. This field is required.
Execute on	Option to select whether to use a specific MID Server or a MID Server cluster. This field is required.
MID server name	(Only when the **Execute on** field is set to Specific MID Server) The MID Server to which log data from Amazon CloudWatch is pulled. This field is required. **Note:** • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of integrations streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically.
MID Server Cluster	(Only when **Execute on** is set to Specific MID Server cluster.) The MID Server cluster to which the log data is pulled. This field is required. The data input runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the data input tasks to the next available MID Server in the cluster according to the configured order.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details (continued)

Field	Description
	Note: • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the data input or integration form, the MID Server clusters list displays only failover clusters. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • The default maximum number of data inputs or integrations streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 data inputs or integrations running on it. This is true even when that MID Server is down. For more information about MID Server clusters, see Configure a MID Server cluster.
Data source	The source of the log data that the integration pulls to your ServiceNow instance: CloudWatch. This field is read-only.
Description	Option to add a brief description of the integration to help identify it.

Set data retrieval method

Field	Description
How to extract data from AWS CloudWatch?	
Authentication method	The AWS credentials needed to access resources in AWS service accounts. This field is required. Choose AWS credentials from the list, or add new AWS credentials to the list by selecting **Manage Credentials** and then defining new credentials on the **AWS Credentials** page.
Group Name(s)	The log group(s) to fetch log data from in Amazon CloudWatch. This field is required. If you want the integration to search multiple log groups, specify the relevant groups in a

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set data retrieval method (continued)

Field	Description
	comma-separated list. To fetch log data from all groups, use an asterisk (*) as a wildcard character.
AWS Region	The AWS region where the Amazon CloudWatch cluster is hosted. For example: us-west-1. This field is required. For a list of AWS regions, see https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/using-regions-availability-zones.html#concepts-regions
Which data to send to ServiceNow?	
Filter pattern	The pattern by which to filter incoming events. Various types of filter patterns are supported. For example: • A pattern for fetching log events that contain a single term. • A pattern for fetching log events that contain multiple terms. • A pattern for fetching log events that include a term and exclude another. **Note:** Filter patterns are case sensitive. For more information, see https://docs.aws.amazon.com/AmazonCloudWatch/latest/logs/FilterAndPatternSyntax.html
Prefix	Option to define a name prefix for Amazon CloudWatch log streams to read from. The integration reads only from log streams with this name prefix. **Note:** Only a single log stream prefix per data item is supported. For multiple prefixes, create multiple integrations.

Advanced settings

Field	Description
Connection timeout (ms)	The number of milliseconds to wait before timing out the AWS connection attempt.
Socket timeout (ms)	The number of milliseconds to wait before timing out a data transfer over an established connection.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced settings (continued)

Field	Description
Sub sample drop ratio	The number of logs to batch together, out of which one will be dropped. The default value is -1: No logs are dropped. This setting is used to reduce the number of fetched logs. For example, if you want one log out of every five to be dropped, change the value to 5.
Polling interval	The interval, in seconds, to wait before polling for new logs.
Character encoding	The character encoding used for this integration: UTF-8.
Batch size	The maximum number of logs retrieved per query.
Max length in bytes	The maximum length of log messages, in bytes.
Sub sample receive ratio	The number of logs to batch together, out of which one log will be received and the remaining ones dropped. The default value is -1: No logs are received. This setting is used to reduce the number of received logs. For example, if you want to receive one log out of every five, change the value to 5.
Sleep interval (seconds)	The interval, in seconds, to wait before querying again after a query has returned no logs.
Default timezone	The default timezone if the log date and time doesn't include timezone information.
Drop if queue is full	Option to select discarding logs if there is a load on the MID Server.

Amazon S3 integration configuration fields

Description of the fields on the Amazon S3 integration configuration forms for Health Log Analytics.

For the Amazon S3 integration setup procedure, see Set up an Amazon S3 integration for Health Log Analytics.

Provide details

Field	Description
Integration Name	Unique name of this integration. For example: My S3 integration. This field is required.

A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 data inputs or integrations running on it. This is true even when that MID Server is down. For more information about MID Server clusters, see Configure a MID Server cluster.
Data source	The source of the log data that the integration pulls to your ServiceNow instance: S3. This field is read-only.
Description	Option to add a brief description of the integration to help identify it.

Set data retrieval method

Field	Description
Bucket name	The Amazon S3 bucket to stream. This field is required.
Region	The AWS region where the Amazon CloudWatch cluster is hosted. For example: us-east-2. This field is required. For a list of AWS regions, see https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/using-regions-availability-zones.html#concepts-regions
Authentication method	The AWS credentials needed to access resources in AWS service accounts. This field is required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set data retrieval method (continued)

Field	Description
	Choose AWS credentials from the drop-down list, or add new AWS credentials to the list by selecting **Manage Credentials** and then defining new credentials on the **AWS Credentials** page.

Advanced settings

Field	Description
Include	The file or object to include when the system performs pattern matching.
Exclude	The file or object to exclude when the system performs pattern matching.
Bucket prefix	The prefix for the objects to be fetched. The integration fetches only objects with this prefix. **Note:** This field is typically used to fetch only specific folders within a bucket.
Buffer size	The size of the download buffer, in bytes.
Threadpool size	The number of concurrent threads that are downloading files from the bucket.
Anonymous	Option to force accessing the bucket without credentials, while ignoring default credentials if they exist.
Traverse	Option to access each directory in the bucket.
Sorting object by last modified time	Option to fetch objects if the objects in the bucket are sorted by time.
Sub sample drop ratio	The number of logs to batch together, out of which one will be dropped. The default value is -1: No logs are dropped. This setting is used to reduce the number of fetched logs. For example, if you want one log out of every five to be dropped, change the value to 5.
Sleep interval (seconds)	The interval, in seconds, to wait before querying again after a query has returned no events.
Max length in bytes	The maximum length, in bytes, of events.
Connection timeout (ms)	The number of milliseconds to wait before timing out the attempt to establish a connection to AWS.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced settings (continued)

Field	Description
Max retry per file	The maximum number of times to retry file processing in case of failure.
Socket timeout (ms)	The number of milliseconds to wait before timing out data transfer over an established connection.
Default timezone	The default timezone if the log doesn't include timezone information.
Sub sample receive ratio	The number of logs to batch together, out of which one log will be received and the remaining ones dropped. The default value is -1: No logs are received. This setting is used to reduce the number of received logs. For example, if you want to receive one log out of every five, change the value to 5.
Polling interval	The interval, in seconds, to wait before polling for new events.
Character encoding	The character encoding used for this integration: UTF-8
Drop if queue is full	Option to select discarding logs if there is a load on the MID Server.

Apache Kafka integration configuration fields

Description of the fields on the Apache Kafka integration configuration forms for Health Log Analytics.

For the Apache Kafka integration setup procedure, see Set up an Apache Kafka integration for Health Log Analytics.

Provide details

Field	Description
Integration Name	Unique name of this integration. For example: My Kafka integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
Execute on	Option to select whether to use a specific MID Server or a MID Server cluster. This field is required.
MID server name	(Only when the **Execute on** field is set to Specific MID Server)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details (continued)

Field	Description
	MID Server to which log data from Apache Kafka is pulled. This field is required. **Note:** • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify the maximum number by adding the property `sn.occ.log_ingestion.max_datainputs_per` to the MID Server and then changing the default value. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically.
MID Server Cluster	(Only when **Execute on** is set to Specific MID Server cluster.) The MID Server cluster to which the log data is pulled. This field is required. The data input runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the data input tasks to the next available MID Server in the cluster according to the configured order.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details (continued)

Field	Description
	Note: • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the data input or integration form, the MID Server clusters list displays only failover clusters. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • The default maximum number of data inputs or integrations streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 data inputs or integrations running on it. This is true even when that MID Server is down. For more information about MID Server clusters, see Configure a MID Server cluster.
Service instance	The service instance (formerly the application service) to which to bind the log data. This field is required.
Data source	The source of the log data that the integration pulls to your ServiceNow instance: Kafka. This field is read-only.
Description	Option to add a brief description of the integration to help identify it.

Set data retrieval method

Field	Description
Kafka node names	A comma-separated list in the format HOST:PORT,HOST:PORT. This field is required. The list does not have to include all the Apache Kafka Cluster servers.
Topics	A comma-separated list of topics to which the data input must subscribe. This field is required.
Kafka credentials	The Apache Kafka credentials.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set data retrieval method (continued)

Field	Description
	You can select existing Kafka SSL credentials, or create new ones by selecting **Create Kafka credentials** from the drop-down list. For a description of the fields on the Kafka SSL credentials form, see Kafka SSL credentials fields.
Group ID	The name of the Apache Kafka Consumer Group.

Advanced settings

Field	Description	Default value
Timeout	The time, in milliseconds, spent waiting in the poll if data is not available in the topics.	500
Default timezone	The time zone of events that the system will use if a log does not specify the time zone. By default, the system uses GMT in such cases, but you can specify a different time zone.	GMT
Sub sample receive ratio	The number of events to batch together, out of which all but one will be discarded. This setting is used to decrease the number of received events.	-1
Character encoding	The character encoding for this data input. This field is read-only.	UTF-8
Node discovery timeout	The time, in milliseconds, before node discovery times out.	30
Sub sample drop ratio	The number of events to batch together, out of which one will be discarded. This setting is used to reduce the number of fetched events.	-1
Max length in bytes	The maximum length, in bytes, of events.	32766
Drop if queue is full	Option to discard logs if there is a load on the MID Server.	False

Amazon Data Firehose integration configuration fields

Description of the fields on the Amazon Data Firehose integration configuration forms for Health Log Analytics.

For the Amazon Data Firehose integration setup procedure, see Set up an Amazon Data Firehose integration for Health Log Analytics.

Provide details

Field	Description
Integration Name	Unique name of this integration. For example: My Firehose integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
Transport	The protocol used for streaming log messages to your instance: Amazon CloudWatch Logs. This field is read-only.
Description	Option to add a brief description of the integration to help identify it.

Cribl integration configuration fields

Description of the fields on the Cribl integration configuration forms for Health Log Analytics.

For the Cribl integration setup procedure, see Set up a Cribl integration for Health Log Analytics.

Provide details

Field	Description
Integration Name	Unique name of this integration. For example: My Cribl integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
Service Instance	The service instance (formerly the application service) to which to bind the log data. This field is required.
MID Server name	The MID Server to which the Cribl logs are streamed. This field is required.
Port	The port on the MID Server. This field is required. Choose a port within the range 6000-6200 from the array. The port must not be occupied by another process. Make sure that your

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details (continued)

Field	Description
	organization's security team opens the selected port on the MID Server.
Description	Option to add a brief description of the integration to help identify it.
Transport (for push integrations)	The protocol used for streaming log messages to your ServiceNow instance: TCP. This field is read-only.
Source (for pull integrations)	The source of the log data that the integration pulls to your ServiceNow instance: Cribl. This field is read-only.

Set up connection

Field	Description
Cribl URL	The URL of the Cribl instance. This field is required. HLA uses this URL to establish the connection with the Cribl instance and make the necessary API calls. For example: • On-Prem: https://my-cribl.company.com:9000 • Cloud: https://myorg-12345abcde.cribl.cloud • Sandbox: https://sandbox-xyz789.sandbox.cribl.io
Authentication method	The authentication method used by the Cribl integration. This field is required. The Cribl integration supports: • Token-based authentication: Required for Cribl Cloud and also supported for self-hosted (On-Prem) Cribl instances. • Basic authentication: Preferred for self-hosted (On-Prem) Cribl instances. Both of these authentication methods use the default credential alias: Cribl_Credential_Alias. For information about setting up credentials for the authentication method used by the Cribl integration, see Set up Cribl integration authentication credentials. **Important:** Verify that only one active credential record of each credentials type exists under the credential alias.
Worker Group	The Cribl Worker Group from which to stream log data to the instance. This field is required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set up connection (continued)

Field	Description
	The drop-down list displays Worker Groups based on the provided Cribl cloud instance URL and authentication method. For example: • default • dev-workers • prod-workers • staging-workers
Cribl route	The Cribl route that directs log data to a specific destination. This field is auto-populated with a drop-down list of all available routes, each configured with a default destination. Select the desired route from the list. This field is required. For example: • default • demo-route
Cribl destination	The Cribl destination to which the log data is directed. This field is auto-populated and read-only. When HLA populates this field, it provides a link to the destination on the Cribl server. For example: sn_hla_cribl_tcp_json_abcdef

Edge Delta REST integration configuration fields

Description of the fields on the Edge Delta REST integration configuration form for Health Log Analytics.

For the Edge Delta REST integration setup procedure, see Set up an Edge Delta REST integration for Health Log Analytics.

Provide details

Field	Description
Integration name	Unique name of this integration. For example: My Edge Delta REST integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
MID web server	The MID Web Server to use. This field is required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details (continued)

Field	Description
Service instance	The service instance to which to bind the log data. This field is required.
Port	The port for the MID Server. This field is read-only. It is auto-populated when the MID Web Server is chosen.
Transport	The transport method used for streaming log messages to your ServiceNow instance: REST. This field is read-only.
MID server name	The MID Server to which the log data is pushed. This field is auto-populated when the MID Web Server is chosen. It is read-only.
Description	Option to add a brief description of the integration to help identify it.

Edge Delta TCP integration configuration fields

Description of the fields on the Edge Delta TCP integration configuration forms for Health Log Analytics.

For the Edge Delta TCP integration setup procedure, see Set up an Edge Delta TCP integration for Health Log Analytics.

Provide details

Field	Description
Integration Name	Unique name of this integration. For example: My Edge Delta TCP integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
MID server name	MID Server to which the Edge Delta logs are streamed. This field is required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details (continued)

Field	Description
	Note: • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically.
Port	The port on the MID Server used for listening on logs. This field is required. Choose a port within the suggested range from the array. The port must not be occupied by another process. Ensure that your organization's security team opens the selected port.
Service instance	The service instance to which to bind the log data. This field is required.
Transport	The protocol used for streaming log messages to your ServiceNow instance: TCP. This field is read-only.
Description	Option to add a brief description of the integration to help identify it.

Advanced settings

Field	Description
Lookup hostnames	Option to perform DNS lookup to resolve IPs to hostnames. The default value is false.
Sub sample drop ratio	The ratio of logs to drop. The default value is -1: no logs are dropped. For example: If you want one out of every five logs to be dropped, change the value to 5.
Sub sample receive ratio	The ratio of logs to receive. The default value is -1: no logs are received. For example: If you want one out of every five logs to be received, change the value to 5.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced settings (continued)

Field	Description
Max length in bytes	The maximum length of log messages in bytes. The default value is 32766.
Character encoding	The character encoding for this data input. Default is UTF-8.
Line breaker delimiters	The line break character separating the raw log lines. Splitting values must be separated by a comma followed by a space: ", ". For example: "\r, \n, , splitHere, #".
Boss thread count	The number of threads that manage connections.
Worker thread count	The number of threads that handle incoming data.
Read timeout seconds	The timeout in seconds since the last read. When the timeout expires, the system closes the channel.
Default timezone	The time zone of events that the system uses if a log does not specify the time zone. By default, the system uses GMT, but you can specify a different time zone.
Drop if queue is full	Option to discard logs if there is a load on the MID Server.

Elasticsearch integration configuration fields

Description of the fields on the Elasticsearch integration configuration forms for Health Log Analytics.

For the Elasticsearch integration setup procedure, see Set up an Elasticsearch integration for Health Log Analytics.

Provide details

Field	Description
Integration Name	Unique name of this integration. For example: My Elasticsearch integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
Execute on	Option to determine whether to use a specific MID Server or a specific MID Server cluster.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details (continued)

Field	Description
MID server name	(Only when **Execute on** is set to Specific MID Server) The MID Server to which log data from Elasticsearch indices is pulled. This field is required.
MID Server Cluster	(Only when **Execute on** is set to Specific MID Server Cluster) The MID Server cluster to which the log data is pulled. This field is required. When you select a cluster, the MID Servers in the selected cluster and their status are displayed. The integration runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the integration tasks to the next available MID Server in the cluster according to the configured order.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details (continued)

Field	Description
	Note: • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the integration form, the MID Server Clusters list displays only failover clusters. • The MID Server cluster must include only MID Servers that support basic authentication. mTLS is not supported for log ingestion. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • If Elasticsearch uses client certificate or CA certificate authentication, all MID Servers in the cluster must have the appropriate certificates. • The default maximum number of integrations streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 integrations running on it, even when that MID Server is down.
Service instance	The service instance to which to bind the log data. This field is required. **Note:** If no relevant service instance exists, Create an service instance and add CIs to it. Set the status of the new service instance to Operational.
Data source	The source of the log data that the integration pulls to your ServiceNow instance: Elastic. This field is read-only.
Description	Option to add a brief description of the integration to help identify it.

Data retrieval method

Field	Description
Server URL	The URL used to access the cluster. This field is required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data retrieval method (continued)

Field	Description
Authentication method	The authentication method used to authenticate the integration to Elasticsearch. Default is none. When you select the authentication method, the corresponding credentials fields display on the form. **Note:** As an admin, you can create an authentication method by navigating to **All** > **Health Log Analytics** > **Authentication Methods** and selecting **New**.
Index prefix	Prefix prepended to the names of the Elasticsearch indices from which you want to read data. The integration only reads data from indices that match the configured prefix. For example: network-logs-* matches indices such as network-logs-2024.01.01. This field is required. This setting ensures that HLA only ingests data from the relevant indices. For example: only-read-these-indices-*
Document timestamp field	Timestamp field in documents stored in the read indices. This field is required.
Timestamp field format	Format of the timestamp field in the documents. If no format is specified, the default Unix epoch time format is used, in milliseconds. For example: 1684168407 (May 15, 2023 4:33:27 PM)
Term filters	JSON map of the terms to filter. **Note:** Avoid using the term query for text fields. If the target field is mapped as both text and keyword, reference the keyword by using fieldname.keyword. For example: {"severity": ["error", "warning"]}

Advanced settings

Field	Description
Max connections per route	The maximum number of connections to be opened per node.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced settings (continued)

Field	Description
Max scroll slices	The number of shards configured for the relevant index in Elasticsearch. This number tells Elastic how many parallel queries to execute in each polling request.
Proxy host	Host name of the HTTP proxy through which requests are sent.
Proxy port	Port of the HTTP proxy through which requests are sent.
Use MID certificate policy check	Option to enable the MID certificate policy check. Select this option if you want to ship your logs encrypted using SSL TLS. Then navigate to **All** > **MID Server** > **MID Security Policy** and add the MID certificate policy check to the table. For more information, see MID Server certificate check policies.
Use cross-cluster search	Option to search for data across Elasticsearch clusters. When this check box is selected, the **Clusters to search** field displays. **Note:** Your settings in the **Use minimal privileges** check box and the **Delay in reading current timestamp (seconds)** field on the **Advanced configuration** form affect how data is collected across multiple clusters.
Clusters to search	The Elasticsearch clusters to search.This field displays only when the **Use cross-cluster search** check box is selected. Do one of the following: • Leave this field empty or enter "*" to search all the remote clusters defined in Elasticsearch. • Specify the clusters to search in a comma-separated list. **Note:** To also search the local cluster, add a comma at the beginning or end, or add two commas in succession to the list. For example: "east,,west" or ",east,west" or "*,"

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced settings (continued)

Field	Description
Use minimal privileges	Option to read log data directly from the Elasticsearch indices with the configured prefix. • When selected, the integration reads the log data directly from the Elasticsearch indices with the configured prefix. To perform this task, it needs only read privileges. **Note:** When this check box is selected and you're using cross-cluster search, data is collected from all the clusters simultaneously. • When clear, the integration fetches all indices with the prefix, filters them, and reads the log data from the filtered indices. Performing this task requires additional privileges. **Note:** Leaving this check box clear when using cross-cluster search affects how data is collected from the clusters. For more information, see the Enabling and Using Cross-Cluster Search for Elasticsearch Data Inputs in Health Log Analytics [KB1556079] article in the Now Support Knowledge Base. For additional information about streaming logs using the Elasticsearch integration, see the Stream logs using Elasticsearch data input - Advanced guide [KB1080162] article in the Now Support Knowledge Base.
Max documents per query	Maximum number of documents fetched in a single query.
Sliced-scrolling tie breaker	Value used to slice the data. Each slice is scrolled in parallel. Default: _id
Search-after tie breaker	Unique value per document to use as tiebreaker when sorting log entries by timestamp.
Use search-after API	Option to toggle between using sliced-scrolling and search-after APIs. **Note:** Sliced-scrolling APIs are preferable when reading historical data, while search-after APIs are better for reading real-time data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced settings (continued)

Field	Description
Index time-suffix format	Format of the time suffix when using time-based index names, such as [logstash-]YYYY.MM.DD. When using aliases, leave this field empty. For example: uuuu.MM.dd
Data reading timeout (milliseconds)	The duration of time, in milliseconds, before a request to the Elasticsearch cluster times out.
Index discovery interval (seconds)	The number of seconds between intermittent MID Server requests to the Elasticsearch cluster for new indices from which to read data.
Scroll context time (milliseconds)	The lifetime of the created scroll when using the scroll API to read data from Elasticsearch. For more information, see the Elasticsearch scroll API documentation.
Event processor workers	The maximum number of CPU cores used in parallel to process events fetched from Elasticsearch. A higher setting increases the data input throughput at the cost of higher CPU usage.
Worker queue size	The maximum number of batches to queue for processing. A higher setting increases throughput, at the cost of higher RAM usage.
Default timezone	The time zone of events that the system will use if a log does not specify the time zone. By default, the system uses GMT in such cases, but you can specify a different time zone.
Sub sample drop ratio	The number of events to batch together, out of which one will be discarded. This setting is used to reduce the number of fetched events.
Sub sample receive ratio	The number of events to batch together, out of which all but one will be discarded. This setting is used to decrease the number of received events.
Character encoding	The character encoding for this data input.
Sleep interval (seconds)	The interval, in seconds, to wait before querying again after a query has returned no data.
Max length in bytes	The maximum length, in bytes, of log messages.
Delay in reading current timestamp (seconds)	The number of seconds before current time to query to include delayed data.The configured

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced settings (continued)

Field	Description
	number of seconds is subtracted from the current time for reading the last timestamp. **Note:** If this value is 0 and data is collected from multiple clusters simultaneously, the query may not include data that was sent with a delay on one of the clusters,
Polling interval	How frequently the system polls for new log data.

GCP PubSub integration configuration fields

Description of the fields on the GCP PubSub integration configuration forms for Health Log Analytics.

For the GCP PubSub integration setup procedure, see Set up a GCP PubSub integration for Health Log Analytics.

Provide details

Field	Description
Integration Name	Unique name of this integration. For example: My GCP PubSub integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
Service Instance	The service instance (formerly the application service) to which to bind the log data. This field is required.
Execute on	Option to select whether to use a specific MID Server or a MID Server cluster. This field is required.
MID Server name	(Only when **Execute on** is set to Specific MID Server.) The MID Server to which the logs are streamed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Provide details (continued)

Field	Description
	For more information about MID Server clusters, see Configure a MID Server cluster.
Source	The source of the log data that the integration pulls to your ServiceNow instance: PubSub. This field is read-only.
Description	Option to add a brief description of the integration to help identify it.

Set up connection

Field	Description
Project ID	The project ID of the Google Cloud project. For example, my-project-id. This field is required. You can obtain the project ID from your Google Cloud homepage by selecting My Project. The project ID will be displayed.
Authentication method	The credential alias ServiceNow® uses to access Google Cloud. The default value is sn_occ.HLA_Credential_Alias. This field is required. **Note:** You can add more credential aliases to the list of available aliases to choose from by selecting **Manage credential aliases** from the list and adding a credential alias.
Topic name	The Google Cloud Pub/Sub topic to which to subscribe Health Log Analytics. For example, my_topic. This field is required. You can obtain the topic name from your Google Cloud homepage by searching for Pub/Sub. All topic names will be displayed.
Subscription name	The subscription Health Log Analytics uses to receive log data that is published on the Google Cloud Pub/Sub topic. If you leave this field blank, Health Log Analytics uses ServiceNow-Subscription.

Advanced Settings

Field	Description	Default value
Subscriber thread pool size	The number of concurrent threads that are downloading	1

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced Settings (continued)

Field	Description	Default value
	files from the Google Cloud Pub/Sub topic.	
Sub sample receive ratio	The ratio of logs to receive. This setting determines the number of logs to group together, out of which one is received. It reduces the number of logs you receive. The default value is -1, meaning no logs are received. For example, if you want to receive one log out of every five, change the value to 5.	-1
Max length in bytes	The maximum length of log messages, in bytes.	32,766
Character encoding	The character encoding for this data input. This field is read-only.	UTF-8
Sub sample drop ratio	The ratio of logs to discard. This setting determines the number of logs to group together, out of which one is dropped. It reduces the number of fetched logs. The default value is -1: no logs are discarded. For example, if you want one log out of every five to be dropped, change the value to 5.	-1
Rate limit	The maximum number of events per second that this data input processes.	-1
Default timezone	The default time zone of events. The system uses this default when the log does not specify a time zone.	GMT
Drop if queue is full	Option to discard logs if many processes are waiting in the queue to access the MID Server.	Clear

Microsoft Azure Event Hubs integration configuration fields

Description of the fields on the Microsoft Azure Event Hubs integration configuration forms for Health Log Analytics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For the Microsoft Azure Event Hubs integration setup procedure, see Set up a Microsoft Azure Event Hubs integration for Health Log Analytics.

Provide details

Field	Description
Integration Name	Unique name of this integration. For example: My Event Hubs integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
Service Instance	The service instance (formerly the application service) to which to bind the log data. This field is required.
Source	The source of the log data that the integration pulls to your ServiceNow instance: PubSub. This field is read-only.
Description	Option to add a brief description of the integration to help identify it.
Execute on	Option to select whether to use a specific MID Server or a MID Server cluster. This field is required.
MID Server name	(Only when **Execute on** is set to Specific MID Server.) The MID Server to which the logs are streamed. **Note:** • You can only select a MID Server with log ingestion capability that supports basic authentication. MID Servers that support mTLS are not listed. • If log ingestion is not enabled on the selected MID Server, Health Log Analytics enables it automatically. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. This field is required.
MID Server cluster	(Only when **Execute on** is set to Specific MID Server cluster.) The MID Server cluster to which the log data is pulled. This field is required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details (continued)

Field	Description
	The data input runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the data input tasks to the next available MID Server in the cluster according to the configured order. **Note:** • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the data input or integration form, the MID Server clusters list displays only failover clusters. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • The default maximum number of data inputs or integrations streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 data inputs or integrations running on it. This is true even when that MID Server is down. For more information about MID Server clusters, see Configure a MID Server cluster.

Set data retrieval method

Event Hubs namespace	The scoping container for the event hub or hubs. This field is required.
Event Hub name	The event hub from which to fetch log data. This field is required.
Consumer Group name	The Consumer Group to use. This field is required. Enter an existing Consumer group or create one in the event hub. The default value is $Default.
Event Hub Credentials	The Event Hub credentials to use. This field is required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set data retrieval method (continued)

	Select existing Azure Shared Access Signature (SAS) credentials or create the Azure SAS credentials to use. If you create new Azure SAS credentials, you must provide the SAS policy name and key.

Advanced settings

Field	Description
Restore point rate	The number of logs the integration can read before a restore point is saved.
Processor threads count	The total number of processor threads.
Sub sample drop ratio	The ratio of logs to discard. This setting determines the number of logs to group together, out of which one is dropped. It reduces the number of fetched logs. The default value is -1: no logs are discarded. For example, if you want one log out of every five to be dropped, change the value to 5.
Sub sample receive ratio	The ratio of logs to receive. This setting determines the number of logs to group together, out of which one is received. It reduces the number of logs you receive. The default value is -1, meaning no logs are received. For example, if you want to receive one log out of every five, change the value to 5.
Operation timeout (seconds)	The number of seconds to wait before timing out event hubs operations.
Receive idle timeout (seconds)	The number of seconds to wait before timing out receive operations.
Max length in bytes	The maximum length, in bytes, of log messages. The default value is 32766.
Prefetch count	The number of logs received in advance of event hubs operations.
Max batch size	The maximum number of events passed to a single process call. The default value is 100.
Default timezone	The default time zone of logs. The system uses this default when the log does not specify a time zone. The default value is GMT.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced settings (continued)

Field	Description
Character encoding	The character encoding for this integration. The default value is UTF-8.
Drop if queue is full	Option to select discarding logs if there is a load on the MID Server.

Microsoft Azure Log Analytics integration configuration fields

Description of the fields on the Microsoft Azure Log Analytics integration configuration forms for Health Log Analytics.

For the Microsoft Azure Log Analytics integration setup procedure, see Set up a Microsoft Azure Log Analytics integration for Health Log Analytics.

Provide details

Field	Description
Integration Name	Unique name of this integration. For example: My Azure Log Analytics integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
Execute on	Option to select whether to use a specific MID Server or a MID Server cluster. This field is required.
MID server name	(Only when the **Execute on** field is set to Specific MID Server) MID Server to which log data from Microsoft Azure Log Analytics is pulled. This field is required. **Note:** • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of integrations streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically.

Provide details (continued)

Field	Description
MID MID Server Cluster	(Only when **Execute on** is set to Specific MID Server cluster.) The MID Server cluster to which the log data is pulled. This field is required. The data input runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the data input tasks to the next available MID Server in the cluster according to the configured order. **Note:** • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the data input or integration form, the MID Server clusters list displays only failover clusters. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • The default maximum number of data inputs or integrations streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 data inputs or integrations running on it. This is true even when that MID Server is down. For more information about MID Server clusters, see Configure a MID Server cluster.
Service instance	The service instance (formerly the application service) to which to bind the log data. This field is required.
Data source	The source of the log data that the integration pulls to your ServiceNow instance: Azure Log Analytics. This field is read-only.
Description	Option to add a brief description of the integration to help identify it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set data retrieval method

Field	Description
Redirect url	The redirect URL of the access log application. This field is required. The URL refers to the Microsoft Azure redirect_uri authorization property. For more information, see the Authorization code URL (GET request) section in the Microsoft Azure documentation.
Authentication method	The credentials used to access Microsoft Azure resources. This field is required. If no credentials exist, select **Create new Azure Service Principal credential**. Create a credential by filling in the fields and then selecting **Submit**. For information on the **Tenant ID**, **Client ID**, and **Secret key** fields, refer to the Microsoft Azure documentation. When you have created a credential, you can select it from the drop-down list.
Workspace ID	The Customer ID used to call the Microsoft Azure Log Analytics REST API. This field is required.
Table name	The name of the table in Microsoft Azure Log Analytics where the data input fetches the log data. For more information, see the View table information section in the Microsoft Azure documentation. This field is required.
Event time property name	The Microsoft Azure Log Analytics field in which to detect the event time. This field is required.

Advanced settings

Field	Description
Event Processor workers	The number of concurrent event processing workers, where each worker processes a batch of events independently.
Workers queue size	The queue size of the Event Processor workers.
Sub sample drop ratio	The number of events to batch together, out of which one will be discarded. This setting is used to reduce the number of fetched events.
Sub sample receive ratio	The number of events to batch together, out of which all but one will be discarded. This setting is used to decrease the number of received events.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced settings (continued)

Field	Description
Max documents per query	The highest number of rows retrieved in each query.
Columns to select	Comma-separated list of column names to return. **Note:** This field is ignored when you provide a custom query.
Character encoding	The character encoding for this data input.
Sleep interval (seconds)	The interval, in seconds, to wait before querying again after a query has returned no events.
Polling interval	The interval, in seconds, to wait before polling for new events.
Drop if queue is full	Option to discard logs if there is a load on the MID Server.

Log Query	Option to define your own Log Analytics query. This field overrides the values configured in the other query settings fields.
	
	Note: If this field is empty, Health Log Analytics generates the query using the values set in the other fields.
	
	For your custom query, use the following JSON format:
	
	`{"query": "query | where TimeGenerated > %s | take 500"}`
	
	For example:
	
	`{ "query":"ContainerLog | where LogEntry contains 'cartservice' | where TimeGenerated > %s | take 500", "workspaces": ["defaultworkspace-3ab145ff-f9cd-433f-8533-d1b1ee24aee6-eus"], "project": ["TimeGenerated", "LogEntry", "LogEntrySource"] }`

MID Server integration configuration fields

Description of the fields on the MID Server integration configuration forms for Health Log Analytics.

For the MID Server integration setup procedure, see Set up a MID Server integration for Health Log Analytics.

Provide details

Field	Description
MID server name	The name of the MID Server from which the integration collects log messages and streams them to the instance. **Note:** You can only create one MID Server integration per available MID Server. If an existing MID Server integration or data input uses the same MID Server, you can't create an additional one for this MID Server. This field is required.
Integration Name	The name of the integration. When you select the MID Server name, this field is auto-populated with the selected MID Server. This field is read-only.
Service instance	The service instance to which to bind the log data. This field is required. By default, it is set to ServiceNow MID Server. **Note:** This field is only available for MID Server integrations created in version 36.0.17 or later versions.
Description	Option to add a brief description of the integration to help identify it.

Advanced settings

Field	Description
Default timezone	The time zone of events that the system will use if a log does not specify the time zone. By default, the system uses GMT in such cases, but you can specify a different time zone.
Sub sample drop ratio	The ratio of events to drop. The default value is -1.
Sub sample receive ratio	The ratio of events to receive. The default value is -1.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced settings (continued)

Field	Description
Max length in bytes	The maximum length of log messages, in bytes. The default value is 32,766.
Character encoding	The character encoding for this data input. The default value is UTF-8.
Drop if queue is full	Option to discard logs if many processes are waiting in the queue to access the MID Server.

REST API integration configuration fields

Description of the fields on the REST API integration configuration forms for Health Log Analytics.

For the REST API integration setup procedure, see Set up a REST API integration for Health Log Analytics.

Note: REST API integrations support only UTF-8 encoding for incoming data.

Provide details tab

Field	Description
Integration Name	Unique name of this integration. For example: My REST API integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
MID web server	The MID Web Server to use. This field is required.
Service instance	The service instance (formerly the application service) to which to bind the log data. This field is required. **Note:** If no relevant service instance exists, Create a service instance and add CIs (Configuration Items) to it. Set the status of the new service instance to Operational.
Transport	The protocol used for streaming log messages to your ServiceNow instance: REST. This field is read-only.
Description	Option to add a brief description of the integration to help identify it.
MID server name	The MID Server to which the log data is pushed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details tab (continued)

Field	Description
	This field is auto-populated when the MID Web Server is chosen. It is read-only.
Port	The port for the MID Server. This field is read-only. It is auto-populated when the MID Web Server is chosen.

ServiceNow System Logs Retriever integration configuration fields

Description of the fields on the ServiceNow System Logs Retriever integration configuration form for Health Log Analytics.

For the ServiceNow System Logs Retriever integration setup procedure, see Set up a ServiceNow System Logs Retriever integration for Health Log Analytics.

Provide details

Field	Description
Integration Name	Unique name of this integration. For example: My System Logs integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
Service instance	The service instance (formerly the application service) to which to bind the log data. This field is required. The default service instance for this integration is ServiceNow System Logs.
Description	Option to add a brief description of the integration to help identify it.

Splunk Poller integration configuration fields

Description of the fields on the Splunk Poller integration configuration forms for Health Log Analytics.

For the Splunk Poller integration setup procedure, see Set up a Splunk Poller integration for Health Log Analytics.

Provide details

Field	Description
Integration Name	Unique name of this integration. This field is required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details (continued)

Field	Description
	Note: When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
Execute on	Option to select whether to use a specific MID Server or a MID Server cluster. This field is required.
MID server name	(Only when the **Execute on** field is set to Specific MID Server) MID Server to which log data from Splunk is pulled. This field is required. **Note:** • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically.
MID Server Cluster	(Only when **Execute on** is set to Specific MID Server cluster.) The MID Server cluster to which the log data is pulled. This field is required. The data input runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the data input tasks to the next available MID Server in the cluster according to the configured order.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details (continued)

Field	Description
	Note: • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the data input or integration form, the MID Server clusters list displays only failover clusters. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • The default maximum number of data inputs or integrations streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 data inputs or integrations running on it. This is true even when that MID Server is down. For more information about MID Server clusters, see Configure a MID Server cluster.
Service instance	The service instance (formerly the application service) to which to bind the log data. This field is required.
Data source	The source of the log data that the integration pulls to your ServiceNow instance: Splunk. This field is read-only.
Description	Option to add a brief description of the integration to help identify it.

Set data retrieval method

Field	Description
REST API Server URL	The URL used to access the Splunk REST API. This field is required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set data retrieval method (continued)

Field	Description
	Note: • By default, the Splunk REST API endpoint is available on port 8089. Therefore, the default endpoint for the Splunk REST API is: `http://<splunk-server>:8089`. • The REST API endpoint is different from the front-end endpoint.
Authentication method	The credential alias to be used. This field is required. The Splunk integration uses credential aliases instead of direct references to credentials for authentication. The credential aliases are listed by type: aliases that contain basic auth credentials, and those that contain token auth credentials. If an alias holds both credential types, it appears in both categories. You can select **Manage credential aliases** to manage your credential aliases and create new ones in the **Connection & Credential Aliases** list.
Query	The query Splunk uses to search your data. This field is required. For example, the query `sourcetype="adc_access_log"` instructs the Splunk Poller integration to retrieve all logs with the source type adc_access_log.

Advanced settings

Field	Description
Max documents per query	The maximum number of documents retrieved each time log data is fetched from Splunk. Default: 10,000.
Splunk Request Timeout (seconds)	The maximum time, in seconds, allowed for data retrieval before the request times out.

Splunk TCP integration configuration fields

Description of the fields on the Splunk TCP integration configuration forms for Health Log Analytics.

For the Splunk TCP integration setup procedure, see Set up a Splunk TCP integration for Health Log Analytics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details

Field	Description
Integration Name	Unique name of this integration. For example: My Splunk TCP integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
MID server name	MID Server to which log data from Splunk is pulled. This field is required. **Note:** • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically.
Port	The port for the MID Server. This field is required. Make sure that your organization's security team opens the selected port on the MID Server.
Description	Option to add a brief description of the integration to help identify it.
Transport	The protocol used for streaming log messages to your ServiceNow instance: TCP. This field is read-only.
Use Cooked Data	Option to ingest log data from Splunk in the preprocessed ("cooked") format that Splunk uses on the forwarder. Ingesting data into HLA in this format ensures that each log line retains the relevant contextual information that Splunk embeds into it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced settings

Field	Description
Use SSL/TLS	Option to use SSL/TLS, for enhanced data security and protection. **Note:** SSL/TLS must be enabled if you want to send logs in a compressed format.
Lookup hostnames	Option to perform DNS lookup to resolve IPs to hostnames. The default value is false.
Use Forwarder TimeZone	Option to pass information about the time zone in which the forwarder is located. The MID Server uses this information to adjust for the time zone from which the logs arrive. This option is displayed when **Use Cooked Data** is selected. It is relevant when using Splunk Universal Forwarders.
Enable Compression	Option to send logs in compressed format. Sending logs in a compressed format minimizes the size of the data being transferred, which is important when dealing with large volumes of log data. This option is displayed when **Use Cooked Data** and **Use SSL/TLS** are selected. It is relevant when using Splunk Universal Forwarders.
Sub sample drop ratio	The ratio of logs to drop. The default value is -1: no logs are dropped. For example: If you want one out of every five logs to be dropped, change the value to 5.
Sub sample receive ratio	The ratio of logs to receive. The default value is -1: no logs are received. For example: If you want one out of every five logs to be received, change the value to 5.
Max length in bytes	The maximum length of log messages in bytes. The default value is 32766.
Character encoding	The character encoding for this data input. Default is UTF-8.
Boss thread count	The number of threads that manage connections.
Worker thread count	The number of threads that handle incoming data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced settings (continued)

Field	Description
Read timeout seconds	The timeout in seconds since the last read. When the timeout expires, the system closes the channel.
Default timezone	The time zone of events that the system will use if a log does not specify the time zone. By default, the system uses GMT in such cases, but you can specify a different time zone.
Drop if queue is full	Option to discard logs if there is a load on the MID Server.

Splunk UDP integration configuration fields

Description of the fields on the Splunk UDP integration configuration forms for Health Log Analytics.

For the Splunk UDP integration setup procedure, see Set up a Splunk UDP integration for Health Log Analytics.

Provide details

Field	Description
Integration Name	Unique name of this integration. For example: My Splunk UDP integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
MID server name	MID Server to which log data from Splunk is pulled. This field is required. **Note:** • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically.

Provide details (continued)

Field	Description
Port	The port for the MID Server. This field is required. **Note:** Make sure that your organization's security team opens the selected port on the MID Server.
Description	Option to add a brief description of the integration to help identify it.
Transport	The protocol used for streaming log messages to your ServiceNow instance: UDP. This field is read-only.

Advanced settings

Field	Description
Lookup hostnames	Option to perform DNS lookup to resolve IPs to hostnames. The default value is false.
Sub sample receive ratio	The ratio of logs to receive. The default value is -1: no logs are received. For example: If you want one out of every five logs to be received, change the value to 5.
Character encoding	The character encoding for this data input. The default value is UTF-8. This field is read-only.
Drop if queue is full	Option to discard logs if there is a load on the MID Server.
Sub sample drop ratio	The ratio of logs to drop. The default value is -1: no logs are dropped. For example: If you want one out of every five logs to be dropped, change the value to 5.
Max length in bytes	The maximum length of log messages in bytes. The default value is 32766.
Default timezone	The time zone of events that the system will use if a log does not specify the time zone. By default, the system uses GMT in such cases, but you can specify a different time zone.

TCP integration configuration fields

Description of the fields on the TCP integration configuration forms for Health Log Analytics.

For the TCP integration setup procedure, see Set up a TCP integration for Health Log Analytics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details tab

Field	Description
Integration Name	Unique name of this integration. For example: My TCP integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
MID server name	The MID Server to which the logs are streamed. This field is required. • You can select only MID Servers with log ingestion capability that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties.
Port	The port for the MID Server. This field is required. Select a unique port from the array. The placeholder shows the range of ports from which to choose. Make sure that your organization's security team opens the selected port.
Service instance	The service instance to which to bind the log data. This field is required.
Transport	The protocol used for streaming log messages to your ServiceNow instance: TCP. This field is read-only.
Description	Option to add a brief description of the integration to help identify it.

Advanced settings

Field	Description
Use SSL/TLS	Option to use SSL/TLS.
Lookup hostnames	Option to perform DNS lookup to resolve IPs to hostnames.
Boss thread count	The number of threads that manage connections.
Worker thread count	The number of threads that handle incoming data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced settings (continued)

Field	Description
Read timeout seconds	The time zone of events that the system will use if a log does not specify the time zone. By default, the system uses GMT in such cases, but you can specify a different time zone.
Default timezone	The default time zone of events. The system uses this default when the log does not specify a time zone.
Sub sample drop ratio	The ratio of events to drop.
Sub sample receive ratio	The ratio of events to receive.
Max length in bytes	The maximum length of log messages in bytes.
Character encoding	The character encoding for this data input.
Drop if queue is full	Option to discard logs if there is a load on the MID Server.
Line breaker delimiters	The line break character separating the raw log lines. Splitting values must be separated by a comma followed by a space: ", ". For example: "\r, \n, , splitHere, #".

UDP integration configuration fields

Description of the fields on the UDP integration configuration forms for Health Log Analytics.

For the UDP integration setup procedure, see Set up a UDP integration for Health Log Analytics.

Provide details tab

Field	Description
Integration Name	Unique name of this integration. For example: My UDP integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
MID server name	The MID Server to which the logs are streamed. This field is required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details tab (continued)

Field	Description
	Note: • You can select only MID Servers with log ingestion capability that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties.
Service instance	The service instance (formerly the application service) to which to bind the log data. This field is required.
Port	The port for the MID Server. This field is required. The port must be within the range 6000-6200. Make sure that your organization's security team opens the selected port on the MID Server.
Transport	The protocol used for streaming log messages to your ServiceNow instance: UDP. This field is read-only.
Description	Option to add a brief description of the integration to help identify it.

Advanced

Field	Description
Default timezone	The time zone of events that the system will use if a log does not specify the time zone. By default, the system uses GMT in such cases, but you can specify a different time zone.
Sub sample drop ratio	The ratio of events to drop. The default value is -1.
Sub sample receive ratio	The ratio of events to receive. The default value is -1.
Rate limit	Limitation on the number of events per second that the data input processes. The default value is -1.
Max length in bytes	The maximum length of log messages, in bytes. The default value is 32,766.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced (continued)

Field	Description
Character encoding	The character encoding for this data input. The default value is UTF-8. This field is read-only.
Drop if queue is full	Option to discard logs if many processes are waiting in the queue to access the MID Server.

Vector Agent integration configuration fields

Description of the fields on the Vector Agent integration configuration forms for Health Log Analytics.

For the Vector Agent integration setup procedure, see Set up a Vector Agent integration for Health Log Analytics .

Provide details

Field	Description
Integration Name	Unique name of this integration. For example: My Vector Agent integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
MID server name	The MID Server to which the Vector Agent logs are streamed. This field is required. **Note:** • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of integrations streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically. • If the MID Server is down or the connection is lost, the Vector pipeline may get blocked.
Port	The port on the MID Server. This field is required. Choose a port within the range 6000-6200 from the array. The port must not be occupied

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details (continued)

Field	Description
	by another process. Make sure that your organization's security team opens the selected port on the MID Server.
Transport	The protocol used for streaming log messages to your ServiceNow instance: TCP.
Description	Option to add a brief description of the integration to help identify it.

Data input configuration fields

This section provides descriptions of the fields on the Health Log Analytics data input configuration forms.

Amazon CloudWatch data input configuration fields

Description of the fields on the Amazon CloudWatch data input configuration form.

Basic configuration

Field	Description
Name	Name of the new data input. This field is required.
Description	Description of the data input.
Execute on	Option to select whether to use a specific MID Server or a MID Server cluster. This field is required.
MID	(Only when the **Execute on** field is set to Specific MID Server) MID Server to which log data from Amazon CloudWatch is pulled. **Note:** • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically. This field is required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
MID Server Cluster	(Only when **Execute on** is set to Specific MID Server cluster.) The MID Server cluster to which the log data is pulled. This field is required. The data input runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the data input tasks to the next available MID Server in the cluster according to the configured order. **Note:** • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the data input or integration form, the MID Server clusters list displays only failover clusters. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • The default maximum number of data inputs or integrations streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 data inputs or integrations running on it. This is true even when that MID Server is down. For more information about MID Server clusters, see Configure a MID Server cluster.
Service instance	The service instance to which to bind the log data. **Note:** If no relevant service instance exists, Create an service instance and add CIs to it. Set the status of the new service instance to Operational. This field is required.

The following fields show read-only information:

Field	Description
Status	Status of the data input.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Transport	Protocol used to stream the log data. This data input uses Amazon CloudWatch to stream log data to your instance.
Sources count	The number of log sources this data input has created.
Disabled since	The time when the data input stopped or failed.
Last log time	The time when the last log streamed in the data input.
Error message	The streaming error. This field is populated automatically. It displays only when a streaming error has occurred.

Query settings tab

Field	Description	Example
From	The date and time to start reading the data. Data older than this date and time is not read. **Note:** Setting this value to a past date might require the system to read large amounts of data, causing congestion. This field is required.	Now -1 week
Group Name(s)	The log groups to search. If multiple log groups must be searched, specify the groups in a comma-separated list. To fetch log data from all groups, use an asterisk (*) as a wildcard character. This field is required.	hla-cw-loggroup1,hla-cw-loggroup2
Prefix	Name prefix for the Amazon CloudWatch log streams to read from. The data input reads only from log streams with this name prefix.	hla-cw

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query settings tab (continued)

Field	Description	Example
	Note: Only a single log stream prefix per data item is supported. For multiple prefixes, create multiple data inputs.	
Filter pattern	Pattern by which to filter incoming events. Various types of filter patterns are supported. For example: • A pattern for fetching log events that contain a single term. • A pattern for fetching log events that contain multiple terms. • A pattern for fetching log events that include a term and exclude another. **Note:** Filter patterns are case sensitive. For more information, see https://docs.aws.amazon.com/AmazonCloudWatch/latest/logs/FilterAndPatternSyntax.html	• Pattern for fetching log events that contain a single term, "STATUS_CODE": "STATUS_CODE" • Pattern for fetching log events that contain multiple terms, “STATUS_CODE” and “200”: “STATUS_CODE 200” • Pattern for fetching log events that include a term, “STATUS_CODE,” and exclude another term, “200”: “STATUS_CODE” – “200”

Transport tab

Field	Description
AWS credentials	Field that refers to the AWS Credentials list (aws_credentials.list). The list contains the AWS access and secret access keys.
AWS region	The AWS region where the Amazon CloudWatch cluster runs, for example, us-west-1. For a list of AWS regions, see https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/using-regions-availability-zones.html#concepts-regions This field is required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced configuration

Advanced configuration form

Field	Description	Default value
Connection timeout	The number of milliseconds to wait before timing out the AWS connection attempt.	1000
Batch size	The maximum number of logs retrieved per query.	2500
Socket timeout	The number of milliseconds to wait before timing out a data transfer over an established connection.	10000
Default timezone	The default timezone if the log date and time doesn't include timezone information.	GMT
Sub sample drop ratio	The number of logs to batch together, out of which one will be discarded. This setting is used to reduce the number of fetched logs.	-1
Sub sample receive ratio	The number of logs to batch together, out of which all but one will be discarded. This setting is used to decrease the number of received logs.	-1
Max length in bytes	The maximum length of log messages, in bytes.	32766
Sleep interval	The interval, in seconds, to wait before querying again after a query has returned no logs.	60
Polling interval	The interval, in seconds, to wait before polling for new logs.	0
Drop if queue is full	Option to discard logs if there is a load on the MID Server.	False

Amazon S3 data input configuration fields

Description of the fields on the Amazon S3 data input configuration form.

Basic configuration

Field	Description
Name	Name of the new data input. This field is required.
Description	Description of the data input.
Execute on	Option to select whether to use a specific MID Server or a MID Server cluster. This field is required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
MID	(Only when the **Execute on** field is set to Specific MID Server) MID Server to which log data from Amazon S3 is pulled. **Note:** • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically. This field is required.
MID Server Cluster	(Only when **Execute on** is set to Specific MID Server cluster.) The MID Server cluster to which the log data is pulled. This field is required. The data input runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the data input tasks to the next available MID Server in the cluster according to the configured order.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the data input or integration form, the MID Server clusters list displays only failover clusters. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • The default maximum number of data inputs or integrations streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 data inputs or integrations running on it. This is true even when that MID Server is down. For more information about MID Server clusters, see Configure a MID Server cluster.
Service instance	The service instance to which to bind the log data. **Note:** If no relevant service instance exists, Create an service instance and add CIs to it. Set the status of the new service instance to Operational. This field is required.

The following fields show read-only information:

Field	Description
Status	Status of the data input.
Transport	Protocol used to stream the log data. This data input uses Amazon S3 to stream log data to your instance.
Sources count	The number of log sources this data input has created.
Disabled since	Time when the data input stopped or failed.
Last log time	Time when the last log streamed in the data input.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Error message	The streaming error. This field is populated automatically. It displays only when a streaming error has occurred.

Query settings tab

Field	Description	Example
From/To	Starting and ending dates and time for reading the data. • From: Data older than this date and time is not read. **Note:** Setting this value to a past date might require the system to read large amounts of data, causing congestion. • To: Data newer than this date and time is not read. For live data, set this date far into the future. This field is required.	From: Now -1 week To: 2300-01-01 15:59:59
Bucket name	The Amazon S3 bucket to stream. This field is required.	my-s3-bucket
Prefix	Prefix for the objects to be fetched. The data input fetches only objects that begin with this prefix. This field is typically used to fetch only specific folders in a bucket.	/only/this/folder/
Include	File or object to include when the system performs pattern matching.	.*include-me.*
Exclude	File or object to exclude when the system performs pattern matching.	.*skip-me.*

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Transport tab

Field	Description
AWS credentials	Field that refers to the AWS Credentials list (aws_credentials.list). The list contains the AWS access and secret access keys.
AWS region	The AWS region where the Amazon S3 bucket is located, for example, us-west-1. For a list of AWS regions, see https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/using-regions-availability-zones.html#concepts-regions This field is required.

Advanced configuration

Advanced configuration form

Field	Description	Default value
Anonymous	Option to force accessing the Amazon S3 bucket without credentials, while ignoring default credentials if they exist.	False
Traverse	Option to access each directory in the bucket.	False
Object sorted by Last Modified Time	Option to fetch objects if the objects in the bucket are sorted by time.	False
Connection timeout	The number of milliseconds to wait before timing out the attempt to establish a connection to AWS.	100
Threadpool size	The number of concurrent threads that are downloading files from the bucket.	1
Buffer size	Size of the download buffer, in bytes.	100MB
Socket timeout	The number of milliseconds to wait before timing out data transfer over an established connection.	10000
Max retry for file	The maximum number of times to retry file processing in case of failure.	10

Advanced configuration form (continued)

Field	Description	Default value
Default timezone	The default timezone if the log doesn't include timezone information.	UTC
Sub sample drop ratio	The number of events to batch together, out of which one will be discarded. This setting is used to reduce the number of fetched events.	-1
Sub sample receive ratio	The number of events to batch together, out of which all but one will be discarded. This setting is used to decrease the number of received events.	-1
Rate limit	The maximum number of events per second that this data input processes.	-1
Max length in bytes	The maximum length, in bytes, of events.	32766
Character encoding	The character encoding for this data input.	UTF-8
Sleep interval	The interval, in seconds, to wait before querying again after a query has returned no events.	60
Polling interval	The interval, in seconds, to wait before polling for new events.	0
Drop if queue is full	Option to discard logs if there is a load on the MID Server.	False

Apache Kafka data input configuration fields

Description of the fields on the Apache Kafka data input configuration form.

Basic configuration

Field	Description
Name	Name of the new data input. This field is required.
Description	Description of the data input.
Execute on	Option to select whether to use a specific MID Server or a MID Server cluster. This field is required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
MID	(Only when the **Execute on** field is set to Specific MID Server) MID Server to which log data from Apache Kafka is pulled. **Note:** • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically. This field is required.
MID Server Cluster	(Only when **Execute on** is set to Specific MID Server cluster.) The MID Server cluster to which the log data is pulled. This field is required. The data input runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the data input tasks to the next available MID Server in the cluster according to the configured order.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Error message	The streaming error. This field is populated automatically. It displays only when a streaming error has occurred.

Query Settings tab

Field	Description	Example
From	Starting date and time for reading the data. Data older than this date and time is not read. **Note:** Setting this value to a past date might require the system to read large amounts of data, causing congestion. This field is required.	Now -1 week

Transport tab

Field	Description	Example
Kafka node names	A comma-separated list in the format HOST:PORT,HOST:PORT. The list does not have to include all the Apache Kafka Cluster servers.	123.4.5.6:9092,123.3.4.5:9093
Topics	A comma-separated list of topics to which the data input must subscribe. This field is required.	FirstTopic,SecondTopic,ThirdTopic
Kafka credentials	Reference to the Apache Kafka credentials. You can display the Kafka SSL credentials form by selecting the Search icon ( ) and opening a record. The form enables you to choose the security protocol used for authenticating with Apache Kafka from the following options:	None

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Transport tab (continued)

Field	Description	Example
	• **SSL** - SSL channel. • **SASL_SSL** - SASL authenticated, SSL channel. • **SASL_PLAINTEXT** - SASL authenticated, non-encrypted channel. For a description of the fields on the Kafka SSL credentials form, see Kafka SSL credentials fields.	
Group Id	The name of the Apache Kafka Consumer Group.	logs

Advanced configuration

Advanced configuration form

Field	Description	Default value
Timeout	The time, in milliseconds, spent waiting in the poll if data is not available in the topics.	500
Node discovery timeout	The time, in milliseconds, before node discovery times out.	30
Default timezone	The default timezone if the log doesn't include timezone information.	GMT
Sub sample drop ratio	The number of events to batch together, out of which one will be discarded. This setting is used to reduce the number of fetched events.	-1
Sub sample receive ratio	The number of events to batch together, out of which all but one will be discarded. This setting is used to decrease the number of received events.	-1
Max length in bytes	The maximum length, in bytes, of events.	32766
Character encoding	The character encoding for this data input.	UTF-8
Drop if queue is full	Option to discard logs if there is a load on the MID Server.	False

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Kafka SSL credentials fields

Description of the fields on the Kafka SSL credentials form.

SSL security protocol

Field	Description
SSL keystore	The content of an actual server.keystore.jks file, encoded as a Base64 string.
SSL keystore type	Format of the SSL keystore file. Default: Java KeyStore (JKS).
SSL keystore password	Password to the keystore, identical to the value of the ssl.keystore.password property in Apache Kafka.
SSL key password	Password, identical to the ssl.key.password property value in Apache Kafka.
Use SSL truststore	Option to use SSL truststore. When checked, an SSL truststore is mandatory.
SSL truststore	The content of an actual client.truststore.jks file, encoded as a Base64 string. This field appears only when **Use SSL truststore** is checked.
SSL truststore type	Format of the truststore file. Default: Java KeyStore (JKS). This field appears only when **Use SSL truststore** is checked.
SSL truststore password	Password to the truststore, identical to the value of the ssl.truststore.password property in Apache Kafka. This field appears only when **Use SSL truststore** is checked.
SSL provider	Name of the security provider used for SSL connections.
Disable hostname verification	Option to disable verification of the hostname.
Additional Kafka consumer properties	Semicolon-separated string of additional Kafka consumer properties. For example: ssl.protocol=TLSv1.2;ssl.enabled.protocols=TLSv1.2,TLSv1.1

SASL_SSL security protocol

Field	Description
SASL Mechanism	The SASL authentication mechanism to be used by the Kafka client. The options are: • PLAIN • SCRAM-SHA-256 • SCRAM-SHA-512 • OAUTHBEARER Default: PLAIN.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SASL_SSL security protocol (continued)

Field	Description
Token endpoint URL	The token provider URL where credentials are sent to fetch access tokens. This value is defined in the client properties file. This field appears only when the **SASL Mechanism** is **OAUTHBEARER**.
Client ID	Unique, public identifier for the application. The authorization server uses it to recognize the calling application. This value is defined in the client properties file. This field appears only when the **SASL Mechanism** is **OAUTHBEARER**.
Client Secret	Private password known only to the application and the authorization server. Used to prove the application's identity. This value is defined in the client properties file. This field appears only when the **SASL Mechanism** is **OAUTHBEARER**.
Scope	Defines the level of access or permissions requested by the application. This field appears only when the **SASL Mechanism** is **OAUTHBEARER**.
OAUTH extensions	Custom metadata or additional parameters for the token request or validation process, in key-value pairs. This field appears only when the **SASL Mechanism** is **OAUTHBEARER**.
Use SSL truststore	Option to use SSL truststore. When checked, an SSL truststore is mandatory.
SSL truststore	The content of an actual client.truststore.jks file, encoded as a Base64 string. This field appears only when **Use SSL truststore** is checked.
SSL truststore type	Format of the SSL truststore file. Default: Java KeyStore (JKS). This field appears only when **Use SSL truststore** is checked.
SSL truststore password	Password to the truststore, identical to the value of the ssl.truststore.password property

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SASL_SSL security protocol (continued)

Field	Description
	in Apache Kafka. This field appears only when **Use SSL truststore** is checked.
SSL provider	Name of the security provider used for SSL connections.
Disable hostname verification	Option to disable verification of the hostname.
User name	The user name, if any, associated with this credential. **Note:** The specified user name is used for SASL authentication using JAAS. The following JAAS configuration is passed to the Kafka Server: `org.apache.kafka.common.security.plain.P required username=<user_name> password=<password>` This field does not appear when the **SASL Mechanism** is **OAUTHBEARER**.
Password	The password associated with this credential. **Note:** • The specified password is used for SASL authentication using JAAS. The following JAAS configuration is passed to the Kafka Server: `org.apache.kafka.common.security.plain. required username=<user_name> password=<password>` • The password you specify is invisible. It is stored in the database in encrypted form. This field does not appear when the **SASL Mechanism** is **OAUTHBEARER**.
SASL JAAS config template	The JAAS configuration to be used by the Kafka client, with the placeholders $[username] for the username, and $[password] for the password.
Additional Kafka consumer properties	Semicolon-separated string of additional Kafka consumer properties. For example: ssl.protocol=TLSv1.2;ssl.enabled.protocols=TLSv1.2,TLSv1.1

© 2026 ServiceNow, Inc. All rights reserved.

SASL_PLAINTEXT security protocol

SASL mechanism	The SASL authentication mechanism to be used by the Kafka client.The options are: • PLAIN • SCRAM-SHA-256 • SCRAM-SHA-512 • OAUTHBEARER Default: PLAIN.
Token endpoint URL	The token provider URL where credentials are sent to fetch access tokens. This value is defined in the client properties file. This field appears only when the **SASL Mechanism** is **OAUTHBEARER**.
Client ID	Unique, public identifier for the application. The authorization server uses it to recognize the calling application. This value is defined in the client properties file. This field appears only when the **SASL Mechanism** is **OAUTHBEARER**.
Client Secret	Private password known only to the application and the authorization server. Used to prove the application's identity. This value is defined in the client properties file. This field appears only when the **SASL Mechanism** is **OAUTHBEARER**.
Scope	Defines the level of access or permissions requested by the application. This field appears only when the **SASL Mechanism** is **OAUTHBEARER**.
OAUTH extensions	Custom metadata or additional parameters for the token request or validation process, in key-value pairs. This field appears only when the **SASL Mechanism** is **OAUTHBEARER**.
User name	The user name, if any, associated with this credential.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SASL_PLAINTEXT security protocol (continued)

	Note: The specified user name is used for SASL authentication using JAAS. The following JAAS configuration is passed to the Kafka Server: `org.apache.kafka.common.security.plain.P required username=<user_name> password=<password>` This field does not appear when the **SASL Mechanism** is **OAUTHBEARER**.
Password	The password associated with this credential. **Note:** • The specified password is used for SASL authentication using JAAS. The following JAAS configuration is passed to the Kafka Server: `org.apache.kafka.common.security.plain. required username=<user_name> password=<password>` • The password you specify is invisible. It is stored in the database in encrypted form. This field does not appear when the **SASL Mechanism** is **OAUTHBEARER**.
Additional Kafka consumer properties	Semicolon-separated string of additional Kafka consumer properties. For example: ssl.protocol=TLSv1.2;ssl.enabled.protocols=TLSv1.2,TLSv1.1

Cribl data input configuration fields

Description of the fields on the Cribl data input configuration form.

Getting Started

Field	Description
Data input name	Name of the new data input. This field is required.
Description	Description of the data input.
MID server	The MID Server to which the Cribl logs are streamed. This field is required.
Port	The port on the MID Server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Getting Started (continued)

Field	Description
	Choose a port within the suggested range from the array. The port must not be occupied by another process. Make sure that your organization's security team opens the selected port. This field is required.

Config

Field	Description
Cribl instance URL	The URL of the Cribl instance. HLA uses this URL to establish the connection with the Cribl instance.
Cribl API token	The Cribl API token HLA uses to authenticate with Cribl and make API calls.

Process

Field	Description
Cribl route	The Cribl route that directs log data to a specific destination. This field is auto-populated with a drop-down list of all available routes, each configured with a default destination. You must select the desired route from this list. This field is required.
Cribl destination	The created Cribl destination. The Cribl destination points to the MID Server host and port configured in the data input. This field is read-only.

Edge Delta data input configuration fields

Description of the fields on the Edge Delta data input configuration form.

Edge Delta data input configuration form

Field	Description
Data input name	Name of the new data input. This field is required.
Description	Description of the data input.
Transport	The Edge Delta destination used for streaming log messages to the ServiceNow instance. The options are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Edge Delta data input configuration form (continued)

Field	Description
	• TCP - Frequently used for handling large volumes of log data. If you select TCP, you must provide the MID Server and port. When choosing the TCP transport option, create a TCP destination in Edge Delta to send log data to the instance from any source. Use the same MID Server host and port you have configured for the Edge Delta data input. **Note:** For TCP, TLS/SSL is not supported. • HTTP: Frequently used for sending smaller logs via RESTful APIs, HTTP, or HTTPS for secure transmission. **Note:** For the HTTP protocol, authentication is used. If you select HTTP, you must provide the MID Web Server that is running on the MID Server. The system then populates the MID Server and port fields automatically, based on the provided MID Web Server. Depending on the MID Web Server configuration, you can send logs using either HTTP or HTTPS. If the **Secure Connection** check box on the MID Web Server extension form is clear, use HTTP. If it is selected, use HTTPS. For more information, see Event Management MID Web Server extension form. In addition, if the **Authentication Type** on the MID Web Server extension form is Basic, provide Basic authentication details in the Authorization header. If the **Authentication Type** is API Key, provide the key as “Key Api_Key". When choosing the HTTP transport option, create an HTTP destination in Edge Delta and enter the Endpoint URL in the following format: http://{MID_SERVER_IP}:{MID_WEB_SERVER_PORT}/api/mid/hla/raw. In Advanced Settings, create two headers to be attached to the HTTP request: ○ An Authorization header with the MID Web Server API key value or basic credentials as MID Web Server configured. ○ A Content-Type header named with the application/json value.
MID web server	The MID Web Server to which the log data is streamed.
MID server	The MID Server to which the Edge Delta logs are streamed. This field is required. If you selected HTTP in the **Transport** field, this field is populated automatically based on the selected MID Web Server.
Port	The port on the MID Server used for listening to logs. Choose a port within the suggested range from the array. In the case of TCP transport, the port must not be occupied by another process. Make sure that your organization’s security team opens the selected port.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Edge Delta data input configuration form (continued)

Field	Description
	This field is required. If you selected HTTP in the **Transport** field, this field is populated automatically based on the selected MID Web Server.
Service instance	The service instance to which to bind the log data. This field is required. Choosing the service instance enables HLA to correlate CIs and service instances in the CMDB for root cause analysis. **Note:** If no relevant service instance exists, Create an service instance and add CIs to it. Set the status of the new service instance to Operational.

Elasticsearch data input configuration fields

Description of the fields on the Elasticsearch data input configuration form.

Basic configuration

Field	Description
Name	Name of the new data input. This field is required.
Description	Description of the data input.
Execute on	Option to determine whether to use a specific MID Server or a MID Server cluster. This feature is supported in the Health Log Analytics application, Version 26.0.17 - February 2023 and later, available from the ServiceNow Store.
MID	(Only when the **Execute on** field is set to Specific MID Server) MID Server to which log data from Elasticsearch indices is pulled.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically. This field is required.
MID Server Cluster	(Only when the **Execute on** field is set to Specific MID Server Cluster) The MID Server cluster to which the log data is pulled. The data input runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the data input tasks to the next available MID Server in the cluster according to the configured order. This feature is supported in the Health Log Analytics application, Version 26.0.17 - February 2023 and later, available from the ServiceNow Store.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the data input form, the MID Server Clusters list displays only failover clusters. • The MID Server cluster must include only MID Servers that support basic authentication. mTLS is not supported for log ingestion. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • If Elasticsearch uses client certificate or CA certificate authentication, all MID Servers in the cluster must have the appropriate certificates. • The default maximum number of data inputs streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 data inputs running on it, even when that MID Server is down. For more information about MID Server clusters, see Configure a MID Server cluster. This field is required.
Service instance	The service instance to which to bind the log data. This field is required. **Note:** If no relevant service instance exists, Create an service instance and add CIs to it. Set the status of the new service instance to Operational.

The following fields show read-only information:

Field	Description
Status	Status of the data input.
Transport	Protocol used to stream the log data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	This data input uses Elastic to stream log data to your instance.
Sources count	The number of log sources this data input has created.
Disabled since	The time when the data input stopped or failed.
Last log time	The time when the last log streamed in the data input.

Transport tab

Field	Description
Server URL	URL used to access the cluster. This field is required.
Max connections per route	Maximum number of connections to be opened per node. Default: 2.
Max scroll slices	The number of shards configured for the relevant index in Elasticsearch. This number tells Elastic how many parallel queries to execute in each polling request.
Proxy host	Host name of the HTTP proxy through which requests are sent.
Proxy port	Port of the HTTP proxy through which requests are sent.
Authentication method	The authentication method used to authenticate the data input to Elasticsearch. The options are: Basic auth, apiKey, or client certificate. **Note:** When you select the required authentication method, the corresponding credentials fields display on the form.
Basic auth credentials	User name and password used to connect to the Elasticsearch search engine. **Note:** Fill in either this field or the **AWS credentials** field.
AWS credentials	AWS credentials to use to connect to the AWS-hosted Elasticsearch search engine. **Note:** Fill in either this field or the **Basic auth credentials** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Transport tab (continued)

Field	Description
AWS region	AWS region where the Elasticsearch cluster runs.
API key credentials	The API key used to connect to the Elasticsearch search engine.
Client certificate	The client certificate used to connect to the Elasticsearch search engine.
Use MID certificate policy check	Option to enable the MID certificate policy check. Select this option if you want to ship your logs encrypted using SSL TLS. Then navigate to **All** > **MID Server** > **MID Security Policy** and add the MID certificate policy check to the table. For more information, see MID Server certificate check policies.

Query Settings tab

Field	Description	Example
From/To	From and to dates and time for reading the data. • From: Don't read data older than this date. **Note:** Setting this value to a past date might require the system to read large amounts of data, causing congestion. • To: Don't read data newer than this date. For live data, set this date far into the future.	From: 1970-01-01 15:59:59 To: 2300-01-01 15:59:59
Use cross-cluster search	Option to search for data across Elasticsearch clusters. When this check box is selected, the **Clusters to search** field displays. **Note:** Your settings in the **Use minimal privileges** check box and the **Delay in reading current timestamp (seconds)** field on the **Advanced configuration** form affect how data is collected across multiple clusters.	
Clusters to search	The Elasticsearch clusters to search.	east,west,south

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query Settings tab (continued)

Field	Description	Example
	This field displays only when the **Use cross-cluster search** check box is selected. Do one of the following: • Leave this field empty or enter "*" to search all the remote clusters defined in Elasticsearch. • Specify the clusters to search in a comma-separated list. **Note:** To also search the local cluster, add a comma at the beginning or end, or add two commas in succession to the list. For example: "east,,west" or ",east,west" or "*,"	
Index prefix	Prefix for the Elasticsearch indices to read from. The data input reads only from indices with this prefix. This field is required.	only-read-these-indices-*
Use minimal privileges	Option to read log data directly from the Elasticsearch indices with the configured prefix. • When selected, the data input reads the log data directly from the Elasticsearch indices with the configured prefix. To perform this task, it needs only read privileges. **Note:** When this check box is selected and you're using cross-cluster search, data is collected from all the clusters simultaneously. • When clear, the data input fetches all indices with the prefix, filters them, and reads the log data from the filtered

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query Settings tab (continued)

Field	Description	Example
	indices. Performing this task requires additional privileges. **Note:** Leaving this check box clear when using cross-cluster search affects how data is collected from the clusters. For more information, see the Enabling and Using Cross-Cluster Search for Elasticsearch Data Inputs in Health Log Analytics [KB1556079] article in the Now Support Knowledge Base. For additional information about streaming logs using the Elasticsearch data input, see the Stream logs using Elasticsearch data input - Advanced guide [KB1080162] article in the Now Support Knowledge Base.	
Document timestamp field	Timestamp field in documents stored in the read indices. This field is required.	
Timestamp field format	Format of the timestamp field in the documents. If no format is specified, the default Unix epoch time format is used, in milliseconds. For example: 1684168407 (May 15, 2023 4:33:27 PM)	yyyy-MM-dd'T'HH:mm:ss.SSSSSSS'Z'
Term filters	JSON map of the terms to filter. **Note:** Avoid using the term query for text fields. If the target field is mapped as both text and keyword, reference the keyword by using fieldname.keyword.	{"severity": ["error", "warning"]}
Max documents per query	Maximum number of documents fetched in a single query.	
Sliced-scrolling tiebreaker	Value used to slice the data. Each slice is scrolled in parallel. Default: _id	
Search-after tiebreaker	Unique value per document to use as tiebreaker when sorting log entries by timestamp.	
Use search-after API	Option to toggle between using sliced-scrolling and search-after APIs.	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query Settings tab (continued)

Field	Description	Example
	Note: Sliced-scrolling APIs are preferable when reading historical data, while search-after APIs are better for reading real-time data.	
Index time-suffix format	Format of the time suffix when using time-based index names, such as [logstash-]YYYY.MM.DD. When using aliases, leave this field empty.	uuuu.MM.dd

Advanced configuration

Advanced configuration form

Field	Description
Data reading timeout (milliseconds)	The duration of time, in milliseconds, before a request to the Elasticsearch cluster times out.
Index discovery interval (seconds)	The number of seconds between intermittent MID Server requests to the Elasticsearch cluster for new indices from which to read data.
Scroll context time (milliseconds)	The lifetime of the created scroll when using the scroll API to read data from Elasticsearch. For more information, see the Elasticsearch scroll API documentation.
Event processor workers	The maximum number of CPU cores used in parallel to process events fetched from Elasticsearch. A higher setting increases the data input throughput at the cost of higher CPU usage.
Worker queue size	The maximum number of batches to queue for processing. A higher setting increases throughput, at the cost of higher RAM usage.
Default timezone	The default timezone if the event date and time doesn't include timezone information.
Sub sample drop ratio	The number of events to batch together, out of which one will be discarded. This setting is used to reduce the number of fetched events.
Sub sample receive ratio	The number of events to batch together, out of which all but one will be discarded. This setting is used to decrease the number of received events.
Character encoding	The character encoding for this data input.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced configuration form (continued)

Field	Description
Sleep interval (seconds)	The interval, in seconds, to wait before querying again after a query has returned no data.
Max length in bytes	The maximum length, in bytes, of log messages.
Delay in reading current timestamp (seconds)	The number of seconds before current time to query to include delayed data. The configured number of seconds is subtracted from the current time for reading the last timestamp. **Note:** If this value is 0 and data is collected from multiple clusters simultaneously, the query may not include data that was sent with a delay on one of the clusters,

GCP PubSub data input configuration fields

Description of the fields on the GCP PubSub data input configuration form.

Basic configuration

Field	Description
Name	Name of the new data input. This field is required.
Port	The port for the MID Server. Select a unique port from the array. The placeholder shows the range of ports from which to choose. Make sure that your organization's security team opens the selected port. This field is required.
Execute on	Option to select whether to use a specific MID Server or a MID Server cluster. This field is required.
MID	(Only when the **Execute on** field is set to Specific MID Server) The MID Server to which the logs are streamed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: • You can select only MID Servers with log ingestion capability that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically. This field is required.
MID Server Cluster	(Only when **Execute on** is set to Specific MID Server cluster.) The MID Server cluster to which the log data is pulled. This field is required. The data input runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the data input tasks to the next available MID Server in the cluster according to the configured order. **Note:** • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the data input or integration form, the MID Server clusters list displays only failover clusters. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • The default maximum number of data inputs or integrations streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 data inputs or integrations running on it. This is true even when that MID Server is down. For more information about MID Server clusters, see Configure a MID Server cluster.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Service instance	The service instance to which to bind the log data. This field is required. **Note:** If no relevant service instance exists, Create an service instance and add CIs to it. Set the status of the new service instance to Operational.

The fields in the following table show read-only information.

Field	Description
Transport	Protocol used to send the log data: PubSub.
Sources count	The number of log sources this data input has created.
Status	Status of the data input.
Disabled since	The time when the data input stopped or failed.
Last log time	The time when the last log streamed in the data input.

Transport tab

Field	Description
Project ID	The project ID of the Google Cloud project. For example, my-project-id.
Topic Name	The Google Cloud Pub/Sub topic to which to subscribe Health Log Analytics. For example, my_topic.
GCP Credential Alias	The credential alias to be used. Specify one GCP credential alias by selecting the magnifying glass icon. Select an existing credential alias from the **Connection & Credential Aliases** list, or select **New** to create a new record. The default is sn_occ.HLA_Credential_Alias. For information about creating a credential alias, see Credential aliases for Discovery.
Subscription Name	The subscription Health Log Analytics uses to receive log data that is published on the Google Cloud Pub/Sub topic. If you leave this field blank, Health Log Analytics uses ServiceNow-Subscription.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced configuration

Advanced tab

Field	Description	Default value
Subscriber Thread Pool Size	The number of concurrent threads that are downloading files from the Google Cloud Pub/Sub topic.	1
Default timezone	The default time zone of events. The system uses this default when the log does not specify a time zone.	GMT
Max length in bytes	The maximum length of log messages, in bytes.	32,766
Character encoding	(Read-only) The character encoding for this data input.	UTF-8
Sub sample drop ratio	The ratio of events to drop.	-1
Sub sample receive ratio	The ratio of events to receive.	-1
Rate limit	The maximum number of events per second that this data input processes.	-1
Drop if queue is full	Option to discard logs if many processes are waiting in the queue to access the MID Server.	Clear

Microsoft Azure Event Hubs data input configuration fields

Description of the fields on the Microsoft Azure Event Hubs data input configuration form.

Basic configuration

Field	Description
Name	Name of the new data input. This field is required.
Description	Description of the data input.
Execute on	Option to select whether to use a specific MID Server or a MID Server cluster. This field is required.
MID	(Only when the **Execute on** field is set to Specific MID Server) MID Server to which log data from Microsoft Azure Event Hubs is pulled.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Query settings tab (continued)

Field	Description	Example
Max batch size	The maximum number of events passed to a single process call.	100

Transport tab

Field	Description
Event Hubs namespace	The scoping container for the event hub or hubs. This field is required.
Event Hub name	The event hub from which to fetch log data. This field is required.
Event Hub credentials	Shared access authorization policy with which to authenticate to the event hub. This field is required.
Consumer Group name	The Consumer Group to use. This field is required.

Advanced configuration

Advanced configuration form

Field	Description	Default value
Restore point rate	The number of events the data input can read before a restore point is saved.	100
Processor threads count	The total number of processor threads.	2
Operation timeout	The number of seconds to wait before timing out event hubs operations.	120
Receive idle timeout	The number of seconds to wait before timing out receive operations.	60
Prefetch count	The number of events received in advance of event hubs operations.	500
Default timezone	The default timezone if the log doesn't include timezone information.	GMT
Sub sample drop ratio	The number of events to batch together, out of which one will be discarded. This	-1

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced configuration form (continued)

Field	Description	Default value
	setting is used to reduce the number of fetched events.	
Sub sample receive ratio	The number of events to batch together, out of which all but one will be discarded. This setting is used to decrease the number of received events.	-1
Max length in bytes	The maximum length, in bytes, of events.	32766
Character encoding	The character encoding for this data input.	UTF-8
Sleep interval	The interval, in seconds, to wait before querying again after a query has returned no events.	60
Polling interval	The interval, in seconds, to wait before polling for new events.	0
Drop if queue is full	Option to discard logs if there is a load on the MID Server.	False

Microsoft Azure Log Analytics data input configuration fields

Description of the fields on the Microsoft Azure Log Analytics data input configuration form.

Basic configuration

Field	Description
Name	Name of the new data input. This field is required.
Description	Description of the data input.
Execute on	Option to select whether to use a specific MID Server or a MID Server cluster. This field is required.
MID	(Only when the **Execute on** field is set to Specific MID Server) MID Server to which log data from Microsoft Azure Log Analytics is pulled.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically. This field is required.
MID Server Cluster	(Only when **Execute on** is set to Specific MID Server cluster.) The MID Server cluster to which the log data is pulled. This field is required. The data input runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the data input tasks to the next available MID Server in the cluster according to the configured order. **Note:** • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the data input or integration form, the MID Server clusters list displays only failover clusters. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • The default maximum number of data inputs or integrations streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 data inputs or integrations running on it. This is true even when that MID Server is down. For more information about MID Server clusters, see Configure a MID Server cluster.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Service instance	The service instance to which to bind the log data. **Note:** If no relevant service instance exists, Create an service instance and add CIs to it. Set the status of the new service instance to Operational. This field is required.

The following fields show read-only information:

Field	Description
Status	Status of the data input.
Transport	Protocol used to stream the log data. This data input uses Microsoft Azure Log Analytics to stream log data to your instance.
Disabled since	The time when the data input stopped or failed.
Sources count	The number of log sources this data input has created.
Last log time	The time when the last log streamed in the data input.
Error message	The streaming error. This field is populated automatically. It displays only when a streaming error has occurred.

Query settings tab

Health Log Analytics uses the values set in these fields to generate the query for receiving log data from Microsoft Azure Log Analytics. The Log query field enables you to configure a custom query

Field	Description	Example
From	Starting date and time for reading the data. Data older than this date and time is not read.	Now -1 week

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query settings tab

Health Log Analytics uses the values set in these fields to generate the query for receiving log data from Microsoft Azure Log Analytics. The Log query field enables you to configure a custom query

(continued)

Field	Description	Example
	Note: Setting this value to a past date might require the system to read large amounts of data, causing congestion. This field is required.	
Data source name	The name of the table in Microsoft Azure Log Analytics where the data input fetches the log data. For more information, see the View table information section in the Microsoft Azure documentation. This field is required.	ContainerLog
Event time property name	The Microsoft Azure Log Analytics field in which to detect the event time. This field is required.	TimeGenerated
Max documents per query	The highest number of rows retrieved in each query.	500
Columns to select	Comma-separated list of column names to return. **Note:** This field is ignored when you provide a custom query.	LogEntry,LogEntrySource

Log query	A custom query for receiving log data from Microsoft Azure Log Analytics.
	
	The settings in this field override those in all other fields on the **Query settings** tab except the **From** field. If the **Log query** field is empty, Health Log Analytics
		`{ "query":"ContainerLog`
		
		`| where LogEntry contains 'cartservice'`
		
		`| where TimeGenerated > %s`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query settings tab

Health Log Analytics uses the values set in these fields to generate the query for receiving log data from Microsoft Azure Log Analytics. The Log query field enables you to configure a custom query

(continued)

Field	Description	Example

	generates the query using the values set in the other fields.
	
	For the custom query, use the following JSON format:
	
	`{"query": "query | where TimeGenerated > %s | take 500"}`
		<pre>| take 500",
		"workspaces":
		["defaultworkspace
		-3ab145ff-f9cd-433f
		-8533-d1b1ee24ae
		e6-eus"],
		"project":
		["TimeGenerated",
		"LogEntry",
		"LogEntrySource"]
		}</pre>

Transport tab

Field	Description
Redirect Url	The redirect URL of the access log application. The URL refers to the Microsoft Azure redirect_uri authorization property. For more information, see the Authorization code URL (GET request) section in the Microsoft Azure documentation. This field is required.
Azure service principal credentials	The credentials used to access Microsoft Azure resources. Choose **Client Secret** from the drop-down list. **Note:** You do not need Azure Enterprise Agreement (EA) credentials. This field is required.
Workspace Id	The Customer ID used to call the Microsoft Azure Log Analytics REST API.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced configuration

Advanced configuration form

Field	Description	Default value
Event Processor workers	The number of concurrent event processing workers, where each worker processes a batch of events independently.	4
Workers Queue Size	The queue size of the Event Processor workers.	5
Sub sample drop ratio	The number of events to batch together, out of which one will be discarded. This setting is used to reduce the number of fetched events.	-1
Sub sample receive ratio	The number of events to batch together, out of which all but one will be discarded. This setting is used to decrease the number of received events.	-1
Character encoding	The character encoding for this data input.	UTF-8
Sleep interval	The interval, in seconds, to wait before querying again after a query has returned no events.	60
Polling interval	The interval, in seconds, to wait before polling for new events.	0
Drop if queue is full	Option to discard logs if there is a load on the MID Server.	False

MID Server data input configuration fields

Description of the fields on the MID Server data input configuration form.

Basic configuration

Field	Description
Description	Description of the data input.
MID	The name of the MID Server from which the logs are streamed.

The following fields show read-only information:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Status	Status of the data input.
Transport	Protocol used to stream the log data. This data input uses the MID Server to stream log data to your instance.
Sources count	The number of log sources this data input has created.
Disabled since	The time when the data input stopped or failed.
Last log time	The time when the last log streamed in the data input.

Advanced configuration

Field	Description	Default value
Default timezone	The default time zone of events. The system uses this default when the log does not specify a timezone.	GMT
Sub sample drop ratio	The ratio of events to discard.	-1
Sub sample receive ratio	The ratio of events to receive.	-1
Max length in bytes	The maximum length of log messages, in bytes.	32766
Character encoding	The character encoding for this data input.	UTF-8
Drop if queue is full	Option to discard logs if there is a load on the MID Server.	

REST API data input configuration fields

Description of the fields on the REST API data input configuration form.

Basic configuration

Field	Description
Name	Name of the new data input. This field is required.
Description	Description of the data input.
MID Web Server	MID Server to which the log data is pulled.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. When you select the MID Server, the **MID** and **Port** fields are completed automatically. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. This field is required.
Service instance	The service instance to which to bind the log data. **Note:** If no relevant service instance exists, Create an service instance and add CIs to it. Set the status of the new service instance to Operational. This field is required.

The following fields show read-only information:

Field	Description
Status	Status of the data input.
Transport	Protocol used to stream the log data. This data input uses REST to stream log data to your instance.
Sources count	The number of log sources this data input has created.
Disabled since	The time when the data input stopped or failed.
Last log time	The time when the last log streamed in the data input.

Rsyslog, Filebeat, or Winlogbeat data input configuration fields

Description of the fields on the Rsyslog, Filebeat, and Winlogbeat data input configuration forms.

Basic configuration

Getting Started tab

Field	Description
Data input name	Name of the new data input. This field is required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Getting Started tab (continued)

Field	Description
Description	Description of the data input.
MID Server	The MID Server to which the logs stream. **Note:** • You can select only MID Servers with log ingestion capability that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. This field is required.
Port	The port on the MID Server. Choose a port within the suggested range from the array. The port must not be occupied by another process. Make sure that your organization's security team opens the selected port. This field is required.
Content pack	(Linux using Filebeat only) The content pack to use. Content packs contain default source types and mapping script templates. Health Log Analytics activates the selected pack automatically and uses its mapping script for mapping the data input sources. For more information, see Health Log Analytics content packs for quicker time to value.

Tagging and Binding tab

Field	Description
Path	The full path from which to stream logs. You can use a wildcard. This field is required.
Service instance	The service instance to which to bind the log data. This field is required. **Note:** If no relevant service instance exists, Create an service instance and add CIs to it. Set the status of the new service instance to Operational.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tagging and Binding tab (continued)

Field	Description
Component	The device type or stack layer as context for the logs that is used for anomaly detection and correlation. For example: Tomcat. Components typically represent CIs in the CMDB. Several components are often clustered together in a single service instance.
Source Type	The source type, which defines how Health Log Analytics handles a specific application and parses the log data. For example: Tomcat Catalina. Each data input can have multiple source types, based on the diversity of its log formats. Service instances and components can have any number of source types.

Advanced configuration

For Rsyslog data inputs:

Rsyslog advanced configuration form

Field	Description	Default values
Use SSL/TLS	Option to use SSL/TLS.	
Look up hostnames	Option to perform DNS lookup to resolve IPs to hostnames.	false
Boss thread count	The number of threads that manage connections.	1
Worker thread count	The number of threads that handle incoming data.	4
Read timeout seconds	The timeout in seconds since the last read. When the timeout expires, the system closes the channel.	30
Default timezone	The default time zone of events. The system uses this default when the log does not specify a time zone.	GMT
Sub sample drop ratio	The ratio of events to drop.	-1
Sub sample receive ratio	The ratio of events to receive.	-1
Max length in bytes	The maximum length of log messages in bytes.	32766
Character encoding	The character encoding for this data input.	UTF-8

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Rsyslog advanced configuration form (continued)

Field	Description	Default values
Drop if queue is full	Option to discard logs if there is a load on the MID Server.	

For data inputs that use Beats agents:

Beats advanced configuration form

Field	Description	Default value
Client inactivity timeout (sec)	The timeout, in seconds, to close an inactive channel.	15
Worker thread count	The number of threads that handle incoming data.	4
Default time zone	The default time zone of events. The system uses this default when the log does not specify a time zone.	GMT
Sub sample drop ratio	The ratio of events to drop.	-1
Sub sample receive ratio	The ratio of events to receive.	-1
Max length in bytes	The maximum length of log messages, in bytes.	32766
Character encoding	The character encoding for this data input.	UTF-8
Drop if queue is full	Option to discard logs if there is a load on the MID Server.	false

ServiceNow Log Export data input configuration fields

Description of the fields on the ServiceNow Log Export data input configuration form.

ServiceNow Log Export data input configuration fields

Field	Description
Name	Name of the new data input. This field is required.
Service instance	The service instance to which to bind the log data. **Important:** The service instance field is pre-populated with a value. Changing this value is necessary only if there is a compelling reason to do so. Consider the implications carefully before making any changes.
Certificate password alias	The credential alias you created in **Basic Auth Credentials**. This field is required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ServiceNow Log Export data input configuration fields (continued)

Field	Description
	For more information, see the Before you begin section in Configure a ServiceNow Log Export data input in Health Log Analytics manually.
Description	Option to add a brief description of the data input to help identify it.
Log level	The log level indicating the severity of the log messages. The available log levels are: • INFO: Information messages representing service actions. This is the default log level. • ERROR: Non-fatal error messages. • WARN: Warning messages indicating potential issues.
Status	Status of the data input: Active or Not Active. This field is read-only.
Disabled since	The time when the data input stopped or failed. This field is read-only.

ServiceNow System Logs Retriever data input configuration fields

Description of the fields on the ServiceNow System Logs Retriever data input configuration form.

ServiceNow System Logs Retriever data input form fields

Field	Description
Name	Name of the new data input. This field is required.
Description	Description of the data input.
Service instance	The service instance to which to bind the log data. The default value is ServiceNow Glide Sys Log. This field is required. **Note:** Health Log Analytics comes with the source type glide_sys_log for log traffic from the ServiceNow Glide Sys Log service instance.
From	From date and time for reading the data. The data input doesn't read data older than this date and time. This field is required.
Status	Status of the data input.
Disabled since	The time when the data input stopped or failed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ServiceNow System Logs Retriever data input form fields (continued)

Field	Description
Syslog table filter	The criteria used to filter log data from the System Log table before streaming it to the AI engine.

Splunk data input configuration fields

Description of the fields on the Splunk data input configuration form.

Basic configuration

Getting Started tab

Field	Description
Data input name	Name of the new data input. This field is required.
Description	Description of the data input.
MID Server	The MID Server to which the logs stream. **Note:** • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. This field is required.
Port	The port for the MID Server. Make sure that your organization's security team opens the selected port in the MID Server. This field is required.
Transport Protocol	The protocol used for streaming log messages to your ServiceNow instance. • TCP - When using the Transmission Control Protocol (TCP) protocol, all logs will reach the instance. However, the Splunk pipeline might be blocked if the MID Server is down or the connection to it is lost. TCP is the default transport protocol. • UDP - When using the User Datagram Protocol (UDP) protocol, the Splunk pipeline will never be blocked. However, some logs might be dropped before they reach the instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Getting Started tab (continued)

Field	Description
	For more information about streaming log data using the TCP or UCP transport protocol, see the Streaming Splunk data using Heavy Forwarder: Selecting TCP or UDP [KB0998928] article in the Now Support Knowledge Base.
Use Cooked Data	Option to ingest log data from Splunk in the preprocessed ("cooked") format that Splunk uses on the forwarder. Ingesting data into HLA in this format ensures that each log line retains the relevant contextual information that Splunk embeds into it. **Note:** If you select this option, there is no need to edit the `props.conf` and `transforms.conf` files during Splunk data input configuration.
Use Forwarder TimeZone	Option to pass information about the time zone in which the forwarder is located. The MID Server uses this information to adjust for the time zone from which the logs arrive. This option is relevant when using Splunk Universal Forwarders.
Enable Compression	Option to send logs in compressed format. Sending logs in a compressed format minimizes the size of the data being transferred, which is important when dealing with large volumes of log data. This option is relevant when using Splunk Universal Forwarders and can only be used when SSL/TLS is enabled.

Advanced configuration

Advanced configuration form

Field	Description	Default values
Use SSL/TLS	Option to use SSL/TLS. **Note:** To send logs in a compressed format, SSL/TLS must be enabled.	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced configuration form (continued)

Field	Description	Default values
Look up hostnames	Option to perform DNS lookup to resolve IPs to hostnames.	false
Boss thread count	The number of threads that manage connections.	1
Worker thread count	The number of threads that handle incoming data.	4
Read timeout seconds	The timeout in seconds since the last read. When the timeout expires, the system closes the channel.	30
Default timezone	The default time zone of events. The system uses this default when the log does not specify a time zone.	GMT
Sub sample drop ratio	The ratio of events to drop.	-1
Sub sample receive ratio	The ratio of events to receive.	-1
Max length in bytes	The maximum length of log messages in bytes.	32766
Character encoding	The character encoding for this data input.	UTF-8
Drop if queue is full	Option to discard logs if there is a load on the MID Server.	

Splunk Polling data input configuration fields

Description of the fields on the Splunk Polling data input configuration form.

Basic configuration

Getting Started tab

Field	Description
Name	Name of the new data input. This field is required.
Description	Description of the data input.
Execute on	Option to select whether to use a specific MID Server or a MID Server cluster. This field is required.
MID	(Only when the **Execute on** field is set to Specific MID Server.) The MID Server to which the logs are streamed. This field is required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Getting Started tab (continued)

Field	Description
MID Server Cluster	(Only when **Execute on** is set to Specific MID Server cluster.) The MID Server cluster to which the log data is pulled. This field is required. The data input runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the data input tasks to the next available MID Server in the cluster according to the configured order. **Note:** • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the data input or integration form, the MID Server clusters list displays only failover clusters. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • The default maximum number of data inputs or integrations streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 data inputs or integrations running on it. This is true even when that MID Server is down. For more information about MID Server clusters, see Configure a MID Server cluster.
Service instance	The service instance to which to bind the log data. This field is required. **Note:** If no relevant service instance exists, create a service instance and add CIs to it. Set the status of the new service instance to Operational.
Transport	The protocol used for streaming log messages to your ServiceNow instance.
Sources count	The number of log sources this data input has created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Getting Started tab (continued)

Field	Description
Status	Status of the data input.
Disabled since	The time when the data input stopped or failed.
Last log time	The time when the last log streamed in the data input.

Advanced configuration

Transport tab

Field	Description
Server URL	The URL used to access the Splunk REST API.
Query	The query Splunk uses to search your data.
Authentication Type	The authentication type. • Basic authentication: Sends a username and password with each HTTP request. Basic authentication is simpler than token-based authentication, but less secure. • Token authentication: The client obtains a token from an authentication server and uses that token to authenticate against Splunk.
Splunk Poll Credential Alias	The credential alias to be used. Select the magnifying glass icon to specify a Splunk Poll credential alias. Select an existing credential alias from the **Connection & Credential Aliases** list, or select **New** to create a new record. The selected credential alias can hold one Basic Auth credential and one Token Auth credential. For information about creating a credential alias, see Credential aliases for Discovery.
From	The date and time from which Splunk searches the data.
To	The date and time until which Splunk searches the data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced tab

Field	Description
Max documents per query	The maximum number of documents retrieved each time log data is fetched from Splunk. Default: 10,000.
Splunk request timeout (seconds)	The maximum time, in seconds, allowed for data retrieval before the request times out.

TCP data input configuration fields

Description of the fields on the TCP data input configuration form.

Basic configuration

Field	Description
Name	Name of the new data input. This field is required.
Description	Description of the data input.
Port	The port for the MID Server. Select a unique port from the array. The placeholder shows the range of ports from which to choose. Make sure that your organization's security team opens the selected port. This field is required.
MID	The MID Server to which the logs are streamed. **Note:** • You can select only MID Servers with log ingestion capability that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. This field is required.
Service instance	The service instance to which to bind the log data. This field is required. **Note:** If no relevant service instance exists, Create an service instance and add CIs to it. Set the status of the new service instance to Operational.

The following fields show read-only information:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
